THE RIPENING OF THE WOOD.—The sunless season has been unfavourable for the ripening of the wood of all fruit trees. Those under glass may be assisted in this matter by providing a little heat in the water pipes. Keep the shoots well thinned so that sunshine and air may reach all parts of the tree. Maintain a free circulation of air in the houses at all times.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

BULBS.—The ease and certainty with which bulbs may be obtained in flower during the winter months make them indispensable where large supplies of pot plants and cut flowers are required. For ordinary purposes, the cheap bulbs give satisfactory results, but for exhibition purposes the higher-priced, named varieties must be purchased. The best results are only obtained when the bulbs are potted early; therefore, if they have not yet been ordered from the seedsman, the order should be despatched without delay. The earliest-flowering varieties should be potted as soon as the bulbs are received, and the later sorts dealt with as circumstances permit. Every gardener has his favourite varieties for the different seasons of the year, but it is always advisable to try a few fresh ones from time to time, which, if found preferable, may supersede some of the older varieties. Those vareties enumerated below in their various sections are recommended for general purposes.

HYACINTH.—With the exception of the Roman and Italian varieties, Hyacinths are not usually employed as cut flowers; but pot plants, especially when grown in 4½-inch pots, are exceedingly useful for conservatory decoration, and for placing in vases or jardinières in the house. *White:* Latour d'Auvergne (very early), La Grandesse, Baroness van Tuyll, L'Innocence, and albo-maximus. *Blue:* King of the Blues, Grand Maître, King Alfred, Ivanhoe, Pieneman, Johanne, and Schotel. *Pink:* Lady Derby, Morineau, Norma, Fabiola, and Roceus Maximus. *Red and Rose:* La Victoire, Amy, General Pelissier, Koh-i-Noor, Mr. Robert Steiger, and Roi des Belges. *Yellow:* City of Haarlem and Yellow Hammer. Most of these varieties are effective when grown in pans of 5 to 12 bulbs of one variety.

TULIPS.—Those of the Duc Van Thol type are decidedly the earliest varieties, and where early blooms are required, the white, scarlet, and yellow sorts should be grown. These may be followed by Pottebakker (white and yellow),

Proserpine, Mon. Trésor, Keizerskroon, Prince of Austria, Vermilion Brilliant, Rose Gris de lin, Rose luisante, La Reine, Van der Neer, White Joost van Vondel, Queen of the Netherlands, Thomas Moore, and Spaendonck. Double varieties may include La Candeur, Tournesol, Murillo, Couronne d'Or, Vuurbaak, Salvator Rosa, and Primrose Beauty. For late flowering, the Parrot Tulips are very useful, but they must not be subjected to a high temperature, nor must the roots be allowed to become dry, or the flowers will be blind. The Darwin Tulips are not usually grown in pots, but, if care is taken, such varieties as Clara Butt, Mr. Farncombe Sanders, Pride of Haarlem, and Glow will give good results. For cutting purposes I have found them much more satisfactory when grown in boxes.

NARCISSI.—Although the colours of Narcissi are not so bright and varied as those of Hyacinths and Tulips, the plants are very valuable, and, probably, easier to cultivate. There are many varieties to choose from, but it is best to rely upon the standard sorts if large quantities of cut flowers are required. For very early forcing, the old varieties, Van Sion and Golden Spur, are the best. These may be followed by Emperor, Empress, Victoria, Princeps, Henry Irving, Sir Watkin, and Mme. de Graaff; these, except Sir Watkin, all belong to the large trumpet section. Of the Leedsii and small-cupped varieties, the most useful are Barrii conspicua, Mrs. Langtry, Poeticus ornatus, Stella superba, Lulworth, Campernelle rugulosus, and C. J. Backhouse. The Poetaz varieties are well worth a trial; I find they last well as pot plants, are more showy than the true Polyantha varieties, and are not so strongly scented. For growing in small pots, the hoop-petticoat Daffodils, Narcissus Bulbocodium (sulphur white and yellow), are very useful, as also are the hybrids of N. Cyclamineus and N. Triandrus. Other useful bulbs for growing in pots are Crocus (Mont Blanc, Maximillian, purpurea grandiflora, and Giant Yellow); Chionodoxa in variety; Muscari botryoides and Fritillaria meleagris; whilst, for flowering late in the season, corms of the early-flowering Gladioli, such as G. Colvillei, Ne plus Ultra, Peach Blossom, Rosy Gem, and The Bride should be potted during the autumn.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

ANEMONE JAPONICA.—The wet season has suited these plants, and they are blooming profusely. They do well in damp and partially-shaded positions, where the flowers last longer than when exposed to the full glare of the sun. In addition to the white variety, there are several with colours ranging from red to very light pink. Queen Charlotte, rosea superba and Prince Heinrich are three good sorts. The plants do best when they are not disturbed for several years. Manure and leaf-mould may be forked into the soil during the winter.

PROPAGATING SUMMER BEDDING PLANTS.—The propagation of Pelargoniums used for summer bedding was treated upon in the Calendar for August 17. Certain subjects, including Marguerites, Calceolarias, Veronicas, and Pentstemons should be propagated this month, in order that the plants may become well rooted and established before the winter arrives. The cuttings may be rooted in pots or boxes, or dibbled in cold frames. If a large stock is required, the last method is the best. Use a moderately light, sandy compost in all cases. If a frame is used, the soil at the bottom should be made solid, so that the roots may not enter into it, as this would cause a severe check to the plants when removing them in the spring. Spread a light layer of sand over the surface, and make the soil firm before inserting the cuttings, taking care that the base of the cutting is in contact with the soil. Water the cuttings after they are inserted, and shade them from bright sunshine till roots have formed. Overhead dampings once or twice daily, according to the weather, will keep the cuttings fresh, but do not promote so much moisture as to cause damping; where there is a danger of this happening, a little air should be admitted at night, but not sufficient to cause flagging. When roots have formed, increase the amount of air till the lights are dispensed with altogether, except during inclement weather. By a cool and hardy treatment, the plants will be sturdy and healthy, and not so susceptible to injury from cold. In times of frost they should be well protected; if necessary the protective material may be allowed to remain on the lights for several days in succession, without the slightest fear of injury. Heliotropes, Coleuses, Nerines, Fuchsias, Alternantheras, and Salvias are propagated differently. The cuttings are rooted in 5-inch pots filled with light, sandy soil, made moderately firm. Dibble the cuttings in to the number of seven to ten in each pot, according to their size and strength. They should be placed in a propagating pit, and plunged in a little bottom heat, where they will soon form roots. After this stage they should be removed from the pit and exposed gradually to more light and air. Coleuses, Iresines, and Alternantheras require considerable warmth to keep them in a healthy condition during the winter; they do best on a shelf in a warm, light house. Heliotropes, Salvias, Ageratums, and similar plants should be placed in the intermediate house, as too much warmth causes them to grow weak and spindly during the winter. Stocky plants quickly provide plenty of healthy cuttings in the spring.

EARLY-FLOWERING CHRYSANTHEMUMS.—The incessant rains of August caused these plants to grow unusually tall. The early-flowering varieties are providing plenty of flowers for cutting and brightening the borders with their colours. See that the stakes and ties are in a proper condition, and afford stronger stakes where necessary, to make the plants secure against damage from heavy rains and winds. Keep the borders clear of weeds by frequent hoeings; if the ground is too wet for the hoe to be used, hand-weeding must be practised.

GENERAL WORK.—Autumnal storms are causing much extra work in keeping the garden tidy, but every effort should be made to keep the lawns and pleasure grounds as attractive as possible, during the remaining few weeks of summer. Leaves of trees are already falling; these should be swept up and placed in a heap in the soil yard, to form leaf-mould. The rains have caused Grass to grow very quickly, necessitating constant attention in mowing and trimming of verges. Lawns should be rolled on favourable days, and worm-casts swept up. The flower-beds should be picked over frequently, in order to have them in the best possible condition till frost destroys their beauty. If Moss has grown on paths and roadways underneath trees, a weed destroyer should be applied, to ensure clean walks and drives during the winter.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

LOGANBERRIES.—If the old fruiting canes of Loganberries have not yet been cut away, they should be removed at the first opportunity, so that the young growths may become thoroughly ripened before winter. It is a good plan to tie five or six of the strongest canes to the poles or wires, to prevent them from being damaged by strong winds.

NUTS.—Remove all suckers from the bases of the trees of Cobnuts and Filberts, and take measures against squirrels, or they will soon clear the crop. Nuts are rather later in maturing this season than usual; they should be gathered as soon as the kernels are brown on the outside and stored on a cool, moist floor, where they will keep in a good condition for a long time. Walnuts should be gathered as soon as they will part freely from the husks.

MULBERRIES.—If it is proposed to bottle these fruits, they should be gathered carefully just before they are ripe, and only when they are quite dry. Mulberries are appreciated by many for dessert, and should be placed in small punnets to prevent handling the fruits more than is avoidable.

BUDS AND GRAFTS.—The weather has been most favourable for the operation of budding, and neither shading nor syringing of the buds has been necessary. Examine the trees frequently, and loosen the ties if they become too tight, otherwise the stocks may be damaged. Recently-grafted trees should also be attended to in this respect, and, if necessary, secured to stakes, especially those on tall stocks exposed to strong winds.

GENERAL WORK.—All fruit trees have made unusual growth this season; if mulchings have been employed, these should be removed, so that the borders may be fully exposed to the influences of sunlight and air. Where the ground has become hard by heavy rains and constant treading, especially near wall trees, the surface should be lightly pricked up. Trees infested with American blight or other insect pests should be attended to, and every effort made to thoroughly cleanse the branches with a suitable insecticide before the pests descend into the ground to hibernate during the winter and spring. The preparation known as No. 2 Fluid is an excellent wash, and two or three thorough syringings with this will completely destroy the majority of insect pests. Keep weeds in check with the hoe; this has been a most difficult matter this season, but if weeds are allowed to grow and hand weeding becomes necessary, much time and labour will be necessary to clear even a small area of ground.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

PREPARATIONS FOR WINTER.—Already there have been indications of frost, and the more tender crops of vegetables may be damaged from this cause at any moment. On the morning of the 3rd inst. the thermometer registered only 34°, and Vegetable Marrows were damaged considerably by the cold. Every precaution should be taken to guard the crops against frost, for it frequently happens that after the first autumn frost there is a long spell of fine, open weather, Much may be done by providing temporary shelter for such tender crops as Marrows and French Beans. The merest protection is generally sufficient at this season to prevent damage.

COLD FRAMES.—A suitable number of portable frames should be found in every garden where a supply of vegetables is required throughout the year. The frames need not be of an expensive character, but they should be of uniform size, so that the lights may be removed from one to another as occasion requires, thus obviating the necessity of moving the frames themselves. The position chosen for wintering the various crops should be one exposed to the south, but sheltered, if possible, on the north and north-east. Ground that has been occupied during the summer months with early vegetables provides an admirable site for the purpose. The soil in the frames should be of a moderately light texture, and placed as near to the glass as possible, leaving only sufficient space for the development of the crops. The compost should be free from wireworm, and moderately dry; it should be made very firm.

PARSLEY.—It is always a difficult matter to furnish a supply of Parsley during the winter months, and one or two frames should be devoted to this herb. The plants should be transplanted from the beds, and if they are of a fairly large size, they should be lifted with a fork, and all but the youngest leaves removed. Parsley is a deep-rooting plant, and it is necessary to use a long dibber to provide holes of sufficient depth for the roots. Plant in rows, at about 8 inches apart, allowing about 4 inches between the plants in the row. Make the soil very firm about them, and, after they have received a thorough soaking with water, apply a good dusting of soot. As is usual with transplanted plants, the frames need to be kept close for a time afterwards, and the interior syringed twice daily. Shade should be provided during bright weather until the plants are re-established, when plenty of fresh air may be admitted. The first rough leaves are developing on late-sown Parsley, and the plants should be pricked out rather closely together. They will afford a plentiful supply of leaves during the late spring. Surplus plants may be set under a rough shelter or at the foot of a south or west wall.

LETTUCE.—Seedling Lettuces in various stages of growth should be planted in frames, selecting hardy varieties for the purpose. Hick's Hardy White and Brown Cos are two excellent varieties for winter cropping; the best Cabbage variety is Hammersmith.

ENDIVE.—This vegetable should be treated in exactly the same manner as advised for Lettuce.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPTEMBER 17—
Nat. Dahlia Soc. Sh. at Crystal Palace (2 days).
WEDNESDAY, SEPTEMBER 18—
North of England Hort. Soc. Sh. at Leeds.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—56°8.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, September 11* (6 P.M.): Max. 53°; Min. 44°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September 12* (10 A.M.): Bar. 30°: Temp. 58°; *Weather*—Dull.
PROVINCES.—*Wednesday, September 11*: Max. 54° Ireland S.W.; Min. 49° Shields.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

WEDNESDAY—
Trade Sale of Bulbs, &c., at 1; Palms and Plants, at 4, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.
Sale of the whole of the Specimen Exhibition Stove and Greenhouse Plants, at The Nurseries, Leamington, by Protheroe & Morris, at 12.
Palms and Decorative Plants, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 3.

THURSDAY—
Clearance Sale of the whole of the stock of Palms, &c., at 17, Tyrrell Road, E. Dulwich, S.E., by Protheroe & Morris, at 12.

Forests and Rainfall.

It is an opinion very generally held by both foresters and amateurs in forestry that woods exert an influence on the amount of rain which falls in their neighbourhood. But although the opinion is general the evidence by which it is supported is by no means conclusive, and, as indicated in an article* on forests and rainfall, the verdict which must be given in the present state of our knowledge is that of "not proven."

History would at first sight appear to provide irrefutable evidence in favour of the generally-accepted view. For example, certain rivers, such as the Loire, are now considerably smaller than they were a few centuries ago. The writer of the article referred to above, in referring to the case of the Loire, mentions that in 1551 the Marquis of Northampton went from Orleans to Nantes with his suite in "five large, many-cabined boats," whereas now navigation is not possible above the halfway town of Saumur.

Evidence of this kind, however, is by no means conclusive. Though the partial drying up of the river may be indeed a consequence of the deforestation which was carried on extensively in the Loire district in the XVIIth century, it does not follow that the reduced volume of water in the river is due to a lessened rainfall. For with deforestation rain finds its way as flood water rapidly to rivers. The latter rise quickly during the floods and subside to relatively meagre proportions after the surplus rain water has been carried off.

Stronger evidence in favour of the view that forests increase rainfall is derived from data collected at "parallel" stations, that is stations one of which is in the forest and the other in neighbouring open country. Thus at Lintzel, Hanover, the rainfall in 1882 was considerably less than that at most of the neighbouring stations; but as trees planted in 1877 grew, the rainfall at this station increased, and in 1890 it was generally in excess of that of surrounding stations. But, as is pointed out by the writer whom we quote, there are pitfalls in the interpretation of even such apparently straightforward evidence as that just cited.

Sheltered from wind, the forest rain gauge is apt to give higher readings than that exposed in a more open region. It has been pointed out, moreover, that the facts may be read in the reverse way; that when deforestation is accompanied by decreased rainfall it may be that deforestation is a consequence and not a cause of the reduced precipitation. Thus in Chinese Turkestan, according to Mr. E. Huntington, and in the country of the Sin-Ling range in China, according to the account given by Mr. F. Kingdon Ward in these pages,* deforestation is going on extensively, and in these instances it would appear that the forests are dying because the water supply is decreasing. The subject, which is one of considerable economic and social importance, must be regarded in the light of these considerations as still open, and although we may incline to agree with the general opinion we must await further evidence before regarding that opinion as well founded.

ROYAL HORTICULTURAL SOCIETY.—The President and Council of the R.H.S. have been asked to suggest names of gentlemen willing to act on the Jury of the (1) Horticultural Exhibition at St. Petersburg, in the spring of 1913, and (2) the Exhibition of Fruit and Chrysanthemums to be held at Nantes on November 12-17, 1912. The secretary, Rev. W. WILKS, will be glad to hear from any British horticulturists intending to be present at either of these exhibitions.

——— The trial of Violas has this year been so successful, particularly in the late spring and early summer, that it has been suggested (and the Council have accepted the suggestion) that the trial should be continued in 1913, with a special view of the date of the flowering of the various varieties. Growers, amateur as well as trade, are therefore requested to send three rooted cuttings of each variety (old as well as new), so that they may be planted before the third week in October. The cuttings should be sent to the Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey.

——— The R.H.S. Daffodil Show will next year be held on Tuesday and Wednesday, April 15 and 16. The schedule of prizes may be obtained from the Secretary by application, accompanied by a stamped addressed envelope.

NORTH OF ENGLAND HORTICULTURAL SOCIETY.—The next meeting of the N.E.H.S. will be held on the 18th inst. in the Queen's (Midland) Hotel, Leeds, at 6.30 p.m., when Mr. W. DYKE, of Cranbourne Nursery, Ware, will deliver a lecture on "Commercial and General Manures." The show arranged for this date is postponed. It is proposed to hold a show on October 17 and 18.

A POTATO COMPETITION.—The St. Barnabas, Sutton, and District Horticultural Society have concluded a competition in Potato culture. On February 13 of the present year they purchased 51 bags of seed Potatos, each bag containing nine tubers weighing 1 lb., and distributed the separate bags to 51 competitors, offering four prizes for the heaviest yields from each 1 lb. of seed, and four prizes for the best quality tubers. The bags were sealed, numbered and drawn for, and each contained Potatos of the same variety, and as nearly alike in every respect. Two members of the committee inspected the weighing of the sets at the time of planting, and were also present when the crop was lifted. The successful grower was Mr. C. F. CLARK, an under-gardener to R. L. POWELL, Esq., Banstead Grange, Banstead, Surrey, his crop scaling 231½ lbs., made up of 219 lbs. 2½ onnces of ware tubers, 9 lbs. 7 ounces of seed tubers, and 2 lbs. 14½ ounces of chats or smaller tubers. Mr. CLARK's crop also gained the highest award for quality. The seed was a selected stock of "The Colleen," a second early variety of Irish origin, raised by Mr. J. F. WILLIAMSON. Other competitors' crops ranged from 90 lbs. to 200 lbs.

FORESTRY IN WALES.—The Board of Agriculture have sanctioned the appointment of Professor FRASER STORY, of the University College, Bangor, as Advisory Officer in Forestry for the whole of Wales in connection with the new scheme in which the North Wales University College will undertake advisory work in forestry in the Principality.

ACREAGE OF HOPS.—A preliminary statement compiled from the returns collected on June 4 shows that the acreage under Hops in England is 34,831, being 1,755 acres more than in 1911, and 1,945 acres in excess of 1910. The chief Hop-growing counties are Kent (21,400 acres), Hants. (1,516 acres), Hereford (5,236 acres), Sussex (2,847 acres), and Worcester (3,186 acres).

FRENCH GARDENERS AT RAYNES PARK.—The members of the Société Francaise d'Horticulture de Londres visited Messrs. JAMES CARTER & Co.'s establishment at Raynes Park on the 7th inst. There was a large party, including Mr. GEO. SCHNEIDER, the chairman. The tour of inspection included visits to the offices, warehouses, stores and trials. At the luncheon Mr. SCHNEIDER thanked Messrs. CARTER & Co. for their hospitality, and Mr. HAROLD BEALE, a member of the firm, responded.

"THE ORCHID REVIEW."—The September issue of the *Orchid Review* contains an article on the leaf-spot of Odontoglossum, which is now recognised as the work of a definite parasitic fungus, and has been identified by Mr. F. W. ROLFE with a fungus which was described in France under the name of Cercospora Odontoglossi, Prill. and Delacr. It was first found on Odontoglossum crispum at Versailles. This fungus is now shown to have given trouble in several collections, but means are described for keeping it in check. A striking new generic hybrid between Cochlioda Noezliana and Oncidium macranthum is described, under the name of Oncidioda Cooksoniæ, and an article is devoted to the yellow varieties of Lælia tenebrosa.

* *Nature*, August 29, 1912.

* August 24, 1912.

FREE HOMESTEADS IN MANITOBA.—Contrary to the general impression that obtains, it appears there are still plenty of free homesteads available for settlers in the Province of Manitoba. A large area of land suitable for this purpose has hitherto been held up owing to differences between the Provincial and Dominion Governments. These differences have now been settled and a large area of land is now to be thrown open for free selection. It is expected that there will be a great rush to obtain the land, particularly as one large district is only 30 miles distant from Winnipeg, thus ensuring the advantage of a large and growing market close at hand.

FIG. 96.—WAHLENBERGIA VINCAEFLORA: FLOWERS BLUE.
(See p. 216.)

THE GENUS EUCALYPTUS.—The fifteenth part of Mr. J. H. MAIDEN'S "Critical Revision of the Genus Eucalyptus" deals with E. oleosa, E. Gillii, a new species, and E. falcata, with four plates. E. oleosa is a shrubby species, occasionally attaining the dimensions of a small tree, and comes under the local designation of Mallee, a native name applied to several shrubby species. It ranges through Southern Australia, from the extreme west to the Murray River, in Victoria, and northward into New South Wales. Two plates and part of a third are devoted to the illustration of this species, which belongs to the group bearing quite small seed-vessels. The other species illustrated are closely allied to E. oleosa.

FRUIT INDUSTRY IN CENTRAL AMERICA.—According to the *Financial Times*, a general scheme of consolidation has been arranged, whereby the whole of the railroads in Central America will be placed under one administration dominated by the United Fruit Company, of the United States, while plans of development have been drawn up which, together with the cost of acquiring the lines, will require a sum of at least $40,000,000. It is pointed out that the scheme will prevent other interests from obtaining a footing in a region where the United Fruit Company has, for some time past, sought to make itself paramount, while the project, it is further contended, should add greatly to the prosperity of the companies to be taken over. The lines over which control has already been obtained will not only link one with another but will be joined up with certain Mexican railways, thereby giving a connection between New York and Guatemala.

NORTH AMERICAN SPECIES OF HEMITELIA.—A new synopsis of the North American species of Hemitelia, by W. R. MAXON, appears in part 2, volume xvi., of the *Contributions from the United States National Herbarium*. The members of this genus are among the most handsome of tree Ferns. Mr. MAXON enumerates 21 species including three or four from the West Indies. The author encountered great confusion in the synonymy of some of the species, especially in relation to those bearing the name Hemitelia speciosa. The cultivated H. Lindenii is the true speciosa. There are figures of a dozen species. The same paper contains definitions and figures of the American species of Cibotium, namely: C. Schiedei, C. regale, C. guatemalense, and C. Wendlandii; generally referred to as Dicksonia in this country. Nothochlaena leonina and N. Rosei are new Mexican Ferns.

SPRAYING APPLE TREES.—The Agricultural Experiment Station of the University of Nebraska has issued a useful little *Bulletin* on the subject of "The Spraying of Apple Trees." The remedies recommended for the control of Apple scab are Bordeaux mixture, or commercial lime-sulphur solution. For the control of the codlin moth, lead arsenate at the rate of 2 lbs. to 50 gallons of spray material is recommended, the latter being either Bordeaux mixture or lime-sulphur. The usefulness of the *Bulletin* is enhanced by a series of illustrations of Apple flowers, which serve to indicate graphically in what state the blossom should be when the first and second applications of the spray-fluids should be made.

SETTLERS IN EASTERN CANADA.—In Nova Scotia power has been obtained by legislation for the purpose of providing assistance to take up farms to settlers who are not otherwise in possession of sufficient means to do so. If the individual is found to possess adequate farming experience and is judged otherwise suitable, assistance, if need be, is given him to the extent of 80 per cent. of the valuation of the farm he proposes to purchase. This guarantee the Government has arranged through a loan company. A settler who possesses at least 20 per cent. of the capital required and sufficient to start on his farm, after paying his passage, is at once placed in a position of acquiring an independence. The authorities in Nova Scotia, New Brunswick and Ontario are prepared to receive applications from any number of married men with families who possess from £100 to £300, through their representatives in London, who will furnish the fullest particulars and advice.

THE TONGA BEAN.—In the course of an article in the *Journal d'Agriculture Tropicale* (July 31, 1912), Hon. M. J. GRISARD draws the attention of agriculturists of tropical countries to the prevailing scarcity of the Tonga Bean, and suggests that its cultivation might prove remunerative. The Bean, which contains in its cotyledons large quantities of coumarine, is the seed of the leguminous plant, Dipteryx odorata, a native of the forests of Venezuela, Guiana and Northern Brazil. Although its pharmaceutical uses are but scanty, the active principle of the Tonga Bean is employed in commerce on a huge scale, especially for the purpose of perfumery, soaps, pomades and many scents depending largely on coumarine for their aroma. The sale of Tonga Beans is particularly great in the United States, and the world's output is insufficient to meet the demand.

WAHLENBERGIA VINCÆFLORA.

(See fig. 96, p. 215.)

THE Wahlenbergias of Australia and New Zealand possess a definite character of their own, quite distinct in habit from the European members of the genus. The latter, in fact, form such a well-marked section that they are generally known by the name of Edraianthus. Those included in the section Edraianthus are all more or less biennial in habit, although some species like W. dinarica and W. serpyllifolia keep on for several years under favourable conditions. They all form long, somewhat fleshy roots, with a tuft of leaves close to the ground. From this tuft the inflorescences are produced on decumbent stems, long in some like W. tenuifolia, and short in others like W. dinarica. In the latter choice little species the flowers just top the leaves.

The Australian and New Zealand species are very variable in size and habit, and a good deal of confusion has arisen with regard to the nomenclature of the various species. Cheeseman, in his *Flora of New Zealand*, mentions three species, but does not clear the matter up satisfactorily, as he makes W. vincæflora a synonym of W. gracilis. The type of the latter, however, is a small flowered annual, whereas the former is a large flowered perennial. The three Australian and New Zealand species in cultivation are:

W. ALBO-MARGINATA, Hook.—This is the plant figured in the *Botanical Magazine*, t. 6613, as W. saxicola, and is a perennial. It is called the "Bluebell of New Zealand," and spreads by means of underground stems which produce rosettes of leaves at intervals. The leaves vary in length from an inch to an inch-and-a-half; the lower are broadly spatulate, while the upper leaves are longer and narrower and have undulate margins. The flowering stems, 9 inches to 12 inches high, branch near the base, and have very few leaves, while the flowers are borne singly on stalks nearly 6 inches long. The colour of the flowers, which are over an inch across, varies from pale blue or lilac to white, with deeper-coloured veins. Like the other two species, it is very free-flowering, producing flowers from June to September. This plant is only found in New Zealand.

W. SAXICOLA, A. H.—Similar in habit to the above, this species only grows to the height of from 2 inches to 4 inches. It bears small blue flowers, the petals barely exceeding the sepals in length. The type specimen comes from Mt. Wellington, in Tasmania, where it grows in the scanty soil of crevices of large rocks. It is also found in New Zealand.

W. VINCÆFLORA, Dene (see fig. 96).—Under the name of W. gracilis, which is a small flowered annual, this plant has been grown in gardens for many years. It was figured in the *Botanical Magazine*, t. 691, as Campanula gracilis, from plants which flowered in Curtis's Botanic Garden in 1803. These plants were raised from seeds which germinated in soil surrounding other plants imported from Australia. A good form of it was exhibited at the meeting of the Royal Horticultural Society, on June 4 last, under the provisional name of W. gentianoides, and obtained an Award of Merit. It was raised by Mr. R. Prichard, of West Moon, Wimborne, and was found amongst a batch of seedlings of the so-called W. gracilis. W. vincæflora is a very variable perennial. It is found in New Zealand, but is more common in South Australia, where it is known as the "Australian Harebell." It is a graceful little plant with many slender stems, branching freely and reaching a height of from 1 foot to 15 inches. The blue flowers, 1½ inches to 2 inches across, are borne singly on long stalks.

All three species are easily grown in light, rich soil, in shady positions, and produce seed freely. *W. T.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE R.H.S. AUTUMN FRUIT SHOW.—Now that the date of this show is approaching, I would suggest that the Council make arrangements to prevent exhibitors losing their exhibits. Last year many thefts were committed, and even Grapes were removed from the boards. The police should receive instructions to clear the hall at the end of the show of all those who have no interest in the exhibits. I admit that in some instances even an exhibitor may be liable to pick up a wrong dish, but no exhibitor would take another man's Grapes from the boards. It is usually the small exhibitor who is the loser. *A. G.*

COLOUR IN HARDY FRUITS.—Mr. S. Gilthorpe's notes, p. 201, seem to me well-timed. On two occasions quite recently the subject has been discussed in my presence, and on both occasions last year's discussion was referred to. The first one was when a small party of gardeners and amateurs were inspecting the fruit trees in the Cattal Nurseries of Messrs. J. Backhouse & Son, York. The manager, Mr. William Richardson, drew our attention to the grand colouring of certain varieties of Apples, such as Worcester Pearmain and Red Victoria. Yet the sun had shone less this summer than for many seasons past. He specially appealed to the writer, whose sympathies have on the whole up to now been on the side of those who thought the sun had much to do with colouring Apples in the north. I at once admitted I was wrong. The next day, accompanied by Mr. R. McIntosh, of York, a well-known and experienced cultivator of hardy fruits in that district, I went to Warter Priory, Pocklington, to inspect recent extensive garden developments there. The first object noticed was some pot-grown trees of Peasgood's Nonesuch Apple standing amongst Currant bushes, protected overhead with fish netting. Each tree bore several fine fruits. Without any mention of the previous day's discussion, Mr. Jordan said he had put the trees there from the large orchard house, so that the fruits might become coloured. They had only been out three or four days, and he could see a decided advance in that direction almost daily. There had been practically no sunshine in the interval. As is well-known, Mr. Jordan is one of the very best cultivators of fruits in the country. He is a firm believer that atmospheric conditions apart from bright sunshine have much to do with the colouring of Apples. The soil at the two places is quite different. At Cattal it is a good red loam overlaying sandstone; at Warter, a less enriched soil, with the chalk of the Yorkshire Wolds for its base. Having attended several horticultural shows this year, I can confirm Mr. Gilthorpe's opinion as to the better colouring of black Grapes this season as compared with last year. This applies more particularly to the two best varieties for dessert, viz., Black Hamburgh and Madresfield Court. Muscat of Alexandria has not been so well coloured. Peaches, too, especially of the Belle-garde type, have exhibited high colour during the present season. *Yorkshire Gardener.*

——— Mr. Gilthorpe's letter respecting the colouring of fruit is most interesting. Apples here have coloured well this exceptionally wet season. I have never seen deeper colour in Lady Sudeley, Worcester Pearmain, and Beauty of Bath; whilst Mère de Ménage, Red Astrachan, Peasgood's Nonesuch, Tom Putt, and other varieties are all well coloured. Peaches have coloured well, and Figs have ripened outside. Owing to the excessive rains, Plums cracked badly, and we have lost a large number of these fruits. There is a deficiency of flavour in all fruits this season. *J. S. Higgins, Glynllivon Gardens, Carnarvon.*

——— I have long maintained that wet and wind have a great influence on high colour in Apples, and the present season seems to confirm my opinion. Apples here, and especially the varieties Worcester Pearmain and Bramley's Seedling, are much more brightly coloured this year than last season. The fruits in the majority of varieties are also better developed than they were in 1911. This is no doubt due to the abundant rains, for it is well established that Apples like plenty of moisture. What is needed now is sunshine to ripen the wood. *Wilmot H. Yates, Rotherfield Park Gardens, Hampshire.*

THE BEARING OF APPLES.—My observations coupled with the experience of a large number of commercial growers in Kent, have led me to the conclusion that it is chiefly the late varieties that have the tendency to bear in alternate years, due, in my opinion, to the wood failing to ripen when the tree is carrying a large crop. I have in mind some 40 fine standard trees of the variety Royal Jubilee. Some of these are carrying excellent crops, while others which bore well last season are barren. On the trees which are carrying crops the foliage is remarkably fresh and green, while on those which have no fruit the foliage is turning yellow, and the wood is ripening well. Viewed at a distance the trees would give one the impression of being different varieties. I have also noted Bramley's Seedling showing the same marked appearance. *F. G. Cousins.*

HISTORY OF THE JARGONELLE.—It is not so clear, as Mr. Sydney H. Kenwood assumes, that the Jargonelle of our gardens is not the old Jargonelle. It is to Miller, who mentions both names, that the statement is due that the Jargonelle and the Cuisse Madame had been confounded with each other on their introduction, but others have controverted this statement as devoid of foundation in fact. The earliest mention of the fruit by that name that I have seen is in De Serres *Theatre d'Agriculture* as "de Jargonet," which would make it appear that it was named after a place or a person. It is not named among the Pears in the earlier *La Maison Rustique*. There are, or were, three distinct varieties named Jargonel or Jargonelle: Dr. Hogg's variety, to which with other names he gives as synonyms Beau Présent, Epergne, Grosse Cuisse Madame, and St. Samson. This is the recognised form. The Jargonelle of Merlet, synonyms Bassin, Bellissime d'Eté, St. Laurent and Belle Cornélie; and Bradley, whose list first appeared in one of his monthly tracts, obviously copied from Merlet, has one called La Jargonelle simply. In Furber's Catalogue of Pears (1724), it is spelled "Jargonel." Laurence spells it "Jergonel," ripe in August, and "Cusse Madam," ripe in July, and if clearer evidence than this is needed to show that Miller was mistaken in his assumption that names had been changed, it is to be found in Langley's *Pomona*. Langley's position as a nurseryman making the evidence particularly strong, and in *Pomona* our Jargonelle is figured under that name, and the Cuisse Madame by its proper designation. As an indication of how almost inextricably the names are mixed, there is a "Petite Cuisse Madame" in *The Gentleman's Recreation* of Richard Blome (1686), the Cuisse Madame of Laurence and of Langley and the Grosse Cuisse Madame, the Jargonelle of to-day, La Jargonelle of Bradley, and the Grosse Jargonelle or Windsor. The conflicting names in synonyms could be carried much further. Mortimer, I should say, refers to one of these by the name St. Laurence. I have nothing to say concerning the derivation of Jargonelle, except that each of the derivations proposed seems to be rather far-fetched. If De Jargonet of De Senes is the correct word, it would put the question at rest. The Pear Volema is always noted as The Warden. *B.*

TRADE NOTICES.

POLLARDS NURSERIES, LTD.

The above-named company has been registered with a capital of £50,000 in £1 shares (20,000 Preference), to carry on the business of florists, market and nursery gardeners, dealers of all kinds of plants and garden requisites, and general contractors, as formerly carried on by A. W. Pollard, at Longfield Lane, Cheshunt, Herts., as Pollard's Nurseries.

JOSEPH ROCHFORD & SONS, LTD.

This company has been registered with a capital of £70,000 in £1 shares, to carry on the business of fruit growers, nurserymen, farmers, market gardeners, seedsmen, raisers, growers, and dealers of all kinds of seeds, plants, trees, shrubs, bulbs, flowers, vegetables, fruit, corn, cereals, &c., and to adopt an agreement with J. Rochford. The signatories are: J. Rochford, Turnford, near Broxbourne, Herts.; J. P. Rochford, Covent House, Turnford, near Broxbourne, Herts.; B. Rochford, 21, Fitzjohn's Avenue, N.W. (one share each). Private company. Mr. J. Rochford is the first governing director. Office, Turnford Nursery, Turnford, near Broxbourne, Herts.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 10.—The Royal Horticultural Hall at Vincent Square was agreeably furnished on Tuesday last with interesting exhibits. Gorgeous Dahlia blooms of many kinds and large masses of excellent herbaceous Phloxes were the dominant features of the show.

The ORCHID COMMITTEE recommended two First-class Certificates and two Awards of Merit to novelties.

The FLORAL COMMITTEE bestowed 21 Medals and 14 Awards of Merit. Of these Awards of Merit, 9 were made to Dahlia blooms, in conjunction with the National Dahlia Society, whose First-class Certificate is simultaneously awarded.

The FRUIT AND VEGETABLE COMMITTEE awarded three Medals, two Awards of Merit, and one Card of Cultural Commendation.

At the 3 p.m. meeting of Fellows, Miss Troyte-Bullock delivered a lecture on "Cape Pelargoniums."

Floral Committee.

Present: Henry B. May, Esq (in the Chair); and Messrs. C. T. Druery, J. Green, W. J. Bean, J. Hudson, E. A. Bowles, J. W. Barr, George Gordon, C. R. Fielder, Wm. Howe, J. F. McLeod, Chas. Dixon, W. T. Ware, Arthur Turner, John Dickson, H. J. Jones, Chas. E. Pearson, W. P. Thomson, C. H. Jenkins, and W. J. James.

Mr. JAMES BOX, Lindfield, Sussex, arranged large masses of herbaceous Phloxes, which were exceedingly effective. The deep-purple Mahdi contrasted well with the nearly-white Frau Antoine Buchner and the pure-white Freifraulein von Lassberg. The variety Rijnstroom, which received an Award of Merit, was present in large quantities, and showed a great advance on others of similar colour. In another part of the Hall, Mr. Box exhibited a splendid collection of border flowers, the early-flowering Chrysanthemums and Montbretias being especially good. (Silver-gilt Flora Medal.)

Mr. AMOS PERRY, Enfield, Middlesex, contributed an attractive group of hardy plants. Artemisia lactiflora was shown in a large mass; Delphiniums of good size and colour; long spikes of Liatris pycnostachya; Heleniums, and a batch of Sedum spectabile atropurpurea were especially good. The tall, stout heads of Kniphofia nobilis were in marked contrast with those of the tiny but equally beautiful species K. rufa, which is deserving of extended culture. (Silver-gilt Banksian Medal.)

Messrs. J. CHEAL & SONS, Crawley, Sussex, displayed a large number of trees and shrubs in flower, with autumn colouring. There were tall plants of various Crabs and species of Cratægus, which bore large crops of fruit, placed along the centre of this collection, which included varieties of Heaths. Japanese Maples, several species of Ceanothus, the bushy Spiræas, and Veronicas in flower also contributed towards making a pleasing exhibit. Messrs. CHEAL & SONS also showed many varieties of Dahlias. (Silver Flora Medal.)

Messrs. G. & A. CLARK, Dover, displayed hardy border flowers, including several varieties of Kniphofia Uvaria, Liatris pycnostachya, various Gladioli, and Michaelmas Daisies.

Mr. O. DIXON, Putney, also showed cut blooms of hardy herbaceous perennials.

Messrs. GUNN & SONS, Olton, Warwickshire, arranged a fine collection of herbaceous Phlox in a very attractive manner, and exhibited the wide range of colour obtainable to great advantage. (Silver Flora Medal.)

Messrs. BARR & SONS, Covent Garden, London, exhibited many hardy border flowers near the entrance. A group of Kochia tricophylla, with vivid autumn colouring, behind some flowering plants of Valotta purpurea and cut spikes of Nerine Fothergillii major, and vases of various herbaceous Phloxes, made a charming display. The uncommon colour of the flowers of the old favourite Verbena venosa attracted attention, as also did a spike of Lilium nepalense. At the back of a small collection of rock-plants there was a good row of Polygonum affine. (Silver Banksian Medal.)

Messrs. WHITELEGG & PAGE, Chislehurst, Kent, arranged a very neat collection of border flowers and a few Alpines in pots.

Messrs. GEO. BUNYARD & CO., LTD., Maidstone, Kent, included in their collection of hardy border flowers good varieties of Anemone japonica, such as A. j. elegantissima and A. j. rubra; Rudbeckia "Autumn Glory," Aster "Saturn," A. "Lustre," herbaceous Phloxes, and Lilium tigrinum Fortunei. (Silver Banksian Medal.)

Mr. A. LL. GWILLIM, Sidcup, Kent, exhibited a large number of excellent blooms of tuberous Begonias—chiefly of the double varieties—laid on show boards, with leaves of the Virginian Creeper. The rows of Begonias were broken by vases of well-grown Michaelmas Daisies. (Silver Banksian Medal.)

Mr. G. REUTHE, Fox Hill Nursery, Keston, Kent, showed many interesting Alpine and other uncommon plants and shrubs. Perovskia atriplicifolia, Gentiana Andrewsii, Clethra alnifolia rosea, Escallonia organensis, Desfontainea spinosa, and Berberidopsis corallina are a few of the subjects displayed.

The Misses HOPKINS, Shepperton-on-Thames, furnished a small rockery with many plants in flower.

Messrs. WM. FELLS & SON, Hitchin, Herts., also made a rockery, using red sandstone in a pleasant and unostentatious manner.

Messrs. W. & J. BROWN, Peterborough, exhibited in Dianthus Napoleon III a very sturdy purple-flowered variety. The colour of the flowers of Petunia New Purple quite justifies its name.

T. B. BOLITHO, Esq., Trewidden, Penzance (gr. Mr. Maddern), sent sprays of several exceedingly interesting shrubs from his well-known garden. Styrax Obassa was well furnished with the pendulous racemes of nut-like fruits which follow the fragrant flowers The Protean Guevina Avellana must have been taken from a very healthy bush, and it bore many racemes and a number of flowers; the kernel of the resulting nut is said to be esteemed in Chili. Two shoots of Magnolia hypoleuca each bore a horned fruit fully 6 inches long. Sprays were also sent of the white-flowered Tricuspidaria dependens.

Messrs. WM. PAUL & SONS, LTD., Waltham Cross, had a surprisingly fine display of cut Roses, mostly arranged in round baskets. Such well-known varieties as George C. Waud, the deep-red Florence Haswell Veitch, Lady Wellington, La Tosca, General MacArthur, Mrs. R. G. S. Crawford, and Hugh Dickson were very good indeed, and amongst the lesser-known varieties there were good examples of Hugo Roller, a Tea Rose with creamy-white petals; Château de Clos Vouget, deep velvety crimson; Coronet, a very pretty semi-double cluster Rose; and Senateur Mascurand. (Silver Flora Medal.)

Messrs. BENJ. CANT & SONS, Colchester, also showed an attractive group of Roses. The many stands contained fresh typical blooms of such varieties as Irish Elegance, Dean Hole, Juliet, Reliance, R. N. Thomas, and Caroline Testout. The seedling Tea Rose Lady Reay, which was placed near a fine stand of the Lyon Rose, is a charming variety. (Silver Flora Medal.)

Messrs. STUART LOW & CO., Bush Hill Park, Middlesex, displayed vases and cut Roses. The popular varieties Juliet and Lyon were well shown. Beauté de Lyon, a hybrid Briar Rose, possesses uncommon colouring, which may be described as a deep reddish-apricot shade. A stand of the dwarf Polyantha Rose Jessie was exceedingly effective.

Messrs. R. FELTON & SON, Hanover Place, London, were awarded a Silver Flora Medal for their delightful exhibit of imported Nelumbium blooms.

Miss WALTERS ANSON exhibited a beautiful painting of life-like Nelumbium blooms. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, contributed many round baskets, containing floriferous Clematis, hardy Fuchsias in small pots, bearing large quantities of flower, and Ceanothus species and varieties. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, Upper Edmonton, again showed many excellent stove and greenhouse Ferns and a collection of sturdy, floriferous, shrubby Veronicas. (Silver Banksian Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, contributed some very fine plants of Cordyline australis in variety. The variegated plants of Dracæna Doncettii and the yellow and green Bruanti variegata are very valuable for greenhouse decoration or for furnishing large vases in the dwelling-house. (Silver Banksian Medal.)

DAHLIAS.

Messrs. CARTER, PAGE & CO., 3, London Wall, London, arranged a very large bank of Dahlias, which made a gorgeous show. The massed centre of Pæony-flowered varieties was flanked by vases of exceedingly fine Cactus flowers, such as Nisi Prius, Great Western, Leda, and Mrs. McMillan. (Silver-gilt Flora Medal.)

Messrs. HOBBIES, LTD., Dereham, made an exceedingly effective display of Dahlias. Tall stands contained blooms of the decorative and collarette varieties, which included, amongst the former type, the bright rose-coloured Delice, the rich-toned Leveller and Bonfire, and the orange-scarlet Dr. Hogg. (Silver-gilt Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, filled one length of tabling with a comprehensive collection of Dahlia blooms, which were tastefully arranged with sprays of Aster (Michaelmas Daisy) growths. (Silver Flora Medal.)

Mr. S. MORTIMER, Farnham, Surrey, exhibited many very fine blooms of show and fancy and Cactus Dahlias on exhibition stands. (Silver Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, arranged a number of Dahlia blooms, amongst which the dark Excelsior, Jupiter, Conquest, Jeannie Charmet and Florrie Wells were prominent. At one end of the Dahlias Messrs. WARE showed a fine selection of border flowers. (Silver Banksian Medal.)

Mr. CHARLES TURNER, The Royal Nurseries, Slough, showed an exceptionally fine collection of Dahlia blooms. The varieties Alfrida, Berthe von Süttner, Eleanor, and Bayard were splendid, and the white Cactus Snowdon was probably the best in the show. (Silver Banksian Medal.)

Mr. J. T. WEST, Tower Hill, Brentwood, also showed a good collection of Dahlias of different sorts. (Bronze Flora Medal.)

Messrs. S. BIDE & SONS, Farnham, Surrey, showed Sweet Peas of many varieties. The best were Arthur Unwin, Scarlet Emperor, Mrs. R. Hallam and Barbara.

AWARDS OF MERIT.

Chrysanthemum Crimson Pollu.—A chestnut crimson, early-flowering variety with gold reverse to the florets. Shown by Messrs. W. WELLS & CO.

Helenium autumnale rubrum.—The flowers of this variety are of a very deep red colour. In the hall they appeared to be too dark. Shown by Mr. AMOS PERRY.

Achillea Perry's White.—A splendid white border flower which shows a great improvement on former varieties. Shown by Mr. AMOS PERRY.

Phlox Rijnstroom.—The large flowers are of a soft rose-colour, which is at times paler in the centre. This very desirable herbaceous Phlox was shown by Mr. JAMES BOX.

Pentstemon Gaddesden Gem.—One of the very best Pentstemons. The large scarlet flowers have white tubes. Shown by Mr. A. G. GENTLE.

Dahlia Queen Mary.—A decorative variety of excellent form; the florets are lined and flushed with rose colour. Shown by Messrs. H. CANNELL & SONS.

D. Crawley Star.—This variety represents a new section, which may be termed the Cosmos type. The flowers are of a rosy-mauve colour. Shown by Messrs. J. CHEAL & SONS.

D. Ideal.—A fine crimson collarette variety with a yellow collar. Shown by Mr. RIDING.

D. Albert Maumene.—A rosy-mauve collarette bloom with much paler collar. The disc florets of this large round flower are reflexed. Shown by Mr. RIDING.

D. Selma.—A very pretty Pompon variety. The flowers are buff coloured, slightly suffused with Apricot when mature. Shown by Mr. CHARLES TURNER.

D. Nantwich.—A medium-sized Cactus variety. The buff-coloured, incurved florets are occasionally suffused with red.

D. Dolly.—A compact Cactus variety. The scarlet colour merges to white at the tips of the florets.

D. John Riding.—A very long incurved Cactus variety of rich red colour. These three varieties were shown by Messrs. J. STREDWICK & SON.

D. Papa Charmet.—A decorative variety with bright, velvety maroon florets. Shown by Messrs. HOBBIES, LTD.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Messrs. Jas. O'Brien (hon. sec.), R. Brooman-White, W. Bolton, W. H. White, Arthur Dye, J. E. Shill, J. Cypher, W. H. Hatcher, W. P. Bound, W. Cobb, J. Charlesworth, A. McBean, F. J. Hanbury, W. Thompson, Stuart Low, Gurney Wilson, and Sir Harry J. Veitch.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), staged an effective group of showy Orchids, set up with Adiantum Ferns, for which a Silver Flora Medal was awarded. Varieties of Cattleya Suavior, C. Source d'Or, C. Armstrongiæ, C. Gertrude Pitt (Mossiæ × Pittiæ), C. Gaskelliana, and other Cattleyas were prominent; whilst there were good examples of Lælio-Cattleya rubiginosa (L. Boothiana × C. Schilleriana), L.-C. Hector, L.-C. Henry Greenwood, and L.-C. Nysa. We noticed various Brasso-Cattleyas, fine Odontioda Charlesworthii, several Odontoglossum Victor Hye de Crom, O. crispum King of Britain, a very handsome blotched form, and other Odontoglossums.

E. H. DAVIDSON, Esq., Borlases, Twyford, staged a selection, among which were noted the new Odontoglossum Aurora (Rossii ruhescens × Lambeauianum), with a spike of nine handsome flowers, the first of the Rossii hybrids to produce the erect, many-flowered spike of the ordinary hybrid Odontoglossum. The flowers were large, white, tinged with lilac flush, and spotted with dark purple on the sepals and petals. Lælio-Cattleya Neleus (C. Iris × L.-C. Ophir), bright yellow, with a fine, light-crimson lip, with gold veining; a very fine, dark-scarlet Odontioda Charlesworthii, and an equally bright Odontioda of unknown parentage; Cattleya Cybele var. Sanderæ, a charming flower; Odontoglossum crispum Louis, a noble, pure-white flower, with a large maroon blotch on the lip, and other showy varieties.

H. S. GOODSON, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day), showed a selection of rare Orchids, including the handsome Cattleya Rhoda "Fairlawn variety," which secured a First-class Certificate in August, 1910, and is very fine in colour; C. Atalanta illuminata, with large, rose-coloured flowers; Lælio-Cattleya Elva var. St. Vincent (Award of Merit, 1908); some Brasso-Cattleyas, and a grand new hybrid (see Awards).

Messrs. SANDER & SONS, St. Albans, staged a small group remarkable for several instances of fine culture and for the superb new Dendrobium Schützei, which justly secured a First-class Certificate (see Awards). Among the best noted were Arachnanthe Lowii, with three long, drooping spikes of its curious flowers; a noble specimen of Vanda cœrulea, 4 feet in height, and bearing leaves to the base; Cœlogyne Micholitzii and C. fuscescens brunnea; Lælio-Cattleya Fred Gott (Martinetii × bicolor), with large rose-purple labellum; L.-C. venusta (L.-C. Schilleriana × L.-C. Aphrodite), white, with purple feather on the petals, and bright-purple lip; and several other pretty hybrids.

Messrs. STUART LOW & Co., Bush Hill Park, staged an effective group, at the back of which were good specimens of the yellow Oncidium varicosum, and a finely-flowered O. macranthum, Stanhopea graveolens, several specimens of Dendrobium Phalænopsis Schröderianum, Renanthera Imschootiana, and the curious Cirrhopetalum appendiculatum.

His Grace the Duke of MARLBOROUGH, Blenheim Palace, Woodstock (gr. Mr. Hunter), sent Vanda cœrulea Blenheimensis, a model flower, closely veined with pure blue, the white ground showing between; Lælio-Cattleya Phœnix "Blenheim variety" (L.-C. Hy. Greenwood × C. Hardyana), with a fine claret-coloured lip; L.-C. eximia "Blenheim variety" (C. Warneri alba × L. purpurata alba), blush white, with purple veining on the lip; and a pretty hybrid Cypripedium.

Messrs. J. & A. A. MCBEAN, Cooksbridge, showed Cattleya Thurgoodiana "Model," a large, finely-formed and richly-coloured flower; and Cattleya Adula excelsa, a grand flower, with bronzy-yellow sepals and petals and rich purplish-rose lip.

Mr. SIDNEY FLORY, Tracy's Nursery, Twickenham, staged a small group, in which were a fine plant of Pescatorea Klabochorum, white, with claret lip and tips to the segments; Zygopetalum Maxillare Gautieri, with a bright-blue lip; a good Cattleya Pittiana; the rare and pretty Dendrobium McCarthiæ; Cypripedium Jas. H. Veitch; C. Massaianum; C. Kubelc grandis; C. beechense; C. Lord Ossulston; and C. Curtisii, with eight flowers.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), sent Lælio-Cattleya Mrs. Donald MacMaster (C. Dowiana aurea × L.-C. luminosa), a very remarkable hybrid, of attractive colour. In size and shape it is nearest to C. aurea, but the lip is more openly displayed. The sepals and petals have a golden-yellow ground suffused and veined with reddish-rose. The broad lip is reddish-rose, with a dark reddish ray in the centre, and fine gold lines at the base.

AWARDS.

FIRST-CLASS CERTIFICATES.

Dendrobium Schützei, from Messrs. SANDER & SONS. A remarkable and beautiful new species from the Philippines, nearest to the handsome D. Sanderæ, but with flowers formed like and somewhat resembling those of D. formosum giganteum, which it also resembles in growth. The stout pseudo-bulbs are 9 inches to 1 foot in height, and bear four to five flowers on a spike, pure white, with a small, emerald-green disc to the lip, which has a ray of the same colour, with dark spots at the base. The lanceolate sepals are keeled, the petals broad and openly displayed, and the lip broad and effective.

Lælio-Cattleya × Memoria H. A. Tracy (L.-C. Canhamiana × C. Hardyana), from H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day). A superb flower, among the largest of hybrid Cattleyas, and of fine shape and substance. Sepals white, tinged and veined with rosy-lilac; the broad petals bright rose, with a silver veining at the edge. The broad, rounded lip, which has a crimped edge, is intense purplish-crimson, with yellow disc and veining at the base.

AWARDS OF MERIT.

Odontioda Devossiana "Fowler's variety" (O. Edwardii × C. Noezliana), from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). A very bright hybrid, with branched spikes of dark-red flowers, with yellow disc to the lip.

Lælio-Cattleya St. Gothard "Glebe variety" (L.-C. Gottoiana × C. Hardyana), from C. J. PHILLIPS, Esq., The Glebe, Sevenoaks. Flowers large and of fine shape, closely approaching a good C. Hardyana. Sepals and petals tinged and marbled rosy-lilac. Lip deep ruby-red, with yellow disc.

CULTURAL COMMENDATION

To Messrs. SANDER & SONS, St. Albans, for a grand specimen of Vanda cœrulea, 4 feet in height, and bearing 74 leaves and two fine spikes, the one bearing 19 and the other 10 fine, blue flowers.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the Chair); and Messrs. Jos. Cheal, W. Bates, Wm. Pope, J. Jaques, H. S. Rivers, A. H. Pearson, E. Beckett, H. Markham, Owen Thomas, and A. W. Metcalfe.

A Silver Knightian Medal was awarded to H. B. BRANDT, Esq., Nutfield, Surrey, for a very fine collection of Grapes and other fruits. The Grapes included large, shapely bunches of splendidly-coloured Appley Towers, Black Alicante, Lady Downe's, Prince of Wales, and Diamond Jubilee. Amongst the Apples shown the varieties Cox's Pomona, Wealthy, and American Mother were especially meritorious, as also was a dish of Durondeau Pear.

A. W. MERRY, Esq., Welwyn, Herts., also showed a very good collection of fruit. This exhibit was of a much more varied character. The several Melons (Barnet Hill Favourite and Hero of Lockinge) were of nice, useful size, and possessed the yellow colour and perfume which betokens rich flavour. There were also very good bunches of Grapes, many varieties of Apples and Pears, Plums, a box of ripe Alpine Strawberries, and several dishes of Cob and Filbert Nuts. (Silver Knightian Medal.)

H. V. WOODGATES, Esq., Old Malden House, Worcester, sent dishes of very large Warner's King and The Queen Apples, which deservedly received a Silver Banksian Medal.

The Countess of SELKIRK, Balmae, Kirkcudbright, exhibited excellent Morello Cherries.

AWARDS OF MERIT.

Strawberry Merveille de France.—An autumn-fruiting variety, which produces large crops of good-flavoured fruits. Shown by Messrs. GEORGE BUNYARD & Co., LTD.

Potato The Diomond.—An oval, smooth-skinned tuber. It is a very heavy cropper, and the haulm becomes about 3 feet high. Shown by Messrs. BARR & SONS.

These Awards were made after trial at Wisley.

A Card of Cultural Commendation was awarded to Lord LLANGATTOCK, The Hendre, Monmouth, for an exceedingly fine fruit of "Smooth Cayenne" Pineapple.

NEWTOWNARDS HORTICULTURAL.

SEPTEMBER 6.—Roses of splendid quality were the outstanding feature of the autumn show of the above society, which was held as usual in the nursery grounds of Messrs. Alexander Dickson & Sons. As in former years, three large marquees were required for the numerous exhibits. The chief prize-winners were:—C. W. DUNBAR-BULLER, Esq., D.L., Woburn; Lord O'NEILL, of Shanes Castle; Lord DUNLEATH, Ballywater; CHARLES DUFFIN, Esq., Danesfort; and FRANK WORKMAN, Esq., The Moat, Belfast.

PLANTS.

There was only one entry in the class for a miscellaneous group of plants, and the 1st prize was awarded to C. W. DUNBAR-BULLER, Esq., D.L. (gr. Mr. E. R. Rutherford), for an exceedingly tasteful arrangement of especially well-grown plants. CHARLES DUFFIN, Esq. (gr. Mr. J. M'Cormick), Belfast, was the most successful exhibitor with ten stove and greenhouse plants; 2nd, Lord O'NEILL (gr. Mr. W. G. Wadge).

In the class for two Palms or Cycads the 1st prize was awarded to Lord DUNLEATH (gr. Mr. W. J. King), and the 2nd prize to FRANK WORKMAN, Esq. (gr. Mr. Thos. Culbert).

Lord DUNLEATH exhibited the best collection of Coleus, and Mr. C. W. DUNBAR-BULLER the best pair of Japanese Lilies.

There was strong competition in the class for six dinner-table plants, in which the 1st prize was awarded to CHARLES DUFFIN, Esq.; and the 2nd prize to C. W. DUNBAR-BULLER, Esq.

FRANK WORKMAN, Esq., showed six exceedingly good Codiæums (Crotons), and was closely followed by the collection from the gardens of CHARLES DUFFIN, Esq.

In the class for amateurs who do not employ gardeners the most successful exhibitor was Mr. W. J. FERGUSON, who excelled with Pelargoniums (in three classes), Coleus, Fuchsias, Mignonette and Marguerites. Mrs. JAMES WILLING also won 1st prizes in several classes.

In the nurserymen's class Messrs. ALEX. DICKSON & SONS, LTD., Newtownards, were awarded the 1st prize (a gold medal) for a large group of stove and greenhouse plants, which contained exceedingly fine Palms, Codiæums, Caladiums, Ferns and many splendid Gloxiniæ.

CUT FLOWERS.

Of the many fine collections of 24 Cactus Dahlias the best was that from C. W. DUNBAR-BULLER, Esq., whilst CHARLES DUFFIN, Esq., and P. KERR-SMILEY, Esq., M.P. (gr. Mr. E. Horne), Belfast, were 2nd and 3rd respectively.

The best 18 Show and Fancy Dahlias were exhibited by JOHN BENNETT, Esq., Ballyclonghan; 2nd, C. W. DUNBAR-BULLER.

There were many meritorious bunches of Sweet Peas staged. The three prizes in the class for 24 bunches were awarded to Lord DUNLEATH, Colonel R. H. WALLACE, C.B. (gr. D. Patrick), Downpatrick, and Lord O'NEILL, in the order named.

HERBERT BROWN, Esq. (gr. Mr. J. Taylor), Helen's Bay, was awarded the 1st prize for 12 bunches of Sweet Peas.

The exhibit of 18 spikes of Gladiolus which won the 1st prize for C. W. DUNBAR-BULLER, Esq., was exceptionally good; 2nd, E. C. HERDMAN, Esq., D.L. (gr. Mr. E. G. Reilly), Strabane.

As we have already indicated, the Roses were of very high merit. The best collection was shown by Mrs. G. H. BROWN (gr. Mr. Jas. Reid), Helen's Bay; 2nd, P. KERR-SMILEY, Esq.

The best collection of hardy border flowers was exhibited by Col. R. G. SHARMAN-CRAWFORD, D.L., who also showed the premier 12 border Carnations; and the best annuals came

from the gardens of P. KERR-SMILEY, Esq., M.P. E. C. HERDMAN, Esq., D.L., was very successful with Asters and Marigolds.

In the nurserymen's cut-flower classes Messrs. ALEX. DICKSON & SONS, LTD., were awarded the 1st prizes in all the six classes, their collection of Roses being excellent.

FRUIT AND VEGETABLES.

The classes for decorated fruit tables formed the feature of this section of the show. The 1st prize for the table of fruit, and also for decorations, was awarded to Sir THOS. J. DIXON, Bart. (gr. Mr. J. Bradshaw), Hillsborough; 2nd, Lord O'NEILL. Sir THOMAS DIXON also showed the best Grapes and Plums of all kinds. Lord O'NEILL sent the best scarlet-fleshed Melon, whilst the 1st prize green or white-fleshed Melon was won by Col. R. G. SHARMAN-CRAWFORD. The Earl of RODEN exhibited the best dish of Peaches, and Sir CHAS. DIXON similarly excelled in the class for Nectarines. In the vegetable classes Lord O'NEILL, Col. WALLACE, Col. R. G. SHARMAN-CRAWFORD, and C. W. DUNBAR-BULLER were the most successful exhibitors.

CHESHIRE AGRICULTURAL.

AUGUST 28.—The horticultural section of the Cheshire Agricultural Society's show, which took place at The Roodee, Chester, on this date, proved the most successful for several years past, the only falling off being in the exhibits of cut flowers.

There were four entries in the class for a group of miscellaneous plants, and the exhibits were well up to the average quality of these shows. The 1st prize was won by Mr. C. H. CREASEY, Oxton, Birkenhead; 2nd J. G. FROST, Esq., Mollington Hall (gr. Mr. T. Gilbert).

For six stove or greenhouse plants, Mr. B. CROMWELL was successful with medium-sized plants, including a good specimen of Ixora.

A. E. HALL, Esq., Abbotsfield, Chester (gr. Mr. H. Randles), led in the class for four Ferns.

Mr. A. ELLAMS won the 1st prize with capital plants in the class for four Pelargoniums, and he also showed, as the best specimen plant, a well-grown Fern; 2nd, Mr. CROMWELL; and 3rd, Sir FOSTER CUNLIFFE, Bart., Wrexham (gr. Mr. M. Brennan).

In the cut-flower section Mr. P. MILLER, Hartford, and Mr. S. SALISBURY, Wallasey, won the 1st and 2nd prizes, respectively, in the class for Cactus Dahlias.

Mr. A. D. PITCAIRN CAMPBELL, Bangor-on-Dee, showed the best dozen Asters; and Mr. BERNARD J. SANDY, Sandiway, excelled in the class for 12 Roses.

Mr. L. N. BROOKE, Heswell, staged the best annuals; whilst G. R. DARSIE, Esq., Newton House (gr. Mr. J. Dean), won the 1st prize for 12 bunches of hardy herbaceous cut flowers; and Mr. A. D. PITCAIRN CAMPBELL the 1st prize for six bunches of hardy border flowers.

Mr. WYNNE, Rowton, and Miss ROBERTS, Wrexford, excelled in the classes for 12 and 6 vases of Sweet Peas respectively; Capt. TOWNSEND CURRIE, Christleton (gr. Mr. T. Saunders), won Messrs. Webb & Sons' special prize for six vases of Sweet Peas; whilst Messrs. McHattie's prize offered for six vases of these flowers was won by Mr. J. BAPSCOTT.

Fruit was staged in fair quantity, and of good quality throughout. Sir GEORGE MERRICK, Bart., Anglesey (gr. Mr. W. Pilgrim), was successful in the class for two bunches of black Grapes, showing well-coloured bunches of the variety Madresfield Court; whilst, for two bunches of white varieties, J. AMPHLETT, Esq. (gr. Mr. R. Jones), Colwyn Bay, excelled with well-coloured examples of Muscat of Alexandria.

P. H. ASHWORTH, Esq., Gresford (gr. Mr. H. Young), showed the best Peaches; Mr. W. PILGRIM had the winning exhibit of Nectarines; and Mr. J. DEAN exhibited the best Melon.

The exhibits of vegetables were well up to the average of these shows. T. C. NELSON, Esq. (gr. Mr. D. Macdonald), won the 1st prize, offered by Messrs. Sutton & Sons for six distinct kinds, with fine produce. The 1st prize in Messrs. Dickson and Robinson's class was won by Mr. CHAS. PARKER, Waverton, who also showed a fine exhibit. The winner of Messrs. Clibrans' 1st prize was Mr. J. EDWARDS, Ruabon; whilst in Messrs. Webb's class the 1st prize was won by Mr. J. TOMLINSON, Northwich.

SCOTTISH HORTICULTURAL.

SEPTEMBER 3.—The monthly meeting of the above society was held on this date at 5, St. Andrew Square, Edinburgh. Mr. Massie, the president, was in the chair, and there were 80 members present. Mr. John Highgate, Hopetoun Gardens, read a paper on "How to Produce Effective Displays with Hardy Plants." Mr. Highgate said that in most cases the class of hardy plants to be grown would depend on the size of the garden, or on the borders or beds to be furnished. No one, for instance, would dream of growing Gunnera or some of the larger Senecios in a garden of very limited size. In some large places it was becoming the fashion to have borders devoted to single colours. He had never been impressed by this arrangement. Another, and a more popular, style was to plant in patches of one variety, but it did not admit of such a great variety as in the more common mixed style. The planting of good-sized clumps, with a large variety of subjects, so as to prolong the season of flowering as much as possible, was what he recommended, as in this way one could have a much better selection than if planted in patches. Where possible, edgings should be formed of Alpines, such as small Linarias, Thymes, Sedums, or Erinus alpinus, instead of the more formal Box edging. A style which was becoming popular, and deservedly so, was to introduce Japanese Maples, Buddleias, Prunus Pissardii, Roses, &c., in order to relieve the flatness of the herbaceous border. One could scarcely imagine anything more handsome than a few good plants of Spiræa ariæfolia, the long plumes of white flowers, dotted along the back of the border, and against these such plants as Prunus Pissardii and Acer Negundo variegata could be effectively used as dot plants. Golden Privet could also be employed in this way. Roses could be used in a variety of ways, but perhaps the most common, and certainly the most effective, way to use them was as plants against rustic poles or espaliers behind the border. Other old favourites were the hardy Fuchsias and the improved form of Monarda didyma, called "Cambridge Scarlet." For masses of colour the last-mentioned plant was certainly one of the best, but it required to be replanted every year, or at most every two years, as they quickly exhaust the soil. A plant which was an acquisition for the herbaceous border was Artemisia lactiflora. It produced white flowers in autumn, and white flowers were scarce then; but, like Monarda, it required frequent replanting. Senecio Wilsoniana was very suitable for the backs of borders, or for planting by streams. For a late season effect a bed of Japanese Maples and Lilium auratum, with an edging of hardy Heaths, gave great satisfaction. But the most imposing display to be imagined was one produced by bold groups of Roses, with or without a background. One was apt to get tired of too much repetition of Dorothy Perkins and Crimson Ramblers, but there were many other varieties, such as Conrad Meyer (one of the finest of Roses when trained against a rustic pole), which could be used in this way. A simple and exceedingly pretty arrangement on the lawn was a bed of the dwarf Phlox "Regulus," with standard plants of Hydrangea paniculata as dot plants, and an edging of Cerastium tomentosum.

The exhibits were:—New Pentstemon "Mrs. F. Fulford," from Mr. F. FULFORD, Montgomerie Castle, Tarbolton (awarded a Certificate of Merit); New Tomato "Simpson's No. 1" (= Carter's Sunrise × seedling variety), from Mr. G. N. SIMPSON, Edinburgh (awarded a Certificate of Merit); Ampelopsis Henryi and Tomato "Balch's Fillbasket," from Messrs. JAMES GRIEVE & SONS, Edinburgh; spike of Dobbie's "Countess Spencer" Sweet Pea, with six flowers, and Sweet Peas "Elfrida Pearson" and "Isobel Malcolm," with double standards, from Mr. R. H. COCKBURN, Gartmore Gardens, Perthshire; double-flowered Heather, from Mr. W. YOUNG, Currie; Tomato "Phillips' Hipper," from the CITY OF EDINBURGH DISTRESS COMMITTEE'S Farm at Murieston, per Mr. Cairns (awarded a Cultural Certificate); and Fruits, Vegetables, &c., damaged by hail, from Mr. C. RITCHIE, Kimmerghame Mains, Duns.

At the meeting on October 1, the secretary will give a paper on "Edinburgh's Park and other Trees," with lantern illustrations.

DUNDEE HORTICULTURAL.

SEPTEMBER 5, 6, 7.—The annual show of this association was held on these dates, and proved the finest of the series. In view of the meeting of the British Association a special effort was made in order that the exhibition should be worthy of the occasion, with very satisfactory results. The entries numbered 2,600, there being 350 more than last year. The local Executive Committee of the British Association gave a sum of £100 to be offered in prizes, and this, together with the usual prizes, resulted in a very keen and strenuous competition. The Dundee Horticultural Association was formed in 1864, and when the British Association visited the town in 1867 a handsome donation was given to the local society, enabling it to make a capital start, since which it has never once looked back. Year by year the show has grown, and now it is one of the finest—if we except fruit, in which Edinburgh excels—in Scotland.

The annual dinner was held in the Queen's Hotel, Ex-Bailie Melville presiding.

POT PLANTS.

In size and quality this section has ever been an outstanding feature at the Dundee shows. On this occasion past efforts were excelled, and competition was very keen for the British Association prizes. For the best group of plants arranged on the ground, to be judged for quality and effective arrangement, Mrs. BOASE, Binrock, Dundee (gr. Mr. James Beats), was awarded the 1st prize, her beautifully-designed exhibit comprised some finely-grown Codiæums (Crotons), whilst the flowering plants consisted principally of Chrysanthemums, Lilium auratum, and pink Clerodendrons. This exhibit reflected great credit on the gardener, Mr. Beats, who has for the eleventh time carried off the premier honours for the best groups at this show. C. G. GILROY, Esq., The Grange, Monifieth (gr. Mr. James Bethel), was placed 2nd; and A. SINCLAIR, Esq., Seathwood, Dundee (gr. Mr. George Scott), 3rd. In the class for nine stove or greenhouse plants J. KINNEAR, Esq., Fernbrae, Dundee, excelled with well-grown Codiæums (Crotons) forming his leading foliage plants, and very fine specimens of Ixora and Clerodendron were amongst his flowering specimens. Mr. GEORGE REID, Invertay, West Ferry, Dundee, was awarded the 2nd prize, the prominent flowering plant of this exhibit being a specimen of Statice; 3rd, Mrs. BOASE. There was a remarkably good show of Ferns. For exotic Ferns Mr. GEORGE REID and Mr. JAMES BEATS divided the honours. W. T. MORRISON, Esq., Gowrie House, Perth, showed the winning exhibits in the classes for four British Ferns, and also for six dwarf British Ferns, while Mr. REID, Invertay, was successful in the class for tree Ferns. Dracænas made a fine show. W. GRIEVE, Esq., Hazlewood, Broughty Ferry, Dundee, winning the 1st prize. Pelargoniums, both single and double specimens, were well shown, J. G. CLARKE, Esq., Elmslea, Dundee, and Mrs. BOASE, Binrock, being placed 1st in these classes respectively. The last-named exhibitor also secured the premier award for the best pot plant of Lilium auratum. J. G. CLARKE, Esq., excelled for three well-grown Coleus. In the class for six stove or greenhouse plants (three foliage and three flowering) the 1st prize was awarded to G. REID, Esq., Invertay. Mrs. BOASE and Mr. KINNEAR were placed 2nd and 3rd respectively. The best Palms were shown by Mrs. BOASE; 2nd, Mr. KINNEAR. For varieties of Cocos or Geonoma Palms, Mr. GRIEVE, Hazlewood, secured the premier award. Mr. REID, Invertay, showed the winning exhibits of Cordyline and Selaginella. Mr. MORRISON, Gowrie House, exhibited the best collection of 20 Alpine plants (distinct), and Mr. REID, Invertay, showed the best table plants.

CUT FLOWERS.

Notwithstanding the unfavourable season, a capital show was made with cut flowers. A special prize was awarded for the best exhibit of cut flowers in vases, Orchids excluded. A keen competition ensued, and the 1st prize was awarded to A. SINCLAIR, Esq., Seathwood. Finely-grown Chrysanthemums, Liliums of various varieties, and large, intensely-coloured Sweet Peas were the predominating flowers shown. 2nd, Mrs. BOASE, with well-grown Carnations. 3rd, C. S. GILROY, Esq., The Grange, Monifieth. Mrs. BOASE (gr. Mr. James

Beats) was awarded the premier prizes in the class for (a) decorated dinner table, (b) bouquet of Roses, (c) basket of flowers, and (d) wreath. W. J. J. STEUART FOTHRINGHAM, Esq., Fothringham (gr. Mr. John Machar) won the Dundee Corporation Challenge Cup with a capital exhibit of Sweet Peas. 2nd, Mrs. DUNBAR DUNBAR, Seapark, Forres (gr. Mr. J. A. Grigor).

In the open classes for nurserymen and florists Messrs. JAMES COCKER & SONS, Aberdeen, exhibited the winning table of Roses. 2nd, Messrs. D. & W. CROLL, Dundee, who were successful in the class for 12 vases of decorative Roses. For baskets of Roses Messrs. ADAM & CRAIGMILE, Aberdeen, secured the premier award. The best display of hardy flowers arranged on a table was made by Messrs. JAMES COCKER & SONS, Aberdeen. For four vases and six vases of summer-flowering Chrysanthemums the 1st prizes were awarded to A. SINCLAIR, Esq., Seathwood, and Mr. JOHN FRASER, Dryburgh House, Lochee, Dundee, respectively. Mr. JAMES BETHEL, Monifieth, was placed 2nd in both classes. In the class for annuals Mr. G. REID, Invertay, was successful. Asters were well shown by Mr. WILLIAM NICOLL, Dundee, who won the premier award for these flowers. Mr. DAVID KEILOR, Seabourne House, Broughty Ferry, showed the winning exhibit of Cactus Dahlias. The 1st prize for Pompon Dahlias was awarded to Mr. JOHN S. SUMMERS, Dundee. Mr. THOMAS BUCHANAN, Lyndhurst, Dundee, was successful in the class for border Carnations. In the class for trusses or bunches cut from stove or greenhouse plants Mr. A. DUNCAN, Carbet Castle, was awarded the 1st prize. Mr. WILLIAM GRIEVE and Mr. JOHN SIMPSON were very successful exhibitors of Roses. Mr. GRIEVE won the 1st prizes in the classes for 12 Cactus Dahlias and 12 Souvenir de la Malmaison Carnations. Begonias were remarkably well shown, Mr. THOMAS C. BROWN securing the 1st prize offered for the best 12 blooms.

FRUIT.

There was very keen competition in the fruit classes. The special prize which was offered for the best collection of six bunches of Grapes was won by Mr. JAMES BEISANT, Castle Huntly; 2nd, Mr. JOHN G. CLARKE, Elmslea. Mr. SCOTT, Seathwood, was successful in the class for Black Alicante Grapes. Other successful exhibitors of Grapes were Mr. WILLIAM BALFOUR, Rockfield, Dundee, and Mr. WILLIAM GREEN, Mylnfield, Invergowrie. The hardy fruits were especially fine, Apples being well shown. For the best 12 varieties of Apples Mr. WALTER STAWARD, Aston Hall, Oswestry, Shropshire, was successful; 2nd, Mr. WILLIAM BENVIE, Murie Gardens, Errol. Mrs. McGRATH, Letham Grange, Arbroath, won the 1st prize for Apples, Plums, and Pears. The other prize-winners for Apples included Mr. BETHEL, Mr. HARRY NUNN, Ballindean; Mr. SAMUEL SHIELDS, Glencarse; Mr. HARPER, Tulliebelton, Perthshire; Mr. JOHN SIMPSON, Panmure Gardens, Dundee; and Mr. JOHN SUMMERS, Ashcliffe, Dundee. First prizes were won by Mr. JOHN BIRREL, Glassingate Gardens, Dunblane (for a scarlet-fleshed Melon); Mr. J. E. DAVIS, Stanley (for a green or white-fleshed Melon); Mr. D. A. MILNE, Linlathen (for Peaches and Nectarines); Mr. STAWARD, Aston Hall Gardens (for Apricots); Mr. D. NICOLL, Forgandenny (for a collection of orchard house fruit); Mr. J. FARQUHARSON, Kinfauns Castle, Perthshire (for a collection of hardy fruits grown in the open air); and Mr. J. M. NIVEN, Port Allan, Errol (for Jargonelle Pears).

VEGETABLES.

A great display of vegetables was seen, and some fine competition resulted. The special prize in this section was won by Mr. JAMES KINNEAR, Dundee, for a fine collection. 2nd, Mr. HARPER, Tulliebelton, Perthshire; 3rd, Mr. GEORGE HENDRY, Dundee. Other prize-winners in the vegetable classes were:—Mr. D. DALRYMPLE, Cupar, Fife (Beetroot); Mr. JAMES BENVIE, Inchmartine, Incbture (Kidney Beans); Mr. G. H. YOUNG, Balmyle, Dundee (Potatos); Mr. D. HAMPTON (Parsnips); Mr. J. BEISANT (Vegetable Marrow); and Mr. GOODALL, Errol (Turnips and Parsley).

AMATEURS' CLASSES.

The "Amateur" Corporation Cup, offered for the best display of cut flowers exhibited on a table, was won by Mr. ALEX. EASTON, Dundee; 2nd, Mr. D. SMITH, Dundee. Plants in pots were well shown, and the leading prize for six stove or greenhouse plants was awarded to Mr. W. ROBERTSON, Dundee.

NON-COMPETITIVE EXHIBITS.

Local nurserymen and florists exhibited some capital groups. Messrs. THYN & SON had a large exhibit, covering over 600 square feet. Messrs. HARLEY & SONS showed floral designs. The exhibit of Messrs. D. & W. CROLL, Dundee, comprised Roses, Begonias, Sweet Peas, and vegetables. Messrs. LAIRD & SINCLAIR showed a rockery, flanked on either side by a fine collection of floral designs. Messrs. STORRIE & STORRIE showed choice fruit.

STIRLING HORTICULTURAL.

AUGUST 29, 30.—The annual exhibition of this society, held in the Albert Halls, Stirling, on these dates, marked the centenary of the association. The display was worthy of the occasion, demonstrating that the enthusiasm of the society's early days had not vanished.

The displays of plants were numerous, Palms, Ferns, Fuchsias and Zonal Pelargoniums excelling. The leading prize-winners in this section were: Messrs. J. MACDONALD, Touch; J. K. MESTON, Springbank; R. McDONALD, The Elms, and A. JOHNSTONE, Annfield.

Cut flowers were an interesting feature, and included fine exhibits of Sweet Peas, Gladioli, Roses, Dahlias, hardy herbaceous and rock-garden plants. Two fine collections were shown by Messrs. DAN. CARMICHAEL, Coldstream, and JOHN MACLENNAN, Clarendon Place, who were awarded the 1st and 2nd prizes respectively. Messrs. CHAS. SHAW, Boquhan; GEO. WATSON, Kippen; CHAS. KAY, Gargunnock; JOHN NEAVES, Kirkintilloch; T. F. MALCOLM, Dunmore; J. K. MESTON; HENRY GRAY and A. JOHNSTONE secured the winning prizes in the other classes for cut flowers.

Fruit of fine quality was shown, and the competition in these classes was keen. Mr. J. BLACKLOCK, Blairdrummond, won the 1st prize for a collection of eight varieties; 2nd, Mr., JOHN MITCHELL, Airthrey Castle. For the collection of hardy fruit the positions were reversed.

Mr. J. MACDONALD, Touch, secured the premier prize for two bunches of Grapes; Mr. MITCHELL was successful for four bunches and two bunches of a white variety. For one bunch, Mr. MESTON was awarded the 1st prize.

Exhibits of vegetables were excellent. Mr. SHAW was the most successful exhibitor in the class for a collection of ten kinds, and Mr. GEO. WATSON showed the best collection of six kinds.

Children's classes attracted much attention, there being competitions for bouquets of wild flowers made up in the hall, of wild fruit and British grasses. The prizes for these classes were provided by the Stirling and District Horticultural Association in such a generous way, that prizes were awarded for all the entries, which numbered 44.

HORTICULTURAL TRADES' ASSOCIATION.

(ANNUAL MEETING.)

THE annual gathering of nurserymen and seedsmen forming the above association took place last week at Scarborough, and though the attendance suffered from the deplorable weather which has been general all over the country, the meeting was a very successful one. The only rainfall was on the 3rd inst., when no excursions were arranged. Visits were made to the local nurseries of Messrs. Walshaw & Son, and the programme included a 60-mile motor run to Scampston Hall, Castle Howard, and the beautiful ruins of Rievaulx Abbey. One day was devoted to York, including a visit to Messrs. Backhouse & Son's nurseries. The world-famed rock-garden, ferneries, &c., at Halgate and the fine new nursery recently established at Cattal were inspected.

The evenings were devoted to the discussion of trade matters, including the effect of legislation on the nursery business, the vexatious restrictions on foreign trade by the regulations imposed during the Phylloxera scare, the best methods of checking unfair and dishonest trading, and similar matters. Mr. W. J. Jefferies, of the Cirencester Nurseries, was unanimously elected president for the coming year.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

CENTENARY SHOW.

SEPTEMBER 4, 5, 6.—The show of the above society, held in the West End Roller Skating Rink at Bunhouse Grounds, Glasgow, on these dates, represented the one-hundredth anniversary exhibition. Most of the competitive exhibits were staged in the Skating Rink, but the trade groups were accommodated in two large marquees adjoining the building. The evening preceding the opening of the show was very boisterous, with heavy showers of rain, and the marquees, unfortunately, were flooded with water. Drains, however, were made with considerable promptitude, and the floors of the tents were strewn with ashes, so that when the show was opened to the public the ground was in a fairly good condition. The entries had decreased by 250 as against those of last year, when the show was held in the grounds of the Glasgow Exhibition, but on this occasion they are well above the average for these shows. Despite the wet, sunless summer, the quality of the exhibits has seldom been excelled in Glasgow. Vegetables were especially good. The great feature of the show was the trade exhibits. The Royal Horticultural Society was represented by a deputation including Sir Daniel Morris, Sir Harry Veitch, Mr. H. B. May, Mr. James Hudson, and Mr. Arthur J. Gaskell. R.H.S. cups and medals were awarded to several of the more important exhibits.

COLLECTIONS OF FRUIT.

In the fruit section the principal class was one for a table of dessert fruit, 10 feet by 4 feet 6 inches, decorated with plants in pots, cut flowers or foliage. In addition to the prize money given by the society, a special prize of £5 and the Veitch Memorial Medal was awarded to the exhibitor of the 1st prize collection. Separate prizes were also provided for the decorations. The 1st prize for fruit was awarded to the Duke of PORTLAND, Welbeck Abbey (gr. Mr. Jas. Gibson). His fruit, which was all well finished, consisted of Grapes Buckland Sweetwater, Muscat of Alexandria, Madresfield Court, and Black Hamburgh; Peaches Barrington and Sea Eagle; Nectarines Pine-apple and Spencer; Apples Washington and Cox's Orange Pippin; Figs Negro Largo and Brown Turkey; Pears Marguerite Marillat and Souvenir du Congrès; and two fine seedling Melons. This exhibit was placed 2nd for decoration. J. GRAEME THOMSON, Esq., Norwood, Alloa (gr. Mr. James Small), was placed 2nd for fruit and 3rd for decoration. Lord ELPHINSTONE, Carberry Tower, Musselburgh (gr. Mr. D. Kidd), was awarded the 3rd prize for fruit and 1st for decoration.

In the class for a collection of 12 dishes of fruit, of distinct varieties, the Duke of PORTLAND was again the leading exhibitor, followed by A. A. H. SPIERS, Esq., Houston, Renfrew (gr. Mr. James Brown). 3rd, J. GRAEME THOMSON, Esq., Alloa. For a collection of six dishes of fruit the 1st prize was won by Mr. JOHN FINNIE, Shandon; 2nd, W. T. MACLELLAN, Esq., Helensburgh (gr. Mr. H. MacSkimming); 3rd, the Duke of PORTLAND.

GRAPES.

The principal class for Grapes was one for eight bunches, not more than two bunches of any variety, each exhibit to be decorated with plants or cut flowers in glasses or vases. Lord ROWALLAN, Kilmarnock (gr. Mr. James Dixon), won the 1st prize, this carrying with it, in addition to the prize money, the "Centenary" Silver Cup presented by the Glasgow seed trade. This exhibitor's bunches were splendidly finished, and comprised two bunches each of Muscat of Alexandria, Madresfield Court, Black Hamburgh and Muscat Hamburgh. He received the following points:—

		Max.	Points.
Muscat Hamburgh	...	9	8
,,	...	9	7½
Muscat of Alexandria	...	10	8
,,	...	10	8
Madresfield Court	...	9	8½
,,	...	9	8½
Black Hamburgh	...	9	7½
,,	...	9	7½
		74	63½

R. W. DONALDSON, Esq., Row (gr. Mr. Robt. Glen), was 2nd with 59 points out of a possible 72; 3rd, W. MACKAY, Esq., Ascog, Bute (gr. Mr. D. Halliday); 4th, WM. FORBES, Esq., Falkirk (gr. Mr. John Middleton).

In the class for four bunches of Grapes (two white and two black varieties), W. MACLELLAN, Esq., was placed 1st; JOHN FINNIE, Esq., 2nd; and W. MACKAY, Esq., 3rd. W. MACLELLAN, Esq., and JOHN FINNIE, Esq., were 1st and 2nd respectively in the class for two bunches of Black Hamburgh. For two bunches of white Grapes W. MACLELLAN, Esq., again led with splendid examples of Muscat of Alexandria; 2nd, JOHN FINNIE, Esq. In the class for white Grapes other than Muscat of Alexandria Lord ROWALLAN was easily 1st with beautiful, well-balanced bunches of Mrs. Pearson. There were several smaller classes for Grapes.

In the class for a collection of six varieties of Pears, four fruits of each sort, Miss HAMILTON, Rozelle, Ayr (gr. Mr. Andrew Harvey), was awarded the 1st prize; 2nd, Duke of PORTLAND; and 3rd, H. J. YOUNGER, Esq., Kilmun (gr. Mr. R. Greenlaw). H. J. YOUNGER, Esq., was easily 1st for a collection of Apples, to consist of 12 varieties, four fruits of each sort. 2nd, Mr. A. T. HARRISON; 3rd Mr. J. SMALL. The best collection of Plums in six varieties was shown by HUGH S. GLADSTONE, Esq., Dumfries (gr. Mr. D. Campbell); 2nd, Mr. A. HARRISON; 3rd, Miss HAMILTON, Ayr. There was only one competitor in the class for 12 Plums in two varieties, and the 1st prize was awarded to the exhibitor, Mr. JOHN RUSSELL, Prospect House, Newton Mearns. For two Melons, one green or white and one scarlet variety, H. J. YOUNGER, Esq., was awarded the 1st prize, and Lady AUGUSTA ORR EWING (gr. Mr. H. Jowitt) the 2nd prize. For 12 Peaches in two varieties Mr. JOHN FERRIER, Craigends, was placed 1st; Mr. JOHN FINNIE 2nd; and HUGH S. GLADSTONE, Esq., 3rd.

In the class for 12 Nectarines in two varieties H. J. YOUNGER, Esq., was 1st; Mr. A. T. HARRISON, 2nd, and J. GRAEME THOMSON, Esq., Alloa, 3rd. The best 12 Figs were shown by W. MACKAY, Esq., Ascog.

The Highland and Agricultural Society of Scotland offered a Silver Medal, in addition to the 1st prize, in the class for 12 dessert Apples. This was won by the Duke of PORTLAND, followed by J. H. BELL, Esq., Rossie Forgandenny (gr. Mr. D. Nicoll).

VEGETABLES.

The vegetables were accommodated in a special marquee, and this was one of the most popular attractions of the show. For a collection of 13 varieties, the prizes being presented by Messrs. Sutton & Sons, the Duke of PORTLAND was 1st, with a splendid exhibit, and was very closely followed by Mr. CHAS. SHAW, Keppen Station. The 3rd prize was awarded to Lady ORR EWING, Portpatrick.

For a collection of nine varieties, for prizes presented by Messrs. Webb & Sons, Mr. CHAS. SHAW was 1st, Mr. JOSEPH DENNY, Stranraer, 2nd, and Mr. JOHN GRAY, Uddingston, 3rd.

The prizes presented by Messrs. Austin & McAslan for 13 varieties of vegetables were won by Mr. CHAS. SHAW, who secured the 1st place and the Hunter Memorial Medal, followed by Lady ORR EWING and the Rt. Hon. Earl of HOME, Bothwell Castle (gr. Mr. W. P. Bell), in this order.

In the collection for nine varieties, open to amateurs, there was good competition and high quality; the 1st prize and a silver cup presented by the directors was won by Mr. JOSEPH DENNY, Stranraer; 2nd, Mr. GEO. WATSON, Keppen; and 3rd, Mr. JOHN GRAY.

The Highland and Agricultural Society offered a Silver Medal in addition to the 1st prize for a collection of salads. This was won by Mr. CHAS. SHAW.

For 12 distinct varieties of Potatos there was keen competition, the Earl of HOME, Bothwell Castle, being placed 1st, Mr. DONALD MCPHERSON, Bridge of Weir, 2nd, and Mr. JOHN FERRIER, Craigends, 3rd.

There was a good competition in the class for a collection of Tomatos, in which Messrs. FORREST & Co., Welldale Nurseries, Douglas, excelled.

POT PLANTS.

The principal class in the pot-plant section was for a group of miscellaneous plants arranged on the ground in a space of 15 feet by 10 feet. The 1st prize consisted of £7, together with £5 and a medal presented by the trustees of the Veitch Memorial Fund. The judges had little difficulty in awarding the 1st prize, which was won by Sir WILFRID LAWSON, Bart., Brayton Hall, Carlisle (gr. Mr. A. Knight), for an effective display of Codiæums. Alocasias, Orchids and Lilium lancifolium, with Palms and Ferns. All the plants were well grown. The 2nd prize was won by Colonel STEWART RICHARDSON, Ballathie, Perth (gr. Mr. J. E. Davis), for a collection, beautifully arranged, but lacking the quality of the winning group. T. G. BISHOP, Esq., Helensburgh (gr. Mr. J. Hood), was 3rd, and W. BEATTIE, Esq., Helensburgh (gr. Mr. A. Kelly), 4th.

Prizes were offered for a group of stove or greenhouse plants arranged on the ground in a circle 8 feet in diameter. With a good group, in which Codiæums and Liliums were the chief features, Sir WILFRID LAWSON was again the leading prize-taker; 2nd, Colonel STEWART RICHARDSON; 3rd, Colonel GRAY BUCHANAN, Cambuslang (gr. Mr. W. Ferguson).

In the class for 12 plants suitable for table decoration, in 12 distinct varieties, the pots not to exceed 6 inches in diameter. Messrs. MALCOLM CAMPBELL, LTD., Glasgow, were placed 1st; Sir WILFRID LAWSON, Bart., 2nd; and A. H. PETTIGREW, Esq., Lanark (gr. Mr. A. L. Davidson), 3rd.

For six similar plants, Mr. JAMES THOMPSON, Giffnock, was awarded the 1st prize; Sir WILFRID LAWSON, Bart., the 2nd; and A. H. PETTIGREW, Esq., the 3rd prize.

The Earl of HOME (gr. Mr. A. McMillan) was a notable prize-winner in the remaining classes.

The leading prizes in both the classes for Orchids were won by W. MACKAY, Esq., Ascog, Bute (gr. Mr. D. Halliday).

CUT FLOWERS.

There were only two entries in the class for 24 spikes of Gladioli in not fewer than 12 varieties, and here the 1st place was secured by Messrs. GEO. MAIR & SONS, Prestwich, for magnificent spikes. This stand of flowers was one of the features of the show, and well deserved the special recognition it received from the deputation from the Royal Horticultural Society. Messrs. A. CAMPBELL & SONS, Gourock, were 2nd.

For a collection of Roses in a space of 8 feet by 5 feet there were three competitors. Mr. W. FERGUSON, Dunfermline, showed best, his blooms of Mrs. David McKee and Duchess of Wellington being exceptionally fine. Messrs. JAS. COCKER & SONS, Aberdeen, were placed 2nd; and THE KILLERMONT NURSERY CO., Bearsden, 3rd.

Mr. W. FERGUSON again excelled in the class for eight vases of decorative Roses; 2nd, Messrs. D. ROBERTSON & Co., Helensburgh.

In the class for six vases the Dunfermline grower again excelled, Messrs. COCKER being 2nd, and Messrs. ROBERTSON 3rd.

For 36 blooms of Roses, distinct, Messrs. COCKER won the 1st prize, Mrs. Andrew Carnegie, their new variety of this season, being prominent on the stand; Mr. W. FERGUSON was placed 2nd; and the KILLERMONT NURSERY Co. 3rd.

For 24 blooms, HUGH RENWICK, Esq., Lanark (gr. Mr. W. Virtue), was 1st; CHAS. C. MANN, Esq., Gourock (gr. Mr. J. Barclay), 2nd; and Mr. PETER KENYON 3rd.

The class for 12 blooms was restricted to amateurs, and here the 1st prize was won by Mr. ROBERT BORROWMAN, Bargeddie.

Messrs. M. CAMPBELL & SONS, High Blantyre, were placed 1st in the leading collection for Dahlias. The flowers were all exceptionally well grown, and were mostly of the Cactus type; 2nd, Mr. GEORGE BOWNESS, Nurseryman, Busby.

Messrs. M. CAMPBELL & SONS were the leading prize-winners in the principal classes for Carnations.

In the class for a collection of Sweet Peas, open to all, a Lanarkshire amateur, Mr. JOHN FLETCHER, Auchenheath, won easily. The flowers were well grown and showed little traces of injury from the weather. 2nd, Mr. J. H. CROSSLEY, Comrie.

The best collection of 18 vases of Sweet Peas was shown by Mr. GEO. BOWNESS, Busby; whilst for 12 vases Mr. FLETCHER was placed 1st.

As usual, the exhibits of early-flowering Chrysanthemums were exceptionally good. Mr. THOMAS ROBERTSON, Thornliebank, and Mr. JOHN SMELLIE were the leading winners in the principal classes.

In the class for 12 vases or bunches of hardy flowers, distinct varieties, some splendid exhibits were staged. The 1st prize, which included a Gold Medal, for the most meritorious display in the cut-flower section, was awarded to Mr. CHAS. PATTISON, "The Village Blacksmith," Linwood. The Royal Horticultural Society also honoured this working blacksmith with a Silver Banksian Medal, and his exhibit deserves the highest praise. 2nd, ALEX. MURRAY, Esq., Duncryne, Alexandria (gr. Mr. R. McLelland).

Mr. C. KAY, Gargumnock, excelled in the class for 48 Fancy Pansies, his flowers being exceptionally good. He was the principal winner in the other classes for these flowers. Mr. JOHN MCGRORY, Junr., Campbeltown, had the best exhibit of 48 Violas.

DECORATIVE CLASSES.

The principal class in this section was for a decorated dinner table (8 feet by 4 feet). The 1st prize was awarded to T. G. BISHOP, Esq., Helensburgh (gr. Mr. J. Hood), for a light and effective arrangement of Irish Elegance Roses, and Selaginella. Mr. J. DONALDSON, Kern, was 2nd, with an arrangement of pink Carnations, Codiæum foliage, and Selaginella.

R.H.S. AWARDS.

The following Awards were made by the deputation of the Royal Horticultural Society to competitive exhibits:—

Silver Knightian Medal to the Duke of PORTLAND (gr. Mr. Jas. Gibson), for a collection of vegetables.

Silver Banksian Medal to Messrs. GEO. MAIR & SON, Prestwich, for 24 spikes of Gladioli.

Veitch Memorial Medal to Sir WILFRID LAWSON, Bart., Brayton Hall, Carlisle (gr. Mr. A. Knight), for a group of flowering plants.

Silver Banksian Medal to Mr. WILLIAM FERGUSON, Dunfermline, for a collection of Roses.

Silver-gilt Flora Medal to Messrs. M. CAMPBELL & SON, for a collection of Dahlias.

Silver Flora Medal to Col. STEWART RICHARDSON (gr. Mr. J. E. Davis), for a group of plants.

Silver Flora Medals to Mr. JOHN SMELLIE, Busby, for Dahlias and Chrysanthemums, and Mr. JOHN FLETCHER, Lanark, for a collection of Sweet Peas.

Silver Banksian Medal to Mr. CHARLES PATTISON, Linwood, near Paisley, for hardy herbaceous flowers.

Veitch Memorial Prize to the Duke of PORTLAND for a collection of fruit.

"Hogg" Memorial Medal to Lord ROWALLAN, Kilmarnock (gr. Mr. Jas. Dixon), for two bunches of Mrs. Pearson Grapes; W. MACLELLAN, Esq., Helensburgh (gr. Mr. MacSkimming), for two bunches of Muscat of Alexandria Grapes.

The following R.H.S. Awards were made to non-competitive exhibits:—

Gold Medals.—Messrs. J. VEITCH & SONS, for Orchids; and Messrs. SUTTON & SONS, for vegetables.

Silver Cups.—Messrs. DOBBIE & Co., Edinburgh, for cut flowers; Messrs. MALCOLM & CAMPBELL, LTD., Glasgow, for fruit; Messrs. MAY & SONS, Edmonton, for Ferns; and Messrs. BLACKMORE & LANGDON, Bath, for Begonias.

Silver-gilt Knightian Medal.—Messrs. CLIBRANS, Altrincham, for vegetables.

Silver-gilt Flora Medal.—Messrs. AUSTIN & MCASLAN, Glasgow, for stove plants.

Silver-gilt Banksian Medals.—Messrs. WEBB & SONS, Wordsley, for vegetables; Mr. D. G. PURDIE, Glasgow, for plants; and Mr. HUGH DICKSON, Belfast, for Roses.

Silver Flora Medal.—Messrs. W. CUTBUSH & SON, Highgate, for Carnations.

Silver Banksian Medals.—Messrs. W. WELLS, LTD., Merstham, for Chrysanthemums; Messrs. CUNNINGHAM, FRASER & Co., Edinburgh, for cut flowers; Mr. G. A. JONES, Kilkenny, for Gladioli; Messrs. YOUNG & Co., Cheltenham, for Carnations; and Messrs. AUSTIN & MCASLAN, Glasgow, for collection of vegetables.

AWARDS TO NOVELTIES.

The First-class Certificate of the Glasgow and West of Scotland Horticultural Society was awarded to the following novelties :—

Collerette Dahlias "*Princess Louise*," "*Frogmore*," "*Kensington*," and *Prince John*," and *Pompon Dahlia* "*Moira*."—All these were shown by Messrs. DOBBIE & Co., Edinburgh.

Rose "*Mrs. Andrew Carnegie*."—Shown by Messrs. COCKER & SONS, Aberdeen.

Early-flowering Chrysanthemum "*Crimson Polly*."—Shown by Messrs. W. WELLS, LTD., Merstham.

NON-COMPETITIVE EXHIBITS.

Messrs. SUTTON & SONS, Reading, exhibited many of their specialities in vegetables. Some fine Melons were also shown. The background of the stand consisted of single Asters and Antirrhinums. (Gold Medal.)

Messrs. J. VEITCH & SONS, Chelsea, staged a collection of choice Orchids and fine stove plants. (Gold Medal.)

Messrs. DOBBIE & Co., Edinburgh, put up a large collection of very showy collerette Dahlias, Sweet Peas, Roses, and Chrysanthemums. (Gold Medal.)

Messrs. AUSTIN & MCASLAN, Glasgow, contributed two separate groups, one consisting of choice stove plants and the other of vegetables. Gold and Silver Medals, respectively, were awarded these exhibits.

Messrs. BLACKMORE & LANGDON, Bath, staged a magnificent display of tuberous-rooted Begonias. (Gold Medal.)

Messrs. CLIBRANS, LTD., Altrincham, showed an extensive collection of well-grown vegetables in great variety. (Gold Medal.)

Messrs. WEBB & SONS, Stourbridge, put up a very pretty circular exhibit of Sweet Peas and many varieties of vegetables. (Gold Medal.)

Messrs. MALCOLM CAMPBELL, LTD., Glasgow, showed choice Grapes and fruit on a well-arranged stand. (Gold Medal.)

Mr. HUGH DICKSON, Belfast, exhibited a collection of Roses, including several new varieties. (First-class Certificate of Merit.)

Messrs. ALEX. CROSS & SONS, Glasgow, set up an attractive exhibit of their horticultural specialities. (Certificate of Merit.)

Messrs. J. FORBES, LTD., Hawick, showed Violas, Carnations, Pentstemons, &c. (Certificate of Merit.)

Messrs. SANDER & SONS, St. Albans, showed a small collection of choice Orchids. (First-class Certificate of Merit.)

Messrs. H. B. MAY & SONS, Edmonton, staged a collection of Ferns. (First-class Certificate of Merit.)

Messrs. YOUNG & Co., Cheltenham, exhibited a large collection of perpetual-flowering Carnations. (First-class Certificate of Merit.)

Messrs. CUNNINGHAM, FRASER & Co., Edinburgh, had a small display of cut flowers. (First-class Certificate of Merit.)

Messrs. WM. CUTBUSH & SONS, Highgate, staged choice Carnations. (First-class Certificate of Merit.)

Mr. WM. LEIGHTON, Glasgow, exhibited pot plants. (First-class Certificate of Merit.)

There were many other trade exhibits.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

A COMMITTEE meeting of the above society was held at the R.H.S. Hall on the 9th inst. Mr. Charles H. Curtis presided. Thirty-four new members were elected, making a total of nearly 400 since July last. The sick pay for the month amounted to £27. Two members having reached the age of 70, withdrew from their deposit the sums of £68 and £49 10s. respectively, still leaving a balance of £10 for their nominee. The secretary, Mr. W. Collins, who is retiring, thanked the members for their kindness to him, and regretted his inability to carry on the work. The chairman on behalf of the committee expressed their high appreciation of Mr. Collins' long and valued services, and expressed a hope that he would long be spared to still render some assistance to the society. All communications should be addressed to Mr. A. C. Hill, 35, Alexandra Road, West Kensington Park, who has been appointed secretary *pro. tem.*

CARLISLE AND CUMBERLAND HORTICULTURAL.

SEPTEMBER 4, 5.—This society's annual show was held at Carlisle, on these dates, in the spacious City Market Hall, in conjunction with the Northern Counties Fruit Congress and Show. The judging was undertaken by representatives of the North of England Horticultural Society.

FRUIT SECTION (OPEN).

The Challenge Bowl offered for 12 dishes of Apples by Messrs. Walter Voss & Co., Ltd., was won by Mr. J. MILLICAN, Carlisle. Mr. W. ALEXANDER, Hexham, was placed 2nd, and Messrs. LESLIE BROS., Carlisle, 3rd.

Messrs. LESLIE BROS. were awarded Messrs. Coopers & Nephews' prizes in Classes 3 and 4.

In the class for one 28 lb. box, non-returnable, of cooking Apples, graded and packed for market, Mr. W. WALTON, Carlisle, was successful. 2nd, Mr. J. MILLICAN.

In the single-dish classes of early varieties of cooking Apples, Mr. J. MILLICAN won the 1st prize in every class, and he also excelled for the dessert varieties Cumberland Gilliflower and Mr. Gladstone, and any variety other than those named, also for Royal Jubilee, Lane's Prince Albert, Newton Wonder, Allington Pippin, and for a locally cultivated variety. Other 1st prize-winners in the single-dish classes were *Beauty of Bath*, Mrs. F. W. CREWDSON; *Worcester Pearmain* and *Cox's Orange Pippin*, Mr. A. KNIGHT; *James Grieve*, Mr. T. FIXTER; *Bismark*, Mr. W. WALTON, and *Fearn's Pippin*, Mr. J. T. STEWART.

In the class for three dishes of Pears, distinct, Mr. T. FIXTER was successful; 2nd, Mrs. F. W. CREWDSON.

For one dish of Pears the 1st prize was awarded to Mr. G. COULTHARD; 2nd, Mr. T. FIXTER.

Mr. W. SCOTT showed the three winning dishes of Plums. For one dish of Victoria Plums Mr. T. S. WALTON excelled. Mr. J. ROBERTSON was successful in the class for any other variety of Plum.

In the classes for Gooseberries, Mr. J. TURNER and Mr. J. TAIT were the 1st prize-winners for green and red sorts respectively.

Mr. T. FIXTER showed the finest Loganberries, Red Currants, and Raspberries.

The 1st prize for White Currants was awarded to Mr. C. LEWIS; Mr. J. T. STEWART receiving the 1st prizes for Black Currants and Cherries.

In the classes confined to gentlemen employing regular gardeners, the Challenge Cup, offered for 12 dishes of hardy fruits, was awarded to Mr. J. COCKER; 2nd, Mr. W. SCOTT.

Mr. W. SCOTT won the Silver Cup offered for six dishes of fruit grown out-of-doors.

For six dishes of fruit Mr. J. COCKER secured the 1st award.

For two bunches of black Grapes, Mr. G. F. HALLETT, Netherby Hall, was successful, Mr. W. SCOTT being placed 2nd.

In a similar class for one bunch, Mr. J. ROBERTSON secured the 1st prize; 2nd, Mr. J. FARQUHARSON.

Mr. T. FIXTER won the 1st prize for white Grapes; and Mr. J. ROBERTSON showed the best Melons.

In the class for Peaches, Mr. W. SCOTT and Mr. G. F. HALLETT were the 1st and 2nd prize-winners respectively.

In the two classes devoted to market growers, Mr. J. MILLICAN exhibited the winning collections in the classes for culinary and dessert Apples; Mr. W. WALTON and Mr. J. W. TELFORD receiving the 2nd prizes.

SWEET PEAS.

In the class for 12 varieties, the Challenge Bowl offered by Robert Sydenham Limited was awarded to Mr. J. ROBERTSON, the 2nd prize being awarded to Mr. J. HAY.

The 1st prize for 12 vases was awarded to Mr. J. SHAW; 2nd, Mr. G. F. HALLETT. Mr. SHAW was also successful in the class for 12 vases arranged with foliage; 2nd, Mr. G. L. MOFFAT.

In the plant classes the chief winners were Messrs. A. KNIGHT, J. DIXON, J. HAY, and C. LEWIS.

In the class for a collection of hardy herbaceous perennials, Mr. J. HAY excelled; 2nd, Mr. J. ROBERTSON. Mr. J. W. JAMES showed the best exhibit of 12 Cactus Dahlias.

The most successful exhibitors in the Rose classes were Mr. T. PRIDE and Messrs. F. FRANCE and J. ROBERTSON.

VEGETABLES.

The Silver Cup offered for a collection of 12 kinds was won by Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett). This exhibitor also won the 1st prize in Messrs. Sutton & Son's class.

Mr. J. SMITH excelled in Messrs. Ed. Webb & Sons' class.

A keen competition ensued in all the other classes, a notable feature being the success of a local allotment holder, Mr. J. SMITH, who excelled in several classes.

AWARDS TO NOVELTIES.

First-class Diplomas were granted for *Perpetual Carnation* "*The Geisha*" (Messrs. GEO. FAIRBAIRN & SONS); *Collerette Dahlias The Czar*, *Queen Anne*, and *Sandringham* (Messrs. DOBBIE & Co., Edinburgh).

Second-class Diplomas were awarded for *Cosmos White Queen*, *Pink Queen*, *Princess Louise*, and *Crimson King*.

NON-COMPETITIVE EXHIBITS.

The Medals were awarded by the N.E.H.S.

Messrs. LITTLE & BALLANTYNE, Carlisle, staged a large, circular exhibit of flowering and foliage plants, in addition to a large collection of hardy fruits. (Large Gold Medal.)

Messrs. GEO. BUNYARD & SON, LTD., Maidstone, Kent, exhibited 50 dishes of out-door-grown fruits, including chiefly Apples and Pears. (Large Gold Medal.)

Messrs. T. RIVERS & SONS, Sawbridgeworth, showed a small but meritorious collection of orchard house and out-door-grown fruit. (Large Silver-gilt Medal.)

Mr. J. MILLICAN, Scotby Nurseries, staged a splendid assortment of locally-grown Apples. (Large Silver-gilt Medal.)

Messrs. G. FAIRBAIRN, Botcherby Nurseries, Carlisle, staged Begonias, Carnations, Dahlias, and Sweet Peas. (Large Silver-gilt Medal.)

Messrs. E. F. FAIRBAIRN & SONS, Edentown, displayed a collection of Phloxes, Dahlias, and hardy plants. (Silver-gilt Medal.)

Messrs. DOBBIE & Co., Edinburgh, exhibited a beautiful collection of collerette Dahlias, Cosmos, and Scabious. (Silver-gilt Medal.)

A well-grown group of Orchids was exhibited by Sir BENJAMIN SCOTT (Mayor of Carlisle). (Silver Medal.)

Mr. W. B. LITTLE arranged an exhibit of Apples and Pears from the County Council Experimental Fruit Plots, marked according to their suitability for various soils. (Silver Medal.)

A table of cut flowers and pot plants was staged by Messrs. CLARK BROS. & Co., Carlisle. (Bronze Medal.)

Messrs. ALEX. MCLAUGHLIN, Stranraer, were awarded a Bronze Medal for models of conservatories and greenhouses; and Messrs. MUNCASTER BROS., Carlisle, a Bronze Medal for bee appliances.

Mr. W. MILLER, Wisbech, showed Apple Red Victoria.

Special awards were made to the FOUR OAKS SPRAYING MACHINE Co. and Messrs. W. WEEKS & SON, Maidstone, for spraying appliances.

THE CONFERENCE.

The conference meetings were held in the Arcade room in close proximity to the Show and were well attended. During the afternoon of the first day Mr. J. S. Chisholm, Lecturer to the Northumberland County Council, gave a demonstration on the bottling of fruits.

At 5 p.m. the same day, Mr. G. P. Berry, Edinburgh and East of Scotland College of Agriculture, gave a lecture on "Soils in Relation to Fruit-growing." He emphasised the necessity of an alkaline condition of the soil for successful fruit-growing. He stated that modern investigation had revealed the fact that, unless the soil was in a neutral state, it was impossible for the healthy bacteria which played such an important part in the manufacture of good material to carry on a healthy existence. This, in a great many instances in the past, had been ignored, and it probably explained to a great extent the poor results obtained by inoculation with nitrifying bacteria in experiments. He strongly emphasised the importance of drainage and the need of

guarding against stagnant water in the soil during the winter. In many instances, said Mr. Berry, fruit plantations suffered more through the decay of autumn-made roots in winter, due to the water-logged condition of the soil, than to any extremes of climate during the growing season.

Mr. Haig referred to the feeding of fruit trees, and said that when growing Pears in certain soils he had great difficulty in obtaining fruits of a satisfactory flavour, whereas their size and appearance were all that could be desired. He assumed it was owing to a deficiency of potash, and was at the present time carrying out experiments.

At 7.30 p.m. Mr. Somers Rivers, Sawbridgeworth, in the absence of Professor F. V. Theobald, gave a lecture on "The Spraying and Washing of Fruit Trees as a Means of Combating Insect Pests and Diseases." He said that now that a Department of Horticulture had been formed they might, perhaps, look forward to the State taking a lead in advising and experimenting, as was done in most countries where fruit-growing was carried on. Growers themselves had neither the time nor the money to spend upon such trials. If the Government were to undertake experiments in different parts of the country—districts varied so much that results were difficult to collate—much valuable information could be collected. Mr. Rivers dealt with many of the most common pests and diseases of fruit trees, and gave the times when to spray and the specifics to use.

On Thursday a fruit-bottling demonstration was given by Mr. W. B. Little.

Later in the same day Mr. F. J. Chittenden gave an address on "Canker and Other Bark Diseases of Fruit Trees." The chief subjects dealt with were canker, Apple and Pear scab, and Brown rot.

At 7.30 p.m. Mr. Chisholm gave a practical demonstration in the methods of pruning fruit trees and bushes.

Obituary.

James Condie. — We regret to record the death of Mr. James Condie, who died on the 27th ult., at Larbert. Deceased was for 50 years gardener at Brooks Hill, Harrow Weald. He retired about 18 months ago, when he was granted a pension by his employer, Mr. S. J. Blackwell, whom he had served for about 30 years. Mr. Condie was an enthusiastic supporter of the Gardeners' Royal Benevolent Institution. He leaves one son. His remains were laid to rest in Dollar Cemetery, his native town, where he received his early education, and served his apprenticeship.

Harry Dampier.—The death of Mr. Harry Dampier, gardener, of New Orleans, U.S.A., is announced in *Horticulture*. Mr. Dampier, who was a native of Devonshire, settled in New Orleans 20 years ago, and was 57 years of age. His wife and two daughters survive him.

J. S. Bergheim.—We regret to record the death of Mr. J. S. Bergheim, whose gardens at his residence, Belsize Court, Hampstead, contained a remarkable collection of interesting plants, including Orchids. On the 7th inst. Mr. and Mrs. Bergheim were journeying in their motorcar on the Ripley Road, and, in attempting to avoid a cart, the car skidded and turned over. Mr. Bergheim, who was in his 70th year, sustained a fractured skull, and was otherwise injured, and Mrs. Bergheim sustained a severe shock. Both were taken to the Surrey County Hospital, Guildford, where Mr Bergheim died on the 10th inst., without regaining consciousness. Mrs. Bergheim is recovering satisfactorily, and the chauffeur escaped almost unhurt. Mr. Bergheim was well known in financial circles in the City, but he was also a keen naturalist. He had a large circle of friends interested in science, and was always studying various points in plant economy and plant culture. Almost every year he made a journey to some distant country, accompanied by Mrs. Bergheim; this year the visit was to Brazil. He brought back interesting specimens, and Belsize Court has many curiosities collected during these visits.

LAW NOTES.

AMERICAN GOOSEBERRY-MILDEW.

A gardener was summoned recently at the Cheltenham Police Court under the order of the Board of Agriculture, 1912, for having knowingly sold Gooseberries affected with American Gooseberry-mildew. The evidence was to the effect that a pot of 68 lbs. of Gooseberries was sent to Cheltenham fruit market by defendant on July 9, and that they were disposed of by auction. The auctioneer noticed nothing wrong with the Gooseberries, but the purchaser informed the Bench that when he emptied the basket he noticed the fruit was wet. As there had been no rain for a day or two, his suspicions were aroused, and further examination convinced him that the Gooseberries had been washed. There were traces of American mildew on the berries. He communicated with the police. Mr. Allen H. Lees, of Evesham, Board of Agriculture inspector, said he inspected the defendant's garden. He found some badly-diseased berries on the bushes, and a little of the disease on the twigs. The berries had the winter stage on them; this was chocolate-brown in colour. Defendant denied having told the inspector that there was a little mildew last year; there was saw-fly, and it was for that pest that he treated the bushes with lime.

The Bench imposed a fine of £1 and costs.

THE LATE JAMES CONDIE.

COMPENSATION FOR INJURIES.

At a recent sitting of the Bromley County Court, Leonard James Fenniag, 18, of 4, Church Road, Sidcup, jobbing gardener, sued John Bartlett, a solicitor, of Savernake, Carlton Road, Sidcup, for compensation under the Workmen's Compensation Act, in respect of an injury to his eye. The applicant, an under-gardener, stated that up to March 20 he was in the employ of the respondent. He had been in his employ for two years, and had earned 15s. a week for the last 12 months. Whilst chopping wood on March 20, a chip flew up and struck him in the eye. He went to Guy's Hospital on the following day, and on March 28 an operation was performed and the eye removed. Later a false eye was inserted, and he returned to work about the middle of June. He found, however, that he could not work; he was afraid of chopping his fingers and of cutting himself with the scythe. He was discharged on August 5, and had been unable to obtain work since, being considerably handicapped through the loss of his eye. In reply to the judge, the respondent said it was not his wish that the matter should be disputed. He agreed that the lad was incapacitated.

The judge made an order for the applicant to receive 10s. a week from the date of the accident to that day, and 7s. 6d. a week during his incapacity, remarking that the case should never have been brought before him, as the employer was willing to pay compensation.

THEFT OF FERNS.

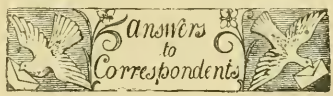
At the Wonford Petty Sessions, Exeter, a defendant was sentenced to two months' imprisonment for damaging Fern roots, the property of the Earl of Iddesleigh, at Upton Pyne, on the 22nd ult., value 10s. The gamekeeper, William Venton, stated that he saw defendant gathering Ferns at 6 a.m. He had 1,400 Fern fronds and six roots. Mr. H. Osmond, estate agent, stated that the Ferns had been taken from a Fernery.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS'.—The monthly meeting of this association was held on August 29, at St. John's Parish Rooms, Clifton. Mr. Theoday presided. A paper on "Hardy Flowers" was read by Mr. Rich, of Bath. Amongst other points dealt with by the lecturer were the various methods of propagation, manuring, and the value of these flowers for use as cut blooms. He stated that hardy border flowers may be had in bloom from March to November. The prizes offered by Mr. J. C. House for four branches of Phlox were won as follow: 1st, Mr. Woodward; 2nd, Mr. Scott; and 3rd, Mr. Curtis.

STIRLING AND DISTRICT HORTICULTURAL.—The first monthly meeting for the season was held on September 3, in the Temperance Hotel, Stirling; Mr. Wm. Watts, Bridge of Allan, occupied the chair. A lecture was delivered by Mr. Sinclair, superintendent Beveridge Park, Kirkcaldy, his subject being "How to Make the Flower Garden Beautiful." The lecturer showed several photographs representing colour and planting schemes; these gave the members an excellent idea of the bedding practised at Beveridge Park. Mr. Ritchie will lecture on "The Apple" at the October meeting.

BATH GARDENERS'.—The members of this association met on the 9th inst., under the presidency of their chairman, when a paper was read by Mr. Allen, on "The Cultivation of the Melon." Mr. Allen dealt principally with the culture of those fruits in frames. Special prizes were offered for 20 Runner Beans. Mr. Garraway was awarded the 1st prize for a splendid dish, Mr. Sparey being placed 2nd. The meetings will take place on the second and fourth Mondays in each month.



*** *Owing to pressure of space we are compelled to hold over our report of the Royal Caledonian Society's exhibition until the next issue.*

Acetylene Gas Refuse: *W. M.* Several notes on the value of this substance as a manure will be found in *Gardeners' Chronicle*, vol. xlv. In a note published in these columns, May 8, 1909, p. 299, Mr. Staddon states that it is best applied to vacant land, and dug into the ground. No plant should be placed on the land for at least two months after the gas lime is applied. The best time for applying it is autumn or spring. Do not put it on fresh from the generator when wet, but in some out-of-the-way corner of the garden, where it should remain until it is well drained and nearly dry.

A Gardener's Character: *Correspondent.* You cannot legally compel your employer to give you a character, but it is undoubtedly his moral duty to supply you with one. If he wilfully gives you a false character when replying to your new employer's enquiries, you could sue him for libel. Your best plan would be to explain all the circumstances to your new employer.

A Gardener's Hours: *A. S.* The number of hours worked in gardens varies, and, there being no fixed rule, the British Gardeners' Association recommends that "for under gardeners, 54 hours (exclusive of time allowed for meals) in the summer period (eight months) and 48 hours per week in winter, should be the maximum, and beyond this extra remuneration should be given."

Black Currant Shoot: *F. E. C.* The Black Currants are affected with big bud or gall-mite Phytoptus ribes. If only a few swollen buds are found, you will do well to cut away the shoots on which such buds are and burn them.

If only certain bushes are badly attacked, let them be grubbed out carefully, and remove both root and branch to the fire. If matters are even worse than this your best plan is to grub out every one of the bushes and burn them. After this, double-dig the ground, putting the top spit below the second spit, which will destroy any mites there may be in the surface soil, and it will not be wise to plant Black Currants on the same ground for several years afterwards. When buying fresh stock every precaution should be taken to be certain that it is free from the pest at time of purchase, and bushes, if subjected to preventive treatment, ought to remain healthy for an indefinite period. When spraying as a preventive measure against attack and on mildly-attacked bushes from which big buds have been removed, the mites are so secreted in the buds that it is necessary that some spray of only moderate strength be used so that it may be applied frequently and sufficiently. In this way the liquid will soak through the bud scales and reach the mites. In an article contributed by Mr. A. H. Pearson to *Gardeners' Chronicle*, May 21, 1904, p. 298, and May 13, 1905, it was stated that in May and June mites change their abodes from old to new buds, and spraying is more likely to be effective at such a time, and the cultivator should spray the bushes with a mixture of soft soap, Quassia and water at the strength of 2 ounces of soft soap and 4 ounces of Quassia to each gallon of water at intervals of 10 days. Apply it by means of the knapsack sprayer (Vermorel's).

BLUE HYDRANGEAS: *A. M. C.* Try watering the plants twice weekly with a solution of ammonia alum (half-ounce to 1 gallon of water). It is desirable to water with this solution in the autumn until the plants pass into their resting stage. During their flowering period the plants should not be grown in the full sun, or the blue colour will become blotchy. Other cultivators have obtained good results by the use of such substances as alum, iron, and slate chippings mixed with the soil.

CHRYSANTHEMUM SEEDLING: *J. H.* Your plant is the double-flowered Matricaria inoroda, a very floriferous and pretty border plant.

EXHIBITING RUNNER BEANS: *Trimsaran.* According to the R.H.S. *Code of Rules for Judging* the pods should be long, straight, clear, even, fleshy and brittle. The following points are recommended: length and form, 2; substance, 2; condition, 2; colour, 1—total 7. As to whether your pods were the finest we are unable to say, and the decision must rest with the judges.

HORTICULTURAL INSTRUCTOR: *Climbing Corydalis.* We can only express a very general opinion as to the probability of your being ultimately successful in obtaining an appointment as a lecturer in horticulture. The competition for these posts is very keen, and as a general rule the best man wins. When other qualities are equal, personal appearance and address would almost certainly have great influence with the committee or council who make the appointment. In our opinion you are too young and your practical experience is limited. We have read your copies of testimonials, and it seems to us that you have neglected horticulture in favour of botany, and other sciences, which, admirable in themselves, are not sufficient to enable you to carry out successfully the duties of a horticultural instructor.

HYDRANGEA ARBORESCENS: *W. E.* Hydrangea arborescens can be cut back in the spring in the same manner as H. paniculata grandiflora, but the flowering period will be late, in fact, this treatment cannot be recommended except in very warm localities. In your district the better way would be to thin out the old and weakly wood in the spring, leaving the remainder entire, except that any unripened ends of the shoots may be cut back to sound wood.

MARGUERITES FAILING: *J. P.* Eelworm is present. This is a difficult pest to eradicate and insecticides are of very little avail. The best plan is to burn the plants, and remove the soil in which they have been grown, either sterilising it by baking, or burying it deeply in some out-of-the-way part of the garden. The house should then be cleaned thoroughly with carbolic in solution, washing the woodwork with soft soap, carbolic acid and warm water.

A correspondent in *Gardeners' Chronicle*, July 8, 1911, page 7, recommends top-dressing pot plants with rape dust, which acts as an exterminator of eelworms and as a fertiliser of the soil at the same time. See also an article in the issue for July 13 last, page 30.

MELONS FAILING: *W. J. F.* The wilted parts of the Melon sent contain bacteria. It would appear that a bacterial "wilt" (possibly caused by Bacillus carotovorus), is attacking your plants. A complete plant, packed carefully in a tin box, should be sent us for examination, in order to make identification certain. In any case affected plants, or stems, should be removed and burnt.

NAMES OF FRUITS: Correspondents sending Peaches and Nectarines for naming should enclose leaves of each variety, and state whether the flowers are large or small, and if the trees are grown under glass or in the open.—*Fruitian.* 1, Clapp's Favourite; 2, Flemish Beauty; 3, Beurré Bachelier; 4, Durondeau; 5, Doyenné du Comice; 6, Beurré Bosc.—*Lyons.* 1, Beauty of Bath; 2, King of the Pippins; 3, Lane's Prince Albert; 4, Kerry Pippin; 5, 6, 7, Worcester Pearmain; 8, Not recognised; 9, Bess Pool; 10, Allington Pippin.—*F. Severn.* Mr. Gladstone.—*H. W.* 1, Ecklinville Seedling; 2, Red Astrachan; 3, Grenadier.—*E. A. L.* 1, Not recognised; 2, Lord Suffield; 3, Northern Dumpling; 4, Not recognised; 5, Manks Codlin; 6, Too small to name.—*H. Elliott.* 12, Will publish name in a later issue; 13, Not recognised; 14, Beurré Rance; 15, Pitmaston Duchess; 17, Clapp's Favourite.—*J. Mills.* Not recognised.—*G. Clark.* 1, Peasgood's Nonesuch; 2, Prince Albert; 3, Manks Codlin.—*Caldwell & Sons* Badly grown fruits and not more than half-developed. 1, Williams's Bon Chrétien; 2 and 5, Beurré d'Amanlis; 3, 6, 8, 11, 12, Not of sufficient size to determine the varieties.—*J. H.* 1, Louise Bonne of Jersey; 2, Williams's Bon Chrétien.—*Constant Reader.* 1, 2, 6, 7, Not recognised: most likely local varieties; 3, Pitmaston Duchess; 4 and 5, Louise Bonne of Jersey; 8, Beurré Clairgeau; 9, Easter Beurré; 10, Vineuse; 11, Uvedale's St. Germain; 12, Beurré d'Amanlis; 13, Beurré Hardy; 14, Beurré Diel. Plums: 1, Monarch; 2, Denniston's Superb.

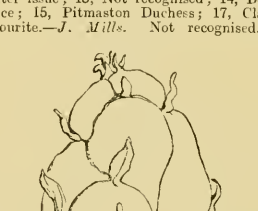


FIG. 98.—A PROLIFEROUS PEAR.

NAMES OF FUNGI: *Fungi.* 1, It is not possible to name the fungus from the strands of spawn (mycelium) received. It is not likely that this fungus attacks living plants. 2, If the "mildew" noticed on the Tomato is black, it is the "sooty mould" (Fumago) which was present on the leaves. This fungus feeds on the "honey dew" excreted by Aphides. Get rid of these by a nicotine wash, and the "sooty mould" will disappear. 3, The fungus is an immature stage of one of the Polyporaceæ—probably Stereum. It has probably developed after the death of the tree, but was not the cause of its death.

NAMES OF PLANTS: *Nutley.* Lysimachia clethroides.—*W. H. C.* 1, Sempervivum arachnoideum; 2, Kleinia articulata; 3, K. repens; 4, Sedum rupestre; 5, Senpervivum calcareum; 6, Scorpiurus vermiculata.—*F. C. L.* 1, Hieracium borealæ; 2, Sonchus oleracea; 3, Polygonum persicaria; 4, Lapsana communis; 5, Bidens cernua; 6, Epilobium montanum. The best work for studying British wild flowers is Hooker's *Students' Flora*, with illustrations. For the other purposes mentioned, Nicholson's *Dictionary of Gardening* or Robinson's *Flower Gardening* would be useful. These books may be obtained from our publishing department.—*Rude.* Cratægus Pyracantha.—*Perennial.* Monarda didyma (the red), Lysimachia vulgaris (yellow). On another occasion please number the specimens.—*H. O.* 1, Oncidium candidum; 2, Cypripedium venustum; 3, Leochilus cochlearis; 4, Ionopsis teres.—*A. J. M.* Oncidium Lanceanum.—*C.* Desfontainea spinosa and Hypericum patulum.—*R. H.* 1, Pteris tremula; 2, Adiantum hispidulum; 3, A. cultratum; 4, Pteris cretica; 5, P. serrulata.—*G. Chamberlain.* You send more than the proper number; a small donation to the R.G.O.F. box would be appropriate. 1, Pittosporum tenuifolium; 2, Cedrus sp.; 3, Cupressus sp. (send cones); 4, Sequoia gigantea; 5, Abies Pinsapo; 6 and 7, Pseudotsuga Douglasii; 8, Thnya plicata; 9, Cryptomeria elegans; 10, Pinus insignis; 11, Cupressus Lawsoniana var.; 12 and 14, C. nutkatensis; 13, 16 and 17, Thuya plicata; 15, Cupressus pisifera; 18, C. sempervirens.—*J. D.* Agrostis vulgaris.

PACKING GRAPES FOR TRANSIT BY POST: *A. F.* Grapes may be sent with safety through the post if they are packed in wooden boxes with wood-wool. The latter should not be of too fine a quality, as the coarser material offers greater resilience. Place a layer of the wood-wool at the bottom of the box, next insert a sheet of tissue paper, place the Grapes in position, and then pack the wood-wool about them, making it secure down the sides by means of a blunt table knife. Thus packed, the Grapes should reach their destination in a perfect condition.

ABNORMAL PEAR: *T. B.* Monstrous Pears, such as the one illustrated in fig. 98, are very common in some seasons. The edible portion of a Pear is the dilated end of the flower-stalk, in which the tree-fruit or core is embedded. In these proliferous Pears, for some reason or other, the swollen branch, after temporary arrest, has started into growth, and produced other swollen branches, with leaves proceeding from them. See also *Vegetable Teratology* (Masters), pp. 422-3.

PEARS CRACKING: *Enquirer.* The Pears are affected with the Pear Scab (Venturia pirina). Spray the diseased trees with Bordeaux mixture, using it at not more than half strength, when the buds commence to open, repeating the operation next spring when the petals are falling from the flowers, and again when the young fruits have attained the size of Peas. Where the disease has been troublesome previously syringe the trees in the winter thoroughly with a solution of sulphate of iron.

RUNNER BEANS: *G. M. D.* In *Gardeners' Chronicle*, September 9, 1905, Mr. Wm. Smythe recommends preserving Runner Beans by putting them into a liquid containing ¼ ounce of salt-petre and about ½ ounce of salt to 2 quarts of clear, spring water. He states that they are not too salt, and keep well for winter use.

TOMATO DISCOLOURED: *J. A.* The yellow patches in the Tomato fruits are due to a deficiency of potash in the soil.

TULIPS DISEASED: *Fidem* and *W. W.* The Tulip bulbs are being destroyed by various saprophytic fungi (Penicillium glaucum and another species of Penicillium). So far as can be gathered from the specimens received, the bulbs have been previously attacked when in the ground, and patches of surface tissue have been destroyed. Various fungi causing a decay are now entering at these places. The effect of steeping the bulbs in a solution of formalin (1 pint of commercial formalin in 32 gallons of water) for 2 hours may be tried.

WATER LILIES: *A. C.* See reply to *W. W.* in the last issue, p. 203.

THE ROMANCE OF THE ROAD.

IT may be that the title of this article will conjure up in the minds of youthful readers memories of dreadful novels devoted to the heroic and unlawful doings of highwaymen. They will picture the lonely tavern, with the sour-faced innkeeper at the door, wherein the unsuspecting traveller would have met his doom had it not been for the warning conveyed to him with all the fit accompaniments of mystery by the rose-cheeked serving maid. The romance of the road with which we deal is, however, not that of a fast-disappearing style of melodrama. It is the romance of the road itself: that long, straight stretch of road which pursues its course through county after county; the road along which Roman legions marched; the road winding tortuously between deep hedgerows starry with Dog Rose and sweet with Honeysuckle.

In the history and vicissitudes of roads themselves there is romance more real and enthralling than in the dubious capers of villains long since and duly hanged.

The spirit of this romance breathes through the sober pages of the reprint of a discourse on *The Road, Present, Past, and Future*, delivered by the Rt. Hon. Sir John H. A. Macdonald, member of H.M. Road Board, at the Royal Institution of Great Britain early in the present year. That discourse may be commended in its entirety to all who have a feeling for history, and also to all whose concern it is to attend, whether in parks, in public or private gardens or elsewhere, to the making of roads.

Sir John Macdonald shows us the road in the making, the road with all its virtues and defects, and finally, with prophetic vision, reveals to us the road of the future.

With the decadence of Rome the art of road-making was lost, and it was not till comparatively recent times—at all events in our country—that this art was rediscovered.

The rise of commerce and the love of travel compelled the conversion of the quagmires of Elizabethan and later times into good roads, over which, as was the case with the Bath Road, a hundred and more coaches thundered in a single day. Then, when the road had been resuscitated, came the advent of the railroad, and once again the highway roads fell on evil days. With dwindling traffic, it seemed nobody's business to maintain the road, and the post of road-surveyor became a perquisite and sinecure, to be filled, as was actually the case in one district, by "a miller, an undertaker, a carpenter, a coal merchant, a publican, a baker, an infirm old man, and a bed-ridden old man who had not been out of his house for several months." This in the early years of last century. Nor, although those geniuses of road-making, Macadam and Telford, effected improvements, was the neglect of the road to be wondered at, for the railroad had robbed the highway of nine-tenths of its traffic.

This neglect might have continued long had it not been for the coming of the motorcar and the marvellously rapid increase in the number of these vehicles. The extent of this increase, though familiar enough to all of us, may be gauged by the figures cited by Sir John Macdonald. Thus there were no fewer than 200,000 motor vehicles upon the roads of Great Britain in 1911, and in that year, of the 500,000 horses that were used formerly in London alone, 420,000 had disappeared from the streets.

How great is the revolution set on foot by the advent of the motor vehicle we need not stay to inquire, though we may venture on the hope that it may entail in the near future a reform in the cooking practised in wayside hostelries. To-day the road has come into its own again, and is the recipient of a princely endowment, held in trust for it by the Road Board.

The vastness of this endowment may be judged by the fact that every motorbus which helps to make London hideous and progress easy pays as its share of the endowment of the road £45 per annum. Collectively these terrors of the London streets pay three-quarters of a million a year—the proceeds of the petrol tax—toward the repair of the roads which they help to destroy.

No less interesting than the vicissitudes of the road is the history of progress in the art and science of road-making. The modern history of the road begins with Macadam and Telford, who showed that the essentials of a good road are a good foundation and a good crust, and who demonstrated that the latter may be obtained by the use of small, angular stones: angular that they might bind well to form an impervious surface, and small (passing a 1½ inch gauge) in order that the blows which a stone receives may not, even though they fall on its edge, dislodge it from its setting. Most interesting is it to discover from Sir John Macdonald's account how the wise precepts of Macadam came to be disregarded. The origin of this disregard is traceable to the steam roller. Before that monster was devised the traffic made the road. The road-maker was content to provide the stones, and the horses and vehicles did the rest, the unceasing beat of hoof, the pressure of the wheels sooner or later bedded the stones, keying them in the bed and forming a crust which served to keep out water—the destroyer of roads. The road-mender saw to it that the traffic did its work thoroughly. He placed trestles now on one side and now on the other side of the road, compelling the luckless driver to prolong his suffering by zigzagging across the loose stones. When one section was thus well and truly laid, the position of the trestles was altered, and the carts and coachmen were put to the hard labour of making another section of the road. But when the steam roller came all this was changed, and although the change was greatly to the advantage of the traveller, it was equally to the detriment of the road. For, in order for the steam-roller to do its work nicely, it became the practice to water the roadway under construction. Thus the agent of destruction which, when it once gains access to the body of the road, destroys it utterly was introduced, despite all the teaching of Macadam, one of whose maxims might be written: Water—there is the enemy! Instead of bedding the stones in the dry body, they were worked into a slush of water and mud. As the slush dried or froze or was compressed, the stones worked loose, and all had to be redone. Other evils attended the introduction of the steam-roller. It drove the sludge before it into ridge and furrow; and yet another evil arose from the habit of road-menders in using stones of larger size than those prescribed by Macadam. Such stones are useless, for reasons already mentioned. A hoof's blow falling on one edge of a big stone dislodges it from its bed, and so makes holes for the entrance of water. No wonder that bad road-making is yet more costly than good! All this has changed. Brains have been devoted to the study of the road, and in the future it will be made and mended on scientific principles. These principles are simple. First, the bed or foundation must be good, and second, the crust must be tough and as impervious as may be to water. The latter end is secured by the use of pitch or bitumen, which materials give cohesion to the stony ingredients of the crust. The substitution of tar for mud-binding has worked wonders in the roads of Kent and other counties, and with the use of yet finer stones than those prescribed by Macadam the problem of the impenetrable crust has been solved—solved, that is to say, from the point of view of the road-maker, but by no means

solved from that of the horticulturist. For there is no doubt, as we have shown in sundry places in this journal, that tarred roads are bad for vegetation. But the perfect road requires something more than good foundation and crust. It requires an elastic carpet to deaden the noise and to take the weight of the blow, and thus preserve the crust. The modern road surveyor has discovered in bitumen a substance which has the property of resiliency necessary for this purpose, and it will not be long before he makes us roads which, though carpeted with some resilient, sound-deadening material, shall cost no more to construct and far less to maintain than any of the roads of the past. Hence, after many vicissitudes and many ups and downs, the road is at last coming to its own as the best highway of all, whereon the motor may fly with winged wheels, the horse-driven vehicle roll without racking the bones of beast and man—even the pedestrian may aspire once again to tread the old road, and, unpoisoned by dust, find pleasure in a leisured and clean progression along the King's highway.

CULTURAL NOTES.

TRANSPLANTING PEACH TREES.

In many gardens there are Peach and Nectarine trees that would become more fruitful if they were transplanted occasionally, and this is especially the case with trees growing under glass. It may be considered advisable to move trees (a) because they require more space, (b) because they are growing too vigorously, or (c) on account of the unsatisfactory condition of the roots. The work of transplanting may be successfully done at any time from now until growth recommences in the spring; but it is best done at the present time whilst the leaves are still on the trees and it is possible for the trees to make fresh roots before next season. All the branches should be loosened from the walls or trellis and tied into bunches before commencing to operate on the roots. A trench should be dug at a convenient distance from the stem of the tree, and the soil that is removed from the roots forked into it. Great care must be taken whilst exposing the roots to avoid injuring them, and, as each side of the root-system is sufficiently exposed, it is advisable to damp the roots and cover them with a wet mat. Before thus exposing the roots of the tree, all preparations should be made for conveying the tree to its fresh position, so that the roots may be covered with soil again at the earliest moment. The drainage of the border should be examined to make sure that it is in perfect order. The borders should not be made too large or deep, as too much root room frequently results in gross, unfruitful wood. It is a far better plan to have a restricted border and to add to it as required. The most suitable soil for a Peach border is good fibrous loam, cut from old pasture land, and stacked for at least six months before being used. A liberal quantity of old mortar rubble and coarse charcoal should be well mixed with the chopped loam. The soil should be moist, but not wet, at the time of planting. Whole turves should be placed, with the grass-side downwards, directly on to the drainage, and the compost then placed in position and made firm as the work proceeds. It is essential to have a firm base on which to place the roots, which should be planted near to the surface. Any broken roots should be removed with a sharp knife, making the cut in a slanting direction from the undersides of the root; all very strong roots should be shortened, and have small notches cut on their upper sides to induce the formation of fibrous roots. A supply of fine soil should be at hand to work around the roots, which should be spread out evenly and as straight as possible. When dealing with large trees, the roots of which are in tiers, care should be taken to cover each layer of roots separately. After the planting is finished, the branches should be loosely secured to the trellis or wall to keep them in position. The border should then have a thorough soaking with clear water, and the structure should be kept close for the next week or two, after which time air should be admitted. Should the weather be bright and sunny, temporary shading may be employed with advantage. The trees should be frequently syringed until the foliage commences to fall. Trees treated in the manner described invariably yield a satisfactory crop the following season, and if the growth has been excessively rank and vigorous, this treatment assists the wood to ripen. *J. Gardner, Batsford.*

RAISING SWEET PEAS FROM CUTTINGS.

There is one detail in connection with the growing of Sweet Peas that does not appear to be known to the majority of growers, and that is the extreme simplicity of increasing the stock by means of cuttings. New varieties are always expensive, and the seed of some kinds is sometimes a little capricious. But by means of cuttings a stock of any variety may be increased at least four or five-fold. From the first, the original plants must be encouraged to grow as sturdily and short-jointed as possible, for cuttings from drawn or weakly plants are never likely to prove satisfactory, even if they form roots, which is doubtful. Cuttings should be taken from the parent plants when the latter are about 4 inches high, by which time they should have made five or six joints. A sharp pair of scissors is much better than a knife for taking off the tips of the plants, for the Sweet Pea is tough, and if force has to be used in the operation the roots are likely to be injured. A clean cut should be made below a joint, care being taken to leave three joints on the parent plant. After the leaves, except the two uppermost, have been removed from the cuttings, they should be dibbled in around the sides of small pots filled with sand only. It is best to water the sand first to make it firm, and to repeat the operation after the cuttings have been inserted. The pots should then be stood in a box deep enough to allow a piece of glass to be placed over the top without touching the tips of the cuttings, and the box should then be put in an ordinary cold frame or on a very gentle hot-bed. In the former method, the cuttings will root in a fortnight to three weeks; in the latter, more quickly, but some varieties take longer than others. A little shading should be provided if the sun is bright, but otherwise the cuttings should be exposed to all the light possible. The glass should be wiped dry if much moisture condenses upon it, and immediately replaced. Watering should not be necessary for the first week, and probably not until the cuttings have made roots. When they have reached that stage, the glass should be removed, and a week later the cuttings may be potted separately into small pots and treated exactly as if they were seedlings. The three or four side shoots left on the parent plants may be treated in the same way when they are long enough, and if all are grown on without a check, these plants raised from cuttings will bloom just as well as seedlings, and almost as soon. *East Sussex.*

FIG. 99.—PRIMULA SUFFRUTESCENS: FLOWERS REDDISH-PURPLE, WITH YELLOW TUBE.

(See p. 227.)

FORESTRY.

TREE GROWTH IN BELGIUM.

By far the largest Beech trees that I have seen are growing in the famous forest of Bois de la Cambre, just outside Brussels. Growing in deep sandy soil, the trees have attained gigantic proportions, both as regards their height and cubic contents of stem, many being from 100 feet to 120 feet in height, and containing 200 cubic feet of timber. In a single line of these trees which I particularly noticed, the individual specimens were standing at about 18 feet apart with straight, clean trunks which rose to 60 feet without a branch, and contained on an average 160 feet of wood. The very gradual taper of the stems is most remarkable, as in many cases the girth of bole was almost as great at 40 feet as at 3 feet from the ground. The Elm trees in the grounds of the Royal palace are, taken as a whole, and from a timber point of view, the finest that I have seen, many rising to fully 100 feet in height, with clean, very gradually tapering trunks that girthed from 10 feet to 12 feet at a yard from the ground level. *A. D. Webster.*

THE ALPINE GARDEN.

PRIMULA SUFFRUTESCENS.

Primula suffrutescens (fig. 99) is a Californian species, shrubby in appearance, with woody, branching stems which creep along the ground; it is thus distinct from any other member of the genus.

The foliage, including the petiole, is from ¾ inch to 2 inches in length and ¼ inch to ⅝ inch in breadth. The leathery, wedge-shaped, spatulate leaves are denticulated in front. The scape, about 4 inches high, carries an umbel of several reddish-purple flowers with a light yellow tube.

This plant should be grown in loamy earth and peat, with the addition of a little rough sand. It requires protection during the winter, and thrives best in a half-shaded situation.

The plants shown in fig. 99 were flowering in my rockery at the end of June. *John MacWott, Morelands, Duns.*

SAXIFRAGA RUDOLPHIANA.

This beautiful Saxifrage is a variety of S. oppositifolia. The plant illustrated in fig. 100 is growing in the garden of Mr. R. Smyth, Mount Henry, Dalkey, Co. Dublin. It is planted in well-drained, gritty soil of a poor nature, and has flowered freely for the past five years. The colour of the flowers is pink, the blooms are larger than the type, and present a fine patch of colour in March at the base of a large rock, especially when lighted up by the sun.

VERONICA CINEREA.

Veronica cinerea is different from any other species of Veronica known to me, and one of the finest of all for the rock-garden. It forms a low-growing plant, producing a mat of grey leaves, almost flat on the ground. In April and May it produces its small spikes of violet-blue flowers, which open in succession. The effect of the grey, ash-coloured foliage and the violet-blue flowers is very charming. I observe in a Continental catalogue it is described as having white blooms, but it is quite probable that there are both blue and white varieties, just as with many other Veronicas. I assume my plant to be Boissier's V. cinerea, from Asia Minor. It came to me without any cultural suggestions, and I have planted it on a terrace in my rock-garden but little above the ground level, in dry soil. Its appearance makes one doubtful of its standing the winter well in wet districts.

ARABIS STURII.

I wonder if anyone can give the exact origin of this little Arabis, which is generally understood to be of garden origin. It is, in any case, one of the best of a genus not distinguished by neatness, yet of much garden value. A. Sturii is an exception to the prevailing want of refinement among the Arabises, being very neat and pretty with its small carpet of glossy leaves and its small, white flowers, which are borne an inch or two above the foliage. It appears to be an accommodating little plant, and thrives well with me on a south-east exposure in my rock-garden in light, dry soil.

ERYTHRONIUM HENDERSONII.

Erythronium Hendersonii has fine scapes, each carrying several beautiful flowers with recurved petals and of a good purple colour. Examined closely and upturned, the flower becomes still more beautiful to the eye, as the purple segments are almost black towards the base, with the exception of a little yellow, the whole combination being exquisite and fascinating. I have had this handsome Dog's Tooth Violet in my garden for several years past, but it has, unfortunately, made hardly any increase. It is planted in a cool exposure at the base of rockwork facing almost N.N.E., where it grows satisfactorily and blooms every year. The soil is open and rather sandy. *N. Arnott, Dumfries.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 66-71.)

(Concluded from p. 211.)

WALES.

Cardiganshire.—The fruit crops generally are very much under the average. In this garden Pears are a good crop. Apples, with the exception of two or three varieties, are poor. Plums are good, especially Victoria, Czar and the Gages. Morello Cherries are very satisfactory. Gooseberries, Raspberries and Red Currants were plentiful crops, but Black Currants were affected by aphis. Strawberries were very good. Our soil is shallow and heavy, overlying slaty rock, and is of a very cold nature. *W. Phillips, Derry Ormond, Llangybi.*

Carnarvon.—The fruit crops generally are satisfactory, and the fruits of good quality. Apples, however, are much under the average. Last season there was a glut of these fruits, and this may account to a certain extent for their scarcity this season. Trees that were sprayed in January last with V.I. fluid are making very clean growth and looking well. Small fruits were very good indeed, but the Strawberry season came to an end very suddenly, owing to many of the berries rotting on the ground whilst they were still green. June was a very wet month, 6.59 inches of rain falling. The soil here is very gravelly and hungry, and dries out very quickly. *J. S. Higgins, Glynllivon Park Gardens.*

Denbighshire.—The fruit crops are not so good as might have been expected considering the wealth of blossom. Certain varieties of Apples are carrying fair crops, whilst others are barren. Pears set well and the fruits required thinning. Certain varieties of Plums are carrying good crops. Strawberries were a heavy crop, but owing to continuous rain half the fruits rotted. Small fruits were plentiful. The soil is a stiff clay. *J. A. Jones, Chirk Castle Gardens.*

—— With the exception of Apricots, fruit trees generally blossomed well and are carrying good crops. The buds of Apricots seemed to have been damaged before they opened. Strawberries looked well up to the middle of June, when, owing to the sunless, damp weather at that time, many of the fruits rotted. *J. Martin, Bryn Estyn Gardens, Wrexham.*

Flintshire.—The prospects of the fruit crops at one time were exceedingly good, but cold winds at the time Apples were in bloom spoilt the bright prospects and also injured the young growth of Peach trees, the leaves being badly blistered. Pears appear to have escaped damage, as there is a good crop of clean fruits. Gooseberries are superabundant, and Raspberries very good. Strawberries were greatly spoilt through the continual rains when ripening. We were much troubled with caterpillar and aphis. *J. Barnard, Mostyn Hall Gardens, Mostyn.*

Glamorganshire.—On the whole the fruit crops in this district are very disappointing, especially after the profusion of bloom on all kinds of fruit trees. The reasons for the partial failure are, I think: (1) the continued dry weather and cold nights during the time the trees were in bloom, and (2) blight, which affected the Apple trees at the end of May and in the early part of June. Apples are an average crop but badly affected with blight. The varieties carrying the heaviest crops are James Grieve, Cox's Orange Pippin, Ribston Pippin, King of the Pippins, Bramley's Seedling, Lane's Prince Albert, Lord Burghley and Lord Derby. Pears are an average crop, but very good and clean, especially Marie Louise, Louise Bonne of Jersey, Winter Nelis, Glou Morceau, Doyenné du Comice and Easter Beurré. Peaches and Nectarines are excellent, all varieties carrying heavy crops, and the trees have been very free from blister. All small fruits were plentiful and good. Strawberries have been a heavy crop, but half the fruits were damaged by the heavy rains during the time the berries were ripening. Our rainfall for June was 7½ inches. The soil is of a light texture with a gravelly subsoil. *R. Milner, Margam Gardens, Port Talbot.*

[*Photograph by E. V. Low.*

Fig. 100.—Saxifraga rudolphiana in an Irish garden.

Pembrokeshire.—There is a fair general crop of hardy fruits. In some districts Apples are very plentiful, whilst in others this crop is a comparative failure. Winds from the Atlantic sweep over the county in the spring and do great injury to foliage and flowers. Consequently numbers of Apple trees in exposed gardens scarcely ever bear fruit. Plums are a good crop, especially the variety Victoria, whilst Damsons, which are extensively grown in this county, are a very heavy crop. Insect pests are doing great damage to fruit trees this season, especially in the case of Apple trees which have not been sprayed. *Geo. Griffin, Slebech Park, Haverfordwest.*

—— The fruit crops are good, with the exception of Apples on young trees, although established trees are bearing very heavy crops. It is many years since I saw a better crop of Pears; the fruits of most varieties required thinning. Peaches on south walls are plentiful. We had a

very heavy crop of sweet Cherries, but Morellos were not so plentiful. Plums set well, and are a heavy crop. Raspberries, Red and Black Currants have never been finer or more abundant, and the same may be said of Gooseberries. Royal Sovereign Strawberry has done remarkably well, also Givon's Late Prolific and Laxton's Latest. I have grown many varieties of Strawberries in these gardens, but have now discarded all but those named. The gardens are on a slope facing south. The soil is a light loam overlying slate stone. *Wm. A. Baldwin, The Gardens, Clynfiew, Boncath, S.O.*

RADNORSHIRE.—Pears and all kinds of Nuts are very plentiful. Late Apples are almost a failure, but early sorts were satisfactory. Small fruits were variable crops; Currants were scarce and bad, whilst Raspberries were plentiful and good. Late Strawberries were satisfactory, but early Apples are not so good as last year, and Pears are under the average. Plums, Raspberries and Gooseberries were all satisfactory crops. Black and Red Currants were poor, the latter being deficient in colour. Strawberries were most promising, but rain and cold winds delayed the setting of the fruits, consequently only about half the crop ripened. Cherries were good. All trees have made healthy, clean growth. *W. A. Maxwell.*

TYRONE.—The fruit crops are very satisfactory. Pears are particularly good. Strawberries suffered badly from damp, and many of the early fruits decayed. Aphis was prevalent very early this year, and did some damage. The codlin moth has also been in evidence, whilst American blight is always with us in greater or less degree. *Fred. W. Walker, The Gardens, Sion House, Sion Mills.*

FIG. 101.—MUSSAENDA SANDERIANA: FLOWERS YELLOW, WITH WHITE, PETALOID SEPALS.

sorts were damaged by frost when in flower. Peaches and Nectarines were extremely few, and there was only half a crop of Apricots. *J. MacCormack, Maesllwch Castle Gardens, Glasbury.*

—— The fruit crops generally are disappointing. The scarcity of Apples is no doubt owing to the very heavy crop of last year and also to a severe hailstorm the like of which was never witnessed here before. The weather in spring was cold, and the greater part of the Plum crop was ruined. Black Currant bushes are badly affected with blight, notwithstanding spraying was practised. *Wilson Palliser, Norton Manor Gardens, Norton.*

IRELAND.

KING'S CO.—All fruit trees gave great promise in the blossoming season, but owing no doubt to the drought of March and April and the cold winds in May, accompanied by thunder and heavy rains, the good promise was not realised.

WESTMEATH.—Low temperatures and drought during April and May are the chief causes of the poor fruit crops in this locality. The frequent rains during the month of June caused many of our Strawberries to rot. Our soil, which rests principally on clay, ranges from heavy to medium texture, and is rather shallow in places. *Geo. Bogie, Pakenham Hall Gardens, Castlepollard.*

CORK.—It was a splendid season up to the middle of May, when severe frosts did much injury to Apples and Pears, particularly the latter. The codlin moth is very prevalent here, numbers of Apples falling prematurely from this cause. Cold, south-westerly winds early in June were most destructive to Apple orchards exposed to the south or west. Numbers of trees are badly blighted. *M. Colbert, Aghern, Conna.*

KILDARE.—With the exception of Black Currants, we had heavy crops of good fruits. Even Apricots required some thinning, Raspberries and Gooseberries were much over the average, but Black Currants were a total failure, due to a frost which occurred on May 13. Strawberries also suffered from the same frost, and at a later period many of the berries rotted from excessive wet. The subsoil is a cold, retentive clay. *Fredk. Bedford, Straffan House Gardens.*

WATERFORD.—The favourable spring has ensured a very abundant crop of most fruits, notably Apples and Pears, which have not been better for the past 12 years. Plums are very plentiful and good, which is rather unusual in our low-lying valley. All fruit trees are making good growth. The gardens are situated at an altitude of 95 feet above sea-level. The soil is of a poor quality, and rests on a retentive clay. *D. Crombie, Curraghmore Gardens, Portlaw.*

CHANNEL ISLANDS.

GUERNSEY.—The fruit crops are rather disappointing, although the prospects were good at one time. Unfortunately, when the trees were well in bloom, heavy rains and cold winds prevailed, with the result that Pears, Plums and Cherries are not plentiful. *C. Smith & Son, Caledonia Nursery.*

JERSEY.—The fruit crops are, on the whole, fairly good. The failure of Plums, Peaches and Apricots was due to the very dry and hot weather of April, which caused the fruits to drop. Pears also dropped freely, but a fair crop remains. Apples, being later in setting, did not suffer so much. *Thomas Sharman, Imperial Nursery, St. Heliers.*

SCOTLAND.

THE DEVELOPMENT COMMISSIONERS AND SCOTTISH FORESTRY.

THE second Report of the Development Commissioners gives important information regarding the aid the Commissioners have granted towards the teaching of forestry in Scotland. The Commissioners agreed to give a grant, not to exceed £2,000, to be spread over five years, in aid of forestry instruction in connection with the University of Edinburgh, to be expended in the provision and maintenance of a forest garden, this to be for the use of the University students and for those of the Edinburgh and East of Scotland College of Agriculture. At the same time, an indication was given that consideration would be extended to proposals for further work when a definite agreement had been made between the two bodies having the use of the forest garden. The Commissioners agreed to give an additional grant of £9,000 for new buildings, equipment, and salaries of lecturer and demonstrators. In a further reference to the subject, it is stated that the Agriculture (Scotland) Fund, which was established subsequent to the Development Fund, is applicable to several of the subjects, such as forestry, to which the latter can be applied. The Commissioners think that, as a matter of principle, the demands of Scottish forestry and agriculture should be met from the Scottish Fund, as far as possible. *Correspondent.*

MUSSAENDA SANDERIANA.

THIS new species was first described in *Gard. Chron.*, July 17, 1909, p. 34, by Mr. H. N. Ridley, of Singapore, who states that in its natural habitat the plant grows about 5 feet or 6 feet high, but is often prostrate on the ground. Mussaenda Sanderiana (see fig. 101) was introduced by Messrs. Sander & Sons, St. Albans, from the Eastern Tropics through their collector, Mr. W. Micholitz. The attraction of the plant lies in the white, petaloid sepals, which are borne by one flower out of every three. The plant flowers when about a foot high, and continues to produce blossoms as the growths are completed. The flowers, apart from the petaloid sepals already mentioned, are inconspicuous, being yellowish in colour. The plant requires a stove temperature and an abundance of light. It grows well in a mixture of equal parts loam and peat, with a liberal admixture of sand. It forms a fine companion to the scarlet-crimson Mussaenda erythrophylla.

ECHINOCACTUS MYRIOSTIGMA.

Echinocactus myriostigma (see fig. 103) is in many ways a remarkable plant. Belonging to a genus rich in every conceivable form of spines, it and its neighbour E. Asterias are perfectly spineless, except for a few small, brown setæ mixed with woolly hairs which surround the flowers at their first appearance.

The form of the stem, too, is unusual, and composed of five or six high ridges, so that a transverse section would resemble the outline of a starfish. When originally described by Lemaire, this peculiarity led him to give the name Astrophytum to what he considered a distinct genus.

The whole of the surface of these ridges is beautifully freckled with brilliantly white spots, which upon examination under a strong lens are found to be tufts of very fine hairs densely interwoven. At a little distance these spots give the plant a silvery-grey appearance, more like that of some stone carving than of a living plant.

The flowers are straw-coloured, and my plant flowers thrice in each season, bearing only one flower at a time. The sepals are unicolorous, but the sepals are tipped with purplish-black and end in a distinct mucro of the same colour. The plant illustrated in fig. 103 is young, and measures only 3½ inches in height, but older specimens grow to a foot or more. This species requires the protection of a warm greenhouse or stove. When I first had the plant it was kept in an ordinary greenhouse and it scarcely increased for a year or two, but after its removal to a sunny shelf in the stove it developed rapidly. It is a native of a district called Moran, in Mexico, and was introduced to Europe by M. Galeottii, and was first flowered at Havre by the late M. Courant. There is a good figure of it in Schumann's *Blühende Kakteen*, t. 110, and a less satisfactory one in the *Botanical Magazine*, vol. lxxi., t. 4177. *E. A. Bowles.*

DENDROBIUM SCHÜTZEI.

Amongst the numerous Orchids exhibited at the last meeting of the Royal Horticultural Society none attracted such attention as the magnificent new species of Dendrobium from the Philippines (see fig. 102), and the Orchid Committee conferred the highest distinction in a First-class Certificate. The flowers have much the appearance of D. formosum giganteum, and in growth also the plant resembles this older species. It grows about 9 inches or 1 foot high; the flowers are shown in the figure natural size. They are white, with a small emerald-green disc to the lip, which has a ray of the same colour, with dark spots at the base. The plant was shown by Messrs. Sander & Sons, who introduced the species to cultivation.

Fig. 103.—Echinocactus (Astrophytum) myriostigma: flowers straw-coloured.

NOTICES OF BOOKS.

French Gardeners in London.

We have received the *Bulletin** of the Society of French Gardeners in London. It is in the form of a double number, on account of the indisposition last year of the society's president, Mr. Geo. Schneider. In form and size the *Bulletin* does not differ materially from its predecessors, and the contents are arranged in much the same order. The record of the society's work for the past two years occupies 181 pages, and the *Bulletin* is neatly and clearly printed in good type. There are no illustrations save a portrait of Mr. H. B. May, which is given as the frontispiece, and of whom some appreciative remarks appear from the pen of Mr. Schneider. The literary matter is of peculiar interest to the members, especially those who are no longer able to take active part in the society's work on account of remoteness, for many of the members have either returned to France or have been called upon to fill posts in other parts of the world. At the monthly meetings papers are read on subjects of horticultural interest, and some of these are reproduced *in extenso*. The purely routine matter consists of the society's rules, lists of members, reports of monthly meetings, balance-sheet, library catalogue, and other matter of interest to members. There are also full reports of the society's annual dinners at the Café Royal in 1911 and 1912.

(Received R.H.S. First-class Certificate on the 10th inst.)

The Week's Work.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

PLANTING CARNATION LAYERS. — If the work has not been commenced already no time should be lost before preparing the beds and borders for the reception of rooted layers of border Carnations. The ground should be trenched deeply; no animal manure should be incorporated with the soil, but if the latter is of poor quality, some good loam, or, failing this, a quantity of old soil from the potting shed, should be mixed with the top spit. When the trenching is finished, a layer of wood ashes and burnt earth should be spread over the surface, forking the materials lightly in, and making the ground firm again before planting. In most instances the layers are well rooted, and early planting on warm, well-drained soils is undoubtedly the best method of culture. If the soil is of a heavy, retentive nature many of the plants may die during the winter. In such cases it is better to pot the layers, or winter them in shallow boxes. If autumn planting is practised, a sufficient number of the layers should be reserved and potted, in order to fill up any blanks in the borders in the spring, as there are marked differences in the constitutions of the different varieties. If experience has taught that wintering the layers in pots and boxes under glass is the better plan for the district, the plants should be taken up when well rooted and placed in ordinary cutting boxes. Where large numbers of Carnations are grown, boxes, being more convenient to handle, are recommended in preference to pots. The compost may consist of three parts loam to one part of leaf-mould, and plenty of sand. The roots will grow freely in the new soil, and the plants will be in a condition for making a good start when set out in the spring. The layers should be shaded for a few days until they recover from the check caused by removal. Later they may be placed in full sunshine out-of-doors on a bed of ashes for as long as fine weather lasts. On the approach of bad weather, they should be placed in cold frames, where they can be protected from heavy rains. Draw the lights off on all favourable occasions, and ventilate freely even when the lights have to be placed on the frames in consequence of heavy rains. A moderate frost will not harm the plants, but rather will be beneficial, inasmuch as the layers being made the more hardy may be put out in their permanent quarters early in the spring.

CEANOTHUS.—The Ceanothus is one of the most beautiful of autumn-flowering shrubs, and there are numerous varieties, of which Gloire de Versailles is still one of the best. This variety is quite hardy in this district, and will grow in almost any position. In colder localities it is often planted against warm walls, where it thrives exceedingly and produces a charming effect. But the plant is seen at its best when grown in a clump or group in a large bed on the lawn, especially when planted thinly in bush form over a carpet of some other suitable flowering plant. Specimens grown in pots may be planted at almost any season, but the next few weeks is probably the very best time in the whole year in which to plant them. Select young, healthy specimens, as these start most kindly into growth. The ground may be trenched deeply, mixing in plenty of rich manure; if of poor quality, some good loam should be placed around the roots of the trees when planting, which should be done firmly. Secure the shoots to stout stakes directly the planting is finished. Young, healthy plants should be pruned hard in the following spring, and in the following years, to an inch or two above the previous place of pruning. The plants will flower splendidly and continuously under this treatment. Specimens in these gardens that were flowering well in July are still objects of great beauty, and will continue in bloom for some weeks to come.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

CARROTS.—Young Carrots, even though not longer than one's finger, are much esteemed as a vegetable, and, provided there is sufficient accommodation for growing them, there is no reason why a supply of roots should not be maintained throughout the year. Varieties of the stump-rooted kind do best at this season, Inimitable being one of the best sorts, as it makes but little top growth, and matures quickly. Seeds sown now, either in frames or cold pits, will furnish good Carrots throughout the winter months. Roots that are large enough may be lifted and stored in sand, in which material they will keep good for some considerable time.

CUCUMBERS.—As the season advances more fire-heat will be necessary to keep the plants growing healthily. The atmosphere should always be kept moist, but discontinue syringing plants that are bearing fruit. Avoid over-cropping, and watch for the first traces of mildew, which should be checked as soon as detected.

CELERY.—In these gardens the foliage of Celery is wonderfully free from attacks of the Celery-fly grub, the plants having been dusted frequently with soot, which is an excellent preventive of this pest. The earthing-up of the later batches requires attention. The day previous to doing this work the roots should receive a good soaking with water. Choose fine weather for the work, so that the foliage may be quite dry, otherwise the stalks may decay later. Before commencing to place the earth about the stems, examine the plants with a view to removing any split or otherwise damaged leaves, also side growths. Stretch lines on either side of the trench tightly, cut down the soil with a spade, break the particles of earth with a fork, and then place the soil around the stems. The work is best done by three men if they can be spared, one on either side to dig and break the soil, the other, walking backwards, to place it in position. The blanching should be done at intervals, and, in the case of the later batches, should not be carried out too early, as the stems are much hardier when they are green. A period of from six to eight weeks is required for blanching, the older plants requiring an even longer period. Plants of the earlier batches that were blanched with brown paper as recommended have furnished excellent Celery of good quality. Celery required for exhibition purposes should be examined occasionally to see that it is in good order.

GLOBE ARTICHOKES.—In warm districts these plants will probably continue in bearing during the present month. Keep the plants as tidy as possible, and when they are injured by frost cut the growths to the ground level. Suckers should be taken off early for purposes of stock, and potted into 7-inch or 8-inch pots. They may be wintered into a cold frame, very freely ventilated. These plants will be useful for forming fresh beds in the spring, when the older plants may be discarded. The newer varieties are great improvements on the older sorts.

SEAKALE.—These plants should be kept free from weeds and decaying foliage. Stir the soil about them with the hoe, and cut out the flowering stems as soon as they appear.

TURNIPS.—Turnips have done well this season, and if the stock exceeds the demand the surplus roots may be lifted and stored before they become too large. Thin the seedlings of later sowings, and stir the ground frequently with the hoe. There is still time to make further sowings.

BEETROOT.—The main crop of Beetroot needs more careful attention and lifting than the earlier Globe varieties, in order that the roots may keep well. Avoid bruising or breaking the latter, especially the tap roots, otherwise the Beets will be of an inferior colour when cooked. The outer leaves should be rubbed off when the plants are lifted. The roots should be stored in a cool shed, in fine soil, arranging them in layers. They should be kept moist and covered with straw during the winter. Beetroots for exhibition purposes should be of a moderate size, smooth of skin, of good shape, and tapering evenly. The rootlets should be trimmed off and the roots well washed before being placed on the exhibition stage, with the tips extending towards the face of the exhibit.

SEAKALE BEET.—This vegetable is not largely cultivated, but it is a very ornamental plant, and should be grown in gardens where there is plenty of space. The plants are now at their best condition, and the outer leaves may be pulled and sent to the kitchen. The mid-ribs are treated in the same way as Asparagus, the rest of the leaf being cooked like Spinach; hence the name Seakale or Spinach Beet.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

HOUSING PLANTS.—If time permits, all glass-houses that are to be used for wintering plants should have a thorough cleansing and the walls be limewashed, so that everything will be clean before the plants are brought indoors. Before housing winter-flowering Carnations the plants should be tied carefully to neat stakes and sprayed thoroughly or dipped in a solution of sulphide of potassium (½ ounce to each gallon of water). Besides being an efficient fungicide, this specific also helps to keep the plants free from red spider. Zonal Pelargoniums intended for winter-blooming should also be placed indoors. The rainy weather has caused the plants to make very sappy growth, but a week or two in a good airy house, with proper care in watering, will soon change this condition. Salvias also should be housed, but plants required for very late flowering may be placed under a temporary shelter to shield them from the rains, putting them in the plant-houses after an earlier batch has finished flowering. Salvias planted out in the open ground should be lifted and potted, and such subjects as Bouvardias, Libonias, and Solanums. In the event of warm weather after the plants are lifted it may be necessary to spray them overhead and keep them in a closed atmosphere for a few days, to prevent them from flagging and to encourage fresh root action. When it is safe to do so the plants should be exposed to all the air possible with a view to hardening the growth, which this season is unusually sappy.

CHRYSANTHEMUMS. — By this time all disbudding should be finished in the case of the large flowering varieties. The plants should receive a little artificial manure about every ten days, either in the water or sprinkled on the surface of the soil during showery weather. A few of the very early plants of such varieties as White Queen and Mrs. A. T. Miller that may be showing colour should be housed at once. Also such early-flowering varieties as those of the Mme. Marie Massee family, Perle Chatillonaise, Carrie, Polly, and Hector. Well-furnished pots of these varieties are very useful for the decoration of the conservatory or the dwelling house. During late September and October, even after housing, these plants should be given a dressing of artificial manure.

SCHIZANTHUS, MIGNONETTE AND CLARKIA. —The last autumn batch of these beautiful spring-flowering annuals should be sown at once, the two former plants in 60 size pots, from which the seedlings may be transferred into larger receptacles as soon as they require more room. The Clarkias may be sown in boxes or pans, pricking them off when about an inch high, either into boxes at about 2 inches apart or singly into 60 size pots. A cool frame is the best place to raise these plants, transferring them to a shelf near the glass in a greenhouse as the autumn advances.

NERINE.—Plants that have been turned on their sides during the past month or two to keep the soil in the pots dry should be placed in a light house before the flower spikes commence to form. Water will not be necessary until the spikes are a fair size, when the roots should receive just sufficient moisture to keep them damp. Nerines require very little water as compared with most bulbous plants.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to SIR JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

RIPENING OF THE GROWTHS.—Owing to the unfavourable summer the growths of most tropical Orchids are much softer in texture than usual. Every effort should be made to induce the thorough ripening of the growths and pseudo-bulbs of plants in the East Indian, Cattleya and Mexican houses.

SHADING.—It is impossible to give precise directions at this season on the subject of shading, for much depends on the kind of plant. In any case the reduction should be gradual, the object being to cause the foliage to become hardened, so that little shading will be necessary after the end of the present month. If, in addition to blinds, shading has been provided by stippling the glass with flour and water or other substance, the glass should be washed thoroughly as well as the woodwork. Previous to commencing the work stop up the pipes leading into the tanks to prevent any sediment passing in with the rain water. The permanent blinds should still be retained in position, as shading may be necessary during bright days, but they must be used with discretion; the plants should be exposed to all the light available whenever this is possible without causing damage by scorching.

ATMOSPHERIC MOISTURE.—The amount of moisture in the atmosphere must be regulated with extra care until after fire-heat is more extensively employed. The cooler houses will require damping the least, because there will be less evaporation in these structures. In the warmer houses sufficient atmospheric moisture must be promoted to counteract the effects of fire-heat. The East Indian, Cattleya and Mexican houses will require to be damped on mornings and afternoons, while the intermediate and cool houses in which very little fire-heat is employed at present should be damped only in the mornings, except on bright days, when the paths and stages should be sprinkled in the afternoon.

WATERING.—The watering of the plants must be regulated according to their various stages of development. Those with pseudo-bulbs nearly completed should receive a gradually diminishing supply, but water must not be withheld to such an extent as to cause shrivelling. Plants that are completing their growths should still be afforded an adequate supply of moisture. As the nights become colder it will be necessary to provide extra fire-heat; on warm days the ventilators should be opened slightly to prevent scorching, but retaining as much sun heat as is practicable. The cool, damp summer has suited Odontoglossums, and the majority of the plants are developing vigorous growths. The ventilation of the house in which they are grown should be done very carefully at this season, air being admitted through the bottom ventilators at all times, regulating the degree in accordance with the outside temperature. During warm nights the top ventilators may be opened slightly to admit the autumn dews that are very beneficial to Odontoglossums, especially those that have been freshly potted.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

LATE GRAPES.—Late Grapes can usually be ripened without the aid of much artificial heat, but this dull and cold season it has been necessary to keep the water pipes warm during the day and night. Even now late Grapes are much later than usual, and they will need every assistance to get the bunches perfectly finished by the end of the season. The temperature must be kept at a minimum of 60°, although there must be no excessive use of artificial heat, as this would probably cause the bunches to finish badly. The house should be ventilated with great care so as to keep the temperature as equable as possible, but it is necessary to have a circulation of air at all times, more or less according to the conditions prevailing out-of-doors. Laterals should be removed as they appear and a sharp look-out kept for mealy bug. The bunches must be protected from wasps by covering the ventilators of the house with hexagon netting. If the borders are confined inside the house the roots will need considerable water until the crop is ripe. Choose a fine morning for watering, when the ventilators can be thrown wide open, and see that the temperature of the water is not lower than 60°. Outside borders must be protected from heavy rains. Any mulching materials which may have been placed on them early in the season should be removed and the surface of the borders lightly pricked up with a fork. Remove the covering during fine weather so that the borders may get exposure to sunshine and air.

MID-SEASON VINES.—It will be safe now to prune away much of the growth from Vines that have yielded fruit. This will expose the remaining wood to the sunshine and help to plump up the buds at the base of the shoots. Healthy vines which have carried heavy crops of Grapes may be given a soaking of manure water from the farmyard before the leaves fall. Vines which are in need of renovation may be treated any time after this date. Any additions to the borders of young vines should be carried out at this time of year.

YOUNG VINES.—Vines which were planted in permanent borders last spring have made good progress, and the chief consideration is now to get the wood thoroughly ripened by the end of the season. Maintain a free passage of air through the house at all times, and should there be any doubt as to the canes becoming well matured keep the water pipes slightly warmed. Syringing may now be discontinued, and less moisture thrown about the house. The roots will not need so much water as formerly, but they must not be allowed to get dry.

MELONS.—These plants will require more attention to cultural details now than is the case earlier in the season. Plants carrying fruits approaching the ripening stage will need a minimum temperature of 70°. The plants require very careful watering, and stimulants must not be used so freely as hitherto, whilst syringing may be discontinued and the walls and paths in the house damped occasionally instead. When the fruits commence to ripen the water supply must be decreased gradually. The atmosphere must also be kept quite dry, leaving the top ventilators open just a little day and night.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

LIFTING AND ROOT-PRUNING.—I have always emphasised the importance of checking gross growth by root restriction; but it is possible to carry the operation to excess, whilst the removal of nearly all the roots from young trees completely ruins the plants. Where space allows, young trees on the Paradise stock rarely require to be lifted more than once or twice, and this operation is performed more for the purpose of placing the roots that are growing in a downward direction to a more horizontal position than to check or retard their growth. In the cases of bush and low, pyramidal trees, lifting is the best operation, as the roots can be examined readily, and laid out regularly to within a short distance of the surface. In many instances the application of a rich top-dressing is more beneficial than root-pruning, especially in the case of older trees. Large trees should be root-pruned rather than lifted, whenever such operation is considered necessary. The work is best done as early in October as circumstances permit, while the trees still retain their foliage, so that advantage is taken of some slight root-action before the fall of the leaf. Loam of a medium nature is generally all that is necessary for mixing in the trench, but road scrapings, burnt refuse, lime rubble, and similar materials may be used with advantage. Here, again, the work may be much facilitated by the preparation of the compost in advance and storing it in a dry place. These operations may now be undertaken in the case of Peaches and Nectarines on walls. Commence by taking out a trench 2 or 4 feet distance from the tree, according to the size of the latter. Remove the soil towards the stem as far as is considered necessary, and sever with a clean cut any roots that are found growing in a downward direction. Trim any roots that have become damaged with the fork, and see that none of them cross each other. In filling in the trench, use a moderate quantity of fresh compost mixed with fine chalk or a dusting of fresh lime if the ground is deficient in this constituent. In the case of old trees growing in unsuitable soil, it is advisable to use all fresh compost. Place the roots near to the surface and tread the soil firmly. Apricots have a bad reputation through the branches dying back, but this is often because the roots are growing in too rich soil. Every effort should be made to favour a moderate growth by careful root pruning, and affording a porous compost. Young trees should be lifted with a ball of soil attached to the roots in proportion to the size of the tree. Trim the ends of all damaged roots, and, when the plant is placed in position again, arrange the roots near to the surface. When the work is completed, give the soil a good watering if it is dry, and syringe the branches occasionally if the weather is sunny. Opinions differ as to the best depth of soil for fruit tree borders; many maintain that 2 or 3 feet is necessary. But the soil, sub-soil and situation must be taken into account. Dwarf trees will grow in shallow ground if they are well cared for and the roots suitably mulched. In cold, heavy soils, it is better to plant on hillocks or ridges. Even then root pruning on one or two occasions during the early stages of the tree is necessary. In gardens where trees are grown extensively on walls, it is a good plan to purchase a few maiden trees annually to make good any failures that occur. If trees of suitable sizes and shapes are available the spaces may be furnished at once and the trees will grow away with very little check.

STRAWBERRIES.—The plants should be examined once more and all runners removed. The surface soil between the rows should be loosened with the hoe preparatory to placing a mulch of half-decayed manure over the roots. Mulches are best applied now as the autumn rains wash the manurial properties down to the roots. The litter also protects the crowns and foliage from injury during times of severe frost.

THE APIARY.

By CHLORIS.

THE CARE OF HIVES IN AUTUMN.—Much is often said about thoroughly cleansing and overhauling the hives in spring, but few bee-keepers ever dream of doing the same needful work in the autumn. This autumn cleansing should be carried out as soon as possible, choosing fine weather for the work. Thoroughly examine the colonies to ascertain if there is sufficient food sealed, and, if not, rectify the matter without delay, for at the latest we can only feed on syrup until the middle of October; but, if the weather remain cold, syrup feeding will have to cease much earlier. Having seen that the larder is well supplied, next give attention to the floorboard; if possible, supply a clean one, but, where this cannot be done, then thoroughly scrape away all the collected filth of the season. Those floorboards which are removed should be scraped and afterwards thoroughly washed in a carbolic solution and exposed to the air for a short period. From this it will be seen what a great advantage it is to have hives of one pattern and size throughout an apiary, for one or two spare parts are sufficient to put a fair number of hives in a sanitary condition. Next see to the quilts, which should be clean, fitting exactly into the corners and covering all the frames. It will be a great advantage and save much bee life if passages are left, and these may be secured by laying a few sticks about half an inch thick on the top of the frames. Over the ordinary quilts it is wise to make cushions of some good, non-conducting material, which need not cause any great expense, because corkdust, sawdust, shavings or leaves will serve admirably, but whatever material is chosen, the cushion cover must be packed loosely. The roof should be closely examined, because the bad summer has tried the roofs of even well-made hives. All leakages should be stopped, first rubbing in some paint, and, when dry, filling in firmly with putty. To make doubly sure, some old calico may be tightly stretched across and tacked to the edges of the roof by means of thin laths, and then painted several times.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 23—
Nat. Chrys. Soc. Floral and Executive Coms. meet.

TUESDAY, SEPTEMBER 24—Royal Hort. Soc. Coms. meet Vegetable Sh. at R.H.S. Hall. (Lecture by Mr. C. Hermann Senn on "How to Cook Some of the Root Vegetables.")

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—55·2.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, September 18* (6 P.M.): Max. 62°; Min. 47°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September 19* (10 A.M.): Bar. 30·2°: Temp. 56°; *Weather*—Fair.
PROVINCES.—*Wednesday, September 18:* Max. 59° Ireland N.W.; Min. 52° Shields.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10·30.

MONDAY, WEDNESDAY AND THURSDAY—
Sale of Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

WEDNESDAY—
Trade Sale of Bulbs, &c., at 1; Palms and Plants, at 4; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

The Origin of Life.

It was the result of a curious coincidence that the subject of the origin of life loomed so large at the Dundee meeting of the British Association. The president, Professor Schäfer, elected to treat of it in his address, and the zoologists and botanists, ignorant of Professor Schäfer's intention, agreed to hold a joint discussion of this matter. There are many who will incline to the opinion that a discussion on such a complex and baffling subject must be futile, and those who hold this view will point to the negative results which ensued from the debate.

This opinion, however, we do not share, and we think that, although the riddle of the universe—this origin of life—is as yet unread, it is useful for men of science who have expert knowledge of the recent advances made by biology, to endeavour to ascertain how these advances bear on the larger problems which vex the minds not only of scientists but of all thinking men. For another reason also we welcome this discussion. In olden times, before the advent of experiment as the instrument of scientific discovery, such a discussion could not, by the nature of the case, rest on any sound basis of discovered fact; it could only rest on the bosom of nothing. Now, if the discussion is to have any lasting influence on opinion or belief, it must be based on ascertained facts of life.

Let us, therefore, consider what are the facts brought forward by those who incline to the opinion that life originated automatically from non-living matter. The essential ideas put forward by the exponents of this view would seem to be as follow:—The evidence for the evolution of the higher forms of life from lower forms is, although not conclusive, very strong indeed: so strong, that it might almost be said of biologists that they are all evolutionists nowadays. The evolutionary hypothesis accepted, it would seem, at first sight, reasonable to extend that hypothesis to its logical conclusion, and to hold that the simplest forms of life had their origin in non-living matter.

A great difficulty, however, lies in the path of those who do thus extend the evolutionary hypothesis. The simplest forms of life with which we are at present acquainted are extraordinarily complex. Anatomically they may appear to be very simple, a semi-fluid mass of protoplasm in which but little structure is manifested; but these simplest forms of life are, physiologically, extremely complicated. They possess the powers of assimilation, of growth, of movement. They react by precise and purposeful methods to the various factors of their environment; in other words, they exhibit the most remarkable attribute of living things, that of sensitiveness. Such rudimentary forms of life are able to manufacture various kinds of complex agents—enzymes—which severally carry out in the cell the chemical changes which accompany life. Some of these changes are antagonistic to others, yet the simple cell controls them all in the interests of the organism.

Therefore, the advocates of a terrestrial origin of life are driven almost necessarily to imagine the existence of forms of life of a much lower order than that to which amœbæ and the like belong. Nor are they unjustified in making this assumption, for modern discovery has demonstrated the existence of organisms too small to be seen by the microscope and so minute that they are capable of passing through a Pasteur-Chamberland filter. Thus the organism responsible for the mosaic disease of Tobacco belongs to this class of infra-microscopic beings. Hence it is tempting to suppose that the simplest organism consisting of a single cell or mass of protoplasm is a complex body, formed by the aggregation of large numbers of infra-microscopic organisms, and those who take this view suggest that, by the coming together into a symbiosis of such minute living particles the simplest living organism, as we know, came into being.

Fascinating as this speculation is, it must be scrutinised more closely before it may be accepted. We must ask what evidence is there that the infra-microscopic organisms are less complex physiologically than those of larger size? Do they live, as it were, only a partial life and not the full life of the larger single cell? If their life is as complex as that of the amœba, then the existence of the infra-microscopic organism helps us nothing, for such organisms do nothing to bridge the gulf between the living and the dead. If it is less complex, then it behoves those who use the argument under consideration to show us wherein their simplicity lies. Are they incapable of assimilation, of growth, of movement, or of the manifestation of sensitiveness? So far as we are aware, this fundamental question has not been answered, and until an answer is forthcoming, the conception of the life of a unicellular organism, as the expression of the assembled activities of constituent symbionts, must remain but an interesting speculation. Even though the hypothesis were accepted, it would still remain to ask by what process are these constituent contributory infra-organisms assembled? How did they "live" alone, and how did they come together? These are problems which the advocates of a terrestrial origin must solve before this hypothesis may be regarded as a scientific theory.

To attempt to sum up justly the various theories which have been put forward to account for the origin of life would be almost as difficult as to attempt to define life itself. The manifestations of life are so complex that it is impossible to say whether the living substance is a chemical compound or mixture of such compounds, whether the living cell is to be likened to a cunningly-contrived piece of mechanism, which was created as such or "made itself," or arose out of a chance or designed meeting of contributory and complementary units of a lower order, or whether the living cell is best likened to a factory, in which are various apparatuses for the carrying on of different and often contradictory processes. If it is impossible to picture an image of life, it is yet more impossible to conceive of its origin. That all living organisms work in obedience to chemical and physical laws appears to be incontrovertible; but this by no means supplies an argument for the chance origin of life from dead matter. Nevertheless, we hold, as stated at the outset, that discussion on this high subject is right and useful. It diverts us from the smaller matters of the daily routine, it chastens us in our contemplation of achievement, and it brings to bear on the problem which now seems beyond solution facts which some day may enable us to say with the soothsayer: "In Nature's infinite secrecy a little can I read."

SUPPLEMENTARY ILLUSTRATION.—Blush Rambler is certainly one of the best of the rambling Roses, for in addition to its beautiful and abundant trusses of flowers the plant is a vigorous grower, and soon covers a pillar or archway with growth. The specimens shown in the Supplementary Illustration were raised from cuttings, a method of increasing this class of Rose which is comparatively easy. Mr. TAYLOR, to whom we are indebted for the photograph, informs us that he planted two specimens, each not more than 1 foot high, in April, 1910. The trellis work is 7 feet high, and 1 foot 6 inches wide, and it is now completely covered with the Roses. During the past season the plants produced no fewer than 375 trusses of flowers, and many of the inflorescences were 11 inches in diameter. The colour of the flowers is indicated in the name. The variety was first distributed in 1903 by Messrs. B. R. CANT & SONS.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on the 24th inst. in the Society's Hall, Vincent Square. At the 3 o'clock meeting in the Lecture Room, Mr. C. HERMANN SENN will give an address on "How to Cook some of the Root Vegetables."

THE NATIONAL SWEET PEA SOCIETY will hold its London exhibition of 1913 at the Royal Horticultural Hall, Westminster, on July 17. It is hoped that a northern provincial exhibition may be arranged for the second week of August, 1913. The Society's annual meeting will be held this year on October 17 at the Hotel Windsor, Victoria Street, Westminster, and the business meeting will be followed by a conference.

PRESENTATION TO A SEEDSMAN. — Mr. JAMES BRAND, manager of Messrs. ARTHUR S. RITCHIE & Co., Belfast, will shortly proceed to Canada, where he intends to commence business on his own account. As a token of the high esteem in which he is held, Mr. BRAND was entertained at dinner on the 9th inst. by the members of the staff and a few friends, who made him a suitable presentation and expressed their best wishes for his success in Canada.

BEQUEST TO BOTANY.—The South London Botanical Institute at Herne Hill will benefit considerably under the will of Mr. ALLAN OCTAVIAN HUME, who left the sum of £15,000 to be spent on the advancement of the study of botany in South London. The South London Botanical Institute, writes a correspondent, was incorporated in July, 1911, and a series of public lectures explaining the work of the institute is about to be given. The institute has 40,000 botanical specimens mounted and enclosed in black japanned cases. It is hoped to acquire two acres of land, and to lay out a landscape garden and a water garden.

VISIT OF MR. EDWARD WHITE TO CANADA AND SWEDEN.—Mr. EDWARD WHITE has just returned from a visit to Canada and Sweden. He had been invited by the Canadian Government to advise them on the arrangement of departmental buildings at Ottawa about to be erected on an area of about 30 acres of land occupied at present by houses and streets. The site is on the cliff overhanging the Ottawa River and adjoining the Parliament buildings, and there is a sheer drop of nearly 200 feet to the river. The Government intend to make the buildings in every sense worthy of Canada. Mr. WHITE'S visit to Sweden was undertaken for the purpose of advising the authorities on the plans for restoring and improving the gardens of the Royal palaces at Stockholm and Drottningholm. The latter place is the "Windsor Castle" of Sweden, and it occupies a splendid position. Mr. WHITE may be congratulated on having accomplished in five weeks a journey attended with so much important work.

RAILWAY STATION GARDENS.—The directors of the Glasgow and South-Western Railway Company have decided to increase the total amount offered in prizes for the best-kept gardens at stations on their line, from £100 to £150, and they announce that in future there will be 47 prizes in five classes, the amounts ranging from £5 in the first class to £1 in the fifth. This year 30 prizes have been awarded. Of these six are in the first class, and the stations and station-masters are: Dalbeattie, Mr. W. B. KIRKPATRICK; Ruthwell, Mr. JAS. BARR; Dalrymple, Mr. ROBERT FISHER; Dalmellington, Mr. WILLIAM TAYLOR; Carronbridge, Mr. JOHN RAE; Moniaive, Mr. GEORGE MACDONALD.

CULINARY PEAS AS PILLS.—With an ingenuity worthy of a better cause a man at Portsmouth has coated ordinary Peas and sold them as "tasteless kidney and liver pills." The police stated that when subjected to the warm temperature of the propagating house in the local park the "pill" grew.

ERNEST CALVAT.—The memorial subscribed for by Chrysanthemum growers all over the world, has now been erected on the tomb of the great French Chrysanthemum raiser in the cemetery at Grenoble where he lived. The French Chrysanthemum Society was represented by several of its members on the occasion of the inauguration of the monument, M. PH. RIVOIRE making a suitable speech. M. CALVAT'S son-in-law replied on behalf of the family. Only a few members of the family and representatives of the horticultural societies to which CALVAT belonged were present.

AGRICULTURAL EDUCATION IN CANADA.—Agricultural Colleges have been established at various points in the Dominion. One of those most recently established is that at Winnipeg, under the auspices of the provincial Government of Manitoba. The president of this college, Professor W. J. BLACK, is now on a short visit to Great Britain, and, while here, will study the emigration problem, more particularly in connection with its relation to his work at the Agricultural College. In the course of an interview Professor BLACK gave a very interesting account of the work of his college. This latter has only been in existence six years, yet in that time its work has grown to such an extent as to make the buildings originally erected quite inadequate to meet present demands. Consequently the Manitoba Government is spending a large sum of money on the erection of an entirely new set of buildings, which will be available towards the close of the present year. The college course is very comprehensive and extends over two winter sessions of five months each, and is designed to meet the requirements of the young farmer. A condition of entrance is that the students should have worked for at least two years on a farm. A young man who has worked on a British farm for two years may, without any further period of farm work, enter the college immediately on his arrival in Canada, and Professor BLACK will be glad to correspond with parents and others who are interested with a view to making arrangements for the reception of students on their arrival in Western Canada. Information regarding the college can be obtained from the Dominion Government Emigration Offices in Great Britain, or Professor BLACK may be addressed directly at Winnipeg.

TOBACCO CULTIVATION IN HAMPSHIRE.—On behalf of the Development Commissioners, Lord BASIL BLACKWOOD has written to Mr. A. J. BRANDON, of Redfields, Church Crookham, Hampshire, a letter, in which he states:—"It is very improbable that the rebate will be continued in future years, but the Commissioners will be prepared to help approved growers to make a start. It is obviously desirable that the tobacco grown should be concentrated, so far as possible, at various centres. If 40 or 50 acres can be grown in one district the Commissioners will give the growers every assistance." A later letter reaffirmed that the rebate would not be continued, but said that the Commissioners were still considering the matter, and seemed most anxious to render assistance from the Development Fund. It was, however, unlikely that such aid would take the form of direct subsidy, but would rather help to form re-handling associations to buy the tobacco from the farmer on reasonable terms, and to prepare it for the market. *Times.*

A ROSE NUMBER.—Our Paris contemporary *La Vie à la Campagne*, in one of its recent issues, devotes considerable attention to Roses. The number is enclosed in a pretty cover having a reproduction in colour of one of REDOUTE'S paintings. Several others from the same artist appear in the issue, besides about 130 illustrations of Rose gardens, views, and designs connected with Rose culture. Besides dealing with French Rosaries, such as the gardens at l'Hay and Bagatelle, the issue contains views and notes of Rose gardens at Downside, Aldenham House, Gatton Park, Hatfield, Knebworth, and other notable English gardens. There are numerous articles on many subjects relating to the flower.

INDIAN FOREST SERVICE.—The regulations for recruiting of probationers for the Indian Forest Service in 1913, show that the intention to lower the age limits has been so far modified that the limits will remain, for 1913, the same as hitherto, namely, 19 to 23 years on July 1, 1913.

HIGH-LEVEL PLANTS IN THE KARAKORAM.—Under the title *Relazione sulle Piante raccolte nel Karakoram*, Prof. R. PIROTTA and Dr. F. CORTESI have published a brief account of the botanical collection made by the Duke DEGLI ABRUZZI'S expedition. It is extracted from the larger work on the expedition, and is interesting as giving the details of localities at high levels. Charming photographs are given of Saxifraga imbricata, Sedum Rhodiola and Potentilla pumila as growing on the rocks at about 16,500 feet to 18,300 feet. The Saxifrage was found at the higher level, and all the plants were flourishing in these elevated stations and highly floriferous.

AGRICULTURAL RETURNS, 1912.—The preliminary statement of the agricultural returns for England and Wales collected in June last shows an increase in the arable area of 36,071 acres and a decrease in the area under permanent grass of 115,432 acres. The areas of each of the four corn crops were substantially increased: Wheat by 20,824 acres, or one per cent., Barley by 32,205 acres, or two per cent., Oats by 25,221 acres, or one per cent., and Rye by 13,860 acres, the latter representing over a third of the previous year's total. The area under Beans shows a reduction of 24,437 acres, but there was an increase under Peas of 34,250 acres. Potatos show an increase of almost eight per cent., the total now being 463,007 acres almost equal to the 464,208 acres returned in 1905. The largest decline in any arable crop was a drop of 51,715 acres under Turnips and Swedes. Other fodder crops show increases, some of them considerable, such as Mangolds (35,575 acres), Kohl-rabi (7,074 acres), and Vetches (27,072 acres). Flax again nearly doubled its area, and the total is now 830 acres. Hops have increased by 1,775 acres, or more than five per cent. Clover and rotation grasses show a material diminution, chiefly in those reserved for Hay. The permanent grass reserved for hay shows an increase of 110,497 acres, while that for grazing decreased by 225,929 acres.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

BLACK CURRANTS.—In your last issue, p. 206, *A Southern Grower* attributes the reversion of Black Currants to their having been propagated from a faulty stock, but I can assure him that such was not the case in the instance referred to in my previous letter; the cuttings were taken from trees grown specially for the purpose and carefully looked over every season to see if they are all right, also a careful examination of young stock shows only about one plant per thousand which has reverted. Why then do they "revert" later on? It would seem that *A Southern Grower's* trees are also given to this, in some measure at least, as he speaks of treading down those affected. What we want to learn is why this reversion takes place at all. I find one or two observers have seen it so long ago as 20 years, but they say it was quite rare then and only an odd plant was noticed. They all agree that it has increased very much of late years, but cannot suggest why this should be. I always read *Southern Grower's* communications with interest, but I must disagree with his assertion about sun being essential to the production of high colour in Apples; this season Apples are better coloured than usual, and from July 26 onwards for five weeks we had only one day's sunshine (in this locality), so that they must have coloured in spite of these adverse conditions. *A. H. Pearson.*

THE HISTORY OF THE JARGONELLE PEAR.—While I am not qualified to enter upon a philological discussion with the author of the above entitled article in your recent issue (see p. 198), I would venture to differ from him on the ground of pomological record as to the history of this Pear. The assumption that it is identical with the Cuisse Madame is quite unsupported by the evidence of Le Lectier, Quintinye, and more recent authors. The English Jargonelle is the Epargne of France, and first appears in Le Lectier's rare catalogue dated 1628, the only known copy of which exists in the Bibliothèque Nationale at Paris. This same list contains also the Cuisse Madame as a distinct variety. Later in the same century, Quintinye separates these two varieties, Cuisse Madame ripening in July, Epargne in August. An illustration of the two sorts side by side may be seen in Noisette's *Jardin Fruitier*, first edition, plate 27. Following the general rule in pomological nomenclature, it is probable that the Cuisse Madame was the better known, or earlier, of the two, and the larger size and somewhat similar appearance of Epargne caused it to be called Grosse Cuisse Madame. It will, I believe, always be found that the name of a fruit will exist in an unqualified form before it is qualified by adjectives such as Grosse, Petit, &c., &c. The true and original Jargonelle was also known to Le Lectier, and is perfectly distinct from either of the above, see Noisette's *Jardin Fruitier*, plate 38. This is the variety described by Merlet. The name seems then to have been used to designate a group of Pears, and it may be in this way that the Epargne has had this name attached to it in this country. If I may add my guess as to the origin of the word Jargonelle, I ask may it not be a corruption of the word Garzignole, a name used by Agostino Gallo for a group of Pears in his "*Vinti giornata dell agricoltura*?" These Pears were late varieties it is true, but the fifteenth century was not too particular as to small details of this sort, and the name may have persisted apart from the objects to which it was formerly attached. *E. A. Bunyard.*

ERODIUM CHRYSANTHUM.—For many years past I have had in my garden several plants of Erodium chrysanthum, but have never obtained any seed. In a Gloucestershire garden I saw seed in abundance, and seedlings coming up in the path. Seeds from this garden were given me, but so far I have not had any plant that yielded seed. When visiting a nursery garden on August 10 last

FIG. 104.—ACHILLEA PTARMICA "PERRY'S WHITE."
(Received R.H.S. Award of Merit on the 10th inst.)
(See p. 235.)

I was shown a plant which was named Erodium chrysanthum. I demurred, as the foliage was green instead of grey and the flower more white than yellow; it then occurred to me that a difference in the seed-bearing plant had been pointed out to me, and on examining the flower I found it had only a pistil. The owner kindly gave me the plant, and the next day I planted it close to a male plant and pollinated the flower. On September 12, 32 days afterwards, the seeds were ripe and on the point of scattering. Close to this Erodium is a plant of E. amanum. A friend, no mean authority, was surprised that the same plant bore both staminate and pistillate flowers. This made me look about among the self-sown seedlings, and among them I found several that had only pistillate flowers. E. macradenium and E. gruinum have, here, both sexes on the same plant, and it would be interesting to know the facts in connection with the other species commonly grown. *A. C. B.*

BIRMINGHAM HORTICULTURAL SOCIETY.—It is with very great pleasure that the committee is able to announce a highly satisfactory result from the recent show of the Birmingham Horticultural Society, as, notwithstanding the inclement weather, the profits amount to the sum of over £100. At a meeting of the General Committee held recently a resolution was passed according a vote of thanks to the exhibitors. It was also felt desirable that an explanation should be forthcoming regarding the shortage of tent accommodation, due to an error on the part of the contractors, and whose acknowledgment and apology have been received. The committee tenders its sympathy to any who were thereby unavoidably inconvenienced, and unhesitatingly state that this is a matter which will be remedied upon all future occasions, and no effort will be spared to ensure the comfort and convenience of exhibitors. *Wm. G. Carradine, Secretary.*

TITS IN THE GARDEN.—I was interested in the note on the bullfinch (see p. 197), and should like to know something about Tits, especially the Blue Tit. I have looked upon them as my friends in the garden, and have placed nesting boxes for them and fed them all last winter and spring. This summer they have rewarded me by destroying my buds of Sweet Peas. I cannot think the birds are after aphis, as they attack the buds as soon as they are formed, and seem very pleased with themselves, for they titter away and devour the next bud. Has any reader experienced anything similar with these birds? *John T. Graves, Burton Joyce, near Nottingham.*

COLOUR IN HARDY FRUITS (see pp. 201, 216).—We have more than 150 varieties of Apples, and the fruits in this district produce good colour, the soil being loam on chalk. After comparing the seasons 1911 and 1912 I have come to the conclusion that moisture plays an important part in colouration. During the season 1911, we had very little colour in our fruits. Worcester Pearmain and other early sorts compared unfavourably with fruits of the present season. As soon as there was dew in 1911 colour development was noticeable, and we had finely-coloured late varieties. This season early varieties of Apples are beautifully coloured, and I am in full hopes that the later sorts will develop colour up to my full expectation. Respecting Apples in the orchard house, trees that are allowed to stand on a damp ash bottom produce finer coloured fruits than those that are placed on a drier base and in full glare of the sun. *M. Nicholls, St. Clere Gardens, Kemsing, near Sevenoaks.*

———I read Mr. Gilthorpe's remarks on the colour of hardy fruits with great interest, and can confirm what he states. Our hardy fruits are as well coloured, and in some cases much brighter than last year. We need a lot of rain in these gardens, the soil being a fairly-light, good loam, with a hard, gravelly-clay subsoil. Varieties of Apples particularly bright this year are The Houblon, Bismarck, Peasgood's Nonesuch, Coronation, Ribston Pippin (a great favourite here), Worcester Pearmain, and Newtown Pippin, which, perhaps, is the most remarkable of all, for the variety has never before developed colour in these gardens; in fact the fruits have never properly ripened, although left on the trees until very late in the season. All Apples are ripening very early, and will not be so large as usual. Pears are colouring well. Many varieties of Perry Pears on this estate and in the neighbourhood are a wonderful sight. Peaches and Nectarines were highly coloured, although the flavour was not extra good. White and black Grapes are of the average colour. *H. Prentice, Hartbury House Gardens, Gloucestershire.*

LILIUM GIGANTEUM AT LOCHINCH CASTLE, WIGTOWNSHIRE.—I should perhaps have mentioned in my contribution on the Lily season in Scotland in your last issue (see p. 209) that the immense specimen of Lilium giganteum growing in Lady Dalrymple's "wild garden" in an extremely shady situation, besides reaching a height of nearly 13 feet, had no fewer than 16 enormous flowers. Its only rival that I have heard of, in Scotland at least, within the last decade was the plant which reached almost an equally commanding stature in Cavens Gardens, Kirkbean, Kirkcudbrightshire, about 10 years ago. It was 12 feet high, but had not, if I rightly remember, an equal number of flowers. *David R. Williamson, Wigtownshire, N.B.*

MIMULUS LEWISII (see p. 191).—The *Index Kewensis* refers Mimulus roseus to M. Lewisii. The plant I have as M. roseus is a native of North-west America, and is generally hardy in Scotland, though not now much seen in gardens. It does not like too much dry weather, and I have seen it suffer greatly and even die in times of prolonged drought. If a mulching is not provided it should be planted in a moist place or be well supplied with water during the growing and flowering season. I have known the plant for many years, and I saw a good specimen in a Kirkcudbrightshire garden recently. It had come from Barskimming, in Ayrshire, where it is hardy. *S. Arnott.*

ACHILLEA "PERRY'S WHITE."

THIS fine novelty is a seedling variety of Achillea Ptarmica, raised at Perry's Hardy Plant Farms. It grows over 3 feet in height, and has stiff, rigid, much-branching stems, the laterals being 1 foot or more in length, and forming a pyramidal bush 3 feet through. The double, white flowers (see fig. 104) are produced in the wildest profusion, and each flower measures 1 inch in diameter. The plants flower from June to late autumn, and the variety is extremely valuable for cutting or for decorative purposes. Messrs. Perry exhibited the novelty at the R.H.S. meeting held on the 10th inst., and gained an Award of Merit for their novelty.

SOCIETIES.

ORSETT AND DISTRICT AGRICULTURAL AND HORTICULTURAL.

SEPTEMBER 5.—The eighteenth annual exhibition of this society, held on this date in the beautiful grounds of Orsett Hall, was in every respect a great success, the number of entries, which amounted to 732, being a record. Several large growers of hardy fruit for market reside within the Orsett district, which, in respect to soil and situation, is admirably adapted for the production of first-rate produce. Consequently, Apples, Pears, and Plums of the best quality are always a great feature at the Orsett show.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 5.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Bamber, J. C. Cowan, J. Evans, W. Hatcher, W. Holmes, A. J. Keeling, J. Lupton, D. McLeod, W. Morgan, C. Parker, H. Thorp, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

Silver-gilt Medals were awarded to Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), who showed an excellent group of well-grown plants of varieties of Cattleya "Iris"; and R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), for a miscellaneous group.

Large Silver Medals to J. McCARTNEY, Esq., Bolton (gr. Mr. Holmes), for a group of Cattleyas and Odontoglossums; and Mr. E. F. DAVIDSON, Twyford, Berkshire, who staged a group of very choice plants.

Silver Medals to Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), for a small group of Cattleyas, Cypripediums, and Miltonias; Mr. J. EVANS, Congleton, for a group of Cattleyas; the LIVERPOOL ORCHID AND NURSERY Co., for a group comprising Lælias, Cypripediums, and Vandas; and Messrs. STUART LOW & Co., Middlesex, for a miscellaneous group.

Other exhibitors were Messrs. A. J. KEELING & SONS, Bradford, and Mr. W. SHACKLETON, Great Horton.

HANWELL AND GREENFORD HORTICULTURAL.

SEPTEMBER 11.—The seventh annual show of this society was held at the Park Hall, Hanwell, on this date. Several fine non-competitive groups were exhibited. One, shown by LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury Park, was composed of well-coloured Codiæums (Crotons). Palms, Begonias, Spiræas, and Lilies. G. L. EASTES, Esq., of Greenford Green, staged a group of plants grown from seed imported from China three years ago. Another fine group was exhibited by the president, A. W. PERKIN, Esq. The 1st prize in the class for allotments was won by Mr. W. JEFFRIES, who was awarded 91 points, Mr. E. DANIELS being placed 2nd with 78 points.

VEGETABLE SHOW AT MANCHESTER.

SEPTEMBER 12, 13.—Messrs. Dickson & Robinson, Manchester, held their fourth annual show of vegetables on the above date in the large hall of the Coal Exchange. The entries numbered over 400. Onions were exceedingly numerous, and generally finer than at any preceding show.

The best exhibit of four bulbs of "Premier" Onion was entered by Mr. AVERY, Loudwater HOUSE Gardens; 2nd, Mr. H. FOLKES, Gaddesden; 3rd, Mr. WHEELER, Wenvoe Castle. There were 58 collections in this class, which was open to the United Kingdom. One bulb of Mr. COBB's set was a perfect specimen; not before has such a fine bulb of this variety been shown in Manchester.

For four bulbs of Premier grown north of Birmingham over 30 entered, and most of the bulbs were of fine quality, size, and finish. Mr. T. JONES, Ruabon, won the 1st prize; Mr. SMITH, Newtown, the 2nd prize; and Messrs. G. & T. SIMPSON the 3rd prize.

In Class 5 for one bunch of Moneymaker Tomato, Mr. E. WINCHESTER, Rubery, easily won the 1st prize; 2nd, Mr. WILKINSON, Tyntesfield Gardens; 3rd, Mr. J. C. REEVES, Horsham.

Mr. H. TYSOE, Bedford, showed the best pods of Hercules Pea, and Rt. Hon. Lord Bishop of BATH and WELLS (gr. Mr. Leakey), the best pods of Lancastrian Pea.

Mr. H. TYSOE won the 1st prize for "Exhibition" Runner Beans, and the Rt. Hon. Countess COWPER (gr. Mr. Stannard) the 1st prize for "Market Favourite" Beet.

The best Sugar Loaf Cabbages were shown by C. L. BLUNDELL, Esq. (gr. Mr. Guy); the best "Perfection" Carrots by Mr. JAMES WHITE, Bampton; the best three heads of "Standwell" Cauliflower by Mr. THOS. JONES; three sticks of "Prize Pink" Celery by Mr. W. HOOPER; six plants of Exhibition Leek by Mr. H. TYSOE; six roots of Hollow Crown Parsnip by Rt. Hon. JAMES ROUND (gr. Mr. Bishop); three heads of "Early Favourite" Savoy by C. L. BLUNDELL, Esq. (gr. Mr. Guy); and six roots of "Manchester Market" Turnip by Capt. H. LONSDALE (gr. Mr. Mills).

Mr. Ben Ashton gave a lecture on the evening of the 12th, and Mr. Tysoe, one of the most prominent of the prize-winners, delivered a lecture on the following evening on the culture of vegetables.

WATFORD HORTICULTURAL.

SEPTEMBER 13.—At the meeting of this society held on the above date, the chairman, Mr. E. S. Theobald, presented Mr. G. W. Cuthbertson with a Rose bowl on behalf of the members as a token of their esteem, on his retirement from the office of treasurer, which he had held since the formation of the society. The latter part of the evening was devoted to a paper on "Fruit Gathering and Storing," by Mr. H. Barrow, of Rickmansworth Park.

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 11, 12.—Notwithstanding the wet, sunless season, the autumn show of this Society, which was held in the Waverley Market, Edinburgh on the above dates, compared favourably with earlier exhibitions. The number of entries was about equal to the average of the last three years, and the quality of most of the exhibits was good. The colour of the Apples was not up to the usual standard, and in cut flowers also the ill-effects of the season were to be seen. Roses were poor in colour generally, and Sweet Peas had none of the brilliance which they show in a good season. Vegetables were very good, and pot plants generally were quite up to the usual quality. The trade exhibits, though rather smaller in number than last year, made a good display, and altogether the spacious hall had a well-furnished appearance. The weather was fine, though cold.

FRUIT.

(GARDENERS AND AMATEURS.)

There were three entries in the class for a table of dessert fruit, decorated with plants, flowers, or foliage, or any combination of these (Orchids excluded). The 1st prize was awarded to the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre). The following fruits were shown in the exhibit, and the points awarded are appended :—

	Max.		Awarded.
Grape Madresfield Court ...	9	...	7
Grape Muscat of Alexandria	10	...	7½
Grape Black Hamburgh ...	9	...	6½
Grape Gros Maroc	8	...	7
Peach Golden Eagle	8	...	6½
Peach Princess of Wales ...	8	...	6
Nectarine Pineapple	8	...	6½
Fig Negro Largo	7	...	5
Fig Brown Turkey	7	...	4½
Plum Jefferson	6	...	4½
Pear Triomphe de Vienne ...	8	...	7½
Pear Marguérite Marillat ...	8	...	7
Apple Cox's Orange Pippin...	7	...	6
Apple Washington	7	...	5½
Melon Scarlet Seedling ...	8	...	7
Melon Conqueror	8	...	6½
Total for fruit	126		100½
Decoration :—			
Beauty of flower and foliage	6	...	5
Harmonious blending of colours	6	...	5
General arrangement for effect	6	...	4
Total for decoration ...	18		14

The Earl of WEMYSS, Gosford (gr. Mr. Wm. Galloway), was placed 2nd. He was awarded 92½ points for fruit out of a possible 126, and 13 points for decoration. The AMERICAN AMBASSADOR, Wrest Park, Beds. (gr. Mr. G. McKinlay), was placed 3rd with 80½ points for fruit out of a possible 130, and 11 points for decoration.

In the class for a collection of 12 dishes of fruit, grown in Scotland, not more than two dishes of each of the following kinds :—Grapes, Peaches, Nectarines, Apples, Pears, and one dish of each of any other kind, the Marquis of TWEEDDALE, Yester, Haddington (gr. Mr. Wm. Hunter), was awarded the 1st prize; Lord ELPHINSTONE, Carberry Tower, Musselburgh (gr. Mr. D. Kidd), was placed 2nd; and J. NEILSON, Esq., Mollance, Castle Douglas (gr. Mr. J. M. Stewart), 3rd. Lord TWEEDDALE's fruits included two bunches of Grape Lady Downe's; two bunches Muscat of Alexandria (two bunches to a dish); Melon Royal Sovereign; Peaches Bellegarde and Stirling Castle; Nectarine Humboldt; Apricot Moor Park; Fig Brown Turkey; Plum Jefferson; Apples Emperor Alexander and Peasgood's Nonesuch; and Pear Pitmaston Duchess. For the collection of 12 dishes of fruit grown in an orchard house the AMERICAN AMBASSADOR was the only exhibitor, and he was awarded the 1st prize.

The Scottish Challenge Trophy, valued at 50 guineas, was offered for the best eight bunches of Grapes, not more than two bunches of any variety. Superior cultivation and finish to be considered of the greatest importance, and the collections to be decorated with foliage plants in pots, cut flowers, foliage, or any combination of these. The 1st prize, which included £6 in cash and a gold badge, was awarded to Lord ROWALLAN, Rowallan, Kilmarnock (gr. Mr. J. Dixon). The trophy having been won three times by this competitor now becomes his property. 2nd, The Earl of HARRINGTON (gr. Mr. J. H. Goodacre); and 3rd, W. MACKAY, Esq., Ascog, Bute (gr. Mr. D. Hallidey).

The following were the bunches shown in the 1st prize exhibit, with the points awarded :—

	Max.		Awarded.
Muscat of Alexandria ...	10	...	8
Muscat of Alexandria ...	10	...	7
Muscat Hamburgh	9	...	7½
Muscat Hamburgh	9	...	7
Madresfield Court	9	...	8
Madresfield Court	9	...	8
Black Hamburgh	9	...	6
Black Hamburgh	9	...	6
	74		57½

The Earl of HARRINGTON obtained 55½ points out of a possible 74; Mr. MACKAY 53 points out of a possible 71; and Mr. HOLM RIGG 42½ out of a possible 74.

Lord BALFOUR OF BURLEIGH, Alloa (gr. Mr. J. J. Wann), was successful in the class for four bunches of Grapes, distinct varieties. His varieties comprised Muscat of Alexandria, Muscat Hamburgh, Mrs. Pince, and Black Alicante. Sir HERBERT MAXWELL, Bart., Monreith (gr. Mr. S. Gordon), was a good 2nd, showing Muscat of Alexandria, Buckland Sweetwater, Mrs. Pince, and Alnwick Seedling. The Earl of SEAFORTH, Brahan Castle, Ross-shire (gr. Mr. W. Campbell), excelled in the class for two bunches of Muscat of Alexandria, and the Earl of WEMYSS was successful in the class for two bunches of Black Hamburgh. In the single-bunch classes Mrs. NISBET HAMILTON, Archerfield, Dirleton (gr. Mr. Thos. McPhail), secured the premier award for Muscat of Alexandria; the Earl of HARRINGTON excelled for Black Hamburgh; WM. FORBES, Esq., of Callander, Falkirk (gr. Mr. J. Middleton), was awarded the 1st prize for Black Alicante; Sir HERBERT MAXWELL was successful for Alnwick Seedling; Miss CARSE, Springbank, Musselburgh (gr. Mr. L. Moodie), won in the class for Gros Colman; Lord ELPHINSTONE showed the best Lady Downe's; ARTHUR JAS. BALFOUR, Esq., M.P., Whittinghame, Prestonkirk (gr. Mr. G. Anderson), excelled for Appley Towers; Lord ROWALLAN, Madresfield Court; and Col. STUART RICHARDSON, Ballathie, Perthshire (gr. Mr. J. E. Davis), won in the class for any Grape introduced since 1900, with the variety Prince of Wales.

The Earl of HARRINGTON was placed 1st for six Peaches, with "Princess of Wales"; 2nd, Mrs. HAMILTON OGILVY; and 3rd, J. OSWALD, Esq., Dunnikier, Kirkcaldy (gr. Mr. J. K. Brown), who won the 1st prize for six Nectarines; 2nd, the Earl of STAIR.

For 12 Apricots C. W. COWAN, Esq., showed the premier exhibit with "Large Early"; 2nd, the Marquis of TWEEDDALE.

There were three competitors for the collection of 12 varieties of Apples, and the 1st prize was awarded to Mr. R. WHITING, Credenhill, Hereford; 2nd, Mr. E. W. CADDICK, Caradoc, Ross; and 3rd, the AMERICAN AMBASSADOR.

In the class for a collection of Apples grown in Scotland out-of-doors, for which there were four entries, Col. GORDON, Threave House, Castle Douglas (gr. Mr. J. Duff), was awarded the 1st prize and the Malcolm Dunn Memorial Medal.

J. HARRIOTT BELL, Esq., Forgandenny (gr. Mr. D. Nicoll), was the 1st prizewinner for four dishes of Apples (pot grown or orchard house), with a splendid collection, the fruits including Gascoyne's Scarlet, Peasgood's Nonesuch, Emperor Alexander, and James Grieve. The AMERICAN AMBASSADOR was the only other competitor, and he was awarded the 2nd prize.

The Marquis of LANSDOWNE, K.T., Meikleour, Perthshire (gr. Mr. T. Chisholm), excelled in the class for six dessert Apples.

In the single dish classes (six fruits) Mr. R. M. WHITING was placed 1st for Charles Ross, Duchess of Oldenburg, Dumelow's Seedling, Stirling Castle, Lord Suffield, Beauty of Kent, Ecklinville; Col. GORDON, Threave House, for Gascoyne's Scarlet, Grenadier, and Golden Spire; the Earl of WEMYSS for Irish Peach; Mr. CADDICK for James Grieve, Lady Sudeley, Bismarck, Cellini, Emperor Alexander, Lane's Prince Albert, Lord Derby, Peasgood's Nonesuch, Potts's Seedling, and Warner's King; J. NEILSON, Esq., for Worcester Pearmain; the AMERICAN AMBASSADOR for Lord Grosvenor; and Mrs. MANNERS for Bailie Neilson.

H. J. YOUNGER, Esq., Benmore, Argyllshire (gr. Mr. R. Greenlaw), was successful in the class for a collection of 48 Pears of 12 varieties.

In the class for a collection of Pears grown in Scotland, six varieties, four of each, the Earl of WEMYSS excelled; 2nd, the Marquis of LANSDOWNE, Meikleour; and 3rd, Miss HAMILTON, Rozelle.

For pot or orchard house grown Pears, the 1st prize was secured by Miss HAMILTON, Rozelle.

PLANTS.

In the classes open only to gardeners and amateurs, Major THORBURN, Craigerne, Peebles (gr. Mr. T. McNeill), was awarded the 1st prize for four stove or greenhouse plants; 2nd, Sir ROBT. USHER, Bart., Norton, Ratho (gr. Mr. G. McKinna); and 3rd, the Earl of HOME. Sir R. USHER was placed 1st for a single stove or greenhouse plant; R. HINDLE, Esq., Edinburgh (gr. Mr. A. Jeffs), was successful for one Orchid; whilst for three Cypripediums A. DRYBURGH, Esq., Gogar Park (gr. Mr. A. Findlay), was the 1st prizewinner.

Sir WILFRID LAWSON, Bart., Carlisle (gr. Mr. A. Knight), excelled in the classes for two Crotons and two Azaleas, and also for six table plants; Sir R. USHER for two Dracænas; the Earl of HOME for six foliage plants (exclusive of Palms), and for the same kind of plants in pots not exceeding 9 inches; and the Rt. Hon. R. C. MUNRO FERGUSON, M.P. (gr. Mr. D. McLean), for two Coleus. The Earl of HOME was successful for four Palms, also for two Palms and one Palm; and Sir R. USHER showed the finest Cycad.

In the class for four exotic Ferns, distinct species, exclusive of all others for which prizes were offered, Major THORBURN secured the 1st award; 2nd, A. DRYBURGH, Esq.; and 3rd, Sir R. USHER. Miss CARSE, Musselburgh, was 1st for four Adiantums; J. HERDMAN, Esq., Hazelbank, Murrayfield (gr. Mr. J. Hermiston), was successful for a tree Fern; ALEX. COWAN, Esq., Valleyfield, Penicuik (gr. Mr. J. Turnbull), for four British Ferns (excluding dwarf kinds) and for six Scolopendriums.

CUT FLOWERS.

GARDENERS' AND AMATEURS' CLASSES.

Mr. JAS. STEWART, Junr., Alloa, secured the 1st award for 12 spikes of Gladioli with fine specimens; 2nd, Mr. J. C. FORDY, Warkworth. For six spikes of these flowers Mr. A. BRYDON, Innerleithen, was placed 1st. Mr. A. BENNETT, Tweedmouth, excelled for six spikes of Hollyhock. Mr. CHAS. SHAW, Kippen Station, was successful in the classes for 12 Cactus Dahlias, six Pæony Dahlias, and six bunches of single Dahlias. Mr. R. SUTHERLAND, Kirkintilloch, secured the 1st place for six bunches of Cactus Dahlias; and Mr. JENKINS, Cambuslang, excelled in the class for six bunches of Pompon Dahlias.

In the Sweet Pea classes, Mr. JOHN FLETCHER, Auchenleath, was successful in the classes for (a) 12 bunches, (b) six bunches, and (c) a single bunch.

In the class for 24 Roses in not fewer than 18 varieties, the Earl of DALHOUSIE, Panmure, Carnoustie (gr. Mr. John Simpson), excelled; 2nd, Mr. L. BLACK, Kinglassie. Mr. J. CRAIG, North Berwick (gr. Mr. J. Mathison), was awarded the 1st prizes for (a) 12 H.T. Roses and (b) any scarlet or crimson Rose. Mr. J. SIMPSON was placed 1st for 12 T. Roses. T. R. B. ELLIOTT, Esq., Harwood House (gr. Mr. J. Darling), showed the best pink Rose in the variety Mrs. W. J. Grant, whilst the best white Rose was Frau Karl Druschki, shown by this exhibitor.

In the Carnation classes Major MCNEILL, Galashiels (gr. Mr. Jas. Cochrane), was placed 1st for three vases of mixed border or Picotee varieties; and Sir J. GILMOUR, Montrave, Leven (gr. Mr. J. Wilson), for three vases of perpetual-flowering varieties.

C. W. Cowan, Esq., secured the 1st prize for six bunches of herbaceous perennials. For 12 vases of hardy or half-hardy annuals Mr. J. Cochrane excelled; and Mr. Wm. Young, Craighlaw, Kirkcowan, won the silver cup presented by Mr. J. Phillips, Edinburgh, for a collection of flowers cut from the open border. Major Thorburn had the best single and Mr. J. Paul the best double Asters, whilst Mr. J. Richardson showed the best Phloxes.

The 1st prizes in the classes for white and coloured hand bouquets were won by Mr. A. Knight, Brayton, and for six buttonhole bouquets by Mr. A. Johnstone, Edinburgh. Mr. R. McAndie was 1st for one spray for a lady's dress, and Mr. D. Kidd, Carberry, had the best basket and vases filled with flowers, fruits or foliage of hardy trees and shrubs, and Mr. J. C. Brown, Edinburgh, for nine dwarf hardy Ferns. In the class for six table Ferns, J. Neilson, Esq., was awarded the 1st prize. Mrs. Dewar, Drylaw House (gr. Mr. W. T. Galloway), was successful for six single-flowered varieties of tuberous-rooted Begonias and for three double-flowered varieties. Mr. Joseph Plant excelled with three plants of single-flowered tuberous-rooted Begonias.

VEGETABLES.

Open Classes.

In the class for a display of vegetables arranged on a space 6 feet by 4 feet, to comprise 18 dishes, in not fewer than 12 kinds, Mrs. Fleming Hamilton, Craighlaw, Kirkcowan (gr. Mr. W. Young), was placed 1st, and Col. Stewart Richardson (gr. Mr. J. E. Davis) 2nd. In the class for a smaller collection arranged on a space 4 feet by 4 feet, in 12 kinds, grown in Scotland, Stephen Mitchell, Esq., Kippen Station (gr. Mr. C. Shaw), was awarded the 1st prize; 2nd, the Earl of Home; and 3rd, the Earl of Lauderdale, Thirlestane Castle (gr. Mr. R. Stuart).

AWARDS TO NOVELTIES.

First-class Certificate.

Montbretia Star of the East, exhibited by Mr. George Davison, Westwick Gardens, Norwich.

Awards of Merit.

Seedling Apple Thomas Jeffrey, exhibited by Mr. D. W. Thomson.

Seedling Apple Miller's Red Victoria, exhibited by Mr. G. W. Miller, Wisbech.

Tomato Simpson's No. 1, exhibited by Messrs. G. N. Simpson.

Chrysanthemum Crimson Polly, exhibited by Messrs. Wells & Co.

Pentstemon Mrs. F. Fulford, exhibited by Mr. F. Fulford, Montgomerie Castle, Tarbolton.

Collerette Dahlias Prince John, Princess Louise, and *Frogmore*, exhibited by Messrs. Dobbie & Co.

Rose Mrs. Andrew Carnegie, exhibited by Messrs. Cocker & Sons.

Chrysanthemum Mrs. J. Mason, exhibited by Messrs. Mason & Co.

AWARDS TO NON-COMPETITIVE EXHIBITS.

Gold Medal.—This was awarded to Messrs. Dobbie & Co.

Silver-gilt Medals were awarded to Messrs. Webb & Sons, Little and Ballantyne, Thomas S. Ware, Ltd., Thyne & Son, Storrie & Storrie, Sander & Sons, W. Cuthbush & Son, John Downie, Young & Co., Cunningham, Fraser & Co., Mr. David W. Thomson, Messrs. W. Thomson & Sons, Ltd., and the King's Acre Nurseries, Ltd.

Silver Medals were awarded to Messrs. R. Wallace & Co., Mr. Jones (Kilkenny), Messrs. Wm. Wells, Ltd., Bakers', L. R. Russell, T. Methven & Sons, Stuart Low & Co., John Forbes, Ltd., Mr. McLeod, Tillie, Whyte & Co., R. B. Laird & Sons, Jas. Cocker & Sons, G. Gibson & Co., and Mr. D. McOmish (Crieff).

Bronze Medals to Mr. Robert Bolton, Messrs. G. Fairbairn & Sons, E. F. Fairbairn and Sons, Mr. G. W. Miller, Messrs. J. Mason & Co., Thomas Kennedy & Co., Mr. H. N. Ellison, Messrs. Gunn & Sons, and the Edinburgh and East of Scotland College of Agriculture.

NATIONAL ROSE.

September 12.—The National Rose Society has every reason to be well satisfied with their autumn show, which was held on the above date at the Royal Horticultural Hall, Vincent Square, Westminster. The weather was fine, and within a few minutes of the opening hour the hall was filled with visitors. The entries were more numerous than last year, and in nearly every class the competition was keen. It was interesting to note the effect of the unseasonable weather—in many instances the exceptional coldness had been responsible for an increase of colour, which gave the blooms a glorious appearance, but the lovely colour was not accompanied by much perfume. Many varieties which, even in autumn, usually have a delicious fragrance were almost scentless, but their appearance was charming. As usual the arrangements worked smoothly, and members of the Press were much helped by the excellent official lists of awards published by the secretary's department.

Classes for Nurserymen.

There were 12 entries in the class for 36 blooms, and a great many fresh, well-coloured blooms were shown. There seemed, however, to be a tendency to overdress the blooms, which had in some instances a very formal appearance. Mr. Hugh Dickson, Belfast, won the 1st prize with exceedingly fine blooms; the very best were: Mr. John Jameson, Mrs. Foley Hobbs, Caroline Testout, Leslie Holland, Earl of Warwick, Hugh Dickson, and King George. 2nd, Messrs. J. Jeffries & Son, Cirencester, whose stand included splendid blooms of Mrs. R. G. Crawford, Hugh Dickson, and Captain Christy. 3rd, Messrs. J. Cocker & Sons, Aberdeen.

The competition in Class 2 was not so strong, but most of the Tea and Noisette blooms were of great merit. The 1st prize was awarded to Mr. Hy. Drew, Longworth, who exhibited especially good blooms of Maman Cochet, Mme. Constance Soupert, Mrs. Edward Mawley, and Auguste Comte. 2nd, Mr. Geo. Prince, Longworth, who showed Mrs. Foley Hobbs, Mme. Dupuy, and Mrs. E. Mawley especially well. 3rd, Mr. John Pigg, Royston.

The exhibits in the class for nine baskets of cut Roses were arranged in a very pleasing manner. Mr. John Mattock, who was awarded the 1st prize, showed Mrs. David McKee, Mrs. Sharman Crawford, Bessie Brown, and Caroline Testout in his collection.

White Roses were shown extensively in Class 4, which provides for 12 blooms of any Rose to be shown in a handleless basket. Messrs. F. Cant & Co. won the 1st prize with a fine set of Frau Karl Druschki. Messrs. Hugh Dickson, Ltd., were awarded the 2nd prize for a good basket of their variety Hugh Dickson. 3rd, Messrs. J. McGredy & Son, Portadown, who showed Mrs. Herbert Stevens.

The best 18 vases of distinct varieties was shown by Mr. John Mattock, Headington, who had excellent examples of Irish Glory, Orléans Rose, General MacArthur, Mrs. Aaron Ward and Dorothy Page Roberts. 2nd, Messrs. F. Cant & Co., Braiswick, Colchester, whose best flowers were of the varieties Peace, Gustave Nabonnand, and Ecarlate.

The exhibits in the class for nine varieties were unusually good. The 1st prize was awarded to Mr. E. J. Hicks, Twyford, Berks, for a splendid collection, in which the varieties Rayon d'Or, Pharisaer, La Tosca, and Mrs. Wakefield Christie-Miller were splendid. 2nd, Mr. Will Tayler, Hampton, whose best vase was that of Marie Pavie. 3rd, Messrs. G. & H. Burch, Peterborough.

In the class for nine baskets of cut Roses there were six competitors. The baskets were mostly arranged in a stiff manner, and in many cases the tubes which contained the stalks were too much exposed. The blooms were very meritorious, and the baskets of Dorothy Page Roberts, Lady Pirrie, Reine Mère d'Italie, and General MacArthur, which won the 1st prize for Mr. Hugh Dickson, were particularly good. 2nd, Mr. John Mattock, whose best baskets contained Marie Van Houtte, Mme. Abel Chatenay, and Countess of Gosford. 3rd, Messrs. S. Bide & Sons, Farnham.

The class for five baskets of cut Roses also contained very fine blooms. Messrs. Wm. Spooner & Son won the 1st prize, their best varieties being La Tosca, Joseph Hill, and Orléans Rose. 2nd, Mr. J. Crossling, Penarth, who showed very good baskets of Marie Van Houtte and Mme. Jean Dupuy. 3rd, Mr. Hy. Drew.

Mr. John Mattock, New Headington, Oxford, who won the 1st prize offered for 24 vases of decorative Roses, included splendid sets of Gustav Grünerwald, Mons. Paul Lédé, Lady Pirrie, Mme. Jean Dupuy, and A. R. Goodwin. 2nd, Messrs. F. Cant & Co., whose best vases contained Gottfried Keller and Lady Wenlock. 3rd, Mr. John Pigg.

The competition in the class for 12 varieties was equally good, and the collection which won the 1st prize for Messrs. W. Spooner & Son, and which included splendid examples of Arthur R. Goodwin, General MacArthur, La Tosca, Trier, and Miss Dorothy Mocatta, was a very fine effort.

The 12 varieties of dwarf Polyantha Roses made a charming display. The best collection was shown by Mr. Geo. Prince, from whose stand we select Rosalind, Phyllis, and Mrs. Cutbush as being of great merit.

Groups of Roses.

There were only two representative groups of Roses placed on the floor, and, although each contained a large number of good blooms, neither was arranged to the best advantage. The group shown by Messrs. Hobbies, Ltd., Dereham, which received the 1st prize and Gold Medal, was decidedly the better, and the corner of the hall allotted to them was well filled, but the pots, and especially those of the bordering of Maidenhair Ferns, were too much in evidence. A large rustic basket of the dwarf Polyantha Rose "Jessie" was exceedingly pretty. The principal varieties displayed were the seedling pillar Rose "Lemon Queen" (Frau Karl Druschki × Mme. Ravary), Lady Ursula, Lyon, Hugh Dickson, and Mildred Grant. The 2nd prize and Silver-gilt Medal was awarded to Messrs. Paul & Son, Cheshunt. The standard Roses in this exhibit were not so good as those in the former, but there were vases containing good cut blooms of such varieties as Caroline Testout, Gustave Régis, Mrs. W. J. Grant, Mrs. R. G. Crawford, and Mme. A. Mari.

The groups of cut Roses arranged on the staging were decidedly the feature of the show. A very great amount of time, skill and taste had evidently been expended on the arrangement of these beautiful collections. The quantity of splendid Roses employed in them was astounding, and many of the individual blooms were as good as the average at the summer shows. The 1st prize and Gold Medal group arranged by Messrs. Gunn & Sons, Olton, Birmingham, was particularly charming. The background was exceedingly well arranged, and the system of arches entirely successful. The Silver Medal group, exhibited by Messrs. W. & J. Brown, Peterborough, was a very good 2nd indeed; the front of this group was decidedly the better of the two, the former group excelled in the quality of the blooms and the more tasteful background. 3rd, Mr. Geo. Paince, Longworth, whose outstanding feature was a splendid stand of Rayon d'Or. An extra prize was awarded to Messrs. B. R. Cant & Son.

In the smaller class for a representative collection of cut Rose blooms the 1st prize was awarded to Messrs. R. Harkness & Co., Hitchin. The ornamental basket of Irish Elegance and the pillars of Lady Hillingdon and Mme. Abel Chatenay were especially good. The low arch of Lyon and Irish Elegance which occupied most of the front of Mr. F. M. Bradley's group was particularly well done, and the group fully deserved the 2nd prize.

The class for 36 varieties was responsible for a beautiful display. The 1st prize was awarded to Messrs. Frank Cant & Co., who had excellent vases of Marquise de Sinety, Comtesse du Cayla, Gottfried Keller, Mrs. Herbert Stevens, Gruss an Teplitz, Hugh Dickson, Mme. Ravary, Hugo Roller, &c. 2nd, Mr. John Mattock, whose outstanding varieties were Lady Hillingdon, Betty Berkeley, Bessie Brown, Countess of Gosford, and Lady Battersea. 3rd, Messrs. J. Jeffries & Sons.

The 1st prize exhibit of Messrs. B. R. Cant & Sons, in the class for the hips of nine distinct species or varieties of Rose illustrated the decorative value of Rose hips in an admirable manner. Those of the Rugosa varieties, namely,

alba, rubra, Le Cid, and especially of atropurpurea, were very attractive. 2nd, Messrs. PAUL & SONS, Cheshunt, who showed R. microphylla, which if berried freely would be exceedingly ornamental. 3rd, Mr. GEORGE PRINCE.

AMATEURS' CLASSES.

The competition in this section of the show amply indicates that the interest in Roses is not confined to the trade growers, and the quality of the blooms compared very favourably with those in the nurserymen's classes.

The best 18 blooms in Class 19, which is open to all amateurs, were shown by Mr. CONWAY JONES, Hucclecote, Gloucester. The blooms of Mme. Constance Soupert, Lyon, Caroline Testout, and Florence Pemberton were magnificent. 2nd, Mr. F. DENNISON, Cranford, Leamington. 3rd, Mr. W. BOYES, Middleton-on-the-Wolds.

In the class for 12 blooms, which is restricted to growers of fewer than 2,000 plants, the 1st prize was awarded to Mr. GULLIVER SPEIGHT, Market Harboro, who had fine blooms of Souvenir de P. Notting and Mme. Wagram. 2nd. Rev. J. PAGE ROBERTS, Strathfieldsaye Rectory, Mortimer.

Class 26 induced the best competition, and in the beautiful exhibit shown by Mr. W. P. PANCKRIDGE, Petersfield, there were delightful vases of Medea and Florence Pemberton. 2nd, Rev. F. R. BURNSIDE, Gt. Stambridge Rectory, Essex.

On the whole the baskets of cut Roses were not quite so good as in the section for nurserymen, but they possessed much merit. The best three baskets were shown by Mr. CONWAY JONES. 2nd, Mr. G. A. HAMMOND, Burgess Hill. 3rd, Rev. J. H. PEMBERTON, who employed the varieties White Maman Cochet, Hugh Dickson, and Auguste Comte.

Mr. S. W. BURGESS, Old Bank House, Tonbridge, showed the best single basket.

Mr. CONWAY JONES had a charming collection of 12 varieties in vases, and those of Hugh Dickson, Souvenir de Pierre Notting, and Mons. Joseph Hill were exceedingly fine. 2nd, Rev. J. H. PEMBERTON, who had a splendid vase of Rosette de la Légion d'Honneur. 3rd, Mr. H. R. DARLINGTON.

The best five vases of Rose hips shown with their foliage were exhibited by H. R. DARLINGTON, Esq., Potters Bar. The vase of the variety Nitida, with deep crimson leaves and scarlet hips, was very attractive. 2nd, Rev. J. H. PEMBERTON, Havering-atte-Bower, Essex. 3rd, Mr. E. B. LINDSELL, Bearton, Hitchin.

Mr. CONWAY JONES (1st prize) showed a fine collection of Roses in Class 31, and those of the Rev. J. H. PEMBERTON were only slightly inferior.

DECORATIONS.

The dinner tables decorated with cut Roses and any kind of foliage, which were laid out in the Lecture Room, attracted a large number of the visitors. There were no novel effects, but the 14 tables provided a very pretty spectacle. As at the summer show, the beautiful single-flowered Rose Irish Elegance demonstrated its superiority for decorative purposes, and each of the three winning tables were arranged wholly or in part with this variety. Unless the schedule-framers provide against it by dividing the competition into two sections —for single and for double-flowered varieties— there is a great danger that, influenced by the recent awards, the great majority of future exhibitors will employ Irish Elegance Rose, and the sameness of the exhibits will then destroy the interest in this class. The 1st prize was awarded Mrs. ROBINSON, Park Hill, Carshalton, whose table was beautifully arranged, but the centre was disproportionately large.

The baskets of Roses arranged with any kind of foliage were very beautiful, and the awarding of the prizes must have caused the judges a deal of anxiety. Mrs. J. W. SMITH was placed 1st, and Mrs. E. WILLIAMSON, Wilstead, Canterbury, 2nd, and Mrs. HALE 3rd.

The bowls of Roses also commanded admiration, and in this class the prizes were awarded to Mrs. C. PAGE, Enfield; Mrs. BURNETT, Holly Lodge, Southampton; and Mrs. J. W. SMITH, in the order named.

NEW ROSES.

It was not to be expected that Section 8 would, at this season, bring to light many new varieties of superlative merit. There were not many new Roses in the two classes, but of these the judges considered three to be worthy of Gold Medals, and a Silver-gilt and Silver Medal were also awarded to meritorious Roses.

GOLD MEDAL ROSES.

Mrs. Charles E. Pearson (see fig. 105).– A very beautiful H.T. variety; said to have a good constitution, and to be very free-flowering. It may be described as being a slightly more globular Lyon Rose without the salmon shade in its colouring.

British Queen.—An exceedingly fine, white H.T. Rose. It has much the shape of White Maman Cochet with the substance of Frau Karl Druschki. Both of these varieties were shown by Messrs. S. MCGREDY & SON.

Sunburst.—This now well-known variety was shown by Mr. G. BECKWITH.

SILVER-GILT MEDAL.

Little Dorrit.—A charming little H.T. Rose. The pale pinkish colour of the centre merges into red or reddish-purple as the petals mature. Shown by Messrs. G. PAUL & SON.

SILVER MEDAL.

Queen of the Musks.—A very floriferous pale purple-coloured hybrid musk Rose. Shown by Messrs. G. PAUL & SON.

PREMIER BLOOMS.

A Silver Medal was awarded to each of the following as being the best representative in the show of their respective types:—

AMATEURS.

H.T.: Mme. Wagram, shown by Mr. CONWAY JONES. *T.*: Maman Cochet, from Mr. CONWAY JONES. *H.P.*: Frau Karl Druschki, from Mr. F. SLAUGHTER.

NURSERYMEN.

H.T.: Miss Cynthia Ford, shown by Mr. HUGH DICKSON. *T.*: Mrs. Foley Hobbs, from Mr. GEO. PRINCE. *H.P.* and Gloire de Chédane Guinnoisseau, Mr. HUGH DICKSON.

FIG. 105.—H.T. ROSE MRS. CHARLES E. PEARSON.
(Awarded the National Rose Society's Gold Medal on the 12th inst.)

Mr. G. MOULES, Hitchin, was the most successful exhibitor amongst the growers of fewer than 1,000 plants, and the 2nd prize was awarded to Mr. G. B. LEHMAN, Crawley.

Mr. W. P. PANCKRIDGE, Petersfield, was awarded the 1st prize in the class for growers of fewer than 500 plants. 2nd, Rev. L. CHALMERS HUNT, Willian Rectory, Hitchin.

In the class for growers of fewer than 200 plants Mr. L. P. ROBERTS, Westcott, Dorking, was placed 1st.

Mr. CONWAY JONES, whose stand contained the premier Tea-scented bloom, won the 1st prize in the strongly-contested class for nine distinct Tea or Noisette Roses. 2nd, Mr. F. SLAUGHTER, Steyning.

As in the nurserymen's classes, the vases of Roses provided many graceful exhibits. Class 25, which requires seven stems of seven distinct varieties, was open to all amateurs, and Mr. CONWAY JONES was the most successful exhibitor. 2nd, Rev. J. H. PEMBERTON.

NATIONAL DAHLIA.

SEPTEMBER 17, 18.—The National Dahlia Society have decided to hold only one exhibition this season, and this show was held at the Crystal Palace on the above dates. The entries were more numerous than last year, but despite the more favourable climatic conditions the exhibits on the present occasion were scarcely so good as usual. The dainty little Pompon Dahlias are an exception, for this year many of the blooms were very near to perfection. There was a great falling off in the exhibits of single Dahlias, and it was interesting to notice that in the classes for Cactus varieties the prizes were usually awarded to those exhibits which included the most varieties with incurving florets.

SEEDLING DAHLIAS.

The gold medal offered as a special prize for the best new seedling Show, Fancy or Cactus Dahlias was awarded to Messrs. J. STREDWICK & SON for the variety Gigantic. The name suitably indicates the size of this splendid variety. The florets are very long and

incurved, and their colour is "old gold" shaded with buff on a few of the older florets. The undeveloped centre florets are nearly pure yellow.

Awards to Novelties.

First-class Certificates were awarded to the following novelties:—

George Scowfield.—A medium-sized Cactus variety with bright salmon-coloured, incurving florets which are paler at the tips. Shown by Messrs. J. Stredwick & Son.

Johnnie.—A Pompon Dahlia of perfect form, in which the deep maroon of the centre florets shades to crimson. Shown by Mr. J. T. West.

Mrs. A. Brown.—This single, yellow variety was shown as *Yellow Prince*, but as there was already a Dahlia of this name it had to be re-named. Shown by Mr. A. Brown, Grange Road, Leagrave, Bedfordshire.

Autocrat.—A very fine yellow show Dahlia. Shown by Messrs. Keynes, Williams & Co.

Kathleen.—A very free-flowering, purplish-mauve coloured, "Miniature Cactus" variety. Shown by Mr. J. T. West.

Nurserymen's Classes.

Mr. S. Mortimer, Swiss Nursery, Rowledge, Farnham, was the only exhibitor of 48 Show Dahlias, and his collection deservedly received the 1st prize.

There were five entries in the class for 24 Show Dahlias, and Mr. Chas. Turner, Royal Nurseries, Slough, was awarded the 1st prize for an excellent collection of blooms. The outstanding varieties were Perfection (orange-buff), Standard (deep crimson), T. Girdlestone (a very fine bloom), Ed. Mawley (crimson self), Chieftain (lilac-purple), and Mrs. Chas. Noyes. The 2nd prize was won by Messrs. J. Cheal & Sons, Crawley, Sussex, whose collection was not nearly so even, but the blooms of Wm. Powell (yellow) and Margery (lemon-shaded amber) were excellent. 3rd, Messrs. W. Treseder, Ltd., The Nurseries, Cardiff.

There was only one exhibit (that of Mr. S. Mortimer, which received the 1st prize) of 18 blooms of Fancy Dahlias, and these were of unequal quality to the foregoing.

Of the four collections of 12 blooms of Fancy Dahlias, that shown by Mr. Chas. Turner was decidedly the best. His blooms of Nansen, Mrs. Saunders and Goldsmith were very fine; 2nd, Messrs. W. Treseder, Ltd.; 3rd, Mr. M. V. Seale, Sevenoaks.

The three collections of 18 varieties of Cactus Dahlias in bunches of six blooms of each made a very attractive display. Messrs. J. Stredwick & Son, Silverhill Park, St. Leonards-on-Sea, again won the silver challenge cup and 1st prize. This splendid exhibit included very fine blooms of F. W. Fellowes (orange scarlet), Rev. A. Lowe (yellow flushed with pale pink at the tips), Gigantic and John Riding, which received an Award of Merit at the last exhibition of the R.H.S. The 2nd prize exhibit (Messrs. J. Cheal & Son) contained meritorious blooms of Frederick Wenham (very pale pink with yellow centre) and Iolanthe. 3rd, Messrs. J. Burrell & Co., Cambridge.

The 1st prize for 12 blooms similarly arranged was awarded to Mr. M. V. Seale, who showed good vases of Daisy Easton (yellow) and Snowdon (white).

The collections of 48 Cactus blooms caused the judges considerable trouble, two of the exhibits being of remarkably even quality. The 1st prize was awarded to Messrs. Keynes, Williams & Co., Salisbury, who included Gwendoline Tucker, Flossie Redout, Kingfisher, Glory of Wilts, Golden Crown and Irresistible. 2nd, Messrs. J. Stredwick & Son, who showed splendid blooms of Scout, H. L. Brousson, Rosary, Golden Crown, Gigantic, and others. 3rd, Messrs. J. Burrell & Co.

The best exhibit of 24 blooms of Cactus Dahlias was shown by Messrs. Wm. Treseder Ltd. This was an exceptionally good collection, nearly all the blooms being very fine. 2nd, Mr. M. V. Seale, whose stands contained especially good blooms of Mrs. Pourrier (bright red) and Snowdon.

The collections of 12 varieties of Cactus blooms arranged in vases of six flowering stems with hardy foliage were displayed on separate tables. Messrs. J. Cheal & Sons, who won the 1st prize, made an attractive display with such varieties as Coral and Salmon Queen.

The exhibits in the large class for Pompon Dahlias were exceedingly good. The best collection of 24 varieties was shown by Mr. Chas. Turner, and his charming exhibit included such dainty varieties as Glow, Mephisto, Nelly Broomhead, Cyril, Nerissa, Adelaide, Bacchus and Jessica. The 2nd prize was awarded to Messrs. J. Cheal & Sons, whose blooms were but little inferior.

Messrs. J. Burrell & Co. were awarded the 1st prize for 12 varieties of Pompon Dahlias.

In point of numbers the single-flowered Dahlias were poorly represented in the nurserymen's classes. There were only two competitors in Class 12 (24 varieties), and the class for 12 varieties drew no entry. The best collection was shown by Messrs. J. Cheal & Sons.

Many of the blooms shown in Class 14, which was for six varieties of Pæony-flowered Dahlias, six blooms of each, arranged in a vase with any suitable hardy foliage, were very fine, but the exhibits possessed very little decorative value. Mr. Chas. Turner, who won the 1st prize, showed very large blooms; 2nd, Mrs. J. Cheal & Sons.

Mr. Chas. Turner also showed the best collection of Collerette Dahlias in 12 varieties, 10 blooms of each, in separate vases.

Amateurs' Classes.

The collections of "Show and Fancy or intermixed" Dahlias in these classes were of very even quality, and contained many good blooms. The best exhibit of 24 blooms, for which the Silver Challenge Cup was awarded, was shown by Mr. S. H. Cooper, The Hamlet, Chippenham.

In the class for 12 blooms, the 1st prize was awarded to the collection shown by Mr. H. Tysoe on behalf of the Misses Fitzpatrick.

The only exhibit of six varieties of Cactus Dahlias, shown on six stems in vases, with any appropriate foliage, was that of the Rev. A. Bridge, Worth Rectory, Three Bridges, Sussex, which was awarded the Silver Challenge Cup.

The collection of nine varieties of Cactus Dahlias, in bunches of three of each, which won the Silver Challenge Cup offered in Class 19 was very fresh and attractive. The exhibitor was Mr. F. W. Fellowes, King's Walden, Hitchin. The blooms of Ivernia, Glory of Wilts, and Richard Box were of more than average merit. 2nd, Rev. A. Bridge.

Mr. H. Peerman, Glencross, Nantwich, showed the best collection of 24 blooms of Cactus Dahlias; and the 1st prize for 12 blooms of Cactus Dahlias was won by Mr. F. W. Fellowes The outstanding varieties were Iolanthe, H. H. Thomas, and Mrs. Douglas Fleming.

The Silver Challenge Bowl presented by the Crystal Palace Co. for the best 12 Pompon Dahlias, shown in bunches of 6 blooms of each variety, was won by Mr. H. Brown, Havelock Road, Luton.

The best single Dahlias were shown by the Rev. A. Bridge; 2nd, Rev. C. S. Pearce, Coombe Vicarage, Oxfordshire.

In the classes for amateurs who have not previously won a prize at a N.D.S. show, Mr. A. Jeffries, Langley Burrell, Chippenham, was the most successful exhibitor of 6 blooms of Show or Fancy Dahlias, and was also awarded the 1st prize for 6 varieties of Cactus Dahlias.

The Crystal Palace Co.'s Silver Medal and the 1st prize for the best vase of 12 Dahlia blooms of any kind, arranged with suitable foliage, were won by Mr. H. Edwards, Norton Priory Gardens, Chichester, who exhibited a large and imposing vase, which was attractively arranged.

Open Classes.

Messrs. J. Burrell & Co. made a very good display with their 1st prize collection of 12 miniature Cactus Dahlias; 2nd, Mr. M. V. Seale.

The 1st prize for six blooms of any Cactus Dahlia was awarded to Mr. C. Luckin, who showed excellent examples of the white variety Snowdon. The 2nd prize was awarded to Messrs. J. Stredwick & Son, who showed splendid blooms of F. W. Fellowes.

Messrs. J. Cheal & Sons showed the best 12 varieties of Fancy Single Dahlias; the 1st prize collection of Fancy Cactus Dahlias was exhibited by Messrs. J. Stredwick & Son, and Mr. Chas. Turner arranged the best vases of Decorative Dahlias, with hardy foliage.

Non-competitive Exhibits.

Messrs. H. Cannell & Sons, Swanley, Kent, displayed a very choice collection of splendid cut blooms, very tastefully arranged. (Large Gold Medal.)

Messrs. S. Spooner & Sons, Hounslow, exhibited a very large collection of Apples and a few dishes of Pears. (Large Gold Medal.)

Mr. J. B. Riding, Chingford, Essex, displayed a very fine collection of the various sorts of Dahlias. (Gold Medal.)

Mr. J. T. West, Tower Hill, Brentwood, arranged a group of cut Dahlia blooms. (Gold Medal.)

Messrs. J. Carter & Co., Raynes Park, displayed on a circular stand Dahlia blooms with small pots of Ferns, edged with pots of "China" Asters. (Large Silver-gilt Medal.)

Mr. J. Emberson, Hoe Street, Walthamstow, arranged a very comprehensive collection of Dahlia blooms with fronds of Bracken and Michaelmas Daisies. (Silver-gilt Medal.)

Messrs. T. S. Ware, Ltd., Feltham, displayed many very good double-tuberous Begonias and various hardy border flowers at the end of their collection of Dahlias. (Large Silver-gilt Medal.)

Messrs. Hobbies, Ltd., Dereham, arranged many Dahlias and two large rustic baskets filled with good Rose blooms. (Large Silver-gilt Medal.)

Messrs. Dowel & Son, Hammersmith, London, exhibited garden requisites. (Silver-gilt Medal.)

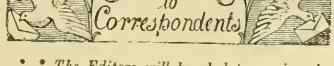
BRITISH GARDENERS' ASSOCIATION.

September 11.—A meeting of this association was held in the Goold Hall, Edinburgh, on this date. Mr. W. H. Morland occupied the chair, and addresses on the work and aims of the society were delivered by Mr. J. Harris and the secretary, Mr. Cyril Harding. A resolution pledging the meeting to form a branch of the association in Edinburgh was carried unanimously. A provisional committee was formed. Mr. J. Harris, Demonstration Garden, Liberton, was elected branch secretary pro tem.

Obituary.

William Baylor Hartland.—As these pages go to press we hear with regret of the death of Mr. William Baylor Hartland, proprietor of the Ard Cairn Nurseries, Cork, at the age of 76, which occurred on the 15th inst.

Joseph M. Cole.—Mr. Joseph M. Cole, florist, died at Peroria, U.S.A., on August 9. According to *Horticulture*, Mr. Cole opened the first store for the sale of cut flowers in Peroria, about 58 years ago. He was born in London, and settled in America with his parents at a very early age.



*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

Abnormal Arum: *F. E. S.* A specimen of Richardia with three spathes is not unusual; we frequently receive similar examples.

Abnormal Begonia: *W. G.* The abnormal flower is not due to fasciation, but to a duplication of parts.

Celery Diseased: *A. B.* The fungus causing the disease attacking the Celery is Septoria petroselini. All diseased foliage should be removed and burned or deeply buried. In future spray the Celery in the spring with the Bordeaux mixture at half the usual strength in anticipation of the disease. If Celery or Parsley is to be planted on the same ground treat the soil with kainit.

ABNORMAL HELENIUMS: *B. & Sons.* The specimens you kindly send show an interesting series of proliferation of flower heads (see fig. 106). Certain of the buds of the capitulum, instead of forming ray florets, have grown out to form secondary inflorescence stalks. The abnormality is of interest, as also is the fact that the ray florets show all stages from green to yellow, these having taken on a petaloid appearance. Although we have had an occasional example of virescent Helenium, we do not remember having seen such a remarkable series of "sporting" malformations.

COVENT GARDEN MEASURES: *C. R.* The number of Cucumbers contained in a "flat" depends entirely upon the size of the graded fruit, and varies from 24, 30, 36, 42, 48, to 60 fruits. Early in the season, say, in February and March, the flats generally contain 3 dozen Cucumbers. Later on, when the plants have increased in vigour, occasionally flats consisting of 24 and 30 fruits are included in each consignment. Flats containing 24 and 30 Cucumbers are generally sent to the Continental markets from Covent Garden, those containing from 3 to 4 dozen fruits each being more in demand in the home markets. The number of Parsnips and Carrots contained in a market bag depends on the size of the individual roots. English Carrots, Turnips, and Beetroots are sold in dozen bunches, the latter consisting of from 6 to 12 roots, according as the roots are large or small. A market bundle of Asparagus consists of 100 sticks. Parsley, Mint, and Sage should be made into good-sized bunches for marketing, putting in each bunch as many sprigs of the respective kinds as the hand can span when the stems are pressed tightly together. Bunches of cut flowers and Fern generally consist of 12 sprays or spikes; these include Bouvardias, Marguerites, Myosotis, Lily of the Valley, Lilacs, Violets, Gypsophila paniculata grandiflora, and Carnations. Richardias (Arums) are sold at per dozen spikes. However, we know from practical experience that bunches of the above-mentioned flowers, consisting of from 18 to 24 individual sprays (Arums excepted), find a more ready and profitable sale in the market than the stereotyped dozen sprays command. Bunches of the annual Gypsophila elegans grandiflora alba should consist of good handfuls. Bunches of Asters, Chrysanthemums, yellow and white Marguerites, and Gaillardias should be arranged in a "faced" spray, to present the individual flowers to advantage.

GOOSEBERRY AND ROSE SHOOTS FOR SOUTH AFRICA: *E. M. M.* Make the cuttings into bundles and bind them tightly. Have them of equal length, and then dip the cut ends in hot sealing wax. Dispatch them in a tin-lined box in damp Moss. You might insert the ends in Potatos instead of using the sealing wax, the object being to retain the moisture in the shoots.

MANURE FOR CHRYSANTHEMUMS: *A. W. C.* When the plants have filled the final pots with roots, liquid manure may be given freely until the flower buds commence to expand, but not afterwards. It has been found that sulphate of ammonia hastens the development of the buds, and gives brighter and richer colour to the blooms. A little nitrate of soda applied early in the season has the effect of hastening the growth, but this manure should be used with great caution. The compost employed at the final potting of Chrysanthemums should be of a rich nature, and room should be left in the pots for applying rich top-dressings as growth advances.

Names of Flowers, Fruits, and Plants.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.*

FRUITS: *H. Elliott.* 12, A very fine fruit of Williams's Bon Chrétien.—*J. O. D.* You send more than the proper number. A small donation to the R.G.O.F. box would be appropriate. Apple and Plum stocks cannot be named with certainty unless the plants are seen growing. We do not recognise the insects. The Grapes are badly shanked and infested with mealy-bug. Shanking is caused generally by unsatisfactory conditions of the border. The single berry is "scalded," caused by neglect to ventilate the vinery early in the morning. 1, Baron de Melor; 2, Knight's Monarch; 3, Williams's Bon Chrétien; 4 and 7, Marie Louise; 5, Beurré Diel; 6, Beurré Hardy; 8, Comte de Lamy; 9, Dumelow's Seedling (Wellington); 10 and 11, Hawthornden; 12, Worcester Pearmain; 13, Blenheim Pippin; 14, Uvedale's St. Germain; 15, Gilliflower (not Cornish Gilliflower); 16, Beauty of Kent; 17, most likely a local variety; 18, not recognised; 19, Magnum Bonum; 20, Brownlees's Russet; 21, White Nonpareil; 22, Emperor Alexander; 23, Dean's Codlin.—*A. F.* 1,

FIG. 106.—A PROLIFEROUS HELENIUM.

Towers Glory; 2, Northern Spy; 3, Striped Leadington; 4, Duke of Devonshire; 5, Old Hawthornden; 6, Castle Major.

PLANTS: *G. G.* 1, Chrysanthemum lacustre; 2, Lobelia hybrida; 3, Tanacetum vulgare; 4, Heliopsis lævis; 5, Achillea millefolium roseum; 6, Œnothera fruticosa; 7, Erigeron philadelphicus.—*J. H.* 1, Ononis spinosa; 2, Alchemilla alpina; 3, Solidago virgaurea; 4, Hieracium aurantiacum; 5, Geranium nodosum; 6, Solidago sp. (too scrappy to identify).—*W. H. M.* 1, Delphinium Belladonna; 2, not recognised, the flowers had fallen; 3, Phlox Eugénie Danzanvilliers. Delphiniums at this season of the year are not in character, and cannot be named with any degree of certainty.—*A. C. D.* Dimorphotheca Ecklonis.—*H. V.* You send more than the proper number (six specimens). 1, Thuya orientalis var.; 2, Cupressus Lawsoniana var. globosa; 3, C. pisifera aurea; 4, Phillyrea decora; 5, Picea nigra; 6, Cupressus pisifera var. filifera; 7, Thuya plicata; 8, Pinus excelsa; 9, P. Strobus; 10, Cupressus thyoides var. nana; 11, Picea excelsa nana; 12, Pyrus arbutifolia. — *O. W.* (Not more than six specimens should be forwarded at one time.) 1, Cupressus nootkatensis variegata; 2, C. Lawsoniana albo-maculata; 3, C. obtusa; 4, C. Lawsoniana; 5, C. Lawsoniana erecta; 6, Juniperus communis; 7, Cryptomeria japonica; 8, C. japonica; 9, Cupressus obtusa; 10, C. Lawsoniana erecta viridis; 11, Juniperus chinensis; 12, Cupressus Lawsoniana var.; 13, Pseudotsuga Douglasii; 14, P. Douglasii, glaucous form; 15, Cupressus Lawsoniana; 16, C. Lawsoniana glauca; 17, Thuya occidentalis var.; 18, Picea orientalis.—*J. P. Garth.* Phygelius capensis (Cape Figwort).—*W. T. Windsor.* Melilotus officinalis, a British plant sometimes cultivated by those who keep bees.—*W. C. B.* 1, Aspidium (Polystichum) pungens; 2, Onoclea sensibilis; 3, Selaginella viticulosa; 4, Salvia chamædryoides.—*A. J. E.* Dendrobium chrysanthum.—*E. Y.* Nicandra physaloides.—*R. E. F.* 1, Lantana, garden variety; 2, send flowers, leaf not sufficient; 3, Sedum Sieboldii variegata.—*H. H.* 1, Epidendrum patens; 2, Neobenthamia gracilis; 3, Davallia pyxidata; 4, Masdevallia Barlaeana.—*Constant Reader.* 4, not recognised, send when in flower; 6, Arbutus Unedo; 7, Euonymus europæus.—*C. E. T.* 1, Achillea Eupatorium; 2, Helenium autumnale; 3, (Conifer) Taxodium distichum.

NECTARINES SPLITTING: *H. W.* No disease of any kind is present. The splitting has been caused by too much moisture at the roots. Certain varieties are more prone to splitting than others.

PELARGONIUM: *E. M.* The variety of bedding Pelargonium at present furnishing the flower-beds in front of Buckingham Palace is Paul Crampel.

POISONING BY PRIMULA OBCONICA: *F. B.* It is recommended to rinse the hands well in spirits of wine (methylated spirits) and then wash them under a running tap, using plenty of soap.

RED SPIDER ON VINES: *G. S. W.* This pest thrives in a dry atmosphere and excessive artificial heat, and these conditions should be prevented by syringing the vines well and frequently. Until the berries are thinned out the surface of the border and paths should always be damped, and the evaporating troughs on the water pipes filled with water or liquid manure. An attack of red spider very often follows upon drought at the roots. The leaves affected with this pest should be sponged with soapy water, or the house fumigated with a nicotine vaporising compound. If these means fail the sulphur treatment should be employed. Some limewash should be placed in a vessel, and this should be stirred into a few handfuls of flowers of sulphur. Then in the meantime, and choosing the dusk of evening for the operation, heat the water pipes, and apply the liquid over the pipes with a brush. Keep the water pipes hot for two hours, and during this time make the house as airtight as possible, and take care that the atmospheric temperature does not rise much beyond 80° Fahr. When two hours have elapsed, the fires may be slackened gradually, and the sulphurous atmosphere may be allowed to escape by means of the top ventilators, which should be opened a very little. If necessary, this treatment may be repeated on alternative evenings, and it is better to repeat it several times than overdo the operation on the first occasion.

WHITE FLY: *S. H.* The small white fly which you say is so troublesome on Melianthus major and Fuchsias is probably the Snowy Fly (Aleyrodes proletella). Spray the plants with tobacco and soft soapy water, and if any flies are to be found alive after this spraying, dust the plants with a little soot.

DESTRUCTIVE INSECTS AND PESTS

SCHEDULED BY THE BOARD OF AGRICULTURE AND FISHERIES.

It may safely be said that at no period in the history of British horticulture has so much attention been devoted to the protection of crops from the depredations of insect and fungous pests as now, though good work was being done in elucidating the life histories of such pests more than a century ago. For sound information on insects and for a powerful impetus to the popular study of insect life we are not a little indebted to the old writers Kirby and Spence, whose invaluable *Entomology*, the first edition of which was published in 1815, and a "people's edition" in 1870, is unique of its kind. Curtis was another indefatigable investigator of a later period, and his monumental *Farm Insects*, with numerous figures and coloured plates, is very full and thoroughly trustworthy. Later came Miss Eleanor Ormerod, whose work in connection with economic entomology was of a most complete character. The degree LL.D. (Edinburgh) which was conferred on Miss Ormerod shortly before her death marked a somewhat tardy recognition of her great services to economic science. At the present day many investigators are engaged in working out the life histories of pests, and at the same time striving to discover satisfactory means of preserving crops from attack.

Side by side with the study of insect life, the investigation of parasitic fungi has been carried on by large numbers of workers, who have made valuable contributions to the general knowledge of parasitic fungi which infest cultivated plants.

It is doubtless not easy to form an accurate idea as to the actual monetary losses due to insect and fungous pests in the United Kingdom, but it is quite clear that the damage done is enormous—farm and garden crops, fruit, flowers and live stock being alike attacked. Two examples may be mentioned which afford some idea of what the estimated losses are, even though these may be exaggerated It was originally computed by correspondents of Dr. Eleanor Ormerod that the losses in Britain due to the ox warble fly amounted to from £2,000,000 to £7,000,000 annually. Though these figures are doubtless too high, the losses from this one pest are nevertheless very heavy indeed. The loss due to forest insects in the United States is immense, and it is stated that over a 10-year period the amount of timber killed and reduced in value by insects represents an average loss of some £12,500,000 per annum. It is, therefore, clear that any insect or fungus which is known to attack crops may, if imported into a country in which it was previously unknown, prove a real source of danger to the successful cultivation of those crops.

It is unnecessary to emphasise the fact that a very great deal is now known about the commoner insect and fungous pests, while it is well known that the knowledge gained has led to the regular practice of certain measures calculated to keep such pests within bounds. The practices of spraying fruit trees, Hop-washing, Potato-spraying, steeping cereal grains before sowing to prevent attack by fungi, the use of insect poisons, fumigation, and in general the attacking of the pests at the weakest point in their life history, have all arisen gradually, and have become more effective owing to a better knowledge of the pests against which they are directed.

More, however, is being done. So long ago as 1877, this country was alarmed by the advent of the Colorado beetle, and as this pest proves a great scourge of Potatos in the United States of America, it was felt that its possible establishment in Great Britain was a menace to our own crop. Provision was at once made by the Colorado Beetle Order, 1877, to stamp out the infestation, and its eradication was successfully accomplished by the Agricultural Department of the Privy Council—now the Board of Agriculture and Fisheries. This beetle, therefore, has never become established, though it again entered the country in 1901, when it was found near Tilbury, but was dealt with quickly and satisfactorily.

The widespread damage done by insect and fungous pests has of late years assumed such significance that it has been more and more realised that official action is necessary to cope with such pests and to control their distribution. The question came before Parliament in 1907, when the old Act of 1877 was extended, and the Destructive Insects and Pests Acts, 1877-1907, now enable the Board of Agriculture and Fisheries to deal drastically with these problems. In the past five years the Board have made several Orders, making the presence of certain pests on the farm and in the garden notifiable, with penalties for non-compliance. Further, the Orders render certain action compulsory in the case of the scheduled insects and pests.

At the present time four main Orders are in force.

(A) Under the Destructive Insects and Pests Order, 1910, are scheduled:—

The Narcissus Fly (Merodon equestris, Fabricius).

Wart Disease or Black Scab of Potatos (Synchytrium endobioticum, Percival). (See below.)

The Vine Louse (Phylloxera, vastatrix, Planchon).

The San José Scale (Aspidiotus perniciosus, Comstock).

The Mediterranean Fruit Fly (Ceratitis capitata, Wiedemann).

The Colorado Beetle (Doryphora decemlineata, Say).

The Large Larch Sawfly (Nematus erichsonii, Hartig).

The Potato Moth (Lita solanella, Boisduval).

The Gipsy Moth (Liparis [Ocneria] dispar, Linné).

The Brown Tail Moth (Euproctis chrysorrhæa, Linné).

The Nun Moth (Lisparis monacha, Linné).

The Cherry Fly (Rhagoletis cerasi, Linné).

Black Knot (Plowrightia morbosa, Saccardo).

Tomato Leaf Spot (Septoria lycopersici, Spegazzini).

Melon or Cucumber Canker (Mycosphærella citrullina, Grossenbacher).

American Pear Blight (Micrococcus amylovorus, Burrell).

(B) Under the American Gooseberry-mildew Order of 1911 is scheduled:—

The American Gooseberry - mildew (Sphærotheca mors-uvæ).

(C) Under the Wart Disease of Potatos Order of 1912 Wart Disease of Potatos (Synchytrium endobioticum, Percival) is removed from the Order of 1910 (see above) and given an Order to itself.

(D) The American Gooseberry-mildew (Fruit) Order of 1912 regulates the sale and importation of Gooseberries. Seventeen destructive insects and pests are mentioned in these Orders, the main provisions of which, as they affect gardeners, may here be given for convenience.

(A) The Order of 1910 states:—

"1.—(1) The occupier of any premises on which an insect or pest mentioned in the Schedule to this Order exists, shall forthwith notify the fact, with particulars of the time and place of discovery, to the officer appointed by the Local Authority to receive such notices, or, if no such officer has been appointed, to the Board; and, where practicable, a specimen of the insect or pest shall accompany the notice.

"2. An inspector or other officer appointed in that behalf by the Local Authority and any inspector of the Board may, upon production if so required of his appointment or authority, enter any premises on which he has reason to believe that an insect or pest mentioned in the schedule to this Order exists or has recently existed, and examine any plant, fruit, crop, seeds, tubers, bulbs, layers or cuttings on such premises.

"4. Every person who shall knowingly use, or sell for use, for planting any plant, seed, tuber, bulb, layer or cutting attacked by an insect or pest mentioned in the schedule to this Order, or any seed, tuber, bulb, layer or cutting which has been derived from a plant so attacked and is capable of spreading the insect or pest, shall be liable on conviction to a penalty not exceeding £10.

"5. It shall not be lawful, except with the written permission of the Board, to import, sell, or offer for sale a living specimen of any insect or pest mentioned in the schedule to this Order."

(B) The Order of 1911 specifies as follows:—

"3. The occupier of any premises on which there is a bush* which is, or appears to be, diseased shall forthwith notify the fact by post or otherwise to the Board, or to the clerk to the Local Authority, or to an Inspector of the Board or of the Local Authority, and where practicable a specimen showing the disease shall accompany the notice."

This Order further requires that no bush shall be moved from any garden in which disease exists or appears to exist until after an investigation by the Local Authority, who may at any time and from time to time, by a notice served on an occupier of infected premises require him to adopt such measures for prevention of the spread of the disease as are also authorised by the article and specified in the notice.

"The landing in Great Britain of any bush brought from any place out of Great Britain (except the Channel Islands) is prohibited, except that this provision does not apply to the landing of any Currant bush under the authority of a licence authorising such landing previously obtained from the Board of Agriculture and Fisheries."

(C) The Wart Disease of Potatos Order of 1912 provides in the same way as the other two for notification of the existence of the disease, and orders that no tubers shall be removed from any premises on which the disease exists or appears to exist until after investigation by the Local Authority, who are empowered to prohibit the planting of Potatos in the infected premises except under prescribed conditions. It is further provided:—

"8. It shall not be lawful to use any diseased tubers for planting, or to sell or offer for sale diseased tubers for that purpose, and an inspector of the Local Authority acting under their directions may, by a notice served on the occupier of any infected premises, prohibit the removal of any tubers from the infected premises except under such conditions as the inspector acting under such directions may consider necessary to prevent any diseased tubers being so used or sold or otherwise disposed of for planting."

(D) The American Gooseberry-mildew (Fruit) Order of 1912 prohibits the sale or exposure for sale of diseased Gooseberries, and further prohibits the importation of Gooseberries from any place outside Great Britain (except the Channel Islands), except when the package is labelled "Imported Gooseberries," and bears the name of the consignor and the country and district of origin. Cleansing of packages which have contained diseased Gooseberries is also provided for.

The Orders cannot be further quoted here, but it may be noted that all provide a penalty not exceeding £10 in the case of persons convicted of an offence under the Orders. It would be well for all those who are interested to make themselves fully acquainted with the provisions of the Orders.

In subsequent articles it is proposed to deal separately with the 17 destructive insects and pests mentioned above, the presence of which in any garden is notifiable under the Orders outlined.

H. C. Long.

FIG. 107.—LÆLIO-CATTLEYA MEMORIA H. A. TRACY.

* "Bush" is defined as a Gooseberry bush or Currant bush, and includes a cutting, stock, or seedling, and any part of a bush except the fruit.

LÆLIO-CATTLEYA "MEMORIA H. A. TRACY."

OUR illustration (fig. 107) represents this handsome hybrid, which obtained a First-class Certificate at the Royal Horticultural Society's meeting on the 10th inst., when it was shown by H. S. Goodson, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day). The sepals are white, tinged and veined with rosy-lilac and the broad petals bright rose, with a silver veining at the edge. The lip is an intense purplish-crimson with gold lines extending from the base. It is interesting to note the similarity of this hybrid, both in the form of the flower and the growth of the plant, to typical Cattleya.

The plant was purchased from the late Mr. H. A. Tracy just before his death, and Mr. Goodson has named it after that well-known orchidist.

TREES AND SHRUBS.

BERBERIS DICTOPHYLLA.

This Barberry was introduced from Yunnan many years ago, but it is not common, nor grown to the extent it deserves. It forms a medium-sized shrub some 4 feet or so in height, and is somewhat broad in proportion. The branches are erect when young, but become semi-arching with age. The ovate leaves are borne in clusters of five at each node, each leaf being about ½ inch long and having a few irregular teeth on the edges. They are bright, grass-green above, and intensely glaucous beneath. This glaucescence is also present on the stems, more especially the younger ones, the blue-whiteness of the whole plant being especially striking in summer. The usual three spines found in most of the Barberries are present beneath the leaves at each node, each spine being somewhat less than one inch in length, and sharply-pointed. The flowers are small, pale yellow in colour, and are succeeded by oval berries, which are red when ripe. Neither the flowers nor the fruits are very striking, the chief beauty of the plant being the peculiar glaucescence of the stems and the undersides of the leaves. It is easily propagated by seeds or by layering.

COTONEASTER RUGOSA HENRYI.

This variety is a comparatively recent introduction from China, and from present appearances will be a popular garden-plant when it becomes better known. It forms a somewhat spreading shrub, with the branches springing from opposite sides of the main stem, giving the plant a somewhat flattened appearance, and making it a good subject for a wall. The reddish stems are covered with a greyish felt or tomentum, and clothed with linear-ovate leaves about 3 inches long by somewhat less than 1 inch wide. They are rugose and woolly on the upper surface, and covered beneath with a thick, grey tomentum. The white flowers appear in May, and are borne in small corymbs on nearly every part of the wood of the previous year, being followed by clusters of small, oval berries which turn a bright-red in the autumn. The leaves develop a crimson-scarlet before they fall, and the autumn foliage, in conjunction with the brightly-coloured fruits, renders the plant a brilliant autumn subject for the garden. Plants growing in Messrs. J. Waterer & Sons nursery here, in a somewhat wet position, succeed only moderately well. A dry, sunny wall is the best place for this plant, and in such a dry situation the fruits and foliage colour to perfection. The stock may be readily increased from cuttings or seeds, the latter being freely produced in most seasons. *J. Clark, Bagshot, Surrey.*

RECLAIMING SAND DUNES IN BELGIUM.

Large areas of shifting sands have been successfully planted along the Belgian seaboard, and the method is so simple and inexpensive that an account of it may be interesting to those who live near the coast and to whom the fixing of drifting sands is a matter of importance.

Near the beautiful summer resort of Knocke miles of the coast on either side of the town have been successfully dealt with, the plantation extending inwards to, in some instances, a couple of miles from the sea. These sandy wastes along the Belgian coast are not of the flat character usually met with in some parts of England, but may well be described as of the hill and dale type, many of the dunes rising abruptly to over 200 feet in height and then as rapidly falling to almost sea level; indeed, in viewing the irregular, sharply-rising dune hills behind the town of Duinbergen, they may readily be taken for a rocky formation rather than for vast mounds of sand.

Not in all cases has success crowned the enterprise of the planter, for I noticed several instances where the almost constantly-shifting sands had baffled the best efforts of those who had undertaken their reclamation. However, failures were few and successes far greater than could be expected on so exposed a coast and on such treacherous sands. The method adopted is simple in the extreme; first a fence of brushwood is erected to seaward, and behind this shelter the Marram or Sea Matweed, Sea Buckthorn and Dwarf Willow (Salix repens) become quickly established, and by their creeping rootstocks soon spread about and firmly fix these drifting sands.

Owing to the exposed situation, trees are planted but sparsely next the coast, but inland I saw thriving plantations of the Cluster Pine (Pinus pinaster and its variety maritima), Scots Pine, Poplar, Willow and other trees which had been planted by the State some 20 years ago.

The Sea Matweed is planted in small tufts about 2 feet between each and in lines about a yard apart. It is a most accommodating and hardy plant, and in pure sand the four running roots soon form an anchorage that even the most severe storms are unable to dislodge.

I was surprised to see the Dwarf Willow succeeding so well in pure sand; in many instances several acres of the dunes were completely carpeted by the refreshing green of this useful plant. The Sea Buckthorn, with its silvery foliage and masses of orange-coloured berries, was also quite at home, and covered vast areas of the dunes. After these shrubs have become established, numerous other plants put in an appearance, including the Rest Harrow (Ononis), with its freely-produced, deep-red flowers, Wild Geranium, Violets in abundance, Sedums, and many kinds of maritime grasses. The plantations of the Cluster Pine, or rather its variety maritima, which are inland about a mile, show how well suited this tree is for doing battle with the keen winds of the sea coast, as do also those of the Scots Pine and mixed woods of Poplar, Mountain Elm, Maple, and several kinds of Willow. Here, for the first time, I noticed that the Cluster Pine was attacked by the Pine beetle (Hylurgus piniperda), but not to any serious extent. Beneath many of the Pines and throughout the wood generally I was delighted to renew acquaintance with the red-flowered Helleborine (Epipactis rubiginosa). Nowhere have I found it so prolific, and beneath a single Pine tree I counted more than 50 specimens, and many of the tufts had over 40 flower-heads.

The White Poplar (Salix alba) seems to be peculiarly suitable for planting on sandy soils by the sea coast, as it sends up shoots freely around the stem, and owing to the white undersides of the leaves has a decidedly ornamental appearance when agitated by the wind. Both the White Poplar and the Aspens are pollarded, the tops being annually cut off at about 10 feet from the ground level owing to the exposed situation and winds which blow almost incessantly from seawards.

The reclamation of these dunes show what can be done to convert dreary, treeless, sandy wastes into thriving forests and shrubberies. *A. D. Webster.*

Fig. 108.—Lobelia tupa at Benchil, Broughty Ferry.

LOBELIA TUPA.

The illustration (fig. 108) shows a plant of Lobelia Tupa growing in the gardens of Mrs. F. Stewart Sandeman, at Benchil, Broughty Ferry, N.B. Though this handsome species was introduced from Chili as long ago as 1824, a really good specimen is rarely seen in gardens. When well grown it is a striking object in the herbaceous border, and a plant that at once attracts attention. Mrs. Stewart Sandeman's plant has occupied its present position for about seven years, and has developed into a huge specimen, carrying this year 27 flower-spikes, the tallest of which is 5½ feet high. During the summer of 1911 the plant ripened a quantity of seed, a portion of which was kindly sent to the writer and it has germinated freely. Lobelia Tupa seems to thrive best in gardens near the sea, in a free, sandy soil. In such a position it is perfectly hardy without protection, whilst on heavy or wet soils the plant can be brought safely through the winter if given a moderate protection. The foliage, which is broad and handsome, is of a pale green covered with whitish down; the flowers are reddish-scarlet in colour, and on well-established plants very showy. In recent years this species has been somewhat scarce, yet it is a subject worthy of a place in the most select collections of plants. *T. Hay, Greenwich Park.*

THE ROSARY.

IRISH ROSES.

I HAVE duties which give me the opportunity of visiting Ulster each year in connection with the Monaghan County agricultural show, a gathering and exhibition of the most comprehensive character.

But my desire at the moment is to convey a few impressions to my old rosarian friends of the Irish-raised seedling Roses that I saw during a recent visit. These Roses were raised by Dr. Campbell Hall, Monaghan; Messrs. Alex. Dickson & Sons, Newtownards; Messrs. S. McGredy & Son, Portadowa; and Messrs. Hugh Dickson & Son, Belmont. Dr. Campbell Hall's fine seedlings I saw in his own garden, Messrs. McGredy's I also saw at Portadown, whilst the flowers of both the Messrs. Dicksons were displayed in their fine stands at the show.

I was particularly struck with the blooms shown by Messrs. Alex. Dickson & Sons of their grand dark seedling Rose "George Dickson," also with varieties raised and exhibited by Messrs. Hugh Dickson & Son, Belmont. In Dr. Hall's garden I had the enjoyment of seeing "Annie Crawford," and not for the first time, as an exhibition Rose of the finest type, a beautiful silvery pink with a full, pointed centre and great, deep petals, in every sense a Hybrid Perpetual that has come to stay. Another H.P. Rose, "Mrs. George Wilson," a dark crimson, of which there was at least half-a-dozen perfect flowers that would give added size and form, combined with perfume, to the finest stand of Roses I have ever seen staged. I mention the names of two Roses that I can remember in this garden, but there were others, named and unnamed, of equal merit to many new Roses which have been awarded the Gold Medal of the National Rose Society.

At Portadown, Messrs. McGredy's large plantation of seedling Roses, although it was September 13, was a sight to cheer a Rose-lover's heart. Teas, Hybrid Teas, and Hybrid Perpetuals in every form, type, and shade of colour were growing there in perfect health. That is the place where they can best be judged and a definite conclusion arrived at as to their constitution, freedom of flowering, resistance to mildew, adaptability for exhibition, for decorating the garden, cutting for the house, for florist's purposes, and last, but not least, for the perfume so dearly loved in the old days. In walking through and admiring the beautiful collection of seedling Roses, I was brought to a full stop when I reached the corner, where what I should consider to be a pure Tea Rose was growing. It was almost pure white, and in form and shape a glorified form of Catherine Mermet, but much larger. After admiring the Rose and noticing that there were a hundred or more perfectly-formed flowers fit for either the exhibition stand or the drawing-room, I was told with pride by the Rose grower that this sweet-scented Rose was "British Queen," and had been awarded the National Rose Society's Gold Medal the previous day at the Society's autumn show in London, a just and well deserved award, for if Messrs. McGredy never raised or sent out another Rose, those who love our national flower will, for all time, treasure this one.

I am now still more strongly convinced, from what I saw in the two gardens of gentlemen who are devoting time and great interest to the raising of Roses, that the present system adopted by the National Rose Society of awarding its medals or commendations for seedling Roses should be changed entirely. At the four meetings of the Society, raisers are requested to put up a specimen plant of the new seedling Rose with six blooms, upon which the award of the judges or jurors is to be decided. How many of the awards that these gentlemen have made would they now confirm after they have grown the Roses over which they went into such raptures when they adjudicated upon the plants placed before them upon the show bench, deciding at the same time whether the Rose was to be considered a Tea or Hybrid Tea, a point which, with due respect, should be decided by the raiser. The time has arrived when the final awards should not be made at the shows of the National Rose Society, but the seedling or sport should be seen in its own home when in a fit condition for inspection and criticism by, say, three gentlemen, whose award would be confirmed by the council of the National Rose Society, it being distinctly understood that the names of the gentlemen who made the award would be given in the usual way. If a practical course like this were adopted, many excellent Roses that could not be shown or exhibited at or on certain dates could be inspected where they were raised, and thus receive that token of merit they deserve. Had such a plan been practised in the past, I venture to think that some Roses would not have received the high honours that have been conferred upon them. *W. J. Grant.*

FIG. 109.—SAXIFRAGA LONGIFOLIA IN A DEVONSHIRE GARDEN.

(See p. 247.)

CULTURAL NOTES FOR OCTOBER.

THE end of October is the best time for procuring, from the hedgerows, wild Roses intended for budding as standards the following season. This is fully a month earlier than the majority of growers procure these stocks, but planting early has many advantages. The roots of these strong briars are usually very few in number and exceedingly coarse, but if they are planted early, the soil settles about the roots, and the stems retain their moisture. Another advantage is that the plant has time to develop a few new roots before the winter arrives.

For several seasons I have made careful observation, and invariably found the best results are obtained from stocks which have little, if any, of the older portions of the roots left upon them at the time of planting. If a plant is lifted after a couple of years it will be found that the major portion of the thick root-stock is decayed and covered with a white fungus. There are two reasons for the early transplanting of the budded briars. First, the stock is generally planted deeper than it should be permanently, in order to conserve the moisture in the stem and prevent the stock dying from this cause, which often happens, especially in the case of the taller ones. Lifting allows transplanting at a proper depth. Secondly, suckers may be removed even when in a very young stage.

Stocks do not require richly-manured ground, but the Roses, when worked, need good soil, and shifting allows of this being supplied at the right time. I may appear to have said more upon this matter than is necessary, but experience has convinced me that much of the prejudice against standards is due to their careless or thoughtless preparation, and selecting varieties unsuited for the purpose.

Provided the ground is in a suitable condition and the plants not too much in growth, I prefer to plant Roses by the end of this month. Having made several experiments, I find that early-transplanted plants suffer much less from shrivelled wood, except, perhaps, just at the first, when shrivelling may be prevented by overhead sprayings during dry weather.

In the majority of instances Roses are not planted firmly enough. I do not suggest that the soil should be rammed hard, but it should be trodden firm. Upon no consideration should the roots be set in animal manures. Rather than have too rich a soil around the roots at the time of planting, I recommend mixing a special compost for the purpose and placing a few handfuls of it amongst the roots, previous to filling in the hole with the ordinary soil. When Roses that have been placed in excessively rich soil are lifted, it will be found that the rootlets have a brown or burnt appearance, suggesting an unsuitable medium.

One can scarcely take too much care in spreading out the roots and adding a little of the soil at one time, so that the whole may be well trodden together. In the case of "maiden" or one-year-old plants (dwarfs), the junction of Rose and stock should be placed about 3 inches below the soil when the planting is completed.

Standards should not be planted quite so deeply as when they were maidens, and the stems should

be secured at once to stakes. Attention to staking is of greater importance than many imagine, for the wind has much more effect upon standards than dwarf plants, which will scarcely sway at all if planted properly. Towards the end of the month a few stocks raised from cuttings intended for winter grafting may be lifted and potted. It is well to plunge the pots in cocoanut fibre and sand, as the bark will be softer and lift better. If a few of these stocks are potted now they will be in a good condition for grafting by the end of November. Some of the seedling Briars may be treated in the same manner; these are much more frequently used now than are the cuttings of Briar and Manetti. Any fairly-sheltered place outside is suitable to plunge them in, and one good watering should suffice.

Roses Under Glass.

Pot Roses should not remain entirely unprotected after the end of October. They do not require heat, but merely protection from excessive wet and frost. I have frequently traced failures to the wood having been frozen, and we sometimes get frost enough after this date to do harm. The wood must not be frozen if the plants are to be forced successfully early in the winter. Another small batch of the ripest plants may be brought indoors for forcing. *Practice.*

SAXIFRAGA LONGIFOLIA.

This Saxifraga (see figs. 109 and 110), whether in a large or small state, is a most delightful plant. Its rarity makes it valuable in the eyes of growers, as in few collections can really handsome, well-grown tufts of this superb plant be found. It is a true Alpine, and always does best in rock-fissures which are almost or quite perpendicular, where the roots can run down to something cool and rich. During the growing season it appreciates abundant moisture. It is the noblest of the silvery Saxifrages, and a most satisfactory plant in all stages. It is interesting to watch the gradual increase of the young rosette of stiff, symmetrical foliage for two or even three years, and finally the growth of the great flower-spike, when, after due ripening of the seed, the plant dies. Unlike other Saxifrages of this section, it produces no offsets, and young plants can only be obtained from seed. The plumes of flower are often nearly 2 feet in length and a foot wide at the base. The characteristic beauty of its huge rosettes of silver-crusted foliage, its immense plumes of innumerable snowy-white flowers, and, above all, the ease with which it may be grown, mark it at once as a most desirable plant for every rock-garden. Even where the conditions cannot be considered as favourable, it is by no means unusual to see the individual rosettes over a foot in diameter, and many of the leaves close on 7 inches or 8 inches in length. Its headquarters are in the Pyrenees, where it may be seen in great numbers effectively veiling the surface of almost perpendicular rocks. This fact has given rise to many of the failures experienced in its culture. The rosettes, where they can be collected, are pulled roughly from the rocks and sent home with instructions to plant them in a wall. They naturally fail, both because the greater part of the roots have been destroyed, and because there is nothing in common between a natural rock-face and a wall. If the roots of these Saxifrages could have been followed, they would have been found feet, perhaps yards away, in the crevices of the rocks, cool and moist, while the rosette on the surface was quite dry. These are the conditions that suit Saxifraga longifolia, and it may be easily grown, even in small rockeries, with layers of stones. Seeds can be raised in a cold frame, and the seedlings either kept in pans or boxes, or planted out in suitable spots in the rock-garden. The more exposure they are given, the better they will thrive. *Wyndham Fitzherbert.*

HARDY FLOWER BORDER.

HERBACEOUS PÆONIES.

There have been more complaints this season than usual of the failure of these plants to flower. The cause is not far to seek, for it is primarily if not entirely due to the great heat and drought of 1911. The plants remained at a standstill at a time when leaf-growth should have been most active. The successful flowering of the herbaceous Pæony largely depends on the growth made in the previous year, for good crown buds are necessary. Hence it is important that the plants are kept growing in their season. As the direct result of the long-continued heat and drought of last year, the plants acquired a debilitated condition, and the crown buds were much weakened. Thus the leaf-growth this season was of diminished vigour. The Pæony, in its method of root production, the shortness of its season of growth, and the storing up of the embryo flower in the crown bud of the plant, differs from many other hardy herbaceous subjects. In these

Fig. 110.—Saxifraga longifolia in the Jardin d'Acclimatation, Geneva.

circumstances, attention should be paid to the fullest development of the leaf-growth by providing moisture and the requisite food supplies. Blindness has been seen in the case of recently-planted as well as established specimens this season, whilst those plants that have escaped have not borne flowers of average quality. Exceptions have been seen in some of the single Japanese varieties, such as General Nogi and Nymph, the latter, side by side with good varieties of P. sinensis, having flowered splendidly. The old-fashioned double crimson P. officinalis fl. pl. has, however, suffered as much as any variety, more particularly in very light or very heavy soils.

In the case of recently-planted examples, I have advised that the plants should be allowed to remain in their positions, and be mulched or encouraged with liquid manure from September onwards, when the period of root activity in the Pæony begins afresh. In the case of old-established clumps growing in exhausted soil, I recommend lifting, dividing and replanting early in September. Those who do their Pæony planting when a few inches of new growth is apparent in early spring are doubtless among those who complain that this subject is "impatient of disturbance," and it certainly is—if disturbed at the wrong time. In spring, the main root-fibres have been produced, and once broken or checked by lifting they do not recover. Like the Daffodil, the Pæony should be replanted during its dormant period, so that its rooting may be begun, continued and ended in the soil. It is because of its peculiarities in root production that I place the Pæony in a small group which I style "periodical" rooting as opposed to many others which produce root-fibres perpetually or nearly so. By dividing the plants in August and September, and replanting them, they soon recover from the check.

Pæonies should never be transplanted in big clumps intact. They either root feebly or not at all from the broken tap roots and trunk; the best roots issue from the base of the crown bud, or around it. In a big clump the majority of the buds are not in contact with the soil. The great majority of the tap roots are of no further use to the plant in such circumstances, and may be cut away. This done, take a large clump, place it on its side on the potting bench, and selecting two strong hand-forks, place these back to back, and thrust or drive them with a mallet into the trunk or root-stock of the plant 2 inches or so below the base of the crown buds. By wrenching in an opposite outward direction the trunk is severed, and if need arises the operation may be repeated. Good planting specimens should possess three or four well-developed crown buds. In the Pæony the roots cross and recross each other, and by cutting straight through with a sharp instrument much loss is experienced, but by wrenching the roots asunder this loss is reduced to a minimum. Where handsome groups of plants are required, these may be obtained by arranging several specimens close together, say, at 2 feet or 2½ feet apart each way. In planting, it should be recognised that the Pæony is a deep-rooting and gross-feeding plant, hence a deep, rich soil is essential to permanent success. In the light soils of this portion of the Thames Valley, in addition to ample waterings at other times, I have often supplied the roots liberally with liquid manure in winter time, with the best results. *E. H. Jenkins, Hampton Hill, Middlesex.*

The Week's Work.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

CARROTS.—The operation of lifting the main crop of Carrots intended for use during the winter should be performed on a fine day. They should be carefully dug up with a long-pronged fork and sorted over, the best-shaped specimens being set apart. The tops should then be removed, and the Carrots stored away as soon as possible, either in the pit or in the root store, as the case may be. Another alternative is to keep them under a north wall, plunged in sand or dry soil; but the root store, if well built and in a suitable position, is probably the best place for them. A very good store can easily be constructed in the form of a lean-to shed against a north wall, with earthen floor and partitions of plain four-and-a-half brickwork. A trellis of wattle hurdles can be laid against the partitions for the storing of Onions.

CAULIFLOWERS.—One more sowing may be made, for wintering in a cold frame, at about the end of this month. The seed bed should be protected by means of a frame. As soon as the seedlings of the previous sowing are large enough, they should be planted out in poor soil in a cold frame, with a distance of 4 inches between each plant. They should not be coddled—even during the winter they should have as much fresh air as possible, though they must be protected from actual frost.

LATE PEAS.—The dull weather and chilly nights which have been experienced lately have been most unfavourable to the growth of Peas, and many of the flowers have failed to set. However, an improvement has taken place during the last few days, and, if this continues, an occasional soaking with manure water may be given on bright days. Birds have been very troublesome of late, and it will be well to protect the pods with netting. The growths should be thinned out, if necessary, and if the late flowers appear too numerous these may be thinned also.

FRENCH BEANS.—Special attention should now be paid to French Beans growing in cold frames, as they will continue to give a supply of pods after the Scarlet Runners have all been cut out-of-doors. The plants should be well supported with stakes and kept moist; while the crops are swelling, manure water may be given with good results. On frosty nights it will be well to allow a very little heat. When the weather is bright, the foliage should be syringed; this, and an occasional stirring of the soil between the rows, will tend to keep the plants in a healthy fruiting condition. If there is a warm house available, the earliest sowings may now be made for the following season; but unless a brisk heat can be obtained, it will be well to defer sowing for a time. If, however, it is decided to sow now, care should be taken that the pots are not too large; 8 inches is a suitable size. A compost of turfy loam should be used, and some horse-droppings added, such as are used for the formation of Mushroom beds. A little leaf-mould may also be used, and the mixture kept in a loose condition. Until the seeds germinate, the pots should stand close together; the surroundings should be kept damp by means of syringing.

TOMATOS.—Plants for winter-fruiting should now be well established in pots, and strong growth—not gross—should be encouraged. The plants should stand in a fairly light place in a house with a south or south-west aspect, and they must be watered carefully. On bright, warm days, ventilation may be freely given, but in foggy, damp weather air must be admitted with caution, and a little heat supplied to maintain a temperature of 50° to 60°. Side growths should be removed, and a slight sprinkling of finely-sifted loam, with a liberal addition of artificial manure on the surface, will tend to keep the roots active. Successional plants, intended for fruiting in the early spring, must be shifted, in order to prevent their becoming pot-bound; they should be kept in a light position—such as a shallow pit—where a little heat is available when required. They will fruit well in forcing houses if sufficient light can be obtained; Winter Beauty and Sunrise are two varieties which will do particularly well under this treatment. The pots should not be more than 9 inches across.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

PLANTING VIOLETS IN FRAMES. — Plants which have been growing in the open ground all the summer will now be ready to be transferred to frames or pots. The transfer should be completed, if possible, by the end of the month, so that the plants may be established before the winter begins. Owing to the dull, wet weather, Violets have made more foliage than usual, and there has been so little sunshine that it is to be feared that the crowns will not be so well ripened as one would wish for winter flowering. Before the actual lifting is begun, the frames should be prepared and everything be in readiness, as there must be no delay in planting when once the roots are out of the ground. The greatest care should be taken in lifting the plants; the ball of earth round the roots must be kept perfectly intact, and if any plants do not fulfil this condition they cannot be relied on to thrive in the frame. They must also be strong and healthy, or it is useless to transfer them. Methods of cultivation vary considerably. We ourselves find it the best plan to plant the Violets in a frame facing due south, so as to ensure their obtaining the full benefit of the sunshine. The bottom of the frame must be very firm; it is often found desirable to utilise frames which have been used for growing Cucumbers or Melons. The compost for planting should consist of two parts turfy loam to one part of leaf-soil, and one part of spent Mushroom-bed or well-rotted manure. To this, some crushed mortar rubble should be added, and plenty of sharp sand. The soil should slope down towards the front of the frame, and the foliage of the plants should be at least 12-18 inches away from the glass at the top. This latter point is important, as there should always be space for air between the plants and the glass. During severe weather it is often necessary to close the frame altogether, in which case, ventilation from outside being impossible, a supply of air space inside is essential. The plants should be put in firmly, and well watered when finished. They should be shaded from bright sunshine for the first few days, and the frame may be kept fairly close. If the plants seem inclined to flag, the foliage may be damped at intervals. Air should be admitted gradually, at first only in the evening and at night, but after a few days abundant ventilation may be admitted during favourable weather. Draughts and cold winds should be avoided, and some finely-sifted leaf-soil or Cocoanut fibre refuse may be laid on the surface of the soil. All decaying leaves should be picked off and the glass kept clean.

VIOLETS IN POTS.—Flowering Violets are often grown in pots, and all plants intended for this purpose should be potted at once and placed in conditions similar to those recommended for frame plants. The advantage of the potting method lies in the fact that the plants can be moved at will into the conservatory or the dwelling-house.

HELENIUM. — These plants are among the brightest of the herbaceous perennials, and some of the taller varieties are now conspicuous in the borders. The dwarf varieties, such as H. pumilum and Bolanderi, flower profusely earlier in the season over a long period. At the present time, H. grandicephalum, H. striatum, and H. cupreum are noticeable, and the newer H. Riverton Gem is much admired for its bright colouring—a happy combination of terra-cotta and old gold. H. autumnale grandiflorum and H. a. superbum are both capital plants for autumn flowering.

DAHLIA.—The Dahlia plants are now at their best, and every effort should be made to keep them in flower as long as possible. In view of the prospect of autumnal storms, all ties should be well secured. After a rough wind it is a good plan to examine the stakes and replace any broken ones, cutting off, at the same time, any old blooms and damaged growths. By means of constant attention, the Dahlias may still prove attractive for some weeks.

SUB-TROPICAL BEDS.—The growth of the plants in these beds usually becomes somewhat rampant late in the season, and the strong-growing, rather weedy subjects are apt to encroach on their weaker neighbours. Special attention must be given to the permanent plants which will be taken back to the greenhouse after the summer spent out-of-doors. For the sake of the more tender plants, the approach of frosts should be carefully watched for, and adequate protection given in order to prevent any injury.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

CATTLEYA.—Plants of C. gigas, C. Hardyana, and C. Warneri that have passed out of flower will soon begin to produce roots from the pseudo-bulbs, and any which require to be repotted or resurfaced should be attended to without delay, as also should such Lælias as L. tenebrosa, L. purpurata, and their numerous varieties, which will, by this time, have commenced their new growth, and will be pushing new roots from the base of the young shoots. When the plant has been removed from the pot, the old, useless pseudo-bulbs, especially those that have no leaves, should be cut away. The plants should then be placed into receptacles of sufficient size to accommodate them for the next two seasons. Ample drainage must be afforded, and pots which are to contain moderate-sized plants should be filled to about half their depth with clean crocks, whilst for larger specimens a greater depth of drainage should be used, and less potting material. When potting, keep the rhizome of the plants just level with the rim of the pot, and press the compost firmly among the roots.

LÆLIA ELEGANS.—The plants of this species which have recently passed out of bloom will be producing fresh roots from the youngest pseudo-bulbs, and should also be repotted at this period. When repotting any of these species with long bulbs, it is important that the plant is made thoroughly firm by tying a few of the bulbs to neat, strong stakes. Any plants of such Cattleyas as C. Mendelii, C. Mossiæ, C. Trianæ, C. guttata and C. Leopoldii that have grown too large for their pots may safely be repotted at this season. If they are pushing new roots from the base of the youngest pseudo-bulbs, do not pull the plants from the old pots, but break them and carefully remove the pieces of pots, and, without disturbing the drainage or roots, place the whole into a pot of suitable size, filling in around with some new compost. The rooting medium for all the above-mentioned plants should be similar to that mentioned for Cattleyas in the calendar for April 6. After being repotted, the plants should be exposed gradually to more light and air, only afforded sufficient water at the roots to prevent shrivelling, because if the compost is kept continually damp at this season, the plants will commence to make growth instead of taking their proper season of rest. I do not advocate unnecessary repotting of Cattleyas, Lælias, or their hybrids at this season, but it is generally known that where numbers of these plants are grown they are not all ready to be dealt with at the same time. Repotting should be done when it is seen that new roots are emerging from the new pseudo-bulbs or leading growths. The Cattleyas which flower in the autumn (C. labiata, C. Bowringiana, and many Cattleya and Lælio-Cattleya hybrids) have finished their season's growth, and are pushing up their flower-spikes. These plants should be staged in the cooler part of the Cattleya house, where plenty of fresh air will reach them, and where they will be exposed fully to the light, so that the new pseudo-bulbs and leaves will become hardened. Only sufficient water to keep the roots moist until the flowers are fully developed should be afforded, when the supply must be lessened gradually. Many species and hybrids of Cattleya and Lælia are finishing their growths, and during dull, damp weather it will probably be found that the outer sheath which encircles the new bulb has become soft and sappy, and, clinging tightly to the bulb, excludes the air. As this condition often causes the bulb to rot, the sheath should be slit open from top to bottom, keeping the plant dry for a few days and reducing the atmospheric moisture.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

VIOLETS.—There should be no delay in transferring Violets to frames from the open ground, and, provided they are lifted with good balls of soil, the plants will receive very little check at this season. Brick frames are undoubtedly the best structures, as they keep out more frost than those made of wood, though these latter may be used in districts where frost is not severe. If a daily supply of Violets is required during the winter, a portion of the stock should be planted in frames where heat may be provided during very cold weather. As a rule, the plants are not fastidious in respect to soil, provided it is of a fairly open texture and sweet; but, wherever possible, a little fresh loam should be provided. The frames should be filled to within about 9 inches of the glass, except for the larger-growing, single varieties, when at least 1 foot should be allowed between the soil and the glass. In planting, press the soil moderately firm, and place the crowns fairly well out of the soil, so as to obviate, as far as possible, any danger from damping. Give the roots a good watering, and keep the lights off until protection from wet or cold weather is necessary. To prevent the foliage from flagging during bright sunshine, syringe the plants overhead with very weak soot-water; but this should only be done when absolutely necessary.

HOUSING CHRYSANTHEMUMS.—By this date large-flowering Chrysanthemums should be ready for placing indoors, as frost may occur at any time. So far as possible, plants in different stages of development should be housed separately. Those that are already opening their flowers should be placed in a cool, dry house, where, if necessary, they may be shaded to retard the blooming. The very late varieties may be placed together in a house, where, later on, fire-heat may be provided. These late plants may be given manure for some time to come; by placing them together feeding will be done much more easily than if housed in a haphazard manner. The early and mid-season decorative and single varieties should also be housed, giving the plants as much room as possible to ensure the growths keeping stocky. Late varieties, such as Winter Cheer, White, Yellow, Bronze and Pink Victoria, A. J. Balfour, and J. W. Crossley, may still remain out-of-doors, but they should be arranged together, so that, in the event of frost, they may be either covered with lights or some protecting material. In such a position they may, with advantage, remain for three or four weeks. For the present, all the air possible should be allowed the plants. After they are brought under glass, the plants will require a fair amount of water, for there will not be much atmospheric moisture, and dryness at the root would cause a severe check. Liquid manure may be given in all instances till the blooms are about half developed, when clear water only should be used.

WATERING AND SYRINGING.—The majority of plants do not require so much water at this season as during the period of more active growth, and overwatering must be guarded against. An excess of water during autumn would result in a sappy growth, which is not easily rectified. Syringe the plants in the stove houses overhead on bright mornings only; where much fire-heat is employed, keep the stages and paths damp, as even at this season, red spider and thrip soon make their appearance if the atmosphere becomes too dry.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

STRAWBERRIES IN POTS.—In order that the crowns may be well ripened by the end of the season, every chance must be given for sunshine and air to move freely about them. If necessary the plants should be thinned out, as overcrowding must be avoided. Weeds must be removed regularly, also side growths and runners. Thoroughly syringe the foliage on hot days, for this will tend to keep the plants free from attacks of red spider. Mildew will sometimes affect the leaves at this time of the year, but this may be prevented by spraying the plants occasionally with a solution of soft soap and sulphur. The pots being now full of roots, water will be required much more frequently than formerly. Liquid manure and soot-water should also be afforded with increased strength as the crowns develop.

EARLY POT VINES.—Those vines which will be required for starting at the beginning of November, should soon be perfectly matured. If the wood is well ripened the canes may be shortened to the desired length in the first week in October. They may then be placed in an exposed position till the time arrives for placing them into the forcing house. In selecting the vines for very early forcing, preference must be given to those which have made short-jointed growths of medium strength. These will be more thoroughly matured than the stronger ones. The vines will require a little preparation before placing them in the forcing house. The rods must be thoroughly scrubbed with a fairly strong mixture of soft soap and sulphur, taking care not to damage the buds in the process. Remove some of the soil from the surface of the pots to make room for a top-dressing of rich loam mixed with crushed bones, wood-ashes, and a little concentrated manure. If there is no room for the top-dressing material, zinc collars may be placed round the pots. Ram the soil firmly with a wooden rammer. The most suitable house for forcing early pot vines is a three-quarter span having a southern aspect. The house must be well provided with hot-water pipes, so that the temperatures may be easily kept up without heating the pipes to excess. A house which is not too large should also be preferred.

EARLY PERMANENT VINES.—The wood on these vines should be sufficiently matured to admit of the pruning being done early next month. In pruning very old vines it is not always prudent to cut the wood too hard back. To ensure an even crop of good bunches it may be necessary in some cases to lay in some young shoots where there is room to tie these to the main rods. In all cases it will be wise to leave two or three good prominent buds on each shoot. The vines may not present such a neat appearance by this treatment as they would if the shoots were cut hard back, but the crop should not be sacrificed for the sake of appearance. When pruning is finished, give the house a thorough cleansing, and if painting is necessary the present is the best time for this to be done. The rods should then be given attention. If mealy bug has been troublesome all loose bark must be removed, which should be caught on a sheet of canvas and burnt. Afterwards well scrub the rods with strong soft-soapy water or Gishurst compound, using a stiff brush for the purpose. If painting is not done the trellis and all iron work should be well saturated with paraffin. All brickwork should also be given a good coating of lime-wash. The borders then must be carefully forked over, removing sufficient of the surface soil to make room for a good top-dressing of loam, lime rubble, wood-ashes, and artificial manure. Before starting the vines into growth, examine the border, and if water is required let the roots be given a good soaking. They will not require watering again till the vines have burst into growth.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

GATHERING FRUIT.—Fair weather should be chosen for the gathering of all kinds of fruits, it being necessary for them to be harvested in a dry condition. They should be sorted carefully, and imperfect specimens selected for present consumption. The season is a backward one, and some fruits are still immature; if the situation is somewhat sheltered, allow such fruits to hang for as long as possible, as they always keep better when ripened properly. Late Pears on walls should be allowed to hang for some time to come; being protected from damage by winds, they will keep and ripen better than fruits on exposed trees, and are also of much better flavour. Late varieties of Plums should be gathered earlier than usual this season if damp weather continues, as many of the fruits will split through the wet and be spoiled for dessert purposes. It should be constantly borne in mind that those fruits which are stored properly will increase in value as the weeks pass; it is only in autumn that a temporary glut is liable to cause the cultivator to under-estimate the worth of his crop.

THE APIARY.

By CHLORIS.

DISEASES AND BEEKEEPING.—Owing to the losses which beekeepers have sustained from diseased bees, there is a tendency to give up beekeeping; in other cases to continue, but to neglect the bees. Both cases are wrong, and the latter especially so, because they are endangering the health of the bees of their neighbours who take beekeeping seriously. No agricultural or horticultural pursuit is free of bad seasons, and beekeepers must expect to share the common lot of those who are dependent to some extent on the character of the weather.

BEE LEGISLATION.—On July 25, Mr. Runciman introduced a Bill in the House of Commons to deal with bee diseases, so every beekeeper should now make it his business to inform members of Parliament upon the difficulties surrounding the art of beekeeping, and the dangers to which we are subjected without the hope of redress through the ignorance and carelessness of neighbours.

The principal clauses of the suggested measure are:—

1. That the Board of Agriculture may make such orders as they think expedient for preventing the introduction into England and Wales of any pest or disease affecting bees, and for that purpose any such order may prohibit and regulate the introduction or admission by post of bees and any articles or appliances used in connection with beekeeping, and any other thing whereby any such pest or disease may be introduced, and any such order may direct or authorise the seizure, detention, destruction or disposal of any bees or things introduced or admitted in contravention of such order.

2. The Board may authorise the destruction by the Local Authority of any colony of bees affected and any receptacle (other than a movable comb hive) in which there are or have been affected bees, and may authorise the local authority to pay compensation of the value of the thing destroyed, of bees, or any other thing, which, in their opinion may spread the pest or disease.

3. (a) An order under this Act may impose fines recoverable on summary conviction for offences against the order, not exceeding ten pounds for one offence. (b) An order under the Act may direct or authorise the local authority to carry into effect and enforce the order within the district of the local authority, and if the local authority fails to carry into effect the order or provisions, the Board shall have the power of executing and enforcing the order, and recovering the expenses incurred, such as are conferred on the Board by Section 34 of the Diseases of Animals Act, 1894. (c) In proceedings under the Act no proof shall be required of the appointment or handwriting of an inspector, etc.

4. (a) The Local Authorities under the Diseases of Animals Act shall be the local authorities for this Act. (b) Every local authority shall appoint so many inspectors and other officers as they may think necessary for the execution and enforcement of orders under the Act. (c) Local authorities and officers shall make such reports, etc., as the Board require.

5. (a) The inspector of the Board or local authority may, if he desire, be accompanied by an expert adviser, enter any building or place wherein he has reasonable ground for suspecting that there are or have been bees affected by any pest or disease, or that any order under the Act has not been, or is not being complied with, and examine any bees on such premises and anything thereon used for or in connection with bees. (b) Any person obstructing an officer from entering such building or place shall be deemed guilty of an offence under the Act, and be liable to a penalty of ten pounds.

6. The Act shall apply to Scotland.

FLORA OF THE MALAYAN PENINSULA.—In 1889, the late Sir GEORGE KING published the first part of his "Materials for a Flora of the Malayan Peninsula" in the *Journal* of the Asiatic Society of Bengal, and each succeeding part has also been issued separately. This work has now reached the 22nd part under the editorship of Mr. J. SYKES GAMBLE, who was a contributor during Sir GEORGE KING'S lifetime. It contains the families Nyctaginaceæ, Amarantaceæ, Polygonaceæ, Aristolochiaceæ, Chloranthaceæ, Lauraceæ and Hernandiaceæ, all except the Polygonaceæ worked out by Mr. GAMBLE. These seven families contain 33 genera and 189 species, of which 1 genus and 78 species were previously undescribed. Most important of these families is, of course, the Lauraceæ, of which 156 species, belonging to 16 genera, are described. Litsæa alone numbers 55 species, many of them doubtless valuable timber trees, but on this point no information is given. Many interesting points must come to light in the course of examining so much material, and a few additional pages devoted to their record would be of service, to say nothing of saving them from oblivion and relieving the monotony of descriptions. However, a plan is a plan. Mr. GAMBLE estimates the number of species of Cinnamomum at about 140, unless that be a misprint, of which only 15 are recorded from the Peninsula. The new genus, Stemmatodaphne, is a monotype allied to Phœbe.

APPOINTMENTS FOR OCTOBER.

TUESDAY, OCTOBER 1—Scottish Hort. Assoc. meet.

WEDNESDAY, OCTOBER 2—
Nat. Chrys. Soc. Exh. at Crystal Palace (2 days). Nat. Vegetable Soc. Exh. at Watford. Co. Clare Hort Soc. Fruit and Farm Produce Exh.

SATURDAY, OCTOBER 5—
Soc. Française d'Hort. de Londres meet.

TUESDAY, OCTOBER 8—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Dr. Charles Crowther on "The Influence of Atmospheric Impurities on Vegetation.") Hort. Club Meet.

THURSDAY, OCTOBER 10—
Royal Hort. Soc. Autumn Sh. of British-grown Fruits (2 days).

FRIDAY, OCTOBER 11—
Ann. Conference of Affiliated Mutual Improvement Societies at R.H.S. Hall, Westminster.

MONDAY, OCTOBER 14—
United Hort. Benefit and Prov. Soc. Com. meet.

WEDNESDAY, OCTOBER 16—
North of England Hort. Soc. meet. at Leeds. (Lecture by Rev. J. B. Hall on "Apple Culture.")

MONDAY, OCTOBER 21—
Nat. Chrys. Soc. Executive and Floral Com. meet.

TUESDAY, OCTOBER 22—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by the Rev. Prof. G. Henslow on "The Senses of Plants.")

WEDNESDAY, OCTOBER 23—
Hertfordshire Fruit, Root and Chrys. Soc. Sh. (2 days). Women's Agric. and Hort. International Union's Sale and Exh. at R.H.S. Hall. Nat. Poultry Diploma Exam. at Hall.

TUESDAY, OCTOBER 29—
Nat. Chrys. Soc. Sh. at Crystal Palace (3 days). Kent Commercial Fruit Sh. (2 days).

WEDNESDAY, OCTOBER 30—
Kent. County Chrys. Soc. Sh. (2 days). Borough of Croydon Chrys. Sh. (2 days.)

THURSDAY, OCTOBER 31—
Torquay Dist. Gard. Chrys. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—54°1.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, September 25* (6 P.M.): Max. 57°; Min. 48°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September 26* (10 A.M.): Bar. 30·1°; Temp. 56°, *Weather*—Fine.
PROVINCES.—*Wednesday, September 25:* Max. 57° Ireland S.W.; Min. 48° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Sale of Dutch Bulbs at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

TUESDAY AND WEDNESDAY—
38th Annual Sale of Nursery Stock at Sunningdale Nurseries, Windlesham, Surrey, by Protheroe & Morris, at 12.

WEDNESDAY—
Trade Sale of Bulbs, at 1; Palms and Plants, at 4; at Protheroe & Morris's rooms.

THURSDAY—
Clearance Sale of Nursery Stock at Marden Park Nurseries, Woldingham, by Protheroe & Morris, at 12.
Leasehold Fruit Farm and Nurseries at Eynsford and Swanley, Kent, at the Mart, London, E.C., by Protheroe and Morris, at 2.
Freehold Market Nursery, Park Lane, Cheshunt, Herts, at the Mart, London, E.C., by Protheroe & Morris, at 2.

FRIDAY—
Orchids, at Protheroe & Morris's rooms, at 12.15.

Soil Conditions and Plant Growth.

No one, with reason, could require a commander on active service to employ the intervals between his engagements in writing a history of the campaign. All that is expected is that he should dispatch reports from time to time showing the progress which his army is making. Later on, when peace broods again over the land, the historian will tell the story and apportion praise and blame with the cold and cruel justice of the student. So, also, whilst the arduous work of building up a science is in progress, it is not reasonable to expect anyone engaged in that service to write a finished and final account of the operations which are bringing the campaign slowly to a successful issue.

Hence, in taking up Dr. Russell's new volume on "Soil Conditions and Plant Growth,"* though we may expect it to contain luminous reports of the progress of the army of biochemists in their work, we must not look for a finished story nor for final statements. We shall be content if we learn from headquarters that the operations are proceeding smoothly, and that steady advance is being made.

Looked at from this standpoint, there can be no doubt that Dr. Russell's monograph is eminently successful. It shows that he and his fellow-workers in the Old and New World are beginning to evoke scientific order out of the chaos of observed facts.

No horticulturist requires to be reminded that the soil is a material of extreme complexity, that it is the seat of complex chemical operations, and that it is the natural home of vast numbers of micro-organisms all drawing nourishment therefrom and adding waste substances thereto. Hence it is not necessary to emphasise the difficulty which attaches to investigation into the science of the soil and into the relations between the soil and the crops which it bears. What is worth while perhaps is to note that the agricultural chemist has also, and at last, realised the complexity of the problems presented by the soil. In consequence of his having learned this lesson, agricultural chemistry is passing through a transition stage.

Gone is the curt confidence which marked its earlier manner. It no longer attempts to apply off-hand the chemistry of the laboratory to the field. It recognises that the chemistry of the soil is not that of dead things only, but is the chemistry of the living, of the dying, and of the dead. So profound has been the effect of this discovery, that agricultural chemistry has joined hands with biology, and has even gone so far as to change its name. It is now a branch of the great science of biochemistry.

Though changed in name, its purpose is still the same—a high and splendid purpose—though vastly difficult of achievement. That purpose is no less than to discover the laws which lie at the foundation of all good practice.

In its early, confident days, agricultural science sought to accomplish this object by seeking in the plant or soil for the "Principle of Vegetation." Successive pioneers announced, in the not-uncertain tones which science is apt to use, their several discoveries. Van Helmont, who grew a Willow twig in water in a pot of earth, found that in the course of five years it had gained several hundreds of pounds in weight, though the earth in the pot weighed only 2 ounces less at the end of the experiment than at the beginning. Hence he was able, by neglecting the 2 ounces of lost soil, to proclaim that in water he had discovered the principle of vegetation. Another 17th century agricultural chemist, Glauber, announced that saltpetre constitutes this principle. Others preferred the claims of humus, and Jethro Tull, the great Oxford husbandman, insisted that the particles of soil themselves, if only small enough, were the principles; that the roots of plants had mouths—albeit very little ones—and the end of all good practice was to prepare the plant's pabulum by breaking up the soil as finely as possible. Thus, through many vicissitudes of speculation, agricultural chemistry toiled after agricultural practice—which had had a start of countless centuries—intent on explaining to the grower the mysteries of the soil and its relation with the plant. The slow growth of this scientific knowledge is traced in detail by Dr. Russell in an admirable introductory chapter, to which the curious reader may be referred. This youthful, sanguine phase of agricultural chemistry endured even until our own times, for we ourselves have known chemists who thought that to present a soil analysis to an inquirer was to solve his problems as to soil treatment. That phase, however, is over, and Dr. Russell's work marks the second transitional phase between the simple naïveté of ignorance and the simple certainty of assured knowledge. Agricultural science in this second phase may be likened to one of those puzzles—popular among children—in which a finished picture must be formed by the fitting together, piece by piece, of many small portions which, as they lie pell-mell, present no obvious relations one with another.

This being the state of the science—so many scattered pieces of fact awaiting the fitting together—it is no disparagement of Dr. Russell's work to say that it fails to complete the picture. Nevertheless, by assembling the scattered pieces of the soil puzzle, and by showing that they are susceptible of association into a finished whole, the author has made a noteworthy contribution to the progress of the science. It is apparent, from what has been said already, that Dr. Russell's work must be studied piece by piece, section by section, rather than as a whole.

Studied in this way the work will prove of great assistance, not only to the agricultural chemist, but also to the gardener. To the latter it will prove by no means easy reading, and this because the narrative is, perforce, interrupted at every stage by the introduction of the evidence in support of the statements of the narrative. Far from suggesting that this is a defect, we hold that it is such a merit as to make the volume specially to be commended to the young gardener. For not only is it full of useful information, but it offers exercises—of which many of us stand in need—in the estimation of the value of evidence. The ordinary text book tells you facts, but Dr. Russell's monograph adopts the harder, wiser method of giving you the evidence for the facts.

To give but one illustration, namely, that which deals with the influence of water supply on the effectiveness of manures; every gardener knows in a general way that if a plant receives insufficient water it is unable to derive full profit from manure. But the evidence which Dr. Russell offers shows this in striking and exact measure. Thus, if soils containing different amounts of water are treated with small doses of

* *Soil Conditions and Plant Growth*, by E. J. Russell (Longmans, Green & Co.) Price 5s.

nitrogenous manure, the plant in the drier soil is not able to make any use of the manure; that in the somewhat moister soil is able to use the first dose, but gets no advantage from the second; whereas the plant in the well-moistened soil is able to use with advantage all the nitrogen supplied.

We have cited the example, not so much because of its intrinsic importance, but because we know that many a young gardener learns but slowly and with difficulty the art of using artificial manures. A failure or two, due to an insufficiently considered use of this or that artificial manure, is apt to bring him into the ranks of the "disbelievers in artificials," whereas if he will but devote himself to mastering the essential facts and to realising the complexity of relations which obtain between plants and the soil, he will discover that the discriminating use of artificials is one of the secrets of successful practice.

NELUMBIUM SPECIOSUM. — Our issue for August 10 contained an illustration of Nelumbium speciosum growing in the Water Lily house at Kew, and it is in botanic gardens that this magnificent Eastern flower is usually cultivated. Nevertheless, the species is sometimes to be found in private gardens, and Colonel LOCKWOOD, M.P., sends us a photograph showing a very fine group of Nelumbiums in one of the plant houses at his residence at Bishops Hall, Romford. The plants are 6 feet high, with leaves 26 inches in diameter, and flowers 12½ inches across, showing how well they respond to the cultivation afforded them.

THE FARRER CUP FOR ROCK PLANTS.—The Council of the R.H.S. offer at the Spring Show, May 20-22, 1913, a Silver Cup presented to them by Mr. REGINALD FARRER. This will be awarded for six new or rare dwarf rock plants, naturally about 9 inches in height, and not fewer than six or more than 12 specimens of each. New colour forms of well-known plants admissible, double flowers excluded. Variety, novelty, interest, and correctness of name to rank above size of specimens. It is not essential that all, or even more than one, of any species should be in bloom, e.g., it is scarcely to be expected that an exhibitor would have six Saxifraga florulenta in bloom simultaneously, but a group with a flower-spike should take precedence of another in which the spike is lacking. Every exhibitor must attach a card giving in print or in very clear writing the history of each set of plants (e.g., whence he obtained the plant, or through whom and when, its habitat, &c.), and observation remarks (e.g., case of difficulty of cultivation, suitable soil, positions and uses, methods of propagation, peculiarities, &c). Points: Novelty and interest, 20; beauty, 20; garden value, 15; culture, 10; correctness of name, history, quality of observation remarks, 20; rarity, 15. The Council will award suitable medals according to merit, at their discretion, to the exhibitor adjudged 2nd, and possibly to the 3rd. *W. Wilks, Secretary.*

GENTIAN CUP COMPETITION FOR MARCH 4 AND 5, 1913.—The Council of the Royal Horticultural Society offer a silver cup presented to them by Messrs. R. WALLACE & Co. for the best exhibit by an amateur of Alpine plants, including suitable bulbs and dwarf shrubs, in a space not exceeding 5 by 3 feet. The use of stone is not absolutely necessary, but the judges will be instructed to favour its correct use, and the natural arrangement of the plants in connection therewith. The plants may be shown either in pots or as lifted from the ground.

NORTH OF ENGLAND HORTICULTURAL SOCIETY.—The committee of the Leeds Workpeople's Hospital Fund have offered an 80 guinea Challenge Cup for the best exhibit in the show to be held at Leeds on October 17 and 18 next. The committee also offer a 15 guinea Challenge Cup for the best exhibit in the show (the trade excluded). Lady BARRAN will open the show at 2 p.m. on Thursday, October 17. All profits from the show will be given to the hospital fund.

FLOWERS IN SEASON.—Mr. FREDERICK ROEMER, Quedlinburg, Germany, has sent us a white-flowered form of Statice sylvestris and a variety of Statice sinuata named Prince Chamois, with flowers of very pale rose-buff colour. Mr. ROEMER informs us that the varieties come true from seed.

CONGRESS ON ELECTROCULTURE. — On October 24 an International Congress on Electroculture will be opened at Rheims. A programme of subjects to be dealt with may be obtained of the Secretary, 58, Boulevard Voltaire, Paris.

INTERNATIONAL HORTICULTURAL EXHIBITION AT ST. PETERSBURG.—Preparations are in progress for the Imperial International Horticultural Exhibition, which is to take place in St. Petersburg at the end of April next year. The schedule includes about 160 classes. The jury will be composed of equal numbers of Russian and foreign judges. Anyone wishing for further particulars can obtain them on application to the offices of the exhibition, 32, Quai de la Cour, St. Petersburg.

"HORTICULTURAL DIRECTORY" FOR 1913.—We are desired by the Editor of this work to ask head gardeners if they will kindly notify him at 10, Essex Street, Strand, of any change of proprietorship or address that may have occurred since last October.

M. GEORGE GIBAULT.—We are informed that M. G. GIBAULT, the Librarian of the National Horticultural Society of France, has recently been made a corresponding member of the Royal Horticultural Society. M. GIBAULT is an authority on botanical and horticultural literature; his new work *Histoire des Legumes* will perpetuate his name in the annals of horticulture.

"BOTANICAL MAGAZINE."—The issue of the *Botanical Magazine* for September contains plates and descriptions of the following plants:—

DENDROBIUM (CERATOBIUM) IMTHURNII, tab. 8452.—This species, which is one of the tallest-growing of the genus, was found by Sir EVERARD IM THURN, when he was Governor of Fiji and High Commissioner of the Western Pacific, in the island of Efate, one of the New Hebrides group. Dendrobium Imthurnii is nearly allied to D. antennatum, Lindl., but differs from that species in having longer, stouter, pseudo-bulbs, broader, thick and rigid leaves, and in the shorter petals. The flowers are of medium size, white, with lilac streaks on the lateral lobes of the labellum.

COLUMNEA GLABRA, tab. 8453.—This is at once the most beautiful and the most common species of the genus which occur in Costa Rica. It grows on the cool mountain tracts at altitudes of from 5,000 to 6,000 feet above sea-level. Dr. WERCKLÉ, in *La Subregion Fitographica Costaricense*, divides the Costa Rica Columneas into pseudo-epiphytic species, which have large leaves and small flowers, and true epiphytes, with small leaves and large flowers. In the latter group there are a few species with stems which creep along the branches of trees and attach themselves to the bark by their roots. A greater number have free stems, which, as with C. microcalyx, are pendulous from the supporting branches, or, as in the case with C. glabra, quite erect. The plant from which the illustration in the *Botanical Magazine* was taken was sent to Kew by M. LEMOINE, in 1907, and has been grown in an open compost, rich in humus, in a moist atmosphere of a temperature of 50° to 60° Fahr. Under these conditions it has become 2 feet high, and in spring is covered with brilliant scarlet flowers. Propagation may be effected by the minute seeds, or by cuttings, which root freely in sandy peat; but as the seedlings grow slowly and are difficult to raise, the latter method is the better, and plants raised from cuttings flower at an earlier age.

BERBERIS VERRUCULOSA, tab. 8454.—This species was found by Mr. E. H. WILSON on the mountains around Tatien-lu, in Western Szechuan, in 1904. It differs from B. pruinosa in having verruculose branches, and in its fewer and larger flowers. B. verruculosa becomes a low, dense bush, and, as growth is comparatively slow, it is a useful shrub for the rock-garden. The flowers are clear yellow in colour, and are succeeded by oblong, blue-purple, Prune-like fruits.

CHIRONIA LAXA, tab. 8455.—Of the 34 known species of Chironia 25 are natives of South Africa, and, although many of them have been at, one time or another, introduced to this country, only two are in general cultivation: these are C. linoides and C. floribunda. Seeds of the species now figured (C. laxa) were sent from Tembuland by Canon MASON to his brother, Canon MASON, Master of Pembroke College, who gave them to Mr. R. I. LYNCH, the Curator of the Cambridge Botanic Gardens, where a plant flowered in 1911. The greatest difficulty attendant in its cultivation is the Begonia mite, for which a suitable insecticide must be used. Mr. LYNCH found that when care is exercised the plants grow well in a sandy loam. If seeds are sown early the plants may flower during the first year, but stronger plants are obtained from later sowing, when the plants flower during the next year. C. laxa has a weak habit, so that three or four plants should be grown together in a 4½-inch pot. The plants become about 15 inches high, and have slightly spreading branches. The entire, opposite, lanceolate leaves are about ¾ to 1 inch long, and 1 to 1½ lines broad. The relatively large 5 partite flowers are pale magenta in colour.

PRIMULA WATTII, tab. 8456.—This dainty little Primula (see illustration in *Gardeners' Chronicle*, April 27, 1912) which was exhibited at the meeting of the R.H.S. on April 2, 1912, by Messrs. R. GILL & SON, Falmouth, under the provisional name of P. Gillii, is a native of Sikkim, and whilst under cultivation in this country it flowers during April or a little later; in its native state the plants usually flower from about the middle of July, at which season the plants experience daily rain or heavy mist. Unfortunately, like so many other Primulas, this species is practically monocarpic, and after the plants have flowered when about a year old they either die or are too weak to flower a second time. So these species have to be treated as annuals, but, unfortunately, they do not always ripen their seeds under cultivation. The green flower scape of P. Wattii is about 4 inches high, and bears a many-flowered head of rounded, pendulous flowers. The calyx is green with longitudinal brown streaks, and the petals of the white, mealy-eyed corolla are deep violet in colour.

EDINBURGH SHOW. — Mr. H. N. ELLISON, West Bromwich, informs us that he was awarded a Silver Medal for his collection of Ferns at the Edinburgh Show, not a Bronze Medal as stated in our report.

GHENT INTERNATIONAL HORTICULTURAL EXHIBITION, 1913.—We have received the complete syllabus and list of classes for the Ghent Quinquennial Exhibition of 1913. On this occasion the "Quinquennial" will coincide with, and form a part of, the Universal International Exhibition, to be held in Ghent next spring. The horticultural exhibition will open on April 26 and continue until May 4. Class 1, as usual, is arranged for collections of 12 new plants not in commerce; this is always the most interesting and important class at the Belgian shows. Then follow a few smaller classes for plants entirely new or that have not been exhibited previously at Ghent. There are 90 classes for Orchids, and his Majesty the KING of the BELGIANS is offering a gold medal for the best and most varied collection exhibited by an amateur. Hot-house plants are given the same important position in the schedule as at previous shows, and those who may visit Ghent next spring for the first time will have a grand opportunity of seeing the splendid stove plants, both flowering and ornamental-leaved species habitually cultivated by Belgian horticulturists. The fifth group, that of the Palms, is headed by a class for 100 plants; the 1st prize for this is a work of art, specially presented by the Committee of the Exhibition, who are giving similar valuable prizes in many of the most notable sections. The LOUIS DE SMET prize, provided for by a fund instituted in memory of the late M. DE SMET in 1887, is offered for the best collection of 60 plants of Azalea indica in 30 varieties. Section 23 for Agaves, Yuccas, and Cactaceæ contains 16 classes, including one for Furcræa Lindenii, to be judged for its beauty, apart from any other merit. The section for fruit is relatively small, but contains some interesting classes. The 26th group is concerned with horticultural science and education, and includes competitions and classes of the most varied nature. Expositions of the Mendelian theory of inheritance, collections showing the adaptation of plants to different surroundings, and exhibits of the various means adopted by different plants to ward off enemies, will serve to add to the attractiveness of the exhibition, both to the amateur and to the scientific horticulturist. One of the most interesting classes is that in which a demonstration is required of the effects produced on a plant (to be determined) by the action of an anæsthetic or a galvanic current. The last group but one in this exhaustive schedule, which contains 841 classes, is for floral decorations. The "Palais d'Horticulture," in which the exhibition will take place, is an immense building, which has lately been erected at a cost of 1,750,000 francs. The superficial area on which it stands measures 30,000 square metres. It is divided into different halls, one of which, the "Fêtes Hall," measures 14,000 square metres. For the accommodation of the stove plants, a warm exhibition house, 6,000 metres square, is provided. Copies of the schedule and other information may be obtained from the Secretary, M. JULES DE COCK (Coupure, 160, Gand, Belgium). Entries for exhibition must be sent in on or before March 29 next.

INTERNATIONAL HORTICULTURAL CONGRESS AT GHENT.—A circular has just been issued announcing a congress to be held in conjunction with the Ghent Quinquennial next year. A copy of the circular can be obtained of the Secretary, M. ED. RODIGAS, 79, Avenue Charal, Brussels.

ERODIUM CHRYSANTHUM (see p. 234).—Our correspondent *A. C. B.* writes to say that an interesting point respecting the seeding of Erodium referred to in the last issue was the fact that the same day on which the flower was pollinated the seed pod had begun to form. Owing to a printer's error E. macradenum was made to read E. macradenium.

SWEET PEA TRIALS.—Mr. WALTER P. WRIGHT informs us that owing to the increase in the number of Sweet Peas sent to him for trial, he has decided to put his trials on a business footing for 1913 and organise an expert committee to assist him. The trials will be conducted in the garden of Reading University in 1913. The great object, writes Mr. WRIGHT, will be to give absolutely unbiassed and independent assistance to raisers and growers, and to this end a novel and interesting plan has been devised.

FLORA OF THE TRANSVAAL.—Mr. BURTT-DAVY and Mrs. RENO POTT-LEENDERTZ have compiled a "Check-list of the Flowering Plants and Ferns of the Transvaal and Swaziland," which appeared in the *Annals* of the Transvaal Museum, May, 1912, and has also been issued separately with the original pagination. It is no more than a list of the plants at present known to inhabit the region in question, and it is published with a view of gaining further contributions for a more comprehensive work. Nevertheless, it is a most useful and interesting addition to South African botanical literature, for by it one can form an idea of the vegetation and make comparisons with better-known areas. The area of the Transvaal is upwards of 100,000 square miles, of which about one-sixth lies within the tropics. The present list of flowering plants and Ferns comprises about 3,250 species, belonging to 920 genera and 157 families, or nearly three-fourths of the families of the world. The composition of the vegetation is very different from that of the Cape district, such characteristic genera as Pelargonium, Oxalis, Mesembryanthemum and Erica being jointly represented in the Transvaal by only 37 species. Of the Restiaceæ only one species is recorded, and the Proteaceæ are represented by 14 species belonging to three genera. The predominating families in the Transvaal are:

	Genera.	Species.
Compositæ	89	304
Leguminosæ	62	275
Liliaceæ	34	189
Asclepiadaceæ ...	34	156
Orchidaceæ	21	123
Iridaceæ	14	79
	254	1,126

This works out approximately at 25 per cent. of the genera and 30 per cent. of the species recorded from the region. Distinctive features in the landscape are presented by the numerous species of Aloe, Acacia, Rhus, Combretum, and Helichrysum. Of Helichrysum about 60 species are enumerated. As the authors point out, this list cannot be regarded as by any means exhaustive.

A CATERPILLAR PEST IN ITALY.—According to a report received at the Foreign Office from the British Consul at Nice (Mr. J. W. KEOGH), in 1909-10, it was brought to the notice of the French Minister of Agriculture that serious damage was being caused in Italy to fruit trees and other plants by insects, and particularly by a caterpillar—Diaspis pentagona. This pest spread rapidly all over the Italian Riviera and gravely menaced agriculture in the south of France. At the end of 1911 it was found necessary to prohibit the importation into France from Italy of all plants, including cut flowers, except the vine and resinous plants; also many kinds of fruit. The yearly average importation of cut flowers alone, by way of Ventimille, amounted to 804 tons. A commission was appointed to study the question, and it was found that in the four months from November 1 to March 1 (being the period when most of the cut flowers were imported into France) the caterpillar was not found. A modified order was issued in April, 1912, admitting, in addition to the vine and resinous plants, Palms and the fruits of the Orange, Lemon, Mandarine and the Cedrat if recognised to be in a healthy condition. Cut flowers are also to be admitted, but only during the months of November, December, January and February. Rose petals, however, for the manufacture of perfumes, will be admitted all the year round if in sacks and provided proper precautions are taken.

PUBLICATIONS RECEIVED.—***Chrysanthemums,*** by Thomas Stevenson, with chapters by C. Harman Payne and Charles E. Shea, being vol. xiii in the PRESENT-DAY GARDENING series, edited by R. Hooper Pearson. (London: T. C. & E. C. Jack.) Price 1s. 6d.—***Queensland Agricultural Journal.*** August. (Brisbane: Anthony James Cumming.)—***Heredity and Eugenics,*** by William E. Castle, J. M. THE PERGOLA.

(See Supplementary Illustration.)

THE pergola, now so constant a feature of English gardens, has been copied from our Italian neighbours, and we have yet to learn how to use it to the best advantage. Most of us have but one stereotyped notion—that of training creeping Roses over iron or rustic supports, usually forming a long, low bower. This arrangement, although pretty enough while the particular Rose is in bloom, is not particularly decorative or useful at other seasons. Moreover, the flowers are seen only from without, and the effect of hanging blossoms, so charming in Italian pergolas, is missed.

In Italy the pergola is not so much an ornament as a necessity, to provide protection from the heat, and it serves as an *al-fresco* dwelling-room. The supports, usually from 8 to 10 feet high, are sometimes formed of rough wood over which vines are trained, but more often they are pillars of solid timber, of stone or brick-work, or of ornamental terra-cotta, as shewn in the photograph from Mr. Winter's well-known garden at Bordighera (see Supplementary Illustration). The supports are joined by wooden trees, and the cross-pieces overhead are also formed of wood strong enough to carry a considerable weight.

The only Rose much in vogue for growing on pergolas is Rosa Banksiæ, partly because it blooms early and partly on account of its thick, close foliage, which provides shelter from the sun. The true pergola plants are the Wistaria and the vine; the leaves afford a deep shade, and the hanging flowers of the one and the fruit of the other satisfy the beauty-loving eye of the Italian.

Charming as is the Wistaria when trained against a wall, the effect is even better when grown as a standard or over a pergola. In an old-fashioned Berkshire garden is a standard Wistaria some 60 years old, and its branches, carried many feet from the stem, make the prettiest arbour I have seen. Standards, however, take time to mature, but, supported on strong pillars, the Wistaria soon grows large enough to give the required shade, if planted in a sunny and sheltered position. W. sinensis is

probably the hardiest, but the white variety, W. s. macrobotys, and the later-flowering species W. frutescens (the American Kidney Bean) can be grown in most parts of England.

The Grape vine is naturally of little use in this country, but Vitis californica serves the purpose extremely well. It is a strong grower, and in autumn its crimson leaves and purple berries are as beautiful as the Wistaria blossoms are in spring.

One of the prettiest of English pergolas known to me forms a covered walk from the house to the end of the small garden. The wide pathway is laid with grey-stone flags, and the pillars are of harled brickwork supporting wooden beams. It is covered with Wistaria, and on either hand grow Narcissus, Madonna Lilies, Clematis, Campanulas, and other white and lilac flowers; no stronger colours are permitted. The result is most cool and restful to the eye. At the far end the pergola widens to form a loggia overlooking the tennis lawn. Over it grows the Californian vine, that keeps its leaves through October. From early spring to late autumn there is shade and colour in that pergola. *M. Bayley.*

SCOTLAND.

ROYAL MEMORIAL TREE AT FYVIE.

Her Majesty the Queen paid a visit to Lord and Lady Leith of Fyvie, at Fyvie Castle, Aberdeenshire, on the 18th inst., and planted a memorial tree in the grounds near the castle. The tree chosen was a small Copper Beech. There are several other trees planted by royalty in the policies, these including specimens planted by Queen Victoria, Prince Arthur of Connaught, and King Alfonso of Spain.

SUGGESTED IMPROVEMENTS ON THE CALTON HILL, EDINBURGH.

On former occasions we have referred to contemplated improvements at Calton Hill, Edinburgh, in order to make that park more attractive to the public. None of the schemes seemed to meet with general acceptance, but a later one has met with the approval of a sub-committee of the Edinburgh Parks Committee. The suggestions are embodied in a report by Mr. J. W. M'Hattie, Superintendent of Parks, the City Superintendent and the City Road Surveyor, and comprise alterations in the approaches, the formation of a carriage drive, and the planting of trees. Suggestions are made for the placing of suitable garden embellishments, one being the formation of an enclosure by means of a clipped Yew hedge, in which might be placed garden ornaments. The total cost of the scheme would exceed £2,000. *Correspondent.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Hydrangea hortensis.—I enclose a photograph (fig. 111) of two Hydrangeas growing on the south front of the house of Mr. George Ayling, Privett, Alton, Hants. For several years the two plants have flowered well, but this year they are exceptionally fine and carry 925 panicles of flowers. This, no doubt, is due to the exceptionally hot summer of last year, which assisted the plants to mature their buds and wood, as is shown by many smaller Hydrangeas in the neighbourhood which are flowering well. The flowers of the plants photographed are blue and pink: there are more blue heads where the plants get the most shade from a porch, which indicates that light and shade have something to do with the coloration of the flowers, and this has been my experience in pot culture, as plants placed under the shade of a north wall to retard them have produced much bluer flowers than others grown in the same mixture of soil without being retarded in shade. We are over 600 feet above sea level, and have a cold, retentive soil with a subsoil of clay and flints overlying chalk, consequently fruit trees and flowering shrubs are always better in a year following immediately upon a hot season. *T. Down, Basing Park Gardens, Hampshire.*

Fig. 111.—Hydrangea hortensis in a Hampshire garden.

Tom-tits and Nuts.—I have been interested in the correspondence about the Tits eating Sweet Pea buds, and should be glad to know if any of your correspondents have known these little birds make a raid on Cobnuts. I have a few bushes of the Cobnut, and from the time the nuts formed their kernels until they were gathered the Tom-tits spoilt nearly half of them by pecking holes in the shells and eating the kernels. *S. S., Mitcham, Surrey.*

American Blight on the Roots of Apple Trees.—Every gardener and fruit-grower who has had this pest to contend with knows how difficult it is to eradicate. I have made many trials and failed often, but this year I have discovered two remedies which are in every way effectual. After root growth is finished for the season (this is very important), make some holes around those trees which are infested at their roots with this pest, either with a dibble, stake, or crowbar, at depths varying from 9 inches to 18 inches, and into these holes insert small pieces of carbide of calcium (about ½ ounce each in size). The holes should be closed quickly as the work proceeds, and the land will become fumigated and the roots of trees be cleansed without any harm to vegetation. I would also state that I have found the use of this fumigant a good means of clearing the land of grub and wireworm attacking the Carrot crop. Now for the second remedy I have applied for four or five years, and, on my recommendation, others have tried with success. It is an excellent method of killing American blight on the root stems, limbs or branches of trees, and also many other pests attacking Cauliflowers, Carrots, Onions, Roses, fruit trees, &c. Gather the foliage and the extremities of the shoots of the common Elder (Sambucus nigra) and boil them; dilute the decoction with two parts clear water, and water the land with the liquid. This will cleanse it of earth pests, blights, pests or diseases. Spray or paint the infested plants and trees or affected portions with the same liquid. These remedies are inexpensive. If some of your readers would try either or both remedies and report the results in the columns of the *Gardeners' Chronicle*, their communications would be of great value and interest. *John Smith, Durham.*

The Bearing of Apples (see p. 216)—The fact that some late varieties of Apples do not bear every year, as Mr. Cousins notes, does not solve the difficulty. Here there are no more consistent croppers than Alfriston, Northern Greening, Mère de Ménage, Prince Albert, Striped Beefing, Adams's Pearmain, Duke of Devonshire and Stone or Birmingham Pippin, their season of usefulness extending until May. Much can be done by judicious thinning, but the varieties I have mentioned, whether thinned or not, almost always bear good crops. *R. P. Brotherston.*

The Colouring of Hardy Fruits (see p. 234).—If, as Mr. Pearson maintains, sunshine is not essential to the colouring, how does he account for the fact that most Apples colour only on the portions exposed to the sun, and for the other fact that a perfectly shaded fruit does not colour at all? Shaded vegetables, foliage, flowers, and even grass lack their full tints. Again, how is it that fruits grown in British Columbia, California, Australia, and Tasmania, where there is more sunshine and less rain in summer than we have here, are more highly-coloured than ours? I repeat that I never had less colour in early Apples, gathered before the rainy weather ceased, than I had this season. Worcester Pearmain, Allington Pippin, Cox's Orange Pippin, Bismarck, and Newton Wonder coloured after the wet time ceased, but not more than they did last year, while other mid-season or late varieties have not been nearly so well coloured as they were in 1911. My Pears, again, are much less coloured than usual, and I never saw hothouse Peaches so nearly devoid of colour as some were in a neighbour's houses. *A Southern Grower.*

Monstrous Helenium autumnale. With regard to the note on this plant (see p. 240), I think the monstrosity occurs fairly often. It was described as a virescent form in *Gardeners' Chronicle*, February 23, 1895, p. 241. I gave some plants to a young friend who was making a new garden in 1908; they flowered the following year, one coming as you have described. I took the flower to Wisley, where we tried to propagate it, but were not successful. I then got the stalk from my friend and managed to start two shoots from it, but they damped off during the winter. On inquiry, I find that the plants have resumed their normal form of flower. I presume that the new ground they were planted in was too good for them, the result being the monstrosity, and that they have now sobered down. *W. Marshall, V.M.H., Bexley.*

THE ORIGIN OF LIFE (see p. 232).—There is one and the most prominent characteristic of life which no one at the British Association appears to have mentioned. I refer to what Sir A. H. Church called the "Directivity of Life." Just as he can "direct" atoms and molecules in his laboratory, and produce, say, indigo, so the life in the indigo-plant has a directing power to produce the same product, with the same elements, in the same way. This "directivity" is to be observed in every organ and in every cell of every plant, from the smallest to the largest in the world. It is life which directs the lifeless physical forces to move lifeless matter (food) so as to build up definite purposeful structures or organs. This kind of directivity—which also enables organic beings to vary and acquire new adaptive purposeful organs—is unknown to the inorganic kingdom. Therefore, before even an *a priori* conception of the origin of life is entertained, the origin of "life-directivity" must be sought. At present this is a blank in all speculations as to the origin of living beings from lifeless compounds. *George Henslow.*

WAHLENBERGIA PUMILIO.—I do not understand *W. I.* when, in his interesting paper on Wahlenbergia vincæflora (p. 216), he says that those of the genus included in the section Edraianthus are all more or less biennial in habit. My experience of Wahlenbergia (Edraianthus) Pumilio is quite at variance with this. I have had it growing for seven seasons on the crest of a retaining wall, whence it shows no symptom of flagging, but increases in vigour each year, despite the exhausting strain of covering itself with blossom. *Herbert Maxwell, Monreith.*

———In speaking of this section of the genus as biennials more or less, it will be noted that I qualified my general statement by saying that some species, like W. Pumilio and W. serpyllifolia, persist and flower freely for some years when planted in suitable situations. Sir Herbert Maxwell has evidently been successful in keeping his plants for a long time, but my experience is that they have a tendency to flower themselves to death. I find that the best way is to persist in raising young plants from seed. Much, of course, depends on elevation and other conditions, for, in some gardens, a plant will be short-lived, whilst in another it may flourish for a long time. *W. I.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 24.—The Hall at Vincent Square, Westminster, was unusually well filled at the meeting held on Tuesday last. The competitive exhibition of vegetables was very successful, and there were also some fine non-competitive collections. In addition to the vegetables, there were meritorious exhibits of Roses, Dahlias, and border flowers.

The ORCHID COMMITTEE awarded three Medals and five Awards of Merit to novelties.

The FLORAL COMMITTEE bestowed 25 Medals, eight Awards of Merit to novelties, and, in conjunction with the National Dahlia Society, four Awards to New Dahlias.

The FRUIT AND VEGETABLE COMMITTEE awarded 10 Medals.

At the 3 p.m. meeting of the Fellows, Mr. C. Herman Senn gave a lecture on "How to Cook Some of the Root Vegetables."

In the Lecture Room at 6 p.m., by permission of the Council, Mrs. W. W. Astor provided a tea for the Church Army gardeners who cultivate a piece of waste land adjoining the Hall.

Floral Committee.

Present: H. B. May, Esq. (in the Chair); and Messrs. Chas. T. Druery, W. J. Bean, G. Reuthe, Chas. Dixon, W. Bain, Wm. Howe, F. J. McLeod, John Green, J. W. Barr, J. Jennings, C. Blick, R. W. Wallace, Arthur Turner, H. J. Jones, W. Cuthbertson, Chas. E. Pearson, E. H. Jenkins, Wm. J. James, James Hudson, George Paul, E. A. Bowles, Ed. Mawley, F. Page Roberts, W. T. Ware, C. R. Fielder, and R. C. R. Nevill.

Messrs. FRANK CANT & Co., Colchester, exhibited many beautiful Roses. The blooms of the varieties Ecarlate, A. R. Goodwin, Lyon, Mme. E. Resal, Mrs. R. G. Sharman Crawford, La Tosca, Alice Roosevelt, Peace and Comtesse du Cayla were especially good. (Silver-gilt Banksian Medal.)

Messrs. WM. PAUL & SON, Waltham Cross, also displayed Roses. Two Bamboo stands were filled with the charming variety Juliet, while another contained equally fine blooms of Mme. Abel Chatenay. Round baskets of the rich, yellow varieties Marquise de Sinety and Lady Hillingdon were admirable. (Silver-gilt Banksian Medal.)

Messrs. ALEX. DICKSON & SONS, Newtownards, Co. Down, arranged their Roses in very tall stands, bordered with exhibition boxes. The varieties Lady Pirrie, Dorothy Page Roberts, and Rayon d'Or were especially noteworthy. (Silver-gilt Banksian Medal.)

Messrs. B. R. CANT & SONS, Colchester, showed a collection of Roses in which the stands of Irish Elegance, La Tosca, Warrior, Lyon, Léonie Lamesch, and a stand filled with Lady Waterlow and Ulrich Brunner were very charming. (Silver-gilt Banksian Medal.)

Messrs. R. W. PROCTOR & SONS, Chesterfield, showed Roses in ornamental baskets and small vases. The outstanding varieties were Jonkheer, J. L. Mock, Chateau du Clos Vougeot and His Majesty. (Bronze Flora Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, displayed various Roses and Carnations in a very dainty and attractive manner. (Silver Banksian Medal.)

Mr. W. EASLEA, Danecroft Nursery, Eastwood, included a basket of a new seedling H.T. Rose "Cherry Page" in his collection.

Messrs. DOBBIE & Co., Edinburgh, staged many vases of Sweet Peas. Besides splendid blooms of such named varieties as Etta Dyke, Princess Victoria, Rosabelle, and Lady Miller, there were several very promising seedlings. The same firm exhibited some beautiful flowers of Scabious. (Silver-gilt Banksian Medal.)

Messrs. JARMAN & Co., Chard, staged bright and clean blooms of such Sweet Peas as Mrs. H.

FIG. 112.—KNIPHOFIA "JOHN BENARY" (SYN. LORD ROBERTS).
(Received R.H.S. Award of Merit on Tuesday last.)

Dickson, Chas. Foster, and Elsie Herbert. (Bronze Banksian Medal.)

Messrs. J. VEITCH & SONS, LTD., Chelsea, showed small batches of Nerine Fothergillii major, Streptocarpus, Ixoras, and several splendid plants of Kniphofia (Tritoma) John Benary (see fig. 112). In another part of the Hall Messrs. VEITCH exhibited very floriferous, tall, standard plants of Salvia splendens. (Silver Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited exceedingly good trusses of Crozy Cannas and a great variety of border flowers.

Messrs. H. B. MAY & SONS, Upper Edmonton, displayed stove and greenhouse Ferns, in which varieties of Selaginella and the "Golden" Ferns were conspicuous. (Silver Flora Medal.)

Messrs. Stuart Low & Co., Bush Hill Park, Enfield, exhibited exceedingly good Carnation blooms. (Bronze Flora Medal.)

Mr. James Box, Lindfield, showed the most beautiful group in the Hall. The charming masses of early-flowering Chrysanthemums, rich red Gladiolus spikes, excellent Phloxes, and many other good flowers were very tastefully arranged. (Silver Flora Medal.)

Messrs. Robert Veitch & Son, Exeter, exhibited several exceedingly good forms of shrubby Veronicas, also Clematis nutans, Erythrina Crista-galli, their new Calceolarias Veitchii and The Bronze Age, and Nerine Bowdenii.

The Misses Hopkins, Shepperton-on-Thames, showed a small collection of Alpines.

Messrs. Pipers, Bishop's Road, Bayswater, showed many interesting Alpines in small pots and pans. (Silver Banksian Medal.)

Mary Countess of Ilchester, Holland House, Kensington (gr. Mr. G. Dixon), contributed cut sprays of varieties of Cratægus. (Silver Banksian Medal.)

Messrs. W. Wells & Co., Merstham, arranged a very bright display of border Chrysanthemums, which provided a warm show of colour. (Silver Banksian Medal.)

Messrs. R. Wallace & Co., Colchester, exhibited good spikes of hybrid Gladiolus Helianthus sparsoflius, and Michaelmas Daisies. (Silver Banksian Medal.)

Messrs. Barr & Sons, Covent Garden, London, exhibited various Gladiolus, Michaelmas Daisies, and Acidanthera bicolor, an interesting bulbous plant from Abyssinia.

Messrs. Paul & Son, Cheshunt, staged an interesting collection of sprays of trees and shrubs with their fruits. Castanea americana rubra, which fruits at an earlier age than C. sativa, Pyrus Sorbus, the true Service Tree, which bore unusually large fruits. Daphniphyllum glaucescens, Pyrus Malus albo-plena, which is interesting in that plenty of fruits follow the nearly-double flowers, and the desirable Euonymus latifolia are a selection of the many interesting examples shown. (Silver Banksian Medal.)

Messrs. R. H. Bath, Ltd., Wisbech, exhibited their new yellow Chrysanthemum "Martin Reed," which is a sport from the creamy-white rose-tinted variety Perle Chatillonaise. Blooms of two bronze-flowered sports from the same variety were also shown, and there was an interesting branch on which the parent and the yellow sport were both in flower.

Mr. Amos Perry, Enfield, showed a variety of Michaelmas Daisy, which is superior to the older variety "Mrs. Perry."

Mr. W. E. Th. Ingmersen, Harewood Road, Croydon, also exhibited Michaelmas Daisies.

Mr. L. R. Russell, Richmond, exhibited a good group of Clematis, hardy Fuchsias and other plants.

Mr. H. J. Jones, Lewisham, showed a comprehensive collection of Michaelmas Daisies. (Silver Banksian Medal.)

Messrs. G. & A. Clark, Dover, arranged border flowers, which included very good Pyrethrums.

Messrs. Price & Fyfe, Grove Park Nursery, Lee, exhibited early-flowering Chrysanthemums. (Bronze Banksian Medal.)

Messrs. Thompson & Charman, Adam Street, London, showed a few vases of herbaceous flowers.

Fig. 113—hybrid tea rose mrs. mackellar; colour pale yellow.

(Received R.H.S. Award of Merit on Tuesday last.)

Mr. Ernest Dixon, Roehampton, also showed cut border flowers.

Mr. J. B. Riding, Chingford, exhibited many fine Dahlia blooms. Besides an excellent collection of Collerette varieties, there were several good Anemone-flowered Dahlias, with erect flowers, which show themselves well. Mme. Legrange (deep red), Meissonier (pink), and Mons. Ch. Dupont (rosy-purple) are typical varieties. (Silver Banksian Medal.)

Messrs. J. Cheal & Sons, Crawley, showed many Dahlias, in which the Cactus and miniature Cactus varieties were especially good. (Silver Flora Medal.)

Mr. Charles Turner, Slough, showed a few exceedingly good blooms of Pæony-flowered and Pompon varieties, as well as several bicolor single Dahlias. (Silver Banksian Medal.)

Messrs. Carter Page & Co., London Wall, London, exhibited many Cactus, Pæony-flowered, and Collerette Dahlias. This exhibit also included cut spikes of Antirrhinums and Violas. (Silver Banksian Medal.)

Mr. T. West, Brentwood, also exhibited an interesting collection of Dahlias, which included many good blooms. (Silver Banksian Medal.)

Messrs. Dobbie & Co., Edinburgh, arranged a very meritorious collection of Collerette varieties.

Messrs. T. S. Ware, Ltd., Feltham, exhibited an attractive collection of Dahlia blooms and various border flowers. (Bronze Banksian Medal.)

Messrs. Bakers, Wolverhampton, made an imposing display of Pæony-flowered Dahlias.

Awards of Merit.

Chrysanthemum Joan Carter.—A very useful, single, yellow-flowered variety. This is quite the best of its type; the colour is rich and the flowers are borne on stiff, wiry stalks. Shown by Messrs. W. Wells & Co.

C. Framfield Early White.—A globular Japanese variety, with incurved tips to the florets, which will supersede the older varieties of its class. Shown by Mr. Davis.

Pentstemon Mrs. F. Fulford.—The specimens shown were very fine indeed. The flowers are large and bright red in colour. Shown by Mr. Fulton, Tarbolton.

Kniphofia (Tritoma) John Benory (syn. Lord Roberts) (see fig. 112).—The three plants of this splendid tall Kniphofia were fully 5 feet high and the heads of flaming red flowers were 12 inches long. Shown by Messrs. James Veitch & Sons.

Rose George Dickson.—A deep velvety-crimson H.T. Rose of splendid shape and rich perfume.

R. Mrs. MacKellar (see fig. 113).—A seedling H.T. Rose; the pale yellow flowers are of good size and are borne on very stout stalks, which are furnished with bronze-coloured foliage.

R. Edward Bohane.—A beautiful, rich crimson H.T. variety. These three fine Roses were shown by Messrs. Alex. Dickson & Son.

R. Little Dorrit.—This pretty Tea Rose was awarded a Silver-gilt Medal at the recent show of the National Rose Society (see *Gardeners' Chronicle*, p. 238, September 21, 1912).

In conjunction with a sub-committee of the National Dahlia Society, the following Dahlias received the customary awards:—

D. Useful.—A small-flowered, rosy-mauve, decorative variety. Shown by Mr. West.

D. Johnny.—A very good, deep maroon Pompon. Also shown by Mr. West.

D. Mrs. Randle.—A large pink Cactus variety.

D. Jennie Wren.—A medium-sized shell-pink coloured Cactus bloom; the undeveloped florets are yellow. Both of these fine varieties were shown by Messrs. James Stredwick & Son.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), C. J. Lucas, J. Wilson Potter, R. A. Rolfe, R. G. Thwaites, F. Sander, F. J. Hanbury, C. H. Curtis, T. Armstrong, W. Cobb, A. McBean, J. Charlesworth, W. H. Hatcher, Arthur Dye, J. E. Shill, W. H. White, J. S. Moss, R Brooman-White, William Bolton, de B. Crawshay, and Sir Harry J. Veitch.

Lady Wernher, Luton Hoo, Luton (gr. Mr. Metcalfe), staged a very effective group of splendidly-grown and finely-coloured Vanda cœrulea, arranged above specimens of the white Dendrobium formosum giganteum; a Silver-gilt Flora Medal and Cultural Commendation were awarded. With them were a grand plant of Lælio-Cattleya Dominiana, with two spikes of four and three flowers respectively, good L.-C. Bletchleyensis, L.-C. callistoglossa, Cattleya Adula, and other hybrids, the whole tastefully arranged with Maidenhair Ferns.

Baron Bruno Schröder, The Dell, Englefield Green (gr. Mr. J. E. Shill), showed a magnificent specimen of Cypripedium W. R. Lee, with many spikes, bearing together upwards of 40 flowers; this had been grown at The Dell from a small plant of the original batch (Cultural Commendation), and a large specimen of Brasso-Cattleya Mme. Chas. Maron, with six flowers.

Francis Wellesley, Esq., Westfield, Woking (gr. Mr. Hopkins), showed his Lælio-Cattleya Mrs. Phayre magnifica (C. aurea × L.-C. Norba superba), a charming flower, of fine shape, but smaller in size than C. aurea. The sepals and petals are primrose-yellow, the sepals having a faint green tint; lip deep rose with gold veining.

E. H. Davidson, Esq., Borlases, Twyford, staged a small group, which contained the new

Odontoglossum Woodroffeæ (Rossii rubescens × Queen Alexandra), the finest O. Rossii cross yet raised (see Awards). Also the pretty, new Sophro-Cattleya Dora (C. Dowiana Rosita × S.-C. Cleopatra), a pretty flower, of good shape and attractive colour. Sepals and petals chrome-yellow, tinged with copper-red; lip rosy-red, with gold veining.

Messrs. HASSALL & Co., Southgate, were awarded a Silver Flora Medal for a group of pretty hybrids, principally raised by the firm, including eight examples of their fine strain of Cattleya Minucia, a selection of the pretty and fragrant C. Eldorado cross, C. iridescens, varying much in colour, L.-C. Walter Gott, C. Nestor (Iris × Harrisoniana), and some unnamed crosses, including one between Cattleya Skinneri and C. Bowringiana, very floriferous.

Messrs. STUART LOW & Co., Bush Hill Park, secured a Silver Flora Medal for a good group, at the back of which were graceful sprays of the yellow Oncidium varicosum. A good selection of Cattleyas were in the group, the finest being C. Hardyana "Enfield variety," a large and richly-coloured flower.

Messrs. J. & A. MCBEAN, Cooksbridge, staged an effective group of good Odontoglossum crispum, Dendrobium Dearei, D. Sanderæ, Odontioda Charlesworthii, O. Bradshawiæ, and some other showy hybrids, the best of which was their handsome Cattleya Lord Rothschild albescens (Dowiana aurea × Gaskelliana alba) (see Awards).

FREDERICK J. HANBURY, Esq., Brockhurst, East Grinstead (gr. Mr. T. Matthews), sent Cypripedium Winifred Hollington "Brockhurst variety" (niveum × callosum Sanderæ), a pure-white form, with dotted lines of purple on the petals and dorsal sepal; and a pretty hybrid between C. Charlesworthii "Closes Hall variety" and, according to the record, C. Fairrieanum, but no trace of the latter species could be found. The dorsal sepal was like the white form of C. Charlesworthii, the rest of the flower resembling the same species.

Mrs. NORMAN COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), sent a beautiful Cypripedium raised by G. F. Moore, Esq., between C. Argus Moensii and Fairrieanum; a fine, cream-white flower, prettily marked with purple in lines and blotches. It is a good form of C. Luxembergense syn. Marguerite Opoix.

Messrs. CHARLESWORTH & Co., Haywards Heath, staged a select group, interesting features in which were Cycnoches maculatum, with a long, drooping spray of male flowers, and a pair of large and very dissimilar female flowers, of wax-like texture, greenish, with white lip; and C. Egertoniana, with a spray of purple blooms.

Messrs. JAS. VEITCH & SONS, Chelsea, showed Brasso-Cattleya Ilene rosea, a very pretty, rose-pink form, with pale-yellow disc.

C. J. PHILLIPS, Esq., The Glebe, Sevenoaks, showed Cattleya Fabia "Glebe variety," large, and of fine colour, and L.-C. Hastediana (see Awards).

Mr. SIDNEY FLORY, Tracy's Nursery, Twickenham, showed a good form of Cypripedium Beechense, the pretty C. Faire-Maude (Fairrieanum × Maudiæ), and a good O. crispum, with some spotting on the sepals.

Messrs. SANDER, St. Albans, showed the beautiful Cattleya nobilis nobilior (Warneri × Schofieldiana), and the elegant little Cirrhopetalum miniatum, from Annam, with a one-sided umbel of slender, orange-red flowers.

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontoglossum Woodroffeæ (Rossii rubescens × Queen Alexandræ), from E. H. DAVIDSON, Esq., Borlases, Twyford. A superb novelty, and very distinct from any previously raised, the dark colouring and fine substance of O. Harryanum and the yellow ground colour of O. triumphans (the parents of O. Queen Alexandræ) showing and blending effectively. The flowers, which are large, are borne on an erect spike. Sepals reddish-claret, with the yellow ground colour showing in wavy lines between the blotches. The petals are broader and similarly coloured, except that the blotches are smaller and there is more of the ground colour showing between. Lip broadly ovate, clear, rosy-lilac, with a bright-yellow crest

AWARDS OF MERIT.

Odontoglossum Neptune (crispum × nebulosum), from Monsieur H. GRAIRE, Amiens. A remarkable cross, the hybrid being intermediate between the parents, but with strong evidence of O. nebulosum in habit. Flowers white, with dark-red spotting on the inner halves of the segments. Lip white, with dark, reddish blotches in front of the yellow crest.

Odontioda Margarita (Odontoglossum madrense × Cochlioda Noezliana), from Monsieur H. GRAIRE. Flowers in shape nearest to O. madrense; cinnabar-scarlet on the inner parts of the segments, rose-pink outward.

Lælio-Cattleya Hastediana (L.-C. Henry Greenwood × C. Dowiana aurea), from C. J. PHILLIPS, Esq., The Glebe, Sevenoaks. Flowers resembling a small L.-C. Dowiana, the lip being very attractive and of a rich claret-purple colour.

Zygopetalum maxillare Sanderianum, from Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White). A very remarkable and distinct form, with large flowers, the sepals and petals pale green, barred with light purple. Lip broad, white, with thick, ribbed, violet crest. Probably a fine form of the plant figured in Regel's *Gartenflora* (1888) as Z. Sanderianum.

Cattleya Lord Rothschild variety albescens (Gaskelliana alba × Dowiana aurea), from Messrs. J. & A. MCBEAN, Cooksbridge. A charming and delicately-tinted flower, of fine shape. Flowers clear white, with golden centre to the lip, which is tinted with light lilac in front.

CULTURAL COMMENDATION

To Mr. Metcalfe, gr. to Lady WERNHER, Luton Hoo, for a selection of finely-grown Vanda cœrulea, with large and brightly-coloured flowers.

To Mr. J. E. Shill, gr. to Baron BRUNO SCHRODER, for a very large specimen of Cypripedium W. R. Lee (Lord Derby), with over 40 flowers.

Fruit and Vegetable Committee.

Present: Jas. Cheal, Esq. (in the Chair); and Messrs. J. Harrison, F. Perkins, Owen Thomas, W. J. Jefferies, J. Willard, Hy. Hooper, J. Jaques, W. E. Humphreys, Joseph Davis, H. Markham, Geo. Kelf, A. W. Metcalfe, A. R. Allan, A. Bullock, Geo. Wythes, George Woodward, James Vert, H. Somers Rivers, A. H. Pearson, Geo. Bunyard, W. Poupart, Wm. Pope and W. Bates.

Messrs. GEORGE BUNYARD & Co., Maidstone, exhibited a splendid collection of Pears in numerous varieties, which included Gilogil, Winter, Windsor, Princess Beurré Jean van Geerk, Marguerite Marillat and Pitmaston Duchess. (Gold Medal.)

Mr. R. C. NOTCUTT, Woodbridge, showed a very fine collection of Apples and Pears. The Apples included Hollandbury, Rival, Wealthy and Peasgood's Nonesuch, and amongst the Pears Marguerite Marillat, Triomphe de Vienne and Louise Bonne of Jersey call for special mention. (Gold Medal.)

Lady WERNHER, Luton Hoo, Bedford (gr. Mr. A. W. Metcalfe), exhibited an attractive collection of Apples and Pears. (Silver Knightian Medal.)

E. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson), sent an exceedingly meritorious collection of "Peppers" (Capsicum varieties) in pots, which ranged from the very large fruits of "Chinese Giant" down to the narrow fruits of the small, bright "Red Cluster," and included the interesting variety Chameleon, which has red, purple and yellow fruits on the same stems. (Silver Knightian Medal.)

The MEMPES FRUIT FARM, Purley, showed a collection of Melons, including good fruits of such varieties as Hero of Lockinge, Ringleader and Sutton's Universal. (Silver-gilt Knightian Medal.)

Mr. VICO, Thaxted, Essex, contributed a meritorious collection of fruit and vegetables. (Bronze Banksian Medal.)

Col. COX, Harefield Place, Uxbridge (gr. Mr. J. Orton), sent an interesting collection of ornamental Tomatos.

Messrs. SUTTON & SONS, Reading had a display of very fine vegetables. The Leeks, Celery, Sugar Corn (Maize, Early Dwarf), Kohl Rabi, Red Cabbage, Beans and Peas were exceedingly good. (Gold Medal.)

Messrs. J. CARTER & Co., Raynes Park, showed an excellent collection of vegetables. At the back there were immense succulent-looking Cardoone and long sticks of clean Celery. Towards the front the Radishes (Round White Tipped and Olive Forcing), Aubergines (Long Purple), and Garlic (Giant) were especially noteworthy.

Messrs. DOBBIE & Co., Edinburgh, exhibited many varieties of Potatos attractively laid out in shallow baskets. Amongst the purple-skinned varieties we noted the very long tubers of Mountain Ash, a variety not yet for sale, and Herd Laddie. (Silver-gilt Banksian Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, London, filled a length of tabling with a great variety of vegetables. Lettuces, which included the varieties Continuity and Crystal Palace, were prominently placed.

Mr. H. HEMSLEY, Crawley, Sussex, included in his collection of vegetables very good Peas (Gladstone) and Autumn Giant Cauliflower. (Silver Banksian Medal.)

From the CHURCH ARMY GARDEN, Westminster, Mr. E. O. Sullivan staged many kinds of vegetables, which showed exceedingly good cultivation. The Savoy Cabbages, Onions, Brussels Sprouts and Long Carrots were especially good. (Bronze Banksian Medal.)

COMPETITIVE CLASSES FOR VEGETABLES.

Many of the vegetables in the two collections exhibited in the class for 12 distinct kinds were models of cultivation. The Sutton Challenge Cup and 1st prize of £10 were won by Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree, with a splendid exhibit. The Celery, Onions, Peas (Centenary), and Leeks (Prizetaker) were excellent. The 2nd prize was awarded to H. T. TATHAM, Esq. (gr. Mr. W. Gaiger), Kendall Hall, Elstree, who showed very good Celery, Carrots, and Brussels Sprouts.

There was much better competition in the class for nine distinct kinds, and the premier position was taken by W. H. MYERS, Esq. (gr. Mr. C. Ellwood), Swanmore Park, Hampshire, who showed excellent Peas (Duke of Albany), Leeks, Carrots, and Onions. 2nd, Col. Cox (gr. Mr. J. Orton), Harefield, Uxbridge. 3rd, Mr. R. STAWARD, Panshanger Gardens, Hertford.

The 1st prize for six distinct kinds was won by BRODIE HENDERSON, Esq. (gr. Mr. H. Smith), Epping House, Little Berkhamsted, who showed splendid Peas (Centenary), Celery, and Potatos. 2nd, J. KERR, Esq. (gr. Mr. T. Avery), Loudwater, Rickmansworth. 3rd, Miss E. L. BRADSHAW, The Grange, Steeple Aston, Oxfordshire.

The collections of 12 distinct varieties of Potato included a large number of clean tubers of good, useful size. The 1st prize was awarded to M. MCMURDIE, Esq. (gr. Mr. A. Basile), Woburn Park, Weybridge, who showed splendid dishes of the varieties Windsor Castle and Wordsley's Pride. 2nd, Mrs. E. H. DENISON (gr. Mr. A. G. Gentle), Little Gaddesden, Berkhamsted. 3rd, Sir HUMPHREY TURNER, (gr. Mr. A. Humphrey), The Bedford, Havering.

The best collection of six varieties of Potato was shown by H. W. HENDERSON, Esq. (gr. Mr. F. L. Pike), Serge Hill, King's Langley, Hertfordshire. 2nd, H. T. TATHAM, Esq. 3rd, Hon. VICARY GIBBS.

There were some very good Onions shown in class 6, and the exhibit which won the 1st prize for W. H. MYERS, Esq., was exceedingly good. 3rd, Mr. R. STAWARD.

The classes for Salads did not contain any novel salading. The Hon. VICARY GIBBS, who was placed 1st in the class for nine kinds, included good Radishes (French Breakfast), Tomatos and Beet. 2nd, H. T. TATHAM, Esq.

The Hon. VICARY GIBBS, who showed the best collection of "other vegetables," included fruits of the Long Purple Egg-plant, Long Red Capsicum, Celeriac, Salsify, and Scorzonera in his excellent exhibit. 2nd, W. H. MYERS, Esq.

The best Scarlet Runner Beans, in a very strongly contested class, were shown by W. H. MYERS, Esq. 2nd, H. KEEP, Esq., Aldermaston, Reading.

Lord FOLEY (gr. Mr. H. C. Gardner), Ruxley Lodge, Claygate, won the 1st prize for French Climbing Beans. 2nd, Hon. VICARY GIBBS, whilst H. T. TATHAM, Esq., excelled in the

class for dwarf French Beans, and the Hon. VICARY GIBBS was again placed 2nd. Sutton's Black was the best Beet shown (H. T. TATHAM, Esq.), and the 2nd prize was won by Mr. STAWARD.

The Hon. VICARY GIBBS showed an excellent dish of Brussels Sprouts; the second best were shown by H. W. HENDERSON, Esq. The best three plants were shown by J. KERR, Esq.; 2nd, Hon. VICARY GIBBS. Lord FOLEY showed excellent Cabbages; 2nd, Hon. VICARY GIBBS. The best Savoys were shown by Mrs. E. H. DENISON; 2nd, Col. Cox. The 1st prize for Cauliflowers was awarded to Hon. VICARY GIBBS; 2nd, BRODIE HENDERSON, Esq.

R. MCMURDIE, Esq., showed exceptionally good examples of Celeriac; 2nd, Hon. VICARY GIBBS. The Celery shown was also very fine. R. MCMURDIE, Esq., won the 1st prize for White and 2nd for Red, whilst the Hon. VICARY GIBBS excelled with Red and won the 2nd prize for White Celery.

The 1st prize for Cucumbers was awarded to W. H. MYERS, Esq.; 2nd, Lord NORTH (gr. Mr. E. Janes), Wroxton Park, Banbury.

The prizes for Marrows were awarded to the Hon. VICARY GIBBS and W. H. MYERS, Esq., in the order named, whilst these positions were reversed in the class for Leeks.

The Hon. VICARY GIBBS was the only exhibitor of Mushrooms, and was awarded the 1st prize.

Onions of all kinds were large and firm. J. KERR, Esq. (gr. Mr. Avery), Loudwater, Rickmansworth, and Mr. STAWARD won the 1st and 2nd prizes respectively with round or globular bulbs. The prizes for flat Onions were awarded to H. T. TATHAM, Esq., and Mr. STAWARD.

The best Parsnips were shown by Hon. VICARY GIBBS; 2nd, H. T. TATHAM, Esq. Mrs. DENISON won the 1st prizes for long and for short Carrots; the 2nd prizes were awarded to Hon. VICARY GIBBS for the former vegetable, and to J. KERR, Esq., for the latter.

BRODIE HENDERSON, Esq., excelled with Peas; 2nd, Mrs. L. DAVIS.

Mrs. DENISON was the most successful exhibitor of white and parti-coloured Turnips, and the Hon. VICARY GIBBS, who won the 1st prize for yellow Turnips, was 2nd with white varieties. Mr. STAWARD was placed 2nd with yellow Turnips, and J. KERR, Esq., was similarly successful with the parti-coloured varieties.

The best dish of white Potato was shown by Miss BRADSHAW; 2nd, Mrs. DENISON, whilst the Hon. VICARY GIBBS showed the 1st prize coloured tubers; 2nd, W. H. MYERS, Esq.

The best Kale of both kinds was shown by the Hon. VICARY GIBBS. BRODIE HENDERSON, Esq., won the 2nd prize for dwarf Kale, and Mr. STAWARD a similar honour for the tall variety.

Tomatos were as nearly perfect as possible, and the 1st prize dish, shown by W. H. MYERS, Esq., deservedly won that honour; 2nd, Lord NORTH, whilst the best yellow fruits were shown by Hon. VICARY GIBBS. Col. COX and BRODIE HENDERSON, Esq., were, in the order named, the successful exhibitors of ornamental Tomatos.

The 1st prize exhibit in the class for any other vegetable consisted of a pair of Red Cabbages, shown by R. M. MCMURDIE, Esq., whilst a dish of Globe Artichokes won the 2nd prize for Mr. STAWARD.

Scientific Committee.

SEPTEMBER 10.—*Present*: Mr. E. A. Bowles, M.A., F.L.S. (in the Chair); Messrs. J. W. Odell, A. Worsley, J. Fraser, G. Wilson, E. M. Holmes, W. Hales, J. O'Brien, and F. J. Chittenden (hon. sec.).

Erica cinerea malformed.—Mr. E. M. HOLMES showed a specimen of Erica cinerea from Ringwood in which the corolla was divided to the base so that the flowers had the appearance of those of Ling. He also showed a specimen from Studland in which the flowers were replaced by very numerous bracts almost as in the Wheat-ear Carnation.

Malformed Armeria.—Mr. A. W. HILL reported that he had examined the flowers sent to the last meeting in which the corolla was replaced by a calyx, so that there were two calyces, and had failed to find either fungus or mite present to account for it. It was suggested that some pest, such as eelworms, had attacked the roots.

Sweet Pea with proliferous inflorescence.—Mr. FRASER showed an inflorescence of Sweet Pea which after flowering had elongated and produced leaves and flowers to the number of 14 in all.

Lysimachia vulgaris.—Mr. FRASER also showed a shoot of Lysimachia vulgaris which had grown out of a shady position in a horizontal fashion, and the leaves had arranged themselves as in a shoot of Polygonatum.

Watsonia.—Mr. A. WORSLEY showed a specimen of Watsonia iridifolia which differed in some respects, but especially in its extreme robustness, from the variety O'Brienii (also called Ardernii). It was thought probable that it was merely a robust form of that variety.

Musa Bakeri.—Mr. WORSLEY also showed staminate flowers of Musa Bakeri from a plant raised by him from seed.

Certificate of Appreciation.—The Council have awarded a Certificate of Appreciation to Mr. C. H. HOOPER for his work in connection with the pollination of hardy fruits.

Seeds of Parrot Tulips.—Some fruits of Parrot Tulips were sent from Sussex, but on examination the seeds contained were found to possess no embryo.

THE LATE W. BAYLOR HARTLAND.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 23.—At a meeting of the executive committee of the above Society, held at Carr's Restaurant, Strand, under the presidency of Mr. T. Bevan, the secretary (Mr. Witty) submitted an interim financial statement to date, which showed a substantial balance in hand. It was decided that the prizes at the two forthcoming shows in October should be paid immediately after the exhibitions are closed.

The annual dinner will be held on November 27, at the Holborn Restaurant.

At the conference to be held at Essex Hall on November 20, at 7 p.m., Dr. Russell will read a paper on "Soil Sterilisation," and a small show of Chrysanthemums will also be held in conjunction with the conference. The judges and stewards for the two exhibitions at the Crystal Palace were appointed, and it was stated that the two N.C.S. medals offered at the Royal International Show at Chelsea last May had been awarded to exhibits which, considering the time of year, were very meritorious.

An invitation for a delegate to be sent to the Chrysanthemum Show to be held at Nantes next November was discussed, and it was resolved that no action be taken. Mr. Thomas Bevan was appointed to represent the N.C.S. at the International Horticultural Congress to be held in Ghent during the Quinquennial Exhibition next April.

One Fellow and 12 new members were elected.

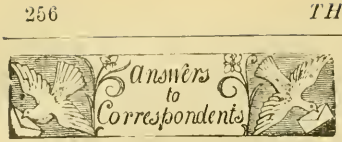
NORTH OF ENGLAND HORTICULTURAL.

SEPTEMBER 18.—There was a large attendance at the meeting held at the Queen's (Midland) Hotel, Leeds, on the above date. Professor R. S. SETON, B.Sc., of Leeds University, presided, and Mr. W. DYKE delivered a lecture on "Commercial and General Manures." A collection of fruit (Grapes, Apples, Pears, Peaches, &c.) from Lady NUNBURNHOLME, Warter Priory (gr. Mr. F. Jordan), was unanimously recommended a large Gold Medal. Mr. J. C. FORDY, Warkworth, Northumberland, exhibited Gladioli, for which a cultural certificate was awarded. The Rev. C. GALLACHER, Hunslet Vicarage, in the heart of Leeds, exhibited Gloxinias and Coleus (Silver Medal). The Collerette Dahlias Prince John and Frogmore from Messrs. DOBBIE & Co., Edinborough, received First-class Certificates, as also did the Chrysanthemum Crimson Polly shown by Messrs. W. WELLS & Co., Merstham, Surrey.

Obituary.

WILLIAM BAYLOR HARTLAND.—In our last issue we briefly announced the lamented death of this great florist and nurseryman, which took place at his residence on Sunday, September 15, at the age of 76 years. W. Baylor Hartland was born at Mallow, Co. Cork, in 1836. His father, who was a nurseryman at Cork, died there in 1848, and soon afterwards William Baylor was apprenticed to his uncle, Mr. J. B. Hartland, seedsman in the same city. He remained with his uncle until 1878, when he went into business on his own account, and at once commenced to collect and cultivate Daffodils at the present establishment, Ardcairn, Ballintemple, Co. Cork. He personally collected all the available species in their native habitats, he purchased every desirable variety, and resolutely set to work to improve the members of the genus Narcissus, and secure for Daffodils the public appreciation he felt they deserved. To this end he published the first known complete catalogue of Daffodils in 1884, and a copy of this catalogue may be seen in the British Museum. The Ardcairn collection and its fame grew apace, and in 1897, the Jubilee year of the Victorian era, another important catalogue was issued, consisting mainly of illustrations of the best Daffodils from drawings by Gertrude Hartland. Some of the best varieties of his own raising are William Baylor Hartland, King of the Poets, Countess of Southesk, Jenny Woodhouse, and Orestes.

Mr. Baylor Hartland devoted an immense amount of energy to the collection and culture of Tulips, and the present-day cottage varieties are to a large extent the results of his visits to the old gardens in Ireland, many of them cottage gardens, where most of the varieties were discovered. Hartland obtained the assistance of Mr. J. G. Baker, of Kew, and the late Mr. Burbidge, of Trinity College, Dublin, who helped him to identify and classify the varieties he discovered. His first list of Tulips was published in 1896, and some of the best varieties he introduced are Royal Visit, Glare of the Garden, Mrs. Keightley, Illuminator, The Fawn, and Fairy Queen. Mr. Baylor Hartland was a great collector, enthusiastic, impulsive, of a poetic temperament, full of original ideas, a lover of old books, and a true Irishman. His poetic inclinations may be seen in his useful little books, and notably in that tourist's handbook, *Wayside Ireland, its Scenery, Botany, Agriculture and Peasantry*, in which much useful information is conveyed in a very interesting style. He was elected a member of the Daffodil Committee of the Royal Horticultural Society of England about 1885, and was one of the best authorities on the subject. He contributed frequent articles to the *Gardeners' Chronicle* during a long period. The funeral took place at the old Protestant Churchyard, Douglas, Co. Cork, on the 18th inst., in the presence of a large number of friends, the coffin being borne by the principal men in the nurseries. He leaves four sons and one daughter.



*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

APPLE: *Kent.* We have not been able to identify the Apples received; they probably represent, as you suggest, a local seedling. The attractive fruits are of useful size and of fair quality for dessert. As the flesh is a trifle mealy and the pips have not plumped up, we suspect that the fruits were gathered a little too soon.

ASTERS DESTROYED BY INSECTS: *Hardworker.* The insect enclosed with the injured plant is the larva of the common cranefly, Tipula oleracea. It is very rarely that these insects infest such plants as Asters, and their attacks have no doubt been favoured by the excessive rains. Roughly dig the borders or beds and leave the soil exposed to frosts. If there should be a recurrence of the pest next season the only course is to trap the maggots by inserting pieces of green turf near the plants.

CALADIUMS FROM SEED: *Correspondent.* The seeds of Caladium should be sown in March, in a mixture of peaty or light, loamy soil, to which has been added enough silver sand to keep it porous, the whole having been passed through a ¼-inch sieve. Prepare clean pots of a suitable size, or better still shallow pans, with plenty of drainage to allow a free passage of water; fill to within an inch of the top with the prepared soil, and gently press it down; then thinly sow the seeds over the surface and cover with soil ¼ inch deep. Water thoroughly with a fine-rosed can, then place the pots in a bottom heat of 75°, and cover with a sheet of glass to prevent evaporation. As soon as the seedlings appear remove the glass and place the pans on a shelf as near to the light as possible. Water carefully, as at this stage the seedlings are liable to "damp" off if kept too wet. When large enough to handle, transplant the seedlings into thumbpots using similar soil, but adding a little broken charcoal. Keep them as near to the glass as possible in a brisk, moist heat, and pot on as required into larger pots, using soil of a coarser nature according to the size of the pots and giving the plants abundance of water as the pots become filled with roots. Caladiums are swamp-loving plants and must never be allowed to become dry.

CARNATION AND BEGONIA GLOIRE DE LORRAINE: *J. M. A.* The fungus found on the Carnation leaves is Heterosporium echinulatum. Remove all the badly-diseased leaves, and plunge the plants into a rose-red solution of permanganate of potash on two occasions at intervals of four days, and repeat the operation if necessary. There is no disease present on the Begonias. The appearance is due to conditions of cultivation.

CELERY: *J. S. M.* The Celery you send has been far too heavily dressed with soot, which has burnt the skin of the stalks.

CYCLAMEN DISEASED: *P. G. W.* The roots of the corms were rather badly infested with eelworms (Tylenchus), as you surmised. The source of infection was in all probability the loam, but the worm which you enclosed in the cartridge case belongs to a much less harmful group, and is not a true Tylenchus; the latter are microscopical and not visible to the naked eye. As a precautionary measure you have taken the proper course by destroying the infested corms, there being no other really satisfactory treatment.

DAMSON DISEASED: *Fruit.* The black, sooty appearance of the leaves is due to fungi which have grown owing to the presence of plant lice. Spray the trees with a paraffin emulsion to which should be added liver of sulphur at the rate of 1 lb. to 100 gallons of water.

FIG LEAVES: *B. N.* The white spots on the leaves are caused by some substance which has been sprinkled or sprayed over the foliage. No. 1 is covered with a fungus called Capnodium, which lives on the honey-dew deposited by aphides on the leaves. An insecticide should be used to destroy the aphides.

FRUIT FOUND IN GARDEN SHED: *W. & Co.* The fruit is that of a Palm, probably of Rhopalostylis sapida (syn. Areca sapida).

FUNGUS: *H. G. B.* The fungus is "Black Scab" (Synchytrium solani). Its presence should be reported to the Board of Agriculture.

GRAPES UNHEALTHY: *G. W. J.* There is no disease to be found on the Grapes; the injury is due to excess of water at the root, and lack of heat.

INSECTS IN GREENHOUSE: *G. B.* The material you have sent us on "sticky fly-paper" is inadequate for diagnostic purposes. If you will send us better specimens we will advise you.

INSECTS IN VINE BORDER: *Perplexed.* The beetle sent is a harmless species. It is a member of the genus Trox, and is possibly Trox sabulosus. All the members of this genus live upon dry bones, horns, hoofs, and other animal remains, and the probabilities are that they were introduced in the way you have suggested in your communication.

LILIUM CANDIDUM: *W. A.* In order to keep the leaves green, spray the plants in their early stages of growth with liver of sulphur, using 1 ounce of sulphur to 4 gallons of water. There is no disease present on the bulbs.

MUSCAT GRAPES DECAYING: *J. A.* The vines are attacked by the Grape rot, Glœosporium ampelophagum. Your best plan is to drench the vine before the buds open with a solution of sulphate of iron, 1 lb. in 10 gallons of water. This remedy can only be employed during the winter, otherwise it would destroy the foliage.

NAMES OF FRUITS: *F. U.* 1, Red Astrachan; 2, Summer Strawberry; 3, Worcester Pearmain; 4, Shepherd's Fame. Pears: 1, Madame Treyve; 2, Beurré Hardy.—*Grinstead.* 1 to 5, Pitmaston Duchess; 2, not recognised. We think a local stewing variety. —*G. N. S.* Cox's Pomona.—*A. G. L.* Jargonelle.—*W. S.* Huyshe's Prince Consort.—*T. D.* Pear: Beurré d'Amanlis; Apple: Winter Quoining.—*J. D.* Lady Derby.—*B. B.* Beurré d'Amanlis. The fruits are ready to gather; they will not keep many days after gathering.—*H. E.* 12, Marguérite Marillat; 13, Beurré Superfin; 14, Doyenné du Comice; 15, Easter Beurré; 16, Beurré Hardy; 17, Josephine de Malines.—*Constant Reader.* 1, Uvedale's St. Germain; 2, Kerry Pippin.—*J. E. H.* 1, not recognised, a local variety; 2, Potts's Seedling; 3, Lord Derby; 4, Emile d'Heyst; 5, Stirling Castle; 6, Red Astrachan. —*Enquirer.* 1, Peasgood's Nonesuch; 2, Cellini; 3, King of the Pippins. *E. J. W.* 1, Keswick Codlin; 2, Lady Derby; 3, Washington; 4, The Queen; 5, Claygate Pearmain; 6, Stirling Castle.—*Bude.* Williams's Bon Chrétien. The figs were smashed.—*F. E. C.* Pear: Williams's Bon Chrétien. Quite ready to gather. 1, decayed; 2, French Crab; 3, Brownlee's Russet; 4, Cox's Orange Pippin; 5, too small to name. *L. M. B.* All fruit trees in pots, especially Peaches, need a great deal of attention in respect to thinning and feeding. They should never be allowed to become the least dry at the roots, otherwise premature ripening takes place, and as a result the fruits are sour. Again they should not be allowed to ripen in a cold house under vines. Peaches are always of better flavour when exposed fully to the sunshine, and if a gentle warmth can be afforded, so much the better.—*H. C.* 1 and 2, decayed; 3, Beurré d'Amanlis; 4, Cox's Pomona; 5, Lady Henniker; 6, Lord Burghley.—*H. H.* Pear: Beurré Hardy. Apple: Nancy Jackson.—*A. H.* 1, Summer Strawberry; 2, Bramley's Seedling; 3, Beurré Hardy; 4, Louise Bonne of Jersey; 5, Souvenir du Congrès; 6, Pitmaston Duchess; 7, Comte de Lamy.—*H. R.* Large Pear: Beurré Bosc; small one: not recognised. *Gardener.* 1, Duchess of Oldenburg; 2, Pile's Russet; 3, Cox's Pomona; 4, Mother; 5, The Queen; 6, Tower of Glamis; 7, not recognised; 8, deformed fruit; 9, Northern Greening. Others next week.—*H. M.* Pears: 1, Beurré Clairgeau; 2, Catillac; 3 and 5, Beurré Diel; 4, Beurré Sterckmans; 6, Beurré Bachelier; 7, Doyenné du Comice; 8, Beurré Hardy; 9, Duchess d'Angoulême; 10, Winter Nelis. Apples: 1, Fearn's Pippin; 2, Egremont Russet; 3, Cox's Orange Pippin; others next week.—*A. S. K.* Louise Bonne of Jersey.—*T. H. Chilton.* 1, Beurré d'Amanlis; 2, Autumn Bergamot.—*J. Ross.* 1, Beurré de Jonghe; 2, Jean de Witte; 3, Golden Knap; 4, Madame Treyve.—*J. Harris.* Emily Childs. —*H. Collier.* 1, Brockworth Park; 2, Josephine de Malines; 3, Emile d'Heyst; 4, Comte de Lamy; 5, Beurré Sterckmans.

NAMES OF PLANTS: *Constant Reader.* 3, Specimen withered, probably Rose Henriette de Beauveau; 5, Comtesse du Cayla.—*G. W. W.* Datura Stramonium.—*H. F. W.* 1, Clematis orientalis; 2, Chironia ixifera; 3, possibly a species of Eupatorium, but send when flowers are open; 4, Aster, a garden variety almost impossible to name correctly, there are so many sorts; 5, Cimicifuga simplex; 6, C. cordifolia.—*W. W. W.* 1, Francoa ramosa; 2, Passiflora sp., probably P. cœrulea; 3, Trachelospermum jasminoides; 4, Tradescantia zebrina discolor; 5, flower too withered to name; 6, insufficient material to name; 7, Nepeta Glechoma variegata; 8, Begonia fuchsioides; 9, Asparagus Sprengeri; 10, Bougainvillea glabra.—*O. R. T.* 1, Lælia Dayana; 2, Oncidium incurvum; 3, O. cheirophorum; 4, Cochlioda vulcanica; 5, Odontoglossum Lindleyanum; 6, Oncidium flexuosum.—*J. McD.* Sarcanthus erinaceus.—*H., Ltd.* 1, Leycesteria formosa; 2, Aralia species.—*W. A.* The photographs you send are of Rhopalostylis sapida, which is known in gardens as Areca sapida, or as Kentia sapida.

PEARS CRACKING: *R. S. F.* The answer to your query is the same as to *Enquirer* in last week's issue, p. 224.

POTATOS DISEASED: *Cestrian.* The Potatos are attacked with Phytophthora infestans. Following the digging of the crop in autumn, every bit of haulm should be gathered and burnt. Tubers that are diseased should be picked out and destroyed by burning. Next season spray the plants with the Bordeaux mixture early in July, following this spraying by one or two more sprayings at intervals of a fortnight, and taking care to spray the undersides of leaves as well as the tops. To prevent this disease, the crops should be planted on well-drained soil, free from excessive dampness.

PROFITS FROM FRUIT FARMING: *E. E. C.* Only a general reply can be given to your inquiry as to the usual profits of fruit farming on holdings of 20 acres and upwards. Much depends on the amount of capital available to tide the grower over unprofitable seasons and on the nature of the soil, its situation, nearness to good markets, experience of fruit-growing on the part of the cultivator, and, last, but not least, his business aptitude. Some localities are well adapted for the culture of Plums; in others, such as the neighbourhood of the Chilterns, Cherries can be profitably grown, and so on, but, notwithstanding this, as a wise man does not put all his eggs in one basket, so, unless the conditions are exceptionally favourable, a general fruit farm is the wisest venture. You would do well, before embarking on your project, to visit some of the districts in Kent, Sussex, Hampshire, and Gloucestershire, where fruit farming is carried out on a large scale, and if you then care to again write, giving fuller information, we will further advise you.

ROSE LEAVES INJURED: *H. S. F.* The injury is due to insects of some kind, but as no examples were enclosed with the leaves it is impossible to say what the pest is. We may add, however, that the insect is furnished with mandibles, and therefore spraying with Paris green at the rate of 1½ ounce to 20 gallons of water would in all probability destroy the pest.

VINES DISEASED: *B. N.* Eelworm is present. Soak the soil twice, at intervals of 10 days, with nitrate of soda, using 2 ounces of nitrate to a gallon of water.

PLANT NAMES FROM ANIMALS.

THE popular division of all earthly products into animal, vegetable, and mineral, though not scientific, may be allowed, if only it be understood that the three divisions are not separated by impassable barriers, but that they are in many cases so closely allied that one division often overlaps another and even mixes with it. A familiar instance of the overlapping of mineral and vegetable is found in the common cases of silica in Wheat and in the Mare's-tail (Hippuris), of lime in the crustaceous Saxifrages, and of nitrates and potash in almost all vegetable matter. The union of animal and mineral is seen in the iron found in the blood and bodies of most animals, including man, besides other more unpleasant minerals, and the close analogy and even union of animals and plants are shown in many ways. One instance will suffice. In the very interesting account of the marine worm Convoluta roscoffensis, lately published by Professor Keeble, it is clearly shown that the Convoluta is a true "plant-animal," so that at one time of its life the animal is the predominant partner and at another the plant. The book is called *A Study in Symbiosis*, and the professor proves that in the Convoluta "the animal requires the same food substances as the plant. Hence it is constrained to take it from the plant, and the aphorism, 'All flesh is grass,' is no mere figure of speech, but a terse statement of truth."

This analogy or union between plants and animals is no new doctrine; it is, indeed, very old. Aristotle, in the *Hist. Anim.*, says that there is much in common between plants and animals, and his pupil, Theophrastus, says the same. In some editions of Theophrastus the work starts with the intention of showing the analogy between plants and animals. The reading is doubtful, but the idea can be traced in many other parts of the book. Pliny and Dioscorides copied Theophrastus, but the extreme view was not reached till Baptista Porta, in the latter part of the 17th century, published his *Phytognomonica*, in which he showed the strong likeness between plants and animals, and did not hesitate to attribute to plants virtues and vices and even "anima," by which he meant the internal force and secret working of the plant. We may now laugh at his fancies and call them fantastic, but he was a real natural philosopher and observer of nature, and the book is well worth looking into. About the same time or a little earlier Bacon, in his *Sylva Sylvarum*, has a chapter on "The Sympathies and Antipathies of Plants" and another on "The Affinities and Differences of Plants and Living Creatures," in which he quotes the proverb, "Homo est planta inversa," which he translates, "Man is like a plant turned upwards, for the root in plants is as the head in living creatures." Passing by other writers, I come, in 1818, to *An Essay on the Probability of Sensation in Vegetables*, by Dr. J. P. Tupper. He was a very learned physician with a large practice, and he grounds his theory on motion in plants, sleep, irritability, &c., and the treatise is well worth reading. Again passing by other writers, I come to Professor Darwin's presidential address to the British Association at Dublin in 1908, in which he said "it is impossible to know whether plants are or are not conscious. . . but in certain conditions we must believe that in plants there exists a faint copy of what we know as consciousness." With such great authorities we need not hesitate to recognise a real relationship between ourselves and the flowers of our gardens.

Before I go to the subject of my paper, "Plant Names from Animals," I must still add a little to my forewords, because I wish to draw attention to one particular point of resemblance which I do not like to pass over. It is curious that among the likenesses between animals, especially man, plants, &c., many different writers have given to plants the power of speech, because speech is the great point in which man considers himself superior to what he calls the dumb creatures. Yet it has been so from very early times. In one of the earliest existing fables, "The trees went forth to anoint a king" (Judges ix.), and the Olive, the Fig, the Vine and the Bramble spoke very clearly; and in another fable (2 Kings xiv.) the Thistle sent a verbal message to the Cedar. In connection with this it is worth noting that before David's decisive battle against the Philistines he was told to wait "till thou hearest the sound of a going on the top of the Mulberry trees." The message from the trees was audible to David and led him to victory. Throughout the Bible, especially in the Old Testament, trees and other plants are spoken of with an almost human personality.

It is the same with the Greek and Roman writers. The oracles of Dodona were spoken by the Oaks. The reeds of Mount Tmolus said very clearly that Midas had the ears of an ass; and Sophocles speaks of "the many-tongued Oak." Æsop introduces us to many talking plants. Virgil, Horace, Ovid, Lucretius and all the Latins who delighted in outdoor life bear their testimonies to the same feeling. How the relationship between plants and animals was recognised by them is shown by the way in which, perhaps unconsciously, they applied the same descriptive epithets to both. Virgil, for instance, applied these human epithets to plants: Ridens, segnis, læta, languens, impia, spirans and others.

Passing over many years, I come to the English writers. In the *Shepheard's Calender* for "Februarie" Spenser tells the pretty tale of the "spiteful brere" abusing the "goodly Oake" in very scolding English. Then we come to Shakespeare, who teaches the good lesson that "sweet are the uses of adversity," which will find for us "tongues in the trees and good in everything." In 1665 the learned Thomas Fuller published his "Antheologia or Speech of Flowers," in which the flowers speak of themselves in very plain English. Then, skipping many years, not for want of material, but for want of space, I may finish this part of my subject with Tennyson's "Talking Oak," of which he says:—

"Tho' what he whispered, under Heaven
None else could understand,
I found him garrulously given,
A babbler in the land."

I say nothing of the many modern books on the "Language of Flowers," because most of them are rather foolish, and in all of them the names and language merely show the private fancies of the authors. I can only recall two instances in which the words spoken by the flowers are descriptive and have some authority and may be called popular. One is the Balsam, which, from its sensitiveness to touch, has for its specific name "noli-me-tangere," and for its generic name is rightly called "impatiens." The other is the Heartsease, which, from very early times, has had all sorts of pretty names, speaking a definite language, such as "Call me to you," "Kiss me at the garden gate," "Jump up and kiss me," and many others of the same kind. From very early times the Mandrake has been credited with the

power of shrieking when pulled out of the ground. The belief was based on its fancied human appearance, and Josephus says it was a common opinion in his time, and it certainly lasted till the time of Shakespeare and Jonson, both of whom speak of its shrieks.

If I may speak of myself, I should say that I do not consider these semi-human attributes to be far-fetched or over-fanciful. To me they are real. As I walk through my garden, I find in the flowers not only beauty and interest but also companionship; they talk to me, and as they talk they never scold and are never monotonous. One day telleth another, and the tale is never the same from day to day. Keble felt the same, and shows it in his beautiful flower-poem for the 17th Sunday after Trinity. So did George Herbert, Cardinal Newman, Alphonse Karr, and Forbes Watson in his delightful *Gardens and Flowers*. What the flowers say depends upon the hearer; the voices of flowers are like the voices of church bells, of which it is said "What the soule thinketh that the bell clinketh" (Burton). In the same way, what the flowers say depends on the hearer, but they have voices, and so I partly understand St. Paul's lesson, "There are, it may be, many kinds of voices in the world, and none of them is without signification"—man is not the only *animal loquens*.

In these forewords I have tried to show how universal has been the belief in the relationship between plants and animals. I now go on to the way in which that belief has been shown in the many instances in which the names of animals have been given to plants, and I begin with the birds.

Aquila, the eagle, has given his name to the Aquilegia, the Columbine. That this is the right origin of the name I have no doubt, though the derivation from aqualegus, a water-collector, has some authority. But I am content to follow Linnæus, who puts Aquilegia into his list of wrongly-named plants and says that the right name is aquilina, i.e., eagle-like, referring to the likeness between the upper petal of the flower and the curved beak of the bird. The connection with the eagle has been adopted in many European languages, but has not been kept in the English. Our English name for the plant is Columbine, and how a plant can be connected both with the eagle and the dove seems a contradiction in terms, and recalls Horace's line, "Nec imbellam feroces progenerant aquilæ columham," and I should suppose that Columbine refers to the colour, like Chaucer's "Eyen Columbine."

Erodios, the heron. pelargos, the stork, and geranos, the crane, give us Erodium, Pelargonium and Geranium and the English Crane's-bill, all pointing by their seeds to the sharp bills of the birds. Our domestic poultry give us Chickweed, Chick-pea, Cockscomb, and Henbane. The connection of Henbane with the bird is not quite certain. The seeds are hurtful to poultry, but the Greek Hyoscyamus connects the plant with the hog. The pheasant's eye is found in the pretty autumnal weed of the cornfields and in the Pheasant's-tail Grass (Apera). We have no English plant connected with the pigeon, but we find it in the pigeon pea (Cajanus), the pigeon berry (Phytolacca), and the pigeon beak (Lotus), all exotic. The dove may be found in the Columbine, and in I. Walton's and J. Dennis' Culverkeys. The "culver" is certainly the dove, but the "keys" makes a difficulty, and Walton's azure Culverkeys makes me connect it with the blue Geranium, the seed (keys) of which may be said to resemble the pigeon's foot. The swallow, chelidon, is found in Chelidonium, either because, according to Theophrastus and Pliny, the plant springs up and decays at the coming and departure of the swallows, or because, according to the absurd derivation given by Aristotle and Dioscorides, the swallow picks the seeds to restore the lost eyes of its young ones. We find the crow in Crowberry (Empetrum) and in Crowfoot (Ranunculus); the cuckoo appears in the Cuckoo Flower and in the Lychnis Flos-cuculi; the lark in the Larkspur and the Corydalis, and from the Greek hierax, a hawk, Theophrastus derived the name hieracion, and we keep the name of the hawk in the Hawkweed and Hawkbit, both derived from Pliny's account that hawks eat it for their eyesight. Strouthios is the Greek name both for the ostrich and the sparrow. The ostrich is found in the Ostrich Feather Fern, and carries its name in Greek, Struthiopteris, from Strouthios and pteron, a feather. From the sparrow, Strouthios, we get the plant Struthiola. A plant is named Struthios by Pliny, and is supposed to be a Gypsophila, and he calls Quinces Struthea mala, which looks as if he did not much care for them, otherwise I do not find the sparrow in any plant, unless we admit the Cockney Sparrowgrass, for Asparagus, a form which really seems to have established itself in some English literature. The partridge is found in the Partridge berry (Gaultheria) and the Partridge Pea. The peacock and parrot give their names to the Parrotbeak (Clianthus) and the Peacock Lily (Tigridia), but the plants are exotic and the names modern. The duck is found in Duckweed and in the Ducks-foot (Podophyllum), while the Greek name of the goose (chen) survives in the Chenopodium or Goosefoot, and its Latin name (anser) in Potentilla anserina. In Gooseberry the derivation is not connected with the bird. The cassiowary is said to have given its name to the Australian Casuarina. *H. N. Ellacombe, Bitton Vicarage.*

(To be continued.)

Fig. 115.—PRIMULA INTEGRIFOLIA IN THE TYROL: ALT. 9,900 FEET.

PLANT NOTE.

CLERODENDRON FALLAX.

Included in the genus Clerodendron are some widely dissimilar types, for among hardy species there is Clerodendron fœtidum, which though classed as a shrub is almost of an herbaceous character, while C. trichotomum attains the dimensions of a small tree. The tender species also show much variation, for while several of them are decided climbers, others are of erect, shrubby growth. To this last group belongs Clerodendron fallax, a native of Java, and certainly one of the most showy of the entire genus. It has been grown in gardens for a long time, but has come markedly to the fore within the last few years, and deservedly so, as it is exceedingly useful for various decorative purposes. This Clerodendron is of upright growth, the sturdy stems being furnished with large, heart-shaped leaves, and terminated by large, erect branching panicles of deep scarlet flowers. It blooms as a rule in the summer and early autumn months. Seeds frequently ripen, and in this way young plants can be readily obtained, while cuttings are also easily rooted. Effective specimens may be grown in pots from 6 inches to 8 inches in diameter, and in order to obtain the best results they should be assisted when the pots are well furnished with roots, with occasional doses of liquid manure. *W. T.*

IPOMŒA LEARII.

Considering that flowers of a clear, decided blue tint are so generally admired, it is somewhat surprising that this Ipomœa is not grown more frequently. Perhaps it is owing to the fact that the flowers are not of a sufficiently lasting nature to admit of their being used to any extent in a cut state, though on the plant they are delightful, and are borne throughout the greater part of the summer and well on into the autumn. As with many of the Ipomœas this is a rapid-growing climber, and the large Convolvulus-like flowers are of a rich bright blue with a lighter throat. It needs the temperature of a stove or intermediate house for its successful culture; indeed, in the last-named house it is less liable to the attacks of red spider, which in the stove sometimes gives trouble. Ipomœa Learii is not difficult to strike from cuttings of the young shoots, and the plants so obtained grow away freely afterwards. Owing no doubt to its great beauty, it is cultivated in many parts of the tropics. In cultivation it forms a charming rafter plant. *W. T.*

PRIMULA INTEGRIFOLIA ON THE HIGH ALPS.

The illustration in fig. 115 shows a European Primula, peer of the lovely Oriental forms recently illustrated in these pages. It is P. integrifolia, which I photographed on July 1 last, at a height of 9,900 feet, while descending the Vertainspitze, an outlier of the Ortler group in the Tyrol. One specimen at least was seen at 10,000 feet, but the group illustrated was part of a natural rock-garden nearly half-an-acre in extent, surrounded by snow, which was prevalent down nearly to 8,000 feet. A snowstorm was raging at the time, and I used my ice-axe for a camera stand; the slope being so steep, it was difficult to get back far enough to take the picture. The colour was intense violet, far more blue than the usual shade even of this Primula, perhaps because of the unusual height. The rocks were, of course, dripping with ice-cold snow water. At least 150 plants are included in the picture. *J. Edmund Clark, B.Sc., Purley.*

BROCKHURST.

Brockhurst, the residence of Frederick J. Hanbury, Esq. (gr. Mr. T. Matthews), is interesting not only to lovers of beautiful gardens, but to the naturalist and botanist, for the museum contains a complete collection of British Lepidoptera and the herbarium some 70,000 specimens of British plants. The gardens also contain numerous rare British plants. A former owner planned the gardens and pleasure grounds, but Mr. Hanbury has developed them, so that to-day they are amongst the finest in the country. The rock-garden is one of the most extensive in these islands, for, although not yet finished, it is one-eighth of a mile in length, and consists of a ravine cut in the natural rock, with shelving, irregular sides, the home of rare and interesting species.

The view from the terrace (see fig. 118) includes graceful slopes, studded with fine Conifers and other trees, with Pomegranates, Stauntonia latifolia, Solanum crispum, and various other uncommon creepers around the house. The garden

Fig. 116.—Brockhurst, East Grinstead.

front contains rocky herbaceous borders, in the middle of which are steps of natural stone. In the spaces between, on stones, close-growing rock plants thrive, such as the Corsican Helxine Soleirolii, Arenarias, Acænas, Androsaces and Saxifrages. A chain of four large ponds, fed by natural springs, extends from the higher to the lower ground, their rock-bound sides affording suitable homes for marsh-loving plants. Above the ponds are long stretches of Rhododendrons, some of the plants being 25 feet in height, and providing a great display of flowers in their season. There is a large collection of Spiræas in the moist, shady rockeries, and the plants attain to a large size. In the more recently formed garden, on high ground known as the Upper Field, a Pergola of Wichuraiana Roses was a mass of bloom at the time of my visit. Beds of Roses were beautiful objects, although the wet season had not been favourable to these flowers. On the brow of the hill, and excellently well situated for scientific purposes, is a meteorological station and observatory, completely equipped for research and in charge of a competent scientist. Around it, in beds and rockeries, is a fine collection of Ericas, including some 30 to 40 species and varieties. Some of them are in flower all the year round. Planted with the Ericas are fine clumps of Dabœcia polifolia and its white variety. So well do the hardy Heaths flourish at Brockhurst that one of the most effective features of the place is a long stretch of rocky bank, in which, many years ago, were planted small plants of Erica vagans, collected in Cornwall. These have now formed dense bushes and give a mass of bloom.

Few other gardens are naturally so well adapted for providing suitable situations for every class of plant, from those which thrive best on dry, rocky places to those which flourish in marsh land. Mr. F. J. Hanbury is specially successful in the cultivation of many uncommon plants obtained from La Mortola, the gardens of his cousin, the late Sir Thomas Hanbury. Among rare British plants I noted Potentilla verna thriving well; Ajuga pyramidalis gathered in Co. Clare (whence the British Maidenhair, which thrives in a moist nook in the rockery, was also obtained); Rubus saxatilis, Linn., Sonchus palustris, and Euphorbia Peplis (not E. Peplus, which is a common plant). Mr. Hanbury is specially interested in these rare British plants. Other uncommon plants noted were Moricandia arvensis, species of Corrigiola, Hyoscyamus aureus and other interesting plants collected in Jaffa. In the ponds it was interesting to see the Arum Lily (Richardia africana) thriving and producing its white spathes freely, whilst on the bank were two large patches of Dierama (Sparaxis) pulcherrima, producing their tall sprays of lilac and purple flowers in profusion. Cordyline australis grows well in the open garden in a sheltered nook; Saxifraga Fortunei thrives remarkably well on the rockery, and many other tender plants, such as the Sikkim Rhododendrons, a fine collection of which occupy a sheltered ridge beside one of the ponds, give ample reward for the care taken in selecting the site and planting them. Beside the shady walks, in rock and natural greensward, Hepaticas, Daffodils, Anemones, hardy Cyclamen and other spring bulbs are established. There are two kitchen gardens on different levels, surrounded by the glasshouses. In the kitchen gardens are broad herbaceous borders, well furnished with showy flowers and many interesting, uncommon plants. In one of the borders Brassica insularis, a Sardinian plant, forms a large bush, producing a profusion of white, fragrant flowers throughout the summer. Spiranthes autumnalis and other British Orchids are well established in the grassy slopes, and beside the house are a noble tree of Araucaria imbricata, a fine Weeping Beech and some stately Conifers.

The Orchids.

There is a very extensive collection of Orchids at Brockhurst, and Mr. Hanbury takes great interest in hybridising and raising new hybrids. There are two excellent blocks of new Orchid houses. Good varieties of showy species are well represented, but the chief interest lies in the hybrids, which include many crosses of Cypripedium, Cattleya, Lælia and Brassavola. There are no fewer than 500 crosses of Cypripedium, some of which have already flowered, and large numbers are due to bloom in their season. There are four houses of Cypripediums with plants in all stages of growth, including many in seed pans and store pots. In one house I noticed sturdy specimens of C. bellatulum, which, like C. niveum and others of its section, thrives best in a mixture of mortar rubbish and loam. The plants of C. bellatulum are suspended from the roof. In flower or bud were C. Rossettii, C. Germaine Opoix, C. Thalia Mrs. Francis Wellesley, C. Mrs. E. V. Low, C. Maudiæ, C. callosum Sanderæ, C. Chapmanii magnificum, C. St. Alban, C. Unixia, C. Godefroyæ leucochilum, and a large number of seedling Cypripediums, while the fine collection of varieties of C. insigne, which numbers more than 100 distinct forms, gave evidence of a fine show of blooms later. In one of the houses were observed numerous seedling Odontoglossums on an elevated woodwork stage. These have not been so satisfactory as the many hybrid Cattleyas and Lælias which abound in the intermediate houses, but they are now becoming more vigorous.

In the Odontoglossum houses the bulk of the well-grown specimens are forms of O. crispum, good blotched varieties noted being Victoria Regina, Orvieto, Luciani, Raymond Crawshay, Rossendale, Empress of Germany, Brigadier, and Starlight. A very fine form of O. Uro-Skinneri, with two spikes, very distinct O. Adrianæ, various good forms of O. crispo-Harryanum and other hybrids were in bloom, and in these cool houses are large numbers of hybrid Cymbidiums of various crosses, those between C. erythrostylum and C. Tracyanum being specially promising. In the coolest part of the house Dendrobium Victoria Regina thrives admirably and produces its blue flowers freely. The collection also includes a good batch of the scarlet Cochlioda Noezliana and some hybrids of it; C. vulcanica, Lycaste Skinneri, L. lanipes, L. leucantha, various showy Masdevallias, including M. bella, M. Chimæra and others of the section, Oncidium incurvum and other cool-house Oncidiums. In the intermediate houses the greater part of the occupants are Cattleya, Lælia and Brassavola hybrids, some of which are in flower. Numerous Cattleya granulosa Schöfieldiana hybrids vary much in shape, while generally retaining the peculiar form of the labellum of C.

granulosa, though in exceptional cases with crosses of the C. labiata section the more tubular base to the labellum occurs. A good batch of distinct forms of Lælio-Cattleya elegans, some being in bloom, and thousands of various crosses of Lælia and Cattleya approaching the flowering size, promise an interesting display. Brassavolas have been successfully crossed to a large extent at Brockhurst, where crossings of the terete-leaved Brassavolas have produced some very pretty flowers, the best of which are Brasso-Cattleya Joan, with its trumpet-shaped white labellum spotted with mauve (now in bloom), and B.-C. Faith (Brassavola Perrinii × Cattleya Leopoldii). Hybrids of Brassavola glauca were remarked, also Lælio-Cattleya Clonia Brockhurst variety, which is quite the best form of this pretty hybrid; Cattleya Maronii × C. Dowiana aurea, which is an improvement on C. Maronii; and a very fine lot of Cattleya Bowringiana hybrids, the C. Portia and C. Mantinii forms being remarkably vigorous and well furnished with flower-sheaths. All the finer varieties of C. Mantinii have been acquired, but the Brockhurst variety appears to be the best.

In other houses are a good selection of Lælias, especially of the large-flowered species, such as L. purpurata, L. tenebrosa, &c.; a representative collection of the large-flowered Cattleyas with albinos of most of the species, which are being used for crossing in various ways; a number of C. Dowiana aurea and some good specimens of most of the best species. Throughout the whole collection the floriferous character of the plants and their sturdy condition arrest the attention of the visitor. The Mexican house has a good collection of Lælia anceps, and, on one side, some fine Sobralias, including the bright-yellow S. xantholeuca, the pure-white S. macrantha alba, S. Veitchii and others. In this tolerably cool house Vanda teres is in fine health, and strong specimens of Dendrobium Wardianum show that they can be grown without much fire-heat, which some consider necessary. The same remark applies to the general collection of Dendrobiums, both species and hybrids, which, although given a tolerably warm house when making their growth, are, at other times, kept cooler than in most establishments. Dendrobium Phalænopsis Schröderianum, D. higibbum and others of the section are grown in a warm house, and not rested so cool as the Burmese species. At the end of this house is a warm division set apart for raising seedling Orchids and fitted with cases, in which the seed-pots are placed. Various methods of raising seedlings have been tried, but the method now adopted as the most satisfactory is to prepare seed-pots or pans either by making them up with fine Orchid compost, on which is placed a layer of carefully-selected, live Sphagnum-moss, leaving the surface convex in form; or to place in the pots spherical wads made by covering moist Sphagnum-moss with thin gauze or thin calico; the seeds are sown thinly on the moist surface, and germinate equally well under both methods. Seeds of many interesting crosses are germinating in the cases; some of the seed-pots have already given a first crop of small seedlings and are being retained in the cases to supply more, should the first batch fail. Of a larger size, and soon ready to be passed on to the plant houses, are many healthy little specimens in tiny pots on the side stage. The work is very interesting, but requires constant attention. In another house were excellent examples of Lælia pumila and L. Jongheiana with hybrids of them, a good form of Lælio-Cattleya Clive and some others in bloom, together with Cycnoches chlorochilon Brockhurst. *J. O'B.*

FLORISTS' FLOWERS.

THE PERPETUAL-FLOWERING MALMAISON CARNATION.

The old, time-honoured Souvenir de la Malmaison Carnation has been abused by some and admired by others, and when it is gone and the plant is no more, some of us who have put in many years work adding to its list of varieties will regret its loss. But that its days are numbered none can deny, and that the new Perpetual-flowering Malmaison will take its place is certain.

The definition of what really is a "Malmaison" is not what I intend to discuss. I believe it is generally agreed upon that the first plant of Souvenir de la Malmaison was raised by a Frenchman from seed obtained from Remontant varieties, and anyone who has worked upon these plants can believe this. The "Malmaison" is, however, sterile, and the late James Douglas was most positive that no seed could be obtained from it. Yet some of us have used its pollen to advantage, and this fact leads me to believe that there is much "Perpetual" blood to be found in the old "Malmaison."

The point, however, which I wish to make plain is that the new Perpetual-flowering Malmaison comes from the same source as the old Souvenir de la Malmaison, viz., Remontant or Perpetual Carnations. Perpetual-flowering Malmaisons can, of course, be obtained by crossing "Malmaisons" on to Perpetual-flowering Carnations, and Mr. Brooks obtained Lady Millar, and I raised Princess Juliana that way. I do not, however, look for the best results from this method.

Mr. Burnett raised Marmion, the first Perpetual-flowering Malmaison, and also Mr. C. F. Raphael from Perpetual-flowering Carnation parents, and many growers to-day maintain that they are not Malmaisons, because they have not Malmaison parents. However, as I have said, it is generally agreed that the first Malmaison came from a Remontant stock, and now that the type is more fixed, it is not to be marvelled at if Perpetual-flowering Malmaisons are produced, and I look to this fact being proved during the next few years.

Everyone who has raised Perpetual-flowering Carnation seedlings knows that certain slow, strong-growing seedlings are produced which are, as a rule, thrown away. If, however, they are persevered with for two or three years, wonderful results can be obtained, and the origin of the Perpetual Malmaison discovered. Of course, like all seedlings, the useless ones are numerous, and the percentage would not be more than one good in 500 selected seedlings. We have been working on these lines for three years, and it is surprising how certain seedlings have improved under selection and careful cultivation, and, depend upon it, every colour and shade figuring in the Carnation to-day will be produced in this new plant. I believe Mr. Engelmann has similar views.

I would never have taken up my pen to write this, if the new Perpetual Malmaison was simply a mule, never to reproduce its kind, but we have procured certain plants of them which are fertile, and some of the seedlings we have obtained from these are most encouraging, producing flowers as large and full as Prince of Wales, while we have quite a good stock worked up of seedlings far superior to varieties of the same colour in the old Malmaison class and perfectly perpetual in growth, with stiff stems during all seasons.

The Perpetual-flowering Carnation Society has discussed this plant and its future in committee, with the intention of making special classes to encourage its culture. It is therefore well beyond the stage when the hybridist "dreams dreams and sees visions" of things he hopes will be, and very shortly those gardeners who have tried to cheat Nature by producing flowers of the Souvenir de la Malmaison the entire 12 months of the year, will be spared this difficult and never satisfactory task by having a plant which will naturally bloom perpetually. *Montagu C. Allwood.*

Fig. 117.—Brockhurst, East Grinstead.

SWEET PEAS FOR APRIL.

The following varieties of Sweet Peas have proved most suitable for cultivation under glass for flowering in April and May (see also p. 266) :—

White.—Etta Dyke, Nora Unwin, and Moneymaker.

Cream.—Clara Curtis, Dobbie's Cream and Isabel Malcolm.

Lavender.—R. F. Felton, Masterpiece, and Nettie Jenkins.

Cream pink.—Mrs. Hugh Dickson, Mrs. Routzahn and Doris Esher.

Orange.—Thomas Stevenson, Edrom Beauty and Helen Grosvenor.

Salmon.—Melba, Earl Spencer and Stirling Stent.

Blush pink.—Elfrida Pearson, Mrs. H. Sykes and Princess Victoria.

Scarlets.—Scarlet Monarch, Red Star and Vermilion Brilliant.

Fancies and Bicolors.—Afterglow, Charles Foster, May Campbell, Mrs. Cuthbertson and Mrs. W. J. Unwin.

Edged Flowers.—Elsie Herbert, Mrs. C. W. Breadmore and Marchioness of Tweeddale.

Each of these varieties may be depended upon to succeed, and those may be selected which appeal most to the individual taste. *Experto Crede.*

FORESTRY.

FOREST SURVEYS.

The question of State afforestation in the British Islands is one which is so often raised that it threatens to become monotonous. Royal Commissions are appointed, reports published, and even private individuals go to a lot of trouble to show the advisability or otherwise of afforestation. But are we now any further than we were 20 years ago? The question is taken up periodically by the Government, and then shelved as soon as some other subject turns up, so that it looks as though no serious thoughts are entertained of ever tackling it in a serious way. The last development grant has been so split up that one is tempted to ask what good is likely to come of it.

The Supplement of the *Journal* of the Board of Agriculture, dated August, 1912, is devoted to an interesting paper by Mr. R. L. Robinson on some of the Kerry woods in Wales, the object being to collect reliable information for a forest survey. The report is especially valuable owing to the fact that the work has been carried out in a thoroughly scientific and at the same time workmanlike manner, and although some of the data upon which the calculations are based are evidently more or less the result of guess work, they probably err on the right side in giving a low estimate of the value of the yield.

Mr. Robinson points out that there are two methods of selecting land for afforestation. In the first case it may be assumed that the project will pay its way, and the ground mapped out and planted accordingly. This is the line of reasoning usually adopted in this country, and as opinions are bound to differ upon a question where proof is lacking, much inconclusive argument is the result. The second and rational method is to investigate the commercial prospect of afforestation in a district, and to start the work of surveying or scheduling the land on the basis of information thus obtained.

An attempt has been made to survey the Kerry woods upon these lines. The most up-to-date methods have been adopted, and it is particularly satisfactory to see the usual makeshift ways of measurement (quarter-girth, &c.) abandoned in favour of more accurate methods. If forestry ever gets hold in this country, the system of measurement will have to be improved. The work of surveying was carried out roughly as follows:—Several wooded areas at varying altitudes, and as far as possible typical of their surroundings, were selected and carefully measured. A thorough examination and analysis was made of representative trees in each group, and an idea thus obtained of the past and future development of the whole wood.

Owing to the lack of reliable yield tables for this country, the Austrian calculations compiled by Schiffel were used for the yield estimates. These tables were found to be the most suitable, as they make allowances for the density of the canopy, a factor apparently neglected by German foresters. Samples of soil from each group were also submitted to a thorough mechanical and chemical analysis. The working expenses could not be correctly estimated, as without a working plan no figures could be given. The future timber prices are of course also unknown. Nevertheless, by assuming liberal working expenses, and a very moderate rise in the price of timber, the calculations must perforce be on the side of safety. With the help of this data it is easy to work out the expectation value of the soil, and consequently the maximum sum which can be expended on the acquisition of freehold land if a profit is to be realised. Owing to the numerous advantages which capital invested in forestry enjoys, a comparatively low rate of interest, viz., 3 per cent., is generally looked upon as sufficient.

Whether the area examined by Mr. Robinson is of positive or negative value for afforestation, is not the main issue. The most useful service which he has rendered is to be looked for in the abandonment of obsolete ideas, and the compilation of a survey upon a practically and financially sound basis. *G. W.*

FURBER'S CATALOGUE.

The catalogue of trees, fruits and plants appended to the second volume of *The Gardener's and Florist's Dictionary* (1724) of Philip Miller is well known to collectors of gardening books. But there is an edition of this catalogue, which was published separately, of which I have seen only one copy, and have never heard of another. So far as I know, it is the earliest nurseryman's list ever published separately, though there were lists published in one or two books on gardening of an earlier date. The catalogue in question is bound up with pamphlets of about the same date, some much earlier, e.g., Gerald Langbaine's *Momus Triumphans*, and a few later. It contains 16 pages, of which one is a title page, another is occupied by a preface, and there is a rude engraving of a mansion with attached flower gardens as a headpiece. The page measures 8¼ inches by 6¾ inches, but has been larger both ways. The title is interesting and the preface worth transcribing, on account of the divergence of Furber and Miller regarding popular names.

The preface, nearly all in italics, fills the whole of the back leaf of the title page.

The PREFACE.

The Design of printing this Catalogue is to inform the Lovers of Gardening of the Names of several curious Exotick and Domestick Plants, that are hardy enough to stand abroad and flourish in our Climate; I shall avoid mentioning their Names at length as they are inserted in the Botanical Authors, but content my self rather by calling them by such Names only as they are generally known in ENGLAND.

I have also added a Catalogue of Fruits, which I have for many Years been collecting; which I believe contains as great Variety of such Fruits as will be serviceable for our ENGLISH Gardens, as will be met with in any Collection for Sale in this Kingdom; with a Catalogue of Plants fit to adorn a Gentleman's Green-House, and do not require a Stove in Winter; with a short Account of some Flowers fit to adorn the open Borders in a Parterre, without the Trouble of covering in Winter, or shading in the Time of Bloom, as the nicer Sorts require.

I likewise take this Opportunity of returning my Thanks to those worthy Gentlemen, who have been so kind as to furnish me with several curious Plants from abroad.

In *Miller's Dictionary* the introductory notice is as follows:—

A Catalogue of Curious Trees, Plants, &c.

For the Satisfaction of such Gentlemen, that are curious in collecting of foreign Trees and Shrubs, and are not willing to be at the Expence of building Stoves and Green-houses, I have here set down a Catalogue of such Trees and Shrubs, both Exotick and Domestick, as will prosper in our Climate, in the open Ground, as hath been several Years experienced by Mr. Robert Furber, Gardener, over-against Hide Park Gate, at Kensington, where any Gentlemen may be furnished with any of the following Trees and Shrubs at reasonable Rates; and for the general Satisfaction of Gentlemen, which are skill'd in Botany, I have endeavoured to give Authentick Names opposite to the English, that it may be useful to every Body, the Gardeners understanding what Gentlemen mean when they write for any of the following Plants, and that Gentlemen may understand what the Gardeners mean when they call any of the following Plants by the names used amongst them.

The page is divided longitudinally, Furber's names on the left half and the "Authentick Names" on the right half. The transcription, if from Furber's catalogue, is rather carelessly done, e.g., "Acacia, or Honey-Locust of Virginia," appears as "Acacia or Honey, Locust of Virginia," which is botanically named "Acacia Americana abruæ foliis, triacanthos, sive ad axillas foliorum spina triplici donata." It is Gleditschia triacantha. Whether Miller's knowledge did not extend to naming all the plants, or for some other reason, a few plants are not included, one of which, Tuft-Nuts, or, as Furber has it, "Tuft-Nut grows to a large tree," one would have specially liked to have been determined. It is a designation I have never seen elsewhere, and conveys no other information save that it may be expected that the Nuts would be arranged as the flowers of Sweet William, otherwise London Tufts and Candytuft in a capitulate manner.

The arrangement differs in the two. In Furber's Catalogue it is as follows:—Trees and Shrubs; A Catalogue of Curious Fruits, Apples; A Catalogue of Pears of the Choicest Sorts made me a Present by Mr. Alderman Brocas; Other sorts of Pears, &c.; A Catalogue of Plants fit to adorn a Green-house, and which require no artificial Heat in the Winter more than a good Green-house; A Catalogue of Flowers for the open Borders.

In the *Dictionary* the arrangement is Trees and Shrubs; A Catalogue of Plants, out of which any Gentleman may collect at Pleasure, for to furnish a Green-House, and not require a Stove in the Winter; A Catalogue of Flowers for the open Borders; A Catalogue of Curious Fruits, Apples; A Catalogue of Pears of the Choicest Sorts made a Present to Mr. Furber by Mr. Alderman Brocas; Other Sorts of Pears, &c.

The list of greenhouse plants is very considerably restricted, and it is not free from mistakes.

The Gardener's and Florist's Dictionary, it may be added, was printed by the same person as the Catalogue of Furber. Thus:—

London: Printed by H. P. for Charles Rivington at the Bible and Crown in St. Paul's Churchyard, 1724.

There are numerous errors in the names of plants in both, Furber's spelling being to a large extent phonetic, and to-day we should have been thankful had he not restricted the names to those "generally known in England." *R. P. Brotherston.*

THE ROSARY.

SELECTION OF ROSES FOR BEDDING.

A LADY recently asked me to select some Roses for 18 beds containing about a dozen Roses each, and, so far as practicable, to comply with three conditions:—(1) They are to be of decided colours; (2) they must be "real Roses," by which is meant that whether the flowers are large or small they must individually have some of that beauty of form we are accustomed to look for in exhibition Roses, and (3) they must be fragrant. The purpose for which they are required virtually involves the further conditions (4) that they must be fairly free and constantly in flower during the Rose season; (5) of good constitution, and (6) of suitable habit for bedding purposes.

From all our beautiful modern Roses it might be thought an easy task to pick out 18 varieties that would comply with these conditions, but when I come to put them on paper the criticisms which suggest themselves seem more numerous than I expected. And as it may be that other readers of this journal are of one mind with my friend in their likes and dislikes, I am tempted to work out my task at length for their benefit.

To begin with the first requirement of decided colouring. This alone rules out many very beautiful Roses. Pharisaer, Prince de Bulgarie, Ethel Malcolm, Countess of Derby, Mme. Antoine Mari, Mrs. Theodore Roosevelt, and other charming Roses of half-and-half shades of colour must obviously be rejected. The second condition, beauty of form, excludes most of the dwarf Polyantha and China Roses, and such H.T.s as Ecarlate, which might well comply with most of the later conditions; and the third requirement, that of fragrance, disposes of Frau Karl Druschki, while Marquise de Salisbury must go because, whether from lack of constitution or susceptibility to fungoid pests, it is by no means always reliable; again, Souvenir de Pierre Notting, though of excellent habit and in many respects one of the good garden Roses, produces too few flowers of any value to be suitable for our purposes.

I begin with the pinks, and here I shall expect to find the greatest choice, and I take half the total number allowed me. My list is André Gamon, Dr. J. Campbell Hall, G. C. Wand, La France, Lady Ashtown, Lyon Rose, Mme. Abel Chatenay, Mme. Maurice de Luze, and Mrs. E. G. Hill. It is, I am well aware, open to criticism: neither Lady Ashtown nor Mrs. E. G. Hill is so fragrant as one would expect from their appearance. They have some fragrance and that is all that can be said for them in this respect. La France, on the other hand, pre-eminent for sweet perfume, is not without faults of a different kind. In wet weather the flowers ball, the petals stick together and refuse to open, and this defect would appear to be worse on heavy and highly-cultivated soils. It is well to grow plants of this variety from cuttings. Should any change be desired in this list, it can be supplied by Caroline Testout, only omitted because many of its flowers are lumpy and too round in shape, and Mme. Jules Grolez, which perhaps ought to find a place in the original selection instead of Dr. J. C. Hall, the perfume of which is not very pronounced.

My list of red Roses is also a strong one: Richmond, Liberty, General MacArthur, Horace Vernet and Commandant Felix Faure. Horace Vernet is included according to instructions, but it might be thought worth a place by reason of its rich and abundant perfume, and because of the high proportion of good flowers and the few magnificent ones which it produces. At its best it is as near perfection in form as we have yet attained. It cannot, however, be said to be constantly in flower, and in strictness ought not to be here for that reason. It is often said to be best as a maiden, but I am not sure that this is always the case, and have known plants which, though cut back year after year, still produce good flowers; but it is true that at times plants deteriorate after the first year for no apparent reason. If we exclude Horace Vernet, there is no difficulty in filling its place. There are two rather new red Roses to be found in Mrs. Edward Powell and Georges Reimers. Of these I have grown each for one year only, and Mrs. E. Powell seems to me preferable as being a slightly more pleasing colour and better shape. Georges Reimers has shown some tendency to produce the rounded centre to which I objected in Caroline Testout. Though the flower is not so large, it is certainly free in flowering and a bright Rose in the garden, but I must see it again before forming a definite opinion. Mrs. E. Powell, on the other hand, has been so good with me this year that I feel more confidence in recommending it. If an older Rose is desired, I would take either Laurent Carle or Captain Hayward. The first produces its flowers more freely and continuously than the latter, but the colour, though distinct, is not so good as that of Capt. Hayward. I have had some thoughts whether Richmond and General MacArthur ought not to be alternatives one to the other: those whose gardens are on light or loamy soils choosing Richmond, those on stiff clay taking "The General"; but the early flowers of Richmond are so lovely, so continuous, and the fragrance so excellent, that I cannot bring myself to exclude it. Those, however, who try it and fail, would do well, especially if they own a heavy clay soil, to substitute one of the others I have named.

My list of yellows is necessarily smaller, and I take three: Mme. Ravary, Rayon d'Or and Lady Hillingdon. Here again I feel some doubt whether my selection will be approved. Mme. Ravary has no doubt a fine definite colour in summer, but if the rain comes, as it must do in autumn, it seems to wash the colour away. Rayon d'Or has a definite colour, brilliant in tint, but is lacking in form, though not so much so as necessarily to exclude it. It is certainly continuously in flower, for one can always find a few flowers in the bed the summer through, but I am yet uncertain whether it can be called free. So far, I have seldom had a mass of flowers out at a given time, but it may improve in this respect as the plants get established. Of Lady Hillingdon, I can say with confidence it is, for a Tea, a good garden Rose. The foliage is most beautiful, and the habit good. If all the flowers had the lovely deep yellow which many of them possess, I should feel no hesitation in including it, but many flowers lack the perfect shade—why I have failed to discover—and when they are wanting in colour the flowers look quite uninteresting; often on the same stem some flowers will be coloured, others washy and pale; nor does their position on the stem seem to make much difference; sometimes the crown-bud will be coloured and side buds pale, and at other times the position will be reversed.

I come last to white, and have only one to suggest, Molly Sharman Crawford, the only Rose of its colour which seems to me to comply with the conditions. Mrs. Foley Hobbs may do so, but my experience has been of only a few plants for one year, and I hesitate to be too definite as to its qualities for massing, but it is a strong grower and one of the best new Tea Roses brought out for a long time. The only alternatives would be either Mme. Pernet Ducher, a pretty little Rose, though it too soon loses its shape, or Mrs. David McKee, a good garden Rose, but perhaps not a definite enough colour, being lemon-yellow, so I retain my first selection.

I have made the foregoing selection, it must be remembered, in an endeavour to comply with definite and somewhat stringent conditions. Were I selecting bedding Roses for my own garden, there are many shades of soft-coloured Roses, some of which, e.g., Mme. Antoine Mari, I might prefer to many of those here mentioned, but it is clear that there are many of our gardening friends to whom definite colouring appeals strongly, and for these my list may possibly be worth some consideration. *White Rose.*

FIG. 118.—BROCKHURST, EAST GRINSTEAD.

(See p. 259.)

THE ALPINE GARDEN.

MORAINES AND MORAINE GARDENS.

In July, 1896, when the late Rev. Wolley Dod was in Geneva, we were discussing the best way of growing Alpines, especially the more delicate species. I remember expressing the opinion that in England they should be planted on a wall, but Mr. Dod objected that English walls were usually composed of brick, and had not, therefore, the proper characteristic of absorbing water in wet weather and giving it out by evaporation during dry periods. We also discussed the matter of soil; for high Alpines this should, of course, be very poor, as in the real moraines in the neighbourhood of the Alpine glaciers.

Some time afterwards Mr. Dod made his first moraine, and assisted Miss Willmott to make one for herself. I saw the moraine at Warley (the first I had ever seen) about 12 or 13 years ago. Nowadays almost all moraines in England, and even in America, are made in the same way.

What is a "moraine" in the true sense of the word? In its natural state, it is an ugly—very ugly—mass of sand and stones, surrounding the glaciers at one end, and forming around them a sombre framework. All the stones and refuse which are brought down with the glacier are deposited on the moraine at the foot. The moraine may be broad or narrow—old or new. The old ones are usually covered with shrubs and trees; even forests are found on some of the oldest, if not too high up. Here in Geneva we are surrounded by an old moraine (possibly ten to twenty thousand years old!) which bears what we call the "flore calcifuge." This flora can always be recognised by the presence of the true Chestnut (Castanea vesca), a tree which will not grow on lime. When we speak of a moraine garden, however, it is the modern moraine we are thinking of, on which no shrubs will grow, because there have never been any trees to fertilise the bare ground with their leaves—the soil simply consisting of sand and stones. There is, indeed, a moraine flora quite as distinct as the floras of bog, wall, or meadow; and many flowers prefer the wet sand of the moraine to any other medium. Examples of such plants are Epilobium Fleischeri or Dodonæi, Saxifraga stenopetala and aizoides, Linaria alpina, Cerastium glaciale, Androsace glacialis, Artemisia spicata and A. Mutellina (perhaps also A. glacialis), Dryas octopetala (sometimes), Ranunculus glacialis, Anthyllis vulneraria, Campanula cenisia, Viola cenisia, Comolia and others.

These plants are at first "colonisers," being the first to grow on the thin, sandy soil. Afterwards, when their leaves have somewhat fertilised and enriched the ground, a few more exacting plants, such as Edelweiss, Epilobium alpinum, Campanula pusilla, Salix retusa, S. reticulata, and S. herbacea, Gentiana imbricata, Festucas, and Carex, Erigeron alpinus and E. uniflorus, Draba tomentosa, D. frigida, D. aizoides, Chrysanthemum (Leucanthemum) alpinum, Senecio incanus or S. carniolicus, Azalea procumbens, Arabis alpina, Achillea nana; and some Alsines and Arenarias. The vegetation on these spots is always hardy and healthy, although the soil is so poor and the sun very hot. The fact is that the sandy ground is always wet; and the air, owing to the proximity of the glaciers and snows, perpetually saturated with moisture. The rays of the sun are thus never sufficiently powerful to burn the foliage of the plants, and the moraine, originally so bare and ugly, a mere field of broken stones flung in disorder about the mouth of the glacier, becomes a charming picture of brightness and beauty, the small, gay blossoms gradually spreading, like a carpet, over the whole surface.

Can we reproduce the moraine in our own gardens? I think that in some cases we can; but it is difficult to realise how poor and meagre the soil must be—in fact, the ideal is sand, mixed with stone débris. Then, it must be continually watered *from below*, and must get as much sunshine as possible. In the moraines of the Rev. Wolley Dod and Miss Willmott (which were, I believe, purely sand and gravel) perfect success was attained with such plants as Ranunculus glacialis, R. alpestris, and R. parnassifolius, Androsace (high Alpines), Linaria alpina, Senecio incanus, Papaver Rhoeas, Campanula cenisia, and C. Allionii. I think Miss Willmott was very successful with Eritrichium nanum, and I am sure this treatment is the best for many high Alpines. But for the greater number the wall garden is most suitable. This is particularly the case with Campanulas, Primulas of the group Eu-Auricula, Lithospermums, Æthionemas, Edraianthus, and Saxifragas of all kinds, and also for all the Androsaces of the group Aretia, Dryas, Ramondias, &c.

I have already said that an all-important feature in a moraine garden should be the underground watering. This is the same principle as that which directed the famous "culture en baquets" invented by Dr. Rosentiehl at Enghien, near Paris, and so well applied by M. and Mme. Daigremont at Soisy, near Montmorency. In the north of Italy, Sphagnum is grown under these conditions with great success; and here, at Floraire, I give the same treatment to my high Alpines. I have a basin, 30 feet long, 8 feet wide, and 4 feet deep, through which water constantly flows. On the side of this a bank has been constructed of rolled stones, forming a large gravel, a foot deep, so that the water may run through. On the top of the gravel Sphagnum has been planted, in which the following plants are growing:—Gentiana bavarica, G. imbricata, G. pumila and pyrenaica; all the Pinguiculas, all the Parnassias, Anagallis tenella, Wahlenbergia hederacea, Primula capitata (true), P. Poissonii, P. purpurea (true), P. farinosa, P. stricta, P. scotica, P. magellanica, and P. luteola.

All these are doing well, except Wahlenbergia, which does not stand much sunshine. The method is a good one for the southern European countries, but can hardly be recommended for England. For English gardens, I cannot do better than repeat my advice, to stick to wall-gardens and moraines. *H. Correvon, Geneva.*

FIG. 119.—BROCKHURST: A SECTION OF THE RECENTLY-CONSTRUCTED ROCKERY.

(See p. 259.)

RUBUS ARCTICUS.

This diminutive Bramble is not commonly grown in gardens, as it is not easy to establish. In the spring it produces small Rose-pink blossoms, and continues in bloom for several weeks; but it is most ornamental in the autumn when its dainty leaves, which are only a few inches above the ground, assume a delightful, deep crimson colouring which lasts for several weeks.

It is one of the most beautiful plants in the rockery at this season. Rubus arcticus thrives best in a light compost which contains a fair proportion of peat and sand, and should be kept fairly moist at the root. Partial shade is advisable, and if it can be given a position under the overhanging branches of such a plant as Prunus prostrata, little difficulty should be experienced in establishing this Bramble, when it spreads fairly rapidly by pushing up young growths around the parent plant. *F. Gardner, Batsford.*

VEGETABLES.

EARLY CAULIFLOWERS AND CABBAGES.

The question of autumn versus spring-sown Cauliflowers and Cabbages is often the subject of debate, and I may bear testimony to the success obtained from spring-raised plants of both Cabbages and Cauliflowers as against those raised in the autumn and wintered in frames. I may claim to speak with experience on the subject, as I am responsible for the production of a very large quantity of these vegetables in the spring and early summer. Last winter will long be remembered as one of the worst on record for the wintering of these plants. I had made every preparation for a supply of 50,000 Cabbages, and, up to Christmas, the plants were all that could be desired, but between that date and March I lost almost all the crop, whilst Cauliflowers were such a failure that I never intend to raise them again in autumn for wintering. Having to make good the loss, I procured seeds of Early Forcing and First and Best Cauliflowers, also Flower of Spring and Early Offenheim Cabbages. The seed was sown in February in cold frames, the soil being placed as near to the glass as convenient. The seedlings received careful attention but no coddling, and I was able to plant my first batch of plants in April and the second early in May. I have records of the first cutting of both kinds of vegetables, the date being June 26, and we have maintained a constant supply since. The Cabbages raised from the seed sown in the spring were ready for cutting a fortnight earlier than those that were sown in autumn. There is less labour in the case of seedlings raised in spring, which is an item of considerable importance. At the present time I am cutting more than 1,100 heads per week, and even at this rate I have sufficient of the crop to last for some considerable time. After all the heads have been cut the plants will furnish a big supply of Sprouts. The system of leaving the stems to sprout is a very economical one, and I practise it with Savoys, Brussels Sprouts, and green and purple Kales. It is an advantage to have Cauliflowers ready as soon as the first crop of Peas, and the varieties mentioned are suitable for this purpose, these being followed by Walcheren, Eclipse, and Late Autumn. *V. H. Lucas, Sheffield.*

HARDY FLOWER BORDER.

GERANIUM WALLICHIANUM.

I have seen no allusion to the merits of Geranium Wallichianum, yet few hardy plants can rival it for beauty at this season of the year. A shady position is generally recommended, but here, in Berkshire, a patch 7 feet by 4 feet has been a charming sight for many weeks past, growing in full sun and in light, gravelly soil. This particular patch is of the variety which has the centre of the flower white and the edge (¼ inch deep) a lovely blue. This has very narrow and pale stripes, which hardly detract from the pure white of the centre. In the pink form, the white centre is far smaller; the edge (which extends to nearly the base of the sepals) is pink, traversed by broad, crimson lines. The dark-purple stamens lend additional beauty. I know not which of the two is the more attractive. *A. C. B., Reading.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Raspberries.—It is rather early as yet for the planting of canes, but permanent beds of Raspberries may be freshly staked, thinned out to the required number, and tied in. They must not be shortened back, or the canes will be liable to damage by frost, especially after so wet a season. A light dressing of rich manure may be given after the ground between the rows has been cleared of weeds, but neither spade nor fork must be used. In the choice of materials for mulching, it is well to be guided by the nature of the soil. If the ground is light and warm, good rotten manure may be safely applied; but on a heavy, cold soil, only some light material should be used.

Autumn Raspberries.—Up to the present very little has been expected of the autumn canes, but with the improvement in the weather, good progress has been made, and if the warmth continues, fair results may be attained.

Currants and Gooseberries.—As soon as the leaves have all fallen from these bushes, the latter should first be pruned, and then well sprayed with some effective insecticide, to clear the trees of any insect pests which may have found a home there. The old mulchings and loose soil should be removed to a depth of 2 or 3 inches, especially round the stems, where larvæ are usually very plentiful. A good dressing of quicklime should then be given, the bushes dusted with it, and the old soil should be replaced by some fresh compost, firmly trodden down. The bushes should be syringed once or twice during the winter and spring, and a sharp look-out kept for any signs of caterpillars. If necessary, the bushes may be dusted with lime again in the early spring.

Plums.—A great improvement in colour and flavour, consequent on the better weather, has been noticeable in such late varieties as Grand Duke, Late Orange, Reine Claude de Bavay and others. Many wasps and flies have perished as a result of the recent cold nights—a matter for congratulation, as they are usually a source of great trouble at this season. If the excellent weather of the last few weeks continues, the fruits may be allowed to hang to the middle, or even the end, of this month.

General Directions.—An effort should be made finally to clear the fruit quarters of weeds. Hitherto this has been almost an impossibility, since hoeing is of little use in almost constant rain.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Early Peaches and Nectarines.—The trees in the early house will now be shedding their leaves. About twice a week a birch broom may be drawn over the trees in order to dislodge any leaves which are ready to fall. This helps to keep the house tidier than is the case where the leaves are left to fall of themselves. If the wood is not yet thoroughly ripened, no effort must be spared to get it well matured before closing the house. A little warmth in the pipes will be of service. When the trees are all bare of leaves, attention must be given to pruning, cleaning and training. If all the old fruiting wood has already been removed, not much pruning will be needed now; but the trees must be carefully examined, and if there is sufficient young wood to admit of the removal of some of the old bare branches, this should be done. The appearance of the trees will be improved by the operation, and the crop will be the better for the predominance of young fruiting shoots. After the pruning is done, the shoots should be loosened from the trellis, and the trellis and house thoroughly cleaned with strong soap-and-water. If mealy bug is found, the trellis should afterwards be painted over with paraffin, working it well into all holes and crevices. Great care must be taken, in washing the trees, not to injure the buds. The main stems should be washed with a very stiff brush in a strong solution of soft soap and sulphur; but the fruiting wood must be treated more gently, and with a softer brush. In training, care must be taken to secure all the main branches first in their proper position. When this is done, the tying of the young fruiting shoots will be easily accomplished. The ties must not be too tight—neglect of this precaution often results in canker. When training is finished, all brickwork lime-washed, and everything in the house cleaned, the surface of the border must be carefully pricked up to a depth of 2 or 3 inches. The border should then be top-dressed with rich loam, mixed with a liberal quantity of lime rubble and wood ashes. If the roots are dry, a good soaking with clear water should be given.

Pineapples.—Plants of the "Queen" variety which are intended for fruiting next season will not require so much moisture at the root now that the days are getting shorter, and care must be taken to see that water is not given unnecessarily. Syringing must also be done less frequently, and the atmosphere kept less moist than has been advisable hitherto. The temperature should be gradually reduced, so that the plants may rest during the winter, the minimum being fixed at about 65°. During the day it may be allowed to rise to 80° in bright, sunny weather, if a fair allowance of fresh air is admitted. The bottom heat should be kept as even as possible throughout the winter—preferably at about 70° Suckers should receive the treatment recommended above. They should not be allowed to become too crowded, and the roof-glass must be kept quite clean—it is important that every plant be fully exposed to the light. Those on which the fruits are colouring should, if possible, be removed to a house where the atmosphere is warm and dry. The later fruits may then be induced to swell in a suitable atmosphere. The temperature in this house may be sustained at 70°, but in sunny weather it may be permitted to rise to 80° or even 85°, so long as the air is allowed to circulate at the top of the house.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Azalea indica.—Any plants of Azalea indica which have been in the open air until now must be removed and placed under glass at the first sign of frost. House room is usually somewhat scarce at this season, and it may be necessary to place them in one of the resting fruit houses. If so, they should not be allowed to stand on the border, or worms will find a ready entrance into the pots. After being placed in the house, they should be sprayed overhead on all fine mornings for a time; otherwise a loss of foliage may be the result of the change from the damp atmosphere outside to the dry air of the house.

Carnations.—Winter-flowering Carnations should now be afforded all the light and air available. The temperature should not be allowed to drop at night lower than 50°. The earlier batches, the flower-buds of which are developing, may be given a little manure water or artificial fertiliser, but with strict moderation, as the shortening days will mean slower growth. Souvenir de la Malmaison Carnations which were layered late should be potted as soon as possible. The earlier ones, if well rooted, may need a little spacing on the stages. Water should be given sparingly, so as to keep the growth compact during the winter. Both batches should be fumigated regularly to keep off the ravages of green fly.

Bouvardia.—Plants of Bouvardia should now be growing freely, and forming flower-buds on almost every shoot. They should be carefully watered with liquid manure whenever they seem dry; at this season it will not be often needed. The temperature should be kept moderately warm, and if the plants are young, they will continue to flower nearly all the winter.

Pentas carnea.—This is a flowering stove plant resembling a Bouvardia. It flowers all through the winter, and is both attractive and useful, especially for small vases and buttonholes.

Decorative Chrysanthemums.—These will not make much growth until they are brought indoors; but afterwards, when they

become large, it will be well to disbud the plants freely. This especially applies to single varieties, which should be reduced to one bud to each shoot; by this means the flowers will keep much better and attain to a more graceful shape. An exception may be made in favour of Mary Anderson, Mary Richardson, and others of the same class. In the other decorative sections, especially in the Incurved, it is a good plan to thin down to one bloom for each shoot. The same rule applies to many of the Japanese varieties, though for table decorations it is sometimes necessary to leave them in sprays.

Shading. — If plants have been gradually inured to the sunlight, there is no need for much shading; the little sun we get at this time of year is wholly beneficial, and helps to enable the plants to withstand the unfavourable winter weather. It is well to choose a showery day to remove any shading which has been sprayed or brushed on to the glass; it is less difficult to remove when damp than when perfectly dry. The water used to wash off the whitening should not be allowed to run into the tank used for watering plants, as it would mark the leaves; it is quite a simple matter to disconnect the down pipe before beginning operations. All roller blinds should be taken down and stored, first being thoroughly dried. If any are discarded as being worn out, an order for fresh ones should be placed in plenty of time for the spring.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Autumn-sown Onions.—The seedlings will soon be appearing above the ground, and as soon as it is safe the Dutch hoe may be used with advantage between the rows. A light dusting of soot should be given, and all weeds hand-pulled. A few small sowings of Onions may be made, if required, fairly close together in a cold frame.

Main Crop of Onions.—These should be examined when an opportunity occurs, and the loose outer skins removed. All roots showing the least sign of decay should be rejected, and the rest carefully graded preparatory to "roping." This method of preserving Onions is a very good one; the bulbs are easily examined, well exposed to the air, and take up very little room.

Chicory.—Where a sufficient supply of these useful salad roots has been sown, blanching may be carried out as soon as practicable. A few should be lifted from the earliest sowing (carried out at the end of April or beginning of May), and all foliage removed by cutting it off just above the crown. The roots should then be placed in pots or boxes in the Mushroom house. Nine or 10-inch pots are suitable for this purpose; each will accommodate five or six roots, and spent Mushroom-bed manure will do well to place around them. With an inverted pot placed over them, they will keep as long as required.

Rhubarb.—If an early supply of Rhubarb is required, the work should be begun towards the middle of the present month. The roots should be selected from an early-maturing plantation, e.g., under a south wall, and only early varieties should be taken, such as Royal Albert. The crowns should be carefully lifted and placed under a north wall, there to lie in a dormant state for a fortnight, covered only with a little Bracken or straw. After this they will start into growth very readily when placed in the warmest end of the Mushroom house with sufficient soil in between the roots to cover them. They should be syringed twice a day with lukewarm water. If a new plantation is to be made, either for permanent beds or for the production of crowns for forcing, the preparation of the ground should be undertaken as early in the autumn as possible, especially on heavy soil. Deep cultivation and rich soil provide the best conditions for Rhubarb; plenty of decaying garden refuse may be buried at the bottom of deep trenches, and a liberal dressing of farmyard manure should complete the operation. The ground may then be left in a rough condition until March, when planting will begin.

Corn Salad.—There is still time to make another small sowing of Corn Salad out-of-doors for a winter supply. The seed should be sown in drills, preferably on a south or south-west border. The ground should be well dug, and raked to a fine tilth. When the seedlings are large enough, they should be thinned out so as to stand about 4 inches apart. The Dutch hoe should be used between the rows to eradicate weeds and to promote good growth.

Mustard and Cress. – Sowings should be made in boxes; they require a certain amount of heat.

Cardoons.—These should be blanched as soon as possible, the process requiring at least eight or nine weeks. Brown paper, covered with haybands, is the medium usually employed, being both simple and clean. A little soil should be banked around the bands, and the plant must be securely fastened to the stake. Only a few Cardoons should be cultivated in one place, as they need especially generous treatment throughout the whole period of growth.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Renovating Herbaceous Borders.—This is an operation which is almost sure to be undertaken more or less thoroughly in every garden at the end of the summer, and there is no time like the present for carrying out such work. In some cases a new scheme of colours will be required; in others new plants are to be introduced, and room must be made by the removal of old ones. If the work is done now, while the relative heights, &c., of the various plants are easily to be seen, there is the more likelihood of placing them in their correct positions. When single plants or groups are to be placed in the border, the ground should be deeply dug, and as far round as possible. If the soil inclines to poverty, a little new soil should be put in, to encourage the new plants to establish themselves easily. The earlier the work is taken in hand the better the results are likely to be. The only drawback is that, if extensive overhauling is contemplated, the display of flowers will be destroyed, while if left to themselves, the plants might bloom for several weeks longer.

Delphiniums and Pæonies. — These two plants should be dealt with as early as possible. They begin their growth quite early in the spring, and they rarely do well if they are moved late in the autumn. Any replanting should therefore be carried out at once. Pæonies especially are extremely impatient of removal. Both Pæonies and Delphiniums are now largely grown, and well repay careful cultivation. The ground for planting should be deeply trenched, and a good supply of rotten manure dug into the bottom soil, deep enough for the roots not to reach it when first put in. If the soil is rather heavy and rough, a little leaf-mould or old potting soil may be worked into the top spit and round the roots. Delphiniums can be planted with charming effect almost anywhere: in beds, in clumps in the shrubbery, in mixed borders, in the woodland and natural gardens, by the banks of a stream, or among the fruit trees in the kitchen garden. Pæonies also are general favourites, and there are many lovely varieties now to be obtained in all shades, from white and the palest rose to deep crimson. They will thrive almost anywhere, and they are very attractive in the flower borders of the kitchen garden. In a mixed border they have the disadvantage of looking somewhat untidy towards the end of the season, on account of the foliage having a tendency to droop and trail. This difficulty can in a measure be obviated by planting a few summer-flowering Chrysanthemums or dwarf perennial Asters in front of the Pæonies. In early summer, while the Pæony is still at its best, a border devoted entirely to different varieties of this flower is extremely effective, and lasts in bloom over a long period. The position of the border is a somewhat important consideration. Pæonies are liable to a good deal of damage if exposed to rough winds, and should preferably be sheltered by a background of shrubs or woodland.

Lavender. — The propagation of this shrub should now receive attention, as young plants will probably be required to fill up gaps in existing Lavender beds, or for stocking new ones. It is difficult to plant too much Lavender. It is in great demand, as it combines an attractive appearance with a delicious perfume. A cold frame, similar to that used for Veronicas and Pentstemons, would be suitable; or, if only a small quantity is required, a box will be sufficient. Two plants which go well with Lavender are Santolina incana (or Cotton Lavender) and Rosemary. Both are propagated in the same way, and are very popular.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Miltonia.—Brazilian Miltonias, such as M. Regnelii, M. Binotii, M. spectabilis, and M. s. Moreliana, should be kept rather dry after passing the flowering stage. Just sufficient water should be given at the roots to prevent any shrivelling of the leaves or pseudo-bulbs. M. cuneata, M. Clowesii, and M. candida grandiflora are now developing their flower-spikes. As they pass the flowering period they also should receive the treatment recommended above. These plants are very subject, especially at the present season, to attacks of red spider. As a precaution against this pest, the leaves should be occasionally sponged with a solution of soft soap and tepid water. Any plants of Miltonia vexillaria which have been cultivated in the cool house during the summer should now be removed to the Cattleya or intermediate house. They should be placed in a light, airy position, and as the young growths advance and the new roots form, the supply of water should be gradually decreased. During damp, dull weather, the immediate surroundings of the plants should not be kept too moist or the foliage will decay. Miltonia Roezlii, and its variety M. alba, are now starting new growth and forming fresh roots. If repotting is necessary, this is the best time to do it. Ample drainage should be provided for, and the compost used should be the same as that recommended for Miltonia vexillaria in the calendar for August 17 last. A suitable place for these plants is the warmer end of the intermediate house. After repotting they should be watered sparingly until the young roots are well established in the new compost.

Lælia. — L. pumila and its many varieties which have been growing in the cool house during the summer will now benefit by a removal to the intermediate house. They should be suspended near the roof-glass while in flower, and until the new growths are completed the roots should be well supplied with water. When the new pseudo-bulbs are formed less water may be given, but care must be taken to see that the roots are never allowed to become dry. These plants are frequently attacked by the white scale insect. This is very destructive, and should be destroyed directly it appears. Plants of L. harpophylla are now making new growth, and should be placed in an intermediate temperature. Water must be given with moderation until the new shoots are well advanced, as too much moisture at the roots at this period will cause decay. As the plants advance in growth the supply of water may be increased. L. anceps, L. Marriottiana, L. albida, and L. autumnalis are now producing flower-spikes, and will require plenty of moisture at the roots.

Calanthe.—The deciduous Calanthes of the Veitchii and vestita types are now finishing their growth. Well-ripened bulbs are essential to the formation of strong flower-spikes and fine blooms, and the plants should therefore be placed near the roof-glass and be given plenty of space, so that the foliage may not shade the bulbs. A brisk temperature should be maintained in the house, with a good circulation of air. This treatment will tend towards the drying of the plants, and they will require plenty of water at the roots until the foliage begins to decay.

Lycaste.—Lycaste Skinneri and its variety alba, L. Mary Gratrix, L. Ballæ, L. cruenta, L. leucantha, L. Deppei, and a few others, will soon be finishing their young growth and forming a quantity of fresh roots. They will require a liberal supply of water until the new pseudo-bulbs are fully developed. The night temperature should not be allowed to fall below 55°; a light, airy position in the warmest part of the Odontoglossum house would suit them. They should be sprayed overhead during the morning of each bright day.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, OCTOBER 8—
Royal Hort. Soc. Coms. meet. Hort. Club Meet.

THURSDAY, OCTOBER 10—
Royal Hort. Soc. Autumn Sh. of British-grown Fruits (2 days).

FRIDAY, OCTOBER 11—
Ann. Conference of Affiliated Mutual Improvement Societies at R.H.S. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—51°6.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, October 2* (6 P.M.): Max. 62°; Min. 47°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October 3* (10 A.M.): Bar. 29·8°; Temp. 57°; *Weather*—Fine.
PROVINCES.—*Wednesday, October 2:* Max. 62° Cornwall; Min. 40° Scotland E.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY.
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

TUESDAY AND WEDNESDAY—
Nursery Stock, at Shortlands Nurseries, Ash, Surrey, by Protheroe & Morris, at 12.

WEDNESDAY—
Trade Sale of Bulbs, at 1; Palms and Plants, at 4; Protheroe & Morris's Rooms.
Rose Trees, Shrubs, Perennials, Palms and Azaleas, at Stevens's Auction Rooms.

THURSDAY—
Nursery Stock, at Church Nursery, Lee-on-the-Solent, by Protheroe & Morris, at 12.

FRIDAY—
Sale of a portion of the "Wilderspool" Collection of Orchids, at Wilderspool, Warrington, by Protheroe & Morris, at 1.

Sweet Peas in April.

Visitors to the principal exhibitions last spring experienced some surprise at the magnificent exhibits of Sweet Peas contributed by certain nursery firms, particularly by Mr. C. W. Breadmore and Messrs. Dobbie & Co. These flowers were to be seen even at the Royal Horticultural Society's exhibitions in April, but the finest specimens were doubtless those contributed by the latter firm to the International Exhibition in May. The effect of these displays was to furnish convincing proof to gardeners and the public that Sweet Peas of the highest merit may be obtained thus early in the season by those who care to carry out the necessary culture. As a guide to our readers on this subject we print the following instructions on the treatment of Sweet Peas under glass as they represent the cultivation practised by those who have already achieved signal success.

The seeds should be sown at the present time, either in boxes or in pots, or even in a seed bed in a greenhouse. Some firms that cultivate flowers for market adopt the bed system, potting the plants up into 2½-inch pots as soon as they are large enough to be handled, and allowing them to remain in these pots during the winter in unheated frames. Messrs. Dobbie, on the contrary, sow their seeds in boxes, putting the seeds 2 inches apart in each direction, so that there will be no risk of the young plants becoming drawn through overcrowding. This matter is important, because it is essential that these early plants should make short-jointed growth and form a stocky habit. When they have made three pairs of leaves, each plant is pinched for the purpose of inducing it to form side shoots from the leaf axils near the base. Here it may be remarked, that Scotch cultivators have found that plants so pinched do not break into growth in the colder districts of Scotland so easily as in the south, therefore it may be desirable in northern districts to defer sowing until January.

When the seeds have been sown in boxes early in October, the latter may be placed in a greenhouse until the plants are 1 inch through the soil, but on no account must the temperature of the house be allowed to get at all high. At this stage the boxes should be removed to unheated frames, facing the south, and every precaution taken to guard the tender plants from slugs and vermin. In such conditions the plants may remain until the commencement of the new year, when they will need to be repotted singly into 3-inch pots, employing a moderately rich, porous compost which will favour the multiplication of roots. Following the potting operation small twigs should be placed in the pots to support the growths, and the plants should be placed in the cool greenhouse, where means exist to repel frost and where ventilation may be given on all favourable occasions. If the plants are destined to flower in 10 or 12-inch pots, the latter must be prepared by thorough cleansing and by providing them with liberal and efficient drainage. The potting compost should consist of turfy loam with small quantities of leaf-mould, sand and bonemeal. Pots of these sizes may contain four plants, assuming that each plant is to be confined to a single stem, but if the purpose is to grow flowers for cutting rather than for exhibition two, or at the most three, plants should be placed in a pot, and each plant allowed to produce two growths. The shoots should be trained to thin Bamboo stakes which must be 7 feet long, and the lateral growths should be carefully removed, allowing only the flower-spikes to develop at each node.

The final potting should take place early in March, and at this operation the soil requires to be made very firm. After the potting the same cool conditions, with plenty of ventilation, and only sufficient fire-heat to prevent frost, are necessary. No feeding with manures must be attempted until the plants have commenced to flower. If the growths have the internodes longer than 4 inches the culture is at fault, too much heat has been given, or the plants have been watered too freely.

It should be remarked that certain varieties require special treatment. Speaking generally, the cultivation already explained will prove successful with most of the standard varieties, but if the weather in late autumn and winter prove very severe, those varieties having flowers exhibiting any of the orange shades will not be likely to succeed in unheated frames in November and December. Such varieties at Early Spencer, Barbara, Melba, Stirling Stent, and even Edrom Beauty and the finer scarlet varieties will need the conditions of the greenhouse. It may also be pointed out that crimson, purple and maroon-coloured varieties are not well suited for culture under glass. All varieties exhibiting but little colour succeed well, as do most of the salmon, lavender and pink shades. In another column (p. 261) a selection of varieties specially suitable for indoor cultivation is contributed by a correspondent who has proved their amenability.

Hail Preventers.

An article in the *Agricultural Journal* of the Union of South Africa advocates strongly the erection of hail preventers in that country. The apparatus recommended is that invented by two French landowners, General de Négrier and Count de Beauchamp. The installation, which costs about sixpence per acre, consists of three essential parts, namely, a terminal, a conductor, and a diffuser. The terminal is made of a good conductor of electricity—for example, copper—is fixed at the top of a high building, such as a church tower or factory chimney, and should be not less than 33 feet above the tops of the highest trees in the neighbourhood. The conductor is made of thick copper plates in a lead casing, and connects at its lower end with the diffuser. The latter, also of copper, is placed in a pond, well, stream, or underground watercourse.

The apparatus has been used for three years at four stations in France with most successful results. The stations are some 6 miles apart, and form such an effectual electrical barrier that during the period since its installation the municipal authorities have been able to report "no damage" after each storm which has visited the protected area. Hail has not formed within the region, and hailstones driven by wind into the protected area are found to melt at once, and hence to do no damage.

With their Athenian gift for displaying intelligent interest in new things, the French have established a permanent commission in order to observe and report on the effects of this and similar inventions. It appears probable that, by installing the apparatus on the Eiffel Tower and other suitable high points in Paris, it will be possible to prevent not only hailstorms, but also thunderstorms from breaking over the city. We have not heard that any experiments with the apparatus have been made in this country, but having regard to the disastrous effects on glasshouses produced occasionally by hail, we commend the subject to the notice of the newly-established horticultural branch of the Board of Agriculture.

Royal Horticultural Society.—The next meeting of the Committees will take place on the 8th inst. in the Society's Hall, Vincent Square, Westminster. At the 3 o'clock meeting of the Fellows in the Lecture Room, Dr. Charles Crowther will deliver an address on "The Influence of Atmospheric Impurities on Vegetation."

R.H.S. Autumn Fruit Show.—The Royal Horticultural Society's annual exhibition of British-grown fruit will take place in the Society's Hall, Vincent Square, Westminster, on Thursday and Friday, the 10th and 11th inst. A lecture will be delivered by Mr. C. H. Hooper at 3 o'clock on the first day on "An English Fruit Farm in its Making."

Horticultural Club.—A house dinner of the Horticultural Club will take place on Tuesday, October 8, at 6.30 p.m., when a lecture on the subject of "Afforestation in the Black Country" will be delivered by Mr. P. E. Martineau, organising secretary of the Midland Reafforesting Association.

Trials at Wisley, 1912-13.—The Council of the Royal Horticultural Society has made arrangements for the following subjects to be tried at Wisley in 1912-13:—(Fruit) Autumn-fruiting Strawberries, 20 runners of each variety; berry-bearing fruits, three plants of each sort to be sent by February; Strawberries, Raspberries, Gooseberries, and Currants are excluded from this trial. (Flowers) Antirrhinums, Aquilegias, seeds of both these to be sent in February; Pyrethrums, Gaillardias, seeds and plants of both these to be sent in February; Violas, three plants of each variety to be sent at once; bearded Irises, flag or German, two plants of each variety to be sent in July, 1913. (Vegetables) Peas, one pint of seed to be sent in February; Potatos, early and mid-season; each variety must be labelled "early" or "mid-season," and 20 tubers of each variety should be sent by February; Tomatos, one packet of seed to be sent in February—this trial will be held under glass and out-of-doors; Turnips, one packet of seed to be sent in February. Packages of seeds or plants sent by post should be forwarded to the Superintendent, R.H.S., Wisley Garden, Ripley, Surrey. Consignments by rail should be addressed, the Superintendent, R.H.S., Wisley Garden, Horsley Station, L.S.W.R. Everything sent for trial must be named, and the name and address of the sender attached.

School-children Plucking Flowers in the L.C.C. Parks.—The system of encouraging the pupils in the London County Council schools to study botany apparently has its drawbacks, for it is reported that complaints as to school-children plucking flowers in the London parks and open spaces have increased recently. In some cases the children have pleaded that they were collecting specimens for their schools, and head teachers are accordingly to be asked to warn their pupils that on no account must flowers be picked in the parks.

Paris Chrysanthemum Show.—An important show of Chrysanthemums, organised by the French Association of Amateur and Professional Chrysanthemists, is to be held in Paris, in the "Grand Palais" of the Champs Elysées, from October 23 to 27. During the progress of the exhibition a conference will be held, in which questions affecting the Chrysanthemum will be discussed. The French railways are allowing a rebate of 50 per cent. to those attending the show. The secretary, 28, Rue Baudin, Paris, will be glad to send particulars of the different classes to those interested.

An Exhibition of Arts and Handicrafts by Women.—An exhibition of Arts and Handicrafts, to include gardening, will be held by *The Englishwoman*, at the Maddox Street Galleries, 23a, Maddox Street, Regent Street, London, from November 6 to 16.

Catalogue of the Plants in the Botanic Gardens, Singapore.*—This, we believe, is the first published catalogue of the plants cultivated or existing in the original vegetation in the Straits Settlements Botanic Gardens at Singapore. It has been compiled by Mr. J. W. Anderson, Assistant Curator, with the acknowledged assistance of Mr. H. N. Ridley, the late Director. We believe the Singapore Gardens are at least equal in area to Kew, but no particulars of this kind are given. Nor is there any summary of the collections. The families of flowering plants are numbered, from which we learn that 138 are represented. The catalogue is, however, something more than a list of names. Authorities, native countries, habit, uses, and other items of information appear. It is supplemented, too, by a classified list of economic plants after the nature of their products as: edible fruits, fibres, oils, rubbers, &c. There is a general index to the genera and to English and native names. The plan is not quite uniform throughout; the genera being arranged systematically for the greater part, but both genera and species of the Monocotyledons and Ferns are in the more useful alphabetical order. Palms must form a prominent feature in the gardens if we may judge by numbers, nearly

Fig. 120.—Perpetual-flowering carnation "Rosette": colour deep pink.
(Exhibited by Messrs. Allwood Brothers at R.H.S. meeting on September 24 last.)

* *Botanic Gardens, Singapore: Index of Plants, 1912.* (Singapore: Printed at the Methodist Publishing House.) 1912. Octavo, pp. 162. Price $1.00.

a hundred genera being represented. The collection of Orchids is also extensive, Dendrobium alone being represented by upwards of 70 species. Many New World genera are poorly represented, thus Epidendrum and Lælia by a single species each, and such a prominent genus as Odontoglossum does not figure in the list. We are glad to learn that a guide to the gardens is in preparation. Singapore is one of the botanic gardens that supplement their grant by the sale of plants.

"Records of the Botanical Survey of India." – Four parts of this publication have been recently distributed together. They are Nos. 5 and 6 of volume iv, and Nos. 2 and 3 of volume v; all dated 1911. The first number of this series is devoted mainly to an account of Messrs. W. W. Smith and G. H. Cave's botanical explorations of the Zemu and Llonakh Valleys of Sikkim, and an enumeration of the plants collected. In 1848-9 Sir Joseph Hooker visited, as pioneer, this region, which is very difficult for travellers, and one in which unpleasant experiences may overtake the incautious. Through the coolies lagging behind on one occasion, Smith and Cave had to pass the night without any shelter; but they took care it did not occur again. Rhododendron jungle was one of the greatest obstacles to forward progress. The marsh land of Llonakh is of a type not seen elsewhere in Sikkim, and the travellers met with such familiar British plants as Glaux, Hippuris and Ranunculus aquatilis, previously unrecorded from the Eastern Himalaya. The enumeration is almost limited to the plants found above 11,000 feet, and it is assumed that it is a fairly complete record of the Alpine flora of the area investigated. Including 25 species of Ferns, three Lycopods and one Selaginella, the enumeration comprises 1,010 species belonging to 403 genera and 102 families. Saxifraga, Pedicularis, Primula, Saussurea, Rhododendron and Gentiana are most numerously represented, numbering jointly 145 species, with no fewer than 34 of Saxifraga. A few new species are described, and we note one new genus, Parajæschkæa, Burkill, allied to Gentiana. There is a good map and two striking views at 11,000 feet and 14,500 feet respectively. Running hastily through the enumeration, we have noted no habitats above 16,500 feet. The rest of this number is occupied by descriptions of new plants from India and Burma, among them the new genus Craibiodendron, allied to Pieris, Ericaceæ. No. 6 of volume iv is limited to an interesting contribution by Mr. J. H. Burkill, entitled, "Determinations of the Prickly Pears now wild in India." This title by no means covers the scope of the paper, which seems to be practically exhaustive of the history and characteristics of the species naturalised, not only in India, but also in other countries of the Old World. The author presents a critical review of all the literature accessible relating to the species naturalised in India, and, incidentally, to the species naturalised in other countries. A tabular view of all the species concerned illustrates their distribution so far as the author's data permitted. The species now wild in India are five, namely, Opuntia cochinelifera, O. monacantha, O. nigricans, O. elatior and O. Dillenii, to which a key is given, followed by references to figures of the species under whatever names they may have appeared, with a summary of synonyms and pseudonyms. A map shows their present distribution in India, so far as ascertained, and a sixth species, O. decumana, is added in the map as wild in the western peninsula. The author also gives some account of the attempts at Cochineal cultivation in India, and the futile introduction of the insect for the destruction of the Cactus. The second and third parts of vol. v are continuations of Major Gage's "Catalogue of Non-herbaceous Phanerogams Cultivated in the Royal Botanic Garden, Calcutta." On the appearance of the first part of this catalogue, the plan was described in these columns, May 27, 1911, and it is there designated a Name Guide. For the purposes of this Name Guide, the whole garden was divided into squares of 100 feet each way. These squares are numbered, and the trees and shrubs within each square are labelled, the label bearing a name and a number. The first part of this work carried the numbering to 4,001, and the present parts carry it to 9,930, presumably the end. A systematic part is to follow, by means of which the extent and composition of the collection will be shown, and the numbers coming after the names will, as we understand, complete the guide.

The Adulteration of Seed (U.S.A.)— The U.S.A. Department of Agriculture has published in *Circular No. 39* the results of analyses of seed secured in the open market and found to be adulterated and misnamed. This it does by virtue of powers vested in it by Act of Congress. The results show that the Act serves a useful purpose. Thus, of 305 samples of seed of Orchard Grass—presumably, Dactylis glomerata (Cock's-foot)—28 were adulterated with Meadow Fescue, Rye Grass or other seed. Seed sold in open market as Kentucky Bluegrass was found in 35 out of 430 samples to consist wholly or in part of Canada Bluegrass, Timothy or Bent. Hairy Vetch (Vicia villosa) appears to be yet more subject to adulteration, for of 703 samples no fewer than 187 were impure. Five samples were innocent altogether of any trace of the seed of the name under which it was sold; the others contained some Hairy Vetch, together with Vetches of other sorts. Red Clover alone proved true to name; of 510 samples not one was found to contain anything but Red Clover.

Clearing Land with Dynamite. — The following account of the use of dynamite for clearing land is contributed by Mr. R. B. Howard, Chief Protector of Aboriginals, to the *Queensland Agricultural Journal* for July, 1912:—"For some years I have been using dynamite on my farm for purposes of clearing the land of timber, for subsoiling, and also for draining. In clearing land of stumps or trees, a charge of dynamite is placed *under*, not *in*, the stump, by boring a hole with a 1¼ inch shell auger on three sides of the tree or stump to be operated upon. The holes are bored at an angle of, say, 45 degrees, with the object of bringing the bottom of the holes as closely together as possible, the depth of each hole being about 3 feet. The size of the stump will regulate the charge. For a stump of 18 inches in diameter I would use four cartridges in each hole—that is, 12 altogether. When charging, I always split the paper wrapper of the cartridge on two sides, and place *one* cartridge at a time into the hole, carefully squeezing down with a wooden hammer. Only *one* cartridge is primed with detonator and fuse. This cartridge is, of course, *not cut*. When the holes have been charged and tamped, the fuse is fired, and the concussion in one hole has been found sufficient to explode the others. It will, of course, be understood that the bottom of the holes must not be more than, say, 8 or 10 inches apart. This method of clearing land I have found a good deal more preferable and less costly than pulling stumps or trees with a machine, and I estimate you can blow up 50 stumps in the time it would take to remove one or two under other methods. The effect of the dynamite is to split up the stumps, remove all soil sticking to the roots, break all the main roots, and loosen the soil for yards around; and the stump burns readily. Moreover, *one* man can do all the work. In the ordinary cultivation work I have found dynamite most useful in almost every class of soil, but more especially where a sub-stratum of clay is in evidence. By drilling or boring with an auger holes to a depth of 3 feet 20 feet apart, and charging each hole with three plugs of dynamite, it will be found, after explosion, that the subsoil is fractured, for a radius of not less than 10 feet from each hole, to a depth of about 4 feet. It would be quite superfluous for me to point out to the agriculturist the value of such an effect on the soil. In fact, from the experience I have gained in using dynamite, I am strongly of the opinion that, were its value as an adjunct to farming more generally known, it would come into general use. The cost compared with other methods has also to be considered; and when it is pointed out that one acre of land can be efficiently subsoiled—more so than by any other means—for a sum less than £5, the value of the operation is apparent. In my own case I have just treated about two acres of land in which ornamental trees have been planted, but, although about three years old, the growth was stunted and altogether unsatisfactory, owing to a cold, impervious white clay underlying the few inches of top soil; and I am satisfied these trees will now make a good growth. Again, I have also treated my orchard in a similar way, and the result has already been very satisfactory. The general opinion appears to be that dynamite is exceedingly dangerous to handle. Well, so is a gun if placed in the hands of a careless person. My sons and myself handle dynamite constantly without the slightest fear of an accident; and, if the same care is exercised as would be in the case of a loaded firearm, there is little or no danger—in fact, a pea rifle in the hands of a young lad is far more dangerous than a ton of dynamite under the care of a responsible person."

Tomato Rust.—A short illustrated account of the disease known as Tomato rust is given in Leaflet No. 262 of the Board of Agriculture. The disease, which is, unfortunately, only too well known both in this country, in France, Italy, and the United States, is due to the attack of the fungus Cladosporium fulvum, Cooke, and was first described by Dr. M. C. Cooke, from specimens received from North Carolina in 1883. The first serious outbreak of the disease did not occur in this country till four years later. The fungus affects the leaves, stem, and sometimes the fruit of the Tomato, but the first sign of the disease is to be found in the leaves. Unfortunately, it is not till the fungus has obtained a fairly good footing in the plant that it is to be recognised. The spawn or mycelium runs in the tissues, where, of course, it is invisible to the naked eye. It breaks out on the underside of the leaf to form its spores, which are associated in small patches. Though the spores are produced on the underside of the leaf, their presence is indicated by pale yellow patches on the upper surface coincident with the spore-patches. As the spores ripen they produce a rusty brown colouration of the leaf, which rusts and dies. Black streaks appear on the stem and the disease is apt to spread with great rapidity from plant to plant. The writer of the leaflet points out that the spread of the fungus is prevented by horizontal spraying, which tends to distribute the spores from one leaf to another, and suggests that if a vertical spray could be employed, the spores would be dealt with more effectively, by being washed down into the soil. Fungicides are of little avail unless employed at a very early stage. For this purpose, half-strength Bordeaux mixture is recommended. If a careful watch be kept and if the affected leaves are removed at once, the disease may sometimes be kept in check.

Appointment.—On the recommendation of Kew, Mr. Frank Birkinshaw, a member of the Royal Botanic Garden staff, has been appointed, by the Secretary of State for the Colonies, assistant agricultural superintendent in St. Vincent, West Indies.

Publications Received.—***Twelve Moons,*** by Frances A. Bardswell. (London: Elkin Mathews.) Price 2s. 6d.—***Royal Gardens,*** by Cyril Ward. (London: Longmans, Green & Co.) BURNS-LAND.

"Ayr and Ellisland, Mauchline and Dumfries, are the shrines of countless pilgrims," so said Lord Rosebery in one of his Burns orations. Many a horticulturist finds his way to these shrines during the season, and at the Burns Monument, hard by the Brig o' Doon, the gardens are so arranged and tended that after inspecting the monument a visitor who loves nature can spend an hour inspecting the trees and shrubs, the Roses, Sweet Peas and other plants which grow so well on the sheltered, gently-sloping banks of Doon.

It is interesting to remember that the father of Robert Burns was a gardener. In 1750, he came to Ayrshire from Kincardineshire to become gardener on the estate of Fairlie, in the parish of Dundonald. In 1752 he became a gardener at Doonside, and later was engaged as gardener and overseer by Provost Ferguson on the estate of Doonholm. In 1756, while still in Provost Ferguson's service, he feued from Dr. Alexander Campbell, physician in Ayr, then proprietor of the estate of Rozelle, for a feu duty of £71 2s. 5d. Scots, equal to about £5 18s. 6d. of our money, 7 acres and 18 falls of land at Alloway, intending to carry on business as a nurseryman and market gardener. On this ground he built with his own hands the cottage in which the poet was born. This is no place to speak of Burns, his worth and his work, but it would be unpardonable in a Scotchman if he did not on every opportunity speak up for his hero. Let Carlyle do it. He says of Burns—"impelled by the expansive movement of his own irrepressible soul he struggled forward into the general view and with haughty modesty laid down before the world, as the fruit of his labour, a gift which Time has now pronounced imperishable. . . In pitying admiration he lies enshrined in all our hearts, in a far nobler mausoleum than that one of marble; neither will his works, even as they are, pass away from the memory of men. While the Shakespeares and Miltons roll on like mighty rivers through the country of Thought . . . this little Valclusa Fountain will also arrest our eye: for this also is of Nature's own and most cunning workmanship, bursts from the depths of the earth, with a full gushing current into the light of day; and often will the traveller turn aside to drink of its clear waters, and muse among its rocks and pines!"

It is in the monument grounds that the most earnest attempt at gardening is carried on. The monument was erected in 1820 by public subscription, and it and the grounds were vested in trustees chosen from the leading public men in Ayrshire. The grounds were laid out and planted in 1822-23 by the gardeners of Ayrshire. It would be extremely interesting to know if there is a record in existence of these operations. For 45 years the ground and monument were open free to the public, but complaints becoming rife about the neglected condition of the grounds, the trustees imposed a charge of twopence for admission, the revenue thus obtained being entirely expended on the maintenance and improvement of the grounds and in purchasing adjoining properties. In 1881 the trustees purchased from the Ayr Shoemakers' Incorporation the whole premises which had grown up around the cottage where Burns was born, and the public-house licence attached to same, for £4,000. The licence they abandoned, and spent £500 in repairing the cottage and laying out the ground adjoining, but, as I have already said, it is in the grounds surrounding the monument where the best gardening is found. Entering through the turnstile in the month of August, one is immediately struck by the way in which Sweet Peas are cultivated. They are grown in oblong boxes or tubs and placed at regular intervals along the main path. The superintendent informed me that so much interest had been taken in them that he was sure some hundreds of the visitors would adopt his method next season in their own gardens. When I saw the plants, or rather clumps of plants, in the tubs in August they were about 6 feet high, and each clump was carrying from 50 to 60 excellent spikes of bloom, and they had been doing so continuously since the second week in June. Around the sides of each tub there had been placed six bamboo stakes about 7 feet in height, and the plants trained up these. No disbudding had been done, but flowers were removed directly they were past their best. There was no trace of disease, four-bloom sprays were abundant, and many of the varieties, I was informed, had given five-bloom sprays. Well-known standard sorts, all evidently true to name, had been selected, most notable being Mrs. C. W. Breadmore, Nora Unwin, Edrom Beauty, Marie Corelli, Sunproof Crimson, Mrs. Hugh Dickson, Mrs. Routzahn, Nubian, Elfrida Pearson and Apple Blossom Spencer. Tubs of the two last-named varieties had been placed in niches in the monument, and showed up to great advantage against the dark-grey stone. Climbing Roses were another great feature. They were mostly treated as pillars, so as not to obscure the view of the river from any point of the gardens—Dorothy Perkins, Hiawatha, Mander's Triumph, Minnehaha, Lady Gay, Gardenia and Alberic Barbier were all doing well. Gradually all the old Laurels and common shrubs are being rooted out and their places taken by the finer sorts of Cupressus, Olearias, Thuya, Juniperus, Maple, Kalmia, Prunus, Weigelia, Forsythia, and other sorts.

Annuals are used to advantage in the borders in front of the shrubs, and masses of bloom of Clarkias, Alonsoas, Larkspurs, Linarias, Phlox Drummondii, Verbenas and Antirrhinums testified to the value of such plants when well looked after. Two beds of rather uncommon Pelargoniums were most effective. These were Star of India, which does better than Mrs. Pollock, and the old Harry Hieover. An indirect association with the late Mr. W. R. Smith, of Washington, who was one of the best gardeners in the United States, and one of the greatest authorities on all things pertaining to Burns, was pointed out in a collection of perennial Peas (Lathyrus latifolius), which had been sent from America by Mr. Smith, all of which were growing luxuriantly and blooming freely in sunny corners of the finely-sheltered grounds. It will be a pleasure to many gardeners who love Burns's writings, but have not had the privilege of visiting his haunts, to know that horticulture is so well managed on the banks of Doon. Two men are responsible for this. Mr. J. R. Dickson, a true gardener, who came from Aberdeenshire 14 years ago to act as superintendent and manager of the grounds, and Mr. W. H. Dunlop, the secretary to the trustees, who could not take more interest than he does in the property of the trustees if it belonged to himself, and who does it all, I am told, as a labour of love. In the 14 years Mr. Dickson has had charge of the place over a million visitors have passed through the turnstile. It is a great matter that good gardening should be brought to the notice of such a multitude, who come from the ends of the earth to the shrine of Scotland's immortal bard. *W. Cuthbertson, Edinburgh.*

HOME CORRESPONDENCE

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

A Proposed Fruit Congress and the North of England Horticultural Society.—I have been asked recently by the Rev. J. Bernard Hall, of the North of England Horticultural Society, to fix up a congress on fruit or fruit and Potatos for the four northern counties of England, to be held in 1914, and, further, am requested to appeal to the Durham County Council for funds to meet various expenses. I am wondering if I may have the assistance (in the first instance) of your valuable paper to ventilate this scheme, and, as regards the congress, to get into touch with horticulturists and others in the north who would intimate their willingness to work with me to run the said congress. The Northern Fruit Congress of the past years has been, more or less, a one-man scheme, and a financial failure. In 1910, Captain Cuthbert had to pay a deficit balance of £50. In 1911, the Rev. J. B. Hall accepted the responsibility and dropped £30. In 1912, the Rev. J. B. Hall and Mr. W. B. Little ran in double harness at Carlisle. These two are going to turn up again at Kendal in 1913. If a congress on fruit or a horticultural congress in any form is wanted, why should there not be a proper representative congress committee or council to carry on such a movement, on similar lines to those on which any other congress is managed, and make it peripatetic—annual meetings in different centres? The second request, viz., to approach the Durham County Council, or any other county body for cash, and more particularly the Council in question, as not one of them is a horticulturist, is not the right move to take. Mr. Hall argues that the Yorkshire Agricultural Society arrange and provide many years in advance; they and other allied societies have the interests of the work at heart, understand and provide in advance: not so a county governing body. To ask a County Council (amongst whom no one is enthusiastic) to run a show or scheme two years hence and out of the rates is ridiculous. If a body of ladies and gentlemen can be found to work together, I will gladly work hard with them. Whilst writing in connection (although indirectly) with the North of England Horticultural Society, it may not be out of place to note the progress of this northern society. One wonders sometimes if it is wanted. The secretary often states that existing societies and others must invite them to come out if they are to visit a centre. The mission of the North of England Horticultural Society should be to tell societies that they are coming to their town on a given date, create interest, and partially finance the concern. If this is done horticulture will advance. The old custom to wait for folks to send for you is dead. *John Smith, Fellow of the N.E.H.S. and Horticultural Lecturer for County of Durham. September 27.*

The Autumn Colouring of Foliage.—In spite of the general impression that a considerable amount of sunshine is essential for the autumn colouring of the leaves of deciduous trees, this dull and moist season the foliage has coloured wonderfully well. This fact clearly indicates that sunshine is by no means the only essential factor for the bright colouring of leaves. Since the weather became fine and dry, many of the trees have changed their appearance very rapidly; in fact, the autumn colouring commenced quite as early as after a bright, hot summer. The excessive wet has nourished the trees and leaves and kept them in a healthy condition, and there are none of the dead, brown leaves on the trees that were so conspicuous last year. Amongst the more showy subjects in this garden Quercus coccinea is especially effective. Its bright scarlet

foliage contrasts well with the more sober hues of many other trees. Liquidambar styraciflua, with its crimson and purple leaves, forms a handsome object when it has attained large proportions. Kœlreuteria paniculata is very showy, and Euonymus europæus has developed an effective crimson shade. The spreading branches of Parottia persica and their brilliant leaves are very conspicuous at this season. Citrus trifoliata is beautifully coloured, and the foliage of Paliurus australis has become a rich yellow. Crataegus Crus-galli, Pyrus Aucuparia, Ribes aureum, Viburnum plicatum and Azalea sinensis have all assumed telling shades of bronze and crimson. Few subjects surpass Rhus cotinoides, or R. Toxicodendron in effect; their leaves are now a brilliant crimson colour. Berberis Thunbergii is another beautiful shrub, and when planted in large beds nothing surpasses its effect in the autumn. The more recently introduced B. acuminata also colours well, especially the leaves on the young growths. Many of the Japanese Cherries are richly coloured, and contribute bright patches of crimson. Large beds of Rosa lucida are very striking objects, and, later on, their coloured stems will be quite a feature. Aralia chinensis is seen to advantage now: its leaves vary in colour from deep crimson to yellow. Several of the ornamental vines are especially attractive. Vitis Coignetiæ and V. Thunbergii have glorious colours, and are admirable when rambling in large masses over Thorns and other common trees. Vitis Henryana has assumed a striking appearance, and Ampelopsis Veitchii coloured early. The Japanese Maples must not be overlooked, as some of them create delightful effects. Acer japonicum laciniatum, with its crimson foliage, is one of the best in autumn, and A. palmatum ampelopsifolium and A. rufinerve are especially attractive. The latter makes quite a large specimen, and its beautifully-shaded leaves, that vary in colour from yellow to deep crimson, give the tree a striking appearance. *J. Gardner, Batsford.*

COLOUR OF HARDY FRUITS (see pp. 234, 251).—Noticing *Southern Grower's* remarks, I am constrained to say that I cannot agree with him that solar influence alone is absolutely essential to high coloration, for this year's experience has proved otherwise. He also remarks that Colonial fruits are more highly coloured than our British fruits. There, again, I cannot agree with him, for in these gardens at the present time there are fruits that could not easily be excelled. I visited the International Show in Dublin some few years ago and saw the Colonial exhibits there, and they deserved the highest praise, but I venture to say our English growers can produce fruit as good both in colour and quality. I quite agree with him that a good summer is essential to produce the beautiful aroma and high flavour of Colonial fruit, but for colour it is not necessary. I would ask him how it is that I have seen all kinds of hardy fruit grown on north walls and in odd corners of cottage gardens, where the sun could only penetrate, perhaps, for a few hours each day, and in a season like the present all the trees have not only proved prolific, but the fruits have developed good colour? Some of our most beautiful flowers also show their most perfect beauty when shaded; indeed, they revel in shade. I noticed particularly this year that fruits under the branches were most brilliantly coloured, but those covered entirely with leaves were green, showing that light is essential, but not necessarily strong sunshine. Here, in these gardens, the soil is a good, stiff loam on a sandy subsoil, this, I have no doubt, being an important factor in coloration, especially in a wet season. *S. Gilthorpe, Nynehead Court Gardens, Wellington, Somerset.*

LARGE PLANE TREES.—Probably the largest Plane trees in this country are those in the club grounds at Ranelagh. One in particular, near the croquet grounds, is of giant proportions, being fully 24 feet in circumference of stem at a yard from the ground, while the far-spreading branches cover a space of 90 feet in diameter. Another tree of the same kind, not far distant, is nearly as large, and there are many specimens of little inferior proportions in other parts of these beautiful and secluded grounds. These are not the true eastern Plane but what is known as the London variety (Plantanus orientalis aurifolia), which is readily recognised by the less deeply-divided leaves, and is distinguished from the western Plane (P. occidentalis) by the several heads of fruit which are attached to each peduncle, those of the western tree being usually produced singly. There are many fine Plane trees in and around London, but certainly those at Ranelagh, especially the one whose dimensions are recorded, have few or no equals in this country. *A. D. Webster.*

FRUIT AT WROTHAM PARK GARDENS.—On a recent visit to Wrotham Park gardens, Barnet, I observed a number of trees of Sea Eagle and Princess of Wales Peaches planted against a south wall, carrying extraordinarily fine crops. The space from the ground to the coping was furnished with splendid fruits, which was all the more remarkable considering the unfavourable season. There were also fine crops of Pears, Plums and Apples. A Black Hamburgh vine planted in 1728 had borne a large number of choice bunches, whilst in another vinery was a large crop of various black Grapes, the variety Appley Towers being noticeable for its highly-finished berries. *V. H. L., Sheffield.*

A CURIOUS RADISH (see fig 121).—Until this year I should not have thought the expression "getting tied up in a knot" could possibly be applied to a Radish. However, it appears I am under a misapprehension, for this has actually occurred to a Radish grown in my garden. *H. W. Sheldon, 78, Upper Richmond Road.*

FIG. 121.—ROOT OF RADISH.

LEPTOSPERMUM SCOPARIUM NICHOLLII.—The history of Leptospermum scoparium Nichollii (the Crimson Manuka), which won the 25-guinea cup presented by the *Gardeners' Chronicle* for the best novelty at the International Exhibition held in May last, will have interest to many of your readers. It is as follows:—In the summer of 1905 Mr. W. Nicholl, a well-known wool-buyer, of Belfast, Canterbury, N.Z., while visiting Nairn & Sons' Nurseries, wore a buttonhole of Crimson Manuka. The firm at once recognised a new thing, and asked its whereabouts and if it could be procured. This, however, was a secret, and all the information tendered by Mr. Nicholl was that the original plant was growing in the Manuka scrub between Chaney's Corner and the sea. Messrs. Nairn & Sons, however, would not be put off, and asked for cuttings, which were supplied by Mr. Nicholl. These cuttings were not very successful, as the growth was too hard, and only one or two plants were raised, these being stunted in growth. One branch, however, bore some seeds, which were sown, and as a result some 110 plants were raised. These, with the exception of seven, showed in their growth similar character to the old variety of the Manuka, and later, when in bloom, were mostly white. The exceptions, however, showed dark-reddish foliage and a difference in habit. When in bloom they proved to be crimson in colour, and from one of these (the best variety) the now famous Leptospermum Nichollii has been named and introduced to the horticultural world. Botanists locally have been much interested in this break, and have formed quite a number of theories for what Dr. Cockayne calls a mutant. Quite a number of plants have been successfully sent to the Old Country, and are doing well. Captain Dorrien-Smith, who has collected many plants in New Zealand, stated here that this crimson Manuka was the finest novelty in New Zealand plants that had left its shores for the last 30 years. An intcresting point worth noting is that it was a Cornishman (Mr. Nicholl) who first brought this flower into notice, and it was from a Cornish garden that the flowers were shown at the International Exhibition. *L. Roberts (Nairn & Sons, Christchurch, New Zealand).*

TITS IN THE GARDEN (see pp. 197, 235 and 251)—My experience of the little blue tit may be of interest. The bird has not fed on the Sweet Pea buds in these gardens, but it has been very destructive to the culinary Peas, pecking the Peas from the pods, being especially busy towards the end of the summer, when the Peas were becoming scarce. The tits have also damaged many Apples, particularly such varieties as Red Quarrenden, Duchess's Favourite, and Cox's Orange Pippin. Many Pears were also spoilt, and it has been necessary to protect both fruits with netting or gauze bags. This year is the first time I have known the tits raid the Cobnuts, and the samples I send will show how the birds have pecked through the shells and eaten the kernels. At first I could not believe that this was caused by the tits, but I have watched them at work in the Nut bushes. The tits chiefly confined their attentions to one particular bush, which was loaded with Nuts, and now not more than one-half remains. I consider the tom-tit to be the most destructive bird in the garden, and I have yet to learn its redeeming virtue. *J. L. Waterman, The Gardens, Syndale, Faversham.*

ACETYLINE GAS REFUSE.—During the last 12 months there have been many inquiries in the *Gardeners' Chronicle* as to the best methods of using the waste lime from acetylene gas generators. When I first took charge of these gardens there was no special place for clearing out the generator. Consequently, the old lime was found in different places, which made the gardens untidy. I chose a place near the rubbish heap, and enclosed it with a Privet hedge, with an opening large enough for a barrow to enter. A galvanised tank with a capacity of 100 gallons was installed for washing out the generator, and I found the same water would serve for months. During dry weather the lime in the generator was scraped out and placed in a heap; the generator was then washed and turned upside down to dry, but in wet weather this was done under cover, as it is necessary to replace the generator perfectly dry and free from grit. The spent carbide which accumulates during the summer becomes dry, when it is spread over vacant ground evenly, at the rate of one barrow full to every 12 square feet. After it has been dug in the ground for some time, say, about two months, Potatos, Cabbages, Lettuces, Peas, Beans and other kinds of vegetables may be planted; or it may be placed on vacant land to destroy insect pests, including wireworm. Acetylene gas refuse may be used in the place of slaked lime, but slaked lime is more beneficial. *F. R. Staddon, Sydmonton Court Gardens, Newbury.*

OUTDOOR PEACHES IN NORTH YORKS.—In reference to Mr. Bunyard's note on outdoor Peaches at Barham Court, Maidstone (see p. 212), it may be recorded that there is a fine crop of these fruits at Gilling Castle Gardens, Malton. The trees are trained on a long terrace wall facing south. At the time of my visit, early in September, several of the trees were cleared of their fruits, but others were laden with clean, well-coloured Peaches. One tree in particular of the variety Stirling Castle had a crop of some 300 fruits, averaging 6 ounces each. Other varieties grown include Royal George, Noblesse, Hale's Early and Waterloo. During the four years that Mr. Elliott has been gardener at Gilling the trees

have never failed to produce a crop. A treble thickness of netting is placed over the trees when they are in bloom. Picking commences early in July with Waterloo, closely followed by Hale's Early. Several young trees planted during recent years are making clean, robust growth. These will be lifted and root-pruned before being planted in their permanent positions. Established specimens are furnished with clean, fruitful wood to within 1 foot of the border. No pains are spared to keep the trees free from mildew and insect pests. Contrary to the usual practice the border, which is some 5 feet to 4 feet wide, is regularly forked over and planted with flowers. A top-dressing of lime rubble, wood ashes and manure is worked into the border each season when the bedding plants are rearranged. The garden at Gilling consists of a series of terraces made in a steep slope, and is well sheltered on all sides. The natural soil is a light, fertile loam of a good depth, which, owing to the formation of the ground, is warm and well drained. A range of glasshouses occupies part of one of the lower terraces. The castle, a plain, solid building of masonry, stands about 300 feet above the sea level, and dates back to the 13th century. It was for many generations the home of the Fairfax family until it was purchased by the present owner, W. S. Hunter, Esq., 10 years ago. Gilling is situated some 12 miles west of Malton, and lies amongst lovely scenery in the Vale of York, a district noted for fruit culture. *W. Davidson, Inspector to North Riding County Council.*

Reversion in Black Currants (see p. 234).—Reversion is common enough in the breeding of live stock, and it is not surprising, therefore, that this "throwing back" to a semi-wild condition happens in the vegetable world. Why Boskoop Giant Currant should be more subject to reversion than any other Currant is a mystery. Perhaps, if its origin were made known, there would be some explanation. Supposing for argument's sake that the variety originated from a chance seedling that may have been a cross between a wild Currant and a cultivated one, if there are any wild Currants in Holland. In that case the reversion would be explicable. A neighbour of mine has a few acres of Raspberries, and one of three varieties is Beehive. This variety alone reverted entirely in the second year after planting, the first fruiting season. If memory serves, there was not a perfect fruit on about one-third of an acre. Such fruits as there were were only pieces of a few pips each. This year there was a considerable improvement, which seems to indicate that recovery does occur in some cases. It would be interesting to try the effects of very heavy manuring and extra cultivation upon a few reverted Black Currants. If I do not forget it, I will be one to try the experiment. Perhaps Mr. Pearson will be another? *A Southern Grower.*

SCOTLAND.

EDINBURGH BOTANIC GARDENS EXTENSION.

The disputes in connection with the proposed extensions of the buildings at the Royal Botanic Gardens, Edinburgh, which have engaged the attention of the Scottish Law Courts, are not yet settled. A committee of the Edinburgh Town Council, after consideration of the question, recommended the Council to appeal to the House of Lords against the decision of the Court of Session, and this report was laid before a meeting of the Council. The latter body, after discussing the question in private, have decided to make the appeal.

THE NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.

This association, resuscitated some time ago, holds its meetings in Aberdeen, and is doing excellent work in advancing horticulture in the north. The report of the past year's work is exceedingly satisfactory, and the fact that the association has already 246 members on its roll shows that it is meeting with the hearty approval of horticulturists in and around Aberdeen.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

September 24.—*Present:* Mr. E. A. Bowles, M.A. (in the Chair); Dr. A. B. Rendle, M.A., F.R.S., Messrs. R. A. Rolfe, J. Fraser, W. Hales, R. H. Curtis, A. W. Hill, J. G. Wilson, J. O'Brien, and F. J. C. Chittenden (hon. sec.).

Lilium candidum.—Mr. Bowles exhibited a remarkably vigorous specimen of the double form of Lilium candidum.

Gall on Willow.—Mr. J. Fraser showed a rather small example of the gall on Salix fragilis produced by the mite Eriophyes salicis, collected on the bank of the Brent, near Ealing. Mr. W. Marshall, V.M.H., also sent an example of this gall collected on the bank of the Dart, Kent. It is only a few years since the first specimen recorded as British was shown before this Committee, but several specimens have since been received from various parts of south-east and east England.

"*Wheat-ear*" *Sweet William.*—Mr. J. Fraser also showed a specimen of Sweet William with the bracts multiplied aa in the "Wheat-ear" Carnation.

Cirrhopetalum miniatum.—Mr. Rolfe drew attention to a Cirrhopetalum exhibited by Messrs. Sander & Sons, St. Albans, as having been introduced from Annam with Dendrobium Bronckartii. It resembled C. gracillimum, Rolfe, especially in its caudate, almost thread-like lateral sepals, and in the strongly ciliate dorsal sepal and petals, but differed in having vermilion-coloured flowers, with the hairs of the dorsal sepal and petals yellow. His first knowledge of the plant was in September, 1910, when it was sent to Kew for determination from the Royal Botanic Garden, Glasnevin, with the information that it had been purchased from Messrs. Sander & Sons as a plant imported with Dendrobium Bronckartii. It was then named and described as Cirrhopetalum miniatum, Rolfe. Afterwards a painting was received from M. Maurice Valcke, a collector for Messrs. T. Pauwels & Co., Meirelbeke, Belgium, who stated that he met with the plant at Haut Laos, between Siam and Cochin China.

Erica cinerea malformed.—Mr. A. W. Hill showed a specimen of Erica cinerea malformed in the same way as those exhibited by Dr. Rendle on a previous occasion, this time from wild plants collected in South Devon.

Green-berried Elder.—Mr. J. Bennett Poë sent specimens of the albino form of the Elder in which the ripe fruits are greenish (as in white Grapes). Some members of the Committee thought them sweeter than the black form.

Aristolochia clematitis fruiting.—Mr. Bowles showed fruits of Aristolochia clematitis from his garden at Myddelton House, Waltham Cross, containing ripe seeds.

Fruit of Pyrus Neidwetzkyana.—He also showed, on behalf of Canon Ellacombe, fruits of Pyrus Niedwetzkyana, in which the flesh is deeply coloured, as are all parts of the tree.

Verbascum with galls.—He also showed the curious proliferations which are sometimes noticed at the base of Verbascums, and which have previously been shown before the Committee, but which were, in the present examples, growing some distance up the stem.

Albino forms of Geranium Robertianum.—Mr. Bowles also showed the two albino forms of Geranium Robertianum, one with a red stem, the other with a green, which have maintained themselves for a long time in his garden. Almost all the plants of the latter form appear to be traceable to one or two sources, and the Committee would be glad to hear of its occurrence in a wild state.

Helenium cupreum virescent.—Mr. J. Hudson sent a specimen of a virescent and proliferous form of Helenium cupreum from the garden at Gunnersbury.

Alpine plants attacked by dodder.—Miss Willmott sent an interesting series of Alpine plants attacked by a species of dodder, including Sedum album, S. elongatum, Daphne alpina, a mossy Saxifrage, Thymus serpyllum, Campanula rotundifolia, Thalictrum minus, Phlox subulata, and Dianthus deltoides.

"*Reversion*" *in Black Currants.*—Mr. E. A. Bunyard sent an interesting series of specimens illustrating his idea that the "reversion" to which the attention of the Committee was recently directed was the result of the development of lateral branches after injury to the terminal bud. Among the specimens sent (which did not appear to be all of one variety) were shoots showing mechanical injury, shoots probably injured by the shoot-cutting weevil, and shoots injured by "big bud," all exhibiting the reverted foliage, with normal shoots for comparison (see *Gard. Chron.*, August 24, 1912, p. 159). The hypothesis, the Committee considered, hardly accounted for the persistence of the "reversion" so that whole bushes were affected season after season.

BRITISH MYCOLOGICAL AND SCOTTISH CRYPTOGAMIC.

September 13.—The autumnal meetings of these societies were held in combination this year at Forres—the scene of Shakespeare's "blasted heath"—when, under the most delightful weather conditions, a week of strenuous research work was spent in the surrounding country. The proceedings opened on Friday, the 13th ult., in the Moray Arms Hotel—the headquarters of the societies—and the first foray was to Glenferness, where an abundance of fungi was found, some of the specimens being entirely new to Scotland. On the same evening the annual business meeting of the British Mycological Society was held. Mr. A. D. Cotton, of the Herbarium, Kew, was elected president; Mr. D. A. Boyd, Saltcoats, vice-president; and Mr. Carleton Rea, Worcester, hon. secretary and treasurer. It was decided to hold the next meeting at Haslemere, Surrey. Professor M. C. Potter, D.S.C., was appointed to represent the society at the meeting of the British Association at Birmingham in 1913, and also to act as delegate to the first international conference of pathologists at Paris next month. On the 14th ult. the forest of Rothiemurchus was explored, and the foray yielded many valuable specimens. On the Monday the fine woods and policies of Cawdor Castle—the Thane's residence—were visited. In the evening Miss Gulielma Lister delivered the presidential address on "Past Students of Mycetozoa and their Work." On Tuesday the woods of Cluny Hill and Sanquhar were explored, and in the evening a capital paper was read by Mr. J. Ramsbottom, B.A., on the "History of Plant Diseases." On Wednesday Relugas and Darnaway Woods were visited with fine results, and in the evening the annual business meeting of the Cryptogamic Society of Scotland was held. On Thursday the members visited Blairs Loch, Altyre House, and the banks of the Findhorn, where many specimens were found. The collection of specimens was on view in the Moray Arms Hotel, and included several of the first of the kind to be found in Scotland and one species entirely new to science.

BIRMINGHAM AND MIDLAND GARDENERS'

LECTURE ON PLANT DISEASES.

October 1.—Mr. Walter E. Collinge opened the autumn session of the Birmingham and Midland Gardeners' Association on Monday last with a lecture on "Plant Diseases."

Plants, like human beings, the lecturer pointed out, were liable to innumerable diseases, due to a variety of causes, such as insects, parasitic worms, fungi, bacteria, and poverty of soil.

When a human being was attacked by typhoid fever, people no longer felt content in knowing that the cause of the disease was a microscopic bacillus; such knowledge was exceedingly useful and important to the medical man, but immediately an outbreak occurred we asked ourselves, what about the drains; what were the causes that had led to the propagation and dissemination of the bacillus; and what was the most speedy and effective method of treatment? Slowly but surely this same spirit was beginning to enter into the treatment of plant diseases. It was not enough for the horticulturist, fruit-grower, or farmer to know that the disease that had ruined their crops and robbed them of their hard-earned profit, was due to a fungus, an insect, or a parasitic worm, and that this or that chemical would destroy it.

They wanted to know what were the conditions that had led up to the occurrence of the disease. How far poverty of soil, bad drainage, imperfect cultivation or lack of sterilisation had provided the suitable conditions for the pest or parasite to become a plague.

In this country plant pathology was more or less an academical study, often pursued by senior students possessing no practical knowledge of agriculture or horticulture, or, indeed, of plant cultivation in any sense whatever, whereas abroad the subject was being dealt with by men of long experience and wide training.

The question was often asked, "Have diseases of cultivated plants increased in number and virulence during recent years?" Undoubtedly there were more diseases in the country than ever before, for these reasons: Firstly, what was formerly known as "blight" was now known to be a general term for diseases due to both different species of fungi and of insects. Secondly, we were annually importing into the country fresh diseases. At present we lacked any effective control of pests or produce, and consequently such diseases as Bean Anthracnose, Yellow disease of Hyacinths, Tomato and Cucumber Wilt, Yellow Wart Disease of Potatos, and other pests had made their appearance amongst our crops and plants. Apart from the work at Kew, plant pathology in its higher branches and its practical application to the crops was not studied in this country as in others. Our conceptions of its possibilities were cramped and puny.

Dealing with certain specific diseases, Mr. Collinge described the peculiar disease known in the Midlands as May sickness in Wheat; wilt in Cucumber and Tomatos, Bean Anthracnose, and many others, all of which were illustrated by lantern slides. Methods of dealing with the various diseases on a practical scale were described, and much valuable information as to methods of prevention given.

NATIONAL VEGETABLE.

October 2.—It has to be admitted that a vegetable show does not appeal successfully to the public, and least of all to town dwellers; therefore, no one was surprised when, after the very meagre attendances at the two London exhibitions, the Committee decided to hold this year's show in the provinces. Watford was selected as being the centre of an important gardening district, and the exhibition was accommodated in the spacious Clarendon Hall.

Of the show itself there can be only one opinion, namely, that it was much the best of the three held under the auspices of this society. But the meagre patronage was unworthy of such a fine event. In reviewing the exhibits it may be remarked that the season has suited kitchen-garden produce uncommonly well. Celery we have never seen finer, Onions were superb, Cauliflowers were of splendid size and quality, whilst root-crops, and especially Potatos, Beetroots and Turnips, were all of superb quality. The schedule comprised some 80 classes, but in only 23 were the prizes provided by the Society, the remainder being made up of various nurserymen's classes The majority of the Society's classes were for amateurs and cottagers, and an inspection of these belied the popular fallacy that these growers can produce as fine vegetables as the professional gardener. With these exhibits and those, say, from the gardens at Welbeck Abbey or Aldenham House, there could be no comparison.

The Duke of Portland's exhibit in the premier class for a collection worthily upheld the traditions of the Welbeck gardens, and Mr. Gibson is to be congratulated on the manner of staging, as well as on the quality of the vegetables. The use of a dark background of velvet furnished a pleasing change from the stereotyped bed of Parsley, and was every more effective.

The exhibit from the Hon. Vicary Gibbs was a show in itself; it occupied a space of 250 square feet, with a depth of 8 feet, and comprised 120 dishes in 40 distinct kinds. It was the largest and most comprehensive collection ever put up by Mr. Beckett.

Displays by traders numbered only four, so that the show may be regarded as almost wholly competitive. The arrangements, under the supervision of Mr. E. G. Quick, the hon. secretary, and Mr. H. J. Wright, the treasurer, were all that could be desired.

Society's Classes.

What must be regarded as the most important section of the competitive classes was that embracing the first five classes of the schedule, and these were open to all competitors. There were four exhibits, but the one from the Duke of Portland's Garden, Welbeck Abbey, was pre-eminent, and gained the 1st prize easily. Taken as a whole, it was one of the finest competitive displays of vegetables we have seen, and comprised New Red Intermediate Carrots, Black Beet, Superb Pink Celery, Duke of Albany Peas, Student Parsnips, Ailsa Craig Onions, Snowball Turnips, Dwarf Gem Brussels Sprouts, Autumn Giant Cauliflowers, Eclipse Tomatos, Superlative Potatos, and Prizetaker Leeks. The Carrots and Beets were magnificent produce. The 2nd prize was awarded to Mr. J. Hudson, Eunson's Road, Leicester. This exhibitor had remarkably good Ailsa Craig Onions, Autumn Giant Cauliflowers, Giant White Celery, and New Red Intermediate Carrots. 3rd, W. H. Henderson, Esq., Serge Hill, King's Langley (gr. Mr. F. L. Pike), whose best dishes were Giant Pink Celery, Ailsa Craig Onions, and Early Autumn Giant Cauliflowers.

In the class for a collection of nine kinds there were three exhibits, and the 1st prize was awarded to H. T. Tatham, Esq., Kendall Hall, Elstree (gr. Mr. W. Gaiger), for excellent vegetables, including Long Red Surrey Carrots, Prizewinner Runner Beans, Superb Pink Celery, and stout-stemmed Prizetaker Leeks; 2nd, John Kerr, Esq., Loudwater, Rickmansworth (gr. Mr. T. Avery), his Premier Onions being extra fine.

Prizes were offered for a collection of six distinct kinds of vegetables shown by cottagers or allotment holders in the county of Hertfordshire. There were 12 competitors, who contributed a good display of useful vegetables. The 1st prize was originally awarded to Mr. A. E. Dawes, Watford, but the finest collection was shown by Mr. W. Humphreys, Elstree, whose Celery, Onions, Cauliflowers, and Potatos were all splendid, and this exhibitor was finally declared the winner. Taking these exhibits generally, Celery, Onions, Leeks and Cauliflowers were the finer produce. Carrots lacked the smooth exterior of the best exhibition roots, Potatos were too large, and Parsnips were uneven in contour. One exhibitor showed splendid Leeks.

The best dish of nine Tomatos was shown by Mr. J. Hudson, Leicester, who exhibited large fruits of the variety New Emperor; the 2nd prize was awarded the Duke of Portland. There were eight competitors in this class.

There were only three exhibitors in the class for six Leeks. Mr. T. Jones, Ruabon, exhibited the 1st prize collection, these being amongst the finest Leeks in the exhibition. The variety was Champion. The 2nd prize was also awarded to this variety.

Amateurs' and Cottagers' Classes.

The most important of these classes was for a collection of six distinct kinds, in which 11 competed. In several instances the amateurs showed they knew how to exhibit as well as grow good vegetables, but others had much to learn in these respects, and especially in exhibiting. One display was accommodated in a flat tray, whilst others were arranged flat on the table.

The 1st prize collection, shown by Mr. H. Keep, Aldermaston, comprised splendid produce, and it was arranged in the best exhibition style. Ailsa Craig Onions were extra large and solid; Cauliflowers were white and compact; Leeks well blanched, but not extra stout; Tomatos, of the Conqueror variety, were well coloured and graded; and there were good Potatos and Prizewinner Carrots. Mr. W. Coleman, Buckingham, who was placed 2nd, exhibited excellent Celery, Onions, Beans, and Tomatos.

In the smaller class for three kinds there were eight exhibits, in which nothing remarkable was seen, the 1st prize being awarded to Mr. H. Andrews, Berkhamsted, for Onions, Cauliflowers, and Celery of moderate quality. The 2nd prize collection consisted of Factor Potatos, Intermediate Carrots, and Sunrise Tomatos, all generally excellent and not coarse.

Fig. 122.—Hybrid Tea Rose Edward Bohane: colour rich crimson.
(Received R.H.S. Award of Merit, September 24, 1912.)

Potatos.—The 1st prize for three dishes of Potatos was awarded to large tubers of the variety Dreadnought, Swinard's Seedling (a fine white oval Potato with smooth skin), and The Factor, shown by Mr. Hoad, Willesborough, Kent. Mr. Coleman, who was placed 2nd, showed a splendid dish of The Factor.

There were 16 exhibits in the class for two dishes, and Mr. Coleman was awarded the premier prize for large, clean, well-matched tubers of the varieties King Edward VII and The Factor.

Onions.—The variety Ailsa Craig was most numerously shown by the 22 competitors, and all the three prizes were awarded for this variety. The best bulbs were shown by Mr. H. Keep.

Carrots.—Mr. J. White, Bampton, Oxford, showed the finest roots; the variety was Red Intermediate, and this variety was also placed 2nd and 3rd.

Beetroot.—Smooth, solid, medium-sized roots of Black Beet were placed 1st of 13 exhibits. The successful exhibitor was Mr. E. Deakin, Birmingham.

Parsnips.—These vegetables were shown splendidly. Mr. Tom Jones, Ruabon, excelled with magnificent roots of the Hollow Crown variety. Maltese, shown by Mr. T. King, Chippenham, was placed 2nd.

Turnips.—Sixteen exhibitors competed, and they showed white varieties chiefly, but yellow and purple roots were included in some instances. The 1st prize was awarded for model roots of a white green-top variety, shown by Mr. F. J. Gentle, King's Langley; 2nd, Mr. W. Coleman, with Snowball.

Celery.—Mr. Jones excelled with clean, large, solid heads of Prize Pink variety; there were 18 entries, and all the exhibits were of excellent quality.

Cauliflowers.—Nothing could be finer than the exhibit of three Cauliflowers shown by Mr. Coleman. The heads were of very large size, compact and white, as though blanched. Mr. Gentle was placed 2nd with smaller heads.

Mr. Keep showed the best Runner Beans; Mr. Cady, Sudbury, the best Leeks; Mr. Coleman the best Peas; Mr. Jones the best Tomatos; and Mr. Holdstock, Luton, the best Marrows. There was a class for Herbs, but it was not well represented.

Nurserymen's Classes.

Robert Sydenham Limited.—There were 12 classes for produce grown from seeds supplied by Robert Sydenham Limited. For a collection of nine kinds the sum of £16 10s. was offered in six prizes. This proved a splendid class, five exhibitors all showing finely. The best collection was staged by Mr. T. Jones, Ruabon; 2nd, Mr. J. White, Bampton, Oxford. For a collection of eight kinds, the better of two exhibits was shown by Mr. E. Deakin, Birmingham. The largest Parsnips in the show, exhibited by Mr. J. White, were placed 1st in a class for these vegetables; other exhibitors also showed well in this class. Carrots and Beetroots were both excellent; and the Celery shown by Rev. T. McMurdie of gargantuan proportions—the variety was Bibby's Defiance. The best Cauliflowers and Leeks were shown by this exhibitor; whilst Mrs. Jenner, Wenvoe Castle, near Cardiff (gr. Mr. W. Wheeler), had the finest Onions.

Messrs. Barr & Son's Classes.—This firm offered prizes in ten classes. Those best contested were for Onions and Carrots. The Carrots, of the stump-rooted, scarlet variety, were shown best by Mr. A. Evans, Moor Lodge, Presteign, whilst Mr. H. Tatham, Elstree, excelled for Crimson Globe Onions.

Messrs. W. Cutbush & Son's Classes.—This firm offered prizes in 12 classes. New Red Intermediate Carrots, shown by Mr. T. King, Chippenham; magnificent Prizetaker Leeks exhibited by Rev. T. McMurdie, Woburn Park, Weybridge (gr. Mr. A. Basile); Barnet Hero Onions, shown by Mrs. Dennison, who also showed the finest Parsnips of the variety Model: and Crimson Beet, exhibited by A. B. H. Goldschmidt, Esq., Mildenhall (gr. Mr. G. Hatch), were the best vegetables in these classes.

Messrs. Dickson, Brown & Tait's Classes.—This firm offered prizes in no fewer than 18 classes. Celery Prize Pink was of remarkable size. Miss Allcard, Horsham (gr. Mr. T. Sparks), was awarded the 1st prize. Premier Onions were exhibited well by nine competitors, the best by Mr. John Kerr. Splendid Carrots were shown in a class for Perfection Intermediate variety, and Mrs. Dennison was placed 1st for magnificent roots. Two bunches of Moneymaker Tomato, shown by Mr. H. W. Henderson, King's Langley (gr. Mr. F. L. Pike), bore 35 fruits.

Messrs. Dickson & Robinson's Classes.—This firm gave prizes in 14 classes. Here were seen some of the best Beans in the show; the variety was Giant Exhibition. Mr. Coleman was placed 1st with magnificent pods. The Lord Kitchener variety of Lettuce is evidently a splendid late variety, judging by the fine produce shown. It is a Cabbage variety, and those shown by Mr. Henderson, for which the 1st prize was awarded, were of remarkable size. Standwell Cauliflower was shown well by 11 exhibitors. Manchester Market Turnip is a good, solid, green-top, white variety; the best were shown by Mrs. Dennison. Cabbages, Parsnips and Potatos were also shown well in their several classes.

Mr. W. E. Sand offered prizes for two dishes of Potatos of the varieties Erin's Queen and Irish Hero, the former a flat oval and the latter a round variety. The 1st prize was won by Mr. Henderson.

Messrs. Clay & Son's Class.—This firm offered substantial money prizes in a class for six dishes of Potatos, distinct. There was an excellent competition amongst 11 competitors. Mrs. Dennison won the 1st prize easily, having magnificent tubers of such fine sorts as King Edward VII, Snowball, Emperor, and Long Keeper. 2nd, Mr. M. Hoad, Willesborough, Kent.

Messrs. Watkins & Simpson's Class.—This was for a collection of six kinds, open only to market gardeners. There was only one entry, from Messrs. W. J. Lobjoit & Son, Hounslow, and it was awarded the 1st prize.

The Marquis of Northampton, Castle Ashby (gr. Mr. A. R. Searle), excelled in Messrs. Gleeson & Co.'s class for a collection of 10 kinds; whilst Mr. G. Prickett, Croxley Green, the only exhibitor in Messrs. J. K. King & Sons' class for a collection of six kinds, was awarded the 2nd prize. Seventeen competed in Messrs. H. Lane & Son's class for three dishes of Potatos, distinct, the 1st and 2nd prizes being awarded to Mrs. Dennison and Viscount Goschen, Hawkhurst (gr. Mr. J. Gilmour), respectively.

Non-Competitive Exhibits.

The display of vegetables from the Hon. Vicary Gibbs' Garden, Elstree (gr. Mr. E. Beckett), was awarded a large Gold Medal. Among the choicer kinds were Tender and True Parsnips, Superb Pink Celery, Prizetaker Leeks, Early Giant Cauliflowers, and New Red Intermediate Carrots; besides these were such uncommon vegetables as Golden Waxpod French Bean, Silver or Sea Kale Beets, Capsicums, Chilies, Aubergines, Finocchio or Florence Fennel, Kohl Rabi, purple-podded Beans, American Land Cress, and Corn Salad.

Messrs. Barr & Sons, King Street, Covent Garden, showed the largest trade exhibit, and it was made very attractive, being well and tastefully arranged. It occupied 150 square feet, and embraced 100 dishes of all kinds of vegetables. (Gold Medal).

Messrs. Dobbie & Co., Edinburgh, showed 40 varieties of Potatos, arranged very attractively in baskets on a black velvet background with sprays of Ampelopsis. Amongst the varieties were noticed Exhibition, Red Kidney, King Edward VII, Midlothian Early, British Queen, Milecross Early with very clear skin, Dobbie's Favourite, and The Factor, a splendid main crop variety. (Silver-gilt Medal.)

Messrs. H. Lane & Son, Great Berkhamsted, Hertfordshire, were awarded a Silver-gilt Medal for a collection of Apples and Pears.

Messrs. Dickson & Robinson, Manchester, exhibited splendid bulbs of Premier Onion, for which a Silver Medal was awarded.

NATIONAL CHRYSANTHEMUM.

October 2, 3.—The exhibition of early-flowering varieties, held in the transept of the Crystal Palace on the above dates, will rank as one of the most successful the National Chrysanthemum Society has held. The entries were greatly in excess of last year, and many of the exhibits reached a high standard of excellence. For the most part the exhibits were confined to blooms grown in the open air, and these were exceedingly fresh and well coloured, and there was a marked absence of weather-stained flowers. The excellent trade exhibits, which were not for competition, and the various stove and greenhouse plants arranged by Mr. C. Caselton, the Superintendent of the Crystal Palace grounds, contributed largely towards making this show very attractive.

There were fewer novelties than usual: to these the Society awarded two First-class Certificates and a Card of Commendation.

Open Classes.

There was only one "Floral Display" of Chrysanthemums, that shown by Mr. F. Brazier, Caterham, to which the judges awarded the 2nd prize. This semi-circular group included, amongst other good blooms, excellent examples of the varieties Nina Blick and Ethel Blades.

The best collection of 12 Japanese blooms was shown by G. L. Wigg, Esq. (gr. Mr. H. Sargent), Rockshaw, Merstham. The varieties Mrs. R. Luxford, Mrs. A. T. Miller, and Mrs. L. Thorn were very fine. 2nd, E. J. Mocatta, Esq. (gr. Mr. T. Stevenson), Woburn Place, Addlestone.

The exhibits in the class for six Japanese blooms were not so evenly matched. The 1st prize was won by A. T. Miller, Esq. (gr. Mr. Geo. Mileham), Emlyn House, Leatherhead, who showed an excellent set of blooms. 2nd, H. Runciman, Esq., Nightingale Lane, Wanstead.

The premier 12 bunches of undisbudded Chrysanthemums grown in the open air, shown by Mr. G. Bowness, Riverside Nursery, Glasgow, were far away the best, and made an attractive display. 2nd, Mr. J. Emberson, Grove Road Nursery, Walthamstow.

Mr. J. Emberson showed many exceedingly good flowers in his 1st prize collection of 12 bunches of disbudded blooms, which were grown in the open air. 2nd, Mr. G. Bowness.

The best vase of single-flowered Chrysanthemums was shown by Mr. J. Emberson; 2nd, Mrs. A. C. Brown, Brokes Lodge, Reigate.

Mr. J. Emberson showed six exceedingly good vases of blooms in the class for Japanese or decorative varieties; 2nd, Mr. G. Bowness.

The competition in class 17, which provides for one vase containing 3 Japanese blooms, was exceedingly good. The 1st prize was awarded to the Rev. T. Sheepshanks, Stokelake House, Chudleigh, Devon (gr. Mr. A. Dunkley), for three splendid blooms of Frances Jolliffe; 2nd, E. G. Mocatta, Esq., who showed very good blooms of White Queen.

The best vase of any yellow or bronze single-flowered variety was shown by Mr. F. Brazier, High Street, Caterham; 2nd, Mr. G. Bowness.

The best vase of any other colour was that of the variety Kitty Riches, shown by Mr. J. Emberson; 2nd, Mr. G. Bowness.

Mr. J. Emberson showed the best vase of single Chrysanthemums, arranged with suitable foliage; 2nd, Mr. G. Bowness.

The 1st prize hand-basket of Chrysanthemums and foliage, shown by Mr. L. Wheeler, The Gardens, Wood Hall, Dulwich, was very attractive; 2nd, Mr. J. Emberson.

Mr. R. Bagden, Gipsy Hill, Upper Norwood, won the 1st prize for a basket of autumn foliage; 2nd, Mr. A. R. Bide, Highlands, Farnham.

Amateur Classes.

The only exhibitor of 12 bunches of disbudded, early-flowering Japanese blooms, Mr. H. Dunkley, St. Peter's Avenue, Kettering, was awarded the 2nd prize. There was good competition in the class for undisbudded sprays, where Mr. H. Dunkley won the 1st prize, and Mr. C. Fox, Linden Garden, Tunbridge Wells, was placed 2nd.

Mr. D. B. Crane, Wood View, Highgate, was awarded the 2nd prize for six bunches of Pompon Chrysanthemums.

The 1st prize offered for three vases of undisbudded early-flowering varieties was awarded to Mr. C. Fox. Mr. F. W. STEVENS arranged a very tasteful epergne in class 26; and the 2nd prize epergne, shown by Mr. C. FOX, was also very pleasing.

DECORATIVE CLASSES.

The best table of bouquets, wreaths, sprays, &c., illustrating the decorative value of Chrysanthemums, was arranged by Mr. A. H. COLE, Camberwell New Road, London. The second best was shown by Miss A. FYFE, Grove Park Nursery, Lee.

The competition in the open class for dinner-table decorations with Chrysanthemums was very keen, but, unfortunately, from a spectacular point of view, 10 of the 11 competitors confined themselves to the use of yellow and bronze-coloured varieties. The 1st prize was awarded to Mr. A. W. TROSSELL, The Parade, Beckenham; 2nd, Mrs. A. ROBINSON, Vorhyrst, Carshalton; 3rd, Mr. F. W. STEVENS, The Gardens, Donnington, Sydenham.

In the amateurs' class there were only three competitors, and the 1st prize was won by Miss A. BASHFORD, Barrow Hedges Farm, Carshalton; 2nd, Mr. WEBB, The Gardens, Melrose, Sydenham.

The exhibits of three epergnes of Chrysanthemums and suitable foliage in the open class were very pretty. The 1st prize was won by Mr. F. W. STEVENS; 2nd, Mrs. A. ROBINSON.

In the class for a vase of Chrysanthemums for table decoration (the trade excluded) Mr. F. W. STEVENS was awarded the 1st prize for a very tasteful arrangement.

AWARDS.

FIRST-CLASS CERTIFICATES.

Mrs. G. Lloyd Wigg.—A gigantic Japanese variety with exceptionally broad canary-yellow flowers, which have very long, narrow florets. Shown by Messrs. W. WELLS & Co.

Bob Pullen.—A rich, yellow Japanese variety, with very broad, drooping florets. Shown by Mr. H. J. JONES.

CARD OF COMMENDATION.

Juliet.—A beautiful decorative Chrysanthemum of a shade of colour approaching to "Old Rose." Shown by Messrs. CRAGG, HARRISON & CRAGG.

NON-COMPETITIVE EXHIBITS.

Messrs. W. WELLS & Co., Merstham, arranged a fine group of Chrysanthemums. Amongst the Japanese varieties there were immense blooms of Hon. Mrs. Lopes (11 inches across), Thorp's Beauty, White Queen, and Mrs. G. Lloyd Wigg. This exhibit contained excellent flowers of the different varieties, and was exceedingly well arranged. (Gold Medal.)

Messrs. JAMES CARTER & Co., Raynes Park, had a most attractive stand, which well deserved the medal bestowed upon it. A huge crown, supporting very many vases of "China Asters," rose above a base of Cactus Dahlias, Michaelmas Daisies, and batches of Asters artistically arranged.

Mr. H. J. JONES, Ryecroft, Lewisham, contributed a very large exhibit of excellent Chrysanthemum blooms flanked by good sprays of Michaelmas Daisies and other border flowers. (Gold Medal.)

Mr. NORMAN DAVIS, Framfield, Sussex, exhibited a splendid display of tall stands containing exceedingly good cut blooms of Chrysanthemums, interspersed with many Michaelmas Daisies arranged in a very successful manner. (Gold Medal.)

Mr. A. H. COLE, Camberwell New Road, London, was awarded a small Gold Medal for a semi-circular group of Chrysanthemums and foliage.

Messrs. CRAGG, HARRISON & CRAGG, Heston, Hounslow, Middlesex, exhibited fresh, clean blooms of many choice varieties of Chrysanthemums. (Large Silver Medal.)

Messrs. H. B. MAY & SONS, LTD., Upper Edmonton, showed a very good collection of stove and greenhouse Ferns, Ixoras, and Begonia Mrs. L. de Rothschild. (Small Gold Medal.)

Messrs. DAVID RUSSELL & SON, Essex Nurseries, Brentwood, contributed a good group of Tree Ivies, tall Cupressus Lawsoniana, and heavily-berried plants of Pernettya mucronata.

In another part of the show Messrs. RUSSELL exhibited a collection of Apples and Pears. (Small Gold Medal.)

Mr. F. BRAZIER, Caterham, showed Michaelmas Daisies and a few border Chrysanthemums.

Messrs. D. DOWELL & SON, Hammersmith, exhibited garden sundries.

Mr. JAS. B. RIDING, Chingford, showed many excellent Dahlias, chiefly of the Collerette section. (Silver-gilt Medal.)

Messrs. T. S. WARE, LTD., Feltham, had a long table filled with good Dahlias and many border flowers. (Silver-gilt Medal.)

J. A. NIX, Esq., Tilgate, Crawley (gr. Mr. E. Neal), showed a very fine collection of fruit, decorated with excellent Crotons and Palms. There were six varieties of Grapes, 56 of Apples, and 44 of Pears. (Gold Medal.)

NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL.

SEPTEMBER 18.—The annual meeting of this association was held in the Botanical Class-room, Aberdeen University. Mr. Robson, the vice-president, occupied the chair. He congratulated the members on the success which had attended the first year of their resuscitated association after lying dormant for 17 years, and hoped it was a happy augury of still further prosperity. Mr. William Reid, the hon. secretary, stated that there were 246 members, and that during the year seven meetings had been held at which papers of very considerable pro-

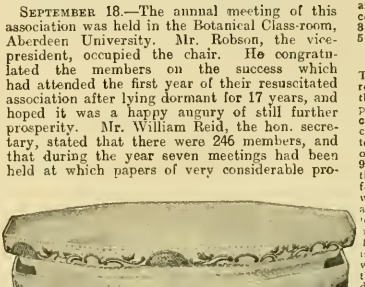

FIG. 123.—A NEW BULB BOWL.

fessional interest had been read. The session closed with an excursion to Brechin Castle Gardens and Bearshill, which was well attended. Mr. W. Wylie, the hon. treasurer, said the association had a credit balance of £8 3s. 5d.; there had been a considerable outlay in connection with the resuscitation of the association. Mr. C. I. France read an account of the excursion to Brechin Castle, which will appear in the next volume of the association's *Transactions*. The office bearers for the ensuing session were appointed as follow:—Hon. President, His Excellency the Earl of Aberdeen, Haddo House; President, Mr. J. McKinnon, The Gardens, Haddo House; Vice-President, Mr. Alexander Robson, Aberdeen; Secretary, Mr. W. Reid, Aberdeen; and Treasurer, Mr. W. Wylie, Aberdeen.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS'.—The monthly meeting was held on September 26, at St. John's Parish Rooms, Clifton, Mr. Baston presiding over a large attendance of members. A lecture was delivered by Mr. I. C. House, on "Useful Perennials for Cutting Purposes." Mr. House gave the best method of treating cut flowers and the most suitable time to cut them. Prizes were offered for four bunches of hardy perennials, and the 1st prize was awarded to Mr. Scott.

BATH GARDENERS'.—A meeting of this association was held on September 23, when there was a good assembly of members. Prizes were offered to under gardeners for the best paper on the "Cultivation of Violets." Mr. Matthews, of Coombe Royal Gardens, Bath, was awarded the 1st prize. In introducing his subject Mr. Matthews stated that the flowering season of the Violet extended from September to May. A partly shaded position suits them, where they are not exposed to the sun during the hottest part of the day. A very important fact was that the plants should not be allowed to get dry or they would soon be attacked by red spider. Decayed leaves and runners should be removed and the soil should be constantly stirred between the plants. The lecturer described the different methods of cultivating the Violet, including the growing of the plants in pots.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending October 2.

A remarkably wet night after four very dry weeks.—Another cold week, and the ninth in succession. In fact, there has not been a single unseasonably warm day for nearly 10 weeks, and during September there occurred but five unseasonably warm nights, three of which were in the past week. The ground is now 2° colder than is seasonable, both at 1 foot and 2 feet deep. Rain fell on four days of the week, and to the total depth of nearly 3 inches, which is about half an inch in excess of the average amount for the whole of September. During the 12 hours ending 9 a.m. on September 30 2¼ inches of rain was deposited, or a greater quantity than in any single day or night, with three exceptions, during the last 26 years. Rain began falling at 9 p.m. on the 29th ult., and continued without intermission until noon on the following day. During the 9 days ending the 28th ult. there was no percolation at all through either of the soil gauges, but since then 8¾ gallons of rain-water has come through the bare soil gauge, and 8 gallons through that on which short grass is growing. The sun shone on an average for 4 hours a day, which is about the mean duration for the same period of the year. At the beginning of the week the weather remained calm, but since then the wind has been at times of moderate strength, and has come principally from some easterly point of the compass. The mean amount of moisture in the air at 9 p.m. fell short of a seasonable quantity for that hour by 5 per cent.

SEPTEMBER.

The coldest September recorded here for twenty-six years.—This was the coldest September of which I have here any record, the mean temperature being as much as 5° below the average for the month. Both the day and night temperatures, taking the month as a whole, were equally exceptional, but the days were much more unseasonably cold than the nights. On the warmest day the highest temperature in the thermometer screen was only 65°, and on the coldest night the exposed thermometer registered 9° of frost. Both of these extreme readings are colder than any previously recorded here in September. Rain fell on only nine days, and to the total depth of 2⅜ inches, which, although only a quarter of an inch in excess of the average for the month, is greater than that for any September for 16 years. Almost the whole of the rainfall of the month was deposited on the last two days of it. The sun shone on an average for 3½ hours a day, which is 1½ hours a day short of the September average, and, with three exceptions, less than in any September during the past 26 years. The winds were, as a rule, high; indeed, higher than in any September for 13 years, and yet in no hour did the mean velocity exceed 14 miles. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by 2 per cent. *E. M., Berkhamsted, October 2, 1912.*

GARDENING APPOINTMENTS.

Mr. ROBERT SPENCE, for the past 3½ years Gardener to the late Colonel E. H. KENNARD, Gt. Tangley Manor, Surrey, as Gardener to the Marchioness of CREWE, at Crewe Hall, Crewe.

Mr. WALTER CHECKLEY, for the past 8 years General Foreman at Overstone Park Gardens, Northampton, as Gardener to Lord HOTHAM, West Hill Park, Titchfield, Hampshire.

Mr. J. W. FUNGE, previously for 4 years Foreman at the Warren House, Stanmore, also at Silverlands, Luton Hoo, and Mentmore, as Gardener to the Bethlem Royal Hospital, St. George's Road, Southwark, S.E. (Thanks for 1s. which has been placed in the R.G.O.F. box.)

Mr. DAVID DUNN, for nearly 9 years Foreman at Beech Holme, Colwyn Bay, North Wales, as Gardener to T. J. WADDINGHAM, Esq., Hafod, Aberystwyth.

Mr. F. T. WOODFIELD, for the past 12 months Gardener at the County New High School for Girls, Leytonstone, and previously at Bedgebury Park, Goudhurst, and Glympton Park, Woodstock, as Gardener to the Venerable Archdeacon POTTER, Rake Manor, Milford, Surrey.

Mr. GEORGE JOHNSON, for the past 18 months General Foreman at Tilgate Forest Cottage, Crawley, as Gardener to E. C. DENNLER, Esq., Oakwood, Crawley, Sussex.

Mr. J. POWELL, for the past 8 years Gardener to Mrs. KYRLE CHAPMAN, Shillingstone Grange, Blandford, and previously Foreman at Kilkenny Castle, Ireland, as Gardener to Sir RALPH LETHBRIDGE, Sandhill Park, Taunton, Somerset.

Mr. J. ROBERTS, for the past 6 years Gardener to F. OGILVY, Esq., Rowhams Manor, East Horsley, Surrey, as Gardener to John MACGREGOR, Esq., Ersham, Hailsham, Sussex.

Mr. R. LAY, for the past 5 years Gardener to G. C. ELLIOT, Esq., Hull Place, Sholden, Deal, and previously for 7 years Foreman at Harthain Park, Corsham, Wilts., as Gardener to E. WORMALD, Esq., Grass Farm House, Church End, Finchley, London, N. (Thanks for contribution which has been placed in the R.G.O.F. box. —ED.)

NEW INVENTION.

BULB BOWL.

MESSRS. HUNTER & GOW send us a sample of a new double octagon bulb bowl (see fig. 123). Its novelty consists in the fact that it contains an inner bowl, with holes in the bottom, which enables the water to drain from the fibre or soil in the outer bowl. The inner bowls are supplied separately, which enables the cultivator to get a succession of bulbs for the same outer bowl. The bowl has a white body, and the design is in blue.

MARKETS.

COVENT GARDEN, October 2.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Remarks.—There still continues to be a full supply of home-grown dessert varieties of Apples. Culinary varieties arrive in unlimited quantities. We are acquainted with one grower who is marketing from 40,000 to 50,000 bushels; which will give an idea of the abundance of the crop this year. The first shipment of Nova Scotian Apples is to hand, and consists of 3000 to 4000 barrels of the varieties Blenheim Pippin, Gravenstein, and Ribston Pippin. Newtown Pippins from California are also to hand, and this country has sent about 4000 boxes of Pears. The market is well supplied with English Pears. French Pears consist of the varieties Duchesse d'Angoulême, Louise Bonne of Jersey, and Doyenne du Comice. These are well graded and packed in crates containing from 15 fruits upwards. Two thousand boxes of Oregon Italian Prunes have arrived this week; the fruits are packed in trays weighing 6 lbs. net, 4 to each box. German Switzer Plums are now a full supply. Black varieties of English bothouse Grapes continue a very heavy supply; many have sold for as little as 4d. per lb. Prices for the best samples of Muscat of Alexandria and Canon Hall are firmer, and there is a slightly increased demand for them. A few samples of English Peaches are still obtainable, and those from America are arriving in fairly large quantities packed in boxes containing from 18 fruits upwards. There is now a limited supply of English Melons. Italian Figs continue to be very plentiful. Tomatos from English and Channel Islands growers are about equal to to the demand. Shipments of Tomatos from the Canary Islands are expected weekly. Some very fine samples of Walnuts are arriving from Ghent via Dutch ports for the English market. Home-grown Walnuts are plentiful and good. Cobnuts were never so plentiful, and their prices have fallen as low as 2d. per lb. Mushrooms are still scarce; best samples are making from 1s. 6d. to 2s. per lb. Ordinary vegetables continue to be very plentiful with the exception of Peas. *E. H. R., Covent Garden, October 2, 1912.*

New Potatos.

	per cwt. s.d.	s.d.		per cwt. s.d.	s.d.
Bedfords	4 0	4 6	Blacklands	3 6	4 0
Kents	4 3	5 3	Lincolns	4 0	5 0

Remarks.—Trade is not very good, and prices rule about the same as last week. Good tubers are difficult to obtain; many Potatos are arriving which exhibit disease. *Edward J. Newborn, Covent Garden and St. Pancras, October 2, 1912.*

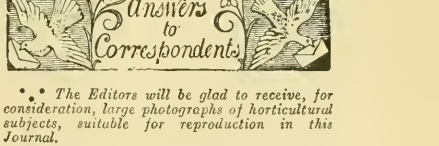
SCHEDULES RECEIVED.

Women's Agricultural and Horticultural International Union.—The show and sale of this association will be held at the Royal Horticultural Hall, Vincent Square, Westminster, S.W., on Wednesday, October 23. Secretary, Miss Ella Gill, 45, Queen's Chambers, London, S.W.

The British Dairy Farmers' Association.—The thirty-seventh annual Dairy Show will be held at the Royal Agricultural Hall, London, on October 8, 9, 10 and 11. Secretary, Mr. F. E. Hardcastle, 12, Hanover Square, London.

Obituary.

W. R. Guilfoyle.—The death of Mr. W. R. Guilfoyle, on June 26 last, is recorded in the *Kew Bulletin*. Deceased was born in Chelsea, but proceeded to Australia early in life. He succeeded the late Baron Ferdinand von Mueller as director of the Melbourne Gardens in 1873. His first botanical appointment was as botanist to H.M.S. "Challenger," during her cruise among the South Sea Islands in 1868.



*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

Alicante Grapes Shanking : *M. S.* The present trouble is caused by shanking, which is generally the result of some unsatisfactory condition of the border. During the approaching season give the roots a thorough overhauling, to ascertain where the trouble is. It may be that the border is inefficiently drained, or that the soil is unsuitable. After putting the drainage in proper order, afford some fresh, sweet compost, using good loam as the basis, and give the vines every inducement to make roots near to the surface. During the growing season these roots should be fed by mulches of suitable materials. The specimens you sent last year were affected with the fungus Botrytis.

Apple and Peach Leaves: *F. H.* The leaves received are affected with the Shot-hole fungus (Cercospora circumscissa), so-called because the small, circular portions affected shrivel and fall away leaving holes which appear as though the leaves had been perforated by small shot. It is too late to

apply any remedy, but next spring just as the leaves are expanding you may spray the trees with the ammoniacal solution of copper and repeat the spraying at intervals. The Bordeaux mixture is injurious to the leaves of Peaches even in a diluted condition. In the *Gardeners' Chronicle* for October 14, 1905, p. 282, a correspondent stated that he had used Campbell's Sulphur Vaporiser with good results.

Begonia Unhealthy: *W. H. P.* The plants are not diseased, but have been subjected to an excess of moisture and insufficient ventilation. Keep the plants drier, and ventilate the house whenever the conditions are favourable. There are indications of mite, which may be destroyed by dipping the plants in a nicotine extract.

Coloured Potatos: *A. S. T.* Many of the Potatos with purple or red skins to the tubers are quite as good eating as the ordinary brown-skinned varieties. In fact, some epicures claim that the red varieties are superior, whilst the long violet, or purple, tubers are highly esteemed for preparing Potato salads.

Crab Stock: *H. P. B.* Stocks of the Crab Apple intended for grafting or budding next season should be about a quarter of an inch in diameter, if they are to be planted this autumn. With regard to their value per 1,000, this depends on the quality, and prices quoted are no guide unless you see the plants or a sample. The figures you give would be average prices. Stocks such as you describe should be suitable for your purpose.

Dredging Mud from Shallow Stream: *C. T.* As you have given no particulars as to how you propose carrying out your dredging operations, it is impossible to give a correct estimate of the probable cost. If you have the means of diverting the water from the bed of the stream during the time you are removing the silt, the cost will be considerably less than would be the case if the work has to be carried out with the flow of water to contend against. If you propose removing the mud by means of barrows, you should be able to do so at about 1s. 6d. per cubic yard, provided the water has been drained away and the barrow run is on an easy gradient. If you use small skips, run on a 13-inch-gauge railway; you may be able to do it cheaper if you have a large quantity of silt to remove. Should it be necessary for you to remove the mud while the water is flowing over it the work will probably cost 2s. 6d. per cubic yard. In the event of you possessing a flat-bottomed barge with a dredging bag on chains and pulleys, the cost will be slightly less. Taking the 1s. 6d. basis, it will cost 2s. 3d. per yard run of your stream to clear away the silt to a depth of 1 foot 6 inches, whereas if the 2s. 6d. basis is taken, the cost will be 3s. 9d. per yard run. We understand you do not require to tip the material any distance from the stream, therefore it is not necessary to add the cost of wheeling. These prices are estimated on the assumption that workmen are paid at the rate of 6d. per hour. A local contractor would be much better able to advise you on this matter.

Early Potato for "Medium Soil": *A. S. T.* We cannot recommend any Potato as being absolutely disease-resisting, but the variety Duke of York is frequently satisfactory when grown in soils similar to that you describe. You could plant this variety in bulk for first early produce next season, and, at the same time, test, in a few rows, such early sorts as Sharpe's Victor, May Queen, and Sharpe's Express, and note the results. We should prefer the horse manure.

Insect: *E. M.* The insects you send are millepedes. They are most common in ground containing decaying vegetable matter. If the land is bare of crops, apply a dressing of gas-lime at the rate of 1 ton to the acre. It is not advisable to plant on ground that has been treated with gas-lime until several weeks have elapsed. There are numerous specifics on the market, such as Vaporite, which are very useful for destroying such ground pests as millepedes. See *Gardeners' Chronicle*, April 27, 1912, p. 276.

Kew Gardens: *Eighteen.* For admission as gardeners to the Royal Botanic Gardens, Kew, application must be made on a form to be obtained from the director of the gardens. Applicants must be unmarried, between the ages of 19 and 24, and must have been employed for not less than four years in good gardens or nurseries. They must also be healthy, free from physical defects, and not below the average height. Applicants will be informed whether their names have been entered for admission, and on a vacancy occurring will receive a notice to that effect. If an applicant is not appointed within three months after the date of his application, he should write again if he still desires admission. Those selected for appointment as gardeners, who are British subjects, are eligible to remain at Kew for a period of two years from the date of joining, if they render approved service. A gardener ceases to be employed at Kew at the termination of two years' experience in the Royal Botanic Gardens, unless he has been selected for service as a subforeman for a further definite period. Whilst at Kew an allowance of 21s. per week is received by the gardeners to meet the cost of subsistence. Sub-foremen are allowed 27s. per week.

Names of Fruits: *H. R.* (continued from last week). 10 and 12, Dumelow's Seedling; 11, Cox's Orange Pippin; 13, Cornish Gilliflower; 14, Schoolmaster; 15, Waltham Abbey Seedling; 16, Sturmer Pippin; 17, Ecklinville Seedling; 18, Golden Spire; 19, Royal Snow, syn. de Neige; 20, Old Nonesuch; 21 and 23. Worcester Pearmain; 22, White Nonpareil; 24, Grenadier; 25, Warner's King. Pears, 1 and 2, Pitmaston Duchess.—*H. M.* (continued from last week). 4, very small, not recognised; 5 and 10, Blenheim Pippin; 6, Keswick Codlin; 7, French Crab; 8, not recognised; 9, Tower of Glammis; 10 and 11, not recognised; 12, Old Nonpareil; 13, Winter Magetin; 14 and 22, Dumelow's Seedling; 16, 20, and 26, Ribston Pippin; 18, Lord Derby; 19, Stirling Castle; 21, Peasgood's Nonesuch; 22, Dumelow's Seedling; 23, Mank's Codlin; 24, American Mother; 25, Cellini; 27, Cox's Orange Pippin; 28, Worcester Pearmain.—*Dalrymple Bros.* 1, Blenheim Pippin; 2, Fearn's Pippin; 3, Nanny; 4, White Melrose; 5, White Nonpareil; 6, Bess Pool; 7, Washington; 8, a very good Apple, but not recognised; 9 and 11, Waltham Abbey Seedling; 10, not recognised.—*W. J. Vasey.* a, Beurré Clairgeau; b, Bellissime d'Hiver; c, Ramilies; d, Joséphine de Malines; e, Fondante d'Automne; f, Bergamotte d'Hollande; g, Scarlet Golden Pippin.—*P. C.* 13, Hanwell Sonring; 32, Cornish Aromatic; 30, Beauty of Kent; 35, Dean's Codlin; 18, Prince Albert; no number, Blenheim Pippin; 33, Nelson Codlin.—*J. H.*, 1, a very fine Apple, not recognised; we suggest that you should send six fruits to the Committee of the Royal Horticultural Society; 2, Hormead Pearmain; Plum Belle de Septembre.—*A. W. K.* All dessert. 1, Emile d'Heyst; 2, Louise Bonne of Jersey; 3, 5, 6, Doyenné du Comice; 4, Le Lectier; 7, Hacon's Incomparable; 8, Bergamotte Esperen.—*P. L. H.* Beurré d'Amanlis.—*W. B.* 1, Marie Louise; 2, Pitmaston Duchess; 3, Beurré Capiaumont; 4, Doyenné du Comice; 5, Maréchal de Coeur.

Names of Plants: *A. A. G., Elmwood.* Specimen withered; probably Agathea coelestis.—*E. W. K.* 1, Rosa sp., send again in bud; 2, Hypolepis anthriscifolius; 3, send in flower; 4, Cistus formosus; 5, Dahlia sp.; 6, Lychnis dioica fl. pleno.—*T. N.* Helenium pumilum magnificum.—*J. R.* Ceratostigma plumbaginoides.—*H. F. Z.* 1, Silene pendula fl. pleno; 2, Agrostemma (Lychnis) coronaria; 3, Hieracium aurantiacum; 4, too shrivelled to identify; 5, Nepeta Mussinii; 6, Phlox stellaria atrolilacina; 7, Linaria maroccana; 8, Spiræa callosa.—*Constant Reader.* Please send better specimens: those received are too withered.—*W. P.* 1, Pinus Coulteri; 2, Thuya orientalis; 3, not recognised; 4, Thuya sempervirens; 5, T. gigantea; 6, Retinospora plumosa; 7, Thuya plicata; 8, Juniperus communis.—*G. H. Johnstone.* The Beech is Fagus sylvatica heterophylla, which originated as a sport from the common Beech. The larger leaved specimen you send is a partial reversion to the ancestral form—a very common phenomenon among trees that have originated as vegetative sports.—*J. Voss.* 1. Quercus sessliflora, the Durmast Oak. It differs from the common Oak (Q. pedunculata) in having stalked leaves but stalkless Acorns; 2, Q. rubra, the American red Oak, distinguished among the red Oaks by its opaque undersurface.—*J. C. J.* Cattleya Clarkiæ (bicolor × labiata).—*W. W.* Bulbophyllum recurvum.—*P. J.* 1, Ionopsis teres; 2, Masdevallia ochthodes; 3, Rholidota obovata; 4, Masdevallia striata; 5, Cochlioda vulcanica; 6, Maxillaria rufescens; 7, Pleurothallis elachopus; 8, P. lateritia; 9, Stelis Brockmulleri; 10, Eria convallarioides.—*Oxon.* A garden form of Veronica Andersonii.—*E. T.* 1, One of Veitch's hybrid Calceolarias; 2, Scrophularia nodosa variegata.—*E. N.* Cratægus Crus-galli prunifolia.—*C. & S.* Not recognised; kindly send a better specimen.—*Enquirer.*—Viburnum Opulus.—*H. B. H.* 1, Aplopappus ericoides; 2, Cupressus Lawsoniana; 3, Thuya dolabrata; 4, Nepeta Glechoma variegata. — *W. B. Belton.* 1, Erythrina sp.; 2, Mimosa sp.; 3, Melia Azedarach; 4, Coprosma Baueri; 5, Ligustrum lucidum.—*Miss E. F. D.* We do not undertake to name varieties of Hollyhock. The Rose is probably Commandeur Jules Gravereaux; the specimen was pale and damaged.

Rabbits and Black Currants: *W. P. B.* We are so well acquainted with the vagaries of rabbits that we should hesitate to describe any plant as being "rabbit-proof." Nevertheless, we have in our mind's eye a brake swarming with rabbits where natural seedling Gooseberries and Currants, of both kinds, grew freely, and these were never touched by the rabbits. Since receiving your letter, we have placed branches of Black Currant in a small rabbit enclosure, and, although the rabbits play around them, the result is the same—the bark remains intact and not a leaf has been nibbled. But in both cases the rabbits have plenty of food: it is the hungry rabbit which does the unexpected damage, and hungry rabbits will eat almost any vegetation. You must also bear in mind the fact that, whilst rabbits will rarely touch established plants of certain species, they sometimes bark newly-planted individuals. This will occasionally happen with Rhododendrons. We know well an estate in the west of England where large numbers of unprotected Rhododendrons luxuriate, and seedlings innumerable spring up around them, and by the sides of the walks, yet it is necessary to surround any newly-planted Rhododendron with wire netting, or the abundant rabbits would spoil it during the first night. Some trappers take advantage of the rabbit's liking for newly-turned earth, and place traps in mounds of fresh soil. If you plant Black Currants near the rabbit warrens you should inspect the bushes daily during cold weather (especially when snow is on the ground), and if there are any signs of the rabbits having commenced to injure them, lightly smear the main stems with tar.

Rhubarb: *A. S. T.* Daws's Champion is one of the very best varieties of Rhubarb for forcing or for furnishing early supplies out-of-doors.

Rose Leaves: *F. E. C.* Your Roses are badly attacked with the "Rose rust" (Phragmidium subcorticatum). The earlier stage of the disease gives an orange colour to the foliage, but now the autumn stage produces dark-brown patches. Gather all fallen leaves and burn them. Spray any plants that have been attacked with a solution of sulphate of copper during the winter.

Seedlings: *G. W. F., Bromley.* We have received some soil and seedling Lobelias, but no particulars with them. In the absence of any information, we are inclined to think the soil has been too freely watered before it contained many roots, and this has caused the green appearance of the surface.

ODONTIODA LAMBEAUIANA, "WESTONBIRT VARIETY"

THE
Gardeners' Chronicle
No. 1,346.—SATURDAY, October 12, 1912.

CONTENTS.

ILLUSTRATIONS.

THE MARKET FRUIT GARDEN.

EXCEPT for the last two days of the month, during which a great quantity of rain fell, a dry and cold September followed a wet and cold August. Between September 1 and 28 my rainfall measured only 4-100ths of an inch, but over an inch of rain fell in the day and night of the 29th, and more on the 30th, making the total for the month 3.48 inches. During nearly the whole of the time the wind was in a cold quarter.from north to east. East wind was welcome, however, as the best security for dry weather, and as a great help towards the destruction of weeds turned up by the hoe or the cultivator. Previous to the 29th, again, there had been complete immunity from the gales which are usual in September and which did so much harm in August in blowing fruit off the trees. Gales accompanied the rain of the 29th and 30th, but nearly all the Apples in my orchards had then been gathered.

Weedy Orchards Cleaned at Last.

During the whole of the spring and summer the foul condition of the orchards was a trial to the fruit-grower who strives to keep them clean. In March the rainfall was so nearly continuous that weeds were necessarily left to grow unchecked. In April there were arrears of digging to be made good, while spraying in the latter part of the month was a hindrance to hoeing. Some good work was done with the horse cultivator, but in the latter part of April and in the greater part of May the land had dried into so hard a condition that hand-hoeing was merely scraping. In June the rainfall was frequent enough to set weeds afresh after they had been chopped up, and this was also the case in July to a great extent, while August was a month of almost daily rainfall. On the other hand, after the first day of September there were four complete weeks of splendid weather for the destruction of weeds, and it is a source of great satisfaction to see the orchards in a clean condition at last.

Costly Hoeing.

Never before have I known the hoeing of fruit plantations to be so costly as it has been this season. In the first instance the soil had been run into a compact mass by the extreme wetness of the winter and the first month of spring. When it dried it was almost as hard as cement, and hoeing was very slow and hard work. As a rule, to hoe the whole of the land among trees and bushes costs me 12s an acre, the understanding being that the whole surface is to be cut. In some Kent fruit districts, where the soil is more friable than mine, the price is often only half as much; but work that I have seen in progress in those places left much to be desired. This season, however, the first hoeing in a grassy plantation cost over £1 per acre, and even so the men earned only 3s. a day, which is not enough for piecework. They "took" the job at 15s., but could not earn day wages (2s. 8d.) at that price. In other cases, where the horse-cultivator does all but a small square of land around each tree and bush, the cost of hoeing was 50 per cent. more than is usual.

A Needed Implement.

As a rule, the horse-cultivator cannot be used without damage to the fruit trees after the fifth year from planting in the case of bush-shaped trees set 12 feet apart, or the sixth season in the case of short half-standards planted at the same distance apart, Gooseberries or Currants being 6 feet apart from each other and an equal distance from the trees. The damage is done mainly by the chain traces, which slant up from the whipple-tree to the level of the horses' shoulders and scrape the bushes and the lower branches of the trees. Injury is also done to a less extent by the harness and by the heads of the horses. What is wanted is a very low motor-cultivator, all the parts being as close to the ground as they can be. Something of the kind, it appears, has been brought out and tried at Evesham, but whether successfully or not I cannot say. If any reader can give information on this point it would be useful. The work of horse cultivation is much more effective than that of hand-hoeing, as well as very much cheaper. One great advantage of the former is that by means of it an orchard of eight or nine acres can be cultivated in a couple of days, if done in only one direction, or in four days if done in two directions, so that it can be dealt with whenever there is a spell of settled dry weather. On the other hand, unless a great gang of men can be obtained, hand-hoeing an equal area takes twice as long as the cultivation up and down and across, so that rain is usually experienced before a job is finished. It is true that there is a narrow space up each row of trees or bushes to be done by hand after the horse cultivation in one direction, or a small square around each tree or bush where it is done in two directions, but this work is quickly performed. If a motor-cultivator of the kind mentioned were available and effective, it could be used without material damage until the bush fruit was removed as over-aged or too much shadowed by the trees to be worth retaining. After that, there would be, of course, double the space for cultivation by motor power, and the work could be continued during the whole life of an orchard if the trees were pruned sufficiently to keep overhanging branches from trailing close to the ground.

Planting in View of Horse Cultivation.

As planting time is approaching, it is reasonable to refer to a point of importance in relation to distances of setting trees and bushes. My earliest plantings were done with a view to horse cultivation up and down and across between the rows of trees and bushes. This necessitated equal distances apart for trees of all varieties, whether of compact or spreading habit of growth, and it also necessitated the placing of small fruit bushes not less than 6 feet from each other or from a tree. In some later plantings the plan has been altered, horse cultivation in only one direction being contemplated, in order that the bushes may be set more closely, whilst the distances of trees apart in the rows may be varied in accordance with their respective habits of growth if desired. In my soil I find that a distance of 4 feet between Gooseberry and Black Currant bushes suffices at least for nine or ten years, and it appears to me that if severe cutting is necessary for the rest of their lives to prevent interlacing, the loss is less than that involved by having the bushes much fewer in number than they need to be for many years. When cultivation only up and down between the rows is contemplated, trees of a compact habit of growth can be set 12 feet apart in the rows, while those of spreading habit can be allowed 16 feet. In each case there would be a space of 4 feet from bush to bush or from bush to tree. Even so, the space between compact and bushy trees would be uniform in one direction; but when they are angled—a tree in one row being opposite to a bush in the next tree row—there would be more than 12 feet from tree to tree crossways, whilst the variation in distances in the rows would be a great advantage to varieties of spreading habit. Another advantage of this plan over that in preparation for

horse cultivation in two directions is that pruning to prevent side growths being in the way of the horses or their harness needs to be done only on two sides of each tree instead of on four sides, if needed at all. An alternative plan in relation to the small fruit would be that of planting the bushes at distances of only 3 feet, with the intention of grubbing up every other bush when they have become too crowded, or, in the case of Black Currants, cutting every other bush down to the ground level, to allow of its shooting afresh, and treating the remainder in a similar way when those first cut-back have become well furnished with branches. Never having seen this latter plan tried, I mention it without venturing to recommend it. If adopted, the distances of the trees apart in the rows might range from 12 feet to 15 feet, instead of 12 feet to 16 feet, as in the case of the 4 feet bush planting. The chief doubt in the case of the close planting of bushes is as to whether there would be space enough for the full ramification of the roots.

Apples Dropping up to the Last.

The dropping of Apples referred to in previous notes was bad enough in the cases of early varieties, but the loss from this cause was greater still with late and long-keeping sorts. It led to the gathering of the late Apples before the usual time, and this may affect injuriously their keeping capacity. Moreover, it helped to keep up the glut in the markets, so that prices continued miserably low till the end of September. To get no more than 3s. 6d. a bushel for the best lots of such fine Apples as Lord Derby and Warner's King is unpleasant, to say nothing of seconds sold at 2s. to 2s. 6d. Rail and marketing expenses have to be deducted in all cases.

Inferior Late Apples.

Bramley's Seedling Apples this season are the worst lot I ever grew, most of them being small, and many of the rest mis-shapen. Lane's Prince Alberts are also lacking in size, and include a large proportion of tail. A mis-shapen Apple has been lately declared to be the result of imperfect pollination. If this be true, the shortness and inferiority of most late varieties may be attributable to defects in the pollinating season. My best crops of late Apples are those of Royal Jubilee and Gascoyne's Scarlet Seedling, and the fruit of each is well up to the average in size. By the way, one well-known fruit nurseryman declares Royal Jubilee to be in season from October to December, while another says October to March. Never having tried to keep the variety for more than a few weeks after gathering the crop, I am not able to confirm or dispute either statement. But the variety does not look like a long keeper, as its skin is very thin and liable to show the slightest bruise, and the fruit turns quite yellow shortly after being gathered. It is desirable to store every Apple that can be kept until the supplies of home-grown fruit in the markets have been greatly reduced, but although I have a properly-constructed fruit chamber, I shall be agreeably surprised if my large crop of Royal Jubilee keeps in marketable condition up to Christmas. *A Southern Grower.*

DESTRUCTIVE INSECTS AND PESTS

SCHEDULED BY THE BOARD OF AGRICULTURE AND FISHERIES.

II.*—THE NARCISSUS FLY.

A fly of the genus Merodon of the family Syrphidæ has long been known to live in the larval stage in certain bulbs. According to Verrall (*British Flies*, vol. viii, 1901) only one species of Merodon occurs in Great Britain, this being M. equestris Fabricius, of which there are three varieties, namely, narcissi, validus, and transversalis. Another species, M. clavipes Meigen, is included by Walker in his *British*

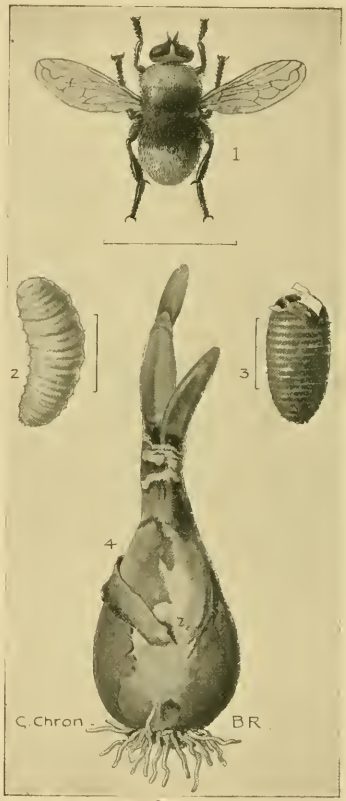

Fig. 124.—the narcissus fly (merodon narcissi).

1, The perfect insect (magn. 2); 2, Larva (magn. 2); 3, Pupa (magn. 2); 4, Affected bulb arrested in development (nat. size).

Diptera, and is also recorded as British by Curtis, but this is probably owing to an error, and doubt is thrown by Verrall on the accuracy of the identification. Larvæ in Narcissus bulbs sent from Cornwall in 1896 are described (*Journal* of the Board of Agriculture, December, 1896, p. 287) as "clearly those of a species of fly known as Merodon clavipes Meigen," but this species was apparently considered identical with M. narcissi F. It may at any rate be said that a species of Merodon, almost always M. equestris Fabricius, has become a most serious pest of Narcissus bulbs in this country, and is very widely distributed. It is remarked by Verrall that, until he caught a specimen at Denmark Hill, in South London, on June 8, 1869, M. equestris was not known to be a British species. Theobald, however, says: "There is little doubt that it has always existed as a native insect amongst the wild Daffodils in the west and other parts of the country." [It seems fairly certain that in the past many larvæ found in bulbs were wrongly identified as those of M. equestris, but were really those of Eumerus strigatus, Fln., a related syrphus fly, and named by Theobald the Small Narcissus Bulb Fly. A very full account of the two species is given by Theobald in his *Report on Economic Zoology* for the year ending September 30, 1911 (South-Eastern Agric. Coll., Wye), pp. 107-117.]

An extensive attack was recorded from Cornwall, in October, 1896,† bulbs submitted for examination being much decayed, two larvæ occurring in some bulbs, but generally only one. Five per cent. of bulbs at Penrhyn were found to be infested, and several thousand bulbs of Narcissus stella, N. gloriosa, and other varieties had to be destroyed. Since that time, with the great increase in the growth of Narcissi in Great Britain, the Narcissus fly has become so widely distributed that it occurs almost wherever these bulbs are grown in this country. It is commonly held that it was introduced into England from Holland, but, as stated above, Theobald believes it to be native. In the *Journal* of the Royal Horticultural Society (1901-2, p. 249) it is stated that "the fly was first noticed by Reaumur in 1738, but at that time it had probably not spread further northwards than the centre of France, and even there it was rare; and it was only in 1840 that it was noticed as a pest in Holland, and was handed on in due course to England and even America." It is certainly now prevalent in British Columbia, and Hewitt (*Report* of the Dominion Entomologist, 1911, Canadian Dept. Agric.) considers that it has been introduced into Canada on imported bulbs, and he found it on bulbs imported into Ontario from Holland. It was found in Montreal in 1903. Prof. Ritzema Bos informed Dr. Hewitt that in Holland the fly chiefly attacks N. tagetta and Jonquillas. In British Columbia Mr. G. Norman observed that the early varieties of Daffodils, such as "Golden Spur" and "Henry Irving," are not attacked, but such varieties as N. poeticus ornatus and N. poeticus poetarum suffer considerably. Wilks states that the pest is undoubtedly imported from Holland, and to his own knowledge also from Spain, as he once found "no fewer than seven young grubs of the fly in a single imported bulb of Johnstonii, 'Queen of Spain.'" The same authority expresses the opinion that no garden exists in this country where 1,000 bulbs are grown in which M. equestris could not be found among them.

The fly causes a great deal of loss among bulbs; it is undoubtedly very prevalent in England. It is imported every year in Dutch bulbs in great numbers. It has been recorded‡ as attacking bulbs of Atamasco Lilies (Habranthus pratensis), and Scarborough Lilies (Vallota purpurea), while cases of the fly attacking Liliums and Hippeastrums are also mentioned. Theobald says that the larvæ are common in Hyacinths, Tulips, and

* The previous article appeared in the issue for September 28, 1912, p. 241.

† *Journal* of the Board of Agriculture, Dec., 1896, p. 287.

‡ *Journal* of the Royal Hort. Society, Oct., 1911.

Narcissi, and he has found them in Vallota purpurea (1897), Galtonias, and wild Hyacinth or Bluebell.

The fly (fig. 124) is a fairly large insect, nearly three-fourths of an inch in length and an inch in spread of wings. It more nearly resembles a small bee than a fly, and is conspicuously pubescent or covered with a dense soft velvety "pile" which obscures the ground colour. It varies considerably in colour, having bands which may be tawny, golden yellow, black, or greyish. In three specimens before me one appears, at first sight, almost black, save the hinder part of the abdomen, which is yellowish; a second has the front of the thorax tawny, centre of body black and hind portion of the abdomen golden yellow; while in the third the thorax is tawny and the abdomen greyish. Verrall states that in M. equestris the thorax has grey or tawny pubescence in front, with a broad black fascia behind, while the abdomen is all fulvous except about the grey base; in var. narcissi the thorax is covered entirely with a fulvous pubescence, and the abdomen is grey haired; var. transversalis is all grey haired, except that the third abdominal segment is black haired; and in var. validus the pubescence is nearly all black except on the end of the abdomen—this last seeming to be the usual form of the species in England.

The thorax is robust, and rather longer than broad; the abdomen varies a good deal in shape, though usually "short, ovate, and rounded behind." The eyes are moderately hairy all over, and in the male "touch for about half the length of the frons or vertex"; in the female the eyes are well separated. The wings are almost transparent, and are without any markings other than the veining, though darker near the veins at the base. Verrall remarks "I have no reason for supposing that any of the variations are seasonal or in any way affected by diet, but so far as I know all or any of the forms may appear at any place and at any time." The fly on the wing flies in the manner of a hummingbird hawk moth, or a drone bee, hovering with swiftly-moving wings, or darting rapidly to right or left. When at rest it is somewhat sluggish.

The larva is about half an inch in length when active, but at rest appears shorter, as it lies in a curved position; its cylindrical body, tapering at the extremities, is much wrinkled and folded, clearly showing the divisions of the body. In colour it is cream or dirty greyish-brown. It has no distinct head, but under the pointed and somewhat flattened upper extremity is the retractile mouth furnished with two dark-coloured mouth hooks. The larva pupates in the soil, the pupa being oval and darkish brown, much wrinkled, but with no marked divisions.

The females are very active on the wing, but when pairing or at rest they are sluggish. Wilks says that "the greatest peculiarity of the fly is the noise which it makes when flying about. I can only describe it as something between a shriek and a whistle; it is, of course, a small sound in itself, but great in comparison with the size of its author, and you can often hear it at a distance at which the fly itself is unperceived." The eggs (perhaps 100 in number) are laid on or near the bulbs, among the foliage of the bulbs, or possibly in the surrounding soil, between the months of May and July, and, whether the resulting grubs enter from above or from the base, they eat their way into the bulbs and cause great damage, reducing the tissue to an oozy decayed pulp. The larvæ feed and grow in the bulbs, remaining in them for some months, finally pupating in the soil from about March to May and giving rise to the flies in May and June. Typically there is one maggot to each infested bulb, but seven maggots have been found in a single bulb. Mr. Leney, of Chertsey, informed Theobald that on lifting the bulbs to have them examined and to kill the larvæ no more than two full-grown larvæ occurred in each bulb, but more frequently only one in a bulb; when, however, the larvæ are in a younger stage and about half the size of those fully matured he invariably found from seven to eight in a single bulb. The larvæ certainly seem to leave one bulb and pass to another, and Theobald says§ "Those I have kept attacked as many as ten bulbs before becoming mature. When one bulb is destroyed they crawl through the soil and enter the next one at its base." Further, bulbs in store in quantity are similarly treated, Wilks stating (*Journal* of the Royal Horticultural Society, 1902-3, p. 184) that under such conditions a grub will often eat its way out of the side of one bulb and into the side or top or any part of another in contact with it, and he has found a grub with its head buried in the side of one bulb and its tail in the neck of another.

§ *Report* on Economic Entomology, Natural History Museum, 1902-3.

As regards preventive or remedial measures several plans may be adopted. In the first place lifted bulbs should be carefully examined several times before planting—and lifting may usefully be a little early and planting a little late to allow more time. Infested bulbs will usually be found to be rather soft, and all infested bulbs should be burnt. Beds in which attacked bulbs have been grown should be deeply dug several times, and lime may usefully be dug in. The advantage of destroying bulbs is proved by the experience of a large Irish grower; seven or eight years ago Merodon proved a great pest in Narcissus bulbs, but the practice was adopted of destroying all sickly, infested bulbs, with the result that the pest was rarely found (*Journal* of the Board of Agriculture, 1909, p. 295). Further, the flies may be caught with a net when they settle, though care is necessary, as they are easily disturbed, settling, however, after flying a few yards. When caught in the net the flies should be crushed. On the wing they are caught in the net only with great difficulty owing to their rapid and variable flight. It has also been suggested that the flies may be trapped by placing plates filled with treacle, and the edges smeared with honey, near the bulbs: the honey attracts the flies, which are caught in the treacle. Mr. George S. Saunders suggested that if bulbs could be placed for 20 minutes or half an hour in water kept at a temperature of 115° F. the heat would probably kill the grubs without harm to the bulbs.

Soaking affected bulbs in cold water at the natural temperature is stated to have been successful in some instances in drowning the contained larvæ, which emerged from the bulbs and were found in the vessel holding the water and bulbs. Theobald, however, writes (1911 *Report*) as follows:—"Ritzema Bos suggests soaking the bulbs which are suspected for eight days in water, so as to drown the grubs. Some I treated in this manner did not yield good results." *H. C. Long.*

Fig. 125.—Normanhurst, the residence of Earl Brassey.

NORMANHURST.

The residence of Earl Brassey is separated from that of the Earl of Ashburnham (see p. 208) only by a country lane. Or, to be more correct, the lane is a bond of union between the two estates. The houses themselves are a couple of miles apart, and the one is entirely hidden from the view of the other. Here we are surrounded by contrasts. Ashburnham lies in a dell, Normanhurst on the southern slope of a hill; the former cannot be seen till you are within a stone's throw of the warm, brick pile, the latter, formed of stone, is a landmark for miles. As Ashburnham speaks of age, ripeness and almost of decrepitude, Normanhurst throbs with the beat and energy of youth. Yonder we find relics of the Carlovingian, here of the Victorian age.

Hare speaks of Normanhurst as a very ugly house of bastard Renaissance, in a beautiful situation, with lovely views over sea and land. His statement doubtless is true, so far as his own taste goes, but who that sees the house from below the lake with the rustic bridge in the foreground but will admit that the effect is picturesque in the extreme? Here, then, where the Vetches and Clovers, Dandelions and Hawkweeds, Broom and Gorse, Bracken and Herring-bone grow in wild profusion, as they have grown for ages, we may wander along beautiful roads or well-kept paths, tread the softest of lawns, and gaze upon bed and border filled with choicest of horticultural gems. With the whole country for choice, it would surely have been difficult for anyone to select a more charming

spot for a retreat. The district is full of historic interest. To the geologist and botanist the surroundings are as fascinating as to the antiquary.

In the matter of flowers, the Sweet Pea is a great favourite. At the time of my visit they were just past their prime, but the autumnal glory showed what that of summer had been. The Poinsettia is popular here, and flourishes better than in many places. The brilliancy of the scarlet bracts, when the colour is developed by effective culture, renders it very attractive. I saw some very fine Chrysanthemums and Begonias, but perhaps Carnations may be looked upon as the most favoured of flowers. Plants of Souvenir de la Malmaison were in perfect health, and on July 16 I saw upwards of 400 blooms each in exquisite blush and beauty.

No county can excel Sussex in the matter of Figs. In good seasons they ripen freely out-of-doors, and Normanhurst is no exception. Peaches and Nectarines also succeed well out-of-doors. Of the latter fruit, Victoria and Lord Napier are favourites. Gourds, Melons, Cucumbers, and Tomatos are brought to a high standard. There is little trouble with diseases here, which shows that right methods of culture, ventilation and general treatment have been mastered. The vineries occupy considerable space. Black Hamburghs had done well, and I learnt that Muscat of Alexandria from these gardens had won many first prizes. *Hilderic Friend, Swadlincote.*

NOTICES OF BOOKS.

The Grava Grasses.*

Both "Grama" and "Bouteloua" are unfamiliar words to most of us. Grama is a Spanish word, and Grama Grasses might be rendered gramineous Grasses. Bouteloua is a large genus confined to America, and belonging to the tribe Chlorideæ. Its nearest relation among our native Grasses is Cynodon Dactylon, which grows on sandy shores from Dorset to Cornwall. Mr. Griffiths defines 36 species of Bouteloua, with which he associates the genera Triæna, Pentarrhaphis, and Cathestecum, comprising jointly half-a-dozen species, all restricted to the Mexican region. Bouteloua ranges from Canada to the Argentine, and certain species are specially characteristic of dry regions in the west, both in the north and the south. The author says: "It is doubtful whether there is another group of native pasture Grasses which is of as much economic importance as this, when both quality and quantity are considered. In the northern prairie region, Bouteloua gracilis forms a very large part of the so-called Buffalo-Grass formations, and makes a very fair sod over thousands of square miles." In the arid south-west, the species of Bouteloua are not turf-formers, except at altitudes of 5,000 to 7,000 feet, but they furnish the greater part—and the better part—of the feed from 7,000 feet down to the driest desert mesas and lowlands. Some half-a-dozen species include the main pasture Grasses over very large areas of the highlands of Mexico. With regard to their adaptability to cultivation, the author states that many efforts were made from about 1892 to 1900 in the United States to cultivate the different species of Bouteloua. But, although they all respond readily to cultural treatment, they have not a good seed habit, hence he is doubtful whether even the most valuable species can become of importance in cultivation. Apart from the fact that they are not free seeders, there are difficulties in collecting and cleaning such seed as there is, and the whole spike has to be sown. Nevertheless, good yields of hay can be secured from the perennial B. curtipendula. The plates illustrating this admirable and comprehensive monograph are mostly reproductions of photographs of landscapes in which the various species of Bouteloua are characteristic features. Others represent areas of Bouteloua curtipendula and B. gracilis under cultivation. The analyses of the flowers and inflorescences in the text have all the appearance of being correct and sufficient. From a practical standpoint, Mr. Griffiths' account of these Grasses is worth the attention of the farmer in South Africa and Australia. *W. Botting Hemsley.*

* *The Grama Grasses: Bouteloua and Related Genera*, by David Griffiths. Contributions from the United States National Herbarium, xiv, pp. viii + 343-428, plates 61-83, with numerous analytical figures in the text. 1912.

The Early Naturalists.*

This account of the lives and work of the early naturalists will be read with profit by all who are interested in the study of nature. There will be, however, perhaps one class who will not view with entire satisfaction its appearance, and those are collectors of old books on this subject, for we have no doubt that many new converts will be made to this fascinating pursuit, and market prices will rise in sympathy with the demand.

The scope of the work includes writers from the early 16th century, when interest in natural science began to awaken after its prolonged slumber, and ends with Darwin, when, as the writer justly remarks, a new page was turned. Whilst a considerable portion deals with zoology, there is much on botanical and, incidentally, horticultural subjects likely to interest readers of this paper.

The writer emphasises the remarkably slow growth of observation and experiment, and this is not without its applications even in the present time, when the multitude of books tends to make a superficial talk easy and real investigation scarce. Space will not permit any detailed examination of even the botanical portions of the work: suffice it to say that the reader will find in a condensed form the progress of the development of botanical science written in an easy and lively style.

A few points of criticism may be noticed. On p. 149 it is related of Henshaw that he exhibited at the Royal Society "Spirals of Nut trees, showing that they grow snailwise." The author remarks that these must have been Hazel stems strangled by Honeysuckle. We consider it more likely that they were stems of the variety of Hazel which grows naturally corkscrew-wise, and which may still be found "in gardens of the curious."

In writing of the microscopical work of Swammerdam, we are told, on p. 178, that "he knew how to render anatomical preparations transparent by balsam." It is somewhat of a surprise, therefore, to read, on p. 187, that the same investigator "gives as good a representation of the eye of a bee as could be obtained in the days *when there were no transparent sections.*"

A good account is given of the work of Linnæus, and the author endeavours to dispel the opinion commonly held that the credit of the system of binomial nomenclature we use is due to the great Swedish botanist, whereas, like all great systemists, he owed this and much else to previous workers, but to him is due the credit of obtaining for it a general acceptance. The great influence of his name and work threw, as the author points out, a devastating influence over European botany, as its aim and end for many long years were mainly an accurate disposition of labels rather than any real study of plants, and the traces of this influence, we fear, still remain. We miss, in the account of Linnæus, any mention of the great and valuable work done in this country by James Lee, of Hammersmith, in popularising the sexual system: the fact that this was considerable was acknowledged by Linnæus himself. But these criticisms are small matters in view of the pleasure naturalists will feel in reading this most fascinating history. We hope that a second volume, in due course, may carry on the story up to modern times. *E. A. B.*

* *The Early Naturalists*, by L. C. Miall, D.Sc., F.R.S.

Fig. 126.—Onosma helveticum.

(See p. 281.)

ONOSMA.

The Onosmas have their headquarters in south-eastern Europe and Asia Minor, but what perhaps is the most distinct species, O. pyramidalis, which has scarlet or crimson flowers, is a native of the Himalayas. This species is very rare, and I am not aware that it is at present in cultivation. Fifteen species are found in Europe, but probably not more than ten in all are grown in gardens. The Onosmas are all essentially plants for sunny places, and should be planted in poor, stony soil with perfect drainage. In rich ground they make luxuriant growth in summer, but are very liable to damp off during the winter. Most of them are easily cultivated and are readily raised from seed, but, as a rule, they dislike transplanting when they have attained a moderate size. It is, therefore, advisable to grow the seedlings in small pots, and plant them as soon as they are well rooted. One of the exceptions to this rule is the beautiful O. albo-roseum, which makes plenty of fibrous roots, and may be transplanted with success if the work is done carefully. Of the species in cultivation the following are six of the best:—

O. albo-roseum.—This species, a native of the mountains of Asia Minor, is of spreading, subshrubby habit and forms in cultivation a cushion-like plant about 6 inches high. The evergreen, silver-grey leaves are covered with stiff hairs. The handsome flowers, which are freely produced in clusters, are somewhat Pear-shaped in outline, white, tinged with rose at first, but changing to pink. During the month of June it is a most attractive plant, the white and pink flowers harmonising well with the hoary foliage. Seeds are freely produced and germinate readily. There is a form with white flowers, known as O. album.

O. arenarium.—This species is of somewhat bushy habit, with branching stems about 1 foot in height. The lower leaves are some 3 inches long, and less than ½ inch broad; they are covered with stiff, bristly hairs. The stem-leaves are broader and sessile; the flowers are pale-yellow or nearly white. The plant is a native of Eastern Europe and the Caucasus, and is usually found in arid, stony places.

O. Bourgæi is a handsome species, native of Armenia, producing large, white bell-shaped flowers in June. Like A. arenarium, the plant is strong-growing, and possesses hairy foliage. Being a biennial, stock must be raised from seeds annually; seeds are produced somewhat freely.

O. echioides.—The well-known "Golden-drop," with its masses of large, bright-yellow flowers, is one of the most popular plants in the rock garden in June. It is a widely-spread species, its habitat extending from Western Europe into Asia Minor.

O. sericeum (see fig. 127).—This species is a comparatively recent introduction from Asia Minor. The plant has a suffrutescent base, with freely-branching stems, bearing rosettes of silky, grey leaves from 3 inches to 4 inches long. The leafy flowering stems are from 6 inches to 9 inches high. The flowers vary in colour from pale-yellow to white, tipped with pink. O. sericeum is a free-growing plant, and does well on sunny ledges planted in stony soil.

O. stellulatum.—The habit of this plant is somewhat like that of O. sericeum, but taller. The pale-yellow or citron-coloured flowers appear in May and June. The species is a native of Eastern Europe. Plants are easily grown from seed, and, like all the others, succeed well in poor soil in sunny situations. O. helveticum (see fig. 126), the Swiss form of this species, has rather broader leaves, and is not so tall as the type. Both plants are very apt to damp off in winter, and are not so long-lived as O. echioides.

W. I.

PLANT NAMES FROM ANIMALS.

(Concluded from p. 258.)

Beside these bird-names given to particular plants, there are other more general names drawn from bird life, but not from any particular bird, such as Bird-cherry, Bird's-eye Primrose, Bird's-foot, Bird's-nest Fern, Bird's-tongue (Ornithoglossum), and Ornithogalum, from ornis and gale, a plant so named by Dioscorides and Pliny, probably from its white flowers, and now called by us Star of Bethlehem.

There are also some plants named from the wing or feather of a bird, pteron. The name Pteris is applied to the whole family of Ferns, and was given to a Fern by Theophrastus. It is found in the Ferns Oreopteris, Thelypteris, Cystopteris, Phegopteris, Dryopteris, and in the Bracken, Pteris aquilina, which is another plant-name for the eagle, and points to the figure of the bird shown when the stem is cut across.

From the birds I go to the beasts, meaning chiefly quadrupeds. I omit all names derived from man or human nature, and I go at once to the king of beasts, the lion. From the Greek leon, and the Latin leo, and the English lion, we get many names, but it is rather curious that the name leo has been generally given to low-growing plants and to plants we may call weeds. Thus the lion is best known in the Dandelion, Dens leonis, Dent de lion, a very beautiful plant, but we rank it as a weed. Then we have Leontopodium or Lion's Foot, the botanical name for Edelweiss, and Leontice, from leon and eikos, resemblance, because the leaf is like the stump of the lion's foot. From the tiger we get Tigridia and the Tiger Lily, and from the leopard we get the Leopardsbane (Doronicum), Pardanthus and the Lilium pardalinum. Wolf, lupus, has many plants named from him, as the Lupin, named by Virgil and Pliny, but the connection with the wolf is not clear; Lycopsis, which, however, has for its English name Bugloss, i.e., Ox-tongue, the Club Moss (Lycopodium), the Wolf's Berry (Symphoricarpus), and the Wolf's-bane (Aconitum), said to be used to poison wolves. The bear, arctus and ursus, is seen in Arcteum, the Bearberry (Arctostaphylus Uva-ursi), the Bear's-breech or Cow Parsnip, Bear's-ears (Primula ursi Auricula), but the ursi is now dropped, and the Bear's-foot (Helleborus fœtidus). The ox, bos, gives its name to the Bugloss, i.e., Ox-tongue, apparently to the Bullrush, but the derivation is wrong; to the Ox-eye Daisy, Buphthalmum, to the Cow-bane and Cow-itch, the Cowslip, the Cow Parsnip, and the Oxlip, and Vaccinium is from the Latin vacca, the cow. The horse is found with its Greek name hippos and its Latin equus in Equisetum, the Mare's Tail, in the Coltsfoot, and in Hippobroma and Hippophaë. It is used to express coarseness in the Horse Chestnut, Horse Bean, Horse Radish, and Horse Thistle. The ass, onos, is seen in Onobrychis, from onos and brychis, a trumpeting or braying, but I do not know how the name and the plant are connected. Onoseris, Onosma, Onopordon, and Ononis, the Rest-harrow, all get their names from the onos, but they are all far-fetched. In the Rest-harrow, I suppose that when the harrow is stopped by the plant, rest is given to the ass that draws it. The stag is found in the Harts-tongue Fern and buck in the Buckthorn, a Plantain, and in the Roebuck Berry, but the Buckbean is more likely Boghean. The cat is in Catmint, Cat's Ear, and Cat's Tail, but has many more derivatives. The Greek cyon, cynos, a dog, is in Cynorchis, Cynara, Cynanchum, from its poisonous qualities; Cynoglon, the Dog's-tooth Grass; Cynoglossum, Hound's-tongue; Cynosurus, Dog's-tail, also a Grass; and the English is in Dog's-tooth Violet from the root, Dogwood, and Hore-hound; and, as a term of contempt, we have the Dog Violet and the Dog Rose, which was almost the same in the Greek cynosbatos, i.e., Dog-bush; and the Dog's-bane, which gets its name from the Apocynum of Dioscorides, a plant that was supposed to be poisonous to dogs, and not exactly identified. The fox gives its name to the Foxglove. The connection is not at all clear, and folk's-glove is suggested, but the N.E.D. decides in favour of the fox, and that settles the question. Under its Greek name, alopex, the fox occurs in Alopecurus, the Fox-tail Grass. The goat, with its Greek tragus and the Latin caper, is in Caprifolium, Tragopogon, Goat's Beard, Tragacanthus, Tragopyrum, Goat's Wheat, Goat's Rue, and Goatsfoot. The hedgehog, erinaceus, is found in the pretty blue-flowered Erinacea pungens of the Pyrenees, and the sea hedgehog, echinus, is in Echinops, Echinocactus, Echinocereus, and Echinospermum. The hare's Greek name, lagos, is in Lagurus, the Hare's-tail Grass, and in Lagopus, hare's foot, and the English name is in the Hare's-foot Fern, the Hare's-ear Grass, the Hare's-tail Grass, and the Harebell. The dolphin

Fig. 127.—Cnosma sericeum.

occurs in Delphinium. The Greek name of the pig, hys, is found in the Hyoscyamus, in Hyophorbe, a Palm, of which the fruit is eaten by pigs, while the English names are found in Sowbread (the old name of the Cyclamen), Sow Thistle, Hognut or Pignut, Hog Plum, Swine's Succory, and Swine's Cress. The Greek for the lamb is arnos, and it gives the name to Arnoglossum, probably the Plantain; the English name is in Lamb's Lettuce and the sheep in Sheep's Scabious or Sheepsbit. The squirrel is in the Squirrel-tail Grass. And I finish this part of my subject with the mouse, who carries his Greek name into Myosurus, the Mousetail, and into Myosotis, formerly known as Mouse Ear and now as Forget-me-not. The zebra has of late years given its name to the Zebra Pampas Grass.

There are a few which I cannot rank as quadrupeds, but cannot pass over. There is the mythical dragon, which gives us the Snapdragon and whose Greek name is in Dracæna, or the dragon's blood, and in Dracocephalum, Dracontium, and Dracunculus. The monkey tribe keeps its Greek name, pithecos, in Pithecolobium, the monkey's ear-ring; in English we have the Monkey Flower, Mimulus, an there is good authority for the derivation of the pretty African bulbous flower, Babiana, from the baboon, who eats the bulbs.

I cannot recall any plant-names from amphibious animals, such as the rhinoceros, the hippopotamus, the crocodile, seal, or otter, but the tortoise gives its Greek name to the Chelone and its Latin name to Testudinaria, which has the elephant (Elephantipes) for its specific name. Nor can I recall any plant-names from fishes, except the Fishbone Thistle and the Salmon Berry (Rubus), probably so called in Canada from being found in the places where salmon abound.

I go to the reptilia. From the Greek names, echis, echitis, ophis, and echidna we get Echium, the Viper's Bugloss, Echinopsis, Ophioglossum, the Adder's-tongue Fern, Ophiopogon, the Snake's Beard, the Viper's Grass, the Fern Ophiopteris; and in English only the Snake's-head Iris, the Snake's-head Fritillary, and the Snake's-foot, the fruit of the Arum. The lizard's name is seen in the Lizard's Orchid, and its Greek name, saurus, in the Sauropus and Saururus. The scorpion has its name in the Scorpion Grass, and Scorpion Senna (Coronilla emerus). The frog, rana, is in Ranunculus, in the species morsus ranæ of Hydrocharis (Frog-bit), and in the Frog Orchid, while the toad is in the Toad Flax (Linaria), and the Toad's-stool, with its older name of Paddock-stool.

Among the molluscs, I can only find the Medicago or Snail-plant, and the Oyster plant (Mertensia) found on our north-eastern coasts.

I finish with the insects and crustaceans. From its Greek name, melissa, the bee has given its name to the British balm, Melissophyllum, and we have the Bee, Fly, and Butterfly Orchids. The fly is also in the Flycatcher, the Flywort, and perhaps in the Bluebottle.

Cimex, the bug, gives its name to Cimicifuga, the Bugwort. Fleawort and Lousewort either point to the curative power of the plants against the insects, or, according to Pliny, in his account of the Pedicularis, from pediculus, a louse, from the supposed fact that they attract the insects.

From the crustaceans we get the spider, the crab, and the lobster. The spider is in the Spiderwort (Tradescantia) and the Spider Orchid, and his work in the lovely Spider-web (Sempervivum arachnoideum) of the Alps. The lobster is in the bright Lobster-claw shrub (Erythrina), and the crab is perhaps in the Crab-apple, though the name may be from the old word that is found in crabbed, meaning something unpleasant, and in an old account of the fruits they are called Mala amara.

I do not pretend to have given all the plant-names from animals; I know there are more. But I give this list in the hope that, so far as it goes, it will interest some readers, and perhaps induce some to carry the search further. I shall be very thankful to hear of any omissions or corrections, sent either to myself or the Editors of the *Gardeners' Chronicle*, and, in conclusion, I have to thank the Provost of Eton for his valuable help, especially in the Greek and Latin derivations. Having had his help, I have the comfort of knowing that the information I have given on these points is correct. *H. N. Ellacombe, Bitton Vicarage, Bristol.*

The Week's Work.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Viola.—Plants intended for use as summer bedding should be raised from cuttings inserted now. The rains of August started the plants into fresh growth, so that there will be no difficulty in obtaining plenty of basal shoots, which are the best for propagating purposes. In a few favoured districts Violas may be struck and wintered in the open ground, but usually cold frames are necessary. Any old shallow frames are suitable, and there is no necessity for them to be entirely weatherproof, as Violas are best wintered with as little coddling as possible. A light, sandy soil should be used, and this should be made firm. The cuttings should be dibbled in fairly thickly, as they will not grow much before the time comes for transplanting them into their permanent quarters in the spring. Water the cuttings, and, if necessary, shade them lightly during the brightest part of the day, especially if it is sunny when drying winds prevail. Damp the shoots occasionally, and increase the amount of air after the sun has set. The cuttings will root readily, and when roots are formed the plants should be exposed to the air in favourable weather.

Clearing the Flower Beds.—Frost may now occur without much warning, and plants required for use another season must not be allowed to remain in the beds longer than is necessary. Standard and pyramidal plants are too valuable to risk losing from frost, and should be lifted carefully and potted without delay. They should be placed in a cool house, and watered very sparingly during the winter. If the stock of cuttings of bedding Pelargoniums is insufficient, some of the old plants should be potted. These may either be grown on for furnishing vases or large beds next season, or they may be placed in a fairly warm house and started into growth to supply a stock of cuttings early in the new year. Grevilleas, Cordylines, Heliotropes, Abutilons, Agaves, Fuchsias, and other more or less tender subjects that have been used as dot plants should also be lifted and housed.

Plants in Tubs.—Specimen plants in tubs employed on terraces, verandahs, and other prominent positions, are beginning to look shabby, and should be removed to a place where they may be protected when necessary. If it is not convenient to bring them in the glass-houses for the present, the hardier subjects may be stood in a sheltered yard or corner, where they may remain for some weeks to come. Hydrangeas and similar subjects may be left out-of-doors for some time, and will come to no harm if a little tiffany or shading material is thrown over them when frost is expected. If house room is limited, these plants may be wintered in a barn, stable, or similar structure. Certain deciduous plants, such as Aloysia, the lemon-scented Verbena, and Fuchsias, may be wintered under similar conditions.

Preparations for Spring Bedding.—As soon as the summer occupants are removed, the beds should be prepared to receive the spring-flowering plants. The ground should be trenched or dug deeply, for many summer-flowering plants are gross feeders, and soon exhaust the soil. Ground intended for Polyanthuses, Wallflowers, and Myosotis should be well manured. As a general rule, the beds should be trenched and manured now, so that, when the time arrives for clearing the beds and preparing for summer bedding next May, a moderate digging and the addition of leaf-mould or spent manure from an old Mushroom bed will be all that are necessary. In any circumstances, the work of preparing the beds should be pushed on, as such plants as Wallflowers, Polyanthuses, and Aubrietias should be planted in their permanent quarters without delay. The ground is still fairly warm, and the plants will quickly re-establish themselves, whereas, if planting is left till late in the autumn, the frost finds the ground soft and unsettled, and the plants tender, so that many are killed.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Preparations for Planting.—In gardens where it is intended to plant a large number of fruit-trees, a quantity of fine compost should be prepared and wheeled on the ground near the stations during dry weather, for scattering among the roots. The site for the trees should be well prepared; the soil should be well drained and, for dwarf trees, dug to a depth of 2 feet, but for standards and other tall trees it should be worked to a greater depth. Dwarf trees are the most profitable, and the most convenient for small gardens. Do not plant in heavy, cold land if it can be avoided; where the soil is naturally unsuitable, much may be done to improve it by adding road-scrapings, lime rubble, wood ashes, and similar materials that will provide a more open texture. In the case of such fruits as Apples and Pears, manure should not be used at the time of planting, but it may be freely incorporated in the soil when Gooseberries, Currants, and Raspberries are planted. Thorough preparation of the ground is necessary to obtain the best results in fruit culture, and trenching is to be recommended, as its good effects are lasting. An important matter, especially in the case of heavy soils, is efficient drainage. In the case of wall trees, a layer of rough lime rubble, broken bricks, or similar material should be placed at the bottom of the trench, which should be from about 18 inches to 2 feet deep. Where young trees are planted in the place of worn-out specimens, the soil should be removed entirely, and replaced with fresh compost, as the food constituents will have been exhausted by the older trees. Stone fruits require plenty of calcareous matter in the soil, but this is not so necessary in the case of Apples and Pears. If the materials are mixed in readiness and stored under a shed, it will save much time when the work of planting is being done. Select only varieties which are known to do best in the district, and purchase good trees from a reliable source. Another important matter is the kind of stocks on which the trees are grafted, for cheap trees are not always grafted on the most suitable kinds. For general purposes the broad-leaved Paradise is the best stock for Apples, while Pears do best on the Quince and Cherries on the Mahalab. But large Pear trees need to be grafted on the free stock, and standard Apples on the Crab, as these stocks have a strong, deep root-system which enables the trees to withstand strong wind. Certain varieties of Pears do best when they are double-grafted, and this point must be taken into consideration. It is best to plant only a few varieties, selecting those that are known to do well in the particular neighbourhood. A trial should be given to a few of the novelties each season, to ascertain if they are capable of giving better results than the older varieties.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Cucumbers.—To maintain a continuous supply of Cucumbers during late autumn and winter, close attention must be given to the plants' requirements. One of the chief points is to keep the temperature as equable as possible without using too much fire-heat. A minimum temperature, ranging between 65° or 70°, according to outside conditions, is suitable. Less moisture, both at the roots and in the atmosphere, must be used than during the summer months; an excess of moisture during winter is likely to result in an attack of "spot" disease. Should this complaint appear, syringing should be discontinued, though the atmosphere must be kept moist by damping the paths and walls of the house. Red spider must be guarded against; should it appear, syringe the foliage with a solution of soft soap and sulphur, as it is very important to keep the plants free from this pest during the winter months, when growth is slow. Stop the shoots at the second or third leaf, and train them evenly over the trellis, allowing plenty of room for the leaves to develop. Keep the glass, both inside and outside, quite clean, so that all the light available may reach the plants. Avoid overcropping, and cut the fruits before they become too large; if not required for immediate consumption, place them in a cool cellar, where they will keep fresh for a considerable time. Apply a top-dressing of fibrous loam,

decayed leaves (which should be clean and sweet), and a little well-decomposed horse manure as often as roots appear on the surface. It is better to add a little of these materials at frequent intervals than to apply a heavy dressing at one time. Admit air carefully through the top ventilators whenever the weather permits. On cold nights it is good practice to place coverings over the glass to conserve the heat.

Tomatos.—Old plants which have nearly finished cropping should be thrown away, cutting off any fruits which are likely to ripen. Plants which are swelling their fruits must be liberally fed with stimulants, such as liquid manure from the farmyard, soot water, and an occasional sprinkling of fertiliser. Apply a top-dressing of rich materials when there are plenty of roots on the surface. Side shoots should be removed regularly, and leaves which are likely to prevent the sun ripening the fruits should be cut back. Attention must be given to the setting of the fruits on the later plants, as the flowers do not set readily at this time of the year. Maintain a free circulation of air in the house, but avoid cold draughts. Pollinate the flowers about noon. During bright weather a sharp tap on the stem will be sufficient to distribute the pollen, but when the weather is dull and cold the flowers should be dusted with a brush. Sufficient artificial heat must be employed to keep the temperature at about 60°. When plants with plenty of roots have set one or two trusses of fruits, stimulants should be given as advised above. Towards the end of this month seeds may be sown for raising a batch of plants that will fruit early next year. Sow the seeds very thinly in shallow pans in a light compost, and place them in a warm, moist atmosphere till the seedlings are well through the soil. The young plants should be placed in a light, airy structure quite near to the glass. A temperature of about 55° or 60° will be suitable during the winter months. Select a free-setting variety of good constitution, such as Winter Beauty, Sunrise, or Dwarf Red.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Begonia Gloire de Lorraine.—These plants make a considerable amount of growth even after they have commenced blooming, therefore the shoots must be tied constantly in order to secure shapely specimens. Plants of later batches that have not been afforded stakes should be attended to in this respect at once; a single stick placed in the centre of the plant will suffice in most cases. Plants intended for exhibition purposes must receive regular attention, training the shoots free from each other, so that they may develop to their fullest extent. This variety of Begonia should always be allowed plenty of space, especially when the plants are coming into bloom, at which stage they should receive rather more air and less warmth than before, for the blooms develop better and keep in a good condition longer under cool conditions. Begonias of the Winter Cheer type should be growing freely, and the flowers, being rather heavy, need to be supported at an early stage. Each main shoot should be secured to a light stake. All winter-flowering Begonias have made plenty of roots, and may be afforded liquid manure whenever moisture is required, which will not be very often at this season, unless the plants are near to the hot-water pipes. The roots may also be fed frequently with a little fertiliser, such as Valsal, which adds colour both to the foliage and flowers.

Cineraria.—These plants are ready for transferring to their flowering pots. Select receptacles suitable to the size of the individual plants, those of 6 inches or 8½ inches in diameter being the most useful sizes. By potting now the plants will have time to form new roots, and get well established before the winter.

Primula.—If this work has not been done already, Chinese Primulas should be potted at once in their flowering pots, receptacles of 4½ inches and 6 inches being suitable: the smaller pots are preferable if the plants are required for purely decorative purposes. Primulas need a higher temperature than Cinerarias, and may be accommodated in a glasshouse if the space is available, or they may be placed in a heated frame for a time. The earliest plants will soon be in bloom; if they are growing in moderately-small pots they may be given liquid manure. Although P. malacoides is almost hardy, the plants are liable to lose a considerable amount of foliage if they are allowed to remain too long in a damp frame. When the plants are coming into bloom, they should be allowed plenty of air.

Calceolaria. Greenhouse Calceolarias also need potting. The plants may still be left in a cold frame, but they should be removed to a warm greenhouse during times of severe frost.

Propagation.—Certain decorative plants, including Panicum, Tradescantia and Lycopodium may be propagated from cuttings now, and will provide useful little specimens by the new year to take the place of old and worn-out plants.

Watering.—All kinds of indoor plants need to be watered with extra care at this season, especially those of a soft-wooded nature. Syringing also must be reduced, and if overhead syringing is necessary in the warmer houses to keep down insect pests, it should only be done once a day, and in the morning after the temperature has risen a little. Even then syringing must be done very lightly or the water may run down the stems, and cause the roots to become too wet. As the weather becomes colder, it will be wise to drop the temperatures of the houses also, rather than resort to an excess of fire-heat.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Leaves for Forcing Purposes.—The trees will be shedding their leaves freely, and a supply should be procured for the making of hot-beds. It is very necessary that fallen leaves are promptly removed from the kitchen garden, as, besides being untidy, they may smother young growing plants. In nearly every establishment there is a demand for early vegetables, and where heated pits are not available (and even to augment the supplies produced by means of these), cold frames placed upon a bed of leaves will be found of excellent service. The leaves will provide sufficient heat of a lasting and mild nature for gentle forcing. An enclosure should be made, if one does not exist already, for storing the leaves. Stout posts and boards are necessary for the purpose, and those creosoted last the longest. Old railway sleepers are splendid for the purpose, and will last for years. The leaves should be well trodden down; large pieces of boughs or other rubbish should be discarded. Leaves when decayed are excellent material for wheeling on to vacant ground. Each year we remove the older half of our stock and fill up with new material.

Frames.—Excepting those that are required for wintering the various crops, the surplus portable frames should be stored during the winter months. If they are not placed under cover they should be raised off the ground; during inclement weather they may be brought into a shed, dried, repaired if necessary, and painted. I have before emphasised the great value of having them of a standard size, so that the lights may be transferred from one frame to another as required.

Maincrop Potatos.—Maincrop Potatos are badly diseased, and even those that were clamped some time ago have become more diseased. It will be prudent to examine the tubers in the clamps and reject all that are unsound. Keep the ridges protected from heavy rains by means of tarpaulins or other suitable material, removing the covering on dry days, and delay soiling the clamps permanently for a time. Sprinkle lime freely amongst the tubers as I advised in a recent Calendar.

Seakale.—This vegetable is generally in request for November parties, and for the earliest supplies the use of retarded crowns is to be recommended. In such a season as this the plants in the ground have a tendency to continue growing at this period. Seakale is conveniently forced in the same manner as recommended for Chicory, but should, for preference, have the warmest position in the house. If a darkened place is formed in a warm house, retarded crowns will furnish a supply of stems in from three weeks to a month.

Runner Beans.—When the plants are destroyed by frost they should be pulled up, the haulm stripped from the sticks and the ground cleared. Protection on frosty nights will often prolong the cropping for a considerable time, but if protective material is used care must be taken to keep it away from the foliage, otherwise the leaves are bruised, and the damage is worse than that from exposure.

Leeks.—Late Leeks that were planted in holes bored in well-prepared ground have done exceptionally well this season, and little attention beyond an occasional hoeing of the soil has been necessary. Watering with farmyard manure will assist the stems to swell and improve the quality of the Leeks for cooking purposes.

Winter Greens.—A few late plants may be planted on vacant ground, and, provided the winter is not too severe, will prove useful later. The earliest-planted Kales have made wonderful growth owing to the wet season, but they are rather tender, and fine weather is needed before sharp frosts set in. Stir the land occasionally and support any plants that need this attention. Remove decaying foliage so that the air and light may reach the plants.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Cleansing the Houses.—The glass, both inside and outside, and the woodwork of the plant houses should be thoroughly washed, in order that the inmates may receive all the light available. Before commencing the work, if it is convenient to do so, the plants should be moved to an adjacent compartment to prevent the foliage from becoming soiled with the water. Where this cannot be done the house should be washed in sections, and the plants protected with shading material suspended next to them. Soft soap should be mixed with tepid rain-water, but not in sufficient quantity to damage the paint. The soapy water should be syringed from the paint-work with clean water after the scrubbing is finished. The stages and walls should be scrubbed, and if the former are covered with shingle, this should be washed as well. The pots should be scrubbed, the plants cleansed of scale and all other insect pests, and diseased pseudo-bulbs and leaves removed. Any young growths that are in need of support should be neatly tied to stakes, but not so tightly as to prevent the future development of the pseudo-bulb or young growth.

Restaging.—In rearranging the plants on the stages take into consideration their various requirements. They should not be placed too near to the roof-glass—no part of the plant should be nearer than 8 inches—and those that are suspended should be placed midway between the bars of the roof to escape dripping moisture, as this often causes serious injury to the foliage.

Temperatures.—From now onwards for the next few weeks the night temperatures of the various compartments should be maintained as nearly as follow:—East Indian house, 70° to 75°; Cattleya house, 65° to 70°; intermediate house, 60° to 65°; and Odontoglossum house, 52° to 55°. The higher readings should be maintained only when the outside temperature does not fall below 45°. If the outside conditions are colder the lower readings are preferable. Frost may occur suddenly, especially in the early mornings, causing the temperatures of the various houses to fall a little below the proper degrees. On such occasions no water should be afforded the plants, neither should damping be done until the houses are sufficiently warm again, as a cold, moist atmosphere is invariably the cause of "spot" and disease appearing in many kinds of Orchids. It is safer to err a trifle on the warm side at night rather than to run the risk of low temperatures in the morning, as a little extra heat may be regulated by ventilation. With the advent of cold nights slugs will become more plentiful in the houses, and if not destroyed will do great damage to the roots of the plants, and destroy the flower-spikes. These pests should be trapped by means of Lettuce leaves or damp bran placed between the plants and searched for after it is dark, with the aid of a lantern. Cockroaches, also, become more troublesome as soon as extra fire-heat is employed. These pests may be destroyed by Rams den's beetle paste, or some other suitable poison placed in their haunts.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations. *The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 14—
United Hort. Benefit and Prov. Soc. Com. meet.

WEDNESDAY, OCTOBER 16—
North of England Hort. Soc. meet. at Leeds. (Lecture by Rev. J. B. Hall on "Apple Culture.")

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—49·7.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, October 9* (6 P.M.): Max. 61°; Min. 42°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October 10* (10 A.M.): Bar. 30°: Temp. 52°; Weather—Slight fog.

PROVINCES.—*Wednesday, October 9*: Max. 54° Spalding; Min. 52° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, Rose Trees, Shrubs, Perennials, &c., at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

MONDAY TO SATURDAY—
Nursery Stock, at The Nurseries, South Woodford (by order of Mr. John Fraser), by Protheroe & Morris, at 11.30.

WEDNESDAY—
Trade Sale of Bulbs, at 1; Palms and Plants, at 4, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY AND THURSDAY—
Nursery Stock at Lindfield Nurseries, Haywards Heath, by Protheroe & Morris, at 11.30.

FRIDAY—
Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Our Food Supplies.

The extent to which this country is dependent on foreign supplies of food-produce has recently been the subject of considerable controversy. Some experts have computed that so little as one-fifth of our total food is raised at home; others have put the home-grown food-stuffs at one-half of the total. The former estimate is based, probably, on the fact that, of Wheat, including grain and flour, about one-fifth or less is grown at home. That this is the case is shown by the statistics issued recently by Mr. Rew, the assistant secretary of the Board of Agriculture, who computes that the value of home-grown Wheat, &c., is £10,000,000, and that of imported Wheat £48,000,000. This ratio, however, is by no means an index of that which obtains between home-raised and imported food-stuffs of other kinds. Thus, from the same statistics, we learn that the value of home-raised meat is £78,000,000, and that of imported meat only £51,000,000. Making allowance for the fact that the meat raised at home commands a higher price than that which is imported, it yet appears true that we raise more cattle for food purposes than we import.

In the matter of poultry, eggs, rabbits, and game, considerably less than half comes from abroad. Nevertheless, the fact that £10,000,000 worth of these commodities is obtained from foreign countries shows that a market awaits the enterprising smallholder of this country if he can compete in price with the foreigner. The same remark holds good for dairy produce, the imports of which realise the gigantic sum of £35,000,000 per annum. The extent of the foreign fruit trade may be gauged by the figures supplied in the statistics. Whereas the home produce realises yearly only £6,000,000 sterling, foreign fruit fetches £16,000,000.

The only vegetable food stuffs with respect to which the home grower appears to hold his own are those classed as vegetables, and it will come as a surprise to those who know the extent of imports from France, Italy, Sicily, Algiers, and elsewhere that the value of the imports of vegetables is only £4,000,000 sterling, as compared with £20,000,000, the value of the home-grown produce. The cash price paid for the larder of this country is nearly £350,000,000 per annum, and of this sum we pay one another £167,000,000, and the foreigner £180,000,000, so that, roughly speaking, about half of our food supplies for which money is paid comes from overseas. A careful perusal of these interesting statistics brings to light many other facts of interest. Thus it appears that, under the pressure of economic force, our tastes are changing. We eat less cheese than formerly, because it pays the farmer better to sell his milk than to make butter and cheese. For the same reason, 70 per cent. of the butter which we consume is of foreign origin. Again, it will be a matter of congratulation to those who believe in meat-fed men, and a matter of regret for those who favour vegetarianism, to learn that we each consume, on the average, 130 lbs. of meat per annum. Ominous and striking is the way in which our imports of fruit advance year by year. A comparison of the fruit imports of 1910 with those of 1911 shows that the practice of buying more and more foreign fruits applies to Apples, Pears, Cherries, and Grapes, as well, of course, as to the ubiquitous Banana, of which no fewer than 6¾ million bunches were imported last year.

Farm Orchards.

An interesting *Bulletin* (*Farmers' Bull.*, 491) has been issued by the U.S. Department of Agriculture under the title of "The Profitable Management of the Small Apple Orchard on the General Farm." The purpose of the *Bulletin* is to draw the attention of farmers who possess orchards to the fact that there is considerable profit to be made by the proper exploitation of their fruit-quarters. Many of the statements in the introduction to the *Bulletin*, which is written by Mr. M. C. Burritt, apply with equal force to the small farm orchards of this country.

Mr. Burritt points out that in earlier days farmers knew little of scientific orchard management and cared less. The orchard was not looked on as a source of profit, hence was left to take care of itself. As a result, where conditions were unfavourable, the trees became stunted, scrubby, diseased and unproductive. The trees, set too thickly, pushed up till they reached an unmanageable height. Often planted in grass, the hay was taken and nothing returned, or else, when not in grass, rotations of crops were taken and the trees starved. The traveller in this country may also have seen such orchards.

Now, as the writer of the *Bulletin* points out, conditions have changed. Apples are in increasing demand and a certain measure of profit is to be made even out of the small orchard. Hence he asks and answers the question: "Will it pay to rejuvenate the old orchard trees?" The answer, which is based on data collected from orchards in West New York State, is in the affirmative. These data show that average yields obtained from orchards which have—at all events recently—received proper treatment range in different years from 50 to 225 bushels per acre and the price from 2s. to 4s. a bushel. That is, these orchards produce an annual gross return of from £7 10s. to £33 15s. per acre. The last figure appears high, even for America, and the author is careful to point out that the estimates represent returns greater than can be expected from an ordinary farm orchard.

The first step to be taken by anyone who contemplates improvement of his orchard is, of course, as Mr. Burritt points out, to ascertain whether it is one which will pay to rejuvenate. Orchards with a poor stand of old trees, with unprofitable varieties in unsuitable situations, and those with trees wasted by disease, are hopeless. But if the orchard pass these tests it may be made more profitable, and the latter part of the *Bulletin* is concerned with the methods whereby this end may be achieved. Advice is given under four heads: Pruning, fertilising, cultivating, and spraying.

Before giving details of these several operations Mr. Burritt lays down a general scheme of operations: if in sod, plough in autumn about 4 inches deep; if not in grass, plough in late autumn or spring. Spread manure in winter, 12 to 15 loads of farmyard manure to the acre, or give a complete artificial manure in spring. Cut out all dead and diseased wood before growth starts, head back the high limbs and thin to admit air and light. Lime the soil (1,500 to 2,000 lbs. to the acre) and work it and the manure into the soil with a disc harrow or spring-tooth harrow. Keep up this cultivation till midsummer. After cultivation ceases for the season, sow a cover or green manure crop to plough in the following spring. Clover may be used or Rye or Buckwheat. Spray according to instructions given in State and Government publications. Then follow detailed recommendations under the heads we have mentioned. With these, however, it is unnecessary for us to deal, our purpose being accomplished in showing how thoroughly the interests of the farmer are looked after by the U.S. Department of Agriculture.

Supplementary Illustration.—The "Scarlet Odontoglossum," mentioned in a letter by the collector Bowman, in 1867, which was supposed to be based on an erroneous conception of the colour of Miltonia vexillaria, was a standing joke among orchidists for many years, but the advent of the charming Cochlioda Noezliana gave the opportunity to the hybridist to cross that plant with Odontoglossum, and in effect give us the "Scarlet Odontoglossum." Certain of the Odontiodas approach in size and shape so nearly to Odontoglossum crispum, with the scarlet colour predominating, that for garden purposes they are of similar value, especially as the Cochliodas and Odontiodas are like the Odontoglossum, cool-house plants and of easy culture. Most orchidists will remember the first of the race, Odontioda Vuylstekeæ (Odontoglossum Pescatorei × Cochlioda Noezliana), which evoked such great interest at the Temple Show, 1904, when it was shown by the raiser, Monsieur Chas. Vuylsteke. Odontioda Bradshawiæ (O. crispum × C. Noezliana), raised by Messrs. Charlesworth & Co., followed in 1907, the same firm exhibiting as a grand novelty at the Temple Show, 1908, O. Charlesworthii (C. Noezliana × O. Harryanum) of a deep, blood-red colour, and these two are still amongst the best of all the Odontiodas. Then came O. Goodsoniæ, of unknown parentage; O. gattoniensis (C. Noezliana × O. Kegeljanii), and in 1909 O. Lambeauiana (C. Noezliana × O. Lambeauiana), the Westonbirt variety of which, by the kindness of Lieut.-Col. Sir Geo. L. Holford, K.C.V.O., is reproduced in the Supplementary Illustration. Its merits as a brilliantly-coloured, cool-house Orchid may be seen readily by reference to the plate. A peculiarity in these crosses of Cochlioda Noezliana is the persistence with which the progeny retains the red colour of that species, either unbroken or diffused, and seldom in clear blotches, as might be expected when crossed with blotched Odontoglossum as in the Odontioda Lambeauiana, whose parent Odontoglossum Lambeauianum results from crossing O. Rolfeæ (Harryanum × Pescatorei) with a blotched O. crispum. Odontioda Cooksoniæ (C. Noezliana × O. ardentissimum) was one of the attractions of the Temple Show, 1909, and since that time there has been a steady increase of these brightly-coloured hybrids, the last being the pretty scarlet and rose-pink Odontioda Margarita, shown by Monsieur H. Graire at the meeting of the Royal Horticultural Society on September 24 last, and raised from Odontoglossum madrense and Cochlioda Noezliana. Secondary crosses have also been made, one of the best being Odontioda King George V (Odontioda Vuylstekeæ × Odontoglossum laudatum), which was illustrated in *Gardeners' Chronicle* May 28, 1910, p. 349. In this and some other secondary hybrids the colour is more broken up and displayed in large blotches, but the red tint is retained, and in time the counterparts of the existing purple and brown-blotched Odontoglossums may be secured with scarlet or some shade of red in their markings. The future of these desirable Orchids is promising. Mr. de Barri Crawshay, who has produced already improved forms of the best types, and, by way of experiment, has made various crosses which could not be in advance of known kinds, has yet many to develop; Sir Jeremiah Colman, Mr. William Thompson, Mr. R. G. Thwaites and others are still raising crosses, whilst many Orchid nurserymen are also actively engaged in this promising field.

Royal Horticultural Society.—In connection with the show of autumn-blooming Orchids to be held on November 5 and 6 next, there will be a conference in the Lecture Room of the Royal Horticultural Society at Vincent Square, Westminster, on Wednesday, November 6, from 11 a.m. to 4 p.m., when Mr. J. Gurney Fowler, the treasurer of the Society, will occupy the chair. The following papers have been promised:—(1) "Some Epiphytical Orchids," by Mr. H. G. Alexander; (2) "The Physiology of Fertilisation," by Professor Keeble; (3) "The Application of Genetics to Orchid Breeding," by Major C. C. Hurst; (4) "Albinism in Orchids," by Mr. R. G. Thwaites. As the seating accommodation of the Lecture Room is limited, seats should be secured beforehand by application to the secretary, who will be pleased to forward reserve seat tickets to those applying for them as far as the accommodation will allow. *W. Wilks, Secretary, R.H.S.*

National Vegetable Society's Show.—The secretary informs us that the attendance at the recent exhibition at Watford was much more satisfactory than at either of the shows held in London. Mr. Owen Thomas has been appointed chairman in succession to the late Mr. Alexander Dean. Messrs. Dickson, Brown & Tait offered prizes in only four classes; the exhibits credited in our report to this firm were shown in Messrs. Dickson & Robinson's classes.

Flowers in Season.—Messrs. Hugh Low & Co. have forwarded a box of Carnation blooms of several varieties. Baroness de Brienen is a very large flower, of soft, salmon-pink colour, developed on a stout stem; Rosette has fimbriated petals of a beautiful rose-cerise shade; Benora is a white-ground Fancy, tipped and striped with red; and Cinnabar, a shade of terra-cotta red.

Flower Gardening at Battersea.—For the ninth year, with a view to encouraging the cultivation of flowers and plants by the tenants of their houses and tenements on the Latchmere and Town Hall Estates, the Battersea Borough Council arranged competitions for the best-kept outdoor and indoor flower gardens on the estates. There were competitions for (1) upstair window-sill garden; (2) indoor window gardens; (3) back gardens (central); and (4) back garden (side of houses). The entries numbered 43, and the prizes and certificates will be presented by the Mayoress on the 22nd inst.

Presentation to Mr. C. S. Fuidge.—The two special exhibitions instituted by the Royal Southampton Horticultural Society last year, to mark the occasion of the society's jubilee, involved much extra secretarial work, and Mr. C. S. Fuidge, the secretary, has been the recipient of presentations, including a gold medal, from the members. The committee arranged an evening fête, the proceeds of which were handed to Mr. Fuidge at a meeting of the council on the 1st inst. Mr. E. K. Toogood in making the presentation alluded to the fact that Mr. Fuidge had been connected with the management of the society since 1867; having served five years on the committee before undertaking the duties of secretary, which office he has held for 40 years.

Harmless Bees.—According to the *Times* a strain of bees harmless to handle has been successfully hived by Mr. Burrows, of Loughton, Essex. The bees, which have been obtained by mating a Cyprian drone with an Italian queen, are very active workers, and Mr. Burrows claims that they are less liable to disease than the ordinary English bees. The new bees are not stingless, but the sting is innocuous. One hive this year yielded over 200 lbs. of honey.

Wart Disease of Potatos in Canada.—The following amended regulations regarding the importation of Potatos into Canada have been issued by the Deputy Governor-General in Council: "Whereas it is deemed advisable and in the public interest that the importation of Potatos from Europe should be prohibited, therefore the Governor-General in Council is pleased to order and it is hereby ordered as follows:—Section 13 of the Regulations established by Order in Council of February 27, 1911, in accordance with the provisions of Chap. 31, 9-10, Edward VII, entitled 'An Act to prevent the introduction or spreading of insect pests and diseases destructive to vegetables,' is hereby amended by inserting after the word 'from' in the first line thereof the word 'Europe,' so as to read:—'13. The importation of Potatos into Canada from Europe, Newfoundland or the Islands of St. Pierre or Miquelon is prohibited.' —Rodolphe Boudreau, Clerk of the Privy Council, Government House, Ottawa, September 19, 1912."

Hard Seed of Leguminous Plants.—It is a fact well known to seedsmen and others that the seeds of many leguminous plants contain among their number a certain proportion which either germinate slowly or not at all. Such seeds are known as hard seeds, and various methods of treatment are employed in order to encourage their germination. The methods in current use are of two kinds, chemical and mechanical. The latter consists in scratching or rubbing the seed-coat, and for this purpose appropriate machines are in existence. The former method consists in treating the seeds with a strong chemical, that usually employed being concentrated sulphuric acid (sp. gr. 1.84). Although it would appear at first sight strange that seeds should be able to resist such a powerful reagent, the fact remains that many do possess this power. This appears from the experiments of Adrian Brown to be due to the existence in the seed-coats of resistent seeds of a layer which is impermeable to the acid. Such seeds, when treated with sulphuric acid, do not allow this substance to pass beyond the membrane, hence the embryo is protected from its destructive action. A recent *Bulletin* (No. 312) of the Agricultural Experiment Station (Cornell University) describes experiments which confirm the fact already fairly well known, that hard seeds of many leguminous plants such as Red Clover, White Clover, and Alsike, may be induce to germinate after immersion in concentrated sulphuric acid. The chemical method is scarcely likely to supersede the mechanical method, although it has, perhaps, certain advantages over the latter. Thus, according to the authors of the *Bulletin* cited above, immersion in the acid—which may last so long as two hours without causing injury to the Clover seed—effects a destruction of the seeds of certain weeds occasionally associated with samples of Clover. Among the seeds killed rapidly are those of Daisy, Wild Carrot, Bracted Plantain (killed after 15 minutes), and Sorrel, Curled Dock and Old Witch Grass (killed after 60 minutes). The seeds of Dodder (Cuscuta sp.) are, unfortunately, as resistant as those of Clover itself, hence the sulphuric-acid method is useless for the purpose of freeing Clover seed from the seed of this pestilent weed. The method of using sulphuric acid is simplicity itself. The seeds are put in a glass vessel or stone jar, enough acid is poured over to cover them completely, stirred with a glass rod, and allowed to stand. After about half-an-hour the vessel may be stood beneath a tap in an earthenware (not a metal) sink. The tap is then opened and the acid washed away. Seeds so treated may be planted at once, or dried and planted subsequently.

"International Year Book of Agricultural Statistics." — The International Institute of Agriculture has just published in French its first *International Year Book of Agricultural Statistics* (*Annuaire International de Statistique Agricole*, 1910), which is a collection of statistical tables, systematically grouped, and containing figures of area and production of the principal crops and the numbers of live stock, during the decennial period 1901-1910, in the countries adhering to the institute, which are now 50 in number, and include almost the whole of the civilised world. The scope of this Year Book is twofold: in the first place it shows what progress has been made up to the present time in the organisation of agricultural statistics, and, secondly, gives the results obtained from such statistics. The tables, which extend over a period of 10 years, and include a long list of countries, show the area and production of a number of crops, and the years for which figures exist. Figures for all countries are expressed in the same measures, and grouped into concise and intelligible tables so as to enable the reader to form an opinion of the evolution of agriculture either in individual countries or in the whole group of countries adhering to the institute. The volume may be obtained from the Board of Agriculture and Fisheries, 8, Whitehall Place, London, S.W., price 4s. 2d. post free.

Manures. — An interesting example of the need for a proper comprehension of the mode of action of artificial manures is supplied in an anecdote related in Part VII of *A Pilgrimage of British Farming*. The writer of this interesting series of articles, now appearing in *The Times*, gives an account of a farmer who, as a concession to new ideas, determined to apply 10 cwt. to the acre of superphosphate to one of his fields. This he did, with excellent results. Thus encouraged, he increased the application to 16 cwt. in the following year on the same field, and, not unnaturally, got little or no crop. He then reverted to the use of dung, and obtained a magnificent return, because, with the nitrogen of the dung, the hitherto unused phosphate came into action. The conclusion which the farmer drew was that superphosphate and such like manures were foolishness, and that dung alone was good. The anecdote illustrates the need for the constant reiteration of the fact that the mineral needs of plants are various, and that it is not possible to satisfy a plant hungry for nitrogen with an excess of phosphates or something else. The wise gardener makes use of both dung and artificials.

Captain Cook. — The memorial erected at Whitby to the memory of that great navigator, Captain Cook, may remind us that this wonderful man was not only a great sailor and a great geographer, but also a botanist of considerable attainments. The basis of his greatness lay no less in his fearless and adventurous courage than in his wonderful powers of observation—powers never more beneficently exercised than when they led him to the discovery that change of diet may prevent the outbreak of scurvy—that gravest of diseases incident to sailors.

LIFTING PEACHES AND NECTARINES.

On several occasions I have lifted large trees of Peach and Nectarine early in October, when the leaves were still quite green and fresh, transferring them to glasshouses with perfect success. One of the most important details in the work is to have everything in readiness, so that the roots may be restored to the soil after as little exposure to the air as possible. For many years I have trained young trees on walls expressly for the purpose, and have utilised them to replace trees that are worn out or that have given unsatisfactory crops. It is well known that trees that have been trained out-of-doors in the way I have described soon yield heavy crops of fruit when transplanted carefully under glass, and produce shoots of a medium growth, which is best for the production of large crops of first-class fruits. Borders intended for planting Peach trees need not exceed 2 feet 6 inches in depth; the subsoil should be well drained, nothing being more harmful to the roots than a cold, water-logged soil. This is all the more important seeing that, however carefully other details are attended to, trees in an unsuitable rooting medium never succeed satisfactorily. After the drainage materials have been placed in position, and covered with turves placed grass-side downwards to prevent the finer particles of soil from filling the interstices, the trees may be planted in sweet, mellow loam procured from an old pasture, mixed with a quantity of old mortar rubbish, wood ashes, and well-decayed manure, these ingredients serving to keep the compost open. As the soil is often dry at this season, it is well to give the roots a good soaking with water a few days previous to lifting the trees. Plant rather firmly, and, when the work is finished, shade the trees for a few days and syringe them overhead daily during bright weather. One good watering at the roots should suffice for some time after planting, and will settle the soil in position. The following varieties may be recommended in the order of their ripening:—*Peaches:* Hale's Early, Rivers's Early York, Stirling Castle, Royal George, Dymond, Bellegarde, Crimson Galande, Barrington, Nectarine Peach, Sea Eagle, and Princess of Wales. *Nectarines:* Lord Napier, Stanwick Elruge, Pine Apple, and Humboldt. There are other excellent varieties than those named, but I have not included them, as they would not extend the season. *H. Markham, Wrotham Park, Barnet.*

SCOTLAND.

GUNNERA MANICATA.

Nowhere does Gunnera manicata flourish so well in the United Kingdom as in Ireland, where the generally mild climate and the presence of a good deal of atmospheric moisture prove congenial to this noble foliage plant. In the south-west of Scotland, parts of which have a climate approaching that of Ireland, there are some fine plants of this species, and its cultivation appears to be extending. I know of plants which have been established for several years, and some of these are of considerable size. The largest specimen is one of two plants at St. Mary's Isle, Kirkcudbright, in Captain Hope's lovely garden, where so many good plants are grown. Several of the leaves were 8 feet across, and the plant was 10 feet high, with a circumference of 60 feet. The other plant was smaller, but it had been removed last spring; eventually it will probably rival its neighbour. I am aware that this specimen, which is on a lawn, does not equal in size some of the plants grown in Ireland, but it must be remembered that, after all, the climate of Scotland is not quite the same as that of Ireland, and that some of the Irish Gunneras have been longer planted. There is, or was, a magnificent specimen at Narrow Water Castle, and another fine specimen at St. Anne's.

PRESENTATION TO A GARDENER.

On October 2 a public presentation was made to Mr. William Thomson, who has for a number of years been gardener at Cally House, Gatehouse, Kirkcudbrightshire. The movement originated with the members of the local horticultural society, but it was warmly supported by others. The presentation was made by the Provost of Gatehouse, and consisted of a purse of sovereigns. Mrs. Thomson was given a silver teapot. *S. Arnott.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

The Northern Fruit Congress and the N.E.H.S. — I was rather astonished to see Mr. Smith's letter in your paper, and would have passed it by in silence, but I feel compelled to make one or two statements. (1) It has all along been assumed by the Central Hexham Committee that the congress would "go the rounds." (2) Naturally, I approached Mr. Smith, the Durham County Council instructor, with regard to a congress in Durham. The question is: Does Durham, and Darlington in particular, desire the Northern Fruit Congress in 1914? One county nobleman has already publicly expressed a wish for it to visit Darlington. (3) Mr. Smith has never been asked to request his county council for cash. He has been invited to approach his county secretary for co-operation, such as has been so courteously accorded to us at Hexham, Newcastle, and Carlisle. (4) If certain people are foolish enough to part with hard cash to pay up deficiencies, it does not follow that the Northern Fruit Congress is a failure—educationally. The promoters of it were out, and are still out, for education. We think we have been of some use. (5) I fear that Mr. Smith has—to use a midshipman's phrase—got hold of the "sticky end of the stick." Good luck to him, however, in his endeavours to arouse Durham. *J. Bernard Hall.*

———I was hoping that I would never again have cause to question any of Mr. Smith's statements, but really I cannot let the letter on page 269, under the above heading, go unchallenged. If he had taken part in the recent congresses and shows, he would, perhaps, have been better qualified to write on the subject. The statement that the Northern Fruit Congresses of the past few years have been more or less a one-man scheme and a financial failure is entirely false, and reflects on the working committees, which were formed at Hexham, Newcastle, and Carlisle. Certainly there was a deficit on the first year's meeting, owing to the enormous expenditure incurred by having the programme carried through on a somewhat elaborate scale, but this was the first year of such a congress and show, and more or less an experiment. Moreover, it was not a case of Captain Cuthbert "having" to pay a deficit of £50. It was given generously without solicitation, and, so confident was Captain Cuthbert of the good work done by the congresses that he visited and took an active part in the Newcastle meeting of 1911, and this year, at Carlisle, he made a capital speech at the opening ceremony in support of such meetings. As regards the Rev J. B. Hall dropping £30 at Newcastle (!), all I can say is that I received a letter from Mr. Morrison, the Newcastle secretary, saying that the Chrysanthemum Society had finished up with a good balance in hand, largely owing to the interest created by the fruit show and congress. This year, at Carlisle, in spite of the adverse weather conditions, we are also in the fortunate position of being able to declare a balance. So far from it being a one-man scheme, I might say that Mr. Hall had practically nothing to do with it this year. A local committee was formed, and included well-known growers like Messrs. J. Millican and R. Leslie, who, together with myself, drew up the schedule and made all arrangements, even selecting the subjects of the papers to be read and collecting the donations. The N.E.H.S. was then invited to send delegates to take charge of the judging, and this it did gratuitously. Mr. Hall also came down and rendered valuable assistance. I know that the Newcastle Committee were responsible for the organisation of the show, &c., there, but need not give details. With regard to the Kendal meeting in 1913, perhaps the following information will interest Mr. Smith. Long ago, a well-known local lady, Mrs. F. W. Crewdson, Levens, kindly undertook to make all preliminary arrangements and act as secretary pro tem. Up to date she has about £100 guaranteed, and a meeting is being convened for October 19 to form a working committee. The Director of Education in Westmorland is also taking an active part in the scheme. Surely this system of

forming local committees, to organise each congress according to local requirements, is a good and sound one. Mr. Smith assumes that none of the Durham County Council representatives are enthusiastic. Can he really be in earnest when making such an assertion? I must say I found the Cumberland and Westmorland County Councils only too pleased to further our efforts here, and when, 12 months ago, I approached them for a grant towards defraying the out-of-pocket expenses of two lecturers, I was asked for an estimate. This I put down at £10, and this sum was immediately recommended. I do not wish to encroach on your space further, but must express regret that Mr. Smith was only present at one of the three congresses, and also emphasise the fact that the Carlisle Committee invited the N.E.H.S. to visit its exhibition, and doubtless the Kendal Committee will do the same, so, apparently, the old custom referred to by Mr. Smith at the conclusion of his letter is not yet quite dead. *W. B. Little.*

———As one greatly interested in the Fruit Congresses held at Hexham in 1910 and Newcastle in 1911, I was pleased to see from Mr. Smith's letter that someone was moving in the matter of continuing the congresses. Many of us in the north would gladly co-operate in making them a success. The 1911 Congress was a great success, and the statements that there was a loss of £30 and that the Rev. J. B. Hall accepted any responsibility are incorrect. *Fredcrick Fox, Newcastle-on-Tyne.*

Sweet Peas in April (see p. 266) — It might be said that Devon's genial climate favours the autumn-sown Sweet Peas, but I believe that in many another county cultivators would be successful provided care and attention were given the seedlings for some time after they appear above the ground. On October 17 last year I took out a trench 18 inches in width and as much in depth, forked up the bottom soil, and then placed a moderate layer of well-decayed stable manure in the trench. I returned part of the soil, and then scattered a good layer of wood-ashes with another layer of soil on the top. The soil was pressed moderately firm and the seeds sown. As soon as the seedlings appeared, and at short intervals, a mixture of wood-ashes and fresh soot was scattered amongst the little plants to ward off slugs and sparrows. Out of two rows, 28 and 20 yards in length respectively, I did not lose a score of plants. In December small shoots of Holly and the green Euonymus were inserted on both sides of the row as a protection against winds and frosts. Early in January we experienced 18° of frost and a heavy fall of snow for Devonshire, but the cold did not injure the plants in the least. I staked them early, and by May 12 I was able to gather good, stout flower-spikes each carrying three and four blooms, which realised good prices in Covent Garden Market up to the middle of June. Successional sowings in early March and the end of April continued the supply up to the frost of last week. *James Mayne, Mill Roy, Budleigh Salterton, October 5.*

———The interesting directions contained in the leader on p. 266 will be very useful to growers who have to provide Sweet Peas as early in the year as possible. I remember when living in Kent some years before 1864, and for many years after, we had the plants in flower early in the spring by sowing early in the previous autumn in the open. I cannot remember the date when the first flowers usually appeared, but most likely some reader of the *Gardeners' Chronicle* living in that beautiful county will be able to supply it. After reading the particulars given on p. 266 it seemed to me much easier to continue the old plan of sowing outside in the autumn; few gardeners can spare room under glass for Sweet Peas in the early spring, and they are also occupied with other matters at that time. In the year 1864 there were, I believe, no named varieties in existence, for the first one I remember was Scarlet Invincible, which was sent out soon after. We grew a mixture which included very similar colours to that which is sold at the present time. We obtained plenty of flowers by successional sowings, but not so large and perfect as the named varieties of to-day. Some of the recent varieties are not so hardy as the earlier kinds. Venus, Gladys Unwin, Flora Norton, and Miss Willmott survive the winter outside here, and flower splendidly in the early summer; this year the first flowers were open on May 23, and a very large quantity of bloom was gathered from a row 160 feet long in the succeeding weeks. Other varieties that have survived the winter in previous seasons are Mars and Gorgeous. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

Curious Radishes (see p. 270). — Mr. Sheldon's illustration of a Radish tied into a knot is not the first instance, for I possess an excellent water-colour drawing of a similar Radish by Mr. W. G. Smith, and given to me by the late Dr. M. T. Masters. It grew in Mr. Saunders's garden in 1866. Two Carrot roots, spirally twisted, have been illustrated in the *Gardeners' Chronicle* (reproduced in fig. 128); also, that of a forked Carrot root, the two branches being spirally twisted together. Perhaps Darwin's discoveries of the way roots try to avoid obstructions may explain the process, as shown

Fig. 128.—Two carrot roots spirally twisted.

by his figure of Zea Mays, D. (*The Movements of Plants*, p. 179, fig. 69), of which the root has twisted itself into a knot, as fully explained by the author. *George Henslow.*

Leonardslee Rockery in September.— The weather during September was drier and brighter than for several preceding months, and the display of flowers on the rockery unusually good. On the moraine the dwarf and free-flowering Oxalis lobata was very pretty with its erect, yellow flowers, 3 inches in height. Silene laciniata Purpusii was also very charming; its scarlet flowers gave an extra bright touch of colour. The plant is not one of the strongest growers, and, owing to slugs being very fond of the shoots, it requires some care. Iberis gibraltariaca is a Candytuft, which produces its pink flowers very freely. Odontosperma maritima is suitable for large or small fissures in the rocks, where its growths may trail suspended and display the bright golden-yellow flowers; this species should be propagated by cuttings at the present time, it being unlikely that plants on the rockery will survive the winter. Androsace lanuginosa was a perfect mass of colour; it is certainly one of the gems in early autumn. Campanula Hendersonii still remained in bloom, and Veronica Catarractæ with white, pink-eyed flowers. The Mesembryanthemums were gorgeous. Some of the best of 50 varieties include M. azureum, M. Cooperi, M. aureum, M. coccineum, M. blandum and M. spectabilis. The Mesembryanthemums are propagated annually, though one of the species, M. edulis, stands well out-of-doors without damage throughout the winter. A week ago when in Cornwall I noticed by Poldhu, the Marconi station, hedges of this variety, but they looked as if they had suffered severely from the severe frosts of last winter. The best method of propagation is to take the cuttings in the usual way and place five or six together in 4½ inch pots and put them in a frame. If the atmosphere is kept close for a few days, the cuttings will soon produce roots, when they can be removed to a cool but frost-proof frame, or be placed on a shelf near the glass in a cool house. September and October are two months in which Alpine gardeners should take notes to assist them in their preparations for next season. *W. A. Cook, Leonardslee Gardens, Horsham.*

Blue Tits and Sweet Peas.—These pretty little birds have been a great pest in these and other gardens in this district during the past summer, so much so that, unless something can be found to combat them, exhibition flowers will not be grown. It is strange that they do not attack Sweet Peas when sown thickly and not disbudded, but so bad was the attack on the disbudded plants that it was necessary to keep someone continually scaring them. At first I tried spraying the plants with Quassia extract in the hope of making the buds distasteful to the birds, but this was of no avail. I next used a shot gun, but although one victim was killed on the top of one stake, another daring (or tame) tit would still be perched on an adjoining stake. I watched them at work, and found that they were trying to find seeds, but I could not understand why they were so persistent when they were, apparently, constantly disappointed. The strangest part of it is they ceased attacking the plants entirely during one or two weeks of hot sunshine. After our local show I stopped scaring, with the result that not one single flower was allowed to open, and this continued from August 1 until the middle of September. *A. J. Elgar, Killarney House Gardens, Co. Kerry.*

American Blight and Decoction of Elder Shoots.—The remarks of Mr. J. Smith (p. 251) on this subject open up a wide question. It is to be hoped further trials in the direction named may be carried out. I know nothing as to the merits of carbide of calcium mentioned by Mr. Smith as a deterrent of American blight, but have used and seen used a decoction of Elder leaves for over forty years past, mainly as an antiseptic to ward off thrips, red spider, and green or black fly. I first learned of its use from the gardener at Constable Burton, near Bedale, in 1870. He was a self-taught man, as he told me, having spent his early days in farm work. His employer, Mr. McLaren, was a lover of indoor plants and fruits in general. Being only a tenant of the place, and as the kitchen gardens and glass connected therewith were some distance from the house, he erected a group of glass houses near to the residence. They were put up in an unconventional way, with the object of being removed at the close of his lease. The arrangement of their occupants was quite as unusual as were the structures. They included some of the finest specimen Cattleyas, Lælias and Dendrobiums of the older species and varieties then to be seen in the country. They were growing in varied receptacles, such as pots, baskets and on blocks, the latter formed in curious shapes from branches of wood, mostly Elder. No doubt some of your older Orchid grower readers will remember the collection. On my asking the gardener for hints as to his culture, he pointed to a small plantation, with a robust undergrowth of the common Elder. It was the duty of the garden boy once a week to go and cut and tie up as many small bundles of the shoots as there were open tanks in the houses, taking out the old and putting in the fresh bundles. He was specially instructed to lay each bunch on the pathway, and jump on it, to let out the "juice," as he put it. Syringing and watering were done from these tanks. A good many years ago I discussed the matter with that veteran plant cultivator, the late Mr. Thomas Baines. His opinion was the same as my own, namely, that any cultural benefits derived were of an antiseptic character; the foliage, compost and roots being made unpleasant to insect pests. Later on I used Elder shoots in a similar way, and, I believe, with benefit, especially with Crotons and Cattleyas. I also tried decoctions of Feverfew, Foxgloves and the common Laurel, with the same object. The two latter plants are of a poisonous character. In these days

of what I may term scientific insecticides, the above remarks may be set down by some as a bit out of date. They are simply records of facts, observed and practised. If Mr. Smith's experiments are confirmed by experience, he will deserve the gratitude of fruit-growers. The only remedy I have found for American blight on Apples has been a winter dressing of clay paint and coal tar well mixed together. *Yorkshire Gardener.*

SOCIETIES.

ROYAL HORTICULTURAL.

October 8.—The fortnightly meeting held on Tuesday last in the Society's Hall, Westminster, was a great success; the large Hall was filled with groups, which overflowed into the two annexes.

The largest exhibit was a collection of ornamental trees and shrubs shown by Messrs. James Veitch & Sons, for which a Gold Medal was awarded. Another feature was a collection of Bamboos displayed by Mr. L. R. Russell. Other exhibits in the floral sections included Roses, Carnations, Chrysanthemums, border Asters, Begonias and Ferns. The Floral Committee conferred nine Awards of Merit to novelties.

The groups of Orchids were remarkably good for the time of year, and the Orchid Committee granted one First-class Certificate and four Awards of Merit to novelties.

There were several important exhibits before the Fruit and Vegetable Committee, but this body made no award to a novelty. A Gold Medal was awarded to Messrs. James Veitch & Sons for a collection of Apples and Pears.

At the 3 o'clock meeting in the Lecture Room, Dr. Charles Crowther gave an address on "The Influence of Atmospheric Impurities on Vegetation."

Floral Committee.

Present: H. B. May, Esq. (in the Chair); Messrs. John Green, R. Hooper Pearson, W. J. Bean, C. Blick, J. F. McLeod, Wm. Howe, J. Jennings, J. Dickson, Charles Dixon, H. J. Jones, Charles E. Shea, Chas. E. Pearson, W. P. Thomson, E. H. Jenkins, W. J. James, W. G. Baker, and G. Reuthe.

Messrs. James Veitch & Sons, Ltd., King's Road, Chelsea, put up the largest group in the Hall. It comprised a collection of some 260 ornamental shrubs and trees, including many recent introductions from China. The exhibit was pleasingly arranged, the blending of the various subjects showing the different tones of foliage and coloured fruits to the best advantage, whilst the front was decorated with dwarf specimens, of which the beautiful Berberis Wilsonæ in fruit was strikingly handsome. We can only enumerate a few of the more interesting subjects :—Cotoneaster rugosa Henryi, with flat clusters of scarlet berries; Pyrus Veitchii, with dull-red fruits; Ilex Veitchii; Viburnum Davidii; Berberis brevipaniculata; Stransvæsia undulata, showing a fine colour in the foliage, and bearing bunches of scarlet berries; Ilex Pernyi; Fraxinus bracteata, the fine, dark foliage is retained late in the season; Berberis verruculosa, the dark-green leaves being glaucous beneath; Sarcococca ruscifolia; Lonicera nitida, a shrubby evergreen Honeysuckle, resembling a Cotoneaster; Libocedrus macrolepis, not quite hardy, but very beautiful, the shoots having a golden sheen; Viburnum Henryi, finely in fruit; and Magnolia Delavayi, a handsome evergreen species. Messrs. Veitch also showed miscellaneous indoor flowering plants, including Lapageria rosea, and its white variety, varieties of greenhouse Rhododendrons of the javanico-jasminiflorum type, a fine batch of Nerine Fothergillii major, varieties of Bouvardia, and Abutilons. (Gold Medal.)

Mr. L. R. Russell, Richmond, Surrey, exhibited 45 species and varieties of Bamboos, the collection occupying a space of 500 square feet. Some of the plants were 15 feet high. The finer specimens were Arundinaria fastuosa, A. Hindsii graminea, A. Simonii, A. nitida, Phyllostachys aurea, P. castillonis, P. Quilioi, P. violescens, P. viridi-glaucescens, Bambusa disticha var. Alphonse Karri, B. palmata, B. tessellata, Thamnocalamus Falconeri, and T. nana variegata. (Silver Flora Medal.)

Messrs. H. B. May & Sons, The Nurseries, Upper Edmonton, showed a collection of stove and greenhouse Ferns. Davallias, Adiantums, Polypodiums, Aspleniums, and varieties of Nephrolepis were represented by well-grown specimens. (Silver Banksian Medal.)

Messrs. J. Hill & Son, Lower Edmonton, exhibited a group of Asplenium Nidus, the Bird's Nest Fern, including the variety laceratum, and a sporeling with dissected and sub-divided leaves like those of Asplenium Herbstii. The specimens exhibited splendid culture, some of the fronds being 5 feet long. (Silver Flora Medal.)

Messrs. W. Wells & Co., Merstham, Surrey, displayed blooms of Japanese Chrysanthemums of the exhibition type, including the varieties Frances Jolliffe, Hon. Mrs. Lopes, Thorp's Beauty, White Queen, and the new Mrs. G. Lloyd Wigg. Interspersed amongst these were smaller vases of the much prettier single and decorative sorts, such as October Gold, Altrincham Jewel (yellow, single), Mdlle. L. Fourneau (pink), and Delores (rosy-buff). (Silver Banksian Medal.)

Messrs. Cragg, Harrison & Cragg, Merrivale Nurseries, Heston, Middlesex, showed vases of Chrysanthemums as grown for market. Nothing could be finer for decorative purposes than the beautiful blooms of Mrs. Rootes (white), Celia (yellow, single), Juliet (vinous red), Miss Collier (white), Phoebe (purple), and Crawfordia (yellow).

Messrs. John Peed & Son, West Norwood, arranged a very pleasing group of Chrysanthemums, the blooms being set off by Ferns. White Queen, David Ingamells's Yellow, Mary Bulton, Mrs. F. C. Stoop, C. Lock, and Capt. Julyan are well-known exhibition varieties.

The Misses Price & Fyfe, Grove Park Nursery, had a small exhibit of Chrysanthemums of well-known varieties.

Mr. F. Lilley, Guernsey, showed Nerines. The largest and most striking was N. coruscans major; N. Bowdenii is a beautiful pink flower, and very tall; N. elegantissima has wavy, salmon-pink petals; and N. delicatissima narrow, pure-pink petals. (Silver Banksian Medal.)

Messrs. T. S. Ware, Ltd., Feltham, exhibited blooms of tuberous-rooted Begonias on boards, with a few plants at the back of the group. Adjoining the Begonias, this firm showed a large bank of Michaelmas Daisies and border Chrysanthemums. (Silver Banksian Medal.)

Lady Grey exhibited sprays of Heaths and allied plants, also flowers of Protea, from an exhibition of wild flowers held at Caledon, Cape Colony on September 14. (Silver Flora Medal.)

Messrs. W. Paul & Son, Waltham Cross, showed baskets and epergnes of Roses. Blooms of Juliet Corallina, Mme. Abel Chatenay, Ophelia, Laurent Carle (a beautiful shade of carmine), Mrs. A. R. Waddell (reddish-salmon), Lady Hillingdon, and Mrs. Chas. Hunter were all remarkably good. (Silver Banksian Medal.)

Messrs. Ben R. Cant & Sons, Colchester, staged a bright group of Roses, for which a Silver Flora Medal was awarded. Conspicuous varieties were Lady Hillingdon, Lyon Rose, Alexandra Zariii (a delightful H.T. single variety, the beautiful buds being stained with red on a pale-orange ground), Georges Nabonnand, General McArthur, and St. Helena (a large H.T. variety of pale colour).

Messrs. Frank Cant & Co., Colchester, showed Roses, for which a Silver Banksian Medal was awarded. The best varieties, as exhibited, were Lyon Rose, Hugh Dickson, Peace, Lady Hillingdon, Mrs. Wakefield Christie-Miller, Rayon d'Or, and Alice Roosevelt.

Messrs. W. & J. Brown, Peterborough, showed Roses in boxes, and on tiers of staging covered with black velvet. The group included excellent flowers of Juliet, Sunburst, Maman Cochet, White Maman Cochet, Lyon Rose, and Mme. Vermorel. (Silver Flora Medal.)

Messrs. Stuart Low & Co., Bush Hill Park, Middlesex, made a bright display with Carnations, relieved with Nephrolepis Ferns. The new Benora variety is a white-ground fancy, tipped with red. It is very free in blooming, possesses a long, stout stem, and is slightly fragrant. (Silver Banksian Medal.)

Varieties of Carnations were also displayed by Messrs. Allwood Bros., Haywards Heath.

Messrs. H. Cannell & Sons, Swanley, Kent, showed Zonal Pelargoniums, vases of Helianthus sparsifolia, and a semi-double sport from Chas. Turner Ivy-leaved Pelargonium, named Vicar of Shirley. This new flower has scarlet and rose petals, the upper segment bearing dark blotches. New Zonal varieties included Bornemann's Best, a dark cerise flower of large size. (Bronze Banksian Medal.)

Messrs. Dobbie & Co., Edinburgh, showed numerous varieties of Collerette Dahlias. (Silver Banksian Medal.)

Mr. H. J. Jones, Ryecroft Nurseries, Hither Green, Lewisham, showed 40 varieties of Michaelmas Daisies, with specimen blooms of Japanese Chrysanthemums. (Silver Banksian Medal.)

Messrs. Barr & Sons, King Street, Covent Garden, showed seasonable border flowers, including the fine blue Aster Ultramarine. In the centre of the group were spikes of Gladioli Peace, Dawn, and Afterglow. The exhibit included a selection of border Chrysanthemums. (Silver Banksian Medal.)

Messrs. W. Cutbush & Son, Highgate, filled a corner of the hall with a bank of garden flowers, principally varieties of border Asters. In the centre was the fine variety Climax, and in front of this an epergne of Pentstemons. There were large vases of Tritomas, Helianthus oryzalis, Phytolacca decandra in fruit, and Solidago. Messrs. Cutbush also showed, as a separate exhibit, Carnations above a ground of dwarf Polyantha Roses.

Mr. James Box, Lindfield, Sussex, furnished the corresponding corner at the end nearest the clock with a similar group, in which Phloxes, Gladioli and Chrysanthemums were conspicuous features. The arrangement was extremely good. (Silver Flora Medal.)

Messrs. Geo. Jackman & Son, Woking, Surrey, were awarded a Silver Banksian Medal for a large group of Roses and border flowers.

Several beautiful new Seedling Asters were shown by Mr. Ernest Ballard, Colwall, Herefordshire. Glory of Colwall, pale lilac; Lady Lloyd, rose-pink with purple sheen; and Peggy Ballard, a semi-double mauve-coloured variety, were amongst the best.

Michaelmas Daisies were also shown by Messrs. W. Fells & Son, Hitchin; Messrs. Carter Page, London Wall; and Mr. George Reuthe, Keston, Kent, who also displayed a number of Alpine plants.

Mr. Ernest Dixon, Roehampton Nurseries, contributed a small group of garden flowers.

Mr. J. T. West, Tower Hill, Brentwood, showed Dahlias of various types, including many of the pæony-flowered varieties. One of the finest decorative sorts is Brentwood Yellow, which received an Award of Merit last season. (Silver Banksian Medal.)

Mr. Reginald Prichard, West Moors, Wimborne, arranged a small rockery.

The Misses Hopkins, Shepperton-on-Thames, and Mr. Leslie Greening, Richmond, arranged small rock-garden exhibits.

Awards of Merit.

Aster Nancy Ballard.—A seedling from the well-known Beauty of Colwall variety. It has the same stiffly-erect habit and rather rounded heads of flowers, but appears to be denser and more free-flowering. The colour, a purplish-mauve or a light shade of Bishop's violet-purple (*Rép. de Couleurs*), is also brighter. The flowers are about 1 inch in diameter, and are very double. Raised and shown by Mr. E. Ballard, The Court, Colwall, Herefordshire.

Berberis Stapfiana.—A dense, spiny bush, with deciduous foliage, reminding one of B. Thunbergii, but the growths are more erect and the leaves not red-tinted. The berries are coral or currant-red, borne in dense, close clusters. The specimen shown was about 4 feet high, and well berried. Raised from seed collected by E. H. Wilson in China, and shown by Messrs. J. Veitch & Sons, Ltd.

Pyrus Veitchiana.—A handsome, fast-growing tree, with spreading branches, raised from seed sent from China by Mr. E. H. Wilson. The leaves are simple, broadly ovate, with finely-toothed lobes. The dull-crimson berries make the tree ornamental, being very freely borne in heavy clusters; each about half-an-inch in diameter. Specimens have already attained 15 feet in height at the Coombe Wood Nursery. Shown by Messrs. Jas. Veitch & Sons, Ltd.

Adiantum cuneatum var. micropinnulum (see fig. 129).—This variety was raised from A. cuneatum var. gracillimum; it shows a much finer division of the pinnules, and the young fronds are beautifully tinted with rosy-bronze. It is the most feathery and graceful of all the cool-house Adiantums, and, although not quite new, is very little known. The plants were shown in 4½-inch pots by Messrs. H. B. May & Sons.

Chrysanthemum Celia.—A yellow, single flower, which is very effective with the green of the opening disc. Disbudded blooms 4 to 5 inches in diameter were shown, carrying five or six rows of ray florets, but the later blooms in spray are said to be equally good. Stout stems and stiff petals add to the value of the flowers, but its great charm lies in the vividness of the colouring. Raised and shown by Messrs. Cragg, Harrison & Cragg, Heston.

C. Mrs. G. Lloyd Wigg.—A very large, rather flat-headed, lemon-yellow Japanese variety, which was shown in better condition at the National Chrysanthemum Society's exhibition at the Crystal Palace on October 2, when it received the First-class Certificate of the N.C.S. (see p. 274). Shown by Messrs. Wells & Co.

Cotoneaster bullata.—A vigorous shrub, of loose, open habit, notable for the rich, stalked, pendent clusters of large, glossy, crimson berries, borne freely on the short spurs produced in the axils of last year's leaves. The ovate, pointed leaves measure about 3 inches long and 2 inches wide. Raised from seed collected by E. H. Wilson in China, and shown by Messrs. J. Veitch & Sons, Ltd.

C. salicifolia var. rugosa.—A very handsome, sub-evergreen shrub, with markedly weeping or pendent habit, and very characteristic, Willow-shaped, lanceolate leaves, about 2 inches by ¾ inch, much wrinkled between the deep-set feather veining, and downy on the under-surface. The berries are bright scarlet, ¼ inch in diameter, globular, borne in clusters of 6 to 12, or more. This variety was the best of the new Chinese shrubs exhibited at this meeting.

C. Zabelii.—A sub-evergreen, Chinese shrub, of vigorous habit, making long, arching growths, clothed with ovate, pointed leaves (about 1½ inch by ¾ inch), which are downy on the under-surfaces. The berries are borne in clusters of from three to nine or more, on short spurs, are of a good size, flattened at the head, but of too dull a crimson to make the plant showy in autumn. A pot-grown specimen was shown, and the species gives promise of developing into a small tree. These two last were shown by the Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. E. Beckett, V.M.H.).

Some Further Novelties.

The new Chinese shrubs exhibited by the Hon. Vicary Gibbs and Messrs. Veitch formed one of the most interesting features of the show. Of those entered for certificate, Cotoneaster salicifolia var. rugosa was the most ornamental, but it was a little unfortunate that the variety shown by Messrs. Veitch under the name of C. rugosa Henryi was not also entered for award, as in the length and character of the leaves and the size of the clusters of berries it was a decided improvement on the type shown by Mr. Gibbs.

Mr. Gibbs exhibited Cotoneaster Dielsiana elegans, a wiry, erect form, very distinct in habit, but not berried richly enough to make it striking, and C. integerrima (acutifolia) villosa, a pretty, dense-habited, dwarf species with inconspicuous berries, but richly-tinted foliage.

Messrs. Veitch included a number of new species, of which the most striking were Osmanthus armatus and Cotoneaster Harroviana. The latter has small clusters of scarlet berries, and the Osmanthus is characterised by very deeply-toothed, firm-textured leaves, which are as much as 5 inches long. These the Floral Committee desired to see again. Other good novelties included Ilex Veitchii, a species suggesting I. Pernyi in foliage and pyramidal outline, but bolder in growth, and Eleutherococcus Henryi, a quinate-leaved shrub with growths terminated by Privet-like clusters of black berries. Lycopsis sinensis and Stransvæsia undulata were shown in fruit.

In addition to the double Aster receiving an Award of Merit, Mr. Ballard also showed Glory of Colwall, which was awarded a First-class Certificate at the Edinburgh show. The flowers were much larger than those of Beauty of Colwall, and of a pale mauve, but they were past their best. They showed, however, the possibilities in the development of the large-flowered double Michaelmas Daisies, and were much admired.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Messrs. Jas. O'Brien (hon. sec.), R. A. Rolfe, J. Wilson Potter, W. Thompson, R. G. Thwaites, F. J. Hanbury, T. Armstrong, A. McBean, C. H. Curtis, J. Charlesworth, J. Cypher, W. P. Bound, J. E. Shill, H. G. Alexander, Arthur Dye, W. H. White, Gurney Wilson, William Bolton, J. S. Moss, de B. Crawshay, Sir Harry J. Veitch, and Sir Jeremiah Colman, Bart.

Lieut.-Col. Sir George L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed three finely-grown hybrids of merit, namely, Lælio-Cattleya Berthe Fournier var. Fascinator (L.-C. elegans × C. aurea), with six large, bright-rose coloured flowers on a spike; L.-C. Priam (C. Harrisoniana × L.-C. callistoglossa), a good flower resembling C. Armstrongiæ; and the richly-coloured Cypripedium Draco "Holford's variety."

H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for a group in the centre of which was his fine Cattleya Iris King Edward VII, which had previously secured a First-class Certificate and was illustrated in the *Gardeners' Chronicle*, October 16, 1909, p. 258; the handsome Cattleya Hardyana received an Award of Merit (see Awards); Sophro-Lælio-Cattleya Elissa (S.-L. Gratrixiæ × C. Hardyana) was novel in colour; Lælio-Cattleya Carmencita (C. Dowiana Rosita × L.-C. luminosa) when developed will be a good and distinct hybrid; and other fine hybrids were noted, including good forms of Lælio-Cattleya Bletchleyensis; L.-C. Elva var. Herbert Goodson; Cattleya fulvescens; C. Rhoda; Odontoglossum crispum Nellie Blanche, a very large white flower with spotting on the sepals; and Miltonia vexillaria "Memoria G. D. Owen."

Messrs. Sander & Sons, St. Albans, were awarded a Silver-gilt Flora Medal for an extensive group containing many interesting plants. Among the hybrids, Cattleya Isis (Ella × Hardyana) was a pretty light rose-coloured flower with dark, ruby-red lip having a small, yellow spot on each side; C. Fabia Rex, white with a finely-coloured lip; Lælio-Cattleya Britannia (C. Warscewiczii × L.-C. Canhamiana), an attractive flower; several Brasso-Cattleyas, and the new Brasso-Lælio-Cattleya Astarte (L.-C. Martinetii × B. Digbyana), a clear, rosy-lilac flower with primrose-coloured disc; Cattleya Hardyana "Royal Sovereign," white mottled with lilac and with dark ruby lip; C. fulvescens, various hybrid Odontoglossums and Cypripediums. Among the species were Oncidium Marshallianum magnificum, a large yellow flower with red-brown blotches on the petals; Cycnoches Egertonianum viride, the green and white Catasetum Russellianum, Epidendrum auratum, Cirrhopetalum, reflactum, and others.

Fig. 129.—Adiantum cuneatum var. micropinnulum. (R.H.S. Award of Merit on Tuesday last.)

E. H. Davidson, Esq., Borlases, Twyford, was awarded a Silver Flora Medal for a group containing a fine selection of forms of Cattleya labiata varying from the blush-white petalled to the dark-purplish crimson, that named Davidson's variety having a lip almost entirely of a deep claret-crimson. Other fine novelties were Odontoglossum Eric, almost entirely of a deep reddish-purple and Lælio-Cattleya Virginia (L. purpurata alba × C. Harrisoniæ alba).

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a Silver Flora Medal for a group in which were some interesting Cattleya crosses and showy species of Cattleyas. Also the new Brasso-Cattleya Pittiana (B.-C. heatonensis × C. Mrs. W. J. Whiteley), a neat, rosy-lilac flower with a light base to the slightly-fringed lip, well-grown Odontoglossums, Odontioda Charlesworthii, and other Odontiodas.

Messrs. Stuart Low & Co. obtained a Silver Flora Medal for a group at the back of which were some good Oncidium varicosum. With them were Dendrobium Phalænopsis, D. formosum giganteum; varieties of C. labiata, C. Iris, C. O'Brieniana alba, C. Hodkinsonii, Miltonia Bleuana, Pleione lagenaria, and a selection of hybrids.

Messrs. J. Cypher & Son, Cheltenham, were awarded a Silver Banksian Medal for a group in which were a fine form of Cattleya Euphrasia with five flowers on a spike, and other good Cattleyas, Miltonia vexillaria Leopoldii, and a good selection of Cypripediums, including Felicity, Niobe superbum, Maudiæ and Sir Redvers Buller.

Messrs. Charlesworth & Co., Haywards Heath, staged a selection of rare Orchids, including a new hybrid between Odontoglossum Rossii majus and O. Wilkeanum, a pretty flower; Dendrobium Sanderæ and various good hybrid Cattleyas.

Messrs. J. and A. McBean, Cooksbridge, staged a small group in which were a brilliant red form of Odontioda Charlesworthii (see Awards), another form of their Cattleya Lord Rothschild var. albescens, some good forms of Odontoglossum crispum, and Odontiodas.

Sir Trevor Lawrence, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), sent Cypripedium Rolfeæ "Peeters' variety," a good dark flower, and Miltonioda Harwoodii. See Awards.)

Monsieur Firmin Lambeau, Brussels, sent the handsome Catasetum splendens imperialis; the flowers are wax-like white, with the greater part of the lip violet-crimson, some dark crimson spots being also at the bases of the petals.

R. G. Thwaites, Esq., Chessington, Streatham (gr. Mr. G. M. Black), showed some good Cattleya Fabia, a very fine Odontoglossum percultum, two brilliant red Odontioda Devosseana, O. Lecana and other hybrids.

W. Thompson, Esq., Walton Grange, Stone (gr. Mr. Stevens), showed Odontoglossum Nerissa (nævium × crispum), a small flower, white, evenly spotted with rose, and Cypripedium "Our Queen," for which he had previously received an Award of Merit.

E. G. Mocatta, Esq., Addlestone (gr. Mr. Stevenson), sent Odontoglossum Jasper "Woburn variety" of fine shape.

F. Du Cane Godman, Esq., Horsham, sent Lælio-Cattleya Godmanii var. Aurora, a very handsome hybrid.

Pantia Ralli, Esq., Ashtead Park, sent a fine form of Cattleya Dowiana aurea.

C. J. Phillips, Esq., The Glebe, Sevenoaks, showed several handsome hybrid Odontoglossums, Lælio-Cattleya Ophir "Glebe variety," a large-flowered Oncidium Forbesii, and a handsome white-petalled Cattleya (see Awards).

E. Towson, Esq., Ellerdale, St. Albans, showed Cypripedium Ellerdale (Bingleyense × insigne "Harefield Hall").

Monsieur Chas Maron, Brunoy, France, showed Brasso-Cattleya Olympia (C. Solfaterre × B.-C. Mrs. J. Leemann) of a light-yellow colour, Cattleya Marguerite Maron (Eldorado alba × labiata Cooksoniæ), and C. Fabia alba Mme. Ed. Debrie with fine white sepals and petals.

Mr. Sidney Flory, Tracy's Nursery, Twickenham, showed the rare Pescatorea Dayana rhodacra, a large, white flower with rose-coloured tips to the segments and pale-rose lip. Also two forms of Warscewiczella marginata.

AWARDS.

First-class Certificate.

Cattleya hybrid (Fabia alba × Warscewiczii Frau Melanie Beyrodt), from C. J. Phillips, Esq., The Glebe, Sevenoaks.—A handsome flower close to C. Fabia alba, with white sepals and petals and good lip with ruby-purple front. (This award was given subject to a suitable name being given the novelty.)

Awards of Merit.

Cattleya Hardyana var. Herbert Goodson, from H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day).—A very good flower, with white sepals and petals and dark reddish-purple lip with gold lines running from the base.

Miltonioda Harwoodii (M. vexillaria × C. Noezliana), from Sir Trevor Lawrence, Bart., K.C.V.O. (gr. Mr. W. H. White).—A very remarkable cross. The spike is erect, the flowers in general appearance and colour resembling a bright rose-pink Calanthe Veitchii, though structurally different.

Cattleya Mrs. Pitt "Charlesworth's variety" (C. Dowiana aurea × C. Harrisoniana).—Flowers of a uniform, warm-rose tint, with yellow markings on the lip. (From R. C. Doux, Esq., Marfield, W. Derby, Liverpool.)

Odontioda Charlesworthii "Orchid Dene variety" (O. Harryanum × C. Noezliana), from Messrs. J. & A. McBean, Cooksbridge.—A very fine form, with large flowers of good shape and of a deep blood-red colour.

Fruit and Vegetable Committee.

Present: Joseph Cheal, Esq. (in the Chair); Messrs. Edwin Beckett, J. Willard, J. Davis, Thos. Coomber, John Basham, A. Bullock, Owen Thomas, P. C. M. Veitch, and W. Poupart.

Messrs. James Veitch & Sons, Ltd., Chelsea, filled a table with Apples and Pears of splendid quality. There were 180 varieties of Apples and 37 of Pears. Along the centre of the table were large sprays of Cratægus Aronia (yellow fruits), C. orientalis (red fruits), and C. punctata (purple fruits). A selection of the Apples includes Emperor Alexander, Lord Derby, Tyler's Kernel, King of Tompkins County, Allington Pippin, Beauty of Kent, Gascoyne's Scarlet Seedling, Dumelow's Seedling, Annie Elizabeth, Margil, Alfriston, Newton Wonder, and Chelmsford Wonder. Two small trees of Rev. W. Wilks variety bore exceptionally large fruits, whilst gathered fruits of this fine culinary sort weighed more than 1 lb. apiece—the largest 1 lb. 7 oz. (Gold Medal.)

The Barnham Nurseries, Ltd., Barnham, Sussex, showed splendid Apples and Pears, the Apples being deeply coloured and generally excellent. The baskets were relieved with wild fruits and autumn foliage. The varieties Charles Ross, Barnack Beauty, Gascoyne's Scarlet Seedling, Rival, Christmas Pearmain, Winter Ribston Pippin, Cox's Orange Pippin, Egremont Russet, Allington Pippin, Lord Derby, and Potts's Seedling are a selection. There were also fine fruits of Beurré Fouqueray, Verulam, Beurré Baltet Père, Durondeau, Doyenné du Comice, and Uvedale's St. Germain Pears. (Silver-gilt Knightian Medal.)

The Marquis of Ripon, Coombe Court Gardens, Kingston Hill (gr. Mr. Thomas Smith), exhibited 55 dishes of Apples and Pears, for which a Silver-gilt Banksian Medal was awarded.

Remarkably fine fruits of The Queen, Ribston Pippin, Peasgood's Nonesuch and King of the Pippins were shown by Mr. Woodgates, Worcester Park. (Silver Banksian Medal.)

A very large exhibit of Onions was shown by Lady Cowper, Panshanger, Hertford (gr. Mr. Staward). The varieties were very numerous, and the collection comprised one of the best exhibits of Onions we have seen for a long time. Besides numerous fine bulbs of the Ailsa Craig type, there were clean, sound examples of Brown Spanish, White Globe, Crimson King, White Italian Tripoli, Bedfordshire Champion, Trebon's Snowball, James's Keeping, Market Perfection, Long Keeper and others. (Silver-gilt Banksian Medal.)

Mr. W. Barker, West Norwood, exhibited tubers of King Edward VII Potato.

SCOTTISH HORTICULTURAL.

October 1.—The monthly meeting of the above society was held on this date at 5, St. Andrew Square, Edinburgh. Mr. Massie, the president, was in the chair, and there were 105 members present.

The secretary, Mr. A. D. Richardson, gave a lecture, illustrated by a large number of lantern slides, on "Edinburgh's Park and other Trees." He pointed out that though Edinburgh was very much behind some of the cities in the United Kingdom as regards street planting, there were many varieties of trees which grew well, even in the most central parts of the city. Certain species of Pyrus, such as P. intermedia, P. Aria, P. pinnatifida, and P. rotundifolia did well, and Thorns and Laburnums also withstood the smoke-polluted atmosphere. But the tree which succeeded best was the Platanus acerifolia, the so-called "London" Plane, though, owing to some unintelligible prejudice, it had been very little planted as a street tree. The Ash, Elm, Beech, Sycamore, and Lime were the principal trees planted, and there were still some fine specimens. The Beech was gradually disappearing, however, and its place would never be taken by the same kind of tree. Curiously enough, many of the oldest Elms were not Ulmus montana, the Scotch species, but U. campestris, the English Elm, and young trees of the latter species were thriving well. Amongst the soft-wooded, broad-leaved trees (Salix alba) the white or Huntingdon Willow gave most promise of becoming a good tree, and Populus alba, the white Poplar, seemed to deserve more attention than it was given.

The President next gave a short account of a visit to Normandy in September. The agriculture there, he said, was very similar to our own, excepting that a considerable area was devoted to Buckwheat and Indian Corn for fodder. The methods of cultivation, however, were very primitive as compared with those practised in this country.

The exhibits were: New Collerette, Cactus, Pompon, dwarf-bedding, Pæony-flowered and double fancy Dahlias, and early-flowering Chrysanthemum "Cynthia," exhibited by Messrs. Dobbie & Co., Edinburgh (Collerette Dahlia "Princess Louise," Pæony-flowered Dahlia "Kakadee," dwarf-bedding Cactus Dahlia "Marianne," and Chrysanthemum "Cynthia" were each awarded a Certificate of Merit); new Michaelmas Daisies "Glory of Colwall" and "Nancy Ballard," exhibited by Mr. Ernest Ballard, The Court, Colwall, Herefordshire (each was awarded a First-class Certificate); Kniphofia "Marie Dirken," exhibited by Messrs. Dicksons & Co., Edinburgh (awarded a Certificate of Merit); and a large collection of sprays of foliage of hardy trees and shrubs, exhibited by Mr. D. W. Thomson, Edinburgh (highly commended). Mr. Thomson also showed some fine spikes of Pentstemon "Mrs. F. Fulford." The President exhibited magnificent fruits of Pitmaston Duchess Pear, each fruit weighing about 1½ lb., and Messrs. Todd & Co. showed a fine vase of Michaelmas Daisy "Beauty of Colwall."

At the meeting on November 5 Messrs. A. Eddington and James Hay will read papers on "Villa Gardening" and "Window Gardening" respectively.

HORTICULTURAL CLUB.

AFFORESTATION IN THE BLACK COUNTRY.

October 8.—On the occasion of the monthly dinner of the Horticultural Club, held in the Hotel Windsor, Westminster, on Tuesday last, Mr. P. E. Martineau, the honorary secretary of the Council of the Midland Reafforestating Association addressed the members on the aims and work of the association. Mr. Martineau's remarks were illustrated by lantern slides, which showed the nature of the country and the results which the society has achieved. The Midland Association, which was founded in 1903, owes its existence in the first place to a number of residents in the Midlands who, impressed with the desolation of many of the mining districts, determined to ascertain by experiment whether it would not be possible to furnish the gaunt and bare pit heaps and other refuse mounds which disfigure the countryside with a covering of trees. The association has for its president Sir Oliver Lodge, and it enjoyed, to the time of his death, the valuable services of the late Professor Fisher, who acted as consulting expert. Mr. Hubert Stone is director of the planting operations. The work of the association is two-fold: first to spread information and to excite interest on the subject of afforestation in general; second, to advocate the utilisation of waste lands for the production of timber. The latter makes the more direct appeal to Midlanders, and, as is also natural, some of the members of the association are attracted to it on æsthetic grounds, and lend their support in the hope that some day the Black Country may be made green. Others, encouraged by the experiments that have been carried out under the auspices of the association, are prepared to maintain in the course of time the enterprise of planting the waste land, if there is the prospect that the operations will result in profit. The scope of the work of the association may be estimated by the fact that the waste

lands which suitable for afforestation are some 1,400 acres in extent. The association, however, possesses an income of only £150 a year; hence it can neither buy land nor incur the liability of any considerable annual rental. Nevertheless, despite its lack of funds, the association began work in 1903 by establishing two plantations, and by 1908 it had formed 15 plantations, the total extent of which exceeded 60 acres. The results of this pioneer work were sufficiently encouraging to convince the association that the waste land of the Midlands, if properly planted, might be made to bear timber. It also discovered that local unemployed labour might be used with satisfactory results for the work of planting. At the time of the appointment of the Royal Commission on Afforestation, the association hoped, not unnaturally, that its objects would meet with the approval and support of the Commission. The evidence which the association placed before that body was calculated to show that although the Black Country may not be especially suitable for afforestation purposes, yet it is possible to utilise this region for tree planting, and that local conditions of labour are favourable to this operation. It must be admitted that, at first sight, the soil which the association cultivates is of an unfriendly nature. Nevertheless, experiments have shown that trees will grow upon it. The material of which the mounds and heaps are composed varies according to the mining carried on in the several districts, and may consist of heaps of "clunch," or of slag and red ash mixed with "clunch"; weathered limestone also occurs in large quantities in many of the mounds. Where chemical works are situated, there is often to be found a thick crust of sulphur over the heaps, and such places are sterile, even the coarsest grass refusing to grow. The "locky-dirt," as the miners call the stuff dumped on the heaps, changes remarkably and consistently with the weather; when it is dry, it forms small, flat, grey cakes; when wet, large, sticky masses. Many of the heaps remain on fire for long periods, and, till the fires have cooled, nothing will grow on them. The first natural vegetation which occurs in these situations is a coarse grass, which is followed usually by Dyer's Rocket (Reseda) and by Coltsfoot (Tussilago). Sometimes one part of the heap becomes cool enough to support vegetation, and, in that case, it is found that the Birch thrives so well close to the part of the heap which is still burning that seedlings spring up within a yard or so of the burning area. In addition to Birch, Australian Pine has been tried, but the plantings of this tree are so recent that it would be premature to speak of its suitability for the purpose. Encouraged by the demonstration that trees can be made to grow in the waste land, the association has made application to the Development Fund for assistance. As the result of the application, the plots have been examined, but, so far, financial assistance from the fund has not been forthcoming. It is to be feared that the claims of the association may be lost sight of owing to the grandiose claims of afforestation, which, as one may gather from Mr. Runciman's speeches, the Board of Agriculture is engaged upon. Having regard to the fact that labour is abundant in the Black Country, whereas local labour for afforestation in Scotland and Wales is not available, it would seem reasonable for the Board to give at least a cautious encouragement to the work of the association. Nor should it be forgotten that the timber grown in the Black Country would find a market locally. Alder and Birch, for example, that thrive well there, are particularly suitable for supplying the demand for small timber used in Birmingham in making handles for tools and smaller articles. Of the plantations established by the association, the best are those of Black Waggon at Old Hill, which is the property of the association, and the Fever Hospital, at Bilston, which belongs to the District Council. In spite of difficulties encountered in establishing trees in these plantations, the growth has been good, and the trees withstood the drought of 1911 remarkably well. The Wych Elm has grown successfully planted in the "valleys" between the pit mounds, pushing up tall and straight. In plantations above coal mines the Beech has done well, and the Sycamore is successful on the limestone waste near Dudley. The work of dealing with this waste land is complicated by the fact that the pit mines vary in shape and size. In the north of the district they may measure a mile either way, and are low, whereas the heaps in the south are high and narrow.

Mr. Martineau's address was followed with much interest by the members of the club and their guests, and gave rise to a keen discussion. Sir Richard Paget said that only a resident of the district could realise the utter desolation caused by mining, and he was strongly of the opinion that the owners should not be allowed to so ruin the face of the countryside. In Germany the heaps of refuse are returned to the pits, and he felt that this method should, when practicable, be followed in this country. Even should the planting prove to be unremunerative, Sir Richard Paget felt that the work should be continued, as the improvement to the district was so great. It seemed that trees will grow where but little other vegetation will exist, but it must be remembered that the life of a tree is long, and that he who plants trees plants for his heirs.

Mr. R. L. Robinson, of the Board of Agriculture, hoped that the information he had gathered upon the subject would be of use to the Board at a later date. England owed much of her greatness to the industry that caused these same pit heaps, and for that reason he felt that the district had a great claim to help from the Treasury. Whilst he felt somewhat pessimistic as to any profit ultimately accruing from the

FIG. 130.—THE NATIONAL VEGETABLE SHOW AT WATFORD.

Honorary exhibit staged by the Hon. Vicary Gibbs (gr. Mr. Edwin Beckett).

(See report in last issue.)

planting, the improvement, as he knew from personal experience, was very great, but, besides trees, was it not possible to plant selected species of flowering and evergreen shrubs?

Mr. M. C. Duchesne thought that, although it was doubtful if mature timber would pay, there would be a good market for coppice wood, and, in addition to the trees already experimented with, he suggested planting Poplar, as Poplar timber was largely used for crates.

Dr. Percy Groom agreed with the æsthetic value of the planting. He warmly supported the movement, which he felt had great experimental value.

Mr. W. W. Watts reminded the gathering that it was not sufficient to make the country merely pretty, although the awful desolation of the Black Country must be seen to be realised. Trees were absolutely necessary to improve the lives of the residents. He hoped the movement would interest landowners, and that they would plant trees and so improve the country.

In reply Mr. Martineau said that Alder had been planted for coppice with standards of different trees according to the nature of the soil. In their planting the association had carefully noted the kind of trees which grew best in the various localities.

The next meeting will take place on November 5, when Mr. Kingdon Ward will lecture on "A Naturalist in Western China and Tibet," illustrated with lantern slides.

Obituary.

F. W. Seale.—The *Journal of Horticulture* announces the death on September 29 last of Mr. F. W. Seale, of the St. John's Nurseries, Sevenoaks, at the age of 51. Mr. Seale was a specialist in Dahlia cultivation, and he raised many seedlings of merit.

ANSWERS TO CORRESPONDENTS.

Abies with Gouty Swellings: *J. P.* The swollen, nodulous growths are caused by the Spruce-gall aphis, Chermes abietis (see fig. 131). The trouble is very common on the Silver Fir, and the Larch is also liable to attack. Any remedial measures, such as spraying, must be continued for at least two or three years, and Larches in the neighbourhood sprayed as well. The insect lays about 25 eggs on the edges of the bud scales. When the young are hatched, they live on the sap, and the galls, which are at first green, are formed. The creature emerges in July or August. The best spray is composed of 3 lbs. of soft soap, dissolved in ½ gallon of boiling water, with 1 pint of paraffin added whilst the soapy water is still boiling. After this has been well mixed, it should be diluted with 5 gallons of soft water, and applied as a fine spray. If the tree is a small specimen, the affected shoots should be cut off and burned whilst the nodules are green. Fir tree oil will kill the pest, but its application in the case of large trees is impracticable.

Broad-leaved English Paradise Stocks: *H. P. Bridge, Jun.* Stocks for Apples and other fruit trees may be obtained at prices varying from 5s. to 8s. per 100, or 45s. to 70s. per 1,000, according to size. There are probably at least three varieties of Paradise stock, the old French or Doucin stock and two varieties raised by the late Mr. Rivers, of Sawbridgeworth, one described by him as the Nonesuch Paradise and the other the broad-leaved Paradise. The true English broad-leaved Paradise is perhaps the most effective in giving the dwarf habit; some, however, think the French Paradise the best dwarfing stock for certain kinds of Apples, such as Cox's Orange Pippin. The history of the subject is given in *Gardeners' Chronicle*, 1869, p. 51. The subject was also referred to by M. Decaisne in the *Journal* of the R.H.S., vol. ii. (1870), p. 55, and in a paper by the late A. F. Barron, "Experiments in Grafting Apples," vol. xi. (1889), p. 13 of the same *Journal*. The stocks may be increased from suckers or by cuttings inserted in the autumn. Apples are propagated very much like Roses, and the scions may be either grafted on the stocks in spring or they may be budded in July or August, or the stocks that have failed to take the spring grafts may be budded in summer, and any budded stocks that have failed can be again grafted the following spring.

Chrysanthemums Unhealthy: *W. C.* No disease is present; the damage has probably been caused by frost.

Chrysanthemums Unsatisfactory: *Queen's Co.* We do not believe that standing the plants on a clean, hard bottom is responsible for the loss of foliage. Chrysanthemums grow equally as well when stood on an asphalt bottom as on boards, ashes or garden soil, but the soil in the pots dries more quickly. The probable reason of their failure is the poor quality of the loam, which needed the addition of manure, wood ashes and lime, this latter ingredient being very essential. The sample of foliage sent appears starved. If a lack of nourishment is not responsible, the trouble may be due to the cold, wet season, as stagnation at the roots produces the same result, especially as the early part of the season (April, May and June) was very hot. Sprinkle lime lightly on the surface of the pots and watch its effect on the foliage during the next week or two.

Datura (Brugmansia) Leaves: *C. B.* The small, circular punctures have in all probability been produced by a night-feeding insect, possibly a weevil. Search the plants carefully after dark, and if you discover the depredator, send it to us for identification and advice.

Fig. 131.—Galls caused by Chermes abietis.

Grevillea robusta: *F. B.* The leaf is injured by scorching; no disease is present.

Maggots in Soil: *G. B.* The small black fly is a species of Diptera, and, as far as can be judged, is also the parent of the maggots which have destroyed the roots of the plant in question. Bisulphide of carbon applied to the soil near the roots, at the rate of one teaspoonful to a 4-inch pot, would destroy the maggots, but seeing that the plant is so badly infested, we would strongly advise you to destroy it at once.

Muscat of Alexandria Grapes: *H. D.* The trouble is due to shanking; see reply to *M. S.* in the last issue, p. 275.

Names of Fruit: *A. T. U.* 1, Gascoyne's Scarlet Seedling; 2, Newton Wonder; 3, White Whorle; 4, Radford Beauty; 5, Bismarck; 6, Roundway Magnum Bonum; 7, Maltster; 8, Harvey's Wiltshire Defiance; 9, Cornish Gilliflower; 10, Hoary Morning.—*H. N.* 1, Alfriston; 2, Ecklinville; 3, Beurré Jean Van Geert; 4, Jersey Gratioli; 5, Beurré Superfin; 6, Beurré Bachelier.—*A. M. S.* 1, decayed; 2, Marie Louise d'Uccle; 3, General Todleben; 4, Beurré d'Amanlis; 5, Mme. Treyve; 6, Maréchal de Cour; 7, Duchesse d'Angoulême; 8, Pitmaston Duchess; 9, Beurré Superfin.—*Tower Lodge.* The Pears arrived quite decayed.—*A. R.* Claygate Pearmain.—*E. F. D.* Sheep's Nose.—*J. A. C.* 1, Ribston Pippin; 2, Harvey's Wiltshire Defiance; 3, Hollandburg; 4, Potts's Seedling; 5, Alfriston; 6, Fondante d'Automne; 7, Beurré Diel; 8, Beurré Clairgeau; 9, Beurré Hardy.—*W. S.* Beurré d'Amanlis.—*J. B., Thirsk.* 1, Marie Louise; 2, Gansel-Seckle; 3, Durondeau; 4, Marie Louise d'Uccle; 5, Pitmaston Duchess; 6, Beurré d'Amanlis; 7, Brockworth Park; 8, Williams's Bon Chrétien.—*H. B.* 1, Beurré d'Amanlis; 2, Triomphe de Jodoigne.—*C. B.* 1, Acre Pippin; 2, Grenadier; 3, the Pear much resembles Marie Louise; 4, Cullen.—*W. G. C.* Golden Winter Pearmain.—*R. A. H.* 1, Beurré Capiaumont; 2, Jalousie; 3, Mme. Treyve; 4, Gansel's Bergamot; 5, Beurré Hardy; 6, Reinette Grise.—*F. A. A.* 1, Pitmaston Duchess; 2, Duchesse d'Angoulême; 3, Beurré Sterckmans; 4, Hacon's Incomparable; 5, Joséphine de Malines; 6, Beurré Bachelier; 7, Fondante d'Automne; 8, Passe Colmar; 9, Mme. Treyve.—*N. H. A.* 1, Emile d'Heyst; 2, Passe Colmar; 3, Joséphine de Malines; 4, Marie Louise; 5, Louise Bonne of Jersey; 6, Beurré Rance; 7, Maréchal de Cour; 8, green fruit (Beurré Bachelier, the other fruit was decayed, but did not appear to be the same variety); 9, Beurré Superfin; 10, Jargonelle.

Names of Plants: *E. W.* Populus balsamifera (Balsam Poplar).—*W. W. W.* 1, Veronica Traversii; 2, Anchusa italica; 3, Achimenes coccinea; 4, Hypericum calycinum; 5, Heuchera sp., cannot name without flower; 6, send when in flower; 7, Santolina Chamæcyparissus.—*Insignis.* 1. Ceanothus "Indigo"; 2, Veronica chathamica; 3, Oxalis corniculata; 4, Sedum rupestre; 5, Escallonia exoniensis; 6, Trifolium repens atropurpurea; 7, Fuchsia (garden variety); 8, Escallonia rubra; 9, Veronica Lyallii; 10, Cinnamomum zeylanicum; 11, Ceanothus "Gloire de Versailles"; 12, Hypericum Androsæmum.—*F. E. G.* Funkia subcordata (F. grandiflora of gardens).—*G. Barrell.* 1, Buddleia asiatica, a fine species for a cool greenhouse; 2, Episcia sp., probably E. fulgida, which requires a warm, moist stove.—*A. P., Sunningdale.* Viola palmata.—*T. O.* 1, Adiantum pedatum; 2, Lastrea decomposita; 3, Adiantum hispidulum; 4, Pteris aquilina.—*C. J.* 1, Justicia carnea of gardens; 2, Celsia cretica; 3, Nephrolepis exaltata; 4, Scolopendrium vulgare; 5, Cyrtomium falcatum; 6, Asplenium Nidus; 7, A. alatum; 8, Leycesteria formosa.—*J. B., Mullingar.* Rohdea japonica (syn. Orontium japonicum) figured in *Botanical Magazine*, tab. 898.—*A. C. D.* Aster Amellus var.

Pelargonium Paul Crampel: *R. A. B.* There is no disease present; the blotches on the leaves have been caused by the unfavourable weather.

Sulphur as a Manure: *A. W. C.* As a rule, sulphur is present in all soils in combined form, and there is no need to apply it as a manure.

Vine Leaves: *B. N.* The injury is caused by a mite called Phytophus vitis. All diseased leaves should be removed and burnt, so that the mites do not migrate to the buds.

Vines Unsatisfactory: *Sleepless.* The sample of soil sent with the few roots points to a very unsatisfactory condition of the borders, and young wood lice are present in great numbers. The inferior lateral growths and the bunches of fruit show that the vines are enfeebled. The border needs a thorough overhauling, and your best plan would be to lift the vines and reconstruct it afresh. Directions for the reconstruction of a vine border will be found in the issue for May 11, p. 326. If you wish to obtain a supply of Grapes next season, you should treat half the border this year and the other half next year, as vines should only be cropped very lightly the first season following the replanting.

OCTOBER ROSES.

At the moment of writing I have before me some fresh and attractive Rose blooms, whilst out-of-doors the plants are still bright with flowers. One of the finest Roses now in bloom is Mme. Wagram Comtesse de Turenne, and I think the qualities of this Hybrid Tea variety are superior to those of any other Rose that may be depended upon to flower in September and October. Twenty years have passed since Bernaix introduced this Rose to commerce, but, for some reason or other, it is not so generally grown as might be expected, therefore I was gratified to read that it was awarded the Silver Medal offered for the best flower of a Hybrid Tea variety at the autumn show of the National Rose Society held in the Royal Horticultural Society's Hall, held on September 12 last. Mme. Wagram Comtesse de Turenne is best grown as a tall bush. Its pale flesh-coloured flowers, tinted with rose, are large and shapely, and, unlike some of the others mentioned here, is at its best in autumn, being of little or no value earlier in the season. It is first and last a late Rose, and, as such, it is worth the attention of the planter.

A Rose of almost equal merit for October flowering is Mrs. Wakefield Christie-Miller. This variety has a most distinct and attractive colouring, and its flowers are plentiful at the present time. The formation recalls that of the popular variety Caroline Testout, and the colour may be described as a soft blush overspread with a pearly sheen, which gives place to a rich vermilion-rose on the exterior of the petals. The warm colour catches the eye because of its distinctness from that of all other Roses. This grand Hybrid Tea is unlike Mme. Wagram Comtesse de Turenne, for it is satisfactory all through the summer.

Duchess of Westminster, distributed last season, is especially good as a late Rose. I have before me a flower of brilliant colour and of a size and formation not excelled by the exhibition blooms of July, and this in spite of a storm of wind and rain experienced three days ago. The fragrance is delightful, and the colour is best described in the words of the eminent raisers—a clear rose-madder. Like Mrs. Wakefield Christie-Miller, it is a very distinct Rose, so far as colour is concerned, although, in formation, it is widely different from that Rose.

Of the dark crimson Roses, Chateau de Clos Vougeot is, at present, the best. The plants are full of flowers, somewhat unshapely it is true, but valuable for their rich colour so late in the season. This Hybrid Tea, introduced in 1908, is inclined to be straggly in growth, and, consequently, is not an ideal bedding Rose, but its late-flowering qualities, coupled with its fragrance, will commend it to those who desire a dark-red autumn variety. Amongst the crimson Roses we find, in Scotland, that General McArthur is the best for blooming in late autumn. It is flowering freely now, and the habit of the plant is good, the colour presenting a richness and depth of tone unprocurable earlier in the season. I am inclined to think that this reliable bedding Rose will be displaced by Lieutenant Chauré, a Hybrid Tea, distributed by Pernet-Ducher two years ago. This novelty is always good, and for two seasons I have never seen the colour fade, a failing of which I cannot acquit General McArthur. Lieutenant Chauré is a rich crimson in colour, the flowers are fairly full and well formed, and the habit is dwarf and admirably adapted for bedding or massing. This Rose has been good all the season, and is still giving a supply of richly-coloured flowers. It promises to become one of the most useful and valuable bedding Roses of the near future.

Two old favourites are still yielding an abundance of flowers of good quality. I refer to La France and Caroline Testout. We are sometimes told that the former Rose is degenerating, and is not nearly so fine as formerly, but I can see no evidence, so far, to support this assertion.

Lady Alice Stanley, beautiful at all times, is especially so at the present season. This exquisite Hybrid Tea Rose, one of the Portadown introductions of 1909, is one of the best of the newer Roses. The flowers are fragrant, and have a desirable fullness and substance. The exterior of the flower is a deep, coral-rose, the interior a pale flesh colour, and the formation is good.

Cynthia Forde is another desirable, autumn-flowering Hybrid Tea Rose, the rich pink, beautifully-formed flowers being very fine and plentiful at this late season. Antoine Rivoire, a descendant of Dr. Grill and Lady Mary Fitzwilliam is now yielding an abundance of rosy flesh-coloured flowers of handsome shape. This Hybrid Tea is invariably good in autumn, and has some reputation for its free flowering qualities at this time.

Among the yellows, or "yellowish" Roses, the best at present is Le Progrès. While it lacks the character of flowering freely late in the year as the other Roses I mention, it is, nevertheless, flowering sufficiently well to justify its inclusion in a list of October Roses. But the colour now lacks the brilliance associated with its blossoms earlier in the season.

The only Tea Rose I shall mention, and its inclusion in the Tea section is, perhaps, of doubtful propriety, is Harry Kirk. Like Le Progrès, however, the flowers, although fairly good in size and formation, show a lack of colour, altogether different from the blooms of summer

I will not prolong the list, but merely add that the Roses I have mentioned are flowering freely, while most of the others have only an odd blossom or two remaining upon the plants, and those by no means representative of the varieties as we know them in summer. We may be grateful that there are some varieties at least which deserve to be described as "October Roses."
George M. Taylor, Mid-Lothian, October 7.

TROPICAL WATER-LILY HOUSE, KEW, IN SEPTEMBER.

(Supplementary Illustration.)

The tropical Water-Lily house at Kew Gardens is a square, span-roofed structure, the framework of which is built entirely of iron. It is designed to afford the plants as much light and air as possible consistent with the necessary strength for supporting such a wide expanse of roof. The interior is 46 feet square, the height to the ridge is 17 feet 6 inches and the sides up to the eaves 9 feet, the upper two-thirds of the latter being of glass. The roof is supported by six light steel-bar girders. The foundations are all built of fine quality limestone. Ventilation is provided by sliding lights, mounted on rollers on either side of the ridge, and by a number of smaller apertures at the sides. The centre of the house is occupied by a large circular tank, 36 feet in diameter, with sloping bottom, 2 feet deep at the sides and about 4 feet in the middle. A double row of hot-water pipes maintains the water at the necessary temperature of about 70° F. The four corners of the house are occupied by smaller tanks for growing bog plants. Around the sides, near to the ground line, are six rows of hot-water pipes, and above them is a light but strong stage. Upon this stage is built each spring a bank of light, rich soil of about 15 inches in depth, and faced with turves. In this are planted many beautiful tropical gourds and exotic foliage and flowering plants. Between the side stages and tank is a circular pathway. The tank is planted with Water Lilies and other aquatics, whilst running around its margins is a row of large plants of various kinds of Hedychium and Canna. At the entrance is a large, span-roofed porch, some 20 feet in diameter. The roof of the porch is draped with a large specimen of Bougainvillea glabra var. Sanderiana, which produces quantities of its rich-coloured bracts and yellow flowers all the summer. The white and blue varieties of Plumbago capensis are trained to wires near to the path, whilst at the back is a specimen of the "False Jessamine" (Gelsemium sempervirens), a native of North America, which in late autumn produces quantities of deliciously-fragrant, yellow flowers. Beneath the climbers is a border,

some 6 feet diameter on either side, filled with large flowering specimens of both double and single varieties of Hibiscus rosa-sinensis, H. schizopetalus and H. Cameronii, also the very beautiful hybrid H. Archeri (H. schizopetalus × rosa-sinensis), the flowers of which are brilliant scarlet, with deeply-cut or lobed petals. Interspersed between the Hibiscus are low, bushy plants of the rose-coloured Jacobinia magnifica, and, fronting the whole as an edging, are white and pink varieties of the tropical "Periwinkle," Vinca rosea. Of the numerous and very beautiful Water Lilies which are grown in the centre tank, the finest is the large blue Nymphæa pulcherrima, and a worthy rival of the blue Australian species N. gigantea. I have measured flowers of N. pulcherrima 9½ inches in diameter, and blooms of N. gigantea are often 9 inches across. The flowers remain open in the afternoon and evening, when the forms of N. Lotus and N. stellata are closed. N. gigantea requires more heat than other tropical species, and for years past it has thrived under the same conditions as, and in association with, the Victoria Regia. Of the many varieties of N. Lotus grown at Kew, the finest is undoubtedly the large red form known as Omarana, with flowers 6 to 8 inches in diameter, set off by a large cluster of yellow stamens. There are several varieties of this species, including shades of rose, pink and white. Amongst the white forms is the variety thermalis, a native of the ponds fed from the hot thermal springs in Hungary. All the forms of this species close their flowers at about noon each day. Of the forms of N. stellata, the Berlin variety is the earliest to flower, and it keeps up a constant succession of blooms until late in the autumn. In colour it is of a rich lavender-blue, the centre being filled with bright golden-yellow stamens. The flowers exhale a sweet scent during the evening.

N. stellata var. zanzibarensis has the deepest blue of all the Water Lilies. The flowers are somewhat rounder in outline than are those of the type, and with more obtuse petals. It has been given specific rank by some authorities as N. zanzibarensis. It is certainly different from N. stellata in several characters, notably in that the flowers remain open much longer; moreover, the shape and size of the petals and flowers are not alike. N. stellata var. zanzibarensis rosea is quite distinct from the true var. zanzibarensis in the size and shape of the petals and flowers. It deserves a place in all collections from the fact that its flowers remain open until about 6 p.m. Of the smaller-growing Nymphæas which find a home in this house, the best is N. rubra, a species new to the collection. The flowers are about 4 inches in diameter, and of a rich bright crimson colour. The leaves are shortly petioled, the blade being only 4 to 7 inches in diameter, and of a dull coppery-red. N. versicolor, N. flava, and N. flavo-virens are also grown, but not one has flowered very freely. The first-named is very pretty, for, as its name suggests, the flowers are a combination of colours—shades of rose, blush-white and violet.

Facing the doorway on the opposite side of the tank is a mass of the "Sacred Lotus" (Nelumbium speciosum), with its beautiful, erect, silvery-white peltate leaves rising to a height of several feet, and its large, handsome, rose-coloured flowers. The flowers of this plant are variable in colour, ranging from white to deep red. A number of double and semi-double forms are cultivated by the Japanese and Chinese. The rhizomes and scapes are used as food in times of scarcity, and the petioles of the young leaves are cut up into lengths and cooked in the same way as Asparagus.

Associated with the Nelumbium are several large specimens of the gigantic Aroid Typhonodorum Lindleyanum, of which a description and Supplementary Illustration were given in *Gardeners' Chronicle*, September 7, 1912. Two specimens of the "Water Poppy" (Hydrocleys Commersonii) have been a feature of the tank all the summer, and have borne many hundreds of their lovely primrose-yellow flowers. Recent experience with this plant has shown that when grown in shallow water with its roots running out into the mud it produces hardly a single flower, but when grown in a small pot, and its long, free-branching stems and leaves are allowed to float out on the surface of deep water, it flowers at nearly every leaf. Specimens of the male and female plants of the "Eel" or "Tape Grass" (Vallisneria spiralis) are grown in pots. The plant is a submerged aquatic, the female flowers being supported on long slender peduncles, which, when ready for pollination, elongate and allow the flowers to float upon the surface of the water. The male flowers, which are borne on short peduncles, break away from their stalks and float to the surface, where they mingle with the female flowers. After fertilisation, the long peduncles of the female flowers contract spirally and draw the flowers down under the water, where they remain until the fruit develops.

Of the species of Hedychium grown in large pans in this house, the best is H. coronarium. The pure-white flowers are produced in short terminal heads, and are deliciously fragrant. H. spicatum and H. elatum have both primrose-yellow flowers, and are rather tall-growing plants, reaching to a height of some 8 or 9 feet. Of the hybrids there are large specimens of H. coronarium × Gardnerianum, a fine, free-flowering plant, with the white flowers and dwarf habit of H. coronarium and the longer inflorescence of H. Gardnerianum; it also possesses the character from the latter parent of opening most of the flowers together and not in succession, as obtains in H. coronarium. Two fine hybrids, with scarlet or brick-red flowers, are seen in H. angustifolium × Gardnerianum and H. coccineum × coronarium. Of the two the former is the better, the spikes being longer and of a brighter colour. Alternating with the Hedychiums are large pots of Cannas, a few of the best of the garden varieties being grown. Some of the plants are 8 or 9 feet high, and flower profusely. They are given a rich artificial manure throughout the whole of the growing season. Trained on wires near to the glass are many kinds of Gourds, also several kinds of Cucumis Melo.

A very beautiful plant is the "Horned Cucumber," of which there are several plants; one specimen has nearly 130 of its oval, spiny fruits. The fruits are some 3 to 5 inches in length, covered with long tubercular spines, and are a bright orange-scarlet colour when ripe. Trichosanthes anguina, the "Snake Gourd," is also bearing a heavy crop of fruit; these are silvery-white, striped and spotted with green at first, but when ripe they change to dull red, and soon afterwards decay. The fruits are a foot or so long, linear or lanceolate, and sometimes grotesquely twirled and twisted. The "Wax Gourd" (Benincasa cerifera) is conspicuous on account of the size of its fruits, which are of a beautiful silvery-grey colour. The fruit is cooked in India in the same way as the Vegetable Marrow. Several species of the "Towel Gourds" or "Loofahs" are grown, notably Luffa ægyptiana and L. acutangula; each is bearing a fine crop of fruits. A number of other very beautiful Gourds are also in various stages of development. One of the best of the small-fruited kinds is Momordica Charantia, a slender-growing species with pretty palmately-lobed leaves and with a large number of its handsome fruits. The latter are elliptic in shape, 3 to 5 inches long and covered with short tubercles. The fruits are green when young, but change to brighter orange when ripe, and split open into three lobes, each of which is reflexed like a Lilium, displaying a double row of seeds along each lobe, surrounded by a mass of bright-crimson pulp. The plant is cultivated in India, China and the Malay States for its medicinal properties, and also for food. M. Balsamina is a smaller-growing species, allied to M. Charantia.

"The Colocynth" (Citrullus Colocynthis) has also fruited well this season; the fruits are globose, prettily variegated with green and white, and some 3 to 4 inches in diameter. Remains of the fruits and seeds of this plant are often found in the ancient tombs of the Egyptians. The pulp is extremely bitter, and is in use for medicinal purposes, being a powerful purgative.

Several varieties of the "Calabash" (Lagenaria vulgaris) are grown. The fruit of this species is extremely variable in size and shape. It is employed in the tropics for all sorts of domestic purposes, and the narrow, curved end of the fruit near the stalk is used in large numbers for the making of tobacco pipes. The varieties known respectively as "Bottle," "Flask" and "Club" Gourds may be readily recognized from their shape, and these may all be seen in fruit. *C. P. R.*

(To be continued.)

NURSERY NOTES.

DEANLANDS NURSERY, BALCOMBE.

In this favoured site for gardening purposes Mr. C. F. Waters some years ago arranged a commodious block of glasshouses for the cultivation of Cucumbers, Tomatos, and popular florists' flowers for market purposes, Carnations being always favourites. In the course of time the Carnations, in the culture of which Mr. Waters is a specialist, came to occupy most of the houses formerly devoted to other plants, and proved well worthy of the preference shown them, giving flowers, always in demand, in greater or less quantity all the year round. The object has been to secure supplies when other flowers are scarce, the summer crop being of the least consequence. Nevertheless, even in summer there are large quantities of bloom on the leading kinds and some specially good things in the house of seedlings raised at Deanlands, the best of which is the large cerise Carnation Edith Waters, which has already acquired a good reputation.

It is interesting to note in the various batches the method of culture, beginning with the large quantities of newly-layered old plants, then passing to the frames of young plants under shelter, and the larger plants of winter-flowering varieties already sending up their spikes. Then in the glasshouses are the plants in full vigour and bloom, while the bulk of the occupants of the large span-roofed houses has given their main crop and are only left for the occasional blooms they supply. But just as the Carnations encroached on other flowers, so they are steadily being, in a measure, ousted by the Orchids, which here, as in other parts of the district, are found to thrive well with even less attention than is required for ordinary florists' flowers; moreover, in proportion to the space occupied, the sale of their blooms is more remunerative.

Odontoglossum crispum of splendid quality and remarkable vigour occupy several long, low spans, which were originally built for Cucumber growing. The change to Orchid houses was made in the simplest manner. The earth beds, fronted by a low brick edge, were levelled and formed the moist surface. On flower-pots placed on these, open woodwork stages were laid, the change being effected for a few pounds. The result has been highly satisfactory; the plants are all that could be desired, and the yield of flowers plentiful. There are a number of O. crispum in bloom, some very large-flowered O. Pescatorei, O. Harryanum, O. Thompsonianum, and a vigorous batch of the cinnabar-scarlet Cochlioda Noezliana.

In the intermediate houses are some 2,000 Cattleya Mendelii and a fine lot of C. Mossiæ, in both cases purchased as small, rough, freshly-imported pieces, but now of good quality and many in sheath. A batch of Lycaste Skinneri with

some in flower, a healthy lot of Miltonia vexillaria, good Vanda cœrulea, a vigorous lot of Cattleya Trianæ, C. Schröderæ, and C. labiata, varieties of Lælia anceps, and small lots of many other Orchids useful for cut flowers were also remarked.

Among the Cypripediums were a good batch of C. niveum with some in flower, C. bellatulum, and C. Godefroyæ leucochilum doing well; Sobralia xantholeuca with several large, clear yellow blooms; two very fine forms of Cattleya Dowiana in flower, and fine plants of C. D. aurea, some being in sheath although small. Hybrid Orchids also are well represented, and provision made for raising novelties, some seed capsules on Odontioda Charlesworthii, various Odontoglossums, Cattleya Mossiæ Wageneri, and others being well advanced, and a goodly supply of little hybrid Dendrobiums and Lælio-Cattleyas well in progress.

Among hybrids in bloom were a remarkably fine dark form of Lælio-Cattleya Martinetii, with bronzy-gold sepals and petals tinged with rose, and very dark claret lip, a number of hybrids of Cattleya granulosa, while C. Portia, C. Mantinii, and other hybrids of C. Bowringiana promise well for winter blooms.

NEW OR NOTEWORTHY PLANTS.

PODOCARPUS FORMOSENSIS,* Dümmer.

Matsumura and Hayata, in their recent publication *Enumeratio Plantarum in insula Formosa*, etc., cite† four species of Podocarpus occurring in that island, namely, P. latifolia, Wall., P. macrophylla, Don, P. Nageia, R. Br., and P. argotænia, Hance, of which the latter is now referred by Pilger to Cephalotaxus, viz., C. argotænia, Pilg. An inspection of the material at Kew, however, suggests the existence of a hitherto undescribed species, which exhibits an obvious alliance to P. Nageia, a valuable timber tree, occurring also in Japan, and, according to Mr. A. Henry, known in the Mandarin language as "Sha-shan" or "Shan-sha." From it, however, P. formosensis is differentiated by its rigid habit, the congested and stiff nature of the branchlets, the thicker-textured, relatively smaller leaves, which are, moreover, narrowly elliptic or more frequently lanceolate-elliptic, their apices peculiar in being obtusely truncate and often blackened as if a heated iron had been applied to them, and rarely possessing the characteristic long cusp of P. Nageia. The specimen (No. 1357) upon which the following description is based was collected by Mr. Schmüser at South Cape, on behalf of Dr. A. Henry, who communicated it to Kew, but, unfortunately, particulars respecting its habit or size, whether arborescent or frutescent, are lacking.

Second and third year's branches stout, semi-terete and invested with a rough scaly dark-brown or greyish bark; branchlets subopposite, erect, congested, rigid, alternately compressedly tetragonous, smooth, glabrous, densely leafy; internodes 0.8—1.5 cm. long. Leaves opposite, decussate, ascending and imbricate, narrowly elliptic or elliptic-lanceolate, obtuse or obtusely ustulate-truncate, narrowing below the middle into a broadened and flattened pseudo-petiole; 2.5—3.5 cm. long, 0.7—1.5 cm. broad, thick and rigid in texture, apparently nerveless and smooth on both surfaces, the dorsal stomatiferous subparallel lines scarcely visible; margin scarious and slightly recurved. Fruit borne on a stout scarred peduncle, 7 mm. long, glabrous, 1.4 cm. in diameter, thickly fleshy, the receptacle obsolete. *R. Dümmer.*

* Species nova P. Nageiæ, R. Brown affinis sed habitu magis rigidiore, ramulis confertis, foliis anguste ellipticis aut frequenter lanceolato-ellipticis raro cuspidatis minoribus crassioribus facile distinguendus. Cephalotaxus Nageia, Henry List Pl. Formosa, 91 (1898), partim.

† Op. cit. pp. 393-399 (1906).

NOTICES OF BOOKS.

CHRYSANTHEMUMS.*

This volume, the most recent of "The Present-Day Gardening Series," maintains the high standard of efficiency that is found in the previous volumes of the series. To Mr. Harman Payne is deputed the relation of the history of the flower, and the reader is presented with a clear and succinct chronology which is worthy of all praise, as was to be expected from one who has made a closer study of the subject than any other person. It would be impossible to mention all the names of the great growers, but at least that of Mr. Douglas, of Loxford Hall, and Mr. Donald, of Knott's Green, both of whom produced finer blooms and superior plants to those of Mr. Forsyth, of Stoke Newington, might have been included. A slip seems to have been made in attributing a slackness in Chrysanthemum culture subsequent to 1874. In the Wimbledon district at least, where Roe was producing fine blooms at Dover House, Roehampton, along with Jordan, Bentley, and others, there was no slackening of the pace. I miss, too, the name of Mr. Edwin Molyneux, the influence of whom, if not in the Metropolitan area, at least in the provinces, has been far greater than that of any other individual in promoting the cultivation of the Chrysanthemum.

Mr. Shea provides an illuminating chapter on the botany, fertilisation, and production of new varieties from seed. He also writes the preface to the book. The bulk of the volume, however, is from the pen of Mr. Stevenson, and those who possess the latter's book on *Sweet Peas* need not be told how practical a writer he is. In this volume he is better even than in the former; the subject is treated with a firmer hand, and the instructions are more terse and clear. Nothing of a cultural nature seems to have escaped notice, and though it may be possible to object to some of the recommendations, as, for instance, the advice to apply manurial stimulants at an early stage of growth, yet it is certain that some soils require that treatment. In addition to the usual chapters on cultivation, exhibiting, &c., there is an informative one that can be safely recommended on the decorative uses of the flower. Mr. Stevenson is correct in his commendation of large blooms for large apartments, but it cannot be concealed that many ladies cherish an antipathy to Chrysanthemum blooms, whether large or small, but chiefly to the former. So what can gardeners do when they have to respect the desires of such persons? Mr. Stevenson and Mr. Shea alike have visions of a glowing future for the Chrysantbemum, and are impatient of the croakings of the incredulous and those who—perhaps not without reason—insinuate a waning of its popularity. Hence, no doubt, the vigour of the pronouncements of the volume and the virility of its tone. The illustrations, I need hardly add, are perfectly beautiful, as is usual in the series. *R. P. Brotherston.*

* *Chrysanthemums*, by Thomas Stevenson, with chapters by C. Harman Payne and Charles E. Shea, with eight coloured plates (Present-Day Gardening Series). (London and Edinburgh: T. C. and E. C. Jack.) Price 1s. 6d.

Fig. 132.—Podocarpus formosensis (½ nat. size).

Rock Gardens.*

This is a manual intended mainly for the use of owners of small or medium-sized gardens who make a speciality of Alpine plants. A large portion of the book is devoted to the subject of construction of rockwork and selection of soil, though Mr Jenkins lays but little stress on the latter point, insisting more upon the quality of the stones, which he states should be absorbent in all cases. This is contrary to our experience, which shows that many Alpines grow and flourish upon the hardest whinstone. An exposed position is recommended, and one where there are no trees. This latter point is important, for the roots of trees often rob the imported soil; and though it is possible to keep adjacent roots within bounds, it is not easy.

Beside general directions for the construction and preservation of the rock-garden, the book contains chapters on special glass structures, frames and window boxes for Alpines, and also directions for their propagation by cuttings and seeds. The very useful lists, including one of Conifers, help to make the little volume both useful and interesting to the beginner. There are several attractive illustrations showing examples of Alpines as decorative garden plants. *B.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

The Moraine (see p. 263).—The contribution to this subject from the pen of M. H. Correvon, will have been read with deep interest by many. There is no doubt that the crucial question in respect to the moraine at the present time is that of the water supply. Mr. Reginald Farrer and Mr. R. A. Malby have previously afforded us the benefit of their experiences and their views, which are largely divergent on this question. M. Correvon is evidently in favour of getting the water through the moraine, and in this view he supports Mr. Malby. On the whole, I am disposed to take the view that, while water through the moraine is useful, and in some cases necessary, it depends largely upon climatic considerations whether it is really imperative or not. It has to be remembered that the use of Sphagnum for Alpine flowers, spoken of incidentally by M. Correvon, is not always helpful, but rather the reverse in British gardens. So, also, I have learned to consider that water for the moraine is not such a necessity in the gardens of a great part of these islands as is alleged. I am of opinion that there are seasons when it would be very beneficial, but in many parts of Great Britain and Ireland the rainfall is so large that it is very rare indeed to find the moraine in need of any other supply of water. I quite agree that M. Correvon's method is excellent for his conditions and for those of gardens in districts where the summer rainfall is very small, but for other places it will be found that the underground stream is not only unnecessary, but sometimes injurious. A well-arranged moraine, consisting of ample drainage below, a thin layer of soil, and the remainder of chips, grit and sand, will suffice for the successful cultivation of most of the difficult Alpines which cannot be cultivated on a wall or a rockery. During times of drought a thorough watering with the hose or the watering can will afford all the moisture that is required. *S. Arnott.*

Reclaiming Sand Dunes in Belgium.—I was interested to read Mr. Webster's article on the Belgian sand-dunes (see p. 243), and can assure him he need not go so far afield to find the same thing being carried out with success. I refer to the sand-dunes between Southport and Liverpool, where there must be still hundreds of acres that could be planted with certain success that would pay well for the outlay. A few days ago, when visiting Formby, a friend took me for a little drive from Freshfield to the shore. It was a great pleasure—I noted the beautiful Sea Buckthorn, heavily laden with orange-coloured berries, for nearly a mile along the front; it was a sight I shall not easily forget—intensified, no doubt, by my not having seen it berried before then. The splendid success of the Firs, apparently planted some eight or ten years since, was seen in their marvellous growth, clean, vigorous and straight, yet planted in nothing but fine sand. Here, then, is an extensive field of afforestation, where there is every indication of it being a commercial success and of great benefit to the district. I was told that the gales from sea are most terrific at times, yet, up to the growth of these Firs some 8 to 12 feet, they have not turned an inch landwards. The interesting problem is: How much higher will they grow before the storms will affect them? As to the species of Firs, so far as I could judge whilst driving along, they were much the same as in Belgium. I noticed several other shrubs and trees growing quite at home, especially the Willows, most successfully, but, as they grow higher, their heads are forced landwards. Elms, Maple and Poplar are all affected in this way, so the question again presents itself: Will the Pines, that are so straight, turn landwards also? I was pleased to see that more of these sand-hills are being planted on the way from Freshfield to Southport; there is a big field for operation, almost too much, one would think, for my lord of the manor. It is truly a national question. *J. Taylor, Hardwicke Grange, Shrewsbury.*

The Perpetual-flowering Malmaisons.—With reference to your correspondent's article under this heading (see p. 260), there are one or two qualifications I should like add to his statements. In the first place, however, he is quite in error in claiming to be the raiser of Princess Juliana, for this variety was raised by the late Mr. E. F. Hopper, when he was Carnation grower to Messrs. Hugh Low & Co. I was associated with the late Mr. Hopper in his work of raising new varieties, and Mr. Hopper's deputy is still in the employ of Messrs. Low. "That the days (of Malmaisons) are numbered none can deny" may be partially true, but until we have obtained in other types of the flower, varieties as good as Duchess of Westminster or Princess of Wales, the cultivation of Malmaisons will continue to be practised. I am sorry your correspondent avoids the definition of a Malmaison, because so much depends on what a Malmaison really is. His point, however, that the Perpetual Malmaison of to-day comes from the same source as the old Malmaison, is incorrect, as the latter was obtained probably from the French "Remontant," whereas the former comes mostly from the American strains, which truly enough we call Perpetual, but yet are totally opposite in form of flower and different in habit from the French Remontant Carnation. *Laurence J. Cook.*

Autumn Colouring of Foliage.—Mr. J. Gardner's list (see p. 269) and remarks on this subject are very interesting; I quite agree that sunshine is not the only essential factor in the process, but surely it is one of the main causes. If we take the plants mentioned, we find that practically all of them, in their native habitats, have generally, at the time of coloration, a good amount of sunshine, together with frost or cold at night. From this, and the fact that when planted where they get sunshine but no decided amount of cold at night, and then do not colour, I think we may safely infer that sunshine and a low temperature at night are the main factors. I leave it to others to explain the why and wherefore. *F. Martin, Summercourt, Wrotham.*

Apple Miller's Red Victoria.—We commenced to show this variety on August 20 at Shrewsbury, and continued to exhibit and market fruits in September. I send you six fruits from a tree planted in December, 1908. The variety is a splendid one for market; the trees bear freely in a young state, and the fruit finds a ready market. The colour is marvellous, even now (September 27) the fruits are quite a show. *Stephen Castle, Manager, G. W. Miller, F.R.H.S., Walpole St. Andrews, Wisbech.* [Very soft fruits of extraordinary brilliant colouring. They cook well, have a good flavour, and are so sweet as not to need added sugar. The variety was illustrated in the issue for October 24, 1908, p. 297.—Eds.]

The Coloration of Fruit.—It is extremely interesting to read the many speculations concerning the colouring of Apples and foliage in such a sunless summer as that of 1912. There can be no doubt that it is plenty of moisture and clear, pure air (oxygen) which cause our fruits to colour well. Some writers say that the high colour is due to climatic conditions. It is a pity that there is not more experimental work done, and not so much guessing. In this matter of coloration, any reader can try the following experiment. Procure several small boxes, without lids, about 9 inches to 12 inches square and 3 inches to 4 inches deep. Holes should be made in the bottoms of the boxes for ventilation, and some strips of wood (laths) should be laid across the bottom of the box to keep the fruit from touching the bottom boxes; lay in one box a lining of blue paper, another of red paper, and a third white; obtain fully-grown Apples, of various kinds, and lay them in the box in various positions—upright, on their sides, or stalk upwards. When this is done the boxes should be placed quite in the open, near the ground, resting on 5-inch or 7-inch pots. Between Raspberries or Currants is a good place for light and shade. As soon as the night dew has evaporated, commence spraying the fruits with clear water at regular intervals of one, two, or three hours, bringing the spraying to an end as the evening shadows fall. Whatever intervals of spraying are decided upon, it must be done regularly, and in a week's time a marked difference will be evident. The fruit in the blue-lined box will be the deepest colour, the white second and the red third. The fruits may be collected for experiment and suspended in the branches of bushy trees, and there sprayed regularly, when they will soon become highly coloured. *John Smith, The Shire Hall, Durham.*

Irish Orchids.—Near Omagh, Co. Tyrone, I found this year an Orchid which seems to be the Orchis densiflora, Wahl. (Habenaria Gymnadenia, H. conopsea), var. densiflora, which differs from Gymnadenia by its larger and more densely-flowered spikes (the Irish ones were 6 inches long) and by the relatively shorter and straighter spur. It is new to Ireland, but the late Rev. W. Newbould found it many years ago (teste *Eng. Bot.*, ix, 103) in Herts. Orchis O'Kellyi I also found in Co. Tyrone and at Toome Bridge, Antrim. *G. Claridge Druce, Oxford.*

THE ALPINE GARDEN.

PRIMULA GLUTINOSA AND P. INTEGRIFOLIA.

As the note and illustration on Primula integrifolia (see p. 258) both refer quite clearly to Primula glutinosa, perhaps it may be of interest to repeat a few facts about these two species.

P. glutinosa can always be recognised with absolute certainty among European Primulas by the rich violet-blue colouring of the flowers, which sometimes varies to more vinous tones indeed, but always so far keeps the note of blue that where P. glutinosa is abundant the hill seems veiled in blue-purple. The flowers also have a peculiar and most delicious fragrance, the segments of the corolla are cleft into such deep lobes that each bloom looks as if it consisted of 10 narrow petals, and the head of blossom is enclosed in big and baggy bracts. The narrow, strap-shaped leaves are toothed all round their edge, and are markedly sticky. The plant does not form lawns or wide masses, but grows in definite little clumps or clusters. This is the essential portrait of P. glutinosa, which there is no reasonable chance of mistaking for any other species. It is specially abundant in the Ortler district, in the Hohe Tauern, the Brenner Alps, and the Southern Dolomites, occurring locally in splendid quantities at considerable elevation, and invariably on granitic or volcanic formations, never on limestone. It affects the moist, high turf of the upper slopes and ridges, and has a greater toleration for moisture than many of its kind, though I have never seen it growing actually as a bog-plant.

* *Rock Gardens and Alpine Plants*, by E. H. Jenkins; edited by T. W. Sanders. (London: W. H. and L. Collingridge.) Price 2s. 6d.

P. integrifolia may be known very clearly by the fact that its leaves are entire. Botanists, indeed, no more than those politicians of whom one happens to disapprove, are by all means always founts of pure and perfect accuracy in their descriptions, and Buddleia albiflora, for instance, has flowers of a tender lilac. But in the case of Primula integrifolia they have not played fast and loose with facts; the leaves are entire, and one cannot describe as "entire" leaves so clearly toothed as those of P. glutinosa. P. integrifolia ranges further west than the other, being found in the Pyrenees, here and there in Switzerland, and abundantly in the Engadine on the highest moorland turf, where it forms lavish lawns of loosely-spreading masses; the flowers are very large, soft, lilac-pink, and carried in heads of two or three, double the size and half the number of those produced by P. glutinosa. If P. integrifolia could ever be confused by the casual eye with any of its congeners, it would be with the magnificent mat-forming Primulas of the arthritic section. But a second glance will set matters right without delay or difficulty. For all the four arthritic Primulas have leaves that are absolutely smooth, glossy, hard and leathery, but the narrow, oval-pointed leaves of P. integrifolia are soft in texture, sparsely downy, and fringed with an eyelash of fine green hairs.

Neither species is common in cultivation; but then, what species is? Sad experience teaches me that in most gardens the only Primulas to be found are Auriculas and the countless hybrids of hirsuta, always described as "viscosa," as well as by other fancy names. Perhaps, too, P. Wulfeniana or P. glaucescens may be seen, either under the name of P. calycina, which does not exist, or of P. carniolica, which is a most rare, glorious and distinct species. Therefore, I should like to preach a crusade in favour of the Primulas in general, so lovely, so brilliant, and, on the whole, so easy to grow, with a modicum of the attention that every true rock-gardener expects to have to bestow on his treasures; otherwise they would not be treasures. But of P. glutinosa I must confess that it wants more than a modicum; it is a difficult species on the whole, not hard to keep so much as to flower. Clean, cool, peaty soil, well drained but moist, in a pure air, seems to suit its needs; in any case the beauty of our one blue Primula is so exceptional and so ravishing that one hardly conceives it possible that earnest enthusiasts should grudge it the attention that they so willingly squander on comparatively squalid and impossible little conundrums such as Androsace Haussmannii. Eritrichium itself is not more beautiful and twice as difficult; yet for 20 who run gladly towards bankruptcy for Eritrichium, hardly one will be found coping with imperial P. glutinosa—no, and hardly even with rich, amenable, happy-go-lucky splendours as P. Clusiana and P. spectabilis. As for P. integrifolia, it is quite easy to grow, though I cannot rank its beauty so high as that of the arthritics or P. glutinosa. But then they would spoil any market. *Reginald Farrer.*

Fig. 133.—PERPETUAL-FLOWERING CARNATION BENORA.

FLORISTS' FLOWERS.

PERPETUAL-FLOWERING CARNATIONS.

Varieties of perpetual-flowering Carnations soon run their course and pass out of cultivation. The question therefore naturally arises—Why do they deteriorate? Because this type of Carnation has no period of rest, but grows and flowers during its entire life. After the first four years of its existence a variety gradually becomes weaker, and if one follows the life of a perpetual-flowering Carnation for 12 months this will not cause wonder. During the winter, the natural resting period for all members of the Dianthus family, the perpetual-flowering Carnation is busy growing and flowering. Cuttings are removed from the parent plant, and when they have passed through the weakening ordeal of rooting, they are rapidly grown on into flowering plants, so that from the time a seedling produces its first flowers until the plants of that particular variety number millions and are grown in practically every civilised country, it grows unceasingly. Small wonder that a variety deteriorates. It is seedlings alone which can possess new vigour.

Those of us who remember Mrs. T. W. Lawson when it was first sent out in 1900 know that those who grow it to-day only have a shadow of the Lawson of 1900, and this is not remarkable considering the millions upon millions of plants which have been propagated since the year 1896, when it first flowered as a seedling.

Selection and good cultivation contribute to prolong the life of all varieties, and weak stock is worthless. But, as I have tried to make plain, no variety of perpetual-flowering Carnation can, like Tennyson's brook, go on for ever. A Rose may retain its vitality, a border Carnation may, but a perpetual-flowering Carnation cannot.

Which are the varieties, in my opinion, that already show depreciation, and which of the new aspirants to fame will supersede them are matters on which I may write at some later date. Every new Carnation is not an Enchantress, yet greater varieties than Enchantress will come, if, indeed, some are not here. *Montagu C. Allwood.*

CARNATION BENORA.

Each season there are numerous novelties added to the already extensive list of Perpetual-flowering Carnations. One of the most recent at the exhibitions is Benora (see fig. 133), a white-ground, fancy flower, with markings of bright red. The flower is of fine size, and possesses a long, stout stem, making it valuable for the florist. The variety was included in Messrs. Stuart Low & Co.'s exhibit at the R.H.S. meeting on October 8.

THE NARCISSUS FLY.

(See also Illustrated article in last issue.)

This year on account of gaps in some of my Daffodil plots, though I saw no mature fly about, I suspected the presence of the grub of the Narcissus fly, and in the latter half of June I took up the whole of my collection, mostly seedlings, about 10,000, including loose offsets. I examined every bulb closely and carefully both at neck and base, going over them twice and cutting open any that were doubtful. Altogether I found 35 to 40 bulbs with the grub in them. It is quite certain that in every single case the grub had entered at the base. In all cases except nine (including three with full grown grubs), the bulbs outwardly were absolutely intact, except for the one spot where the grub had entered. Whether the actual point of entrance was at the junction of the base plate with the layers of the bulb, or just below the edge of the base where the outermost ring of roots spring from, I was unable to be sure in all cases, the hole (which was probably very minute) being always closed up, or obscured at any rate to my rough and ready examination, by the surrounding tissue of the base becoming brown and corky. And the area of the base which becomes so affected by the puncture seems altogether out of proportion to the injury, as if the grub at entrance emitted some substance which acted as an irritant. In all these cases the grub was still small, less than ½ inch long, and had not travelled more than from one-third to three-quarters of the length of the bulb towards the neck. In the other few bulbs (five or six) the grub was larger, and had bored as far as the neck or nearly so, and there was therefore a possible opening at the neck, but it was quite clear in these cases, too, that the grub had entered from the base, where the damage was older and more extensive, the boring at the upper part, where the grub was found, being only about its own diameter and evidently more recent.

How the grub arrives at its point of entrance I found no evidence to show—whether it creeps down the outside of the bulb till it arrives at the edge of the basal plate, or whether it goes down inside the outer skin! The latter may be the case with bulbs that have formed an offset, for in the majority of such bulbs (though not in all) the point of entrance was at or near the junction of the offset with the main bulbs. But in the case of young bulbs that have not yet begun to form an offset it would seem impossible for the grub to get down inside the outer skin. Also, there was nothing to show that the grub does not travel through the earth and not on the surface of the bulb at all, though in that case it is more difficult to understand how it arrives at the right spot, unless it first starts on a root and so up into the bulb.

Usually the grub bores straight towards the centre and then turns up, but in three cases the grub had apparently turned up immediately after entering, and had bored along in the substance of the first layer (under the skin) like a Celery leaf grub. In two of these cases after meandering some way without growing any larger (or even getting smaller), the grub was evidently starved and either dead or dying. In the third case it had at last bored through into the next and more succulent layer, and, as the boring showed, had then rapidly increased in size. I note this especially, as I think it points to the advisability of getting the bulbs up and dried as quickly as possible, as evidently the grub when young needs moisture to thrive.

In three bulbs the grub was practically full grown at the time of taking up in June. As it is hardly possible that the fly could appear during the winter, it seems probable that the eggs (or even the young grub) may remain dormant for some time.

All my bulbs being planted in lines in plots, and plans kept of their position in the ground, it was possible to locate roughly the position of each bulb in which a Merodon was found. They were scattered irregularly over nearly the whole of the plots, and there was no evidence of concentration in any one spot. This seems to show that the fly lays its eggs quite at random, and one at a time. And this is confirmed by the fact that (with one doubtful exception) only one grub was found in each bulb.

The only measure I took during flowering time was to sprinkle Alphol broadcast over the plots twice during May. What effect this had in keeping the fly away and deterring it from laying its eggs, or in killing the grub as it hatched out, or whether if the sprinkling had been repeated oftener and more thoroughly the fly might have been kept off altogether, I cannot say, as I left none untouched for comparison. But I think it is worth trying systematically. It is perfectly harmless even to young seedlings.

When the Merodon has appeared I think it should not be very difficult to eradicate. My present experience suggests that all the bulbs should be taken up early, washed or cleaned roughly and dried quickly. I dried some in the sun for two days, and if I had to go through the job again I should do so with all. Then, as soon as possible after taking up—when cleaning and trimming off the roots—they should be examined, and again later, a week or two before planting, which for one season it would be best to defer rather longer than usual. It is a considerable labour, especially when they are seedlings which have to be kept separate. But once it is recognised that the point of entrance is at the base, much time is saved, as the necks need not be closely examined. And with very little experience the bulb that has been entered by a Merodon can be quickly and almost certainly detected. A few bulbs may be mistaken through having a mark caused by an accidental injury, but a slight preliminary scraping of the outer skin and adjacent part of the base will very quickly show the difference.

In cases where a bulb which it is particularly desirable to keep has been attacked, it can generally be saved if taken up early and examined soon. All that I examined up to about the middle of August could have been saved, and some half-dozen or so I did save, scraping out the corky portion of the base and extracting the grub with a pin before it had done much damage.

Such bulbs, though they would not flower, would form healthy offsets. Later on the damage becomes more extensive, and the grub gets so far in—and sometimes turns to the side—that it is difficult or impossible to get it out without cutting the bulb.

While being definitely assured by this experience that the Merodon grub invariably enters the bulb at the base, I think I can also suggest how the supposition may have arisen that it entered (sometimes, anyway) at the neck. Many of the bulbs taken up were rotten inside (the final stage, I suppose, of "basal rot," due to the exceptionally wet winter), and frequently this rottenness was chiefly in the upper part of the bulb. These nearly always contained a number of maggots, which at first sight are very like young Merodon grubs. But they never reach a length of more than ¾ inch, they are much more active than the Merodon grub, and have a red speck at one end, whereas the Merodon has a black speck. I kept a number of them, and they all turned into a small kind of dung fly. *A. J. Bliss.*

Narcissus Fly.—I have read with interest Mr. Long's article on the Narcissus fly. On p. 278 he states that "Theobald says that the larvæ are common in Hyacinths, Tulips, and Narcissi." The statement is right with respect to Narcissi, but I have handled many thousands of Tulip bulbs from different places, have grown thousands myself, and have never found one attacked by the fly. What does Mr. Long say? *Joseph Jacob, Whitewell Vicarage, Salop.*

The Week's Work.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Aerides, Angræcum, and Saccolabium.—Many of these plants that flowered early in the year will soon have completed their growth, and the supply of water at the roots should be reduced gradually. Although these Orchids never entirely cease making leaf-growth, it is important that they should enjoy a short period of rest. When in active growth, sufficient water should be afforded to keep the moss on the surface in a green and fresh condition, but from now onward through the winter months the moss should be allowed to dry to a greenish-yellow colour before water is applied. Angræcums that are in full growth, including A. pellucidum, A. Eichlerianum, and A. sesquipedale, still require plentiful supplies of water, whilst A. eburneum and A. Monteiræ are pushing forth flower-spikes and require to be kept moist at the roots.

Trichopilia.—The Trichopilias flower at various times of the year, and, for that reason, their repotting should be carried out at intervals, just when new roots appear from the base of the new pseudo-bulbs. T. suavis is the handsomest species, and is most frequently grown, but T. fragrans and its variety alba, T. coccinea, T. tortilis, and T. sanguinolenta are all worthy of cultivation. Most of these plants grow best in rather deep Orchid pans suspended near to the roof-glass in an intermediate temperature. But T. fragrans thrives best during the summer months on the stage in the cool Odontoglossum house. Whilst growing actively the plants should be afforded a plentiful supply of water at the roots, but when the season's growth is finished, they should receive less moisture and more air to ripen them.

Cymbidium.—Plants of Cymbidium Lowianum, C. Tracyanum, and the many hybrids that are now showing their flower-spikes should be well supplied with water at the roots, whilst others that are backward in this respect should be kept on the dry side for some weeks to come, otherwise new growth will commence and the plants fail to bloom. C. grandiflorum has also finished its growth and is pushing flower spikes from the pseudo-bulbs of the previous year. To ensure success in flowering this species, the plants should be placed in a cool, light position and the roots kept on the dry side during the winter. C. eburneum and C. Mastersianum should be grown in a less exposed part of the house and be kept rather dry at the roots; having but little pseudo-bulbs to sustain them, they should at no time be allowed to become quite dry.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Planting Roses.—Make preparations for the planting of Roses without delay. As these plants occupy the ground for several years, it is necessary that the soil receive a thorough preparation at the start. Roses may be planted during favourable weather at any time from now until March or even April, if the work is done with very great care, but the best time of all is the latter part of October and November. At these times the ground is still warm, and the roots have opportunity to become established before the winter. There is another advantage in early planting, from the fact that those who order early have the pick of the nursery stock. From these considerations, therefore, the work of trenching should be hastened, so that the ground is settled somewhat before the time for planting. The best soil for Roses is a strong, rich loam of a heavy nature, but it should be thoroughly well drained, or the plants will soon become unhealthy. Light, sandy, or gravelly soils are unsuitable, as they are too hot in summer. Unsuitable soils may be improved; a quantity of the natural soil should be removed and replaced with specially-prepared compost. Where the staple is light and sandy, strong, clayey loam should be added. When trenching, dig in plenty of farmyard manure at the bottom of the trench, but do not allow the

manure to come into contact with the roots, which will find their way to the manure later, when they are in a better condition to assimilate the food properties. In selecting a site for a Rose garden or Rose beds, the question of shelter must be considered. Protection from the north and east is imperative, whilst cold, draughty situations and wind-swept corners should be avoided. The modern system is to plant in masses of one colour, if not of one variety. In large schemes of Rose planting, approved varieties only should be selected; novelties should be planted in borders where their characteristics may be studied better. Small beds or borders may, with advantage, be filled with the charming, dwarf Polyantha varieties, which provide a pleasing change, and bloom almost continuously throughout the season. The following dwarf Polyantha Roses may be recommended:—Etoile d'Or, Jessie, Pearl d'Or, Cecile Brunner, Léonie Lamesch, Anna Marie de Montravel, Mrs. W. H. Cutbush, and Aschenbrödel.

Sweet Peas in Pots.—The present month is a suitable time for sowing Sweet Peas in pots. Such plants are very valuable if early flowers are required, and the practice should always be adopted in the case of new varieties, as they are better under control and not so liable to injury from enemies. Any ordinary potting soil is suitable, and the seeds may either be sown singly in small pots, or from four to five in 5-inch pots; if preferred, ordinary seed-boxes may be used. The seeds should first be coated with a mixture of red lead and paraffin, rolling them in the mixture; this will prevent mice and other insects from devouring them. After the seeds are sown, the pots should be placed in a close frame or upon a shelf in a cool house. After the seedlings have appeared, an abundance of air should be given whenever the weather is favourable. Sweet Peas may be sown out-of-doors in the open in certain localities, but they are not to be relied upon, except in the most favoured districts, and even then only the commoner varieties should be selected.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

The Recent Frosts.—The unusual spell of severe weather that has been experienced in many districts during the past fortnight has destroyed the more tender crops. Some districts, however, have escaped the cold, and in places within 10 miles of these gardens the frost has done but little damage. At Aldenham we registered 8°, 9°, and 10° of frost on several occasions, these being the lowest readings of the thermometer at this time of the year during the 30 years I have been at Aldenham. Such plants as have been destroyed by the cold should be cleared away, and preparations made for manuring and trenching or digging the ground for next season's crops. I am referring especially to land of a light, porous nature; heavier soils are much better worked during the New Year, except in the case of ground that has not formed part of the kitchen garden before. If the kitchen garden is to be extended, the soil should be well drained and trenched thoroughly, bringing up the sub-soil to the surface, and leaving the whole in as rough a condition as possible, to expose the clods to the influences of the frost. If the soil is deficient in lime, this material should be scattered over the surface. No time should be lost in placing the more tender crops either in cold frames or where shelter may be afforded them.

Cauliflowers. — Cauliflowers raised from seed sown last month for providing a supply of these vegetables next May, June, and July should be transplanted into cold frames, setting them fairly near to the glass. The compost should not be of too rich a nature, or the growth will be soft and sappy. The soil should be of a fairly fine texture, and made very firm. Insert the stems as low down as the seed leaves, and set the plants 4 inches apart each way. Plants of late batches of Cauliflowers of the Autumn Giant type which have not yet formed their heads should be lifted carefully and planted in cold pits or frames, placing them on their sides. Make the soil very firm about the roots, water the plants, and keep the frame fairly close for a few days. When the plants are re-established, admit plenty of air. These Cauliflowers will provide a valuable supply of heads for many weeks to come.

Mushrooms. — Field Mushrooms have been very scarce this season, owing, no doubt, to the wet weather. Mushrooms grown indoors should never be forced hard, as this treatment invariably results in failure. Endeavour to maintain the same atmospheric conditions in the Mushroom house as obtain on dewy September nights. Beds which have been in full bearing for some time past should be watered with diluted liquid manure from the farmyard. Continue to prepare the materials for the making of fresh beds. The manure should be placed under an open shed, and turned frequently until it has become properly sweetened, when it may be brought into the house and placed in position, treading it as firmly as possible.

Celery.—This crop has done remarkably well this season where disease has not appeared, and especially the plants of the later batches. Continue to place earth about the stems on fine days, especially in the case of the very latest batches. It may not be necessary to blanch all the crop for the present, as when the shoots are blanched the plant is more tender, and not so likely to escape damage from frosts.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Caladium.—The foliage of these plants having died, the roots should be stored for the winter in a dry, warm place. If most of the roots are withered, the old soil should be shaken from the corms and the latter placed in dry sand. Caladiums should be stored during the winter in a temperature not lower than 60°, or they may be allowed to remain in the pots over the winter under the stages of the plant stove, but care must be taken that water dripping from the pots above does not wet the soil.

Humea elegans.—Plants of Humea elegans should not receive a check at any time, and, if they require larger pots, these should be afforded before the roots become pot-bound. But guard against overpotting. When root-bound, the plants often lose their foliage in the spring, whilst a very close, moist atmosphere may cause spot to develop in the leaves. From now onwards, the plants will do best in a cool, dry house.

Canna.—Pot plants of Cannas should be stored in a frost-proof house where the atmosphere is not too dry. Those that have been kept slightly damp grow much more freely in the spring than those that have been stored perfectly dry. As soon as the foliage has withered, place the plants in a cold frame, preferably a brick structure from which frost can be excluded. Stand the plants on an ash bottom and cover them with dry leaves, which will prevent the rhizomes from drying unduly.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Selecting Varieties for Planting. — Varieties of Apples are exceedingly numerous, and the number is constantly being added to. Special attention must be given to select only varieties that succeed in the particular district, and this also applies to Pears. It is a common mistake to plant too many varieties, as it is a much easier matter to select six varieties than twenty varieties. Of culinary Apples that succeed well as bushes and pyramids in most districts, I may mention Lord Grosvenor, Early Victoria, Warner's King, Lane's Prince Albert, Newton Wonder, and Bramley's Seedling. For larger collections Potts's Seedling, Lord Derby, The Queen, Bismarck, Beauty of Kent, and Stone's Seedling may be added. For exhibition purposes, Peasgood's Nonesuch, Emperor Alexander, Tyler's Kernel, Golden Noble, Hambling's Seedling, and Norfolk Beauty will be required. The last-named is an excellent all-round variety. Select varieties of Apples suitable for planting as standards are Blenheim Pippin, Dumelow's Seedling (Wellington), Newton Wonder, Lady Henniker, Gascoyne's Scarlet Seedling, and King Edward VII. Varieties of dessert Apples for training as pyramids include Lady Sudeley, Worcester Pearmain, James Grieve, Rival, Cox's Orange Pippin, and Claygate Pearmain. If it is required to extend the list, other handsome varieties will be found in Charles Ross, Barnack Beauty, King of the Pippins, Allington Pippin, Ribston Pippin, Scarlet Nonpareil, Wealthy, and Lord Hindlip. Amongst novelties I would recommend for trial are Rev. W. Wilks, W. Crump, and Hector Macdonald. Considering the great assortment of Pears, it is even a more difficult matter to make a selection, but I would recommend Fondante d'Automne, Triomphe de Vienne, Beurré Hardy, Louise Bonne of Jersey, Pitmaston Duchess, Williams's Bon Chrétien, Durondeau, Charles Ernest, Beurré Superfin, Conference, Joséphine de Malines, and Doyenné du Comice. Culinary varieties should include Beurré Clairgeau and Catillac, both of which may be grown as standards.

Selection of Plums for Planting.—For culinary purposes I would recommend The Czar, Victoria, Pond's Seedling, and Monarch, whilst good dessert sorts are Early Transparent Gage, Denniston's Superb, Jefferson's, Kirk's, Reine Claude de Bavay, and Coe's Golden Drop.

Selection of Small Fruits.—Two good Red Currants are found in Raby Castle and La Marseillaise. White Dutch is the best white variety, and Boskoop Giant may be recommended as the best Black Currant, although Carter's Champion and Lee's Prolific may also be planted, the latter on account of the fruit hanging for a long time. There are numerous Gooseberries: a few of the best are Crown Bob, Whinham's Industry, Whitesmith, Keepsake, Langley Gage, and Langley Beauty. Of Raspberries, I would recommend Superlative, Hornet, and Baumforth's Seedling.

Distances for Planting.—The distance at which fruit trees are planted must be governed more or less by the nature of the soil and the district. Pyramid and bush Apples on the Paradise stock, and Pears on the Quince, may all be planted at distances of 9 and 10 feet apart. Apples and Pears on the free stock should be planted 12 feet apart, whilst strong-growing kinds of Apples trained as standards should be not closer than from 25 to 30 feet. Gooseberries should not be planted closer together than 5 or 6 feet, and Raspberries may be allowed this distance between the rows, but the stools need only be set at 3 feet apart. Fan-trained trees, such as Peaches, Pears, Cherries, and Plums, require to be set 15 to 18 feet apart, whilst horizontal-trained trees should be allowed 20 feet.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Planting Peaches and Nectarines.—It is an advantage to possess a few young trees growing on a wall or trellis out-of-doors in readiness to replace worn-out trees under glass. If such trees are available, and have been given proper treatment in regard to lifting and root-pruning, they may be planted now with a reasonable chance of producing a fair crop of fruits next season. If the trees are lifted with a good ball of young, fibrous roots, and planted at once, the roots will become active in a few days. The trees will then have time to recover from the check and become well established in the spring. It will be advisable to start the trees into growth very gradually next season, for if they are allowed to develop naturally the chances of a good crop of fruits will be far greater. They need not be planted in a large bulk of soil. A border sufficiently large to conveniently take the ball of roots is all that is required. It is always advisable to keep the roots of young Peach trees somewhat restricted till the trees begin to carry full crops of fruit. The soil should not be too rich, as this causes the shoots to grow gross, which is often the cause of young trees failing to crop satisfactorily. The bottom of the border should be covered with a thin layer of concrete, to prevent the roots getting out of bounds. Make sure that the border is amply drained, using plenty of old bricks and coarse brick rubble for this purpose. Arrange the border in layers, making sure that each layer is made quite solid. Mix plenty of broken brickbats and old mortar rubble in the soil as the work proceeds, and refrain from using manures of any kind unless the ground is poor. Plant the trees near to the surface of the border, and, when finished, give a good soaking with clear water. Syringe the trees twice daily till they have recovered from the check.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 21—
Nat. Chrys. Soc. Executive and Floral Com. meet.

TUESDAY, OCTOBER 22—
Royal Hort. Soc. Comm. meet. (Lecture at 3 p.m. by the Rev. Prof. G. Henslow on "The Senses of Plants.")

WEDNESDAY, OCTOBER 23—
Hertfordshire Fruit, Root and Chrys. Soc. Sh. (2 days). Women's Agric. and Hort. International Union's Sale and Exh. at R.H.S. Hall.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—49°7.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, October 16* (8 P.M.): Max. 58°; Min. 37°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October 17* (10 A.M.): Bar. 29·8°: Temp. 53°; *Weather*—Fine.
PROVINCES.—*Wednesday, October 16*: Max. 54° Cornwall; Min. 51° Shields.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, TUESDAY AND WEDNESDAY—
20th Annual Sale of Nursery Stock at Milford Nurseries, near Godalming, by Protheroe & Morris, at 12.

MONDAY, WEDNESDAY AND THURSDAY—
Rose Trees, Dutch Bulbs, Perennials and Shrubs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

WEDNESDAY—
Trade Sale of Bulbs, at 12; Palms and Plants, at 4; at Protheroe & Morris's rooms.

THURSDAY AND FRIDAY—
88th Annual Sale of Nursery Stock at Hollamby's Nurseries, Groombridge, near Tunbridge Wells, by Protheroe & Morris, at 11.30.

FRIDAY—
Mexican Lælias, by order of de B. Crawshay, Esq., at Protheroe & Morris's rooms at 12.45.

The Colouring of Apples.

The discussion in these columns on the subject of the colouring of Apples has given rise to a considerable amount of interest both among practical gardeners and among students of plant chemistry. This, indeed, is as it should be, for, as is the case with so many other obscure problems in horticulture, the problem of the causes of coloration in fruit is one which requires for its solution the co-operation of the workers in garden and laboratory. The former have under their close observation, year after year, large numbers of different varieties, and they are able to contrast the degrees of coloration exhibited by the several sorts in any given year, and to compare the coloration exhibited in one year with that shown by the same variety in previous years.

That differences of opinion exist among observant gardeners as to the conditions which determine coloration is evidence that the problem is not simple, and tends to prove that more than one set of conditions are concerned in affecting this ripening process. This conclusion is also manifest from the results of recent experiments which have been made in the laboratory on the coloration of plants.

The nature of the chemical process which leads to the development of red pigment in the superficial tissues of Apples is known with some degree of accuracy, and is in the main similar to that which leads to the production of the sap or anthocyan pigments of flowers and other parts of plants. In its essentials this process is one of oxidation, and is brought about, as described in these pages August 10, 1912, p. 116, by the action of special chemical oxidizing agents—known as oxydases—on special colourless substances known as pigment producers. The pigment producers are not present in the unripe Apple in a form in which they can be acted upon by the oxidizing agents of the cell. They occur in the young, green fruit only in combined form, and in this condition the pigment producers are preserved from the influence of the oxydases. As ripening proceeds, the chemical combination which contains the pigment producers is broken down again by a definite chemical agent produced by the cells for this purpose, and the pigment producers, set at liberty in small quantities, are acted upon by the oxidizing agents and converted into red pigments. There is no doubt that different varieties of Apple possess different potentialities of pigment production, that is, the amount of pigment-producer which one kind of Apple is capable of yielding differs from that which may be formed by another kind. That this is so will be apparent at once to gardeners, who know that under no conditions will a fruit of Blenheim Pippin, for example, produce as much pigment in its skin as a fruit of Gascoyne's Scarlet Seedling.

In discussing this problem, the first fact to be recognised is therefore this: that internal and hereditary characteristics exercise influence on the amount of pigmentation.

Arising out of this fact is another, which must not be lost sight of, namely, that it is by no means certain that all the individual trees of a given variety of Apple are identical with respect to pigment-producing potentialities. The next fact to bear in mind is that pigment formation, as we have shown, is the outcome not of a simple chemical process of the cell but is rather the last and visible manifestation of a series of chemical changes which, invisible in themselves, are nevertheless essential antecedents of the final operation which results in the production of colour.

Now every chemical operation is influenced with respect to the rate at which it takes place by the conditions under which it occurs. Among these conditions are temperature, and in the case of plants, light; but there are also others which may influence the rate of the chemical change no less remarkably. To mention one only, the degree of acidity of the sap and the rate at which this acidity is reduced during the ripening process may and almost certainly does affect coloration. The problem of determining the conditions which facilitate the development of pigment in fruit may be stated therefore in these terms.~ Under what conditions are the pigment-producing processes most active? At this point, when the question becomes definite, we have to confess with regret that our knowledge becomes slender. We may say with confidence that light plays a part in determining the amount of oxidizing agent present in the cell; hence we may admit that chemistry confirms the observations of gardeners that the amount of coloration of the fruit of a given year is dependent on the amount of light. It may well be that, as stated by a correspondent in these columns, the nature of the light, that is to say its colour, white, red or blue, &c., may exercise a potent influence; but further evidence is wanted before this conclusion may be admitted.

Another fact of observation may be not without significance, namely, that many plants develop large quantities of red pigment when they are exposed to low temperatures. Hence it may prove to be true that the finest coloration of fruit is produced in years the ripening months of which are characterised by bright light and low temperatures. Again, it is quite possible not only that the weather of the previous year counts in determining the coloration of the fruit, but also that the amounts of moisture in air and soil are not without effect. For it is not an exaggeration to say that the ripening process involves what we may call a partial death of the cells of the skin and pulp of fruits. Not till these cells have lost some of their vital activities do the red pigments, symptoms of approaching mortality, declare themselves. With moister weather the life of the cells may be prolonged and their pigmentation delayed. Here, however we part company altogether with certain knowledge, and we must be content to await further observation and experiment before our analysis of the causes of fluctuations of pigmentation may be carried to a successful issue. That this may and will be done there is no doubt, and that results of practical value will ensue from a thorough solution of this problem we are certain. The students of bio-chemistry ought therefore to be under a considerable debt of gratitude to those gardeners who have brought this important subject into prominence, and who have put on record the results of their observation.

COLOURED PLATE.—The subject of the coloured plate to be published with the next issue is Echium Wildpretii.

ROYAL HORTICULTURAL SOCIETY.—The next fortnightly meeting will be held on the 22nd inst. in the Society's Hall, Vincent Square, Westminster. In the lecture-room at three o'clock the Rev. Prof. G. HENSLOW, M.A., V.M.H., will deliver an address on "The Senses of Plants."

"The Botanical Magazine."—The issue for October contains illustrations and descriptions of the following plants:—

Chamaedorea glaucifolia, tab. 8457.—This elegant Palm was at one time largely employed as a table plant, and is one of the most graceful members of the genus. Its habitat is a matter of some speculation, and recently it has been stated to be a native of Guatemala, although, when first described, it was believed to have been introduced from New Grenada. A specimen has been in cultivation in the Aroid house at Kew for some 40 years; the plant flowered this season, and furnished the material for the *Botanical Magazine* illustration. The Kew plant has a very slender stem, too thin to support the crown of foliage.

Ceropegia Thorncroftii, tab. 8458.—This new species is named in compliment to Mr. G. Thorncroft, who discovered the plant in the neighbourhood of Barberton, Transvaal. The species closely resembles C. crispata, but it has much smaller flowers, characterised by gibbous projections on the middle of the keels on the inner side of the lobes. Plants grown in the Botanic Gardens, Cambridge, have succeeded in ordinary tropical conditions, but the species apparently enjoys a rather higher temperature in winter, and a greater degree of dryness than most Ceropegias. The corolla is white blotched with purple; the flowers are about 1½ inch long.

Osmanthus Delavayi, tab. 8459.—This is a Chinese species introduced to cultivation by the late Abbé Delavay, who sent seeds to Mr. M. L. de Vilmorin. The plant should prove a useful addition to the shrubbery, as it is evergreen, flowers early in the season, and the blossoms possess a delightful fragrance. The flowers are white, and are produced in terminal clusters.

Elsholtzia Stauntonii, tab. 8460. — This plant was illustrated in *Gardeners' Chronicle*, January 13, 1912, p. 21, from a photograph by the Rev. T. Arnold Hyde, Ringinglowe, Kent. The species is described as the best of the genus from a garden point of view. It has pale rose-coloured flowers, which Mr. Hyde likens to a vigorous spike of pink Heather. The plant is quite hardy, forms a shrub some 5 feet high, and flowers freely in September and October. Cuttings of the young shoots root readily in a close frame in autumn.

Furcraea elegans, tab. 8461.—This, the handsomest of the Furcraeas, is distinguished from all other species by the size of its leaves, which sometimes grow to a length of nearly 8 feet. The material from which the *Botanical Magazine* plate was prepared was sent from Lady Hanbury's garden at La Mortola. Specimens in the Succulent house at Kew have never flowered. The dull, green leaves have a band of purple on their margins. The inflorescence attains to a height of about 25 feet, and produces pale green flowers with purple exteriors, which become brownish later.

Cultivation by Electricity.—A congress will be held at Reims on October 24-26 on the subject of the use of electricity for the cultivation of plants. The programme of the congress, which may be obtained from the secretary, 58, Boulevard Voltaire, Paris, includes a large number of subjects, among which are the following:—"Influence of atmospheric electricity on plants and on nitrification in the soil," "Influence of electricity generated by artificial means on the growth of plants and on plant-parasites," "Protection of fields and glasshouses from hail," "Forcing by electricity," "Effects of electric light on plants," "The use of electric light in the destruction of insects and other applications of electricity to horticulture."

Sir Joseph Hooker.—The current number of *Knowledge* (October, 1912) publishes a reproduction of the admirable photograph by J. Russell & Sons of Sir Joseph Hooker, taken when he was 94 years old. In addition to the portrait, the number contains also the oration on the life and work of Hooker which was delivered by F. O. Bower, Regius Professor of Botany, before the members of the University.

Kent Commercial Fruit Show. — This exhibition will be held on the 29th and 30th inst., at the Corn Exchange, Maidstone. The association was formed with the object of introducing amongst home growers systems of packing and grading Apples similar to those adopted by American and Tasmanian growers, and also to exhibit British Apples in bulk. The secretary informs us that, as the direct outcome of last year's exhibition, an export trade in Apples to the Argentine and South Africa has been instituted. It is expected that this year's exhibition will be twice as large as the initial one, and that not only Kent, but Herefordshire, Worcestershire, Cambridgeshire, Devonshire, Norfolk, Suffolk, Surrey and Sussex will be represented by exhibits. The secretary, Mr. R. Wellington, The College, Wye, has arranged with the railway companies to offer special facilities for visitors from London.

A Useful Museum. — We learn from *Le Jardin*, October 5, 1912, that the Society of French Agriculturists has installed at its headquarters in the Rue d'Athènes a permanent museum of objects illustrating methods of packing and exhibiting, among other things, the latest and most approved ways of packing fruit, early vegetables and flowers. The attention which the business world in France devotes to this aspect of trade, and the ingenuity which the French display in packing goods for transport are bound to make this novel museum attractive, particularly to English horticulturists, who will doubtless visit it in large numbers.

Protection of Wild Birds. — We learn from *Nature* that the Royal Society for the Protection of Birds is establishing a sanctuary at Brean Down, Somersetshire, a bare, grassy promontory, with broken cliffs, the home of the white Rock Rose. Its chief bird—there are three specially protected—is the beautiful sheldrake. Of the other two, the raven has built here for fifty years. Lately the peregrine, so often found near the raven, has established itself. Kingfishers, sparrow-hawks, daws, kestrels, shrikes, linnets, rock-pipits, and wheat-ears are also natives. For permission to establish this sanctuary the society is indebted to the Somerset County Council.

The Protection of Wild Plants.—The following by-law of the Cornwall County Council might well be adopted by other authorities which possess plants worth protecting and vandals worth suppressing:—"No person shall (unless authorised by the owner or occupier, if any, or by law so to do) uproot or destroy any Ferns or other wild plants growing in any road, lane, roadside, waste, wayside bank or hedge, common, or other public place, in such a manner or in such quantities, as to damage or disfigure any such road, lane, roadside waste, wayside bank, or hedge, common or other public place. Provided that this by-law shall not apply to persons collecting specimens in small quantities for private or scientific use. Any person offending against this by-law shall be liable to a penalty not exceeding five pounds."

The United States Harvest.—Estimates place the Wheat harvest of U.S.A. for 1912 at 700,000,000 bushels, which yield has been exceeded but twice in previous years, namely, in 1901 and 1906. Oats and Hay have also yielded heavily, and the crops are larger than in previous years.

The Packing of Fruit, &c. — A *Bulletin* issued by the Board of Trade makes the following recommendations with respect to the packing of fruit and delicate vegetable produce. First place a layer of soft shavings at the bottom of the box or basket, cover with sheets of paper, lay in the fruits so that they cannot be moved, and in the case of choice sorts make no more than two layers. Such fruits are best dispatched in small boxes containing one layer only. If such boxes are used, soft shavings above and below and soft "silk paper" round each fruit suffices: if two layers, they should be separated by two sheets of paper, between which packing material is also placed in an even layer. By this means so many as four dozen dessert Apples, Pears, or Plums may be packed in a single box. Fruit such as Peaches and Apricots should be made up always in single layers. Strawberries are best made up in 3-lbs. lots, Cherries in lots of 4 lbs.

Parasitic Origin of Monstrosities.—It has been affirmed more than once, and on good grounds, that certain monstrous abnormalities, such as the doubling which occurs in some flowers, are due to the excitation set up in the plant by a parasite. An example of this kind is given by M. Molliard-Marin in the *Bulletin* de la Société Botanique de France. The malformation which he describes in the Daisy took the form of proliferation of the flower-head, doubling of the corollas of the ray florets, and sterility of the female sexual organs. The exciting cause of these far-reaching disturbances is the presence in the young flower-forming plants of a species of Eriophyes.

The Precocious Flowering of Plants is a phenomenon not unknown to cultivators, who also know that it is usually due to low vegetative power, caused by deficient nutrition, resulting from poorness of soil or insufficient moisture, just as excessive vegetative vigour is often the result of overfeeding. In nature the same phenomena are observable, and in a general way it is evident that premature flowering is an effort to secure reproduction when the conditions render normal development impossible. But there are many singular instances of precocious flowering on record that are not so easily explained, though in some instances injury to the tissues seems to have stimulated the attempt at reproductive activity. Thus occasionally the embryo of a Cocoanut will push forth an inflorescence as a first effort in germination. Possibly the embryo may have been injured by insects. Again, there are various species of plants which produce two kinds of leaves (often with intermediate forms), designated the juvenile and adult. Ordinarily, flowers appear only associated with adult leaves, though exceptions are not uncommon. Dr. L. Cockayne has recently put on record (*Report* of the Australasian Association for the Advancement of Science, vol. xiii (1912), pp. 217-221) observations "on some examples of precocious blooming in heteroblastic species of New Zealand plants," or those whose juvenile forms are markedly different from that of the adult. He has observed that the juvenile forms or stages often flower, and, in the absence of evidence to the contrary, they could only be regarded as distinct species. Plants of this category are not uncommon in New Zealand. One of the most interesting is Sophora tetraptera (Edwardsia grandiflora), the forms of which have puzzled botanists and horticulturists. Several are figured in the *Botanical Magazine* and elsewhere as species. Dr. Cockayne appears to regard S. microphylla as specifically distinct from S. tetraptera, and S. prostrata as a variety or state of it. The latter comes true from seed. In certain localities the shrub and tree grow side by side, whilst in drier situations only the shrub exists.

THE WINTER GARDEN AT AVERY HILL.—At a meeting of the London County Council on October 15, Mr. W. J. SQUIRES presented a petition signed by 5,000 ratepayers, praying the Council to reopen the winter garden at Avery Hill. Mr. KINGSLEY WOOD asked the Chairman of the Parks Committee why, as the garden was dedicated to the use of the public for ever by the chairman of the Council in 1903, it had been closed, and when it was proposed that it should be reopened. Mr. J. W. LORDEN, chairman of the Parks Committee, stated, in reply, that the winter garden had been temporarily closed, as several iron bars had fallen without warning. The matter was engaging the serious attention of the Committee, as also was the question of increasing the popularity of the garden. Directly the building was in a safe condition the public would be re-admitted. The petition presented by Mr. SQUIRES was referred to the Parks Committee for consideration.

RESTRICTIONS ON THE IMPORTATION OF PLANTS INTO SOUTH AFRICA.—The following information has been distributed as a circular by the Union of South Africa Department of Agriculture :—"Nurserymen with South African customers are hereby respectfully informed that plants, excluding bulbs and seeds, are admitted into the Union from overseas only under special permit. Permits are not given at all for Conifers, or for Eucalyptus, or Acacia trees. They are freely given without regard to quantity for house Palms, Ferns, Carnations, Geraniums (Pelargoniums), Chrysanthemums, Orchids, and many other tender plants; but are given only for ten plants of a variety in the case of ornamental shrubs. While for fruit-bearing plants and Roses, and for trees in general, they are given only for varieties that are not procurable in the Union and that cannot be grown from seed, and for not more than ten of a kind. It is desirable that nurserymen refrain from filling any order in the absence of knowledge that a permit has been issued or is practically certain to be issued with respect to it. Applicants are supplied with permits in duplicate so that one copy may be sent with the order. Labels and invoices should invariably give the varietal names of trees, shrubs, Roses, climbers, &c., as otherwise the inspectors may not be able to connect the plants with the permits. In filling orders for the latest varieties of Roses, and orders for other plants for which customers may say they are unable to get permits in advance of ordering owing to their not being able to give the varietal names, it is advisable to send to the customer a list of what varieties will be supplied a week or two ahead of dispatching the plants. This action would admit of the customer getting a permit before the plants arrive, and thus perhaps avoid serious delay in the delivery of the consignment." *Department of Agriculture, Division of Entomology, Pretoria, September, 1912.*

DAMAGE BY THE LARCH SAWFLY.—A severe infestation of Larch sawfly prevails in the Lake District, and has necessitated the felling of thousands of Larch trees. During the past three years no fewer than 30,000 trees have had to be felled from this cause, entailing a serious loss to owners.

SUMMER BEDDING AT THE "ZOO."

IT is no exaggeration to say that nowhere in or around London is there more effective flower gardening than in the gardens of the Royal Zoological Society at Regent's Park. This is the 33rd year of Mr. John Young's superintendency of the gardens, and in this unfavourable season he has fully maintained the reputation of his charge. Crude masses of colour, such as a large flower-bed filled with one variety of scarlet Pelargoniums flanked with other beds filled solely with yellow Calceolarias or pink Pelargoniums find no place in these gardens. Nor has the visitor to gaze upon a series of beds carpeted with some such "groundwork" as Begonia semperflorens, from which rise at fixed and regular intervals specimen "dot plants" even more alike than are the Peas in a pod. The charm of the flower gardens at the Zoo lies in the great variety and in the delightful manner in which the different forms of foliage and colours of flowers are blended; for Mr. Young knows the value of colours. Some of the effects to be seen a fortnight or so ago were beyond praise. Among the most striking was a large oval bed which contained tall, dark-flowered Heliotropes—Heliotropes of no particular shape, neither standards nor pyramids, but just tall, dark Heliotropes, covered with fragrant flowers. Here and there between the dark flowers and foliage flamed a long plume of orange-coloured Celosia like the rays of a golden sunset flashing across the darkening sky. A few scarlet Pelargoniums with a band of Alyssum maritimum completed the picture. In the same garden—the South Garden—in front of the eagles and birds of prey, there was, amongst others, a very large bed: a huge mound of Golden Privet stood boldly in the middle, and around it were plants of Cuphea nearly 3 feet high, and red and yellow Celosias from which rose the fragrant flowers of Lilium auratum. Towards the front there were occasional plants of Acalypha Macfeeana, and the whole was enclosed with Begonia semperflorens in various shades of pink. In another instance the glowing crimson flowers of Lobelia cardinalis Victoriæ rose just above the alternating plants of Gnaphalium macrophyllum, whilst below them the ground was covered with Pelargonium "Verona," which had yellow leaves and pale pink flowers. Yet another large bed, a parallelogram with rounded ends, had a broad, raised band of Thrift, then came a 9-inch high row of Golden Euonymus; the remainder of the bed being filled with large numbers of pink-flowered Verbena Miss Willmott, with a light canopy of Humea elegans and the variegated Veronica Andersonii, which had been allowed to bear its charming pale purple flowers.

In the country garden the frequent use of white-flowered bedding plants is not effective—there is usually so much green, in the form of trees and grass, that as a general rule white looks "cold," and does not appeal to the eye as do the warmer coloured flowers. But in the more confined town gardens trees are not so plentiful, and at the Zoo the flower gardens are bounded on one side by the ironwork cages. In such conditions white flowers in the garden have quite a different value, and are often as effective as the reds or yellows or bright pinks, and the bands of dwarf Alyssum or the carpetings of Pelargonium "Flower of Spring" are very effective. The flower garden, with its uncommon design of triangular beds in front of the monkey house, was exceedingly beautiful. The vases, overflowing with charming plants, made a splendid finish to the well-filled beds, which contained Fuchsias, Celosias, various Pelargoniums, Gnaphaliums, Chlorophytum and other plants, whilst earlier in the season the Irises and Carnations were beautiful.

Near the herbaceous borders a large bed of Roses showed that the "Queen of Flowers" can be grown well in London, whilst on the opposite side of the walk a bed of various succulent plants—Agaves, Aloes, Gasterias and Opuntias—and a bed with pillar plants of the pleasantly-scented Tropæolum Cripsii, with its double orange and yellow flowers, attracted attention.

In the frame yard the glasshouses and frames contained large numbers of young plants for next summer's display, for the successful gardener makes timely preparations, and this is especially necessary in the establishment so well managed by Mr. Young, where large quantities are required, as, for instance, 25,000 Pelargoniums, 14,000 Lobelias, 12,000 Violas and 3,000 Pentstemons, to name only a few sorts. *A. C. B.*

A PLEA FOR OLD FRUIT TREES.

MANY old Vines, Peaches, Apples, Pears, Plums, and Cherries are destroyed every year which would still be fruitful if provided with a new border of good, turfy loam and manure and annual surface-mulchings of rich manure.

We speak of fruit trees being old and practically done at a certain age—old in years they may be—but we have no justification for saying that because they are old their fruit-bearing capacity is also old in the same sense, because it is nothing of the sort. This is renewed to the old trees year by year exactly in the same way as it is renewed to younger trees, for the twigs on an old tree which bear fruit are only of the same age as the twigs bearing fruit on a young tree. It is the same with roots—fresh ones are annually formed by old trees just in the same way as by the new. Fruit trees become decrepit not through old age, but through being starved and over-pruned into this condition, growing, as is frequently the case, in the same soil for a generation, a soil which has long been bankrupt of the elements of fertility necessary to sustain vigorous growth and active life in the trees.

We have abundant evidence in the experience of practical men to sustain the contention above made that trees will go on bearing fruit for almost an indefinite time, if timely and properly helped by the addition of new soil and manure to the roots, moderate cropping, and generous treatment in other ways. It is also well known that the fruit such old trees bear (like old wine) is improved in quality, and often in colour, by the age of the tree.

In further confirmation of the contention above made that age is not always the primary cause of decay in fruit trees, I may be allowed to cite a few pertinent examples. Take the case of the old Hampton Court Vine, planted in the year 1768. This year the Vine celebrates its 144th birthday! The Cumberland Lodge Vine is practically of the same age (a year or two younger, and said to be a cutting from it). It is not too much to say that these two Vines are in as good, if not better, health to-day than they have been at any time, thanks to the generous and careful culture bestowed upon them. So long as these Vines are treated generously, he would be a bold man who attempted to determine the span of life to which they will attain. There used to be an old Peach tree under glass at Chatsworth which covered the roof of a lean-to Peach-house of immense size. It was at the time I am speaking of (21 years ago) about 50 years old. It seldom produced a crop of fruits of less than from 70 to 80 dozens, and I imagine it is still productive.

At Gunnersbury House gardens, Mr. Hudson can show some old Cherry trees growing on the walls of an old kitchen garden which have been there 60 years or more. These trees bear regularly magnificent crops of the highest-quality fruit every year—such crops as no young fruit-trees occupying the same space of wall could produce. I hope that I have made my proposition good

that it is not age alone which causes decay in fruit trees, and I also hope that these remarks may result in many old trees being saved from destruction, and encouraged to renew their youth and fruitfulness by the means indicated. *Owen Thomas.*

SCOTLAND.

ABERDEEN MUNICIPAL GARDENERS' WAGES.

The gardeners employed in the parks of the city of Aberdeen having applied for an increase of wages, the question was remitted to a sub-committee to consider and report, and their report has been received by the Links and Parks Committee. It was agreed to give the following advances, in accordance with the recommendations of the sub-committee. An increase of 3s. per week to the foreman gardener at Union Terrace Gardens, and 2s. per week additional to the other gardeners in the employ of the committee.

NEW PUBLIC PARK FOR GLASGOW.

A new public park for the Springburn district of Glasgow is to be opened shortly. It has been presented to the city by an anonymous donor, and is valued at about £13,000.

THE INSURANCE ACT AND FRUIT PICKING.

In August, as was reported in these columns at the time (see p. 201), an enquiry with reference to draft orders of the Scottish Insurance Commissioners in connection with subsidiary employments was opened in Perth, with special reference to fruit picking. A further meeting was held in Edinburgh in connection with the question on October 11, by Miss M. M. Paterson, one of the commissioners, and evidence was given on Potato planting and similar subjects. *Correspondent.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

October 8.—*Present:* Mr. R. Hooper Pearson (in the Chair); Messrs. J. O'Brien, J. Fraser, W. Hales, R. Curtis, G. Gordon, J. T. Bennett-Poë, and F. J. Chittenden (hon. sec.).

Bulbophyllum Gentilii.—Mr. O'Brien showed, on behalf of Sir Fred. Moore, a specimen of Bulbophyllum Gentilii, Rolfe (see *Orchid Review*, October, 1912, p. 314). This species has the nectar glands placed on the upper side of the dorsal sepal. It has been confounded with B. Calamaria (*Bot. Mag.* 4088), and the two species are mixed in herbaria.

Mentha viridis var.—Mr. J. Fraser showed a specimen of the Mentha described by Sir John Smith under the above name occurring wild about Bocking and Maidstone.

Nomenclature of Orchid hybrid.—The Committee considered the question of the nomenclature of a hybrid Orchid referred to it by the R.H.S. Council. The alleged parentage was C. × Fabia alba (C. labiata × C. Dowiana aurea) × C. Warcewiczii var. "Frau Melanie Beyrodt" and the name suggested for the seedling was C. × Harrisiana. The committee considered that this name transgressed the recommendations of the Vienna Botanical Congress regarding plant-names in that it was too much like existing names in the same genus, thereby tending to confusion (e.g., Cattleya Harrisoniana, C. × Harrisii and C. Harrisæ); the name was therefore not tenable. Further, they thought that although Art. xii of the rules of horticultural nomenclature (*Journal* R.H.S., vol. xxxvii, p. 151) permitted the use of names of Latin form (with signs of hybridity) for such cross-bred plants as this, it would be more convenient if vernacular names were chosen, generally from the classics. In the instance under consideration, the Committee recommended that the exhibitor should be asked to choose such a name.

Tomatos with pale, round spots.—Some Tomato fruits with pale spots, circular in outline, about ¼ inch in diameter and each having a minute black spot in the centre, were sent from Highgate. Microscopic examination failed to reveal the presence of a fungus, and the Committee concluded the damage was probably the result of punctures by a hemipterous insect, possibly white fly, or a species of Lygas.

Potatos with super-tuberation.—Potatos showing growth after the first stage of tuber production were sent from Bush Hill Park. These are frequent this season, owing to rains during August.

Glassiness in Apple. A specimen was sent from Battle showing the peculiar soddening of the tissue called glassiness. This is not at all infrequent this season, several specimens having been received at the Society's laboratory, and Mr. Chittenden said he had found similar fruits on trees at Wisley (on the sunny side of the tree) as early as July.

UNION OF HORTICULTURAL MUTUAL IMPROVEMENT SOCIETIES.

October 11.—The annual conference of delegates from societies affiliated with the R.H.S. and societies enrolled in the Union of Horticultural Mutual Improvement Societies took place on this date in the Royal Horticultural Hall, Westminster. No fewer than 124 societies were represented. Sir Daniel Morris, K.C.M.G., presided, and, on behalf of the Council of the R.H.S., stated that suggestions from the meeting which would further the interests of the affiliated societies would have the careful consideration of the parent Society. Acting upon a suggestion made at the last conference, the cost of lectures provided with lantern slides had been reduced from 7s. 6d. to 5s. each, and 10 new lectures of great interest have been prepared, and will shortly be in circulation for the use of the affiliated societies.

Sir Daniel Morris referred to the competition for affiliated societies at the Fruit Show, and regretted that no competition was forthcoming for the challenge cup offered this year for affiliated societies at the Holland House Show, and stated that the cup will again be offered next year.

The Council have prepared cards for use at local shows, whereby the exhibitors and general public may learn the points of perfection to aim at in different vegetables.

The first item on the agenda was an exhibition of photographs of garden subjects in colour, shown by Dr. G. G. Hamilton, hon. secretary of the Bournemouth society. In the collection were pictures of individual flowers, garden views, old-world gardens, and views in the New Forest.

The next subject was a discussion on "How to attract young men to attend the meetings of Mutual Improvement Societies."

Mr. Stevenson, of the Bournemouth society, advocated the offering of prizes for essays to the younger men.

Mr. Swan, of Egham, suggested that head gardeners should approach the younger men under their charge and point out to them the advantages of attending meetings and lectures, also to encourage them to take part in the debates which follow the lectures. By adopting this practice at Egham the attendance of young gardeners at the local society had increased considerably.

Several delegates spoke in favour of the suggestion. The use of lantern lectures was recommended by several speakers, as these resulted in better attendances.

Another suggestion was to supply the younger members with horticultural papers and a library of gardening books. Mr. J. Gregory, of the Croydon society, stated that the Croydon Public Library helped in this respect, and provided works of interest to gardeners.

The subject of the desirability of admitting lady gardeners to Mutual Improvement Societies was introduced by Mr. Bullen, of the Guildford society. Mr. Bullen read a short paper, which showed that considerable difference of opinion on the subject existed amongst the members of his society. Owing to limitation of time, the debate on this paper was curtailed, but the general opinion was that the question of admitting ladies should be dealt with by each society. Several delegates stated that ladies were admitted and welcomed to their meetings.

Mr. P. C. H. Jay, of the St. Barnabas Society, Sutton, Surrey, asked for information on the garden club movement. He stated that many members of his society were allotment holders and amateurs, and they have adopted a system of payment by instalments for manures, seeds, plants and other horticultural requisites. The method so far had worked well.

The last item on the agenda, suggestions for rules for the judging of bottled fruits, could only be very briefly considered. The Chairman read a short summary of the general principles governing the judging of bottled fruits at the R.H.S. shows, but there was no time to discuss the subject.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

October 3.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Bamber, H. G. Bennett, J. Butterworth, J. C. Cowan, J. Cypher, J. Evans, A. Hanmer, W. J. Hargreaves, Dr. Hartley, W. Hatcher, W. Holmes, J. Lupton, D. McLeod, C. Parker, F. K. Sander, H. Thorp, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

A Large Silver-gilt Medal was awarded to W. R. Lee, Esq., Heywood, for a miscellaneous group of plants.

A Silver-gilt Medal was awarded to Z. A. Ward, Esq., Northenden (gr. Mr. Weatherby), who showed a group composed principally of Cattleyas of the C. Iris section.

Large Silver Medals were awarded to R. Ashworth, Esq., Newchurch, for a mixed group, and Col. J. Rutherford, M.P. (gr. Mr. Lupton), for a miscellaneous collection of Cattleyas of the C. Iris section.

Silver Medals were awarded to the Rev. J. Crombleholme, Clayton-le-Moors (gr. Mr. Marshall), for a well-arranged group of Cypripediums; J. McCartney, Esq., Bolton (gr. Mr. Holmes), for a group composed of Cattleyas; Messrs. J. Cypher & Sons, Cheltenham, for a group of Cypripediums, Cattleyas, and Odontoglossums; Mr. J. Evans, Congleton, for a group of Cattleyas, and Messrs. A. J. Keeling & Sons, Bradford, for a mixed group.

Other exhibitors included O. O. Wrigley, Esq., Bury (gr. Mr. Rogers); R. Le Doux, Esq., West Derby (gr. Mr. Fletcher); S. Gratrix, Esq., Whalley Range (gr. Mr. Brown); Messrs. Sander & Sons, St. Albans; Messrs. Mansell & Hatcher, Rawdon; Messrs. Hassall & Co., Southgate; Mr. W. Shackleton, Great Horton; Mr. J. E. Sadler, Newbury; and Mr. H. Arthur, Blackburn.

AWARDS.

First-class Certificates.

Cattleya "Lord Rothschild."—A fine flower, of good, even colour and with well-lined lip; *C. Lord Rothschild alba variety "Dr. John Utting,"* a flower of good form, with white sepals and petals and brilliant lip. Both shown by R. Le Doux, Esq.

Awards of Merit.

Odontoglossum × Ada Barclay and *Cypripedium Domingo de Larranaga* (*C. nitens × C. Standard*), both from R. Le Doux, Esq.

Lælio-Cattleya Luminosa aurea (*L. tenebrosa Walton Grange × C. aurea*), *L.-C. Golden Oriole* (*L.-C. Charlesworthii × C. aurea*), *Cypripedium bellatulum variety majesticum*, and *Cattleya Apex* (*C. Enid × Mendelii*), all from R. Ashworth, Esq.

Cattleya Germania "Ward's variety," from Z. A. Ward, Esq.

Cypripedium Troilus "West Point variety" (*C. nitens × C. insigne Hareficld Hall*), from S. Gratrix, Esq.

Cypripedium Charlesworthii variety "Rawdonense," from Messrs. Mansell & Hatcher, Ltd.

First-class Botanical Certificate.

Cymbidium lancifolium, from Mr. H. Arthur.

NORWICH AND DISTRICT FRUIT GROWERS'.

The second annual dinner of the Norwich and District Fruit Growers' Association was held at the Criterion Restaurant, Norwich, on the 3rd inst. Between 70 and 80 attended. The president, Mr. H. Lacey, occupied the chair, the guest of the evening being Mr. A. G. L. Rogers (Horticultural Branch, Board of Agriculture).

Exhibition of British-Grown Fruits.

October 10, 11.

THE eighteenth exhibition of British-grown fruits under the auspices of the R.H.S. was held on these dates in the Society's Hall, Westminster. The building was filled with exhibits, and, as usual, Apples predominated. Grapes and other choice dessert fruits compared favourably in numbers and quality with those of former years. On the contrary, there were only two exhibits of orchard house trees, and neither was up to the usual standard for these shows. The class for nine vines in pots was again represented by only one collection, and does not appear to meet with appreciation. There was a falling off in the class for a collection of hardy fruits in the amateurs' and gardeners' section. The classes for nurserymen were well filled, and the exhibits in this section comprised almost one-half of the show.

The outstanding feature of the exhibition was a collection of culinary and dessert Apples, shown by Messrs. Gaskain & Whiting, Faversham. They were probably the finest Apples ever exhibited. It is to be regretted that two of the choicest displays of dessert fruit were disqualified through the inclusion of Washington Apples, a variety which is classified in the schedule as a culinary Apple.

The Fruit and Vegetable Committee awarded two Cultural Commendations for Apple William Crump and fruits of Passiflora, shown by Mr. N. F. Barnes, of Eaton Gardens, Chester, and Mr. James Vert, Audley End Gardens, respectively.

The arrangements, under the management of Mr. S. T. Wright, gave every satisfaction, whilst much assistance was rendered to the Press and others by the Secretaries, Mr. Frank Reader and the other officials.

At 3 p.m. on the first day of the exhibition Mr. H. Hooper delivered a lecture on "An English Fruit Farm in the Making."

DIVISION I.

Collection of Hothouse Fruits.

(Classes Open to Amateurs and Gardeners Only.)

There were two classes for collections of dessert fruit. The more important was for nine dishes, to include not fewer than six kinds. Only one each of a Pineapple, Melon, Black Grape and White Grape was allowed, and an exhibitor could not show more than two varieties of any other kind or two dishes of the same variety. Four competed, and the original awards of the judges were as follow:—1st, Lady Henry Somerset, Eastnor Castle, Ledbury (gr. Mr. G. Mullins); 2nd, The Duke of Newcastle, Clumber, Worksop (gr. Mr. S. Barker); 3rd, the Earl of Harrington, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre). It was subsequently discovered that Washington Apple, which was included in the 2nd and 3rd prize collections, was classified in the schedule as a culinary variety, and these were disqualified. This decision placed the other exhibitor, C. A. Cain, Esq., The Node, Welwyn (gr. Mr. T. Pateman), 2nd. Later the Council presented special prizes for the disqualified exhibits.

Lady Henry Somerset's collection included two bunches each of Muscat of Alexandria and Gros Maroc Grapes, Countess Melon, Pitmaston Duchess and Doyenné du Comice Pears, Charles Ross Apple, Pine Apple Nectarine, and Late Devonian and Barrington Peaches. The Black Grapes were remarkably good, and one bunch of Muscat of Alexandria magnificent. The Duke of Newcastle showed a remarkably fine dish of Doyenné du Comice Pears and splendid Cox's Orange Pippin Apples. The Earl of Harrington's Black Grapes were finely finished and well matched, and his fruits of Cox's Orange Pippin Apples were very highly coloured. Mr. Cain's best dishes were Conference Pears, Emerald Gem Melon, and Ribston Pippin Apples. The Grapes were large, big berried bunches.

Collection of Six Dishes.

Exhibits in the smaller class included four kinds, but no Pineapple. There were six exhibits, and Lord Belper, Kingston Hall, Derby (gr. Mr. W. H. Cooke), won the 1st prize. He showed Muscat of Alexandria and Gros Colman Grapes, Pitmaston Duchess Pears, Cox's Orange Pippin and Charles Ross Apples, and Peach Gladstone. The White Grapes were small bunches but superbly finished; the black variety was Gros Maroc, the bunches and berries being extra large. 2nd, Lord Hillingdon, Wildernesse, Sevenoaks (gr. Mr. J. Shelton). Bunches of Black Hamburgh Grapes were large and well finished, but the berries were on the small side. A choice Melon, good Doyenné du Comice Pears, and excellent fruits of Cox's Orange Pippin Apples were included in the collection. 3rd, Lord Howard de Walden, Audley End, Saffron Walden (gr. Mr. J. Vert). This exhibitor showed good fruits of Sea Eagle Peaches and Coe's Golden Drop Plums.

Grapes.

The most important class was for five distinct varieties, two bunches of each sort, and not fewer than two white varieties. Five entries were forthcoming; the collection from the Duke of Newcastle's garden was pre-eminent, and won the 1st prize easily. The exhibit included Gros Maroc, very large both in bunch and berries, but a trifle red; Muscat of Alexandria, evenly matched and very ripe; Black Hamburgh, excellent in every respect; Buckland Sweetwater, big-shouldered bunches with amber-coloured berries; and Madresfield Court. 2nd, the Earl of Harrington. Madresfield Court in this exhibit was splendid, as was also Golden Queen. The bunches of Muscat of Alexandria were big, but the berries were green and on the small side. Madresfield Court was beautifully finished, and there were also Muscat Hamburgh and Gros Maroc. 3rd, C. Bayer, Esq., Forest Hill (gr. Mr. E. C. Wickens). G. Millar, Esq., Newberries, Radlett (gr. Mr. J. Kidd), showed two fine bunches of Lady Hutt, whilst Capt. Morrison Bell, M.P., Pitt House, Chudleigh (gr. Mr. W. Worth), showed the largest bunches in Muscat of Alexandria and Black Alicante.

The next class was for two bunches each of four varieties, selected from Madresfield Court, Mrs. Pince, Muscat Hamburgh, Mrs. Pearson, Dr. Hogg, and either Muscat of Alexandria or Canon Hall. It proved a poor competition between two exhibitors. The 1st prize was awarded to Lord Hillingdon, Wildernesse, Sevenoaks (gr. Mr. J. Shelton). Muscat of Alexandria was the best variety, the other bunches—of Madresfield Court, Mrs. Pearson, and Mrs. Pince—were only of mediocre quality.

Two bunches were required in each of the following classes:—

Black Hamburgh.—This popular variety was shown by six exhibitors. All the bunches were well coloured and the smallest was preferred by the judges for the 1st prize, but the berries were magnificent in size and finish. They were exhibited by Rev. W. Beecher, Wellow Hall, Newark (gr. Mr. A. Heald); 2nd, the Duke of Newcastle, whose bunches were the largest; 3rd, the Earl of Harrington.

Mrs. Pince.—Three competed in this class; large bunches with small, but plump, well-finished berries, shown by Mr. St. Maur, were awarded the 1st prize; 2nd, G. Miller, Esq., Newberries, Radlett (gr. Mr. J. Kidd), for compact, well-matched bunches.

Black Alicante.—This was the best Grape class in the show. There were 10 exhibits, and not a weak one amongst them. The 1st prize was won by Mrs. W. G. Raphael, Castle Hill, Englefield Green (gr. Mr. H. Brown); 2nd, Lady Henry Somerset; 3rd, Lady Tate, Park Hill, Streatham Common. L. Currie, Esq., Minley Manor, Farnborough, Hampshire (gr. Mr. W. H. Allen), also showed finely, the judges marking the card highly commended.

Madresfield Court.—The best two bunches of this variety amongst three exhibits were shown by the Earl of Harrington. They were of medium size, tapering, and splendidly finished. The largest bunches were shown by Lord Savile, Rufford Abbey, Ollerton (gr. Mr. J. Doe), and these were awarded the 2nd prize.

Prince of Wales.—Lord Savile was successful in this class, his bunches being remarkable for the size of the berries. The 2nd prize was won by H. H. Könız, Esq., Ardenrun Place Gardens, Blindley Heath (gr. Mr. H. J. Alderman). There were two other exhibits in this class.

Any other black Grape.—There were 13 exhibits in this class, and the varieties shown were: Gros Maroc (two entries), Gros Colman, Alnwick Seedling, Appley Towers (three entries), Gros Guillaume, and Lady Downe's (three entries). The 1st prize was awarded to Appley Towers, shown by J. Liddell, Esq., Sherfield Manor, Basingstoke (gr. Mr. R. Learmouth); 2nd, Lady Downe's, shown by Mrs. W. G. Raphael.

Muscat of Alexandria.—The best of ten exhibits was shown by W. W. Mann, Esq., Ravenswood, Bexley (gr. Mr. J. Simon). The berries were superbly finished, and the bunches well matched; 2nd, Lord Hillingdon, Hillingdon Court, Uxbridge (gr. Mr. A. R. Allan); 3rd, Lady Henry Somerset.

Any other white Grape.—The 1st prize in this class was awarded to the variety Mrs. Pearson, shown by C. A. Cain, Esq., The Node, Welwyn (gr. Mr. T. Pateman). They were large, shapely bunches and fine of berry; the 2nd and 3rd prizes were also awarded to this variety.

Collection of Hardy Fruits.

The only competitor in the class for a collection of 30 dishes of hardy fruits, distinct, arranged in a space not exceeding 12 feet by 3 feet, was Sir Marcus Samuel, Bart, Mote Park, Maidstone (gr. Mr. W. H. Bacon), and he was awarded the 1st prize. Peasgood's Nonesuch, Warner's King, Harvey's Wiltshire Defiance, Royal Jubilee, Bow Hill Pippin, Emperor Alexander, Chas. Ross, Wealthy, and other Apples were all good; also Pears Beurré Hardy, Conference, Fondante du Cuerne, and Doyenné Boussoch. The collection included Lady Palmerston and Sea Eagle Peaches, Brown Turkey Figs, Walnuts, Morello Cherries, Wyedale and Monarch Plums, Cobnuts, Damsons, and Quinces.

DIVISION II.

Nurserymen's Classes.

Fruits Grown Entirely Out-of-doors.

The prizes in these classes consisted of medals awarded at the discretion of the Council. Four classes were provided, which enabled small as well as large firms to be represented. The largest class was for a display of hardy fruits, arranged on a table 30 feet long by 6 feet broad. Three collections were staged, and one Gold and two Silver-gilt Knightian Medals were awarded. The Gold Medal was given to the collection displayed by Messrs. Geo. Bunyard & Co., Ltd., Maidstone, whose fruits, in common with all the exhibits in this section, were mainly Apples. They were arranged in small baskets, embraced 150 distinct varieties, and furnished a magnificent exhibit which was well displayed. A selection of the Apples includes Cox's Orange Pippin, Blenheim Pippin, Coronation, Houblon, Charles Ross, Cornish Aromatic, Mother, King of Tompkins County, Bramley's Seedling, Lane's Prince Albert, Warner's King, Hambling's Seedling, Bismarck, and Byford Wonder. Good Pears were seen in Doyenné du Comice, Directeur Hardy, Conference, Duchesse d'Angoulême, and Fondante de Thirriot.

Messrs. H. Cannell & Sons, Swanley, and Messrs. J. Cheal & Sons, Crawley, each showed fine exhibits. The Kentish fruits were splendidly coloured, and included Apples Warner's King, Gascoyne's Scarlet Seedling, The Queen, Emperor Alexander, Mrs. Barron, Wealthy, Warner's King, Bismarck, Baron Wolseley, Blue Pearmain and Atalanta. Messrs. Cheal arranged their exhibit very pleasingly, showing such fine Apples as The Queen, Royal Jubilee, Newton Wonder, Alfriston, Warner's

King, Bismarck, Cox's Orange Pippin, Gascoyne's Scarlet Seedling, Prince Albert, and Allington Pippin.

There were five collections in the class for a display of hardy fruits, arranged on a table 20 feet long by 6 feet broad. The Gold Medal was awarded to Mr. R. C. Notcutt, Woodbridge, for fruit of splendid quality, but the arrangement was too flat. A selection of the choicer Apples includes Emperor Alexander, Cox's Orange Pippin, Baumann's Red Reinette, Dr. Harvey, Chelmsford Wonder, Cornish Aromatic, Blenheim Pippin (especially fine), and Mère de Ménage. The Barnham Nurseries, Barnham, Sussex, and Messrs. S. Spooner & Sons, Hounslow, were awarded Silver-gilt Knightian Medals, and Messrs. Laxton Bros., Bedford, and Messrs. W. Seabrook & Sons, Chelmsford, Silver Knightian Medals.

For a display of hardy fruits, on a space 12 feet by 6 feet, there were four exhibits. Mr. Chas. Turner, Slough, put up the finest collection, and was awarded a Silver-gilt Knightian Medal. The new variety Arthur Turner, a large culinary Apple, with greenish-yellow skin, flushed on the side next to the sun, was represented by several choice fruits. Emperor Alexander, Cox's Pomona, Bismarck, Hoary Morning, Warner's King, and other well-known varieties were well and tastefully exhibited. In this class Messrs. G. Cooling & Sons, Bath, were awarded a Silver-gilt Banksian Medal, Messrs. John Peed & Son, Norwood, a Silver Knightian Medal, and Messrs. Paul & Son, Cheshunt, a Silver Banksian Medal.

Orchard House Fruit and Trees.

On this occasion there were two exhibits of orchard house fruit and trees, shown by Messrs. T. Rivers & Sons, Sawbridgeworth, and The King's Acre Nursery Co., Hereford. Messrs. Rivers were awarded a Gold Medal for their display, which contained several large Apple trees, the finest specimens being of the variety King of Tompkins County. Trees of Buckingham Apple were very heavily cropped, and other fine specimens were Peasgood's Nonesuch, Belle Pontoise, Bismarck, and Barnet Beauty. Pears were represented by trees of Conference, Pitmaston Duchess, Marie Louise, and Beurré Bachelier. There were also Figs in pots, choice gathered fruits of Beurré Alexandre Lucas, Magnate, and Pitmaston Duchess Pears. Cox's Orange Pippin, Emperor Alexander, Peasgood's Nonesuch, Gascoyne's Scarlet Seedling, James Grieve, and Egremont Russet Apples were arranged along the front. The fruits of Egremont Russet Apples were a golden-brown colour. The King's Acre Nursery Co. were awarded a Silver-gilt Banksian Medal. Their finest trees were Apples King of Tompkins County, Beauty of Kent, Gascoyne's Scarlet Seedling, and Bismarck, and their choicest gathered fruits Emperor Alexander, Peasgood's Nonesuch, Wealthy, Cox's Pomona, Gloria Mundi, James Grieve, and Rival.

In the class for nine vines in pots Messrs. T. Rivers & Son were the only exhibitors, and were awarded a Silver Knightian Medal. The varieties were Gros Colman, Black Alicante, and Golden Queen; the vines bore from 10 to 12 bunches each.

DIVISION III.

(Open only to Market Growers.)

Great interest was centred in the class for 20 baskets of Apples (dessert and cooking varieties), in which Messrs. Gaskain & Whiting, Dorgate, Faversham, staged the finest collection of Apples in the show. Each of the 20 baskets contained almost perfect examples of the various sorts. The dessert varieties were of ideal dessert size and of most attractive colouring, the basket of Blenheim Pippin being of superb quality. Of the splendid culinary Apples perhaps the outstanding basket was that of Warner's King. A Gold Medal was awarded this splendid exhibit. The 2nd prize, a Silver Banksian Medal, was awarded to the Hollesley Bay Labour Colony (Superintendent, Mr. B. Smart), Suffolk, for a very creditable display, but it paled before the 1st prize collection. In this exhibit the basket of Cox's Orange Pippin contained very deeply-coloured fruits.

The Silver-gilt Medal presented by the Fruiterers' Company for the best 12 baskets (six cooking and six dessert) of Apples was awarded to Mr. A. E. Mason, Rectory Farm, Hampton Hill. In this very fine collection the basket of Yellow Ingestre contained exceptionally good examples of that variety, and the fruits of Charles Ross, amongst the dessert varieties, was also exceedingly good; the best culinary fruits were those of Bismarck and Beauty of Kent. 2nd, H. Lumley Webb, Esq., Tunstall House, Sittingbourne (gr. Mr. J. Holloway), who exhibited highly-coloured fruits of Ben's Red, Ribston Pippin, and Worcester Pearmain.

DIVISION IV.

(Fruits Grown Entirely in the Open). (Gardeners and Amateurs Only.)

Many of the exhibits of Apples and Pears in the following classes, which were restricted to competition amongst gardeners and amateurs, were of excellent quality, and the competition in most instances was very keen.

Fig. 134.—Chrysanthemum "Celia," exhibited by Messrs. Cragg, Harrison and Cragg: flower yellow with green centre.
(R.H.S. Award of Merit, October 8, 1912. See report on p. 289.)

The Hogg Medal and 1st prize offered for 24 dishes of Apples (16 cooking and eight dessert) was awarded to C. A. Cain, Esq., The Node, Welwyn (gr. Mr. T. Pateman). The dessert varieties in this very fine exhibit were Ribston Pippin, Wealthy Allington Pippin, James Grieve, Rival, Charles Ross, King of the Pippins and Cox's Orange Pippin. Amongst the cooking varieties the best were Emperor Alexander, Lane's Prince Albert, Washington, and Peasgood's Nonesuch. 2nd, Sir Marcus Samuel, Bart., Mote Park, Maidstone (gr. Mr. W. H. Bacon), who showed more highly-coloured dessert fruits but was rather weaker with the culinary varieties.

The only exhibit of 18 dishes of Apples (12 cooking and six dessert) was that of J. G. Williams, Esq., Pendley Manor, Tring (gr. Mr. F. G. Gerrish), who deserved and was awarded the 1st prize. The dishes of Red Blenheim, Charles Ross, Ribston Pippin and Peasgood's Nonesuch were very fine.

J. Liddell, Esq., Sherfield Manor, Basingstoke (gr. Mr. R. Learmouth), was awarded the 1st prize in the class for eight cooking and four dessert Apples for a very meritorious collection.

The 1st prize exhibit of six dishes of cooking Apples shown by C. A. Cain, Esq., was by far the best shown in the class.

The six dishes of dessert Apples which won the 1st prize in Class 27 for Lady Henry Somerset, Eastnor Castle, Ledbury (gr. Mr. G. Mullins), were excellent samples. The fruits were of perfect shape, not too large, and had beautiful colour. 2nd, Sir Marcus Samuel, whose collection included good examples of Doyenné Boussoch, Marie Louise D'Uccle and Beurré Baltet Père. 3rd, J. Liddell, Esq.

The only exhibit of nine dishes of dessert Pears, that from Mr. A. P. Brandt, Esq., Bletchingly Castle, Bletchingly, Surrey (gr. Mr. J. W. Bards), was awarded the 2nd prize. The dishes of Beurré Hardy and Durondeau were excellent.

Sir Edmund G. Loder, Leonardslee, Horsham (gr. Mr. W. A. Cook), the only exhibitor, was awarded 1st prize for six very even dishes of dessert Pears.

The stewing Pears exhibited by Col. B. J. Petre were of immense size, but of splendid shape. The varieties shown in this first-class exhibit were Uvedale's St. Germain, Catillac and General Todtleben. The 2nd prize collection came from the Earl of Devon, Powderham Castle, Exeter (gr. Mr. T. H. Bolton); 3rd, Sir Marcus Samuel.

There were only two exhibitors of three dishes of Plums, and the fruits were somewhat shrivelled. Lord Howard de Walden, Audley End, Saffron Walden (gr. Mr. J. Vert), was awarded the 1st prize; the varieties shown were the uncommon cooking Vert's Violet, Coe's Golden Drop and President.

There were two sets of three dishes of Damsons or Bullaces, and the best was that shown by J. G. Williams, Esq., who sent the Prune Damson, Common Damson and White Bullace, all of very good quality and still quite plump. 2nd, Mr. R. Staward, The Gardens, Panshanger, Hertford.

The 50 fruits of Morello which won the 1st prize for Mr. J. G. Williams, Esq., were unusually good for the time of the year. 2nd, J. B. Fortescue, Esq. (gr. Mr. C. Page).

DIVISION V.

(Special County Classes.)

Prizes were offered for collections of six dishes of Apples (four cooking and two dessert) and for six dishes of dessert Pears, to be shown by gardeners and amateurs only, who must have grown the fruit entirely in the open in their respective districts.

In eight of the 11 territorial divisions of the British Isles the exhibits of Apples were of exceptionally high quality, and many of the Pears were exceedingly meritorious.

Kent.—The 1st prizes in both sections of the competition for Kent growers were won by Capt. S. G. Reid, R.E. (gr. Mr. J. Coleman), the Elms, Yalding. Amongst the Apples shown, the varieties Bismarck and Ribston Pippin were excellent, as also were the Pears Conference and Beurré Superfin. Curiously enough, the 2nd prizes were both awarded to W. Erle Drax, Esq. (gr. Mr. J. Bond), Wye.

Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall.—The collection of Apples which won the 1st prize in the above large district for the Duke of Richmond and Gordon (gr. Mr. T. Brock), Goodwood, was of superlative quality; if a choice had to be made, the dishes of Charles Ross, Peasgood's Nonesuch, and Allington Pippin would probably be selected. The 2nd prize was awarded to Mr. J. Copp, Ferndale, Teignmouth, who showed a highly meritorious collection.

The best Pears were exhibited by F. J. B. W. Digby, Esq. (gr. Mr. T. Turton), and of the six very fine dishes mention must be made of those of Doyenné Boussoch and Beurré Bachelier.

Wilts, Gloucester, Oxford, Bucks, Berks, Beds, Herts, and Middlesex.—J. B. Fortescue, Esq. (gr. Mr. C. Page), Dropmore, Bucks, was the only exhibitor of Apples in this division. The 1st prize was awarded this very fine collection, which included the varieties Ribston Pippin and Bow Hill Pippin of excellent quality.

The class for Pears was very strongly contested, and the 1st prize was awarded to the Rt. Hon. Lord Hillingdon (gr. Mr. A. R. Allan), Hillingdon Court, Uxbridge, who showed splendid dishes of Durondeau and Charles Ernest. 2nd, B. E. Richardson, Esq. (gr. Mr. E. Colman), Hill House, Stanstead Abbots.

Essex, Suffolk, Norfolk, Cambridge, Hunts, and Rutland.—The 1st prize for Apples was awarded to the Rt. Hon. W. Lowther (gr. Mr. A. Andrews), Campsea Ash, Suffolk, whose exhibit was uniformly good. 2nd, Sir Montagu Turner (gr. Mr. A. Humphrey), Havering, Romford.

The best Pears were shown by Col. the Hon. C. Harbord (gr. Mr. W. Allan), Gunton Park, Norwich, who included a splendid dish of Doyenné du Comice. 2nd, C. H. Berners, Esq. (gr. Mr. W. Messenger), Woolverstone Park Ipswich.

Lincoln, Northampton, Warwick, Leicester, Notts, Derby, Staffs, Shropshire, and Cheshire.—In this widely-separated district the 1st prize for Apples was awarded to F. Bibby, Esq. (gr. Mr. J. Taylor), Hardwicke Grange, Shrewsbury, who had a splendid dish of American Mother. 2nd, Sir Oswald Mosley, Bart. (gr. Mr. H. Collier), Rolleston Hall, Burton-on-Trent.

The prizes for Pears were also awarded to these exhibitors in the same order of merit.

Worcester, Hereford, Monmouth, Glamorgan, Carmarthen, and Pembroke.—The only exhibit from these combined counties was that of Pears, shown by Mr. E. Hyde, Old Post Office, Trumpet, Herefordshire, which was awarded the 2nd prize. The class provided for the other counties of Wales was not contested.

The Northern Counties of England and the Isle of Man.—The 1st prize for Apples in this district was won by Baron de Forest (gr. Mr. J. C. McPherson), Londesborough Park, Yorkshire. 2nd, Mr. W. Chuck, Broadswood Hall Gardens, Doncaster. These competitors were also placed in the same order in the class for Pears, in which Baron de Forest showed excellent fruits of Conference and Hacon's Incomparable.

Scotland.—The 1st prize Apples shown by Col. Gordon (gr. Mr. J. Duff), Threave House, Castle Douglas, possessed splendid colour. 2nd, R. M. Pilkerton, Esq. (gr. Mr. J. J. Staward), St. Fort House, Newport, Fife, who was the only exhibitor of Pears, for which he deservedly was awarded the 1st prize.

Ireland.—There were no Irish-grown Pears shown, but the Apples from the Earl of Bessborough, C.B. (gr. Mr. T. E. Tomalin), Bessborough), Piltown, were excellent. 2nd, C. B. Broad, Esq., Aghern, Conna, County Cork, who also showed fine examples.

The Channel Islands did not supply a collection for either of the classes.

DIVISION VI.

(Single-dish Classes.)

The customary classes for single dishes (of six fruits) of the various named varieties of Apple and Pear, all of which the Society consider to be worthy of general cultivation, were responsible for an exceedingly good array of fruit, and the competition must have been very gratifying to the Council of the Society.

Dessert Apples.

Adams's Pearmain: The 1st prize was awarded to W. Erle Drax, Esq., who showed very fine fruits; 2nd, H. St. Maur, Esq., Stover Park, Newton Abbot (gr. Mr. G. Richardson).—*Allington Pippin:* Of the many good dishes of this variety the best was shown by the Earl of Westmorland, Woodstock Park, Sittingbourne (gr. Mr. C. Wotton); 2nd, J. Lewis, Esq., Bedgebury Park, Goudhurst (gr. Mr. J. R. Smith).—*American Mother:* The exhibits of this variety were characterised by very beautiful colour, especially the 1st prize dish from J. B. Fortescue, Esq.; 2nd, Col. R. Bullock.—*Belle de Boskoop:* The 1st prize was won by H. St. Maur, Esq.; 2nd, C. B. Broad, Esq.—*Blenheim Pippin:* Many of the dishes shown contained ideal dessert fruits, small and of bright, attractive colour, especially those which won the 1st prize for C. H. Coombe, Esq.; 2nd, C. H. Berners, Esq.—*Ben's Red:* The best dish was shown by C. R. Broad, Esq.; 2nd, Rev. H. A. Bull, Westgate-on-Sea (gr. Mr. F. King).—*Charles Ross:* The exhibitors of this variety evidently experienced difficulty in selecting the small fruits so desirable for the table, but most of them, especially the 1st prize dish of the Rev. H. A. Bull, were of attractive colour and very good shape; 2nd, Right Hon. W. Lowther.—*Christmas Pearmain:* There were only two dishes shown, but each deserved their prizes. 1st, Duke of Richmond and Gordon; 2nd, Mr. B. J. Mercer, Wierton Place Gardens, Maidstone.—*Coronation:* The 1st prize was awarded to the Duke of Richmond and Gordon; 2nd, Mr. John Copp.—*Cox's Orange Pippin:* The exhibits of this variety showed great variation in size and colour, and, in a lesser degree, in shape. The 1st prize was awarded to H.R.H. Duchess of Albany, Claremont, Esher (gr. Mr. J. Smith-Kelly), for a splendid dish; 2nd, W. Erle Drax, Esq.—*Duke of Devonshire:* The best dish was shown by Mr. J. Copp; 2nd, W. A. Voss, Esq., Fairlight Glen, Rayleigh, Essex.—*Egremont Russet:* The prizes for this variety were awarded to W. Erle Drax, Esq., and C. H. Berners, Esq., in the order named.—*Houblon:* For this variety the prizes were won by Mr. J. Copp, 1st, and Mr. J. Hill, Kingston Lacy Gardens, Wimborne, 2nd.—*James Grieve:* The many fruits of this popular variety possessed delightful colouring; the best dish was shown by Mr. J. Copp; 2nd, W. Erle Drax, Esq.—*King of Tompkins County:* The 1st prize was awarded to the Earl of Bessborough; 2nd, the Earl of Westmorland.—*Lord Hindlip:* Many of the fruits shown were of medium size and highly coloured. 1st, the Earl of Bessborough; 2nd, Capt. S. G. Reid, R.E.—*Margil:* The best fruits were shown by Capt. S. G. Reid, R.E.; 2nd, J. B. Fortescue, Esq.—*Rival:* There were many dishes of beautiful fruits, and the best were shown by the Duke of Richmond and Gordon; 2nd, W. Erle Drax, Esq.—*Ribston Pippin:* Of the many very good dishes of this superb variety the best was shown by Col. the Hon. C. Harbord; 2nd, W. Castle, Esq., Holland House, Mildenhall (gr. Mr. J. Reynolds).—There were no exhibits of Ross Nonpareil, St. Everard, or William Crump.—*St. Edmund's Pippin:* The only exhibit of this variety, that of Col. the Hon. C. Harbord, was awarded the 1st prize.—*Wealthy:* There were many very fine dishes of this variety. The best were shown by C. H. Berners, Esq.; 2nd, Duke of Richmond and Gordon.—The class for any early variety not named above included 30 dishes. The 1st prize was awarded to Viscount Enfield, Wrotham Park, Barnet (gr. Mr. H. Markham), who showed Ellison's Early Orange variety, which received an Award of Merit in 1911. 2nd, W. Erle Drax, Esq., for King of the Pippins. 3rd, F. J. B. W. Digby, Esq., for a dish of Werder's Golden Reinette.—The similar class for late varieties was responsible for the exhibition of 24 dishes. Col. the Hon. C. Harbord was awarded the 1st prize for a dish of Winter Ribston. 2nd, the Duke of Richmond and Gordon, for beautifully-coloured fruits of Paroquet. 3rd, Marquis of Ripon, Coombe Court, Kingston Hill (gr. Mr. T. Smith), who showed Reinette du Canada.

Cooking Apples.

Annie Elizabeth: of the seven dishes of this variety, the best was shown by W. Erle Drax, Esq.; 2nd, Mr. B. J. Mercer, Wierton Place Gardens, Maidstone.—*Beauty of Kent:* There were many very fine fruits shown; the 1st prize was awarded to R. McMurdie, Esq., Woburn Park, Weybridge (gr. Mr. A. Basile); 2nd, F. W. Platt, Esq., Ken View, Highgate (gr. Mr. C. Turner).—*Blenheim Pippin:* The larger fruits in this class for culinary fruits were not so brightly coloured as was the case with the smaller dessert fruits, but they were clean and of good shape. 1st, Rt. Hon. W. Lowther; 2nd, Duke of Richmond and Gordon.—*Bramley's Seedling:* The 1st prize was awarded to D. A. Seligman, Esq., Iden Manor, Staplehurst (gr. Mr. P. B. Awcock); 2nd, Lord Howard de Walden.—*Bramley's Seedling:* This standard variety was best shown by the Earl of Westmorland; 2nd, Capt. S. G. Reid, R.E.—*Byford Wonder:* Two dishes of this variety were shown by Mr. Joseph Copp and J. B. Fortescue, Esq., and were awarded 1st and 2nd prizes in the order named.—*Dumelow's Seedling:* This splendid variety, more generally known as "Wellington," was very well shown; the best fruits came from Lord Hillingdon; 2nd, W. W. Mann, Esq., Ravenswood, Bexley (gr. Mr. J. Simon).—*Ecklinville:* The 1st prize was won by J. B. Fortescue, Esq.; 2nd, W. Erle Drax, Esq.—*Edward VII:* The only dish was shown by Col. R. Bullock, who received the 1st prize.—*Kenneth Early:* There was also only one dish of this variety, and in this case the 2nd prize was awarded to J. Lewis, Esq.—*Emperor Alexander:* A wonderfully fine dish of this variety unfortunately had no card, and so was not judged, or it would have received the 1st prize. In the circumstances the 1st prize was awarded to H. St. Maur, Esq.; 2nd, Capt. S. G. Reid, R.E.—*Gascoyne's Scarlet Seedling:* As with the previous variety, the best exhibit was not identified by the exhibitor's name, and was passed over. The next best, which received the 1st

prize, was shown by Lord Howard de Walden; 2nd, Rt. Hon. W. Lowther.—*Golden Noble:* The dishes of this variety were exceedingly good; the best was shown by W. Erle Drax, Esq.; 2nd, G. Hanbury, Esq., Blythewood, Maidenhead (gr. Mr. C. L. Branson).—*Grenadier:* The two dishes were of indifferent quality, and the 2nd was awarded to J. B. Fortescue, Esq.—*Hambling's Seedling:* The large, green fruits appeared as though they would keep indefinitely; the best were shown by W. Erle Drax, Esq., 2nd, Earl of Bessborough, C.B.—*Lady Henniker:* The 1st prize dish (J. Lewis, Esq.) was very good indeed; 2nd, W. Erle Drax, Esq.—*Lane's Prince Albert:* There was very strong competition in this class, in which the 1st prize was won by the Earl of Bessborough, C.B.; 2nd the Duke of Richmond and Gordon.—*Lord Derby:* Each of the four dishes shown was worthy of a prize: 1st, Capt. S. G. Reid, R.E.; 2nd, Duke of Richmond and Gordon.—*Mère de Ménage:* Of the three dishes, the best was shown by H. St. Maur, Esq.; 2nd W. Erle Drax, Esq.—*Newton Wonder:* The fruits of this variety were all good, and the best were from W. Erle Drax, Esq.; 2nd, Mr. J. B. Mercer.—*Norfolk Beauty:* The 1st prize was awarded to the Rt. Hon. W. Lowther; 2nd, J. B. Fortescue, Esq.—*Peasgood's Nonesuch:* There were 12 dishes of this variety, and the 1st prize was awarded to the Duke of Richmond and Gordon, who showed excellent examples; 2nd, W. Erle Drax, Esq.—*Potts's Seedling:* The 1st prize was awarded to Mrs. Austin, Ellerne Mede, Totteridge (gr. Mr. G. Longhurst); 2nd, W. B. M. Bird, Esq. Eartham House, Chichester (gr. Mr. A. Gooding).—*Rev. W. Wilks:* The fruits shown were very variable and not equal to those recently exhibited in the hall: 1st, the Earl of Bessborough, C.B.; 2nd, W. Erle Drax, Esq.—*Royal Jubilee:* The best were shown by the Duke of Richmond and Gordon; 2nd, F. J. B. W. Digby, Esq.—*Stirling Castle:* J. B. Fortescue, Esq., was awarded the 1st prize, the 2nd being withheld.— *The Queen:* These fruits were very good indeed; the best were from the Earl of Bessborough, C.B.; 2nd, Rt. Hon. W. Lowther.—*Tower of Glamis:* The 1st prize was won by Mr. B. J. Mercer; 2nd, Lord Hillingdon.—*Warner's King:* The competition in this class was very strong: the 1st prize was awarded to the Earl of Westmorland; 2nd, Mrs. T. O'Donnell, Tinahely, Piltown. There were 20 dishes shown in the class for eight fruits of any other variety; the 1st prize was awarded to the Earl of Bessborough, C.B., who showed Loddington Seedling; 2nd, Rt. Hon. W. Lowther (Twenty Ounce).

Dessert Pears.

Beurré Alexander Lucas: Of the several good dishes, the best was shown by F. J. B. W. Digby, Esq.; 2nd, Earl of Westmorland.—*Beurré d'Amanlis:* There was only one exhibit, that from Mrs. Austin, which received the 2nd prize.—*Beurré d'Anjou:* The 1st prize was won by J. B. Fortescue, Esq.; 2nd, C. H. Berners, Esq.—*Beurré Bosc:* The fruits of this variety were very good: 1st, F. J. B. W. Digby, Esq.; 2nd, Rt. Hon. W. Lowther.—*Beurré Dumont:* The better of the two dishes was shown by R. McMurdie, Esq.; 2nd, Lord Hillingdon.—*Beurré Hardy:* In a well-contested class the 1st prize was awarded to R. McMurdie, Esq.; 2nd, Capt. S. G. Reid, R.E.—*Beurré Perran:* The only dish was from F. J. B. W. Digby, Esq. (2nd prize).—*Beurré Superfin:* The 1st prize was awarded to E. G. Mocatta, Esq., Woburn Place, Addlestone (gr. Mr. F. Stevenson), for splendid fruits; 2nd, R. McMurdie, Esq.—*Bickling:* The only dish, from Col. Hon. C. Harbord, was worthy of the 1st prize awarded it.—*Charles Ernest:* The best dish was shown by F. J. B. W. Digby, Esq.; 2nd, R. McMurdie, Esq.—*Comte de Lamy:* Of the seven dishes, the best was shown by Lord Hillingdon, Hillingdon Court (gr. Mr. A. R. Allan); 2nd, Lord Hillingdon, Wildernesse, Sevenoaks (gr. Mr. J. Shelton).—*Conference:* There were five dishes, and the 1st prize was won by F. J. B. W. Digby, Esq.; 2nd, Earl of Westmorland.—*Doyenné du Comice:* Of the 19 good dishes, the finest was shown by F. J. B. W. Digby, Esq.; 2nd, Col. the Hon. C. Harbord.—*Durondeau:* Most of the fruits had the very beautiful colour which is characteristic of this variety: 1st, F. J. B. W. Digby, Esq.; 2nd, R. McMurdie, Esq.—*Easter Beurré:* The 1st prize was won by Lord Hillingdon; 2nd, Mr. J. Hill.—*Emile d'Heyst:* The examples shown were very good indeed; the best came from F. J. B. W. Digby, Esq.; 2nd, Duke of Newcastle.—*Fondante d'Automne:* The best dish was shown by R. McMurdie, Esq.; 2nd, Col. the Hon. C. Harbord.—*Fondante de Thirriot:* The 1st prize was awarded to C. H. Berners, Esq.; 2nd Col. R. Bullock.—*Glou Morceau:* Of the many dishes, the best was that shown by B. E. Richardson, Esq.; 2nd, R. McMurdie, Esq.—*Gratioli of Jersey:* The best dish was shown by Mrs. M. P. Read, St. Mary's, Teddington; 2nd, Rev. H. A. Bull.—*Josephine de Malines:* There were 12 dishes shown, and the 1st prize was won by F. J. B. W. Digby, Esq.; 2nd, Col. the Hon. C. Harbord.—*Le Brun:* The two dishes were exceptionally good: 1st, R. McMurdie, Esq.; 2nd, Capt. S. G. Reid, R.E. —*Le Lectier:* The best of 12 dishes was shown by Lord Howard de Walden; 2nd, Capt. S. G. Reid, R.E.—*Louise Bonne of Jersey:* The six dishes included some very good fruits indeed, especially the 1st prize set from F. Bibey, Esq., Hardwicke Grange, Shrewsbury (gr. Mr. T. Taylor); 2nd, Lady Tate, Park Hill, Streatham Common (gr. W. Howe).—*Marie Benoist:* The fruits shown were very variable: the 1st prize was won by F. J. B. W. Digby, Esq.; 2nd, Lord Foley, Ruxley Lodge, Claygate (gr. Mr. H. C. Gardner).—*Marie Louise:* There were 12 dishes exhibited, and the 1st prize was won by J. Lewis, Esq.; 2nd, R. McMurdie, Esq.—*Nouvelle Fulvie:* F. J. B. W. Digby, Esq., won the 1st prize amongst nine competitors; 2nd, B. E. Richardson.—*Olivier de Serres:* The 11 dishes showed great differences in shape and quality; the 1st and 2nd prize were awarded to Lord Hillingdon for fruits from his gardens at Hillingdon Court, Uxbridge and Wildernesse, Sevenoaks, respectively.—*Pitmaston Duchess:* There were also 11 dishes of this variety, but all were of merit; the best was shown by the Rev. H. H. Bull; 2nd, M. Fraser, Esq., Brimley, Teignmouth.—*President Barabé:* The two exhibits, those from Col. the Hon. C. Harbord (1st) and F. J. B. W. Digby, (2nd), thoroughly deserved their awards.—*Souvenir du Congrès:* There were only three dishes of this well-known variety; the prizes were awarded to R. McMurdie, Esq., and J. B. Fortescue, Esq., in the order named.—*Thompson:* Of the seven dishes the best was shown by Lord Hillingdon; 2nd, E. J. Mocatta, Esq.—*Triomphe de Vienne:* The 1st prize was awarded to Lord Hillingdon.—*Winter Nelis:* The best of the seven dishes was shown by Lord Foley; 2nd, J. B. Fortescue, Esq. There were no prizes awarded for Beurré d'Avalon, Beurré de Naghan, Directeur Hardy, or Santa Claus. In the class for eight fruits of any early variety not named there were 16 competitors, and the 1st prize was awarded to R. McMurdie, Esq., who showed Marguérite Marillat; 2nd, J. Mercer, Esq. (St. Luke); 3rd, Capt. S. G. Reid, R.E. (Marechal de la Cour). Amongst the 20 dishes shown in the class for any late variety not named there were ripe fruits of Beurré Diel and Doyenné Boussoch. The 1st prize was awarded to F. J. B. W. Digby, Esq.

THE LECTURE.

In the afternoon of the first day a lecture on "An English Fruit Farm in the Making" was delivered to a large audience by Mr. Henry Hooper. The chair was occupied by Mr. A. H. Pearson. The lecturer described every process in the making of a fruit farm, from the selection of a site to the planting of the trees and bushes. He emphasised the importance of selecting a suitable site, and defined very clearly the points determining the suitability of sites. The subjects of "Soils and Subsoils," "Preparation of Orchard Land," "Selection of Varieties," and "Cross Pollination" were fully treated upon. The lecturer referred to the importance of choosing the best varieties from the commercial standpoint. Mention was made of the newly-instituted horticultural branch at the Board of Agriculture, and fruit farmers were urged to take advantage of the benefits the Board may be in a position to afford to the fruit-growing industry.

Obituary.

Thomas Fletcher.—The death of this florist on August 31, at Warren, Ohio, U.S.A., is recorded in *The American Florist.* Mr. Fletcher was a native of Lancashire, and settled in America in 1863.

Richard E. Evans.—The same journal announces the death of Mr. Richard E. Evans, florist, Salt Lake City, Utah, a native of Portsmouth.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending October 16.

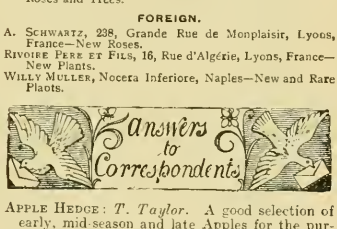
A St. Luke's summer.—The last eight days have been, with one exception, warm for the time of year, while the nights have been, with one exception, very cold, and on two nights the exposed thermometer registered 9° of frost. Since the present month began the same thermometer has fallen from 4° to 13° below the freezing point on all but two nights. The ground is now 3° colder than is seasonable, both at 1 foot and 2 feet deep. Rain fell on only one day during the week, and the amount deposited was scarcely sufficient to moisten the surface of the ground. There has been no measurable percolation of rainwater through either of the soil gauges for nine days. The sun shone on an average for 4¾ hours a day, or for 1½ hours a day longer than is usual at the same period in October. Calms and light airs have alone prevailed, and the light airs have come principally from some southerly point of the compass. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 9 per cent. Most of the mornings were foggy, and on the early morning of the 11th there was, for some hours, a dense fog. *E. M., Berkhamsted, October 16, 1912.*

CATALOGUES RECEIVED.

Henry Drew, Longworth, Berks.—Thames Valley Roses
George Prince, Longworth, Berks.—Roses.
Mansell & Hatcher, Ltd., Rawdon, Yorkshire—Orchids.
S. Bide & Sons, Ltd., Alma Nursery, Farnham—Sweet Peas.
James Veitch & Sons, Ltd., Kings Road, Chelsea—New Hardy Plants from Western China.
Charles Elick, Warren Nurseries, Hayes, Kent—Carnations.
Elisha J. Hicks, Hurst, Twyford, Berks.—Roses.
Jno. Jefferies & Son, Ltd., Market Place, Cirencester—Roses and Trees.

FOREIGN.

A. Schwartz, 238, Grande Rue de Monplaisir, Lyons, France—New Roses.
Rivoire Père et Fils, 16, Rue d'Algérie, Lyons, France—New Plants.
Willy Muller, Nocera Inferiore, Naples—New and Rare Plants.



Apple Hedge: *T. Taylor.* A good selection of early, mid-season and late Apples for the purpose you describe would be Stirling Castle, Lord Grosvenor, Lane's Prince Albert and Newton Wonder for cooking; and Mr. Gladstone, Beauty of Bath, James Grieve, Allington Pippin, Cox's Orange Pippin, and Duke of Devonshire for dessert. If worked on the Paradise stock, none of these would be very gross growers.

Crab: *Pleshey.* Probably a chance seedling. It is distinct from any variety of Crab known to us. We note with pleasure that you have read our pages for so long a period as 50 years.

Danger from Using Gas Lime: *R. O. F.* If you refer to the paragraph in "Answers to Correspondents'" column, page 276, under "Insect—*E. M.*," you will see that we advised our correspondent to defer planting crops on ground that had been dressed with gas lime until several weeks had elapsed. The injurious properties of the gas lime become exhausted in time, and the substance has then no injurious effects on the roots. It is always advisable to allow ground to remain fallow for so long a time as possible after it has been treated with such material, and for this reason it is best applied in the autumn and winter. The advice given by farmers on horticultural matters is not always the best obtainable.

Fungus in Dwelling House: *D. W. P.* The fungus is the dry rot fungus (Merulius lacrymans). Drench every part of the wood and soil with formalin twice, at intervals of 10 days.

Gardeners and the Insurance Act: *D. C.* In applying for insurance you will have to give your precise occupation. The fact that a head gardener is treated as a domestic servant, so far as his right to a month's notice is concerned, does not affect the point—an insurance society is entitled to know the precise risk which it is undertaking.

Insects in Dwelling House: *A. F.* The insect of which you sent us examples is Niptus hololencus, an interesting little creature clothed with fine, velvet-like, golden-yellow hairs. Its original home is Asia Minor, but it has been introduced with merchandise, and is now generally distributed throughout the British Isles. It has often been recorded as destructive to wool, drugs, &c., and seems fond of sugar, so much so that specimens are often found in vessels containing such material. It is not parasitic on man.

Melon Dying: *Hillfield.* The plant of Melon contains the mycelium of a fungus (Botrytis) in the vessels of the stem. All dead and dying plants of Melon and of any other kinds of plants in the house should be promptly removed and destroyed. The fungus Botrytis flourishes on any dead or dying vegetable matter (leaves, stems, &c.); if such are removed, the disease disappears.

Names of Fruits: *H. M.* Nut Corylus Colurna; 1, Doyenné du Comice; 2, Joséphine de Malines; 3, Easter Beurré; 4, send again when ripe; 5, General Todleben.—*F. E. C.* 1, Minchull Crab; 2, Cullen.—*J. W. T.* Cox's Orange Pippin.—*E. E. B.* The numbers were detached; send fresh specimens, and write the numbers on stamp edging attached to the fruits.—*H. A.* 1, Lady Sudeley; 2, Biggs's Nonesuch 3, Melon Apple; 4, Winter Strawberry; 5, not recognised, probably a local variety.—*J. B. B.* W. 1, Beurré Bosc; 2, Autumn Bergamot.—*L. S.* The particulars you give are not sufficient for us to express an opinion on the subject.—*J. R. S.* Doyenné Gris.—*E. D.* 1, Durondeau; 2, Mme. Treyve; 3, Beurré Bachelier; 4, Uvedale's St. Germain; 5, Louise Bonne of Jersey.—*E. M.* 1, Catillac; 2, Bergamotte Esperen; 3, Maréchal de Cour; 4, Miller's Glory.—*A. F. W.* 1, not recognised; 2, Chaumontel; 3, Margil.—*Fisher & Son.* Wealthy.—*Oak.* 1, Warner's King; 2, Bismarck; 3, Golden Spire; 4, 5, 6, cannot name such inferior fruits; 8, please send again; 9, Maréchal de Cour; 10, Beurré Capiaumont; 11, Aston Town; 12, Prince Consort.—*Hortus.* Pears—1, Durondeau; 2, British Queen; 3, Soldat Laboureur; 4, Marie Louise d'Uccle; Apples—1, Beauty of Kent; 2, Broad End syn. Kentish Broading; this variety very much resembles Bramley's Seedling; 3, Flanders Pippin. (Thanks for 2s. for R.G.O.F. box.—Eds.)—*W. H. S.* Apple Lord Suffield; the six Pears were all numbered No. 2, they all seem to be dissimilar; send fresh specimens and number them in rotation.—*F. S.* 1, Mme. Treyve; 2, Beurré Sterckmans; 3, Triomphe de Jodoigne; 4, Bergamotte Esperen; 5, Joséphine de Malines; 6, Hormead's Pearmain.—*R. G. D.* 1, Waltham Abbey; 2, Warner's King; 3, Dumelow's Seedling; 4, Tom Putt; 5, Scarlet Costard; 6, Blenheim Pippin.

Fig. 135.—Primula malacoides: flowers pale pink.

Names of Plants: *J. Francis.* 1, Aponogeton distachyon (seedlings); 2, Stachys lanata.—*F. E. C.* 1 and 7, Roses, Flower of Fairfield; 2, Hiawatha; 4, probably Mme. Willermoz; 5, probably Laurette Messimy; 6, unrecognisable. *A. J. G.* Rose Fellemberg.—*A. J. G.* 1, Senecio tanguticus; 2, Polemonium cœruleum variegatum; 3, Calceolaria integrifolia var.—*Hart.* 1, Olearia argyrophylla; 2, O. nitida.—*F. E. Gribble.* Pyrus vestita.—*O. D. K.* Polystachya luteola; of no commercial value.—*Hort.* 1, Masdevallia Barlæana; 2, Lanium Berkleyi; 3, Epidendrum latilabrum.—*Ajax.* Solanum nigrum.—*H. R.* Cotoneaster frigida.

Notice to Terminate Engagement: *J. W.* You neglect to furnish us with any particulars as to the exact position you filled in the nursery, but we assume it was that of a journeyman gardener. You are a weekly servant, and, presumably, entitled to a week's notice; but the question is involved by the announcement exhibited on the premises that no notice is given or expected on either side, which you might be expected to read. It will be better in all your future engagements to have a proper understanding on the question of notice before you commence work.

Peach Tree Unhealthy: *D. Mc. L.* No fungus present. The tree is diseased beyond remedy. It should be removed and burned.

Preserving Cobnuts and Walnuts: *G. S.* A good method of preserving nuts is to dig holes in the open ground, and sink Seakate pots up to the rims, placing a piece of slate at the bottom, in order to prevent worms from getting into the pots. The nuts should then be put into the pots and the lids placed on securely. In these circumstances, the nuts will remain in a fresh and firm condition for several months. Another method is to keep the nuts in tubs or boxes buried in white sand.

Primula malacoides: *Foreman, Gloucestershire.* Primula malacoides was introduced into commerce by Messrs. Bees Ltd., who raised plants from seeds collected in China by Mr. George Forrest. The answer to your first question, therefore, is that it is a natural species. The plant is hardy in some districts, but it flowers so late in the season that the species is more satisfactory when treated as a greenhouse plant, for which culture it is admirably adapted, owing to its free-flowering habit and elegant appearance. The flowers are pale-pink. If you turn to the *Gardeners' Chronicle* for December 5, 1908, pages 396 and 397, you will find illustrations (one is reproduced in fig. 135) depicting the character of the inflorescence and the habit of the plant, with a description by Professor Bayley Balfour, F.R.S.

Railway Expenses: *A. B. C.* An employer is not liable for the railway expenses of journeymen moving from one place to another unless he has agreed to defray them. The difficulty you describe has arisen because you failed to have a proper understanding before accepting the post. We are frequently urging gardeners to secure agreements before taking up situations, and if they neglect to provide themselves with this means of preventing difficulties they cannot hope to escape the consequences of their negligence.

Trees to Form a Screen by Riverside: *F. S.* You have a good opportunity of making a beautiful plantation when planting the large frontage with trees to screen the buildings. With this end in view, mixed species would be decidedly better than to plant the area with evergreen trees. To fully advise you, some knowledge of the aspect and "lie" of the ground would be necessary, but the following list includes fast-growing evergreen and deciduous trees which would be suitable for your purpose:—Evergreens: The Douglas Fir (Abies Douglasii), Picea Menziesii (P. sitchensis), P. Engelmannii, Cryptomeria japonica, Pinus austriaca, P. Cembra, P. excelsa, P. ponderosa, P. Strobus, and Thuya gigantea. In the deep, rich, red soil of south Devon the English Elm (Ulmus campestris) grows rapidly; the Scotch Elm (Ulmus montana) is a very suitable tree to plant in low-lying moist places. Other appropriate deciduous trees are the Ash, Larch, White Poplar, Balsam Poplar (Ailanthus glandulosa), Alder, such Birches as Betula alba, B. lutea, B. nigra, and B. papyracea; Sweet Chestnut (Castanea sativa), and the deciduous Cypress (Taxodium distichum). As you suggest, moderately close planting tends to "draw up" young trees, and such planting would provide the screen quickly, but this must not be overdone. The trees should be planted fully 4 feet by 4 feet apart, and thinning must be properly attended to in later years. We have found that it rarely answers to plant large specimens; they frequently "stand still" too long. The most satisfactory results are obtained from well-rooted young trees not more than 3 feet to 4 feet in height. The plantation would be much more ornamental if such flowering and berried shrubs and trees as Hollies, Rhododendrons, Cotoneasters, Cratæguses, Cherries, &c., were planted near the river front of the plantation. You do not state the precise district in which the proposed planting is to be done, but we assume that, as considerable building operations are going on, the trees will not be injured by rabbits.

ECHIUM WILDPRETII

THE

Gardeners' Chronicle

No. 1,348.—SATURDAY, October 26, 1912.

CONTENTS.

ILLUSTRATIONS.

A GLOUCESTERSHIRE WILD GARDEN.

THERE is maintained in the Public Park at Pittville, Cheltenham, a garden for the wild flowers of Gloucestershire—a living collection of only those plants that are found in the county. The scheme began as an experiment in 1896. The garden had to be made representative of Gloucestershire. The plants native to the county had to be brought together from remote places, and their weak and strong points had to be discovered; but the garden now is an established collection of over 200 plants.

Its chief features perhaps are the vitality of the plants and the wealth of blossom. These apparently are due to the fact that the wild plants simply revel in growth once they no longer have to fight their fellow-beings for a livelihood. As an instance, the Limestone Milkwort, with a mass of gentian-blue the size of a saucer, is a very different thing from the scrappy plant having a tussle with other plants in the turf of the upland wolds.

In the proposals made to the Corporation for such a garden, the plants to be brought together were indicated as being the rarer and more beautiful plants of the county. The reason for this limitation was to prevent the garden being considered as a mere botanical collection, with rows of specimens for students. It certainly has been used largely by visitors from the Cheltenham colleges and schools and various societies, but the garden grows as much for lovers of flowers and of the country as for devotees of botany. Accordingly, a certain amount of latitude was necessary for a happy compromise.

The limitations were perhaps lucky for the founder of the garden, since some excellent plants have disgraced themselves and have of necessity been banished. One cannot perhaps lay down rules for other gardens to be formed, but certainly the following species have wanted too much of this garden to themselves—the Yellow Vetchling, Biting Stonecrop, Whitlow Pepperwort, Dyer's Weed, Hawkweed, Cerastium arvense. These and others have dared to come up in all the beds once they got a root-hold in one bed. Birds seemed largely responsible for some of these extensions. Other plants, such as the pretty blue Skullcap, have quickly appropriated a whole bed, and then, creeping underground to the nearer beds, have come up in these as well, looking very pleased with themselves. So some plants, otherwise delightful, have had to go. At least, the intention has been to banish them, but they never quite disappear. They play a little game of their own. Remnants of them lie low and come up in concealed places, hiding behind other plants. Quite a little piece comes up and is not noticed, and suddenly some day a whole large plant is seen beaming, and by this time there may also be offshoots from it elsewhere.

Some creeping plants are more amenable. They certainly insist on having to themselves whole beds, but if these are bounded by lawn turf about 4 feet wide, which is cut, say, once a week, the plants keep within their confines. Such plants include the Dittander, Soapwort, Creeping Bellflower, narrow-leaved Willow herb (see fig. 136), Bistort, and Yellow Loosestrife.

As regards the arrangement of the garden, the chief care has been to make the plants feel at home, and so far as possible to adapt the natural features of the ground first for this purpose, and, secondly, for a picturesque grouping. Water-loving plants from the rivers and bogs must have the necessary moisture, those from the woods their shade and leaf-mould, and inhabitants of the limestone and oolite districts must have their chemical wants attended to. Even after these special beds are filled, there are still left large numbers of plants which can be put into ordinary beds and arranged in more or less classified order. Beginning with Candytuft, this series goes on through Corn Cockle, Campions, golden clumps of St. John's-worts, magenta and purple Mallows and Geraniums, Melilots and others away to Knapweeds, the violet Scabious group, a blue pillar of Chicory and many more, finally ending with brilliant red tufts of Wood Betony. To break any monotony in the lines of these beds, they have been grouped round a large sun-dial (see fig. 136), designed to embody the type of architecture of the old Cotswold manor-houses.

FIG. 136.—A GLOUCESTERSHIRE WILD GARDEN: THE TALL PLANTS IN BEDS BY THEMSELVES ARE THE NARROW-LEAVED WILLOW HERB AND COMMON TEAZLE.

Although Gloucestershire is an inland county, still the penetrating Severn estuary has gained for it many plants of the seaside. Some of these when found in their wild state grow on a tiny beach of lovely red sand only some 80 yards long, which is swept by the south-west gales and the inrushing river-tides. Others grow higher up the river and get shifted about by the Severn bore. But they all grow well in the garden—Yellow Horned Poppy, Sea-pink, Sea-lavender, Sea-wormwood and others—just given a little rock salt to remind them of their old

abodes. And some of them remind one in turn that they used to flourish in the county, but are being lost through the inroads of docks and civilisation.

For rock-loving plants there is a rockery of large boulders of inferior oolite. These fit together in layers, and dip from front to rear, so as to represent in miniature an outcrop of the escarpment above the Vale of Gloucester.

FIG. 137.—A GLOUCESTERSHIRE WILD GARDEN: GERANIUM SANGUINEUM AND THYMUS SERPYLLUM.

For some plants coming from the limestone country two large beds have been filled with the loose soil of their district carted from a distance. Mulleins, Dropwort, Purple Milk-Vetch, Viper's Bugloss, Clustered Bell-flower, Horseshoe-Vetch, Squinancy-wort, Woolly Thistle, and Senecio campestris, with its silky coat of white down, thrive in these beds. The soil, too, looks well, and is quite worth the extra expense.

Reference to the flowers of the limestone country suggests a little point about the garden which cannot be overlooked. It is that it has its delights not only for what it is and what it shows, but also for what it recalls, for it takes us in imagination into the county where the plants have their homes. As a native of the county looks at the massed groups of Geranium sanguineum (see fig. 137) and Spiked Speedwell, or the dainty Hill Meadow-rue, he lives for a moment on the summit of the St. Vincent Rocks, near Clifton. As he turns in another direction, Sedum rupestre and the Madder take him to the cliffs above the Wye Valley. Yet again, the Catsfoot, Meadow Saxifrage and Limestone Polypody represent the bleakest tops of the Cotswolds, whence one can see from Berkshire to Radnorshire.

So with other plants not on the rockery, it is wonderful what scenes they recall—the Daffodil and the fields of the red sandstone district yellow washed in the spring: Euphorbia stricta and the wild, steep banks overlooking Tintern Abbey: the inmost recesses of the Forest of Dean brightened by the crimson Martagon Lily (see fig. 138), which is naturalised in many parts of Great Britain: the Purple Loosestrife, and the quiet reaches of the Avon stretching away towards Stratford: the Bog-bean and little half-forgotten marshes that have not changed for centuries. And visitors from other counties find a similar pleasure in memories that are stirred—from an association of the Bastard balm and Devonshire copses to that of the Fritillary and Oxfordshire meadows.

Such a garden, too, serves as a treasure-house and show-place for rarities. At the same time great care has been taken in this particular garden not to attempt to grow plants difficult of culture, if this might lead to robbing the countryside of them. It is sacrilege to transplant the rarer Orchids for instance. On the other hand, such a plant as the Peach-leaved Bell-flower (only found as truly wild in two counties) was known to be a strong grower. So a small root was taken, and it has increased so much in the garden that there are now plenty of plants to spare for a spot near the original habitat, where, strange to relate, the species has been exterminated. Much the same line of argument applies to the Pasque flower, Anemone pulsatilla.

Only a few Orchids do well, at any rate in this garden, amongst those which succeed may be mentioned the pyramidal, sweet-scented, marsh and spotted Orchids (see fig. 138). Others seem to require special vegetable humus in the soil on which the roots can feed; or it may be that the fungus which infests the roots fails in all but special soils. Exact conditions such as these are difficult to maintain, not only for Orchids, but for the Eyebright, Lousewort, Centaury, Yellow-wort and other such commoner plants which also require them. Care, too, should be taken not to take from the country some of the more delicate bog-plants, unless proper peaty soil and plenty of soft water can be obtained for them. Otherwise it means a constant tax upon the natural abode of a species to keep it represented in the garden.

Amongst rarieties not hitherto mentioned that flourish in this garden are such plants as Arabis stricta, Cardamine impatiens, Stachys alpina, Polygonatum officinale, Scilla autumnalis, Ornithogalum pyrenaicum and Allium sphærocephalum.

Finally, during the flowering season the plants may be allowed a certain amount of latitude in their growth. The borders look better for an absence of extreme neatness and of curtailment as to similar-sized clumps of plants. But during the time of the first growth, and again when the blossoms are over, there cannot be too much method and careful cutting and arrangement. Also, the seeds, especially of biennials, must be properly harvested and sown with a fair amount of system, whilst sketch plans of the beds are found useful.

If other corporations will call in the aid of local botanists, and start such gardens, it is believed that the results will be found good, and that they will be appreciated.

But. . . ! to quote Mr. Rudyard Kipling:

"Our England is a garden and such gardens are not made
By singing, oh how beautiful, and sitting in the shade:
. . . . . .
And when your back stops aching and your hands begin to harden,
You will find yourself a partner in the Glory of a Garden."

—*W. Lock Mellersh.*

FIG. 138.—A GLOUCESTERSHIRE WILD GARDEN: LILIUM MARTAGON (FOREST OF DEAN) AND ORCHIS MACULATA X O. LATIFOLIA.

THE ROSARY.

CULTURAL NOTES FOR NOVEMBER.

If the ground has been prepared as advised in my last notes, there should be very few cases in which the freshly-purchased plants could not be in their permanent quarters by the end of November. If the soil is very wet, it is better to defer planting until the spring; still, autumn planting is much the best, and with a little judgment it is seldom impracticable. I have already referred to the value of firm planting and the spreading out of the roots. See that the latter are not exposed to drying winds, especially when the weather is inclined to be frosty, for much harm is done when the wood shrivels from a loss of sap.

Roses Under Glass.

Before housing pot plants, see that the drainage is perfectly free, and search for insect pests, which can be destroyed much more easily when the wood is ripe and dormant than after growth has commenced. When using strong specifics, place the plants on their sides to prevent the liquid reaching the soil in the pots. Any leaves that remain should, unless they are very young, be removed. Most of these would be cut away in the process of pruning, and removing them now may prevent disease or insect pests being introduced into the house. Under glass, pests and diseases spread rapidly, and thrive on the young, tender growths. Wherever possible, the interiors of the houses, including the benches and walls, should be washed thoroughly and disinfected before the Roses are brought indoors. Climbers should be unfastened from the walls and cleansed so far as circumstances will allow. A number of insects find shelter in crevices and behind the shreds with which the Roses are attached to the wall.

At first, the plants may be stood fairly close together, if necessary, in a small house, and be removed to more roomy quarters when the Chrysanthemums are over. But it must be remembered that Roses need plenty of light and air as soon as growth becomes active. Wall Roses need careful pruning and thinning. In the case of ordinary climbers, leave plenty of wood formed during the previous season. But some varieties, such as William Allen Richardson, should have a few of the healthy side growths spurred back to the original rod, provided the latter is not too old. Long, well-ripened growths on climbers flower much better and almost with certainty from every eye if they are trained as horizontally as possible.

Do not secure long rods to the roof at a nearer distance than 1½ foot from the glass. The new shoots will be sure to grow towards the light, and come into contact with the glass, only to be injured by cold and damp, and more especially hoar frost, that so quickly forms on the roofs of glasshouses.

On no account should Roses be hurried into growth at the start; the steadier they develop the better until about 2 inches of growth is made, when they may be forced a little. They will need extra fire-heat by that time, because the weather will be colder.

Considerable discretion must be exercised in syringing and damping at this season, as superfluous moisture may cause harm in the centres of the growing shoots and stop the formation of buds.

Fumigation is more suitable for the destruction of any insect enemies now than in the spring, when the trees may be syringed freely with clear water without fear of injury from damping. Avoid fumigation to excess, as this is very injurious to the points of the young shoots. I have frequently traced the greater part of a bad loss of flowers to this cause. Certain varieties are much more harmed by powerful fumigants than others. Niphetos is very susceptible to injury from this cause. Fumigation should always be carried out carefully at night time, and the plants syringed as soon as the weather will allow next day. This practice is a capital method of cleansing the growth and foliage from insects that are not dislodged, and renders the work more effective.

It should not be necessary to point out how much wiser and more effective it is to attack the first few foes than to allow the pests to gain a strong foothold; far too many growers are apt to delay fumigation because the insects are few in numbers.

(See p. 309.)

Grafting Roses Indoors.

A number of decorative Roses are not suitable for propagating from budding, either because the wood is not strong enough, or from a lack of suitable buds. Most of the China and Dwarf Polyantha Roses come in this category. Certain of the Teas and their hybrids are also more easily propagated by winter grafting. Peace, G. Nabonnand, Mme. Antoine Mari, Lady Battersea and others of a similar habit produce excellent grafting wood in the numerous small shoulders or side growths which carried the last blossoms. A grafted plant of these Roses is fit for planting out the following May, and will flower well from mid-June until frost appears.

If grafted low, the scion may be inserted upon the root of the stock itself, and the growth of suckers prevented. The life of a grafted Rose is as long and safe as that of a budded Rose.

In a previous note I referred to the potting of stocks; the more forward of these will be forming new roots by the middle or end of November.

The methods of grafting have been described on several occasions, and are generally known. The wood used for scions should not be the least affected by frost. I have never had good results from frosted shoots; even under the most careful and experienced treatment. A propagating case, with a temperature of 60° to 65°, is very suitable. Avoid dampness in any form. It will be necessary to wipe the glass or turn it over each morning and night to dispel the condensed moisture.

Our propagating cases are made much after the style of a miniature span-roofed house. The squares of glass lie loosely over the case, resting against a cross board, instead of a pitch-plate, and just overlap the sides of the case at the bottom. This allows the superfluous moisture to run down and avoids drip, which is so fatal to the Rose graft in its younger stages.

I would warn, too, against practising overhead waterings in the early stages. It stops the formation of the callus, and is often the main cause of failure. Keep the frame closed and avoid strong light; the plants may be kept quite dark for a couple of weeks or until a callus has formed and growth is proceeding rapidly. If water is necessary, it should be applied with extra care to avoid wetting the graft. More light may be given as the plants develop, and air may be admitted gradually.

The propagating cases should not have wooden bottoms; fungus soon grows on wood in a close, warm atmosphere, unless the timber is thoroughly seasoned and painted. Nor, for the same reason, do I advise the use of leaf-mould or manure in the potting compost. Pure loam and a little sand are all the plants require until they are potted. Very small pots may be used at first, and thus a large number of plants may be grafted in the same case.

The more forward of the plants should be removed to one end of the case so that they may receive more light and air. Grafted Roses seldom develop evenly, and a few must be kept closed longer than the others.

By using loose squares of glass, the ventilation in the frame can be regulated perfectly; the case may be partitioned with squares of glass placed upright. *Practice.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA SCHRÖDERÆ IN CANADA.

I am enclosing a photograph of a house of Cattleya Schröderæ taken last Easter in these nurseries from which about 5,000 flowers were cut for the Easter trade. With it is a specimen plant of C. Schröderæ alba, which flowered among them. I was grower for many years to Messrs. Hooley Bros., Southampton, before coming here, and I find that Cattleyas grow much finer here. Many of the spikes carry four to seven flowers, and several of the plants 22 to 36 blooms. The house is 100 feet long with the stage spanning both ways. We have a similar house of Cattleya Mossiæ. *W. J. Jones, Dale Nurseries, Brampton, Ontario, Canada.*

NOTICES OF BOOKS.

Japanese Gardening.*

English gardens owe much of their beauty to the fine hardy flowers which we have received from Japan. They first came to us in the early years of the eighteenth century, and from that time to the present a very large number have found their way into English gardens, having the strong recommendation that they are not only beautiful, but hardy. To mention only a few, from Japan have come to us Chimonanthus, Pyrus japonica, many Magnolias, Hydrangeas, Aucuba, Azalea, Diervilla, Ginkgo, Anemone japonica, many Irises, and Lilies.

And we have many books on Japanese gardens and flowers, all pretty, and some of them (as the *So Moku*) scientific.

The beauty of Japanese gardens, and the delight they are to the Japanese, are fully brought home to us in Mrs. Taylor's book; but we are glad to see that she does not recommend that we should make copies of them in England. They are an important part of a Japanese home, and they suit the Japanese; but it would be as foolish to make our English gardens exact copies of the Japanese as it would be to build our houses on the model of the houses in Japan.

In Japan, gardening is a religion, and a very conservative religion. The Japanese gentleman of to-day carries on the tradition of the garden that was cultivated by his father and grandfather. But is it such a success that we should wish to see the same in England? No one has a more intimate and artistic acquaintance with English and Japanese gardens than Lord Redesdale, and this is his verdict, as published in the *Bamboo Garden* in 1896, and repeated in a more recent book:—

> "The Japanese garden is a mere toy, that might be the appanage of a doll's house. Everything is in miniature—a dwarf forest of stunted Pines; a Lilliputian waterfall, running into a tiny pond; stone lanterns of grotesque shape springing up here and there; paths made of great, flat stepping-stones; dwarf Conifers; all spick and span, intensely artificial, a miracle of misplaced zeal and wasted labour; all governed by laws sacred and immutable."

Surely we do not want that! Yet the experiment is being tried in a few places, and there are many who think that all that is wanted to produce the charm of a Japanese garden can be got by a bridge, a few stone lanterns, paved paths, and many pots.

There are two things which the Englishman demands of his garden, for which the Japanese gardener cares little or nothing. In all Mrs. Taylor's pretty pictures there is no thought for a good lawn, without which an English garden lacks its chief beauty; and though the Japanese likes large stones in his garden, he has no thought for the rock-garden with moraines, which English gardeners now so much affect. The Japanese thinks little of small Alpines, but he thinks a great deal of rows of pots holding plants and tree Pæonies!

We have left ourselves too small a space to speak of the merits of Mrs. Taylor's book. We should have liked it better if it had been half the size; she knows her subject well, and she has a ready pen, but it has tempted her to write at too great a length. The sentences are long and involved, and the language is for the most part stilted, so that the reading is very often far from easy. A new edition, half the size, and in simpler English would be an improvement.

Still, in spite of this faint praise, we can recommend the book; it is a dainty book, and, with its pretty illustrations and general good get-up, it is well fitted for a drawing-room table, but we cannot give to it a much higher rank than that. *H. N. Ellacombe.*

* *Japanese Gardening*, by Mrs. Basil Taylor. (Methuen & Co.) 21s. net.

EDOUARD BORNET.

A special interest attaches to No. 4 of the *Bulletin de la Société Botanique de France* (vol. 59, 1912) in that it contains an admirable biography of the veteran and distinguished botanist Edouard Bornet, who died in December of last year. Bornet was born in 1828, and lived to the advanced age of 83, and of him as of Hooker it may be said with truth that though he grew old he never grew antiquated. His life was devoted to botanical science, and the most important of the long series of contributions which Bornet made to that science were in the domains of plant breeding and of cryptogamic botany.

His most memorable contributions in the latter branch of science were the discovery of the remarkable mode of sexual reproduction which occurs among the red algæ, and the complete demonstration of the truth of the hypothesis put forward and supported by strong evidence by Schwendener that Lichens are not single and specific organisms, but that they are composite beings made up of two partners or symbionts, namely, an alga and a fungus. It was Bornet who first showed that the algal cells or gonidia of the Lichen give rise only to algal cells and not to the Lichen, and that in order for a Lichen to be formed the algal constituents must come into intimate relation with the hyphæ of the fungus. Schwendener's discovery, now a commonplace of botany, gave rise to fierce and acrimonious discussion, for the Lichenologists were by no means willing to allow their pets to be degraded—as it seemed to them—into the position of joint-stock companies. Bornet, however, showed his wisdom in disregarding the controversialists—

> . . . Bent low before the blast,
> In patient, calm disdain,
> He let her legions' thunder past,
> Then turned to thought again.

No less epoch making was the part which the distinguished savant played in establishing the garden of acclimatation at Antibes. This justly celebrated garden was established originally by Bornet's friend and former teacher, Thuret, in order that the two colleagues might have a suitable laboratory and garden wherein to carry on their joint investigations. So long ago as 1857 Thuret purchased the site of the present garden, which lies between the Golfe de Nice and the Golfe Juan, in what is one of the most beautiful situations of the world, the Cap d'Antibes. There they established all manner of sub-tropical and other exotic trees and plants, Pittosporums, Callistemons, Stapelias, many species of Cistus, and a host of exotic plants introduced into Europe for the first time. Readers of Georges Sand will remember her enthusiastic description of the garden of the Villa Thuret, from the lawn of which emerges the sudden apparition of blue sea and great white Alps above the topmost branches of the trees—"an Eden which seems to be borne on the bosom of infinite space." Bornet's work in hybridisation was carried out principally on the species of Cistus, many of which he succeeded in crossing with one another. He demonstrated, moreover, that many—no fewer than 250 of the hybrids which he obtained—yield fertile seed, and thereby helped to destroy the notion which prevailed so long and so generally that species hybrids are sterile. It is interesting to observe that Bornet's hybridisation work was carried on at the same time as that of Mendel, and it is a misfortune for the student of genetics that the former, absorbed by his no less important algological studies, did not publish the results of his experiments, which were made and recorded with scentific precision.

The Villa Thuret, which was for so many years the scientific home of Bornet, was bequeathed by its owner to the State, and still flourishes as a centre for those scientific studies which will always be associated with the names of Thuret and Bornet.

Both were men of a model which is becoming rarer with the professionalisation of science. Neither sought anything except truth, and as a result both have found lasting fame and high regard, even among their successors so busily occupied with the engrossing work of getting on.

NOTES ON FORESTRY.

FORMING NEW PLANTATIONS.

All preliminary operations in connection with the formation of new plantations, such as drainage, fencing and pitting, should now be taken in hand so that by the end of the year planting may be engaged in.

Except in certain situations, autumn planting is to be preferred to that carried out in the spring, the exceptions being cold, wet lands or exposed and high-lying grounds.

The preliminary work will include in certain cases marking out the site of the plantation, clearing the ground of all scrub and rough-growing herbage, relieving the soil of excessive moisture, fencing, and opening the pits for the reception of the young trees at a later date. Local conditions will often have a distinct bearing on how these operations should be carried out, while the actual cost will be greatly influenced by the rate of wages paid in the particular district of the country where the plantations are to be formed.

WILLOWS FOR CRICKET BATS.

The demand for "maiden" or unpollarded Willow timber, suitable for making the best class of cricket bats, was never greater than at present. During the past summer £10 was paid for a Willow tree in London, and in the Epping district £5 each was offered and refused for a number of trees of the white or Huntingdon species, while a large quantity of the same timber in another district fetched from 3s. 6d. to 5s. per cubic foot, but the trees were not of prime quality or the size desired.

These prices, double or treble that of Oak, clearly point to the fact that Willow timber suitable for the manufacture of high-grade cricket bats is well worth cultivating, and when, in addition, we consider how readily the tree is accommodated in the matter of soil and situation, as well as ease of propagation, one cannot but wonder why the timber is expensive.

True, every class of soil will not grow Willow timber successfully, but there are many damp-ish fields of fair class loamy soil that would grow the tree to perfection.

Neither will every species of Willow produce timber suitable for making the best class of cricket bats, the true white or Huntingdon tree (Salix alba) or, better still, one or two of its varieties, alone being suitable for the manufacture of such.

WOODLANDS FOR SALE.

About 300 acres of freehold woodlands, including timber, are to be offered for sale on the Gwydyr Estate, North Wales, at an early date. The plantations are situated in the Conway Vale of Trefriw, Capel Curig and Bettws-y-coed, places that are well known for their beautiful mountain scenery. Some time ago it was mooted that all the trees in the Vale of Conway, near Llanrwst, were to be cut down, but a letter from the agent of the estate assured me that such was not the case, and that the famous clump of Weymouth Pine (Pinus Strobus) would be carefully preserved.

These trees, which are growing on the mound near the old mansion and chapel of Gwydyrucha, have no equals in this country, many of the individual specimens being from 80 to 100 feet in height, and with stems which girth 10 feet and upwards at a yard from the ground level. Incidentally, and as showing to what size trees grow in the Conway Vale, it may be mentioned that a Spruce Fir blown down near these trees some years ago was 124 feet in height. *A. D. W.*

TROPICAL WATER-LILY HOUSE, KEW, IN SEPTEMBER.

(Concluded from p. 294.)

Beside the Gourds, there are also numerous other climbers. There are several species of "Yams," which thrive well. Dioscorea bulbifera var. sativa (see fig. 140), the common Yam of the tropics, is bearing a large crop of aerial tubers in the axils of all the principal leaves. Another common Yam is D. alata, but this species is devoid of stem tubers. Both species are largely grown in many tropical countries, the tubers being cooked like Potatos. Two large specimens of the West Tropical African D. prehensilis are trained on wires over the Water Lilies, the lateral branches forming a light and graceful curtain on either side and hanging down almost to the water. The roots of this plant are remarkable, being covered with short lateral rootlets, which harden and become spinous. The tuber is enclosed in a perfect network of these spiny roots. A large spreading vine, Vitis pterophora, is also trained on wires across the tank; the stems are four-angled, and bear large, handsome foliage. A few long, slender, aerial roots are developed; when they reach the soil they act as additional feeders for the rapid-growing stem. Late in the autumn of each year the ends of the stems hang down, and a length of about 1 foot becomes enlarged and stored with nutriment, finally falling to the ground, where it remains dormant until the following growing season. This curious method of vegetative reproduction enables the plant to cover enormous areas of the forest regions of Brazil, of which it is a native.

Many other climbers are dotted about amongst the Gourds, including the Snail Flower (Phaseolus Caracalla), with its curious spiral buds and flowers; the light and graceful Ipomœa Quamoclit, with its small, feathery pinnate leaves and bright scarlet flowers, and the beautiful cobalt-blue-flowered Clitoria ternatea and its white variety. Of the larger woody climbers the best is Allamanda cathartica var. Hendersonii, of which a large specimen is covered with its large, handsome, yellow and brown flowers. Several Passifloras, the lavender-flowered Solanum Seaforthianum, the yellow-flowered Stigmaphyllon ciliatum, Aristolochia grandiflora, with its curious pouch-shaped flowers, and rather unpleasant smell; these and many others form a beautiful vegetative curtain. Beneath the climbers, and planted out in the same border, are groups of beautiful foliage plants, interspersed with a few flowering dwarf shrubs and herbs. Species of Eranthemum, with beautiful and highly-coloured foliage, are a feature. E. atropurpureum, with dark, bronzy-red leaves and large, terminal white and red flowers; E. tricolor, with dark reddish-green, blotched and striped with shades of pink, red and purple; E. tuberculatum, a charming dwarf shrub that is covered several times a year with numbers of white flowers, each more than an inch in diameter, and E. Cooperi, a companion plant with lanceolate leaves and white spotted with purple flowers. Acalyphas are largely planted, such well-known kinds as A. macrophylla, A. macrostachya (A. musaica of gardens), A. Godseffiana, A. marginata, A. Wilkesiana (A. tricolor of gardens), A. Clibranii, A. obovata and A. Hamiltoniana being used with fine effect. The bulk of these plants are planted in masses, and their foliage becomes highly coloured in the autumn. A large clump of Graptophyllum Nortonii is extremely handsome, the leaves being dark reddish-green, irregularly marked along the bright red midrib with bright-rose or deep red markings. The undersides of the leaves are plum-red with bright crimson markings. The well-known Caricature Plant (Graptophyllum hortense) is grown in several parts of the house, and is a fit companion to the other species. The markings on the leaves are yellow on a ground-work of green, and in many cases the outline of a man's face is to be seen, hence the common name of the plant. A large mass of a new species of Sanchezia—S. parvibractea—occupies a prominent position on a corner of the stage. The leaves are large and beautifully striped along the principal veins with bright yellow. It is a larger and more erect-growing plant than the old S. nobilis, and makes a very pretty object when grown in pots. Several species of the genus Nautilocalyx

Fig. 140.—Dioscorea bulbifera.

are grown in small groups. All the species of this genus in cultivation are decorative. N. Forgetii, a recent introduction from Peru, is of bushy habit, with edges of the leaves prettily crimped. The flowers are primrose coloured and nearly 2 inches long. N. bullatus and N. Lynchii have recently been transferred to this genus from Alloplectus. Two other new species, N. pallidus and N. hirsutus, introduced by Messrs. Sander & Sons from Peru, are growing in this house. Many other kinds of foliage and flowering plants are cultivated on the side stages, and all thrive remarkably well.

The small tanks devoted to bog plants in each of the four corners of the house are filled to within a few inches of the top with loamy soil, and in this are growing such plants as Sagittaria montevidensis, S. lancifolia, the former reaching to a height of 9 feet, and Montrichardia aculeata, a large and strong-growing Aroid, with light-yellow spathes. A large mass of the distinct and handsome Pontederia cordata occupies a central position in one of the tanks. The flowers are pale blue in short spikes on long peduncles and are borne in quantity during several months. Nearly the whole of one side tank is filled with a large mass of the "Papyrus" (Cyperus Papyrus). A pretty bog plant is Hydrolea spinosa, of half-shrubby habit and covered with bright-blue flowers. Two of the tanks contain masses of the curious Limnobium bogotensis and Salvinia natans, which float on the surface of the water in the same way as the common Duckweed. The Salvinia is a curious and anomalous Fern ally; the leaves are borne in whorls of three at each node; two of these are ordinary round or oval foliage leaves, and the third is a submerged and much-divided leaf, springing from a short petiole and covered with brown hairs. The plant does not form roots, the function of the roots being performed by the submerged leaves. Reproduction in this plant is somewhat rare, but for the past three years a small percentage of the Kew specimens have borne their curious sporocarps.

A number of fine basket plants hang near to the sides of the centre tank. One of the best is Jacobinia suberecta, which has been a mass of flowers all the summer. Dissotis plumosa is a pendulous-growing Melastomad with mauve-coloured flowers. A particularly charming basket plant is Coccocypselum hirsutum; its bright violet-coloured fruits are freely produced. Several kinds of Achimenes are grown, also a fine basket of each of the Hemigraphis—H. colorata and H. repanda. The new Torenia atropurpurea, a native of Perak, has flowered freely in a basket all the summer; the flowers are rosy-violet in colour and about two-thirds of an inch in diameter. *C. P. Raffill.*

PLANT NOTES.

COCHLIOSTEMA JACOBIANUM.

This old plant is now but seldom grown in gardens, and yet it is well worth cultivating for the intense blue colour and quaint structure of the flowers. It is usually raised from seed, which, under suitable conditions, germinates freely. A brisk, moist heat is necessary for the successful culture of this plant, but when in flower, it may be removed to a cooler structure and kept drier at the root. These conditions will prolong the flowering period. The lax inflorescences are freely produced from the sheath-like bases of the leaves.

When out of flower the plant resembles certain of the Bromeliaceæ, being practically stemless, and having rigid, long, recurving, pale-green leaves. *Jonathan Fiona, Ultima, N.B.*

FURCRÆA BEDINGHAUSII IN AUSTRALIA.

I forward a photograph of one of several plants of Furcræa Bedinghausii, C. Koch. (Syn. Furcræa Bedinghausii, C. Koch. "Bedinghausen's Giant Lily," Mexico). The plants have flowered luxuriantly in these gardens during November, December and January last. They grew 30 feet 6 inches in height, and the height of the scape, bearing the inflorescence, was 21 feet 7 inches. The species thrives well in this climate, and a good fibre is obtained from the leaves. *J. Cronin, Curator, Melbourne Botanic Gardens, South Yarra.*

The Week's Work.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Oncidium.—Plants of Oncidium varicosum, O. crispum, and O. Forbesii are developing their flower-spikes, and must not suffer drought at the roots, or the flower-buds may drop. These plants produce strong, branching inflorescences, which exhaust their energies. Therefore only robust, well-rooted specimens should be allowed to flower. Those that are weakly should have their flower-spikes removed as soon as the latter appear, and be given every encouragement to grow strong. In no case should the flower-spikes be allowed to remain on the plants after the pseudo-bulbs show the least signs of shrivelling. O. Papilio and O. Kramerianum that are producing a succession of flowers from their slender stems should not be allowed to become dry at the roots at any time, and the flower-stems should be removed after three or four flowers have developed. These plants are best grown in shallow Orchid pans or teak-wood baskets, which should be suspended in a light position in the warmest part of the Cattleya house.

Vanda.—Plants of the tall-growing section, which includes V. tricolor and V. suavis, and their varieties, should receive attention at the roots, either repotting them or affording fresh surfacing materials only, as may be necessary. Those plants that have sufficient rooting space for another season's growth and with the lower leaves still attached, should be provided with fresh material after a quantity of the old compost has been removed from the surface. Well-rooted specimens that are growing in pots too small for another season should be repotted afresh in receptacles of a suitable size. In turning the plants out of the receptacles it will be found that some of the roots are clinging to the sides, and care must be exercised that they are not damaged. Provide pots that will accommodate the roots without crowding them, and arrange the plant in the centre of the pot with the lower leaves almost level with the soil. First place a large piece of potsherd over the drainage hole, and then arrange the lower roots in position, taking care not to crack or break them. Fill the pot to within half its depth with clean crocks and over these arrange a layer of Sphagnum-moss, finishing with a mixture of Sphagnum-moss and A1 fibre in equal parts, the latter cut into short portions, and the whole mixed with plenty of small pieces of crock. Work the compost well amongst the roots, pressing it firmly, and arranging it to the level of the rim. The potting is completed by a layer of living Sphagnum-moss on the surface. Specimens with healthy roots but bare of most of the bottom leaves should have the old potting materials and drainage removed, but without detaching the roots which are clinging to the sides of the pot. The lower part of the stem may be cut away, so as to bring the bottom leaves almost level with the soil; the plant may then be repotted in the usual way, using the compost recommended. The growth should be tied to neat stakes to keep the plants firm and in an upright position. Aerial roots should be pegged to the moss; the longer ones may be directed into the soil. Newly-potted plants should be shaded from sunshine, and their immediate surroundings kept moist by frequent syringings around and between them. It is essential that the plants are always stood on a damp bottom. Water will not be necessary for a few days after the potting, but later they should receive copious waterings. As often as the surface moss becomes dry, it should be sprinkled with water to keep it alive. These plants delight in plenty of fresh air, and the bottom ventilators near to them should be opened at all times when the external temperature is not lower than 50°. These Vandas will grow well in the intermediate house or the cooler end of the Cattleya house. The leaves and stems of the plants should be sponged with a suitable insecticide to cleanse them from dirt and insect pests. A small brown scale insect attaches itself firmly to the leaves; great care is necessary when dislodging the pest or the leaves may be damaged. After the sponging is finished the foliage should be well washed with tepid water. V. Kimballiana and V. Watsonii are developing their flower-spikes, and the atmosphere should be kept rather warmer and drier. Sufficient water should be afforded the roots to keep the Sphagnum-moss growing, but when the flowers have fully expanded, the amount of moisture at the roots should be reduced and only sufficient given to keep the leaves firm and plump.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Cabbages.—Examine the rows of Cabbages and make good any failures. There is yet time to plant another breadth of Cabbages, and it is advisable at this season to set them as thick again as it is intended to allow them to remain. Plant very firmly and water the roots thoroughly. Spare plants in the seed-bed should be transplanted fairly thickly together in rough, skeleton frames, where a little protection may be afforded them.

Turnips.—Turnips have done remarkably well, and, in many cases, those sown with the object of providing roots during the winter are already matured. Roots that are large enough should be lifted and stored in sand or ashes. Very late sowings of Turnips promise well; the plants should be thinned moderately, and the soil hoed frequently.

Asparagus.—The plants of the permanent beds have completed their growth and no benefit is gained by allowing them to remain. The stems should therefore be cut down and burnt so that the beds may be cleared of fallen leaves and other rubbish. The speediest and best way of clearing the Asparagus growth is to use a pair of hedge shears, and the rubbish should be burnt on the nearest vacant ground. Clear the beds of all weeds and spread over the beds a little well-decayed farmyard manure, which should be covered with a little soil from the alleys. Leave the latter in a straight and tidy condition, and the beds will present a pleasing appearance and need no further attention until next spring.

Forcing Asparagus.—Forced Asparagus is always much appreciated, and cannot be had in season too early. If suitable means and materials are available, forcing may be commenced at any time from now. To obtain stems at this season of the year and for the next three or four months, a warm house provided with bottom heat is calculated to produce the best results. In some establishments a special shed exists for the purpose, in which a hotbed or two may be made, the structure being provided with hot-water pipes and lighted by means of a skylight. Manure mixed with leaves will furnish heat for a longer time than manure alone. The materials of the hotbed should be allowed to settle before covering them with soil on which to place the roots, and also to allow the rank gases to escape. Select well-matured crowns for forcing, and do not expose the roots to the air longer than is absolutely necessary. Just cover them with soil and give a good watering. During the growth of the stalks keep the bed and surroundings well damped with the syringe, using water warmed to the temperature of the house. The use of such a structure, a forcing pit or other warm house is preferable at this season to cold frames placed on hot-beds, unless ample covering can be given the frames in cold weather. Oftentimes the covering must perforce remain for a considerable time, and this causes a weak growth.

Tarragon.—To keep up a supply of young growths of this herb a few roots should be lifted and placed in a box of light soil. Stand the boxes in a cool house in a light position and do not allow the compost to become very dry.

Manures.—Generally, cow manure is preferable for light soils, whilst horse-dung, with plenty of litter, is best for heavy retentive land, being also of a warmer nature. Certain soils should have a dressing of lime yearly when the ground is dug. Gardens that have been overdone with manures are rendered much more fertile by discarding dung for a season and giving the land a good dressing of wood ashes, soot or lime.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Roses in the Wild Garden.—Many of the stronger-growing and hardier varieties of the Wichuraiana section and other climbing Roses provide suitable subjects for planting in clumps in the semi-wild garden or by woodland paths. Planted against old tree stumps, or over clusters of old roots, they soon become objects of beauty, and a few of them should be planted each autumn. Only strong-growing and proved varieties should be selected for such positions. The ground should be prepared for their planting, and if the natural soil is unsuitable a properly prepared compost should be incorporated with it to give the plants a good start. These Roses require very little attention after they are planted, for they are seen at their best when growing naturally and unrestrained.

Perennial Asters.—The fine weather of September and October was favourable to the blooming of border Asters, and the plants have been a prominent feature in the flower garden for some weeks past. The flowers are little injured by moderate frosts. At Eastwell Park we plant these flowers not only in the mixed borders, but also in a long border by themselves. In such a border the varieties may be compared readily and inferior sorts eliminated. Those who contemplate planting this season will find the following varieties suitable:—Climax, which is one of the very best of the tall, strong-growing sorts, the large, clear, light-blue flowers being borne on long stems; Feltham Blue, which approaches Climax closely for general excellence, the loosely-petalled flowers being exceedingly beautiful; Keston Blue, a very distinct sort, with prominent yellow disc; Mrs. Hudson Morris, Triumph, Miss Southall, Sensation, and F. W. Burbidge, all these being tall-growing varieties. Beauty of Colwall is by far the best double variety and superior to Peggy Ballard, a newer introduction. The best forms of Aster Novæ Angliæ are Lil Fardell, with large, rose-coloured flowers; Mrs. J. F. Rayner, Mrs. S. T. Wright, and A. acris roseus, A. Coombe Fishacre, and A. diffusus horizontalis have graceful shoots covered with small flowers, and should be included. Those of the ericoides and cordifolius sections are very popular; the long, graceful sprays of innumerable flowers are produced in the greatest profusion, and have a very decorative appearance either on the plants or as cut blooms. Enchantress, Hon. E. Gibbs, Bianca, Maidenhood, Desire, and White Diana are amongst the best in these sections. Those of the Amellus type are particularly neat growers, and do not spread so rapidly; they are, in consequence, suitable for the front of the border. A. Amellus, Bessarabicus (one of the oldest) is still one of the best; Beauté Parfait, Riversleæ, H. J. Cutbush, and Little Gem are all good sorts. Other dwarf-growing varieties, such as St. Egwin, Porcelain, and King of the Dwarfs, are especially suited for planting in small borders, being of neat and compact growth. Peter's White (a new introduction) is the best white variety and superior to Mrs. Peters or Norah Peters, and is of robust growth. Several of the species provide valuable border plants; Aster Thompsonii blooms continuously for several months; the pale lavender flowers are very attractive. A. puniceus pulcherrimus, A. vimineus, A. salicifolius, A. longifolius var. formosus, A. lævis, A. Henryi, and A. acris may all be recommended as good representatives of their respective sections.

Senecio Clivorum.—This is a capital subject for planting in swampy places by the side of a lake or stream or in the semi-wild garden. The showy, golden-yellow flowers are borne on strong stems, and stand well above the bold foliage. The latter, even when not surmounted by the flower-spikes, is distinctly striking. It is a strong-rooting subject, and will thrive almost anywhere, so long as the roots enjoy plenty of moisture. The flowers are produced in July and August. Senecio Clivorum is very effective when grown in masses.

Salvia patens.—Except in very favoured districts, it is not safe to leave plants of Salvia patens in the flower-beds. They should be lifted and planted in boxes for the winter, pruning the stems to about 6 inches. Keep them in a cool frame, where they are not subjected to extremes of dampness or dryness.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Late Grapes.—In ordinary seasons all late Grapes should be perfectly ripe by this date, but possibly, in some districts, certain of the latest kinds may be some days yet before they can be regarded as well finished. It is quite possible, too, that some kinds will fail to finish as perfectly as usual, owing to the extraordinary amount of sunless weather which was experienced when the bunches were in the early stages of colouring. Where Grapes are still unfinished, plenty of air must be admitted to the vinery whenever the weather permits, and it will be as well to keep a little heat in the hot-water pipes to dispel moisture, which will quickly condense on the berries if the atmosphere is allowed to become too cold. The roots must not be allowed to get too dry, but one more watering should be sufficient till the Grapes are cut, unless the borders are very shallow. Afford water only when the weather is quite bright, and before noon, when both the top and bottom ventilators may be opened. A layer of clean straw placed on the borders after watering will do much to keep the atmosphere dry. At this season of the year the gardener has to use all his resources to house various plants, and it is not unusual to see vineries containing ripe fruit utilised for the purpose. One cannot condemn this practice too eeverely, and, unless it is absolutely necessary, it should be avoided. In other cases, select plants which will cause the Grapes the least injury. Plants which require very little or no water should be chosen, and these should be placed as far away from the vines as possible. Plants which are being sheltered in fruit houses where permanent trees are planted should be placed on shelves raised off the borders. Such plants should be given no more water than is really necessary. Carelessness in these matters is the cause of the soil in fruit borders becoming sour and stagnant in a very short time, and this is the principal cause of badly-finished fruit.

Figs. — Plums and Peaches being finished, there is not a very wide range of fruits suitable for dessert purposes. Consequently, every effort should be made to keep up a supply of Figs for as long as possible. Some of the later trees may be encouraged to ripen fruits for a considerable time with very little trouble. The atmospheric conditions necessary for ripening the fruits will also favour the ripening of the wood that will furnish next season's crop. It will be necessary to maintain a little heat in the hot-water pipes at all times, and a constant circulation of air, more or less, according to the weather conditions. The trees will not need so much moisture at the roots at this time of the year, although the soil must not be allowed to get too dry, especially if the trees are planted in shallow, restricted borders. Trees which are in an unsatisfactory condition will need attention at the roots. It will invariably be found that those which are inclined to grow too strong are provided with far too much rooting space. In such cases a good portion, if not all, of the roots should be lifted and planted again in a more restricted border. Make sure that the soil is well drained, and, when adding fresh compost, mix plenty of old broken bricks and mortar rubble with it, and take care to make the border quite firm.

Early Fig Trees in Pots.—For the earliest supplies of fruit, a batch of trees may be placed under glass early in November. If the trees have been subjected to early forcing in former years, the wood should now be sufficiently well ripened. But in selecting trees which have not been forced early, much care must be exercised. Trees with short-jointed wood of medium strength respond best to early forcing. They should be pruned and cleaned before being placed indoors. The pruning consists chiefly in removing weak growths or thinning the shoots where they are too dense. The wood should be cleansed thoroughly with a solution of soft-soap and sulphur, using a soft brush for the purpose. A careful search must be made for scale insect, which sometimes causes much damage to the plants. These insects are very hard to eradicate once they become established. Care must be exercised when cleansing the trees not to damage the young fruits, which may now be seen quite plainly on the well-ripened shoots. For the first few weeks no attempt should be made to force the trees into growth, and, unless the temperature outside is very low, fire heat should not be used. A temperature of 45° or 50° will be suitable till the trees show signs of growth. Spray the plants lightly with tepid rain-water on bright mornings, and damp the walls and paths in the house on these occasions, but avoid creating a stagnant atmosphere by the excessive use of moisture. The roots will not require much moisture till the trees are in active growth, nevertheless, they must be examined carefully at regular intervals, and, when water is required sufficient should be given to soak the soil right through. Trees which have recently been repotted need very careful watering till growth and roots are active. Fallen tree leaves and stable litter should be collected and prepared for the making of a hot-bed about the middle of December. The materials should be thrown in a heap and turned several times at intervals of a few days, to allow the rank gases to escape. It will then provide a hot-bed of moderate temperature, which will suit the trees till they are in active growth. The hot-bed should be formed in a house which is not too lofty, so that the trees will be quite close to the glass. The house should face due south.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Show, Fancy and Regal Pelargoniums.—Plants that were pruned early in September are developing plenty of new growth, and should be repotted. Some of the old soil should be removed, and a few of the coarser roots cut back to allow the plants to be repotted in the same receptacles. Rich, gritty loam mixed with a little manure from a spent Mushroom bed, leaf-mould and bone-meal will provide a suitable potting medium. Pot moderately firmly, as this will favour firm, short-jointed growths during the winter months. After they are potted, the plants may be grown in a fairly close frame, and when the roots have penetrated into the new soil air should be given freely, according to the weather conditions. Young plants rooted during the summer should be ready for shifting into larger pots, receptacles 3 inches or 4½ inches in diameter being large enough. When well grown, these young plants flower for a longer period than older specimens. Zonal Pelargoniums in the plant houses should be growing freely; extra care must be taken in watering them, keeping the soil on the dry side, as soft shoots which have grown fast do not flower so well as those that are sturdier. Admit air freely during bright weather, and maintain a little warmth in the hot-water pipes during damp weather to keep the atmosphere of the house dry.

Plumbago rosea. — The earliest plants of this beautiful winter-flowering subject are developing their flower-spikes, and should be afforded rather less moisture than during the growing season. The temperature of the house should be maintained at about 55° at night. The blooms will open a good colour and keep for a considerable time in this temperature. Plumbago rosea is one of the prettiest of all flowers for dinner-table decorations, and every effort should be made to secure a good crop of bloom. Younger and probably later plants should be kept growing freely, feeding them, as is necessary, with manure water. These plants will come into bloom as those of the earlier batch are finishing.

Poinsettia.—The Poinsettias, known more correctly as Euphorbia pulcherrima, are fast developing their bracts, and, as they come to maturity, will need less moisture at the roots and a drier atmosphere. The temperature of the house may be lowered to about 50° at night, as cooler conditions will result in the plants flagging less when brought into the dwelling-house or conservatory.

Chrysanthemum.—Many of the Japanese varieties are at their best condition of blooming. Where the conservatory permits of groups being arranged on the ground, this is the best method of displaying them. Arrange the flowers to the best advantage, and label the varieties, writing the names on cards that are more readily seen than the labels in the pots. The early buds are opening well this season, without the least indication of coarseness. Such well-known varieties as Lady Talbot, Master James, Frances Jolliffe, Mrs. L. Thorne, Mrs. A. T. Miller, White Queen, Hon. Mrs. Lopes, Captain Mitford, Evangeline, F. S. Vallis, and Kara Dow are all good sorts, whilst among the novelties King George V, His Majesty (probably the best of all the crimsons), Gladys Herbert, Japan, Mdlle. Jacqueline Ochs, Miss Roope, Francis Rowe, Thomas Lunt, Mrs. Gilbert Drabble, and Queen Mary are all more than promising. The groups in the conservatory should not be arranged too stiffly, and may include some of the Single and Decorative varieties, with dwarfer specimens, such as those of the Caprice du Printemps type, for an edging. At this stage, watering must be done very carefully; moisture should be withheld until the plants are fairly dry, allowing as little as possible to wet the stages and floor. If a tiled or cement floor, the superfluous water should be mopped up as soon as it has drained from the pots. The remarks on watering apply also to the plants in the ordinary houses, and where blooms are being kept for show purposes, every precaution must be taken to keep the atmosphere of the house dry, especially in foggy or damp weather.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Winter Dressings.—The application of a suitable winter dressing to fruit trees is most necessary. The winter moth and many other insect pests of Apples, Pears, Plums and Cherries change from the chrysalid stage at this season of the year. The female of the winter moth creeps up the stems of the trees and deposits her eggs in crevices and injured parts of the bark near to the buds. In the spring the eggs hatch and the caterpillars commence at once to eat the young leaves. Grease-proof papers, which may be purchased cheaply ready for use, should be placed around the tree-trunk to trap the moths. It may be necessary to apply fresh grease at intervals to prevent the grease-band from becoming too dry. Spraying is more popular, and more generally practised than grease banding. Two or three sprayings during the autumn and spring will generally suffice to destroy insect pests, but those who have applied grease bands with success should continue to use them. It is advisable to remove and burn the surface soil from beneath trees that have been badly attacked this season, as this will destroy numbers of the pests. As a further precaution, a dressing of soot and lime should be given before fresh compost is applied. The above remarks refer chiefly to trees grown in the open, including those in orchards; wall trees and those trained to fences and trellises are not so easily treated. Spraying the trees during the winter and spring is not only effectual in destroying insect pests, but it also clears the trees of moss and lichens. If only a small quantity of winter wash is required, it is an advantage to purchase it ready made, but care must be taken to observe the directions given by the manufacturer or serious damage may be done.

Morello Cherries.—At the first opportunity Morello Cherry trees should be pruned, cleansed and trained, so that the work may, if possible, be done before bad weather sets in. But no matter how carefully the work is arranged, a considerable amount of pruning and training fruit trees on outside walls has to be done, perforce, under conditions of discomfort to those engaged in the work. Whenever possible, the trees should be detached from the walls and all shoots which will not be required removed. All shoots on young trees may be required for extension, but the shoots on established trees should not be closer than 4 to 6 inches apart. After the pruning is completed, the prunings and rubbish should be conveyed to the fire heap; many insect pests will be destroyed in this way.

Pruning.—Late varieties of Peaches and Nectarines are cleared of their fruits and may be pruned and the shoots regulated to let in the light and air. Although the sun has not much power now, it is imperative that useless shoots should be removed as early as possible, for if the wood is fully exposed it has a better opportunity of becoming well ripened. It may appear a small matter, but attention to these little details may mean all the difference between success and failure the next and subsequent years.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

APPOINTMENTS.

TUESDAY, OCTOBER 29—
Nat. Chrys. Soc. Sh. at Crystal Palace (3 days). Kent Commercial Fruit Sh. (2 days).

WEDNESDAY, OCTOBER 30—
Kent. County Chrys. Soc. Sh. (2 days). Borough of Croydon Chrys. Sh. (2 days.)

THURSDAY, OCTOBER 31—
Torquay Dist. Gard. Chrys. Sh.

FRIDAY, NOVEMBER 1—Hinckley Chrys. Sh. (2 days).

SATURDAY, NOVEMBER 2—
Soc. Française d'Hort. de Londres meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—47·1.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, October 23* (6 P.M.) Max. 61°; Min. 38°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October 24* (10 A.M.): Bar. 29·3°: Temp. 48°: *Weather*—Dull.

PROVINCES.—*Wednesday, October 23*: Max. 59° Cornwall; Min. 44° Shields.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, Rose Trees, Shrubs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

TUESDAY—
Clearance sale of Greenhouses, Piping, &c., and Stock, at 67, High Road, Pouder's End, by Protheroe & Morris, at 12.

WEDNESDAY—
Azaleas, Rhododendrons, &c., at Protheroe & Morris' rooms, at 5.
10,000 Gloxinias and Begonias, also Palms, Azaleas, &c., at Stevens's Auction Rooms, at 12.30.
Well-grown Nursery Stock, at The Nurseries, Twickenham, by Protheroe & Morris, at 1.30.

THURSDAY AND FRIDAY—
Healthy Nursery Stock, at Arthur's Bridge Nursery, Woking, by Protheroe & Morris, at 12.

FRIDAY—
Important consignment of Orchids from Singapore, at Protheroe & Morris' rooms, at 12.45.

Illustration Farms in Canada.

So much is written in the daily Press of the wonderful developments in the agriculture of Canada and the United States that the untravelled Englishman is apt to suppose that the work of cultivating the land is conducted in an abler manner in distant countries than it is in his own. This opinion is reinforced by the fact that if he is an observant man he may find many examples—in lack of co-operation, in failure to utilise fully or to apply judiciously artificial manures, in neglect of orchards and so on—testifying that farming practice in parts of Great Britain are susceptible of improvement. Hence it is with particular pleasure that we call the attention of those of pessimistic proclivities to the courageously outspoken and, as we believe from our own limited observation, true statements made by Mr. James W. Robertson, the Chairman of the Committee on Lands of the Dominion of Canada, in the course of his evidence before the Select Standing Committee on Agriculture and Colonisation, 1912. Before proceeding to deal with some of the facts recounted by Mr. Robertson, we may congratulate both that gentleman and the Dominion at large on the fact that truths, even though they are not of the sugared sort of self-praise, may be stated frankly and printed without "editing" in a Government publication. It bodes well for the future of a country when it is willing to make a critical examination of its progress, neither minimising what is admirable nor concealing that which is susceptible of improvement. Mr. Robertson's evidence of the progress of agriculture in Canada is based on a survey of 985 farms in 1910. The most impressive result of that survey consists in the discoveries, first, that systematic rotation was practised on only 9 per cent. of the farms inspected, and, second, that "weeds are very prevalent—dangerously prevalent." Mr. Robertson's travels in Europe enable him to affirm that in contrast with the farms of Canada those of Europe are clear of weeds. As everyone knows, there are grave difficulties in the way of farming land in Canada to the same pitch of excellence which may be practised in Europe. Labour is scarcer and more expensive, and the farms are larger; but what impresses us most in Mr. Robertson's statements is that he does not waste time in finding excuses. He states the facts and focusses attention on remedial measures; an attitude as welcome as it is unusual in discussions of this kind.

Thus the incurable optimist might dissemble truth by pointing to the vast and rapidly-increasing magnitude of the farming industry in Canada; but the wise observer is more concerned to learn that, according to the survey, the returns from individual farms in Manitoba show, in 46 per cent. of cases, a yield less than those of 10 years ago, and, in connection with this fact, to learn that farming in Manitoba consists in the main in taking two years' grain followed by one year of summer fallow.

It will be evident at once that such a system must impoverish the land, and that the reduction of yield to an unremunerative level is only a matter of time.

Our own country learned its lesson by bitter experience. Thus, 400 years ago the yield of Wheat on English farms was about 26 bushels per acre. From this level it fell and fell till, 200 years ago, it is said to have been 8-10 bushels. Then progress was made again—thanks largely to rotations, and also to drainage—till the yield is now 32-34 bushels.

Mr. Robertson recognises clearly that if production is to reach anything like its proper level in the Dominion steps must be taken to disseminate among the farmers information with respect to and examples of better practice. He refers to the system practised for many years in Denmark, and now adopted also in Ireland, which enables young farmers, by means of grants, to learn farming systems and methods by working on the best farms of the country. As the result of this system, and of other progressive measures, Denmark has been enabled to take out of the United Kingdom annually over £2,000,000 more than any other country obtains from a similar quantity of farm produce.

Another measure which is advocated by Mr. Robertson, with which we are in fullest sympathy, is the establishment of illustration farms managed for profit. Research stations, agricultural colleges, and all the apparatus for the amelioration of farming with which we are so familiar in this country are well and good; but they do not and cannot teach the novice how to farm. They may help the farmer with advice on particular points, but in order that he may be convinced he must see in his own neighbourhood a farmer who, without superior advantage, does things better than himself. They have a habit in Canada of giving practical effect to ideas, and we do not doubt that illustration farms will become established facts, and that they will play a great part in introducing higher standards. Of course, we shall be told that conditions here are not what they are in Canada; but nothing that we may be told is likely to shake the conviction bred of experience that, if there is room for improvement in farming or horticultural practice in Great Britain, the improvement will be achieved, not by the sporadic talk of occasional visitors—no matter what may be their diplomas and knowledge of the science of agriculture as expounded in text-books and as taught in colleges—but by the devotion of good farms to the demonstration of good and suitable practice. We would fain hope that, if the whole of the Development Grant has not been swallowed up in the establishment of research institutes and the endowment of applied science, some may be forthcoming for the amelioration of agriculture by some such system as that urged by Mr. Robertson in the case of the Dominion of Canada.

Brittany Early Potatos.

The climate of many parts of Brittany is so favourable to the production of early vegetables that it is no wonder that this branch of horticulture has progressed so rapidly of recent years. The rate of this progress may be gathered from the fact that whereas 12 years ago the exports of early Potatos equalled 19,500 tons, they amount now to 60,000 tons. A note in *Le Jardin* on the subject states that Fluke Geant, with yellow skin and almost white flesh, is the variety which is cultivated most for this purpose. In addition to early Potatos, Brittany sends, chiefly by way of St. Malo to Southampton, Hull and Liverpool, Tomatos, Strawberries, Onions, Cauliflowers, Artichokes and also an increasing number of flowers. Anyone who has visited that most desolate of all spots in a country of inhospitable coasts, namely, Penmarch, has before his eyes an illustration of the possibilities of the Brittany climate, even more striking than the actual demonstration of successful practice exhibited in the neighbourhood of Roscoff and of Paramé.

There at Penmarch, which looks out over miles of wicked and low-lying rocks into the Atlantic, is a range of Peach houses erected by an enterprising but over-sanguine horticulturist. We have no doubt that the abandonment of these houses was due not to the impossibility of growing the fruits, but to the fact that Penmarch lies far away from any line of railway, and is, except in the tourist season, abandoned by all except the lighthouse keepers and the lace-making villagers. Indeed, it may be said with confidence that in Brittany, wherever shelter may be obtained from the devastating western winds, early produce may be raised. The growing importance of Brittany as a competitor with our favoured south and south-west centres has to be reckoned with, the more because the Bretons have shown great enterprise in linking up the whole countryside with ports such as St. Malo, St. Brieuc and Treguier. To maintain their advantage of proximity to the markets, it will be necessary for our growers to pay increasing attention to matters of transport. One or two days make all the difference with respect to prices.

National Chrysanthemum Society.—This Society will hold its second autumn show of Chrysanthemums at the Crystal Palace, Sydenham, on the 29th, 30th, and 31st inst.

National Rose Society.—The provincial show of the National Rose Society next year will be held at Gloucester on July 15. The decision of the Council has given the greatest satisfaction to rosarians in the city and county of Gloucester.

Perpetual-flowering Carnation Society's Exhibition.—The winter show of this society will be held in the Royal Horticultural Hall, Vincent Square, Westminster, on December 3 and 4. The society undertakes to stage exhibits from members residing more than 50 miles from London. The secretary is Mr. E. F. Hawes, Ulysses, Fortune Green, London.

Chrysanthemum Shows in the London County Council Parks.—We are informed that the annual Chrysanthemum shows are open to the public at the undermentioned London County Council parks:—Battersea, Brockwell, Finsbury, Southwark, Victoria, and Waterlow.

The Welsh National Emblem.—A question was raised in the House of Commons on Monday last as to the use of the Daffodil on the Insurance stamp instead of the Leek, as emblematic of the Principality of Wales, and what was the incident that occasioned the adoption of the Daffodil. A Welsh member, Mr. Llewellyn Williams stated that the Welsh word for Daffodil is "Ceninen Pedr," which being interpreted is Peter's Leek. He questioned whether it was not due to a blunder of Shakespeare, or Bacon, or some other equally ignorant Saxon, that the Welsh national emblem had been changed from a charming flower to a stinking vegetable. The Chancellor of the Exchequer, in reply, stated that the use of the Daffodil in lieu of the Leek for the Health Insurance stamps followed the precedent of the Insignia of the Prince of Wales at his Investiture at Carnarvon last year.

The Germination of Juniper Seed.—Nurserymen and others who have to raise Junipers know how slow and difficult to germinate are the seeds of certain Junipers, such as J. virginiana, J. Cedrus, and J. phœnicea. Experiments by Dr. Perez, of Teneriffe, show that seeds of J. bermudiana immersed in boiling water for 3 to 10 seconds, and then placed in water at 20° C. and allowed to cool, give rapid germination. The same author states that yet more drastic treatment gives fair results with the refractory J. phœnicea. The method consists in soaking the seed in alcohol, but we should not recommend anyone to try it on an extended scale, except after testing the method on a small number of seeds. Mr. Jahandiez, writing in the *Annales* of the Natural History Society of Toulon (1911), recommends the treatment used by Mr. Thays for seeds of Ilex paraguayensis, namely, immersion in water at 80° C., the water being renewed every six hours during four days.

Latex in Plants.—The use subserved by the milky juice or latex which occurs in many plants, Euphorbias, Poppies, and rubber-producing species generally, has been the subject of much discussion among botanists. Some hold that it is of the nature of a waste product; others that it represents an accumulation of food materials on which the plant may draw in time of need; others, again, combine these views, and regard the latex, which contains various substances in solution and suspension, as serving both functions. Recent work by Bernard (*Ann. du Jard. Bot. de Buitenzorg*, 1910) serves to show that latex may function as a reserve of food substances. By cultivating laticiferous plants in an atmosphere containing no carbon-dioxide the formation of sugars is suppressed and the starved plants utilise the starch grains suspended in the latex. At all events, these grains become corroded just as they do when they are acted on by a diastatic enzyme in the normal course of the "digestion" of starch, that is, the conversion of starch to sugar.

Flowers and Insects.—It is known largely through the observations of Mr. F. Plateau that many flowers, though they possess brightly-coloured petals, fail to attract insects, and hence are not cross-pollinated. Thus it is to be inferred that insects require other signals than those provided by colour before they will deign to visit flowers. By the simple experiment of introducing into such flowers either a substance with an odour agreeable to insects or a sweet substance which appeals to their sense of taste, Mr. Plateau has succeeded in alluring insects to flowers which they neglected formerly, and has thus shown that the senses of smell and taste play, with the sense of sight, an important part in bringing about the cross-pollination of flowers.

The Germination Capacity of Seeds.—A paragraph in *Horticulture* (October 5, 1912) appears to indicate that the U.S. Department of Agriculture suggests that "the sale of packeted (vegetable) seed will not be on a proper basis until each packet is labelled with the percentage of live seed which it contains." Anyone who has had experience of the germination capacity of seed of different harvests, and of the rapidity with which seeds of certain crops fall off in respect to germination capacity, will know that much as we all desire to secure good seed and to penalise those who distribute inferior seed, such a proposal as that suggested cannot be put into practice. To take one point only, the percentage of germination of not a few kinds of seed will vary very considerably according as the trial is made in germinations between blotting paper or in earth. We share the aspiration, but we deprecate the suggested method.

Co-operatives and Small Holdings.—The Mansfield Woodhouse Small Holdings Co-operative Society has purchased from the Duke of Portland eight dwellings, each with five acres of land, for the purpose of small holdings. The total cost of the land and buildings is £4,089 16s. 9d., and this sum, which has been advanced by the Duke of Portland with interest at 3 per cent., is repayable over a period of 35 years by annual amounts calculated on the annuity system. The Duke of Portland pays his own expenses in connection with the matter, so that neither the society nor the holders have to find any capital, except for stocking and cultivating the holdings.

A Strike of Seedsmen.—The daily Press records that 40 employees of Messrs. Toogood & Sons, Southampton, have left their work. The firm presented for signature a radius agreement, which prohibited any employee from engaging in a business of a similar character within 30 miles of Southampton for a period of two years after leaving their employ, and proposed that one month's notice should be given on either side. It was further stipulated that no man could leave the firm's service between the months of January and May inclusive. Six employees who refused to sign were, it is stated, paid off, whereupon the other employees ceased work and commenced to picket the premises.

French Chrysanthemum Society.—The 17th annual congress of the French Chrysanthemum Society will be held from November 12 to 17, at Nantes, in conjunction with the local horticultural societies, which have arranged a show of flowers, fruits, and vegetables. The agenda for the congress comprises questions relating to a pocket edition of the colour chart (*Répertoire de Couleurs*), how to measure the diameter of a Chrysanthemum bloom, classification, selection of easily-grown varieties for beginners, and other subjects. As is customary, several days are appointed for festivities and visits to places of interest.

Publications Received.—***The Journal of Agricultural Science***. October. Vol. v., Part 1. (Cambridge: University Press.) Price 5s.—***Notes from the Royal Botanic Garden, Edinburgh.*** September. Present Day Gardening Series, edited by R. Hooper Pearson. (London and Edinburgh: T. C. & E. C. Jack.) Price 1s. 6d. each volume.

ECHIUM WILDPRETII.

(See Coloured Supplement.)

There are supposed to be about 80 species of Echium, and 20 of the largest of them have been found in Madeira and the Canary Islands, where they form a conspicuous feature of the vegetation, some growing to a good size and bearing noble panicles usually of blue-purple flowers. E. simplex, which develops a very large rosette of long, green, hairy leaves on a short, unbranched stem, and ends its career when about three years old by producing a tall candelabra-like panicle of blue flowers, is known as the "Pride of Teneriffe." By far the most striking of them, however, is E. callithyrsum, which has many synonyms, including E. candicans, the name under which it is figured in the *Botanical Magazine*, t. 6868 (1886). I have seen this species in the Temperate House at Kew with a stout, woody stem and many branches up to 8 feet in height, and when in spring almost every branch bore a broad panicle a foot long of blue-purple flowers it was a magnificent picture. Such an

effort of flowering invariably kills the plant, and, so far as I know, all these arborescent Echiums are monocarpic, that is, they flower once and then die. They are well worth waiting for, and as they usually seed freely, fresh stock is soon available.

E. Wildpretii (see Supplementary Illustration) made its début at Kew in 1899. It was raised there from seeds sent by Mr. Wildpret, curator of the Botanic Gardens, Orotava, Teneriffe. They were sown in heat, and the seedlings were grown on in a sunny greenhouse, with liberal provision of good loamy soil and root room, their final shift being into 8-inch pots. They were two years old when they flowered in May, and by sowing seeds annually a batch of plants has been on show at Kew every spring since. Even before the flower spike develops, the plants are attractive; their leaves, covered with silky hairs after the manner of the Silver Tree, forming a handsome rosette 18 inches high and through. The flower spike adds another 2 feet to this height, and when the purplish-pink flowers are all open the plant is singularly handsome. I know no plant like it. Certainly, among the many plants grown at Kew for the conservatory, there is not one that attracts and pleases the visitors more than does a batch of this Echium. The altitude at which it grows wild in Teneriffe has not been recorded, but it is probably some distance above sea level, and, therefore, the plant ought to be a good one for open-air gardening if protected from frost. The suggestion has been made that it is a natural hybrid, but from the fact that it comes quite true from seeds and is, moreover, distinct enough in foliage and habit from the other species found in Teneriffe, we may accept it as a good species. In such gardens as that of Sir Thomas Hanbury, at La Mortola, and Mr. Dorrien Smith's, at Tresco, this Echium ought to be quite at home; indeed, I can imagine that, where the essential conditions of bright sunshine, light, well-drained soil and no frost are present, it might easily become a troublesome weed, as our own beautiful native Bugloss (E. vulgare) sometimes is to farmers in this country. *W. W., Kew.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Alpine Plants and Manure.—It is a matter of common knowledge to those who grow Alpine plants that many of them are injuriously affected by manure. As the result, partly of observation in the Alps and partly of experiment in the garden for some years, I have come to the conclusion that the pronouncement against manure, regarded as a general statement, is largely fallacious. It is perfectly true that for the higher and more difficult Alpines *nitrogenous* manure is apt to result in disaster. The plants may thrive luxuriantly for a time, as do some of the Androsaces and Saxifrages, but, with me at any rate, they get too soft and die out during the winter. The sappiness encourages attacks of mould (Botrytis), to which the plants fall an easy prey, and those that escape this danger are apt to suffer badly from frost and thaw. But it is quite otherwise with certain chemical manures. Quite remarkable results were obtained by using phosphate of potash, especially with the non-calcareous Alpines, though many lime-lovers have also flourished exceedingly under the treatment. I obtained the best results by using about a teaspoonful to a square yard in late spring, and find that things such as Primula viscosa, Geum reptans, Morisia, Edraianthus, and Saxifraga species have all profited by it, whilst Androsace lanuginosa, A. Chumbyi, A. villosa, and others have made a strong, hard growth, which has enabled them not only to come well through the winter, but to flower far better than they have ever done with me before. The colours of some species were greatly brightened, and two clumps of Saxifraga oppositifolia illustrated this in a surprising degree. They were obtained by the division of a single plant. One of the clumps was treated with the phosphate of potash, the other was not. When in flower, the difference in size, colour, and abundance of flower was so great that they hardly seemed to belong to the same species. There is obviously room for much more experiment in this direction, and doubtless various conditions, such as the nature of the original soil, will be found to exert some influence on the result. In my own case, I obtained the most striking success with plants growing in a moraine of granite chippings, to which lime rubble and a little ordinary soil were added when it was first made. But the influence of the salt was no less obvious on some of the easy, rampantly-growing plants, such as Saponaria ocymoides, which were grown in a light, sandy loam. The brilliance of the colouring was greatly enhanced, and the period of flowering was considerably prolonged. It is not unlikely that others may have made similar experiments, and the chief object of this note is to elicit from others the results of their experience. *J. Bretland Farmer.*

Where the Board of Agriculture Might Help.—On the 10th inst. Mr. Henry Hooper gave an extremely helpful lecture at the Horticultural Hall, Westminster, on "An English Fruit Farm in the Making" (see p. 307), with special references to the newly-instituted horticultural branch of the Board of Agriculture; and the truth of his remarks on the amount of work which might be done by the Department in this direction cannot be too strongly upheld. The cultivation of fruit trees should be viewed from a slightly different standpoint than other crops, as being essentially a provision for the future, and if it is properly carried out, both as to choice and culture, there can be no better national investment. The Kent Commercial Fruit Show, to be held at Maidstone on the 29th and 30th inst., should prove a useful object-lesson to many growers who are unable or unwilling to keep their methods up to date. The efforts of those who, in spite of many difficulties and hindrances, have succeeded in attaining a high standard of culture and the best of results, are surely worthy of encouragement and assistance from those whose business it is to foster the resources of our own country. In very many instances experiments of world-wide utility have been carried out by growers entirely at their own expense and risk; these efforts should be adequately recognised, and facilities granted to all who are willing to undertake experimental work, and who yet are unable to afford either the necessary time or money. The paragraph in the last issue of *Gardeners' Chronicle* (see p. 301) immediately following the announcement of the fruit show, is an indication of what is being done in France for the assistance of horticulture. The permanent museum to be established in the Rue d'Athènes, Paris, will be a constant object-lesson to those connected with this most important industry. Museums in England are apt to be regarded only as collections of archaic implements and objects of various kinds, showing how poorly off were our ancestors for proper tools and instruments. Indeed, many of those which we are content to use to-day deserve a place in such a collection, especially, perhaps, the transport vehicles, in which fruit and vegetables—often of a highly-perishable nature—are carried from place to place. We should see to it that a museum be attached to every large market, showing the most up-to-date methods of transport, and the best and most modern implements and instruments of every description. This would be a standing means of instruction for every grower, and would do a great deal to stimulate emulation and invention. As yet, however, transport methods are in a state of chaos, to the great detriment of most of the fruit and the more perishable vegetables. Goods are carried long distances by porters (as through the swamps of Africa), instead of by rail. No wonder the charges for handling are often greater than the profit gained by the grower! Then the markets themselves—and especially Covent Garden Market—are extremely congested; they are too small, and even the space available is not used to the best advantage. There should be large halls, with two or three broad galleries (not too high up), where the lighter goods could conveniently be raised by a lift, and there displayed. There should also be dustproof storage-room under the floor. Another difficulty is the inaccessibility of many of the best markets to the fruit-growing districts. Naturally, railway communication to all parts is impossible, but good motor services would help materially to solve the problem, if sufficient accommodation were provided at the markets. It is often extremely difficult to load and unload quickly, owing to the want of space, and this involves sometimes a serious loss of time and money. It is unnecessary to enlarge further on this subject, but sufficient indication has been given of the directions in which the Horticultural Department of the Board of Agriculture, or the Board of Trade, might help, viz., in establishing markets within reach of every fruit-growing district; in making and keeping all markets up-to-date, and giving every convenience and facility for showing and storing goods; and in encouraging, by means of instruction and the establishment of museums, improvement in methods of culture and transport. *A Market Grower.*

Loquat Fruiting Out-of-doors (see fig. 141).—Enclosed is a fruiting branch of the Loquat (Eriobotrya japonica) from a tree planted against a south wall in the open in the gardens of A. E. Byron, Esq., at Culver, about five miles south-west of Exeter. It is rare to find the Loquat fruiting in the open in England, but this particular plant had several branches with ripe fruit this season. *Robert Veitch & Son, Exeter.*

Blue Tits and Sweet Peas (see p. 287).—I have been troubled the same as Mr. A. J. Elgar with these little pests, but, happily, I hit on a plan which completely frightened them out of the garden. I first tried quassia extract and afterwards a shot gun, but without success. I then shot a seagull and fastened it on a thin cord stretched across the garden from wall to wall The seagull's wings were spread out, and most surprising results followed. The tits were frightened by this large, white bird, which seemed to be in full flight as the wind swayed it. Next year I intend to place more seagulls in the garden in the same way. *W. A. M., Coolfin, Banagher, King's Co.*

An Orchidaceous Air!—Novelists, horticultural lecturers and others in search of adjectives might refer with advantage to a brilliantly-ornate article written by the dramatic critic of *The Times* in the issue of that journal for October 23. In the course of a eulogy and critical appreciation of Sarah Bernhardt, the writer refers to the "sinuous grace, attenuated form, and orchidaceous air" which distinguish the great French actress. "Orchidaceous air" is good! It suggests, moreover, a mould for the coining of numerous new adjectives. Liliaceous in the form of lily-white is already bespoken by the poet; but iridaceous has an expansive and chromatic aspect; amaryllidaceous should prove useful for sportive characters; and scrophulariaceous might serve as a new adjective of abuse. When ordinal names are exhausted, the descriptive writers might fall back on those of genera. Cattleyal and cypripedial—the latter, of course, for a slippery customer—suggest themselves at once, and doubtless a little research in the *Index Kewensis* would result in the discovery of an array of new ornaments with which our drab nouns might be bedecked, and flowery language might thus be put on a sound and scientific basis. *Eccentric.*

The Narcissus Fly.—The note by Mr. Bliss (see p. 298) suggests several points for consideration. The entry of the grubs at the base of the bulb in every instance is interesting, as proving a fact in a definite instance. As shown in my article last week, the larvæ remains (as larvæ) for some months in the bulbs, but it is unlikely that the eggs or "young grubs" remain "dormant." The points as to eradication are deserving of consideration since they suggest:—(1) Early lifting and quick drying of the bulbs, in the hope of killing the young grubs; and (2) the possibility of spraying growing bulbs, to deter the flies from egg-laying. It may be added that since my article appeared last week I have been informed of a case in which, in connection with an extensive infestation, soaking the bulbs in cold water for 24 hours resulted in the drowning of very large numbers of the larvæ, and it is believed to be a completely successful means of combating the pest. *H. C. Long.*

Fig. 141.—Fruiting branch of Eriobotrya japonica (Loquat).

(See p. 318.)

A Plea for Old Fruit Trees.—I agree with Mr. Thomas (see p. 302) that too often old trees are destroyed that would give good crops if they were only afforded proper attention. Gardeners are too eager to produce large bunches of Grapes instead of being content to secure heavy crops of medium-sized bunches of high quality, and the result is that young vines only are appreciated. When I planted the vines at Swanmore Park in February, 1879, similar work was done in two other gardens. In one of these gardens the same vineries have been planted twice since, whereas the vines here are as good to-day as they have ever been during the 33 years of their existence. Grapes have been largely exhibited from all three places. As Mr. Thomas says, assistance at the roots with common-sense management of other details are the means of obviating the necessity of removal and replanting. Of course, much depends upon how the vines are managed during the first 10 years, for, if they are allowed to ramble away at will, and almost fill the allotted space in a brief period, one does not wonder that they require renewing. A more restricted pruning of the leaders than is too often practised is necessary for the welfare of the vines over a long period. Many growers wish to see the roof space covered as quickly as possible, but this is not the best policy. In the Yorkshire garden where I started my gardening career, some 50 years ago, Black Hamburgh and Muscat of Alexandria vines had been flourishing there some years. When I visited this garden some six years ago these same vines were still giving good crops of Grapes. I hope Mr. Thomas's remarks will be noted by those who contemplate rooting-out their old trees, and trust they will be the means of staying their hand. *E. M.*

Measurement of Timber.—I have just read the notice of the paper on Kerry Woods by Mr. R. L. Robinson, on p. 261. In it the writer remarks that "it is particularly satisfactory to see the usual makeshift ways of measurement (quarter-girth, &c.) abandoned in favour of more accurate methods. If forestry ever gets a hold in this country, the system of measurement will have to be improved." This subject is probably not less than 200 years old. It must be remembered that in the case of irregularly-grown trees, any system of measurement is more or less arbitrary, and that any alteration in the system at present in use, and generally accepted, would involve a corresponding change in prices, so that the inconvenience which would be caused would scarcely have any real justification. *Saml. Margerison, Calverley, near Leeds.*

SOCIETIES.

ROYAL HORTICULTURAL.

October 22.—The show on Tuesday last was smaller than the previous one, but it was quite equal to the average of these exhibitions in autumn. The Floral Committee awarded two Gold Medals to collections of stove and greenhouse plants and ornamental shrubs respectively. Other exhibits in this section were Chrysanthemums, Carnations, Begonias and hardy plants. This Committee granted one First-class Certificate and eight Awards of Merit; seven of the latter were awarded to Chrysanthemums.

Collections of Orchids were not so numerous as usual, but the Committee granted four First-class Certificates and six Awards of Merit.

The Fruit and Vegetable Committee had several groups brought to its notice, and this body granted a provisional Award of Merit to a new Apple.

At the 3 o'clock meeting in the lecture room, the Rev. Prof. George Henslow gave an address on "The Senses of Plants."

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); Messrs. Charles E. Shea, W. Cuthbertson, W. J. James, Chas. T. Druery, W. P. Thomson, H. J. Jones, C. Dixon, Arthur Turner, John Green, W. B. Cranfield, E. A. Bowles, F. Herbert Chapman, J. W. Barr, R. C. Notcutt, C. Blick, J. F. McLeod, Wm. Howe, J. Jennings, John Dickson, Chas. E. Pearson, E. H. Jenkins, Ed. Mawley, R. Hooper Pearson, W. J. Bean, R. C. Reginald Nevill, and W. G. Baker.

Messrs. James Veitch & Sons, Ltd., King's Road, Chelsea, arranged, on the floor at the platform end of the Hall, an imposing collection of stove and greenhouse plants, for which a Gold Medal was awarded. The grouping was remarkably effective; the larger specimens were shown to the best advantage in a setting of smaller subjects, and the whole was admirably blended to produce the finest colour effect. The back was formed of a row of tall plants of Cocos flexuosa, against whose sombre greenery the bright colours of wonderfully fine Codiæums stood out in bold relief. The front was undulating, whilst in the centre showy Orchids gave a bright mass of colour. Here and there, on tall stands, were superb plants of Nepenthes, including N. ventricosa, N. Chelsonii excellens, N. Tiveyi, and N. Sir W. T. Thiselton-Dyer, the stands being grouped in clumps of Lilium speciosum. Amongst the more important foliage plants we noticed, as being especially fine, Dieffenbachia imperialis, the large, dark-green leaves having bars of pale green at intervals; Alocasia Mortefontainensis, large, saggitate leaves, with prominent white veining; Anthurium crystallinum, a broad blade of richest velvet-green, with prominent lighter veins; A. Veitchii, equally beautiful; Phœnix Rœbelinii; Asparagus myriocladus; Adiantum Glory of Moordrecht; Sanchezia nobilis variegata; Maranta Sanderiana, the glossy, dark-green leaves are striped with white; Dracæna Deremensis Bausei, a rare plant, marked with broad, silvery bands; D. Goldieana and Cyclanthus bipartitus.

Mr. L. R. Russell, Richmond, staged the largest group in a collection of ornamental shrubs, tree Ivies, and berried plants. In addition to a floor group, 90 feet long by 12 feet wide, two long tables were filled with smaller specimens in pots. The tree Ivies were the feature of this magnificent exhibit; the varieties dentata variegata, flavescens, digitata aurea, Gold Cloud, and haccifera lutea were especially good. Fine Hollies in berry included Ilex latifolia and Perry's Silver Weeping. Plants of Aucuba were splendidly berried, many of the plants being only a foot high. Pernettyas, various species of Symphoricarpus, Skimmias, and Cratægus Pyracantha were also covered with their pretty fruits. Olea ilicifolia, Eleagnus of sorts, Conifers in variety, Andromeda Catesbæi, and numerous other fine shrubs found a place in this imposing exhibit. (Gold Medal.)

A small group of stove and greenhouse plants was exhibited by P. Purnell, Esq., Woodlands, Streatham Hill, London, for which a Bronze Banksian Medal was awarded.

Messrs. Stuart Low & Co., Bush Hill Park, Enfield, showed popular varieties of perpetual-flowering Carnations, plants of Prince of Wales Violet trained to sticks, and Clianthus Dampieri. (Silver-gilt Banksian Medal.)

Messrs. Young & Co., Hatherley, Cheltenham, showed excellent blooms of Carnations of the perpetual-blooming type, the varieties Rose Enchantress, Mikado, Mayday, Duchess of Devonshire, and Christmas Cheer being a selection. (Silver Banksian Medal.)

Messrs. W. Cutbush & Son, Highgate, showed Carnations and Polyantha Roses, these flowers making a delightful combination. The Roses, which included the varieties Mrs. W. H. Cutbush, Baby Tausendschön, Jessie, and Mme. N. Levavasseur, were arranged as a setting to the Carnations, of which the finest was Mrs. L. Mackinnon. (Silver Banksian Medal.)

Carnations were also shown by Messrs. Allwood Bros., Haywards Heath.

Messrs. H. B. May & Sons, Edmonton, showed small pot plants of Chrysanthemums, a batch of Begonias of the Gloire de Lorraine type, Cyclamens (well bloomed for so early in the season), and a batch of Primula obconica showing greatly-improved flowers. (Silver Flora Medal.)

Messrs. W. Wells & Co., Merstham, Surrey, showed Chrysanthemums arranged with tinted Oak foliage and Ferns. There were large blooms of Mrs. D. Syme, H. E. Converse, Mrs. L. Thorn, White Queen, and other Japanese varieties; and smaller flowers of such pleasing decorative sorts as Gloria (pink), Cranford Yellow, Wells's Crimson, Celia, Figaro (bronzy-yellow), and H. W. Thorp (white). (Silver Flora Medal.)

Messrs. Cragg, Harrison, & Cragg, Heston, Middlesex, arranged a very pretty floor group of Chrysanthemums and Crotons with Grevilleas and Palms at the back. Mensa (white), Flo rie King (pink), Charles Kingsley (yellow), Celia (yellow), and Mrs. W. Garner (bronze, deeper than Bronze Pagram), are all beautiful single varieties. T. A. Weston is a new yellow reflexed Japanese variety. (Silver Banksian Medal.)

Chrysanthemums and Carnations were exhibited by the Misses Price & Fyfe, Grove Park Nursery, Lee. Amongst the former plants were many good blooms of the white incurved H. W. Thorp variety. (Bronze Flora Medal.)

The only exhibit of Roses was shown by Mr. George Prince, Oxford. The blooms were very good, especially those of the varieties Rayon d'Or, Lady Hillingdon, Hugh Dickson, Lady Pirrie, Gruss an Teplitz, and General McArthur.

Messrs. S. Bide & Sons, Ltd., Farnham, showed two varieties of Begonia, derivatives of Mme. Charrat and a shrubby species. The one named Bavaria has light pink flowers; the other, Saxony, has rose-pink blossoms.

Messrs. H. Cannell & Sons, Swanley, Kent, showed novelties in Cannas, a batch of Cactaceous plants, and numerous specimens of the elegant Lotus peliorhynchus. The newer varieties of Canna were Hungaria, rose-pink; Neva, salmon-rose; Professor Vochting, red and gold; and Jean Monval, crimson-scarlet. (Silver Banksian Medal.)

A large number of plants of Begonia Gloire de Lorraine were shown by Mr. Percy Westmacott, Rose Mount, Ascot (gr. Mr. Geo. Gumbrell). (Bronze Banksian Medal.)

Mr. W. A. Manda, St. Albans, exhibited batches of Nephrolepis Whitmannii and N. Giatresii and a few larger plants of the beautiful Polypodium Mandaianum, which received a First-class Certificate at the recent Holland House Show.

Mr. H. J. Jones, Lewisham, again showed border Asters, the finest varieties on this occasion being Late Splendens, purplish-blue, and Mrs. Green, the nearest approach to pink in those of the Novæ-Belgiæ section.

Varieties of Codiæums (Crotons), as grown for market, were well shown by Mr. Ladds, Swanley, Kent.

A large table was filled by Messrs. Whitelegg & Page, Chislehurst, Kent, with the beautiful blue Aster Climax, one of the finest of all Michaelmas Daisies.

Messrs. T. W. Ware, Ltd., Feltham, showed Alpines in pans, the small, white-flowered Kniphofia modesta, and branches of ornamental shrubs. (Bronze Flora Medal.)

Small rock-garden exhibits were arranged by the Misses Hopkins, Mere Gardens, Shepperton, and Mr. Leslie Greening, Richmond.

AWARDS.

First-class Certificate.

Scolopendrium vulgare crispum nobile.—A very noble, hardy Fern, found wild on Warton Crag, Lancashire. The best-developed fronds were 2 feet long and 6 inches in breadth, the weaker fronds 4 inches broad, very handsomely crisped and of beautiful texture. The plant was some 3 feet in diameter, and had been grown in the open. Shown by Mr. W. B. Cranfield, East Lodge, Enfield Chase.

Awards of Merit.

Chrysanthemum Bob Pulling.—A very rich, golden-yellow Japanese exhibition variety. The large, deep bloom has broad, long, hanging florets. Shown by Mr. H. J. Jones.

C. Charles Kingsley.—A deep, rich-yellow single, the older flowers showing the faintest suffusion of bronze. The variety exhibits much of the size, form, and substance of Mensa, from which it is a seedling. Shown by Mr. Norman Davis.

C. Honble. Mrs. John Ward.—A medium-sized, pale-yellow, Japanese exhibition variety, more richly coloured in the centre. It is a sport from the favourite White Queen, and possesses the useful characteristics of that variety. Shown by Mr. Chas. Beckett, Chilton Gardens, Hungerford.

C. J. W. Streeter.—A sulphur-yellow, incurved, exhibition variety, with all the good points of the well-known white variety H. W. Thorp, from which it is a sport. The long stems and clean growths will make this a favourite market variety. Shown by Messrs. Cragg, Harrison & Cragg.

C. Miss M. Borrer.—A pretty, rose-pink (violet-rose, shades 2 and 3 of the *Rep. de Couleurs*) single variety, and the only variety securing an award that was shown in the spray form. The flowers are not large, nor of great substance, but the stems are sturdy, and the growths break freely and give a great profusion of bloom. Shown by L. F. Harrison, Esq., Orchards, East Grinstead (gr. Mr. A. H. Chapman).

C. Mrs. John Maher.—This is a handsome, pure-white, decorative variety, with flowers 5 inches in diameter. The wiry stems and clean foliage make it an admirable representative of the market type of bloom. Shown by Mr. T. Page, Hampton Nurseries.

C. Mrs. Loo Thomson.—This is a sulphur-yellow sport from Mensa. The disbudded blooms are nearly 5 inches in diameter, and gain considerable substance from the disposition of the ray florets in four or more rows. They have the smooth surface characteristic of Mensa, drooping slightly at the margins. Shown by Mr. Norman Davis.

Nephrolepis Millsii.—This is a distinct variety of Nephrolepis. Derived, perhaps, from Fosteri, it has a very characteristic open habit, not crested and dense, as are most of the recent varieties, but more wiry in growth, with small, finely-crenated divisions of the fronds. Shown by Mr. W. A. Manda.

Some Further Novelties.

Twenty-seven of the 40 novelties submitted to the notice of the Floral Committee were Chrysanthemums, and, although a number secured awards, many varieties were passed over. As a decorative plant, attention might be drawn to Ideality, shown by Mr. Norman Davis. It is a white single variety derived from Mary Anderson × Mensa, and possesses the dwarf habit of the former variety, never growing more than 2 feet.

Messrs. James Veitch & Sons showed three new Chinese species of Berberis, but the genus is already so richly represented in gardens that there is a natural hesitation in commending anything not distinctly better than those already in cultivation. B. Veitchii is a sub-evergreen, with pendent clusters of numerous plum-purple, oval, glaucous berries. B. Geraldii has very small purplish red berries in very large branched clusters. B. Coryi, the most ornamental of the three, has round, glaucous, currant-red berries, very densely borne round the stem, and appears to be evergreen, bearing clusters of spoon-shaped leaves, which are glaucous below.

Kniphofia modesta, shown by Messrs. T. S. Ware (1902), Ltd., was perhaps the most distinct novelty exhibited, but the foliage was very weak, and it can scarcely be recommended for outdoor culture. Tyson discovered the plant in 1884 in Griqualand East, and it has also been found in Natal. The raceme is cylindrical or tapering, a foot in length on 2 feet stems; the flowers are pure white and expand in funnel shape from a constriction just above the ovary. The small corolla lobes spread at right angles to the tube, and, as usual, the stamens and style are exserted. The species is figured in *Bot. Mag.*, t. 7293.

Col. Stevenson Clarke, Cuckfield, sent a flowering specimen in a pot of the very rare Delphinium macrocentron, discovered in 1884 in the mountains of East Tropical Africa. The corolla is very distinct in form, and the long, straight, erect spur is typical. There is a peacock-like combination of blue and green in the flowers, but the constitution of the plant seems to render it of doubtful value out-of-doors. The species is figured in the *Bot. Mag.*, t. 8151.

Another interesting plant was Nephrolepis Giatresii, shown by Mr. Manda, a sport from the variety Scottii, but peculiarly compact in growth, and therefore a good decorative subject. The fronds are scarcely more than 1 foot in length, and arch gracefully.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Messrs. Jas. O'Brien (hon. sec.), Gurney Wilson, J. Wilson Potter, R. G. Thwaites, F. J. Hanbury, T. Armstrong, A. McBean, C. H. Curtis, W. Bolton, W. Cobb, J. Charlesworth, J. Cypher, W. H. Hatcher, J. E. Shill, H. G. Alexander, A. Dye, W. H. White, C. J. Lucas, Stuart Low, R. Brooman-White, J. S. Moss, de B. Crawshay, and Sir Jeremiah Colman, Bart.

Baron Bruno Schröder, The Dell, Englefield Green (gr. Mr. J. E. Shill), staged a small group of splendidly-grown Orchids of fine quality, for which a Silver Flora Medal was awarded. It included the new white Brasso-Cattleya Digbyano-Mossiæ "The Dell variety," which secured a First-class Certificate; Cattleya labiata Opal, a splendid blush-white form; a clear yellow Cattleya Dowiana aurea; two fine plants of C. Dowiana alba, with white sepals and petals and richly-coloured lip; C. Corona (Hardyana × Mantinii); Lælio-Cattleya George Woodhams (L. purpurata × C. Hardyana), a very fine deep-rose flower with large ruby-purple lip, and various good Cypripediums.

C. J. Phillips, Esq., The Glebe, Sevenoaks (gr. Mr. Bucknell), sent Cattleya aurea "Glebe variety," a noble clear yellow form, with very dark lip veined with gold; Lælio-Cattleya Bola (L.-C. callistoglossa × C. labiata), large and of good colour; and Cattleya Basil (Mantinii × Enid).

Lieut.-Col. Sir George L. Holford, K.C.V.O. (gr. Mr. H. G. Alexander), showed the pretty Cattleya Mercutio (Harrisoniana × Lord Rothschild) and a fine form of Lælio-Cattleya Golden Oriole (see Awards).

H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Banksian Medal for a group rich in Sophronitis crosses, and which included Sophro-Lælio-Cattleya Menippe var. "H. S. Goodson" (see Awards), Sophro-Cattleya eximia, S.-C. Atreus, and other forms. Some good Odontoglossums, Cattleyas, various showy Lælio-Cattleyas, Phaio-Cymbidium Chardwarense and Brasso-Cattleyas were also noted.

R. le Doux, Esq., Marlfield, West Derby (gr. Mr. Fletcher), sent Cattleya Ena "Marlfield variety" (Hardyana Massaiana × bicolor), a very effective flower.

Messrs. J. Cypher & Sons, Cheltenham, were awarded a Silver Flora Medal for an excellent group of Cypripediums arranged with Dendrobium Phalænopsis Schröderianum, Miltonia vexillaria Leopoldii, Houlletia odoratissima, fine white Dendrobium formosum giganteum, Cattleya Fabia, C. Dietrichiana and Masdevallias.

Messrs. Stuart Low & Co., Bush Hill Park, secured a Silver Flora Medal for a group in which good Vanda cœrulea, Cattleya labiata, Oncidium varicosum and Dendrobium formosum giganteum were well represented. Specially noteworthy also were a very dark Lælio-Cattleya Dominiana, forms of Cattleya Iris and C. Fabia, and Miltonia vexillaria Leopoldii.

Messrs. Sander & Sons, St. Albans, were awarded a Silver Flora Medal for an attractive and varied group, prominent in which were good hybrid Cattleyas, among the forms of C. Fabia the variety Invicta being remarkable. Cattleya Portia varieties, the fine C. Hardyana picturata, C. conspicua, C. Iris C. J. Davis and various showy Lælio-Cattleyas and Odontoglossums were also remarked.

Messrs. Hassall & Co., Southgate, were awarded a Silver Banksian Medal for a group of good forms of Cattleya labiata, C. Fabia, the primrose yellow form of C. Sylvia (Fabia alba × aurea), C. Hardyana, the pretty C. Hassellii (Empress Frederick × labiata), C. Mantinii, &c.

E. H. Davidson, Esq., Orchid Dene, Twyford, showed a selection of fine Orchids. For his Sophro-Lælio-Cattleya Sandhage (C. Enid × S.-L. heatonensis), see Awards. Another fine novelty was Lælio-Cattleya Orion var. "J. Lakin" (L.-C. Haroldiana × C. Dowiana aurea), a beautiful pale yellow flower slightly freckled with rose and handsome deep rose lip with gold veining. The very dark claret-purple Cattleya Mantinii "Fowler's variety," and other good Cattleyas were also noted.

Messrs. J. & A. McBean, Cooksbridge, staged a small group including the attractive Cattleya Lord Rothschild variety albens; C. Fabiatia (Portia × Fabia); Sophro-Lælio-Cattleya Helen (S.-L. heatonensis × L.-C. Gottoiana), a very charming hybrid with large, deep-rose flowers with a slight violet shade, and deep ruby lip. A very fine novelty.

Messrs. Charlesworth & Co., Haywards Heath, staged a small group in which were Angræcum Buyssonii, with a long spray of white flowers; good Odontoglossum grande, some fine Lælio-Cattleyas, including a good hybrid between Lælio-Cattleya callistoglossa and Cattleya Mantinii; Cattleya Hardyana, with prettily-freckled sepals and petals; C. Fabia, Oncidium varicosum Lindenii and several good hybrid Cypripediums.

Mr. E. V. Low, Vale Bridge, Haywards Heath, sent Cattleya labiata The Sultan, a white variety with purple on the lip; and C. labiata Lady Duff, a good white with slight blush tint on the lip.

Walter Cobb, Esq., Normanhurst, Rusper (gr. Mr. C. J. Salter), sent his fine variety of Zygo-Colax Charlesworthii which had previously secured an Award of Merit; and Cattleya Fabia "Cobb's variety," a very dark-coloured form.

AWARDS.

First-class Certificates.

Cattleya labiata Opal, from Baron Bruno Schröder, The Dell, Englefield Green (gr. Mr. J. E. Shill).—A very fine white variety with a slight pure pink veining on the front of the lip, which has a light yellow disc. The finely-grown plant bore a spike of four flowers.

Brasso-Cattleya Digbyano-Mossiæ "The Dell variety" (Brassavola Digbyano × Cattleya Mossiæ Wageneri), from Baron Bruno Schröder.—A very large form with broad segments and well-developed, fringed lip. White, with primrose-yellow disc to the lip.

Cymbidium Doris (Tracyanum × insigne) from Messrs. J. & A. McBean, Cooksbridge.—A remarkable cross, with the erect habit and form of C. insigne, but with larger flowers, coloured as in C. Tracyanum. Sepals and petals cream-white, tinged and lined with chocolate-red. Lip straw colour spotted with red.

Cypripedium Pallas-Athene (parentage unrecorded), from W. R. Lee, Esq., Plumpton Hall, Heywood (gr. Mr. Branch).—A model flower, showing much of C. insigne Harefield Hall, but larger and broader in all its parts, the large dorsal sepal being greenish at the base and white above, and bearing dark-purple spotting, changing to rose in the middle white portion.

Awards of Merit.

Sophro-Lælio-Cattleya Sandhage (C. Enid × S.-L. heatonensis), from E. H. Davidson, Esq., Orchid Dene, Twyford.—A very handsome flower, equal in size to Cattleya labiata; the colour is rose, with an intense ruby-crimson lip. The influence of Sophronitis in this cross is very obscure.

S.-L.-C. Menippe var. "H. S. Goodson," from H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day).—Flowers are equal to Sophro-Cattleya Doris, but of a rich, reddish mauve, darker in the lip, and of a glowing tint.

Lælio-Cattleya de Hemptinne (C. Dowiana aurea × L.-C. Ronsselensis), from Count Joseph de Hemptinne, St. Denis, Ghent.—A remarkable hybrid, with bright, chrome-yellow flowers of good size, the lip tinged with red.

Cattleya Comet var. "Princess Mary" (Warneri alba × Dowiana), from Pantia Ralli, Esq., Ashtead Park.—A very attractive white flower with gold disc and veining to the lip, the base bearing some purple markings.

C. Moggie Raphael "Goodson's variety."—Flowers large and of fine shape, the lip being specially good and of a deep crimson colour, veined with gold from the base.

Lælio-Cattleya Golden Oriole "Holford's variety" (L.-C. Charlesworthii × C. aurea).—In size this resembles a good C. Dowiana, but the sepals and petals are clear orange-red colour; the lip ruby-crimson, with gold disc and veining. From Lieut.-Col. Sir George L. Holford, K.C.V.O. (gr. Mr. H. G. Alexander).

Fruit and Vegetable Committee.

Present: C. G. Nix, Esq. (in the Chair); Messrs. W. Bates, J. Davis, E. Beckett, W. Pope, G. Reynolds, A. Bullock, J. Jaques, Owen Thomas, John Harrison, H. Somers Rivers, A. Grubb, and A. R. Allan.

An exhibit of Apples and Pears, shown by Messrs. Geo. Bunyard & Co., Maidstone, Kent, was very pleasingly displayed, the fruits being arranged in baskets covered with white paper and on a white ground. There were very choice fruits of (Apples) Washington, Gascoyne's

Scarlet Seedling, Allington Pippin, Lord Hindlip, Cox's Orange Pippin, Ribston Pippin, and other well-known sorts, also (Pears) Doyenné du Comice, Emile d'Heyst, Beurré de Jonghe, Charles Ernest and Beurré Diel. (Silver-gilt Banksian Medal.)

Messrs. DOBBIE & Co., Edinburgh, staged about 40 plants of their exhibition strain of Parsley, the plants being magnificent specimens, with unusually large leaves, which were curled to a remarkable degree. It was one of the finest exhibits of this herb we have ever seen. (Silver Banksian Medal.)

An exhibit of fruit was shown by the ESSEX EDUCATION COMMITTEE, from the school-garden at Purfleet. The collection included Grapes, Apples, Pears, Plums, Raspberries, and Cobnuts. (Silver Knightian Medal.)

C. E. BARING YOUNG, Esq., Oak Hill Park, East Barnet (gr. Mr. J. G. Walker), showed 20 varieties of Apples and Pears and a dish of good Medlars.

Mr. POPE, Highclere Gardens, showed a seedling Apple named Guelph. The variety, which was raised by Mr. Chas. Ross from Houblon × Rival, resembles in appearance the variety named after Mr. Ross. The Committee expressed a high appreciation of its quality and a deputation will inspect the tree next September, and report on its cropping qualities, with a view to conferring an Award of Merit.

NATIONAL SWEET PEA.

OCTOBER 17.—The annual general meeting of the National Sweet Pea Society was held in the Hotel Windsor, Westminster, on this date. About 50 of the members were present, and the president, Mr. Robert Sydenham, presided.

EXTRACTS FROM THE REPORT.

Both at Sutton Green and at Burbage the Society's trials of Sweet Peas were afforded greater space than in previous years. This was the first occasion on which duplicate trials were conducted. The trial grounds were 100 miles apart, and respectively on light and heavy soils. Two hundred and fifty-five stocks were tested, and the Committee wishes to thank Mr. Harry Foster and Major U. C. Hurst, F.L.S., for their able conduct of this important branch of the Society's work. At Burbage the trials were not in full bloom when visited by the members on July 12, whereas the day previously, at Sutton Green, the rows were splendidly in flower. Burbage is probably 10 or 14 days later in the matter of climate than Sutton Green. The Floral Committee met at Sutton Green on July 4, and at Burbage on July 6. Every member was present each day. An Award of Merit was granted to each of the following:—*King White* (Trial No. 2), sent by Messrs. Alex. Dickson & Sons, Newtownards and Belfast; white. *Lady Miller* (Trial No. 22), sent by Mr. A. Malcolm, Duns, Berwick; apricot or cream, suffused with pink. *Decorator* (Trial No. 60), sent by Messrs. Dobbie & Co., Edinburgh; old rose, a waved form of "Rose du Barri." *Decorator* (Trial No. 61), sent by Messrs. G. Stark & Son, Great Ryburgh; rich crushed-strawberry. *Decorator* (Trial No. 83), sent by Mr. A. Malcolm, Duns, Berwick; white, waved form of "Rose du Barri." *Agricola* (Trial No. 135), sent by Mr. Robert Bolton, Warton, Carnforth; blush, suffused rosy-lilac. *Improved Bertrand Deal* (Trial No. 136), sent by Mr. Bertrand W. Deal, Brooklands, Sweden; rosy mauve. *R. F. Felton* (Trial No. 162), sent by Mr. Robert Bolton, Warton, Carnforth; lavender. Trials Nos. 60, 61 and 83 were declared to be identical, and the Committee recommended that one name be used for them. This recommendation has been accepted. The Provisional Silver Medal award was made in favour of Trials No. 22 and No. 162, the Committee considering these to be of equal merit.

Although the Society's London Exhibition, held at the Royal Horticultural Hall, Westminster, on July 2 and 3, was favoured with splendid weather, the paying attendance was not so large as usual. The takings were £36 8s. 6d. as compared with £41 in 1911. The flowers displayed were of unusually high quality, and in the competitive classes no fewer than 2,257 bunches were displayed, while as many more were on view in the trade exhibits.

One hundred and eighty-six new members were added to the list, and at the time of closing the accounts about the same number of old members had omitted to pay their subscription for 1912. Doubtless many of these omissions will be rectified before the new list of members is issued.

The Society is to be congratulated upon its sound financial position. Early in the year £50 was placed on deposit, this amount bringing the Society's reserve fund up to £200. The profit on the year's working was less than in 1910 and 1911, but this may be largely accounted for by the shortening of the financial year by two months. Accounts were closed on September 30, and as September is now one of the holiday months, and is a busy time for seedsmen with crops to inspect and harvest, there were many unpaid subscriptions on that date. However, the Committee hope that these matters will soon right themselves.

Arrangements have been already made for holding the Society's trials at the Burbage Experimental Station, Hinckley, in 1913, under the conduct of Major C. C. Hurst, F.L.S. The Committee understands that it will not be possible to hold trials at Sutton Green again, therefore a larger test will be made at Hinckley. The "Annual" and Schedule for 1913 will be issued to members during the first week of December, 1912. Mr. Lester Morse will contribute his "Impressions of the London Show"; Dr. Boxall has promised "Notes on Sweet Peas in New Zealand," and in addition to the Reports, Audit, Prize List of 1912, and List of Members, the "Annual" will include the Conference Proceedings and many items of special interest. The London Exhibition of 1913 will be held on Thursday, July 17, and will continue for the one day only. Arrangements are in progress for holding a Provincial Show in the North of England about the second week in August. The Carlisle Horticultural Society has promised a hearty welcome to the National Sweet Pea Society.

The financial statement shows a balance in hand of £53 11s. 5d. and a sum of £200 on deposit. The subscriptions for 1912 amounted to £315 5s. 3d.

The secretary, Mr. C. H. Curtis, said that the balance-sheet represented the income for 10 months only instead of 12, and but for this fact the amount credited to subscriptions for 1912 would be considerably higher. The adoption of the report and balance-sheet was proposed by Mr. Sydenham, seconded by Mr. Christie, and carried without comment. Mr. John Collingridge proposed a vote of thanks to the officers and committee, which was carried unanimously. The next business was the election of President for the ensuing year. The retiring President, Mr. R. Sydenham, said that it was customary to elect a member of the trade one year and a private member the next. Mr. W. Cuthbertson therefore proposed the name of Sir George Trevelyan, Bart., as President for 1913. It was understood that this gentleman had been approached, but he had written to say that his age was so great as to preclude him from taking an active part in the affairs of the Society. However, it was considered that if it were the wish of the meeting, Sir George Trevelyan would consent to hold the office, and on the proposition of Mr. Stevenson his election was carried by the unanimous vote of those present. Mr. H. Smith was elected chairman of committee; Mr. Edward Sherwood was reappointed hon. treasurer; and Mr. Richard Gluyas, of the Union of London and Smith's Bank, reappointed auditor. The hon. secretary, Mr. C. H. Curtis was also re-elected on the proposition of Mr. Robert Sydenham, who spoke of the valuable work Mr. Curtis had done for the Society. Mr. Sydenham also recommended that an honorarium of 70 guineas be given to the secretary. The re-election of Mr. Curtis was carried with acclamation, and the honorarium granted.

The next motion on the agenda was the election of the general committee. The old members were re-elected *en bloc*, with the exception of three who were disqualified through having failed to make the necessary number of attendances, and one of the members had died. The four vacancies were filled by Messrs. Dipnall, Bertram Deal, H. W. Wilkins, and J. Harrison Dick. The election of the Floral Committee caused considerable discussion. Captain Ashworth moved that the meeting consider the situation created by the proposal of Mr. Walter P. Wright to establish trials, and the intention of Miss Hemus to start a new society. Captain Ashworth earnestly begged that the meeting should make some concession to the feeling that had been aroused, and he hoped that even at the eleventh hour they might be able to get rid of this trouble. He could state on behalf of Miss Hemus that she would tear up her proposal if the affairs of the Society were based on a sound footing. Captain Ashworth stated that the Floral Committee was dominated by the trade, and that while nobody could prove any unfairness or bias on the part of the members, yet its constitution was not calculated to command general confidence. Touching upon Mr. Wright's scheme, Captain Ashworth pointed out that Miss Hemus's name and probably others had been included without authority. He condemned it as a one-man scheme, likely in the end to produce the same kind of trouble as is aroused by the present constitution of the Floral Committee. With regard to Miss Hemus's scheme he announced her readiness to withdraw it, and a wish to work for the prosperity of the present Society if the meeting were prepared to make some concession. Mr. Lumley supported Captain Ashworth. Mr. Sydenham said he regarded the situation brought about by Mr. Walter P. Wright as a very serious one, but he expressed a doubt as to whether Miss Hemus would gain the confidence of the public. However, he hoped that these little ruptures would be healed over, and that all would work harmoniously for the interests of the Sweet Pea as in the past. He considered that experts were required on the Floral Committee, and that amateurs did not possess such qualifications as those who had made the flower a lifelong study. The members were men of the highest integrity and honour. Mr. Stevenson said that he was impressed by the fairness of Captain Ashworth's remarks, but he was bound to take exception when it was stated that the Floral Committee was dominated by the trade (Captain Ashworth rose to say that he referred to numbers only). Mr. Stevenson said that he had been a member of the Floral Committee for several years past, and on more than one occasion he had seen members of the trade vote against their own varieties. Mr. G. W. Leak said that there was undoubtedly dissatisfaction respecting the constitution of the Floral Committee, but it was in the power of the members to alter the rules. Several members spoke of the impossibility of the great majority of the members attending these meetings in London. After discussion, Captain Ashworth withdrew his original proposition, and moved that the general committee be recommended to take a postal vote of all the members of the Society on any proposition brought forward for alterations of rules that may be submitted before the next general meeting. This was carried, and the chairman considered that the proposition was a good one, because it tended to bring about harmony. He would ask the secretary to include it in the report. Captain Ashworth said that he was satisfied, and he would do all in his power to push the interests of the Society. Meanwhile the scrutineers returned, and announced the election of the Floral Committee as follows:—Messrs. Thomas Stevenson, T. Jones, A. Ireland, R. Bolton, G. W. Leak, H. E. Bide, A. Hallam, F. H. Chapman, and H. D. Tigwell.

Mr. Brander, a member, regretted that no further information was forthcoming from the Society about the streak disease of Sweet Pea, and he considered it a matter which the Society should take seriously in hand. He moved that the committee reopen the question of diseases, and endeavour to find a remedy for streak. Mr. Sydenham said he had no doubt that the committee would give it serious attention.

DINNER AND CONFERENCE.

About 30 members were present at the dinner, which was presided over by Mr. Robt. Sydenham. The conference was held directly after the dinner was over, the newly-elected chairman of committee, Mr. Herbert Smith, presiding. The chairman briefly introduced Major Hurst, F.L.S., who gave a paper dealing with Sweet Pea rogues. Major Hurst said that for the past 10 years or so he had been interested in Sweet Peas. He had noticed with interest in 1911 that the trials at Sutton Green showed a very large percentage of dominant rogues. These puzzled him considerably, and he decided to investigate the matter closely. For this purpose he obtained 206 distinct stocks, and they were grouped apart from the N.S.P.S. trials.

The latter embraced 254 stocks, and, in addition to these, he had a further group of his own Mendelian stocks numbering 43. These three groups were classed as Tables No. 1, 2, and 3. No. 1 contained about 3,339 plants, No. 2 about 5,551 plants, and No. 3 about 8,000 plants. The 43 Mendelian stocks he termed pure line stocks, but none of them had been isolated or protected from outside fertilisation.

In Table No. 1 108 plants per 1,000 proved to be rogues. In Table No. 2 114 plants per 1,000 were rogues, and in Table No. 3 only five per 1,000 were rogues, none of these being type rogues. Type rogues, the lecturer explained, were not true Spencers. The Spencer type has an open, extended keel, whilst the so-called grandiflora type has a closed or clamped keel.

As showing the difference in the seeding of the two types, he mentioned that from one acre of Spencers not an ounce of seed had been seen, whilst the clamped keel type seeded quite freely. Major Hurst explained that clamped keels are always dominant, and if this type was excluded from the seed ground, there was no reason whatever why plain or clamped rogues should appear in a stock of Spencers. He was certain that a carefully rogued stock of Spencers would not throw dominant clamped keels the following year.

In tabulating the rogues in the three tables, he classed them as dominant, recessive, and type rogues, and whereas in Tables 1 and 2 all three forms were present, in Table 3 only dominants were present. Dominant and recessive rogues might be both colour and type rogues. Dominant colour rogues could always be removed, as they appeared in the second year. Recessives appeared the following year. The first year from the cross every plant was dominant. Whereas type rogues were easily preventable, colour rogues required closer attention.

Cream was the lowest recessive, white is

dominant to cream, whilst the old blue bicolor was dominant to all other colours. Salmon shades were more prevalent in giving colour rogues than any other, and cream followed closely.

Rogues were interesting, and they were not always due to faulty roguing, for he felt convinced that some seed was cross-fertilised by outside agency, as it had been found that a stock of light-coloured seed had produced coloured rogues, including maroons and mauves.

A cream flower self-fertilised gives cream progeny, but if fertilised from another cream plant the chances are that coloured varieties would appear, because there are three classes of creams: those that possess no other colour factors, those possessing red factors, and those possessing blue factors. If any two are brought together a break-up follows, and all colours appear in the progeny. Owing to the bad season, they had not been able to save seed of the dominant rogues in Table 3, so a number of cuttings had been inserted in the hope of saving some for flowering next season.

It was curious that the orange-scarlet varieties at the trials showed very few rogues, and he felt sure that the one rogue in Dobbie's Thos. Stevenson at Sutton Green and the plant in his Table No. 1 were due to outside influence. At the same time he could offer no absolute proof that insects did fertilise the flowers, although he surmised that the leaf-cutter bee was a culprit in this respect. Regarding the recessive rogues in the commercial stocks in Table 1, more than half of them were found in the cream-pink section. Touching upon the varieties Audrey Crier, Miriam Beaver, and Syeira Lee, these were unfixable, as they resembled the Andalusian fowl, inasmuch as they always produce about 50 per cent. true, and 25 per cent. each light and dark.

How to avoid rogues appearing was a matter that growers were decidedly interested in, and he advised saving all stocks from single plants, and sowing separately, allowing 50 yards between each stock or variety. By this means the chance of insects affecting the flowers was reduced, and if growers were careful to remove all clamped keels as soon as they appeared, they need not fear that similar types would again appear.

The Discussion.

At the invitation of the chairman, Mr. Robt. Sydenham asked whether Major Hurst advised saving all seed from one plant together, or whether it would be wiser to save every pod separately and grow on for two years.

Major Hurst agreed that it would be a good plan, but those who attempted to follow it would find themselves concerned with a very big problem, for, assuming that a score of pods were saved in the first year, the following year there might be several thousands, and to keep every one separate would be an almost endless task.

Mr. Sydenham stated that his firm saved about a dozen pods of Maud Holmes the first year, and 130 the second, and nine-tenths of these bred true in the third year. Would it be safe to assume that a variety was fixed in the third year?

Major Hurst said it depended upon the colour. If the dominant rogues were pulled out, only recessives would appear the next year, and then would come the tremendous amount of work if every pod was kept apart.

Mr. Andrew Ireland stated that when they planted their first seeds of George Herbert it gave one type rogue. The remainder were saved, and next year type rogues again appeared, but the following year all came true, and remained so. Regarding Thos. Stevenson, he mentioned that at Messrs. Dobbie's nursery he found one rogue, an orange-pink variety, in 40 plants growing indoors, whilst outdoors they had half-a-mile of plants, four to the yard, and only one rogue was found in the lot. Regarding Sunproof Crimson, he found this in their stock of John Ingman. It came true, and never gave a rogue until this year, and this was a white with a wire-edge of red. He also mentioned that from 48 plants of a white variety he obtained a purple bicolor.

Mr. G. W. Leak said he had always been puzzled by breaks among Sweet Peas, and he mentioned that when Sybil Eckford gave a number of white seeds he thought the men had got the seeds mixed. The white seed, however, produced none other than James Grieve, which kept true. Respecting Miriam Beaver, as Major Hurst had said, this produced two other shades, but this season, for the first time, it gave a third, a very deep pink, but, owing to the season, not a seed could be saved.

Mr. Vernon Hill asked whether he was correct in assuming that rogues in the first year were dominants, and if pulled out recessives would follow, and that these should be pulled out also. Regarding cross-fertilisation by outside agencies, he mentioned that he had observed blue tits and bullfinches among his Sweet Peas, and on close inspection he found the birds were mutilating the flowers and extracting the unripe pollen. This was particularly noticeable in dull weather. In hot weather the buds developed too fast, so that the pollen became ripe quickly, and the birds did not interfere with it.

Mr. H. E. Bide confirmed Mr. Hill's remarks on the tits. He also noted the white tail among Sweet Peas, but found that these birds were after aphis. He also stated that he effected a cross between Paradise Ivory and Lord Nelson, and secured a blue Spencer, which came true one year and then broke.

Mr. H. W. Harvey mentioned that early this year several correspondents complained that cream-coloured seed varieties, like Etta Dyke and Clara Curtis, had broken into many colours, and on enquiry he came to the conclusion that such seed had been grown in California, and had become fertilised by insects. Curiously enough, mauve varieties from the same grower were perfectly true.

Mr. E. W. King stated that when in California he looked in vain for clean cream and white stocks. Sweet Peas grow so finely there, and the grandifloras came so large, that it was impossible for anyone but an expert to pick them out. He mentioned a field of Aurora Spencer, which looked superb, and the grower asked him what he thought of it. Mr. King hazarded that 60 or 70 per cent, were true, but when he got to a worker who was busily roguing out the plain types, he found that the Spencers only averaged about 30 per cent., all the rest being grandiflora, the original Aurora.

Mr. Wm. Cuthbertson took heart from Major Hurst's statement that only five rogues per 1,000 plants appeared in the Mendelian pure line stocks at Hinckley, for if such could be obtained there he saw no reason why he and others should not get similar results. Regarding the rouges in Tables 1 and 2, it would be interesting to know whether any of these stocks were foreign-grown. With reference to clamped keels, if these were to be kept out rigorously, did it mean that so fine a variety as Nora Unwin must not be grown anywhere near the others? Was it true that soil changes caused variation? Although he was interested in Mendelism, he found it difficult to understand why apparently true stocks should break up. Did it mean that there was much more crossing by insects than has hitherto been imagined? He assumed that in California the pollen of Sweet Peas would always be in better condition than at home, and thus more liable to bring about intercrossing. So far as his firm were concerned, the proportion of rogues appearing on their Essex farms was very small, and he imagined that even with Spencers home growers had little to fear from outside crossing. They might not be able to get their stocks biologically pure, but he was satisfied they could always get them pure enough for commercial purposes. The problem of the increasingly protruding stigma in the Spencer Sweet Peas was an important one in his view.

Mr. Thos. Stevenson stated that although he had raised two or three varieties, he had never made a cross. The John Ingman that he first showed he found in Countess Spencer; from this, next year, he obtained a veined-blue break, and the seed from this gave no two flowers alike. He had every colour imaginable, and his Rosie Adams, America Spencer, and Black Knight Spencer all came from this break. The remainder were either lost or were worthless. The few that he saved never gave any further rogues.

Mr. H. A. Perkin said that he had changed his soils from light to heavy, but got no variation. He noted, however, that whereas he saw many leaf-cutter bees on the light land, practically none were seen on the heavy soil, although the two places were only half-a-mile apart.

Mr. T. A. Weston, referring to the mixtures coming from Californian seed, believed that weather had much to do with it; for he had seen it stated by one grower that after a very hot day it was impossible to find a Sweet Pea flower in form. The heat caused the wings and keel to gape or wilt, leaving the stigma open to all outside influences. He asked Major Hurst whether any crosses with perennial Peas had been made, and what had happened. He referred to a cross made with Lathyrus tingitanus, which produced a small chocolate-coloured variety, that never once broke. Why was it?

Major Hurst, in rising to reply, regretted that time would not allow him to deal with everything fully. Regarding the two rogues at Marks Tey and the two in the trials, found in Thos. Stevenson, he felt certain that these resulted from a grain or two of pollen being conveyed to some flower last year. The fact that only one plant in half-a-mile was wrong proved that. The crimson from John Ingman was probably created by an outside cross, made two years before. He, too, had observed the deep pink in Miriam Beaver this year, but in his case the flowers were clamp-keeled, whereas Mr. Leak's was a Spencer flower.

Mr. Bide's blue was an instance of the F_2 generation coming true and then breaking. Mr. Harvey's remarks about cream and white varieties breaking, bore out what he had said about the colour factors coming together. The fact that Mr. King observed inability of Americans to pick out type rogues proved why such rogues were common.

There was no reason whatever why type rogues should appear in commercial stocks. He doubted whether the pollen in California was wind-borne. He saw no evidence that soils caused rogues. It was quite unthinkable that a change of soil brought a new colour factor into play. Mr. Stevenson's blue-veined break was a dominant. All blues are dominant, and for that reason gave much trouble. He considered the leaf-cutter bee the most probable cause of outside crossing. Regarding perennial crosses, he made a number some years before, but failed to obtain seed. He noted No. 9 at the N.S.P.S. trials had a strong resemblance to the perennial, in having small flowers carried in larger numbers than usual, whilst the growth was not unlike a perennial species.

At this point Mr. Ireland handed over a letter from the raiser of the variety referred to, and from this letter Major Hurst learned that Earl Lovelace resulted from a cross made some years ago between Dorothy Eckford and Sadie Burpee.

Mr. Sydenham asked why Sweet Peas sent to Madeira and Sicily reverted back to the old wild form in about two years.

Major Hurst surmised that the quick reversion was due to insect agency. Possibly in Sicily there were insects that worked among the flowers, and as the wild form was natural there the latter were brought into touch by the insects, and, being dominant, eclipsed the other colours. Regarding the seedling referred to by Mr. Weston, he thought this was on a par with certain Orchids. He had cross-fertilised certain species of Orchids, and although the cross stimulated the ovules sufficiently, yet the resultant seedlings retained the characteristics of the mother only.

The seedling Pea was of a like nature, for it carried the leading factors of the Sweet Pea but would not break. Such seedlings are termed false hybrids, and they do not change from their first appearance.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

October 14.—The monthly committee meeting was held at the R.H.S. Hall on this date; Mr. Thomas Winter occupied the chair. One hundred and thirty-one new members were elected. It was stated that the sick pay for the month amounted to £38 13s. A grant was made from the benevolent fund to enable a member to pay his contributions, also a grant to a member from the convalescent fund, and one member was allowed to withdraw his interest. Business relating to the National Health Insurance was also dealt with, and a sub-committee formed to deal with current business arising from the same.

NORTH OF ENGLAND HORTICULTURAL.

OCTOBER 17, 18.—This Society held its monthly exhibition of fruit, flowers, and vegetables at the Corn Exchange, Leeds. This was the first occasion on which it has been extended to two days, and the innovation was a qualified success. The principal prizes were two challenge cups, one valued at 80 and the other at 15 guineas. The more valuable one was offered for the best exhibit in the show, and the other was restricted to amateurs. J. PICKERSGILL, Esq., Leeds, won the 80-guinea cup with a large group of Codiæums, Cattleyas and Oncidiums. The other cup was awarded to W. D. CLIFFE, Esq., Meanwood Towers, Leeds, for a collection of 75 varieties of vegetables.

Plant and Floral Committee.

The following medals were awarded in this section:—

Gold Medal to J. PICKERSGILL, Esq., Bardon Hill, Weetwood, Leeds (gr. Mr. J. Donoghue), for a miscellaneous group of plants that was awarded the Premier Cup.

Large Silver-gilt Medal to Messrs. DICKSON & ROBINSON, Manchester, for a group of Asters and Chrysanthemums.

Large Silver Medals to Messrs. W. & J. BROWN, Peterborough, for a stand of Roses; Messrs. W. WELLS & Co., Merstham, for Chrysanthemums; and Messrs. JOHN HILL & SONS, Stone, Staffordshire, for a collection of evergreens.

Silver Medals to Messrs. YOUNG & Co., Cheltenham, for Carnations; J. BLACKBURN, Huddersfield, for Carnations; J. C. FORDBY, Castleford House, Northumberland, for a collection of Gladioli; and Messrs. LITTLE & BALLANTYNE, Carlisle, for a collection of shrubs.

Large Bronze Medals to Messrs. WM. CUTBUSH & SONS, London, for Asters and Roses; and WM. BONSALL & SON, Harrogate, for a group of Bouvardias.

Bronze Medals to Messrs. KER & SON, Liverpool, for Cyclamens and Crotons; Mr. F. C. EDWARDS, Leeds, for hardy Chrysanthemums; A. C. WATSON, Moseley, for Begonias of the Gloire de Lorraine type; Messrs. HARKNESS & SONS, Bedale, for Asters; Mr. G. BAGSHAW, Leeds, for Carnations; Messrs. S. BROADHEAD & SON, Huddersfield, and Messrs. G. GIBSON & Co., Bedale, who both showed rockwork and Alpine plants.

NOVELTIES.

Second-class Diplomas were awarded Chrysanthemum "Mrs. J. Fielding," a sport from Goacher's Crimson, shown by Messrs. HARKNESS & SONS, Bedale; Berberis Wilsonæ, shown by Messrs. G. GIBSON & Co., Bedale; and Aster "Stella," shown by Mr. G. YELD, York.

Orchid Committee.

This Committee made the following awards:—

Gold Medal to Messrs. MANSELL & HATCHER, Rawdon, Leeds, for a large group of Orchids.

Silver-gilt Medal to W. H. ST. QUINTIN, Esq., Scampston Hall, York (gr. Mr. F. C. Puddle), who showed an interesting collection of seedling Cattleyas.

Bronze Medals to Mr. W. SHACKLETON, Bradford, for a small group; J. H. CRAVEN, Esq., The Beeches, Keighley (gr. Mr. F. W. Corney), for a collection.

NOVELTIES.

First-class Diplomas to Cattleya "The Bride," shown by Mr. W. H. ST. QUINTIN; and Cypripedium Boltonii, shown by Mr. J. H. CRAVEN.

Second-class Diplomas to Lælio-Cattleya scampstonensis, shown by Mr. W. H. ST. QUINTIN; and Cypripedium Charlesworthii, shown by Mr. W. SHACKLETON.

Fruit and Vegetable Committee.

Large Silver Medals were awarded to Messrs. W. SEABROOK & SONS, Chelmsford, for a collection of Apples; W. D. CLIFFE, Esq., Meanwood Towers, Leeds (gr. Mr. W. N. Haigh), who showed 75 varieties of vegetables, including fine "Premier" and "Barnet Hero" Onions; Mr. WM. E. SANDS, Hillsborough, Ireland, for a collection of Potatos of 60 varieties.

A *Silver-gilt Medal* was awarded to Mrs. HOGG, Meanwood, Leeds, for an exhibit of bottled fruit; and a *Silver Medal* to Messrs. LITTLE & BALLANTYNE, Carlisle, for a collection of fruit.

Large Bronze Medals were awarded to Messrs. LITTLE & BALLANTYNE for Potatos; and Mr. W. LAWRENSON, Yarm-on-Tees, for a collection of Apples and Pears.

Obituary.

GEORGE CARPENTER.—*Horticulture* announces the death of Mr. George Carpenter, florist, Philadelphia, U.S.A. He conducted a florist's business at Gerard Avenue, Philadelphia, for over 30 years. Mr. Carpenter was a native of England.

JAMES KERR.—Mr. James Kerr, of the Floral Farm, Kaiti, and formerly the junior member of the late firm of Messrs. Kerr Brothers, nursery and seedsmen, Dumfries, died recently at Napier Hospital, New Zealand. Mr. Kerr went to New Zealand about six years ago.

ANSWERS TO CORRESPONDENTS.

BEGONIA GLOIRE DE LORRAINE: *R. E. F.* The roots of your Begonias are affected with eelworm. There is no cure; destroy the plants by burning, and sterilise the soil in which they have been grown.

BULRUSHES: *W. B.* The best method of establishing Bulrushes in water is to plant them in round hampers or wicker baskets of any kind, using on the top a layer of turves. Secure the turves with strong cord so that they will not float off when the basket is lowered into the water. In time the basket will decay and the plants establish themselves in the mud at the bottom, and require no further attention. Bulrushes may be purchased from the nurserymen who specialise in hardy plants, and may be planted at any time during the late autumn, winter, or early spring.

FREMONTIA CALIFORNICA DYING: *W. P. F.* The shoots are injured by Cladosporium, which has caused gumming. Continue to spray the plants at intervals with the liver of sulphur. The reason that spraying appeared to be of no avail was due to the plants having been infected before spraying was commenced.

GOOSEBERRY BUSHES DYING: *Hortus.* No disease is present; the trouble must be looked for in some unsuitable cultural conditions.

HEATH GARDEN: *J. A. T.* If it is intended to keep the different varieties separate, it will be advisable to plant them in irregularly-shaped beds. Before planting, the ground should be deeply dug, and, as your soil is a heavy loam, a quantity of sand, leaf-soil, and peat should be incorporated at the time of digging. Peat is not necessary, provided the soil is made light with the addition of sand and leaf-mould. Stones are not necessary, and it would not be wise to plant the Heaths in grass. They will make more rapid growth if the ground around them is kept free from weeds for a few years; after that time the Heaths will smother the weeds. It will be best to start them in beds, but in time the plants will grow into irregular, natural groups. The distance to leave between the plants depends on the varieties and the space available.

MADRESFIELD COURT GRAPES UNHEALTHY: *J. E.* No disease is present; the trouble is due to some wrong cultural treatment.

MARROW: *J. B.* The terms vegetable and fruit have each a different significance, according to the sense in which they are used. Botanically, the Marrow is a fruit, as are Beans and Peas; but these being used for culinary purposes are also termed vegetables.

NAMES OF FRUITS: *T. B. R.* 1, Délices d'Angers (Fondante du Panisel); 2, Beurré Bachelier; 3, Léon Leclerc de Laval; 4, Gansel's Bergamot; 5, Winter Nelis; 6, White Nonpareil.—*H. H.* 1, General Todleben; 2, Mme. Treyve; 3, Duchesse d'Angoulême; 4, Doyenné du Comice; 5, Emile d'Heyst; 6, Marie Louise. Beurré Diel is very liable to crack, especially in a wet season. It is caused by a fungus. Wash with a good fungicide, early in spring.—*J. A. L.* 1 and 2, too small to name; 3, Zéphirin Grégoire; 4, decayed; 5, General Todleben; 6 and 8, Hessle; 7, Thompson's; 9 and 10, Beurré Bosc; 11, Mme. Treyve; 12, Beurré d'Anjou; 13, Beurré Diel; 14, Forelle.—*B. P. P.* Peasgood's Nonesuch.—*R. J. F.* 1, Winter Hawthornden; 2, Cox's Pomona; 3, Washington.—*T. S. C.* Apple much bruised and partly decayed on arrival; it resembles Lord Grosvenor.—*Duncombe.* 1, Beurré Hardy; 2, Black Worcester; 3, Magnate; 4, Autumn Bergamot; 5, Marie Louise; 6, Mme. Treyve; 8, Gansel's Bergamot; 10, Catillac. Several of the numbers detached on arrival.—*H. R.* 1, Chaumontel; 2, Soldat Laboureur; 3, Beurré Diel; 4, Uvedale's St. Germain; 5, Sturmer Pippin; 6, Golden Harvey.—*F. L. P.* Comte de Flandre.—*G. T. S.* 1, Franklin's Golden Pippin; 2, Langton Nonesuch; 3, Lady Sudeley; 4, Cockle Pippin; 5, Lord Suffield; 6, Potts's Seedling.—*E. E. B.* 1, Huyshe's Prince Consort; 2, General Todleben; 3, Hambledon Deux Ans.—*W. & S.* Fondante d'Automne.—*E. L.* 1, Lord Derby; 2, Golden Pippin.—*G. W.* 1, Fondante d'Automne; 2, Maréchal de Cour; 3, Vicar of Winkfield; 4, Gansel's Late Bergamot; 5, no fruit; 6, Joséphine de Malines; 7, no fruit; 8 and 10, Doyenné du Comice; 9, Chaumontel; 11, Bishop's Thumb; 12, Beurré Diel; 6, 7 and 8, numbers detached. One of the Pears decayed and stained the numbers; we have done the best we can. There were three "8's," but only two were Doyenné du Comice.—*Apples.* 5, Gravenstein; 6, Tom Putt; 7, Warner's King; 8, Mère de Ménage; 1, 3 and 9, Peasgood's Nonesuch; 10, not recognised; 4, no fruit; 11, Hoary Morning; 12, Blenheim Pippin; 2, Golden Noble; 13, Ribston.—*J. H.* Grape Mrs. Pince's Black Muscat.

NAMES OF PLANTS: *Ignoramus.* 1, Mesembryanthemum coccineum; 2, Aster "Robert Parker"; 3, A. vimineus; 4, A. dumosus; 5, A. cordifolius elegans; 6, A. diffusus horizontalis; 7, A. Novæ Angliæ var. ruber.—*Enquirer J. W.* 1, Lamium maculatum; 2, Salvia Horminum; 3, Leucophytum Brownii; 4 and 5, too scrappy to be identified; 6, Erigeron speciosus (probably).—*E. Rogers.* Polygonum polystachyum.—*J. H.* 1, No specimen; 2, Dendrobium sp., cannot name without flower; 3, Cordyline stricta; 4 and 5, garden forms of Dracæna terminalis; 6, Vinca rosea.—*Wermhite.* 1, Juniperus Sabina; 2, J. chinensis variegata; 3, Ilex crenata; 4, Leucothoë Catesbæi; 5, Cryptomeria japonica; 6, Genista tinctoria elatior.—*Foreman.* 1, Cattleya Forbesii; 2, Brassia caudata; 3, Maxillaria rufescens; 4, Pleurothallis conanthera; 5, Cochlioda vulcanica; 6, Odontoglossum Lindleyanum.—*Burnside.* 1, Isoloma Deppeanum, often called Gesnera elongata in gardens; 2, Diosma ericoides.—*Correspondent.* 1, Rose William Allen Richardson; 2 and 3, not recognised.—*F. C., Orchardleigh.* 1, Eupatorium Wienmannianum; 2, E. petiolare; 3, Pereskia aculeata.

PELARGONIUM MRS. W. B. CURRIE: *G. J. B. Foreman.* This Pelargonium grows too leggy for use as a bedding variety, but it makes an excellent pot plant in a conservatory or greenhouse.

STOCKS: *Doubtful.* There are many varieties of the Paradise Stock employed for working Apples, and they vary in their dwarfing capacities. They are all raised from cuttings, and they would not come true from seed. Pears are grafted on the Quince stock or on seedlings raised from the wild Pear; Plums and Peaches on various kinds of Plums—Damask, Mussel, &c. Cherries are grafted on the Mahaleb for dwarf trees and on the wild Gean for standards. Crab stocks are supposed to be raised from Crabs, but they are more often merely seedlings raised from Apples without regard to variety.

JOURNEYS BY THE RIVER OF GOLDEN SAND.

WHEN collecting plants for Bees Ltd. last year in western China, I first struck the Yangtze—the River of Golden Sand—at the point where it makes a big, close loop, running north and south round the Lichiang mountains, thus adding hundreds of miles to its length before definitely setting out eastwards to cross China; we were then some 2,500 miles from its mouth.

It was early April, and the Chionanthus trees were in full bloom, growing in the rockiest places, and hanging at times right over the water just as Willows do in England. The flowers are polygamous, and, though scentless, are visited by numerous insects, chiefly small flies, since there is no attempt at concealing the honey.

I saw this tree again, in even greater profusion, in the valley of the Mekong, where, however, it is restricted to a small region which we may call the rainy belt.

There were not many flowers out on this occasion, two or three Boraginaceæ, including a lovely blue Cynoglossum, which was the most conspicuous.

The river platform, which averages, perhaps, half a mile in width, was, however, extensively cultivated. Peas are the chief spring crop, and scattered amongst them I was interested to observe not a few opium Poppies; but so closely did the white and magenta Poppies blend with the Peas that the former were not readily detected, and I soon came to the conclusion that this was no chance sowing, but a deep design to outwit the provincial authorities, who had recently come down heavily on the opium farmers.

The proscribed plant was no longer to be seen alongside the main road, but I had already passed a small field of it hidden away in the mountains between the Salween and Mekong rivers, and in May I came across another field of it further north.

The mountains, which here closely invest the Yangtze, are built up mainly of limestone, and except on their southern slopes are thickly forested; in the gullies are to be found a rich assortment of deciduous trees, but the exposed slopes are covered with Conifers. On April 14 I tried to reach the summit of the western range, which rises to a height of 3,000 or 4,000 feet above the river, in order to see whether the mountain flora was beginning to appear; however, at an altitude of about 10,000 feet above sea-level we found the corries full of snow, and a barrier of clean-cut limestone precipices, one of which I all but fell over when plunging blindly through a thicket, prevented us from reaching the top.

From Pine forests below we passed through Firs above, and then Bamboo brake and dwarf Rhododendrons; but we were too early for the Alpine flora.

Camp was pitched beneath a grove of Oaks, Quercus incana (which has leaves very like the Spanish Chestnut), on which grew the curious Mistletoe, Viscum articulatum; other shrubs along by the river were species of Pistacia, Berberis, Spiræa, and so on, but with the Chionanthus trees like great masses of snow everywhere, I had eyes for little else, though the rocks were sometimes blue with Iris tectorum.

At this time I had an escort of two soldiers, one armed with a rifle of which he was very much afraid, the other with a fan. Sometimes I had a little rifle practice at the expense of the Chinese Government, and there were always yellow ducks to shoot, though this meant swimming occasionally across an icy-cold backwater in order to secure the booty.

On the sixth day we left the Yangtze and set out westwards over the mountains towards the Mekong; more than three months passed before I again saw the River of Golden Sand, some 300 miles further north.

It was the end of July when I received a message from the French priest three days south of Atuntsi saying that the English had taken Lhasa, and that the Chinese had sworn to exterminate the English in Yunnan. It was five o'clock in the evening when the news came, and early next morning we were on the road to Batang, eight days' journey to the north, though we did it in six.

The last stage takes us for about 20 miles along the banks of the Yangtze, here very different in appearance to what it is further south, for we were now in the arid region. That country is characterised by (i) an open shrub formation; (ii) a number of rosette plants, such as are met with in dry regions elsewhere; and (iii) wherever granite occurs, by thickets of Opuntia vulgaris, cultivated for the sake of its fruits. It would be interesting to know how this Mexican plant became distributed throughout the arid valleys of western China.

The shrub formation varies a good deal according to the degree of aridity, reaching a minimum development, both in number of species and individuals, in the Salween and Mekong valleys, where the rainfall probably does not exceed five inches a year. In the arid region of the Yangtze we are now concerned with,

FIG. 142.—THE YANGTZE RIVER IN THE ARID REGION, 3,000 MILES FROM ITS MOUTH. THE BATANG FERRY IN THE FOREGROUND.

familiar shrubs are Sophora viciifolia, Rosa species, Caragana, Clematis Delavayi, a small bushy species with inconspicuous white flowers, Wikstrœmia, with small orange flowers, Bauhinia densiflora, and others. There is a marked tendency amongst them to develop thorns or spines.

The rosette plants include Eremurus chinensis, local but abundant along the Yangtze below Batang, the flowering stems reaching a height of 3 or 4 feet and bearing a long pyramid of white flowers; Androsace Bulleyana, a most beautiful species with a compact umbel of vermilion flowers (it should be hardy in East Anglia at least); Saxifraga candelabrum, like the last, a biennial, Didisandra lanuginosa, with pale blue or white flowers, and a Selaginella, closely resembling a Californian species, which rolls itself up into a ball in the driest weather, a performance which is to some extent imitated by the Fern Cheilanthes farinosa, also abundant here, each frond of which curls up, exposing the brightly-silvered undersurface.

FIG. 143.—THE MEKONG-YANGTZE DIVIDE, ALT. 12,000 FEET.

On the hill tops Abies (destroyed by lichen) and Bamboo brake; in the valleys grassland and bog.

The Selaginella referred to is by far the most dominant plant in the arid regions, its rosettes and globes occurring on the rocks in thousands.

I need only allude briefly to the origin of the arid regions. The great mountain ranges here run north and south, so it will readily be seen that where they are of great altitude the south-west rain-bearing winds will deposit their moisture on the intervening ridges, and, sweeping right across these narrow rifts, leave them dry. This state of desiccation is further aggravated by the up-valley winds, which blow throughout the summer months, being caused by the great heating of the shut-in valleys during the day and the consequent filling up with cold air off the mountains above of the partial vacuum so produced.

The altitude of the Yangtze valley at Batang is about 9,000 feet above sea-level, and is about 150 yards wide.

On our return we made an interesting voyage of 15 or 20 miles down the river in a skin boat or coracle, and then we recrossed in the ferry boat, a big flat-bottomed scow. A few miles below the ferry is one of the biggest rapids I have ever seen.

In the middle of September I journeyed to the Yangtze again, this time to Pangtsila, three days south-east of Atuntsi, the Mekong-Yangtze divide being crossed at an altitude of 15,800 feet. The actual valley bottom is here extremely arid, supporting very little vegetation indeed, but an Ipomœa grows amongst the shrub vegetation, and a little higher up is a second twiner, Codonopsis convolvulacea; the higher slopes, where Pines and Oaks grow (10,000-11,000 feet), might perhaps be called the arid region, while we restrict the term semi-desert to the deep valley bottoms, where the rainfall reaches a minimum of only a few inches a year. Of the plants already cited, perhaps only Sophora, Rosa, Caragana, and Selaginella are true semi-desert plants; to the list from the arid region on the above definition, however, may be added one or two succulents such as Sedum, Anemone japonica, the pink-flowered Amphicome arguta, the twining Dregea sinensis, a Dianthus, Campanula colorata, Ceratostigma Griffithii and many other plants.

In October we visited the Yangtze for the last time, crossing the divide by a pass between 17,000 and 18,000 feet high to the north-east of Atuntsi. The river here flowed in a terrific cañon about 4,000 feet deep, and the road, one of the most perilous I have ever traversed (we did the worst part of it by night, and my heart was in my mouth all the time), kept between 2,000 and 3,000 feet above the river, which could be seen but not heard.

Villages occupy the summits of alluvial cones washed from the mountains, and the crops are irrigated by means of the mountain torrents diverted for the purpose. Buckwheat, Barley, Millet, and Hemp are the chief crops; Pomegranates, Walnuts, Oranges, Beans, and Maize are also grown. *F. Kingdon Ward.*

DESTRUCTIVE INSECTS AND PESTS

SCHEDULED BY THE BOARD OF AGRICULTURE AND FISHERIES.

III.*—WART DISEASE OF POTATOS.

DURING the past five or six years serious and widespread damage to Potatos has been caused by a disease to which the common name of "Wart Disease" has been given, or alternately "Black Scab," "Canker," or "Cauliflower Disease." The disease had already been known to exist in Great Britain for many years past, and had been described by different workers, but during the past few years it has come into prominence owing to its exceptional prevalence, and its insidious and increasing distribution by means of diseased seed tubers sent into unaffected districts. This disease was promptly scheduled under the Destructive Insects and Pests Acts, 1877-1907, and, with American Gooseberry-mildew, has had the distinction of absorbing the energies of a number of county inspectors, under the direction of inspectors of the Board of Agriculture and Fisheries.

To say that wart disease has proved troublesome is to understate its gravity. The following quotation will show how it has been regarded officially, for after the remark that none of the pests scheduled under the Order of 1910 has given rise to more controversy, and caused such adminstrative difficulty as wart disease, it is stated that:—"It has been referred to two, if not three, genera, and passes under half-a-dozen local and popular names. It has been asserted to be a new disease spreading with great rapidity through Great Britain, and it has been declared to have been known in parts of England for 40 years. It has been made a peg to hang strange superstitions upon, has roused far more than its proper share of interest abroad, and has been made the subject of more legislative restrictions than any other English plant disease; while much of the controversial literature on the subject has shown a painful lack of appreciation of the disease and the problems attending its control. Fortunately some useful work has been done on the subject during the period dealt with in this Report, and it is now possible to say, with a good deal more certainty than before, what the disease is, in what parts of Great Britain it exists, and what are the problems to be faced in dealing with it by administrative measures."†

The useful work referred to is doubtless chiefly that of the Inspectors of the Board, Mr. Malthouse, of the Harper-Adams Agricultural College, and, from the purely scientific side, of Professor Percival at Reading and Professor Johnson in Ireland, whose reports will be found respectively in *Centralblatt für Bakteriologie*, &c., vol. xxv, December, 1909, pp. 440-447, and *Scientific Proc. Roy. Dublin Soc.*, vol. xii, 1909-10, pp. 131-144. Valuable reports have since been made by the Harper-Adams Agricultural College (Newport, Salop), and by Mr. A. S. Horne in the *Journal* of the Royal Horticultural Society (vol. xxxvii, Part II, December, 1911, pp. 362-389), the latter containing references to 82 papers on this disease and the corky disease. Extensive accounts of the distribution of the disease and the administrative measures taken to deal with it will be found in the Reports of the Intelligence Division of the Board of Agriculture and Fisheries.

* The previous articles were published in the issues for September 28, 1912, p. 241, and October 12, 1912, p. 278.

† Board of Agriculture and Fisheries, Ann. Rept. Intel. Div., Part II, for the year 1909-10. (Cd. 5,470, 1911.)

The disease (fig. 144) is due to a micro-organism which has been placed by Percival in the genus Synchytrium, with the specific name Synchytrium endobioticum Percival. Briefly it may be said that Percival's researches show that in the warty growth on the diseased Potatos during summer and autumn there are produced (1) brown "resting" sporangia, most of which do not germinate until spring, though similar sporangia are produced all through the summer, and some of them germinate during the same season in which they arise, say, in July and August: these sporangia contain several hundreds of round zoospores; and (2) a second type of sporangia, produced chiefly in May and June: these are "either produced singly or two to five together, forming a sorus of sporangia enclosed within a brown coat," and each sporangium contains hundreds of zoospores similar to those in the "resting" sporangia (see fig. 144, 1 and 2).

When the sporangia germinate the zoospores, or swarmers, are actively motile in the soil water, and finally "enter the Potato through the delicate tissue of the buds on the thin rhizomes and in the 'eyes' of the young tubers." According to Johnson the roots of the plants are also attacked. From the time of infection there is very rapid growth of the adjoining tissue, and ugly, irregular warty outgrowths appear, varying in colour from dirty yellow to earthy or brown. The following passage from Percival's paper admirably describes what occurs: "The branch and leaf primordia of the eye grow out irregularly, and the new tissue superficially resembles pieces of the young fasciated inflorescence of a Cauliflower. The new warty growth may be looked upon as a malformed branch system stimulated by the parasite to grow irregularly and before its natural time. When formed on parts near the surface of the soil where light can get at it the growth becomes green, and portions sometimes resemble fleshy leaves. The 'tumours' vary in size; some of them are like small wrinkled Peas, others as large as a hen's egg, and greater than the tubers on which they are found. They may grow out from all the eyes on the tuber, or from only one or two. They also occur upon the thin rhizomes of the plant." The stem and foliage, and even the flower, of the Potato may also be affected, and an excellent photograph of diseased foliage has been published by the Board of Agriculture and Fisheries (fig. 145). Affected tubers are illustrated in fig. 144.

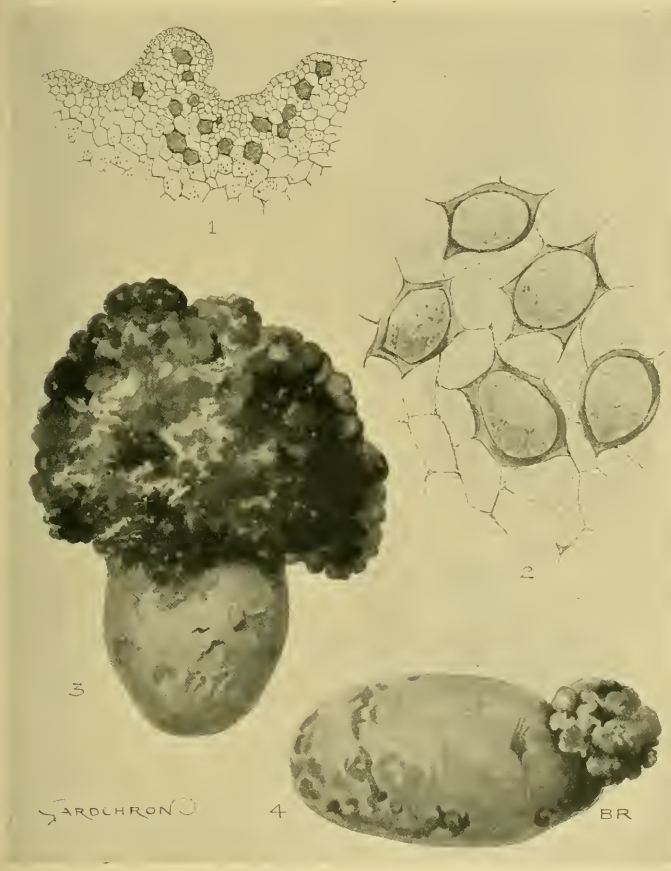

Fig. 144.—Wart disease of potatos (synchytrium endobioticum).

1, Section of Potato leaf showing wart disease; 2, resting sporangia, highly magnified.; 3, tuber in an advanced stage of disease; 4, tuber at an early stage of disease.

A crop affected by wart disease may be practically ruined, and diseased tubers are unfit for market, and must never be used for seed purposes, nor should any apparently unaffected tubers from a diseased crop be so used. Though serious losses occur on a few farms, the disease has been most troublesome in gardens and allotments where Potatos are grown very frequently. It may be said that the spores remain in the soil for a long period, and that if five crops of Potatos are grown on the same infected soil the land concerned will be ruined for Potato cultivation, whether the crops are grown in successive years or in a rotation of two to four or five years.

Since the presence of wart disease—or its suspected presence—must be at once notified to the proper authorities, and since the measures officially recommended are fully given in Leaflet No. 105, to be obtained free of all charge from the Board of Agriculture and Fisheries, it is not proposed to discuss preventive and remedial treatment here. It may be said, however, that the following procedure should always be adopted: (1) great care should be taken to ensure a supply of clean seed tubers, free from all disease; (2) since some varieties of tubers are resistant to the disease these varieties may be grown in districts where the disease has been prevalent. A list of varieties is given in the leaflet referred to, and some are included in the chart*, in which the yields of a number of resistant varieties are compared; (3) wherever the disease is suspected the proper authorities (the Board of Agriculture and Fisheries or the County Council) should be immediately notified, badly diseased tubers and haulms should be burnt, and the affected crop generally should be boiled and used for pigs. *H. C. Long.*

NOTICES OF BOOKS.

Heredity and Eugenics.†

It was a happy inspiration which led the members of the biological departments of the University of Chicago to institute a course of lectures to the general public on the recent developments of our knowledge of variation, heredity and evolution. The lectures were delivered during the summer of 1911, and their substance, incorporated in a well-illustrated volume of some 300 pages, is now available to a yet wider public.

The title of the volume does not appear to be well chosen, for a rough estimate of its contents shows that about seven-eighths of the pages are devoted to the subject of genetics, and that eugenics is confined to a modest one-eighth or even smaller fraction of the book.

For our part we have no quarrel with this distribution, though we are inclined to think that the eugenist may grumble at the thinness of the fare which is provided specially for his consumption. It may be, of course, that in choosing the title the authors wished to convey a discreet hint that, whereas we possess a substantial and valuable mass of definite knowledge on the subject of genetics, our certain information on eugenics is as yet but a thing of shreds and patches. Whether or no this be the explanation of a title which seems at first sight misleading, it is, in our opinion, a fact that our knowledge of the pure science of genetics is considerable, and our knowledge of the applied science of eugenics is slender, an opinion which is not dispelled by a

* Prepared from figures obtained at the Harper-Adams Agricultural College.

† *Heredity and Eugenics.* Published by the Cambridge University Press (Fetter Lane, London), as agents from the University of Chicago. 10s. net.

perusal of Professor Davenport's chapters on the latter subject.

We will devote our attention, therefore, to the larger section of the volume, which is concerned with genetics. Notwithstanding the fact that these chapters are the work of four authors, they exhibit a singular uniformity of style. The intricate matters are presented in a clear, straightforward if undistinguished manner, and it is only occasionally that such an expression as "generalise this view-point" mars the somewhat solemn simplicity of the presentation. When we turn to a consideration of the matter as opposed to the style, we confess to a certain sense of difficulty of judgment. We feel that the opinion of a member of the audience before which the lectures were delivered, would be of far greater value than that of one whose professional work lies in the science of genetics. Of this we are quite sure, that an English audience would have found it extraordinarily hard to follow a lecture so difficult as that by Professor Castle on Heredity and Sex, and that it would have been lost altogether in attempting to appreciate the lecture by Professor Tower on the Modification of the Germinal Constitution of Organisms by Experimental Processes. This lecture, or lectures, occupies no fewer than 128 pages of the book, and contains, we imagine, not fewer than 20,000 words. Undoubtedly the Chicago audience was not "gravelled for lack of matter."

If, however, we dismiss from our minds the origin of the book and regard it as a contribution to the literature of genetics, we cannot regret altogether the disproportionate length of Professor Tower's chapter, for it gives us a useful summary of the much discussed Œnotheras of De Vries, as well as of the valuable researches of Tower in inducing by artificial means modifications in beetles. Even with the number of pages at his disposal Professor Tower is only able to devote a paragraph to the classical work of Klebs in inducing modifications in plants.

The opening chapters, which are written by Professor Coulter, give a succinct but excellent account of the biological facts necessary to the layman who is commencing a study of the problems of evolution. They are succeeded by chapters by Professor Castle, who, as it seems to us, does not quite realise the attitude of the majority of mutationists whom he criticises. Professor Castle holds the view that evolution proceeds both by discontinuous and by continuous small variations, and suggests that mutationists insist on the former as the sole method of evolution. We are of opinion, however, that this contention is incorrect. The attitude of the mutationist is, as we conceive it, the logical attitude of asking for experimental proof of an evolution due to accumulation of small variations. He is aware that mutations occur, and he is induced to believe that appropriate analysis will show that cases in which evolution appears to proceed by a series of small steps are in reality examples of mutation.

The contribution by Professor East on Inheritance in Higher Plants and on the Application of Biological Principles to Plant Breeding will prove of most interest to horticulturists. On the latter subject the writer insists on the horticultural importance of first generation hybrids, and cites an example in the production of a more prolific variety of tobacco by inter-crossing Havana and Sumatra types. The former has large leaves and short, stocky habit, the latter is tall and has more but smaller leaves. The first generation of the cross has the large leaves of the one parent together with the larger number of leaves of the other.

As we have suggested already in these pages horticulturists might well make a larger use of the fact of the greater vigour of first generation hybrids. According to Professor East, Tomatos among other crops give good results when this method of breeding is practised with them.

The volume is well printed, and remarkably free from typographic errors, though "protein" for "protean" on p. 308 is unfortunate.

ORCHID NOTES AND GLEANINGS.

THE GLEBE, SEVENOAKS.

ELABORATE SYSTEM OF RECORDING HYBRIDS.

ALTHOUGH Orchid cultivation with a view to hybridisation was commenced by C. J. Phillips, Esq. (gr. Mr. Bucknell), but a comparatively short time ago, the fact that he has introduced business methods into his operations as a hybridist, though not with a view to profit, renders it possible to say of it that there are features in that collection which might be copied with advantage by others pursuing the same hobby.

FIG. 145.—WART DISEASE ON POTATO FOLIAGE.
(See p. 327.)
By permission of the Controller of H.M. Stationery Office.

First of all, none but the best obtainable varieties and hybrids are acquired for hybridising, and in crossing the probabilities of improvement, both in form and colour, are well considered. In this direction Mr. Phillips is assisted greatly by his method of recording the plants and the work done with them. His records are kept in the library by means of the "Card Register," now largely used in offices. The drawers contain a large number of cards, and a sufficient number is marked with the names of the species and varieties of each genus, which is indicated by the name of the genus on a larger card showing above the collection of species and varieties. On each card the name of the plant, its origin, and other particulars are entered, and a photograph of the flower is attached. Later, when the plant is crossed, the record is placed on the card. If the cross fails, it is also recorded, and if the seeds germinate, the date of the first appearance of the evidence of plant-life is entered, and other particulars as occasions arise. The photographs of the flowers and records of peculiarities in colour are studied, both forms destined for use in crossing being placed side by side, and the probabilities considered. This plan provides a means of definitely estimating the influence of either parent when the seedlings bloom, even though fresh flowers of the parents are not available, and thus many facts equally interesting to science and to floriculture may be determined. Coloured drawings of the choicest varieties are also secured when the plants are in bloom.

In sowing the seeds, Mr. Phillips leaves as little as possible to chance, all being carefully recorded, and each batch isolated as much as possible. The seeding house, which was originally a Melon house, has been carefully adapted, a lower stage of porous red slabs giving the moist surface, and other provision for moisture from the floor by natural evaporation secured. The house is in two divisions. The first is fitted with cases in which the seed-pots are placed, the seeds being sown generally on the convex, muslin-covered wads in the pots now commonly in use, although some Odontoglossums, &c., are sown on the surface of the compost in which other plants are growing. In the cases are tens of thousands of freshly-germinated seedlings varying from the tiny, spherical, green body in the first stage to the leafy forms of various sizes. The seed-pots are so thickly studded with young plants that pricking off into small store pots has to be done continually, or, if left too crowded, the seedlings "damp off," as it is called, and the whole sowing may be lost.

On the stage in the second division are large numbers of young plants of promising crosses, soon to take their places in the houses where they will flower.

The objects are chiefly to raise good, showy hybrids, which shall be advances on those previously flowered; to cross and raise hybrids of sufficiently showy, but widely dissimilar parentage both as regards species and genera; and also occasionally wide crosses of the Orchids of less beauty, but which would give interesting results. Evidences of these objects are numerous in the Orchid houses, many of the plants in which bear fine seed capsules approaching maturity. In the house in which the centre stage is occupied by Cymbidiums are several promising crosses, notably a fine fruit on Cymbidium Tracyanum crossed with a good form of C. Pauwelsii, and C. erythrostylum × Tracyanum. Here, too, Cymbidium Woodhamsianum is sending up a fine spike.

In the large Cattleya house several handsome, white-petalled forms of C. labiata are in bloom, especially good being C. labiata Mrs. E. Ashworth, C. l. glauca, and another fine form near to C. l. Cooksoniæ. Among dark forms of C. labiata the variety King George V is a noble form with richly-coloured flowers, the petals and broad lip being finely fringed. Cattleya Fabia alba and other white-petalled Cattleyas are also in bloom, the most remarkable being C. Rhoda alba (Iris × Hardyana), a very wide departure from any other form. C. Adula "The Glebe variety" is equally remarkable, its petals being very broad and the colouring attractive.

Various unnamed hybrids were in flower, together with fine, dark forms of Lælio-Cattleya Bletchleyensis, L.-C. Geo. Woodhams, which, from its strong growth and richly-coloured flower, should make a good parent; Brasso-Cattleya Ilene, and a very handsome secondary hybrid Brasso-Cattleya were also noted, and several good Cypripediums in bloom, the hybridisation of which, however, it is not intended to follow. Of interesting plants in bloom or set with seed capsules were Lycaste costata, L. hybrida, and a plant of L. Skinneri with three large seed

capsules, the one set with Cymbidium Wiganianum, another with Sophronitis grandiflora, and the third with its own pollen. Whether fertile seeds will result remains to be seen. Anguloa Cliftonii also bears a pod crossed with A. uniflora and Pescatorea Roezlii with Lycaste hybrida, and many other interesting crosses are bearing fruit. Huntleya meleagris is about to bloom, and will again be tried, although its crosses have previously failed, and in one of the houses is a noble plant of Cattleya O'Brieniana alba with nine leading growths.

In the Odontoglossum house is a good selection in bloom, and sturdy plants of most of the best forms of O. crispum, those noted being a superb form of O. c. xanthotes, O. c. Solum, O. c. Luciani, O. c. Carmania, and some grand flowers of the typical white type. Also good forms of O. eximium, O. ardentissimum, and some unnamed hybrids of excellent quality. Odontiodas give their bright-red colours, and have been already used for crossing, and several very wide crosses are rapidly approaching maturity.

The Orchid houses are near the dwelling house on the highest point, and surrounded by four acres of grounds, the sloping sides of which are planted with ornamental trees and herbaceous plants, while an extensive rock-garden has been formed recently.

THE ROSARY.

MY FIRST YEAR AMONG THE ROSES.

Last October I bought 60 Rose trees—climbers, bush and standard—from a well-known rose-grower in East Anglia, and, as I had never had a garden before, my experiences may interest some readers of the *Gardeners' Chronicle*, especially as the trees, except Lady Ashtown, which died owing to having been planted in a dry corner away from rain, have been masses of bloom, in most cases twice.

The soil is sandy and had not been prepared in any way before the arrival of the trees in late October. A day or so before they were delivered I had dug holes, in most cases not larger than would just allow the roots to be pushed in practically anyhow. The standards were staked well at the time of planting, as I found that wind was one of the features of the Hampshire coast, five hundred yards from which my new abode was situated. The oblong plot of ground on which the house is built has a south frontage of 100 feet, and the east end, where most of the trees were planted, is 33 feet. Throughout the winter the bushes and climbers were protected with soil well up above the top of the roots, and the standards with bracken fronds and tow during a short period of frost. In early spring I had two cartloads of horse manure thrown down among the trees and about the same amount of loam on top of the manure, as I considered it possible the rain would wash both the manure and the loam away too soon if they were dug deep into the sandy soil. I pruned the H.P.s and climbers early in March and the rest before April—in all cases hard; and by the middle of May the first blooms appeared on my only Gloire de Dijon. Since then Roses have never been absent, and, as I disbudded the first crop by allowing only one flower on each shoot, the blooms were exceedingly large and well-formed. From the time the first buds began to open liquid manure was used at least once a week, or rather an artificial manure scattered liberally round the trees and well washed in. At first basic slag was the sole artificial employed, while after June other kinds were used. The June crop, after severe disbudding, yielded from 12 to 18 perfectly-formed flowers on the following standards:—Clio, Hugh Dickson, Frau Karl Druschki, Capt. Hayward, Caroline Testout, Mme. Ravary, Gustav Grunerwald, Duke of Teck, White Killarney, Paul Neyron, J. B. Clark, Lyon's Rose, W. A. Richardson, Ben Cant, Baroness Rothschild, Maman Cochet, White Maman Cochet and Mrs. John Laing; while Gruss an Teplitz, Anna Olivier and Mme. Cusin had at least double that number. Of the bush trees Mme. Abel Chatenay, Zéphirine Drouhin, Ulrich Brunner and La Tosca have done well since the middle of June; Mme. Leon Pain, Claudius and Lohengrin have also grown excellent specimens both in summer and autumn. The following standards have over a dozen good buds and blooms—after disbudding—now:—Caroline Testout, Gustav Grünerwald, Mme. Ravary, Gruss an Teplitz (the four trees which have done best); J. B. Clark, Hugh Dickson, Clio, White Killarney (which has quite excelled in flower the ordinary Killarney), W. A. Richardson, White Maman Cochet (better in autumn than spring), Frau Karl Druschki, Anna Olivier and Captain Hayward. General Jacqueminot had a moderate June crop and a poorer autumn one, Prince Arthur was slightly better, and Killarney suffered badly from mildew both in leaf and flower. Others which suffered a little from mildew were General Jacqueminot, Paul Neyron, Lyon and Crimson Rambler. But insects and other pests have done little harm owing to fairly frequent syringings, the cutting off of mildewed growth, and chiefly from careful hand-picking as regards insects. Bessie Brown and Mrs. Theodore Roosevelt have had some large and beautiful flowers, but I would omit them in any future collection. Gloire Lyonnaise, A. Guinoisseau, Elizabeth and Marie Baumann are bushes which have done well, and Mme. A. Carrière has been satisfactory considering the windy position it occupies. Of the climbers Lady Gay has been easily first and Blush Rambler a good second, while the others have satisfied me in the following order:—Lady Waterlow, The Garland, White Dorothy, Crimson Rambler, Pink Rover and Dorothy Perkins (last probably because of a cramped root position). The trees which have so far had the least bloom are Rêve d'Or, Bouquet d'Or and Maréchal Niel, but these have at present some healthy-looking buds. Well-established trees are said to give much better results than first-season trees, but I shall be delighted in any season with anything approaching my first attempt at Rose-growing, in spite of the sandy soil, the careless planting, and the presence of established shrubs growing alternately with the Roses and of a whole host of flowers so crowded that no room exists for others. Of things other than Roses the shrubs (24) are strong and healthy and mostly from 6 to 7 feet; and the Delphiniums, Gladioli, Gaillardias, Lupins, Asters, and hundreds of spring bulbs have done remarkably well. Only the Pæonies failed—at least two out of three, for one was full of flower with the perfume of a Gruss an Teplitz and a Gustav Grünerwald combined. At present the Chrysanthemums are bursting into flower, and promise a bright scene for the late autumn. I am told by some friends that my excellent results with Roses are due to the fact that they enjoyed the wet summer in the sand after the heavy loam of their native East Anglia, and by others that they are due to the doses of artificial manure and the hose. But though these circumstances may have had a great deal to do with the success of the Roses, I cannot but think the chief reason is that I have killed insects by the million and shown no mercy to the finest of weeds. As a beginner in gardening, I have, of course, many things to learn, but one thing I have learnt is that no outdoor occupation—and I was for years the keenest of men at golf, cricket, football and other sports—has afforded me so much pleasure as gardening. So much so, indeed, that my golf sticks have not been touched since the early spring. A neighbouring amateur gardener has stated—and not with very amicable feelings—that I "live" in the garden. Surely no one would wish to live in a more beautiful place. *Weedless, October 10.*

TREES AND SHRUBS.

AUTUMN TINTS OF NORTH AMERICAN TREES.*

It is not the occasional flowers which can be found in the arboretum in the middle of October which chiefly make it interesting at this time, but the autumn condition of the trees and shrubs which flower in the spring or summer. Valuable lessons in decorative gardening can now be learnt here (Arnold Arboretum), for nowhere else are the colours assumed by the fading leaves of hardy trees and shrubs more varied and interesting; no other part of the world can equal the north-eastern United States in the abundance of the fruits produced by these plants, and in New England the most beautiful of all autumn gardens can be made.

The difference between eastern North America and western Europe in the autumn colouring of the native plants of these two regions is now well shown in the arboretum. The leaves of the plants of eastern North America are now for the most part brilliantly coloured or have coloured and fallen, while the leaves of the trees and shrubs of Europe are still green, and in the case of many of these plants the leaves fall and wither with little change of colour. This interesting fact is seen in the American species of the genus Fagus. The American Beech now enlivens the forest with the yellow tints of its leaves, while the leaves of the European Beech are still almost as green as they were at mid-summer. The leaves of the American Elm have already fallen, except in the case of vigorous trees which still show the yellow tints of autumn, while the leaves of all forms of European and Asiatic Elms are still fresh and green. The leaves of Viburnum Lantana, the wayfaring tree of Europe, are still dark green or only slightly tinged with red along the margins, while the North American Viburnum Lentago, V. prunifolium, and V. cassinoides are splendid in their autumn dress, which is set off by their dark blue fruits. The contrast between old and new world plants in this respect is even more marked in the Viburnums of the Opulus group. Of these the leaves of the European Viburnum Opulus are still dark green and as fresh as in July; those of V. americanum, the native High-bush Cranberry, so-called, have turned to shades of yellow and red, and are fast falling, while those of V. Sargentii of north-eastern Asia, which were bright orange-red two weeks ago (September), have almost disappeared.

Many of the trees and shrubs of Eastern Asia, however, are as brilliant in colour in autumn as those of related American species. On a few Asiatic plants the autumn foliage is even more beautiful than that of the American plants in the same genus. The collection of Grapes (Vitis) illustrates this fact. This collection, which is now well established on the trellis at the east end of the shrub collection, is one of the most successful groups in the arboretum, and is particularly valuable in showing the decorative value of many of the Grape vines of Eastern America which have not been often cultivated. The autumn leaves of American species turn yellow or remain green until touched by frost, to which they are very sensitive, but on the principal Japanese species, Vitis Coignetiæ, a large and vigorous vine with immense semi-coriaceous leaves, the leaves in the autumn turn brilliant scarlet. They are not always so brilliant here, however, as they are this season, for Vitis Coignetiæ is a plant from the far north, and it is possible that the climate of Eastern Massachusetts is not severe enough to bring out every year all its autumnal beauty. It is, however, one of the handsomest of the Grape vines in the arboretum collection, and for Canada and other cold regions it may be expected to become the most valuable of hardy vines.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ALPINE PLANTS AND MANURE (see p. 318).—
—Dr. Farmer calls attention to a much neglected detail in the cultivation of Alpines, for the general belief is that these plants do not require manure. At The Six Hills Nursery during the last few years we have used artificial manures for many Alpines as a matter of course, and every year we experiment on a few fresh subjects. Down to the present we have not found any plants that are not benefited by this treatment. Plants of Campanula pulla, C. pulloides, C. pusilla varieties, and other dwarf species growing in pans 14 inches in diameter received applications of concentrated manure (Clay's) at the rate of a teaspoonful to a pan every three weeks from the middle of March until the flower-buds were showing. In each case much larger flowers and stouter stems were obtained, but C. pulla gave the most marked result, the flowers being three times the size of those on plants not manured. Varieties of Saxifraga aizoon develop a much larger and stronger inflorescence when fed at the time the flower-spike is first seen in the centre of the rosettes of leaves. Saxifragas of the Kabschia and oppositifolia sections are greatly benefited by an application of manure during their season of most active growth. At the present time we have a frame containing about 3,000 plants of these Saxifragas raised from cuttings inserted in April, and potted early in June in 2½ inch and 1⅞ inch pots. In early August, when the roots had grown round the insides of the pots, a 2½ inch pot of fertiliser, mixed with five times its bulk of sand, was given to each 300 plants. The result has been a surprise to everyone who has seen them, the plants being twice the size they would have been without the manure. Other Alpines which show good results from feeding are Gentiana acaulis, G. verna, Onosma echioides, Oxalis enneaphylla, Lithospermum graminifolium, and mossy Saxifragas. Considerable care is necessary in using artificial manure for Alpines, a much smaller quantity being required than for ordinary garden plants. It is best to mix it with dry soil or sand to ensure even distribution. Manure should never be applied to plants that are dry, and care should be taken that no manure is allowed to remain on the foliage; choose a dull day for applying the manure. *C. Davies, Stevenage.*

———The notes by Dr. Farmer on this subject are both interesting and valuable. As he states, "there is obviously room for much more experiment," and much might be done were Alpine gardeners less timorous and conservative. It is quite true that the application of nitrogenous manures to not a few Alpines might result disastrously, as, for instance, with Omphalodes Luciliæ and Onosmas, though even with these it may be, after all, but a question of degree, or the perfect decomposition of the manure, and the nature of the soil in which the subjects were planted. Naturally, too, the method of application would play an important part, and a plant that would benefit by manure as a mulch might suffer from it if intermingled with the soil in which the plant is growing. For mixing with the soil I know of nothing so valuable as two-year-old cow manure, first heated and dried to destroy insect life, and subsequently finely pulverised or sifted. In this way I have used it with considerable success at the rate of one part to eight of Banstead or other loams, securing an increased vitality without that excess of vigour or sappiness so likely to lead to disaster. Farmyard manure of any sort or in any condition is not recommended, nor is it desirable as a mulch to plants growing in the rock-garden. It is too great a temptation to birds, and the plants suffer accordingly. In the soil, however, many Alpine Primulas delight in well-decomposed stable manure. For example, P. marginata, all the P. "intermedia" set, P. pubescens alba, P. villosa, P. latifolia, and others. Nearly 25 years ago some plants of P. nivalis (P. pubescens alba) from Mr. Smith, Newry, passed through my hands. Their roots bore such evidences of manure that I wrote enquiring if it was usual to employ manure in their cultivation at Newry, and got the characteristic reply that they were found to be "just as happy on the manure heap as anywhere else." Primula Sieboldii is quite a glutton for manure, and exhibits greatly-increased colour beauty and vigour without any disadvantage. It is 30 or more years since I began experiments with artificial manures for Alpine plants, always, however, incorporated with the soil. In this way I have employed certain proprietary manures, also bone-meal, and superphosphate of lime. The patent manures were chiefly used for Primulas, and at the rate of a levelled 48 potful to a barrowful of soil. Ourisia coccinea and many other plants delighted in it. I was less satisfied with this mixture for the rarer Saxifrages, and so adopted the bone-meal and superphosphate, the first-named applied at a similar strength proving the best. My most disastrous experiment, however, was the result of using the burnt ashes from a large fire of weeds and wood rubbish with the soil for these same plants. The mixture appeared ideal, but proved a complete poison. In less than a week some of the plants were black in the face, and an examination of the root-fibres revealed that they also were black. Quickly realising what had happened, I washed the plants in water to free them from the soil. One 8-inch potful to 1½ bushel of soil was about the rate at which it was used. To-day I record it against myself as an error of judgment, wrong in practice, unsound in principle, since I had no means of determining its strength. Brought into immediate contact with the roots, the salts in solution constituted a fatal dose. Had the material been applied as a mulch, with not less than eight times its bulk of soil, it might have proved beneficial. Obviously, potash in a certain form and of known strength is good for Alpines, as witness Dr. Farmer's experience, whilst potash and ammonia combined in wood ash, and of unknown strength, are dangerous. Surface applications are the only means of manuring rock-gardens, and, that being so, there is no longer need for starving them on the old, orthodox lines. *E. H. Jenkins.*

FLOWERS AND INSECTS.—In a short paragraph in the *Gardeners' Chronicle* for October 26, p. 317, it is said that it might be inferred from Mr. Plateau's observations "that insects require other signals than those provided by colour before they will deign to visit flowers." But many flowers without any scent, at least to our sense of smell, are visited, such as Campanulas, Epilobiums, as well as the white Convolvulus; but the following incident proves that the white butterfly, at least, is attracted by colour where scent was out of the question. Walking down High Holboru, I saw a white butterfly hovering in front of a shop window. I crossed the road to watch it, and found it trying to settle on the pane immediately in front of some large china jars covered with painted flowers. Finding it impossible to get at them, it flew away. *George Henslow.*

BLUE TITS AND SWEET PEAS (see p. 318).—May I protest against the act of *W. A. M.* in shooting a seagull for the purpose of using its corpse to scare tits from his Sweet Peas? Apart from the fact that gulls are most useful and indispensable birds for keeping our sea coasts free from decaying refuse, and also for destroying numbers of destructive insects and other small fry on the fields, *W. A. M.* is not justified in killing them for *any* purpose, let alone such an unworthy one. Neither is he justified in killing the tits, which are also of great use in destroying insects. His Sweet Peas can be protected in a variety of other and less drastic ways. If he has a large stretch of plants, why does he not wire or net the whole patch in with 7-foot posts at the corners, and here and there between for strengthening purposes, the net or wire netting being stretched on wires strung from post to post? Raspberries and other fruits are protected in this eminently sensible manner, but if it does not appeal to *W. A. M.* and other readers in difficulties, let me recommend them to send a shilling to the Royal Society for the Protection of Birds, 25, Queen Anne's Gate, London, S.W., for one of their booklets on *How to Protect Grain, Fruit, &c., without Destruction of Birdlife*," which will give a wealth of practical hints on the matter. *C. Nicholson, Hale End, Chingford.*

ON JAPANESE GARDENS (see p. 312).—May I a little embroider upon Canon Ellacombe's theme? Not that in any word I should venture to disagree with what he, in Japanese phrase, augustly says. But just as there was at one time, I think, a rather silly craze among the ignorant for everything Japanese, in the garden or out of it, so now there seems to me a danger of swinging back too far into the other extreme, to a crude contempt for all the really valuable lessons that the Japanese gardeners have to teach us. I claim that our debt to Japan is far more than that of a few "avadavats and Indian crackers" in the form of Magnolias and Pæonies; that, in fact, if our hearts be humble and our eyes rightly open, Japan can be a perfect Uncle Oliver to us in the precious gifts of learning. We have been too long blinded by this nonsense about imitation. So long as we try to "imitate" Japanese gardens so long shall we be utterly alien from the good lessons of Japanese gardening. The way of imitation is death: by wise adaptation goes the road of learning. The horrors that one has seen at home by way of "Japanese gardens"! The ridiculous mudpies at the White City that the Japanese must have chuckled over grimly to themselves as they erected them for the confiding admiration of us poor innocents; the devious compilations of stepping-stones and Bamboos; the "Japanese" gardens that consist of a rustic "summer-house," a Hydrangea, and a bronze stork! No wonder there was a reaction against such rubbish. Of course, there cannot be a *Japanese* garden without a Japanese house for it to fit. (But, oh! Canon Ellacombe, I hanker still! If you had been with me in my house in Tokyo, where the winter is far worse than mine up here, and quite Polar to Bitton, you would not be so sure as to the foolishness of having some such delicious and delicate structure, with its garden, tucked away in some sheltered corner of this country, well out of sight of churches, and houses, and railways, and gasworks. That would be my dream if I were rich; but, there, it is only a dream, and beside the present point.) Well, granting the generic absurdity of Japanese houses and gardens in our country, I still think two great injustices are done to the Japanese principle nowadays. For one thing—and this is merely a matter of taste—as people may once have overvalued (I cannot think it possible) the beauty of a Japanese garden, so now, it seems to me, they tend far more grotesquely to undervalue it. There are a hundred thousand different forms of beauty: education means the gradual widening of the spiritual eye to embrace them all. We grow from Dahlias to Delphiniums: from "bedding" to Bitton. The beauty of a Japanese garden is a step to take, and it is a real step, quite as far apart from the vulgar and uneducated Japanolatry of some years since as from the cold contempt into which more recent taste seems to be reacting. Can it really be possible, though, that Lord Redesdale has nowhere any warmer word? Alas, for me, then! I cannot be cold to any form of beauty; "nihil decorum a me alienum puto"; and I can no other, like Luther at Augsburg, than declare that some of the great Japanese gardens have seemed to me of a beauty so exquisite and overpowering and perfect that they took my breath away, and still hold my spirit captive, hardened as I am by now to even such splendours as Bitton, and Levens, and Belvoir, and Myddleton House. Of course, they are harmonies compiled from Nature: that is, the most rigidly artificial of compositions, not servile imitations, but embroideries on a theme (like this note of mine on the Canon's). But they *are* beautiful—overwhelmingly. I declare it again, with the more confidence that I remember how all, surely, who have seen the *real* thing—as distinct from stupid or impudent European mistranslations—are on my side with all their hearts. Nor is their appeal made to the educated eye alone: I am as the beasts that perish with regard to the iron rules, the profound symbolism, the countless restrictions and prescriptions that make the grammar of Japanese art: yet on me, as on every other uninstructed globe-trotter, the beauty of a good Japanese garden imposes itself irresistibly at a glance, while, as for the Koraku-En, it will haunt me on my deathbed, and I shall think I am in Heaven. So, let those who have not seen Japanese gardens trust me who have. They *are* beautiful, and

with a beauty that excludes no other form of beauty from one's affections. And my second point is this: without imitating, or doing anything so silly, we can, by studying the spirit of the Japanese garden, glean a hundred invaluable lessons. The Canon rightly speaks of our rock-gardens and moraines. It is precisely there that a wise love of Japanese gardens and an understanding of their harmonies can most conspicuously help us with our own. Never may one dream, indeed, of copying a real Japanese garden, or of possessing a sham one made of storks and botrytic Lilies; but look at the true thing, and see how perfect the scale, how precise the proportion, how every rock holds exactly the right position, how every tree and bush is placed at the one inevitable point in a faultless composition, until at the end, so final and absolute is the effect of the whole, that the rash beholder is led into overlooking the art, the skill, the perception and forethought that have gone to make up what looks so simple a picture because it is so flawless, and thus, in the ignorance of his heart, begins to talk about "imitations" of Nature. Poor, dear Nature, if only she could do as well as her copyists! This sort of thing is not done at once: it takes some thousands of years to acquire that expert and unerring artistic sense and certainty of touch which enables a Chinese or a Japanese easily, and as if by instinct, to get every line or curve into the exact place and relation to each other that the preconceived composition requires. We have been building rock-gardens for some fifty to a hundred years. When I think of the shapeless jumbles that even now prevail, the amorphous stone-pies, potato-ridges of rock, dogs' graves, raw wildernesses of chaos and cement monoliths that we nowadays employ to dignify our Alpines, my whole grateful soul revolts against the scorn with which the uninstructed turn upon the Japanese rock-garden, so dignified, harmonious, concentrated, simple, and serene. Our Alpines would not suffer from being grown in such a composition: is it not possible for us to steer a middle course between fulsome Japanolatory and our native notion that "anything will do": and without trying (goodness knows it would be in vain) to repeat Oriental work in the West, to understand that in the East they have a sense of scale, proportion, composition, and harmony in their gardens (as in everything else) such as it would not hurt us to study also in our gardens and in our lives; but, above all and most especially, for the benefit of those unguided stone heaps or quarries which at present are considered good enough for the treasures of the hills? Let us have moraines and everything; but why is not our rockwork to be a beautiful picture no less than its plants—a careful composition? And this it can never be until we learn to have more respect for the profound wisdom underlying the elaborate gardening ritual of China and Japan. *Reginald Farrer.*

The Narcissus Fly (Merodon equestris) (see pp. 278, 318).—The article by Mr. Bliss is calculated to help those who are anxious to stamp out this pest, and I recommend, especially, raisers of new varieties to carefully read his letter. The retardation in the egg state causing delay in the development of the larvæ is a very important matter that no one hitherto has published any observations on. I now wish to point out my theory in connection with the two sizes of the grubs referred to by Mr. Bliss. I have in my possession a larval grub found in a bulb turned up on its showing defective foliage at the end of May, before the fly had deposited eggs that could possibly have developed so far. This larva I took out of the bulb, which was small, full of refuse, and evidently not capable of maintaining the larva until it metamorphosed. I therefore split another bulb, and fixed the grub therein. I have just examined this grub; it is very much alive, has burrowed into the dry bulb, and is still in the larval state. This fact is in agreement with Mr. Bliss's letter where he refers to the small and larger grubs found by him in his search. I think, therefore, I am right in assuming the two-years (approximately) larval life of the grub. Mr. Long in his letter on p. 318 recommends three processes for destruction: 1, Lifting early and drying to kill; 2, spraying to prevent the female laying eggs on foliage; and 3, steeping the bulbs in water for 24 hours; but neither method is approved by experience. The gruh is capable of living in the dried bulb; the female does not eat the leaves (even if the spraying could get to the neck of the bulb, which I doubt), therefore the eggs are not affected, and previous writers who have tried the dipping say *Don't!* I would recommend: 1, The use of a proper net to catch the fly; 2, the close examination of all lifted bulbs; 3, careful search round all foliage showing injury in March and April; 4, a watch early on cold mornings for the fly in a semi-torpid state on hedges, Box borders, and along the Daffodil beds. I caught with my net in 1911 184 flies, of which number 47 were females and 127 males; in 1912, 66 females and 38 males. *Geo. Stocks, Doncaster.*

Origin of Perpetual-flowering Carnations.—Surely Mr. Cook (see p. 296) knows that almost every writer on Carnations, including that greatest American authority, Mr. Chas. Willis-Ward, admits that the American Perpetual Carnation came from the French Remontant Carnation in the first place. M. Dalmais, of Lyons, is generally credited with raising the first of these about the year 1840. However, it is certain that the French Remontant Carnation is the parent of all the Anglo-Saxon varieties of Perpetual-flowering Carnations, and the Americans themselves readily admit this. Regarding the raiser of the Perpetual Malmaison Princess Juliana, if Mr. Cook only took the trouble to look at Messrs. Low & Co.'s breeding book, he would see that I crossed Malmaison Yaller Gal on to Mrs. Lawson in 1905, and Princess Juliana was a progeny entered as H.M. 22. Mr. Hopper left the service of Messrs. Low & Co. in 1904, *Montagu C. Allwood.*

Winter-flowering Begonias at Hale.—On the occasion of a recent visit to Messrs. Clibran's, at Hale, Cheshire, I saw thousands of winter-flowering Begonias in bloom. Some of the more conspicuous varieties comprised Clibran's Pink, Clibran's Triumph (salmon-red), Beauty of Hale (salmon-rose), Altrincham Pink (an excellent variety of erect habit), Perfection (rosy-red, very free), and Progress and Apricot, these last two varieties exhibiting quite new shades of orange. Among the novelties of the present season were flowers of beautiful shades in single, semi-double and double forms. The condition of the plants was excellent, and they well illustrated the value of this new type of Begonia for winter-flowering. *R. C. B.*

Moraine Gardens.—I read with interest Mr. Arnott's note on the moraine garden (see p. 296). For many years I have maintained that the culture of Alpines in Sphagnum-moss is only suitable for dry climates, and is not to be recommended for English gardens. Concerning the moraine itself, if it is not watered from below it is not a moraine garden; neither should the name be used in the case of a sand or gravel garden. *H. Correvon.*

Germination of Seeds.—So many letters have appeared in the *Gardeners' Chronicle* lately relating to the difficulty of germinating certain seeds that I feel impelled to propound my own very simple remedy, which I term "the miniature bush fire method." Where all hard-shelled seeds are concerned, whether Leguminous or Junipers or Macrozamia, I have always found it answer. Take the pot or pan in which it is intended to sow the seed and fill it with earth having a medium amount of moisture. Sow the seed and sift a little more earth on top; then take the pot out-of-doors and get a handful of Hay or Ferns sufficient to cover the pot as if it were buried in a little haycock. Set fire to it and let the Hay burn out. When the pot is sufficiently cool take it into the hot-house and give it a shower of rain from an ordinary watering pot with a fine rose. Wait 10 days, and if there are no signs of germination, repeat the operation; but it is a hundred to one that it will not have to be repeated. *Caution.*—Take care not to burn the labels; the pot may crack if the soil is too wet. I first thought of this method after seeing seedlings come up in millions (Acacias chiefly) after a bush fire in Australia which had been shortly followed by a shower of rain. *A. A. Dorrien Smith, Capt., Kingshill, Berkhamsted.*

A Gloucestershire Wild Garden.—The interesting account of a Gloucestershire wild garden (see p. 309) should serve a good purpose by encouraging the cultivation of more of our native plants in gardens. As indicated in the article, these plants frequently grow more vigorously and form more attractive subjects under cultivation than when struggling for existence in a wild state. The native flora includes some really beautiful flowers that are worthy of a place in any rock-garden, and were they expensive and more difficult to procure, patrons of gardening would be eager to add them to their collections. Others are more suitable for the wild garden, or the stream side, and, when suitably placed, they form delightful features. *J. Gardner, Batsford.*

Apple Bramley's Seedling. — *Southern Grower* complains (see p. 278) of the inferior quality of his Bramley's Seedling Apples this season. I am forwarding half-a-dozen fruits of this variety. They represent an average sample gathered from a tree 14 years old. You will notice that their colour is very good. Our Apples are grafted on the free stock, and growth is vigorous, but they produce fruits of a good uniform marketable size. The soil is shallow, and rests on a silt of the old river bed; it is naturally very warm. The trees receive a liberal dressing of artificial and bone manure each season, and in the winter we dress the ground freely with soot, which is a very cheap winter dressing. Trees on the Paradise stock produce larger and flatter fruits, and bear in a younger stage than those in the free stock. *Stephen Castle, Walpole St. Andrews, Wisbech.* [The fruits received from our correspondent were of satisfactory size and extremely good colour for the variety.—Eds.]

FOREIGN CORRESPONDENCE.

COLORATION OF FOLIAGE.

Many interesting ideas and some facts have come to light on the coloration of foliage and fruit in the recent correspondence in the pages of the *Gardeners' Chronicle.* Last year was phenomenal in Holland; the foliage coloured exquisitely, for there were no very early and severe frosts to mar the effects.

This year coloration had hardly begun when several sharp frosts occurred; the leaves of the Horse Chestnut were frozen in one night and fell immediately. The leaves of Juglans (Walnut) fell before showing any signs of colouring or ripening.

The Tulip tree (Liriodendron) had no time to assume that hue of golden glory which makes them such a picture in the light of the setting sun. The first frost caused the leaves to curl, and the last to turn brown, and now, with wind and rain, all the trees are bare.

The Oaks and Beeches, despite a bareness in exposed parts, are now a wealth of old gold colour. Previous to the frosts of October 3 and 4 the foliage was green, or hardening into a dull brown, and it seems incredible with the cold and damp atmosphere that has prevailed such colouring could be possible.

Of the American Oaks, Quercus rubra makes the finest blaze on young trees, and when of low growth the colour of the enormous leaves seems to be even more intense. The large trees of Q. rubra rarely develop autumn tints, the leaves turning at once a dull brown and falling, whereas the old specimens of Q. palustris and Q. coccinea colour gloriously. Perhaps the deepest hue of all is to be found in the leaves of Q. sessiliflora rubicunda, the uprightness and the short branches giving the tree a pillar-like character amongst other trees.

Last year Q. macranthera was a mass of golden-brown; this year every leaf has fallen prematurely. Sheltered specimens of Liquidambar are slowly assuming hues in which a purplish-metallic shade is predominant.

Perhaps the richest colouring of all just now is to be found in the masses of hardy Azaleas, but the glory is only for a briefness we dare not utter—a gale or a frost and autumn's fleeting, fiery charms will be no more. *H. Rabjohn, Twickel Gardens, Holland.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

ROOT-PRUNING AND PLANTING.—Seldom has the weather of autumn been more favourable for carrying out these operations, for even the heaviest soils have been sufficiently dry to permit of the work being done. Every effort should be made to complete these ground operations. Trees that are root-pruned and planted early under favourable conditions should give little or no trouble next season; whereas those planted later in unfavourable weather cannot be expected to be so satisfactory. Although the trees are not yet defoliated, the wood is fairly well matured, and they are in the best possible condition for lifting and planting. In selecting a new site for an orchard choose a fairly exposed position on a deep and well-drained soil, a partly-shaded position will also give good results. It is most important that the soil be well drained and the holes made large enough to accommodate the roots.

WALL TREES.—The planting of wall trees should receive early attention, as the sooner the work is completed the better will be the results next season. Reserve trees should always be at command to replace useless or worn-out specimens. Borders at the foot of south walls are generally well drained, and it is equally important that those in other aspects, including north borders, are also perfect in this respect. Many varieties of Cherries, Plums and Pears will succeed on north walls, and the fruits maturing later extend the season. The old soil should always be removed when replanting wall trees and replaced with fresh compost. A little bone-meal may be used with advantage where Peaches and Nectarines are planted, but manure of any other kind should be avoided. Dessert Cherries are amongst the first of the stone fruits to require attention. Young trees that are making too much growth should be lifted or partly lifted and replanted, adding lime rubble and wood ashes to the soil, but not rich loam. In planting Cherries of all kinds mix a liberal quantity of lime rubble with the soil and make the ground thoroughly firm, but be careful that the planting is done in dry weather. Apricots delight in a well-drained, calcareous soil, and should only be planted against south or west walls. The trees require plenty of water when in active growth. Young, healthy specimens do best when not disturbed, although the roots may be pruned moderately in their early stages. Old trees of Apricot resent severe root pruning or any other check after they attain a certain age, the effects of which are seen in gumming.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

DISA.—Plants of D. grandiflora, D. racemosa, D. langleyensis, D. kewensis, D. Veitchii, and others are developing shoots from the bases of the previous year's growths, and should be given attention at the roots. Specimens that have become pot-bound and formed crowded masses may be turned out of their receptacles and divided. All the old soil should be shaken from the roots and the portions made up into specimens again. In doing this arrange growths of a uniform size, the object being to have the portions in flower at the same time. If desired the stronger shoots may be potted singly in 4-inch pots. When these growths have rooted freely they may be shifted into pots 7 inches in diameter. Fill each pot one-third its depth with clean crocks for drainage, place a layer of Sphagnum-moss over the crocks, and fill nearly level to the rim with the compost, which should consist of two-thirds fibrous peat and Sphagnum-moss, one-third fibrous loam from which all the small particles of soil have been removed, and a liberal quantity of silver sand and crushed crocks. The roots are very brittle and easily broken, therefore extra care should be taken not to injure them. The plants should be grown in the cooler part of the Odontoglossum house or in a moist, shady position in a cool greenhouse; they should receive plenty of air at all times. The surface of the soil should be kept just damp until the roots are growing actively, when the supply of moisture should be increased gradually. At that stage the plants will be benefited by living heads of Sphagnum-moss placed on the surface of the compost. They should be sprayed overhead during each fine morning, and the surroundings kept moist at all times. Fumigate the house occasionally to prevent thrips infesting the plants.

DENDROBIUM.—The majority of plants of D. Phalænopsis Schröderianum and its varieties are in full bloom, and the flowers may be kept in a good condition for several weeks if a dry atmosphere and intermediate temperature are maintained. The flowering must not be allowed to exhaust the energies of the plants, therefore as soon as the pseudo-bulbs show the least signs of shrivelling the spikes should be removed. After the plants have passed out of flower, they should be placed near to the roof-glass in a house where the temperature does not fall below 60°. During the long season of rest the roots should be afforded only sufficient water to keep the pseudo-bulbs plump. Plants of Dendrobium formosum and its variety giganteum should, after passing out of flower, receive similar treatment to that recommended for D. Phalænopsis. Evergreen Dendrobiums, such as D. densiflorum, D. thrysiflorum, D. sauvissimum, and D. chrysotoxum, should as the season's growth is completed, be grown in an intermediate temperature and afforded only sufficient water at the roots to keep the leaves fresh and the pseudo-bulbs plump. If these plants are over-watered or subjected to a low temperature during the resting season the foliage becomes spotted and unsightly.

PLEIONE.—Plants of P. Wallichiana, P. præcox, P. maculata, P. lagenaria, with pseudo-bulbs matured and bare of leaves, should be placed in a moderately dry position in an intermediate temperature to flower. When watering the roots avoid wetting the buds or flowers, as it may cause them to damp off. P. Hookeriana and P. humilis bloom at a later period, and should be still kept in a cool house, affording them just sufficient water to keep the pseudo-bulbs from shrivelling.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

FREESIA AND LACHENALIA.—The earliest batches of these plants are pushing up their growths, and the pots should be placed quite close to the roof-glass in a frame, or on a shelf in a cold greenhouse. If Freesias are required in bloom by Christmas, they should be placed in a slightly-heated frame or house, but no attempt should be made to force them into growth, or the shoots will be weak and the flowers poor.

ROSES.—If it is proposed to supplement the stock of Roses in pots, the present is a good time for potting suitable varieties from the beds. The plants should be potted as quickly as possible after they are lifted, using a good rich compost and plunging them as advised for those already established. The stronger roots may be pruned a little, and the tops of the stronger-growing varieties shortened a trifle. General Jacqueminot, Captain Hayward, Frau Karl Druschki, Mrs. J. Laing, and Mrs. R. G. S. Crawford are all good H.P.s that may be relied upon to bloom well. Others that are suitable include Mrs. W. J. Grant, Kaiserin Augusta Victoria, Lady Hillingdon, Joseph Lowe, Mme. Maurice de Luze, Mme. Abel Chatenay, Sunburst, Liberty and Richmond. The following climbers may also be lifted and flowered successfully in pots, if the latter are plunged till the plants get well rooted:—Dorothy Perkins, Hiawatha, Excelsa, Electra, Goldfinch, Tausendschön, Paradise, and Blush Rambler.

SHRUBS FOR FORCING.—The present is a suitable time to pot the various shrubs intended for forcing during the early spring. Such plants as Azalea sinensis, Lilacs in variety, Viburnum, Staphylea, Prunus of sorts, Philadelphus, Wistaria, and Laburnum may all be employed for the purpose. The flowers will provide a valuable supply of cut blooms, whilst the plants will furnish excellent specimens for decorating the greenhouse and conservatory. Many of the plants may be forced from year to year, provided they are given suitable treatment after they have flowered. They need proper attention all through the summer, and this applies especially to Wistaria and Laburnum. It will be found that these pot plants, with their short, slender growths, furnish a larger quantity of blossom than the ordinary shrubs in the open. Lilacs are much more satisfactory when they have been grown in pots for a season before forcing; specimens lifted from the ground, potted and forced the same season will often fail to produce satisfactory blooms. Plants of Azalea sinensis may be allowed to remain in pots after they have bloomed, but the best plan is to plant them out before lifting them again for forcing the following autumn. But this plant can be purchased very cheaply, and a fresh stock every season is a great advantage. Plants of Cerasus, Deutzia, Staphylea colchica, Prunus, Philadelphus, shrubby Spiræas, and Viburnums may all be lifted from the open ground, potted and forced into bloom during the coming winter and spring. The potting should be done as early as possible, and the plants plunged in a bed of ashes until they are required. Both Cytisus Andreanus and C. præcox are useful for flowering late in the spring. The plants, however, should be established in pots before they are forced, as specimens lifted from the open receive too great a check through the greater portion of the soil becoming detached from the roots. Hamamelis arborea (The Witch Hazel) makes a very pretty object when in bloom, and may also be forced in pots. Specimens 3 or 4 feet in height arranged with other forced shrubs are very effective. Most of the plants I have enumerated may be grown as standards, in which form they are very useful for standing in large vases in the dwelling-house, or for serving as foils amongst the other shrubs in the conservatory or winter garden. Several of the deciduous Magnolias may be grown as pot plants. They form striking objects when in bloom, and show to advantage arranged with Bamboos, especially the elegant Bambusa gracilis. Dielytra spectabilis is a very decorative plant when in flower, and may be included in the list of forcing plants. Its cultivation is extremely easy. The herbaceous Spiræas may also be potted now, and, although these are perhaps not so decorative as some of the other kinds I have enumerated, they are hardy and extremely useful where large numbers of pot plants are required. For very early flowering, it is best to purchase retarded crowns, as these bloom sooner than plants lifted from the ground.

ACHIMENES.—These plants have also completed their growth, and the corms may either remain in the pots or the soil be shaken from the roots, and the corms stored in pans or dry sand. The pots should be placed on their sides in a cool house to prevent water reaching the soil.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

SEAKALE.—The plants grown for providing crowns for forcing have completed their growth, and the first opportunity that presents itself should be taken of lifting the whole of the crop and storing the crowns in a convenient place for drawing upon as occasion requires. If no better position can be found for them, they may be neatly laid in under a wall and well covered with sand or ashes. The rootlets should first be trimmed off and put into baskets, and, during inclement weather, made into sets or thongs for planting next spring. These rootlets should be cut into lengths 5 or 6 inches long; the upper cut, which will eventually form the crown, must be cut straight across, and the lower one a little on the slant. Tie up the prepared root-cuttings in bundles of 25 and store them in a cool place. Towards next February they may be introduced to a gentle heat and moisture to start into growth, thoroughly well hardening them off afterwards before planting out-of-doors.

CAULIFLOWERS.—Examine the Cauliflower break frequently and protect the curd of any plants coming into use by tying up the leaves and bending over a few of the longer ones. Before the month gets too far advanced, the latest plants, which would not be likely to

mature out-of-doors, should be lifted and laid in cold frames, where they may receive adequate protection from frost. After transplantation, give the plants a good watering in and keep the frame closed for a day or two. Following this period, air must be admitted on every favourable opportunity and the yellow leaves removed as often as they are observed. Plants of Cauliflower that were left for seed should now be lifted from the open ground and suspended in a cool, dry, and airy structure to complete their ripening.

Chinese Artichokes.—These are not commonly seen in gardens; nevertheless, they are delicious eating, and their use provides extra variety during winter. The crop may now be lifted and stored for use as required. Every tuber that can be found should be lifted; otherwise they will form a source of continual trouble next season, as every particle is capable of producing growth. These little Artichokes make a very attractive dish in a miscellaneous collection at the exhibitions, and, when wanted for that purpose, are best left in the ground, as lifting and storing, though carefully done, tend to destroy that fresh appearance so essential for exhibition.

Horseradish. — This crop is frequently neglected in private gardens, yet good, straight roots are certainly preferable to small, stunted specimens. The ground should be suitably enriched, and a system of transplanting each year followed, after well digging or trenching, in order to get a deep-rooting medium. Not only does lifting and replanting improve the quality of the roots, but if the largest are placed in soil for use as required this is preferable to hunting about with a fork trying to find the best. The plantation should be divided into two lots, and the older half lifted each year. Replanting should be carried out by using the straightest of the roots not needed for consumption, planting them at a foot apart and burying the crowns some 5 or 6 inches below the surface. Planting is best done by means of a long dibber.

Salsify and Scorzonera. — These two vegetables require much the same treatment for their successful culture. The crops may be lifted now and stored in sand for use as required during the winter. Some growers leave a portion of the Salsify crop in the ground for the production of chards in the spring, which are the young flower-stems used in quite a young state and cooked similarly to Asparagus.

Onions.—Examine the bulbs in the store at frequent intervals, and throw out any that are likely to decay. If left too thickly, these are more than likely to go wrong, and an occasional turning will not do any harm. The large bulbs obtained from spring sowing will prove extremely useful for boiling. Handle them as little as possible, and place them closely together, but not touching each other.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Strawberries in Pots.—The plants at this date must be protected from frost, and there are several methods which may be adopted. Probably the best plan is to plunge the pots in leaves in a cold frame. The plants may be protected by lights from heavy rains and snow, but during times of mild, dry weather the lights should be removed. Where lights are not available there is no better method than to plunge the pots up to their rims in coal-ashes. This involves a considerable amount of labour, but if it is done thoroughly few pots will be broken by the frost. Bracken is often recommended for protecting Strawberries, and this is an excellent material for the purpose where the plants can have the protection of glass to ward off rains. But the use of bracken out-of-doors is not to be recommended because it decays quickly when exposed to the weather. Bracken is very useful for strewing over the plants during very severe frost, but it must be kept dry. The plants intended for very early forcing may be left out-of-doors till severe frost sets in. This year the crowns are not so well ripened as usual, and the longer the plants are left in their summer quarters the better they will respond to forcing. All weeds and surplus crowns should be removed when plunging the pots, and should red spider be detected on the leaves, the plants should be laid on their sides and syringed thoroughly with a strong mixture of soft soap and sulphur.

Forcing Strawberries.—Unless a garden is equipped with ample convenience the forcing of Strawberries should be delayed till the New Year, for unless suitable houses are available the chances of success will be very small. Neither is it desirable to attempt to obtain ripe Strawberries at a very early date unless they are specially needed. To obtain ripe berries early in March a batch of plants should be placed indoors about the end of November or early in December. The most forward and best ripened plants should be selected for the earliest batches, and those having single crowns are most likely to throw up strong flower-spikes. All the plants should be syringed well with an insecticide before they are placed indoors as a precaution against red spider and aphis. Examine the drainage of each pot, and make sure that it is in perfect order. A shallow, heated pit is an excellent structure for starting the plants into growth. A hot-bed which will furnish just sufficient heat to excite the roots into growth should be made. This should be placed quite close to the glass, so that the plants may receive as much light as possible. For the first two or three weeks a temperature of about 45° will be ample; it will be wise to use artificial heat very carefully till the flower-spikes are developing. Spray the plants on fine mornings when forcing has commenced, and keep the atmosphere moist by damping the walls and paths as often as is deemed necessary. Water the roots with extreme care till the plants are in active growth.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Naturalising Bulbs.—The planting of bulbs in the semi-wild garden, along woodland walks, in grass land, orchards and other unconventional places is now largely practised, for in such situations they produce charming effects. No time should be lost in getting the bulbs planted, as after this time of the year they deteriorate out of the ground. The character of the surroundings should determine the style of planting, but the plants should never be arranged in straight lines, formal clumps, or at regular intervals. If space permits, the bulbs should be thrown carelessly along the ground in drifts or waves, and good effects are obtained when masses or drifts of certain kinds, if not of one variety, are kept distinct. Many of the most suitable varieties of Daffodils for this purpose may be purchased very cheaply, and by using these liberally, a striking effect may be produced the first season. Princeps, Golden Spur, Sir Watkin, Grandis, Emperor, Empress, Horsefieldii, Mrs. Langtry, Barri Conspicuus, and varieties of the Poeticus section are amongst the most suitable for this system of planting. Hyacinths and Tulips do not lend themselves for informal planting so well as Daffodils, but Snowdrops, Winter Aconites, Scillas, Muscari, Alliums, Wood Hyacinths, Crocuses and the lovely Chionodoxas are all especially adapted for naturalising, and should be planted freely.

Bulbs in Beds and Borders.—The flower-beds and borders having been dug deeply when the summer bedding plants were removed, all kinds of bulbs should be planted without delay. Hyacinths and Tulips are usually preferred in the flower garden, as these give brighter effects than Daffodils, which look best when growing in grass. New or special varieties of Daffodils may be grown in small beds or borders in the reserve garden, where they can receive extra attention. It is advisable to keep the different species in separate beds, but beautiful combinations of colour may be obtained by planting varieties of Hyacinths and Tulips in distinct colours. White Hyacinths may be set thinly over a ground of Myosotis or Aubrietia, and the brighter-coloured Hyacinths amongst white Arabis or Alyssum. Beds of massed Tulips make a very gay effect; of late years the Darwin and May-flowering Tulips have become very popular, and these should be included. Late-flowering Tulips are useful as cut blooms, and should be planted in the reserve garden for the purpose.

Gladioli.—As the foliage ripens and before severe frosts occur the corms should be lifted, labelled, tied in and hung up to dry, preparatory to storing them for the winter. When thoroughly dry, the foliage should be cut off, and the corms cleaned and stored in a dry place.

Herbaceous Lobelias. — Lobelias of the cardinalis type should be lifted from the borders and the roots either laid in ashes or soil in a cold frame or placed in boxes for the winter. Beyond ventilating the frames freely in mild weather and affording the roots moisture when necessary, the plants will require very little attention until the spring.

Canna. — Cannas also should be lifted and housed; space can usually be found for them under the stages in cool houses. These plants should not be neglected during their resting period. Although they do not require much moisture in winter, they must not be subjected to extreme dryness at the roots.

Turfing.—Any turfing operations or the mending of bad patches on lawns should be done forthwith, as frost may soon make it difficult to carry out the work. By laying turf early in the autumn and keeping it well rolled, the sods soon unite and the work is much more satisfactory than if done in the spring, when drying winds prevail.

THE APIARY.

By Chloris.

Seasonable Work. — The quilts should be made tight-fitting in the corners, and, to add to the effectiveness, provide good cushions of loose leaves or cork-dust. To make the hives watertight give the outsides two or three coats of good oil paint. The best method is for the bee-keeper to mix his own paint. The following will be found sufficient for a ten-framed hive:—1 lb. of white lead mixed with equal parts of unboiled linseed oil (boiled linseed oil causes the paint to blister in sunny weather) and turpentine. To make the paint set quickly add a tablespoonful of gold size. If the hives are to be painted for the first time, the paint may be made much thinner for the first coat, and in this instance not less than three coats should be applied. It is a wise plan to paint the hives of different colours, so that virgin queens may experience no difficulty in distinguishing their own hives. Many valuable queens have been lost owing to this difficulty when they are returning from their mating flight. To obtain a slate colour use vegetable or lamp black; for stone colour add yellow ochre, or a richer tint of stone may be secured by adding a little sienna. When all is thoroughly mixed, strain the paint through a piece of old stocking, working it through with a brush. Before applying the paint, which should never be used thick, but thin enough to work easily, rub the hives thoroughly with glasspaper. Too often paint is put on thickly, without working it in the wood. After the first coat has dried, all cracks and crevices should be filled in with putty. The entrances should be nearly closed, so that only one bee may pass at a time. All bee-keepers should make quite certain that the colonies are strong, for weaklings are certain to die during the winter or early in the spring, whereas if two or three weak stocks are united to make one strong lot there is every possibility of them coming out well next spring and yielding a surplus in the summer. Weak colonies, even though they may survive the winter, require another year to attain sufficient strength to yield a return.

Selling Honey. — The total yield for the current season is not heavy, yet many bee-keepers are content to realise between 4d. and 6d. per lb. wholesale so that they may convert the honey into cash. Better prices will be available later, when the present slight glut is over, and, even if all the honey cannot be sold this winter, if it has been harvested in good condition it will keep for a long time without appreciable deterioration—I refer to extracted honey. In the case of sections, the matter is different, because they will not keep unless the correct temperature is maintained, and this is difficult unless a good store-room is available, because the honey must not be allowed to granulate in these. Should it be found that bees have an insufficiency of food, good, thick syrup may still be given, so long as the weather remains favourable. Give the syrup warmth, and wrap up the whole so as to prevent the heat from escaping.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR NOVEMBER.

SATURDAY, NOVEMBER 2—
Soc. Française d'Hort. de Londres meet.

TUESDAY, NOVEMBER 5—
Royal Hort. Soc. Coms. meet; special Exh. of Orchids (2 days). (Lecture at 3 p.m. by Miss Edith R. Saunders on 'Double Flowers.") Hort. Club House Dinner. Bournemouth Fl. Sh. (2 days). Chelmsford Chrys. Sh. (2 days). Southampton Chrys. & Fruit Sh. (2 days). Scottish Hort. Assoc. meet. Birmingham Chrys. Sh. (3 days). Brighton Chrys. Sh. (2 days).

WEDNESDAY, NOVEMBER 6—
Bath Gard. Debating Soc. Chrys. Sh. (2 days). Dulwich Chrys. Sh. (2 days). Northants Chrys. Sh. (2 days). Dover Hort. Soc. Sh. Tooting Hort. Soc. Sh. (2 days). Eastbourne Hort. Soc. Chrys. Sh. (2 days). Highgate Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 7—
Exeter Chrys. Sh. (2 days). Newport Chrys. Sh. Linnean Soc. meet. Bury Hort. Soc. Sh. (2 days). Weston-super-Mare & Dist. Chrys. Sh. Frome Chrys. Sh. Stirling Chrys. Sh. (2 days). Maidenhead Chrys.

FRIDAY, NOVEMBER 8—
Altrincham & Dist. Chrys. Sh. (2 days).

SATURDAY, NOVEMBER 9—Burton Chrys. Sh.

MONDAY, NOVEMBER 11—
Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, NOVEMBER 12—
Plymouth Chrys. Sh. (2 days). Belfast Chrys. Sh. (2 days). Chester Paxton Soc. Sh. (2 days). Royal Bot. & Hort. Soc. of Manchester Chrys. Sh. (3 days).

WEDNESDAY, NOVEMBER 13—
Dorchester Chrys. Sh. (2 days). Buxton Chrys. Sh. Colchester Rose & Hort. Soc. Sh. Bristol Chrys. Sh. (2 days). Barry Chrys. Sh. (2 days). Clevedon Chrys. Sh. (2 days). Ancient Soc. of York Florists (2 days). Finchley Chrys. Soc. Sh. (2 days).

THURSDAY, NOVEMBER 14—
Edinburgh Chrys. Sh. (3 days). Bridgwater Chrys. Sh. Aberdare Chrys. Sh. Cardiff Chrys. Sh. Newport Chrys Sh. Sheffield Chrys. Sh. (3 days).

FRIDAY, NOVEMBER 15—
Leeds Paxton Chrys. Sh. (2 days). Bradford Chrys. Sh. (2 days). Blackburn Chrys. Sh. (2 days). Bolton Chrys. Sh. (2 days).

MONDAY, NOVEMBER 18—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, NOVEMBER 19—
Royal Hort. Soc. Norwich Chrys. Sh. (3 days).

WEDNESDAY, NOVEMBER 20—
Nat. Chrys. Soc. Exh. and Conference at Essex Hall. Newcastle Chrys. Sh. (3 days). Royal Met. Soc. meet. N. of Eng. Hort. Soc. meet at Hull (2 days). Bristol Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 21—Linnean Soc. meet.

FRIDAY, NOVEMBER 22—
Aberdeen Chrys. Sh. (2 days). Dunfermline Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—44·9.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, October 30* (6 P.M.) Max. 65°; Min. 50°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, October 31* (10 A.M.): Bar. 29·3°; Temp. 51°; *Weather*—Moderate Sunshine.

PROVINCES.—*Wednesday, October 30:* Max. 51° Spalding; Min. 48° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe and Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, Rose Trees, Flowering and Decorative Shrubs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, London, at 12.30.

WEDNESDAY—
Fruit Trees, Begonias, Gloxinias, &c., at Stevens's Auction Rooms, at 12.30.
Palms and Plants, at 5; Miscellaneous Bulbs and Plants, at 11; 1934 cases Japanese Liliums, at 2.30; at Protheroe & Morris's rooms.
Fourteenth Annual Sale of Nursery Stock at Shortlands Nursery, Shortlands, Kent, by Protheroe & Morris, at 11.

FRIDAY—
Special Sale of Roses, at Protheroe & Morris's rooms.
Rare Cypripediums from the "West Point" collection of Orchids at the Coal Exchange, Manchester, by Protheroe & Morris, at 1.30.

Cider Sickness.

The expression "cider sickness," used by Messrs. Barker and Hillier as the title of their article in the October issue of the *Journal of Agricultural Science*, has reference not to any possible effects induced in those who drink this excellent beverage, but to a malady of cider itself. This malady is only too well known to cider manufacturers. It is apt to appear in new cider, and entails losses estimated at several thousand pounds per annum. The symptoms of the malady are a frothing and sudden evolution of gas. These signs are to be met with in May after the normal fermentation has run its course, and at a time when all good cider is "still." Following on this outburst, which, in the case of bottled cider, may suffice to explode the bottle, the liquid loses its fruity flavour and its characteristic aroma, and its sweetness disappears altogether. Anyone who has tasted the normal brew of cider served out in the villages of the less-frequented parts of Brittany may console himself for the nausea he has experienced by reflecting that the cider was very sick. With cider suffering from this disease, which, needless to say, is due to a bacterium, the case is very bad indeed. It becomes turbid, and thickens to a milky state; but if it be left alone—and no one would touch it in this state—the malady works itself out. The cider gradually becomes clear, the "sick" flavour and aroma disappear, and the liquid, though never again its old, sweet, fruity self, becomes drinkable once more. Messrs. Barker and Hillier describe all these symptoms of the sick cider. They have investigated the chemical changes which the intruding bacteria induce. They show that, as with human diseases, some kinds of individual ciders are more susceptible to attack than are others. The sharp varieties are, on the whole, immune—the bacterium preferring, as we do ourselves, the sweet and bitter-sweet kinds. The disease is infectious, and a drop of sick cider may infect a cask of sound liquor. After much labour, the authors succeeded, by growing cider organisms on beer-wort gelatine plates, in isolating a bacterium, which proved to be the culprit. This objectionable organism is able to grow in air or in the absence of air, and its normal course of existence is such as to cause all the unpleasant symptoms which we have described.

As to preventive measures, not much may be said. The bacterium appears to be introduced with the fruit. Washing the latter with cold water is not much good; whether hot water would be of more service the authors are not yet able to say. Sterilising the fruit with formaldehyde is practicable, but might lead to other difficulties. Perhaps a way round the difficulty may be discovered by "breeding," or rather brewing a cider which is resistent to the disease. Or, though the authors do not make the suggestion, it may be possible to confer immunity on cider by inoculating it with an attenuated virus in the form of a culture of the bacterium, so grown as to have lost some of its original sinfulness of habit. It is in any case interesting to have in these researches yet another instance of the fact that maladies are incidental, not only to flesh but also to fluids, and we feel sure that, when these investigations have been carried a step further, the term "doctoring cider" will have a newer and more auspicious meaning than it has at present.

The Simple Carbohydrates and the Glucosides.*

It is a tribute to the excellence of Dr. Armstrong's monograph on the simple carbohydrates and glucosides that a second edition has been called for. The author has taken advantage of the opportunity to make considerable additions to the text. In particular, the chapter on the glucosides has been enlarged and a new chapter has been added on the significance of the carbohydrates in plant physiology. Among the most interesting of the newer facts contained in the present edition are those appertaining to the synthesis of the tannins. These substances, which are so widely distributed in the vegetable kingdom, and whose precise function in the economy of the plant is so obscure, have been the subject of recent investigation by Fischer, who, in conjunction with Freudenberg, has synthesised from glucose derivatives substances which possess all the properties of the natural tannins.

In his discussion on the function of glucosides in plants, Dr. Armstrong adopts the view which is supported by the investigations conducted by Professor Armstrong and himself that these widely-spread substances serve to keep quiet and out of action bodies which in proper time and place are destined to render active service to the development of the plant. Combined with glucose, these active constituents of glucosides are rendered inert—put out of action, in fact. But when the glucoside which contains them is hydrolysed they are liberated and are free to produce effects such, for example, as those connected with the chemical operations involved in the ripening of fruits.

Dr. Armstrong's monograph is indispensable to all students of physiological botany, and may be recommended also to the general reader who has a fair working knowledge of chemistry.

Industrial Fellowships.

One of the most interesting examples of co-operation between science and commerce is provided by the Industrial fellowships which have been established in the New York State College of Agriculture at Cornell University. The foundation of these fellowships is a tribute both to the energy of Professor Whetzel, who is in charge of the Department of Plant Physiology in the University, and to the wise liberality of the firms and individuals to whose financial aid the fellowships are due.

The origin of this kind of co-operation is briefly as follows. Men engaged in the

* *The Simple Carbohydrates and the Glucosides*, by E. Frankland Armstrong, D.Sc. (2nd Ed.). Monographs of Biochemistry. (Longmans, Green and Co.). 5s. net.

industry of horticulture are not infrequently confronted with difficulties which they themselves are unable to surmount. For example, nursery stock in a given locality is attacked by a certain disease which ordinary methods are powerless to check. On the other hand, in such a University as Cornell, there are always a number of young men who, having finished their degree course, are anxious to gain wider experience and to pursue a definite line of investigation in their pursuit of a doctor's degree. Therefore, if the grower is willing to establish a temporary fellowship, the college is able to find a man who will devote himself to a particular investigation named by the founders of the fellowship. The firms which establish the Industrial fellowships pay the piper; they also call the tune. If the investigations are productive of good the founders of the fellowship enjoy, in common with the rest of the community, the commercial advantages accruing from the investigations. This at first sight may appear to be unfair, and the founder might perhaps expect to enjoy the exclusive advantage of discoveries made by the holder of his fellowship. A little consideration will show, however, that a university must never be a party to the patenting of knowledge; that it is its business to discover and disseminate knowledge and not to monopolise it.

It is an encouraging indication of the enterprising and patriotic spirit of American horticultural firms that in the year 1910 this scheme had advanced so far that four Industrial fellowships were actually in existence and that four others were about to be founded.

It should be mentioned that the research fellow who holds one of these posts does not shut himself within his laboratory; but, whenever the nature of the problem requires it, he takes his apparatus with him and pitches his field laboratory on the spot in which the pest or other object of his investigations is to be found.

Fig. 146.—Scolopendrium vulgare crispum nobile.

(See p. 337.)

Coloured Plate.—The subject of the coloured plate to be published with the next issue is Miltonia "Memoria Baron Schröder."

Dr. M. C. Cooke.—We are authorised to state that the report which has appeared in the daily Press and elsewhere of the death of Dr. M. C. Cooke is erroneous. The friends of the veteran mycologist will be glad to learn that, in spite of his 87 years, Dr. Cooke is enjoying good health, and has read the "obituary notices" with a considerable measure of interest and appreciation. Were plagiarism not altogether foreign to his habits, Dr. Cooke would be disposed to say, with another distinguished man who suffered a like fate—the reports of his death have been greatly exaggerated.

Royal Horticultural Society.—The next meeting of the Committees of the Royal Horticultural Society will take place on Tuesday, the 5th inst., and the Orchid Exhibition, already announced, will open on Tuesday and continue the following day. At 3 o'clock on Tuesday Miss E. R. Saunders will deliver a lecture on "Double Flowers," whilst a conference on Orchids will be held in the Lecture Room on the second day, November 6, from 11 to 1 and 2 to 4. Four papers are to be given as follow:—Morning session: (1) "The Physiology of Fertilisation," by Professor Keeble; (2) "The Application of Genetics to Orchid Breeding," by Major C. C. Hurst; (3) "Some

Epiphytical Orchids," by Mr. H. G. ALEXANDER; (4) "Albinism in Orchids," by Mr. R. G. THWAITES.

HORTICULTURAL CLUB. — The next house dinner of the club will take place on Tuesday, November 5, at 6 p.m., at the Hotel Windsor, Victoria Street, Westminster, when Mr. F. KINGDON WARD, B.A., will deliver a lecture on "A Naturalist in Western China and Tibet." The subject will be illustrated with lantern slides.

THE FRUITERERS' COMPANY. – At the Mansion House on Monday, October 28, the Master, Wardens, and Court of the Fruiterers' Company presented to the Lord Mayor a basket of home-grown British fruit. Major W. H. THOMAS (the Master), who made the presentation, explained that the custom originated in the fact that at one time the Lord Mayor had the privilege of demanding tithe of all the fruit brought into the City for sale. The levying of the impost gave rise to contention, and the right was commuted for an annual presentation of fruit to be made by the Fruiterers' Company to the Lord Mayor. Replying to the toast of "The Fruiterers' Company" at the dinner which followed, Major THOMAS said that the company offered prizes and certificates, as well as gold and silver medals, for the growing of the best and most marketable fruits, the renewing of worn-out orchards, and for the selecting and packing of fruit for the market. During the past few years the company had printed and circulated fruit-culture charts for the use of fruit-growers. In addition, they had instituted a scholarship of £50 a year at the John Innes Horticultural Institution.

RADIUM AND PLANTS. — The effects produced by the exposure of seeds and plants to radium emanations have been investigated by Prof. MOLISCH, who finds that, generally speaking, they are disastrous. Plants subjected to these emanations are in many cases permanently damaged, the germination of seeds is delayed, and in many cases, for example in various leguminous seed plants, such as Robinia Pseudacacia, the leaves are thrown off, even though the experiment be carried out in spring or summer. If extremely small amounts of radium are used a speeding up instead of a retardation of germination may be obtained, e.g., with Stocks, Cucurbita Pepo, and Helianthus annuus. The permanent nature of the injury appears to be due to the action of the emanations on the cells of the growing point, both of shoot and root. A remarkable modification made its appearance as a result of subjecting plants of Sedum Sieboldii to this agent. Normally the shoots of this plant bear three leaves in whorls, but those exposed to the emanations for three days developed leaves arranged in opposite pairs. The mode by which radium produces its effects on the cells of plants is unknown, though many of its effects recall those produced by poisons. It is interesting to note that the above-mentioned symptoms are produced by the exposure of plants to .0000063 millegram of radium.

A TRIBUTE TO ALPINE PLANTS.*—"If you wish to grow Alpines with joy and glory you cannot be too simple and inexpensive in your preparations. . . . For Alpines, being really noble, are the most democratic of plants, and know no distinction of rank or wealth; all that they know and care for are their friends, whether from pithead or palace. Their instincts are unerring, and they have no respect of persons."

* Mr. Reginald Farrer in *The Rock Garden* (PRESENT-DAY GARDENING SERIES).

FRUIT GROWING IN ONTARIO.—According to a writer in *The Empire Magazine*, land suitable for fruit-farming can be had at the rate of from £12 to £20 per acre. The developed lands are much more expensive, and the man of small capital should not deal with such. The initial cost of planting is small, trees being obtainable for an average of 7½d. each. Generally about 40 Apple trees or 170 Peach trees are sufficient for each acre. Intercrops can be grown for a few years until the trees commence to bear. The smaller fruits and vegetables have an excellent market, and give very good returns. Strawberries and Raspberries give a return of £20 to £60 net per acre. Early vegetables are especially remunerative, but the district where they can be grown is limited; however, there is still plenty of land in that section. Early Tomatos give £100 per acre regularly, and as much as £250 has been obtained. Celery, Onions, and other crops give very high yields. In the southerly sections Tobacco is a staple crop. Small farms of 10, 20, and 30 acres can be secured in every fruit-growing district.

ONTARIO'S TOBACCO CROP.—This year's crop of Tobacco in the province of Ontario will be smaller than it was last year, which was the largest on record, and more than double the yield of any previous year. It is estimated to have amounted to 15,000 lb. Tobacco culture in Canada is confined almost wholly to the province of Ontario. In the fiscal year ended 31st March, 1912, the Dominion exported 58,809 lbs. of Canadian-grown leaf tobacco valued at $25,944. These shipments were divided: 8,762 lbs. to Great Britain, 40,856 lbs. to the United States, and 9,192 lbs. to other countries, with respective values of $1,320, $22,521, and $2,103.

CEREAL AND FLAX CROPS IN ARGENTINA.—The October number of the *Bulletin* of Agricultural Statistics, published by the International Institute of Agriculture, gives figures for the areas sown with cereals and Flax in Argentina, which are as follow:—Wheat, 16,964,000 acres against 17,036,000 acres in 1911; Oats, 2,939,000 acres against 2,547,000 acres in 1911; Flax, 4,310,000 acres against 4,026,000 acres in 1911.

GREEN TOMATO CHUTNEY.—Green Tomatos are unusually plentiful this season, especially on the outdoor plants. These unripe Tomatos make a delicious chutney, which is prepared as follows:—Take of green Tomatos 4 lbs., Apples and Onions 1½ lb. each, sultanas ½ lb., sugar ¾ lb., salt 1 ounce, and peppers and Chilies to taste. Slice the Tomatos, Apples and Onions, and boil these with the other ingredients for four hours in 1½ pint of vinegar. The preserve will keep in a good condition for an unlimited period.

THE BOTANICAL RESULTS OF THE DUKE OF MECKLENBURG'S TRAVELS IN CENTRAL AFRICA.*—German enterprise and perseverance in tropical Africa are not limited to commercial and big game or sporting expeditions. The expedition under the direction of the Duke of MECKLENBURG was composed of men representing almost every branch of knowledge, and scientific investigation was combined with sport of the most exciting character. The narrative of the expedition, edited by the Duke himself, is a most fascinating and interesting story, issued in editions costing from fifteen shillings to five pounds. Apart from this and the botany, a number of volumes have appeared, or are in preparation, on the topography, geology, meteorology, zoology, ethnography, and anthropology of the country visited, forming together the most encyclopædic account of tropical Africa yet extant. The country systematically explored was the north-west corner of the German East African Protectorate, the Lake Region, and the north-east part of the Congo State, and the travels terminated in a journey across the dark continent from ocean to ocean. The botany is the work of specialists in all its branches, and the titles given below sufficiently explain what has appeared. So far it is limited to the systematic side, and no really startling novelties are described; indeed, the number of novelties in flowering plants is unexpectedly small, perhaps a proof of the care exercised in working out the collections. Terrestrial Orchids furnish a considerable contingent, belonging largely to the genera Lissochilus and Eulophia, and Polystachya is prominent among the epiphytes. The Cryptogams are, perhaps, the most interesting section. Lamproderma echinatulum, a curious little Myxomycete, was collected on Ruwenzori at an elevation above 10,000 feet, and was previously recorded only from Tasmania and New Zealand in the south, and from Scotland in the north. The collections of Liverworts and Mosses exceeded expectations, and BROTHERUS, who elaborated the latter, states that there are 57 new species out of a total of 137, and one interesting new genus—Leptodontiopsis. Tropical Africa is particularly rich in species of Ficus, Loranthus and Vernonia, to which many new species are here added. Compositæ, Rubiaceæ and Leguminosæ predominate. Of the second a species of Leptactinia and another of Oxyanthus are remarkable in having large clusters of very slender, tubular flowers about 6 inches in length. Helichrysum alismatifolium is singular in a heteromorphous genus. Noteworthy among the very few new genera of flowering plants is Milbræd iodendron, an arboreous member of the Leguminosæ allied to Swartzia.

* *Wissenschaftliche Ergebnisse der Deutschen Zentral-Afrika-Expedition*, 1907-1908, unter der Führung Adolf Friedrichs, Herzogs zu Mecklenburg. Band ii. Botanik. Herausgegeben von Dr. J. Milbraed, Berlin. Lieferung i.: Pteridophyta, Coniferæ, Monocotyledoneæ. Lieferung ii.: Cryptogamae Thallophyta, Bryophyta. Lieferung iii.: Dicotyledoneae-Choripetalae i. Lieferung iv.: Dicotyledoneae-Sympetalae i. Large 8vo. pp. 1-420; plates 46, and many figures in the text, especially of the Mosses. Leipzig: Klinkhardt & Biermann, 1910-1911. Price 16·25 mark, or the parts separately at a somewhat higher price.

NORTH OF ENGLAND HORTICULTURAL SHOW.—Messrs. W. WELLS, LTD., inform us that they were awarded a large Silver-gilt Medal at the Leeds exhibition of this Society, and that a similar award was made to Messrs. W. & J. BROWN, Peterborough. Our report credited these firms with large Silver Medals.

PUBLICATIONS RECEIVED.—***British Violets***, by Mrs. E. S. Gregory, with an introduction by G. Claridge Druce, M.A. (Cambridge: W. Heffer & Sons, Ltd.) Price 6s. net.

SCOTLAND.

LATE AUTUMN FLOWERS.

THE flowers of late autumn have been marvellous this year. For example, the great Lobelia cardinalis (so greatly eulogised by the late Sir Archibald Alison in his famous History, in an incidental but most memorable passage on the scenery of America) has never been more impressive in such gardens as those of Lochinch Castle, Logan, and Dunraggit, than it has been this year. As already recorded in the *Gardeners' Chronicle* (September 14, p. 209), I have seen near the residence of the Earl of Stair a glorious representative of the gigantic Lily of the Central Himalayas, 12 feet high, and I have just been informed by Mr. J. Dalrymple Hay Stewart, of Dalry, in Kirkcudbrightshire, of another giganteum, grown by Mrs. Jasper Young, who resides near New Galloway, which appears to have reached an almost equally commanding height.

In my own well-sheltered garden the finest floral effects for some time past have been created by a long vista of L. longiflorum,

Wilsonii and Lobelia cardinalis. The contrast afforded by the bronzy foliage and luminous scarlet blooms of the North American plant, and the snowy-white, trumpet flowers of the Japanese Lily, was exceedingly striking. Very beautiful for the last six weeks at least have been the Collerette Dahlias, of which Messrs. Dobbie showed me a magnificent display at their Edinburgh Nurseries on October 18.

Among the latest of my Sweet Peas this season have been Dorothy Eckford, one of the very finest of the "grandiflora" varieties, which have gradually given way before the Spencer hybrids; Mrs. Routzahn and Marie Corelli; Mrs. Cuthbertson, still greatly adorning the branches of my only Walnut tree; Florence Nightingale, the queen of all the lavender varieties; Earl Spencer loftiest aspiring Rose in my extensive collection; Antoine Rivoire, an exceedingly graceful and profusely-flowering Hybrid Tea; Georges Nabonnand, one of the most floriferous and artistic in its aspect at this late period of the year; Viscount Carlow and Countess of Shrewsbury, recent acquisitions from the "Emerald Isle." Equally worthy of honourable mention for their splendid floral achievements towards the end of October are the incomparable Hugh Dickson and the uniquely-coloured J. B. Clark. *David R. Williamson, Wigtownshire.*

NEW PUBLIC PARK FOR RENFREW.

The new public park of Renfrew was formally opened on October 19. The park is the gift of Mr. William Robertson, shipowner, who per-

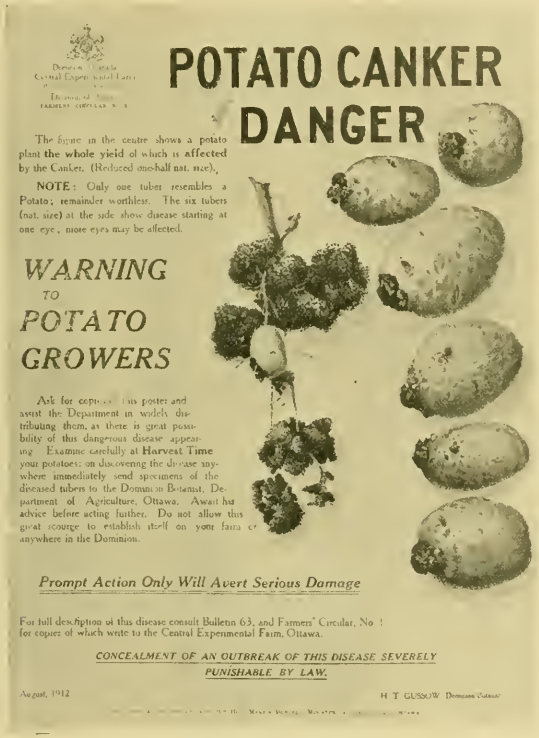

FIG. 147.—FACSIMILE OF POSTER DISTRIBUTED BY THE CANADIAN MINISTRY OF AGRICULTURE.

The posters are printed on thick cardboard.

and Melba, in colour and in form very closely allied; the exquisite Etta Dyke, and Queen Alexandra.

I have read with much interest the admirable article on October Roses by Mr. Taylor (see p. 293). The special varieties that still at this date (October 22) continue to flower with marvellous facility are: Viscountess Folkestone, to which among very late-flowering Roses in my garden I should be disposed to assign the premier place; Clio, still blooming very prominently above a high Fuchsia, at a height of 15 feet: Frau Karl Druschki, one of the most *remontanté*—as the French expressively call it—of all Hybrid Perpetuals; Margaret Dickson, the formed the opening ceremony, and, with Mrs. Robertson, planted the first two trees. The park, which is 30 acres in extent, is to be known as the Robertson Park.

NEW RECREATION PARK FOR GALASHIELS.

At a meeting of the electors of one of the wards of Galashiels recently, the Provost announced that Councillor Hugh Roberts had offered lands for additional recreation grounds. These form part of the estate of Ladhope, and extend to about 45½ acres. It is proposed to grant these for 999 years at a nominal rent of 5s. per annum.

PRESENTATION.

Mr. Alexander Morton, gardener to the late Countess of Seafield, at Cullen House, Cullen, has received a presentation from some of his friends on his leaving Cullen House to take up a southern appointment.

GIFTS OF PARKS TO SCOTTISH PARISH COUNCILS.

A novel point in connection with the power of administration of public parks in Scotland by Parish councils has recently been submitted to the Local Government Board for Scotland.

The bequest of about 20 acres of land was made by the late Mr. J. G. Starke, Troqueer Holm, Dumfries, to trustees to be handed over to the parish council of Troqueer for a public park. The parish is partly burghal and partly landward, and no power is conferred on any but landward parishes or landward committees by the Act of Parliament under which the parish councils were constituted to acquire land for parks or to rate for their maintenance. Acting under legal advice, the council, of which Mr. S. Arnott is chairman, submitted the question regarding its power to administer to the Local Government Board, and that authority has given its opinion that the council has this power under a clause providing that holders of parish trusts can hand them over to parish councils. This, however, gives no power to rate, and, in dealing with the land, which is at present let on lease (this expiring at Martinmas, 1913), the council will have to rely upon the revenue from the grazing of the park, which will be but small. The bequest made no provision for its upkeep, but a small sum was left as the beginning of a fund for laying out the land. *Correspondent.*

THE CRESTED HART'S TONGUE.

Amongst the varietal forms of the common Hart's Tongue Fern (Scolopendrium vulgare), both the wild sports and those obtained by selective propagation, it is generally recognised that the "crispum" or frilled section is the most beautiful. In this section the normally flat, strap-shaped frond is transformed into a beautiful, double frill, and although the pure types of this are perfectly barren, it is a curious fact that many varieties have been found wild, each one of which must obviously be an independent sport. For without spores plants cannot arise under wild conditions, and the plants must result from scattered spores of some unrecognized fertile form of probably normal appearance. The crispum varieties in cultivation vary markedly in the width of frond, length of stalk, depth of frilling, and so on, but all the finds hitherto have been surpassed in robustness, vigorous growth, and width of foliage by a plant Scolopendrium vulgare crispum nobile (see fig. 146), exhibited by Mr. W. B. Cranfield, of Enfield, at the R.H.S. meeting of 22nd ult., when it was awarded a First-class Certificate (see p. 320).

The illustration of this magnificent specimen precludes the need for further description. The plant was found on the limestone ridge known as Warton Crag, near Carnforth, and was obtained from Mr. H. Bolton in the village of Warton, situated at its foot. The crispum section of the Hart's Tongue represents really the true "plumose" type, in which the reproductive vigour is diverted from spore production into that of extra leafage, the spores being entirely suppressed. We see the counterpart of this phenomenon in the various forms of the "Welsh Polypody" (P. vulgare cambricum), which are always quite barren for the same reason. *C. T. D.*

IRISES FOR THE ROCK GARDEN.

ENGLISH rock gardens usually contain few representatives of the genus Iris, although there are many species admirably adapted for cultivation in positions that, besides affording some shelter, also bring them up to a level with the eye. It may be that the reason for this neglect of Irises in our rock gardens may be traced to the fact that the mountains from which the majority of the commonest rock plants come, namely, the Alps and the Pyrenees, contain practically no Alpine representatives of the genus. It is true that I. xiphioides, misnamed the English Iris, grows in the Alpine meadows of the Pyrenees, but it is scarcely what we understand by a rock plant.

Further afield, however, many dwarf species of Iris are to be found—in the Balkans, in the Caucasus, in the mountainous regions of Asia Minor of the Altai district and of Turkestan, and even up to 17,000 or 18,000 feet in Thibet. The Iris which has the distinction of growing at this elevation, the highest known level, is the floriferous little species, I. Potaninii, which unfortunately has never apparently been in cultivation. It has small tufts of narrow and curiously blunted leaves only an inch or two in height, clothed against the rigours of the climate in dense wrappings of curling fibrous remains of the leaves of former seasons. From each small tuft of leaves springs a flower much resembling those of I. pumila, either of a yellow or a purple colour. No stem develops, so that the ovary remains in the protection of the leaves, while the flower is raised on a long perianth tube.

But even if I. Potaninii is still an unattainable ideal of a rock garden Iris, we need not despise its European cousin the true I. pumila, which in some of its forms is almost as diminutive. It is true that the real plant is hard to obtain, but anyone who has seen a number of collected plants in flower will not wish to be without it. Each plant produces flowers that are different from those of its neighbour, and all colours, from pale sky blue to deep red black, are found, together with others in which the prevailing colour is yellow, either with mahogany or green markings. To do well I. pumila needs a sunny position in soil rich in lime.

I. pumila has another cousin in the Balkans, namely I. mellita, which differs chiefly in that its spathes are rigid and sharply keeled, while those of I. pumila are membranous and hardly at all keeled. This keeled character of the Balkan Iris is a curious fact. Besides being the chief distinction between I. pumila and I. mellita, it also distinguishes I. Reichenbachii from I. chamaeiris, and, what is still more curious, I. Sintenesii from I. spuria. To my mind, the flowers of I. mellita are still more pleasing than those of I. pumila, for there is a clearness of colour and a sharpness and delicacy in the veining not found in the Austrian plant. The colour of I. mellita is either a curious chocolate-purple set off by a beard of thick-set silky hairs tipped with electric blue, or apparently it may be a clear yellow, though of this form I have only so far seen herbarium specimens. A form of this Iris, in which the young leaves are edged with red, as are those of some of the forms of I. germanica, e.g., Amas and especially Kharput, has been described under the name of I. rubromarginata, though it seems at most to be a sub-species or local form.

I. Reichenbachii is a Balkan species as variable in size as I. chamaeiris in the South of France, and some of the forms from the higher levels are delightful dwarf plants with clear yellow or purple flowers, differing chiefly from I. mellita by the shorter, broader spathes and by the fact that the stem is always developed.

In Europe, the so-called I. arenaria is not an Alpine plant, but it is probable that it is identical with I. flavissima, which is common in the Altai mountains. Short-lived though the display is, it is hard to find anything in a rock garden that will surpass the brilliance of a close mass of a number of flowers of this bright yellow Iris with its orange beard. A light, rich, sandy soil is necessary, and the plants are perhaps best raised from seed. The rhizomes run in all directions, and in a year or two from the time the seedlings appear numbers of flowers may be expected.

It might be thought improbable that a plant should be found in Transylvania and then not again until we reach the Altai, but, curiously enough, there appear to be at least two other species of Iris which have the same curious distribution, namely, I. ruthenica and I. humilis. The rare examples of the latter species from the Altai have, it is true, been named I. Ludwigii, but an examination of the type specimens in the St. Petersburg herbarium has left little doubt in my mind that these are identical with the European I. humilis. The plant is practically a stemless I. graminea, but it is scarcely attractive, and, as it does not always flower freely, it is perhaps hardly worth a place in the rock garden. I. ruthenica, however, with which apparently it is found growing both in Transylvania and in the Altai, is a very valuable plant. In its best forms it grows into close masses of grassy foliage which are literally covered in May with the white-blotched blue flowers proceeding from the pink-flushed spathes. With regard to this Iris a caution is necessary. Never attempt to move it except while growth is active in summer, and obtain new colonies of it from seed rather than by transplantation.

For large rock gardens, nothing can surpass some of the Californian Irises, which are so little known but which are not really difficult to

FIG. 148.—IRIS BRACTEATA: FLOWERS YELLOW, WITH LILAC-COLOURED VEINS.

manage if a limestone soil is avoided and if attention is paid to the caution just given with regard to the cultivation of I. ruthenica. I. Douglasiana is almost too vigorous for all but the largest pockets, but I. Purdyi, I bracteata (see fig. 148), I. macrosiphon and I. tenax are all worthy of places. The diverse and delicate colourings to be found among these Irises are endless, and the general rule that multiplication must be by seeds rather than by division has its compensation in the surprises to which it gives rise. I. bracteata, which in its typical state has yellow flowers veined with brownish purple, has already given me several forms, some of which are approaches to crimson, while one is a delightful colour that may best be described as old rose. A descendant of the second or third generation of what was originally a cross between I. Douglasiana and I. macrosiphon has flowers of a pure white, conspicuously veined with violet purple, and there seems to be no end to the colour forms to which this valuable group may give rise. What is still more extraordinary is that the colours all seem to harmonise together and to avoid those crude clashes which from time to time offend the eye among the commoner Alpine plants.

The Oncocyclus Irises of the Caucasus and Cilicia, I. iberica, I. paradoxa, I. Sari, and others are probably real Alpine plants, but, alas, our summers are not hot enough or dry enough to ripen the rhizomes, and it is open to doubt whether they will ever become permanent inhabitants of our rock gardens.

It is different with the bulbous species of the reticulata and Juno groups, for these will live on year after year and increase, if a few simple rules are not ignored. The members of the Reticulata group should be lifted every year or two and treated for the disease which otherwise is liable to carry them off in a veritable outbreak of the Black Death. No bulbous plant, which at some period of the year loses all its roots as does I. reticulata (see fig. 149), can resent an annual shifting, provided that the growth has been allowed to ripen off naturally and provided that the bulbs are not kept too long out of the ground nor allowed to weaken themselves by starting into growth before they are returned to the soil.

Fig. 149.—Iris reticulata: flowers purple and gold.

Juno Irises, on the other hand, are undoubtedly weakened by any attempt to lift or move them. It is impossible to do this without breaking some of the fragile roots, and from these breakages some delicate species, such as the typical I. persica, rarely seem to recover. These must therefore be planted in the sunniest and best-drained position available and given good rich soil, without new manure. If the surface slopes sharply to the south and so throws off the rain and at the same time allows the sun's rays to penetrate to the bulbs, these should go on increasing in vigour, provided that they are judiciously fed by top dressings of leaf mould and suitable artificial manures. Provided that the drainage is perfect, the plants seem to do better in a rather heavy loam than in too sandy a soil. *W. R. Dykes, Charterhouse, Godalming.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

October 22.—*Present:* Mr. E. A. Bowles, M.A. (in the Chair); Messrs. J. Arkwright, W. Cuthbertson, H. J. Elwes, A. Worsley, A. W. Hill, J. Fraser, J. Odell, A. R. Rolfe, J. O'Brien, R. Hooper Pearson, and F. J. Chittenden (hon. sec.).

Bordeaux injury.—Mr. A. W. Hill showed, on behalf of Mr. Massee, some Apples to illustrate the russetting due to the action of Bordeaux mixture upon their skins.

Antirrhinum sporting.—Mr. Chittenden showed from a garden near London stems of an Antirrhinum bearing short, leafy growths in the axils of the bracts instead of flowers. The leaves were very small. A similar specimen was subsequently sent by Messrs. R. Veitch, of Exeter.

Rhododendron sporting.—Sir George Holford exhibited a Rhododendron raised from the cross R. javanicum "Ruby" × R. j. "Ne Plus Ultra." It bore two inflorescences, one having bright red flowers, the other not quite so deep in colour and with yellow corolla tubes. The two parents had both crimson-scarlet flowers of slightly different shades. The flowers on the two trusses were of the same age. Ten plants of the cross had flowered, each bearing flowers of a richer colour than either of the parents, but none of the others had shown similar sporting proclivities.

Grey Oak.—Dr. Voelcker sent a piece of Oak wood of a peculiar greyish-blue colour from a tree struck by lightning. The Committee thought the coloration was probably the result of exposure to sun and air, especially as the tint approached that of weathered Oak palings.

Albino Geranium Robertianum.—Mr. Eric M. Luckin, of Feltham, wrote: "With reference to your enquiry as to wild albino forms of Geranium Robertianum, some four years ago I discovered a plant growing in a meadow bearing albino flowers, stems green. The two years following I revisited the spot and found the plant, but this year I failed to locate it, and fear it has been destroyed. The meadow is near Haywards Heath, Sussex."

WOMEN'S AGRICULTURAL AND HORTICULTURAL INTERNATIONAL UNION.

October 23.—Since the Women's Union was started in 1899 its growth has been satisfactory, and it now numbers some 350 members in this country and abroad. The sixth annual show was held at the Royal Horticultural Hall on the above date, the venue being a new one, as the former shows have been at the Botanical Gardens. The Hall was well filled, and had it not been for the bad weather of the two days previous to the show it would have been difficult for the executive to have found room for all the exhibits. Much credit is due to the committee and the secretary, Mrs. Chamberlain, for the excellence of the arrangements.

The exhibits were all first-class, and showed what women can do in the lighter branches of horticulture. The international character of the society's work was instanced by exhibits from Germany. In the horticultural and dairy sections there were well-filled classes of cut flowers, pot plants, fruit, vegetables, dairy produce, dressed poultry, honey, preserved fruit, bread, hams, landscape gardening, and decorative designs. The Swanley College successes were numerous. Splendid exhibits of fruit and dairy produce won prizes for Miss Courtauld, Earls Colne, Essex; while the Carnations, Chrysanthemums, and table decorations of the Misses Price & Fyfe, Grove Park Nurseries, Lee, S.E., would have done credit to any florist. Mention must also be made of the exquisite Violas and Violets effectively exhibited by the Misses Dixon & Eve, Elmscroft Nurseries, Edenbridge, Kent. The preserved fruits section showed what could be done in an industry, which we think has not as yet received its due meed of attention.

There were 223 entries of live poultry, all the best laying, table, and general purpose breeds being well represented. *J. W. T.*

Kent Commercial Fruit Show.

OCTOBER 28, 29.—The second Kent Commercial Fruit Show was held at Maidstone on Tuesday and Wednesday last. The number of entries was 363—a large increase over those of the first show, which was held at Ashford last year. Although most of the classes were open to competitors from the whole of Great Britain and Ireland, only 49 exhibits were sent from nurserymen resident in other counties than Kent.

When it is remembered that in the largest classes one entry comprised six boxes of Apples, some idea of the size of the exhibition may be formed. To its excellence, however, only those present can testify; and on this point we have no hesitation in declaring that it was by far the best competitive show of Apples ever seen in this country. That being the case (and our judgment was confirmed by several specialists who have been in the habit of attending fruit shows), it would probably be safe to add that it was the best competitive show of Apples ever held in Europe. Apart from the magnificent collections of the principal nurserymen, no exhibits of Apples, even those shown annually under the auspices of the Royal Horticultural Society, have surpassed those sent to this Kent show in number and general excellence, and certainly none of the Colonial shows has equalled this one in all-round merit.

The testimony thus given to Kent as an Apple-growing county is very striking, since only one award—a second prize—fell to an outside exhibitor.

The first class—an open one—was for Bramley's Seedling Apples, six boxes to an entry, and comprised 36 exhibits. This was a magnificent class, a large proportion of the entries being of considerable size, fine symmetry, and splendid colour. The 1st prize was gained by Mr. G. E. CHAMPION, of Linton, Maidstone, for fruit of fine size and colour, admirably packed.

We must here make a digression to point out that the awards did not always fall to the finest fruit, as other points had to be taken into consideration by the judges. Their marks were awarded as follow:—

	Marks.
Size	25
Colour	15
Condition	20
Uniformity of grading	10
Quality of packing	20
General appearance	10
	100

The 1st prize collection in Class 1 must have scored well on all points, though there were certainly larger Apples in the class. The other prizes went to exhibits of a very high order of merit. The 2nd prize was won by Messrs. W. SKINNER & SONS, of Boughton, Winchelsea, Maidstone; the 3rd prize by Mr. R. FERGUSON, Maidstone; and the 4th by Mr. W. W. HUBBLE, Hunton, Maidstone; while Mr. C. MURDOCH, Linton, Maidstone, was highly commended.

Newton Wonder Apples in the next class were marvellously good in size, form and colour, and there were 27 entries of six boxes each. The prizes were awarded, in the order given, to Messrs. GASKAIN & WHITING, Dargate, Faversham, who were the largest and most successful of the exhibitors; Mr. C. MURDOCH, Linton; Mr. F. SMITH, Toddington; and Major W. A. NICHOLSON, West Malling; Mr. S. SKELTON, West Farleigh, being highly commended. In this class was found an illustration of the fact that the best fruit did not always take the 1st prize, as Mr. SMITH'S Apples were the best for size, colour and form combined, but were set down to the third place in consequence of giving less satisfaction to the judges in respect of packing. Apart from formality as to placing, they appeared to the ordinary visitor to be well packed, but strict attention had not been paid to the rule in this respect.

The variety Lane's Prince Albert in the next class, also an open one for six boxes to an entry, consisted of 26 exhibits. Many of these were excellent, but the class was not on the whole equal in merit to either of the preceding ones. This fact goes to confirm the general opinion that this season is not a favourable one for this particular variety. The prizes fell in the order given to the Executors of the late R. NEVE, Tenterden; Mr. E. H. CHAMBERS, Boughton, Winchelsea; Mr. F. NEAME, Faversham; and Major W. A. NICHOLSON, all of whom showed very fine Apples.

The open class for six boxes of Blenheim Pippin was an admirable one, although it contained only 15 exhibits. Messrs. GASKAIN & WHITING were placed 1st for a splendid collection, followed by Mr. W. W. HUBBLE and Mr. A. MISKIN for most creditable exhibits.

The class for six boxes of Lord Derby, also an open one, comprised 26 exhibits, most of which were composed of remarkably fine Apples. Messrs. GASKAIN & WHITING were again placed 1st, and were followed by Mr. W. W. HUBBLE and Mr. F. SMITH.

Worcester Pearmain is somewhat out of season, and the entries were confined to 11, showing six boxes each. Some of the fruits were of fine size and excellent colour, but the class as a whole had less general merit than any of those previously noticed. Mr. S. SMITH, Barming, Maidstone, won the 1st prize with a magnificent exhibit, followed by Mr. F. SMITH, Mr. A. MISKIN and Mr. W. W. BERRY.

It seem a pity that there was no separate class for Cox's Orange Pippin, as there were many remarkably fine exhibits of this best of all dessert Apples in the mixed exhibits. This was especially noticeable in a large class, comprising 32 entries, for three boxes of any dessert Apple, excluding Blenheim Pippin and Worcester Pearmain. Messrs. GASKAIN & WHITING won the 1st place for some wonderfully good Cox's Orange, and the 2nd prize fell to some fine King of the Pippins, shown by Mr. R. STEPHENSON, of Burwell, Cambs., the only winner of a prize outside the ranks of Kentish growers. Mr. S. SMITH, Barming, won the 3rd prize.

Competition in the open class for three prizes offered for the best-packed box of Apples brought a response from 32 entrants. Mr. A. MISKIN, Chart Sutton, won the 1st prize, and the 2nd and 3rd went to Mr. F. SMITH and Major W. A. NICHOLSON respectively.

Class 9, for Bramley's Seedling or Newton Wonder, was open only to commercial growers in Kent with orchards of less than 20 acres in all. The 1st prize was won by Mr. P. P. SCOTT, Leeds, Maidstone, and Mr. F. I. NEAME, Faversham, and Mr. G. STUDD, Tong, Sittingbourne, took the 2nd and 3rd prizes. There were only seven entries.

A still smaller class—comprising only four entries—was for Lane's Prince Albert or Lord Derby; the prizes fell to Mr. H. E. HUTCHINSON, Mr. F. I. NEAME, and the SOUTH-EASTERN AGRICULTURAL COLLEGE. Another Kent class, of 12 entries, was for one box of any dessert Apple. Mr. H. E. HUTCHINSON, of Staplehurst, gained the 1st prize for some admirable Cox's Orange Pippins, while Messrs. TATE BROS., of Longfield, won the 2nd prize with Allington Pippins of fine size and colour. Mr. J. WEEKS, Egerton, Ashford, came 3rd, with Charles Ross.

Class 12 was for Pears, and comprised 21 exhibits, some of which were remarkable for size and quality. Messrs. GASKAIN & WHITING were placed 1st for an unnamed variety, and were followed by Mr. A. MISKIN, for Doyenné du Comice. Considering that this has been an exceptionally good season for Pears, the display of this fruit was a little disappointing.

The class for bottled fruit, confined to Kentish residents, contained 16 entries. It was a creditable display. The exhibits consisted of three bottles each of four varieties of fruit. The prizes, in the order given, were won by Mrs. WELLINGTON, of Wye; the HORTICULTURAL COLLEGE, Swanley; and Mr. W. USMAR, of Maidstone.

Class 14 was an open one for any cooking Apple in season, one box to an entry, and it attracted no fewer than 52 entrants, many of whose exhibits were most remarkable. Messrs. GASKAIN & WHITING again scored one of their numerous successes, winning the 1st prize with some very fine fruits of Annie Elizabeth. There was only one other prize, which fell to the lot of the Executors of the late R. NEVE for a splendid collection of Northern Greening.

Another large open class, consisting of 34 entries, was for one box each of any dessert Apple in season. Here were more Cox's Orange Pippins in fine form, and it was with this variety that Mr. J. SUTT, of Rainham, carried off the principal honours, followed by Messrs. GASKAIN & WHITING, who won the only other prize awarded.

The cup offered for the best dessert Apple introduced since 1900 produced only eight competitors, and only two varieties were shown, Rival and Jonathan. Mr. F. DUNCANSON won the cup with Rival.

The best class—again an open one—was for a collection of maiden fruit trees. A Champion Cup was offered in this competition by Mr. F. S. W. Cornwallis, the President of the Kent Commercial Fruit Show Association. Only four competitors entered, and the cup was won by Mr. J. W. TODMAN, Borough Green, Kent.

Messrs. Coupe & Sons, of Covent Garden, offered a challenge cup for the best exhibit in Classes 1, 2, 3, 4, and 6, including Bramley's Seedling, Newton Wonder, Lane's Prince Albert, Blenheim Orange, and Worcester Pearmain, to be grown in Kent, Surrey, or Sussex. The cup was awarded to the winner of the 1st prize in the class for Bramley's Seedling, namely, Mr. G. E. CHAMPION, of Linton, Maidstone.

A champion cup for the best exhibit of any of the varieties above named, including, in addition, Lord Derby, in the open classes for six boxes each, was offered by Messrs. Garcia, Jacobs & Co., of Covent Garden. The winners were Messrs. GASKAIN & WHITING, for their 1st prize entry of Lord Derby. The same exhibitors were also awarded a cup presented by Mr. Mercer Smith for their 1st prize collection of Annie Elizabeth in the class for cooking Apples.

SALE OF APPLES BY AUCTION.

Some of the prize collections of Apples realized very high prices at the auction held on Tuesday. The top price was 40s. per box for Mr. G. E. Champion's 1st prize Bramley's Seedlings; while Messrs. Gaskain & Whiting's 1st prize Cox's Orange Pippin were sold for 30s. per box, and their 1st prize Blenheim Pippin for 15s. From 3s. 9d. to 5s. per box were more usual prices for the remainder of the exhibits.

NATIONAL SWEET PEA.

SWEET PEA TRIALS FOR 1913.

WE are asked to state, in relation to the trials of Sweet Peas for 1913, which will take place at the Burbage Experiment Station, Leicestershire, conducted by Major C. C. Hurst, that only novelties sent for trial will be eligible for certificates or awards granted by the Society.

For the novelty trials a charge of 2s. 6d. per variety will be made, and novelties will be accepted only from the raiser or introducer. Thirty seeds of each novelty must reach the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex, before January 4, 1913. The seeds must be placed in plain packets, but each packet must bear a number or letter for purposes of identification. With the seeds there must be a letter bearing the sender's name at the top, the number or letter of each variety sent, and, opposite such letter or number, the name of the variety (if any), the colour section to which it belongs, and (if orange or salmon) whether it should be shaded.

Sweet Peas will also be tested for purity at a charge of 10s. per stock or variety sent. Not fewer than two dozen seeds should be sent. In every case the amount due for trials charges must accompany the seeds. Every sender will receive the report of the Floral Committee in the autumn of 1913.

National Chrysanthemum Society.

October 29, 30, 31.

CHRYSANTHEMUMS appear not to have suffered from the wet, sunless summer, for in several respects this was the finest show of the series held at the Crystal Palace under the auspices of the N.C.S. The dates were earlier than usual, but this fact had no injurious effect upon the show. Chrysanthemum exhibitions have changed in many respects since the old Aquarium days. Trained specimen plants have entirely disappeared from the show, and groups of plants are no longer an important feature. We missed this year even Messrs. Butler Bros.' dwarf pot plants, which were so much admired in recent years. The Incurved varieties are waning in popularity as exhibition flowers, and the important class for 36 distinct varieties no longer finds a place in the schedule. But Japanese varieties are more popular than ever, whilst the market and decorative sorts have assumed great importance at these exhibitions. There also appears to be a revival of interest in the beautiful Pompon varieties, for the classes allotted to these flowers were much better contested than for many years past. The singles, too, meet with increased appreciation, especially those of the Mensa type, which are so suitable for decorative purposes.

The greatest advance is seen in the displays made by traders, and on this occasion the finest group of Chrysanthemums, and probably the largest ever staged, was exhibited by Mr. Norman Davis. Almost equally good were the groups shown by Messrs. W. Wells & Co., and Messrs. H. J. Jones, Ltd. The methods of arranging these large collections deserve the greatest praise. There appeared to be a greater brightness about the show than usual, and no doubt this was in part due to the beautiful weather, for the sun shone brilliantly on the opening day. Several criticisms were directed against the spreading of the exhibits over too great a space, but this was a minor fault. No fewer than 73 novelties were submitted for award, and the Floral Committee conferred nine First-class Certificates and two Awards for colour.

At one time exhibits of fruits and vegetables were important features of these shows, but this year only one collection of vegetables was staged, whilst there were few displays of fruit.

As usual, the arrangements were perfect, and the thanks of the Press and others are due to Mr. Richard Witty and his courteous assistant Mr. Bridges.

Groups.

Two classes were provided for groups of Chrysanthemums, but only one exhibit was forthcoming. It was shown in the class for a floral display of Chrysanthemums from which traders were excluded. The exhibitor was Lady Tate, Park Hill, Streatham (gr. Mr. W. Howe), and the 1st prize was awarded. This excellent group was arranged as a pyramid, crowned with a fine Kentia. Three excellent plants of Dracæna Victoria and well-coloured Codiæums were arranged at suitable places and served as fine foils to the Chrysanthemums which were unnamed.

Open Classes.

Blooms Shown on Boards.

Incurved Varieties.—The principal class in this section was for 12 blooms, distinct, and it attracted four competitors. The finest exhibit was shown by Pantia Ralli, Esq., Ashtead Park, Epsom (gr. Mr. G. J. Hunt), who had much the larger blooms. The varieties were Buttercup, Mrs. G. Denyer, Romance, Mrs. F. Judson, W. J. Higgs, Boccace, Lady Isobel, Clara Wells, Duchess of Fife, G. F. Evans, Marjorie Shield, and a large magenta-coloured seedling; 2nd, Miss Weyburn, Hadley Manor, Barnet (gr. Mr. A. Jones), whose finest blooms were Emblème Poitevine, Mrs. G. Denyer and Clara Wells; 3rd, Miss Langworthy, Holyport (gr. Mr. T. G. Broom).

For six blooms of one variety seven competed, and all the exhibits were excellent. The 1st prize was awarded to Mr. Mappin (gr. Mr. T. Beeson), for very large flowers of the rich yellow Buttercup; 2nd, Mrs. Slattery, with the same variety; 3rd, Miss Weyburn, with Romance.

Japanese Varieties.—The Society offered the Holmes Memorial Challenge Cup and the sum of £7 as the 1st prize in the important class for 48 blooms, distinct. Three other prizes of the total value of £13 were also offered. Five competed, the quality of the exhibits being above the average. The best display was made by H. Mocatta, Esq., Addlestone, Surrey (gr. Mr. Thos. Stevenson). There was not a weak bloom in the exhibit, and many of the specimens were of unusual merit. A flower of the yellow F. S. Vallis was of extraordinary size. Other choice flowers were Mrs. Gilbert Drabble (white), Mrs. L. Thorn (pale yellow), Thomas Lunt (crimson), Miss Roope (deep yellow), Hon. Mrs. Lopes (yellow), William Turner (white), H. E. Converse (crimson, with golden reverse), Gladys Herbert (pale mauve-pink), Lady Talbot (yellow), Frances Jolliffe (golden, suffused with rose), Fred. Chandler (a fine bloom), W. Gee (pink), Harry Wood (crimson), His Majesty (deep crimson), Algernon Davis, Superbe, Queen Mary and Miss A. Finch. The 2nd prize was awarded to Pantia Ralli, Esq., who also showed splendidly. A few of the choicer blooms were W. Turner, H. E. Converse, Frances Jolliffe, Miss A. E. Roope, Pockett's Crimson, F. S. Vallis, Mary Inglis, D. B. Crane, Rose Pockett and Mrs. R. Luxford; 3rd, Sir Carl Meyer, Bart., Shortgrove, Newport, Essex (gr. Mr. E. Guile); 4th, E. J. Thal, Esq., Frensham Place, Farnham (gr. Mr. C. Moore).

Twenty-four Japanese blooms, distinct.—This proved one of the best classes in the show. The competitors numbered 13, and all showed splendidly. Mr. Mocatta again excelled, his blooms being so large as to appear crowded, whilst the colours were bright and varied. Outstanding varieties were Frances Jolliffe, H. E. Converse, William Turner, Miss Roope, Mrs. Gilbert Drabble, Lady Talbot, Thos. Lunt, Hon. Mrs. Lopes, Queenie Chandler (pale yellow), John Peed (pink), and F. S. Vallis; 2nd, L. G. Wigg, Esq., Rockshaw, Merston (gr. Mr. Sargent), who showed large, well-finished blooms of President Viger, Eclipse, Lady Crisp, Pockett's Crimson, Frances Jolliffe, William Rawlings, Mrs. G. C. Kelly and others; 3rd, Pantia Ralli, Esq.

Blooms Shown in Vases.

The "Great Vase" class was much better contested than last year, there being six exhibits on this occasion compared with two. The schedule required 12 vases of Japanese varieties, distinct, with not less than 6 inches of the stems showing above the receptacle. The vases were 14 inches in height and arranged on a low table.

The 1st prize was won by Mr. Mocatta, whose blooms were magnificent, and showed to better advantage on stout stems with foliage than those displayed on boards. The varieties Frances Jolliffe and Hon. Mrs. Lopes were of immense size and splendid in every respect; Miss Alice Finch, Mme. G. Rivol, Master James, Lady Talbot, Mrs. R. A. Witty, Queenie Chandler, Mrs. R. Luxford, William Turner, Fred Chandler and F. S. Vallis were the other varieties. The 2nd prize was awarded to J. Newton-Mappin, Esq., Headley Park, Epsom (gr. Mr. T. Beeson). This exhibitor showed large, well-finished blooms of O. H. Broomhead, Mrs. A. T. Miller, Lady Letchworth, Mrs. C. H. Totty, Reginald Vallis, Lady Talbot, Mrs. Kelly and others. 3rd, Rev. A. C. Cooper-Marsdin, Borstaldene, Bickley (gr. Mr. W. Rigby).

There was only one exhibit in the class for 12 vases of Incurved varieties, for which the Holmes Memorial Challenge Cup and the sum of five guineas were offered as the 1st prize. The exhibitor was Mr. Pantia Ralli, and the varieties were Boccace, Mr. F. Judson, Clara Wells, W. J. Higgs, Buttercup, Frank Trestian, Mrs. G. Denyer, C. H. Curtis, Calypso, Romance and Wiseman.

Single-vase Classes.—In these classes, for one vase of three Japanese blooms each, the prizes were awarded as follow:—*White:* 1st, Mrs. A. T. Miller, shown by J. Newton Mappin, Esq., Epsom (gr. Mr. T. Beeson); 2nd, White Queen, shown by A. T. Miller, Esq. *Yellow:* 1st, Lady Talbot, shown by Mrs. Slattery, The Orchard, Marlow (gr. Mr. R. Evans); 2nd, the same variety, shown by Sir Carl Meyer, Bart. (gr. Mr. E. Guile). *Any other colour:* 1st, Francis Rowe, reddish-bronze, shown by R. H. B. Marston, Esq., Canterbury (gr. Mr. Fairservice); 2nd, Reginald Davis, shown by Sir Carl Meyer. The variety Frances Jolliffe, shown by Rev. A. C. Cooper Marsdin, Bickley (gr. Mr. W. Rigby), was awarded the 3rd prize. These magnificent blooms remained beautifully fresh when others had drooped.

Anemone-flowered Varieties.

Much the best exhibit of six vases of these flowers, shown by seven competitors, were staged by Miss Langworthy, Holyport (gr. Mr. T. J. Broom). The blooms were large, fresh, and splendid in colour. The varieties were Mrs. H. Eland, Miss A. Lowe, La Marguerite, Mons. C. Lebocqz, Mrs. N. Brun, and John Bunyan, all well-known sorts. 2nd, C. D. Clark, Esq., Shortlands (gr. Mr. W. Passey), who showed greater variety. 3rd, Lady Yule, Bricket Wood (gr. Mr. J. Foster).

Pompons.—These pretty flowers were shown much more numerously than usual. There were no fewer than eight exhibits in the class for six vases, and the 1st prize was awarded to a magnificent exhibit shown by J. W. Hussey, Esq., Bouverie House, Exeter. Mme. Elise Dordan, W. Westlake, Black Douglas (exceptionally good), Prince of Orange, and Compte de Morny were all of superlative quality. 2nd, C. Urban, Esq., Teddington (gr. Mr. F. Fitzwater), with fine vases of Osiris, Cendrillion, William Sabey; and Prince of Orange.

Anemone Pompons.—The 1st prize in the class for six vases of these Chrysanthemums was won by Mr. Urban, whose flowers were the largest. The varieties were Antonius, Rose Marguerite, Emily Rowbottom, Marie Stuart, Mr. Astie, and Perle. 2nd, Lady Yule.

Single Chrysanthemums.—There were five tables of single Chrysanthemums in the competition for a silver rose bowl offered by C. E. Shea, Esq. A daintily-arranged table was placed 1st; the exhibitor was F. J. Jarrow, Esq., Abbey Road, St. John's Wood (gr. Mr. A. Robertson); 2nd, Mr. F. G. Bealing, Bassett, Southampton, whose display was rather too massive for these elegant flowers.

There was a class for eight vases of single Chrysanthemums, and here Mr. Mocatta (gr. Mr. Stevenson) won handsomely, having much the largest and finest blooms. The varieties were White Pagram, Edith Pagram, Snowflake, Charles Kingsley, Bronze Pagram, Yellow Purity, Miss Mabel Booth, and Ceddie Mason. Four exhibits were staged in this class.

A Decorative Class.

Mr. Norman Davis offered prizes in a class for 12 Japanese blooms, distinct, arranged with foliage on a space of 5 feet by 3 feet. A large table was filled with nine exhibits, the best of which was shown by Mr. Mocatta, who arranged large blooms of the best exhibition quality in a setting of Ferns, Codiæums, and Abutilon Thompsonii, with sprays of Phyllanthus nivosus at the back. The choicer blooms were those of the variety Frances Jolliffe, William Turner, Queen Mary, His Majesty, Lady Talbot, Fred. Chandler, and Francis Rowe. 2nd, Mr. A. Smith, Roehampton; 3rd, A. T. Miller, Esq., Leatherhead (gr. Mr. G. Mileham).

Amateurs' Classes.

These were well contested and the flowers generally were excellent specimens. In the class for 12 Japanese blooms, distinct, four competed, and J. Barber, Esq., Bromley (gr. Mr. J. Bedson), was placed 1st for excellent blooms of Master David, Mary Farnworth, Walter Jinks, Lady Talbot, Mrs. A. T. Miller, and Alice Lemon. 2nd, Mr. C. Pullen, Raynes Park.

For 12 Japanese blooms, distinct, in Section B, Mr. C. Fox, Tunbridge Wells, was placed 1st of seven competitors, whilst for six Japanese blooms, distinct, Mr. G. Richardson, Tulse Hill, excelled with excellent blooms. The best

six blooms of a Japanese variety were shown by Mr. C. PULLEN, Raynes Park, who had splendid blooms of Lady Talbot.

The finest of three exhibits in the class for six blooms of an Incurved variety was shown by E. WOOD, Esq., Upper Norwood (gr. Mr. A. Dyer), who showed the variety Clara Wells.

Mr. CAMPKIN, Southend, was successful in the classes for six Japanese blooms, distinct, and three Japanese varieties, two blooms of each sort.

Mr. L. THOMSON, Thormby, Liverpool, was the only exhibitor in the class for six vases of Single Chrysanthemums, and he was awarded the 1st prize.

DECORATIVE CLASSES.

Two classes were provided for tables decorated with Chrysanthemums, the one for yellow and bronze varieties, the other for colours other than these. There were nine tables in the yellow and bronze class, and the arrangements generally were very good. The 1st prize was awarded to Mr. A. W. Trossell, gardener to H. ATTENBOROUGH, Esq., Beckenham. Twelve competed in the other class, and the 1st prize was awarded to Mrs. A. R. BIDE, Farnham, who employed pale pink Chrysanthemums, with Adiantum Fern and Berberis Darwinii.

The best two vases of Pompon or Anemone-Pompon varieties, arranged for effect, were shown by Mr. URBAN. Mr. D. B. CRANE, Highgate, excelled in the class for one vase of single Chrysanthemums, arranged with foliage; Mrs. BREWSTER, Canterbury, exhibited the best basket of Chrysanthemums and the best basket of autumn foliage and berries.

AFFILIATED SOCIETIES.

The special competition for societies affiliated with the N.C.S. was represented by three associations, and the Dulwich Society exhibited the best flowers. The other competitors were the Finchley Chrysanthemum Society, and the Reigate and District Society, the 2nd and 3rd prizes being awarded in this order. The Dulwich flowers were exceptionally good, especially the Incurved varieties H. W. Thorp, Mrs. G. Denyer, Romance, Buttercup, and Clara Wells. Choice Japanese blooms were seen in Mrs. A. T. Miller and Mary Boulton, whilst of the numerous singles, a vase of the variety Sir Frank Crisp was unusually good.

FRUIT AND VEGETABLES.

Grapes.—Three of the four exhibits of three bunches of white Grapes were of the variety Muscat of Alexandria, which was awarded the 1st and 2nd prizes. The 1st prize bunches, shown by J. BALFOUR, Esq., Moor Hall, Harlow, Essex (gr. Mr. A. Jeffries), were very large, nicely balanced, and composed of rich-looking amber berries. The 2nd prize was won by C. BAYER, Esq., Tewkesbury Lodge Forest Hill (gr. Mr. E. C. Wickers); 3rd, Dr. LACROZE, Roehampton Lane, S.W. (gr. Mr. F. Cresswell), who showed three good bunches of the variety Mrs. Pearson. Black Grapes were divided into two classes, and in that which excluded Gros Colman Lady TATE, Park Hill, Streatham Common (gr. Mr. W. Howe), won the 1st prize for three excellent Sloe-black bunches of Alicante; 2nd, J. BALFOUR, Esq., for the variety Appley Towers; 3rd, Sir WALPOLE GREENWELL, Bart., Marden Park, Woldingham (gr. Mr. W. Lintott). There were only two exhibits of three bunches of Gros Colman, and the 1st and 2nd prizes were awarded to C. BAYER, Esq., and Lady HOME respectively.

Apples.—The best six dishes of dessert Apples were shown by Mr. A. SMITH, The Convent Gardens, Roehampton, who included good examples of Margil, Ribston Pippin and Cox's Orange Pippin; 2nd, Rev. McMURDIE, Woburn Park, Weybridge (gr. Mr. A. Basile); 3rd, Dr. JACKSON, Thornton Heath (gr. Mr. W. Paulley).

The 1st prize collection of six dishes of culinary Apples, shown by the Rev. McMURDIE, were especially good; 2nd, Mr. A. SMITH; 3rd, Dr. JACKSON.

Pears.—Of the three exhibits of six dishes of dessert Pears that of the Rev. McMURDIE was decidedly the best. The varieties Roosevelt, Beurré Diel and Charles Ernest were excellent; 2nd, Sir WALPOLE GREENWELL; 3rd, Dr. JACKSON.

Vegetables.—As usual, ROBERT SYDENHAM, LIMITED offered prizes for a collection of vegetables. The only exhibit was shown by the Rev. McMURDIE. The kinds were Standard Bearer Celery, Lyon Leeks, King Edward VII and The Factor Potatos, Hollow Crown Parsnips, Ailsa Craig Onions, St. Valery Carrots, Autumn Giant Cauliflowers and Tomatos.

AWARDS.

FIRST-CLASS CERTIFICATES.

Queen Mary (Japanese).—A large, white variety of the finest exhibition type. Shown by Messrs. W. WELLS, LTD.

Ivernia (Japanese).—A bright flower of buff colour suffused with rosy-bronze. Shown by Messrs. J. STREDWICK & SON.

Miss Elsie Davis (Japanese).—A large exhibition variety, of amaranth colour, with silvery reverse.

Francis Rowe (Japanese).—A large, bronzy-terra-cotta bloom, showing gold on the reverse.

Miss A. E. Roope (Japanese).—A large, golden-yellow variety, suitable for exhibition purposes. These three shown by Messrs. H. J. JONES, LTD.

His Mojesty (Japanese).—This splendid crimson variety was raised from J. W. Molyneux × Lady Violet Beaumont. One of the finest novelties at the show. Exhibited by Mr. NORMAN DAVIS.

Mrs. Gertie Ladds (single).—A bold flower, of chestnut-crimson colour. Shown by Mr. PHILIP LADDS.

Miss Thelma Hartmann (Incurved).—A well-shaped flower of blush shade. Shown by Mr. WALTER JINKS, Thames Ditton.

Sidney Lawrence (single).—The florets of this pretty variety are a bright amber colour. Shown by Mr. L. LAWRENCE, Sevenoaks.

AWARDS FOR COLOUR.

Miss N. Borrer (single).—This variety has light pink flowers, with a white zone. Shown by Mr. A. CHAPMAN, East Grinstead.

Charles Hall (single).—A medium-sized flower, of a shade of crimson-chestnut. Exhibited by Mr. PHILIP LADDS.

NON-COMPETITIVE EXHIBITS.

Mr. NORMAN DAVIS, Framfield, Sussex, put up the largest group in the exhibition, and was awarded a large Gold Medal and the Gold Medal offered by Messrs. Clay and Sons for the best miscellaneous exhibit in the show. The exhibit occupied the whole width of the centre transept opposite the grand organ. It was arranged in the form of five semi-circles, against a deep screen of crimson plush, which threw the bright colours into relief. The largest, central bay was composed entirely of exhibition blooms of Japanese and Incurved varieties, arranged in epergnes of different heights, amidst choice plants of Codiæums, with Ferns as a ground. This portion was very imposing, but the prettiest effect was seen in the wings, one of which was composed of single and the other of decorative Chrysanthemums. One of the smaller bays was wholly of Pompon, quilled, hirsute, thread-petalled, sweet-scented and reflexed varieties. The largest blooms were His Majesty (a new variety of intense crimson colour), Countess of Granard, Mme. P. Radaelli, D. B. Crane, White Queen, Hon. Mrs. Lopes, Lady Talbot, Evangeline, C. H. Totty, Amber Queen (new), Mme. G. Rivol, and J. W. Molyneux.

Messrs. H. J. JONES, LTD., Ryecroft Nurseries, Hither Green, put up an imposing exhibit of Chrysanthemums. Choice exhibition blooms were arranged in large porcelain vases and fancy baskets on a ground of ornamental-foliaged plants. The back was composed of epergnes, 8 feet high, decorated with specimen blooms set off by the golden foliage of Sweet Chestnut, thrown into relief by tall Palms against a screen of crimson drapery. At either end there were semi-circular bays furnished with a great assortment of single, decorative, border, and other types of the smaller Chrysanthemums. Among the more notable of the larger varieties were Bob Pulling (an immense bloom of clear yellow), Mrs. Roope (a trifle deeper shade than the former), Mrs. H. J. Jones (the largest variety in the collection, a shade of greenish-yellow), J. Surry (a rich-crimson flower showing a golden reverse), Mrs. R. C. Pulling (lemon-yellow), Mrs. Elsie Davis (a large Incurved Japanese variety of deep-rose colour), J. G. Bier (a white bloom with narrow florets), Mrs. Gilbert Drabble (white), Mrs. Edgar Tickle (a pretty rose-pink shade), Francis Rowe (terra-cotta), and Mary Hollert (very faint blush). (Gold Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, staged a remarkably fine group of Chrysanthemums, the Japanese blooms ranking amongst the best in the show; indeed, blooms of the Queen Mary variety were unequalled amongst the white sorts. This magnificent variety was given the place of honour, being staged immediately in the centre towards the front. The rich colours of the red and purple varieties blended with white, pink, bronze, gold, and other shades, were set off by large sprays of autumn foliage and greenery. Of the large varieties, there were excellent blooms of H. E. Converse, Wm. Turner, Mrs. R. A. Witty, Mrs. R. Luxford, Mrs. C. H. Totty, Mrs. G. L. Wiggs, D. B. Crane, Gertrude Peers, and Mrs. Gilbert Drabble. (Gold Medal.)

Messrs. JOHN PEED & SON, Norwood, staged a circular group of Chrysanthemums in the form of a pyramid. Large exhibition blooms of such varieties as Mrs. G. C. Kelly, Rose Pockett, Frances Jolliffe, W. Turner (white), Alice Lemon, Master James and D. B. Crane were prominent, and there were numerous bunches of single and decorative varieties, of which none was more beautiful than the single white Mensa. This firm also exhibited a collection of Apples and Pears. (Small Gold Medal.)

Messrs. CRAGG, HARRISON & CRAGG, Heston, Middlesex, were awarded a small Gold Medal for a group of market varieties of Chrysanthemums.

Messrs. H. CANNELL & SONS, Swanley, Kent, showed numerous varieties of Chrysanthemums, a collection of zonal Pelargoniums, and a table of Apples and Pears. (Silver-gilt Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed excellent Ferns, well-grown Begonias of the Gloire de Lorraine type, Primula obconica, and Cyclamens. (Silver-gilt Medal.)

Messrs. YOUNG & Co., Hatherley, Cheltenham, exhibited varieties of Perpetual-flowering Carnations, for which a large Silver Medal was awarded.

Messrs. HOBBIES, LTD., Dereham, Norfolk, filled a large table with Roses.

Messrs. H. PATTISON & Co., Streatham, showed the "Pattison" horse boots, implements for eradicating weeds from lawns, patent turf renovator and other garden necessities.

VISIT OF THE FLORAL COMMITTEE TO WOBURN PLACE.

OCTOBER 26.—On this date, by the kind permission of E. G. Mocatta, Esq., of Woburn Place, Addlestone, the members of the Floral Committee of the N.C.S. paid a visit to the gardens, chiefly to view the collection of Chrysanthemums. The party was met at the station by Mr. Thomas Stevenson, who conducted the members through the greenhouses, Rose gardens, rock and water garden, and fruit and vegetable garden. The several houses containing the Chrysanthemums were the chief attraction. Large numbers of gigantic Japanese blooms, together with a good selection of good singles and decoratives, were much admired. It was felt that Mr. Stevenson would be quite able to hold a leading position wherever he might exhibit this season. The party was entertained to tea in the conservatory adjoining the mansion.

HEREFORD FRUIT AND CHRYSANTHEMUM.

OCTOBER 23, 24.—The 21st annual show of this society was held in the Shire Hall, Hereford, on these dates. The principal exhibits were of Apples, which were shown remarkably well in upwards of 50 classes. Pears also were good, but these fruits were not so large as we have seen them at previous Hereford shows. There were very creditable exhibits of Grapes, especially of the variety Gros Colman. Only six classes were allotted to Chrysanthemums.

OPEN CLASSES.

There were only two exhibits in the class for 50 dishes of Apples, distinct, arranged with floral decorations in a space of 70 square feet. The 1st prize was won by Mr. C. W. POWELL, Warham Court, who arranged his fruits in baskets. The other exhibitors, Messrs. PEWTRESS BROS.,

of Tillington Nurseries, were awarded the 2nd prize. In the class for 30 dishes of Apples, distinct, Mrs. HILL, Moreton Court (gr. Mr. Stansfield), was the only exhibitor, and received the 1st prize for a very meritorious collection of the leading varieties, the group being pleasingly decorated with foliage. In the class for 12 dishes of culinary Apples, distinct, five exhibits were staged, and competition was very keen amongst three of the competitors. Messrs. GETTING & NEWTON, Glewston Court, Ross (gr. Mr. Kelly), were placed 1st, and Capt. W. R. Cox, Ashleigh, Ross, 2nd.

Four competed in the class for eight dishes of dessert Apples, distinct, and the 1st prize was won by A. G. BURNEY, Esq., The Weir, Hereford (gr. Mr. G. H. Holden), who showed the varieties Egremont Russet, Cox's Orange Pippin, Adams's Pearmain, King of the Pippins, Rival, James Grieve, Wealthy, and Charles Ross. 2nd, J. RILEY, Esq., Putley Court (gr. Mr. Taylor); and 3rd, Mr. KELLY.

Five classes were provided for Apples packed in boxes, and the exhibits proved very interesting. Only one prize was offered in each class. Five exhibitors showed the variety Newton Wonder, and the 1st prize was won by Captain CLIVE WHITFIELD (gr. Mr. K. Stevens). In the class for Lane's Prince Albert, Captain S. R. Cox was awarded the 1st prize, and he also excelled in the class for Cox's Orange Pippin. For the variety Bramley's Seedling, Mr. C. W. POWELL was placed 1st, whilst the finest exhibit of Blenheim Pippin was shown by Messrs. PEWTRESS BROS.

SINGLE-DISH CLASSES.—Many excellent fruits were seen in the single-dish classes for Apples, and in most cases the competition was very keen. The following are the names of the 1st prize winners:—Captain COX, for Cox's Orange Pippin; Rev. G. H. DEVONPORT, for Ribston Pippin; Messrs. PEWTRESS BROS., for Blenheim Pippin; E. W. CADDICK, Esq., for King of the Pippins; W. S. R. COX, for Warner's King; Messrs. GETTING & NEWTON, for Bramley's Seedling and Lane's Prince Albert; Messrs. PEWTRESS BROS., for Dumelow's Seedling; E. W. CADDICK, Esq., for Gascoyne's Seedling; A. G BURNEY, Esq., for Peasgood's Nonesuch; J. RILEY, Esq., for Newton Wonder; Mr. C. W. POWELL, for Annie Elizabeth; and Lord DERBY and R. M. WHITING, Esq., for Allington Pippin and Rival.

In the class for 12 varieties of Pears arranged with foliage there were three good exhibits, and A. W. FOSTER, Esq., Brockhampton Court (gr. Mr. Parrott), was awarded the 1st prize. This exhibitor staged excellent fruits of Beurré Bosc, Doyenné du Comice, Pitmaston Duchess, Marie Louise d'Uccle, Emile d'Heyst, Marie Louise, Charles Ernest, Durondeau, and others. 2nd, the Rev. G. H. DEVONPORT.

Sir JOHN COTTERELL, Garnons (gr. Mr. C. Liddle), secured the principal prize in the class for eight dishes.

SINGLE DISHES CLASSES.—The following are the prize-winners in the single-dish classes for Pears:—Mrs. WOODHOUSE, Burghill, for Marie Louise; Sir R. LUCAS TOOTH, for Doyenné du Comice; Rev. G. H. DEVONPORT, for Pitmaston Duchess; Sir J. COTTERELL, for any other dessert variety, with Beurré Superfin; and the Hon. Mrs. WILMOT, for a culinary sort with Catillac.

Three exhibits were staged in the class for six dishes of miscellaneous fruits, and Sir J. COTTERELL excelled with capital Gros Colman and Muscat of Alexandria Grapes, Doyenné du Comice Pears, Cox's Orange Pippin Apples, Coe's Golden Drop Plums, and a Melon. Other 1st prize-winners in the classes for collections of fruit were Mrs. WOODHOUSE and Mr. SYKES.

CHAMPION CLASSES.—The best dessert Apples in the show were of the variety King of the Pippins, shown by E. W. CADDICK, Esq.; the best culinary Apples, fruits of Bismarck, exhibited by Captain W. S. E. COX; and the best Pears Doyenné du Comice, shown by Sir R. LUCAS TOOTH.

FLORAL CLASSES.—The leading exhibitors in the Chrysanthemum classes were Messrs. PARROTT, J. CORNER, A. G. BURNEY, and C. F. HOLFORD.

NON-COMPETITIVE EXHIBITS.

The KING'S ACRE NURSERY Co., Hereford, showed upwards of 70 dishes of Apples and Pears, and floral designs. Mr. WILSON, Commercial Street, Hereford, staged floral devices. Messrs. YOUNG & Co., Hathertley, exhibited Carnations.

MARKETS.

COVENT GARDEN, October 30.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—English and Colonial Apples are in fair demand considering the large quantities arriving in Covent Garden. English Doyenné du Comice Pears are a record crop, whilst heavy shipments of these fruits are arriving from the colonies Home-grown Gros Colman and Black Alicante Grapes of excellent quality are on sale, and the demand shows a slight improvement. Selected bunches of Canon Hall Muscat are in request. Good samples of Californian Plums are obtainable. Blackberries, Medlars, and Quinces are all fairly plentiful. Tropical fruits now in the market include Avocado Pears, Mangoes, Custard Apples, Monstera deliciosa and Lychees. Nuts include Cobnuts, Walnuts, Spanish and French Chestnuts, Brazils, Almonds, Barcelona Nuts, and Cocoanuts. Supplies of English Tomatos are about equal to the demand. Teneriffe Tomatos are arriving to a better condition. Mushrooms are

an increased supply and are meeting with a good demand at lower prices than last week. French Dwarf Beans from France and the Channel Islands continue a good supply. Paris Green Asparagus is obtainable in fairly large quantities. The commoner vegetables have been very plentiful during the past week. Cauliflowers and Brussels Sprouts in particular. *E. H. K., Covent Garden, October 30, 1912.*

New Potatos.

	per cwt. s.d. s.d.		per bag. s.d. s.d.
Bedfords	3 9- 4 0	Dutch	3 6- 4 0
Kents	4 0- 5 3	Belgian	3 3- 4 0
Blacklands ...	3 9- 4 3		
Lincolns	4 0- 5 0	German	3 9 4 3

REMARKS.—Trade and prices remain about the same. Still a large quantity of German, Dutch and Belgian Potatos arriving. Very best English Potatos are in demand. *Edward Newsum, Covent Garden and St. Pancras, October 30, 1912.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending October 30.

The wettest week for four weeks.—After four very cold days the day temperatures on the 25th inst. began to rise, and are now about 6° warmer than is seasonable. The last four nights have also been very warm for the time of year. On the other hand, on the first three nights of the week the exposed thermometer registered from 6° to 9° of frost. During the past few days the ground temperatures, which had been very low, have risen rapidly, and are now a degree warmer at 2 feet deep, and 2° warmer at 1 foot deep, than is seasonable. Rain has fallen on the last four days to the total depth of 1⅓ inches; or to a greater depth than in the previous 25 days of the month. During the week 6¾ gallons of rainwater has come through the bare soil gauge, and 5 gallons through that on which short grass is growing. The sun shone on an average for 1¾ hours a day, which is more than an hour a day short of the usual duration at the same period in October. On three consecutive days no sunshine at all was recorded. The first three days of the week were very calm, but since then the wind has been often rather high, but in no hour did the mean velocity exceed 15 miles. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 1 per cent. *E. M., Berkhamsted, October 30, 1912.*

Obituary.

JAMES LESLIE.—Mr. James Leslie, retired gardener, Aberlour, died there on October 21 aged 85 years. He was for many years gardener at Aberlour Orphanage.

ANSWERS TO CORRESPONDENTS.

APPLE LEAVES: *W. F.* The Apple leaf-miner (Lyonetia clerckella) is attacking the tree. Gather the fallen leaves and burn them. Next September spray the foliage with a strong arsenical wash, which will kill the larvæ and pupæ. Constant spraying with paraffin emulsion in the spring will prevent the pest laying her eggs.

CREOSOTE: *A. S. T.* This can be purchased from the Cheap Wood Co., 16, Devonshire Square, London, or Messrs. Carson and Sons, Grove Works, Battersea.

GOOSEBERRY AND CURRANT ROOTS: *L. E. C.* A fungus is present at the roots. A mixture of two parts quick-lime and one part sulphur should be worked into the soil.

DENDROBIUM PHALÆNOPSIS: *A. K.* Some species of Orchids are not easily induced to flower much earlier than their normal season, and Dendrobium Phalænopsis is such an Orchid. But as you have flowered the species so successfully in October, you might be able to get a proportion of the plants in bloom a month earlier if you make a selection of strong plants and subject them to a more vigorous period of rest, keeping them drier and cooler than you have been in the habit of doing, and return the plants to the warm, moist house earlier than has been your custom.

INSECTICIDE: *G. V. D., Bruges.* The insecticide to which you refer is, no doubt, hydrocyanic acid gas. It may be prepared from either potassium cyanide or sodium cyanide, but it is preferable to use the latter. Hydrocyanic acid is liberated when sulphuric acid is poured on to the cyanide of soda. The operation requires great care, owing to the *extremely poisonous* nature of hydrocyanic acid gas. The chemical is placed in an earthenware vessel, and the acid arranged above it in a bottle or other glass receptacle, with a string attached leading outside the building, say, through the keyhole. This is to enable the operator to liberate the acid from the outside. For delicate subjects and for vines in full leaf, 1½ ounce of the cyanide, 3½ ounces of sulphuric acid, and 10½ fluid ounces of water may be used with safety. The work should be done in the evening, and not in the strong sunlight, whilst the temperature of the house should not exceed 60 degrees, and the plants and surroundings should be dry. The glasshouse should be kept closed during fumigation from three-quarters of an hour to an hour, and then the ventilators and doors should be opened from the outside, and should remain open for some time before anyone is allowed to enter the house. It is best to do the work on a calm day. Close any crevices in the house through which the fumes might escape. The horticultural sundriesmen supply outfits and material.

MANURES: *A. S. T.* Your previous question concerning the relative values of horse manure and moss litter manure was answered at the foot of "Early Potato for Medium Soil" on p. 276 of our issue for October 5 last. The present form of your enquiry is not quite clear; if by straw manure you mean farmyard manure, this is certainly the more valuable, even at the increased price per ton. You do not state the price of the horse manure, but for digging into the soil it is more valuable than moss litter manure, which, however, is frequently very good for applying as a mulching, especially on lawns.

NAMES OF FRUITS: *W. E.* Gravenstein.—*J. B., Thirsk.* 9, Brockworth Park; 10, Woodcock; 11, Kentish Fillbasket.—*W. G. W.* 1, Maltster; 2, Beurré d'Amanlis; 3, Magnate; 4, Tom Putt; 5, Lord Derby.—*F. M.* 1, Marie Louise; 2, Bergamotte Bufo; 3, Blenheim Pippin; 4, The Queen.—*H. T. Z.* 1, Doyenné du Comice; 2, Bachelor's Glory; 3 and 4, Beurré Superfin; 5, Christmas Pearmain; 6, Grosse Calabasse; 7, Durondeau.—*A. B.* 1, Beurré de Capiaumont; 2, Uvedale's St. Germain; 3, Reinette Franche; 4, Mank's Codlin; 5, specimen too small; 6, Pitmaston Duchess.—*H. Pristney.* 1, Maréchal de Cour; 2, Beurré Clairgeau; Apple, Gascoyne's Scarlet Seedling.—*E. E.* 1, King of the Pippins; 2, Hanwell Souring; 3, Belle Dubois; 4, Withington's Fillbasket.—*R. J. R.* 1, Summer Strawberry; 2, Warner's King; 3, Melon; 4, Orange Goff; 5, Old English Nonesuch; 6, not found; 7, Pitmaston Duchess; 8, Vicar of Winkfield; 9, Beurré Baltet Père; 10, Bergamotte d'Automne; 11, Beurré Clairgeau; 12, Maréchal de Cour; 13, King's Acre Pippin; 14, Dean's Codlin; 15, English Nonesuch; 16, Gravenstein; 17, Waltham Abbey; 18, Stirling Castle.—*M. H. O.* 1, Dutch Mignonne; 2, White Nonpareil; 3, Northern Greening; 4, Cockle Pippin; 5, Flower of Herts.; Pear Autumn Bergamotte.—*F. T. R.* 1 and 5, Annie Elizabeth; 2, Warner's King; 3, Lady Henniker; 4, Bess Pool.—*G. W. P.* 1, Cellini; 2, Alfriston; 3, Reinette du Canada. Pears: 1, Marie Louise d'Uccle; 2, Beurré Superfin; 3, Beurré Diel.—*H. E. S.* 1, Beurré Léon le Clerc; 2, Old Nonpareil; 3, Bramley's Seedling; 4, not recognised; 5, Emperor Alexander; 6, St. Edmund's Pippin.—*E. G. Langford.* Pear Bellissime d'Hiver; Apple Court-pendu-plat.—*T. P.* 1, Beurré de Jonghe; 2, Beurré Diel; 3, Beurré de Caen; 4, Brown Beurré; 5, Rymer; 6, Summer Pearmain.

NAMES OF PLANTS: *Thomas Bury.* Polygonum sachalinense; not a British plant.—*H. B.* The Aster is not Feltham Blue variety; it more closely resembles A. formosissimus.—*W. F.* 1, Acer rubrum; 2, Magnolia grandiflora; 3, M. tripetala; 4, Cornus macrophylla; 5, Acer rubrum.—*E. A. H.* 1, Juniperus chinensis; 2, Pinus Strobus (Weymouth Pine); 3, Thuya occidentalis globosa; 4, T. plicata var.; 5, Libocedrus decurrens; 6, Thuya plicata (Lobbii); 7, send when in flower; 8, Cupressus plumosa albo-variegata; 9, Thuya orientalis nana.—*S. P.* 1, Cupressus funebris; 2, Ceanothus dentatus.—*Sir A. H.* 1, Veronica speciosa (garden form); 2, Vitis Wilsonii.—*Anxious.* 1, Probably Alyssum incanum; 2, Anthemis arvensis.—*Herbert W. Stevens.* The Michaelmas Daisy resembles the variety Edna Mercia, but there are others of a similar shade: a knowledge of the habit is necessary in determining these flowers.—*W. J. Green.* Hibiscus Manihot, a common tropical plant. It has long been in cultivation in this country. Although usually grown in a stove, the plant thrives in a sunny greenhouse and in the milder parts of this country it is used for summer bedding.—*Torbay.* Ornithogalum lacteum.—*F. T.* 1, Oncidium flexuosum; 2, O. barbatum.

PEARS: *L. S.* No disease is present in the fruit. The decay has been caused probably by bruising.

PEARS DISEASED: *W. H. Cobham.* The disease is Pear scab (Fusicladium pirinum). On the first appearance of this fungus on the foliage, spray the leaves with the Bordeaux Mixture at half the usual strength (6 lbs. of copper sulphate and 3 lbs. of quick-lime to 100 gallons of water); it the spores are once allowed to mature, the case is hopeless, owing to their enormous numbers and rapid dispersion. The spraying should be practised at intervals as found necessary, until the fruits are about the size of Hazel Nuts. It is not advisable to use strong Bordeaux Mixture, or it will scorch the foliage. Where the disease is present, all the Apple and Pear trees should be thoroughly drenched with a solution of sulphate of copper, 1 lb. of sulphate to 25 gallons of water, during the winter, before the buds have commenced to swell, as this winter spray fluid must not be applied afterwards. Any fallen fruits or leaves that are diseased should be gathered and burnt.

SCABIOUS WITH PROLIFEROUS FLOWERS: *H. W. P.* The abnormality is caused by certain of the buds of the capitulum growing out to form secondary inflorescence stalks instead of forming ordinary florets.

TENNIS COURTS AND BOWLING GREEN: *S. J. M.* The measurements you state for the proposed lawn-tennis courts are quite correct, but, as there is a deal of levelling to be done, you might reduce the allowance of 15 feet between each court. The usual size of a bowling green is 40 yards square, and the ground is surrounded by a shallow trench. The ground is laid out square, so that it may be played upon from all sides in turn, and so frequently change the field of play, and if you make your green in two parts the area for play will be greatly restricted. Some bowls have a great amount of bias, and on such a narrow green as that you suggest, the "jack" would have to be rolled approximately along the middle of the green. If you have had experience in this kind of work your plan of engaging men to work under your supervision is decidedly the most economical, but with only four men the work will progress but slowly. As you evidently are aware, the cost of the work can only be roughly estimated by us. The cutting, rolling, and relaying of the turf will probably cost you 4s. per 100 turves (3 feet by 1 foot), and to this must be added the cost of loading and shifting them to the courts. The usual cost of levelling ordinary soil is 3d. per yard, super, but the nature of the soil and the distance it has to be wheeled must be considered. The wages for such men as you require varies from 5d. to 7d. per hour, and the best labour is nearly always the cheapest. As there is no local labour available, you may probably find that your best plan will be to engage men through some garden contractor. For levelling, builders' labourers are often very satisfactory, but they are generally useless for laying and beating turf.

TOOL FOR CUTTING CARDBOARD: *A. S. T.* We do not know of any tool made especially for cutting cardboard the shape you require, but the work could be done with a large, strong pair of scissors, or with the tool used by plumbers for cutting thin sheet-lead, which is stocked by all ironmongers; any of whom would probably suggest other suitable implements.

GEORG REIMERS (H.T., Soupert et Notting, 1910) is a cross between Richmond and Etoile de France. It seems likely to make a useful garden Rose, for it is very free and continuous in flowering, with blooms of a good crimson-red, intermediate between the colours of its parents. It has been described as an improvement on Richmond, but it will have to prove a very good Rose to be this. As in the case of Ethel Malcolm, I have only possessed plants for one year, but have thought it worth increasing, and the only thing I have against it is its habit of folding the petals over the centre point, which is apt to spoil the symmetry of the bloom, but I hope it may get over this bad habit when it becomes established.

HERZOGIN MARIE ANTOINETTE (H.T., Welter Jacobs, 1911). This is a most beautiful little Rose, of perfect shape, and deep orange-yellow in colour, not altogether unlike Lena in appearance. If it would only grow well it would be a charming little plant, the blooms being very suitable for buttonholes, but it seems of delicate constitution, and my specimens have not made much progress. I must, therefore, have more experience of it before I can recommend it, except as an experiment. Its shape and colour are its best points.

JONKHEER J. L. MOCK (H.T., Leenders and Co., 1909) has in its pedigree such notable Roses as Caroline Testout, Mme. Abel Chatenay, and Farben Königin. The deep rose flower is well built, well carried, large and handsome. The plant is a strong and vigorous grower, and seems promising.

LADY PIRRIE (H.T., Hugh Dickson, 1910). This is one of the most beautiful decorative Roses yet introduced. The prevailing colour is a deep salmon-pink, and the petals have a slightly waved or crinkled edge. The flowers are so thin that in hot weather they open too rapidly, and hence are perhaps best in cool weather, or in autumn. The plants are apparently of good constitution and carry fine leathery foliage. I am planting a bed of it this autumn in half shade, which I hope may prove the best way to grow it.

MME. SÉGOND WEBER (H.T., Soupert et Notting, 1908), was raised from Antoine Rivoire and Souvenir de Victor Hugo (the latter a rose-coloured H.P. brought out by Pernet père, not to be confounded with the well-known Victor Hugo, of Schwartz, which is red. It is a lovely Rose in fine weather, the colour being light salmon-rose mixed with old rose or fawn. It is a good grower and flowers fairly freely and continuously. The bloom is moderately large and well shaped, but seldom good enough for exhibition purposes. Unfortunately the petals are spoilt by the first shower of rain, but in spite of this the variety is worthy of a place among good garden Roses.

MARGARET (H.T., Wm. Paul and Son, 1909) is a very well-shaped flower of good substance and pale salmon-rose in colour. The plant is a good grower, and the flower is often perfect enough for exhibition. This Rose has few faults, but is not very distinct in colour, and did not give me quite so many flowers as I could wish during this wet summer, but then I have only had it for one year, and it has been very good during the autumn.

MRS. ALFRED TATE (H.T., McGredy and Son, 1907) is another beautiful garden Rose. For this purpose it is perhaps among the best half-dozen new Roses. The buds are long, pointed and reddish-orange in colour. The tint of the flowers is difficult to describe, the reddish-pink has a lot of yellow in it that lights up well either by candle light or in a tent, and often for the want of a better term it is described as salmon. It is a colour that matches well with Irish Elegance, but is more salmon and less pink. The flowers are carried straight and erect, well above the foliage, but they are scarcely more than semi-double. The blooms are produced freely, but not quite continuously, that is, there are noticeable intervals between the flowering periods. The plants grow fairly tall, 2½ to 3 feet, but are not spreading, and they may be planted as closely as 18 inches apart in the bed. The foliage is dark green and good, whilst the growth is excellent. I think I may say this is already a popular variety, and will become more so as it gets better known. *White Rose.*

(To be continued.)

FIG. 150.—ÆSCULUS CHINENSIS GROWING IN THE PRECINCTS OF A CHINESE TEMPLE.

ÆSCULUS CHINENSIS IN CHINA.

THE illustrations in figs. 150 and 151 show Æsculus chinensis growing in the precincts of a temple in the hills 30 miles west of Peking. This species is by no means common in the district; only nine specimens were seen, all growing in temple grounds. The Western Hills across the Peking Plain, with the exception of the temple preserves, have been cleared of vegetation, and there is no sign of Æsculus growing outside these places. It is much prized by the priests, who regard it as a sacred tree. It grows into very fine specimens, the stem of the one photographed being 17 feet girth, 1 foot from the ground, and several are over 50 feet in height, with large-spreading leaf surfaces.

At the time of my visit (May 1, 1912) the flower-spikes were just showing, but the flowers were not open. The Chinese call it the "So Lo Shu." Sir Alexander Hosie's translation of the word is as follows:—

"'So,' to frisk or dance or even to saunter; 'Lo,' a net or to expand; 'Shu,' a tree. But it may be that 'So Lo' is a Chinese rendering of the Sanskrit 'Sâla.' Professor Giles, in his Chinese dictionary, says that the 'So Lo' tree is the Shorea robusta, Gaertn, an immense timber tree, under which Buddha was born and died." The latter fact may possibly explain the priests' attitude towards it, and also the use to which they put the seeds, namely, as a medicine for stomach trouble. The nuts are pounded and taken in hot water. As this Chestnut has long been sought by botanists and horticulturists, it is interesting to state that the living specimens, brought to England viâ Siberia, arrived home in good condition. The photographs are reproduced by permission of Sir Harry J. Veitch. *W. Purdom.*

FORESTRY.

THE LARCH SAWFLY.

Judging from the enquiries received, this comparatively new pest of British woodlands would appear to be increasing to an alarming extent in this country. This is the more unfortunate in that its depredations are not confined to the European Larch, for in several plantations the Japanese form has been attacked in a most virulent manner. Trees growing in a south or west aspect, and particularly where the soil is poor, would appear to fare worst, and the insect has been found at all altitudes up to fully 900 feet. Preventive or remedial measures may be carried out successfully in the case of single trees or small groups; but when a whole plantation is affected, the cost of combating the insect is so great as to be almost out of the question. As in the case of the Oak Leaf-roller moth (Tortrix viridana), the Larch sawfly is being kept somewhat in bounds by the attacks of other insects, for example, spiders of various species destroy the larvæ in large numbers. Dusting with hellebore, though an expensive undertaking, has been recommended, and causing smoke to pass over and amongst the affected trees from fires on the outskirts of the woodlands is found to be beneficial. Handpicking, too, has been carried out with good results.

HIGH PRICES FOR OAK TIMBER.

Exceptionally high prices were paid for Oak timber at a sale held recently at Wilton, near Rugby. For single trees of Oak and Ash the highest prices were £31 and £15 10s. respectively, whilst the average for ten trees of Oak worked out at £23, and for five of Ash fully £12 each. The trees, which were large, and the timber of which was excellent, were competed for keenly by buyers from many parts of England and Scotland. But all through the past season the best quality of Oak timber has sold well, whilst young, supple Ash, suitable for tool handles and the manufacture of agricultural implements, has found a ready market at remunerative prices.

REPRODUCTION OF THE WEYMOUTH PINE.

The Weymouth Pine reproduces itself in several parts of this country, but probably nowhere more freely than in Aspley Wood, on the Woburn estate. Advantage has been taken of this natural reproduction to get up a crop of this Pine by carefully thinning and otherwise attending to these self-sown seedling trees. On the Holwood estate, in Kent, too, many fine young trees are the result of chance seedlings. Though attaining large dimensions, it is hardly likely that the Weymouth Pine will be valuable for afforesting purposes, particularly where the economic value of the timber is a point of consideration.

DEARER FIREWOOD.

With the advance in the price of firewood prepared in London from imported timber, there is every reason to believe that house faggots and bundles of wood for firelighting made from home-grown wood will correspondingly increase in value. The rise in price is mainly attributable to a dearth of vessels to carry the firewood, and to increased freights for shipping, the latter being about double what they were at the corresponding period of last year. As a consequence, only about one-half of the usual supply of wood is forthcoming, and the increase in price works out at about 6d. per 100 bundles. Small faggots for fire lighting made of home-grown wood have been delivered at 2s. 6d. per 100 bundles—a price that will no doubt increase with the present scarcity of the foreign supply. *A. D. W.*

NOTICES OF BOOKS.

The Cotton Plant in Egypt.*

Mr. Lawrence Balls, who occupies the post of botanist in the Department of Agriculture of the Egyptian Government, has written a remarkable book. This work on the Cotton plant in Egypt is distinguished not so much because of the many important observations which it records—and it is full of such observations—but because it illustrates a novel and better method of the application of scientific research to problems of agricultural economics. There are in vogue at present two general methods for the resolution of the problems of economic biology: the one may be called the slap-dash method and the other the method of watertight compartments.

[Photograph by W. Purdom.

Fig. 151.—Stem of Æsculus chinensis.

[See p. 346.)

Any student of economic mycology may find a dozen examples of the former method in the work of mycologists in relation to plant diseases, and every student of science is aware that the method is unscientific. The departmental method, which is that in high favour in this country at the present time, consists in the carving of economic problems into large slices for distribution among various specialised institutions. Neither of these methods is good and neither is adopted by Mr. Balls. As the philosopher looks on life and sees it whole, so Mr. Balls looks at the Cotton plant. In his professional capacity he recognises that the yield of this crop is determined ultimately by the extent of our knowledge of the conditions which determine the healthy and hearty growth of the Cotton plant. Therefore he has devoted himself with a courage and energy beyond all praise, and worthy of the widest emulation, to the study of the physiology and biology of this plant.

To those who are eager for large profits and quick returns the method will make no appeal. They come with specific problems; they require immediate answers and infallible remedies. These science cannot give, for they are the exclusive stock in trade of charlatans. But to the bigger men with larger views Mr. Balls's mode of attack will appeal. We can imagine, for example, a Lord Kitchener—though, perhaps, he might find the task of reading Mr. Balls's book more difficult than that of subduing the Mahdi—having an appreciation for the wisdom of a man who prepares for an assault by careful disposition of his forces and by thorough inspection of his ground, instead of flinging his forces forthwith against the citadel.

Such men of long views will agree with Mr. Balls that a problem which, like that of the Cotton crop, affects the prosperity of nations and involves sums so vast as 20 to 30 million pounds per annum, requires to be approached with thoroughness and circumspection. Moreover, the Cotton of Egypt, which stands like corn of patriarchal times for the prosperity of the land, has suffered severely of recent years, and it behoves anyone to move cautiously when the movement means either the prosperity or impoverishment of a nation.

It is these considerations which lead us to declare at the outset of our review that Mr. Balls has written a remarkable book. He has attacked the problem of the economic biology of the Cotton plant in a fundamentally proper

* *The Cotton Plant in Egypt: Studies in Physiology and Genetics*, by W. Lawrence Balls, M.A. (Macmillan's Science Monographs.) 5s. net.

manner by endeavouring to ascertain all that is to be known of the mode of growth of the plant and of the conditions which make or mar the crop.

Nor is it to be supposed that this method of approach is ultimately slower than the more specious mode of undertaking the enquiry by compartments. The divisions of economic biology in mycology, genetics, soil-science, and so forth are arbitrary; they correspond to nothing real in plant-life. No one may say in advance to which section a given problem should be referred. On the other hand, by proceeding from the general to the particular, the problems sort themselves out automatically and reveal the lines along which their resolution may be pursued.

Mr. Balls's work provides many striking illustrations of the truth of this fact. His study of the root system of the Cotton plant confirms the all-important conclusion that the recent failure of the crop is the consequence of more copious irrigation and the resultant raising of the water-table. He shows, moreover, that the damage done varies in amount and definitely with the time of the year at which the excessive irrigation is practised.

Among the many interesting researches described in this volume, mention may be made of those on the "sore-shin" fungus and on the diurnal rate of growth of the Cotton plant. As a result of the investigations conducted on the fungus, which is a parasite of the Cotton plant, Mr. Balls is able to suggest a reason for the well-known fact that it is destructive of the seedlings only when the temperature is low. As the temperature rises, the fungus produces a substance which is poisonous to itself, and the rate of production of this toxin increases with the temperature. Hence, when seeds of Cotton germinate in warm weather, although the fungus gains access to their tissues, its growth is checked by the large amount of toxic substance which it produces, and the seedling is not mortally injured. This phenomenon Mr. Balls terms "thermotoxy," and if it is of general occurrence it may possibly prove a useful basis on which to develop preventive measures against other parasitic fungi. For example, it would be well worth the while of some mycologist to work out the temperature relations of the fungus (Fusarium solani) which does so much damage to stored Potatos. A determination of the temperature at which the fungus is least active might indicate a method which would be susceptible of reducing the ravages due to this disease.

The most remarkable fact discovered by Mr. Balls has reference to the daily rate of growth of the Cotton plant. By measuring the rates of elongation throughout the day it was discovered that direct sunshine brings about a complete cessation of growth. Throughout the season of active development from the seedling stage until autumn the elongation of the stem is arrested directly the sun shines upon it. So exact is the relation that "a cloud passing across the sun is immediately effective in permitting growth, which ceases again directly the cloud has passed." This sunshine effect, which is a striking testimony to the intensity of the light and heat of the Egyptian sun, is attributed by Mr. Balls to loss of water by the plant. In the high temperature so much water is transpired that growth becomes impossible, and, in support of this conclusion, Mr. Balls points out that if, by removing some of the leaves the rate of transpiration be lowered, the stem resumes its growth almost instantly.

As we have indicated, Mr. Balls has done good service in pointing, by his example, to the one true way of solving problems in economic biology, and we regret, therefore, that the book is so written as to appeal only to those who have a fair knowledge of botany. It is to be hoped that the author may see his way to the preparation of a smaller volume, in which the story of his researches is put in a form intelligible to the layman, and from which are removed many of the observations which are as yet inconclusive. Even the student of botany will, we fear, find considerable difficulty in picking out the fundamental conclusions drawn by Mr. Balls from his extensive experiments in the domain of genetics. Nevertheless, so much of the substance of the work is valuable, and the attitude of the writer to his problem is so just, that it would be ungenerous to close this review with a note of adverse criticism.

Mr. Balls has carried on his work with energy, acumen, and endurance. He has not faltered under a sun so fierce that it arrests not only the growth of many plants but also the energies of most Europeans. He hands us a volume which is partly monograph, partly note-book, and he would be but a curmudgeon who grumbled because he had at times to dive a little deep for the pearls.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE NARCISSUS FLY.—While Mr. A. J. Bliss (p. 298) has afforded proof that the grub of the Narcissus fly does usually enter the bulb at its base, it would be incorrect to conclude that it "invariably" does so. I have this season had proof of its entering from the upper part between the bulb and the offset, as though the larva had found a congenial resting-place amid the coats of the bulb at that point. This is not an isolated experience, or of one season. Occasionally, too—the instances I admit are rare—one finds the grub entering from the side of the bulb. In the former case the discoloration of the tunics of the bulb usually betrays the presence of the grub, though this might also be due to the presence of mite (Rhizoglyphus). Whilst, therefore, an entry is generally effected at the base, other parts of the bulb should be looked at during examination. The conclusion I came to years ago when considering the frequency with which the grub entered from the base was that the eggs had gradually found their way down the smooth side of the bulb, those entering by the neck having been arrested in their progress by the fork formed between the offset and main bulb. In the case of those entering at the side of the bulb, I assumed that the bulb had been either turned upon its side, or that some hard substance, such as a stone, pressing closely to the bulb had constituted a temporary shelf or resting-place for the grub. There is no doubt whatever about the grub entering by the neck or from the upper part of the bulb, as by pulling away the offset the direction of the progress of the pest was at once revealed. It is consistent, too, with the position in which the eggs are first deposited by the fly. Mr. Bliss also alluded to "basal rot," though in speaking of this it is doubtful whether all Daffodil growers refer to the same thing. The late Rev. Wolley Dod, who originated the phrase, had, I believe, in mind that species of basal decay which first caused a diminished production of root fibres, and, being malignant, resulted finally in an entirely rootless base. That, I think, was proved to demonstration by a series of bulbs I placed before the Narcissus Committee many years ago; these were subjected to a scientific examination, and the conclusion was arrived at that the condition was due to the bulb-destroying mite already referred to operating in the subterranean tissues of the bulb. By working largely near the base and clearing away all the fleshy tissue from the inner tunics of the bulbs in true excavator-like fashion, severance from the basal area was effected and "rot" was the inevitable result. More recently, however, a distinct form of decay affecting the whole bulb has arisen and its cause has not as yet, I believe, been determined. *E. H. Jenkins.*

——— With regard to the illustration to Mr. Long's article on the Daffodil fly (p. 278), the affected bulb, from the amount of leaf and root growth shown, would appear to have been kept under conditions (in bulk, &c.) such as would cause it to start growth, or else one that had been planted and taken up again; that is, a bulb at a much later period than the usual planting time. If this is not understood, it might mislead anyone who was examining his bulbs for evidence of the grub. No bulb that I examined, up to planting time (October 15 this year), was at all like that shown in the illustration; there was no *visible* hole whatever in any bulb, even those which had full-grown grubs in them. I have had some correspondence since my note appeared, and so far the writers agree that they have never seen a bulb of their own growing with a hole in the side, as is shown in the illustration. In such a bulb the hole may have been made either (in the case of a planted bulb) by the grub leaving the bulb to pupate, though I should have expected it to leave by the neck, or (in the case of bulbs kept in bulk) by the entrance of a full-grown grub migrating from another bulb. In either case, it would be no assistance to anyone looking for evidence of the grub in his bulbs between taking up and planting time I think investigators may have been misled by the imaginative use of the word "cloaca," and the idea (which is purely an assumption) that the grub makes an outlet for its excrement. As a matter of fact, all

(Photograph by W. Purdom.

FIG. 152.—TEMPLE GROUNDS IN WESTERN HILLS, PEKING, CONTAINING THE TREE OF ÆSCULUS CHINENSIS SHOWN IN FIG. 150.

(See p. 346.)

appearances go to show that the grub enjoys itself and thrives best under conditions which may perhaps seem insanitary to us, but are congenial to it, and that a "cloaca" is the last thing it would go in for. All the bulbs I have examined had nothing in the nature of an outlet below, and the grubs were thriving—some full grown—having evidently been in that condition for months. *A. J. Bliss.*

A Visit to Glenart Castle (see fig. 153).—On a recent trip to the beautiful County Wicklow I had the pleasure of visiting Glenart Castle, the magnificent Irish home of the Countess of Carysfort. I entered by the Vale Road gate, near to the lovely vale of Ovoca. I shall never forget the quiet loveliness of the scene that lay before me: the expanse of water backed by choice Rhododendrons which stretched from the water's edge to the top of the high hill. There are 10 acres of Rhododendrons, and hundreds of the specimens measure 20 feet in height. The drive takes a winding course with stately trees of noble proportions on either side, fine Oaks, Beech, Elm, and other deciduous species. The Conifers, too, call for particular mention; there are Sequoias (Wellingtonias) over 106 feet in height, also splendid specimens of Pinus Strobus, P. Cembra, the lovely P. insignis, Cedrus Deodara, Abies nobilis, A. Pinsapo, Thuya orientalis, T. plicata, T. occidentalis, and other species, many raising their heads to over 100 feet.

Fig. 153.—Glenart Castle, Arklow, Co. Wicklow.

I also saw some fine Eucalyptus trees; one measured 60 feet in height, and the trunk at 3 feet from the ground was 4 feet 6 inches in circumference. On reaching the top of the hill there is a charming view of Arklow, the Irish Sea, and the lovely country for miles around. The flower grounds, glasshouses, terraces, and lawns are entered by a stately and most imposing archway and fine, high tower built of dressed Irish granite blocks. The summer bedding was resplendent with flowers of the choicest description; as I passed along the terraces I caught sight of clumps of Eucalyptus of various kinds, fine Retinosporas, splendid Cordylines, Chamærops, and massive clumps of Hydrangeas, which had wintered well for years past. The present gardener, Mr. William Bailey, has not held the appointment long, but his intelligence and energy are showing themselves on every side. *James Ward, Norwich.*

The Lizard Orchid.—It is somewhat strange that, until a few years ago, the Lizard Orchid (Orchis hircina) was thought to be almost extinct as a British plant. During the past five years no fewer than six stations have been added to its range, and it has cropped up this year again in two other parts of England. Unusually fine specimens were shown to me that had been collected in the Dover district, but, fortunately, in such situations as to preclude the possibility of annihilation. Can it be that, like other Orchidaceous plants, notably Cephalanthera and Epipactis, the seeds of the Lizard Orchid lie dormant in the ground for many years? I saw a small colony of the rare little scorched Orchid (Orchis ustulata) on the chalk cliff near St. Margaret's Bay some time ago, but it also is far from common, though by no means so rare as the Lizard Orchid. *A. D. Webster.*

Recent Revisions of Johns' "Forest Trees of Britain."—Two revised editions of this well-known book have been brought out recently. The first, although it bears no date, was published by Messrs. George Routledge & Son in 1911, and was edited by Messrs. E. T. Cook and W. Dallimore. The other edition, edited by Professor Boulger, and published by the Society for the Promotion of Christian Knowledge, the original publishers of Johns' book, appeared this year, and, according to the title page, it is the tenth edition of the work, the first edition having been published in 1869. What necessity there was for bringing out two revisions of the book with such a short interval between them is not very apparent, but that is a matter which need not be discussed here. What does concern us, however, is that we have two editions of the book, revised by different editors, which in some particulars flatly contradict each other. In the original edition, Johns described two Planes, viz., the Eastern Plane (Platanus orientalis) and the Occidental Plane (P. occidentalis), and in his revision Professor Boulger has retained these two species just as Johns left them. There is no reference to the London Plane in this edition. In Messrs. Cook and Dallimore's edition, however, a drastic alteration occurs. In the case of the Occidental Plane, the names "acerifolia" and "London" have been substituted for "occidentalis" and "Occidental" respectively, and, with some modification, Johns' description of the Occidental Plane has been made to do duty as a description of the London Plane; his figures also have been used to illustrate the last-named tree. No explanation is forthcoming for this change. Nor is this all, for the term "Occidental" in a quotation from Gilpin which Johns used in the original has been transformed in this edition into "London," so that Gilpin, as well as Johns, is made to appear as if he knew the London Plane by that name, which, of course, he did not. If the editors had been dealing with a romance instead of a scientific subject, such treatment of it as we find in Messrs. Cook and Dallimore's revision would have mattered little; but it is a very different story when a book of this sort, in which, so far as possible, scientific accuracy should be aimed at, is so treated, and it is, to say the least, most puzzling to those who take an interest in trees to have such divergent views as are here put forward placed before them by different editors of the same book. In his revision, Professor Boulger has substituted the specific name surculosa for campestris in the case of the English Elm. Is this his reply to Mr. Claridge Druce's query in the *Gardeners' Chronicle* of January 20, 1912 (vol. li, p. 53), where he asks Professor Boulger "by what name shall the English Elm be called?" If so, I fear, Professor Boulger will not find unanimity on the point among British botanists. The name is not even mentioned in the *Hand List of Trees and Shrubs* at Kew (second edition, 1902). *A. D. Richardson, Edinburgh.*

The National Sweet Pea Society.—In your report of the annual meeting of the N.S.P.S. Captain Ashworth charges me with using his wife's ("Miss H. Hemus") name in connection with my Sweet Pea trials without permission, and adds that I have "probably done so in many other cases." There is not a shadow of justification for these statements. *Walter P. Wright.*

Blue Tits and Sweet Peas.—I was pleased to read that *W. A. M.* has found a method of scaring tits from Sweet Peas, and if I am troubled again with these pests I shall certainly adopt his plan of the seagull. One might naturally expect a protest from some bird enthusiast, but Mr. Nicholson must bear in mind that there are some employers who would blame the gardener for the damage. Mr. Nicholson's method would be very expensive, whilst nets would never keep out these little birds. Besides, there would be endless bother in staking, watering, &c., inside the enclosure. I have a theory why the tits attacked the Sweet Peas so badly last summer: the weather being so wet the insects which the tits apparently live on did not hatch out in their proper season. I base this idea upon the fact that the little creatures entirely disappeared during the few sunny days we had here, but renewed the attack directly it commenced to rain again. *A. J. Elgar, Killarney House Gardens, Co. Kerry.*

Late Peas.—It may interest your readers to know that I am still picking Peas out-of-doors. We have three rows each 60 feet long, and the plants are green and healthy, notwithstanding that we experienced frost on 12 occasions lately, ranging up to 7°. If the weather remains mild, the plants will continue in bearing, as they are flowering freely. The varieties are Late Queen, The Gladstone and Autocrat. The seeds were sown in July in trenches prepared as for Celery (but the soil was made level again) in an open part of the garden. The gardens are situated very high, close to Beacon Hill. Enclosed you will find pods, flowers and haulm, the latter being over 6 feet high. *F. R. Staddon, Sydmonton Court Gardens, Newbury, Berkshire. October 31.*

An Old Rock-garden.—I am unaware at what date rock-gardens were first made in this country, but it may interest some of your readers to hear of one which was planted at any rate before 1819, when some unpublished verses were written about it, in which appears the obsolete word "clift" for cleft, and also cliff:

"Each clift, each chink, each rugged haunt
Teems with its own its native plant!"

Having observed on several labels in the herbarium of my ancestor, Thomas Clark, Junr.* (the "obliging correspondent" of Sir Wm. J. Hooker), the expression "Cheddar Cliffs," I communicated 18 months ago with an elderly relative who had given me Clark's herbarium 20 years previously, with the result that she mentioned these lines, written by a friend of her great-aunt, who had the garden to which they referred. My correspondent, Miss M., said that her aunt made her rock-garden about 100 years ago, so far as she could tell from circumstantial evidence. The verses in its praise, of which two lines are quoted, were dated 1819. Her mother, born in 1801, was familiar with the rock-garden, and it was from her that Miss M. knew all she did about it, "the time and interest expended in its creation, and her aunt's pride in taking her visitors down the steep steps and paths; also the amusing contempt of the *older* generation, Aunt M.'s mother, for instance, whose ideal in gardening was uniformity. . . . . The rock-garden was made on the steep hill slope below their garden, where

* See *Journal of Botany*, August 1898, and August, 1905, for Biography, &c.

natural rocks of considerable size break out of the slope and form vertical rock-faces and broken surfaces here and there. Rockeries in those days were not common; indeed, I believe my aunt's was quite an idea of her own. She brought fresh soil, and made paths and planted things, but used no artificial stone." More of these natural rockeries might be planted to-day by those who are fortunate enough to have the opportunity. *H. S. Thompson.*

FUCHSIAS AS ROOF PLANTS.

MANY varieties of Fuchsia, especially those of a lax habit of growth, are admirably adapted for training to the roof of a greenhouse.

In the first place, owing to the strictly pendulous nature of the blossoms, they are seen to the best advantage when disposed on a flattened surface overhead; next, they are borne in great profusion throughout a lengthened period, while the plants themselves are less liable to the attacks of insect pests than many other greenhouse climbers. Further, Fuchsias, being of a deciduous nature, do not, when trained to the roof, shade the plants underneath at a time when the greatest amount of light is essential to the occupants not only of the greenhouse, but also of any other glass structure.

The vigorous growth made by Fuchsias when trained at an angle corresponding with the roof of a greenhouse, and the profusion in which they flower were well shown by an exhibit of Messrs. Veitch's at the Olympia Show last year, and again at the International Horticultural Exhibition at Chelsea. The varieties shown in this way were Clipper (red tube and sepals and purple corolla), General Grenfell (coral-red tube and sepals, bluish-purple corolla), Lustre (a long, white flower with a bright-red corolla), Mrs. Marshall (an old and popular market variety with light flowers, valuable for almost any purpose), Mrs. Rundle (pinkish tube and sepals and salmon-red corolla), Mrs. Todman (a long, whitish flower with rosy-scarlet corolla), Olympia (large carmine-scarlet corolla and salmon-pink calyx), and The Shah (bright coral-red tube and sepals and a violet-blue corolla).

This by no means exhausts the list of varieties suitable for the purpose above named, for, beside these, the following are worthy of especial note:—General Roberts (a very large, dark-coloured flower), Rose of Castile Improved (whitish tube and sepals and purple corolla) and the red-flowered Monarch.

Fuchsias with white corollas are very generally admired, but none is mentioned above, because they are less lax in growth. A very old variety, Alexandrina, with medium-sized flowers, used to be splendid when treated as a roof plant, but it appears to have dropped out of cultivation. A good variety with well-shaped flowers and a clear-white corolla is Cadmus, which can be well recommended for the purpose.

Varieties with double flowers are not so well adapted for roof plants as the single ones; still, they afford a change and are admired by many. Good dark, double-flowered varieties are Brilliant, President Felix Faure, and Phenomenal, and with white corollas the universally-grown Ballet Girl and Mme. Jules Chrétien.

The pretty little Fuchsia gracilis variegata supplies quite a unique feature when trained to a greenhouse roof, and if planted out in a prepared border it will soon cover a considerable space. On a roof the white variegated leaves form a striking background, or rather overhead canopy, to the myriads of small, slender flowers, which hang in great profusion.

Some of the true species are available for the same mode of treatment, one of the very best being the Peruvian Fuchsia simplicaulis, which has been grown at Kew for many years; yet, surprising to say, it does not become generally cultivated. It is of quite a loose, rambling habit, and bears pendulous clusters of very long, rosy-scarlet flowers. I have seen this fine roof plant under the name of F. penduliæflora. *W. T.*

The Week's Work.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

ROTATION OF CROPS.—This is of far greater importance than is often supposed, and should receive consideration long before the time for sowing or planting arrives, so that the ground may be treated appropriately. A change of site is beneficial to most vegetables, though there are exceptions, for good crops of Onions, Shallots, Horseradish and Artichokes may be cultivated year after year on the same ground. In addition to changing the kind of vegetable crop, it is advantageous for vegetables to follow Strawberries. Potatos will succeed on the same piece of ground successively, provided the soil be well worked and manured each time. Carrots, Parsnips and Beet should follow crops for which the land was specially well manured, as the use of fresh manure is detrimental. The treatment of Celery brings the ground into a high state of cultivation, and most vegetables do well after Celery. The Brassica family, which includes Turnips, should not be allowed to follow each other, but should generally succeed tap-rooted vegetables. They may be planted again after a complete change of two crops. Though the soil does not require the addition of manure for tap-rooted vegetables, it is essential that it be thoroughly well worked to a good depth so that the roots may grow deeply.

PEAS.—Early Peas may be grown in pots, boxes or borders provided a suitable house is available. At Aldenham we usually grow them in 10-inch pots and gather the first pods about the end of April, but the date is largely determined by the weather whilst the plants are making their growth. Clean pots should be selected and they should be drained efficiently, covering the crocks with turfy material to keep the finer particles of soil from choking the drainage. The pots should be half filled with a compost consisting of turfy loam and a small quantity of flaky leaf-mould and manure from a spent Mushroom bed, with a sprinkling of bone-meal, soot, and wood ashes. If the soil is prepared a week or two before it is required and protected from rains, it will be an advantage. Do not employ manures at the commencement, but rather use a sweet compost that will remain open in texture and admit of an abundance of food being applied later. The seeds should be sown twice as thickly as necessary in order to admit of thinning, and they should be buried about ½ inch below the soil. Five or six plants are ample in each pot. After the seeds are sown the pots may be stood closely together in a cold frame on a firm bottom of ashes. Water the soil thoroughly with a rose can. Rats and mice must be guarded against, as these may devour the seeds and render the work a failure; traps should be placed near to the pots. During the time the plants are growing, they should not be subjected to much fire-heat, for they need to grow sturdily from the commencement. Admit air freely whenever the weather permits, removing the lights entirely on very mild days and replacing them at night to prevent damage from frost. When the seedlings are about 3 inches high, remove the weaker ones, and leave the other plants distributed as evenly in the pots as possible. When the shoots have reached the top of the pots, the latter may be filled with the compost. Select free-setting varieties of both dwarf and tall sorts, for although the latter require considerable head room, they never grow quite so tall as in the open, and furnish good crops of large, well-flavoured Peas.

BROAD BEANS.—For several years we have grown early batches of Broad Beans from sowings made at the same time as the Peas and treated much the same. Place five or six good Beans in each pot and use rather more soil at the commencement than in the case of the Peas. As soon as the plants need support, afford each growth a neat little stick. Broad Beans require plenty of light and air. Varieties of the Leviathan type are the most suitable for pot culture. I have long since abandoned the practice of sowing Broad Beans out-of-doors in the autumn, as our soil is not suitable, the risk of failure being too great. But in warm districts it may be carried out successfully, although I recommend the seedlings to be grown first under glass and transplanted afterwards.

POTATOS.—Where it is intended to grow early Potatos in pots, suitable tubers for the sets should be selected without delay and placed in single layers in trays to sprout. Stand the trays in a light position in a cool house or shed to favour a sturdy growth; they should be ready for planting in pots or boxes next month. Boxes are quite as convenient for growing early Potatos as pots, and they last for several seasons. At Aldenham we use herring boxes, which are readily obtained from the local fishmonger.

GLOBE ARTICHOKES.—The growth of these plants may be cut down nearly to the ground and a quantity of cinder ashes heaped about the base as a protection to the stocks. But before the ashes are applied, loosen the soil with a fork in order that water from heavy rains may pass away easily. In the event of severe weather, straw, bracken or some other litter should be applied as a further protection.

CELERY.—The latest batches of Celery should be earthed up, placing the soil up the stems to the fullest extent. Choose a dry day for the work, and break the particles of earth finely.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

MARGUERITE MRS. F. SANDER.—This beautiful double-flowered Marguerite is one of the most useful plants of recent introduction, the pure-white flowers being very valuable for use in floral decorations. The plant blooms very freely in pots, and surpasses any of the single varieties in this respect. Cuttings of a soft nature will root readily at this season in a little heat, or they may be struck without heat in a frame in the same manner as the single varieties used for bedding purposes. I prefer the former method, as the plants may be potted as soon as they are rooted and become ready for a further shift early in the spring. Flower-buds may appear as soon as the cuttings are rooted, but should be pinched out; by pinching the shoots fairly hard back, stronger, better growth develops than if only the flower-buds are removed.

CLIMBERS.—Certain of the greenhouse and stove climbers, such as Clerodendron, Allamanda, Gloriosa and Fuchsia may, if in pots, be afforded a complete rest by removing them to a cool, dry house during the winter. A fruit house in which the trees are resting is a very suitable place for wintering them.

FUCHSIA.—Cuttings of Fuchsias inserted early in September are well rooted and should be potted singly into 60-sized pots. They may be grown in a frame or a glasshouse where the temperature is about 50°. If they are afforded a position exposed to the light they will grow stocky and short-jointed even in winter.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

BUSH FRUITS.—In gardens where large quantities of Gooseberries and Currants are required, it is necessary to form new plantations from time to time. Fruits produced by young bushes are superior to those obtained from older plants, and as the plants can be purchased or raised in gardens very easily, a certain number should be planted every few years. As soon as the old plantations of these fruits show signs of deteriorating, a corresponding area should be planted afresh, and when the young bushes come into bearing the old ones should be grubbed up. Bush fruits are best planted in quarters by themselves, especially the dessert varieties, as they can then be protected more easily from birds. The fruits of those distributed about the garden can be picked green. Gooseberries and Currants succeed in almost any good soil. Black Currants require a moist, light, rich soil and a partially-shaded and cool position. They are greatly benefited by copious applications of liquid manure when in full growth. Black Currants grow freely

and develop very fine fruit when trained on fences or north walls. Trees purchased from nurserymen should be examined at the roots, and any of the latter that are broken or bruised should be trimmed with a sharp knife; if dry, the roots should be moistened with wet mud. Avoid planting too deeply, for it is best to arrange the roots near to the surface. The trees should be afforded temporary supports, to prevent them becoming loosened in the ground by strong winds, but they should not be tied finally until the spring. Bush fruits that are bare of leaves may be pruned, and if caterpillars have been troublesome, well dusted with quick-lime. Red and White Currants should always be trained with a single stem, but Black Currants produce the greatest quantity of fruit when they are allowed to form suckers. Many growers defer the pruning of Gooseberries until the birds have taken a share of the buds, but it is best to prune early and net the bushes before the buds begin to swell. Remove all downward-growing shoots which are less than 10 inches from the ground, shorten others, and open out the centre of each plant to let in the light and air. Red and White Currants produce the finest fruit on short spurs, and should be pruned accordingly, but a few of the older branches should be removed annually, and young ones trained in their places. Black Currants do not fruit on spurs, and in their case shortening the branches should not be practised. Endeavour to obtain vigorous young shoots from the base, as on these the fruits are borne. Room may be made for them by the removal of branches which are more than three years old.

RASPBERRIES.—If it is intended to make a new plantation of Raspberries, advantage should be taken of open weather to get the young canes planted and the ground mulched. The soil should be of a light, rich nature and deeply cultivated, with good drainage, and leaf-mould, burnt refuse, road scrapings, or similar materials are all beneficial. Raspberries never fruit much the first season, therefore cut the canes down nearly to the ground in the spring, when danger from frost is past.

STRAWBERRIES.—The plants have grown freely this autumn, and vigorous young plants may have developed late runners, which should be removed. The ground should be hoed and a mulch employed afterwards that will be suitable for the particular soil, whether light or heavy.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

BULBOPHYLLUM. — Plants of Bulbophyllum anceps, B. inflatum, B. vaginatum, B. virescens and B. Ericssonii and others are growing freely and pushing forth new roots from the bases of the young growths. Any specimens that require fresh rooting material should be attended to in this respect. Those that have outgrown their receptacles, and have a number of useless back pseudo-bulbs, may be divided into portions, each with two or three stems behind the leading growths, and made up into fresh specimens. Others that have sufficient rooting space to serve them for another season and with compost in a good condition, may have a portion of the latter removed from the surface, replacing it with fresh materials. Any of the leading growths that have extended over the sides of the receptacles should be trained round towards the centre of the pot, and pegged on to the surface moss. A suitable potting medium consists of equal parts A1 fibre, Osmunda, and Sphagnum-moss, with a quantity of crushed crocks added. During their season of active growth the plants should receive sufficient water at the roots to keep the layer of moss in a growing condition. The plants may be placed in a moist position in the East Indian house.

CIRRHOPETALUM PICTURATUM. Attention at the roots is also required by this plant, which should be grown in a moist position in a house having an intermediate temperature. Owing to the rambling habit of the plant, boat-shaped teak-wood baskets are the best receptacles for this species.

CŒLOGYNE. — C. cristata and its varieties are nearing the completion of their season's growth, and will soon be pushing flower-spikes from the new pseudo-bulbs, at which stage the supply of water at the roots should be reduced, but not to such an extent as to cause the plant to suffer. Well-rooted, pot-bound specimens will be greatly benefited from now onwards to the flowering stage by periodical applications of weak manure water prepared from cow dung. C. barbata, C. ocellata, and C. elata are developing their flower-spikes, and should be well supplied with moisture until the flowering season is past.

MASDEVALLIA.—Plants of M. tovarensis are developing the flower-spikes, and specimens that have been growing under cool conditions during the summer months should be removed to a house having an intermediate temperature. Great care should be exercised in watering these plants at this season; the compost should always be allowed to become dry between each watering, as excess of moisture at the roots may cause the foliage to damp and fall from the plants.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

ARTEMISIA LACTIFLORA.—This plant is suitable for the waterside, and will thrive also in the herbaceous border if the roots are well supplied with water. The flower-stems grow about 4 feet high, and the blooms expand in September and October. The habit of growth is pleasing and the foliage is distinctly ornamental, being finely laciniated. The plumes of creamy-white flowers resemble those of a giant Spiræa.

DAHLIAS AND BEGONIAS.—The frost having destroyed the foliage, these subjects should be lifted and stored for the winter. Cut off the Dahlias to less than 1 foot of the roots, and store the tubers in a frost-proof place—a cellar is very suitable, or they may be placed under the stage of a cool house—not where it is too dry, or they will shrivel and deteriorate. Begonias should be lifted and the corms cleansed thoroughly, preparatory to storing them. A slight drying will assist the cleaning process; they should be stored in similar conditions to the Dahlias.

EREMURUS.—To flower these plants successfully their first season, the planting should be done early in the autumn, and the sooner after the foliage has decayed the better. The early varieties bloom in May and June, the spikes of the different species ranging from 3 or 4 feet to nearly 10 feet in height. Growth commences very early in the spring, and as the young foliage is very susceptible to injury from frost or cold winds, it is advisable to plant in sheltered situations. If the position is not naturally sheltered, some protection should be afforded in spring; a few evergreen boughs will serve the purpose exceedingly well. Eremuri are very suitable for the semi-wild garden, and show to advantage against a background of tall Bamboos. Or they may be associated with dwarf-growing shrubs in a sheltered corner, whilst they succeed admirably at the back of the herbaceous border. In whatever situation they may be, their stately spikes of flowers invariably attract attention. The best soil for Eremuri is a deep, rich loam that has been trenched and enriched at the bottom with plenty of decayed manure and leaf-soil. E. robustus is one of the strongest growers, and, with good cultivation, the flower-spikes will attain to a height of from 8 to 10 feet. The rosy-pink blooms are sweetly-scented. E. Elwesianus is another strong-growing plant, and throws up its spikes of pink flowers in May. E. himalaicus, one of the earliest to bloom, has white flowers and a somewhat shorter flower-spike than E. Elwesianus. E. Bungei flowers later in the summer, thus prolonging the season; the flowers are bright yellow. E. Warei is also worthy of inclusion in a good collection of herbaceous plants.

BULBOUS IRISES.—Both Spanish and English Irises should be planted whenever the ground is in a suitable condition. The bulbs are inexpensive, and they should be planted not only in flower-borders, but in the reserve garden, to furnish cut blooms. If space is limited, they may be grown in the fruit quarters amongst the trees and bushes. They grow best in a light, porous soil; if the ground is of a heavy, retentive nature, it can be rendered more amenable by adding leaf-mould, manure from an old Mushroom bed or discarded potting soil. The Spanish Iris blooms before the English Iris, and though the flowers are much smaller, they are valuable on account of their earliness. Of the Spanish section, Chrysolora (yellow), King of the Blues, Snowball (white), Philomela, The Pearl, and Beauty are all good varieties. Half-a-dozen choice varieties of English Irises are King of the Blues, alba grandissima, Electric, Blue Celeste, Daylight, and Mont Blanc.

BORDER CHRYSANTHEMUMS. — There is a danger, on wet and cold soils, of many varieties of border Chrysanthemums dying during the winter; to guard against this, the roots should be lifted. They may be placed in boxes and grown in cold frames, with plenty of ventilation. If space is limited, they will usually be quite safe laid in ashes in a sheltered corner under a wall. Before lifting the roots, the stems should be cut down to about 6 inches, and a label fixed securely to each plant.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

EARLY POT VINES.—If ripe Grapes are required at the end of April or early in May, the vines should be placed in the forcing house without delay. For very early forcing a lean-to or hip-roofed house facing due south should be selected. The house should be amply provided with hot-water pipes so that the proper temperatures may be maintained without making the pipes excessively hot. A hot-bed should be formed to furnish bottom heat, and the pots plunged in this. The bottom heat should not be excessive; a suitable bed may be made with three parts Oak or Beech leaves and one part short litter. The materials should be thrown into a heap and turned several times at intervals of two or three days. The bed should be of sufficient bulk to provide warmth over a long period. For the first two or three weeks fire-heat should not be employed unless the thermometer falls very low. A temperature of 45° or 50° will be suitable till the vines show signs of breaking into growth, when it may be raised 5°. As growth proceeds the temperature should be gradually increased. When the pots have been plunged in the hot-bed, the rods may be tied along the front of the house in a horizontal position, till they burst regularly into growth. Water should be applied to the roots with great care until growth is active; when moisture is necessary, the pots should be filled twice, to ensure the roots being soaked through. Spray the rods both morning and noon on bright days, and promote a moist atmosphere by damping the bare surfaces in the house whenever necessary. Black Hamburgh, Madresfield Court and Foster's Seedling may all be relied upon for early forcing.

EARLY PERMANENT VINES. — Where the earliest crop of Grapes is obtained from pot vines, the forcing of the permanent vines may, with advantage to the plants, be delayed till the end of the year. But if ripe Grapes are required from the permanent vines early in May they should be started forthwith, provided the wood is ripened perfectly. The temperature and general treatment recommended for the pot plants will be suitable for these, except that the rods need not be tied along the front of the house, as old vines generally break freely. The rods should not, however, be tied up permanently to the trellis till they have had another good washing. This work should be done just when the buds are breaking into growth, taking care not to damage the young growths. If the vines are infested with mealy bug, the pest should be destroyed whilst the vines are in the early stages of growth; this precaution will save much labour later in the season.

POT FRUIT TREES.—These may now be placed in their winter quarters. Trees which will be required for forcing within the next few weeks may be placed in a cool, airy house. Others may be arranged closely together under a south or west wall out-of-doors, where they will be somewhat sheltered from heavy rains. Such a position will be favourable for the further ripening of the wood and fruit spurs, which is not so satisfactory as might be desired, owing to the dull summer. Trees affected with American blight should be cleansed of this pest before they are placed in their winter quarters. Methylated spirit is an effective specific, but it must be used with great care. The soil in the pots should be covered with bracken or leaves to prevent the fluid injuring the roots. Pot Fig trees should be placed in a cool house, where they will be safe from frost.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS.

SATURDAY, NOVEMBER 9—
British Gardeners' Association (Birmingham and Midland Branch) meet.. Burton Chrys. Sh.

MONDAY, NOVEMBER 11—
Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, NOVEMBER 12—
Plymouth Chrys. Sh. (2 days) Belfast Chrys. Sh. (2 days). Chester Paxton Soc. Sh. (2 days). Royal Bot. & Hort. Soc. of Manchester Chrys. Sh. (3 days).

WEDNESDAY, NOVEMBER 13—
Dorchester Chrys. Sh. (2 days). Buxton Chrys. Sh. Colchester Rose & Hort. Soc. Sh. Bristol Chrys. Sh. (2 days). Barry Chrys. Sh. (2 days). Clevedon Chrys. Sh. (2 days). Ancient Soc. of York Florists (2 days). Finchley Chrys. Soc. Sh. (2 days).

THURSDAY, NOVEMBER 14—
Edinburgh Chrys. Sh. (3 days). Bridgwater Chrys. Sh. Aberdare Chrys. Sh. Cardiff Chrys. Sh. Newport Chrys Sh. Sheffield Chrys. Sh. (3 days).

FRIDAY, NOVEMBER 15—
Leeds Paxton Chrys. Sh. (2 days). Bradford Chrys. Sh. (2 days). Blackburn Chrys. Sh. (2 days). Bolton Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—43·5.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, November 6* (6 P.M.) Max. 62°; Min. 49°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November 7* (10 A.M.): Bar. 30·2°: Temp. 54°; *Weather*—Overcast.
PROVINCES.—*Wednesday, November 6:* Max. 51° Shields; Min. 50° Cornwall.

SALES FOR THE ENSUING WEEK.

MONDAY TO FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Rose Trees, Liliums, Dutch Bulbs, Shrubs and Azaleas, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

WEDNESDAY—
Palms, Azaleas and other plants, at Protheroe & Morris's Rooms, at 5.

THURSDAY—
Special Sale of Roses in all varieties, at Protheroe & Morris's Rooms, at 12.30.

FRIDAY—
Rare and Valuable Orchids, at Protheroe & Morris's Rooms, at 12.45.

Agricultural Credit Societies.

Those interested in the development of co-operative societies, the purpose of which is to grant loans to small farmers, should apply to the Board of Agriculture for a copy of leaflets Nos. 260 and 261. The former gives statistics of the agricultural credit societies which were in existence in 1910 in England and Wales, and the latter describes the successful career of the oldest credit society, that of Scawby, in Lincolnshire. At that date some 40 societies had been established, although not all of them had been formed long enough to get into full working order. Of the 40 societies 31 supplied statistics, from which it is seen that the total membership for the year under review is 663, that 119 loans had been granted to members, and that the total sum so loaned was £1,390. The smallness of these numbers is apt to be misleading unless it is borne in mind that the majority of the societies were of recent origin in 1910. The statistics of the older societies show that although, even in the case of those societies, the operations were on a small scale, their membership was higher and their activity greater than those of societies more recently established. Thus the six societies of Scawby, Laxfield, Grandborough, Castle Morton, Hedge End and Wiggenhall—all of which were established in 1895 or 1896—possessed 145 members and issued loans during 1910 to 34 of their members and to the extent of £511.

The rate of growth of this movement is shown by the statistics to be slow and intermittent. Thus the first three societies were established in 1895. In the following year three more came into existence. Then there appears to be a break of about eight years, during which period no new agricultural co-operative societies were established. Three were founded in 1904, two in 1905, two in 1907, after which year the rate of increase became more marked. The year 1908 saw the formation of seven societies, and in each of the succeeding years 10 new societies were established.

The existing societies are distributed fairly evenly over the south-eastern, eastern, and midland counties, but do not appear to have penetrated north of the Wash. Norfolk heads the list with five societies, and is followed by Surrey and Lincoln with four, Kent, Leicester and Worcester three each, Oxford two, and several other counties with one society. The existing credit societies, whose sole function is to arrange loans for their several members, are all registered under the Friendly Societies Act, 1896. The funds are created by subscriptions, and may be lent to or invested for members, and no part of the funds may be divided as profit, bonus or in other manner. The loans granted to members must be devoted to purposes approved by the society which lends them. Though it is open to societies to limit their liability it is noteworthy that all those in existence have preferred not to do so and have adopted the rule making every member jointly and severally liable for all debts incurred by the society. Most of the societies have adopted the model rules recommended by the Agricultural Organisation Society, to which body all but two of the local credit societies are affiliated. Only those who live within a certain area are eligible for membership, and the applicant must be approved as of good character before admission is granted. Loans, which are limited in amount to £50, are granted only on approved security and for a defined purpose. The rate of interest required ranges from four to six per cent., and is generally five per cent.

Any profits are carried to reserve, and in no circumstance may such profits be disbursed among members; in the case of dissolution of the society the surplus funds must be spent on some useful purpose in the parish.

It is to be hoped that when more recent returns are available they will show a considerable increase both in the number of societies and of members. The figures at present available show only one society with a membership of more than 50, and the average membership of all is only about 21. It is to the interests of the community of small agriculturists to support these institutions, and, indeed, without some such means of obtaining loans at reasonable rates of interest it is difficult to believe that the small holder can make headway. Many a small man has suffered from the effects of the present disastrous season and must stand in need of just that assistance which these self-supporting societies can afford. Nor should the latter attract only those who are likely to be in need of loans; they should serve as foci of local patriotism, for their purpose is admirably defined in the name, "All for Each," adopted by the Southall society. That the establishment of credit societies in all parishes of agricultural districts is calculated to help the small man is shown by the account given of the Scawby society in leaflet No. 261 of the Board of Agriculture. The population of Scawby parish, which is near Brigg, in Lincolnshire, is about 1,000. The land under crops or grass amounts to 2,825 acres, of which two-thirds are under crops. The land is divided into 39 holdings, of which 26 are each of less than 50 acres. The society started in 1894 with nine members, and has at present 32. Among the members are 11 small farmers and three market gardeners. The remaining members are engaged in various trades, and most of them also cultivate holdings.

During its existence the Scawby society has made no fewer than 78 loans to its members, and the total sum loaned in this way amounts to £2,300.

The original rate of interest charged on loans was five per cent.; but this was raised subsequently to six per cent. in order to build up a reserve fund. That achieved, the rate of interest was reduced again to the figure at which it stood at first.

The reserve fund amounted in 1910 to some £64, and since, as already indicated, this reserve is inalienable, the financial position of the society is so sound that it might, if it chose, reduce to a yet lower figure the rate of interest which it charges to its members.

With this model before us we cannot refrain from hoping that a system which has proved its value on a large scale in other countries may in the immediate future make far more rapid headway in England than it has done in the past.

SUPPLEMENTARY ILLUSTRATION. — Miltonia vexillaria has been known since 1867, when it was described in the *Gardeners' Chronicle* as Odontoglossum vexillarium by the late Professor H. G. REICHENBACH. It at once became the aim of all Orchid importers to be the first to introduce the so-called Banner Orchid. But all efforts in that direction proved futile until early in 1872, when Messrs. JAS. VEITCH & SONS were fortunate enough to secure a small collection brought home by CHESTERTON from New Granada, where the plant in its several forms has a

wide range. But the plants then introduced, and those of other consignments which followed, did not give much promise of becoming such fine ornaments in our Orchid houses as they are now that the cultural requirements are better understood. Miltonia Memoria Baron Schröder, shown in our Supplementary Illustration, is included in the collection of Lieut.-col. Sir GEO. L. HOLFORD, at Westonbirt, whose gardener, Mr. H. G. ALEXANDER, is so skilful in the cultivation of all kinds of Orchids. This unique plant, about the origin of which there is some doubt, was shown as a seedling at the Temple Show, May 24, 1910, when it secured a First-class Certificate, and it was described and illustrated in the *Gardeners' Chronicle*, May 28, 1910, pp. 353-355. The coloured plate shows the plant reduced, but it will readily be seen that the flower is one of the most remarkable of this section of Miltonia. The raisers state that they believe it originated by fertilising a fine, large-flowered Miltonia vexillaria with M. v. Memoria G. D. Owen, which seems highly probable, and consequently it is still a form of M. vexillaria. Other experts consider that it was probably a secondary cross of Miltonia Bleuana (vexillaria × Roezlii), and, therefore, the name originally given might well be retained. Miltonia vexillaria varies much in colour from the large, white M. v. Snowflake, for which Sir GEORGE L. HOLFORD obtained a First-class Certificate at the R.H.S. meeting on June 4 last, to the rose-tinted M. v. Memoria G. D. Owen, with its large, deep-claret-red mask on the lip. Indeed, so much does it vary, and so excellent are the varieties, that over 30 awards have been made to the forms of the species at the Royal Horticultural Society, more than 20 of them being First-class Certificates. As a subject for the hybridist it has been equally prolific, resulting in M. Bleuana (vexillaria × Roezlii), M. Hyeana (vexillaria × Bleuana), M. St. Andre (Bleuana × Roezlii), and others which are equally beautiful and variable. With the introduction of scedling forms and hybrids of M. vexillaria the difficulties in cultivation seem to have been overcome, for in most collections both the species and hybrids thrive admirably in any well-arranged house with a rather higher temperature than the Odontoglossum house, a moist corner in the intermediate house being generally found to suit them.

NATIONAL CHRYSANTHEMUM SOCIETY.—A special show and conference will be held at Essex Hall, Essex Street, Strand, on Wednesday, the 20th inst. The show will open at 1 p.m. The conference will take place in the Lower Hall at 7 p.m. Dr. E. J. RUSSELL will deliver a lecture on "Soil Sterilisation" (illustrated by limelight views), to be followed by a discussion. The President of the Society, Sir ALBERT ROLLIT, D.C.L., LL.D., will occupy the chair. The annual dinner will be held in the Royal Venetian Chamber, Holborn Restaurant, on Wednesday, the 27th inst., at 6.15 p.m., under the auspices of the President. The Challenge Trophy, the Holmes Memorial Cups and Medals will be presented to the winners during the evening.

BRITISH GARDENERS' ASSOCIATION.—The following meetings have been arranged to take place during November:—Saturday, the 9th inst., at Rodway's, Bristol Street, Birmingham, at 8 p.m. Speakers: Messrs. W. B. CHILD, J. D. JONES and CYRIL HARDING. Tuesday, the 12th inst., at the Conservative Annexe, Clarendon Road, Watford, at 8.15. Speakers: Messrs. E. F. HAWES and CYRIL HARDING. Wednesday, the 13th inst., at the Grosvenor Hotel, College Street, Swansea, at 7.30. Speakers: Messrs. A. BLACKBURN and CYRIL HARDING. Thursday, the 14th inst., at the Y.M.C.A. Hall, Cardiff, at 7.30. Speakers: Messrs. W. W. PETTIGREW and CYRIL HARDING. Friday, November 15, at Pitt's Restaurant, Kew Green, at 7.30. Speakers: Messrs. H. B. A. TINDALL, G. W. BUTCHER, and CYRIL HARDING.

NORTHERN FRUIT CONGRESS, 1913.—This congress and show will be held at Kendal, Westmorland, on October 15 and 16, 1913, in co-operation with the North of England Horticultural Society. A meeting of the promoters was held at Kendal on the 19th ult., when an executive committee was appointed. Subscriptions and guarantees (including £30 guaranteed at the meeting) already amount to £70, and a challenge cup has been offered by the High Sheriff, W. D. CREWDSON, Esq. Two other challenge cups, the "STRAKER" and "VOSS" cups, are already in hand. Lord HENRY BENTINCK has promised to open the congress. Delegates will represent the Royal Horticultural Society with power to award R.H.S. Medals. The Department of Horticulture of the Board of Agriculture will put up an exhibit of Potatos and diseases of Potatos. The Cumberland and Westmorland Beekeepers' Association will hold their annual show in the same building. A ladies' reception and hospitality committee has been formed. It is expected that papers will be read on "Land Tenure and Fruit Growing," "Diseases of Potatos," "Organisation of the Damson Industry," and "Conditions Necessary to Successful Fruit Growing" (local). There will be demonstrations in pruning, spraying and fruit bottling. The Rev. J. BERNARD HALL will lecture on "Apple Culture," in the Town Hall, Kendal, on the 16th inst., in order to arouse local interest.

THE SATURDAY HALF-HOLIDAY.—Messrs. DOBBIE & Co., Edinburgh, have arranged that in future their nurseries shall be closed at 1 p.m. on Saturdays. For over 20 years the time to cease work on Saturdays has been 2 p.m., and the new concession has given great satisfaction to the employees, between whom and the firm most cordial relations have always existed.

CHRYSANTHEMUMS IN THE LONDON PARKS.—The Chrysanthemum displays in the London parks are this year quite as interesting as in the past. The few alterations are chiefly of a decorative character, and may be considered as improvements. Thus at Battersea the collection is arranged in a double bank with an intervening path. The middle of the path is broken to make room for a large oval central bed filled with the variety Soleil d'Octobre. Hanging baskets from the ridge are a new feature. The ends and sides of the span-roofed glasshouse are arranged with decorative Japanese varieties, while the collection includes a fine selection of Incurved, Anemones, Singles, and Japanese varieties. At Southwark Park the T-shaped greenhouse is so arranged that one central serpentine path conducts the visitors from the entrance to exit. There are many beautifully-flowered specimens well arranged. At Brockwell Park the flowers are exhibited in a greenhouse about 40 feet long. There is a good collection, but it would be more instructive for the public if the plants were labelled. At Waterlow Park there is a capital attempt at effective decoration, and the varieties used are well suited for the purpose. The large conservatory at Finsbury Park contains a fine collection of Chrysanthemums, well arranged and interspersed with Ferns and other greenery. The blooms are well grown, clean and bright, but it is a matter for regret that so little regard is paid to the labelling of the varieties. At Victoria Park a new departure consists in the construction of a serpentine path through the house. The liberal way in which the plants are named and the clearness of the type are highly commendable and much appreciated. There are numerous finely-grown plants of decorative Japanese varieties. The collection also comprises choice blooms of good Incurved, Anemone and Single varieties.

APPOINTMENTS FROM KEW.—We learn from the Kew *Bulletin* that Mr. GEORGE HENRY EADY and Mr. ERNEST WILLIAM MORSE, formerly members of the gardening staff of the Royal Botanic Gardens, have been appointed by the Secretary of State for the Colonies, on the recommendation of Kew, Curators in the Agricultural Department of the Gold Coast.

BOTANICAL APPOINTMENT.—Dr. A. ANSTRUTHER LAWSON, Lecturer on Botany at Glasgow University, has been appointed to the new Chair of Botany in the University of Sydney, New South Wales. Dr. LAWSON, who graduated at Glasgow in 1895, is a son of Mrs. J. KERR LAWSON, the Scottish novelist.

DIRECTORSHIP OF SINGAPORE BOTANIC GARDEN.—The Kew *Bulletin* announces the appointment of Mr. I. H. BURKILL, M.A., Reporter on Economic Products to the Government of India and Curator of the Industrial Section of the India Museum, Calcutta, as Director of the Botanic Gardens, Singapore, in succession to Mr. H. N. RIDLEY, M.A., C.M.G., F.R.S., retired.

ESTIMATES OF THE CORN AND HAY CROPS.—Returns issued by the Board of Agriculture and Fisheries show that the total yield of Wheat in England and Wales in 1912 amounts to 6,710,183 quarters, which is more than three-fourths of a million quarters less than last year. The yield per acre, 28.81 bushels, is nearly four bushels less than in 1911, and almost three bushels less than the decennial average. The yield per acre of Barley was nearly one bushel below that of 1911, and, like Wheat, nearly three bushels below the average, but in consequence of the increased acreage, the total production is very little below that of last year. Oats are more deficient, being fully six bushels per acre below the average, and three bushels below last year; while the total production falls short of 1911 by some two-thirds of a million quarters. Beans are 2¾ bushels below the average, but better than last year's poor crop. Peas are 4¾ bushels below average, but, in consequence of a considerably increased acreage, the total production is a little above that of 1911. The Hay crop is much larger in bulk than last year; that from Clovers and rotation grasses is nevertheless 3½ cwts. below the average. Meadow Hay is the only one of the seven crops now reported on which shows an over-average yield, although the excess is not more than five-sixths of a cwt. The total production of Hay of all kinds amounts to 8,125,444 tons, which is nearly 2,000,000 tons more than was produced in the droughty season of 1911.

LINNEAN SOCIETY.—The Linnean Society inaugurated its winter session with a dinner and conversazione, which were held on Thursday, October 31. The dinner ,which was held at the Criterion Restaurant, was well attended, and proved a great success. At the conversazione, which took place in the rooms of the Society (Burlington House), exhibits of members were shown and lectures were delivered by Professor SEWARD and Professor HERDMAN.

ACREAGE OF SMALL HOLDINGS.—In reply to a question in the House of Commons last week Mr. RUNCIMAN stated that the Board of Agriculture had received schemes providing for the voluntary acquisition of small holdings extending to 141,667 acres, and in addition orders had been made for the compulsory acquisition of a further 16,151 acres, making a total of 157,818 acres.

The Resources of the Empire.—In publishing the names of the Royal Commission appointed to inquire into and report upon the natural resources of the Empire, *Nature* (October 31, 1912) comments on the fact that the list does not contain the name of anyone prominently associated with any branch of scientific knowledge. The omission is interesting, and would appear to be a tacit acceptance on behalf of the Empire of the spirit of the epigram attributed to revolutionary France of a hundred years ago—La Republique n'a pas besoin de savants. The revolutionaries put their faith in practice by guillotining Lavoisier, "the father of modern chemistry." We are of milder manners, and relieve our men of science from the onerous and patriotic task of surveying the resources of our Empire. They have contributed to the development of those resources more than any other body of men in the community. Why, therefore, should the State ask their opinion on a subject on which they have only expert knowledge?

Selborne Lectures.—The series of lectures which the Selborne Society annually arranges, and which are given in the theatre of the Civil Service Commission, Burlington Gardens, W., will begin on November 11, when Lord Montagu of Beaulieu will preside, and Mr. Fred Enock will deal with "Fairy Flies and their Hosts." The lectures are given on Mondays, at 6.30 p.m., and tickets can be obtained through members, or from the honorary secretary, Mr. Wilfred Mark Webb, 42, Bloomsbury Square, W.C. The other subjects are on "The Elizabethan Playhouses of London," by Dr. William Martin (November 24); "English Cathedrals," by Mr. Charles E. Keyser (December 9); "Minor Planets," by Dr. A. C. D. Crommelin (January 20); "Fibres and Fibre Lore," by Mr. C. Ainsworth Mitchell (February 17); and "Byways in Biology," by Mr. James Saunders (March 3). The special children's lecture will be given by Mr. Spencer Fletcher, on "Dew, Hoar-frost, and Clouds" (January 9).

Agriculture in Belgium.—Agriculture in Belgium is easily classified by the conditions of the soil. First comes a belt of strong clay land some eight miles only in width, which has been reclaimed from the sea and grows fine crops of Barley and Wheat. The main part of the country is then divided into three grades of varying quality running east and west, the farms growing larger in the southern belt. The northern strip, of which Ghent is the principal centre, is sandy and requires heavy manuring. In this is to be found the most intensive culture in Europe, excepting only the circle of market gardens round Paris. Half the land yields two crops a year; everywhere is spade culture, and its value is in some cases as high as £850 per acre. East Flanders is land of poor quality. The central belt across is the richest, a fine loamy soil of wonderful productiveness. Beet, for instance, has been grown in alternate years for half a century without exhausting the fertility of the soil. South of this is the mountainous district of the Ardennes, where forestry is a big feature, and south-east is a limestone country, where the chief industry is farming—the farms ranging from "three cow" to "20 cow." The Belgian climate is a kindly one to the farmer and horticulturist—no excess of either heat or cold—the average temperature ranging from 59° to 86° only. Of the 14,500,000 acres which comprise Belgium, about 11,000 are cultivated land, while 3,000,000 are woodlands, nearly half of which are in the Ardennes. There are only 1,250,000 acres of uncultivated land in the country, and the balance is represented by the built area, roads, canals, &c. Belgium thus offers a compact field of study for the agriculturist, from the large farmer to the small holder, and the International Exhibition at Ghent next year will furnish an excellent opportunity to visit Belgium and study their problems on the spot.

SOCIETIES.

ROYAL HORTICULTURAL.

November 5, 6.—The competitive classes for Orchids, arranged in connection with the Orchid Conference on Wednesday, gave an unusual character to this meeting, which extended over two days. More than half the Vincent Square Hall was filled with collections of these flowers; thus the first competitive exhibition of Orchids held in this country in the month of November proved an unqualified success. As will be seen from the detailed report, the exhibits were drawn from the chief collections in the country, both amateurs' and traders', but the palm must be given to Sir George Holford, whose plants were magnificent. Most of the Orchid exhibits were arranged as separate groups, the long rows of tabling being dispensed with, so that the show was much more effective than usual. No fewer than six Certificates and ten Awards of Merit were conferred by the Orchid Committee.

The exhibits before the Floral Committee were fewer than usual. This Committee granted 11 Awards of Merit.

The Fruit and Vegetable Committee had practically nothing to inspect; the only award made by this body was a Cultural Commendation.

At the three o'clock meeting in the Lecture Room, Miss Edith R. Saunders gave a paper on "Double Flowers," a report of which is published on p. 357.

The Orchid Conference which was held on Wednesday made up in interest what it lacked in numbers. Papers were read by Professor Keeble, on "The Physiology of Fertilisation"; by Major Hurst (Director of the Burbage Experiment Station), on "The Application of Genetics to Orchid Hybridisation"; by Mr. H. G. Alexander, Orchid-grower to Sir George Holford, on "Epiphytal Orchids"; and by Mr. R. G. Thwaites, on "Albinism in Orchids." The several papers contributed by these gentlemen were followed with evident interest by the members of the Conference, and gave rise to most useful discussions.

The business-like character of the Conference was guaranteed by the presence in the chair of Mr. J. Gurney Fowler, Treasurer of the R.H.S.

An account of the several papers will be published in due course, but it is well worth pointing out here that perhaps the most valuable part of the Conference consisted in the emphasis given to the importance of Orchid raisers keeping full and careful records of the results of their experiments, not only when these results are of a positive nature, but even when they fail to achieve the immediate end for which they are designed.

Floral Committee.

Present: H. B. May, Esq. (in the Chair); Messrs. G. Reuthe, W. J. James, William Bain, John Dickson, Chas. Dixon, A. Turner, Chas. E. Pearson, Chas. E. Shea, W. P. Thomson, John Green, W. J. Bean, C. R. Fielder, Jas. Hudson, J. F. McLeod, Wm. Howe, W. T. Ware, E. H. Jenkins, R. Hooper Pearson, W. G. Baker, J. W. Barr and C. Blick.

Messrs. James Veitch & Sons, King's Road, Chelsea, filled a table with their beautiful winter-blooming Begonias and another with dwarf Chrysanthemum plants in pots. Of the former Mrs. Heal, Julius, Winter Perfection, Elatior (one of the finest), and Ensign were represented by large batches of well-grown plants. The Chrysanthemums were principally varieties of the Caprice du Printemps type, those named White Cap, Purple Cap, Red Cap and Yellow Cap being the choicer. (Silver-gilt Banksian Medal.)

Messrs. W. Cutbush & Son, Highgate, filled a large table with Begonias of the winter-flowering section. In the centre of the group was a new white variety named Lady Waterlow, a sport from Turnford Hall of the Gloire de Lorraine type. The others were shades of red, and included Beauty of Hale, Mrs. Heal, Winter Cheer, Ensign, and Emily Clibran, all well-known sorts. (Silver Banksian Medal.)

Messrs. Blackmore & Langdon, Twerton-on-Avon, Bath, showed two varieties of Begonias of the semperflorens type, named Pink Beauty and Carmen. They were stated to be hybrids of B. semperflorens and Gloire de Lorraine, but resembled large-flowered forms of the first-named parent.

Mr. L. R. Russell, Richmond, showed varieties of Sonerilla, Bertolonia and Anectochilus. These dwarf plants have beautifully coloured leaves and are amongst the most decorative of all stove foliage plants. Bertolonia Mme. Van Houtte, B. Sanderæ (with shades of green), B. sericea cristata, B. maculata, Anectochilus petiola (light green markings on deeper green), A. setaceus (red markings on olive green), and Sonerilla argenta were among the more interesting. (Silver Flora Medal.)

Messrs. W. Wells & Co., Merstham, Surrey, showed Chrysanthemums, including their fine new white seedling Queen Mary, Mrs. G. W. C. Drexel, also new, a large Japanese bloom of pink colour, Thos. Lunt (crimson and gold), Mrs. Gilbert Drabble, and a promising, unnamed seedling of sulphur-yellow colour. Besides these large blooms there were excellent flowers of the beautiful single varieties Sylvia Slade, Marjory Lloyd and others.

Messrs. H. B. May & Sons, The Nurseries, Edmonton, showed varieties of Nephrolepis exaltata and Osmunda palustris. The newest Nephrolepis, named Willmottæ, received an Award of Merit. The varieties Marshallii, M. compacta and Whitmanii compacta have moss-like fronds, but muscosa has leaves not so finely sub-divided. (Silver Banksian Medal.)

Messrs. Allwood Bros., Haywards Heath, exhibited a small but choice collection of Carnations. Marmion, Fairmount, Rosette, Empire Day and Mary Allwood, a fine new flower of red-dish-pink colour, were all excellent.

A small collection of Carnations and vases of Heliotropes, Hymenocallis macrostephana and Plumbago rosea were exhibited by the Rt. Hon. Viscount Ridley, Blagdon Hall, Cramlington (gr. Mr. F. Perry).

Mr. G. Reuthe, Keston, Kent, showed hybrid Nerines, Berberis Bealii and Alpines in pots. Galanthus Olgæ and Oxalis lobata were exhibited in bloom.

A small rock-garden was exhibited by the Misses Hopkins, Shepperton.

Awards of Merit.

Chrysanthemum Queen Mary (Japanese).—A large incurved, white variety, which received the F.C.C. of the National Chrysanthemum Society on the 29th ult. (see p. 342). Shown by Messrs. W. Wells & Son.

C. Miss A. E. Roope (Japanese).—A large exhibition variety with broad, curled florets of rich lemon-yellow colour (golden yellow of the N.C.S.). It is a seedling from Hon Mrs. Lopes. (See p. 342.)

C. Hector Menzies (single).—The flowers are less stiff and formal than some, there being a slight twist of the florets tips. The large flowers, with two or three rows of florets, are a clear lemon yellow colour. Both these shown by Messrs. H. J. Jones, Ltd.

C. Portia (single).—A very beautiful, large-flowered variety. The rays are of a uniform shade of terra-cotta (approaching the darker dull carmine lakes of the *Répetoire des Couleurs*, and slightly recurve at the edges, giving a quill-like tip, which here and there reveals the yellow under-surface of the florets.

C. Snow Queen (Anemone-flowered).—A pure white variety, more admired perhaps than any other novelty exhibited. The length of the ray florets, which were in two or three rows, and the smallness of the white Anemone-like disc, showed the proportions of the best singles, and thus broke away from the bunchiness or heaviness of the typical Anemone-flowered varieties. These two were shown by Messrs. Cragg, Harrison & Cragg.

C. Mr. Leonard Harrison (single).—A fine flower, with broad, flat florets and vigorous habit, especially admired for its rich colour—a bright chestnut-red with a distinct yellow ring at the base of the rays surrounding the disc. Shown by Mr. L. F. Harrison, Orchards, East Grinstead (gr. Mr. A. H. Chapman).

Carnation St Nicholas.—An American-raised, perpetual flowering variety, said to be the largest and brightest scarlet Carnation in commerce. The calyx is excellent, and the flower is distinctly clove-scented. As shown, the blooms were rather thin. The colour is the carmine-red of the *Répetoire des Couleurs*, commonly referred to as vermilion. Shown by Messrs. Stuart Low & Co.

Nephrolepis exaltata Willmottæ.—This is a dwarf form, closely resembling the variety Marshallii, but the leaves are more moss-like. Shown by Messrs. H. B. May & Sons.

Begonia Optima.—This beautiful variety was raised from B. Socotrana × Pearcei seedling. The large, rose-pink flowers, tinged with salmon, are freely but loosely borne.

B. Emita.—Derived from B. Socotrana crossed with a single, orange-scarlet, tuberous-rooted variety. The habit is more compact, the foliage is more handsome, and the colour marks a more distinct advance than in the variety Optima. The open flower is a rich orange shade, but the very glabrous but not glossy, and finely veined on the paler under-surface. The margin has the sharp curving teeth characteristic of some of the Olearias, but the surface is flat and ovate-lanceolate to lanceolate in shape, sometimes tapering to a fine point. The flowers are pure white, about ½ inch in diameter, with a central cluster of numerous white filaments. They are borne very freely in little bunches of three to seven or more in the axils of the leaves, and at the ends of the shoots, so that a plant in full flower presents a remarkable sight. Cheeseman *(Manual of New Zealand Flora)* describes the species as an extremely variable one, and groups the forms of it under three sub-species, mainly

Fig. 154.—Hoheria populnea: flowers white.

(From specimens exhibited at R.H.S. meeting, on Tuesday last, by Mary Countess of Ilchester.)

general colouring is a deep rose-pink, pervading the unopened buds and the back of the expanded flowers, which are generally uppermost from the drooping habit of the flower. Both these shown by Messrs. J. Veitch & Son, Ltd.

Hoheria populnea (see fig. 154).—Heheria (derived from the native name) is a Malvaceous monotypic genus, found only in New Zealand. The shrub is closely allied to Plagianthus and Gaya, which share with it the popular name of Ribbon Wood or Lace Bark. The flowering sprays exhibited were cut from a bush 9 feet high growing in the open at Abbotsbury, but the species may reach 20 or 30 feet. The leaf and flower shown were both very distinct. The leaf is leathery in texture, characterised by the breadth and variability of the leaf. The best form, vulgaris, is abundant in the North Island, where it flowers from March to May. The other forms have smaller, fewer and earlier flowers and leaves, which are more lanceolate or even linear. The type is figured in Hooker's *Icones Plantarum*, 565-6. Shown by Mary Countess of Ilchester, Abbotsbury, Dorset (gr. Mr. H. Kempshall).

Some Further Novelties.

No fewer than 41 of the 52 novelties submitted for award before the Floral Committee were varieties of Chrysanthemums. In addition to those receiving awards, other good varieties were Daisy Burden, a large and very soft-pink single flower shown by Messrs. H. J. Jones, Ltd., and an effective bronze single, Caterham Bronze, shown by Mr. Frank Brazier. The growing popularity of the winter-flowering Begonia was evidenced by the entry of further types, in addition to those from Messrs. Veitch, Messrs. Clibrans, and Messrs. Blackmore & Langdon. The variety Pink Beauty, derived from crossing B. semperflorens Triumph and a seedling from Lemoinei gracilis × Gloire de Lorraine, is distinct and pretty, but none too free in flowering.

FIRST AUTUMN EXHIBITION OF ORCHIDS.

A pleasant change from the ordinary arrangement of long tables occupying the centre of the Hall was made by the removal of most of the straight tables and the substitution of circular, quadrangular, and triangular stages, each devoted to a separate group.

The most important groups were those staged by Lieut.-Col. Sir Geo. L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), which in themselves exceeded in beauty and extent any previous show in the month of November.

The largest group, in Class 7, for a group of Cattleyas, Lælias and Brassavolas and their hybrids, was a superb exhibit occupying about 300 square feet, and was a gorgeous show of colour and variety, in which the handsome Cattleya Fabia of the renowned Westonbirt strain was represented by over 50 plants, bearing together 260 flowers. White forms of Cattleya labiata were a representative collection, bearing together over 40 flowers, one being pure white except for an orange disc to the lip. Many hybrid Cattleyas were also included, for the best of which and other fine novelties see "Awards." The pure white C. Dusseldorfei Undine had four spikes with 16 flowers, C. fulvescens "Westonbirt variety" was very handsome, and varieties of C. Dirce, C. Brenda and C. Prince Olaf were specially noted. Among Lælio-Cattleyas the Westonbirt strain of L.-C. Berthe Fournier, the bright yellow L.-C. Golden Beauty and Golden Fleece; L.-C. Neleus (a fine yellow hybrid between C. Iris and L.-C. Ophir), and other equally handsome hybrids made a grand display. Among species and varieties were a batch of C. Dowiana with its richly-coloured variety Rosita and some superb forms of C. Hardyana. (Gold and Silver-gilt Lindley Medals.)

Adjoining was Sir George L. Holford's group of Vanda cærulea in Class 12, the only entry. It made a splendid group occupying 120 square feet and containing about 45 fine specimens bearing from one to three grand spikes of pure blue-tinted flowers, the best being appropriately the variety Lady Holford, a great beauty which secured a First-class Certificate. These were arranged with finely-flowered Oncidium varicosum; the bright yellow flowers went admirably with the sky-blue Vandas. (Gold and Silver-gilt Lindley Medals.) Fronting these two fine groups was Sir George Holford's group of Cypripediums in Class 10, which was arranged on a separate stage of about 130 square feet. In this group were most of the best-known species and hybrids, and prominent varieties such as C. Beacon magnificum, C. nitens-Leeanum Hannibal, C. Dante, C. Draco, C. Lucifer, C. Sultan, C. Actæus and its charming yellow and white variety Bianca; C. Rosettii and other Westonbirt novelties of great merit, the new C. Muriel securing an Award of Merit. (The Davidson Silver Cup.)

G. F. Moore, Esq., Bourton-on-the-Water (gr. Mr. Page), continued the end stage with a splendid group in the elevated parts of which were fine displays of Dendrobium Phalænopsis Schroderianum, the central arrangement having also the bright-reddish mauve variety rubescens, the blush-white Miss Louisa Deane, and the pure white variety hololeuca. Above them were graceful sprays of Oncidiums, and in the arrangement in the lower part of the group were a rich display of Cattleyas, Lælias, Brasso-Cattleyas and other hybrids and a fine selection of Cypripediums, among which were noted as specially fine C. The Baron, C. Niobe superbum, an interesting selection of C. Fairrieanum crosses, good batches of C. Maudiæ, C. callosum Sanderæ, C. Bianca, &c. (Gold Medal.)

At the other end of the side stage H. S. Goodson, Esq. (gr. Mr. Day), staged an effective

group in the centre of which was a brightly-coloured selection of Sophro-Cattleyas and Sophro-Lælias. Some very handsome hybrid Odontoglossums and Cattleyas were also noted, C. Mrs. Pitt "Goodson's variety" being the best of its class, having a uniformly deep rose flower with yellow disc. (Small Silver Cup.)

J. GURNEY FOWLER, Esq., Glebelands, South Woodford, in Class 3, for a group of Orchids, arranged in a space not exceeding 150 square feet, occupied very effectively a triangular stage with raised centre, the highest point having graceful Palms with yellow Oncidiums, white and blotched Odontoglossums, well-flowered Cattleyas, Lælio-Cattleyas, &c. Some good scarlet Odontiodas, Cattleya labiata alba and other white forms, bright orange scarlet Epidendrum Godmanii variety Eve. Some good Cypripediums, including C. Earl of Tankerville, were also included. (Silver Flora Medal.)

The entire length of the staging at the end of the Hall was occupied by Messrs. MANSELL & HATCHER and Messrs. CHARLESWORTH, the former entering a grand group in Class 29 for north country exhibitors. Two elevated parts were made, principally of excellent varieties of Cattleya Fabia, with which were good C. Mrs. Pitt, C. Armstrongiæ, excellent Lælio-Cattleyas, and other hybrids. The sunk portions were of good Cattleya labiata, including some white forms, with scarlet Odontiodas, richly-blotched Odontoglossums, and an excellent variety of Cypripediums. Rare species noted were Cirrhopetalum mundulum, C. appendiculatum, Bulbophyllum Godseffianum, and other Bulbophyllums. (Large Silver Cup.)

Messrs. CHARLESWORTH & Co., Haywards Heath, had one of the best and largest groups, the whole of the centre being of the rich, orange-scarlet Epidendrum vitellinum autumnale, which made a very bright effect, Vanda cœrulea, bright-yellow Oncidiums, a fine selection of Odontiodas and hybrid Odontoglossums. Among a very fine lot of hybrid Cattleyas and Lælio-Cattleyas were two superb novelties, C. Rhoda The Jewel and L.-C. Orion var. Othello, which secured First-class Certificates. (Gold Medal.)

On the broad stage inside the entrance, Messrs. SANDER & SONS, St. Albans, had a very extensive and well-arranged group, containing fine examples of most of the showy Orchids of the season. The three main elevations were of good Cattleya Fabia, C. Hardyana, various Brasso-Cattleyas, and Lælio-Cattleyas, the lower arrangements being of Cypripediums, with specially-finely blotched Odontoglossums arranged above them, with occasional sprays of scarlet Odontiodas. A batch of Pleione lagenaria was very effective, and a new Oncidium and Xylobium were also noted, as well as the fine, pure-white Cattleya Mulleri, a good flower of fine substance, which was raised by crossing C. Mrs. Myra Peeters and Harrisoniana alba. (Gold Medal.)

On the other side, Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey (gr. Mr. Collier), had a splendid group, the elevated centre of which was of Cattleya Portia cœrulea and C. labiata cœrulea, two distinct forms, with a decided blue tint, a shade of which the Gatton collection has many representatives. The yellow Cypripedium insigne Sanderæ, Vanda cœrulea, elegant sprays of Dendrobium Phalænopsis, and some excellent hybrid Cattleyas, Odontoglossums, Lælio-Cattleyas, &c., were also noted, and at one end a selection of Botanical Orchids —for which a Silver Cup was awarded—including the singular Bulbophyllum mirum and other Bulbophyllums, Pleurothallis, Saccolabiums, &c. Among the Odontiodas, O. Bradshawiæ gattonensis, a deep scarlet, secured an Award of Merit. (Large Silver Cup.)

Messrs. J. CYPHER & SONS, Cheltenham, in Class 6, had an excellent group on a circular stage, the handsome Cattleyas, Lælio-Cattleyas, Odontoglossums, &c., being effectively arranged, with Palms and Crotons. Dendrobium

FIG. 155.—VANDA CŒRULEA "LADY HOLFORD."
(R.H.S. First-class Certificate on Tuesday last.)

vitellinum, good Odontoglossum grande, and a very fine selection of Cypripediums, of which the new C. Glebelands (Latbamianum × insigne Chantinii) secured an Award of Merit. (Silver-gilt Flora Medal.)

In Class 5 E. R. ASHTON, Esq., Broadlands, Tunbridge Wells, staged an excellent group containing great variety in Lælio-Cattleya luminosa, Canhamiana and Colmaniana, a nice selection of Cattleya labiata, including some white-petalled varieties, and among new plants two good forms which secured Awards of Merit. (Silver Cup.)

F. DU CANE GODMAN, Esq., South Lodge, Horsham, in Class 5 staged a very effective exhibit of Oncidium varicosum, O. cheirophorum, O. ornithorhynchum and its white variety, Epidendrum vitellinum, Odontoglossums, Cattleyas and Lælio-Cattleyas, the finest of which was L.-C.

Phalænopsis Schröderianum, D. formosum giganteum, and a grand specimen of Cattleya Bowringiana lilacina were also prominent. (Silver-gilt Flora Medal.)

Messrs. Cypher, in Class 11, also well filled a similar stage with excellent Cypripediums, the forms of C. insigne and standard hybrids being shown to advantage, C. insigne Sanderæ, still the best yellow insigne, was illustrated by fine specimens. (Silver Cup.)

Messrs. Stuart Low & Co., Bush Hill Park, in Class 4 for a group of Orchids, in a space of 150 square feet on a circular ornamental staging in the middle of the Hall, had one of the most effective and well-arranged groups, the centre being carried well up, and at the edges four ornamental vases, elevated on pedestals, were placed. These were filled with Dendrobium Phalænopsis, Vanda cœrulea, Oncidium varicosum and other elegant Orchids; the body of the group being composed of Cattleya Fábia, C. labiata, including white forms, and C. Octave Doin; some good Lælio-Cattleyas, Odontoglossum and Odontiodas, with Dendrobium formosum giganteum, were also noted. (Gold Medal.)

Messrs. Jas. Veitch & Sons, Chelsea, staged a select group of Cattleyas, Brasso-Cattleyas, Lælio-Cattleyas, white Calanthes, and Odontoglossums, their new O. Aurora, which obtained a First-class Certificate, being a superb exhibit. (See Awards.) (Silver Banksian Medal.)

Messrs. J. & A. A. McBean, Cooksbridge, in Class 6 staged a good group of Odontoglossums, including fine O. crispum and some showy hybrids, their O. eximium "McBean's variety," which secured an Award of Merit. A batch of Cattleya aurea, fine C. labiata, two well-flowered Vanda Sanderiana, the new Cymbidium Doris and an unnamed hybrid of C. elegans, the beautiful Miltonia vexillaria Leopoldii, Lælio-Cattleya Myrrha, Cattleya Leugæ, C. Fabia Vulcan, and C. Fabiata were also specially noted. (Silver Cup.)

Mr. Sidney Flory, Amyand Park Nursery, Twickenham, staged an effective group including Cymbidium Tracyanum, the large example with four spikes obtaining the prize (a Silver Banksian Medal) for a single specimen Orchid. Four specially good fine hybrid Odontoglossums, some good O. crispum, fine Cypripediums, including a good C. Fulshawense, were also in the group. (Silver Banksian Medal.)

Mr. G. W. Miller, in his group of Cypripediums with other good kinds, showed C. Clarkseniæ (Actæus × insigne Laura Kimhall), resembling C. insigne Sanderæ. A selection of C. labiata, &c., was also shown. (Silver Banksian Medal.)

Mr. Treseder, Ardcairn, Co. Cork., staged a small group of hybrid Cypripediums, Cattleyas and hybrid Orchids, together with Odontoglossums, &c. (Bronze Banksian Medal.)

Mr. Harry Dixon, Spencer Park Nurseries, Wandsworth Common, had a well-arranged group of Oncidium varicosum, Epidendrum vitellinum, Odontoglossums and hybrid Cattleyas, one of which was a very fine dark form with the shape of C. aurea. (Silver Banksian Medal.)

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a small group with some excellent white-petalled forms of Cattleya labiata, including La Vièrge, with three fine flowers, alba (pure white), G. G. Whitelegge, and R. I. Measures. Specially fine were Le Président, W. R. Lee and Daphne. Also in the group were Lælio-Cattleya Decia alba, L.-C. Epicasta "Vale Bridge variety," Cattleya Dusseldorfei Undine, Cymbidium erythrostylum, Odontoglossum grande aureum, and some Cypripediums. (Silver Flora Medal.)

C. J. Phillips, The Glebe, Sevenoaks (gr. Mr. Bucknill), sent a finely-flowered plant of Cattleya labiata "Glebe variety," a good white flower with a pale blush-pink tinge on the lip; and C. Fabia "Glebe variety," a grand form of a bright rose tint with broad ruby-purple lip having an orange disc.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), sent Odontioda Bella (C. Noezliana × O. hellatulum) of a deep blood-red colour; and a good Odontoglossum Thompsonianum.

W. P. Burkinshaw, Esq., Hessle, near Hull, showed the fine white Cypripedium Boltonii magnificum and C. Aphrodite.

Mrs. Norman Cookson, Oakwood, Wylam (gr. Mr. H. J. Chapman), sent the large white Calanthe Cooksoniæ, the deep claret-red C. Angela, and the fine Odontioda Bradshawiæ "Cookson's variety," like a large scarlet-tinted Odontoglossum crispum. All had previously received First-class Certificates. (Silver-gilt Banksian Medal.)

Sir Trevor Lawrence, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed Cattleya Venus "Burford variety" (Iris × aurea), a clear yellow flower with light-rose lip veined and margined with yellow.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Messrs. Jas. O'Brien (hon. sec.), W. Bolton, W. Waters Butler, W. Cobb, R. G. Thwaites, de B. Crawshay, G. F. Moore, J. S. Moss, R. Brooman-White, H. J. Chapman, W. H. White, A. Dye, J. E. Shill, W. H. Hatcher, J. Cypher, J. Charlesworth, C. H. Curtis, Gurney Wilson, F. M. Ogilvie, F.

Fig. 156.—double columbines.

Type form and the spurless variety stellata, in which doubling is due to petalody of the stamens.

Sander, A. McBean, T. Armstrong, F. J. Hanbury, R. A. Rolfe, Stuart Low, Sir Harry J. Veitch, and Sir Jeremiah Colman, Bart.

AWARDS.

First-class Certificates.

Vanda cœrulea Lady Holford (see fig. 155) from Lieut.-col. Sir Geo. L. Holford, K.C.V.O., (gr. Mr. H. G. Alexander). A noble variety of this charming Orchid. The large, round flowers had a silver-white base delicately tinged and veined with clear-blue colour.

Cattleya Peetersii "Westonbirt variety" (labiata alba × Hardyana alba), from Lieut.-col. Sir Geo. L. Holford. Flower large and of fine shape, clear white, with a very fine lip coloured in front ruby-purple and heavy gold veining from the base.

Odontoglossum Aurora (O. Lambeauiana × Rossii rubescens), from Messrs. Jas. Veitch &

Fig. 157.—double wallflower capable of propagation by seed.

Doubling is due to splitting of the petals. A very early stage in the process is seen in the isolated petal.

Sons, Chelsea. A fine advance on previous Rossii crosses, and the richest in colour and best in form. The broad sepals and petals bave a broad, blotched band of deep bronzy-red and a rose margin. The broad and finely-shaped lip in rose-purple, with a yellow crest on the white disc.

Odontioda Bradshawiæ gattoniensis (O. crispum × C. Noezliana), from Sir Jeremiah Colman, Bart (gr. Mr. Collier). Flower nearly as large as O. crispum, deep scarlet-red.

Cattleya Rhoda The Jewel (Iris × Hardyana) from Messrs. Charlesworth & Co. A charming new departure, with flowers of good shape, clear canary-yellow, with a bright cherry-red lip veined with gold.

C. Orion variety Othello, from Messrs. Charlesworth & Co. A very dark claret-purple flower, with maroon lip delicately marked with lighter shades.

Awards of Merit.

C. Fabia gloriosa (labiata × aurea), from Lieut.-col. Sir Geo. L. Holford, K.C.V.O. A very fine variety, with a broad and showily-coloured lip.

C. Fabia Sunset, from Lieut.-col. Sir Geo. L. Holford. Flowers large, deep rose, with a large expanse of yellow in the lip.

C. Hardyana La Perle, from Lieut.-col. Sir Geo. L. Holford. A grand form, with clear-white sepals and petals and ruby-purple lip, with yellow disc and veining.

C. Venus var. Princess (Iris × Dowiana aurea), from Messrs. Charlesworth & Co. A pretty yellow flower, with ruby lip having gold veining.

Cypripedium Muriel (Euryades × Cynthia), from Lieut.-col. Sir Geo. L. Holford. A great improvement on C. Euryades; larger and broader. Dorsal sepal white, with large chocolate-purple blotches.

C. Glebelands (Lathamiana × insigne Chantinii), from J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). Flower as large as C. insigne Harefield Hall, and of similar colour. The dorsal sepal, which has a fine white upper half, is very well marked.

Brasso-Cattleya Mme. Hye. "Ashton's variety" (B. Digbyana × C. Harrisoniana), from E. R. Ashton, Esq., Broadlands, Tunbridge Wells. A distinct variety, with rose sepals and petals, and broad, slightly-fringed white lip.

Cattleya Oberon (Fabia × Hardyana), from E. R. Ashton, Esq. Flower large and with a resemblance to a good C. Hardyana, the lip being especially fine.

Lælio-Cattleya Walter Gott (L.-C. bletchleyensis × C. bicolor), from Messrs. Sander & Sons. A large flower, as good as C. Iris, and of a bright rosy-mauve shade, with a broad rose-crimson lip. A really good form.

Odontoglossum eximium "McBean's variety," from Messrs. J. & A. McBean, Cooksbridge. A model flower, which resembles Odontoglossum crispum Leonard Perfect, but has larger and brighter blotches on a white ground. The only sign of hybridity is in the lip.

Fruit and Vegetable Committee.

Present: Jos. Cheal, Esq (in the Chair); Messrs. W. Bates, J. Davis, H. Markham, G. Reynolds, John Harrison, W. Poupart, C. G. A. Nix, and A. W. Metcalf.

The only exhibit of importance was a fine, fruiting Orange tree exhibited by Messrs. Felton & Sons, florists, Hanover Square. It was stated to have borne 280 fruits this season, and was grown within seven miles of Charing Cross. (Cultural Commendation.)

LECTURE ON DOUBLE FLOWERS.

We are indebted to Miss Saunders for the following summary of her paper on "Double Flowers."

Doubling in flowers, as is well known, is due to different structural modifications in different cases. Most frequently the cause is either simple petalody of some or all of the stamens, or the petalody may be accompanied by an increase in the number of the parts due either to splitting or to actual multiplication of the whorls.

Whether a double-flowered form can be propagated by seed or not depends upon the nature of the modification which has led to the doubling. In some genera the flower may become very strongly double and yet produce good pollen and ovules, as in the Hollyhock. In other cases the ovary may remain normal but pollen may be absent, as is generally the case in the Sweet William (fig. 158); or the opposite may occur, for example, in the Petunia, in which the ovary is almost always malformed, but where there is abundance of pollen.

In a very large number of double flowers, however, both reproductive organs are affected, and neither ovules nor pollen are present. In this last case the flower becomes completely sterile, and such double-flowered plants as a rule can only be propagated vegetatively.

A striking and apparently unique exception occurs in the case of Stocks, where the doubles, which are completely sterile, are obtained from the seed of certain strains of singles, which may be termed double-throwing singles in contradistinction to the pure-breeding strains which give only singles. These double-throwing strains yield a constant proportion of singles and doubles, the doubles being in excess. This excess (as has been explained in an earlier account)* is accounted for on the supposition that the presence of two factors is essential to singleness, and that these two factors occur in all the pollen

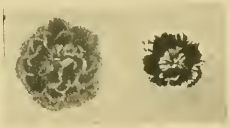

FIG 158.—TWO TYPES OF DOUBLE FLOWER IN THE SWEET WILLIAM.

Ovules are formed as in the single flower, but there is no pollen.

and all the ovules of the true-breeding singles; but in a pure-bred individual of a double-throwing strain this combination is present in less than half the number of ovules and is absent altogether from the pollen. As the larger half of the ovules and all the pollen are carrying doubleness, and as a double is formed whenever a double-carrying pollen grain fertilises a double-carrying ovule, it follows that the majority of the offspring of such an individual will be double.

In the ten-week strains the proportion of doubles varies from about 53 to 57 per cent., and this proportion is maintained quite independently of external conditions. Whether the plants are kept dry or well-watered, whether they are grown in a rich soil or a poor one, the percentage of doubles remains the same.

The view that in Stocks more doubles are obtained from the lumpy, irregular seeds than from the more symmetrical ones is not borne out. The character of the future plant, whether single or double, is already determined at the moment of fertilisation, and is unaffected by the shape of the seed, which is determined mainly, if not entirely, by the dimensions of the pod and the spacing of the ovules (fig. 159).

Though we cannot hope to obtain a higher yield of doubles by pursuing one method of cultivation rather than another, or by selecting the most irregular-shaped seeds and discarding the others, it is sometimes possible in the case of one particular strain to effect a fairly complete separation of the seeds, giving rise to singles and doubles respectively. This strain is the curious form known as sulphur-white, which gives white singles, cream doubles and a small percentage of white doubles. The sulphur-whites of some growers have small, brown, irregular and lumpy seeds (see fig. 160 D) like those of the ordinary pure white form, but there is also sulphur-white seed on the market which is larger, rounded and regular, and mixed in colour, some being browner and others yellowish, like those of the cream form Princess Mary (of B with A, fig. 160). These yellowish seeds give rise to the double creams; hence by sorting the seeds according to colour it is possible to obtain sowings which are almost entirely composed in the one case of singles and in the other of doubles.

Evidence has already been obtained in other cases besides Stocks, e.g., in Primula sinensis and Petunia that doubling is inherited in accordance with definite laws which are independent of external conditions. In those cases where a series of intermediate grades occur between the single and the extreme form of double the question of inheritance is more difficult to determine, and further investigation is needed to discover the inter-relations of the different grades and the extent to which each breeds true.

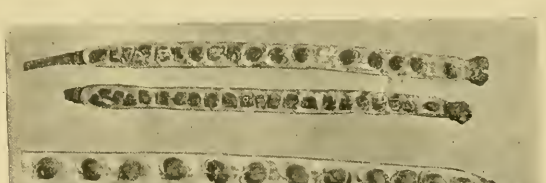

FIG. 159.—SEED PODS OF STOCK. ONE VALVE REMOVED TO SHOW THE SEED.

Upper pods short, showing some seeds irregular in shape through mutual pressure. Lower pods long, seeds with considerable interspaces, and all regular in shape.

* See *Gard. Chron.*, Oct. 28, 1911, p. 809.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

OCTOBER 17.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. J. Bamber, J. C. Cowan, J. Cypher, J. Evans, Dr. Hartley, W. Holmes, J. Lupton, D. McLeod, H. Morgan, C. Parker, H. Thorp, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

A Large Silver-gilt Medal was awarded to A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), who showed a pretty group of Cattleyas and Cypripediums.

A Silver-gilt Medal to Mrs. A. K. WOOD, Glossop (gr. Mr. Gould), for a fine group of well-grown plants.

Large Silver Medals to Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), for a group of Cattleyas; R. ASHWORTH, Esq., Newchurch (gr. Mr. Branch), who staged Cattleyas, Odontoglossums, and Cypripediums; Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), for a group composed principally of Cattleyas, Odontoglossums, and Cypripediums; J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), who showed Cattleyas and Cypripediums; Messrs. J. CYPHER & SONS, Cheltenham; and Messrs. CHARLESWORTH & Co., Haywards Heath, for a miscellaneous groups.

Silver Medals to Rev. J. CROMBLEHOLME, Clayton-le-Moors (gr. Mr. Marshall), for a pleasing group of Cypripediums; Messrs. SANDER & SONS, St. Albans, who staged a small group of good varieties of Cattleyas; and Mr. J. EVANS, Congleton, for Cattleyas in variety, and several forms of Odontoglossum crispum.

Other exhibitors included O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers); WM. THOMPSON, Esq., Walton Grange (gr. Mr. Howes); R. LE DOUX, Esq., West Derby (gr. Mr. Fletcher); H. H. BOLTON, Esq., Newchurch (gr. Mr. Eastwood); and Mr. E. F. DAVIDSON, Twyford.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya × *Ena* "*Marlfield variety*" (*bicolor* × *Mossiana*); *Cattleya labiata* "*Mme. Le Doux*," fine, well-shaped flowers; *Cattleya Mrs. Pitt* "*Charlesworth's variety*," all from R. LE DOUX, Esq.

Cattleya Enid "*Ward's variety*," from Z. A. WARD, Esq.

Cypripedium Our Queen (*Leeanum* × *Stevensii*), a well-shaped flower, from WM. THOMPSON, Esq., Walton Grange.

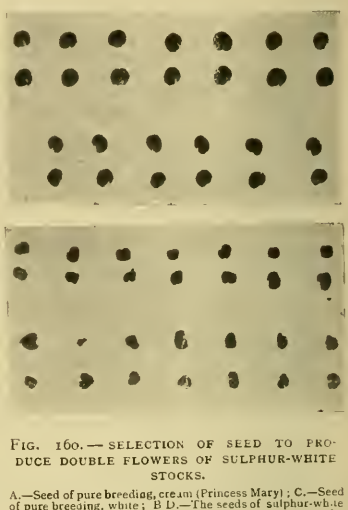

FIG. 160.—SELECTION OF SEED TO PRODUCE DOUBLE FLOWERS OF SULPHUR-WHITE STOCKS.

A.—Seed of pure breeding, cream (Princess Mary); C.—Seed of pure breeding, white; B D.—The seeds of sulphur-white sorted into groups, viz.: B.—Larger number yellow seeds, which give double cream; D.—Small, irregular brown seeds, which give single white. (See text.)

Cattleya labiata variety "*Queen of Spain*," a good flower; *Cattleya Enid* "*Orchid Dene variety*" (*Mossiæ* × *gigas*); *Brasso-Cattleya heatonense variety* "*Virginale*" (*B. Digbyana* × *C. Hardyana alba*); *Lælio-Cattleya Colmanæ* "*Orchid Dene variety*" (*L.-C. callistoglossa* × *aurea*), good shape, lip large and deep velvety colour. All above from Mr. E. F. DAVIDSON.

AWARDS OF MERIT.

Odontoglossum × "*Scintillans*" (*Rossii rubescens* × *Wilckeanum princeps*), from WM. THOMPSON, Esq.

Cattleya Portia magnifica, from Mr. E. F. DAVIDSON.

KENT COMMERCIAL FRUIT SHOW.

OCTOBER 28, 29.—Supplementing our report, on p. 340 in the last issue of this show, held on the above dates, we now refer to the more important of the non-competitive exhibits as follow:—

Messrs. GEORGE BUNYARD & Co., LTD., Maidstone, had an exhibit of Apples and Pears, in which the excellence of very numerous varieties was very striking.

An interesting display in connection with plant diseases, insect pests, and Tobacco growing was contributed by the SOUTH-EASTERN AGRICULTURAL COLLEGE, Wye. A demonstration of Apple grading and packing was given on the second day of the show.

Numerous stands displayed machines for spraying, materials for washing fruit and Hops, and other appliances used by growers.

Messrs. DRAKE & FLETCHER, Maidstone, showed two grading machines, one for Apples and the other for Tomatos and small fruits; also an assortment of spraying machines.

Messrs. WEEKS & SON showed a hand-grading machine and packing table, with numerous spraying machines.

The BRITISH BASKET Co., Glasgow, exhibited an assortment of chip baskets and Apple boxes.

Messrs. McDOUGALL BROS., Manchester, showed materials for fruit and Hop washing.

Messrs. CORFE & SON. Maidstone; Messrs. WALTER VOSS & Co., London; and Messrs. BERGER & SON, London, were also exhibitors of similar materials.

The FOUR OAKS Co., of Sutton Coldfield, Birmingham, showed sprayers; Messrs. STETT & Co., Faversham, displayed spraying machines and washes; Messrs. HAYES BROS., Maidstone, showed packing boxes, a nailing press, and tools for use in fruit-growing; Messrs. E. A. WHITE & Co., of Paddock Wood, exhibited sprayers and washes; Messrs. J. & N. SMYTHE, Maidstone, staged fruit boxes.

CONFERENCE ON FRUIT CULTURE.

The Conference in connection with this exhibition was held in the Town Hall, Maidstone, on the second day. Mr. Fred Smith occupied the chair. A paper was read by Mr. M. J. R. Dunstan, M.A., Principal of Wye Agricultural College, entitled "The Scope of Scientific Research in Fruit Growing."

Mr. Dunstan said that science is organised and accurate knowledge; some of the best practical farmers despise science, yet their good practice is based on science unconsciously applied. To the Rothamstead experiments is largely due our present knowledge of the economical manuring of farm crops and the feeding of farm animals.

With respect to fruit, said Mr. Dunstan, there has not been so much investigation work done as with farm crops, one reason being that the life of a fruit tree requires a longer period for investigation, also the conditions are somewhat more complex.

Are there any subjects bearing on fruit-growing in which we may add to our knowledge? What are the subjects on which investigations are required, and by whom and where can they be investigated?

With reference to the first part of his question, the lecturer said that some of the problems of fruit-tree growing are of a botanical natnre. For example there are different strains of the Paradise stock, whilst the grafts themselves show differences and variations according to the individual trees from which they are taken. In pruning, it is possible that what is found best suited to one district may not be so suitable in another. Another subject of interest is the non-setting of blossoms, due to various causes, such as frost, lack of pollination, or the condition of the weather following pollination.

Certain varieties of fruit, though good, are specially subject to insect or fungoid pests; some sorts are more susceptible to spray fluids than others. The investigation of these subjects is being carried out by the John Innes Horticultural Research Institution; new varieties should stand a severe commercial test before being widely distributed to growers, to avoid disappointment.

The study of insect and fnngoid attacks needs investigation, to learn the life history of the insect or fungns, in order to ascertain their vulnerable points, and the time for the application of the specific. Further investigation is needed in the cases of American Gooseberry-mildew, silver-leaf, and some of the Potato diseases.

We also require a knowledge of the effect of the sprays on insect or fungns, whilst chemistry may teach improved methods of mixing the specifics and introdnce new materials useful to the work. We are not yet well acquainted with the manuring of fruit-trees or the effect of commercial artificial mannres, which is of special importance now that the snpply of animal mannres is decreasing. The economic problems, including the packing, preserving, distribnting, and marketing of frnit, might be investigated.

The practical man must have patience in these tests, for even failure in an experiment may teach something that may help towards success.

Four conditions are necessary for such research work:—(1) A staff of workers who must individnally be both scientific and practical; (2) laboratories; (3) land; (4) confidence of frnit-growers.

As regards the staff of workers, Mr. Dunstan said that at the Wye College they had efficient investigators, and the College was well supplied with laboratories.

They were in a fair way to have suitable land by next autumn. The Board of Agriculture had granted the College £1 000 for answering inquiries from farmers, fruit-growers, and others, and it had promised £500 per annum towards the expenses of a fruit research station if suitable land is found and funds are also raised in the county.

Mr. E. Salmon said different varieties of Gooseberries behaved very differently when treated with lime and sulphur; some kinds were not harmed, whilst others lost their leaves. He stated that a central row of 40 Gooseberry bushes in a plantation attacked by American Gooseberry-mildew was sprayed six times during the season with lime-sulphur at intervals of a fortnight, and was found at the end to be free of mildew, though the row had diseased bushes on either side. Mr. Stephen Ballard, of Malvern, speaking on behalf of the Herefordshire growers, asked Kent to adopt the same box package as Herefordshire was using, namely, that holding 56 lbs. He had been packing Apples in boxes for 20 years, and thought this to be the best weight. Mr. C. Smith considered that the bushel box suited the Kentish growers best, and they were not prepared to adopt Mr. Ballard's suggestion.

FERTILISATION OF FRUIT BLOSSOMS.

A lantern lecture entitled "Bees and the Fertilisation of Fruit Blossoms" was given by Mr. W. Herrod, Secretary of the British Beekeepers' Association.

Mr. Herrod said the Isle of Wight bee disease had made fruit-growers realise the value of bees in orchards, for the Board of Agriculture had received a deputation of fruit-growers, asking its advice and assistance to grapple with the disease. Bees never make holes in fruit, though the wasps do, but after the hole is made the bees may be tempted to take advantage of it. Spraying should not be done whilst the trees are in blossom, both for the sake of the crop and the bees.

The non-setting of fruit, said Mr. Herrod, is attributable usually to one of five causes—too much wood growth, injury by frost, bad weather, fungoid disease, or lack of bees.

In South Africa a Pear tree with 62 trusses of 558 blossoms was covered with cheese cloth to exclude insects, and placed where there was a strong wind; no fruit set on the tree, but on similar trees around in the open fruit set plentifully; Black and Red Currants and Gooseberry bushes covered to exclnde insects set practically no fruit.

At Lord Sudeley's fruit plantations in Gloucestershire, where fruit did not set well, 200 colonies of bees were placed in different parts, and the setting of the fruit improved greatly. There are now some 300 hives distributed about the Toddington estate in five different apiaries. In like manner, Messrs. Chivers have introduced bees among their Cherry orchards at Histon in Cambridgeshire for pollination purposes. It is advisable to place the bees as near as possible to the trees.

The lecture was illustrated by lantern slides, some of the most interesting being tables of the time of flowering of the various frnit trees, and observations of the visits of insects, kindly lent by Mr. C. H. Hooper, whose painstaking observations of this branch of fruit growing were referred to with appreciation.

BIRMINGHAM CHRYSANTHEMUM, FRUIT, AND FLORICULTURAL.

NOVEMBER 5, 6, 7.—The annual show of this Society, held in the Bingley Hall on the above dates, was extensive and of good average merit. Cut Chrysanthemums were clean and fresh, but trained specimen plants were few in number and less profusely flowered than usual. Begonias constituted an outstanding feature. They have never been seen in anything like the quantity or quality at Birmingham before. Apples and Pears were of good size and beautifully coloured. Vegetables were excellent, there being no fewer than 32 collections exhibited for the special prizes offered by various seedsmen. The schedule comprised 124 classes, 35 for Chrysanthemums, 17 for miscellaneous plants and cut flowers, and 57 for vegetables.

SPECIMEN PLANTS.

Six classes were provided for these but, as in recent years, competition was very poor, there being only one entry in each of the first five classes and three in the sixth class, which was for three single-flowered varieties. J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), won 1st prizes for (1) six Japanese varieties, (2) six large-flowering varieties (Japanese excluded), (3) three Japanese varieties, (4) one Japanese variety, (5) one large-flowering variety (Japanese excluded), and (6) three single-flowered varieties. E. MARTINEAU, Esq., Edgbaston (gr. Mr. E. Bostock), and T. W. PIGGOTT, Esq., Moseley (gr. Mr. R. Bullock), were awarded 2nd and 3rd prizes respectively in the last-named class.

GROUPS.

The most important class was for a group of plants arranged on a space of 16 feet by 10 feet. The 1st prize was again awarded to J. A. KENRICK, Esq. (gr. Mr. A. Cryer), whose well-balanced group, consisting largely of massive Japanese and Incurved varieties, was arranged with artistic effect. Decorative and single-flowered varieties were also well shown, and pleasant relief was afforded by the introduction of graceful Bamboos, Palms, and Ferns. 2nd, HUME C. PINSENT, Esq., Lordswood Road, Harborne (gr. Mr. G. Corbett), whose Japanese varieties were splendid, but the arrangement was much inferior to that of the 1st prize exhibit.

In the next class, which was similar to, but smaller than, the last-named, two very creditable displays were placed before the judges, who gave the 1st prize to H. GREEN, Esq., Gravelly Hill.

J. A. KENRICK, Esq. (gr. Mr. A. Cryer), was the only competitor in a class for decorative Chrysanthemums arranged as grown on a space of 12 feet by 8 feet. Thinning was allowed, but disbudding to single flowers prohibited. The plants were covered with flowers and well arranged.

CUT BLOOMS.

In the principal class for cut blooms, which was for Japanese and Incurved blooms, arranged on a table 18 feet long by 5 feet wide, and for which a silver challenge shield and £8 were offered as the 1st prize, Mr. NORMAN DAVIS, Framfield, Sussex, was the only exhibitor. He had magnificient blooms of D. B. Crane, His Majesty, H. W. Thorpe, Clara Wells, Romance, &c., nicely arranged in vases and stands over a groundwork of Ferns. Mr. DAVIS excelled in the next class, which was for single Chrysanthemums on table space of 8 feet by 4 feet. His masses of Mrs. Loo Thomson (a yellow Mensa), Charles Kingsley, Brightness, and Arcturus were particularly good. 2nd, Major EVERETT, J.P., Knowle (gr. Mr. W. Newton).

The winning exhibit of 18 Japanese varieties, one bloom each of three varieties, in a vase, came from HUGH ANDREWS, Esq., Toddington Manor, Winchcombe (gr. Mr. J. R. Tooley). The blooms were beautifully fresh, of good depth and finish, and were as follow:—Mme. Rivol, Mme. P. Radaelli, H. Dow, Bessie Godfrey, W. Igglulden, R. Luxford, Master James, A. P. Miller, Hon. Mrs. Lopes, W. Gee, F. Jolliffe, Lady Talbot, Purity, G. I. Kelly, C. Penford, Rose Pockett, F. S. Vallis, and Mrs. Mease. 2nd, Mr. H. WOOLMAN, Shirley, whose best flowers were Master James, Miss Gladys Herbert, White Queen, and Rose Queen. 3rd, Lieut.-Col. BEECH, Coventry (gr. Mr. E. J. Brooks). The last-named exhibitor was placed 1st in a class for four Japanese varieties, three blooms of each. He had massive, well-finished blooms of Lady Talbot, F. S. Vallis, Mrs. Lopes, and Frances Jolliffe. 2nd, J. H. WHEATLEY, Esq., Berkswell Hall, Coventry (gr. Mr. W. H. Westbury), who also won 1st prizes in classes for (1) three blooms of any white Japanese variety, with Purity, and (2) three blooms of any yellow Japanese variety. His examples of the Hon. Mrs. Lopes were very meritorious.

HUGH ANDREWS, Esq. (gr. Mr. J. R. Tooley), took the lead in a class for the best pink-coloured Japanese variety. His examples of W. Gee were large and shapely. Mr. H. WOOLMAN, Shirley, excelled in a class for any crimson-coloured Japanese variety with Master James in superb condition. Mr. WOOLMAN was awarded the 1st prize in another class for four varieties of decorative Chrysanthemums, eight sprays of each variety in a vase. 2nd, Major EVERETT, Knowle (gr. Mr. W. Newton).

The best half-dozen vases of decorative Chrysanthemums, six sprays of each, came from T. G. HYDE, Esq., Worcester (gr. Mr. H. Matthews), who showed splendid examples of Dazzler and Felton's Favourite.

There were five good entries in a class for 12 Japanese varieties arranged on a table 6 feet by 3 feet. Exhibitors were at liberty to use any foliage. 1st, F. E. MUNTZ, Esq., Umberslade (gr. Mr. H. S. Foster); 2nd, HUGH ANDREWS, Esq. (gr. Mr. J. R. Tooley); 3rd, J. B. BROOKS, Esq., Finstall Park, Bromsgrove. The leading exhibit of 12 Incurved varieties came from T. W. PIGGOTT, Esq., Moseley (gr. Mr. R. Bullock).

There were 19 entries in the class for dinner tables, each 8 feet by 4 feet, and the 1st prize was won by Sir GEORGE H. KENRICK, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), whose flowers were crimson with a golden reverse. 2nd, Mrs. BATCHELOR, Hampton-in-Arden.

Prizes were offered by Messrs. James Randall & Sons, Shirley, for 12 varieties of market Chrysanthemums. The only exhibitor was Mr. NORMAN DAVIS, Framfield, who was awarded the 1st prize of £3. He showed superb flowers of Freda Bedford, Felton's Favourite, True Gold, Mary Hope, and Black Prince.

Mr. W. J. WAKEFIELD, Harborne, won Mr. J. Udale's prize for three vases of Incurved varieties like Mrs. George Glenny, Mrs. Dixon, and Mrs. G. Rindle.

The 1st prize of £1, offered by Messrs. Wells & Co., for the best bloom of Mrs. Gilbert Drabble, was won by Lieut.-col. BEECH, Coventry (gr. Mr. E. J. Brooks). 2nd, J. H. WHEATLEY, Esq., Coventry (gr. Mr. W. H. Westbury).

MISCELLANEOUS PLANTS AND FLOWERS.

In the class for cut flowers of Tree Carnations, arranged on staging 10 feet long by 4 feet deep, two exhibits were placed before the judges, who awarded the 1st prize to Messrs. YOUNG & Co., Cheltenham; and the 2nd to Mr. S. MORTIMER, Farnham, Surrey.

The exhibits of Begonia Gloire de Lorraine made a grand show, there being no fewer than eight entries in the class for 12 pots and seven in the class for six pots. The winning exhibitor in the first-named class was LIONEL SPIERS, Esq., Edgbaston (gr. Mr. John Farmer), and in the second F. E. MUNTZ, Esq., Umberslade (gr. Mr. H. S. Foster).

Of the four exhibits in a class for 12 Cyclamen, and in the class for six specimens the Rev. H. BUCKSTON, Derby, was placed 1st.

Mrs. C. GREAVES, Wormington, was successful in classes for bouquet of Chrysanthemums and in another for a basket of tinted foliage and berries.

The 1st and 2nd prizes offered by Mr. H. N. ELLISON, West Bromwich, for six Ferns were won by Mr. J. HIGLEY, Edgbaston, and Mr. A. CRYER, Edgbaston, respectively.

FRUIT.

In the leading fruit class, which was for a collection of British-grown fruit, to occupy a table space of 10 feet by 5 feet, there were two exhibits. The 1st prize of £7 was won by Lady HENRY SOMERSET, Eastnor Castle, Ledbury (gr. Mr. G. Mullins), who showed very fine Grapes, large and well-coloured Apples and Pears in variety, and Hero of Lockinge Melons. 3rd, Mr. W. E. HYDE, Ledbury.

The best of two exhibits in a class for a collection of British-grown hardy fruits came from Sir R. L. LUCAS TOOTH, Bart., Holme Lacey, Hereford (gr. Mr. E. Parry), who had medium-sized, well-coloured Apples and Pears, also Red and White Currants, Coe's Golden Drop Plum and Filberts. 3rd, Sir FRANCIS LLOYD, Aston Hall, Oswestry.

Lady HENRY SOMERSET (gr. Mr. G. Mullins) won 1st prizes in classes for (1) six bunches of Grapes (not fewer than three varieties), (2) three bunches of white Muscat Grapes, (3) six dishes of dessert Apples, and (4) four dishes of Pears.

The best three bunches of black Grapes, as well as the best pair of white Grapes (Muscats excluded), were exhibited by HUGH ANDREWS, Esq. (gr. Mr. J. R. Tooley).

GODFREY NETTLEFOLD, Esq., Edgbaston (gr. Mr. J. Higley), beat four contestants in a class for black Grapes reserved for local growers; 2nd, Mrs. RICHARD PEYTON, Edgbaston (gr. Mr. W. Young).

C. WINN, Esq., Selly Park (gr. Mr. T. T. Sheppard), took the lead in a local class for white Grapes; 2nd, A. G. BULLER, Esq., King's Heath (gr. Mr. G. H. Ganderton).

Mr. C. W. POWELL, Warham, Hereford, won 1st prizes for (1) six dishes of cooking Apples and (2) eight dishes of Pears. In each case the fruits were large and highly-coloured.

VEGETABLES.

Robert Sydenham Limited offered prizes for nine kinds. 1st, Mr. T. JONES, Ruabon, who had very good Ailsa Craig Onions and Autumn Giant Cauliflowers; 2nd, Mr. JAMES WHITE, Bampton; 3rd, Mr. E. WINCHESTER, Rubery.

Robert Sydenham Limited also offered prizes for local growers. 1st, Mr. E. DEAKIN, Hay Mills; 2nd, Mr. F. WHITBREAD, South Yardley.

Messrs. Webb & Sons' prizes were offered for eight kinds. The 1st prize was won by Mr. F. J. BARRATT, Overton, who had excellent Cauliflowers, Carrots, Onions and Celery; 2nd, Mr. J. HUDSON, Leicester.

The prizes offered by Messrs. Sutton & Sons were for nine kinds. 1st, the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett); 2nd, Mr. JOHN HUDSON, Leicester; 3rd, Mr. F. J. BARRATT, Overton.

Messrs. Dickson & Robinson, Manchester, offered prizes for single dishes, in which Mr. T. JONES, Ruabon, was the most successful exhibitor.

NON-COMPETITIVE EXHIBITS.

Large Gold Medals.—Messrs. Clibrans, Altrincham, for Begonias; the Rev. H. Buckston, Sutton Hall, Derby, for Begonias; King's Acre Nurseries, Hereford, for fruit; Messrs. Dickson & Robinson, Manchester, for Michaelmas Daisies; Messrs. Webb & Sons, Stourbridge, for vegetables, &c.; Messrs. John Waterer & Sons, Bagshot, for hardy shrubs.

Small Gold Medals.—Mr. W. J. Godfrey, Exmouth, for Chrysanthemums and Zonal Pelargoniums; Messrs. Wells & Co., Merstham, Surrey, for Chrysanthemums; Mr. H. Woolman, Shirley, for Chrysanthemums; Hereford Fruit Growers, for fruit; Messrs. Pewtress Bros., Hereford, for fruit; Mr. C. W. Powell, Hereford, for fruit; Messrs. Hewitt & Co., Solihull, for hardy shrubs; Messrs. Wood & Son, Wood Green, for garden sundries.

Silver-gilt Medals.—Messrs. Dickson & Robinson, Manchester, for Onions; Messrs. Thomson & Co., Birmingham, for vegetables, Messrs. W. H. Simpson & Sons, Birmingham, for vegetables; Mr. H. N. Ellison, West Bromwich, for Ferns.

Silver Medals.—Messrs. Peed & Son, West Norwood, for Chrysanthemums and Begonias; Messrs. Hewitt & Co., for Carnations, &c.; Miss Thompson, Handsworth, for Cacti; Messrs. Bakers, Wolverhampton, for hardy shrubs; The Patent Ladder Co., Peterborough, for extension ladders; Messrs. Robinson Bros., West Bromwich, for sundries; Mr. A. Bayliss, Birmingham, for rustic work; Messrs. J. Turton & Co., Birmingham, for greenhouses.

Bronze Medals.—Sir William Cook's Convalescent Home, Romsley Hill, near Birmingham, for vegetables; H. S. Batson, Esq., Handsworth, for Primulas; Mr. A. Edwards, Nottingham, for table decorations.

First-class Certificates.—Japanese Chrysanthemum His Majesty, from Mr. Norman Davis; single Chrysanthemum Mrs. Loo Thompson, from Mr. Norman Davis; Japanese Chrysanthemum Crimson Velvet, from Mr. W. J. Godfrey; Japanese Chrysanthemum Godfrey's Success, from Mr. W. J. Godfrey; Japanese Chrysanthemum Mrs. N. Molyneux, from Mr. W. J. Godfrey; Japanese Chrysanthemum Mrs. Drexel, from Messrs. W. Wells & Co.; Japanese Chrysanthemum Queen Mary, from Messrs. W. Wells & Co.

Obituary.

JAMES JONES.—We regret to record the death on the 22nd ult. at the Draythan, near Newport, of Mr. James Jones, late head gardener to Col. the Hon. F. C. Morgan, at Ruperra Castle, Monmouthshire. Mr. Jones, who was in his 83rd year, retired on an allowance some 20 years ago granted by the late Col. Morgan. He filled the post of gardener at Ruperra for 45 years, having succeeded his father, who held the post for 50 years.

JAMES C. MURRAY.—The death of this florist of Peoria, U.S.A., at the age of 63 years, on October 13, is announced in *The American Florist*. Mr. Murray was born in Yarmouth, England. Twenty-five years ago he opened a florist's business in Peoria.

ANSWERS TO CORRESPONDENTS.

ACETYLENE GAS REFUSE AS A MANURE: *S. H. A.* An article on the results of experiments with this material for manurial purposes conducted by Mr. W. B. Burgess, of the South Eastern Agricultural College, Wye, was published in *Gardeners' Chronicle*, April 24, 1909, p. 264. Several correspondents wrote subsequently giving their experience, including Mr. F. R. Staddon, who stated that he had used it in the case of Potatos, Peas, Beans, Celery, Spinach, Onions, Carrots, Parsnips, Turnips, Broccoli, Cabbage, and Brussels Sprouts, also as a dressing for new plantations of Strawberries. Mr. Staddon stated that in all cases the crops were benefited. (See *Gardeners' Chronicle*, May 8, 1909, p. 299.)

AMATEUR GARDENER: *A. H.* According to the R.H.S. *Code of Rules for Judging* an "amateur" is one who grows plants, fruits, or vegetables (either personally or by paid labour) solely for the enjoyment, or for the domestic use of the produce, and not with the object of pecuniarily benefiting by it. The fact of his disposing of surplus produce for money does not necessarily disqualify him unless the whole maintenance of the garden is intended to return him an annual profit. Neither a nurseryman (or his assistants), a gardener who receives wages (or is paid in kind), nor any lady or gentleman who grows or advertises garden or orchard produce for the purpose of sale should be regarded as an amateur in respect to exhibits contributed to competitive exhibitions.

CEDARS: *W. S.* It will be better to apply the farmyard dung as a top-dressing than to employ bonemeal. If convenient, strip off the grass, remove some of the old soil about the roots, and replace with old potting compost. The mulch may then be applied, and the turf replaced in the spring. The bonemeal may be mixed with the old potting soil.

CHRYSANTHEMUM SPORT: *J. W. F.*—The variety La Triomphe is very liable to sporting; we do not know if there is a similar sport to yours already in cultivation.

CLINKERS AS A DRAINAGE FOR PEACH BORDERS: *E. A. M.* Clinkers may be employed as drainage material for Peach borders, and their use is recommended by Mr. H. W. Ward in *The Book of the Peach* (which may be obtained from our publishing department, price 2s. 9d., free by post). It is sometimes stated the roots of these trees will not grow into the drainage formed of this material. But this is an advantage, for it is not desirable that the roots should enter the drainage.

NAMES OF FRUITS: *Longmon.* 1, Triomphe de Jodoigne; 2, General Todleben; 3, Beurré Dumont; 4, Durondeau; 5, Catillac; 6, Tower of Glamis; 7, Ashmead's Kernel Improved.—*Rex.* Flower of Herts.—*J. L.* Beurré Bosc.—*W. E. C.* 1, Beurré Bosc; 2, Maréchal de Cour (Conseilleur de la Cour); 3, Ribston Pearmain.—*S. V. S.* Comte de Flandre.—*Bunting.* Cox's Pomona.—*Hope.* 1, Beauty of Kent; 2, Cullen; 3, Emperor Alexander; 4, Old Hawthornden; 5, Easter Beurré; 6, Glou Morceau; 7, Durondeau.—*G. W. T.* Pears: 1, Bergamotte Bufo; 2, Beurré Diel; 3, Louise Bonne of Jersey. Apples: 1, Dumelow's Seedling; 2, not recognised; 3, Cellini; 4, Wyken Pippin; 5, Beauty of Kent; 6, Lord Derby; 7, Hoary Morning.—*A. T.* 1, Tom Putt; 2, Winter Quoining; 3, not recognised; 4, Hanwell Souring; 5, Orange Goff; 6, Nanny; 7, Margil.—*J. T. S.* 1, decayed; 2, Sandringham; 3, Manks Codlin; 4, Beauty of Kent; 5, decayed; 6, Lady Henniker.—*W. E.* 1, too small to name; 2, Beurré Hardy; 3, Doyenné Blanche; 5, decayed; 6, Beurré d'Anjou; 7, 8, and 9, decayed.

SPANISH IRISES: *J. E.* Details on the cultivation of these bulbous plants are given on p. 351 in the weekly Calendar on the flower-garden.

THE MARKET FRUIT GARDEN.

AFTER a wet beginning, October gave us favourable weather up to the 19th, subsequent to which date rain fell nearly every day up to the 30th (inclusive), and very heavily on some occasions. My register records rain on 15 days, amounting to 4.43 inches. This heavy rainfall stopped almost all useful work on the land, keeping fruit plantations which had been cultivated by horse power or hand in a muddy condition after the 19th. Excessive rain is especially objectionable when it falls upon soil in a fine state of division, as it is after one of the operations named, because the loose soil holds water like a sponge, and the roots of trees and bushes are kept in a water-logged condition. Besides, all good effect from recent hoeing is prevented, and there is a great deal of washing from the higher to the lower parts of hilly fields. After the orchards have been dug, they withstand a wet period better. In my own case, the wet weather stopped the work of wheeling manure on to the land from the heaps in which it had been left on the headlands. The intention was to get the manure on to the orchard, and to have it spread and dug in as early as possible, and all but the digging had been done on three-fourths of the land; but the deluge of rain prevented a finish, and the digging of the manured portion of the orchard was out of the question while the soil was saturated with water. Even the pruning of trees on arable land was almost impracticable during the wettest period of the month, as the steps used for the work sank into the mud, and had to be dragged out forcibly in shifting them.

Wet Weather, Canker, and Scab.

When the soil of an orchard is waterlogged for any considerable time, there is always the uncomfortable feeling that canker and scab will be promoted among Apple trees. It is certain that scab is most prevalent in wet seasons, and, apparently, the infection of canker is also promoted by wet weather. At any rate, the rotting of bark in canker wounds is increased when it is saturated with water. It seems to me, moreover, that the infection of canker rises with the sap from a diseased spot through the wood of a branch or shoot, and that wet weather, so long as the sap is rising, is likely to increase this spreading of the disease.

Neglect of Summer Pruning.

Where, from lack of time, summer pruning was neglected, the waste of energy among young or comparatively young trees has been enormous. All my Apple trees which had not been planted over four years were summer-pruned, and these now have comparatively few surplus shoots. But the trees of some varieties in orchards planted six or seven years ago, not summer-pruned, are densely covered with shoots, the great majority of which are superfluous. In pruning Domino Apple trees, many cases were found requiring the removal of over 200 shoots to a tree. This variety makes natural spurs so densely that no artificial spurring is desirable. If the superfluous shoots had been cut off cleanly early in the past summer, the shoots left for branches would have been much stouter than they are. These remarks apply equally to Cox's Orange Pippin and Allington Pippin, which have a tendency towards the formation of thickets of side shoots on the main branches. The neglect of the summer pruning of trees six or seven years from the planting was due, in my case, to my reluctance to let anyone but myself train young trees.

Notes on the Kent Fruit Show.

It would have been well to have conducted the numerous adverse critics of English fruit through the Kent Commercial Fruit Show (see report in the issue for November 2). They would have seen there a very large collection of Apples, superior to any from the United States or even from British Columbia—superior in colour, as well as in size, so far as the naturally well-coloured varieties were concerned. I have never seen any imported Apples, culinary or dessert, equal in excellence on all points to a very large proportion of the Maidstone exhibits. Even in grading and packing, many of the exhibitors proved themselves quite equal to their American and Canadian competitors.

The great defect of the splendid show was the exclusion of Apples packed in sieves and half-sieves. If the organisers are confident as to the superiority of the boxing system, they should not be afraid to let baskets compete with boxes. Many of the exhibitors admit that it does not pay, as a rule, to pack culinary Apples in boxes, 6d.—the price of a box—being a serious handicap upon fruit worth as much as 4s. to 5s. a bushel, and a prohibitory expense on Apples worth only 3s. Even when more than 5s. has been made for very choice samples, it has to be borne in mind that the extra careful grading required for boxes makes the proportion of seconds much greater than it would be if the fruit were packed in bushel baskets. A cooking Apple is none the worse for its purpose because of a speck or two upon it, and, as to size, it is doubtful whether a retailer who sells by the pound wants to have every Apple of full size, as a few fruits of three-quarter size are convenient for just turning the scale.

The only conclusive test of the profitableness of the boxing system would be that of taking a number of large lots of Apples, as gathered from the trees, dividing each lot into two equal parts, marketing one part of each lot in boxes and the other part in baskets, and comparing the net returns. My impression is that, so far as culinary Apples are concerned, the baskets would win in nine cases out of ten. As no one appears to advocate the packing of seconds in boxes, however, the trial might allow of these being marketed in baskets or barrels, the firsts only being packed in boxes, comparing the financial results with those of packing both firsts and seconds in baskets.

Methods of Packing in Boxes.

Fruit-growers who are desirous of trying the boxing system, if they are not familiar with it, should obtain a pamphlet on "The Packing of Apples in Boxes," from the secretary of the South-Eastern Agricultural College, Wye, Kent, price 3d. to residents in Kent or Surrey, or 6d. to other counties. Eight methods of placing the fruit were exhibited by the College authorities at the Kent Show, and seven of these are described and illustrated in the pamphlet. One noticeable feature of the show was the generality of packing Apples on their sides, instead of eyes upwards, which has been more common in the past. Another point was that many—if not most—of the 1st prizes were awarded to the straight pack, which is condemned by the boxing authorities as liable to cause bruising in transport. The straight-packed Apples certainly looked most attractive, and as their appearance was so good at the exhibition it must be equally good in the market, if the fruits are not bruised. Many of the boxes of large Apples packed in the diagonal or offset method could not have contained 40 lb., as the loss of space was considerable. Unless box-packers get full weight into their boxes, their method of packing will soon be discredited.

Explosives in Fruit Planting.

Much attention has been attracted to the demonstrations in the breaking-up of soil to a great depth by means of explosives, carried out by Messrs. Curtis and Harvey at the recent show and ploughing match of the Rochester and Gravesend Agricultural Association. One demonstration showed the ease of extraction of great tree stumps by means of gelignite. More novel was the making of holes for fruit trees by an explosive, which loosened the subsoil to a depth of 5 feet 6 inches, and to about the same extent in a horizontal measurement. The cost of the explosive is put at 4½d. to 6d. per hole. But even if it is to be supposed that it would be advantageous to encourage the roots of the trees to penetrate to the depth named, which is questionable in the case of some subsoils, not the holes alone, but the whole of the land should be treated, not only in order to induce the roots of trees to spread laterally, but also for the benefit of small fruit, if grown among the trees. If 300 trees were planted on an acre of land, the cost of exploding for the holes, according to the rates named above, would be £5 12s. 6d. to £7 10s., while the cost of treating all the land is put at £5 10s. per acre. According to the reports of the trial, the subsoil is not thrown up to the surface, but is heaved up with the top soil still above it. This is as it should be; but only experience can show whether the treatment will be beneficial or otherwise. *A Southern Grower.*

HYBRID NOMENCLATURE.

ODONTOGLOSSUM LAMBARDEANUM.

"THIS complex parentage" (see below) "is, after very careful consideration, what I feel almost certain to be the 'modus' by which the present hybrid has been produced." (Mr. de Barri Crawshay, in the *Orchid World*, July, 1912, p. 220.)

I take the above extract—from one of three similar articles by Mr. de Barri Crawshay, in the *Orchid World*—as a fair example of the confusion which is likely to arise from the application of Latin or Latinised names to garden-raised Orchids.

The instance just cited shows 14 combinations, in which five species are involved. The intricacies of the origin of this hybrid, whether correctly given or not, are nothing to the confusion which will arise when the millions of cross-bred seedlings (now in all stages of growth) attain maturity and require to be named and provided with pedigrees. These cross-bred plants are florists' flowers none the less because they are Orchids. They are the most beautiful and interesting of all garden flowers, and their names should be such that, in the future, when details of their origin are only obtainable by long research, they may be recognised at once for what they are, namely, garden plants.

THE ROOT OF THE EVIL.

It is a curious fact that the giving of Latin names to garden products was not begun by the raisers of hybrid Orchids, either amateurs or nurserymen, but by scientific botanists, who did not consider sufficiently what the future would bring forth. Occasional natural hybrids received scientific names, and when a few primary hybrids were home-raised, it was considered necessary to name them in a similar way. Hence we have the fine hybrids of early times, raised by Messrs. Veitch, named and described in the same manner as the species by the late Professor Reichenbach. In course of time the Orchid Committee and Council of the Royal Horticultural Society came to perceive that definite rules must be laid down for the nomenclature of garden-raised Orchids, and a sub-Committee was appointed to consider the subject. Among the members of this Committee were Sir Harry J. Veitch, Mr. J. Gurney Fowler, the late Mr. Norman C. Cookson, Mr. de B. Crawshay, and myself. Several meetings took place, and a rule was established that, so far as possible, names in the vernacular should be given to all garden-raised Orchids. An exception had to be made in the case of primary hybrids, on account of so many having already been named in Latin by early raisers, and certificated and recorded by the Royal Horticultural Society; so the Committee, with some reluctance, were compelled to provide that primary hybrids might be named either in Latin or in the vernacular (fancy names).

The Committee were desirous of restricting the use of the Latinised names to the compound forms adopted at the Paris Conference—such as "Digbyano-Mossiæ," &c.—all departures from that method being in the vernacular. After the primary hybrids, all further crosses were to be regarded as horticultural varieties, and were to be given fancy names.

This method worked well at the time. Sir Trevor Lawrence, Bart., K.C.V.O., the President of the Royal Horticultural Society, adopted and retained the system of the bi-nominal and fancy compound name, or the simple name in the vernacular, and he still follows this plan, which is calculated to give the least possible amount of trouble to the botanist of the future. Lieut.-Col. Sir George Holford, whose products are among the best yet raised, always uses brief fancy names; the late Mr. Norman Cookson gave either compound or fancy names; and Mr. de B. Crawshay—until his present lapse—invariably named his Odontoglossums, &c., in the vernacular; and most other raisers followed the same course.

Science, however, once more intervened. The *Orchid Stud Book* was published, in which many compound and fancy names (described and published over and over again, and certificated and recorded by the R.H.S.) were changed for Latinised appellations in a manner which appears to us unwarranted. Since that time, the desire for Latinised names (particularly the names of persons) has steadily increased, until it has given rise to such nomenclature as that illustrated at the foot of this note. At the root of the trouble lies the fact that the Royal Horticultural Society were not content with the recommendations of their own experts, but always referred the question to some other body, who, by the nature of the case, knew far less about the subject. Thus the Vienna Conference, in relation to this question, was more or less barren of result. The Brussels Conference succeeded no better; the decision, which seems only to have been arrived at after a series of compromises between those holding divergent views, was extremely ambiguous.

SOME POINTS TO CONSIDER.

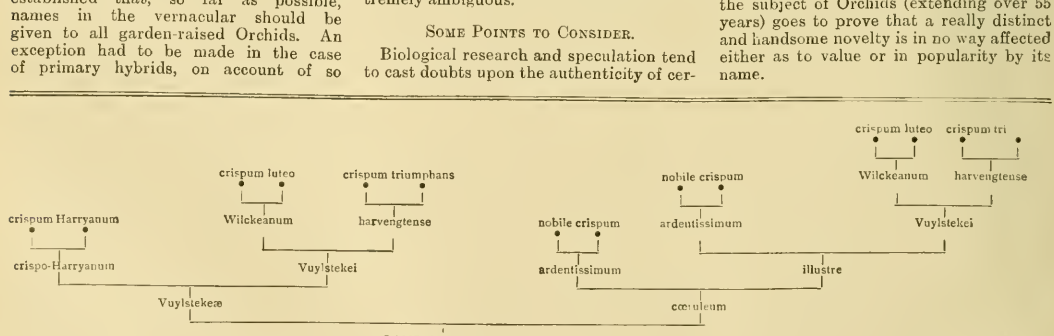
Biological research and speculation tend to cast doubts upon the authenticity of certain species formerly implicitly accepted; and the manner in which inter-crossing of widely separated species and genera is effected seems to lend weight to the suggestion that the different sections have been evolved from a small number of primitive types. For this reason, the questions of what is a species and what is a hybrid are not so easy to determine as would appear at first sight; though we are not at present concerned with natural types.

There is a great deal of misunderstanding in connection with the word "hybrid," in consequence of the indiscriminate manner in which it is applied to all cross-bred plants raised in gardens. The Nomenclature Committee of the Royal Horticultural Society—or, at all events, its earlier members—confined the use of the word "hybrid" to the first generation (crosses between species), and classed all that came after as horticultural varieties, artificially raised. The Brussels Conference seems to have extended the term to ternary hybrids, and classed—or intended to class—all others as horticultural varieties. It is this extended use of the term hybrid (to which, for the sake of convenience, I myself conform) which encourages many growers in the belief that the recommendations permitting the giving of Latinised names under certain conditions to primary hybrids applies to all garden-raised crosses.

At the Botanical Congress held at Madison, U.S.A., it was resolved that all garden-raised plants should be given specific names in the vernacular; and the same decision has been adopted at other American conferences.

For home-raised Orchids there is no other reasonable course to take, and it is the one which will give the least trouble to botanists in the future. I maintain that the rule should be strictly adhered to, the parentage (where known) being given in each case. Where any doubt as to parentage exists, either in the mind of the raiser or in the opinion of the Orchid Committee, it should be entered with the remark "parentage unrecorded"; or in cases where a dominant factor is evident, the name of the species conclusively showing, without completed parentage, as, for example, Odontoglossum Rossii ×. In cases where a varietal name is required, such terms as "superba" and "magnifica" should be prohibited.

These restrictions in the matter of nomenclature would inflict no injustice on the plant or its owner. My experience on the subject of Orchids (extending over 55 years) goes to prove that a really distinct and handsome novelty is in no way affected either as to value or in popularity by its name.



There are other points to which I should like to refer later; but at present, I will only add that, in my opinion, it would be well if the subject were considered by a body of really competent authorities—the Director of the Royal Botanic Gardens, Kew, the Keeper of the Botanical Department of the Natural History Museum at South Kensington, and others. An opinion at first hand from judges such as these would be both interesting and valuable. *Jas. O'Brien.*

NEW OR NOTEWORTHY PLANTS.

VIBURNUM CORIACEUM.

(See fig. on p. 371.)

This handsome and distinct species, which has a wide geographical range in nature, apparently began its garden history at Kew, where seed was received from Saharunpore in 1881. Whether plants of this importation ever reached the flowering stage is doubtful, but Mr. A. Rehder, the author of the latest "Conspectus of the Chinese Species of Viburnum" (Sargent, *Trees and Shrubs*, ii, p. 91, t. 143), states that there is a specimen of it in the Arnold Arboretum herbarium, cultivated at Kew in 1882. Though it is not stated, this could hardly have been a flowering specimen. At all events, it is on record that V. coriaceum was received at Kew from Paris in 1892, and flowered there in 1899. This introduction was of Yunnan origin. In 1910 it appeared in Messrs. James Veitch & Sons' *New Hardy Plants from Western China*, and the specimen in figure 165 was sent to the Editors by Mr. P. D. Williams, who has plants in cultivation at Lanarth, Cornwall. So far as my knowledge extends, the species has not previously been represented from the living plant. Sargent's figure, cited above, gives no idea of the beauty of the subject. V. coriaceum is not closely allied to any other species, and it is easily recognised throughout its wide geographical area; the variation exhibited being chiefly one of dimensions. It is a mountain shrub or tree, ranging from Simla eastward through the Himalayas, at altitudes of 4,000 to 8,000 feet, to Assam, Burma, Western and Central China, and it also occurs in Java. Blume described it under the name of coriaceum, from Javanese material, in 1825, and in the same year Buchanan-Hamilton's name, cylindricum, appeared in Don's *Prodromus Floræ Nepalensis*. On the probably correct assumption that Hamilton's name was published earlier in the year than Blume's, Rehder places coriaceum as a synonym of cylindricum. But as the former name has been generally used in botanical literature, and is the only one known to cultivators for this plant, it seems undesirable to make a change in which there is an element of uncertainty. Collett describes Viburnum coriaceum as a shrub or small tree in the Simla district. In China it varies, according to locality, from a shrub 10 to 15 feet high to a tree 50 feet high. Our figure of Mr. Williams's plant gives a better idea than words can of the quality and appearance of this species, which is still a garden novelty. The leaves are very handsome, thick, with a glossy upper surface, and strong nervation, and attain, in vigorous plants, a length of 9 to 12 inches. The inflorescence and flowers are quite different in aspect from those of the ordinary Viburnum. The cylindrical corolla is the most striking characteristic of the species, and the very long, projecting stamens, with purple, oscillating anthers, add greatly to the beauty of the plant. Viburnum hebanthum (V. zeylanicum), a common shrub in Ceylon at elevations of 5,000 to 7,000 feet, is treated as a variety of V. coriaceum in Hooker's *Flora of British India*. *W. Botting Hemsley.*

ADAIR PLACE.

The Surrey residence of Mrs. Adair is splendidly situated high up at one end of Englefield Green, opposite the entrance to the famous Cooper's Hill College, where for many years students were trained for the Indian forestry service. Just inside the entrance gates of Adair Place there is a tall, stately Sequoia gigantea, which towers above the shelter belt, and the leader has, so far, withstood the winds. On the other side of the carriage drive there are several examples of the Bird Cherry (Prunus Padus), as fine as I have ever seen. There are few more valuable medium-sized deciduous trees suitable for beautifying small parks or lawns, yet this tree is often partly hidden in the background of shrubberies, where its full beauty cannot be seen.

During the time Mrs. Adair has owned the estate she has made important additions to the house, and materially increased and beautified the gardens. At one period Mrs. Adair, who travels largely, and is also the owner of Glenveigh Castle, County Donegal, was unable to give much personal attention to her garden, but since Mr. V. Holder has been in charge the gardens bear the stamp of first-rate supervision and intelligent cultivation. The chief features of the gardens are the extensive and very successful pergolas, which enclose the kitchen garden, and a large rockery, which has recently been made in the lower part of the garden. The broad verandah, which looks over a small sunken Rose garden and away across the wooded valley to Windsor Castle, is a delightful adjunct to the dwelling-house. The inner walls are tastefully draped with silken materials, and between the lounge chairs there are groups of plants. Carnations figure largely in the scheme of plant decoration. To furnish this verandah, which takes the place of the customary conservatory, and for house decoration, fully 3,000 plants are grown, and at the time of my visit Campanula pyramidalis, Francoa ramosa, F. appendiculata, and various Liliums assisted in making it very attractive. On the approach of cold weather, the glass fronts are replaced, so that this pleasant retreat can be used all the year round. Along the broad gravel terrace there are large tubs, with Hydrangeas—which, in this south aspect, in spite of waterings with various solutions, persist in bearing pink trusses of bloom—blue Agapanthus, and pink and red flowered Ivy-leaved Pelargoniums, all bearing an abundance of flowers. Sweet-smelling foliage is greatly esteemed, so nearer to the house there are smaller tubs planted with various scented-leaved Pelargoniums, and in the borders around the house several lemon-scented Verbenas (Lippia citriodora) have been planted.

The many climbers which embellish the house include Solanum Wendlandii, Lonicera Henryi, Tecoma grandiflora, with stout racemes just beginning to expand; Choisya ternata, and, climbing on a large Wistaria chinensis, Clematis "Nellie Moser." Although far from the sea breezes, a big bush of Escallonia macrantha is flourishing as well as any in the west country. From the western terrace there is a fine view over the trees on a moderately steep slope to Wraysbury and the distant hills. The small sunken Rose garden, which is enclosed by double hedges of Yew and Sweet Briar, contains too many beds to be effective, but this defect will be remedied. In early September the beds of the varieties Prince de Bulgarie, Lady Roberts, J. B. Clark, Frau Karl Druschki, La Tosca, and Queen of Queens were still in full bloom, and, in a smaller secondary garden down a few grass steps, Rose Lady Ashtown was making a good show.

Fig. 161.—Adair Place: the terrace.

At the eastern end of the terrace a group of Japanese Maples shows the way to the flower garden, which, although somewhat long and narrow, is very bright and attractive. The design is simple—just a row of square flower-beds alternating with parallelograms in the grass on either side of a broad gravel walk—but when the beds are well filled it makes an exceedingly pleasant promenade. In the boundary hedge the original green Privet has recently been replaced by Yew, which has made very good growth; but the cone-shaped golden Privets, which occur at regular intervals and are a foot taller than the Yew "panels" of the screen, might have also been discarded with advantage. As required by the design, the flower-beds are planted in opposite pairs; one pair, which contain Humea elegans, with tall plumes rising above 2-feet-high Fuchsias (the red and white-flowered variety Mrs. Marshall), with a groundwork of dwarf rose-coloured Petunias, were exceedingly successful,

as also was a combination of the yellow-foliaged Fuchsia "Golden Regina" and tall plants of Iresine Herbstii magnifica as "dot" plants in a bed of the mauve-coloured Viola "J. B. Riding." Another delightful pair of beds contained large, very floriferous plants of Mrs. Marshall Fuchsia and salmon-coloured Phlox Drummondii.

THE ROCKERY.

A hollow in the side of the low hill provided a splendid site; this, and the skill of the builders in placing the Derbyshire boulders in correct positions, combined to make a very natural-looking rock-garden. Winding paths of easy gradients make the inspection of the many Alpines a very pleasant task. Most of the plants have been arranged in bold masses, and so, in a very short time, have given the rockery an old-established appearance. Arenaria balearica and A. tetraquetra have spread very widely this year, and cover many of the boulders by the sides of the path with rich-green growths. Further away from the paths Cotoneaster humifusa, C. pyrenaica, Muhlenbeckia, and Juniperus procumbens hang over the rocks in charming profusion.

FIG. 162.—ADAIR PLACE: THE HARDY FLOWER BORDER.

Lithospermum prostratum thrives exceedingly well, and the abundant hanging growths bear beautiful blue flowers nearly all the year round. Remembering the discussion of a year ago in the *Gardeners' Chronicle* on the requirements of this plant, I was especially interested to see how well it grew in a soil which lacks lime. The many Heaths and Heathers which grow so freely in the same soil would, if it were necessary, give ample corroboration to Mr. Holder's statement that there is no lime in the soil. Thymus lanuginosa and T. serpyllum albus have also spread freely, and form delightful cushions on which the dew sparkles. Daphne Cneorum, a charming little bush, which is the despair of the owners of some gardens, is here perfectly happy. The uncommon Acera microphylla is represented by a very good tuft, with the characteristic red burr-like capitulums. A colony of Ramondia pyrenaica, planted in a shady nook, is flourishing. Although June and July are the most important months in the gardens at Adair Place, and the rockery was planted with that fact in view, there were still at the time of my visit in autumn a goodly number of plants in bloom; a large tuft of Viola gracilis and a clump of Polygonum vaccinifolium, which was overrunning several boulders, commanded attention. The "Blue Primrose" was also in bloom. At the bottom of the rockery there is the pool, which is anathema to a certain authority when placed in conjunction with a rockery, but, right or wrong, it is very effective, and adds to the beauty of the scene, especially when the glowing scarlet of the falling leaves of a Virginian Creeper, which clothes the trunk of a Scots Pine near its margin, is reflected in its still waters. Above the rockery there is a little plateau, and Prunuses, Rhododendrons, and Spiræas have found a congenial home around the level greensward, from which a path leads down to fascinating woodland walks. On the left of the rockery there has recently been planted a collection of Bamboos, Japanese Roses, and many other shrubs. Ozothamnus rosmarinifolius and Olearia stellata are growing into fine, healthy bushes.

Irises are largely grown in these gardens. At the far end of the shrubbery walk there are large, oval beds of such sorts as Iris Delavayi, I. sibirica, I. Kæmpferi, and I. gigautea, whilst a long grass walk near the house is bordered with a very complete collection of I. germanica varieties. The herbaceous borders are rather extensive, and are arranged with a view to broad colour effects, which are achieved in an exceedingly successful manner. Although they are at their best during the early summer months, when Mrs. Adair is in residence, there still remained sufficient plants in flower to make the borders attractive. The outline is very pleasing, and the borders are sufficiently wide to permit the use of large clumps of each kind of plant. Although often relegated to the wild garden, Lythrum roseum superbum is a very showy border plant, and continues to bloom for a long period. Monarda didyma, Delphinium "Belladonna," Asclepias Curassavica, Pentstemon "Southgate Gem," Galtonia candicans, Lilium tigrinum, Artemesia latifolia, and Campanula pyramidalis are the names of a few of the plants which were flowering well. A broad stretch of mown grass divides the beautiful herbaceous borders from one length of the Rose pergola, which is 165 yards long, 8 feet high, and 8 feet wide. The climbing Roses have made long, stout growths, which promise to furnish as fine a display next summer as there has been this year. The vine pergola is 145 yards long, and is planted with American varieties of the vine. Unfortunately, the names of the varieties were lost before Mr. V. Holder came to Adair Place: this year they are fruiting well, and it has been possible to identify the different varieties. Some of them produce bunches of useful size, with quite large berries, and are very desirable for outdoor culture.

THE GLASSHOUSES.

The houses devoted to Carnation culture are filled with splendid, healthy plants, on which not the slightest trace of "rust" or other disease was to be found. Of the 3,000 plants which are grown, the principal variety is Enchantress, but there are also many plants of other varieties of the Perpetual-flowering Carnation, such as Carola, Mrs. C. W. Ward, Britannia, White Perfection, and Rose Dorée. "Malmaison" Carnations are also grown equally well, but in smaller numbers. The other glasshouses and the frames, whether they contained stove plants—graceful, well-coloured Codiæums in small pots for table decoration—or greenhouse plants, or, like a smaller structure which is requisitioned for growing specimen plants of different Lantanas and Centaurea gymnocarpa for next summer's bedding scheme, all showed unmistakable evidences of good cultivation. The Tomato house carried a splendid crop of Veitch's Invicta Tomato.

The "blue garden" in the middle of the kitchen garden surrounds a small ornamental pool. The late-summer display is chiefly obtained from Salvia patens, annual Delphiniums, and Verbenas. Anchusa italica and Sweet Peas of various shades of bluish-purple have flowered abundantly. From the blue garden the cross-walks of the kitchen garden, which radiate to the pergolas, are flanked with flower borders, and from this point of vantage the effect is charming. A small pergola at the higher end of the garden is covered with American Blackberries, which bear enormous crops of sloe-black fruits, twice the size of the finest hedgerow Blackberries. In one of the quarters several rows of Sweet Peas have amply justified Mr. Holder's faith in allowing them abundance of room. The plants were unusually far apart, but the growths had met on all sides, and produced large quantities of first-class blooms.

As with many other estates which enjoy splendid views, the soil at Adair Place is poor and shallow, but, by dint of good cultivation and the judicious addition of manure, the garden produces excellent crops of most vegetables. As I entered the kitchen garden the men were drawing the Onions and laying them with their roots facing the south, to ensure good ripening. The bulbs were as large and firm as anyone could wish to grow, and the other crops have responded equally well. The Apple trees are bearing heavy crops, and in very many instances the fruits have that brilliant colour the conditions for the development of which have been discussed recently in the columns of the *Gardeners' Chronicle*. Pears are not so plentiful; but bush fruits have been very satisfactory. *A. C. B.*

AMERICAN CROPS.—The estimates of this year's crops in the United States of America make more than usually good showing. Thus the Wheat crop, according to a summary of the figures provided by the Agricultural Department at Washington, and published in the *Scientific American*, is estimated at over 700,000 bushels, and should yield the farmers upwards of 1¼ million pounds sterling. The Corn or Maize crop is gauged at 3,000 million bushels, of a farm value of 270 million pounds. The Oat crop, the highest ever recorded, totals 1,290 million bushels, and the total estimated value of farm crops is placed at the stupendous figure of 1,490 million pounds.

NEW ROSES.—II.

(Continued from p. 346.)

Continuing my remarks on some of the newer Roses, I include, as before, only the varieties introduced since 1908 which I happen to have tried in my own garden with more or less satisfactory results.

Mrs. A. R. Waddell (H.T., Pernet Ducher 1908).—The charm of this Rose lies in its wonderful colour, which is most difficult to describe. I find many different attempts at description. "Coppery-red suffused salmon," says one, and another "rosy scarlet buds and salmon flowers," while the raiser calls it "a slender, well-shaped bud of the deepest apricot opening to a most graceful loose-petaled flower . . . paling to orange-salmon." On the whole the last seems to me best, but there are, no doubt, rosy-red tints in the bud on a general apricot ground. However we describe it the colour is striking and beautiful. The plant is a good grower and an excellent garden plant. The flowers are semi-double and stand the rain better than one would expect. In autumn the colour is much paler, but even then is interesting. I have found it very attractive in pots in the greenhouse for early spring. I may add that the flowers harmonise in a pleasing manner with the coppery-red of its young leaves.

Mrs. Edward Powell (H.T., Bernaix, 1910).—This has been one of my greatest successes in the garden during the past year. I planted a small bed of nine plants last autumn and from June to the present time I do not think I have been without a flower. The colour is bright and attractive, the raiser calls it scarlet lake shading to purple garnet, and this is not a bad description. To call it light scarlet crimson with a dash of blue in it would not be far wrong, and while blue in a red rose would seem to carry condemnation with it in most cases, yet this is an exception. It retains its colour wonderfully, even in cold weather. The flower is erect, of moderate size, and of tolerable shape, but not perfect enough for exhibition, for which I should hardly imagine the Rose at all suited. The plant seems a strong and good grower, ripens its wood well, and carries good dark glossy foliage free from disease. Altogether it seems to me a first-class bedder.

Mrs. Fred. Straker (H.T., A. Dickson & Sons, 1910).—This is a good garden Rose in fine weather. It is very free-flowering and the flowers are well shaped and of medium size. The buds are a deep salmon or orange pink, a colour more or less retained by the reverse of the petals in the open flower, the face of the petals being a pale pinkish fawn colour. I was delighted with this Rose, of which I have a good batch, in the fine weather of the early summer, but since the wet weather came, though the plants have produced quantities of flowers, few have been of much account. It seems therefore to be chiefly valuable as a fine warm weather Rose. If it gets a moderate share of sunshine it is very decorative both on the plants and when picked, the flowers being carried well on long stalks.

Mrs. George Shawyer (H.T., Lowe & Shawyer, 1911).—This is another well-shaped flower, larger and fuller than the last, with very long pointed buds and deep straight petals of good substance and a bright full rose colour. The plant is of satisfactory growth and carries its flowers erect. The flowers opened during the wet of the past summer better than I expected. Messrs. Mount's beautiful exhibits of this fine Rose have shown of what it is capable when grown under glass, and the couple of plants I have tried in this way myself have shown that it readily accommodates itself to life as a pot plant and is easy to manage when so grown. The flowers can readily be got on long stems, and I think I like it best when cut in the bud stage before the flowers fully expand.

Mrs. Maynard Sinton (H.T., McGredy & Son, 1910) is another well-shaped flower, large and full. For a Rose with so many petals this has opened well this wet summer. The colour is silvery white suffused pink, with a pink centre, and quite pretty. The flowers are carried singly and erect, rather like those of Mildred Grant. It ought to make a good exhibition Rose, but I am a little afraid that it is too dwarf and stumpy to make a really good garden plant.

Mrs. Wakefield Christie Miller (H.T., McGredy & Son, 1909).—This is a large loose-petaled flower, and one of the bicolors, that is, the inside of the petals is a soft silvery blush and the outer or reverse side is a brilliant rose colour with a dash of scarlet in it. Now and again it is capable of making an exhibition bloom, and I well remember the magnificent specimen of this variety shown at the Autumn Rose Show about two years ago, but I fancy that, like Betty, it will only produce such a flower at rare intervals. If the weather is at all hot it opens far too quickly, and is best in cool weather. In fact, as a garden plant it is best of all in the autumn, when its brilliantly-coloured flowers look well and very cheerful from distant parts of the garden. The growth of the plant is very sturdy and upright and the flowers are carried erect. I have found it makes a good standard, and, so far as I can judge, has an excellent constitution. Its weakness is a tendency to form rather coarse flowers, which look better at a distance than on close inspection. The centre petals are generally rather loose and somewhat rounded instead of being pointed. It has, however, the merit of continuing in flower very late; if not stopped by unusual frost it will continue well into December, and in the late autumn, when so many of our Roses have had all the colour washed out of them, the brilliant tints of Mrs. W. C. Miller are very grateful. *White Rose.*

(To be continued.)

Fig 163.—ADAIR PLACE: VIEW IN THE ROCKERY.

(See p. 364.)

SOWING PEAS AND BEANS IN AUTUMN.

With the raising of the more tender Marrow-fat Peas the time-honoured practice of sowing a few rows of a dwarf early variety on a warm border to furnish the earliest pods commenced to fall into desuetude, and at the present time it is only occasionally that the edible Pea is sown out-of-doors in the autumn. Although the place of the old practice has been taken, in part, by the present custom of sowing the seed in pots or in narrow, hollowed turves, placed in a cold frame, yet it had much to recommend it. For one thing, if the winter proves to be exceptionally unkindly and nothing is gained by November sowing, on the other hand, there is but little lost—the value of the labour expended and the seed do not amount to much—and when the seedlings do pass successfully through the winter the pods are ready for gathering earlier than those on spring-sown plants. To be successful with late autumn sowings a warm, sheltered, well-drained border is essential, and the depredations of mice must be guarded against. The seed should be sown more thickly than is the case with the main-crop varieties, and as soon as the seedlings appear above the ground, brushwood should be inserted on each side of the rows, and the soil drawn up, to provide protection against cold winds. At this juncture it is a wise precaution to lightly dust the foliage of the Peas with just sufficient soot or lime to make it unpalatable to the slugs, but not enough to choke the pores of the leaves.

Probably discouraged by one or two failures, the average gardener leaves the forcing of the Pea alone. This is an unfortunate policy, because a dish of green Peas, say, at Easter, would be greatly appreciated in the dining-room, and would be a most agreeable change from the forced Beans with which many growers are so successful. The edible Pea does not lend itself to such hard forcing as the French Bean, the only successful method is to "hasten slowly," and another drawback—but far from being insuperable—is the greater height to which Peas grow, and, consequently the danger of the seedlings being drawn up weakly whilst quite young, at the very time they should be kept as sturdy as possible. To overcome this the seed may be sown in flower pots of 5-inch diameter, and the plants grown in a cold frame near to the glass until the pots are comfortably full of roots, and then planted, without dividing the plants, 2 feet apart, in a brick pit. As abundance of light and air is essential, not only should the glass lights be washed, but the interio of the walls should also be well whitewashed. Under frame culture it will be found that the Pea

haulm becomes quite 6 inches taller than would be the case out-of-doors, and sufficient extra headroom must be allowed. The soil should be light, deep and rich, and be trodden as firmly as possible before the planting is done. The after cultivation consists in careful ventilation and watering. Air should be freely admitted whenever the external conditions permit, and water sparingly given until the pods begin to form. During the flowering period moderately dry conditions are essential, and it is an advantage to shake the plants daily so as to disturb the pollen.

The Broad Bean is not amenable to forcing, but if the seed is sown in the open ground in November much earlier supplies are obtained than is the case with February sowing. The Mazagan varieties are the best for autumn sowing, and a strong soil is well suited to their needs. *A. C. B.*

NOTICES OF BOOKS.

THE ROCK GARDEN.*

I SOMETIMES wonder how far the present epidemic and contagious fever of rock-gardening would have spread among the wealthy and in their hands have altered the face of our land had not the appearance of other means of emptying fat purses, such as motorcars, aeroplanes and People's Budgets, synchronised with it. Imitation Dolomites, Mont Blancs or Matterhorns might have covered acres of every large estate, and the geologists of a few æons hence would have been driven to inventing several glacial periods, subsidences or upheavals to account for the disappearance of Snowdon and Ingleborough from their ancient sites, and the distribution of their component rock in certain areas of every county of Britain.

Now arises a new problem. Will "the white mountain limestone of the Craven district" travel thence in railway trucks till it is as universal in every back-yard and garden as coals in the adjoining cellars.

For Mr. Farrer has used his facile pen to teach "the small grower," "the man who has small means and only a small plot of ground to play with," that, to continue quoting his words, "nothing could possibly fill the small garden plot with perennial delight so adequately, cheaply and appropriately as a constellation of rock-plants."

All who are acquainted with Mr. Farrer's beguiling and inspiriting writing will know how, by an occasional candid confession that a plant is a "miff" or "very rare and very ugly," or "of a squawking majenta," he makes us give him our entire confidence (and the nearest nurseryman who offers the plant, our hard-earned pelf) when he lauds some favourite of his in the prismatic glittering galaxy of adjectives of which he is such a master.

One great feature of the Present-day Gardening series is the skill with which the editor selects one of the greatest living exponents of each branch to treat of his special line of knowledge in concise yet sufficiently thorough form, and this volume is no exception. From the able, research-suggesting preface of Dr. Bretland Farmer to the all-too-sudden terminating counsel of peppering to taste with bulbous plants, there is not a dull page in it.

One would expect this writer to deal especially with the Primula and Saxifrage families, and he has not failed to give, for the size of the book, wonderfully full lists of both genera, with most helpful notes on their appearance and cultivation, most of which bear the hall-mark of personal acquaintance with the plant, both in its native home and in the gardens of its captivity. In addition, the Alpine species of Campanula, Dianthus and Ranunculus are also monographed in miniature with equal cunning.

It is a valuable handbook, not only for the beginner, but also for the lover of Alpine plants of long experience, and should have a marked influence in bettering the cultivation of many of the more difficult plants.

I rejoice to see that Mr. Farrer gives a much-needed warning in the words "I write from an Alpine climate." Ever since I saw Primula farinosa and Cystopteris fragilis growing wild on the confines of his garden, I have taken the liberty of translating all his directions for the cultivation of difficult plants into terms better suited to my lowland level and arid atmosphere, and the reader will do well to ponder his advice on this point on p. 30.

The coloured plates in this series are surprisingly beautiful, considering how small a sum is asked for each volume. It is greatly to be wished, however, that the publisher would devise some better means of fixing them in the volume; at present they are deciduous.

I admire the consistency with which the correct pronunciation of names terminating in "oides" is enforced, and the care taken to procure such correct spelling and use of capitals, etc., in all the names. I have hunted sedulously for any slips, but, excepting on p. 46, where I imagine "peacockeyed" is intended to be applied to seedlings of Dianthus zonatus and not of D. Caryophyllus, and the use of "single stems" apparently for a single-flowered stem in the description of the glories of Anemone alpina, I have found none. *E. A. Bowles, Myddleton House, Waltham Cross.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE HALF HOLIDAY.—We are very glad to see on p. 353 of your last issue that Messrs. Dobbie & Co. have for the last 20 years granted their nurseries to be closed at 2 p.m. and now 1 p.m. on Saturdays. It is to be much regretted that there is so little of the "Dobbie" spirit in the western counties, and as we "nursery employees" have no union we trust that the note you have published will have a good effect here. Perhaps our northern friends can scarcely credit that we are still plodding away from 6 a.m. to 6 p.m. with only one hour less on Saturdays. *Nursery Employee.*

RICHARD BRADLEY AND HIS PUBLISHER.—Owing to absence from home I have not been able to reply earlier to Mr. Brotherston's letter (see p. 160) upon my remarks on *The Seedsman's Calendar* and its author (see p. 132). I am surprised that his remarks are simply a negation of Bradley's authorship without any attempt to name another author for the work. In respect to Mr. Brotherston advising me to refer to *The Dunciad*, it is regrettable that he should have done so, as the Editors would not be likely to grant me sufficient space to treat the subject exhaustively, nor would it be of horticultural interest. I hope it will suffice to admit the statement therein, but the merits of Pope may be considered, and these are ably given by Professor Minto in the *Encyclopædia Britannica*, where Pope is violently denounced as little better than a common swindler. Johnson's judgment of his character is as follows: "The man who played the politician about Cabbages and Turnips and hardly drank tea without a stratagem was not likely to be straightforward in a matter in which his ruling passion was concerned, besides altering his own title pages and blaming others for doing so." Mears published many books of merit for great authors, as may be found at the end of Bradley's works, and such as I have seen are well printed and many are illustrated with copper plates. So far as the testimonial from *The Dunciad* concerns him, I would just as soon appeal to *Gulliver's Travels* for support on a political subject as to these humorous satires. The mention of Mr. Bradley's name in the body of the calendar is quite in accordance with the presumption at the time of the first edition under Townsend's name, and it is just possible that he may have contributed a portion as they were evidently on friendly terms, and Bradley refers to him in another work. As to the internal variations on the Mushroom, that is not surprising, as Bradley admits on p. 584 of *An Appendix* as follows: "I have mentioned indeed a way of making Mushroom beds, but I have since seen and considered those excellent ones in France which produce Mushrooms all the year about, and am therefore at present more capable of giving instructions upon that head than I was before." I have now given all my available data and admissions by the publisher that Bradley was the author of *The Seedsman's Calendar. J. Murison.*

THE PARENTAGE OF CARNATION PRINCESS JULIANA.—I have only just had my attention called to Mr. Allwood's letter (see p. 331). I should not have made my statement unless I had proof that what I said was correct. The variety Princess Juliana originated as a sport from one of the late Mr. Hopper's numerous seedlings. Now, the parent stock of this was sold in the year of the Royal Show at Lincoln, namely, 1907. If Mr. Allwood can explain how to pollinate a flower, raise seed, and work up a stock of a variety in the short time that he was employed at Bush Hill Park prior to June, 1907, many would be interested to hear! As it is well known, a sport often "reverts" to the original, and this is just what Princess Juliana has done. In his letter to you he states that the parentage of Princess Juliana is recorded in the "breeding book," as he calls it, and under H.M. 22. This is not the case, and Mr. Allwood should know that this is not so. I will deposit £5 with an arbitrator if he will do the same, under the conditions that the one who has made the incorrect statement shall forfeit this sum, which shall be divided equally between Dr. Barnardo's Homes and the Fresh Air Fund. Mr. Allwood is perfectly aware that I know of the origin of the American Carnation, because circumstances caused him to read my book *Perpetual Carnations*, published early in 1912. I quite agree with another correspondent when he said "Honour to whom honour is due," and I say especially to those that are dead. Princess Juliana is one of many Carnations raised by the late Mr. E. F. Hopper. *Laurence J. Cook.*

MANURING ALPINE PLANTS.—The notes by Dr. Farmer, Mr. Davies and Mr. Jenkins on the subject (see p.p. 318, 330) are all interesting. The subject of manuring Alpine plants has engaged my attention for several years, and certain experiments have met with considerable success. I engaged in considerable correspondence on the question a few years ago, when I learned that several others who had experimented likewise had obtained successful results. My first trials were restricted to fine ground bones or bone-dust. This I found specially good for Campanulas, such as C. pusilla or pumila, C. G. F. Wilson, C. abietina, &c. In every case increased vigour and larger flowers followed its application. In the case of the tufted Campanulas, I worked it well among the foliage, and then watered the plants freely overhead. I have also found powdered cow manure very suitable for Primulas and Campanulas, though I think the latter are apt to grow too strong in wet seasons if this manure is used. Dr. Hugo Mueller gave me an excellent recipe for a fertiliser to be applied in liquid form. It consists of phosphate of potash, nitrate of potash, sulphate of magnesia, and nitrate of lime, dissolved in a large quantity of water. I have the recipe, but I would not give it in detail without Dr. Mueller's consent. It proved a capital invigoriser for Alpines which were showing signs of having exhausted the soil. Some of the artificial fertilisers have the fault of exhausting the soil in the end, although their beneficial effects are seen for a time. I have found ground bones one of the most satisfactory materials to use on my soil, also for plants in pots filled with the ordinary compost used for Alpines. I use this bone-dust for most of the plants with white leaves, and for a number of the Saxifrages and Campanulas. One may add a word of caution, and this is that the Alpines which grow too vigorously in a moist climate are much more liable to injury in winter. If we can make them more floriferous and brighter-coloured the greater vigour is hardly to be desired, except in those which are liable to become weak and dwindle away. Dr. Farmer has done a distinct service in studying the question in a practical way, and we may hope that he will continue his trials and give us the benefit of his further experience. *S. Arnott, Dumfries.*

Nephrolepis Todeoides.—I enclose a photograph of a large plant of Nephrolepis Todeoides. The Fern has been in my possession for nearly four years. When I obtained it there were only three small fronds, and it was growing in a 2½-inch pot. The specimen is now more than 4 feet 6 inches in diameter and has hundreds of large fronds. *J. Jones, Torre Mount, Torquay.* [The photograph shows a remarkably fine specimen of this beautiful Fern.—Eds.]

Artemisia lactiflora (see p. 351.)—A border in these gardens planted with clumps of Artemisia lactiflora 5 feet apart, the intervening spaces in front furnished with Lobelia cardinalis "var. Firefly," produced a splendid effect this summer. Artemisia lactiflora grows well in heavy loam mixed with plenty of well-rotted manure, and requires frequent waterings in dry weather. I find it best to take up the plants in November, divide the clumps and place them in a cold frame until April. Slugs must be guarded against after planting. *W. Turner, Winthorpe House Gardens, Newark-on-Trent.*

The Irish Spiranth (Spiranthes Romanzoviana).—Not many years ago this Orchid had but one known station in Europe—a little meadow at Bantry Bay in the south of Ireland, and from which specimens were sent to me by the late Mr. Gumbleton. Now three other stations are reported, all in Ireland, one in the extreme north, from which a specimen has been forwarded to me. It is a sweet little plant, 3 or 4 inches high, with yellowish-white, deliciously fragrant-scented flowers. I have attempted its cultivation and failed, though the nearly-allied S. æstevalis (the Summer Spiranth) has become quite established on a dampish rockery. This also is a rare plant, being only reported from three counties, though a new station near Chislehurst has lately been discovered. *A. D. Webster.*

Blue Tits and Sweet Peas (see pp. 318 330, 349).—There is not the least occasion for your correspondents to shoot that most useful friend of the farmer, the gull, in order to prevent tits approaching their Sweet Peas. Moreover, by doing so in close time, they become liable to a fine of 20s. A bird-shaped kite suspended on the string will answer as well, or better. The gull is not a natural enemy of the tit, and the kite can be made to move in a lighter breeze. But in indicating the reason why simple precautions of the kind are so commonly neglected, Mr. A. J. Elgar hits the nail on the head. He says they mean "endless bother." "I canna be fashed" has a good deal to do with the damage for which birds are blamed. *L. Gardiner, Secretary, Royal Society for the Protection of Birds.*

Late Peas (see p. 349).—Mr. Staddon may be interested to know that we also have been picking Peas up to the present week. In several years I have gathered Peas continuously from June till the middle of November; my latest recorded date is November 19. At the present time we have a fine row of the variety "Latest of All" in full vigour and bloom, the plants being very robust. This row, should the weather prove favourable, will doubtless supply good pods well into December, but such a result is scarcely to be expected. *Wilmot H. Yates, Rotherfield Park Gardens, Hants., November 8.*

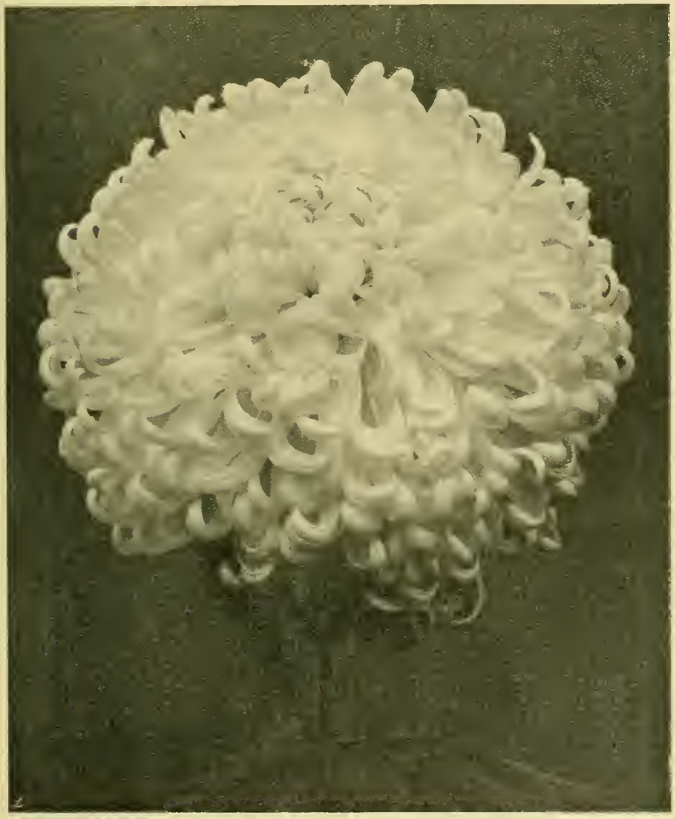

Fig. 164.—Chrysanthemum Queen Mary: a white Japanese variety (much reduced).

FLORISTS' FLOWERS.

PERPETUAL-FLOWERING CARNATIONS.

I will endeavour to point out certain good old varieties of Perpetual-flowering Carnations which have been supplanted by good new ones. Those I do not mention have, generally speaking, proved a failure in this country, although they may be grown with some measure of success in certain districts. I shall not mention the 1912 novelties; their turn will come later.

In white varieties, Queen Louise, Lilian Pond, Mrs. S. J. Brooks, The Belle, Lady Bountiful, White Lawson, and even White Perfection cannot be compared with such a specimen of its type as White Wonder, or a selected strain of White Enchantress.

Taking scarlet varieties, compare G. H. Crane, Cardinal, Flamingo, Victory or Robert Craig with Scarlet Glow, now recognised as the best red variety. Beacon and Britannia are also very good sorts.

Enchantress has stood pre-eminent for so long that we almost forget its contemporaries, such as Alpine Glow, and Mrs. Chas. Knopf or Admiration; these could never be compared with it.

May Day is perhaps the best all-round Perpetual-flowering Carnation to-day, and is rapidly replacing Mrs. H. Burnett. Although not quite the same shade of colour, in productiveness it is far superior, while Regina and Rex will never survive, and old Fair Maid, which was a great Carnation in its time, must be discarded.

In the dark pinks, or those of a cerise shade, competition has always been keen, and we find Mrs. C. W. Ward outdistancing that grand old Carnation Mrs. T. W. Lawson. Nelson Fisher, Afterglow, Aristocrat, Alvina, Pink Imperial, and Ethel Croker have all lived their day, but the new Rosette should have no difficulty in proving itself superior to any other variety of a similar shade, and Mrs. C. W. Ward may have to join the ranks of those that have gone before.

Gloriosa and R. F. Felton rival each other for premier place in the true pink class, of which Floriana was for so long the best variety. The market growers favour Gloriosa, which was partly spoilt in America through over-propagation. R. F. Felton is a prime favourite in private establishments on account of making a larger plant, but it is not so productive. It is also more subject to disease, and therefore must be cultivated under glass during the summer. Lady Alington stands alone in the rose-salmon pink class, and is a great favourite. It lacks, however, strength in stem and calyx, and does not last well when cut, but is undoubtedly a great Carnation.

In crimson varieties there is little competition. Carola, on account of its size and colour, is a great favourite, but those who seek quantity will favour the new variety Triumph, which should leave old Harry Fenn, Gov. Roosevelt, Harlowarden, Black Chief, Havard, and Waneka far behind.

In the popular heliotrope shade, Mikado is the sole well-known variety, but the new varieties Fairmount and Geisha are of similar shade.

In white flaked varieties, M. A. Patten, Bay State, Jessica, Glendale, &c., must stand aside to allow Wivelsfield Wonder and Benora to fight for the premier place. The Royal Horticultural Society has, however, voted for the former variety by giving it an Award of Merit and ignoring Benora, which has been set before it twice; other fancy varieties are purely a matter of taste, each being distinct. *A.*

CHRYSANTHEMUM QUEEN MARY.

This fine new white Japanese Chrysanthemum was shown exceptionally well by Mr. Thomas Stevenson in the class for 43 blooms of Japanese varieties at the National Chrysanthemum Society's Exhibition at the Crystal Palace on the 29th ult. Messrs. W. Wells & Co. at the same show had several excellent blooms in their fine non-competitive group, and this firm also exhibited the variety at the meeting of the Royal Horticultural Society on the 5th inst., when the Floral Committee granted it an Award of Merit. The flower is very large, with a somewhat flattish top, and, as will be seen on reference to fig. 164, the florets are pleasingly incurved at the tips. It ranks at once as one of the finest late white Japanese varieties for exhibition purposes, and is the best new white Chrysanthemum of the season.

PLANT NOTES.

IXORA COCCINEA.

DIFFICULTY is experienced sometimes in the cultivation of Ixora coccinea, and even where other Ixoras grow to perfection this species is a failure. This may be explained to a great extent by the fact that I. coccinea requires a higher temperature than any other species, with the possible exception of I. Duffii. During the winter months the minimum temperature should be 65°, rising in the daytime to 70° or even 75°, but during the summer months it is almost impossible to give the plants too much heat, provided, of course, that a sufficient supply of moisture be forthcoming. During the summer the atmospheric temperature at night should not fall below 75°, and it should rise to 80° during even dull days, while on bright days the temperature may rise to 95°, or even more than that; great care must be taken that the house is kept thoroughly moist by damping and by syringing overhead at least three times a day during bright weather.

In pruning these plants the grower must be guided by the time at which he requires them to flower; the flowers will be produced from four to six months after pruning, according to the period of the year in which the operation is carried out, that is to say, plants cut back in the winter will take longer to produce their flowers than plants pruned during the spring months. For example, plants required to flower in May should be pruned in November, or if required to flower in August they must be pruned in March or April. Ixoras will bear a free use of the knife, and they may be even reduced to half their size if required.

Potting is best carried out in September or October, and nothing but good fibrous peat must be used, except a liberal addition of silver sand; the plants must have good drainage and be potted fairly hard. Cuttings will root freely at any period of the year, but perhaps those inserted in the spring are most satisfactory; they should be potted singly into small pots and placed in a propagating frame on gentle bottom heat, when they will root within a few weeks. Ixora coccinea is often used as the stock on which to graft other varieties, but in this respect it is not to be compared to I. Duffii, a plant with a much more robust constitution. During the growing season the plants may be assisted by the application of some good artificial manure, such as a guano or Clay's fertiliser, but they are not gross feeders, the secret of success undoubtedly being abundance of heat and atmospheric moisture. *Ralph E. Arnold, Cheltenham.*

BEGONIA RICINIFOLIA ROSEA GRANDIFLORA.

THE *Revue d'Horticulture Belge* (October 15) contains an illustrated description of a new Begonia which bears the above name. It is known more briefly as "Gerbe Rose." The plant is stated to have been produced by crossing Begonia ricinifolia and B. Gloire de Lorraine. It has the general aspect of the former species, but is of more compact growth, with leaves of lighter green. The plant is very floriferous, and its blossoms are at least three times larger than those of B. ricinifolia and are brilliant rose, or white with a rosy flush. The new form does well in the open. Potted and brought into a cool greenhouse in September it begins to blossom at the end of November, and continues in flower till January or February.

DOUBLE PETUNIA.

ACCORDING to a brief notice in the *Florists' Exchange* a new double seed-producing Petunia of the grandiflora type has been raised by the Theodoria B. Shepherd Co., of U.S.A. The doubles may be had in all colours, and are free seeders, producing 75 per cent. of double flowers.

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

PRUNING.—Most of the trees are bare of leaves, and pruning may be commenced, for it is much pleasanter to do this work in mild weather than in winter. The pruning of Apples, Pears and other top fruits may follow the pruning of bush fruits. No hard-and-fast rules can be laid down as to how the pruning of the different varieties should be done, for the work requires extensive knowledge. Young trees require a rather severe pruning for the first few years to form well-shaped specimens, whilst such varieties of Apples as Lady Sudeley and Beauty of Bath, and Pears Jargonelle and Marie Louise, which fruit on the ends of short branches, must be treated accordingly. Such shoots as fruited last year may be removed. If my advice on pinching the shoots in summer has been followed, young trees will require little pruning beyond shortening the leading shoots to 12 inches or 18 inches, according to the variety, and cutting back the side shoots to two or three buds. After the pruning is completed, gather up the prunings and other rubbish and burn them. Next attend to the training of the trees. Stakes about 3 feet or more in length should be driven into the ground and the branches secured to them. The young shoots of old trees that have filled their allotted space should be cut back to from two to four buds, according to the variety. It is generally safe to prune strong-growing varieties to four buds, and weakly or medium-growing sorts to two buds. Old trees are often crowded with branches and fruit spurs, and, in consequence, sunlight and air are excluded from the interior branches, so that fruit is produced only on the outside of the trees. Some of the spurs, and a few of the useless branches, should be removed annually, and young shoots trained in from the base. If scale or other insect pests are present on the trees, the latter should be sprayed with a winter wash; although I do not recommend the washing of clean trees at this season.

PLUMS.—These trees succeed in most districts, and in any suitable soil. Cooking varieties are best grown as standards or half-standards. The choicer varieties may be planted as wall trees, for when grown as pyramids few of them compensate for the trouble occasioned by root-pruning and other measures necessary to induce them to bear freely. Damsons are best grown as standards, and may be planted as shelter for other fruit trees. Good varieties are King of Damsons, Cluster, Farleigh Prolific and Damascene.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

PROTECTING THE CROPS.—The mild, damp weather during the early part of November suited the crops of late-planted green vegetables. We have obtained excellent salads from plants in skeleton frames merely protected at night-time with mats, but there is a danger now from frost, and plenty of material, such as mats, straw litter, or bracken Fern should be got in readiness to protect the frames. But whenever the weather is favourable give an abundance of fresh air to crops in frames, and keep the plants clear of decaying leaves and rubbish, also stir the soil on the surface.

SPINACH.—Autumn-sown Spinach is looking remarkably well. If the ground is sufficiently dry to enable the work being done, stir the soil between the rows with a Dutch hoe. Do not thin the plants of the latest sowing too severely, but at the same time avoid overcrowding. Remove by hand any weeds that have come up in the rows.

JERUSALEM ARTICHOKES.—The stems of these plants may be cut off, and either burnt or put in a heap with other decaying refuse for use in the bottom of trenches: decaying vegetable matter is very valuable for incorporating with heavy soils, as it promotes a more porous texture. A portion of the roots may be lifted, and the largest and best tubers stored in sand or ashes. But the bulk of the tubers may remain in the ground, the same as Parsnips, to be dug as required. The variety New White is much better than the old purple sort, for not only are the tubers a better shape, but also better-flavoured, and have a more appetising appearance when cooked.

BROCCOLI.—The plants are none too hardy this year, and before the end of the present month it will be advisable to place at least a portion of them on their sides to enable them to withstand frost. This may be accomplished by taking out a trench next to the end row, and turning over the plants, so that their heads face north. The second row should be treated similarly, covering the stems of the first row with the soil taken out from the second trench. Make the plants quite firm in the ground, as they are very tender at the collars. Do not disturb the roots more than is necessary to avoid too severe a check. Some covering material may be necessary during very cold weather, and this should be used as dry as possible; it should be removed directly the weather is mild again.

SALADS.—Preparations must be made for the supply of winter salads in suitable houses and pits. The three principal crops are Lettuce, Endive and Chicory. The last-named is one of the easiest to grow, as it will do well on almost any soil, and may be forced without much trouble. If the whole of this crop has not been lifted, sufficient roots for forcing should be placed handy in case the frost makes the ground too hard to lift them. There are several varieties of Lettuce suitable for growing in winter. The seeds should be sown in shallow boxes, and grown in a light frame or pit. The plants may be set closely together, and cut when quite small, somewhat like Mustard and Cress. Lettuces may also be grown in the cool orchard or other houses where space permits. Endive should be blanched by either tying up the leaves or covering them with inverted pots.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

ODONTOGLOSSUM.—Plants of O. citrosmum, that are nearing the completion of their season's growth should be suspended or staged near to the roof-glass in the cooler part of the Cattleya or intermediate house. The supply of water at the roots should be reduced gradually until, after the new pseudo-bulbs are thoroughly developed, moisture should be withheld for longer periods, affording only sufficient to prevent the pseudo-bulbs from shrivelling. This treatment should be continued through the winter months, and until the flower-spikes are seen to be pushing from the centre of the young growths. Plants of O. grande and O. Schlieperianum that have passed out of bloom should be placed on a dry shelf near to the roof-glass in the cool house and rested. O. Insleayii and its variety Leopardinum are producing their flower-spikes, and should be liberally supplied with water until after the flowers fade, when they should be rested.

CATTLEYA, LÆLIA AND LÆLIO-CATTLEYA.—Autumn-flowering Cattleyas, Lælias, and Lælio-Cattleyas, such as Cattleya labiata and its many varieties; C. Bowringiana, C. Dowiana and its variety aurea, C. Fabia, C. Iris, C. Mantinii, C. Portia, C. Hardyana, Lælia præstans, L. Perrinii, Lælio-Cattleya luminosa, L.-C. Ophir, and L.-C. Epicasta are in bloom. The flowers will remain in a good condition for some weeks if the roots are kept on the dry side, and the amount of atmospheric moisture reduced. Care must be taken that the flowering does not exhaust the energies of the plants, therefore the spikes should be cut directly the pseudo-bulbs show signs of undue shrivelling. After the plants have passed out of flower the old spikes and succulent flower-sheaths should be removed, severing them as near as possible to the top of the pseudo-bulb. If these remain moisture sometimes accumulates at the base of the flower-sheath, and sets up decay in the leaves and new pseudo-bulbs. The plants at that stage should be afforded a period of rest in the coolest and best ventilated part of the Cattleya house. The roots should receive only sufficient water to keep the pseudo-bulbs plump. The plants should be encouraged to form new

roots, but premature top-growth should be prevented. Weakly specimens should have their flower-spikes removed as soon as they appear through the sheath in order to throw all the energies into growth.

CATTLEYA.—Plants of C. Trianæ that have completed their growths should be carefully watered; they need only sufficient moisture to keep the roots damp, but the supply may be increased slightly when the flower-spikes are seen to be pushing from the base of the sheaths. C. Lawrenceana makes its growth during the winter months, and is, in consequence, a difficult plant to cultivate successfully for many years. During the winter months it should be grown in the warmer part in the Cattleya house, and placed near to the roof-glass, so that it may obtain plenty of light. The compost should be allowed to become quite dry between each watering, when the water should be poured around the outer edges of the compost. From now onwards during the winter discretion should be exercised in applying water to the roots of all Cattleyas and Lælias, for it is far better to keep the plants on the dry side than to allow the compost to become saturated.

CYPRIPEDIUM.—C. concolor, C. niveum, C. Godefroyæ and its variety leucochilum, C. bellatulum and the many hybrids of these plants should receive very careful treatment during the dull winter months. Having thick, fleshy leaves the plants do not require so much moisture at the roots as other Cypripediums, and the compost may become quite dry before water is applied, when the receptacle may be immersed nearly to the rim, or the water may be poured around the outer edges of the compost, the object being to prevent moisture lodging in the axils of the leaves. Take care that water dripping from the roof does not come in contact with the foliage. In removing the flower-scapes cut them clean to the base, for if a portion of the stalk is left it sometimes sets up decay which soon proves fatal to the plant.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

BEDDING PLANTS IN FRAMES.—Cuttings of summer bedding plants inserted early in the autumn are well rooted, and the frames should be ventilated freely in mild weather, to promote a stocky growth. Plants such as Pentstemons, Calceolarias, Violas, and Veronicas, in cold frames, should be grown as hardy as possible; remove the lights entirely when the weather is mild. Pelargoniums intended as bedding plants should be kept in a moderately dry atmosphere, and dry at the roots, as they should not grow too freely during the winter. All decaying leaves should be removed at frequent intervals, as the decay may set up damping in the plants.

VIOLETS IN FRAMES.—The plants should be kept scrupulously clean, and if the soil shows a tendency to become caked or hard the surface should be stirred lightly. Whenever water is necessary, it should be afforded on bright, dry days, as a healthy Violet plant requires an abundance of moisture at the roots; the watering should be thorough. Ventilate the frame freely during the warmer parts of the day, reducing the amount of fresh air before the temperature drops in the afternoon. Have ready mats or canvas covers for use during times of severe frost, in order to avoid using fire-heat, which should not be resorted to except when severe frosts occur.

PLANTING BAMBOOS.—Bamboos should be transplanted before severe weather sets in. These plants are usually sold by the nurserymen in pots, unless very large specimens are required for producing an immediate effect. If it is intended to plant large clumps, the sites should be prepared in advance, so that they may be set in the ground directly they are received. The Bamboo will thrive in almost any good ordinary soil, but heavy land should have plenty of leaf-soil and turfy loam incorporated with it. In all cases the ground should be trenched, and a quantity of rich, fine soil scattered amongst the roots. If the weather is dry at the time of planting, the roots should be watered freely and a mulch of leaf-mould applied. Many believe that Bamboos will not thrive except in very favoured localities, but this is erroneous. The greatest damage is not caused by frost, but by cold winds, therefore when selecting a site for Bamboos, see that it is sheltered from the north and east winds. A loose, rich soil is a great advantage. If these two points are considered, there need be no fear of failure with most kinds of Bamboos. In the calendar for May 11 a fairly comprehensive list of the hardier varieties was given. Arundinaria Falconeri, A. insignis, A. falcata, and A. nobilis should not be planted out-of-doors, except under very favourable conditions, but they are beautiful objects in a large conservatory or winter garden. It is a popular error that Bamboos like swampy ground. Although they require plenty of water in the summer, badly-drained or marshy ground must be avoided.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

BEGONIA GLOIRE DE SCEAUX.—This Begonia is one of the most beautiful of indoor flowering plants during the winter and early spring, and is generally afforded similar treatment to Gloire de Lorraine. This latter sort is in full bloom, and requires a somewhat cool treatment now, but Gloire de Sceaux should still be grown in a warm house with plenty of atmospheric moisture. The plants are developing their foliage, and those in pots of a moderate size require liberal feeding. The foliage is easily broken, therefore the plants should be afforded as much room as possible, so that there will be no danger of injury from the watercan. Do not spray the plants overhead, but damp the spaces between the pots once or twice daily. Should aphis or thrips be detected, the plants should be fumigated lightly.

CUTTINGS.—Plants of Acalypha hispida (syn. Sanderiana) and A. musaica raised from cuttings inserted some weeks ago are well rooted, and require larger pots. Most other subjects propagated in the autumn will grow well in the cutting pots all through the winter. They should be placed in a light position near to the roof glass, but the watering should be done carefully, as the soil is usually filled with roots, and a shelf in a greenhouse is a very dry place.

EUCHARIS GRANDIFLORA.—After a short rest these plants are growing freely again, and should be afforded one or two good soakings of liquid manure made from cow dung. The blooms are somewhat slow in opening at this season, and, with a little care, the plants may be had in flower up to Christmas, when the flowers will be greatly appreciated. The Eucharis is very subject to attacks of mealy bug, and as there is not much potting to be done just now, time may be afforded to eradicate this pest by sponging. It is several years since I was troubled with mealy bug in the plant houses, but I have had plenty of experience with this pest earlier in my career, and there is no better insecticide for the purpose than paraffin and soft soap emulsion. Sponging or spraying the plants two or three times with this mixture will usually destroy any mealy bug that may be present.

CHRYSANTHEMUMS.—The plants when cut down should be sorted over, retaining those that have produced the best flowers for purposes of stock. The stools should be placed in a light, cool house, where they will develop short-jointed growths suitable for making cuttings. It is a good practice to retain one stock plant for every six or eight cuttings required, and this will be a good guide to the number of stools to save. In turning the main batch of plants out of their pots save the old potting soil, as it will be useful for a variety of purposes. It should be stored in a dry place, where it will become sweetened by the air.

POTTING LOAM.—No time should be lost in obtaining a stock of good turfy loam for potting purposes. In many districts the turves are drier now than they were earlier in the season, and this is an advantage. If they are wet stack them together as lightly as possible, leaving plenty of spaces for the air to circulate. This precaution is more necessary in the case of loam of a heavy texture, for there is usually no fear of light soils becoming sour through being stacked wet. If the loam is of poor quality manure should be mixed with it at the time it is stacked, and this is better than adding manure at the time of potting; short horse-dung or a little bone-meal, soot, and wood-ashes will tend to make it more fertile. Peat is found on many estates, and this also may be cut and stacked now. If the peat is fairly moist it will be better to place it under cover. There is not so much of the material used as formerly, for in many establishments the culture of stove plants is largely discontinued. Leaf-mould is another valuable material for potting purposes, and the gardener should endeavour to make a good heap or pitful of clean Oak or Beech leaves. The present offers a favourable time for securing the leaves. On large estates, where there are woods and numerous park trees, the leaves swept up in the garden may be utilised for hot-beds, as those obtained from the grips and dykes in the woods make much better and sweeter leaf-mould.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

EARLY PEACHES AND NECTARINES.—To obtain ripe Peaches very early in the season preparations for forcing should be made at once. Pot trees are very useful for the purpose, and if a suitable house is available a good crop of excellent fruit may be assured. If the shoots are matured perfectly they may be pruned and the trees cleansed and placed under glass at once. Should a special glasshouse be not available for the present the trees may be placed temporarily in a vinery in which the vines have just been started; the conditions in the vinery will be suitable until the trees flower. Shorten the extra strong growths, and thin out the weak, useless shoots. There is a danger of these small trees becoming crowded with growth, and this must be avoided or they will quickly become bare of growth at their base. Their constitution also will be impaired if they are allowed to make too much useless growth. Cleanse the branches thoroughly and carefully as the buds are easily damaged. If scale insects are present take care that every insect is destroyed, as this pest multiples quickly when the trees are placed in a warm house. A solution of soft-soap and sulphur applied with a well-worn paint brush will destroy all insect pests. The trees may afterwards be placed on their sides and syringed vigorously with the same specific. Fire-heat need not be employed for the first two or three weeks unless severe frosts occur; the temperature must not drop below 45°. The trees will require very little water at the roots till growth is active; when water is afforded see that sufficient is given to soak the soil right through. Syringe the trees once or twice each day when the weather is bright, and damp the walls and paths frequently to promote a moist atmosphere. Admit air freely whenever the weather is favourable, and leave the top ventilators open a little at night when it is not cold.

LATE AND MID-SEASON PEACHES.—Push forward the work of pruning, training and cleansing the trees as quickly as possible so that everything may be completed by the end of the year, as there is not so much danger of damaging the buds now as later. Old trees which have given unsatisfactory results should be attended to. In nearly all cases of failure the trouble will be found at the roots; if the work of renovation is accomplished before the turn of the year the trees will have time to recover from the check before they start into growth. Old trees with plenty of young shoots may have some of the older branches removed to make room for young fruiting wood. A few old branches removed every year will keep the trees furnished with healthy fruiting wood. After the pruning is finished tie the shoots into bundles and wash the house thoroughly, and finally wash the shoots with the specific recommended above. In training the shoots it may be found that there is still too many of them and a few more should be cut away. It is a great mistake to overcrowd the young shoots. When the training is finished remove the surface soil from the borders with a fork and apply a top-dressing of loam mixed with plenty of lime-rubble and wood-ashes. In the case of old trees a small quantity of crushed bones and artificial manure should be mixed with the soil. It is important to allow the trees a long period of rest before starting them again into growth, therefore the houses should be thrown wide open during the time when growth is dormant. See that the trees do not suffer for want of moisture, especially in the case of those growing in inside borders.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS.

MONDAY, NOVEMBER 18—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, NOVEMBER 19—
Royal Hort. Soc. Norwich Chrys. Sh. (3 days).

WEDNESDAY, NOVEMBER 20—
Nat. Chrys. Soc. Exh. and Conference at Essex Hall, Newcastle Chrys. Sh. (2 days). Royal Met. Soc. meet, N. of Eng. Hort. Soc. meet at Hull (2 days), Bristol Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 21—Linnean Soc. meet.

FRIDAY, NOVEMBER 22—
Aberdeen Chrys. Sh. (2 days). Dunfermline Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—42·2.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, November 13* (6 P.M.) Max. 43° Min. 37°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November 14* (10 A.M.): Bar. 29·6°; Temp. 45°; *Weather*—Overcast.
PROVINCES.—*Wednesday, November 13:* Max. 44° Lancaster; Min. 49° England, E Coast.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Rose Trees, Azaleas, Shrubs, Bulbs and Liliums, at Stevens' Rooms, 38, King Street, Covent Garden, London, W.C., at 12.30.

TUESDAY—
Sale of well-grown Nursery Stock at Nuneham's Nursery, Caterham, by Protheroe & Morris, at 12.

WEDNESDAY—
Trade Sale, Bulbs and Roots, at 11; 2719 cases Japanese Liliums, at 2.30; Palms and Plants, at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

THURSDAY—
Roses, at Protheroe & Morris' Rooms, at 12.30.
Nursery Stock at The Nurseries, Leamington, by Protheroe & Morris, at 12.

FRIDAY—
Orchids at Protheroe & Morris' Rooms, at 12 45.

Ills that Potato Flesh is Heir To.

We do not know the arguments which justify the adage with respect to the cat and its nine lives; but anyone conversant with the vicissitudes suffered by a Potato in the course of its apparently uneventful life would be well within the bounds of veracity in ascribing nine lives to the "noble tuber." For it is known to be subject to the attack of no fewer than nine different kinds of fungi and bacteria, and of these nine diseases most are deadly in their effects. From its early youth to its matured tubered state, this alien of South American origin is beset by fungous and bacterial foes. The van of this incessant attack is led by the fungus Alternaria solani, which produces early blight. Following close on Alternaria is Cercospora concors, the parasitic fungus which induces leaf blotch. Escaping or recovering from early blight and blotch, the Potato may fall a victim to the untimely attention of bacteria. Bacillus solanacearum may invade the tissues of its stem and tubers, and turn them brown with brown rot, so that the stems and leaves wilt and die. Though fate grant immunity from B. solanacearum, a yet worse foe in Bacillus phytophthorus must be avoided or resisted. This is the redoubtable begetter of black leg, an unkind name for a widespread and fatal state characterised by a rotting at the base of the collar, and a soft rot of the tuber.

Besides these mortal maladies, the stem blight or rosette ascribed to the fungus Rhizoctinia (Corticum vagum) must be considered as a mere ailment. But more and worse pathological adventures are in store for the Potato. The dry rot fungus, Fusarium oxysporum, may gain entrance through the roots, cause a certain amount of wilting and blackening, and, lying ensconced in the tubers, play havoc with the stored Potatos, mummifying them till wizened and wrinkled, as though by premature old age, they become unfit for food or propagation. A passing episode, and one which results only in a certain disfigurement, is scab, the outward sign of a visitation by another fungus, Oospora scabies.

Nor is the tale of tribulation told. Black scab, or wart disease, may cut the thread of the troubled life of the Potato, and late blight may turn to nought the promise of a fruitful harvest. The former disease is the work of a fungus-like micro-organism, Chrysophlyctis endobiotica, the latter, which is a classic among diseases, is caused by the fungus Phytophthora infestans. As we contemplate the shapely, clean-skinned and spotless Potatos on the exhibition table, we know not which to admire most, the nursing skill of the cultivator or the strange eventful history of the tuber. For the more we learn of the nature of disease, the more certain it appears that escape from attack is no mere chance, but is due first to the provision by the grower of the best conditions for growth, and second, to the possession on the part of the plant of specific powers of resistance, which enable it to prevail over or repel the attacks with which it is beset from all sides. Evidence of the existence of such natural immunity is plentiful, and not to be gainsaid. We have published such evidence of immunity from black scab, and on an early occasion we shall describe experiments which show that a similar power of resistance to late blight is exhibited in different degrees by the commercial varieties of Potato.

Sewage-Sick Soils.

An investigation by Messrs. Russell and Golding (*Journal of Agric. Sci.*, October, 1912) into the sickness of sewage soils has led the authors to the conclusion that the causes which produce this state are, in the main, identical with those which bring about sickness in ordinary soils.

As the result of previous investigations by Russell and Hutchinson, it is suggested that even in an ordinary soil the community of soil micro-organisms is not working at its maximum efficiency as measured by the rate at which plant food is being produced.

If such imperfectly efficient soils be partially sterilised, the crops taken on them are larger than those obtained from untreated soil. Hence the agent which is lowering the fertility of the soil is a vital agent. Various considerations point to the unicellular animals (protozoa) of the soil as the cause of reduced fertility, and it is suggested that in ordinary soils these animals prey upon soil bacteria, reduce their numbers, and hence their activity in producing nitrogenous plant food.

By partial sterilisation, the protozoa are killed, but certain of the bacteria are not. Free from their hereditary foes the surviving bacteria increase, multiply and manufacture more vigorously than in either normal or sick soils.

The essential conclusion reached by Russell and Golding with respect to sewage-sick soils is similar to that just outlined. Such soils will stand no more sewage. If further additions be made the material fails to percolate through the soil, crops are injured and even killed. Partial sterilisation of the soil restores its "health."

Hence, if a practical method can be devised whereby sick soil may be sterilised partially and cheaply, a definite advance will have been made in the problem of sewage treatment; for the sewage farm may then serve for an indefinite period for the successful cultivation of crops.

Coloured Plate.—The subject of the coloured plate to be published with the next issue is Prunus pana rubra.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on Tuesday next in the Society's Hall, Vincent Square, Westminster. At the 3 o'clock meeting of the Fellows an address on "Some Gardens in and around Bournemouth" will be delivered by Dr. G. G. HAMILTON, F.R.C.S.

HORTICULTURAL EDUCATION ASSOCIATION.—We are informed that the Horticultural Education Association has recently acquired a considerable accession of membership. Messrs. JOHN WEATHERS, JAMES UDALE, HARRY L. FOSTER, J. CLARKE WALLACE, G. W. PYMAN, K. D. SCOTT, and B. P. PERRY are the latest to join. The hon. secretary is Mr. W. P. WRIGHT, Lyminge, Folkestone.

ROYAL SOCIETY OF ARTS.—The 159th Session of the Royal Society of Arts will be opened on Wednesday, the 20th inst., by Lord SANDERSON, G.C.B., K.C.M.G., Chairman of the Council, who will deliver an address and distribute the medals awarded last session. Amongst the papers announced for the session are "The Manufacture of Sugar from Wood, and its Economic Importance," by Mr. A. ZIMMERMANN, on December 4; and "Synthetic Rubber," by Dr. F. MOLLWO PERKIN, on December 11. In the Colonial Section, Professor W. H. WARREN will describe "The Hardwood Timbers of New South Wales," on November 26, when Sir GEORGE HOUSTON REID will take the chair.

PRESENTATION TO A GARDENER.—Mr. JAMES WATSON, who has occupied the position of head gardener at the Hall gardens, Easton, for the past 22 years, and during the whole of that period has filled the office of Secretary to the Easton Hall Horticultural Society, has been presented by the members of the society and friends with a purse of gold on the occasion of his leaving the district.

FIG. 165.—VIBURNUM CORIACEUM (V. CYLINDRICUM); FLOWERS, CREAM-WHITE WITH PURPLE ANTHERS; FRUIT, SMALL, BLACK.
A, partially expanded flower; B, section of a flower showing exserted but still inflexed staminal filaments; C, a similar section showing the fully-developed erect stamens; D, pollen.
From specimens supplied by Mr. P. D. Williams. (For text see p. 363.)

THE DISPUTE AT SOUTHAMPTON.—In respect to the dispute between Messrs. TOOGOOD & SONS, Southampton, and some of their employées, referred to in our issue of October 26, Messrs. TOOGOOD inform us that they have cancelled the agreement-form which constituted the point of difference between the firm and a small proportion of its Chapel Store staff. They state that the existing agreement has been in use for nearly 20 years, but that the firm attached so little importance to it that it has in some cases been permitted to fall into desuetude. The immediate object in desiring to have it signed in this particular case was to ascertain, in view of the early removal of the firm's stores to Millbrook, which of the Chapel Store staff wished to continue in the firm's service at the new stores.

WHEAT AND RAINFALL.—The *Agricultural Gazette of New South Wales* publishes an interesting article by JOHN B. TRIVETT, Government Statistician, on "Wheat Growing in Relation to Rainfall." Although many factors contribute to the limitation of the Wheat crop, the chief determiner of successful Wheat production is the amount of rainfall during the growing period. The normal amount of rain which suffices in New South Wales is 10 inches between April to October. The map which accompanies the article is instructive in showing the extent to which Wheat growing has increased since 1904, and also in indicating that, in spite of this increase, the boundary of the Wheat region still lies, for the most part, a considerable distance to the western wet-side of the 10-inch rainfall line. Since 1904 an area of some 13 million acres has been added to the Wheat belt in New South Wales, and of this area only 858,000 acres are outside the western limit of the 10-inch line.

HYBRIDISATION OF APPLES.—Interesting results obtained by crossing the Apples Joseph de Brichy and Bismarck are described in an article in *La Tribune Horticole* (October 29). The former variety was used as the seed parent and Bismarck as the pollen parent. The characters of the varieties are:—Joseph de Brichy: Fruit fairly large, clear yellow, regular rounded-conical in shape, first quality, ripening from the beginning of winter onwards. Bismarck: Fruit fairly large, white and yellowish, with bright-red flesh, good quality, ripening in winter. Sixteen seeds (from two Apples) of the cross were sown in February, 1907, and produced 14 plants. After replanting under glass, the seedlings were planted out in May. Monsieur KOULIN, who carried out the experiment, grafted the young plants in January, 1908, on pyramids of Reinette Grise, Empereur Alexandre, and other varieties. The grafts flowered last year, and bore fruits of the following descriptions. That from a seed numbered 2, large or fairly large, green-yellow, pitted with red, of good quality by October, and keeping till spring. No. 7: Very large, yellow-whitish, with carmine streaks, first quality, flesh soft and yellow, ripe in October. Others gave fruits also of distinct and valuable quality. No. 7 is interesting inasmuch as, when a seedling, it came near being discarded, because, although it was extraordinarily vigorous, it was very spiny, and had the general appearance of a wilding. The event appears to show that an Apple of good quality may exhibit in its seedling stage characters such as those of spininess, which belong to the wild type. Of the hybrids, five are distinct and of first quality, eight have not yet borne fruit. All are characterised by vigorous, upright habit of growth. It is to be hoped that, encouraged by this success, some of our gardeners who have the facilities and the leisure will undertake similar experiments in the growing of Apples.

MR. ERNEST HEMMING.—We learn from our contemporary, *The National Nurseryman*, U.S.A., that the editorship of that journal, rendered vacant by the death of Professor JOHN CRAIG, has been filled by Mr. GEORGE HEMMING, formerly a member of the garden staff at Kew. After leaving the Royal Botanic Gardens, Mr. HEMMING settled in America, and for the past 15 years has been engaged with the firm of Messrs. THOMAS MEEHAN & SONS.

JOSEPH PRIESTLEY.—The name of JOSEPH PRIESTLEY is honoured not only by the chemist but also by the scientific student of horticulture, for PRIESTLEY, in discovering oxygen, not only made one of the greatest contributions to chemical knowledge, but also laid the foundations of our understanding of the mode of life of plants. Indeed, as is well known, PRIESTLEY, who was above all a great experimenter, was the first to show that green plants, in sunlight, liberate oxygen; and, although the full significance of this great discovery was left to others to demonstrate, PRIESTLEY's pioneer work deserves honour and wide recognition. A strenuous man, not particularly happy in the regard of his contemporaries, PRIESTLEY left this country at the age of 62, and emigrated to the United States. But posterity has repaired the wrong of his contemporaries. His zeal for social and religious reform, which aroused the fury of the mob in Birmingham, has not obscured in that city the memory of PRIESTLEY's greatness. There, as also at Warrington and Leeds, memorials to the great chemist have been erected, and now Birstall, in the West Riding, has erected yet another statue to commemorate the fact that it was in Yorkshire (in 1733) that PRIESTLEY was born. The ceremony of unveiling the statue was performed by Sir EDWARD THORPE, who declared, in the course of his appreciation, that, great as was PRIESTLEY as an experimentalist, he has yet a greater claim on our regard as a champion of liberty. Greatest claim of all of this "hero of the 18th century" lies in the fact that persecution and insult, though they drove him from his native land, failed to sour or even disturb his serene and genial temper—a trait which is appreciated by none more than by the people of the West Riding of Yorkshire.

SICKNESS IN GREENHOUSE SOILS.—Reference is made on another page to some recent investigations on sewage-sick soils. It is interesting to observe that similar symptoms of lessened fertility are exhibited by greenhouse soils, particularly in the rich composts used by growers of Cucumbers and similar crops. In partial sterilisation, either by heat or antiseptics, Messrs. RUSSELL & HUTCHINSON have discovered a method whereby the fertility of such soils may be restored. Recent experiments by Messrs. RUSSELL & PETHEYBRIDGE have been directed to a search for an inexpensive and efficient sterilising agent. Of the various materials used, the authors report (*Journ. of Agric. Sci.*, October 12) that formalin (formaldehyde) gives good results, and that certain tar oils are very promising. There can be no doubt that if the authors succeed in discovering a suitable and cheap antiseptic they will confer a great boon on growers of crops such as Cucumbers and Tomatos, for the annual soils and manures bill is a most serious item in commercial growing, and the fact that the soils used in forcing houses become sick very quickly means that they have to be discarded before the full manurial value has been extracted from them. Fig. 166, which we owe to the courtesy of Dr. RUSSELL and the Cambridge University Press, illustrates in striking manner the superiority of the growth made by Tomatos planted in partially-sterilised soil as compared with that of plants grown in sick soil.

(Partially sterilised.) (Unsterilised soil.)

FIG. 166.—TOMATOS GROWING IN PARTIALLY-STERILISED AND IN UNSTERILISED SOIL.

POA SIBIRICA ROSHER.—The *Bulletin* of the Imperial Botanical Garden of St. Petersburg (vol. 12, part 4, 1912) contains a description (in Russian) of a new species of Poa—P. sibirica—which is of wide distribution and of distinct character.

ROYAL METEOROLOGICAL SOCIETY.—A meeting of this society will be held at the Surveyors' Institution, Great George Street, Westminster, on Wednesday, the 20th inst. Papers will be read on (1) "The Unprecedented East Anglian Rainfall of August 26, 1912," by Dr. HUGH ROBERT MILL; and (2) "A Three-year Period in Rainfall," by Mr. ARTHUR PEARSE JENKIN.

THE ARTHUR BALFOUR PROFESSORSHIP OF GENETICS.—Mr. ARTHUR BALFOUR, in a letter to the Vice-Chancellor, announces the appointment of Mr. R. C. PUNNETT to the ARTHUR BALFOUR Professorship of Genetics at the University of Cambridge. As announced previously, the new professorship is due to the generosity of an anonymous donor, and the selection of the first occupant of the chair was entrusted to the Prime Minister and Mr. ARTHUR BALFOUR. Professor PUNNETT is well known to students of Genetics, and the importance of his contributions to this branch of science thoroughly justifies his appointment to the new post. As readers of Professor PUNNETT's book on Mendelism are aware, he combines in rare measure the power of investigation with the art of expression.

BIRMINGHAM PUBLIC PARKS. — The most recent addition to the Birmingham parks and open spaces is the "Garrison Lane" or "Callow Fields" recreation ground. It is situated in a densely-populated district, on a site which held about 400 squalid dwellings. The Parks Committee deserve well of the community for seizing this opportunity to introduce greensward, with such trees and shrubs as the conditions permit into this district. The transformation is great, and provision is made for a children's playground. Gymnasia, consisting of swings, &c., are provided, and powerful electric lights will enable the little ones to take full advantage during the long winter evenings of these amusements, to their own benefit and the relief of the congested adjacent streets. Mr. W. H. MORTER, Chief Officer of the Birmingham parks, who is responsible for the arrangements generally, has the satisfaction of knowing that the public, no less than the City Council, appreciate the successful work accomplished, and the Parks Committee have placed a record on their minutes of their appreciation.

FRUIT SALES BY SAMPLE.—It having been decided in a recent test case, states *The Western Mail*, that wholesale buyers have no claim under the special sales conditions of the brokers when the bulk does not equal sample, a representative and largely-attended meeting convened through the South Wales and Monmouthshire Fruit Buyers' Association took place at the Colonial Buildings, Cardiff, on the 29th ult., to consider the position. Mr. WEAVER (Messrs. SUTTON & WEAVER) presided, and said that while they as wholesale buyers did not want to be on antagonistic terms with the brokers, the time had arrived when they must consider their own interests. It was only by organising themselves into a strong association that they could hope to get the present sales conditions altered, and by so organising they would be improving the port of Cardiff as a fruit-distributing centre. Mr. FRED EDMUNDS (Cardiff), solicitor to the association, having explained legal decisions given in test cases, it was decided by a large majority to support the association by membership and also in any action that might be decided upon.

"ADULTERATED" GRAPES.—The perverse ingenuity of the adulterator has never exceeded that exhibited by certain vendors of Grapes. According to the *British Medical Journal*, the bloom of the Grape is now imitated by a fine powder sprayed or spread on the fruit by a special apparatus. The presence of the fraud may, it is said, be detected by means of the tongue.

THE APPLICATION OF GENETICS TO ORCHID BREEDING.*

ORCHIDS are truly regarded as the aristocrats of the plant world, and the results achieved by Orchid breeders during the past 20 years constitute one of the seven wonders of the world of horticulture. No other natural order of cultivated plants has yielded so many beautiful hybrids in so short a time as the Orchidaceae. A reference to the *Orchid Stud-Book* shows that at least 40 genera and 300 distinct species have been already utilised by Orchid breeders in the making of their hybrids. About 2000 of these are primary hybrids, while no fewer than 300 are generic hybrids. Besides these botanical hybrids there are on record some thousands of horticultural secondary, tertiary and multiple hybrids, to say nothing of multitudinous varietal and individual forms which no man can number.

When one remembers that most of these remarkable results have been achieved in less than a generation (one might almost say, since the last Orchid conference was held here), and that the raising of such delicate exotics from seed, under purely artificial conditions, is by no means an easy matter even for the expert, one cannot but admire the practical genius of British and Continental Orchid breeders that has brought about such a consummation. Those who had the good fortune to see the remarkable display of Orchids at the International Exhibition at Chelsea last May, must have been impressed by the leading part played by hand-raised hybrids in the various groups.

In face of such an imposing array of beautiful hybrids, it may seem presumptuous on the part of a student of genetics to offer to the Orchid breeder any suggestions as to the advantages that might be derived from an application of the science of genetics to Orchid breeding, for where practical Orchid breeding has been so successful the application of genetics might naturally be regarded as superfluous. But those behind the scenes know better. The wonderful hybrids that appear in public represent only one side of the picture.

Orchid breeders of experience know too well that in order to secure a really first-class hybrid it is necessary to raise large numbers of others. Many are called, but few are chosen. Some crosses naturally yield more good forms than others, but generally speaking first-class hybrids are few and far between, and the moderate and poor forms are far too numerous. In secondary and more complex hybrids especially, the numbers of misfits and unwanted weeds that turn up time after time is rather disconcerting, and the question often arises as to whether many of these crosses are worth making at all from the economic point of view, though from the scientific standpoint they are naturally most instructive.

Old and New Methods.

From this it is evident that chance plays a great part in modern Orchid breeding, and that there is really very little certainty in the game as played by the leading exponents. Now, if the modern science of genetics teaches anything, it is that there are *certainties* to be found in breeding. A careful study of recent work in genetics points unmistakably to the important fact that law and order may be perceived in breeding. From the economic point of view it costs just as much to raise a poor form as it does a good one, the time, trouble and expense involved being the same, and the practical problem that faces the Orchid breeder is how to manage his matings so as to reduce the numbers of worthless forms to a minimum.

This is where the application of genetics to Orchid breeding should come in to help the breeder. Of course, in the early stages of the application it cannot be expected that all Orchid breeding will be reduced to a certainty—that would be too much to expect, nor would it be altogether desirable, for in such a case Orchid breeding would be divested of much of its charm. Already a few certainties in Orchid breeding are known, thanks mainly to the application of Mendelian principles, and that many certainties await discovery there can be no doubt.

One important point however should be noted, and that is, that under present conditions Orchid breeders must very largely discover these certainties for themselves by the application of the principles of genetics. In this respect, Orchid breeding differs much from ordinary plant breeding. The Orchid field is so wide, the conditions so difficult, and the complications so numerous, that only a practical expert can carry out the necessary experiments, and even he must have considerable resources of capital and experience at his command.

In order to apply genetics to Orchid breeding it will be necessary for the Orchid breeder to make himself familiar with the first principles. These principles are now universally accepted by all serious students of heredity who have experimented for themselves, and they can be applied equally to all kinds of plants and animals, including man himself. From the practical point of view it will not be necessary for the Orchid breeder, at the outset at all events, to venture much beyond these first principles. His own experiments, if based on these principles and carefully carried out, will soon yield a harvest of valuable data that will lead him on to more advanced work and to a deeper insight into the possibilities and certainties of Orchid breeding.

First Principles of Genetics.

Each plant or animal is composed of many characters, most of which are heritable.

Each heritable character is represented in the germ-cells by one or more factors.

In the fertilised cell, or zygote, each factor is present either in a double state or a single state.

When a double dose of the factor is present the plant or animal is called homozygous, or pure, in regard to that factor.

When a single dose of the factor is present the plant or animal is called heterozygous, or impure, in regard to that factor.

When a factor is altogether absent, the plant or animal may be called zerozygous, or wanting, in regard to that factor.

Previous to fertilisation the germ-cells divide and segregation takes place in regard to each factor.

Each cell with a double dose of the factor becomes two fertilising cells or gametes, each with a single dose of the factor.

Each cell with a single dose of the factor becomes two fertilising cells or gametes, one of which has a single dose of the factor and the other has none.

Fertilisation consists in the union of two fertilising cells or gametes, a pollen or sperm-cell from the male uniting with an egg-cell from the female.

If both paternal and maternal gametes have a single dose of the factor, a zygote is formed with a double dose of the factor, and the plant or animal is homozygous, or pure, in regard to that factor.

If, however, one of the gametes has a single dose of the factor and the other has none, a zygote is formed with a single dose of the factor, and the plant or animal is heterozygous, or impure, in regard to that factor.

If neither of the gametes has the factor at all, it is, of course, absent from the zygote, and the plant is zerozygous, or wanting, in regard to that factor.

Practical Consequences.

The practical consequences of these first principles of genetics are that, as regards any one heritable character represented by a factor, there are three distinct kinds of individual plants: (1) homozygous or pure; (2) heterozygous or impure, and (3) zerozygous or wanting. Each of these three kinds of individuals will give a different result when bred from. With regard to outward appearance No. 3 will, usually, be easily distinguishable from Nos. 1 and 2, representing as it does the hypostatic or recessive form from which the epistatic or dominant character is absent.

If, as sometimes happens, a single dose of the dominant factor produces the same effect in the zygote as a double dose, we get the phenomenon of complete dominance, and in such cases Nos. 1 and 2 are indistinguishable in outward appearance, and their homozygous or heterozygous nature can only be determined by breeding from them.

* Abstract from the Paper read at the Orchid Conference by Major C. C. Hurst, Director of the Burbage Experiment Station.

If, however, as often happens in Orchids, a single dose of the dominant factor produces a different effect in the zygote from a double dose, we get the phenomenon of incomplete dominance; in such cases Nos. 1 and 2 are distinguishable in outward appearance, and their homozygous or heterozygous nature is determined at sight without breeding from them.

The apparent blending of characters observed in many Orchid hybrids is, no doubt, due to the effect of the single dose of one factor reacting on the effect of a single dose of another factor, resulting in a mosaic.

When more than one heritable character is involved in the breeding problem, as usually happens in Orchids, the different kinds of individual plants become exceedingly numerous. One plant, for instance, may be homozygous for one character, heterozygous for another, and zerozygous for a third character, and so on. Each individual plant, however, has a definite germinal or gametic constitution which can be ascertained by cross-breeding it with other plants. In this way a factorial analysis of the plant can be made, and as regards each heritable character the plant will be found to be either homozygous, heterozygous or zerozygous, and as such it will behave when bred from. Once the factorial analysis of a plant has been made, all future breeding from that plant is reduced practically to a certainty.

Colour and Albinism.

Recent results show that in certain cases an apparently simple heritable character is due to the presence of more than one distinct factor. For instance, in Orchids we have already one case of that description, and no doubt there are many more yet undiscovered. From evidence collected by the writer some years ago, there can be no doubt that the rosy-purple colour present in the flowers and leaves of the various species of Cattleya and Cypripedium is due to the simultaneous presence of two complementary colour factors which we call C and R. If one or both of these factors is absent, the result is a true albino, with no trace of purple sap in the flowers and leaves. This purple colour can only be produced when the two factors C and R are both present.

Now, as we have just seen, the colour factors C and R may be present in a double state, CC and RR; or in a single state, Cc and Rr; or they may be absent altogether, cc and rr; consequently no fewer than five different kinds of albinos may exist, as follow:—

(1), CCrr; (2), Ccrr; (3), ccRR; (4), ccRr; (5), ccrr.

For the sake of convenience, it is usual in genetics to represent the presence of a factor by a capital letter, and its absence by a small one.

These five albinos may be absolutely identical in appearance and outward characters, yet each has a different germinal constitution, and consequently will give different results in breeding. Each of these five albinos will breed true to albinism when selfed, but when they are crossed *inter se* different results will be obtained. Thus, out of the 15 possible matings 11 will give all albinos; 2 will give on the average equal numbers of albinos and coloured forms: 1 will give one coloured form to three albinos: and 1 will give all coloured forms.

Table 1 gives the factorial details of these 15 matings, showing how the above calculations have been made.

Identification of Individual Stud Plants.

The practical consequences of these first principles are important and far reaching from the Orchid breeder's point of view.

If each individual plant grown from a seed has a definite germinal constitution which determines its breeding powers and potentialities, then it is necessary that each individual plant used as a parent should have an identification mark. Whether this identification mark consists of an individual name, a stud number, or anything else, is simply a matter of convenience, so long as the identity of each stud individual is maintained for future use. In 1909 the writer suggested that identification might be assured by putting the name of the importer or raiser in brackets after the ordinary name, together with a number showing the order of its appearance, e.g., Cypripedium callosum Sanderæ (Sander 1), (Low 1), (Cookson 1), (Statter 1), and so forth. The first was imported in 1894, the second in 1904, and the third and fourth were raised by hand presumably from the first. All divisions of the original plant would, of course, have the same germinal constitution, and would consequently bear the same identification mark.

There is no doubt that in course of time certain individual plants would acquire a stud reputation much in the same way as a noted sire or brood mare does in thoroughbred horses, and the propagation of such an individual Orchid by division, and its distribution, would become a valuable economic asset.

Having secured the identification of the individual stud plants, the next step is to ascertain their germinal constitution by breeding from them. The original Mendelian method was to self them, but recent results show that this method alone is not sufficient to give a complete analysis of the germinal constitution of a plant. In order to do this it is necessary to cross-breed them, and in cases like albinism, for instance, this is the only method possible. From this it is evident that the ordinary experiments in hybridisation and cross-breeding made by Orchid breeders are precisely what we require in order to ascertain the germinal constitution of individual plants, provided that each individual plant used as a parent is carefully identified for future reference and use.

As we have seen, cross-breeding is a far more effective method of analysis than selfing, even from the point of view of genetics. The crux of the whole problem, however, lies in the identification of individual plants. Unless this is done all the rest is vain. Unfortunately, with a few brilliant exceptions, our multitudinous Orchid records and labels are almost useless for this purpose. Some of these brilliant exceptions consist of certain unique hybrids to which their owners gave a distinctive name, proudly refusing to conform to the technical rules laid down by the authorities in nomenclature (and by the irony of fate the writer happened to be one of the latter). Many of these names can be traced in the *Orchid Stud Book* as synonyms, and it is possible that the natural conservatism of Orchid breeders has caused them to retain many of these old names on their labels. If such is the case, the identification of some of our best stud individuals may not be so difficult after all.

In most cases, however, the adoption of genetic methods will necessitate the making over again of the best hybrids, using as parents the best individuals of the best varieties of the best species of the best genera. The primary hybrids thus obtained would be pedigree hybrids, and the best individuals of these might be further utilised in accordance with the particular aims that the breeder may have in view. In this way the Orchid breeder would be able to build up a pedigree strain made up of superior individuals, and the reversions and recombinations that he would obtain among the secondary hybrids would also tend to be superior to those bred in the ordinary way.

In breeding on these lines the Orchid breeder will soon discover for himself that while a few stud individuals are homozygous or pure for the good qualities required, the majority will be heterozygons or impure for those particular characters. For stud purposes these heterozygous or impure forms should be discarded at once, no matter how good looking they may be, and only the homozygous or pure forms should be used for future breeding. Should the homozygous or pure forms not turn up quickly enough for his purpose, the breeder can always make them from the heterozygous or impure forms in the ordinary Mendelian way. In many cases no doubt this will be well worth doing.

This rigorous elimination of the heterozygous plants that throw unwanted forms may sometimes require considerable courage on the part of the Orchid breeder, involving, as it does, the sacrifice of certain prejudices and predilections, especially when it comes to the point of discarding for stud purposes a much-prized plant that has perhaps won the classic F.C.C. at the R.H.S. The science of genetics tells us plainly that things are not always what they seem, and a good-looking plant is not always a good plant to breed from. Only a few Derby winners are successful at the stud, everything depends on their germinal constitution. From the genetic point of view it would be a far sounder proposition to use for breeding an individual Orchid that had *bred* an F.C.C. winner, than to use an actual winner of the F.C.C. with a bad breeding record.

The F.C.C. awarded by the Orchid Committee of the R.H.S. is universally acknowledged to be the highest prize in the Orchid world, and winners of this prize may be regarded as classic Orchids. From the point of view of genetics, the individual parents of these classic winners deserve special recognition as stud Orchids.

A reference to the records shows that during the past three years 118 F.C.C.s have been awarded by the Orchid Committee of the R.H.S. Of these F.C.C. winners 87 appear to be hand-raised hybrids. Of the 174 parents of these hybrids, only 31 can be identified from the records as individual plants, and it is quite possible that a few of these names even may be represented in collections by more than one seedling individual.

May I venture to suggest that special groups made up of these stud Orchids and their progeny would provide an exhibit at the R.H.S. shows that would not only be interesting to Orchid growers generally, but would be particularly useful to Orchid breeders as a demonstration of the germinal constitution of these stud Orchids. Competitive classes might even be arranged for these progeny tests, to decide which individual Orchids are best for stud purposes.

The result would be to create a special demand for high-priced stud Orchids that does not exist to-day. In view of the increasing numbers of Orchid growers all over the world, it is hardly likely that such a demand would be confined to the British Isles, and there is no reason why this country should not in the future provide the world with stud Orchids as it does to-day with thoroughbred horses and pedigree animals generally.

So far we have dealt with the general application of the principles of genetics to Orchid breeding. It may be useful now to put the matter into a somewhat more concrete form, by suggesting briefly a few special possibilities of the practical application of genetics to Orchid breeding.

The Breeding of Albinos.

The beauty and value of albino Orchids are generally recognised, and the Orchid breeder naturally wishes to raise new and improved forms by hybridisation. In other words, he wishes to vary the shape and size of the flower

TABLE 1.—ALBINO MATINGS.

Parents.	Offspring.	Result.
(1) CCrr × (1) CCrr...	All CCrr	All albinos.
(1) CCrr × (2) Ccrr	1 CCrr : 1 Ccrr	All albinos.

(1) CCrr × (5) ccrr	All Ccrr	All albinos.
(2) Ccrr × (2) Ccrr	1 CCrr : 2 Ccrr : 1 ccrr	All albinos.
(2) Ccrr × (3) ccRR	1 CcRr : 1 ccRr	1 coloured : 1 albino.
(2) Ccrr × (4) ccRr...	1 CcRr : 1 ccRr : 1 Ccrr : 1 ccrr ...	1 coloured : 3 albinos.
(2) Ccrr × (5) ccrr	1 Ccrr : 1 ccrr	All albinos.
(3) ccRR × (3) ccRR	All ccRR	All albinos.
(3) ccRR × (4) ccRr...	1 ccRR : 1 ccRr	All albinos.
(3) ccRR × (5) ccrr	All ccRr	All albinos.
(4) ccRr × (4) ccRr...	1 ccRR : 2 ccRr : 1 ccrr	All albinos.
(4) ccRr × (5) ccrr	1 ccRr : 1 ccrr...	All albinos.
(5) ccrr × (5) ccrr	All ccrr	All albinos.

while retaining the chaste beauty of the true albino. So far as we know, all albino Orchids breed true to albinism when selfed, but no remarkable improvement in shape, size and distinctness can be obtained in this way. On the other hand, as we have already seen, when different species of albinos are crossed, they do not always breed true to albinism, but often give coloured forms which are not wanted by the Orchid breeder.

The science of genetics has provided a reasonable explanation of these interesting results. Experiments are yet wanting to provide breeders with a complete analysis of the germinal constitution of all the well-known albinos, and this cannot be satisfactorily accomplished until we can be quite certain as to the identification of individual albino plants, and, more important still, that the albinos concerned are true albinos.

Subject to the above reservations, however, the following list of 22 well-known albinos is given, with their presumed germinal constitutions, so far as ascertained :—

Cypripedium callosum Sanderæ ...	ccRR
C. Lawrenceanum Hyeanum ...	ccRR
C. Maudiæ	ccRR
C. insigne Sanderianum	ccRR
C. Rosettii	ccRR
C. bellatulum album	CCrr
Cattleya Mossiæ Wageneri	ccRR
C. Gaskelliana alba	ccRR
C. Hyeæ	ccRR
C. Hyeæ Suzanne	ccRR
C. Hyeæ Jungfrau	ccRR
C. intermedia alba	ccRR
C. labiata alba	ccRR
C. Mackayi Dusseldorfei	ccRR
C. Mackayi Undine	ccRR
C. Mackayi "Westonbirt variety"	ccRR
C. Brenda	ccRR
C. Peetersiæ Myra	ccRr
C. Harrisoniana alba	CCrr
C. Mendelii alba	CCrr
C. Schröderæ	CCrr
C. Warneri alba	Ccrr

These albinos may be divided into two classes, C albinos and R albinos. To secure all albino offspring, C albinos must be mated with C albinos and R albinos with R albinos. If C albinos are mated with R albinos coloured forms are bound to arise. The above list may serve a useful purpose as a provisional one for breeders to work upon, and no doubt further results in the near future will enable us to considerably extend the analysis, and also to confirm or otherwise the above tentative germinal constitutions.

In working with albinos, Orchid breeders must be careful to distinguish between true albinos and false albinos. True albinos have pure-white flowers and green leaves, without a trace of purple sap-colour, though green and yellow plastids are usually present in the flowers. As we have seen one or both of the colour factors C and R are absent in the germ-cells of these forms. On the other hand, false albinos, like Cypripedium insigne Sanderæ, C. Lawrenceanum Gratrixianum, Cattleya Mossiæ Reineckiana, and others, have a certain amount of purple sap-colour in the flowers and leaves, and are not true albinos, though, for practical purposes, they are usually called "albinos," and, in many cases, are quite as beautiful and as much sought after as the true albinos. In these false albinos both the colour factors C and R are present in the germ cells, and they give quite different results in breeding from the true albinos. These false albinos are really dilute-coloured forms, and the fact that they usually behave as Mendelian recessives in breeding shows that their condition is due to the absence of a factor for dense or full coloration, which factor is present in the typical coloured form.

The different kinds of dilution found in most species suggest that more than one factor is concerned in the typical dense form. This application of genetics to Orchid breeding explains a good many apparent mysteries. For instance, it explains why the false albino Cypripedium insigne Sanderæ breeds true to its special dilute form or throws true albinos when selfed, and yet behaves as if it were an ordinary C. insigne when crossed with the true albinos C. Maudiæ, C. Lawrenceanum Hyeanum, and C. callosum Sanderæ. These true albinos arose originally by the loss of a colour factor (C), but the factor for dense coloration (D) would still be present in those albinos though not manifested on account of the albinism. When this factor for dense coloration (D) is brought in by the cross it naturally causes the parent C. insigne Sanderæ to behave as if it were an ordinary C. insigne.

If these so-called "reversionary" forms were to be self-fertilised or crossed *inter se*, both the recessive dilute coloration (dd) and the albinism (cc) would appear in certain individuals. On the average, the dilute forms would be expected to appear in three out of sixteen plants, and the albino forms in four out of sixteen plants. The recent cases reported in which the true albino Cypripedium Lawrenceanum Hyeanum crossed with the false albino C. niveum gave typical coloured plants of C. Aphrodite, and in which the false albino C. niveum crossed with the false albino C. Lawrenceanum Gratrixianum gave the false albino C. Antigone album, are, of course, easily explained in the same way. To the student of genetics such cases as these present no difficulty.

Economics and Eugenics.

The application of the principle of genetics to Orchid breeding brings out an economic point of considerable importance, the appreciation of which should save the breeder a considerable amount of time, trouble and expense. From what we have shown, it is evident that no useful purpose can be served by the indiscriminate matings of complex hybrids, which are far too common in Orchid breeding. From the economic point of view, it is extremely doubtful whether it is really necessary to go beyond the mating of primary hybrids in Orchid breeding. We have seen that any two good qualities can be combined in this way in the second generation, in a single experiment, with two, three, or four species or genera.

If more than this be required, other parallel experiments can be carried out at the same time, and the respective results of the separate experiments can, if really necessary, be combined afterwards. For instance, experiment (1) might be carried out to make a Dark Scarlet Cattleya from Sophronitis grandiflora, while experiment (2) might be carried out at the same time to make an Orange Scarlet Cattleya from Lælia harpophylla. When these two shades of the Scarlet Cattleya are obtained in the second generation, they might be mated together in order to produce in the third generation a Scarlet Cattleya superior to both.

Another great advantage in the adoption of the method of parallel experiments will be that the special secondary hybrids obtained in this way will of necessity have a double dose of each of the two good qualities bred for, consequently they will be equally valuable for use as stud Orchids; being homozygous to the desired characters, they will breed true to themselves when selfed, and will give more definite and less variable results when crossed with one another.

The application of the principles of genetics to Orchid breeding leads one to conclude that, from the economic and eugenic point of view, the only sound method to adopt in Orchid breeding is to make a fresh start, by selecting a choice stud of the best individuals of the best varieties of the best species of the best genera, due preference being given to those stud individuals that have already bred a winner of the F.C.C. at the R.H.S., and have also proved themselves to be homozygous in their good qualities. These selected stud Orchids should be combined by crossing in every possible way, in order to make superior primary stud hybrids. Finally, these superior stud hybrids can be combined in any way that the breeder may think fit, in accordance with the particular objects he may have in view.

In the discussion which followed, Mr. de Barri Crawshay congratulated Major Hurst on his paper, and particularly on the pertinacity with which he insisted on the application of Genetics to Orchid breeding. Mr. de Barri Crawshay pointed out that the seedling mortality among Orchids is extraordinarily high, and introduces of necessity considerable disturbance in the numerical estimation of results.

Mr. O'Brien said that the elaborate and instructive paper given by Major Hurst raised subjects of great interest to Orchid raisers. One is the extreme variability and tendency to degenerate (for florists' uses) in complex hybrids. It is well known that, in many cases, the plants raised between two cross-breds of fine quality may be either bad, or only occasionally may a really fine novelty appear among them. It is this fact which excuses the raiser in asking a good price for a unique plant. With regard to the degenerates, he thought that it might be explained by Nature working in its own way. The showy development of the perianth was of secondary importance to the plant, the primary object of which is to exist, and the structural base is the essential condition for existence. In wide crosses, if one considers the great structural differences both in plant and flower between the two parents, it is not difficult to see that, in forming another being between them, a new base is required, and the energies are devoted to that purpose. The resultant plants have to make a fresh start.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

November 5.—*Present:* E. A. Bowles, M.A., F.L.S., Esq. (in the Chair); Sir H. Veitch, Prof. W. Bateson; Messrs. A. Rolfe, J. O'Brien, G. Gordon, R. Hooper Pearson, W. Hales, A. Worsley, and F. J. Chittenden (hon. sec.).

Horse-chestnut with twin petioles.—Mr. Bowles showed petioles of Horse-chestnut in pairs springing from a connate base, from his garden at Waltham Cross. Only two such specimens were found and the leaf-blades borne by them were quite normal.

Apples with more than normal seeds.—Mr. Chittenden drew attention to the production in some varieties of Apple of more than the normal number of seeds. The usual number of ovules produced by the Apple is two in each cell, and this is regarded as one of the chief characters separating Pyrus from Cydonia in which there are usually more than two. He had found in Frogmore Prolific Apple a large number of fruits containing more than two seeds in a cell, and the same in fruits of Duchess's Favourite. Prof. W. Somerville had first drawn his attention to the phenomenon some years ago in American Apples, but Mr. Chittenden had not hitherto seen it in British Apples. The seeds were borne in two series of two, one on each carpel margin.

Variations in wild flowers.—Mr. T. H. Dipnall sent the following list of variations which he had noticed in the form and coloration of British wild flowers :—*(Double flowers)* Ranunculus acris, Papaver Rhæas (one flower and another with all flowers semi-double), Cardamine pratensis, Saponaria officinalis, Silene noctiflora, Primula vulgaris, Sagittaria sagittifolia, Knautia arvensis (like a large lavender Thrift). Colour Variations : *(White)* Viola odorata (common and red also), V. canina, Lychnis Flos-cuculi, L. diurna, Geranium molle, G. lucidum, Ononis arvensis, Vicia sepium, Campanula rotundifolia, C. Trachelium, Myosotis sylvatica, Ajuga reptans, Lamium purpureum, Primula vulgaris, Orchis mascula, O. maculata, O. Morio, Gymnadenia conopsea, Ophrys apifera, Agraphis nutans, Fritillaria Meleagris, Adoxa moschatellina, Cnicus palustris, Centaurea nigra, Symphytum officinale. *(Pale yellow)* Ranunculus acris, Scrophularia nodosa, Sarothamnus (Genista) scoparius. *(Dull purple)* Papaver Rhæas. *(Pink)* Cratægus oxyacanthus, Calystegia sepium, Primula vulgaris, Lychnis vespertina, Erica cinerea (very pale), Veronica chamædrys, Centaurea nigra (very pale), Orchis Morio, Agraphis nutans. *(Blue)* Anagallis arvensis. *(Pale blue)* Agraphis nutans, Campanula Trachelium. *(Salmon pink)* Papaver Rhæas.

Catasetum macrocarpum, female flower.—Mr. G. Rae Fraser, Letchmore Heath, Herts, sent an inflorescence of Catasetum macrocarpum bearing five female flowers, from the same plant as the one exhibited on October 8, 1910. He remarked that the plant has made three futile attempts to flower since then, and at the fourth had produced the present spike. Mr. R. A. Rolfe reported that it agreed with the plant figured as Monacanthus viridis, by Lindley, in the *Botanical Register* (t. 1752), from a plant which flowered with Lord Fitzwilliam, at Wentworth, which is now known as the female of Catasetum macrocarpum, Rich. It is not, however, the original Monacanthus viridis, Lindl., which is the female of another species.

HORTICULTURAL CLUB.

NOVEMBER 5.—On this date, at the Hotel Windsor, the Horticultural Club held its monthly house dinner, under the chairmanship of Sir Harry J. Veitch, and there were present 35 members. Following the dinner Mr. F. Kingdon Ward, B.A., delivered a most interesting lecture, entitled "A Naturalist in Western China and Tibet," and illustrated by a large number of very beautiful lantern slides from photographs taken by the lecturer.

Mr. Ward, who will shortly return to China on another botanical expedition, accompanied the exhibition of the slides by explanatory remarks concerning the nature of the mountainous region which he traversed and the varied character of the plant life which all but pervaded it, the exceptions being considerable areas of arid waste which alternated curiously with adjacent regions where heavy rains fell for six months in the year.

The lecture was peculiarly interesting in the light it threw upon the reasons of this variation. A range of mountains 18,000 to 20,000 feet in height would, for instance, act as a rain screen by intercepting the rain-bearing winds from another range but a few miles distant, the result being that on the windward side the rainfall would be enormous but on the leeward extremely small. This, in its turn, greatly affected the character of the vegetation, as did also the winds engendered by different conditions and accentuated by the geographical contour of the land, tree-growth being suppressed or encouraged so that while one side of a valley was only clothed with scrub or dwarfed Rhododendrons, the other side might be densely wooded. The difference in shelter thus induced also altered the plants of smaller growth, which, however, in the shape of Alpine flora, particularly of the Saxifrage, Androsace, and Meconopsis or Poppy tribe, constituted a general and particularly rich field for research and a source, it is hoped, of many new additions to our collections. Some slides showing specimens of plants growing *in situ* evoked particular interest.

Views of the great River Yangtse Kiang and some of its affluents showed some magnificent gorges through which they had eroded their way, between cliffs of several thousand feet elevation. Happily, despite rumours of dissension between the various sections of the inhabitants of the widely-extended region traversed, and even of English invasion, Mr. Ward found hospitality of its rough kind to prevail throughout his travels, and met with no serious adventures.

In the subsequent discussion, however, in which Sir Harry J. Veitch and Messrs. Barr, Bilney, Druery, Hooper Pearson, and others participated, some very gruesome accounts of sights seen and perils encountered by other explorers, including Mr. W. Purdom, in the same regions were quite sufficient to demonstrate that the plant-hunter there practically takes his life in his hand, and has need to possess plenty of pluck and diplomacy in addition to the all-essential botanical knowledge required in such pursuits.

The next house dinner will take place on December 3, when Mr. Arthur W. Sutton, F.L.S., will lecture on "My Desert Camping Tour to Mount Sinai"; the lecture will be illustrated with 100 limelight views from original photographs taken by the lecturer.

CROYDON CHRYSANTHEMUM.

OCTOBER 30, 31.—The 25th annual show of this society took place on these dates in the Central Baths Hall. The large building was well filled with exhibits.

A challenge cup, valued at 12 guineas, was offered in the open class for 18 Japanese blooms. There were only two exhibits, and the 1st prize was awarded to WICKHAM NOAKES, Esq., Selsdon Park (gr. Mr. W. Howarth), whose flowers were Maud Jefferies, John Peed, Henry Poulton, Rev. R. D. Eves, Pockett's Crimson, Mrs. L. Thorn, Sir A. Rollit, Rose Pockett, Evangeline, F. S. Vallis, Splendour, Valeria Grant, Sir F. Crisp, Lady Talbot, Shanklin, White Queen, Mary Poulton, and Reginald Vallis. 2nd, G. A. ALLEN, Esq., Wynnston, Limpsfield, Surrey (gr. Mr. W. Fleet).

The President's cup, valued at five guineas, was offered in a class for 15 cut blooms of Japanese flowers in three or more varieties, open to growers living in a radius of five miles of Croydon Town Hall. There were eight exhibits. That shown by A. GOSHERON, Esq., Tennison's Road, South Norwood (gr. Mr. R. Gladwell), was placed 1st, followed by Mr. NOAKES and Dr. T. JACKSON, Thornton Heath (gr. Mr. W. Paulley), in this order.

The Epps Challenge Cup was offered for 10 Japanese blooms, shown by amateurs residing within the five-mile radius. It was won by Mr. L. WHITE, Braemar Avenue, Norbury. 2nd, Mr. C. C. HUNT, South Norwood. 3rd, Mr. F. M. PARRIS, Croydon.

The premier Japanese bloom in any exhibit was the variety Hon. Mrs. Lopes, shown by C. LAZENBY, Esq., Eden Park (gr. Mr. G. Fisher), whilst the premier incurved bloom was Romance, shown by Mr. W. PAULLEY.

In the open class for 10 blooms of incurved Chrysanthemums in two or more varieties, Mr. G. H. FISHER, Downs View, Purley (gr. Mr. T. Finch), was awarded the 1st prize for the varieties Buttercup and Mrs. G. Denyer. 2nd, Mr. W. PAULLEY.

Single varieties were well shown by Mr. G. FISHER, who won the 1st prize for three vases of any varieties arranged with any foliage. 2nd, Mr. T. FINCH.

For six plants of winter-flowering Begonias Mr. G. FISHER was placed 1st of five competitors.

The 1st prize in the class for nine foliage plants suitable for table decoration was won by Sir WALPOLE GREENWELL (gr. Mr. W. Lintott), and this exhibitor excelled in the classes for two bunches of Grapes and a collection of nine kinds of vegetables.

TRADE EXHIBITS.—THE BURNHAM NURSERIES, LTD., were awarded a Gold Medal for a collection of Apples. Messrs. W. WELLS & Co., Merstham, exhibited varieties of Chrysanthemums. Messrs. E. W. T. ROOERS, of Croydon, showed bulb bowls and bulbs growing in moss-fibre, also a new late Potato named "Vitality." Messrs. W. WOOD & SONS, Wood Green, showed horticultural sundries. Messrs. E. A. WHITE, LTD., exhibited Abol syringes and insecticides. Messrs. PASCALL & SONS, South Norwood, displayed flowerpots, whilst Mr. T. BUTCHER, Croydon and South Norwood, had a collection of floral designs.

PORTSMOUTH CHRYSANTHEMUM.

OCTOBER 30, 31.—This annual exhibition was held in the Town Hall, Portsmouth, on these dates. Competition was keen, and the quality of the exhibits in the various sections was quite up to the average of former years.

In the cut bloom section the leading class was for 36 Japanese blooms, in which eight competed. Captain DALGETY, Lockerley Hall, Romsey (gr. Mr. W. Baxter), won the 1st prize easily with large, well-staged flowers Prominent varieties were: the Hon. Mrs. Lopes, G. Hemming, Mme. G. Rivol, Eclipse, William Turner, F. S. Vallis, and Col. Lawrence. Sir RANDOLF BAKER, Ranston, Blandford (gr. Mr. A. E. Usher), was placed 2nd with smaller blooms.

Mr. MARTIN SILSBURY, Shanklin, Isle of Wight, the well-known raiser of new varieties, won the 1st prize in the class for 24 Japanese blooms; his finest varieties were Fred Green (a rich velvety-purple colour), Thos. Lunt (crimson), Queenie Chandler (soft primrose), Mrs. Gilbert Drabble (white), Queen Mary (white with a flush of pink), and Japan (yellow and orange); 2nd, PANTIA RALLI, Esq., Ashtead Park, Epsom (gr. Mr. G. Hunt).

For 12 Japanese blooms, distinct, five competed. M. HODGSON, Esq., Moreton House, Winchester (gr. Mr. A. J. Marsh), was easily 1st with splendid blooms of Frances Jolliffe, Maud Williamson, the Hon. Mrs. Lopes, and others; 2nd, W. GARTON, Sarisbury Court, Southampton (gr. Mr. Edwards).

The class for Japanese and incurved varieties mixed, 12 blooms of each type, was keenly contested. Mr. GARTON, who excelled, showed flowers of excellent quality.

Incurved blooms were not numerous, owing to the early date of the show. PANTIA RALLI, Esq., excelled for 24 blooms with shapely specimens of Romance, Calypso, Triomphe de Montbrun, Buttercup, C. H. Curtis, Mrs. Percy Wiseman, and other well-known varieties.

M. HODGSON, Esq., won the 1st prize for 12 incurved blooms, distinct, with specimens which were too large to show the best characteristics of the varieties; W. GARTON, Esq., was 2nd, and showed flowers of great refinement.

M. HODGSON, Esq., showed the best six bunches of single Chrysanthemums, distinct, having well-developed flowers of popular sorts; Mr. C. JOHNSON, Garner Street, Southsea, was placed 2nd.

Pompons were well displayed by Mr. H. SNOOK, 52, Fitzroy Street, Portsmouth, who included many old favourites in his 1st prize collection.

In the group classes Mr. R. BURRIDGE, florist, Portsmouth, won the premier prize for an exhibit occupying 60 square feet; his plants were dwarf, but the flowers were on the small side. Mr. J. JEFFREYS, Southsea, who was awarded the 2nd prize, had finer blooms, but the front of the exhibit was badly arranged.

Mr. RAPLEY, Warblington, Havant, showed the best dinner-table arrangement, utilising bronze and yellow Chrysanthemums with suitable foliage.

Exhibits in the fruit and vegetable sections were good. Captain DALGETY had the best Grapes, Muscat of Alexandria. W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. Ellwood), showed the best six dishes of Apples, and he also secured all the 1st prizes in the vegetable classes with one exception—Messrs. Toogood & Son's class—where he was placed 2nd to Mr. HOARE, Havant.

NON-COMPETITIVE EXHIBITS.—Messrs. SUTTON & SONS, Reading, staged 80 dishes of well-grown vegetables; the collection was much admired, and included Tomatos, Potatos, Cucumbers, Celery, Cauliflowers, Leeks, Beet, and Carrots.

The BARNHAM NURSERY Co., Barnham, staged three dozen dishes of well-coloured Apples of popular sorts.

PUTNEY, WANDSWORTH AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 6, 7.—The 35th annual exhibition of the above society, held in the Baths, High Street, Wandsworth, on these dates, was the most successful for many years past. Practically every class was well filled, and competition was keen. In the group class, plants of single and decorative Chrysanthemums were admitted for the first time, and this condition made it somewhat easier for competitors, so that a stronger competition resulted. The 1st prize, a silver cup and 20s., given by the tradesmen of Wandsworth, was won by Dr. LACROZE, Roehampton (gr. Mr. F. Cresswell); 2nd, Mr. R. H. VINCENT, Wimbledon; 3rd, F. FAULKNER, Esq. (gr. Mr. G. Cook). The class for a group of miscellaneous plants was also well contested, and the 1st prize was awarded to Mrs. BROWN, Wimbledon Park (gr. Mr. J. H. Payne); 2nd, Lord RATHMORE (gr. Mr. A. Scarlett). The most successful exhibitor in the classes for cut blooms was Mme. THUNDER, The Convent, Roehampton (gr. Mr. A. Smith), who was successful in the classes for (1) eight vases of Chrysanthemums, three blooms in each vase; (2) 24 blooms shown on boards; and (3) 12 blooms, six whites and six of any other colour. The Dowager Countess of KINTORE (gr. Mr. D. Anderson), J. F. SCHWANN, Esq. (gr. Mr. W. Gill), and G. G. ANDERSON, Esq. (gr. Mr. H. Barrett), were other prominent exhibitors in the classes for cut blooms. The class for vases of single Chrysanthemums attracted a large number of competitors. M. S. NAPIER, Esq. (gr. Mr. S. Mynett), won the 1st prize in the section for disbudded flowers, and Dr. HOFFMANN (gr. Mr. T. Dolley) in the class for flowers with the other buds present.

The Dowager Countess of KINTORE excelled in the class for a collection of six kinds of vegetables, and Dr. LACROZE in Messrs. Jas. Veitch & Sons' class for four dishes. Choice Apples and Pears were shown by Mme. THUNDER and J. F. SCHWANN, Esq. Extra prizes were awarded in these classes, there being so many fine exhibits. The best plants of Begonia Gloire de Lorraine were shown by M. S. NAPIER, Esq. Sir W. J. LANCASTER (gr. Mr. F. H. Goddard) was placed 1st for six table plants, and also for two bunches of black Grapes. J. F. SCHWANN, Esq., showed the best white Grapes.

NON-COMPETITIVE EXHIBITS.—Messrs. JAS. VEITCH & SONS staged a splendid group of flowering and foliage plants; Mr. L. RUSSELL, Richmond, put up a fine group of variegated shrubs; whilst Messrs. J. MANWOOD & SON and Mr. W. R. MANN, both Putney florists, exhibited floral designs.

TORQUAY DISTRICT GARDENERS'.

OCTOBER 31.—The annual autumn show of the above society was held in the large room of the Bath Saloons on this date.

The entries were above the average, and the competition was very keen in most of the classes. The 1st prizes in the classes for (1) a group of Chrysanthemums arranged in the form of a semi-circle; (2) a circular group of single Chrysanthemums; (3) six trained Chrysanthemums; and (4) three single trained plants were won by Mrs. LYON with very fine plants.

Col. CARY won the 1st prize in the class for six table plants in flower, whilst the 1st prize for six foliage table plants was won by Dr. QUICK, who also excelled for three flowering table plants.

The Chrysanthemum blooms were much superior to those of recent years. The premier collection of 24 Japanese blooms was shown by Mrs. LYON, who also won the prize for the best bloom in the show. This lady won 1st prizes in the classes for 18 Japanese blooms, 12 Japanese blooms in vases, six Japanese blooms distinct, 12 Japanese blooms in four varieties, six Japanese blooms of a yellow variety, six blooms of any colour, and six vases of single Chrysanthemums.

In the vegetable classes almost all the 1st prizes were won by Col. CARY, and in the fruit section the 1st prizes were shared between Col. CARY and Mr. P. P. ALEXANDER.

The nurserymen's exhibits added much to the attractions of the show. The DEVON ROSERY CO., Torquay, contributed a stand of floral arrangements of various flowering and foliage plants and about 50 varieties of Apples. Messrs. ROBERT VEITCH & SON, Exeter, had a fine collection of Carnations and other plants. Mr. W. B. SMALE, Torquay, staged two new Chrysanthemums, Henry Wood (deep red) and Mrs. M. Brockman (bright pink), and also showed greenhouse plants. Mr. R. W. HODDER, Torquay, exhibited some fine Cyclamen, Messrs BURRIDGE & SONS, Torquay, showed Chrysanthemums, Spiræas, Ericas and Lilium speciosum roseum.

SOUTHAMPTON CHRYSANTHEMUM.

NOVEMBER 5, 6.—This annual autumn show was held in the Coliseum, Southampton, and, although not quite so large as in former years, was a success.

PLANTS.—In the class for six distinct plants, each with not fewer than five blooms, suitable for conservatory decoration, J. C. E. D'ESTERRE, Esq., Elmfield, Southampton (gr. Mr. C. Hosey), won the 1st prize easily. Mr. F. G. BEALING, The Nurseries, Bassett, Southampton, was placed 2nd Single varieties were well displayed. The best exhibit of three was shown by an amateur, Mr. ALLAN COOPER, 115, Hill Lane, Southampton, who succeeded in beating Mr. BEALING. The varieties were Ceddie Mason, Mrs. Tresham Gilbey, Peter Plant, Tennyson, Sylvia Slade, and Polar Star. J. C. D'ESTERRE, Esq., had the best of three exhibits in the class for four bush plants grown naturally. In the amateurs' section for six plants of Japanese or Incurved varieties, Mr. C. JOYNER, 31, Cracknore Road, Freemantle, was awarded the 1st prize.

CUT BLOOMS.—In the important class for eight Japanese varieties, three blooms of each sort, shown in vases, there were three exhibits. Major CHICHESTER, Embley Park, Romsey (gr. Mr. W. Hall), was awarded the 1st prize for fine flowers of Frances Jolliffe, Mrs. L. Thorn, Master James, F. S. Vallis, and W. Turner. 2nd, J. C. D'ESTERRE, Esq. Major CHICHESTER was also 1st in the classes for two white-flowered varieties, three blooms of each, and two vases of a coloured variety.

Mr. BEALING was placed 1st for blooms other than single varieties arranged for effect.

Decorative varieties were also shown well by Mr. BEALING, who had the best collection of five: he also excelled in the class for six single varieties, disbudded in bunches. For six vases of single varieties not disbudded Mr. C. DYMOTT, Freemantle Nurseries, Southampton, was placed 1st.

Several classes were provided for blooms exhibited on boards. In the class for 24 Japanese blooms four entered. Captain DALGETY, Lockerley Hall, Romsey (gr. Mr. W. Baxter), won easily with handsome flowers well staged. 2nd, Major CHICHESTER.

W. GARTON, Esq., Salisbury Court, Southampton (gr. Mr. D. Edwards), had the best exhibit of 12 Japanese blooms distinct.

Incurved varieties were not numerous. M. HODGSON, Esq., Moreton House, Winchester (gr. Mr. A. J. Marsh), won the 1st prize in this section. 2nd, W. GARTON, Esq.

The premier Japanese bloom was the flower of W. Turner in Major CHICHESTER'S 1st prize collection in the vase class. The premier Incurved flower was C. H. Curtis, shown by Mr. HODGSON.

Table decorations were tastefully arranged. The 1st prize was won by Miss M. SNELLGROVE, Southampton, who employed bronze-coloured Chrysanthemums and suitable foliage.

FRUIT.—The best black Grapes were bunches of Appley Towers, shown by Major CHICHESTER, while Captain DALGETY contributed the finest white Grapes in well-ripened bunches of Muscat of Alexandria. ELLEN Lady SWAYTHLING excelled in the class for dessert Apples, whilst W. GARTON, Esq., was 1st in the similar class for culinary Apples. Major CHICHESTER was successful in the class for four dishes of Pears.

W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), won the leading prizes in the vegetable classes with superior produce arranged in good style.

Messrs. J. CARTER & Co., Raynes Park, exhibited a number of excellent vegetables, representing their many good strains of leading varieties.

Messrs. TOOGOOD & SONS, Southampton, had a smaller exhibit of vegetables.

CARDIFF CHRYSANTHEMUM.

NOVEMBER 6, 7.—The 26th exhibition of this society was held in the Skating Rink, Cardiff, on these dates. The show was an excellent one, for, although there had been more exhibits on some previous occasions, the quality all round was excellent, whilst the non-competitive exhibits were the finest ever staged. Chrysanthemums were, in most instances, excellent, and vegetables also were shown well, but fruit was rather disappointing.

In the Chrysanthemum classes there were two exhibits of 24 blooms of 12 Japanese and 12 incurved varieties, and the 1st prize was won by the Marquess of BUTE, Cardiff Castle (gr. Mr. Farmer). The 1st prize included the "Bell Harrison" Challenge Cup. The other exhibitor, Sir E. G. PHILLIPS (gr. Mr. Evans) was awarded the 2nd prize. Mr. H. A. ALLEN, Penarth, led in the class for 24 Japanese blooms in not fewer than 12 varieties, thus winning the "Courtes" Challenge Cup; 2nd, G. L. CLARK, Esq. (gr. Mr. J. E. Davies). There were several exhibits in the class for 12 Japanese blooms distinct; the 1st prize was again won by the Marquess of BUTE; Mr. ALLEN followed closely. Another good competition was seen in the class for 12 blooms, in not fewer than six varieties. The 1st prize was awarded to Mr. H. SKAMP, Penarth; 2nd, Mr. S. J. T. GRINTER. The "Empire" Challenge Cup, offered in the class for 12 blooms in not fewer than four varieties, was won by Mr. ALLEN with splendid flowers, including the varieties Mrs. A. T. Miller, Master James, F. S. Vallis, Bessie Godfrey, and F. Jolliffe; 2nd, Mr. H. EDWARDS, who was 1st in the class for six blooms.

INCURVED VARIETIES.—There were two fine exhibits in the class for 12 incurved blooms, distinct. The Marquess of BUTE showed the finer specimens; his blooms of G. F. Evans, J. Agate, Buttercup and Boccace were particularly fine: 2nd, Mr. EVANS.

BLOOMS SHOWN IN VASES.—In these classes were some of the best blooms in the show. The society offered a challenge cup in the class for eight vases, three blooms in each, and this was won by Mr. FARMER. The varieties included G. C. Kelly (a specimen of this variety was adjudged the best bloom in the show and was awarded the N.C.S. Certificate), Bessie Godfrey, William Turner, F. Mew, Lady Talbot, and White Australia. Mr. H. A. ALLEN was placed 2nd for a fine exhibit. 3rd, Mr. JOYS, Courtyrala Gardens. Mr. S. J. T. GRINTER won the Vivian Challenge Cup in the class for six vases with well-coloured, solid blooms of W. Gee, Lady Talbot, Master James, F. S. Vallis, and F. Jolliffe; 2nd, Mr. ALLEN. For a vase of five blooms of any white variety four exhibitors staged Mrs. A. T. Miller in fine condition, and the prizes were awarded to Messrs. L. E. TREHERNE, S. J. T. GRINTON, and H. EDWARDS in this order. Messrs. TREHERNE, H. EDWARDS, and H. A. ALLEN were successful respectively in the class for five blooms of a coloured variety. Beautiful flowers were staged in a class for one vase of single varieties, the finest by Mr. G. SCREEN, Penarth.

GROUPS OF PLANTS.—The class for a group of miscellaneous plants arranged in a space of 40 square feet attracted two exhibitors. Lady HILL, Rookwood, Llandaff (gr. Mr. Macintyre), showed the finer exhibit. Messrs. W. TRESEDER, LTD., Cardiff, were the only exhibitors in the class for single and large-flowering Chrysanthemums arranged with ornamental foliage plants in a space of 60 square feet. Mr. A. BROWN, Grove House Gardens, was the only exhibitor in the class for a group of Chrysanthemums arranged in a space of 50 square feet. Mr. S. J. T. GRINTER had no competitor in the class for single-flowered Chrysanthemums in a space of 40 square feet, and Mr. W. HATHERDALE was alone in the class for a group of Chrysanthemums in a space measuring 32 square feet. The 1st prize was awarded in each case. There were eight decorated dinner tables. Mrs. H. A. GERHOLD, Penarth, won the 1st prize with a tasteful arrangement, in which Carnations were chiefly employed. Mr. MACINTYRE showed the best 12 plants suitable for table decoration, and also the best six table plants. Mr. G. N. GERMAN won the 1st prize for six Orchids.

FRUIT.—In the class for six bunches of Grapes, in not fewer than two varieties, Sir JOHN GUNN, St. Mellons (gr. Mr. Dobbs), excelled with the varieties Muscat of Alexandria, Mrs. Pearson, Gros Colman, and Black Alicante; 2nd, L. E. TREHERNE, Esq. (gr. Mr. G. H. Brown). This gentleman led in the class for two bunches of Black Grapes. Mr. DOBBS was successful for six dishes of culinary Apples, whilst Mr. MACINTYRE excelled for six dishes of dessert Apples. For six dishes of Pears Mr. GERMAN secured the 1st prize.

Messrs. DOBBS, A. E. COLLIER, SHOULD and HASSY were prominent exhibitors in the vegetable classes.

NON-COMPETITIVE EXHIBITS.—The Earl of PLYMOUTH, St. Fagans Castle (gr. Mr. Hugh A. Pettigrew), staged a fine group of Begonia Gloire de Lorraine, which was awarded a Certificate of Merit. Messrs. S. TRESEDER & SON, Cardiff, were awarded the National Chrysanthemum Society's Silver-gilt Medal for floral designs, &c. Mr. P. THOMAS, Cardiff, showed floral designs, for which a Silver Medal was awarded. Messrs. WILLIAM TRESEDER, LTD., exhibited floral designs, Roses, Conifers and other plants (Gold Medal). Messrs. CLIBRAN & SONS, Cheltenham, were awarded a Silver Medal for an exhibit of Orchids. Both Mr. G. W. DRAKE, Cardiff, and Messrs. C. WILLIAMS & SON, Cardiff, received Certificates of Merit for exhibits of Chrysanthemums.

BRIGHTON AND SUSSEX CHRYSANTHEMUM.

NOVEMBER 5, 6.—The 30th exhibition of this society was held in the Dome and Corn Exchange on these dates. The exhibition was an excellent one, despite the fact that the classes for groups were not well contested. Fruit was well shown, whilst the vegetables were the finest on record. Trade exhibits, as usual, added greatly to the success of the show.

The 1st prize for a circular group of Chrysanthemums arranged for effect in a circle 8 feet 6 inches was won by Dr. TULK-HART.

For a similar group, to include Ferns and other foliage plants, the premier award, which included a silver cup and the Society's silver medal, was won by S. C. WHITING, Esq.

In the class for 12 bush plants of Pompons only, P. H. BAYER, Esq., won the silver cup and the society's silver medal offered as the 1st prize.

The cut-flower classes constituted the principal attraction. In the class for 36 Japanese blooms, in not fewer than 24 varieties, the 1st prize, which included a silver bowl and the society's silver medal, was won by G. L. WIGGS, Esq., Merstham, who showed excellent blooms of Master James, F. S. Vallis, Willie Rawlings, Purity, W. Mease, Mrs. Gilbert Drabble, F. Jolliffe, Frank Payne, and Mrs. L. Thorn. Colonel C. P. HENTY, Arundel, was

placed 2nd; Mrs. L. C. GOAD, Worthing, 3rd; and the Rev. F. S. SCLATER 4th.

The 1st prize in the class for 25 Japanese blooms was awarded to H. RAMSBOTTOM, Esq., Crowborough. His varieties included Thorpe Beauty, Mary Poulton, Mme. Rivol, Mrs. Chas. Beckett, Mrs. G. C. Totty, and George Mileham (1908); 2nd, Messrs. J. STREDWICK & SON, St. Leonard's-on-Sea.

For six large, Incurved blooms, distinct, Colonel C. P. HENTY was placed 1st.

Colonel HENTY also excelled in the class for six blooms of an Incurved variety with the variety Clara Wells; whilst for six Japanese blooms of one variety G. L. WIGGS, Esq., secured the premier award with Frances Jolliffe.

In the amateur classes Mr. F. WEST, Brighton, won the 1st prize easily in the class for a group of Chrysanthemums arranged in a space 8 feet by 4 feet; 2nd, Mr. G. FUNNELL.

For 12 Japanese blooms of any variety Mr. C. FOX, Tunbridge Wells, excelled; 2nd, Mr. J. E. JOHNSON.

WOOLTON CHRYSANTHEMUM.

NOVEMBER 6.—The 14th show of this society was held in the Church Hall, Woolton, on this date. The entries were somewhat fewer than usual, due partly to the early date of the exhibition and partly to the fact that certain exhibitors of former years have removed from the district.

The exhibits of cut blooms were excellent. In the principal class for 24 Japanese blooms, distinct, Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), won the 1st prize with a very fine exhibit. Mrs. CLARKE, Allerton Hall (gr. Mr. J. Clark), was successful for 18 varieties, and Mrs. SCHINTZ, Childwall Hall (gr. Mr. R. Hitchman), showed the best dozen blooms of Japanese varieties. In the class for 18 Incurved varieties, Col. J. B. GASKILL, Roseleigh, Woolton (gr. Mr. J. Stoney), was awarded the first prize, and Col. J. P. REYNOLDS, Dove Park (gr. Mr. G. Lowe), was the winner in the class for 12 varieties.

For nine vases of single varieties, nine blooms in each vase, A. S. MATHER, Esq., Beechwood, Woolton (gr. Mr. H. Howard), was successful; whilst for six vases of decorative varieties, Mr. G. HAIGH secured the 1st award. This exhibitor proved successful in the classes for four vases of incurved varieties and ten Japanese blooms in a large vase, and he was also awarded the N.C.S. certificate for his blooms of Buttercup and Hon. Mrs. Lopes. For vases of single blooms the 1st prize was awarded to D. CUNNINGHAM, Esq., Gorsey Cop, Gateacre (gr. Mr. W. Wilson). Interesting collections of bouquets, sprays and button-holes were staged; the chief prize-winners in this section were Mr. W. H. RICHARDSON, Camp Hill, and Mr. J. BARKER, Highfield.

In the fruit section Grapes were excellent. Mr. W. WILSON won the 1st prize in the class for Black Alicante, and Mr. J. HONEY showed the best Muscat of Alexandria Grapes.

Vegetables were excellent. The finest exhibit for a collection shown by a professional gardener was staged by Mr. R. HITCHMAN.

DEVON AND EXETER HORTICULTURAL.

NOVEMBER 7, 8.—The 212th exhibition of the above society was held at Exeter on these dates. Although the attendance was more satisfactory than last season, the exhibition did not attract so many visitors as formerly. The entries numbered 544, but here again there was a falling off; several of those who previously contributed exhibits have moved from the district, whilst the excellent exhibits from the late Rev. T. Sheepshanks, of Stokelake, were greatly missed. The outstanding feature of the exhibition was seen in the class for single Chrysanthemums, in which the President, Mr. P. C. M. Veitch, offered a silver cup. The trophy was won by Mrs. GIDLEY, Hoopern House (gr. Mr. W. R. Baker). A silver challenge cup was also offered by the Member for Exeter, Mr. E. H. Duke, K.C., and this was again won by Mrs. W. J. PEINO, Spreytonway, who, having won the cup three times, now retains it as her property.

CHRYSANTHEMUMS. — Mrs. GIDLEY was awarded the 1st prize for 12 blooms, and Mr. H. ST. MAUR, Stover Park, was successful for 18 blooms of Japanese varieties. The other prize-winners in the cut bloom classes were Mr. W. BROCK, Mr. J. W. HUSSEY, Mrs. HEARN, The Countess of EGMONT, and Captain RADCLIFFE.

The class for single Chrysanthemums in pots, in which the President's silver cup was offered, produced the finest group in the show. The trophy, as stated above, was won by Mrs. GIDLEY. The varieties included Sandown, Radiance, Peter Plant, Mensa, Charles Kingsley, Sylvia Slade, Cannell's King, Margaret Gray, Mrs. J. Hill, Leo, Mary Pope, Ceddie Mason, Metta, and Mrs. F. C. Hunter. 2nd, Mrs. H. H. WIPPELL, Ivy Bank (gr. Mr. Gould).

For a group of decorative Chrysanthemums arranged with foliage plants, Mrs. W. J. PRING (gr. Mr. J. Webber) was placed 1st, and thus won the "Duke" challenge cup for the third and final time. 2nd, Mr. W. BROCK.

FRUIT.—Captain MORRISON BELL, M.P. (gr. Mr. W. Worth), was the chief prize-winner in the Grape classes; he was awarded the 1st prize for Black Alicante, 2nd for White Muscat, and 1st for "any other variety," while he also staged the finest exhibit in the class for a collection of fruit. Mr. F. R. ROPP was placed 1st for White Muscat and 2nd for "any other variety" he was also placed 2nd in the class for a collection of fruit.

In the class for 24 dishes of Apples H. ST. MAUR, Esq., Stover Park, was successful; 2nd, the Countess of EGMONT (gr. Mr. T. Ley).

Captain MORRISON BELL, M.P., excelled in the class for a collection of nine varieties of Pears; 2nd, Dr. SAMIWAYS (gr. Mr. A. C. Williams); 3rd, Mr. F. R. ROPP.

Dr. SAMIWAYS showed a very fine dessert Pear under the name of President Roosevelt, of a blushing cream colour, very large, and almost citron-shaped.

VEGETABLES.—These classes were strongly represented, some grand produce being staged. Mrs. GIDLEY secured the 1st prize in the society's class for a collection, and in Messrs. Robert Veitch & Son's class for a collection. A. LYTHALL, Esq., and Dr. SAMIWAYS also won prizes in the vegetable classes. There were good exhibits in the special classes of Messrs. Sutton & Sons, Carter & Co., and Toogood & Sons.

TRADE EXHIBITS.—Messrs. ROBERT VEITCH & SON, Exeter, filled one end of the large Victoria Hall with a display of Orchids, Carnations, single Chrysanthemums, ornamental and flowering shrubs, and a collection of fruit of the best exhibition varieties.

Messrs. SAUNDERS & BISS showed models of their dry method of glazing. Exhibits were also staged by the DEVON ROSERY CO., Torquay; Messrs. TOOGOOD & SONS, Southampton; Messrs. SUTTON & SONS, Reading; and Messrs. JARMAN & Co., Chard.

STIRLING CHRYSANTHEMUM.

NOVEMBER 7, 8.—The 23rd annual show of the above society was held in the Albert Hall, Stirling, on these dates. The entries showed a slight decrease, but there were more competitors than usual.

The principal class for cut blooms was that for six vases, distinct, three blooms in each vase. Mr. SMALL, Norwood, Alloa, secured the premier award, namely, the cup offered by Captain Stirling, the Hon. President, with clean, well-finished bloome of good size; 2nd, Mr. A. S. WATT, Whiting Bay Hotel, Arran. Mr. SMALL also led in the classes for 12 blooms shown on boards, and six blooms, distinct. Mr. WATT won the 1st prize for (1) six white and (2) six yellow blooms; the latter were specially fine.

The specimen plants of Japanese and single-flowered varieties were not up to their usual standard, the one notable exception being the exhibits of Mr. HENRY GRAY, Park Terrace, Stirling, whose plants have never been excelled at any previous show. Supplementary plant classes were well filled, Mr. J. K. MESTON, Springbank, Stirling, being most successful. Messrs. CHAS. PALMER, Alloa, and DAN. CARMICHAEL, Stirling, also occupied leading places.

Excellent Grapes were shown by Mr. MITCHELL, Airthrey Castle, Bridge of Allan, his bunches of Muscat of Alexandria being amongst the best exhibited in Scotland this year. Mr. MITCHELL led in three classes for fruit, whilst Messrs. R. MCDONALD, Stirling, and WM. SMITH, Menstrie, each won a 1st prize in this section. Mr. MITCHELL showed excellent Pears, whilst Mr. J. BLACKLOCK, Blair Drummond, exhibited splendid Apples.

Vegetables made a meritorious display. Mr. J. K. MESTON led in the class for a collection; Messrs. J. MACDONALD, Touch, JAS. BIRRELL, Braco Castle, and D. MACFARLANE, Gargunnock, all showed well-grown produce.

The most successful amongst the amateurs were: Baldie MACINTOSH, Stirling, and JAS. STEVENSON, Bannockburn (plants); GEO. WATSON, Kippen, and M. CARRIGHAN, Gargunnock (vegetables).

Honorary exhibits were staged by Messrs. DRUMMOND & SONS, Stirling, who showed a large collection of Apples and Pears; Mr. JOHN CRAIG, Stirling, who arranged a table of flowering and foliage plants, and Mrs. TASKER, Stirling, who contributed early-flowering Chrysanthemums and Roses.

WINDSOR CHRYSANTHEMUM.

NOVEMBER 8.—The 21st autumn show of the above society was held in the Royal Albert Institute, Windsor, on this date.

Single Chrysanthemums are always excellent at these shows, and this year was no exception. A handsome challenge cup is offered by His Majesty the King for large Japanese blooms shown in vases, and this class attracted five competitors. Several classes were provided for Carnations.

The chief competition in the plant section was for a group of decorative Chrysanthemums arranged in a semi-circle. Three handsome groups were exhibited, and as they each reached to a height of 10 feet against the wall, the effect was very fine. F. RICARDO, Esq. (gr. Mr. G. West), won the premier award with grandly-flowered plants of such varieties as Ceddie Mason, Sylvia Slade, Bessie Pagram, Mensa, and Mary Richardson. Mrs. GERALD GOODLAKE (gr. Mr. H. Hearn), who was placed 2nd, had finer flowers, but the arrangement was not good.

CUT BLOOMS.—In the "King's" Cup class for eight varieties, three blooms of each in vases, the 1st prize was won by J. B. FORTESCUE, Esq., Dropmore, Maidenhead (gr. Mr. C. Page), with grandly-developed specimens of F. S. Vallis, Lady Talbot, Col. H. E. Converse, P. C. Kelly, Alice Lemon, and T. Mew. Mrs. GERALD GOODLAKE followed closely, whilst Colonel COX (gr. Mr. J. Orton) was placed 3rd.

A class was provided for 18 blooms, distinct, to demonstrate how the larger Japanese blooms may be utilised for decoration when cut with long stems and employed with foliage plants in small groups. Mrs. GERALD GOODLAKE was placed 1st with much the finer specimens, but the group was not so well arranged as that shown by Mrs. ADAIR, Adair Place (gr. Mr. W. Holder).

The best Incurved blooms were shown by Mr. FORTESCUE, who won in the classes for 12 varieties, distinct, and six blooms of any one variety.

For six vases of single varieties not disbudded, F. RICARDO, Esq., was 1st, staging popular varieties, each spray carrying about seven fully-developed flowers. 2nd, Mrs. E. B. FOSTER, Clewer Manor (gr. Mr. W. Cole).

Mrs. ADAIR won the 1st prize in a class for 12 Japanese blooms on long stems arranged in a vase with any natural foliage with a mass of Frances Jolliffe arranged with scarlet Oak and trails of Asparagus plumosus. 2nd, Mrs. GERALD GOODLAKE.

In the local classes the best 12 Japanese blooms were contributed by Sir E. DURNING-LAWRENCE (gr. Mr. W. Lane), whose bloom of His Majesty was of sterling merit, being the best of the bright coloured varieties.

In the Carnation classes F. RICARDO, Esq., was placed 1st for six plants and for three varieties, six blooms of each in a vase. This exhibitor also excelled in Mr. Dutton's class for six varieties.

T. PLOWRIGHT, Esq., exhibited the best 12 blooms in one vase.

FRUIT AND VEGETABLES.—Lord HILLINGDON, Uxbridge (gr. Mr. A. Allan), won in the classes for White Grapes and six dishes of Pears, whilst L. H. HANBURY, Esq. (gr. Mr. C. Frost), was placed 1st for six dishes Apples.

Col. Cox secured the premier place in both Messrs. Sutton's and Messrs. Carter's classes for six vegetables, with excellent Celery, Onions, Cauliflowers, Leeks, and Potatos.

NON-COMPETITIVE EXHIBITS.—Mr. CHARLES TURNER, Slough, showed 60 dishes of Apples and Pears, for which a Gold Medal was awarded.

Messrs. TITT & SON, 24, Thames Street, Windsor, staged wreaths, bouquets, and other floral designs.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending November 9, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—Much cloud was experienced over the whole Kingdom, and during the earlier days of the week rain was very general. Subsequently, however, little rain fell except in the north and west of Scotland.

The temperature was above the average, the excess being more than 4° in Ireland, and more than 3° in the north-west of England and the west of Scotland. The highest of the maxima occurred at most stations on the 7th or 8th, and ranged from 64° in Ireland to 57° in Scotland W. and England N.E., and to 53° in Scotland N. The lowest of the minima, which were recorded on the 3rd or 4th, varied from 22° in Scotland E., and 24° in England S.E. to 33° in England S.W. and Ireland S., and to 40° in the English Channel. During the greater part of the week the minima were high for the time of year. The lowest glass readings were 13° at Birmingham, 16° at Hampstead, and 17° at Kew. In various parts of the Kingdom the temperature of the earth 1 foot below the surface was rather higher than the normal, but at 4 feet it was below it at all stations except Clacton-on-Sea and Canterbury.

The mean temperature of the sea did not differ greatly from the normal generally, but at Aberdeen and Cleggan it was nearly 2° above it, and at Newquay nearly 2° below it. In most places the water was a little warmer than during the corresponding week of last year. The mean values ranged from 54° at Plymouth to about 45·5° at Burnmouth and Kirkwall.

The rainfall exceeded the average in Scotland N. and W. and Ireland N., and very slightly in England N.W. Elsewhere it was below. More than an inch fell over a large area in the north-west on the 4th; the largest amounts reported being 1·4 in. at Douglas and 1·7 in. at Lancaster.

The bright sunshine was much below the normal. The percentage of the possible duration ranged from 16 in the English Channel, and 15 in England S.W. to 5 in the Midland Counties, and to less than 0.5 in Ireland N. In all districts except Scotland E., England S.W. and the English Channel the mean daily duration was less than an hour. At West Linton and Armagh the week was sunless.

THE WEATHER IN WEST HERTS.

Week ending November 13.

A falling temperature throughout.—Since the 8th inst. the day temperatures have been gradually declining. On that day the highest reading in the thermometer screen was 56°, whereas to-day it is only 40°, or 16° colder. The night temperatures, on the other hand, although also declining, have been, as a rule, warm for the time of year. The ground is at the present time 1° colder at 2 feet deep, and 2° colder at 1 foot deep, than is seasonable, and 7° colder than it was at the latter depth four days ago. Rain fell on the last three days, but to the total depth of only a quarter-of-an-inch. A few flakes of snow were noticed on the afternoon of the 12th. There has been some percolation each day during the week through both the soil gauges, but the amounts have been small. The sun shone on an average for only 32 minutes a day, which is 1¼ hour a day short of the average duration for the same period in November. Two days were altogether sunless, and on three other days the sun was shining brightly for less than half-an-hour. The winds have been, as a rule, high, and on the 11th the mean velocity in the windiest hour reached 20 miles—direction W. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 4 per cent. *E. M., Berkhamsted, November 13, 1912.*

GARDENING APPOINTMENT.

Mr. DUKES, for 5 years Gardener to H. S. CHARRINGTON, Esq., Dover Club, Burton-on-Trent, as Gardener to Mrs. STEPHENSON, Burton House, near Stafford. (Thanks for donation of 2s. for R.G.O.F. box.—EDS.)

TRADE NOTICE.

MR. A. H. JOHNSON, of Erdington, Birmingham, a well-known member of the horticultural and agricultural seed trade, has joined the staff of Messrs. Hurst and Son, Houndsditch.

SCHEDULE RECEIVED.

Darlington Horticultural Society.—The autumn show of this society will be held in the Corn Exchange, Darlington, on Wednesday, November 20. Secretary, Mr. A. H. Harrow, Priestgate House, Darlington.

MARKETS.

COVENT GARDEN, November 13.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—The following varieties of English Apples are obtainable: Dumelow's Seedling (Wellington), Bramley's Seedling, Lane's Prince Albert, Newton Wonder, Cox's Orange Pippin, Allington Pippin, Warner's King, and Blenheim Pippin. Apples are arriving from Nova Scotia, Wenatchee, and California in large quantities packed in barrels and boxes. Many of the fruits are very showy and particularly well graded. Pears

from home growers and the Channel Islands are a limited supply; shipments of Pears from the Colonies include the varieties Keiffer, Winter Nelis, Magnifique, Easter Beurré, and very fine fruits of Doyenné du Comice. Home-grown Grapes have been a slightly better trade this past week, due to a falling off in the supplies. Cobnuts, Walnuts, Almonds and Chestnuts are all plentiful. English Tomatos are a good supply for the season of the year. Tomatos from Teneriffe are arriving in a better condition. Madeira Dwarf Beans have met with a slow trade this past week. Guernsey and Paris Dwarf French Beans continue very plentiful. Mushrooms, the bulk of which is sent from places on the South Coast, have been an irregular supply, but about sufficient for the demand. There is a large supply of vegetables of all kinds. *E. H. K., Covent Garden, November 13, 1912.*

Potatos.

	per cwt. s.d. s.d.		per bag. s.d s.d.
Bedfords	4 0– 4 6	Dutch	2 9– 3 6
Kents	4 6– 5 0	Belgian	3 0– 3 9
Blacklands ...	3 6– 4 0		
Lincolns ...	3 6– 5 0	German	3 6– 4 0

REMARKS.—Trade remains quiet. Best tubers are in demand, but there is a slow trade in the commoner samples. The consignments are about the same as last week, and there is no alteration in prices. *Edward J. Newborn, Covent Garden and St. Pancras, November 13, 1912.*

Obituary.

HENRY GROVES.—We regret to record the death of this gentleman, which occurred on the 2nd inst. at his residence, Clapham, after a long illness. Mr. Groves was an accomplished botanist, and with his brother James was regarded as an authority on the Characeæ. He was a councillor of the Linnean Society. The ninth edition of Babington's *Manual of British Botany*, issued in 1904, was edited by the brothers Groves.

ALEXANDER DYER.—The death is announced of Mr. Alexander Dyer, for a number of years seedsman and gardener at Kittybrewster, Scotland. Mr. Dyer formerly conducted the business now carried on by Mr. Jas. Robertson, seedsman, Kittybrewster.

Answers to Correspondents.

*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

A GARDENER'S NOTICE: *M. E. S.* It is customary for a head gardener to give or receive a month's notice on terminating an engagement. With regard to the payment of railway expenses after an employe has left your service, we do not think you would be liable, as no agreement was made to this effect at the time the engagement was made.

BEGONIAS UNHEALTHY: *H. S.* and *W. W. P.* There is no disease present to account for the decay of the plants. The trouble has been caused by too much moisture. Keep the plants and their surroundings drier and admit air whenever the weather is favourable.

BRITISH FLOWERS IN INDIA: *Barr* and *Hunter.* You ask for a list of British flowers that will grow in India. The question is of such a general character that it is a difficult one to answer. India presents such a wide range of climatic conditions, from dry and humid intense heat to intense cold, that much depends on the situation. British flowers—that is, British wild flowers—flourish in the hill stations, and, indeed, many of the genera and species are common to the two countries. Taking the flora of the Simla district, for example, of the 659 genera, 244 are also represented in the wild flora of Britain; and 173 of the species are the same in the two countries. Similarly the hardy, cultivated flowers (fruits and vegetables) of Britain are successfully grown in India. You should consult Firminger's *Manual of Gardening for Bengal and Upper India*, Woodrow's *Gardening in India*, or Macmillan's *Handbook of Tropical Gardening and Planting.*

CAMELLIA: *H. J. C.* The Camellia flower, obtained from a cross between C. Donckelaarii and C. reticulata, is of very large size, and the rich deep-red colour with salmon shading is very beautiful. We cannot state whether it is distinct from varieties already in cultivation.

CHOICE CONIFERS: *A. E. T. R.* In rearranging your large bed of Coniferous trees you should not overlook the value of the pendulous kinds, such as Juniperus recurva and Retinospora filifera and its golden variety. The glaucous form of the Deodar is Cedrus Deodara argentea. The following is a short list of "slow-growing Conifers, which are either of compact or pyramidal habit":—Picea excelsa var. clanbrassiliana, P. excelsa var pygmæa, Cupressus Lawsoniana var. Allumii, C. L. var. erecta viridis, and the many other varieties which have silvery, golden or white-and-green foliage. The garden genus Retinospora will furnish you with a number of forms you require, which you will find in the catalogue of any nurseryman who specialises in these trees. If your soil is well drained, Athrotaxis cupressoides and A. laxifolia will be hardy. Other uncommon species are Cupressus thyoides, Pinus beuvronensis. Cephalotaxus pedunculata var. fastigiata, Libocedrus decurrens, Tsuga Pattoniana, and Picea polita. Picea pungens glauca var. Kosteriana is probably the best of the Spruces with silvery foliage, but its rate of growth is likely to be too great; we have not found the pendulous form to be altogether satisfactory; the branches exhibit too great an upward tendency. There are several golden forms of Taxus baccata var. fastigiata (Irish Yew), which you will find useful, and the monstrous form of Cryptomeria japonica, known as C. japonica var. monstrosa or as C. j. var. spiralis, is very interesting. Of the various Junipers, we should select Juniperus Sabina var. procumbens, J. excelsa var. stricta, J. communis var. fastigiata, and J. c. var. alpina aurea.

DISEASED VINES: *J. B.* The roots of the vines submitted to us for examination are very badly infested with the Vine Phylloxera (Phylloxera vastatrix). It is a very bad case, and we strongly advise you to remove all the old soil from the borders and dress the brickwork with a strong solution of paraffin emulsion, applied hot. The pest being a notifiable one, you should inform the Secretary of the Board of Agriculture and Fisheries of its occurrence on your premises.

ERRATUM.—The inscription under fig. 160 in last week's issue should read as follows:—Samples of seeds of two sulphur-white strains compared with those of a pure cream (Princess Mary) and a pure white. (A) Seed of pure breeding cream (Princess Mary); (C) seed of pure breeding white; (B and D) seeds of two sulphur-white strains. B strain: Seeds large, regular, flat, like those of the pure cream. These are mixed as to colour, and can be sorted, the browner seeds giving the single whites, the yellower seeds the double creams. D. strain: Seeds small, irregular, and all brown, like those of the pure white.

GRAPES WITH SUPERFICIAL MARKINGS: *Old Subscriber.* The spots on the berries are not due to disease. The injury may have been caused by rubbing or scorching.

GRUBS ATTACKING CYCLAMEN: *A. G.* The grubs that are attacking your plants are the larvæ of the weevil. It is sometimes difficult to kill these pests without causing injury to the plants: turn the plants out of their pots occasionally and pick out all larvæ that are visible with a pointed stick, and destroy them. If this treatment proves ineffective, shake the roots entirely free from the soil and larvæ, and then repot the plants in an uncontaminated compost. Place traps of pieces of vegetable, such as Carrot or Potato, near where the damage is done, and examine them at night, as weevils are most active when it is dark. Another way of killing the grubs is to turn the roots out of the pots, and spray the soil with carbon-bisulphide.

NAMES OF PLANTS: *Hope.* Francoa appendiculata.—*A. B. S.* Ornithogalum lacteum.—*Horsley.* 1 and 2, Thymus Serpyllum; 3, Acæna Novæ-Zelandiæ; 4, Saxifraga Aizoon.—*Miss E. L.* Cerinthe major.—*H. Burton.* 1, Cydonia Maulei; 2, C. japonica.—*A. B. A.* Pyrus Torminalis, one of the most interesting and uncommon of British trees.—*W. B.* 1, Olearia Forsteri; 2, Eugenia apiculata.—*D. and W. C.* 1, Smilax aspera; 2, Escallonia pteroladon.—*J. H.* We do not undertake to name varieties of Michaelmas Daisies or other florists' flowers. You should send them to some grower who can compare them with plants in his collection. We have done the best we can for you. 1, Aster Novi-Belgii variety; 2, A. Amellus var.; 3, A. Lil Fardell; 4, A. Novi-Belgii var.; 5, A. Novæ-Angliæ var.; 6, A. Novi-Belgii var.; 7, Sirius.—*In Notepaper Box (no letter).* 1, Codiæum irregulare; 2, C. Weissmannii; 3, C. Johannis; 4, C. variegatum; 5, Dracæna concinna; 6, Helxine Solierolii.—*S. and S.* Euonymus alatus.—*Old Subscriber.* Rhus Cotinus, Whig Tree.—*G. H. S.* Solidago nemoralis var. incana.—*L.* Agrostis vulgaris var.—*Enquirer.* Schizostylis coccinea.—*F. F.* 1, Brassia verrucosa; 2, Maxillaria tenuifolia; 3, Oncidium pubes; 4, O. cheirophorum.—*M. K. B.* 1, Eriobotrya japonica; 2, Acacia dealbata (Mimosa); 3, A. armata; 4, Edwardsia microphylla; 5, Spiræa callosa; 6, Eupatorium Weinmannianum; 7, Salvia Horminum; 8, Nerium Oleander; 9, Lygodium scandens; 10, Polypodium glaucum; 11, Oplismenus undulatifolius variegatum; 12, Centranthus ruber var. alba; 13, probably Phaius grandifolius; 14, Begonia glaucophylla. It was a difficult matter to identify your specimens. You should number each.—*A. B. C.* Cymbidium pendulum. The leaf of Phalænopsis shows "spot" or Orchid disease, probably induced by excessive heat, especially at night. Remove damaged leaves and keep cooler and tolerably dry until new growth commences, when put into a warm, moist house.

ORCHIDS MARKED: *Eremurus, Darlington.* The injury to the leaves is known as "spot," caused by condensation of water on the leaves, and by the night temperature being too low in proportion to the day temperature.

PHASEOLUS CARACALLA: *L. G. P.* Commonly known as the Snail Flower, from its curious, spirally-twisted flowers, is best raised from seed which may be purchased from the nurserymen. The seeds should be sown in early spring, and germinated in a moist, intermediate house. The seedlings should be grown in a rich, open soil in rather large pots, or they may be planted out when large enough, and trained on wires or string in a position close to the glass. Little or no shade is required, the aim being to obtain strong, vigorous growths, as the plant seldom flowers unless in robust health. Should the plants show signs of exhaustion, feed them liberally with cow manure, or an occasional application of artificial manure. Syringe the foliage once or twice daily in hot weather, and guard against the presence of red spider, which is particularly fond of this plant, and unless checked will speedily ruin it. It is better to raise fresh plants from seed each spring than to keep the old plants over the winter. Never allow the plant to become so dry at the roots as to cause flagging; aim at keeping the soil just moist, sufficient to cause it to bind together when squeezed in the hand.

SECOND-HAND GARDENING BOOKS: *J. B. M.* Insert an advertisement in the gardening papers, or write to Messrs. Wheldon, Great Queen Street, London.

SLUGS ATTACKING TULIP BULBS: *W. J. A.* The best plan to adopt with slugs is to place Cabbage leaves as traps, and examine the leaves when it is dark. Slugs are particularly fond of the stalks of Cabbage and other greens. If soot and lime are mixed and sown over the ground at the rate of 1 peck or 1½ peck per rod, it will be found that this will do much good if the applications are repeated occasionally. Waterings with clear limewater or water containing 1 ounce of carbonate of ammonia to the gallon may be applied over the plants and ground. This will cause the slugs to come up to the surface of the ground, when they can be easily collected and destroyed. Sulphate of iron has often been recommended for destroying slugs, using 300 kilos. (660 lbs.) to the hectare (2½ acres prox.).

THE POLLINATION OF FRUIT TREES.

THE spring frosts of this year were very disastrous to experiments in pollination, but a certain number of artificial pollinations have been accomplished on lines similar to those described in a previous article (*Gard. Chron.*, October 28, 1911, p. 299).

The experiments which I have made since the date of that article prove that the following Plums are self-fertile:—Monarch, Oullin's Gage, Golden Transparent, Gisborne Red, Magnum Bonum, Warwickshire Drooper, Common Damsou, Bradley's King Damson, Glastonbury Damson, and two other Damsons known as Prune Damson.

Those which have proved self-sterile include Prune Damson, Pond's Seedling, Curlew, Mallard, President, Grand Duke, Stint, Golden Gage, and French Prune.

The list of self-fertile Plums is not so complete as it might be, for owing to damage by frost, new results obtained outside the fruit house could not be taken as positive. There is evidence, both from analogy and from the results of Plum hybridisation undertaken by Messrs. Laxton Bros. in the past, to show that self-sterility is a simple unit character, self-fertility being recessive, and that the heterozygote, when self-fertilised, sets a fruit here and there, as do Mallard and River's Early Prolific. Breeding has shown beyond a doubt that the latter Plum is heterozygous.

I have found this year that even in the common Sloe there are both sorts, fully self-fertile and absolutely self-sterile.

One Cherry, other than Morello, has proved an exception to the general rule, for Late Duke is quite self-fertile, and has yielded a fine crop of seed. The Cherries Morello and Kentish were tested as to their ability to pollinate other Cherries efficiently, and proved efficacious in that respect, though it will be remembered that Andrew Knight raised hybrids from the Morello which proved sterile.

An experiment was undertaken to discover to what extent the wind may pollinate a *self-fertile* Plum. The result, though marred by frost, was quite in accordance with what Messrs. Lewis and Vincent found with regard to Apples. One of two young standard trees of Victoria was enclosed in muslin of a mesh sufficiently small to exclude bees and large flies, but large enough to admit wind quite freely. This tree bore one Plum, while the uncovered tree bore about a quarter of a crop, and but for the frost would doubtless have been heavily laden.

This shows then that, whether a tree be self-sterile or not, *insects are absolutely necessary for efficient pollination.*

In the controversy constantly waged between the advocates of the hive bee and those of the wild bee, it would seem that sufficient notice has not been taken of the weather obtaining at pollination time. As in so many cases in controversies of this kind both protagonists are right, for in bright, sunny weather, with a gentle breeze, the bees working may be 75 to 90 per cent. hive bees, but if the weather be dull and cold, pollination is done exclusively by wild bees and flies, which work much more readily under adverse weather conditions than do hive bees.

I am much indebted to the Toddington Orchard Co., on many of whose trees I have experimented, and to Mr. C. S. Martin, manager, who has given me every assistance in my experiments. *W. O. Backhouse.*

THE ALPINE GARDEN.

CAMPANULA × PROFUSION.

I NOTICE that Mr. Farrer, in his recent work on *The Rock Garden* (Present-day Gardening series), associates this pretty, late-flowering hybrid with C. cæspitosa, more generally known as C. pusilla. I do not know Mr. Farrer's reason for this, C. pusilla had nothing whatever to do with the variety, and, so far as I know, no plant of that species was within a mile at the time the cross was made. The history of the hybrid is as follows:—I had been endeavouring for several years to obtain crosses between C. isophylla and C. carpatica vars. as pollen parents and C. pyramidalis var. as the seed bearer. I believe I persisted for five successive years before getting a fertile seed. Unfortunately, in the year of securing seed, the tags marking the parentage became detached, and I therefore had to make a guess as to the pollen parent. I formed the opinion from the position of the capsule, that C. carpatica was the male parent; but, since the plant has become more developed, I have come to the conclusion that it was C. isophylla. This is made more obvious by the foliage when the plant is grown under glass, and is less apparent when the plant is cultivated in the open. There is no doubt about the seed parent—that was a white-flowered C. pyramidalis. The strangest part of it all is that the hybrid is a diminutive in both flower and foliage of its presumed parent, and no one would dream of C. pyramidalis being in any way connected with it. Virtually, indeed, it is not. There are two varieties in commerce named Profusion: the one a self-coloured flower, the other a sky-blue, mauve-shaded variety. It was the self-coloured flower to which the R.H.S. Award of Merit was made in August, 1896. The presence of the two plants under one name is due either to two seedlings having been pricked off together or to a seed vegetating subsequently. Of course, there was only one flower colour when the plant was certificated. A few days later I attempted a further cross, and soon afterwards sold the plant to the late Mr. Selfe Leonard, conditionally that he should await delivery till the seed ripened. The attempted cross was, however, a failure, and no seed was produced. In the meantime, however, flowers of the shaded variety appeared, and, though I tried to eliminate the plant, some roots must have survived, and, being presently propagated, got into commerce. The shaded or blue-and-mauve variety is, I believe, the more plentiful; possibly, too, the more charming. Both, however, are good, free, and late-flowering, and both show the characteristic trailing habit of C. isophylla, though it is more highly developed in the self-coloured variety, which I may refer to as "Profusion No. 1." For autumn effects in the rock-garden both seedlings are desirable, and, being distinct, should be planted freely. *E. H. Jenkins.*

NOTICES OF BOOKS.

THE GENUS EUCALYPTUS.

WE have before us two additional parts of J. H. Maiden's *Critical Revision of the Genus Eucalyptus*, namely, xv and xvi. The first treats of Eucalyptus oleosa, E. Gillii, a new species, and E. falcata, and contains plates 65 to 68. E. oleosa is an exceedingly variable species, of wide distribution, to the illustration of which three very full plates are devoted. Part xvi deals with a larger number of species, though the number of plates is the same. A new variety of E. oleosa is named Floctonii, "in honour of Miss Margaret Flocton, the accomplished artist of my *Critical Review of the Genus Eucalyptus and Forest Flora of New South Wales.*" It is good to acknowledge the merits of the artist whose work adds so much to the value of a monograph such as this; but Mr. Maiden does not explain why he ignores the usual feminine termination (E. Floctoniæ), thus failing to make it clear that his artist is a lady. Of the 12 other species described and figured in this part, six are Maiden's species, namely, E. Le Souefii, E. Clelandi, E. Stricklandi, E. Griffithsii, E. Pimpiniana, and E. Woodwardi, here figured, at least, for the first time. We have copied the names as published by Maiden, from which it will be seen that the author does not follow the usual rule in forming his genitives. Pimpiniana is derived from "Pimpin," the native name. The remaining species are: E. decurva, E. corrugata, E. Campaspe, E. diptera, and E. grossa. In many ways this is an interesting number—the third which has appeared this year, and we congratulate the author on the fact. So far, 88 species have been dealt with in 72 plates.

DAIRY-FARMING.*

IN so far as science is organised knowledge this little book cannot be called scientific. It is more in the nature of a natural growth in response to an open invitation given to members through the medium of *The Dairy World*. As might have been expected, like other natural growths, it contains a good many weeds and

* *Dairying and Dairy-Farming*: by Members of the Dairy Students' Union.

weeds of the same sort, and the reader cannot help wishing that the editor had used the hoe and pruning knife more freely to admit of the fuller development of the many admirable productions which it contains. The president remarks in his introduction that "our minds have to be trained to discriminate," and from this point of view the book undoubtedly offers educational facilities.

The notes by Messrs. R. H. Evans, J. W. Tayleur, and G. W. Walker-Tisdale will be found very valuable to those framing courses of elementary lectures on dairy-farming, &c., and some of the examples given are very striking. Mr. J. C. Newsham's articles are very good, especially No. 5 on the construction of cow-sheds, but more space is required for the development of his article on "Some Poisonous and other Plants Affecting Milk."

Many of the articles are much too sketchy, particularly those by Messrs. W. Newton and C. H. Page on "Notes from a Milk Factory" and "The Uses of Casein"; this fault is carried to an extreme by Mr. John Porter, who recommends "the use of concentrated sulphuric acid for the 'Gerber' milk test."

The publication of the book has called forth many valuable little articles, such as that by Miss Jean Mason on "Buttermaking," by J. C. N. on "Cheesemaking," and last, but not least, that by Miss Dora Saker on "Cheese-making Records," a practical investigation which is worthy of further development.

Many useful notes are given at the end of the book, which, as a whole, will provide interesting reading and valuable references.

CAPE HEATHS.

At a recent meeting of the Royal Horticultural Society, Sir George Holford exhibited on behalf of his sister, Countess Grey, a collection of cut flowers of Cape Heaths. They had been brought in surprisingly fresh condition from Caledon, in Cape Colony, where Lady Grey saw them at an annual show of wild flowers. They comprised about 40 species, and as only very few of them were recognized by those present at the meeting, they were sent to Kew, where they were named by Mr. N. E. Brown. Two turned out to be new, and it is proposed to name them E. Greyi and E. Holfordii. A list of the species is given below. It will be seen that, although very few of them are in cultivation in England now, they have nearly all been grown at Kew and in other British gardens at some time or other.

(1) (2) (3) (4) (5) (6)

FIG. 167.—SOUTH AFRICAN ERICAS.

(1) E. glenna grandiflora. (2) E. colorans. (3) E. Walkeria. (4) E. perspicua. (5) E. regia variegata. (6) E. campanulata.

The history of the South African Ericas as British garden plants may be described as meteoric. When Philip Miller published his *Dictionary of Plants* in 1768 they were unknown to gardeners. They were among the many good garden plants collected in South Africa and sent to Kew by Francis Masson, "the first and one of the ablest and most successful of the numerous gardeners sent out from Kew to collect living plants for the garden." That was in the years from 1772 to 1795. The first species to be figured in the *Botanical Magazine* was E. grandiflora, t. 189 (1792), where it is described as "one of the many new and beautiful species which within these few years have been sent from the Cape by Mr. Masson." This was followed by E. cerinthoides, t. 220 (1793), and by the end of the century 15 species had been figured in that work, including such beauties as E. ventricosa, E. Massonii, E. retorta, E. Aitoniana, E. vestita, &c. Cape Heaths soon became popular, and they were not only grown well, but they were also crossed with each other. Writing in 1843, Dean Herbert declared that a considerable number of Cape Heaths which had been looked upon as species were garden hybrids raised in this country by Rollison, of Tooting, and others. Aiton's *Hortus Kewensis*, Ed. II, published in 1811, enumerates 126 species as being at that time in cultivation at Kew.

During the first half of the 19th century, Cape Heaths were prime favourites as greenhouse plants. Loudon wrote of them in his *Magazine:* "Of what other genus can it be said that every species without exception is beautiful throughout the year and at every period of its growth—in flower or out of flower—and of every size and age? Suppose an individual had the penance imposed on him of being forbidden to cultivate more than one genus of ornamental plants, is there a genus he could make choice of at all compared to Erica? —perpetually green, perpetually in flower—of all colours, of all sizes, and of many shapes." Gardens were famous in those days for their collections of Cape Heaths, as they are in these for Orchids. Kew possessed a great collection; so also did the Botanic Gardens, Edinburgh; George Hibbert, Clapham; E. A. Woodford, Vauxhall; J. G. Angerstein, Blackheath; Messrs. Lee & Kennedy, Hammersmith; Richard Williams, Turnham Green Nurseries; and Messrs. Loddiges, Hackney. There was a large heathery under glass in the Duke of Bedford's garden at Woburn Abbey, and Professor Dunbar, Edinburgh, had the finest collection in Scotland. William McNab superintendent of the Royal Botanic Gardens, Edinburgh, one of the most successful growers of Cape Heaths, wrote a treatise on their propagation and cultivation, which was publish in 1832. Loudon, in *Hortus Britannicus* (1830), enumerates no fewer than 565 species and hybrids as having been cultivated in England, 348 of which had been figured in Andrews's *Heathery*, the *Botanical Magazine*, and other works. The raisers of hybrids were Messrs. Rollisson, Turnbull, Marnock, and the McNabs.

It is evidence of the decline in favour of these plants in the latter part of the 19th century that the last to be figured in the *Botanical Magazine* was E. Chamissonis, t. 6108, in the year 1874, where the decadence of the Cape Heath cult is the subject of comment. "The best collections of the present day are mere ghosts of the once glorious Ericeta of Woburn, Edinburgh, Glasgow, and Kew. Very many species have indeed fallen out of cultivation, and a few easily-propagated hybrids for decorative purposes are all that are to be seen of this lovely tribe."

The excitement and interest displayed over the collection of flowers shown by Lady Grey may be taken as evidence of a desire to restore Cape Heaths to popularity. The only good reason one can adduce for their loss of favour is that their culture is special and, compared with that of the majority of greenhouse plants, difficult. But the same may be said of Orchids. McNab, in his treatise, maintains that when their requirements are understood, Cape Heaths are quite as easy to manage as other greenhouse plants. Forty years ago there were considerable collections of species and hybrids in cultivation in the nurseries of Messrs. Low & Co., Clapton; John Fraser & Sons, Lea Bridge; and Jackson & Sons, Kingston, where they were grown in ordinary frames without any special effort by men who had been trained to provide the right soil and conditions, which were simple enough. It would not be difficult to start afresh by obtaining seeds from the wild plants in Caledon and other parts of the Cape where they still abound. According to Bolus, the showiest species are found on the mountains, which they colour as our native Heaths do our moors and hill-sides. They are most abundant in the narrow strip of country between the western coast and the coast ranges,

which was the special botanising ground of Masson and other collectors of Cape plants. Caledon is in the centre of this district.

The following is a list of species of Erica bought from Caledon, Cape Colony, by Countess Grey, and shown at a meeting of the R.H.S., October 8, 1912:—

W. W.

THE MARKET FRUIT GARDEN.

The Sequel to Aphis Attacks.

In pruning Apple trees at the present time, the injurious effect of the great attacks of aphis of the past summer is distressingly in evidence. Shoots that were badly infested are dwarfed, twisted, and often covered with sticky growths. They should be cut back below their deformed parts to a good wood bud. If left unpruned, they would be covered with blossom and probably with fruit next season, but their growth would be permanently stopped, and only inferior Apples would be borne by them. The contrast between the appearance of a young and vigorous tree which was not attacked by the aphis and that of a tree which was badly infested is very striking. As stated on previous occasions, the aphis does more harm in my orchards than all other insect pests combined. I can almost entirely extirpate Apple suckers and caterpillars; but the aphis can claim the victory every season, in spite of any amount of spraying, and this statement applies to Plums as well as to Apples. If anyone could discover a wash which would prevent the mother queen aphides from starting the breeding campaign on trees, he would be a great benefactor to fruit growers. It is possible that a strong nicotine wash, applied as a preventive to aphis attack, as well as immediately after one had been begun, would have a good effect. At the present price of nicotine, however, the expense would be prohibitive. Next season, it appears, the growth of Tobacco, under certain conditions not yet made known, will be allowed. If the conditions are not such as to be practically prohibitive, this will be a great boon.

Continued Low Prices for Apples.

The Apple crop must have been a bigger one than early reports led anyone to anticipate, as the markets continued to be glutted up to the end of October. It was known that early varieties cropped heavily, and some mid-season sorts also yielded well. But the continued glut was partly due to the premature marketing of late varieties and partly to the checking of the demand by retail fruiterers, whose prices have been out of all fair proportion to wholesale rates. In the third week of October I sent some fine Lord Derby Apples to a large seaside market, and got a return of only 3s. per bushel for well-graded firsts, from which rail expenses and 6d. for commission had to be paid. In the same week, in the same town, greatly inferior fruit was ticketed at not lower than 3d. a pound in ten fruiterers' shops which were inspected, or at the rate of 10s. a bushel. Possibly the shops which cater for the lowest class of trade may have sold Apples at a lower price; but the demand from well-to-do people must have been checked greatly by fruiterers charging them more than three times as much as growers received. By such checking of the consumption, an artificial glut in the market is produced, seriously to the injury of growers.

British and American Apples

Another point in connection with prices is that first-class American and Canadian Apples have been making more than first-class British fruit, well graded and packed. The former have been quoted up to 6s. a bushel for cooking varieties, or 1s. more than English fruits, which are vastly superior—at least as big, more juicy, and better flavoured. This was the case also with Blenheim Orange. Consumers, apparently, pay attention only to size and appearance, ignoring quality and flavour. *A Southern Grower.*

FOREIGN CORRESPONDENCE.

CULTIVATION OF ALPINE PLANTS AND ORCHIDS.

Having read with much interest M. H. Correvon's article on the cultivation of Alpine plants in the south (see p. 263), perhaps I may be permitted to relate my experience in connection with their cultivation here in Naples.

It may be a matter of surprise to your readers to hear that I have come to the conclusion that the conditions of culture of two such different sets of plants as Alpines and Orchids are subject to the same rules; but my experience points towards this conclusion. In October, four years ago, I visited the Botanical Garden at Dresden, and saw some Orchid plants cultivated in bare stones, and apparently doing very well. This was of the greatest interest to me, as my few Orchids were not in a satisfactory condition, owing to my not having been able to obtain proper Sphagnum-moss and other necessary materials. On my return, therefore, at the beginning of November, I repotted my whole stock—perhaps 30 or so pots—in small pumice-stone, having first thoroughly washed the roots in water. During the winter I could perceive no improvement, but in the spring I was delighted to find that young, healthy growth was being made by the Calanthes and Phaius (Japanese species, such as Calanthe discolor, C. citrina, C. japonica, Phaius Blumei, P. grandifolius, and P. maculatus), also by Cypripedium insigne, C. villosum, C. Harrisianum, Lissochilus Krebsii, and L. graniticus.

These are all terrestrial Orchids; and I was curious to know whether the epiphytes were doing as well as these. I had received some time before, from a friend, a very poor specimen of Cœlogyne cristata; it had only three small pseudo-bulbs, hardly larger than Sweet Pea seeds. During the period of growth following my experiment the bulbs were found to be as large as Hazel Nuts, and now, in the second year, they are the size of large Walnuts. I tried the same experiment with Odontoglossums and Cattleyas, and the growth is in every case satisfactory.

This method of cultivation is very simple; the merest amateur could carry it out with success. The chief point to remember is to give a large quantity of water in the morning and evening, and none at all during the day; the stones I use are very porous and hold sufficient moisture to last 10 or 12 hours.

After attaining to such success with Orchids, I felt inclined to try my hand with Alpines, such as Campanulas. I obtained a small collection, consisting of C. pulla, C. pulloides, C. pusilla. C. pusilla alba, C. elatinoides, C. Raddeana, and others, and planted them in stones, sinking the pots in soil among other plants, in a half-shady place under some Orange trees. I was astonished at the splendid growth and the fine, well-developed blooms. The roots have now filled the whole pot; and, though it is only a short time since they were planted, there is quite a carpet of young plants. I have applied the same method to our beautiful Campanula fragilis, and also to Woodwardia orientalis and W. scolopendrium.

I employ pumice-stones which were thrown up in the eruption of Vesuvius in the year 79 A.D. If any of your readers would like to make an experiment with them, I should be quite willing to send a small quantity by post. *Willy Müller, Hortus Nucerensis, Nocera Inferiore, Italy.*

FORESTRY.

SEASONABLE WORK.

Before beginning to plant it is, of course, necessary to bear in mind for what purpose the planting is to be done: whether to beautify the landscape or to provide cover for shooting or hunting. If the former object is intended, the chief consideration should be the nature of the landscape, in order that any fresh feature provided by planting may be in harmony with the surroundings; if the latter, the following directions may be of some use:—

At the commencement, a fence should be erected round the site decided upon, and to it wire netting should be fixed. This should project into the ground for some 6 inches at the bottom, in order to keep out rabbits, which do a good deal of damage to young trees. Inside the fence a quickset hedge should be planted; this, if given proper attention, will become a strong barrier by the time the covert has matured. There should be a distance of at least 10 feet between the hedge and the first trees in the plantation.

The best material for covert planting consists of Hazel, common Ash, and Spanish Chestnut, and these trees suit almost any soil. The Chestnut gives the quickest result, being of a fast-growing nature. A few standard trees and Conifers should also be planted amongst the underwood at intervals of about 30 yards. When planting these, it is a good plan to drive a stout stake into the ground as a support.

It may be well to say here that orders for planting should be given early, but, when ordering, it should be expressly understood that the trees are not to be lifted until they are wanted. Many failures in planting are the result of the trees having been out of the ground too long. A great deal of work should be done before the trees arrive; for instance, the holes should be dug ready to receive them. For planting Hazel, Ash, and Spanish Chestnut the holes should be 15 inches square and 10 inches deep. The same size should also be allowed for Larch, Austrian Pine and Scotch Fir, unless the trees are more than 2 or 3 feet in height, when the roots will probably require rather more room.

With regard to the labour required for digging holes, a satisfactory solution to this problem may be found in the method of piece-work. A very fair price would be 15s. per 1,000 holes. Any man who is in the least efficient can earn at this rate a fair wage, and do the work well and thoroughly. A simple way of checking the size of the holes is to measure the sole of the boot, and, when walking over the ground, to place the foot occasionally in a hole of doubtful size. *Arthur Gooding.*

THE HEATHER BEETLE.

Of late years this beetle has been so on the increase in Scotland that the Heather over large areas has been killed outright by its attacks. It was first noticed in Scandinavia in 1866, and in Scotland about nine years ago. During the past two years, however, it has increased at an alarming rate and large areas of heather, particularly in Ayrshire, Lanarkshire, and Renfrewshire, have been completely killed by the beetle.

The beetle in size and shape resembles the better known Pine beetle, but is of lighter colour, yellowish brown with a black head, and less than a quarter of an inch long. *A. D. Webster.*

PROBLEMS OF PROPAGATION.*

(Concluded from page 3.)

Resinous Cuttings.

Another problem confronts the gardener when he attempts to propagate by cuttings plants which are full of resin, as are so many of the Coniferæ. It was said for a long time, and is said even now, that propagation by cuttings of many Conifers is not possible. The impracticability of such propagation from the point of view of commerce we may admit in the case of many coniferous genera. As a fact of science all can be propagated. One essential difficulty in the way of propagation by cuttings of some of these plants—e.g., Abies and Picea—for commerce lies in this, that the terminal shoot alone gives a good radially impressed offspring. The dorsiventrality of the lateral shoots is so engrained in the organism that it reappears in the product of a cutting from a lateral shoot. And so propagation by cuttings does not in many genera spell multiplication.

The Coniferæ generally do not form callus freely. Pines and Firs do not develop stool-shoots, and this has been suggested—although

Fig. 168.—Rooted cutting of Pinus.

it is not valid—as an obstacle to their propagation by cuttings. All of them form some callus (fig. 169). Far more of an obstacle is the resin. Deficient as they relatively are in the usual means—callus—which Nature provides for protection of wound-surface, the Conifers have acquired another means of protection—resin. This when it exists flows out copiously on an injured surface, covering it as effectively as does callus with a hard skin. The significance of this in propagation will be readily appreciated. The cut surface of the cutting bleeds and the resin exuded hardens over it and any callus there is, thus forming an effective obstacle to the exit of young rootlets. What then is the propagator to do? Simply scrape off the resin-skin. Most Conifers so treated, and under the application of the wound-stimulus of paring the callus, propagate freely (fig. 163). Of all of them Pinus seems to be the most obstinate, but it also yields to treatment, e.g., plunging the end of the cutting in nearly boiling water (fig. 169).

Dicotylous plants with resinous or milky juice are in like case with Conifers, and require to be treated after the same fashion.

A great outflow of the resin or juice from the cutting is damaging. Luting of the cut end by placing in water or by rapid drying of the exuded resin or juice prevents the risk of loss.

Cuttings of Monocotyledons.

The propagation of monocotylous plants by cuttings brings us in contact with some striking features in which they differ from dicotylous plants, and I am disposed to think that possibly the difference I am about to describe may have been one of the reasons for the prevalent idea that some of these monocotyls do not propagate by cuttings.

In illustration take the case of Asparagus. Here, as in monocotyls generally, a short terminal portion of the shoot will give no result. A larger branched twig must be severed for use as the cutting. Placed in the required conditions, it exhibits phenomena fundamentally diverse from those shown by the dicotyl:—

(a) First of all no callus is formed. Only a skin of cork is produced to cover the wounded surface.

(b) No roots are sent out from the stem by the cutting.

(c) A bud in the axil of the lowermost leaf on the cutting (or of it and of the one immediately above it) begins to enlarge, and as it does so from its base emerge new rootlets. This enlarging bud is the beginning of the new plant that is to come from the cutting. As the bud spreads laterally it sends up aerial shoots, and as these develop the portion of mother-shoot used as a cutting withers and dies off. It takes no share in the formation of the new plant.

This distinctive difference in behaviour of dicotyls and monocotyls is no chance one. It belongs to phyletic history, and is of the essence of the constitution of the two groups of plants. Dicotyls begin with a terminal plumule. Monocotyls begin with a lateral plumule. From the beginning the dicotyl has the instinct of upward terminal growth, and that means rapid growth. From the beginning the monocotyl displays lateral growth, and that means sluggish growth.

The habit thus early shown by these two classes of plants is impressed upon them, and reappears in the stages of vegetative propagation by cuttings. The terminal shoot of the dicotyl extends as the new plant from the cutting. A lateral bud develops as the new plant in the monocotyl and the terminal portion of the cutting dies.

There is a further interesting point to note here:—A wood-cambium, such as occurs in dicotyls, is absent from monocotyls. Yet in some tree and shrubby forms monocotyls make a wood-cambium of a special kind, for example Dracæna. Correlated apparently with this divagation from the ordinary monocotyl type in the direction of the dicotyl, the terminal portion of the shoot when cuttings are made elongates, and forms an extension of the severed shoot after the fashion of the dicotyl.

It is usual when selecting a portion of the mother-plant for the purpose of making a stem-cutting to include at least one node, because it is there that a shoot-bud actually in evidence or latent will be found, from which the new extension will proceed. But in some plants such selection is unnecessary. Any portion of an internode may be used as a cutting. Take for instance Acanthus. In such cases the shoot-bud for extension is an entirely new formation from the callus.

The root, like the stem, offers a part from which cuttings can be made, and it is frequently used for the purpose, especially in the case of plants whose propagation otherwise has proved more difficult—for instance Calycanthus, Cladrastis, Ailanthus, and others—and also in some cases where an earlier result is desired than can be obtained by a stem-cutting—as in Spathodia campanulata.

Propagation from Roots.

In the use of the term "root" I refer to the true root. It is difficult when reading gardening literature to determine, in many cases when propagation by roots is spoken of, the sense in which the word is used—whether as including all underground parts of plants, or the root in its strict botanical sense.

Propagation by root-cuttings is governed by the same principles as are involved in shoot-cuttings. There is callus-formation on cut surfaces as on the shoot. There are, however, no nodes and internodes offering regions of selection, and this is correlated with another feature in the root which operates to promote the success of cuttings. The spots whence branch-roots normally arise in the root are not confined to definite intervals on the length of the root. They come off from the pericycle of a primary root apparently as required by the plant. Fewer develop than the capacity of the root provides for, and there is thus an ample reserve, any of which may develop when needed. The shoot-bud is here a new formation, and may come from the callus or from the pericycle of the root.

Any root with adequate substance and food-supply may be used for propagation under suitable stimuli.

We have seen how in nature—e.g., in Bryophyllum—vegetative propagation may be carried on through the leaf itself without the stem, and I have described how the leaf may be ancillary to the stem in the case of a shoot-cutting by

Fig. 169.—Cuttings of Pinus sylvestris, showing callus formation.

assisting in the formation of roots if it be left at the base of the cutting. It has then clearly potentialities for use as a cutting itself, and you are all doubtless familiar with the fact in the multiplication of Lilies from the scale-leaves of the bulb. It is a common garden practice. Here the leaf is a tuberous food-store. Moisture and other necessary conditions suffice to stimulate callus-formation at the severed surfaces whence the new plantlets arise—beginning always as bulblets.

Propagation from Leaves.

An illustration of the principles governing propagation by leaves is offered in nature by Zamioculcas Loddigesii. The leaves when shed exhibit no particular feature indicating their special dedication to the purpose of propagation, but after they have become detached from the plant the leaves remain green and active, and the food-material which they contain at the time of their fall accumulates at the cut surface, and is there devoted to the formation of a large tuberous callus from which roots develop, and then a vegetative shoot-bud is extended to form the rhizome of a new plant.

Different as the leaf is from the stem, the procedure in its utilisation for propagation is the same. It does not produce new leaves—it produces shoots. Given the possession of adequacy of active indifferent cells, that is to say, cells not already impressed with a definite morphological destiny and a sufficiency of food, then in

* The eighth Masters Memorial Lecture delivered by Professor I. Bayley Balfour, F.R.S., at the meeting of the Royal Horticultural Society, on June 4.

proper conditions of moisture, aeration, and temperature any leaf may be used as a cutting.

The practice of using leaf-cuttings is an old one, and was followed more in the past than now—Citron, Lemon, and Laurels were so propagated by the Romans. Nowadays, however, it is restricted by gardeners to a comparatively small number of facile forms—such for example as one finds in Begonia, Melastomaceæ, Gesneraceæ, Crassulaceæ, where there is substance and abundant water in the leaf—soft-wooded plants one may call them. Although thus limited in use, the method of propagation from leaves is one which the gardener should not underestimate. Apart from the fact that it is, when easy, an economical method—inasmuch as many plants

FIG. 170.—CROP OF TOMATOS GROWN BY MR. J. A. BARKHAM, RYDE.

may be obtained from one leaf—there is another practical point I wish to mention. It offers a means of obtaining quickly flowering specimens. A leaf from near the flowering region in a Begonia, for example, used as a cutting will give plants that flower earlier than can be otherwise obtained than by the cutting of the whole flowering shoot. For a really adequate scientific explanation of this interesting phenomenon we must await further experimental work.

In leaf-propagation there is, however, one difficulty which has doubtless been in the way of its more frequent use. Root-formation takes place freely from the callus of the wound of the leaf as a rule. But the formation of the new shoot-bud is often retarded. I have pointed out that in stem-cuttings, which have the shoot-bud ready on the stem awaiting the vivifying impulse of a water-supply from new roots, the exuberant callus may be slow in forming roots or refuse to do so until the further application of the wound-stimulus by paring of the callus. Here in the leaf it is the new shoot-formation that is retarded—for example, in Ficus elastica, Camellia, and Hoya carnosa. Why exactly this should be is one of those problems of propagation of which we have not yet the solution. Stimulus of callus-paring operates in hastening if the callus be large, but that does not seem to meet the whole case. There is, indeed, evidence that the quality of food-material may be an influential factor, and that possibly an acid state of the plastic material may be requisite for shoot-formation in the circumstances. Further experiment is required. If research should prove that the quality of pabulum is an efficacious stimulus the importance of the discovery from the practical gardening standpoint would be great, and its bearings would extend beyond the immediate matter of propagation by leaf-cuttings.

From the standpoint of practical gardening the time at which a cutting is taken is a matter of considerable moment in many cases. In the outlook my thesis compels me to take, it bulks less largely because the colonial organisation of the plant lends itself so readily to adjustment to artificial treatment and stimulus that I might—with perhaps a large reservation—say not only that all plants can be propagated by cuttings but also that most plants can be propagated at any period under right conditions—that is to say, conditions which secure that the activity of the formative cells is adequately preserved while the stimulus to growth is applied. The risk in selection of an unfavourable period is correlated with the condition of the food-supply, the conversion of which means probable delay in striking with the attendant danger of wilting.

Principles and Practice.

In the case of many plants of temperate regions which strike readily, no special preparation for securing rooted cuttings is necessary, and success is easy if due attention be given to watering.

To other plants, and particularly those of warm countries, and other plants of special features, more attention must be given, and in general terms one may say that there are two outstanding lines of practice suitable with or without modification for individual plants, and characterised by the manner in which water is supplied and the temperature maintained. They may be designated:—

1. Overhead watering in full sunshine.
2. Under-root watering in shade.

The first method is for cuttings that do not suffer readily from water on their crowns, and is more rapid, and more effective. The sun's rays have evidently a stimulating influence other than that implied in the heat unit, and are more decisive in promoting energetic growth than the suffused heat derived by the cutting from the water alone under the second method.

The second method does away with all the difficulties that attach to damping-off from excess of moisture on the surface of the cutting, and also from intermittancy in consequence of variations in temperature of the water, and for plants which are woolly the safeguard against overwatering is sometimes critical.

I have confined myself to dealing with some of the matters that seem to me to lie at the foundation of the idea expressed in my text—"It is well known that many plants cannot be propagated from cuttings"—and to endeavour to show how some at least of the difficulties experienced by propagators are not a consequence of inherent qualities in the plants themselves, and that therefore by method in propagation they may be overcome. In what does that method consist?

(a) In maintaining adequate water-supply in the cutting until it is able to absorb for itself.

(b) In applying stimuli to encourage the development of the new water-absorbing organs—and in other cases to promote the development of the shoot.

(c) In securing adequate aeration of the rooting end of the cutting.

Therein is the essence of propagation by cuttings.

Much investigation will be required before we are able to prescribe for all desirable plants what is the best procedure for their vegetative propagation from the gardening standpoint.

For some years in Edinburgh investigation of the kind required has been in progress, and I have drawn largely upon the work of Mr. Laurence Baxter Stewart, the enthusiastic plant propagator, whom I am so fortunate as to have on my staff, as well as upon the work of one of my pupils—Miss Bertha Chandler—who has been engaged for some time in working out the details of propagation and preparing a story of principles and methods in which will be incorporated with the results of her own experiments a record of methods advocated by propagators as these are preserved in periodical literature and books on gardening. I hope that the record will be in a sufficiently advanced state for publishing next year, and that it may convince gardeners of the incorrectness of the commonly accepted notion conveyed in the text from which I have spoken.

A FINE CROP OF TOMATOS.

THE crop of Tomatos illustrated in fig. 170 was grown by Mr. J. A. Barkham, Ryde, who has kindly supplied the following particulars:—The variety is named Magnificent, and was raised from a cross between Carnation and Winter Beauty. The fruits are of good colour and shape, and average from four to six to the pound; owing to the small number of seeds, there is a considerable amount of flesh. The plants were raised early in February in a temperature of 55°, and, when the seedlings were large enough to handle, they were potted singly in small pots in a mixture of loam, leaf-mould and sand. They were afterwards shifted into 4½-inch pots, and when large enough planted in the borders.

SOUTH AFRICA.

THE NARRA FRUIT.

THE British Territory of Walfish Bay, on the West Coast of South Africa, forms part of the South African Union. It is the poorest and most desolate portion of the Union, consisting of nothing but shifting sand dunes. There is no drinking water, only a few water-holes yielding a brackish, nauseous fluid, which frequently gives out; at the Bay Settlement all the necessary water is supplied by the Government condensing station. The district covers an area of about 1,080 square miles, but the population is naturally very small, consisting of a few white inhabitants stationed at the bay and about 800 Hottentots.

The nature of the territory prevents anything but the poorest of floras. The daily south-western hurricane covers the ground with heavy sand; the salt air kills any plants which may survive the sandstorms, with the result that no vegetation can exist, with the single exception of the Narrah, or Narra, plant [Acanthosicyos horrida.] As may be imagined, this hardy denizen of a blighted territory is protected in a very special manner from the enemies which have annihilated every other plant in the region. The plant is a Pumpkin, and belongs to the Cucurbitaceæ; but, unlike other Pumpkins, it has no leaves. The foliage atrophies as soon as it appears, and from each node a pair of long, sharp thorns is produced. The root strikes deeply—30, 40, and even 60 feet—into the sand, until it reaches moist ground, and in order to avoid being covered by the sand, the growth is tremendously rapid, and enables the plant always to push up above the surface. In this respect, the absence of leaves is naturally a great advantage, as foliage would provide a ready surface for deposits of sand.

The fruit forms in October, and reaches maturity about Christmas, lasting until the end of March. It is about the size of a small Water Melon, and contains 60 or 70 seeds, or "pips" as they are called. The seeds are highly nutritious and very palatable; they taste like fine nuts, and are frequently used as Almonds. The natives are in the habit of selling them, usually boiling them first. The flesh of the Narra, when ripe, is of a pale cream colour, sweet, but with a trace of pleasant acidity, and almost liquid. The fruit, which can be divided into sections like the Orange, contains large quantities of sugar, and is highly nutritious, forming the staple—indeed almost the sole—food of the Hottentot inhabitants of the district. The people are in the habit of staking off small plots on which the Narra grows. The plots are handed down from father to son, and the owner for the time being strictly preserves his rights over the harvest. Those who are too idle, or too unfortunate, to have established any such claim, wander about in families from sand-dune to sand-dune, plucking and eating the fruits of unappropriated plantations. As the Narra fruits mature very quickly, the natives have adopted the following method of preserving them:—The Narras are boiled in a pot to a thick soup, and, while still liquid, pressed through a crude sieve composed of a woven basket. The liquid runs through on to the dry, sandy ground, where it forms into huge pancakes which are dried hard by the sun. The seeds are left behind in the basket, and are subsequently sold by the natives in Cape Town, where the merchants dispose of them as "nuts" or "Almonds."

The large, flat cakes, when thoroughly hard and dry, are rolled up (sand and all), and kept as provision for the winter. Sometimes they are eaten in this condition, chunks being cut off, as from a roll of tobacco. The substance is so tough that only a Hottentot, who is accustomed to use his teeth for this purpose from early youth, can bite it, and so astringent that it causes considerable burning and swelling of the palate and gums to anyone who is not used to it.

Sometimes the dried cakes are boiled before use; the result is a thick brown soup, at the bottom of which is formed a sediment consisting of the starch, which separates from the other constituents.

Perhaps it is hardly necessary to state that the Hottentots have discovered a method of producing an alcoholic substance, resembling beer, from the Narra. For this purpose the fruits, when ripe, are laid out in the sun for two or three days. They are then pressed to extract the juice, which is boiled into syrup. No addition of sugar is necessary; but in order to supply a slightly bitter flavour and to assist fermentation, a little of the root is scraped into the syrup. This root, by the way, is often used by the natives for medicine. It is extremely bitter, and it is said that even the odour is enough to turn milk sour. Certainly a drop or two of the juice of the fruit is sufficiently acid to coagulate milk immediately, though, strangely enough, this property is possessed only by the ripe fruit.

It has already been noted that the Narra seeds resemble Almonds, and if the raw seeds are pressed between stones a fine, fragrant oil is obtained. Naturally, when boiled, much of the oil is lost. Even after the oil is extracted, sufficient nourishment (of an albuminous nature) is retained in the seeds to make them a valuable food for poultry.

In conclusion, I may say that most of the above particulars were supplied to me by Mr. V. von Gerard, the magistrate at Walfish Bay, one of the few European residents in the district. *C. G. Willson, Uitenhage, Cape Province, S. Africa.*

NEW ROSES.—III.

(Continued from p. 365.)

RAYON D OR (Aust. Hyb., Pernet Ducher, 1910).—This Rose is said to have been raised as a cross between Mme. Mélanie Soupert and Soleil d'Or. By universal consent on its first appearance it was regarded as a fresh break among Roses. Its special feature is the colour of its flowers, which are a deep canary yellow, sometimes almost golden yellow. This colour is clear and uniform, and, though no doubt paler in autumn, it is much less washed out by the autumn rains than is that of most of the yellows. The habit of the plant is branching, the young stems are a nice brown and the foliage a dark and very glossy green. It seems proof against mildew, but not against black spot—though I fear I might ask whether there is any Rose that is proof against this fell disease, and get no satisfactory reply—it is rather a dwarf grower, my plants being about 1 foot 6 inches to 2 feet 6 inches high, and flowers quite continuously during the season. I think there has hardly been a day during this summer and autumn without a flower in my little bed of some half-a-dozen plants, but I have seldom seen a mass of flowers out at a time. The flowers are fragrant, but as a rule have little beauty of form. In this respect, we are hoping great things of Mrs. George Beckwith, of which we had a glimpse at the International, and when it comes we trust it may add to the colour of Rayon d'Or some beauty of form in the flower. Till then, we must do our best with what we have, and few will do wrong in growing a little batch of this bright yellow Rose.

SHEILAGH WILSON (H.T., Dr. J. Campbell Hall, 1910).—This is really a semi-climber, its growth being nearly as strong as that of Reine Olga de Wurtemburg. It has been described as a perpetual Paul's Carmine Pillar. It is certainly perpetual, and generally carries some flowers, but it is hardly as bright as Carmine Pillar, and seems to suffer rather badly from mildew. Still it is a step in advance and worth growing as a perpetual climbing or pillar Rose until we can get a better.

SIMPLICITY (H.T., Hugh Dickson, 1909), said to be a seedling from Kaiserin Augusta Victoria. This is a white Rose with large flowers which are single or nearly so. Several flowers are produced at the top of the stems, and they open successively. It is a very beautiful flower at its best and useful in the garden, but it is not altogether easy to have it at its best for indoor decoration without taking some trouble. The difficulty is that a great part of the charm of the flower lies in the contrast of the yellow stamens in the centre with the white petals, and these stamens rather soon go to a dirty brown, when the freshness of the flower is gone too. It is, therefore, necessary to make up one's mind to sacrifice a few flowers and cut the blossoms just before they open, removing any that are fully expanded, and then allow the flowers to open indoors. It is a good upright grower, carrying its flowers well, with good foliage, and it makes a beautiful and useful garden plant.

THERESA (H.T., A. Dickson & Sons, 1910).—The striking colour of the summer flowers is the feature of this Rose. It is a deep apricot orange, but very variable even on the same plant. In autumn, one may sometimes pick a flower which is quite buff yellow. This Rose makes a nice shrubby little plant of symmetrical outline about 2 feet 6 inches to 3 feet high. The foliage is plentiful, but the leaflets are not large, and it is rather given to mildew. Curiously enough my plants suffered more from this disease in the dry year of 1911 than in the wet one of 1912. The flowers are only semi-double and wanting in form. Though fairly free flowering it is not quite continuous, but gives several crops during the season. It is not an indispensable Rose, but for those who have room for it Theresa will afford a good deal of interest and pleasure in the course of the year.

WHITE KILLARNEY (H.T., Waban Rose Co., 1909).—This is a creamy white sport from the well-known Killarney, and like its original it often gives a most beautiful and perfectly-formed flower. It is also a good garden plant, and the flowers show up well in the borders. It is a good grower, but naturally, having regard to its origin, is somewhat prone to mildew; the flowers, however, do not suffer so much as do the pink ones of the parent when the plant is attacked. Mildew, moreover, may always be kept in check by a little timely and persistent syringing. White Killarney is quite fragrant.

VELUVEZOON (H.T., Baron von Pallandt, 1909).—This strikes me as quite a good garden Rose, but it seems little known, for I do not remember seeing it in any garden but my own. It is a good grower, free from mildew, of nice branching habit, and has large, full and well-shaped flowers which are carried well on the plant. The colour of the flowers is bright carmine rose with a certain amount of yellow at the base and specially on the reflexes of the petals. The shade of colour is perhaps the weak point of this Rose, but the yellow shading tends somewhat to relieve a colour which otherwise might be thought rather crude. For those who have room to spare it is a Rose quite worth growing.

At this point I would venture, in the interests of the Rose, to express a hope that some of our hybridists would give us a little more information as to the parentage of the Roses that are put on the market. Not a few of our best Roses are referred to by the raisers as pedigree plants, so one would suppose the parentage is known, but, as a rule, it is only by Continental raisers that this information is given. To them accordingly we proffer our thanks. *White Rose.*

KEW NOTES.

FOLLOWING upon the general rebuilding of the rock-garden, the east side at the south end is now in process of reconstruction. The part near to the dripping well is being considerably heightened; the well itself is being placed further back to provide space in front for a bog-garden. A shortage of materials when this portion of the rockery was first made necessitated the use of a mixture of various stones. These are now being substituted by weather-worn Cheddar limestone.

The building of a new span-roofed Orchid house for Cattleyas by the side of the existing public Orchid houses has necessitated the removal of several trees. Two large evergreen Oaks, weighing approximately 7 tons and 8½ tons respectively, have been moved with the aid of the large transplanting machine. The grass bank and chains clothed with Ivy, which form the boundary of the terrace on which the range is built, have been extended along the front of the new house. The dimensions of the structure are: length 46 feet 9 inches, width 20 feet, height to eaves 6 feet 6 inches, to top of ridge 13 feet. The side and central benches in the house are of teak. The principal rafters are iron and the woodwork deal. Heywood's patent system is used in the glazing. The flower-beds in front of the large Palm house, along the Broad Walk and near to No. 4 greenhouse, have been planted with bulbs, principally Tulips and spring-flowering plants, Wallflowers, Iberis, Violas, and Polyanthus.

This season the Roses near to the Palm house have furnished a splendid display late in the autumn. A few of the best sorts are Duchess of Wellington, Mrs. A. R. Waddell, Frau Karl Druschki, Caroline Testout, Gruss an Teplitz, Mme. Abel Chatenay, General MacArthur (a lovely crimson variety and one of the most fragrant of Roses), Lady Pirrie, Mrs. Aaron Ward, Pharisaer, and La Tosca.

In the Bamboo garden the tallest and stateliest of all the specimens is, perhaps Phyllostachys fastuosa. Arundinaria nitida, which is represented by several large clumps, A. japonica (Bambusa Metake), Phyllostachys viridi-glaucescens, P. nigra, P. Henonis and Arundinaria Hindsii deserve special mention. Among the Bamboos Funkia lancifolia tardiflora was nicely in flower in October.

Considerable work is in progress on the north-west boundary of the gardens. The shrubbery border, stretching from the Brentford gate some 300 yards in the direction of the Isleworth gate along the riverside, has never proved satisfactory, owing to the presence of numerous young Elm trees, beneath which, as most gardeners know, it is very difficult to get shrubs to grow to form a screen. Some of the Elms are being removed, and replaced with large specimen evergreen Oaks—moved with the large transplanting machine—Yews, Hollies and other evergreens. These will form an effective screen to the warehouses and chimneys of Brentford in winter as well as during the summer months.

When it was decided 30 years ago to sow down with grass seed a considerable part of the long walk—1,000 yards in length—along the Sion Vista, a thin layer of soil was spread over the surface and the seed sown without removing the gravel. During dry summers the exact position of the old road or path is clearly indicated by a long stretch of brown turf. To remedy this defect a commencement was made a few years ago to remove the gravel, and the end of the work is well in sight.

The provision of a short grass avenue through the wood leading from the Azalea garden to the Rhododendron dell should prove an additional feature in this part of the gardens.

The replanting of a small portion of the Rose dell near to the pagoda, which was made 17 years ago, is in progress. The excavations give ample evidence of the old gravel pit which occupied the site previous to 1895 6. The terraces at the sides and around the bays are faced with the stumps of large trees to hold the soil in position.

There is much to admire in "the square" devoted to Cotoneasters at the south end of the temperate house. Seldom, if ever, have the bushes been so abundantly laden with fruits. Pride of place must be given to Cotoneaster rotundifolia, which is aglow with shining red fruits, set off effectively with small green leaves. Close rivals are C. Simonsii, C. frigida (the twigs of which are in numerous instances bending down, so ladened are they with fruits), C. Franchetii, C. pannosa, C. amœna (a new species, see *Gardeners' Chronicle*, January 2, 1912, p. 2), and C. buxifolia.

The south octagon of the large temperate house, which was erected in 1862, is being rebuilt. Iron is principally used for the girders and rafters, the woodwork being teak. Messrs. Heywood's patent glazing is employed. This system has steel bars clothed with lead, by which means the glass obtains a good bearing. The panes of glass rest on a soft cushion of asbestos, which renders the roof practically weather-proof. *K.*

FIG. 171.—BEGONIA "LUCY CLIBRAN": COLOUR OF FLOWERS, PINK SHADED WITH APRICOT.
(R.H.S. Award of Merit, see p. 394.)

SCOTLAND.

EDINBURGH ROYAL BOTANIC GARDENS BUILDINGS.

THE Edinburgh Town Council has approved of the proposed settlement of the question regarding the building line at the Edinburgh Royal Botanic Gardens, the estimated cost to the city being £825.

THE NORTHERN SEEDS AND ROOTS ASSOCIATION.

THIS association, which has its headquarters at Portsoy, held its annual general meeting recently, when Mr. G. Smith, Ordens, presided over a good attendance. The report showed that there is a substantial increase in the membership and a balance of funds in hand. The silver cup presented by Provost Sutherland has been won outright by Mr. W. M'Lennan, Bogton. It was stated by the secretary, Mr. James Young, that an anonymous donor had presented a silver Rose bowl for competition at the society's show.

THE LATE MR. DAVID STEELE.

MR. DAVID STEELE, Forfar, who died recently at his home, Beechhill, will be remembered as the donor of the Steele Park to his native town of Forfar.

EDINBURGH'S LORD PROVOST.

THE new Lord Provost of Edinburgh, Mr. Robert Kirk Inches, has filled the office of Convener of the Parks Committee of the Edinburgh Town Council for the past three years, during which time various improvements have been effected in the parks and open spaces of the city.

MR. JAMES EDDIE, INVERURIE.

AMONG the new Scottish burgh magistrates elected this year is Mr. James Eddie, nurseryman and seedsman, Inverurie, who has been elected third bailie of Inverurie. *Correspondent.*

The Week's Work.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

THE HERB BORDER.—The present is a favourable time for putting the herb border in order, so that it may appear as tidy as possible during the winter. Useless and untidy growths should be cut away, weeds removed, and the soil neatly raked or forked over. Any plants that are worn out should be replaced with fresh specimens, or the planting may be left until the spring.

PATHS.—As work in the kitchen garden is not very pressing just now attention may be directed to the paths, which should be swept and rolled. Any that need resurfacing should be attended to without delay. Much damage is caused to the paths in the kitchen garden at this time of the year by the wheelbarrow, but this may be largely prevented by using planks. There should always be plenty of good scrapers at convenient spots to prevent the soil being trodden on to the gravel.

CUCUMBERS.—Success with this crop during the next two months, will, in a large measure, depend upon the locality, for it is not a difficult matter to maintain a supply of Cucumbers in winter in districts free from smoke and fog, provided a suitable structure is available. The roof-glass, both inside and out, needs to be kept as clean as possible, and the washing is best done with the aid of a brush tied securely to a stout bamboo pole; if the glass is washed in showery weather the work will be done much easier. The house, or pit, should be provided with plenty of hot-water pipes, so that the necessary temperatures may be maintained without employing excessive fire-heat, as nothing is more detrimental or injurious to the plants than a dry, hot atmosphere. The use of much fire-heat may be largely prevented by placing a thick mat of some material against the bottom of the door to prevent draughts, and covering the roof with blinds or mats at night time. Where there are two doors in the same house, the one exposed to the cold winds should be kept locked. The plants must not be overcropped, neither should they be allowed to carry too much foliage. They should be syringed on every favourable occasion, especially on the underside of the leaves. Use tepid rain-water, and do the work sufficiently early in the day to allow the foliage to become dry again before night. At this time of year the plants do not grow very fast, but tying and thinning may need attention once a week. Stir the surface of the soil occasionally to promote aëration, and afford a top-dressing of fine soil enriched with manure. If the beds are near to the hot-water pipes, the soil will dry very quickly, and water must be afforded as often as necessary. Two of the best varieties for winter cropping are Lockie's Perfection and Syon House. The latter is an old sort, and the fruits are smaller than those of most varieties, but it is a free cropper, and the plants give good results in winter.

TOMATOS.—Plants in bearing will not make much growth now, and watering must be done with increased care. A small quantity of fine loam mixed with its bulk of some rich fertiliser should be scattered over the surface of the pots. Keep the leading growths tied to the stake, and remove all axilliary shoots. Avoid overcrowding of the plants, as they need plenty of light to fruit well. Young plants intended for fruiting in the spring should be placed near to the roof glass, in order that growth may be sturdy. These young plants should be supported with neat stakes, and afforded larger pots as soon as the roots need increased room, using a rich compost, but no manure. The soil for Tomatos in winter should not be of too close a texture, and, if the plants are drawn, place them as low in the pots as possible. Like all newly-potted plants, they must be watered with extra care for some time afterwards. Should aphis be present on the plants, fumigate the house with a nicotine preparation on one or two occasions. A small white fly (Aleyrodes) is very troublesome on Tomatos in winter, but I have frequently found that when an adjoining house, separated by a glass partition, is cyanided, the small amount of gas that escapes through the spaces between the panes of glass is sufficient to destroy the fly on the Tomatos.

FRENCH BEANS.—If heated pits or other suitable glass structures are available, sowings of a suitable variety of French Bean may be made at regular intervals. Topdress those already raised, and thin the seedlings where they are too thick. It may be necessary to afford supports to the plants, and nothing is better for the purpose than twigs of Birch. As the plants grow they will need increased supplies of water at the roots and plenty of atmospheric moisture; the leaves should be syringed on frequent occasions to prevent red spider. So soon as the pods are formed, feed the roots with liquid manure. After the rough leaves have developed, pinch out the points of the main growths. Although this stopping of the shoots delays fruiting, the plants grow dwarfer and ultimately produce as many Beans as if they had not been stopped.

CAULIFLOWERS.—Young Cauliflowers transplanted in frames for the winter should have an abundance of air during mild, open weather, for in no circumstances should the plants be grown tender. Make a fresh sowing under glass, selecting a good forcing variety. Sow the seeds thinly, and, when the seedlings are large enough, prick them out in the boxes filled with prepared soil, and grow them near to the glass.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

LATE GRAPES.—If the Grapes are not intended to be kept for a long time, it will be an advantage to cut the bunches, so that the vines may be rested forthwith. The bunches may be placed in a cool room, where they will remain in a good condition for a considerable period. Unless the vinery is utilised for housing flowering plants, the ventilators should be thrown open at all times; in any circumstances, the welfare of the vines must be considered and air admitted whenever the weather permits. Those vines which are required to carry bunches until the end of the year must be attended to carefully. Water should not be afforded unless the roots are extremely dry. The proper ventilation of the houses will have a direct bearing on the good keeping of the Grapes. During damp or foggy weather the top ventilators should be nearly closed and the bottom ones shut: these latter apertures need never be used except during bright, warm weather. If the atmosphere is kept dry, a current of air will be unnecessary, as this would only cause the Grapes to shrivel. Endeavour to keep the temperature at about 45° or 50°; it is advisable to keep the hot-water pipes slightly warmed always. The bunches should be examined at least twice a week to remove decaying berries, which must be done without damaging the sound ones.

LATE MUSCAT GRAPES.—If a suitable room is available, the bunches should be cut and the stems placed in bottles filled with water. The Grapes will keep just as long as if they were left on the vines. The removal of the bunches will permit of watering the roots, which are doubtless in need of a good soaking. If the roots are in a healthy condition, the watering may be followed by an application of diluted liquid manure. Keep the Grape-room quite dry. When the bottles require refilling, take them outdoors for the operation. Place two or three pieces of charcoal in each bottle to keep the water sweet. Maintain an equable temperature of about 45° in the room, which should be kept quite dark. After the Grapes are cut, open the doors and the ventilators of the vinery to the fullest extent, and partially prune the vines, to facilitate the ripening of the wood.

MID-SEASON VINES.—The pruning and cleansing of the vines should be hastened, as it is important to get as much as possible of this work done before the beginning of the New Year. No hard-and-fast rules can be laid down as to the number of buds to retain on the spurs. Certain varieties, such as Duke of Buccleuch and Buckland Sweetwater, need plenty of young wood to ensure a crop. Do not prune very old vines too hard; where room exists, train in some of the young, vigorous shoots, as these may take the place of worn-out rods. Young, healthy vines may be pruned to two prominent buds. The cleansing of vines which have been badly infested with thrip, red spider or mealy bug, must be thorough. Remove all loose bark, and pay special attention to holes or crevices where the insects may be concealed. Afterwards scrub the rods thoroughly with a strong mixture of soft soap and sulphur. It is a good practice to fumigate fruit houses at this time of year with sulphur, but care must be taken that the fumes do not escape into houses which contain tender plants. Take advantage of fine weather to do the necessary work of renovating and extending fruit borders.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

FERNS.—Plants of Adiantum that have been used for the embellishment of the conservatory or winter garden are, possibly, now somewhat shabby, and should be removed to a fairly cool house and afforded a rest, keeping the roots partially dry for a time. As soon as the fronds commence to turn yellow they may be cut off, for although this treatment is not always practised with Ferns, it ensures a good crop of young fronds in the early spring when decorative plants are very useful. The fernery proper should be kept somewhat dry at this season. All close-growing plants should have untidy and decaying fronds removed regularly, and this applies to specimens planted on walls and rockeries as well as those in pots. If decay attacks one or two of the fronds, it will soon spread through the whole plant, unless it is checked at once. Do not employ more fire heat than is necessary, especially where such plants as Blechnum and Woodwardia are growing, as these Ferns are very liable to attacks by thrip, which soon spreads in a dry, warm atmosphere.

PHYLLANTHUS NIVOSUS AND P. ATRO-PURPURENS.—I have exhibited shoots of these stove foliage plants as decorations in exhibits of Chrysanthemums this season, and, from the numerous inquiries made for their names, the plants appear to be little known. They are fairly quick-growing subjects, and specimens in small pots attain to a height of from 3 to 5 feet in a single season. The habit is not branching, which renders the plants all the more suitable for arranging amongst other subjects. Cuttings made from young shoots with a heel of the hard wood or bark attached will form roots at any season. Specimens that have been employed for decoration and have lost many of their leaves may be cut down to within 6 or 8 inches of the pot level. This will result in new shoots developing, and often vigorous suckers. The latter, if removed with a few roots attached, will soon become established. The plants should be potted in light, porous soil, mixed with plenty of peat and leaf-mould and broken crocks. The potting should be done firmly, as specimens in comparatively small pots give the finest leaf-colouring, and the roots are apt to become raised in loose soil. Specimens cut down now or at any time before Christmas will produce suitable shoots for purposes of propagation in the spring.

GARDENIA.—Plants of Gardenia, whether in pots or planted out in pits, must be watered with extra care at this season; those grown in pits should receive a little fresh air on bright days, as the atmosphere does not move so freely in pits as in larger glasshouses. In a close atmosphere the plants are liable to become sickly, and the earliest flower-buds may drop in consequence. A sudden change in the temperature will also cause bud-dropping, and this must be guarded against. If the pits are heated inadequately the roof-glass should be covered at night-time with some cold-excluding material whenever frost threatens.

THE SHOW HOUSE.—Do not maintain a moist, close atmosphere where plants of Euphorbia (Poinsettia) pulcherrima, E. jacquiniæflora, Begonias in variety, Browallia speciosa, and similar subjects are in bloom, as this would cause the flowers to fade prematurely. The same remark applies to houses containing Primulas, Cyclamens, and Cinerarias, although these are not grown so warm by 10 or 15 degrees as the other plants enumerated above.

BULBS.—The batches of the earliest-potted bulbs should be examined, and plants that have sufficient roots and a little top growth should be removed to a frame. Fresh batches of the very earliest bulbs may be placed in the forcing

house. If Tulips of the Duc van Thol type are required in bloom at Christmas, a full month's forcing will be necessary. Retarded crowns of Lily-of-the-Valley may also be placed in heat to furnish spikes by Christmas. For later flowering, the Berlin crowns may be employed, and these should be potted so soon as they are received from the nurserymen.

HELLEBORUS NIGER.—The Christmas Rose is generally regarded as a border plant, but the roots may be lifted and the plants flowered in a slightly-heated frame. Lift the roots with plenty of soil attached, so that the plants will receive only a slight check. Another plan is to place frames over the plants in the borders. The frames will not only serve as a protection from severe weather, but keep the flowers from being splashed by the rains.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

ORCHARDS. — Neglected orchards are very common in all parts of the country, but much may be done to improve the condition of the trees, except when they are very old and neglected, when the best plan is to grub them up and plant afresh. Younger trees may be brought into a satisfactory condition of bearing by careful pruning. It will be generally found that certain of the branches may with advantage be removed altogether. For instance, those that cross each other, or are bare of fruitful shoots. After the pruning is completed, the stems should be limewashed, and the top growth syringed with a winter wash to destroy lichen and pests. Freshly-slaked lime may be sprinkled freely on and amongst the trees, as this will destroy grubs of injurious insects and be beneficial to the roots. A dressing of manure may be applied to exhausted trees, but if farmyard dung is not available, such materials as bonemeal, soot, wood ashes, charred vegetable refuse, and road scrapings will be beneficial. Every effort should be made to finish this work whilst the weather remains favourable.

FIGS.—If it is considered necessary to protect the branches of Fig trees on walls, the shoots should be loosened from the wall, fastened together, and covered with straw or bracken. The bundles of branches should then be secured close to the wall, and allowed to remain undisturbed until the spring. Gross-growing trees are the more likely to suffer harm from cold. Many Fig trees have an unusual amount of unripened wood this season, and these also are sure to be damaged if the winter is very severe. It is also necessary to protect the roots with a covering of Bracken-Fern or litter. It should be remembered that trees which are regularly root-pruned, and planted in soil of a calcareous nature, produce hard, short-jointed shoots that ripen well and are less likely to be injured by frost.

THE FRUIT ROOM.—Remove all decaying fruits frequently, but do not fill the vacant spaces with other specimens, especially in the case of Pears, for the less they are handled the better. Let there be a free circulation of air through the fruit-room by keeping the ventilators open on all favourable occasions.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

ZYGOPETALUM.—The partially-developed pseudo-bulbs of Zygopetalum Mackayi are sending out flower-spikes, and, from now onwards until the flowering season is over, extra care must be taken in watering the roots, for an excess of moisture may cause the leaves to become spotted. Water should only be applied when the compost is dry, when sufficient should be given to soak the materials thoroughly. The plants may then be allowed to become dry before affording moisture again. Plants of Z. crinitum, Z. Clayi, Z. Perrenoudii, Z. Gottianum, Z. Burkei, and Z. Protheroianum, also Zygo-Colax, including Z.-C. Wigandanus and Z.-C. Charlesworthii, are in full growth, and should be afforded liberal supplies of water at the roots until the growth of the new pseudo-bulbs is completed. All these plants thrive best in a moist, shady position in the cooler part of the intermediate house. Plants of Zygopetalum Ballæ are developing flower-spikes, and rooting freely, from the base of the newly-formed pseudo-bulbs. They should be placed near to the roof-glass in the warmer and shadier part of the intermediate house. Sprinkle the surface layer of Sphagnum-moss frequently to keep it healthy. Z. rostratum and Z. Roeblingianum may be afforded a similar treatment, but should be grown in a warmer temperature. Plants of the Bollea section, such as Bollea cœlestis, B. Lalindei, Pescatorea Lehmannii, P. Dayana, P. Klabochorum, P. Roezlii, Batemannia, Burtii, B. Colleyi, Chondrorhyncha fimbriata, and C. Chestertonii are pushing forth new roots, and any specimens that require fresh rooting materials should be attended to in this respect. They grow best in pots or pans, which should be filled to half their depth with clean crocks for drainage purposes. The compost should consist of two parts Sphagnum-moss and two parts Osmunda and Al fibres cut in short portions, with a liberal quantity of crushed crocks. The materials should be well mixed. Press the compost moderately firm, and fill the pots to the rims, finishing with a layer of live Sphagnum-moss. During the winter months the plants should be grown in the warmer part of the intermediate house, but they should not be exposed to sunshine at any time. Spray the growths overhead frequently, and keep the surroundings moist, also the Sphagnum-moss. Zygopetalum maxillare and Z. Gautieri are producing roots from the base of the young growths, and plants that require increased rooting space should be given attention. These Orchids have a rambling habit, and are not suitable for growing in pots or pans; they do best fixed on a portion of the stem of a Tree-Fern. If necessary, the rooting space may be extended by wiring another piece of stem on the top of the old block. The roots should be kept moist at all times, and Zygopetalum maxillare thrives best when suspended in a moist, shady position in the warmer part of the intermediate house.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

THE PAMPAS GRASS. — The Pampas and other ornamental Grasses associate well with Bamboos. The Gyneriums are very beautiful plants, especially when grown in large clumps by the waterside. Arundo conspicua is also very handsome, and should be more extensively grown than at present. It throws up its stately plumes in July, hence the name summer flowering Pampas. It may be grown as an isolated specimen on the lawn or grouped with other Grasses and Bamboos in larger spaces.

HARDY AZALEAS. - The Azaleas are now classed by the botanist with Rhododendrons, but for garden purposes they may be regarded as distinct. Although these beautiful flowering shrubs may be planted during fine weather at almost any time from September till April, it is better to do the work before severe weather sets in. In most seasons the weather remains fairly open until well into December, and it is a good practice to get the bulk of the planting done before that time, for shrubs planted in the autumn have a much better chance of success the following season than those planted late in spring, when drying winds usually prevail. Few flowering shrubs rival the gay colours of the different sections of hardy Azaleas, whilst for brilliant effects in spring they are not surpassed. The foliage also assumes most beautiful colours in the autumn, the leaves of many varieties turning a vivid scarlet. Many refrain from planting Azaleas and Rhododendrons because their gardens are not peaty, but there need be no hesitation because of this provided the ground is free from lime, or is not a shallow soil resting on chalk. Much may be done to overcome even these difficulties by making special stations for planting, although this precaution is not always a success. It is advisable to make a small experimental planting, to see how the plants succeed. Soil of a heavy, clayey nature should be trenched and have plenty of leaf-mould mixed with it. In planting, scatter some turfy loam about the roots, to enable the plants to make a good start. When the work is finished, apply a mulch of leaf-mould to protect the roots from extremes of weather. Bulbs may be associated freely with Azaleas and Rhododendrons, and, if early flowering varieties are selected, the beds will remain attractive over a long period. There are many beautiful hybrids of Azalea sinensis. If beds of distinct varieties are required, Anthony Koster, Glory of Boskoop, J. C. van Thol, Mme. A. Koster, Prince of Orange and Floradora may be selected. For woodland planting or for mixed beds, seedlings of all the sections may be employed, and these may be purchased at a moderate cost. Standard plants disposed at intervals through the beds will break the uniformity of the effect.

RHODODENDRON. — Hardy Rhododendrons thrive under the same conditions as Azaleas. Being evergreen, and of a robust growth, they are often planted as a background for Azaleas and other shrubs of a moderate growth. Where they flourish, Rhododendrons may be substituted for the common Laurel as hedges or wind screens. Rhododendrons prefer partial shade during the hottest part of the day, the blooms lasting for a longer period when protected from the full glare of the sun. They are useful for planting under large deciduous trees, where many other shrubs will not thrive. Good clumps or beds of one colour give a better effect than indiscriminate planting. Mrs. Holford, Pink Pearl, Sylph, Doncaster, Mrs. John Waterer, Mrs. Anthony Waterer, Lady Clementine Walsh, and Martin Hope Sutton are suitable varieties for massing.

PLANTING ROSES.—The beds having been prepared some time since so that the soil has become somewhat settled again, the planting of Roses should be proceeded with whenever the ground is in a suitable condition. On no account plant when the ground is wet and pasty, rather cover the roots with soil temporarily, and plant at the first favourable opportunity afterwards. Trim all damaged roots, making clean cuts, and see that the holes are made sufficiently large to allow of the roots being spread out evenly. Scatter some fine soil amongst the roots and tread the soil quite firm.

THE CARNATION RUST.—This is caused by a rust fungus known as Uromyces caryophyllinus, and is particularly common on Carnations grown under glass in this country. Affected plants are characterised by the presence of brown spots on the leaves and stems, each one of these discoloured areas being a mass of spores, which serve to disseminate the disease to healthy plants. Though plants are not often killed outright by this pest, they are seriously weakened, and always become unsightly when attacked by it. The fungus may spread with great rapidity, especially in houses where the plants are crowded. Once the disease becomes established, it is a matter of great difficulty to check it. The reason for this is that no fungicide is able to reach the mycelium or spawn of the fungus, which lives entirely within the tissues of the plants. Fungicides are useful, however, in that they check the formation of new centres of infection. Bordeaux mixture or a dilute solution of copper-sulphate (1 lb. in 25 gallons of water) may be applied, but, in order to be effective, spraying must be performed so soon as the first sign of disease appears in the house, and must be repeated at weekly intervals. At the same time, affected plants should be removed from the vicinity of the healthy ones. Where the disease is severe, it would be wise to discard the plants and obtain a healthy stock. The Carnation house should be well ventilated, the plants should be watered in such a way that the leaves are not wetted, and the foliage should not be allowed to touch the soil. Cuttings should only be taken from healthy plants. In the United States, where the disease was so bad 20 years ago that it seriously threatened the growing of Carnations on a large scale, it has been found that certain varieties, such as William Scott, are much less susceptible to the disease than are others. It is obvious that resistant varieties should be sought and cultivated in this country. *F. T. B.*

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 11.

WEDNESDAY—
Palms, Plants, Azaleas, Rhododendrons, Camellias, Aspidistras, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.
Fruit Trees, at Platt Nurseries, Borough Green, near Wrotham, Kent, by Protheroe & Morris, at 11.30.
Bulbs, Liliums, &c., at 12.30; Roses, at 2.15; Roses, Fruit Trees and Shrubs, at 3; Ornamental and Decorative Plants, at 4.30; Roses, Rhododendrons, Azaleas, &c., at 5; at Stevens's Auction Rooms, 38, King Street, Covent Garden, W.C.

THURSDAY—
Roses, by Protheroe & Morris, at 12.30.

FRIDAY—
Orchids, by Protheroe & Morris, at 12.45.
Mushroom Spawn Manufactory, Fruit Farm, &c., at the Mart, Tokenhouse Yard, by Protheroe & Morris, at 2.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41·5.

ACTUAL TEMPERATURES:—

PROVINCES.—*Wednesday, November 20*: Max. 53° Ireland, S.W.; Min. 43° Aberdeen.

The Chemists' Conquest of the Air.

The achievements of the chemist in meeting the steadily-increasing demands of agriculture for manures, especially those containing nitrogen, afford an interesting example of technical progress. For a long time the deficiency of nitrogen due to the removal of this element in the crop was supplied by the importation from abroad of Chili saltpetre, guano and the like, and an imposing industry has been built up to supply the world's demand for nitrogen-fertilisers. As this demand increased, search was made to find other sources of the element, more especially as the available supplies of saltpetre are decreasing year by year. The waste liquors of gas works, which sometimes contain as much as 3 per cent. of ammonia, came early under notice, and the production of ammonium sulphate from this source has become an important item in the prosperity of gas companies. A further substantial supply of nitrogen is afforded by the ammonia recovered from molasses residues. Many other waste nitrogenous products are now turned to a like purpose.

The problem of the utilisation of sewage is still unsolved, but, on the other hand, science has shown how to draw upon the unlimited store of uncombined nitrogen in the atmosphere, and render it available for the nutrition of the plant. The industrial application of this discovery has followed at an amazing rate. Already several rival processes are in successful commercial operation. One essential, a supply of electrical energy at a very low cost, has led to the establishment of many of these new factories in Norway, where immense water-power is available.

In one process, nitrogen is made to pass over calcium carbide, heated to 1000° C. Nitro-lime is produced, which is directly available as manure. In a rival process, nitrogen and oxygen are caused to combine under the influence of a high tension electric discharge; the nitric acid formed is neutralised with lime and the marketed product is known as Norway saltpetre.

In a third process, nitrogen is made to unite with hydrogen, and so furnish ammonia.

At the same time progress on the agricultural side has led to the appreciation of the value of green manuring, and the importance of leguminous crops in enriching the soil. The progress is particularly marked in connection with our knowledge of the nitrogen fixing bacteria of the soil, which, when supplied with a suitable source of energy, are able to fix nitrogen from the air and thus enrich the soil. In order that nitrogen fixation may go on in the soil a supply of carbohydrate, in the form of sugar, or other similar substance, is necessary. By the addition of such substances to the soil, the rate of nitrogen fixation is increased. Hence carbohydrates are destined—if they may be had cheaply enough—to be used more and more as manures. One of the latest suggestions is the application to the soil of the waste liquors of the wood-pulp industry which are so difficult to dispose of at the present time without polluting the rivers. When neutralised with lime, these liquors contain much carbohydrate material in a form directly available for the soil bacteria.

The outlook for the agriculturist is thus of the brightest, and he may rest assured that the pessimism displayed by Sir William Crookes in his address to the British Association some years ago is no longer justified, though it may be that Sir William's warning has acted as an incentive to the chemists in their conquest of the air.

Coloured Supplement.—Prunus (or Amygdalus) nana, a native of South Russia, and known popularly as the Russian or Dwarf Almond, is not so common in gardens as it deserves to be. It was cultivated as a hardy shrub in this country more than 200 years ago. A figure of this species was published in the *Botanical Magazine* in 1791 (t. 161), where we are told that it was then justly considered as an ornamental shrub which rarely grew higher than 3 feet, and was very suitable for the shrubbery of small extent. Miller says it was common in the London nurseries in his time, nearly two centuries ago. That the plant deserves to rank with the best hardy spring-flowering shrubs may be seen at Kew in April, when the bushes are covered with white, pink, or red Almond blossom. There are several colour varieties of P. nana, the best being that illustrated in the Supplement, namely, P. n. rubra. The flowers are over ½ inch in diameter, and as they are borne all along the slender shoots, the effect of a good bush when at its best is particularly pleasing. For lawn beds or a mixed shrubbery, or for a "break" plant in the rock-garden, this little Almond is an excellent plant. In exposed positions it scarcely exceeds 1 foot in height. It ought to be a good forcing plant, and market-gardeners might do worse than establish it in pots to be forced into flower early in the year. The named varieties of P. nana are alba (white-flowered), georgica (a darker shade of pink than the type), and gessleriana (less robust than the type, with deep-red flowers). Propagation is by means of suckers, which, however, do not make such shapely plants as those that are raised from layers, for which the branches should be laid in the usual way in April or May; by autumn they will have rooted, and be fit for removal. The appearance of a bush of this Almond when in leaf, after the flowers are past is that of a small Willow. Its nearest allies are P. incana, a native of Asia Minor; P. Jacquemontii, Afghanistan; P. Simonii and P. Davidiana, both Chinese species; and, of course, the Almond proper, P. Amygdalus, and the Peach, P. persica.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner of the National Chrysanthemum Society will be held in the Holborn Restaurant, on the 27th inst., at 6.15 p.m. The President, Sir ALBERT ROLLIT, D.C.L., LL.D., will occupy the chair, and will present the Challenge Trophy, the Holmes Memorial Cups and Medals to the winners during the evening. Tickets may be obtained from the Secretary, Mr. RICHARD A. WITTY, Savernake Road, Gospel Oak.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the Lecture Hall of the Institution, on the 25th inst., at 8 p.m., when a paper will be read by Mr. E. M. KONSTAM, Barrister-at-Law, entitled "Land Values Taxation: a Criticism of the Evidence before the Departmental Committee on Imperial and Local Taxation."

YORKSHIRE GALA.—The fifty-fifth annual exhibition will be held in the Bootham Park, York, on July 18, 19, and 20, 1913. The Council has purchased from Messrs. PIGGOTT BROS. & Co., LTD., a portion of the patent ventilated tent erected by that firm at Chelsea for the Royal International Horticultural Exhibition. The new tent will give an increased area of at least 20 per cent.; the outer walls will be 12 feet in height.

LEGACY TO A GARDENER.—Under the terms of the will of the late Mrs. MEROPE PETROCOKINO, of Norcliffe, Broughton Park, Manchester, the sum of £1,000 is left to her gardener.

STRAWBERRY GROWING IN ONTARIO.—Such high prices have been obtained for Strawberries in the Dominion in the last two or three years that many farmers with an acre or two of space available are now considering the advisability of setting out plants for Strawberry growing. In a recent report Mr. W. T. MACOUN, Dominion Horticulturist, gives the following estimate of the cost of producing an acre of Strawberries and the returns at 5 cents a box:—

Rent of land (two years)	$10.00
Preparation of land	4.00
Fertilisers	30.00
Plants	36.00
Planting	5.00
Cultivation	15.00
Mulching	10.00
Boxes	21 00
Picking	60 00
Crates and marketing	25.00
Total	$216.00
Selling 6,000 boxes at 5 cents per box	300.00
Net profit	$84.00

Many growers disposed of big crops this year for 10 cents. per box and higher.

Fruit-growing in British Columbia.—The most prolific crop of Peaches and Apples ever known has been obtained this year in the Okanagan district of British Columbia. It has been on such a scale that the marketing system of the valley has temporarily broken down. Hundreds of tons of Peaches have been left to rot on the ground, and for the same reason a bountiful Tomato crop, for which product the district is famous, has to a large extent been sacrificed. In this province within a few years upwards of a hundred thousand acres of fruit must have been brought into bearing. Within the next 12 months another railway system will be serving the Okanagan district.

The Royal Medal.—Botanists will learn with pleasure that Dr. Francis Darwin is the recipient of the Royal Medal, an award made by the Royal Society for distinction in biological research. Dr. Darwin's contributions to plant physiology are many and important, and date from the time when he assisted his father, Charles Darwin, in the classical experiments published in *The Power of Movement of Plants*. The views expressed in that volume on the sensitiveness of plants, and particularly on the localisation in the root-tip of sensitiveness to gravity, have long been accepted. Nevertheless, at the time that these conclusions were published they were assailed with some vehemence by the official world of botany, and they are now accepted so widely and unhesitatingly that it is apt to be forgotten that it was the Darwins—father and son—who first promulgated them, and, in doing so, showed how fundamentally similar are the nervous mechanisms of plants and animals.

Legion d'Honneur.—The grade of Chevalier in the Légion d'Honneur has been conferred on MM. Antoine Rivoire, Pierre Guillot, and Tissot in recognition of their services in connection with the Turin exhibition. Of these distinguished French horticulturists, M. Rivoire has played a great part in the organisation of horticulture in France, M. Guillot is a well-known rosarian and vice-president of the French Society of Rosarians, and M. Tissot carries on a large business in horticultural "sundries."

Snowdrop Petals as Snuff.—In the course of a recent lecture on "English Wild Flowers," at the London Salon of Photography, Mr. H. Essebigh Corke is reported to have said that Snowdrop petals, when dried and crushed, make an excellent substitute for snuff.

Publications Received.—*The Journal of the Board of Agriculture*, November. (London: Board of Agriculture and Fisheries.) Price 4d.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Wart Disease of Potatos.—The article by Mr. H. C. Long (see p. 326) on the Wart Disease of Potatos is one of considerable importance to everyone interested in this subject, and its appearance is most opportune. I believe that this disease is increasing rapidly in England, and drastic steps must be taken at once in order to ensure its eradication. It is true that the Board of Agriculture has issued a leaflet dealing with the subject, and preventive and remedial measures are described therein in detail, a list of varieties being given which have proved free, or practically free, from attack. But how have these varieties fared this season? Have they upheld their immune character? Wart disease has also been scheduled as a notifiable one under the Destructive Insects and Pests Acts of 1877 and 1907, and all growers upon whose land this "Black Scab" appears are liable to penalty if they fail to notify the fact of its occurrence to the officers of the Board of Agriculture, or, in some districts, the police. The good intentions of those who drafted the measures to deal with this epidemic are quite apparent, but further effort and exertion would seem very necessary if the complete extermination of this dangerous disease is to be secured. The Canadian poster, a facsimile of which you reproduced (see p. 337), issued by the Department of Agriculture of that country, is a useful means of distributing information, but our colonial friends have gone further. They have closed their ports against Potatos grown in Great Britain, and are determined to run no further risks from fresh imports from a contaminated country. It would have been well had we adopted similar precautions some years ago. As it is, is there one of our colonies now open to our exports of seed Potatos? The situation is really serious, and growers of seed Potatos seem to be unaware of their position in these times. As one who is much interested in the cultivation of the Potato, I would welcome some immediate action in the matter by the Board of Agriculture. Is it not time to close our ports against the imports of Continental Potatos, and should tubers which may, or may not, be affected be allowed unchallenged access into the rural districts to spread further devastation amongst the crops? In the report of the London markets in the *Gardeners' Chronicle* of November 9, I note that your contributor remarks, "The market is glutted with foreign Potatos, and prices for these are lower." Is not this a possible source of contamination, and are these tubers wholly free from this disease? Have the Board of Agriculture an organized system of inspection of such imports of Potatos, or are they allowed to pass entirely unchallenged; that is, beyond the usual Customs search for the detection of dutiable goods? If there be no such inspection, it is surely time it was begun. It seems absurd that Potatos should be allowed entry into Britain, even at any time, without searching inspection by qualified officers of either the Customs or Board of Trade. Is it not a fact that this disease is an imported one, and its origin here attributed to tubers imported from the Continent? It has evidently been known in Britain since 1886, but no reports of its presence would appear to have become general until 1901, and after this lapse of 15 years the area of infection had, undoubtedly, become very extended, and there is no denying the fact that a large portion of England is suffering badly at the present time. We seem, so far, to be almost free in Scotland, and I have never seen a case in this country. *George M. Taylor, Mid-Lothian.*

Hybrid Nomenclature.—(see p. 362)—The "confusion which is likely to arise from the application of Latin or Latinised names to garden-raised Orchids" arose long ago from quite different causes. Mr. O'Brien remarks: "It is a curious fact that the giving of Latin names to garden products was not begun by the raisers of Orchids, either amateurs or nurserymen, but by scientific botanists." It began long before hybrid Orchids were even thought of, but we will limit the remark to Orchids. It is true that the first hybrid Orchid, Calanthe Dominii, was named by Lindley, but the second and six others out of the first dozen were named by the raisers, and some of those afterwards described by Reichenbach received names furnished by the raisers. The point is merely mentioned as a matter of historical accuracy. In course of time confusion arose, but not from the cause asserted. Three other systems had arisen, with the additional complication that different seedlings out of the same capsule had received separate specific names, and in 1889 the R.H.S. appointed a subcommittee to consider the question. Its members were: Sir Trevor Lawrence, Bart., and Messrs. Harry J. Veitch, F. Sander, H. Williams, J. O'Brien, N. C. Cookson, W. J. Thompson, and F. W. Burbidge. From the Society's own report I extract the following:—"Hybrids between species raised artificially should be named in Latin, with the addition of the word hybridus, —a, —um, or the sign of hybridity, ×." "Crosses between varieties raised artificially should receive suitable vernacular or informal names." "The Orchid Committee should decline to recognise any unauthorised name, or any name that is deemed unsuitable, or one that is not applied in conformity with the preceding rules." This is not a rule that "as far as possible names in the vernacular should be given to all garden-raised Orchids," an exception being made by the Committee, "with some reluctance," that "primary hybrids might be named either in Latin or in the vernacular (fancy names)." The double name never worked well. When "Digbyano-Mossiæ," the example cited by Mr. O'Brien, was proposed, the *Gardeners' Chronicle* remarked: "We hope some means may be taken to render the name less cumbrous." It is too long, as our writers sometimes find when speaking of its white variety, Queen Alexandra, so they omit it. The vernacular was tried, and Cypripedium Charles Canham was described (by request), but was promptly changed into Canhamii. Soon afterwards Epidendrum O'Brienianum was described, with the special request of the raisers that the form "James O'Brien" should not be used, a reason being given that has since been recorded. The classical name, which I think originated with Cypripedium Io, has worked admirably, and its use was soon greatly extended. But to return. Mr. O'Brien remarks: "Science once more intervened. The *Orchid Stud-Book* was published, in which many compound and fancy names . . . were changed for Latinised appellations." The *Stud-Book* adopted a simple and uniform rule that specific names should consist of a single word—the use of two short words being permissible where they can be connected by a hyphen. It adopted all classical and fancy names that agreed with the said rule, and it declined to recognise others. It did what would have been done at the outset if the R.H.S. rules had been followed, carrying out the original idea so far as possible. Space would fail to describe the condition of things when the work was published, but the *Gardeners' Chronicle* described it as "a definite step towards the evolution of order out of chaos." And let the R.H.S. itself defend the system adopted. Last year the Society printed its replies to questions submitted to it by the Brussels Nomenclature Congress (to which it sent two representatives). Some of these questions were based directly upon names taken from the *Orchid Stud-Book*. The answers were: "The specific names of such hybrids should be in the Latin form." "These specific names should consist of a single word." *R. A. Rolfe.*

Richard Bradley and His Publisher (see pp. 132, 136, 160).—It would be a work of supererogation to attempt to convince Mr. Murison that Bradley was not the author of *The Compleat Seedsman's Monthly Calender*, but just as I am convinced from internal evidence that *The Flower Garden Display'd* was written by Bradley, so from similar evidence am I convinced that he did not write, nor could he have written, the book in question. Never once in his writings does Bradley refer to himself as a gardener, and when he has occasion to refer to gardeners he refers to them as "the gardeners." In this volume the author invariably associates himself with the brotherhood just as Fairchild, Cowell, Switzer, and others do in their books of the same period. This is sufficiently striking. But proof that it is impossible to controvert lies in the fact that the book was written by a comparatively uneducated person, and though it cannot be said that Bradley's style was on a level with that of the essayists, all his writings bear clear proof that, if not those of a learned savant, yet they were of a superior order to those of contemporary horticulturists, excepting, perhaps, Switzer. The production of books at the period, as is well known, was in the hands of persons devoid of principle. Meers was no worse than many of his neighbours, if that could be any justification, and as an example of how low down they could descend I may quote what I have already previously noted of Cowell's, *The Curious and Profitable Gardener* being republished two years later as *The Curious Fruit and Flower Gardener*, and the next year as *The Compleat Fruit and Flower Gardener*. "By R. Bradley, late Professor of Botany," &c. At one time it appeared as if Bradley wrote this, yet we know he did not write it, because the sheets in the three volumes are identical. *The Lady's Recreation* is another impudent swindle. But to note all such instances would need an article to itself. *R. P. Brotherston.*

THE LARCH SAWFLY.—My attention has been called to an article by *A. D. W.* in your issue of November 9 on the Larch sawfly. May I be allowed to remind readers of a pamphlet published (1912) by the Department of Agriculture of the Dominion of Canada on the Larch sawfly? In this pamphlet Dr. Gordon Hewitt gives a full account of the parasites and natural enemies of the sawfly and of the means of controlling the pest that have been tried and found successful in the extensive plantations of Larch trees on the Manchester Corporation's estate at Thirlmere. Dr. Hewitt was formerly lecturer on economic zoology in the University of Manchester, and the work begun by him has been continued by his successor, Mr. J. Mangan. The cost of the remedial measures is certainly not so great "as to be almost out of the question," and the results obtained have exceeded our own most sanguine anticipations. Last summer and the summer before last (1911 and 1912) the Thirlmere plantations were practically free from the pest, although the trouble was raging in the surrounding districts. I am quite certain that the sawfly pest could be prevented and, if present, remedied in this country if the methods suggested by us, and carried out at Thirlmere by the Manchester Corporation, were adopted. It is a great pity that the "non possumus" attitude of the owners of Larch plantations in this country should still be maintained and encouraged. *Sydney J. Hickson.*

SCARING BIRDS.—Probably through being unacquainted with the gardener's endless round of work, the secretary to the Royal Society for the Protection of Birds, in his note under the title "Blue Tits and Sweet Peas," on p. 367, is unfair when he assumes that gardenere do not use the contrivances recommended by his society because they "canna be fashed." From my experience, and a long acquaintance with other gardeners, I can assure Mr. Gardiner that, except in rare instances, it is impossible to find time to attend to kites and such things, which he himself tacitly admits mean "endless bother." Because, in self-defence, gardeners shoot birds, it must not be inferred that they are callous and indifferent to their charm, for such is far from being the case. The average gardener is as great a bird lover as any member of the Royal Society for the Protection of Birds, and is equally ready to deprecate their wanton destruction; but it must be borne in mind that the gardener's first duty is towards his employer, and that he tills the garden to furnish produce for the table. *A. C. B.*

CARNATION PRINCESS JULIANA.—In reply to Mr. Cook's challenge (p. 366), I shall be quite willing to give £5 to the Gardeners' Orphan Fund if Mr. Cook can prove that I did not raise Carnation Princess Juliana and that Mr. Hopper did raise it. *Montagu C. Allwood.*

———It is a trivial matter whether Mr. Allwood or Mr. Hopper raised the variety of Carnation known as Princess Juliana. Mr. Allwood is a successful raiser, and we look to him for many good novelties in the future. His Lady Alington is, to my mind, the finest of the Perpetual-flowering type. I have never previously heard of Mr. Hopper. However, the *Gardeners' Chronicle* knows no favourites, for all receive fair play, and that is why I have read the paper for over 30 years. I hope Mr. Allwood will continue to write his always interesting and instructive notes on Perpetual-flowering Carnations. *Thomas Spencer, Hale Hall Gardens, Bowdon, Cheshire.*

MANDRAGORA AUTUMNALIS.—This plant is now in beautiful flower in my garden, reminding me of Anemone pulsatilla, and I think the time of flowering is worth recording. I have had the plant for many years, and when I first obtained it, it flowered in the late autumn, as it does in S. Europe. Gradually it altered its time of flowering, and for many years it has flowered in the spring at the same time as M. officinalis, and this year it is flowering now, its normal time. It is a handsome hardy perennial, well worth growing. It often produces fruit here, and the seeds germinate freely, but the seedlings are very impatient of removal. It is well figured and described in Sweet's *Bot. Fl. Gn.*, vii. *Henry N. Ellacombe, Bitton, November 8.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 19.—The usual fortnightly meeting was held on Tuesday last in the Society's Hall, Vincent Square, Westminster. Orchids were not so numerously shown as usual, but they constituted the most imposing exhibit in the Hall, namely, a group of Vanda coerulea from the Duke of Marlborough's garden at Blenheim. The ORCHID COMMITTEE recommended two First-class Certificates and two Awards of Merit.

Chrysanthemums, Carnations, and shrubs formed the principal subjects before the FLORAL COMMITTEE: there were also many exhibits of floral paintings. This body recommended 11 Awards of Merit to new varieties of Chrysanthemums, Carnations, and Begonias respectively.

Exhibits of fruits and vegetables were of importance, and the FRUIT AND VEGETABLE COMMITTEE awarded two Gold Medals to collections of fruit and vegetables respectively. Several exhibits of preserves received awards of medals.

At the three o'clock meeting, a lantern lecture on "Some Gardens In and Around Bournemouth" was given before a large audience by Dr. G. G. Hamilton. Numerous coloured photographs of garden and country scenes in the neighbourhood of that popular seaside town were shown on the screen, and Dr. Hamilton gave a few particulars of each picture.

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); Messrs. Chas. T. Druery, G. Reuthe, W. J. James, John Green, John Dickson, Chas. Dixon, Chas. E. Shea, F. Page Roberts, F. Herbert Chapman, W. Bain, H. J. Jones, Chas. E. Pearson, Wm. Howe, J. F. McLeod, W. J. Bean, J. Jennings, Edw. Mawley, Arthur Turner, J. W. Barr, R. G. Reginald Nevill, and James Hudson.

Messrs. JOHN WATERER & SONS, LTD., Bagshot, Surrey, put up an imposing group of ornamental trees and shrubs, including a large number of Hollies. The plants were splendidly grown, and the coloured forms exceptionally bright. In the centre at the back was a magnificent specimen of Holly Golden Queen, with a globular head 7 feet in diameter. There were similar but smaller specimens of Waterer's Gold and Silver Queen on either side. Weeping Hollies were represented in golden, silver and green varieties. Other interesting plants were a standard Taxue adpressa, Athrotaxis selaginoides, a very distinct Conifer; Thuya plicata var. zebrina, one of the finest golden Conifers; Retinospora plumosa argentea, a remarkably fine specimen; Ilex crenata aurea, with leaves like those of Pernettya, and many a beautiful gold colour; a plant of the variety latifolia had numerous black berries; Cupressus Westermanni and a standard plant of Cupressus (Retinospora) filifera aurea were both a bright golden colour. (Silver-gilt Flora Medal.)

Mr. G. REUTHE, Keston, Kent, showed a collection of uncommon shrubs and Himalayan Rhododendrons. The rare Fagus fusca, an evergreen Beech; F. Menziesii, F. betuloides, Gevuina Avellana, Restio subverticillatus, Damnacanthus indicus, Pittosporum Kirkii, Olearia ilicifolia, O. Colensoi, O. angustifolia, and Athrotaxis imbricata were included in the collection.

Mr. L. R. RUSSELL, Richmond, filled a large table with dwarf shrubs of an ornamental character, and plants of Azalea indica Mme. Petrick, with rose-coloured blossoms.

FIG. 172.—BEGONIA SPLENDOUR.
(R.H.S. Award of Merit, November 19. See page 393.)

Messrs. Clibrans, Altrincham, exhibited varieties of winter-flowering Begonias. The plants were splendidly flowered, healthy, and made a very imposing exhibit. The varieties were very numerous, and included several good seedlings, Altrincham Pink, Clibran's Triumph, Miss Clibran, Clibran's Pink, Scarlet Beauty, Emily Clibran, Duchess of Westminster, and Beauty of Hale; some of these are described under "Awards of Merit." (Silver Banksian Medal.)

Messrs. James Veitch & Sons, King's Road, Chelsea, again showed varieties of winter-flowering Begonias. The finest variety was The Gem, a close-habited, rosy-carmine flower. The same plants were exhibited in bloom at the last meeting, and the flowers had remained beautifully fresh. Other varieties were Julius, Ensign and Success. The exhibit included plants of Lindenbergia grandiflora and Browallia speciosa. As a separate exhibit Messrs. Veitch showed a large collection of dwarf Chrysanthemums in pots, mostly varieties of the single type. (Silver Flora Medal.)

Messrs. W. Cutbush & Son, Highgate, filled a table with greenhouse flowers, including Carnations, Begonias, Ericas, Liliums, Roses, Lilacs, and Spiræas. The choicer Carnations were Mrs. L. Mackinnon (scarlet), Mrs. Walderf Astor (yellow ground with cerise markings), R. F. Felton (pink), King George (scarlet "Malmaison"), and Goldfinch (apricot). This firm also showed pans of Iris alata and I. Vartanii. (Silver Banksian Medal.)

Messrs. H. B. May & Sons, Edmonton, showed batches of Cyclamens in distinct colours, plants of Plumbago rosea, the form of Euphorbia pulcherrima known as major, and numerous decorative Ferns. (Silver Banksian Medal.)

Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. Edwin Beckett), displayed blooms of Streptocarpus of the improved "Aldenham" strain of these pretty greenhouse flowers.

A large group of Plumbago rosea, bordered with plants of Clerodendron fallax and Ferns, was shown by Sir George Faudell Phillips, Hertford (gr. Mr. F. Fitch).

Mr. W. A. Manda, St. Albans, showed a small number of Ferns and a pretty variegated Antherieum named Mandaianum.

Messrs. W. Wells & Co., Ltd., Merstham, arranged the most imposing floral group, with varieties of Chrysanthemums. There were no fewer than 100 specimen blooms of the new white Queen Mary variety (see fig. 164 in the last issue). These were arranged in a bold mass in the centre, with 18 of the choicest specimens in a very large ornamental basket in front. The ends of the exhibit were formed of great banks of the white Japanese William Turner and Mrs. Gilbert Drabble. There were also large clumps of Mensa, Phyllis Bryant, Mrs. Prowting (a primrose-coloured sport from Cannell's White). Mrs. Drexel, Lady Talbot, Miss Ada Brocker, Decembor Gold, Glaucus, and others. (Silver-gilt Flora Medal.)

Fig 173.—Carnation "Salmon Enchantress."
(R.H.S. Award of Merit, November 19. See page 394.)

Messrs. H. J. Jones, Ltd., Hither Green, Lewisham, filled a table with varieties of Chrysanthemums. This well-arranged exhibit included such popular sorts as Mensa (the finest white single), Mrs. Gilbert Drabble, Florrie King (an Incurved Japanese variety), Mrs. W. T. Smith (white), Mrs. Alice Thorpe (yellow), Sylvia Slade (a pretty single variety of magenta colour), Mrs. A. E. Roope, and Queen Mab. (Silver Flora Medal.)

Mr. James Box, Lindfield, Sussex, filled a corner with a pretty exhibit of single Chrysanthemums. The blooms of Golden Spray are like a bright yellow Senecio, and are developed in lax bunches. The fine crimson and gold Ceddie Mason variety was shown in a large batch in the centre of the exhibit. (Silver Banksian Medal.)

Messrs. H. Cannell & Sons, Swanley, Kent, exhibited Chrysanthemums and Zonal Pelargoniums. This firm usually exhibit uncommon varieties of the former flower; on this occasion they showed a novelty in Bacchus, like a bunch of white and red silk twist. Sam Caswell is another pretty variety of this type with pink florets.

Messrs. Cragg, Harrison & Cragg, Heston, showed vases of single Chrysanthemums of the type grown for market. A new variety named Elfrida has buff florets suffused with rosy-crimson. The new Snow Queen with "Anemone" centre was included in the collection.

Messrs. John Peed & Son, Norwood, arranged a collection of single Chrysanthemums. The exhibit was very attractive, and included the fine varieties Chas. Dickens and Phyllis.

Mr. T. Ward, Bishop's Stortford, staged bunches of single Chrysanthemums of well-known varieties.

The Misses G. C. Price & A. B. Fyfe, Grove Park Nursery, Lee, showed varieties of Chrysanthemums and Carnations.

Exhibits of Carnations were staged by Mr. C. Englemann, Saffron Walden; Messrs. Allwood Bros., Haywards Heath; Mr. William Lawrenson, Yarm-on-Tees; and Messrs. Stuart Low & Co., Enfield, who had also their fine salmon-coloured Cyclamen and plants of Acacia platyptera.

Messrs. John Piper & Sons, Barnes and Bayswater, showed a fine collection of 60 species and varieties of Saxifraga.

Messrs. T. S. Ware, Ltd., Feltham, showed pans of Alpines and the pretty Erigeron speciosum "Quakeress," which has flowered continuously since June.

Messrs. Barrie & Brown, 39, King William Street, London, showed 12 species of Sempervivums, models of Alpine gardens, and a nesting box for wild birds. The box is about 1 foot high and 7 inches wide and deep. The roof is high pitched and projecting, so as to protect the nest from rains, sun, and cats. The entrance is close up under the apex of the roof, and a perch affords a place upon which the birds can alight before entering the nest.

Mr. Wilfred Mark Webb, Odstock, Hanwell, hon. secretary of the Selborne Society, exhibited "Selborne" nesting boxes for wild birds and bird-feeding appliances.

A Silver Flora Medal was awarded to Frank Galsworthy, Esq., Chertsey, for paintings of floral subjects.

Awards of Merit.

Chrysanthemum Michael Harrison (single).—The flowers are large and of great substance, with three or four rows of ray-florets. The general colour is light reddish-brown (approaching the darkest shade of dull carmine lake, *Rép de Couleurs*), but around the disc is a band of clear yellow one-third of an inch wide, which gives the flower a bold effectiveness. The rays are also lightly tipped with yellow. Shown by Mr. S. F. Harrison, East Grinstead (gr. Mr. A. H. Chapman).

C. Audrey (single).—A large flower with rich-yellow, flat ray-florets in two or three rows. Shown by the Manor House Nurseries, Cardiff.

C. Miss May Fox (Japanese).—An exhibition variety of good depth and substance, with long, drooping ray-florets. The flowers are a pale, creamy yellow, but greenish yellow in the undeveloped centre. Shown by Messrs. H. J. Jones, Ltd.

C. Mrs. W. T. Smith (Japanese).—An exhibition variety of medium size and close globular form. The pure-white florets are broad and incurving; the young blooms are tinged with yellow. Shown by Mr. Alex. Smith, Roehampton.

Begonia Lucy Clibran (see fig. 171).—This and the three following Begonias are of the winter-flowering type, and were raised from Begonia socotrana and tuberous varieties. In each plant the foliage is bold and handsome, more closely approaching that of the tuberous-rooted section. The large, double flowers of Lucy Clibran are 3 inches in diameter, and of a soft pink shaded with salmon and apricot. When fresh, they are said to be tinted with orange, but those shown had suffered somewhat in transit.

B. Splendour (see fig. 172).—The flowers are semi-double, with a tuft of small petals at the centre and a few extra larger ones. The plant is

neat in appearance and very free-flowering. The colour is reddish scarlet, and darker than other varieties.

B. Scarlet Beauty.—This variety has semi-double flowers, with the form of the last. The blossoms are a bright scarlet colour, and borne freely in a large, loose truss.

B. Eclipse.—This variety has semi-double flowers, very freely borne, and carries a number of fertile, single flowers. The colour is a light salmon-red. These four exceedingly attractive Begonias were shown by Messrs. CLIBRANS.

Carnation Mary Allwood.—A perpetual-flowering variety, with fine stem, good calyx, strong clove scent, full flower, and smooth petal. The colour is a light salmon-rose, close to shade three of raspberry red of the *Rép de Couleurs.*

C. Salmon Enchantress (see fig. 173).—This is a pleasing salmon-pink sport from Rose-pink Enchantress. The colour is similar to that of Lady Alington, and the variety is said to possess all the good points of Enchantress in growth, freedom of flowering, and form. Both these Carnations were shown by Messrs. ALLWOOD BROS.

C. Snowstorm.—This was probably the most generally admired individual flower in the show. The plant is a strong grower, with wiry stem and unusually good foliage. The flowers are large and full-petalled, almost globular in shape, delightfully clove-scented, and pure white. Shown by Mr. WM. LAWRENSON.

SOME FURTHER NOVELTIES.

The novelties submitted for award included 39 varieties of Chrysanthemums. In addition to those certificated, Edna Deane (shown by Mr. G. FERGUSON. The Hollies, Weybridge) was of interest from its unusual form. For half their length the ray florets were tubular or quilled, and buff in colour, the outer half then opening to a small, lance-shaped ray of pale fawn. The most interesting plant botanically was Drosophyllum lusitanicum (shown by Mrs. C. C. BERGHEIM, Belsize Court, Hampstead). The leaves are about 4 inches long, linear and channelled, and borne in a close spiral at the end of a 1½ inch stem. Glandular hairs studded the leaf margins, and there were two rows on the dorsal side. The flower is bright yellow. The blooms were faded. The plant received a Botanical Certificate in 1875, and it is figured in the *Bot. Mag.*, tab. 5796. Its home is the sandy shores and dry rocks of Spain and Portugal.

Orchid Committee.

Present: Sir Harry J. Veitch (in the Chair); Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, R. Brooman-White, W. Bolton, W. H. White, A. Dye, W. P. Bound, H. G. Alexander, J. E. Shill, W. H. Hatcher, J. Cypher, J. Charlesworth, C. H. Curtis, A. McBean, F. Sander, T. Armstrong, F. J. Hanbury, R. G. Thwaites, R. A. Rolfe, C. J. Lucas, and Gurney Wilson.

The feature of the show was the very fine group of Vanda cœrulea arranged by Mr. Hunter (gr. to His Grace the Duke of MARLBOROUGH, Blenheim Palace, Woodstock), for which the Society's Gold Medal, together with a Silver Lindley Medal for excellent cultivation, was awarded. The group had a frontage of 36 feet and a depth of 6 feet. It was arranged with a raised centre, with lower curve on each side, the ends being also elevated, the fine blue sprays of flowers arching gracefully in all directions, their clear, blue tints showing well above the setting of pale-yellow Cypripedium insigne Sanderæ and other Cypripediums which were arranged in the front and lower parts of the group. The central design contained choice varieties of V. cœrulea of very fine colour and distinct veining, the best of the varieties noted being Rosamund, Margaretta, Mrs. Spencer Churchill, and Hunteri. The whole formed a very meritorious exhibit.

Messrs. STUART LOW AND CO., Bush Hill Park, were awarded a Silver Flora Medal for an effective group, in which good forms of Cattleya Fabia, white varieties of C. labiata, and other showy Orchids were arranged beneath sprays of yellow Oncidium varicosum, and other graceful species. Among hybrids, the white Cattleya Dusseldorfei Undine, a pretty hybrid between Sophronitis grandiflora and Brasso-Lælia Helen, and a very fine cross between Cattleya labiata and C. Luddemanniana were noted.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, were awarded a Silver Banksian Medal for a group principally composed of good Cypripediums, including forms of C. insigne, C. Euryades, C. Lecanum, and C. Baron Schröder. Among Odontoglossums were O. Anaphe (crispum × Uro-Skinneri), a prettily-spotted flower and a distinct hybrid between Brasso-Lælia Digbyano-purpurata and C. Dowiana aurea, the latter being the seed-bearer. The flower was intensified in its rosy-mauve colour by the cross, but the yellow of the female parent did not appear.

Messrs. SANDER & SONS, St. Albans, secured a Silver Banksian Medal for an interesting group, in which were noted a good Cypripedium Dreadnought, C. Pyramid var. Black Prince of the C. Euryades class but very heavily blotched; C. Troilus, Lord Nelson, and other good Cypripediums. Finely-coloured Cattleyas and Lælio-Cattleyas, two distinct forms of Cœlogyne fuscescens, Cirrhopetalum Medusæ, Bulbophyllum hirtum, and other curious species were also remarked.

Messrs. J. CYPHER & SONS, Cheltenham, received a Silver Banksian Medal for a representative group of Cypripediums, including some good forms of C. insigne and C. Lecanum. Also C. Fulshawense C. F. Sander, C. Milo "Westonbirt variety," C. Thalia gigantea, C. Swinburnei magnificum, and C. Mme. Jules Hye.

Messrs. SWAN & PRICE. Keyfield Nursery, St. Albans, were awarded a Bronze Banksian Medal for a group of Cypripediums, which included C. Queen Alexandra (a very good flower; parentage unknown), C. Baron Schröder, C. Tityus Louise, C. Actæus varieties, C. Priam, C. Goweri splendens, and various unnamed kinds.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), sent Lælio-Cattleya Adolphi Iris, a pretty Indian yellow flower, spotted with claret-red, with crimson front to the lip.

Messrs. CHARLESWORTH & Co., Haywards Heath, staged a select group, in the centre of which was their new Trichopilia Gouldii, with a spray of five, white fragrant flowers. Together with an excellent selection of Cypripediums were the singular Catasetum discolor, a selection of Odontoglossums including a very richly-coloured home-raised Odontoglossum crispum, and the singular Oncidioda Marjorie (Cochlioda Noezliana × Oncidium Forbesii), curiously intermediate in character and with bronzy flowers having a whitish front to the lip.

Messrs. HASSALL & Co., Southgate, staged a group of Cypripediums and Cattleyas. With them was a plant of the remarkable Angræcum infundibulare, with large, white labellum, and a dark-coloured Dendrobium Cœlogyne.

E. H. DAVIDSON, Esq., Orchid Dene, Twyford, sent Cattleya labiata Heleue, a very clear white flower, with violet blotch on the lip; a very large and handsome Odontoglossum, with finely-marked flowers; and the new Lælio-Cattleya Bella "Orchid Dene variety" (see Awards).

Messrs. J. & A. MCBEAN, Cooksbridge, sent a curious hybrid between Lælia autumnalis and Cattleya Octave Doin named L.-C. auto-Doin. The flower was of good size, rose, with white base to the lip.

H. S. GOODSON, Esq., Putney (gr. Mr. G. E. Day), sent Sophro-Lælio-Cattleya Olive, a well-formed flower of a reddish-rose colour; the showy Cattleya Iris King George V, and Odontoglossum amabile Rosetta, of fine colour, but not fully expanded.

C. J. LUCAS, Esq., Warnham Court, showed Lælio-Cattleya Muriel (a neat white flower) and Cypripedium Harlequin.

W. THOM, Esq., Athol House, Blackburn, showed Cypripedium Bulgare (insigne Harefield Hall × Parkerianum).

Lady THEODORA GUEST, Inwood, Templecombe (gr. Mr. Hester), sent Cattleya Neptune (labiata × Schilleriana).

F. ARNOLD HINDLEY, Esq., Croft Villa, Great Horton, Bradford, showed Cypripediums Hassallii "Hindley's variety" (Bingleyense × Charlesworthii), a finely-formed flower, with large, rose-tinted dorsal sepal.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), sent a good Lælio-Cattleya Neleus (C. Iris × L.-C. Ophir), in form like C. Iris, but broader. Sepals and petals yellowish, tinged with green; lip crimson.

AWARDS.

FIRST-CLASS CERTIFICATES.

Lælio-Cattleya Bella "Orchid Dene variety" (L. purpurata × C. labiata), from E. H. DAVIDSON, Esq., Orchid Dene, Twyford.—A very remarkable hybrid, which, in its colour and fine form, approaches nearest to C. labiata. The flowers are bright, rosy-lilac, the lip being purplish-crimson, with a white base, having some purple markings.

Cypripedium Elatior (Lecanum × Baron Schröder), from F. M. OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth).—A very fine form of the favourite hybrid originally raised by Messrs. Jas. Veitch & Sons. In the plant shown the flowers were of fine shape and very dark colour. The petals and lip had a greenish-yellow ground, heavily tinged with purple. Dorsal sepal white, densely spotted with dark claret-purple.

AWARDS OF MERIT.

C. Latona (Niobe × Alcibiades), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander).—Flower of good shape. Dorsal sepal white with a small green base, above which are lines of large purple blotches. Sepals and petals resembling those of C. Thalia.

Lælio-Cattleya Scylla (L.-C. Cappei × C. Lord Rothschild), from F. M. OGILVIE, Esq.—A very effective hybrid, with flowers of apricot-yellow colour, the margin of the lip tinged with rose.

Fruit and Vegetable Committee.

Present: Jos. Cheal, Esq. (in the Chair); Messrs. George Woodward, Edwin Beckett, J. Willard, George Keif, A. Grubb, A. R. Allan, Wm. Pope, W. E. Humphreys, John Harrison, Owen Thomas, Geo. Wythes, W. Poupart, H. Somers Rivers, A. Bullock, J. Davis, and A. W. Metcalfe.

A Gold Medal was awarded to Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, for a collection of vegetables. This fine exhibit included most kinds in season, there being altogether 100 dishes. The quality of the produce was superb and the method of exhibiting admirable. Novelties included New Intermediate Beet, (a selection from Egyptian Turnip-rooted), Golden Shallots, Paris Market Brussels Sprouts, Black Spanish Radish, Smooth Prague Celeriac, and China Rose Radish. Hollow Crown Parsnips were of large size, and there were splendid Onions of the Cocoa-nut variety, Michaelmas White Broccoli, Model Carrots, Selected Red Beets, Invicta Tomatos, Potatos in variety, Capsicums, Cucumbers, Cress, Endive, Leeks, Mushrooms, and many other kinds.

Messrs. JAMES CARTER & Co. exhibited from their trial grounds at Raynes Park a collection of Cabbages and Kales. There were 20 varieties of Cabbage, including 10 sorts of Savoys and 9 of Kales. An improved strain of Model Cabbage was the best in its section, and there were also good heads of Hartwell, Ball Head, Large York, and White Prizetaker. The old Green Curled was unequalled amongst the Savoys, which included Scotch Green Curled, Dwarf Extra Curled, and Cottager's. Uncommon greens were seen in Norwegian Savoy, Couve Tronchuda, Chou de Russie, and Ragged Jack Kale. Chou de Russie, or Russian Kale, is a splendid winter green; the plant is very hardy, and the leaves are excellent as a vegetable. (Silver Banksian Medal.)

Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Edwin Beckett), exhibited 70 varieties of Apples, 25 varieties of Pears, several bunches of Grapes, also dishes of Nuts and Medlars. The Apples were very good specimens, especially the varieties Blenheim Pippin, Wealthy, Adams's Pearmain, Cox's Orange Pippin, Hoary Morning, Kentish Fillbasket, Emperor Alexander, Stone's Pippin, Bismarck, Peasgood's Nonesuch, and Bramley's Seedling. The Grapes included four bunches of Black Alicante, ten of Muscat of Alexandria, two of Cooper's Black, and two of Princess of Wales, the berries in all cases being well finished. (Gold Medal.)

A very attractive exhibit of Apples and Pears was shown by Mrs. W. GORDON CANNING, Hartpury House, Gloucester. Apples Gascoyne's Seedling, Melon (exceptionally large), Chas. Ross, Tyler's Kernel, Sandringham, and Bismarck, and Pears Beurré Baltet Père, Van Mons, Chas. Ernest, and Marie Benoist were all remarkably good. (Silver Knightian Medal.)

Mr. C. Goring, Wiston Park, Steyning, Sussex (gr. Mr. W. Bennett), was awarded a Bronze Knightian Medal for a collection of Apples and Pears.

Confections and preserves were staged by Mrs. Miller, Moyleen, Harlow (Silver Banksian Medal); Miss Sewell, South Kensington (Silver Banksian Medal); and Messrs. E. Westmacott & Co., Leadenhall Street, London. (Silver Knightian Medal.)

A Cultural Commendation was awarded to Mr. Staward, The Gardens, Panshanger, Hertfordshire, for fruits of White Ischia Figs.

SCOTTISH HORTICULTURAL.

November 14, 15, 16.—The 27th annual Chrysanthemum exhibition of this association was held in the Waverley Market, Edinburgh, on these dates. The weather was dry, with a rather cold north-westerly wind, but the new heating and ventilating system worked admirably, and a comfortable and equable temperature was maintained. The attendance was very good, and the receipts showed an increase over those of 1911 of more than £100.

There was a considerable decrease in the entries, which were 200 fewer than in 1911; this was no doubt partly due to the fact that the council now demand a deposit from every competitor as a guarantee that his entries will be staged. As a consequence only an extremely small proportion of the entries was not forthcoming. This was very marked in the vegetable section, in which (though more than half of the total deficiency occurred here) there was quite as good a display as in 1911. The falling off was seen chiefly in the principal classes for specimen Chrysanthemums. In the leading class, for example, there were only two exhibits, and in the Scottish Challenge Cup class the number was little more than half the average. The quality of the exhibits in this section was not quite up to the standard of 1911.

Cut Flowers.

The City of Edinburgh Queen Victoria Memorial Cup was offered in the leading class for cut blooms of Japanese Chrysanthemums. The schedule required 15 vases in 15 varieties, three blooms in each vase. The finest exhibit was staged by Captain Archibald Stirling, Keir (gr. Mr. Thos. Lunt); 2nd, Mrs. Simson, Bonaly Tower, Colinton (gr. Mr. James Fraser). This being the third occasion on which the cup has been won by Captain Stirling it now becomes his property. The 3rd prize of £5 was awarded to Mrs. Simson. The varieties shown by Captain Stirling and the points awarded to them were as follow:—

Variety shown	Max mum Points.	Points awarded.
Coronation	12	8
Hon. Mrs. Lopes	12	9
White Queen	12	8½
Geo. Hemming	12	8½
Mrs. L. Thorn	12	10
Mary Poulton	12	10
Lady Talbot...	12	9
Mrs. A. T. Miller... ...	12	11
Frances Jolliffe	12	9
Maud Williamson	12	10
Melchet Beauty	12	8½
Purity	12	9
F. S. Vallis	12	9
J. H. Silsbury	12	9
Wm. Turner...	12	10
	180	138½

Mrs. Simson's blooms received 87 points out of a possible 180.

In the Scottish Challenge Cup class for eight vases of Japanese Chrysanthemums in eight varieties, three blooms in each vase, open to Scottish gardeners and amateurs, there were six exhibits. The trophy was won by John Graeme Thomson, Esq., Norwood, Alloa (gr. Mr. James Small); 2nd, Jas. E. B. Baillie, Esq., Dochfour (gr. Mr. R. Mackenzie); 3rd, W. T. MacLellan, Esq., Auchenault, Helensburgh (gr. Mr. H. MacSkimming). Mr. Thomson showed William Turner, Frances Jolliffe, Mrs. A. T. Miller, F. S. Vallis, Mrs. L. Thorn, White Queen, Fred. Chandler, and Lady Talbot, receiving 76 points out of a possible 96. J. E. B. Baillie, Esq., was awarded 74½ points; W. T. MacLellan, Esq., 72½; and the Right Hon. R. C. Munro Ferguson 71½ points. The bloom of "Wm. Turner" in Mr. Graeme Thomson's exhibit was awarded the Silver Medal for the best bloom in the show.

In the class for six vases of Japanese Chrysanthemums in six varieties, three blooms in each vase, W. H. Dobie, Esq., Dollarbeg, Dollar (gr. Mr. J. Waldie), with 57 out of 72 points, was awarded the 1st prize; W. T. MacLellan, Esq., was awarded the 2nd; the Rt. Hon. R. C. Munro Ferguson, the 3rd; and David Thomson, Esq., Greenfield, Alloa (gr. Mr. L. McLean), the 4th prize.

For 12 blooms of Japanese Chrysanthemums in 12 varieties, shown on boards, Captain Stirling was placed 1st; J. Graeme Thomson, Esq., 2nd; and J. E. B. Baillie, Esq., 3rd.

Captain Stirling was also 1st in the classes for two vases of Japanese Chrysanthemums of one variety, three blooms in each vase, and for four vases in 12 varieties, three blooms in each vase. The Hon. Mrs. Askew Robertson, Ladykirk, Norham (gr. Mr. G. Little), was 2nd, and the Rt. Hon. R. C. Munro Ferguson 3rd in the class for two vases, and D. Thomson, Esq., 2nd, and Mr. Alex. S. Watt, Whiting Bay, Arran, 3rd in that for four vases.

C. E. Green, Esq., Gracemount, Liberton (gr. Mr. P. MacLachlan), excelled in the class for four vases in four varieties, three blooms in each vase; 2nd, Colonel More Nisbet, Drum, Gilmerton (gr. Mr. R. Whannell).

The Earl of Wemyss, Gosford (gr. Mr. W. Galloway), excelled in the class for three vases of Chrysanthemums in three varieties, not more than 12 sprays in a vase, for quality and decorative effect; 2nd, Dr. Scott, Musselburgh (gr. Mr. Wm. Armstrong).

Lord Elphinstone, Carberry Tower, Musselburgh (gr. Mr. D. Kidd), was placed 1st for one vase of Chrysanthemums, disbudded, and arranged for effect, whilst for six vases of single Chrysanthemums in six varieties, not more than 12 sprays in each vase, the Earl of Wemyss was placed 1st; Mr. J. Bruce, Davidson's Mains, being 2nd; and C. W. Cowan, Esq., Dalhousie Castle (gr. Mr. W. G. Pirie), 3rd.

Sir Wilfrid Lawson, Bart., Brayton (gr. Mr. A. Knight), excelled in the class for three vases of single Chrysanthemums in three varieties, not more than 12 sprays in each vase; the Earl of Home being 2nd; and for three vases of the same kind the Earl of Wemyss won the 1st prize.

In the class for market growers, that for six vases of Chrysanthemums in six varieties, three single and three double sorts, Mr. James Bruce, Davidson's Mains, and Messrs. Todd & Co., Musselburgh, who were the only exhibitors, were placed 1st and 2nd respectively.

Messrs. Wells & Co., Merstham, secured the Silver Medal offered for the best new Chrysanthemum not in commerce with a fine bloom of "Queen Mary"; the Hon. Mrs. Askew Robertson was awarded the Bronze Medal for the variety "The Hon. Mrs. Askew Robertson."

Decorative Classes.—Miss H. Newlands, Leith, showed the best (1) bride's bouquet, (2) two bridesmaids' bouquets, (3) bouquet of Chrysanthemums, (4) bouquet of Carnations, and (5) floral wreath. Sir W. Lawson, Bart., Brayton (gr. Mr. A. Knight), was 1st for (1) a bouquet (Chrysanthemums and Carnations excluded), (2) basket of flowers (Chrysanthemums excluded), (3) hand bouquet (Chrysanthemums excluded), and (4) basket of Orchid blooms arranged for effect. Mrs. Boase, Binrock, Dundee (gr. Mr. J. Beats), excelled for a basket of Chrysanthemums and hand bouquet of Chrysanthemums. Lord Elphinstone, Carberry Tower (gr. Mr. D. Kidd), was 1st for floral decorations for a dinner table (Orchids excluded); A. Sinclair Henderson, Esq., Seathwood, Dundee (gr. Mr. G. Scott), was 2nd. The flowers used in Lord Elphinstone's decoration were Francoas and Carnations with a ground-work of Ampelopsis Veitchii.

Chrysanthemum Plants.

Lady Steel, Boroughfield, Edinburgh (gr. Mr. W. Michie), won 1st honours in the classes for (1) six distinct varieties (Single and Pompon excluded), (2) four Japanese (distinct), (3) two varieties (distinct), (4) one large-flowered, and (5) one Single (Marguerites excluded), while Mrs. Simson, Bonaly, excelled for six plants in 7-inch pots.

Plants.

In the plant classes the quality was about the average, and here also there was a smaller number of exhibits than usual. In the Palm classes the Earl of Home, Douglas Castle (gr. Mr. A. McMillan), was placed 1st for six specimens in pots, not exceeding 7 inches, and also for two specimens, whilst Mrs. Rose, Richmond House, Glasgow (gr. Mr. J. Templeton), excelled for three specimens, and Sir Wm. Younger, Bart., Auchin Castle, Moffat (gr. Mr. J. Macgregor), for one specimen. Sir J. Gilmour, Bart., Montrave, Leven (gr. Mr. J. Wilson), was placed 1st for six Dracænas; the Rt. Hon. R. C. Munro Ferguson, Raith, Kirkcaldy (gr. Mr. D. McLean), excelled for six Primula sinensis and six Primula obconica; the Rt. Hon. A. J. Balfour, M.P., Whittinghame, Prestonkirk (gr. Mr. G. Anderson), showed the best six table plants (excluding Ferns); Miss Balfour Melville, Pilrig House, Edinburgh (gr. Mr. Wm. Robertson), the best six dwarf hardy Ferns; and Mr. A. Johnstone, Hay Lodge, Edinburgh, the best six table Ferns. Other winners of 1st prizes were: Mrs. Wauchope, Niddrie (gr. Mr. J. Alexander), for six plants of Salvia splendens; Major Thorburn, Craigerne, Peebles (gr. Mr. J. McNeill), for six pots of Roman Hyacinths; the Earl of Home for three pans of Lily of the Valley and six specimen Ferns; Lord Strathedeen and Campbell, Hartrigge, Jedburgh (gr. Mr. A. Williams), for six Cyclamen and four winter-flowering Begonias; Sir W. Lawson for eight decorative foliage plants; and Sir Wm. Younger for four decorative foliage plants.

Fruit and Vegetables.

The exhibits of fruit were, considering the season, fairly good, but amongst the hardy kinds there was a distinct falling off, both in quantity and quality. There were only two competitors in the class for a collection of eight dishes, viz., Lord Elphinstone and the Earl of Wemyss, who were awarded the 1st and 2nd prizes respectively.

W. Mackay, Esq., Ascog, Bute (gr. Mr. D. Halliday), was awarded the 1st prize for four bunches of Grapes, distinct, but the prize was withheld on protest on the ground that bunches labelled Mrs. Pearson and Dr. Hogg were both of the former variety; Lord Elphinstone was placed 2nd, and C. W. Cowan, Esq., 3rd.

In the class for two bunches, W. Mackay, Esq., was also 1st for Black Alicante and for any other variety. W. H. Dobie, Esq., was placed 1st for one black and one white variety; C. W. Cowan, Esq., showed the best Muscat of Alexandria; Sir J. King, Bart., Carstairs House (gr. Mr. J. Shiells), excelled for Gros Colman; the Rt. Hon. A. J. Balfour, M.P., won the class for Appley Towers variety; and Major Thorburn for Lady Hutt.

In the hardy fruit classes, Colonel Gordon, Threave House, Castle Douglas (gr. Mr. J. Duff), was placed 1st for (a) 18 dishes of Apples, in not fewer than 12 varieties (grown in Scotland), (b) for 18 varieties of Apples, (c) for six varieties culinary Apples, and (d) six varieties of dessert Apples. The Earl of Wemyss excelled for six varieties of Pears grown in Scotland, whilst the American Ambassador, Wrest Park, Bedfordshire (gr. Mr. G. McKinlay), showed the premier collection of six varieties of Pears.

In a class for market growers for three baskets of dessert Apples and three baskets of culinary Apples, each in three varieties and 12 lbs. in each basket, Mr. R. G. Sinclair, Congalton, Drem, was 1st in each class.

Vegetables.—There were five competitors in the class for a collection of vegetables, nine distinct kinds, selected from a list published in the schedule, and the 1st prize was awarded to the Earl of Lauderdale, Thirlestane Castle, Lauder (gr. Mr. R. Stuart); the Earl of Home, Bothwell Castle (gr. Mr. W. P. Bell), was 2nd; and J. Ramsay Stewart Richardson, Esq., Tulliebelton House, Bankfoot, Perth (gr. Mr. W. Harper), 3rd. The Earl of Lauderdale's collection consisted of Ailsa Craig Onions, Student Parsnips, Perfection Tomatos, Delicacy Cucumbers, Lyon Leeks, Self-Protecting Autumn Broccoli, Macgregor's Beet, Gay Gordon Potatos, and Solid White Celery.

In the single dish classes, the Earl of Lauderdale was also successful in obtaining 1st prizes for eight Leeks, six Dobbie's International Leek, two Cucumbers, and one dish of any other vegetable. A. Sinclair Henderson, Esq., excelled for Tomatos; Mr. Wm. Gilchrist, Lasswade, for Broccoli; Mr. J. W. Scarlett,

Inveresk, for Brussels Sprouts and Savoys; R. M. PILKINGTON, Esq., for culinary Cabbage; the Earl of HOME for Curled Greens; Mr. JAS. PATERSON, Roxburgh, for Celery; Colonel GORDON for Beetroot; Mr. ANDREW TAYLOR, Earlston, for Parsnips and Carrots; W. H. DOBIE, Esq., Dollarbeg, for Turnips; T. G. BAIRD, Esq., Rosemount, Ayr (gr. Mr. P. Melville), for Onions; ALEX. COWAN, Esq., Penicuik (gr. Mr. J. Turnbull), for Parsley; Miss BALFOUR MELVILLE for Jerusalem Artichokes; Sir HERBERT MAXWELL, Monreith (gr. Mr. S. Gordon), for Potatos; and Mr. G. M. SELVICE, Liberton, for market Leeks.

NON-COMPETITIVE EXHIBITS.

Messrs. W. WELLS & Co., Merstham, were awarded a Gold Medal for an exhibit of Chrysanthemums; Messrs. SUTTON & SONS, Reading, staged an exhibit of vegetables, for which a Gold Medal was awarded; Messrs. JOHN FORBES (Hawick), Ltd., staged Carnations, winter-flowering Begonias, and Michaelmas Daisies; Messrs. YOUNG & Co., Hatherley, showed Perpetual-flowering Carnations (Silver Medal); Messrs. DOBBIE & Co., Edinburgh, exhibited a collection of Potatos (Silver Medal); Messrs. WM. CUTBUSH & SON, Highgate, showed perpetual-flowering Carnations, including Mrs. Lucy MacKinnon, Hon. R. James, Mrs. Waldorf Astor, and perpetual-flowering "Malmaison" King George (Silver Medal); Mr. H. N. ELLISON, West Bromwich, showed Ferns in variety; Mr. D. W. THOMPSON, Edinburgh, exhibited hybrid winter-flowering Begonias; Messrs. HUGH LOW & SON, Enfield, staged perpetual-flowering Carnations; Messrs. LILLIE, WHITE & Co., Edinburgh, showed Bay trees and other plants; Mr. D. MCLEOD, Chorlton-cum-Hardy, exhibited Cypripediums; Messrs. BALL & BIBBERSTEDT, Leith, showed a non-bleeding Beet; Mr. JOHN STORRAR, Colinton, showed a Potato grafted on a plant of Tomato.

AWARDS.

FIRST-CLASS CERTIFICATE.

Chrysanthemum "*Thomas Lunt*," exhibited by Mr. THOS. LUNT, Keir, Dunblane.

CERTIFICATES OF MERIT.

Chrysanthemums "*Queen Mary*" and "*Mrs. W. G. Drexel*," exhibited by Messrs. W. WELLS & Co., Merstham, and *Chrysanthemum* "*Snow Queen*," exhibited by Messrs. CRAGG, HARRISON AND CRAGG, Heston.

NATIONAL CHRYSANTHEMUM. EXHIBITION OF LATE-FLOWERING VARIETIES.

NOVEMBER 20.—In conjunction with the annual conference, which was held in the evening, an exhibition of cut Chrysanthemum blooms was held in the Essex Hall, Strand, London, on the above date. The all-round excellence of the exhibits and the keen competition shown in nearly all of the classes must be very gratifying to the Society, and should have the effect of making a show for the late-flowering varieties a permanent part of their programme.

The premier class was for 35 Incurved blooms, in which the Challenge Cup and 1st prize in money was won by PANTIA RALLI, Esq., Ashtead Park, Epsom (gr. Mr. G. Hunt), who showed an excellent collection. Many of the blooms were so large that their outer florets touched those of their neighbours. The yellow varieties were, perhaps, the best, the colours of the shapely blooms being rich and clear, the hairy variety Emblème Poitevine being especially noteworthy. Amongst the whites, Souvenir de William Clibran and Edwin Thorp were the best; whilst Clara Wells (cream and pale bronze), H. Hearn, Amber Beauty, and W. Pascoe were very good specimens. The 2nd prize was awarded to Miss LANGWORTHY, Gay's House, Holyport (gr. Mr. T. J. Broom), whose finer blooms were Nellie Threlfall, W. Pascoe, and Clara Wells. 3rd, W. W. MANN, Esq., Ravenswood, Bexley, Kent (gr. Mr. J. Simon).

The display of market Chrysanthemums which won the 1st prize in Class 2 for Mr. NORMAN DAVIS, Framfield, Sussex, was admirable in quality as well as in arrangement. The blooms of the different varieties were of that quality and freshness which one would expect to see prominently displayed in a first-class florist's establishment. A large stand of December Gold, a variety which Mr. DAVIS grows so well, was balanced by a good vase of the lesser-known variety Christmas Gift, which was extremely ornamental. The white-flowered varieties were represented by Maud Jeffries, Mrs. H. Luxford, and an unnamed Anemone-flowered variety. Wells's Late Pink and the deeper-coloured Phoebe are two very desirable pink varieties, and Black Prince, which is appropriately named, was very striking. The 2nd prize was won by Mr. J. TULLEY, Enfield Highway, who showed many useful varieties.

Messrs. CRAGG, HARRISON & CRAGG also competed in this class. The arrangement as well as the quality of the blooms pleased us more than the 2nd prize collection.

There were only three exhibits in the class for three vases of single-flowered varieties, and the 1st prize was awarded to Messrs. CRAGG, HARRISON & CRAGG, Merrivale Nurseries, Heston, Middlesex, for charming vases of Merstham Jewel, Portia, and Sandown Radiance.

Of the nine vases of single-flowered varieties, the best was shown by Mr. PHILIP LADDS, Swanley Junction, who utilised the varieties Bronze Beauty and Ethel Mortimer.

The Chairman's prize for a pair of vases of spidery, thread-petalled, pompon, or Anemone-pompon blooms was responsible for two very attractive exhibits. The 1st prize was won by Miss S. G. ABETHELL, Devonshire Lodge, Muswell Hill, London (gr. Mr. E. R. Cooper), and the 2nd by Miss LANGWORTHY.

The prizes offered by Messrs. W. Wells & Co. for a vase of 12 disbudded single Chrysanthemum blooms were won by Lod THOMSON, Esq., Ailsa Craig, Formby, Liverpool, and Mrs. ROGER GREGORY, Shoreham House, Shoreham, Kent (gr. Mr. L. Lawrence), in the order named.

Unfortunately, there was only one basket of Chrysanthemums exhibited in the Walthamstow Chrysanthemum Society class, yet this style of exhibit makes a very pleasing change from the arrays of vases and show boards. The 1st prize (a Large Silver Medal) was awarded to Mr. J. EMBERSON, Grove Road Nursery, Walthamstow, for a charming arrangement.

TRADE DISPLAYS.

A Large Gold Medal was awarded to Mr. NORMAN DAVIS, Framfield, Sussex, for a magnificent collection of cut blooms. The chief feature of this exhibit was the large stands of Japanese varieties, of which those containing immense, high-quality blooms of the variety Mrs. G. Drabble were especially prominent. At one end the blooms of A. M. Faulkner (the long florets in the centre of the flower have a pale golden colour, which merges to a dull purple in the mature florets, the two colours blending to a rosy tint), a sport from Edith Jameson, flanked by the white Mrs. Turner and December Gold were a charming combination. Other fine Japanese varieties were Mrs. G. C. Kelly, His Majesty, Lady Talbot, Gorgeous, and Mme. Paolo Radaelli. The single varieties shown were Royalty, Mensa, Agnes Pictor, &c., whilst the front row included such "button-flowered" kinds as Snowdrop, Baby, and White Baby.

A Gold Medal was also awarded to Messrs. CRAGG, HARRISON & CRAGG, Merrivale Nurseries, Heston, Middlesex, for an exceedingly meritorious display, which was chiefly composed of fresh and good blooms of such single-flowered varieties as Pink Beauty, Edith Pagram, Mrs. W. Garner, Celia, and Mensa. Several vases of yellow-flowered Incurved varieties, such as Romance and Golden King, illustrated the colour value of this type.

The Gold Medal group of Mr. PHILIP LADDS, Swanley Junction, Kent, contained a very good selection of the best market varieties, the single-flowered varieties being very prominent. These included such valuable kinds as Bronze Beauty, Ethel Mortimer, Mrs. Higgs, and Miss Phyllis Bryant. Amongst the Japanese varieties, Freda Bedford, Mme. Rivol, Mme. Paolo Radaelli, and William Turner demanded notice.

A Small Gold Medal was awarded to Messrs. W. WELLS & Co., Merstham, Surrey, for a smaller but very interesting collection. The centre was filled with splendid blooms of the white-flowered variety Queen Mary, whilst at the ends of the table there were good displays of Mrs. G. Drabble and William Turner.

Messrs. GODFREY & SON, The Nurseries, Exmouth, Devon, exhibited vases of Mollie Godfrey, a rosy-purple, large-flowered, single variety, and Godfrey's Perfection, a decorative, white-flowered, Anemone variety.

NOVELTIES.

The 22 exhibitors of new single-flowered Chrysanthemums presented 45 varieties for the consideration of the Committee. Of these four gained First-class Certificates, and three other awards were made, whilst two Japanese varieties received First-class Certificates. In addition to the first-class certificate a special prize was offered for the best novelty; this was won by Messrs. CRAGG, HARRISON & CRAGG for their variety Portia.

FIRST-CLASS CERTIFICATES.

Portia.—A large single flower with long, rolled, reddish terra-cotta coloured florets, which contrast well with the golden disc.

Snow Queen.—A very decorative pure white variety, which has a small anemone centre. The flower is well-formed, and the broad ray florets are slightly recurved at their tips. Both of these varieties were shown by Messrs. CRAGG, HARRISON & CRAGG, Heston, Middlesex.

Jory Saunders.—A large buff-coloured, and a trifle loosely formed, single flower. Shown by Mr. T. LAWRENCE, Shoreham House, Shoreham.

Royalty.—A medium sized, very prolific, deep crimson single variety, which will find favour as a decorative variety. Shown by Mr. NORMAN DAVIS, Framfield.

Autocrat.—A white Japanese variety, suitable for market purposes. The florets are broad, and of good substance. Shown by Messrs. LOWE & SHAWYER, Uxbridge.

Prince of Wales.—A very large, full, compact Japanese variety. The broad crimson florets have dull bronze reverses. Shown by Mr. NORMAN DAVIS.

CARDS OF COMMENDATION.

Mrs. Roger Gregory.—An attractive single variety, with flowers of medium size and good form. The broad rosy-mauve florets are recurved at their tips. Shown by Mr. T. LAWRENCE.

Crimson Queen.—A wine-coloured-crimson single variety. The tips of the florets of the broad flowers are slightly incurved.

Elfrida.—This large, deep apricot-coloured variety received its award for colour. Both these were shown by Messrs. CRAGG, HARRISON & CRAGG.

GLOUCESTERSHIRE ROOT, FRUIT AND CHRYSANTHEMUM.

NOVEMBER 9.—The 49th annual exhibition of the above society was held in the Shire Hall, Gloucester, on this date. The entries numbered nearly 900, and the exhibits were of general all-round excellence.

The principal prize-winners in the vegetable classes were Lieut.-Col. TIMMIS, Matson House; Sir HUBERT PARRY, Highnam; Mr. J. H. CROXFORD, Tuffley; Mr. HUGH ANDREWS, Toddington Manor; Mr. J. T. WITHERS, Hambrooke; Mr. JOSEPH BENNETT, Claxhill; Mr. M. P. PRICE, Titterton Court; Mrs. H. T. HIGGINS, Tuffley; and Mr. H. J. TILLEY, Cheltenham.

The finest exhibit of Apples and Pears was shown by Mr. W. GORDON-CANNING, of Hartpury House; 2nd, Col. HENRY, of Haffield. Other principal prize-winners in this section were Messrs. POWER & WHIFFEN, Acton Court, Ross.; J. BOTT, Hereford; A. J. COOK, Norton; JAMES HITCH & SONS, Sturdington; S. R. COX, Ashe Leigh; H. J. PHELPS, Tibberton; M. P. Price, Tibberton Court; A. HARRIS, Quedgeley; A. R. ONSLOW, Newent; W. E. GOULDING, Elmore; J. W. BENNETT, Claxhill; T. PONTING, Taynton; and Sir HUBERT PARRY, Highnam.

Mr. HUGH ANDREWS, Toddington Manor; Sir HUBERT PARRY, Col. HENRY, and Mr. G. N. WALKER, Gloucester, won prizes in the Grape classes.

The exhibits of Chrysanthemums and winter-flowering Begonias were the best ever seen in the history of the society, a fact probably due to the increased prize money allotted to this section of the show. For Begonias the chief prizes were divided between Sir HUBERT PARRY and Mr. HUGH ANDREWS. Mr. HUGH ANDREWS (gr. Mr. J. R. Tooley) carried off premier honours for a display of Chrysanthemums, and was also placed 1st for 12 Japanese blooms.

ROCHFORD AND DISTRICT HORTICULTURAL AND CHRYSANTHEMUM.

November 5.—The second annual autumn exhibition of the above society was held in the Corn Exchange, Rochford, on this date, and, on the whole, was a success, the number and character of the exhibits staged in the various sections being fairly satisfactory. In the group classes, James Tabor, Esq., The Lawn, Rochford (gr. Mr. J. Burles), was awarded the 1st prize for a group of Chrysanthemums arranged on a ground space of 10 feet by 6 feet, thereby winning for the third time the challenge cup which he offered as president. 2nd, Mr. F. Moore. Mr. Tabor was also placed 1st for a group of miscellaneous plants; 2nd, Mr. Bright. In the open classes for cut blooms, Messrs. H. E. Campion, P. C. Wiseman, W. Thurley, F. Flavell, and G. F. Cottell were the most successful exhibitors. A challenge cup was offered by Alderman J. C. Ingram, J.P., for floral designs displayed on a table 6 feet by 3 feet, open to all nurserymen and florists residing within a radius of 10 miles of Southend Post Office. This was a very interesting class, and the trophy was won finally by Mr. A. Pilgrim, florist and fruiterer, London Road, Southend. Apples and Pears were shown well by Mr. H. B. Herbert, Eastwood; Mr. F. Langstone, Great Wakering; Mr. Murrell, Barling; and Mr. F. Moore, in the respective classes. Mr. T. Lock and Mr. W. Robinson were awarded the 1st and 2nd prizes respectively for collections of six kinds of vegetables.

CHESTER PAXTON.

November 12, 13.—A successful exhibition was held on these dates in the Town Hall by the Chester Paxton Society. Apples and Pears were shown in great variety, and in each case information was forthcoming as to soil and mode of culture, thus making the exhibits both interesting and instructive from the grower's point of view.

The Rev. Canon Wardell Yerberg was the most successful exhibitor in the class for a group of single-flowering Chrysanthemums, in which there were four creditable collections, all exhibiting skill and taste in arrangement. J. R. Samuel, Esq., of Shotwich (gr. Mr. F. Berry), was 2nd, and Percy W. Whaller, Esq., Chester (gr. Mr. C. Edwards), 3rd.

For a semi-circular group of naturally-grown Chrysanthemums, Mr. A. Walker gained the 1st prize, the quality and colour of the blooms being extremely good; 2nd, T. Gibbon Frost, Esq. In the class for six single blooms Mrs. Butt, Chester (gr. Mr. E. Palin), gained the prize; whilst for four pot plants, Mrs. E. P. Smith was equally successful.

There were rather fewer exhibits of cut blooms than usual. R. Brocklebank, Esq. (gr. Mr. T. Winkworth), gained the 1st prize for 18 Japanese Chrysanthemums, in six varieties, arranged in vases; whilst for 12 Japanese blooms, in two vases, the first prize was awarded to Mr. Joseph Smith.

The premier class for fruit was for a collection of Apples and Pears; twelve dishes of culinary and six of dessert Apples, and six dishes of Pears. There were seven exhibits, and Sir George Meyrick, Bart., (gr. Mr. W. Pilgrim), won the 1st prize with a very fine collection.

For 12 varieties of cooking Apples, Mr. R. R. Salmon gained the 1st prize, and H. Potts, Esq. (gr. Mr. J. Fleet), the 2nd. For six varieties, Mr. W. G. Townsend Currie and Mr. T. Day won the 1st and 2nd prizes respectively.

The two sections devoted to single dishes contained about 70 classes, and many of the fruits shown were extremely fine. Sir George Meyrick gained the Society's Silver Medal for a splendid dish of Peasgood's Nonesuch Apples.

In the class for two bunches of Black Grapes Sir George Meyrick—who showed Black Alicante—gained the 1st prize; 2nd W. Droonsfield, Esq. (gr. Mr. W. May). In the class for two white varieties, James Amphlett, Esq. (gr. Mr. R. Jones) was placed 1st with Muscat of Alexandria.

Gold Medals were awarded to the Duke of Westminster, Eton Hall (gr. Mr. N. F. Barnes) for a table of splendid Apples and Pears arranged with Chrysanthemums; W. Richardson Moss, Esq. (gr. Mr. W. E. Sharp) for a table of Cypripediums arranged with Ferns and Palms; and Messrs. Mc Hattie & Co., for an exhibit of Chrysanthemums, Salvias, and Carnations.

LANCASTER CHRYSANTHEMUM.

November 13.—This annual show proved a great success. Owing to Lord Ashton's non-competitive exhibit not being forthcoming on this occasion, it was possible to get the whole of the Chrysanthemum classes in the Alexandra Hall, the vegetables, window plants, and Primulas being staged in an adjoining room. There was a slight decrease in the number of entries compared with last year.

Lord Ashton's Cup, offered in the group classes, was won by Sir Norval W. Helme, Springfield Hall (gr., Mr. T. Atkinson); 2nd, J. W. Pickard, Esq. (gr. Mr. Lambert).

Mr. H. L. Storey (gr. Mr. Roberts) staged an exceptionally fine group of stove and greenhouse plants.

Fruit was a strong section, and vegetables were probably the best ever seen at this show.

In the open class for cut Chrysanthemums Mrs. Porritt, Grange, secured the "Lady Storey" rose bowl offered for 18 Japanese blooms; 2nd, Mr. W. W. Brocklehurst, Macclesfield. Mrs. Porritt was also 1st in the classes for twelve blooms, six blooms, three white blooms and three yellow blooms. Mr. E. Frank, Schelford, Cheshire, showed the best three blooms of any variety. The 1st prize for three distinct vases of Chrysanthemums was won by Mr. J. G. Martin, Grange.

In the class for four vases of single varieties Mr. E. G. Clark, Lancaster, was awarded the 1st prize: he staged splendid specimens of Kitty Bourne, Metta, Bronze Pagram, and Florence King, the best singles in the show. He also won the 1st prize for two vases and four vases of decorative varieties, being followed by Mr. E. Storey in each class.

Sir N. W. Helme was easily 1st in the classes for three Japanese, three decorative, and three single varieties in the plant classes.

In the amateur classes the principal prize-winners were Messrs. H. Jackson, F. S. Curtis, J. G. Martin, G. Holmes, T. Huntington, E. Boardley, and R. Willacy.

In the fruit classes the winners were Messrs. W. Robinson, W. Orr, W. Parkinson, J. Crossfield & Son, E. Frank, Mrs. Fenton, and Mr. W. W. Brocklehurst; vegetables were best shown by Messrs. J. Sharp, T. Brighouse, A. Stretch, T. Fenton, J. Gregson, and R. Seddon.

BANBURY CHRYSANTHEMUM.

November 13, 14.—The annual exhibition of the above society was held in the Town Hall, Banbury, on these dates.

The "Banbury" Challenge Cup was offered in the open class for nine vases of Chrysanthemums, not fewer than eight varieties, arranged with foliage. The cup was won by Sir S. Scott, Bart., M.P., Westbury Manor (gr. Mr. F. Tapper); 2nd, Lord North, Wroxton Abbey, Banbury (gr. Mr. E. R. Janes).

For 12 blooms of distinct varieties, the 1st prize was awarded to Rev. W. B. Bradford, Broughton Rectory (gr. Mr. A. W. Sadler), and this gentleman also excelled in the class for six blooms, distinct.

The best collection of 18 distinct varieties was shown by Sir S. Scott, Bt., M.P.; 2nd, Mr. W. C. Cartwright, Aynbo Park (gr. Mr. S. Brown).

Sir S. Scott was also placed 1st for 12 distinct varieties.

For six blooms of any variety, the 1st prize was awarded to Mr. J. B. Akroyd, Birdingbury Hall (gr. Mr. F. Daniels); 2nd, Sir S. Scott, who showed the best 12 blooms of Incurved varieties. The best six blooms of one variety of Incurved were shown by Mr. J. B. Akroyd; 2nd, Sir S. Scott.

Lady Knightly, Fawsley, staged the finest six vases of single Chrysanthemums, distinct.

The best six vases of decorative Chrysanthemums, distinct, were shown by H. Boxold, Esq. (gr. Mr. W. Rawlings).

The "Coronation" Challenge Cup, value £10 10s., was offered for a table of winter-flowering plants, other than Chrysanthemums. It was won by Lord North; 2nd, Mrs. Myers.

The "Banbury Cross" Challenge Cup, offered for a table of winter-flowering and foliage plants, Orchids excluded, was also won by Lord North.

Fruit.—The society's challenge cup, value £15 15s., was offered in the class for a dessert table, decorated with six dishes of fruit (to include one bunch each Black and White Grapes), cut flowers and foliage. The finest exhibit was staged by Mr. W. C. Cartwright; 2nd, Lady Knightly.

Lord North showed the best six dishes of culinary apples and the best six dishes of dessert varieties. This exhibitor won eight 1st and six 2nd prizes, including two cups.

Mr. W. C. Cartwright won the society's challenge cup outright.

COVENTRY CHRYSANTHEMUM.

November 14, 15, 16.—A satisfactory feature of the 18th annual exhibition of the Coventry and District Chrysanthemum Society was the increased number of entries, for there have been fewer exhibits in some classes of late years.

The Countess of Craven gained the 1st prize for three bunches of Grapes. In the open classes for a group of Chrysanthemums there was only one exhibitor, Mr. W. Finch, Coventry. In the class for a group of miscellaneous foliage and flowering plants, exclusive of Chrysanthemums, Hugh Rotherham, Esq. Keresley Grange (gr. Mr. G. Griffin), secured the chief award; 2nd, C. Vernon Pugh, Esq. (gr. Mr. T. Kemp). There were some very attractive displays of Gloire de Lorraine Begonias, for which F. Foster, Esq. (gr. Mr. J. Mille), was awarded the 1st prize, whilst Captain Starkey, of Leamington (gr. Mr. S. Blackburn), was placed 1st for table plants. Captain Starkey was also a successful exhibitor of Apples and Pears. In the classes for cut blooms of Chrysanthemums the Countess of Craven secured no fewer than four 1st prizes.

In the class for a circular group of Chrysanthemums 8 feet in diameter, open to gentlemen not employing more than two gardeners regularly and residing within 12 miles of Coventry, J. P. Ward, Esq., Coventry, was placed 1st. A. Hoyle, Esq., gained the principal award for three vases of Incurved Chrysanthemums, whilst H. Mitchell, Esq. (gr. Mr. T. Batchelor) won in the similar class for Japanese Chrysanthemums. Mr. H. Mitchell showed the best collection of vegetables in the open class.

Mr. H. L. Curzons exhibited 100 dishes of fruit. Among the trade exhibits was a particularly meritorious display of fruit by the Exons, of Thomas Webb, Coventry. F. Twist, Esq. (gr. Mr. W. Hicks), showed fine bunches of Grapes in a non-competitive exhibit.

LEEDS PAXTON CHRYSANTHEMUM.

November 15-16.—The exhibition of this society was held on these dates, in the Albert Hall, Leeds.

In the Open Class for 36 blooms, 18 Incurved and 18 Japanese varieties, the 1st prize was awarded to Arthur James, Esq., Coton House, Rugby (gr. Mr. A. Chandler); 2nd, Alderman Penrose Green, Esq. (gr. Mr. C. Shaw); 3rd, C. Watson, Esq. (gr. Mr. Carter). Mr. A. Chandler was successful for 12 Japanese varieties; also for 12 Incurved varieties.

In the Local Classes, Mr. C. Shaw was awarded the 1st prize for 24 blooms, including 12 Incurved and 12 Japanese varieties; 2nd, Mr. Fred Norman. Other prize winners in the local class were Messrs. C. Shaw, Carter, Norman, Bell (gr. to —. Oxley, Esq.), W. N. Hague Smith (gr. to Greenwood, Esq.).

Plants.—C. Fulford, Esq., Headingley Castle (gr. Mr. H. Harrison), was the only exhibitor in the class for a group of miscellaneous plants, and was awarded the 1st prize.

E. O. Simpson, Esq., Hazlewood Castle (gr. Mr. A. Lupton), exhibited six fine specimens of Begonia Glore De Lorraine. These were awarded the N.E.H.S. Medal. The Bronze Medal of this society was awarded for Cyclamen exhibited by W. D. Cliffe, Esq., Meanwood Towers (gr. W. N. Hague). This exhibitor, Mr. Blakey (Howden), and Mr. Groundwell (Leeds) were the principal prize winners in the vegetable classes.

ECCLES AND PENDLETON CHRYSANTHEMUM.

NOVEMBER 8, 9.—This exhibition was held in the Town Hall, Eccles, which is not large enough for the convenience of both exhibitors and visitors. In consequence of crowding the flowers were not seen to advantage.

In the cut bloom section four good collections were staged in the class for 24 blooms of 12 Japanese and 12 Incurved varieties, Sir GILBERT GREENALL, Bart., Warrington (gr. Mr. C. Goves), the winner of last year's prize in this class, was again successful. His best blooms were (*Incurved*) Pantia Ralli, J. Hygate, Mrs. B. Hankey, Mrs. R. H. Hall, Romance, Marjorie Shield, and Daisy Southern. (*Japanese*), Lady Talbot, Eclipse, President Viger, Lady Talbot, Hon. Mrs. Lopes, and Frances Jolliffe. The 2nd prize was awarded to Sir W. H. TATE, Bart, Woolton, Liverpool (gr. Mr. G. Haigh), his blooms of Buttercup and Hon. Mrs. Lopes being of high merit. 3rd, H. BECK, Esq., Huyton (gr. Mr. J. Copper). Mr. GOVES continued his successes throughout the remaining classes, winning in the classes for (1) 24 Japanese blooms in not fewer than 12 varieties; (2) 12 Incurved varieties distinct; (3) 12 Japanese blooms, distinct; and (4) 12 blooms, six Incurved and six Japanese varieties. Mr. C. GOVES received the award of merit offered for the best Japanese bloom in this section with the variety President Viger.

In the gardeners' classes JAMES BROWN, Esq., Heaton Mersey (gr. Mr. J. W. Smith), won the challenge cup offered for 18 Japanese blooms arranged in six vases. Mr. Smith was also successful in the classes for 12 Japanese blooms: 12 Incurved blooms, and 12 blooms (six Japanese and six Incurved). Viscount BRACKLEY (gr. Mr. W. Byrom) showed the best six Japanese varieties and the best six vases of naturally-grown flowers. SCOTT FORBES, Esq. (gr. Mr. W. Holmes), showed the best six Incurved and the best six Japanese blooms. Mr. SMITH received a certificate of merit for the variety Mrs. A. T. Miller.

In the plant section there were six exhibitors in the class for half circular groups, each 9 feet by 6 feet. Mr. J. W. SMITH was awarded the 1st prize. 2nd, Miss G. AGNEW (gr. Mr. W. Palethorpe). Mr. SMITH was again successful for three pot plants of Japanese Chrysanthemums, and won the premier position in three other classes, staging well-flowered plants in each case. Mr. W. HOLMES was the winner of the 1st prize in the class for three plants not disbudded. For six table plants T. C. ANSDALE, Esq. (gr. Mr. A. E. Fox). was successful, and he also excelled in the classes for six pots of Roman Hyacinths and six pots of Begonia Gloire de Lorraine.

The non-competitive exhibits included Palms from the Earl and Countess of ELLESMERE's garden. Messrs. DICKSON & ROBINSON, Manchester, arranged a choice collection of autumn flowers. Messrs. DICKSON, BROWN & TAIT, Manchester, contributed fine spikes of Lily of the Valley and Begonias. Messrs. FRANK DICKS & Co. showed Palms, Heath, and Potatos.

DERBY CHRYSANTHEMUM.

NOVEMBER 8, 9.—The annual exhibition of the above society was held at Derby on these dates. The exhibition was one of the best of recent years; ideal weather prevailed, and there was an increased attendance.

The 1st prizes in the two classes for groups of Chrysanthemums arranged for quality and effect were won by Mr. J. H. COLEY, Duffield, and T. POTTER, Derby, respectively. In the cut bloom classes the 1st prize for six vases of Japanese varieties was won by Mr. W. SHERWIN, Locko Park, and for six vases of single Chrysanthemums by Mr. J. H. COLEY, Duffield. In the class for 18 Japanese blooms, Messrs. F. MEAKIN, Derby, J. H. COLEY, and W. SHERWIN were the successful competitors, whilst for 12 Japanese blooms Mr. W. SHERWIN was placed 1st. In the class for 12 Incurved blooms, Mr. J. WOOD, Alvaston, was awarded the 1st prize. Mrs. ORTON, Longford Hall, arranged the best table decoration, and Mr. J. WOOD the best large vase of Chrysanthemums. Mr. J. H. COLEY was awarded a special prize for his bloom of Lady Talbot, which was the premier bloom in the show.

RAYLEIGH AND DISTRICT HORTICULTURAL.

NOVEMBER 8, 9.—The annual autumn exhibition of the above society was held on these dates, and was a great improvement on former shows. The exhibits of vegetables were very good, but Apples and Pears were the principal features. Successful exhibitors of fruit in the open classes were Mr. F. LANGSTONE, Great Wakering, and Mr. S. TAYLOR, Alpha Nursery, Rayleigh Mr. LANGSTONE was awarded the 1st prize in the class for six dishes of dessert Apples, Mr. TAYLOR being a close 2nd. Mr. LANGSTONE also excelled in a similar class for culinary varieties, and again Mr. TAYLOR was placed 2nd. Mr. TAYLOR showed the best six dishes of Pears. Among the non-competitive exhibits, Mr. W. A. Voss, Eastwood Road, Rayleigh, staged 16 baskets and dishes of Apples and seven dishes of Pears; the fruits were of excellent quality. Mr. LANGSTONE showed numerous dishes of excellent Apples and Pears. Dr. BURROWS, Rayleigh House, also contributed a fine collection of fruit, and Mr. JORDISON, The Nurseries, Hall Bridge, showed two shallow baskets containing about five dozen even, well-coloured fruits each of Carter's Sunrise and Comet Tomatos. Messrs. W. B. RAND & SONS, Down Hall Road, Rayleigh, showed extra fine fruits of Cucumbers.

WATFORD HORTICULTURAL.

NOVEMBER 12.—The third autumn exhibition of this society took place on this date and proved a great success. Fifty competitors staged 370 exhibits, compared with 250 of the previous year, and there were several honorary and trade displays, principally of flowers and vegetables—there being a rather small quantity of fruit.

The premier Chrysanthemum in the show was a bloom of the variety Lady Talbot, shown by Mr. E. TAYLOR, Colney Park. A collection of vegetables from the gardens of Loudwater, Rickmansworth, the residence of Mr. J. KERR, won the Silver Medal offered for the best competitive exhibit in the show. Mr. T. F. STANNETT, Radlett, won the Royal Horticultural Society's Bronze Medal for a group of 24 Japanese Chrysanthemums. The Countess of CLARENDON gave a Silver Cup for the best table of autumn flowers and tints, this being won by Mr. W. J. PRITCHARD, Elstree. The President's Cup, offered in the allotment and garden classes, was won by Mr. J. FRANKLIN.

HONORARY EXHIBITS.—Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), exhibited 36 varieties of single Chrysanthemums. Lady CLARENDON showed a small collection of Apples and Pears.

WEST OF ENGLAND CHRYSANTHEMUM.

NOVEMBER 12.—This society opened its annual show in the Guildhall, Plymouth, on this date, and the exhibition was one of the most successful and comprehensive that have been held in recent years. Cut blooms were staged in large numbers, and were distinctly in advance of those shown in former seasons. The groups were graceful and effective, and many of the pot-plants evidenced the highest culture.

In the class for 24 Japanese blooms the 1st prize was won by Lady BULLER, on whose stand the varieties Lady Talbot, F. S. Vallis, Rose Pockett, W. Turner, and Master David were very fine.

For 12 Japanese blooms the 1st prize was won by Mr. T. B. BRADSHAW, whose specimens of Hon. Mrs. Lopes and Mrs. David Syme were very good.

In the class for 12 vases of single Chrysanthemums the 1st prize was won by Mr. T. B. BRADSHAW, but he was beaten in the local class for the Silver-gilt Medal by Mrs. BAINBRIDGE.

The 1st prize for a group of stove and greenhouse plants was won by this lady with an excellently-arranged and very elegant group.

Excellent salads in variety were shown by Mrs. BAINBRIDGE, who easily won the 1st prize.

For a group of single Chrysanthemums the 1st prize was won by Dr. BURKE with a well-arranged collection of plants bearing fresh and attractive flowers.

The premier exhibit of four specimen Chrysanthemums was shown by Mr. E. J. HANNAFORD, who also won the 1st prize for a white Japanese variety.

For one Japanese variety of any other colour the 1st prize was won by Mr. G. HOSKIN.

The best Salvias, Chinese Primulas, Primula stellata, Zonal Pelargoniums, and six table plants were shown by Mrs. BAINBRIDGE.

The exhibits of fruit were very fine. In the class for 24 dishes Mr. H. ST. MAUR was awarded the 1st prize. Vegetables were also very good.

NON-COMPETITIVE EXHIBITS.—The nurserymen's exhibits were excellent, and added considerably to the attractions of the show. The DEVON ROSERY CO., Torquay, was awarded a Gold Medal for a superb show of nearly 150 varieties of fruit, of which 118 were Apples. The KING'S ACRE NURSERIES, Hereford, also received a Gold Medal for a collection of fruit. Messrs. SUTTON & SONS, Reading, staged a select collection of vegetables, which were very well set up and were remarkable for their excellent quality and freedom from coarseness. A Gold Medal was awarded this firm. Messrs. ROBERT VEITCH & SON, Exeter, showed Pancratium macrostephana, Euonymus europæus, Ilex camelliæfolia, Stransvæsia undulata, Cotoneaster angustifolia, C. pannosa, Eugenia Ugnii, Nerine Bowdenii and Nerine hybrids, Physalis Bunyardii, Grevillea longifolia, Orchids, and winter-flowering Carnations. (Silver Medal.)

KILMARNOCK CHRYSANTHEMUM.

NOVEMBER 15.—This annual show was held in the Agricultural Hall, Kilmarnock, on the foregoing date. Both cut blooms and pot plants of Chrysanthemums were good, and the exhibits of other plants and fruits compared well with those at previous shows.

In the gardeners' classes for cut Chrysanthemums the principal one was for 12 Japanese blooms. W. GRAHAM, Esq., Crosbie Tower (gr. Mr. Jas. Muir), was awarded the 1st prize; 2nd, A. W. CROOKSTON, Esq., Balloch-myle (gr. Mr. P. Anderson). A. W. CROOKSTON, Esq., was placed 1st for six Japanese blooms, two vases of a white Japanese variety, and six and three vases respectively of "exhibition" Chrysanthemums, the exhibits in each case being very good. W. BAIRD, Esq., showed the best three vases of decorative varieties. W. GRAHAM, Esq., excelled in the classes for three vases of single varieties, six vases of stove or greenhouse flowers, and six tubes of Chrysanthemums. Mr. D. WALKER, Kay Park Terrace, showed the finest Carnation.

In the pot-plant classes the best table arranged for decorative effect was shown by Sir W. H. HOULDSWORTH, Coodham (gr. Mr. J. M'Gran); 2nd, Mrs. MANN THOMSON, Dalkeith

In the classes for plants the principal prize-winners were W. BAIRD, Esq., Cambusdoon; Mrs. KENNEDY, Howard Street, Kilmarnock; Mr. A. J. FERGUSON, Mr. J. COCHRAN, High Glencairn Street; Mr. A. METHVEN, Galston; W. BAIRD, Esq., Sir W. H. HOULDSWORTH, Bart., and Colonel BLAIR, of Blair (gr. Mr. W. Mair).

In the fruit classes Apples were remarkably fine. Mr. THOMAS SMITH, Dundonald Road, Kilmarnock, carried off all the 1st prizes for these fruits. Mr. G. CLARK, London Road, Kilmarnock, was placed 1st for black Grapes, and W. GRAHAM, Esq., Crosbie Tower, for white Grapes.

NON-COMPETITIVE EXHIBIT.—Messrs. W. and T. SAMSON, nurserymen and seedsmen, Kilmarnock, exhibited pot-plants, cut flowers, and floral designs.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

NOVEMBER 11.—The monthly meeting of this society was held at the Royal Horticultural Society's Hall, Westminster, on this date. Mr. Chas. H. Curtis presided. Fifty-five new members were elected, bringing the membership of the society up to 1,900. The sick pay for the month amounted to £39 2s. Several members withdrew, under Rule 19, double the amount of interest standing to their credit. The sub-committee's report was confirmed, and the Secretary reported on the return of the National Insurance cards.

MARKETS.

COVENT GARDEN, November 20.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples in the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—The market is well supplied with English Apples, both dessert and cooking varieties. Consignments of Apples from overseas are increasing, and the fruits are arriving in an excellent condition from all sources. This week's shipments included per s.s. "New York" 9,763 barrels and boxes, including 230 cases of Cranberries; per s.s. "Huron" 2,687 packages, and per s.s. "Minnetonka" 14,533 packages, including Pears. Pears from all sources consist chiefly of the varieties Doyenne du Comice, Winter Nelis, and Keiffer. English Gros Colman and Black Alicante Grapes are arriving in excellent condition, and are meeting with a fairly good demand. Selected bunches of Muscat of Alexandria are scarce and in better demand. Colmans are still plentiful, but English Walnuts are finished, and consignments of French Walnuts are smaller. French and Italian Chestnuts are very plentiful. Mushrooms are arriving in considerable quantities, principally from the Worthing district. Supplies of English Tomatos are decreasing daily, but the supply of these fruits from Teneriffe is increasing weekly and the Tomatos show improved quality. Beans from Guernsey and Madeira continue a good supply. Asparagus (Paris Green), in bundles of 40 heads, is now obtainable at moderate prices. Trade in ordinary vegetables has been slow during the past week, supplies being very heavy.—*E. H. Rider, Covent Garden, November 20, 1912.*

Potatos.

	per cwt. s.d.	s.d.		per bag. s.d.	s.d.
Bedfords	4 0	4 6	Dutch	2 9	3 6
Kents	4 0	5 0	Belgian	3 0	3 9
Blacklands	3 6	3 9			
Lincolns	3 6	5 0	German	3 6	4 0
King Edward	4 0	4 9	Dunbars	6 0	6 6

REMARKS.—Trade is slightly better. The consignments of English Potatos are small, but there are very large quantities of foreign Potatos on the market. Best quality English tubers are very scarce. Prices remain about the same as last week. *Edward J. Newborn, Covent Garden and St. Pancras, November 20, 1912.*

DEBATING SOCIETIES.

IPSWICH GARDENERS'.—At the meeting of this association held on the 23rd ult., a lecture on "The Relationship Between Science and Methods Practised in Fruit Tree Culture" was given by Mr. J. Arthur, a delegate from the Stowmarket Association. Mr. T. E. Mayhew was in the chair. At the outset the lecturer stated that failures were not entirely due to climatic and local conditions. He proceeded to review the methods of propagation, including budding and grafting, and dealt with stocks and their physical peculiarities. With regard to pruning as commonly practised, the lecturer was in favour of allowing greater freedom of growth to render slower the flow of sap and insure its more equal distribution. The lecturer also dealt with the training of fruit trees, and emphasised the necessity of summer pruning.

CHELMSFORD & DISTRICT GARDENERS'.—A meeting of this society was held on the 1st inst.; Mr. Edwards presided, and about 60 members were present. Mr. A. Turner, of the Institute of Agriculture, gave a lecture on "The Why and Wherefore of Watering." The lecturer (who prefaced (with the aid of diagrams) the passage of water through the plant to the leaves, and described the process of transpiration. The lecture was illustrated by a number of experiments.

WARGRAVE GARDENERS'.—At the meeting of this society, held on the 30th ult., a lecture was given by Mr. G. Stanton, entitled "The Tints of Autumn." The various ways tinted leaves could be used in decorations, vases, epergnes, wreaths, &c., were explained, and how to press and dry them. Mr. Stanton gave a long list of trees, shrubs and other plants which provided the richest leaf colouring.

READING GARDENERS'.—The usual fortnightly meeting of this association was held in the Abbey Hall, on Monday, the 4th inst. The President, F. W. Hamerton, occupied the chair, and there was a large attendance of members. The lecturer appointed for the evening was a delegate from the Bristol Society, who at the last moment was unfortunately prevented from attending. His place was, however, filled by Mr. I. House, and the subject selected was "Hardy Perennials." In the first part of his paper Mr. House defined the term "hardy perennial herbaceous plants," and stated that bulbous plants should not be admissible in a class for hardy herbaceous plants, nor will doubtful hardiness. Certain plants said Mr. House are best left undisturbed for several years, such as, Aster Amellus, Dictamnus Fraxinella and Pæonies, whilst others are better for annual or biennial replanting.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending November 20.

A very sunless week.—The weather during the past week has been variable in temperature. On the warmest day the highest reading in the thermometer screen was 53°, and on the coldest night the exposed thermometer registered 7° of frost. The ground is at the present time 1° colder than is seasonable both at 1 and 2 feet deep. A quarter of an inch of rain fell on the 13th, but since then there has been no rain worth mentioning. The percolation through both the soil gauges has become smaller as the week advanced, and yesterday there was no measurable percolation through the gauge on which short grass is growing, and only a very small quantity through the bare soil gauge. The sun shone on an average for 10 minutes a day, which is nearly 1½ hours a day short of the average for the same period in November. On the five consecutive days ending the 16th no sunshine at all was recorded. Light airs and calms alone prevailed until the 19th, when towards evening the winds became rather high. For the windiest hour the mean velocity was 16 miles—direction W. There was about a seasonable amount of moisture in the air at 3 o'clock in the afternoon. *E. M., Berkhamsted, November 20, 1912.*

CATALOGUES RECEIVED.

HERD BROTHERS, Market Square, Penrith—Forest, Ornamental and Fruit Trees.

CLARK BROTHERS & Co., 65, Scotch Street, Carlisle—Forest and Ornamental Trees.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. L. CHANTLER, for the past 10½ years Gardener to H. J. WILLIAMS, Esq., Hookstile House, South Godstone, Surrey, as Gardener to H. de H. WHARTON, Esq., Rockley House, Marlborough, Wiltshire.

Mr. JOHN NIBBS, for the past year Gardener to Lieut.-Colonel O'SHAUGHNESSY, Kidmore House, Kidmore End, Reading, Berkshire, as Gardener to G. A. STOCKFELD, Esq., The Elms, Taplow, Buckinghamshire.

Mr. F. HARRISON, for the past 4 years Foreman at Rushtoo Hall Gardens, Kettering, and previously Foreman at Busbridge Hall Gardens, Godalming, as Gardener to Sir JOHN SMILEY, Barton Hall, Bury St. Edmunds.

Mr. C. W. CAPP, for the past 12 months Gardener to the late F. RILEY SMITH, Esq., Barton Hall, Bury St. Edmunds, as Gardener to Mrs. RILEY SMITH, Welherby Grange, Wetherby, Yorkshire.

Mr. R. ISHERWOOD, for the past 9½ years Gardener to Captain J. H. CUTHBERT, D.S.O., Beaufront Castle, Hexham, as Gardener to M. O. ROBERTS, Esq., Easton Hall, Grantham.

Mr. T. DALGLEISH, for the past 2 years Outside Foreman at Blairdrummond, Perthshire, as Gardener to W. B. DUNLOP, Esq., Seton Castle, Longniddry, East Lothian.

Mr. DONALD MCINNES, for a number of years Foreman at Glamis Castle Gardens, as Gardener to W. D. GRAHAM MENZIES, Esq., Hallyburton, Coupar-Angus.

Mr. ALEX. INNES, late Gardener at Hallyburton, Coupar-Angus, as Nursery Manager to Messrs. D. and W. CRAIL, Broughty Ferry.

Mr. W. C. UPHILL, for 1 year Gardener to A. EDWARDS, Esq., Forest View, Salisbury, as Gardener and Bailiff to Colonel Brittan, Failand Hill, Failand, Bristol. (Thanks for 1s. for R.G.O.F. box.—EDS.)

Mr. A. E. WELCH, for 1 year Gardener at FOX Hill House, Keston, Kent, as Gardener to C. C. ELLIOT, Esq., Hall Place, Sholden, Deal. (Thanks for 1s. for R.G.O.F. box.—EDS.)

Mr. J. GAMMON, for the past 2½ years Gardener to R. E. S. THOMAS, Esq., Wormington Grange, Broadway, Worcester, as Gardener to Mrs. BOUGHTON-KNIGHT, St. Mary's Knoll, Ludlow, Shropshire. (Thanks for 1s. for R.G.O.F. box.—EDS.)

Obituary.

W. B. TEGETMEIER.—Mr. Tegetmeier, the distinguished naturalist, died on November 19, at the advanced age of 97. A man of wide attainments, Mr. Tegetmeier was known chiefly by his observations and writings on pigeons and poultry. He held the post of poultry editor of the *Field* for more than 40 years, and as his correspondence with Darwin and his various writings show, Mr. Tegetmeier possessed a profound practical and scientific knowledge of the subjects on which he was for so long a recognised authority. So long ago as 1854, he published a volume on *Profitable Poultry*, which was followed 13 years later by *The Poultry Book*. The late naturalist was interested especially in the breeding of animals, in which branch of science he carried ont numerous experiments, not a few of which were cited by Darwin in *The Origin of Species* and in *Animals and Plants under Domestication*.

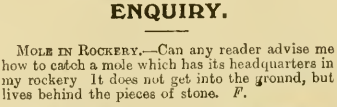
ALEXANDER FRASER.—We regret to record the death of this well-known gardener, at Edinburgh. Mr. Fraser was for many years gardener at Drumduan, Forres. He retired from this post about a year ago, and settled in Edinburgh, where several of his family have resided for some years. Deceased was a prominent member of the Forres Chrysanthemum Society.

JOHN ELLIOTT BURTON.—We learn with regret of the death, at Twickenham, on the 11th inst., of John Elliott Burton, in his 80th year. Mr. Burton was a native of Flitwick, Bedfordshire, and commenced his gardening career in the Duke of Bedford's gardens at Woburn Abbey. He was subsequently appointed gardener to Lord John Russell, at Rodboro' Manor, Gloucestershire, and later to Sir Edward Dean Paul, Bart., Cambridge House, Twickenham. The funeral took place at Twickenham Cemetery, on the 16th inst.

JOHN KINNAIRD.—Amidst every manifestation of regret, the funeral of Mr. John Kinnaird, market gardener, Burnieboozle, Aberdeen, took place on Monday, the 18th inst., in Allenvale Cemetery, Aberdeen. For nearly three generations the members of the Kinnaird family have been connected with the market-gardening industry in Aberdeen, and at the annual shows of the Royal Horticultural Society of Aberdeen deceased invariably took a prominent place in the prize list. He passed away at the comparatively early age of 58 years, being survived by a widow, a son—Mr. John Kinnaird, who was associated with him in the business—and a daughter.

ENQUIRY.

MOLE IN ROCKERY.—Can any reader advise me how to catch a mole which has its headquarters in my rockery It does not get into the ground, but lives behind the pieces of stone. *F.*



**** The Editors will be glad to receive, for consideration, large photographs of horticulturol subjects, suitable for reproduction in this Journal.*

ERRATUM.—(Sterilised soil experiment). In fig. 166, p. 372, for "Tomatos" read "Cucumbers."

MARGUERITE FOR WINDOW BOXES: *E. L. C., Chicago.* The dwarf strain of summer-flowering Marguerite is most suitable for the purpose.

NAMES OF FRUITS: *Wool.* 1, Allington Pippin; 2, Roundway's Magnum Bonum; 3, Baumann's Reinette.—*E. C.* Pears: 1, decayed; 3, Vicar of Winkfield; Apples: 2, Franklin's Golden Pippin; 1, Ashmead's Kernel Improved.—*Old Subscriber.* 1, Marie Benoist; 2, Doyenne du Comice; 3, no fruit; 4, Allington Pippin.—*E. E.* 1, Hanwell Souring; 2, Annie Elizabeth; 3, Prince Bismarck; 4, Welford Park Nonesuch; 5, Blenheim Pippin; 6, Pitmaston Nonpareil; 7, Glory of the West.—*W. M. B.* Pyrus japonica (Chelmsford Wonder).—*W. Leith.* 1, Doyenné du Comice; 2, Cornish Gilliflower.—*McMillar.* Doyenné du Comice.—*Sender unknown* (the fruits were packed in one of Messrs. Bull & Son's boxes. 1, Small's Admirable; 2, Ecklinville; 3, Golden Noble; 4 and 8, Prince Bismarck; 5, Ribston Pippin; 6, Stirling Castle; 7, Lord Grosvenor; 9, Warner's Seedling; 10, Stunmer Pippin; 11, Scarlet Nonpareil; 12, not recognised; 13, Flower of Herts.; 14, Northern Greening; two 15, large green fruit Lord Derby, small one Margil; 16, Adams's Pearmain; 17, Waltham Abbey; 18, Dutch Mignonne (Reinette du Caux); 19, Gascoyne's Scarlet Seedling; 20, Pine Golden Pippin; 21, Chaumontelle; 22, Catillac; 23, not recognised; 24, Joséphine de Malines; 25, Napoleon III; 26, 27, 28, 31, 32, no fruits; 29, Beurré Rance; 30, not recognised; 33, Winter Nelis.—*J. B., Thirsk.* 11, Marie Louise; 12, Josephine de Malines; 13, Winter Rousselet; two other fruits quite decayed.—*J. M.* Doyenné du Comice.—*E. G. Langford.* Beauty of Kent.

NAMES OF PLANTS: *Gardener, Herts.* Hæmanthus albiflos.—*T.* Leucothoë Catesbæi.—*J. M. S.* 1, Azara microphylla; 2, Cornus capitata, commonly called Benthamia fragifera in gardens.—*J. P.* Cotoneaster.—*M. T.* 1, Liparis Ugandæ; 2, Polystachya Ottoniana; 3, Bifrenaria aurantiaca.

POTATOS TURNING BLACK WHEN COOKED: *A.* The cause of the cooked Potatos being black is probably due to the tubers remaining too long in the ground. Next season lift them as soon as the haulm is ripe or before, even if the skins are liable to become rubbed a little. Heavy soils are not suitable for Potatos, especially if the ground is not well drained: this year the succession of damp weather during growth may have had some effect upon the quality.

ROSES FOR PLANTING IN BEDS: *Anxious.* You require a list of 18 Roses suitable for beds about 6 feet wide, quality of flower and freedom of flowering being of more importance than colour. You are quite right in omitting Frau Karl Druschki and Hugh Dickson, for both these Roses, beautiful as they are, are quite unsuited for beds. They look well in early summer, but at no other period; their long, waving autumn growths make them quite impossible as bedding Roses. Moreover, you do not want single Roses or Tea varieties. Your list for consideration, which is as follows: (1) Caroline Testout, (2) Dr. J. Campbell Hall, (3) General McArthur, (4) Killarney, (5) Lady Ashtown, (6) Lady Pirrie, (7) La Tosca, (8) Mme. Abel Chatenay, (9) Mme. Mélanie Soupert, (10) Mme. Ravary, (11) Mrs. Alfred Tate, (12) Pharisaer, (13) Paul Lédé, (14) Richmond, (15) Avoca, (16) Captain Hayward, (17) The Lyon Rose, and (18) Mme. Ségond Weber, is a great help, as it points to the type of Roses you require, and, taken all round, is a good list. We think the first 14 varieties will do very well. Avoca, however, we cannot advise you to use. It is a perfect and lovely flower, but its growth is like that of Hugh Dickson, "only more so," by which we mean that its autumn growths are even longer and more straggling than those of Hugh Dickson, and if treated as a cut-back, it is not nearly so free in flowering. To get many flowers from Avoca, it should be pegged down, and even then the autumn flowering is not very free. Captain Hayward, again, might be dispensed with, for, although it is not a bad bedding Rose, it has flowering periods, one in summer and the other in early autumn, and there is a good part of the season in which it is flowerless. The Lyon Rose is a beautiful variety, but it is too dangerous to use in a prominent position like a bed, for should it get a touch of black spot (as it has done this year), the whole of the leaves will fall, and the bed becomes bare and unsightly early in August, and so continues for the rest of the season. Mme. Ségond Weber we feel more doubt about; it is a beautiful Rose and free enough in flowering, but it is very easily spoilt by the first shower of rain, and in a wet district, such as the north-west of England, we hesitate to recommend it. In place of these four, we are inclined to advise Mrs. David McKee, Mrs. E. G. Hill, Mrs. Edward Powell and Prince de Bulgarie. Mrs. David McKee is a thoroughly good garden Rose, lemon-yellow in colour, flowering well even now (mid-November). Mrs. E. G. Hill is a most useful Rose, and more continuous than any Rose of tolerable shape except Richmond. We are aware some growers have not succeeded with it, but have not been able to examine the conditions in which it was cultivated. It does best with us in half shade. Mrs. Edward Powell is very free and continuous; there is a slight tinge of blue in the red, but it is not unpleasing. Should, however, this be objected to, Liberty might be substituted. Prince de Bulgarie is a pale-coloured flower with apricot centre; it is quite a good garden plant, but does not like shade or rain. If a larger Rose than this is wanted, we would select Mrs. Theodore Roosevelt, which is quite remarkable for the number of good blooms it produces. Paul Lédé, which is among the first 14 in the above list, is a good garden Rose, especially early in the season; but Mme. Léon Pain is a better-shaped Rose, and is rather more continuously good through the season.

WATER-CULTURE OF HYACINTHS: *A.* There is no reason why Hyacinths should not do well in glasses at Brighton as in any other place. Instead of rain-water, which is not to be recommended, try ordinary tap water; the addition of lime will be an advantage. Place a few lumps of charcoal in the vessels and stand them in a dark cupboard until growth commences, then gradually inure the plants to the light. Have the base of the bulb almost touching the water, which should be changed every three weeks or so.

ILLUSTRATIONS.

WINTER FLOWERS AT ASCOTT.

MR. Leopold de Rothschild's gardens at Leighton Buzzard are particularly famous for the bright tints of berry and foliage to be seen in winter throughout the extensive grounds, and for the showy flowers in the plant houses during the same period. The present gardener, Mr. John Jennings, has managed the gardens for a great number of years, and his skilful cultivation and wide knowledge of plants have enabled him to introduce fresh features almost every season.

The views from the homely mansion, the central portion of which is an original English homestead of 1606. show in every direction the beautiful effects to be obtained in winter by careful planting. Colour is provided by the blue tints of Piceas, the bright yellow of tall specimens of Cupressus Lawsoniana lutea; purple, red and rose by the foliage of various species, and all these colours are intermixed with the countless shades of green of the various trees and shrubs, and the bright variegation of the Privets and Hollies. In a distant rocky dell the tall, silver plumes of Pampas Grass contrast with the bright-scarlet berries of the Hollies and the orange colour of the berry-laden Sea Buckthorn, while at the edge of the old orchard a tree of an unknown and primitive Apple still bears its load of small, yellow fruits. All berry-bearing trees and shrubs are heavily cropped this season, a fact which, according to ancient lore, presages a hard winter. But, as Mrs. Leopold de Rothschild truly remarked, it tells more plainly of a past season favourable for the setting and development of the fruits than of a rigorous winter to follow.

In the plant houses winter-flowering Carnations occupy several large, span-roofed structures. The plants are grown chiefly on two plans, one set being in pots and the others planted in beds. The plants now commencing to give their fine blooms were struck last January, potted on and retained in the houses until May, when they were placed on ash-beds in the open ground, and at the end of September or beginning of October taken into the houses which they now occupy. Looking at the fine heads of bloom and bud on the large specimens, which are alike throughout, it seems marvellous that they should have attained such perfection in so short a time. The other method is to put the strong young plants out in August in the central beds and side staging, to remain in the houses for winter blooming for two winters, when they are in turn replaced by young plants. The houses are planted in rotation, those plants now in bloom being partly in their first year, and the others in their second season. The whole of the occupants of the houses are in excellent condition, the bushes, as they may be called, bearing flowers and buds in great profusion. It is noticeable that the quality and size of the blooms of well-known varieties are much better than are seen ordinarily. Mr. Jennings has noticed that, even in plants propagated from the same stock, some give better blooms than others, and he always propagates from the best.

Among the best varieties are Enchantress (white, pink and rose-coloured varieties), Pink Delight, White and Pink Lawson, White Perfection, Beacon and Britannia (scarlet), May Day (pink), Carola (a dark red), Gloriosa (pink), Mikado (a slate-blue), Winona (rose-pink), Mrs. Carl Meyer and Mrs. Leopold de Rothschild.

In some of the houses it is interesting to note a number of old and well-known plants—often seen in gardens as occasional specimens—which at Ascott have been worked up in batches for winter-flowering, and with excellent effect. Among these are Statice profusa, which occupies one side of a house, and gives a mass of bright-blue colour, which will continue well into next summer. Another plant is Plumbago rosea, which is generally seen in gardens as a pillar-trailer, or a straggling plant trained round a globe. At Ascott, large numbers are grown in 6-inch pots, each furnished with many shoots about 18 inches to 2 feet in height, the upper third densely set with bright carmine-rose flowers. The plants are cut down annually, and the species makes a very good subject for decorative purposes in winter.

Callicarpa purpurea is cultivated to form pretty pot plants, and its decorative berries contribute to the winter show. It is usually seen as a straggling specimen, but at Ascott cuttings are rooted, and the growths stopped when about 2 feet high. They afterwards produce several sprays, which in time flower and produce their charming Tyrian-blue berries.

The large Rose house of many spans, after supplying a wealth of bloom, still has a quantity of buds to develop throughout the winter. Those plants now growing in beds, on the ground, will be removed and planted on benches of soil, raised on earthenware supports, so as to allow of the passage of air beneath. This method gives a more equal temperature between the top and the root than does planting in the basement on the natural earth.

Taking a rapid glance at the contents of some of the houses, we find a house of Cyclamen Salmon King (salmon-rose with dark eye) in bloom, with plenty of buds to follow; the next house contains Begonia socotrana, its pretty rose-coloured flowers showing well above the fine orbicular green foliage.

Another house contains Spiræas and Eupatoriums, and the lofty Chrysanthemum house has a great show of the best varieties. The most noteworthy amongst these latter is the attractive variety Sylvia Slade, a showy, rose-purple single flower with clear white ring round the yellow centre. This also appears very attractive in the decorations in the mansion.

A batch of scarlet Salvias and a house of Begonia Gloire de Sceaux next present themselves; in the latter house a fine effect above the bronzy-purple foliage being made by the clear, blue flowers of Ipomœa cœrulea, which climbs each of the rafters.

A house of Begonia Gloire de Lorraine and B. Mrs. Leopold de Rothschild is a mass of bloom, and the houses of B. Winter Cheer and B. John Heal are equally bright. Palms, Dracænas, Codiæums and other foliage plants are all well cultivated. The Pelargonium houses are masses of colour, the centre bed in one being entirely of the dark scarlet-double Raspail. A batch of Coleus thyrsoideus will give bright-blue flowers later. A number of plants of Cypripedium insigne are in full bloom. Primula obconica of the best strain makes a fine show, and various other batches of showy winter flowers were observed. A grand stock of "Malmaison" Carnations, and a profusion of Violets are also to be noticed. It is satisfactory to be able to add that Mr. Leopold de Rothschild and his gardener take great interest in every detail, and thus there is much pleasure derived from the plants during their growth. We do not doubt Mr. Rothschild when he states that success in many directions has been attained only after not a few failures. *B.*

NEW OR NOTEWORTHY PLANTS.

SINOMENIUM DIVERSIFOLIUM.

(See Fig. 178, p. 411.)

THE above is a new name, so far as the generic part of it is concerned, for a plant that is in cultivation under the appellation of Cocculus variiformis. By whom the latter was given is uncertain, though possibly I may be partly responsible for it. But the plant has a history dating back in botanical literature to 1867, when Miquel described it under the name of Cocculus diversifolius, founding the species on Japanese specimens. Passing over the intermediate vicissitudes of this plant, Mr. E. H. Wilson and I had to deal with it in 1906, when we were describing a selection of his novelties for the Kew *Bulletin*.

(moon) = Chinese moon-seed. In Diels's classification, Sinomenium is placed next to Menispermum canadense, one of the very few other members in cultivation of this large and interesting, though by no means showy, family. And there seems to be good grounds for giving it separate generic rank. Messrs. James Veitch & Sons raised this new climber from seed collected by Mr. E. H. Wilson.

Mr. Worthington Smith's sketch in fig. 178 was prepared from specimens furnished by Mr. P. D. Williams, Lanarth, St. Keverne, Cornwall, from a plant some 20 feet high, which flowered for the first time this year on a north-east wall. Mr. Williams states that the foliage shows great variation, the leaves being of totally different types.

The name diversifolium signalises great variability in the shape of the leaves; which variability occurs sometimes on the same branch and sometimes on different branches. Unlike that which obtains in the majority of heterophyllous plants, the variously-shaped leaves are borne on the flowering branches, and cannot be classed as juvenile (or barren-shoot) and adult forms. In the Kew Herbarium there are specimens with ovate leaves having a truncate base; others with a cordate base; others orbicular-cordate; others with a three-lobed apex, and others palmately five-lobed.

The specimen figured bears only male flowers, and all the flowering specimens in the Kew Herbarium which were examined were male; hence the female plant must be rare. Male flowers consist of six sepals in two series; six petals, very small and enfolding singly the filaments of six of the nine stamens, in a similar manner to the Rhamnaceæ. *W. Botting Hemsley.*

FIG. 174.—CYPRIPEDIUM × LATONA. (*Photograph by F. Waldeck.*

(Received R.H.S. Award of Merit on the 19th inst.)

Both he and Dr. A. Henry had collected specimens of it in various localities in Central and Western China. On comparing these specimens with those from Japan, and investigating the nomenclature of the species, we discovered that there was a valid Mexican Cocculus diversifolius of much earlier date. Accordingly we renamed the Chino-Japanese plant Cocculus heterophyllus, without testing the correctness of its being placed in the genus Cocculus. And we may have at first proposed the name variiformis, afterwards rejecting it for heterophyllus, as more appropriate; but I find no record of it, published or unpublished. Turning to Dr. L. Diels's excellent monograph of the whole of the Menispermaceæ in Engler's *Pflanzenreich* (1910), I find that he has founded a new genus on our plant, calling it Sinomenium, derived from Sina (China) and mēn

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA CORNELIA.

A VERY pretty hybrid between Cattleya labiata and Lælia pumila has just flowered with Mr. Jas. Hudson (gr. to Leopold de Rothschild, Esq., Gunnersbury House, Acton). The flower is 6 inches across and each petal 2 inches wide; both sepals and petals are silver-white tinged with rose-pink. The tube of the labellum is pink outside and chrome-yellow at the base, the broadly-expanded crimped front being of a bright purplish-crimson. The cross was first raised and flowered by Messrs. Jas. Veitch & Sons, and noted in the *Gardeners' Chronicle*, December 2, 1893, so that the fact that it is winter-flowering is established, and this renders the hybrid the more desirable.

STANHOPEA PLATYCERAS.

THIS is one of the most beautiful of Stanhopeas, its large, elegantly-formed flower having the sepals and petals of a pale cream-yellow spotted with rose-purple, the boat-shaped basal part of the lip maroon-purple, the horns of the middle portion and the front lobe whitish with purple markings. It flowered in Lord Rothschild's gardens in 1907, and received an Award of Merit at the Royal Horticultural Society's meeting on September 3, in that year, the plant having been imported with Cattleya Warscewiczii. It was originally described by the late Professor Reichenbach in the *Gardeners' Chronicle*, Jan. 11, 1868, p. 27, but although it has been so long known it has always been a rare plant. A specimen is in flower with Mr. Sidney Flory, Tracy's Nursery, Twickenham, the same plant having bloomed three times this year. The true Stanhopea inodora is also in flower.

CATTLEYA DIONYSIUS.

THIS very beautiful hybrid between Cattleya Fabia alba (labiata alba × Dowiana aurea) and C. Warscewiczii var. Frau Mélanie Beyrodt was shown by C. J. Phillips, Esq., The Glebe, Sevenoaks (gr. Mr. Bucknell), under the provisional name C. Harrisiana at a meeting of the Royal Horticultural Society on October 8, last, when it was awarded a First-class Certificate. At the same time it was intimated that a name, other than that under which it was shown, should be selected. Mr. Phillips readily adopted the more convenient name given above, and this appears on the records of the Society. It is a charming flower of fine size and substance, with white sepals and petals delicately flushed in places with pink. The finely-expanded labellum is ruby-purple, with gold colored disc and veining at the base.

CYPRIPEDIUM × LATONA.

OUR illustration (see fig. 174) represents the hybrid Cypripedium for which Lieut.-Col. Sir George Holford, K.C.V.O. (gr. Mr. H. G. Alexander), received an Award of Merit at the Royal Horticultural Society's meeting on November 19 last. It was raised at Westonbirt by crossing C. Niobe (Spicerianum × Fairrieanum) and C. Alcibiades (Leeanum × Monsieur de Curte). The flower is of good shape and substance, the broad white sepal being blotched with rose-purple. The petals and lip have a yellowish ground tinged and spotted with dark mahogany-red.

FOREIGN CORRESPONDENCE.

MIMULUS ROSEUS.

REFERRING to a note on this plant on page 191 of this journal, I should like to say that Mimulus roseus, Douglas, syn. M. Lewisii, Pursh. is a good species, and occurs in the Sierras, from Central California northwards and eastward to Montana. No wonder that this species is hardy in Scotland. I should very much like to get this plant for trial here. *M. Buysman, Jardin Botanique, Lawang, Java.*

THE FORCING OF TULIPS.

THE idea is prevalent that for forcing purposes Tulip bulbs must be large in order to give the best results, but there never was a greater fallacy. If they are of a reasonable size, solid, and the dark-coloured outside skin in a healthy condition (which shows they have not been heated) nothing more is needed. In fact, it is often the case that a small, ripe bulb grown on "heavy" soils will give infinitely better results than a large bulb grown in the more sandy situations. Solidity, combined with a general healthy appearance, is the best criterion in buying bulbs.

If they are purchased either from Holland or other sources, they should be examined immediately on arrival, and stored in a cool, dry place until they are needed for boxing or potting.

Receptacles of various sorts are used in which to plant bulbs for forcing purposes, but we will assume that boxes 20 inches long, 13 inches broad, and 3½ inches deep are to be used. If they have been employed for growing other kinds of plants they should be thoroughly washed or sterilised to destroy the spores of fungi which are ever ready to spring into life so soon as the conditions are favourable. Many of these disease-producing fungi—if they do not mean complete disaster—are the cause of disappointment to the grower, and a menace to the reputation of the firm which supplied the bulbs.

Nearly any kind of soil is suitable for supplying a rooting medium if it be clean and not overcharged with artificial manures, but a well-prepared loam is undoubtedly the best. Soil previously used for growing Cucumbers or Melons, &c., which often contains a quantity of unused manure, should never be used alone, and if it is mixed with other soil the whole should be sterilised by steam or one of the many chemical preparations to ensure thorough cleanliness and freedom from fungous and other pests.

A quantity of well-rotted manure should next be procured for covering the bottoms of the boxes, or failing that a good decomposed leaf-mould. If the latter be used it should be sterilised in order to destroy worms, millipedes, the eggs of small snails, and the numerous kinds of life which naturally carry on the work of decomposition, but are deadly to the tender roots of bulbs.

These preparations ought to be made some time before they are needed, so that any ill effects of the sterilisation may disappear.

When everything is ready—particular care should be taken to see that the drainage of the boxes is sufficient—a covering of the manure or leaf-mould should be placed in the bottom of the box, say, about ½ inch deep, then soil should be put in loosely to half fill the box. Take the bulb between the thumb and two forefingers and press it moderately firmly into the soil. This ensures that there are no "air spaces" between the bottom of the bulb and the soil. Fill the box with soil loosely to the top, press down the latter with the points of the fingers—not the palm of the hand—and "boxing" is complete.

Where any other kind of receptacle is used the same directions apply, except that the bulb should always be the same distance from the surface. If the bulb is level with the finished surface, or about ¼ inch below, it is in the right position, and on no account should it be planted any deeper.

The boxes should then be placed in a warm, sheltered position, thoroughly soaked with water, and covered to a depth of 3 or 4 inches with ashes which have been weathered for some time to allow any injurious substances to escape into the atmosphere. Particular attention should be given to watering. It is probable that more Tulips fail through being allowed—through carelessness or want of knowledge—to become dry at the roots when standing under ashes than from all other causes combined. If they are allowed to become dry the greater percentage will produce the malformed flowers with which most of us are familiar during the early part of the year.

It does not follow, however, that all malformed flowers are caused by dryness when the bulb is forming young roots with which to nourish the embryo flower, but dryness is certainly the most usual cause.

The directions given so far have one object in view: to encourage the bulb to form a large quantity of healthy roots, so that when the plants are placed in the genial atmosphere of the forcing house they will quickly respond, and give satisfactory results.

Where a fairly large quantity is necessary in order to keep up a continuous supply of flowers during a long season, and a house can be set apart for the purpose, ideal conditions can be maintained. But few places are in this happy position, and the bulbs have often to be grown along with other subjects which—as often as not—require different treatment. It is for those so placed that the following directions are given, and anyone having a house to spare can modify them to suit the altered conditions.

The "staging" should have a covering of some moisture-retaining material, without this it is impossible to obtain the best results. For the early batches—by early is meant up to the end of January—a little, and only a little, bottom heat is necessary. A covering of thick canvas should be nailed to the roof of the house inside, and taken up the house high enough to allow it to fall to the front of the staging. This will make a compartment inside the house which will have the direct rays of light broken sufficient to cause the bulbs to develop flowers rapidly, and yet will not be so dark as to cause the development of anæmic-looking foliage.

The temperature should be from 65° to 70°F. during mild weather, allowing a fall of 5° or even 10° during severe frost, so that the pipes need never be kept abnormally hot to maintain the temperature sufficiently high.

When everything is in readiness, and the bulbs are showing a fair quantity of young roots, the boxes should be carried carefully into the house and placed under the canvas. Light sprinklings of water should be given to wash away any ashes which may be adhering to the tender points, and afterwards twice a day until the flower-buds are well up. It is only in extreme cases that they require watering at the roots more than once or twice, and water should never be given unless it is needed. In cutting the flowers the bulb may be pulled up, and split with a knife down the side of the flower-stem which allows about 1 inch more stalk to the flower.

If these directions are carried out in conjunction with those given in the accompanying table, the best possible results will be obtained at a minimum cost, and the labour is much less than under the old method of placing the boxes under the staging and gradually bringing them to the light. *T. W.*

CULTURAL NOTES.

RHUBARB FOR FORCING.

WHEREAS with Asparagus exposure of the roots to the air spells ruin, the very opposite is the case with Rhubarb, for it is those roots which have been exposed to the atmosphere, and particularly to frost, that force the best. For the earliest forcing the necessary roots should be lifted without delay so that they may have a miniature winter before being introduced to the forcing house. During the autumn the roots lifted for exposure are best when laid in an open shed, because the heavy rains of the season would defeat, in a measure, the object in view. It is only the kinds of Rhubarb which naturally start into growth early which force well, and it is useless to lift roots of any of the late kinds for forcing purposes. Such varieties, when subjected to heat, grow very slowly and only produce thin, flavourless stalks. Of the early varieties Daws's Champion is the best for growing out-of-doors and for forcing. Even so early as at Christmas forced roots freely produce stout stalks of bright colour which are well flavoured. Reading Ruby, Hawke's Champagne, and Royal Albert are four good early varieties which also force well. Too often no special preparations are made for supplying the roots for forcing purposes, but promising clumps are lifted from the Rhubarb bed. This is not as it should be: the proper plan is to keep a separate stock for early forcing, and, as the roots which have been lifted and forced are of no further use, enough young plants should be annually raised to ultimately take their places. This may be done by division of the roots, or by sowing seeds of one or more of the early varieties. In the latter case it will be found that all the seedlings do not come true, so all the coarsest, late individuals should be thrown away, unless wanted for other purposes. Raising from seed has also the advantage that there is always a probability of raising a new and improved kind. If seeds are sown in heat early in the year the seedlings may be planted in a border towards the end of May, and will become large plants by the end of the season; but if the seed-sowing cannot be done in a warm house, it may be done in a frame, and in this case the seedlings should be kept in pots during the first year. After the middle of January Rhubarb may be forced in the open by placing large pots over the crowns and heaping fermenting materials around and over them. This is an economical method, for the roots are not exhausted, but may be left in the ground when the forcing is finished. From now until the period mentioned the forcing is best done in a hot-house, as it is difficult to maintain a steady heat out-of-doors. But Rhubarb is easily forced, and, in the absence of a proper forcing house, the roots when placed in boxes of light soil will force readily in a warm greenhouse. Brightly-coloured stalks are the result of exposure to the light, but as the flavour is better and there is a sufficiency of colour for most tastes when the forcing is done in semi-darkness the boxes may well be placed under the staging and covered with a loose heap of clean straw. *A. C. B.*

NOTES ON THE VEGETATION OF THE DOWNS.

While the neighbourhood of Box Hill is well known to botanists, the vegetation of the Leatherhead Downs seems hardly to have received the attention it deserves, at any rate in connection with the study of plant associations. Here may be seen excellent examples of the Yew woods, which are characteristic of the North and South Downs, and in this locality, at least, they appear to represent the original vegetation before it was greatly modified by man. Tansley and Rankin* state that the origin of the Yew woods is not clear, and that they occupy situations quite similar to those of the typical Beech woods, i.e., the fairly steep sides of the chalk downs, and in some cases the bottoms of dry chalk valleys. They suggest that they may originate in the following way: "If a Beech wood possessing numerous Yews is destroyed by total felling of the dominant trees, or if it degenerates owing to various causes, chalk scrub and chalk grassland, in which Yews are prominent, will take its place. The Yews produce seedlings freely under such conditions, and the young trees, probably owing to their poisonous foliage, are largely, if not wholly, immune from the attacks of rabbits and other animals. As soon as a locally-closed community of Yews is formed, competitors are almost entirely excluded, owing to the very deep shade cast by the trees. In this way local Yew groves might be formed, and an extension of the process might lead to the formation of extensive, nearly pure Yew woods, since the intervening scrub and grass association would be gradually destroyed by the extension of the Yew. The process would, no doubt, be slow, owing to the tardy growth of the trees. On the other hand, it would be very sure, because the equipment of the Yew for this kind of competition is overwhelming. Nothing but the formation of a very dense scrub of other species or the felling of the Yew trees would be likely to arrest it. The explanation given is in accordance with the observed facts, but at present it lacks corroboration or direct verification. It is possible that other factors are operative, and it may be that the habitat of the Yew wood really differs from that of the Beech wood, though we have no clue to such a difference."

While the above explanation may be the true one in certain instances, it seems more likely to the writers that the reverse process has taken place in many cases: that Beech woods possessing numerous Yews have partially replaced pure Yew woods or chalk scrub in which Yews are prominent. The Yew can exist in situations from which the Beech is excluded, namely, on very steep slopes in almost pure chalk, as, for instance, on the western flank of Box Hill. On the southern escarpment of the North Downs, in places between Dorking and Guildford, mixed Beech and Yew woods may be seen on the gentler slopes and the bottoms of lateral valleys, whereas the steeper slopes are covered with a pure Yew wood. There can be little doubt that the soil, except in very steep places, is gradually improved by the action of the Yews, so that in course of time it becomes suitable for colonisation by the Beech.

On the steep, open hillside, covered with close chalk pasture, the Beech cannot establish itself. Where scrub occurs on the chalk escarpment, however, in the neighbourhood of Beech woods, one may see seedling Beeches springing up underneath the shrubs of the Whitebeam (Pyrus Aria), Sloe, Hawthorn, Wayfaring tree (Viburnum Lantana), Privet, Holly, Dogwood, Juniper and Yew. The shrubs mentioned frequently occur in groups on the escarpment for the same reason, namely, that the bare soil underneath a shrub is a favourable situation for the successful germination of large seeds, which cannot establish themselves on the close and unbroken turf.

Many steep slopes on the chalk escarpment are covered with an almost pure Juniper scrub, which now occupies a much smaller area than formerly. On the Chiltern Hills we have studied the vegetation of the escarpment for miles, and have seen various stages in the disappearance of Juniper scrub. In one enclosed pasture, where sheep were grazing, a few moribund bushes, showing traces of fire, were observed. In the course of a few years these will have disappeared, and there will be nothing to indicate the former existence of the Juniper association in this locality. Elsewhere the Juniper had been entirely exterminated in an enclosed pasture, but was found on the margin of a Beech wood which crowned the hill above it. In a third locality an extensive Juniper scrub was seen, in the upper part of which young Beeches had sprung up at the base of some of the Juniper bushes. The development of the Beech in this instance results in the death of the Juniper under which it germinates. Various stages in this process could be seen, the Juniper bushes being healthy, moribund or dead, according to the state of development of the Beeches beside them.

A list of the characteristic shrubs and climbers of the chalk scrub is given by Tansley and Rankin†. Two species which might be added are the Yew and the Black Bryony (Tamus communis). The list, as amended, includes the following erect shrubs:—Holly, Spindle tree, Buckthorn, Feld Maple, Sloe, Whitebeam, Hawthorn, Dogwood, Elder, Guelder Rose, Wayfaring tree, Privet, Spurge Laurel, Box, Hazel, Goat Willow, Butcher's Broom, Juniper and Yew. Scrambling shrubs are represented by species of Bramble and Rose; woody climbers by Clematis, Ivy, Honeysuckle and Woody Nightshade; herbaceous climbers by the two species of Bryony.

A striking feature of the list is that 21 out of the 26 genera have fleshy fruits (in the Spindle tree the fruit-wall is dry and the fleshy part is the orange aril surrounding the seed). It can hardly be supposed that this is fortuitous, and it seems a legitimate conclusion that birds are the active agents in the regeneration and extension of the chalk scrub. The Maple, Goat Willow, and Clematis have fruits or seeds adapted to distribution by wind, and the Hazel by squirrels, whilst the Box appears to have fewer facilities for seed dispersal at a distance, but this is counterbalanced by the immunity from rabbits enjoyed by its seedlings.

According to the view here put forward, the chalk scrub has generally replaced open chalk pasture, and in its turn has been succeeded in many cases by Yew woods or Beech woods with Yews. It is not, of course, denied that it may have arisen in some instances from the degeneration of Beech and Yew woods, but the facts seem to point in the other direction in the instances which have come under our observation.

A characteristic view of the outskirts of a Yew wood on the Leatherhead Downs is shown in fig. 175. Immediately behind the figure is a dense mass of Privet, which extends to the centre of the photograph, where it is succeeded on the right by a slightly taller bush of the Spindle tree (Euonymus europæus). Above the Privet can be seen a tall and slender Elder tree, which has managed to spring up and hold its own, in spite of the dense shade cast by the Yews, which form a continuous mass behind it. The photograph includes on the extreme right (not quite in focus) a part of a tall bush of Guelder Rose (Viburnum Opulus) with Privet beneath it.

[*Photograph by J. Hutchinson.*

Fig. 175.—Outskirts of a Yew wood on the Leatherhead Downs.

The Elder is well equipped by means of its extremely rapid growth for establishing itself amongst fairly close associations of Yew or Box. A sheltered coombe in the Chiltern Hills, which we hope to describe on a future occasion, is filled with a luxuriant growth of Box trees in all stages of development, from seedlings to old, much-branched trees with trunks 8 inches in diameter. The only tree which has obtained any great place amongst the Box is the Elder, which occurs gregariously at the bottom of the coombe and as isolated specimens here and there in the Box thickets, where an old tree has fallen to the ground, leaving an open space.

Another view of the outskirts of the same Yew wood is shown in fig. 176, in a place where the undergrowth is represented only by a solitary dead Juniper bush with a young Privet beneath it. To the right of the Juniper is a

* Tansley, *Types of British Vegetation* (1911), 170-171.

† Tansley, l.c. 171.

sunny patch indicating the existence of a small, clear space behind the large Yew which nearly fills the picture. In such intervals between the trees, the Black Bryony has a chance of establishing itself, and twines from branch to branch to a considerable height.

The history of the dead Juniper may be read from fig. 176. Before the Yew which now overshadows it had attained its present growth, the Juniper flourished and grew upright to a height of about 3 feet. As the branches of the Yew began to overhang it, the left-hand stem and a branch of the right-hand one turned outwards (to the left in the illustration) in search of the light, which they were in danger of losing. The struggle must have gone on for many years, judging by the size of the horizontal part of the stem, until it terminated in the death of the Juniper. The lower habit of growth of the Privet makes it more successful in forming undergrowth at the outskirts of Yew woods, as there is considerably more light near the ground than a few feet up.

Besides the patches of Yew wood on the Leatherhead Downs, there are large thickets rich in species. In quite a small one 11 species were noted, including erect shrubs, trees and climbers, namely, Clematis, Spindle tree, Buckthorn, Dog Rose, Dogwood, Wayfaring tree, Privet, Ash, Hazel, Birch and Juniper. Larger thickets close by included Box, Yew, Brambles and White Bryony in addition. The great abundance of the Spindle tree is a noteworthy feature of this locality. It is possible, however, that it may be due in some measure to planting.

Charming natural groups of shrubs may be observed, one of which is shown in fig. 177. In front are small examples of the Wayfaring tree (Viburnum Lantana); behind and above it comes a mass of Dogwood literally laden with fruits, and above all are the delicate branchlets and foliage of a Spindle tree.

The herbaceous vegetation composing the chalk pasture in this locality presents features of at least equal interest, which we hope to describe in another article. *T. A. Sprague and F. Hutchinson.*

NEW ROSES.—IV.

(Continued from p. 386.)

TEA-SCENTED ROSES.

The great development of the Hybrid Tea Roses in recent years and their quality of continuity in flowering, has produced such a revolution in the Rose garden, and has attracted so much attention, that the improvement that has taken place in other classes of Roses has received perhaps less attention than it has deserved. Nevertheless, quietly and unobtrusively, there have been introduced into our gardens valuable additions belonging to other groups, and notably in the Tea-scented section. The Tea Roses—the aristocrats of the Rose garden—possess a delicacy and refinement which is all their own, and will surely continue to appeal to the connoisseur. Fifty years ago their beauty was fully appreciated, but they were too difficult to grow out-of doors in this country. Shirley Hibberd was driven to have recourse to glass to grow most of the Teas of his day, and the great advance that has taken place in this section has been in the direction of obtaining a strain with greater hardiness, capable of withstanding our English winters. Apart from the Dijon Teas, we had Homère (1859), Marie van Houtte (1871), Anna Olivier (1872), Perle des Jardins (1874), Mme. Lambard (1877), and perhaps a few others which are still good garden Roses, fairly hardy and reliable, but we shall probably not be far wrong if we take the introduction of Maman Cochet in 1893 as the date of the great modern advance of the Tea Rose. Since then we have had such useful garden and exhibition Roses as White Maman Cochet (1897), Mrs. Edward Mawley (1899), Corallina and Sulphurea (1900), Mme. Jules Gravereaux (1901), Lady Roberts, Mme. Antoine Mari, Mme. Jean Dupuy, and Souvenir de Pierre Notting (1902), Paula (1903), Mrs. A. Ryass (1904), Comtesse de Saxe and Mme. Constant Soupert (1905), Mrs. Myles Kennedy (1906) and Harry Kirk (1907), which brings me to the date at which I am commencing my review of the new Roses. The noticeable feature of all the Roses I have mentioned is their comparative hardiness and ability to withstand the rigours of our English climate. No doubt this result has been attained to some extent at the expense of the purity of the strain, but if we get (as I think we do) plants which we can grow in our gardens, possessing the delicate colouring and perfect form of the older Teas, we need not complain of the blot on the 'scutcheon. I may be asked what is the specific distinction between the Hybrid Tea and the Tea Rose. My impression is that the actual line of distinction is even less marked than that between the Hybrid Tea and Hybrid Perpetual. The typical Hybrid Perpetual has very green foliage, and in early summer puts up a stem with numerous side buds carrying a bunch of flowers at the top, a process which it repeats, but with stronger growth in autumn. In the Hybrid Tea the foliage is generally more or less red when young; the plant throws a stem for its early-summer growth, often with a single flower at the top, and this is immediately followed by a strong loose panicle carrying flowers down the greater part of its length, which flowers successively, furnishing the late July and August blossoming, and is followed by fresh flowering growths from September onwards. The upper surface of the leaf varies from the "matt" or dull texture of the Hybrid Perpetual to the shiny surface typical of the Tea Roses. In the Teas the method of flowering resembles that described previously for the Hybrid Teas, one or more strong panicles being thrown up for the second flowering. They differ from the Hybrid Teas chiefly in the greater excitability of their buds, which usually commence to grow out before the terminal flower has matured. The wood buds on these flowering panicles are very much fewer than in the Hybrid Perpetuals, and are situated at longer intervals on the stems. In the typical Tea Rose the leaf surface on the upper side is always of the glossy character found in R. indica, and the young growths are beautiful shades of red and brown. Probably few would have much difficulty in distinguishing a typical Tea Rose from a typical Hybrid Tea, but modern hybridisation has produced many varieties which are intermediate between the two sections and whose proper position is difficult to determine.

[*Photograph by J. Hutchinson.*

Fig. 176.—Juniper tree on the Downs near Leatherhead killed by overhanging yew; young plant of privet beneath.

Down to the present the National Rose Society has not attempted to determine the position of these doubtful hybrids, but has accepted them as members of the section in which the raisers happen to have placed them on their introduction. It is therefore not surprising to find among the Tea Roses varieties which some think might more properly find a place among the

Roses of some other section. To the writer it would seem not unreasonable if Roses like Harry Kirk and Mrs. Myles Kennedy were grouped with the Hybrid Teas, while Princesse de Sagan, Betty Berkeley, and a few others might be placed among the Chinas.

However, this is a long digression, and I come back to those Tea Roses introduced in or since 1908 which I have tried in my own garden with more or less satisfactory results.

NEW TEA-SCENTED ROSES.

ALEXANDER HILL GRAY (T., A. Dickson & Sons, 1911). This Rose made its debut at the shows some year or two before its introduction to commerce, and so, though only a last year's Rose, it has become tolerably familiar to many rosarians. It is a beautiful flower, and may well be described as a fuller and more pointed Mme. Hoste. Like this Rose, it is of lemon-yellow colour, perhaps rather deeper in the centre; it appears to grow well, but as, down to the present, I have only grown it in pots, I cannot speak of its hardiness. It certainly makes a good pot plant, and has a considerable Tea perfume.

ALICE DE ROTHSCHILD (T., A. Dickson & Sons, 1910). This is another yellow Rose rather deeper in colour than the last but not quite so full. I think it will make a good garden and bedding Rose. It seems rather taller than A. H. Gray.

HUGO ROLLER (T., Wm. Paul & Son, 1908) is a decorative Rose, not large enough for exhibition, but very pretty in the early summer. Its colour is lemon-yellow with a deep picotee edge of rose colour, not altogether unlike a small Marie van Houtte, with a deeper-coloured edging. It is not quite so good a grower as I could wish, and therefore not everyone's Rose, but those who have room to spare should grow a few plants.

LADY HILLINGDON (T., Lowe and Shawyer, 1910). This is a most beautiful Rose, which everyone who can grow a Tea Rose should possess. It is said to be the result of a cross between Papa Gontier and Mme. Hoste. The colour is a bright fawn-yellow suffused with orange, that is when the flower is at its best, but no doubt the colour varies considerably, and I have always had a number of flowers in which the colour is much paler, and it is then less interesting. Often one will get bright and dingy flowers on the same stalk, sometimes the crown flower will be bright and the side ones dull, and sometimes their position will be reversed. I incline to think the weather has something to do with the matter, and that I get more bright-coloured flowers in fine, warm weather. It makes a beautiful bedding Rose, and is almost worth growing in a bed for the beauty of its foliage, which retains the bronzy-red of the young growths for an unusually long time. The colour of the foliage, moreover, harmonises with and sets off that of the flowers. With me it has proved an excellent grower, and for a Tea Rose has a very erect habit. The flowers are not very full, but long and beautifully shaped, and are very useful for cutting, as they can be had on long stalks and last well in water. They will open well even in wet weather. It is excellent in pots, and, though I have not tried it as a standard, many of my friends tell me it does well when so grown.

White Rose.

FORESTRY.

THE MANAGEMENT OF DECAYING TREES.

WHEN the value of old trees in an ornamental or utilitarian sense is taken into account it is remarkable what a small amount of attention they receive when subjected to accident or disease. In the great majority of cases injury to root, stem or branch is the direct cause of decay, and this is particularly the case with old trees, the generally enfeebled condition of which greatly facilitates the spread of disease. Branches that have been broken over by the wind are undoubtedly the main cause of decay, though injuries to the root or stem, as by frost, lightning, timber-haulage or other accidents are fertile means of bringing about a diseased and unhealthy condition of the trees. Probably the Elm suffers more from wind damage and disease than any other tree, though the Oak is by no means exempt, and examples of the former are, unfortunately, but too common in almost every public and private park throughout the country.

In and around London diseased and gradually dying out specimens of the Elm, Willow, Mulberry, Lime, Catalpa and other trees are frequently to be seen, and in 9 out of every 10 cases the origin of disease can be clearly traced to the neglect of wounds that have been brought about by falling branches. From various other causes, too, such as atmospheric conditions, poverty or poisoning of the soil, and the attacks of insect- and fungous-pests, town trees may become "stag-headed" and unhealthy, and if not attended to may die out altogether.

Broken branches.—Both for the sake of appearance and for the health of the tree broken and twisted branches should be attended to with as little delay as possible, the main point being to prevent water from lodging in the wound and so setting up disease. This is especially necessary when the branch has been broken close to the main stem or one of the heavy limbs, and when, in all likelihood if unattended to, disease would be carried direct into the main trunk. Perhaps old Elm trees suffer most in this way, owing to the brittle nature of the wood, which causes it to snap readily, and also to the fact that this tree is more apt to be affected by disease and heart rot than most other species. Not only are the branches readily broken by the wind, but what is known as "branch-shedding" often takes place during still, hot weather, and without the slightest warning. The point at which a branch has been broken over should be made quite smooth, first by aid of a sharp saw, and afterwards by the pruning knife or chisel, care being taken that the bark around the wounds is neither injured nor loosened, and that it comes close up to the saw mark. A coat of paint, or, preferably, coal tar, may then be applied, both pruning and painting being carried out during dry weather. A broken branch should never be sawn over on the horizontal, but always in a sloping direction, so that water may pass off rapidly. When, as is often the case, a portion of the trunk is carried away by the falling limb, the difficulty of dressing and otherwise attending to the wound is greatly increased. But in all cases smoothness of surface and prevention of ingress of water are the principal points to be observed in the treatment.

Hollow trunks.—Probably the simplest, certainly the cheapest, method of dealing with diseased and hollow trunks is to clean out thoroughly all dead and decaying matter, the interior being scraped and swept with a rough brush, so that the loose, rotting wood is removed. When quite dry the interior of the trunk should be painted with one or, preferably, two coats of creosote and filled up with a composition of one part of Portland cement to three of clean gravel and sand, the surface coating containing the largest quantity of cement. A coat of coal tar on top of the dry creosote goes far in making the concrete keep firm to the wood. When a fairly healthy tree is being operated upon, and when the bark is likely to grow over the exposed surface, the concrete should only be brought up on a level with the underside of the living bark. Sometimes brickbats, broken small, are used instead of gravel, but for various reasons cement is preferable.

The concrete surface may be prevented from cracking by applying annually a coat of paint,

which for appearance sake may be of a similar colour to that of the bark of the tree. The growth of fungus on a tree stem is always an indication that disease is present.

Injured bark.—All loose and injured bark should be carefully cut away, and the wood, when perfectly dry, coated with coal tar. In removing the injured portions, cut well back to the living bark so as to ensure rapid and uniform healing. Should the wood from which the bark has been removed be injured in any way, the pruning chisel may be requisitioned, and all that is damaged carefully cut away before the tar is applied. Loose bark is most frequently brought about by injury from a passing cart or wheelbarrow, or careless felling, but in not a few instances may be the direct result of frost, lightning or unfavourable soil and situation.

Root injury.—This is a frequent cause of trouble, especially on lawn and standard trees, and may be the result of a knock or injury from a passing cart, roller, or mowing machine. When fungus has permeated the roots, little can be done to save the tree, but with superficial injuries, remedies, if applied in time, are generally followed by good and lasting results. Roots which run near the surface are most often open to injuries, and are, fortunately, most readily attended to. The soil should be removed from around the decaying root, the diseased portion with the loose bark cut back to the healthy wood, and the whole painted, first with an antiseptic, and finally, when quite dry, with coal tar. Should the tree have suffered much in health from the injuries, branch pruning and enriching the soil amongst the roots will often be found beneficial.

Other causes of decay.—As well as the above, there are many other causes that bring about an unhealthy condition or the death of a tree. Some of these are natural decay, impoverished soil, stagnant moisture, the attacks of insect and fungoid pests and piling earth around the stem. The latter is a fruitful cause of decay and death, and if the soil is of sufficient depth the trees may succumb in from eighteen months to two years. Stagnant moisture is usually readily removed, while natural decay and a "stag-headed" condition may in some cases be successfully dealt with by timely and judicious pruning and by substituting fresh soil for the spent material amongst the tree roots.

From the above it will be seen that, if taken in time, tree wounds are by no means difficult to deal with, nor is the work entailed by so doing of a costly description, and this being the case, there is no reason why specimens that are of particular value in an ornamental or useful sense, or such as are of historic interest or with interesting associations, should not, when accident befalls them, receive prompt and careful attention in order to ward off disease and death. *A. D. Webster.*

ROGUES IN SWEET PEAS.

(An outline of the paper by Major C. C. Hurst, Director of the Burbage Experiment Station, read at the Fourth Sweet Pea Conference, October 17, 1912 (see report in *Gardeners' Chronicle*, October 26).]

The difficulty of securing true stocks of the Spencer forms of Sweet Peas causes concern to raisers, growers and distributors of seed. The large numbers in which rogues make their appearance in certain stocks of Sweet Peas may be seen from the table (Table 1), which contains a record, expressed in percentages, of these which occurred in commercial stocks in the National Trials and in the Mendelian stocks—all grown at the Burbage Experiment Station in 1912.

The commercial stocks (see Table 1A) comprise 150 varieties grown from seed sent out in 1911-12 by the leading growers and distributors. The plants in the National Trials (Table 1B) consisted for the most part of novelties and superior forms submitted by raisers to the Floral Committee of the National Sweet Pea Society (1912).

The pure-line (Mendelian) stocks (Table 1c) comprised 13 leading varieties in 12 distinct colours. Each pure line was grown from seed saved from a single plant pure (homozygous) for colour and Spencer form. The flowers of the seed-bearing parent plants were not covered, and the parent plants were isolated from one another only in so far that blue sap-flowered plants were grown 100 yards from the others; the whites and creams were planted together at one end of the group of red sap-coloured plants, and the yellow sap-coloured plants were grown at the other end.

TABLE I.

Type and Colour Rogues in Sweet Peas.

Forms of Rogues in Sweet Peas.

Two kinds of rogues occur in Sweet Peas—type rogues and colour rogues. The type rogue bears flowers which are not true to the Spencer form. The characters of the Spencer type are:—large flowers (except in some salmon and scarlet shades), standard and wings waved or frilled, and an open keel. The condition of the keel distinguishes the Spencer from the old grandiflora type. In the latter the keel is closed, and the stamens and pistil are clamped together at the apex of the keel; in the Spencer type the keel is loose and open at the apex, hence the pollen is shed within the keel and the pistil protrudes therefrom.

The type rogues enumerated in the above table are Sweet Peas with clamped as opposed to open keel. Among them occur plants which depart from normality in other directions, e.g., in possessing hooded or erect standards; but no matter what be their other characteristics all the type rogues agree in the possession of the clamped keel.

The colour rogue is, as the name implies, untrue to colour; for example (as illustrated in Table 2) among orange-scarlet stocks, e.g., Thomas Stevenson or Edna Unwin, there may occur plants with deep pink or dark mauve flowers.

TABLE II.

Analysis of the Rogues of Table 1 (c).

The 53 rogues of Table 1 (c) all occurred among orange-scarlet stocks of Sweet Pea, viz.:—

Variety.	Plants.	True.	Rogues.	Colours.
Thomas Stevenson—				
4 stocks of seed =	663	663	—	—
1 stock	97	96	2	1 deep pink, 1 orange pink
1 stock	55	54	1	deep pink
1 stock	120	118	2	deep pink
Edna Unwin—				
1 stock	148	148	—	—
1 stock	286	238	48	dark mauve
Totals { 9 stocks of 2 varieties =	1,369	1,816	53	—

The Significance of Type Rogues.

Inspection of Table 1 shows that whereas a considerable number of type rogues occurred in the trials of commercial stocks and also in the national stocks, none occurred in the plants grown from pure line seed. Now it has been shown by Major Hurst that clamped keel is a simple dominant to open or Spencerian keel. That is to say, a cross between two plants each pure for one of these characters gives rise to offspring, the F_1 generation, all characterised by clamped keel. In the next generation produced by self-fertilising F_1 plants, the plants with clamped-keeled and open-keeled flowers will occur in the proportion of three of the former to one of the latter, and, as is familiar to students of Mendelism, of the three clamped-keeled plants, one is pure to that character and two are impure. The impure or heterozygous plants yield on self-fertilisation three dominant clamp-keeled to one recessive open-keeled.

Hence it is at once apparent that the type rogues of Table 1 are due to the presence in the stud-stock of plants homozygous or heterozygous for this character. That this is the explanation is shown by the fact that the Mendelian lines (Table 1c) bred by Major Hurst contain no type rogues. The moral is clear. To eliminate all type rogues pure-line breeding is necessary. This is easy in the Sweet Pea because it is self-fertilised, and all that is necessary is that the seed of individual plants should be harvested separately, and that the seed which is to be used for stock purposes should be sown in separate groups, one group for the seed of each individual plant. Rogues must be eliminated as soon as they appear, and thus the several lines are purified. How far cross-fertilisation by the agency of insects may introduce anew the clamp character cannot be stated definitely; that the risk of such crossing occurs will be evident immediately, but that it is not considerable is indicated by the fact that no type rogues appeared in the pure line plants (Table 1c). Isolation will help to preserve the seed-producing stock from the danger of crossing with a clamp-keeled variety.

It is, of course, just possible that the real character may prove to depend on more than one factor, and, if this prove to be the case—though it is not likely—a reconstruction of clamp-keel by crossing two open-keel plants may occur. This contingency, however, may be disregarded for the present, and growers may obtain from the foregoing observations a fair assurance that it rests within their powers to eliminate type-rogues from their pedigree stocks.

The Significance of Colour Rogues.

In order to appreciate the significance of colour rogues, we must again make appeal to our knowledge of the Mendelian factors which determine coloration in Sweet Peas.

As the result of the researches of Bateson and Punnett and of Major Hurst, it is known that purple bicolors are dominant to all other colours in Sweet Peas, and that cream is recessive to white and also to coloured flowers. Of the series—purple bicolor maroon, crimson, pink-tinged white, white and cream—each colour is dominant to those which succeed it in the series.

Of other colours, orange and salmon shades are dominant to white or cream and recessive to pink or crimson; purple and blue shades are dominant to red shades; purple-maroon is dominant to maroon; maroon to mauve and lavender; and lavender to deep and pale blue. If, therefore, it be remembered that any cross between one colour form and another below it in this series results in the production in the first generation of flowers of the colour of the higher member of the series used in the cross, we can apply the Mendelian knowledge to an analysis of colour-rogues.

Viewed in the light of this knowledge, the colour-rogues show themselves as indicated in Tables 1 and 2 to be either dominant or recessive rogues. Thus, the colour-rogues described in Table 2 are all dominant, that is, the colour of the rogues—deep pink, orange-pink, dark mauve—stands higher in the series than does the typical orange-scarlet of Thomas Stevenson or Edna Unwin, in stocks of which these rogues appeared.

Of the colour-rogues, 219, which appeared among the commercial stocks, there were (Table 1A) 82 of the dominant and 137 recessive type, and a similar proportion, viz., 106 dominant to 208 recessive, was exhibited by the rogues which appeared in the National trials (Table 1B) of new and superior varieties.

Such dominant rogues may owe their origin to one of two causes. The less likely cause may be indicated first.

The colour of a purple (bicolour) Sweet Pea depends on the presence of three factors, which may be represented by the capital letters C, R, and B (small letters being used to indicate the absence

of these factors). If the B factor be absent the colour is of a red shade; if it be present with the C and R factors, the colour is purple. If either C or R be absent no colour is exhibited by the flower. Hence it is evident that a cream Sweet Pea may have one of several constitutions. For if C, R and B are all absent cream results, or if C be absent and only R and B are present (c R B) the flower is nevertheless cream: similarly if the constitution be C and B the flower is cream coloured.

Wherefore, if we imagine two cream-coloured Sweet Peas of the following constitutions:—C r b and c R B, then if they are crossed with one another they give rise to a plant with the constitution C c R r B b. Such a plant possesses, albeit in a heterozygous state, the three factors C R B. It therefore bears flowers of a purple colour. Such reversionary purples have, in point of fact, been produced by the mating together of whites or creams. Therefore a similar origin of dominant rogues in the experiments under review is not precluded.

Bearing in mind this possibility, and returning to an examination of the colour-rogues of Table I, it is discovered, if the 82 dominant rogues are classified, that 43 are in the salmon section, and, further, that 35 of the 43 are rosy-salmon rogues in Stirling Stent. Now all these 35 are also type rogues, possessed, that is to say, of the clamped keel. Their origin is therefore clear, and such dominant colour rogues appear to be due to the same cause as that which gives rise to type rogues.

These 43 rogues having been accounted for, there remain 39 dominant rogues (82 — 43) to be investigated.

They are to be attributed to cross fertilisation, and in this connection it is interesting to observe that they are most numerous in the cream section, that is, in that section in which not only would cross-fertilisation with a coloured form lead inevitably to the production of colour, but in which also crossing between two creams *might*, as indicated already, lead to colour in the F_1. Hence it is to be concluded that dominant colour rogues are of two kinds. One kind, which it is easy to eliminate, is due to the presence of mixed seed in the stock. The other, which it is difficult to eliminate, is due to cross-fertilisation through the agency of some insect, the leaf-cutter bee, or other. Since covering of the flowers is impracticable, the only precaution to be taken consists in growing a stock as far away as possible from any other type of Sweet Pea, and in spacing the plants as far away as possible from one another.

Recessive Colour Rogues.

Since the colours of Sweet Peas form a series, the members of which stand as dominants to those which succeed them, it follows that, just as some dominant rogues are due to mixed stock, so recessive rogues may be due to the same cause. Further, of the 137 recessive rogues in Table I, no fewer than 78 occur in the cream, pink, and deep pink sections. Many of this number are traceable to varieties such as Miriam Beaver, Syeira Lee, and Audrey Crier. Now these are known to be heterozygous varieties, hence no amount of rogueing or pure line breeding will fix them. If they are required they must be built up afresh each generation.

Practical Applications.

(1) Pure line breeding reduces the number of rogues. Thus, whereas the rogues in Table I, A and B, are about 100 per 1,000, those in Table C are about 5 per 1,000.

(2) Covering, though it would, together with pure line breeding, result in the elimination of all rogues, is not commercially practicable.

(3) Therefore pure line breeding and as much isolation as possible are to be recommended. These ends may be secured in the following way:

(a) Save all stock seed from single plants grown not less than 3 feet apart each way.

(b) For stock seed use only plants from a true breeding (homozygous) stock.

(3) When growing bulk seed, let the stock seed from each single plant be sown separately, but side by side. Then the stocks in which rogues appear may be dealt with separately.

(4) Grow each colour at least 100 yards from another.

(5) Eradicate all type rogues with clamped keels, and allow none to be on or near the seed grounds.

The Week's Work.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

EARLY-FLOWERING GLADIOLI.—Gladioli of the Colvillei section bloom in June and July, when cut flowers are greatly appreciated. The corms mature early in the season, and start into growth again in the autumn. If they are not planted already, the work should be done without delay, as the corms deteriorate if left for too long out of the ground. Choose a warm, well-drained border with soil of a fairly light or sandy nature. Wet, heavy ground should be made more porous by adding old potting soil, leaf mould, or manure from a spent Mushroom bed. If the situation is a damp one, the beds should be raised slightly above the ground level. The white Colvillei "The Bride" is grown in very large quantities; other beautiful varieties are Peach Blossom, Crimson Queen, Ackermann, Ne Plus Ultra, Rosy Queen, Pink Perfection, Fire King, and rosea maculata.

BORDER CARNATIONS.—Carnations in beds and borders should be examined at intervals during the winter, and, if they have become loosened in the soil through frost, made firm again; this work should be done when the soil is fairly dry. When this has been done, the soil on the surface should be stirred lightly with the hoe. By attending to the plants in these matters, they will make clean, healthy growth in the spring. Field mice are often destructive to Carnations; if these pests appear, set traps and take other precautions to destroy them. Light dustings of soot will tend to make the foliage distasteful to vermin of all kinds, as well as provide food for the roots. Plants growing in pots or boxes in cold frames should have an abundance of fresh air at all times. Plenty of ventilation is very necessary during dull, mild days of autumn, when the atmosphere is charged with moisture, for close, damp conditions favour the spread of "rust" and other diseases.

MONTSRETIA.—These plants are best lifted and stored for the winter if the soil is wet and heavy. The corms should be dug up and placed in boxes filled with moderately dry soil, or they may be stored in ashes in a frame. Annual lifting of the plants enables the grower to trench and manure the ground thoroughly before replanting.

HARDY CYCLAMEN.—Hardy Cyclamen are often planted on the rockery, but they also do well in shady corners, or on banks under trees. They grow best in sandy loam and leaf-mould mixed with crushed mortar. Established plants are benefited by a top-dressing of fine, light soil, but the ground should be left undisturbed as much as possible, in order to allow the seedlings to develop.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

OLD POTTING SOIL.—I have in former calendars emphasised the importance of storing a quantity of soil in a dry place for filling seed-boxes in the New Year, and for use in transplanting seedlings early in the season. At Aldenham we save the old soil from the potting sheds and store it in a heap in an open shed, where it is sifted during wet weather. This fine soil is excellent for use in transplanting Onions, Leeks, Cauliflowers, Parsley, and similar vegetables. It may also be used for filling seed pans, though I prefer new soil for that purpose. Manure from spent Mushroom beds is also valuable for many purposes, such as mixing with potting soil; the larger portions may be used as drainage material for the boxes, and will serve the double purpose of providing food to the roots.

LEAF-MOULD.—The value of leaf-mould for potting purposes cannot be over-estimated, and each year a heap should be got together in some out-of-the-way place. The leaves should be turned two or three times during the winter. At Aldenham we place portable frames on heaps of leaves for forcing early crops. We have just finished filling an enclosure made of stout planks with fallen leaves. Half of the old heap has been carted away for mixing with the garden soil. A good proportion of the other half will be placed in the Potato trenches. The material will be turned once or twice during the winter and mixed with lime.

LOAM FROM PASTURE.—If the turves are devoid of fibrous material or otherwise poor in quality, it is a good plan to place a layer of fresh manure between them when they are stacked. Wireworm is often present in pasture land, and should be destroyed by charring the turves. Where plenty of rough wood is available this may easily be done by making a ridge and placing the turves grass-downwards on either side, and allowing them to become thoroughly hot, afterwards mixing the charcoal and wood ashes with the loam. Loam from an old pasture land is excellent material for mixing with the ordinary soil of the garden, and especially in the case of light land.

TOOLS.—As work in the kitchen garden is not pressing at this season the various tools should be overhauled, and any deficiencies made good. The tools belonging to the several departments should be marked by a number as well as the initials of the owner. Each tool house or shed should be under the charge of a responsible member of the staff. A list should be hung up in the shed giving the number of each implement and its owner's name. The tool house should receive a thorough cleansing, lime-washing the walls if necessary.

ARTIFICIAL MANURES.—A special place should be set apart for storing fertilisers where they may be obtained easily and kept tidy. Bins are very useful for the purpose and also for storing soot. If the manures are intended to remain in the bags, the latter should be placed on a trellis or at least something to keep them off the ground, otherwise the sacks will soon become rotten. The mouths of the bags should be kept closed.

LIQUID MANURE.—Much valuable manure is often lost in the liquid that drains from farm buildings. This should be caught in a tank, which need not have a capacity of more than a few hundred gallons, and may be constructed cheaply. A pump fixed to the tank will be found a great advantage.

DRAINING WET LAND.—Land intended for use as a kitchen garden should not be waterlogged. Low-lying, retentive soils should be drained, and of the many methods nothing is better than drain pipes set in a suitable trench, and covered with coarse brickbats or similar materials.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

CHRYSANTHEMUMS.—The majority of plants of the large-flowering varieties have been cut down. The stools, if placed in a light, airy house as advised a week or two ago, will furnish suitable shoots for cuttings. For general purposes, the first and second weeks in December are the best period for rooting the cuttings. The propagation frame or case should be slightly warmed, and kept closed to prevent the cuttings from flagging, but it is advisable to admit a little air in the frames each evening to allow superfluous moisture to escape, closing the frames again in the morning. It must be remembered that the strongest cuttings do not always make the best plants, and small to medium-sized shoots of a fairly hard nature are much to be preferred. Such shoots as I have described root more freely than those of a gross nature, whilst cuttings that are coarse often make 5 or 6 inches of top growth before they commence to form roots. The rust disease is not so prevalent as a few years ago, but it is advisable, in view of the wet season, to dip the shoots in a solution of sulphide of potassium at a strength of ½ ounce to one gallon of water. Most of the large Japanese varieties should be propagated at this season, but good plants may be obtained from cuttings rooted as late as February, which is quite early enough for the majority of sorts that are grown as bush plants, including the single varieties. If it is intended to delay the propagation of these plants until February, it is advisable to remove all the shoots down to the ground level, as this will ensure a quantity of strong, healthy cuttings at the time they are required. The character of the season has a

marked influence upon certain varieties of Chrysanthemum, but some are little affected by cold and wet or hot and dry conditions. These latter varieties are the best for general cultivation, and such as the following :—Lady Talbot, Reginald Vallis, F. S. Vallis, Mrs. A. T. Miller, White Queen, Mrs. L. Thorn, Frances Jolliffe, Hon. Mrs. Lopes, Miss Annie Nicoll, Master James, Mrs. R. Luxford, Evangeline, Mrs. G. C. Kelly, Mrs. R. A. Witty, Colonel E. C. Converse, William Turner, Mrs. Gilbert Drabble, Fred Chandler, D. B. Crane, Kara Dow, Queenie Chandler, Eclipse, Bessie Godfrey, Francis Rowe, Miss A. E. Roope, Thomas Lunt, His Majesty, and Miss A. Finch. Amongst the finer of the newer varieties I may enumerate Miss E. Surry (pink), Mrs. G. Lloyd Wigg (yellow), Bob Pulling (yellow), Hon. Mr. John Ward (a primrose sport from White Queen), Master Rex (old gold or amber), Primrose Queen, Mrs. Thomas Stevenson (an improved D. B. Crane), Ivernia (rosy-bronze), Mrs. W. T. Smith (white), Queen Mary (white), Miss May Fox (white with a green centre), and Miss Joan Miller (pink). These varieties have been exhibited in excellent condition at the shows, and each gives promise of advance on existing varieties. Good late-blooming, medium-sized Japanese varieties are found in M. Paula Radaelli, Mme. G. Rivol, Mrs. W. Iggulden, Superb, Mme. R. Cadbury, Edith Jameson, Miss A. M. Falkner, Mrs. A. M. Falkner, E. G. Mocatta, William Turner, December Gold, Mrs. Gilbert Drabble, and Mrs. W. T. Smith. For a supply of cut blooms for decorative purposes those grown by the market nurserymen flower freely and possess the finest colours. Choice varieties of this type are Market Red, Mrs. W. Roots, Captain Julian, Mrs. McNeece, Soleil d'Octobre, H. W. Thorp, Freda Bedford, Thomas Page, Moneymaker, Source d'Or, Mrs. Greenfield, Mrs. A. T. Miller, White Queen, Emperor, Mrs. W. Buckbee, A. J. Balfour, Winter Cheer, December Gold, Mrs. D. Syme, Kathleen May, William Turner, Maud Jefferies, Foxhunter, True Gold, and Heston Bronze. Among the numerous single varieties the following are to be recommended: Robert Milner, Canary Bird, Mrs. Tresham Gilbey, Mary Richardson, Sylvia Slade, Hilda Lawrence, Charles Kingsley, Ceddie Mason, Bronze, White and Pink Pagram, Cinnamon, Marjorie Lloyd, Mrs. W. G. Garner, Miss May Thorne, Mrs. W. Higgs, Merstham Jewel, Hubert Williams, Mensa and Pictor, whilst a few of the best of the newer varieties are Ideality, Mrs. Loo Thompson, Sussex Yellow, Dazzler, Sydney Laurence, Portia, Royalty, Snow Queen, and Joey Saunders.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Manuring.—The weather during the past month has been very wet, and ground operations have been carried out with considerable difficulty, especially on heavy soils. It will be well to examine the fruit trees, to ascertain which are in need of manure, so that the dung may be wheeled to the stations directly frost occurs. Fruit trees that bear freely soon become exhausted unless they are well manured every year or two, but no hard and fast rule can be laid down as to the quantity to apply, for certain soils require much more manure than others. The experienced fruit-grower can easily tell when trees are growing in exhausted soil by the deterioration to be observed in the size and quality of the fruit, and also in the growth. Mulchings of farmyard manure will prove most useful, but wood ashes, lime, and chemical manures containing potash may also be employed. If this work is attended to each autumn it will not be a difficult matter to keep the trees in a healthy condition, for robust trees are not so liable to become infested with insect and fungous pests as those allowed to suffer neglect. Remove the soil to a depth of 4 or 6 inches before applying the manure and replace with rich, fine loam mixed with wood ashes and lime rubble. When the mulching of manure is applied place a layer of soil about 2 inches deep on the top to prevent birds from scratching it about. In cases of wet, heavy soils, it may be better to defer applying the mulch until the spring, and give a dressing of soot, lime, or kainit and superphosphate in equal parts at the rate of 2 to 4 lbs. to each tree, according to the size of the latter. Fork the surface soil of all fruit borders lightly after the pruning and training of the trees are completed, first gathering up the prunings and burning them. Bush fruits, including Raspberries, are greatly benefited by a good dressing of manure at this season. Old trees in orchards are also benefited by a liberal surface mulch; the winter rains will wash the manurial properties down to the roots. Proceed with the root-pruning and lifting of fruit trees as recommended in the Calendars for September 20 and 27, as the sooner this work is completed the better will be the result, and the soil is now in a suitable condition for the operations. Attend to the top-dressing and renovating of wall trees whilst the weather remains favourable.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Winter Cucumbers.—It is not an easy matter to maintain a supply of Cucumbers through the winter. One of the chief points to observe is cleanliness. Not only should the glass be kept quite clean, but also the walls and woodwork in the house. Should red spider appear on the plants, cut off the infested leaves and syringe the remainder of the foliage with a solution of soft soap and sulphur. Stop and tie the shoots regularly, and train them well apart over the trellis, so that the leaves are exposed to the light. The roots will not need watering more than once or twice a week, but keep the surface of the bed moist by syringing. Stimulants should be applied with moderation; a small quantity of concentrated fertiliser sprinkled over the surface of the bed occasionally will be all that is needed. Cover the roots with turfy loam and leaf-mould as often as they appear in quantity on the surface. Keep the atmosphere sweet by opening the top ventilators a little whenever the weather is favourable. A minimum temperature of 70° will be suitable, but during frosty weather the temperature may drop to 65°, and at such times the houses should be covered with mats or tiffany to obviate the use of excessive fire-heat. Syringe the plants only when the weather is bright. If "spot" disease appears on the leaves, discontinue syringing, but keep the atmosphere moist by damping the bare surfaces in the house.

Pineapples.—An effort should be made to have a few ripe Pines at Christmas, and, if necessary, the ripening of the fruits may be hastened by placing the plants at the warmer end of a stove. Only plants that are swelling their fruits need high temperatures during the winter: all other plants should enjoy a period of rest for the next two months. It will not be necessary to employ much fire-heat if the roofs of the houses are covered with some material during the night. Do not afford water to the roots unless moisture is absolutely necessary, for it is best to keep the plants which are resting on the dry side, those that are planted near to the hot-water pipes should be examined frequently. Do not use cold water, but first warm it to the same degree as the temperature of the house. Syringing will not be necessary often, but the walls and paths should be damped occasionally to promote atmospheric moisture. A little air may be admitted through the top ventilators before noon whenever the weather is favourable. A temperature varying between 60° and 65° will be warm enough for successional plants and suckers, but fruiting specimens should be grown in a moist atmosphere with a minimum temperature of 70°.

Queen Pines.—Plants intended for fruiting next summer should be placed in the forcing house about the middle of next month. In the meantime, the structure should be washed thoroughly and the walls lime-washed. A low, well-heated pit facing south is most suitable. The materials for the bothed should be prepared in readiness. Before plunging the plants in the hotbed, remove two or three of the lower leaves and topdress the roots with pieces of fibrous loam, crushed bones and artificial manure. Select plants with stout leaves, thick collars, and open centres as these are the most likely to produce fruit. When plunged, the tops of the plants should be quite near to the glass, which should be kept clean.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Cypripedium. — Plants of the flat-leaved section of Cypripedium, including C. Lowii, C. Rothschildianum, C. lævigatum, C. Parishii, and C. stonei, are rooting freely and may, if necessary, be repotted. Specimens requiring increased rooting space should be turned out of their receptacles and the old drainage materials removed from between the roots, disentangling the latter as much as possible but taking care not to break or damage them. Remove also some of the old compost from the surface. Select a pot large enough to accommodate the plant for two seasons, and place a few clean crocks over the bottom for drainage. Hold the plant in position in the centre of the pan, and work more crocks around and between the roots to half the depth of the pot, which should then be filled level to the rim with compost, consisting of equal parts Osmunda fibre, Sphagnum-moss, and fibrous loam from which all the small particles have been removed, mixed with a quantity of crushed crocks and silver sand. Plants of the Selenipedium section, such as C. calurum, C. cardinale, C. Sedenii, C. macrophyllum, and C. leucorrhodum, that need repotting may be dealt with in a similar manner, but in their case the crowns of the plants should be placed slightly below the rim of the pot in order to allow space for watering. After the repotting is completed water should be applied very sparingly for some time, but when the roots have established themselves in the new compost they should be kept moist at all times. In winter see that moisture does not settle in the centres of the young growths or in the axils of the leaves, as this may set up decay.

Pleone. — As plants of P. lagenaria, P. concolor, P. maculata, P. præcox, and P. Wallichiana pass out of flower they should be repotted, and this is best done when new roots are developing from the bases of the young shoots. Ordinary shallow Orchid pans without side holes are the most suitable receptacles for these plants. The old compost should be shaken from the roots, and all dead portions of the latter cut away. The plants may be made up in clumps of about one dozen pseudo-bulbs in a 6-inch pan, or they may be broken up and the finest bulbs selected and potted together. The smaller specimens that are not likely to bloom soon may be grown on for another season. The potting mixture may consist of equal parts fibrous loam and peat mixed with chopped Sphagnum-moss, some finely-crushed crocks and silver sand. The pans should be filled one-third their depth with clean crocks for drainage, covering these with a layer of Sphagnum-moss and some of the compost. Place the pseudo-bulbs evenly over the surface, leaving sufficient space between each plant to allow for the full season's growth. Work the soil around and amongst the roots, so that the pseudo-bulbs are fixed firmly in position. For a few weeks after potting the roots will require very little water, but when the shoots are growing vigorously the supply of moisture should be increased gradually until the roots and leaves are fully developed, when water may be applied copiously. During the winter months the plants should be placed on a shelf near to the roof-glass, or suspended in a light position in an intermediate house. In the spring and until the growths are fully developed they will do best in a house a few degrees warmer than the intermediate structure. The cooler-growing varieties, such as P. humilis, P. Hookeri, and P. yunnanensis, succeed best when suspended from the roof of the Odontoglossum house. These plants have completed their season's growth, and require only sufficient water to prevent the pseudo-bulbs from shrivelling. The repotting may be done after the flowering season is past.

Gardening Conference at Vienna. — A conference on horticulture and allied subjects is to be held at Vienna from December 9 to 14 inclusive, under the auspices of the Vienna Horticultural Society. The fee will be K.5 (about 4s.) for members and K.10 for non-members. The subjects for discussion include methods of culture, new plants, and Mendelism. There will also be visits to various gardens and social functions.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plant for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR DECEMBER.

MONDAY, DECEMBER 2—
Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, DECEMBER 3—
Royal Hort. Soc. Coms. meet and Perpetual-flowering Carnation Soc. Sh. (2 days). (Lecture prepared by Mme. Tzikos St. Leger on "The Vegetation of the Islands of Lake Maggiore.") Scottish Hort. Assoc. meet. Hort. Club Dinner and meet.

THURSDAY, DECEMBER 5—Linnean Soc. meet.

SATURDAY, DECEMBER 7—
Soc. Française d'Hort. de Londres meet.

MONDAY, DECEMBER 9—
United Hort. Benefit and Prov. Soc. Com. meet.

WEDNESDAY, DECEMBER 11—
North of England Hort. Soc. meet. at Leeds.

MONDAY, DECEMBER 16—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, DECEMBER 17—
Royal Hort. Soc. Coms. meet (no exhibition).

WEDNESDAY, DECEMBER 18—
Royal Meteorological Soc. meet.

THURSDAY, DECEMBER 19—Linnean Soc. meet.

AVERAGE CLEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41·5.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, November* 27 (6 P.M.) Max. 42°; Min. 37°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, November 28* (10 A.M.): Bar. 29·7°: Temp. 37°; *Weather*—Overcast.

PROVINCES.—*Wednesday, November* 27: Max. 43° Ireland, West Coast; Min. 34° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY—
Bulbs, at 12; Roses at 1.30; by Protheroe & Morris, at 67 & 68, Cheapside, E.C.

MONDAY AND WEDNESDAY—
Rose Trees, Shrubs, Liliums, Dutch Bulbs, &c., at Stevens's Auction Rooms, 38, King Street, Covent Garden, W.C., at 12.30.

TUESDAY—
Bulbs, at Protheroe & Morris' Rooms, at 12.

WEDNESDAY—
Bulbs, Herbaceous Plants, &c., at 12; Roses, at 1.30; Palms and Plants, at 6; at Protheroe & Morris' Rooms.
Sale, of the Stove and Greenhouse Plants, at Clare House, West Malling, Kent, by Protheroe & Morris, at 1.

FRIDAY—
Roses, at Protheroe & Morris' Rooms, at 12.30.
Orchids, at Protheroe & Morris' Rooms, at 12.45.
The Mushroom Spawn Manufactory Fruit Farm and Market Garden adjoining Twyford Abbey, Park Royal, W., at the Mart, London, E.C., by Protheroe & Morris, at 2.

"Rogues."

There are few subjects of more interest to the growers and raisers of plants than the origin of rogues; that is to say, of plants which show in habit, colour, or other character a departure from the type. Despite the care which is bestowed by seed-raisers on the purification of their strains, rogues are apt to appear and to cause annoyance to the gardener and concern and loss to the raiser of seed. No one who is aware of the enormous amount of care which is taken by commercial houses to secure pure stocks of seed will be inclined to attribute the occurrence of rogues to any act of carelessness on the part of the raisers, and although some people may be inclined to despair of discovering means of banishing rogues completely from our stocks of seed, such despair is not reasonable. Before we earn the right to pessimism on this subject, we must first exhaust every means of inquiry into the scientific status of rogues. Above all, it is important to discover whether their occurrence is inevitable or preventable, and, if the latter, what are the means whereby rogues may be excluded from seed stocks.

Such inquiries are now on foot, and the results obtained already show that in certain cases at all events the origin of rogues is not a mystery only to be deplored, but a natural consequence of imperfect methods of seed-raising. Wherein the present methods are imperfect may be seen from a study of the report which we publish of the results of Major Hurst's experiments with Sweet Peas.

A brief summary of Major Hurst's observations was published in these columns (October 26) in the report of the annual meeting of the Sweet Pea Society, and a full account of his paper which was read before the members of the Society will appear in the Sweet Pea Society's *Annual*. Nevertheless, the paper is of such moment, and has such important bearings on the occurrence of rogues in all kinds of cultivated plants, that we give, on another page, a full outline of Major Hurst's results, together with sufficient experimental detail to enable the reader to grasp the conclusions and to draw and apply the moral arrived at by him in his illuminating studies.

Methods of Forcing.

It is now a matter of common knowledge that certain plants may be forced to flower prematurely, either by exposing them to the vapour of ether or by immersion in warm water. In the case of either method—that of etherisation or of the warm bath—the plants which are to be forced must be in the resting state, and the treatment must be continued for a certain time. Recent experiments have shown that the warm bath method may be applied more widely than seemed possible when Molisch first introduced the process. Other experiments indicate that similar results may be obtained by yet another process, and we propose in the present article to give an account of the results of these two separate lines of experimentation.

From a contribution to Möeller's *Deutsche Gaerten-Zeitung*, it appears that the warm-bath treatment is successful, not only in the case of Lilac, but also with many other plants, such as Laburnum, Magnolia, the decorative Prunus and Pyrus species, such as Prunus triloba and Pyrus Malus Scheideckeri, Hawthorn and Viburnum Opulus.

Further, the warm bath produces its effect not only on those plants the flower-buds of which are borne on the old wood, which buds are therefore present at the time of immersion; but it is operative also in plants, such as Hydrangeas and Roses, which bear their flower-buds in the young wood—which buds are not differentiated at bath-time.

For the former class of plants the temperature of the bath should be from 30-35° C. (82-95° F.), and the subjects should be immersed for from 15-18 hours. For plants of the latter class, the temperature should be somewhat lower—about 25° C. (77° F.), and the plant should remain in the warm water for 18 or 20 hours.

The effect of the treatment on Roses of forcing varieties, for example, those of the Polyantha section and also such sorts as Ulrich Brunner and Schneekönigin, is that the subsequent time for flowering is reduced from 12 or 13 to 9 or 10 weeks. The Roses are brought, after the bath, into a house with a temperature of 50° F., which temperature is raised gradually, as development proceeds, to about 60° F. Hydrangeas also come into flower two weeks earlier as the result of the warm bath. Success with Azaleas and Rhododendrons has not yet been achieved, for the immersion, although it induces the swelling of the flower-buds, has the ill effect of causing the leaves to turn brown and to drop. It is possible that with these plants the method of injection may prove more successful. In this method a few drops of warm water are forced by means of a syringe into the stem at the base of the flowering-buds.

The roots of plants which are to be subjected to the warm bath must be healthy and fairly dry. The plants in pots or with a dry ball of earth are inverted in the tub, so that the water reaches only to the rim of the pot, and does not cover the roots. A wooden tub or tank serves for the bath, and the required temperature may be obtained and maintained by means of a heating coil submerged in the vessel. After the bath the plants may be placed at once in the forcing house. For subjects which are required to be brought more slowly to the flowering stage, a bath at lower temperature (59-64° F.) proves efficacious.

The latest method for preparing plants for forcing is the method of watering with a nutritive solution, which method is described by Mr. Lakon in the *Botanische Zeitung*. The nutritive solution employed is that known in botanical laboratories as Knop's solution, and consists of calcium nitrate (4 parts), magnesium sulphate (1 part), potassium nitrate (1 part), and potassium phosphate (1 part). The salts of potassium and magnesium are first dissolved in water, and the calcium salt is added. The solution should be very dilute, say, at the rate of 0.7 grams of the salts to 2,000 or 3,000 cubic centimetres of spring water or rain water.

The results which Mr. Lakon claims for the new method are striking. Lilac in October, immersed for 12-24 hours in this solution, produced swollen flower-buds within 13 days, and blossomed 17 days after the treatment. On the first day after the "nutritive bath" the leaves of the Lilac begin to expand. Yet more rapid

Fig. 178.—Sinomenium diversifolium ♂ (Cocculus variiformis).

A, a male flower, seen from above; B, the same, seen from below; C, a diagrammatic, longitudinal section of a male flower; D, a stamen enclosed by a folded petal; E, an anther; F, pollen.

(See text on p. 402.)

flowering is obtained by first drying the branches for three days in an oven at 26° C. (78.8° F.), and then plunging them in the "nutritive bath." Lilac subjected to this treatment developed all its leaves in the course of six days. The common Beech, treated on December 2, had its leaves well expanded 25 days afterwards, and, as pointed out by Mr. G. T. Grignan (*Revue Horticole*, 1912, p. 422), this fact is the more remarkable in that the Beech does not respond well to either etherisation or the ordinary warm-bath treatment.

The mere watering of pot plants with the nutritive solution suffices, according to Mr. Lakon, to hasten the production of flowers.

ROYAL HORTICULTURAL SOCIETY. — The next meeting of the Committees of this Society will take place on December 3, in the Vincent Square Hall. At 3 p.m. a lecture by Mme. DE TZIKOS ST. LEGER, on "The Vegetation of the Island of St. Leger in Lago Maggiore," will be read.

——— A series of drawings of Irises, made by Mr. F. H. ROUND for Mr. W. R. DYKES's new book on the Genus Iris, will be shown by the Cambridge University Press, together with copies of the volume.

HORTICULTURAL CLUB. — The next house dinner of the club will take place on Tuesday, December 3, at 6 p.m., at the Hotel Windsor, Victoria Street, Westminster, when Mr. ARTHUR SUTTON will give us a lecture entitled, "My Desert Camping Tour in Mount Sinai," illustrated by 100 limelight views from original photographs taken by the lecturer.

NATIONAL CHRYSANTHEMUM SOCIETY SHOWS, 1913. — The National Chrysanthemum Society will hold two exhibitions at the Crystal Palace in 1913, and the dates have been fixed for October 1 and 2 and November 5, 6 and 7 respectively. The secretary has given early intimation of the dates so that local Chrysanthemum shows may not clash with the National Society's fixtures.

NEW YORK FLOWER SHOW. — The International Flower Show (the third of its kind in New York) is to be held in that city next April, from the 5th to the 12th inclusive, under the auspices of the Society of American Florists and Ornamental Horticulturists. The show is to be held in the new Grand Central Palace, Lexington Avenue. The American Rose Society will make awards of certificates and medals. The London address of the committee is 75, Chancery Lane, W.C., where applications for further information should be addressed to the secretary, Mr. A. STAINES MANDERS.

"THE BOTANICAL MAGAZINE."—The issue for November contains illustrations and descriptions of the following plants:—

ERIOPSIS HELENAE, tab. 8462.—This species was first described by Dr. KRANZLIN in *Gardeners' Chronicle*, August 14, 1897, p. 98. Plants were originally introduced by Messrs. SANDER & SON from Peru, and one was presented by Messrs. SANDER to the Royal Gardens, Kew, which flowered in June, 1909, and furnished the materials for the *Botanical Magazine* plate. The large inflorescence consists of numerous yellow flowers with brown margins; the labellum is white with purple spots.

MESEMBRYANTHEMUM PEARSONII, tab. 8463.—This new species was collected by Professor PEARSON during the "Percy Sladen" expedition to the Orange River. The species is closely allied to M. testiculare, but the leaves are much larger and the calix is exserted to about the level of the leaf tips. The flowers are a dull yellow colour and more or less striped with purple; the outer petals are entirely mauve-purple. The flowers remain closed during the day, so that the species is not likely to become a popular garden plant.

CORNUS CONTROVERSA, tab. 8464.—This species was formerly included under C. brachypoda. The plant is quite hardy in this country and forms an elegant, small, deciduous tree. It grows best in a good loamy soil, and needs abundant moisture to develop its full beauty. Although it may be increased by cuttings or layers, seeds give the best results.

IRIS CAROLINIANA, tab. 8465.—This beautiful Iris is a native of North Carolina, and was cultivated first in the Harvard Botanic Garden. Although its affinities are near to I. versicolor, it is quite distinct from a horticultural standpoint. The plant flowers freely on the rock garden at Kew in swampy ground. The flowers are lavender-purple, with darker veining, marked white on the sides, and yellowish in the centre.

COROKIA VIRGATA, tab. 8466.—The specimen from which the *Botanical Magazine* illustration was prepared was raised from a cutting sent by us to Kew, a shoot having been forwarded by a correspondent for identification. The plant is probably the same as the one Mr. CHEESEMAN describes as forming a twiggy bush some 6 or 12 feet high in the North Cape district. The leaves have a white tomentum beneath, but are green above. The inflorescences are terminal and axillary, and the flowers are produced on three-flowered racemes; the petals are yellow. It is probable that the plant will prove hardy in favoured districts in this country.

FLOWER COLOUR CHANGES IN FLAX.—In the course of a paper on the glucosides and enzymes of Flax, which was read by Dr. J. V. EYRE at the Dundee meeting of the British Association, the author stated that seed taken from a blue-flowered crop is said commonly to give rise, when grown in a different climate, to a crop of white-flowered plants. It is probable, however, as was pointed out by Professor BATESON in the discussion which followed Dr. EYRE's paper, that this change of colour is not to be attributed to variation, but rather to the fact that the seed of commercial Flax is not pure for colour character.

NEW HYBRIDS OF ANTHURIUM ANDREANUM.—The striking hybrids of Anthurium Andreanum and A. Scherzerianum raised by Herr BEYRODT form the subject of an article and coloured plate in *Die Gartenwelt* (November 16, 1912). The new hybrids are characterised by their massive single spadix, the white or rose-coloured spathe of which is about 7 inches wide by 10 inches long. As the plate indicates, these Beyrodtianum hybrids are remarkable productions, and though they differ from A. Scherzerianum in producing not 10 or more spadices, but one only, the magnitude of the single spadix more than compensates for its limited floration.

SULPHUR FOR CHRYSANTHEMUMS. — Growers of Chrysanthemums whose plants are apt to suffer from mildew or rust will read with interest the statement made by Mr. MÉKER in *La Revue des Chrysanthémistes* that the incorporation of flowers of sulphur with the compost in which the plants are grown is a sure preventive of disease. Mr. MÉKER recommends the use of sulphur in the proportion of 0.75 per cent., that is, three-quarters of a pound of sulphur to 100 lbs. of compost, and advises the use of sulphur not only in the flowering pots but also in the soil in which cuttings are struck.

BORDEAUX SPRAYING FOR PEACH CURL.—Peach leaf curl is one of the most ubiquitous diseases in this country, and there are few, if any, trees grown in the open that are free from the pest. Some gardeners, indeed, are so accustomed to the complete failure of the crop on trees growing in the garden that they accept the failure as a matter of course, and attribute it to the weather. There is no doubt that a certain amount of failure of Peach trees is due to the attack of the fungus Exoascus deformans, which gives rise to the malformation and discoloration of the leaves, the most obvious signs of infection. Nor is there any doubt that the disease may be kept within bounds, nor that the loss of fertility from this cause may be prevented. Diverse experiments have demonstrated that Bordeaux mixture is an effective agent in the prevention of the disease, or rather, in obviating its worst effects. The most recent trials of this fungicide are those carried out by Mr. C. B. WEEKS, Horticultural Commissioner of Tehema County, California, and published in the *Monthly Bulletin* of the State Commission of Horticulture, California. As the result of his experiments, Mr. WEEKS recommends two sprayings, one in the spring before the green of the leaf appears, and one in the autumn. In the autumn spraying, which may be done between the middle of November and the middle of December, the strength of the Bordeaux mixture may be 7—7—50, that is, 7 lbs. of copper sulphate and 7 lbs. of lime to 50 gallons of water. For the spring spraying, the mixture must be much weaker, as the bursting leaf is very readily injured. The strength at this period should be 2—2—50.

"THE TOWN BEAUTIFUL." — This was the title of a lecture delivered to the Gorgie Flower Society by Mr. J. N. MCHATTIE, the superintendent of the parks and gardens of the city of Edinburgh, on the 20th inst. The society was organised last spring to encourage gardening in the Gorgie district of Edinburgh, which is a very congested one, and it has met with gratifying success. Before exhibiting a series of lantern slides, Mr. MCHATTIE spoke upon the work being done in Edinburgh and other large cities. He thought that mistaken ideas in town-building had continued sufficiently long to have a marked effect upon the physique of the town dweller, and that the cure will be found in exposing our homes, factories, and workshops more perfectly to the influence of pure air. Modern civilisation demanded an assurance that the development of a city should be carried out on enlightened lines, and the public looked to the authorities to increase the beauty of the towns under their control. Those who will not apply new remedies, said Mr. MCHATTIE, must expect to suffer from new evils. If cities are to be beautiful they must be healthy. Health is bound up with individual happiness. In cities like London, Birmingham, Manchester, Edinburgh, and Glasgow, great improvements had taken place in recent years—all making for the improvement of the town and home. The better the people are educated the more beautiful will be the city they wish to live in. The first step the citizen has to take is to improve the aspect of his surroundings. In the series of lantern views, specially prepared for the lecture, Mr. MCHATTIE showed illustrations of many different kinds of window gardening and front-plot gardening as practised in the Gorgie district, the pictures of the prize plots evoking great applause from the audience, who immediately recognised them. In contrast with these, Mr. MCHATTIE showed snapshot pictures of a number of neglected front gardens. A series of very fine slides in colour of the Saughton Park and Princes Street gardens was also shown.

PERPETUAL-FLOWERING CARNATION SOCIETY.—The winter exhibition of this Society will be held in the Royal Horticultural Hall on Tuesday and Wednesday, December 3 and 4. The non-competitive exhibits will be staged on the Tuesday in conjunction with the R.H.S. exhibition. The annual dinner of the Society will be held at the Holborn Restaurant on the evening of the first day, and will be followed by the annual meeting. On the second day a conference will be held in the Lecture Room of the Royal Horticultural Hall at 3.30 p.m. Mr. J. S. BRUNTON will preside, and Mr. J. GARDNER, of Bateford Park Gardens, Gloucester, will read a paper on "The Culture of Perpetual-flowering Carnations." Mr. W. E. WALLACE will open a discussion on the subject.

A FRUIT RESEARCH PLANTATION.—The Governors of the South-Eastern Agricultural College, Wye, decided at a meeting held on November 11 to establish a fruit research plantation in the south-eastern district of England, and to administer the plantation with the aid of the grant of £500 which the Board of Agriculture has granted for the purpose.

AGRICULTURAL YEAR-BOOK.—The International Institute of Agriculture at Rome has just published in French its first International Year-Book of Agricultural Legislation (*Annuaire Internationale de Legislation Agricole*, 1911), which supplies particulars of the principal laws and regulations relating to agriculture throughout the world. The information is classified under the following subjects: (1) agricultural and trade statistics; (2) trade in agricultural products, fertilisers and live stock; (3) finance and Customs duties affecting agriculture; (4) plant production and trade; (5) animal production and trade; (6) agricultural education and institutions; (7) plant diseases, plants and animals injurious to agriculture; (8) agricultural co-operation, insurance and credit; (9) rural property, land colonisation at home; (10) capital and labour in relation to agriculture; (11) rural sanitation and rural administrative control. The full text is given of all fundamental laws, and of others when a summary is not considered sufficient. The volume may be obtained from the Board of Agriculture and Fisheries, 8, Whitehall Place, London, S.W. Price 8s. 4d., post free.

VIBURNUM CORIACEUM (see fig. 165, p. 371, November 16).—Respecting this little-known species, Mr. P. D. WILLIAMS, Lanarth, Cornwall, informs us that the leaves change from their characteristic grey-white colour whenever touched or slightly bruised. If the bruise is not severe the leaf regains its normal colour the following day.

PUBLICATIONS RECEIVED.—***Fruit Growing for Beginners,*** by F. W. Harvey. (London: Country Life, Ltd.) Price 1s.—***The Sweet Pea Notebook,*** by Walter P. Wright. (Walter P. Wright: The Grey House, Lyminge, Folkestone.)—***The Journal of the Royal Horticultural Society.*** (London: Royal Horticultural Society.) Price to non-Fellows, 5s.

APPLE PADNALL SEEDLING.

THIS new culinary Apple (see fig. 179) was submitted by Mr. R. Roberts, Padnall Hall Gardens, Chadwell Heath, before the Fruit and Vegetable Committee of the Royal Horticultural Society on July 3 last, and a deputation was appointed to inspect the tree at Padnall Hall. The report was favourable, and an Award of Merit was granted at the meeting on August 27. The tree is a vigorous grower and it fruits abundantly. Shoots with clusters of large fruits were exhibited at the R.H.S. meeting. It is a greenish-yellow variety, with solid flesh, and of a useful size for culinary purposes.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

HYBRID NOMENCLATURE (see pp. 362 and 391).—Mr. R. A. Rolfe cites rules laid down by the earliest sub-committee on Orchid nomenclature of the Royal Horticultural Society, and, although in the main the recommendations have been acted upon at subsequent meetings, some changes have taken place. In the matter of using Latinised names for primary hybrids, the accepted rule is thus set forth in the rules of horticultural nomenclature passed by the International Congress at Brussels, 1910: "The specific name of a hybrid (hybrids between species) *may* be expressed in Latin or in any language that is written in Roman characters. Thus both forms—× Cypripedium nitens and × C. Minotaur—are correct." It will be seen that the choice of a name is optional, and the object of my article was to indicate that the fancy name was the only one which would not give trouble. In support of my remarks on p. 362, November 16, relative to what I consider the unwarranted change of well-established names for Latinised appellations in the *Orchid Stud Book*, I would like to point out that there is a fixed rule against such procedure, which has always existed, and which is set forth in the Brussels Conference rules as follows:—"No one has a right to alter a name or combination of names without weighty reasons founded upon a very thorough knowledge of the facts or upon the necessity of abandoning a nomenclature contrary to the rules." Again, at the end of the rules, Article xvi: "In any case where the rules of horticultural nomenclature would be actually contrary to practice permitted or tolerated at present, they would not have a retrospective action." So far as the first-named paragraph goes, there can be no question about the regularity of the names superseded in the *Orchid Stud Book*. Most of them were adopted by the Orchid Committee of the Royal Horticultural Society, many were awarded Certificates, described and figured in the various periodicals, recorded in the Society's *Journal*, and appear among the nearly 2,000 pictures of certificated Orchids, with the records duly filled in and signed by me as recorder. These names were in accordance with the rules, and had the authority of the Paris Nomenclature Conference. If it were competent for the authors of the *Orchid Stud Book* to proceed in the manner they have done, it would be equally excusable for any set of self-constituted authorities who cared to say that they objected to the old names and also to the names given in the *Orchid Stud Book*, to proceed with a fresh scheme and publish it, and so produce confusion indefinitely. But there is another phase of the question which should deter those who have a desire to give new names, and that is that, to many, the use of such names for sale purposes makes an old plant into a novelty. In that way purchasers at auctions, who do not know that the plants offered under new names (although not with the intention to deceive) are the same as those they have under their original names, may purchase what they do not want. It has been done frequently. The Royal Horticultural Society, in their classification of these horticultural products, must be taken as the highest authority in the world on the subject. The amount of time and care spent on the records of the Awards, the recording in the *Journal* of the Society, and by means of the records of the paintings, is known only to those who take part in the work. In that direction, Mr. J. Gurney Fowler, during the many years which he has been chairman of the Orchid Committee, has given a great amount of time and the closest attention to the minutest details. The work of recording by him is done from my report of the Awards after every meeting, and if there is a letter wrong it has to be put right, ready for the annual enumeration of the certificated plants of the year. Other points are frequently considered, but no change has been made in the names under which the plants were certificated and recorded. And now as to my objection to Latinised names. Such names are almost exclusively personal names, and the well-known rule is that, even for species, a Latinised personal name should not be given unless it be the

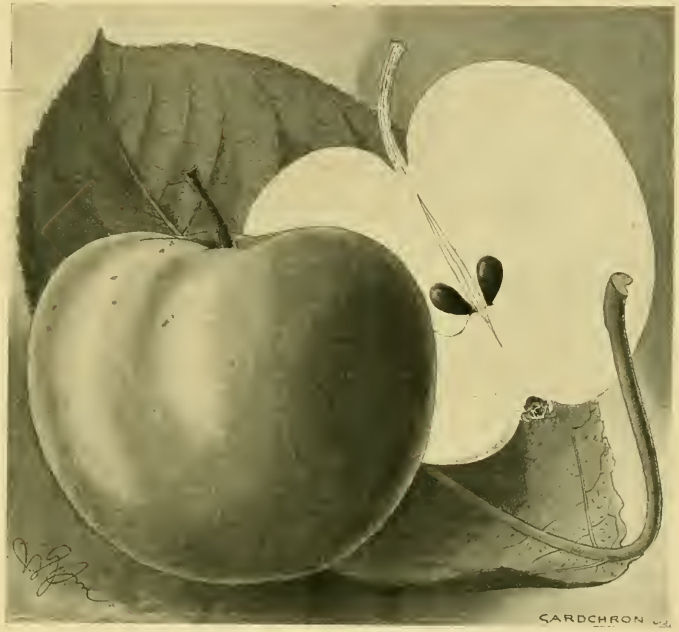

FIG. 179.—APPLE PADNALL SEEDLING (REDUCED).
(R.H.S. Award of Merit on August 27.)

name of the discoverer, introducer, or other person closely connected with its introduction or history. With hybrids we can substitute raiser, &c., and the rules justify the use of Latinised personal names of that kind. But the greater part of such names are complimentary, the persons indicated never having seen the plant. In such cases the better way would be to give the persons name in full—Cattleya John Jones, not Cattleya Jonesii. One reason why fancy names are almost positively necessary is that the indications of hybridity, always prescribed in rules where Latinised names are allowed for primary hybrids, are not generally used, and only experts, even when reading current literature, know which are hybrids and which species; whereas, if the hybrids were named "Neptune," "Minerva," or similar names, they tell their own history. Orchid hybridisation is yet in its infancy. It has a great future in which it can help both science and horticulture, as well as give great pleasure to its devotees. But the thorn in the Rose will always be in evidence unless a simple plan of naming is adopted over which there can be no dispute. *James O'Brien.*

CAMPANULA × PROFUSION.—We are greatly indebted to Mr. Jenkins for his information regarding the parentage of Campanula × Profusion. This is a decidedly attractive Campanula, but I was unaware that Mr. Jenkins recognises that there are two varieties of C. Profusion in cultivation until I read his note. The variety I am best acquainted with is the self-coloured one. There is a remarkable resemblance—one may say similarity—between this and the hybrid Campanula we have known for years as C. haylodgeneis, raised, I believe, by the late Mr. Anderson Henry, but which is becoming very scarce. It has the yellowish foliage and the flowers and habit of Profusion, which it resembles so much that most cultivators consider them "too much alike." Mr. Anderson Henry did not seem to be very careful in his parentage records, and it was usually considered that his hybrid was raised from C. pusilla and C. carpathica, or C. garganica and C. carpathica. Now that we have Mr. Jenkins's statement, it seems probable that C. isophylla and C. pyramidalis may have been the parents of Mr. Anderson Henry's hybrid also. C. haylodgensis does not appear to live long in many northern gardens, and this would bear out the suggestion that C. isophylla may have been one of the parents. *S. Arnott.*

AGAVE LEOPOLDII; A PROTEST!—About 30 years ago the late Dr. Killock, who grew a collection of succulent plants in his garden at Stamford Hill, N., raised a hybrid between Agave filifera and a form of A. schidigera which he called princeps. As the seedlings thus obtained differed somewhat from each other, he divided them into two groups, naming them Leopold and Leopold II. I saw the plants in Dr. Killock's garden, and they varied in length and width of leaf and in the length and curliness of the white marginal filaments. They were in time distributed, Kew getting a share, and when Dr. Killock died in 1903, his son presented to Kew a number of fine specimen succulents, among them being several of the hybrid Agave. There does not appear to be any reason for doubting the record of the origin of these plants. In August, 1893, a First-class Certificate was awarded to A. Leopold II by the Royal Horticultural Society, in whose *Journal* it is described as "a cross between A. schidigera princeps and A. filifera. It has long, narrow, sharply-pointed, dull-green leaves, from the edges of which come white, curly, hair-like filaments. The growth of the plant is compact and handsome." If A. filifera and A. schidigera are distinct species, then A. Leopoldii is a true hybrid; if they are nothing more than forms of one species, it is what is termed a cross. Baker, in his *Handbook of Amaryllideæ*, does not describe A. schidigera, merely stating that it has the "habit of A. filifera, from which it differs by the white, marginal filæ being flattened, not subulate." A. filifera is known to be variable, and it might even include A. schidigera. I find the name of A. Leopoldii in a printed list of succulent plants grown by J. T. Peacock, dated 1878, and, of course, the name is now well established in gardens. In October last year a plant of A. Leopoldii flowered in the Kew collection, and a drawing of it was made which has lately been published in the *Botanical Magazine* (t. 8,451), not, however, as A. Leopoldii, but as A. disceptata. The change of name is there excused on the ground that the characters of the plant "negative the suggestion that it is a hybrid between any two of the Littæas (section of Agave) known to have been in cultivation in any part of Europe. On the contrary, these characters clearly point to its being a perfectly valid species, and, although as to this there is not the same certainty, its characters suggest that it is probably a native of Central America." I am forced to disagree with this statement. There are evidences that A. Leopoldii is very closely related to both A. filifera and A. schidigera; indeed, it might well pass for a seedling form of either, and as the Littæa section of Agave is either Mexican or Arizonian, there does not appear to be any support for the suggestion that A. Leopoldii is a true species probably from Central America. Be that as it may, even if one admits that Dr. Killock was mistaken as to the origin of the plants he named A. Leopold and A. Leopold II (afterwards altered to A. Leopoldii) it does not justify the substitution of an entirely different name. The name he gave should be allowed to stand. It is bad enough when we are forced by recognised botanical custom to alter the names of garden plants, but in this case there is no need. *W. W.*

ADULTERATED GRAPES. — The practice of spraying or spreading powder on Grapes to imitate bloom, referred to on p. 373, is by no means new, and was formerly practised by exhibitors. London's *Gardener's Magazine*, vol. iii, contains an article by Mr. Robert Gauen, gardener at Millbrook, near Southampton, on "The Art of Ornamenting, Showing, Preserving, and Packing Cucumbers, Grapes, Plums, and other Fruits, whose Principal Beauty consists in their Delicate Bloom." This is an abridgement of a manuscript by Mr. Gauen, and it describes the process of supplying the bloom by means of fine magnesia powder. There is an illustration of the box used for the application of the powder. In another volume a different method of applying a powder for improving the bloom of Grapes for exhibition is also given, together with a contrivance for applying the same. Gauen's article was written in July, 1827. In an editorial note it is stated that "we are glad of the above communication because it supplies what we have long been desirous of laying before our readers. All the information that we were able to gain among the London fruit shops was that yellow Grapes sometimes had their bloom restored by being fumigated with sulphur; and that some fruiterers of little repute were in the habit of dusting them with the powder of the common blue used by laundresses." Gauen's article is interesting, and not the least so is the part relating to the addition of prickles to Cucumbers. *A.*

LATE PEAS.—I am sending you a few pods of Peas from a peck or more gathered to-day. The variety is Gladstone. Our gardens face south-west. *W. H. Masters, Brynderwin Gardens, Hindhead, Surrey, November 23.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

NOVEMBER 19.—*Present:* Mr. E. A. Bowles, M.A. (in the Chair); Dr. A. B. Rendle, Prof. W. Bateson, Messrs. E. M. Holmes, A. Worsley, G. Wilson, R. H. Curtis, A. W. Sutton, W. E. Ledger, W. Hales, W. Fawcett, and F. J. Chittenden (hon. sec.).

Variation in Nephrolepis.—Mr. W. MARSHALL, V.M.H., sent a plant of Nephrolepis exaltata var. todeaoides which, after once repotting, had been allowed to grow as it liked. It had given rise to fronds exactly similar to those of the type of N. exaltata and also to numerous other forms, including todeaoides, some with more, some with less, frequently divided pinnules than that plant. The case of this Fern is a very curious one, paralleled, however, by certain other garden plants. The type was introduced from the tropics about 1793, and gained the reputation of being the most useful of its genus. A few varieties were recognised during the nineteenth century, but it was not until after the beginning of the twentieth century that many made their appearance, and since then they have come thick and fast. The first of them apparently came from America, but others have appeared in England since. The striking exhibit of Messrs. MAY & SON in the Science and Education Section at the Royal International Exhibition showed the origin and course of variation in the plants of this genus in a remarkable manner.

The Glastonbury Thorn.—Mr. W. E. LEDGER showed flowers of the well-known Glastonbury Thorn from his garden at Wimbledon. This variety (Cratægus Oxyacantha var. præcox) apparently flowers on short shoots, which have no definite resting period as in the normal form of the species, where spurs producing flowers in alternate years are the rule, with a definite winter rest. The Committee could call to mind no analogous cases among Apples or Pears, and would be glad to learn of any that may be known.

Drosophyllum lusitanicum.—Mrs. BERGHEIM, of Belsize Park, sent plants of this interesting carnivorous plant. The genus is allied to Drosera, but the foliage is erect in habit, and the glandular tentacles are on the lower (exposed) surface of the leaves instead of the upper, as in Drosera.

Mistleto on Pear.—Sir HARRY VEITCH, V.M.H., sent two branches of Pear in which Mistleto had been sown, to illustrate the difficulty experienced in getting the parasite to establish itself on that tree. In both cases the seed had germinated, but the branches had died, and they were typical of all the infections tried.

Oncidioda × "Marjorie."—Messrs. CHARLESWORTH & Co. sent a plant resulting from a cross between Cochlioda Noezliana and Oncidium Forbesii. Several crosses between members of these genera have now flowered, and Messrs. CHARLESWORTH were awarded a Certificate of Appreciation in 1910 in recognition of their work in demonstrating the possibility of uniting these genera, which, although sufficiently distinct morphologically, are evidently closely allied physiologically.

Ivy leaves diseased.—Mr. E. A. BOWLES showed foliage of Ivy from Waltham Cross having numerous pale brown spots with a purplish margin.

LINNEAN.

NOVEMBER 7.—Professor E. B. Poulton, F.R.S., President, in the Chair.

The first paper was by Dr. R. R. Gates, "On Mutating Œnotheras," which was communicated by Professor J. B. Farmer, F.R.S. The following facts and views regarding mutation as an evolutionary factor were referred to:—

1. Œnothera Lamarckiana has probably undergone crossing in the wild state to the same extent that other open pollinated species intercross.

2. The mutation phenomena are an evidence of germinal instability resulting from crossing, change of climate, or cultivation.

3. Hybrid splitting is inadequate to account for the forms which suddenly appear.

4. Some of the mutants differ from the parent in their physiological adjustments, and this may account for cases of "climatic adaptation," but mutations will not suffice to explain the more complex adaptations which involve inter-relationships between several organisms.

5. Œ. rubricalyx has originated as a heterozygous mutant, but there are obvious difficulties in applying the same explanation to the other mutants of Œnothera.

6. The origin of certain of the mutations, at least (e.g., Œ. lata and Œ. gigas), is intimately concerned with chromosome mechanisms; that of certain others may be concerned with the action of releasing stimuli.

7. Darwinian natural selection always assumed an original environmental change for the organism, either (*a*) a change of climate in a given area, or (*b*) the introduction of new organisms, leading to the gradual modification of the species.

8. But neither chance-wise mutations in all directions, nor the vicissitudes of changing climates and distributions can account for the orderly phylogenies which larger groups of organisms frequently show.

9. There is no single evolutionary factor, but the process is a multifarious one.

The last paper was by Mr. Henry N. Ridley, F.R.S., on a collection of plants from Mount Menuang Gasing, Selangor.

In February, 1912, Mr. C. B. Kloss made an expedition to Mount Menuang Gasing, in Selangor, to collect the fauna and flora of this mountain. In this paper is an account of the expedition and of the plants collected by him in four or five days spent at an altitude of 4,900 feet there.

Menuang Gasing is the most southern high point of the great chain of the granite mountains which form the backbone of the peninsula, and the object of the expedition was to discover whether the high mountain fauna and flora descended as far south as this point. The mountain is 4,900 feet high, and though there are other hills a little to the south of this, it is the highest and most likely to bear the high hill flora. The fauna was found to belong to that of high northern ranges, and the flora shows clearly that it corresponds. Among the characteristic plants found were the Golden Balsam (Impatiens oncidioides, Ridl., Bucklandia populnea, R. Br.), the rare Polyosma parviflora, King, Pratia begonifolia, Lindl., Dilochia Cantleyi, Ridl., and Goodyera gracilis, Hook. fil.

The only mountain south of this one of approximate altitude is Mount Ophir in Malacca; the flora of this is well known, and is very different from that of the main range. Indeed, there is every evidence that Mount Ophir was never connected with the main chain, at least during the period of the evolution of the flora.

One hundred and forty-three species were collected by Mr. Kloss, of which 14 were undescribed; of these the most noteworthy were what is probably the biggest species of the large genus Oberonia, a remarkable species of Blastus, and a new species of Balanophora.

ULSTER HORTICULTURAL.

November 12, 13.—This society's autumn exhibition was held in St. George's Market, Belfast, on these dates. The displays of stove and greenhouse plants were not quite up to the average. Amateurs showed well, especially Mr. Frank Workman and Mr. Charles Duffin.

In the class for a group of Chrysanthemums and foliage plants, 16 feet by 10 feet, Charles Duffin, Esq., Danesfort (gr. Mr. James M'Cormick), was awarded the 1st prize; this exhibitor was also successful for four Crotons, dissimilar.

J. Bradley, Esq., Knock (gr. Mr. Wm. Vance), excelled for a group of single Chrysanthemums and foliage plants, the 2nd prize being awarded to Mrs. Forster Green, Derryvolgie (gr. Mr. A. Smiley).

For a group of stove and greenhouse or forced plants, arranged for effect, Frank Workman, Esq., The Moat (gr. Mr. T. Culbert), secured the premier award. Mr. Workman also excelled in the classes for (1) two Palms or Cycads, and (2) six Crotons, dissimilar.

For six plants, dissimilar, suitable for table decoration, in pots not exceeding 6 inches in diameter, C. W. Dunbar-Buller, Esq., Dunaghadee (gr. Mr. E. Rutherford), was placed 1st.

In the classes for Begonias of the Gloire de Lorraine type, G. Preston, Esq., Antrim Road (gr. Mr. James M'Bride), was successful.

Cut Flowers.

John Jameson, Esq., St. Marnock's (gr. Mr. J. M'Kellar), won many 1st prizes in this section, being successful for (1) 15 vases of Japanese blooms, (2) one vase of Chrysanthemums, (3) 48 Japanese blooms, and in the special colour classes for five blooms each.

For 10 vases of Japanese blooms the 1st prize was awarded to the Countess of Caledon; 2nd, C. Duffin, Esq., who secured the 1st award for one vase of single blooms arranged for effect.

Colonel R. H. Sharman-Crawford, Crawfordsburn (gr. Mr. J. Whytock), proved a successful competitor, winning in the classes for (1) 20 vases of single blooms, (2) one vase of single blooms (any white variety), (3) a similar class for a pink variety; and H. Brown, Esq., won the 1st prize for 10 vases of single varieties.

Fruit and Vegetables.

The exhibits in this section were very good, and the tables of dessert fruit of much interest. Vegetables were well displayed, excellent roots being staged in the farmers' classes, in which W. H. M'Laughlin, Esq., Macedon (gr. Mr. I. Smith), was placed 1st. This exhibitor was also successful for six bunches of Grapes.

For a table of 24 dishes of Apples Mrs. Wm. Coffey excelled.

The 1st prize for 12 dishes of Apples was awarded to the Rt. Hon. Earl of Bessborough, Kilkenny (gr. Mr. T. E. Tomlin).

The Duke of Portland, Welbeck Abbey (gr. Mr. W. Gibson), secured the 1st prize in the class for a collection of 12 kinds of vegetables, and was successful also in the classes for six Onions, six Parsnips, and six Beet.

H. Brown, Esq., Rathmoyle (gr. Mr. J. Taylor), showed the best collection of vegetables of six kinds.

FINCHLEY CHRYSANTHEMUM.

November 13.—The 27th annual exhibition was held on this date in the King Edward Hall.

The principal prize, a Silver Challenge Bowl, presented by the society, and the sum of £2, given by the President (J. J. Ward, Esq.), was won by Miss Wyburn, Hadley Manor (gr. Mr. A. Jones). Competitors were called upon to display four vases of specimen Japanese blooms, distinct, each vase containing five blooms of one variety. Mr. Jones showed F. S. Vallis, F. Chandler, Lady Ryder, and Master Jones, and obtained 17 points. Full points were awarded for F. S. Vallis. Mr. C. H. Gosling was placed 2nd with 15½ points. His vase of A. T. Miller was particularly fine.

Special interest was taken in a new class, in which the President offered a silver rose bowl for the most prettily-arranged floral table decoration of Chrysanthemums with Fern foliage, or any variety of Asparagus. The 1st prize was won by Mrs. R. Grace, jun., whose arrangement was exceedingly artistic.

A striking array of single Chrysanthemums was displayed by W. H. West, who won the five-guinea challenge shield presented by Mr. T. A. Williams.

The show of fruit and vegetables was quite up to the high standard of recent years, Mr. J. Turk won the 1st prize for a collection of vegetables of six distinct kinds.

MANCHESTER CHRYSANTHEMUM.

November 12, 13, 14.—The Royal Horticultural and Botanical Society of Manchester held an autumn exhibition on these dates, and the result was very gratifying.

In the class for nine large-flowering Chrysanthemums L. Breaslauer, Esq. (gr. Mr. J. Sidall), was awarded the 1st prize with medium-sized, well-flowered plants. The same exhibitor was successful for six Japanese blooms.

For six pots of Roman Hyacinths Mr. S. D. Petrocochino was placed 1st; 2nd, Mr. A. R. Jones.

His Honour Judge Bradbury (gr. Mr. W. Bramwell) excelled in the class for eight Chinese Primulas.

The best collection of Orchids shown by an amateur was the exhibit of W. R. Lea, Esq. 2nd, Col. Rutherford.

The chief class for Chrysanthemum blooms was that for 48 specimens, 24 Japanese and 24 Incurved varieties, distinct. There were only two competitors. Pantia Ralli, Esq. (gr. Mr. G. Hunt), staged the winning exhibit, his varieties including:—*(Japanese)* His Majesty, W. Mease, Marie Looms, William Turner, Willie Rawlings, President Viger, Glaucus, and Superb. *(Incurved)* H. Hearn, Amber Beauty, Mrs. R. Judson, and Boccace. 2nd, Sir Gilbert Greenall, Warrington (gr. Mr. C. Goves).

The 1st prize for 24 Incurved blooms in not fewer than 12 varieties was won by Mr. G. Hunt, and he was successful in the class for 12 blooms.

For 36 Japanese blooms in not fewer than 18 varieties Mr. C. Jones, Abergele, secured the premier award, and Lord Sheffield (gr. Mr. W. E. Wright) was the winner for 18 blooms.

In the class for 12 blooms Mr. Wright was also successful.

For 36 miscellaneous blooms Mr. J. Stoney was placed 1st with an assortment of Japanese Incurved and reflexed varieties.

The best exhibit of cut blooms in the nurserymen's class was shown by Mr. W. J. Garner.

In the local classes Mr. C. Goves was 1st for 12 Japanese and for 12 Incurved varieties respectively.

Non-competitive Exhibits.

Gold Medals were awarded to Messrs. J. Cypher & Co., Cheltenham, for a group of flowering and foliage plants, including Orchids. Messrs. Charlesworth & Co., for Orchids, including many choice types of Cattleyas and Odontoglossums. Mr. W. R. Lea, whose collection included fine Cattleyas and Cypripediums. Messrs. Dickson, Brown & Tait for an imposing display of Apples and Pears. Messrs. Clibrans, Altrincham, for winter-flowering Begonias.

Silver-gilt Medal to Col. Rutherford for a collection of Orchids.

Silver Medals to Miss Annie Wood and Mr. A. Warburton for collections of Orchids.

WINCHESTER CHRYSANTHEMUM.

November 13, 14.—This annual exhibition was held on these dates in the Guildhall, Winchester. The exhibits were not so numerous as usual, but those staged were of good quality.

In the class for a group of Chrysanthemums arranged in a space of 8 feet by 7 feet, there were three competitors; Lady Blaine, Barton Mark, Winchester, was placed 1st; 2nd, the Rev. A. G. Bather, Sunnyside, Compton Road, Winchester.

In the class for nine plants, in not fewer than six varieties, each plant to carry not fewer than five blooms, J. A. Fort, Esq., The College, Winchester (gr. Mr. G. Cousens), had the best of four entries, employing such varieties as F. S. Vallis, Lady Talbot, and W. Mease. 2nd, Captain Clayton Mitchell, R.N., West Highlands, Winchester (gr. Mr. C. White).

Mr. Fort was also successful in the class for nine white or yellow-flowered varieties. The 2nd prize was awarded to Mrs. Moorsom, Holyrood, Winchester (gr. Mr. H. Gigg).

Lady Blaine secured the 1st award for single-flowered varieties.

Miscellaneous plants arranged for effect were best contributed by Captain R. J. Arbuthnot, St. Phillip's, Winchester. 2nd, H. Taunmer, Esq., Hockley House, Twyford (gr. Mr. E. Hart).

The best exhibit of two dozen Japanese blooms was shown by E. J. Thal, Esq., Frensham Place, Farnham (gr. Mr. C. Moore). He had fresh, richly-coloured specimens of such varieties as Mrs. Gilbert Drabble, Lady Talbot, Hon. Mrs. Lopes, and W. Turner. 2nd, Matthew Hodgson, Esq., Moreton House, Winchester (gr. Mr. A. J. Marsh).

Incurved varieties were more conspicuous for quality than for numbers. The finer of two exhibits in the class for 20 blooms, in not fewer than 18 varieties, was shown by M. Hodgson, Esq. Pantia Ralli, Mrs. B. Hankey, W. Pascoe, C. H. Curtis, and W. Pascoe were the more noticeable varieties. 2nd, J. E. Thal, Esq. The last-named exhibitor won the leading award for 12 blooms.

There were six entries in the class for a vase filled with Chrysanthemums arranged with natural foliage for effect. J. Liddell, Esq., Sherfield Manor, Basingstoke (gr. Mr. R. Learmouth), was awarded the 1st prize.

The best six single-flowered varieties grown naturally were contributed by the Right Hon. the Earl of Northbrook, Stratton Park, Micheldever (gr. Mr. Henderson), who showed Mensa, Leo, Mrs. Chamberlain, Sylvia Slade, and Old Gold. The 2nd best exhibit was shown by W. H. Myers, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood).

For decorative varieties, Mr. A. E. Taylor, Winchester, was again the 1st prize-winner, as he has been for many years past. Mrs. Buckbee, Source d'Or and Phœbus were prominent varieties. W. H. Myers, Esq., secured the 2nd award.

In the Carnation classes the best six blooms, each of three varieties, were shown by Donald Niccol, Esq., Burntwood, Winchester (gr. Mr. W. Last), with Carola and Enchantress as his best varieties.

Fruit formed an interesting part of the show. ELLEN Lady SWAYTHLING contributed the best black Grapes (Lady Downes), also the best white bunches in Muscat of Alexandria. Mr. MYERS won the 1st prize for dessert Apples; whilst Lady SWAYTHLING showed the best kitchen varieties. J. LIDDELL, Esq., exhibited the finest Pears in four varieties.

W. H. MYERS, Esq., won the premier prizes for vegetables in Messrs. Sutton & Sons' and Messrs. Toogood's classes.

TRADE EXHIBITS.—Messrs. E. HILLIER & SONS, Winchester, had an excellent display of highly-coloured Apples, Pears, Carnations, Palms, and Begonias.

Messrs. JEFFERY, Winchester, showed Ericas, Pernettyas, Carnations in pots, and shrubs.

Messrs. B. LADHAMS & Co., Shirley, Southampton, staged rock plants in variety.

Messrs. TOOGOOD & SONS, Southampton, put up a fine exhibit of vegetables.

W. H. MYERS, Esq., filled a table with Apples of excentional colour, arranged with foliage.

BOTANICAL SOCIETY OF EDINBURGH.

NOVEMBER 14.—The first meeting of the Botanical Society of Edinburgh for the session 1912-13 was held on the above date at 5, St. Andrew Square. Dr. A. W. Borthwick, the retiring president, occupied the chair. Sir Archibald Buchan-Hepburn was elected president for the ensuing session. Mr. W. W. Smith was appointed honorary secretary.

The following communications were read:—Mr. E. Holmes Smith, B.Sc., gave a preliminary note on the occurrence of mucilage on the roots of Melastomaceæ; Mr. R. C. Davie, M.A., B.Sc., described the microscopic structure of the leaves of certain Australian Banksias; Dr. Malcolm Wilson gave a preliminary account of a disease in Plums caused by a Cladosporium. A paper explaining the structure of the embryo of Lagunculuria racemosa, a Combretaceous Mangrove plant, was read on behalf of Professor Bayley Balfour.

Among the exhibits shown to the members was a series of interesting casuals collected in the neighbourhood of Edinburgh by Mr. James Fraser.

The following plants, new or uncommon, in cultivation were shown from the Royal Botanic Garden, Edinburgh:—

Arenaria picta, Sibth. et Sm., from Asia Minor and Syria.—A pink-flowered species, resembling Tunica Saxifraga.

Cyananthus Forrestii, Diels, a new species from Yunnan.—A small-flowered species with pale lavender flowers and graceful habit.

Erodium Stephanianum, Willd., Eastern Cbina.—A plant of the shores with dark purple flowers.

Gentiana gentilis, Franch., from Yunnan.—An annual free-flowering Gentian with purple-blue flowers.

Lobelia taliensis, Diels, a new species from Yunnan.—Small growing with purple-blue flowers.

Primula pseudocapitata, Ward.—A new undescribed species from Yunnan with rotate capitula, resembling P. capitata, but much smaller.

Psilostrophe Tagetinæ, Kuntze.—A beautiful yellow-flowered Composite from the Southern United States.

Saxifraga turfosa, Eng. and Irmscher.—A new yellow-flowered species from Yunnan allied to S. diversifolia and S. parnassifolia, but distinguished by its long stolons.

Saxifraga sp.—A new Yunnan species with yellow flowers, allied to S. cinerascens, Franch.

Selago spuria, Linn.—A free-flowering, white-flowered species from South Africa.

Stylidium articulatum, R.Br., Australia.—One of the riband-leaved rosette forms of the genus.

Swertia angustifolia, Ham.—A delightful pale lavender-flowered species with spotted petals from the Himalaya.

There were also exhibited specimens of the Tulip disease (Sclerotinia parasitica) and some new Chinese Compositæ collected by Mr. G. Forrest in Yunnan, including the following interesting forms, which it is hoped will soon be in cultivation:—Anaphalis chlamydophylla, Diels; Cremanthodium Forrestii, J. F. Jeffrey; C. nobile, Franch; C. rhodocephalum, Diels; Pertya phylicoides, J. F. Jeffrey; and Saussurea leucoma, Diels.

CHELTENHAM ROOT, FRUIT AND CHRYSANTHEMUM.

NOVEMBER 13, 14.—The 42nd annual show of the above society was held in the Town Hall, Cheltenham, on these dates, and was in all respects an admirable exhibition. Chrysanthemums were superb. The specimen plants were better than for some years past, and the specimen blooms, though less numerous, were of excellent quality. Primulas, Begonias, Cyclamen, Carnations, Salvias, and Violets were shown to perfection. Fruit all round was of good quality, and the classes well filled.

The most attractive feature of the floral section was undoubtedly the collection of Japanese Chrysanthemums shown in six distinct varieties and staged at the entrance to the hall. Mr. G. J. MAYO was successful in winning for the first time the new cup offered by the Mayor and Corporation, having won a similar cup outright. The varieties shown by Mr MAYO were Swanley Giant, Leon Truelli, Rose Ellis, Chelsonia, Mme. Alberta Bertland, and Splendour. The prizes for three distinct varieties were secured by Lady DICK-CUNYNGHAME (1st), Mrs. ST. CLAIR FORD (2nd), and Mr. G. J. MAYO (3rd). Very handsome groups of Chrysanthemums were shown by Mr. MAYO and Mr. G. W. RESTALL, who were placed 1st and 2nd respectively. In the class for six varieties suitable for house or table decoration, Mr. HUGH ANDREWS, of Toddington Manor, was placed 1st, and Messrs. BARRETT & SONS, 2nd. The 1st prize for a collection of Japanese Chrysanthemums and foliage plants was won by Mr. HUGH ANDREWS; 2nd, Mr. E. ADLARD.

In the classes for cut blooms of Japanese varieties, Mr. HUGH ANDREWS, Mr. E. ADLARD, Mrs. ROBINSON, Mr. W. J. GRESSON, and Messrs. J. BARRETT were the prize-winners.

In the open classes for plants, the principal prize-winners were Mr. W. J. GRESSON, Mr. J. HORLICK, Mr. HUGH ANDREWS (for Carnations); Mr. A. DRAKE, Mr. J. HORLICK, Mrs. RATCLIFFE (for Cyclamens); Mrs. RATCLIFFE, Mr. A. DRAKE, Col. FAIRFAX RHODES (for Begonias); Mr. J. PLAYER, Mr. H. O. LORD, Col. FAIRFAX RHODES (for Salvias); Mr. H. ANDREWS, Col. FAIRFAX RHODES, Mr. C. M. FLETCHER (for Primulas); Mr. H. O. LORD, Mr. H. J. TILLEY, and Mrs. ROBINSON (for Violets).

In the fruit classes the chief awards went to Sir PERCY CUNYNGHAME, Messrs. W. J. GRESSON, W. S. R. COX, J. BOTT, G. W. RESTALL, HENRY NEWMAN, F. TAYLOR, J. PLAYER, W. GORDON CANNING, W. J. SPENCER, J. HITCH & SONS, C. M. FLETCHER, H. O. LORD, H. J. TILLEY, HUGH ANDREWS, Col. FAIRFAX RHODES, Mrs. AUBREY, Mrs. RATCLIFFE and Mrs. H. GRAVES.

LIVERPOOL CHRYSANTHEMUM.

NOVEMBER 13, 14.—The annual autumn exhibition of this association was held in the Corn Exchange. Although the available space has been slightly decreased, the Exchange is yet a desirable place of exhibition, and is well lighted. The show was well up to the average of the 32 that have preceded it, and the room was furnished with bright and effective exhibits.

For 36 blooms, 18 Japanese and 18 Incurveds, in not fewer than 12 varieties in each section, there were three competitors. The 1st prize was won by Sir GILBERT GREENALL, Bart., Warrington (gr. Mr. C. Goves), his best flowers being *(Japanese)* William Turner (which secured the N.C.S. certificate as the best Japanese bloom in the exhibition), F. S. Vallis, Frances Jolliffe, Président Viger, Lady Talbot and Hon. Mrs. Lopes; *(Incurved)* G. F. Evans, Mrs. G. Denyer, Marjorie Shields and Romance. 2nd, Sir W. H. TATE, Bart., Woolton (gr. Mr. G. Haigh). His example of Buttercup secured the N.C.S. certificate offered for the best Incurved bloom in the show.

The 1st prize for 18 Incurved blooms in not fewer than 12 varieties was awarded to THOMAS HENSHAW, Esq., West Derby (gr. Mr. J. George); 2nd, A. COOR, Esq., Aigburth (gr. Mr. C. Osborne).

In the class for 12 blooms, Mrs. CLARKE, Allerton (gr. Mr. J. Clark), was the 1st prize winner.

The best 18 Japanese blooms, in not fewer than 12 varieties, were shown by Mr. C. GOVES.

In the class for 12 blooms, J. STONE, Esq., Ruby (gr. Mr. D. McKelvie), was placed in the 1st position.

The class for six vases of singles, nine blooms in each vase, brought a charming display, in which Mr. LOO THOMPSON, an amateur, secured the premier award. This exhibit was a pretty feature of the show.

FRUIT.

In the class for a collection of six dishes, F. BIBBY, Esq., Shrewsbury (gr. Mr. J. Taylor), was the 1st prize winner; 2nd, Mr. H. OSBORNE.

The 1st prize for four bunches of Grapes was won by EDMUND LORD, Esq., Rawtenstall (gr. Mr. J. Wright), with bunches of Black Alicante and Muscat of Alexandria.

Black Alicante was best shown in the separate class by W. H. FERNIE, Esq., Thornton Hough (gr. Mr. W. Piper), whilst for any other black variety, Mr. E. R. FINCH was successful.

For two bunches of Muscat of Alexandria, Mr. W. WILSON excelled.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to R. LE DOUX, Esq., West Derby (gr. Mr. J. W. Fletcher), for a collection of Cypripediums; Messrs. R. P. KER & SONS, Liverpool, for Cyclamens backed with Crotons and Palms; Messrs. MANSELL & HATCHER, Rawdon, for Orchids; Messrs. FISHLOCK BROS. for cut blooms in great variety; Messrs. STUART LOW & Co. for Orchids and Carnations.

Silver Medals to the LIVERPOOL ORCHID CO. for Orchids; Mr. W. ROWLANDS for Begonias; Mr. C. A. YOUNG for Carnations; Mr. NORMAN DAVIS for Chrysanthemums; and Mr. H. MIDDLEHURST for Potatos.

BLACKBURN CHRYSANTHEMUM.

NOVEMBER 15, 16.—The annual show of this society was held in the Town Hall, Blackburn, on these dates. The exhibits were more numerous than usual, and overflowed into an adjoining room.

In the class for a group of large-flowering Chrysanthemums two exhibits were staged, both being well arranged. Mr. H. BRADBURN was placed 1st; 2nd, T. MITCHELL ECCLES, Esq. (gr. Mr. J. Pimplott). The 1st prize for a group of single Chrysanthemums was awarded to Mr. PIMPLOTT; 2nd, J. THOMPSON, Esq. (gr. Mr. C. Samways).

For a group of miscellaneous plants Mr. H. TINDWALL, secured the chief award. The 2nd and 3rd awards were won by H. SHUTT, Esq. (gr. Mr. J. Bartlett), and Mr. C. SAMWAYS respectively.

The best group of Orchids staged on a table 8 feet by 4 feet, was shown by Col. J. RUTHERFORD, M.P. (gr. Mr. J. Lupton). For a table of Cypripediums, WILLIAM THORN, Esq. (gr. Mr. A. E. Strafford), was successful with a collection of much merit, artistically arranged with light foliage; 2nd, ALFRED NUTTALL, Esq. (gr. Mr. T. Cass).

There were three entries in the class for a table of Begonias, H. SHUTT, Esq., being awarded the 1st prize.

CUT BLOOMS.—In the class for 24 Incurved Chrysanthemums, not fewer than 18 varieties, A. E. TROOP, Esq. (gr. Mr. R. H. Jones), was placed 1st; his best flowers were Buttercup, Romance and W. H. Thorpe; 2nd, Mr. H. BOYD. Messrs. H. BRADBURN, J. W. WELLS, and R. H. JONES were successful in this order for 12 varieties.

For 24 Japanese blooms, in not fewer than 18 varieties, Capt. FIELDEN, Witton (gr. Mr. H. Boyd), won the 1st prize, the leading blooms shown being Countess of Granard, Hon. Mrs. Lopes, White Queen and Mrs. A. T. Miller; 2nd, Mr. H. BRADBURN; for 12 blooms Messrs. BOYD and PIMPLOTT were placed 1st and 2nd respectively, whilst for three vases Mr. JOHN THOMPSON was successful.

FRUIT AND VEGETABLES.—Exhibits in this section were not very extensive. EDMUND LORD, Esq. (gr. Mr. J. Wright), secured three 1st prizes for Grapes, having the best Black Alicante and Muscat of Alexandria.

Mr. J. BARKER was awarded the 1st prize for a collection of vegetables; 2nd, Mr. H. J. WELLS, who secured the 1st prize for six Onions.

BOLTON CHRYSANTHEMUM.

NOVEMBER 15, 16.—This annual show was held in the Albert Hall, Bolton. The entries were fully up to the average, but there was only one exhibit in the group class, compared with three or four on former occasions.

In the class for 24 blooms, 12 Japanese and 12 Incurved varieties, distinct, Sir GILBERT GREENALL, Bart., Warrington (gr. Mr. C. Goves), added to his list of many successes of this season. His best blooms were *(Japanese)* F. S. Vallis, Mrs. A. T. Miller, W. A. Etherington, W. Turner; *(Incurved)* Mrs. G. Denyer, Romance, E. F. Evans, and Mrs. Hankey. 2nd, Sir W. H. TATE, Bart., Woolton (gr. Mr. G. Haigh).

For 36 Japanese blooms in not fewer than 24 varieties Mr. C. JONES, Abergele, won the 1st prize.

The class for six vases of single varieties, distinct, brought a good contest. The prize winners were: 1st, Mr. A. ADSHEAD; 2nd, Mr. H. SHONE; and 3rd, Mr. W. P. RYLANDS.

The premier vase of Carnations was staged by Mr. J. ENTWISTLE.

PLANTS.

As stated above, only one exhibit was staged in the class for a circular group of miscellaneous plants arranged for effect 12 feet in diameter. The exhibitor was J. W. MAKANT, Esq. (gr. Mr. H. Shone), and he was awarded the 1st prize.

A group of naturally-grown Chrysanthemums arranged in a half circle 9 feet by 6 feet, shown by GERARD S. PECK, Esq., Heaton (gr. Mr. B. Hardy), was placed 1st; 2nd, Miss ANNA M. PHILIPS, Prestwich (gr. Mr. D. Wilson).

Mr. D. WILLIAMS was successful in the similar class for a group of large-flowering Chrysanthemums.

For a table of Orchids Mr. G. H. DRINKWATER was awarded the 1st prize with a very effective display. Cattleya labiata, Cypripediums in variety, and Oncidium varicosum were well staged on a groundwork of Ferns and Palms. 2nd, J. MCCARTNEY, Esq. (gr. Mr. W. Holmes).

NATIONAL CHRYSANTHEMUM.

ANNUAL CONFERENCE.

NOVEMBER 20.—There was a large attendance at the annual conference of the National Chrysanthemum Society, which was held at 7 p.m. in the Essex Hall, Strand, London, on the above date, when Dr. Russell, of the Rothampstead Experimental Station, delivered a lecture on "Partial Sterilisation of Soil," which was illustrated by lantern slides.

Dr. Russell said that during the past eight years they had been experimenting at Rothampstead with a method of soil treatment known as partial sterilisation, working with a variety of plants, and he had collected the results of those experiments which deal with Chrysanthemums, and proposed to bring them before the notice of the Society. The lecturer explained that by sterilisation was not meant rendering the soil sterile; rather the reverse, for the various methods employed had the result of increasing the fertility of the soil. The soil is densely inhabited by minute living organisms, some helpful to plant life and others harmful, and laboratory experiments led them to conclude that any method of treatment which killed some, but not all, would be beneficial to soil fertility, and it was a fortunate fact that the injurious organisms were the more easily killed, whilst the essential bacteria were hardier and survived treatment which decimated the others. It was patent that any method which would destroy the harmful denizens of the soil without interfering with the necessary inhabitants would give these latter freer scope to exert their beneficent purposes. Their experiments proved that, by partial sterilisation, this result was achieved, and that the treatment had increased the amount of plant food in the soil. The experiments had been chiefly conducted with exhausted soil—soil in which plants such as Chrysanthemums, Cucumbers, and Tomatos had been grown, and which, in its untreated state, was incapable of producing healthy plants. The lantern slides illustrated the great improvement which resulted from several of the forms of treatment. The experiments started with a necessarily limited number of plants, as near alike as possible, and their treatment, as regards watering, feeding, etc., was as identical as possible. The methods of partial sterilisation followed were heating by steam and treating the soil with various poisons. These may be grouped as follows:—

(1) Formaldehyde, pyridene, and calcium sulphide.

(2) Carbolic, cresol, toluol, petrol, and other tar oils, chiefly waste products.

This is the present order of merit, but, as the experiments are only in their infancy, the order given must be looked upon as being entirely provisional, for at any time future experiments may result in deposing the substances in Group 1 in favour of some other agents. Formaldehyde is the agent to be most generally recommended, for it is a vapour, and so easily permeates the soil. Toluol and petrol, like formaldehyde, are vapours, but they are inflammable and dangerous to use. The tar oils are not successful because they are sticky and do not mix well with the soil. Heating by steam has, so far, been found to be the most satisfactory method, but its results are closely followed by the use of Group 1.

METHODS OF APPLICATION.

Partial sterilisation by steam may be performed by making a structure like a shallow plant pit and placing in it about a cartload of the soil. The sterilising apparatus is shaped like a tined harrow, or like a gridiron (see fig. 180); an open end should project so that the steam may enter. A convenient size of the apparatus has been found to be about 3½ feet long by

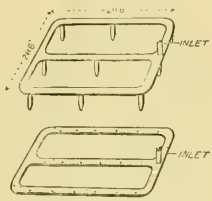

FIG. 180.—THE HARROW AND GRIDIRON METHODS OF STERILISING SOIL.

2½ feet wide, the piping being 1 inch in diameter. Steam is injected at a pressure well above atmospheric pressure, and the soil heated to a temperature of about 200° Fahr. for 20 to 30 minutes. The soil is then removed and placed in a heap, under cover for choice, to cool slowly. The heating of the soil may be done by dry heat, but it is not so easy to control the heat, and if the soil becomes overheated there is a complete killing of its micro-organisms.

The poisons may be watered or sprayed on the soil, and the soil be mixed thoroughly. On the Continent, an injector has been used, but not with altogether satisfactory results. The general conclusions regarding the effects of partial sterilisation which may be drawn are that cuttings do not root so readily in the treated as in untreated soil, but this retardation is ultimately made up for, and, once roots have been formed, the plants grow faster and stronger, flower earlier, and produce larger flowers. The root system is also much better, the roots are more abundant, and contain more fibres. The differences between the treated and the untreated soils is not so marked when a very good compost has been used, and the difference can be still further reduced by adding manures. In fact, the treatment takes the place of manure, and plants growing in the treated soil can be grown longer without feeding than is the case with untreated soil. The great advantage of the treatment is that of soil economy, for the same soil may be used over and over again, but, in the case of the private grower who can obtain plenty of manure and good virgin loam, it cannot be said there is any advantage to be obtained from the treating of the soil unless future experiments showed that the flowers proved to be better; nevertheless the methods are of great importance to the commercial grower who has to buy his soil and manure. This is a matter for experiments on a large scale, and it is only by trial and experiment that any progress can be made, and the object of the lecturer was to point out a direction in which experiments may profitably be conducted.

THE DISCUSSION.

In reply to Mr. Leach, it was stated that the quantity of chemical required to sufficiently sterilise the soil was 1 part per 1,000. Too much had been used, and, in future experiments, the quantity would be reduced in the endeavour to arrive at the correct minimum. Mr. Leach also asked the average price of formaldehyde, and Dr. Russell replied that it was about 6d. per lb.; the cost would work out at 9d. per ton of soil treated.

Mr. Cull inquired as to the results of adding manures to the treated soil, to which Dr. Russell replied that the use of high manure reduces the effect of the sterilisation.

Mr. Rowbotham asked if sterilisation by frost was as effective as sterilisation by heat, and elicited the reply that experiments in America had shown the results to be the same; but the soil in that country lies frozen for much longer periods than is the case here.

Mr. J. Stevenson quoted his experience with sterilisation of soil, which he had chiefly practised in the hopes of combating the streak disease in Sweet Peas. He used formaldehyde at a strength of 1 gallon to 200 gallons of water, and watered a plot of ground six weeks before planting out the seedling Sweet Peas, and at the end of two months these plants were fully 20 per cent. better than any others, and eventually they became superior to any plants he had ever seen; their growth increased considerably. When sterilising soil by heat for Chrysanthemums the results were not good, but he was of the opinion that he had subjected the soil to too much heat. The plants "hung fire, and never pulled up with the others." At the end of the month the cuttings had not formed roots: the roots ultimately made were too fine in texture, and of a greyish colour. Later, the plants grew too rapidly, but the root-action was always feeble, and towards the end of the season nearly all the foliage was lost.

Mr. A. Cragg said that his firm had been experimenting for the past five years, and they also found that cuttings did not root readily in sterilised soil. It seemed as if they suffered from indigestion—there was too much food available for them; poor, but not diseased, soil is the best for cuttings, and only rooted plants should be potted into sterilised soil. He was convinced of the value of partial sterilisation by steam to the grower who had to purchase his soil, and their experience with Ferns showed that plants in 2½-inch pots were saleable from two to three weeks earlier than those grown in untreated soil.

Mr. E. F. Hawes described a method of treating the soil by steam heat by means of a cylinder and buckets attached to an endless chain.

Mr. Fairlie spoke of an amateur gardener who sterilised soil by using the household sanitary galvanized dustbin. A small quantity of water was placed under an inverted sieve in the bottom of the bin, and the bin then filled with soil. This was heated by a coke fire, and the results were admirable. He had grown 1,000 Carnations in steam-sterilised soil, and the plants grew with almost alarming rapidity.

In a humorous speech, Mr. Wells gave his experience of treating soil to steam heat to prevent "rust," and to destroy the seeds of Chickweed, which were a great pest. Mr. Wells used a 10-ton traction engine, and treated a large quantity of soil with gratifying results. The expense was great, but it paid.

Mr. C. H. Curtis reminded Dr. Russell that on a former occasion he had inquired as to the value of "drying-out" diseased and worn-out soil versus steam-heating, and instanced the methods used by the Tomato growers in the Channel Islands when treating sick soils, and suggested that this drying-out method would be much cheaper than treating it with chemicals. Dr. Russell replied that this method was receiving attention, but at present he was not prepared to make a definite statement, although he was aware of instances in which it had proved effective.

Mr. Bevan, in proposing a vote of thanks to Dr. Russell, spoke of the old method of drying soil for Cucumbers, &c., on the top of boilers to

kill eelworms and wireworm; and also said that he had been surprised to see how well the hardy deciduous trees withstood drought when growing on soil which had been burnt to destroy the roots and seeds of noxious weeds.

Mr. D. B. Crane, who seconded the motion, said that cultivators might well expect a great future for the sterilisation of soil: the experiments were in their initial stage, and he confidently looked forward to hearing of cheaper methods of performing the work.

AYR CHRYSANTHEMUM.

NOVEMBER 20.—The Ayr Chrysanthemum Society held its annual show in the Town Hall, Ayr, on this date, when there was an excellent exhibition of plants and blooms of Chrysanthemums and a capital show of other plants, flowers, fruits and vegetables. The entries compared well with those of previous years, and the quality generally was very high. The "Pollock" Cup, offered for Chrysanthemum plants, was won by MRS. POLLOCK, Glenfairn (gr. Mr. W. Currie); 2nd, W. BAIRD, Esq., Canbusdoon (gr. Mr. R. J. Clark). Mrs. POLLOCK also excelled in the class for two plants not disbudded, for a circular table of plants, and for Chrysanthemums in 7-inch pots. Mr. JAMIE led for singles. In the other pot plant classes, including Primulas and Begonias, the most successful exhibitors were J. A. CAMPBELL, Esq., Craigie House (gr. Mr. Robert Blair); W. BAIRD, Esq.; R. A. OSWALD, Esq., Auchincruive (gr. Mr. A. M'Cartney), and Mrs. POLLOCK. In the classes for cut blooms, Mr. A. S. WATP, Whiting Bay, Arran, was a very successful competitor.

W. BAIRD, Esq., led for four vases of Japanese blooms, not disbudded. In the other classes for cut flowers and decorative work the winners were Mr. A. NOBLE, Corsehill, Ayr; Mrs. POLLOCK; Mr. JAMIE, and Mr. C. L. RENDALL, Alloway. In the fruit classes the finest Grapes were shown by R. A. OSWALD, Esq., and Mr. A. NOBLE. Mr. T. SMITH, Dundonald Road, Kilmarnock, was placed 1st for 12 dessert and 12 baking Apples. R. A. OSWALD, Esq., was 1st for Pears. An amateur, Mr. T. ANDERSON, had the best collection of vegetables in both the open and amateurs' classes.

HULL CHRYSANTHEMUM.

NOVEMBER 20, 21.—Twenty years ago the exhibitions of this society were amongst the most important in the country, but interest waned, and nine years ago the committee decided to discontinue the show. In the meantime a new City Hall has been built in a favourable part of the city, and the old show was resuscitated this year. Unfortunately, the society has, in the interregnum, lost one of its most valued supporters, the late Mr. E. Harland, who so long acted with Mr. Dixon as secretary.

CUT BLOOMS.—The principal of the ten open classes was for 24 Japanese blooms, in not fewer than 18 varieties. The 1st prize, consisting of a silver cup and the sum of £6, was won by H. G. HEWITT, Esq., Weelsby Old Hall, Grimsby (gr. Mr. Fleming), with full-sized, solid, richly-coloured blooms, well staged. The leading varieties were Lady Talbot, Mrs. G. C. Kelly, Mme. P. Radaelli, Mme. G. Rivol, Hon. Mrs. Lopes, Mrs. A. T. Miller, Frances Jolliffe, Fred. Green, W. Mease, Miss A. Nicoll, W. Jinks, and President Viger. Captain J. F. LAYCOCK, Wiscton, Bawtry (gr. Mr. Musk), was a good 2nd, and ARTHUR JAMES, Esq., Coton House, Rugby (gr. Mr. A. Chandler), 3rd. Exhibits of Incurved varieties were few in number. Two competed in the class for 18 blooms, and Mrs. HALL WATT, Bishop Burton Hall, Beverley (gr. Mr. G. Wilson), was placed 1st with medium-sized, neat flowers of C. H. Curtis, Mme. Ferlat, Pantia Ralli, Mrs. G. Denyer, W. Pascoe, Mrs. F. Ashworth, Romance, Buttercup, Fred Palmer, and Mrs. J. Seward. In the class for two vases of seven blooms each of two yellow Japanese varieties, Mr. JAMES excelled with Lady Talbot and F. S. Vallis. In a similar class for white varieties, Mrs. HALL WATT won with the varieties Purity and Mrs. A. T. Miller. ARTHUR JAMES, Esq., followed closely. The best six blooms of any Japanese variety were shown by ARTHUR JAMES, Esq., who showed the variety Frances Jolliffe.

For twelve vases of single Chrysanthemums in not fewer than nine varieties, six competed. Mr. MONTAGUE STATHER, Arlington Nursery, Cottingham, won the premier place with handsome, freely-flowered sprays. The varieties Sylvia Slade and Bessie Pagram were especially good. 2nd, E. KENNETH WILSON, Esq., Little Tranby, Beverley (gr. Mr. W. Allison).

For six vases of singles, disbudded, H. HILDYARD, Esq., Cottingham (gr. Mr. A. Drewery), won the 1st prize with such varieties as H. J. Williams, Florrie King, Robert Thorpe, Bessie, and Bronze Pagram.

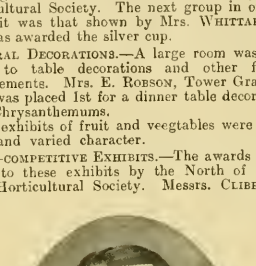
The local classes were well filled. For 18 Japanese varieties, Miss BENNETT, Westlands, Grimsby (gr. Mr. G. Burrows), won the 1st prize, as she did also for a dozen specimens.

GROUP CLASSES.—In the class for a group of Chrysanthemums and foliage plants arranged for effect four competed. Mr. R. B. WITTY, superintendent of the public parks and gardens of Hull, was placed 1st, with a superior display, but as he elected not to take the prize he was awarded the large silver medal of the North of England Horticultural Society. The next group in order of merit was that shown by Mrs. WHITTAKER, who was awarded the silver cup.

FLORAL DECORATIONS.—A large room was devoted to table decorations and other floral arrangements. Mrs. E. ROBSON, Tower Grange, Hull, was placed 1st for a dinner table decorated with Chrysanthemums.

The exhibits of fruit and veegtables were of a large and varied character.

NON-COMPETITIVE EXHIBITS.—The awards were made to these exhibits by the North of England Horticultural Society. Messrs. CLIBRANS,



THE LATE HENRY PURSER.

Altrincham, showed exceedingly fine vegetables, for which a Gold Medal was awarded. Messrs. TOOGOOD & SONS, Southampton, had a similar but smaller display (large Silver-gilt Medal). Messrs. E. P. DIXON & SONS, Hull, showed floral designs, flowers, and fruit (large Silver Medal). Messrs. W. WELLS & CO., Merstham, Surrey, showed Chrysanthemums, for which a Silver Medal was awarded. Messrs. MANSELL & HATCHER, Leeds, arranged an interesting group of Orchids (Silver Medal).

ABERDEEN HORTICULTURAL.

The annual meeting of the members of this society was held recently in the Music Hall Buildings, Aberdeen. There was a large attendance, and the chair was occupied by Colonel Gill, chairman of the society.

The annual report stated that from a horticultural point of view, considering the rather unsatisfactory season, the August show, both in number and quality of exhibits, was creditable to all concerned, while the financial results were also satisfactory. The income for the year amounted to £488 11s. 6d., and the expenditure was £438 1s. 3d., leaving a surplus of £50 10s. 3d., which, with the credit balance of £27 7s. 10d. at the beginning of the season, left a balance of £77 18s. 1d. to be carried forward to next year.

The report was adopted. On the motion of Mr. Todd, seconded by Mr. Robson, it was agreed to start a reserve fund with a sum of £30.

Obituary.

HENRY PURSER.—We regret to record the death, on the 17th inst., at the advanced age of 82, of Mr. Henry Purser, formerly head gardener to Lord Zouche. Mr. Purser commenced his gardening career in the Earl of Denbigh's garden, Newnham Paddocks, Leicestershire. Later he was appointed gardener to the Hon. Wentworth Powis, at Berwick Hall, near Shrewsbury, where he remained for 30 years. He left Berwick Hall to take charge of Lord Zouche's garden at Baronhill, near Rugby, Staffordshire. At the end of five years Baronhill was let and Mr. Purser was appointed to the charge of Lord Zouche's garden at Parham Park, Sussex, where he remained for 13 years. Ten years ago he retired in consequence of failing health, and was granted a pension by Lord Zouche. Deceased's widow is sister to Mr. Owen Thomas.

REV. DR. LANOSBOROUGH.—We learn with regret of the death, on November 22, of the Rev. Dr. David Landsborough, Kilmarnock, at the age of 86. Dr. Landsborough contributed a number of papers to the Botanical Society of Edinburgh. He made a special study of the botany of Ayrshire, and the island of Arran, and he contributed articles on "The Effects of Winter on Vegetation in Arran."

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending November 23, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—As a whole the conditions were dull and unsettled. Rain fell in slight or moderate quantities daily at many stations in the west and north, and on several days in most other parts of the Kingdom. Some localities in the east and south of Britain remained dry, however, throughout the greater part of the week, and at Donaghadee rain fell on only one day.

The *temperature* was above the average very generally, the greatest excess being a little over 4·5° in Ireland, and the smallest 1·5° in England S.E. The highest of the maxima, which occurred late in the period, ranged from 60° in Ireland S. to 56° in several districts, and to 55° in Scotland E. The lowest of the minima were registered during the first half of the week, and ranged from 22° in Scotland E. to 36° in Ireland S., and to 42° in the English Channel. As a rule the minima were some degrees above the normal. The lowest grass readings reported were 17° at Newton Rigg, 18° at Crathes, 19° at Balmoral, and 20° at Hampstead. The temperature of the soil continued below the average in most parts of the country at a depth of 4 feet, but, except at Clacton-on-Sea, it was above it at a depth of 1 foot.

The *rainfall* exceeded the average in Scotland N., but was less elsewhere. At Glencarron there was a fall of 1·07 inch on the 19th. At various places in the north-east, and at a few in the south-west, as well as at Donaghadee, the total fall was less than 0·1 inch.

The *bright sunshine* was below the normal except in Scotland N. and E. In Scotland E. the percentage of the possible duration was 31 and the daily mean 2·4 hours. In Ireland, and the south-west, east, and Midland Counties of England the daily mean was less than an hour. In England E. (where the possible duration was only 8) the daily mean was no more than 0·7 hour.

THE WEATHER IN WEST HERTS.

Week ending November 27.

A warm and wet week—The day temperatures during the week were all above the average, and on the warmest day the highest reading in the thermometer screen rose to 56°, which is 9° higher than is seasonable. The nights were also equally warm for the time of year, with the exception of the last night, when the exposed thermometer registered 4° of frost. The ground is now at about a seasonable temperature both at 1 and 2 feet deep. Rain fell on four days, and to the total depth of rather more than an inch, making this the wettest week for four weeks. Some hail fell at times with the rain on the last two days. About half-past five on the afternoon of the 26th rain and hail fell for ten minutes at the mean rate of over 1 inch an hour. During the week 4½ gallons of rainwater came through the bare soil percolation gauge, and 8½ gallons through that on which short grass is growing. The sun shone on an average for 1 hour 24 minutes a day, which is a quarter of an hour a day short of the average duration for the same period in November. On the only two sunny days the sun shone respectively for nearly four hours, and for nearly six hours, the remaining five days being altogether sunless. The first day and also the last three days of the week were windy, and in the windiest hour the mean velocity was 18 miles — direction S. There was again a seasonable amount of moisture in the air at 3 p.m. *E. M., Berkhamsted, November 27, 1912.*

TRADE NOTICE.

MR. WILLIAM MALLETT, for several years with Messrs. Hobbies Ltd., has joined his brother Mr. George Mallet, of the Cheddar Nurseries, Somerset, as manager of the hard wooded section of that business at the Bridge Hill, Batscombe and Broadway branches, all in Cheddar.

MARKETS.

COVENT GARDEN, November 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—The principal varieties of English Apples available are Dumelow's Seedling (Wellington), Newton Wonder, Bramley's Seedling, Blenheim Pippin, Cox's Orange Pippin, and Allington Pippin. Apples imported, both in boxes and barrels, are arriving in large quantities, the principal varieties being Cox's Orange Pippin (in boxes of 10 to 12 dozen, very handsome fruits), Jonathan, Winter Banana, Grimes' Golden and Spitzbergen. Pears from home growers and the Channel Islands are principally of the Doyenné du Comice variety. Several thousand boxes of Pears arrived this week from overseas, consisting largely of Doyenne du Comice and Winter Nelis, all the fruits being in excellent condition. English hothouse Grapes continue a very heavy supply, the bulk consisting of Black Alicante and Gros Colman, of which some firms are receiving over a thousand packages per day, each of an average weight of 10 lbs. Best samples of Canon Hall Muscat are scarce and in demand. The following tropical fruits are obtainable:—Avocado Pears, Persimmons, Passion Fruits, Custard Apples, Mangoes, Pines, Monstera deliciosa, Lychees and claret-coloured Bananas. Californian Seedless Oranges are obtainable. Cob-nuts remain a good supply. Supplies of English Tomatos are nearly exhausted, but Teneriffe Tomatos are plentiful, the fruits being of good quality. Forced vegetables obtainable include Mushrooms, Dwarf Beans, Peas, Seakale, Potatos, Asparagus and Cucumbers. Holly and Mistleto are making their appearance in the market. Ordinary vegetables continue a very heavy supply. *E.H.K., Covent Garden, November 27, 1912.*

Potatoes.

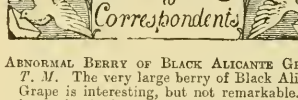
REMARKS.—Trade is about the same as last week, and prices are not altered. Best tubers are in good demand. Consignments of foreign Potatos are still large. *Edward J. Newborn, Covent Garden and St. Pancras, November 27, 1912.*



ABNORMAL BERRY OF BLACK ALICANTE GRAPE: *T. M.* The very large berry of Black Alicante Grape is interesting, but not remarkable. Its large size is due to abnormal development.

ADDRESSES: *W. F. S., South Hackney.* London Playing Fields Society, 49 and 50, Parliament Street, S.W.; Middlesex County Council, Guildhall, Broad Sanctuary, Westminster.

APPLE JAMES GRIEVE: *H. W.* This variety was raised by Messrs. Dickson, of Edinburgh, Cox's Orange Pippin being one of the parents. It received an Award of Merit from the Fruit and Vegetable Committee of the Royal Horticultural Society on October 12, 1897, when exhibited by Messrs. Geo. Bunyard & Co.

BOOKS: *T. D. Skinner. Chemistry of The Garden*, by Herbert H. Cousins, price 1s. 1½d.; *The Book of Garden Pests and Plant Diseases*, by R. Hooper Pearson, price 2s. 10d. Both obtainable from our Publishing Department. The prices include postage.

CATTLEYA LEAVES: *Bristow.* The leaves are burrowed extensively by the larvæ of a small beetle, and, so far as we can gather, it is a new pest, but, unfortunately, in the absence of adult specimens we cannot give you more definite particulars. If, however, you will be good enough to send us examples of the adult beetles, which will, in all probability, be found on the outsides of the leaves at night, we will endeavour to identify the pest.

CONIFER UNHEALTHY: *Craigs.* There is no trace of disease on the specimen sent. The generally unhealthy state of the tree is probably due to a bad rooting medium, such as cold gravel or clay. An excess of moisture at the roots would also cause the foliage to turn brown and die.

EARLY-FLOWERING CHRYSANTHEMUMS: *A. S. T., Edinburgh.* It is not usual for early varieties of Chrysanthemums to flower later or become taller in growth as they get older. Owing to the unusual weather many plants attained to an unnatural height during the past season. The term "disbudding" is applied to the system of removing all but one flower-bud on each shoot. Early-flowering varieties are usually planted in the ground and allowed to grow naturally, the first bud appearing when the plant is from 1 to 2 feet high. After the appearance of this first bud, the plant makes a number of side growths and a quantity of flower-buds; if only one bud is retained on each shoot the flowering should be earlier, not later, as you suggest. It is not advisable to pinch outdoor Chrysanthemums to make them bushy; as a rule, they are naturally quite bushy enough, and pinching produces a soft, attenuated growth which results in much poorer flowers

GARDENER'S ILLNESS AND DISMISSAL: *Justice.* (1) Your relative is still legally employed. (2) He should claim full wages during the time he was absent, as his employment was not terminated. (3) He is entitled to a month's notice, or wages in lieu of notice, and the value of the accommodation at the lodge should be included in estimating the amount payable. (4) If the employer can prove that the notice duly reached your relative, this would probably be held sufficient. Your relative had better return to work without delay on leaving hospital, assuming that his health permits.

"HANDBOOK ON PRUNING ROSES": *Enquirer.* Two editions of the *Handbook on Pruning Roses* have been issued by the National Rose Society since that of 1905—one in February, 1909, and the other in November, 1911. The 1905 edition is therefore somewhat out of date.

LOAM FOR MELONS: *J. T.* Liquid manure from the farmyard poured over the heap would be beneficial, but it would be better to enrich the soil with manure as advised in the calendarial on the Management of the Kitchen Garden (see page 408).

MELON IN A COLLECTION OF FRUIT: *C. E. M.* A Melon in a collection of miscellaneous fruits has a point value of eight, compared with six for Pears and six for Apples. The fruit you submitted for our inspection was remarkably good; it was of excellent shape, a rich yellow colour, and splendid flavour. It would certainly be entitled to higher pointing than either of the other fruits you mention.

NAMES OF PLANTS: *J. Newens.* 1, Cephalotaxus Fortunei; 2, C. pedunculata; 3, Juniperus chinensis; 4, Cryptomeria japonica var. elegans. *J. L. W.* Salvia Horminum.—*A. P. U.* We do not recognise the variety of Chrysanthemum. Send to some grower of these flowers who has means of comparing it with flowers in his collection.—*E. P. & Co.* The berries are those of Schinus Molle, known as the Californian Pepper Tree and Peruvian Mastic Tree. It is not a hardy tree in Great Britain, but is used to a large extent as shade trees and for planting in streets in Australia, California, and other warm, temperate countries.—*Foreman.* 1, Selaginell denticulata; 2, S. uncinata; 3, S. Wildenovii; 4, S. stolonifera; 5, Pteris geraniifolia: 6, Adiantum formosum.

ODONTOGLOSSUM LEAVES CURLED: *R., Bradford.* "Curled and sometimes crinkled" leaves such as you describe are often seen on individual plants of Odontoglossum, even where the majority of the plants are not affected. Such leaves are usually smaller than the perfect ones, and indicate that at some period there has been a temporary deficiency in the supply of nutriment, or that the leaf has not had space to develop. Where occasional plants are potted in a compost which does not admit of free drainage, and hence holds too much moisture, the roots become affected, and nutrition is arrested. Again, leaves which have been infested with aphides or thrips when in the tender stage often show such deformity as you describe when they mature. The fact that only occasional plants are affected in your case, whilst the others remain perfect, seems to indicate that the cause is not a serious one, and if you examine the damaged plants by the light of our suggestions you should be able to arrive at a probable explanation. When the Odontoglossum house is kept too warm at night, the leaves become thinner than desirable, and often curl back at the edges; but if that were the cause in the present case the damage would be more general.

ONIONS, LEEKS, AND CELERY FOR EXHIBITION: *C. M.* The ground for Onions should be trenched thoroughly to a depth of at least 2½ feet, and incorporated with plenty of good farmyard manure. The surface should be left as rough as possible, strewn with fresh soot and wood ashes and allowed to remain undisturbed until the time for planting. The seed should be sown from the end of December to the end of the following month in shallow boxes filled with well-prepared soil. The seedlings should be raised in gentle heat, and pricked off when they are large enough to handle. They should be hardened thoroughly and planted out in prepared ground in April at a good distance apart. Liberal supplies of water and liquid manure should be afforded the roots; concentrated fertilisers may be used if liquid manure is not available, and these should be applied during showery weather. Endeavour to keep the plants healthy and growing freely from the moment they appear above the surface until the swelling of the bulbs is completed, when they should be immediately lifted and harvested, taking care not to bruise or damage them. Leeks should be sown and raised precisely in the same manner as Onions, and the seedlings planted out in well-prepared trenches, with a layer at least 18 inches deep of good manure in the bottom of the trench. The plants should be put out in May, and the blanching commenced at once. This is best done by paper collars, which can be purchased from the sundriesman or seedsman. These should be drawn up the stems from time to time until these latter are blanched sufficiently, placing fine soil about the plants as the work proceeds. Afford liquid manure from the farmyard liberally, and damp the tops of the plants during the early evening on fine days during the summer. Celery should not be sown before the end of February or the beginning of March in a compost which is not too rich. Raise the plants in gentle heat, and never allow the seedlings to become dry at the roots. Transplant them in boxes immediately the second leaf is discernible. Grow the plants in a greenhouse temperature, and plant them in liberally-manured and well-prepared trenches as soon as they are large enough and hardened thoroughly. It is hardly possible to overwater Celery during the summer; drought is the most common cause of failure. Celery for exhibition should always be blanched with brown paper, using bands 6 inches in depth, and adding additional strips until the blanching is completed. Liquid manure from farmyard dung and sewage are both excellent stimulants for Celery. Soot also is valuable both for the manure it contains and its effectiveness in preventing attacks of the Celery fly and slugs.

RUSSIAN MELON: *H. C.* We are unable to identify the variety from the portion of fruit sent. There are several Russian Melons, and it most nearly resembles the early Russian Water Melon. It is apparently much inferior to varieties usually grown in hothouses, and as you find the flesh unpalatable, you will do well to discard it and stick to the ordinary kinds. The fruits you have would probably make excellent preserve, or they might be candied.

SPRAYING FOR BIG-BUD IN BLACK CURRANTS: *F. W. W.* Mr. A. H. Pearson, Lowdham, recommends spraying with soft soap and Quassia for the destruction of big-bud mite. In a note on the subject in *Gardeners' Chronicle*, February 17, 1912, p. 107, he offers to send full particulars to anyone who wishes to adopt his method. Experiments in spraying were conducted by officers of the Board of Agriculture at Harvington, Worcester, and the lime and sulphur mixture gave the best results. The materials used were lime and sulphur in dry form, one part lime (air-slaked) to four of sulphur.

SUBSTITUTES FOR ANIMAL MANURES: *H. M.* As you are unable to obtain farmyard or other animal manures, you will have to rely mainly on concentrated fertilisers. Your soil being sandy and of a hungry nature, you should incorporate with it materials that will help to retain the manurial properties of the fertilisers and improve the texture of the staple. There is nothing better for the purpose than decayed vegetable matter. All fallen tree leaves should be gathered, placed in heaps to decay, and dug into the ground the following autumn. If woods exist in your neighbourhood, it should be possible to obtain a cheap and valuable supply of humus from the deposit beneath the trees and in hollows. Farmyard dung makes the soil darker, warmer, and more retentive of moisture; promotes aeration, and tends to the multiplication of micro-organisms, which play so important a part in the fertility of the soil. The chemical fertilisers should be applied in small quantities in the spring and early summer, when the plants are growing actively. Nitrogen, phosphoric acid, and potash are the principal manures you should purchase.

THE SWEET CHESTNUT: *F. B., Northampton.* The dimensions of several fine examples of the Sweet Chestnut (Castanea sativa) are given in Vol. iv of *Trees of Great Britain and Ireland*, and most of the following information is taken from this work. The age of a tree cannot be determined by its size, since it will grow much more rapidly in certain soil and climatic conditions than others. Trees have been known to attain to a height of 65 feet, with a girth of 3 feet, in less than 40 years; and one well-known example in Ireland, which is probably the largest in the country, is known to be less than 200 years old. This specimen (at Rossanagh, in Wicklow) was planted in 1718. In 1903 it was 80 feet high, with a short trunk dividing into three very large limbs. Near the ground the trunk girth was 49 feet; at 3 feet from the ground the girth was 27½ feet, swelling again at 5 feet to 29½ feet round. The spread of the head was 100 feet in diameter, and the limbs measured in girth 12 feet 8 inches, 11 feet 2 inches, and 10 feet respectively. One of the best-proportioned trees in England is growing near Studley Royal. In 1904 it measured 112 feet in height, and the girth at 5 feet from the ground was 20 feet. A tree at Shrubland Park, Ipswich, is recorded as being 47 feet in circumference near the ground, 31 feet at 3 feet above the ground, and 27 feet at double this height. At Rydal Hall, Westmorland, there is a tree with a girth of 26½ feet at 5 feet above the ground, and 37 feet at the base. The largest tree at Kew has a girth of 21 feet; and one at Stevenstan, in North Devon, is said to be 86 feet high, and, although the girth is only 16 feet 11 inches, it is reported to contain 833 cubic feet of timber. Most of the dimensions here given, however, compare unfavorably with those of other famous trees. Possibly the tree at Tortworth is one of the most interesting. It is said to have been planted during the reign of King John, though there does not seem to be any reliable evidence to this effect. It is now nothing but a decayed shell; but it was mentioned by Strutt in 1766 as having a girth of 50 feet at 5 feet from the ground. At 10 feet high it divided into three limbs, the largest of which had a girth of 28½ feet. The remains of this tree are still to be seen; it is on Lord Ducie's estate at Tortworth, in Gloucestershire. On Lord Darnley's estate, Cobham Hall, Kent, there are some trees of a large size, one of which is said to have attained a girth of 33 feet at 12 feet from the ground. The tree also grows to a very large size in Scotland; one, at Castle Leod, Ross-shire, is reported to be 76 feet high, with a girth of 28 feet at the base, and 21 feet 4 inches at 5 feet from the ground. At Inverary Castle, Elwes measured one which was 77 feet high, with a 20-foot girth. The date of the introduction of the Sweet Chestnut to this country is not definitely known. Many authorities are of opinion that it was introduced by the Romans, but others incline to the belief that it is of British origin. The trees you refer to are probably two to three hundred years old.

VINE BORDER: *Glen.* Not only is it possible to grow Muscat Grapes well for a number of years in a border 6 feet wide, but, in our opinion, they can be grown better with their roots thus restricted than is possible in borders of greater width. When the roots are allowed to ramble unchecked in a rich medium, the shoots often do not ripen properly. Two-and-a-half feet is ample depth for a vine border, and if it is made so that it settles to 3 inches lower than this, so as to allow for slight top-dressings from time to time when the surface becomes matted with roots, it will be an advantage. Boundary walls, with mortar joints and soil on both sides, should be faced with cement half-an-inch thick, and means should be taken to prevent the roots getting under the foundations. If the young vines grow vigorously, it is a good plan to cut a trench 3 or 4 feet from their stems through the border, in the autumn after the first season's growth, when the leaves commence to lose their green colour, so as to check the few roots that may be unduly rampant.

DESTRUCTIVE INSECTS AND PESTS.

III.—AMERICAN GOOSEBERRY-MILDEW.*

(See Coloured Supplement.)

THE disease of Gooseberries to which the name Sphærotheca mors-uvæ, Berkeley and Curtis, has been given, is, as its common name implies, of American origin. In the United States it has long been a great trouble to Gooseberry growers, but appears to have been unknown in Europe until about 12 years ago, when the presence of the disease was discovered in Ireland. Since that time the pest has become distributed in most European countries—Norway, Sweden, Denmark, Germany, Finland, Russia, Belgium, and Holland—and has been rampant in a number of English counties for the past six years. It has done so much damage, and is so feared by growers, that, as already stated (September 28), it was scheduled under the Destructive Insects and Pests Acts, 1877 and 1907, as a disease the presence of which must be at once notified to the Board of Agriculture and Fisheries, the Clerk to the Local Authority, or to an Inspector of either of these bodies. The notification of the disease applies also to its occurrence on Currant bushes, which may also be attacked. The sale of diseased Gooseberries is prohibited by an Order dated March 30, 1912. Legislation has been introduced to deal with Gooseberry-mildew in Norway, Sweden, Finland, Holland, and Denmark.

The first appearance of the American Gooseberry-mildew in the British Isles was recorded and illustrated in the *Gardeners' Chronicle*, August 25, 1900, p. 143, where an excellent account of the life history of the disease is given.

It is only too true that the American Gooseberry-mildew is a serious pest which causes immense loss, but the fact deserves to be emphasised. The mildew (see coloured supplement) attacks leaves, shoots and fruits; and badly-attacked fruit is ruined for market purposes, even if the sale of diseased fruit were not forbidden. In a leaflet issued by the Board of Agriculture it is stated that the disease has "greatly increased the cost of cultivation of Gooseberries in the countries in which it has appeared, and in some cases it has rendered Gooseberry-growing impossible."

There are two readily distinguishable stages of the disease—the so-called "summer" and "winter" stages. The first of these may appear from May (or even April occasionally) throughout the summer until about November, and is in the form of a soft, white mildew on the leaves of new wood and on the fruit, but not commonly on leaves of old wood (coloured plate figs. 1-4). This form produces great numbers of minute spores, which serve to distribute the pest, as they are blown by the wind and carried about in other ways, and on falling on young fruits or opening buds germinate quickly. In moist, warm weather the mildew may in this manner spread with great rapidity, though it does not always do so. The "summer" spores are very numerous, but short-lived, and when the weather is dry and cool they may not be seriously harmful.

The so-called "winter" stage (coloured plate, figs. 5-7) may be found from July onwards, throughout the winter until the succeeding spring. It occurs in the form of dull-brown patches of a colour which has led to the term "chocolate stage" being employed. Towards and during winter the colour changes gradually until it is soft grey. If these chocolate or grey patches are examined with a pocket-lens little black dots may be seen. These are the winter fruits, or perithecia.

In the "summer" stage a felty mat of mycelium is produced—the white stage—and from this spring chains of conidia or "summer" spores referred to above (fig. 1 of coloured plate). In the "winter" stage the black fruits or perithecia each consists of a strong, hard case or shell, containing eight resting spores, which are liberated in spring and early summer (May to July) to continue the life-history of the species, or as is the case with some to remain dormant for a time. "Some winter fruits remain attached to the infected twigs throughout the winter, but the greater number fall off and lie in the soil. Most of them burst and release the infectious spores in the following summer, but there is reason to believe that they may lie dormant for about 18 months, and infect the bushes in the second year."†

American Gooseberry-mildew has doubtless been distributed in many ways, not the least of these being connected with the trade in Gooseberry cuttings and bushes from infected centres. In this way diseased stocks have been transported over railways and waterways, as well as by road, and may unwittingly be carried by a visitor from a diseased plantation to his own. Diseased berries may serve to spread infection, as also may baskets in which such Gooseberries have been transported. The wind, animals, birds, and even insects, may also act as distributors of spores.

Soft, young, rapidly-growing shoots, especially those from bushes growing on well-treated, highly-manured, deep, porous land, are the most readily attacked, and some varieties which are naturally exceptionally vigorous growers, and produce much young wood late in the year, are more liable to attack than slow-growing sorts. According to the Board of Agriculture, the Keepsake, White Lion, and Crown Bob varieties contract disease to a greater extent than the slow growers—Whitesmith, Careless, and Long Swan. So far as berries are concerned the soft-skinned berries of Golden Drop and Whinham's Industry are more apt to suffer from mildew than those of any other variety. "Ripe berries of any variety are liable to attack. In the case of Keepsake, the berries are fairly immune, while hairy berries of all varieties appear to suffer much more than smooth ones."

In considering preventive and remedial measures, it should always be recollected that a pest should be attacked at the most vulnerable stage of its life-history. In the case of American Gooseberry-mildew, this period appears to be immediately before the date when the perithecia fall off the bushes on to the soil, for they are the means by which the disease is carried on from year to year. The most direct and satisfactory means of combating the mildew, therefore, is to remove all affected shoots early in October, before the perithecia have fallen and infected the soil. All prunings should be burnt. In this way most of the perithecia are destroyed. Such pruning at the proper time is, perhaps, worth all other measures put together, though other steps should be taken when occasion demands. Among these are:—(1) Care in purchasing young bushes; (2) pruning before planting; (3) care not to plant in infected soil; (4) thorough disinfection of packages in which diseased bushes or berries have been placed, using a solution of 1 lb. of copper sulphate in 20 gallons of water; (5) careful and regular inspection of the bushes to ensure early detection of an outbreak; (6) spraying in spring and summer with liver of sulphur, 1 lb. in 32 gallons of water, or 1 lb. in 24 gallons after July, with the addition of 1 to 1½ lb. of soft soap; (7) nitrogenous manures should be used sparingly; and (8) the prompt gathering and destruction of all diseased berries.

One of the chief things to be considered by both private and market growers is the fact that the disease or its suspected presence must be reported, and to this end they should be on the look out for the appearance of the mildew, and should submit specimens suspected of the disease to the nearest authority. *H. C. Long.*

THE WOBURN FORESTS.

IT would be excusable if, after reading what has been written about forestry and the need of it in this country, the conclusion was arrived at that there were no good examples of forests to be found in the British Islands. The illustrations in forestry books are, as a rule, prepared from photographs taken in other countries, those of British woods being generally to show how things should not be done. Yet there are well-managed woods here equal to any to be found on the Continent, although they are, sad to say, comparatively few and far between. Woburn, the estate of the Duke of Bedford, has forests probably second to none in the kingdom.

On a recent visit to these woods, in company with Dr. Henry and the students of forestry from Cambridge, I had an opportunity of seeing British sylviculture at its best.

Little more than 100 years ago the land now occupied by trees was a barren, sandy waste, and there were doubtless plenty of people then who thought it worthless for tree-growing, just as there are people now who would have us believe that our millions of acres of waste land can never be made productive. Such people ought to be taken to Woburn Sands, and they would then cease to talk about the impossibility of converting "waste" land into profit-yielding forests.

At Woburn about 5,000 acres are covered with Scots Pine, which is particularly happy in the deep sand of the higher elevations. Some writers tell us that Pine woods cannot be naturally regenerated, but there is no difficulty at Woburn. Indeed, it appears unnecessary ever to resort to artificial regeneration except in the formation of new woods, which, in the strict sense of the term, cannot be called regeneration. A mature Pine wood of about 12 acres in area which had been clear felled in two roughly equal parts, with an interval of three years between the cuts, is now thickly covered with remarkably sturdy young trees from 12 to 15 years old. This is interesting, because it is exceptional, as some of the seeds must have been wind-carried well over 100 yards, no seed trees having been left standing. Beyond the erection of wire-netting to keep out the rabbits, nothing was done to help the seedlings, except, of course, that the ground was cleared of heather at the time of felling. Plantations of all ages look remarkably healthy, and are as well stocked as though machine-sown.

The woods of mature Scots Pine are perhaps rather thin, although they are denser than is usually the case in this country. It was interesting to see a number of clean-stemmed maritime Pines, fully as high as the Scots, and quite as straight in the shaft. The Weymouth Pine suffers here, as in all parts of the country, from the fungous disease Cronartium ribicolum, which prohibits its use as a forest tree in this country, and has lately commenced to be destructive in the United States.

The Larches at Woburn are perfect, and, in consequence, extensive plantings are being made. The Japanese Larch still has its staunch supporters, though they received a shock from its behaviour in the drought of 1911. Up to about 80 years of age in the hollows and 60 years on the sandy hillsides of Woburn, the European species produces very good crops of excellent timber, but it is advisable to cut it at the ages mentioned, otherwise it gets "pumped," that is, it begins to deteriorate at the base of the stem. This is no doubt due to the comparative poorness of the subsoil. Disease is present, but the vigorous growth of the trees enables them to recover from its attacks. Experiments are being conducted by Mr. E. R. Burdon, of the Cambridge Forestry School, with a small plantation of eight-year-old Larches in an unfavourable soil, the object being to artificially infect the trees by placing badly-cankered sticks under them. Although this has been going on for some years now, none of the trees show signs of infection. The general behaviour of the Larches at Woburn confirms the growing belief that the Japanese Larch is in no way superior to the European, and is in fact inferior to it in more ways than one.

It is a pity that Corsican Pine does not produce better timber at an early age. In mining districts the thinnings are eagerly bought for conversion into pit-props, as the young stems, although not very durable, are generally exceptionally clean, and practically free from taper. But there are no mines anywhere near Woburn, so that this tree has no special value here. The so-called "Mermaid" wood, composed of European Larch and Corsican Pine in the proportion of about 2 to 1, was planted in 1900, so that, allowing three years as the age of the seedlings when put in, the trees are now 15 years old. The Larches are, on the whole, better than the Corsicans, but there is no danger of the latter being suppressed. The Larches are from 25 to 40 feet high, and the Corsicans from 20 to 30 feet. The average girth works out at about 11 inches for both species. An interesting experiment has been carried out in an exposed position on a hill-top, Corsican and Scots Pine having been planted pure in two plantations standing side by side. Both show remarkable vigour, and there is little to choose between them as regards height and girth. These plantations are about 12 years old, and although it is as yet early to judge, the Scots Pine should ultimately be the more valuable on account of its superior timber.

Broad-leaved trees are not a great feature in the Woburn woods, and this is not surprising considering the character of the soil. Oaks in pure plantations were planted 11 years ago on the German method, viz., in rows 4 feet apart, the distance between the plants being 18 inches, so that the number of plants per acre works out at something like 7,000. These plantations were laid down according to the directions of Sir W. Schlich, and although they will probably need underplanting before they reach maturity, no fault, beyond perhaps the excessive cost of planting, can be found with them at present. Needless to say, Quercus sessiliflora has been chosen for this experiment, as the soil is altogether too dry and light for the pedunculate species. Chestnuts, although apparently vigorous and healthy, almost invariably develop ring shake, their timber thus being rendered useless for anything but fence posts and other rough work. This mysterious defect has baffled foresters and scientists alike, but it is significant that the main fissures in several felled trees which we examined all nearly exactly corresponded, viz., were situated in the 50th annular ring from the date of felling (1911). Weather records show a winter of extreme severity in the years 1860-61. In regions not subject to hard frosts ring shake is comparatively seldom found, so it is possible that frost may be the cause of the trouble. Ash grows well in some of the more fertile spots at Woburn, and some remarkably fine specimens are to be seen, but extensive plantings will never be possible over the large areas owing to the lack of mineral foods, particularly lime, in the soil.

I do not believe there are forests to be found in this country better than those just described, and it would be interesting to compare some of the yields with those from Continental woods. The work at Woburn is on the lines of true forestry, not the casual arboriculture which is common on so many British estates. Some things there, such as the non-removal of mature timber or the excessive number of shelter trees over newly-formed plantations, would surprise Continental foresters, but it must be remembered that the Duke of Bedford, although keenly interested in forestry, has also a love for the effects produced by large groups of trees, and prefers a fine view to the profits which could only be made by spoiling it. Mr. Mitchell, his forester, understands this too, and the result is not only good forestry but a landscape of exceptional beauty. *J. G. Watson.*

SOUTH AFRICA.

VALUE OF SMALL HOLDINGS.

IT is interesting to find that the small holdings movement is penetrating into such sparsely-populated regions as South Africa, and it might seem paradoxical that a country with a population of 12 persons to the square mile should concern itself with the problem of small holdings. But to the observant student of intensive cultivation, no paradox is involved, for the question of small holdings is at bottom the question of the limits of size consistent with the most efficient cultivation.

As the writer of the article points out, Mr. Seebohm Rowntree, in his recent work on *Land and Labour; Lessons from Belgium*, concludes, from a careful investigation extending over four years, that Belgium gains enormously from the subdivision of her land among large numbers of small cultivators. The facts are eloquent. With a naturally poor soil, Belgian crops—other than Wheat—stand first in Europe for amount of yield per acre, and the average yield of Wheat reaches the fine quantity of 34 bushels per acre. Side by side with this high productiveness stands the fact that the density of population of Belgium is not far short of double that of England, the respective numbers being 589 persons per square mile in Belgium, and 342 in Great Britain. Applying the moral to be drawn from Europe to the case of South Africa, the *South African Agricultural Journal* recognises that small farming is to be encouraged, and maintains that, with the small holdings, there must be freehold and co-operation. It urges that every farmer should lay off an acre-farm, which should serve him as a model and a standard to which he might aspire to raise the yields from his larger fields.

NEW OR NOTEWORTHY PLANTS.

BUXUS HENRYI, Mayr.

Mayr, in his *Fremland Wald und Park baume*, p. 451 (1906), refers to a peculiarly distinct species of Box, discovered by the eminent Chinese collector, Augustine Henry, near Ichang, which he designates as Buxus Henryi. As, however, the description is inadequate for the identification of his species, I have thought fit to amplify his diagnosis, basing my remarks upon Henry's specimens (No. 3,387), which are preserved at Kew, and which I presume to be conspecific.

A much-branched shrub, 6 feet high, second year's shoots more or less terete with exfoliating greyish, glabrous bark; current year's twigs straight, 3-4½ inches long, alternately compressedly quadrangular, smooth, greyish, and absolutely glabrous; internodes ½ to 1 inch long; axillary buds minute, puberulous; terminal buds long and slender, Beech-like; leaves opposite,

Fig. 182.—flowers and foliage of buxus henryi.

spreading, lanceolate or broadly lanceolate, obtuse or minutely apiculate, narrowing gradually from below the middle into a scarcely perceptible grooved petiole, 2-2¾ inches long, ¾-1⅛ inch broad, thinly leathery and rigid, greyish-green above, paler below, distinctly penninerved and glabrous on both sides, the closely-parallel lateral veins with their accompanying reticulations not very patent; margin closely wavy and slightly recurved and cartilaginous; inflorescences axillary, opposite, scarcely exceeding half an inch, several-flowered, invested below with imbricate conspicuously scarious and greyish, oblong subacute or obovate ciliolate bracts, the inner of which are transparent.

The exceedingly large leaves of B. Henryi (see fig. 182) and its conspicuous inflorescences, with their exserted stamens, which suggest the species' affinity to the Balearic Box, would render it a desirable adjunct to the Boxes now obtaining in English horticulture. The desirability of its introduction is commended to the notice of plant-collectors in China. *R. A. Dümmer.*

ECHIUM WILDPRETII.

The *Revue Horticole* for October 1 contains some notes and two illustrations by Dr. G. V. Perez, Teneriffe, on several species of Echium which grow wild in that island. One of these, E. Auberianum, now appears to me to be identical with E. Wildpretii, as grown at Kew since 1897, figured in the *Botanical Magazine*, t. 7847, and represented by a coloured plate in the *Gardeners' Chronicle* for October 26. In the note accompanying this plate I stated that E. Wildpretii was "distinct enough in foliage and habit from the other species found in Teneriffe" to be accepted as a good species. I have since carefully examined the specimens of this and other Echiums in the Kew herbarium and have read Dr. Perez's notes, and I am now convinced that the plant described by Webb as E. Auberianum, represented by the picture in the *Revue Horticole* and grown by Dr. Perez, is our E. Wildpretii. The following is a rough transcript of a portion of Dr Perez's notes. Writing of E. Auberianum, he says it grows in Teneriffe at an altitude of about 6,000 feet, and that a plant of it which flowered in his garden this year attained a height of 8 feet. The flowers are bright pink when they open, the pink of the Ivy-leaved Pelargonium Mme. Crousse, but their colour changes to purple as they age, and the two colours together give the whole spike the effect of brick-red, which is the colour shown in the *Gardeners' Chronicle* plate. The same species has also been named E. Bourgeauanum. Where it grows wild E Auberianum experiences frost; it is, in fact, the hardiest species in the island. It ought therefore to succeed out-of-doors in the warmer parts of this country.

Dr. Perez also mentions a hybrid Echium now growing in his garden which flowered for the first time last September. It was a chance seedling from an old plant of E. candicans, and owed its origin, he believes, to the intervention of bees which had carried pollen from the flowers of E. simplex growing near to the flowers of E. candicans. In habit the hybrid is more like E. simplex than E. candicans, though one of the plants bore three flower-spikes instead of only one, as E. simplex does. The flowers were a clear blue, about the same shade as the flowers of Plumbago capensis. E. simplex must be a magnificent object where it grows as it does in Teneriffe. Dr. Perez had a plant of it which when in flower was 11 feet high. Before flowering it forms a short-stemmed rosette about 4 feet in diameter, the leaves being 2 feet long by 4 inches wide. The three most striking species of Echium belonging to the Simplicia section and natives of Teneriffe appear to be E. simplex, E. Pininana, which has leaves nearly 3 feet by 6 inches, forming a single rosette about 5 feet through, and E. Auberianum (Wildpretii).

Eight years ago Lord Walsingham flowered several species of Echium in his garden at Merton Hall, Thetford. (See *The Garden*, July, 1904, p. 59.) One of these he had under the name of E. candicans giganteum, but from his description of the plant it must have been E. Auberianum, and not a variety of E. candicans, which is of branching habit and blue flowered. *W. W.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM SUPERBUM GIGANTEUM VAR. ROEBELENII.

The variety Roebelenii is a white form of the well-known D. superbum, and one of the finest of the genus, not excepting even the grand D. Wardianum. The snow-white sepals and broad, undulated petals, with a deep violet and white lip, will make it one of the most desirable Orchids, both for exhibition purposes and the cut-flower trade. The large, showy blooms expand in October and November, when there are very few Dendrobiums in flower. The long, pendulous stems are not so strong as in the ordinary type, but very often they attain 6 to 7 feet in length. The flowers are set almost the whole length of the stem in twos, threes and fours; indeed, as many as 100 flowers have been counted on a single stem. Their perfume is not so pronounced as in the old type. D. superbum giganteum is found over the whole Eastern Archipelago as far as New Guinea, and from the Gulf of Bengal to the Gulf of Tonquin, but so far very few white forms have been found amongst them. It has been my good fortune to come across this fine variety, growing together with the old form, though it is by no means very plentiful and many big trees had to be felled to get a small lot together. D. superbum invariably grows in low grounds; warmth and plenty of moisture are necessary to their well-being. So far as I can see they never are entirely at rest; even in the dry season they push forth new growths. In their home the rainy season begins in November and lasts till May; then follows a very dry period, at the end of it the flowers expand and last in bloom for several weeks. They mostly grow on very high Teak trees, with very little shade from the overhanging branches. Plenty of water and decayed leaves falling between their roots seem to be quite essential to their well being and to enable them to produce such enormously long stems. Indeed, I cannot believe a small pot with a few crocks and a little Sphagnum-moss are sufficient to grow them successfully and keep them in perfection for any length of time, but this matter I have to leave to the wisdom and experience of growers at home. *C. Roebelen, Orchid Collector, Bangkok, October, 1912.* [Dried flowers are sent which well bear out Mr. Roebelen's remarks, but it may be well to state that three white forms are already in gardens, those known as Burkei (see *Gardeners' Chronicle*, 1884, vol. xxi, p. 306) and Hutton's variety (see *Gardeners' Chronicle*, 1869, p. 686) being apparently of the same class as that now described.—Eds.]

CORSICA.

THE Island of Corsica, which owes much of its fame to the fact that it was the birthplace of the great Napoleon, is no less interesting to the naturalist than to the historian.

It lies 106 miles from the coast of France, and 50 miles from the Italian shore. The Strait of Bonifacio, 6 miles in width, separates it from the Island of Sardinia. Corsica was formerly known as "L'ile de Beauté," and it well deserves the name. A solid chain of mountains stretches along the middle of the island from north to south, and culminates in Monte Cinto, which is nearly 9,000 feet high. The central range throws several arms towards the sea, notably one in the east, which, intersected by deep valleys, ends abruptly at the coast, where the rocks rise sheer out of the water, and the shore is broken into innumerable gulfs. The western slopes are more gentle, and form wide, fertile valleys and plains, which were once known collectively as the granary of Rome. At the present day, unfortunately, the name is no longer applicable. From the mountains many torrents make their way to the valleys below, carrying with them large quantities of sand and small particles of rock, which so fill up the beds of the streams that the water overflows the land.

Malaria is rife in warm weather, and until lately no precautions were taken to prevent its ravages by destroying its agent, the mosquito.

THE CLIMATE.

Owing to the mountainous and varied character of the land, the climate varies very much in different parts of the island. Broadly speaking, the climate may be said to be intermediate between that of the French Riviera and that of Algeria, but less extreme, owing to the influence of the sea. The island is of granitic formation, except for a small block of limestone in the south; its geology is curious and somewhat complex, igneous rocks cropping up in the strangest positions. The arable soils are mainly alluvial. They have been formed by deposits brought down from the mountains by the streams, and are of a light, sandy nature. In some places clay appears to have been formed by the atmospheric-weathering of granite rocks.

According to the latest report by the Hon. Henry Dundas,* only one-fifth of the island is cultivated; and even this estimate would seem high, since it is possible to traverse many miles without seeing any sign of cultivation. At first sight one might be tempted to blame the idleness of the population for this neglect, but it must be remembered that in some parts water is very scarce, and in the south five or six months of drought are by no means unusual. Again, malaria, as already stated, is extremely prevalent, and makes it impossible to live in the plains during the summer. A few months ago the sum of 12,000,000 francs was voted by France for the purpose of draining the eastern coast, in the hope of reducing malaria and restoring the ancient fertility of the plains. During the last few years the occupation of agriculture has received a certain stimulus in the shape of the formation of the "Syndicat Agricole"; and a change in the food-habits of the population has also operated favourably in this direction.

From an extremely remote period until recent times life in Corsica has been very easy. In every valley, as well as on the slopes of the granite hills, there grew in wild profusion a most useful tree—the Sweet Chestnut. The fruit, ground into a flour, formed the staple food of the people, who cooked it with goat's milk to make "pollenta," and ate it at every meal. Home-made cheese formed a large part of the diet, and also wild game, which the people shot at will—for every Corsican possesses and carries a gun. Unfortunately, a parasitic fungus has of recent years attacked the Sweet Chestnut, and, after ruining the plantations in the centre and south-west of France, made its appearance in the thick groves of Corsica. The attack of this disease is insidious and deadly. It usually makes itself apparent at the time that the trees affected have finished their annual growth. The leaves hang on the branches in autumn long after the healthy trees are bare. They fall ultimately, and no new leaves being formed, the tree dies. The process usually takes three or four years; and when the tree is cut down, the wood is found to be quite black, as if the sap has turned to ink; the disease is, indeed, known as the "ink" disease. A long series of investigatione has been carried out by the French Government with a view to the identification and elimination of the fungus; but down to the present no remedy has been discovered.

Besides the "ink" disease, another enemy to the Chestnuts, scarcely less harmful, has made its appearance. This enemy is the tannin factory, which prepares tanning materials from the wood of the Sweet Chestnut trees. About £80,000 worth of extract of Chestnut-wood is exported annually to England and Germany to be used in the dyeing industry; and, dreading the fungus-disease, and attracted by the idea of getting ready money for his trees, the Corsican willingly sells his capital. Scarcely any young trees are planted in the place of those which are felled; with the result that in a few years, the owner of forest land is obliged to till it in order to get a living. In this way, agriculture slowly increases, and makes a certain amount of progress.

In spite of all the adverse circumstances against which the Chestnut trees have to contend, there are still some large forests in the island. The best are to be found in the districts of Orezza and Otto, and large quantities of the fruit are exported thence to Lyons, for the manufacture of "marrons glacés."

Many of the lower slopes are covered with Olive trees, especially in the district of Balagne, and all round Ajaccio (see fig. 183). The grey foliage of the Olive gives the landscape a peculiar aspect; somewhat dull at times, but with a certain beauty of its own, especially when a light wind stirs the leaves, which gleam and glitter in the bright Corsican sunshine. Numerous species of Citrus grow, and succeed very well, in the Corsican plains:—C. Aurantium (Orange), C. vulgaris (bitter Orange), C. decumana (Shaddock), C. medica (Citron), and C. nobilis (Mandarin). Cedrats and Lemons are exported in fairly large quantities, but the tree which thrives best is the Almond. There are several large plantations of this tree, and they could, no doubt, be increased, as Corsican almonds, which are very rich in flavour, find a ready market. A company, financed entirely by British capital, has been established for six years on two large plots outside Bastia; on one, there are about 10,000 Almond trees. Figs thrive almost anywhere, and the same may be said of Peaches. A little wine is made, chiefly in the north, around Cape Corso.

Very little in the way of horticulture proper has as yet been attempted. This seems a pity, as natural conditions are even better than in the Riviera itself. Round the towns of Ajaccio and Bastia there are a few private gardens, where Palms, Cacti, Araucarias, Acacias, and Eucalyptus grow exceedingly well. A few market gardeners grow various kinds of vegetables with success. New Potatos, Green Peas, and similar products are obtainable all through the winter; but the long period of drought makes gardening difficult in the summer. Attempts at growing flowers—notably Roses, Carnations, and Freesias—have proved successful; and, no doubt, when communication is more frequent, this branch of horticulture will increase.

THE CORSICAN FLORA.

In the preface to the *Flore Générale de la France* MM. Bonnier et de Layens say:—"As for the Isle of Corsica, its flora is so peculiar that we have not included it in our book." Corsica possesses, however, a large number of species in common with the neighbouring Continental coast; others are only met with in countries as far distant as Greece, Spain, and Algeria; which seems to point to a former connection between all these countries. Others, again, are indigenous to Corsica; but the native plants are becoming rarer each year, chiefly owing to increased means of communication. Of the plants indigenous to the island we may mention:—Draba Loiseleuri Boiss., Cistus corsicus Lois, Silene corsica D.C., Silene Requienii Ott (Melandrium Requienii

* Report on Corsica, by Consul the Hon. Henry Dundas, 1910.

Rohr), Erodium corsicum (a very pretty, freely-flowering rock plant), Ruta corsica, Gallium corsicum Spreng., Bellis Bernardii Boiss. and Reut, Aronicum corsicum D.C., Helichrysum frigidum, Linaria hepaticæfolia Duby, Mentha Requienii Benth., which forms a dense, strongly-scented carpet. Thymus herba-barona Lois, Helxine Soleirolii (of which there is a good border on the stage of No. 4 house at Kew) grows in the open in warm places.

The most striking feature of the Corsican flora is the "maquis." This is the name given to the thickly growing shrubs covering all the land which is not cultivated or wooded. Various species of Cistus form the greater part of the "maquis," the dominant forms being Cistus monspeliensis, L., with narrow, dark leaves, and white flowers; C. salvifolius, L., or sage-leaved Cistus. A natural hybrid, formed by a cross between C. monspeliensis and C. salvifolium often occurs, and is known as C. Flichei. C. incanus, L. (C. corsicus Lois), is quite distinct from the three first-named species, having wider leaves, and large, attractive-looking pink flowers. The aroma of the Cistus is perceptible a considerable distance out at sea; and Napoleon, the greatest of all Corsicans, wrote from St. Helena:—"La Corse! cette île enchantée! son odeur seule me la ferait reconnaitre."

On the fresher slopes, the Strawberry tree (Arbutus Unedo) takes precedence of the Cistus, forming impenetrable thickets. The fruits ripen in December, and are used for making jam. Pistacia Lentiscus is common in the "maquis"; and also Erica arborea, which grows very tall, and when in bloom, in early spring, forms greyish-white pyramids. The roots of this Erica are sent to Ajaccio, where they are used for the manufacture of "briar" pipes.

Myrtus communis and Phillyrea angustifolia are much in favour in Continental gardens; they both grow in the "maquis," and the inhabitants of the island make baskets of the straight, young shoots of the Myrtus. Calycotome spinosa is conspicuous on account of its sharp thorns. It is a first-class hedging shrub, though somewhat bare in winter. The plant presents a charming appearance in early spring, when it is aglow with bright-yellow flowers. It has a peculiar advantage in that it is not nibbled by goats or rodents, all its parts being poisonous. There are several other plants of smaller size and less profusion, such as Daphne Gnidium, Genista corsica, Lavandula Stœchas, Psoralea bituminosa, Helianthemum Tuberaria, H. guttatum, Helichrysum tempis, H. angustifolium, &c.

Long, prickly trails of Smilax aspera and Asparagus acutifolius bind the shrubs together, and make them impenetrable. The general appearance of the "maquis" is that of a dark green carpet, relieved in winter by golden spots of Calycotome and Genista. In May, the Cistus are in bloom, and the "maquis" then looks at its best; but with June come the hot, dry winds from Algeria, which destroy the flowers and foliage, leaving everything burnt and reddish, and suggestive of an African landscape. In olden times the "maquis" formed a safe retreat for the outlaw flying from gendarmes or vendetta; but the days of banditti are over, and they are only seen on picture post-cards. The chief utility of the "maquis" shrubs at the present day consists in providing material for the manufacture of charcoal, of which 5,500 tons are exported annually. Bundles of Cistus and Lentisques are used by bakers as fuel for their ovens. Where the "maquis" has been destroyed and the ground abandoned, it quickly becomes covered with Asphodelus albus and Asparagus acutifolius. Asphodelus albus is attractive, with its tall, graceful spikes of white flowers. It has fleshy roots, which are very difficult to dig out of the soil when once they are established. *C. L. Digoy.*

(To be continued.)

FOREIGN CORRESPONDENCE.

THE BULGARIAN ROSE HARVEST.

It is part of the irony of history that the most sanguinary struggles sometimes take place in the fairest spots. The slopes of the Balkan Mountains are the Rose garden of South-eastern Europe. Once south of the Shipka Pass (so grimly held by the Turks in 1877-8), the traveller finds himself in the Valley of Flowers. Should it be late May or early June, the whole countryside (sloping upward to the snow-clad mountains, downward to the Maritza River, and thus forming a natural "South Wall") is red with the Musk Roses from which the famous "attar"—worth its weight in gold—is extracted, and gay with the songs of the girls and women who pick the Royal blossoms. Motley and picturesque are the flower-gatherers—here a group of veiled Mohammedan women, representing the daily diminishing Turkish element, there a bevy of Greek girls in native caps, fair-haired Russians or swarthy Albanians—for the native Bulgarian population is unequal to the daily task of picking the tons of blossoms necessary to produce a few pounds of the "essence," and workmen are recruited from far and wide. Nor can they gather for many hours daily, for the perfume distiller knows that the best results can only be obtained from flowers plucked at dawn or eventide, and once the sun is high in the heavens, work is suspended until the cooler hours. But many hands make light work, and the white-sleeved native girls and women (interspersed with a few lads, and reinforced by the foreign pickers) empty their baskets unceasingly into sacks which the long string of donkeys carries to the primitive distillery.

A simple thatched shed—a lean-to constructed against any convenient wall—a brick furnace surmounted by a rude alembic, a tub of cold spring water (constantly renewed by a gully from the mountain side) to cool the pipe, a large flask or bottle to receive the product—such is the rude factory in which the most precious liquid in the world is produced among the most picturesque surroundings. The valley of Damascus, the vale of Cashmere, Ghazipur, a few favoured spots in Italy and Sicily, and (last but not least) the French Riviera also produce the Rose, but Bulgaria fears no rival except the last-named. With ample wood to feed the distillery furnaces, running water to cool the alembic pipe, cheap peasant labour, a singularly suitable soil, and a site designed by Nature herself for a flower garden, the Valley of Roses is likely to hold its own for long years to come. This part of Bulgaria, at any rate, is—as a famous warrior remarked of another favoured land—"a country worth fighting for." *F. A. W.*

AGRICULTURAL EDUCATION IN FRANCE.

France has a way of doing without fuss, and merely because they are in accord with common sense, many things which other countries can only contrive after much talking and arduous campaigning. Among those things which they order better in France are the agricultural co-operative credit societies, and no higher tribute to the success of these societies is to be found than that contained in a report made by United States representatives to President Taft. That report states that as a consequence of this and other educative work done during the past 15 years in France, the value of the annual crops has been increased by £20,000,000.

Board of Agriculture Appointments to the Horticultural Branch.—The attention of our readers is directed to the announcements in another column of the intention of the Board of Agriculture to appoint a General Horticultural Inspector to the Horticultural Branch of the Department. In addition to the general inspectorship, appointments of two other inspectors will be made in connection with the work of the Board dealing with scheduled pests.

THE ROSARY.

CULTURAL NOTES FOR DECEMBER.

With respect to transplanting, it is unnecessary to repeat the advice given for November, except to insist upon a careful selection of varieties with a view to their individual habits of growth. This point is often neglected, and Roses are frequently found in places which are unsuited to their size and habit, especially in beds and borders of mixed varieties. Even with climbers and pillar Roses, a variety is often to be seen which only reaches to about half the desired height, and another which so overgrows its support as to be unsightly. A row of pillar Roses, or a border of dwarfs, should be all of the same, or nearly the same, height; and unless the habit of each is well known, it is worth while to make inquiry. As regards dates of flowering, the same care in selection should be exercised. These remarks have, perhaps, little to do with actual culture. They are merely suggestions, thrown out in the hope of preventing disappointment.

In exposed positions, some protection will probably be needed; but as little should be given as possible—coddling will do more harm than good to hardy varieties, and these are now so numerous that there is no excuse for growing tender ones out-of-doors. The best protection for dwarfs is supplied by drawing up the soil round the roots and base; this is better than heavy mulchings of rotten manure, which nearly always freezes and does more harm than good. The indiscriminate scattering of loose straw litter among the plants should also be avoided; this is only of use where they are exposed to a cold, frosty wind, and since the wind invariably blows the litter away, the plants are soon completely exposed to its biting influence. Branches or twigs of Fir (according to the size of the plants) are much better. They are more easily arranged, do not retain moisture, and are too heavy to be readily blown away. If the position is very exposed, it is a good plan to form a miniature hedge of the branches, laying a few among the plants as well. In the case of tender dwarf Roses (such as Ma Capucine) it is a good plan to stick a few branches of Birch among the plants; if taller than the Roses they keep off wind and hoar frost.

Ample light and air should be afforded at all times, both in summer and in winter.

ROSES UNDER GLASS.

There is little to be done indoors, except to bring a few more plants into the warmth, and to provide a slightly increased temperature for the first batch. January is probably the best time for starting the main batch, since there is a prospect of more light as they develop; though the sun may not be visible, the light is sensibly increased. The earliest of the grafted plants may be removed from the case, though they should be retained for a time in the same section of the house. This part of the subject of Rose culture, however, was so fully treated in the notes for November that it is unnecessary to go further into the same matter now. The same method should be continued until a sufficient number of plants are obtained. *Practice.*

NEW ROSES.—IV.
TEA-SCENTED ROSES.

(Concluded from p. 406.)

Mrs. Foley Hobbs (T., A. Dickson & Sons, 1910). This Rose is coming (or perhaps I should rather say has come) very rapidly into favour with exhibitors, some of whom regard it as the best Tea introduced since White Maman Cochet. It is ivory-white with a good high centre and plenty of petals; sometimes, particularly when grown under glass, it has a faint tinge of peach colour in the centre. The plant is strong, vigorous and hardy, and grows rather tall. It is certainly a very beautiful and perfect flower of distinct outline and firm, the edges of the petals of which are slightly indented or waved, and the flowers are freely produced. It is, however, not merely useful to the exhibitor, but is also an excellent garden Rose, and will become popular when known.

Mrs. Herbert Stevens (T., McGredy & Son, 1910). If Mrs. Foley Hobbs is one of the best Tea Roses for exhibition, the variety Mrs. Herbert Stevens must take its place among the best half-dozen decorative Roses of recent introduction. It is altogether a delightful Rose, both in the bud and in the flower. The colour is a pure white, and the buds long and pointed, while the flowers, with their long, shell-shaped petals of good substance and opaque, are most attractive. The flowers are thin and therefore open well. I should have thought them too small for exhibition, at least as a rule, but I am told that the flowers will come of large size if strictly disbudded. The flowers are fairly well carried on long stems, which make them most useful for decoration, while their highly artistic form and finish make them great favourites with ladies for wearing in the evening. The only things I have against this Rose are its slight tendency to mildew, and also that in my garden its growth has not been so vigorous as I could have wished, and the foliage is poor, but I am told I shall not have to complain of the growing power when the plants are fully established. I have only had my plants for a year, but have found the flowers most attractive and very freely produced. I think it a Rose that everyone should grow freely.

Mrs. Hubert Taylor (T., A. Dickson & Sons, 1909) on its introduction was spoken of as a more vigorous Mme. Cusin. It is certainly a strong grower, but the flowers are less attractive, and are paler than those of Mme. Cusin, being a pale rose-pink. Sometimes they are pretty and the plant is certainly a good doer, but I am often disappointed with its performance.

Molly Sharman Crawford (T., A. Dickson & Sons, 1908). I very early fell a victim to the charms of this beautiful Rose, which flowers continuously from one end of the summer to the other. The flowers are white, generally well shaped, and carried erect well above the foliage. The plant is fairly symmetrical, with beautiful foliage, red when young, and passing through bronze to green. It is a good grower, and has been perfectly hardy with me. It is specially good in hot weather, and I found its value in the hot summer of 1911, when so many Roses became useless, but it will also stand a certain amount of wet. Its weak points, if it has any, are that in cold weather the petals are apt to come slightly crinkled or rough on the surface, and that for its class it is a little, but not badly, subject to mildew. This notwithstanding, it is about the best white bedding Rose we have at present, and is a thoroughly good garden Rose, with a very pleasant Tea perfume.

Nita Weldon (T., A. Dickson & Sons, 1908) is another white Rose with a slight tint of buff. It seems a useful Rose for exhibition, and has not been a failure as a garden Rose, but it requires good cultivation

Paula (T., Paul & Son, 1908). This Rose is said to have been raised by crossing a seedling from Maréchal Niel with a seedling from G. Nabonnand. It is lemon-yellow in colour, not very full, and a little too loose in shape, but a pretty decorative Rose. The plants are very bushy and well shaped, and flower freely and continuously. The flower has a pleasant fragrance.

W. R. Smith (T., Henderson, 1908) was raised as a cross between Kaiserin Augusta Victoria and Maman Cochet. The flowers are white with a tinge of blush, usually well formed and of plenty of substance, but not carried erect. The plant is a good grower, with plenty of foliage, of a good dark green, and seems free from mildew. It is a good Rose for exhibition and quite a fair garden plant. *White Rose.*

THE ALPINE GARDEN.

PRIMULA CARNIOLICA AT HOME.

Judging from catalogues, Primula carniolica should be a common plant in gardens. In point of fact it is a very rare one indeed (and hardly less so in nature), the plants that masquerade under its name being usually forms of P. glaucescens. The true P. carniolica is the third and least-known in the brevibracteate group, which also includes P. marginata and the magnificent true P. viscosa (also a very rare plant in gardens, where it sometimes slips in under the names of P. latifolia, P. graveolens, or P. cynoglossifolia). Of the three, P. viscosa has the widest distribution, ranging along the granite Alps from the Pyrenees. P. marginata belongs to the Maritime, Graian and Cottian Alps, but P. carniolica, despite its promising specific, is restricted to a very small district north of Trieste, on the wooded hill-tops round Idria, where, even so, it is of very local occurrence.

I have never been so far for a single species. For weary day after day one toils out to Vienna, and thence, for weary day after day, far down into the Southern Alps, until at last one has got utterly beyond all civilised peoples and languages, into a far corner of the world, where every word is alike unspellable and unpronounceable, built entirely of x's and z's, and rarely consists of fewer than ten syllables. Here in its remote fastnesses, dwells Primula carniolica. The country is wooded and fertile, the hills are only of some 4-5,000 feet, and hardly, if at all, rise clear of the woodland. In the tumble of mountain ranges the eye is struck by the comfortable steadings that perch in cleared patches of culture all up their sides. And the whole Slavonian land gives an impression of ease and prosperity. The Slavs of this secluded hill-country have a nobler look than they show in more populous and central districts.

Even in its own realm it is not easy to come by P. carniolica, so sporadic is the distribution of the plant. One climbs by steep and stony tracks, over grassy slopes, ablaze in the late August with Michaelmas Daisy and lovely Cyclamen, up and up, by hot and sunburnt ways, over delusive summit after summit, each in turn showing a fresh apparent summit in the distance, until one is hot and anxious indeed. For all the way, no matter at what height, there is no sign whatever of the Primula—no, not even when you are well within the zone where all right-minded Primulas have the habit of being found. I ranged from likely spot to likely spot, and from each returned empty to the track. To have come so far—! And meanwhile Omphalodes verna was the only thing of interest I saw; and there were now, of course, no more flowers. Ultimately, though I had precise directions, it was in a cold sweat of misery that I climbed at last empty-handed into the icy wind that swept the summit of the hill; and still I had found nothing. Here, however, was a mown meadow, with heaps of stone picked off to clear it, and piled up. On the far side was another steep and wooded slope facing the north, and here, in the grass on the shady side of the stone piles, just as I was longing for death, suddenly began P. carniolica.

In the grass the Primula was poorly, and had a depressed, unhappy look, struggling with long trunks along the ground. It was down in the wood below that it belonged and abounded in rich luxuriance in the dense shade, thriving in the deep wads of moss, and on the damp faces and ledges of shady rocks. This rare and wonderful Primula differs wholly in character from its two relations (and from all its section, indeed). It is not a saxatile plant like P. marginata. It is not an open-air plant like P. viscosa. It loves obscurity and moss and moisture, and, alone of all our Alpine Primulas, rejoices in rich, cool, and copsy corners, such as might suit the common Primrose. Here, in deep sponges of moss, it forms wide, straggling

plants, sending out its woody trunks through the soft expanse. Here and there spring its tufts of leaves, which are long and oval and slack in texture, rather glossy, and absolutely devoid of hairs or powder. They die utterly away in autumn, and the green bud of next year's foliage alone remains to tell you that the plant is there. When I found it the leaves were yellowing, and I was disappointed to find only one seed-head. It would seem that course, an albino form, which must be lovely. In my own case, as all the flower was over, I must trust to luck for it, and to my pertinacity in searching out such plants as had a pallid look in their leaves. In the same station, too, has been rarely recorded the beautiful hybrid of P. carniolica with P. Auricula—that P. × venusta which, crossed again with its maternal aunt P. marginata, has resulted in the glorious violet of the secondary hybrid P. × Marven. But,

Fig. 185.—Flowering spray of Asparagus Lutzii.

it flowers sparsely at home. With me, in an open but not sunny border, it grows robustly, and flowers more readily than almost any other. The flowers are of quite remarkable beauty, even among Primulas. They are carried in loose heads of 3-6, on rather flaccid, smooth, green stems of some 6 or 8 inches, and are large, splendid and round, of a very delicate, lovely rose-pink, with a conspicuous mealy eye, and an exquisite scent. There has been found, of though I quested eagerly, I caught no glimpse of P. venusta, nor indeed did I ever succeed in sighting any form of P. Auricula. However, long and far and arduous and expensive as the journey may be, it is not wasted time or cash if it yields such a first-class treasure of beauty and vigour as the very rare and remote P. carniolica, most shy, secluded and romantic of its race—hardly excepting even the no less rare and misrepresented P. Allionii. *Reginald Farrer.*

NOTICES OF BOOKS.

British Violets.*

In this volume Mrs. Gregory has brought together the result of more than a quarter of a century's work on the British Violets; that is to say, the species of Viola of the section Nominium, which excludes the Pansies (V. tricolor, &c.).

Mrs. Gregory has not only studied the plants in the field, but also under cultivation, and has examined the material in the collections at the British Museum, Kew, and Cambridge, and also specimens sent by numerous correspondents. Twelve species are recognised: Viola odorata, V. hirta, V. calcarea, V. palustris, and V. epipsila of the group Acaules, and V. silvestris, V. Riviniana, V. rupestris, V. canina, V. lactea, V. stagnina, and V. montana of the Caulescentes group. Hooker's *Student's Flora* (Ed. 3, 1884) recognised six species, while the recent edition of Babington's *Manual*, by Messrs. Groves (1904) gives eight. The additional species are (1) Viola calcarea (Gregory), a segregate from V. hirta, which Babington had included with other forms as a variety of that species, and which was restricted and defined by Mrs. Gregory in the *Journal of Botany*, 1904. Though when thus restricted it is a widely different plant in appearance from typical V. hirta, Mrs. Gregory is fain to admit that the two are connected by a whole series of intermediates. (2) V. epipsila (Ledebour) was first detected by Mrs. Gregory as a British plant from South Devon, and has since been noted from other localities in southern England, Wales, and Ireland. It is very closely related to V. palustris, but kept distinct in most European floras. (3) V. lactea (Smith), which British botanists have regarded generally as a subspecies of V. canina. (4) V. montana (L.), discovered in Woodwalton Fen, Huntingdon, in 1905. This is synonymous with V. nemoralis (Kützing), a German and Scandinavian plant, but the author expresses her doubts as to its validity as a good species, and would "not be surprised if it turned out to be a hybrid between V. canina var. lucorum and V. stagnina."

Under each species is cited its synonymy; this is followed by a detailed description of the plant and its parts, various notes, and details of distribution in the British Isles. The numerous varieties, forms, and hybrids are discussed in detail and at length. An important feature of the book are the numerous excellent illustrations, partly reproductions of photographs and partly line drawings, the latter by Miss W. Mills. Mr. G. C. Druce supplies an introduction, in which he reviews the history of our knowledge of the British Violets. Mrs. Gregory also acknowledges his help, along with that of other workers at British botany, in her preface.

The book is very clearly printed, and forms a valuable addition to the literature of the critical study of the British flora. Mrs. Gregory is to be congratulated on the completion of a useful piece of work. *A. B. R.*

ASPARAGUS LUTZII.

The new Asparagus, A. Lutzii, illustrated in fig. 185, was raised by Mr. Lutz, of Bingen-on-Rhine, from seed obtained by crossing A. plumosus nanus and another species of Asparagus.

The hybrid is characterised by upright and vigorous growth, by good-sized short shoots (the so-called leaves), and by freedom and persistence of flowering.

As shown in fig. 185 the branches, which reach a height of upwards of 6 feet, grow fairly erect, and exhibit but little trace of the climbing habit. They may be tied to bamboo stakes or to vertical wires. It would appear from the photographs and description which the raiser has sent to us that the hybrid A. Lutzii will prove useful both for decorative and cutting purposes.

* A monograph, by Mrs. E. S. Gregory. 8vo., pp. xxiii, 108, illustrated. (Cambridge: Heffer.) 1912. Price 6s. net.

KEW NOTES.

CRATÆGUS CARRIÈREI.

This hybrid Thorn originated in France, the reputed parents being C. mexicana and C. prunifolia. On the Continent the name C. Lavallèi is sometimes used for the same hybrid. Its most valuable character is that the fruits hang on the trees till December, its only rival in the Thorn collection at Kew at the present time being one of the parents, C. mexicana. The fruits of this species are yellow, forming a pleasing contrast to the rich orange-red fruits of the hybrid. Carrière's Thorn is also a showy tree when in flower, with corymbs of white blossoms half-an-inch across, prettily relieved with pink stamens. The fruits are ⅜ inch in diameter, borne 10 to 18 in a bunch. Previous to falling in late autumn the leaves assume a shining bronzy-red hue.

CRATÆGUS OXYACANTHA PRÆCOX, THE GLASTONBURY THORN.

Judged by the number of inquiries for this remarkable tree by visitors, this is the most popular tree in the outdoor garden at the present time. The flowering season of the Thorns is May, but, in addition to producing blossoms at that time, the Glastonbury Thorn flowers more or less freely between November and March. A tree in the Thorn avenue south of the temperate house is at the present time flowering freely, while there are also a considerable number of ripe fruits from the May flowers. The legend of the Glastonbury Thorn is that, when Joseph of Arimathea landed in this country to preach the Gospel, he brought with him a staff of Thorn wood. At night, while he slept, he fixed the staff in the ground. In the morning when he awoke, according to the legend, the staff had taken root and was covered with white blossoms.

DAHLIA IMPERIALIS.

A fine specimen of this striking Mexican plant is flowering in the succulent or Cactus house No. 5. From the fact of its not flowering till early winter it is necessary to grow the plants in large pots or tubs, and remove them from outside, where they may be grown during the summer, to a cool greenhouse at the first sign of frost in autumn. The plant in question has five vigorous growths about 9 feet in height, terminating in panicles of white blossoms, faintly tinged with mauve.

COTONEASTER PANNOSA.

This Chinese species was first collected and sent to France by a missionary about a dozen years ago. It is now represented at Kew by a large bush, 6 feet to 7 feet high. The larger branches are upright, the younger ones slender and semi-drooping. The leaves are small, the red fruits are also on the small side and very freely borne on the branchlets. These seem less attractive to the birds than other species, for the birds have only just commenced to eat them, while most of the fruits are gone from the surrounding bushes of other species, except C. rotundifolia.

A VINE PERGOLA.

The need for a better position for the collection of Vitis and one where the many varied species and varieties might be better observed and compared has long been felt desirable. Consequently, an iron pergola is now in course of construction between the refreshment kiosk and the Rose dell. Running N.E. to S.W., the pergola is about 150 yards in length; the uprights and crossbars are of 1 inch barrel iron, having an outside diameter of 1⅜ inch. Along the sides the uprights are connected with galvanised chains To each upright three wires are fixed, tripod fashion, standing out about 1 foot from the base as additional support for the growths of the Vitis. The pergola is 10 feet high, 11 feet wide, with an average of about 12 feet between each pair of standards, of which there are 41 on either side, 82 in all. *K.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Ground Operation.—The work of root-pruning, lifting and removal of fruit trees has been carried out under exceptionally favourable conditions. Continue these operations whilst the weather remains mild, for, if delayed, cold rains and snow may prevent the work being done until very late in the spring. It is not so necessary in the case of light, sandy soils, that may be worked within 24 hours after rain. Trees on light soils soon become exhausted unless they are top-dressed frequently, and the fruits thinned. Drainage is another operation which should be done at this season; this work is often neglected, but it is very important, especially when preparing land for orchards. Fork up the soil where fruit trees are growing, but take care not to injure the roots. If healthy roots are found near to the surface, apply a good dressing of manure or compost similar to that recommended in a previous Calendar. Road scrapings, hedge trimmings, prunings and other refuse charred in the fire heap will furnish valuable material to supplement animal manures.

Insect Pests.—The present is the best time in the whole year for clearing the trees of insect pests, for growth is dormant and strong specifics may be employed. Follow out previous directions given in Calendars for the destruction of American blight, mussel scale and winter moth. It is not sufficient to spray old, cankered branches infested with American blight and aphis; the specific should be well worked into the crevices with a half-worn painter's brush. It is not an easy matter to destroy by spraying scale insects on old badly-infested Pears: the rough bark should be treated with a brush. Quick-lime dusted freely over the trees will destroy many insects, keep the bark clean, and prove of great value to the roots.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Management of Orchid Houses.—Great care must be exercised in regulating the temperatures and the atmospheric conditions of the Orchid houses in winter: endeavour to keep the temperature as even as possible. During frosty weather, when much fire-heat is necessary, the atmosphere should be prevented from becoming too dry. On bright mornings following frosty nights, as soon as the temperature commences to rise to the proper degree, every available space should be moistened thoroughly by syringing; the stages, bare spaces between the pots, the paths and underneath the hot-water pipes should all be damped. At the same time water any plants that are dry. Houses with paths formed of iron gratings or wooden lattice work over the natural earth will not require damping so much as those with paved or tiled floors. The East Indian, Cattleya and intermediate houses should be damped between 2 and 3 p.m. One damping should suffice in the Odontoglossum house, but at all times the amount of atmospheric moisture should be regulated according to the weather.

Temperatures.—The night temperatures of the various houses should be regulated as nearly as possible as follow:—East Indian house, 65° to 68°; Cattleya house, 58° to 63°; intermediate house, 55° to 58°, and Odontoglossum house, 48° to 52°. On very cold nights the lower temperatures will be sufficient, as an excess of fire-heat may prove harmful to the plants. The houses should be warmest at mid-day. During very cold weather, the temperature should be about 5° warmer at mid-day than in the early morning, but the thermometer may be allowed to rise several degrees higher during periods of bright sunshine. If lath blinds are fixed to the houses, they should be lowered during cold nights; if permanent blinds are not used, the glass should be protected by some other covering, such as waterproof canvas or archangel mats. Their use will prevent the temperature from fluctuating, economise fuel, and keep the atmosphere from becoming very dry.

Ventilating.—Admit fresh air when it is possible to do so without lowering the temperature or chilling the plants. Air is best admitted through the bottom ventilators, which should be arranged so that the cold air becomes warmed somewhat by passing over the hot-water pipes. The ventilators on the side sheltered from the wind should be opened first, and, as the temperature in the house rises, those on the other side may be opened a little to cause the air to circulate.

Lycaste.—The flower-buds of Lycaste Skinneri and its variety alba are well advanced, and the plants should be grown in a light position in a house having an intermediate temperature. As the flowers approach their full development, the plants should be subjected to moderately dry conditions. Only sufficient water should be applied to the roots to prevent the pseudo-bulbs from shrivelling. Weakly plants should have the flower-buds removed as soon as they appear. These remarks apply also to L. Balliæ, L. Mary Gratrix, L. leucantha and L. cruenta. The deciduous species such as L. aromatica and L. cochleata should be rested as soon as the pseudo-bulbs are fully developed. Water should only be applied when the pseudo-bulbs show signs of shrivelling.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Early Pot Figs.—Forcing may be commenced by plunging the pots in a moderately warm hot-bed. The trees should be placed near to the roof-glass, so that they may receive plenty of light. The temperature of the house should be 55° or 60° at night, with a rise of 5° during the day. Water the roots carefully and regulate the amount of syringing and damping in accordance with the weather conditions. On every favourable opportunity admit a little fresh air to the trees.

Early Fig Trees in Borders.—The date of starting the permanent trees into growth must be regulated largely by the season when ripe fruits are in the greatest demand. If the wood is ripened thoroughly, it is an advantage to start the trees early to allow the fruits to ripen slowly, rather than to attempt to hurry them at the last moment, as Figs are impatient of hard forcing. It is usually about five months from the time the house is closed before the fruits are ripe. Although the young growths were stopped and thinned in the summer, the trees must be again examined carefully, and if there is a superabundance of growth, the shoots must be liberally thinned. It is a good plan to cut out a few of the old branches annually to allow plenty of room for young fruiting wood. Remove all suckers unless the base of the tree is becoming bare, in which case one or two shoots may be retained. If the trees are affected with mealy-bug, special measures must be taken, as this pest breeds very quickly on the Fig. The trellis may be thoroughly cleaned of mealy-bug by painting it with paraffin. The interior of the house should be subjected to a thorough cleansing and the brickwork lime-washed. When this work has been finished, remove 2 or 3 inches of soil from the surface of the border, and top-dress with turfy loam mixed with plenty of old brick rubble and wood ashes.

Early Pot Vines.—As soon as the buds show signs of bursting into growth, raise the temperature 5°, and more as growth proceeds. Make sure that the bude are breaking freely from top to bottom of the canes before releasing the vines from their present horizontal position to tie them in their permanent place on the trellis. If the latter is very close to the glass, the rods may be fastened a few inches below it. Remove all surplus shoots as soon as it can be determined which are the best laterals to retain. It is a mistake to allow the vines to form useless growth or too many bunches, therefore, when they have made sufficient growth to fill the trellis, all surplus laterals should be removed. Water the roots with great care. When moisture is necessary, give two soakings as a safeguard against the soil becoming dry in the centre of the ball of roots. If the tank in the vinery is filled every night, the water will be always suitably warmed; for syringing rain-water is preferable. Replenish the hot-bed with

fresh litter and leaves at intervals, after first preparing them thoroughly. Discontinue syringing when the buds have burst freely into growth, but promote a moist atmosphere by damping the bare surfaces as often as necessary.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Carnations. — Layers of Souvenir de la Malmaison Carnation which were potted during the latter part of August or during September should now be sufficiently well rooted to allow of a transfer into 6-inch pots. It may be considered a little early, but I find that by early potting better rooting is secured and compacter growth. Before being repotted, the plants should be examined, and any foliage affected with rust removed and burnt. As the plants are taken out of the first pots they should be dipped in a solution of sulphide of potassium (½ ounce to a gallon of water), and then placed on the floor of the house. If they are placed on the shelves the solution will mark the paint, and such marks are very difficult to remove. The compost for "Malmaison" Carnations need not be of a very elaborate composition. A good fibrous yellow loam is the chief necessity, of the proper texture and sufficiently porous. It should not require the addition of any quantity of leaf-mould or manure; a good proportion of finely-broken crocks, brick, and lime rubble is recommended with perhaps the addition of a little wood ash and bonemeal. If the plants are subject to attacks of eel-worm sterilised soil should be used. This should have been prepared some time since, as freshly sterilised soil is discouraging for rooting purposes, especially if it has been sterilised by the drying process. The potting should be carried out firmly and evenly, and a small stake placed in each pot. If this is done and the stake tied to the plant in one place, further support will be unnecessary until the plant begins to form flower-shoots. The pots may be placed closely together at present, but when the side growths begin to come more space will be needed. If the soil is fairly moist at the time of repotting, the watering-in may be deferred for a few days, when all the plants should be given a thorough moistening. After this stage very careful watering will be necessary, as a damp condition results in yellow, drooping foliage, and fast growth. If they are kept fairly dry they will grow slowly and hardily, especially if liberal ventilation is provided in all weathers. This latter condition must be subject to sufficient heat being kept in the water pipes to maintain the dryness of the atmosphere in the house.

Perpetual-flowering Carnations. — At this dull season of the year perpetual-flowering varieties will be somewhat slow in opening, but they should not be forced, or weak stems and anæmic flowers will be the result. The water-pipes immediately beneath the stages should not be overheated, or the plants will be attacked by red spider. Where there are pipes under the stages, it is as well to sprinkle a little sulphur over them in order to discourage the pest; but this precaution will not obviate the necessity of exercising the utmost care not to overheat the pipes or close the top ventilators, which often leads to the plants being burnt. I have noticed this season what a fine variety "Triumph" is. This new crimson, though hardly, perhaps, to be classed with "Carola" in point of size, has all the points of a good perpetual Carnation; down to the present I have not seen a single split calyx, and it lasts in water extremely well. "Mary Allwood" and "Salmon Enchantress" should also prove good varieties; they both gained awards at the R.H.S. They are distinct in colour, and the form of the first-named is as good as that of many of our best border varieties.

Propagation.—Cuttings put in now will root more readily than if left to any other time. They are naturally hardier than if the planting is left until the spring, and they make a good deal of root without much top growth, which is a decided advantage. A high temperature is not essential; it is, in fact, prejudicial. An overhead heat of 50° to 55° is ample, with a slight degree of bottom warmth. The cuttings may be rooted in pots, boxes, or in a shallow bed; if large numbers are required, the latter method is probably the best. They will root well in a mixture of sand, finely pounded brick or crock rubble, and just a little loam. They should be ready for potting quite early in the New Year, and will then have a long season before them in which to mature their growth.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Protection Against Frost. — Since the severe frost in the early part of October the weather has remained fairly mild, and the rainfall has exceeded the average. Most of the vegetable crops cultivated with a view to autumn and winter requirements, are looking remarkably well. Indeed, they are rather too luxuriant, and there may be extensive damage in the event of a sudden severe frost. Some slight protection should be held in readiness, if possible, in order to guard against this contingency; it is well worth while, especially with tender plants. The kitchen garden should be made perfectly tidy, not only for the sake of appearances, but also because it is beneficial to the crops. This important part of the work should be completed by Christmas. It will be particularly easy this year, on account of the trees having shed their leaves earlier than usual.

Asparagus.—This is one of the easiest vegetables to force if good crowns are employed and the hotbed well prepared and sufficiently mild. During severe weather the frames and lights should be protected, but in favourable circumstances a reasonable amount of ventilation is essential.

Winter Broccoli.—This crop seems particularly promising, and many of the earlier varieties are already yielding a good supply. The plants should be examined frequently, and the leaves tied securely over the curds. Whenever there seems a likelihood of severe frost, a little light protective material, such as bracken or straw, should be placed over and around them.

Turnips.—These are also in a very satisfactory condition. Those which are fully matured should be taken up and placed thinly together under a north wall. When stacking, some finely-sifted ashes should be placed between each layer, and room for ventilation should be left. The stacks must not be too large. A little soil should be drawn over any turnips which are not yet matured.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Clematis.—If good varieties of each section of Clematis are planted in different situations, they will provide continuous blooms from May or June until the end of October. The most beautiful colours are represented in this family, notably very fine shades of purple, lavender, and violet, not to be found in many species. Clematis plants are grown in pots for sale by most nurserymen, and they are most convenient in this form, since they can be transplanted at almost any time without risk. The present season, when the ground can be thoroughly prepared by deep trenching and manuring, is a favourable time for planting. The Clematis is a gross feeder. It has a partiality for chalk or lime; if this substance is not naturally present in the soil some should be added. Mortar rubble is a convenient form in which to provide it. Clematis can be planted in all sorts of positions, and will seldom look out of place. The plants can be used to cover walls, pergolas, and trellis work; to adorn rustic poles, such as light Larch tops; to brighten a porch or a lich-gate. It can be used in conjunction with other climbers, such as Roses; if several different varieties are planted in this way, the blooming period will precede, and outlive, that of the Roses. Clematis can also be planted with great effect to enliven the more sombre corners of the shrubbery, either winding up and over artificial poles, or climbing naturally over some of the more strongly-growing shrubs. When once established the majority of Clematis varieties grow very quickly, and soon cover a large area. All are beautiful, but a short list of varieties in each section may be useful, especially the information as regards the flowering period. C. lanuginosa:—Flowers from June to October This section comprises some of the finest varieties: Nellie Moser, Beauty of Worcester, Queen Alexandra, Mme. van Houtte, La France, and King Edward VII. C. Jackmannii and C. viticella:—The flowering period of the plants in these sections is rather later than in the preceding one, lasting until late in the autumn. Jackmannii superba, and J. alba and rubra, Star of India, Lady Bovill, ascotiensis, and the newer Lady Northcliffe. C. patens section:—This type is the earliest to bloom, and includes the varieties Fair Rosamond, Duke of Edinburgh, Albert Victor, and Lady Londesborough. C. florida:—The varieties in this section flower in June and July. Belle of Woking, Duchess of Edinburgh, John Gould Veitch, and Venus Victrix are the chief varieties. Other good Clematises should be included if possible, such as C. montana (grandiflora and rubens), both very floriferous, the former white and the latter rosy-pink. These both flower in June. Also C. flammula, a small-flowered, sweetly-scented species, flowering in August. The hybrids from C. coccinea, such as Countess of Onslow and Duchess of Albany, flower over a long period.

General Work.—At present the work out-of-doors is hindered by the inclement weather. There has been very little frost so far, and until the end of November the weather was exceptionally open; but continual rain has rendered planting almost impossible. There are, however, indications of improvement, and it is better to wait for a favourable opportunity than to put choice plants into the ground in its present condition. Such work as clearing away worn-out and weedy shrubs (Laurels, &c.) can be done in almost any weather. The ground should be thoroughly cleared of all roots, especially those of Nettles, Woodbine, and other perennial weeds which accumulate in neglected shrubberies. These should be burnt at once, in order to make sure that they are not mixed with leaves and thus returned to the ground; such a mistake would cause much trouble in the following season.

THE APIARY.

By Chloris.

Feeding. — Those who have neglected the feeding of their bees should lose no time in making some good, soft, buttery candy, free from crystals. A sufficient quantity should be placed under the quilts to last until the end of January. The bees should be manipulated as little as possible; any excitement will lead to a larger consumption of food. This reduces the stores to an unnecessary degree, and is very bad for the bees. Indeed, unless a surfeit can be worked off by a cleansing flight, the result is often an attack of dysentery.

Combs Laden with Pollen.—If the combs are exceptionally full of pollen, they are useless for storing, and should be melted down for wax. The pollen becomes very hard, and the bees are obliged to gnaw away the loaded cells and rebuild them before they can be used again. The waste matter falls on the floor-board, where it accumulates, and encourages the entrance of the wax moth, which lays its eggs in the waste.

Partly-filled Sections. — These are a source of considerable anxiety to beginners, who often wonder whether they can be utilised again or not. The fact is that they are of great value in the early spring, used as bait-sections; when fitting up the section racks, they should not be placed in the centre, but round the outside. They should be stored until the spring in a dark, warm, dry place, or the honey will foment.

Beekeepers' Associations. — These societies would perform a most useful function if they were to arrange exhibitions of bee products during the autumn and winter, as well as demonstrations and shows in the summer. Up-to-date appliances might form the subject of one class, and a sale stall for the honey would probably be found remunerative, as well as popularising what is really a very valuable article of diet. It can be used for sweetening tea, coffee and cocoa instead of sugar. In cakes it has been found most successful, as they remain moist much longer than when sugar is used. Honey has also a distinct medicinal value. Points such as these might be selected for the topics of an occasional lecture.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plant for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS.

SATURDAY, DECEMBER 7—
Soc. Française d'Hort. de Londres meet.

MONDAY, DECEMBER 9—
United Hort. Benefit and Prov. Soc. Com. meet.

WEDNESDAY, DECEMBER 11—
North of England Hort. Soc. meet, at Leeds.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41·2.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, December 4* (6 P.M.) Max. 52°; Min. 44°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December 5* (10 A.M.): Bar. 30·0°: Temp. 43°; *Weather* - Overcast.
PROVINCES.—*Wednesday, December 4*: Max. 52° Shields; Min. 45° Margate.

SALES FOR THE ENSUING WEEK.

MONDAY—
Bulbs and Herbaceous Plants, at 12; Roses, at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

MONDAY AND WEDNESDAY—
Roses, Perennials, Lilies and other Bulbs, at Stevens's Rooms, 38, King Street, Covent Garden, W.C., at 12.30.

WEDNESDAY—
Dutch Bulbs, Hardy Border and other Plants, at 12; Palms and Plants, at 5, at Protheroe & Morris's Rooms
Special Sale of Roses, at 12.30, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Orchids, at Protheroe & Morris's Rooms, at 12.45.

The Acclimatation of Plants.

Much has been written on the subject of the acclimatation of plants; but little is known of the nature of the process whereby a species becomes acclimatised. As with so many other phenomena of variation, so with respect to this, two opposed views are held. On the one hand, it is suggested that a species is plastic, and hence capable of responding to a definite change of conditions by an equally definite change in constitution. If this view—that circumstances alter species—be accepted, a comprehension of the process of acclimatation would seem to present no difficulty. A plant brought, for example, from a warm to a cold climate responds to the stimulus of change of temperature. This response, which takes the form of a gradual or rapid change of structure and metabolism, results in an immediate or gradual increase in the power of resistance to low temperatures.

To discuss this hypothesis adequately would require one or several articles devoted exclusively to that purpose, and would carry us, moreover, beyond our present object, which is rather to state the alternatives than to prove or disprove them.

Acclimatation on the foregoing hypothesis is a special case of variation, and of adaptability, which properties are admitted universally to be attributes of plants.

The alternative hypothesis holds that the permanent acquisition of hardiness by a plant translated from a warmer to a colder region is not a phenomenon of adaptability, and, indeed, is not due to the acquisition by the plant of a new character, but to the manifestation on the part of certain members of the species of a character which they possessed already, before their change of habitat.

According to this interpretation, the several members of a species differ widely from one another in many and subtle ways. Though these differences are not of such a kind as to make themselves manifest to the eye, they are none the less real and permanent. When the members of a species are introduced into a new country in which the conditions differ from those of the natural habitat, certain individuals may survive, and others may die. The survivors are those which possessed already before their introduction such a constitution as enables them to withstand the changed conditions. Nor may it be supposed that we are dealing here with fine-drawn distinctions and mere scholastic quibbles. For, according as the acclimatisor holds one or other of these alternative views, so his practical method will vary.

If he believe in the adaptation theory he will be content to introduce a fair number of plants, and to so grow them that they are inured gradually to the new conditions. He will hope that by this procedure the principle of adaptability may be given time to act, and that each year will see a movement in the direction of increased hardiness.

If, however, he hold to the opposite view, his method will be different altogether. If the plant be one of which he can obtain seed in large quantity, he will provide himself with a plentiful supply of seed and so plant it that the seedlings are exposed to all the rigours of the new climate. His hope will be that if any of the plants survive the test, the offspring of the survivors will be found also to be hardy. If, however, the acclimatisor is able to obtain a few plants only, he will grow those plants under sheltered conditions until he has been able to work up a large stock, which he will then subject to the decisive test of exposure.

He will go further than this, and if any of the plants survive the test, the acclimatisor will not only save self-fertilised seed, but he will also cross the hardy plants with one another; for he will argue that hardiness may depend on more than one constitutional factor, each of which may contribute to the property desired.

Wherefore some may survive by reason of their possession of one factor for hardiness, and others because they possess another factor. These separate factors may be brought together by mating the two plants with one another, and they may be obtained pure in a certain proportion of the descendants.

Despite the important practical results which have been obtained in acclimatation, no comprehensive experiments have ever been tried with the proclaimed object of determining whether adaptability or pre-existing constitution is the agent responsible for success in acclimatation. All we know is the fact, proved abundantly, in many countries and during many centuries, that the plants of certain climates may be introduced successfully into countries of very different climatic conditions.

Everyone is aware of the enormous number of plants which have been introduced from other parts of the world, and students of contemporary horticulture are impressed by the assiduity with which the United States, through its Department of Agriculture, is exploring the whole world with the object of introducing new plants for cultivation, and for hybridisation. Thus the 28th inventory (Bull. No. 248 of the *Bureau of Plant Industry*, 1912) contains records of 668 introductions from Chinese Turkestan, Mongolia, the Philippines, East Indies, British India, Hawaiian Islands, New Zealand, and South America. Included in this remarkable inventory are cold-resistant Alfalfas from Chinese Turkestan, a hardy wild Apple from the same region, winter Radishes for midsummer planting, four Mongolian wild Roses, a new species of Cotton, New Zealand Apples resistant to woolly aphis, and among a host of others the Narras (Acanthosicyos horrida), the thorny Cucurbit of the dunes around Walfisch Bay—a description of which we published recently.

To rival the activity displayed by the United States in introducing new plants, we must go back to the time of the Romans, whose services to horticulture are described by Gibbon in glowing periods, of which we quote those bearing on acclimatation:—

"Almost all the flowers, the herbs and the fruits that grow in our European gardens are of foreign extraction, which in many cases is betrayed even by their names.

"In the time of Homer the Vine grew wild in the island of Sicily, and most probably in the adjacent continent; but it was not improved by the skill, nor did it afford a liquor grateful to the taste of the savage inhabitants. A thousand years afterwards Italy could boast that, of the four score most generous and celebrated wines, more than two-thirds were produced from her soil. The blessing was soon communicated to the Narbonnese province of Gaul; but so intense was the cold to the north of the Cevennes, that in the time of Strabo it was thought impossible to ripen the Grapes in those parts of Gaul. This difficulty, however, was gradually vanquished, and there is some reason to believe that the vineyards of Burgundy are as old as the Antonines. The Olive in the western world followed the progress of peace, of which it was the symbol. Two centuries after the foundation of Rome, both Italy and Africa were strangers to that useful plant; it was naturalised in those countries, and at length carried into the heart of Spain and Gaul. The timid errors of the ancients that it required a certain degree of heat, and could only flourish in the neighbourhood of the sea, were insensibly exploded by industry and experience."

BRITISH GARDENERS' ASSOCIATION.—A meeting of this association will be held at Lewis's Café, Station Road, Colwyn Bay, on the 11th inst., at 7.30 p.m. The chair will be taken by Mr. A. L. STATHAM, and the meeting will be addressed by the general secretary, CYRIL HARDING.

NATIONAL ROSE SOCIETY. — The annual general meeting of the National Rose Society will take place in the Holborn Restaurant, on Tuesday, the 17th inst., at 3 p.m. Proposals for the alteration of certain of the rules and regulations of the Society will be submitted by Mr. C. E. SHEA and Mr. WALTER STEVENS. A conversazione will be held in the Crown Room from 4.30 to 6 p.m., to which all members are invited. Application for tickets must be made to the hon. secretary on or before Thursday, December 12, in order that suitable arrangements for refreshments may be made. The president will deliver a short address, and Dr. GEO. G. HAMILTON will say a few words about "Roses and Some Bournemouth Gardens," illustrated by lantern slides in colour photography. The Society will hold a spring show on Thursday, May 1, 1913, in the Royal Horticultural Hall, Vincent Square, Westminster.

ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.—The directors of the Royal International Horticultural Exhibition, 1912, met at the Royal Horticultural Hall, Westminster, on the 26th ult., to consider a resolution for disposing of the property of the company, after payment of all debts and liabilities. The balance sheet showed a net profit of £2,870 3s. 7d. Allowing for payments which have still to be made, the balance may be taken as approximately £2,500. It was decided to disburse the profits in the following manner:—To the Irish Gardeners' Association and Benevolent Society, £100; towards the reprinting and bringing up to date of Dr. A. G. Pritzel's Botanical Index, £250. (To this latter purpose the R.H.S. have already promised to give £1,000.) The remainder of the profits (about £2,150) will be divided between the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund, in the proportion of two-thirds to the former institution and one-third to the latter. A second resolution was passed, namely "That the company be voluntarily wound up, and that Mr. G. J. INGRAM be appointed liquidator." These resolutions are subject to confirmation at a later meeting.

CANTERBURY'S NEW MAYOR.—Mr. GEORGE MOUNT, the well-known rosarian, has been elected Mayor of the ancient borough of Canterbury. At the election ceremony which took place in the Guildhall Councillor WOOD said that Mr. MOUNT's name was a household word, and that he was honoured and respected by everyone who knew him. A former Mayor of Canterbury, WILLIAM MASTERS, was also a nurseryman, and he occupied the same nursery, and we believe that Mr. MOUNT lived in the same house for a time. WILLIAM MASTERS was father of the late Dr. MAXWELL T. MASTERS, who was Editor of the *Gardeners' Chronicle* for 41 years.

THE AVOCADO PEAR.—Under such alluring headings as "Where Meat Grows on Trees," the popular weekly periodicals draw attention to the fruit of Persea gratissima, claiming that it is "composed of all the substances which are to be found in meat." The facile pen of the writer credits this fruit with containing about 20 per cent. of fat and many other ingredients of great value, so that one "meat Pear is quite sufficient to make a meal for the average man." The natives of Mexico, he continues, live entirely on the Avocado, and, as experts have declared this fruit to be far superior to the Banana, and, in fact, the most valuable fruit known, it is hoped that with a sufficient supply of the trees the world may do away with meat entirely. But, lest the vegetarians should overwhelm the fruiterers with their orders, the concluding sentence informs them that the reason why the fruit is so little known at present is because it is grown nowhere on a large scale; what few trees there are grow around the huts of the natives, where they flourish with little care, and afford easy meals for the indolent owners. Other writers on tropical economic plants give the Avocado Pear a somewhat wider distribution, and state that, although originally confined to the West Indies, it is now grown in many tropical countries and is esteemed as a dessert fruit.

POTATO HAULM AS FOOD FOR SHEEP.—Early in October experiments were made by VÖLTZ, at the Institute of Fermentation Industries, Berlin, with Potato haulm, which was partially dried out-of-doors. After further drying in kilns, the haulm was chopped and given to two wethers, who ate it freely. The haulm was found to be more digestible when mixed with Hay.

THE POTATO CROP. - The Board of Agriculture and Fisheries estimates the total production of Potatos in England and Wales at nearly 2,244,000 tons, which represents, on an area of 463,000 acres, a yield of 4.85 tons per acre, the lowest since the returns of produce were first collected in 1884. The worst return previously was 4.97 tons per acre in 1900.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE R.H.S. TRIALS.—The latest *Journal* of the Royal Horticultural Society is to hand. It contains accounts of trials at Wisley, and a perusal of the Delphinium and Sweet Pea trials reminds us of a letter we addressed to the Secretary of the Society last year after reading the report of the Gladiolus trials. Our letter was simply acknowledged, and we would like to ventilate the matter in your columns. Of the Delphiniums reported on in the Wisley trials in 1912, at least 50 were raised in our nurseries, but of these 23 have the name of another nurseryman attached. Surely, this is extremely misleading and unfair to us as raisers and introducers of these varieties; for is it not generally understood that the name of a plant followed by the name of a firm or person signifies that the firm or person is the raiser or introducer? Under the present system, anyone can send other people's fine varieties, and get a most excellent but undeserved free advertisement for himself. We should have thought that when it is known the name of the raiser might be added in different type, and when it is not known it might be stated that the name of the person or firm attached was that of the sender only. *Kelway & Son.*

FRANK ASHTON RELIEF FUND.—A small committee of Orchidists has been formed to assist Mr. Frank Ashton, who has, unfortunately, fallen into indigent circumstances, and who is no longer able to follow his employment as a traveller in Orchids. He has been struggling against fate for the past two or three years, but has at last been compelled to give up owing to a very badly poisoned foot, to attacks of chronic rheumatism, and to an affection of the eyes. He is no longer able to travel, and his resources are practically at an end. An appeal is therefore made to all those who have been associated with Mr. Ashton in the Orchid business to show their practical sympathy with him in his great affliction by contributing towards a fund which will be utilised to establish him in some small home business. The committee of the Kew Guild (of which Mr. Ashton is a life member) have generously made a grant of £5 towards the fund. Further donations may be sent to the Secretary of the Kew Guild (Mr. Herbert Cowley, South Side, Kew Green), or to me, and will be gratefully acknowledged on Mr. Ashton's behalf. *John Weathers, 7, Talbot Road, Isleworth, Middlesex (Secretary).*

BORDEAUX SPRAYING FOR PEACH CURL (see p. 412).—This is a most destructive disease of Peach trees, as the foliage is rendered useless. I consider attacks of Peach curl are mostly due to low temperature, as I have never seen it on trees under glass; also it is not so prevalent in the southern districts as in the Midlands. At one time it was very troublesome here on wall trees outside, but persistent hand-picking early in the season, a thorough syringing with soft soap and quassia just before the flowers opened, and protecting the tender foliage have almost banished it. Protection from wind is afforded by double fish netting hung at a moderate distance from the trees and stretched tight across laths, so that it meets the top of the wall. I should hesitate to apply the Bordeaux mixture to Peach trees even in the resting stage, for an extra strong solution of Gishurst compound or similar substances has been known to cause severe bud-dropping, and the effects of the Bordeaux mixture would probably be worse. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

HYBRID NOMENCLATURE (see p 413).—Mr. O'Brien says that I have cited the "earliest sub-committee on Orchid nomenclature." It was useless to cite the latest, which was appointed to deal with the special subject of the nomenclature of multi-generic hybrids. And what is the use of his citing the rules of a nomenclature congress that did not meet till after the *Orchid Stud Book* was published? The clause, "No one has a right to alter," &c., is only a saving clause under the section "Names that are to be rejected, dropped or modified," and is only intended to prevent the abuse of a very necessary rule. The names superseded in the *Orchid Stud Book* were neither regular nor correct, and their number is the measure of the neglect of recorders to observe existing rules. The remark concerning "self-constituted authorities" has no application to the *Orchid Stud Book*, for its authors adopted the Vienna rules, embodying them in a short and simplified wording. The Vienna rules say: "Hybrids.—The name, which is subject to the same rule as names of species, is distinguished by . . . . the sign × before the name. Ternary hybrids, or those of a higher (more complex) order, are designated like ordinary hybrids." Again, Mr. O'Brien says "the superseded names were in accordance with the rules, and had the authority of the Paris Nomenclature Conference." I have the said rules before me, but cannot find anything to support this statement. If a "changed name" becomes a "new name"—and the point is not contested—that is an additional reason why the names chosen should be in correct form at the outset. Mr. O'Brien says "Cattleya John Jones," not "C. Jonesii," is the better way. Then why did he give such names as Cypripedium Clinkaberryanum, Lælio-Cattleya Brymeriana, Dendrobium Owenianum, and many others? There were already the precedents Lælio-Cattleya Aurora, Cassandra, Proserpine, Stella, Zenobia, &c., &c. One would never dream from Mr. O'Brien's remarks that I have given scores of others. They

are admirable, but their use does not exclude such names as Calanthe Dominyi, Veitchii, &c. It is not necessary to follow Mr. O'Brien further. He was a member of the committee which drew up the rules, the neglect of which has necessitated so many names being "rejected, dropped, or modified." He now censures those who attempted to carry them into practice. It is deplorable. *R. A. Rolfe.*

WART DISEASE OF POTATOS.—A few remarks may be made in reply to Mr. Taylor, whose interesting note appeared on November 23, p. 391. It may safely be said that drastic steps are being taken to eradicate this disease in England, and many notices prohibiting the planting of Potatos other than immune or resistant varieties in infected ground have been served. It does not, however, seem reasonable to suggest the prohibition of the importation of Potatos, which are a necessary foodstuff. The disease is too widespread in Britain for such a step to serve a useful purpose, and the inspection of imported Potatos is not feasible. Further, while foreign Potatos are usually only imported for consumption, wart disease is unlikely to be introduced with them, since foreign countries appear to be comparatively free from it. There does not appear to be the slightest evidence that wart disease originally came from the Continent, though it was reported from Hungary in 1896; it was more or less prevalent 30 years ago in out-of-the-way parts of Cheshire, if not scientifically recorded until 1902 by my friend, Mr. J. W. Eastham, B.Sc. The last two lines of Mr. Taylor's letter exhibit the fallacy of arguing from local conditions. Midlothian is believed to be comparatively free from wart disease, but if Mr. Taylor will but cross to Fife he may find whole villages with scarcely a garden but what is badly infested with it. *H. C. Long.*

STERILISING SOIL.—In view of Mr. Stevenson's remarks at the Chrysanthemum Conference about sterilising soil by heat for Chrysanthemums (see p. 417), I venture to give my experience with Begonia Gloire de Lorraine. In 1911 I lost a large number of plants through eelworm. This season I sterilised all the soil in which a large number of plants were grown from the cutting stage onwards with good results as regards destroying eelworm. The plants grew freely, but always appeared drawn and leggy, and although they made very large specimens were deficient, in size of bloom, colour, and substance. A few plants grown in soil that had not been treated were not so tall, but more compact in habit, better coloured, whilst the blooms were large and of great substance. Has any reader had a similar experience? *E. R. James.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 3.—In view of the Perpetual-flowering Carnation Society's exhibition, on Wednesday, in the same Hall, many growers of these flowers took the opportunity of exhibiting Carnations at the R.H.S. meeting, the groups remaining for the following day. The FLORAL COMMITTEE awarded a Gold Medal for a collection of these flowers shown by Mr. ENGELMANN. There were fewer exhibits of Chrysanthemums than at recent meetings, but Begonias were again a prominent feature. The FLORAL COMMITTEE recommended seven Awards of Merit. Plenty of space was available for miscellaneous exhibits, including paintings of floral subjects, horticultural sundries and preserves. The ORCHID COMMITTEE recommended two First-class Certificates and three Awards of Merit.

The FRUIT AND VEGETABLE COMMITTEE awarded two Gold Medals, one for a collection of bottled fruits, the other for Apples shown by the GOVERNMENT OF BRITISH COLUMBIA. Three new Apples received Awards of Merit. At the three o'clock meeting in the lecture room a paper on "The Vegetation of the Islands of Lake Maggiore," by Mme. Tzikos St. Leger, was read by the secretary.

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); Messrs. C. T. Druery, John Green, W. J. Bean, G. Reuthe, J. W. Barr, Wm. Howe, J. F. McLeod, John Dickson, Chas. Dixon, H. J. Jones, Arthur Turner, Chas. E. Shea, J. T. Bennett-Poë, E. H. Jenkins, W. J. James, Chas. E. Pearson, E. A. Bowles, F. Page Roberts, Jas. Hudson, C. R. Fielder, C. Blick, R. C. Reginald Nevill, John Jennings, W. Cuthbertson, and W. P. Thomson.

Messrs. W. CUTBUSH & SON, Highgate, exhibited forced plants from retarded stock; a number of pretty dwarf Roses of the polyantha section; Daphne indica rubra; Ericas in variety, the best of these being E. gracilis; and varieties of Begonia. As a separate exhibit this firm staged a collection of Carnations of the perpetual-blooming type. (Silver-gilt Banksian Medal.)

FIG. 186.—PRUNUS MIQUELIANA: FLOWERS WHITE.
(R.H.S. Award of Merit on Tuesday last.)

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed several fine winter-flowering Begonias; a group of Bouvardia Humboldtii corymbiflora (white); B. Dazzler (scarlet); a collection of Indian Azaleas; and small pot-plants of Chrysanthemums. Begonia Julius has small, double flowers of salmon-pink colour; it is an excellent variety for growing in baskets. (Silver Flora Medal.)

Messrs. H. B. MAY & SONS, Edmonton, filled a table with miscellaneous flowering plants and Ferns, for which a Bronze Flora Medal was awarded.

Mr. C. LANGE, Hampton, showed plants of Hydrangea Mme. Emile Mouillère with remarkably large inflorescences; varieties of Carnations; and a large batch of Begonia Glory of Cincinnati. (Silver Flora Medal.)

Mr. L. R. RUSSELL, Richmond, Surrey, showed numerous well-flowered plants of Indian Azaleas, a collection of ornamental and berried shrubs, and a few plants of Anœctochilus, including the rare A. (Goodyera) Pollissonii. (Silver Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, made a bright display with Zonal Pelargoniums. The following are new varieties:—Sensation (rich red), W. Pfitzer (orange scarlet), Borneman's Best (rose magenta), and Mrs. F. Seares (palest pink).

Well grown Cyclamens were shown by Rev. HENRY BUCKSTON, Sutton Hall, Derby. Many varieties had frilled petals, and these were very pretty in the bud stage. Victoria Buckstone is a fine white variety of this type. (Silver Banksian Medal.)

Messrs. STUART LOW & CO., Enfield, contributed a very pretty exhibit of Carnations. A prominent place in the centre was afforded their fine Baroness de Brienen variety (salmon-pink); at the back were hanging baskets filled with pink and white varieties, whilst in the foreground the new Rosette of bright pink colour showed to advantage. Satin Robe is a new variety of silver pink colour, an improvement on Winsor. (Silver Flora Medal.)

Mr. C. ENGELMANN, Saffron Walden, was awarded a Gold Medal for an exhibit of Carnations. The varieties and seedlings numbered 100, the collection being the finest in the Hall. Amongst novelties we noticed Fanny (a fancy with scarlet markings on a pink ground), My Rose (cerise), Lucy (pink), Golden Ray (yellow), and two sports of Carola (one with a rose ground marked with crimson, the other with scarlet petals).

Messrs. ALLWOOD BROS., Haywards Heath, exhibited Carnations of exceptional quality. The new varieties Salmon Enchantress and Mary Allwood appeared to advantage.

Exhibits of Carnations were also staged by Mr. W. LAWRENSON, Yarm-on-Tees (Silver Banksian Medal); Mr. H. BURNETT, Guernsey (Silver-gilt Flora Medal); Messrs. YOUNG & CO., Hatherley (Silver Banksian Medal); and Misses G. C. PRICE & A. B. FYFE, Grove Park Nursery, Lee.

Col. FRANK M. LOCKWOOD, M.P., Bishop's Hall, Romford, Essex (gr. Mr. G. Craddock), showed numerous well-grown plants of the white Japanese Chrysanthemum Mrs. Swinburne. (Cultural Commendation and Silver Flora Medal.)

MANOR HOUSE NURSERIES, Cardiff, showed single Chrysanthemums. Audrey (yellow), Caledonia (pink), and Doris Chaplin (pink, with a zone of white around the bold, yellow disc) are three of the choicer varieties in this collection.

Messrs. GODFREY & SON, Exmouth, Devonshire, showed the fine white Anemone-flowered Chrysanthemum Godfrey's Perfection, which received an Award of Merit on November 21, 1911.

Messrs. W. WELLS & CO., Merstham, Surrey, staged Chrysanthemums in variety, for which a Silver Banksian Medal was awarded.

Messrs. JOHN PEED & SON, Norwood, exhibited a large group of Begonias of the Gloire de Lorraine type.

Messrs. BARRIE & BROWN, King William Street, London, showed Ericas and Begonias.

Mr. CLARENCE ELLIOTT, Stevenage, exhibited a small rockery planted with Alpines and dwarf Conifers. There were numerous rare Saxifrages, also a fine batch of Gentiana acaulis in bloom. The Conifers included plants 6 to 9 inches high of Pinus sylvestris globosa, also small plants of Juniperus Sabina tamariscifolia, and Abies Remontii.

Messrs. WHITELEGG & PAGE, Chislehurst, showed a large number of Alpines in pots and pans, and similar exhibits were staged by Messrs. T. S. WARE, Ltd., Feltham (Silver Banksian Medal), and Mr. G. REUTHE, Keston, Kent, who also showed Nerines.

Miss MALONE, 111, Cheyne Walk, Chelsea, exhibited a selection of her oil paintings, which are in the modern French landscape style. When viewed from the proper distance, these

representations of gardens and woodlands are exceedingly effective. The garden at "The Master's" Lodge, St. John's College, Cambridge, "My Lady's Garden" on the terrace at Wrest Park, La Rosarie de la Haije, and "Poppies" are the titles of a few of the striking paintings which were on view.

AWARDS OF MERIT.

Asplenium divaricatum elegans.—A graceful Fern with fronds divided into fine linear segments. The habit is open and the fronds are feathery, not plumose or crested. The almost black stems give an added effect to the pale-green foliage. The plants exhibited were a foot high in 5-inch pots. (Shown by Messrs. J. J. PARKER & Co., Whetstone.)

Chrysanthemum Miss A. Brooker (decorative or small Japanese of the new classification).—A handsome variety for decorative purposes and suitable for market. The colour is a light chestnut (the deepest shade of blood-red of the *Rép. de Couleurs*), and the petals incurve, showing a bronze reverse. (Shown by Messrs. J. VEITCH & SONS and Messrs. W. WELLS & Co.)

C. "Eric Wild" (single).—A neat flower possessing two or three rows of smooth, flat petals. The colour is a pale mauve-pink, with a narrow, not very distinct band of white surrounding the disc. (Shown by Messrs. W. WELLS & Co.)

C. Mrs. Wingfield Miller (single).—A handsome flower less formal in the arrangement of the petals, which are in three or four rows, than the last variety, and distinct in keeping slightly cup-shaped when fully developed instead of opening flat. The colour is a purplish-rose, a little darker than shade four of violet-rose of the *Rép. de Couleurs*, and the disc is banded with a clear, white ring about an eighth of an inch in width. (Shown by Messrs. WELLS, Merstham.)

Prunus Miqueliana (see fig. 186).—A Japanese species allied to subhirtella. The flowering sprays exhibited had pale-brown, twiggy growths, from each node of which sprang close clusters of three or four short-pedicelled flowers. The flowers are white, but with age the numerous filaments become pink and give a flushing of pink to the spray; they are about ¾ inch in diameter, and have about 15 small lance-shaped petals. Nicholson *(Dictionary of Gardening)* describes the plant as having deeply and irregularly-cut leaves and sparsely-hairy pedicels and calyces. The leaves had already fallen from the sprays exhibited, and although there was a slight pubescence on some twigs, the calyces and pedicels appeared to be quite glabrous. A very pretty, low-growing tree, which in Sussex flowers regularly in November and December. It requires a sharp frost to destroy the expanded flowers, and the buds are seldom injured. (Shown by Col. STEPHENSON R. CLARKE, C.B., Borde Hill, Cuckfield—gr. Mr. Conn.)

Carnation Mrs. A. F. Dutton (see fig. 187).—A sport from White Perfection. The stem and calyx are excellent, but the blooms are scarcely scented. The colour is a very bright rose (shade four *Rép. de Couleurs*), but pales towards the edge of the petals. (Shown by Mr. A. F. DUTTON.)

C. Bonfire.—A rather small-flowered, perpetual-flowering variety, but exceedingly neat and pretty, with excellent stiff stems and sound calyx. The petal edge is serrated, and the flowers are not scented. The colour is a very bright scarlet. (Shown by Messrs. W. WELLS & SONS.)

CULTURAL COMMENDATION.

Chrysanthemum Mrs. Swinburne. A large batch of this fine white Chrysanthemum was shown; the plants were grown in 5-inch pots. One specimen bore 11 large, disbudded flowers and one unopened bud, the whole plant being only 2 feet high. (Shown by Col. LOCKWOOD, Bishop's Hall, Romford—gr. Mr. G. Craddock.)

SOME FURTHER NOVELTIES.

Winter-flowering Begonia Duchess of Westminster, shown by Messrs. CLIBRANS, is a good addition to the varieties exhibited at the last meeting. The flowers are double, and a bright shade of deep rose-pink.

Carnation Northport, a variety that has received extraordinary praise in America, was shown by Messrs. WELLS. The colour is an intense cerise-pink.

Messrs. R. WALLACE & Co. showed Iris Vartanii White Pearl. This is an albino form of the type, but retains the distinct yellow ridge on the claw of the falls. The type was named by the late Sir Michael Foster after Dr. Vartan, of Nazareth, who first sent it to him. It is the earliest to flower of the reticulata group, being out normally from October-December, and considerably in advance of Histrio, and is figured in the *Bot. Mag.*, 6,942. White Pearl was imported from Palestine in 1910 as a white form of I. histrioides, and has been distributed under that name. It has also been sent out as a white Histrio, but it is quite distinct from these species. It is a pretty little species with almond-scented flowers, and owing to the character of our November weather, they generally require the protection of an Alpine house.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Messrs. Jas. O'Brien (hon. sec.), J. S. Moss, Gurney Wilson, J. Wilson Potter, R. G. Thwaites, F. Sander, R. A. Rolfe, T. Armstrong, A. McBean, C. H. Curtis, W. Cobb, J. Charlesworth, J. Cypher, W. H. Hatcher, J. E. Shill, H. G. Alexander, A. Dye, W. P. Bound, W. Bolton, de B. Crawshay, Sir Jeremiah Colman, Bart, and Sir Harry J. Veitch.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed the unique Vanda cœrulea Sanderæ with two spikes of perfectly-shaped flowers differing from all other forms in colour, the tint being clear magenta pink with no trace of blue. It was awarded a First-class Certificate, November 22, 1910, when first shown. Also Cypripedium × Nydia (Niobe ×

FIG. 187.—CARNATION MRS. A. F. DUTTON: COLOUR, BRIGHT ROSE.
(R.H.S. Award of Merit on Tuesday last.)

nitens-Leeanum), a fine flower, and two others. (See Awards.)

Messrs. JAS. VEITCH & SONS, Chelsea, staged a good group, for which a Silver Flora Medal was awarded. An interesting feature of this exhibit was a batch of seedlings between Zygopetalum Mackayi and Odontoglossum crispum, the flowers differing in no way from the Z. Mackayi staged at each end of the group. The peculiarity has been frequently noted, but the facilities for comparison made the exhibit very interesting. A fine lot of Cypripedium included C. Idnia (insigne Harefield Hall × Countess of Carnarvon), a large flower of the Æson giganteum class; C. Glebelands "Veitch's variety"; C. Gaston Bultel; good forms of C. Leeanum, and some promising unnamed hybrids. Others noted were Brasso-Lælio-Cattleya Morna (B.-C. Mme. Chas. Maron × L.-C. bletchleyensis), a bold flower of a light rose-pink tint, and several bright Lælio-Cattleyas.

Messrs. SANDER & SONS, St. Albans, staged an effective and interesting group, containing several novelties. The best were Cypripedium St. André (Leeanum A. Lefebvre × Actæus Bruggense), a fine flower, with a large, pure-white dorsal sepal, having an emerald-green base, with some small, dark spots and a distinct purple medium line: petals and lip pale green, tinged with purple; C. Conquest (Earl of Tankerville × Leeanum Clinkaberryanum), much larger than Earl of Tankerville, but similarly coloured; and C. Smaragdina (Euryades Leopardianum × Ville de Paris), a model flower with a clear gamboge-yellow ground, beautifully blotched with chocolate purple. A very interesting plant was Chondropetalum Fletcheri, which had Chondrorhynca Chestertonii for seed-bearer, and which showed conclusively the correctness of the record. Lælio-Cattleya Golden Oriole, and other showy Lælio-Cattleyas, and some interesting species were also shown.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was given an Award of Merit for a varied group, the front of which was of the yellow Cypripedium insigne Sanderæ, C. insigne Harefield Hall and Bohnhoffianum, varieties of C. Leeanum, C. Pittianum, &c. Among the Odontoglossums, O. ardentissimum "Pitt's variety," raised at Rosslyn, was a very pretty and richly-coloured form. Various other hybrid Odontoglossums and several Cattleya Clarkæ, Dendrobium Phalænopsis, Chondropetalum Fletcherianum, and Maxillaria Hubschii were also noted.

Messrs. J. CYPHER & SONS, Cheltenham, secured a Silver Banksian Medal for a representative group of Cypripediums, which included many fine forms. With them were Zygopetalum crinitum, Lælia anceps Schröderæ (of very dark colour), Lælio-Cattleya Rubens (large and of fine shape), and Cattleyas.

Messrs. W. BAYLOR HARTLAND & SONS, Cork, were awarded a Silver Banksian Medal for a group of Cypripediums and hybrid Odontoglossums. Very effective was Cypripedium insigne Sanderæ. Odontoglossum Grogamiæ bore a finely branched spike of rose-purple flowers, and among Cattleyas we noted a very distinct home-raised C. Hardyana, C. aurea being the seed-bearer. The sepals and petals were creamy-yellow, slightly flecked with rose, the lip rose-purple with gold veining.

Messrs. J. & A. MCBEAN, Cooksbridge, staged an effective group, in which were their new Cymbidium Doris and a very fine form of C. Wiganianum. Several dark hybrid Odontoglossums, O. Phœbe, three of their seedling Cattleya aurensis, and some good Cypripediums were also exhibited.

Messrs. CHARLESWORTH & Co., Haywards Heath, staged a small group, in the centre of which was a magnificent specimen of Angræcum sesquipedale with ten of its large, wax-like flowers. Various good Cypripediums, scarlet Odontiodas, and the beautiful new Sophro-Lælio-Cattleya Carna (see Awards) were also included.

Messrs. HASSALL & Co., Southgate, staged a selection of Cypripediums and Cattleya and Lælia hybrids. Also Vanda suavis and other Orchids.

E. H. DAVIDSON, Esq., Orchid Dene, Twyford, showed a remarkably pretty hybrid between Lælio-Cattleya Gottoiana and Cattleya Dowiana aurea, the flowers resembling the latter in fine shape, but with the petals more openly displayed. Sepals and petals primrose yellow, freckled at the tips with rose. Lip rosy-carmine with gold veining.

His Grace the Duke of MARLBOROUGH, Blenheim Palace (gr. Mr. Hunter), sent Cypripedium Beatrice (aureum Hyeanum × Memoria Jerninghamiæ) with a white dorsal sepal.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed the fine Cypripedium Leeanum J. Gurney Fowler; a fine Odontoglossum Lambeauianum with a branched spike of many flowers; and Odontioda Latona.

Messrs. SWAN & PRICE, Keyfield Nursery, St. Albans, sent Cypripedium Maurice, a good flower of unrecorded parentage.

Messrs. STUART LOW & Co., Bush Hill Park, showed Cypripedium Eva (aureum Hyeanum × Memoria Jerninghamiæ).

AWARDS.

FIRST-CLASS CERTIFICATE.

Lælio-Cattleya Golden Oriole "var. Ruby" (L.-C. Charlesworthii × C. Dowiana aurea), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A very handsome flower, totally different in colour to the original form. The petals and lip are of a rich claret-red colour, delicately veined with yellow; the sepals have a yellow ground tinged and blotched with claret-red. Unless closely examined, the flower appears to be almost entirely claret-red.

Odontioda Latona "Fowler's variety" (Odontioda Bradshawiæ × Odontoglossum crispo-Harryanum), from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis).—A very fine hybrid with flowers equal in size to O. crispum and richly blotched. The ground colour is white, the sepals and petals having a broad rose margin, the inner parts heavily blotched with reddish mauve. The front of the lip is white and the crest yellow, with a large reddish blotch.

AWARD OF MERIT.

Cypripedium Viking (Buchanianum × illustre), from Lieut.-Col. Sir GEO. L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander).—This beautiful hybrid has the fine substance of C. Druryi and its wax-like, dorsal sepal, which is pure white with an ovate violet-purple band up the centre. Petals and lip Indian yellow tinged with brown.

Sophro-Lælio-Cattleya Carna (L.-C. Cappei × S.-L. heatonensis), from Messrs. CHARLESWORTH & Co.—A beautiful flower of large size and of a bright magenta-rose colour with yellow base to the lip.

Cypripedium Eurybiades (Euryades × Alcibiades), from Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White).—An improvement on C. Euryades. Flower large. Dorsal sepal pure white above, emerald green below; evenly spotted with dark purple. Lip and petals yellowish-tinged dark purple.

CULTURAL COMMENDATION.

To Mr. W. H. WHITE, Orchid grower to Sir Trevor Lawrence, Bart., for a fine specimen of Sigmatostalix radicans with many spikes.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (in the Chair); Messrs. Jos. Cheal, W. Bates, Edwin Beckett, F. Perkins, Geo. Kelf, H. Markham, A. R. Allan, A. W. Metcalfe, J. Davis, A. Bullock, J. Jaques, Geo. Wythes, A. Grubb, and Owen Thomas.

Messrs. J. CHEAL & SONS, Crawley, were awarded a Silver Banksian Medal for an exhibit of Apples and Pears. The new variety Crawley Beauty was represented by several baskets of fine fruits. Encore, a comparatively new variety, is an excellent late culinary Apple; one of the fruits weighed 1 lb. 7¼ ounces. There was a good dish of the new Pear Beurré de Naghan.

The most imposing exhibit of fruit was shown by the GOVERNMENT OF BRITISH COLUMBIA. It consisted entirely of Apples, mostly in boxes, as shipped for the English market. The fruits were superb, and the Committee selected the variety Winter Banana as worthy of an Award of Merit. Spitzenberg (a solid red Apple of fine flavour), Grime's Golden, Winesap, Rome Beauty, Wagner, Canadian Baldwin, Canada Red, Newtown Pippin, and Cox's Orange Pippin represent the pick of the varieties. (Gold Medal.)

A Gold Medal was awarded to Mrs. W. BANKS, Park Street, Westminster, for a collection of preserves. It was the finest exhibit of this nature ever seen at these meetings, and comprised 168 distinct kinds of bottled vegetables and fruits. As showing the comprehensive nature of this exhibit, we may enumerate Mushrooms, Chutneys, Mulberries, Loganberries, Apricots, Quince jelly, Carrots, Peas, Celery, Beans, and Currants. The exhibitor informed us that the Mulberries and Loganberries are especially delicious, and that Currants are the most difficult to preserve whole. Some of the vegetables were bottled in sterilised salt water.

Silver Knightian Medals were awarded to Mrs. MILLER, Moylem, for preserves, and Messrs. WESTMACOTT, for South African produce.

A Silver Banksian Medal was awarded to Miss HILDA, Harcourt Terrace, Kensington, for preserves. A Bronze Banksian Medal was awarded to Mr. D. E. TOWER, Pershore, for a similar exhibit.

AWARDS OF MERIT.

Apple Crawley Beauty.—A late culinary variety, about 2¾ inches deep; richly coloured on the side next to the sun, and prominently streaked with red at the base. The parentage is unknown. Messrs. CHEAL & SON, the exhibitors, informed us that it is a local variety found in many cottagers' gardens in the neighbourhood of Crawley. The fruits hang very late in the season, often after the leaves have fallen.

Apple Winter Banana.—A solid fruit, 3 inches deep and 4½ inches in circumference, of pale-yellow colour flushed with red. The flesh is juicy, sweet, and of fine flavour. Shown by the GOVERNMENT OF BRITISH COLUMBIA.

Apple Steyne Seedling.—This Apple resembles a large fruit of Cox's Orange Pippin. It is of excellent eating quality, and is a fine addition to late dessert varieties. Shown by Lady THORNYCROFT.

THE LECTURE.

Mme. Tzikos St. Leger's paper was read by the secretary. The title, "The Vegetation of the Islands of St. Leger in Lake Maggiore," was rather a misnomer, but if any of the large audience attended in the expectation of hearing an account of the indigenous vegetation of these islands, they must have been agreeably surprised when the story so interestingly unfolded proved to be an account of the work performed by Mme. St. Leger, who transformed the rocky, windswept and almost desert island on which she has made her home into a beautiful and interesting garden. It seems that when Mme. St. Leger acquired the island it contained a disused nunnery, of which only the strong outer walls were sound, one tall Lime tree, which had been a landmark for years, and a few stunted Oaks, which eked out a precarious existence drawn from the scanty nourishment found between the crevices of rocks. This was practically the extent of its vegetation. The long, narrow Lake Maggiore is situated partly in Northern Italy and partly in Switzerland. The imaginary line across the lake, which divides it, is so rigidly respected that any yacht crossing it is hailed from the Customs vessel and inspected. The two St. Leger islands are about two miles from the Italian shore, and enjoy a delightful climate during the hot season; when the dwellers on the mainland are oppressed by heat, the temperature on the St. Leger islands, thanks to the surrounding water, rarely rises above 70° Fahr., whilst during the winter months the minimum of 15° Fahr. is rarely reached. This equable climate renders possible the diverse and almost tropical vegetation which Mme. St. Leger has introduced. As there was practically no soil on the island, enormous quantities had to be brought from the mainland in boats, and before any planting was commenced the nunnery was put into habitable condition and garden paths were made.

The lantern slides illustrated the great amount of success which has attended the gardening operations. As the lecture progressed, the bare, rocky expanses, with their few stunted trees and weeds, gave place to charming views of Palms (Chamærops excelsa), with tall, straight stems, crowned with leaves and fruits, contrasting with dark-green, upright Roman Cypresses (Cupressus sempervirens) or with the long leaves of the Japanese Banana (Musa japonica, syn. M. Basjoo) which border the paths. Mention was made of such rare and interesting Conifers as Pinus longifolia, Cupressus majestica (C. torulosa var. majestica), Picea Morinda, Araucaria Bidwillii, Cupressus torulosa, Ginkgo biloba, and a "Retinospora" with a curious name unknown

to the *Kew Hand-list* or the *Manual of Coniferæ*, but which had the characteristic appearance of Dacrydium Franklinii. The lantern slides of Eucalyptus amygdalina, with tall, straight, silvery trunks; an exceedingly fine Date Palm (Phœnix dactylifera); a Cycas revoluta; and a large Tangerine Orange bush, which bears abundant crops of fruit, evoked great admiration.

On the north side of the island a row of Weeping Willows, planted partly as a protection from the rough winds, encircle rarer trees, and one result of importing soil is that Poplars and Maples now grow wild amongst them.

Roses, in groups and in the borders, bear a profusion of blossoms; the variety Maréchal Niel was in flower last Christmas Day, and Laurette de Messimy bloomed in February.

A kitchen garden was made, and 3 feet of pure sand, treated with suitable manure, produced satisfactory crops of Cauliflowers, Potatos, and other vegetables.

GHENT HORTICULTURAL.

November 3.—The monthly meeting of the Chambre Syndicale des Horticulteurs Belges et Société Royale d'Agriculture et de Botanique de Gand was held on the above date, and the following awards were made.

Certificates of Merit.

Cypripedium insigne var. perfectum; Odontonia Firminii (Odontoglossum crispum × Miltonia vexillaria); Cypripedium Bruggense; and *C. Durandii*, shown by Monsieur F. Lambeau.

Cattleya St. Anne; C. Venus var. lutescens; C. Fabia alba; Cypripedium Memnon; C. elatior; C. Priam; C. Gaston Bultel; Laelio-Cattleya Bulgaria; and *Masdevallia Bella*, shown by Monsieur Jos. de Hemptinne.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

November 7.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Cypher, J. Evans, A. Hanmer, Dr. Hartley, W. Holmes, A. J. Keeling, J. Lupton, D. McLeod, H. Thorp, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

A Silver-gilt Medal was awarded to A. Warburton, Esq., Haslingden (gr. Mr. Dalgleish), who staged a miscellaneous group.

Large Silver Medals to Z. A. Ward, Esq., Northenden (gr. Mr. Weatherby), for a group of Cypripediums and Odontoglossums; and Messrs. Sander & Sons, St. Albans, for a choice group.

Silver Medals to Col. J. Rutherford, M.P., Blackburn (gr. Mr. Lupton), for Cattleyas in variety; Rev. J. Crombleholme, Clayton-le-Moors (gr. Mr. Marshall), who staged a group of Cypripediums; J. McCartney, Esq., Bolton (gr. Mr. Holmes), for Cattleyas and hybrids; Messrs. J. Cypher & Sons, Cheltenham, for Cattleyas and Cypripediums; and Messrs. A. J. Keeling & Sons, Bradford, for Cattleyas.

Other exhibitors included O. O. Wrigley, Esq., Bury (gr. Mr. Rogers); R. Ashworth, Esq., Newchurch (gr. Mr. Gilden); F. A. Hindley, Esq., Great Horton, Bradford; Mr. W. Shackleton, Great Horton; and Mr. W. Birchenall, Alderley Edge.

AWARDS.

First-class Certificates.

Cattleya Iris variety Ashworthiæ.—A large, round flower, of good colour, with deeply-coloured lip, exhibited by R. Ashworth, Esq.

Cypripedium "Jasper" (Alcibiades × Hitchense).—A well-formed flower; the dorsal petal has a white margin. From Z. A. Ward, Esq.

C Hassollii "Hindley's variety" (Charlesworthii × bingleyense).—From F. A. Hindley, Esq.

Award of Merit.

Odontoglossum crispum variety Arthur.—A hybrid of unknown parentage. Shown by Z. A. Ward, Esq.

At the meeting held on November 14 the following members of the committee were present: Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Cypher, J. Evans, W. Holmes, J. Lupton, C. Parker, H. Thorp, Z. A. Ward, and H. Arthur (secretary).

Gold Medals were awarded to W. R. Lee, Esq., Heywood (gr. Mr. Branch), for Cypripediums; Col. J. Rutherford, M.P., Blackburn (gr. Mr. Lupton), and Messrs. J. Cypher & Sons, Cheltenham, for a fine display of Cypripediums and Cattleyas.

Silver-gilt Medals to Mrs. A. K. Wood, Glossop (gr. Mr. Gould), for a pleasing display of Cattleyas and Lælio-Cattleyas in variety; A. Warburton, Esq., Haslingden (gr. Mr. Dalgleish), for a fine group; and Messrs. Charlesworth & Co., Haywards Heath, for a choice mixed group.

Large Silver Medal to R. Ashworth, Esq., Newchurch (gr. Mr. Gilden), for a miscellaneous collection.

Silver Medals to Rev. J. Crombleholme, Clayton-le-Moors (gr. Mr. Marshall), for a small group of Cypripediums; and J. McCartley, Esq., Bolton (gr. Mr. Holmes).

Other exhibitors included Messrs. A. J. Keeling & Sons, Bradford, and Mr. J. Evans, Congleton.

AWARDS.

First-class Certificate.

Cattleya labiata "Cyme."—A large, well-set flower, of pure white-sepals and petals, with faint colour in lip. From Col. J. Rutherford.

Awards of Merit.

C. labiata "Vestalis," Cypripedium Actæus "Ashlandense No. 2," and *C. insigne Rossendale (Sanderæ × Laura Kimball),* all from R. Ashworth, Esq.

Cultural Certificates

were granted to Mr. Gilden for a fine example of *Cattleya Portia*, and to Mr. Gould for a good specimen of *Vanda cærulea*.

WESTON-SUPER-MARE AND DISTRICT CHRYSANTHEMUM.

November 7.—The 26th exhibition of this society was held on this date at Knightstone Pavilion.

In the class for a group of Chrysanthemums, in a space of 50 square feet, a magnificent group exhibited by Frank E. Dove, Esq., Chandos Lodge (gr. Mr. G. Henley), was awarded the 1st prize; 2nd, Mr. Cornellius (gr. Mr. C. Cook).

For a group of miscellaneous plants arranged for effect Mr. C. J. Ellis, Weston Nurseries, Weston-super-Mare, won the 1st prize easily with a beautifully-arranged group containing finely-coloured Crotons, Poinsettias, Liliums, Cattleyas, and Oncidiums; 2nd, Mr. W. Brooks, Whitecross Nurseries.

In the class for 24 blooms of Japanese Chrysanthemums there was not a weak bloom in the whole of the exhibits. The 1st prize was won by H. E. Murry, Esq., Anderdon, Taunton (gr. Mr. J. Bishop); 2nd, Hugh Andrews, Esq., Wickwar (gr. Mr. J. H. Tooley). For 12 Japanese blooms the 1st prize was won by Frank Dove, Esq. (gr. Mr. G. Henley).

Exceptionally fine flowers were shown in the class for six Japanese blooms; the 1st prize was won by E. E. Baker, Esq., Weston-super-Mare (gr. Mr. H. Whitehead); 2nd, Mrs. W. S. Ballis-combe, Worle.

HITCHIN CHRYSANTHEMUM.

November 14.—This show was a great success. The principal prize was offered for the best exhibit of six vases of Japanese blooms in six varieties. There were five competitors, and John Balfour, Esq. (gr. Mr. A. Jefferies), won easily with grand blooms of the varieties William Turner, Mrs. G. Drabble, Lady Talbot, F. S. Vallis, Fred Green, and John Peed. 2nd, Bailey Hawkins, Esq., Stagenhoe Park, Welwyn (gr. Mr. E. Kinns). Mr. Balfour was successful in the class for 12 Japanese varieties, distinct, in vases, also for one vase of five blooms of a white variety, with William Turner; one of the blooms in this vase was adjudged the best Japanese Chrysanthemum in the show. The same exhibitor showed the best vase of five blooms of any coloured Japanese variety with F. S. Vallis.

The vegetables classes were keenly contested. Mr. Hartless excelled in both Messrs. Carter's and Sutton's classes for collections. Mr. E. Kinns was placed 2nd in both classes.

Fruit.—The best of seven exhibits in the class for two bunches of white Grapes was shown by Mr. Jefferies. There were nine entries in the class for two bunches of black Grapes, and Mr. Cronforo was placed 1st with large, handsome bunches of Muscat Hamburgh. Mr. T. Pateman showed best in the class for Apples and Pears. This exhibitor won the 1st prize for a collection of fruit with choice Grapes, Apples, and Pears. Lord Hampden (gr. Mr. C. E. Martin) was placed 2nd.

BRADFORD CHRYSANTHEMUM.

November 15, 16.—The twenty-sixth annual exhibition of this society was held on these dates. The entries, although scarcely so numerous as last year, compared favourably with previous exhibitions.

Cut Blooms.—In the open class for 24 Japanese blooms in not fewer than 18 varieties, Sir Wm. Bass, Burton-on-Trent (gr. Mr. R. Nisbet), was awarded the 1st prize. His best blooms were Frances Jolliffe, Mrs. David Syme (the premier flower in the show), Wm. Gee, Mrs. Mersham, Wm. Biddle, F. S. Vallis, Wm. Turner, Mrs. K. Luxford, and White Queen. 2nd, Arthur James, Esq., Coton House, Rugby (gr. Mr. A. Chandler), with fresh, bright, but smaller blooms.

Local Classes.—For 24 blooms, Incurved, the 1st prize was won by Mr. H. B. Farmer. 2nd, Mr. A. Chandler. Mr. Chandler was also awarded the 1st prize for six vases of Japanese blooms. For 18 Japanese blooms in not fewer than 12 varieties, Mr. John Thornton, Drighlington, was placed 1st. 2nd, Mrs. Constable, Otley (gr. Mr. W. H. Aldridge). Mr. H. Clark was successful in the class for 12 Incurved blooms, and the 1st prize for six dissimilar Japanese varieties was won by Mr. J. Thornton. 2nd, Mr. W. H. Aldridge.

Messrs. Wells & Co., Ltd., Merstham, exhibited Chrysanthemums, including the new variety Queen Mary.

ROYAL METEOROLOGICAL

November 20.—The opening meeting of this Society for the session was held at the Surveyors' Institution, Dr. H. H. Dickson, President, in the Chair.

Dr. H. R. Mill, Director of the British Rainfall Organization, read a paper on the unprecedented rainfall in East Anglia on August 26 last. He based his discussion on the records of 265 rainfall observers in the eastern counties, from which he constructed a series of maps, showing the hour of commencement and of cessation of rain and the total rainfall of the 24 hours in question. The rain commenced in London between 1 and 2 a.m. on August 26, but the hour of commencement grew later towards the northward, rain not beginning to fall in Lincolnshire until after 7 a.m. The intensity of the fall increased rapidly over the whole area, the maximum being reached in a fall of 4 inches in 4 hours from 11 a.m. in the neighbourhood of Norwich. The rain afterwards diminished in intensity and gradually ceased, the hour of cessation being 6 p.m. round the outside of the area affected from Orford Ness to Grantham, but later towards the centre, where, over nearly the whole of Norfolk and a large wedge of Suffolk, it did not cease until after midnight on the 26th, and at some places not until 4 or 5 a.m. on the 27th. In this central area the rain fell without intermission for more than 20 hours, and at some points probably for 24. The distribution of the rain was somewhat remarkable. There were two foci of maximum fall, both in Norfolk, the northern central south of Cromer with more than 7.50 inches, the larger central east of Norfolk culminating in about 20 square miles, with more than 8 inches of rain in the 24 hours. About 1940 square miles in Norfolk and Suffolk had more than 4 inches of rain, the most curious feature being a triangle of much lower rainfall running through the west of Norfolk south-eastward from the Wash. The area with more than 2 inches of rain was at least 5,800 square miles. The general rainfall of each of the counties was calculated for this day and also for the various

river basins; and, speaking generally, it was said that during the 24 hours as much water was deposited on the land as would fall in normal circumstances in two or three months. Several very heavy falls of rain in one or two days which had been recorded in different parts of the country were considered, and it was shown that, although more than 8 inches had fallen at Seathwaite, in the Lake District, on more than one occasion, as the result of one or two days rain, there was no instance of so large an area having more than 6 inches of rain in two days as occurred in East Anglia on August 26. Former flood-rains in the same area were considered, and shown to have been quite insignificant in comparison; and only two instances could be found—July, 1875, and November, 1878—when the rainfall of a whole month surpassed that of these 24 hours. The cause of the prolonged torrential downpour was not to be found in the physical geography of the district affected, but in the meteorological conditions for the full elucidation of which the data were insufficient. The fact that a small secondary depression had passed northward from the English Channel to the coast of Norfolk and then turned eastward across the North Sea suggested a relationship with a similar though less intense rainstorm which affected the east of Ireland on August 25, 1905, when a similar depression passed northward from St. George's Channel to the coast of Wicklow and turned off abruptly across the Irish Sea. Considering the unprecedented magnitude of the volume of rain precipitated the floods, of which a series of photographs was shown, were remarkable rather for their moderation than for the destruction wrought.

Mr. A. P. Jenkin also read a paper on a three-year period in rainfall.

NORWICH CHRYSANTHEMUM.

NOVEMBER 21, 22, 23.—This annual show was held in St. Andrew's and Blackfriars Halls on these dates, and proved a great success.

A Challenge Cup was offered for a circular group of Chrysanthemums and foliage plants 8 feet in diameter. E. G. BUXTON, Esq., Catton Park, Norwich (gr. Mr. F. Notley), won the cup with fairly good blooms of Japanese varieties, freely-flowered singles, and good foliage plants, but the exhibit was not well arranged. 2nd, G. E. WHITE, Esq., Eaton House, Norwich (gr. Mr. D. Cockeril).

The most important class for cut blooms was for 48 specimens of Japanese Chrysanthemums, not fewer than 36 varieties. Sir CARL MEYER, Shortgrove, Newport (gr. Mr. E. Guile), won the 1st prize easily with fine, fresh blooms of Mrs. G. Drabble, J. C. Neill, Mary Farnworth, Leviathan, Fred Green, F. S. Vallis, E. M. Quickendon, Acquisition, Mrs. W. Igguldeu, W. Turner, and others. Sir S. NEWMAN, Rainham Hall, Norfolk (gr. Mr. H. E. Stredwick), was placed 2nd; 3rd, W. H. PALMER, Esq., Ormesby (gr. Mr. E. G. Leach).

In the class for 36 Japanese blooms, open to growers in the county of Norfolk, five competed. The best blooms were shown by T. O. RISBY, Esq., Ormsby (gr. Mr. C. Nichols), whose best varieties were W. Rawlings, J. H. Silsbury, Frances Jolliffe, W. Mease, and Mrs. F. Vallis. W. T. F. JARROLD, Esq., Roxley Thorpe (gr. Mr. W. Marjoram), was awarded the 2nd prize.

The best 12 Japanese blooms, distinct, were shown by Sir G. BARON, Ormsley Hall (gr. Mr. H. Spiri). Especially fine were the six Japanese blooms exhibited by Mr. J. E. PRENTICE, London Road, Harleston; his flowers of Glaucous, Lady Crisp, and Bessie Godfrey were equal to any in the show. Mr. J. F. GAYMER, Millfield Cottage, North Walsham, was a good 2nd. In the class for six blooms of a white Japanese variety, Sir J. NEWMAN staged exceedingly fine specimens of the pure white W. Turner, and secured the leading award. This exhibitor also excelled in the class for six blooms other than a white variety with F. S. Vallis.

Prizes were offered for a group of cut blooms arranged on a table with any foliage. Sir G. BACON was placed 1st in this class.

Incurved blooms were few in number but fairly good in quality. Sir C. MEYER had the best exhibit of 12 varieties. Doris Rayner, Clara Wells, Duchess of Fife, Mrs. G. Denyer, Fred Palmer, Triomphe de Montbrun, and Mrs. Hygate were the best varieties.

There were six classes for naturally-grown Chrysanthemums—terminal sprays. For 12 varieties, arranged in vases, six sprays in each, C. E. WHITE, Esq., excelled with an attractive exhibit of such useful decorative varieties as Lizzie Adcock, M. Julien Valet, Champion Exe, Dr. Englehard, and Source d'Or. 2nd, Mr. E. F. GREEN.

There were excellent exhibits of Carnations, Violets, and Begonias. In the fruit classes Apples and Pears were especially good. For three bunches of black Grapes, distinct, Col. HARBORD won the 1st prize with Black Alicante, Gros Maroc, and Gros Colman. The best three bunches of Black Alicante were shown by E. REEVE, Esq. (gr. Mr. E. Florence). The finest Muscat of Alexandria Grapes were exhibited by F. A. RISING, Esq., Ormesby (gr. Mr. C. Nicholls). There were numerous exhibits in the class for 10 varieties of dessert Apples. Lord STRADBROOK, Henham Hall (gr. Mr. F. Simpson), won the 1st prize with splendid fruits. Lord STRADBROOK also excelled in the class for nine varieties of culinary Apples. Col. PETRIE, Westwick, won quite easily the premier prize for six varieties of dessert Pears with grand fruits.

NON-COMPETITIVE EXHIBITS.—Messrs. DANIEL BROS., Norwich, furnished one end of St. Andrew's Hall with a fine display of Chrysanthemums and other flowers. (Gold Medal.)

Messrs. SUTTON & SONS, Reading, staged a large collection of vegetables. (Gold Medal.)

Messrs. W. WELLS & Co., LTD., Merstham, showed Chrysanthemums. (Gold Medal.)

Messrs. HOBBIES LTD., Wisbech, showed Liliums, Roses, Dahlias, Begonias, and Chrysanthemums. (Gold Medal.)

Mr. G. W. MILLER, Clarkson Nurseries, Wisbech, arranged, in front of the orchestra, an attractive group of Orchids. (Gold Medal.)

Mr. W. SKABROOK, Chelmsford, and Mr. R. C. NOTCUTT, Ipswich, showed collections of Apples.

ABERDEEN CHRYSANTHEMUM.

NOVEMBER 22, 23.—This show was held in the hall of the Young Men's Christian Association, Aberdeen, on the above dates. The exhibits were well up to the standard of previous years, and the entries were numerous.

POT PLANTS.—For a group of Chrysanthemums and other plants arranged in semi-circular form on a space 8 feet by 4 feet, the 1st prize, a piece of silver plate, was won by A. R. GRAY, Esq., of Garthdee, Aberdeen (gr. Mr. Robert Begg). It was a capital group. A Kentia Palm formed the crown, while Cocus Weddelliana added to the effect. The Chrysanthemum blooms included finely-grown specimens of Mrs. Lopes, Mrs. A. T. Miller, the new white Master James, J. H. Silsbury, and several beautiful singles. Colonel STUART RICHARDSON, of Ballathie, Perthshire (gr. Mr. John E. Davies), was placed 2nd. Mr. A. R. GRAY also won the 1st and 2nd prizes for specimen Chrysanthemums in pots, his entries including a magnificent pot of the Nellie Pockett variety. For single and decorative Chrysanthemums Mr. GRAY also took leading honours.

CUT BLOOMS.—Colonel STUART RICHARDSON, Ballathie (gr. Mr. John E. Davies), won the 1st prize easily in the class for 18 blooms of Japanese Chrysanthemums, six varieties. His blooms included choice specimens of Mrs. F. W. Vallis, Mme. P. Radaelli, Master David, Mrs. Eric Crossley, Wm. Turner, and Mrs. F. S. Vallis. Sir CHARLES FORBES, Bart., of Newe, Strathdon, Aberdeenshire (gr. Mr. John McRobbie), was a good second. In the class for six blooms of yellow and white Japanese Chrysanthemums, Mrs. THORNTON, Thornton Castle, Kincardineshire (gr. Mr. Duncan McLean), was placed 1st. Mrs. DUNBAR-DUNBAR, Seapark, Forres (gr. Mr. J. A. Grigor), closely followed. The last-named exhibitor won the premier award in the class for 12 blooms. The best three blooms of one variety were shown by Mrs. THORNTON, and the best 18 vases of decorative Chrysanthemums by Mrs. DUNBAR-DUNBAR.

The best collection of kitchen Apples was shown by A. B. INNES, Esq. (gr. Mr. C. Stuart). He also showed the best dessert Apples. Mrs. DUNBAR-DUNBAR, Seapark, Forres, carried off the chief honours for dessert Pears. Grapes were not much in evidence, but the bunches of Black Alicante shown by Mr. COUPER, of Craigiebuckler, were well worthy of the 1st place.

LINNEAN.

NOVEMBER 21.—A general meeting of the Society was held on this date, Prof. E. B. Poulton, F.R.S., President, in the Chair.

The Rev. George Henslow, M.A., gave the substance of his paper, "On Vegetable Mechanics," as follows:—

The object of this paper is to show that plants respond to gravity, strains and stresses, in order to resist them and so secure stability. Kerner thought that the stems of herbs and trunks of trees were constructed on a combined system of girders; but if a tree has a heavy mass of foliage borne at the summit of a tall cylindrical stem (as of mahogany), or even a short one (Fagus Rumphii) buttresses are often formed by the roots, which enable the tree to keep the centre of gravity over an extended base.

If the stem be hollow, diaphragms are introduced to render it secure. These are in some cases cup-shaped as in East Indian Bamboos, thereby securing a greater "pull" against lateral injury.

In tropical lianes, various mechanical contrivances secure strength with elasticity. In Bauhinia there are cup-shaped bulgings on either side of a flattened stem. In the Monkey-ladder (Caulotretus), besides the bulgings, flanges are added on the edges, making a complete girder.

In Cucurbitaceæ and Passiflora the tendril coils, after securing a hold by its curled tip, the coils being in opposite directions. This is secured by a "crank" being first formed which rotates.

In leaves, the distribution of the mid-rib and veins secures the blade from transverse bending and tearing. In Bananas, the leaves, being degenerate in character, are invariably torn to shreds by the wind.

In flowers adapted to insects various mechanical contrivances enable the calyx and corolla, or the stamens, to support the insect; while others enable it to carry the pollen away. The calyx multiplies its ribs and the corolla expands anteriorly, while the stamens become levers, &c.

Fruits are often subject to strains as in bursting, but if a Pear hangs vertically from an oblique stalk, there is a tendency to tear it away. Nature then develops a hump at the base which counteracts the resultant of the two other forces.

The whole of the purposeful structures to secure strength to resist injurious strains, is the issue of the directivity of life.

NATIONAL CHRYSANTHEMUM.

ANNUAL DINNER.

NOVEMBER 27.—Members and friends of the National Chrysanthemum Society met at dinner on this date in the Royal Venetian Chamber of the Holborn Restaurant. The room was lavishly decorated with Chrysanthemums; a bank of large exhibition blooms, relieved with Palms and other greenery, was arranged along one side of the Hall, whilst the tables were gay with epergnes of smaller decorative varieties. The company, which numbered 105, included many ladies. Amongst those present we noticed Messrs. Thomas Bevan, E. F. Hawes, J. Witty, D. B. Crane, C. Harman Payne, R. J. Frogbrook, J. W. Moorman, W. Wells, Norman Davis, T. Stevenson, R. B. Leech, G. Hunt, and R. A. Witty (secretary). The Secretary read a letter from the president, Sir Albert Rollit, LL.D., regretting his inability to be present owing to indisposition. In the president's absence, and at his express wish, Mr. Thomas Bevan, chairman of the committee, occupied the chair.

After the usual loyal toasts had been honoured, the chairman gave the toast of "The National Chrysanthemum Society." Mr. Bevan referred with regret to the absence of the president. He gave a brief history of the Society from the time when it was formed from the old Stoke Newington Chrysanthemum Society, and referred to the wonderful progress seen in all sections of the flower since that time. There was, he said, a possibility of some of the older sorts appearing again under new names, for in some of the varieties on the tables he fancied he saw familiar faces, and this must be taken into consideration in awarding certificates to novelties. The toast was received with enthusiasm. The chairman then proceeded to distribute the medals, cups, and other trophies won at the Society's exhibitions.

The next toast was "The Donors of Special Prizes," proposed by Mr. E. F. Hawes. Mr. Hawes said the Society was greatly indebted to those who had offered these special prizes, which, as those present could see, were numerous and valuable. They were indebted to their president for one of the handsome cups, and he, Mr. Hawes, proposed that a telegram should be sent to Sir Albert Rollit regretting his absence, and wishing him a speedy recovery. The proposal was received with acclamation. Mr. R. J. Frogbrook, in responding to the toast, expressed the satisfaction of those who had contributed special prizes, for the competitions were excellent, and the quality of the exhibits everything that could be desired.

Mr. C. B. Crane proposed "The Exhibitors and Affiliated Societies." The trade exhibits, said Mr. Crane, were the finest ever seen at the N.C.S. exhibitions, and he especially mentioned those of Messrs. Norman Davis, W. Wells & Co., H. J. Jones, John Peed & Son, and Craig, Harrison and Craig. He also referred to the great success of Mr. Thomas Stevenson, who won the 1st prizes in all the important classes at the principal show.

Mr. Wells, in responding, expressed the indebtedness of the traders to Mr. Caselton, the superintendent of the Crystal Palace, for his courtesy and help. He considered that there should be a rigorous selection of novelties submitted for awards.

The toast of "The Chairman" was proposed by Mr. C. Harman Payne in a humorous speech. He said that Mr. Bevan was a man of resource, perseverance, courtesy, and kindliness, and a keen supporter of the National Chrysanthemum Society. The toast was received with musical honours.

Other toasts were "The Press," proposed by Mr. J. W. Morman, and responded to by Mr. J. Harrison Dick, and "The Ladies and Visitors," proposed by Mr. J. McKerchar.

PERPETUAL-FLOWERING CARNATION.

DECEMBER 3, 4.—The 13th exhibition of the Perpetual-flowering Carnation Society, held at the R.H.S. Hall on these dates, will rank as the best in the history of the Society. The entries were above the average, the exhibits were of high quality, and there was a large attendance of visitors.

OPEN CLASSES.

The three groups of cut Carnations, arranged on tabling 10 feet by 3 feet, with decorative plants or cut foliage, presented a very attractive appearance. A large number of excellent blooms of the best varieties were used by the several competitors. The 1st prize was won by Mr. C. ENGELMANN, Honeybrook Nursery, Saffron Walden, with a tastefully-arranged collection. The outstanding varieties were Sunstar, Rose Doré, Lady Northcliffe, Carola, and Pink Delight. The 2nd prize was awarded to Messrs. WELLS & Co., The Nurseries, Merstham, Redhill, for a very bright exhibit. The varieties Scarlet Glow (which has such an appropriate name), Dorothy Gordon, and Northport were especially noteworthy. 3rd, Col. RIDEOUT, Langley, Bucks, who showed a smaller collection of very fresh blooms.

The only exhibit of three vases containing 12 blooms of British novelties distributed since January 1, 1910, was that of the varieties Sunstar, Lady Northcliffe, and Carola, for which the Brunton Challenge Cup was worthily awarded to Mr. ENGELMANN.

The Challenge Cup presented by the American Carnation Society for a similar collection of American novelties was awarded to Mr. H. F. MASON, Church Farm Nursery, Hampton Hill, Middlesex, for three vases of exceedingly fine blooms of Dorothy Gordon, Gloriosa, and White Wonder; 2nd, Mr. W. E. WALLACE, The Nurseries, Eaton Bray, Dunstable; 3rd, Mr. C. ENGELMANN.

The class for "25 blooms, any one variety, Enchantress, Mrs. Chas. Knopf, and similar colours," was responsible for eight vases of charming flowers. The 1st prize was awarded to Mr. E. GUILE, The Gardens, Shortport, Newport, for a splendid vase of his variety Lady Meyer; 2nd, Mr. W. E. WALLACE; 3rd, Col. RIDEOUT.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, won the 1st prize in the class for a vase of Carnations of medium shades of pink with the variety Baroness de Brienen; 2nd, Mr. W. E. WALLACE; 3rd, Mr. C. ENGELMANN.

The best vase of rose-pink Carnations was that of Gloriosa shown by Mr. W. E. WALLACE; 2nd, Col. RIDEOUT.

The premier vase of any deep pink variety was "Una Wallace," shown by Mr. W. E. WALLACE; 2nd, Mr. C. ENGELMANN.

The white varieties shown were mostly White Perfection, and the 1st prize was won by Mr. H. F. MASON, Church Farm Nursery, Hampton Hill, Middlesex, with beautiful blooms; 2nd, Mrs. COLLINS, Heathfield Nursery, Swanley; 3rd, Col. RIDEOUT.

Scarlet Glow, as shown by Mr. W. E. WALLACE, was decidedly the best of the scarlet varieties; 2nd, Mr. H. F. MASON, who showed Beacon; 3rd, Mr. H. J. DUDNEY, The Nursery, South Road, Erith, Kent.

There were only two vases in the class for crimson or clove-coloured blooms. The 1st prize was won by Mr. W. E. WALLACE for a splendid vase of Carola; 2nd, Mr. C. ENGELMANN.

Mr. WALLACE also won the 1st prize for a vase of Fancy Carnations; he showed Benora in very good form; 2nd, Messrs. STUART LOW & Co; 3rd, Mr. C. ENGELMANN.

Mr. A. F. DUTTON, The Nurseries, Iver, Bucks., won the 1st prize for the best vase of any other self Carnation with the variety Mikado. 2nd, Col. RIDEOUT.

Mrs. BIDE was the only exhibitor of a basket of Carnations, and was awarded the 1st prize for a tasteful arrangement.

The six dinner tables were all decorated with pink-coloured Carnations. The arrangement which won the 1st prize for Mrs. BIDE, Highfield, Guildford Road, Farnham, was very dainty and charming; 2nd, Sir RANDOLF BAKER, Bart., Ranston, Blandford (gr. Mr. A. E. Usher); 2nd, Mr. H. E. GUILE.

The best three ladies' sprays were shown by Mr. S. F. JACKSON, Danehurst, Epsom; 2nd, Miss E. GUILE; 3rd, Mr. R. B. LEACH, Dulwich.

The best six gentlemen's coat flowers were shown by Capt. WEINER; 2nd, Mr. WM. HEATH, The Hylands, Chelmsford; 3rd, Mrs. E. GUILE.

Mr. W. HEATH was awarded the 1st prize for a bright hand-basket of Carnations; 2nd, Mr. W. HOLDER; 3rd, Mrs. A. BIDE.

AMATEURS' CLASSES.

Lord Howard de Walden's challenge cup for the best semi-circular group of Carnation plants was awarded to CECIL P. RAPHAEL, Esq., Porter's Park, Shenley, Herts. (gr. Mr. A. Grubb), who showed a highly meritorious collection. The blooms were very large and fresh and of excellent colour. 2nd, Mrs. BISCHOFFSHEIM, Warren House, Stanmore. 3rd, Mrs. ADAIR, Adair Place, Englefield Green (gr. Mr. W. Holder).

The two circular tables of cut Carnations were an agreeable change. The 1st-prize table, arranged by Sir RANDOLF BAKER, Bart. (gr. Mr. A. E. Usher), evoked the admiration of many visitors; 2nd, Mr. H. SMITH, Epping House, Little Berkhamsted, Herts., whose style of arrangement was in several respects the better, but the blooms lacked the high quality of the 1st-prize exhibit.

Three of the four dinner tables were decorated with pink Carnations. The 1st-prize table (Sir RANDOLF BAKER) was run very closely by that arranged by Mr. W. HOLDER, of Adair Place Gardens.

Sir RANDOLF BAKER also won the 1st prize for six Carnation plants (2nd, Mrs. ADAIR, who showed smaller but well-grown plants) and the Stuart Low prize offered for the best plant of the variety Baroness de Brienen, as well as for the best vase of that firm's novelties.

In the class for 12 blooms of Burnett's novelties, Sir RANDOLF BAKER, Bart., was equally successful, whilst the best six blooms were shown by Capt. WEINER, Ewell Castle, Surrey.

The gold medal offered by Messrs. Wells & Co. for six blooms of four specified varieties was won by Sir RANDOLF BAKER; 2nd, Lord BURNHAM, Hall Barn, Beaconsfield (gr. Mr. J. Johnson).

The class for one vase containing 25 blooms of Carnations was strongly contested. The 1st prize was won by Sir RANDOLF BAKER; 2nd, S. F. JACKSON, Esq.

In the colour classes, Sir RANDOLF BAKER was generally successful. He won the 1st prizes in the classes for varieties of the Enchantress shade of colour, the Mrs. Burnett type, the rose-pink, and for the deep pink. Second prizes were awarded to Mr. J. WEST, Old Windsor; Mr. H. S. CULWICK, The Gardens, Westlake, Yeovil.

The 1st and 2nd prizes for white varieties were awarded to Mr. S. F. JACKSON and Sir RANDOLF BAKER in the order named; whilst in the class for scarlet varieties Sir RANDOLF BAKER was again leading, with Capt. WEINER 2nd.

The best clove-coloured blooms were shown by Mr. S. F. JACKSON and Capt. WEINER.

The 1st prize for any other Self was won by F. RICARDO, Esq., The Friars, Old Windsor (gr. Mr. G. West); 2nd, Sir RANDOLF BAKER, who gained the 1st prize for Fancy Carnations.

The "Dutton" prizes for 12 blooms of specified varieties were won by Sir RANDOLF BAKEN and F. RICARDO, Esq., in the order named.

Sir R. BAKER also won the special prize offered by Mr. C. Engelmann, for six plants in bloom; 2nd, Mrs. ADAIR.

In the sections restricted to amateur members, who employ a part-time gardener, or who cultivate their Carnations unaided, Mr. C. LOOSEMORE, Rodwell Station, Weymouth, was the most successful exhibitor. Mr. T. H. PLOWRIGHT, Windsor, won the 1st prize for self-Carnations.

NON-COMPETITIVE EXHIBITS.

Mr. C. ENGELMANN, Saffron Walden, Essex, filled a large part of the end of the hall with an enormous collection of splendid cut Carnation blooms. The tall stands contained such varieties as Lady Northcliffe, Enchantress, and White Perfection. The clove-coloured Carola was exceptionally fine, as also were the blooms of Dorothy Gordon, Princess Charming, Sunstar, Red Jessica and Beacon. Several seedlings of different colours promise to develop into useful varieties. (Gold Medal.)

Messrs. STUART, Low & Co., Bush Hill Park, Enfield, had an imposing show of cut Carnations, arranged in an effective manner. Besides several interesting seedlings the novelties Rosette (deep pink), Cinnabar (dull rose), British Triumph (clove-coloured) and St. Nicholas (scarlet) were worthy of admiration. (Gold Medal.)

Mr. W. LAWRENSON, Yarm-on-Tees, showed many well-known varieties and Snowstorm (white), and Mrs. Charles Page (very large shaded pink of the Remontant type). (Silver-gilt Medal.)

Messrs. YOUNG & Co., Hatherley, Cheltenham, exhibited in the Hon. John Boscawen (soft pink) and Mrs. Brodie-Henderson (faded rose), two new varieties. (Silver-gilt Medal.)

Mr. G. LANGE, Hampton, showed Scarlet Glow, Alma Ward, Mrs. W. C. Ward, &c., in typical form. (Silver Medal.)

Messrs. ALLWOOD BROS., Wivelsfield Nurseries, Haywards Heath, arranged many choice varieties in an exceedingly attractive manner. The novelties included the richly-coloured Mary Allwood, which has such a delightful fragrance, Geisha, Salmon Enchantress and Empire Day, especially desirable varieties. (Silver-gilt Medal.)

Mr. H. BURNETT, Guernsey, showed splendid examples of Marmion, Mandarin, Beacon, Benora, R. F. Felton and Sunstar. (Large Silver-gilt Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, London, included in their attractive group a large stand of the glowing scarlet variety Mrs. L. Mackinnon, and smaller collections of such valuable sorts as Viscountess Goschen, Lady Coventry, Lady Meyer and Mrs. Waldorf Astor. (Silver Medal.)

Mr. A. F. DUTTON, Iver, Bucks., displayed a large number of blooms of the variety Mrs. A. F. Dutton, which received an Award of Merit. (See R.H.S. awards.)

Messrs. FELTON & SONS, Hanover Square, London, exhibited a very interesting collection of the best British-raised novelties. (Silver-gilt Medal.)

AWARDS OF MERIT.

Mary Allwood (see p. 394).—Shown by Messrs. ALLWOOD BROS.

Baroness de Brienen.—This salmon-pink variety received an R.H.S. Award of Merit, November 7, 1911. Shown by Messrs. STUART LOW & Co.

Snowstorm (see p. 394).—Shown by Messrs. W. LAWRENSON & SON.

Mrs. A. F. Dutton (see R.H.S. Awards, fig. 187).—Shown by Mr. A. F. DUTTON.

SANQUHAR HORTICULTURAL.

THIS society held its annual meeting in the Town Hall, Sanquhar, recently. Mr. J. Thomson occupied the chair, and a highly satisfactory report was submitted by Mr. John Milligan, secretary and treasurer. The debt has been cleared off through the results of a successful year's operations, and there is a small credit balance. Mr. Jas. Moffat was elected president, Mr. John Milligan secretary and treasurer, and Mr. R. M'Kendrick, Junr., assistant secretary.

DEBATING SOCIETIES.

STIRLING & DISTRICT HORTICULTURAL.—At the meeting of this association held on the 5th ult., in the Y.M.C.A. Hall, Stirling, a lecture on "Cork, Cork Trees, and Cork Growing" was delivered by Major Yates. The lecture was illustrated by limelight views. Mr. M. Chapman gave a résumé of the outstanding features of the gardens visited by the society during the season.

KILMARNOCK AND DISTRICT GARDENERS'.—The second lecture of the present session was given on the 18th ult. by Mr. A. Hosking, instructor in horticulture to the West of Scotland Agricultural College, the subject being "Plant Hybridisation," with a reference to "Plant Breeding." Mr. Hosking pointed out the necessity of a knowledge of the structure of flowers, the various methods of pollination, and the various precautions to be taken in order to effect successful crossing by artificial means, illustrating his lecture with specimens. After a reference to the historical aspect of the subject, Mendelism and graft hybrids, plant-breeding by selection was dealt with.

BRISTOL AND DISTRICT GARDENERS'.—A meeting of this association was held in St. John's Parish Rooms, Clifton, on November 14. Mr. Theday presided over a large attendance. Mr. C. H. Cave, vice-president, gave a lecture on "Hybridising of Daffodils."

——— A meeting of the above association was held on the 28th ult. A lecture was delivered by Mr. Lovelock, of the King's Dene Nurseries, on "Pot Fruit Culture." The prizes offered by Messrs. James Carter & Co. for a selection of vegetables were won by Messrs. Benfield, Miles and Young in this order.

CARDIFF GARDENERS'.—The usual fortnightly meeting of this association was held at the Queen's Hotel, Cardiff, on the 13th ult.; Mr. A. H. Cossom presided. Mr. Garnish, a member of the Bristol association, read a paper on "Pots and Pans and Boxes for Cutting."

——— At the meeting held on the 29th ult. Mr. A. H. Cossom presided over a moderate attendance of the members. Mr. Fry, gardener at The Court, Llandaff, delivered a paper on "The Perpetual-flowering Carnation." Mr. Fry stated that propagation should be commenced in November. He recommended layering from old plants in July, as plants thus obtained were superior to those raised from cuttings. Mr. Fry dealt with the various insects and other pests of the Carnation. He stated that if the plants were kept growing in a healthy condition very little trouble would be experienced with rust disease.

BATH GARDENERS'.—A meeting of this society was held at the Foresters' Hall, Bath, on the 12th ult. Mr. Tarbett, the chairman, presided. Mr. J. Merchant gave a paper on "The Fragrance of Roses." The lecturer referred to the fine perfume of the old Damask and Provence Roses, and among the newer Roses singled out for special mention on account of their perfume Hugh Dickson, Commandant Félix Faure, Conrad F. Meyer, Rose a Parfum de l'Hay, La France, Maréchal Niel, Madame Alfred Carrière and Cherry Ripe.

CHELMSFORD AND DISTRICT GARDENERS'.—The fourth meeting of the winter session was held in the Institute of Agriculture on the 15th ult. Mr. Malins Smith presided, and about 60 members attended. Previous to the lecture a competitive exhibition of Chrysanthemums was held; the first prize was won by Mr. Hunt, second Mr. Killingby. A non-competitive exhibit of these flowers was shown by Mr. White. Mr. C. E. Searls gave a lecture on "Lawns, Bowling Greens and Tennis Courts."

——— A meeting of this association was held in the Institute of Agriculture on the 29th ult. Mr. C. J. Simpson occupied the chair, and about 40 members were present. Mr. C. Wakely gave a lecture on "Pot Plants and Potting." In order to make the lecture of practical value Mr. Wakely brought specimens of pot plants and potting materials.

RUDDINGTON & DISTRICT GARDENERS'.—At the meeting held on the 12th ult., Mr. R. Sutton gave a lecture on "Gardening" in the absence, through illness, of the appointed lecturer, Mr. Horace J. Wright. Mr. Baynes Smith presided. Mr. R. Sutton said the title of his lecture should be "Gardening, Limited," for he only intended to speak of the first and most important part of a gardener's work. This was double-digging, and though the work was hard, a gardener was well repaid by the better crops which were the result, especially if special manures or soils were incorporated. The Chairman spoke of the fruit grown so successfully in the dry belt in Canada as the result of deep cultivation. Mrs. Wray Hunt, in proposing a vote of thanks to the lecturer, said that the vivid pictures of a garden reminded her of the words of a great man: "If you have beautiful thoughts in your mind, you have always a garden in flower."

WARGRAVE AND DISTRICT GARDENERS'.—A meeting of the association was held on Wednesday, November 13, and there was a good attendance of members to hear a paper on "Seed Sowing" delivered by Mr. J. A. Hall, Gardener at Shiplake Court. He said he would take the question "When shall I sow my seeds?" and endeavour to answer it from his own experiences at Shiplake Court. He first explained that water, heat and air were necessary for germination, but sometimes germination was irregular. There were several causes for this. It was generally found that if seeds were sown soon after they were gathered, germination was speedy. Healthy seeds often rotted owing to excess of moisture. Attention was then drawn to the number of seeds produced by some plants. Thick sowing and overcrowding were greatly deprecated. The various depths for sowing were mentioned, and the different methods of covering till germination occurred were described. Mr. Hall gave a general list which could be used month by month, commencing with January.

——— At the meeting held on the 27th ult. competitions in vase decorations were arranged, and there were 18 entries. The prize-winners in the head gardeners' and foremen's class were:—1st, Mr. A. Histead, Old Vicarage Gardens, Shiplake; 2nd, Mr. W. H. Scott, Hermitage Gardens, Twyford; 3rd, Mr. H. Attlesey, Wargrave House Gardens; and in the class for journeymen: 1st, Mr. Bristow, Scarlet's Gardens, Hare Hatch; 2nd, Mr. R. Baker, Park Place Gardens; and 3rd, Mr. Dancer, Scarlet's Gardens, Hare Hatch. The flowers used in the competitions were sent to the Royal Berkshire Hospital the following morning.

READING GARDENERS'.—A large attendance of members gathered on Monday evening, the 18th ult., at the Abbey Hall, when Mr. E. F. Hazelton, of The Gardens, North Hyde, Hayes, gave a paper on "The Treatment of Pears." The lecturer stated that his experience with different varieties of Pears, and more particularly as to flavour, on various types of soil in widely-separated districts, had been so contradictory that he hardly cared to express an opinion as to the best varieties when considered from the point of view of quality. Local experience must be the chief guide in the matter. In the discussion which followed the reading of the paper, points were raised on the respective merits of the Pear and Quince stocks; early and late varieties; the first season after planting or not; the character of good Pear soils, the general deficiency of flavour in Pears in 1912, together with the unusual early maturity of late varieties.

NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL.—A meeting of this association was held in the Aberdeen University Buildings on Wednesday, 20th ult. A paper entitled "A Trip to Holland and the Bulb Fields," was read by Mr. A. Brown, of Messrs. Alexander & Brown, Nurserymen, Perth. With the aid of beautiful lantern slides, Mr. Brown gave a capital account of a visit he paid to Holland in the spring two years ago. He described in a delightful manner the many varieties of Daffodils, Tulips, Hyacinths, &c., grown in Holland, showed on the screen many photographs of beautiful specimens, and concluded with some valuable and practical hints as to cultivation, drainage, soil, &c. Mr. Douglas, gardener at Bowdlerville, Esq., of Peterculter, Aberdeen, dealt with flowers. Referring to Sweet Peas, he stated that those which had done best with him during the past unfavourable season had been Lady Evelyn Eyre, Hercules, Bobbie's Cream, and Juliet. Dealing with Primulas, Mr. Douglas said that since the introduction of Primula obconica several fine varieties had been sent out with flowers of varying shades of rose and rosy red, but the aim of many lovers of that plant had been to obtain a really bright red variety. That had now been secured in Primula obconica Kewensercinæ. Mr. Douglas also referred to several new herbaceous plants, specially commending a lovely salmon pink Astilbe.

DEVON AND EXETER GARDENERS'.—At the meeting held on the 27th ult. Mr. Charles Thomas, Poltimore Gardens, gave a lecture on "The Carnation and its Cultivation." Mr. A. Hope and Mr. Thomas said that in 1629 Carnations were the greatest of garden favourites. The application of manure at the time of planting was not to be recommended, but if the soil was poor a dressing of manure, wood ashes, or soot would be beneficial. It was necessary to get the young plants well established before the winter months, as a safeguard from frosts and trying winds. The middle of July was not too early to commence layering, and the work should be completed by the middle of August. The lecturer enumerated Duchess of Fife, Mrs. Nicholson (pink), Trojan (white), Midas (buff), Omar (crimson), G. B. Draper, Leander, Uriah Pike, Goldilocks, Aurelian (yellow ground), and Fancy as desirable varieties.

Obituary.

CAPTAIN HENRY ROGERS.—We regret to record the death, at Plymouth, on the 26th ult., of Captain Henry Rogers, R.N., in his 88th year. Capt. Rogers contributed notes on forestry to these pages from time to time, giving his experiments on the commercial value of thinning plantations. The last article appeared in the issue for December 30, 1911. He commenced planting trees as far back as 1857, and kept careful records in a "log" of the growth of the various trees.

ENQUIRY.

CATS AND BULBS.—Can any reader inform me how to prevent cats from scratching up bulbs planted in flower-beds? I have tried pepper, but this is rendered useless by the first rain. *W. A. H.*

MARKETS.

COVENT GARDEN, December 4.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Remarks.—English dessert and culinary Apples continue a very heavy supply, and many growers still have large stocks to dispose of. Importations of Apples in boxes and barrels are much in excess of past years. The following varieties of English and imported Pears are available:—Doyenné du Comice, Winter Nelis, Easter Beurré, Passe Crassane and Kieffers. The Kieffer Pears are packed largely in barrels. There are large supplies of English hothouse Grapes with the exception of Muscat varieties. English Tomatos are finished, but Teneriffe Tomatos are arriving in an excellent condition. Mushrooms have not been so plentiful this week. Dwarf Beans from Madeira are an increasing supply, and the Channel Islands Seakale is now more abundant. Forced Peas (Guernsey) are obtainable in larger quantities than hitherto. Walnuts are nearly over, but there is a greater demand for Cobnuts. Other nuts, such as Chestnuts, Brazils, Almonds &c., are plentiful. Very heavy consignments of fruit are now arriving in readiness for the Christmas trade. Ordinary vegetables are very plentiful. Holly and Mistleto now reach the market in large quantities. *E. H. R., Covent Garden, December 4, 1912.*

Edward J. Newburn, Covent Garden and St. Pancras, December 4, 1912.

GARDENING APPOINTMENTS.

Mr. David Armstrong, for the past 3½ years Foreman at Riccarton Gardens, Midlothian, as Gardener to J. A. Macconochie-Welwood, Esq., Kirknewton House, Midlothian.

Mr. A. W. Mowl, for the past 8 years Gardener to Victor Edelstein, Esq., Oaklands, Bradford, as Gardener to F. Winnington, Esq., Stanford Court, Worcester.

Mr. E. Knowles, for many years Gardener to the late Alderman R. Clough, Beechclippe House, Keighley, as Gardener to Sir Prince Smith, Bart., Southburn, Driffie'd. (Thanks for donation of 1s. for R.G.O.F.—Eds.)

Mr. F. P. Dickson, previously Gardener at White Lodge, Richmond Park, Surrey, as Gardener to Sir Offley Wakeman, Bart., Yeaton-Peverey, Shrewsbury. (Thanks for donation of 2s. 6d. for R.G.O.F.—Eds.)

Mr. J. Gilbert, for the past 17 years Gardener to Captain Warner, Langton Hall, Market Harboro', as Gardener to C. B. Warner, Esq., Kepwick Hall, Northallerton, Yorkshire.

Mr. E. Percival, for the past 4 years Gardener to Sir John A. Miller, Bart., Heywood Westbury, Wiltshire, as Head Gardener to the Count Conrad, Hockberg, Croydon Hall, Washford, Somerset.

Mr. H. Pritchard, for the past 18 months Foreman to Lady Hickman, Wightwick, Wolverhampton, as Gardener at the same place. (Thanks for 1s. for R.G.O.F.—Eds.)

Mr. R. Ivison, for the past 16 months Gardener at Orton Hall, Westmorland, and previously for 5 years at Nawoth Castle, Carlisle, as Gardener to C. O. Sandys, Esq., Graythwaithe Hall, Newby Bridge, Ulverston, Lancashire.

Mr. P. A. Barnes, late Foreman at Bifrons Park, Canterbury, Kent, The Vyne, Oakley Hall, Hampshire, and Rood Ashton Park, Wiltshire, as Gardener to Sir J. A. Miller, Bt., Heywood House, Westbury, Wiltshire. (Thanks for 2s. for the R.G.O.F. box.—Eds.)

Mr. George Haig, for 22 years at Garvald Gardens, Dolphinton, as Gardener to F. Menteith Ogilvie, Esq., Barcaldine, Ledag, Argyllshire.

Mr. Alex. Chalmers, for 14 years at Haggerston Castle, as Gardener to Mrs. Woodrop, Garvald, Dolphinton.

CATALOGUES RECEIVED.

Amos Perry, Enfield, Middlesex—Rock and Border Plants.

Charles Ramsay & Son, Ball's Bridge, Dublin—Fruit Trees, Roses, Shrubs and Climbing Plants.

T. Smith, Newry—Roses; Trees and Shrubs; Climbing Plants; Hardy Alpine and Hardy Herbaceous Plants.

Clibrans, Hale, Altrincham—Fruit, Forest and Covert Plants, Ornamental Trees, Shrubs, and Climbers.

Wm. Watson & Sons, Ltd., Clontarf Nurseries, Dublin—Fruit Trees, Roses and Shrubs.

W. Drummond & Sons, Ltd., Stirling—Forest, Ornamental and Fruit Trees.

Wm. Fell & Co., Ltd., Hexham—Forest Trees, Shrubs, &c.

J. Cheal & Sons. Ltd., Crawley, Sussex—Trees, Shrubs, Roses and Fruit Trees.

Laxton Brothers, Bedford—Fruit Trees and Roses.

J. Naylor & Sons, Long Sutton, Surrey—Alpine and Herbaceous Plants; Roses, Fruit Trees, Trees and Shrubs.

Little & Ballantyne, Carlisle—Trees.

Austin & McAslan, 89, Mitchell Street, Glasgow—Trees and Plants.

M. H. Sinclair, Queen's Road West, Aberdeen—Roses.

Bertrand W. Deal, Kelvedon, Essex—Sweet Peas.

Dicksons, Chester—Orna meotal and Forest Trees, Shrubs.

FOREIGN.

Pape & Bergmann, Quedlinburg—New Plants.

Leonard Lille, 107, Cours Emile-Zola, Lyon-Charpennes, France—New Plants.

Haage & Schmidt, Erfurt, Germany—Novelties in Seeds.

Barbier et Cie, 16, Route d'Olivet, Orleans, France—Roses; Nursery Stock.

Leon Chenault et Fils, 79, Route d'Olivet, Orleans, France—Trees, Shrubs and Roses.

SCHEDULE RECEIVED.

National Rose Society's first spring Rose show to be held on Thursday, May 1, 1913, in the Royal Horticultural Hall, Vincent Square, Westminster. Secretary, Edward Mawley, Rosebank, Berkhamsted.

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending November 30, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—A very unstable condition prevailed throughout generally; there was much cloud with frequent rain, while late in the week a considerable amount of snow fell over a large area in the north and some localities in the south. On the afternoon of the 27th ih under occurred a fersey and Guernsey.

The *temperature* was below the average very generally; in Scotland the deficit was as much as 5° or 6°. The highest of the maxima were recorded at most stations on the 25th or 26th, and ranged from 67° in the Midland Counties and Ireland N. to 52° in Scotland N. The absolute minima were extremely low in Scotland and the North of England, and were recorded on the 29th and 30th. At West Linton the thermometer on the latter date descended to 1°, at Balmoral, Kilmarnock, and Newton Rigg (Pen.) at Cally, Gatehouse, to 7°, and to below 13° in several other localities. Over Ireland and the southern half of England the values ranged from 18° in Ireland N. to 23° in England S.E., and to 35° in the English Channel. The lowest grass readings recorded were 5° at West Linton, 8° at Newton Rigg, 0° (zero) at Balmoral and Worksop, and 4° at Aspatria. The temperature of the soil at the depth of 1 foot was very generally above the normal, and except at some places in the north-east of England, and Aberystwyth, it was also above it at the depth of 4 feet.

The *mean temperature of the sea*.—On nearly all parts of the coast the water was warmer than the air, the corresponding week of last year, and in most places its temperature was above the average. The means for the week varied from about 51·5° on the extreme south-west coast of England and 51° at Seafield to a little above 41° at Cromarty and Scarborough.

The *rainfall* was considerably in excess of the average in nearly all districts. Falls of more than an inch occurred at some Scottish and Welsh stations early in the week, the highest figures being 1·5 inch at Glasgow on the 24th, 1·6 inch at Bettws-y-Coed on the 26th, and 1·3 inch at Stornoway on the 26th. At Buxton and Worksop the depth of snow on the 29th was 6 inches, and at Rothesay on the 30th 7 inches. At Wick on the 29th the snow yielded, when melted, 0·93 inch of water in the gauge.

The *bright sunshine* did not differ materially from the normal except in Scotland E., where there was a rather considerable excess. The percentage of the possible duration ranged from 11 in Scotland N., and 14 in Ireland N. to 24 in England S.W. and 28 in Scotland E.

THE WEATHER IN WEST HERTS.

Week ending December 4.

A cold week.—This was, on the whole, a cold week, both during the daytime and at night. On the coldest day the highest temperature in the thermometer screen was only 34°, and on the coldest night the exposed thermometer registered 17° of frost—the greatest cold since the beginning of February. The ground is at the present time 3° colder at 2 feet deep and 1° colder at 1 foot deep than is seasonable. Rain fell on four days, to the total depth of three-quarters of an inch. On two days there were slight falls of snow. During the week 3¼ gallons of rain-water came through each the bare soil percolation gauge, and also through that on which short grass is growing. The sun shone on an average for 1 hour 14 minutes a day, which is a quarter of an hour a day short of the mean duration for the same period of the year. The 2nd inst. was a windy day, and in the win Best hour the mean velocity rose to 17 miles—direction west, but during the rest of the week light airs alone prevailed. The average amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 7 per cent.

NOVEMBER.

About average in temperature and rainfall, and sin what gloomy.—This was a month of variable temperature. In fact, there were three distinct periods of cold weather and two of warm weather during the course of it. Taken as a whole the temperature was about average. On the warmest day the highest reading in the thermometer screen was 56°, and on the coldest night the exposed thermometer registered 17° of frost. Although somewhat low these extreme readings are nothing very unusual for November. Rain fell on 14 days, and to the total depth of 2½ inches, which is about a quarter of an inch below the average for the month. A few flakes of snow fell on two days. The sun shone on an average for 1 hour 10 minutes a day, which is 40 minutes a day short of the mean daily duration for the month—making this, with two exceptions, the most gloomy November I have yet recorded here—that is to say since 1886. On 13 days no sunshine at all was recorded. The wind, taking the month as a whole, was of about average strength. In the windiest hour the mean velocity amounted to 20 miles—direction west. For only 10 hours was the direction of the wind any point between north and east. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by one per cent.

THE AUTUMN.

Remarkably cold, rather dry, and exceptionally sunless.—This proved a cold autumn, indeed, with one exception the coldest autumn for 25 years. September was very cold, October cold, and November of average temperature. The total rainfall, taking the three months as a whole, was rather below the autumn average. The sun shone on an average for 2 hours 51 minutes a day, which is 24 minutes a day short of the mean duration for the quarter. In the last 18 years there has been only one other autumn as sunless

OUR UNDERGROUND WATER SUPPLY.

Since the winter half of the drainage year began in October the total rainfall has fallen short of the average for the same period in the previous 56 years by three-quarters of an inch, which is equivalent to a loss of 17,870 gallons on each acre in this district. At the same time last year there was an excess of 1,130 gallons per acre. *E. M., Berkhamsted, December 4, 1912.*

ANSWERS TO CORRESPONDENTS.

*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

BOOKS: *Reader.* The *Garden Vade Mecum* is the least valuable of John Abercromby's many books, and may be purchased for a few pence. —*Subscriber. The Garden Beautiful*, by W. Robinson. To be obtained from our publishing department, 7s. 11d. post free.—*A. J. F., Spa. Chrysanthemums*, by Thomas Stevenson (Present Day Gardening Series). Obtainable from our publishing department, price 1s. 9d., free by post.

BULBS DISEASED: *Enquirer.* The bulbs are injured by the Botrytis fungus, which causes "Lily disease." The injury is superficial, and would not prevent the plant from blooming. It would be well to mix a little powdered sulphur with the soil.

CARNATION: *B. C.* It is impossible for us to determine what is wrong with the plant, as you have sent the flower only. As you suspect eelworm to be the cause, you should examine the roots to see if nodules or warts are present, as these are a sure indication of eelworm. If the foliage appears diseased, send some of the leaves for examination.

CARNATION LEAVES: *E. H. E.* The red spots are caused by the punctures of aphides or mites.

CARNATION PRINCESS OF WALES: *Malmaison, Ireland.* This variety is a rich form of the Pink "Malmaison." When exhibited at one of the Temple Shows it was specially admired by Queen Alexandra, then Princess of Wales, and it received its name from this circumstance.

CHART FOR GREENHOUSE THERMOMETER: *L. & C.* Write to Messrs. Negretti & Zambra, Holborn Viaduct, London.

CHRYSANTHEMUMS OUT-OF-DOORS: *Beginner.* To obtain good blooms of Chrysanthemums out-of-doors, the cuttings should be inserted at any time from now until the end of February. The plants should be grown on in a frame or cool house until April, when they should be removed out-of-doors. They should be planted out in May in well-prepared ground, which need not be heavily manured. The plants should either be pinched or allowed to grow naturally, according to the variety, until the flower-buds appear some time during August, when they should be disbudded to one bloom on each shoot. In certain cases it might be advisable to reduce the number of shoots somewhat to secure flowers of the very best quality. It is sometimes necessary to cover the plants or beds with canvas or tiffany at some distance above the flowers, otherwise the blooms will not open properly. During the summer the plants must not be allowed to suffer from want of water, and the ground should be hoed each week. The following varieties are suitable for the purpose:—Polly, Crimson Polly, Cranford Pink, Framfield Early White, La Pactole, Dolores, Almirante, Touraine, Goacher's Crimson, Bronze Goacher, Countess, Cranfordia, Hector, Normandie, Nina Blick, and Fée Parisienne.

CODLIN MOTH: *W. Q. R., Kirkdale.* A little sacking or hay bands should be placed around the stems in July, about 1 foot from the ground, to prevent the caterpillars from climbing into the trees. The bands should be left on until the winter, or they may be removed at the end of October or in November when fixing the grease bands that are used against the larvæ of the winter moth. Such bands should be burned, for they will contain larvæ. All fruits that have been attacked should be gathered and burnt directly they fall, and before the caterpillars have escaped. Next spring the trees should be sprayed as soon as the blossoms have fallen. The spray generally used is Paris Green, applied at the strength of ½ lb. of Paris Green to 120 gallons of water.

CREOSOTE IN PLANT HOUSES: *F. R.* We are not surprised that plants such as Begonia Gloire de Lorraine and Euphorbia pulcherrima (Poinsettia) were injured after you had sprayed the walls of your glasshouse with strong creosote. The fumes from this material are very destructive of plant life, and there have been cases where plants in flower-beds near newly-made roads of creosoted wood blocks have been entirely destroyed. It will not be safe to use the house for plants until a long period has elapsed. In the meantime, throw the doors and ventilators wide open, so that the fumes may escape. (See *Gard. Chron.* October 1, p. 249.)

FLORAL GUM: *Correspondent.* The following details for the making of floral gum are taken from Quin's *Garden Receipts*: Finest pale-orange shellac broken small, 4 ounces; methylated spirit, 3 ounces; digest in a warm place in a closely-corked bottle until dissolved. The mixture should have the consistency of treacle. Or, borax, 1 ounce; water, ¾ pint; shellac as before, 3 ounces; boil in a closely-covered vessel until dissolved, then evaporate until nearly as thick as treacle. The first gum dries very quickly, the second much more slowly.

GAS TAR FOR DRESSING VINES: *Foreman.* A correspondent, writing in *Gard. Chron.*, January 26, 1907, p. 60, on tar as an insecticide for Vines in winter, gives the following recipe: To one gallon of finely-sifted, dry soil, add half a pint of pure gas-tar (tar varnish should not be used); mix this in an iron pot, and place over a steady fire, adding boiling water sufficient to bring it to the consistency of paint. When cool, the mixture is ready for use.

GRAPES DISEASED: *Correspondent.* The trouble is due to black rot, a fungus disease which has attacked the fruit stalks. During the winter, when the vine is resting, drench every part of it with a solution of sulphate of copper 1 lb. in 25 gallons of water. When the leaves are young, spray the vines with the Bordeaux Mixture at half the usual strength, and again at full strength just before the flowers expand.

HAND BOUQUET OF CHRYSANTHEMUMS: *Exhibitor.* The kind of bouquet is immaterial, as the schedule does not call for either a shower or a bunch arrangement, although competitors in such classes usually exhibit the ordinary or bunch bouquet. The prize is awarded for the most effective and artistic design, and a shower bouquet, if superior, would undoubtedly be placed first. A posy of this nature should be arranged lightly, and the colours of the Chrysanthemums should be selected with great care.

HOLLY: *F. R. S.* It is not unusual for the same Holly tree to bear spiny and spineless leaves. In *Holly, Yew and Box*, a figure on p. 9 shows 16 leaves taken from a single specimen of the common Holly; some of the leaves are very spiny, whilst others have entire margins. The author states that "it is a common thing to find many of the leaves on the mature trees partially or wholly spineless, especially on the upper branches."

JAPANESE CHRYSANTHEMUMS: *Mum.* The following varieties of Japanese Chrysanthemums are suitable for cultivating as specimen plants:—Miss Nellie Pockett (white), W. Duckham (pink), Captain Julyan (pab yellow), William Turner (white), Mrs. R. Luxford (Indian red), C. H. Totty (pink), His Majesty (crimson), Mrs. G. C. Kelly (plum), Mr. L. Thorn (yellow), and W. R. Church (crimson).

NAMES OF FRUITS: *W.* 1, Rymer; 2, Scarlet Nonpareil; 3, King of the Pippins; 4, Winter Ribston; 5, Golden Noble; 6, Comte de Lamy. *H. G. K.* Hollandbury.—*W. K.* 1, Tower of Glamis; 2, Fearn's Pippin; 3, Radford Beauty; 4, Bramley's Seedling; 5, Castle Major; 6, Pear White Doyenné.—*O. W.* 1, Golden Noble; 2, Peasgood's Nonesuch; 3, Norfolk Stone Pippin; 4, Cox's Pomona; 5, Lord Derby; 6, Reinette de Caux, syn. Dutch Mignonne; 7, under proper size.—*T. A. S.* 1, Tower of Glamis; 2, Dumelow's Seedling (Wellington); 3, ditto; 4, Lord Burghley; 1, Pear Baronne de Mello; 2, decayed.—*Eltham.* Pears, 1, decayed; 2, no specimen received; 3, Glou Morceau; Apples, 1, Dumelow's Seedling (Wellington); 2 and 3, no fruits; 4, Northern Greening; 5, Emperor Alexander.—*H. C.* 1, Groom's Princess Royal (syn. Matthew's Eliza); 2, Beurré d'Anjou; 3, Comte de Lamy.—*Cestrian.* 1, Dredge's Fame; 2, Old Nonpareil; 3, Gravenstein; 4, Lemon Pippin.

NAMES OF PLANTS: *Cardiff.* Nerine crispa.—*J. MacD.* Cœlogyne fimbriata (not of any special value).—*F. F.* 1, Sophronitis cernua; 2, Oncidium pubes; 3, O. barbatum; 4, Cœlogyne flaccida.—*Glen.* 1, Dendrobium Phalænopsis; 2, Cypripedium Leeanum; 3, Dendrobium formosum giganteum.—*W. H. P.* 1, Chlorophytum elatum variegatum; 2, Selaginella caulescens; 3, S. Kraussiana; 4, S. cæsia; 5, S. Brannii.

ONTARIO: *Y. J. H.* The address of the Ontario Government Agent is 163, Strand, London.

PELARGONIUMS DYING: *A. H.* The injury is caused by Botrytis, which was present in the plant from which the cuttings were taken. There is no cure.

POTATOS: *W. B.* It is impossible to name varieties of Potatos from tubers only.

SEED OF ECHIUM WILDPRETII: *C. W. Anderson.* You will probably be able to obtain seeds of Echium Wildpretii from Mr. Wildpret, Teneriffe.

SOIL PESTS AND INORGANIC MANURES: *G. R.* To destroy eelworms, wireworms and slugs, all vacant ground should be heavily dressed with fresh gas-lime (½ cwt. to the square rod) as soon as possible. This should be allowed to lie on the surface of the ground for about six weeks, and then forked into the soil, mixing it thoroughly. If the dressing is delayed until the spring, only one-half of the quantity of gas-lime should be used, and several weeks must elapse before the ground is planted or sown with seeds, as the sulphur compounds in the fresh gas-lime are deadly to all life. Land which carries crops should be baited with Potatos and Carrots, which must be frequently inspected, and the worms and slugs killed. The roots should be buried just under the surface, and, for convenience in finding them, it is a good plan to first thrust a stick into each. Slugs may also be easily trapped by laying Cabbage leaves, bran-mash or moist oatmeal near the plants they attack. The pests may be easily exterminated by the use of carbon bisulphide, but great care must be taken in handling this highly-inflammable substance, which is also very poisonous. Make a series of small holes in the ground at intervals of about 2 feet, and 9 inches deep, and carefully pour 1 ounce of the bisulphide into each hole. Immediately cover the holes, and the vapour will permeate the soil, killing all insects and larvæ. Sulphate of ammonia is an artificial nitrogenous manure, obtained largely as a by-product of gas making, and, like all nitrogenous manures, has the effect of producing luxuriant foliage and growth. So that its use for crops which yield flowers and fruit should be confined to applications in the early stages of their growth. Cabbages, Asparagus, Celery, Seakale and Rhubarb may profitably be dressed with sulphate of ammonia. It may be mixed with superphosphate of lime, and applied in the spring, but it should never be brought into contact with basic slag, or the ammonia it contains will be liberated and given off as a gas. To obtain full value for the use of sulphate of ammonia, there should be sufficient chalk in the soil to convert the sulphate into carbonate of ammonia, in which form it is a plant food. Kainit consists of sulphate of magnesium, chloride of potassium, and water. Its chief value is as an economical form of potash manure. Muriate of potash contains nearly four times as much potash, but kainit is very much cheaper, and usually answers equally well. Kainit may be safely applied in the autumn and winter. Potash is essential for the production of high quality in flowers and fruit, and although all good garden soils contain sufficient potash for the needs of most plants, the application of kainit is usually beneficial. Horn shavings are useful for incorporating with the soil where permanent crops, such as fruit trees and lawn grass are to be grown, as they contain nitrogen, and yield it slowly, but unless the horn shavings can be bought very cheaply we should prefer to use crushed bones.

Gardeners' Chronicle

No. 1,355.—SATURDAY, December 14, 1912.

CONTENTS.

ILLUSTRATIONS.

THE MARKET FRUIT GARDEN.

NOVEMBER, nearly up to its end, proved a highly favourable month for fruit planting throughout the greater part of the country. My own record shows only one considerable fall of rain, a little over a quarter of an inch, before the 25th, when and afterwards the downfall was somewhat heavy. My total up to the 24th inclusive was only 0.80 in. Only on two occasions before the 24th was the land so wet as to interrupt planting, and even then the delay lasted in each case no more than a day. For the remainder of the month the soil was too wet for any operations in arable orchards; but work was found for the men when rain held off in the digging of a portion of an orchard which has been in grass for six years. The month ended with a fall of snow and a severe frost.

Soil Sterilisation in Orchards.

Properly conducted experiments in the sterilisation of soils in orchards are greatly to be desired, partly with the object of ascertaining whether the process destroys insect pests hibernating in the land, and partly to ascertain whether there is sufficient fertilising effect to pay for the considerable expense. It is also desirable to learn which of the numerous sterilisers would be cheapest to use in an effective quantity. The cost of one advertised steriliser, in the quantity recommended, would be £10 per acre! This, of course, is prohibitive. Another would cost only 28s. per acre. A friend tells me of a fruit-grower who has applied 4 cwts. per acre of naphthaline to destroy insect pests, and says that much benefit has resulted. This would cost about 27s. an acre. I tried naphthaline and flowers of sulphur separately, at the rate of fully 2 cwts. per acre, on a piece of land being prepared for winter Lettuces. The applications were made before the digging, and the Lettuces were planted three days later. One object was to ascertain whether either or both of the sterilisers would kill slugs in the soil. Neither had the slightest effect in this direction, apparently, as three-fourths of the Lettuces had been devoured by slugs. A gardener has used for several years carbide of calcium to destroy woolly aphis on the roots of trees, and to kill wireworm and other grubs, with great success, he says. I have not been able to ascertain who sells this substance, or what its price is. Dr. Russell, in his lecture in connection with the recent National Chrysanthemum Conference, named formaldehyde, pyridene, and calcium sulphide as the most successful chemicals for soil sterilisation, though inferior to steam in most trials. Steam is out of the question in orchards, though used in hothouses, and there is a confusing multiplicity of chemicals for selection, while Dr. Russell says that time is needed to prove which is the best. If he will ascertain which effective steriliser is the cheapest, he will confer a benefit upon all who desire to try experiments. But there is one other point to consider. Will the best of sterilisers produce as good an effect as its value in manures? Moreover, some American experiments have proved that only in soils well stocked with organic matter was there any increase of fertility from sterilisation, and that the process in numerous trials reduced the fertility of soils deficient in organic matter.

Underrated Apples.

There appears to be a great want of discrimination among retail fruiterers as to the comparative merits of different varieties of dessert Apples. While such poorly-flavoured varieties as King of the Pippins and Worcester Pearmain are market favourites, Allington Pippin and Gascoyne's Scarlet Seedling are neglected, and sell only at the prices of the best cookers. Now, it is true that Allington Pippin is more acid than most consumers deem desirable, if eaten soon after it is gathered. But, if allowed to hang on the tree until fully ripe, as it should be—and it is not a variety given to dropping prematurely—it is sweet and of a pleasantly-spicy flavour after being kept until November. Excepting Cox's Orange Pippin, I do not know of any Apple Grown extensively for market, and in season in November and December, which in flavour and beauty excels Allington Pippin. Gascoyne's Scarlet Seedling, again, is not at its best shortly after being gathered. It is then somewhat rough in texture, and for that reason is less pleasant to eat than many other dessert varieties. In November, however, its texture is perfect, and it is thoroughly deserving of a high place as a table Apple. These two varieties are among the few which improve in flavour by long keeping. We have so few good dessert Apples suitable for commercial culture which will keep up to Christmas or longer that the unwarranted prejudice against Allington Pippin and Gascoyne's Scarlet Seedling is much to be regretted. The former variety has been extensively planted in Kent, and it is one of the healthiest and most productive of dessert varieties. I am informed that it is in favour in the West of England; but it is not so in London at present.

Baddow Pippin.

This variety, otherwise known as D'Arcy Spice Pippin, appears only to be grown extensively in parts of Essex. In my soil it neither grows nor fruits well, and possibly the reason why it is not at all commonly grown for market is that it does not generally give satisfaction. In Essex the variety grows and fruits well, and it is one of the very best of dessert Apples. For a late keeper I should rank it next to Cox's Orange Pippin, and I believe it keeps much later in the season. It does not lose flavour by keeping as do some other choice late varieties, such, for example, as Duke of Devonshire and Mannington's Pearmain. The two latter are very nice up to the last, but lose much of their spicy flavour, particularly if they are not allowed to hang on the trees until quite late in the autumn. That is a point of great importance in relation to most late Apples. But the worst of it is that where only two or three varieties are left on the trees until long after others have been gathered, birds play havoc with them.

Loss from Keeping Apples.

Last season late Apples paid handsomely for keeping until December or later. This season, on the other hand, there has been a heavy loss from keeping the fruit, owing partly to extensive rotting and partly to the glut of American and Canadian Apples in the markets having kept prices from rising. Last season great advantage was derived from keeping Lane's Prince Albert, Bramley's Seedling, Newton Wonder, and Dumelow's Seedling until January or February, when they made high prices. Possibly they might do likewise this season if they would keep. But I had to begin to market Lane's Prince Albert in the latter part of November as they were rotting extensively. Prices were no better than they were a month earlier, when the bulk of sound Apples was much greater. Even Bramley's Seedling will not keep longer than the present time without considerable loss from rotting. Bismarcks are keeping better, while Newton Wonder and Dumelow's Seedling, as usual, keep best of all.

Apples off Grass Land.

Although, on the whole, the disadvantages of growing Apples in grass—even after they are seven or eight years from

the planting—are so great that I have had much reason to regret having let a part of one orchard go to grass, there are, nevertheless, some compensations. One is that the fruit is much more highly coloured in grass than in arable orchards, and another is that it keeps much longer. The three varieties named above as keeping well this season were grown on grass laud. Small proportions of my Lane's Prince Albert and Bramley's Seedling were also from grass land, and these would have kept until January probably if they had been stored by themselves, which was not the case. Similarly some Cox's Orange Pippins, off grass, which were stored separately from those from arable land, kept well after the others had begun to rot extensively.

An Object Lesson in Grass-land Fruit Culture.

That the partial compensations for growing Apples in grass are not sufficient to balance the disadvantages in my case will have been gathered from the statement made in the first paragraph of this article, to the effect that the grass land is being dug. The soil is a lightish loam over a subsoil of sand, and possibly this explains why the trees have suffered severely since grass was allowed to grow around them in consequence of the extreme difficulty of keeping it from growing by hoeing. A very striking object lesson has led to the decision that the orchard shall return to its arable condition, and this must now be described. Two years ago some badly cankered trees of King of the Pippins and Stirling Castle were grubbed up, Potatos were grown upon the cleared space in the following season, and the land was replanted in the autumn of last year. The space thus converted to arable land is bordered with Lane's Prince Albert on one side and Worcester Pearmain on the other, both of which varieties had become stunted and unhealthy after grass had grown around them. In less than two years the outside rows of these two varieties, although more than half their roots must have been still under grass last summer, showed a wonderful recovery in vigour. The trees in these two rows had made more vigorous shoots, showed larger and greener leaves and more of them, and bore more numerous and larger fruits than the trees in the adjoining rows which were entirely in grass. It is true that the ploughed piece of land was manured for the Potato crop; but the trees still in grass also had a heavy dressing of farmyard manure, and the grass when cut has always been left on the ground. The striking recovery in the trees in the two rows, therefore, must have been due mainly to parts of their roots being in arable land. This, at any rate, is my conclusion, and therefore the grass land is being dug at great expense. Some big trees of such strongly-growing varieties as Bramley's Seedling and Warner's King have withstood the trial of being in grass comparatively well; but Cox's Orange Pippin, Allington Pippin, and two or three other varieties have suffered as badly as Lane's Prince Albert, and worse than Worcester Pearmain. *A Southern Grower.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA DUPREANA "THE DELL" VARIETY.

This noble hybrid (see fig. 193, p. 451) between C. Warneri and C. Warscewiczii is remarkable for its excellence in size, form and colour. Both parents are numbered amongst the showiest of large-flowered Cattleyas, and an examination of the illustration will show that their characteristics are transmitted to the hybrid. The form, and especially the shape of the lip, is of C. Warneri, but the influence of C. Warscewiczii appears plainly in the bright-yellow colour. The sepals and petals are of a deep rose, the lip ruby-crimson, with a pale-lilac margin and gold lines from the base. This hybrid was shown by Baron Bruno Schröder, The Dell, Englefield Green (gr. Mr J. E. Shill), at the Holland House Show of the Royal Horticultural Society on July 2, 1912, when the Orchid Committee gave it a First-class Certificate.

SPIRANTHES ROMANZOVIANA.

I read with interest Mr. Webster's remarks on this pretty Irish Orchid (see p. 367). At intervals we read of its extremely local appearance or disappearance. We have here in quantity two species of Spiranthes growing in open, wet meadows, and the flowers can be gathered by hundreds some seasons, but, from careful observation, I have concluded that the flowers are produced biennially. Last year, after a very thorough search, we found but five plants in bloom of Spiranthes cernua; this season the spikes could be seen in hundreds, also those of S. gracilis, which is much the prettier plant of the two. These Orchids flower very late in the summer (the end of September or early in October), and it is surprising that they ripen seeds. It is well known that many Orchids are weakened by flowering even under the best conditions, and it is fair to assume that so small a plant as Spiranthes Romanzoviana might take a year or more to recuperate. We mow the meadows where the plants grow, or the flowers would never be visible. At flowering time there are no leaves to be seen, only a few leafy bracts on the stem. The common name here is "Ladies' Tresses," and the fragrance of a few spikes is equal to that of Epigæa repens. I would be pleased to send Mr. Webster a few roots another year; I am not aware that either species has been cultivated in Britain. *E. O. Orpet, Lake Forest, Illinois, U.S.A.*

NEW ORCHID LITERATURE.

The eighth number of the second series of the *Bulletin du Jardin Botanique de Buitenzorg* is wholly from the pen of Dr. J. J. Smith, and it is almost entirely devoted to Orchids. Foremost is a discussion of the claims of Cirrhopetalum to generic rank, as separable from Bulbophyllum. Orchidologists have differed on this point from the time of Lindley, Reichenbach and Blume down to the present day. Lindley himself, who founded Cirrhopetalum in 1824, was well aware of the close relationship to Bulbophyllum. Blume and Reichenbach reduced Cirrhopetalum to Bulbophyllum, though the latter writer subsequently described some species in the *Gardeners' Chronicle* under the generic name of Cirrhopetalum; but, as he used to say himself, he was ambitious of providing names acceptable to both horticulturists and botanists! Bentham and Hooker retained both genera, while pointing out that there were species somewhat intermediate in character. Pfitzer restored Cirrhopetalum to generic rank, and Schlechter has followed him in a recent contribution to Orchidology. Now, Dr. J. J. Smith states that he is fully convinced that Reichenbach's view is the correct one, and, accordingly, transfers about 60 species of Cirrhopetalum separately by name to Bulbophyllum. Kränzlin and Rolfe, who have probably examined more living species than any other two botanists, agree in retaining Cirrhopetalum. I do not propose traversing Dr. Smith's arguments, but it is exceedingly doubtful whether we shall ever reach his ideal that all genera should be definable by decided characters. In spite of divergences of opinion, Cirrhopetalum has come to stay, and, considering that families, genera and species are the issue of individual appraisements of the value of various characters, the matter has not the scientific importance that some would attach to it.

Dr. Smith makes some other generic alterations, among them the reduction of Glossorhyncha and Giulianettia to Glomera, resulting in nearly 40 new combinations of names. Schlechter recently restored Gaudichaud's Cadetia, generally regarded as a section of Dendrobium, to generic rank, and Dr. Smith renames about a score of Schlechter's species under Dendrobium. In the same way, Cyphochilus of Schlechter is reduced to Appendicula. We do not pretend to criticise these changes, which may be perfectly justifiable; we record them.

Dr. Smith describes a number of new Orchids, the most remarkable of which is Dendrobium macroporum, of imposing vegetative proportions.

The rest of this part of the Bulletin is taken up with the description of some interesting New Guinea Ericaceæ, from elevations up to about 11,000 feet, belonging to the genera Rhododendron, Vaccinium and Dimorphanthera. It is noteworthy that some of these Ericaceæ occur at no greater elevation than 500 feet. *W. B. H.*

FOREIGN CORRESPONDENCE.

MUSSAENDA SANDERIANA.

It is stated in the issue of the *Gardeners' Chronicle* for September 21 last, that Mussaenda Sanderiana requires a stove temperature, but I think that such a statement is likely to cause disappointment. I found the plant on the Tranninh Plateau in Laos, French Indo-China, at a height of from 3,000 to 4,000 feet, where it grows on the outskirts of woods, in the company of Brambles, Wild Roses, Oaks and so forth.

On the plateau, during the months of December, January and February, hoar frosts are common; sometimes it actually freezes to the extent that water in very shallow pools is covered in the morning with a very thin sheet of ice. Curiously enough, these frosts do not seem to do any damage to the vegetation, and although the nights may be chilly, there is always bright sunshine during the day. Of course, at such a height, even in the hottest part of the year, the temperature is never of that hot and steamy kind found in the tropics at low altitudes or sea level.

Intending cultivators would do well to bear this in mind, and not keep the plant in too hot and steamy an atmosphere. At the same time, it wants plenty of light and all the sunshine available. The best proof of what I say lies in the fact that in Singapore the plant has, at least until quite recently, never flowered. Singapore is evidently too hot for it; it just grows and grows, but it does not flower, whilst Mussaenda erythrophylla, which is found in Africa at sea level, seems to revel in the equatorial heat of Singapore, and flowers all the year round. There are many species of more or less beautiful Mussaendas found all over the East, but they mostly grow in the hot, steamy lowlands, and they generally are of such unwieldy dimensions as to make the successful cultivation of them a hopeless task. When I first saw Mussaenda Sanderiana, it struck me at once not only as the finest white Mussaenda I had seen so far, but also as the only one which might be amenable to cultivation and also worth cultivating. The plants were—in March—just masses of dazzling white, a sight marvellous to behold, and I am certain, if well cultivated, the plant will amply repay all the care and trouble bestowed upon it. *W. Micholitz, Batavia, Java.*

BARON VON MUËLLER.

The presidential address delivered by Mr. J. H. Maiden to the Royal Society of New South Wales is referred to elsewhere (see p. 451). We reproduce here the interesting account which the president gives of the personality of that remarkable man and botanist, Baron von Muëller :—

Nothing other than a tombstone has been instituted to commemorate Baron von Muëller. As a working botanist, I still think that the memorial suggested in my 1897 address is necessary, viz., a complete list of his works, with bibliographic annotations. The list should be in strict chronological order, with a botanically classified supplement. Such a list would find a place on the work-table of every student of Australian plants, and would go far to keep his memory green. The value of such a publication would be greatly enhanced if there were added to it reprints of some of his papers in obscure or rare serials; at present they are lost to most of us.

One of his executors frequently announced his intention of writing a life of the Baron, but he probably realised that he had not the necessary technical knowledge, as he died without accomplishing anything. Meantime Mr. C. A. Topp, a competent authority, during a visit to England, made inquiries as to the encouragement he would receive in writing a life, and abandoned the idea. The probability is now that a full life of Muëller will never be written.

A well-informed life of this remarkable personality would have been very interesting, but the reputation of this great botanist is not dependent on an extraneous circumstance like this. His reputation rests on his published works, and any steps taken with the view of rendering his works more available and more complete, will enhance that reputation.

Personally I think Australia is poorer through no memoir of him as a man having been published. I will leave aside the question of a publication concerning him as a botanist for the present. The late Dr. A. W. Howitt had, and the venerable Mr. Panton, late Police Magistrate of Melbourne, has, innumerable reminiscences of the man who was invariably known as "The Baron." Mr. Panton is one of our best authorities on Australian geography and exploration, and on these subjects Muëller was intensely interested.

He was fond of homage from the younger men. For some years business and private affairs took me frequently to Melbourne, and I always paid my respects to him, except once, when I was making a very brief stay and I was full of business. To my horror, he and his chum, the late Sir Frederick McCoy, bore down on me in Collins Street, and the Baron gave me a good talking to. I had never made such a hole in my manners before, and on the next occasion of my visit to him, perhaps in the way of heaping coals of fire, he paid me the unusual compliment of seeing me into the old St. Kilda bus, and this is how he looked.

He was dressed in a rusty suit of black, with dress coat, the trousers very much too short, showing much blue-grey woollen stocking, while his feet were shod with sabots. Round his neck were several folds of muffler, made of Angora wool, with the ends hanging down. The whole surmounted by a chimney-pot hat of unfashionable model, which had been brushed the wrong way. So long as he had clothes on, the cut or the age of them never entered into his head. He was the pink of courtesy, and sometimes it was difficult not to smile a little at him.

This Angora scarf was historical, and was one of several that had been made from wool that Count de Castelnau, French Consul-General at Melbourne in the 'sixties, gave him. The Count was interested in acclimatisation matters, and certain Angora goats introduced into Victoria turned out very fine animals. An admirer of the Baron had the wool made into mufflers for him, and this pleased him very much, for he was interested in all good works, his attention being by no means confined to botany.

On one occasion I had visited the Baron, and, as usual, had, after a visit of two hours, been unable to get a word in edgeways. As I rose to leave, he noticed that I was recovering from a cold, and, before I could clearly comprehend, he unrolled his Angora scarf from his own neck and quickly rolled it round mine. As he did this he said, "You know I am an M.D." (so he was, honoris causa), and I thoroughly enjoyed the joke. When I got a little distance from the "baronial castle" (as it was playfully called), I removed the scarf, and returned it from Sydney, washed and folded, with grateful thanks. It came to me again by return of post with a letter of mild remonstrance. I am sure you will excuse these brief personal sketches, which are typical of the man.

He was one of the most charitable and unselfish men I ever met, and for many years he was in a chronic state of impecuniosity because he could never resist an appeal for help, while botanical expenses which might have been a charge against the public funds were paid out of his own pocket to a large amount. So he told me many a time. He was a bachelor, and his personal expenditure was of the most modest description—everything went to science and charity.

On two occasions he thought about getting married. Once things went so far as getting the wedding presents, and one of them, a clock, is in the Melbourne herbarium to this day. I think it was well that the wedding never came off. He could not possibly have found time for his wife's company, and it would not have been fair to put her into competition with, say, a new Eucalypt.

Some of his idiosyncrasies were most amusing. If he barked, which he did now and then, there was no bite. He was the quaintest and most picturesque figure I have ever known amongst Australian scientific men.

Fig. 188.—Chrysanthemum Mrs. Swinburne, as exhibited by Col. Lockwood, M.P. (R.H.S. Cultural Commendation, December 3.)

CHRYSANTHEMUM MRS. SWINBURNE.

The Chrysanthemum plant illustrated in fig. 188 is one of a large number exhibited at the meeting of the Royal Horticultural Society on the 3rd inst. by Colonel Lockwood, M.P., Bishop's Hall, Romford (gr. Mr. G. Cradduck). The largest specimen bore 11 fine flowers and one bud, and was only 2 feet high. There appeared to be some difference of opinion as to the variety, which was not known to Mr. Cradduck, and was declared by some to be Maud Jefferies; it may possibly prove to be a sport, as it appeared with Moneymaker. The pots were only 4½ inches in diameter.

TREATMENT OF LAWN-TENNIS COURTS.

ALTHOUGH lawn-tennis is now largely played throughout the year, it is essentially a summer game. Hence reference in December to grass courts will be thought by some to be out of place; others, however (and we are all more or less interested in what has become, since 1874, a national game), will not consider such comments as untimely as bear upon the management and preparation of the grass for the coming season. Without a doubt, much has been accomplished in the way of weeding and so forth during the past month, but in many instances concentration in this work has led to the neglect of many other cares.

[*Photograph by W. Irving.*

FIG. 189.—CYNOGLOSSUM CŒRULEUM: A NEW SPECIES FROM EAST AFRICA.

Nets which should be in the hands of the repairer have been put aside and forgotten; the posts need a coat of varnish; the club chairs and tables should be overhauled, the groundsman's machine well oiled and put away for the winter. Much trouble, too, can be saved by a little forethought.

As a labour-saving instrument the lawn-tennis marker is held to be invaluable; whitewash and linseed oil, made into a hot soup, well mixed, and rubbed into the ground with a brush is, however, much more lasting, and will, in a normal season, last two or three weeks.

Every vestige of the light whitewash lines put on by the marker has by that time disappeared. Some of the little iron T's have been lost or broken; but the careful man has an admirable substitute in wooden pegs. These should be preferably of Oak or some other hard wood; they should be driven into the ground an inch below the surface at the junction of the lines; a small hole will be left above each peg, and on re-marking the ground the corners will be easily found.

Less than 40 years ago, when Lord John Hervey played on his croquet ground in Suffolk, lawn-tennis was scarcely known, and, without a doubt, it owes its prominence to lovers of tennis on the hard court, who realised the advantages of the former as a summer game. Then came the evolution. New rules and regulations came in turn, with the necessity for level courts on a hard and well-drained surface, in which road metal, gravel, a depth of rich soil, the best of grass seeds, or the finest turf that could be procured formed essential parts.

But while sinkage on courts so made is almost imperceptible, on other courts laid out on natural soil depression in the ground is of frequent occurrence, and this should receive the attention of the groundsman in November. Armed with a line or a straight piece of wood and a spirit level, he will see at a glance the sunken places. The turf, sodden by recent rain, can be easily raised to an inch above the level by the use of a garden fork. In places the sod must be removed with the turfing iron, a thin sifting of soil being introduced between the surface and the turf and left until the spring.

By this simple method much can be accomplished; but at the end of every season the turf, on the serving lines, needs to be relaid, and to some small clubs the cost is prohibitive. This is also work which should be done when the ground is thoroughly soaked and before severe frost. Cutting, hauling and laying the sod all mean heavy items in the annual expenditure; these, however, may be greatly reduced, for on every club ground there are, between the courts, patches of turf, which may be removed to the service lines, and replaced by well-worn sod; while a full yard in width may be removed from either side of the net, the soil made and sown with seed or the turf replaced by some of inferior quality without detracting from the value of the court. The careful man, however, who has an eye to the future goes one better. He overlooks nothing, and, should there be waste patches or disused corners of rough grass under his control, they are dug up and tilled with grass seeds of a mixture of Crested Dogstail, Hare's Fescue, Sheep's Fescue, other grasses, and a sprinkling of Clover, according to the nature of the soil, thus in the future saving considerable expense to the club.

Other grievances with which the groundsman has to contend are worms and even moles, while impoverished grass becomes Moss-grown. And this brings one on to the question of manure. Soot, sulphates, phosphates, ammonia and common salt appeal to one as being easily used and productive of certain, quick results. These, however good they may be, merely stimulate, and it is questionable, where possible, if it would not be more advantageous to hark back to the old-time methods of our fathers and use sheep—a flock of ewes! These, if borrowed from a farmer for a day or so in November and enclosed securely, would not only benefit the land, producing richer growth, but, moving continually, would solidify the ground. Farmyard manure from fatting stock, evenly spread, and raked off the ground early in spring, would also have a lasting effect. Such matters as these, however, must be left to the discretion of the secretary of the club, without whose supervision throughout the autumnal as well as the early months of the year no lawn-tennis club can hope to prosper. *Harry Danes.*

CYNOGLOSSUM CŒRULEUM.

SEVEN species of Cynoglossum are found in Central Africa, but C. cœruleum is probably the only one in cultivation, and, judging from dried specimens in the Kew Herbarium, it is the most attractive. The Cynoglossums generally are not suitable plants for cultivation, although certain of the Himalayan species, including C. nervosum and C. Wallichii, have numerous ornamental blue flowers. Plants of C. cœruleum flowered in Messrs. Barr & Sons' nursery this autumn; they were raised from seeds received from British East Africa. The growth is erect and neat, about 12 inches to 18 inches high, and furnished with narrow leaves, the longest of which are about 3 inches. The bright-blue flowers are produced very freely in panicled cymes, and may be likened to those of the Forget-me-not. The species has a somewhat wide distribution, for it is found also in Uganda and Abyssinia. A variety, with broader leaves, named Johnstonii, is found on Mount Kilimanjaro, at an elevation of 6000 feet. In common with all the members of its family, the plant is easily raised from seed. It is not certain whether the plant is hardy, but it is a native of fairly high elevations, and may succeed out-of-doors. *W. I.*

CORSICA.

(Concluded from p. 435.)

A Journey Through the Island.

Twice a week, a steamer leaves Marseilles for Ajaccio. The crossing takes from 12 to 14 hours. It is difficult to imagine a more beautiful sight than that presented by the Bay of Ajaccio on a bright winter morning. The sea is like a sheet of glass, which, at the rising of the sun, reflects every possible colour; the blues and greens so delicately graded that it is impossible to tell where one begins and the other ends. As the light morning mist disperses, the wooded hills emerge, and the mountain peaks tower over the landscape, the rising sun painting their summits the most beautiful colours—violet, red, pink, until at last, the sun having reached its zenith, the pure white snow-covered tops dazzle the sight. Between the sea and mountains occasional glimpses are caught of the town with its innumerable, snowy-white buildings.

Ajaccio is sheltered from cold winds by a barrier of mountains clothed with Olive trees; and the town enjoys an ideal climate during at least eight months of the year. Rain seldom falls in the daytime, but, thanks to the proximity of the mountains, a good deal comes down in the night. At the time of the birth of Napoleon, Ajaccio was a mere village, with the narrowest of streets, across which hung lines of drying linen—red and yellow, according to the Italian fashion. A new town has sprung up since then, with wide avenues and large squares planted with Phœnix dactylifera, P. canariensis, Schinus Molle, Grevillea robusta, Ficus, and other plants. Several monuments have been erected to the great emperor, and it is possible to visit his first home. This latter is very unpretending—merely the *nest* of the eagle; his true home was on the battlefields of Europe.

Ajaccio is full of interest for the botanist, especially from December to June. Beside the "maquis" already described, there are huge bushes of Opuntia ficus indica, which present a most striking appearance and often attain a height of 10 to 12 feet; trails of Smilax aspera are fond of climbing up the stems, and give the plant a curious aspect. The flowers of the Opuntias are gorgeous, and are followed by the sweet Pear-like fruits (prickly Pears). The taller-growing bushes are frequently broken by the wind; but the prostrate stems curl themselves round into the shape of a concave vessel, and so retain and hold all available moisture.

The stems nourished in this manner soon throw out fresh roots, from which new stems spring: the plant thus indicating the method by which it may best be propagated. It has often been found that if the joints are planted upright, they fail to grow or root; but if they are laid flat on the ground, they invariably grow and flourish.

Another Opuntia is also naturalised. Its joints are smaller than those of O. ficus indica, and it has strong and very abundant spines. Its fruits are not edible, and it makes a first-class hedging shrub. Unfortunately I have been unable to ascertain its name.

Oxalis Lybrica = O. cernua is very luxuriant, and becomes extemely troublesome where any sort of cultivation is attempted. Fifty years ago, Ajaccio was the only place in Europe where it was to be found; but since then, it has become disseminated all over the French and Italian Riviera. During the winter its clover-shaped, brilliant green leaves make a vivid groundwork, over which the long-stemmed umbels of bright yellow flowers hang in profusion. The flowers shut at night, but open widely with the first rays of the rising sun. This species is said to be seedless; it is propagated by means of a rhizome, which grows underground and produces numbers of small bulbs.

Fig. 190.—View of Carghese, Corsica.

Early in winter, the bright flowers of Crocus minimus are everywhere to be seen, while Scilla italica and S. amœna hide their little bells under the leaves of the Cistus. Cyclamen repandum is also very common. In moist places, Arisarum vulgare may be observed in December and January, with its curiously shaped spathes; a less common Aroid—Arum muscivorum—is found in one or two places round Ajaccio. Under the Olive trees, Narcissus Tazetta covers large areas of ground; and Lathyrus Clymenum, L. angulatus, and Psoralea bituminosa flower profusely along the roadsides. Romulea Columnæ is found in a few dry, sandy places, where it forms a thick carpet; it is a small, somewhat scarce, bulbous plant, with thin, dark leaves and blue flowers, starlike in form. With it are often associated R. Revelieri and R. Requienii.

With the spring, several Orchids make their appearance. Among others may be mentioned Barlia longibracteata, Ophrys Bertolinii, Orchis papilionacea, Serapias Lingua, S. cordigera, Limodorum abortivum, and Aceras densiflora. When ascending Mount Pozzo at the beginning of May, we have come across wide areas covered with Orchids in profusion. In June, when vegetation begins to suffer from the heat, Pancratium illyricum and P. maritimum produce their handsome umbels of Lily-shaped flowers; the bulbs are of large size, and deeply rooted, which makes it difficult to get a good specimen to carry away.

Ajaccio is the capital of Corsica, and is perhaps the pleasantest spot in an island which is full of beauty and interest. Travelling southwards from Ajaccio by steamer, we land first at Bonifacio. The town is built on a high cliff of limestone (the only limestone in the whole island), which has been bored out into long grottos and caves by the action of the sea. Even under the town itself, there are long tunnels which have been slowly fretted out by the restless waves. Vegetation is scarce, and the want of trees gives to the landscape a sad and depressing aspect. Many interesting plants, however, are to be found growing between the bare rocks. At a short distance from the semaphore, in a deserted, sandy place, Morisia hypogaea forms a carpet of yellow flowers, the colour both brighter and more intense than can be obtained in cultivation. Near the shore Mesembryanthemum nodiflorum and M. crystallinum may be found in large quantities; and where a little soil has been formed, Helichrysum angustifolium, Cineraria maritima, Matthiola incana and Anchusa italica are to be seen. On the road-sides, plants of the Leguminosæ family are predominant, including several species of Lathyrus, Vicia and Lotus.

Looking southwards from Bonifacio, the dark fringed shores of Sardinia are to be seen plainly on the horizon. From Bonifacio back to Ajaccio one may travel overland, and it is a very interesting journey, though terribly slow. Means of locomotion are hardly up-to-date; they consist of an old stage coach drawn by three mules over what is called merely by the barest courtesy a "road." A pleasant excursion may be made from Ajaccio to the "Calanches de Piana"; the distance is about 70 miles altogether, and can be done in one day in a motorcar. The road runs through the Greek colony of Carghese (fig. 190) follows the coast for a time, and then climbs a steep slope through the sweet-scented "maquis." Higher up, the road passes between high rocks; and suddenly, after a sharp turn, a huge mass of rock is confronted, seemingly lying right across the way. This is known as the "Levrier" (or Greyhound) and marks the entrance to the "Calanches." The road now passes through a wonderful chaos of mountain and rock; huge masses of stone are piled one on the top of the other by a perfect miracle of balance; they are chiefly composed of orthoclase, and under the blazing sun they seem to be of a dazzlingly bright pink colour. The road runs through these rocks for about two miles, and then, with the suddenness of a revelation, the intensely blue Mediterranean hursts upon the vision, lying like a sea of glass. This is the Golfe de Porto (see fig. 191). It is impossible to describe with the least adequacy the exquisite beauty of the view; the azure bay, surrounded by rocks of the most delicate shades of rose, makes one of the loveliest pictures which Nature has produced. It is difficult to bring one's mind to bear upon the details of the flora, which is scanty enough; we note rapidly Pinus maritima, several varieties of Cistus, Cytisus triflorus, and Dianthus virgineus.

To reach the highlands of Corsica, it is necessary to use the railway between Ajaccio and Bastia. The line follows the Vallée de la Gravonne; and Corsican railways are sufficiently leisurely to allow plenty of time to admire the picturesque route, and to observe the flora; indeed, no plant growing within reasonable distance need be missed! On the lower slopes, Iris Pseudacorus grows very tall. A few hundred feet above sea level Helleborus corsicus shows its prickly leaves, crowned in winter with large flowers.

After travelling for 2½ hours we arrive at Vizzavona, only 35 miles from Ajaccio, but 2,400 feet above the sea. No sooner have we left the train, than we enter one of the finest forests in the island, entirely composed of Pinus Laricio, the Corsican Pine. The trees grow thickly, and are tall and straight; the forest is the property of the State, and is perfectly kept. Several paths have been cut across the best parts, and Vizzavona is like a sylvan park. As soon as the winter snow has melted, Crocus minimus covers the ground with its bright flowers, and here and there clumps of Helleborus corsicus and bushes of Daphne laureola are to be seen. Vizzavona is used as a summer retreat by well-to-do Corsicans; several hotels and villas have been erected on the slopes of Monte d'Oro. This mountain—one of the highest in Corsica—possesses several rare plants, such as Aquilegia Barnardii Draba Loiseleuri, Lepidium humifusum, Helichrysum frigidum and Linaria hepaticæfolia. The Monte d'Oro is full of interest for the botanist, and also the ordinary tourist; and the same may be said of all the mountains in Corsica. The reward is well worth the trouble, and the journey is one which is not likely to be regretted. *C. L. Degoy.*

THE SEED SUPPLY.

(See also article on p. 450.)

THE seed supply for the present season may be described as deficient generally, for the few cases in which normal quantities of good seeds are to be found in the markets scarcely affect the general yields.

Moreover, whilst last year the crops were also very light, the quality uncommonly high and the percentage of germination extraordinary, this season there is no such compensation, for much loss has been experienced in the cleaning and grading, and the germinating qualities may prove to be moderate and disappointing.

Speaking first of flower seeds, it may be said that, at the commencement, seedling plants of perennials and biennials were extremely scarce in the autumn of 1911. These plants stood the winter well, but during the flowering season (April and May) the want of rain, the prevalence of cold, with two or three sharp frosts, and the drying winds, checked the flowering and seeding of such plants as Polyanthus, Primroses, Auriculas, and Sweet Williams.

Canterbury Bells likewise suffered from the same cause, and the supply is deficient, although somewhat better than last year.

Myosotis was injured by the cold winds of April and May, and an indifferent crop resulted.

Wallflowers fared rather better, and produced a fair crop of good seed, but, owing to the shortage of plants, the seed available is of a limited quantity.

The continuous wet of August, followed by a dry September, caused plants of Antirrhinums to bloom freely a second time, and this fact somewhat destroyed the bright outlook of a good crop; still the supply is moderately good.

Taking annuals collectively, the crops are light to medium. A few kinds, such as Candytuft, Gypsophila, and Nemesia, are good, but many other popular annuals are scarce.

At one time Sweet Peas promised to be a very good crop, but they finished one of the worst on record. The crops in America and other countries were as bad, or worse, and the supply will not be equal to the demand.

Mignonette produced good crops in certain districts, but in other localities the yield was deficient. However, as a whole the supply is of medium quantity.

China Asters suffered from the wet of July and August, more especially the early varieties, which were then in bloom. Medium and late-flowering varieties, improving greatly during the favourable weather in September, produced a fair crop. The percentage of germination, however, cannot be expected to reach a high standard, and this remark may apply to most flower seeds this year.

Heavy rains during August destroyed the bright prospects of a heavy crop of Nasturtium. The plants grew to leaf too freely, instead of throwing an abundance of flowers. The supply is moderate.

It is, however, among the late-seeding annuals that the greatest shortages are felt, such as Ageratum, Calliopsis, Godetia, Larkspur, Lobelia, Marigold, Scabious, and Stock. These were extremely late in blooming, and they were suddenly checked by the frosts of early October.

Turning to the vegetable crops, Beet plants were unable to get a good start owing to the spring drought, and later were affected by excessive wet. The seed supply is deficient.

Some fields of Brussels Sprouts were badly blighted owing to the drought, but there is a fair supply of seeds.

Cabbage and similar crops encountered unsuitable conditions throughout the season. Great difficulty was experienced in getting the plants through the ground in the autumn of 1911, and they were very small. As a result many failed to "run" in the spring. Those that did were badly affected by the drought and much blighted. The seed supply is deficient.

The Carrot crop was fairly good as a rule, although many fields were destroyed entirely by the heavy rains of the late summer.

The great majority of Celery plants failed to stand the winter. Soup Celery is an abnormal price this year, and Celery seed generally is scarce.

The Leek supply is very deficient owing to the lack of plants. It was extremely difficult to raise plants during the summer of 1911.

In most cases Lettuces failed completely. The plants were healthy, and promised full crops up to the middle of July, but cold and damp weather set in just as they were in full bloom, with the consequent ruin of the crop.

The acreage planted with Onions was much below the average, owing to the shortness of bulbs, but the crop was fairly satisfactory and the supply of seed is moderate.

Parsley was one of the worst crops; as the plants were so small when planted out in the autumn, the majority of them failed to "run" to seed.

The Parsnip crop, usually one of the most reliable, was this year practically a failure. The small quantity of seed harvested was of poor quality. There is a certain amount of foreign seed, but it is doubtful whether the produce of such seed will be appreciated by English growers.

At one time it was feared that the Radish crop would be a failure, as the seed failed to germinate owing to the dry weather which set in immediately after it was sown. It came up very unevenly, and the plants made no headway for a long time. Rains fell just in time to save it, but the crop was extremely late.

Spinach was the best crop of the year.

FIG. 191.—GOLFE DE PORTO, CORSICA.

Turnips suffered very severely from the drought and subsequent blight, and were a very light crop.

Swede, like Turnip, is a very poor supply.

Mangold Wurzel was a fair crop, but many fields suffered severely from the spring drought, and failed to recover.

After several seasons of short crops, when prices have been high, many people are tempted to grow inferior stocks for seed purposes, procured from cheap sources. This is bad alike for the seedsman and the grower. The seedsman, however, who takes all possible pains, and goes to great expense to produce seeds of high quality from pedigree stocks, has to compete with inferior produce, and the grower who is unfortunate enough to use this bad seed suffers loss and annoyance when his crop is grown. Unfortunately the quality of seeds cannot be judged by the sample, but only by the produce, and if people would bear this in mind they would not be tempted to buy seeds of doubtful origin for a slight difference in price, which is trifling in comparison with the value of the resulting crop. *Correspondent.*

NEW ROSES.—V.

CLIMBING ROSES.

The list of new climbing Roses brought out during the past four years is a long one. The result of my more or less successful experiments is as follows :—

Alexandre Girault (Wich., Barbier, 1908).—The parentage of this Rose makes it attractive—Wichuraiana × Papa Gontier. The Rose is a strong grower, very free flowering, and quite a good garden plant. It is a carmine colour, with a slight tint of orange, but I must admit the shade of colour has been a little disappointing this year. It flowers in mid-season, i.e., about the third week in June. Some give the date of introduction 1907, but I do not think it came much into this country till 1908.

American Pillar (Multi., Conard and Jones Co., 1909).—Taken all round, I incline to think this the best and the most distinct in character of our new climbing Roses. It is a fine strong grower, easily making growth of 12 feet to 15 feet in a season. The bark is a nice light green, and the foliage very thick, glossy and dark green, clothing the plant down to the base like Ivy, and lasting nearly as long. The flowers are single, bright pink in colour, with a white eye and yellow stamens, and are carried in big, solid trusses. They are most decorative, and always attract immediate attention in a stand of garden Roses. This Rose comes into flower about the end of the second week in June, and lasts in flower for about six weeks It seems quite free from mildew and other diseases, and has no faults that I know of. Unfortunately, it has only one flowering season. The laterals from the previous year's growth, which carry the flower bunches, make very long arms, and this should be borne in mind in planting and training, or they may be damaged by the wind.

Fig. 192.—corsica: the village of corte.

Ards Rambler (H.T., A. Dickson & Sons, 1908).—This is a vigorous grower and perpetual, that is, it flowers again in the autumn. In the summer blooming it often gives quite well-shaped flowers of a carmine colour. It makes strong shoots, and may be used either as a pillar Rose or for a big bush, where plenty of room can be given. I do not think it has flowered with me quite so freely as Ards Rover, which I incline to think the best of the three (Ards Rover, Ards Pillar and Ards Rambler). Still, perpetual-flowering climbers are scarce, and down to the present these three Roses constitute a class which is quite distinct.

Ariel (Wich., Paul & Son, 1910).—This beautiful climber was raised as a cross between R. Wichuraiana and Tea Rambler, and may almost be described as a single-flowered Tea Rambler, but it has, I think even more beautiful foliage. Like this Rose, it makes fine, strong, summer shoots, but not all from the base of the plant. The colour is coppery pink, which we have found harmonises very well with Irish Glory. The contrast of flower and beautiful foliage is the attraction of this Rose. It seems quite hardy and free from mildew.

Coquina (Wich., Walsh, 1908).—One of the prettiest, most-useful and most-distinct of the newer Wichuraiana hybrids. It is very effective as a pillar, each bunch arranging itself so as to display its flowers to great advantage, and the plant carries pretty, lightish-green foliage. The flowers are small and rather cup-shaped, of a porcelain pink, shading deeper to the tips of the petals, which have a yellow base. The bunches are fairly large, and last remarkably well. The length of time the plant continues in flower is, however, its strongest point: it comes out late, about the first week of July, is at its best about the 15th, and thence onwards has continued flowering till November. Moreover, this year has shown that it will stand any quantity of rain. The later flowers are not, of course, produced in such quantity as those of the summer, but in decidedly greater quantity than the occasional flowers of Dorothy Perkins. By some accident this pretty and useful little Rose has escaped notice in the N.R.S. *Catalogue*. It is, unfortunately, almost scentless.

Diabolo (Wich., Fauque, 1908).—This Rose has strong, rather upright growth and single flowers of a fine, deep-crimson colour, with conspicuous yellow anthers. It flowers early, about June 10. Its strong point is its handsome colouring, which is unique in its class. It is said to be a cross between Wichuraiana and Xavier Olibo.

Excelsa (Wich., Walsh, 1909).—Another Rose of striking colour, the flowers of Excelsa being of a very bright, light crimson. It is a mid-season Rose, coming into flower between the middle and end of June. We had a pillar of this Rose in front of a large arch of Hiawatha, and when it was first out it quite put Hiawatha in the shade for brightness of colouring, but when they had both been out some little time it was just the other way about, that is, though brighter at first, it loses colour more quickly than Hiawatha. When it was first shown at the Temple from plants grown under glass I remember asking Mr. Paul, "Can we hope to get that colour in the garden?" Well, the answer is, we do get it, but not for very long. Still, it is gorgeous while it lasts. The flowers are double and sweetly scented. I do not know its parentage.

Goldfinch (Multi., Paul & Son, 1908).—This is a seedling from Hélène. It is vigorous, strong and hardy. The buds are deep yellow, opening to creamy-yellow flowers. It is a good and useful climber, with nice, light-green foliage and stems, and makes a good pillar Rose. It is a mid-season climber, opening about the third week in June. I am pleased with this little Rose, which is one of the best yellow climbers at present, but it does not quite show off its flowers as well as it might do. They are best in the bud stage and are fragrant.

Lady Godiva (Wich., Paul & Son, 1908).—This is a pale-blush sport from the well-known Dorothy Perkins, and, I think, down to the present the most beautiful of its sports. The colouring is very soft and pleasing, and it has all the vigour and good qualities of its parents. Christian Curle (Cocker, 1908), slightly more salmon, and Dorothy Dennison (A. Dickson, 1909), shell pink, are so near to this Rose in colour and habit that they ought not to be kept distinct.

Refulgence (Sweet Briar, Wm. Paul, 1908) is hardy and a good grower. The flowers are nearly single and scarlet-crimson in colour. It is the best of its class since Lord Penzance's Sweet Briars came out.

Shower of Gold (Wich., Paul & Son, 1910).—This Rose is said to have been obtained as a cross between Jersey Beauty and Instituteur Sirdey. It has beautiful, glossy, dark-green foliage, which lasts well, and is a most effective feature of the plant. The flowers are small, double, and rather cup-shaped, golden-yellow at first, becoming pale later, but retaining their colour better than most yellow Roses of this type. The trusses of bloom hang downwards in a graceful manner, and look well on the plant. My flowers began to open this year (1912) on June 16. It may thus be put in the mid-season section. It has all the vigour of its parent Jersey Beauty, and is the best yellow Rose of its class at the present time.

Starlight (Multi., Paul & Son, 1908).—This is a single-flowered Rose, with smooth, shiny, almost-thornless stems, and rather large foliage. The flowers are large for their class, white, edged with a soft-violet rose. The petals, however, are a little wanting in substance, and do not stand rain well.

Sylvia (Wich., Wm. Paul & Son, 1911).—This is a pretty little Rose with lemon or creamy-white flowers. The special feature of this Rose is that it is more or less perpetual. I have only had a plant for one year, and, therefore, must write of it with some reserve. The perpetual Multifloras, such as Trier, are inclined to make bushes rather than the rampant-climbing shoots such as we get in Crimson Rambler and Blush Rambler, and it remains to be seen whether this Rose will not be rather of the habit of Trier than Dorothy Perkins. At all events, my plant has not at present made any very long shoots, though it has given a second crop of flowers.

White Dorothy (Wich., B. R. Cant and Paul & Son, 1908) is another climbing sport from

Dorothy Perkins, with white flowers. It has the habit of its parent, and was the best white climbing Wichuraiana at the time of its introduction. Its weakness is a tendency to sport back to the pink colour of its parent. Like its parent, it belongs to the late section. *White Rose.*

(To be continued.)

KEW NOTES.

COTONEASTER ROTUNDIFOLIA.

THIS Himalayan species is one of the three best Cotoneasters in cultivation. It forms a spreading bush 4 feet to 5 feet high, with rather flattened branches, which, at the present time (November 24), are clothed with roundish, deep-green leaves and quantities of shining red berries. It is worth recording that, though the fruits of this Cotoneaster are large and fleshy, they are generally the last to be touched by the birds. Though the older bushes often lose a few leaves at the ends of the branches, most of the leaves are persistent until early in spring; thus the bush is semi-evergreen. The species may be seen at Kew in a bed by the Orchid houses and in large groups elsewhere in the gardens.

SENECIO CANALIPES.

THIS South African climber is flowering freely on one of the rafters at the cooler end of the succulent-house. It is the most vigorous of the three climbing species of Senecio, the other two being S. auriculatissimus and S. macroglossus. The heart-shaped leaves are lobed and thick in texture. The rich-yellow flowers, each about ¾ inch in diameter, are arranged in loose, terminal inflorescences. The plant is readily propagated from cuttings and is a vigorous grower. It is a free-flowering plant and unsurpassed as a climber for a cool greenhouse at this season of the year.

LUCULIA GRATISSIMA.

A SPECIMEN 12 feet in height of this deliciously-fragrant greenhouse shrub in the large temperate house is covered with blossoms. The delicate flesh-pink flowers are borne in many-flowered terminal cymes. The plant may be propagated by cuttings and seeds. It grows best in a mixture of sandy loam, peat or leaf-mould and coarse sand; the bed or border should be well drained. After the flowering is over, the shoots may need pruning to keep the plants in good shape.

ILEX PERNYI.

THE largest specimen at Kew of this new Chinese Holly is fully 6 feet in height. Young plants are comparatively slow in growth, but this specimen has grown well during the past summer; the shoot forming the leader has increased fully 2 feet in height and is stout in proportion. Mr. E. H. Wilson states that the plant forms a tree in Central China 20 feet to 30 feet in height. The habit is close growing. The leaves (see *Gard. Chron.*, January 30, 1909, fig. 41) are deep, shining green, 1 inch to 1½ inch long, armed with two or three pairs of strong spines on the lower halves and one at the apex.

RUBUS GIRALDIANUS, FOCKE.

THIS species is one of the most conspicuous of the newer Chinese Brambles planted in the collection near to the pagoda. Its white stems rival the Himalayan R. biflorus for autumn effect, whilst in summer the plant forms an elegant bush some 8 feet or 9 feet high, with attractive pinnate leaves. The young shoots are sometimes 10 feet long, and, branching at the upper half, terminate in graceful arched growths. The old stems should be removed as soon as the fruit is ripe. This work must be done with care, as the white substance on the bark is readily rubbed off. The plant was illustrated in *Gard. Chron.*, March 9, 1912, fig. 61, as an unnamed species. K.

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

EARLY PEACHES.—The temperatures of the houses which were closed early last month may be increased about 5°. During very mild weather the temperature may reach 60° during the day, but it should be 5° lower during the night. If possible, during the early stages of growth, warm the house by means of the pipes which are farthest away from the trees. It will be noticed that red-spider invariably appears first on those parts of the trees which are nearest to the hot-water pipes. In consequence of this, the pipes at the back and front of the house should be regulated by separate valves. Admit air during the forenoon whenever the weather is mild, but close the ventilators before the sun has lost its power. It is beneficial to open the top ventilators slightly at night. Spray the trees with lukewarm rain water on bright mornings, and keep the atmosphere moist by sprinkling the walls and paths in the house as often as necessary. Disbudding may be commenced when the shoots are about 1 inch long. One-third of the buds may be removed at this stage, and they should be taken chiefly from the undersides of the shoots. This work should be spread over several weeks, so that the trees may not receive a check. Always start the work at the top of the trees. Fumigate the house with a nicotine compound before the flowers expand to destroy any aphis that may be present. More than ordinary care is needed to ensure the flowers setting at this time of the year. During this stage the temperature should not fall below 55°. Ventilate the house carefully and keep the temperature as equable as possible. Pollinate the flowers at noon, brushing each flower with a rabbit's tail. Endeavour to set fruits on the upper sides of the shoots. Syringing should be discontinued whilst the trees are in flower, as the flowers set best when the atmosphere is dry.

SECOND EARLY PEACHES.—The trees should be prepared for forcing early in the New Year. If the pruning, cleansing and tying of the shoots be finished at once, the house may be thrown open for a week or two prior to starting the trees into growth. When the buds show signs of swelling, close the front ventilators if the wind is cold and the weather frosty.

VINES.—Vines intended for planting in the spring should be cut back before the end of the year and the cut surfaces painted with styptic when they are dry. The vines may be plunged in ashes and left outdoors till a week or two before they are required for planting. Young vines which were planted last season should be pruned. The main rods may be cut back to about 2 or 3 feet, or even less, if they have not made satisfactory growth. These vines should not be allowed to fruit until they have grown for another season, and then only lightly. Overcropping young vines is a frequent cause of failure.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

PROTECTING PLANTS AND SHRUBS.—The time has arrived when severe weather may be expected. Therefore, protecting materials should be placed in readiness, but they should not be employed unless absolutely necessary. Chamærops Fortunei, C. humilis, Phormiums and Cordylines are much hardier than is generally believed, but it is well to give them a little protection during times of severe frosts. Do not afford too much covering to these plants, or they may become tender and be liable to injury when they are exposed again in the spring. For some years past I have placed dry Bracken Fern or, in the case of roots, dry leaves around the stems and bases of tender plants, keeping the leaves in position with branches of such evergreens as Rhododendrons and Laurel. Wire-netting may also be employed to prevent the leaves from being blown away by winds, and the netting will be hidden by the evergreens. Tender climbers on walls should be covered with mats or canvas, but these coverings should be removed whenever the weather permits. If dry Bracken and evergreen branches are used, the air will circulate freely about the plants and prevent them becoming tender. Coal-ashes are useful for protecting the roots of certain plants from frost.

PLANTING CLIMBERS.—The present is a suitable time for planting many of the hardier climbers. Although it is advisable to delay the removal of tender kinds until the spring, the sites for these should be prepared now, so that there may be no delay when planting time arrives. As climbers occupy the ground for a long time, the soil should be well prepared and enriched. In all cases the ground should be trenched deeply; if the subsoil is of inferior quality, it should not be brought to the surface, but it should be well broken up with the spade. Wet ground should be drained. Plenty of decayed manure should be incorporated with the soil at the bottom of the trench, but it must not come in contact with the roots. The plants will be benefited by the manure after they have become established. The majority of climbers thrive in ordinary garden soil, but if the ground is poor, loam should be added before planting. If it is intended to plant peat-loving subjects, such as Lapagerias, the stations should be marked and a suitable compost provided. When planting wall climbers, introduce choice dwarf-growing shrubs at intervals to allow plenty of space at the top of the wall for the stronger-growing subjects, such as Clematis and Roses. Jasminum nudiflorum, Lonicera fragrantissima, and Chimonanthus fragrans should be planted for early blooming. Garrya elliptica is a very attractive wall plant: it produces its grey-green catkins in mid-winter. Magnolias are suitable shrubs for planting against walls, especially M. grandiflora. Spaces should be left for tender climbers, such as Solanum jasminoides, Cobæa scandens, Passifloras, Lophospermum scandens, and Eccremocarpus scaber.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

PHAIUS.—These plants are still growing freely, but from now onwards until the early spring they will require very little water at the roots, provided their surroundings are kept moist: endeavour to keep the compost just moist. P. Cooksonii, P. Norman, P. Marthiæ, and P. amabilis are beautiful hybrids and very floriferous; they require far less room than plants of P. grandifolius and varieties of P. assamicus. Phaio-Calanthe Sanderiana, P.-C. Berryana, P.-C. Arnoldiæ, and P.-C. Colmanæ should be afforded similar treatment to the above. These plants are very subject to attacks of thrip and scale insects, which should be kept in check by sponging the leaves frequently with an insecticide. They should be grown in an intermediate temperature and afforded plenty of fresh air at all times, but they must not be exposed to cold draughts.

MILTONIA.—Plants of Miltonia vexillaria and its hybrids are growing freely. An intermediate temperature is suitable for these Orchids, and the compost will not become dry so quickly as in a house where much fire heat is employed. Stand the plants in a light position and allow them to develop steadily. The young leaves frequently adhere to each other, and should be separated by means of the thin part of the handle of a budding knife. A brown, damp-looking, outer sheath at the base of the young growths often clasps the stem so tightly that the roots push upwards inside it instead of growing into the compost. This sheath should be removed in small pieces without causing injury to the plant. The above remarks apply also to M. Blueana, except that a slightly higher temperature should be afforded this plant. M. Roezlii needs a higher temperature and more atmospheric moisture than those mentioned above. The plant is more or less in active growth throughout the year, and the roots should be kept moist at all times. The foliage should be sprayed on all favourable occasions to keep down the attacks of insect pests. M. candida, M. Clowesii, M. Regnellii, M. Bluntii and others of this section should be staged in the intermediate

house and kept on the dry side all through the winter.

PHALÆNOPSIS.—P. amabilis, P. Sanderiana, P. Schilleriana, P. Stuartiana, and P. leucorrhoda are in flower or developing their flower-spikes. These plants should be watered with great care during the winter, as an excess of moisture at the roots may set up decay in the leaves. The plants should be examined each morning, and if the Sphagnum-moss is dry it should be lightly sprinkled as soon as the temperature rises above 65°. At the same time damp the sides of the receptacles and the roots that are clinging to them with tepid rain-water. Care must be taken that the water does not lodge in the centres of the plant or in the axils of the leaves. The flower-spikes should not be allowed to remain on the plants for long after the flowers are developed or the plants will be weakened and permanently injured. These Orchids should be afforded a light position, but not exposed to direct sunshine. Certain of the green-leaved varieties, such as P. violacea, P. speciosa, P. Luddemanniana, P. Marie, and P. sumatrana are still growing actively, and should be afforded sufficient water to keep the Sphagnum-moss fresh and green. They must also be protected from direct sunshine even at this season. The surroundings of the plants should be damped on both mornings and afternoons, regulating the amount of moisture according to the weather. The bare spaces may be allowed to become dry for a short time during the middle of the day. The night temperature of the house during mild weather should be about 65°, with about 5° increase during the day. On very cold nights, when much fire-heat is necessary, a few degrees lower will suffice, for a close, hot, moist atmosphere is harmful. Admit fresh air to the house without causing cold draughts, opening the top ventilators slightly on the side of the house sheltered from the wind.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

THE GLASSHOUSES.—The roof-glass outside soon becomes covered with soot and dirt in winter, especially in smoky districts, such as the neighbourhood of large towns. This deposit robs the plants of much light, and should be removed on frequent occasions. The glass outside should be wetted by means of the hose, scrubbed with a long-handled brush, similar to that used for cleaning railway carriages, and finally cleansed with a stream of clean water. During the next month or six weeks very little potting will be necessary in the houses, and the opportunity should be taken to give the interiors a thorough cleansing. It is best to empty the house of all the plants, as this will save much time, and prevent the foliage becoming splashed with dirty water. Scrub the paint-work and well wash every part of the house. If red spider, thrip, or mealy bug be present, the walls and woodwork should be syringed with paraffin and water. Opportunity should be taken to lime-wash the walls and paint the hot-water pipes, but this should be done before the paraffin is applied. When the work is finished, turn on the hot-water valves and open the ventilators for a day or two before introducing the plants again. In the meantime the plants themselves should be overhauled, the leaves sponged, and the pots washed, so that everything will be clean and tidy when the house is rearranged.

THE CONSERVATORY.—In most establishments there is a large demand for plants and flowers at Christmas; the conservatory, especially where it adjoins the dwelling-house, should be made as bright as possible at this season. Flowering plants, including Poinsettias, Euphorbias, Richardias, Chrysanthemums in variety, Primulas, Cyclamens, Freesias, Roman Hyacinths, Solanums, Coleus thyrsoideus, and Begonias may be used for indoor decorations, and the embellishment of the conservatory. There will probably be a demand for cut blooms at Christmas, and surplus plants of these subjects in frames and other structures will prove very useful.

PLANTS IN FRAMES.—Frames are not so dry as plant-houses, and unless they are well furnished with hot-water pipes there is a danger from too much moisture in mild, wet weather. Because of this the plants need to be watered with extreme care. Bedding plants in frames should be examined frequently with a view to removing decaying foliage, as decay soon spreads. Pelargoniums should be afforded plenty of space to keep the growth stocky. Calceolarias, Veronicas, Pentstemons, Antirrhinums, and similar subjects in cold frames should be fully exposed during fine weather by removing the lights entirely. All these plants are well-rooted, and they should be kept as hardy as possible. Under this treatment they will not be so liable to injury during times of severe frost, when extra protection should be afforded them.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

SPINACH.—Last year it was difficult to find a really healthy bed of winter Spinach; but this year the crops have done remarkably well, and promise to yield good supplies. Care should be exercised in the gathering; the largest leaves should be plucked separately, and the younger foliage handled with caution to prevent injury. At intervals, the hoe should be run over the ground between the rows, to break the surface, and enable the rain to be carried away more readily. The perpetual variety of Spinach, though not usually considered to be of a very high quality, is extremely hardy, and most useful in mid-winter. A few good rows will yield a surprisingly large quantity, and this sort should be used during severe weather, in order that the tenderer kind may not be gathered too closely. In case large quantities should be required, and crops show signs of not lasting well into the spring, it is a good plan to sow a few rows at this season in a portable frame on a very gentle hot-bed of leaves. The soil should be made up to within about 8 inches of the glass, and the plants thinned to a reasonable distance while the seedlings are quite young. Careful attention should be paid to watering and ventilation, but all coddling must be avoided.

RHUBARB.—In order to obtain satisfactory results in forcing, the crowns must be permitted a certain period of rest prior to introducing them to heat. It should be remembered that some varieties lend themselves more readily to forcing than others, and these should be selected for the purpose. The roots must be carefully dug up with as large a ball of earth as possible, and placed under a north wall. A little long litter should be strewn over them, and they should then be placed in the desired heat, to succeed the earliest batch. If a new plantation is necessary, the ground should be thoroughly trenched *now* to a good depth, and plenty of good farmyard manure dug in. The surface should then be strewn with a liberal supply of burnt garden refuse, and the ground left fallow until the time of planting.

SEEDS.—It is often desirable to perpetuate special strains of certain kinds of vegetables, such as Peas, Beans, and Parsnips. The season has not been favourable for the ripening of seeds; those that have been harvested should be cleaned of rubbish and placed in packets duly labelled. Beans and Peas should be sorted, and small and worthless seeds rejected. Small seeds may be cleaned by passing them through sieves with different-sized mesh. The seed-room should be dry and not too warm. The seeds should be placed either in drawers or on shelves, where they may be handled readily when the time arrives for sowing. It is a suitable time for putting the seed-room in proper order and making alterations that may be an advantage. The old stocks should be examined, and worthless seeds discarded, to make room for the new seeds.

POTATOS.—Potatos are best forced in pots or boxes, and if the "sets" are sprouted a commencement may be made. Pots 8 or 10 inches in diameter are the most suitable receptacles. They should be well drained and filled with a light compost, consisting of three parts well-decayed leaf-mould, one part sandy loam free from wireworm, and a sprinkling of soot. The pots should only be filled to three-parts their depth, to allow room for top-dressings after the plants are well advanced in growth. The soil should be made only moderately firm, but it should be well soaked with water. Moisture will not be needed again until the shoots appear above the soil. Place the pots in a moderately warm house; they may be stood under the plant stages if care is taken to prevent water from the plants above dripping on to the soil. Immediately the shoots appear, the plants should be removed to a position near to the roof-glass. The temperature should be from 50° to 55°, and the atmosphere moist, but not too damp, as this would result in weak growth. Admit air when the weather is favourable. After a time the weaker shoots should be removed.

CELERY.—The plants should be protected whenever the weather is very cold, but they should be exposed directly the frosts have disappeared again. If the soil is heavy, it should be loosened with a fork at the bottom of the ridges, to allow rain-water to pass away freely.

ONIONS.—The larger bulbs should be examined frequently, as many continued to grow after the ripening stage, owing to the damp weather. Decaying bulbs should be removed at once. Make a small sowing of Onions for use as salad.

MUSHROOMS.—The Mushroom house should not be kept too warm, but should be damped frequently. When Rhubarb is forced in this structure, slugs may be introduced, and these pests must be sought for and destroyed, or they will damage the young Mushrooms. As soon as the beds arrive in bearing, the covering material should be removed. Make fresh beds as soon as suitable material is available.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

TREES FROM THE NURSERY.—The nurseryman is often blamed for young fruit trees proving unsatisfactory, whereas the real cause may be something over which he has no control. For instance, injuries or delay suffered in transit, and keeping the roots for too long out of the ground after the trees are delivered are all harmful, and may result in failure. If planting is impossible when the trees are received, owing to the condition of the soil being unsuitable, the roots must receive attention. If the trees are frosted they should be placed in an open shed and well covered with litter until thawed. But, assuming they arrive in favourable weather, the package should be opened at once, and all damaged roots trimmed neatly. If the latter are very dry, they should be immersed in a tank of water, or dipped in stiff puddle for a short time. If the stations have been prepared beforehand, the trees may be planted as soon as the roots are partially dry again. Puddling is preferable at this season to watering, which causes the soil to be wet and cold for a considerable time afterwards. Trees received and planted early in the autumn do not often require these attentions, but those received in February or March, or at any date after the sap has commenced to rise, should always be treated in this manner. Staking is another important operation, for if the trees are not made secure after planting they may make but little progress. If tied loosely, the stems may be chafed through rubbing, but the tying should not be done so tightly that when the soil settles the roots are drawn through the soil.

LABELLING.—The proper labelling of fruit trees is an important matter. The small paper tallies attached to the trees by the nurserymen soon perish, and should be replaced by permanent labels directly the planting is finished. It is advisable to make a plan of the plantation, showing the various trees and their names: the plan should be nailed on a board and hung up in the fruit room. Labels made of sheet lead, with the names stamped on them, are very durable. A little white paint smeared into the lettering will show up the names conspicuously. These labels may be made in the garden. But there are numerous other kinds on the market equally as serviceable. If the tallies are attached to the trees with wire, an examination should be made at least once a year to see that the wire is not injuring the bark. Lead wire is pliable, but it does not last so long as ordinary wire. The labels should be placed where they may be seen readily, and those attached to the trees always at about the same height.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

APPOINTMENTS.

MONDAY, DECEMBER 16—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, DECEMBER 17—
Royal Hort. Soc. Coms. meet (no exhibition).

WEDNESDAY, DECEMBER 18—
Royal Meteorological Soc. meet.

THURSDAY, DECEMBER 19—Linnean Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—40·5.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, December 11* (6 P.M.) Max. 52°; Min. 46°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December 12* (10 A.M.): Bar. 29·7°: Temp. 48°; *Weather*—Fine.
PROVINCES.—*Wednesday, December 11*: Max. 54° Shields Min. 47° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Rose Trees, Shrubs, Lilies and Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

MONDAY AND FRIDAY—
Dutch Bulbs, Herbaceous and other Plants, at 12; Roses, at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

TUESDAY—
The Greenhouses, Piping, Frames, Lights, Brickwork, &c., at the Nurseries, South Woodford, by Protheroe & Morris, at 12.

WEDNESDAY—
Hardy Bulbs, Perennials and Border Plants, &c., at 12; Palms and Flowering Shrubs, at 5; Special Sale of Roses, at 12.30; at Protheroe & Morris's rooms.
Palms, Azaleas and Rhododendrons, at Stevens's Auction Rooms, at 12.30.

THURSDAY—
Miscellaneous Bulbs and Roots, at 11; 3,316 cases of Japanese Liliums, at 2.30; at Protheroe & Morris's rooms.

OUR ALMANAC. — We shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1913. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us* IMMEDIATE INTIMATION *of all fixtures for the coming year.*

Catalogues and the Seed Supply.

Gardeners are just now endeavouring to estimate their seed requirements for next season. The trade catalogues are in course of distribution, and orders will soon have to be despatched. The lists are sometimes made out in such a liberal manner as to satisfy all the desires of the cultivator, but in other cases the most careful consideration is necessary in order to keep the value of the order within the means of the purchaser. Every year the keen gardener feels a very reasonable desire to try a few of the season's novelties, some in the vegetable garden, others in the flower garden, but, unfortunately, the newest varieties, always dearer than standard sorts, are not easily obtainable by those whose annual expenditure on the garden is fixed at a moderate sum. So it is that the making out of a seed order, instead of being the easy matter it seems, is really one of those very difficult tasks that require as much time and thought as can be given them with due regard to other matters.

When we state that we have seen orders that were compiled with extreme care cast aside on reflection for others in which the adjustments seemed to promise to get just a little nearer the ideal it is probable that it will serve to remind many of our readers of experiences within their own recollections. So many variations are possible in an annual seed order for an average garden that probably no two persons would ever draft similar orders for the same garden; tastes differ in regard to desirable kinds, and the views of cultivators do not always agree as to what constitutes a sufficient quantity for a given purpose.

This latter thought leads us to observe that in some cases the means for purchasing a few extra novelties might possibly be saved by reducing the quantities of standard sorts until they represent the minimum that will give satisfaction; for it is to be remembered that unduly thick sowings give but poor results, and it is not good management to have a lot of seeds still unused at the end of the planting season.

We have referred to the difficulties of the seed order, but it must not be thought that the catalogues themselves do not provide liberal compensation. With what pleasure we look forward to them, and how eagerly we turn over the pages during these long, dark evenings. They seem to help us to form ideal garden pictures for the coming season; an illustration here and description there are destined to give us an interest in certain novelties which will last until we ourselves have found in what measure it is possible to realise the promises the catalogue holds out. "Castles in the air" some of the dreams of the long evenings may prove to be, but most of them will materialise, and next year as now the catalogues will quicken our interest as the horticultural heralds of summer.

Poring over the catalogues we are set thinking of whence all the new seeds come, and what conditions favour the production of plentiful harvests of good seeds. We are not able on this occasion to pursue the first question beyond stating that hundreds of acres of land are annually devoted to seed culture in these islands, and many thousands of trained men are engaged in the cultivation, harvesting, and cleaning of the seeds; whilst the machinery used in this latter process is not less ingenious than that employed in any other industry. But in regard to the further question which refers to the conditions favourable to the crops, we know that the principal influences are of a meteorological character. The proportion of dry and rainy weather, of sunshine and cloud —these are the main factors, beyond the selection of site and the exercise of good cultivation, that determine the quantity and quality of the yield. On another page will be found particulars of the yield this season in respect to some of the principal crops, both of flower and vegetable seeds, furnished by a correspondent with exceptional means of estimating the supplies. It is a matter for regret that there are great deficiencies to be faced, and it cannot be said, as last year, that compensation is to be found in the superior quality of the seeds.

In the first place, the weather during the winter of 1911-12 was comparatively mild, and the biennial plants were induced to make a certain amount of growth when they should have rested; consequently, severe weather which occurred in April caused serious injury to many kinds, including those which are usually hardy enough in normal conditions. April was followed by a drought which lasted for seven weeks, at a time of the year when rains were needed to induce the seeds of annuals to germinate and favour the planting out of seedling plants. Directly the long drought terminated there commenced a period of frequent rains, accompanied, during the latter part of July and in August, by unseasonable cold, which prevailed at a season when the hottest weather is usually experienced and vegetation is making rapid growth. During this period it was next to impossible to note any progress in growth, but happily September showed some improvement, and owing to the greater amount of sunshine the situation came to present a less serious aspect than threatened. Cool weather, of course, is not injurious to all crops in the same degree, and there are some classes of seeds which did not suffer nearly so much as in the hot summer of 1911.

To sum up, it is the early-flowering plants which seeded most sparingly, and later plants showed a little improvement. The crop of seed Peas was undoubtedly much better in quantity than the harvest produced last year, but there have been heavy losses during the cleaning operation which will reduce the supply of good seeds. The yield of Sweet Peas was extremely poor, and the crops in America and elsewhere were worse even than our own.

There is one matter connected with these successive years of poor crops that has a very serious aspect for the general cultivator, namely, the deterioration of stocks that necessarily follows. If a field of Cabbage or Beetroot, for example, has to pass through a season of extremes of weather, it is only the coarser and sturdier plants that survive. The more delicate plants die, and these latter belong often to the choicer strains, the result being that there is a marked difference between the parent stock seed and the produce. In some cases, also, carefully saved stock seed, the result of years of selection, is irretrievably lost.

All these matters will be in our minds as we peruse the catalogues, with their alluring descriptions and fascinating pictures, and cause us to feel at least some appreciation, and even sympathy, for those who in good seasons and bad contrive to supply us with good seed which shall spring up and bring forth flowers and fruits in due season.

Fig. 193.—Cattleya Dupreana, "The Dell" variety: colour of sepals and petals deep rose; lip marked with crimson.

(For text see p. 442.)

Botany in N. S. Wales. The presidential address delivered to the Royal Society of New South Wales by Mr. J. H. Maiden, Government Botanist and Director of the Botanic Gardens, Sydney, will be read with interest and appreciation by botanists in all parts of the Empire. Among the subjects with which Mr. Maiden deals are Sir Joseph Hooker's contributions to Australian botany, which began as the result of the Antarctic voyage of the "Erebus" and "Terror" in 1839-1842, continued throughout Hooker's official life at Kew, and terminated only with his death. Mr. Maiden's address contains an interesting review of the development of the early scientific societies in New South Wales, of which the Philosophical Society of Australasia, founded in 1821, was the parent. Now, as in this country, the number of scientific societies is legion.

Of great interest also is Mr. Maiden's account of the Northern Territory Expedition of 1911, which was organised by the Commonwealth Government, and charged with the work of exploring the natural resources of the great Northern Territory. Accounts of the recent Antarctic expeditions of Scott, Amundsen, and other explorers are, of course, included in this section of Mr. Maiden's paper.

One of the most noteworthy changes which have occurred in the flora of New South Wales is the escape from cultivation and wide dissemination of the Prickly Pear, and it is natural that Mr. Maiden should devote a considerable part of his address to tracing the history of this instance of acclimatation. Of the many species of Opuntia which grow in Australian gardens the following have escaped, and established themselves in various parts of the Continent:—Opuntia aurantiaca, O. imbricata, O. nigricans, O. inermis, O. ficus-indica, O. tomentosa, O. monacantha, O. Dillenii, O. microdasys, an unnamed species of Opuntia, and Nopalea (Opuntia) dejecta.

The Prickly Pear of New South Wales legislation is Opuntia nigricans, and the pest Pear is a variety of O. inermis. The latter is the serious pest, both in New South Wales and Queensland, and has shown itself so adaptable to Australian conditions as to have become "one of the wonders of the world in plant acclimatation." On the recommendation of Mr. Maiden, a committee has been appointed to investigate means of exterminating this pest, and has secured the services of a botanist to carry out the experimental work necessary for this purpose.

Among other subjects dealt with in the address are the teaching of botany in Australian schools, the new census of New South Wales plants, and the functions of a botanic garden. With respect to the last topic, it is interesting to learn that the Sydney Botanic Garden, now in charge of Mr. Maiden, came into informal existence in 1788, at the time that the first fleet arrived at Sydney from Rio de Janeiro, bringing with it vegetable seeds from England and economic plants from South America. These were planted, and thus was formed the nucleus of the Botanic Garden. The formal establishment of the garden took place some 20 years later, in 1816.

Coloured Plate.—The subject of the coloured plate to be published with the next issue is Momordica Charantia.

The Surveyors' Institution.—The next ordinary general meeting will be held in the Lecture Hall of the Institution on the 16th inst., when a paper will be read by Mr. M. C. Duchesne, entitled "The Value and Marketing of English Timber." The chair will be taken at five o'clock.

Market Gardeners' Compensation Bills Withdrawn.—In the House of Commons on Wednesday last, Mr. Cecil Harmsworth, speaking on behalf of Mr. Runciman, stated that it was the desire of the President of the Board of Agriculture that the Market Gardeners' Compensation Bills, Nos. 1 and 2, should be discharged from the committee. The Government have withdrawn these bills because of their contentious character, there being no prospect of carrying them into law. It is suggested that an agreed Bill should be introduced early in the New Year.

The Aftermath of War.—It is not only the trade in attar of Roses which is suffering from the Balkan war. The Eastern market in Prunes is idle, Figs from Smyrna are few, and, as we learn from Mr. H. Martinet's note in *Le Jardin*, Roumania is suffering from the fact that its harvest of Haricots is laid up at the wharves owing to the blockade. To the watcher of events from afar these may seem but small matters; but the reflective mind recognises that the failure of commerce is not the least tragic aspect of the grim disaster of war.

Biphosphate.—The new artificial phosphatic manure—biphosphate—which is produced as a by-product in the course of manufacture of nitrate of lime, is stated to contain 26 per cent. of phosphoric acid and 23.8 per cent. of nitrate of lime. Samples of this artificial fertiliser are on view at, and small quantities may be obtained by British manufacturers from, the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Tobacco Growing in Ontario.—In the south-western peninsula of Ontario tobacco growing has become a very profitable branch of farming. In order to place the industry on a substantial footing, the Dominion Department of Agriculture some three years ago established an experimental station at Harrow, in the county of Essex. The station, which comprises 38½ acres, is carried on to some extent as an ordinary farm. Last year 15 acres were devoted to tobacco experiments, in which nine of improved Burley and six of Warne varieties were dealt with. Tests were made with different kinds of beds, methods of curing, various combinations of fertilisers, seed selection, combating the tobacco worm, &c. It has been found that white Burley is the better for the average farmer to grow. During the past three years the average price secured for this tobacco has been 1s. per lb., or an average gross return of £50 sterling per acre.

The Reims Congress.—The congress on electricity in relation to horticulture which was held recently at Reims, demonstrated the remarkable variety of the ways in which electricity serves the ends of horticulture. At the last session of the congress it was decided to establish prizes for researches in electro-culture, and to found an International Association to be devoted to the interests of this subject. A second congress will be held in Paris in 1914.

New Hybrid Freesias.—According to the Italian journal *La Campagna* a number of remarkably beautiful hybrid Freesias have been raised by M. Carlo Lorenz, a horticulturist of Palermo. The *Revue de l'Horticulture Belge* (Nov. 1, 1912), in giving an account of the new forms, states, on the authority of the Italian journal, that the hybrids in question are generic and that they have been produced by crossing Freesia refracta with Sparaxis tricolor. It is stated further that the cross which was made first in 1905, with the Freesia as seed parent, yielded three plants, of which two resembled Freesia refracta and the third possessed flowers of a deeper violet and with clearer stripes. From this plant all the hybrids have been obtained. In the varied structure of the corolla and its expanded form and consistence, as well as in the amount of branching and in the narrow, stiff leaves the hybrids resemble Sparaxis tricolor. It is to be regretted that the two Freesia-like plants were discarded, and it is to be hoped that more information will be forthcoming on the subject of these productions.

Frilled Cyclamen.—On several occasions (see *Gardeners' Chronicle*, March 5, 1898, p. 135, fig. 55) we have illustrated varieties of Cyclamen in which the flowers are modified in various directions, some of them having segments with beautifully-frilled margins. Flowers of this latter type have been sent recently by Mr. Jas. Hawkes, gardener to the Earl of Jersey, at Osterley Park, and they represent a very good strain. Some of the flowers were 3½ inches in diameter, of brilliant colours, and exhibited extraordinary fimbriation. Our correspondent states that he has tried to develop this strain for some years by crossing and seed selection, and he is satisfied that the flowers have such substance that they are capable of lasting an unusually long time in good condition

A Reserve of Wild Nature.—Under the above title the *Times* announced recently the gift—to the National Trust for places of historic interest or natural beauty—of Blakeney Point, Norfolk. The land thus vested in the National Trust lies on the north coast of Norfolk, and is about 1,000 acres in extent. The facts that Blakeney Point possesses an interesting maritime flora and is remarkable for the variety of its birds, make the gift, which is due to the generosity of the Fishmongers Company and of certain private individuals, a particularly valuable one.

Chrysanthemum Diseases.—In a report on the treatment of diseases of the Chrysanthemum, presented to the recent congress of Chrysanthemistes and summarised in *Le Jardin* (No. 619, December 5), Mr. Crepin recommends the following species: *Leaf-scorch* (Septoria Chrysanthemi): Treat by pulverisation on the upper and lower sides of the leaves of a mixture containing potassium penta-sulphide, permanganate of potash and water in the proportions of 1 ounce, ½ ounce and 2 gallons of the respective ingredients. This treatment should be followed by vigorous dredging with flowers of sulphur or nicotined sulphur. It serves also as a preventive against rust. *Rust*: When an outbreak of rust has occurred, Mr. Crepin recommends the use of the mixture described, with the addition thereto of ⅛ ounce of formalin (formaldehyde). The plant may be dipped and stirred in the mixture, and whilst the plant is still wet sulphur should be dredged upon it. Plants which have been brought into glasshouses or under shelter, if affected with any fungous disease, should be treated with a solution of permanganate of potash, ⅛ ounce to 2 gallons of water.

SCOTLAND.

FIRE IN A GLASGOW FRUIT WAREHOUSE.

Through an outbreak of fire, which took place late on the night of Sunday, December 1, the large warehouse of Messrs. Simons, Jacob & Co., wholesale fruit merchants, Glasgow, was destroyed. Upwards of 200 firemen and 16 motor fire-engines were engaged, but all they could do was to prevent the fire from extending to adjoining properties.

The fire also destroyed the Central Commercial Salerooms, used by several firms for fruit sales. The premises of Messrs. Thomas Allen and Co., fruit merchants, in the lane between Candelriggs and Brunswick Street, were also damaged by fire and water. The damage is estimated at about £60,000.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Phalænopsis intermedia Portei (see fig. 194).—It may interest your readers to know that after five years resting the large plant of Phalænopsis intermedia Portei, which has been at Tring Park for over 30 years, has again flowered. It produced this year three large-branched spikes, with a total of 185 flowers and fully-developed buds. The largest spike has 13 branches with 84 flowers and buds, the next largest 7 branches with 61 flowers and buds, and the smallest 5 branches with 40 flowers and buds. The plant was among an importation of Phalænopsis Aphrodite sent home by Boxall to Messrs. Hugh Low & Co. some 32 years ago. *Walter Rothschild, Tring Park, December 9.*

Fig. 194.—Phalænopsis intermedia portei (natural size.)

The R.H.S. Trials and Names. — Messrs. Kelway & Son raise a most important question in the last number of the *Gardeners' Chronicle*. I do not agree with all Messrs. Kelway say. I might ask why did not they themselves send a full collection of Delphiniums? Have they so many orders for them at a guinea a time that they could not spare them? The point of their letter is that in R.H.S. Records the name of the raiser should follow the variety obtaining an Award whenever possible, and I agree in this, and so I think will all fair-minded people. May I suggest to the R.H.S. that they take a leaf out of the book of the National Sweet Pea Society and record trials thus:—"Sweet Pea Countess Spencer (Cole-Sydenham, 1904)." Cole is the raiser and Sydenham the introducer in 1904. The R.H.S. could improve on this. It could give the raiser and, in their case, the sender's name in different type. It would run thus:—"Sweet Pea Countess Spencer (Cole—*Sydenham*), F.C.C., 1901." The information in some cases would be difficult to obtain, but if, when inviting trials, it was requested that the raiser's name in every known case be added after the name of the variety, many would be obtained and gradually a mass of valuable historical information would be accumulated. *W. Cuthbertson (of Dobbie & Co., Edinburgh).*

Hot-water Method of Forcing. — On October 25 last I lifted a fine plant of the common Lilac, also six specimens each of the varieties Charles X and Mme. Legraye and planted them in tubs. They were placed in a temperature averaging 65° and subjected twice daily to a heavy syringing of water warmed to 120°; the roots were also soaked once weekly with water at the same temperature. On November 26 I cut spikes of the common Lilac, there being over 300 inflorescences on the plant. The flowers of the other varieties were a little later. Although the blooms of the common variety are not large, they are very useful, and possess a delightful fragrance. I adopted the plan through reading the article in *Gardeners' Chronicle* on the use of hot water for forcing, in the issue for December 4, 1909, p. 373. *S. Gilthorpe, Nynehead Court Gardens, Wellington, Somerset.*

Hybrid Nomenclature (p. 431.)—There is little in Mr. Rolfe's remarks on this subject which might be referred to as matter of general interest. The Latinised names which he cites as being given by me were perfectly in order, as they applied to primary hybrids, and were not given to supersede previously-recorded names. But there is one remark which might be discussed with advantage, namely, his quotation from the Vienna rules: "Ternary hybrids, or those of a higher (more complex) order, are designated like ordinary hybrids." That implies that the more mixed the parentage the higher the order in their standing as hybrids." My opinion is that garden-raised plants of complex parentage are not hybrids at all in the true sense, and the term is only applied to them for convenience. The following extract from the "Rules of Nomenclature" at Brussels, 1910, clearly indicates the nature of the hybrid of a higher order:—"Ternary hybrids or those of a higher order (crosses between *species* of the same genus) are designated by a name or a formula." That is a very different thing, and it goes quite far enough. Indeed, I cannot see for what reason ternary hybrids were brought into the question. It is well known to those who are on the practical side of Orchid raising that the more complex the parentage, the more unreliable the progeny in any recognisable character, and so far from being of a "higher order," while there may be an occasional fine form, the bulk of a cherished batch sometimes gets put on the fire. Some discussion on this variability would be very interesting; I have notes on the subject which one would scarcely believe were they not well authenticated. *James O'Brien.*

———Formerly the practice was that botanists gave names to genera and species and gardeners gave names to varieties and "sorts." When hybrids were raised artificially, the gardeners gave them names also. Botanists looked on unconcernedly. A hybrid Rose, Rhododendron, Erica, Pelargonium, Calceolaria or Hippeastrum was to them of no more importance than a new Apple or Cabbage. They did not object to the use of Latin names such as bicolor, Broughtonii and hybrida. When they altered the names of Kentias, Latanias, Seaforthias and Geraniums, gardeners paid no heed. Orchids came into horticulture very gradually, and when they were new a botanist, generally Dr. Lindley, named them. He was succeeded by the autocrat, Reichenbach, who had a keen eye for differences, which led him to make too many genera and to see species where he should have seen varieties. This pleased the growers and dealers, of course. When the breeders got to work on Orchids, they obtained results which proved that a considerable number of these genera were so nearly related as to interbreed, a proof of blood relationship too close to admit of their standing as separate genera. The trouble began when botanists failed to recognise this. They preferred to look upon such hybrids as bigeneric, and gave them names to indicate this, such as Brasso-Cattleya, Epi-Cattleya, Sophro-Cattleya. The practical commonsense plan would have been to give the hybrid the same generic name as the parent it most resembled, seeing that names need not be pedigrees nor yet histories. Now we have such absurd names as Brasso-Cattleya-Lælia, Sophro-Cattleya-Lælia, and we may soon have Epi-Sophro-Brasso-Cattleya-Lælia! The same kind of nonsense occurs in the specific names of hybrids, as, for example, Cypripedium Leeano-Chamberlainianum, Lælio-Cattleya crispo-Schilleriana, and Brasso-Cattleya Digbyano-Mossiæ. Many years ago, a Daffodil conference was held for the purpose of setting the names of the plants in order. It was then decided to name all the hybrid and seedling Daffodils in the florist's, not the botanist's way. The late Professor Michael Foster, a gardener-botanist, held that such names should be easy to write, read and speak. This should be the one golden rule for all garden plant names. There is the very practical objection to these fearful Orchid names that they are the exact opposite to what the worthy Professor recommended. Gardeners are themselves largely to blame for this, because, instead of naming their home-bred Orchids, as breeders of other kinds of plants do, they asked the botanists to do it for them. I agree with much of what Mr. O'Brien says, and can also sympathise with Mr. Rolfe's defence of the plan adopted in the *Orchid Stud Book*, notwithstanding his effort to make us swallow Paphiopedilum and Phragmopedilum. I am heretic enough to say blow the conferences and confound the botanists who have helped to make Orchid names what so many of them are. Mr. O'Brien says we need a simple plan of naming over which there can be no dispute; I would go further by saying we require something more drastic to make the names of garden Orchids easy to read, write and speak. This is a matter that concerns the gardener and fancier, not the botanist. The leading breeders and growers should therefore confer and put the names in order, "mopping off" the long and ugly ones and substituting better, as was done in the case of Daffodils. Until this is done we shall continue to get more of the same objectionable names. Only last week two new Orchids were shown and certificated with the following names:—Sophro-Lælio-Cattleya Carna and Lælio-Cattleya Golden Oriole var. Ruby. I should have called them Cattleya Carna and Cattleya Ruby. *W. W.*

GRAPE MADRESFIELD COURT.—In Barron's *Vines and Vine Culture* a remarkable error respecting the cracking of the berries of Madresfield Court Grape remains uncorrected, even in the fifth or latest edition. How such an error has hitherto escaped the notice of the various reviewers of this standard book and has been allowed to be repeated in each of the subsequent editions remains a mystery. A paragraph in the cultural notes on Madresfield Court vine reads:—"If allowed to hang long, the berries are somewhat liable to crack." Such a statement is entirely inaccurate and misleading, for, as all good cultivators know, it is during the earliest stages of changing colour and whilst the berries are swelling a second time after the stoning process that any cracking of the berries takes place. Once the colouring and swelling are complete, no matter how long the Grapes may hang, no cracking takes place afterwards. The splitting is due entirely to wrong atmospheric conditions of the vineries from the very commencement when the grapes begin to change colour. Every season we are asked by numbers of growers—chiefly amateurs—the cause of their Grapes cracking, and, when informed of the true cause, they are somewhat puzzled. The mistake should be corrected in future editions. *W. Crump, Madresfield Court Gardens, Malvern.*

A STEP IN THE RIGHT DIRECTION.—All gardeners will note with pleasure that the Board of Agriculture are about to show their recognition of the importance of horticulture by appointing inspectors in this branch of their department. It is to be earnestly hoped that the Board will appoint good, practical men to the vacancies (as advertised in *Gardeners' Chronicle* for December 7), and will not follow the example of the London County Council and give the appointments to military officers. Gardeners and their calling have long been neglected, but it is now to be hoped that their worth and merit will in future be appreciated at their proper value. When one compares the results achieved by gardeners and the many difficulties they have to contend with, surely no one will excuse me of egotism when I claim that gardeners are, as a rule, men of grit and intelligence, whose services should be recognised and rewarded according to their full value, which has not hitherto been the case. *Wilmot H. Yates, Rotherfield Park, Hants.*

POTATO HAULM AS FOOD FOR COWS (see p. 431).—During the dry summer of 1911 I used several acres of Potato haulm as food for milch cows and young stock with good results. The Potatos had made much top growth, and by the second week in September I concluded the leaves had nearly fulfilled their function, and commenced cutting the haulm for the cows, as grass was very scarce. The animals appeared to appreciate their daily allowance, and repaid us for the treat of green food by giving additional milk. *E. Molyneux, Hampshire.*

SCARING BIRDS (see p. 392).—Whether "the gardener's first duty is towards his employer," as *A. C. B.* asserts, is open to question, and must be left to the conscience of each individual gardener to decide for himself. But gardeners, in common with all other men, have duties to their neighbours (i.e., the rest of the community) which are quite as important, but are apt to be forgotten. For instance, if a gardener finds that a certain kind of bird is destructive in his garden, is he justified in endeavouring to exterminate that kind of bird in his district, without regard to the probable fact that it is very useful to a neighbouring gardener, who grows some other kind of crop, which would be destroyed or seriously damaged by insects which form the favourite food of the bird in question? The obvious answer is: "No, certainly not; but he should take steps to keep the bird from his crops without endangering his neighbours'." Well, then, why doesn't he? The answer is again obvious: "To do so without killing off the bird would mean endless bother and expense, and it is much easier to kill the birds." The corollary to this is, of course, "Never mind the selfish and brutal side of the question, so long as *my* purpose is achieved, namely, the saving of my employer's crops." I mean no offence to any correspondent in thus writing, but wish to put before them a view of the case which is usually overlooked. I am glad Miss Gardiner has written, but surely a person need not be a "bird enthusiast" to appreciate the callous brutality of shooting a harmless and beautiful gull—scarcely "in self-defence," *A. C. B.*!—to scare a few tits from one's Sweet Peas. I can imagine the hullabaloo *W. A. M.* and A. J. Elgar would kick up if someone were to shoot their pet dogs and cats—probably real nuisances to their neighbours!—to make rugs or doormats of, or to use for scaring cats or birds, respectively, as the case might be, from his garden. Yes, but, of course, we know those dogs and cats are private property and therefore sacred (!), whilst the wild birds—well, to whom do they belong? Certainly not to *A. J. E.* and *W. A. M.* more than to the rest of mankind. *C. Nicholson, Hale End, Chingford.*

MR. H. W. ADNITT, RETIRING JOINT SECRETARY OF THE SHROPSHIRE HORTICULTURAL SOCIETY.

THE SHROPSHIRE HORTICULTURAL SOCIETY.

RETIREMENT OF THE JOINT SECRETARIES.

OUR readers will hear with regret that Messrs. H. W. Adnitt and W. W. Naunton, the hon. secretaries of the Shropshire Horticultural Society, who have acted in that capacity from the establishment of the society, 38 years ago, have decided to resign these offices. Those who have followed the fortunes of the Shrewsbury shows, whether as judges, exhibitors, or journalists, know full well that the marvellous success which has been achieved is directly attributable to the business capacity, the horticultural sympathy, and the unvarying courtesy of the two principal officers.

Since the small and unpretentious beginning in the year 1875, the society has pursued its aims with uninterrupted success. During the period referred to, the total income has exceeded £131,000, and from its profits the committee has voted at various times donations amounting to nearly £14,000 to the Corporation of Shrewsbury for improving the show grounds, public buildings, and institutions of the town. But, beyond the financial assistance rendered locally, the general taste for horticulture has been encouraged by the splendid exhibitions held every year. They have attracted the best cultivators of horticultural produce in these islands, and it is not too much to say that the displays of indoor fruits have been unequalled for their superb quality. Messrs. Adnitt and Naunton gained and held the sympathy of exhibitors in a remarkable degree, and were ever looking for some means of adding new features to give fresh interest to their shows. Many years ago the development of the mixed groups of ornamental plants gave Shrewsbury a distinct prominence amongst provincial shows, and, later, the institution of the champion challenge class for Grapes caused the displays to be talked about wherever gardeners happened to meet. The Shropshire Society, too, was amongst the first to encourage high-class exhibits of vegetables, and the strict rules enforced in regard to this and all other sections of the exhibition had the effect of maintaining a very high standard. It is true that the exhibitions were accompanied by various kinds of amusement in the Quarry grounds; but if the society felt bound to have these for raising the funds that were necessary to success, it must be freely acknowledged that the hon. secretaries never failed to hold the horticultural exhibitions in the highest regard, and their efforts were always directed first to furthering the interests of those who visited the Quarry for the purpose of inspecting the show. Messrs. Adnitt and Naunton will carry with them in their retirement the good wishes and grateful recognition of all who know the splendid work they have done for the Shropshire Society and for horticulture.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

December 3.—*Present:* Mr. E. A. Bowles, M.A. (in the Chair); Sir Harry Veitch, Messrs. A. Worsley, G. Wilson, J. O'Brien, J. Fraser, J. T. Bennett-Poë, C. E. Shea, A. W. Sutton, W. Hales, J. Odell, R. Hooper Pearson, and F. J. Chittenden (hon. sec.).

Prunus Miqueliana.—Mr. G. Wilson drew attention to this beautiful shrub which flowers in the open in December in Sussex and elsewhere (see *Gardeners' Chronicle*, December 7, 1912.) Its appearance suggests a garden origin, for the flowers are semi-double.

Fern in bottle.—Mr. J. Fraser showed a specimen of a Fern, Cystopteris fragilis, growing in a bottle, in which it was found in a garden. Though this Fern usually loses its leaves in July, the present specimen was still green.

Orange-fruited Holly.—Mr. E. A. Bowles showed orange-coloured fruits from a Holly in his garden. The tree is probably identical with that referred to in Dallimore's *Holly, Yew and Box* under the name Ilex aquifolium fructu-aurantiaco. It is there suggested that this is a seedling from the yellow-fruited variety, and the tree in Mr. Bowles's garden is apparently of similar origin.

Lælia pumila × *Lælio-Cattleya Ophir (Lælia xanthina* × *Cattleya aurea).*—Mr. G. Wilson said this hybrid with cream-white sepals and petals and purple labellum was raised by Mr. R. G. Thwaites, of Streatham Hill, and was shown by him in support of his hypothesis that white flowers are produced by a mixture of red, blue, and yellow.

The committee will not meet on December 17, there being no general show on that day.

HORTICULTURAL CLUB.

December 3.—After the usual monthly dinner of this club, at which Sir Harry Veitch presided and upwards of fifty members and friends (including many ladies) were present, Mr. Arthur W. Sutton, F.L.S., gave a lecture entitled "My Desert Camping Tour to Mount Sinai," illustrated by a hundred splendid photographs taken by him *en route* and beautifully coloured. Mr. Sutton, who takes a particular interest in the evidence afforded in favour of the accuracy of biblical records by the actual localities to which they refer, explained at the outset that he was heavily handicapped in this direction by the shortness of time at his disposal and the difficulty he felt in not dwelling at too great a length on the many interesting points in this particular connection. The lecturer commenced with a map of the region which he had traversed circuitously for some 200 miles in company with Dr. Mackinnon, the well-known medical missionary of the Edinburgh Mission in Damascus. The first visit made was to the traditional spot where the passage of the Red Sea was effected by the Israelites. It would appear, however, that there are three places which claim to be the site of the passage. One, to the north, where the water is very narrow and shallow, is considered by some travellers as the most likely, as an exceptional state of tide and wind might have facilitated the passage, while the other two involve the traversing of deep water and a much greater distance. The views of the desert were excellent, apparently limitless streaks of barren sand without a trace of vegetation, alternating with views of brilliantly green oases of Palms, sometimes, thanks to a local supply of water and the generally warm climate, of such luxuriant growth as to be traversable only with difficulty. The general temperature varied from 100° in the shade during the day to very near the freezing point at night. The pervading conditions of sand and the consequent limitation to camels for transport of both travellers and their impedimenta rendered the whole journey a most difficult one, camel riding being so uncomfortable as to compel frequent descents for a rest and walking being in its turn equally exhausting, so that recourse to the camel's back for variety's sake involved no particular charm, and this, with short intervals of rest on the dry, heated plain and day after day, did but little to recommend the Sinai Desert as a popular resort. In time, however, Mount Hebron and its hills of brilliant red, interspersed with black and other coloured outcrops everywhere devoid of even a blade of grass, indicated the approach to Mount Sinai; at Mount Sinai, of course, the biblical records were brought home to the traveller most vividly by the character of the surroundings of these heights, and impressed the grandeur of the Bible story on the minds of the travellers. At Sinai both travellers and their guide and camel drivers enjoyed a welcome rest at the famous monastery prior to the return journey.

PERPETUAL-FLOWERING CARNATION.

ANNUAL DINNER AND GENERAL MEETING.

December 3.—About 30 members and friends of the above Society assembled at dinner on this date in the Holborn Restaurant, under the chairmanship of Mr. J. S. Brunton.

After the usual loyal toasts had been honoured, Mr. M. Todd, of Edinburgh, proposed "Success to the Perpetual-flowering Carnation Society." Mr. E. Hawes responded.

Mr. S. Mortimer proposed the health of the chairman of committee, Mr. J. S. Brunton, who had done so much for the Society. The toast was received with enthusiasm.

The annual general meeting followed the dinner. The report was read by the Hon. Secretary, Mr. E. F. Hawes, and passed. The Hon. Treasurer, Mr. L. J. Cook, presented the financial statement, which showed a small credit balance. All liabilities, said Mr. Cook, had been cleared off, in addition to the £25 voted to the Royal International Exhibition.

The election of officers followed. Lord Howard de Walden was unanimously re-elected president, and several new vice-presidents, including Sir Harry Veitch, were also elected. Mr. J. S. Brunton was re-appointed chairman, and Mr. W. E. Wallace vice-chairman. Mr. L. J. Cook was appointed hon. treasurer, Mr. Hawes having retired from the post, Mr. T. A. Weston was unanimously elected secretary. Mr. Hawes was appointed show superintendent. The General Committee was also elected, the retiring members again serving.

THE CONFERENCE.

December 4.—There was a large attendance of the members at the conference, which was held in the Lecture Room of the Royal Horticultural Hall on the above date. Mr. J. S. Brunton presided, and Mr. J. Gardner, of Batsford Park Gardens, Gloucestershire, read a paper on "The Culture of Perpetual-flowering Carnations." We publish the following extracts:—

The Perpetual-flowering Carnation is fast gaining the position of the premier winter-flowering subject for the production of cut blooms. For the decoration of dwelling-rooms, dinner-tables, and similar purposes, the Carnation is unsurpassed by any other flower, and few other flowers continue in a fresh condition for so long a period. These qualities alone are sufficient to render it popular, without taking into account the fact that it is not a difficult plant to grow.

The same plants may be had in flower for 12 months, and, if they are well managed, they will produce blooms during the whole time. Not only do modern varieties produce superior blossoms, but in many cases the habit of growth and the constituents of the plants are distinctly in advance of the old-time favourites.

A matter that might be taken into consideration is the production of varieties with sweet scent; for, although a bloom may be perfect in shape, and the plants possess every good characteristic, if the flowers are scentless they are destitute of a most delightful charm. Whether they possess smooth-edged petals like May Day, or serrated edges like Baroness de Brienen, is really not an important matter, as there is room for both types, for they each appeal to different tastes.

It is essential to devote a suitable house to

MR. W. W. NAUNTON, RETIRING JOINT SECRETARY OF THE SHROPSHIRE HORTICULTURAL SOCIETY.

Carnations if their cultivation is to be made a success, for it is impossible to grow them well in an indifferent greenhouse among a collection of miscellaneous plants. A span-roofed house provided with a centre stage, and a stage all round next to the outside, is suitable for growing these plants. The house should face to the south so as to obtain the maximum amount of sunshine during the winter, and be fitted with a 4-inch flow pipe under the outside stages, with the returns conducted under the centre stage to maintain the requisite amount of leaf in winter. The stages should be covered with fine shingle or small cinders. Both the top and bottom ventilators should be made to open outwards to the fullest extent.

The best way to make a start is to procure strong plants in small pots early in March; if treated properly they will make fine, bushy plants and commence to flower in October. In subsequent years, with the exception of purchasing any novelties that are required, it is preferable to raise one's own stock. The best time to commence this work is during the latter part of December, and cuttings may be inserted until March.

At Batsford we obtain good results by inserting cuttings in August, procured from plants growing in the open garden. The growths are generally firm and well matured at that season, and they make better plants than those rooted in the winter. By propagating in August, strong plants in 60's are obtained by October; these should be kept in a cool house during the winter, and, after the turn of the year, potted on.

When taking cuttings, it is essential to obtain them from plants that are vigorous and free from disease, so as to ensure the continuance of a healthy stock. Those from the centre part of the stem are the best; they should be removed when about 3 inches long, and prepared in the usual way. We obtain good results by inserting them singly in small thumb pots filled with a compost of loam, leaf-soil, and silver-sand in equal parts. The pots are plunged in fibre in a propagating frame, with a bottom heat of 60° and an overhead temperature of 55°. The frame is kept fairly close until they are rooted. A little air is admitted in the morning for an hour or two, and, at the same time, the condensed moisture is removed from the glass.

It is desirable to shade the cuttings lightly from bright sunshine, and give a gentle spraying overhead with the syringe if required. In such conditions they root readily in from three weeks to a month, when they should be gradually exposed to more air. Of course, this treatment varies a little according to circumstances. Pot the young plants on into 60's, using more loam and less sand in the compost, but make sure that they are moist at the root before being potted, and grow them on in a temperature of from 50° to 55°.

Some growers prefer to root their cuttings in sand only, and by this means more can be propagated in a given space. When this method is followed, the frame should be covered at the bottom with a layer 3 inches deep of firm, moist sand, and the cuttings rooted in the sand; but taking into account the fact that they have to be potted into very small pots before they can be placed in the 3-inch pots, it is doubtful if there is any advantage. When they are rooted in pots they can be potted on without much disturbance at the roots. When the young plants are 5 or 6 inches high, pinch out the tops to induce them to produce side shoots and form a bushy habit. They may also be stopped again later, but not after the end of June.

(To be concluded.)

CIRENCESTER AND DISTRICT GARDENERS'.

NOVEMBER 14.—The first open show of the above society was held in the Bingham Hall, Cirencester, on this date. The entries totalled 236 in 51 classes. Flowers and vegetables were well represented. Honorary exhibits of collections of flowers and plants were staged by Messrs. JOHN JEFFERIES & SON, Royal Nurseries, and Messrs. ORPET & SON, Cirencester.

In the Chrysanthemum classes the principal prize-winners were Mrs. W. CRIPPS, the Hon. C. BIDDULPH, Capt. GORDON DUGDALE, and Capt. H. GORDON.

For a miscellaneous group of plants Capt. H. GORDON was awarded the 1st prize, and Lord GRANTLEY, Chesterton, the 2nd prize; and for table plants Mr. T. KINGSCOTE, M.V.O., and Major RIPLEY were 1st and 2nd respectively.

The principal prizes in the fruit classes were won by the Hon. C. BIDDULPH, Mrs. W. CRIPPS, and Capt. GORDON DUGDALE.

In the amateur section the chief prize-winners for flowers were Mrs. F. HOBBS, Mrs. SCOTFORD HARMER, Mr. J. C. EDEN, Mrs. H. T. GARDENER, and Mrs. J. J. GROVE.

NEWCASTLE CHRYSANTHEMUM.

NOVEMBER 20, 21.—The eighth annual exhibition of the Newcastle-on-Tyne and District Chrysanthemum Society was held at the Town Hall, Newcastle, on the above dates. The exhibits generally were very good, but in the open class for 36 blooms the competition was not so keen nor the exhibits quite so good, as on some previous occasions.

In the open class for 12 vases of Japanese Chrysanthemums, comprising not fewer than 12 varieties, three blooms in each vase, the Countess of RAVENSWORTH, Cresswell Hall, Morpeth (gr. Mr. R. Addison), was placed 1st. The varieties Mrs. A. T. Miller, Lady Talbot, Bessie Godfrey, and Miss E. Fulton were especially fine. Dr. J. B. SIMPSON, Bradley Hall, Wylam (gr. Mr. J. Kerr), was placed 2nd, and Capt. LAYCOCK, D.S.O., of Wiseton, Bawtry (gr. Mr. G. Musk), 3rd. The flowers of F. S. Vallis in this latter exhibit were awarded a Medal as the best blooms in the show.

For six vases of Japanese Chrysanthemums (various), the Countess of RAVENSWORTH was again placed 1st, with a fine exhibit, in which the varieties Elsie Fulton, F. S. Vallis, and Lady Talbot were especially noticeable. The Rt. Hon. WALTER RUNCIMAN, M.P. (gr. Mr. Askew), was placed 2nd, and Capt. LAYCOCK 3rd.

For four vases of Japanese (various), the 1st prize was gained by C. LACY-THOMPSON, Esq., Farlam Hall, Cumberland (gr. Mr. A. W. Appleton), and the 2nd by Capt. LAYCOCK. For one vase of white Japanese, the Countess of RAVENSWORTH was again successful, with "White Queen"; 2nd C. LACY-THOMPSON, Esq. For three blooms of a yellow Japanese variety, Capt. LAYCOCK was awarded the 1st prize. In the class for three blooms of Japanese varieties of any colour but yellow, Capt. LAYCOCK was again placed 1st, and the Countess of RAVENSWORTH 2nd. For four vases of Incurved blooms, the Rt. Hon. W. RUNCIMAN was awarded the 1st prize.

For two vases of Incurved varieties, the Rt. Hon. W. RUNCIMAN was placed 1st, and Capt. LAYCOCK 2nd, whilst for six vases of single Chrysanthemums, Capt. LAYCOCK was awarded the 1st prize and Lord ALLENDALE the 2nd prize.

One section was open only to exhibitors from Northumberland and Durham. In the class for four vases of Japanese blooms, various, Dr. J. B. SIMPSON was placed 1st. He showed fine blooms of F. S. Vallis, Frances Jolliffe, and the Hon. Mrs. Lopes. The cup offered in this class is now Dr. SIMPSON'S own property, as he has won it three times in succession. For four vases of Japanese blooms, open to exhibitors within a radius of three miles of Newcastle, the 1st prize was awarded to Mrs. HUNTER, The Grange, Wickham.

The 15-guinea challenge cup offered for four plants was won by J. READHEAD, Esq.; 2nd, Mr. THOMPSON, of South Shields. For a group of Chrysanthemums with foliage and other flowering plants, Mr. A. G. BAMBRIDGE was placed 1st, with a very artistically-arranged exhibit. 2nd, C. I. KINDELL, Esq., Preston House, North Shields (gr. Mr. Hetherington).

A cup of the value of 10 guineas, and a money prize of £2 were offered for a table 6 feet by 4 feet, decorated with flowers. The 1st prize was won by Mr. Lovett (gr. to A. COLLINGWOOD, Esq., Lilburn Towers).

FRUIT.—For two bunches of white Grapes, the 1st prize was won by the Earl of DURHAM, Lambton Castle (gr. Mr. W. Smith), and for two bunches of black Grapes C. I. KINDELL, Esq., was placed 1st. For six dishes of cooking Apples, the Rt. Hon. Sir EDWARD GREY, Bart., Falloden Hall (gr. Mr. J. Henderson), was awarded the 1st prize, and Dr. STEWART, Hexham (gr. Mr. Lloyd), the 2nd prize.

The North of England Horticultural Society awarded several Gold and Silver Medals. A Gold Medal was awarded to Lord RIDLEY for a miscellaneous group of flowers; another to Messrs. FINNEY, of Newcastle, for floral designs. Messrs. SUTTON & SONS, Reading, were also awarded a Gold Medal for a collection of 75 varieties of Potatos; Mr. LAWRENSON, of Newcastle, received a similar award for miscellaneous flowering and foliage plants. Silver Medals were awarded to Mr. W. A. ARMSTRONG, Messrs. MITCHIN & CO., Messrs. DICKSONS, of Chester, and Messrs. W. J. WATSON, LTD., of Newcastle.

EDINBURGH SEED TRADE ASSISTANTS' ASSOCIATION.

DECEMBER 6.—The 18th annual dinner of the Edinburgh Seed Trade Assistants was held in the Royal British Hotel, Princes Street, on this date. The company numbered 110. Mr. James Welsh (of Messrs. Dicksons and Co.) presided. Several employers were present.

Mr. David King, in proposing the toast of the evening, "The Seed Trade Assistants," said that Edinburgh assistants in the past had made a reputation for themselves and for Scottish trade in all parts of the world. Mr. James Lyon replied.

Mr. J. W. Forbes (Advocate) proposed the toast of "The Seed and Nursery Trade." Edinburgh, he said, was one of the great centres of the trade. On looking back some hundred years there were then only three or four firms of importance in the Edinburgh trade, and they are still in existence, but the number of firms had increased five or six times, which showed that Edinburgh was still upholding its great reputation. He referred also to several prominent seedsmen who had become distinguished citizens of Edinburgh. He coupled the toast with the name of Mr. A. Chalmers (of Messrs. Stewart and Co.), who, in replying, said that in the last few years trade had become very difficult. There used to be a time when they could calculate the seed crops with a fair amount of accuracy, but now it was impossible to make up a seed catalogue until a very short time before the seeds came in, as the seed market was so much larger that a shortage in one country made prices fluctuate greatly in all others.

SMITHFIELD CLUB.

DECEMBER 9-13.—Whilst the chief interest in the Smithfield Show at the Royal Agricultural Hall, Islington, centred in the fat beasts, and especially in those exhibited from the Royal farms, there was much of horticultural interest. As usual, Messrs. CARTER & CO., Raynes Park, displayed in a fascinating manner excellent examples of various root and stem vegetables grown from their seeds. Of the several kinds of Onions shown, we were especially interested in the variety Silver Ball, a round, flattish bulb, of good size, mild flavour, and with a skin as silvery as that of the well-known pickling variety. Onion "Carter's Record" should be a splendid exhibition variety; the bulbs were very large, solid, and heavy, and of handsome appearance. The Carrots, Summer Favourite and Red Elephant, were of immense size and vivid colour, but not at all gross. Not the least interesting portion of Messrs. CARTER'S exhibit was a Wardian case containing large numbers of seeds in various stages of germination.

One of the most valuable and instructive features in the stand of Messrs. SUTTON & SONS, Reading, was the glass cases containing specimens of injurious insects and their ravages. Besides the "Flea" beetles, Carrot-root fly, and wireworms, of natural size, and also greatly enlarged, there were examples of the dreaded black scab or wart Potato disease. Of other exhibits by Messrs. SUTTON, the Cyclamen in 48-sized pots bore very large but dainty flowers. Tomatos were firm and brightly coloured; the varieties were Winter Beauty, Princess of Wales, and Sutton's Abundance. Of the various Onions, the colour of the variety Crimson Globe attracted attention. Such garden Carrots as Sutton's Intermediate, although of much more than average size, seemed very ordinary beside the immense roots of the varieties grown for farm use.

Messrs. JOHN K. KING, Coggesball, showed such varieties of Potato as Lord of the Isles, The Dean (a very dark purple), and King Edward VII. The Tomatos Lord Roberts and Day Dawn might well have been grown in

August. Onions and Carrots were also shown in excellent quality.

Messrs. Toogood & Sons, Southampton, included examples of lawn grass with the admirable Gourds, Vegetable Marrows, Tomatos, and Carrots.

Messrs. Fred. Smith & Co., Woodbridge, brought their gold medal exhibit of vegetables from Norwich, and added many bags of garden Pea seeds, and, in Ladysmith, a desirable late kidney Potato. The russet-skinned tubers are of very good shape and are shallow-eyed.

Messrs. E. Webb & Sons, Wordsley, Stourbridge, staged many varieties of Potato, including the varieties New Guardian, Stourbridge Glory, and Empire. The "Champion Prizetaker" Leeks were exceptionally long and very white. Besides immense Ailsa Craig Onions, the white Autumn Mammoth Cauliflowers were splendid.

Mr. Alex. Blatchford, Coventry, showed many excellent samples of Peas (Excelsior, Sherwood, and Fillbasket), Dwarf Beans (Early Prolific), and roots of Beet, Carrots, and other vegetables.

Messrs. Harrison & Sons, Leicester, also exhibited praiseworthy examples of high-quality Leeks, Carrots, Potatos, and Onions.

The various exhibits of Apples and Pears, chiefly of varieties which bear high colour, served to brighten the stands to an acceptable degree. The King's Acre Nursery Co., Hereford, showed such varieties of Apple as Gloria Mundi, Potts's Seedling, Scarlet Costara, and Devon Red, as well as young, vigorous trees ready for planting. Messrs. W. & J. Brown, Peterborough, arranged some very fine fruits and sturdy, well-trained trees, also the new Potato "Vitality," which was said to have been in full leaf as late as September 10. Messrs. W. Horne & Sons, Cliffe, Rochester, also showed trees and fruits of Apples and Pears. The fruits of Apples Lord Derby, Charles Ross, and Annie Elizabeth were excellent. Messrs. W. Seabrook & Sons, Chelmsford, displayed many standard varieties of Apples. Messrs. Dicksons, Ltd., Chester, contributed fruit trees, forest trees, and the flowers of grasses suitable for permanent pastures.

There were more exhibitors solely of Potatos than usual. Messrs. Fidler & Sons, Reading, had a very large assortment, which included almost every variety worth growing. The tubers of Dreadnought, Invincible, and King George V were clean and good, as also were those of the dark-skinned varieties Herd Laddie, Edgecote, and the pink Leda. Mr. A. Findlay, Auchtermuchty, Scotland, made a speciality of his "New Late Kidney." Potatos were also shown by Mr. R. W. Green, Wisbech; Messrs. J. Peed & Sons, Lundin Links, Fife; and Mr. G. R. Sharp, Blackford, Perth. Messrs. E. W. King, Coggeshall, included Carrots and Onions with their Potatos. Mr. T. A. Scarlett, Edinburgh, exhibited bushes and bottled fruits of a new Black Currant "Edina," and "Champion" Brussels Sprouts, as well as many Potato tubers. Messrs. W. Davie & Co., Haddington, Scotland, and Messrs. Little, Ballantyne & Co., Carlisle, also showed Potatos. The latter firm also had especially good fruit and forest trees. Mr. E. H. Taylor, Welwyn, Herts., exhibited an Apple-storing cabinet, bee appliances, and bouquet wire. The British Basket Co., Crownpoint Works, Glasgow, showed many forms of chip baskets. Messrs. Cardon & Gresno, Chancery Lane, London, set up various samples of Chestnut-wood and wire fencing. Mr. John Unite, Edgware Road, London, had quite a shop, showing canvas for tents, plant-protecting and various tying materials. The Four Oaks Company, Sutton Coldfield, demonstrated the value of their pneumatic sprayers and syringes; and Messrs. Marshall & Phelp, Aberdeen, illustrated the handiness of the "Fountain" spraying and limewashing machine. Mr. A. E. Hawker, Mark Lane, London, had on view edible Peas and other seeds treated with Corvusine, which not only protects them from birds and mice, but also assists germination.

Chemical and other manures were shown by "Fisons'," Ipswich, and Messrs. Knights & Mundy, Bermondsey, London.

CONFERENCE ON ORCHIDS.

THE PHYSIOLOGY OF FERTILISATION.*

It has been known for many years that in the majority of plants pollination is essential to seed-formation. The fact is so well established and familiar that pollination, which in strictness denotes the transference of pollen from the stamens to the stigma of a flower, is used sometimes as the equivalent of the term fertilisation.

Nevertheless, as we shall see, pollination is but one of a series of somewhat complicated pro-

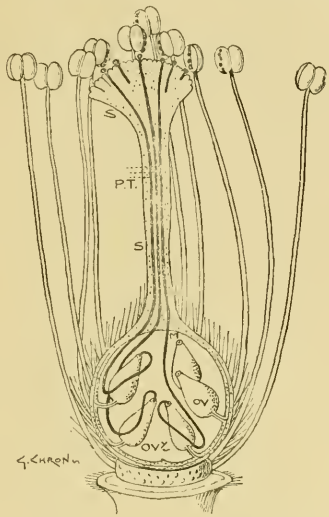

Fig. 197.—Diagrammatic section of flower of Helianthemum marifolium showing pollen tubes.

(P.T.) growing through the style (S), passing into the ovary (OVy) and each reaching the opening (micropyle M) of an ovule (OV), modified (After Kerner & Oliver)

cesses which result ultimately in seed formation. Although the dependence of seed-production on pollination has long been known, the nature of the process which intervenes between these events baffled the curiosity and ingenuity of man until comparatively recent times. Of late years our knowledge of these intervening processes has increased very greatly, and since that knowledge is both interesting in itself and useful in its practical bearings, I propose to sketch in rapid outline the figure of our understanding of the process of fertilisation.

Fig. 198.—Phalænopsis amabilis.

(A column) stigma unpollinated; (B column) 6 days after pollination of stigma; (C column) 6 days after "pollination" with dead pollen; (D) section of column after "pollinating" with cotton wool soaked with pollen extract (After Fitting).

The foundations of our knowledge of the nature of fertilisation were laid a little over three-quarters of a century ago by Amici, who, in 1830, discovered that pollen grains deposited on the stigma send out tubes which pass down the style, enter the ovary and make their way unerringly to the open ends of the ovules (fig. 197). It was not till many years after Amici's time that the real act of fertilisation was observed. Some 40 years ago it was discovered that the pollen tube, after passing through the opening in the coats of an ovule, becomes thin and soft and discharges part of its contents into the ovule.

At the upper end of the ovule lies a minute but definite mass of living substance or protoplasm, which we may describe as the representative of the seed-parent or as the egg-cell. To this egg-cell a similar living mass derived from the pollen tube makes its way, and so representative cells, one of the seed parent and one of the pollen parent, lie close beside one another. Each consists of a denser central body called the nucleus and a more watery envelope of cytoplasm. The two representative cells fuse with one another—nucleus with nucleus and cytoplasm with cytoplasm—and so form a single cell with a single nucleus. This cell, which because of its twofold origin is called the zygote, undergoes growth and division and gives rise to the embryo or plantlet of the seed. The adult plant is derived exclusively from the zygote, which in turn is formed by the union of the two representative cells.

The essentials of this process of fusion are to be observed not in flowering plants only, but also in all but the most rudimentary of the lower plants. These essentials are to be discovered also in animals. Hence we may define fertilisation as the fusion of two representative sexual cells or gametes, and the production therefrom of a single cell, the zygote, which is an incipient individual.

Since the female gamete or egg cell of an ovule does not as a rule form an embryo unless it encounters and fuses with a male gamete, it is evident that this fusion is the essential part of fertilisation and that pollination and the growth of the pollen tubes are but the necessary means to that end. One of the most striking facts which emerge from these discoveries is that both parents make material contributions to the substance of the offspring.

The nuclear contributions appear to be equal in amount and generally similar in kind, but the contributions of cytoplasm made by the two gametes or sexual cells appear to be unequal: the cytoplasm of the egg-cell being considerable, that of the male gamete being smaller in amount and in some cases nil. In the similarity between the nuclei we have the explanation of the well-known fact that, of the many characters exhibited by the offspring, some are derived from one parent, others from the other parent, and others again are intermediate between the paternal and maternal characters. We are not yet, however, in a position to assert that *all* the characters of the offspring are contributed in equal measure by the two parents.

On this subject, however, despite its interest and importance, we cannot dwell now; for we must continue our sketch of the phenomena of fertilisation. Inasmuch as the normal egg-cell does not develop unless it has united with the male gamete, it follows that the latter not only contributes living material toward the upbuilding of the future plant, but that the male cell also provokes or stimulates the egg-cell to grow into the embryo. It might be supposed, and indeed it was supposed until recently, that the growth of the fertilised egg-cell is the direct consequence of the yoking together of the male and female gametes. Just as one horse alone might not be able to draw a cart which two horses may pull easily, so it might be imagined that the female or egg-cell alone is unable to carry on the work of development, which work is easy to the combined forces of the male and female gametes. Recent experiments have shown that this supposition is not correct, and that the development of the egg-cell to form the embryo is due to a definite shock or stimulus which it receives from the male gamete. In terms of our simile, under the powerful stimulus of the whip the single horse may make a supreme effort and set the cart in motion. We are therefore obliged to recognise that fertilisation has a two-fold significance. On the one hand it allows of the formation of an individual which derives materially from the father and the mother and hence may exhibit paternal and maternal characters; on the other hand the male gamete in entering into the egg-cell exerts a stimulus which starts the latter on a course of growth and division resulting in the formation of the embryo.

The evidence in support of the latter conclusion is clear. Thus it has been shown in certain animals and plants that the fertilisation

* Lecture by Frederick Keeble, Sc.D., Professor of Botany, University College, Reading.

stimulus may be imparted to the egg cell artificially and without the aid of the male gamete.

For example, Loeb has demonstrated that, if the egg cells of sea-urchins be taken from the parent and placed in sea water free altogether from male cells, an alteration either of the composition or concentration of the sea water suffices to cause the egg cells to develop into embryos. Nature herself provides us with illustrations of a similar phenomenon in the case of parthenogenetic plants. Species of Hieracium, Alchemilla, Taraxacum, and other plants are known to give rise to good seed even though the egg cells be not fertilised. Similar examples of the parthenogenetic development of eggs into embryos are known among various kinds of animals, and particularly in insects—for instance, in the summer broods of aphides.

In parthenogenetic plants and animals the egg cells carry, as it were, their own stimulus to development; or rather the egg cells of such plants differ from those of the majority of organisms in that they retain the power of development, and are not compelled to await the advent of the male gamete in order to resume their growth. Even more remarkable than the chemical embryos just described are the mechanical embryos which have been produced recently by Bataillon. This experimenter removed the ripe, unfertilised eggs from the frog, punctured each egg by means of a fine glass needle and covered the eggs with water. Of the punctured eggs many died, but out of 1000 which were operated upon no fewer than 120 hatched into tadpoles and actually reached the stage at which the legs are developed and the tail is disappearing.

Astonishing and well-nigh incredible as are these facts they are attested so well that they must be accepted. They are, moreover, susceptible of interpretation in terms of the hypothesis at which we have arrived already. The needle-puncture sets up a disturbance in the egg cell, the effect of which is similar to that exerted by the entrance of the male gamete into the egg cell. In either case, growth and division occur, and the embryo is produced. Needless to say, a tadpole begotten in this manner constitutes a novel and absolute kind of orphan, namely, one that never had a father. It can possess maternal characters only.

Finally, it may be mentioned that Delage and others have succeeded in raising larval animals (Echinoderms) by fertilising egg cells deprived of their nucleus by normal male cells. Such larvæ have nuclear material of paternal origin only, and on current hypothesis they should exhibit paternal characters only.

We are now in a position to state with clearness the significance of fertilisation. By the fusion of the nucleus of the male and female gametes parental characters are transmitted to the offspring; by the entry of the male cell into the egg cell the latter is provoked or stimulated to form the embryo. The stimulation is of a chemical or mechanical nature, and may be brought about by artificial means.

That these conclusions apply also to plants there can be no doubt, and it is by no means improbable that the experimenter of to-morrow may be able to induce plants to develop seed by chemical or mechanical stimulation similar to that which, as we have seen, has proved effective in the lower animals.

It is possible, however, that this experiment has been performed already by Nature herself in the case of Zygopetalum Mackayi.

So far as I know, this Orchid does not produce seed unless it is pollinated. When it is pollinated with the pollen of certain other species, i.e., Odontoglossum crispum, it produces good seed, but to use the words of my friend Mr. O'Brien, the extent of whose knowledge of Orchids is rivalled only by the generosity with which he imparts it, "the progeny still remain Zygopetalum Mackayi, with only sufficient suggestion of a difference in the flowers to prove that the cross has been made. This cross has been made several times with the same result, and other combinations have given rise also to the same progeny." As a contribution to the explanation of this remarkable behaviour, I would offer the following suggestions:—First, that the offspring of the cross Zygopetalum Mackayi by Odontoglossum crispum are pure Zygopetalum Mackayi; second, that the effect of the pollen of the Odontoglossum is that of Bataillon's needle; the pollen or pollen tubes, although they make no material contribution to the egg cell, give the fertilisation-stimulus without which the egg cells of Zygopetalum are unable to develop. Given this stimulus the egg cells develop parthenogenetically. I am willing to admit, however, that the behaviour of this remarkable plant may be yet more subtle than this, but into a discussion of these subtleties this is not the place to enter. The suggestion just offered, that the only part or lot that Odontoglossum crispum has in the fertilisation of Zygopetalum Mackayi is in providing a fertilisation-stimulus, may appear far-fetched to any but those acquainted practically with the ways of Orchids.

Those who work with more torpid, less highly-strung plants may be disposed to ask what justification is there for the suggestion that the pollen of Odontoglossum crispum deposited in the stigmatic surface of Zygopetalum Mackayi may, whilst failing to effect fertilisation, yet act as a stimulus to the parthenogenetic development of the egg cells of that plant.

But the man who works among Orchids will not be disposed to be so sceptical. He is aware of the fact that a fly or even specks of dust settling on the stigma may provoke changes in the flower similar to those which follow on pollination. A striking illustration is provided by the specimens of Odontoglossum crispum, bearing both normal white and canary yellow flowers, which are sent frequently to the *Gardeners' Chronicle* by growers who want to know whether the yellow flowers represent a sport. As is known to experienced Orchidists the latter colour is assumed by the flower as a consequence of pollination. It may also be induced, as the specimens show, by a contact-stimulus set up by dust or grit falling on the stigma. Having in view such facts as these and also their application to the case of Zygopetalum Mackayi, it will, I think, be of interest if I bring this paper to a close by describing the progress of attempts to unravel the several processes which are set going in the floral mechanism as a consequence of pollination.

All gardeners know that pollination does indeed set going a long series of changes in the flower and even in the neighbouring parts of the plant.

It is a well-known fact, for example, that many pollinated flowers wither more rapidly than unpollinated flowers.

So marked, indeed, is the difference between pollinated and unpollinated flowers in this respect, that it is worth while in the case of certain self-fertilised flowers to prevent pollination by the removal of the pistil or stamens.

Again, it is a notorious fact that some seedless fruits, certain Grapes, Currants, &c., do not swell unless they are pollinated. Pollination is useless so far as inducing seed formation is concerned, but it nevertheless fulfils the secondary purpose, in some seedless fruits, of giving rise to a chemical stimulus under which the fruit walls swell and become fleshy or succulent.

These illustrations, which might, of course, be multiplied, serve to demonstrate that pollination, beside bringing about fertilisation, sets up disturbances in the flower, and even in other parts of the plant.

The nature of these disturbances has been investigated recently in Orchids and other plants, and as a result of these investigations, although they leave much unexplained, we know definitely that pollination may bring about three types of events. First, fertilisation, of which we have treated already. Second, changes due to the contact of pollen with the stigmatic surface. Third, results which may be described as intoxications, or responses to chemical stimulation. Illustrations of marked results arising as the consequence of mere contact of the pollen with the stigmatic surface are exhibited by plants such as Mimulus, Orchids, and doubtless many others.

Place a little of its own pollen on the stigma lobes of Mimulus cardinalis, and they begin to close. If more pollen be placed on the lobes they close sooner, and remain closed longer. If much pollen be used in the experiment the lobes remain closed; if only a little be placed on the stigma, the lobes separate after a short time.

Careful experiments by Lutz have shown that the closing movement is due to a contact stimulus. As has been known for a long time, the closing movement of the stigma lobes of Mimulus and similar plants with sensitive stigmas may be brought about by stroking the surface of the stigma with the finger-nail or with a knife.

The cells of the stigmatic surface are in tension, and charged with water. The irritation, either by a load of pollen or by stroking or scratching, brings about a discharge of water from these cells. Those of the upper surface lose more, and contract more, and, shortening, pull the lower surfaces upwards till the lobes meet.

Any pollen, live or dead, will serve to bring about this closure, but unless the pollen used be alive and that of the species itself, the stigma lobes, after a longer or shorter interval, separate once again from one another. That is to say, the shrunk cells re-absorb water, return to their original size, and push the lower surface outward and downward.

But if a good load of pollen of Mimulus cardinalis be put on the stigma of a flower of that plant, the stigma lobes close, and open no more. Here we have an illustration of the second of our three results of pollination, namely, that of intoxication. I do not suggest that the failure to re-open means that the stigma of Mimulus is plunged in a drunken sleep; but that the failure of the lobes to separate is due to the fact that the pollen excretes a poisonous substance which brings about a disorganisation of some of the cells of the stigma, as a result of which they can no longer absorb water, hence cannot press back the appressed lobes. That this explanation is correct is demonstrated by the fact that a watery extract of the pollen suffices to bring about both a closure and a failure to re-open; the former by setting up a contact-stimulus; the latter by poisoning certain of the cells of the stigma, killing them, and thus rendering them incapable of absorbing water.

Toxic actions of this kind would appear to be the key to the explanation of many of the most curious phenomena bearing on pollination. It is well known, for example, that in certain Orchids, Oncidium flexuosum and others, to put the plant's own pollen on the stigmatic surface is to poison it. The flower withers prematurely and fails to set seed (see Darwin's *Annuals and Plants under Domestication*, vol. 2, p. 115).

It is just possible, as suggested by Fitting, that sterility may not infrequently be due to a similar cause, and that it might be worth the while of anyone who wished to obtain seed of a sterile form of Orchid, or other plant, to immerse the pollinia, or pollen, in water or a weak sugar solution for three or four hours, in order to remove the toxic substance before using the pollen for breeding purposes. Again, it appears probable that such a toxic action may be reciprocal; that is, that the stigma may, upon occasion, exercise a poisonous influence on, and so prevent the development of, the pollen. Here, again, artifice may perhaps be used to overcome the difficulty. If the stigmatic surface were wiped clean of its sticky fluid, and if, in place of that fluid, other from the stigma of the pollen parent were smeared on the stigmatic surface, it is possible that subsequent pollination might result in fertilisation. Only experiment can show whether either of these suggested methods would prove of use, and such experiments are for the botanist rather than the grower to carry out.

No plants show better than the Orchids the diverse effects of pollination, and inasmuch as these effects have been analysed carefully by Fitting, they must be described, albeit, briefly.

The chief changes induced by pollination of Orchids are: premature withering of the flower, swelling of the tissues of the column so as to enclose the stigmatic surface, swelling and greening of the ovary, and development of the ovules. Fitting worked with species such as Phalænopsis violacea and P. amabilis, the unpollinated flowers of which, in their native habitat, persist for a month or more. He showed that withering, as I have indicated already, is the result of contact-stimulus. It is induced when not only living, but also dead pollen, or even grains of sand, are placed on the stigmatic surface. Although the withering effect is due also to a contact or wound-stimulus applied to the stigmatic surface, the second consequence of pollination, the arching of the column over the stigmatic surface (fig. 198D), is not. This effect is not induced by sand or other fine particles, although it is produced by the plant's own pollen which has been killed by exposure to steam or chloroform. It is the result of a chemical stimulus or intoxication, as is proved by the fact that a watery extract of the plant's pollen, if put on the stigma, induces the swelling (fig. 198 A, B and C).

Thus a little cotton wool which has been dipped in such an extract, suffices, when placed on the stigma, not only to produce withering by its contact effect, but also to produce the swelling of the column by its chemical effect.

Further, the swelling and greening of the ovary only occur after the pollen-tubes have grown some way down towards the ovary, and these changes are to be attributed to yet another chemical effect produced by substances excreted by the developing pollen tubes.

Such, in brief, are the facts which recent research has brought to light with respect to the significance of fertilisation, and the origin of the accessory effects of pollination. They show in graphic way what a highly organised mechanism is the flower. They indicate that it is attuned to respond in definite manner to different kinds of stimulation, and they prove that many responses on the part of the plant are called forth by definite chemical substances. Although our knowledge is yet too imperfect for it to be of evident service to the Orchid raiser, it is not without promise that it may throw light on the strange phenomena of sterility, and perhaps provide us with means of overcoming that refractoriness. Thus we may anticipate the making of yet more wonderful mongrels than those which now delight the amateur, confound the botanist, and confuse the student of nomenclature.

Mr. O'Brien said he was afraid that in the case of the Zygopetalum he was not in a position to carry the subject much further. As regards the general question of obtaining mature fruits by irritation of the stigmatic surface by means of grit or a similar substance, in the place of pollen, he could give particulars of some interesting experiments which he made some 40 years ago, in one of which fertilisation (proved by the withering of the labellum) took place even without irritation of the stigma. The subject chosen was Miltonia Russelliana, the least showy of the M. Clowesii section; the petals in this variety are thrust forward above the labellum, and guard the column from the approach of insects, unless the invader, in search of food, thrusts the petals aside. Mr. O'Brien said he had found that pushing aside the petals by means of a pencil had the effect of inducing the labellum to wither immediately, although the stigmatic surface had not been touched.

In fact, in this instance, and also in cases where fully-grown fruits were obtained without the use of pollen, there was evidence that the tissues concerned in reproduction acted as though proper fertilisation had taken place, and each function was duly carried out on this assumption, though fertile seeds were not produced.

That false fertilisation may occur also in a wild state was clearly indicated by the late Consul F. C. Lehmann, who, remarking on the comparative paucity of seed-vessels in the best type of Odontoglossum crispum, stated that he had nevertheless occasionally seen small batches laden with fruits, and that these were invariably to be found in exposed situations, where dust and grit were blown about in large quantities by the wind.

With regard to the flower of Phalænopsis, which Professor Keeble had shown with segments withering after fertilisation, this was of the P. Aphrodite section, which has membranous segments. The other section, having waxlike sepals and petals, did not wither, but the colour faded, the flowers becoming green, and in some instances indistinguishable from the foliage. In both cases, the principle was the same; that attractive features, when no longer needed, were dispensed with.

Obituary.

JAMES WATSON. — *Horticulture* records the death of this florist, at Settle, U.S.A. Mr. Watson, who was 77 years of age, was born in England.

WALTER S. NICHOL.—We learn from *The Florists' Exchange* of the death of this nurseryman at Barrington, Rhode Island, on the 12th ult. Mr. Nichol was a native of England, and accompanied his parents, who settled in America when he was five years of age. He was for two years Master of the Patrons of Husbandry and a member of the Rhode Island Agricultural Society.

MARKETS.

COVENT GARDEN, December 11.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—English Apples are arriving in very large quantities. Many of the varieties are keeping badly, and great difficulty is experienced in disposing of them; the varieties Dumelow's Seedling (Wellington) and Bramley's Seedling are exceptions. There are large consignments of Apples from Washington State and British Columbia, the fruits being well graded and attractively packed in boxes. Apples in barrels from Nova Scotia consist of the varieties Fallawater, King of the Pippins and Blenheim Pippin. Varieties from the United States are principally York Imperial and Albemarle, two popular sorts. Supplies of English Pears are finished. Imported Pears consist of the following varieties:—Doyenné du Comice, Winter Nelis, Glou Morceau, Easter Beurré and Keiffer. Oranges from Spain promise well; these fruits are arriving from Jamaica, California (Seedless), and the Canary Islands, whilst there is the small but popular Tangerine variety. English Gros Colman and Black Alicante Grapes are very plentiful indeed; the supply is abnormal for the time of the year. Muscat of Alexandria and Canon Hall Muscat are limited supplies, but there are sufficient bunches to meet the demand. Belgian growers are sending very good samples of Gros Colman Grapes. Teneriffe Tomatos continue to arrive in an excellent condition. Cobnuts and Brazils are dearer, but supplies and prices of other nuts are about the same as last week. Dwarf Madeira Beans received this week are of better quality. Supplies of Beans from the Channel Islands have been fewer during the past week. French vegetables, principally salads, have met with a better demand. Supplies of ordinary vegetables, with the exception of cauliflowers, are much in excess of the demand. Holly and Mistleto are arriving in the market in large quantities. Holly is exceptionally well berried this year. *E. H. K., Covent Garden, December 11, 1912.*

Potatos.

	per cwt. s.d. s.d.		per bag. s.d. s.d.
Bedfords	4 0- 4 6	Dutch	5 6- 6 6
Kents	4 0- 5 0	Belgian	3 6- 3 9
Blacklands ...	3 6- 3 9	German	3 9- 4 9
Lincolns	3 6- 5 0	Dunbars	6 0- 6 6
King Edward ...	4 0- 4 9	Scotch (grey soil)	4 0- 4 9

REMARKS.—Prices are about the same as last week, and trade remains quiet. Large numbers of Potatos are arriving from Holland, Germany and Belgium. *Edward J. Newborn, Covent Garden and St. Pancras, December 11, 1912.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending December 7, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—The conditions were generally very dull and unsettled. Snow fell over all the north-western, northern, and eastern districts early in the week, and subsequently rain was experienced almost daily in Ireland and the west and north-west of Great Britain, and rather frequently in the south and south-east. In the east of Scotland, however, the major portion of the period was dry. Thunder and heavy hail occurred at Bath on the 6th.

The *temperature* was low at the commencement of the period, the thermometer falling to 8° in Scotland E. and England N.W. to 11° in Scotland W. and 15° in Scotland N., and to about 20° in many other districts. In the English Channel, however, the lowest reading was 36°. After the 1st the temperature fluctuated rapidly, but was generally above freezing point except for a time in Scotland. The highest of the maxima, which were recorded at most stations on the 4th, ranged from 57° in England N.W. and over Ireland to 61° in Scotland N. The temperature as a whole was below the average in Scotland and in England N.E., and above it elsewhere. The lowest grass readings were 4° at Worksop, 1° at West Linton and Newton Rigg, 10° at Burnley, Aspatria, and Blackpool, and 11° at Glasgow and Southport. The temperature of the soil at a depth of 1 foot was below the normal at all stations, and was also below it at many stations at a depth of 4 feet.

The *mean temperature of the sea*.—On nearly all parts of the coast the temperature of the sea was below the normal, and in most places it was lower than during the corresponding week of last year. At Plymouth, Scilly, and Seafield the means for the week ranged from between 50° and 51°, but at Cromarty it was only 39°.

The *rainfall* was less than normal in Great Britain, above it in Ireland. On the 3rd as much as 0·9 inch fell at Fort William, followed by 1·7 inch on the 4th.

The *bright sunshine* was less than the average. In Scotland W. and at several stations in the Midlands and north of England there was none. In England N.E. the daily amount was only 0·1 hour, and in England N.E. 0·2 hour. The highest percentage of the possible duration, 17 and 15, occurred in Ireland S. and England S.E.

THE WEATHER IN WEST HERTS.

Week ending December 11.

Six days in succession of the same temperature.—The past week has been warm almost throughout, both during the daytime and at night. For six consecutive days the 1 foot reading in the thermometer screen only varied 1°, from 50° to 51°. On the warmest night the exposed thermometer only fell to 38°, which is 10° higher than the average minimum reading of that thermometer for the month. The ground is now 3° warmer at 4 feet deep, and 4° warmer at 1 foot deep, than is seasonable. Rain has fallen on each of the last six days, but to the total depth of only about half-an inch. During the week 3¼ gallons of rainwater has come through the bare soil percolation gauge, and 3 gallons through that on which short grass is growing. The sun shone on an average for only six minutes a day, which is more than an hour a day short of the mean duration for the same period in December. There were five sunless days, and on the brightest day the sun shone for only 25 minutes. Light airs as a rule prevailed, the direction of those light airs being principally some point between S. and W. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 5 per cent. The last Rose bloom of the year growing in the open ground in my garden was destroyed by rain on the 9th inst., or five days earlier than the average date of its destruction in the previous 27 years, and seven weeks earlier than last year. *E. M., Berkhamsted, December 11, 1912*

ANSWERS TO CORRESPONDENTS.

ANTHURIUM: *J. C. N.* The specimen is a normal inflorescence of Anthurium magnificum, with its long, narrow bract. The plant is usually grown for its large, handsome foliage, and as the inflorescences are unattractive they are usually pinched out when young to give increased vigour to the leaves. From your question "as to when it can be induced to produce its red flowers," we suspect that you have confused the plant with either A. Scherzerianum or A. Andreanum. In any case your plant will not produce any other kind of inflorescence than the one you send us.

BOOK: *C. S. & Co.* The text in the 3rd edition of *Systema Horti-cultural* differs only here and there from the 1st edition, but it includes in addition a short chapter on seasons of sowing, and also the "Gardener's Monthly Directions." There is another edition which includes chapters on "A Catalogue of Seeds, &c.," another of "Housed Greens, &c." "Sold by Mr. George Rickets, Gardener at the Hand in Hogsden without Bishopsgate, London, the Great Collector and Improver of the Beauties of a Garden." Your copy being dilapidated may be worth from 8s. to 10s.

CHRYSANTHEMUMS FOR SOUTH AFRICA: *J. B. K.* You will experience considerable trouble in exporting Chrysanthemums to South Africa, for it may be necessary to first obtain a permit from the Governor or Consul General of the district. Small, hardy, well-established plants will best survive the journey, which occupies three weeks. Practically all varieties do well in that country. Your best plan is to send them through some trade grower who has experience in dispatching plants to that country.

DISEASED CATTLEYA LEAVES: *E. B.* We have been successful in rearing the adult insects from the first specimens which you submitted for examination. The insect is one of the small flea-beetles belonging to the Halticidæ, and is in many ways related to the Turnip flea-beetle Phyllotreta nemorum. Like the latter, it possesses the power of jumping, flying and feigning death. It seems, moreover, to complete the whole of its life cycle within the leaf, so that it is difficult to advise any practical means for its destruction. Insecticides applied to the surface of the leaves would not destroy the insects in the interior without seriously or permanently injuring the plant. Fumigation with hydrocyanic acid gas might possibly destroy the beetles, but the best plan is to burn the infested foliage.

GRAPE VINES: *T. C.* Vines should receive an annual cleansing. Mealy bug, red spider, and thrips are the chief pests of the Grape, and these insects or their eggs may be concealed in the bark whilst the vines are dormant. The pests will increase rapidly when forcing is commenced. If the vines are quite clean you need not remove the outer bark, but as a precaution the rods should be scrubbed thoroughly with a stiff brush.

GRAPES: *J. C.* The shrivelling is not due to the presence of either a fungus or an insect, and must be the outcome of something affecting growth.

HEDYCHIUM HYBRIDS: *Dr. R. F. S., Bombay.* The hybrid Hedychium mentioned in the article on the tropical Water Lily house at Kew (p. 294) cannot be obtained from nurserymen as they are not in commerce. The authorities at Kew often exchange plants; you should therefore write to the Director for small portions of these hybrids, offering something in exchange. You may be able to offer Indian plants in exchange.

LATE DESSERT APPLE: *J. D. C.* Your difficulty in keeping dessert Apples without shrivelling may be due to gathering the fruits before they are perfectly ripe. If you wish to keep dessert Apples until late in the season the fruits should be thinned and the crop allowed to remain on the trees for as long a time as possible. The trees need to be mulched and well watered in summer. The fruit room should not be too dry; it is a good plan to place the fruits on damp bricks. Certain varieties are more liable to shrivel than others. Those you name are amongst the best keepers, but you might try the following sorts:—Sanspareil, Old Winter Nonpareil, March Pippin, Lord Hindlip, King of Tompkins County (this is rather a delicate variety, but it is worthy of a trial), D'Arcy Spice, Allen's Everlasting, and King's Acre Pippin.

LILY OF THE VALLEY UNHEALTHY: *G. M.* No disease is present: the trouble is due to some wrong cultural treatment.

NAMES OF PLANTS: *Burton.* 1, Pseudotsuga Douglasii; 2, Cupressus Lawsoniana; 3, Thuya plicata; 4, Abies Nordmanniana; 5, Picea Alcockiana; 6 and 7, Cupressus Lawsoniana var.; 8, Cedrus atlantica glauca; 9, C. atlantica; 10, Cupressus nootkatensis var. pendula; 11, Juniperus sp., perhaps a form of virginiana; 12, Picea alba; 13, Tsuga Pattoniana; 14, a glaucous form of T. Pattoniana; 15, Cupressus Lawsoniana. [Thanks for donation of 2s. 6d. for R.G.O.F. box.—EDS.]—*W. B.* Ornithogalum lacteum. Sprays are often put on board the mail steamers at Cape Town and arrive in England in fresh condition.—*E. H. M. H.* Impatiens Sultani.—*F. T.* 1, Epidendrum nemorale; 2, Oncidium candidum.—*J. W. W.* Ornithogalum lacteum.

PALM LEAVES WITH BROWN TIPS: *W. B.* The trouble has been caused by some check to the plant. The removal of 12 large leaves may have caused the damage, but brown tips on the leaves are generally the result of improper watering. Two much or two little moisture at the roots results in the leaves dying at the tips. An excess of manure, a dry atmosphere, and cold are contributory causes.

PINES: *J. W. Wilson.* We believe that the spherical objects attached to the leaves of the Pines are the eggs of some kind of spider, but they were crushed, so that we cannot be absolutely certain as to their identity. Place uninjured eggs in a glass vessel plugged with cotton wool, and allow them to hatch.

PRUNING THUYAS: *A. S.* The Thuyas and Retinosporas may be hard pruned at any time during the winter when the weather is mild, but the earlier the work is done the better will be the results.

RASPBERRY CANES: *G. E. G.* The white patches are caused by a destructive fungus, Hendersonia rubi, which also attacks the Loganberry. Spray the plants with Bordeaux mixture twice before the flowers open. Old canes should be removed as soon as possible after the crop is gathered, to prevent the disease spreading to the younger canes.

RETAIL FRUIT, FLOWER AND VEGETABLE BUSINESS: *N. J. F.* The amount of the turnover mentioned in your note is fairly satisfactory for a small business of this kind, provided it is a correct weekly average. If the shop is situated in a good district of the large town you mention, and an examination of the books shows conclusively that a good profit may be made, you might safely embark in the business. Your capital is sufficient seeing that the business is a ready-money concern.

RICHARDIA DYING: *Thanet*: The roots are injured by the fungus Rhizoctinia. Cut off the diseased roots, and repot the plant in soil containing a small quantity of flowers of sulphur.

ROSE SINICA ANEMONE: *C. P.* It is not uncommon to find an occasional flower of this variety late in the autumn, but not such numbers as you describe. The general method of flowering of this Rose is not unlike that of the Multiflora and Wichuraiana varieties, that is the flowers are normally produced on the end of short laterals proceeding from the strong shoots of the previous year. Late in the season one or two buds on these sub-laterals behind the node that has flowered frequently put out fresh growths carrying a few leaves which are evidently potentially flowering shoots, although the majority of them are sterile, or come blind. Now and again one of these shoots from the sub-laterals will carry a bud which is capable of opening if the weather is favourable.

ORANGE-GROWING IN ITALY.

IT is probable that Oranges were imported from the Levant to Italy by the Genoese merchants of the 15th century. The name originates from the Sanskrit "nagrungo," which, in Hindustani, is corrupted into "narungee," in Spanish "naranja," and in Italian "arancia."

The Chinese varieties were imported from the East to Portugal and their colonies, the Azores: the St. Michael Oranges being to this day amongst the sweetest and best that reach the London market.

Cultivated Oranges are derived from two distinct species of Citrus—sweet or China Orange, C. aurantium (sinensis), and bitter Orange or Bigarade, C. amara. The best bitter Oranges come from Seville, but some are also grown in Italy. The trees are smaller than the ordinary sweet Oranges, and have pinkish or white flowers, which appear in the summer; the fruit ripens the following spring. Flowers and fruit are common on the same branch.

The Orange industry in Southern Europe is of comparatively recent times. The ancient Mediterranean agriculturists do not seem to have known the fruit; the later Greeks and Romans had a form of Citron which they called "Median Apple," and which they looked upon as an exotic fruit.

So far back as the year 1200, a bitter Orange tree is said to have been planted in the garden of the monastery of St. Sabina, at Rome, by a friar named St. Dominic, and, following up the old tradition, visitors to the monastery are shown a tree still alive in the garden, supposed to be a direct descendant from the first Orange tree planted by the monk.

Sweet Oranges began to be cultivated in Italy at the beginning of the 16th century, and their numbers increased rapidly, until the Orange trade is now one of the most important industries of southern Italy.

Orange trees can grow wherever the temperature is sufficiently mild and the water supply adequate. For exportation, the fruits are packed when green, just ripe enough to show signs of turning to yellow; they ripen in the cases. The fruits which are gathered ripe from the tree are far superior to those which arrive in England. When gathered, the fruits are sorted according to their size and quality, and packed with Maize husk and leaves; the finest specimens are selected and wrapped singly in tissue paper, on which the name of the grower is printed. At Christmas some of the cases are decorated with silver paper and little picture cards, to make them look as attractive and ornamental as possible.

The Orange grows best on the Sorrento plain, and the sight of the golden fruit among the green leaves against the blue sky and the luminous islands of Capri and Ischia, once seen, can never be forgotten—it is the Garden of the Hesperides redivivus. In autumn the whole panorama of the valley changes; long lines and squares

[Photograph by Argus, Milan (copyright).

FIG. 199.—GATHERING ORANGES IN ITALY.

of yellow straw cover the Orange trees to protect them from frost.

The Oranges are picked in the summertime by girls, who are most careful in selecting them. They wrap them in paper and place them in the boxes, each of which contains from 120 to 160 fruits. Cases of the ordinary fruits may contain 400 and more Oranges.

Labour is still very cheap in Southern Italy, notwithstanding that a rise of 2½d. a day was granted quite recently to the Orange pickers and sorters. The men receive 1.50 lire a day (1s. 3d.), the women from 1 lira to 1.25 lire (from 10d. to 1s.), and children, who are also numerously employed, about 50 centenmi (5d.) a day. They live on vegetables, cheese, fruit and wine principally. The Orange workers are happy folk, and sing constantly whilst in the Orange groves or packing the cases.

There are many varieties of Oranges. The foremost amongst them are the Jaffa, Navel, Silver or Plata, Egg, Sustain, Excelsior, and St. Michael. The most perfect Oranges are those which are large, juicy, pipless, sweet, and thin-skinned.

Stocks are raised from seeds. The seedlings are removed to a nursery-bed plantation and grafted in their seventh or eighth year; they are then planted where they are to grow permanently. The distance from one tree to another varies according to the nature of the soil and the size the plant will reach when fully grown. The soil has to be well fertilised and watered.

Different varieties are cultivated, some for the fruit, others for the flowers or leaves, for every part of the Orange tree is utilised. Bitter Oranges are cultivated for the aromatic quality of the rind, and these are commonly known under the name of "Seville Oranges," though they also grow in Italy and elsewhere. Marmalade is made from the peel of bitter Oranges, also Orange wine, and syrup and tincture for medicinal purposes to disguise the unpleasant taste of certain drugs. Perfumers use the oil of the rind, which can be easily obtained by pressing the fresh peel against a piece of sponge. The liqueur Curacoa is also made from the rind of the Bigarade, and candied peel, so largely used in confectionery. Even the tiny Oranges that drop from the tree, known as "issue-pens," are utilised. They are prepared, when in a fresh state, in a special way, and sold in Italy and France as a sweetmeat.

Orange wood takes a very good polish, and is a favourite material for making cabinets and other small articles. The leaves also are useful. They have a faint scent, which grows stronger when pressed, and taste bitter; they are dried with care and sold to grocers. The leaves are used in a decoction as a soothing tonic, which, if taken in moderate doses, calms nervous excitability. But the leaves must be picked green from the tree; those which fall off are of inferior quality and not efficacious.

Orange flowers are the emblem of maidenhood, on account of their sweet perfume and pure white colour, and they are used in almost all countries for bridal purposes. Apart from this sentimental and ornamental purpose, the Orange flowers are picked and dried, and sold to chemists to be made into an aromatic infusion—Orange-flower-water, obtained by a process of distillation. Oranges were used as pomander or scent balls.

Soon after they were introduced into England, Cavendish describes Cardinal Wolsey entering a crowded chamber "holding in his hand a very fair Orange, whereof the meat or substance within was taken out, and filled up again with the part of a sponge, wherein was vinegar and other confections." A dried Seville Orange, stuffed with Cloves and other spices, was considered a fashionable preventive against infection.

The Orange tree is a very ornamental garden plant. In the 18th century, the "Poma de Orange," which was brought into England from Spain as far back as the year 1290, was plentifully grown in conservatories; now, the best trees for this purpose are usually imported from Italy.

It is impossible to fix the age of the Orange tree. Large trees give thousands of fruits each, and they yield a plentiful crop up to 80 years; Orange trees may live to 100 years, but these are generally of the bitter variety.

The Orange industry in Italy is again regaining some of its former importance. At one time the fruits were exported in large numbers, but the unbusinesslike methods and the sharp practices of the dealers spoilt this otherwise prosperous trade, and Oranges were left to fall off the trees and rot on the ground, as no satisfactory market could be found for them. Now new channels of exportation have been found, and new markets are ready to receive the ever-increasing supply. *E. S. Romero-Todesco.*

FIG. 200.—SORTING AND WRAPPING ORANGES IN ITALY.

FORESTRY.

GROWTH OF THE CORSICAN PINE.

TWENTY-THREE years ago several plantations composed principally of Larch, Scotch, Austrian, and Corsican Pine were formed on the Earl of Derby's estate at Holwood, in Kent. Previous to being planted, the ground had for many years been under Strawberries, and was, therefore, in good condition for bearing a crop of timber.

The partially-sheltered situation and free soil caused a rapid growth of the trees, and the majority, at the age of eight years, were 12 feet high. On examining the same plantation lately, it was found that the Corsican Pines had outstripped the other trees both in point of height and cubic contents of stem, and were on the average about 6 feet taller than their rivals.

Similar results have been obtained on other estates in England and Wales. Hence it would appear that, in exactly similar conditions, the Corsican Pine is of more rapid growth than either the Larch, the Austrian or Scotch Pine. It is an excellent shelter or nurse tree, but the timber produced has not come up to expectation, therefore it is unlikely that, for purely economic purposes, the Corsican Pine will enter largely into the composition of young plantations.

TIMBER FOR CLOG SOLES.

OF late years the demand for timber suitable for clog soles has been on the increase, indicating that this class of footwear is either more in request for special purposes or gaining in popularity. Birch and Alder are the timbers generally in use for the manufacture of clog soles, though fresh, young Sycamore, Willow, Horse Chestnut, and Lime will not be refused in small quantities. The price is from 7d. to 10d. per cubic foot when felled, the buyer generally having the option of roughly converting the timber into soles in or adjoining the woodlands where the trees have been felled. By so doing, the cost of carriage is greatly reduced, all refuse being sold as firewood on the ground. In large manufacturing towns, such as Liverpool and Manchester, the demand for clog soles is greatest; but, indeed, wherever

a damp condition of the floors is brought about by the work in progress the wooden-soled shoes are in demand. Large quantities of clog soles are sent every season from various parts of Wales to the London and provincial markets, where they sell readily, if they are not, indeed, already sold before they leave the woodlands. Forming the clog soles from the log of timber is an interesting and ingenious proceeding that can only be successfully carried out by those who have served an apprenticeship to the work.

First the tree stem is sawn through to the desired lengths, which are split to a little over the thickness of the clog sole required. The finishing process is carried out by means of a knife, one end of which is fastened by a movable pivot to a bench or trestle about 2 feet high, the other being furnished with a handle. The roughly-split clog sole is then deftly shaved down to the required size and shape.

TREES FOR PROFITABLE PLANTING.

Judging from the present prices of, and demand for, certain kinds of timber, the following trees should enter largely into the composition of British woodlands, particularly where the value of the timber produced is a matter of first consideration. The demand for Ash is far greater than the supply; not, however, isolated trees from field and hedgerow, which are usually rough and knotty, but the straight, clean-barked trees from close plantations. The timber of the former is generally short-grained and brittle, while that of plantation growth is supple, long-grained, and well adapted for the more important uses to which Ash timber is applied, such as the making of tool handles and the manufacture of agricultural implements. Where soil and site are suitable, by all means plant the Ash. Regarding the Oak, little need be said as to its value for profitable planting, but it does not come so quickly to maturity as the Ash. The timber is, however, more valuable, and is always in demand.

On chalk or limestone the Beech is an excellent tree, the timber grown on such soils being of superior quality, as instance that throughout the chalky districts of Kent, Hertfordshire, and Buckinghamshire. That produced on the Chiltern Hills is famous for quality, and enters largely into the making of Windsor chairs. Good Beech from well-known districts always command a market at remunerative prices. For damp ground, the white or Huntingdon Willow is by far the most profitable tree to plant, the timber reaching maturity at an early age, and being, probably, the most valuable of any produced in this country. Amongst Coniferous trees, the Larch is the most profitable to plant, and the demand for the timber is greater than the supply.

SUPPORTING HEAVY AND DISEASED BRANCHES.

Unwieldy and heavy limbs are most commonly to be found on isolated trees, or such as have had plenty of room for the perfect development of stem and branch. As the loss of one or more of the larger branches often mars the ornamental appearance of a specimen tree, every reasonable means should be taken to prevent such an accident, as by reducing the weight of the branch by a judicious system of pruning, or supporting heavy and diseased limbs by bands and connecting rods. Not only is a tree stripped of much of its natural beauty by the wrenching away of heavy limbs and branches, but disease is almost sure to follow in the wake of the accident, unless means to obviate such are promptly applied. Even after the most careful examination, diseased and consequently dangerous branches are by no means readily detected, and this points to the necessity for using every available means to prevent the fall of the branches either by judicious pruning, which reduces the weight of foliage, or by timely support.

The lifetime of many trees in London has been greatly prolonged and their natural beauty retained by timely attention in the matter of supporting heavy limbs and branches that were likely to become detached during stormy weather, and as the doing of such work costs but little, there is no reason why the operation should not be greatly extended. There are several methods of giving support to heavy and diseased branches, such as by means of wires, chains, or light iron bands and connecting rods; but in all cases the object is to unite the branches in such a way that they may offer the greatest amount of resistance to the storm and, at the same time, to be neither conspicuous nor clumsy. Chains, though often used, probably owing to their being readily obtainable, are, for various reasons, to be avoided, the flat iron band lined with leather being preferable, more readily adjusted, and less likely to cut into the bark and wood. The bands, which can be made by any blacksmith, are usually 2½ inches wide, and of the shape of the branch to be encircled, each being in two parts for ease in fixing, and to allow of slackening at any future time should necessity demand. The band is made of a larger size than the branch to be encircled, so as to allow of the insertion of a leather collar between it and the wood, the purpose of the leather being to prevent undue friction and chafing of the bark during stormy weather. The bands, whether placed around two opposite branches or the main stem and a branch, are connected together by a light iron rod and three-quarters of an inch in diameter. This rod, like the bands, is divided into two parts, which are connected by a swivel and screw for convenience in loosening or tightening. Great care is necessary in choosing the point at which a band should be placed, and equally as to which branches or branch and stem should be joined together so that the greatest resistance may be obtained, and in order that the one may act as a support to the other. The shape of the tree and disposition of the stem and branches can alone be a guide in this matter.

When compared with a chain, the advantages of this method of supporting heavy branches are principally ease of fixing, greater rigidity, less friction, adaptability for loosening or tightening as may be required, and better results. *A. D. W.*

Fig. 201.—Cypripedium viking; dorsal sepal white, marked with emerald green; lip and petals yellowish, tinged with purple.

(R.H.S. Award of Merit on December 3, 1912.)

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM VIKING.

Our illustration (fig. 201) represents a flower of the new hybrid between C. Buchanianum (Druryi × Spicerianum) and C. illustre (Lathamianum × nitens) for which Lieut.-Col. Sir George L. Holford, K.C.V.O., obtained an Award of Merit at the Royal Horticultural Society's meeting on December 3 last.

It will be seen that the flower shows the thick substance and general form of C. Buchanianum and the influence of C. Druryi obtained through it. The dorsal sepal is pure white with a greenish base, from which ascends a bright violet-purple band and feathered lines. The petals and lip are honey-yellow tinged with red-brown.

LÆLIO-CATTLEYA MYRRHA "ORCHID DENE VARIETY."

This charming and delicately-tinted cross between L.-C. Gottoiana (L. tenebrosa × C. Warneri) and C. Dowiana aurea was shown by E. H. Davidson, Esq., Orchid Dene, Twyford, at the meeting of the Royal Horticultural Society on the 3rd inst. It is a flower of fine shape; the openly-displayed sepals and petals are a primrose-yellow colour, freckled at the tips with rose, the lip being rosy-carmine, with gold veining from the base. The original form between L.-C. Gottoiana and C. Dowiana Rosita was shown by H. S. Goodson, Esq., on November 8, 1910, the cross being originally raised by Messrs. Charlesworth & Co. It is singular that L.-C. Gottoiana, which is not held in much esteem by Orchidists, should produce such finely-shaped hybrids as this and L.-C. St. Gothard.

INDIA.

THE Mango is generally regarded as the finest of all tropical fruits. It is extensively cultivated in India, where ripe Mangos are used for dessert and the green fruits for a variety of other purposes. The delicious Mango chutneys from that country are familiar. There are several varieties of the Mango, and in fig. 202 is shown a tree of the round variety growing in the gardens at Sajjan Niwas, Udaipur. The superintendent, Mr. T. H. Storey, who furnished the photograph, states that most of the fruits weighed 1¼ lb. each.

The illustration in fig. 203 shows a herd of wild pigs on the outskirts of the gardens at the palace of Khas Odi, near to Udaipur. Pigs are the most destructive of all garden and field pests in India, as they root up almost everything, except the prickly Euphorbias (see p. 472). Mr. Storey, who is a Scot, has described Khas Odi as "one of the most beautiful places about Udaipur," with its Scottish hills and lakes, and the only thing wanted is the Heather to give them a homelike appearance.

The photograph of Pontederia cordata (fig. 204) was sent by Mr. C. M. Tembe, superintendent of the State Gardens, Indore, with the following particulars:—The plant is one of the handsomest aquatics in cultivation, combining grace of habit and leaf with beauty of flower. It forms thick tufts of almost arrow-shaped, long-stalked leaves from 1 to 2 feet high, crowned with spikes of lilac-coloured flowers. In India the plant thrives in shallow pools, ponds or tanks, and generally prefers an open, sunny situation, where it grows freely. The spike is 9 inches long, and bears more than a dozen flowers. The flower has six petals, one of which has a purplish-blue eye with a yellow spot in the centre. The blossoms close at sunset, but remain open throughout the day. The colour of the petals in early morning is rosy, turning to lilac as the day advances. The petioles are dilated and hollow. Propagation is easily effected by division at any season in the year. A small portion of the plant thrown into the water at once commences to grow. The plants begin to flower in the rainy season and continue blooming till about the middle of November. It was introduced at Indore about two years ago by Mr. W. Fraser Biscoe, formerly Conservator of Forests of the Indore State. Since then it has become common in all the gardens. The illustration is of a shallow square masonry tank in Lall Bagh, where this species has flowered profusely.

FIG. 202.—TREE OF THE ROUND-FRUITED MANGO IN THE SAJJAN NIWAS GARDENS, UDAIPUR, INDIA.

THE ROSARY.

A FRENCH ROSE BOOK.*

THIS is a most interesting book, and none the less so because it differs markedly from what we in this country are accustomed to expect in a book about Roses. Thus, in the book before us, which comprises some 235 pages, cultivation occupies but two, propagation two more, and pruning a single page. On the other hand, while the authors disclaim any desire to write a technical treatise, considerable space is devoted to an explanation of the botanical terms used in describing Roses, to their differences of colouring, and to a sketch of the botanical species of the Rose and a few of their principal varieties.

The Section des Roses of the French Horticultural Society, under the presidency of Mr. Vilmorin, is responsible for its introduction.

There are many interesting questions connected with the geography of the Rose. Why has it never passed the equator, but is confined in both the old and new worlds to northern latitudes? How is it that the study of fossils has left the history of the Rose practically barren? An impression of a leaf supposed to represent some member of the R. canina group has been found in the south of France, and three or four other fossils have been discovered in Europe and three in America. That is all. From these scanty materials the deduction is made that the Rose possibly came into the northern hemisphere late in the history of evolution, and, judging from the method of distribution of the species, the further suggestion has been hazarded that the Caucasus may have been its place of origin, in which connection we notice that our authors hold that the Rose of Damascus is more likely to have been of Caucasian than, as Lindley thought, of Syrian origin. However that may be, the knowledge of the Rose must have existed in prehistoric times, for we find references to it practically as far back as our literature extends, and Lindley long ago pointed out that the double form must have been known at a very early date, the 60-petalled Rose being referred to by Herodotus and other early Greek writers. Our authors make the interesting suggestion that in Arabian writings and the literature of India and the Far East there is a practically unexplored mine in which the early history of the Rose might yet be traced.

When we remember that after the destruction of the Romans and the Roses they tended, it was the Arabs who kept alive for us the cultivated Rose, until it was brought back to Europe at the time of the Crusades, the suggestion seems to us of considerable value, and worthy the attention of any rosarian who loves, like Borrow, "an Arabic book to study."

The part of the book dealing with the terms used in describing Roses is one of the most elaborate we remember to have seen, for not only are most of the expressions used in botanical descriptions considered and defined, but also those used in connection with horticultural varieties. The order in which these are dealt with is a more or less natural one; the terms used in describing the general appearance of the bush are taken first, then follow the thorns or armature, the leaves and stipules, and finally the floral organs and fruits, many of the principal characters being illustrated by carefully-executed plates. To those who, like the writer, have at times been at a loss in what category to describe the shape of a particular Rose leaf, the plate illustrating the different shapes of leaves should be very useful. In the sketch of the botanical species of Rosa, the classification adopted is that of Crépin (see *Journal* of the R.H.S., vol. xi, p. 217, and vol. xxvii, p. 499), many of the species being illustrated by drawings of the plants inserted in the text, accompanied in each case by an enlarged

* *Les plus belles Roses au début du XXe Siècle.* Société Nationale d'Horticulture de France. Edited by Charles Amat, Paris, 1912.

illustration of the flower. No detailed descriptions are attempted, but the general character of the species is noticed, and many varieties specially suitable for garden cultivation are mentioned.

Some 85 pages are devoted to a catalogue of garden varieties, a similar method of classification to that chosen for the botanical species being followed as far as possible. The whole list must embrace nearly 1,500 varieties, and out of these the 100 Roses which are best, in the authors' opinions, as also the next best 200 varieties, are indicated in the course of the list. The general method of construction of this catalogue is not unlike that adopted by our National Rose Society, but an excellent innovation has been introduced in giving the parentage of each Rose whenever it is known. The division into groups is carried much further than we are accustomed to think necessary in this country; thus we find the Tea-scented Roses divided into four groups—(1) Roses derived from or resembling Safrano, (2) those resembling Comtesse de Labarthe, (3) various Teas not yet classified, and (4) Teas of climbing habit, while the classification of the Hybrid Perpetual is still more elaborate, running to no fewer than 13 divisions or groups, represented by (1) La Reine, (2) Baronne Prevost, (3) Géant de Batailles, (4) Victor Verdier, (5) General Jacqueminot, (6) Jules Margottin, (7) Mme. Récamier, (8) Triomphe de l'Exposition, (9) Mme. Victor Verdier, (10) Charles Lefèbre, (11) Baroness Rothschild, (12) not classified H.P.s, and (13) a short list of climbing varieties. It is curious that no subdivision of the Hybrid Teas has been attempted, although the variations in this group are quite as great as in the H.P.s. The Austrian hybrids, however, are put in a group by themselves under the name Rosa Pernettiana, and are described as "Hybrids de lutea × Hybrid Remontant, type Soleil d'Or." This is perhaps not quite accurate, seeing that most of these varieties have been obtained by crossing Soleil d'Or with Hybrid Teas. We notice one rather curious omission, in that so far as we have been able to discover the Lyon Rose is nowhere referred to in the book, although this Rose was brought out in 1907, and the catalogue seems to include Roses introduced down to the end of 1909. Another omission we notice in the Hybrid Musks; no place is found for The Garland or Mme. d'Arblay, Brunonis being the only Rose mentioned in this section. These Roses are both excellent climbing varieties, but it is, of course, possible that they have failed to become known in France. Nevertheless, the catalogue is full of interest, and should be so in a particular degree to the hybridist and to the student of the Rose.

The last part of the book contains a number of short chapters on different subjects. We have already referred to that on cultivation; in treating of manures we notice the authors recommend generally that an excess of phosphates should be maintained, but that potash should be kept within strict limits, and never added unless the soil is really poor in this constituent, clay soils being generally sufficiently rich in this respect, and they state that excess of potash will not only cause functional trouble, but produce a kind of potassium chlorosis. The use of magnesium is considered of importance, the carbonate to be employed in the preparation of Rose-beds in the proportion of 25 kilos. to the are (100 square metres, or about 119.6 square yards), or approximately ½ lb. to the square yard, while in the case of established plants the sulphate is to be used in the proportion of 100 grams to the are, or about 1-30th ounce to the square yard or an ounce to the pole.

The chapters on pests and diseases are well done and illustrated by pictures of many of the insects and fungi which attack the Rose. Where an attack of the grubs of the cockchafer (white grub) is suspected, the rosarian is advised to plant lettuces among his Roses. The grubs are very fond of Lettuce, and if these plants are found to wither or go yellow they may be pulled up, when the grubs are certain to be found among their roots. We find that French Roses suffer from much the same enemies as do our own. In dealing with the fungal diseases of the Rose, preventive measures by treatment during the winter with sulphate of iron or of copper or Bordeaux mixture seems to be chiefly relied upon. Where there is open country round the Rose garden, this may perhaps be effective, but in this country, where gardens are so often surrounded with hedges and tree belts, we fear this treatment can seldom be completely effectual.

A chapter on hybridising describes with considerable detail the method adopted for artificial fertilisation. If the pollen is not used direct from the flower selected as the male parent, the authors advise the collection of the anthers in small glass tubes before the pollen sacks dehisce, by which means they can, if desired, be kept for eight days or more before the pollen is used. The usual practice is to keep the stigma of the female parent covered in small paper or muslin bags from the time of removal of the anthers, both before and after fertilisation, but our authors consider that once pollination has been effected further protection is not necessary. The final chapters of the book deal with the use of the Rose in the garden in beds or masses, and on trellis and screens, and its employment for decoration in the house. It is very interesting to hear of the methods adopted by our neighbours across the water, but we incline to think some of the advice given, and the use of the rather elaborate structures illustrated in the volume, upon which to train climbing varieties, might produce effects that would be somewhat too stiff and formal to suit the best of our English Rose gardens.

In addition to the plates and illustrations in black and white in the text, many of which are excellent, the book contains a number of coloured chromo-lithograph plates, depicting different varieties of Roses, the pictures showing both the bud and the open flower. Unfortunately, in many cases the flower has been depicted at too advanced a stage to show the Rose in perfection as we regard it in this country. No English judge would look twice at flowers exhibited in this condition, while the attempt to show the colouring of Roses of composite colouring is rather hard and not altogether happy. But we must recognise that the art of illustrating the Rose in colour is yet in its infancy, and, notwithstanding these criticisms, we have perused the work with great interest and much pleasure, and welcome it as a useful addition to the literature of the Rose, and worthy of the eminent rosarians who have been instrumental in producing it.

We recall, with much appreciation of his courtesy, M. Vilmorin's graceful act in presenting to the National Rose Society at their conference in May, 1912, the first copy of this book to reach this country.

(See p. 464.)

NEW ROSES.—V.

(Concluded from p. 448.)

ROSES OF OTHER SECTIONS.

I will add a few words on this subject, and will begin with a pretty little section which owe their introduction, I believe, to Mr. G. L. Paul. These are the dwarf-perpetual Wichuraianas. They seem specially suitable for beds or for the rockery (where I chiefly use them), or for edging. There are several varieties, but the three that have pleased me most are the following:—

Agate (Dwarf Wich., Paul & Son, 1909).—This is a dwarf-growing little plant very constantly in flower. It never seems to grow tall, and carries bunches of yellow flowers, fading to lemon as they age; the plant has very glossy-green foliage.

Iceberg (Dwarf Wich., Paul & Son, 1908), obtained by crossing Jersey Beauty with Nellie Johnstone. This is a rather more erect grower than the last, and has small, snow-white, nicely-formed flowers very constantly produced. The last Sunday in November my plants were covered with buds, many of which will open if they get the chance. The foliage is equally glossy, and good to that of Agate.

Seashell (Dwarf Wich., Paul & Son, 1908).—The buds are a terra-cotta pink, and the flowers white, edged or flamed pink, and nearly single. Though very pretty when in flower, my plant has not been quite so continuously in bloom as the last. Still, the flowers are attractive.

POLYANTHA POMPONS.

JESSIE (Poly. Pom., Merryweather, 1909) has had the good fortune to become more speedily popular than is the lot of most Roses. It is very dwarf, and the flowers are bright rose-crimson when young, and constantly produced when in good soil. If starved it will flower but little. For bedding it is as useful as a Pelargonium. The variety is said to be a sport from Phyllis, but it may be a seedling from that variety.

ORLEANS ROSE (Poly. Pom., Levavasseur, 1909).—I can best describe this as a taller and more robust Mrs. W. H. Cutbush. The colour is much the same, but the bunches of flower are larger and carried on taller and browner stems. It is a useful Rose and a good doer.

TIPTOP (Poly. Pom., Lambert, 1909) is a very dwarf little Rose with well-shaped miniature flowers of a coppery-orange colouring. It makes a useful little plant for edging.

CHINA ROSES.

There are three new China Roses which I have grown, and appear to me worth mention:—

CHARLOTTE KLEMM (China, Turke, 1908).—A cross between Alfred Colomb and Cramoisie Supérieure. I have taken the date from the N.R.S. *Catalogue*, but am not certain that it ought not to be 1906. This is a very fine bedding Rose flowering right on into the autumn, and very effective in a mass. The colour is called fiery red in the catalogues, but this ought to imply a yellow shading such as we get in some of the Tulips, which tone this Rose has not. I should rather describe it as a bright blood-red. The flower is somewhat larger than that of most China Roses, hence its want of good form is more noticeable. For all that, its freedom of flower, brilliant colour, and continuity make it about the best red China for bedding.

LEUCHTFEUER (China, Kiese, 1909), obtained by crossing Grüss an Teplitz with Cramoisie Supérieure. The result has been the production of a flower of very fine colouring, a brilliant scarlet-crimson. Like most of its class, it is of poor shape. Still, it is worth growing for its fine colour. It appears to me to be rather near to President Taft, and, perhaps, the two may ultimately be regarded as synonymous, but I shall hope to compare them more carefully next year.

MDLLE. DE LA VALETTE (China, Schwartz, 1909).—I very early took a fancy to this pretty Rose. It grows nearly as tall as Lamette Messimy, and, perhaps, is in some respects intermediate between this Rose and Mme. Eugène Résal. The colour is a bright coppery-red on yellow ground, giving a general impression of an orange-pink colouring. It is said to have been raised as a cross between Mme. Eugène Résal and Aurore, the latter probably the China Rose of that name brought out by Schwartz in 1897. Altogether no fewer than seven Roses have been christened Aurore. Mdlle. de la Vallette is free flowering and fairly continuous, quite distinct, and a beautiful colour.

HYBRID RUGOSA.

These, unfortunately, do not make the autumnal Rose Apples which are so marked a feature in the typical Rugosa.

DANIEL LESEUER (Rug., Cochet, 1908).—Its parentage is said to be Pierre Notting × Safrano × R. rugosa. It is a very strong grower, making shoots 6 feet to 8 feet in a season. It has in many respects the habit of the Dijon Teas; it is chiefly remarkable as being the first introduction of yellow into the Rugosa. The colour is a buff-yellow tinted old gold; the flowers are large and often pleasing.

HILDENBRANDSEECK (Rug., Lambert, 1909).—A cross between R. rugosa atropurpurea and Frau Karl Druschki. This is another strong-growing Rose; the flowers are a pretty carmine-pink, nearly single, and smaller than one would expect from its parentage. It is fairly continuous till the frosts. *White Rose.*

THE ALPINE GARDEN.

PRIMULA WULFENIANA AT HOME.

THE last and smallest, but not least, of the four royal arthritic Primulas is found far away from P. spectabilis and P. glaucescens, but not much more than 12 hours journey from P. Clusiana. It is also found in gardens with more frequency than its near relations, though it usually lurks concealed under various false or fantastic names. P. Wulfeniana belongs to the small district south of Klagenfurt, in the Karawanken and the Carnic ranges, where in the topmost turf it forms enormous masses exactly as does P. spectabilis by Garda, and P. Clusiana on the high Alps of Styria. Height, indeed, is the one drawback of these plants. Endlessly does one have to toil up forest after forest, over Alp above Alp, until at last, on the highest grassy hog's back of the mountain, the eyes are blest with their sight.

It was not till late August that I set off to trudge up a great limestone peak which is conspicuous from Klagenfurt. In the woodland as I went the Cyclamen was in its richest beauty, a flight of rosy butterflies in the green twilight of the coppice. On open banks Genista repens was passing into seed, and in the very sand of the track was growing a singularly lovely little Campanula, whose name is a sore puzzle to me. The name of C. pusilla has been made, of late years, to cover many names—modesta, cæspitosa, &c.; and C. pusilla we all know well, though it sometimes calls itself Miss Willmott, and sometimes breaks away into cæspitosa. In any case, this plant of the Dolomites, Karawanken and Eastern Alps has a fair, prima-facie right to be called C. cæspitosa (for this is the name locally applied), while it is quite certainly not the same as C. pusilla. It is clearly cæspitose before flowering; it makes a single tap-rooted tuft, a single tuft of shoots, and never spreads. The flower-stems are much taller and finer than those of C. pusilla: they rise to some 8 inches or 12 inches, and spray about with just the same wiry elegance that distinguishes Dierama pulcherrima. The flowers are smaller than those of C. pusilla, longer and narrower in the bell, delicately ribbed, most exquisitely poised, pendent, up the fine stems, and of a blue more deep and misty than that of C. pusilla. It is a very common plant in roadside shingles and arid places, and abounds at much lower elevations than C. pusilla, which, in the Karawanken, at least, appeared to me only to occur at Alpine levels, and not so very commonly at that. Nor did I ever come on any connecting link. The plant, however, struck me as having extraordinary loveliness and charm. Its distribution and character give one no reason to doubt but that it ought to prove a treasure of the easiest temper in our gardens. I have never seen it there yet; a year ago, however, it was sent me as C. cæspitosa.

Higher up, the path ascended interminably through woodland, and it was, as it seemed, many hours before we emerged upon the open promise of an Alp. Then, for the first time, towering up before us in rocky ridge over ridge, into the dense mist that mercifully concealed the remoteness of the summit, did we at last set eyes on the mountain. Up we went, and up, and up, and up until all sense of direction and hope of arrival were lost in the white sea of mist. Rhodothamnus was there, and many other beauties of the high limestones, indeed; but there was a sense of autumn sadness, and all the flowers were gone. Soon the track was zigzagging over slopes of scree, and there we vainly quested for Ranunculus Traunfellneri, which had prudently retreated underground, and there we were indemnified by close and cosy tufts of Androsace villosa, so different from its habit elsewhere, and from the maddening little threads of A. Chamaejasme.

I pass now to the next morning, when we emerged from the hut in which we had slept. Immediately behind the hut rises a grassy slope, towards the undulating rocky arête of the summit. Here and on limestone, it was asseverated and sworn into my unbelieving ears that Eritrichium dwelt. When I protested that I had never, never seen it on limestone, my companion declared that he had never seen it anywhere else. The lucky man; neither then, nor ever, did I see it in those parts. But in the little cliffs lurked Campanula Zoysii, which gave me even greater pleasure. Here, at the end of August, it was still in bud; so when can it flower and seed? (Perhaps, by the way, it was the season's fault, but, despite my expectations, through

FIG. 204.—FONTEDERIA CORDATA IN LALL BAGH STATE GARDENS, INDORE.

(See p. 464.)

late August and September, I only collected some six packets in all of ripe seed.) C. Zoysii was here growing like C. Raineri of the Bergamasque limestonee, in tight, calcareous crevices of the cliffs. But, fortunately, the chinks were not in rock so hard as that insisted on by C. Moretiana in the Dolomites, so that collecting was possible and interesting work. But unnecessary, for C. Zoysii, unlike the others, is so robust-natured a plant that it seeds happily down into sub-Alpine shingle beds, and can there be seen growing by the yard—a happy presage of its superior vigour in our gardens—where nothing could be more exquisite, or look so difficult and exacting, as its delicate little puckered soda-water-bottles of pale, gentle blue. And among other prizes on that cliff I got a pure-yellow form of Saxifraga squarrosa, and a large-flowered variety of beautiful Potentilla Clusiana, a worthy white companion to P. nitida. On the grass slope below the summit Primula Wulfeniana was growing in masses a yard across. It is much smaller, flatter and wider in growth than any of its kin, forming a solid, integral, shining part of the turf, instead of standing out in the huge clumps of P. spectabilis, or in the taller-leaved, sparser colonies of P. Clusiana. It seems seldom to carry more than two or three flowers to a head, though these are produced in generous abundance. Its indestructible vigour is shown by the fact that it is known and grown in our gardens. Among it grows Gentiana alpina, and the much-rarer G. Froelichii, which must form, in flower with the Primula, a really sensational picture. On the shingle screes abound Petrocallis, Thlaspi alpinum, and the unique Alyssum ovirense, a really lovely Alyssum of prostrate habit, with round, silver-white leaves, and large flowers of clear, soft yellow. Then, again, a little higher, on the crest itself, on the underside of each overhanging sod of turf, were huge masses of Saxifraga Burseriana in that tight, small, minor form, so different from the ample splendour it takes in the low, rich levels of the Trent Valley; which leads me to remark, in conclusion, that all catalogues now seem to talk of a S. Burseriana "tridentata," which is an absurd name (for what Burseriana could ever be in any way tridentate?) and an obvious lapsus calami for S. B. *tridentina*—that is, the magnificent great tridentine (of Trent, like the Council) form of S. Burseriana, which dwells in the low-down southern glens of the Dolomites in those parts, which grows twice the size of any other, and which has yielded us, in its time, both Gloria and Magna. This point should be got right. *Reginald Farrer.*

LARDIZABALA BITERNATA.

This climbing evergreen shrub, which is perfectly hardy in the South of England and Ireland, is very suitable for covering walls. The plant was named Lardizabala in honour of M. Lardizalay, a Spanish naturalist, and is a native of Chili. It was introduced to this country by Mr. Geo. Davy, who sent specimens to Messrs. Robt. Veitch & Son, Exeter, where it first flowered in 1849. It was also sent from Valparaiso by Wm. Lobb. The leaves are mostly biternate, but on flowering branches they are sometimes ternate. The flowers, which are borne numerously on drooping stems, are purplish-chocolate in colour.

A fine specimen was recently in full flower at Fota, County Cork, where the plant does remarkably well. It is growing on a north-east wall of the mansion, and the shoots attain to a length of 6 feet to 10 feet in a season. In Chili the fruits are sold, and the tough fibre used for making cordage. Cuttings of half-ripened wood inserted in sandy soil under a bell glass root readily. *A. C. Beswick.*

NOTICES OF BOOKS.

Botany in Belgium During the Last Half-century.*

Such is the title of Professor A. Cogniaux's presidential address to the Royal Botanical Society of Belgium on the occasion of the 50th anniversary of the foundation of the society. Professor Cogniaux, who had only recently recovered from a long and severe illness, was one of the 92 original members who founded the society in 1862, when the first president, Barthélemy du Mortier, discoursed on the services rendered by Belgians to Botany. Professor Cogniaux continues that history down to the present time in a most interesting form. He is one of the six survivors of the founders, and the only one personally well known to the systematists of this country, which he formerly visited regularly in connection with his work on the *Flora Brasiliensis*, &c. At the time of the foundation of the society, the Belgian State possessed no botanic garden, and there was neither botanical library nor herbarium accessible to the public. There were celebrated private horticultural establishments and a Royal Horticultural Society, and, on the dissolution of the latter in 1870, Dumortier overcame all difficulties, and succeeded in founding on its ruins a national botanic garden, but with a very small staff. The death of Von Martius, the founder of the monumental *Flora Brasiliensis*, in the same year, offered an opportunity of acquiring a valuable nucleus of a general herbarium. In spite of the most strenuous opposition, Dumortier succeeded in persuading the Government to purchase the Martins' herbarium, and the garden and smaller herbaria belonging to the moribund horticultural society. The garden, &c., was obtained at the cost of a million francs, and the Martins' herbarium for 32,000 francs. Thus a great opportunity was utilised, and, after a struggling existence, the establishment is now one of the most important in Europe, Professor Cogniaux declares, both as to its herbarium and its library. The former is especially rich in plants from the Congo, and the library is largely supplemented by that of the Botanical Society, which exchanges publications with 286 societies and institutions. A feature of the society's operations is the award of money prizes for botanical work in various branches. This is supplemented by a decennial Government grant of 5,000 francs, gained for the first period by Professor Cogniaux himself.

The historical portion is followed by a review of the principal botanical works published in Belgium or by Belgians, conveniently arranged under subjects. Notable among the publications relating to exotic plants are the *Illustrations of the Congo Flora*, by Durand and De Wildeman. Professor Cogniaux himself has been one of the largest contributors to the *Flora Brasiliensis*, having elaborated the Cucurbitaceæ, the Melastomaceæ, and the Orchidaceæ. The Melastomaceæ fill two folio volumes, comprising 1,066 pages and 238 plates, and the Orchids three volumes of 2,037 pages with 371 plates. Belgium has produced a number of valuable illustrated horticultural journals and serials, such as the *Flore des Serres*, *La Belgique Horticole*, and *L'Illustration Horticole*, the last of which ceased to appear in 1896. The *Revue de l'Horticulture Belge et Etrangère*, founded by Comte O. de Kerchove in 1875, is still running; but the *Iconographie des Orchidées* and other publications illustrating the family, edited by Cogniaux, have ceased to appear. It is evident, however, from this able and spirited address, that both botany and horticulture are flourishing in Belgium as in the past, on which we congratulate the author and his countrymen. *W. Botting Hemsley.*

* *La Botanique en Belgique pendant le Dernier-Demi-siècle*, 1862-1912. Discours prononcé . . . par Alfred Cogniaux, President de la Société Royale de Botanique de Belgique, le 22 Juin, 1912.

Fig. 205.—Lardizabala biternata: flowers purplish-chocolate coloured.

The Small Landholder's Handbook.*

The coming into operation of the Small Landholder's (Scotland) Act appears to have instigated the author to write this handbook. He recommends a combination of agriculture and horticulture for small holdings, to be worked under a system of co-operation. A plan of a 30-acre holding is presented, divided into 20 acres for roots and cereals and ten acres for Apples, Gooseberries, Currants, Raspberries, and Strawberries. Other crops, such as Clover or mixed seeds, Potatos, &c., would also be grown on the agricultural section. Why he has not arranged for the Gooseberries and Currants to be grown among the Apples is not clear. As dairy farming is recommended, a small field of permanent

* *The Small Landowner's Handbook*, by William Williamson. (Edinburgh and Glasgow: Hodge & Co.)

grass would be a great convenience, and this would be useful for a horse or pony and poultry, as well as for the cows. He would, no doubt, vary the horticultural products, according to circumstances, as he gives instructions for growing various culinary vegetable crops, Tomatos, and flowers. Bee-keeping is recommended, partly for its advantage in relation to fruit-setting, and pigs and poultry are supposed to be kept. It is stated in the preliminary remarks that "fruit crops average £50 an acre," as if this were a fact ascertained by statistical returns. No one knows within £10 an acre what the average returns are; but, seeing that on almost every fruit farm some plantations are either not in full profit or past their prime, and that there are seasons of deficient crops occasionally, it may be suggested that half £50 would be nearer the mark as the average gross returns. Detailed criticism of the directions as to fruit-growing would lead to not a few objections to the advice of the author. For example, he recommends the planting of Cobnuts 6 feet apart, instead of the customary 12 feet. Again, he advises growers to plant three-year-old Apple trees, whereas up-to-date growers plant two-year-old or maiden trees, not only in England, but also in the United States and Canada. Worse still, it is suggested that maidens be purchased, and transplanted once or twice in a nursery bed before being planted out a year or two later. The result would be serious dwarfing of the trees. The author presents a very sanguine balance-sheet as an estimate of the expenses and returns of a 30-acre farm, 10 acres of fruit, at £50 per acre, being represented as bringing in £500, and 20 acres of agricultural land, at £9 per acre, £180. The expenses are as low as the returns are high, as they amount to only £241 10s., leaving the handsome balance of nearly £440. The author adds that from this balance must be deducted a wage for the holder and his wife and bonus for the permanent workers, besides interest on capital, rates, taxes, depreciation and for the shortage of income while fruit trees and bushes are young. Surely it is misleading to present such a balance-sheet. Only rent and labour are put on the expenditure side. Not a penny appears for manure, feeding stuffs, tradesmen's bills, rail carriage, or market expenses. *B.*

FOREIGN CORRESPONDENCE.

SELF-STERILITY OF FRUIT TREES.

MR. BACKHOUSE'S interesting communication in the *Gardeners' Chronicle* for November 27, 1912, in reference to the pollination of fruit trees, reminds me that we carried on some extensive experiments along the same lines in the United States a few years ago, and arrived at very much the same results. In general we found self-sterility more common than reported by Mr. Backhouse. Even in cases where varieties are reasonably self-fertile, better crops of fruit and better specimens result when suitable cross-pollination is provided.

Of course, in this country we deal with a much larger range of varieties, drawn from several botanical species, such as the Japanese Plums (Prunus triflora) and the multifarious native American species. All these seem to be distinctly more inclined to self-sterility than the varieties derived from Prunus domestica. The American varieties in particular seem to be practically always self-sterile. At any rate, we have arrived at the conclusion that self-sterility is so common and self-fertility so rare that it is never safe practice to plant solid blocks of one variety of Plum in any orchard. We always recommend alternate rows of different varieties which bloom at the same time. *F. A. Waugh, Amherst, Mass.*

The Week's Work.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

CALANTHE.—Deciduous Calanthes, including C. vestita, C. Veitchii, and their hybrids are opening their flowers. If the plants are removed to an intermediate house the flowers will last for a considerable time in a good condition; as cut blooms they will not fade so soon as when brought from a close, moist atmosphere. After the inflorescences are cut the plants should be allowed a complete rest, placing them on a dry shelf near to the roof glass so that they are well exposed to the light. The temperature should not fall below 60°. Withhold water from the roots until the plants start into growth again in the spring. If space is limited the pseudo-bulbs may be removed from the pots, the soil shaken from the roots, and the plants stored in boxes, placing silver sand around the bases. It is preferable to leave them in the pots, as they then start more freely into growth in the spring. Those of the later-flowering C. Regnieri section, such as C. Stevensii, C. Sanderiana, and their hybrids, should be grown for the present in the warmer house and watered at the roots occasionally. When they have passed out of bloom they should be afforded a similar treatment to the others.

VANDA.—Plants of Vanda teres should be allowed a long season of rest, affording only sufficient water to prevent the stems and tercte leaves from shrivelling. They should be placed in a light position in a house having an intermediate temperature. Plants of V. Hookeriana and the hybrid Agnes Joacquim are still growing actively and should be allowed to remain in their present quarters until growth is completed.

ODONTOGLOSSUM. — O. crispum, O Pescatorei, O. luteo-purpureum, and the many hybrids that were potted in September may be afforded an increased amount of water at the roots in accordance with their requirements. Recently-imported plants of O. crispum should be established as quickly as possible. The decayed bracts at the base of the pseudo-bulbs should be cut away, but care must be taken not to strip the leading growths to such an extent as to expose the dormant buds to injury. Decayed roots should also be removed. Place the plants on the stage in a shady part of the cool Odontoglossum-house on a thin layer of damp Sphagnum-moss, standing them upright. If only a small number they may be arranged in shallow boxes in this manner. They will need very little moisture for some time to come, but the moss should be kept moistened. Continue this treatment until they have made roots, when the plants should be potted. Use a compost similar to that recommended for Odontoglossums in my article of August 31. The pots should be of sufficient size to accommodate the plants for two seasons. Little water will be needed until the roots have grown freely in the compost, but the surroundings should be kept damp by syringing occasionally between the pots. In potting imported plants fix them firmly in the compost without burying the back pseudo-bulbs or dormant buds. This can be accomplished by tying some of the compost beneath the plant before placing it in the pot.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

CORDON FRUIT TREES.—There is no quicker or better plan of furnishing bare spaces on walls caused by the removal of large, trained trees than by planting cordons. This kind of tree has other values; a large number of varieties may be planted for trial in a comparatively small space; they produce fruits of large size and excellent quality, whilst a row planted along the paths of the kitchen garden will increase the attractions of this quarter. Cordon trees are especially valuable for growing in small, walled-in gardens, as they economise space and do not shade the ground much. Young bush and pyramid trees may produce superior fruits, but after, say, ten years, they occupy much valuable space and are best planted in the orchard. Pears should be worked upon the Quince stock; certain varieties also require to be double-grafted and planted at about 2 feet apart. The trees should be set at an angle of 45°. The following varieties of Pears succeed well as cordons: Beurré d'Amanlis, Beurré Hardy, Beurré Superfin, Charles Ernest, Conference, Doyenné du Comice, Dr. Jules Guyot, Durondeau, Emile d'Heyst, Louise Bonne of Jersey, Marguerite Marillat, Marie Benoist, Pitmaston Duchess, President Barabe, and Triomphe de Vienne. Others of almost equal merit might be added to the list. Apples should be worked on the Paradise stock and planted at the same distance apart as Pears. The trees require root-pruning occasionally during the first few years, especially if planted in very rich soil. In northern gardens it is necessary to grow many of the choicer dessert Apples, such as Cox's Orange Pippin and King of Tompkins County, against walls and buildings. The following varieties of Apples are well adapted for growing as cordons: Allington Pippin, Beauty of Bath, Claygate Pearmain, Cox's Orange Pippin, James Grieve, King of the Pippins, King of Tompkins County, Lady Sudeley, Lord Hindlip, Ribston Pippin, Rival, Scarlet Nonpareil and Worcester Pearmain. Such culinary varieties as Beauty of Kent, Duchess of Oldenburg, Emneth Early, Lane's Prince Albert, Norfolk Beauty and The Queen may be grown in small gardens as cordons, but they are more profitable when trained as pyramid or standard trees in orchards. Plums and Cherries may also be grown successfully as cordons, but the trees require careful attention in the matters of pinching and root-prunings.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

HIPPEASTRUM (AMARYLLIS).—Plants of the earliest batch of Amaryllis are developing their flower-spikes, and may be hastened into bloom in a warm house. The roots should be afforded very little water until the flower buds are fairly well advanced, for an excess of moisture may cause the foliage to grow at the expense of the flowers. These early plants will be useful for interspersing amongst forced Narcissi and similar bulbs.

CINERARIA.—The earliest plants are developing their flower heads, and should be afforded plenty of stimulants. If plants are required in bloom very early, a number of the more forward specimens should be placed in a warm house. The tall stellata varieties and those of the dwarf, compact cactus type are useful for conservatory decoration.

ZONAL-LEAVED PELARGONIUMS. — The weather during November was very unfavourable to Pelargoniums, but if the atmosphere of the house has been kept fairly dry, and not too much moisture afforded the roots, the plants should be in good condition. It is not to be expected that the flowers will be so good as those produced in October and November, but in the New Year they will improve in quality, and, if the plants are fed carefully, they will continue to make a good display.

SHOW, FANCY, AND REGAL PELARGONIUMS. —Plants of these sections that were repotted in the autumn should be afforded larger pots as soon as they are well rooted. Certain of the plants may be placed at once into their flowering pots. They grow best in a mixture of good fibrous loam, manure from a spent Mushroom bed, sand and bonemeal; the bonemeal at the rate of a 4½-inch potful to each bushel of loam. It is necessary to pot the plants before they become root-bound, as otherwise much of the foliage may turn yellow before the flowers appear. Young plants rooted during the past summer may require potting; 6-inch pots are quite large enough for the first season, and they will flower in these receptacles.

LACHENALIA. — Plants that are still in cool frames should be taken into the greenhouse and placed near to the roof-glass. As the pots are filled with roots, a little liquid manure, made from cow dung, may be used whenever the plants are watered. It is

not advisable to place the plants in a very warm house, but a batch may, with advantage, be transferred to a house having a night temperature of about 50°. The extra warmth will cause the plants to flower two or three weeks in advance of the others and thus prolong the season.

Mignonette.—Plants raised from seed sown in 3-inch pots during September should be ready for re-potting. A similar compost to that recommended for Pelargoniums will be suitable if a small quantity of lime rubble is added. If there are four or five plants in each pot the growths will not need stopping, but if only one or two plants, the shoots should be pinched as soon as the roots have established themselves in the fresh soil. The plants will grow best in a cool, light position and develop sturdy growth and strong flower-spikes.

Annuals in Pots. — Clarkia, Schizanthus, Godetia, and other annuals sown last autumn for flowering in pots should be re-potted as soon as the roots require increased room. The plants grow fast, and must be placed well apart to avoid overcrowding.

Cyclamen.—The earliest plants are in full flower, but those of later batches are only showing their buds, and should be fed with weak liquid manure as often as they require water, taking care not to wet the foliage or the centres of the plants. Fumigate the greenhouse occasionally to destroy aphis, but see that the plants are quite dry again before doing this, or the edges of the foliage may be damaged. The foliage of Schizanthus is very liable to injury from this cause, and it will be well to take other measures in the case of this plant.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Cucumbers.—A sowing of Cucumbers may be made now, to replace the old plants which are fruiting at this season. Just now the seeds do not germinate very freely, and much care in treatment should be exercised until the seedlings appear above the soil. Loam and leaf-mould employed in equal proportions form a suitable compost, after being passed through a fine sieve and warmed by placing in the house a day or two before use. The seeds should be sown singly in 2½-inch pots, and these latter plunged in a hotbed (the temperature should be about 85°), with a sheet of glass over the top. The hotbed should be placed as near the glass as possible; the seedlings can then remain in the same position until they have formed two or three rough leaves. Encouraged by the hotbed, the roots will grow freely, and the leaves will develop in proportion. As soon as sufficient roots have been formed, the plants should be transferred into 5½-inch pots, and remain on the hotbed until they are ready for planting out. In the meantime, a house should be prepared for their reception, with a well-made hotbed formed of stable litter and leaves. The materials for this bed should first be turned several times at intervals of three or four days to allow the rank gases to escape. A layer of sweet leaf-mould should be placed on the surface of the bed, about 4 inches deep. The bed should be made as near to the roof-glass as possible. The young plants must be placed in mounds of soil consisting chiefly of loam and leaf-mould, at a distance of about 5 feet apart, and the temperature at this stage should not fall below 70°. They should be syringed with tepid rainwater when necessary, and the atmosphere should be kept moist by frequently damping the walls and paths of the house. One of the chief points to be observed in the culture of Cucumbers is cleanliness; probably, if the surroundings of the plants were kept clean, and their roots always well supplied with clean, sweet compost, there would be very little "spot" disease. The old plants may be encouraged to mature their fruits by attention to the regulation of the shoots, careful watering, and the maintenance of an equable temperature.

Tomatos.—Plants which were raised in October should now be ready for transference into 6-inch pots. Root action is not very free at this season, and the compost should be lighter in texture than usual; a mixture of fibrous loam, leaf-mould and manure from a spent Mushroom bed, with a sprinkling of crushed lime-rubble, will answer the purpose. The soil must be warmed before it is used, and it will be advisable not to press it tightly in the pots. The plants should be kept near to the glass, and the glass will need to be kept quite clean. A minimum temperature of 60° will be suitable, except during very cold nights, when it may be allowed to fall 5° lower. The plants which are fruiting may be grown in a temperature of 60° to 65°. The fruits should be exposed to the light as much as possible; the roots may be given an occasional sprinkling of some artificial manure, in order to assist the fruits to swell.

Late Grapes.—If a suitable Grape room is available, all late Grapes should have been cut by this time, so that the vines may receive attention. The roots will probably be in need of thorough watering; if the borders are in a healthy condition, diluted manure-water may be used, after first soaking the border with clear water. The house should then be thrown wide open. If the roots need attention, the work should be carried out.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Onions.—In order that the bulbs may be well ripened by the end of August or September, it is necessary to make an early start. The seeds should be sown either in shallow boxes or large 60 pots, and germinated in a light position in a house having a night temperature of from 50° to 55°. Take care to provide clean pots or boxes, and see that they are drained efficiently, placing a few portions of fibrous loam over the crocks to prevent the finer particles of soil from choking the drainage: if the soil becomes sour through too much moisture the seedlings will not grow satisfactorily. The compost may consist of two parts good loam, one of sweet leaf-mould, and one of manure from a spent Mushroom bed, with sufficient sand to keep the soil open. If the materials are mixed several weeks in advance it will be an advantage. Make the soil in the pots or boxes firm and cover the seeds with a thin layer of fine soil pressed firmly. If boxes are employed, the seedlings must not be grown too thickly, in view of the subsequent transplanting; those in pots should be finally reduced to one plant in the centre. Endeavour to grow the plants sturdy from the commencement, admitting air whenever the conditions are favourable. Water the seeds by means of a fine rose, and keep the surroundings damp by syringing. See that the roof-glass is kept quite clean, so that plenty of light may reach the seedlings.

Leeks.—Leeks required for exhibition purposes may be raised in a similar manner to Onions, except that the sowing may be made a fortnight later. Their requirements during the early stages are practically the same as for Onions, except that I prefer to sow and grow the plants in pots, to avoid much disturbance at the roots when transplanting.

Cauliflowers.—Cauliflowers in cold frames must receive constant attention. Stir the soil between the rows frequently, remove unsatisfactory plants and any leaves that have turned yellow. Guard against slugs. Should frost necessitate covering the frames for a long time, remove the covering in the daytime whenever possible, if only for an hour about noon.

Carrots.—A sowing of Carrots may be made in a heated brick pit during the first week in the New Year. Let the soil be suitably prepared, and, after the Carrots are planted, sow Radishes either between the rows or broadcast over the bed. Damp the frame once or twice daily, and, during very cold weather, cover the glass with some protective material.

Stakes and Labels.—The preparation of stakes for the crops will find employment for the staff during times of inclement weather. At such times, too, labels may be prepared. Nothing adds more to the good appearance of the kitchen garden than neat, well-written labels, but they should not be too small. If the wood is painted with one good coat of white paint, it will only require to be lightly smeared with fresh paint when the names are written.

General Work.—It is time to consider what seeds will be required for the coming season, for the earlier the order is put in hand the better. A few novelties should be tried each year, but when reading the descriptions in the catalogues, remember that soil and other local conditions have much to do with success. Complete, at the earliest opportunity, the work of trenching and manuring, so that the soil may be in the best possible condition for the early crops. When the ground is hard with frost, wheel manure to places where it may be required. As there is not much pressing work in the kitchen garden just now, the sites may be selected for the various crops and labelled temporarily; then, when the time for planting arrives, there need be no delay.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Hedges. — The ground should be prepared thoroughly before planting hedges or windscreens: if the soil is naturally of poor quality it should be enriched with suitable materials at the time of digging. A well-kept hedge is an ornament in the garden and has many uses. There is a wide selection of shrubs, both evergreen and deciduous, suitable for planting as hedges, including many with ornamental flowers. A well-kept hedge of Lavender is rarely passed without comment, and although it is most attractive in summer when furnished with its sweetly-scented flowers, it is pleasing even in mid-winter, when the blue-grey foliage shows up conspicuously. Hedges of Sweet Briar are always charming. In planting this Rose for this special purpose it is necessary to cut the growths back fairly hard for the first season or two, to ensure plenty of growth at the base. A hedge of Sweet Briar soon becomes leggy and bare at the lower part if neglected in this matter. Penzance Briars may also be planted as hedges, but these plants require a strong and substantial support, such as a wooden or light iron fence. A hedge of these Roses requires careful training to keep it in good condition. The old flowering shoots should be removed, at the base if possible, and the young growths trained evenly over the support. The best time to do this work is in the autumn, immediately after the plants have flowered, as the new growths thus get better exposure to sunshine and air. Many of the stronger-growing climbing Roses of the Wichuraiana and Polyantha sections may be used for hedges; they require practically the same treatment as the hybrid Briars. For the first season or two the plants will not need much thinning of the shoots, but when they have numerous branches, old and worn-out shoots should be removed. The ground for Roses should be trenched deeply and well manured. Established hedges should be made tidy and the ground forked lightly; when this work is finished, a heavy mulching of well-decayed manure should be placed over the roots. Hedges of flowering shrubs should not be trimmed severely, and the necessary pruning should be done after the flowers are over. Evergreen hedges are best for density of growth, and of this kind nothing surpasses a well-kept Yew or Holly hedge. These species are sometimes regarded as too slow of growth, but trees may be purchased of sufficient size to make the hedge effective at once.

Lily of the Valley. — There are many shady nooks and corners in the garden where this sweetly-scented flower may be planted. The foliage is not ornamental after mid-summer, and it is best not to select prominent positions in the garden. The Lily of the Valley grows best in a shady situation in cool, damp soil, and may be placed amongst shrubs or under tall deciduous trees, where it will grow well. The present is a good time for planting the crowns: plenty of leaf-mould should be forked into the soil. Established plants should be cleared of weeds and rubbish, and top-dressed with fine leaf-mould, or, failing this, old potting soil.

Solomon's Seal.—This old-fashioned plant is a capital subject for the wild garden or woodland. The rhizomes may be planted at any time during winter. The long, graceful sprays of pale-green foliage are much in request in spring, for use with cut flowers.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

Congress on Plant Pathology.

From the report published in *Le Jardin*, it appears that the subject which gave rise to most discussion at the recent International Congress of Comparative Pathology—held in Paris this year—was that of international co-operation against plant diseases. The subject was introduced by Mr. Louis Dop, vice-president of the International Agricultural Institute of Rome, who presented a report suggesting various resolutions having for their object the establishment of an international agreement for the study of plant pathology, for the publication of information thereon, and for the organisation of a service of inspection of plants destined for export.

The proposals of Mr. Ritzema Bos were similar in scope to those which that distinguished plant pathologist laid before the conference at the recent Horticultural Exhibition at Chelsea.

Mr. Eriksson, of Sweden, put forward suggestions which appear to have been much more revolutionary. He proposed that a certificate of immunity of their plants and seeds from disease should be required of all seedsmen and nurserymen; recommended the institution of a governmental system of inspection, as the results of which certificates should be granted, and, if need be, the foundation of State establishments for the raising of seeds and trees free from disease. In short, as our contemporary puts it, Mr. Eriksson's aspiration would appear to be to socialise plant pathology—and, with it, plant industry.

The proposals of Mr. Eriksson were not rejected by the congress, though it did not pronounce in their favour. Hence, there is no need at present to discuss a policy which is not likely to commend itself to the majority of people in this country.

The practical outcome of the Paris Congress was a decision to request the French Government to convene an international commission at Rome in 1913 in order to examine into international measures for the organisation of means of defence against the maladies of plants, which measures shall be submitted to the general assembly of the Institute of Agriculture. It is of pressing importance that Great Britain shall be represented adequately at the Rome conference. It is, in our opinion, not advisable to confine that representation to officials who may not possess expert knowledge. It is important that we should send from this country the most experienced men that we possess.

It is, moreover, of yet greater importance that the representatives of this country should first ascertain the views of our horticulturists, and should not give their adhesion to extreme proposals. We require undoubtedly a competent staff of inspectors, and we must organise a national system whereby, as the result of inspection of their stocks, certificates of immunity may be granted to our growers or traders. This country is behind others with respect to concerted action bearing on plant pathology, but it will not be wise to attempt to remedy our past laxity by undue precipitation: to make haste slowly must be our aim.

A Candid Opinion.

Horticulturists will read with interest, and without resentment, the candid opinion on their attributes expressed by Mr. Spencer Pickering in the course of an article on horticultural research.* The passage deserves to be quoted in full, in order that we may all profit by the criticism upon us by one of ourselves whose introspection as well as experience enables him to speak with confidence and in general terms of our common failings:

"The scientific worker is rarely open to the accusation of ignoring popular beliefs and traditions, for in many cases it is found that these have a solid substratum of truth; but the well containing this truth is often very deep and requires a deal of clearing out before anything of value is reached. Such beliefs are common with horticulturists, who, as a class, must be reckoned amongst the most conservative of men, ready to adhere to whatever they have been taught in youth, as if it were the accumulated wisdom of ages which no facts or demonstration can upset. With them it is authority, not direct experiment, which must settle disputed points; a man who has grown trees from boyhood, whose father has grown them before him, is a prophet amongst the people, however limited his intelligence may be. Of this spirit of opposition to inquiry and progress, we have, not unnaturally, experienced the full force, for the Woburn Farm directed its attention, in the first place, to investigating the foundations on which horticultural practice in various particulars was laid, and the results in many cases have not been favourable to accepted views."

We are impressed particularly with the profundity of the opening statement that the scientific worker is rarely open to the accusation of ignoring popular beliefs and traditions, and were it not made on the high authority of Mr. Pickering, we should be inclined to suggest (1) that the scientific worker is open to this accusation, and (2) that it is fit and proper—paradoxical as it may seem—for a scientific person to ignore popular beliefs and traditions. We would venture, moreover, to support the former assertion by one or two examples taken from the history of horticultural science. Popular belief among farmers taught that leguminous plants fixed nitrogen, and popular belief maintained this thesis for hundreds of years before science became converted to this way of thinking. Popular belief held that the male parent affected the character of the seed of Maize. Orthodox science was prepared for many years to prove that this could not be. Ultimately science proved that popular belief is right.

Into the defence of the second proposition we need not enter, beyond remarking that it is the business of a science to build itself up on firm foundations, and that though now and then popular belief may give a happy lead for the discovery of new truth, the man of science who allows himself to be distracted from his synthesis of knowledge by following "tips" derived from popular belief will not, as a rule, achieve much.

These, however, are matters on which opinions may differ; there can, on the other hand, be no two opinions as to the opportuneness, the good taste, and the accuracy of Mr. Pickering's comments on the characteristics of horticulturists as a class. Burke maintained that you cannot indite a nation, but Mr. Spencer Pickering proves that he can condemn an international class. Let us hope that, like the fruit trees which Mr. Pickering causes to flourish by ramming their roots, we shall become a worthier class as the result of this treading on our toes.

We are engaged in receiving salutary lessons and not in imparting them; otherwise, we should have drawn the attention of our chastener to the scientific facts that epoch-making discoveries must be supported by overwhelming evidence, and that the wider the departure of the new discovery from established belief the more elaborate and universal must be the evidence which supports it. By this canon both Mr. Pickering and the horticultural class would, we feel sure, wish to stand. How completely Mr. Pickering's discoveries in the planting of trees conform with this canon readers may judge for themselves by perusing the article to which reference has been made and from which we have abstracted not the least interesting of its contents.

* "Science Progress" (No. 26, October, p. 281).

THE CHIEF INSPECTORSHIP (HORTICULTURAL BRANCH OF BOARD OF AGRICULTURE).—We understand from correspondence which we have received that the fixing of 40 as the age limit for applicants for this post has given rise to disappointment among some of the older and otherwise eligible horticulturists. We should advise such men to send in their applications, for we feel confident that, although the Board would wish, if possible, to secure the services of a young man, it will not let the matter of two or three years stand in the way of the election of the best man to this important position.

OUR ALMANAC. — We shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1913. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us* IMMEDIATE INTIMATION *of all fixtures for the coming year.*

PERPETUAL-FLOWERING CARNATION SOCIETY.—The spring show of this society will be held at Leamington on April 10 and 11, 1913. Schedules may be obtained from the Hon. Secretary, Mr. T. A. WESTON, Floradale, Orpington.

THE SECRETARY OF THE BOARD OF AGRICULTURE.—Sir THOMAS ELLIOT, Secretary of the Board of Agriculture, has resigned his appointment and accepted the office of Deputy Master of the Mint. Sir THOMAS served in the Board of Agriculture for many years, and will take with him in his retirement the good wishes of agriculturists and horticulturists.

KEW GARDENERS' SOCIAL EVENING. — The annual social gathering of past and present members of the Kew Gardens staff will be held at the Boat House, Kew, on January 10. The hon. secretary, Mr. G. C. JOHNSON, 2, Watcombe Cottage, Kew, will be pleased to hear, on or before the 6th prox., from those intending to be present.

KEW GARDENS EMPLOYEES' UNION.—Last Friday evening a demonstration organised by the Royal Gardens (Kew) Employees' Union was held in the Parish Hall, Gloucester Road, Kew, to promote the interests of the members, and to urge the Board of Agriculture to improve their working conditions. Two resolutions were carried as follow:—"That this public meeting condemns the Act of the Board of Agriculture in not improving the conditions of employment of those employed in the Royal Gardens, Kew, and urges that immediate attention be paid to their claims, and that this public meeting protests against the manner in which the employees of the Royal Gardens, Kew, are treated under the Health Insurance Act, 1912. The men claim that they are underpaid, in that gardeners are paid 21s. and labourers from 23s. to 24s. a week; that the men employed as constables should have a six-day week, and reasonable hours for meals, and that the deductions for health insurance are excessive.

"THE BOTANICAL MAGAZINE." — The issue for December gives descriptions and illustrations of the following plants:—

PINUS FLEXILIS, tab. 8467.—This rare Conifer is a native of Colorado, and was introduced into cultivation in 1861. Trees in the pinetum at Kew include the largest specimen in the British Isles; it is 33 feet high, and has a girth of 3 feet. The species belongs to the section of Pinus having five leaves in a bundle; distinguishing characters are the entire margins of the leaves, the deciduous leaf sheaths, and glabrous young shoots. Mr. BEAN, who writes the description, recommends the plant for the garden or park, as it is very distinct in appearance. The specimens at Kew are healthy, although the atmosphere and soil are so unfavourable for Conifers.

PRIMULA JULIÆ, tab. 8468.—This pretty Primula was illustrated in *Gardeners' Chronicle*, May 4, 1912, fig. 142, p. 293, from a photograph by Mr. W. IRVING. The flowers are rosy-purple, and bear a close resemblance to some of the coloured Primroses, as, indeed, does the plant generally, save in the smaller leaf-blades.

AKANIA HILLII, tab. 8469.—A specimen of this plant has been grown at Kew since 1872, but never flowered until February of this year. It was received from Mr. LINDEN, a Continental nurseryman, under the name Lomatia Bidwillii, and not until it had flowered was the mistake discovered. The narrow, toothed leaves are from 1 to 2 feet long, and shining on both sides. The inflorescence is an axillary panicle, developed from the old wood, 1 to 1½ feet long, bearing white, sometimes pale-rose, coloured flowers.

LISSOCHILUS ANDERSONII, tab. 8470.—This species is a native of the Gold Coast region. A plant received at Kew from Aburi in 1908 flowered in April, 1910, and furnished the material for the *Botanical Magazine* plate. The flowers are pale sulphur-yellow or greenish-yellow, and about ¾ to 1 inch long. The paler-coloured lip has numerous light purple-coloured ridges. The plant grows best in a stove in a position fully exposed to the sun. It should be potted in a compost of turfy loam, leaf-mould, and sand in equal proportions. During the resting period water should be withheld, and the temperature maintained at from 50° to 60°.

ROSA OMEIENSIS, tab. 8471.—Although this Rose was originally discovered on Mount Omei, Szechuan, about a quarter of a century ago by the Rev. E. FABER, we owe its introduction to this country to Mr. E. H. WILSON, who collected on behalf of Messrs. JAMES VEITCH & SONS. Specimens flowered in the Coombe Wood Nursery of that firm in 1908. It has the same elegant leafage as Rr. sericea, to which species it has certain affinities. The fruits are borne on yellow stalks; this colour and the scarlet of the berries provide a strange contrast. The white flowers are only about 1 inch across.

"THE ORCHID REVIEW."—With its present December issue this useful Orchid journal commences the completion of its twentieth volume, and we take the opportunity to congratulate the editor on the success of his venture, launched in 1893 as an illustrated monthly journal "devoted to Orchidology in all its branches." The original programme has been followed faithfully. Few things relating to Orchidology have escaped attention; each subject has been exhaustively dealt with, and the matter placed before the reader in plain and straightforward language. The history of Orchids and their cultivation from the earliest times, the evolution of Orchids, their structural peculiarities, interesting facts concerning their discovery, the climatic conditions of their native habitats, and other subjects likely to be interesting and useful to the Orchidist, have received attention. Current topics have always been well represented, and the reports of Orchid exhibitions and meetings well reported. We trust that the *Orchid Review*, which attains its majority in the coming year, will continue to flourish for many years to come.

A NEGLECTED GARDEN. — In July last the London County Council decided, as reported in the *Gardeners' Chronicle*, August 17, p. 137, in pursuance of the provisions of the Gardens in Towns (Protection) Act, 1863, to take charge of the garden in Blenheim Crescent and Elgin Crescent, Kensington, with a view to vesting it ultimately in a committee of the rated inhabitants of the surrounding houses for the use of such inhabitants or in the Kensington Royal Borough Council for the use of the public. Sufficient evidence has now been received to enable the County Council to make an order vesting the garden in a committee of the rated inhabitants of the surrounding houses, the effect of which will be to enable the committee to spend upon the maintenance and management of the garden such sums as may be necessary, and to enable and require the Council of the Royal Borough of Kensington to raise such sums by an addition to the general rate assessed upon the occupiers of the houses surrounding the garden.

CAMBRIDGE FORESTRY SCHOOL.—The fifth annual report of the Forestry Committee gives abundant evidence of the progress which is being made by the Forestry School at Cambridge. The training of probationers for the Indian Forest Service began in 1911. Dr. HENRY has continued his experiments in crossing trees. Mr. BURDON has issued a report on his visit to the United States and Canada made for the purpose of studying the methods of research in timber at the experiment stations in those countries. The collections of timbers and of diseases of trees have been extended, and gifts of specimens have been received from America and India, as well as from landowners and others interested in forestry. Certain of the expenses of the department have been met by a grant from the Treasury funds (Development Grant). The forestry building will be begun on the site selected in the Downing grounds as soon as the sum of £5,500 has been collected. Towards the sum, Mr. H. J. ELWES has contributed £1,000, and Mr. DAVID DAVIES, M.P., and Messrs. N. M. ROTHSCHILD & Co. each £500; other donations bringing the building fund up to £4,550. The offer of the Board of Agriculture to grant £500 per annum for advisory work in forestry has been accepted and the district allocated to the Cambridge School for this purpose comprises the 12 counties of Middlesex, Essex, Hertford, Bedford, Northampton, Huntingdon, Cambridge, Suffolk, Norfolk, Rutland, Nottingham, and Lincoln. An Advisor in Forestry will be appointed shortly in order to take charge of this branch of the work. Grants towards the maintenance of the school have been made by the County Councils of Cambridge, Norfolk, and West Suffolk, and ten colleges of the University have also contributed between them a sum of £115.

NEW LONDON PUBLIC GARDEN.—The Parks and Open Spaces Committee of the London County Council have come to a decision with regard to the future of the Rookery estate, which was recently acquired for addition to Streatham Common. It was originally intended to regard the property as an extension of the common and to leave it in its present condition so far as was compatible with public use. The Committee are now satisfied, however, that many of the amenities would be destroyed if the land were included in the common without close supervision during the day and without any supervision at night, and they are of opinion that the most suitable way of dealing with the property is to retain it as an enclosed garden, especially as the Council has no place of the kind within a considerable distance of this district. The grounds are well wooded, and many of the trees, including some beautiful Cedars with overhanging branches within easy reach of children, and the Rose walk also, if not properly protected, might be injuriously affected. A scheme has accordingly been prepared for laying out and enclosing the ground. The scheme includes the formation of paths, the provision of flower-beds, herbaceous borders, the conversion of the present kitchen garden into an Old English garden, the improvement of the existing lawns and terrace, and the erection of certain internal and boundary fencing. The Committee are desirous of preserving the existing amenities as far as possible, and they propose to adapt for the use of the public such portions of the grounds as cannot at present be regarded as possessing any particular value from the ornamental point of view. The total cost of the work involved in the proposal is estimated not to exceed £1000, while the cost of maintenance will not exceed £300 a year. The Finance Committee of the Council, while approving the present proposal, state that when the Council was asked to

purchase the property, the information placed before it was seriously, though no doubt unintentionally, misleading. Instead of a net capital expenditure of £1,275 being the extent of the Council's liability, it now appears that it is necessary to spend a capital sum of about £2,275, followed by a charge for maintenance of £300 a year. It is, in their opinion, very important, from the point of view of financial control, that the Council, when incurring a liability, should be made aware of the full extent thereof, and the Committee state that it is much to be regretted that the question of the utilisation of the property and the cost of its maintenance were not more closely inquired into before the Council was asked to purchase the property.

SALE OF BOOKS.—At a sale of books and manuscripts from the library at Walsingham Abbey, Norfolk, and other sources, held recently at Sotheby's Auction Rooms the following prices were realised :—Agricola's *Philosophical Treatise of Husbandry and Gardening*, translated by R. Bradley, 1721, and Furber's *The Flower Garden Displayed*, 1732, £1 14s.; T. Hale's *Compleat Body of Husbandry*, 1756, and J. Martyn's *Historia Plantarum Rariorum*, 1728, £3; P. Miller's *Figures of the most Beautiful, Useful and Uncommon Plants*, 300 coloured plates, 1760, £4; *The Florist and Pomologist*, 15 vols. in 9, 1863-76, 18s.; Paxton's *Magazine of Botany and Register of Flowering Plants*, vols. i-iv, 1834-8, 12s.; T. Moore's *Floral Magazine: Descriptions of Popular Garden Flowers*, with coloured plates, 1861-71, £4; Henry Andrews' *Botanists' Repository for New and Rare Plants*, in English and Latin, 10 vols., 664 coloured plates, 1797, £13; Seeman's *Flora Viticnsis: Description of the Plants of the Viti or Fiji Islands*, with 100 coloured plates, by W. Fitch, 1865-73, £17 5s.; John Sibthorp's *Flora Græca*, 10 vols., with numerous finely-coloured plates by Sowerby, 1806-40, £200 (Dulau & Co.); *Icones Filicum, or Figures and Descriptions of Ferns*, by Sir W. J. Hooker and R. K. Greville, 240 coloured plates, 1831, £5 5s.; H. J. Elwes' *Monograph of the Genus Lilium*, with coloured illustrations by W. H. Fitch, 1880, £8 10s.; P. F. de Siebold's *Flora Japonica*, 2 vols., 151 coloured plates, 1835, £21 10s.; Oeder's *Flora Danicæ*, 15 vols., coloured plates, 1766-1852, £16; Mrs. E. Bury's *Selection of Hexandrian Plants Belonging to the Natural Orders Amaryllidæ and Liliaceæ*, with coloured plates engraved by R. Havell, atlas folio, 1834, £18; James Sowerby's *English Fungi or Mushrooms*, 3 vols., coloured plates, 1797, £8 10s.; *Monandrian Plants of the Order Scitaminea in the Botanic Garden at Liverpool*, by W. Roscoe, 112 coloured plates, 1828, £5; P. Lawson's *Pinetum Britannicum: Descriptive Account of all Hardy Trees of the Pine Tribe Cultivated in Great Britain*, 3 vols., 1884, £9 10s.; F. Sander's *Reichenbachia: Orchids Illustrated and Described*, 4 vols., 192 coloured plates, in the original parts as issued, one of 100 signed copies, 1886-94, £10 5s.; Lindley and Hutton's *Fossil Flora of Great Britain*, 3 vols., 1831-7, £1 5s.; Sir W. J. Hooker's *Species Filicum: Descriptions of the Known Ferns*, 5 vols., 1846-64, £2 18s.; Sir W. J. Hooker's *A Century of Orchidaceous Plants*, 1849, £5 5s.; J. Conder's *Flowers of Japan and the Art of Floral Arrangement*, with coloured illustrations by Japanese artists, 1892, £1 12s.; *Rhododendrons of Sikkim-Himalaya*, by J. D. Hooker, edited by Sir W. J. Hooker, fine coloured plates, 1849, £2 14s.; J. F. Cathcart's *Illustrations of Himalayan Plants*, with descriptions, &c., by J. D. Hooker, and coloured plates by W. H. Fitch, 1855, £3; J. Bateman's *The Orchidaceæ of Mexico and Guatemala*, coloured plates, atlas folio, 1843, £9 5s.; N. Wallich's *Plantæ Asiaticæ Rariores, or Descriptions and Figures of a Select Number of Unpublished East Indian Plants*, 3 vols., 300 coloured plates, 1830-2 (only 254 copies were issued for the original subscribers), £9 5s.; W. Fitch's *Victoria Regia: Illustrations of the Royal Water Lily*, with descriptions by Sir W. J. Hooker, coloured plates, atlas folio, 1851, 10s.; J. J. Rousseau's *Botanique*, with 75 coloured plates after P. J. Redoute, Paris, 1805, £1 19s.; *Flora Londoniensis*, by W. Curtis, with continuation by W. J. Hooker, 2 vols., coloured plates, 1819, £2 5s.

ALPINE PLANT COMPETITION.—The silver statuette illustrated in fig. 206 is offered by Mr. CLARENCE ELLIOTT for competition amongst amateurs at the meeting of the Royal Horticultural Society on May 14. It will be awarded for the best exhibit of Alpines and rock plants arranged on a rockery measuring 6 feet by 3 feet.

FIG. 206.—TROPHY FOR THE BEST EXHIBIT OF A MODEL ROCK GARDEN.

Details of the competition were published in *Gardeners' Chronicle*, July 27, p. 72. The trophy represents a chamois, and was designed by Mr. ALLAN G. WYON.

THE BEAN THRIPS.—This destructive pest is the subject of bulletin No. 118 (U.S. Department of Agriculture), and although it cannot be said that the author, Mr. H. M. RUSSELL, is able to provide us with any new and thoroughly effective remedy against its attack, nevertheless his account of the life history and distribution of the thrips (Heliothrips fasciatus) contains much that is of practical value. As is well known, the Bean thrip is only too readily recognised by the black colour of its head, body, and antennæ. The adult feeds on the leaves of the Bean and other plants, the females lay their eggs in the leaf tissues, and the larvæ hatched in the leaf emerge and join the mature brood on the surface. A noteworthy point in the habits of the thrips is that after hibernation the adults collect on wild food plants and feed and multiply thereon. Thence the thrips extend to other weeds or to fruit trees, and finally to crops such as the Bean. Among the plants which serve specially as food plants in the wild spring Lettuce (Lactuca scariola), which may be as badly infested as any cultivated plant. The rapid dispersal of the Bean thrips is due to its power of flight and to its habit of leaping to considerable distances. The thrips are long-lived, some which were observed by Mr. RUSSELL living so long as 70 days, and it is probable that the hibernating individuals may persist for no less than five months. This length of life, together with the fecundity of the thrips, suffice to account for the enormous numbers in which they may occur in the summer months. As indicated already, the Bean thrips attack many cultivated plants, orchard trees, e.g., the Pear, and also wild plants, and it cannot be emphasised too strongly that it is the last-named which serve as the main foci whence the thrips are disseminated to the crops. In the United States, Alfalfa, Cotton, and Pears, in addition to Beans, are subject to attack. Of the weeds which serve as nurse plants mention may be made of the wild spring Lettuce, the sow Thistle (Sonchus oleraceus), and species of Chenopodium, Helianthus, Atriplex, Erigeron, Lotus, Bidens, and Verbascum. It is therefore evident that the more weeds are kept under the less will be the danger of the thrips gaining completely the upper hand. Heavy rains also are effective in destroying large numbers of these insects. The thrip has, moreover, many natural enemies in the form of parasites, which doubtless account for the failure of the insect to be a constant scourge to the cultivator. Where spraying is practicable Mr. RUSSELL recommends a mixture made up of one gallon of black-leaf Tobacco, 1 lb. of whale oil soap to 60 gallons of water, or else a 40 per cent. solution of nicotine at the rate of one part to from 1,000-2,000 parts of water.

WILD PIG AND OTHER PESTS IN THE TROPICS (see p. 465).—Respecting the subject of the illustration on p. 465, we have received the following communication from Mr. HUGH F. MACMILLAN, of the Peradeniya Botanic Garden, Ceylon. Mr. MACMILLAN is at present enjoying a holiday in this country. "Wild pigs, like porcupines, are among the most troublesome animal pests of gardens and plantations in some parts of the tropics. They root up and devour bulbous and tuberous plants of every description, and often commit serious damage in a single night, their ravages being usually carried out in the dark or quiet hours. In Ceylon, Southern India, and Malaya, the wild pig has long been regarded by planters as an enemy to reckon with, being especially destructive to root crops. In recent years, however, these ungainly, black, long-bristled creatures have developed a taste for young rubber plants, and, consequently, young rubber plantations have sometimes to be protected by close, barbed-wire fence, or guarded by watchers armed with guns. The wild pig is hunted for sport in the countries above named, and good boar heads are usually preserved as trophies. The porcupine also is a destructive animal, for it resembles the wild pig in its tastes and methods. It is a difficult and dangerous creature to approach, owing to its long, poisonous quills. Poisoned baits and entrapping with spring guns (though the latter are seldom successful) are the usual means of dealing with them. Other enemies of the cultivator in the tropics are flying foxes (large, fruit-eating bats of nocturnal habits), deer, wild cats (which eagerly devour sweet fruits, such as Pineapples and Bananas), bandicoots (large rats), and, lastly, but by no means the least destructive, squirrels. Elephants, buffaloes and other large animals are capable of doing great damage in a very short time, either by pulling up young plants or trampling them down. The snake is rather

the friend than the enemy of the planter, in that it helps materially to maintain the balance of nature by destroying rats and other rodents."

TREES AND SHRUBS.

TREES AT BAYFORDBURY.

A short time ago, by the courtesy of Dr. Henry, I was enabled to accompany his forestry class on an excursion to Mr. H. Clinton-Baker's pinetum at Bayfordbury. Mr. Baker's collection is well known, and his excellent book has done much to further the knowledge of exotic Conifers in this country. It is no exaggeration to say that the Bayfordbury collection, both as regards variety and perfection of growth, is one of the finest to be found in Europe. The first thing which strikes the visitor on approaching the house is a magnificent group of Lebanon Cedars, some of them more or less clean-stemmed, others with several stems, and all of very large dimensions. It is strange that this tree is not more widely tried under forest conditions, for the multitude of fine specimens all over the country shows plainly that it is as much at home in England as in its native land. Much attention is given to trees that have yet to prove their hardiness and value, whilst the familiar Cedars are neglected.

The pinetum is situated on a hill-side, and makes no pretence to park-like effect, the trees growing in bracken and grass, just so far apart as not to interfere with each other. The soil appears to be a deep, sandy loam of moderate quality.

The most striking tree on the estate is a magnificent yellow Pine (Pinus ponderosa), over 100 feet in height, and about 3 feet in diameter at 5 feet from the ground. It is beautifully symmetrical in habit, and about the second largest in the United Kingdom. It is comparatively young, having been planted in 1837. Just near it is a splendid Corsican Pine (P. Laricio), nearly 120 feet in height, and about 3 feet in diameter. This Pine is so well known that its merits need not be discussed in detail here. Its growth in this country is only surpassed by the native trees in Corsica, and the slenderness of its branches tends towards clean timber. It is unfortunate, however, that the timber should take so long to come to maturity, as no heart-wood is produced until a very late age. The eastern and western Hemlock Spruces (Tsuga canadensis and T. Mertensiana) are represented by well-grown and typical examples, clearly demonstrating the bushy growth of the former, and the tall, erect habit of the latter. The western species comes from a country with a climate very like our own, and judging by its growth all over Great Britain, there is no reason to doubt its suitability for extensive planting. There are better timbers, it is true, but given a large and steady production, timber merchants will accustom themselves to it in the same way as those on the Continent have adapted themselves to the use of Silver Fir. Pinus Lambertiana the Sugar Pine, looks happy at Bayfordbury, and has produced a good many cones. In this respect most of the trees there are decidedly prolific, some of them bearing enormous crops. P. Coulteri does not cone readily in this country, but here the huge fruits are to be seen, some of them nearly 6 lbs. in weight, and armed with strong spines.

P. tuberculata and P. muricata, the fire Pines, were covered with old and young cones, which are incapable of opening unless subjected to considerable heat, natural regeneration consequently being dependent upon the occurrence of forest fires. The longevity of the seeds is remarkable, and it was stated that the contents of a cone taken from a branch with 20 annular rings had yielded seeds which germinated readily and produced a high percentage of healthy seedlings.

P. Cembra, the Swiss Stone Pine, although essentially a mountain tree, grows at Bayfordbury with great freedom, one tree being about 70 feet in height, with a dark, almost impenetrable crown. The Weymouth Pine (P. Strobus) is also very fine, but it is doubtful whether this tree will ever be a success in European forests on account of its liability to disease.

Of the Firs, the most striking examples were those of Abies Pinsapo, A. nobilis, A. magnifica (with enormous cones), A. grandis, A. cephalonica, A. numidica, and A. firma, whilst there were beautifully-grown specimens of Picea alba, P. Engelmannii, P. ajanensis, P. cephalonica, P. polita, the rare P. Breweriana, P. Omorica, and P. Morinda. I also noticed a very fine specimen of Tsuga Pattoniana, which, with its elegant glaucous needles, is of high value for decorative purposes. The Japanese Douglas Fir, Pseudotsuga japonica, one of the rarest of trees, was sent to Bayfordbury by Capt. Clinton Baker, R.N., and has proved to be perfectly hardy. It closely resembles the American species, but differs in having slightly bifid needles. It will be interesting to note the development of the Bayfordbury plant, which is, I believe, the only specimen in cultivation in this country. It is said to form a fair-sized tree in Japan and Formosa, but it cannot be compared with P. Douglasii for size. Another interesting tree is a Larch supposed to be a hybrid between Larix europæa and L. leptolepis, with the general habit of the former and the cones of the latter. Two-year-old seedlings from this tree are showing remarkable vigour, several of them being already nearly 5 feet in height. At Dunkeld and Murthly in Perthshire there are trees exhibiting the same peculiarities, and seedlings are exceptionally vigorous.

Beside Conifers there are some fine broad-leaved trees at Bayfordbury, the Oaks being particularly large. The following dimensions are only approximate:—Quercus palustris, 80 feet in height and 2 feet 6 inches in diameter at breast height; Q. rubra, 60 feet by 3 feet; Q. velutina, 80 feet by 2 feet 3 inches; and Q. imbricaria, now unfortunately a mere stump, having been broken off by the wind, diameter 2 feet. The superiority of Q. sessiliflora over Q. pedunculata for dry, light soils is shown by two trees growing side by side, the sessile species having been planted in 1840 and the pedunculate species in 1811. The former is now much the larger of the two, and is better developed in every way, although it is 29 years younger. There are also some very fine Turkey Oaks in the park, and a specimen of Acer campestre about 70 feet by 3 feet, is one of the largest in the country. The same may be said of a plant of Arbutus Menziesii, about 25 feet in height, covered with fruit, and apparently indifferent to the vicissitudes of the English climate.

When it is considered that Bayfordbury is less than 20 miles from London and subject to smoke, fogs, and sudden changes of temperature, the healthiness and vigour of the trees are surprising to those who like to attribute failure to the nearness of the city with its attendant evils. *J. G. Watson, Descanso House, Kew.*

MOMORDICA CHARANTIA

(Coloured Supplement).

One of the most attractive indoor features provided annually at Kew is a collection of tropical gourds in the Water Lily house, where the plants are trained under the roof so that the fruits hang over the path and the large, circular tank in which Water Lilies, Hedychiums, &c., are grown. The grounds are no new feature, for Sir William J. Hooker, when figuring a Momordica in the *Botanical Magazine* in 1859, stated: "One of the tropical stoves at Kew has been rendered very attractive for some years past by the introduction of various cucurbitaceous plants, trained under the rafters and lights. It is a family of plants that has been too much neglected, for they present no small degree of beauty in their flowers, and their fruits are remarkable in their size or form or colour, and often their utility." In how many British gardens to-day are gourds of any kind cultivated as decorative plants? Marrows, Cucumbers and Melons we grow to eat, not to look at; the other members of the family have no charms for the average gardener. We are remarkably neglectful of the ornamental qualities of fruits. A few—Solanum capsicastrum, Mandarin Orange, Egg plants and Capsicums—are about the only pot-plants; Winter Cherry the only hardy herb, and a few shrubs such as Pernettya, Cotoneaster, Pyracantha and Aucuba are grown for their fruits.

Our present concern, however, is with the tropical gourds that are worth growing on this account. They include the snake, club, bottle, wax and towel gourds, which are not merely odd looking, but really attractive.

The Momordicas, one of the commonest being that represented in the coloured supplement, which is from a drawing by Miss Ivy Massee of a plant grown at Kew, are as easy to cultivate as Virginian Creepers, and they fruit very freely. M. Charantia is widely distributed in the tropics of the Old World. It is cultivated in India to cover fences and arbours, and its bitter leaves are used as a substitute for Hops. The fruit, covered with tubercles, is at first green and gherkin-like, afterwards changing to a rich orange-yellow colour and opening as shown in the plate, to display the numerous bright-crimson pulp-covered, prettily-sculptured seeds. The plant requires the same cultural conditions as the Cucumber. M. Balsamina has smooth red ovate fruits about 3 inches long, and M. dioica has similar fruits covered with soft spines. There is a close resemblance between the three species.

A very different species is M. mixta (cochinchinensis), which has comparatively stout, long, angular shoots, large cordate palmately-lobed leaves and campanulate, flannel-like flowers 4 inches wide, cream-yellow, with purple blotches. The flower is quite attractive enough to entitle the plant to a place among handsome-flowered climbers. Male and female flowers are on separate plants, and in 1894, both sexes being in bloom together at Kew, fruits were obtained, one of which was figured in the *Gardeners' Chronicle* (November, 1894, p. 530). They were ovate, 7 inches by 5 inches, covered with short spines and coloured bright crimson, a splendid object.

Mention may here be made of another magnificent cucurbit, Hodgsonia heteroclita, a native of the Himalayas and other parts of India. It appears to be perennial; at any rate there used to be a plant of it at Kew which grew for years in a tropical house, its stems at least 100 feet long, with leathery lobed leaves about 8 inches wide. This plant never flowered, all efforts to make it do so, and many were made, being fruitless (or flowerless), and finally proving fatal. There is a picture of the flowers in Hooker's *Illustrations of Himalayan Plants,* and I commend this picture to those who wish to immortalise themselves by reintroducing and flowering a truly wonderful climber. The genus is near Trichosanthes (Snake Gourd). W. W.

SCOTLAND.

EDINBURGH AND EAST OF SCOTLAND COLLEGE OF AGRICULTURE AND HORTICULTURE.

AT a meeting of the governors of the Edinburgh and East of Scotland College of Agriculture, held on December 11, a letter was read from Mr. A. D. Richardson, secretary of the Scottish Horticultural Association, in which it was suggested that there should be a direct representation of horticulture on the governing body of the college. In reply to a question, it was stated that the Scottish Horticultural Association did not subscribe to the funds of the college, and the chairman, Col. Wardlaw Ramsay, said that the representative could only come in as a co-opted member. The question was adjourned until next meeting.

The Board of Agriculture has intimated its willingness to advance on loan, free from interest, the sum of £1,000 to meet the overdraft incurred through capital expenditure in connection with the Liberton Experimental Garden.

PRESENTATION TO A GARDENER.

MR. T. A. CROSBIE was the recipient of a number of gifts on the occasion of his leaving Aberdeen for Singapore, where he has received an appointment with Messrs. Guthrie & Co., Port Dickson. Mr. Crosbie served his apprenticeship as a seedsman with the firm of Messrs. Smith & Son, Aberdeen, and afterwards obtained an appointment with Messrs. Dobbie & Co., of Edinburgh.

EDINBURGH AFFORESTATION SCHEME.

AT a recent meeting of the Edinburgh and District Water Trust a communication from the Development Commissioners respecting the proposed afforestation scheme for the Talla catchement area was read. Two of the Commissioners had visited the proposed area, and it was stated that they were prepared to take a favourable view of an application by the Water Trust for a loan. It was suggested that the trustees should make a formal application to the Treasury in accordance with the regulations.

The preliminary report by Professor Stebbing favours the planting of Larch, and is to the effect that the Scots Pine is not suitable for the high parts. The total cost of the scheme is £3077.

DESTRUCTION OF TREES BY A HURRICANE.

A SEVERE storm, rising in some districts to a hurricane, caused an immense amount of damage to trees throughout Scotland on the 26th ult. Many trees were destroyed in the public parks of Edinburgh, Glasgow and other towns, but the devastation was much greater in other districts. In the Blairgowrie localities many trees were blown down, and at Arran timber ready for shipment was carried out to sea.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

HYBRID NOMENCLATURE (see p. 453).—Mr. J. O'Brien says that my quotation from the Vienna Rules "implies that the more mixed the parentage the higher the order in their standing as hybrids." It means nothing of the kind. Curiously enough, the Brussels Rules are identical up to the word "designated," and his explanation of the phrase "higher order" as "crosses between species of the same genus" is erroneous. This phrase would indicate primary hybrids, which had been dealt with in a previous sentence. The phrase "higher order" means, as I interpreted it, "more complex," that is to say, hybrids containing three, four, or even five species. A plant is not less a hybrid because other species are brought into the ancestry. And Mr. OBrien should have finished quoting the Rule: "The name, which is subject to the same rules as names of species." He should also have cited the example given: "× Salix Staehleri." The fact is that both testify against him, and confirm the practice of the *Orchid Stud-Book* of two years earlier date. The Latinised names cited by me as given by Mr. O'Brien were not cited as being out of order, but only to show that he has followed the custom which he now denounces as the "root of the evil." They were taken quite at random, but it so happens that one of them is *not* a "primary hybrid," and Mr. O'Brien did not originally say that it was one. Mr. O'Brien "cannot see for what reason ternary hybrids were brought into the question." Let him peruse his original remarks at page 362. It is difficult to know how to describe this style of criticism; in fact, it combines several styles, but I have sufficiently indicated them. A critic of another kind has leapt into the arena. *W. W.* would "mop off" long and ugly names and substitute better in a way that would leave the *Orchid Stud-Book* far behind. He would "blow the conferences and confound the botanists who have helped to make Orchid names what so many of them are." Let us take his nine examples. Three of them

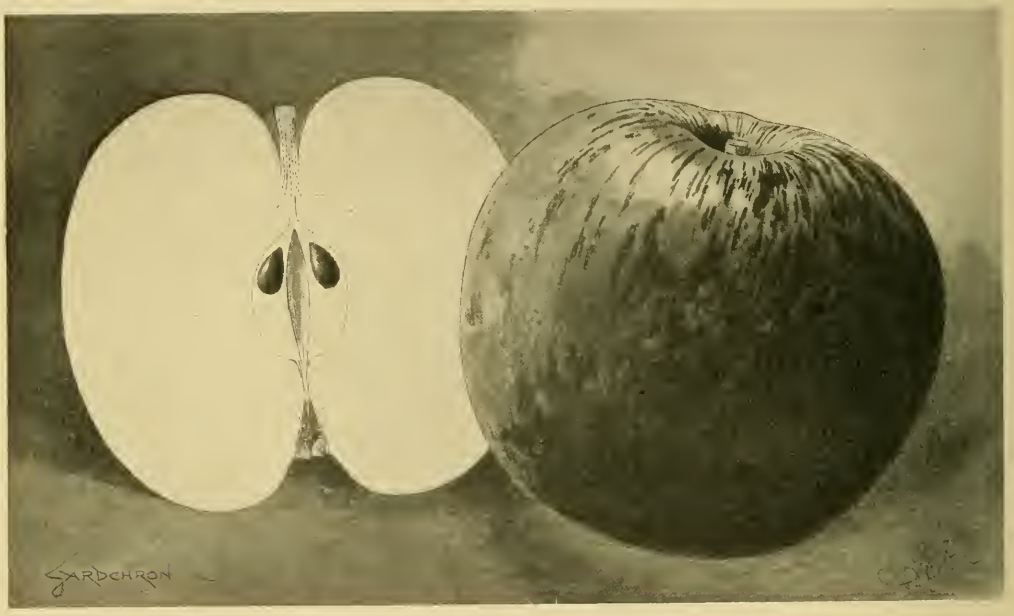

FIG. 207.—CULINARY APPLE CRAWLEY BEAUTY.

APPLE CRAWLEY BEAUTY.

THIS Apple (see fig. 207) is commonly grown in gardens in the neighbourhood of Crawley, Sussex, and it is probably a purely local variety. Specimens were submitted to the Fruit and Vegetable Committee of the Royal Horticultural Society by Messrs. J. Cheal & Sons on December 3, and the Committee granted the variety an Award of Merit. The fruit is of very handsome appearance, being of deep red on the side next to the sun, the other side is also marked with prominent lines of the same colour: it measures 3½ inches in depth and the same in diameter. The stalk is short and deep set; the eye is set in a deep depression, but fairly open. Messrs. Cheal inform us that the tree is a very regular cropper, owing to the blooming period being so late as to escape the spring frosts. The quality is stated to be excellent, and it should rank as a first-rate cooking Apple. The fruits are of very even outline, and there is little waste in paring. They hang very late in the season, and will keep in good condition until February or March.

were given by nurserymen or amateurs, and not one of the others was given by a botanist in the incorrect form in which he cites it. It is true that some are in current use, but only in opposition to rule. Two are not even current in the incorrect form cited. One is purely imaginary, and seems to have been set up for the pure pleasure of knocking it down again. Of course, it may have been mentioned before in a facetious sense. This is the kind of thing that does duty for criticism. *W. W.* would call "Sophro-Lælio-Cattleya Carna and Lælio-Cattleya Golden Oriole var. Ruby"—the incorrect form of the generic name is not mine—"Cattleya Carna and Cattleya Ruby." The fact that they are not Cattleyas at all, and that the latter has already a specific name are points too trivial for consideration. He would give to such hybrids the generic name of the parent it most resembled. His two recommendations would not only give us several different names for seedlings out of the same capsule—Cypripedium aureum over again—but it would even put some in one genus and some in the other. *W. W.* wants to see short names used. He might have cited me as one of the earliest and most consistent advocates of the system—Cattleya Zenobia dates from 1887. I have seldom used any other when personal choice was possible. He is good enough to "sympathise with Mr. Rolfe's defence of the plan adopted in the *Orchid Stud-Book*, notwithstanding his effort to make us swallow Paphiopedilum and Phragmopedilum." Let me tell him that the former was incorporated into two horticultural works—Stein's *Orchideenbuch*, four years, and Count Kerchove's *Livre des Orchidées*, two years—before I used it. I had previously objected to Prof. Pfitzer's union of the Tropical American with the Asiatic Cypripediums in a single genus. Then I stumbled across the generic differences which Lindley over half a century earlier said it was long expected the Indian Lady's Slippers would be found to possess, though searched for in vain. By this time Pfitzer had given a full account of his genus, separating it into two sections, Cœlopedilum (Asiatic) and Phragmopedilum (American). The latter (as involving the least change) I adopted as a separate genus, unfortunately overlooking the fact that Paphiopedilum was originally based on the American species. In the same way Pfitzer was evidently unaware of the fact that for the Asiatic species there was already a valid name, viz., Cordula, of Rafinesque. This name is not mentioned in the *Genera Plantarum*; in fact, the book was practically inaccessible, and it was years before I succeeded in getting sight of a copy. The path of nomenclature is strewn with such obstacles and pitfalls, and perhaps *W. W.* will now extend a little silent sympathy in this direction. *R. A. Rolfe.*

Wart Disease in Potatos.—With reference to my previous letter on this subject, and the contention of Mr. H. C. Long as to the fallacy of arguing from local conditions, let me say that I was quite aware that the county of Fife was affected, but I believe that the disease is, meantime, almost wholly confined to cottagers' plots and gardens. The area affected by disease is, considering the acreage grown in Scotland, a very small one, and although I am in touch with a good many Potato growers, I repeat I have never seen the disease in Scotland. The land under Potato cultivation in this country during the present year, according to the Board of Agriculture returns, was practically 150,000 acres. It is computed by reliable authorities on the subject that the area affected by disease represents about 20 acres in all, or less than .00013 of the whole acreage returned to the Board of Agriculture. But some assert that 10 acres is nearer the area known to be diseased. My contention was that Scotland is, so far, practically free from disease, and I still maintain that it is. Considering the deadly nature of wart disease, judging from the experience of some of the English counties, it will be nothing short of deplorable if it is allowed to spread any further in this country. Mr. Long writes that it may be safely said that drastic steps are being taken towards eradication of the disease in England, but I contend that what has already been done is not sufficient. The Board of Agriculture has a dangerous disease to contend with, and more stringent regulations are necessary if it is to be combated with success. Precautions similar to those adopted in the recent foot and mouth disease outbreak, now happily of only academic interest, seem to be required. Prohibition of culture on land where disease has appeared should be enforced, together with total destruction of all tubers, sound or unsound, in or near the ground affected. Compensation may be necessary, but in consideration of the smallness of the quantity affected at present, this would only mean a moderate figure in comparison to the interests involved. I am writing on this matter only so far as Scotland is concerned. It would be interesting to know how England has fared this year in regard to the disease, and how many fresh cases have been reported to the Board of Agriculture. There is another point. The Board recommends certain varieties for cultivation in disease-infected soil and districts as having the virtue of immunity, or partial immunity, from wart disease. How have these resistant or semi-resistant varieties fared this season? Mr. Long asserts that it is not reasonable to prohibit the importation of foreign Potatos, as they are a necessary foodstuff. I am not prepared to admit that we require to import tubers for any purpose. One well-known authority on Potatos in Scotland has calculated that had America been closed last season (as it now is) to exports of our surplus tubers the results would have been serious to growers in these islands. This gentleman declares that the quantity of ware exported was sufficient to keep our markets, not only in Scotland, but in England, Ireland and Wales, steady at 50s. to 60s. per ton practically during the whole season of 1911-12; and, had there been no export trade, the comparatively small surpluses exported, together with the ordinary supplies, would have kept prices at a figure returning 20s. to 30s. per ton less to the farmers of Great Britain and Ireland on the whole of their ware marketed between December 1 and May 1. Many growers and dealers declare that this is a very conservative estimate, and state that thousands of tons would never have been marketed at all had there been no export business. One of the principal local authorities in Fifeshire has passed a resolution recommending the Board of Agriculture to prohibit the import of foreign Potatos, and I should like to see a similar resolution from every centre in the country. I can give Mr. Long instances of disease imported by foreign tubers if he requires the information, and if he makes inquiry in England regarding the present importations from the Continent he will find that many greengrocers are very chary of handling some of the stock, owing to poor quality. England relies upon Scotland for a large quantity of tubers for seed purposes, and we have an opportunity of keeping a clean, healthy stock if prompt measures are taken by the authorities. *George M. Taylor, Midlothian.*

Tomato Culture.—After years of experience I have found the following method of Tomato culture most successful. My practice is to sow the seeds in shallow boxes, filling the latter to within a quarter of an inch from the top with rough, fibrous loam (without sand, leaf-mould, or any other ingredient). It is simply torn to pieces and packed firmly into the boxes, leaving the surface level to receive the seeds. I have always found that the soil drains itself freely and naturally in this way. The seeds are covered with silver-sand so that they are hidden from view, and no more. This plan hastens germination by allowing air to penetrate to the seeds, and also prevents any disagreeable fungus from forming on the surface of the soil. Excessive evaporation is prevented by covering the boxes with pieces of brown paper, cut the required size. When germination has sufficiently advanced, the brown paper is removed altogether, afterwards placing the boxes near the light. When the seedlings are large enough, they are potted directly into 3-inch pots, using the same turfy loam for potting. From these pots they are planted out on benches, which are 18 inches wide and run round the house. Broken slates or tiles are placed on the wooden slats which form the benches, just enough chopped-up, turfy loam being used to cover the roots of the plants when planting. When the roots show through this, more soil is added, which has had incorporated with it ½ lb. of white, slaked lime to every bushel of soil. As soon as the roots appear through this, repeated small dressings of the latter soil are added, until the mound is 1 foot in depth. After that no more soil is added, the roots being allowed to grow over the front of the benches. I have had them grow so long as to touch the floor beneath the staging. The mound of soil is kept continually moist, and air is admitted freely on all favourable occasions. By this method the flower trusses come very close together on the stem, are very prolific, and my plants have never suffered from disease. *Thos. Francis, Ash Lawn Cottage, Benenden, Kent.*

A JAPANESE IRIS GARDEN.

The illustration in fig. 208 shows a field of Japanese Irises in the Yokohama Nursery Company's establishment, Japan. It is not difficult to imagine what a gorgeous spectacle the vast numbers of flowers must have presented, for the blooms of Iris Kæmpferi range from white through all shades to maroon, deep blue and violet. This species has been cultivated by the Japanese for centuries, and with the Wistaria, Cherry and Willow is reflected in the native art. The tea-house is an appropriate adjunct to a Japanese view, whilst the dress of the Japanese ladies serves to remind us of the figures on the old willow pottery. Iris Kæmpferi grows best in such damp situations as the sides of brooks. At Wisley Gardens in Iris time the Japanese varieties appear as a broad serpentine band of colour, following the course of a little stream that runs through the grounds. In Japan they are often planted in the rice fields. During the season the plants are at rest, from November to March, the ground is manured once a month, but no manure is afforded after the foliage appears.

SOCIETIES.

ROYAL HORTICULTURAL.

December 17.—The last meeting of the Committees of the R.H.S. for the year 1912 took place on Tuesday last at the Society's Hall, Vincent Square. Amongst the Orchids were some very fine novelties, but apart from these there was very little for the Committees to take into consideration.

Floral Committee.

Present: H. B. May, Esq. (in the Chair); Messrs. G. Reuthe, W. Howe, C. R. Fielder, John Dickson, C. Dixon, C. H. Pearson, W. P. Thomson, E. H. Jenkins, G. Gordon, J. F. McLeod, R. Hooper Pearson, E. A. Bowles, John Green, W. J. James, Arthur Turner, and J. Jennings.

The only subject before the Floral Committee was a Perpetual-flowering Carnation, exhibited by Messrs. Stuart Low & Co., Enfield.

Award of Merit.

Perpetual-flowering Carnation Benora.—This is a variety of the Perpetual-flowering type; the flowers are white flaked with red. (See illustration in *Gardeners' Chronicle*, October 19, p. 297.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, Gurney Wilson, Stuart Low, W. Bolton, F. J. Hanbury, H. G. Alexander, A. Dye, A. McBean, T. Armstrong, J. E. Shill, C. H. Curtis, J. Charlesworth, W. H. White, and Sir Harry J. Veitch.

No groups were staged on this occasion, but novelties were submitted for award, and two First-class Certificates, eight Awards of Merit, and one Lindley Medal were awarded, the last-named to Mr. A Dye, gardener to the Right Hon. Lord Rothschild, Tring Park, for a magnificent plant of Phalænopsis intermedia Portei (the original plant grown at Tring Park for over thirty years). (see *Gard. Chron.*, December 14, p. 453, fig. 194). The inflorescence shown had seven branches and numerous flowers, and was one of three developed by the plant.

First-class Certificates.

Cypripedium Demeter (C. F. Moore × Earl of Tankerville), from Lieut.-Col. Sir George L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—In the parentage of this noble Cypripedium C. exul., C. Boxalli, C. niteus (twice), C. Leeanum, and C. Spicerianum are concerned, but their characters are not easy to

trace. The flower is a grand extension of C. Euryades splendens in appearance, and the heavy blotching and good form indicate C. Earl of Tankerville. The large dorsal sepal is white above, emerald-green below, and bears large, claret-coloured blotches, with a ray of smaller rose-purple spots. The broad petals and lip are primrose yellow, heavily tinged with purple.

Sophro-Lælio-Cattleya Thisbe (C. Iris × S.-L. heatonensis), from F. M. OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth).—A very brilliantly-coloured flower of good size, the lip being shaped as in C. Iris. The whole flower is of a deep blood-red colour, the lip being the darker and having a bright crimson hue.

AWARDS OF MERIT.

Cypripedium Sir William Chance (Thompsonii × Memoria Jerninghamiæ), from Francis Wellesley, Esq., Westfield, Woking (gr. Mr. Hopkins).—C. Memoria Jerninghamiæ, still one of the most distinct of Cypripediums, originated at Westfield, and it has transmitted its fine quality in an improved form to the present novelty. The large slightly concave dorsal sepal is snow-white with a broad, pyramidal, branched band of deep claret-purple up the centre from the base. Petals and lip honey-yellow tinged with purple, the median line in the petals being claret colour.

Sophro-Cattleya Westfieldensis (C. labiata × S.-C. eximia), from FRANCIS WELLESLEY, Esq.—A pretty flower with bright-rose coloured sepals and petals and mauve-crimson lip. The plant is of dwarf habit and very floriferous.

Odontoglossum Jasper "Fowler's variety" (crispum Victorio Regina × omabile), from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis).—The finely-grown plant bore a very strong inflorescence, the blooms being of fine shape. The sepals and petals are bright rose colour, blotched on the inner parts with claret-red. Lip white, with a yellow crest and reddish blotches.

Odontoglossum Scintillans "Orchid Dene variety" (Rossii rubescens × Wilckeanum), from E. H. DAVIDSON, Esq., Orchid Dene, Twyford.—Sepals almost covered with dark claret-coloured blotches. Petals white on the inner halves, blotched with claret red, the margins being rosy-lilac. Lip dark rosy-lilac, the disc white with a red blotch.

Odontoglossum eximium J. Lakin (ardentissimum × crispum blotched variety), from E. H. DAVIDSON, Esq.—A grand flower equal to the best blotched forms of O. crispum, which in its good shape it resembles. Flowers white, tinged with purple at the back and closely blotched with reddish violet colour.

Cattleya Tityus (Enid × Octave Doin), from H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day).—In shape a model flower, the broad lip being specially fine. Lip circular in front and crimped; purplish rose with a light yellow disc.

Cypripedium Idina (insigne Harefield Hall × Countess of Carnarvon), from Messrs. JAS. VEITCH & SONS, Chelsea.—The fine flower showed much of the characters of C. insigne Harefield Hall, but the dorsal sepal was shorter and broader and the whole inflorescence more dwarf. The dorsal sepal was white with a cap-green base, from which ascended purple-spotted lines.

Oncidioda cinnabarina (Cochlioda Noezliana × Oncidium monachicum), from Messrs. CHARLESWORTH & Co.—A very singular bigeneric hybrid with a long inflorescence of cinnabar-red flowers, with narrow, stalked sepals and petals and whitish tip to the labellum.

CULTURAL COMMENDATION.

To Mr. W. H. White, Orchid grower to Sir TREVOR LAWRENCE, Bart., K.C.V.O., for a fine specimen of Platyclinis uncata with 68 drooping racemes of small, greenish flowers.

OTHER EXHIBITS.

Sir TREVOR LAWRENCE, Bart., sent Eria Fletcheri, a curious dwarf species with small spherical pseudo-bulbs, many of them bearing a single cream-white flower on a woolly stalk; and Cymbidium gattonense (Tracyanum × Lowianum).

E. H. DAVIDSON, Esq., showed Cattleya Maggie Raphael "Orchid Dene variety" (Trianæ alba × aurea), a good flower with pure white sepals and rose, gold-veined lip, a rather better form than the Orchidhurst variety illustrated in the *Gardeners' Chronicle*, February 3, 1912, p. 75, fig. 35.

CLEMENT MOORE, Esq., Hackensack, New Jersey, U.S.A., showed Cattleya A. Dimmock, evidently a hybrid of C. Lawrenceana, with rose-coloured sepals and petals and purplish-crimson lip.

H. S. GOODSON, Esq., sent four very fine hybrid Odontoglossums.

FRANCIS WELLESLEY, Esq., showed Cypripedium Delhi (insigne Harefield Hall × Earl of Tankerville), a well-marked flower of good shape.

Messrs. CHARLESWORTH & Co. sent Oncidium hybridum (tigrinum × lamelligerum), and Restrepia striata.

FIG. 208.—IRIS KÆMPFERI IN THE YOKOHAMA NURSERY, JAPAN.

(For text see p. 475.)

O. O. WRIGLEY, Esq., Bridge Hall, Bury (gr. Mr. Rogers), showed Cypripedium Mrs. Harry Bruce (Sallieri × Thompsonii), a large flower shaped like C. villosum giganteum. The fine emerald-green dorsal sepal had a narrow white margin and a series of blackish-spotted lines in the centre.

Lieut.-Col. Sir GEO. L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), sent Cypripedium Artemis (nitens × Fairrieanum), a pretty flower of a delicate hue.

Messrs. JAS. VEITCH & SONS showed several pretty hybrid Cypripediums.

Mr. HARRY DIXON, Spencer Park, Wandsworth, showed the yellow Oncidium Jamesonii.

Messrs. STUART LOW & Co., Enfield, showed two extreme forms from a batch between Lælia Iona and Cattleya Dowiana aurea. The one had the sepals and petals pale yellow with purple lip veined with gold; the other was entirely rose coloured with claret veining.

RESOLUTION RESPECTING DISBUDDING.

The inflexible rule against giving an Award to a plant which has had any of its buds removed (sometimes accidentally), or the spike restricted, having been tried for a considerable time and found to interfere with the discretion of the Committee, the Chairman, in conference with the Committee, was asked to draw up a resolution on the subject, and it was moved by Mr. de B. Crawshay, and seconded by Mr. Jas. O'Brien, that Awards will not be recommended for any plants the nature, size, and character of the flowers of which have, in the opinion of the Committee, been in any way changed by the removal of buds or parts of the spike.

This leaves the Award at the discretion of the Committee, who will determine whether the plant show represents the normal character of its flowers.

Fruit and Vegetable Committee.

Present: Joseph Cheal, Esq. (in the Chair); W. Bates, J. Davis, Owen Thomas, C. G. A. Nix, and P. C. M. Veitch.

This committee met, but it did not make any Awards.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 28.—*Committee present:* Z. A. Ward, Esq. (in the Chair); Messrs. R. Ashworth, J. Bamber, J. C. Cowan, J. Cypher, J. Evans, W. Hatcher, W. Holmes, J. Lupton, D. McLeod, W. Morgan, C. Parker, F. K. Sander, H. Thorp, A. Warburton, and H. Arthur (secretary).

A Silver-gilt Medal was awarded to R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), for a meritorious group.

Large Silver Medals to Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), for a nice group, principally Cypripediums; Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), for a mixed group; and A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), for a group of Cypripediums.

Silver Medals to J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes); S. GRATRIX, Esq., Whalley Range (gr. Mr. Brown); A. E. PENNY, Esq., Preston (gr. Mr. Sumner); and Messrs. J. CYPHER & SONS, Cheltenham, for miscellaneous groups.

Large Bronze Medal to Rev. J. CROMBLEHOLME, Clayton-le-Moors, for a small group.

Other exhibitors included O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers); W. R. LEE, Esq., Heywood (gr. Mr. Branch); WM. THOM, Junr., Esq., Blackburn (gr. Mr. A. E. Stratford); W. J. HARGREAVES, Esq., Burnley; F. A. HINDLEY, Esq., Bradford; Messrs. SANDER & SONS; Messrs. A. J. KEELING & SONS; and Messrs. STUART LOW & Co., Enfield.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cypripedium Maudiæ, variety John Martendale Gratrix.—A large, handsome flower, of brilliant colour, from S. GRATRIX, Esq.

AWARDS OF MERIT.

C. Mary Gratrix (Æson giganteum × Leeanum Corona).—From S. GRATRIX, Esq.

C. Draco (insigne × Euryades) and *Odontoglossum crispum variety Bulgar.*—From Z. A. WARD, *Esq.*

C. Strelsa (Alcibiodes × Harefield Hall).—From W. R. LEE, Esq.

C. Bulgar (Parkerianum × Harefield Hall).—From WM. THOM, Junr., Esq.

Lycaste cruenta.—From A. J. KEELING & SONS.

BOTANICAL CERTIFICATE.

Eria (species unknown).—From A. J. KEELING & SONS.

DECEMBER 5.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Bamber, J. Cypher, A. Hanmer, W. Holmes, J. Lupton, D. McLeod, C. Parker, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

A Gold Medal was awarded to O. O. WRIGLEY, Esq., Bury (gr. Mr. E. Rogers), for the meritorious group exhibited at the previous meeting.

Large Silver Medals to A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), for a mixed group; Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), for a group of Odontoglossums; R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), who staged a miscellaneous group; S. GRATRIX, Esq., Whalley Range (gr. Mr. Brown), for a collection of choice Cypripediums; Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), for a mixed group; and Messrs. J. CYPHER & SONS, Cheltenham.

Silver Medal to J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), for a group of Cattleyas.

Bronze Medals to G. H. PEACE, Esq., Monton Grange (gr. Mr. Mace), for a small group of Cypripediums; and F. A. HINDLEY, Esq., Great Horton, for a group of Cypripediums.

Other exhibitors were WM. THOMPSON, Esq., Walton Grange (gr. Mr. Howes); Mr. H. ARTHUR, Blackburn; Messrs. SANDER & SONS, St. Albans; and Messrs. A. J. KEELING & SONS, Bradford.

AWARDS.

AWARDS OF MERIT.

Cypripedium "Lion" (Boadicea × Sollieri Hyeanum) and *C. Queen Maud (Harefield Hall × ?)*, from S. GRATRIX, Esq.

C. "Cynosure" (parentage unknown), from R. ASHWORTH, Esq.

Epidendrum vitellinum autumnalis, from WM. THOMPSON, Esq.

FIRST-CLASS BOTANICAL CERTIFICATE.

Masdevallia cucullata, from A. J. KEELING & SONS.

CULTURAL CERTIFICATES.

Cypripedium insigne "MacNabiana," shown by A. WARBURTON, Esq. (gr. Mr. A. Dalgleish).

C. "Our King," from W. THOMPSON, Esq. (gr. Mr. J. Howes).

BRITISH GARDENERS' ASSOCIATION.

DECEMBER 11.—A meeting of local gardeners was held at Colwyn Bay on this date for the purpose of forming a branch of the British Gardeners' Association. The general secretary, Mr. Cyril Harding, addressed the meeting, and explained the aims and objects of the association. It was decided to form a branch at Colywn Bay, and Mr. Statham, Tyn-y-Coed Gardens, near Llandudno, was elected chairman, and Mr. C. Cheese, The Gardens, Beech Holme, Colwyn Bay, hon. secretary.

COVENTRY CHRYSANTHEMUM.

DECEMBER 12.—Alderman A. H. Drinkwater, J.P., presided at the 18th annual dinner of the Coventry and District Chrysanthemum Society held on this date. There was an excellent attendance, and the report of the secretary, Mr. G. Griffin, was of a most satisfactory character. The recent exhibition proved very successful. The expenditure amounted to £131 10s. 8d., and the income to £181 19s. 10d., after bringing forward a balance of £47 12s. from the previous year. The sum of £6 8s. had been received during the week, so that there was a balance of £61 or £62. There had been a decrease in the subscriptions, but the money received at the doors this year was £2 5s. more than in 1911, which constituted a record.

PERPETUAL-FLOWERING CARNATION.

"THE CULTURE OF PERPETUAL-FLOWERING CARNATIONS."

(Concluded from p. 456.)

FOR potting in 4½-inch pots, a compost consisting of three parts good fibrous loam, one part flaky leaf-soil, with the addition of sufficient silver sand and broken charcoal to keep the compost sweet and open, is recommended. Add a 6-inch pot full of some Carnation manure to each bushel of the compost. When preparing the loam pull it to pieces by hand, as this enables heavy lumps to be removed, and also permits the operator to pick out any wireworm or eelworm that may be present in the soil. Pot firmly, but take care not to place the plants too deeply—they should be the same depth in the soil as before; deep potting is sometimes the cause of stem rot. Grow the plants on in the same house until the end of April, when they may be removed to a cold frame. Ventilate with care at first, but later admit more air, until finally the lights are removed entirely, except during times of heavy rains.

When they are well rooted, shift the plants into 8½-inch pots, in which they will flower, and use a similar compost to that recommended before, in a rather coarser condition.

As soon as they are well established, stand the plants out-of-doors on a bed of ashes; but erect a framework over them, on which to place lights in case of wet weather. The stems should be supported as required, and for this purpose the patent wire supports have superseded the old method of staking and tying.

During bright weather the plants derive much benefit from sprayings of clear water on about two occasions daily. On the first sign of aphis spray the affected growths with Quassia Extract. As the plants become well rooted, weak snot water may be given with advantage at alternate waterings, and it may also be sprayed occasionally on the foliage.

The plants should be housed at the end of August, when diseased leaves should be removed and the pots made clean from dirt and weeds. It is important to admit all the air possible at this period, both by night and day, but when the outside conditions become cooler regulate the ventilators and the hot-water system to maintain a temperature of from 48° to 50° at night, with a few degrees increase during the day time. Keep the ventilators open a little during the night, when this can be done without lowering the temperature too much. Carnations must never be subjected to excessive fire heat: any attempt to force the plants into flower would result in weak growth and flowers of poor quality.

Light top-dressings of Carnation manure are a great help to the opening buds and result in larger blooms of good colour besides stimulating growth. During the winter, fertilisers should be applied sparingly, but after the turn of the year the plants will readily respond to judicious feeding. It is an advantage to spray with clear water between the pots during bright weather; but during damp and fog endeavour to maintain a dry, buoyant atmosphere. Damp, close air is one of the chief causes of disease.

Keep the plants carefully disbudded, and in doing this work remove the lateral buds gradually; to disbud too closely at one time is a check to growth, and sometimes causes the crown bud to come blind.

As regards the rust fungus, liquid specifics are not advisable during the winter, for they do not materially check the disease. Much might be done to eradicate rust if growers would propagate from healthy stock and maintain those conditions that are detrimental to the fungus spreading. It is an advantage to cut off and burn any leaves that are attacked. Red spider may be destroyed by spraying the plants with nicotine soap insecticide, applying it with force under the foliage. To destroy aphis, fumigate the house once a fortnight with a nicotine compound.

For bedding purposes, it is preferable to procure strong plants, in 4½-inch pots, that are already set with flower-buds. They should be hardened off before they are planted out at the end of May, when they will commence to flower

at once and continue in bloom until frosts appear. They should be planted in well-cultivated and enriched soil.

The discussion was opened by Mr. C. Engelmann, who could not agree with the lecturer in placing a high value on August-struck cuttings, which, in his experience, flowered well before Christmas, but after that date the plants become hard and woody, and were difficult to keep during the remainder of the winter. To flower satisfactorily throughout the winter months, Mr. Engelmann was of the opinion that the plants are best raised from cuttings inserted in December, and the plants must be kept soft and growing.

A member spoke of his experience in growing the plants on benches, remarking that he obtained more flowers, but the quality was not quite so good as those grown in pots.

In reply to Mr. E. F. Hawes as to the best varieties for summer-bedding, Mr. Gardner named White Perfection, Mrs. Burnett, Enchantress and Winsor as being the most suitable.

A lady member inquiring as to the hardiness of the Perpetual-flowering Carnation, was informed that this type usually lived out-of-doors throughout the winter months. The growths were cut back by frosts, but the plants renewed their activity in the spring, and flowered well throughout the summer and autumn.

A member from the Isle of Wight spoke of a small, brown moth, which injures the growing point of the plants on the island, and inquired if this also happened in England.

Mr. Engelmann replied that, fortunately, it was unknown here, but that growers in the south of France experience a difficulty with apparently the same insect. At present the only known method of combating the moth was to keep it away from the plants. The methods adopted were the fixing of netting across the ventilators of the Carnation houses, and creating a strong draught during the period of visitation.

SCOTTISH HORTICULTURAL.

DECEMBER 5.—The monthly meeting of the above society was held on this date, at 5, St. Andrew Square, Edinburgh. Mr. Massie presided, and there was an attendance of 80 members.

The meeting was devoted to a discussion on the following questions :—(1) Is galvanised wire and wire netting injurious to fruit trees? (2) In judging Leeks "as grown for market," what are the points chiefly to be considered? (3) What are the advantages of sterilising soil? (4) Has the grass herbage any influence in intensifying the colour of the fruit in orchard-grown Apples? (5) What causes luminosity when a light is applied to the inflorescence of Dictamnus fraxinella? (6) How is multiplicity in the flower-spikes in the bulbs of some varieties of Hyacinths brought about? (7) What is the "English" Elm? And (8) What is a spray? No one had observed any injury to fruit trees from the use of galvanised wire or wire netting. It was pointed out that market Leeks could not be judged from the same standpoint as those produced by the private grower. The primary consideration should be weight, but freshness should also be considered. The question of blanching did not arise, as market growers could not afford the necessary labour for this work. The third question gave rise to considerable discussion, but no new point was forthcoming. No definite conclusions were arrived at regarding the influence of Grass on the colour of orchard fruit. Some considered that dew arising from the Grass might have some effect on the fruit; it was pointed out that in a moist climate like that of Ireland Apples coloured well, and that the moisture might have something to do with colour. The earlier ripening of fruit on Grass-land was attributed to the drier condition of the soil at the roots of the trees. It was agreed, however, that, from all points of view, it was inadvisable to have a Grass covering over the roots of fruit trees. A note was read detailing some experiments by Sir Edward Thorpe in connection with the luminosity produced by Dictamnus fraxinella, from which it appeared that the glands with which the inflorescence is covered are really exceedingly brittle ducts, which are filled with an essential oil, and that when, for example, a burning match is brought into contact with them they take fire, the essential oil is ejected, and the flame is enlarged and made more luminous by its combustion. No satisfactory explanation could be given as to the production of more than one flower-spike in the bulbs of such Hyacinths as Gertrude, Grand Maitre, and Maximus (which had been fairly common last season), but the opinion was expressed that the weather of the previous season had had something to do with it. It was pointed out that, besides the true English Elm (Ulmus campestris) there was another small-leaved species, largely imported from Germany, which was being distributed by British and American nurserymen as the small-leaved Elm, and that this had led to some confusion, the true English Elm also being called the "small-leaved" Elm in nurseries. Much diversity of opinion was expressed as to the correct definition of the term "spray."

It was stated that the profit on the occasion of the recent Chrysanthemum show was approximately £35, and it was decided to hold a three days' exhibition in 1913 on November 12, 13 and 14.

Mr. David King was nominated President of the association for 1913.

The annual business meeting will be held on January 14.

LINNEAN.

DECEMBER 5.—At the meeting held on this date the first communications was by Mr. E. J. Bedford, entitled "Notes on Two Orchids New to East Sussex: Further Notes on Several Rarer Species of the Orchidaceæ," and communicated by Mr. C. E. Salmon.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

DECEMBER 9.—The monthly committee meeting of the above society was held at the R.H.S. Hall on this date. Mr. Chas. H. Curtis occupied the chair. Five new members were elected. The sick pay for the month amounted to £41 12s. 4d. The sum of £29 18s. 5d. was paid to the nominee of the late Mr. Eli Alderman.

NATIONAL DAHLIA.

DECEMBER 10.—The annual general meeting of the above society was held at the Hotel Windsor on this date. The president, Mr. George Gordon, V.M.H., occupied the chair. The report of the committee for 1912 was read by the hon. secretary, Mr. E. F. Hawes, and adopted on the proposition of the chairman, seconded by Mr. C. J. Wyatt, of Messrs. Keynes, Williams & Co.

The President stated that the society had not made the progress it should have done, and he appealed to the members to advance its claims and gain new members. He advocated the value of the garden Dahlia from a decorative point of view, and stated that he had recently received an offer of a 75-guinea challenge cup, to be offered for garden Dahlias under certain conditions.

A vote of thanks was passed to the retiring officers and members of the committee.

The following officers were re-elected :—President, Mr. George Gordon; chairman of committee, Mr. Joseph Cheal; hon. treasurer, Mr. John Green; auditor, Mr. J. Harrison Dick.

Mr. J. B. Riding was elected hon. secretary in place of Mr. E. F. Hawes, who resigned owing to pressure of other business. On the motion of Mr. J. Stredwick, Mr. Hawes was granted an honorarium of £8 and thanked for his services. Mr. G. L. Caselton was appointed show superintendent.

At a meeting of the committee held immediately after the annual general meeting, the members of the executive committee were selected, with the addition of Messrs. Hawes, Shoesmith, and Brunton in the places of three retiring members.

A publications committee, consisting of Messrs. C. H. Curtis, J. Harrison, Dick, and the officers was also elected.

NATIONAL HARDY PLANT.

DECEMBER 12.—The annual meeting of the above society was held in the room of the Horticultural Club, at the Hotel Windsor on this date. Mr. A. J. Macself occupied the chair.

The annual report for the year was adopted, on the proposition of Sir John Llewellyn, seconded by Mr. Barr. The balance-sheet, which showed a balance in hand of more than £15, was adopted, on the proposition of Mr. Barr, seconded by Mr. Weston. The following officers were elected :—Chairman of Council, Mr. Frank Bouskell; treasurer, Mr. R. Morton; hon. secretary, Mr. A. J. Macself. The Council was elected.

Sir John Llewellyn asked the society to co-operate in a Primula conference to be held in April, 1913. He pointed out the good work which had resulted from the first conference, and that, with the many important additions in the Himalayan and China sections, the work required bringing up to date. The Chairman welcomed the idea, and assured Sir John of the hearty co-operation of the society, and that he was authorised to state that Dr. MacWatt and other Primula experts would be pleased to assist. A long discussion ensued as to publishing a quarterly journal. Ultimately it was decided to issue the Year Book for the present year and to defer the question of the quarterly journal for the present. It was decided to hold a show in 1913, if possible, between June 2 and 9.

BOTANICAL SOCIETY OF EDINBURGH.

DECEMBER 13.—The second meeting of the session was held on the afternoon of the above date. Among the items of business were the following :—

"A Survey of the Vegetation of the Parish of Shotts, Lanarkshire," by George Brown, M.A. The paper described the various plant associations and their relation to the topographical, geological, and climatic characteristics of the district.

A paper on the seedling of Thysanotus was read on behalf of Professor Bayley Balfour. It dealt with a peculiar outgrowth on the surface of the cotyledon, which has been interpreted by Goebel as a boring organ. Its function, however, seems rather to be that of a hydathode.

Professor J. B. Bews, M.A., Pietermaritzburg, gave a brief account of the botanical survey work being done in Natal, and indicated the various formations characteristic of that area.

Among the exhibits on the table were the following plants from the Royal Botanic Garden, many of which are new to cultivation in this country :—

Haplopappus scaposus, Remy.—A Chilian undershrub of the general features of Primula suffrutescens. A good evergreen for the rockery.

Helichrysum Selago, Benth. et Hook. f.—A New Zealand shrubby species showing markedly imbricate as well as spreading leaves.

Hydrocotyle hirsuta, Sw.—A small-leaved form from San Domingo with spikes of whorled sessile flowers.

Salvia controversa, Tenore.—A curious species from the Mediterranean region with bullate pinnatisect leaves and small blue flowers. Not very showy.

Trifolium tomentosum, Linn.—A small-leaved form from the Mediterranean region with pretty trusses of red flowers.

A number of species of Celmisia, including :—Small tufted forms with short linear leaves—C. laricifolia, Hook. f.; C. sessiliflora, Hook. f. Longer linear leaved forms—C. Armstrongii, Petrie; C. Petriei, Cheesem.; C. pseudo-Lyallii, Cockayne; C. longifolia, Cass.; C. viscosa, Hook. f. Broad-leaved forms—C. holosericea, Hook. f.; C. Dallii, Buch.; C. hieraciifolia, Hook. f.; C. densiflora, Hook. f.; C. discolor, Hook. f.; C. incana, Hook. f.; C. Lindsayi, Hook. f.; C. Traversii, Hook. f.; C. petiolata, Hook. f.; C. spectabilis, Hook. f.; C. Brownii, F. R. Chapm.; C. verbascifolia, Hook. f.; C. coriacea, Hook. f.

Young plants of the bastard Beeches of New Zealand—Nothofagus Menziesii, Oerst., N. fusca, Oerst.; and twigs of N. cliffortioides, Oerst. Also young plants of N. obliqua, Blume, from Chili.

Among the other exhibits were :—Disease on Begonia hybrids caused by an insect of the genus Tarsonemus, shown by Mr. James Whytock; Ophiobolus graminis, a disease on Wheat, by

Dr. Malcolm Wilson; phyllody of flower parts of Tragopogon pratense, by H. F. Tagg; and two new Himalayan Primulas from the Chumbi Valley—Primula obliqua and Primula chumbiensis—by W. W. Smith, M.A.

NATIONAL CHRYSANTHEMUM.

DECEMBER 16.—On Monday last the Executive Committee of this society met at Carr's Restaurant, Strand, when Mr. T. Bevan took the chair.

It was moved that the Floral Committee's report be adopted, the contents of which were, briefly, as follow:—That, by way of experiment for one year, certificates for market varieties be awarded. That the prefixing of surnames in the possessive case to new Chrysanthemums be not recognised. That a charge of 1s. be made for each novelty entered for adjudication by the committee. The annual dinner of the Floral Committee to be held on February 17 next about 7 p.m.

There having been nine entries in Class 4 at the Essex Hall show on the 20th ult., it was resolved that a second prize, a silver medal, be awarded.

The Secretary announced that the contract with the Crystal Palace authorities had been signed for the 1913 shows, which will be held there as follow:—October 1, 2, and November 5, 6, 7. A show will also be held in the Essex Hall on December 10 in conjunction with a conference, the subject of which is to be determined.

NATIONAL ROSE.

DECEMBER 17.—The annual general meeting of the National Rose Society was held on this date in the Holborn Restaurant. The president, Rev. J. Pemberton, presided, and there were about 150 members present. The annual report was read by the hon. secretary. The following are extracts from the report:—

"The number of members is now more than double what it was five years ago. For the first time in its history four shows have been held during the year, and, for the first time, one of those in Ireland.

"The southern show was held at Southampton on June 26, in celebration of the jubilee of the Southampton Royal Horticultural Society. The season being an exceptionally early one greatly favoured that exhibition, which, taking into consideration its extent and the general high quality of the blooms, must be regarded as having been the finest Rose show ever held in the southern counties. The Metropolitan exhibition again took place, by the kind permission of the President and Council of the Royal Botanic Society, in their beautiful gardens in Regent's Park, the date of the show being July 9. This proved also a fine show, but was not quite so extensive as in some recent years. Her Majesty Queen Alexandra, the Society's royal patroness, after an absence of two years, once more honoured the Society and marked her continued interest in its doings by paying a visit to the exhibition. The attendance of members and visitors was larger than at any previous show held by the Society. The provincial exhibition took place on July 19, in the Botanic Park, Belfast, this being the first time that the Society has held a show in Ireland. This new venture proved a great success. One of the great surprises of the year was the large display of beautiful Roses which were to be seen at the Society's autumn show, after one of the coldest and wettest Augusts ever known.

"The Society's Rose Conference was held at the Holborn Restaurant on May 20, when the President delivered an admirable address on the 'Modern Development of the Rose.' Many foreign rosarians present joined in the discussion which followed.

"The dinner which followed was attended by a still larger number of foreign rosarians and their friends.

"Two new publications have been issued to the members during the year—in April, the *Rose Annual for 1912*, and in November a new edition of the *Hints on Planting Roses*.

"The number of societies in affiliation with the National Rose Society is now 56, one of which is in Australia and three others in New Zealand.

"The Council record, with regret, the death on her 87th birthday, of Mrs. D'Ombrain, a vice-patroness of the Society, and the wife of the late Rev. H. H. D'Ombrain.

"The Society has also lost during the year Mr. R. L. Garnett, a keen and successful amateur exhibitor at the Society's northern exhibitions.

"The receipts from all sources during the past year, including a balance from the previous year of £488 15s. 10d., amounted to £4,076 18s. 9d., and the expenditure to £3,634 6s. 7d., leaving a balance at the bankers of £442 12s. 2d. after £250 had been placed to the reserve fund. The reserve fund now stands at £1,500.

"During the past 12 months 810 new members have joined the Society. Allowing for the losses by death and resignation, the total number of members is now 5,504. Taking the year as a whole, two new members a day have, on an average, been added to the list of membership.

"The first spring show the Society has ever held will take place in the Royal Horticultural Hall, Vincent Square, on Thursday, May 1.

"The Metropolitan exhibition will be held in the Royal Botanic Gardens, Regent's Park, on Friday, July 4.

"The Provincial show willl take place at Gloucester, on Tuesday, July 15, in conjunction with the Gloucestershire Rose and Sweet Pea Society.

"The autumn exhibition will be held in the Royal Horticultural Hall on Thursday and Friday, September 11 and 12."

The Hon. Treasurer, Mr. G. W. Cook, read the financial statement, which was eminently satisfactory. In proposing the adoption and publication of the report and financial statement, the President stated that he was confident that the spring show in 1913 would be as great a success as was the first autumn show. He was pleased that the next autumn exhibition would continue for two days; it would be possible to keep the exhibition open much later than 6 p.m. on the first day, and thus opportunities would be afforded for large numbers of Rose lovers to visit the show. The Chairman also referred to the membership, which was more than double that of five years ago. He said that the International Show of May last had done much to stimulate interest in flowers, and it had brought them in closer touch with many foreign rosarians. He referred to the value of the Society's publications.

The President's motion was seconded by Mr. H. R. Darlington, who appealed to the Society to collect the late Rev. H. H. D'Ombrain's writings for publication. He also suggested that a Rose stud-book be instituted, as such a work would be of great interest and value.

The report and statement were adopted.

Mr. Chas. E. Shea proposed a number of minor alterations in the rules, and these were adopted.

Two propositions made by Mr. Walter Stevens, regarding the necessity of appointing officers to see that the rules and regulations of the shows were carried out, were negatived after some discussion.

Votes of thanks were passed to the officers of the Society, and Mr Edward Mawley, hon. secretary, responded.

At this stage the Chairman announced the result of the election of officers for 1913. Mr. Chas. E. Shea was appointed president. The other officers were all re-appointed, also the vice-presidents. The council was elected.

Mr. Frank Cant proposed that the Dean Hole Memorial Medal be presented to Mr. George Dickson. The proposition was supported by several speakers, and all present voted in its favour.

The retiring President then introduced his successor, Mr. Chas. E. Shea, who expressed his thanks for the honour accorded to him.

The meeting closed punctually at 4.30 p.m. The bulk of those present and several new arrivals assembled in the Crown Room for tea, after which an interesting discourse was given by the President, followed by a brief lecture, illustrated with coloured lantern slides, on "Roses and some Bournemouth Gardens," given by Dr. G. G. Hamilton.

The tables were decorated with flowers by Mr. R. F. Felton.

DEBATING SOCIETIES.

STIRLING AND DISTRICT HORTICULTURAL.—At the meeting of this association, held on the 3rd inst., Mr. Wm. Watt, Bridge of Allan, presided. Mr. M. Chapman, late of Torbrex Nursery, gave a lecture on "The Early History of the Apple, Pear, and Plum." Mr. Chapman quoted numerous extracts from old records connected with Stirling and district. Apple Stirling Castle was raised in a garden close to the castle, and distributed by Messrs. Drummond & Sons, Stirling.

READING GARDENERS'.—At the meeting held on the 2nd inst., Mr. H. Costin, of the University College Fruit Station at Shinfield, delivered an address on "Small Fruits." The lecturer first dealt with the preparation of soil for small fruits generally, advising double digging as a minimum preparation, unless the site has previously been well prepared for the growing of some other crop. In the case of heavy soils, road grit or similar material should be worked into the under layer in order to promote aeration and the free passage of water. Heavy soils should be prepared early in the autumn or in spring while in a moderately dry condition. Strawberries, Raspberries, Loganberries, Currants and Gooseberries were all dealt with by Mr. Costin.

CHESTER PAXTON.—The annual general meeting was held in the Grosvenor Museum on the 7th inst., under the chairmanship of Mr. N. F. Barnes. The annual report, submitted by the hon. secretary, Mr. C. P. Milln, showed that the society is in a flourishing condition, and that the members and subscribers are more numerous than in any previous year. The lectures have been well attended. The exhibition was one of the best ever held, but the attendance was below the average, with the result that there was a considerable financial loss. Mr. T. Gibbons Frost, J.P., was re-elected president; Professor Robt. Newstead, F.R.S., was re-appointed consulting naturalist; and Mr. C. P. Milln re-elected hon. treasurer and secretary.

BRISTOL & DISTRICT GARDENERS'.—At the meeting of this association, held on the 12th inst., Mr. Fry, a member of the Cardiff Society, gave a paper on "Perpetual Carnations." The lecturer recommended rooting the cuttings early in the new year, in a temperature of 60°, placing several together in pots filled with sand and peat.

KILMARNOCK AND DISTRICT GARDENERS'.—At the meeting held on the 11th inst., Mr. W. Cuthbertson, of Messrs. Dobbie & Co., Edinburgh, delivered a lecture, illustrated with limelight views, on "The Modern Sweet Pea: Its Development and Cultivation." The lecturer traced the development of the Sweet Pea from the advent of Countess Spencer, which he described as a pure mutation. A slight dressing of lime in the autumn, said Mr. Cuthbertson, encourages the formation of root nodules. The young plants should be pinched when they have made three pairs of leaves, as the side shoots will be stronger than the main branch.

BATH GARDENERS'.—The 9th annual meeting of this society was held on the 9th inst. Mr. T. Parrott occupied the chair. The chairman stated that unless they received a guarantee of support from those present they could not hold the usual Chrysanthemum show in 1913. It was decided to defer the consideration of this matter until the first meeting in January. Mr. Sparey, in presenting the annual report, said the society had had another successful year. The meetings had been exceptionally well attended. Mr. H. Cowley had won the silver medal with a total of 91 points. There was a small balance in favour of the society on the year's working. Mr C. T. Foxcroft was elected president, Mr. T. Parrott, chairman, Mr. G. Garraway, vice-chairman, Mr. J. D. Halleburtoo, hon. sec., and Mr. H. Sparey, hon. treasurer.

CARDIFF GARDENERS'.—At the meeting of the above association held on December 10, Mr. C. Oldham, of Roath Road Public Gardens, gave a paper on "Soil Fertility." He advised the free use of lime in all soils, especially those of a heavy nature. Heavy, retentive soils, said Mr. Oldham, should be turned up as rough as possible in the early autumn, and fairly-fresh manure incorporated with set light, sandy soils, however, should not be dug before January, using well-decomposed manure.

WARGRAVE GARDENERS'.—The last meeting of this session took place on December 11, and was well attended. A certificate of cultural merit was awarded Mr. W. Bazeley, Twyford Nurseries, for a good plant of "Odontoglossum Maculæ." The Wargrave Plant Farm showed flowers of Iris stylosa and I. speciosa cut from the open. The subject for the evening's discussion, "Greenhouse Flowering Plants from Seed," was introduced by Mr. J. Stephens, gardener at Culham Court. He treated in a very practical way Begonias, Calceolarias, Cinerarias, Cyclamens, Primulas, Schizanthus and Stocks, giving full cultural directions from seed-sowing to flowering.

CROYDON & DISTRICT HORTICULTURAL.—A meeting of this society was held on the 3rd inst. At the lecture delivered to the members in October last by Mr. H. B. Shepherd, F.I.C., F.C.S., on the uses of artificial fertilisers, Mr. Shepherd promised to answer any questions the members wished information upon if they would write him giving details, and he would furnish replies in similar form. The meeting on this occasion was set apart for the replies and further discussion upon them by the members. After each written answer from Mr. Shepherd had been read the members gave the results of their experiences, and by this means much useful information was gathered.

CATALOGUES RECEIVED.

W. SEABROOK & SONS, Chelmsford—Fruit Trees, Roses, Ornamental Shrubs and Trees.

PENNICK & Co., Delgany, Dublin, Ireland—Shrubs, Forest and Fruit Trees, Alpine and Herbaceous Plants.

FISHER, SON & SIBRAY, LTD., Handsworth, Sheffield—Hardy Trees and Shrubs.

Miss H. HEMUS, Holdfast, Upton-on-Severn—Sweet Peas.

C. F. A. VAN DER SLUYS, Ramee, Guernsey—Carnations.

ALLWOOD BROS., Wivelsfield Nurseries, Haywards Heath, Sussex—Carnations.

AMOS PERRY, Enfield, Middlesex—Lilies.

LAW NOTE.

FAILURE OF A NURSERYMAN.

THE Official Receiver for the Kingston District has issued his report and observations under the failure re Sydney James Denson, Nurseryman, Field Common Nursery, Walton-on-Thames, from which it appears that the debtor has filed a statement of affairs showing gross liabilities amounting to £10,231 17s. 8d., of which £4,427 10s. 8d. is due to unsecured creditors; to fully secured creditors £5,800. The assets are estimated to produce £215 13s.

The debtor alleges his failure to have been caused through losses on Dutch bulbs and general depression in trade.

He commenced business in partnership with his brother at Maida Vale in 1888, and about three years later he and his brother took a lease of the Field Common, Walton-on-Thames, at a rent of about £80 a year; they erected a few greenhouses, and carried on business there until May, 1896, when the partnership was dissolved, and the debtor took over as his share of the partnership the Field Common Nursery business, with its assets and liabilities, and he paid his brother the sum of £200 to equalise matters on dissolution; this sum he borrowed from his father-in-law, to whom he is also indebted for further loans, as stated below. About 1898 he purchased the freehold of Field Common Nursery, about 44 acres in extent, for the sum of £5,600; he borrowed £3,000 on mortgage and further sums from his father-in-law, partly for the purchase price and partly to enable him to build 29 greenhouses, and he is now indebted to his father-in-law on a second mortgage of about £2,000. The household furniture is claimed by the debtor's wife as having been sold to her some three years ago for payment of £100 to the debtor. About a year ago she gave her father a bill of sale on this furniture for £75, which she lent to the debtor. Of the unsecured indebtedness £1,570 is in respect of money lent and law costs.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

MR. ARTHUR FRESHWATER, formerly Gardener to Mr. G. R. LANE FOX, M.P., Bramhadi Park, Yorkshire, as Gardener to Lady ESME GORDON, Paxton Park, St. Neots, Huntingdonshire.

MR. M. DORSETT, for the past 8 years Gardener to CHAMPION B. RUSSELL, Esq., Stubbers, Romford, Essex, as Gardener to The Duchess of WELLINGTON, Ewhurst Park, Basingstoke, Hampshire.

MR. R. RICHARDS, for the past 9 years Gardener at The Hermitage, Holmes Chapel, Cheshire, as Gardener to S. C. WORSEY, Esq., Brine Baths Hotel, Shrewbridge Hall, Nantwich, Cheshire.

MR. S. WISE, for the past 2 years Foreman at Burntwood Hall, Barnsley, as Gardener to Colonel LODGE, Bishopdale, Aysgarth, Yorkshire. (Thanks for 1s. for R.G.O.F.)

MR. ERNEST J. BAGULEY, for the last 8 years Gardener to G. M. BROWN-WESTEAD, Esq., Lea Castle, Wolverley, Worcester, as Gardener to A. E. BATCHELOR, Esq., Greystoke, near Warwick.

MR. C. WARE, for over 4 years Gardener to C. T. PARKER, Esq., Quorn Lodge, Loughborough, as Gardener to V. FLEMING, Esq., M.P., Braziers Park, Ipsden, Oxfordshire. (Thanks for 2s. for R.G.O.F.)

MR. G. A. BACON, for a number of years Gardener to H. CHARRINGTON, Esq., Mickleover House, near Derby, as Gardener to the same gentleman, Quarndon Hall, near Derby.

MR. GEORGE COLLISTER, for the past 20 years Gardener at The Manor House, Little Bookham, Surrey, as Gardener to the Rev. F. B. TEESDALE, Whitminster House, Stonehouse, Gloucestershire. (Thanks for 1s. which has been placed in the R.G.O.F. box.)

MR. JOHN HEATH, for the past 12 months Gardener to Col. WATERHOUSE, Penn Hall, Wolverhampton, as Gardener to Mrs. Lees-Milne, Ribbesford House, Bewdley, Worcestershire. (Thanks for 1s. for R.G.O.F.)

MR. W. HAUGHTON, late Gardener to Sir GEORGE YOUNG, Formosa Place, Cookham, Berks,, as Gardener to Judge HARRISON, Doghurst, Yiewsley, Middlesex.

SCHEDULES RECEIVED.

Madras Agri-Horticultural Society.—The seventy-fourth annual exhibition of this society will be held on Friday and Saturday, February 21 and 22. Secretary, Mr. P. F. Fyson, Agri-Horticultural Society's Gardens, Teynampett, Madras.

County Clare Horticultural Society.—The spring show of this society will be held on April 16, 1913. Secretary, Mr. H. Bill, Liffard, Ennis, Co. Clare.

ANSWERS TO CORRESPONDENTS.

CARBIDE REFUSE AS MANURE: *Reader.* For particulars of slaked carbide residue see *Gardeners' Chronicle*, October 5, p. 270.

CARNATIONS UNHEALTHY: *J. C. H.* The injury is due to either aphides or thrips. The plants should be syringed or, better still, dipped in tobacco water.

CELERY: *J. O.* The rotting is caused by Sclerotinia sclerotiorum, a soil fungus. Treat the soil with gas lime, and allow it to remain for six weeks before planting another crop. Burn all diseased plants.

CHRYSANTHEMUMS: *T. W.* Chrysanthemum cuttings may, at this season of the year, be rooted in any kind of glass structure, but to insure the best and quickest result they should be inserted in either pots or boxes in a very light compost and rooted in a closed frame. If this frame is stood in either a cold house or one where the night temperature is not allowed to rise above 50°, and the cuttings sprayed slightly overhead on all fine mornings, they should be rooted fit for removal in four or five weeks. The Japanese varieties should be inserted at once, but the single and decorative sorts may be left until February.

ENDIVE: *Geo. Porter.* The variety of Endive is Extra Broad-leaved Batavian.

FORCING: *W. L. L., France.* A solution which will answer your purpose is made as follows: Take a large bottle, clean it thoroughly, add to it the following:—Potassium nitrate, 1 ounce; magnesium sulphate, ½ ounce; calcium sulphate, ½ ounce; calcium phosphate, ½ ounce, and as much iron sulphate or iron chloride as will go on the point of a small knife blade—half fill the bottle with, say, a quart (a little more than a litre) of clean rain or spring water, stopper it and shake till most of the ingredients have dissolved. When using the solution, first shake the bottle thoroughly and add one-fifth of its contents to a gallon (about five litres) of rain or spring water. Keep the stock bottle in a dark place. (One ounce avoirdupois equals 28 grammes.)

FUNGUS IN A MUSHROOM HOUSE: *C.* The fungus is Gliocladium agaricinum. It is usually introduced with the manure, and is difficult to eradicate. Try watering with nitrate of soda, using 4 ounces in 1 gallon of water. It is advisable to remove all the material of the bed, give the house a good cleansing, and start afresh. The disease spreads rapidly.

GOOSEBERRY SHOOTS FOR EXAMINATION: *A. M.* The shoots are infested with American Gooseberry-mildew, which formed the subject of the coloured Supplementary Illustration in the issue for the 7th inst. You will find particulars of preventive and remedial measures on p. 421.

GRAFTING ROSES: *Rosewood.* In selecting suitable scions for grafting Roses much will depend upon the kind of growth. Very short-jointed wood may be cut off, so as to leave a few eyes upon the side breaks attaching the main part of the wood to the stock. No special length of growth is necessary, but there should be from two to four eyes. The best and most generally employed stocks are those of the seedling Briar that have been established in pots for one season. You may, however, graft them first and pot the plants immediately afterwards. The grafting of Roses is described in the issue for October 26, p. 311. Rose cuttings may be inserted in spring, summer, and autumn. Young, semi-ripened shoots may be rooted in the spring if kept close for a time in an ordinary greenhouse. The majority of varieties are rooted best during September in a sheltered border of sandy soil, in the open. *Roses*, by H. R. Darlington (Present-Day Gardening Series), will be suitable for your purpose. It may be obtained from our publishing department, price 2s. 10d. free by post.

KENTIA PALM LEAF DISEASED: *Puzzled.* The disease is due to the fungus Ascochyta Kentiæ, a well-known parasite on Kentia. Sponge the leaves twice a week with a solution of permanganate of potash. Use sufficient permanganate to cause the water to become a rose-red colour.

MEALY BUG ON VINES: *S. G. R.* The following method of destroying mealy bug on vines may be recommended:—When the vines have shed their foliage the lateral growths should be pruned back in the ordinary way. Remove all the loose bark from the individual rods and spurs and burn both the prunings and bark. Next wash the vines with soapy water made by dissolving ¼ lb. of soaf soap in one gallon of hot water. The mixture should be kept well stirred, and applied with a stiff brush to every portion of the vine. After this has been done, smear the vines thoroughly with a mixture of coal tar and clay, consisting of one part of the former to nine parts of the latter. The clay should be dried and powdered, so that it may be passed through a ¼ inch sieve. By means of a 3-inch flower-pot measure the pulverised clay into a large flower-pot, the hole in which is blocked with a lump of stiffish clay. Then put the measure of tar into the vessel. Mix the ingredients well, and then add sufficient boiling water to give it the consistency of ordinary paint. Apply it to the affected vines, as indicated above, using a stiffish paint brush, and keeping the mixture well stirred meanwhile. The glass and woodwork of the vinery should be well washed previous to this with soft soapy water, and the plaster and brickwork close down to the vine border with hot liquid lime. This done, replace the loose surface soil with new compost, following with a surface dressing of horse-droppings and a good watering at the roots. The vines may be allowed to break into growth of their own accord in February or early in March.

NAMES OF FRUITS: *J. M.* 1, Waltham Abbey Seedling; 2, Beauty of Kent; 3, Reinette de Caux (syn. Dutch Mignonne).—*R. W. W.* 1, Radford Beauty; 2, Ribston Pearmain; 3, Emperor Alexander; 4, Roundway Magnum Bonum.—*T. H.* 1, Passe Colmar; 2, Marie Benoist; 3, Joséphine de Malines; 4, Glou Morceau; 5, Seaton House; 6, Ashmead's Kernel Improved; 7, Soldat Laboureur.—*H. Rogers.* Annie Elizabeth.—*W. C. H.* Baldwin.

NAMES OF PLANTS: *G. S.* 1, specimen with cones, Sequoia gigantea; 2, Abies numidica.—*P. C., Ludlow.* 1, Cypripedium barbatum; 2, Oncidium, probably flexuosum; 3, Cœlogyne cristata; 4, Dendrobium thyrsiflorum; 5, Zingiber officinalis (Ginger); 6, Tillandsia sp.: the species cannot be determined in the absence of flowers. All these plants will grow satisfactorily in a warm greenhouse or conservatory.—*W. H. Byfield.* These are forms of Oncidium varicosum, a species that varies considerably in the size and colour of its flowers. Your flowers are of the best type. Oncidium varicosum is a cool-house plant.—*F. D.* We are unable to identify the Dahlia; it is probably a new species, but this fact is not at present determined.

SCALE INSECTS: *E. T.* Nicotine fumes seldom kill scale insects. The scales should be removed by scrubbing. Then spray with paraffin emulsion, as this specific penetrates beneath the scales and kills the insects.

STOCKS: *The Warren.* The Quince can be worked on both the common Quince and the Hawthorn, the latter being the hardier stock of the two, though the scion does not grow quite so fast as on the Quince stock. We recommend budding standard trees, in preference to grafting, as the majority of budded plants make longer, straighter, and cleaner stems than those grafted. The stocks should be planted the season before they are worked; stocks planted now may be budded next July or August if the bark "runs" well. Pyrus floribunda is usually worked on stocks of the common Crab-apple, on which it grows well and flowers freely. It can be budded low down to form its own stem, or the stocks may be allowed to grow standard high and then worked. Propagation is equally successful by either method.

ZONAL PELARGONIUMS UNHEALTHY: *Learner.* There is no fungus or insect present. The injury is caused by wrong cultural treatment.

ROSES AND MAGNESIA.

IT is possible that it may be worth while for Rosarians to devote attention to the influence of magnesia on Rose culture. This substance has long been known to occur in plants, but it has generally been considered either of no value to the plant or positively harmful. For instance, experiments had indicated that magnesium carbonate was inimical to the germination of seeds (Watts), and Kearney and Cameron had shown in America that salts of magnesia possess, even in solutions of great dilution, a toxic action upon plant roots, which effect, however, was diminished in the presence of salts of calcium; Loew's experiments indicate that excess of magnesium over calcium results in a sterilising effect on the soil, and Hall, in commenting on this, draws attention to the fact that soils resting on serpentine, a mineral containing magnesia, are notoriously poor, and also points out that certain very impoverished clays on the Wealden formation contain a high proportion of magnesia.

Nevertheless, so long ago as 1889, Mr. E. Tonks's well-known paper in the *Rosarians' Year Book*, relying on a table from Wolff's "Aschen Analysen" (Berlin, 1871-1880). recommended a manure for Roses containing sulphate of magnesia in the proportion of two parts to 33, with, however, an excess of lime salt. There the matter seems to have rested for 20 years. In 1909, M. Georges Truffaut, in a paper which appeared in a contemporary, noted the large proportion of magnesia found in the analysis of Rose plants, and stated that while soils in which magnesia is deficient produced but a weak growth of Roses, the addition of magnesium salts as a manure brought about a marked increase of vigour and growth. About the same time a writer in the *Journal* of the French National Horticultural Society recommended the application of nitrate or sulphate of magnesia to weakly Roses which refused to respond to treatment with ordinary manure, stating that dressings of these salts in soils deficient in magnesia had been attended with satisfactory results.

The following year (1910), at the International Rose Conference held in Paris, the particular value of magnesia in the nourishment of Roses was one of the subjects for discussion; the importance of its influence was insisted on, and magnesium was declared to be indispensable for Roses. It was stated that it should be given always in the form of the sulphate, in doses of 200 grams to the metre (about 5 ounces to the square yard): kainit, an impure mixture of chloride and sulphate of potash, which contains about 12 per cent. magnesium, being recommended. One speaker, however, declared magnesium chloride to be poisonous to Roses. This directed the attention of foreign rosarians to the subject, and there seems to have been an idea that a particular effect of magnesia on the Rose was to cause the development of the receptacle, or seed envelope.

M. Leon Civet, in 1911, made some observations as to the effect of magnesium and manganese on 428 dwarf Roses in 23 varieties, mostly Hybrid Teas, planted in the rosary at Château de Saint-Maximin (Oise), and reported that, notwithstanding the very hot summer, 410 of these Roses had grown well, 10 rather feebly, and eight not at all, while the flower production was uninterrupted throughout the season. Having regard to the facts that the plants were all young, and that the temperature was excessive, he considered the result from the point of view of the growth of the Roses very satisfactory. For our present purpose the additional complication introduced by the manganese is perhaps to be regretted.

In the same year we have a record given in the *Journal des Roses* of some most interesting experiments by M. Cochet-Cochet. They are three in number, and most carefully recorded. The first of these was made with a batch of plants of Ulrich Brunner in pots. The plants were divided into three lots. Lot 1 was watered with pure water, lot 2 with a solution of ammonium nitrate 0.217 grams to the litre (or, roughly, ¼ ounce to the gallon of water), and lot 3 was watered with a solution of nitrate of magnesia, 1 gram to the litre (or, in round figures, an ounce to the gallon of water). The waterings were continued throughout the growth of the plants, varying in amount according to the dryness and temperature, but so proportioned that each pot received the same amount of liquid. In the autumn he obtained the following results: lot 1 was much the worst, lots 2 and 3 were of about the same vigour, but lot 3, which had received the magnesium, held the lead well, and on taking them from their pots, the root system was found better developed than in the case of the other two lots.

The second experiment was made with 1,800 plants of De la Grifferaie stocks intended for budding, planted in ground manured in the ordinary way, and divided into two plots. One of these plots, in addition to the manure, had received a dressing of finely-powdered carbonate of magnesia obtained from the dolomite formation, and therefore containing lime in considerable quantity. This was applied at the rate of 20 kilograms per acre (about 11 lbs. to the pole, or 8 cwts. to the acre).

Planting was done in April, and down to July no particular difference between the two plots was noticed. At the beginning of August, however, the plants on the plot treated with magnesia suffered arrest of growth for a time, and when they were budded on August 25, they were decidedly less tall than the plants on the control plot, the difference being, on the average, some 8 inch (20 cm.). The plants continued their relative rates of growth for a time after budding was finished, when suddenly about 60 per cent. of plants treated with magnesia commenced to make new growth from the stems where they were bent over, and this new growth continued late in the season, so that towards the middle of January they appeared from a distance still covered with leaves, though the Roses on the control plot had lost all their foliage. In the following year (1911) the Roses developed normally from the buds, but the extreme dryness of the year prevented accurate account being taken of the result of the experiment. At the same time, the Roses in the plot treated with magnesia were decidedly superior to those on the control plot, being both taller and more sturdy.

The third experiment was undertaken to ascertain whether the improvement in the magnesia-treated plot in the second experiment was due to the admixture of lime in the dolomitic magnesium carbonate. Two plots each of 1 are (109 square yards) were treated, the one with 12 kilos. of dolomitic magnesium carbonate and the other with such a quantity of carbonate of lime that the amount of carbonate in each plot should correspond. These were planted with De la Grifferaie stocks, and gave similar results to those of the second experiment, the plants in the magnesium plot again making late growth and retaining their leaves to the middle of January. M. Cochet-Cochet concludes: (1) that magnesia exercises a definite influence on the growth of Roses, and (2) that employed in the form of carbonate to the Grifferaie stock, it augments development and prolongs growth into the autumn, enabling the plant to retain its leaves in an abnormal manner.

Reverting for a moment to the analysis of the ashes of Roses, Wolff found magnesia distributed in the plant in the following proportions: Roots 7.15, wood 7.62, leaves 9.23, and flowers 5.94. That is to say, the leaves contain a far greater proportion of this substance than any other part of the plant. If, then, analysis is any guide, we should expect the effect of treatment with magnesium salts to produce its greatest effect in the foliage, and this appears consonant with M. Cochet-Cochet's results. It is, moreover, to some extent confirmed by recent experiments which have shown magnesia to be a constituent of chlorophyll.

It was formerly thought that any beneficial effect of magnesia was probably due to its action in liberating potash, but from

the presence of the salts in the quantity in which it is found in the Rose, and from the above experiments, this view must be abandoned, and it must now be admitted that it produces a definite and independent effect, which may be better understood after further experiments. *White Rose.*

NEW OR NOTEWORTHY PLANTS.

GERBERA HEDERÆFOLIA* (DÜMMER).

An acaulescent herbaceous plant. Leaves radical, tufted (five to a tuft), petiolate, ascending; petiole very stout, sheathing at the base, 1⅜ inch to 3½ inches long, thickly white-lanate all over; blade triangular, obtuse at the apex, deeply cordate and rounded at the base, 1½ inch to 2½ inches long, 1 1-12 inch to 2½ inches broad, thickly coriaceous, light green and glabrous at maturity above, thickly white-lanate below, the midrib and obsolete lateral nerves sunken on the upper surface. Scape solitary and slender, bearing one flower-head, nude, 9 inches long, white-lanate. Flower-head when expanded 2½ inches to 3 inches in diameter, the involucral bracts, one to two-seriate, lanceolate, acute, about 5-12th inch long, sparingly white-woolly externally, brown tipped. Ray florets yellowish, four nerved, 1 inch to 1½ inch long, ⅛ inch to ¼ inch broad. Achenes glabrous, surmounted by white pappus.

In the form of the leaves, G. hederæfolia, as is implied by the specific name, has a striking resemblance to those of the common Ivy, except that the under surfaces are covered with a dense snow-white woolly felt, which admirably harmonises with the pale green tint of the opposing side. The species is an acceptable acquisition to the few Gerberas obtaining in China, and was discovered by Mr. Wilson in Western Hupeh, Central China, in April, 1901.

SCOTLAND.

EDINBURGH DISTRESS COMMITTEE'S ESTABLISHMENT AT MURIESTON.

Few Labour Distress Committees in Scotland have achieved such good results as the Edinburgh Committee. The land was formerly valued at only £1 per acre per annum, whereas that which has been reclaimed is now valued at £25 per annum, and a considerable portion of the estate has been disposed of for market-gardening. By invitation of the committee, a party of about 200 recently visited Murieston. A new departure is to be begun by the establishment of a colony for lads, who are to be taught market gardening and farm work. An influential representative committee has been formed, and the sum of £200 has been already subscribed.

AFFORESTATION ON ARDGOIL.

The question of the afforestation of a portion of Ardgoil belonging to the Glasgow Corporation has been under consideration for some time, and a report on the subject was laid before a meeting of the general finance committee recently by Mr. James Whitton, superintendent of the city parks, and Bailie Alston. Three areas in the vicinity of Lochgilphead were suggested as a beginning, and these comprised in all about 1,100 acres. The most suitable was one of about 200 acres, and the estimated cost £1,500. The committee agreed to recommend that this be undertaken, that Mr. Whitton be authorised to prepare a detailed scheme, and that plants for the other areas be drawn up for further consideration. *Correspondent.*

* Species nova, distincta, Hederæ foliis simillimis supra deinde glabris sub us dense albo lanatis, scapo gracili nudo albo-lanato, facillime distiguenda. (Wilson, 1834, Herb., Kew.)

THE HILL, HAMPSTEAD.

(See figs. 209, 210 and Supplementary Illustration.)

The London residence of Sir William Hesketh Lever is situated on the edge of Hampstead Heath, a couple of minutes walk from the famous "Jack Straw's Castle" hostelry. The front entrance to the house gives no indication of the fascinating beauty of the garden, and once inside the gates the visitor finds it difficult to realise that the garden is very limited in size, and so near to the city of London. The front of the house, which has a sharply-pitched roof with dormer windows, is strongly suggestive of the French château. Along the front is a broad verandah which looks out over the two lawns and away to the pergolas. Against the front of the verandah and the walls of the wing, which bears several very handsome, large, leaden water-heads, there are many climbing shrubs. Magnolias are especial favourites, and to obtain as long a season as possible the deciduous, spring-flowering Magnolia conspicua has been planted in close proximity to the later evergreen M. grandiflora, and the growths are being inter mingled.

[*Photograph by H. N. King.*

FIG. 209.—PERGOLA AT THE HILL, HAMPSTEAD.

THE PERGOLAS.

When Sir William Lever acquired The Hill the garden was very steep and possessed no distinctive characters of importance. The cutting of the Hampstead Tube Railway gave an opportunity for obtaining many thousands of loads of soil, and the steep hillside was transformed into a plateau which made possible the delightful, cool, restful, level lawn and the stretch of handsome pergolas which form the subject of the lower half of the Supplementary Illustration. As will be seen these pergolas are in the Italian style; the columns are of Portland stone, and the beams are of English Oak. The lattice work, sides, and the cross-beams are furnished with such climbing plants as Wistaria sinensis, Jasmines, Pyrus japonica, various Clematis hybrids, Crimson Rambler, and Dorothy Perkins Roses, but these plants are not allowed to cover entirely the pergola and so bide its splendid proportions. The design of the woodwork at the ends (see fig. 209) is a triumph of the draughtsman's skill, the perspective was so cleverly drawn that even when standing within 2 feet of the work it is difficult to realise that one is looking at a plain surface and not into an alcove. Altogether, the broad,

Photographs by H. N. King.

THE HILL, HAMPSTEAD, THE RESIDENCE OF SIR W. H. LEVER, BART.

Printed by Temple Press Ltd., London, E.C.

paved floor of the well-designed pergola, lightly covered with beautiful plants, permitting views on one side of the Heath and of the smooth, green lawn which surrounds the green-tiled Water-Lily pond, forms a most pleasant promenade as well as a gracious ornament to the garden. When complete, the Pergolas at The Hill will be unique, for the extension is being made on a large scale.

Were it not for the fascinating pergolas the lawns would claim all one's attention and admiration. The lower lawn is quite level, and the herbaceous borders which divide it from the pergolas provide a handsome setting during the season. Here are grown the best plants for making a bright display throughout the summer months. On the right-hand extremity of the lawn there are large-spreading Oak and Beech trees, which cast a pleasant shade and tell of the many years which have come and gone, but which are the despair of the gardener who endeavours to induce plants to grow on the ground beneath them. The statuary in the garden is of exquisite workmanship, the bronzes, by Onslow Ford, are

[Photograph by H. N. King.

FIG. 210.—VIEW IN THE GARDENS AT THE HILL, HAMPSTEAD.

magnificent, and the dolphin fountain in the middle of the Water Lily pool arrests attention.

The retaining wall of the lower terrace is clothed with Roses, Ceanothus, and Jasmines, and a broad flight of steps with low and easy tread leads up to the higher terrace and its bordering of flower-beds which in summer blazed with Paul Crampel Pelargoniums, and were filled with Wallflowers, Forget-me-Nots, and a variety of spring-flowering bulbs.

Below the pergolas, on much lower ground, there are the glasshouses and frame yard. The chief feature of The Hill is the outdoor garden, and the glass is not extensive; its principal use is to supply plants for the house and for filling the flower-beds in the early summer. Much of the frame-yard, and what should have been flower-borders, was in a state of chaos on the occasion of my visit, owing to the extensive building operations in connection with the pergola extension. This condition is viewed by Mr. J. Barton, who has been in charge of the gardens for the past three years, in a philosophical light, for it is unavoidable. Before taking charge at The Hill, Mr. Barton was for nine years engaged latterly as foreman, at Thornton Manor, Sir William Lever's Cheshire estate. Building operations are a hindrance to good gardening, but Mr. Barton was looking forward to their completion, when he would be able to bring this part of the garden into as good a condition as the remainder. *A. C. B.*

NOTICES OF BOOKS.

Fruit Farming.*

As a handbook on commercial fruit-growing we commend this work as the most comprehensive, practical, and useful of its class that we have seen. It is literally packed with detailed information upon all branches of its subject, and is profusely illustrated. The author has long been known for his writings upon the subject, and particularly in relation to the financial aspect of the fruit industry. In preparing the present handbook, moreover, he has had the valuable assistance not only of some of the most capable and experienced of fruit-growers, but also of such specialists on the scientific aspects of his subject as Mr. George Massee, Dr. Bernard Dyer, and Professor F. V. Theobald, who, in common with Mr. Geoffrey J. Hooper and other fruit-growers, contribute sections of the work. The arrangement of the sections is not so systematic as it might be, probably owing to the fact that most of them have been previously published separately. This defect gives the book a somewhat disjointed appearance; but the reader will find the information he needs readily enough by means of the index. Beginning with the training of the fruit farmer, the author proceeds to deal with the capital required, the selection of a farm, the previous cultivation and setting out of fruit plantations, the planting and treatment of the various fruits, pruning, spraying, picking and packing, pollination, book-keeping, cover crops, beasts and birds in relation to the fruit-grower, approximate cost of cultivation, regrafting, protection from frost, and many other subjects. Chapters are contributed by Dr. Bernard Dyer on the manuring of fruit trees and bushes; by Geoffrey F. Hooper on the commercial cultivation of the Loganberry, preserving factories, and the future of fruit-growing in Great Britain; by F. V. Theobald on some insect pests of fruit and insecticides; by George Massee on diseases of fruit crops; by Arthur Miskin on spraying with lime and sulphur; by Spencer N. Pickering and F. V. Theobald on a spraying calendar; by H. H. Mason on co-operation for fruit farmers; by O. B. Cowley on some legal points; by T. J. Poupart on packing and grading for market; by B. T. Barker, M.A., on cider orchards, and on Apple jelly by Miss A. Elrington. The only important branches of the subject which appear to have been overlooked are of shelter for fruit trees and bushes and fruit thinning. It must be added that, as the author admits, pruning is not sufficiently treated. A great many estimates of the expenses and returns of various crops and of cost of cultivating operation and picking fruit are given. One of the great merits of the book is its thoroughly up-to-date information, though exception must be taken to the cost of Apple trees at 1s. each, which is double the price of good two-year-old trees purchased in quantities, while maiden Apples, now being planted extensively, are cheaper still. On some of the points dealt with there are differences of opinion even amongst experts; but, generally, the advice appears to us to be thoroughly sound.

* *Fruit Farming, Practical and Scientific, for Commercial Fruit Growers and Others*, by Cecil H. Hooper, M.R.A.C., F.S.I. (London: The Lockwood Press.)

Fruit Growing for Beginners.*

This is, as described on the title page, "a simplified and concise handbook on the cultivation of fruit," and it contains some illustrations. Advice, mostly sound, is given upon the treatment of all kinds of fruit commonly grown, and a good feature of the work is a summary at the end of each chapter, repeating in very brief and plain terms the principal points of the chapter. Grafting, budding, and pruning are explained with the help of illustrations, also a limited number of insect pests. Generally the advice as to pruning seems to us sound, though objection must be taken to the recommendation to leave only three or four buds when Apple trees are spurred in summer-pruning, and no more than two in the following winter pruning. Six and four would be preferable, until a fruit-bud has been formed, as excessive closeness in spurring leads to a profuse growth of spray. A sensible caution is given to persons thinking of engaging in fruit-growing as a business, misled by glowing, but untrustworthy, statements of great profits. The author points out the need of experience before a man launches out on his own account. There is much good advice in general terms; but in a shilling handbook dealing with all the most common fruits full details are hardly to be expected. *Southern Grower.*

* *Fruit Growing for Beginners*, by F. W. Harvey. (London: County Life Office.)

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA CICELY.

A very interesting cross between Cattleya Forbesii and Lælia cinnabrosa (Lælia cinnabarina × L. tenebrosa) has flowered with Mr. Eustace F. Clark, Eveshot, Dorchester, who submitted an inflorescence to the Orchid Committee at the R.H.S. meeting on the 3rd inst. The parentage is clearly discernible in the several flowers borne on the tall scape, which, in habit, displaye the influence of L. cinnabarina. The reddish-orange colour of this species (as is usual when this plant is used as a parent) is also present. The flowers are about 4 inches across, the sepals and petals narrow and nearly equal; the colour is apricot-yellow tinged with a reddish hue. The narrow and tubular lip has a small, rounded front lobe, and is formed similarly to that of C. Forbesii.

THE FERNERY.

INDUCED APOSPORY IN FERNS.

SINCE the first discovery of apospory by the present writer in 1884, it has been found that this phenomenon, namely, the production of prothalli direct from the frond, without the intervention of the spore, has presented itself in several forms, such as soral apospory, in conjunction with the aborted sori or spore heaps, or apical apospory, by simple extension and modification of the frond tissue itself. It had so far, until Professor Goebel's investigations,* been confined to otherwise abnormal varieties, and on some of these apospory only presented itself or could be induced to appear under special cultural conditions. Thus, in the case of Athyrium filix-fœmina var. unco-glomeratum, Dr. F. W. Stansfield has shown that, despite the quite deciduous nature of the species, the extremely comminuted crests retain vitality through the winter under close culture, and produce both bulbil and aposporous outgrowths in the following spring. Professor Goebel's investigations lead, however, far beyond this, since a considerable number of quite normal species are found to produce aposporic and apogamic prothalli, as also simple asexual plants, if the primary or first fronds produced from the prothallus are severed therefrom and layered on sterilised turf or loam. Among the plants so treated he mentions particularly Aneimia Dregeana, Alsophila van Geertii, Ceratopteris thalictroides, Gymnogramme chrysophylla, Polypodium aureum, and Pteris longifolia, of most of which he gives illustrations showing the diverse methods in which these regenerative outgrowths appear on the layered primary fronds. Since, however, these species were taken purely by chance from a large collection, the presumption is justifiable that the great majority of species possess the same regenerative faculty, though it appears to be confined to the first fronds, in which a hard-and-fast line between the gametophytic and sporophytic generations does not yet appear to be drawn. Hence, when the normal process of growth is interrupted by severance from the prothallus, and favourable conditions are afforded, the constituent cells produce outgrowths, sometimes presenting the prothallus character, sometimes the frond character, and sometimes an intermediate state in which stomata, a definite frond character, are in close juxtaposition with antheridia, an equally definite feature of the prothallus. At the time of Professor Goebel's report, none of the induced prothalli had produced plants, which he imputes rather to cultural conditions than to incapacity. None of the illustrations show archegonia, and only one antheridia, though in one of these the antherozoids are developed. He anticipates that when a second generation appeared it would probably be an apogamous one; but since apospory has been shown to be capable of producing perfect bisexual prothalli—A. f.-f. Clarissima to wit—in more than one instance, though in most cases the progeny are imperfect and weakly, it is reasonable to expect that like exceptions will crop up when the cultural-inducing experiments are extended.

The practical value of these discoveries to the Fern cultivator are not so far obvious, since once the prothallus has produced its primary frond the propagator has attained his object; but, to the biologist, they are of undoubted importance, as confirming the indication already afforded by apospory, that the line between the two generations represented by prothallus and frond-bearing Fern is more or less undefined, and there is doubtless much to be learnt by such cases as are here concerned, regarding the nuclear conditions of the cell, which determine the subsequent difference of growth. *Chas. T. Druery, V.M.H.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

PEACHES.—If the trees are not already detached from the wall, they should be untied, pruned, and secured firmly against strong winds without delay. Provided superfluous shoots were removed as recommended in previous notes, the winter pruning will be a simple matter, for only faulty shoots, which may have escaped notice when the foliage was still on the trees, need to be removed. If scale, red spider, or any other insect pest is present on the bark, the main stems and branches should be washed thoroughly with a moderately strong insecticide; use the specific at a less strength in the case of the young shoots. Do not wash the trees during very cold weather, but choose a mild, fine day for the work. The walls should be syringed well, and again before the buds begin to swell. If the trees are infested with red spider, a few handfuls of flowers of sulphur will be advantageous. In connection with the tying of the trees, it is well to remember that one of the secrets of success is sparse training; the shoots should be trained at 5 or 6 inches apart. Many gardeners adopt the plan of tying the shoots in winter to light poles about 1 foot from the wall, with the object of retarding the growth. If this is done, the shoots should be separated, not tied in large bundles.

APRICOTS.—If convenient, the trees should be pruned before the end of the year. The Apricot is subject to a number of insect pests, and it will be necessary to wash the trees thoroughly with good insecticide; the walls must also be subjected to the same treatment. The roots may be left undisturbed, provided they are growing in a restricted body in rather poor soil. Root-pruning will check gross growth in young trees, but prevention is better than cure, and it is wise always to plant in poor soil, mixed with plenty of lime rubble. A rich rooting medium is a frequent cause of canker, and, when once a tree is attacked by this insidious disease, it is most difficult to restore it to health.

RASPBERRIES.—Provided the old canes and superfluous suckers were removed directly after the fruits were gathered, no pruning will be necessary. The annual mulching should be applied as soon as possible, since the winter rains will wash the manurial properties into the soil, enabling those canes which are left in position to avail themselves of the nourishment provided. The manure should be spread over the roots on the first frosty morning; it should be liberally applied, since food is essential to strong growth. The manure should be allowed to remain on the surface, since digging would injure the roots. If for any reason planting has been delayed, this work should be postponed, at any rate for the next two months.

NUTS.—Nut bushes are often grown in out-of-the-way corners and allowed to remain unpruned for too long a period. March is the best time for pruning, but at the present time neglected bushes should be cleared of suckers and the shoots thinned moderately, leaving plenty of growths with catkins to be cut out later. All loose and exhausted soil should be cleared away from beneath the bushes, and replaced with fresh compost and manure.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

A RETROSPECT.—Being the close of the year, a review of the past 12 months in the kitchen garden may be interesting. The weather can hardly be said to have been ideal; nevertheless, in very many districts vegetables succeeded remarkably well. In some cases total or partial failures were recorded, owing to the continuous rains and lack of sunshine; but on the whole it is a question whether better vegetables have ever been exhibited than those shown at the principal exhibitions in 1912. At the spring and early summer meetings of the Royal Horticultural Society excellent collections were staged, whilst magnificent produce was seen at the International Horticultural Exhibition in May. At provincial shows the vegetable classes were well contested; at Shrewsbury it was generally admitted that the vegetables surpassed those of all previous shows. Another splendid display was made at the R.H.S. special vegetable show in September, whilst the produce exhibited at the National Vegetable Society's Exhibition at Watford was the finest ever seen in this country. In the vegetable classes at the autumn shows the same high order of merit prevailed, and competition was of the keenest. Not only the quality, but the staging and packing left little to be desired. Amateurs and cottagers alike presented their exhibits of kitchen garden produce in the most attractive manner. It was my privilege on the 16th inst. to act as one of the judges at the annual Christmas show held at St. Ives, Huntingdonshire, and I was greatly impressed with the quality of the exhibits, especially those of Onions and Potatos.

Owing to the low temperatures and continued wet weather, Potato disease spread rapidly during September and October. This was especially noticeable in the case of varieties which had hitherto been regarded as more or less immune. The variety King Edward VII has not only given the best crops during the year, but the tubers have been remarkably free from disease. In other years this Potato has been affected more than any other variety, though it usually crops well. Tomatos out-of-doors have been, in most districts, a complete failure; this is the more unfortunate since the splendid results of last year encouraged growers to plant largely. Vegetable Marrows also proved very unsatisfactory, owing to the low temperatures and absence of sunshine. Peas, Beans, Cauliflowers and other Brassicas gave exceptionally good results, whilst Turnips, Celery, Carrots and Beetroots have seldom given better crops. The condition of all the winter vegetables is perfect; and unless very severe weather prevails there should be an abundance of all kinds.

PLANS FOR THE FUTURE.—During the long evenings make notes on the successes and failures of the past season. By this means mistakes which have led to bad results may be avoided in the future, and fresh methods of culture which have been found successful adopted during the coming season. Much preparatory work should be undertaken out-of-doors; the ground should be prepared carefully, seedlings tended and nursed, and autumn-sown plants, which are being wintered in cold frames, carefully watched. Roots intended for forcing should be introduced into heat as desired.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

PRUNING WALL PLANTS AND CLIMBERS.—Although many of the hardier climbers and wall plants retain their foliage until late in the winter, it is necessary to overhaul them thoroughly at least once a year, and, provided the weather remains open, the present is the best time for such work. Climbers should not be restricted too much in the growing season, but need only looping up at intervals during the summer; hence the necessity for a thorough pruning or thinning of the shoots at this time of year. This refers chiefly to shrubs and climbers growing on walls, pergolas, and trellises, and not so much to those in the semi-wild garden, which require somewhat different treatment. Climbers are usually planted with a view to their producing the best effect over the longest period, and for this reason a mixed collection of plants is desirable. Discretion must be exercised in the matter of pruning. Care must be taken not to remove shoots that would flower the following season. Shrubs, such as Forsythia, Chimonanthus fragrans, Jasminum nudiflorum, and early-flowering Loniceras, flower best on shoots of the previous season. These should be left for the present, and removed immediately after the flowers are over. Other wall plants, such as varieties of Ceanothus, Buddleia, Clematis, Polygonum baldschuanicum, and Solanum crispum, should be pruned well back to firm wood, retaining sufficient of the better shoots

to furnish the space. Cut away all weak and unripe growth and old flowering-shoots, training the remainder thinly over the wall. Many choice evergreen shrubs, including Choisya ternata, Azara microphylla, Myrtles, Camellias, Magnolia grandiflora, Grevilleas and Olearias, do well as wall plants. These plants do not make rampant growth, and only require sufficient pruning to keep them within bounds. Besides the choicer varieties of Ivy, other good evergreen climbers are: Lapagerias, Stauntonia latifolia, and Smilax aspera. If these species are planted among deciduous subjects, they will help to give the wall a furnished appearance in winter. They require little pruning. Ivies should not be clipped for the present; this work is best left until the spring, when the plants should be trimmed closely. Fresh growth will soon cover the wall with greenery. Climbing Roses (if not already pruned as advised in my previous notes) should be well thinned, cutting out as much of the old wood as desirable: a few, well-ripened shoots present a much better effect than a large number crowded together in a limited space.

The Shrubbery.—The ground between the shrubs should be cleared of rubbish and forked lightly. The fallen tree leaves should not be removed, but dug into the ground. If, for the sake of appearance, the fallen leaves were removed during the autumn, they should be replaced with a top-dressing of leaf-mould or old potting soil. The work should be done without delay, especially if bulbs are planted among the shrubs, as these are growing rapidly owing to the mild weather.

Gravel Paths.—When making up gravel walks, place sufficient coarse material under the the fine gravel to ensure proper drainage, and see that the drains are in perfect working order. Since repairs to drains necessarily upset the paths, this work should be done at once, so that the gravel may be in good order again by the spring. When the paths are dry, they should be well rolled.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

The Season.—The past season has been an unfavourable one for the culture of fruits under glass. In some districts it has been a difficult matter to obtain well-ripened Grapes; our latest Grapes were not perfectly ripe until the end of October. Owing to absence of sunshine the wood of newly-planted vines has not ripened well, and much fire-heat has been required in consequence. The summer of 1912 was in direct constrast to the preceding one, and the cost of producing fruits under glass this year will have greatly exceeded the amount spent in 1911. The chief lesson which has been learnt in this connection is that of not delaying for too long the planting of late fruit trees. Late Peaches are a case in point; the almost total absence of sunshine during the later stages of their development had a prejudicial effect on the flavour of the fruits, and the young wood is not well matured. The earlier months of the season were more favourable, especially May and the greater part of April. In consequence, early fruits were excellent, but it is difficult to forecast the weather with any degree of accuracy, and it is far better to plant too early than too late.

Strawberries.—As soon as the early forced Strawberries begin to form their flower-spikes the plants should be removed to a shelf near to the roof-glass in a house having a minimum temperature of 55° or 60°. The pots are now full of roots, and some form of stimulant should be applied. Soot water, or diluted farmyard drainings, may be used during the early stages of growth. Later on, when the fruits are swelling, these manures may be supplemented by some concentrated fertiliser. During sunny weather syringe the plants with lukewarm rainwater twice daily, and keep the atmosphere moist by damping the bare surfaces in the house frequently. Further batches of plants should be introduced to heat as occasion requires. It is a good plan to put a batch in each of the different fruit-houses; but before bringing them indoors examine them carefully, and if spider is present on the leaves place the pots on their sides and syringe the foliage with an insecticide.

Melons.—A sowing of Melons may be made at once, provided a suitable house is available. The seedlings should be raised in 2½ inch pots, filled with loam mixed with finely-crushed mortar-rubble. The pots should be plunged in a hot-bed. The seedlings should be kept near to the roof-glass until they are ready for planting out. A house or pit with a southern aspect is suitable; the structure should be cleaned thoroughly, washing every part with strong soapy water, using a stiff brush. Wash the glass both inside and out, since the plants need plenty of light. In the meantime, the materials for forming a hot-bed should be collected and prepared, so that all may be in readiness when the time for planting arrives. Stable litter and leaves in equal proportions, and well mixed, will make a suitable hot-bed. It must be made very firm, and raised quite near to the glass. The young plants may be transferred to pots, or to a bed of soil; I prefer the latter method as the plants are not so likely to receive a check, and the fruits are of better quality. The soil should be chiefly strong, fibrous loam mixed with mortar rubble and wood ashes. The mounds should be 20 inches wide and 9 inches deep; make the soil firm.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Pot Roses.—Roses intended for early forcing may be brought into the glasshouses at once, for there is no advantage in leaving them out-of-doors after this date (except in the case of the latest batches) if room can be found for them in a quite cool house. If they have been potted and plunged as advised in an earlier calendar, the roots should have made a considerable amount of growth. They will require a week or two of rest, and dry conditions under cover, before the pruning of even the early batches is begun. After this, the plants may be accustomed gradually to slightly warmer conditions. Care must be taken, however, not to hurry them into growth unduly during the early part of the season, or they will break unevenly and produce weak, thin shoots. Tea Roses are not so popular for forcing as they were 10 or 15 years ago. They have been supplanted by such varieties as Liberty, Captain Hayward, Mrs. J. Laing, Frau Karl Druschki, Mme. Abel Chatenay, and Caroline Testout, which produce their flowers on long, stout stems that are better for use in vases than the weak, somewhat drooping stalks of the Tea-scented varieties.

Hydrangea hortensis.—Plants which were rooted during the summer and autumn, and are growing in 4½-inch pots, should be examined. Those which are prominently in bud should be placed in a warmer house, where they will bloom early in the season. Hydrangeas last for a long period in bloom, and the flowers are varied in colour, so that the plants are particularly useful for decorative purposes. The fine new variety Mme. Emile Moullière has inflorescences of the purest white, and the plants may be had in flower through almost all the year. Other good varieties are Mdlle. Renée Gaillard (white, with serrated edge); Souv. de Mme. Chautard (large, deep-pink blossoms); Dentelle (also a white variety, which turns pink after a time); Mdlle. A. Barillette (creamy white); Radiant (deep pink, with very strong growth); Ronsard (white, changing to pink); and Botaniste Pellereau (pink, with enormous trusses and individual pips).

Bouvardia.—As Bouvardias cease to flower, they should be removed to a cool house, and watered very sparingly. If they still seem to be growing vigorously they may be kept in heat, and will probably continue to give a few blooms. Plants which were rooted in spring, and are flowering now for the first time, may be expected to continue in bloom. Those which have already been cut back two or three times usually flower for a shorter period.

Sweet Peas.—Plants which were raised in September or October for flowering in pots may be transferred from the cold frame into a cool, light, airy greenhouse, first placing a few twigs round the growths to prevent them drooping. They are less likely to suffer from frost in the house than in the cold frame, and the growth will become hardier. The time for transferring them into the flowering pots (usually January or early February) will depend upon the condition of the roots. If the small pots are full of roots, the plants will suffer by being left too long in a cramped space. Rich soil is quite unnecessary in the early stages; good turfy loam, mixed with manure from a spent Mushroom bed, and a little bonemeal and wood ashes, form a suitable rooting medium. The soil should be pressed firmly. When the plants are in their flowering pots they should be allowed plenty of room. The plants should not be hurried into growth until the days begin to lengthen, and steady growth should be encouraged until the roots take firm hold of the new soil, and then, as the spring advances, a warmer atmosphere and more moisture may be afforded

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart. Gatton Park, Surrey.

Lælia.—Plants of Lælia autumnalis and L. albida which have ceased to flower should be rested for a period, affording only sufficient water at the roots to keep the pseudo-bulbs fresh and plump. Damping between the pots should be discontinued, and fresh air, regulated by external conditions, should be admitted. The night temperature of the house should be about 55°. Lælia anceps and its numerous varieties are opening their blossoms, and the plants should be kept moist at the roots. After the flowering is over the plants should be given treatment similar to that recommended for the other species. The proper time for potting these Lælias is when they begin to form new roots at the base of the present season's growth.

Vanda.—Vanda Amesiana and V. Watsonii are in bloom, and, if the roots are kept moderately dry, the flowers will last for a long time in good condition. When flowering is over only sufficient water should be given to prevent the roots from shrivelling, for the plants need a brief period of rest. V. Kimballiana is no longer in flower, and should also be rested until the roots are again active, when moisture may be afforded in increased quantities.

Cattleya.—Plants of Cattleya Warneri, which are growing actively, should be kept in the warmest part of the Cattleya house. They should be placed in a light position, and be sufficiently watered at the roots to keep the compost moist until the flowers have opened. The work of repotting should be done immediately after the withering of the blossoms, so as to allow room for the production of fresh roots from the bases of the new pseudo-bulbs.

Odontoglossum Uro-Skinneri.—Plants of this species will soon be pushing forth new roots from the bases of the young growths, and repotting should be attended to if necessary. The pots should be filled to half their depth with clean crocks, placing a layer of firm rhizomes over the drainage materials. The compost may consist of equal parts A1 fibre, Osmunda fibre, and Sphagnum-moss, the whole cut up rather roughly, and incorporated with crushed crocks and silver sand. The materials should be mixed well together, and the potting done lightly, so that the thick, fleshy roots may grow freely in the compost. When the repotting is complete, the pot should be filled to the level of the rim with a layer of chopped Sphagnum-moss. Very little water will be required—only just enough to keep the surface moss moist until the new pseudo-bulbs show signs of swelling, after which the supply of moisture may be increased gradually. The warmer part of the Odontoglossum house is the best position for the plants.

Oncidium ornithorhynchum, — This species has recently passed the flowering period, and as soon as the new roots are perceived to be pushing up from the base of the young growths, attention should be given them. If the plants are in pots of a suitable size, and the compost is in good condition, they need only be resurfaced. Some will require repotting, and for these a similar compost should be used to that recommended for Odontoglossum Uro-Skinneri. The plants should be grown in the cool intermediate house.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Rose Trees, Liliums, Perennials, Shrubs, &c., at Stevens's Auction Rooms, King Street, Covent Garden, at 12.30.

WEDNESDAY—
Hardy Border Plants and Perennials, Dutch Bulbs, Lilies and other Hardy Roots and Bulbs, at 12; Special Sale of Roses, at 1; Palms and Plants at 5; at 67 and 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Hardy Bulbs, Roots and Tubers, Herbaceous and other Plants, at 12; Roses, at 1.30; by Protheroe & Morris.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—39°5.

ACTUAL TEMPERATURES:—
LONDON.—*Sunday, December 22* (6 P.M.) Max. 60°; Min. 45°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Monday, December 23* (10 A.M.): Bar. 29·6°; Temp. 51°; *Weather*—Overcast.
PROVINCES.—*Sunday, December 22:* Max. 49° Cornwall; Min. 41° Aberdeen.

1912. Many events have conspired to make the year which is well-nigh past an annus mirabilis in the annals of horticulture. It was the year of the International Exhibition; it witnessed the formation of a horticultural branch of the Board of Agriculture; it was the first occasion on which the State gave adequate proof of its desire to aid in the development of the art and industry of agriculture and horticulture. Each of these circumstances would lend distinction to the year in which it occurred, and together they mark an epoch in horticulture. The International Exhibition gave the world a wonderful demonstration of the pre-eminence of British horticulture; and it did more than this. It proved that the artistic taste of our exhibitors has progressed with unexpected rapidity, and it showed that practical and scientific horticulturists may not be regarded as incompatibles, but are determined to work together for the further advance of horticulture. That the exhibition was successful also from the financial aspect is but a final proof of the energy and ability of Mr. Gurney Fowler and his fellow-directors, and, in bidding farewell to 1912, we may express the hope that he and they may all be spared to organize our next International Exhibition. It may be that a memorial volume of the exhibition will be published, and, if so, we hope that portraits of the "organisers of victory" will adorn its pages. We have already, it is true, a happy souvenir of the exhibition in the knighthood which was conferred on Mr. Harry Veitch, for, although the honour is his, all good horticulturists enjoy his distinction almost as though it were their own.

The exhibition has come and gone. Its fruits in gold and silver have been garnered in; but the other events to which we have referred are of too recent occurrence for us to judge what their fruits will be. Nevertheless, none may doubt that the organisation of horticulture is destined to render great service to the community. The warmth of the welcome with which Mr. Runciman's announcement was received is proof that the formation of a special branch of the Board of Agriculture has raised high hopes among horticulturists. The speed with which the President has given effect to his promise encourages this general feeling of hopefulness. Mr. Rogers has been appointed head of the new branch, and is engaged in the selection of a staff to carry out the inspection and other work of his sub-department. We understand that an expert in entomology has been appointed, and, as our readers are aware, the selection of a horticulturist to the post of general inspector will be made in the near future. Among the difficult problems which will present themselves to the Board is that of instituting an effective service for the inspection and certification of the freedom from disease of nursery stock and other horticultural produce. Markets are closing to our exporters, and nothing but a State service of inspection will satisfy foreign customers and keep foreign markets open to our traders. The present, however, is not the occasion on which to deal in detail with the work which, as we hope, lies before the horticultural branch; rather is it one in which we may all unite in congratulations that the State has at last recognised in an official manner the national importance of horticulture.

The third event which makes the past year memorable is the allocation of considerable sums from the Development Grant for the purposes of agricultural (and horticultural) education and research. In the grants which have been announced already, horticulture has not been forgotten altogether. Funds have been placed at the disposal of the College at Wye, and of the University of Bristol, for experimental work in fruit-growing. That there is ample scope for work of this nature goes without saying, and readers of our articles by *Southern Grower* are familiar with many of the questions which, in the opinion of commercial fruit-growers, are in urgent need of solution. We shall not be regarded as ungrateful if we look upon the grants which have been made for horticultural purposes rather in the light of welcome instalments than as representing a satisfaction of the just claims of horticulture. It is to be remembered that the unsolved physiological problems of horticulture are at least as numerous and important as the pathological problems. The investigation of soil sterility is making good progress at Rothamsted, but research is required into the economic importance of the new methods of forcing, the possibilities of the utilisation of electricity in plant growing, methods of ripening and storing fruit, and many other subjects. Again, beyond these problems of physiological nature lie others of economic import: problems of distribution, both of goods and of men; for instance, that concerning the keeping on the land of our own country many of the men who, if they follow custom, will emigrate to practise horticulture abroad instead of continuing its pursuit at home.

In addition to progress in the directions just described, the year of 1912 has seen an attempt to deal with the problem of horticultural education, and although the attempt has not yet led to definite results, progress has been made. The committee appointed by the Royal Horticultural Society has drafted its report, and has expressed emphatically its conclusions that a National Diploma of Horticulture should be established, and that this diploma should above all be a guarantee of its holder's skill and efficiency in practical horticulture. Should such a diploma be established, it is bound to lead to a further systematisation of horticultural education. What would appear to be urgent is the establishment—pressed for more than once in these columns—of a National Institute of Horticulture. The rôle of such an institute would be to play a part in controlling and extending horticultural education, harmonising horticultural interests, and, by differentiating between them, advancing the status of horticulturists. We can imagine no more valuable innovation than the establishment of such an institute, and we are of opinion that a national diploma issued under the joint auspices of the horticultural section of the Board of Agriculture, the Royal Horticultural Society, and the Institute, would become in a short time not only national in name but also in fact.

We pass from the review of these aspects of horticulture—upon which there is bound to be diversity of opinion side by side with community of aim—to a subject upon which there can be no two opinions. That subject is one dear to the heart and near to the lips of Englishmen—the weather. The past year will long remain notorious on account of its sunless summer. Summer came—and went before her time; in August we had to deplore the havoc of the rain, and autumn alone made some tardy amends for the meteorological misbehaviour of the earlier part of the year.

The shows of the year were remarkable for their excellence, and suffered not at all from their great competitor—the International Exhibition. Of the leading events the Holland House, Shrewsbury, Daffodil, National Rose, Sweet Pea, Carnation, and R.H.S. Fruit Exhibitions were all remarkable, and fanciers and amateurs will be pleased to know that the Daffodil Show is to be repeated, and that a Tulip Show will be held during 1913 under the auspices of the premier horticultural society.

In many ways the most interesting of the 1912 exhibitions was the first autumn show of Orchids. The fact that such an exhibition was possible at that season is a tribute to the skill and success of the hybridist, who has learned not only to combine colours, but to confound the seasons. The conference held in connection with the exhibition, though thinly attended, proved of considerable interest and value.

The exhibitions of 1913 are casting their chromatic shadows before them. Mention has been made of the Daffodil and the Tulip exhibitions, but we ought to point to the fact that there will be no "Temple" show next year. The usual May show will be held instead in the grounds of the Royal Hospital, Chelsea, which proved so fine a show site only a few months ago.

Other shadows, but grey and sad ones, have been thrown across the world of horticulture. Death has taken lavish toll, and we mourn the loss of many men of eminence in this domain of the world's work: William Baylor Hartland, the Irish nurseryman, who rescued the cottage Tulips from their rural obscurity; Alexander Dean, a great horticulturist in every sense of the word; Robert Fenn, the Potato raiser; Hayward Matthias, of Carnation fame; Pedro M. Binot, the Orchid collector; Théophile Durand, Director of the Belgian State Botanic Garden; and Eduard Strasburger, the most distinguished botanist of his generation. These men and others of no less worth have passed away.

Others have risked their lives in the service of horticulture:—G. Forrest and W. Purdon, collecting in China, suffered hairbreadth escapes, but happily have survived to supply us with new plants from the great unknown provinces on the western borders of that country.

Finally, no chronicle of the year would be complete that did not contain a reference to the wonderful popularity of the Alpine garden. There be men—and wise ones, too—who predict that "these violent delights have violent ends and of their issue die," but we incline to predict an even yet greater vogue for this style of gardening. As we admired the Alpine gardens at Chelsea, we felt or fancied something symbolic in them. They represented with consummate art a perfect blend of freedom and constraint, and symbolised the perfect state of man.

OUR ALMANAC.—With our issue for next week we propose to publish the *Gardeners' Chronicle* Almanac for the year 1913. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents will send us* **IMMEDIATE INTIMATION** *of all fixtures for the coming year.*

ROYAL HORTICULTURAL SOCIETY.—The first meeting for the New Year will be held on January 7 in the Society's Hall, Vincent Square, Westminster. There will be no lecture on this occasion.

BITTER PIT IN APPLES.—Dr. ALFRED J. EWART, in a paper on "Bitter Pit and the Sensitivity of Apples to Poisons," read before the Royal Society of Victoria, gives results which show conclusively that the complaint is not due to disease, but is a symptom of local poisoning. Not only arsenate of lead, but also the other common spray poisons are effective causes of the complaint, and, so far as the evidence goes at present, bitter pit seems to be much more prevalent in sprayed orchards than in those which have never been sprayed or had any poison applied to the soil. It is shown that moderately dilute solutions of metallic poisons penetrate through the breathing pores of Apples in sufficient quantities to produce bitter pit, and yet these quantities are so minute as to be incapable of detection even by very delicate chemical analysis. Copper is not quite so poisonous as mercury, and lead much less so, while its action is also slower. Seeing that bitter pit is much more abundant in well-tended orchards than in neglected ones, it has been suggested that cultivation may be responsible by causing the roots to grow deeper than usual, and thus interfere with nutrition. This, however, is improbable, although it might be true if the subsoil contains minute traces of poison. The injurious action of copper sulphate and other soluble metallic poisons to Apples may be lessened by the addition of substances which decrease the percentage of free ions, and on these lines it may be possible to modify even such relatively insoluble spray poisons as Bordeaux mixture and arsenate of lead without appreciably affecting their value as insecticides and fungicides. It is shown that ozone, ammonia, and nitric acid present in the atmosphere are able to produce surface pitting in Apples. In conclusion, Dr. EWART points out that bitter pit is, strictly speaking, not a disease, but a symptom of local poisoning produced in the sensitive pulp cells of Apples; that more than one poison may produce it, and that such poisons may be derived from more than one source.

NURSERY EMPLOYÉS SOCIAL EVENING.—On the evening of Friday, the 20th inst., an entertainment was given by Messrs. DOBBIE & Co., Edinburgh, to the members of their staff, at the Oak Hall, Princes Street. The company numbered more than 200. The chair was taken by Mr. W. CUTHBERTSON, who referred in appreciative terms to the work of the staff, both at Edinburgh and at Mark's Tey. The employés at Mark's Tey were also entertained on the same evening, under the chairmanship of the manager, Mr. ANDREW IRELAND.

MR. THOMAS HUMPHREYS.—The many friends of Mr. THOMAS HUMPHREYS, Curator of the Botanical Gardens, Birmingham, will learn with deep regret of the sad bereavement he has sustained in the death of his wife, which occurred on the 20th inst. from pneumonia, contracted shortly after an operation. Mrs. HUMPHREYS was well known to exhibitors and others in the habit of visiting the Daffodil, Auricula and other shows held in the Edgbaston Conservatory, and those from a distance have frequently received from her evidences of the extraordinary kindness that was her principal characteristic. Her unexpected demise will be lamented.

WHEAT EXPERIMENTS.—In order to test the yielding capacities and quality of several French and certain other varieties of Wheat, the Irish Department of Agriculture carried out a series of field tests at the Albert Agricultural College Farm, Glasnevin, in 1911. The results of these tests were published in the Department's *Annual Report on Wheat Experiments* for that season. The tests have been repeated this year, and the list has been supplemented by four other varieties. Three of these were Danish Wheats imported from Copenhagen, and one a variety grown to some extent as a spring Wheat in Counties Carlow and Kildare. The yields for 1912 are, with one exception, considerably below those for 1911. The average yield of Wheat on the farm for a number of years past has been about 12 barrels per statute acre. All the French Wheats show a large decrease, and the only increased yield for the whole series is that of Red Fife, the seed of which was obtained from the produce of some hand-selected ears grown in 1910. The three Danish varieties, Queen Wilhelmina, Tystofte Small Wheat, and Danish Square Head, gave very good yields. In point of quality, Red Fife was undoubtedly the best Wheat of the series, next in order coming Burgoyne's Fife. Queen Wilhelmina, a white Wheat, may be placed next, and then, a long way behind, White Marvel. Tystofte Small Wheat and Danish Square Head are varieties of the Square Head Master type, but not so coarse. The French varieties, with the exception of White Marvel, are very poor quality, Dreadnought and Perfection being wholly unsuited for milling requirements. The partial failure of Perfection this year was, in a large measure, due to bad germination of the seed. April Red, a variety resembling Red Fife in shape of ear, excepting that it has a distinct awn, is a late spring Wheat. In yield it does not equal Red Fife, to which variety it is also inferior in quality. Regarding the two new hybrid Wheats, Little Joss and Burgoyne's Fife, while the former is undoubtedly the heavier yielder, in quality it is greatly inferior to Burgoyne's Fife. Other things, such as quality of straw, being equal, there is nothing to recommend Little Joss in preference to Tystofte Small Wheat, a variety which, by reason of its productivity and generally acceptable quality, is grown extensively in Denmark. Of all the varieties tested, Queen Wilhelmina, on account of its yielding capacity and quality, appears at present to be the most desirable Wheat, and certainly merits the attention of Irish Wheat growers.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

RHODODENDRON PONTICUM VAR. AUCUBÆFOLIUM.—I enclose a small shoot of this fine winter shrub with foliage coloured bright yellow and green. The variety is sometimes known as variegatum. The plant is perfectly hardy and is free flowering. A clump of this Rhododendron is attractive all through the year, especially in winter. The leaves are not at all like those of Daphniphyllum, which is sometimes said to be one of the parents. The flowers are mauve coloured, like those of ordinary R. ponticum. *W. A. Cook, Leonardslee Gardens, Sussex.*

FLOWERS AT HOLYWELL, WALES.—During the past season I have noticed the following species in bloom in the neighbourhood of this old country town:—Jasminum nudiflorum, Arabis albida on walls as well as in gardens, Cerastium tomentosum, Pyrus japonica, Ribes, Viburnum Tinus (Laurustinus), Tulips, Polyanthus, Narcissus, Chionodoxa, Snowdrops, Crocus, Daffodils, Hyacinths, a bed more than a yard across of Muscari botryoides, Wallflowers in abundance on walls as well as in gardens, Violas, Auriculas, Polyanthus, Lily of the Valley, Clematis Vitalba (Traveller's Joy), Double Daisies, Deutzia gracilis, Iris hispanica, I. germanica, Pæonies, Wistaria sinensis, masses of Thrift, mossy Saxifrages, Centaurea montana, C. alba, Centranthus rubra (Valerian) on old walls and in gardens, Oriental and other Poppies, Lupins, Iberis corifolia, Lathyrus latifolius (Everlasting Pea), and Lilium candidum (at Wilton, near Ross, Herefordshire, this Lily is planted in quantity in old cottage gardens); Veronica Blue Gem, V. decussata and V. salicifolia, Delphiniums, Campanulas, Pyrethrums, Montbretias, and Campanulas Medium (Canterbury Bells). Against the end of a very old cottage I noticed a large bush of Coronilla Emerus in full flower, and Erinus alpinus on an old wall, whilst in a narrow border in a backyard the common purple and white Balsams were growing breast high. Rhus typhina, Epilobium, angustifolium, Michaelmas Daisies, and Chrysanthemums are common, and in a neglected garden were several plants of Yucca gloriosa in flower; last year I saw many plants of Yucca with inflorescences in an amateur's garden on the border of the town. Adjoining the Junction

Station platform were a dozen good plants of Kochia scoparia. Roses are not very common, but there are two or three extra good collections; the end of one house was covered with the variety William A. Richardson. Laburnums cover arches and porticoes. A strip 1 foot wide and 6 feet long in front of a cottage, apparently part of a forecourt before the pathway was paved, had mixed bulbs in spring and, later, dwarf Nasturtium and a few other annuals. All the above plants, it will be noted, were in the streets except in three or four cases. There are numbers of large Apple and Pear trees in gardens at the back of dwellings, most of them, with flat tops 15 feet to 20 feet across, and severely pruned. The larger Pear trees are of the varieties King Pear, Marie Louise, and Jargonelle. *W. P. R., Fron Haul, Holywell, November 14.*

RIPENING OF WOOD IN FRUIT TREES.—Many growers contend that it is essential that the wood of fruit trees should be well ripened in order to ensure success. What difference can it make to a tree in the production of fruit whether the wood be well ripened or not? I have had 30 years' experience in fruit growing, and I cannot refrain from stating that there is absolutely nothing in this ripening of the wood theory. During the hot summer of 1911 the wood was thoroughly ripened, but the fruit crops this year were not exceptional. In the majority of gardens, I fear that they were practically a failure, especially Apples and Pears, whilst Plums were, in some, only an average crop. The reason was an insufficiency of moisture at the roots, whilst the trees were making their growth, and should have been forming fruit-buds. Experience teaches me that to be successful with fruit growing, ripe wood is not so essential as moisture both at the roots and overhead. In 19 cases out of 20 the fruit crops are better after a wet season than a dry one. Can anyone then explain why such is the case if ripening of the wood plays such an important part? If growers would pay more attention to the roots, in the way of root pruning and feeding, we should hear less of failures. Everyone is aware that large crops of fruit are obtained from trees on north walls where practically no sun can reach the wood. *L. S. Small, Malshanger Park Gardens, Basingstoke.*

LATE PEAS.—We gathered pods of Gradus Pea so late as the second week in December. The seeds were sown in the first week of June in heavy soil, and the crop was an excellent one. Is this a record? *Wm. G. Pallenden, Westwood Gardens, West Meon, near Petersfield*

HAMAMELIS MOLLIS.

THIS handsome shrub was first figured and described by Professor D. Oliver in Hooker's *Icones Plantarum* t. 1742 (1888), from dried specimens collected in Hupeh by Dr. A. Henry; but Messrs. James Veitch & Sons had it already growing in their nurseries, raised from seed sent home from the more eastern province of Kiukiang by Mr. Maries, in 1879. Some account of this will be found in the *Gardeners' Chronicle*, xxiv (1898), p. 364, and further particulars in xxxiii (1903), p. 185. The same year a coloured figure of it appeared in the *Botanical Magazine*, t. 7,884. Hamamelis mollis is undoubtedly the most ornamental of the genus, and it may be distinguished, when in leaf, from its congeners by the dense white tomentum on the under surface of the leaves. The flowers are perhaps of a brighter yellow than those of the other species, and the seeds are white, whereas those of H. japonica are black and highly polished—at least, all that have come under my observation. If my memory serve me rightly, there are black-seeded and white-seeded species of the allied genus Corylopsis. A bush of H. mollis may be seen at Kew immediately to the right on entering by the main gates from the green. *W. B. H.*

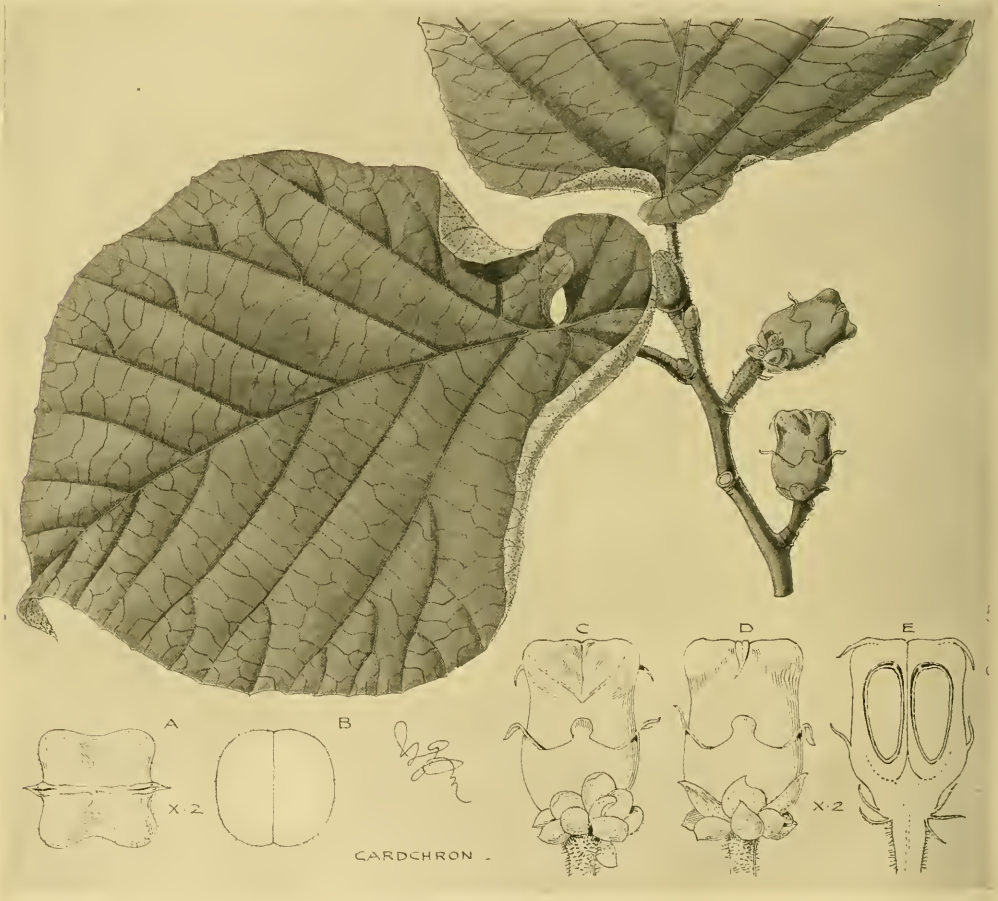

FIG. 211.—HAMAMELIS MOLLIS IN FRUIT.

A, capsule seen from above; B, cross-section of capsule; C and D, different aspects of the same; E, longitudinal section showing the attachment of the seeds of which there is one in each cell.

THE CABBAGE FLY.

A STUDY IN ECONOMIC ENTOMOLOGY.

June was near its end, and I was preparing for a little rest and change, so I went into the garden to see what there might be of interest for me to observe. As my eye passed down a row of newly-planted Cabbages, it was evident that something was amiss with at least one of the young plants. It showed signs of sickness and decline. I remembered that last year there had been a similar appearance, and that it was due to some kind of maggot at the root. On lifting the plant, I found again that there was a maggot at the root, and there could be little doubt that one of the Cabbage flies (Anthomyia radicum) was the offender. Instead of instantly consigning the creatures to the flames, I made a note of the date and of the origin and number of the maggots and placed them, with about an ounce of mould, in a cocoa tin, intending, in due course, to study their movements.

Six weeks elapsed before I took up the tin and read the note. On opening the lid to see if, after the lapse of so long a period, anything was to be learned, I found a fly fluttering away to the window, then another, and a third. The window being closed, it was possible at once to capture them and place them in a tube. Here, then, was the first observation—at the end of six weeks there were living flies. These had come from the larvæ, and, therefore, the larvæ must have pupated. But what of the other dozen or more maggots which had been placed in the box? On turning out the mould it was found that about half-a-dozen flies had emerged and died in captivity. Here was another fact, the value and interest of which will shortly appear. Empty brown chrysalis cases were found, then some which were not vacated, showing that a part of the flies had not yet emerged. No maggots remained, but the number of pupa cases, full or empty, agreed so well with my record—"about 20 grubs"—that there was no doubt all had passed into the chrysalid state.

A little further examination revealed the presence of about four different species of plant mites, three species of white worm, and a beetle larva. Some, at least, of these were evidently parasites, or, at least, retainers and followers. They could only live where the fly lived, or where the fly had prepared the way.

Now observation by itself is of but limited value. Everyone with eyes can see, and all who have ears may hear. But the question is—what do we see or hear? Only that which we bring the powers to understand. We must have, in the first place, accuracy, detail, true and full particulars; but that only supplies the groundwork. The next thing is the power to draw reliable conclusions from what has been observed. Two men observe a cloud. To one it is just a cloud and nothing more: to the other it is the precursor of a storm. The first passes on and suffers: the second makes ready for the downpour, and escapes the wetting. So two men work in the garden. Each sees his fruits and vegetables suffer. One is content with the observation: the other discovers the cause, and reasons out for himself the plan to be adopted for their future safety.

What, then, do the facts recorded respecting the Cabbage fly teach us? The lessons are many and important. Thus we find that, while some flies attack the leaf, at least one species works its mischief at the root. Where the seat of the evil is, there must the remedy be applied. If one fears that the seed-bed has been attacked, he will place the roots of his plants in some preparation which will have the effect of destroying the eggs or newly-hatched grubs. Next we have the life-history. Maggots in June, pupæ in July, flies in August. This observation is a limited and imperfect one, yet it is full of instruction. We learn that the flies do not all develop and emerge exactly in the same period or at the same time. On August 15, some flies were newly hatched, while some had died already in confinement, and others were waiting to emerge. See the meaning of this. If all took to the wing the same day, they might find the conditions adverse, and the whole brood perish. But, by emerging successively, a few at a time, they secure for their destructive race the largest possibilities, and make their offspring a perpetual source of anxiety. For it would be a poor garden and a very bad season which did not afford some of the flies an opportunity to lay their eggs. Thus we learn that constant watchfulness is necessary if the Cabbage fly is to be kept in check, and are forewarned that the moment a sickly Cabbage is observed, every grub at its root should instantly be secured and destroyed.

But even here our study does not end. When the larvæ change into pupæ, new forms of life appear. And as the flies leave their breeding-place they are attended by a number of parasitic mites, which they distribute right and left as they flit among the plants, and so carry other deadly forms of infection. While further, white worms, which need some form of decaying vegetable matter for their pabulum, haunt the place where decay has set in, and soon become so numerous as to prove a further terror to the gardener.

Apply all this to practical horticulture, and see what it means. We make a simple observation in our plot of Cabbages. Perhaps we do no more; then we leave the pest to multiply and become a constantly-increasing curse to ourselves and others. Or we go a little further and pull up the sickly specimens, and consign them to the rubbish heap. Here we have even wrought a greater evil than that of mere neglect, for we have placed the maggots in the way, perchance, of a freer and readier transformation. But if we are wise, we shall not play the priest and pass by, or the Levite and observe: we shall take the matter seriously in hand, and do our best to remedy the evil. When we can learn first to observe, then to examine, and finally draw from our observations right conclusions, we shall begin to be of service to mankind and the world. But all this means that we must have brains, and, further, that we must exercise them with patience, persistence and devotion, for thus and only thus is success to be ensured.

The lines which I have followed in this particular study are, *mutatis mutandis*, those which are to be followed generally in the study of economic entomology, and every working gardener may find at any season of the year some subject to which he may devote his attention with pleasure and profit.

For the guidance of the practical gardener and the economic entomologist, it may be well to give a few details respecting the species of Cabbage fly which we have been discussing. The imago or perfect insect is figured in Miss Ormerod's *Manual of Injurious Insects*, 2nd Ed., 1890, p. 25. The maggots are "whitish, cylindrical, and legless, tapering to the head, and blunt at the tail, and when full grown they are about the third of an inch long." In due time they change into pupæ, with brown cases, from one-fourth to one-third of an inch (or 5 to 6 mm.) in length, and 2 mm. broad. Within these cases the flies undergo their final change, and in a state of nature may emerge in about two or three weeks from the time when their cocoons are formed. The flies measure about half-an-inch in length, as well as in the spread of the wings (i.e., from tip to tip), and there is a marked difference between the male and female. The eyes are large and brown, the body dark grey, with stripes on the sides, back, and abdomen of the male. The fly is strong on the wing, and may be met with from early summer on to November. It appears that the autumn broods pupate and remain in the soil as chrysalids during the winter, ready to emerge and lay their eggs as soon as the young Cabbages are ready for them. *Hilderic Friend, Swadlincote.*

Fig. 212.—POLYGONUM CAMPANULATUM; FLOWERS PINK AND WHITE.

POLYGONUM CAMPANULATUM.

About 70 different Polygonums are found in the Himalayas, including several important garden species. One of the most valuable is the handsome P. polystachyum, which forms a bushy plant about 5 feet high, covered in the late autumn with panicles of pink and white flowers. The pretty little P. sphærostachyum grows only a foot or so high, and produces heads of rich, red flowers. It is a suitable plant for growing in moist, shady places, but P. campanulatum (see fig. 212) flourishes in the open border. The latter belongs to the same section as P. polystachyum and P. molle, two well-known garden plants, and forms a bushy plant from 2 feet to 3 feet high, with much-branched stems, terminating in cymes of pink flowers in September and October. The petioled leaves are elliptic-oval in shape, with acuminate points, the upper surface of the leaf being green, while the underside is covered with a fibrous brown tomentum. Three varieties, differing chiefly in the amount of tomentum on the underside of the leaf, are found in the temperate and sub-Alpine Himalayas of Eastern Nepal and Sikkim, at an elevation of from 9,000 to 12,000 feet. The plant illustrated in fig. 212 was received from Miss Shaen, of Binfield, who obtained seeds from Calcutta, and first flowered it in September, 1910. The species is quite hardy, and, the growth being dwarf and compact. Direct sunshine causes scorching, especially if the soil is light and dry, therefore it is best to plant it in a rather shady position. Like many other Polygonums, this species produces underground creeping stems, but not to the same extent as the Japanese P. cuspidatum; the stock may be easily increased by division of the clumps. *W. I.*

PRIMULA FORSTERI.

THE illustration in fig. 213 shows Primula Forsteri growing in a moraine in a position facing the east, where the sun's rays do not reach it. Mr. John MacWatt, of Morelands, Duns, Perthshire, who sends us the photograph, states that the situation seems to suit the plants well, as they keep in good health, grow splendidly, and flower with remarkable freedom. Mr. Farrer describes* Primula Forsteri, of the Brenner Alps, as a natural hybrid from Primula hirsuta, crossed with P. minima, and as having a closer resemblance to this latter parent. The flowers are rose-coloured.

PROGRESS OF HUSBANDRY.

THE Presidential Address on "Early Associations for Promoting Agriculture and Improving the Improver," delivered by Mr. T. H. Middleton before the members of the Agricultural Section of the British Association last September, is full of interesting historical details, as will be seen from the following extracts. It appears that Dundee itself had much to do with the first associations for improving agriculture, for, in 1796, James Donaldson, a Forfarshire agriculturist, made a vigorous appeal for the establishment of such societies amongst farmers. Mr. Middleton states that interest in the practice of improved husbandry was first aroused in England by the books of Fitzherbert, and that it "was between 1523, when Fitzherbert's *Boke of Husbandry* was first printed, and 1557, when Tusser published his *Points of Good Husbandry*, that the classical writers began to exert a direct influence on English farming. In 1532 there appeared Xenophon's *Treatise of Householde*, 'ryht counnyngly translated out of the Greke tonge into Englyshe by Gentian Hervet,' which at once became popular and ran through a number of editions. At least as early as 1542 editions of the works on agriculture and gardening by Cato, Varro, Columella, and Palladius were published in England, and they must certainly have been known to Tusser, for in his *Five Hundred Points of Good Husbandry*, composed some years later, there is clear evidence of the influence of the writings of Xenophon and Columella.

Mr. Middleton shows that "the awakening of interest in husbandry was largely due to the rapid changes in the economic conditions of England which set in about Fitzherbert's time. These changes we cannot now discuss, but their magnitude may be indicated by the rise in price of the single staple—Wheat. According to Thorold Rogers, the average price between 1400 and 1540 was 5s. 11¾d., the decennial averages for the last four decades being 5s. 5½d., 6s. 8¾d., 7s. 6d. and 7s. 8½d. Between 1541 and 1582 the average price was 13s. 10½d., and 16s. 8d. for the last 12 years of this period. Between 1583 and 1642 the average price rose to 36s. 9d. In particular years high prices were reached, and in 1596 and 1597 Fleetwood chronicles prices of from 80s. to 104s. per quarter.

"The change in the cost of living directed men's attention to the husbandry and housewifery recommended by Fitzherbert and Tusser. The smaller landowners, who could no longer afford to live on their rents, and who saw that yeomen and tenant farmers were prospering, turned their attention to farming, and agriculture became an important occupation of the educated classes.

"The yeoman and tenant farmer did not ask for text-books on agriculture, but the new agriculturists required information, and thus there arose at the end of the 16th century a great demand for books. The booksellers were not slow to make provision for the demand, writers were secured, books were published, and of the more popular many editions were sold.

"At the end of the 16th century the practice of Continental farming began to attract attention in England, and a further proof of the demand for information which then existed was the translation in 1600 of *Maison Rustique*, a French work by two doctors of medicine, Charles Stevens and John Liebault. This volume, which in its English form is known as the *Countrie Farme*, contains seven books and 900 quarto pages. It is intended to be a complete guide for residents in the country, and deals with everything that the landowner wants to know, from the care of his health to forecasting the weather.

"The English agriculturists of the 16th century went abroad for more than books. Gerarde, who like others of his profession deserted medicine to the great advantage of botany, had obtained a number of foreign plants for his collections. From the gardener, too, England learned of the skill of the Flemings, and would gladly have copied their practice; but the Flemings were too busy to write books; so Englishmen went to see for themselves how and why they prospered.

"Sir Richard Weston, a Surrey landowner, who succeeded to his estates in 1613, and who had travelled in Brabant and Flanders, was the first English agriculturist to introduce practices approved on the Continent. He grew Turnips for feedings cows, a century before the time of Turnip Townshend; nearly 300 years ago he was experimenting, as we are still doing, with Clover seed grown in different countries; he had 30 to 40 acres of Clover sown with Barley, and he was inveighing against the sophistication of 'outlandish' grass seeds and contriving plans for raising pure stocks at home in the approved fashion of to-day.

"The importance of such crops as Clover, Lucerne, Sainfoin, and Turnips was quickly recognised, and agriculturists wished to hear and read more about the husbandry of the places from which they had come. Information was supplied in the works of the alien writers Plattes and Hartlib; the latter especially, by his *Legacie* and his *Reformed Husbandman*, did much to popularise a knowledge of Continental farming and to suggest 'the errors, defects, and inconveniences of our English husbandry.' Hartlib was a widely-travelled man, and gave our improvers many fresh ideas, among them a suggestion for a 'Colledge of Husbandry,' but we cannot claim him as an English agriculturist.

"It was not only from Brabant and Flanders that travellers brought to England information about foreign agriculture. As one result of the development of commerce voyagers were introducing from distant countries such important plants as the Potato and Tobacco, and were exciting interest by their stories of foreign products.

"In spite of the political troubles of the second quarter of the 17th century, agriculture continued to secure increased attention, for England had learned that in war or peace the food supply must be cared for, and the importance of corn growing increased with the rise in prices. Thus, when the Commonwealth was established, everything favoured a forward movement. The first practical farmer to plead the cause of the improvement of agriculture was Walter Blith, one of Cromwell's soldiers, who is supposed to have been a Yorkshire landowner, but who, for some years at least, was stationed in Ireland. Blith was himself an ardent agriculturist, and

FIG. 213.—PRIMULA FORSTERI GROWING IN A MORAINE.

* *The Rock Garden* (Present-day Gardening Series).

prefaced his practical book, *The English Improver Improved*, by seven epistles designed to direct the attention of all classes of his fellow-countrymen to agriculture.

"In 1658 there was issued the first series of abstracts of agricultural experiments with which I am acquainted, under the title *Adam out of Eden*. The experiments recorded by the author, Ad. Speed, are of considerable interest; but I mention him for another reason. He appears to have made a living by propounding improvements of an imaginary character. He wrote tracts for noblemen and others, containing estimates of the profits to be gained by adopting new methods. Blith scathingly refers to him as 'Mr. Speed that superlative Improver,' and remarks that so long as his books were private 'I could bear it, and suffer wiser than myself to bee fooled because I was not wise enough as to beware of him, but now that they come to be sold in the Stationers' Shops, and spread abroad the country, to deceive, and beguile the Nation, I cannot forbear.' This was written in 1652; as my edition of *Adam out of Eden* is dated 1659, it is clear that the nation continued to be 'beguiled' for a considerable period by this particular Adam, the forerunner of a numerous family. Whenever there is a revival of interest in agriculture he flourishes; the new manure, the ravaging insect, the blighting fungus, all serve to bring 'Adam out of Eden,' and so long as an interested and gullible public exists 'that superlative Improver Mr. Speed' will be found among us. The pamphlet and the stationer's shop have become antiquated; the Adam of to-day has other methods, which I will not venture to particularise. After all, it is a healtby sign. It is only when the public thirst is deep that Adam gets his chance, and, like Blith, we must resign ourselves now and again to 'bee fooled,' for is it not one of the methods by which the Improver is improved?

"Walter Blith's appeal for the assistance of the learned did not long remain unanswered. At the time his *English Improver Improved* was published a society of scientific men had already been formed in London, and ten years later this society first received the name Royal Society, at the suggestion of John Evelyn. On October 15, 1662, Evelyn's *Discourse on Forest Trees* was presented to the Society. Five years later, when the *Sylva* was published, the author, in the preface, tells us that the Royal Society was then doing much for husbandry. Evelyn records his own experience in studying agriculture and forestry, how he had read all the old authors and got but little good from his studies, and he congratulates his countrymen that 'the *World* is now advis'd and (blessed be *God*) redeemed from that base and servile submission of our noblest *Faculties* to their blind *Traditions*.' Again, referring to the absence of a 'compleat *System of Agriculture*, which as yet seems a *desideratum*,' he says: 'It is (I assure you) what is one of the Principal *Designs* of the Royal Society; not in this Particular only, but through all the Liberal and more useful *Arts*; and for which (in the estimation of all equal *Judges*) it will merit the greatest of *Encouragements*; that so, at last, what the learned *Columella* has wittily reproach'd and complained of, as a defect in that *Age* of *his*, concerning *Agriculture* in general, and is applicable *here*, may attain its desired *Remedy* and *Consummation* in *This* of *Ours*.' He then quotes Columella's remarks about the Schools of Rhetoric, Geometry, and Music, and the absence of agricultural professors and scholars.

"John Evelyn was one of the prominent members of the Royal Society, and he seems to have taken a leading part in defending it against the attacks to which, in the first years of its existence, it was subjected. With much satisfaction he points out, in dedicating the second edition of the *Sylva* to King Charles II, that his essay and the work of the Royal Society have in the past eight years resulted in the planting of over two million timber trees.

"With the exception of the 'Societies of Learning and Gallantry' of the 'Houses of Court and Universities' addressed by Blith, the Royal Society is the earliest to which any influence on agriculture may be traced, and it is certainly the first society which definitely included the improvement of agriculture as coming within its scope. It appears to have depended in no small degree for its early successes on the public interest aroused by the writings of Evelyn and Houghton, and there is evidence that the Society gave much attention to agriculture during the second half of the 17th century, and that its patronage was much valued. The immediate influence of the Royal Society may be traced in Worlidge's *Systema Agriculturæ*.

"Evelyn's *Pomona*, in which he discourses of fruit trees and cider, gives an interesting glimpse of some of the early activities of the Royal Society, for the work itself is based chiefly on contributions by members of the Society to its '*well-furnish'd Registers, and* Cimelia.' Evelyn himself was not practically acquainted with cider-making, and his own interest in the subject, like that of the majority of his fellow-members, was Baconian—i.e., it consisted in a search for 'grounded conclusions and profitable inventions and discoveries.' Possibly, too, the badness of the French wines of the period had some share in directing the attention of the Fellows of the Royal Society to cider, for as early as January 28, 1662, they listened to a discourse on the Adulteration of Wine, by Dr. Charleton.

"In other ways the members of the Royal Society encouraged one another in making improvements; thus when in 1666 Evelyn's 'worthy friend' Mr. Hake went on a journey, he returned carrying with him—for 800 miles—some grafts for Evelyn, together with a 'taste of the most superlative perry the world certainly produces.'

"The proposal made by Worlidge was unheeded at the time, for not until nearly a century after his suggestion was made did English Agricultural Societies begin to appear. A retrograde movement set in soon after the Restoration, and although the Government sought to foster improvements and passed several Acts with the object of stimulating farming, Harte tells us that a 'total change of things, as well as the very cast and manner of thinking, joined with immoral dissipation, and a false aversion to what had been the object and care of mean despised persons, soon brought the culture of the earth into disrepute with the nobility and gentry.'

"An insight into the conditions of the last quarter of the 17th century and the first quarter of the 18th is given us by Lisle, who wrote the Introduction to his *Observations on Husbandry* in 1713. He begins by remarking that it is one of the misfortunes of the age that it lacks honourable conceptions of a country life, he draws attention to the fact that in the decadent days of Rome luxury increased and husbandry was neglected. He calls on the landowner to look around him and see how many fine estates are daily mortgaged or sold, 'and how many antient and noble families destroyed by the pernicious and almost epidemic turn to idleness and extravagance.' He discusses at length the advantages of an agricultural career and recommends it as a profession for the eldest sons of gentlemen, who might regard it as 'a school of profit and education; whereas,' he continues, 'it is rather looked on as a purgatory for the disobedient, a scene of punishment, to which a son, who answers not his father's expectations, is to be abandoned; or a condition of life of which none would make choice, but such whom fortune has not in other respects favoured. If the country gentlemen therefore frequently consist of persons who are either rusticated by their parents in anger, or who, making a virtue of necessity, settle on their estates with aversion or indifference, it is no wonder the comedians exhibit them on our stage in so despicable and ridiculous a figure; but this is the fault of the persons and not of the art. Were they properly initiated in the study of Agriculture, and pursued it as they ought, it would be so far from excluding them from useful knowledge, and bringing them into contempt, that I may venture to assert, they would find it the best school of education, and the fittest to prepare them for the service of their country in the two houses of parliament of Great Britain.'

"Such were the dispiriting social conditions with which the successors of Evelyn in the Royal Society had to contend. The agricultural experiments of the Society, therefore, attracted but little attention outside the ranks of the curious. Houghton, a contemporary of Evelyn's, started a periodical publication, *Houghton's Letters*, but it soon ceased. A generation later, and about the period to which Lisle refers in the above quotation, a work on husbandry was written by a Fellow, John Mortimer. It is dedicated to the Society, 'to whose encouragement, inquiries, and direction it owes its birth.' Special thanks are given to another Fellow, Dr. Sloane, who assisted the author, and 'has greatly contributed to the advancement of useful knowledge.'

"Testimony to the activity of the Royal Society at this period is also to be found in a work on *Curiosities of Nature and Art in Agriculture and Gardening*, a translation from the French of the Abbot de Vallemont by Bishop William Fleetwood, published anonymously in 1707; this work contains the passage: 'The Royal Society of *England* who are so zealous for the Perfection of Agriculture and Gardening, have apply'd themselves with great Care to find out the true way to make Salt-petre, which they likewise allow to be the chief Promoter of the Vegetation of Plants.'

"About this time botanical questions of much interest to agriculturists were occupying the attention of the Royal Society. Robert Ball and Samuel Moreland were investigating reproduction in plants, and a few years later Richard Bradley, another Fellow, Professor of Botany at Cambridge, but more of an agriculturist than a botanist, was explaining how, by cross-breeding, 'such rare kinds of plants as have not yet been heard of' may be produced. He refers specifically to a cross between a Carnation and a Sweet William, but by inference to Burgoyne's Fife and the other things 'not yet heard of,' that are associated with agriculture and botany in the Cambridge of to-day.

"William and Mary were patrons of horticulture. They greatly improved the Royal Gardens, and the nobility, in imitation, laid out parks and *parterres*. This demand gave opportunity to the professional gardener, and the garden designer and nurseryman started business. It likewise gave authors their opportunity, and that it was well taken advantage of is proved by the popularity of Miller's *Gardeners' Dictionary*, written by the Gardener of the Botanic Gardens at Chelsea, and dedicated to Sir Hans Sloane, President, and to the Fellows of the Royal Society.

"A second writer on gardening of this period, the Rev. John Laurence, of Bishop Weremouth, Durham, may be mentioned, for he was also one of the chief agricultural writers of the first half of the 18th century. In 1726 he published a large folio work entitled *A New System of Agriculture*. This book marks the time when what the author calls the 'Spirit of Gardening' appeared, and it proves that gardening was very popular with the landed and educated classes for some years before the revival in agriculture began. Incidentally he refers to the condition of the North of England, and says that the county of Durham may properly be termed the Garden of the North, such are the possibilities of improvement afforded by its soil and situation and the 'hasty Diligence of a wise and polite People.'

"Although for 70 years after its formation, and throughout a period during which agriculture was neglected by the landed classes, the Royal Society did much to keep alive the Spirit of the Improver, the unfortunate apathy of the agriculturist prevented that progress which appeared to be imminent when John Evelyn wrote his *Pomona*. It was not possible for a learned society in London to investigate agricultural questions in the absence of the scientific agriculturist himself; subjects of agricultural interest were therefore discussed chiefly from a theoretical standpoint, and, neglecting the teachings of Bacon and the example of Evelyn, there arose that use of the deductive method which in the past two centuries has done so much to hinder the progress of agricultural science.

"The first to show the fallacy of the deductive method in studying this subject was Jethro Tull, who, though he himself fell into the errors which he condemned, was, in his understanding of the true relationships of science and practice, far ahead of any of his contemporaries. A lawyer by training, he probably took to agriculture because of his poor health. He worked at it for 20 years before he was induced to set out his views in writing, and it was years after he began farming before he read anything on the subject. Dissatisfied with the practice of his times, he set himself to reason out new methods and to make experiments. He got suggestions from foreign travel; he tells us, for example, that the first hint of the value of horse-hoeing

husbandry was derived from the ploughed vineyards of France; but he was careful to submit his ideas to the test of experiment before he adopted them in farm practice. He lived a lonely life, and until the fame of his farming spread abroad and he published his *Horse-hoeing Husbandry*, in 1730-31, he appears to have devoted himself entirely to experiments in farming. The appearance of his book occasioned much correspondence, and thereafter he made himself acquainted with both the ancient and modern writers on husbandry, and used his knowledge to good effect in his argument with the writers whom he terms collectively *Equivocus*. His temper, which, if one may judge from his references to his labourers, was far from serene, was much tried by his controversies with *Equivocus*, and his criticisms of the writers and scientific men of the preceding half-century are severe. He remarks, for example, on the superficial knowledge of agriculture shown by 'Mr. Laurence, a divine; meagre were Tull's opportunities for study, that he lived a retired life in the country, that he had long abandoned letters for practical farming and only began to read the works of others late in life; if, further, we remember that his health was bad, and that his appliances for scientific study were indifferent—'my microscope, indeed, is but a very ordinary one,' he writes—we must give him a foremost place among the scientific agriculturists, not only of the 18th century, but of all time. His wide knowledge and keen reasoning place his *Horse-hoeing Husbandry* in a class by itself among the works of the early improvers.

"Jethro Tull's great work was published two generations after Walter Blith first endeavoured to awaken the Spirit of the Improver in English farmers. Throughout this period not much progress had been made, but a change was at hand. When in 1730 Turnip Townshend left politics and went down to Norfolk to farm his estates,

FIG. 214.—BEGONIA CLIBRANS' PINK.

Mr. Bradley, an academic; Dr. Woodward, a Physician; Mr. Houghton, an Apothecary; these for want of practice could not have the true theory; and the writers who are acquainted with the common practice, as Mr. Mortimer (whether for want of leisure, or not being qualified, I do not know), have said very little of any theory.'

"Tull himself, a thoroughly experienced, practical farmer, whose successful methods had drawn widespread attention to his Berkshire farm, showed no hesitation in setting out his own views on roots, leaves, the pasture of plants, and other scientific subjects then engaging attention. His remarks were based on original observations, and it is clear that he did not merely copy opinions from scientific treatises. He freely criticised the writings of others; even 'Mr. Boyle' and that 'miracle of a man Sir Isaac Newton' are severely handled by this critical farmer, and in a characteristic sentence he remarks: 'From Sir Isaac's transmutation arguments we may learn that a man never ought to depend entirely upon his own for support of his own hypothesis.' When we remember how the tide had turned, and henceforward throughout the 18th century there was a rapid improvement in the practice of English agriculture."

BEGONIA CLIBRANS' PINK.

THE flowers of this fine winter-blooming Begonia measure 3 inches across, and are coloured bright pink; they are developed in large trusses, and there are sometimes as many as 13 blooms in a cluster. As will be seen in fig. 214 a well-grown plant resembles a posy of flowers, set off by the leaves, which are dark green in colour. Plants of this beautiful variety were exhibited by Messrs. Clibrans in a collection of these flowers at the meeting of the Royal Horticultural Society on November 19, when its superlative qualities showed to advantage amongst numerous other varieties. This variety gained an Award of Merit from the R.H.S. Floral Committee on November 10, 1908.

PRUNING COMPETITION AT MADRESFIELD.

THE Agricultural Club at Madresfield Court has held a pruning competition for several years past, and there is no lessening of the enthusiasm shown both by competitors and spectators. The competition of this year was held on November 30, at the Braunford Court Farm, on the Madresfield estate. The subjects selected for pruning were Apples, Plums, Gooseberries, and Black Currants. The Apple and Plum trees ranged in age from 7 to 14 years; some were growing in Grass and some in arable land; and standards and half standard trees were included. Most of the Gooseberry and Currant bushes were full grown, so that all the plants were well established. Stewards were appointed to carry out the arrangements for the competition. They had the power to stop any pruning which they judged to be ignorant and unskilful: and this power is occasionally exercised.

The competition is usually divided into three classes—(1) for juniors, who have had no previous experience; (2) for more advanced and experienced pupils; and (3) for fully qualified pruners—the "Champion" Class. This year there were four entries in class (1), nine in (2), and six in (3). The time for each kind of tree is limited to one hour.

Black Currants were operated on first, a row of bushes being assigned to each pruner. As it is impossible to obtain several rows in which the trees are all alike in character and size, the judges take these circumstances into account when assigning the points. When the Currant bushes were finished, the Gooseberries were pruned. The competitors were watched closely during the whole time they were at work, not only by the judges and stewards, but also by visitors who take a keen interest in the contest. The Plum trees were taken next; the pruning of these trees requires care and deliberation, and the steps and saw were occasionally brought into requisition. The Apples were pruned last.

In awarding the points ten each may be given as the maximum for (1) good workmanship, (2) balance of work after the tree is finished, (3) general excellence, (4) expedition combined with good work. The marking was done by the judges during the progress of the work. Money prizes were given in each class, and a pruning knife was presented to every unsuccessful candidate.

Instruction in pruning is given to any applicant nominated by the members, by an instructor appointed by the club. The pupils are required to attend for instruction on five consecutive days, and are then permitted to qualify for competition. If they satisfy the instructor that they have profited by his instruction, they receive the sum of 12s. each.

The Madresfield Agricultural Club is probably the first to institute an annual pruning competition, though other clubs have since taken it up.

The pruning was on the whole uniformly good. This year the competitors did exceptionally well, and the mistakes were surprisingly few.
