PLANT COLLECTING IN YUNNAN.

HOW many of those who wander through English gardens pause to ask where the different flowers come from and what their natural habitats are like?

A Primula, for example, a Phlox with lovely pink flowers, or a Didymocarpus arrests the eye; but can we picture them in their native home? It may be that great naturalist-traveller Fortune introduced this plant from China more than 30 years ago; that, perhaps, was brought back from Bhotan some 70 years since by the late Sir Joseph Hooker.

Of more recent collectors, Dr. Augustine Henry and Messrs. Wilson and Forrest have introduced many a beautiful plant from remote China. The great mountain ranges of the world—the Andes and the Rockies, the Himalayas, the Karakorum, and the vast ranges of Western China—have been put under tribute to make our English gardens what they are to-day.

It is worth going a long way to see an Alpine slope purple with dwarf Primulas or scarlet with Azaleas, to behold a rich meadow full of waving grasses yellow with Meconopsis integrifolia, or to gaze upon groups of the magnificent Lilium giganteum herded together in the forest, each stem 10 feet high and bearing aloft a dozen immense white, trumpet-shaped flowers.

But to see a single plant of the Cambridge-blue Meconopsis, even though its specific rank be as yet undetermined, is worth a lifetime or a king's ransom. Picture the scene as we approach the limit of plants on the great rocky mountain chain which separates the Mekong from the Yang-tze, barely 30 miles distant from it as the crow flies.

The forest has long since died away, the last straggling dwarf trees lie 1,000 feet below us. The shrub belt has also been left, and the scrub Rhododendron has dwindled to dwarf species rising only a few inches from the ground; soon these too die out, and we reach a short turf with tufts of Saxifrage amongst the rocks. Bleak and bare the precipices tower above us, and vast screes, with

Fig. 1.—THE MEKONG-YANG-TZE WATERSHED, SEEN FROM THE TSA-LEI-LU, AT 15,800 FEET ELEVATION.

huge, angular lumps of rock, litter the slopes. A biting wind comes screaming over the pass and chills us through, hot from our long climb; wraiths of cloud form out of nothing, disappear, and reform around the limestone towers.

We are over 17,000 feet above sea-level, but, save in the deep corries and in the shelter of rocks, there is no snow here from June to September. Grim and forbidding, the great, grey masses of rock lie in confusion everywhere, silent memorials of the glaciers which long ago moulded these hanging valleys to their present form.

And amongst these grey boulders we must look for the Cambridge-blue Poppy. We shall never find it in masses, nor even several plants together, but "remote, unfriendly, alone." Despite its solitary state, we see it from afar.

Well do I remember the first plant I saw—I thought at first that it was a blue stone, yet I climbed over the scree to make sure, for a light blue stone in a grey world is not a thing to pass by at 17,000 feet. Even then I could not believe my good fortune. I thought it was a "sport," handsome, no doubt, but not likely to be repeated. Nor was it a very good specimen, for it had opened early; it was only the end of June, a bitter grey day, with scudding cloud, which obscured the sun and toned down the overwhelming brilliance of the light at these altitudes.

But in July I returned, and there were scores of these wonderful Poppies peeping up from the dark cavities of the scree or sheltering beneath scattered boulders. Each flower was an inch across, of a bright Cambridge blue, with a mass of golden stamens in the centre.

I had to hunt for them, but though they were in hiding, there they were; rarely did the plant exceed 12 inches in height, but 8 or 10 flowers, each borne on a short pedicel, springing up parallel to the main axis, was no uncommon sight.

Then the full joy of collecting in the waste places of the earth burst upon me, and my heart rejoiced.

Can anyone call to mind a flower of a perfect Cambridge-blue which is not "washy"? Probably not, for it is an uncommon colour. Imagine, then, these glowing gems in that cold, grey desert of rock up at the extreme limit of flowering plants, towards the everlasting snows of north-western Yunnan. A field of such Poppies would be a sight for the gods to feast their eyes upon, and for mortals too great a joy.

In autumn, when the wind was ripping to ribbons the blasted vegetation, and the snow was creeping down, I returned to the haunt of the blue Poppy and harvested great quantities of seed, some of which has already germinated at the Edinburgh Botanic Garden.

The plant is not, I believe, new to science, but new to horticulture it certainly is, and, should it survive, it will, we may hope, find its way into many

famous English gardens and rank for all time amongst the unsurpassables.

On the more rainy mountain barrier which separates the Mekong from the Salween, we passed through meadows of sulphur-yellow Meconopsis integrifolia—a plant which grows in its thousands, sufficient almost to colour the stream sides; but here we are only 13,000 feet above sea level, and the summer rainfall is enormous. Even more beautiful perhaps are the damp, grassy meadows above the villages in the valley, where, at 12,000 feet, the yellow Primula sikkimensis grows in dense masses, with many other flowers. But enough has been said. Beautiful as are our English gardens, their fascination pales before that of the untamed plants in their savage haunts. *F. Kingdon Ward.*

PROBLEMS OF PROPAGATION.*

I BELIEVE that all plants may be propagated vegetatively—some easily, some with more or less difficulty; and, therefore, in view of the widely-spread impression to the contrary, I think it is worth while to endeavour to remove the misconception. No more appropriate opportunity could come to me than this occasion, when we commemorate the service to horticulture of Dr. Masters, whose life was devoted to establishing a solid groundwork of scientific truth for the practice of horticulture.

It must be said at the beginning that, for practical gardening purposes, vegetative propagation of many plants is a matter of no moment—it is not worth while. Annual plants, for instance, provide in their copious seed production all that the gardener wishes for. But the knowledge that there is no reason why every desirable plant should not be perpetuated and multiplied by the vegetative process of cuttings—provided that insistent requirements are properly attended to—ought to be an encouragement to all gardeners, and should stimulate further endeavour with difficult subjects of the plant world. "It can't be done," in reference to such propagation, is a phrase that should not cross the lips of a gardener.

In order to demonstrate the soundness of the view which I have expressed and wish to sustain, I must, in the first place, recall the construction of an ordinary flowering plant, so far as it relates specially to this question.

The essential thing to remember in regard to one of these plants is that it is composed of a sheet of protoplasm (living substance) stretched over a skeleton. From root-tips to stem-tips and leaf-points there is this living substance distributed in plant-cells—some in more active state, some in less active state, but each cell of it having to start with and retaining more or less for a time the potentialities of every other cell. The plant is, in fact, a colonial organisation.

In ordinary conversation we speak of a plant as an individual, but it is not an individual in the sense in which one of the higher animals is an individual.

From such an individual no part grows up into a new individual, no part can be removed without mutilation. Its organs are highly specialized, and for its individuality it pays the penalty of being mortal.

From the colonial plant, on the other hand, parts may be removed and others formed to take the place of those removed, and, as you know, a removed part may form an entire new plant again. A new plant may grow up from anywhere. Sucker shoots on roots of Cherry, for example; young plantlets on the margin of leaves of Bryophyllum are familiar objects in gardening. All this is possible because every young, active cell has the capacity of every other cell—and the plant is potentially immortal.

Take the case of an Iris. The plant creeps along in the soil, forming additions to its body, branching, growing onwards, whilst its older parts die off. If accident be excluded, there is no reason why the plant should not live for ever.

Apply to a forest tree the conception thus derived from an Iris. The extension here is into the air; but it is of the same character. There is dying off behind of old parts in the heart of the tree, and in the bark that is shed; but a support remains for the copious canopy of branches and leaves. Of the great age reached by some trees we are all cognisant.

There is, then, in the constitution of the plant everything conducing to perpetuation of a vegetative kind. If we wish to utilise the organisation of the plant for multiplication of individuals, it is from Nature herself that we must learn in the matter of vegetative propagation, and all our practice must be based upon and developed out of the principles that we see in operation in Nature.

Let us take a very simple case—that of the Strawberry, or of Saxifraga Brunoniana. Here long branches are sent out, trailing on the surface of the soil. The bud in the axil of the small leaf on such a branch is nourished by the mother-plant at first. Then the stimulus of moisture at the position of the bud evokes the formation of roots below it, the bud shoots out into a branch, absorbs food from the soil and the air, and becomes an independent plant, ultimately losing connection with the mother-plant through withering and breakage of the linking portion of branch. In this we have a process of normal vegetable propagation in Nature, of which the following are the conditions:—

1. The young bud has an ample food-supply from the mother-plant until it has rooted itself.
2. The roots develop in response to the prolonged stimulus of water and at the expense of food supplied by the mother.

These two factors are primary. They underlie all vegetative propagation. Without food-supply, without water, vegetative propagation is impossible, and the gardener has to secure the presence of both of these if he is to succeed in any propagation.

A like case is often seen in large trees of which some of the branches have reached the ground. They are still attached to the mother-plant, but at the point where they touch the ground the stimulus of moisture induces the development of roots, and the end of the branch above this point becomes an independent tree.

What in the tree is usually self-extension in branching, here becomes self-propagation, and the tree imitates the condition of many herbaceous plants.

In the Strawberry and Saxifraga Brunoniana, the mother-plant does not part with the young offspring until the latter is self-established.

But take the case of Dentaria bulbifera. Here there are the so-called "bulblets." What are they? Merely buds in which some leaves have been developed as fleshy stores of food material, and, being thus supplied, the mother-plant casts them early. In contact with water as a stimulus, they form roots at the expense of their store of food material, and the bud elongates as an incipient shoot. The two factors—food store and water stimulus—are operative here.

That such separable propagative bulblets or tuberous bodies of various kinds are not nearly so common amongst dicotylous as amongst monocotylous plants is a fact of phyletic interest, and it is one, too, of this practical import in gardening—that, without these bulblets, corms, or the like, our gardens would be deprived of the enrichment they derive through the free and rapid propagation of monocotylous plants.

But Nature proceeds in another way at times. Supposing an injury has been done, say, to a branch, by which it is broken off near the base. Nature tries to protect the wound and repair the injury by the familiar process of forming a callus. If the stump of the branch be too long, this is ineffectual, and rotting passes down to the centre of the tree. But if the stump be short, or if we assist Nature by clean cutting the base of the broken branch, as in sound pruning, the callus covers the wound entirely, all trace of it disappears, and from the margin of the healing cushion there may be formed many small shoots—miniatures of the branch that was lost. All know also that if a tree has been felled, say, for coppicing, and the clean-cut stump left, from the callus formed all round the margin of the tree many stool-shoots may be formed, and the tree may, in time, through one or more of these, replace the head that has been removed.

This callus is of supreme importance in relation to propagation. It consists of a quantity of indifferent meristem-cells—cells, that is to say, which are capable of dividing and multiplying, but whose fate has not been definitely determined. Circumstances and relative position will determine that. Callus may arise from any mass of living cells under the stimulus of wounding.

In an ordinary dicotylous stem or root, it may take origin in the pith, in the medullary rays, in the cortex, or in the active wood-cambium, and it forms lobulated projecting masses at the point where it occurs. Perhaps, in most cases, the wood-cambium is the most important seat of its formation.

In a monocotylous stem where callus develops, the cortex is the chief seat of formation, but there is a noteworthy difference from dicotylous plants observable in monocotylous ones. They more rarely form a callus, but are content to heal wounds by a cork covering only.

In a leaf, the callus comes from the living cells of the veins.

In all situations the callus has the same potentialities. It is a wound-protecting tissue to

[*Photograph by F. Kingdon Ward.*

* Lecture delivered by Professor I. Bayley Balfour, F.R.S., at the meeting of the Royal Horticultural Society, on June 4, being the eighth Masters Memorial Lecture.

begin with, but its cells may be absorptive, and may also take on the work of restoration of the plant-body by producing organs that have been removed by wounding. It is a sign of the colonial organisation of the plant.

In the light of the knowledge of the facts to which I have referred, the gardener has to solve the problem of propagation by cuttings.

Multiplication by layering is simply putting a mother-plant in a position in which its shoots have ample opportunity of rooting at the nodes, and so initiating new plants.

Multiplication by division is merely the following of Nature's own process, as seen in the increase of an Iris by the dying off behind of its older parts and consequent separation of its newer ones.

Propagation by Cuttings.

Multiplication by cuttings means the isolation from their previous food and water supply of parts not specially prepared to lead an independent existence, and the art of the gardener is devoted to calling out the exercise by the severed part of the plant of potentialities in the direction of wound-protection and in organ-restitution. He has to secure that the part used as cutting retains adequate moisture until such time as new water-absorbing organs are formed through the utilisation of such food material as is already in the cutting, or which it may acquire. The water-relation is the primary one. Once the severed part provides itself with the means of getting a continuous water supply, it is in the state known as "struck." Further development is a matter of time, and, although often very slow, is open to hastening by appropriate stimuli.

The enormous variety of constitution exhibited by plants makes the problem one of no ordinary complexity. Some plants—so-called soft-wooded plants—offer no difficulty. Hard-wooded plants frequently do, and the reasons are obvious. The key is in the water-relation. For other reasons, which I shall afterwards refer to, resinous plants and those that are rich in the milky fluid called "latex" may also be difficult subjects for propagation by cuttings.

Of the many factors which the gardener ought to consider in relation to propagation by cuttings, I can only refer to a few, and I shall begin by saying something about the parts of the plant used.

The most common procedure in propagation by cuttings is that by shoot-cuttings, and the operation is familiar to everyone.

Take an ordinary example of a dicotylous plant. A short terminal portion of shoot, with buds, is cut off from a mother-plant, and the cut end is placed in a nidus of moist sand or other material.

Sooner or later, if the cutting is inserted at a right depth so that aeration is adequate, as the result of wound-stimulus callus forms on the basal end of the stem of the cutting in the soil, and mainly from the cambium. Then roots shoot out. These roots may emerge from the callus, but may come from the stem above the callus as well, or may emerge from there alone, and we see in this how the stimulus spreads from the point of application. The cutting is thus established as an independent plant. The portion of shoot actually placed in the soil elongates at the top, forms more branches and leaves, and we get thus simply an extension of growth of a shoot which is now no longer attached to the mother-plant.

There has been much discussion amongst propagators over the question—ought the leaves at the base of the shoot used as a cutting to be removed or not? Some propagators remove them, others prefer to leave them. I know of no definite comparative experiments bearing on the advantage of one practice over the other. The practice of leaving them has these advantages :—

(a) The cutting is saved the healing of the wound caused by the severance;
(b) the lower leaves sunk in the soil may root like the stem;
(c) the lower leaves will aid in the manufacture of food for the cutting.

No doubt, in many cases, retention or removal is a matter of little import; but the choice might be critical in a particular species, and the point ought, therefore, to be in the mind of the gardener.

Certainly of more importance is the place on the stem of the mother-plant of the mother-shoot where the severing cut for the base of the cutting is made. In some species of plants this makes all the difference between immediate, belated, or no success.

Commonly, the incision is made just below a node, and, for most plants, this seems to be satisfactory. There are, however, plants which propagate far more readily if the cutting be made through an internode.

Take Clematis by way of illustration. The common belief is that species of this genus are difficult to strike, and propagation by grafting and other methods is frequently adopted. They are really not difficult to strike from cuttings if the cutting be made through an internode. Internodal cuttings may be struck within a fortnight. It is otherwise if nodal cuttings are used. These callus well—profusely, indeed; but refuse to form roots, either from the callus or from the internode above. And it is this circumstance which has given rise to the widely-spread belief that it is difficult to strike cuttings of Clematis.

Now, it is well known that once callus formation is started at the base of a cutting, it often continues until a large nodular ball is formed. Some plants—particularly hard woods—appear to possess this habit in a remarkable degree, and it is no uncommon experience to read that certain plants will callus freely but will not root, or only after so long a period—a couple of years or more is not an unusual time—that the patience of the propagator is exhausted before rooting occurs. Lonicera Hildebrandtii is a conspicuous example.

If one appreciates the fact that the primary impulse to callus formation is that of the wound-stimulus, one may find a remedy for this partial or complete failure. Where the immediate influence of the stimulus is slow, and the product in formation of callus is slight, betterment can be brought about by repetition. The effect of intermittently repeated wound-stimulus is wonderful in the massive development of callus upon stems in position where no special function beyond that of healing is required. Its effect upon callus in position where there is demand for new absorptive organs imperatively required for the life of a cutting is no less remarkable. The wound-stimulus induces root-formation. By paring off the surface of the callus-tumour, it is possible to stimulate almost immediate root-development. If a first paring is ineffectual, a second or a third will bring about the desired growth.

Thus Proteaceæ, which are regarded as difficult subjects, readily respond to the stimulus of callus paring. The callus itself here forms the roots in the first instance. If one pares the callus of a nodal cutting in Clematis, roots are formed, but always from the internode above the callus.

Why there should be this difference between nodal and internodal cuttings I cannot yet say. But the knowledge that repeated wound-stimulus will neutralise the difference should be an aid to the gardener.

Hard-wooded Cuttings.

In contrast with plants which readily and rapidly form an abundant callus—and that is a characteristic of soft-wooded species, species, that is to say, which are in possession of a copious store of water in their tissues, and, therefore, are supplied with the prime necessity for successful propagation by cuttings—there are the dicotylous plants we speak of as "hard-wooded" plants, which are attuned to live in conditions where water is physically and physiologically scanty, and which, if they have enough to satisfy their requirements, only live by the exercise of the strictest economy of the resources available to them. Leguminosæ, for example, such genera as Hovea, Eutaxia, Kennedya, Dillwynia and Eumacea.

In them, then, there is none of the lavishness observable in the soft-wooded, although the processes are the same. The march of events is relatively slow. Wound-stimulus is not transmitted rapidly. The initiation of callus is late, is often not abundant, and formation of new absorbing roots is delayed. It is these elements that govern the difficulties that are held to exist in the propagation of such plants. The drought attunement of such plants makes special demands for nice adjustment of aeration of the nidus. Their slow development prolongs the period during which these have to be maintained. The double danger of wilting of the cutting from insufficient water and of suffocation from want of air becomes therefore a very real one. These considerations should serve to suggest particular conditions that require attention in propagating such plants, and not the least important of these is the necessity of using as small cuttings as possible. Size of cutting is a matter of relatively less moment in the soft-wooded plants.

(To be continued.)

NURSERY NOTES.

SWEET PEAS AT MARKS TEY.

The county of Essex is, thanks to its soil and climate, world-renowned for excellence of its seeds; and it was on this account that Messrs. Dobbie & Co. established seed grounds of their own in the county. The firm has, at the present time, an area of upwards of 60 acres devoted to the production of seed crops. I am not prepared to say how many kinds of plants are dealt with at these farms, because on the occasion of my visit it took so much time to inspect the 10 acres of Sweet Peas. Let the reader think what it means to have 10 acres of Sweet Peas, all trained on sticks and grown exclusively for seed production!

It was interesting to compare the relative progress made by plants from seeds sown out-of-doors in the autumn, in pots in cold frames in the autumn, and in pots in the spring. The first were cropping splendidly, as also were those of the second group, while the third were only now promising that later they would render a satisfactory account of themselves. In numerous instances seed pods were setting magnificently, and although the plants have not the height of those grown expressly for exhibition, they have that sturdy, thrifty aspect which promises seeds in abundance.

Of the principal favourites, the number of plants runs into thousands, while of seedlings and novelties under trial for the first time there are only half-a-dozen or a dozen specimens. Last season the Floral Committee of the National Sweet Pea Society reserved Messrs. Dobbie & Co.'s stock of Thomas Stevenson for the premier award this year—a Silver Medal—provided that the flower maintained all its qualities. At Marks Tey there are thousands of plants all alike, producing superb blossoms, and, much to the delight of the owners, plenty of seeds. If these glowing orange varieties did not "burn" or deteriorate in bright sunshine, I should certainly say that this was one of the most charming Sweet Peas for garden decoration that one could grow.

Another variety that is grown enormously is Lavender George Herbert, which is indispensable for exhibition, and one of the finest for the garden. A third is Elfrida Pearson, an exquisite blush flower of perfect form and wondrous freedom of flowering. Those who admire bi-colours will find themselves in doubt as to whether they ought to grow Mrs. Cuthbertson or Mrs. Andrew Ireland. Let them not worry for long, since the correct way out of the difficulty is to have them both. The plants yield abundant spikes, and the rows remain bright and attractive for a long period.

To cheer up the stand or the garden we must have richness of colour. Here are two varieties which no one can afford to omit—Dobbie's Scarlet and Sunproof Crimson. In their respective colour groups they stand supreme. To lend variety to the collection we must have Brunette, which is at once one of the most distinct and meritorious Sweet Peas that has been shown of late years. The colour is a reddish mahogany. As a cream Dobbie's Cream is refined and beautiful, while Edrom Beauty, Mauve Queen, Lady Miller, Duplex, Mrs. Hugh Dickson, Etta Dyke, Marquis, and Audrey Crier are fully entitled to places in all gardens. *W.*

RHODODENDRON AUGUSTINII AND R. FARGESII.

Rhododendron Augustinii (see fig. 3), named in compliment to Dr. Augustine Henry, is one of the best of the more recently introduced species of Rhododendrons from China. The plant forms a neat, compact evergreen bush, and flowers freely when quite small. The stems are slender, twiggy, free branching, hairy, and, when old, silvery-grey in colour. The leaves are elliptic or lanceolate, 2 to 4 inches long, beautifully tinted or suffused with red when young, and hairy on their upper and lower surfaces. The hairy character of the leaves changes with age, only the hairs along the petiole and midrib being retained in the adult state. The petioles are from ¼ to ½ inch long. The inflorescences are rarely more than five-flowered, there being usually three or four blooms in a truss. The flowers are 2½ to 3 inches in diameter, white, pink, or lilac in colour, with yellow or orange-coloured spots on the dorsal petals; the tube is short, limb large, whilst the petals, which number five, are reflexed with wavy margins. There are 10 stamens, each produced on a long, yellow filament, which is hairy on the lower half. The style is 2 inches long and the stigma capitate. The whole plant is strongly aromatic, and the undersides of the leaves and young growths are densely lepidote. The plant is a native of the mountains of Western Hupeh, Central China, and wild specimens grow to a height of from 4 to 10 feet.

Rhododendron Fargesii (see fig. 4).—This species flowered for the first time in this country in March, 1911, in the garden of Mr. J. C. Williams, Caerhcys Castle, who exhibited a specimen at a meeting of the R.H.S. The plant is very closely allied to R. Fortunei, and in general effect is so much like some of its forms that when I first saw a specimen I concluded it was a hybrid of which R. Fortunei was one of the parents. The plant however agrees so exactly with specimens in the Kew Herbarium, collected by Mr. E. H. Wilson and others in Central and Western China, as to leave no doubt that it is a distinct species. It is dwarf and compact in habit, the shoots growing 6 to 12 inches in length each season. The flowers appear in March and April. The inflorescences are few flowered, usually with about 8 or 10 blooms in each truss. The flowers are broadly campanulate, 2 inches in diameter, rosy-lilac in colour, and spotted a wine-red colour on the upper petals. The petals are usually 8 in number, occasionally fewer, bilobed, with wavy margins; the tube is about 1 inch long, whilst the limb is spreading. The stamens number from 10 to 16 and are shorter than the tube. The yellow filaments are slender, glabrous. Style scarcely as long as the petals, stigma capitate, ovary glandular, ¼ inch long. The calyx is very minute. The pedicels are from 1 to 2 inches long and hairy. The branches, in their upper parts, are red; the stem at the base of the inflorescence is glaucous. The leaves are ovate, 2 to 5 inches long, dark green above, and slightly glaucous beneath; the petiole is 1 to 2 inches long, red and slightly glaucous. There is but very little doubt that the species will prove to be quite as hardy as R. Fortunei, as it is found wild on mountain ranges at altitudes of 7,800 to 9,000 feet. *C. P. Raffill.*

THE ROSARY.

CULTURAL NOTES FOR JULY.

Budding.

The budding of Roses is a very important operation. Certain choice varieties can only be cultivated successfully by increasing the stock annually by this means. Some varieties give flowers of much better quality as "maiden" or one-year-budded specimens, and the budding of these is essential to the exhibitor. Xavier Olibo, Horace Vernet, Louis van Houtte, A. K. Williams, and Duchess of Bedford are examples from the Hybrid Perpetuals; while Lady Mary Fitzwilliam and Mildred Grant are Hybrid Teas of the same nature.

To be successful with budding, it is necessary to have both the bud and stock in good condition, which means that they should be sufficiently matured to cause little or no trouble in removing the bud, or in raising the bark upon the stock. The sap must be active. If the stock and Rose bud are in a suitable condition, the bark of the stock will lift away from the wood without any forcing, which would bruise and otherwise disturb the soft tissues lying between the bark and wood. Special knives, with flattened bone handles, are made for the purpose of lifting

the bark; but a thin piece of hard wood or a label will answer the purpose where only a few stocks have to be budded. A cut 2½ inches in length is ample, and the point of the knife must not be inserted too deeply into the wood when cutting previous to gently lifting the bark. It should just penetrate the bark. Many failures are due to rough treatment and cutting too deeply.

Taking the Bud.

This is done by inserting the knife about a third of the way through the shoot containing the eye or bud to be transferred to the stock. Slip the knife down to an inch or so below the bud, tearing off the bud with some of the bark attached. By bending this strip back a little, the bark will part from the small piece of Rose wood still covering the seat of the bud. Remove this portion of wood by a gentle snatch. If the bud is in a suitable condition, the seat or heel of it will then be exposed and will be prominent enough to ensure its resting well down upon the wood beneath the lifted bark of the stock or growth to be operated upon.

Unless this seat is well developed, it is not much use inserting the bud. Should the growth be either too forward or backward, there will not be a prominent seat, but a slight hollow at the base of the bud, and another should be tried that is either a little more advanced or younger, as the case may be.

Cut off the bark behind the bud, leaving about three-fourths of an inch on that side and 1 inch upon the other. Now gently lift the bark from the stock, and slip the prepared bud beneath it. The cleaner and more expeditiously this operation can be done the better, always avoiding any bruising or forcing in of the bud. Tie the bud in firmly, either with raffia, matting, or strands of coarse worsted. It is essential that the tie should be made from just behind the bud, to ensure the seat or heel fitting well down upon the wood. At the same time, no undue constriction should be employed.

Do not "open" up the bark of any stock or prepare the buds until all is quite ready, otherwise there is risk of the natural sap drying in the air. If the bark does not lift readily, water the plants well, and delay operations for a few days, when you will generally find the stock in a right condition. Do not trim off any superfluous growth immediately before budding, or a check will be caused to the sap.

When cutting a shoot for buds from the Rose tree, remove all leafage at once, with the exception of half an inch or so of the shield above the bud to be used. Always work the Rose bud as closely as possible upon the roots of dwarf stocks and near into the main stems of standards when working buds upon shoulders of the latter. The object of this is to leave the smallest quantity of wood likely to produce stock suckers.

In about three weeks from budding, any failures will become apparent, as such buds will have become brownish-black. In these cases a second bud may be inserted close to the first, or in another shoulder, in the case of standards.

As the growth swells it is advisable to look over the buds and loosen any ties showing constriction, but do not be too free in this respect, or the cut may open too far and prevent a desirable union.

General Work Out-of-Doors.

The usual routine of work in the matter of watering, hoeing, thinning, syringing, and tying needs attention. By the end of July several of the early-blooming varieties may have some of the lately-flowered wood cut away. This is only in the case of climbers and what are generally referred to as "summer bloomers," a rather peculiar name given to those that bloom only once during the season, or seldom produce more than a few extra blooms upon early summer-matured growths.

In most cases these Roses depend chiefly upon wood made this summer for their main crop next year, and this young growth should be encouraged, removing only such shoots as will not be required.

Occasional dressings of artificial manures may still be given, either watering and hoeing as soon as convenient after application, or choosing a showery time for applying them. It is while the Roses are in active growth that they need stimulants, and they obtain results when these can be continued in small doses that do not burn the roots. Should the nights be dry, a thorough syringing with clear water at sunset is very refreshing to the dry foliage.

Roses Under Glass.

Most of the pot Roses will be the better if conveyed to the open air, selecting a sheltered spot, and half plunging the pots. Syringe them frequently.

Plants in borders need all the air possible; even a draught will do little harm where the foliage is matured. A rather dry root-medium and free overhead syringings are necessary. The absence of night dews under glass is not borne in mind sufficiently, with the result that there is often an arid atmosphere, which encourages red spider, thrips, and many other insect pests.

Strong and still actively-growing plants of Maréchal Niel and other climbing varieties in pots will be better if not turned out until their points of growth are more completed; but they must be kept thoroughly clean, and with ample ventilation. The long growths upon Ramblers, whether in pyramid or standard form, also need the same care for a little time longer before removing them out of doors next month. *Practice.*

NOTICES OF BOOKS.

Story of a Rock Garden.*

Mr. Malby has written a very interesting little book about his rock garden, and it may at once be commended to those who have been bitten with the love of the Alpines. He gives admirable instructions for building the rock-work, and his success with difficult plants entitles him to hold views respecting the moraine which are not necessarily those which obtain in all quarters. Anyhow, it may well be that the special arrangements he adopts for watering may suit his climate, and the photographs he gives of at least some of his plants are sure to arouse feelings of envy. Indeed, the illustrations are a strong feature of the book, and this applies to the black-and-white as well as to the coloured plates. An excellent description of a most useful kind of frame is given, and this will prove valuable to many who have experienced the trouble often involved in keeping, or germinating, the seeds of Alpine plants. It will be seen that the author has deserved well of those who are embarking on this fascinating branch of gardening, and who want to profit by the experience of one whose efforts have been crowned with no small measure of success.

Fruit-growing in British Columbia.†

Emigrants to British Columbia who intend to engage in fruit-growing would do well to obtain a copy of Mr. Bealby's book, which is full of useful advice to persons who are strangers to that country. The author insists upon the need of personal inspection before purchasing land, stating that many people have written to him to the effect that they have purchased some which they have not seen, relying foolishly upon the description of the sellers. The land varies greatly in character, some soils being admirably suitable to fruit, and some quite unsuitable, while the like differences in situation have to be considered. Advice is given in reference to soil, situation, and aspect; but the author thinks that a stranger to British Columbia and its system of fruit-growing would do well to engage the services of an experienced grower in the country, whose advice would be valuable both in the selection of land and in the use to be made of it. Such expert advice, he says, can be secured at a moderate cost. With respect to the capital required to

* *The Story of My Rock Garden*, by R. A. Malby. (London: Headley Brothers.) 2s. 6d. net.

† *How to Make an Orchard in British Columbia*, by J. T Bealby, B.A. (London: Adam and Charles Black.)

start a fruit ranch, Mr. Bealby estimates that, putting the cost of the land at £20 per acre, and that of clearing it at the same sum, allowing for the building of a house, all expenses in equipment, cultivation, and planting, and reckoning the proceeds of crops grown between the trees until the latter come into profit, a man who will do all the work himself will be able to get through with £700 for 10 acres, but may require £1,200 if he has a family and engages assistance in his operations.

Oxford Gardens.*

This book contains an interesting mass of information on the botanic garden in Oxford. The style is often "guide-booky," and the attempts to enliven it with rather poor jokes are not always very successful. Still, it is useful at the present time, and it will be even more so in the future, to have an accurate account of the oldest botanic garden in this country, as it exists to-day, placed on permanent record. There is much miscellaneous information scattered through the pages, and evidence in plenty of scholarly erudition.

A chapter on the lecture-rooms and laboratories, which also includes an account of the development of the botanical teaching connected with the gardens, is of interest, and a list (not quite accurate) is given of papers published from the laboratory. A curious chapter on finance finds its place here, and the ingenuousness with which the author ventures upon criticism of the garden accounts seems almost to justify Cecil Rhodes's estimate of the financial understanding of the Fellows of colleges. The volume closes with notes on the gardens of the colleges, in which, as might be expected, Magdalen figures rather largely. It is a pity, perhaps, that the fine collection of rock plants in St. John's College gardens is dismissed with a bare mention.

A book of this kind is not easy to write, and, in spite of certain obvious peculiarities of style, Mr. Gunther may be congratulated on the success of his "labour of love."

Botanical Terms.†

Many beside gardeners will find this a useful book. If anything, perhaps it errs in fulness, for it contains many outlandish names and terms not in general use. This is no real disadvantage, so long as the words one wants are there, and, so far as we have tested the volume, it does not often fail in this respect. The explanations are short and to the point, the type is clear and good, and the book may be recommended as supplying a definite need which many feel, and of doing away with what, to some people, is a bugbear in things horticultural, viz., the difficulties incident to a technical nomenclature.

TREES AND SHRUBS.

DIPTERONIA SINENSIS, OLIVER.

Dipteronia sinensis forms a bush or small tree; it is a native of Central China, where it grows at elevations ranging to 5,000 feet. Specimens have been grown for some few years past at Coombe Wood and Kew, and they are quite hardy. The genus Dipteronia belongs to the Natural Order Sapindaceæ, being closely allied to the Acers (Maples). Considerable interest attaches to the tree botanically, as it is a monotypic genus, and, presumably, unisexual, there being only staminate flowers on the specimen at Kew, which is flowering for the first time.

Dipteronia sinensis has deciduous pinnate leaves, the largest exceeding 1 foot in length, and 5 inches to 6 inches in width. Mature leaves are generally composed of 11 or 13 leaflets; they are opposite, 3½ inches long and ¾ inch wide, ovate-lanceolate in shape, coarsely serrate, green on both surfaces, slightly paler beneath, downy on both sides, with small tufts of down in the axils of the main veins. The rachis also is downy, and of a pleasing reddish tint. The flowers are greenish-white, and borne in a terminal panicle 9 inches in length. Mr. Wilson describes the tree as "having a marked beauty of flower and leaf, as well as very interesting fruits."

The specimen at Kew is about 8 feet high, and attractive in its elegant, pinnate foliage. The flowers at present hardly fulfil the collector's description, though they will probably be finer on older specimens, or it may be that the pistillate flowers are the more ornamental.

D. sinensis thrives in loamy soil, and is readily propagated from cuttings of half-mature growths, inserted during July and August in a propagating frame, provided with a little bottom heat. The plant may also be readily increased by layering. *A. O.*

THE JUDAS TREE.

Effects of the glorious sunshine of the summer of 1911 are apparent in the profusion of blossom displayed by almost every flowering shrub and tree. Upon none has it exerted a more powerful influence than upon the Judas Tree (Cercis Siliquastrum), a native of the Mediterranean region. Neither in Southern Europe nor in this country have I ever seen so fine a specimen as that shown in fig. 5, which gives but a poor impression of the mass of vieux rose blossom, without a green leaf visible. This tree is in the grounds of Twyford Lodge, the residence of Mr. Alfred Gilbey, near Winchester. It measures 35 feet high, and is probably about 100 years old.

Fig. 5.—Cercis siliquastrum at Twyford Lodge, near Winchester: height 35 feet.

The Judas Tree (so called because, according to tradition, it was upon one of this species that the recreant Apostle hanged himself) belongs to the great Order of Papilionaceæ or Pea-flowered plants. Though hardy in all but the coldest districts, it does not often get enough sunshine in the greater part of these islands to enable it to flower so freely as it has done this season. *Herbert Maxwell, Monreith.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Horticultural Education.—Circumstances prevented me attending the late conference on horticultural education at the International Exhibition, much to my regret, because, on reading the report on pp. 398-399, vol. li., it appears to me that the needs of private gardeners were scarcely touched upon. Since the conference, various references to horticultural education have appeared in your pages and in the columns of *The Times*, and the subject has been mentioned more than once in the House of Commons; but, as your excellent leader (p. 420) says, there is a painful impression among horticulturists. The young men we are training in private gardens, nurseries, public parks and market gardens will at some future date have the whole of the nation's horticulture in their hands; it stands to reason, therefore, that, if horticulture is to be improved, it is the young men in training who need most attention. I admit that a gardener's education begins at school, as was emphasised by some of the speakers at the conference. I would go farther and say that no lad should be trained as a professional gardener unless he has been through a secondary school or had shown extra proficiency in his primary work, because he will not be able to grasp scientific teaching unless he can read, write and calculate easily and intelligently. Many lads leave the primary schools now with a very meagre education, and, what is perhaps worse, they have no inclination to add to the little knowledge they have obtained; many of the schools in rural districts and in some of the towns have small plots of land for the elder boys to cultivate; this helps to teach them some of the rudiments of gardening, which are, no doubt, useful, but this is just the point where the young horticulturist's education fails. As at present arranged, he goes to work in a garden as garden boy on leaving school, being probably 14 years of age; from this time forward it is no person's business to teach him anything about his work. If he is quick and intelligent he may possibly pick up some information for himself; whether he does so or not, he has to earn a living in some way, and when a vacancy occurs he is promoted until he gets a journeyman's position. He has no knowledge of the science of his profession, and in most instances does not endeavour to obtain any, partly owing to lack of opportunity The best years of the young man's life are wasted, so far as obtaining a thorough knowledge of his profession is concerned, but he must stick to his occupation, because there are very few opportunities of changing it. If he cannot obtain further promotion as a private gardener he drifts into some other branch of horticulture, such as nursery work, commercial fruit and vegetable growing, employment in public parks, &c., being but poorly equipped for any such work. The remedy is for the Board of Agriculture to provide centres at convenient distances where the young men may study the scientific side of their profession under suitable teachers and without giving up the practical work they are engaged in; this could to a large extent be carried on side by side with teaching agriculture: both require many things in common, including a knowledge of soils, their formation and treatment; plants, their structure and conditions of growth; insects and fungi injurious or beneficial to plant-life; and many other things. If the Board will proceed on a system such as this, horticulture will benefit greatly; if it only intends to set up an office and a few clerks in London, we shall be much better without its assistance. To get the practical part of the gardener's education on a regular plan we must have the suitable young men apprenticed for a time; there is no place like a good private garden for learning gardening; many other plans have been tried, but none has succeeded so well. A list of suitable gardens could be arranged where the employers were willing for their gardeners to take one or two apprentices; this would be to their advantage, because they would get a better class of men eventually; it should also be to the gardener's advantage. There is no reason why he should have lads learning the profession under his superintendence without being compensated for it; the lads should have opportunities by arrangement for attending the centres at intervals for scientific instruction, which they would have to follow up in their spare time by preparing for examinations, both practical and theoretical. By this means every young professional gardener, whether employed in nurseries, public parks or private gardens, would be able to obtain a good scientific education in his profession, and should be compelled to pass a certain standard after a period of training. I must refrain from going further into details; these remarks are only intended to suggest a framework for building upon. The experiences during a fairly long life spent in some of the best gardens of the kingdom convince me that we must work on such a plan in order to educate young gardeners as they deserve to be educated, and this not only for their own good, but for the good of the nation, whose very existence may almost be said to depend on the intelligent and economical cultivation of the land. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

The Education of the Gardener.—I heartily support your correspondent (see p. 430) in reference to horticultural education. But it is not so much education that the rank and file of gardeners require, but "better conditions." The gardener already spends many years' study both in the theoretical and practical side of his profession. His remuneration is far below that of the average mechanic, who after five years' or so apprenticeship demands a fair wage and gets it. The British Gardeners' Association launched the "lifeboat" in the year 1904, the aim and object being the emancipation of the gardener, but success is not yet obtained. Mr. Weather suggests a National Institute of Gardeners. May I suggest a National Union of Gardeners, with a policy not like that of a mutual improvement society, but of educating the gardener to the advantages of being organized? *Charles H. Harris, The Gardens, Branksome Hall, Durham.*

London's Vacant Land as Gardens.—The latest of the Church Army's eight "city gardens," which is parcelled out into ten plots, is bursting with promise under the care of its smallholders in Arnside Street, Walworth. These green and fruitful oases beside the streets of London, which turn vacant bits of building land into vegetable and flower beds, are doubly productive of help. Their preparatory clearing and levelling gives winter work to respectable unemployed married men, and their cultivation affords healthy spare time occupation, the means of earning a few extra shillings, and fresh vegetables for family use, to married working men who are in regular work. At present the Society's London smallholdings number 84. If any London householder has a back garden to spare for such a purpose, we should gratefully accept the loan. *H. T. Bennett, Hon. Secretary City Gardens Department, Church Army Headquarters, 55, Bryanston Street, London, W.*

The late William Fyfe (see p 434).—The late Mr. Fyfe was loved by all those who have worked under his supervision. Considerate and just, he was always anxious for his young men to succeed. As a gardener he had few equals, for he possessed many original ideas, and he carried them out with skill. He was particularly fond of fruit-culture, and it will be remembered that his last public exhibit consisted of 12 grand bunches of Grapes staged at the Royal International Show, perhaps the best-finished Grapes at that exhibition. In former years he frequently exhibited at the Temple Shows of the Royal Horticultural Society. The out-door flower gardening at Lockinge was of the highest order; indeed, every department testified to the sterling qualities possessed by our late friend. Mr. Fyfe's career began in northern gardens, but he came south about 38 years ago to fill the general foreman's place at Lockinge, a post he held for four and a half years. Leaving Lockinge, he proceeded to Thames Ditton, as head gardener, where he remained for six years. He was then appointed by the late Lord Wantage to the charge of Overstone Park Gardens, Northamptonshire, where he remained for six years, finally being appointed to Lockinge Gardens, a post he has filled successfully and faithfully for 20 years. The funeral service took place in the pretty little church in the Lockinge pleasure grounds, close to the brilliant flower beds Mr. Fyfe had recently furnished with plants, and the interment was made in the cemetery a quarter of a mile distant. Lady Wantage journeyed from London to attend the last ceremonies, and many friends gathered from near and far to do honour to the memory of this respected gardener. *George Ellwood (one of deceased's old pupils).*

Curious Nesting-places (see pp. 415, 431).—The tomtit referred to in my note was, as Mr. Nicholson surmises, a great tit. The exact diameter of the pot inside was 12 inches at the bottom, 8½ inches at the top, and the hole was exactly 1¼ inch across. During the week a friend gave me the information, previously unknown to me, that young tits can fly direct from the nest, a fact which Mr. Nicholson corroborates. *F. A. Edwards, Grayswood Place Gardens, Haslemere.*

Early Pea.—Carter's Eight Weeks Pea has proved our earliest variety again this season. The crop has done particularly well and the plants have been extraordinarily prolific. As a forcing Pea and for planting early on a warm border it has no equal with us. We began picking pods at the end of May from seed sown outdoors. Peas generally are doing very well this season, being early and of excellent quality. *W. A. Cook, Leonardslee Gardens, Sussex.*

Longevity of Fern Spores.—For a year or two excavations have been going on at Old Sarum, a Roman fortified encampment on an isolated hill, a mile-and-a-half from Salisbury. In 1911, the old well was found and cleared to a depth of about 35 feet. To obtain water, it would probably be necessary to go down about 200 feet. This year a great number of tiny Ferns have begun to grow all over the old stone facing down the well, and as no Ferns are growing within miles of the place, there is some mystery as to how the spores originated. If, as some think, they were borne on the winds from distant places, why have they not germinated on the sides of the three guard pits which are 30 to 40 feet deep, and structurally and atmospherically almost identical with the well? We are inclined to think the spores are those of the old Ferns which existed in the well before it was filled in, and which for four hundred years have lain dormant while light and air were excluded, the top of the well being some 10 feet below the surface during that time, and that when again they were exposed, have germinated as we see them in large numbers. Perhaps some of your readers may know of similar cases; if so they are certainly worth recording. As far as we can tell at present the variety seems to be the common Lady Fern, Asplenium Filix-fœmina. *Keynes, Williams & Co., Salisbury.*

Classification of Gardeners and Other Asylum Employees.—A question has arisen between the Ayr District Lunacy Board and the General Board of Commissioners in Lunacy for Scotland as to the classification of employees in the lunatic asylum of the Board. Among these was an under-gardener, named John Kaye, and the point was which body had the right to classify the employees under the Superannuation Act of 1909. This has just engaged the attention of the Outer House of the Court of Session. Lord Cullen's decision, given on June 29, was in favour of the contention that the classification had to be made with the approval of the General Board. It appears that the District Board had placed the under-gardener and others in the first class, but the General Board had held that they should be in the second. *A.*

Mr. J. O. Clarke, for the last 27 years gardener to the late Ludwig Mond, Esq., and lately to Mrs. Mond, at The Poplars, Regent's Park, has resigned that position in order to join Mr. Abram Vallance in the nursery business of Bird & Vallance, of Downham Market, as co-partner. The firm will consist of Mr. Abram Vallance and Mr. John Osborne Clarke. Mr. Clarke leaves with substantial souvenirs, and carries with him the best wishes of all with whom he had to do at The Poplars. A notice of the American Nurseries, Downham Market, was given in the *Gardeners' Chronicle*, June 20, 1903.

The Week's Work.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

THE ROSE GARDEN.—The Rose garden is now at its best, and extra attention should be given to it, attending to details, such as trimming of the edgings and keeping the beds and paths clear of weeds and rubbish. Guard against aphides and mildew attacking the plants, and adopt remedial measures early if these pests are detected. Climbing Roses are sending up a lot of growths from the base : as a rule, these are too numerous, and the weaker ones should be removed entirely, securing those that remain that they may not become broken by the wind. When the flowers are over, the old shoots should be cut away, and the young growths trained in their places.

THE SCENTED GARDEN.—An old-world fashion is now being revived in many places, namely, the planting of a corner of the garden with scented plants of all descriptions. Amongst shrubs that may be included are Sweet Briar, Honeysuckle, Roses, Lavender, Rosemary, Artemisia (Southernwood), Calycanthus occidentalis (Allspice), Lilac, Philadelphus, Myrtle, Daphne, Magnolias, and Lippia citriodora (Lemon-scented Verbena). Many perennials and biennials may be introduced, such as Mentha odorata (Bergamot), scented-leaved Pelargoniums, Heliotrope, Pinks, Carnations, Lily-of-the-Valley, Violets, Mimulus (Musk), Dianthus barbatus (Sweet William), and Wallflowers. The annuals also provide many deliciously-scented plants, which may be utilised to furnish blank spaces between the other subjects. Stocks should be used in plenty, also Mignonette, Centaurea, Sweet Sultan, Sweet Peas, and Scabious. Certain of the herbs are worth including, such as Thyme, Origanum marjoranum, (Marjoram), and Ocymum basilicum (Basil). The form of the garden may be laid out to suit the owner's taste. It should, if possible, be in some quiet, out-of-the-way corner. The paths may be grassed or formed of irregular flagstones, with such plants as Thyme growing between them. Shell paths, with an edging of Box, are also suitable. In either case, the scented garden should be made to be in complete harmony with its surroundings.

VIOLETS.—The rains have caused Violets to grow fast. The flat hoe should be used constantly in dry weather to promote a fine tilth. Stirring the soil will save much labour in watering : the hose should only be employed as a last resource to prevent the plants from suffering from drought. If Violets are allowed to become very dry, they quickly become infested with red spider, which is by far the worst pest of this woodland plant. During hot, dry weather much benefit will be derived from light syringings or sprayings in the late afternoons, and if the foliage is dusted with soot at intervals, whilst the leaves are damp, it will be of great assistance in keeping red spider in check. Pinch off the runners as they appear, so as to direct all the energies of the plant to the formation of strong crowns, which, when well ripened, will produce quantities of bloom from October onwards, having first transferred the plants carefully to frames in September.

THINNING ANNUALS.—Owing to the drought of April and May, many annuals were not sown until late in the season : those that were sown early germinated irregularly. If not already done, the plants should be thinned well apart : as a rule, annuals are sown much too thickly. If blank spaces are numerous, choose a dull, showery day, and transplant some of the stronger seedlings. If this is done carefully, and the plants afforded a little attention afterwards, very little difference will be seen in those transplanted and the others. Annuals, such as Clarkia and Godetia, are seen to best advantage when grown in bold clumps or beds. Under good cultivation, they produce a charming colour effect for several weeks, and for brilliant colours and general beauty they are not easily surpassed.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

LEEKS.—Plants of the earliest sowings which are intended for exhibition or consumption from the middle of August and onward should by this date possess a sufficient length of blanched stem. Every inducement should be afforded them to grow freely and thicken their stems. The roots should be fed liberally at every alternate watering with liquid manure from the farmyard. The top growth should be damped over with tepid water during the late afternoons or early evenings of fine days. Plants of successional sowings should have suitable collars, placed around the stems to cause them to lengthen, and, as the work proceeds, fine soil of a poor nature should be placed round the part treated. Avoid placing more soil than is absolutely necessary over the roots, as this has a detrimental effect on the growth of the plants, causing the roots to be far away from the influence of sun-warmth. By far the best method is to make a kind of wooden trough about 10 inches in width, so that the soil around the stems may be confined therein, thus allowing the roots to be fed easily and receive the warmth of the sun. Plants of the latest sowings should, where the work is not already done, be planted forthwith in almost any part of the garden for very late supplies. They are best planted in deep holes made with an iron bar. The foliage should be shortened, and a little fine soil placed about the roots. Water the roots thoroughly well, and gradually fill in with soil round the stem as growth develops.

ONIONS.—During the next few weeks Onions that were raised in heat and planted out for the production of large specimens will need much care and attention. Keep the surface of the soil hoed and free from weeds, affording an abundance of water and liquid manure to the roots. Onions growing in light, porous soil or during spells of drought can hardly be given too much moisture either at the roots or overhead. Artificial manure and soot may be used, but strictly avoid giving stimulants to excess, remembering that fertilisers are best applied during showery weather.

WINTER ONIONS.—For some reason or another that I do not understand, Onions in many gardens fared very badly last winter, and the crops generally are much below the average. Though the bulbs do not keep satisfactorily, they are, nevertheless, extremely useful, and should always be grown. White Naples and others of its type are amongst the earliest to mature, and should be lifted and dried carefully without delay. Those of the giant Rocca type may be left till the middle of the month, when they should be treated in a similar manner. The bulbs of this variety keep much better than the White Naples.

SHALLOTS.—These bulbs have done remarkably well this season, and the whole of the crop should be lifted immediately and afterwards spread out thinly in full sunshine, to ripen. Should the weather at the time be wet and unsettled, the ripening may be done under glass for preference or in a cold frame.

SPINACH.—Several good sowings of the improved form of Spinach should be made at intervals of ten days for the next two or three months, to afford a plentiful supply of leaves during the autumn and winter. It is quite impossible to lay down any hard-and-fast rule as to the date most suitable for sowing, as much depends upon the nature of the soil, the locality, and the weather. It will be perfectly safe if frequent sowings are made from now onwards, the earliest in open parts of the garden in soil which has been heavily manured and deeply worked. Later in the season the sowings should be made on a south border or some other warm, sheltered position. I prefer the round-seeded to the prickly kinds for these sowings.

PARSLEY.—The plants should be thinned to a distance of from 6 to 10 inches apart. The surplus plants may, if required, be transplanted in a sheltered part of the garden. Stir the surface of the soil frequently, and apply fresh soot often. Make another good sowing of this herb on a south border.

THE HERB BORDER.—Keep this border perfectly free from weeds, and where space permits work the Dutch hoe between the plants. Any subjects that have passed flowering, and are inclined to become straggly, should be clipped with a pair of shears. This will cause the formation of just those new growths which are needed for culinary purposes. Sufficient growths of the commoner kinds may be left for cutting and suspending for winter use.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

ROSES.—By this date practically all pot Roses under glass have finished flowering, the climbing varieties being the last to be utilised for decorative purposes. To ensure success with the same plants next season, considerable attention must be paid to them during the summer months. Where strong shoots have developed from the base on such varieties as Dorothy Perkins, Dorothy Dennison, Hiawatha, Crimson Rambler, and Paradise, all the old flowering wood may be cut away, and every encouragement given the plants not only to make good wood but to mature it. Three or four shoots are sufficient to retain on each plant, and, provided they are kept clean and grown steadily, such plants will give better results than younger ones, whether the latter were grafted under glass and grown on or from the open ground, lifted in the autumn and potted. All pot Roses should, if possible, be kept together and stood on an ash bottom in a position where they may obtain plenty of sunlight and air. In the case of Tea Roses, that require special attention to build up good plants, the flower buds should be removed as they appear, thus throwing all the energies of the plant into the formation of sound wood. The pot Roses should be sprayed periodically to keep down aphis and mildew, and, if these pests are prevented from spreading during the summer months, there is much less danger of them being troublesome the following spring. The spraying should be done at least once every ten days. Plants of Maréchal Niel that have finished flowering in cool houses may be pruned hard back, training the young shoots up the wires, about one foot apart. The roots may be allowed plenty of liquid manure as the shoots are growing freely. Syringe the foliage well to keep the plants clean, fumigating them when necessary.

CLERODENDRON BALFOURIANUM AND C. FALLAX.—Plants of Clerodendron Balfourianum that have finished flowering should have the old flowering wood cut out, training the young shoots over the house at a fair distance apart to prevent them from becoming attenuated. Plants in pots will be benefited by a little liquid manure made from cowdung. Seedlings of Clerodendron fallax must not be starved in small pots. They should be potted—large plants in small 24's, and the majority in 32's. Do not grow the plants in a close, warm house at this season, as they develop much better heads of bloom when a moderate temperature is maintained. The flowers remain a much better colour when shade is provided during bright weather.

IPOMŒA RUBRA-CÆRULEA.—This is one of the prettiest of climbing plants for the cool greenhouse, and though the flowers only last one day, they are large, of exquisite colour, and produced in profusion. Plants raised from seed sown in February are flowering freely, and, given reasonable attention, they will continue in bloom till late in the autumn. Red spider is almost the only insect pest that infests the plant, but the foliage is hard and smooth, and a good syringing now and again should suffice to keep red spider in check.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

FIGS.—These trees should be disbudded freely, to prevent the growths from becoming overcrowded, also to expose the fruits to the light and air. Retain short-jointed shoots in preference to those that are growing strongly, and avoid tying the branches close to the wall until the autumn. Short-jointed shoots mature much better than the others, and are more fruitful. Established trees, with full crops of fruit growing in properly-constructed, well-drained borders, should

be afforded liquid manure liberally at short intervals until the fruits show signs of ripening. Apply no manure of any kind to barren trees or those that are making gross shoots. Remove suckers from old trees as soon as they appear, and thin the fruits where they are too numerous, but do not stop the shoots.

LOGANBERRIES.—These plants need a treatment similar to that afforded the Raspberry; they require plenty of manure to furnish the best results. Established plants develop a mass of young shoots from their bases, and of these five or six of the best should be retained, removing the weak sucker growths as in the case of Raspberries. It is sometimes a difficult matter to tie up the young shoots until after the fruits are gathered, but, by securing them temporarily to stakes, they will be prevented from being damaged until the fruits are gathered. The old canes should be cut out immediately after the fruits are gathered, training the young rods in their places, that they may become ripened before winter arrives. Plants of Loganberries last longer than Raspberries with proper care, and often succeed where the latter fail. The fruits should be gathered before they are quite ripe, and may be used for tarts, &c., or bottled.

NEWLY-GRAFTED TREES.—Trees that were grafted recently are growing freely at the scions and making strong shoots. If not already done, the ligatures should be cut or loosened, and the tender shoots secured to stakes. Remove all suckers as they appear below the graft. The recent rains have moistened the soil thoroughly, and, if dry weather sets in, a long, strawy mulch should be applied, to retain the moisture and encourage the grafts to grow freely.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

CATTLEYA, LÆLIA AND LÆLIO-CATTLEYA.—The following plants should be rested for a short period after they have passed out of flower :—Lælia purpurata, L. grandis, L. tenebrosa, Lælio-Cattleya Martinetii, L.-C. Canhamiana, L.-C. Arnoldiana, L.-C. eximia, L.-C. Phœbe, L.-C. callistoglossa, and many of the early-flowering Brasso-Cattleyas and Brasso-Lælia hybrids. The buds should be kept dormant for as long a period as possible, which is best ensured by placing the plants in the coolest and most airy part of the Cattleya house, and affording a very limited supply of water at the roots. As soon as the plants show signs of fresh growth, they should be examined, and those in need of fresh rooting material afforded it. In repotting, care must be taken not to break the roots, as all these plants are very impatient of root-disturbance, and for this reason they should be afforded rooting space sufficient for at least two seasons. Plants of Cattleya Mendelii, C. Mossiæ, C. Skinneri, C. intermedia, C. Schröderæ, and the many hybrids of these Orchids that have recently passed the flowering stage, may be repotted, or, if they have sufficient pot room, and the soil is in a good condition, a resurfacing of fresh materials only, to replace some of the old compost. In repotting, remove all unnecessary back pseudo-bulbs, for these weaken the plants and necessitate the use of larger pots. Employ a compost consisting of equal parts A1 fibre and Osmunda fibre, with a small quantity of Sphagnum-moss, and a rather liberal amount of crushed crocks. Pot firmly, placing the base of the plant just below the rim of the receptacle. After they are potted, the plants should be shaded rather densely for a time, and watered with great care. It is better to allow a slight shrivelling of the pseudo-bulbs for a time after potting them than to endeavour to keep them plump by affording them too much water at the roots. When the young growths lengthen, and the new roots grow freely in the compost, the stems will soon regain their former plump appearance. Plants of Cattleya gigas and its variety Sanderiana are developing their flowers, and should be afforded a little more water at the roots, until the flowers are fully developed. After they have passed out of flower, they should be exposed gradually to the sunlight, and the supply of water at the roots should be decreased gradually. Specimens that require repotting should receive attention when the last-formed pseudo-bulbs commence to develop new roots from their bases. After the repotting is finished, sufficient water only should be given them to prevent undue shrivelling of the pseudo-bulbs. When the plants have become re-established, they should be given a long season of rest in a cool, dry, well-ventilated position in a house having an intermediate temperature. Plants of Cattleya Dowiana and C. Dowiana aurea may also be potted as they pass out of flower, and should be treated in a somewhat similar manner to C. gigas, with the exception that, during their resting period, they should be placed in a position near to the glass in the lightest and warmest part of the Cattleya house. Plants of the autumn-flowering Cattleya labiata are fast developing their new growths, and with them their flower-sheaths. At this stage, the plants should be placed well up to the roof-glass, and should receive liberal supplies of water at the roots until the growths are completed, when the amount of moisture should be gradually reduced.

THE APIARY.

By CHLORIS

RELATION OF NOSEMA APIS TO THE ISLE OF WIGHT DISEASE.—Drs. Fantham and Porter first observed a Protozoön, Nosema Apis, in the alimentary canal of bees obtained from the Isle of Wight in 1906. They were able to show by experiment that the parasite was pathogenic for bees. In 1907 similar conditions were again found to prevail, and the years 1908-10 showed similar conditions prevailing in bees from various parts of the mainland. Experiments in feeding showed that the parasite produced a fatal disease in bees and wasps, and this led them to the conclusion that Nosema Apis was a causative agent of a fatal disease of bees. At the same time Zander found the same parasite in diseased bees in Bavaria. Seeing that no bacterium was discovered by those engaged in research, Dr. Malden paid special attention to protozoal parasites, especially Nosema Apis. For the purpose of examination bees were killed with chloroform, and the alimentary tracks and appendages were removed. Luckily, at this point bees heavily infected with the spore stage were procured, and these were compared with others less heavily infected. "Very marked anatomical changes visible to the naked eye, were seen only in specimens heavily infected with spores. In such cases the walls of the chyle stomach had a white, glistening appearance, and were easily ruptured—a white, milky fluid being exuded. When examined under the microscope the fluid was found to contain a number of spores." In the less infected stages, the alimentary canal appeared normal, but was very fragile. During 1911 specimens from stocks apparently suffering from the Isle of Wight were received, but as fungi rapidly develop in the food track after death, and destroy the epithelium, rendering search for the Nosema Apis nearly impossible, live bees only were examined, so far as circumstances permitted. Careful tables were made, showing the results of the investigation, for specimens were examined from 66 apiaries in various parts of the country. Briefly, the results were:—"The spores of Nosema Apis were found, in larger or smaller numbers, in specimens from 29 apiaries; young stages of Nosema Apis, but no spores, in specimens from 24 apiaries. The examination of specimens from the other 10 apiaries yielded five doubtful and five negative results." Thus, we see that in 84 per cent. of the stocks examined, and reputed to be suffering from the disease, infection experiments proved that the parasite produces a fatal disease, in which there is a marked destruction of the tissues of the alimentary track in heavily-infected specimens. Observation seemed to show that during the warmer months the parasites did not reach the spore stage, but seemed to cause death before this stage was reached. They concluded that the spore stage is oftener reached in the colder months and spring. Zander is of opinion that "Dysentery is not a necessary feature of Nosema infection, and states that the essential symptom of the disease is a sudden and extensive mortality among the bees inside and outside the hive." Maassen and Nithack are both struck with the fact that beekeepers take little notice of disease among adult bees compared with disease among brood, so much so that, judging by the disease among brood in specimens received, Germany would be declared free from dysentery due to Nosema Apis, though research among adult bees proved that the disease was very common. Later, Maassen, after further observation, came to the conclusion that Nosema Apis can be found in many German stocks, though in varying degree, and in the majority of apiaries the number of infected bees was slight, but these infected members he terms "parasite carriers." After a lengthy search he found that some of the slightly-affected stocks contained bees having an enormous number of spores characteristic of the acute form of the disease—dysentery, and he thinks the disease only makes its appearance when the stocks are weakened by unfavourable conditions. The Swiss have found the disease widely diffused over the country, and worst in the spring. "The period at which death of the bee occurs is probably greatly influenced by the weather and other factors duly noted. When the weather is cold and wet and the bee inactive, the parasite appears to be able to develop further and reach the spore stage; but when the weather is warm and the bee active, the rapid multiplication of the parasite leads to the death of the bee before the spore stage is reached." The queen may help to spread infection, for in 4 out of 12 living queens examined spores were found. No spores were found in the ovaries and genital track. Infection may be conveyed from her to others, because she voids excrement in the hive, and the workers have this to remove, and excrement from all bees infected has been found crowded with spores.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, The Royal Gardens, Windsor.

LATE VINES.—The final thinning of all late Grapes should be no longer delayed, as they are more forward than usual, and there is great danger of damaging the berries if this work is deferred. They should be more severely thinned than early or mid-season varieties, especially those which will be required for the latest supplies. The berries in the midst of the bunches must be allowed plenty of room to develop without crowding each other. When there is sufficient foliage to adequately furnish the whole of the trellis, all subsequent growths should be regularly removed, but endeavour to obtain a good covering of growth over the whole of the vinery in order that the Grapes may keep in a good condition for as long a period as possible when ripe. See that the roots are well supplied with moisture and plenty of stimulants till the berries are colouring well. Lose no time in applying a good mulch of well-rotted manure to the borders, if this has not been done already. Owing to the unusual amount of sunshine which was experienced during the month of May and part of June, late Grapes are 10 days or a fortnight earlier than usual; therefore, it will be necessary to delay the vines as much as possible when circumstances will allow. During fine, genial weather an abundance of air may be admitted through both the top and bottom ventilators. Fire heat must be dispensed with as much as possible. Certain varieties are subject to scalding of the berries: this usually takes place after the berries have finished stoning. At this period great care must be exercised in ventilating the houses, especially during changeable weather. Guard against the presence of red spider, and carefully sponge the affected leaves with a weak mixture of soft soap and sulphur as soon as the pest is detected. Mealy bug must also be carefully sought for; should this pest get into the bunches it will do great damage, and will militate against the bunches keeping long in good condition when ripe.

RIPE GRAPES.—To keep the bunches in a good condition for as long a time as possible after they are thoroughly ripe an abundance of air must be admitted, and the glass should be lightly shaded. Weak limewash syringed over the glass, or two or three thicknesses of fish netting spread over the roof, will answer the purpose well. The netting will also prevent birds, which do considerable damage to the bunches, from entering the vineries. Maintain sufficient heat only in the pipes to dispel moisture during cold or wet weather. When the majority of the bunches have been cut, the remainder should be removed, and placed in bottles in a cool room, where they will keep in a good condition over a long period.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 6—
Soc. Française d'Hort. de Londres meet.

MONDAY, JULY 8—
United Hort. Benefit & and Prov. Soc. Com. meet.

TUESDAY, JULY 9—
Nat. Rose Soc. Sh. at Regent's Park. Nat. Sweet Pea Soc. Sh. at R.H.S. Hall, Westminster (2 days). Wolverhampton Floral Fête (3 days). Royal Scottish Arboricultural Soc. Ex. at Cupar (4 days).

WEDNESDAY, JULY 10—
Torquay Sweet Pea Sh. Hereford Rose Sh. Elstree Fl. Sh. Bath Rose Sh. (2 days). Woodbridge Fl. Sh. West Surrey Hort. Soc. Fl. Sh.

THURSDAY, JULY 11—
Rose Show at Helensburgh. Streatham and District Sweet Pea and Rose Soc. Sh. Ousecliffe Rose and Sweet Pea Sh. Newmarket Fl. Sh.

FRIDAY, JULY 12—
Manchester Botanical and Hort. Soc. Sh. (2 days).

SATURDAY, JULY 13—
Nat. Sweet Pea Soc. of America (2 days). Edgware and Little Stanmore Hort. Soc. Sh.

The Director of Rothamsted. The experiment station of Rothamsted has been fortunate in its Directors. Thanks to the energy and accomplishments of Mr. A. D. Hall the reputation of this station as a research institution rose steadily during his tenure of office. A few months ago Mr. Hall resigned his position of head of Rothamsted in order to devote himself to the work of the Development Commission, and, in consequence, there devolved on the Trustees of Rothamsted the important task of finding a new Director. Fortunately, they had not far to seek for the man who should prove an admirable successor to the late Director. Dr. E. J. Russell, whose appointment to the office is now announced, has been associated with Rothamsted for some years past as "The Goldsmiths' Assistant for Soil Investigations." In this capacity the new Director has carried out, both alone and in collaboration with colleagues, a series of investigations into the subject of soil fertility, and these investigations have resulted in discoveries destined, as we think, to become classic. As our readers are aware from Dr. Russell's contributions, published in our columns and elsewhere, these discoveries point to the dependence of the fertility of the soil on complex biological factors. Though complex, these factors are not mysterious, and their mode of intervention in ordering or disturbing fertility is now beginning to be understood. It is not, however, our present purpose to describe in detail Dr. Russell's contributions to the science of the soil, but rather to grasp the occasion to extend to him, on behalf of horticulture, our hearty congratulations on his appointment to the important post of Director of the Rothamsted experiment station.

Thanks to the grant made recently to Rothamsted from the Development Fund the range of activity of that Institution will be extended widely in the immediate future, and we are confident that the wisdom which Dr. Russell has shown in his own investigations will be at the service of his colleagues, to aid them in the hard task of wresting from Nature yet more of her closely-kept secrets. Dr. Russell is young and has the gift and privilege of youth—enthusiasm. He understands not only how to discover knowledge, but also how to impart it. His practical knowledge of agriculture, combined with his scientific training, gives us the right to expect great things from Rothamsted, hence all who are jealous lest this country should fall behind other nations in the pioneer work of scientific exploration will learn with great pleasure of this appointment.

The new Director is at present on his way to the United States in order to deliver a course of lectures at the fourth session of the Graduate School of Agriculture, now being held at the Michigan

DR. E. J. RUSSELL.

Agricultural College. Among other engagements in the States Dr. Russell will pay visits to some of the chief experiment stations in America. He will meet at those stations many investigators intent on work of a nature similar to that in which he is himself engaged, and his visit will enable him to incorporate all that are best of American methods with those which he has invented for himself: for there are, thank goodness, as yet no patent rights in research.

PRIZES AT THE "INTERNATIONAL."—The final list of Awards made at the International Horticultural Exhibition has been issued. Names of exhibitors are given for every class, and those who won prizes are distinguished by the figures 1, 2, and 3, which indicate respectively the first, second, and third prizes. The non-competitive awards are printed in full.

———An interesting event took place at an informal meeting held in the Secretary's tent on the opening day of the Holland House Show, when presentations were made to Mr. EDWARD WHITE, managing director, Mr. T. GEOFFREY HENSLOW, organising secretary, and Mr. S. T. WRIGHT, superintendent of the International Show. The gifts were subscribed by exhibitors as a mark of appreciation of the assistance rendered by these gentlemen in their official capacity. A sum of £200 was collected by a small committee, with Mr. GEORGE BARD and Mr. R. F. FELTON as secretaries, and Mr. HAROLD BEALE as treasurer, and the expenses of collection were defrayed by Messrs. JAMES CARTER & Co. Mr. GURNEY FOWLER, chairman of the Board of Directors, made the presentation in an interesting speech. He handed an example of the large standard Silver Cup of the International Show to each recipient, accompanied, in the case of Mr. WHITE, by a rose bowl for Mrs. WHITE, and sums of £75 each for Mr. HENSLOW and Mr. WRIGHT.

NATIONAL ROSE SOCIETY.—The Metropolitan Show of this Society will be held in the Royal Botanic Gardens, Regent's Park, on the 9th inst. The prizes include two champion challenge trophies, also numerous cups and pieces of plate, besides money prizes to the value of over £400. The present season is the most favourable that we have had for many years past, and an unusually grand and varied display of all types of Roses is anticipated. Luncheon, tea, and light refreshments will be obtainable in the gardens.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—In connection with the recent festival dinner, Mr. INGRAM informs us that the following donations have been received since the list published last week was compiled:—Mrs. W. J. JEFFERIES, Cirencester, £10 10s.; Col. the Rt. Hon. MARK LOCKWOOD, £5 5s.; Messrs. PAUL & SON, £5 5s.; Mr. H. B. MAY, £4 4s.

ANDRÉ LENÔTRE.—The French Minister of Public Instruction has appointed a committee to consider the best means of celebrating the three-hundredth anniversary of the birth of ANDRÉ LENÔTRE, the creator of the gardens of Versailles, gardener-in-ordinary to Louis XIV of France. The approved scheme is a retrospective exhibition of the gardening art, simultaneously in Paris and Versailles, where a chamber in the Palace is to be devoted entirely to LENÔTRE.

SOUVENIR DE LA MALMAISON CARNATIONS.—We have received from Messrs. STUART LOW & Co. a number of fine flowers of choice varieties of Souvenir de la Malmaison Carnations. We are surprised to hear that "since the ascendancy of Perpetual-flowering Carnations, 'Malmaisons' seem to have been put somewhat in the shade." Most of our readers will agree with this further quotation from Messrs. LOW's letter that "they are a very useful class of plant to follow on after Perpetuals, especially in private establishments where a big show is wanted during this time of the year. They can be wintered in a cold frame." Those who are in danger of losing their regard for the "Malmaison" Carnation should visit Messrs. LOW's collection, or the extraordinary fine collection belonging to Mr. PIERPONT MORGAN, at Dover House, Roehampton, where Mr. MCLEOD has two large houses that always present a brilliant display at about midsummer.

MESSRS. HURST & SONS' OUTING.—The annual outing of Messrs. HURST & SONS, seedsmen, Houndsditch, took place on Saturday, the 29th ult., when the employees visited Prested Hall, Mr. N. N. SHERWOOD'S residence at Kelvedon, Essex. The company, numbering nearly 400, left Liverpool Street by special train, and arrived at Kelvedon soon after noon. On this occasion the excursion had more than its

usual significance, for it is just 50 years since Mr. N. N. Sherwood joined the business which he has done so much to develop, and there were many visitors present in addition to the staff. Immediately after lunch an interesting ceremony took place. This was the presentation on the part of the staff of a handsome silver loving cup to Mr. Sherwood to mark the occasion of his jubilee in the firm. Mr. Thomas Cox, in making the presentation, dwelt upon the regard and esteem entertained by the employees for their chief, and for his sons, Mr. Willie and Mr. Edward Sherwood. The good management of the business and the kind consideration of the proprietors were proved by the fact that many of the employees had been in the service of the firm for long periods. The oldest member of the staff is one of the women workers, with a record of more than half a century, and a list was read including the names of many who had been with the firm for periods varying from 21 to 50 years. Mr. Sherwood, on rising to acknowledge the gift, was greeted with enthusiastic applause. Both he and his two sons made appropriate speeches, and in their turn testified to the able manner in which their own efforts had been seconded by the intelligent and loyal co-operation of the staff. Speeches were also made by Mr. J. Gurney Fowler and Mr. Arthur W. Sutton. After lunch there were sports for the employees, and various entertainments on the lawn. We learn from a member of the staff that with the invitations issued for lunch each employee received a cheque presented by Mr. Sherwood. Some of the guests left at five o'clock for London, but the sports continued for another hour and a half, and not until the presentation of the prizes by Mrs. Campbell did the rest of the guests return to London. Needless to say, the proceedings were thoroughly enjoyed, and Mr. Sherwood received many well-deserved congratulations on the fact that he is in the enjoyment of excellent health after 50 years close application to business.

HOLLAND HOUSE SHOW.

Fig. 7.—astilbe "avalanche": flowers white.

Received Award of Merit. (See p. 15.)

ROYAL HORTICULTURAL SOCIETY.

Summer Exhibition at Holland House.

July 2, 3, 4.—The summer exhibition of the Royal Horticultural Society was held on these dates in the grounds attached to Holland House, Kensington. These exhibitions have been for long associated with Holland House, but there have been occasions when they have been held elsewhere, as, for example, at the Royal Hospital, Chelsea, in 1905, and at Olympia last year. Neither of these places is so suitable as the beautiful grounds attached to Countess Ilchester's house, and it is great satisfaction to know that for some years at least Holland Park has been secured by the Council for these shows. The recent exhibition is one of the best of the series, and it only needed fine weather to make the show a great success. The tents were more spacious, lighter, and better ventilated than on former occasions; the groups were arranged more attractively, and the quality of the produce was superb. There were fewer exhibits of sundries and implements than usual, but although these are of great interest to gardeners, they have not the same attraction for visitors as flowers and fruits; the large tent they usually occupy was filled with flowers instead. Contrary to the usual practice, the Orchids were accommodated in one of the side tents, the large marquee being wholly filled with groups, including a magnificent collection of fruit trees and another of stove plants, arranged by Messrs. James Veitch & Sons, for which the Coronation Cup, the premier prize of the show, was awarded. Here also Messrs. R. Wallace & Co. arranged a realistic rock garden. Besides these exhibits there were imposing displays of Roses, Carnations, Ferns, Clematis, and Sweet Peas, whilst the hardy plants would have made a show in themselves. Several attractive groups were staged in the open, including a Japanese garden arranged by Messrs. Carter & Co., in which Iris Kæmpferi was the dominant feature. The morning of the first day was bright and fine, and when the gates were opened a larger number of visitors than usual entered, pointing to a record attendance, but later rain fell incessantly, which militated against a large attendance, and rendered the exit from the field almost impassable for ladies on account of the mud. The second and third days were fair but dull, the weather being anything but summer-like. New plants were submitted for Awards, both before the Floral and Orchid Committees. The former body granted three First-class Certificates, eleven Awards of Merit, and one Botanical Certificate, whilst the Orchid Committee recommended three First-class Certificates and three Awards of Merit.

Excellent arrangements were made, as usual, by the superintendent, Mr. Wright, assisted by Mr. Reader and the other members of the Society's permanent staff.

Roses.

Mr. John Mattock, New Headington, Oxford, arranged a group of Roses, in which the fine quality of the blooms was matched by the admirable taste in the association and balance of colours, and by the recognition of the value of Rose foliage, and an open disposition of the exhibition blooms in vases, too often lost sight of in the crowded bunches so frequently staged. The background consisted of arches of Blush Rambler, Trier, and Hélène, separated by tall stands of the crimsons Her Majesty and Richmond, and enclosing similar stands of Prince de Bulgarie, Frau Karl Druschki, and Mme. Ravary. The centrepiece was a beautiful group of Marquise de Sinety, and there were commanding stands of Lady Curzon, Mme. Mélanie Soupert, and Irish Elegance. The best blooms in baskets included Mrs. Wakefield, Christie Miller, Mrs. Hubert Taylor, Chateau de Clos Vougeot, Geo. C. Waud, Mrs. David McKee, and Lady Ashtown. This group was awarded the Wigan Challenge Cup in open competition for the best exhibit of Roses.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, showed one of the most tastefully-arranged groups of Roses. Ramblers as standards, budded at varying heights, formed the feature of the group, and their foliage balanced the brilliance of the exhibition blooms in baskets and vases in the foreground. Trier, Leontine Gervaise, and Gardenia were especially pretty as dwarf standards, and a pillar of Shower of Gold formed a fine centrepiece. The exhibition Roses were rich in well-known Hybrid Perpetuals, which otherwise were little represented, and the stands included Suz. M. Rodocanachi, Prince de Rohan, Horace Vernet, Victor Hugo, Duke of Edinburgh, A. K. Williams, and Mrs. Sharman Crawford. Among the Hybrid Teas we noted especially Mrs. Theodore Roosevelt, Mme. Ravary, Geo. C. Waud, Magnolia, and Mme. Abel Chatenay.

Messrs. Stuart Low & Co., Bush Hill Park, staged an effective group, with tall columns and bamboo stands of Roses at the back, and vases and exhibition boards in the foreground. Some magnificent blooms of Mildred Grant were included. Rayon d'Or, Marquise de Sinety, Lady Pirrie, Richmond, and Liberty gave admirable masses of colour.

Mr. Geo. Prince, Longworth, Berkshire, had a finely-coloured centrepiece of Rayon d'Or, and some pretty bamboo stands of Lyon, Juliet, and other choice varieties. Mildred Blackbourne, Mrs. A. R. Waddell, and others formed a bed of Roses in the foreground, whilst at the back were arches of Lady Gay, Dorothy Perkins, and Hiawatha.

Mr. Chas. Turner, The Royal Nurseries, Slough, in a group of Roses in the large tent gave prominence to two new Wichuraiana Ramblers, Ethel and Coronation. The former variety received an Award of Merit. The latter is a very bright red flower, several shades lighter than Crimson Rambler or Hiawatha. The background to the group was formed by unusually good specimens of Rambler standards. Geoffrey Henslow, a new crimson Hybrid Perpetual, showed well with stands of Frau Karl Druschki and Lyon Rose. Baskets of Ulrich Brunner, Juliet, Mme. Luizet, and others made a pretty foreground.

Messrs. Geo. Bunyard & Co., Ltd., Royal Nurseries, Maidstone, staged a small group, with a background of Roses in bamboo stands. Frau Karl Druschki, Lyon Rose, and Juliet were shown well in exhibition boxes.

Messrs. H. Cannell & Sons, Swanley, Kent, showed a good batch of American Pillar.

Messrs. Wm. Paul & Son, Waltham Cross, arranged a large group of Roses, of which the general scheme was a groundwork of exhibition and garden Roses in baskets and vases, overhung with tall budded standard Ramblers. Delight, White Dorothy Perkins, and Lady Gay were shown well, but the group was especially rich in the newer Hybrid Teas of pale shades, many of which had been introduced by Messrs. Paul. Their own varieties best worth mentioning included Francis Charteris Seton, Hugo Roller, Bianca, Lady Downe, Margaret, Marcella, and Mrs. Charles Hunter.

Messrs. David Russell & Son, Essex Nurseries, Brentwood, staged six exhibition boxes of specimen blooms against a background of Ramblers and stands of Killarney, Liberty, &c.

The Rev. L. C. Chalmers-Hunt, Willian Rectory, Hitchin, showed 38 vases of Roses, including standard varieties, with some good flowers of Geo. C. Waud, White Maman Cochet, Wm. Shean, and Joseph Hill.

Messrs. Hugh Dickson, Ltd., Royal Nurseries, Belfast, showed a group of bush Roses arranged with simplicity, and unhampered by overcrowding or hackneyed methods of formal staging. The group included a number of standard varieties, but its feature was its novelties. Mrs. Chas. S. Hunting received an Award of Merit. Mrs. Archie Gray (large, creamy-yellow flowers), Mrs. Hugh Dickson (very bright red flowers, rather thin, with magnificent vigour in the stem), Mrs. Sam Ross, Sir Hugo, Sir Edward Carson, and Brilliant (velvety-crimson Hybrid Tea), were also conspicuous. The blooms were of fine quality, but showed the influence of the recent heavy rains in Ireland.

Messrs. Frank Cant & Co., Braiswick Rose Gardens, Colchester, showed a pretty group, with such Ramblers as Gardenia, Blush Rambler, and Frau Marie Weinbach (white), and a stand of Gottfried Keller as a background to vases of Nita Weldon, Gloire de Chedane Guinosseau, Ethel Malcolm, Chateau de Clos Vougeot, and Rayon d'Or.

Mr. R. C. Notcutt, Woodbridge, Suffolk, staged a group of Roses. The background consisted of Ramblers, and good bamboo stands were included of Juliet, Geo. C. Waud, Mme. Ravary, and Pharisaer. Souv. de Pres. Carnot and Gottfried Keller were shown well in vases.

Mr. Philip le Cornu, Jersey Nurseries, Jersey, showed his new Roses Duchess of Normandy and Mrs. Philip le Cornu. The former is a sport from Dean Hole, and possesses the desirable exhibition characteristics of that variety. Lack of sunshine recently prevented the blooms exhibited from developing the yellow in the soft salmon-flesh flowers, which is the charm of this variety.

Messrs. Ben. R. Cant & Sons, The Old Rose Gardens, Colchester, showed an effective group of Roses on narrow staging. Striking trophies of Ecarlate, Lyon Rose, Mme. Mélanie Soupert, Dean Hole, and Mrs. Alfred Tate were included, and some effective colour combinations were tried by associating, in the one bamboo stand, Warrior with White Killarney, Yvonne Vacherot with Prince Camille de Rohan, and Chas. J. Grahame with Mme. Leon Pain. The new Hybrid Teas, Rose du Barri, Sunbeam, and St. Helena, were admirably shown. The foreground to the group consisted of exhibition blooms in boxes.

Messrs. R. H. Bath, Ltd., Wisbech, arranged a small group of Roses, in which Canarien Vogel and Cecile Brunner figured effectively.

Messrs. G Bolton & Son, The Nurseries, Buntingford, Herts., staged a small group, of which the general effect was marred by the bunchiness of the closely-packed vases.

Messrs. Alex. Dickson & Sons, Ltd., Newtownards, showed blooms of unusual quality and colour. Theresa, Mrs. Fred Straker, C. W. Cowan, and Queen Mary were shown effectively against black velvet. Immense blooms of Mrs. Cornwallis West were displayed in boxes, and some beautiful pieces of colour were furnished by Melody, Viscount Carlow, Lady Pirrie, and Geo. C. Waud.

Messrs. Geo. Jackman & Son, Woking Nurseries, Surrey, made a display, of which the effect was somewhat spoiled by its restriction to narrow tabling. Sprays of rambling Roses in hanging baskets and a good use of foliage gave the group novelty and variety. In bamboo stands, Mrs. E. Mawley, Mrs. A. R. Waddell, Harry Kirk, Mrs. Alfred Tate, Edu Meyer, and Lyon Rose showed to advantage, and a specially fine vase of Marquise de Sinety was included.

Messrs. W. & J. Brown, Peterborough, arranged a group of Roses dominated by the centrepiece of Richmond, above vases of Mme. Ravary and Pharisaer. The side stands consisted of Mme. M. Soupert and Countess Dudley, and a number of small bunches of standard sorts were also included.

Mr. W. Easlea, Danecroft Rosary, Eastwood, Essex, showed a pretty collection, with a characteristic arrangement of the Roses in baskets, which gave a freshness and attractiveness to a small group. A fine exhibit of American Pillar formed a centrepiece. In the baskets, Joseph Hill, Mme. A. Chatenay, Arthur R. Goodwin, and Prince de Bulgarie were notable.

Mr. J. D. Webster, Market Avenue Nursery, Chichester, arranged a small collection of Roses in bamboo stands and vases, of which the best varieties included Lady Ursula, Florence Pemberton, and Mme. Ravary.

Messrs. Hobbies Ltd., Dereham, tastefully arranged a large group of Roses, which had a background of standard Ramblers and pillars of Alberic Barbier, Blush Rambler, &c. Stands of Harry Kirk, Rayon d'Or, General McArthur,

Lady Hillingdon, Souvenir de Catherine Guillot, and the new Rambler Pink Pearl were included effectively.

Messrs. W. CUTBUSH & SON, Highgate, showed a group of Polyantha Roses. Mrs. W. H. Cutbush and Jessie formed a bed, above which were hung the branches of Baby Tausendschon and Jessie, worked as dwarf standards. The background was formed of Hiawatha, Crimson Rambler, Mrs. F. W. Flight, and other Rambler Roses.

CARNATIONS.

Messrs. STUART LOW & Co., Enfield, exhibited a magnificent group of Carnations, making a delightful display in hanging baskets, "Liberty" vases and epergnes. On tall stands in vases were large sheaves of Lady Alington (salmon-pink), and Baroness de Brienen (flesh-pink). In taller stands at the back, in a setting of greenery, were vases of Princess of Wales (salmon), Lady Mary Hope (new, terra-cotta), Princess Juliana (perpetual-flowering "Malmaison," orange), and C. P. Little (yellow). In the general display were excellent blooms of Royal Purple, Rival (coral-red), My Favourite (rose-pink), and Mrs. T. M. Crook. Adjoining the Carnations this firm showed greenhouse plants, including Pelargoniums.

Messrs. JOHN PEED & SON, West Norwood, London, exhibited Carnations, having well-known varieties of the perpetual-blooming and Souvenir de la Malmaison types. In the centre of the group was a batch of the crimson Maggie Hodgson variety. Princess of Wales and Mrs. Trelawney, both "Malmaison" varieties, were also shown well.

Mr. JAMES DOUGLAS, Edenside, Great Bookham, showed vases of Carnations of the florists' type. All were of magnificent quality, especially Mrs. Penton, Miss Willmott, John Ridd, Trojan, Mr. R. Gordon, Kate Nickleby, Mr. Berkley, Lord Nelson, Mrs. Henwood, and Jean Douglas.

Mr. C. ENGELMANN, Saffron Walden, showed perpetual-flowering Carnations, having vases of representative varieties.

Mr. H. BURNETT, Guernsey, also exhibited perpetual-flowering Carnations, the blooms being, as usual from this exhibitor, of splendid quality.

W. M. GOTT, Esq., Trenython, Par Station, Cornwall (gr. Mr. G. Millman), exhibited varieties of Souvenir de la Malmaison Carnations, having extra choice blooms of well-known varieties.

A small collection of Carnations was shown by Mr. H. LAKEMAN, Thornton Heath, Surrey, the blooms being exceptionally good.

Mr. C. BLICK, Warren Nurseries, Hayes, Kent, displayed a small but select group of Carnations of the border type. All the varieties were of high merit, the finer being Vandyck, Skirmisher, Charles Blick (a large white seedling), Queen Mary, Salome, Cyclops and Rhea.

BEGONIAS.

Messrs. BLACKMORE & LANGDON, Twerton-on-Avon, Bath, showed magnificent Begonias of the tuberous-rooted section. The colours and size of flowers were splendid. Mrs. W. L. Ainslee (yellow), W. H. Fry (rose), James Douglas (yellow), Rose Superb (rose), Marie Nicholas (salmon-rose), King Alfonso (crimson), Mrs. Robert Morton (yellow, with faint rose-blush), and J. Thornton (white), were all of sterling quality. There were also many choice frilled and crested varieties.

Mr. A. LL. GWILLIM, Cambria Nursery, Sidcup, Kent, showed beautiful plants of tuberous-rooted Begonias, many of the flowers exceeding 6 inches in width.

FERNS.

Messrs. H. B. MAY & SONS, Upper Edmonton, arranged their collection of Ferns in a light and graceful manner. Amongst beautiful, rounded specimens of Davallia fijiensis robusta, Polypodium Knightæ, P. Vidgenii, and a young plant of Angiopteris erecta, which, at maturity, develops immense fronds, there were tall pillars of Lygodium japonicum, fully 10 feet high, L. scandens and L. polymorphum. Rich red colour was supplied by the young fronds of Adiantum Veitchii, the large-fronded A. macrophyllum, A. pulverulentum, and pans of Selaginella plumosa and S. cæsia, whilst the Golden Gymnogramme grandiceps superba vied with the silver species.

Messrs. J. HILL & SON, Barrowfield Nursery, Lower Edmonton, broke the level of their massive group of Ferns with such Tree Ferns as Hemitelia Smithii, Cyathea dealbata, Blechnum braziliense, and a stand of the trailing Polypodium vaccinifolium. Large plants of Davallia fijiensis, Asplenium caudatum, and Polypodium quercifolium served to draw attention to the smaller golden and other varieties which margined this immense collection of Ferns.

Mr. AMOS PERRY, Enfield, showed a bank of hardy Ferns, arranged in rock-work. There were beautiful crested and plumose forms of Athyrium Filix-fœmina, Lastræa dilata, Polystichums, Onoclea sensibilis, Osmunda regalis, O.r. cristata, O. cinnamonea, O. Claytonia, and Adiantum pedatum in variety

SWEET PEAS.

Messrs. DOBBIE & Co., Rothesay, showed a magnificent collection of Sweet Peas, embracing the pick of the varieties in cultivation as well as many novelties. Amongst the latter were Decorator (a Spencer form of the variety Rose du Barri), an improved Thomas Stevenson, Lavender George Herbert, True Lavender, Lady Miller (apricot-pink), Dobbie's Scarlet, Brunette (mahogany-red), and Marks Tey (purple with a maroon standard). There were splendid spikes of Thomas Stevenson, May Campbell, Mrs. C. W. Breadmore, Rosabelle, Melba, and Countess Spencer.

Messrs. SUTTON & SONS, Reading, exhibited a comprehensive collection of Sweet Peas. There were 75 varieties, and the exhibit occupied 75 feet run of tabling. The flowers were shown in glass vases against a dark-velvet background. Notable varieties were Doris Usher (cream-pink), Southcote Blue, Mrs. Heslington (mauve), Bertie Usher (blue striped), Sutton's Royal Rose, Mrs. Hugh Dickson (soft pink), Clara Curtis (cream-yellow), Edith Taylor (salmon-pink), Lady Althorpe (white with a suspicion of buff), Mrs. W. J. Unwin (white ground marbled with rich salmon), Rosabelle (rose), and Moneymaker, one of the best of the white sorts. There were also large epergnes filled with varieties of various colours under the name of "giant frilled."

Messrs. JAMES CARTER & Co., Raynes Park, Wimbledon, put up a handsome group of indoor flowering plants and Sweet Peas. The latter were arranged on an archway, forming a bower of these blossoms, whilst the other subjects included handsome Begonias, Streptocarpuses, and Richardia Mrs. Roosevelt relieved with suitable greenery.

Mr. W. E. ALSEN, Denmead, Hampshire, showed bunches of Sweet Peas of excellent quality. A. A. Fabius (cerise), Annabel Lee (lilac with paler centre), and Minnie Furnell (pale pink) are new varieties raised by this exhibitor.

Messrs. J. CHEAL & SONS, Crawley, showed Sweet Peas extensively, having fine spikes of many popular varieties.

A good exhibit of Sweet Peas was also put up by Sir RANDOLF BAKER, Bart., M.P., Ranston, Blandford (gr. Mr. A. E. Usher). Mrs. A. Ireland, Mrs. W. Unwin, Audrey Crier, Lavender George Herbert, Barbara, Marjorie Linzee, Melba, Edrom Beauty, Tennant Spencer, Eric Harvey, and Doris Usher are a selection.

Mr. C. W. BREADMORE, Winchester, had an exhibit in which the bunches were effectively arranged with sprays of Asparagus Sprengeri and Adiantum Fern. In this large collection the following varieties were especially good:—Aurora, Audrey Crier, Tennant Spencer, Florence Nightingale, Mrs. R. Hallam, Senator, Doris Usher, Stirling Stent, Bertie Usher, Breadmore's Lavender, Mrs. Cuthbertson, Mrs. Fred. Arey (new, cream suffused with rose), and Aurora.

Messrs. ROBERT SYDENHAM LIMITED, Birmingham, were awarded a Silver-gilt Banksian Medal for a collection of Sweet Peas which included the varieties Lilian (pale pink with buff ground), Edith Taylor (rosy salmon), Iris (pale salmon), Barbara (salmon-orange), Princess Henry (lavender-blue), and Prince George (rosy lilac).

Messrs. S. BIDE & SONS, Farnham, Surrey, made one of the prettiest groups of Sweet Peas. They were arranged in graceful baskets on tall white stands with smaller stands in front, the ground having smaller vases on a white surface. Beside being so attractive, the blooms were of splendid quality.

Sweet Peas were also shown by MARSHALL G. GREEN, Esq., The Lodge, Eynsford, Kent (gr. Mr. W. White).

Messrs. E. W. KING & Co., Coggeshall, staged Sweet Peas, for which a Silver Cup was awarded. The blooms were set out to the best advantage; decorated archways were arranged at either end, whilst in the centre were tall columns festooned with sprays of Smilax.

Messrs. JOHN K. KING & SONS, Coggeshall, showed Sweet Peas in great assortment, the front of the exhibit having archways decorated with Sweet Peas and Smilax.

PELARGONIUMS.

Mr. H. J. JONES, Ryecroft Nurseries, Lewisham, staged a bank of Zonal Pelargoniums in pots. The trusses were exceptionally good, and many of the specimens had no fewer than half-a-dozen. Excellent varieties for bedding and greenhouse decoration were seen in Alf. Simpson (scarlet), R. C. Pulling (salmon), E. Newman (scarlet), T. F. Bunting (salmon-pink), Mrs. Gulliver (improved, pale-lilac), and Harry Wood (crimson, with a white eye).

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Ed. Beckett), showed a large and varied assortment of scented-leaved Pelargoniums, both species and varieties. The plants were splendid specimens. P. Radula, P. artemisioides, P. tetragona, P. jatrophæfolium, P. mollis, P. ardens major, and the old favourite Pretty Polly specially attracted notice.

Mr. W. TRESEDER, Cardiff, showed varieties of Regal Pelargoniums, including Lord Bute (purplish-black with rose-pink edge), Lord Tredegar (maroon, with lighter margin), Flora (vermilion and white), and Mary (pink, blotched with terra-cotta).

Mr. PHILIP LADDS, Swanley, Kent, staged a pink Pelargonium named Champion, a variety with large truss of medium-sized flowers; White Queen, and Ambrosia (pale-pink). All three are recommended for bedding purposes.

Messrs. GODFREY & SON, Exmouth, showed varieties of scented-leaved and fancy Pelargoniums, also Sweet Peas.

Mr. H. HEMSLEY, Crawley, showed his new Ivy-leaved Pelargonium "Queen Mary," a variety of deep-rose colour, with deeper markings in the upper petals.

Messrs. CARTER PAGE & Co., 52 and 53, London Wall, exhibited varieties of Zonal-leaved Pelargoniums and Pæony-flowered Dahlias.

Mr. VINCENT SLADE, Taunton, Somersetshire, showed varieties of Zonal Pelargoniums.

STOVE PLANTS.

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, London, arranged a magnificent collection of stove and greenhouse plants in the form of a long group. The necessarily narrow formation was made very pleasing by the judicious use of tall specimen plants, and the raising of pitcher plants on tall Asparagus-covered stands. Groups of dwarf Ixoras bearing large heads of orange-scarlet flowers and Crozy Cannas gave vivid patches of colouring. Smaller groups of Solanum Wendlandii, with their clusters of large mauve flowers, also attracted admiration. Amongst the rarer stove plants we noticed Cyanophyllum magnificum, with immense entire leaves of rich colouring; Anthurium Hookeræ and Rhopala corcovadensis (single-stemmed plants of this tropical tree are very attractive, the velvety young shoots and leaves are covered with chestnut-brown tomentum).

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, arranged a variety of Dracænas, Caladiums, Alocasias, a very good Anthurium crystallinum, and other stove plants.

Messrs. JOHN PEED & SONS, West Norwood, London, showed Caladiums. Amongst the finer specimens were Excellent (purple veining with white and green ground), Mikado (deep rose with broad green edge), King George, new (rose with green spotting), Triomphe de Comte (bright rose with green margin), Argentine (silvery-green), Her Majesty (small, but elegant variety, bright green and silver), Crested Wave (a small-leaved, transparent variety, the palest-rose with green margin), and Mme. E. Pynaert.

Mr. J. BRUCKHAUS, Orleans Nursery, Twickenham, set up a group of Palms, Codiæums, and Caladiums.

MISCELLANEOUS INDOOR PLANTS.

Messrs. JOHN PEED & SONS, Norwood, showed plants of their strains of Streptocarpus and Gloxinia, the latter presenting a great variety of fine colours.

Messrs. James Veitch & Sons, Ltd., Chelsea, showed Cannas, Streptocarpuses, Carnations, Begonias, Achimenes Rose Queen, Sollya Drummondii, Begonias, standard Fuchsias, Solanum Wendlandii (finely-flowered specimens), greenhouse Rhododendrons of the javanico-jasminiflorum hybrids, Lobelia tenuior, Calceolaria Burbidgei, and other fine indoor-flowering plants. As usual, Mr. Heal arranged the various subjects with much skill, and there was little in evidence that in the morning the staging on which this fine group was arranged had collapsed, spoiling many excellent plants.

Messrs. John Piper & Sons, Bayswater, London, exhibited a group of Fuchsias, having large, well-flowered pyramidal and standard plants arising from a ground of smaller specimens. An edging of Tradescantia completed an excellent exhibit. It is to be regretted that none of the varieties were named.

Mary Countess of Ilchester, Holland House, Kensington (gr. Mr. Dixon), exhibited numerous succulent plants, including Aloes, Gastereas, Mammillarias, Dyckia rarifolia, Agaves, and Echinopsis.

In a separate tent, Countess Ilchester exhibited, from Abbotsbury Castle, Dorsetshire (gr. Mr. H. Kempshall), a collection of rare flowering shrubs and trees, including Buddleia Lindleyana, Callistemon salignus aurea, Eucalyptus ficifolia, Podocarpus chilina, Aloe maculata, varieties of Philadelphus, and Notospartium Carmichæliæ.

Messrs. Barr & Sons, King Street, Covent Garden, showed a collection of pigmy trees in china vases of quaint shape.

Messrs. H. Cannell & Sons, Swanley, exhibited groups of Sweet Peas, Gloxinias, Zonal Pelargoniums, Cannas, Begonias, and Roses. The Sweet Peas included most of the newer sorts: Juliet (cream ground with pink), Florence Nightingale (lavender), Thomas Stevenson (orange), Arthur Green (maroon), Miss Doris (orange-pink), and Duplex (blush pink) are a selection. The Pelargoniums included a large batch of the salmon-coloured Paul Crampel variety, Sirdar (scarlet), Dublin (cerise), Mrs. G. Cadbury (salmon), Cymric (purple), and Countess of Jersey (salmon). The Cannas were remarkably good, showing a great advance on the older varieties.

Mr. L. R. Russell, Richmond, Surrey, filled a table, 50 feet long, with the brilliant Salvia Pride of Zurich, making a broad band of rich scarlet colour backed with silver variegated foliage plants.

Messrs. Wm. Cutbush & Son, Highgate, London, arranged a most charming group in a very attractive style. A few tall Palms, two specimen Codiæums, surrounded by a mass of pink Polyantha Rose (Eileen Low), stood above the exceptionally fine batches of Carnations and Roses which, with just a few plants of Statice profusa, composed the groundwork of this delightful group. The principal Carnations were Lady Coventry, King Arthur, and Lady Meyer. Among the many Polyantha Roses, Orleans Rose and dainty little standards of Jessie and Baby Tausendschön were especially good.

Messrs. Carter & Co., Raynes Park, showed a batch of Araucaria excelsa var. gracilis.

Japanese Garden.

Messrs. Carter & Co., Raynes Park, made a pleasant, restful Japanese garden. The large winding lake, which custom decrees must be in every Japanese garden, was bridged by an unpretentious wooden structure, and the bays of the lake were filled with exceedingly good Japanese Iris, chiefly with blue flowers. At the back a Birch-thatched rest-house nestled invitingly amidst tall Conifers and rustling Bamboos. The placid waters of the lake reflected the forms of the trees, and the colours of the Liliums and Irises. There were just a few stone lanterns, but on this occasion Messrs. Carter relied on the quiet attraction of a well-designed garden, lightly planted with good subjects for their exhibit, rather than on such adventitious aids as bronze animals and heavy stone work.

Hardy Plants.

Mr. L. R. Russell, Richmond Nurseries, Richmond, arranged a large group of the tree Ivies. The golden varieties were almost dazzling in their colour, and the white forms had plenty of variegation, but not too much. Beyond the large group of Ivies, Mr. Russell made a water garden, almost surrounded with a splendid collection of Bamboos. A couple of weeping Willows, behind and hanging over the Nymphæa pool, lent an air of reality to the garden. Further on there were many golden and silver-leaved shrubs interspersed with batches of Ceanothus, Buddleia Colvillei, and the old favourite Erythrina crista-galli, with its quaint coral-coloured flowers. Half-a-dozen huge plants of Hydrangea hortensis showed the size this popular shrub is capable of attaining.

Messrs. W. Fromow & Sons, Sutton Court Nursery, Chiswick, Middlesex, had an immense group of hardy trees and shrubs. The Japanese Maples with their variously-hued leaves, made this a very attractive display. Tall, slender Bamboos swayed gracefully in the gentle breeze. Bright golden colour was given by varieties of Yew and Cupressus and good golden variegated Ivies. The varied outline and tasteful arrangement of this collection added much to its attraction.

Messrs. Wm. Cutbush & Son, Highgate, London, displayed splendid examples of topiary work. Whilst these trimmed trees are anathema to some garden-lovers, many others see beauty in the peacocks, pheasants, dogs, sundials, barrows, and such like, formed in growing bushes of Box or Yew.

Messrs James Veitch & Sons, Chelsea, London, set out a large collection of immense pruned Bays. Most of them were pyramidal in outline; a few standards had twisted stems.

Mr. Carlton-White, 53, New Bond Street, London, showed a variety of Box topiary.

Messrs. John Piper & Sons, Bishop's Road, London, made an uncommon topiary garden. The fence of living Box, with round pillars, told of skilful and patient training. Next to the topiary work, Messrs. John Piper arranged a rock garden and pool.

Messrs. Barr & Sons, Covent Garden, London, arranged bold groups of herbaceous flowers on either side of a small pool, with pink Astilbes and Spiræas. The group included good bunches of hybrid Lupins, Harkness's new Verbascum, Geum Mrs. Bradshaw, Spark's Aconitum, Allium giganteum, Chrysanthemum "Shasta," Erigeron speciosus superbus, and Dimorphotheca hybrids. An exceptionally good collection of pigmy trees was also included.

Messrs. G. Bunyard & Co., Ltd., Maidstone, staged an effective group, with masses of distinct colour. The red Pentstemons Southgate Gem and George Horne formed a feature of the group. The pink Astilbes Ceres and Venus were fine, and good plants were included of Lilium longiflorum, Delphiniums, and Eremuri. A piece of rockwork showed Glaucium flavum tricolor, Dianthus deltoides Brilliant, dwarf Campanulas, &c.

Messrs. R. Wallace & Co., Kilnfield Nurseries, Colchester, made a most satisfactory model of a garden design. A formal terrace garden was bounded by a rock wall planted on top with Hypericums, Helianthemums, and similar plants; and at the foot with a pretty combination of Nepeta Mussinii and Pentstemon Myddelton Gem. An herbaceous border at the back was rich in new Eremuri and Verbascums, Lilium longiflorum formosum, &c. Steps led to an upper garden hedged with trained Box, which included a harmony of Nepeta and Erigeron, with Pentstemon. An informal water-garden included Japanese Iris, Bamboos, and a good collection of herbaceous Spiræas and Astilbes. Hardy Ferns and Lilies were appropriately planted at the north side of one of the rock walls. The use of a dark background of Cupressus, assisted by green baize, did much to show up the colours in a very pleasing group.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, showed herbaceous plants, among which we noted Epilobium angustifolium album, Nepeta violacea, and some Pæonies. The interesting feature of the group was the rich collection of cut shrubs with ornamental foliage. These included Acer Schwedleri, A. Schwerinii, Elæagnus longipes, Staphylea trifoliata, Liriodendron tulipifera aureo-marginata, Fagus tricolor, Ligustrum multiflorum, Syringa japonica, and Cotoneaster pannosa.

Mary Dowager Countess of Ilchester, Abbotsbury Castle (gr. Mr. Kempshall), sent a very interesting collection of rare flowering shrubs, which grow so well at Abbotsbury. We should like to enumerate them all, but must be content to mention Eucalyptus ficifolia, Magnolia Watsonii, Carpenteria californica, Deutzia Vilmoriniana, Cornus capitata, Notospartium Carmichaeliæ, Wilson's var. of Buddleia Lindleyana, Amyris Plumieri, Podocarpus chilina, Callistemon salignus aurea, and various rare Mock Oranges and Honeysuckles.

Messrs. Fred Smith & Co., Woodbridge, in a well-staged exhibit of herbaceous flowers, showed good bunches of Scabiosa caucasica, Iris aurea, Œnothera Fraseri, Malva moschata, Gillenia trifoliata, Heuchera micrantha, Lysimachia clethroides, and Lilium candidum.

Messrs. W. Cutbush & Son, Highgate, N., grouped a large and varied collection of herbaceous flowers round a pool of Water Lilies and water plants. At the back were Japanese Iris and flower-spikes of Phormiums. The group also included Lilium giganteum, L. superbum, Thalictrum dipterocarpum, Romneya Coulteri, and bold sprays of early Gladioli.

Messrs. T. S. Ware, Ltd., Feltham, showed a rock and water garden on tabling, and a collection of hardy herbaceous flowers. We noted Spigelia marilandica, Wahlenbergia saxicolor, Lewisia cotyledon, Nierembergia frutescens, Conandron ramondioides, Thymus micans, and Campanula turbinata alba.

Messrs. Geo. Jackman & Son, Woking Nurseries, Surrey, arranged a large group of herbaceous flowers. Some interesting yellow flowers included Heliopsis lævis, Bahia lanata, Anthemis pallida and E. C. Buxton, Delphinium sulphureum, and Thalictrum flavum. The Lilies included Lilium auratum, L. speciosum Krætzeri, and L. rubrum. In another tent Messrs. Jackman exhibited a splendid group of Clematis.

Mr. Jas. Box, Lindfield, Sussex, arranged two groups of herbaceous flowers. Eremuri and Delphiniums produced a good effect, as also did the early-flowering Gladioli. English Iris, Cimicifuga racemosa, Œnothera fruticosa, Scabiosa caucasica var. Mrs. R. F. Felton, and large bunches of Gaillardias and Pyrethrums were also noted.

Mr. Howard H. Crane, Woodview, Highgate, showed Violas and Violettas in shallow bowls of sand, adding, for relief, small sprigs of Thorn and Hornbeam. The Violettas included Rock Orange, Rock Yellow, Butterfly, and Forget-me-not, and amongst the Violas we noted Archie Grant, Kathleen, Marie Burnie, and Primrose Dame.

Messrs. R. H. Bath, Ltd., Wisbech, showed bunches of Delphiniums, Snapdragons, Pæonies, and English Iris with a few vases of Carnations.

Messrs. Jarman & Co., Chard, Somerset, sent an exhibit of Stocks and Viola cornuta.

Messrs. W. Wells & Co., Ltd., Merstham, Surrey, showed a mixed collection of herbaceous and Alpine flowers, interspersed with the newer Carnations Lady Algy, White House, and Dorothy Gordon. Delphiniums and Phloxes dominated the group, but we noted interesting vases of Scabiosa caucasica and Hedysarum coronarium.

Messrs. W. & J. Brown, Peterborough, arranged a small group, but the bunches were well placed. Gaillardias included the red and yellow Lord Exeter (yellow with red disc), Lady Exeter, and the self-yellow Lady Rolleston.

Messrs. Godfrey & Sons, Exmouth, Devon, showed their selected strain of Canterbury Bells, which they have now worked up to about 10 distinct shades of pink, blue, and white; also a few Oriental Poppies and Dimorphothecas. In another tent a group of Scabiosa caucasica, Snapdragons, and various hardy perennials was arranged on tabling.

Messrs. Whitelegg & Page, The Nurseries, Chislehurst, flanked a rocky pool of Water Lilies and Rushes with bold groups of showy herbaceous flowers. On one side Geum Mrs. Bradshaw gave a brilliant piece of colour, and on the other Pentstemon Southgate Gem was shown with Lilies and Scabiosa caucasica alba.

Messrs. Kelway & Son, Langport, Somerset, arranged a long, narrow group on the ground, dominated by their recently-introduced Delphiniums, and Pæonies, Lupins, Gaillardias, and Pyrethrums.

Mr. Maurice Prichard, Christchurch, Hants., showed a rich collection of herbaceous and Alpines, of which the gems were included in an irregularly-disposed rock-garden. We noted with special pleasure Heeria elegans, Houttuynia cordata, Wahlenbergia vincæflora, Hypericum cuneatum, Lysimachia Henryi, and Acantholimon venustum, and Lobelia (Pratia) linneaoides.

Messrs. B. Ladhams, The Shirley Nurseries, near Southampton, in a group of general herbaceous plants, gave special emphasis to the

selected hybrid Salvia superba (turkestanica × sclarea) with bright rose bracts, and their strain of Gaillardias.

Messrs. H. B. May & Sons, Dyson's Lane Nurseries, Upper Edmonton, arranged a group of hardy Ferns.

Messrs. G. Bolton & Son, The Nurseries, Buntingford, Herts., staged a small group of Galegas, Campanulas, Heucheras, Pentstemons, and Potentillas.

Messrs. Carter Page & Co., 52-53, London Wall, London, showed a collection of Violas in shallow pans. J. B. Riding, Swan, Lizzie Storer, Winchmore Bedder, Edina, Primrose Dame, and Virgin White were good. A few Dahlias, Salpiglossis, and Scabious were also shown.

Mr. Leslie T. Greening, Richmond Hill, Surrey, designed a small rock and water garden.

Messrs. Wm. Fells & Son, Hitchin, Herts., arranged a rock-garden rather overburdened with stone, but including good batches of Primula involucrata, Thymus Serpyllum coccineum, Delphinium nudicaule, Viola Bosniaca, Æthionema persica rosea, and several dwarf Campanulas.

Messrs. Gunn & Sons, Olton, Warwickshire, staged a very fine exhibit of Phloxes in bold, effective masses. Especially good were Le Mahdi, Elizabeth Campbell, George A. Strohlein, Gen. van. Heutz, Baron von Dedem, and Ellen Willmott. In another tent were placed batches of Viola cornuta alba, purpurea, and Lilac Gem, mixed with a few baskets of Alpines, and overhung with Lilium auratum.

Mr. Amos Perry, Hardy Plant Farm, Enfield, Middlesex, arranged one of the most pleasing collections of hardy flowers and hardy Ferns. Cool effects were produced by the greens of water plants, the soft pinks of Spiræas and Astilbes, and the blues of Japanese Iris. Bold masses of Delphiniums terminated each end of the group. A collection of Lilies included Liliums pardalinum, parvum, Parryi, Roezlii and Krameri, and a large number of interesting Alpine and herbaceous plants were included.

Messrs. Phillips & Taylor, Lily Hill Nursery, Bracknell, Berks., showed a number of good Lilies and waterside plants, with a collection of herbaceous flowers.

Messrs. G. Mallet & Co., Cheddar, made an exceedingly good display of hardy plants in two small ground groups. Lilium candidum, Salvia nemorosa, Geranium anemonæfolium, Stachys grandiflora and Potentillas were good, and the water garden was also well done.

Mr. Frank Lilley, Bulb Nurseries, Guernsey, showed a large collection of early-flowering Gladioli, of which the brilliant colours were freely relieved with foliage.

Messrs. R. Veitch & Son, Exeter, showed a few very interesting plants, including their new Calceolarias Veitchii and The Bronze Age, with sprays of Plagianthus Lyallii, Desfontainea spinosa, Notospartium Carmichæliæ (unusually well-flowered), and Spiræa Menziesii triumphans.

Mr. R. C. Notcutt, Woodbridge, Suffolk, made one of the most varied and effective displays of hardy flowers in a confined space. His Verbascums were especially good.

Messrs. Rich & Co., Bath, staged a pretty group of herbaceous plants, with a good centrepiece of Verbascum Wiedmannianum, a background of Phloxes, and well disposed bunches of Chrysanthemum maximum Annie House, Coreopsis, and Pentstemons.

Messrs. G. Gibson & Co., Leeming Bar, Bedale, Yorks, arranged a well-packed group in which prominence was given to Verbascums Caledonia and A. M. Burnie; Delphinium Rev. E. Lascelles; Iceland Poppies; Thalictrum aquilegifolium album, and various Campanulas. There was a secondary group, which included Paeonies, Heucheras, and Columbines.

The Guildford Hardy Plant Nursery, Guildford, Surrey, contributed a very pleasing group, in which much more than ordinary care had been exercised in associating the colours and in spacing the flowers to allow their individuality to be seen. A group of yellow flowers included diverse forms of Scabiosa ochroleuca, Aconitum aureum, Cimicifuga racemosa, Thalictrum flavum glaucum, Cytisus nigricans, and Solidago. Pink Spiræas, Clematis recta fl. pl., Delphiniums, and Pentstemons were also noted. A small rock-garden included clumps of Nierembergias, Campanulas and Œnotheras.

Messrs. H. J. Jones, Ltd., Ryecroft, Lewisham, arranged a bank of Phloxes in continuation of the bank of Pelargoniums. The idea was novel, but the effect was not pleasing, for the uniform surface presented too dense a mass of colours. The Phloxes, however, were finely grown, and included specially good specimens of Freifraulein von Lassberg, Dr. Charcot, Sheriff Ivory, Elizabeth Campbell, and Frau Ant. Buchner.

Mr. H. C. Pulham, Elsenham, Essex, exhibited a small rock-garden and a group of herbaceous flowers. We noted Calamintha grandiflora, Geranium lancastriense, Thymus Serpyllum coccineus, and dwarf Campanulas.

Messrs. Bees Ltd., Liverpool, showed herbaceous plants and Alpines in pots. Adenophora Potaninii Lathyrus Smithii, Armeria Bees' variety, Aconitum carneum, and Scabiosa caucasica alba were interesting.

Messrs. J. Cheal & Sons, Ltd., Crawley, arranged a small rockwork exhibit on staging, with a background of dwarf shrubs. Veronica Bidwillii, Campanula pulla, Cistus algarvensis, Erythræa diffusa, and other good plants occupied the pockets. In the open, Messrs. Cheal made a formal enclosed garden, with a summer-house.

Messrs. Blackmore & Langdon, Twerton-on-Avon, Bath, staged a good collection of recently-introduced Delphiniums. The varieties Statuaire Rude, Rev. E. Lascelles, Daniel Osiris, Harry Smetham and other novelties certificated this year, were the outstanding features.

Mr. H. Hemsley, Crawley, Sussex, designed a small rock-garden, and planted it with Coronilla cappadocica, Ruta patavina, Silene armeria, Campanula tyrolensis, and similar plants.

Messrs. G. & A. Clark, The Nurseries, Dover, arranged a large group of herbaceous flowers. The outstanding feature was a brilliant mass of Gilia coronopifolia.

The Misses Hopkins, Mere Gardens, Shepperton-on-Thames, had a pleasing rockwork arrangement of hardy flowers, on which we noticed Linum perenne album, Calceolaria polyrhiza, Bowles's Black Pansy, and Campanula alliariæfolia.

Messrs. Thompson & Charman, 11, Adam Street, London, had a number of interesting herbaceous plants arranged on tabling, including Lilium myriophyllum, L. Hansonii, L. martagon vars., Campanula lactiflora in three shades, Thalictrum dipterocarpum, early Gladioli, and Pentstemons.

Messrs. David Russell & Son, Essex Nurseries, Brentwood, staged two small groups of herbaceous flowers, including Liliums, Monardas, Pyrethrums, and Chrysanthemums, and other common plants. In the grounds, Messrs. Russell exhibited a small Lily pond, flanked with a variety of flowering shrubs, Bamboos, and shapely young specimen Conifers.

Mr. Rassell, Earl's Court Road, London, built a small rockery around a paved court with a sundial.

Messrs. G. Stark & Son, Great Ryburgh, Norfolk, showed a very effective hatch of new, richly-coloured Kniphofias.

Mr. G. Reuthe, Fox Hill Nursery, Keston, Kent, had a natural-looking little rockery, which contained some of the rare plants. The blue-flowered Sollya heterophylla and Acantholimon venustrum, with tufts of Pink-like foliage and rosy flowers were included amongst the rock plants. We also remarked such shrubs as Rhododendron Hookeri, Zenobia speciosa, a very large, bushy Desfontainea spinosa, and many dwarf Conifers suitable for planting at the top of a rockery.

Mr. Clarence Elliott, Seven Hills Nursery, Stevenage, made good use of a fine position. In his rockery large breadths of the beautiful pale-blue Campanula pusilla Miss Willmott, the darker blue G. F. Wilson, the white Nierembergia rivularis, and the lavender Androsace lanuginosa seemed to be quite established and flowering happily.

Mr. R. Prichard, West Moors, Wimborne, arranged a great variety of Alpine plants in small pots on a staging in the open.

Messrs. John Forbes, Ltd., Hawick, Scotland, exhibited herbaceous Phloxes, Pentstemons, Pyrethrums, and Violas. Amongst the Phloxes we noticed Tapis Blanc (a large-flowered variety), D. M. McKinnon (rose with white eye), Muriel Rogers (pale heliotrope with rosy eye), and Pierre Bayle as being the best of a fine collection. The Pentstemons bore long spikes of splendid flowers.

Messrs. John Waterer, Ltd., Bagshot, Surrey, also exhibited very good examples of topiary work. In this instance the specimens were all of Yew.

AWARDS.

First-class Certificates.

Polypodium Mandaianum.—A very vigorous variety of P. aureum, with rich, glaucous, green, crested fronds. (A magnificent specimen was shown by Mr. W. A. Manda, Keyfield Nurseries, St. Albans.)

Lilium warleyense (?).—This is a magnificent Chinese Lily, of which the general appearance suggests a glorified form of L. sutchuenense. The flowers are orange-red, with protuberant, chocolate spots; about 5 inches in diameter, with recurving segments, as in the common Turk's Cap Lilies. They are pendent from slender pedicels, as long as the leaves, and borne at the top of the stem in an open cluster of 20 or more. The stem is about 4 feet high, showing no bulbils, heavily spotted with chocolate and practically smooth. The leaves are numerous, borne spirally up the stem, linear, about 3 to 5 inches in length, and ½ inch or a little more broad. (Shown by Miss Willmott, V.M.H., Warley Place—gr. Mr. C. R. Fielder.)

Lastrea patens Mayi.—This is the graceful, intermediate form between L. lepida and L. patens, which received an Award of Merit at the recent International Show. It was shown in better form than at Chelsea, and its value won for it a First-class Certificate. (Shown by Messrs. H. B. May & Sons, Dyson's Lane Nurseries, Edmonton.)

Awards of Merit.

Begonia Mrs. Robert Morton.—A rich, golden-yellow flower, the petals showing a faint suffusion of salmon-pink, varying in degree with age. The flower is of large size and good form.

B. Florence Nightingale.—A pure-white variety, of smooth texture, medium size, and fine form. (Both shown by Messrs. Blackmore & Langdon, Twerton-on-Avon, Bath.)

Clematis Lady Betty Balfour.—A new addition to the summer and autumn-flowering "Viticellæ" section. The flowers are a deep velvety-purple, richer in colour than Jackmanii, and contrasting finely with the bold mass of white stamens. (Shown by Messrs. Geo. Jackman & Son, Woking Nurseries, Surrey.)

Phlox Arendsii.—An interesting strain of dwarf hybrid Phloxes, in colours of lavender, mauve, and violet, with wiry stems, about 2 feet high, bearing flattish or rounded heads of flower, and said to be hybrids from P. canadensis and P. decussata. Some of the plants were under number only, but the mauve Käthe was one of the best. Luise, a somewhat similar shade, with marked eye, and Grete, dwarfer and lavender-white, were also pretty. The Award was granted for the strain. (Shown by Mr. Georg Arends, Ronsdorf, Germany).

Carnation John Ridd (Border).—A large-flowered, yellow-ground "fancy," heavily splashed with rose-pink.

C. Jean Douglas (Border).—A scarlet self, and the best of its colour. A little brighter than Cardinal, with more substance and of better form. (Both shown by Mr. Jas. Douglas, Edenside Nurseries, Great Bookham.)

Nephrolepis exaltata var. Rochfordii.—A variety somewhat resembling Marshallii compacta, but showing a more delicate subdivision of the fronds. These are a pale, sunlit green, and mosslike from the dense ramifications. (Shown by Messrs. Thos. Rochford & Sons, Ltd., Broxbourne, Herts.)

Astilbe Avalanche.—This is a very vigorous, white seedling, which originated in the batch of seedlings that also gave the popular variety Queen Alexandra. The plants shown had been lifted from the open, were 2 feet high, and densely flowered, with the individual flowers larger than in the type. Its chief value, however, will be for forcing, when it assumes the same graceful, feathery habit that has made the pink forms so popular. The vigour of the new plant makes it especially useful for growing from retarded crowns, as the common variety often fails. (Shown by Messrs. van Waveren & Kruyff, Sassenheim, Holland.)

Rose Ethel.—A pretty, semi-double, pink Wichuraiana seedling, showing a white centre as it opens: a vigorous grower. (Shown by Mr. Chas. Turner, Slough.)

Rose Mrs. Charles S. Hunting.—An apricot-yellow Hybrid Tea variety, richer in colour and with more substance than Mme. Ravary, which, under canvas, it somewhat resembled. (Shown by Messrs. Hugh Dickson, Ltd., Royal Nurseries, Belfast.)

Orchid Committee.

Present: Sir Harry J. Veitch (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Sir Jeremiah Colman, Bart., W. Waters Butler, A. McBean, C. Cookson, W. Thompson, G. F. Moore, H. G. Alexander, E. Ashworth, R. G. Thwaites, W. P. Bound, T. Armstrong, Stuart Low, Walter Cobb, R. A. Rolfe, J. Wilson Potter, Gurney Wilson, W. H. Hatcher, W. Bolton, and H. J. Chapman.

The Orchids were arranged together in one of the long tents, and not in the large marquee as usual. The quality of the exhibits in the various groups was excellent, and more than thirty novelties were submitted to the Committee.

Among the finest in the show were the few magnificent specimens staged by Lt.-Col. Sir Geo. L. Holford, K.C.V.O. (gr. Mr. H. G. Alexander). These comprised a noble specimen of Cattleya Warscewiczii Lowii, with six spikes, some with five, richly-coloured flowers, and bearing together 22 blooms. The plant had already had a First-class Certificate, and to mark the excellence of culture, a Silver Lindley Medal was awarded. The others were the fine white-petalled Cattleya Warscewiczii Frau Melanie Beyrodt, the dark-coloured C. W. Othello and C. Artemis. (See Awards.)

J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), staged a grand group of Selaginellas, most of the species in cultivation being represented, and above them were arranged a very fine lot of Odontoglossums, including two new finely-coloured hybrids and a large, blotched form of O. crispum. The white Cattleya Mossiæ Wageneri, the blush C.-M. Arnoldiana, Anguloa Cliftonii, with three flowers. Odontoglossum ardentissimum, with a branched spike of 50 flowers, and other showy Orchids were included.

Sir Jeremiah Colman, Bart., V.M.H., Gatton Park (gr. Mr. Collier), staged an extensive group. In the centre were many good Odontoglossums and bright scarlet Odontiodas, on plant of Odontioda Bradshawiæ having four spikes, one with six branches and over 40 flowers. Cattleyas were finely shown, including C. Rex and white varieties of C. Mossiæ, and a very showy collection of Lælio-Cattleyas. Specially interesting plants were seen in Cirrhopetalum pulchrum, Bulbophyllum grandiflorum, with five spikes; Angræcum Eichlerianum; Anguloa uniflora; Nanodes Medusæ; Broughtonia sanguinea; and the blue Dendrobium Victoria Regina. The exhibit included an interesting selection of Masdevallias.

E. H. Davidson, Esq., Borlases, Twyford (gr. Mr. Cooper), staged a bright group of Odontoglossums, Cattleyas, Lælio-Cattleyas, and other Orchids. Specially fine were a beautiful form of L.-C. Aphrodite and L.-C. rubens var. The Kaiser. (See Awards.)

The finest group was that staged by Messrs. Charlesworth & Co., Haywards Heath. The centre was comprised of about 60 choice specimens of the white Phalænopsis Rimestadtiana, beneath which was a setting of Epidendrum vitellinum, and, arranged above, a number of scarlet Renanthera Imschootiana, good forms of Miltonia vexillaria, M. Bleuana, and M. Hyeana extending along the whole of the front. On each side were showy Lælio-Cattleyas, the finest being the glorious yellow L.-C. Ceres Princess Mary, with ruby-red lip; scarlet Odontiodas, and remarkably fine hybrid Odontoglossums, the richly-coloured forms of O. eximium being specially attractive. At the back of the group the pure white Sobralia macrantha alba and other Sobralias with graceful Epidendrums, were effective. Rare and interesting plants noted were the hybrid Vanda Charlesworthii, the very rare Grammangis Ellisii, Aërides japonicum with several spikes, Bulbophyllums, and other curious species, including Oncidium Cæsii, Gongora leucochila, Cypripedium caudatum and Lindenii, and pretty Masdevallias.

Messrs Mansell & Hatcher, Rawdon, Yorks, staged a magnificent group, which included a remarkable collection of Lælio-Cattleyas, all the best kinds being represented in well-flowered specimens, together with some novelties, the finest of which was L.-C. Bletchleyensis King George, a large and perfectly-formed flower of a bronzy-yellow tint, suffused with rose, the claret-coloured lip having a darker veining. Among the Cypripediums was G. Chas. J. Catt (Godefroyæ leucochilum × Chamberlainianum), a pretty waxlike white flower, veined with purple, and specially good were the white-flowered Miltonia vexillaria Lambeauiana, Cœlogyne pandurata, C. Dayana, Cirrhopetalnm pulchrum, Dendrobium Lowii, D. revolutum, D. Sanderæ, and other rare species.

Messrs. Jas. Veitch & Sons, Chelsea, in their superb group of new and rare foliage plants, arranged a selection of Odontoglossums, Lælio-Cattleyas, &c. The crowning plant in their exhibit was Brasso-Cattleya × Marion, a very showy hybrid of unknown parentage. The centre of the group was composed of their hybrid Disa Luna, the best and most floriferous of the genus; whilst showy Cattleyas and Lælio-Cattleyas, the white Dendrobium Dearei, Vanda cœrulea, Odontoglossums, &c., were also included.

Messrs. Sander & Sons, St. Albans, showed a selection of good, new Orchids, a pretty form of Lælio-Cattleya Ceres, with yellow petals tinged with rose; L.-C. Martinettii Vesuvius, a showy, bronzy yellow, with light claret lip; the deep

HOLLAND HOUSE SHOW.

Fig. 8.—Rose Mrs. Charles S. Hunting: colour apricot-yellow.

(See Awards of Merit.)

Messrs. Stuart Low & Co., Bush Hill Park, staged an extensive group, in which the Lælio-Cattleyas and forms of Cattleya Warscewiczii were very fine. In a raised group in the centre were Acineta Humboldtii, various white Cattleyas, scarlet Renanthera Imschootiana, the fine Cœlogyne Lowii, Chysis Sedenii, and in front various Masdevallias, and other showy species. Among the Dendrobiums were the rare D. aurantiacum, and others noted were Lælia tenebrosa Walton Grange var.; good scarlet Odontiodas; some elegant Oncidiums, Cattleya Mendelii alba; C. Mossiæ Queen Mary; two batches of Vanda teres; good Miltonias, and other showy Orchids.

blue Bollea Lalindei; Miltonia vexillaria Lambeauiana, with a profusion of white flowers.

Mr. E. V. Low, Vale Bridge, Haywards Heath, showed a small group in which were Cattleya Mossiæ Wageneri Vale Bridge variety, C. M. Reineckiana, the white C. × Myra Peeters; Cœlogyne pandurata, Cattleya Dietrichiana, and others.

Mr. H. A. Tracy, Orchid Nursery, Amyand Park Road, Twickenham, staged a representative group, in which the varieties of Lælio-Cattleya Canhamiana and other Lælio-Cattleyas were effective. Cattleya Whytei bore six flowers; C. Mossiæ Wageneri, home-raised, a clear snow-white flower, with yellow disc to the

lip, and some hybrid Odontoglossums were conspicuous. Of species, the true Bulbophyllum sauroccphalum, and some other botanical species were remarked. The pretty forms of Cattleya Mendelii in this group were effective.

Messrs. J. & A. A. McBEAN, Cooksbridge, showed Miltonia vexillaria Rotundia, a large and very beautiful flower, and Cattleya Warscewiczii Gladiator, a noble flower of fine colour, and others.

F. M. OGILVIE, Esq., Oxford, showed several grandly-grown Odontoglossums, a very handsome specimen of O. crispum of the typical form being specially noticeable.

Mr. W. J. BIGGS, North Enfield, showed Cattleya Mossiæ alba Biggs' variety, the finest white C. Mossiæ yet shown. The flowers were very large, broad in all parts, and snow white.

J. S. Moss, Esq., Wintershill, Great Waltham, showed a pretty hybrid between Odontoglossum crispum and O. × Othello.

Mr. HARRY DIXON, Spencer Park Nursery, Wandsworth Common, staged a pretty group of Odontoglossums, Cattleya Warscewiczii in fine varieties, two fine white Cattleya Mossiæ Wageneri, and other Orchids.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Artemis (C. × Iris × C. Gaskelliana), from Lieut.-Col. Sir GEO. L. HOLFORD K.C.V.O. (gr. Mr. H. G. Alexander).—A very beautiful flower of perfect shape, with pearly-pink sepals and petals, and intense ruby-crimson front to the lip, which has a large yellow disc with white base and red lines.

Miltonia Hyeana Le Conquerant, from Monsieur JULES HYE DE CROM, Ghent (gr. M. Coen).—A grand flower, white with a light lilac tint and a deep purple mask in the lip.

Cattleya Dupreana The Dell variety (Warneri × Warscewiczii), from Baron BRUNO SCHRÖDER, The Dell, Englefield Green (gr. Mr. J. E. Shill). One of the largest and most beautiful of hybrid Cattleyas, it may be likened to an enlarged C. Warneri with the lip of the rich ruby crimson of the best form of C. Warscewiczii. The sepals and petals are a deep rose colour, the disc of the lip being bright yellow.

AWARDS OF MERIT.

Lælio-Cattleya Rubens The Kaiser, from E. H. DAVIDSON, Esq., Twyford.—One of the most beautiful of the hybrids of Lælia pumila. The flowers are abnormally large in proportion to the dwarf growth. Flowers bright rose, lip intense purple with chrome yellow disc.

Odontoglossum percultum King George, from F. M. OGILVIE, Esq., Oxford (gr. Mr. Balmforth).—A showy hybrid, with large white flowers, blotched with purple.

Brasso-Cattleya Marion (parentage unrecorded), from Messrs. JAS. VEITCH & SONS.—A beautiful flower, white and lilac, with a large lip, having purple lines in front.

Cattleya Thurgoodiana Apollo, from Messrs. STUART LOW & Co.—A brilliant rose-red flower, with intense purple front to the lip.

CERTIFICATE OF APPRECIATION.

Odontonia Edna (M. Warscewiczii × O. Wilckeanum), from Messrs. CHARLESWORTH.—An elegant novelty with branched spike of white flowers blotched with brownish yellow.

FRUIT AND VEGETABLES.

Messrs. JAMES VEITCH & SONS' collection of fruit trees in pots was uncommonly fine. Along the back of the large group there stood tall-stemmed, fan-trained trees of Peach Royal George and Nectarine Cardinal, which were models of training, and were studded with fruits. There were many bush trees of Plums, and those of Oullin's Golden Plum and Brandy Gage were even better examples than the trees of Jefferson's Plum. One gridiron-shaped specimen of Denniston's Superb Plum was nearly perfect. Standard Gooseberries, notably of the variety Whitesmith, which stood over the cordon Currants, were wreathed with clusters of fruits; indeed, had many more berries than leaves. A large tree of Morello Cherry showed that this variety is valuable for other purposes than for growing on a north wall. This exhibit was awarded the Coronation Cup.

S. HEILBUT, Esq., The Lodge, Holyport, Maidenhead, exhibited nine very large trees of Cherries and Nectarines in pots. The Nectarines shown were all of the variety Early Rivers, and the Cherries included Emperor Francis, Bigarreau Noir de Guben, and Late Black Bigarreau. These heavily-fruited specimens, with dark-green leaves full of health and vigour, reflect the highest credit on Mr. G. Camp, the gardener, and were well worthy of the Silver Cup bestowed upon them.

The KING'S ACRE NURSERY Co., Hereford, made a very fine display with fruiting pot trees. The healthy young trees bore good crops of high-quality fruits. Apples Baumann's Red Winter Reinette, Emperor Alexander, and The Queen were especially good. The ripe Nectarines and Peaches, and the nearly ripe Souvenir du Congrès Pear were the best examples. The King's Acre Berry—an improved Raspberry—is of good size and has a good flavour.

Messrs. WHITELEGG & PAGE, The Nurseries, Chislehurst, showed long fruiting growths of their Newberry, which received a card of Cultural Commendation on June 18 last.

Messrs. GEO. BUNYARD & Co., Maidstone, showed a variety of Apples, Pears, and Plums in pots. The varieties of Apple Lady Sudeley and James Grieve, with large, red-striped fruits, were exceptionally good. A bush of Ribston Pippin close by showed no signs of canker or decrepitude. Ben's Red, a dessert variety of Apple, distributed by Messrs. BUNYARD in 1890, has deep-red, handsome fruits. Tall-stemmed Nectarines at the back of this splendid group bore heavy crops of fruit.

Messrs. LAXTON BROS., Bedford, showed late varieties of Strawberries. For so late in the season the fruits were very meritorious. The varieties Utility, Givon's Late Prolific, and Laxton's Latest were especially fine. Laxton's Perfection Red Currant, which was also shown, is an excellent variety.

Messrs. STUART LOW & Co., Bush Hill Park, Middlesex, displayed an interesting collection of pot Figs and trained Vines bearing excellent crops. The Fig Violet Sepor appears to be a very desirable variety.

The Duke of RUTLAND, Belvoir Castle, Grantham (gr. Mr. W. H. Divers), exhibited excellent fruits of a dozen varieties of Strawberries. The boxes of Givon's Prolific, Gunton Park, Epicure, and The Countess were splendid.

The HALLIFORD FRENCH GARDEN, Shepperton, Middlesex, exhibited Cantaloupe Melons, Cucumbers, Vegetable Marrows, Cauliflowers, and other excellent vegetables grown under the "intensive" methods.

Rev. CHALMERS HUNT, Willian Rectory, Hitchin, showed a small collection of vegetables.

For Awards made by the Council see p. viii.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 6.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Bamber, J. C. Cowan, J. Cypher, J. Evans, W. Holmes, A. J. Keeling, D. McLeod, C. Parker, F. K. Sander, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

Silver-gilt Medals were awarded to Col. J. RUTHERFORD, Beardwood, Blackburn (gr. Mr. Lupton); A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish); and Messrs. CHARLESWORTH & Co., Haywards Heath.

Silver Medals were awarded to Mrs. WOOD, Glossop (gr. Mr. Gould); Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby); J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes); Messrs. HASSALL & Co., Southgate; and the LIVERPOOL ORCHID & NURSERY Co., Gateacre.

FIRST-CLASS CERTIFICATE

Odontoglossum "Queen Mary" (Vulsteyke × eximium), from W. R. LEE, Esq.

AWARDS OF MERIT.

Odontoglossum crispum "White Star" and *O. c. "White Queen,"* both from W. R. LEE, Esq. *Aërides Houlletiana magnifica,* from Mrs. WOOD. *Lælio-Cattleya Martinettii. John Lupton variety.* from Col. J. RUTHERFORD, M.P. *Cattleya Cowanii magnificum, Marlfield variety.* and *Odontoglossum × Mrs. Carlisle,* both from R. LE DOUX, Esq.

NATIONAL ROSE.

EXHIBITION AT SOUTHAMPTON.

NOTES ON NEW ROSES.

JUNE 26.—We are all of us, whether in the Rose world or elsewhere, desirous of seeing or hearing some new thing, and to the rosarian at least this arises from no idle curiosity. The century is but little past its first decade and already the advance made on the Roses of the nineteenth century is substantial. It is, of course, perfectly true that of the vast number of new Roses brought out every year, comparatively few survive the period, usually about four or five years, which generally elapses before a novelty can be expected to become widely known, but this is in the nature of things; and if the majority of the fresh introductions must be rejected, there is sure to be a residue to carry on the tale of progress.

The Southampton Show of the N.R.S. was notable for some particularly fine and clean Roses, the early season, followed by a moist and cool June, having no doubt been specially favourable for the production of exhibition flowers. In the decorative classes there were some beautiful exhibits of Lady Hillingdon, Lady Pirrie, and Rayon d'Or, and it is clear these Roses have a future before them for use in these classes. General MacArthur also was used in nearly every stand and attracted attention, although it was perhaps not quite at its best in point of colour.

An indication of the earliness of the season was afforded by the appearance in many stands of Blush Rambler, a Rose which is not, in an ordinary season, seen much before the middle of July.

A corner of the large pavilion had been set apart for the exhibition of the new seedling Roses, a class which produced some 14 or 15 entries, and afforded by no means the least attractive feature of the show.

Decidedly the most striking Rose was Messrs. B. Cant & Sons' St. Helena, a beautiful flower, not unlike Mme. Mélanie Soupert in general effect, but rather more pink and of fine form. The ground plan of this variety showed very glossy, deep green leaves, and had all the appearance of belonging to a class which might keep mildew at bay with but little trouble. The resemblance to Mme. Mélanie Soupert lies chiefly in the outer or guard petals; the centre of the flower seems decidedly fuller and slightly more pointed in St. Helena than in Mme. Mélanie Soupert.

A good box of Freda was shown by Messrs. Paul & Son. This is a full Rose with plenty of substance, the centre well shaped and rounded, but with a good point. My recollection of the colour is a general effect of bright clear pink at the edges, the centre a peach colour, with a certain amount of fawn shading on the reverse of the petals. It is certainly a very pretty and cheerful Rose and seems full enough to grow for exhibition. Personally, I think I should have placed it next to St. Helena in this particular batch, and though we have many, perhaps too many, pink Roses, I think there is room for Freda.

A very brilliant effect was produced by a stand of Irish Flame. This Rose is the latest addition to the single Roses sent us from Ireland, and associated with the name of Dickson. The general character of the flower is much like that of Irish Elegance, in which we have a single Rose with a ground colour of yellow or pale orange, suffused with pink which deepens outwards. In Irish Flame the pink is replaced by a colour approaching vermilion, which on the yellow ground produces a striking effect of orange scarlet. If it will keep its wonderful colour in this country, it should become a popular Rose, for the foliage appears to be more glossy than that of Irish Elegance, and this gives promise of freedom from mildew, a disease to which Irish Elegance often falls a victim as the season progresses.

It was no doubt merely by a coincidence Messrs. Bide were showing another variation on Irish Elegance, which they call Mrs. A. Bide. Curiously enough it is a variation rather in the same direction as Irish Flame, so far as colour is concerned. The flowers, however, are more double than those of the two Roses named above, though they are not what is generally called full, but contain one or two rows of petals inside the ordinary guard petals. The colouring, instead of being pink on yellow ground, as in Irish Elegance, is of a reddish tint on a similar ground colour.

There was a large batch of P. le Cornu, a pale yellow sport from Dean Hole, brought from the Channel Islands by the raiser, and a new red Hybrid Tea called Othello. This is a colour we may still welcome in this class, but only trial in the garden can decide whether it will be an improvement on the Roses we possess at present.

Of the remainder I may perhaps mention Edwin Molyneux, a Rose with large shell-shaped petals and a light carmine pink colour, and Minnie Crane, a Rose of a pink colour something near that of Lady Pirrie, but not quite so bright in appearance as the Rose was shown.

The other new Roses exhibited were certainly interesting, and in nearly all cases had some point which attracted attention, but as shown they were less interesting than those I have mentioned, and in a short note of this kind a detailed description would be out of place. I must therefore content myself with saying that I hope we may see some of them again. *White Rose.*

Details of the Exhibition.

Taking the exhibition as a whole, the entries were numerous, the competition keen, the flowers exceptionally fine, and the arrangements all that could be desired.

Mr. Edward Mawley, the Secretary of the National Rose Society, received valuable assistance from Mr. C. S. Fuidge, the Secretary of the Southampton Society.

Open Classes.

The principal class was for 48 blooms (distinct). There were seven competitors, and Messrs. D. Prior & Son, Colchester, were, after a long and close scrutiny, awarded the 1st prize for blooms as near perfection as possible. The leading varieties were Mildred Grant, Gloire de Chedane Guinosseau, Florence Pemberton, Dean Hole, White Lady, Juliet, Boadicea, Her Majesty, Victor Hugo, Comte de Raimbaud, Mme. Jules Gravereaux, Lady Helen Vincent, Mrs. W. J. Grant, Lyon Rose, Earl of Warwick, Gustave Piganeau, His Majesty, Mrs. Myles, Kennedy, A. K. Williams, Jonheer, J. L. Mock, Countess Caledon, and Oberhofgartner Terks.

Messrs. B. R. Cant & Sons, Colchester, were placed 2nd with excellent blooms, of which the following were noteworthy :—St. Helena (especially fine), Mrs. Foley Hobbs, Lieut. Chaure, Margaret, Horace Vernet, E. Mawley, Mildred Grant, W. R. Smith, and Mrs. E. Mawley. 3rd, Messrs. A. Dickson & Sons, Newtownards, Belfast; this firm staged especially fine blooms of George Dickson, Lyon, and Mrs. A. Coxhead.

For 12 triplets Messrs. D. Prior & Son again secured the leading place with choice blooms of His Majesty, Horace Vernet, Gloire de Chedane Guinosseau, Mrs. A. Coxhead, J. B. Clark, Mme. Jules Gravereaux, Bessie Brown and Mrs. Myles Kennedy. Messrs. B. Cant & Sons were awarded the 2nd prize for smaller, but particularly richly-coloured fresh flowers, Horace Vernet, Gloire de Chedane Guinosseau and Mme. Jules Gravereaux being a selection. 3rd, Messrs. A. Dickson & Sons, Newtownards, with larger blooms, but they were too much dressed. Six competed in this class.

In the class for 12 Tea or Noisette varieties there were eight entries. Messrs. D. Prior & Son again excelled with grand blooms of Mrs. E. Mawley, Boadicea, Souv. de P. Notting, Mrs. Myles Kennedy, W. R. Smith and Mrs. F. Hobbs. Messrs. B. Cant & Sons were placed 2nd with smaller flowers of popular varieties; 3rd, Mr. G. Prince, Longworth, Berkshire.

Nurserymen's Classes.

No fewer than fifteen competed in the class for 24 blooms, distinct, the collections making a striking display. Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, won the 1st prize with clean, well-coloured blooms of medium size. Mme. Jules Gravereaux, Jonheer, J. L. Mock, Duke of Teck, Dr. O'Donel Browne, Hugh Dickson and Mrs. W. J. Grant were conspicuously good. Mr. G. Prince won the 2nd prize with larger blooms, but not so fresh as those in the premier collection. Mrs. Stewart Clark and Mildred Grant were conspicuous varieties. 3rd, Messrs. Perkins & Son, Coventry, who showed a magnificent bloom of Juliet.

Eleven staged in the class for eight triplets. Messrs. J. Burrell & Co. were placed 1st with large, good specimens of W. Shean, Mme. Jules Gravereauv, Bessie Brown, G. C. Waud, Dean Hole, Hugh Dickson, and Mildred Grant. Mr. G. Prince was a choice 2nd with conspicuous examples of Avoca, E. Mawley and Gloire de Chedane Guinosseau. 3rd, Mr. H. Drew, Longworth, Berkshire.

For 18 Tea or Noisette Roses eight competed, and Mr. G. Prince won the premier prize with neat, clean flowers of Blanche Martin, Boadicea, W. R. Smith, Mrs. E. Mawley, Mrs. F. Hobbs, and Mme. Jules Gravereaux. 2nd, Mr. H. Drew. 3rd, Messrs. J. Burrell & Co.

The class for 12 blooms of new varieties was especially interesting, as many as nine competing. Messrs. D. Prior & Son followed up their previous successes by winning the premier award with a distinctly interesting exhibit. The varieties were Mrs. A. Coxhead, Nita Weldon, Mrs. J. Welch, Mrs. F. Hobbs, Leslie Holland, Margaret, Mrs. J. W. Budd, Mme. P. Euler, Fermehurst, Elizabeth, and Cynthia. Mr. G. Prince, who won the 2nd prize, showed extra fine blooms of E. Mawley and Juliet. 3rd, Messrs. Alexander Dickson & Son.

For 12 blooms of one variety of H.P. Rose, Messrs. D. Prior & Son excelled with Gloire de Chedane Guinosseau. 2nd, Messrs. S. Bide & Sons, Farnham, with Frau Karl Druschki. There were eight competitors in this class.

The best 12 blooms of a H.T. variety were shown by Messrs. A. Dickson & Son, Belfast, who staged Mrs. Cornwallis West exceptionally finely. 2nd, Messrs. Perkins, with Dean Hole. The competitors in this class numbered 15.

Eleven entered in the class for 12 blooms of any one Tea or Noisette variety. Mr. F. Cant excelled with small, clean blooms of Mrs. Foley Hobbs. 2nd, Messrs. D. Prior & Son, with large but rough blooms of Mme. Jules Gravereaux. The King's Acre Nursery Co., Hereford, secured the 3rd place with the variety Mrs. E. Mawley.

In the class for a representative group of cut Roses shown in vases in a space not exceeding 60 square feet there were only two exhibitors. Mr. Elisha J. Hicks, Hurst, Twyford, Berkshire, was easily 1st with a pleasing display of truly decorative varieties arranged lightly in masses of one variety and quite effectively. The leading sorts were General MacArthur, Pharisaer, Mme. A. Chatenay, American Pillar, Lady Hillingdon, Richmond, Rayon d'Or and Harry Kirk. Mr. H. Drew was the other exhibitor, and he was awarded the 2nd prize.

In the class for 24 varieties, not fewer than three nor more than 12 trusses of each, arranged in a space measuring 8 feet by 3 feet, six competed, the whole making a bold and attractive display. Mr. J. Mattock, Headington, Oxon, secured the premier award with fresh blooms neatly arranged of such varieties as Mons. Paul Lede, Lady Pirrie, Mme. Ravary, Mrs. A. Tate, Lady Curzon, Trier, Marquise de Sinety, and Richmond. Messrs. F. Cant & Co. were 2nd with Crimson Damask, Irish Elegance, Lady Pirrie and Margaret Molyneux. 3rd, Messrs. W. Spooner & Son, Arthur's Bridge Nursery, Woking.

There was a class for seven baskets of Roses, each containing one distinct variety other than exhibition sorts, and Mr. E. J. Hicks was placed 1st with an attractive exhibit of such varieties as Rayon d'Or, Comtesse du Cayla, Lady Hillingdon, General McArthur, Duchess of Wellington, and Mme. Jules Grolez. Mr. J. Mattock was placed 2nd with smaller blooms, of which Mme. Segond Weber, Mme. Mélanie Soupert, Lady Pirrie and Mrs. P. Blair were noteworthy. 3rd, Messrs. S. Bide & Son, Farnham. Messrs. D. Prior & Son had the finest exhibit, but they were disqualified.

Amateurs' Classes.

Much interest was centred in the class for 18 distinct varieties for which the Munt Cup was offered and for which 12 competed. The trophy was won by C. Lamplough, Esq., Kirkstall, Alverstoke, Gosport, who showed medium-sized, shapely, clean specimens possessing fine quality. A selection of the varieties includes : A. K. Williams, Countess of Ilchester, J. B. Clark, Queen of Spain, Mrs. Theodore Roosevelt, Alice Lindsell, Florence Pemberton, and Dean Hole. Mr. G. A. Hammond, Cambrian House, Burgess Hill, Sussex, was placed 2nd, and Mr. E. M. Eversfield, Deune Park, Horsham, 3rd.

Mr. H. L. Wettern, Waratah, Sanderstead, Croydon, had the best of 10 exhibits of six blooms of any H.P. variety with capital specimens of Frau Karl Druschki; 2nd, Mr. Lamplough, with the same variety.

Mr. E. F. Brown, Lynton, Sussex Place, Slough, won the 1st prize in the class for six blooms of a H.T. variety with Dean Hole in superb condition. Mr. Lamplough followed with Mildred Grant. There were 19 competitors in this class. Mr. Alex. Hill Gray, Beaulieu, Newbridge, Bath, was placed 1st for 12 Tea or Noisette varieties with desirable blooms of H. Kirk, Dr. F. Guyon, Mrs. Hubert Taylor, Maman Cochet, and White Maman Cochet. The Rev. R. Pawley, Upton Scudamore Rectory, was 2nd amongst six competitors.

Mr. E. T. Brown, Lynton Place, Sussex, excelled in the class for six triplets in a stiff competition amongst 11 exhibitors. The varieties Mrs. Theo. Roosevelt, Dean Hole, and Laurent Carle were especially fine.

In a class for 12 blooms for growers of fewer than 2,000 plants, Mrs. Croft Murray, Perivale, Isle of Wight, won the 1st prize.

For growers of fewer than 1,000 plants, Mr. Lamplough had the premier collection of 12 blooms.

For 12 distinct varieties of decorative Roses, not fewer than three nor more than 12 trusses of each, the Rev. Joseph Pemberton, Havering, Romford, was placed 1st. He showed such varieties as Red Provence, Aglaia, Gruss an Zabern, Seagull, Lady Curzon and Brunonis. 2nd, Mrs. Ethel M. Wightman, Bengeo, Hertford.

AWARDS.

Seedling Roses were staged numerously. Messrs. B. Cant & Sons were awarded a Gold Medal for St. Helena, a H.T. variety of sterling merit. It is a full-pointed, creamy-white flower with a delicate pink centre when opening, changing with age to a pleasing shade of pale apricot. It was raised from Joseph Hill crossed with Marquise de Sinety.

A Gold Medal was also awarded to Messrs. A. Dickson & Sons, Belfast, for single Rose Irish Flame, which may be best described as a magnificent form of Irish Elegance. It is a grand Rose.

A Card of Commendation was awarded to the variety Duchess of Normandy, a pale Dean Hole.

In the open classes medals were awarded the varieties (H.P.) *Victor Hugo*, shown by Messrs. D. Prior & Sons; (H.T.) *St. Helena*, shown by Messrs. B. Cant & Sons; and (Tea) *Mrs. F. Hobbs*, exhibited by Mr. P. Prince.

In the amateurs' section the following varieties received medals :—(Tea) *W. R. Smith*, shown by Mr. E. W. Morris, Uckfield; (H.P.) *A. K. Williams*, shown by the Rev. J. Pemberton; and (H.T.) *Mrs. Theodore Roosevelt*, shown by Mr. E. L. Brown, Slough.

Decorative Classes.

The displays in this section were of a moderate character beyond the 1st and 2nd prize exhibits. In the class for a decorated dinner table five competed. Mrs. Colston Hall, Virginia Lodge, Warminster, was easily 1st, arranging Roses Irish Elegance and Gottfried Keller with bronze coloured foliage in silver vases, with a bowl in the centre; 2nd, Mrs. G. A. Hammond, Cambrian House, Burgess Hill, Sussex.

In the local classes Mr. W. H. Myers, Swanmore House, Bishop's Waltham (gr. Mr. Ellwood), had a good bowl of Roses of mixed varieties effectively disposed.

Sweet Peas.—Two classes were provided for Sweet Peas by the Southampton Society, each for six bunches. In the class open to all the prizes were provided by Messrs. Toogood & Sons, Southampton, and there were 12 competitors. Mr. F. G. Bealing, Bassett Nurseries, Southampton, was placed 1st with handsome blooms of Barbara, Elfrida Pearson, Tennant Spencer, Clara Curtis and Thomas Stevenson. Mr. H. H. Lees, Havant, was a close 2nd. In the amateur class Mr. F. Green, The Beeches, Swaythling, excelled with handsome vases of Elsie Herbert and Sunproof Crimson as the best; 2nd, Mr. Lees.

Non-competitive Exhibits.

Messrs. B. Ladhams & Sons, Shirley, Southampton, staged a handsome group of hardy flowers.

Messrs. Toogood & Son, Southampton, staged a handsome group of Sweet Peas of grand quality.

Messrs. Longster & Co., Southampton, and Mrs. Stevenson, of Wimborne, also showed Sweet Peas.

Mr. C. W. Breadmore had the new Sweet Peas Aggie Elder, Princess Mary, Mrs. Fred Arey, Duchess of Wellington, and Lord Kitchener, making an attractive display.

Messrs. W. H. Rogers, Bassett Nurseries, staged Roses in pots and as cut blooms, making a capital display.

POTTERS BAR AND DISTRICT AMATEUR ROSE.

June 21.—The annual meeting of this society was held on the above date in the grounds of E. Weber, Esq. Mrs. Trotter, vice-president of the society, presided. The secretary (Mr. H. R. Darlington) having submitted the formal business of the meeting, and the usual resolutions having been passed, the president announced that the summer show of the society would be held on July 11 next. He then called upon Dr. A. H. Williams, vice-president of the National Rose Society, to give an address on the subject of "Climbing Wichuraiana Roses," of which the following is an abstract.

ADDRESS BY DR. WILLIAMS.

The Wichuraianas.

Wichuraiana Roses are of recent origin. Manda in America sent out the first. About the same time the climbing Roses of the Multiflora type came into prominence.

R. Wichuraiana, so far as Europe is concerned, was discovered about 1860. It is closely allied with the Multiflora group, Rubin, Tausendschon, and others. There was at first some confusion arising from the fact that at first they were examined only in dried botanical specimens, but there can be no difficulty about them when they are seen growing in the garden.

R. Wichuraiana possesses shining foliage and creeping growth, while R. Multiflora has stout, rather upright shoots and somewhat rugose foliage.

Since Manda sent out his first hybrids a very large number have been put into commerce. It is estimated that already some 150 varieties of Wichuraiana hybrids have been sent out.

Climbing Varieties.

Leaving the dwarf growers, which do not form part of our subject, the climbing varieties have many features in which they resemble the common parent. So far most of them are only summer flowering. Sylvia is the most promising as an autumn Rose; it was raised at Waltham Cross by W. Paul & Son. It is said to grow more rampantly under glass. Notwithstanding this, taking all the varieties together, we get flowers from May to Christmas.

The classification (see table in col. iii) is difficult, but the climbing Wichuraianas may be conveniently divided into three groups according as they are early, mid-season, or late-flowering, and then may be separated by their colours.

Lady Gay, Dorothy Perkins, and the like flower late. They all flower in clusters. They are near the Multiflora hybrids, but they contain no Rose with yellow-coloured flowers. The early group has greater variety of colouring, certainly more scent, and larger flowers. The latest introduction is the cross with the Moss Rose, called Wich-Moss. They are mostly rampant growers, producing shoots 16 or 17 feet long; so vigorous are they that, when room for them has to be found in the autumn, two-thirds of the plant has to be cut away. The shoots usually begin to grow upwards, but some (e.g., Marco) refuse to do so, preferring to push their shoots along the ground. The Dorothy Perkins group have very flexible growths, and may be trained down a bank or anywhere where they are wanted. Others like Gerbe Rose are too stiff for this purpose.

The foliage of nearly all resemble the parent in having shining foliage, which in some is nearly evergreen—Jersey Beauty, for instance; while in others (e.g. Léontine Gervais), the leaves fall early; others, again, are intermediate. Their foliage, especially in spring, has often shades of red, brown and copper, and is very beautiful.

Of these three sections: (1) The early group begins to flower about June 10. (2) The mid-season group begins to flower June 16 to 21. (3) The late group begins to flower the first week in July. Each section may then be sub-divided, according to the colour of the flowers, as follows:—

The Early Group.

White.—W. F. Dreer. This Rose is not often seen, but is very beautiful. Though not a new Rose, it may be strongly recommended, and should be grown more than it is at present. La Perle I have found disappointing. Purity is the whitest we have, almost as white as Frau Karl Druschki. Frauleln Octavia Hesse is Wichuraiana crossed with Kaiserin Augusta Victoria, and has the same colour as the last-named parent.

Yellow.—Alberic Barbier is one of the best. Robert Craig is deep orange-yellow, buds developing to a great snowball of white. It wants hot weather. Before the hot summer of 1911 I nearly discarded it, but both last year and this year it has proved most satisfactory. Edwin Lonsdale, Francois Guillot, François Fouchard, Eliza Robichon, Marco, and Aviateur Blériot are other examples of this group. All these begin as yellow buds and finish up white. Alice Garnier is a dirty buff-yellow, but is interesting because it often gives quite a little show of flowers in autumn; it is sometimes very nearly white. Shower of Gold (Paul & Son) is the yellowest of all. Klondike is another good yellow.

I have been following the yellow colours from white, but from white you can also take a line down the rede, beginning with Miss Helyett, then on to Joseph Liger, which is beautiful when half open.

Jules Lavacher is Chinese pink. It is a new Rose, and possesses green foliage and a graceful habit of growth; it is very profuse in bloom, and lasts well in water.

Paul Transon comes next, then Pink Roamer, which, however, is not a real pink.

Distinct pinks are Gerbe Rose, Christian Wright; this is perhaps the clearest pink in this section, a good pillar Rose, growing 8 or 9 feet high.

Climbing American Beauty is a carmine, and is pleasing only in the young flower, but is delightfully fragrant.

Ruby Queen is a variable colour. At first an intense carmine, it becomes later a deep pink, and then the white centre expands and the flower becomes a pale pink.

Deepest in colour of all is Diabolo, semi-single, with brilliant gold anthers and petals of a deep crimson colour. It sends up a great supply of new shoots.

Mid-season Varieties.

Beginning again with white flowers, we have Schneeball, not a pure white, and a Rose that cannot compare with White Dorothy.

Frau Marie Weinbach is another white, with traces of pink. Joseph Liger is pale canary-yellow, and opens to white tinged with pink. Marco is more distinctly yellow, but the colour fades. Aviateur Blériot possibly ought to be in the early section. It is a useful Rose, with deep yellow buds opening to paler flowers.

For pinks we may take Garisendan, Debutante, earlier than Dorothy Perkins, but a beautiful colour and of graceful habit. Anna Rubsamen, Jean Guerin, Auguste Barbier are also to be placed in this group.

Combinations of yellow and red.—François Juranville is a distinct colour, and very sweet scented. Léontine Gervais may be called coppery-salmon colour, but the colour is really indescribable; it is very pretty, especially when picked young and put in water. Jean Guichard and Réné André carry on the deepening colour to the pink group. The last-named Rose is pink, and has a coppery bud closely pencilled with carmine, the mixture of colours as a whole giving a pink appearance to the blossoms. Alexander Girault is a rampant grower and profuse bloomer; it is a deep carmine on a yellow base. Joseph Billard, a companion to Jersey Beauty, is a Rose you must see before breakfast if you wish to see it at its best; the outer part is deep crimson and the centre yellow, but as soon as the sun gets on it loses its distinct colour, becoming pink with a white eye. Pinsion is coppery-pink, and opens to an indefinite pink. Ariel is sometimes and perhaps unfortunately described as a single Tea rambler, but it really is a Wichuraiana.

Desiré Bergera and Edmund Proust are in this group, but here the colour is too indefinite. Valentine Beaulieu is a deep rose-pink with a yellow base.

Late-flowering (White).

R. Wichuraiana, the type, and all the rest, begin to flower the first week of July. White Dorothy is a good white, and would be better but for its tendency to sport back to its pink parent.

Mrs. L. Dewhurst is just a white Lady Gay; here also the colour is not stable. These Roses, together with Mrs. Portier Darel and Lady White, are all very much alike.

Milky Way is like the type but larger, and I will wind up this list with Silver Moon.

In this group are no yellows, but pinks are to be found in plenty, e.g., Paradise, Coquina, Dorothy Dennison, Lady Godiva and others, the colours deepening until we end the list with Hiawatha and Excelsa.

These are far from exhausting the list; there are some I have not referred to at all, and, beside these, I have noticed in catalogues the names of some 50 new varieties, which so far I have not seen.

Future Developments and Modes of Cultivation.

Then as to future development. Perpetuity is the quality which we want chiefly, also yellows in the late section, of which there are none as yet. In the early group we want more bright reds.

As to the way I grow these Roses. I have a high steep bank, and I simply dig a hole in the grass and put them in. I purposely have not prepared the ground in any way, as I want to curb their growths, but this I have quite failed to effect. In pruning I cut out all old wood that has not got what I call continuing laterals; where such a lateral which it is wished to retain springs from the old wood we simply cut back to this. They are true ramblers, and will grow on like a Strawberry plant, starting again when they reach the ground. These Roses will do for arches, pillars or pergolas, or weeping standards.

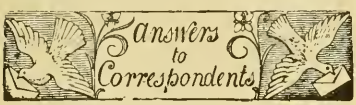
A vote of thanks to the lecturer terminated the proceedings.

CLASSIFICATION OF CLIMBING Wichuraiana Roses.

Early.	Midseason.	Late.
White.		
W. F. Dreer	Frau. M. Weinbach	Wichuraiana, type
La Perle	Schneeball	White Dorothy
F. O. Hesse		Mrs. L. Dewhurst
Purity		Mrs. Portier Darel
		Lady White
		Milky Way
		Silver Moon
Cream to Yellow.		
Alberic Barbier	Joseph Liger	
Edwin Lonsdale	Sylvia	
Francois Guillot	Marco	
Eliza Robichon	Aviator Blerlot	
Francois Poisson	Klondyke	
Francois Foucard		
Robert Craig		
Jersey Beauty		
Gardenia		
Shower of Gold		
Mme. Alice Garnier		
Salmon or Coppery Pink.		
Francois Juranville	Pinson	
Leontine Gervais	Ariel	
Jean Guichard	Desiré Bergera	
Réné Audre	Edmund Proust	
Carmine and Yellow.		
Alexander Girault	Valentine Beaulieu	
Joseph Billard		
Blush Pink or Pink and White.		
Jules Lavacher	Garisendan	Paradise
Miss Hellyett		Jessica
Joseph Lamy		Evangeline
Paul Transom		Coquina
Pink Roamer		Carissima
		Lady Godiva
		DorotbyDennison
Pink.		
Gerbe Rose	Débutante	Minnehaha
Christine Wright	Anna Rubsamen	Dorothy Perkins.
	Jean Gerin	Lady Gay
		The Farquhar
		Rowena
Carmine.		
Climing American Beauty	Auguste Barbier	Delight
Ruby Queen	Rubra	Casimir Moullé
		Francis
		Paul Plotor
Crimson.		
Diabolo		Sodenia
		Troubadour
		Hiawatha
		Excelsa

Obituary.

JOHN ASTRIDGE. — The death of Mr. John Astridge, for many years gardener to the late Mr. Thomas Christy, at Upton House, Alresford, Hampshire, occurred on Monday, the 23rd ult., at the age of 61 years. The body was found in a tool shed in his market garden, with a gunshot wound in the head. At the subsequent inquest evidence was given to the effect that deceased was worried over his business affairs, and a verdict of suicide during temporary insanity was returned. Since the death of Mr. Christy, deceased had conducted a market-gardening business at Alresford. He leaves a widow and four grown-up children.



*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

AMARYLLIS DISEASED: *L. W. & Co.* We have examined the Amaryllis bulb you sent, and, after a very long search, have found that our suspicion as to the presence of the bulb mite is correct. The red appearance of the leaves in places and the red markings of the bulb and roots are almost always indications of the presence of this destructive mite. In the case of the bulb sent, the attack is not hopeless, as the bulb itself was perfectly sound. It might be a good plan to take out any bulbs that are affected in this manner, and thoroughly wash the roots. Remove and burn all the bulb scales that are unsound, and repot the bulbs; another remedy is to wash or spray the bulbs with paraffin, repeating this during the interval of a fortnight, or, after removing the loose scales, to brush the bulbs with sulphide of potassium (liver of sulphur), 1 ounce to 3 gallons of water. The last method is useful against fungi, which follow the attacks of the mite. Still another treatment is to fumigate with bisulphide of carbon. Place the bulbs infested in an air-tight receptacle, and place a saucer containing bisulphide of carbon on the top of them, leaving the bulbs in the vapour for 48 hours. The fumes from bisulphide of carbon are very poisonous, and should not be inhaled. No naked light should be brought near them; the operator should not smoke while performing the work.

BASIC SLAG: *J. M. G., New York.* Basic slag contains from 14 to 20 per cent. of phosphoric acid, or equal to 30 to 42 per cent. of tricalcium phosphate. Write to Messrs. Richardson & Co., York, or The Chemical Works, 15, Philpot Lane, London.

CARNATION PLANT: *Carnation.* The plants are affected with Eelworm. (See reply to *F. M.*)

CARROTS AND POTATOS DISEASED: *W. B.* The Carrots are injured by Sclerotinia Sclerotiorum. The soil is infested with the fungus, and should be treated with gaslime before another crop is grown in it. The Potatos are attacked by Macrosporium. Some good might be done by removing and burning the diseased leaves and the haulm. Early sprayings with the Bordeaux mixture will be useful as a preventive measure.

CYMBIDIUM EBURNEUM: *Humea, Yorkshire.* The Cymbidium leaves are injured by moisture depositing on the leaves when the temperature is falling. Afford more ventilation to the house, so that the leaves may become dry before night time.

EVERLASTING PEA: *Greatbridge.* There is no disease present in the specimens received; the trouble is due to some external condition.

GRAPES AND TOMATOS: *A. H. P.* There is no disease to be found on any of the samples sent. The condition is due to some error in cultivation.

GRAPES DISEASED: *J. W. R.* and *J. M. A.* The Grapes are attacked by Grape rot, which is caused by Gloeosporium ampelophagum. During the resting season spray the entire plant with a solution of sulphate of iron, using 1 oz. in 1 gallon of water. Remove the diseased berries. Mulchings of rich stable manure favour the disease. The only thing that can be done at present is to dredge the bunches with flowers of sulphur.

GROWTHS ON RHODODENDRONS: *E. T. W.* The Rhododendrons are attacked by a species of Exobasidium, a fungus which causes gall-like swellings, usually on the leaves. If the galls are sought and burned before they develop any colour, the plants will be free from attack next year.

GRUB IN ROSE SHOOT: *J. M.* The pest which is burrowing in your Rose shoots is the pith-borer. Break off the shoot below the point of attack, and take care to destroy the caterpillar contained therein.

HORTICULTURAL COLLEGES FOR WOMEN: *Y, Leicester.* The following are among the more important institutions where gardening is taught to women students:—The Horticultural College, Swanley, Kent; University College, Reading; Edinburgh School of Gardening for Women, Corstorphine, Kaimes Road, Murrayfield; Studley Agricultural and Horticultural College for Women, Studley Castle, Warwickshire; Glynde School for Lady Gardeners, near Lewes; Fruit and Flower Farm, Henwick, near Newbury; Training School for Ladies, Arlessey House, near Hitchin; and Home and Colonial School for Ladies, Lane House, Brandesburton, Hull.

IRIS CORMS DYING: *E. W.* The trouble is due to a bacterial disease. Remove the diseased portions and dress the soil with superphosphate of lime.

MELON STEM: *Humea.* Spray the Melon plants with liver of sulphur.

MONSTROUS FOXGLOVE: *E. V. A.* The terminal flower has become regular, a condition known as peloria. The axis has also continued to develop, presenting an example of prolification. It is possible that these conditions have been caused by an excessively rich rooting medium.

NAMES OF PLANTS: *J. B., Falfield.* Spiræa canescens.—*W. Eduntly.* 1, Cratægus orientalis; 2, Ulmus glabra.—*Angerton.* Irises. 1, no flower; 2, I. plicata; 3, I. pallida (? dalmatica), flowers all past; 4, I. variegata var.; 5, Mrs. George Darwin; 6, I. variegata var.; 7, I. amœna Victorine; 8, no flowers.—*A.E.L.* Cattleya Mossiæ.—*R. R.* 1, Oncidium cheirophorum; 2, Epidendrum vitellinum; 3, Oncidium sphacelatum; 4, O. flexuosum.—*A. L., Huddersfield.* Gazania splendens variegata.—*G. H., Stockton.* Selaginella Mertensii and Crassula coccinea.—*A. W.* Ornithogalum longebracteatum, usually grown in cottagers' windows.—*J. M.* A yellow variety of Eschscholtzia californica.—*Enquirer, Dublin.* 1, Jasminum azoricum; 2, Metrosiderus robusta; 3, variegated Mallow, Malva sylvestris; 4, Alyssum, probably A. semonense; 5, Polygonum amplexicaule; 6, Clematis recta.—*W. A. C., Oxon.* 1, Thuya dolobrata; 3, Juniperus japonica; 5, Berberis sp.; 6, Cupressus Lawsoniana var.; 2 and 4, specimens too small for identification; next time send larger portions.—*R. D. S.* Carnation Lady Hermoine.—*H. M.* Lonicera involucrata.

NATIONAL INSURANCE ACT: *J. H.* If your salary and other emoluments amount to more than £160 per annum, and you do not do any manual labour, you can be exempt from the Act. The question resolves itself into this:—Whether or not you are liable to pay income-tax? All income-tax payers not actually engaged in manual labour are exempt from the operation of the Act, but manual labourers are within the Act even if their salary is double that of the income-tax payer.

NYMPHÆA ELLISIANA: *W. E.* There is no disease present in the plants; the unhealthy appearance is due to some wrong cultural treatment.

PEAR LEAVES: *H. H.* The leaves are affected with the Pear leaf blister mite. The only certain method is hand picking the leaves early in the season before the mites migrate into the buds.

PEARS CRACKING: *Constant Reader.* The cracking of the Pears is not due to a fungus disease; it is probably the result of excessive moisture in the soil.

PHLOXES DISEASED: *F. M.* Eelworm is present at the root. This is a very difficult pest to eradicate, insecticides being of little avail. The best plan is to burn the plants, and remove the soil in which they have been grown, either sterilising it by baking or burying it in some out of the way part of the garden.

POTATO HAULM DISEASED: *J. C. F., Eastbourne.* The Potatos are affected with the Potato disease, caused by Phytophthora infestans. Another season you should plant the crop on a well-drained soil in a situation free from excessive dampness. When the crop is lifted in the autumn every portion of the haulm should be gathered and burnt, and diseased tubers should be rigorously separated from the sound ones, and just as carefully gathered up from the soil. Where the disease is usually prevalent or has actually shown itself, spray the plants with the Bordeaux mixture. The first application should be carried out early this month, and be followed by one or two more sprayings at intervals of a fortnight. Care should be taken to spray both sides of the leaves.

QUOITS: *A. R.* There is no standard size for a quoits ground, but the two iron pins, termed "hobs," are usually driven into the ground at a distance of 19 yards apart, the head being 1 inch above the ground. The quoits themselves may be of any weight, but must not measure more than 8 inches across; it is, however, customary to specify the weight of the quoits when arranging a match. The ground around the "hobs" should be clay, so that the quoits will stick where they pitch. The players may be of an even number, and each player throws two rings (quoits), either in succession or alternately. When a quoit pitches over the hob it is termed a "ringer," and two points are scored. There is no score if the quoits of each side lie equi-distant from the hobs; if both quoits of one player lie nearest to the pin two points are scored, and in the case of one being nearest the player scores one point.

SEEDLING DELPHINIUM: *J. G., Burton-on-Trent.* Your seedling Delphinium possesses considerable merit. The colour is very beautiful and the inflorescence of good shape and size. It is worth perpetuating.

SWEET PEAS WITH SMALL FLOWERS: *J. M. H.* You state that your Sweet Peas are growing very strong, with stems 18 inches long, and 80 per cent. of the spikes having four flowers. If you have not taken out some of the side laterals you had better do so. As the plants get a little less vigorous in growth, you will probably find that the flowers will be larger. If this is not noticed, give the plants a dressing or two of chemical manure.

TENANCY OF DWELLING-HOUSE: *J. H. M.* We fear your landlord is correct in his contention, assuming he is not your employer. A tenant who enters into possession of premises without any agreement (either verbal or in writing) as to the duration of the tenancy, and who does not pay his rent every week or every month, is presumed at law to be a tenant from year to year. In that case he must give two quarters notice to quit, and such notice must expire at the end of a current year of the tenancy. For instance, if your tenancy began on the 25th March in any year, then you cannot leave before March 25, 1913, and you should give your landlord notice by registered post on or before September 28 next. (If your tenancy did not commence on a quarter day, you must give "six calendar months" notice instead of "two quarters.") You had better see your landlord again and point out that you are only a weekly servant, and cannot pretend to be able to pay the rent after you leave your employment, so that for his own sake he had better accept the notice you have already given him and re-let the property as soon as possible.

THE MARKET FRUIT GARDEN.

ON the whole, the weather of June was favourable to fruit trees and fruit crops, although if fewer cold nights had been experienced the results would have been better. My rainfall was 3.16 inches, and it has not been excessive after the spring drought, although the quantity for the month is above the average. In some parts of the country, apart from the rainy districts, the total has been much higher. All but about half an inch of my rainfall measurement was made in the first half of the month. The soaking that the land then received helped materially to promote the growth of new wood and to swell fruit of all kinds, while the subsequent dry or partly dry and sunny weather ripened such crops as Gooseberries, Currants, and Raspberries.

Crops Wholly or Partly Gathered.

There is no doubt that the Gooseberry crop was a great one, and yet prices kept up well until the latter part of the green fruit season. Red Currants appear to be generally an excellent crop, and they have been selling only moderately well. Black Currants, on the contrary, are a deficient crop, but the fruits are fine in size and quality. Up to the time of writing they have sold remarkably well—better than in any previous season since I began to grow them for market. My own crop, which covers many acres, was not harmed by frost, and it has turned out the best I have had for many years. In fact, it is my mainstay this season, and will yield me a larger money return than any other crop, unless prices for Plums and Apples should prove exceptionally high. Just before the spring drought ended, Black Currants began to show signs of suffering, and, as stated in a previous article, some of the fruits failed to set. But the rest grew to such a fine size that the yield was an agreeable surprise.

Some Fine Fruit Promised.

Plums, even where they are fairly thick on the trees, promise to be unusually fine fruit. In my own case this is partly because my trees missed their usual attack of aphis. Pears also will be remarkably fine, and most varieties in my orchard are clean and free from scab disease. Apples are swelling well where not spoilt by aphis, as is the case with a large number. As a consequence, the proportion of tail will be unusually large in many varieties, especially dessert Apples.

Persistence of Aphis.

There appears to be no end to the aphis attack on Apples this season, although ladybirds and their larvæ have cleared off multitudes. A few days ago I noticed for the first time numbers of aphides creeping about the trunks and branches of the trees, some winged, but the great majority not so. Why they had left the foliage to creep about the trunks and branches I cannot imagine, unless they had been disturbed by the swarms of linnets, which are busy on infested trees.

Silver-leaf Experiments.

In 1910 and 1911 different dressings were applied to Victoria Plum trees affected with silver-leaf, and the results have been recently examined, and are as follow:—

1. Magnesia 3½ lbs., carbonate in 1910 and sulphate in 1911. Tree dead and since burnt.

2. Magnesia 3½ lbs., and liberal dressing of farmyard manure. A little improvement and a little fruit.

3. Sulphate of iron 3 lbs., and liberal dressings of farmyard manure. Tree greatly improved, and bearing half a crop of fruit. A second tree similarly treated also improved in less degree, and is bearing a little fruit.

4. Sulphate of iron 6 lbs., and 7 lbs. of complete artificial manure, consisting of two parts of superphosphate to one part each of sulphate of ammonia and muriate of potash. Tree cured, and bearing a great crop.

The same dressings have been applied for the third time, except to the two dead trees. In another field a tree of Pond's Seedling Plum was dressed with 3½ lbs. of magnesia. No good resulted, and a dressing of 7 lbs. of complete artificial manure has now been applied. It is a pity that a heavy dressing of sulphate of iron was not tried alone and a heavy one of mixed artificial manures also alone.

A Disappointing Manurial Experiment.

For the third season in succession a liberal dressing of mixed artificial manures (8 cwts. per acre) has been applied to an orchard of Apples and Black Currants, with the exception of one row. The mixture in 1910 and 1911 consisted of two parts of superphosphate to one part each of sulphate of ammonia and muriate of potash, while in 1912 nitrate of soda replaced the sulphate of ammonia, and sulphate of potash was used instead of muriate. Careful examination on several occasions showed no difference between the manured and unmanured trees and bushes of the same varieties until this season, just before the Black Currants were picked, and then the only difference was darker colour and more vigour in the leaves of the manured Black Currants, which may be attributed to the nitrate of soda. No difference in size of bushes or quantity or size of fruit could be seen, and none of any kind was noticeable in the Apple trees—not even in colour of leaves. The trees and bushes are now in the sixth season from the planting, and apparently they have not been in need of manure, as they have grown well. But perhaps the inoperativeness of the manures may be accounted for by the fact that the field was dressed heavily with artificial manures for Potatos two or three times before the fruit trees and bushes were planted. Elsewhere, however, there has often been great difficulty in seeing any effect from artificial manures. I am disposed to think that for fruit trees and bushes the old saying—"there's nothing like muck"—holds good, as some marked improvement in trees dressed liberally with this natural manure has been noticed in three of my orchards. In one of two reports from different experiment stations in the United States recently received, the results of manuring Apple trees with farmyard and artificial manures for a number of years are declared to be practically unnoticeable, while great benefits are shown in the other report to have resulted in a different part of the country. In this case, the best results were obtained from very heavy annual dressings of mixed artificial manures; but it may be doubted whether the farmyard manure was of very high quality.

Apples Dropping.

Early Apples, and particularly Beauty of Bath and Early Julyan, are dropping from the trees to an extent even greater than that of last season. These two varieties are peculiarly liable to dropping, much of the fallen fruit being up to half the mature size. Probably the May drought and aphis attack together may be held accountable for the dropping. Beauty of Bath is always one of the varieties most infested with aphis. Fully half its crop this season will probably drop before the fruit is mature.

A Southern Grower.

SPANISH AND DUTCH IRISES.

IN an article on Iris filifolia, which appeared in the *Gardeners' Chronicle* for September 23, 1911 (p. 218), I mentioned the fact that it was not the true I. filifolia but another plant, which often appears under this name in catalogues and which might more appropriately be called I. xiphium præcox from its early-flowering habit, that was one of the parents of the hybrid "Dutch" Irises. I went on to say that the statement that all the known species of Spanish Irises were combined to produce these Dutch Irises was probably erroneous, for not one of them shows any trace of perianth tube, which would almost certainly have appeared sooner or later if either I. tingitana, I. Boissieri or I. juncea had been among the parents. I am sorry that this statement should have seemed to question the accuracy of the raiser's account of the origin of these hybrids, and it would have been doubtless more correct if I had said that none of the hybrids that I had seen showed any trace of any other parent than I. xiphium and its varieties præcox and lusitanica.

Mr. C. G. Van Tubergen, of Haarlem, the raiser, has assured me that the pollen of both I. tingitana and other species was used to fertilise the pseudo-filifolia or xiphium præcox. This statement I do not wish to traverse, but I am afraid I must still maintain that, except possibly in the shape of the blade of the falls and in the soft blue colouring of some magnificent flowers that Mr. Van Tubergen recently sent me, I have failed to find any trace of that structural difference which separates all the other species from I. xiphium. This difference is found in the perianth tube. In I. xiphium this is very short and funnel-shaped, and, as the flower withers, often breaks off from the top of the ovary with the withered remains of the segments. In all the other species, this short funnel-shaped upper end of the tube is separated from the ovary by a narrow, linear tube half an inch or more in length, which even when withered clings much more closely to the ovary.

None of the Dutch Irises that I have seen shows any trace of this linear perianth tube, and Mr. Van Tubergen admits that he has found no trace of it among his stock. This is the more curious because I had in flower this year a few plants of a cross of I xiphium × I. tingitana, which we owe to the skill of Sir Michael Foster. In this hybrid a linear tube of over half an inch is present, showing apparently that in the first generation of hybrids the presence of the linear tube is a dominant characteristic.

It had occurred to me that the seed parent might possibly have been I. tingitana, but Foster certainly called the hybrid I. xiphium × tingitana in a letter addressed to me not many weeks before his death. Another fact that tends to prove that I. xiphium was the seed parent is that the hybrid flowers freely every year and that the buds do not succumb to late spring frosts after the annoying fashion of those of I. tingitana, when the bulbs of the latter have at last been induced to flower.

This year both I. tingitana and I. xiphium × tingitana were growing here almost side by side and were in bud early in April. Then came the sharp frosts that played such havoc with the undeveloped flower shoots of I. germanica and caused large clumps of this species to remain apparently flowerless, though the frost-bitten immature flower stems could be dissected out of the bases of the tufts of leaves. These frosts killed the buds of I. tingitana entirely, but left those of the hybrid unharmed, so that they opened on April 15, which must surely be almost a record for a Spanish Iris flowering unprotected in the open.

The question of the date at which Spanish Irises flower is very curious. Only to-day (July 3) I have received from the south of France a few bulbs of what must probably be one of the last remaining colonies of I. xiphium that still survive in the wild state in France. These were found in flower on June 30, quite close to the Mediterranean on the coast of Hérault, although it was supposed that the extension of the vineyards right down to the seashore along that coast had exterminated the colonies of I. xiphium that used to grow there. It might certainly have been expected that I. xiphium would have flowered a month or two earlier in such a warm locality, for with regard to other Irises the month of April there corresponds to June in the south of England.

FIG. 9.—DAPHNE × THAUMA: COLOUR OF FLOWERS, PINK.
(D. rupestris × D. striata.)

The fact that the wild I. xiphium may flower so late, even in such a locality, tends, however, to show that it is unwise to separate from that species such Spanish plants as have been described under the names of I. serotina, Willkomm, and I. Taitii, Foster. Willkomm's name of serotina was given to a plant which was found in flower in August and September. Herbarium specimens also show that I. xiphium can be obtained in flower in August and even in September at a height of over 5,000 feet on the Sierras de Cazorla and del Pinar in the south of Spain. I. Taitii has been in cultivation here for several years now and flowers at the end of June or early in July.

In spite, however, of the existence of these late-flowering forms of I. xiphium, I cannot admit that the early-flowering character of a hybrid is evidence that its parents were species other than I. xiphium. Several hybrids of I. xiphium præcox, crossed with pollen of I. lusitanica, which is only a yellow-flowered form of I. xiphium, certainly flower a week or two before either of their parents with the first of the Dutch Irises, with which they seem to be identical.

It is an interesting speculation to try to discover the nearest point of contact between bulbous and rhizomatous Irises. It seems not impossible that this may be found in I. xiphium and I. spuria. The form of the segments of the two flowers is identical, the spathes are not dissimilar, and when, as sometimes happens in strong-growing examples of I. xiphium præcox and of hybrids raised from it, a lateral flower develops on a short vertical branch, the resemblance to I. spuria is particularly striking.

That I am not alone in seeing the resemblance between I. xiphium and I. spuria is proved by the fact that some years ago I was informed that flowers of I. hyèrensis were on their way to me from the south of France. Imagine my surprise when, on opening the box, I found a number of fine flowers of I. tingitana which had been picked and sent to me by mistake for I. hyèrensis. The latter, by the way, is nothing but a cultivated form of I. spuria, in spite of its reputed origin from a cross between a Kæmpferi hybrid and I. xiphioides! It is probably only one more example of the process which is continually going on in any collection of Irises, and by which self-sown seedlings of such self-fertilized species as I. spuria, I. Pseudacorus, I. versicolor or I. setosa come up where other seeds have been sown and have failed to germinate or where other and rarer species have failed in the struggle for existence. *W. R. Dykes, Charterhouse, Godalming.*

NEW OR NOTEWORTHY PLANTS.

DAPHNE × THAUMA (D. RUPESTRIS × D. STRIATA).*

As I do not know of any natural hybrid among the European Daphnes (or, indeed, any others), I believe that the following discovery will be considered of special interest. While scrambling very slowly and cautiously last year upon one of the peculiarly unpleasant cliffs inhabited by Daphne rupestris, I came upon a mass or cushion of glossy verdure that for the first moment

* DAPHNE × THAUMA (D. RUPESTRIS × D. STRIATA).—Frutex dense caespitosus, inter species parentes manifeste intermedius, aspectu magis ad D. rupestrem, colore florum ad D. striatam approximans. Ramuli lignosi, erecti vel paullo depressi, cm. 6-7 rarius excedentes. Folia dimidio majora quam in D. rupestre, minora quam in D. striatá, laetissime imprimis virentia ac nitentia; debinc obscuriora; ovata-lanceolata, alveolata, carinata, tandem marginibus paullulo revolutis, ita ut quasi ovata videantur, crassitudine tamen et coarctatione foliarum D. rupestris fere carentia, etiamsi duriora ac magis coriacea quam folia D. striatae. Flores in natura rarius (ut videtur) emissae, in capitulo pauciflore (5-8), ad colorem dilute roseam D. striatae magis accedentes, sed tubo villoso obscurius porphyreo D. rupestris praeditae valde suaveolentes.

In scopulo uno abrupto, nec facile accessu, montis tombeanensis inventa (locis tamen apertioribus quam rupes illi praerupti ac nudi quibus maxime gaudet D. rupestris) haec planta hybrida, in hortos mox translata, robuste floruit, floresque libenter emisit, documento habitus speciebus parentibus multo validioris.

suggested some curious Arctostaphylos. Another moment's inspection showed me, however, that the plant was a Daphne, being neither D. rupestris nor D. striata (on the mountain classically famous for the former species), but, on the other hand, precisely intermediate between the two. With great care I secured portions of the plant, and these, contrary to the fashion among Daphnes, have thriven and grown with a surprising readiness, which cannot be an inheritance from either parent. At the same time I must premise that the accompanying photograph (see fig. 9), taken on May 23, 1912, in the rock-garden at Ingleborough (from a re-established clump collected on the Cima Tombéa in August, 1911), by no means represents as yet the lush and lavish mat of verdure that is a distinguishing feature of Daphne × Thauma. On my fourth visit to the Tombéa a month ago, I adventured further upon the cliff, and discovered one more large mass of the hybrid, as well as a smaller piece in flower. These remain inviolate on the Tombéa, which I think can be well trusted to safeguard its own secrets without the disguise of pseudonyms. The hybrid seems to occupy more open ledges and places less bare of soil than the pitiless rock-faces affected by D. rupestris.

Daphne × Thauma (D. rupestris × D. striata) stands midway between its parents. It forms a dense cæspitose mass 1 foot or 18 inches across. The branches are erect or slightly decumbent, rarely exceeding some 1½-2 inches in length, and growing with such uniformity as to give the effect of a green cushion. The leaves are approximately twice the size of those of D. rupestris and half that of those of D. striata; they are channelled and keeled, lanceolate-ovate, brilliantly glossy (as in D. rupestris) on the current year's growth, and then deepening to a less shining tone of green. As the season goes on their edges become thickened or revolute, so as to produce the effect of being rotundate-ovate, the point appearing to sink in between the shoulders on either side; in substance they are intermediate, less dense and hard than those of D. rupestris, but much more so than the comparatively flaccid leaves of D. striata (the illustration well shows their distinctive gloss). The flowers seem in nature to be rarely produced; neither of the large, lucent mats discovered had any sign of bud or blossom. In cultivation, however, the plant, besides its gratifying speed of recovery and adaptability of temper, shows a much greater generosity in the matter of flowers. These are produced in sparse heads of 5-8 blooms, and, despite their greater size and beauty, approximate more nearly in their soft, pale pink to the pallid tones of D. striata than to the dazzling clear rose of D. rupestris. Of this latter species, however, they have the darkly-flushed tube. I have seen no trace of fruit (never, indeed, on D. rupestris, and rarely on D. striata). Cima Tombéa, August 2, 1911, and June 9, 1912. *Reginald Farrer.*

LÆLIO-CATTLEYA BARONESS EMMA.

The beautiful hybrid Orchid illustrated in fig. 10 was raised from the fine original L.-C. eximia (L. purpurata × C. Warneri) and a special form of the natural hybrid Cattleya Hardyana (Warscewiczii × Dowiana aurea). The plant was awarded a First-class Certificate at the meeting of the Royal Horticultural Society on June 18 last, when exhibited by Baron Bruno Schröder, The Dell, Englefield Green (gr. Mr. J. E. Shill). In size, form, and colour of the flower, and in the substance of the segments, L.-C. Baroness Emma is a great improvement on L.-C. eximia. The thick substance of the flower and the rich, velvety ruby-crimson of the lip may be traced to Cattleya Hardyana. The sepals and petals are silver-white, tinged and veined with bright rose-pink. The tube of the lip is white, with dark lines at the base, and the disc shows yellow colour, derived from Cattleya Warscewiczii.

THE ROSARY.

REMINISCENCES OF THE "INTERNATIONAL."

Outside the classes for new Roses at the "International," there were in several groups, notably in those of Messrs. Paul & Son, Cheshunt, and Messrs. Wm. Paul, of Waltham Cross, certain Roses of recent introduction which are worth mention.

One of the most striking of these was Magnolia, so called from its general resemblance to flowers of the Magnolia; they are scarcely more than semi-double, but possess large outer or guard petals with crinkled edges, and the form of the flower is very graceful. As shown, they were cream-coloured, but the raisers describe the Rose as a derivative of Maréchal Niel and deep orange-yellow or golden-yellow, so perhaps the colour comes deeper on outdoor plants. I was pleased to see Freda again. At the autumn show of 1911 it was obviously not at its best, but I thought it seemed promising even then. It is a large Rose with a good point and globular centre, the colour being a distinct shade of pink, more pronounced towards the edges, the body colour approaching a Peach tint. It certainly seems to do well under glass, and I noticed it as free-flowering out-of-doors during last autumn, so it should be a useful garden Rose also.

"My Maryland" was to be found in several places, and, as one might expect from a Rose with an American name, will certainly be useful under glass. It is not a full flower, not much more so than Papa Gontier, but it has long, oval buds with petals of good substance, and, no doubt, will be most charming in the stage just before the flowers expand.

Some fine flowers of Lady Alice Stanley were shown. Down to the present this Rose has been somewhat disappointing on account of its rough outer petals, but under glass these seem to come smooth enough.

Portia, a large flower, creamy-white with pale-rose centre, was well shown at the Temple Show, 1911, but I had scarcely seen it since. It would seem to be of that rather stumpy habit technically called robust, which perhaps makes it particularly suitable for growing under glass.

Mrs. Charles Hunter is a very striking colour; most of us know the colour of strawberry ice; if this is made rather deeper and richer we get something very near this Rose.

Fig. 10.—Lælio-Cattleya Baroness Emma: sepals and petals white tinged and veined with rose-pink; lip purplish-crimson. (½ nat. size.)

Souvenir de Gustave Prat, a Rose of French origin, would appear to have a good habit and to be free-flowering; it was noticeable in several groups. The flower has large petals of a sulphur-yellow colour loosely put together.

Jonkheer J. L. Mock was shown very much in the condition we saw it last year at the Temple. It has a fine pink colour and a large petal squarely set in the flower.

Ophelia I should like to see again before forming a definite opinion; it was a pretty Rose, no doubt, but the inner petals seemed too short to be quite pleasing; at the same time, the shades of salmon and rose were fresh and attractive. *White Rose.*

NOTICES OF BOOKS.

CUCUMBER CULTURE.*

THIS work, the sub-title states, is "A handbook dealing with the cultivation of Cucumbers in glasshouses and frames, suitable for amateur, market, and professional gardeners." Chapter I deals with the average crop, cost of production, including manure, fuel, carriage, cartage, and labour. Chapter II relates to capital charges, which are based on the cost of erection and upkeep of house and cost of production of crop in 600 feet run of glasshouse. The author estimates that the plants should produce two flats of Cucumbers per foot of house during the season, making a total of 1,200 flats, equal to 24 tons of fruit. If these are estimated at an average price of 5s. per flat, they would realise £300. The total cost of production, including fuel and carriage, is given as £175. The author considers that an expert workman would be able to look after the 600 feet run of Cucumber houses, doing all the stopping, tying, watering, damping, and cutting, but would require assistance when top-dressing and packing. Five chapters are devoted to such subjects as houses and their preparation, soil for the crop, raising the plants, general treatment, such as planting, training, watering, and damping, shading, top-dressing, feeding, temperature, ventilation, and packing of the fruit for market. Cucumbers in frames on hot-beds are dealt with, whilst three chapters are devoted to the various insect pests and fungous diseases which attack Cucumber plants. The advice to pot the seedling plants direct into 6-inch pots, instead of the customary 3-inch size, will not commend itself to all cultivators. On p. 39 it is stated that if "no shading is used, air will be needed when the temperature rises to 73°, and that more air must be gradually admitted as it goes up." This advice is contrary to the method of ventilation practised by all good Cucumber growers, who very seldom admit any fresh air to their Cucumber houses before the end of March, and then not before the thermometer has indicated 90° or 95°. Shading is rarely used except during such exceptionally hot weather as we experienced last summer. The object of the grower of Cucumbers for market should be to obtain all the fruit possible from strong, vigorous-growing plants within as short a time as possible. Young and vigorous plants, when kept well supplied with water at the roots, and in a uniformly moist atmosphere, revel in high temperatures. The book will prove helpful to those who contemplate growing Cucumbers for market. *H. W. W.*

TRANSACTIONS OF THE NATIONAL CHRYSANTHEMUM SOCIETY, 1911.*

ENCOURAGED by the success which attended the publication of the report of the conference held in 1910 under the title of *The Culture and Exhibition of Large Chrysanthemum Blooms*, the Publications Committee of the National Chrysanthemum Society decided to publish a yearly volume of *Transactions*. The first number contains much valuable information, and members who were unable to attend the conference in 1911 will be specially interested in the reports of the discussions on the papers on "Chrysanthemums for Market" and "Soil Preparation and Some Chemical Foods for Chrysanthemums."

* Price 1s. to non-members.

SCOTLAND.

THE ROSE SEASON.

THE season of Roses may be said to have opened very inauspiciously this year—amid veritable floods of rain. As a natural consequence, many of the finest of the earlier flower-buds suffered severely, a large proportion of them being destroyed. I especially lamented the loss of some of the grandest blooms on Frau Karl Druschki. If this pure-white variety had only fragrance and a somewhat fuller centre, such as that which is the endowment of Kaiserin Angusta Victoria, for example, or the superb Marchioness of Londonderry, it would be as near to perfection as it is possible for human imagination to conceive. White Maman Cochet, which is unfolding its lovely blooms at present, in more favourable atmospheric influences, is also a very attractive Rose, but it can hardly be described with any expressiveness as being pure white, since it manifestly exhibits, even in its earlier stages, a distinct shading of yellow. Its pendulous habit is very regrettable; it is even more pronounced than in that invaluable derivative from Souvenir d'un Ami, namely, the snow-white, richly-odorous Souvenir de S. A. Prince. The Bride, which is a daughter of Catherine Mermet, is, like the latter exquisite variety, somewhat difficult to open, and does not, therefore, succeed in such a season as we have, for the most part, experienced this year. An occasional shower is an inspiration to Roses in their floral development; but, on the other hand, they may easily get too much rain, and, before they have the privilege of expanding, be utterly destroyed. None suffer more from such adverse influences than the pure-white varieties, and especially those to which I have incidentally referred.

Among Roses of comparatively recent introduction, some of the finest this season are Duchess of Westminster (a variety of refined form and lovely complexion) and Viscount Carlow. Florence Haswell Veitch, of splendid growth (a rare attribute in many modern Roses), has a semi-climbing habit, and great floriferousness, but its fine dark, crimson colour was seriously affected at first by the influence of heavy rains. Leslie Holland and Countess of Shrewsbury were most deservedly awarded the Gold Medal at the National Rose Society. I have also at present in radiant bloom a new variety, of medium size, highly effective and fascinating in its fragrance, which, I believe, has not yet been introduced. It ought to prove a veritable acquisition. The most luxuriantly-flowering Rose in my garden this season, falling in what Dean Hole would have described as "cascades of flowers" from the branches of a venerable Damson tree, has been the Waltham Bride, though Hiawatha, probably the finest of the Wichuraianas, promises to be almost equally commanding in its floral effect, which is greatly enhanced by its extremely picturesque situation, growing upwards most gracefully and pyramidally through the branches of an Ailanthus or "Tree of Heaven," which has not reached a heavenly height in my garden. Towering above it is a remarkably fine specimen of Magnolia Watsonii, which, during this extremely variable season, has borne nearly 40 magnificent flowers (with the aspect of Water Lilies opening on a Laurel), many of

them almost 6 inches across. Like some of the Hybrid Tea and Hybrid Perpetual Roses, this Japanese Magnolia, inspired by the season, flowered twice last year. It is not yet too late to record this achievement, at least incidentally, in the pages of the *Gardeners' Chronicle*.

Some of the new Roses, as I have indicated, are very charming, though, perhaps, considerably more in aspect than in fragrance; but I still cling fondly to the older varieties, which, in virtue of their great attributes, have stood the test of time. I sometimes wonder what our Rose gardens, with all their recent acquisitions, would be like without such pre-eminently vigorous and grandly-flowering varieties as La France, Clio, Margaret Dickson (here flowering at a height of 21 feet), Caroline Testout, Viscountess Folkestone, Clara Watson, Devoniensis, Beauty of Waltham, Duke of Edinburgh, Prince Arthur, Mrs. Sharman Crawford (not surpassed by any of the latest Newtownards introductions), and Mrs. John Laing? I hope the day is very far distant when any of these shall be relegated to oblivion. The sweetest Rose in my garden within the last fortnight has been my English namesake; the grandest, an individual bloom of Pharisaer, closely approximating to 7 inches across. *David R. Williamson, Wigtownshire.*

THE FLORA OF FORMOSA.

Having recently spent two months in this island, little known to any but Japanese botanists, though my colleague, Dr. Henry, was the first to publish a list of its flora, I am able to form some idea of its vegetation, of which I had heard such glowing accounts. The island lies between 21° 40′ and 25° 30′ N. Lat., and is, therefore, entirely within the tropics. It consists of a mountainous backbone rising at two points to over 12,000 feet elevation, and falling on the east side in very high and steep cliffs to the sea. On the west, the foot-hills are bounded by a very fertile plain, which produces large quantities of Sugar, Rice, and other tropical crops, and on the north are lower hills, on which a good deal of Oolong Tea, exported largely to the United States, is grown.

The flora of the plains, lower hills, and of parts of the central mountain range is fairly well known, the most recent list of Formosan plants, by the Government botanist, Mr. Kawakami, containing no fewer than some 2,700 species. But a great part of the interior, and especially of the high mountain range in the north, known to Europeans as Mt. Sylvia, is unknown or but little explored, because the aborigines are so hostile that no one can go into their country without great risk of being killed, head-hunting being the favourite pursuit of some of these tribes from time immemorial. Although, since their occupation of the island in 1895, the Japanese have done an immense deal to civilise the country, and the plains are safer to travel in than are some parts of Europe, it is at present quite impossible to visit many districts, and though a large force of police is engaged in trying to subdue the mountain tribes, yet the hope of getting to really new ground with which I left England has been disappointed. Nevertheless, the Japanese Government has given us so much help in districts that are safe, that we have already made a considerable collection of plants, and I have little doubt that my companion, Mr. W. R. Price, who intends to remain during the whole summer and autumn in the island, will enrich Kew with the finest set of Formosan plants that has yet come to Europe.

From what we have seen, I expect that these plants will be of more interest to botanists and foresters than to gardeners, for the climate, even of the mountain ranges up to 8,000 feet, which is as high as we have yet ascended, is, even in the coldest season of the year, so mild, that few of the plants, trees, or shrubs are likely to be hardy in England, and the really Alpine plants found above 9,000 to 10,000 feet seem but few in number, and not likely in most cases to be popular garden plants.

The first thing that struck me on entering the central mountain range of Arisan, which is at present the most accessible of the higher ranges, was its general resemblance to some parts of the Sikkim Himalayas. The virgin forest has been for a long period cut and burnt by the Chinese settlers, who went into the hills to collect camphor, and have settled in the most fertile spots up to about 3,000 feet. Areca Palms and Pineapples are grown nearly up to 3,000 feet, and also large areas of a valuable Bamboo (Phyllostachys bambusoides), which is now being worked up into a coarse paper. Great quantities of Longan trees (Nephelium Longana) have been planted by the Chinese, and their fruit is an important export to China. Pandanus, Musa, Rattans, and another stemless Palm, whose name is at present doubtful, form a conspicuous feature in the forest up to 2,000 or 3,000 feet, together with a particularly fine species of Alpinia, allied to A. nutans; a very ornamental-leaved Aroid, which may be an undescribed species and (on the trees) many large plants of the Fern, Asplenium nidus. The trees generally in the lower forests are not large, all the best, including the Camphor trees, having been cut by the Chinese; but they are much covered with large climbing plants, such as Entada scandens, Mucuna, and climbing Hydrangeas. In addition the many species of Ferns, Mosses and other epiphytes lend great beauty to the forest scenes. We found a very handsome Eriobotrya here, which is probably new. Orchids are, in some districts, plentiful, and more than 100 species are found in the island; but by far the greater number are inconspicuous, and of more interest to the botanist than to the gardener.

The only really fine species is Phalænopsis Aphrodite, which was formerly common at the south end of the island, but which is now becoming quite rare in accessible districts, as it is collected for sale by the natives. At the time I was there, in February, it was in full flower, though the weather, considering the latitude, was very windy and cold (50° to 60°) at night.

In the Arisan forest, at 6,000 to 7,000 feet, are quantities of a Dendrobium with long, thin pseudo-bulbs, which are collected for some medicinal use by the Chinese. I saw several other Dendrobes, one with whitish flowers, resembling D. crepidatum, and a variety of D. nobile in the mountains of the north. I also saw a fine variety of Phaius grandiflorus, cultivated in gardens, and a beautiful white Calanthe, with flowers twice as large as those of C. veratrifolia, of which it may be a variety. Among the most remarkable plants is a Vanilla, supposed by the Japanese botanists to be a variety of Vanda Griffithii, which we found at about 2,000 feet in the north, growing over the trunk of Liboced-

Fig. 12.—Carnation John Ridd: a yellow-ground "fancy" marked with rose-pink.

(Received an Award of Merit at the Holland Park Show. See p. 15 in last issue.)

rus, and having thick, fleshy leaves and stems, 10 to 15 feet long, with pink and green flowers.

Of Lilies, we found two in flower. One, which the Japanese call longiflorum, or philippinense, but which I consider much more nearly allied to Brownii, is abundant in the north about Tamsui and up to nearly 3,000 feet. It bears from one to eight or nine flowers, and would, if imported in quantity, probably become a valuable plant for forcing, as it naturally flowers about Easter. The other is either a variety of L. speciosum, or a nearly-allied species, and is not yet determined. We only found this in one place, where it grew on steep rocks, and the first flowers were just open on March 30. In the same mountains a beautiful Hydrangea and a splendid white Rose, allied to R. lævigata, were in great perfection, and Mr. Price found a few of last year's fruits, which I have brought home. A large white or pink Rhododendron, and a large red Azalea were conspicuous on the hillsides where they occurred,

but not numerous. A fine Crinum, probably C. sinicum, was seen out of flower in the same district. At this season very few plants were in seed, or in a condition to send home alive; but Mr. Price will do his best to bring home any that seem worthy of general cultivation. Of the very remarkable endemic Conifers, which were the principal object of my visit, I was able to see all but Cunninghamia Konishii, which is only known in one locality, which I could not reach; but want of space will not allow me to mention them here, and they are described in the *Journal of Forestry* for July. The season of the year was too early for me to see many herbaceous plants in flower. Among the most handsome were Tricyrtis sp., Paris formosana, resembling the Himalayan P. polyphylla; a large Arisæma, also near the Himalayan Arisæma concinna; and several small but interesting Violets. A most interesting discovery on Mt. Randai was a Shortia, hardly yet in flower, but probably Shortia uniflora; and a Scitaminaceous plant, of which the genus is unknown to me and may be new. It seems very doubtful whether the Cycas described as C. taiwaniana by Carruthers now exists in the island, and the evidence given by Sir W. Thiselton-Dyer in *Journal* Linn. Soc., 26 pp. 560 and 561, is not confirmed by any of the Japanese botanists whom I asked about this plant. It is doubtful whether any species of Cycas is found in Formosa, and C. revoluta, which is naturalised in a very limited area near Kagoshima, in South Japan, is probably not indigenous. *H. J. Elwes.*

NUNEHAM PARK.

(See figs. 13-15, 17 and Supplementary Illustration.)

THE country residence of the Rt. Hon. Lewis Harcourt, M.P., is situated amidst most delightful surroundings at an angle almost equally distant from the historical city of Oxford and the market town of Abingdon. Culham, on the Great Western Railway, is the nearest station, and on leaving the train the visitor immediately enters the Nuneham estate. The way lies along a gently-rising drive, with well-considered curves, in a broad, undulating park. About midway the park proper is entered through an arched lodge. Here, when we visited Nuneham a week ago, the grass was just ripe for the scythe, and when we returned an hour or two later three mowing machines had done so much work that the landscape was altered; the rich brown waving flower-spikes had been laid low, leaving swathes of pale pea-green. Away on either side there are belts of trees with fresh green foliage, bordered with tangled masses of wild Roses—real wild Roses—with dainty, pink-edged petals surrounding golden stamens; flowers with all too short lives but of transcendent beauty. The woods are composed chiefly of shining Beech and feathery Larch, with here and there a lofty Elm, that told of deep, fertile soil. Amongst the more solitary park trees there are many old Thorns—Thorns so old that the trunks of many of them are hollow at the base. We paused to speculate on the significance of the Thorn trees to be seen in so many English parks. Were they planted in these irregular, thin groups of set purpose, or did Nature place them there for discerning owners of the properties to treasure them? Around the trees fallow deer graze in the deep pastures, with a watchful eye on their babies of varying colours and markings. Giant emus and rheas also find a home—the former have young—in this portion of the park, whilst in another place kangaroos may be seen carrying their progeny in their pouches.

The mansion is reached through a pair of hammered gates. The enclosure is bordered by a good hedge of Cistus laurifolius and lines of Roses: the French variety Hermosa, which has numerous mauve flowers, instantly attracts attention, and harmonizes pleasantly with the Chinese monthly Roses. Immediately in front of the mansion the family crest is displayed in dwarf shrubs (see fig. 14). A peacock in green Box surmounts a golden crown set out in a yellow-leaved variety of the same shrub.

WALL SHRUBS.

The Elizabethan mansion is clothed with many interesting and uncommon shrubs, which have made excellent growth during the few years they have been planted. On the north face, Lonicera gigantea superba has long trails of rich golden flowers; Berchemia volubilis has grown up finely; Periploca græca has climbed fully 35 feet, and the growths are terminated with many of its curious brown, green-tipped flowers; a Forsythia, here labelled F. superba (Decumaria barbara?), flowered freely in the spring; Clematis montana rubra in this aspect develops unusually fine colour. The eastern angle of the house has good Bay trees in tubs, and Fuchsia fulgens in old leaden cisterns. On this wall there are many shrubby climbers, including various Clematises; C. coccinea, a very large C. montana grandiflora, and such varieties as Countess Onslow. Ipomœa Leari flowers well; Acacia dealbata appears to be quite at home; Magnolia Campbellii flowered two years ago, but does not seem to be quite happy. Vitis Henryi, in an angle of the house, where it is warm but shaded from the noon-day sun, does extremely well. Magnolia macrophylla is growing only moderately well. There are several sorts of Ceanothus which have flowered profusely and now bear fruits, notably C. rigidus, C. dentatus and C. papillosus. Actinidia Kolomikta has uncommon leaves, the terminal halves being coloured rosy-purple. Clematis æthusiæfolia finds a place next to a Maréchal Niel Rose. Many of the wall shrubs which we are accustomed to see in the gardens of Cornwall and other warm districts are represented at Nuneham, and are quite vigorous, e.g., Lapageria rosea, Carpenteria californica, Solanum crispum, Tricuspidaria dependens, Trachelospermum jasminoides, Edwardsia microphylla, Akebia quinata, Solanum jasminoides and Clianthus puniceus. There is also a large plant of Wistaria chinensis which has spread around the side of the house and embraces a balcony. Myrtles flower and fruit alongside the white and yellow Banksian Roses.

THE TERRACES.

The terrace gardens are very attractive features of Nuneham. Next to the house the terrace is paved with irregularly-laid paving stones, and many lowly, sweet-smelling plants have been placed between the stones. This terrace is devoted to Roses, which are planted in large, rectangular beds of one variety. The deep red Hugh Dickson, the pink Caroline Testout, and the white Frau Karl Druschki, are wonderfully successful, and almost smother the Viola Maggie Mott, which carpets the beds. The next terrace is also filled with Roses, but here the terrace is of gravel, and the beds are bordered with Mrs. Sinkins Pink. In the centre there is a beautiful bronze statue, and around the granite base cluster the dainty flowers of Cecile Brunner Rose. The beds on this terrace are also restricted to separate varieties, such as Killarney, Beauté Inconstans, President Carnot, Antoine Rivoire, and L'Ideal. The retaining wall is covered with Clematis Nellie Moser, and has a border furnished with Rose Mme. Abel Chatenay.

Below the Rose terraces there is the "Nymphæan Terrace," with a small, stone-enclosed pool of Water Lilies, a paved walk, and beds planted with shrubs. Standards of Hydrangea paniculata grandiflora, which line the middle of these beds, promise to be exceptionally fine. The herbaceous borders around this garden are gay with flowers, and the walls are clothed with a great variety of shrubs, the most uncommon being Distylum racemosum, Cestrum lucidum, C. aurantiacum, Adenocarpus anagyrus, and Coprosma lucida. Outside the terrace there are more uncommon wall plants, and in the border there are bushes of Leptospermum scoparium (L. hullatum) 3 to 4 feet high. On the other side of the walk there stretches a long narrow "Blue" border in which Anchusas, Delphiniums, Campanulas and Aconitums are in full bloom. The path to a large croquet terrace, which is bordered with pink Roses, overlooks a bank covered with various Wichuraiana Roses, which have grown rampantly. These terraces are comparatively new features at Nuneham; it was a happy inspiration that prompted the owner of Nuneham and Mrs. Harcourt to make these charming additions to their home.

Under the guidance of Mr. C. E. Munday, the able head gardener, who has cared for the

FIG. 13.—NUNEHAM PARK: SUNDIAL WORKED IN BOX.

Photographs by H. N. King.

NUNEHAM PARK, OXFORDSHIRE, THE RESIDENCE OF THE RT. HON. LEWIS HARCOURT, M.P.

Printed by Temple Press Ltd., London, E.C.

gardens for the past 15 years, and who superintended the extensive alteration at Nuneham, we reluctantly left the terraces, with their beautiful Rose gardens and brilliant herbaceous borders. but there were fresh attractions in store; a long walk, bordered with dwarf French Lavender, disclosed a living sun-dial (see fig. 13). The gnomon is a growing Box, pruned and trained into correct shape, and is as tall as a man; the hours on the large dial are also of Box. We next pass by large groups of Rosa rugosa, Rose Gruss an Teplitz, a fine Rhus Cotinus, placed for autumn effect, on our way to the "Wall Walk," which is nearly 700 feet long, and contains a variety of Alpine and other plants. We passed up the steps (see Supplementary Illustration), taking care not to unduly crush the Pansies or the Pinks, or any of the Rockfoils which luxuriate in them. In the spring time many bulbous plants serve to brighten these stone walls. Space does not permit the mention of a tithe of the plants which grow so well, but we feel that the names of some of the Cacti which thrive under this method will be of especial value. These are Opuntia camanchica gigantea, O. pachyclada rosea, O. rhodantha pisciformis, O. r. brevispina, O. fragilis brachyanthera, and O. Rafinesqui.

Below the wall walk there are many flowering shrubs planted in bold masses, including Cornus capitata, Enkianthus campanulata, Magnolia Alexandræ, and Styrax obassia.

The Dell and Bog Garden.

The far end of this interesting walk brings into view the "Pools of Silence," a series of small ponds culminating in a beautiful garden of Japanese Irises. On the left there is a collection of Japanese shrubs, which has only recently been planted. Leaving the Irises, we ascended to the bog garden, which has been made in an open glade. Here many moisture-loving plants flourish; Gunnera manicata, Rodgersias of several kinds, Spiræas and Astilbes, Polygonum amplexicanle, and smaller patches of Primula Cockburniana, and Cypripedium spectabile. We paused to watch the brilliant flamingoes stalk majestically around the plants, and then continued our upward way. On either side there are large informal beds of rare trees and shrubs. Magnolia glauca, M. Watsonii, Romneya Coulteri, Olearia macrodonta, a standard Fremontia californica, with stout-petalled yellow flowers, Rosa sinica Anemone rioting up Larch poles, a tall Eucalyptus coccifera bearing masses of fragrant flowers, Eriobotrya japonica in the form of a vigorous, healthy bush, many Rhododendron hybrids and a large group of the pink-flowered Indigofera Gerardiana. When nearly at the top, we turned and passed along a fine avenue of Almonds towards the old parish church, passing a tall Maidenhair tree (Ginkgo biloba), which promises to become a fine specimen. Beyond the church is the Heath Garden, with Liliums planted amongst the Heaths.

The Rose Garden.

In a quiet place is an old-style Rose garden of semi-circular shape, enclosed by a tall hedge of Box, which Tropæolum speciosum adorns with trails of scarlet flowers. There is a fine Dorothy Perkins Rose in the centre, and the many beds and stone figures are all deserving of admiration. Capability Brown originally designed the gardens, but the alterations have destroyed much of his work, although "Brown's Walk" still remains. This is a delightful, gently-winding, gravel walk, bordered, not too closely, with trees and shrubs with "peeps" between them. The terraces in front of the house have commanding views, but they cannot compare with the view obtainable from the highest point of Brown's Walk.

Fig. 15.—Nuneham Park: the gardener's cottage.

The brick pergola, which surrounds a small Lily pond (see fig. 17), in front of the gardener's house (see fig. 15), is now almost hidden by the luxurious growth of the Roses and vines. In the well-filled kitchen garden there is a long arch of Roses and many herbaceous borders. The fruit garden is entirely enclosed with $\frac{5}{8}$-inch mesh wire-netting, which is supported by a large angle-iron framework 20 feet high at the apex, 180 feet long by 50 feet wide. In this structure we saw splendid crops of Cherries, Raspberries, Currants, cordon Gooseberries and Loganberries.

Much might be written of the crops in the kitchen garden and the plants in the glasshouses, but the chief interest of Nuneham lies in its out-of-doors garden.

The Week's Work.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Hanging Baskets.—During hot, dry weather plants in hanging baskets require an almost unlimited supply of water. Those of a vigorous habit of growth should be afforded liquid manure freely, and, where necessary, a dressing of artificial manure. Acalypha hispida is one of the most beautiful of plants for growing in baskets, and if planted as advised in a former Calendar (see p. 169), they should now be carrying some fine inflorescences, which must not be wetted with the syringe or the flowers will turn a brown colour.

Layering "Malmaison" Carnations.—Directly Souvenir de la Malmaison Carnations have finished flowering they should be layered. If the plants are infested with red spider, every endeavour should be made to cleanse them before the layering is done. There are several good specifics on the market, and to make sure of destroying all the insects, two applications should be made, the second at an interval of two or three days. The plants should be layered in a frame, using a light compost for plunging them in and for covering the shoots after the layers are made. The foliage should be removed from the shoot up to the point where it is desired to make the cut, this being started just below a joint and finished at the next joint. This length will ensure a good "tongue," from which roots will soon develop, provided the shoot is made quite firm in the soil. After the shoots are layered, keep the frames rather close for a few days, spraying the foliage once or twice daily according to the condition of the weather. But this treatment must not be maintained for too long a period, or the young foliage will grow rank and soft, and be subject to attacks of "spot" (fungus) during the autumn and winter months. A little shade may be provided during the early stages of layering, but as soon as the shoots appear to be making roots, a fairly hardy treatment should be given them, so that the plants will grow hardy and be "stocky" when the time arrives for potting them. To secure a batch of large plants for next season some of the best of those in 6-inch pots should be shifted into 9-inch pots, using a compost of loam, lime rubble, and a little bone-meal. The addition of peat or leaf-mould is by some considered necessary, but I am not greatly in favour of adding either material, especially if good fibrous loam is employed. The plants grow best in a light house, shading the glass a little during the hottest part of the day. Syringe the foliage when the weather is favourable, but let it be remembered that "Malmaison" Carnations do not require a great amount of moisture, especially during damp weather. Winter-blooming Carnations should be stopped to induce a bushy habit of growth, and if the plants are grown in sufficient quantities, they should be arranged in two batches, the one batch being stopped the last time about the end of this month, and the other, say, three or four weeks later. This practice will ensure a good succession of flowers during the winter and spring.

FRUITS UNDER GLASS.

By E. Harriss, Fruit Foreman, The Royal Gardens, Windsor.

Tomatos.—Plants which are fruiting in pots will require an abundance of moisture at the roots, also plenty of stimulants, and further top-dressings if there is room for them. Should white fly become troublesome, remove all the fruits which are colouring and fumigate the plants with a nicotine compound. Sow seeds for raising a batch of plants for furnishing fruits during late autumn and winter. Sow the seeds thinly in pans and germinate them in gentle heat. When the seedlings are well above the soil, place them on a shelf near to the glass in a light, airy house. When large enough, pot the seedlings into 3-inch pots, and keep them growing near to the roof glass. For the first few days the atmosphere should be kept rather close and moist. When the plants have filled the pots with roots, shift them into 6-inch pots, using a compost consisting chiefly of loam mixed with a little manure from a spent Mushroom bed and a sprinkling of crushed mortar rubble. Make the soil firm, or the plants will produce soft, long-jointed growth.

Cucumbers.—At this time of the year the growths of Cucumbers require to be thinned and regulated frequently, otherwise they will quickly become a tangled mass of weak, useless shoots. To keep the plants in a steady fruit-bearing condition, the growths should be stopped and regulated about every 10 days. Do not allow more fruits to develop than are required to meet the demands of the establishment. Cut the fruits when they are a medium size, and, if not required for immediate use, place them in a cool cellar, where they will keep in a good condition for several days. Apply to the surface of the beds frequent small top-dressings of loam and leaf-mould or well-decomposed horse-manure. Plants in full bearing must be given plenty of stimulants; liquid manure from the farmyard, alternated with a sprinkling of fertiliser, will be suitable. Except during cold or wet weather, fire-heat may be dispensed with at this time of the year. When artificial warmth is necessary, be careful not to heat the pipes to excess, as this is very injurious to the plants, and will often cause red spider to appear on the leaves. Syringe the foliage twice daily, and, during hot weather, promote a moist atmosphere by damping the paths and walls of the house several times daily. An occasional syringing with an insecticide will keep the foliage free from insect pests. Another batch of plants should be raised for autumn fruiting.

Cucumber in Unheated Frames.—Cucumbers planted in cold frames will need careful attention in regard to ventilation; during unfavourable seasons it is impossible to be successful with this method of growing Cucumbers, unless the frames are ventilated intelligently. When the plants are in full bearing, give them the same liberal treatment as advised above. Keep the growths well thinned and regularly stopped, and remove old leaves when they are turning yellow. An occasional fumigation with a nicotine compound will keep the plants free from aphis.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Blackberries.—Such varieties of Blackberry as Rubus laciniatus, Wilson Junior, and the Mahdi may always be depended upon to produce good crops of fruit, and might be more often used, with profit, for covering unsightly fences, &c. The old growths should be removed as soon as they are cleared of fruit, and the young canes trained in their places. Apply liberal mulches of manure, especially to plants growing near to walls or other dry places. Even the common wild Blackberry is worthy a place in any garden, and, when well grown, produces fruits superior in flavour to the named varieties. They should be protected from the birds.

Stone Fruits.—As soon as Peaches, Nectarines, and Apricots have finished stoning, the fruits should be thinned finally. Apricots are an uncertain crop, and when a good set is obtained it is a temptation to allow the trees to carry too many fruits. But over-cropping exhausts the trees, so that they require at least a season to recover from the effects. At the commencement of thinning, remove all badly-placed fruits and those that are in contact with the wall or wires, leaving the fruits rather closer together than is recommended for Peaches. In the case of varieties such as Large Early, it always pays to liberally thin the fruits, which, given good cultivation, are almost as large as a Peach. The rains have thoroughly soaked the borders, and water is not necessary, unless the trees are protected by fixed copings. Examine the trees at short intervals while the fruits are swelling to see that the latter are not spoiled by being crushed against the wall, but do not expose the fruits. Apricots develop better when they are slightly shaded with the foliage. Syringe the trees frequently, as recommended in a previous calendar. Pinch and repinch them as it becomes necessary, it being important that the spurs and all shoots should be fully exposed to sunlight and air. Peaches and Nectarines require to be well thinned, removing first those that are not well placed. These fruits, unlike the Apricot, require to be fully exposed to the sun, and the crop should be distributed over the tree as evenly as possible. One Peach fruit to each square foot of surface is a heavy crop even for the most healthy specimens, and the trees should not carry more than this on the average when the stoning is finished. The remarks on watering Apricots apply to Peaches. Trees that are heavily cropped should be assisted by an occasional sprinkling of some artificial manure, just before rain falls. Examine the trees frequently, and keep the laterals persistently pinched, pushing the foliage on one side, or removing a leaf here and there to expose the fruits.

Pears.—There appears to be a good average crop of Pears this season, and the trees are looking fresh and healthy. Large trees which have filled their allotted space should be kept closely pinched, whilst young trees having further space to furnish must be allowed to extend. In some few cases even young trees may require strong shoots to be stopped in order to preserve a proper balance of the specimen. Thin the fruits where they are too numerous, those of the largest varieties most freely, as was recommended in the calendar for June 29.

Morello Cherries.—The trees of Morello Cherries may be pruned, and those who wish may tie in the shoots, but nothing is gained by tightly tying in young branches. The trees produce the finest fruits when the young growths are allowed to extend freely. Protect the fruits from birds before they change colour.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Epidendrum.—Most of the Epidendrums have but little garden value, but certain species are well worthy of cultivation. One of the most useful and decorative is E. prismatocarpum. As plants of this species pass out of flower, they should be given attention at the roots. The most suitable receptacles to grow them in are pots or deep pans. Specimens that are pot-bound, and, having grown over the sides of their pots, are somewhat bare in the centre, should be turned out of their receptacles, and have most of the back pseudo-bulbs removed, leaving only two or three behind each lead. They should then be repotted, placing them so that the growths point to the centre. Any plants that are well furnished with leaves and are in a healthy condition at the roots may be shifted into larger receptacles. Those that have sufficient root space for another season's growth and with compost in a good condition, should have some of the old materials removed from the surface, and a top-dressing afforded them. After repotting, the plants should be watered with care, not letting moisture settle in the centre of the new growths, as it would cause them to decay at the base. When the roots have grown well in the new compost, they should be afforded water liberally until the pseudo-bulbs have completed their growth. The plants grow well in the coolest and lightest part of the Cattleya house, and should be treated the same as for Cattleyas.

Epidendrum bicornutum (syn. Diacrum bicornutum).—Plants of Epidendrum bicornutum and its many hybrids are difficult to cultivate for many years in succession. At the present time, just before the new growths develop roots from their bases, they should, if necessary, be repotted. Shallow pans are the most suitable receptacles in which to grow this species, and they should be well drained, as during the plant season of growth liberal supplies of water are needed; later, when the pseudo-bulbs are fully developed, the amount of moisture should be diminished gradually until, during the resting season, a very small quantity is required. The plants should be suspended or staged near to the roof-glass in the warmest Orchid house, or in an ordinary plant stove.

Epidendrum vitellinum majus.—The winter-flowering variety of this bright, coolhouse Orchid should be repotted or resurfaced when new growth commences. Employ shallow pans provided with ample drainage and either suspend or stand the plants on a stage near to the roof-glass in a light, airy part of the Odontoglossum

house. Afford water sparingly during the early stages of growth, but when root action is most vigorous, give liberal supplies of moisture until the pseudo-bulbs are completed. During the resting season afford only sufficient water to keep the growths firm.

Sobralia.—Plants of S. macrantha, S. xantholeuca and its variety concolor; S. Lucasiana and the hybrids S. Amesiana, S. Veitchii, S. Wiganæ and S. Colmanæ will need repotting directly they pass out of flower. The pots or pans should be well drained, and the compost should consist of two parts good fibrous loam (broken up rather roughly and with all the small portions removed), and one part A1 fibre or Osmunda fibre with a quantity of crushed crocks and silver sand added. Pot moderately firm, and when the work is finished let the base of the plant be a little below the rim of the pot. These are rich-feeding, strong-rooted plants, therefore they should be allowed ample pot room. Newly-potted plants should be watered carefully until the roots have grown well into the compost. Sobralias should be grown in a moist position in a house having an intermediate temperature. Being subject to attacks of red spider, they should be syringed freely on all favourable occasions, taking care to wet the undersides of the leaves. The foliage should also be sponged occasionally with a suitable insecticide.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Romneya Coulteri.—The Californian Tree Poppy is an exquisite plant when seen at its best, and no pains should be spared to grow it well. The species thrives best in a warm, sheltered situation. The shoots should be cut down to the ground before very cold weather sets in, and the plants given a good mulch of manure. This will serve the double purpose of protecting them from frost and supplying extra food to the roots, resulting in strong shoots that will flower next season over an extended period, especially if the plants are assisted by copious waterings during times of drought.

Escallonia langleyensis (see figs. in *Gardeners' Chronicle*, July 10, 1897, fig. 4; and July 2, 1898, fig. 4).—This beautiful evergreen shrub does not appear to be so widely known as its merits deserve. It was raised by Messrs. Veitch about 15 years ago, and is perfectly hardy. The growth is of a semi-scandent habit, and the flowers show to great advantage. The petals are of a bright rosy-carmine shade, the blossoms being produced in hundreds, on branchlets of the previous year's growth. The hybrid is a quick grower, and with good cultivation small plants soon grow into fine specimens. The long, slender shoots grow pendulous as they become older. Even when not in bloom the graceful shoots, furnished with small, oval, evergreen leaves, are ornamental. I strongly recommend the plant to those who do not already possess it. E. exoniensis is another choice variety, with creamy-pink flowers, and makes a suitable companion to E. langleyensis.

Herbaceous Phlox.—See that the growths of Phlox decussata are supported whenever necessary, remembering that shoots of the most sturdy-growing varieties are liable to become broken at the base in windy weather. Border Phloxes require a very liberal treatment, and though established clumps do well in the mixed border, their requirements can be better supplied when grown in separate beds and borders. Keep the ground well hoed, and, as drought is very detrimental to them, a mulch should be applied immediately after a heavy rainfall or the roots have been well watered. During dry weather the plants should be watered copiously.

Pansies and Violas.—The old blossoms and seed-pods should be removed from Pansies and Violas regularly, in order to prolong their flowering. Neglect of this will soon cause a total cessation of blooming, and the plants will appear starved and untidy. On thin, hot soils, they are very apt to become exhausted, and should be afforded a light top-dressing consisting of a little artificial manure with some sifted leaf-mould or other light soil. The top-dressing should be applied during dull, showery weather if possible. This will be of great assistance in keeping the plants in good health, and it will improve the quality of the blooms to a surprising degree. During times of drought they should receive copious waterings, especially if the soil is hot and gravelly. Both Pansies and Violas delight in a cool, rich rooting medium and partial shade during the middle of the day.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

The Season.—At the time of writing the weather is dull and, for the time of year, cold. The crops generally are clean in growth, but maincrop Onions, Beans, and many other vegetables require more seasonable conditions, need more sunshine, although the dull weather has suited recently-planted winter greens, and has saved a considerable amount of labour in watering.

Chicory.—Ply the Dutch hoe between the rows of Chicory, and if the plants of the earliest sowing have not been finally thinned attend to this at once, allowing the plants a distance of from 9 inches to 1 foot apart. Should the crop have failed through any cause, or it is thought insufficient to meet the requirements of the establishment during the winter, a sowing may be made at once as recommended for the earlier planting. Choose an open site, and if encouraged to grow quickly the plants will prove of value for late supplies.

Cucumbers.—Where plants have been in bearing for several weeks it will be advisable to make another sowing of suitable varieties for succession, and to supply a good crop of Cucumbers during the autumn months. Sow the seed thinly in the same way as advised for the earlier sowings, and raise them in a warm house. Place the young plants near to the roof-glass as soon as they appear. Plants in full bearing must be syringed regularly, and the growths stopped and regulated, removing the oldest leaves. Top-dressings of suitable materials should be afforded at intervals—just a covering only to keep the rootlets active. When water is needed thoroughly soak the roots and apply stimulants alternately with the water, using liquid manure and fertilisers. Damp the paths late in the evening, and should red spider be present on the leaves syringe the underside of the foliage just before closing time with tepid, soft water.

Globe Artichokes.—As the flower-heads become large enough for use cut them with a fair length of stem, and place the stalks in water until sufficient are secured for a dish. In this way they may be kept fresh for a fortnight. Every encouragement must be given the plants to bear freely. Give them an abundance of water and plenty of manurial assistance. Even in showery weather water is essential, as the foliage prevents a great deal of the rain from reaching the roots.

Celery.—Continue to plant out the latest batches of Celery if possible before the plants become starved or drawn. Care should be exercised in lifting, preserving as much of the soil as possible about the roots, as this precaution will do much to lessen the check to the plants and hasten their recovery. Remove decayed leaves, and guard against the Celery maggot, removing any leaves that are infested with the pest. For this planting double rows are preferable, therefore the trenches should be made wide. It is a good plan, especially when the weather is warm, to form the trench or trenches between rows of Early Peas, as the latter afford shade to the Celery for a week or so after planting. Dust growing plants of the earlier batches with soot at intervals, and remove side growths and split leaves.

Lettuce.—The rains have suited this crop. Make small sowings wherever sufficient space is available in shallow drills, and thin the seedlings as soon as they are large enough, transplanting the thinnings. For summer use the varieties Superb White and Mammoth White Cos may be selected.

Mushrooms.—For the next two months it is a difficult matter to maintain a supply of Mushrooms, excepting where a very cool structure is available. Failing that, beds may be formed in a cool, shady position out-of-doors. The Mushroom house should be kept well damped, and the walls syringed with cold water as often as is necessary to promote moist conditions. Slugs are very troublesome at this season, and means must be taken to destroy them. Beds that pass out of bearing should be removed and fresh beds prepared.

THE APIARY.

By Chloris.

Bees and Water.—During dry weather it is very necessary, where streams do not exist, to provide water for the bees if brood raising is to be carried on at the rate necessary to keep the stocks sufficiently strong to yield a good harvest. Add a teaspoonful of salt to each pint of water, placing the water in any vessel that prevents all danger of bees being drowned. If an open vessel is used, put some corks in the water or large stones, so that the bees may have plenty of foothold. A barrel with a very small hole bored in its lower edge, from which a small quantity of water can drip, makes an excellent supply if allowed to fall on a sloping board.

Swarming.—At this time of the year bee-keepers are often very busy, and are all the time anxious to increase their stocks by swarming, but the method is so uncertain that much time is lost in watching and waiting for the swarm to emerge, because bees are often prevented from swarming by reason of our uncertain climate. Much time and worry may be saved by artificially swarming the bees, and a few rules are only needed for the guidance of those who wish to do it successfully. When a colony is very strong and crowded with bees, and honey is coming in plentifully, then the bees may be swarmed on any fine day that is convenient.

To Make Three Colonies from Two.—Where a small increase of stock is desired, it may only be necessary to form three colonies from two. Choose a bright day, and at noon, when most of the bees are out foraging, remove six frames from a very strong hive, brushing off all the bees; crowd together in the centre the combs remaining, and fill in the empty spaces on each side with frames containing full sheets of wired foundation. Take the six frames of brood and eggs and place them in a new hive, putting it on the stand where another strong colony has worked, giving this second a new stand. The flying bees will be sufficient to people the new hive, and will set to work to raise a new queen from the eggs in the frames supplied. Put no new frames in this hive, but shut off the empty space by means of the dummy. Much time may be saved if a ripe queen cell can be added, or, better still, a fertile queen may be caged on one of the frames for 36 to 48 hours before being liberated, and then add a frame containing a full sheet of foundation each week until all the space is filled. Where a number of strong colonies exist, say five, then from each of four take two frames of brood and eggs from the centre of the brood nest, brushing off all bees, then on the site of the fifth place a new hive, and in this put the eight frames taken, allowing the flying bees of the fifth to supply bees to raise a new queen as before, while the fifth occupies a new site. Supply each of the four hives with two new frames of wired foundation, which may be placed in the centre of the brood chamber, and this will probably prevent swarms issuing from the colonies so treated. In this case, if a laying queen can be caged as before, much valuable time may be saved; failing this, a ripe queen cell may be placed in a hole in the centre comb, fixed in by the aid of pins. In cutting and handling ripe queen cells, always take great care not to cause unnecessary jarring, or the occupants will be killed. When it is desired to make one colony into two, take the comb in which the queen is found, place a new hive on the site of the old, and put the comb, bees and queen in the centre of the hive, filling in with frames of full sheets of foundation, and these, with flying bees, will form the new colony or swarm. Those in the old hive, removed to a new position, with the frames closed up and an empty comb placed on the outside, will raise another queen and form an excellent colony for next year. Of course, time can be again saved and honey stored if a young queen can be added at once.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 16—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by M. E. A. Bunyard on "The Flowers of Apples and Their Aid in Identifying Varieties.") Southampton Royal Hort. Soc. Jubilee Sh. (2 days). Brighton and Sussex Hort. Soc. Rose and Violet Pea Sh. (2 days).

WEDNESDAY, JULY 17—
Bishop's Stortford Fl. Sh. Cardiff and County Hort. Soc. Sh. (2 days). Caterham Hort. Sh. Tooting, Balham, Merton and Mitcham Hort. Soc. Sh. Sussex County Agric. Sh. (2 days). Saltaire, Shipley, and Dist. Rose Sh.

THURSDAY, JULY 18—
Horticultural Club, annual Summer Outing. Dunfermline Fl. Sh. (2 days). Deal, Walmer, and Dist. Hort. Soc. Ann. Sh.

FRIDAY, JULY 19—
Nat. Rose Soc. Sh. at Belfast. Birmingham Hort. Sh. 2 days).

SATURDAY, JULY 20—
Royal Bucks Sweet Pea and Hort. Soc. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—63°.

ACTUAL TEMPERATURES:—

PROVINCES.—*Wednesday, July 10:* Max. 63° Cambridge; Min. 58° Ireland, S.W.

Eel-worms. The gall-like malformations which are set up in the roots of plants by the eel-worm (Heterodera radicicola) are, unfortunately, only too familiar to gardeners, though it is to be doubted whether even they all realize the enormous extent of damage that is to be attributed year in year out to the activities of this pest.

When an outbreak of eel-worm manifests itself in a crop of Melons, the gardener realises to his cost the loss which he suffers; but in cases of less severe attacks, undergone by plants out-of-doors, the agent is apt to pass unnoticed, and the partial failure of the crop is attributed often to poor soil or to some other adverse cultural condition. Eel-worm disease, which was described first in the pages of the *Gardeners' Chronicle* by Berkeley in 1855, has been with us so long, the disease affects so many different crops, and its results are so disastrous that it is high time that a comprehensive investigation into the methods of prevention was undertaken in this country. Pending such an investigation, we may profit by the information which is forthcoming as the result of researches made in other countries, and in particular we may call attention to the excellent work of Professor Bessey,* of Michigan Agricultural College, on the distribution, life-history and modes of destruction of this pest.

Although the eel-worm (Heterodera radicicola) is now widely distributed throughout the world, there is some reason to believe, as Professor Bessey points out, that it was introduced to Europe and America from tropical countries, and that the general trade in tropical plants, which sprang up about a hundred years ago, was the cause of the extensive introduction of the pest into various European countries. It is significant, in this connection, that the pest originally discovered by Berkeley was found in the roots of greenhouse plants.

If the eel-worm is a comparatively newcomer, it has certainly made the most of its time, for according to Professor Bessey it is now at home in the roots of between 450 and 500 different species of plants. Of these susceptible species, nearly 100 suffer very severely indeed when eel-worms gain access to their roots; upwards of 100 plants serve as fertile breeding grounds for the pest, but do not appear to suffer markedly, and the remainder of the susceptible plants make light of the attack.

The first category includes many plants—florists' plants, fruit and other trees, and vegetables—which are in common cultivation. Among those plants which suffer severely from attack by eel-worm the following may be mentioned:—

Flowering and ornamental plants: Amaranthus tricolor, Musa, Antirrhinum, Carnation, Chrysanthemum, Centaurea, Deutzia crenata, Eschscholtzia californica, Gardenia jasminoides, Hibiscus Sabdariffa, Hollyhock, Ipomœa purpurea, Lobelia erinus, Passiflora, Pæony, Petunia, Sweet Pea, Stock, Nicotiana, Thunbergia fragrans, Tuberose, Violet and the Yellow Lupin.

Of the fruit and other trees, those which are most badly affected when attacked by eel-worm include Cherry, Elm, Fig, Grape, Peach; and among vegetables those which suffer in a marked manner include Beet, Salsify, Carrot, Celery, Cucumber, Egg plant, Endive, Lentil, Lettuce, Melon, Potato, and Tomato. Red and White Clover, Rape and Bitter Vetch are also highly susceptible.

A point well worth notice is that, whereas few, if any, of our common weeds are among the plants which are apt to be destroyed by eel-worm, not a few are of the second category; that is, are aiders and abettors of eel-worm, acting as "nurse-plants" to the pest. In such weeds the eel-worm increases and multiplies, passes out into and spreads through the soil, and so is prepared to attack any susceptible plants that may be grown on the infected land. The moral is obvious, and the clean cultivator perceives an added reason for the success which attends his unceasing war on weeds.

The list of immune plants is, unfortunately, as short as that of the susceptible plants is long. Among the commoner plants which appear to resist the attack of the nematode are some varieties of Oats and Barley, Maize, Solidago, Zinnia, and certain grasses, such as Timothy—a list, be it noted, of poor comfort to the grower who is seeking for a worm-proof plant to grow on his infected soil.

Into the life-history of Heterodera radicicola we need not go at any length, although the habit of the worm in taking up, as its first position in the plant, a station just beyond the growing point of the root, near the cells along which food substances are passing, must excite our admiration, if not our applause.

The larva, which hatches from an egg, is 1-50th of an inch (or less) in length, of cylindrical shape, with tapering ends. The female matures rapidly, and the first crop of eggs is produced within about 20-30 days of the entrance of the larva into the root.

The root is stimulated to excessive growth by the presence of the eel-worm, and hence the gall-like malformations which so often serve to indicate the presence of the pest. Unfortunately galls are produced only after infection has been established for some time, and hence microscopic examination is necessary for the detection of the early stages of the disease.

The natural rate of spread of eel-worms in soil is slow; but, of course, there are many means by which they may be carried and disseminated. Chief of these means are the planting of diseased stock, for instance Potato tubers and cuttings from diseased plants, the spreading of infected soil from greenhouses and frames on the open ground, and the dissemination of the eggs of the pest during horticultural operations, such as digging and watering.

It is noteworthy that the eel-worm has a marked preference for light soils, and according to Professor Bessey, it is found but rarely on clays. Manuring with potash manures has, at all events in many instances, a detrimental effect on eel-worm, and hence potash manures should be tried in the garden when the soil is known to harbour the pest. In spite of their ubiquity, eel-worms are not very resistent to unfavourable conditions. Drought reduces their numbers in the soil, and so also does excessive moisture. Hence, eel-worm-infested soil, which has been removed from a house, should, if no more effectual means of sterilisation are available, be spread in a thin layer on boards, and left to the weather during the winter before it is again used.

As to the best means of exterminating eel-worm, there is a choice of methods, though none may be regarded as ideal. First, the worms may be starved by fallowing the land for two years and keeping it free from weeds. Second, they may be killed by chemicals. Of chemicals, carbon-bisulphide is perhaps the most efficient, but it is expensive. In spite of the high price its use is favoured by French cultivators, who employ a specially-designed apparatus for bringing the carbon-bisulphide into contact with the soil. Unfortunately, eel-worms can exist several feet below the surface, and it is difficult to destroy them.

In greenhouses, the general method is to turn out the soil; but soil sterilisation

* *Bulletin* No. 217, Bureau of Plant Industry, U.S. Dept. of Agriculture.

presents a more profitable alternative. A suitable system of perforated pipes, about 12 inches apart, connected with a boiler generating steam under pressure, has often proved valuable. Potatos are buried in the soil, and steam is passed through it till the tubers are found on examination to be cooked.

Instead of heat, formaldehyde may be used. One part commercial formalin in 100 parts of water is applied at the rate of 1-1½ gallon per square yard of shallow soil. Formaldehyde has also been used in the open, and—so it is claimed—with success.

Undoubtedly the most promising measure is a preventive measure; to wit, the breeding of "eel-proof" varieties.

Fig. 16.—Effect of eel-worms in roots of melon plants.

This has been done in the case of the Cow Pea and Water Melon with striking success, and there would appear to be no reason why it should not be accomplished in the case of other crops.

Horticultural College, Swanley, Kent.—On Tuesday next, the 16th inst., Mrs. Runciman will present the prizes to the students at the Swanley Horticultural College. The meeting will take place at 4 p.m., and the Hon. Sir John Cockburn, K.C.M.G., will preside.

Begonias at Holland House Show.—In addition to the collections of tuberous-rooted Begonias noticed in our report of the Holland House Show, a fine exhibit of these flowers was made by Messrs. T. S. Ware, Ltd., Feltham.

Horticultural Club.—The annual outing of the Horticultural Club will take place on Thursday, the 18th inst. Members and friends will meet at Paddington Station (G.W.R.) and proceed by the 10.40 a.m. train, in saloon carriages, to Slough Station. Conveyances will be in readiness at Slough to carry the party to Burnham Beeches, calling on the way to see Stoke Poges Church. After luncheon at the Beeches, the party will drive to Cliveden and make a tour of the gardens, by the kind permission of W. W. Astor, Esq. Afterwards East Burnham Park will be visited, where Sir Harry and Lady Veitch will entertain the party to tea. Members are asked to write direct to the Hon. Treasurer, Sir Harry Veitch, East Burnham Park, Slough, not later than the 13th inst., intimating how many tickets they require. The following have been elected members of the Club since March 1, when the last list was printed:—Messrs. Harold Beale. Gilbert Beale, Arthur Bullock, George A. Bunting, Herbert F. Cheese, William H. Dunnett, Reginal Farrer, B. Mayo Haynes, Thomas Humphreys, Hugh Lewis, William H. Morter, Victor J. Neal, Leopold Salomons, Hermann Spooner, W. J. Stevens, David Swain, Charles H. Tandevin, Hugh V. Warrender, John G. Weston, E. T. Willis, and Henry Stephenson Yates. *R. Hooper Pearson, Hon. Sec.*

Mr. Edward Harriss, the present writer of our weekly articles on the cultivation of fruits under glass, will leave the Royal Gardens, Frogmore, on the 27th inst. to take up his duties at Lockinge, where he will succeed the late Mr. Fyfe as gardener to Lady Wantage. The many friends of Mr. Harriss will wish him well in his new sphere of labour.

Southampton Royal Horticultural Society.—The Jubilee Show of this society will be held at the County Ground, Southampton, on Tuesday and Wednesday, the 16th and 17th inst. The prizes offered are valued at nearly £250, and include a Rose trophy, silver cups, and medals. There are classes for Carnations, Sweet Peas, miscellaneous plants, cut flowers, fruit and vegetables. Particulars of the show may be obtained from the secretary, Mr. C. S. Fuidge.

Presentation to a Gardener.—Mr. J. J. Teasdale, gardener for the past seven years at Milton Hill, Steventon, Berkshire, and for four years hon. secretary of the local flower show, has received a presentation from the Committee on the occasion of his leaving the neighbourhood.

Mr. Alexander Dean, V.M.H.—Miss E. M. Dean writes that her father wishes to thank his many friends, especially his colleagues of the R.H.S. Fruit and Vegetable Committee, for the kind enquiries during his illness. Mr. Dean is suffering no appreciable pain, other than that which arises from bed weariness. He gets no relief from the prostrate position other than sitting up for an hour when his strength will allow. Excessive debility makes him quite unable to talk with friends.

Nursery Employés Outing.—The annual outing of the members of the recreation club of Messrs. James Backhouse & Son, Ltd., York, took place on the 29th ult., when a visit was made to Edinburgh. After breakfast, the party visited the castle and Holyrood Palace, and later in the day the Forth Bridge. Many took advantage of the opportunity to return by steamer to Leith, thence by tram to Edinburgh for tea, after which a few of the party journeyed to Glasgow for the evening. Others went to Leith, Portobello, and other places in the vicinity.

Rose Miss Flora Mitten.—We have received flowering sprays of a very charming Rose from Mr. H. Elliott, Hassocks, who very kindly furnishes the following particulars:—The plants are 8 to 10 feet high, and covered with large sprays of bright pink, single blooms, which are 3 inches across. The variety is a very strong grower, making shoots from 15 to 20 feet long, and it is hardy in any situation. This variety was raised by the late Mr. William Mitten, a well-known botanist. One of the parents is supposed to have been Rosa Brunoni. It is preeminently a Rose for the open garden, being less satisfactory when grown in pots, as it requires plenty of root room.

Potato Diseases.—We are requested by the Board of Agriculture and Fisheries to inform Potato growers that a case of wart disease of Potatos (Synchitrium endobioticum) has occurred in Cheshire, and to remind them that all cases of this disease must be reported to the police or other officers appointed by the local authority for the purpose. Notifications may be sent to the Board, who will forward them to the proper quarter. The Board desire also to warn Potato growers that in view of the rainfall of the past month, the Potato disease caused by Phytophthora infestans may be expected before long to attack the Potato crop, and they recommend that crops should be sprayed with the Bordeaux mixture at once. This disease is not required to be notified. Leaflets as to both the above-named diseases may be obtained free of all cost on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. Letters so addressed need not be stamped.

Flowers in Season.—Messrs. Kelway & Son, Langport, Somerset, have sent for our inspection several spikes of Delphiniums. They represent distinct shades of colour, the blues being especially beautiful.

The Wages of L.C.C. Gardeners.—The proposals of the Parks Committee of the London County Council for improving the conditions of the gardeners employed by that committee, which were described in our issue of June 22 last, were discussed at a meeting of the Council on July 2. Mr. Jesson, a Labour Member, moved an amendment instructing the Parks Committee to submit forthwith supplementary proposals providing by means of special service allowance or otherwise that all employés in the parks' service, who have served over two years and are in receipt of less than 30s. a week, shall receive an immediate increase of one shilling a week, rising by yearly increments of one shilling to 30s. a week; and that all employés at present receiving between 30s. and 35s. a week shall be granted, on similar conditions, increases of wages equal in amount to those specified for employés at present in receipt of less than 30s. a week. Mr. Lorden, chairman of the Parks Committee, stated that the committee's proposal would mean an immediate rise of two shillings a week for 58 per cent. of the men. The amendment was rejected by 56 votes to 45, and the committee's scheme was agreed to.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

A National Institute of Gardeners.—Will you allow me to advise your correspondent (see p. 430) that if he will use his influence to persuade gardeners to join the "British Gardeners' Association," he will be doing his best to obtain what he believes they require, and to advance horticulture by ensuring that employers will be able to get capable men to fill their situations? I do not see how gardeners can improve their conditions if we have associations, institutes, and other concerns all running in opposition to one another; better there be one strong association with all gardeners joined together, pulling the same way. As the B.G.A. is already organised to obtain for the gardener that which is so necessary for his well-being, every gardener should endeavour to increase its membership, so that it can be made "progressive but not aggressive." *E. H. Chitty.*

———If I read your correspondent aright (see p. 430) he is desirous that an Institute shall supersede the British Gardeners' Association. Anyhow, the assertion he has made to the effect that the existing association has failed to rope in a large percentage of head gardeners throughout the country is true, and the same applies to the absence of sympathy on the part of employers. There is, however, nothing to prevent a change of title from B.G.A. to N.U.G., and, provided an institute was established on the right lines, nothing but good would follow the change. What I feel in the matter is that present-day gardeners are up-to-date from a practical and cultural standpoint, but the majority are deficient in technical knowledge in other directions. Is it not a fact that employers are often obliged to call in a landscape gardener when new gardens or extensive additions are under consideration? Who will be bold enough to credit gardeners generally with a knowledge of mensuration, land-surveying and the principles which govern landscape gardening? It may be urged that the small wage gardeners command is hardly likely to act as an incentive to acquire such knowledge, but it should be remembered that its acquisition would do more to command respect and a status than everything else combined. The authorities should consider the suggestions offered by Mr. Divers (see p. 7), namely, to establish classes at convenient centres throughout the country to teach not practical gardening but the sciences which appertain to it. Granted this, head gardeners and superintendents of public parks should, both in season and out of season, impress upon their assistants the importance of acquiring a technical knowledge. It is a deplorable fact that gardeners are dubbed domestic servants by law. The B.G.A. intend to lodge an appeal at the earliest possible moment with a view to the removal of the slur. Signs are not wanting that horticulture and those who are engaged in it professionally are likely to receive a more full and generous recognition in the near future, and it is a good sign when prominent representatives like Sir Fred. Moore and Sir Harry Veitch are honoured with knighthood. It may be selfish to suggest that public gardeners should stand alone, but it is clear that they could demand their rights provided they were hedged with an Institute and a diploma. What are the conditions in public service to-day? Why in 95 cases out of 100 the surveyor is at the head of affairs, and can anything be more utterly farcical seeing that, as a class, the surveyors are ignorant of the work? The gardener has perforce to knuckle under and wait upon this official, whose legitimate duties are the maintenance of roads and sewers. It is true that many corporations, borough councils and even urban district councils have formed separate departments, and it is equally true that if a united effort were made, backed up by an Institute and possibly by the Royal Horticultural Society, public parks and gardens and municipal surveyors would soon know each other no more. We have witnessed other callings and professions, by co-operation and fixed determination, obtain recognition, and while we see the difficulties in our own path, the peculiar conditions and the prejudice, yet we know that something will have to be done whereby the status of gardeners will be raised. *Walter H. Aggett.*

———Throughout the English-speaking world there are signs of an awakening in regard to horticulture. The powers and the people are gradually realising the possibilities of horticulture as a means to reach the full life. In clubs, on the terrace, in councils and committees, the question of horticultural education is discussed. We are on the eve of great happenings. Are we ready to play our part? Mr. Weathers rightly says "the British Gardeners' Association is the only serious attempt made in recent years to weld gardeners together." Then he loses heart. The real reason why the B.G.A. is not 50,000 strong is because the aims and objects of the Association are not thoroughly understood. The new regime is out to perfect the organisation, and to assiduously push the cause of the B.G.A. in every possible quarter. Already steps are being taken to urge local authorities to provide facilities for classes for the benefit of professional gardeners. Another object in view is to obtain special travelling facilities to enable its members to visit shows and educational institutions. The quality of the work done depends entirely upon the amount of support given. New members are coming in weekly, and there are ample signs that in the near future the B.G.A. will be a power for good in the horticultural world. Honest employers have nothing to fear from this Association, for it is willing to co-operate in every possible manner for the advancement of gardening. The B.G.A. hopes to persuade city authorities to provide more parks, garden cities, and open spaces. We aim at organisation and inspiration. The co-operation of the whole profession is necessary. *Cyril Harding (Secretary British Gardeners' Association).*

Fig. 17.—Pergola at Nuneham Park.
(See p. 27a)

The Horticultural Department of the Board of Agriculture.—I read your leading article (see p. 428), and having had the opportunity of gathering some information bearing on this matter, perhaps you will allow me to point out one or two things. (1) Whether we agree with it or not, the fact remains that the English custom is to place a "layman" in as head of a Government Department. We have not yet reached the millennium when a Business Government will be the order of the day. (2) Another English tradition is that the Government is not "parental." It does not bring into being and nurse industries as do our Colonial Governments.

"Things" grow until such a time as they obtain general recognition, and consequently need Parliamentary administration. (3) Therefore I take it, from all I can gather, that the new Horticultural Department is to be an Administrative Department concerned specially with "plants" as distinct, so far as is possible, from "animals," but also acting as a registering and collecting agency. Plant pests and diseases will come naturally under its care—plant pests *including* definitely horticultural pests. (4) Let us suppose an "expert" practical horticulturist, although it would be difficult to find an all-round, first-class man, is officially appointed as head of the department. How long would such a man remain an "expert" in practical matters? Taking into consideration the progress being made daily in the experimental side of practical gardening, especially commercial horticulture, would not the desk-chair very soon put him out of sympathy with living progressive horticulture? Administrators are needed—men in touch with "traditions," men with a knowledge of present-day human activities, but also in "touch" with experts "in the field." This applies to admirals, bishops, and labour leaders, as well as to leaders in agricultural and horticultural affairs. (5) I conclude therefore, although I may be wrong, that it is useless for us to knock our heads against a brick wall. The new department is *not* to initiate, not even to nurse, but (a) to administer Acts of Parliament, (b) to receive and gather up information, and (c) to give official advice, utilising the services of "experts" all over the country. *J. B. H.*

ROSE-BUDDING.—At pp. 4 and 5 in the Ist issue, *Practice* gives the whole art of budding Roses with most excellent detail. On one point I should like to join issue with him. Why make the process unnecessarily difficult by recommending such an extraordinary length of bud? "Cut off the bark behind the bud, leaving about three-quarters of an inch on that side and 1 inch upon the other." This, including the short length occupied by the bud itself, would make the piece for insertion at least 2 inches. This is quite unnecessary; it would not matter much in budding dwarfs, but would be absolutely wrong with standards, as the object is to get the bud so close down to the main upright stock that, when the bud grows, it shall grow right over the top of the standard stock, which it would never do if it is budded an inch or more away from it. I have budded Roses with some success as an amateur now for more years than I care to remember, and my rule is to leave about *a quarter of an inch* behind the petiole, and about three-eighths or so in front of the bud. A slit in the bark then of about an inch and a half will be found ample for inserting the bud, instead of the 2½ inches advised. The shortening of the inserted bud means less disturbance of the stock, getting the bud into its proper place, especially in standards, and making everything much easier for the operator. *Robt. P. S.*

———The directions I gave were specially intended for the novice, and I purposely intended them to be as plain as possible for the beginner. The space occupied by the Rose-bud itself can scarcely be reckoned in addition to the lengths upon each side of it, and an inch and three-quarters is not much for an amateur to work upon. What can *Robt. P. S.* mean by "the object is to get the bud so close down to the main upright stock that, when the bud grows, it shall grow right over the top of the standard stock, which it would never do if it is budded an inch or more from it"? We cannot have any but the extreme top bud so close to the top as he apparently suggests, and then never right over. My advice was that 2½ inches was ample for the slit in the bark, and I doubt if many make less from point to point. At all events, the extra half-inch would be no impediment to healing if properly tied in, and would naturally assist in getting the Rose-bud into position by slipping it down. Nor is a quarter of an inch behind the bud enough to secure the seat or heel being sufficiently prominent to rest well upon the exposed wood as I suggested. *Practice.*

THE GOLDEN TULIP TREE.—I send you some flowers of the Golden Tulip Tree (Liriodendron tulipiferum marginatum) blooming for the first time here. I fancy the blooms are much more golden than the type, but have not the flowers of the old form for comparison. *George Paul, The Old Nurseries, Cheshunt.*

SOCIETIES.

ROYAL HORTICULTURAL.

HOLLAND HOUSE SHOW.

(Concluded from p. 17.)

IMPLEMENTS AND SUNDRIES.

Messrs. ROBERT SYDENHAM LIMITED, Tenby Street, Birmingham, filled a table with the "Sydenham Rural Table Decorations," in which Sweet Peas and Carnations were tastefully displayed

Messrs. T. CROWTHER & SON, 282, North End Road, Fulham, London, exhibited a valuable and interesting collection of old, iron garden gates; some of them of exquisite workmanship, and in splendid condition. Amongst an attractive set of sundials, the bronze dial of one which bore the "mottoe" "Amende to-day and slack not" was dated 1640, and looked it. Messrs. CROWTHER also exhibited magnificent stone garden seats, vases, and many desirable leaden vases.

THE LEYTON TIMBER CO., Trundleys Road, Deptford, built lightly-designed, but strong, pergolas, and rustic fencing made of Larch and Oak poles. The well-designed summer-houses were tiled with Oak shingles, which make a waterproof and lasting roof. At the ends of this exhibit the LEYTON CO. fixed lengths of Jarrah (Eucalyptus marginata) fencing. Although a trifle dearer than Oak the Jarrah lasts much longer, and is now used extensively by the great railway companies, who appreciate its value.

Messrs. CASTLES, Baltic Wharf, Millbank, Westminster, London, made their customary large display of Teak-wood garden furniture. Besides these well-made articles Messrs. CASTLES had on view immense figureheads from the old battleships H.M.S. "Formidable" and H.M.S. "Duke of Wellington," and a huge wooden steering-wheel.

Messrs. HARRY FREEMAN, LTD., Mulgrave Road, SUTTON, filled a large trellis-work enclosure with rustic summer-houses, chairs and tables treated with their preservative. The "Little Folks" miniature set of tables and chairs would be appreciated by many juvenile gardeners.

Messrs. LIBERTY & CO., Regent Street, London, arranged many dwarf Japanese trees around a central stand with Bamboo windscreens at right angles. In another place this firm displayed garden pottery in a variety of designs.

Messrs. GEO. TROLLOPE & SONS, West Halkin Street, Belgrave Square, London, fixed a fine old Venetian well-head in a setting of greenhouse Ferns, and partly surrounded by a few Roses and foliage plants.

THE POTTERS' ART GUILD, Compton, Guildford, showed a good selection of their garden pottery.

JEYES' horticultural washes and sprayers were attractively displayed. As is well known this firm manufactures excellent preparations for garden use as well as their noted disinfectant.

Messrs H. HARTGEN & CO., Noble House, Noble Street, London, demonstrated the value of the "Holder" pneumatic sprayers.

Messrs. E. A. WHITE, LTD., displayed their non-poisonous "Abol" insecticide, which is so useful for eradicating thrips, mildew, aphis, and other pests. An attendant illustrated the handiness of their garden syringe and sprayer.

Messrs. COOPER & NEPHEWS, Berkhamsted, exhibited various fungicides and plant foods, such as Apterite, V1 Fluid and V2 K Fluid.

Messrs. WAKELEY BROS. & CO., LTD., Honduras Wharf, Bankside, London, had samples of their Hop manure.

THE THREE C's. showed the Chase Continuous Cloche—a valuable article for advancing early vegetables, or for protecting tender Alpine plants.

THE FOLDING SPAN LIGHT CO., Slough, exhibited their useful little seed and plant protector.

THE ROYAL SOCIETY FOR THE PROTECTION OF BIRDS, 23, Queen Anne's Gate, London, showed some nesting boxes and feeding trays.

Preserved Roses and Red Carnations were shown by the PRESERVED ROSES CO., Bournemouth.

Miss HILDA SEWELL, 67, Harcourt Terrace, South Kensington, had a stand of jams and jellies.

Excellent flower baskets were shown from the MEATH HOME FOR EPILEPTICS, Godalming.

Mr. M. JOHNSTON, New Park, Cranleigh, Guildford, showed excellent samples of loam. Freshly cut turves of medium loam suitable for Carnations, heavier samples for Roses, and mature turves were all in view.

Mr. JAMES MACDONALD, Harpenden, Herts., laid out small turves of a great number of grasses suitable for making tennis lawns, golf greens, &c. The model croquet lawn of real grass, and the baize and similar materials on which grass seedlings were growing, formed interesting parts of this exhibit. The different species of grass so well shown had a great educational value.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 6.—The annual meeting was held on this date. The Rev. J. Crombleholme was re-appointed chairman; Mr. Z. A. Ward, vice-chairman; Mr. R. Ashworth, hon. treasurer; Mr. H. Thorp, hon. auditor; and Mr. H. Arthur, secretary. The committee was also elected. The prizes were presented to the successful exhibitors as follow:—

Robson's Gold Cup, presented by the Executors of the late Mr. John Robson, to W. R. LEE, Esq. (gr. Mr. Branch).

Silver Trophy, presented by Mr. W. R. Lee, to Z. A. WARD, Esq. (gr. Mr. Weatherby).

Gold Medal, presented by Mr. W. R. Lee, to J. MCCARTNEY, Esq. (gr. Mr. Holmes).

Gold Medal, presented by Messrs. J. Cypher & Sons, to Z. A. WARD, Esq.

Messrs. Sander & Sons' Prizes to Mr. LUPTON (gr. to Col. J. Rutherford, M.P.), and Mr. WEATHERBY (gr. to Z. A. Ward, Esq.), equal 1sts, and Mr. HOLMES (gr. to J. McCartney, Esq.), 3rd.

Mr. Ed. V. Low's Silver Vase, to J. J. HOLDEN, Esq. (gr. Mr. Johnson).

Messrs. Stuart Low & Co.'s Prizes to J. MCCARTNEY, Esq. (gr. Mr. Holmes).

The Society's Gold Medal (amateurs) to G. H. PEACE, Esq., Monton Grange (gr. Mr. Mace); Silver-gilt Medal to A. WARBURTON, Esq. (gr. Mr. Dalgleish); Gold Medal (for amateurs not employing a gardener) to W. J. HARGREAVES, Esq., Burnley; Silver-gilt Medal to F. A. HINDLEY, Esq., Bradford; Silver Medal to H. ARTHUR, Esq.

A Gold Medal (given by a member of the Society) was presented to the Rev. J. CROMBLEHOLME for his meritorious exhibits during the session.

SCOTTISH HORTICULTURAL.

JULY 2.—The monthly meeting of the above Association was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. MASSIE, the President, was in the chair, and there was an attendance of 90 members.

Miss BURTON, New Saughton Hall, Polton, read a paper on "Pelargoniums." After explaining that the so-called Geraniums used for bedding and other decorative purposes were really Pelargoniums derived from P. inquinans, P. zonale, and other species, most of which had been introduced from South Africa, Miss BURTON dealt with the uses of the plants of the various sections, with their cultivation, and the manner in which they should be employed with other plants in house and garden decoration.

The exhibits included a collection of Regal, zonal, sweet-scented, variegated, and other forms of bedding Pelargoniums from Messrs. DOBBIE & Co., Edinburgh (cultural certificate). A variegated variety named Show Queen was awarded a certificate of merit. A collection of Pelargoniums from Mr. R. MCANDIE, Inveresk Gate, Musselburgh, was awarded a cultural certificate, and a collection illustrating her paper was shown by Miss BURTON. Other exhibits included six seedling varieties of Delphiniums, from Mr. JOHN FRASER, The Old Manse Gardens, Inverkeithing (highly commended for strain); new sweet-scented Pæony, Wm. Mesman, from Messrs. DICKSON & Co., Edinburgh; a seeding from Viola Cornuta, shown by Mr. ANDREW OGG, Knockdolian, Ayrshire; six vases of Pinks, from Mr. C. COMFORT, Broomfield, Davidson's Mains; Carnation, showing reversion, from Mr. R. MCANDIE; and Culinary Peas in pots, showing good results of inoculation with bacteria after sterilisation of the soil, from Mr. GEO. P. BERRY, East of Scotland College of Agriculture.

At the meeting on August 6, a discussion will take place on the training and education of young gardeners.

REIGATE ROSE AND SWEET PEA.

JUNE 29.—The seventh annual exhibition of this Society was held in the Priory grounds, Reigate, the residence of Somers Somerset, Esq., on the foregoing date, and proved by far the finest of the series. A very high standard of excellence marked the exhibits in both the Rose and Sweet Pea sections, the classes being well filled and the competition keen.

ROSES.

In the classes open to nurserymen, Messrs. D. PRIOR & SON, Colchester, won the challenge cup offered for 48 blooms, distinct. Prominent in this collection were fine blooms of Mrs. Myles Kennedy, Leslie Holland, Cynthia, Gloire de Chedane Guinoisseau, Frau Karl Druschki, J. B. Clark, Mrs. Cocker, White Maman Cochet, Her Majesty, Comte de Raimbaud, and Horace Vernet. 2nd, BEN. R. CANT & SONS, Colchester.

In the class for 24 distinct varieties, Mr. HENRY DREW, Longworth, Berks., secured the premier award, with Mr. GEO. PRINCE, Longworth, 2nd, and Mr. ELISHA J. HICKS, Twyford, Berks., 3rd.

For 18 distinct varieties of Tea or Noisette Roses, Mr. DREW again excelled, having choice blooms of Mrs. Myles Kennedy, Molly Sharman Crawford, White Maman Cochet, Mrs. Foley Hobbs, and Mrs. Ed. Mawley. 2nd, Mr. GEO. PRINCE. 3rd, Messrs. D. PRIOR & SON.

For 12 bunches of garden Roses, distinct, Messrs. FRANK CANT & SONS won the 1st prize, which included a challenge cup, with fine blooms of Mrs. Herbert Stevens, Gardenia, Lady Hillingdon, Gruss an Teplitz, and Mrs. Alfred Tate; 2nd, Messrs. W. SPOONER & SON, Woking; 3rd, Messrs. GEO. JACKMAN & SON, Woking.

In the amateurs' classes, ALFRED TATE, Esq., secured the challenge cup offered for the best collection of 24 Roses, distinct, his best varieties being Avoca, Mildred Grant, White Maman Cochet, Mme. Mélanie Sonpert, Horace Vernet, and Yvonne Vacherot. The last-named was awarded the Silver Medal offered for the best bloom in the amateurs' classes. 2nd, Mr. E. M. EVERSFIELD.

For 18 distinct varieties, JOHN HART, Esq., was placed 1st; GEO. R. BONNER, Esq., 2nd; and F. SLAUGHTER, Esq., 3rd.

For 12 distinct varieties, open to growers of fewer than 1,000 plants, Mr. E. LEHMANN secured the challenge cup, Mrs. HENRY BALFOUR being placed 2nd, and C. DAVIES, Esq., 3rd.

SWEET PEAS.

In the open classes, F. A. WELLESLEY, Esq., won the challenge cup offered for 12 bunches, distinct varieties, showing beautiful sprays of Mrs. C. W. Breadmore, Thos. Stevenson, Freda Elsie Herbert, and Elfreda Pearson. 2nd, Sir RANDOLF BAKER Bart., Blandford (gr. Mr. A. E. Usher).

For six bunches, Sir RANDOLF BAKER led, followed by J. W. FRANKS, Esq.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to Mr. ELISHA J. HICKS, Hurst, Berkshire, for a collection of Roses, and Messrs. E. W. KING & SONS, Coggeshall, who displayed Sweet Peas.

Silver-gilt Medals were awarded to Messrs. DOBBIE & Co., Edinburgh and Mark's Tey, for Sweet Peas; Messrs. WELLS & Co., Merstham, for Carnations, Roses, and rock plants; and Messrs. BIDE & SON, Farnham, for Sweet Peas. A Silver Medal was awarded to Messrs. GEO. JACKMAN & SON, Woking, for Roses and hardy flowers.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.

AT a recent meeting of the above society, the schedule of the spring show for 1913 was approved. Several new classes have been added, notably for Calceolarias and herbaceous plants.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THIS society is now approved under the National Insurance Act. At the committee meeting held on Monday, the 8th inst., 82 new members were elected.

ROYAL AGRICULTURAL.

EXHIBITION AT DONCASTER.

JULY 3, 4, 5, 6.—The horticultural exhibits in connection with the show of the Royal Agricultural Society, held at Doncaster, on these dates, were staged in three large marquees. Exhibitors were at a disadvantage in getting their collections from the station to the show-ground, all the available horses being requisitioned for the return of cattle, sheep, and pigs, in conformity with the Government order that these animals could not remain at the show. Nevertheless, the staging was completed well up to time.

COMPETITIVE CLASSES.

There were four entries in the class for a group of miscellaneous plants in and ont of bloom, arranged on a space not exceeding 350 square feet. Messrs. JAMES CYPHER & SONS won the premier prize with an excellent group, having a background of lofty Palms and a series of arches furnished with well-grown plants. The foreground was occupied with bright, single-stemmed Codiæums (Crotons), interspersed with Carnations, Odontoglossums, Begonias, and other flowering plants. (Gold Medal.) 2nd, Mr. W. A. HOLMES, Chesterfield; 3rd, Mr. J. S. SHARP, Almondbury; 4th, Mr. W. VAUSE, Leamington.

Messrs. CYPHER & SONS were the only exhibitors in the class for a collection of Orchids arranged for effect, and were awarded the 1st prize.

For a group of tuberous-rooted Begonias, in pots, Messrs. BLACKMORE & LANGDON led easily with an admirable collection, in which the varieties Duchess of Cornwall and the Hon. John R. de C. Boscawen were especially fine. Lena, a bright-scarlet variety, of free flowering habit, was shown very effectively in baskets.

In a class for a display of hardy flowers, Messrs. HARKNESS & SON, Bedale, excelled with a collection of much merit splendidly arranged. The subjects included Delphiniums, with massive spikes, Gaillardias, Poppies, Irises, Lilium umbellatum erectum, and L. n. grandifolium. Messrs. W. ARTINDALE & SON, Sheffield, were placed 2nd for a good group, but it lacked lightness in arrangement.

Messrs. HARKNESS & SON led for a collection of cut hardy flowers, having fine masses of Papaver orientale Mrs. Perry, Gaillardias in variety, Irises, Liliums, and other seasonable species. 2nd, Messrs. W. ARTINDALE & SON.

In the class for a collection of stove and greenhouse plants, Messrs. JAMES CYPHER & SONS staged Statice profusa, Ixora Pilgrimii, Clerodendron Balfouri, Allamanda nobilis, and others, and were awarded the 1st prize.

The best collection of cut sprays of Carnations was shown by Mr. C. ENGELMANN, Saffron Walden, the varieties Lady Northcliffe, Triumph, and Sunstar being noteworthy.

The class for a collection of cut Roses brought a grand array, the prize-winners being Messrs. F. M. BRADLEY, Peterborough; Messrs. W. & J. BROWN, Peterborough; and Messrs. R. W. PROCTOR & SON, Chesterfield, in that order. The variety Edward Mawley and some of the single Roses were conspicuous in the premier collection.

Messrs. E. W. KING & Co., Coggeshall, were placed 1st for a collection of Sweet Peas, with arches, pillars, and vases containing strong, well-coloured spikes, artistically arranged.

FRUIT AND VEGETABLES.

For a collection of eight kinds of vegetables, the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), was the only competitor. The exhibit fully deserved the premier award that was given. Peas Centenary and Onion Sutton's Leviathan were extra fine.

The best decorative display of fruit, of 30 dishes, was shown by the Duke of PORTLAND, who showed splendid black and white Grapes, Brown Turkey Figs, Gros Mignonne and Dymond Peaches, Spencer and Kirk's Plums, Pineapple and Dryden Nectarines, Lady Sudeley Apple, and Waterloo Strawberries. The exhibit was pleasingly arranged with a background of Carnations and foliage plants. The same exhibitor was successful for four bunches of Grapes; two bunches of "Muscat" Grapes; two bunches of Black Hamburgh Grapes; two bunches of Madresfield Court Grapes; two dishes of Peaches, with fine fruits of Goshawk and Dymond; and two dishes of Nectarines, showing the variety Early Rivers.

For four dishes of Strawberries, CHARLES THELLUSSON, Esq., Doncaster, was placed 1st.

NON-COMPETITIVE EXHIBITS.

These were exceedingly numerous and formed the bulk of the show. Herbaceous Alpines and other cut flowers were staged by Messrs. S. BROADHEAD & SON, Huddersfield, in which Campanulas and water plants were effective. (Silver Medal.)

Messrs. SEAGRAVE & Co., Sheffield, had a fine collection of Violas, Delphiniums, and Pelargoniums. (Silver Medal.)

Messrs. KENT & BRYDON, Darlington, showed Delphiniums, Carnations, Liliums, and other flowers. (Silver-gilt Medal.)

Messrs. R. BATH, LTD., Wisbech, staged Delphiniums, Roses, and hardy cut flowers. (Silver-gilt Medal.)

Mr. W. SYDENHAM exhibited Delphiniums, Violas, and other hardy flowers. (Silver Medal.)

Mr. G. GIBSON showed a bank of Delphiniums, Gaillardias, Carnations, Papavers, and foliage plants.

Mr. W. J. GODFREY, Exmouth, showed border flowers and Canterbury Bells. (Silver Medal.)

Messrs. BAKERS, Wolverhampton, had a fine group of hardy flowers, Conifers, and Water Lilies. (Large Gold Medal.)

Messrs. DICKSON & ROBINSON, Manchester, showed a bold array of Delphiniums, Gaillardias, Irises, Rambler Roses, and an imposing bed of Ghent Azaleas. (Silver-gilt Medal.)

Messrs. W. & J. BROWN, Peterborough, exhibited Liliums, Gaillardias, and other seasonable garden flowers.

Messrs. JAMES BACKHOUSE & SON, LTD., built a rock-garden, making a pleasing display.

Mr. H. N. ELLISON, West Bromwich, showed a collection of small plants of various Cacti, staged against a background of Ferns. (Silver Medal.)

Messrs. SUTTON & SONS, Reading, contributed a group of their strain of Gloxinias, of which the varieties King George V and Duchess of York were good types; they also showed a fine batch of Nemesias, backed with Ferns, Palms, and other greenery. (Silver-gilt Medal.)

Mr. CHARLES THELLUSSON staged in good form Anthuriums, Dracænas, and Palms. (Gold Medal.)

Messrs. H. B. MAY & SONS, Upper Edmonton, contributed Ferns. Nephrolepis Marshallii compacta was especially good and plants of Ixora Williamsii were seen to advantage amongst the Ferns. (Gold Medal.)

Mr. C. J. BATCHELOR, Harrogate, also showed Ferns, including Nephrolepis Batchelori. (Silver Medal.)

The KING'S ACRE NURSERY Co., Hereford, showed fruit trees, including Figs, Peaches, Plums, Nectarines, and Apples. (Silver-gilt Medal.)

Messrs. JOHN WATERER & Co., Bagshot, made a fine display with Rhododendrons and Kalmias, relieved with standard Hollies, Bays, and other foliage plants. Gold Medal.)

Messrs. D. PENNELL & SON, Lincoln, had a good assortment of Ivies, Hydrangeas, trees, and shrubs, and a collection of Delphiniums, Roses, Carnations, and Irises.

Messrs. KENT & BRYDON, Darlington, staged Palms, Hydrangeas, Roses, &c. (Gold Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, had a pleasing collection of Orchids in good variety, also Souvenir de la Malmaison Carnations, of which the varieties Princess of Wales and The Colonel were excellent. Rayon d'Or Rose was also noticeable in their stand of Roses, which together formed an effective display. (Gold Medal.)

Mr. C. F. WATERS, Balcombe, set up Carnations, in which the variety Edith Waters was very fine. (Silver Medal.)

Messrs. YOUNG & Co., Cheltenham, had an excellent array of Carnations. Lady Henderson and Duchess of Devonshire were in good form. (Large Gold Medal.)

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), showed a fine table of vegetables. (Large Gold Medal.)

Messrs. TOOGOOD & SONS, Southampton, had a pleasing collection of vegetables, staged on freshly-grown grass. (Silver-gilt Medal.)

Mr. R. BOLTON, Warton, exhibited Sweet Peas, &c. Stirling Stent and Sunproof Crimson were fine in substance and colour. (Large Gold Medal.)

Miss HEMUS, Upton-on-Severn, showed Sweet Peas, also Petunia Paradise Blue, which should prove an acquisition. (Silver Medal.)

Mr. GEORGE MASSEY, Spalding, showed vegetables and hardy flowers. (Silver Medal).

Messrs. J. BURRELL & Co., Cambridge, also showed Roses, in which single varieties were well represented. (Silver Medal.)

Messrs. B. R. CANT & SONS, Colchester, had an imposing display of Roses, blooms of Juliet being prominent. (Silver Medal.)

Messrs. CLIBRANS, Altrincham, had lofty vases of well-known varieties of Roses. (Silver Medal.)

Messrs. W. & J. BROWN, Peterborough, also contributed Roses, including finely-coloured masses of the Lyon Rose.

Messrs. ALEX. DICKSON & SONS, Newtownards, had an extensive display of good Roses in vases and boxes. (Gold Medal.)

Mr. W. ARTINDALE showed Pansies and Violas in pots, making a very pleasing display.

Mr. CHARLES WARNER, Leicester, had a collection of hardy Fuchsias in variety. (Silver Medal.)

Messrs. WHITELEGG & PAGE showed their new fruit, the Newberry.

Messrs. JARMAN & Co., Chard, showed Centaureas in delicate shades of colouring. (Silver Medal.)

Mr. A. F. DUTTON, Iver, Buckinghamshire, exhibited Carnations (Gold Medal). Messrs. J. CYPHER & SONS, Cheltenham, displayed specimen flowering plants (Gold Medal). Messrs. HENRY MORSE & Co., Norwich, were awarded a Silver Medal for a floral group.

DURHAM, NORTHUMBERLAND, AND NEWCASTLE-ON-TYNE BOTANICAL AND HORTICULTURAL.

JULY 3, 4, 5.—The 88th annual show of the above society was held in the Recreation Grounds, Newcastle. The dates were earlier than usual, and this fact prevented many local exhibitors from putting in an appearance. The shows at Holland House and at Doncaster on the same day also had their effect. Exhibits of special merit were contributed by Messrs. SAMUEL FINNEY & Co., Newcastle-on-Tyne, who showed floral designs and decorative foliage and flowering plants; Messrs. HUGH DICKSON & Co., LTD., Belfast, who exhibited Roses; and Messrs. GIBSON & Co., Bedale, who showed border flowers and Sweet Peas.

The exhibits of fruit, and especially of Grapes, were much below the usual standard for these shows, the classes being poorly contested. The groups of miscellaneous plants were scarcely worthy of the important prizes offered for them.

Rain fell during the first day of the show, but the attendance was good, and on the subsequent days above the average.

Mr. H. H. HILLIER, Darlington, was placed 1st in the class for a group of miscellaneous plants arranged for effect, occupying 20 feet by 12 feet. Several fine Codiæums were included in the group, and at the back were coloured Acers. Roses and foliage plants, but the quality of the flowering plants was not equal to the usual standard of this firm. 2nd, Messrs. CARNEGIE & Co., Newcastle-on-Tyne; 3rd, Mr. T. WILKINSON, Newcastle-on-Tyne.

TRADE EXHIBITS.

Gold Medals were awarded to Messrs. G. FINNEY & Co., Granger Street, Newcastle, for floral designs; to Messrs. LAING & MATHER, Kelso, for a rockery, ornamental trees and border flowers; to Messrs. W. LAWRENSON & SONS, Newcastle-on-Tyne, for a rock-garden, &c.

Silver Medals were awarded to Mr. F. J. BELL, Whitley Bay, for an exhibit of Pansies, Violas and border flowers; and Messrs. ORD BROS., North Shields, for tuberous-rooted Begonias, Palms and decorative foliage and flowering plants.

NATIONAL SWEET PEA.

JULY 9, 10.—The twelfth exhibition of this Society was held on Tuesday and Wednesday last in the Royal Horticultural Hall, Vincent Square, Westminster. The show was one of the best of the series, but the new rule which reads "flowers with double standards will disqualify in all classes except those numbered 6, 9 and 12," caused endless trouble.

Exhibitors had not exercised sufficient scrutiny of their spikes, with the result that numerous disqualifications arose from this cause. In many instances, the best exhibits were passed over by the judges and inferior collections awarded the prizes. In the "Burpee" Challenge Cup Class, the whole of the nine exhibitors transgressed, whilst in another class there were no fewer than 13 disqualifications.

A speaker at the judges' dinner on the evening of the first day said that this would be remembered as the "double-standard year," but he was sure it would be the first, the last, and the only year when such a regulation could exist, a statement that appeared to voice the feelings of those present.

The trade exhibits, taken generally, were not quite so good as usual, but the flowers in the competitive classes were excellent throughout. The exhibitors numbered 180.

The competitive exhibits were arranged against tall green backgrounds, which prevented any general view of the displays, except from the gallery. Although this had the effect of throwing the bunches into better relief, the general spectacular effect was spoiled. The gallery was prettily decorated with bunches of Sweet Peas and greenery by Mr. TIGWELL and the secretary, Mr. C. H. CURTIS, who is to be congratulated on the excellent arrangements.

AMATEURS' CLASSES.

In the first six classes traders were debarred from competing. The Sutton Cup was offered in Class 1 for the best collection of 21 bunches of Sweet Peas, distinct, to be selected from the varieties recommended by the Floral Committee in the Society's Classification List. There were six competitors, and two of the finest displays were disqualified because they included flowers with double standards. These were from Sir RANDOLF BAKER, Bart., Ranston House, Blandford (gr. Mr. A. E. Usher), and A. PITT BROOKS, Esq., Rose Hill, Par Station, Cornwall (gr. Mr. W. H. Prophet). Sir RANDOLF BAKER showed splendid flowers of Edna Unwin, Earl Spencer, Mrs. R. Hallam, Flora Norton Spencer, John Ingman, Etta Dyke, Miss F. Nightingale, Evelyn Hemus, Princess Victoria, and Mrs. W. J. Unwin. The 1st prize was awarded to A. W. STIRLING, Esq., Holme Lea, Goring (gr. Mr. A. Moring), who showed a good collection, notably Evelyn Hemus, Gladys Burt, Thomas Stevenson, Hercules, Elsie Herbert, Florence Nightingale, Flora Norton Spencer, Paradise Ivory, American Spencer, Nubian, John Ingman, Mrs. Hardcastle Sykes, Earl Spencer, and Helen Lewis. 2nd, C. HOPTON, Esq., Greenford (gr. Mr. E. W. Humphrey).

There were six competitors in the class for 24 bunches, distinct, and no fewer than four were disqualified for including blooms with double standards. It is to be regretted that the fine exhibit shown by Sir RANDOLF BAKER was again one of those passed over, for he showed splendid flowers. Still, the 1st prize collection, exhibited by Mrs. A. E. KENSINGTON, Haverbruck, Uckfield (gr. Mr. F. C. Beale), included magnificent vases of Mrs. W. J. Unwin, Winsome, Tennant Spencer, Doris Usher, Maude Holmes (a fine red variety), Mrs. Routzhan, Thomas Stevenson, Nettie Jenkins (fine lavender), Barbara (orange), and Menie Christie. 2nd, A. W. STIRLING, Esq., Holme Lea, Goring (gr. Mr. A. Moring), with a good display, his best varieties being Constance Oliver, Helen Lewis, Senator Spencer, Zephyr, Edna Unwin, John Ingman, and Hercules. W. H. RAWNSLEY, Esq., Well Vale, Alford, Lincs. (gr. Mr. T. Vickers), showed finely, but he had double standards in his examples of Chas. Foster and Elsie Herbert. He showed splendid bunches of Audrey Crier, Mrs. R. Hallam, Helen Lewis, Edna Unwin and Mrs. Hardcastle Sykes.

The Henry Eckford Memorial class required 12 bunches, distinct, to consist of named varieties in commerce. Beside the Henry Eckford Memorial Cup, the 1st prize included the Gold Medal of the National Sweet Pea Society and a sum of money. There was a good contest between 10 competitors, and the collective exhibits made a beautiful display. The judges awarded the 1st prize to E. G. MOCATTA, Esq., Woburn Park, Addlestone (gr. Mr. Thomas Stevenson), for one of the grandest exhibits in the show. However, after the award was made, a double standard was detected in his bunch of Mrs. C. W. Breadmore, and the award was withdrawn. The varieties were Queen Mary, Thomas Stevenson (splendid), John Ingman, Melba, Hercules, Efrida Pearson, Marjorie Linzee, Mrs. C. W. Breadmore, Elsie Herbert, R. F. Felton, Edrom Beauty, and Queen of Norway. The 1st prize was awarded to Sir R. BAKER, Bart., M.P., Ranston, Blandford (gr. Mr. A. E. Usher), who also showed splendid spikes, the varieties being Clara Curtis, Lavender George Herbert, Audrey Crier, Edrom Beauty, M. Holmes, Tennant Spencer, Edith Taylor (big deep rose), Evelyn Hemus, Barbara (orange-salmon), King Manuel (fine crimson), and Dora Usher. 2nd, Capt. ERNEST TWIST, Early Lodge, near Reading (gr. Mr. Thos. Bethell). In this exhibit were choice blooms of Senator Spencer and Mrs. W. J. Unwin (both marbled varieties), Nettie Jenkins, Sunproof Crimson, Clara Curtis and Mrs. Hardcastle Sykes. 3rd, A. W. PERKINS, Esq., Greenford Green, Harrow (gr. Mr. G. Baldwin), for bright, clear flowers of well-known varieties.

There was a keen competition in the class for six bunches of new Sweet Peas, distinct, selected from varieties introduced into commerce since the autumn of 1911. The 1st prize included the "Dobbie" Silver Cup, to be won outright. The judges made their awards as follow:—1st, E. G. MOCATTA, Esq. (gr. Mr. Thomas Stevenson); 2nd, Mr. EDWARD COWDY, Greenhall Mills, Loughgall, Co. Armagh; 3rd, Mr. TOM JONES, Bryn, Penylan, Ruabon. Afterwards it was discovered that Mr. MOCATTA had a flower with a double standard of his variety Walter P. Wright and Mr. Jones of Melba. The judging was, therefore, done again, with the result that Mr. COWDY was placed 1st. Mr. MOCATTA showed the following varieties, all of superb quality:—Barbara, Walter P. Wright, Coronation, Edith Taylor, Mrs. Cuthbertson and White Queen. Mr. COWDY's blooms possessed exceptionally long stems, and the spikes were of tremendous growth, but the petals were not quite so bright in colour as those shown by Mr. MOCATTA. The best varieties were W. P. Wright, Prince George, Dobbie's Cream, Mrs. Cuthbertson, King Manoel, and R. F. Felton. R. P. BROOKS, Esq. (gr. Mr. W. H. Prophet), showed fine spikes of Mrs. Cuthbertson, Dorothy and Lady Knox.

No fewer than 12 competed in the class for three bunches of pink or cream-pink varieties with waved standards. The 1st prize was awarded to F. CHETWYND, Esq., Stapylton, Englefield Lodge, Englefield (gr. Mr. H. Langdown), who selected Mary Langdown, Miss Chetwynd Stapylton, and Mrs. R. Hallam. 2nd, R. B. BROOKS, Esq., for Gladys Burt, Hercules, and Mrs. H. Dickson. 3rd, Sir R. BAKER for Dora Usher, Mrs. H. Dickson, and Audrey Crier.

There was a similar class for three bunches, distinct, with double standards. Mrs. A. E. KENSINGTON, Haverbrack, Uckfield (gr. Mr. F. C. Beale), was awarded the 1st prize for choice blooms of Audrey Crier, Scarlet Emperor, and Orange Perfection. 2nd, Sir R. BAKER, with Dobbie's Cream, Mrs. Breadmore and Bertram Deal. 3rd, Dr. J. E. PHILLIPS, Malpas (gr. Mr. W. Davies), with Mrs. Hardcastle Sykes, Maude Holmes, and Mrs. Cuthbertson. There were seven competitors in this class.

OPEN CLASSES.

CLASSIFICATION CLASS.—This class was for a collection of 24 varieties to illustrate the colour distinctions in the Society's classification list, and to bring into special prominence the finest varieties in the several colours. Sir RANDOLF BAKER exhibited the finest collection, but a bloom of Prince George had a double standard, and the exhibit was passed over in favour of Mr. J. STEVENSON, Poole Road, Wimborne, for the varieties Prince George, Mrs. H. Dickson, Earl Spencer, Nubian, Flora Norton Spencer, Mrs. W. J. Unwin, Princess Victoria, Maud Holmes, Elfrida Pearson, and others. No exhibit displayed the 2nd prize card, but the 3rd prize was won by Mr. H. D. TIGWELL, Greenford.

There were 13 exhibits in the class for 12 bunches, distinct, and the whole of them were disqualified for the reason stated above. This brought things to the same level again, and

the judges recommended the award of the prizes to the three best collections. The finest blooms were shown by Mr. F. G. BEALING, Burgess Street Nurseries, Bassett, a selection of the finest varieties being Mrs. W. J. Unwin, Elfrida Pearson, Stirling Stent, Othello Spencer, Tennant Spencer, Thos. Stevenson, Asta Ohn, and Elsie Herbert. 2nd, C. B. GABRIEL, Esq., Easdale, Horsell, Surrey (gr. Mr. G. Hewitt). 3rd, E. OTTER, Esq., Stanhope Park, Greenford (gr. Mr. F. Fairbairn).

Eleven exhibits were forthcoming in the class for three bunches of seedling varieties, distinct, not yet in commerce, but no great advance was seen in any of the collections. The 1st prize was awarded to Mr. R. BOLTON, Warnton, Carnforth, who showed Andrew Aitken (very pale salmon-rose), Agricola (blush on white), and Birdbrook (crimson mottling on a grey ground). 2nd, A. W. STIRLING, Esq., Holme Lea, Goring (gr. Mr. A. Moring), for Cissie (white, suffused with lavender), Mrs. A. W. Stirling (a large, bright-rose flower), and Hetty (like Agricola). The 1st prize included a silver vase presented by Mr. F. Herbert Chapman.

The "E. W. King" Challenge Cup was for the best 12 bunches of waved varieties, distinct, offered for sale and catalogued during the autumn of 1911 or spring of 1912. Besides the challenge cup, the gold medal of the Society was included in the 1st prize. The trophy and medal were at first awarded to Mr. COWDY, but a double standard in a bloom caused disqualification, and they were finally won by ALFRED F. BLADES, Esq., Brookfields, Reigate (gr. Mr. F. Cordell), for a very fine collection. Edrom Beauty, Mrs. Heslington, Melba, Flora Norton Spencer, Mrs. Breadmore, and Elsie Herbert being especially good. 2nd, R. P. BROOKS, Esq. (gr. Mr. Prophet). 3rd, R. JULIAN LEMON, Esq., Bransfield, Godstone (gr. Mr. J. G. Cowlard).

The class for six bunches, distinct, gave greater opportunity to the smaller growers, and no fewer than 24 competed. Of this number six were disqualified for the same breach of the rules as before. The 1st prize was awarded to R. P. BROOKS, Esq., for Doris Burt, Isobel Malcolm, White Queen, Mrs. W. King, Anglian Orange, and Dazzler. 2nd, Mr. THOMAS JONES. Sir RANDOLF BAKER was at first awarded the 2nd prize.

There was only one exhibit in the class for six bunches, distinct, of varieties with double standards. It was shown by Mr. F. G. BEALING, Burgess Street Nurseries, Bassett, and the 1st prize was awarded. The varieties were Bertram Deal, Duplex Spencer, Sunproof Crimson, Clara Curtis, Seedling, and Elfrida Pearson.

BURPEE CUP CLASS.

The Burpee Challenge Cup and the Gold Medal of the Society were offered for a display of waved Sweet Peas, arranged on a table measuring 8 feet by 3 feet. The eight tables occupied much floor space, and, although they made a pretty display, they occupied more room than could well be afforded in a crowded exhibition. Again all the exhibitors transgressed the rules, and the judges recommended the award of the 1st prize to Mr. ALSEN DENMEAD, Waterlooville. It was a very fine collection, and embraced such sterling varieties as Maude Holmes, Freda, Black Knight Spencer, May Campbell, Mrs. Cuthbertson, Senator Spencer, Mrs. W. J. Unwin, and Bertha Massey. 2nd, F. A. WELLESLEY, Esq., Westfield, Woking (gr. Mr. W. Hopkins); 3rd, Mr. C. W. BREADMORE, Winchester.

DISTRICT CLASSES.

AMATEURS ONLY.

London County Class.—There was only one competitor and the exhibit was disqualified.

Scottish Class.—There were only two exhibits in this class for six bunches, distinct, and one was disqualified. The 1st prize was awarded to Mrs. DUNBAR-DUNBAR, Seapark, Forres (gr. Mr. John A. Grigor).

The following six classes were for nine bunches, distinct :—

Irish Class.—Again there were only two exhibits. The schedule required nine bunches, distinct, and the 1st prize was awarded to Mr. COWDY; 2nd, Mr. JAMES HALL, Moy, Co. Tyrone. Both exhibitors showed well.

Welsh Class.—The Principality was also represented by two exhibitors, Mr. J. E. ALAN GIBBS, Dinas Powis, Glamorgan, and Mr. TOM JONES. Mr. GIBBS was awarded the 1st prize, Mr. JONES, who showed best, being disqualified, but recommended to receive the 2nd prize.

Northern Class.—There were six exhibits, and four were disqualified. Dr. J. E. PHILLIPS, Malpas (gr. Mr. W. Davis), won worthily with good blooms of Flora Norton Spencer, Clara Curtis, Thos. Stevenson, Mrs. Cuthbertson, Hercules, and others.

Eastern Counties Class.—This proved a good class, there being 12 exhibitors. The 1st prize collection, shown by Mr. F. E. HALL, Cumberland Cottage, Redbourn, was very choice, and included the varieties Sunproof Crimson, Edna Unwin, Mrs. Heslington, George Stark Improved, Dobbie's Cream, Edrom Beauty, Hercules, Flora Norton Spencer, and Nubian. 2nd, Sir M. TURNER, Bedfords, Havering, Romford (gr. Mr. A. Humphrey), with very clear flowers, a vase of Elsie Herbert being of outstanding merit. 3rd, Mr. H. TYSOE, The Lodge, Bedford.

Midland Counties Class.—The better of two exhibits was shown by Mr. ROBERT HALLAM, Radcliffe-on-Trent, Nottinghamshire, blooms of Nettie Jenkins, Clara Curtis, King Manoel, and Hercules being very good.

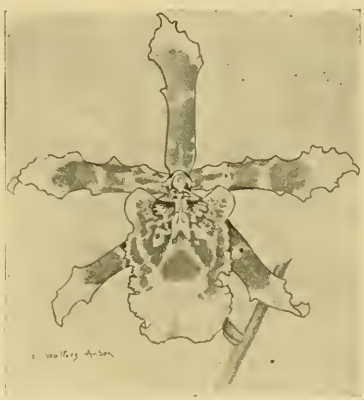

FIG. 18.—ODONTONIA "EDNA": FLOWERS WHITE, BLOTCHED WITH BROWNISH-YELLOW.

(Received R.H.S. Certificate of Appreciation on the 2nd inst. See p. 17 *ante*)

Southern Counties.—This section was represented by six growers, and Mr. MOCATTA won the premier prize with excellent bunches, the varieties Mrs. Routzhan, Edrom Beauty, Marjorie Linzee, Edith Taylor, and Barbara being a selection. 2nd, Sir R. BAKER, who showed Anglian Pink, Tennant Spencer, Moneymaker, and Florrie uncommonly well.

Winners in the other principal classes were :—(*a*) Breadmore Challenge Vase for 12 bunches, distinct : 1st, Mr. COWDY; 2nd, MARSHALL GREEN, Esq., The Lodge, Eynsford (gr. Mr. W. White). (*b*) The Breadmore Challenge Cup for six bunches, distinct : 1st, Mr. W. H. SMITH, Hailsham. (*c*) Hawlmark Challenge Cup, offered by Messrs. Alex. Dickson & Sons : 1st, Mr. TOM JONES. (*d*) Horace Wright Challenge Cup : 1st, Mr. W. N. HOLLOWAY, Percyville, Port Hill Gardens, Shrewsbury. (*e*) Walter Voss Challenge Cup : 1st, Mr. ERNEST J. GEE, Broadway, Chesham, Buckinghamshire. (*f*) James Green and Nephew Challenge Bowl : 1st, Mr. E. D. MARSHALL, Reading.

TABLE DECORATIONS.

In the lecture room upstairs 14 tables, each measuring 8 feet long by 4 feet wide, were set out for table decorations. These embraced Class 35, and a conspicuous feature of most of the exhibits was the use made of the silvered rural flower stands representing little archways, epergnes, gateways, and various other designs. The 1st prize was awarded to Mrs. W. FULCHER, jun., 21, Moulsham Street, Chelmsford, whose centre-piece was the dominating feature. The varieties used were chiefly of the soft pink standard type with creamy wings, and sprays of Asparagus plumosus nanus, narrow and broad-leaved Crotons and Ampelopsis Veitchii were used as reliefs. 2nd, Mr. A. D. RUFF, High Street, Sharnbrook, for a glowing display of salmon-scarlet, relieved by sprays of Asparagus plumosus. 3rd, Mrs. ALFRED EVERETT, Fairview, Chappel, Essex.

AWARDS OF MERIT.

The following varieties have received Awards of Merit after cultivation in the Society's trials :

R. F. Felton, a very large, mauve flower with reddish-purple in the standards. (From Mr. BOLTON.)

Agricola, a blush-white and pink variety. (From Mr. BOLTON.)

Decorator, a red flower, from Messrs. G. STARK & SON, Messrs. DOBBIE & Co., and Messrs. MALCOLM.

King White, a fine white flower, from Messrs. A. DICKSON & SONS.

Lady Miller, a very pretty, pink variety.

Bertrand Deal, a mauve flower, from Mr. BERTRAND DEAL.

NON-COMPETITIVE EXHIBITS.

Messrs. ALDERSEY & MARSDEN-JONES, Tilston, Malpas, Cheshire, were awarded a Silver-gilt Medal for a group of three dozen bunches backed with half-a-dozen fine vertical columns in tubes. "Rosemary" was one of the finest rose Selfs, becoming brilliant cerise with the sun on it.

Mr. W. O. CANTLEY, Bury St. Edmunds, was awarded a Silver Medal for a small collection, in which Seamew, a beautiful lavender, was a conspicuous feature.

Messrs. S. BIDE & SONS, Farnham, Surrey, staged a magnificent collection, for which a Gold Medal was awarded. The arrangement was wonderfully bold and effective.

Messrs. DOBBIE & Co., Edinburgh, made a striking display by having upright battens fixed to the back stage, and, from these, arms at right angles standing out holding a vase, in which a bunch of well-grown flowers was arranged, the vases being draped with sprays of Asparagus Sprengeri. (Gold Medal.)

Messrs. J. K. KING & SONS, Coggeshall, Essex, were awarded a Silver Medal for a good collection of standard varieties, decorated by means of an arch, the uprights of which were covered with pink Gladys Burt and Smilax, the arch with Masterpiece (mauve).

Mr. C. W. BREADMORE, Winchester, was awarded a Silver-gilt Medal for a group in which Clara Curtis (primrose) and Marie Corelli (deep rose-purple) were conspicuous varieties.

Messrs. E. W. KING & Co., Coggeshall, Essex, were awarded a Silver-gilt Medal for a very effective collection, in which the flowers were arranged in vases, columns and Gothic arches.

Mr. T. CROSS, Bury St. Edmunds, had a collection with a central bower and side archways, and was awarded a Silver Medal.

Mr. W. J. UNWIN, Histon, Cambs., secured a Gold Medal for a collection containing about 40 fine masses of superbly-grown flowers.

Messrs. JAS. CARTER & Co., Raynes Park, Wimbledon, staged an excellent bower with conspicuous central masses hanging down and filled with the lovely pink Mrs. Hugh Dickson. The whole arrangement was unique and festooned with "Smilax." (Silver-gilt Medal.)

Mr. JAMES BOX, Lindfield Nurseries, Haywards Heath, was awarded a Silver-gilt Medal for a bold and very effective group.

Mr. W. E. OLSEN, Denmead, Hants., was awarded a Silver-gilt Medal for a collection of some three dozen masses, remarkable for their long stems and large blooms.

Mr. ROBERT BOLTON, Warton, Carnforth, staged a collection remarkable for its bold, upright pyramids and massive vases of flowers, for which a Gold Medal was awarded.

Messrs. JARMAN & Co., Chard, was awarded a Silver-gilt Medal for a very fine collection.

Mr. J. STEVENSON, Wimborne, Dorsetshire, staked a choice collection. (Silver-gilt Medal.)

Messrs. JONES & SONS, Coton Hill Nurseries, Shrewsbury, arranged a collection set off with sprays of Asparagus Sprengeri. (Silver-gilt Medal.)

Robert Sydenham Limited, Birmingham, arranged a collection in silver stands that gave a light and graceful effect. Lilian (pink), Princess Mary (blue), Orion (carmine-crimson), and Edith Taylor (old rose) were shown well. (Silver Medal.)

Messrs. Stark & Son, Great Ryburgh, Norfolk, set up a collection decorated with trails of Asparagus Sprengeri. (Silver-gilt Medal.)

Messrs. Walter Voss & Co., Millwall, E., staged a bold collection of standard varieties, for which a Silver Medal was awarded.

Messrs. Barr & Sons, Covent Garden, were awarded a Silver Medal for a choice collection, the chief features of which were purity of colour, size of blossom and length and strength of stem.

ANNUAL DINNER.

Mr. Robert Sydenham, president of the Society, presided at the dinner held on the evening of the first day. About 80 sat down, including several visitors from overseas, Mr. Beatson (Sydney, N.S.W.), Mr. Carey Hill (New Zealand), Mr. Howard Earl (of W. Atlee, Burpee and Co.), Mr. Lester L. Morse (California), and Mr. Trevethick (New Zealand).

Mr. Sydenham, in proposing the toast of "The National Sweet Pea Society," said it was gratifying to note that the Society still maintained its popularity. He said that the present show contained many superb exhibits, but it was unfortunate that some of the best were disqualified. It had been suggested that a consolation prize should be awarded to Mr. Thos. Stevenson, and he had great pleasure in offering a Rose bowl.

Mr. Lester L. Morse, of California, responded. He said that he had been anticipating this show for the past eight years. Reality was better than anticipation. He had been amongst Sweet Peas since his youth, but he had to say that until July 9, 1912, he had never seen Sweet Peas. He had no idea that blooms could be like banners and stems like flagstaffs.

Mr. Edward Sherwood proposed "The Judges and Exhibitors," and Mr. Thomas Stevenson replied.

Mr. S. B. Dicks proposed the health of "The Visitors," and Mr. Cuthbertson the health of "The Chairman." Mr. Sydenham, in responding to the latter toast, said that they owed a debt of gratitude to the secretary, Mr. Curtis, who had worked early and late; also to Mrs. Curtis; and Mr. and Mrs. Horace Wright.

NATIONAL ROSE.

July 9.—The summer show of the National Rose Society was held at the Royal Botanic Gardens, Regent's Park, on the above date. The weather was almost ideal, and there was a very large attendance of visitors. Queen Alexandra and Princess Victoria paid an early visit to the show, and, under the guidance of the president (the Rev. J. H. Pemberton) and the hon. secretary (Mr. E. Mawley), made a complete inspection of the exhibits, displaying a keen interest in the new varieties and a knowledge of many of the old favourites. The entries were rather more numerous than last year, and there were more new Roses, many of which received recognition, and one of the varieties—the handsome Mrs. Andrew Carnegie—was decidedly the "Rose of the show." The varieties Queen Mary and Old Gold were also greatly admired. The representative groups of Roses were fewer than usual. In one of the large tents sufficient floor space might well be allocated for collections of pot and cut Roses, to be arranged in the form of a Rose garden.

The tents became very hot and uncomfortable, and, notwithstanding this, in many cases the ventilating hoppers in the roofs remained closed during the whole of the day.

Nurserymen's Classes.

The championship class, which requires 72 blooms, distinct varieties, brought together many magnificent flowers, and attracted a great amount of attention from the visitors. The Trophy and Gold Medal were awarded to Messrs. Alex. Dickson & Sons, Ltd., Newtownards, Co. Down, who staged the following varieties in exceedingly good condition. The names of the finest blooms are printed in italics. Conway Jones, Wm. Shean, David McKee, Marquis of Londonderry, Duchess of Sutherland, Dean Hole, Berthe Gaulis, *Caroline Testout*, Mrs. W. J. Grant, *Mrs. David McKee*, Hugh Dickson, Mrs. Ed. Mawley, His Majesty, Frau Karl Druschki, George Dickson, Florence Pemberton, *J. B. Clark*, Alex. Hill Gray, Charles Darwin, *Mabel Drew*, Charles Lefebvre, Mrs. Norman Thompson, *Duchess of Westminster*, Lady Greenhall, *Horace Vernet*, Her Majesty, Alfred Colomb, Mrs. Theodore Roosevelt, Gustave Piganeau, Gloire de Chédane Guinoisseau, *Lady Barham*, Geo. C. Waud, *Bessie Brown*, La Galissiérée, *Ellen Drew*, Countess of Oxford, Robert Scott, Oberhofgärtner Terks, Earl of Warwick, Mrs. Bateman, Lady Helen Vincent, H. V. Machin, Queen of Spain, *Gustave Grünerwald*, Lyon Rose, Comte de Salis, *Mme. Leon Constantin*, *Leslie Holland*, Mildred Grant, S. M. Rodocanachi, Mrs. Cornwallis West, *Duchesse de Morny*, *Marchioness of Dufferin*, Dr. O'Donel Browne, Papa Lambert, Marquise Litta, Countess Annesley, Ulrich Brünner, Mrs. Foley Hobbs, A. K. Williams, Juliet, Gladys Harkness, Ferdinand de Lesseps, Lady Ashtown, Marquise Jeanne de la Chataigneraye, Mrs. John Laing, *Mrs. G. F. Kershaw*, Brilliant, White Maman Cochet, Charles Grahame, and Duchess of Portland. 2nd, Messrs. R. Harkness & Co., Hitchin, Herts., whose finest blooms were Countess of Ludre, Beauty of Waltham, Mme. J. Bonnaire, Mildred Grant, Claudius, Mme. Jules Gravereaux, Gustave Piganeau, and Fisher Holmes. 3rd, Messrs. D. Prior & Son, Colchester, who showed Mrs. E. Mawley, Oberhofgärtner Terks, Duc d'Orléans, and Mrs. John Laing in splendid style.

The 1st prize for 40 distinct varieties, three blooms of each, was awarded to Messrs. Ben. R. Cant & Sons, The Old Rose Gardens, Colchester, for an exceptionally good collection, which included Ulrich Brünner, Her Majesty, W. E. Lippiatt, Lieutenant Chaure, Avoca, Dean Hole, and Mrs. John Laing. 2nd, Messrs. Alex. Dickson & Sons, who exhibited splendid blooms of such varieties as Mrs. Foley Hobbs, Mrs. Cornwallis West, Helen Keller, S. M. Rodocanachi, and Lyon. 3rd, Messrs. D. Prior & Son, Colchester.

The China Trophy exhibit of 48 distinct varieties contained some weather-stained blooms, but under the influence of the heat in the tents these developed, and the damaged outer petals were nearly hidden. Of the four collections, that of Mr. Geo. Prince, Longworth, was decidedly the best, and his blooms of Ulrich Brünner, Mrs. Amy Hammond, Bessie Brown, Mr. S. Crawford, and J. B. Clark were excellent. 2nd, Messrs. G. & W. H. Burch, Peterborough, whose stands were uniformally good; 3rd, Mr. F. Woolward.

The smaller class, requiring 24 blooms, was not so strongly contested, but many of the blooms were exceedingly fine. 1st, Messrs. Chapman & Collin, Thurmaston Road, Leicester, whose outstanding varieties were Marie Baumann, Countess of Rosebery, and Dean Hole. 2nd, Mr. John Mattock; 3rd, Messrs. W. Crisp & Sons.

The premier award in Class 5, for 16 varieties, three blooms of each, was won by Messrs. G. & W. H. Burch, who staged Mildred Grant, Maman Cochet, White Maman Cochet, Oberhofgartner Terks, and J. B. Clark in good condition. 2nd, Mr. John Pigg; 3rd, Messrs. J. Burrell & Co.

The best stand of 24 Tea and Noisette Roses was that shown by Mr. Geo. Prince, in whose collection the varieties Mme. Vermorel, Maréchal Niel, and Mrs. Ed. Mawley were very beautiful. 2nd, Messrs. D. Prior & Son. 3rd, Mr. John Pigg.

Messrs. J. Burrell & Co., Cambridge, exhibited the best 12 Tea Roses, and from this fine exhibition we select Mrs. Dudley Cross, White Maman Cochet and Bridesmaid as being the best. 2nd, Mr. John Mattock, Oxford, whose large blooms were just past their prime. 3rd, Mr. W. R. Chaplin.

Mr. Geo. Prince showed many fine sets in the class for three blooms of 16 varieties: Maréchal Niel, Mrs. Foley Hobbs and Mrs. E. Mawley were the best. 2nd, Mr. Henry Drew, Faringdon, Berks.

The vases of exhibition Roses were disappointing: this, however, was due to the great heat, which caused the blooms to wilt. 1st, Messrs. Alex. Dickson & Sons, who arranged A. K. Williams, Duchess of Westminster and Duchesse de Morny. 2nd, Messrs. D. Prior & Son. 3rd, The King's Acre Nursery Co.

Mr. Geo. Prince exhibited Tea and Noisette blooms of White Maman Cochet and W. R. Smith in a dainty fashion. 2nd, Mr. Henry Drew, who had a good vase of Mme. Constance Soupert. 3rd, Mr. John Mattock.

The President's prize for nine baskets of cut Roses was awarded to Mr. W. Easlea, Eastwood, Essex, who showed Geo. C. Waud, Duchess of Wellington, and Mrs. Alfred Tate amongst his collections. 2nd, Messrs. Hugh Dickson, Ltd, whose best baskets contained Richmond and Mme. M. Soupert. 3rd, Mr. John Mattock.

The class for five baskets of Roses was keenly contested. Mr. W. R. Chaplin won the 1st prize, employing the Lyon Rose, Harry Kirk and Pharisaer. 2nd, Messrs. W. Spooner & Son, whose basket of Mme. Ravary was splendid. 3rd, Mr. E. J. Hicks.

The 18 vases of Roses made a splendid display and attracted much admiration. 1st, Mr. John Pigg, Royston, Herts, whose outstanding varieties were General McArthur, Mme. Abel Chatenay and Richmond. 2nd, Mr. John Mattock. In this exhibit the varieties Lady Waterlow and Gottfried Keller were very beautiful. 3rd, Messrs. W. Spooner & Son.

Mr. E. J. Hicks, who showed Ecarlate, Lady Hillingdon, &c., exhibited vases of distinct Roses in an attractive manner. 2nd, Mr. W. Tayler, Hampton, Middlesex, in whose exhibits the supporting wires were too conspicuous. Mme. Pernet Ducher and Augustine Guinoisseau were exceptionally good.

The boxes of exhibition blooms, with the varieties arranged in lines, contained good blooms. The 1st prize was won by Mr. W. R. Chaplin, Waltham Cross, who showed Richmond, Lady Hillingdon, and Mme. Alfred Tate in very good condition. 2nd, Mr. E. J. Hicks. 3rd, Mr. John Mattock.

Decorative Roses.

The nurserymen's exhibits of decorative Roses made a beautiful feature of the show, and many of the exhibits remained fresh throughout the day. The competition was exceedingly keen.

The best 36 distinct varieties were shown by Messrs. Frank Cant & Co. From this superb collection we can only name Lady Hillingdon, Rayon d'Or and Simplicity. 2nd, Mr. John Mattock, Oxford, whose outstanding vases were Gottfried Keller, Irish Glory and Hebe's Lip. 3rd, Messrs. W. Spooner & Son.

Mr. Chas. Turner, Slough, was the only exhibitor in Class 17, and was awarded the 1st prize for a fine collection, which included Le Progrès and Betty.

Messrs. W. Spooner & Son were awarded the 1st prize in Class 18 for a fine arrangement. The varieties American Pillar and Common Moss were excellent.

The best nine new decorative Roses were shown by Mr. E. J. Hicks, Hurst, Berks, whose vase of Orleans Rose was most charming. 2nd, Mr. Geo. Prince, who staged good vases of Rayon d'Or and Carmine Pillar.

The 12 varieties of Wichuraiana Roses made a beautiful display. Messrs. Frank Cant & Co., who included the varieties Léontine Gervaise, Delight and Minnehaha, won the 1st prize. 2nd, Mr. E. J. Hicks, whose flower Evangeline was beautiful. 3rd, Mr. Charles Turner, Slough.

Groups of Roses.

The 1st prize representative group of Roses, shown by Messrs. Paul & Son, The Old Nurseries, Cheshunt, contained a great amount of bloom, and well deserved the premier award. The groundwork was imposing and well arranged, but the effect was marred by the stems of the tall Wichuraiana standards, which were ungainly. The 2nd prize group of Messrs. Hobbies, Ltd., Dereham, was better balanced, but the standards were too crowded.

The cut Roses arranged on stagings were very attractive, although these exhibits, of necessity, owe their value to colour-mass. The 1st prize was awarded to Messrs. W. & J. Brown, on whose stand the bright colours predominated. 2nd, Mr. F. M. Bradley, Peterborough, whose blooms of Simplicity and General Jacqueminot were charming. 3rd, Messrs. Stuart Low & Co., Bush Hill Park, Middlesex.

Messrs. H. Harkness & Co., Hitchin, who showed good vases of Edu Meyer, Irish Elegance, Lyon, Hugh Dickson, General McArthur, and Rayon d'Or, were awarded 1st prize in Class 23. 2nd, Messrs. G. Jackman & Son, Woking. In this exhibit the stands of Duchess of Wellington, Liberty and Le Progrès were beautiful.

Of the six exhibits in the class for 24 Roses in two varieties, 12 white and 12 red blooms, that of Mr. WALTER BENTLEY, Rose Nurseries, Leicester, was the best. He showed Mrs. Foley Hobbs as the white variety, and the red was J. B. Clark. 2nd, Messrs. D. PRIOR & SON, Colchester.

The Roses in baskets, although numerous, were not of outstanding merit. In the class for 18 blooms of any H.P. the 1st prize was awarded to Messrs. HUGH DICKSON, LTD. 2nd, Mr. WALTER STEVENS, Fair Oak, Radlett, for a basket of Frau Karl Druschki. 3rd, Mr. GEO. PRINCE, Longworth. The best basket of any other type of Rose was also shown by Messrs. HUGH DICKSON. 2nd, Mr. W. BENTLEY. 3rd, Mr. W. R. CHAPLIN, Waltham Cross.

Mr. GEO. PRINCE exhibited the best basket of Tea Roses. 2nd, Messrs. FRANK CANT & CO.

The baskets of Rayon d'Or were almost dazzling in the richness of their colouring. 1st, Messrs. BIDE & SONS; 2nd, Mr. E. J. HICKS; 3rd, Mr. G. PRINCE.

The variety Leslie Holland was the best in the open class for nine blooms of any new variety, and was shown by Messrs. HUGH DICKSON, LTD. 2nd, Ethel Malcolm, shown by Messrs. S. MCGREDY & SON. 3rd, Mrs. Cornwallis West, shown by Messrs. ALEX. DICKSON & SONS.

The 1st prize collection of 12 blooms of new Roses was shown by Messrs. HUGH DICKSON, LTD. The varieties Charles de Lapine, Duchess of Shaftesbury, Marquise de Ganay, Mabel Drew and Leslie Holland were exceptionally meritorious. 2nd, Messrs. ALEX. DICKSON & SONS, LTD., who also showed Leslie Holland in excellent form and condition. 3rd, Messrs. S. MCGREDY & SON.

AMATEURS' CLASSES.

The many classes for amateur rosarians and classified according to the number of plants they individually grow, were exceedingly well contested. In many cases the blooms of the small growers were quite equal in point of size and quality to those of the great trade exhibitors. The champion trophy was won by Mr. E. M. EVERSFIELD, Horsham, His exhibit of 36 blooms was exceedingly fine. The best flowers were Mrs. Theo. Roosevelt, Lady Alice Stanley, Souvenir de Pierre Notting and Juliet. The 2nd prize stand of Mr. E. B. LINDSELL included splendid blooms of Helen Keller, Hugh Dickson and Duchess of Bedford. 3rd, Mr. F. DENNISON.

The best collection of 24 blooms was shown by Mr. E. B. LINDSELL. The varieties S. M. Rodocanachi and Mrs. J. Laing were superb. 2nd, Mr. F. DENNISON.

In the class for growers of fewer than 3,000 plants, the best exhibit was that of Mr. W. BOYES. Mr. E. M. EVERSFIELD was placed 1st in the division for growers of fewer than 2,000 plants.

ARTISTIC CLASSES.

The dinner-table decorations, the vases of Roses, sprays, and buttonholes, filled one tent and made a charming display. In the open class the 1st prize dinner-table decoration of Roses was won by Mrs. A. BIDE, who used the variety Sunburst with purple Rose foliage. In the 2nd prize arrangement the variety Irish Elegance was tastefully employed by Miss M. FODEN. Mrs. BIDE also arranged the 1st prize bowl of Roses with the variety Mrs. Arthur R. Waddell and Dr. F. H. Cooke.

Mr. CONWAY JONES attractively arranged the exhibition Roses Mrs. R. G. Sharman Crawford, C. J. Grahame, &c., in vases. The decorative varieties Gottfried Keller and Phyllis were beautiful in the vases exhibited by Rev. J. H. PEMBERTON. The collection shown by Mr. H. R. DARLINGTON was delightfully arranged. The varieties Mrs. F. G. Hill and La Tosca were splendid.

NEW SEEDLING ROSES.

All the space in the tent set aside for Classes 31 and 32 was fully occupied, and, of the large number of varieties presented, 13 received awards. The great majority were H.T. Roses.

GOLD MEDALS.

Mrs. Andrew Carnegie.—A most lovely Rose, a cross between Frau Karl Druschki and Niphetos, in which the influence of both parents could be traced. The very large blooms are of a delicate lemon colour, with just a suspicion of yellow at the base of the petals, and are borne on very long, stout shoots, which have plenty of rich green leaves. The raisers say that this variety is an even better bedding Rose than Frau Karl Druschki, and in addition to this merit it has—what should be a necessary qualification in all Roses—a delightful fragrance. Shown by Messrs. JAMES COCKER & SONS, Aberdeen.

Old Gold.—The upper surface of the petals of this beautiful H.T. Rose is of the colour of Hemerocallis flava, whilst the under-sides are of a deep pink—a delightful combination. The beautiful bude of this variety will make it a popular "buttonhole" Rose. Shown by Messrs. S. MCGREDY & SON, Royal Nurseries, Portadown.

SILVER-GILT MEDALS.

Queen Mary.—An exceedingly beautiful H.T. Rose. It is much after the style of the popular variety Juliet, but is of better form and habit. It is paler in colour than Juliet and not quite so fragrant, but nevertheless is a valuable decorative variety. Shown by Messrs. ALEX. DICKSON & SONS.

Mrs. Frederick W. Vanderbilt.—This H.T. Rose has many shades of colour, but it may best be described as being deep salmon, suffused with pink. The buds are also of a charming colour.

Mrs. Ethel Part.—A free-flowering H.T. Rose, said to be as good for garden decoration as for exhibition; described by the raisers as deep coppery pink.

Lady Mary Ward.—The centre of the flowers of this variety are of a deep orange colour, which fades to a pale yellow. These three varieties were shown by Messrs. S. MCGREDY & SON.

Mrs. Charles S. Hunting.—An uncommon shade of rose-apricot, varying to pale salmon. This H.T. Rose was shown by Messrs. HUGH DICKSON.

Sunburst.—The colour of this pretty variety is apricot yellow. Shown by Messrs. G. BECKWITH & SON.

Mrs. E. Alford.—A pink-coloured variety intermediate in appearance between Mme. Abel Chatenay and La France. Shown by Messrs. LOWE & SHAWYER.

Mrs. C. Reed.—An H.T. Rose; the colour is light pink with a salmon-pink centre. Shown by Messrs. LOWE & SHAWYER.

William Cooper.—A very bright red H.T. Rose, with long stalks and good foliage, which will probably rival Richmond and Liberty. Shown by Messrs. HUGH DICKSON.

SILVER MEDAL.

Moonlight.—A beautiful single white H.T. Rose; a valuable decorative variety. Shown by the Rev. J. H. PEMBERTON.

CARDS OF COMMENDATION.

Dinah.—A hybrid Moschata variety, with numerous small rose-magenta edged flowers. Shown by the Rev. J. H. PEMBERTON.

Mrs. R. D. McClure.—A very beautiful pink Rose, with globular buds. The young foliage is ornamental, but this variety seems liable to mildew. Other good new Roses shown were Mrs. G. Norwood, Mrs. S. T. Wright, Chas. K. Douglas, Mrs. Archibald Gray, Colleen, and Chas. E. Ingram.

PREMIER BLOOMS.

Six of the Society's silver medals were awarded to the best blooms in the various sections:—

Nurserymen.—H.P., A. K. Williams, shown by Messrs. H. LANE & SON, Berkhamsted; H.T., George Dickson, shown by Messrs. ALEX. DICKSON & SONS, Ireland; T., White Maman Cochet, shown by Messrs. BEN. R. CANT & SONS, Colchester.

Amateurs.—H.P., Horace Vernet, shown by Mr. GULLIVER SPEIGHT, Market Harborough; H.T., Avoca, shown by Dr. T. E. PALLETT, Earl's Colne; T., White Maman Cochet, shown by Mr. A. HILL-GREY, Beaulieu, New Bridge, Bath.

NON-COMPETITIVE EXHIBITS.

Sweet Peas were displayed by Messrs. DOBBIE & Co., Edinburgh, and by Miss HEMUS, Upton-on-Severn. Messrs. R. H. BATH, LTD., Wisbech, staged cut blooms of border flowers, Sweet Peas and Carnations. Mr. H. H. CRANE, Highgate, showed many pans of Violas. Messrs. STUART LOW & Co., Bush Hill Park, Middlesex, exhibited Carnations.

In the small flower-garden, the "New Lawn Sprinkler" attracted a deal of attention and it appears to be a useful article. This is a cheap and strong appliance; by a simple and ingenious arrangement, the force of the water regulates its area of distribution.

Messrs. JEYES' exhibited horticultural washes and disinfectants. Messrs. T. J. SYER & Co., Wilson Street, London, exhibited garden seats and tents. THE HIGGINSON SPRAYING APPLIANCES were also on view. Messrs. E. A. WHITE, LTD., demonstrated the handiness of the Abol spraying syringe, and displayed their insecticides. Mr. D. DOWEL & SON, Hammersmith, showed various samples of garden pottery and tying materials. Messrs. WM. COOPER & NEPHEWS displayed their insecticides and weed killers.

GENERAL BULB GROWERS' SOCIETY OF HAARLEM (HOLLAND).

The following Awards have been made at recent meetings of the Narcissus, Tulip and other Floral Committees of this Society:—

FIRST-CLASS CERTIFICATES.

Narcissus Mrs. Breck.—A seedling variety with white perianth and trumpet. *N. Masterpiece.*—This variety has a white perianth, and a red, flattish cup. *Tulip Queen Alexandra.*—An early single variety; the rose-carmine petals are spotted with green at the base. *T. Progression.*—The brilliant dark-red flowers of this single variety are unusually large. *T. Madame Gevers.*—A clear-yellow, early, single variety. *T. Electra.*—A double variety, with dark carmine-red petals. *T. Feu Brilliant (Darwin).*—This variety has scarlet flowers. *T. Frans Hals (Darwin).*—The flowers are of a violet-blue shade. *T. Giant (Darwin).*—A large-flowered variety with violet-coloured blooms. *T. Zwanenburg (Darwin).*—A white variety. *T. Carmen (Darwin).*—The clear rose-carmine petals are shaded with salmon, and have light-blue spots at the base. *T. Polyhymnia (Rembrandt).*—A large-flowered white variety with fiery-carmine petals striped with white and brown. *Eremurus robustus Elwesianus albus.*—A white variety. *Iris regelio cyclus Apollo.*—The flowers are white veined with violet, lip white veined with brown. *I. r. c. Castor.*—Light violet-rose, dark brown lip. *I. r. c. Laos.*—The white petals are veined with violet. *I. r. c. Saturnus.*—Pale violet; the pure white lip is veined with purple.

AWARDS OF MERIT.

Tulip White Beauty.—An early-flowered, single variety; the interior of the petals is pure white with yellow centres; the exterior blnish-grey. *T. Max Havelaad.*—The orange petals are shaded with blue; an early single variety. *T. Orange Beauty.*—Another early single variety; the yellow petals are bordered with orange. *T. Grand Maitre.*—A clear violet double-flowered variety. *T. Yellow Perfection.*—An early double variety which has pure-yellow flowers. *T. Crépuscule* (Darwin).—The flowers of this variety are rose-lilac in colour. *T. Duchess of Westminster* (Darwin).—A salmon-red variety. *T. Jubilee* (Darwin).—A dark violet-blue-coloured variety. *T. Mauve Clair* (Darwin).—The flowers of this variety are of a lilac shade. *T. Othello* (Darwin).—This well-known Tulip is one of the best dark varieties. *T. Anne Marie* (Rembrandt).—The dark carmine flowers are flamed with white. *T. Cosette* (Rembrandt), *T. Romeo* (Rembrandt), *T. Suzon* (Rembrandt).—All these varieties have flowers of various rose shades, and are flamed with white. *T. Grisdelin Superba.*—A large, early-flowered single variety; the flowers are dark-rose in colour. *T. Imperator Luteolum.*—A double-flowered variety with yellow petals. *T. Pense-rosa.*—A dark-brown late-flowering variety. *T. Luna* (Darwin).—A clear-yellow variety, with black spots on the petals. *T. Carrara* (Darwin).—Pure-white with yellow stamens. *T. Herrogin von Hohenberg* (Darwin).—The flowers have shades of blue and lilac. *T. King George V.* (Darwin).—The flowers have scarlet petals shaded with salmon. *T. Prins der Nederlandin* (Darwin).—A fiery-red variety, flushed with cherry-red. *T. Marvel.*—A late-flowering single

Tulip, with orange-yellow petals, edged with a deeper shade of the same colour. *T. Sulferina.*—A dark-yellow, late-flowering single variety. *T. Carnation.*—A late-flowering, pure-white, single variety. *T. Rasonia* (Breeder).—A dark-violet-coloured flower. *Caltha polypetala.*—A much-improved Caltha palustris. *Freesia Amethyst.*—A seedling Freesia with lilac-mauve flowers. *F. Chapmanii.*—A yellow-flowered variety. *Ixiolirion montanum.*—The flowers of this variety are of a clear blue shade. *Iris regelio cyclus Saga.*—This Iris has violet petals, with a sulphur-yellow lip and purple veining. *I. r. c. Osiris.*—A unicoloured variety; violet on satin white base.

GLOUCESTERSHIRE ROSE AND SWEET PEA.

July 5.—The annual show of the Gloucestershire Rose and Sweet Pea Society was held in the grounds of the Spa, Gloucester, on this date, in beautiful weather. There was a record entry in Roses, which numbered 199, or 50 more than last year, and the show generally was the largest and best held in Gloucester since the visit of the National Rose Society some 9 or 10 years ago.

Rose Classes.

In the nurserymen's classes, Messrs. Alexander Dickson & Sons, Newtownards, won the first prize for 48 blooms, distinct, and four other premier awards; while Mr. H. Drew, Faringdon, Mr. George Prince, and Mr. J. Mattock, were also first-prize winners. In Messrs. Alex. Dickson's collection their new Rose, George Dickson, a superb velvety-red Rose, of great substance, was shown to perfection, and other Roses that attracted general attention in the show were Juliet and Lyon Rose. For ideal dark velvety Roses, however, Horace Vernet and Victor Hugo appeared to hold their own in competition with all the new varieties, and were shown to perfection in most of the stands.

In the open amateur classes, Mr. Conway Jones, Hucclecote, Gloucester, succeeded in retaining for the second year, against very keen competition, the silver challenge bowl, valued at 30 guineas, offered by the society for the best 36 varieties of Roses. Miss F. J. Gwilliam, of Dymark, won the piece of plate offered by the Mayor and Corporation of Gloucester for the best table decoration.

In the classes open to amateur growers of not fewer than 3,000 plants, silver cups were won by Mr. Gulliver Spates, Market Harborough, and Mr. G. R. Bonner, Barnwood, Gloucester.

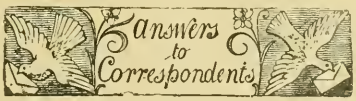
The cottagers' classes were better filled than usual, the the quality of the blooms was excellent. The piece of plate offered by the City Member (Mr. Henry Terrell) for four vases of Roses was awarded to Mr. C. L. Walker, Gloucester.

The National Rose Society's silver medals were awarded to Mr. F. Dennison, Leamington, for a splendid bloom of the variety, Horace Vernet; Mr. Joshua Dodwell, Hereford, for a fine flower of G. C. Waud; Mr. C. Holbrook, Hucclecote, for Melanie Soupert; and Mr. F. W. R. Price, Gloucester, for Mildred Grant.

Sweet Peas.—The entries for Sweet Peas numbered 192, and although there was a slight falling off as compared with the number last year, the display was a grand one, and the quality well up to the average of the best shows held anywhere in the country. Sir Randolf Baker, Bart., Blandford, Dorest (gr. Mr. Usher), won most of the principal prizes, including the silver challenge cup offered by Mrs. Jarrett Thorpe, of Hucclecote, for 24 distinct varieties, and the National Sweet Pea Society's silver medal for a vase of the variety, R. F. Felton, a delicate lavender-coloured Sweet Pea. Lieut.-Col. G. D. Timmis, of Matson, Gloucester, won the Winfield challenge cup offered for six distinct varieties.

A SAILORS' ROSARY.

The subject of fig. 19 is a portion of the Rose garden the sailors attached to the Naval Gunnery School at Whale Island have made in their leisure time. During a recent visit of inspection, the King and Queen admired this evidence of the handyman's versatility, and to commemorate the visit His Majesty planted a tree there. As the illustration shows, the sailors are very successful gardeners.



Abnormal Cattleya and Peaches: *G. S.* The abnormality is not an uncommon occurrence. You will find much valuable information concerning the sowing of Orchid seeds and the subsequent treatment of the seedlings in *Orchids* (Present Day Gardening Series), obtainable from our publishing department, price 1s. 9d. post free. We suspect that the soil in your Peach border requires the addition of lime.

Apple Leaves: *W. L.* The leaves are attacked by the Apple leaf-spot (Sphæropsis Malorum). Clear away all the dead leaves during the winter. Spray the trees with the Bordeaux mixture next spring when the leaves are unfolding.

Black Alicante Vine Dying: *C. S., Wrotham.* Eel-worm is present at the root. This is a very difficult pest to eradicate, and insecticides are of little avail. Your best plan is to burn the plants, and remove the soil in which they have been grown, either sterilising it by baking, or burying it in some out-of-the-way part of the garden (see also p. 30).

Book: *J. S. R.H.S. Code of Rules for Judging.* This work may be obtained from our publishing department, price 1s. 6d., post free.

"Cinnamon Vine": *W. J. M.* We do not recognise the plant from the description you enclose, but if you will send a spray we will endeavour to assist you.

Coleus thyrsoideus: *E. S.* This winter-flowering greenhouse plant does not require a stove temperature. It is a very quick-growing subject, and there is no need to start propagation until May, when cuttings may be rooted readily in a warm propagating case. The cuttings should be inserted singly in thumb pots, and, when rooted, they should be potted in 4-inch pots. When established, the plants should be grown in an ordinary greenhouse, and kept shaded during the hottest part of the day, as the leaves are liable to become scorched, especially if they are syringed when exposed to the sun when the ventilators are open, a common mistake in the cultivation of plants. When syringing during the afternoon, the house should be closed. This Coleus is a fast, gross-growing plant, and should have plenty of root room; if large specimens are required, 8-inch pots should be employed. Small plants intended for house or table decoration should be rooted later in the season, say, June or July; in fact, shoots in bud may be rooted in small 60-size pots with success. When well established and with plenty of roots, the plant requires liberal feeding, liquid manure or soot water being suitable. At no time should the night temperature in which the plant is grown exceed 50°. During winter few plants remain in flower for such a long period.

Cucumbers Unhealthy: *W. H., Earlswood.* There is no disease present. The dressing applied has probably been too strong, as the root development is poor, and accounts for the flagging. Water the plants with a solution of nitrate of soda.

Fern: *W. G.* The Ferns are attacked by a subterranean mealy bug (Ripersia terrestris). Growing plants which are infested by this pest should be removed from the pots, and the roots and soil sprayed with carbon-bisulphide, with the use of a glass spraying apparatus. The pots should be scalded, but the first scalding will not destroy all the eggs; therefore, repeat the process. The plants should be shaded from the sun for a week after the treatment.

Flowers for Market: *A. H. P.* Either variety of Stock you mention should prove remunerative, provided it is well-grown and sent to the market in good condition. The Gypsophila elegans may well follow the Ten-week Stocks, but we question if this would pay you. We should be inclined to try the pink variety (G. elegans rosea). On the open border, seeds of either of the annual Gypsophilas may be sown in the autumn or in the spring from the second week in February onwards. You should ventilate the cool house freely whenever the weather permits.

Grapes: *Y. Z.* The brown rust on your Grapes is due to scalding, caused by insufficient ventilation. Open the ventilators sufficiently early in the morning to allow the fruit and leaves to become dry before the sun becomes powerful.

Internode: *Lancastrian.* The space or portion of stem between two nodes. The node is known in gardens as a joint, being that part of the stem from which the leaves develop.

Fig. 19.—Rose garden at the school of gunnery, whale island.

MELON AND CUCUMBER LEAVES: *C. C.* The plants are attacked by a form of spot disease. All diseased leaves should be burnt as soon as the disease is detected, and if the attack is very severe the plants should be burnt The Bordeaux Mixture has not been found of much use against this disease; if applied at an early stage it might do some good. A mixture of carbolic acid and water in saucers placed in the houses has been stated to check the spread of the disease.

MELONS DYING: *W. G.* Eelworm is present in the roots. See reply to *C. S., Wrotham*, on page 39.

NAMES OF PLANTS: *H. F. Z.* 1, Amelanchier canadensis; 2, Spiræa discolor (syn. S. ariæfolia); 3, Cassinia fulvida (syn. Diplopappus chrysophyllus); 4, Teucrium fruticans; 5, Veronica Traversii; 6, Cryptomeria japonica; 7, Spiræa Menziesii; 8, Leycesteria formosa; 9, Deutzia crenata; on the former occasion your numbers must have been confused.—*Journeyman.* 1, Bocconia cordata; 2, Chelidonium majus; 3, Davidia involucrata; 4, Veronica salicifolia; 5, Prunus cerasifera atropurpurea; 6, Cupressus pisifera squarrosa; 7, C. macrocarpa; 8, insufficient for purposes of identification.—*J. Brown.* 1, Periploca græca; 2, Robinia hispida var. inermis; 3, Cistus monspeliensis.—*H. V.* 1, Sedum reflexum; 2, Antennaria dioica; 3, Geum coccineum fl. pl.; 4, Calycanthus floridus; 5, Rhus cotinus; 6, Codonopsis ovata; 7, Lycium Grevilleanum; 8, Ribes alpina var. aurea; 9, Mentha sp.; 10, Linaria repens; 11, Lonicera japonica aureo-reticulata.—*J. B.* 1, The Conifer is Cupressus Lawsoniana. We cannot undertake to name florists' var. of Fuchsias and Pelargoniums.—*A. W. H.* 1, Vitis Thunbergii; 2, Santolina chamæcyparissus (Lavender Cotton); 3, Iris Monspur; 4, Vitis sp., cannot name without fruit or information of origin, &c.; 5, Jasminum humile; 6, Eryngium Oliverianum; 7, Philadelphus Lemoineierectus; 8, Syringa japonica.—*R. W. V.* Common Hornbeam, Carpinus betulus.—*N. L.* Spartium junceum.—*E. F.* 1, Hordeum maritimum; 2, Nephrodium Felix-mas; 3, Aspidium angulare var.—*F. E. G.* 1, Scolopendrium vulgare var. crispum; 2, Aspidium angulare var. proliferum; 3, the sporelings are probably the Royal Fern, Osmunda regalis. *G. W. R.* 1, Cotyledon sp.: send when in flower; 2, Senecio (Kleinia) articulatus; 3, Stapelia variegata; 4, Dendrobium undulatum; 5 and 7, in the absence of flowers both appear to be the variegated form of Glyceria aquatica; 6, Crassula lycopodioides.—*G. S.* We cannot identify such an incomplete specimen.—*J. W.* We do not recognise the variety of Carnation. Send to some grower who makes a speciality of these flowers.—*Orch.* 1, Oncidium candidum; 2, O. pulvinatum; 3, Cochlioda vulcanica; 4, Aërides quinquevulnera.—*H. G., Bray.* 1, Begonia foliosa; 2, Pilea muscosa; 3, Pellionia Daveauana; 4, Festuca ovina glauca.—*J. W., Liverpool.* Cypripedium bellatulum.—*S. M.* It is quite impossible to reply in the next issue unless the specimens are received early in the week. Rules for correspondents are found under the Editorial notices. Next time send more material and pack the flowers better. In the circumstances, we have done our best, and believe the names given to be correct. 1, Fisher Holmes; 2, Mrs. John Laing; 3, Souvenir de Catherine Guillot; 4, see No. 6; 5, apparently Maman Cochet; 6, Dupuy Jamain; 7, probably General Jacqueminot.

PAINT-DESTROYING FUNGUS: *W. J. M.* The fungus to which you allude is Phoma pigmentivora. By the addition of carbolic acid (2 per cent.) to paint, the spores are prevented from germinating, and the work of painting the house is not rendered useless by the pest.

PEAR LEAVES AND FRUIT ATTACKED: *A. R. A.* The Pear leaves and fruit are attacked by the Pear-leaf blister mite. The best thing to be done now is to pick off as many of the diseased fruit and leaves as possible and burn them. In the winter spray the trees before the buds open with caustic-soda solution, and later, in spring, with paraffin emulsion.

PEAS UNHEALTHY: *Eddiford, Bath*, and *Peas, Lancashire.* There is no disease present: the failure is due to excess of moisture following a dry period.

PINKS UNHEALTHY: *W. L.* There is no disease present in the plants you send: the failure is due to some wrong cultural treatment.

RASPBERRY CANES UNHEALTHY: *A. B., Bedford.* There is no disease present. The unfavourable condition of the plants is due to the drought of the spring.

ROSE SHOOTS: *H. B.* Your soil being so shallow, and resting upon clay, is doubtless exhausted after having been planted with Roses for 30 years continuously. A liberal quantity of the poor subsoil should be removed, and replaced with some of the top layer of soil from the adjoining field. It will be better to allow the turf to rot first, and employ some of the soil for dressing the border in the meantime. Incorporate a quantity of rich farmyard manure and crushed bones with the lower portion of the border when turning over the soil next autumn. It will not be necessary to cart away more than the worst of the subsoil, if you improve the other in the manner we have indicated. The whole border should be well dug to a depth of at least 2 feet. Guard against the presence of wire-worm in the old turf; if the latter is clear of this pest, you could scarcely do better than use it freely.

ROSE STOCKS. *Miss M. G.* We fear you will find the Rosa Polyantha too rampant a grower for culture in pots. It is not used for this purpose by experienced growers. Seedling or rooted Briar Stocks would be more suitable, and these can be obtained from any large Rose grower, either in small pots or suitable for potting up, according to the season. Any of the Rose nurserymen who advertise in these pages would supply the stocks, or you may root your own. Full instructions will appear in our cultural notes in due course.

SCOTS PINES: *Pinus Sylvestris.* From your description, we suspect that the "Pine-shoot tortrix moth" (Retinia buoliana) is causing the trouble. These moths are frequently seen during the present month. The female lays her eggs between the terminal buds of the Pine trees. The caterpillars hatch late in the summer, and gnaw the buds so as to cause a flow of turpentine, which gives them a slight protective coating, and here they hibernate. In the following spring, when the trees begin their growth, the grubs attack the nearest shoot. The caterpillars are at first dark brown in colour, and later become paler in colour, and on ceasing to feed they change to chrysalids, and are to be seen during June on the young shoots: about four weeks later the moths appear. Unfortunately, it seems that there is no cure beyond removing the affected growths.

SEEDLING CAMELLIAS: *A. F. G.* In the warmer parts of the country Camellia bushes frequently bear fruits which resemble small rosy-cheeked Apples. A fair proportion of these fruits contain fertile seeds, which germinate freely. The seedling plants usually bear single or semi-double flowers: if double flowers are required, it is necessary to graft them.

SEED POTATOS FAILING: *Weekly Reader.* The tubers are badly diseased with "winter rot."

STRAWBERRIES: *Cheloodgate.* A leading Covent Garden salesman informs us that the first forced Strawberries to reach the market came from Kent, and the earliest out-door fruits were grown in the Southampton (Hampshire) district. Your other question does not admit of a conclusive reply.

TENNIS COURT: *S. H.* A double tennis court for three or four players should be 78 feet long and 36 feet wide; for the single game the court should be 78 feet long and 27 feet wide. In addition, you should allow from 15 to 20 feet at each end for the convenience of the players. The court should, whenever possible, run from north to south. You will find diagrams of this and other games in the *Calendar of Garden Operations*, obtainable from our publishing department.

THE TREATMENT OF CUCUMBER PLANTS FOR SEEDLING PURPOSES: *H. S.* When the plants have extended up three-parts the height of the trellis pinch out the points of the individual plants in order to promote strong lateral growths, which should be trained to the trellis. Remove all flowers (male and female) from the first lateral growths; the object being to secure an equal distribution of strong, well-developed female flowers over the individual plants for fertilising about mid-day when the pollen is dry. This is done by removing the petals from a male (small) flower and then inserting the stamen well into the fully-expanded female flower and letting it remain therein. When the fruits begin to develop "club" ends, select five or six of the most promising fruits, distributed equally over the individual plants, removing all others, as well as the blossoms, so as to concentrate the full strength of the plants into the development of large fruits. Any fruit that does not develop a club shape should be removed at once. The above treatment is recommended on the assumption that the plants are grown specially for seeding purposes. But should you only want to grow seed sufficient for raising your own stock of plants all you need do is to fertilise the flowers on one or more plants in the manner indicated. As the seeding fruits become fairly developed suspend them in a horizontal position from the trellis with bands of raffia in order to relieve the plants of their weight. All lateral growths should be kept well thinned out and shortened. When the fruits become yellow they may be cut and allowed to perfect the ripening process of the seed in the pulp, that is, if a light crop of saleable fruit is desired after the seeding fruit is cut and the plants are still healthy and vigorous. The plants must be kept well supplied with water at the roots and a moist atmosphere should be maintained during the whole period of growth.

TOMATOS: *J. E. G. F.* The Tomatos are affected with the sleepy disease (Fusarium lycopersici). Water the plants with a solution of sulphate of potash. Dress the land with lime before another crop is planted.

TURNIPS DISEASED: *F. P. L.* The Turnips are affected with the club-root disease (Plasmodiophora brassicæ), which attacks all sorts of Brassicas, and many other species of cruciferous plants as Radishes, Wallflowers, Shepherd's Purse and Charlock. The disease arises from spores present in the soil. Plants are most susceptible to the disease during the first three weeks after germination, and it is therefore essential to form the seed-bed in soil that is free from contagion. After an attack of club-root, quicklime has been found to be a good preventive against further outbreaks. Thirty-five bushels of lime per acre will arrest the disease, and in America it has been found that Cabbages may be grown successfully at intervals upon the same soil if an application of 75 bushels of lime per acre is made every year. When planting out from the seed-bed, reject all plants whose roots are not in a natural condition, burning the rejected ones. Before planting the Turnips into their permanent positions, it is a good practice to dip the roots of the plants in a puddle of thick mud, soot, and a little sulphur.

VEGETABLES FOR EXHIBITION PURPOSES: *Anxious.* The value of each of the vegetables you name for exhibition purposes are, according to the *Code of Rules for Judging* issued by the Royal Horticultural Society, as follow: Potatos, 8 points; Peas, 8 points; Cauliflowers, 8 points; Broad Beans, 6 points; Scarlet Runners, 8 points; Vegetable Marrows, 6 points; Cabbages, 6 points; Carrots, 6 points; Turnips, 6 points; Globe Beets, 6 points; Onions, 8 points; and Tomatos, 8 points. Exhibitors usually select from the kinds in season those which are capable of winning the maximum number of points.

ILLUSTRATIONS.

THE STRAWBERRY SEASON.

THE Strawberry season of 1912 will be remembered by the market-grower as one of disappointment. There have been, it is true, some compensations, but every season which incites high expectations at the commencement must be disappointing when realisation falls below what is expected. Everywhere the plants began to bloom at an exceptionally early date. There was plenty of bloom to be seen before the end of April, and the growers in the earlier districts were naturally sanguine enough to expect that they would take the market by surprise and so obtain some very high prices for their first consignments. In many cases, unfortunately, the late frosts dashed all these hopes to the ground—as one walked through the fields one could see everywhere those fatal black spots in the middle of the blossom which tell of the handiwork of the Strawberry-grower's greatest foe. But as good luck would have it, the frosts did not last for many nights. The later blossoms set well, and an average crop looked certain enough in spite of the losses amongst the earliest flowers. There were out-door Strawberries in the market before the end of May, and for the first pickings good prices were realised. But June opened badly, and in many districts it was one of the worst Junes that can be remembered. Rains were frequent, and the nights were so chilly that mildew spread quickly and the appearance of the fruit was much spoiled. The rains also caused the fruit to rot before it was ripe, and in addition to that the damp conditions gave great encouragement to moisture-loving vermin. It is no exaggeration to state that on the heavier soils tons of fruit have been spoiled this year by slugs alone, and the grower is practically powerless so far as preventive measures are concerned. Where fruit is grown on a small scale, it is easy enough to wrap the plants so that the trusses of fruit are kept more or less out of the reach of such vermin, but the market-grower can do no such thing. All he can do is to dress the ground some time beforehand with some slug-destroying preparation, but even that is a laborious and expensive process, and in many seasons there is no need for it.

On the lighter soils, of course, the amount of fruit lost through damp and vermin was not so serious, but the rains interfered with picking, and it was impossible to market the crop in the best condition. Considering all things, the fruit one saw in the shops was surprisingly good, but as it kept badly, the shopkeeper had to clear it as best he might, and this fact militated against the grower in that buyers were afraid to purchase as largely as they would have done in other circumstances, and were more shy than ever in the matter of price. Competition is still very keen—indeed, there seems no slackening in the ardour of the growers, though one would fancy that the limit of production must soon be reached. Better varieties, better methods of marketing, and improved facilities for getting the fruit to market in the shortest possible space of time have done much to keep the trade alive, but Strawberry-growing will always be something of a gamble, and nowadays the chances of big profits are small. There must be many who have asked themselves lately whether the culture is still remunerative, and it is certain that some growers have, on this occasion, done but little more than make both ends meet.

East Sussex.

RICHARD BRADLEY.

In the earlier years of the 17th century no writer on gardening and allied subjects was so popular as Richard Bradley, F.R.S., sometime professor of Botany in the University of Cambridge. Yet of no writer of the period is so little known. Neither his parentage, the place of his nativity, the year of his birth, nor how he was occupied in his earlier years is known. The period of his activity as a writer extends to only about 20 years, terminating with his death in December, 1732, and for a part of that time I have been unable to discover anything of his private history other than that he resided with Mr. Balle, of Cambden House, Kensington. It may, however, be deduced from remarks in some of his books that he *might* have been a landscape gardener or a horticultural adviser Thus he states that he advised the Duke of Rutland how to plant trees. He made journeys to Devonshire, where he found the farmers' wives making butter in brass kettles placed over a fire, to Bloxham in Lincolnshire, to Nottingham and elsewhere, in each case in connection with gardening, if we are to judge from what he says about his journeys. He was familiar also with Continental gardens—those, for example, of Holland, Flanders and France, whence he derived many rare plants which, till he introduced them into his own garden, were unknown in this country. These and other plants, however, he seems to have lost. He also mentions the rearing of pheasants and poultry as having engaged his attention at one time. Among his friends he names Sir Isaac Newton, the Duke of Rutland, Charles Dubois, Dr. Douglas, James Pettiver, Fairchild of Hoxton, Philip Miller, Rev. John Laurence Warner of Rotherhithe, and others, some of them gardeners of repute. Both Fairchild and Miller wrote short papers or letters for one of his publications. Among the subscribers to *A Philosophical Account of Nature* are dukes, earls, and gentlemen who, we know, were interested in horticulture and forestry. The Duke of Chandos and Lord Parker bought each 10 copies, Sir Isaac Newton 6, Sir John Colebatch, M.D., 25, Fairchild 7, the Duke of Rutland 10, from which it may be gathered Bradley's circumstances were not of a flourishing nature, the book intrinsically being a poor performance. His first venture in literature was the first decade of a *History of Succulent Plants* in 1716, followed, in rapid succession, by a second decade, in 1717, *New Improvements in Planting and Gardening*, Parts I., II., and, in 1718, Part III., and *The Gentleman and Gardener's Kalender*. Several editions followed, and in 1721 *A Philosophical Account of Nature* at the same time appeared, and *A General Treatise of Husbandry and Gardening* was in preparation. The publication of this last work was probably induced by the receipt of essays and letters he had received from men of eminence, in response to invitations given in the earlier publications for anyone who had interesting matter to address him through the medium of his publisher. The first instalment appeared in October, and was continued at intervals of a month. The price was a shilling, and the title *A Treatise of Husbandry and Gardening for the month of October*. It is not without interest that in this brochure Philip Miller wrote perhaps his earliest essay on gardening. He was then "Mr. P. Miller, gardener in Kent Street, Southwark." In the same year (1721), *A Philosophical Treatise of Agriculture*, a translation of a German writer, retranslated from the French edition, was published with a preface by Bradley,

in which he stated he had been employed by many noblemen and gentlemen to obtain a secret of the author's for the propagation and management of trees. This, as well as some of his own works, appeared under other titles, and it is remarkable that so acute a person as Loudon should catalogue one of his books, issued in different years, as three distinct publications. To add to the confusion, *New Improvements* was republished in separate parts, in two or more, with and without *The Gentleman and Gardener's Kalender*, and the last-named publication also separately. *The Virtue and Use of Coffee*, which he calls a drug, appeared also in 1721. This is a pamphlet of 32 pages, as is also *New Experiments and Observations* (1724). In the last-named year he was chosen and appointed Professor of Botany at Cambridge, the appointment, if we are to credit the Rev. T. Martyn, having been obtained by means of a forged certificate and promises which Bradley had no means of fulfilling. His knowledge of botany was so limited that Dr. Martyn performed his duties, and after his decease became his successor. It is also recorded that Bradley was unacquainted with Greek and Latin, yet there are occasional, though very few, Greek quotations in his works; but of Latin he made a more liberal use. It must be remembered, too, that his books on succulent plants have the titles and descriptions in that tongue, and, writing of the Fig in another treatise, he distinctly says: "I ——— have added such remarks as I can gather from the Greek and Latin authors." It has been assumed that he may have been trained for the medical profession. He claimed as "my worthy friend, Sir John Colebatch," who was a famous physician, and the fact of his obtaining very large numbers of plants from several botanic gardens on the Continent and giving medical lectures at Cambridge all tend to countenance that assumption as having a basis of fact, and this would be sufficient to show that the learned languages could not have been so strange to him as some have stated.

But though Bradley was superseded in his duties, the professorship was continued during his life, a remarkable certification to the position he had attained, and though, perhaps, the best of his work had been accomplished previous to his appointment, it is certain that his name was of value to the booksellers, and he continued to the very end of his life a kind of literary hack. *The Family Dictionary* (1726), usually attributed to Bradley, is a translation from the French, with plagiarised material from English works incorporated. Bradley wrote an introduction and that was all, except his name on the title page. Houghton's *Tracts on Husbandry* were reissued later, and *Dictionarium Botanicum* in 1728. In 1729 he wrote an account of Cowell's Aloe, to the latter's great displeasure, and in 1732 the letterpress of *The Flower Garden Display'd*, to go with reproductions of 12 plates of flowers published two years earlier. This book is usually attributed to Furber or Sir T. Moore, but it bears unmistakable marks of being Bradley's. *The Fruit Garden Display'd* seems to have been his very latest work, for instead of the 12 months, only those of June, July and August have letterpress. To this book his name as author is attached.

It remains to be said that a few books have been attributed to Bradley which are not his; such as *The British Housewife* and *The Seedsmen's Catalogue*, and in 1733 a third issue of Cowell's *Curious and Profitable Gardener* by the name of *The Compleat Fruit and Flower Gardener*. In this instance, R. Bradley, etc., is given as the author. The volume is of value as containing two scarce tracts, one on *Pruning Fruit Trees*, and the other on *The Improvement of the Potatoe*.

Bradley was the first writer to popularise the science of his day. If not scientific himself, he was an acute observer, and was master of a popular style, which enabled him to describe the newer views regarding the circulation of the sap and the sexual relationships of plants, cross-fertilisation (of which Philip Miller was an early exponent), and hybridisation, as carried out by Fairchild in his experiments at Hoxton. Some of his books are full of interesting details of the gardening of the period, early forcing, dates, prices, names of nurserymen and their specialities, and of gentlemen's gardeners and their doings. He seems to have been always running about visiting gardens and nurseries and making notes, so that we almost feel intimates of the contemporaries whom he mentions. *R. P. Brotherston.*

Fig. 20.—Odontoglossum amabile "Westonbirt variety": sepals and petals white with purple markings, lip tinged with rose.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM AMABILE "WESTONBIRT VARIETY."

In the magnificent group of Orchids staged by Mr. H. G. Alexander, Orchid grower to Lieut.-Col. Sir Geo. L. Holford, K.C.V.O., at the International Exhibition, were many fine hybrid Odontoglossums showing evidence of high cultivation, and among them the beautiful hybrid illustrated in fig. 20, raised between a blotched form of O. crispum and O. crispo-Harryanum attracted much attention. The flowers are white, all the segments except the lip being tinged with rose. The inner parts of the sepals and petals are beautifully marked with dark purple, and around the yellow disc of the lip is a band of deep red blotches. The reverse side is purple in the case of all the segments.

THECOSTELE ZOLLINGERI.

A fine inflorescence of this rare species is sent by Mr. C. Wright (gr. to the Hon. N. Charles Rothschild, Ashton Wold, Oundle), and taken from a plant received from Miri, Borneo. It

appears never to have been recorded as flowering in England. The plant in growth and in the general appearance of its inflorescence resembles a Gongora or Acriopsis, to which it is nearly related. The pendulous scape is about 9 inches in length, and bears numerous pretty flowers, each over ½ inch across. The sepals and narrow linear petals are white spotted with crimson, the singular lip being yellowish, and the bilobed, glandular, pubescent front pink. It has been recorded from several places in the Malay Archipelago, Tenasserim and Moulmein.

STAUROPSIS PHILIPPINENSIS

This singular little species was shown in the group of Messrs. Sander & Sons, at the Royal International Exhibition, together with other pretty species.

It has always been rare, the only specimen previously known in gardens being that for which Mr. G. E. Day (now gardener to H. S. Goodson, Esq., then gardener to Admiral Cator, King's Langley, Herts.) obtained a Botanical Certificate at the Royal Horticultural Society's Chiswick Show on September 24, 1894

The plant is dwarf, resembling a small Renanthera Imschootiana. The flowers are solitary in the axils of the leaves, rather more than an inch across. The sepals and petals, which are nearly equal, are red-brown, with whitish tips. The fleshy lip is whitish with a hairy keel down the centre. It is the Trichoglottis philippinensis of Lindley.

THE ALPINE GARDEN.

CAMPANULA CENISIA.

This very beautiful and typical high Alpine species has not always had the admiration it deserves, and is far too rare in cultivation. It is never found except in the loose shingle-slopes of the highest Alps, from about 7,500 to 10,000 feet, and is scattered freely, though locally, through the central range, always preferring sandstone or schistose rock, and ceasing wholly in the southern, eastern, and western ranges. Neither in the Maritime, Bergamask, nor Dolomitic ranges, to the best of my belief, will any trace of it be found. Indeed, it almost appears to regard lime and granite with an impartial aversion. It is among the few high Alpines of special interest which a collector in Switzerland may fairly rely on finding, at great elevations, on suitable rock. It grows, for choice, with Viola cenisia, disliking the finer and damper shingle affected by Androsace alpina (glacialis) and the coarser stone tumbles that suit Geum reptans, whilst it does not ascend to the exposed ridges of Eritrichium nanum. On Mount Cenis it shares its shingles with C. Allionii, a species which begins at much lower elevations, and ranges south into hills where C. cenisia is not found; in the Oberland it is abundant and beautiful in certain high glens, among constellations of all the other typical high Alpines except Eritrichium. Above Arolla I have seen it only sparingly. In cultivation I have always found it surprisingly adaptable, free, and brilliant, though there is, I think, no hope of cultivating it except in a moraine. In nature it is deciduous; but in the garden, lacking snow, it turns evergreen. The specimen shown in fig. 21 had not been translated into my moraine a month before it was photographed; thus cheerfully had it outlived its removal, and dismissed its recent memory of Cenisian shingles. The root-system is much finer, and the whole plant much neater, frailer, and more elegant than the coarse stolons of C. Allionii. The flowers are very freely produced, wide-open stars of a peculiar electric blue. A fuller description of C. cenisia, its habit, habitat, cultivation and charm will be found in my volume *Among the Hills*.

Reginald Farrer, Ingleborough.

NURSERY NOTES.

THE TRIAL GROUNDS AT RAYNES PARK.

The expression, "Carter's, of Raynes Park," is rapidly becoming familiar to the ears of gardeners, just as "Carter's, of Holborn," has been an every-day expression for many years.

Those who travel on the L. & S.W. Railway have seen the conversion of an area of 122 acres of meadow land close to Raynes Park Station into a nursery trial ground, with a magnificent building, providing not only the general offices of the firm, but also accommodation for cleaning, storing and packing seeds. This work has taken nearly three years to complete; indeed, though the establishment may be said to thoroughly meet the immediate requirements of the business, at the same time there are many features in course of development which are needed to complete the scheme.

The fact is that a plan such as that which Messrs. Carter have had in hand needs an infinite amount of work and a liberal expenditure of capital. In these circumstances, any undue haste in filling in the details of the scheme would lead to the commission of serious errors—such errors as are easily preventible by the exercise of care and consideration. Nevertheless, the work is proceeding apace, and on the occasion of our second visit there, a few days ago, it was evident that much progress had been made during the past few months. From the railway the view of the building has for a long time been a very satisfactory one; but it will be surpassed by the front entrance to the offices and nursery, which is approached from the main road along which run the trams to Hampton Court. Already there are well-kept lawns and later there will be gay flower beds. Mr. Harold Beale pointed to a centre bed, in which preparations are now being made to build a fish-pond with a handsome fountain—this latter, by the way, was purchased at the "International." Handsome gates of wrought iron are in course of manufacture, and other details, now receiving attention, will combine to make the "garden-front" extremely attractive.

An inspection of the trials out of doors—both of vegetables and flowers—reveals some of the many difficulties which have to be overcome in a "nursery in the making." Messrs. Carter have a good soil at Raynes Park, but it needs some humouring, owing to its being rather stiff. Repeated cultivation and the judicious addition of organic matter will render the clayey ground suitable for most crops, but in the meantime the cultivation of this particular soil early in spring is not rendered easier by such a drought as was experienced last April. Consequently, some of the plants will flower rather late this season, and the early days of September will be the time to see the nurseries at their best. At the present (partly in consequence of the lessons taught by the spring drought) an elaborate system of irrigation is being carried out, which will provide a plentiful flow of water in every part of the grounds, for use when occasion requires; for the Mangolds and culinary Peas no less than the showy flowers.

To return to the main building; this is 320 feet long and 110 feet wide; and an annexe, connected with the building by a colonnade with 18 massive pillars of Portland stone, has a length of 280 feet. The basement of the main building measures 180 feet by 110 feet, and is estimated to be capable of storing about 1,200 tons of seeds. The buildings are heated by means of 4-inch pipes, of which there are no less than a mile's length; there are also 48 great radiators, and a boiler with a capacity of 1,250,000 thermal units. The railway front of the building is furnished with a sign, illuminated by nearly 2,500 electric lamps, representing 25,000 candle-power concentrated in the letters alone At night-time this sign is one of the conspicuous landmarks to travellers to and from Waterloo. The interior of the building is light, well ventilated, and it provides the healthiest conditions for the staff, who may be congratulated on escaping from the more confined premises at Holborn. The machinery for cleaning, testing, and grading the seeds and other purposes, is all worked by electricity. And there is a complete absence of dust. The ingenious labour-saving appliances are well worth close study; some of these are from designs by members of the firm. A system by which the employees are able to get their meals without leaving the premises answers extremely well. The kitchen is furnished throughout with the latest cooking apparatus, reminding one of the

Fig. 21.—CAMPANULA CENISIA GROWING IN THE MORAINE AT INGLEBOROUGH.

equipment of a London hotel. There are four dining rooms which accommodate from 150 to 160 employees at the midday meal. The total staff numbers about 350.

We have said sufficient to indicate the scope of this seed and bulb establishment, but the proprietors, in common with others directly concerned with horticulture, perfectly well recognise that the art of gardening—more popular to-day in these Islands than ever—appeals successfully to a larger public every year, and the needs of to-day will be exceeded by the requirements of to-morrow.

SILENE HOOKERI.

THIS handsome species (see fig. 22) is a native of California, and was first introduced into cultivation by Professor Bolander, who sent seeds to Mr. Thompson, of Ipswich, with whom it flowered in the year 1873. It was then figured in the *Botanical Magazine*, t. 6051, but for some reason the plant was eventually lost. Recently, however, it has been reintroduced by Mr. Carl Purdy, and plants have been exhibited at meetings of the Royal Horticultural Society, and a fine group was shown by Mr. Maurice Prichard at the International Show at Chelsea. S. Hookeri is one of a small group, all natives of California and the Western United States, remarkable for their brilliantly-coloured flowers. Others of this group are the scarlet S. laciniata, S. californica and a recent introduction with flowers of a deep-red colour. S. Hookeri is usually found growing on wooded hillsides, and is described by Nuttall as having both white and rose-coloured flowers. It is a tufted plant, with somewhat lax, short, decumbent stems, and it is very free-flowering in habit. The oblong, lanceolate leaves are 2 to 3 inches long, and the whole plant is softly pubescent or almost woolly. The rose-coloured or pink flowers are over 2 inches across, each petal being four-cleft, while the underside of the flower is of a light buff shade. It will probably not be hardy in this country, except in well-sheltered and somewhat dry situations. In its native habitat the plant affects a stony soil. As a plant for growing in pots or pans in a cold frame it is a valuable acquisition, and since it promises to produce seed freely it would be worth while to raise batches of plants and keep them in frames for the winter, to plant out in the spring in the rock garden. *W. I.*

ABBOTSBURY CASTLE.

BY reason of its sheltered position in the deep valley formed by the sudden steep slope of the Dorset downs on the landward side and by the long hill that provides a rampart against the sea winds on the south-west, Abbotsbury vies with the favoured gardens in Devon and Cornwall in the beauty and health of the exotic and sub-tropical plants and trees that flourish within its confines. It is, perhaps, chiefly remarkable for the great size attained by some of the rare subjects—the dimensions of which are probably unequalled in any other garden in this country. Of late years the pleasure grounds have been much enlarged, greatly to their advantage, and it is stated that further expansion is contemplated. The gardens are guarded from the sea by the lofty pebble barrier known as the Chesil Beach, and are enclosed on all sides by groves of Ilex (Holly), which render the spot a placid sanctuary even when a gale is blowing off Portland Bill, nine miles away. Of Magnolias there are about 40 species and varieties. The finest is M. Campbellii, 40 feet in height, which shrubs in the garden is a gigantic specimen of Lagerstrœmia indica, which is 24 feet high and 18 feet in diameter, and was covered with bloom at the time of my visit. As a rule, in the south-west, this shrub is rarely more than from 4 feet to 6 feet in height, and the Abbotsbury example is probably unequalled. Another plant that is rarely met with of any size is the New Zealand Pink Broom, Notospartium Carmichaeliæ, but at Abbotsbury there is a specimen 7 feet 6 inches in height and 6 feet through, which was a mass of pink flowers when I was there. The example of Philesia buxifolia is probably the finest in the British Isles, being 6 feet across and nearly 3 feet high, and is a marvellous sight when bearing hundreds of its large, drooping, rosy, Lapageria-like blooms. Athrotaxis selaginoides was looking well, and is a very rare tree, not more than one other being known in England. Edwardsia (Sophora) microphylla, said to have been planted 70 years ago, has a tree-like trunk and is 25 feet high, and E. Macnabiana is 18 feet. An unfortunate loss in the last few years is the New Zealand Ribbon Tree (Plagianthus betulinus), which was supposed to

FIG. 22.—SILENE HOOKERI ON THE ROCK-GARDEN AT KEW: FLOWERS PINK.

TREES AND SHRUBS.

DRIMYS WINTERI.

A GOOD example of Drimys Winteri (Winter's bark) may be seen on a wall of the Palm House in the Cambridge Botanic Garden. The specimen is 9 feet in height, and it flowered freely during May. The flowers are creamy-white, about 1½ inch in diameter, and are borne in terminal bunches. The shrub is evergreen, and has leaves 4-5 inches in length and 2 inches broad, glabrous above and glaucous on the under-surface. The young wood being bright red adds to the attractiveness of the plant.

This shrub is not quite hardy, and requires protection during severe weather. At Cambridge a mat is nailed over it when the weather is very cold, and the heat from a glasshouse at the back creates a certain amount of warmth within the mat, rendering a padding of straw unnecessary. The genus Drimys consists of five species, D. Winteri (see fig. 168 in *Gard. Chron.*, June 13, 1885) being the most common. The species was introduced by Captain Winter from Chili and the Straits of Magellan; it grows best in sandy loam in a sheltered position. Propagation may be effected by cuttings of half-ripened shoots inserted in a cold frame. *R. Stewart Lynch.*

one season bore 160 flowers. M. hypoleuca, which has flowered, is 24 feet in height, M. tripetala 25 feet, M. stellata 12 feet high and of equal diameter, and M. Kobus 20 feet. Acacia dealbata is 60 feet in height and is probably the finest specimen in the country, the splendid example at Trebah being about 50 feet. Fifty species of Acacias are grown, the majority of them being at present small in size, as two consecutive hard winters killed many of the more tender specimens. From seed ripened at Abbotsbury plants have been raised of A. dealbata, A. floribunda and A. melanoxylon. A seedling of A. dealbata three years old is 12 feet in height. At one time 52 species of Eucalyptus were grown, and E. amygdalina, E. coccifera, E. Globulus and E. cordata have been raised from trees that flowered in the gardens. The hardiest species has proved to be E. urnigera, which was unharmed through the two severe winters which killed such numbers of Eucalypti and Acacias. Villaresia mucronata, a native of Peru, is supposed to be the only specimen in England. It is nearly 60 feet in height and bears small yellow flowers very sweetly scented. One of the most remarkable be the finest specimen in the British Isles, and was about 50 feet in height and 6 feet in girth. Of Paulownia imperialis there is a splendid example 40 feet in height, and the Fiddle Wood (Citharexylum quadrangulare), a native of the West Indies, is 20 feet in height, and in perfect health. Numbers of Benthamia (Cornus capitata) are grown, and there is a fine specimen of Carya lævigata 70 feet high, which possesses very handsome foliage. Olea excelsa is 45 feet, while Eugenia myrtifolia has developed into an enormous bush 35 feet high, Catalpa himalaicus has attained a height of 35 feet, and C. Kæmpferi, which fruits freely, is 20 feet high. Many species of Oaks are grown, among which are Quercus bicolor, with large and attractive leaves; Q. Phellos, 25 feet, Q. Aegilops, 60 feet high, and Q. glabra, 20 feet; Andromeda arborea, 60 years old, is 18 feet in height and 20 feet through. An interesting tree is Stranvæsia glaucescens from the Himalayas, which is 22 feet in height, and Arbutus canariensis, a rare and tender species sometimes met with in the south-west, is 30 feet high. Drimys Winteri has attained a height of 20 feet, D. aromatica 15 feet,

and Clerodendron trichotomum 18 feet. The pale-yellow form of Callistemon salignus is 10 feet high, Daphniphyllum glaucescens, covered with pale blue berries, 12 feet, Tricuspidaria lanceolata 12 feet, Halesia hispida and Melia Azedarach the same height, while Cytisus Alschingeri, which flowers later than the Laburnum and remains in bloom longer, bears seed pods over a foot in length. Of Olearias, O. Macrodonta 12 feet, O. obovata, with narrow leaves about an inch long, O. virgata, and O. myrsinoides are conspicuous shrubs. A large collection of Wilson's Chinese plants is grown, among which are Rhus vernicifera, Emmenopteris Henryi, Viburnum rhytidophyllum, and Ailanthus Vilmoriana, with leaves 5 feet in length divided into 24 leaflets. Juniperus tamariscifolia was fruiting at the time of my visit, and the Phormiums were flowering finely. There was a good example of the Judas Tree, and the white-flowered variety is also grown. Of Buddleias there were B. Colvilei, the rare B. salvifolia and B. auriculatus. A pretty shrub was Lindera sericea, with small, pink flowers. Cornus macrophylla colours finely in the autumn, and C. foliosa has delicate foliage. Deutzia Vilmoriniana, with pure-white flowers, was very beautiful, as was the rare and tender Philadelphus mexicanus and P. Coulteri, also from Mexico, which bears large, white flowers with pink blotches at the base of the petals. The Pomegranate (Punica granatum) often flowers well, and Viburnum macrocephalum blooms finely. Among other noteworthy subjects were Syringa Emodii, 60 years old and 20 feet in height, Podocarpus andina 20 feet, Vaccinium ovatum, charming in the spring, Ehretia serrata, from the East Indies; Dimorphanthus mandschuricus, which is making a fine specimen, Aristolochia altissima, Azara crassifolia, A. Crippsii, Calycanthus floridus, C. occidentalis, Citrus trifoliata, Citharexylum cyanocarpum, Drimys aromatica, Exochorda grandiflora, enormous specimens of Fatsia japonica, and good examples of the Maidenhair Tree (Ginkgo biloba), Kniphofia Northiæ, and fine specimens of the Fan Palm (Trachycarpus excelsus), which flower well. In the borders Lonicera involucrata, from California was noticed; it is a handsome species, with orange-coloured flowers and crimson bracts. On the north wall Lapagerias do well and flower abundantly.

Fig. 23.—Deutzia myriantha: flowers white.

The rock garden, which is at some little distance from the main garden, occupies a position between Abbotsbury Castle and the Chesil Beach, and is exposed to the full force of the westerly gales, which fill the air with spindrift. In spite of this apparent disadvantage, rock plants succeed to perfection, and before the severe winters of a few years ago the Mesembryanthemums, of which the most complete collection in this country, with the exception of that at the Isles of Scilly, was grown, afforded a superb sight in the spring. Unfortunately, during the winter of 1906-1907, when 20° of frost were registered, all these plants were killed and, the next winter being equally severe, the garden was for a time bereft of these plants. In 1909, however, an entire collection of plants was put out from pots, and these have made good growth.

The rare Primula Palinuri thrives to perfection here, and is a charming sight in the spring when in full flower, with its tall, Cowslip-like heads held above the green leafage. Hydrangea hortensis, in its pink and blue forms, affords a lovely picture in the early autumn, the walks being margined by large bushes in full bloom.

In the main garden there are many Bamboos, some of them having been imported direct from Yokohama. All are in robust health, and many of the great groups are very decorative in the garden. Libertia formosa is perfectly happy, and is grown in large numbers near the water, where the sheaves of white blossoms have an especially pretty effect in the spring. The Mexican Beschorneria bracteata also makes a fine show, and a pretty sight is a hedge—100 yards in length—of Buddleia variablis Veitchiana. Yucca gloriosa is grown in quantity, and some years as many as 200 flower-spikes may be seen simultaneously. Senecio Clivorum, S. elæginfolium, and S. Petasites are very effective in the moist soil by the water. The rare Cordyline indivisa and C. Parryi are grown, and Aralia Maximowiczii.

In the winter garden, erected by the Countess of Ilchester a few years ago, there is a fine collection of flowering plants and shrubs, among which are Mackaya bella covered with bloom, a splendid plant of Lonicera Hildebrandii growing over the roof; Nicotiana wigandioides, with flower racemes from 3 to 4 feet in length, Passiflora Banksii, Bignonia aurea, B. jasminoides, B. venusta, Bougainvillea glabra, B. Sanderiana, Libonia floribunda, Eucalyptus ficifolia, with scarlet flowers, Dracæna Draco, Ipomæa Leari, Stephanotis floribunda, Jasminum macrophyllum, J. simplicifolium, Trachelospermum jasminoides, Solanum Wendlandii (a mass of flower), Chorizema illicifolia, Passiflora atropurpurea, Tacsonia exoniensis, Hakea suaveolens, Melaleuca hypericifolia, a collection of scented-leaved Pelargoniums, and many succulents.

There is also an Aloe house in which are some enormous specimens. The water garden is formed of five ponds connected by a streamlet, which is spanned at intervals by rustic bridges. In the pools are grown the best of Marliac's Water Lilies, and the verges of the ponds are fringed with the pretty, variegated grass, Glyceria aquatica, Indian Rice (Zizania aquatica), Arum Lilies, Papyrus, and great Gunneras. Other noteworthy plants are Ilex dipyrena, 30 feet high, Fagus betuloides, 60 feet, Litsea japonica, 15 feet, Erica arborea, 15 feet, Podocarpus chilina, 25 feet, Lonicera tartarica and its white variety, L. quinqueloculariis, Vella pseudocytisus and Cytisus aolicus. Eucryphia cordifolia and Viburnum Carlesii flower freely. *Wyndham Fitzherbert.*

DEUTZIA MYRIANTHA.

The hybrid Deutzia illustrated in fig. 23 is an exceedingly floriferous plant obtained from a cross between the Chinese species D. parviflora and D. corymbiflora, and raised by Messrs. V. Lemoine & Sons, Nancy. This hybrid makes a very neat bush, and the small, white flowers are relieved by their yellow stamens. As nearly all the shrubby Deutzias thrive in ordinary garden soil, the plant will prove a welcome addition to summer-flowering shrubs.

NOTICES OF BOOKS.

A New Edition.

The work on the Grape vine* by the late A. F. Barron still holds the field as the most complete book published on this popular fruit. Mrs. Barron, who writes a preface to the fifth edition, has had the help of Mr. W. P. Thompson and Mr. A. Ward in bringing it down to date, and Mr. George Monro supplies a list of prices which, by the way, shows the ruinous state of the Grape-growing industry at the present time. To the chapter on the "Vine as an Ornamental Plant" several varieties are added, with illustrations, and a few new Grapes are described, e.g., Directeur Tisserand, Diamond Jubilee, Melton Constable, and Prince of Wales, the last-named being illustrated from a photograph. The selections for special purposes have had several additions, but Mr. Barron's selections remain unchanged. In this, perhaps, there is room for disagreement. Thus, to the seven black varieties for late keeping four are added, making 11 in all. At least Gros Guillaume and West St. Peter's might have been omitted from the old list, and, of the new ones added, Diamond Jubilee left out. Who grows Royal Ascot now? Yet, in the book, it is retained as a suitable variety for pot culture. Then, surely the lengthy notes on Phylloxera might very well have been eliminated from the chapter on injurious insects. Is it to be found anywhere in Great Britain at the present day? I very well recollect having to help to clear out a house of young vines, borders, and attachments at the time of the Phylloxera scare, but have always been sceptical if the insect had ever been there. A note on the system of growing Grapes by means of the primary leaves only, and the consequent suppression of summer lateral growth would have been interesting. The practice is perhaps more usual in the north than the south of our island, but it is sure to extend as its beneficial effects become known. But the value of the book, no doubt, is in the list of varieties, with their synonyms, history, and qualities. It will be a long time before this list becomes archaic and superfluous, and it must always remain a monument to the painstaking care of its compiler. In this part, and elsewhere, a few of the dates might have been corrected. What was "70 years ago" in 1883, when the book was first published is 100 years now, and so with a few other remarks of the same nature, which, to the younger generation, are necessarily misleading. But, notwithstanding these slight drawbacks, the volume remains one of the few gardening books that retains its vitality. *R. P. B.*

Mushroom Cultivation. †

In the preface of this excellent handbook, the author wisely remarks that "Mushroom growing for profit is not an occupation for leisure moments, as is often suggested by glowing essays of the 'Back to the Land' description." As with all other crops, the profitable cultivation of Mushrooms requires skill, knowledge, and unremitting care and attention. Even then the grower is still at the mercy of the weather, for should the climatic conditions be unfavourable, much of his labour is lost. The various phases of Mushroom culture are intelligently and concisely dealt with by Mr. Bide, who knows his subject thoroughly, and anyone who carefully follows the instructions given in this book should be able to grow good crops. The notes on grading and packing for market are valuable, and should be carefully read by the novice. Mr. Bide is rightly pessimistic in the chapter on Mushroom culture in meadows and orchards, and correctly insists that the greatest success is met with when the spawn is planted in meadows where the Mushroom grows naturally.

* "*Vines and Vine Culture.*" By Archibald F. Barron, V.M.H., etc. Fifth Edition, revised and enlarged. (London: *Journal of Horticulture* Office.) Price 5s.

† *Mushroom Cultivation*, by J. Bide. 6d.

THE BISSAGOS ISLANDS.

Situated some 1,800 miles from Lisbon along the west coast of Africa, facing Portuguese Guinea, this group of some 20 islands may possibly be the nearest to Europe of any tropical islands.

The traveller, after leaving Lisbon, sights no land except the Canary Islands till he reaches the mouth of the Geba, whereat the North Atlantic is parted company with, and one swiftly becomes aware of changed conditions, not the least of which is a strong objection to warm clothes.

The Bissagos Islands, as seen from the mouth of the Geba, present the appearance of a vast series of hedges striking off in all sorts of oblique angles. They seem to arise right out of the sea. In point of fact, however, the coastal line describes gentle undulations, giving a possible rise of 50 feet over a shore of, say, a quarter of a mile wide. On this low-lying shore the African Oil Palm (Elæis guineensis) is seen to great perfection and in very large numbers; often faced right on the coast with dense Mangroves. Beyond this thin marginal line is a table-land, obscured often by the coastal vegetation, hence the very general appearance of mere hedge-like lines.

In due course we reach Bolama, and speedily find ourselves on the dry land of that island. It is the third week in November, and consequently the rains are definitely over.

It is nearly midday, dry as dust under foot, hot, decidedly moist atmosphere, and perfectly calm. Withal there is much activity and pandemonium among a large and very picturesque assortment of blacks of all ages and both sexes, owing to the discharge of cargo from two ships and the new arrival.

As we have to wait some time on the coast we move under two fine trees, which give the key to the giants of the islands. One is the silk Cotton tree, the Kapok of West Africa (Eriodendron anfractuosum), the other the Baobab (Adansonia digitata), both trees of economic importance. Near by are fine specimens of Mimosa (Pentaclethra macrophylla); they are loaded with battalions of very large Bean-like seed pods. With its fine spreading head of beautiful foliage, this Mimosa makes a very fine tropical shade tree.

Presently we move off, and light luggage is deposited in a near store-keeper's capacious rooms. I at once asked to see the store-keeper's back garden. It is quite small, about 20 yards square more or less; knowing something of back gardens at home, and seeing nothing but buildings from where I then was, I was surprised to find a Cocoanut Palm in full crop. Then, and subsequently, I was at considerable pains to count the number of nuts, and made out 103, with no fewer than 30 nuts on a single branch. Remembering how large Cocoanuts are as seen growing, this was a marvellous crop for a single branch to carry, and I wished very much it could have been severed intact, and exhibited in, say, the No. 2 Museum at Kew.

I was assured that 12 years previously this back garden was a coastal blank save for the two Cocoanut Palms, which were said to be either 19 or 20 years old. Various other specimens tend to show these islands would grow Cocoanuts exceedingly well. The sum of all coastal line relative to internal area is enormous. This back garden had also Bananas, thick-set dwarf plants, thriving abundantly and producing mostly small to medium-size fruits, delightfully scented, sweet, and really excellent for dessert, in striking contrast with the bulky inferior fruit everywhere hawked in London.

In this garden are two kinds of Anona—squamosa and A. muricata and the Cashew Nut (Anacardium occidentale). I have seen this last tree in India several times, but never had the opportunity of studying it until I was delayed at Bolama. It is immensely interesting at flowering time and during the early stages of fruit and nut production.

In full size this tree may be likened to a Standard Apple tree, with a large but somewhat spreading head. The flowers are very freely produced, but ridiculously small, of a pinkish-red in colour. I think a short-sighted person would fail to discover them. They are produced in large, branching spikes or panicles.

I should say that quite 95 per cent. of the flowers fall off. The average number which set fruits seemed to be about 3 per cent.

Towards the end of the spike, as a rule, with exceptions, however, a development begins and a formation ensues, which, so far as I know, has no like elsewhere in nature—an obtuse miniature Pear-like peduncle is produced, and from the extreme apex of this peduncle is immediately developed a naked Scarlet Runner-like bean or nut.

The growth of the peduncle and seed, or nut, in its infant state is really phenomenal; in so short a time as 48 hours immense progress is made. The primary stalk, very short though it be, thickens greatly, and it is easily seen great energy is focussed on the development of the two or three fruits and nuts to each spike, as no sooner is the formation begun than all the rest of the numerous flowers die and fall from the tree.

It is not too much to say, as witnessed several times a day for a few days consecutively, that so far as size is concerned more than half the life history of a Cashew Nut is accomplished in a week; the subsequent stage of maturing, however, takes much more time.

I sampled wine made from the peduncle with a distinct Cashew flavour, but unfortunately in this case far too much alcohol had been developed. The nut itself when roasted is excellent eating, and the peduncle and nut are used in various ways.

The Mango—originally introduced from Goa, India—is a luxuriant success on the Island of Bolama, producing large trees, and the Government and people alike have combined to plant many hundreds in all sorts of places, totally oblivious of town planning schemes, and still more oblivious of the indispensable necessity of grafting Mangos if quality be desired.

It is a remarkable fact, save for a very few inconsequential decorative plants, every plant in Bolama is grown for its utility. Thus almost everywhere in the town are to be found Bananas, Oranges, Lemons, Mangos, Cashew Nut, Pineapple, Figs, Coffee, Cocoa, Kola Nut, and a variety of other minor economic plants, not the least of which is "Grains of Paradise" (Amomum Melegueta). I venture the opinion that this plant produces in its Chili-like seed pods the greatest amount of pungency in quite the smallest compass known. It has all the appearance of a small-leaved Chili plant; it, however, grows to the size of a large-sized Black Currant bush and is perennial. It becomes studded all over with many hundreds of minute bright red fruits from ¼ inch to ½ inch long, and very small in size. As a condiment its use is universal among black and white; from an economical point of view the Chili is quite outclassed by Amomum Melegueta. Our manufacturers have long ago found out its merits, and probably without knowing it cattle and humans who consume medicines, condiments, cordials, wines, beers, and spirits are in the habit of taking microscopical quantities.

The very small garden attached to the governor's palace, so-called, has a delightful medley; it is right on the street so that all may see. Into this small space are crowded Roses, Oranges, Coleus in full flower, Hibiscus, Acalyphas, Crotons, Vinca rosea, Castor Oil plants in full seeds, Papaws, Marantas, Kola Nut, Oleandra, and a most brilliant flowered shrub or small tree unknown to me, possibly a member of the Proteaceæ from the Cape.

In the town is a small market place, where is exhibited for sale everything produced in the way of live and dead animal and vegetable; an extraordinary jumble. Directly off this

market place is a small square worth noting, for the striking effect produced by a certain combination of plants. It is loosely filled with the African Oil Palm, Mangoes, a few species of Bauhinia, Acacia, and Cashew trees.

The climate of this group of islands is rather severely tropical the year round; it is also on the whole a rather standardised climate that takes very little account of European theories of seasons.

Thus there are two seasons only, of about six months duration each: the hot, dry season from November to May, and the hot, wet season from May to November. Systematic use of a tropical thermometer during November and December showed a daily range of about 15° with a minimum of 70° and a maximum of 85° F. This obviously gives an average of 77½°, which, however, is too arbitrary; thus the daily average from, say, 9 a.m. to 9 p.m. will be quite 82°, the heavy fall of 15° takes place after midnight and lasts until sunrise.

The islands are set in a vast inter-oceanic space, just off the North Atlantic; consequently, the island waters are of the nature of protected bays and harbour waters. They are also subject very fully to the action of the tides, and consequently, every day sees many hundreds of acres of blank island coast, and a perpetual change of waters derived from the Atlantic Ocean, and this fact has, I do not doubt, much to do with the remarkable uniformity of climatic conditions. It also gives rise to abundant moisture; even in the rainless period the humidity is considerable. At sunset there almost instantly ensues a tremendous amount of very warm sea vapour wetting everything and passing over the islands; add to this the heavy fall in temperature after midnight, and it is easy to understand why the Bissagos Islands have always a very heavy dew on them in the early morning.

Characteristic of a great deal of Guinea weather are the absolutely death-like calms; these are specially pronounced at sunset, but commence after noon on most days—by the way, during the dry period the sun goes down a deep blood-red. The most sultry weather of England is not for a moment to be compared with these Guinea coast calms; even the thermometer refuses to move a point for six hours at a stretch.

The rainfall is about 125 inches, which is rather low for so tropical a quarter; this fall is almost entirely confined to the wet period.

The physical features are very much the same in all the islands. The coastal lines are extremely irregular; there are also numbers of beautiful bay-like recesses of various sizes.

There are some reasons for suggesting a volcanic origin. Thus in numerous places round the coast are quantities of a petrified rock of very rugged description. This rock is intensely hard, very heavy, withal brittle.

Another significant fact is the paucity of the fauna. There is no evidence of a single large animal of any kind on any of the islands; indeed, during the whole time I spent investigating certain propositions, I failed to see a single animal, large or small, or even a snake. I was informed, however, that snakes exist, and there is evidence of some kind of rodent of a small type.

The soil is everywhere an intense red-brick colour. It is, however, impregnated with quantities of very fine silica, and must, on no account, be classed with clays or marls. It suggests a fire-burnt soil. Its mechanical features, from the point of view of cultivation, are good; it is also a good absorber of water.

The depth of soil is enormous; indeed, I was nowhere able to gather with any accuracy what the subsoil might be, the only available evidence pointed to a grey type of pure sand.

Another curious feature of these islands is the absence of stone of any sort—I nowhere came across stone, large or small; common-place pieces of stone one can pick up on land nearly everywhere are not to be seen. On the surface and near it are quantities of common-place sea shells in several places in the interior of the island, which seems to suggest they must at some time have been under water.

Opposed to volcanic origin is the fact that these islands—apart from a certain amount of purely coastal rise of a very gentle description—are strictly non-mountainous; indeed, the interior can only be described as table-land, with here and there the smallest of undulations.

Of the group, the small island Egeba is a sea-level island all over. So much is this the case, that the natives grow rice nearly all over the island, and this, too, among many thousands of matured Oil Palms; indeed, this particular island might well have been named Palm Island.

Questioned as to whether the Rice was dry-land Rice, I obtained the answer, "No, not exactly; it is like this, during the wet weather this island lies wet all over: after the rains or rather by the end of them, the Rice crop is so much advanced as to be able to ripen off." And this I found to be so from personal observation.

This is the only island of the group that may be said to be an island of Palms, and it is significant of the requirements of the Oil Palm as such, further borne out by the fact that the Oil Palm refuses to invade the table-lands of the other islands, save in very limited numbers and in a very irregular manner, the while being very numerous to dense on the coast. From which I gather that we have in Elæis guineensis a Palm akin to the Cocoa-nut Palm, which succeeds perfectly near the coast, or otherwise demands a lowland or continuously damp situation.

The predominating feature of quite a number of these islands is the African Oil Palm and no other; they exist, particularly near the coast, by the million.

In the interior of many of the islands are groups of Silk-Cotton and the Baobab tree.

The so-called Silk-Cotton tree (Eriodendron anfractuosum) is surely in the front rank of tree wonders. There are several marvellous specimens on the Bissagos Islands, one of which I found to be 50 yards in circumference at the ground level. Of course, the striking feature of this tree is the remarkable system of buttressing from the ground-line up to as much as 15 feet to 20 feet. One of these giants had a great wealth of a species of Orchid freely intermixed with Stag's-horn Fern growing on it. *F. W. Sears.*

(To be continued.)

Fig. 24.—PHILADELPHUS "VIRGINAL": FLOWERS WHITE.

PHILADELPHUS "VIRGINAL."

The beautiful variety of Mock-Orange, illustrated in fig. 24, was raised by Messrs. V. Lemoine & Sons, the well-known French nurserymen. This variety received a first-class certificate when shown at the meeting of the R.H.S. on June 28, 1911, by Sir Trevor Lawrence, and a flowering spray was reproduced in *Gardeners' Chronicle*, July 8, 1911, fig. 6, p. 6. The double, pure-white flowers are nearly 2 inches across, and, as the illustration shows, they are very freely produced.

The Week's Work.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

WATERING THE CROPS.—To be effective in hot weather, the watering of kitchen-garden crops must be thorough, otherwise it is a waste of time. During the evenings of hot days, sprayings overhead greatly assist growth, and also do much to keep the plants free from insect pests. Wetting the foliage in this manner is beneficial to all crops without exception. Should aphis, mildew or other insects or diseases attack the plants, spraying should be done before the pest obtains too great a hold. Quassia is an excellent wash for Peas, Dwarf Beans, and other crops, and is especially valuable in checking mildew. The spraying or syringing should be carried out in the evening time, and the growth washed the following morning with clear water. Give a thorough soaking of clear water at the roots, if possible, immediately after the syringing.

DWARF BEANS.—During the next few weeks a few sowings of Dwarf Beans may be made at intervals in cold frames. Frames in which crops of early Potatos have been grown may be utilised, and will need but little preparation. The soil should be rich and deeply-worked, adding a small quantity of manure from a spent Mushroom bed. The drills should be drawn at 3 feet apart, and made 6 inches wide and about 2 inches deep. The seed should be sown thinly in a double row, and the seedlings thinned so that the plants will stand alternately in the rows. The soil and surroundings should be kept moist to assist germination, and abundance of air afforded. When the seed germinates a dusting of soot over the soil will act as a deterrent to slugs, and to ensure safety from this pest, a layer of sharp cinder ashes should be placed around the interior of the frame. When the first rough leaves develop the points may be removed from the shoots: this will add to the plants' productiveness and cause them to grow dwarfer, though it retards their fruiting. The plants should be well supplied with water at the roots and syringed frequently on the undersides of the foliage. Afford supports to the growths by inserting bushy twigs.

SPRING CABBAGE. — Between the 20th and the end of the present month, but not earlier, the first sowing of seed of the best varieties of Spring Cabbage should be made. The excellent varieties now obtainable are less prone to bolting than those grown a few years ago. Select an open situation and land that has not been freshly manured or cropped recently with any sort of Brassica. Break the surface soil down to a fine tilth, and if very dry soak the ground with water, then sow the seeds thinly and cover them with fine soil, placing nets over the seed-bed to keep off the birds. Until the seeds germinate, damp the seed-bed through a rose-can as often as is necessary.

CARROTS.—The main crop of Carrots should have the soil stirred with the Dutch hoe at frequent intervals, especially during hot, dry weather. Where means exist, during times of drought, the crop will amply repay for good drenchings of water by means of the hose-pipe on warm evenings. During showery weather sprinklings of soot and chemical manure will prove beneficial. A further small sowing or two of quick-maturing, stump-rooted varieties may be made on vacant borders for furnishing a supply of young roots.

TURNIPS. — From now onwards up to September make small sowings of Turnips at intervals for producing autumn and winter crops. Much of the success with these sowings will depend upon the weather. In hot, dry situations, they are almost sure to become attacked with the Turnip fly. Their principal requirements are frequent hoeings, attention to thinning as required, copious supplies of water, and dampings overhead in the evening time. As recommended for Carrots, dust the crop occasionally with soot during the early morning or when the weather is showery. Red Globe is a splendid variety for hot, dry weather.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

CHRYSANTHEMUMS.—These plants are generally growing well this season, the exhibition varieties having made a considerable growth. Many of the plants are, unfortunately, showing their flower-buds, but at this early date the latter must be rubbed out and another shoot selected for flowering. If it is desired to have some early flowers, buds may be retained towards the end of the month of those varieties that open their flowers kindly, such as Master James, Mrs. A. T. Miller, White Queen, Col. E. C. Converse, Mrs. G. Mileham, and Frances Jolliffe. Many of the early potted plants have filled their pots with roots, and a little mild stimulant should be given them, say, twice a week. Cow manure and soot water are suitable foods to start with; a little later in the season the plants may receive a light dressing of soil to which has been added a little artificial manure. Where decorative varieties are being grown as dwarf plants, the very latest of them will have been pinched for the last time. To ensure a "stocky" growth, the plants must not be over-watered, nor receive any stimulant other than a little soot water till they begin to show their flowers, when this food may be applied rather freely. The tying of the growths of all types of Chrysanthemums must be attended to regularly, and the plants sprayed to keep down aphis. Earwigs should be trapped in short lengths of bamboos placed against the stems of the plants. They are particularly troublesome this season, and much damage will be done by them unless they are diligently sought for.

EUPHORBIA (POINSETTIA) PULCHERRIMA.—The last batch of these plants should now be well rooted and ready for placing in a frame or house. If plants of the earlier batches are well rooted in 4-inch (54) or 4½-inch (48) pots, they may be transferred to 6-inch pots (large 32's). Though these plants require a moderate amount of heat and moisture during their growing season, a hot temperature and close atmosphere are liable to cause them to become drawn. Therefore, when they are well established, subject them to a moderate amount of fresh air, allowing as much room between the plants as possible.

EUPHORBIA JACQUINIÆFLORA.— The treatment given this plant should be similar to that recommended for E. pulcherrima, but a warmer temperature may be afforded. As mentioned in a previous calendar, I prefer to root these plants three in a pot, shifting them into larger pots as they require increased root room. If grown fairly hardy, they will form good specimens in 6-inch (32) pots, only needing the three shoots looped to a central stake as they develop. After potting the plants in their flowering pots, it is a good plan to train them up the wires of a Melon house, following a mid-season crop of Melons. In such a position the wood ripens well, which is essential for the production of fine flower-spikes. The syringe should be used freely to destroy red spider, which sometimes attacks the plants when grown near the top glass.

FREESIA REFRACTA ALBA.—If the old plants have been saved, no time should be lost before shaking away the soil, which will be in a dust-dry condition. A good number of the corms will bloom again, and likely ones should be picked out for potting; the second size corms may be planted about 2 inches apart in boxes, and if grown in a cool house will furnish good flowering corms for another season. The work may be done some time during August. If new stock is required, the corms should be ordered at once. If pure-white flowers are in demand, Jersey or French cultivated corms are far the best, the flowers being much more white and graceful than the ordinary F. refracta alba.

LILIUMS.—Liliums are generally very early in flowering this season. Where a continuous supply of bloom is required, retarded bulbs should be ordered at once. They should be potted and placed in a cold frame, covering the pots to a depth of 2 inches with some light material, such as leaf-mould or short straw. Bulbs growing freely and not expanding their flower-buds should be given liquid manure. If it is desired to prolong the season, some of the plants should be placed on the north side of a wall or building to retard them.

VIOLETS.—If dry weather sets in, syringe the plants well with soot-water two or three times a week, and give them occasional applications of soot-water or a light dressing of Clay's fertiliser. In many instances Violets last season were badly infested with red spider, and the pest may prove troublesome again this year. The underside of the foliage should, therefore, be very carefully sprayed with a mixture of soft soap and sulphur, and if this fails to do good, sulphide of potassium may be tried. Spraying in this way may seem a somewhat tedious operation with such small, flat-growing plants, but there are several good air-pressure sprayers on the market, by means of which the work can be carried out quickly and easily.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

ODONTOGLOSSUM. — Plants of the dwarf-growing section such as O. Cervantesii, O. Galeottianum, O. madrense, O. Rossii, O. Humeanum, O. aspersum, and O. maculatum that require repotting or resurfacing should receive attention. They are best grown in shallow pans —an ordinary Orchid pan without side holes is the most suitable receptacle—and suspended from the roof of a cool house. Use a compost consisting of equal parts Osmunda fibre and Al fibre, chopped up rather short with a quantity of chopped Sphagnum-moss and crushed crocks, mixing the materials well together. Pot firmly, placing the base of the plant just below the rim of the pan, and finish off with a surfacing of living Sphagnum-moss. Afford water carefully until the roots have grown freely in the new soil, after which moisture should be liberally supplied until the growths are completed. While in full growth the plants will be benefited by light sprayings overhead several times daily. All those enumerated are moisture-loving plants, and this fact should be considered when affording them a position in the Orchid houses.

ADA AURANTIACA.—This cool growing Orchid has just passed its flowering stage, and is sending forth new roots from the half-developed growths. At the same time the new growths are pushing from their bases. At this stage they should be given attention at the roots. If there is room in the pot for the full development of the season's growth, some of the old material should be removed and a little fresh compost applied. Others that require it should be repotted, using a compost similar to that recommended for the Odontoglossums. When well rooted, the plants require liberal supplies of water.

COCHLIODA.—Cochlioda Noetzliana, C. Vulcanica and C. stricta are best grown in shallow pans and suspended from the roof of the Odontoglossum house. Any repotting that is necessary should be done when growth commences afresh. The pans should be well drained as these plants require plenty of water at the roots. They should be potted in the same manner as advised for the dwarf-growing Odontoglossums.

TRICHOSMA SUAVIS.—This is another cool-growing Orchid of dwarf habit. The plants are pushing forth new roots from the partially developed growths, and they should be repotted or afforded new rooting material, as in the case of the other plants mentioned.

DENDROBIUM.—The cool-growing species D. Jamesianum and D. infundibulum should, as they start into new growth, be repotted or resurfaced as is found to be necessary. These plants may be grown in pans and suspended, or in pots standing on the stage, but in either case it is important that they are kept well up to the roof glass, so that they may receive plenty of light. They should be potted firmly in a mixture composed of equal parts Osmunda Al fibre and Sphagnum-moss chopped up rather short, with a few crushed crocks and a little coarse silver sand added. When growing actively the plants should be liberally supplied with water at the roots, but keep them rather on the dry side after growth is completed. They should not, however, be allowed to become quite dry, as at all times both the pseudo-bulbs and leaves should be in a plump, healthy condition. D. Victoria Regina should be grown in the same

house as D. Jamesianum and D. infundibulum. It grows best in shallow teak-wood baskets or fastened on a raft, with clean Sphagnum-moss as a rooting medium, and suspended in a moist, shady position.

FRUITS UNDER GLASS.

By E. Harriss, Fruit Foreman, The Royal Gardens, Windsor.

Strawberries. — Preparations should be made for potting the young plants, which will be required for very early forcing, in their fruiting pots as soon as they are rooted sufficiently. Get ready sufficient soil for potting the whole batch of plants, and place it under cover. That which we find most suitable is the top 4 or 5 inches of loam from an old pasture. To each barrowful of the soil are added an 8-inch potful of ½-inch bones and a sprinkling of soot, the whole being turned two or three times. In the case of very light soil, it is an advantage to mix with it a quantity of well-rotted farmyard manure. Heavy, retentive soil is improved by adding wood-ashes or finely-crushed brick rubble. Most of the plants may be potted in 6-inch pots, which should be properly cleaned and furnished with a few clean crocks for drainage purposes. A little soot sprinkled over the crocks will help to deter worms from entering the pots. Guard against placing the plants too deeply in the pots; the base of the crown should not be lower than the surface of the soil, as this would encourage the plants to form too many crowns. Make sure that the soil is in proper condition of moisture before commencing the potting, which should be done firmly. After the potting is finished, the plants should be placed in a somewhat shady position for a few days, to allow them to recover from the disturbance at the roots, and later in an exposed situation on a gravel or ash bottom. Spray the foliage two or three times each day until the plants are fairly well established, and afford water with great care till the roots are growing freely. Remove all runners, and endeavour to keep the plants to one crown. It is a good plan to syringe them with an insecticide occasionally to keep the leaves clean.

Pineapples. — There should now be plenty of strong suckers on the old plants of the Queen variety, which are ripening their fruits. As many as are required for the main batch should be potted without delay in order that the plants may be well established before the end of the season. The compost should consist chiefly of good fibrous loam, which should be pulled to pieces by hand, shaking out the fine particles of soil. If the soil is heavy in texture, a little charcoal and coarse sand should be incorporated with it. It is important that the soil should be in a suitable condition for potting; therefore, if it is at all dry, it should be moistened two or three days before it is required, turned several times to ensure the moisture wetting all the particles, and afterwards covered with mats. Use clean pots, and provide them with crocks for drainage purposes. Those ranging between 5½ inches to 7 inches in diameter should be employed, according to the size of the suckers. Prepare the latter by removing two or three of the bottom leaves and cutting off a small portion of the stem at the base. Place the suckers fairly deep in the pots and ram the soil firmly. The plants should be grown in a shallow pit and plunged in a hot-bed quite near to the roof-glass. The hot-bed may be made of Oak leaves which were thrown into a heap last year, mixed with two-thirds to one-third of their bulk of stable litter. Before plunging the pots, see that the temperature of the hot-bed is not more than 90°; it may afterwards decline gradually to 85°. The plants should be shaded during times of bright sunshine for the greater part of the day till the roots are active. They may then be gradually inured to full sunshine, eventually discontinuing shading altogether. Spray the foliage lightly with rain-water two or three times daily, and damp the bare surfaces in the house frequently to promote a moist atmosphere. If the soil is sufficiently moist at the time of potting, no further water will be required till the suckers have developed roots, and even at that stage moisture must be afforded with great care. The pit should be kept close and moist for the first few weeks, till it can be seen that growth both above and below ground is active. When the roots are growing freely they should receive more air and less shading. During very warm weather, fire-heat may be dispensed with, and even when artificial warmth is necessary, guard against using it to excess, as that would prove harmful to the plants. If the minimum temperature can be maintained at 70° by the sun's rays, fire-heat will not be necessary. Suckers which are becoming too large on plants of the varieties Charlotte Rothschild and Smooth Cayenne should be removed and potted in the manner advised.

Successional Plants of Pines.—Plants for successional fruiting should be encouraged to grow as fast as possible, consistent with maintaining strong, healthy foliage. The successful fruiting of these plants next year depends, in a great measure, on the treatment they receive during the present growing season. Having plenty of roots, they should be growing rapidly, and stimulants may be applied with much more freedom than hitherto. Admit air freely during the morning, when the weather is warm, but close the ventilators early in the afternoon after syringing the plants.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Ivy-leaved Pelargoniums in Beds.—Few plants produce a more brilliant effect throughout the summer months, especially in warm and dry situations, than Ivy-leaved Pelargoniums. At Eastwell we employ them largely for colour effects in the flower-garden, and usually plant large pyramidal-shaped specimens thinly over the bed, carpeting the remaining surface with dwarf plants of the same variety. This system is followed where it is desired to have beds of one colour only. But there are many varieties and many shades of colour, and they provide a diversity when mingled. Tall plants that have been trained to sticks, and with shoots looped up loosely, must have a still stronger stick to support them when planted out-of-doors. The larger the plant, the stouter should be the support, and the stakes should be placed in position directly the beds are planted. The growths should be looped up regularly to show to the best advantage, but should not be tied too stiffly, or their greatest charm will be lost. Remove the old blossoms and decaying leaves.

Solanum crispum. — This beautiful shrub has flowers of a light blue colour, a shade not very common amongst flowering shrubs. The plant is of vigorous growth, and, when well established, flowers in profusion from May or June till the autumn. In these gardens it is planted in a warm situation, as a bush, in a border with no other protection than a wall behind it, and, so far, it has passed through several winters without injury. It grows very quickly, and soon makes a good specimen, succeeding in almost any soil. In cold districts it would be advisable to grow it as a wall plant, and it is well worthy of the position.

Sweet Peas.—On no account allow the old flowers to form seed pods, for if seed is allowed to develop the plants will cease to bloom; they should be removed at least once weekly. Give a little reliable artificial manure at intervals, choosing showery or dull weather for its application. Place a mulch around the base of the clumps or rows, to conserve the moisture in the soil and to save watering. If late-sown plants are required to be at their best condition at a certain date, pinch every bloom off as it appears until a short time before flowers are wanted.

Dahlias.—Place stout stakes to Dahlias as required, and thin the shoots on old plants where necessary. Tie the main stems securely to the stakes and allow the plants plenty of room for development. The showery weather has suited these plants, which are now making rapid progress. Destroy weeds by the constant use of the hoe, and mulch the border if a drought appears probable. Guard against the presence of slugs, earwigs and caterpillars.

Ornamental Grasses.—Many grasses are very pretty and useful for decorative work in the garden and dwelling room. These are best grown either in the kitchen garden or in the reserve quarter: they may also be sown in rows across a border. The plants should be thinned to 9 or 12 inches apart, according to the variety, as certain species require considerably more space than others. Hordeum jubatum, Eragrostis elegans and Briza maxima are three ornamental species to be recommended.

Gypsophila paniculata. — This decorative plant is a perennial that may be grown easily from seed. The plants do not require much room the first season, but afterwards they develop into bushy specimens requiring considerable space. A few plants may be included in the mixed border, and a good be planted in the reserve garden for purposes of cutting. For use in a dried state, it should be cut when at its best condition, and suspended in a clean, dry place. The double-flowered variety has become very popular, and should be included in the mixed border or rock-garden.

Wallflowers.—Seedling Wallflowers should be pricked out from the seed beds before they become drawn and spindly. Plant them in rows at 1 foot apart, and allow a space of about 9 inches between the individual plants. They are best planted in firm and not over-rich soil, which induces a solid growth that is able to withstand the severe weather of winter. In loose, rich soil, the growth is apt to be very soft, and such plants do not transplant well, besides being often harmed by cold.

THE HARDY FRUIT GARDEN.

By F. Joroan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Layering Strawberries.—Having filled the pots with soil so that all is in readiness when required, the layering should be done as soon as the fruits are gathered. The use of pots is preferable to allowing the runners to root in the beds, being much more convenient. Runners layered early become well established before the winter sets in, and will furnish a fair crop the following season. On light soils, provided they receive special attention, these young plants produce the finest fruits. Runners that are lifted direct from the ground with a little soil attached to the roots, will furnish fairly good plants, but they will not compare with those layered in pots. Plunge the pots partly in the ground as this will save labour in watering. Select the strongest runners only, and pinch off all growth beyond the layer. Secure the runners to the soil by means of pegs or place stones on them to keep them in position till rooted. Plant out late forced plants if the work is not already done, as the ground is in a very suitable condition to receive them. See that the roots are well watered a few hours previous to the planting, when further waterings will not be necessary unless very dry weather sets in, in which case a mulch of manure from an old Mushroom bed or similar material should be applied. Old plantations which are not considered worth retaining should be grubbed up at once, and the ground prepared for some other crops. Remove all weeds and dig the soil, incorporating with it manure in quantity according to the condition of its fertility. Allow the ground to settle for a few days before planting the next crop.

Pears and Apples.—The rains have not only caused the fruits to swell, but they have also cleansed the trees of insect pests. Trees that are bearing heavy crops should be thinned of superfluous fruits. This will increase the size of those that remain and conserve the energies of the trees, so that they will be in a condition to bear again next year. When thinning the fruits, take into consideration the characteristics of the different varieties; thin those most that produce the finest fruits, unless the trees are growing too vigorously, when a heavy crop will assist in correcting a gross growth. Many failures in the Apple crop are reported from all districts, but Pears appear to be an average crop.

Wall Trees. — The frequent rains have resulted in the trees making a quantity of weak and sappy growth, therefore no more shoots of the current year than are absolutely required should be retained. Pear, Plum and Cherry trees should be attended to, stopping and tying the shoots and spurring back the breastwood to allow the sunlight and air to reach the shoots that are retained, that the wood may become thoroughly ripened. Trees of Morello Cherry should receive attention, again securing the shoots where necessary. Nets that have been used to protect Strawberries should be placed over the trees before the fruits change colour.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY JULY 23—
Nat. Carnation and Picotee Sh. at R.H.S. Hall. Brighton, Hove and Sussex Hort. Soc. Sh.

WEDNESDAY, JULY 24—
Leamington Fl. Sh. (2 days). Normanby Fl. Sh. (2 days). Bishop's Waltham Fl. Sh. Royal Botanic Soc. meet. Haywards Heath Fl. Sh. Tunbridge Wells and South Eastern Counties Agric. Soc. Sh. Eastbourne Sweet Pea and Rose Sh. (2 days),

THURSDAY, JULY 25—
St Ives (Hunt.) Fl. Sh.

FRIDAY, JULY 26—
Huddersfield Hort. Sh. (2 days). Cheadle Fl. Sh. (2 days).

SATURDAY, JULY 27—
Fife and Kinross Fl. Sh. Western Rose Soc. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62·9.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, July 17* (6 P.M.): Max. 83°; Min. 61°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, July 18* (10 A.M.): Bar. 29·8°; Temp. 68°; *Weather*—Overcast.
PROVINCES.—*Wednesday, July 17:* Max. 75° London; Min. 54° Scotland, N.

SALES FOR THE ENSUING WEEK.

FRIDAY—
Specimen Selaginellas, Imported and Established Orchids, 24 cases various Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Nursery, Horsenden Hill, Greenford Green, Middlesex, with Glasshouses and Buildings and 9¾ Acres of Land, at the Mart, London, E.C., by Protheroe & Morris, at 2.

The Horticultural Output.

It could hardly be expected that the first attempt to ascertain approximately the horticultural production of the country would prove entirely successful, and the estimates included in *The Agricultural Output*, published by the Board of Agriculture as part of the census of production in Great Britain, cannot be regarded as altogether satisfactory. The subject, covering fruit, flowers, and all culinary vegetables grown in the open and under glass, is of very difficult investigation, and requires to be conducted under the advice of experts if trustworthy information is to be obtained. Even then the inquiry into production and money returns would demand disclosures of business concerns which comparatively few growers would be willing to make. With ordinary farm crops the case is different. While the average is returned by occupiers of land, and the yield is estimated by local officers of the Board of Agriculture, the values of the principal Corn crops are divulged by the Corn returns, collected for the annual valuation of the tithe rent-charge, and the prices of most other products are collected from market reports and summarised for a great number of years, while the feeding values of crops, nearly all consumed by live stock on farms, are familiar to agriculturists generally.

Another reason why there is greater difficulty in ascertaining the horticultural than the agricultural output is that the agricultural returns cover only holdings over one acre, and the proportions of horticultural products grown in smaller holdings, including gardens, are much greater than those of ordinary farm crops. Then, in attempting to estimate yields of such crops as small fruit, vegetables, or flowers grown among fruit trees, the produce cannot be regarded as the yield per acre of the area of the orchards, because these undercrops do not occupy all the land. For example, the Gooseberry bushes grown in an acre of taller fruit trees ("top" fruit) would not occupy an acre of land, and would not be so numerous or productive as bushes grown alone upon an acre. Again, in attempting to ascertain the yields of the several fruits per acre it would be necessary to follow some definite rule as to the respective ages at which fruit trees and bushes should begin to count as bearers. To take the total yield of Apples, if it could be ascertained, and divide it by the total acreage of that fruit, to get at the yield per acre, would be misleading, because a considerable proportion of the area is covered by trees too young to fruit at all, and a still larger one by young trees yielding only a trifling quantity of fruit.

There is nothing in the report to indicate that any attempt has been made to meet these difficulties in the way of trustworthy estimates of yield. Indeed, the quantities given in relation to yield seem to indicate that the peculiar difficulties have been ignored.

One advantage is to be derived from the report, namely, that it embodies details as to the acreages of Gooseberries and Currants separately, instead of together, as in the annual agricultural statistics. The figures in the report relate to the year 1908, and to holdings over one acre in Great Britain. Those for orchards are as follow, in acres:—Apples, 172,751; Pears, 9,604; Cherries, 11,868; Plums, 15,683; Nuts, 2,968; other orchards, including mixed fruits, 37,423; total orchards, 250,297. This total covers 27,433 acres of small fruit grown among the trees, and in addition 57,447 acres were occupied by small fruit alone, making the total for small fruit 84,880 acres including 28,815 acres of Strawberries, 9,323 of Raspberries, 5,939 of Black Currants, 3,761 of Red and White Currants, and 16,541 of Gooseberries. If holdings of one acre or less, including Orchards and gardens, the quantities would have been much greater. The following table gives estimates of yields and values in 1908, a year in which the crops are stated to have been under average:—

Crops.	Quantities cwts.	Values £	Yields per acre cwts.
Apples	4,486,000	1,490,000	26
Pears	183,000	90,000	19
Cherries ...	176,000	194,000	15
Plums	715,000	357,000	46
Others and mixed ...	812,000	406,000	—
Total orchard fruit ...	6,372,000	2,537,000	—
Strawberries ...	829,000	1,036,000	29
Raspberries ...	206,000	309,000	22
Black Currants	56,000	84,000	9
Red and White Currants ...	68,000	69,000	18
Gooseberries ...	347,000	208,000	21
Others and mixed ...	252,000	252,000	—
Total: small fruit	1,758,000	1,958,000	—
Totals: all fruit	8,130,000	4,495,000	—

The figures for Apples and Pears include fruit used for making cider and perry.

Most of the yields per acre seem very small even for a season in which the crops were under average. Moreover, the several yields show remarkable lack of proportion one to the other. To put 46 cwts. per acre for Plums and only 26 cwts. for Apples, and to make Red and White Currants yield twice as much as Black Currants is to stamp the estimates as untrustworthy. It must be imagined that estimates of yields were obtained for limited areas, the totals being divided by the figures representing acreages of the several kinds of fruit, without considering whether the trees and bushes were of bearing age or not. Some inquiries were made as to glasshouse products; but the results were not such as to allow of estimates being given. The total area in Great Britain devoted to flowers and shrubs is put at a little over 4,000 acres, and the value of the products at £121,000. These figures seem very small. Over one-eighth of the area was under flowers a few years ago in the Scilly Isles alone, and there are large flower farms and shrub nurseries in various parts of Great Britain. As for the value, it would be surprising to learn that the sale of British flowers in Covent Garden Market alone did not exceed £121,000 per annum.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—The annual exhibition of this Society will be held in the hall of the Royal Horticultural Society, Vincent Square, Westminster, on Tuesday, the 23rd inst. Particulars may be obtained from the Hon. Secretary, Mr. T. E. HENWOOD, 16, Hamilton Road, Reading.

NATIONAL VEGETABLE SOCIETY.—The secretary asks us to announce that at the forthcoming show traders are excluded from competing in Classes 26 to 39 inclusive, in which the prizes are offered by Messrs. DICKSON & ROBINSON. Through inadvertance the condition is omitted from the schedule.

NATIONAL GLADIOLUS SOCIETY.—The second summer show of this society will be held in the Royal Horticultural Society's Hall, Westminster, on August 13. The schedule embraces only 11 classes, and the prizes consist of silver trophies and medals. A silver cup is offered by Sir FRANCIS BURDETT, Bart., President of the Society, for the best collection of Gladioli in the show. *K. Atkinson, Hon. Secretary, Locksheath, Southampton.*

RINGING PEACH TREES.—Investigations made at the experiment station, Bologna (Italy), appear to show that the removal of rings of bark from branches of fruiting trees results in larger and more rapidly ripening fruit, and does not produce any ill effects in the trees themselves (*Queensland Agricultural Journal*, May, 1912).

LÆLIO-CATTLEYA RUBENS "THE KAISER."—In the neat group staged at Holland House by E. H. DAVIDSON, Esq., Borlases, Twyford (gr. Mr. Cooper), this fine hybrid, which secured an Award of Merit, was a prominent feature. The plant, which is dwarf in growth, has abnormally large flowers of a bright-rose tint, the lip being intense ruby-purple with a yellow disc. It was raised by crossing Lælia pumila prætans and Cattleya Hardyana.

LONDON VACANT LAND CULTIVATION SOCIETY.—The fourth annual meeting of this society was held on the 12th inst. at the residence of Baron DE FOREST, M.P., St. James's Place, W. Mr. FRANK SMITH, L.C.C., presided, and in an interesting speech stated that the 500 plot-holders had in four years raised produce worth £7,000 for use or sale. Exhibits sent by the plot-holders were greatly admired. Applicants for plots now number 600, and more land is urgently needed. The hon. sec. is Mr. JOSEPH FELS, 39, Wilson Street, E.C., and the superintendent, Mr. R. L. CASTLE.

ROYAL APPRECIATION OF AN EXHIBIT AT THE "INTERNATIONAL."—Messrs. WALLACE & Co. have received the following letter from Col. STREATHFIELD, private secretary to Queen ALEXANDRA:—"I am commanded by Queen ALEXANDRA to thank you very sincerely for the beautiful water-colour and photographs of your rock-garden at the International Horticultural Exhibition, which you sent to her Majesty, through Sir GEORGE HOLFORD, this morning. Her Majesty thinks Miss DU CANE's picture lovely, and is very glad to accept your kind present. Queen ALEXANDRA is very glad to know that you won her Cup, and thinks the award most justly made, as she has a most pleasing recollection of the beauty of your garden when visiting the Exhibition at Chelsea."

MR. R. LOCKE.—Mr. R LOCKE, the Superintendent of the Government Gardens at Delhi, has received the Kaiser-I-Hind decoration for the excellent work he carried out in connection with the Durbar last year. Mr. LOCKE is the second Kewite who has received this honour at Delhi.

HOW TO MAKE JELLY.—Miss MARGARET MCCALL, a graduate of the Oregon Agricultural College, has an article on making jelly in the last number of *The Oregon Countryman*, published by the students. She states that the most common disappointments in jelly-making are failure of the jelly to harden and the candying of the jelly. Jelly is made by combining sugar and fruit juice and heating to the boiling point for a short time. The ability of the fruit to form jelly is owing to a substance called pectin, present in all fruit when ripe or nearly so. Pectin is similar to starch, and it is the action of the pectin and the acid in the fruit which causes it to gelatinise. Fruit for jelly should be selected carefully, being not over-ripe, so that the pectin is at its best. It should be freshly picked and free as possible from defects. An acid fruit is usually preferable for jelly, but some acid fruits are deficient in pectin, and thus difficult to make into jelly. This trouble may be overcome by adding fruit juice containing a large amount of pectin. The flavour will be modified,

FIG. 25.—LÆLIO-CATTLEYA RUBENS "THE KAISER": SEPALS AND PETALS, ROSE COLOUR; LIP, RUBY-PURPLE WITH YELLOW DISC.

but in many cases the result is a very good jelly. Some of the most desirable fruits for jelly-making are Currants, Blackberries, Raspberries, Loganberries, Grapes, Quinces, Peaches, Apples, and Crab Apples. Juicy fruits, such as Currants and Berries, should not be gathered directly after rain has fallen on account of the large amount of moisture they absorb. They should, for the same reason, be washed as quickly as possible. They may be put in the preserving kettle after washing, crushed slightly with a wooden spoon and heated slowly, stirring them at frequent intervals. When the fruit is hot it should be crushed thoroughly with a wooden vegetable masher. It should then be strained through a double thickness of cheese-cloth placed over a wire strainer, which is over a large bowl. It should drain as long as the juice will drip, and pressure should not be used. The clear juice may be used at once, or may be strained through a flannel bag before use. When the juice has been measured into a clean preserving kettle, a pint of granulated sugar should be added for every pint of juice and stirred until dissolved. When it has been put on the fire and brought to a boil, it should be drawn back and skimmed. This should be repeated twice before pouring the liquid in hot, sterilised jelly glasses. The glasses should be put near a sunny window in a room free from dust and covered with cheese-cloth until the jelly has set. Large fruits, such as the Apple, must be boiled in water until soft, and the liquid strained from the pulp before making the jelly. The heating of the fruit juice and sugar to the boiling point serves three purposes: to sterilise the material completely; to concentrate it to the proper consistency; and to invert, by the combined action of temperature and free acids, a large quantity of cane sugar, preventing the jelly from granulating. Precautions to be observed in jelly-making are: Do not use iron or tin utensils; the fruit acids attack these metals and give a bad colour to the finished product, and affect the taste; the kettle should be porcelain, lined or enamelled, or of aluminium. Do not cook the fruit juice and sugar too long or the pectin will lose its gelatinising power. Do not add too great a proportion of sugar or the jelly will crystallise. Hard boiling may also cause crystallisation. Jellies should be covered as soon as they have set to prevent the growth of moulds and bacteria, and to prevent evaporation. When removed from the glass, the jelly should be firm, but not tough. It should preserve its angles when cut, and should have a good colour and a distinctive flavour of the juice used.

L.C.C. GARDENERS.—Consequent upon the reorganization of the outdoor staff of the Parks Department of the London County Council, which has already been referred to in the *Gardeners' Chronicle*, various promotions have been approved by the Council, and the grading of some of the officers has been altered so as to be in agreement with the revised classification. As regards the grades of men whose rate of pay under the new scheme is on a rising scale, it has been decided that the men concerned shall be granted an immediate increase within that scale when they have served one year or more at the wages they respectively received when the scheme came into operation.

POTATO MOTH IN FRANCE.—In Var, a southern department of France, the Potato moth is causing great damage. As a remedy for its ravages it is proposed (*Horticulture Nouvelle*, Bull. Commt., 1912, 40, 132) not to plant Potatos in the department for a period of two years, and, during that time, to treat the soil with injections of carbon bisulphide, and it is recommended that the same substance be placed in flat dishes to impregnate the air where Potatos are kept, and so kill the insects in the tubers. The larvæ of the Potato moth mine the leaves in the summer; in autumn and winter they burrow in the tubers, both when in the ground and when stored. The Potatos are so affected with the unpleasant odour which the excrement of the larvæ causes that even cattle refuse them.

FIG. 26.—CAMPANULA ALLIONII ON MORAINE.
(See p 53.)

A NEW FERTILISER.—Reference is made in the Board of Trade *Journal* to a new artificial manure, which is being manufactured in Norway. The new manure, which contains 26 per cent. of phosphoric acid and 23.8 per cent. of nitrate of lime, is a by-product formed in the course of manufacture of nitrate of lime. We understand that the fertiliser, which should prove of value because of its phosphorus and nitrogen contents, is not yet on the market, but that it can be produced at a low price.

SCENTLESS ROSES.—A correspondent who has very decided opinions upon the demerits of a Rose that lacks perfume, asks us to publish the following extract from a report of the National Rose Society's Show printed in the *Daily Telegraph* (July 10, 1912):—"The improvement of the Rose during late years has been very considerable, but it is a matter of serious reflection that it has taken place to the neglect of fragrance. In the catalogues of many of the largest firms in the country fragrance is hardly mentioned. Sometimes, when a Rose is described which is pre-eminent for scent, that important quality is not referred to by so much as a word. It is true we are not like Eastern nations in their fondness for sweet perfumes; our climate interferes. Still, in regard to all flowers fragrance is more appreciated by the general public than any other quality. What the lover of sweet flowers may hope for is that the time will come when scentless Roses will be disqualified at Rose shows, and that in catalogues it may be plainly stated which are the flowers that are only faintly or not at all impregnated with this adorable attribute."

LIME-SULPHUR AND POTATOS.—*The American Florist* (June 8, 1912) draws attention to the results of experiments carried out at the New York experiment station, which appear to show that lime-sulphur, when used as a substitute for Bordeaux-mixture, is injurious to Potatos. Plants so treated were dwarfed by the insecticide, died early and yielded about 40 bushels less to the acre than the rows which were unsprayed. The use of Bordeaux-mixture, on the other hand, resulted in an increase of 60 bushels to 100 bushels on the Bordeaux-mixture-sprayed plots, as compared with 40 bushels on the unsprayed plots of equal area.

VINE MILDEW.—It is sometimes said that, because infection of vine leaves by the spores of Plasmopara viticola takes place from their under-surfaces, spray fluids need only be directed toward the lower surface of the leaves. Observations made recently by L. RAVAZ and G. VERGE indicate the necessity for spraying both upper and lower surfaces. For it is on the upper surfaces that the spores fall. There they germinate and produce motile spores (zoospores), which find their way to the under surface of the leaf and penetrate into its tissues from that surface.

TWO GOOD MORAINE PLANTS.

CAMPANULA ALLIONII.

One of the most showy of the plants that flower in my moraine in the early part of May is Campanula Allionii (see fig. 26). In this garden it is the first of the "bell-flowers" to come into blossom.

From rosettes of somewhat glossy-green leaves rise on short stalks beautiful, purple, trumpet-shaped flowers, reminding one of a refined Canterbury Bell. The species seems to be somewhat variable in the depth of colour and the length of stalk. At the International Exhibition, a particularly large, dark form was shown by Mr. Clarence Elliott, which seemed almost stalkless, whereas my flowers are usually supported some 2 inches or 3 inches from the ground.

In the ordinary rock-garden soil, this plant is, I believe, not too free, but in my moraine, consisting of, approximately, 15 parts of stone chips to one of soil, and with fresh water, more or less in quantity, passing through the lower strata from about March to October it thrives apace.

Fig. 27.—Edraianthus serpyllifolius on Mr. Malby's moraine.

Two years ago I planted three rosettes of this lovely Campanula, and I now have (without having in any way interfered with it in the meantime) over 70 rosettes, and this year it produced something over 30 flowers, several of which appear to have set seed.

Seeing that this result has followed from the employment of the moraine conditions which Mr. Farrer recently described in *Gard. Chron.* as "not only entirely unnecessary, but even harmful," it is, I think, somewhat remarkable, and suggests that it is not altogether wise to be too emphatic as to what plants appreciate.

EDRAIANTHUS SERPYLLIFOLIUS.

Another good plant which thrives in my moraine is Edraianthus (Campanula) serpyllifolius (see fig. 27), and a tuft is very pretty when studded with the dainty purple flowers, which rise from the rich, bronzy foliage. The blossoms only last one and a half to two days. Still, the plant generally produces a large number of buds, so that it is decorative for some time.

In this case, as in that of C. Allionii, I place a sheet of glass over the plants during winter to preserve them from excessive moisture and the dirt which accompanies it.

The conditions here in this respect, of course, compare very unfavourably with those of gardens in the open country, since my garden is situated within eight miles of the City, and well within its smoke zone. *Reginald A. Malby, South Woodford, Essex.*

SCOTLAND.

THE FLOODING OF A MARKET GARDEN.

Litigation has been in progress regarding the flooding of a market garden at Restalrig, Edinburgh, Mr. W. B. Hanley, market gardener, Restalrig Gardens, Edinburgh, having brought an action against the Corporation of Edinburgh for £200 damages for the flooding of his garden on two occasions. It was alleged for the pursuer that a culvert belonging to a road under the control of the Corporation was insufficient and caused the flooding. The Corporation denied fault, pleading that neither the culvert nor the channel and banks of the watercourse below belonged to them. In the Outer House of the Court of Session the pursuer was successful, Lord Ormidale having given decree for £150 and expenses, but on appeal the Second Division reversed this decision, and found that the pursuer had failed to establish fault on the part of the defenders.

ABERDEEN CORPORATION GARDENERS' WAGES.

Application having been made by the gardeners under the Links and Parks Committee of Aberdeen for an increase of wages, the question was referred to a sub-committee, which has recommended that increases should be given in several cases.

GLASGOW PARKS DEPARTMENT.

The forthcoming extension of the boundaries of the city of Glasgow and the consequent absorption into the city of many adjoining burghs and public bodies will cause a considerable extension of the work of the Glasgow Parks Department. At least nine additional parks and open spaces will be transferred to the control of Mr. James Whitton, the Superintendent of the Glasgow Parks and Botanic Gardens.

PROPOSED FOREST GARDEN FOR ABERDEEN.

The Forestry Committee of the Governors of the Aberdeen and North of Scotland College of Agriculture has decided to approach the Development Commissioners for a grant towards the cost of their proposed forest garden at Craibstone.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Exhibiting Sweet Peas with Double Standards.—The new rule which the National Sweet Pea Society adopted in their schedule for the current year, and which reads: "Flowers with double standards will disqualify in all classes except those numbered 6, 9 and 12," is a very necessary one. It evidently caused endless trouble at the National Sweet Pea Show, but this would not have been the case had competitors respected the schedule. The large number of disqualifications showed the necessity for the rule, and the wisdom of the society in carrying it into effect. I observe, in your report of the show, that at the judges' dinner in the evening of the first day of the exhibition a speaker said that this would be remembered as "the double standard year," but he was sure it would be the first, the last, and the only year such a regulation could exist, and this expression of opinion seemed to find favour with those present at the function. It may be that this rule will be rescinded by the society, but in the interest of the Sweet Pea I sincerely hope it will be allowed to stand. I believe it leads to disqualification if an exhibitor stages "grandiflora" varieties in a bunch of flowers of the Spencer type. Why, then, should a competitor be allowed to stage double standard, or "duplex," flowers in a bunch of Spencers, or what the National Sweet Pea Society has, hitherto, taught us to recognise as Spencers? We all know that the Spencer type very rapidly ousted the old grandiflora flowers from popularity, and the latter type is now seldom seen. If the rule debarring double standard flowers is cancelled, we may, possibly, rarely see a Spencer flower at the shows in the near future. It is quite evident that the duplex form is now occurring with greater frequency, and many of the best new varieties have this characteristic in a very marked degree. I contend that if the Spencer type is to be preserved, that is, if we wish to retain flowers of the formation of Countess Spencer, Helen Lewis, John Ingman, Princess Victoria, and others, it will be necessary to provide classes for it exclusively. From the double we are getting on to the triple and quadruple standard slowly but surely, and if the National Sweet Pea Society wish to maintain the individuality of what is popularly termed the Spencer type of flower, there can be no question as to the wisdom of the rule adopted on the present occasion. No doubt it is very hard to be disqualified for a brilliant lot of flowers, but the schedule was explicit, and it is as easy to prevent double standards creeping into a bunch as it is to keep out flowers of the grandiflora type. By all means let us have classes for doubles, but it appears to be almost imperative, if single flowers are to be preserved, to have classes exclusively for single standard flowers. The Sweet Pea is evidently a plant in a rapid state of mutation; it has received much attention from the hybridist of late years, and the response has been wonderful. If the present methods of breeding are persisted in, and no fresh element is added to the plant through hybridisation, it is fairly evident that a race of doubles is certain, and that at no distant date. *George M. Taylor, Mid-Lothian.*

The Education of Gardeners.—So far as this matter has been dealt with in these columns, no solution has been offered to the problem of what is to become of gardeners, however highly educated they be in the

future. Mr. Harris (see p. 7) suggests a National Union of Gardeners. This suggestion is well worthy of consideration by all who have the welfare and interests of the profession at heart. Gardeners—the best of them—are but buman, and however devoted they may be to their work, many of them experience bitter disappointments. One of the chief disappointments of many men is found to be the great and increasing difficulty in obtaining a situation. Naturally, the employer is looking out for labour at as cheap a rate of wage as possible, and, unfortunately, owing to force of circumstances, many excellent men are bound to accept wages which a mechanic would refuse. Then consider with what degrading conditions many men have to contend. The long hours, the great fear of causing some trivial displeasure and danger of losing his hard-earned "character" in consequence. I agree with Mr. Harris that the gardener already spends many years in study. Mr. Divers is in favour of having suitable young men apprenticed for a time in private gardens. This system is excellent. If every man had to produce his appreuticeship indentures when applying for an appointment the profession would soon become less crowded. There are many points which could be introduced in the matter. Finally, I would ask all who propose a higher education for gardeners what is to become of these men? Supposing the gardeners of to-day are not sufficiently educated for the purposes of their calling (a supposition which I strongly deny), are there any indications that the future holds forth prospects sufficiently alluring to induce suitable young men to undergo the years of training on a small wage that would be necessary? I admit that other professions are not all "beds of Roses," but, being a gardener who served a term of apprenticeship, and has since experienced many of the ups and downs of a gardener's life, this matter appeals somewhat strongly to me, as I venture to say it should do to all who have any regard to the interests of the profession. *Roamer.*

THE BOARD OF AGRICULTURE.—As an old reader of your paper I was much interested in your article in the issue of June 29 on the Horticultural Branch of the Board of Agriculture. All interested in horticulture have for a long time desired that something should be done by the Government for its advancement, and now that a step has been taken in this direction, it seems to me that all of us should do what we can by way of encouragement. I cannot help thinking that your article will not encourage the new head of the horticultural department, and so indirectly will not further the cause we all have at heart. I refer particularly to your criticism of the "staffing" of the new branch. You say that the difficult work of organising the several departments of horticulture can only be carried out by a man who has had long experience of horticulture from the inside. Many will understand this as meaning such a man as a practical gardener, but when one remembers what has been done for horticulture by many men not strictly speaking having this qualification, it seems evident that a man who has not the special qualification referred to may be of great use. I cannot agree that our sympathy and co-operation can only be secured by the appointment of such a practical horticulturist as I have referred to, and appeal to all to give the new department all the sympathy and co-operation they can, so as to make it, if possible, a great success. I should rather say that any difficulty which may arise will be from the inadequate provision made for the expenses of the department by the Government, and unless horticulturists show that the department is appreciated this difficulty is not likely to be overcome. *Jno. Wm. Jessop.*

THE GARDENERS' PROBLEM.—What can a Government Department do for gardeners? There are those who believe that, because the President of the Board of Agriculture recently promised to start a sub-department of the Board to look after horticulture we have only now to wait and see what benefits it may bring. It will not help gardeners in the way that help is most needed, any more than the Board of Trade helps the miners, or seamen, or the transport workers. In such matters, we know, on the authority of the present Prime Minister, Government cannot do more than "keep the ring," in other words, see that both sides in the dispute get fair play, without favouring either. All the talk about "education" for gardeners is quite beside the question. What gardeners want is a little more belief in themselves, to turn their attention to methods for the regulation of conditions of employment, in short, to set their own house in order, and not ask or allow others to do it for them. There are those who still have faith in horticultural societies in which professional horticulturists have no influence. These societies have been in existence for many years, but they have never made it their business to help the gardener; and, seeing how they are constituted, that is not to be wondered at. The Government, as represented by the Board of Agriculture, will not, because, for political reasons, it dare not, take up gardeners' grievances, and the sooner that is realised the better it will be for all concerned. Gardeners want an institute; then why, in the name of common-sense, don't they set about making one? They are dissatisfied with the emoluments and status of their calling, but who will enforce a remedy if they do not set about it themselves? Their present attitude appears to be that of the drowning man clutching at any straw in the hope of succour. They need not drown; on the contrary, they have only to strike out and they can save themselves. Gardening is a calling of considerable account in this country, but it is a poor one for the worker. Nothing will ever be done to improve the lot of gardeners until they themselves set about it. Training, apprenticeship the abolition of bothy life, the betterment of the journeyman's lot, higher wages, more reasonable hours of labour, fixity of tenure: these are questions which gardeners only can effectually deal with. If gardeners generally are dissatisfied with their place among the workers of the country, their way to salvation is not by going begging to the Government, or by cringing to the employer, but by co-operation among themselves. Are there 20 leading gardeners ready to take up the cause and make it a success? *W. W.*

ELLIOTTIA RACEMOSA. — The rare Elliottia racemosa is flowering again this season in Kew Gardens. It is a small, deciduous tree, attaining, in a wild state, a height of about 15 feet. Of the Rhodora tribe, it forms more or less pyramidal heads of oblong leaves, 3 or 4 inches in length, of a deep but lively green when in health. Its white flowers are carried in stiff, upright racemes; each flower is an inch in diameter, and consists of four petals, on a short, tubular, hairy calyx of a ruddy hue. It has hitherto failed to set any seed, and has resisted all efforts at propagation from cuttings. A layered branch, however, has rooted well, and is now planted on the opposite side of the bed, which is situated in a sheltered position, somewhat to the north-east of the temperate house. The long spires of white blossom provide a very attractive and interesting sight at the present moment, and, in all respects, the plant is well worth a visit. *T. Arnold Hyde.* [An inflorescence, from a photograph by Mr. Raffill, was illustrated in *Gardeners' Chronicle*, January 6, 1912, p. 11, fig. 10.—EDS.]

CORNUS FLORIDA.—I am sending you a branch of Cornus florida from a tree which has been in flower for six or seven weeks. Perhaps some reader would inform me if it is a rare thing for this species to flower so well as far north as Cumberland. *R. Just, The Gardens, Derwent Hill, Keswick.*

ANOTHER SPECIES OF DIPTERONIA.—In the account of Dipteronia sinensis, Oliver, flowering at Kew, given on p. 6 of your issue of July 6, *A. O.* states that Dipteronia is a monotypic genus. This is incorrect. In *Gardeners' Chronicle*, xxxiii., 22 (1903), I described another species, Dipteronia Dyerana, which was founded on my number 11,352, of which there is a specimen in the Kew Herbarium. This is a shrub or small tree, extremely rare, having been seen only once in the mountains near Mengtze in Yunnan at 7,000 feet altitude. D. Dyerana has remarkably large fruit, 2 to 2½ inches in diameter, and is very distinct from D. sinensis. It has not been introduced, and apparently has not been collected by any recent traveller in China. This plant should have been inserted, but was overlooked in the list of Chinese plants published in *Journ. Linn. Soc.* (Bot.) xxxvi., 475 (1905). D. sinensis, which was discovered by me in Central China in 1888, occurs in the mountains of Hupeh and Szechwan at 4,000 to 5,000 feet altitude, and is a large shrub or small tree attaining about 20 feet in height. *A. Henry.*

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 16.—The usual fortnightly meeting was held on Tuesday last in the Society's Hall, Vincent Square, Westminster. The exhibits were not so numerous as usual. The weather was tropical, and very few, other than those interested in the exhibits, put in an appearance. Long after the exhibition had opened not a single visitor had paid for admission, which was most unusual. An outstanding exhibit was a collection of Gooseberries, staged by Messrs. JAMES VEITCH & SONS, for which a Gold Medal was awarded. Another excellent exhibit in the fruit and vegetable section was a collection of 20 Queen Pineapples from Lord LLANGATTOCK'S garden; this also was awarded a Gold Medal.

In the floral section the principal exhibits were Ferns, greenhouse flowering plants, Cacti, Gladioli, Carnations, Nymphæas, and border flowers. The FLORAL COMMITTEE recommended two First-class Certificates and six Awards of Merit. Orchids were exhibited by well-known amateurs and traders, and although groups were fewer than usual, they included the choicest subjects in season. The ORCHID COMMITTEE granted one First-class Certificate and two Awards of Merit.

The FRUIT AND VEGETABLE COMMITTEE conferred an Award of Merit on Peach Royal Charlotte, an old variety.

At the 3 o'clock meeting in the lecture room an address was delivered by Mr. E. A. Bunyard on "The Flowers of Apples and Their Aid in Identifying Varieties," but the attendance was meagre.

Floral Committee.

Present: H. B. May, Esq. (in the Chair); and Messrs. C. R. Fielder, W. Bain, C. Dixon, R. C. Reginald Nevill, J. Dickson, H. J. Jones, C. E. Shea, G. Reuthe, W. Howe, C. Blick, W. J. Bean, W. J. James, W. P. Thomson, Chas. E. Pearson, E. A. Bowles, Chas. T. Druery, John Green, R. C. Notcutt, E. H. Jenkins and Arthur Turner.

Messrs. JAMES VEITCH & SON, LTD., Chelsea, staged a miscellaneous group of flowering plants, which included batches of the javanico-jasminiflorum, Rhododendrons in shades of yellow, orange and pink, Solanum Wendlandii, Sollya Drummondii, Browallia speciosa major, Hibiscus magnificus and Exacum macranthum. (Silver-gilt Banksian Medal.)

Mr. CHAS. BLICK, The Warren Nursery, Hayes, Kent, staged a good collection of border Carnations. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, Dyson Lane Nurseries, Upper Edmonton, showed a number of valuable Ferns representative of the genera Cheilanthes, Adiantum, Nephrolepis, Davallia and Nothochlæna, with a few batches of flowering plants. (Silver-gilt Banksian Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, N., made an effective display with a tastefully-arranged group of Carnations, relieved with Palms, Ferns, Codiæums and Bamboos. Carnation Lady Coventry was conspicuous in the foreground, Cecelia and May Day behind it. (Silver Banksian Medal.)

Messrs. W. WELLS & Co., LTD., Merstham, Surrey, staged a small collection of Phloxes.

Messrs. STUART LOW & Co., Bush Hill Park, Middlesex, staged the only collection of Roses. The group comprised columns of Frau Karl Druschki and White Killarney and large bamboo stands of Molly Sharman Crawford, Dean Hole, Pink Liberty (new), Rayon d'Or, Lyon Rose and others, with vases of less common sorts. (Bronze Flora Medal.)

Messrs. John Peed & Son, West Norwood, staged a good batch of seedling Gloxinias, showing a fine range of colour and with flowers of good substance. The strain of Streptocarpus exhibited by this firm included plants with good blue flowers. (Silver Flora Medal.)

Mr. L. R. Russell, Richmond Nurseries, Richmond, Surrey, arranged on either side of a centrepiece of Begonia Rex and B. Bowringiana interesting batches of the crimson Iresine Victor Bousillon and the rosy-bronze Coleus Cordelia. Standard Fuchsias formed a background.

Mr. Philip Ladds, The Nurseries, Swanley Junction, Kent, showed batches of his new Pelargoniums.

Messrs. H. Cannell & Sons, Swanley, Kent, showed a representative group of Cacti. Those in flower included Opuntia paraguayensis, Mamillaria nigra, M. Rhodanthe, M. Foesteri, M. pusilla and M. Wildiana. (Silver Flora Medal.)

Messrs. Gunn & Sons, Olton, Warwickshire, made a bold display of Phloxes, gaining effect by the use of large masses of one colour. Especially good were Elizabeth Campbell, Grüppenkönigen, Georg. A. Strohlein, Le Mahdi, Antonin Mercie and Mrs. Jenkins. (Silver Banksian Medal.)

Mr. H. J. Jones, Ryecroft, Lewisham, set up bold stands of the best Phloxes. Those with blue-shaded flowers were especially good, including Le Mahdi, A. Mercie, Distinction, Iris, and Esclairmonde. (Silver Banksian Medal.)

Mr. Amos Perry, Hardy Plant Farm, Enfield, Middlesex, arranged one of the most pleasing collections of water and waterside plants. Senecio macrophyllus made a striking centrepiece, and good effects were produced with clumps of Romneya Coulteri, Buddleia variabilis var. Veitchiana, and Delphiniums Belladonna and Lamartin. (Silver Banksian Medal.)

Messrs. T. S. Ware, Ltd., Feltham, Middlesex, staged a miscellaneous collection of herbaceous flowers interspersed with varieties of Phlox decussata. (Bronze Flora Medal.)

The Guildford Plant Nursery, Millmead, Guildford, showed seasonable border flowers.

Mr. Maurice Prichard, Christchurch, Hants., showed one of the richest collections of herbaceous and rock plants. A group of Alpines contained hardly a plant that was not noteworthy, and included Lysimachia Henryi, Campanula Warley, C. Zoysii, C. garganica, and its variety alba, Stachys corsica, and Silene Purpusii. (Bronze Flora Medal.)

Fig. 28.—Patrinia triloba: flowers yellow.
(See Awards of Merit.)

The King's Acre Nurseries, Hereford, showed a remarkable collection of late-flowering Eremuri imported a few years back from Khorasan, N.E. Persia, where they were found at an elevation of from 3,000 to 6,000 feet flourishing in a temperature that in summer never rises above 85° F. and for three months or longer in winter is well below zero. They make better plants on rocky slopes than in the richer valleys, and the young foliage is eaten by the villagers. Magnificent spikes were shown, some exceeding 4 feet in length. They included a considerable range of colour, but could be easily separated into two groups, the one of pinks resembling E. robustus and the other of White's E. Olgæ alba. Flowering at least a month later than the common forms, the race should prove of special value. (Silver Banksian Medal.)

Mr. G. Reuthe, Fox Hill Hardy Plant Nursery, Keston, Kent, showed an interesting collection of rare shrubs and herbs in flower. Campanula mirabilis and Anthropodium cirrhatum are seldom seen. (Bronze Flora Medal.)

Messrs. Robert Veitch & Sons, Exeter, showed a few flowering shrubs. Especially noteworthy was the strongly Musk-scented and beautiful single pure-white Rosa Souleiana.

Messrs. Phillips & Taylor, Lily Hill Nurseries, Bracknell, Berks., arranged a pretty group of hardy flowers, Nymphæas and water plants on the ground. (Silver Banksian Medal.)

Messrs. Barr & Sons, King Street, Covent Garden, showed a good group of hardy flowers. A pretty combination was Lilium testaceum, with Salvia virgata var. nemorosa. Helenium autumnale Taplow Gem (dark brown), H. a. pumilum, and Iris Kæmpferi were also well shown.

Mr. J. E. Lowe, Hatton, Warwick, exhibited a small group of disbudded blooms of the early-flowering Chrysanthemum Early Beauty, a variety with lilac-pink flowers.

Messrs. Carter Page & Co., London Wall, staged a very pretty batch of Antirrhinums, Scabious, and Violas. The Snapdragons were grouped in baskets, and have seldom been shown so effectively. The choicer varieties included luteum, Golden Queen, Pink Queen, Crescia (crimson), Defiance (orange), and Moonlight (yellow and pink). (Silver Flora Medal.)

Messrs. Wm. Fells & Son, Hitchin, Hertfordshire, arranged a group of Phloxes.

Messrs. Bakers, Codsall, Staffordshire, displayed a small batch of Chrysanthemum maximum var. Mrs. Adams.

Messrs. Kelway & Son, Langport, showed a group of their hybrid Gladioli, which included many novelties, but the older type was, for the time, overshadowed by the delicate shades of seedlings showing the influence of G. primulinus. (Silver Flora Medal.)

AWARDS.

First-class Certificates.

Nephrolepis exaltata var. muscosa.—A compact-growing, vigorous Fern, with pale-green fronds, which are less finely divided and not so moss-like as in others of the newer varieties. (Shown by Messrs. H. B. May & Sons, Dyson's Lane Nurseries, Upper Edmonton.)

Plagianthus Lyallii (syn. Gaya Lyallii) see *Gardeners' Chronicle*, June 22, 1911, p. 56, fig. 27.—The pure-white, frail-textured flowers, each 1½ inch in diameter, hang in threes, on slender pedicels from every leaf axil. (Shown by Messrs. Robert Veitch & Son, Exeter.)

Awards of Merit.

Gladiolus, Lang-prim strain.—Hybrids of G. gandavensis, which gave size to the flowers and a vigorous habit, and G. primulinus, which had a marked influence on the form of the flower, and, at the same time, gave a series of delicate colour shades, ranging from lemon-white to orange, suffused with red. Of the named varieties, Ella Kelway was the most pleasing. It has pale-yellow flowers, suffused with blush-pink. Elf is pale orange, whilst Wraith showed strongly the influence of G. gandavensis. The spikes of bloom carried 12 or more flowers, which were scarcely inferior in size to those of the typical gandavensis hybrids. (Shown by Messrs. Kelway & Son, The Nurseries, Langport.)

Patrinia triloba (syn. palmata, see fig. 28).—A Chinese herbaceous perennial, about a foot in height. The leaves have the appearance of being borne in a basal tuft, but are in opposite pairs, separated by a few short internodes. They are prettily palmate, with the lobes serrate, tough, and glossy, shaded lightly with brown. The flower-stem rises about 4 inches above the leaves, and then branches into a loose corymb, from 2 to 6 inches across, of clear-yellow, short-spurred flowers, each about one-third of an inch in diameter. This should prove a very useful summer-flowering plant for the rockery. (Shown by Miss Willmott, Great Warley—gr. Mr. C. Fielder.)

Crossandra undulæfolia.—A rare, rather than new, stove perennial, with salmon-apricot, self-coloured flowers, borne freely in Wallflower fashion at the top of an elongated raceme. The leaves are leathery, glossy, lanceolate, and tapering. The plant grows a foot to 18 inches in height, and may be raised freely from cuttings or seeds. It continues in flower from about May to August, and deserves to be better known. (Shown by Sir Trevor Lawrence, Bart., Burford, Dorking—gr. Mr. Bain.)

Astilbe Rhenania. Another valuable hybrid Astilbe, derived from the variety Queen Alexandra crossed with Arendsii Ceres. Sturdy, free-flowering plants were shown, with flowers of a deep pink, which becomes tinged faintly with violet as the petals age. (Shown by Mr. W. Probittlich, Twickenham.)

Nymphæa formosa.—A fine addition to the hardy Water Lilies. The soft-pink-coloured flowers are 8 inches in diameter, the colour intensifying a little with age, and becoming deeper at the base of the petals. The centre is large and pure yellow. A flower exhibited showed the inner petals pure yellow, even when half-an-inch in diameter.

Nymphæa "Attraction."—The flowers are 9 inches in diameter, deep crimson at the base and paler towards the margin. (Both shown by Leopold de Rothschild, Esq., Gunnersbury House, Acton.—gr. Mr. Jas. Hudson, V.M.H.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), W. Bolton, J. Wilson Potter, C. H. Curtis, A. Dye, H. G. Alexander, J. E. Shill, W. H. Hatcher, J. Charlesworth, T. Armstrong, F. Sander, W. Thompson, Gurney Wilson, W. H. White, Stuart Low, and F. J. Hanbury.

Messrs. STUART LOW & Co., Bush Hill Park, staged a group, at the back of which were some well-flowered Oncidiums, including a very compact specimen of O. macranthum; some late-flowering Cattleya Mendelii, several good white Dendrobium Dearei, with plants of D. fimbriatum oculatum, and the singular little D. bicameratum. A fine specimen of Bulbophyllum Ericsonii, also plants of Miltonia Bleuana, Cœlogyne asperata, a selection of Masdevallias, Brassia verrucosa, Phalænopsis Aphrodite, and some Odontoglossums, Odontiodas, Stanhopea tigrina, and Disa grandiflora were also included. (Silver Flora Medal.)

R. G. THWAITES, Esq., Chessington, Streatham (gr. Mr. G. M. Black), staged a small group of Odontiodas and other hybrids raised at Chessington, and including some fine varieties of the lilac and purple Odontioda Thwaitesii; Lælio-Cattleya Rubens, L.-C. Ingramii, the white Miltonia vexillaria Queen Alexandra, Odontoglossum Harryanum, and O. Rolfeæ. (Silver Banksian Medal.)

Messrs. CHARLESWORTH & Co., Haywards Heath, staged a small group, in which were the pretty rose-pink Eulophia guineensis, the white Habenaria Susannæ, Dendrobium amethystoglossum with two spikes, and two new hybrids. (See Awards.)

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed the pretty Eria rhyncostyloides with three spikes of flowers resembling Rhyncostylis retusa; and Lælio-Cattleya Adelph-Harrieoniæ (L.-C. Adolphus × C. Harrisoniæ) with cream-white flowers spotted with purple.

Baron BRUNO SCHRODER (gr. Mr. J. E. Shill) sent Cattleya Hardyana, The Dell var., a very large and richly-coloured form.

F. J. HANBURY, Esq., Brockhurst, East Grinstead, showed his new Brasso-Cattleya "Faith" (Brassia Perrinii × Cattleya Leopoldii), a pretty, fragrant flower, in shape partaking strongly of B. Perrinii. Sepals and petals pale-green marked with purple, lip blush-white with rose spots.

Messrs. SANDER & SONS, St. Albans, showed Odontoglossum crispum Formidable, a noble flower of great size; sepals white, tinged with rose and bearing an occasional dark spot; petals broad, fringed pure white; lip with a brown blotch in front of the yellow crest.

AWARDS.

GOLD MEDAL AND FIRST-CLASS CERTIFICATE.

Cattleya Warscewiczii alba var. Firmin Lambeau, from Monsieur FIRMIN LAMBEAU, Brussels (gr. Mr. De Munter).—An absolutely pure white form of C. Warscewiczii, the only colour being a pale yellow disc to the lip. The form, which appears to be the first true albino of C. Warscewiczii, originated with Messrs. Lager & Hurrell, Summit, New Jersey, U.S.A. It gained a Gold Medal in the States. The plant was illustrated and described in the *Gardeners' Chronicle*, July 16, 1910, p. 34. It passed into the hands of Messrs. Stuart Low & Co., who sold it to Monsieur Lambeau, who is to be complimented on his successful culture of such a unique specimen.

AWARDS OF MERIT.

Zygopetalum Brewii (*Perrenoudii* × *rostratum*), from Messrs. CHARLESWORTH & Co., Haywards Heath.—Sepals and petals green tinged with purple; lip very showy, the fleshy crest pale blue, the blade rosy-carmine with broad, white margin.

Odontoglossum Epicaste (*Clytie* × *crispum*), from Messrs. CHARLESWORTH & Co.—Broader in all the segments than O. Thompsonianum, almost entirely blackish-chocolate, with very narrow, rose-coloured margin, and tips to the sepals and petals.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the Chair); Messrs. W. Bates, George Woodward, Thomas Coomber, J. Willard, H. Markham, Geo. Kelf, A. Bullock, Geo. Wythes, J. Jaques, A. R. Allan, J. Davis, A. W. Metcalf, and P. C. M. Veitch.

The collection of Gooseberries exhibited by Messrs. JAMES VEITCH & SONS, Chelsea, included 100 varieties, and entirely filled one of the long tables. At the back were pot trees of triple and single cordon Gooseberries, interspersed with a few standard plants and Red Currants. They were all magnificently fruited, the fruit hanging in clusters the whole length of the stems. The dishes and baskets of gathered fruits were arranged attractively, and every berry had been carefully selected. Those following are a selection of the finest for flavour:—Golden Gem, Langley Beauty, Warrington, Langley Gage, Whitesmith, Early Green Hairy, White Champagne, Hedgehog, Leader, Keen's Seedling, Surprise, and Whinham's Industry. For prolific cropping the following are recommended:—Lancashire Lad, Whinham's Industry, Keepsake, Broom Girl, Warrington, Trumpeter, and Speedwell (Gold Medal). This firm also showed, for award, a sport from Jefferson Plum, named Purple Jefferson, which the committee desired to see again.

Lord LLANGATTOCK, The Hendre, Monmouthshire (gr. Mr. T. Coomber), exhibited 20 fruits of The Queen Pine. They were of such superlative quality a Gold Medal was awarded.

Messrs. J. K. KING & SONS, Coggeshall, displayed varieties of Cabbage, Lettuce, and 50 varieties of Peas. The Lettuces wilted quickly in the intense heat, and the opportunity to compare their merits was largely lost. The variety All the Year Round was well hearted, also the bronze Eclipse. The Peas were intended to show their seasons of maturity. Earliest of All, Little Hero, and King of the Earlies were brown and over, Thomas Laxton, Daisy and Bountiful almost past, whilst the Gladstone, Dreadnought, Alderman, Quite Content, Royal Salute, Moneymaker, and Telegraph were in the pink of condition. The flat, undeveloped pods of Late Queen and Latest and Best represented varieties that continue the crop late in the season. (Silver Banksian Medal.)

Messrs. S. SPOONER & SON, Hounslow, showed fruits of Mr. Gladstone and Early Red Margaret Apples.

C. E. BARING YOUNG, Esq., Oak Hill Park, East Barnet (gr. Mr. J. G. Walker), showed stems of Red Dutch and Chiswick Red Currants bearing heavy crops of fine berries.

A good sample of Shallots was shown by C. MOORE KENNEDY, Esq., Keston, Kent (gr. Mr. R. C. G. Hills). They were labelled Hill's Champion, but the Committee considered them merely a selection of the old Russian variety. Fifteen sets had produced 286 fine bulbs. A Cultural Commendation was awarded.

A sample of the variety of Shallot known as All the Year Round was exhibited by ERNEST C. ARNOLD, Esq., Plymouth.

AWARD OF MERIT.

Peach Royal Charlotte.—This is a well-known variety, resembling Noblesse, but with more colour. The flavour was excellent and the fruits of such fine quality a Cultural Commendation was awarded the gardener, Mr. Bain (shown by Sir TREVOR LAWRENCE).

Scientific Committee.

JUNE 18.—*Present:* Mr. J. W. Odell (in the Chair); Sir J. T. D. Llewellyn, Messrs. J. O'Brien, A. Worsley, W. Hales, G. Gordon, and F. J. Chittenden (hon. sec.).

Pseudo-bulbs on inflorescence.—Mr. Jas. O'BRIEN drew attention to a plant of Oncidium abortivum (or O. heteranthum), shown by Sir TREVOR LAWRENCE, K.C.M.G., V.M.H., bearing on the many-flowered inflorescence some well-developed pseudo-bulbs, each with two or three flowers.

Thelymitra sp.—A terrestrial Orchid from Tasmania, was also shown, which proved to be a species of Thelymitra, probably T. carnea, with pinkish flowers, rarely seen in gardens.

Polygonum sacchaliense variegated.—Sir EVERARD IM THURN sent from Scotland leaves of Polygonum sacchaliense showing broad, yellow lines on each side of the midrib, and other yellow marks. The plant had been cultivated for several years in the garden, but had not previously shown any signs of variegation.

Mulberry.—Mr. LUXMOORE, of Eton, wrote regarding a Mulberry tree in his garden which showed a tendency towards diœcism. The staminate flowers were all upon one part of the tree, with but few pistillate ones among them, the pistillate flowers were mostly upon the other branches, and the separation of the two forms of flower was almost complete upon the different parts of the tree. Mr. WILKS stated that a tree in his garden always produced the two forms on separate branches, and the leaf colouring was quite distinct, and had been so for many years. Mr. HALES said the same was true of two trees in the Chelsea Physic Garden, and was constant.

Delphinium sporting.—Mr. CHITTENDEN showed a piece of an inflorescence of a Delphinium bearing blue flowers, the greater part of the inflorescence having produced white ones.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

JULY 12 and 13.—After a considerable interval, this society held a Rose show, on these dates, in the White City, but exhibitors did not support the show as in bygone days, with the result that competition was very poor.

ROSES.—In the class for 36 blooms, distinct, Messrs. W. & J. BROWN, of Peterborough, were the only competitors, and were awarded the 1st prize.

Messrs. BROWN also won the 1st prize for 12 Tea or Noisette varieties, staging good blooms of Maman Cochet, Mrs. E. Mawley, and Mrs. M. Kennedy; and they also won in the classes for 12 blooms of (a) any white or yellow Rose, and (b) for any crimson variety.

In the amateurs' class for 24 trusses, distinct, Mr. R. FOLEY HOBBS, Worcester, had the premier stand, his best blooms being Frau Karl Druschki, Gloire de Chédane Guinoisseau, J. B. Clark, and Ulster; 2nd, Mr. R. PARK, with small, bright blooms.

For 12 blooms of any white or yellow Rose, Mr. HOBBS excelled with the variety Bessie Brown. Messrs. PARK and HOLT were 2nd and 3rd respectively. Mr. HOBBS also showed best in the class for 12 light blooms, with charming specimens of Her Majesty. For any crimson variety, Mr. PARK was placed 1st with the variety A. K. Williams. In the class for blooms grown in the Manchester district, Mr. A. G. HOGG, of Altrincham, showed the best collection of 24 trusses, distinct, Mr. W. COWLEY, of Bramhall, being 2nd. The prize-winners in the class for 12 trusses were:—1st, Mr. J. HOLT; 2nd, Mr. A. M. BUNTON; and 3rd, Mr. C. E. MARSHALL.

Mr. R. FOLEY HOBBS won the two Silver Medals offered for the best blooms in the show with Gloire de Chédane Guinoisseau and Mrs. R. Foley Hobbs in their respective sections.

SWEET PEAS.—These flowers were staged in considerable numbers, the blooms being of good quality. For a collection of not fewer than 50 or more than 100 vases, Mr. F. A. ROBINSON secured the premier award with a choice exhibit, his best varieties being Vermilion Brilliant, Mrs. W. J. Unwin, Melba, Maud Holmes, and Edna Unwin; 2nd, Messrs. CASTLE BROS., Wartton; and 3rd, Messrs. FAULKNER & AITKEN.

GROUPS OF PLANTS.—For a group of plants arranged in a space of 300 square feet, Messrs. J. CYPHER & SONS, Cheltenham, were awarded the 1st prize for a choice exhibit. Mr. J. SHARP, of Huddersfield, won the 2nd prize in this class.

Mr. J. KAULLMANN, Fallowfield, arranged the best group in a space limited to 100 square feet.

The best display of cut flowers was made by Messrs. CALDWELL & SONS, Knutsford.

WEST SURREY HORTICULTURAL.

JULY 10.—The first annual show of this new society was held at Camberley on the 10th inst., and was a great success. The President, Sir Walter Peace, and Mr. Frederic Robinson, who undertook the secretarial duties, are to be congratulated on the results of their efforts. Exhibits were numerous and included non-competitive groups from the gardens of the Duke of CONNAUGHT. Messrs. BIDE & SONS, of Farnham, staged a very fine exhibit, which was highly commended. The President's cup, offered for the finest exhibit in the show, was won by Mr. NAPIER CHURCH, Snaprails, Sandhurst (gr. Mr. J. Evans), for a group of Cattleyas and other flowers.

WOLVERHAMPTON FLORAL FÊTE.

July 9, 10, 11.—The 24th annual floral fête was held at Wolverhampton in the West Park on the above dates. The weather was delightfully fine during the whole of the time the exhibition remained open to the public. It is estimated that nearly 90,000 people visited the show. The takings at the gate amounted to £670, compared with £636 last year, and the aggregate receipts of £2,011 are the second best in the history of the society. Cash prizes to the value of nearly £900 were offered for competition. There were upwards of 700 entries in the competitive classes and about 30 in the non-competitive section. The exhibition was an all-round success. Stove and greenhouse foliage and flowering plants, Roses, herbaceous flowers, table and floral decorations were excellent.

During the judges' luncheon on the first day, a presentation, consisting of a silver tea and coffee service and an address to Mr. W. E. Barnett, together with a set of vases to Mrs. Barnett, was made on behalf of the exhibitors and judges. Mr. Barnett, who has held the position of secretary of the Wolverhampton Floral Fête for 21 years, has been obliged to retire on account of ill-health, much to the regret of all concerned with the exhibition.

Plants (Open).

The principal group class was one for a display of plants in and out of bloom, together with cut flowers, arranged for effect on ground space of 30 feet by 12 feet, down the centre of a very large tent. A hundred pounds was offered in four prizes, viz., £40, £30, £20, £10. There were four entries, and the 1st prize was won by Messrs. James Cypher & Sons, Cheltenham, whose beautifully-arranged group was much admired. It consisted principally of richly-coloured, narrow-leaved Codiæums and Dracænas, well-flowered specimens of Ixoras, Clerodendron fallax, Kalanchoe flammea, tall plants of Humea elegans, and choice Cattleyas, Odontoglossums, and long sprays of Oncidiums over a pleasing groundwork of Caladium argyrites, Dracænas, Begonias, Selaginellas, and other ornamental foliage plants. In the 2nd prize group, which came from Sir George H. Kenrick, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), excellent use was made of some marvellously well-coloured Selaginellas. This group showed considerable artistic merit in arrangement, but it was rather thin at the back, and lacked the brightness characteristic of the display made by the Cheltenham firm. 3rd, Mr. W. A. Holmes, Chesterfield. 4th, Mr. W. Vause, Leamington.

In the next class, which was reserved for foliage plants and Ferns (flowers and plants in flower excluded), arranged for effect on a space of 250 square feet along the side of the same tent in which the first-named groups were displayed, Messrs. James Cypher & Sons and Sir George H. Kenrick (gr. Mr. J. V. Macdonald) were placed 1st and 2nd respectively. The plants in both groups were noteworthy for their high culture, richly-coloured leafage, and artistic arrangement. 3rd, Mr. W. A. Holmes. There were five entries.

Messrs. James Cypher & Sons also took the lead in a class for 20 plants in pots not exceeding 8 inches in diameter, at least eight to be in bloom. They showed four Ixoras, three Clerodendron fallax, one C. Balfouriana, three Erica ventricosa Bothwelliana, two Allamanda Williamsii, two Acalypha Sanderiana, one Chironia ixifera, three Codiæums, and one Cocos Weddelliana. 2nd, H. B. Mander, Esq., Trysull Manor, Wolverhampton (gr. Mr. C. Weaver), whose best specimens were Hydrangeas, Codiæums, Ixoras, and Calceolaria Clibranii. 3rd, Sir T. C. Mander, Bart, Tettenhall Wood (gr. Mr. J. F. Simpson).

The 1st prize of £10, offered for a group of one kind of flowering plants on a ground space of 50 square feet was well won by Messrs. Blackmore & Langdon, Twerton-on-Avon, Bath, who had a wonderfully-fine collection of Begonias. The rich and delicately-coloured flowers were of great substance, some being nearly 8 inches in diameter. 2nd, H. Willcock, Esq., Wolverhampton (gr. Mr. S. Highfield), for Gloxinias. 3rd, E. Shaw Hellier, Esq., Wolverhampton (gr. Mr. F. T. Parnwell), for single and double zonal Pelargoniums.

Mr. J. Knight, Wolverhampton, was the only contestant in a class reserved for rock and water gardens on a space of 30 feet by 14 feet, and he was deservedly awarded the 1st prize of £25. Huge blocks of grey stone were arranged with the idea of providing all plants the light and shade essential to their well-being. Dianthus, Aubrietias, Saxifragas, Sedums, Primulas, Edelweiss, small-growing evergreen Coniferæ, and deciduous shrubs were well represented. Nymphæa flowers floating on the surface of a small sheet of water at the base of the rockery added beauty and variety to this meritorious exhibit.

Messrs. Jas. Cypher & Sons were awarded the 1st prize in a class for six specimen Palms; 2nd, John Arthur Kenrick, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer).

Roses (Open).

Eleven classes were provided in the open section, and competition was keen in most of them; a sum of £125 10s. was offered in prizes. There were five competitors in the class for 72 blooms, distinct, for which the sum of £20 was offered as 1st prize. The successful exhibitors, Messrs. D. Prior & Son, Colchester, had first-quality flowers of Richmond, Her Majesty, Rev. Alan Cheales, A. K. Williams, Bessie Brown, J. B. Clark, Ulrich Brunner, Lady Ashtown, Mrs. John Laing, Duchesse de Morny, Kaiserin Augusta Victoria, Alfred Colomb, Dupuy Jamain, John Stuart Mill, Mrs. W. J. Grant, Konigin Carola, Prince Arthur, Gustave Piganeau, Liberty, Exquisite, Countess of Gosford, Mrs. Theodore Roosevelt, Helen Keller, Suzanne Marie Rodocanachi, Gloire de Chedane Guinoisseau, Oscar Cordel, and White Killarney. 2nd, King's Acre Nurseries, Hereford. 3rd, Messrs. R. Harkness & Co., Hitchin.

Thirty-six blooms of distinct varieties.—Of the seven competitors in this class, the King's Acre Nurseries led with very fine blooms of Alfred Colomb, Caroline Testout, Horace Vernet, Commant, Felix Faure, Juliet, Hugh Dickson, Helen Keller, Beauty of Waltham, Gloire de Chédane Guinoisseau, Lyon Rose, Gustave Piganeau, Gladys Harkness, Dean Hole, Mrs. John Laing, Alice Lindsell, and Claudius. 2nd, Mr. W. T. Mattock, Headington. 3rd, Mr. W. H. Frettingham, Nottingham.

The last-named exhibitor excelled in a class for nine varieties of Roses, shown in separate circular baskets, without handles, not to exceed 14 inches inside diameter. The flowers exhibited were beautifully fresh and well arranged. They were as follow:—Ulrich Brunner, Hugh Dickson, Lyon Rose, Mrs. John Laing, Horace Vernet, Kaiserin Augusta Victoria, Mme. Jules Gravereaux, Comtesse de Ludre, and Her Majesty. 2nd, Mr. John Mattock, Headington, whose examples of the Lyon Rose were particularly good. 3rd, Mr. W. T. Mattock.

Mr. John Mattock was placed 1st in a class for the best dozen Roses introduced in 1909 and subsequently. The varieties exhibited were Mrs. A. E. Coxhead, Mrs. Foley Hobbs, His Majesty, Walter Speed, Juliet, Mrs. M. Sinton, Col. Lecteur, Mrs. H. Taylor, Leslie Holland, Mrs. A. Munt, Elizabeth, and Ethel Malcolm. In the 2nd prize stand, which came from the King's Acre Nurseries, the following varieties were of outstanding merit:—Mrs. A. E. Coxhead, Miss Alice de Rothschild, Claudius, and Frances C. Seton.

In a class for 18 blooms of Tea Roses, distinct varieties, Mr. W. T. Mattock and the King's Acre Nurseries were placed 1st and 2nd respectively. The first-named exhibitor had exquisite blooms of Mrs. Foley Hobbs, Medea, Mme. Constant Soupert, Muriel Grahame, and Comtesse de Nadaillac.

Mr. John Mattock showed the best basket of dark Roses, and Mr. J. Barrow, Oadby, took the lead in a similar class for light-coloured Roses.

There appeared to be very little to choose between Messrs. R. Harkness & Co. and Mr. W. H. Frettingham, who were placed as named in a class for 18 varieties of perpetual-flowering Roses, "exhibition" or otherwise, not more than seven stems of each variety, in vases, on a space of 7 feet by 3 feet. Both exhibits were meritorious. The last-named exhibitor had the winning stand of nine varieties of Roses, in vases, occupying 5 feet by 3 feet. 2nd, Messrs. James Townsend & Sons, Worcester; 3rd, Mr. John Mattock.

In a class for 18 bunches of "decorative" Roses, in not fewer than 3 or more than 12 trusses of each variety, to be shown in separate receptacles, the last-named exhibitor beat Mr. W. T. Mattock and Mr. J. Barrow, who were placed 2nd and 3rd respectively.

Roses (Amateurs).

Mr. R. F. Hobbs, Worcester, won 1st prizes in classes reserved for amateurs, viz.: (1) Thirty-six blooms, distinct; (2) six varieties, three blooms of each; (3) 24 blooms, distinct; (4) 12 blooms, distinct; and (5) 12 Tea Roses, distinct. The Rev. J. A. L. Fellowes, Attleborough (gr. Mr. J. O. Hinckley), also exhibited well.

Mr. J. Egginton, Wolverhampton, was the most successful exhibitor in a class for 18 Roses, distinct, confined to growers residing within 12 miles of Wolverhampton, and in a similar class for 12 Roses Mr. W. T. Bruford, Tettenhall (gr. Mr. T. Finch), took the lead.

Mr. A. Yates, Worcester, was awarded 1st prizes for (1) a bowl of Roses with Rose foliage only, not more than 36 blooms, and (2) a vase of Roses, any foliage admissible.

Bouquets and Cut Flowers (open).

Messrs. Perkins & Sons, Coventry, were awarded 1st prizes in classes for (1) one bouquet composed almost entirely of Odontoglossums, Oncidiums, Cattleyas, and Lilies of the Valley; (2) bridal bouquet (with Orchids) and two bridesmaids' bouquets (Orchids excluded); and (3) one featherweight bouquet.

There were 10 splendid exhibits in a class for decorative plants and cut flowers arranged on table space of 6 feet by 4 feet. The 1st and 2nd prizes were awarded respectively to Messrs. James Cypher & Sons, Cheltenham, and Sir George H. Kenrick, Edgbaston (gr. Mr. J. V. Macdonald). Both exhibitors had choice cut flowers, over and intermingled with small well-grown highly-coloured foliage plants. 3rd, Mr. W. Manning, Dudley.

The best exhibit of hardy border flowers (duplicate or mixed bunches not allowed) arranged on four-tier staging 15 feet by 4 feet, came from Messrs. Harkness & Sons, Bedale, who showed handsome bunches of Gaillardias, Delphiniums, Liliums, Gladiolus, Irises, Verbascums, Phloxes, Centaureas, and Pyrethrums. 2nd, Messrs. G. Gibson & Co., Bedale. 3rd, Messrs. Fred Smith & Co., Woodbridge.

Messrs. G. Gibson & Co. gained 1st prize for a collection of Delphiniums staged as grown on three-tier staging. The unusually strong flower-spikes, clothed with single and double flowers, were very effective. 2nd, Messrs. Harkness & Sons. 3rd, Messrs. Blackmore & Langdon, Bath.

Three tastefully-arranged collections of Pansies and Violas on table space of 7 feet by 3 feet were placed before the judges, who awarded the 1st prize to Mr. J. Bastock, of Moseley, whose flowers were extraordinarily good. 2nd, Messrs. W. Pemberton & Son, Walsall. 3rd, Mr. A. R. Dempster, Kidderminster.

E. Shaw Hellier, Esq. (gr. Mr. F. T. Parnwell), beat Sir Charles T. Mander, Bart. (gr. Mr. J. F. Simpson), in a class for 12 trusses of single zonal Pelargoniums, but in the next class, which was for 12 trusses of double zonal Pelargoniums, the order was reversed.

Lady Grey, Enville Hall, Stourbridge (gr. Mr. F. Green), was placed 1st in a class for a display of Carnations on a space of 6 feet by 4 feet. This exhibitor had large, shapely Malmaison blooms, and the best varieties were Princess of Wales, Maggie Hodgson, and Duchess of Westminster. In the 2nd prize collection, which came from Mr. C. F. Waters, Balcombe, Sussex, perpetual-flowering varieties of splendid quality were arranged with Asparagus.

The best stand of cut flowers for table decoration (not exceeding 18 inches diameter at the base), open to amateurs only, came from Sir Charles T. Mander, Bart. (gr. Mr. J. F. Simpson), whose flowers of pink Carnations, borne on long stems, were beautifully arranged. 2nd, Alderman Berrington, J.P. (gr. Mr. J. H. Phillips). 3rd, the Marquis of Northampton, Northampton (gr. Mr. A. R. Searle).

The winning exhibit of 12 kinds of cut hardy flowers was sent by T. B. ADAMS, Esq., Compton Hall, Wolverhampton (gr. Mr. E. Walker). Included in this exhibit were excellent Campanulas, Calliopsis grandiflora, Liliums, Delphiniums, and Phloxes. 2nd, the Marquis of NORTHAMPTON (gr. Mr. A. R. Searle). 3rd, W. R. WILSON, Esq., Compton.

DINNER-TABLE DECORATIONS (OPEN).

Dinner-table decorations are always a good feature at Wolverhampton, and the present occasion was no exception to the rule. Of the 10 exhibits in a class in which any flowers were admissible, the 1st prize was won by Mr. W. T. MATTOCK, Headington, who used Odontoglossums, Cattleyas, Roses, and sprays of Selaginella. The 2nd prize was gained by Miss A. L. HERBERT, Acock's Green, whose flowers of Viola cornuta purpurea and Lilies of the Valley, intermingled with graceful sprays of bronze-tinted Selaginella, created a charming effect.

In the next class, for table decoration, confined to Sweet Peas, there were 15 entries. 1st, Mrs. S. HALL, Norton Canes, who relied upon pale-pink flowers, narrow, yellow Codiæum leaves, and sprays of Selaginella. 2nd, Mr. E. DEAKIN, Hay Mills. 3rd, Sir GEORGE H. KENRICK (gr. Mr. J. V. Macdonald).

SWEET PEAS (OPEN).

Robert Sydenham Limited offered prizes for nine varieties, to contain certain specified varieties. 1st, T. R. CASWELL, Esq., Oaken (gr. Mr. H. Smart), with clean, strongly-grown flowers. 2nd, Mrs. E. WINCHESTER, Birmingham. 3nd, Capt. W. H. STARKEY, Leamington (gr. Mr. G. L. Blackburn).

The 1st prize in a class for 18 varieties displayed on table space of 8 feet by 4 feet, was won by Messrs. CASTLE BROS., Carnforth. 2nd, Sir R. BAKER, Bart., Blandford (gr. Mr. A. E. Usher).

Messrs. Webb & Sons' prizes were offered for six varieties. Of the eight exhibits in this class, the one from Sir R. BAKER, Bart. (gr. Mr. A. E. Usher), was awarded 1st prize. 2nd, Sir CHARLES T. MANDER (gr. Mr. J. F. Simpson); 3rd, Major MAYALL, Oaken (gr. Mr. C. F. Mowl).

FRUIT.

Fruit was not very extensively shown. The 1st prize of £10 offered for 12 dishes of fruit, distinct, in not fewer than 9 kinds and not more than 2 varieties of a kind, to occupy a space of 6 feet by 4 feet 6 inches, was awarded to Lord SAVILE, Ollerton, Notts. (gr. Mr. J. Doe), whose specimens of Brown Turkey Figs, Dryden Nectarines, Muscat of Alexandria, Buckland Sweetwater, Madresfield Court, and Black Hamburgh Grapes, Apples, and Peaches were very meritorious. The 2nd award was gained by the Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker), who had good dishes of Apples. Grapes, Peaches, Nectarines, Strawberries, Plums, and Figs. Each collection was decorated with cut flowers.

Only two exhibits in the premier class for decorated tables of 30 dishes of British-grown fruit in not fewer than 12 distinct kinds, arranged on separate tables, 10 feet 6 inches by 4 feet 6 inches, for which £55 were offered in four prizes, were placed before the judges, who awarded the 1st prize to the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes), who had good dishes of Triomphe de Vienne and Williams's Bon Chrètien Pears, James Grieve Apples, Royal George and Barrington Peaches, Lord Napier and Pitmaston Nectarines, and Brown Turkey Figs. Grapes were rather small in berry and bunch, and, in some cases, imperfectly finished. The decorations consisted of Carnations, Liliums, and Cattleyas. 2nd, The Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), whose exhibit included Black Hamburgh, Muscat of Alexandria, Appley Towers, and Foster's Seedling Grapes, Peaches, Nectarines, Figs, Melons, Apples, Cherries, and Plums. Pink "Malmaison" Carnations and Francoas were used as floral decorations.

Lord SAVILE showed Grapes in splendid condition. He was awarded 1st prize for:—(1) Four bunches (two black and two white); (2) two bunches of white Grapes; and (3) two bunches of black Grapes. His examples of Buckland Sweetwater, Black Hamburgh, and Muscat of Alexandria were very fine. Other prize-winners in the Grape classes included the Duke of NEWCASTLE (gr. Mr. S. Barker) and the Earl of HARRINGTON (gr. Mr. J. H. Goodacre).

VEGETABLES.

Prizes for vegetables were offered by seedsmen. The seven exhibits in Messrs. Webb & Sons' class, for eight distinct kinds, made a very fine show. 1st, The Marquis of NORTHAMPTON, Northampton (gr. Mr. A. R. Searle), who had excellent Tomatos, Cauliflowers, and Potatos. 2nd, H. WATSON SMITH, Esq., Stourbridge (gr. Mr. H. Davis). The last-named exhibitor excelled in the next class, which was for six distinct kinds, for which prizes were also offered by Messrs. Webb & Sons. 2nd, Sir CHARLES T. MANDER (gr. Mr. J. F. Simpson).

Messrs. Sutton and Sons' prizes were for six distinct kinds. Here again the Marquis of NORTHAMPTON (gr. Mr. A. R. Searle) was placed 1st; 2nd, H. WATSON SMITH, Esq., Stourbridge.

HONORARY EXHIBITS.

Messrs. CLIBRANS, Altrincham, had a prettily-arranged collection of Sweet Peas, Violas, Potentillas, and Centaureas. (Silver-gilt Medal.)

Mr. C. F. WATERS, Balcombe, Sussex, showed Tree Carnations in tall vases. (Silver Medal.)

Messrs. JARMAN & Co., Chard, Somerset, sent Centaureas, single and double Zonal Pelargoniums, Roses, and Carnations. (Silver Medal.)

Messrs. WEBB & SONS, Wordsley, occupied a large space in the big plant group tent. They showed Sweet Peas, Carnations, Gloxinias, pink Spiræas, Liliums, also Melons and vegetables in variety, and of excellent quality. (Gold Medal.)

Messrs. DICKSONS, Chester, had a large assortment of hardy flowers. (Small Gold Medal.)

Mr. W. LOWE, Beeston, Notts., filled a table about 30 feet long by 5 feet wide with a collection of beautifully fresh Roses in vases, tall stands, and boxes. (Gold Medal.)

Mr. B. LADHAMS, Shirley, Southampton, sent a very large group of Gaillardias, together with Coreopsis grandiflora, Campanulas, Scabiosa, and Salvias. (Silver Medal.)

From Messrs. SUTTON & SONS, Reading, came a beautifully arranged collection of upwards of 100 varieties of Sweet Peas, including several promising new varieties. (Gold Medal.)

Messrs. BAKERS, Wolverhampton, had an imposing exhibit of cut flowers, arranged on a dais, after the style of the Dutch exhibit at the recent Royal International Horticultural Exhibition, and was much admired. (Gold Medal.)

Mr. F. A. HAAGE, Erfurt, Germany, had a collection of small Cactaceous plants plunged in sand. (Silver Medal.)

Mr. H. N. ELLISON, West Bromwich, contributed a choice assortment of Ferns. (Silver Medal.)

Lady GREY, Enville Hall, Stourbridge (gr. Mr. F. Green), exhibited about 70 vases of "Malmaison" Carnations. (Small Gold Medal.)

Messrs. HEWITT & Co., Solihull, Birmingham, had a large group of hardy flowers, Roses, and Hydrangeas. (Silver-gilt Medal.)

Mr. H. MASTERS, Handsworth, contributed Violas in sprays and on boards. (Bronze Medal.)

The biggest and best collection of Pansies and Violas came from Messrs. SEAGRAVE & Co., Sheffield. Delphiniums were also included in this exhibit. (Silver Medal.)

Mr. C. H. HERBERT, Acocks Green, Birmingham, contributed a very bright group of hardy cut flowers, in which we noted some very fine seedling Pinks. (Silver Medal.)

Messrs. W. H. SIMPSON & SONS, Birmingham, made an extensive exhibit of Sweet Peas. (Silver-gilt Medal.)

Mr. A. F. DUTTON, Iver, Bucks., had a beautifully-arranged collection of Tree Carnations in large bunches. (Small Gold Medal.)

Messrs. DOBBIE & Co., Edinburgh, showed Roses, Violas, and Dahlias. (Small Gold Medal.)

Messrs. DICKSON & ROBINSON, Manchester, had a circular group of retarded plants. (Silver Medal.)

Messrs. W. CUTBUSH & SON, Highgate, were awarded a Silver Medal for Tree Carnations, Roses, and Marguerites, and a Small Gold Medal for clipped shrubs in tubs.

Mr. FRED CROSS, Arnold, Nottingham, had an arrangement of Sweet Peas and Ferns in rustic stands. (Bronze Medal.)

Mr. A. H. WELHAM, Bridgnorth, showed Sweet Peas, Gaillardias, Verbenas, and annual Chrysanthemums. (Bronze Medal.)

ROYAL SCOTTISH ARBORICULTURAL.

VISIT TO DEESIDE.

DURING the week ending June 29, the members of the Royal Scottish Arboricultural Society held their 35th annual excursion, the district chosen this year being the Dee Valley, Aberdeenshire. The number attending this year exceeded 100. The first excursion was by motor cars to Braemar, the extreme end of the Dee Valley.

No more suitable place could be found in the North of Scotland for such an excurcion, for there is to be found a happy combination of the old and the new, of the original irregular forests with those in which the intensive system of culture has been adopted, and extensive plantations where successful experiments have been made in introducing exotic trees.

Ballochbuie Forest was the first place of call, and Mr. John Michie, his Majesty's factor on the Balmoral estates, acted as guide. According to an ancient tradition Ballochbuie Forest was sold to a Farquharson of Invercauld for a tartan plaid by a McGregor, the previous laird of the forest. In allusion to this circumstance, the late Queen Victoria, who purchased it from Mr. Farquharson of Invercauld, erected a stone with the following inscription: "Queen Victoria entered into possession on the 15th day of May, 1878. 'The bonniest plaid in Scotland.'" Ballochbuie is certainly one of the oldest forests in Scotland, and even at the present day there are giant Pines in it ranging from 260 to over 300 years old; noble specimens of Scots Fir, where the golden eagle is ofttimes found nesting—trees, in short, which give ample justification to the favourite designation, the noble Ballochbuie Forest.

Leaving the cars the party took the Eagle's Nest walk, where the Pines in their natural habitat were seen to advantage. Passing along the path now known as the Queen's Drive, Mr. Michie halted the party before the thick stump of a tree rising to a height of some 12 to 14 feet, and explained that the tree had been dead for nearly 100 years: an old man, who was known by Mr. Michie, remembered seeing it alive when he was a boy.

Throughout the tour, Mr. Michie enlightened the party on many interesting points. He showed the visitors the highest point at which it was possible to grow trees. The trees which he pointed out at an altitude of 1,400 or 1,500 feet took a longer time to reach a marketable size than those on the lower ground. He said the fact was that they required almost two rotations, thus reducing to a certain extent their commercial value. He pointed out, however, that there were exceptions, for in the Braemar and Balmoral districts there were woods producing commercial timber at elevations up to 1,700 feet, a remarkable fact, seeing that the general "timber line" is considered to be from 800 to 1,000 feet.

At this part of the forest Mr. Michie pointed out the damage caused by herds of deer. He led the party to an area where a high deer-proof fence was erected, and in which was growing a capital crop of young Scots Fir, abundantly demonstrating the suitability of the district for the growth of those trees from natural seedings.

The party returned by the Garrawalt Falls, and viewed the fine specimens of natural Scots Pine growing in that area. They had not been thinned out beyond what was necessary, and from the present appearance of the trees it was evident that in bygone days the primary rules of forestry had been followed. Coming to the lower grounds, much interest was evinced in the fine growth of Japanese Larch witnessed here, and comment was made as to the interesting features connected with the whole neighbourhood, and especially as to the extraordinary growth of timber at such a high elevation.

Luncheon was served at Braemar, after which the party set off for Invercauld to inspect the woods there owned by Mr. Farquharson, and from thence to Mar Lodge, and through the finely-wooded country which belongs to the Duchess of Fife, on to the Linn of Dee.

Wednesday's proceedings were especially interesting. In brilliant sunshine the party again proceeded to the Royal demesne, where they were once more met by Mr. Michie. They drove to the base of Craig Deign, an eminence some 1,800 feet above sea level, and perhaps the highest point in the district at which timber can

grow. At the summit were spread out to view the principal peaks of the Cairngorm range—Cairntoul, Braeriach, Ben M'Dhui, Ben-a-Bourd, and Ben Avon. Then to the north-east was Morven, that mountain of snow, while to the south-east stood Mount Keen in full grandeur. To add further to the enjoyment of the excellent panorama there was a fine view of Balmoral Castle and its policies. Garmaddie Wood was then inspected, and on the way to Balmoral Castle an ascent was made of Craig-Gowan.

On this eminence a great variety of exotic and home trees, all in vigorous growth, was found. Conspicuous amongst them are the Picea Douglasii, growing luxuriantly at a higher altitude than can be found, perhaps, anywhere else in the country. There were also fine clumps of Pinus Cembra, P. monticola, and P. Strobus, or Weymouth Pine, and excellent specimens of the comparatively rare Abies Hookeriana. A good sprinkling of the native and Tyrolese Larches was also seen, and a couple of specimens of the Japanese Larch (Larix leptolepis)—the last-named being among the first brought to this country. Many were under the impression that this Larch would supersede the European species, but although it grows rapidly for the first 10 years or so, it gradually loses its vigorous character, and falls out in the race with the European variety.

From Craig-Gowan the company were conducted to the lawn near Balmoral Castle, where luncheon was provided.

After luncheon the gardens were inspected. Much interest was evinced in the memorial trees planted in the grounds. These consist chiefly of the Cembra Pine, which has been found the most suitable for the district. There is a fine avenue of these trees from the castle to the stables. Other noteworthy trees noticed were splendid specimens of the Pinus nobilis, Abies magnifica, A. concolor, A. lasiocarpa, A. grandis, magnificent examples of the Douglas Fir, and Pinus orientalis.

Two trees were planted in the avenue which leads from the principal entrance gateway to the castle to commemorate the visit of the Society. The first, Pinus leucodermis, provided by Mr. Elwes, of Colesborne, and introduced into this country by that gentleman in 1900, from its habitat 6,000 feet high on the mountains of Herzegovina, was planted by Sir John Stirling-Maxwell. On the request of the president, Mr. Elwes planted the other tree—a small but very healthy specimen of the Picea Albertiana, from Banff, Alberta, introduced to this country by Mr. Elwes in 1906.

The company next inspected the Abergeldie, Birkhall, and Lynn Woods, proceeding down the valley to Banchory, which for the next two days became the headquarters of the Society.

Thursday morning opened fine, and Ballogie and Finzean, owned by Mr. W. E. Nicol and the Right Hon. R. Farquharson respectively, were visited. The road taken was by Invercannie (the point at which Aberdeen's water supply is taken in from the Dee) and Potarch. As this part of the country is densely wooded, the surroundings greatly interested the company. The growth of the woods is extremely thick, and the trees with their long, straight stems were much admired. At Ballnacraig, the visitors were met by Mr. George Wyllie, manager of the Ballogie estate. The Potarch woods were then visited, and a plantation of 200 acres, growing about 2,500 trees to the acre, was traversed. The previous crop was of old Scots Pine and Larch, cut out in blocks of 50 acres. It was here explained that the forester before planting removed a thin turf for the purpose of giving the plants more vigour, and thus enabling them to withstand the attacks of the Pine weevil. Another wood to the east, chiefly composed of Scots Pine and Larch, and some 90 years old, proved of much interest. The wood grew 200 trees to the acre, and gave 4000 cubic feet.

Proceeding towards Ballogie House, there were seen some exceedingly fine Conifers of an exceptional height. Some of the outstanding trees noticed were Abies nobilis, height 77 feet, circumference 6 feet 11 inches; A. Nordmanniana, height 79 feet 6 inches, circumference 9 feet; A lasiocarpa, height 74 feet, circumference 5 feet 10 inches.

At Powlair, Mr. Francis J. Cochrane, of Balfour, factor for Dr. Farquharson of Finzean, and Mr. Donaldson, the ground officer, were in waiting. Easter Clune wood was first inspected. Standing on the east of the River Feugh, the district was in olden times the hunting seat of the Bishops of Aberdeen. The present wood is about 40 years old, and is composed of natural Larch, splendidly grown. From an acre measured, it was ascertained that there were about 1,800 cubic feet to the acre. Finzean House was then visited, and here the most interesting feature, from a forestry point of view, was the avenue of Scots Pines, known in the district as "Dr. Farquharson's walking sticks." These remarkable trees drew forth expressions of warm admiration.

On the concluding day the extensive sawmills of Messrs. A. and G. Paterson were visited, where native-grown timber from the district woods is dealt with. Mr. Donald Munro, the head of the firm, showed the visitors round. There was laid out for inspection a number of planks of pine which had been damaged by squirrels. A cross-section of Douglas Fir about 3 feet in diameter, from a tree 50 years old grown in the district, was pronounced as specially fine by the foresters and wood merchants of the company. Mr. W. Dallimore, of Kew Gardens, secured some fine specimens of the Douglas Fir. Mr. Munro provided refreshments, and, in returning thanks for his kindness, Mr. Elwes declared he had never seen a better-equipped mill, nor had he in the course of all his excursions in England obtained more practical information about forest trees than he had that day from Mr. Munro.

Crathes Castle was the next place of call. Built in 1596, this fine old building, the home of Sir Thomas Burnett, was much admired. Here the party was met by Mr. J. C. F. Dunbar, factor on the estate. Traversing the avenue, remarkably fine specimens of Thuya plicata, Cupressus Lawsoniana, Cedars and Douglas Firs were met with. Much interest was taken in the close avenue of tall Lime trees, in capital condition, and in the splendid Yew hedges. These hedges were planted over three centuries ago, and their beautiful symmetry, finely arched passages, and ornamental turrets, formed of no fewer than five tiers geometrically arranged, evoked great admiration. The gardens were inspected. The view of the lakes, with their islands covered with masses of Rhododendrons in blossom, was declared the best example of landscape gardening the party had seen in the course of their tour.

The Durris Estate.

At the next and last place of call of the tour—Durris estate, owned by Mr. Baird—the party found ample demonstration of what practical sylviculture can be brought to. Much of the work viewed here was done under the supervision of Mr. John D. Crozier, now of the Irish Forestry Department. For a number of years the progress of plantations of the Douglas Fir at Durris has been watched with considerable interest, their remarkable growth being the subject of comment by all who have seen them. In addition, there are excellent plantations of Japanese Larch, as well as plantations of a number of the European Larch, all of them showing how timber can be grown to great advantage on Deeside. A feature of the excursion was a visit to a couple of plantations of Menzies Firs growing at an elevation of from 700 to 900 feet above sea level on boggy ground surrounded by moorland. The plantations are 34 years old, and are said to be unique—a pronouncement made by the late Professor Mayr, of Munich, when that forestry expert visited this country two years ago. In the first of the plantations visited the wood was somewhat mixed, Menzies Spruce having been planted along with common Spruce, Scots Fir and a few Larch. It was evident that the Menzies Spruce had practically suppressed the other trees. They were planted in 1878, and in the 34 years have given good promise of being valuable commercial timber in the course of about another 20 years. For hill-planting Menzies Spruce has proved its superiority over Larch, Scots Pine, and Norway Spruce in a marked degree, its power of resistance to high winds and its general reliability on exposed heights being notable. The timber is light, straight grained, and easily dressed.

The policy grounds of Durris have been laid out with great taste and contain an extensive collection of deciduous and evergreen trees and shrubs; many of these, however, have proved unsuited to our northern climate. The Douglas Fir of Oregon takes precedence of all others, and owing to its free growth, freedom from disease, and wonderful adaptability to a wide range of soils, subsoils, and elevations has proved to be a valuable asset to our limited number of commercial timber trees. Its timber, when well grown and matured, is of excellent quality, admits of a beautiful polish, and is especially suited for house construction. Menzies Fir takes second place and resembles the Douglas Fir in its adaptability to soils, &c. It braves the elements on the lower slopes of the Grampian Hills, where Spruce and Scots Pine are unable to make headway, but its timber is much inferior to that of Abies Douglasii. The commercial woods on the estate cover an area of nearly 4000 acres, and are composed chiefly of Larch, Scots Pine, and Spruce. Douglas Fir and Menzies Fir have been freely planted in the younger plantations; Hardwoods have not been planted extensively on the estate. With the exception of the Dee valley, which is composed of light sandy loam resting on gravel, all the remainder of the estate rests on gneiss, the soil alternating from a rather light loam on the low ground to a stiff boulder clay at higher elevations. Larch, Spruce, Douglas and Menzies Fir all do well on the cool bottom, but Scots Fir, although growing rapidly in its younger stages, does not continue its rate of growth.

The concluding walk was through the "den," where were found some magnificent old Oaks and Larches, which were planted during the Duke of Gordon's proprietorship of the estate in the early years of the last century. Some of the Larches measured 100 feet in height, and from 8 to 10½ feet in circumference at five feet from the ground. A specially fine specimen of the Douglas Fir, about 80 years old, was much admired, its measurement coming out at 112 feet in height and 12 feet 6 inches in circumference 5 feet from the ground.

To Mr. Robert Galloway, secretary and treasurer, great praise is due for the admirable arrangements he made for the comfort and enjoyment of all concerned.

NATIONAL SWEET PEA.

INSPECTION OF TRIALS AT SUTTON GREEN.

July 11.—The trial undertaken at *The Times* Experimental Station, Sutton Green, were inspected by the members on this date, the party numbering about 50, including Mr. Lester Morse and Mr. Howard M. Earl, from America.

Contrary to the expectations of many, the trials were in much better condition than last year, for, despite the drought, the plants had made excellent growth, whilst less disease was noticeable, although it was seen to be gaining a strong hold, and in some cases the plants were rapidly withering. The colours throughout were better than last season, and, despite the great heat, few varieties showed damage by burning. No great novelty was seen in the varieties, whilst many of the seedlings were badly mixed. Standard varieties were not present at the trials save for classification purposes, and of these only John Ingman, Mrs. Hardcastle Sykes, Mrs. C. Breadmore and May Campbell were giving rogues. The novelties that gained the Society's awards were in excellent condition. King White is very pure, and the flowers are beautifully placed, whilst the stems are of good length. Lady Miller, a delightful salmon colour, equals Mrs. Hugh Dickson for freedom in flowering, whilst it is several shades deeper than Iris. Decorator is not likely to be a great exhibition variety. The colour is rich cerise rose, bright and telling, but from the size of the flower and habit of growth the variety will be more suited for garden decoration than for the show board. Three distinct stocks gained Awards of Merit, and in the same class will be embraced Aggie Elder, A. A. Fabius. Kathleen, Rose Diamond and others, the difference between them being but slight. Bertrand Deal is a grand lilac mauve variety, and the stock which received an Award of Merit is an improvement upon the original type. The variety R. F. Felton stood out very strongly among the

lavenders, but it possesses too much mauve in the standard. Agricola will make a grand garden variety, for it is strong and free, whilst the flowers are of great size. The petals are blush white suffused with lilac.

Among the 250 other stocks growing at the trials there were several good, though not startling varieties. Earl of Lovelace is a small white variety, its narrow leaves, frequent doubling, and the appearance of the buds suggested its being related to the perennial Lathyrus. This variety may prove of great value, as it blooms with freedom and has numerous four and five-flowered spikes.

Stirling Stent was not outclassed by any salmon, but a double-flowered stock No. 38, assuredly Dobbie's Inspector, was very telling, as it produced more doubles than the so-called double stocks.

Thos. Stevenson, shaded, was not so good as No. 43, which was unshaded.

Among the cream pinks there was nothing to surpass Mrs. Routzahn for colour, but Zarina Spencer, sent by Mr. ROBT. HOLMES, was especially fine.

Edith Taylor, a lovely salmon-rose variety, was as deserving of an Award of Merit as Decorator, but we assume it was not in such fine condition when the Awards were made.

Dragon Fly, sent by Messrs. ALDERSEY & JONES, is very quaint, for it shows close connection with the ancient Captain Clark and Columbia. The curious purple veins in the standard are a feature, but its chief peculiarity is that the flowers open cream and rapidly change to rosy-purple, finally turning purple and mauve. Margaret Madison is several shades paler than Flora Norton, being a pretty blue colour. No. 161, evidently Dobbie's True Lavender, was superb, being easily the truest lavender at the trials. Among dark varieties King Manoel was perhaps the finest. It is an extremely dark maroon and shows less purple than Nubian. Brunette is smaller, but it is a maroon without purple.

Quite a number of flaked and watered seedlings were on trial, but among deep blue flakes none surpassed Loyalty, although No. 228, sent by Messrs. E. W. KING & Co., was very deeply coloured.

No. 238, assumedly Deal's Minnie Orst, was the best blue watered variety, being a true Helen Pierce Spencer. Bouquet and Perdita were pretty pink-watered forms, but, being small grandifloras, they will not be in great requisition. Among the dozen or more double stocks no variety stood out very prominently. Duplex Crimson King was nearly equal to the scarlet flower No. 54, sent by Messrs. DOBBIE & Co., whilst the rest were producing fewer doubles than some of the ordinary varieties.

ELSTREE AND BOREHAM WOOD HORTICULTURAL.

JULY 10.—The fourth summer show in connection with the above society was held on the above date in Aldenham Park by kind permission of Lord Aldenham and the Hon. Vicary Gibbs, the President, whose gardener Mr. E. BECKETT, V.M.H., staged two fine honorary exhibits, and was awarded a Gold Medal. Those consisted of (a) one of the largest collections of vegetables ever staged by the exhibitor, and (b) a tastefully-arranged water garden. E. GREENWOOD, Esq., (gr. Mr. G. Cafell) staged a fine group of Hydrangeas, together with Coleus and other foliage plants, for which a Silver Medal was awarded. Mr. R. F. FELTON, florist, Hanover Square, arranged a table very beautifully with Carnations not for competition.

The trade growers were represented by Messrs. FRANK CANT & Co., Colchester, who won the Society's Silver Rose Bowl, defeating Messrs. HARKNESS & SON, Hitchin, last year's winners.

Non-competitive exhibits were staged by Messrs. WM. CUTBUSH & SON, Highgate, who showed Roses; Messrs. HENRY NEWMAN & SONS, Watford, who staged Sweet Peas and Violas; Messrs. GLEESON & Co., Watford, who exhibited hardy flowers; and Messrs. THOMSON & CHARMAN, who arranged a display of Alpine and hardy flowers.

The show was favoured with excellent weather and was a great success, to which the untiring energies of the Hon. Sec., Mr. W. Pritchard, and an increase of entries greatly contributed.

REIGATE HORTICULTURAL.

JULY 10.—The twenty-sixth annual show of the Reigate Horticultural Society was held on this date in the grounds of "The Frenches," the residence of Mrs. Campion, the president. The show was a great success, and held in beautiful weather; there was a large gathering of visitors. The exhibits were numerous, and of a very high standard of quality; several nurserymen contributed groups, not for competition, notably Messrs. W. WELLS & Co., Merstham, and Messrs. J. CHEAL & SONS, Crawley, Sussex. In a class for a group of plants in a space of 100 square feet, the 1st prize was won by Col. Sir R. W. INGLIS, Craigendowie (gr. Mr. F. Phillips). 2nd. Mrs. CAMPION, "The Frenches," (gr. Mr. W. Rose). The collections of vegetables were exceptionally good, and in Messrs. Cheal & Sons' classes competition was keen, only three points dividing the 1st and 2nd prize groups shown by Mr. W. M. BLACKWOOD and Mr. F. PHILLIPS respectively. The silver challenge cup offered by Mr. H. Hemsley for eight distinct kinds of vegetables was won finally for the third successive time by Mr. F. PHILLIPS.

ROYAL HORTICULTURAL OF IRELAND.

JULY 11.—The summer show of the Royal Horticultural Society of Ireland was held on this date in the grounds of Lord Ivcagh's residence. The Challenge Cup offered for a stand of Roses was won by Dr. J. H. HALL, Monaghan, for the third time, so that the cup now becomes his property. Dr. O'DONEL BROWNE was awarded the 1st prize in the class for a stand of hybrid Tea Roses, whilst Mr. T. F. CROZIER showed much better than any other competitor in the class for 12 Roses. In the classes open only to nurserymen, Messrs. ALEX. DICKSON & SONS, Newtownards, won three prizes, whilst Mr. HUGH DICKSON, Belfast, was awarded four prizes. Messrs. CHARLES RAMSAY & SON, Dublin, were awarded a Silver Medal for an exhibit of Carnation and floral designs. Sir J. GORE BOOTH, Lissadell, was also awarded a Silver Medal. Other nurserymen who received medals and prizes were Messrs. WATSON & SON, Clontarf, for Pelargonium "Watson's Decorator"; Messrs. ELLIS, who showed a group or rare plants; and Messrs. PENNICK & Co., Delgany, for hardy border flowers.

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS.—The annual outing of the members of the above association took place on the 10th inst., when Strathfieldsaye Park and Rectory were visited. The Rev. F. Page Roberts invited the members to visit his Rose gardens when he lectured to them in January last, and Mr. Martin John Sutton, of Wargrave Manor, defrayed the expenses of the outing. The party of 44, left Wargrave at 11.30 a.m., and after a delightful drive through Twyford Hurst, Bearwood, Aborfield and Shinfield, arrived at the Rectory soon after 1.30 where lunch was provided. The Roses were greatly admired —also Sweet Peas which are largely grown at Strathfieldsaye. The gardens of the Duke of Wellington were next inspected under the guidance of the gardener (Mr. A. Nicholls) the glass houses, kitchen gardens, terrace gardens, and well timbered park being each visited in turn.

STIRLING AND DISTRICT HORTICULTURAL.—The second excursion of the season took place on the 13th inst., when Montague Cottage, Blairlogie, the residence of Colonel Hare, was visited. Montague Cottage is situated midway between Stirling and Alloa, in grand environment, nestling at the foot of the Ochils, which forms a noble background, giving shelter from the north and a certain protection from the east. Many tender species succeed in the gardens, notably, Chæmerops humilis planted 12 years ago, Phormium tenax—a colony of the latter was raised from seed saved from a plant growing close by; Choisya ternata, Laurustinus, Magnolias, Paulownia imperialis, Styrax japonicum, Koelreuteria paniculata, Eremerus robustus and Romneya Coulteri.

DEVON AND EXETER HORTICULTURAL.—The members of this society together with the members of the Exeter Working Men's Society and the staff of Messrs. P. Veitch & Son, recently visited Bournemouth on the occasion of the annual outing. Gardens at Bournemouth, Boscombe, and Christchurch were inspected, and also the plantations of the Christchurch French Gardening Company, where the intensive system was well exemplified. The party divided for a portion of the day, some taking steamer to Swanage and Durlstone, whilst others proceeded to Poole to see the celebrated public park there. In the evening an excellent concert was provided in the Winter Gardens.

DIED.

MRS. OLVER, wife of Mr. Olver, of Minterne Gardens, Dorchester, and formerly of The Rookery, Nantwich, on the 2nd inst.

MARKETS.

COVENT GARDEN, July 17.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ens.]

REMARKS.—The following varieties of home-grown Apples are obtainable: Keswick Codlin, Lord Suffield, Beauty of Bath, and Quarrenden. Pears of the variety known in the market as Chalks are also available. The Continental supply of Pears consists principally of the variety Jargonelle. Tasmanian Apples are still obtainable. There are shorter supplies of Figs and Melons with an increased demand; which also applies to Peaches and Nectarines, especially the latter. Strawberries are practically over. Raspberries and Loganberries are obtainable in fairly large quantities, the bulk of the former coming from the Blairgowrie district, Scotland. Currants, both black and red, are still a good supply, showing a slight depreciation in value. There is an abundant supply of home-grown and Channel Island Grapes of all varieties, which meet with a consistent demand. A fair assortment of Cherries are still available. Continental Gages, Plums, and Apricots are fairly plentiful and good. We have received information from a very reliable source that the Kent nut crop will be an excellent one. Dessert varieties of Gooseberries in strike baskets and punnets are available, including the varieties Sulphur, White Lion and various red sorts. Green Walnuts are making their appearance in fairly large quantities. Tomatos are more plentiful and have sold freely. It is anticipated that large consignments of Tomatos from Bordeaux and Paris will reach the London markets shortly. Vegetables include Scarlet Runner Beans, Vegetable Marrows and Peas in variety, the quantities appearing to be sufficient for all demands. Cultivated Mushrooms are, as is usual at this time of the year, very scarce. *E. H. R., Covent Garden, July 17, 1912.*

Old Potatos.

Maincrop ... ... 8 0- 8 6 per cwt.

REMARKS.—There is a plentiful supply of new Potatos, but the demand is very poor and prices are very much lower. *Edward J. Newborn, Covent Garden and St. Pancras, July 17, 1912.*

Obituary.

REV. F. D. HORNER, V.M.H.—Readers will learn with deep regret of the death of this renowned florist at his home, Gretca House, Burton-in-Lonsdale, on the 11th inst. He had

THE LATE REV. F. D. HORNER, V.M.H.

been ailing for a few years, but he survived many of his older friends. He was the son of Dr. Horner, of Hull, a notable grower of Tulips, Ranunculuses and other flowers, and an able writer in the older floricultural papers, such as the *Gossip of the Garden*. The love of flowers and the ability to write about them were thus born in him, and well he used both gifts, for his knowledge was great and his writings inimitable. Whilst he had a catholic love for all flowers, his favourites were Auriculas and Tulips, and it is by them he will be best remembered. In conjunction with his friend, Mr. Simonite, he did great things for the Auricula, and it is largely due to the efforts of these two men that our Auriculas are so good today. Mr. Horner was the secretary of the Northern Auricula Society from its commencement for over 20 years, performing similar duty for the Northern Carnation Society for many years, and when the Victoria Medal of Honour in Horticulture was instituted he was chosen as one of the first recipients. I fain would write of his kindliness of heart, his love for all living things, of his humour and rare power of expressing his thoughts by voice and pen, but for the present these few inadequate lines must suffice as a tribute to the memory of my dead friend. *James W. Bentley.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending July 17.

An extremely hot week.—On five consecutive days the highest reading in the thermometer screen exceeded 80°, and on the hottest of those days (the 15th) rose to 87°. In only three other Julys during the past 26 years has such a high reading as 87° been recorded here. The nights, although warm, were not nearly as unseasonably warm as the days. The ground is now 3° warmer at 2 feet deep, and 5° warmer at 1 foot deep, than is seasonable. Throughout the past fortnight less than one-tenth of an inch of rain has been deposited, and no rainwater at all has passed through either of the percolation gauges during the last six days. The sun shone on an average for 8½ hours a day, which is 1½ hours a day longer than is usual in the middle of July. On each of the last two days of the week the sun was shining brightly for over 12 hours. The winds were again as a rule light, and during the last four days the direction was almost exclusively some point of the compass between north and east. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 6 per cent. *E. M., Berkhamsted, July 17, 1912.*

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

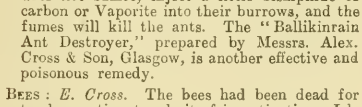
MR. C. WICKS, for the past 5½ years Foreman at Col. FOLLETT'S, Woodside, Old Windsor, as Gardeoer to H. J. DANIELLS, Esq., The Grange, Hillingdon, near Uxbridge, Middlesex.

MR. W. WILLCOCKS, for the past 5½ years Foreman at Straffan House, Co. Kildare, as Gardener to Sir ROBERT HARVEY, Bart., Langley Park, Slough, Bucks. (Thanks for 1s. 6d. sent for R.G.O.F. box.—ED.)

MR. H. BATES, for the past 8½ years Gardener to Miss E. ROBERTSON, Sele Grange, Hertford, as Gardener to Mrs. Ray, Sacombe Park, Ware, Hertfordshire.

MR. F. L. WESTRON, for the past 5 years Gardener to L. WALKER MUNRO, Esq., Rhinefield, Brockenhurst, Hants., as Gardener to A. BENSON, Esq., Upper Gattou Park, Merstham, Surrey. (Thanks for contribution of 1s. 6d. to R.G.O.F. box.—ED.)

MR. A. WEST, for the past 5 years Foreman at Duffryn, Mountain Ash, as Gardener to F. ST. FAIR, Esq., Mill Court, Alton, Hampshire.



ANTS IN FRUIT HOUSES: *A. V.* Very often the nests of ants are made in places where boiling water can safely be poured over them, which is sufficient to destroy these pests. If this does not suffice, inject a little bisulphide of carbon or Vaporite into their burrows, and the fumes will kill the ants. The "Ballikinrain Ant Destroyer," prepared by Messrs. Alex. Cross & Son, Glasgow, is another effective and poisonous remedy.

BEES: *E. Cross.* The bees had been dead for too long a time to admit of investigation. Isle of Wight disease is suspected. Please send more bees, crawlers, and pack them when alive. In the meantime, burn all dead bees and any excrement from them.

BEGONIAS DISEASED: *G. T. B.* Your plants are attacked by one of the several species of Pythium, causing the condition known as "damping off." Water the plants with a solution of sulphate of soda, and take preventive measures against a recurrence of the attack, such as keeping the house and propagating frame dry and well ventilated and drained. In some cases it is well to sterilise the soil before planting.

CARNATION: *Hollandia, Hampton.* A suitable book is *Carnations*, Present-Day Gardening Series, price 1s. 10d., post free, from our publishing department. We do not know of any magazine or periodical devoted to the Carnation. Perhaps the National Carnation Society could help you; the address of the Secretary is 16, Hamilton Road, Reading.

CELERY DECAYED: *J. M.* The Celery has been destroyed by a disease known as Sclerotinia sclerotiorum. Remove and burn all diseased plants. Take away the infected surface soil and spread it over a grass lawn; it will do no harm to the grass, and there will be no danger of it infecting the vegetable quarter. Replace by soil mixed with quicklime.

COTONEASTER FRIGIDA: *H. D.* Under ordinary conditions Cotoneaster frigida fruits regularly every year. But where a large crop is produced one season, the plant becomes exhausted, so that few fruits are produced the following year. The same thing may often be noticed with Hollies and many fruit-trees, particularly Apples.

CUCUMBER LEAVES SPOTTED: *T. C.* The leaves are affected by a disease known as Cercospora melonis, or Cucumber spot. The disease is a most serious one, and as soon as the malady is detected every affected leaf should be plucked off and burnt; if the attack is severe, the whole plant should be treated in this manner. On the subject of preventives you will find articles in the *Gardeners' Chronicle* for April 15, 1905, and June 23, 1906. Spraying with Bordeaux Mixture has not been found particularly successful, but watering the house with carbolic acid solution has been found to do good.

EEL-WORM: *F. S., Henley.* You are not correct in thinking that careless watering could account for the attack of eel-worm in your garden, though over-watering might cause a check to the plants, rendering them more susceptible to attack from infected sources. If the materials of the hot-bed were formerly infested with eel-worm, the disease might have been carried in this way; it would be advisable to sterilise all your potting soil. See p. 30 in the last issue.

FENCE: *Weekly Reader.* If you consider a higher fence of sufficient importance, and are quite sure that your land is accurately measured out, and that the fence is your own, you can give written notice to your neighbours calling upon them to remove the projecting boards within, say, seven days, and stating that, unless this is done, you will have them sawn off. It is to be hoped that this notice will induce the neighbours to come to an amicable arrangement, as otherwise you may have to defend a lawsuit for "trespass." This is often a long and complicated matter, besides involving you in expense, even though the verdict should be in your favour. If the sheds have rested on the fence for many years, you should consult your solicitor before cutting off the projections, as the roofs may have acquired a "prescriptive" right to support from the fence. We assume that the sawing-off would be done from your own side of the fence.

FISH MANURE: *Correspondent.* We are not aware of any book which treats of the manufacture of fish manure from the point of view of the manufacturer. Mr. A. D. Hall's *Fertilizers and Manures* discusses the method in a general way, but does not give any methods of wholesale manufacture. We should advise you to get into touch with some firm which deals in this manure, such as Messrs. A. Cross & Co., Glasgow, or the Humber Fish Manure Co., Hull. The actual process consists of extracting the oil by heated pressure, then drying the material and putting it through a disintegrator to reduce it to powder.

GRAPES DISCOLOURED: *W. A. B.* There is no disease present in your Grapes, but the vines are evidently suffering from want of ventilation. Take care to ventilate the houses well, especially in the early morning, and you will probably find that the discoloration will not continue.

GRAPES DISEASED: *H. W. B., S. W., J. S. D., J. P., Doncaster,* and *R. M.* The Grapes are suffering from a disease popularly known as Grape Rot, which is caused by a fungus, Glœosporium ampelophagum. The plants should be sprayed during the resting season with a solution of sulphate of iron, 1 ounce in a gallon of water. All the diseased berries should be at once removed, and the bunches dredged with flowers of sulphur.

INSURANCE: *J. E. W., Kingswood.* From your letter, we gather that you and your father work in partnership as florists and seedsmen, and that you are part owners of the business. If this is so, there is no question of employment of one by the other, and unless you employ other men or women to work for you, the Act does not affect you. If you do employ labour, you can obtain all particulars as to payments and benefits from the local post office.

LAWN: *Verdant.* Your experience with your lawn is very similar to our own. The drought of spring and early summer was very unfavourable to the growth of seedling grasses, and especially the finer varieties. As in your case we sowed a mixture of the best lawn grasses, but, owing to the dry weather, only the coarser kinds and the weeds survived, so that the turf is very patchy. If you do as you propose, roll and mow the turf well and water it frequently, this should put matters right, especially as you did not destroy the old turf.

LETTUCE CULTURE IN FRAMES: *T. B. G.* The unsuitable nature of your soil and the confined space of the frame are responsible for the failure. Employ a compost consisting of equal parts leaf-mould and loam with the addition of a sixth part of decayed horse manure, as leaf-mould used alone would cause the soil to be too light and open in texture. To be successful with early batches of Cos Lettuce in frames during the spring, the lights should be removed on all favourable occasions; in fact, as the season advances, the best results are obtained when the plants are gradually hardened and the lights eventually dispensed with. Unless Cos Lettuces are specially desired, it would be better to depend on Cabbage varieties for the earliest supplies.

LILY OF THE VALLEY DYING: *J. G. B.* The plants have been destroyed by the Eucharis, or Bulb-mite. The best preventive of this pest is good cultivation, for the mites are most often found in bulbs which are in a bad condition, and have been debilitated by ill-advised treatment, such as periodic forcing and resting, in order to produce two or three crops a year. We do not know of any perfectly satisfactory cure, though you might try watering with a solution of nitrate of soda. The best way is to burn badly affected bulbs, and obtain fresh, healthy stock, endeavouring to keep the plants healthy by good cultivation. It is stated that lime in the soil has a deterrent effect on the mite.

MELON PLANTS DYING: *A. E.* The plants are attacked by a fungus known as Melon-rot (Scoletotrichum melophthorum). Remove all badly diseased plants, and spray the remainder every day, until all trace of the disease disappears. The best specific for the purpose is liver of sulphur, at a strength of 1 ounce in 3 gallons of water. It is well to guard against future attacks of this sort by avoiding overwatering, especially in damp weather.

MELON STEM INJURED: *W. S. R.* An examination of the stems you send reveals the fact that the roots of the Melons have been destroyed by eel-worms. See illustrated article on eel-worms in the last issue, p. 31.

NAMES OF PLANTS: *O. A. F.* Erythrina Crista-galli.—*Millar Brothers.* The quantity of wet packing used had so rotted the flower that there was no trace of colour left.—*T. P. A.* 1, Cimicifuga racemosa; 2, Polemonium cæruleum album; 3, Veronica longifolia; 4, probably Malva moschata (this specimen was rendered unrecognisable by packing too moist); 5, Campanula alliariæfolia; 6, Deutzia crenata.—*F. T. B.* 1, Acanthus mollis; 2, Gleditschia triacantha; 3, Trachelium cœruleum.—*T. J. M.* 1, Browallia (Streptosolen) Jamesonii; 2, Plumbago capensis; 3, Cestrum (Habrothamnus) roseum; 4, not recognised; send when in flower; 5, Acacia sp. (insufficient for identification); 6, Maranta bicolor var. (Brazil).—*Teacher.* Euphorbia, probably E. helioscopia (specimen very scrappy).—*T. S.* 1, not recognised; 2, Veronica Teucrium; 3, Spiræa filipendula; 4, Campanula (specimen too scrappy); 5, Veronica (imperfect specimen); 6, Origanum vulgare; 7, Acalypha sp.—*H. Good.* Henchera brizoides.—*George Cockie.* Dracunculus vulgaris; sometimes known in gardens under the name of Arum Dracunculus.—*F. Dover.* Dracunculus vulgaris, a light-coloured form.—*T. T.* 1, Pteris tremula; 2, P. cretica; 3, Adiantum formosum; 4, Asplenium bulbiferum; 5, A. trichomanes.—*Hort.* 1, Odontoglossum crispum; 2, O. Lindleyanum; 3, Oncidium divaricatum; 4, Brassia brachiata; 5, Cœlogyne fuliginosa; 6, Dendrobium bicameratum.—*T. J. F.* 1, Scolopendrium vulgare; 2, Panax Victoriæ, so far as we can judge from the scrap received; 3, Nephrolepis rufescens Mayi; 4, Selaginella viticulosa; 5, Nephrolepis rufescens; 6. Panicum plicatum.

NECTARINE DISEASED: *W. E.* Spraying is not practicable while the fruit is ripening. The only thing to be done this year is to remove all the diseased fruits; but next season, when the buds are expanding, the trees should be sprayed every fortnight until the fruit is set. Bordeaux Mixture must not be used; the best spraying material is a solution of liver of sulphur.

PEACH LEAVES DYING: *H. H.* There is no disease present in the leaves of the Peach and Nectarine trees you send us. The injury appears to have been caused by unsuitable water or by fumes of some kind. It might be as well to overhaul the heating apparatus to see whether there is any chance of sulphur entering the house from the stokehold.

ROSE LA FRANCE: *J. P.* Your Roses are attacked by the disease known as "Orange Rust." In autumn the same disease, which in summer takes the form now seen, appears as little black spots on the leaves, which fall prematurely. The two stages of the disease are so opposite that they were at one time thought to be distinct diseases. The best way to check the disease is to burn infested leaves and shoots, and spray the plants with potassium sulphide.

SOIL: *T. J. C.* So far as the analyses which you furnish us with go, the soils in question would appear to be well found in all the constitutents of plant food, and from them alone no conclusions can be drawn as to the manuring. It may be taken, however, as a general rule that London clay soils are the better for liming and for dressings of basic slag. We recommend an application of ground chalk at the rate of 1 lb. per square yard, or quicklime at ½ lb. per square yard applied in the autumn, followed with ¼ lb. per square yard of basic slag any time in the winter. The effects of the lime lasts for many years, but the basic slag had better be renewed each year for some time to come; with that and ordinary farmyard manure thoroughly satisfactory crops should be produced.

SWEET PEAS WITHERING: *F. F.* There is no disease present in your Sweet Peas, but you have evidently overwatered them, and that is the cause of their dying.

WEED ON POND: *J. T.* The weed you send us is that known as "flannel weed," and is very troublesome to eradicate. The best specific is copper sulphate; this has been found most successful, notably in the case of the pond in St. James's Park, London, which has been entirely cleared of weeds by this means in a very short time. Ordinary commercial copper sulphate should be used, and for a small pond should be broken small, and enclosed in a bag of loose texture, which should be tied to the end of a pole, and dragged backwards and forwards through the water. In water with a temperature of about 60° Fahr. about 100 lbs. of copper sulphate can be so distributed in an hour. If the water is very hard, or contains much organic matter, a greater amount of the copper sulphate should be used. It is necessary to calculate the amount of water in a pond in order to determine the amount of copper sulphate which may safely be applied. This is done by multiplying together the average length, depth, and breadth of the pond in feet, and multiplying the result by 6¼, the approximate number of gallons in a cubic foot.

ROSE SHOWS.

NOW that the summer Rose shows are practically over it may be a convenient time to consider how far they fulfil the object of their existence, and what improvement may be possible in respect to their nature and management.

It may fairly be claimed that the chief object of a show is to display the Roses to the public in as perfect a condition as the flowers can be staged. The competition for, and the awarding of, prizes is only a means for attaining the end already mentioned, and ought not to be considered as anything more than a valuable method of encouraging each exhibitor to display his flowers to the best advantage. Competition is, therefore, merely a means to an end, and not an end in itself. Of the 6,000 members of the National Rose Society it was recently computed that the total number of exhibitors was fewer than 200, and in most of the local societies the proportion of exhibitors to members is but little higher. The other members are, perhaps, not less interested in the flowers, but what they subscribe for is not the right to exhibit, but to support the show and to enable them to see and criticise the flowers when staged.

That competition among the exhibitors is a most efficient means for attaining the end in view few will deny. The public have long ago discovered it; not only do they give their money for this purpose, but it is common to find the most beautiful and elaborate exhibits bearing the legend "not for competition" entirely neglected by visitors in favour of far less pretentious, and sometimes less beautiful, competitive exhibits. In these classes it is possible that the visitors may, in some cases, find a pleasure in criticising the decisions of the judges; in others they may find a satisfactory sense of the soundness of their own judgment, when they feel able to appreciate the stand marked with the red strip appropriate to the first prize; whilst others, again, may have come with an honest desire of informing themselves as to what really are the best Roses, and it is in the first-prize stands they will naturally seek for this information.

Various, no doubt, are the interests of visitors at the Rose shows, but one and all desire to see the Roses at their best, and it ought to be our ideal of a Rose show to satisfy this legitimate desire. Do we really approach this ideal? I fear it must be confessed that in many cases the question cannot be answered in the affirmative.

The normal course of a Rose show, whether in London or in the provinces, is very much after the same pattern. Early in the morning the exhibitors assemble, most of them having necessarily cut their flowers the day before. If the atmosphere of the exhibition hall or tent is hot the flowers that are obviously full blown are replaced from the spares, but any that have a chance of standing will be left tied till the last moment. The exhibition will be cleared for judging at about 10.30 or 11 o'clock and the task of judging will usually occupy about an hour. If the exhibition flowers will stand for this hour of criticism, that is all that is required of them. Later, when the prizes have been awarded, the flowers may "fly" or fade as they please, the exhibitor being indifferent.

Towards 12 o'clock, when judging is finished, the exhibition will generally be thrown open to the public. In the country a few enthusiasts will come at that hour, and in London a somewhat larger body will survey the show in tolerable peace and contentment. Not so the bulk of the visitors. They will not be there for three hours or more, but from 3 to 5 o'clock the tents will usually be full of visitors. In a normal year the 12 o'clock enthusiasts will probably have little to complain of; the Roses, for the most part, will still be holding well, but in many cases they will be rapidly getting worse. It often happens that by the time the greater part of the public arrive the medal blooms have greatly deteriorated, as many of them did this year at Regent's Park, and then only a vivid imagination can depict them in the state of growth that looked so well at judging time.

The drooping and faded condition of the flowers when so many of the visitors inspect the shows in the late afternoon is alike to be admitted and deplored. In the case of the thinner blooms, which must be shown young if they are to stand even till the judging is completed, the opening of the flowers accompanied by the loss of form and apparent reversion to the pristine condition of the single Rose has become a common matter of remark, and is much to be regretted, leading, as it often does, to the visitors forming a totally wrong idea of what the flowers ought to be when seen at their best. Is there no remedy? I do not despair of one. I believe that difficult as the task may be it might certainly be overcome if exhibitors would determine that better things should be achieved.

I often think I should like to see a class or classes judged at a late hour—shall we say, 4 o'clock in the afternoon?—the exhibitors not being allowed to alter their exhibits after the tents are cleared in the morning. There would, no doubt, be some difficulty about such a class, and it could only be used as an experimental matter, just as one has seen classes for table decorations adjudged by ballot of the visitors attending the show. It would not be practicable to postpone the general awards in this way, because such a course would neither be convenient to the officials nor satisfactory to the visitors who like to notice who have had the prizes awarded to them.

The best chance of improvement seems to be with the exhibitors themselves. If they could be induced to study their flowers in the afternoon, and, feeling a dislike to show flowers which are certain to fade before the day is past, would look some hours ahead when selecting their flowers for staging, a great step would be gained. Something in this direction might also be done by the judges; in fact, their co-operation is essential. If they were willing always to prefer small, well-shaped and fresh flowers to coarse, loose blooms and those just on the point of expanding, exhibitors would soon appreciate the value of young flowers, and follow the lead thus given. At present, unfortunately, too great a value is set by many judges on mere size. Blooms on the point of expanding are necessarily larger than those which are young and fresh, but it is legitimate to hope for an improvement of taste in this respect.

Again something might be done by the officials and those responsible for the arrangements at the show, if they would take timely means to keep the tent or building in which the exhibition is held at a reasonable temperature. The best course in the case of a tent is to take the matter in hand early in the morning before the atmosphere gets hot, and loop the sides up to a greater or less extent nearly to the level of the staging. By this means the wind and sun do not obtain direct access to the flowers, and yet the tent is kept fairly cool. What usually happens is that the tent is left tightly closed till its occupants can bear it no longer, and then portions of the sides are ruthlessly torn down and the flowers exposed to the elements; wind and sun then complete the discomfiture of the unfortunate Roses placed near the opened sides, and the tent, having got thoroughly hot, does not cool again.

While the evil is obvious to everyone, we must look for its correction in no heroic

measure, but in the combined efforts of exhibitors, judges, and officials, together with a general improvement in taste, all being directed to one end, namely, the preservation of the flowers in first-class condition down to the close of the show. If this conclusion is correct another will follow, and that is that improvement must only be looked for gradually. Yet, when we consider how much has been done of recent years in improved methods of staging and arrangement, and how much more graceful and pleasing many of the decorative exhibits now appear than the crowded bunches of a few years ago, when the beauty of the individual flowers was lost in a mere mass of colour, we have, I think, some ground for hope that the reforms we look for will not be long delayed. *White Rose.*

THE FLORA OF KWANGTUNG AND HONGKONG.*

THIS book is a valuable supplement to the somewhat copious recent literature on Chinese botany, inasmuch as it is of a descriptive character. Since the publication of Bentham's *Flora Hongkongensis* in 1861, no work has appeared on the general flora of any part of China that could be used in the identification of the plants. The plan of the book assumes some previous knowledge of the subject. It is essentially a supplement to Bentham's *Flora*, but covering a much wider area. Hongkong itself is only about one-fifth the size of the Isle of Wight, while the province of Kwangtung is nearly as large as Great Britain. Apart from the new territory, comprising about 300 square miles of the mainland north of Kowloon, besides a number of islands, the province of Kwangtung has only been partially botanised along the main river-courses and over a few outlying mountain peaks. The principal fact established by this partial exploration of the mainland is the existence of plants previously only known from Hongkong, and of others which are common to Central and Western China. Some of the gazetteers describe Hongkong as barren and desolate, and it has that appearance, from some aspects, at least; but it is probable that it formerly had a much richer vegetation. The great variety of many of the species still existing points to such a conclusion. Messrs. Dunn and Tutcher have not summarised their work in relation to the additions; but Bentham gives some interesting statistics, and institutes floral comparisons with other areas, as known fifty years ago. We have roughly tabulated the new flora, including a few introduced plants, and we are thus able to indicate with some approach to accuracy the numerical composition of the vegetation as to families (Orders), genera, and species, and in relation to Bentham's figures. The totals are:—

	Families.	Genera.	Species.
Bentham	125	550	1003
Dunn & Tutcher	136	737	1518

A rigid comparison and the elimination of a few colonised plants would not materially affect deductions from a phytogeographical standpoint. Numerically the flora is very rich, considering the small area, comprising representatives of more than three-fourths of the families of vascular plants—flowering plants, Ferns, and their allies, usually recognised in the flora of the world. Of course these figures give no idea of the vegetation, for, as already mentioned, many of the species are very rare, and of some only solitary individuals have been observed. As a specimen of the constitution of the remnants of primeval forest on low ground in Hongkong, we extract the following paragraph from Dunn and Tutcher's "Introduction": "On an acre were found 31 trees of Aporosa leptostachya; the same number of Poupartia Fordii; 10 Antidesma Bunius; 8 Nephelium Longana; 4 Eugenia Milletiana; 3 Garcinia multiflora; 2 each of Bischofia javanica, Cinnamomum Burmannii and Ardisia quinquegona, and single trees of Litsea Sebifera, Helicia erratica, and Ficus chlorocarpa. The ground in such woods is covered with Scitamineae, Liliaceæ, Piperaceæ, and various Grasses and Ferns, while huge Lianes climb over the trees and hang in weird festoons into the semi-darkness of the underwood. These Lianes comprise various species of Derris and Dalbergia, besides numerous species of Apocynaceæ and Asclepiadeae. On the higher ground the woods are formed of Oak, Holly, Pine, Symplocos, Cordia, Ficus, and various Araliaceæ, Hamamelidaceæ, and Lauraceæ."

Pinus Massoniana (syn. Pinus sinensis) is by far the commonest tree in the islands, both wild and planted. Further interesting particulars of the composition of the vegetation by Mr. Tutcher, who has resided in the island for upwards of twenty years will be found in the *Journal* of the Linnean Society, vol. xxxvii., 1904. At that date about 100 species were regarded as peculiar to the island, though some of these may yet be discovered on the mainland. Bentham enumerates 159 species not then (1861) known to occur outside of the island. The descriptive part of Dunn and Tutcher's volume is limited to keys to the families, genera and species; but with the full descriptions of Bentham's *Flora* as a foundation, there should be little difficulty in identifying the additions. *W. Botting Hemsley.*

* *Flora of Kwangtung and Hongkong*, by S. T. Dunn and W. J. Tutcher. Kew *Bulletin*, additional Series X, pp. 370. Price 4s. 6d. 1912.

ROSE BENNETT'S SEEDLING.

THE value of this beautiful, old-fashioned Rose is well shown in fig. 30, which illustrates a splendid example covering the front of Mr. Edward Mawley's residence. The well-known secretary of the National Rose Society was good enough to give us a few particulars of this charming example, which he found on the house on entering into occupation nearly 30 years ago. During this long period Mr. Mawley says he has never known the plant to fail to produce an abundant display of its very fragrant, white flowers. Although it is classed as a summer-flowering Rose, this variety has a very long flowering season. Bennett's Seedling belongs to the Ayrshire class, and was raised by the grower whose name it bears in 1840; it is also known as "Thoresbyana." Its hardy constitution, vigorous habit, and free-flowering nature makes this variety a valuable subject for use in many different ways besides that shown, such as covering arches, pergolas, as a weeping standard, or for making a hedge. The plant has also the good quality of being almost evergreen. There is a danger that with the raising of so many Wichuraiana hybrids—beautiful as so many of them are—these charming old-fashioned Roses may suffer neglect. The raiser of Bennett's Seedling will be well known to rosarians as having given us such lovely Roses as Her Majesty, Cleopatra, and Viscountess Folkestone.

FIG. 30.—ROSE BENNETT'S SEEDLING AT ROSEBANK, BERKHAMSTED, THE RESIDENCE OF MR. EDWARD MAWLEY, V.M.H.

A NURSERYMAN'S SUCCESS.—On the occasion of the recent Tunbridge Wells cricket week, the local tradesmen's association offered prizes for the best window display. The premier prize, a silver cup, was won by Mr. J. CHARLTON, florist, who arranged his window as an old English garden.

NOTICES OF BOOKS.

The Flora of Bristol.*

British botanists and others interested in the rich flora of the Bristol district will not be disappointed in the handsome volume which Mr. J. W. White has recently issued to the public.

Its superficies may be computed, roughly, at 720 square miles, an area about equal to that of an average-sized English county. . . About one-third of this area lies in the Watsonian rice country of West Gloucester; the remainder in that of North Somerset.

This beautiful and closely-printed work of 700 pages, with map and three plates, is very much more than a second edition of the author's modest *Flora of the Bristol Coalfield*, which was published by the Bristol Naturalists' Society in 1886. The book before us is a completely new one, and for the extent and thoroughness of its contents it compares favourably with the very best of the county or other local Floras. It is cheap at 12s. 6d., or 10s. to subscribers, and yet the subscription list of some 128 names hardly does credit to British botanists, even if it does to residents in the Bristol district. There is a sad falling off in the number of subscribers when compared with such a work as Mr. Bagnall's *Flora of Warwickshire* published nearly a generation ago.

Nor is this book a mere catalogue of the flowering plants and Ferns, with lists of localities for the less common or more interesting species. That type of local flora has well-nigh gone: the student of to-day requires something more—he wants notes upon the ecological features of a district, upon plant associations and their relation to the climate, geology, the physical features, and kindred matters.

In addition to some interesting notes of this character in the body of the book, and to detailed descriptions of some of the rarer and more obscure forms found within the chosen area, the Introduction, divided into 14 sections, gives a valuable account of the topography of the district, geology, elevation and surface, coast, woodland, common lands, bog and peat, river drainage, climate, &c. Not the least interesting of these sections is that on the "Origin of the Flora and its Modern Modifications," in which Mr. White gives evidence of his extensive knowledge of the European flora, gained by numerous visits to the Continent. The distribution of the more noteworthy species, according to geological formations, is also well done.

The 60 pages devoted to the history of Bristol botany is not only interesting reading, but a valuable contribution to botanical biography. The concise biographies start with Turner, Lyte, and Gerard, and finish with the names of R. P. Murray and four local botanists.

The late Prof. Babington is described as "the greatest systematic botanist of his generation, and it is feared the last systematist to occupy so high a position in university education." The author, who is special lecturer on systematic botany in the University of Bristol, goes on to say that "in planning a course of botany, a mean must be sought between the older methods, which gave too small an insight into the principles of plant life and the problems of living matter, and that newer nature study which, seeing little save through a microscope, has no breadth of view."

The work is particularly free from typographical errors, and the type is good and clear. *H. S. Thompson.*

* "*The Flora of Bristol*," being an account of all the flowering plants, Ferns, and their allies that have been found in the district of the Bristol coalfields, by James Walter White, Bristol and London, 1912; 12s. 6d. net.

Fig. 31.- cattleya artemis (c. iris × c. gaskelliana.)

PLANT NOTE.

SOLANUM WENDLANDII.

Solanum Wendlandii, a native of Costa Rica, is one of the most attractive of all greenhouse climbers, producing large, bold trusses of lilac-blue flowers. It requires a moderately warm temperature and a humid atmosphere during its season of active growth; but after the flowering stage it should have a period of rest. The most successful method of propagation is from the dormant eyes of the previous year's growth. Cuttings with two or three buds root readily in sandy soil if inserted during early spring and grown in a warm, moist house. Growth is very rapid, and the shoots being of a spiny, tenacious character, become entangled if neglected. The plants may be potted on as required in a mixture of loam, leaf-mould, sand, and a little artificial manure, and grown in a temperature of about 60°. The flowering season is from July onwards. After the growth is well ripened, the plant may be dried off gradually, and allowed to rest during the winter in a cool, dry house. Before being started into growth again, the side shoots should be cut back to one or two buds. The plant is a gross feeder when in full growth. Red spider is a very troublesome pest, and must be kept in check by the frequent use of the syringe. Attractive specimens may be obtained in pots by cutting the plants back to one or two "eyes." The shoots, if allowed to grow unchecked, will produce large terminal trusses of bloom the same summer; they have a tendency to grow to a great length; but they bend readily and may be made to form circular loops or knots. The plant is figured in the *Botanical Magazine*, tab. 6914, from specimens sent to the Royal Garden, Kew, in 1882, by Dr. Wendland, Director of the Royal Gardens at Herrenhausen, Hanover. *R. O. Williams.*

CATTLEYA ARTEMIS.

A First-class Certificate was awarded this fine hybrid (see fig. 31) when shown by Lieut.-Col. Sir Geo. L. Holford, K.C.V.O. (gr. Mr. H. G. Alexander), at the Holland House exhibition. The use of C. Iris (C. bicolor × C. Dowiana aurea) has imparted a fine substance to the flower, the segments being well displayed. The sepals and petals are pearly-pink, with a slight rose veining. The broad labellum is ruby-crimson, with a distinct yellow disc on white ground.

REPORT ON THE CONDITION OF THE OUT-DOOR FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP; AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

FULLER COMMENTS WILL BE GIVEN IN THE FOLLOWING NUMBERS. SEE ALSO LEADING ARTICLE ON PAGE 72.

Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. James Hudson on "Recently Introduced Water Lilies").

THURSDAY, AUGUST 29—Sandy Fl. Sh.

FRIDAY, AUGUST 30—
Dunfermline Hort. Soc.'s Autumn Sh. (2 days)

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62·2.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, July 24* (6 P.M.): Max. 78°; Min. 60°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, July 25* (10 A.M.): Bar. 29·7°; Temp. 74°; *Weather*—Overcast.

PROVINCES.—*Wednesday, July 24*: Max. 74° Yarmouth; Mio. 64° Liverpool.

The Fruit Crops.

The time has again come round when it is possible to form accurate estimates of the hardy fruit crops, and, following our usual custom, we publish returns from correspondents in all parts of Great Britain. It may be pointed out that the reports are furnished by fruit-growers who have contributed returns for many years past, and have thus become accustomed to make accurate observations, and to estimate average crops for their own localities.

Apples constitute the most important of the crops reported upon, and it is disappointing to find that they are almost the worst crop of the year, comparing very unfavourably with the yield last season. For instance, out of 274 returns, as many as 151 compilers declare their crops to be lower than the average, 107 have average crops, and in only 16 instances are they above the average. If we turn to the different districts, we find that the deficiency is very general. In Scotland, the 53 returns consist of 19 average crops, 33 deficient, and only one over-average yield. In England, out of 194 returns, there are only 10 crops above the average; 74 are average yields, whilst there are 110 described as under the average. In Wales, there are 6 average crops and 6 under average, whilst in no single case is an abundant crop recorded. But in Ireland, with the same number of returns as in Wales, there are as many as 11 average or above the average crops, and only one is described as "under"; therefore, the Apple crop appears to be more satisfactory in Ireland than in England, Scotland, or Wales.

Pears are more promising; indeed, it would appear as if they will compensate for the loss on the Apple crop. The returns number 273, and these include 112 average crops, 117 above the average, and only 44 returns under average. This is a better result than last year, when, out of 257 returns, 252 were average or below average crops, only 5 cases in Great Britain reporting yields above the average. Reference to the summary will show that the Pear crop is least satisfactory in Scotland, where there are only 5 crops above the average, out of the 52 returns in that country. On the contrary, in England, out of 194 returns, there are 96 described as above the average; in Wales there are 7, and in Ireland 9 abundant crops in a list of 12 returns from each of these two countries.

Turning to Plums, the crop is neither much better nor much worse than last season. In 1911, out of 259 returns, there were only 29 over-average crops, but as many as 128 below the average. This year the total number of returns is 272, composed of 148 under, 86 average, and 38 over-average crops. It will be noted that the Plum crop is much better in Scotland and Ireland than in England or Wales.

Cherries have been more abundant than in 1911. Out of 259 returns, there are 194 crops equal to or above the average, and only 65 returned as deficient. In England, where the Cherry crop is most considerable, out of 181 returns, there are 134 which describe average or above average crops.

Apricots are almost a failure, and Peaches and Nectarines rather below average, although Peaches and Nectarines are better crops than last season.

The returns published in these columns from year to year upon Gooseberries, Currants, Raspberries, and Loganberries, included under the rather comprehensive heading "small fruits," go to show that the risk of deficient crops in these cases is not serious. Last year, out of 264 returns, there were only 13 crops described as below the average; this year, out of a greater number of returns, namely 274, there are only 12 deficient crops. The figures for both these seasons are better than in 1910, when there were 40 crops described as under the average out of a total return of 227.

The Strawberry crop suffered this season from early frosts and from drought. Consequently, the returns compare unfavourably with those for either 1911 or 1910. Out of 273 returns, there are as many as 174 which describe under-average crops, and, whilst there are 88 average crops, there are only 11 cases in which the crop exceeded the average. Therefore, as was stated in the article published last week, the Strawberry season of 1912 was unsatisfactory, particularly so from the point of view of the commercial grower.

Nuts are not so generally grown as the fruits we have referred to already; at the same time, they constitute important crops in Kent and some other English counties, and a few trees at least are grown in most private gardens. In the yield tables, Walnuts and Filberts are not shown separately, or perhaps the figures for one would indicate a superiority of crop over the other. Out of 161 returns, 143 crops are equal to or above the average, only 18 being described as deficient. These returns are better than those for several years past.

We need not attempt to explain in detail the reasons for the comparative failure of the Apple crop or the moderately good yield of Pears, but, on the contrary, leave our correspondents to relate their experience in succeeding issues. At the same time, it is obvious that in many cases Apple trees were burdened with over-crops last season, and this fact will explain some deficient crops this year, as we have ourselves noticed, in the case of Cox's Orange Pippin, for trees which bore unusually heavy crops in 1911 have very few fruits this season, though they are making more growth than they have for several years. Neither must we forget the great drought of last summer in our efforts to connect cause with effect, for, in many instances, it was so pronounced that the leaves wilted and fell prematurely. Late spring frosts may have injured certain varieties which happened to be at a critical stage when the frosts occurred, and the spring drought may have had its effect upon the trees, for it will be remembered that dry weather continued throughout April, a month commonly characterised by frequent showers. Partly as a result of the drought, aphis attacks have been unusually severe, as *Southern Grower* has pointed out in his excellent articles on the "Market Fruit Garden." The Codlin moth has been as destructive as usual, and Apples are still falling freely owing to the attack of the Codlin moth maggot. On the contrary, American blight has been rather less prevalent than usual, and the ravages of the winter moth are certainly less severe than last season.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held on the 30th inst., in the Society's Hall, Vincent Square, Westminster. At the three o'clock meeting of the Fellows a lecture on "The Pollination and Setting of Fruit Blossoms" will be delivered by Mr. CECIL H. HOOPER.

R.H.S. BULB SHOW, 1913.—A special exhibition of forced spring bulbs will be held on Tuesday and Wednesday, March 4 and 5, 1913, the object being to demonstrate the varieties best suited for gentle forcing. Exhibits of small and large collections are invited from amateurs and the trade. Medals will be awarded according to merit. The Council also offers (subject to the general rules of the Society) prizes presented to them by the General Bulb Growers' Society at Haarlem in five classes, four of which are open to amateurs only, the remaining one being for traders.

"CLARENCE ELLIOTT" TROPHY FOR ROCK-GARDEN PLANTS.—The Council of the R.H.S. offers (subject to the general rules of the Society and the special regulations indicated below) a

HIPPEASTRUM PROCERUM

silver trophy, presented to them by Mr. CLARENCE ELLIOTT, at the meeting fixed for Wednesday, May 14, 1913. (The fortnightly show is, on this occasion, to be held on Wednesday, Tuesday being Whitsun Tuesday.) The trophy is offered to amateurs for an exhibit of Alpines and plants suitable for a rock garden, arranged with rock-work as a small rock garden on a space 6 feet by 3 feet. There must be not fewer than 18, nor more than 24 species or varieties. Herbaceous plants ordinarily exceeding 12 inches in height, bulbs, and variegated or double-flowered plants are excluded. The subjects shown need not all be actually in flower. The plants must all have been grown by the exhibitor since March 1, 1913, at least. Beauty of arrangement, the suitability of the plants to rock-work, rarity, culture, and correct naming will be considered most by the judges. It is suggested that the plants should be grown in pots, not lifted from the open ground; but the pots should in all cases be removed before staging. A background of dwarf shrubs and Conifers may be added.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY.—It might have been expected that the July number of the *Transactions* of this society would deal with the Report of the Departmental Committee on Forestry in Scotland, but it merely contains the report which was summarised in our issue for April 20 last. This number of the society's *Transactions* includes articles on "Thorn Hedges," "Light in Relation to Tree Growth," and "The Larch Saw-Fly."

SARRACENIA PURPUREA AT HOME.—As showing how delightful this plant is in its natural habitat, the following letter, sent by a correspondent to Mr. AMOS PERRY, is of interest:—"In a recent excursion along the Batsto River I ran into a larger patch of Sarracenias than I ever saw before. I thought I appreciated the beauties of this plant, but I really knew nothing of them. There are acres and acres of them, hundreds and thousands, millions, maybe, of bloom, scattered and bunched, here one and there a dozen. Every turn of the river seemed to reveal a larger field. I always thought this was a pretty plant for a tub as a curiosity, but as seen growing wild it is something a landscape man cannot afford to overlook. On ground partially flooded along the river banks in large estates it would be most desirable. It will stand considerable flooding, generally growing right in the water, but in places one finds it on wet, sandy ground wherever Sphagnum grows, needing only wet soil and some shelter. Along the river banks, in association with it, were several other plants that work in most admirably in similar places. Two rare ones, Lophiola aurea and Narthecium, are quite desirable. Lophiola, with its ash-grey heads that persist throughout the winter, is quite beautiful *en masse*, though insignificant individually. Narthecium, with its yellow spikes of flowers, is said to be gorgeous in a like situation, but I have never seen it at its best condition. It, too, has persistent grey heads after the bloom, but they are not so showy as Lopholia, which will grow in semi-submerged flats, and in the only place I have seen it the plant ascends the wet, springy banks some distance from the river. I can think of nothing prettier than a small spring by the roadside 'On Skit,' where about a dozen heads may be found at any time clustered around a little pool less than a foot across. ('On Skit' is a local reference to 'Skit's Branch.') With it was also growing a quantity of Calopogon. A noteworthy plant growing with these is Nuphar advena, which fills the deep, slack water all along the stream and is gorgeous and golden at this writing." Sarracenia purpurea may be seen thriving in good colonies out-of-doors in the gardens of Sir Edmund Loder, Leonardslee, Sussex.

FLOWERS IN SEASON.—Messrs. V. N. GAUNTLETT & Co., Chiddingfold, Surrey, have sent us flowering sprays of many interesting and beautiful shrubs, which included Escallonia "Edinburgh," a very brightly-coloured variety of E. *macrantha*; Deutzia carminea, with large blush flowers; Azalea occidentalis, with flowers suggestive of a large Honeysuckle; Magnolia glauca; Olearia myrsinoides; Andromeda pulverulenta, with exceptionally white undersides to the leaves; and Carmichaelia australis, an interesting New Zealand shrub with dainty, Pea-shaped flowers. Mr. T. SMITH Daisy Hill Nursery, Newry forwarded a shoot of Acer Trautvetteri, a very handsome Sycamore. The seedwings (samara) have brilliant colouring, and the branchlets retain their beauty for a considerable time.

AMARYLLIS "HATHOR" (see *Gard. Chron.*, May 4, p. 292, May 11, 1912, p. 322).—Mr. H. H. B. BRADLEY, of Sydney, Australia, points out that in his first communication on this subject he described his white-flowered variety of Amaryllis Belladonna as an Amaryllis, not Hippeastrum, as printed. In reference to the note by *W. W.* (May 11, p. 322), Mr. BRADLEY states that he believes "the plants in Messrs. SANDERS' nursery came from the garden of the late Sir JOHN HAY; at any rate, a good white Amaryllis is grown there, but admittedly it is inferior to Hathor, and the white Amaryllis known in Sydney as A. Baptistii, raised by Mr. J. BAPTIST many years ago, is quite common there, but this is inferior, again, to that grown in Sir JOHN HAY'S garden, and has more yellow in the lower part of the tube. Self-crossed seedlings from A. Baptistii show a tendency to a yellow longitudinal stripe, while seedlings of A. Baptistii × A. pudica so far are all pink."

[From a sketch by Ivy Massee.

FIG. 32.—AMARYLLIS PROCERA: SHOWING THE LONG-NECKED BULB AND GENERAL HABIT.
(See also Supplementary Illustration.)

THE BLUE AMARYLLIS.

(See fig. 32 and Supplementary Illustration.)

THE blue Amaryllis is one of the most interesting plants in the whole Order Amaryllideæ. It grows wild on the Organ Mountains near Rio, and nowhere else in the world, and it differs so much from all the members of the Amaryllis family that one wonders no botanist has thought fit to establish a new genus for it. Amaryllis proper is now confined to a single species, the Belladonna Lily of the Cape. Hippeastrum, as it is now defined, includes Habranthus, Phycella, and the Western plants that were formerly placed in the genus Amaryllis. There is a family likeness in the several species which justifies this. The blue Amaryllis, however, is a widely different plant. It has a bulb with a stout stem-like neck up to 5 feet or more in length; the leaves are strap-shaped, falcate, with parallel nerves, and thin semi-translucent margins, and they are without midrib to the very base. Moreover, they are not deciduous and they are always distichously arranged. The flowers are roughly similar to those of several genera, including Hippeastrum, Crinum and Griffinia, still they have certain peculiarities, the most remarkable being that of colour. I have not seen the seeds, but I am informed by Mr. Worsley, who has seen this plant growing wild in Brazil and has been most enthusiastic in its cultivation in this country, that they differ from those of Hippeastrum in having a thickened corrugated margin. Attempts to cross the blue Amaryllis with true Hippeastrums have been unsuccessful, and the plant is still the same as when it was discovered, about 50 years ago, by the elder Binot on a mountain near Petropolis, at an altitude of about 4,000 feet. Binot used to call it Amaryllis Imperatrice, in honour of the Empress of Brazil, for whom he used to collect plants. Duchartre named it Amaryllis procera when it flowered in a Continental garden in 1863; Hooker figured and described it in the *Botanical Magazine* in 1871, as Amaryllis Rayneri, in honour of Dr. Rayner, of Uxbridge, in whose garden it flowered. It was my intention to rename this plant again, calling it Binotia procera, in honour of the discoverer, but Mr. Rolfe forestalled me by naming a genus of small-flowered Orchids after him. The temptation is strong now to extend the compliment to Mr. Worsley, a most devoted collector and observer of Amaryllids, to whom we are indebted for a full knowledge of the blue Amaryllis. He visited the plant in its mountain home and collected a large number of full-sized specimens, which he grew and flowered with conspicuous success in his garden at Isleworth. The name of the plant would in that case be Worsleya procera.

I am indebted to Mr. Worsley for the following particulars of the blue Amaryllis: "It grows mostly on little ledges of precipitous cliffs of soft granite, in the crevices of which the roots run, becoming somewhat flattened where they cling to the moist rock. The long-necked bulbs project from the cliff almost horizontally, or even hang from it, the leaves curving elegantly from the apex and always arranged in two series. During the summer months heavy rain falls almost daily on these mountains; in some instances from 5 to 10 inches have fallen in a week. The wet season may last for about nine months. The plant is cultivated in gardens in Petropolis, but it never becomes established there. I have known this species in cultivation here for about 30 years, but have never seen a specimen of it that was really established and happy."

It may be, as Mr. Worsley suggests, that plants raised in this country from seeds would behave better, but there is the difficulty of obtaining the seeds. About half-a-dozen strong plants produced good spikes of flowers at Kew last year, but notwithstanding careful pollination, no seeds were developed. How magnificent these plants were when in flower; their long, silky brown necks supporting elegantly-

curved glaucous green leaves and a short-stalked umbel of hyacinthine blue flowers, each as large as a White Trumpet Lily but much more elegant in outline and in waviness! The plants appeared to be well provided for by the conditions of a sunny greenhouse and with the base of their bulbs set in a sandy, loam soil. During the late M. Binot's life, at least one large consignment of bulbs of the blue Amaryllis arrived annually in this country to be sold privately or in the auction room, and I believe it is the intention of his widow, who resides in Petropolis, to continue to send bulbs of it for sale here. *W. W.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PROBLEMS OF PROPAGATION (see p. 2).—As an old propagator, I read with much interest the report of Professor Bayley Balfour's lecture on "Problems of Propagation," and especially that part of it dealing with propagation by cuttings, and the many curious features that are brought to the notice of the propagator, not the least interesting being the success attending the internodal cuttings of Clematis. Cultivators in my young days looked upon a joint at the base of a cutting as absolutely necessary in nearly all cases, but experience convinced me that they were not essential, and by using internodal cuttings I was enabled to increase many subjects at a much more rapid rate than was formerly the case. A fact well-known to propagators is that many subjects which are difficult to root may be struck more readily from weak cuttings than from stout ones, or even from those of normal vigour. For this reason a stock plant intended for propagating from is often put into a warmer structure in order to weaken the shoots before they are taken as cuttings, which strike root more readily when so treated than if they had grown in a natural manner. This practice, which is technically termed drawing out, is frequently followed in the case of soft-wooded subjects, but it is also very effective with other plants that are difficult to strike. With many hard-wooded plants the greatest measure of success is attained when the cuttings are covered with a bell glass, and on this point I have often had a strange experience. If the top of a cutting has been accidentally bent down by the glass, it has generally been the first one to root. The reason for this I cannot understand. Cuttings should, if possible, never be taken from plants that have been fed with manures of a stimulating character, as though the shoots may be unusually vigorous they take longer to root, and do not grow with the same freedom afterwards as those obtained from plants less liberally treated. This point is too often overlooked; indeed, I was recently consulted as to the failure of a batch of Pelargonium cuttings, which was no doubt owing to the plants from which they were taken having been fed liberally with stimulants. This has long been recognised by Chrysanthemum specialists, who prefer to propagate from plants that have been grown naturally, but in the case of many other soft-wooded subjects the fact is often overlooked. *W. T.*

THE CARDIFF PARKS.—The Cardiff Parks Committee have further recognised the valuable services of their Parks Superintendent and Curator, Mr. W. W. Pettigrew, by granting him the facility of a motorcar. The constantly-increasing areas of parks and playing grounds under the management of the Committee are difficult of inspection, and it is by his personal contact at every point that Mr. Pettigrew has won the hearts of all classes of the people for whose pleasure and benefit he caters. *Welshman.*

THE LEAMINGTON SHOW.—This show opens to-morrow, Wednesday. As I write, the staging is well advanced, and it is fairly certain that the quality and number of the exhibits will not be behind those of previous years. There are six large marquees—one devoted exclusively to table decorations, which are always a special feature at the Leamington exhibitions. Group builders in the various classes are very busy, and in at least one of these classes the competition will be very keen. The Victoria Park is admirably adapted for the holding of a flower show, and lends itself to an effective and convenient arrangement of the tents, with ample space for promenading. The fixture is now well established among the popular institutions and functions of the Midlands, and the committee anticipate large numbers of visitors on both days of the show. A heavy thunderstorm prevailed this afternoon, and the rain will probably clear the atmosphere. *Visitor, July 23.*

LONGEVITY OF FERN SPORES (see p. 7).—Many years ago at the Fisheries Exhibition in London a model of the Pompei excavations was exhibited, and in conjunction therewith a large bell glass containing a fairly vigorous plant of Pteris aquilina, the common bracken, which was definitely asserted to have arisen from a spore dug up during the excavating operations, and therefore dating from the period of the catastrophe. To those acquainted with Ferns, such an assertion was, to say the least of it, amusing. P. aquilina is practically ubiquitous, and produces myriads of spores which are scattered far and wide, and are peculiarly free in germinating when they reach a congenially moist surface. In view of all this I would almost venture to say that the plants mentioned by your correspondent are P. aquilina, and that instead of there being "no Ferns within miles of the place," a little search will reveal the presence of this species well within wafting distance on a windy day. If a plant were sent to me I could settle its parentage at once. *Chas. T. Druery.*

THE EDUCATION OF GARDENERS.—We both hear and read a great deal nowadays concerning the education of gardeners, and the best lines to be followed in the matter. It seems to me that in the case of a great many gardeners a very important part of their education would be to teach them how to live on the miserable pittance that so many employers pay them. Small wonder that many leave the profession for other callings, which, though less pleasant than gardening, afford higher wages and regular hours. Some employers, when engaging a gardener, consider they have also a right to the services of the gardener's wife. Furthermore, the term gardener is a most elastic one, and includes the working of electric light plant, the care of poultry, stock, and agricultural matters in general, as well as in some cases singing in the church choir, and playing cricket. That these are some of the multifarious duties expected of a gardener may be seen by reference to the advertisement columns of the horticultural journals. *W. T.*

ROSE-BUDDING.—I regret I failed to make my meaning plain to *Practice* in regard to budding standard Roses. The object should be to get the inserted bud down in the slit in the bark as close to the upright standard stock as may be, so that when, in a year or two, the inserted bud grows apace, it may callus right over the crown of the stock and make a perfect tree, and so prevent the perishing of the standard stock from weather, as often happens. This could scarcely happen if the bud is gibbeted out on a spur an inch and more away, as recommended, by leaving the shield an inch or ¾ inch long behind the bud. The next time *Practice* gets some good hard buds, let him modify his practice and try leaving them a ¼ inch behind the petiole and, say, ½ or ⅝ inch above the bud, or a little over ½ inch over all; he will find such a bud will grow just as readily as his 2-inch ones, and be not half the bother to insert; two twists of the raffia below the bud, and two, or at most three, above are amply sufficient for holding the bud and closing the bark. I have not the slightest intention to criticise or carp at *Practice's* admirable paper, only to join him in assisting the novice to understand the charming mystery of budding. *Robt. Peel Sheldon.*

———I also recommend the Rose bud to be placed as close to the standard stock as possible. I welcome criticism, because it often brings fresh thoughts to bear upon the subject; but I fail to see how the bud worked upon standards can "callus right over the crown" of the stock, unless in a few instances with the top bud. Nor can I understand how it can possibly "prevent the perishing of the standard stock from weather." In our establishment we work some 75,000 to 100,000 stocks annually, and the greater number pass through my hands or under my supervision. *Practice.*

THE MORAINE.—Mr. Malby's pictures (see pp. 26, 27) are charming, and so are his successes. But what is he so anxious that they should prove? I find it a little difficult to decipher the paragraph which I think is aimed in my direction, but I take it that the two pictures are held to invalidate my experience that cement bottoms are "not only entirely unnecessary, but even harmful." Be at peace, Mr. Malby; my experience has abundantly shown me (and so, in good time, will yours) that both statements are true. But from saying that a cement bottom is unnecessary to all plants and mortal to some, it is a very far jump (which I have never taken) to go on and say that nothing will ever flourish in a cement-bottomed moraine. Mr. Malby's Campanula Allionii is very successful in a cement-bottomed moraine; in an uncemented one close to London I have this year seen a one-year-old clump that even surpassed it in brilliancy and splendour. And as triumph can be attained equally by both roads, the simplo and the troublesome—why should we pursue it by the troublesome? I have not, indeed, any intention of being "emphatic as to what plants appreciate," nor do I see what bearing the remark has upon the point at issue. I repeat that cemented bottoms to a moraine are not only entirely unnecessary (in all but most abnormal situations), but even harmful (to many species and in many sites, as I have painfully seen proved). It is evident that in Mr. Malby's case the extra precaution is, at the most, merely unnecessary. He is greatly to be congratulated; but need surely not be quite so militant in tone against those whose wider experience or better fortune has led them to greater profit by a simpler and less expensive way. *Reginald Farrer.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

EARLY VINES.—Vines which are affected with mealy bug should be examined two or three times before they are pruned. The rods should be thoroughly scrubbed with strong, soft-soapy water, using a stiff brush for the purpose, and well working the mixture into every hole and crevice. As much of this work as possible should be done not only on vines, but on all fruit trees from which the fruits have been gathered. If this work is persevered with now it will be found that the pest will not be half as troublesome during the busy months of spring. Continue to give the foliage a good washing by means of the garden engine in the evenings during hot weather. If the borders are well drained, and the vines in a healthy condition, much good may be done by watering with diluted liquid manure from the farmyard. Vines which have given unsatisfactory results should be examined at the roots, and, if it is considered that the borders are in need of renovation the work of reconstructing them may be commenced at once. Should there be both inside and outside borders, the inside borders only should be dealt with this season, then there need not be any fear of losing next season's crop. Before starting make sure that sufficient loam and all necessary materials are at hand, so that the work may be brought to an early finish. If the compost be dry it should be watered and turned several times, afterwards leaving it in a heap for a few days covered with mats. The best loam procurable should be used for making vine-borders, and, if it is considered that the soil is sufficiently rich without using artificial manure, it will be better without it. At Frogmore we used only a moderate quantity of a coarse vine-border compound, which consists chiefly of crushed bones. Artificial manure may be used with more safety as a surface dressing when the vines have commenced to carry fruit. Old mortar rubble and wood ashes may be used liberally in fruit borders of all kinds. In commencing to dig out the roots it is necessary to first take out a trench about 3 feet wide at the outside of the border. Next carefully fork the soil from about the roots, working towards the

vines. Preserve intact as many roots as possible, and be particularly careful not to damage any of the main ones. In extreme cases it may be necessary to lift the whole of the roots, but, as a rule, it is not wise to do so. During the time the roots are exposed they should be well covered with mats and kept damped with a syringe. The drainage materials should be renewed entirely, and the drains made quite clear. It is not good for the roots to enter the subsoil; therefore, to prevent this the bottom of the trench should be covered with a few inches of concrete. The drainage materials should consist chiefly of brick-bats placed closely together over the concrete. Place the largest pieces at the bottom, finishing off with the finer particles, so that the drainage materials are about 9 inches deep. Cover the drainage with a layer of turves placed closely together grass-side downwards. Afterwards commence building the border in layers about 1 foot deep, taking pains to make each layer solid. The roots should be laid in towards the surface of the border. Examine them carefully before planting them, and cut away any damaged portions, shortening them to ensure a clean-cut surface. The width of the new soil should not be more than 4 or 5 feet for the present. Additions can be made to the border at intervals of two or three years, when it can be seen that the roots are in need of fresh rooting material. The vines should be heavily shaded for two or three weeks after planting, and the atmosphere of the house must be kept close and moist. Syringe the foliage two or three times daily. When the new border is finished give it a good soaking to settle the soil about the roots. Vines thus treated should not be subjected to hard forcing the next season.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

RASPBERRIES.—Autumn-fruiting Raspberries should have the canes secured to wires or whatever support is employed, and all suckers removed as soon as they appear above the ground. On no account must this latter operation be neglected, or the suckers will soon injure the fruiting canes. Summer-fruiting varieties should have all the old canes cut away as soon as the fruit is gathered, at the same time reducing the young canes to six or eight according to the space available. This will allow more light and air to reach the shoots that will furnish next season's crop, and these can be reduced to the required number next spring.

HARDY VINES.—Vines growing in hot, dry positions should receive frequent waterings; those carrying heavy crops of fruits should be afforded liquid manure on alternate waterings. Thin the bunches, if considered necessary, and stop the laterals at one joint beyond the bunch, allowing the leading shoots to extend where there is space to furnish. Secure the shoots, stop the laterals as they appear, remove badly-placed bunches, and expose the others to the light and air that the berries may ripen; syringing will also assist in the ripening process.

HOEING. — The soil of the fruit quarters should be kept well hoed, as the rains followed by brilliant sunshine have caused the soil to become caked and hard. By using the hoe freely at this season small weeds are kept in check, and the moisture retained in the soil.

INSECT PESTS. — If the advice given in the calendar for June 22 has been followed much good will have been done in destroying injurious insects, and their numbers should be less next season. Caterpillars have been very destructive this season, and these are amongst the most difficult pests to destroy, especially when the trees are bearing fruit. Barren trees may be sprayed with Paris green or some other poisonous insecticide. American blight, or woolly aphis, requires special attention at this season. It generally attacks the stems and main branches of both old and young trees. Its presence is often overlooked at this busy season, and, when neglected, it increases very rapidly. But it is in winter that American blight can be best destroyed, as then a caustic soda spray may be used; however, do not neglect to combat it in the meantime. Methylated spirits should be applied with a stiff brush over the affected parts, or in the case of badly infested trees an insecticide should be sprayed over the branches.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to SIR JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

ONCIDIUM. – Cool-growing Oncidiums, such as O. Forbesii, O. crispum, O. ramosum, O. Gardneri, O. concolor, and O. Marshallianum, should be repotted when the young growths are from 2 to 3 inches long. The flowers of all these species are produced on pendulous racemes, and for that reason it is preferable to grow the plants in shallow pans, ordinary Orchid pans without side holes being the most suitable receptacles. The compost should consist of equal parts A1 fibre or Osmunda fibre (cut into rather short portions) and half-decayed Oak leaves and chopped Sphagnum-moss with a suitable quantity of crushed crocks added. Place a few crocks in the bottom of the pans for drainage purposes. Pot rather firmly and leave space for a surfacing of Sphagnum-moss. Suspend the plants from either the roof of the cool-intermediate or Odontoglossum house. Let water be applied sparingly until the roots have grown freely in the compost, when the amount may be increased slightly, but the compost should never be saturated with moisture. O. lanceanum, O. luridum, O. carthaginense, and O. tetrapetalum should also be afforded fresh rooting material. Employ a compost consisting of Osmunda fibre and Sphagnum-moss cut into short portions and a quantity of crushed crocks. See that the pots are well-drained. Arrange the compost in a conical shape well above the rim of the pot. Stand the plants near to the roof-glass in the warmest house. When the roots are growing actively they should be supplied with plenty of water, and the plants sprayed frequently during bright days. During the resting season water should be applied sparingly, but at no time should the compost be allowed to become quite dry, as the plants do not possess pseudo-bulbs. The cool-growing O. macranthum is developing its flower-spikes, and should be supplied liberally with water at the roots until the flowers are expanded. The inflorescences should be removed soon after the flowers are fully developed, as they exhaust the energies of the plants. O. ampliatum majus may also be attended to at the roots. This plant grows best in a shallow, teak-wood basket. Provide plenty of materials suitable for drainage purposes, but only a thin layer of compost. The plant should be suspended from the roof-rafters in a light position in the warmest house.

BRASSIA (SYN. ONCIDIUM) VERRUCOSA.—This is a strong-growing plant that produces long, arching spikes and may be grown in pots on the stage. It should be afforded a light, airy position in the house, and be sprayed frequently overhead until growth is completed.

ONCIDIUM LEUCOCHILUM.—After this plant has passed out of flower it should be placed at the coolest end of the intermediate house, and be afforded very little water at the roots, although frequent overhead sprayings are beneficial in causing the pseudo-bulbs to become plump, these being usually in a more or less shrivelled condition after the plant has blossomed. Repotting should be done soon after the new growths have started. Employ a compost similar to that recommended for the other species. Place a few crocks at the bottom of the pot and pot the plants as for ordinary greenhouse plants.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

ASPARAGUS.—One of the chief points to observe in the cultivation of Asparagus is to keep the beds perfectly free from coarse weeds, and this necessitates hand-weeding periodically. Though somewhat tedious, the work may nevertheless be managed easily when the beds do not exceed 4 feet in width and are provided with wide alleys between them. The Asparagus growths should be kept upright, either by supporting them with feathery Pea-sticks or stakes with string stretched between them. In dry weather thorough soakings of water and such stimulants as liquid manure and artificial fertilisers are invaluable.

CAPSICUMS AND CHILIES.—Plants grown in pots, as recommended in a former calendar, should now be flowering. The pots are filled with roots, and watering must not be neglected: the plants should also be given plenty of manurial assistance so that they may perfect a good crop of fruits in 5-inch pots, which are comparatively small receptacles. Later, if space in the pots permit, a top-dressing of rich materials may be applied. The plants should be exposed fully to the sunshine and air; on warm days the lights may be removed entirely, replacing them at night. In the early morning and again in the afternoon well syringe the plants and their surroundings, as this will greatly assist in keeping them free from aphis (green-fly). Should the presence of aphis be detected, the plants should be fumigated lightly on one or two occasions. Secure the growths as becomes necessary with neat ties.

TOMATOS.—The plants are growing and bearing freely, therefore plenty of water and stimulant must be afforded the roots. Where space permits, such as on vacant parts of walls in fruit-houses, the growth may be allowed to extend. It is surprising what a large quantity of fruit a single Tomato plant will produce when it is watered and fed liberally. The side growths should be removed constantly and the leader made secure. At this season quantities of good fruits may be grown in cold frames on plants trained to a stake. Make one or two occasional sowings for providing a succession of ripe fruit during the winter months. Sow the seed thinly and pot the seedlings before they become drawn, elevating them well up to the light. Place a small stick to each plant as soon as a support becomes necessary.

MAIZE OR INDIAN CORN.—Encourage this crop to grow freely by frequently hoeing the soil, and, when the weather is dry, copiously watering the roots. Give manurial assistance so that the cobs may be ready for cutting towards the end of August.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

LAYERING CARNATIONS. — The earlier the plants are layered now the sooner will they be ready for transplanting to the beds, and the advantage of early planting is obvious. Layering pins may be purchased so cheaply that it scarcely pays to use home-made wooden pegs for securing the layers. A light compost consisting of loam, sand and leaf-mould should be placed around the old plants for the layers to root into. If the weather is dry, the stock plants should be watered thoroughly a day or two before commencing the work. After the incision is made in the stem through a joint, the shoot should be pegged firmly into the soil, keeping the cut surfaces apart. Water the plants afterwards, and damp them overhead during dry weather.

PROPAGATING PINKS.—Pinks may be layered in precisely the same manner as Carnations, but the quickest method of increasing them is by cuttings. The shoots used for the purpose are termed pipings, and these should be inserted in a cold frame, or under a handlight. A large number may be inserted in a small space, and they develop roots with very little trouble. Keep the cuttings damp and well shaded, but not too damp, or the condensed moisture will cause them to decay. Whenever the atmosphere of the frame is excessively moist admit a little air at night time: this precaution will prevent damping.

LAVENDER. — The flower spikes should be cut just before the flowers are fully expanded. They should be tied into small bunches and laid out at once to dry, turning them daily till the stems are quite dry. After the spikes are cut hedges of Lavender may be trimmed: the shoots that develop afterwards will become well ripened before winter.

HEDGES.—All kinds of hedges in the ornamental garden should be kept clipped closely. Those of Privet or the Myrobalan Plum should be trimmed several times during the growing season. Box-edging should also be kept neat and tidy, for if the plants are permitted to grow unchecked the hedge will quickly become uneven, and require much trouble and time to be brought to its proper form again. Box-edging is best clipped during dull weather, as strong sunshine is liable to scorch the shoots after they are clipped. Both the Holly and Yew are splendid for the

purpose, and well-kept hedges of either of these plants are very ornamental objects in the garden. The Cherry and Portuguese Laurels are extensively employed as hedges or screens, but too often they are allowed to grow out of all proportion to their surroundings. It is a mistake to train a Laurel hedge quite square, for after a time it is almost impossible to keep it in a good condition, the top ultimately growing so strongly as to bulge over. If possible, hedges should be trimmed wedge shape, so that they are broadest at the base. Broad-leaved shrubs such as the Cherry Laurel should never be clipped with garden shears: they should be pruned with a sharp knife and the shoots shortened to just above a good leaf. The present is a suitable time to prune them, as the season's growth is practically completed. If the work is done now, the hedge will require little further attention till this time next year. Any lateral growths that may develop should be removed entirely. Laurels planted as a screen should be pruned to the ground level in front, so that the hedge slopes gently back until a desired height is reached.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

BROWALLIA SPECIOSA. — Young plants of Browallia speciosa raised in the spring and grown on in ordinary greenhouse conditions are on the point of flowering. If the plants are intended to bloom early in the autumn they should have all the points of the shoots removed to below the flower buds, and as soon as they have broken into growth again they should be shifted into 32-size pots.

CELOSIA PLUMOSA.—Early batches of this plant should now be carrying good plumes, and a dry atmosphere should be maintained to keep the inflorescences in a good condition. Plants of later batches intended for autumn flowering should be ready for transferring to their flowering pots; 24's are quite large enough; indeed, plants in 32's are often the most useful.

CANNA.—Continue to feed these plants freely, especially those that are throwing up their flower spikes. The earlier plants that have bloomed may be removed out-of-doors, but if some good specimens are required for the autumn there is still time to pot certain of those that have flowered in 32's. Pots 9 inches in diameter will be large enough and firm potting essential. These plants soon develop flower spikes, as the growths at the base are always fairly forward by the time the first flowers are past.

CHRYSANTHEMUM.—During hot weather guard against the Chrysanthemums becoming dry at the roots. This precaution is especially necessary in the case of dwarf plants growing in small pots, and these may require watering three or four times each day.

HOT-WATER SYSTEM.—There is no season of the year better than the present for overhauling the heating apparatus. In some instances a worn-out boiler may have to be replaced by a new one, or it may be one of the sections in a sectional boiler or a tube in the more old-fashioned tubular boiler has developed a leak. At this time of the year such work can be carried out without fear of the plants suffering injury, which is always the case where new boilers have to be placed in position during the winter or spring months. In cases where the boilers may not need repairing it is as well to have all the flues, shafts and furnace fronts overhauled and cleaned by a thoroughly competent bricklayer.

CAPSICUMS OR PEPPERS.—These plants are often grown for decorative purposes, and, provided suitable varieties are chosen, they are to be commended. Plants raised from seeds sown in April should now be setting their fruits, but if it is found that they are shy in setting they should be stood in the open, where, provided plenty of water is afforded the roots and a spraying overhead once or twice daily, the fruits should set freely. As soon as sufficient fruits are set the points of the shoots may be pinched out. Being quick-growing plants liquid manure may be given them frequently, also a little nitrate of soda or some other concentrated fertiliser once a week during the time the fruits are swelling.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 16.—*Present:* Mr. E. A. Bowles, M.A., (in the Chair); Sir J. T. D. Llewelyn, Dr. A. B. Rendle, Messrs. W. Hales, W. Fawcett, R. Hooper Pearson, and F. J. Chittenden (hon. sec.).

Delphinium consolida sporting.—Mr. W. HALES showed inflorescences of D. consolida with all the flowers on one side white. They had appeared in a bed of the ordinary D. consolida at Chelsea where no white forms had been seen before.

Virescent Delphinium. — Mr. CHITTENDEN showed inflorescences from a blue garden form of Delphinium, with all the flowers virescent, the foliose character of the parts (the stamens were not affected) varying in degree. In some the carpellary leaves were still folded and closed at their edges, the ovules being represented by the serrate margins of the folded edges: in others they were quite open.

Plants injured by fumes from smelting works.—Sir JOHN LLEWELYN exhibited leaves of a number of different plants from cottage gardens in the Swansea district showing very serious injury, in the form of dead margins and patches. This injury had appeared simultaneously with the introduction of a new method of extracting zinc from its ores in the neighbourhood, and it was thought that probably the greater volume of fumes emitted from the stacks, and possibly a difference in the composition of the fumes were accountable for the unusual damage. The specimens were referred to Dr. VOELCKER.

Variation in Black Currant Boskoop Giant.—Mr. CHAS. PEARSON sent shoots of black Currant Boskoop Giant to illustrate a variation which had suddenly arisen in several localities. In the sport the leaves become much more dentate and the bushes fail to fruit. Sometimes only a portion of the bush is so affected, but frequently the whole, and in one plantation 50 per cent. of the bushes showed the variation. The Committee would welcome any observations that would throw light upon the phenomenon. It has been suggested that possibly hard pruning may have brought about the result, but there is no record so far of recovery to the normal form.

Eria rhyncostyloides.—A botanical certificate was unanimously recommended to this beautiful, though small-flowered Orchid, native of Java, exhibited by Sir TREVOR LAWRENCE, Bart., V.M.H.

Certificate of Appreciation.—A certificate of appreciation was recommended to Messrs. CHARLESWORTH & Co., Haywards Heath, on the suggestion of the Orchid Committee, for work done in raising Odontonia × Edna, exhibited at Holland House Show.

POTTERS BAR AND DISTRICT AMATEUR ROSE.

JULY 16.—The exhibition of this society was held in conjunction with the Village Flower Show on the above date. The nurserymen's challenge cup offered for 36 varieties of Roses attracted five competitors, and was won by Mr. JOHN PIGG, of Royston, who also secured the chief award in the class for 18 Tea Roses. Messrs. W. and J. BROWN won the cup for a group of Roses with a tasteful display, Messrs. HARKNESS & SONS being 2nd in this class. In the open class for amateurs, Mr. W. O. TIMES carried off the challenge cup with a box of 18 Roses, Mr. H. R. DARLINGTON taking the 1st prize for a box of 12 Tea Roses. The members' challenge cup and replica, the principal local event, was won by Mr. STUART HOGG with a box of 12 Roses. In the decorative classes Mrs. WEBER obtained the 1st prize for five vases of Ramblers, Viscountess ENFIELD that for an arrangement of Roses, and Mr. J. HART for a group of Chinas or Dwarf Polyantha Roses. There was a large entry in the ladies' classes for baskets, bowls and vases of Roses, the principal prizes going to Miss WILSON FOX, Miss WIGRAM, and Miss GORDON THOMPSON. The smaller classes, of which there were several, were well filled. Among the growers of fewer than 100 plants Miss VAUGHAN JACKSON had two very creditable boxes.

ROYAL SOUTHAMPTON HORTICULTURAL.

JULY 16, 17.—The summer exhibition of this Society, held on the above dates, was of special importance. It was not only the Jubilee Show of the Southampton Society, but the display took place in conjunction with the show of the southern section of the National Carnation Society in the County Cricket Ground. It is to be regretted that competition was not very keen, but many of the exhibits were of good quality. There was a fine display of Sweet Peas, and the decorated tables were very good, whilst fruit and vegetables were well staged.

CARNATIONS.

There were three entries for twelve vases of Self, Fancy, and Yellow-ground Picotee varieties, arranged in a space measuring 4 feet by 3 feet. Mr. J. DOUGLAS, Great Bookham, Surrey, was successful with choice flowers of John Ruskin, Pasquin and Purity. Mr. A. R. BROWN, King's Norton, Birmingham, was placed 2nd. The winning exhibit for four vases of Carnation "Selfs" was also staged by Mr. DOUGLAS; 2nd, Mr. HAYWARD MATHIAS, Medstead. In the class for Fancy Carnations other than the white ground varieties, those best shown were exhibited by Mr. DOUGLAS, who also won in the class for four vases; 2nd, Mr. BROWN. The last-named competitor showed the best exhibit in the class for White-ground Fancy Carnations. Mr. DOUGLAS staged the winning exhibit of Yellow-ground Picotees. Dressed flowers were of an ordinary type. For six Flake and Bizarre varieties and for Fancy and for Self kinds, Mr. DOUGLAS excelled. Mr. H. MATHIAS was successful in the class for Yellow and White-ground Picotees.

In the amateurs' section, competition was much keener. For six vaecs of "Selfs" J. A. FORT, Esq., The College, Winchester (gr. Mr. G. Cousens), was placed 1st for very fine flowers. H. PARTON, Esq., Studholme, Moseley, Birmingham (gr. Mr. R. G. Rudd), showed the best four vases of Self Carnations amongst four other entries. Dressed Carnations were best shown by C. A. LINZEE, Esq., Bramdean, Alresford (gr. Mr. R. Ransom). In the class for Tree or American varieties, in which Messrs. Dutton offered prizes, W. H. MYERS, Esq., Swanmore House, Bishop's Waltham (gr. Mr. G. Ellwood) secured the leading award with an effective display of popular varieties.

SWEET PEAS.

Messrs. Toogood & Sons provided the prizes for nine bunches distinct, and the 1st prize was won by Sir R. BAKER, Ranstone, Blandford (gr. Mr. A. E. Usher), with well-staged varieties. 2nd, Mr. F. G. BEALING, Bassett Nurseries, Southampton. Mr. BEALING also won the premier award in the class provided by Robert Sydenham Limited, with grandly developed blooms displayed with taste. Sir R. BAKER won Messrs. Sutton's leading prize for six bunches. The prizes offered by Messrs. Webb & Sons and Messrs. Jas. Carter & Co. also fell to this exhibitor.

ROSES.

In the class for a group of Roses, Mr. JOHN MATTOCK, Headington, Oxford, won the challenge cup offered by the Hon. Mrs. Yorke, Hamble Cliff, with an attractive exhibit. The best twenty-four distinct varieties were shown by Messrs. PERKINS & SON, Coventry; 2nd, Messrs. D. PRIOR & SONS, Colchester. Messrs. PERKINS won the 1st prize for twelve Tea or Noisette varieties, Messrs. D. PRIOR & SONS following.

DECORATIVE PLANTS, FRUIT, &C.

For a group of miscellaneous plants arranged for effect, Mr. E. WILLS, Winchester Road Nurseries, Southampton, excelled with Orchids, Palms, Crotons, and Begonias. 2nd, The Hon. Mrs. ELLIOTT YORKE, Hamble Cliff (gr. Mr. Turner). Captain DALGETTY, Lockerby Hall, Romsey (gr. Mr. W. Baxter), secured the winning award for a collection of six dishes of fruit, with handsome Grapes, Peaches, Melons, &c.

ELLEN Lady SWAYTHLING, South Stoneham House, Southampton (gr. Mr. T. Hall), staged the best collection of four bunches of Grapes, the variety Madresfield Court being especially fine.

The LOCKSHEATH NURSERY Co., Southampton, exhibited the best Peaches and Nectarines, and

W. H. MYERS, Esq., showed the best Melons—Emerald Gem variety.

Vegetables were shown well, Mr. W. H. MYERS being unapproachable in all the classes for collections in which he competed, winning the leading prizes offered by Messrs. Toogood, Sutton & Sons, Carter & Co., and Webb & Sons.

HONORARY EXHIBITS.

The trade exhibits added much to the attractiveness of the show. Messrs. B. LADHAMS & SON, Shirley, Southampton, arranged a large garden of old English design. (Gold Medal.)

Mr. H. B. MAY, Edmonton, showed Ferns in quantity and much variety. (Gold Medal.)

Mr. BENNETT, Guernsey, exhibited Carnations effectively employed. (Gold Medal.)

Messrs. W. H. ROGERS & SON, LTD., Southampton, were represented by shrubs, Roses, and herbaceous plants. (Gold Medal.)

Messrs. TOOGOOD & SONS, Southampton, exhibited vegetables. (Gold Medal.)

Messrs. E. WEBB & SONS, Stourbridge, showed Sweet Peas, Melons, and Vegetables, all of desirable quality. (Gold Medal.)

Messrs. S. BIDE & SON, Farnham, arranged Sweet Peas in rustic baskets and vases effectively. (Silver-gilt Medal.)

Mr. J. STEVENSON, Wimborne, showed Sweet Peas. (Silver-gilt Medal.)

Mr. BREADMORE, Winchester, with new Sweet Peas, secured a Silver-gilt Medal.

The LOCKSHEATH NURSERY Co. arranged fruit trees in pots.

SALTAIRE, SHIPLEY AND DISTRICT ROSE.

JULY 17.—In conjunction with the North of England Horticultural Society, the Saltaire Society held its 10th show on the above date. The North of England Society made various awards to exhibits. Never has such a magnificent collection of Roses, Sweet Peas, and hardy flowers been staged at Saltaire. The visit of the northern society helped to make the show a decided success, for the exhibits occupied two large tents. There were 111 classes, besides the exhibits of the N.E.H.S. Roses were extremely good, both in the open and the local classes, and many of the best new varieties were to be seen in good condition. Messrs. ALEXANDER DICKSON & SONS, Newtownards, again won the 100-guinea Northern Championship Challenge Rose Bowl and Gold Medal in the open class for 60 blooms, distinct, while in the classes for 36, 24, and 16 blooms, distinct, they also beat all comers with remarkable displays of perfectly-formed, fresh, and richly-coloured blooms. Other exhibitors who were frequent prize-winners were Messrs. D. PRIOR & SONS, Colchester; Messrs. HUGH DICKSON, LTD., Belfast; and Messrs. HARKNESS & Co., Hitchin. Mr. TOM PARK, of Bedale, was the most successful local exhibitor, and, considering the cold and wet June north-country growers have experienced, this exhibitor staged exceedingly good blooms.

In the Sweet Pea classes, Mr. BOLTON, of Carnforth, staged one of the best collections of bright-coloured and well-grown flowers we have seen, and the colours were arranged with great taste. The N.E.H.S. was so impressed with Mr. BOLTON'S exhibit that they awarded it their Gold Medal.

Hardy flowers made a good display. A decided improvement was noticed in the staging of these flowers, but there still remains room for lighter arrangement.

ROSES (OPEN TO ALL).

Sixty blooms, distinct varieties.—1st, Messrs. ALEXANDER DICKSON & SONS, LTD., Newtownards; 2nd, Mr. HUGH DICKSON, Belfast; 3rd, Messrs. HARKNESS & Co., Hitchin. Amongst the blooms in the winning stand we noticed good flowers of such varieties as George Dickson (new, dark crimson), Lady de Bathe, Alice Lindsell, J. R. Davidson, Beauty of Waltham, La Galissiere, George C. Waud, Mabel Drew, Mrs. Foley Hobbs and Lord Powerscourt. Thirty-six blooms, distinct: 1st, Messrs. A. DICKSON & SONS; 2nd, Messrs. CHAPMAN & COLLINS, Leicester; 3rd, Mr. H. DREW, Longworth, Berks. Sixteen blooms, distinct: 1st, Messrs. A. DICKSON & SONS; 2nd, Mr. HUGH DICKSON; 3rd, Messrs. D. PRIOR & SONS. Twenty-four blooms, distinct: 1st, Messrs. A. DICKSON & SONS; 2nd, Mr. HUGH DICKSON; 3rd, Messrs. D. PRIOR & SONS. Twenty-four blooms of Hybrid Tea varieties: 1st, Mr. W. BENTLEY, Leicester; 2nd, Messrs. A. DICKSON & SONS; 3rd, Mr. HUGH DICKSON. Twelve blooms, Teas or Noisettes: 1st, Mr. H. DREW; 2nd, Mr. H. DICKSON; 3rd, Mr. A. H. RIGG, Baildon.

AMATEURS' CLASSES.

Thirty-six blooms, distinct: 1st, Mr. TOM PARK, Bedale; 2nd, Mr. CONWAY JONES, Hucclecote; 3rd, Mr. H. V. MACHIN, Worksop. Eighteen blooms, distinct: 1st, Mr. TOM PARK, Bedale; 2nd, Mr. CONWAY JONES; 3rd, Mr. F. J. HARRISON, Ulverston. In the local nurserymen's class for 24 blooms, the winners were, in the order named: Mr. A. H. RIGG, Baildon, Messrs. H. CLARK & SON, Radley, and Mr. W. KERSHAW, Saltaire.

Some excellent blooms were to be seen in the local amateurs' classes. The Silver Rose Bowl was awarded to the premier exhibit; the Society's Silver Medal and the National Rose Society's Bronze Medal were awarded to the premier bloom, which was a splendid specimen of the variety Mildred Grant.

Local amateurs within a 20-mile radius.—For 24 blooms, in not fewer than 18 varieties: 1st, Mr. L. LAW, Hawksworth Hall; 2nd, Mr. J. W. MERRALL, East Morton. Ten-mile radius, 24 blooms, 18 varieties: 1st, Mr. J. M. TANKARD, Roundwood; 2nd, Mr. G. C. WAUD, Baildon, the winner receiving the Silver Rose Bowl and the Society's Silver Medal. Five-mile radius, and growers of not more than 250 trees, 12 blooms, in 9 varieties: 1st, Mr. J. H. BARRON, Bingley; 2nd, Mr. S. WOODHALL.

Classes for smaller growers, cottage gardeners, and allotment holders were well filled, and some very creditable blooms staged.

SWEET PEAS.

Eighteen bunches, distinct, with not fewer than 12 and not more than 20 spikes each, and own foliage only.—1st, Mr. G. H. GARNETT-ORME, Slapton; 2nd, Messrs. CASTLE BROS., Carnforth. The winner is entitled to the Silver Sweet Pea Bowl.

Twelve bunches, distinct.—1st, Mr. J. SMELLIE, Busby; 2nd, Mr. F. J. HARRISON, Ulverston; 3rd, Mr. CECIL E. TAYLOR, Carnforth.

The prizes in Class 29 were offered by Robert Sydenham Ltd., for 18 varieties of Sweet Peas, in bunches of 15 to 20 stems. The value of the prizes offered was £32. The 1st prize of £10 was won by Mr. C. E. TAYLOR, Carnforth; 2nd, Mr. E. KEITH, Wallington. The 1st prizes in Classes 46 and 47, also offered by Robert Sydenham Ltd., were won by Mr. J. SHACKLETON, Keighley, who also won the Silver Vase.

Local amateurs (20-mile radius), 12 bunches, distinct.—1, Mr. S. SHACKLETON, Cross Hills; 2nd, Mr. G. H. GARNETT-ORME.

Local nurserymen, 12 bunches, distinct.—1st, Mr. W. HESLINGTON; 2nd, Messrs. H. CLARKE & SON.

DECORATIVE CLASSES.

Some very artistic dining-table decorations were arranged. The table arranged by Mrs. G. NICHOLSON, with Rose Mme. Abel Chatenay and its own foliage, was very attractive, and this won the 1st prize and Silver Vase. The table arranged with Sweet Peas and own foliage, exhibited by Miss BORWICK, Yeadon, in a space 6 feet by 4 feet, was very beautiful.

Mr. J. SMELLIE won the 1st prizes in all the classes devoted to Pansies and Violas.

NORTH OF ENGLAND HORTICULTURAL SOCIETY EXHIBITS AND AWARDS.

The excellence of the collection of Sweet Peas arranged by Mr. ROBERT BOLTON, Carnforth, has already been mentioned. (Gold Medal.)

A striking feature of Messrs. G. GIBSON & Co.'s (Bedale) collection of hardy cut flowers was the freshness they exhibited, Delphiniums and Roses being very good, and the arrangement of the whole was excellent. (Large Silver-gilt Medal.)

In another interesting group of hardy flowers, that shown by Messrs. HARKNESS & Co., Bedale, were noticed many interesting flowers. The Verbascums, Gaillardias, and Oriental Poppy (pink, unnamed) added much to the attraction of this exhibit. (Silver-gilt Medal.)

For a large bowl of Roses, dwarfs and Ramblers, Messrs. W. & J. BROWN, Peterborough, were awarded a Silver-gilt Medal.

Another Large Silver Medal was given to Messrs. A. J. BATCHELOR & SONS, Harrogate, for an exhibit of Ferns. Many choice and rare varieties were seen, the predominant genus being Nephrolepis.

With Roses, Violas, and Sweet Peas, Messrs. DOBBIE & Co., Edinburgh, made a valuable display. This exhibit was characterised by the great variety of interesting flowers. (Large Silver Medal.)

For a stand of English Iris, Mrs. W. A. SIMPSON-HINCHCLIFFE, Mytholmroyd, was awarded a Silver Medal. It was a pleasure to inspect this harmoniously-arranged exhibit.

Mr. J. W. UNWIN, Histon, Cambridgeshire, was awarded a Silver Medal for a good representative collection of Sweet Peas.

Messrs. MAWSON BROS., Windermere, who arranged a large stand of hardy flowers, and Mr. WM. KERSHAW, Saltaire, with a similar exhibit, were awarded Large Bronze Medals.

A very large group of hardy flowers was arranged on the floor by Messrs. J. ARTINDALE & SONS, Sheffield. Amongst the many kinds which attracted our attention were Phloxes, Delphiniums, Gaillardias, and Tritomas. A better effect would have been obtained in the arrangement if fewer flowers had been used. (Large Silver Medal.)

Mr. ALVA J. HALL, Harrogate, for his collection of choice rock and herbaceous plants, judiciously intermixed with Maples, was given a Silver Medal.

For a small stand of stove and greenhouse plants, including a few Orchids, Messrs. A. J. KEELING & SONS, Bradford, were awarded a Bronze Medal.

Messrs. S. BROADHEAD & SONS, Huddersfield, received a Large Bronze Medal for hardy flower and rock plants.

Messrs. CONWAY'S, LTD., Halifax, were awarded a Bronze Medal for a similar exhibit.

For a stand of Violas, Mr. F. J. BELL, Whitley Bay, was awarded a Silver Medal. These flowers were arranged in the form of sprays backed with Ferns, which showed them to advantage.

Another exhibit of Violas was shown by Messrs. SEAGRAVE, Sheffield. (Large Bronze Medal.)

The COOKRIDGE NURSERY Co., Leeds, made a huge display of Hydrangea paniculata and Ferns. (Bronze Medal.)

A Large Bronze Medal was awarded to Messrs. J. BACKHOUSE & Co., York, for a collection of hardy flowers.

Mr. JOHN BROOKE, Bradford (for a miscellaneous exhibit of flowers and garden sundries), and Messrs. E. W. KING & Co., Coggeshall (for Sweet Peas, which had amongst them many charming varieties), were awarded Large Bronze Medals.

First-class Certificates were awarded to Gaillardia "Mrs. MacKellar" and Verbascum "Flossie Clark." Both were shown by Messrs. HARKNESS & SONS.

RAYLEIGH AND DISTRICT HORTICULTURAL.

JULY 17.—This society held its annual summer show. The most successful exhibitors were (amateurs) Mr. W. DENYER (six 1st and four 2nd prizes); Mr. E. BOYES (four 1st and four 2nd prizes); and Mr. J. W. VICKERS (three 1st and three 2nd prizes). In the ladies' classes Miss BARNARD and Miss CURNOCK were 1st and 2nd respectively for table decorations. Miss BARNARD made good use of pink Sweet Sultan (Centaurea) and Gypsophila elegans grandiflora alba; the 2nd prize arrangement consisted of pink Sweet Peas. Mrs. J. W. VICKERS and Miss HARRIS, The Meadows, Thundersley, were successful in the bouquet and buttonhole classes. Mr. E. BOYES was 1st in the class of a group of miscellaneous plants arranged for effect. Mr. S. H. BRETT, Hillcrest Nursery, Rayleigh, Mr. S. TAYLOR, Alpha Nursery, Raylcigh, and Mr. J. C. JENNER, Lynwood Nursery, Eastwood Road, Rayleigh, arranged three good groups not for competition.

CARDIFF AND COUNTY HORTICULTURAL.

JULY 17.—The 24th annual show of the above society is a great social event as well as being one of the most important of the provincial horticultural exhibitions. The entries were large, the competition generally was very keen, and the fine weather induced a great number of people to attend the show, so that the committee have every reason to congratulate themselves and their secretary (Mr A. Maurice Bailey) on the unqualified success of their most recent exhibition. The principal prize-winners in the open and amateur classes were the Marquess of Bute, the Marquess of Northampton, the Duchess of Somerset, the Earl of Plymouth, Lord Aberdare, Lady Hill, the Mackintosh of Mackintosh, and Sir G. Forestier-Walker. The decorated dinner-tables attracted a deal of admiration, and the cottagers' exhibits reached a high standard of excellence.

GROUPS OF PLANTS.

The 1st prize group of plants, occupying a space of 150 square feet in the open class, arranged by Messrs. J. CYPHER & SON, Cheltenham, was characterised by the light and tasteful grouping which marks Messrs. Cypher's exhibits; 2nd, Lady HILL, Rookwood.

The smaller groups in the class restricted to amateurs were exceedingly well arranged, and the competition was keen. The 1st prize was awarded to Mr. J. L. MORGAN, Llandaff; 2nd, EXORS. of the late Mr. James Howell, Cardiff; 3rd, Mr. H. PENNELL, Merthyr. The EXORS. of the late Mr. J. Howell were placed 1st for three stove and greenhouse Ferns; 2nd, Mr. A. PARSONS, Cardiff. Mr. H. V. PITCHER, Penarth, was awarded the 1st prize for six tuberous Begonias; 2nd, Dr. J. L. THOMAS, Cardiff. The best twelve Zonal Pelargoniums were shown by Mr. W. MELLINGS, Penylan, and the 2nd best by Mr. J. OXENHAM, Cardiff. Mr. W. S. MELHUISH, Cardiff, showed the finest six Zonal Pelargoniums; 2nd, Lady HILL. The class for six plants suitable for table decorations was very strongly contested; the 1st prize was awarded to Mr. J. L. MORGAN for an exceptionally good set of plants; 2nd, Lady HILL; 3rd, The Duchess of SOMERSET. The 1st prize for three specimen plants in bloom, other than Orchids, was won by Mr. A. PARSONS. Lady HILL showed the best Fuchsias, and the MACKINTOSH of Mackintosh received the 1st prize for Gloxinias.

ROSES.

The few cool days which preceded the show enabled the exhibitors of Roses to stage their blooms in good condition, and the flowers retained their freshness throughout the day. In the open class for 12 distinct varieties, three blooms of each, Mr. J. BASHAM, Bassaleg, won the 1st prize; 2nd, Messrs. S. TRESEDER & SON; 3rd, Messrs. JEFFERIES & SON, Cirencester. The KING'S ACRE NURSERY Co. were placed 1st in the similar class for Tea or Noisette Roses; 2nd, Messrs. S. TRESEDER & SON, who received the 1st prize for 24 blooms, distinct. The KING'S ACRE NURSERY Co. were awarded the 1st prize for 18 Tea or Noisette Roses. The best 12 blooms of any variety other than Tea or Noisette were shown by The KING'S ACRE NURSERY Co.; whilst Messrs. J. JEFFERIES & SON were the successful exhibitors with 12 blooms of any other variety. The 1st prize for a collection of Roses occupying a space 9 feet by 4 feet 6 inches was awarded to Messrs. W. TRESEDER & SON; 2nd, Mr. J. CROSSLING, Penarth; 3rd, Messrs. J. JEFFERIES & SON. The R.H.S.'s Silver Medal for the best exhibit in the open classes was awarded to Mr. J. BASHAM.

In the amateurs' class for 12 Roses of not fewer than six distinct varieties, Mr. G. R. BONNER, Barwood, was the most successful competitor; 2nd, the Duchess of SOMERSET; and the same exhibitors were similarly placed in the class for 12 Tea or Noisette Roses.

SWEET PEAS AND CARNATIONS.

The exhibits of Sweet Peas were exceptionally good. The premier prize for 18 vases of Sweet Peas was awarded to Mr. A. E. USHER; 2nd, Mr. R. EDWARDS. The dinner-table decorations of Sweet Peas were very popular: 1st, Mrs. GERHOLD, Penarth; 2nd, Miss VIOLET LIDDIARD, Cardiff. The best six vases of Sweet Peas were shown by Mrs. JENNER, who was equally successful in the classes for one vase and for 12 distinct varieties of Sweet Peas.

In the open class for 12 border Carnations and Picotees Mr. CHAS. WALL, Bath, was awarded the 1st prize, whilst Mr. T. W. THOMAS, Whitchurch, was the successful exhibitor in the similar class for amateurs. The best collection of border Carnations and Picotees was that shown by Mr. C. WALL; 2nd, Lord ABERDARE. Mr. WALL also showed the finest collection of tree and "Malmaison" Carnations. Mr. R. T. WENT received the 1st prize for a collection of hardy flowers, as well as that for six vases of hardy flowers. Messrs. W. TRESEDER & SON were the most successful exhibitors in the open class for a collection of hardy flowers.

DECORATIVE.

A very keen competition prevailed in the decorated dessert tables, 8 feet by 4 feet. The 1st prize was awarded to Messrs. W. TRESEDER & SON, LTD., for an arrangement of pink Carnations and mauve Sweet Peas; 2nd, Messrs. SIDNEY CASE, LTD., Cardiff, for a table of pink Carnations; 3rd, Mr. C. J. ELLIS, Weston Nurseries, Weston-super-Mare, who had a very lightly-arranged table of Gilia coronopifolia. There were three other tables; the flowers used were chiefly pink Carnations, "Malmaisons," and Irish Elegance Roses; Orchids were not permitted.

The 1st prize for a bride's bouquet was won by Mr. P. THOMAS, Albany Road, with a bouquet of Odontoglossums; 2nd, Messrs. W. TRESEDER & SON, LTD., who showed a very large bouquet of Odontoglossums and white Cattleyas; this bouquet would have been better if it had been more loosely arranged, the choice white Cattleyas were almost hidden.

In the class for two floral baskets arranged for effect (Orchids excluded), Mr. C. J. ELLIS, Weston-super-Mare, was awarded 1st prize for a light and artistic arrangement of red and white Carnations; 2nd, Messrs. CASE BROS., Cardiff; 3rd, Messrs. SIDNEY CASE, LTD. For a basket of flowers arranged for effect Messrs. W. TRESEDER & SON, LTD., Cardiff, were awarded the 1st prize; their arrangement of Cattleyas, Odontoglossums and Oncidiums was very tasteful. A very effective basket gained for Mr. C. J. ELLIS, Weston-super-Mare, the 2nd prize.

The best bouquet of Carnations was shown by Messrs. CASE BROS., Cardiff; 2nd, Mr. P. THOMAS; 3rd, Messrs. TRESEDER & SON, LTD. For a bouquet of Roses Mr. P. THOMAS, Albany Road, Cardiff, was awarded the 1st prize; and Messrs. W. TRESEDER & SON, LTD., were placed 2nd.

FRUIT AND VEGETABLES.

Two bunches of Muscat Grapes: 1st, Mr. E. H. EBSWORTH, Llandough Castle; 2nd, Capt. W. B. THURLING, Lydney; 3rd, H. WEBB, Esq., M.P. Two bunches of any other white Grapes: 1st, Mr. D. W. GRAHAM, Bielston Park; 2nd, Mr. E. H. EBSWORTH; 3rd, Mr. R. P. ENGLAND, Rumney Court. Two bunches of Black Hamburgh Grapes: 1st, Mr. GODFREY L. CLARK, Talygarn; 2nd, Mr. E. C. LYSAGHT, Chepstow.

The best dish of Nectarines was shown by Mr. FRANK BIBBY, Shrewsbury; the same exhibitor was also 1st with a dish of Peaches.

The Marquess of NORTHAMPTON, Castle Ashby (gr. Mr. Searle), was awarded the 1st prize for a meritorious collection of vegetables, nine distinct kinds; 2nd, Miss BERNARD.

FORESTRY.

The exhibits of specimen boards of various hardy, broad-leaved and Coniferous trees, and the general exhibits illustrative of forestry, attracted a great deal of attention. The Society's Silver Medals were awarded to the Marquess of BUTE and the Earl of PLYMOUTH for their exhibits.

NON-COMPETITIVE EXHIBITS.

Messrs. SUTTON & SONS, Reading, arranged a large collection of Sweet Peas on an arched trellis.

The KING'S ACRE NURSERY Co., Hereford, exhibited many fruit trees and dwarf rambler Roses in pots.

Messrs. W. TRESEDER & SON, LTD., Cardiff, arranged Conifers amongst Antirrhinums, and in another part of the grounds showed Pelargoniums and other flowering plants.

Messrs. C. WALL, Melrose Nursery, Bath, exhibited tree and border Carnations.

Messrs. YOUNG & Co., Cheltenham, and Mr. C. F. WALTON, Balcombe, Sussex, also exhibited Carnations.

LIVERPOOL HORTICULTURAL.

JULY 17.—The above Society held its annual Rose and Sweet Pea Show in the Corn Exchange on this date. The favourable weather kept the flowers in fair condition throughout the day. The entries were above the average, but, unfortunately, many of the Roses were undersized.

ROSES.

Eighteen hybrid Teas: This class brought only one exhibit, from J. R. DIXON-NUTTALL, Esq., Prescot (gr Mr J. W. Parker), who was awarded the 1st prize. This collection included good blooms of the Lyon, Lady Ashdown, and Mrs. W. J. Grant.

Eighteen blooms, distinct: Mr. PARKER was again the 1st prize-winner; 2nd, Mrs. SMITH (gr. Mr. G. H. Kefford), Thelwell; 3rd, W. A. ROCKLIFT, Esq (gr. Mr. J Aindow), Formby.

Twelve blooms, distinct: Mr. AINDOW obtained the 1st place with an excellent stand of blooms. In the class for six blooms Mr. W. FOULKES was the most successful exhibitor. In the amateurs' class, which requires 12 blooms in not fewer than six varieties, Mr L. THOMSON won the 1st prize with a good set of flowers. Mr. P. FITZPATRICK showed the best six blooms, and Mr. CHARLES GREEN, Neston, arranged the best pair of vases. In the local class Mr. CHRIS HACKNEY won the 1st prize.

SWEET PEAS.

In this section the competition was very keen and the flowers were of excellent quality.

Twenty vases: This class induced a fine competition. Dr. G. H. PHILLIPS (gr. Mr. W. Davies) won the premier award with a splendid collection. The varieties Elsie Herbert, Nubian, and Maud Holmes were especially fine. Mr. R. R. ANDERSON, Birkenhead, was a good second, and was followed closely by J. P. HERON, Esq. (gr. Mr. W. Bond).

Twelve vases: Mr. DAVIES won the 1st place with a collection in which the varieties Thos. Stevenson and Mrs. Hardcastle Sykes were especially good; 2nd, Major F. M. ROOME (gr. Mr. H. Foulkes), Formby; 3rd, E. COZENS HARDY, Esq. (gr. Mr. E. T Barrett).

Twelve varieties with waved standards: Mr. FOULKES was awarded the 1st prize for a very good set of flowers; 2nd, Col. CORNWALLIS WEST (gr. Mr. W. Forder), Ruthin Castle; 3rd, T. HENSHAW, Esq. (gr. Mr. J. George), Roby.

Twelve vases, distinct: The prizes were awarded to Messrs. J. GEORGE, A. RATSON, FAZACKERLY, and R. T. SHEPHERD in the order named.

One vase Sutton's Queen: Messrs. W. BOND and G. FAULKNER were placed in the order mentioned for very fine exhibits.

AMATEURS' CLASSES.

Twelve vases, distinct: Mr. J. ROBERTS, Gresford, won the 1st prize; 2nd, Mr. S. H. CURTIS.

Six vases: Mr. R. AINDOW won the 1st prize, and, for the six vases of blooms with waved standards, Mr. G. FAULKNER was placed 1st.

In the section for members of the corn trade Messrs. E. J. PROCTER and J. TAPSCOTT each won a 1st prize.

In the class for a dinner table decorated with Sweet Peas Miss NEWSHAM was the successful exhibitor, and in the competition for any other flower Mrs. H. E. MARSH, who employed Roses, was awarded the 1st prize. There were 19 competitors in these two classes.

Twelve bunches of cut herbaceous flowers: 1st, Mr. J. GEORGE, who staged a fine collection. Mr. J. W. PARKER won the 1st prize in the class for six bunches.

For six bunches of flowers grown in the open Mr. L. THOMSON secured the premier honour. Mr. J. GREEN won the 1st prize in the members' class.

CARNATIONS AND PICOTEES.

Mr. J. CALDER showed the best six varieties, three blooms of each; the variety Anne Hathaway was especially noteworthy.

Twelve blooms arranged in vases: H. S. BARRETT, Esq. (gr. Mr. Mills), won the 1st prize with fine flowers of such varieties as Lady Willmott and Miss Peggy.

Six blooms: Mr. CALDER showed the best flowers in this class, and for six blossoms restricted to amateurs Mr. R. DUKE won the 1st prize. In the class for one vase, Mr. E. SERGENSON won the 1st prize with the variety Cecilia, and in the members'

class Mr. J. GREEN was the most successful competitor.

Mr. E. TURNBULL exhibited the best six Pansies and Violas.

NON-COMPETITIVE EXHIBITS.

Mr. R. MANSON, Gateacre, made a fine display with brightly-coloured Roses, the Lyon being especially noteworthy. (Gold Medal.)

Messrs. R. P. KER & SON, Aigburth, arranged a fine bank of miscellaneous plants, including good Crotons. This firm also staged fruit and vegetables. (Gold Medal.)

Messrs. DICKSONS, Chester, exhibited an extensive mixed display of cut flowers, Gladiolus being prominent. (Gold Medal.)

The LIVERPOOL ORCHID Co. contributed cut Roses and a collection of Orchids. (Gold Medal.)

Messrs. BEES LTD. arranged Alpines in pots, cut Roses, and herbaceous flowers. (Gold Medal.)

Mr. H. MIDDLEHURST, Liverpool, showed a pleasing stand of Sweet Peas. (Gold Medal.)

Mr. R. WRIGHT also displayed Sweet Peas, and included the variety Mrs. Hettie Roome, a promising seedling. (Gold Medal.)

Messrs. ALDERSLEY and MARSDEN JONES also had fine contributions of Sweet Peas. (Gold Medal.)

Mr. C. A. YOUNG, West Derby, arranged a choice selection of Carnations. (Silver Medal.)

Messrs. JONES, Liverpool, exhibited various cut flowers. (Silver Medal.)

Messrs. AITKEN & FAULKNER displayed Sweet Peas, &c. (Silver Medal.)

Mr. W. ROWLANDS, Childwall Nurseries, contributed cut Roses. (Silver Medal.)

Mr. C. RUSSELL, Blundellsands, had a pleasing display of Carnations. (Silver Medal.)

The COVENT GARDEN SEED Co. showed cut hardy flowers. (Silver Medal.)

Messrs. FISHLOCK BROS. arranged floral decorations. (Silver Medal.)

HORTICULTURAL CLUB.

JULY 18.—The annual outing of the members and friends of the Horticultural Club took place on Thursday, the 18th inst. Despite the unseasonable lapse into chilly and gloomy weather, the event proved to be an extremely enjoyable one. Some 50 ladies and gentlemen journeyed in two saloon carriages from Paddington to Slough station, proceeding thence in motor brakes to Stoke Poges, where they visited the old church sacred to reminiscences of the poet Gray, whose tomb is in the churchyard, and also as containing the pew of William Penn, whose name is equally immortalized as the founder of the now great State of Pennsylvania. Leaving the church, the party was driven through Burnham Beeches and the charming woodland of which they form a quota, stopping therein to partake of an excellent lunch at Wingrove's Restaurant. Mr. W. Goldring, having submitted the toast of "The King," Mr. Druery proposed that of "The Visitors," coupling with the toast the names of Prof. Hutt and Mr. Whyte, two Canadian gentlemen at present visiting this country. Both gentlemen replied in appreciative terms as regards the beauty of the places they were privileged to visit in this country. Mr. Hooper Pearson referred to the regretted absence of Sir Harry Veitch through temporary indisposition, but expressed the delight of the members when they saw that he was able to meet the party at Slough station earlier in the day. Mr. Pearson also read a telegram from the President of the Club, Sir Frank Crisp, regretting his inability to be present and wishing the party a pleasant day. The lunch over, the party proceeded to Cliveden, where, by permission of W. W. Astor, Esq., they were conducted by Mr. Camm, the head gardener, through the magnificent grounds and gardens, enjoying during the walk innumerable glimpses of the Thames, which passes the boundary of the estate. The visitors greatly enjoyed the beauty of the many vistas afforded in the woodland. From Cliveden the party drove to Sir Harry Veitch's residence at East Burnham Park, where tea was provided by Lady Veitch. The gardens were inspected, and the party afterwards returned to Slough station, where they took train for London. Unanimous thanks were expressed to both Sir Harry and Lady Veitch for their hospitality. *C. T. D.*

BIRMINGHAM BOTANICAL AND HORTICULTURAL.

JULY 17.—The annual Rose and midsummer flower show, held at the Botanical Gardens, Edgbaston, on the above date, was the biggest and best yet held under the auspices of this society. The Exhibition Hall was filled with Roses, Sweet Peas, hardy flowers and greenhouse plants. The show was visited by a record number of visitors.

The LAPWORTH NURSERIES, Hockley Heath, had a bright group of hardy flowers, shrubs and Roses, together with a capital strain of Cockscombs. Included in the border flowers were good examples of Campanula carpatica, Phloxes, Geum Mrs. Bradshaw, Helenium pumilum magnificum, Bocconia macrocarpa, Liliums, Gaillardias, Galegas, Anthemis tinctoria grandiflora, Verbascums, Pyrethrums, Hemerocallis, Lathyrus and Pinks. Buddleias—variabilis Veitchii and V. magnifica—were represented by handsome bunches. (Silver Medal.)

Messrs. GUNN & SONS, Olton, occupied a large space with Roses in vases, boxes, and tall bamboo stands. A few of the best varieties were Edward Mawley, Mme. Ravary, His Majesty, Lyon (extra good), Harry Kirk, Pharisaër, Mme. Mélanie Soupert, Mildred Grant, Prince de Bulgarie, Frau Karl Druschki, J. B. Clark, Liberté, Hugh Dickson, White Killarney, and Mrs. Theodore Roosevelt. (Silver Medal.)

W. P. WILLCOX, Esq., Park Hill, Moseley (gr. Mr. A. Hartwell), exhibited a collection of well-grown, double-flowered, tuberous-rooted Begonias. The shapely flowers represented a wide range of colour from white and yellow through shades of pink-rose, salmon and scarlet to crimson. (Silver Medal.)

Messrs. A. R. BROWN, LTD., King's Norton, contributed a collection of Roses. (Bronze Medal.)

Messrs. W. H. SIMPSON & SONS, Birmingham, exhibited a large group of good quality Sweet Peas, in which the undermentioned varieties were of outstanding merit:—Maud Holmes, Mrs. R. Hallam, Edna Unwin, R. F. Felton, Hercules, Othello, Martha Washington, Thomas Stevenson, Elfrida Pearson, White Queen, Nettie Jenkins, Coronation, Afterglow, Edrom Beauty, and John Ingman. (Silver-gilt Medal.)

Mr. DOUGLAS LEIGH, Hampton-in-Arden, had a group of greenhouse foliage and flowering plants and hardy cut flowers.

Mr. ELIE MAHY, Chiswick, sent Gasterias, and Mr. G. H. BALDWIN, King's Norton, showed Gooseberries.

COMPETITIVE CLASSES.

Competition in the competitive classes was very strong. The 1st prize in a class for six varieties of Roses was won by C. B. WORSEY, Esq., Norfolk Road, Edgbaston (gr. Mr. A. Davies), with superb flowers of Avoca, Mme. Mélanie Soupert, Frau Karl Druschki, Mrs. Joseph Hill, Mrs. Stewart Clark and J. B. Clark; 2nd, Mr. T. HORTON, Bournville.

In a similar but smaller class to the last named Mrs. C. E. WHITCOMBE, Bewdley (gr. Mr. W. Thomas), was awarded the 1st prize; 2nd, Mr. G. H. BALDWIN, King's Norton.

In a class for nine varieties of Sweet Peas Mr. T. BATCHELOR, Hampton-in-Arden, gained the 1st prize with shapely flowers of Edna Unwin, Florence Nightingale, Dobbie's Cream, Elfrida Pearson, Nora Unwin, Maud Holmes, Mrs. C. W. Breadmore, John Ingman, and Mrs. Hugh Dickson.

The class provided for six vases of hardy herbaceous flowers, distinct, was very well supported. 1st, Mr. F. ANDERSON, Moseley, who had clean, well-arranged, fair-sized vases of Centaureas, Œnotheras, Galegas, Lychnis, Chrysanthemum maximum and Salvias; 2nd, Mr. H. ANDERSON, Shirley; 3rd, Mr. E. TILT, Erdington.

There were 11 splendid entries in a class for table decorations, cut flowers and foliage only allowed, arranged on round tables about 30 inches diameter. The 1st prize table was daintily arranged with pink Sweet Pea Mrs. Routzahn and bronze-tinted sprays of Selaginella, exhibited by Miss DEAKIN, Hall Mills; 2nd, Mrs. FEWKES, Gravelly Hill, whose flowers consisted of pink and heliotrope Sweet Peas and Gypsophila relieved with Selaginella.

IRISH ROSE AND FLORAL AND THE NATIONAL ROSE.

JULY 19.—The second annual show of the Irish Rose and Floral Society was held in conjunction with the National Rose Society on this date in the Botanic Gardens, Belfast. These botanic gardens provide a charming place for the holding of a flower show, and visitors found it difficult to believe that they were in the heart of a great manufacturing city of nearly half a million inhabitants. The city itself lies in the junction of three valleys, and the spot on which the show tents were pitched afforded a glorious panoramic view of the whole country around. The exhibits were of the highest standard of merit, and throughout compared in quality with those at the leading shows in England.

The National Rose Society's tent was over 250 feet in length. It provided a grand exhibition in itself; besides this, there was a special tent for seedlings.

N.R.S. AWARDS TO NEW ROSES.

The N.R.S. Floral Committee was represented by the Rev. J. H. Pemberton, Messrs. E. Mawley, Molyneux, Hammond, Easlea, Brown, Prior, Mattock, and Felton.

The following varieties received awards:—

H. Vesey Machin, H.T.—A large bloom which, although of gigantic size and deep texture, appears to open quite freely; the colour is intense crimson. Shown by Messrs. ALEX. DICKSON & SONS, LTD. (Gold Medal.)

Mrs. Muir McKean, H.T.—A variety of intense crimson colour, very pure in colour. A grand Rose for the florist.

Colleen, H.T.—This is an immense "Killarney," but somewhat warmer in colour. The petals possess great substance, and as the leaves are hard and glossy, it will no doubt be proof against mildew. (Silver-gilt Medal.)

Lady Mary Ward, H.T.—This Rose was unanimously awarded a Gold Medal. It is decidedly the strongest shade of all varieties with flaming golden-bronze petals.

British Queen.—An enormous white Rose of perfect form and delicate texture. (Silver-gilt Medal.)

Mrs. Fred. Vanderbilt, H.T.—This Rose did not secure any higher award than was given it at Regent's Park, namely, a Silver-gilt Medal. These varieties were all shown by Messrs. SAMUEL MCGREDY & SON, Portadown, who had also *Emerald, H. T.*, a fine florists' Rose, that would light up well, its colour being a brilliant cerise-crimson, and *Mrs. David Watt, H.T.*, which the judges asked to see again.

Mrs. R. D. McClure.—A beautiful, soft, rose-pink variety with a fleshy sheen; a bloom of fine shape and general good quality. (Gold Medal.)

H. E. Richardson, H.T.—A most delightful flower of velvety-crimson shading to brilliant scarlet; not over large, but of good texture and superb quality. (Gold Medal.)

Coronation, H.P.—This Rose is a glorified "Her Majesty," but warmer and softer in colour, and with a better "point" and more reflexed; an easy Rose to open, and, judging from the plant, a very robust grower. (Gold Medal.)

Mrs. James Lynas, H.T.—A well-formed flower of palest rose shading to blush. (Silver-gilt Medal.) These four varieties were shown by Mr. HUGH DICKSON, Belfast, who also submitted for award *Mrs. Charles Hunting, H. T.* (the colour is warm apricot on beautifully smooth petals, which are of elegant shape) and *Mrs. John Jamieson, H. T.*, which the committee desired to see again.

Other novelties of interest were:—*Bon Accord, H.T.*—A very pleasing shade of rose-pink, but somewhat thin. This Rose should prove a grand bedding variety, as the habit is almost perfect. Shown by Messrs. ADAM & CRAIGMILE. *Florence Forrester.*—A beautiful creamy-white bloom; and *Mrs. W. H. Rowe*, after the colour of Sharman Crawford, a large flower of exceptional substance; the best of its colour. Both these shown by Messrs. S. MCGREDY & SON, Portadown.

COMPETITIVE CLASSES. CUT BLOOMS.

The Jubilee Challenge Trophy, a Gold Medal, and a sum of money were offered as the 1st prize

in the class for 36 blooms. HUGH DICKSON, LTD., Belmont, won the 1st prize worthily, with a grand exhibit, including a bloom of Coronation, which won the N.R.S. Medal offered for the best Rose in the show and by the Society for the best Rose other than a H.T. or Noisette variety; also Mildred Grant (a veritable giant), Mrs. W. H. Sargent, Caroline Testout, Mrs. John Jamieson, Leslie Holland, and H. D. Pinkerton (new); 2nd, Messrs. ALEX. DICKSON & SONS, Newtownards, whose collection included fine blooms of Caroline Testout, Sharman Crawford, and Queen of Spain; 3rd, Messrs. S. MCGREDY & SON.

For 72 blooms, distinct, the 1st prize was again awarded to HUGH DICKSON, LTD., who showed in wonderful form; 2nd, Messrs. ALEXANDER DICKSON & SONS, who also showed splendidly, their bloom of George Dickson being worth a long journey to see.

HUGH DICKSON, LTD., secured the 1st award in the class for 24 distinct varieties, three blooms of each; 2nd, Messrs. ALEX. DICKSON & SONS.

For 36 blooms, distinct, Mr. G. PRINCE, Oxford, was successful; 2nd, Mr. J. WALSH, Portadown; 3rd, Mr. F. E. SMITH, near Belfast. Mr. PRINCE also won in the class for 16 distinct varieties, three blooms of each, with Mr. F. E. SMITH, 2nd.

In the class for 18 blooms, distinct, Mr. G. PRINCE again excelled with a grand show of Tea Roses; 2nd, HUGH DICKSON, LTD.

Mr. JOHN MATTOCK was awarded the 1st prize in the class for 12 blooms, distinct; 2nd, Mr. JAMES WALSH; 3rd, Mr. F. E. SMITH.

In the open classes HUGH DICKSON, LTD., was successful for 12 blooms of new Roses, distinct varieties; 2nd, Messrs. S. MCGREDY & SON; 3rd, Mr. W. BENTLEY, Leicester.

For 12 blooms of any new Rose, HUGH DICKSON, LTD., secured the premier award; 2nd, Mr. G. PRINCE; 3rd, Messrs. S. MCGREDY & SON. Messrs. ALEX. DICKSON & SONS excelled in the class for 12 blooms of any H.P. variety; whilst for 12 blooms of any Rose other than H.P., T., or Noisette varieties, Mr. W. BENTLEY was successful; 2nd, Mr. H. DICKSON in both classes.

Mr. GEO. PRINCE won the 1st prize in the class for 12 blooms of any T. or Noisette; 2nd, Messrs. ALEX. DICKSON & SONS; 3rd, Mr. WALTER BENTLEY.

For 12 distinct varieties, five blooms of each sort, Messrs. S. MCGREDY & SON won the 1st prize with one of the most even collections in the show; 2nd, HUGH DICKSON, LTD.; 3rd, Messrs. ALEX. DICKSON & SONS.

Messrs. S. MCGREDY & SON, with grand baskets of Lady Hillingdon, Lyon Rose and Mrs. A. Tate, was successful in the class for five baskets of cut Roses, five distinct varieties, each variety in a separate basket: 2nd, Mr. E. HICKS; 3rd, Mr. J. MATTOCK.

In the section devoted to decorative Roses, Mr. JOHN MATTOCK, with a charming display, secured the leading award for 18 distinct varieties: 2nd, HUGH DICKSON, LTD. In a similar class for 12 distinct varieties, Mr. E. HICKS was successful; 2nd, Mr. G. PRINCE; 3rd, Rev. J. H. PEMBERTON. This was a very fine class.

In the amateurs' section, F. DENNISON, Esq., Leamington, secured the first award in the class for 24 blooms, distinct, with a very creditable exhibit containing many choice blooms.

For 36 blooms, distinct, Rev. J. H. PEMBERTON was placed 1st with very fresh blooms, well staged; 2nd, H. V. MACHIN, Esq., Derby.

F. DENNISON, Esq., was awarded the 1st prize in the class for eight distinct varieties, three blooms of each; 2nd, H. V. MACHIN, Esq.; 3rd, Mrs. DUNLOP. For nine blooms of any Rose except those of the Tea or Noisette sections, Dr. G. CAMPBELL HALL was successful; 2nd, H. V. MACHIN, Esq.; 3rd, F. DENNISON, Esq.

Mrs. DUNLOP showed best in the class for 18 blooms, distinct varieties; 2nd, ROBERT THOMPSON, Esq.

Mrs. G. H. BROWN excelled in the classes for six distinct varieties, three blooms of each, and for six blooms of any Rose except a Tea or Noisette variety.

In the class for 12 blooms, distinct varieties, J. F. HARRISON, Esq., Ulverton, won the 1st prize with finely-coloured blooms; 2nd, J. F. CROZIER, Esq.

For nine blooms of distinct varieties, Col. SHARMAN CRAWFORD was successful, and in a similar class W. UPTON, Esq., excelled; and this gentleman showed best in the class for four distinct varieties, three blooms of each.

In the class for six blooms of any Rose except Tea or Noisette, the premier exhibit was staged by J. H. WELCH, Esq.; 2nd, T. F. CROZIER, Esq.

The best six blooms of new Roses, distinct, were shown by W. BOYES, Esq.; 2nd, Rev. J. H. PEMBERTON.

J. F. CROZIER, Esq., showed best in the class for 12 blooms, distinct, whilst H. V. MACHIN, Esq., excelled in the class for nine blooms of any one variety; 2nd, F. DENNISON, Esq.

Other prizes in the amateurs' section were awarded as follows:—(a) For nine blooms, distinct varieties: 1st, W. BOYES, Esq.; 2nd, H. WHITTLE, Esq. (b) For six blooms: 1st, W. UPTON, Esq.; 2nd, F. J. HARRISON, Esq. (c) For six distinct varieties: three blooms of each: 1st, W. UPTON, Esq.; 2nd, F. J. Harrison, Esq. (d) For six blooms of any one variety: 1st, H. MACHIN, Esq.; 2nd, F. DENNISON, Esq. (e) For 12 distinct varieties, not fewer than 3 nor more than 12 trusses of each variety: 1st, Rev. J. H. PEMBERTON; 2nd, H. V. MACHIN, Esq. (f) For six distinct varieties, not fewer than 3 nor more than 12 trusses of each variety: 1st, F. A. GEORGE, Esq., Worcester; 2nd, Col. SHARMAN CRAWFORD.

CHAMPION ROSES (NURSERYMEN).

The best Rose, other than a H.T. or Noisette variety, was Coronation, shown by HUGH DICKSON, LTD.

The best Rose H.T. variety, George Dickson, exhibited by Messrs. ALEXANDER DICKSON & SONS, LTD. A wonderful flower.

The best Tea or Noisette variety, Mrs. Foley Hobbs, exhibited by Mr. GEO. PRINCE.

CHAMPION ROSES (AMATEURS).

The best Rose, other than H.T. or Noisette variety, Gloire de Chédane Guinoisseau, exhibited by Mr. WILLIAM BOYES.

The best H.T. variety, William Shaw. Shown by WILLIAM UPTON, Esq.

The best Tea variety, Mrs. Myles Kennedy. Exhibited by F. DENNISON, Esq.

All the champion blooms received special Silver Medals.

DECORATIVE CLASSES.

In the class open to ladies only, the best decorated table arranged with any kind of flowers was shown by Mrs. H. E. RICHARDSON, Lisburn, who employed pale pink-coloured Carnations, with a profusion of foliage and a few crimson Dianthus; 2nd, Mrs. F. HARRISON, of Ulverston with Rose Irish Flame, a very beautiful but somewhat formal arrangement; 3rd, Mrs. A. R. BIDE, who employed Rose Lady Hillingdon. This beautiful table was much admired.

For a table decorated with Sweat Peas, the 1st prize was won by Mrs. BEST, Armagh, with Anglian Pink; 2nd, Mrs. D. ATKINSON, for a pretty but thin arrangement.

The best table decorated with Roses was arranged by Mrs. F. J. HARRISON, who used Irish Elegance very effectively; 2nd, Mrs. H. P. PINKERTON, who also contributed a very charming arrangement of Irish Elegance. The centre vase was a trifle heavy. For a bowl of cut Roses the 1st prize was awarded to Mrs. E. M. BENNETT, Southampton, who showed a charming arrangement of Old Gold, a variety which was recently awarded a Gold Medal; 2nd, Mrs. C. WILLIAMSON, Canterbury; 3rd, Mrs. A. ATKINSON. For a vase of cut Roses and foliage the 1st prize was won by Mrs. CHARLES WILLIAMSON; 2nd, Miss JOHNSON; 3rd, Mrs. STEWART. Mrs. BURNETT secured the 1st prize for a basket of Roses.

Messrs. R. F. FELTON & SONS, Hanover Square, London, exhibited, in the Rose tent, an enormous basket of Roses showing a scheme of colour ranging from the palest yellow to the deepest shades of orange and copper, employing successfully such beautiful varieties as Juliet and Beauté de Lyon. The exhibit was recommended a Gold Medal, and at the close of the show was presented by the Council to the Lady Mayoress.

SWEET PEAS.

Those who had visited the fine show of Sweet Peas held by the National Sweet Pea Society on the 9th inst. were surprised to find that the blooms at Belfast were superior. There was scarcely a weak exhibit in the whole of the competitive classes, and many traders arranged magnificent displays.

The 1st prize in the class for 12 distinct varieties was won by the well-known Irish grower, Mr. E. COWDY, with an almost perfect collection. Prominent among them was a vase of the variety R. F. Felton, which experts agreed was the finest in the show. Mrs. W. P. Wright, White Queen, Edna Unwin, and Mrs. H. Sykes were shown splendidly. The 1st prize was a silver cup, presented by Lady Smiley, and a sum of money. Lord O'NEILL, Antrim, was awarded the 2nd prize. Miss E. M. FIELD also showed a most creditable exhibit.

In the class for 12 vases, restricted to certain varieties, the 1st prize was awarded to JAMES HALL, Esq., Moy, who had grand vases of Gladys Burt, Edna Unwin, Charles Foster, and Marjorie Linzee; 2nd, Miss E. M. FIELD, Shankill, Co. Dublin, whose blooms of Stirling Stent and Tennant Spencer were prominent; 3rd, H. E. RICHARDSON, Esq., Lisburn.

For nine bunches JOHN SMELLING, Esq., Busby, N.B., led with a superb exhibit in which it was difficult to detect a weak spike; possibly Rosabelle, Thomas Stevenson and Mrs. Cuthbertson were shown best in this fine exhibit. 2nd, JOHN HARRISS, Esq., Ulverston.

In the single-bunch classes the awards were: (*blue*), 1st, JOHN SMELLING, Esq.; 2nd, Lord O'NEILL; (*white*), 1st, E. COWDY, Esq., with Etta Dyke; 2nd, Mr. SMELLING, with White Queen; (*crimson*), 1st, Mr. COWDY, with Sunproof Crimson, grand in colour and superb in quality generally; 2nd, J. COLLEN, Esq., Portadeen; (*lavender*), 1st, Mr. COWDY, with a splendid vase labelled Lavender Queen, but it was generally recognised as R. F. Felton; 2nd, Col. WALLACE, Downpatrick, with Nettie Jenkins; (*blush*), 1st, Lord O'NEILL, with Elfreda Pearson; 2nd, E. COWDY, Esq., with Mrs. H. Sykes; (*salmon*), 1st, Mr. E. COWDY, with a grand vase of Earl Spencer; 2nd, Mr. H. D. BARTON, who showed Barbara; (*cream*), 1st, Mr. JOHN SMELLING, with Dobbie's Cream; 2nd, Mr. COWDY, with Faulkner's Primrose; (*mauve*), 1st, Lord O'NEILL, with Mauve Queen; 2nd, Mr. E. COWDY, with Wenver Castle; (*cream-pink*), 1st, Mr. COWDY, with Gladys Burt, a glorious vase; 2nd, Mr. JAMES HALL, with Mrs. R. Hallam; (*scarlet*), 1st, J. HALL, Esq., Premier; 2nd, Mr. COWDY, with the same variety; (*Picotee white*), 1st, Lord O'NEILL, with Elsie Herbert; 2nd, Mr. COWDY, with the same variety; (*carmine*), 1st, Mr. COWDY, with John Ingman; 2nd, Lord O'NEILL, with the same variety; (*picotee cream*), 1st, Lord O'NEILL, with Mrs. Breadmore; 2nd, Mr. H. BARTON, with the same variety; (*fancy varieties*), 1st, Mr. COWDY, with a wonderful vase of Prince George; 2nd, Col. WALLACE, with Charles Foster; (*orange*), 1st, Lord O'NEILL; 2nd, Mr. COWDY; (*pink*), 1st, Lord O'NEILL; 2nd, Mr. COWDY, with Marjorie Linzee; (*maroon*), 1st, Mr. JAMES HALL, with Nubian); (*striped or flaked variety*), 1st, Mr. COWDY; 2nd, Miss FIELD; both exhibitors showed Mrs. W. J. Unwin. In several of these classes no fewer than ten exhibits were staged, and the masses of colour produced was most effective.

The cup presented by Mr. Calvert for 24 bunches in not fewer than 18 varieties, was won by R. D. M. BARTON, Esq., Antrim; 2nd, H. E. RICHARDSON, Esq.

CARNATIONS, &C.

The Irish climate is evidently well-suited to the cultivation of perpetual-flowering Carnations, as the blooms shown were finer than are generally exhibited by amateurs in England. For nine vases of six or more varieties, H. E. RICHARDSON, Esq., was successful. He showed choice vases of Carola, Marmion, Jessica, and Rose Doré; 2nd, J. ACHESON, Esq., with R. F. Felton and Mrs. Burnett as his best vases. For three varieties, distinct, the 1st prize was awarded to F. J. CROZIER, Esq.; 2nd, W. J. RICHARDSON, Esq.

Lord DUNLEATH showed the best Souvenir de la Malmaison Carnations, having splendid blooms of Princess of Wales, Sir Charles Freemantle, and Blush Malmaison; 2nd, Lord O'NEILL.

For six vases of border Carnations or Picotees, the 1st prize was won by H. E. RICHARDSON, Esq.; whilst for three vases ROBERT BOYD, Esq., was successful.

Tuberous-rooted Begonias were well shown by Dr. ADAMS, H. B. MURRAY, Esq., and H. E. RICHARDSON, Esq.

Exhibits of Pelargoniums produced a brilliant effect, Mrs. Hughes, Colonel Sharman Crawford, H. B. Murray, Esq., and R. Boyd, Esq., being the principal prize-winners.

Mrs. Green, of Belfast, was placed 1st in the classes for a group of stove and greenhouse plants and six table plants respectively, both exhibits being well staged and of excellent quality.

Some idea of the general interest which was taken in the show locally may be gathered from the fact that a tent over 200 feet long was practically filled by three principal Belfast nurserymen and florists—Messrs. Alexander Dickson & Sons., Ltd., Messrs. Frank E. Smith, Ltd., and Messrs. Arthur Ritchie, Ltd.—with artistic designs, displays of stove and greenhouse plants, hardy flowers and Sweet Peas. These were all staged effectively. Messrs. Alex. Dickson & Sons also showed an instructive exhibit demonstrating the germination of seeds.

Prominent amongst Messrs. Ritchie's exhibits was a representation in mosses and flowers of Shaws Bridge, with a river flowing beneath it. This was a very clever piece of work. Messrs. Smith's exhibit contained fine bouquets of Sweet Peas and a design representing a horse-shoe made with Cornflowers, with four nails of White Carnations.

BIRMINGHAM HORTICULTURAL.

July 19, 20.—The Handsworth Horticultural Society held an annual flower show in the Victoria Park, Handsworth, on the confines of Birmingham, for many years, but the association was recently reorganised, and it is now known as the Birmingham Horticultural Society. The show of the new society was held on the above dates at Handsworth. Stove and greenhouse plants, hardy flowers, Roses and table decorations were largely and well exhibited, but fruit was poorly represented. Unfortunately, the arrangements were deplorably bad, and caused exhibitors a very great deal of trouble and annoyance. It is to be hoped that the committee will give serious attention to this matter in the future.

Plants (Open).

The principal class was one for a group of plants arranged for effect on a space not exceeding 300 square feet. The 1st prize of 20 guineas, together with a Silver Challenge Cup value 10 guineas, was won by Messrs. James Cypher & Sons, Cheltenham, who had a well-arranged group, in which Clerodendron fallax, Ixoras, Kalanchoes, Francoas, Ericas, Orchids, richly-coloured Codiæums, Dracænas, Acalyphas, Alocasias, Marantas, Strobilanthes, and choice Ferns were the principal plants employed. A rustic arch clothed with beautiful foliage and flowering plants marked the centre of the group. The 2nd prize was awarded to Sir George H. Kenrick, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), whose artistic group was fashioned on pretty much the same lines as that of Messrs. Cypher & Sons. 3rd, Mr. W. Vause, Leamington.

The winning exhibit of 12 stove or greenhouse plants was also arranged by Messrs. James Cypher & Sons. Their best specimens were Statice profusa, Clerodendron Balfouri, Allamanda, Hendersonii, and Codiæums Warrenii and The Countess. 2nd, Mr. W. Vause. 3rd, Mr. W. Manning.

Colonel Walker, Acocks Green, gained the 1st prize for a group of tuberous-rooted Begonias arranged on a table space of 12 feet by 3 feet.

The best exhibit of half-a-dozen Coleus plants came from John Arthur Kenrick, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), who also took the lead in a class for six Caladiums.

J. Boston, Esq., Handsworth (gr. Mr. T. Perks), was awarded the 1st prize for six Fuchsias.

There were only two exhibits in the class reserved for rock and water gardens arranged on a space of 20 feet by 20 feet, near the centre of the large circular tent, with double frontage. The 1st prize of £10 was secured by Messrs. Gunn & Sons, whose plants were not all, strictly speaking, rock or water garden subjects. Nevertheless, it was a very striking exhibit, and much admired. Messrs. Child & Co., who had a less-imposing exhibit, were placed 2nd.

Cut Flowers (Open).

Messrs. Perkins & Sons, Coventry, were awarded the 1st prize in a class for 48 Roses, distinct varieties. The blooms exhibited were large, fresh, and of excellent quality. The following varieties were noteworthy:—Captain Hayward, William Shean, Marie Baumann, J. B. Clark, Mme. Mélanie Soupert, Gladys Harkness, Edward Mawley, Mildred Grant, W. R. Smith, Frau Karl Druschki, Avoca, Suzanne Marie Rodocanachi, Lyon, C. J. Grahame, Gloire de Chédane Guinoisseau, and Mrs. David McKee. 2nd, Mr. John Mattock, Headington; 3rd, Mr. W. T. Mattock, Headington.

In the next class, for 24 Roses, distinct, Messrs. Perkins & Sons were again placed 1st. 2nd, Mr. Henry Drew, Longworth, Berks.

Messrs. Perkins also excelled in a class for 18 Roses, distinct, showing grand blooms of Mrs. Joseph H. Welch, Frau Karl Druschki, Mrs. Theodore Roosevelt, Captain Hayward, and Pharisaer. 2nd, Mr. Henry Drew.

The best stand of 12 Tea Roses, in not fewer than six varieties, came from Messrs. W. & J. Brown, Stamford, who had shapely blooms of White Maman Cochet and Mme. C. Soupert. 2nd, Mr. Henry Drew.

Messrs. Gunn & Sons, Olton, were awarded the Silver Cup, value 5 guineas, presented by W. G. Griffiths, Esq., and £4, offered by the society, for the best collection of Roses arranged on table space of 10 feet by 4 feet.

The best exhibit of 12 vases of Carnations or Picotees, 3 blooms of each, with their own buds or foliage, came from Messrs. A. R. Brown, Ltd., King's Norton, whose flowers of Black Douglas, Alba, Rhea, Lord Steyne, Kaffir Chief, and Margaret Thurston were large, handsome, and effectively staged. 2nd, Mr. W. H. Parton, Moseley (gr. Mr. G. R. Rudd).

In another class for a collection of Tree Carnations, arranged on a space of 6 feet by 4 feet, Mr. A. F. Dutton, Ivor, Bucks., won the 1st prize with shapely flowers, principally of the rose-shaded varieties.

In a class for a display of Sweet Peas, occupying a space of 20 feet by 4 feet, Messrs. Herd Bros., Penrith, were awarded the Silver Challenge Cup, value 20 guineas, and a Gold Medal value £5. The flowers were of splendid quality and beautifully arranged.

Messrs. T. Grove & Son, Sutton Coldfield, beat Messrs. Seagrave & Co., of Sheffield, in a class for 24 bunches of hardy border flowers, in not fewer than 18 varieties (annuals and shrubs excluded).

Mr. J. Bastock, Moseley, had the most tasteful arrangement of Pansies and Violas, and Messrs. Harkness & Sons, Bedale, showed the best collection of Delphiniums.

Mr. Stephen Sims, Derby, won the 1st prize for table decorations. Other successful exhibitors of cut flowers included Sir Richard Graham, Bart., and Messrs. W. J. Godfrey & Sons, Exmouth.

Among the successful exhibitors of fruit we noted the Manor Fruit Farm, Knowle (black and white Grapes); F. E. Muntz, Esq., Umberslade (Melons); and Captain W. H. Starkey, Leamington (Black and Red Currants and Strawberries).

Honorary Exhibits.

Messrs. Young & Co., Cheltenham, contributed a grand lot of Tree Carnations.

Messrs. R. J. Barnes & Son, Malvern, showed Roses, Sweet Peas, and Violas.

Messrs. Hewitt & Co., Solihull, had a large bank of hardy flowers.

Messrs. Bakers, Wolverhampton, displayed a selection of hardy flowers in a formal garden.

Messrs. Webb & Sons, Stourbridge, exhibited Sweet Peas, fruit, and vegetables.

Messrs. A. R. Brown, Ltd., King's Norton, showed a bright collection of Roses.

Mr. J. Stevenson, Wimborne, and Messrs. G. Stark & Sons had collections of Sweet Peas.

Mr. A. F. Dutton, Ivor, Bucks., sent choice Tree Carnations.

Messrs. Jarman & Co., Chard, showed Roses, Sweet Peas, and Centaureas.

From Messrs. Peed & Son, West Norwood, came a choice collection of well-grown Caladiums.

Messrs. W. J. Godfrey & Sons, Exmouth, sent Pentstemons and Poppies.

Messrs. Rich & Co., Bath, showed a large collection of hardy flowers.

NATIONAL CARNATION & PICOTEE.

July 23.—The annual exhibition of the Southern Section of this Society was held on this date at the Royal Horticultural Hall. The exhibits were much more numerous than last year (when it will be remembered the exceptionally hot weather caused the plants to finish flowering at an unprecedentedly early date), and compared very favourably, in point of numbers, with previous shows. The vases of flowers in the classes for "Flowers Shown as Grown" made a very attractive display, notably those in Classes 33 to 38, inclusive. There was a very fair attendance, and, whilst the greatest amount of admiration was bestowed on the flowers already mentioned, many of the visitors were keenly interested in the florists' Carnations and Picotees, and were very anxious to learn their various "points." It was a matter for regret with the exhibitors that the date was again too late for some of the southern growers. The season is unusually early, but this could not be foreseen.

The Silver Cup for the highest aggregate of points in Division 1 was won by Mr. James Douglas, Great Bookham. The greatest number of points in the second division was obtained by Mr. R. Morton, Woodside Park, who receives the Cup offered for that division.

Flowers Shown on Cards.

These classes are divided into two divisions: the trade growers can only show in the first division, and amateurs who exhibit in this division are debarred from competing in the second division. The competition in these classes was very good; four of the five classes in Division 1 each had five competitors. In each class 12 blooms must be shown, in not fewer than 9 varieties and not more than 2 blooms of any one variety.

Bizarres and Flakes.—1st, Mr. C. F. Thurston, Wolverhampton, who showed a splendid set of very even blooms. The varieties were:—Gordon Lewis (two blooms), Ophelia, Admiral Curzon, Meteor, Ethel Macrae, Recorder, Torchlight, J. S. Hedderley, and Flamingo. 2nd, Mr. James Douglas, Great Bookham, Surrey, whose exhibit contained several exceedingly fine blooms, notably of the varieties Torchlight (which was the premier Flaked Carnation), Gordon Lewis, Ajax, and Master Fred; but they were not so even as those on the winning board. 3rd, Mr. H. Mathias, Stubbington, Hants.

Selfs.—In this class there were many beautiful flowers shown. Mr. H. Mathias was decidedly first, and his bloom of the yellow variety Maud Allan, which was adjudged the premier Self Carnation, was a delightful flower. The other varieties shown were Tubal, Daffodil, Theodore Galton, Titan, Mrs. H. Green, E. Shiffner, Irma, Delia, Wyatt, Mrs. E. Hambro, and a red seedling. 2nd, Mr. C. F. Thurston, who showed good blooms of Tubal, Cardinal Newman, and Sir Galahad. 3rd, Mr. J. Douglas.

Fancies.—Mr. H. Mathias also won the 1st prize in this class. His stand contained very large flowers of good form and colouring. The varieties were:—Donald McDonald (2 blooms), Bombardier, Erl King, Becky Sharp, Linkman, Devonian, Hecla, Hercules, Mrs. Leo Hunter, Queen Eleanor, and D. O'Connell. 2nd, Mr. C. F. Thurston, whose blooms of Sir Walter and Linkman, though smaller, were very good. 3rd, Mr. J. Douglas.

Picotees: White ground.—The Picotees reached a high standard; in most cases the ground colour was very pure. 1st, Messrs. A. R. Brown, Ltd., King's Norton, who showed Mrs. W. H. Twist, Myra, Dorothy (2), Edmund Shorthouse (2), Lady Maud (2), Thos. William, Janet, Mrs. H. Hoskin, and Violet. 2nd, Mr. J. Douglas, whose purple-edged premier white-ground Picotee Amy Robsart was a charming flower. 3rd, Mr. H. Mathias.

Picotees: Yellow ground.—1st, Mr. H. Mathias, whose collection comprised Ariel, five seedlings, Corona, Gloria, F. W. Goodfellow, Puck, Onward, and Santa Claus. Two of the seedlings were especially desirable. 2nd, Mr. J. Douglas, whose finer blooms were Mrs. J. J. Keen, Goblin, and John Ruskin.

In the second division the flowers were, in some cases, but little inferior to those in the first. Here the requirements were six blooms of dissimilar varieties.

Bizarres and Flakes.—1st, Mr. H. R. TAYLOR, Cheam, who showed the varieties Gordon Lewis, Zebra, and the premier Bizarre Black Diamond especially well. 2nd, Mr. D. WALKER, Kilmarnock.

Selfs.—1st, The Rev. C. A. GOTTWALTZ, Droitwich, whose best blooms were Major Galton and Crystal.

Fancies.—1st, Mr. H. R. TAYLOR. The blooms of Linkman and Margaret Thurston were very noteworthy. 2nd, Mr. E. G. PRICE.

Picotees: White ground.—1st, Mr. H. R. TAYLOR. From this board we selected Dora Knight and Kathleen as being the best.

Picotees: Yellow ground.—Mr. H. R. TAYLOR was again the most successful exhibitor. In this class he showed Her Majesty, Peter Pan, and Agnes especially well. 2nd, Mr. W. H. PARTON.

FLOWERS SHOWN AS GROWN.

In the first division the competition was not so keen as was the case with the flowers shown on cards; only two classes attracted five exhibitors. In these classes, which are, presumably, intended to show the flowers in a natural manner, the supporting wires were far too much in evidence. The following classes each stipulate that four varieties, three blooms of each, shall be shown, in vases, with Carnation foliage.

Selfs.—There were five exhibits in this class, and, whilst the 1st prize collection from Mr. J. DOUGLAS contained the finest blooms, the superabundance of foliage and flower-buds detracted from their decorative value. The 4th prize collection, shown by Mr. H. MATHIAS, was very much more ornamental. The flowers of the variety Bob Acres shown by Mr. DOUGLAS were very bright and fresh. There was no 2nd prize awarded, but Mr. F. W. GOODFELLOW and Messrs. A. R. BROWN, LTD., were placed equal 3rd.

Fancies, other than white ground.—Mr. DOUGLAS was also the most successful exhibitor in this class, but the attraction of his exhibit suffered again from the superfluous foliage. The flowers of the varieties Liberté, Lord Steyne, and Pasquin were exceedingly good. 2nd, Messrs. A. R. BROWN, LTD., who showed four very dainty sets of blooms. 3rd, Mr. H. MATHIAS.

Fancies: White ground.—There were only two competitors in this class. Mr. J. DOUGLAS was awarded the 1st prize. His more noteworthy varieties were The Bride and Montrose. 2nd, Messrs. A. R. BROWN, LTD.

Picotees: Yellow ground.—1st, Mr. J. DOUGLAS, whose outstanding varieties were Her Majesty and Exquisite. 2nd, Mr. H. MATHIAS, who showed Santa Claus in especially good form.

Class 10 required nine distinct varieties, Selfs, Fancies and yellow-ground Picotees, three blooms of each variety. 1st, Mr. J. DOUGLAS, who arranged Liberté and Linkman in splendid condition. 2nd, Mr. H. MATHIAS. 3rd, Messrs. A. R. BROWN, LTD.

OPEN CLASSES.

There were ten classes, open to any exhibitor, and each class required nine blooms of one variety of a specified shade of colour, shown in a vase with Carnation foliage. These exhibits formed a very attractive feature of the show. The Cartwright Challenge Cup and a silver medal were awarded to the best individual exhibit in these classes. These trophies were awarded to Mr. JAMES DOUGLAS for an excellent vase of the apricot-coloured Self Carnation Mrs. G. Jones. Mr. DOUGLAS was very successful in these classes; he was placed 1st no fewer than six times.

Pink or rose: 1st, Mr. J. DOUGLAS, with Rosy Morn. White: Mr. H. MATHIAS was placed 1st with Titan. Dark-red or maroon: 1st, Mr. H. LAKEMAN, Thornton Heath, who showed Mrs. George Marshall. Yellow: Mr. H. LAKEMAN, whose blooms of Carnation Daffodil also received the premier card. Red or scarlet: 1st, Mr. J. DOUGLAS, for Bob Acres. Buff or terra-cotta: 1st, Mr. J. DOUGLAS, with the variety Mrs. G. Jones. Any other Self Carnation: Mr. H. MATHIAS, who showed Helen. Mr. DOUGLAS was placed 1st in the remaining classes with the following varieties:—John Ruskin (yellow-ground Picotee), Pasquin (yellow or buff fancy), The Bride (any other fancy).

In the second division, for amateurs only, three blooms of each variety were similarly shown. The competition was exceedingly strong, and many very good blooms were staged. The chief prize-winners were the following, the names of the varieties shown are placed in parentheses:—Pink or rose: Mr. D. WALKER (Lady Hermoine). White: Mr. R. MORTON (Mrs. Eric Hambro). Dark-red or maroon: Mr. R. MORTON (Mrs. Geo. Marshall). Yellow: Mr. R. MORTON (Daffodil). Red or scarlet: Mr. W. H. PARTON (Etna). Yellow-ground Picotee: Mr. R. MORTON (Exquisite). Buff or terra-cotta: Mr. R. MORTON (Elizabeth Shiffner). Yellow or buff-ground fancy: Mr. G. D. FORD (Mrs. Penton). Any other fancy: Mr. W. H. PARTON (Ivo Sebright). White-ground fancy: Mr. R. MORTON (The Nizam). Any other Self: Mr. D. WALKER (Jim Bludzo).

There was a strong competition in the class for six varieties of Picotees. 1st, Mr. R. MORTON, who showed Mrs. Geo. Marshall and Margaret Lennox especially well; 2nd, Mr. W. H. PARTON; 3rd, Mr. E. J. PRICE, Bournville.

The Martin Smith Cup, offered to the amateur for the best 12 distinct varieties in separate vases, three blooms of each, was won by Mr. ROBERT MORTON, Woodside Park, whose vases of Mrs. G. A. Reynolds, Mrs. G. Marshall, and Etna were splendid; 2nd, Mr. W. H. PARTON, Moseley.

In the classes for smaller growers there were many meritorious flowers shown. Messrs. J. B. WILLETTS, of Yardley, were exceedingly successful; they were the chief winners in three of the four classes. Mr. E. W. PAINTER was the 1st prize winner in the other class.

TABLE DECORATIONS.

There were only two tables arranged for competition. Mr. E. J. PRICE, Bournville, won the 1st prize with May Day Carnation and trails of Selaginella; 2nd, Miss C. BLICK, Hayes, Kent, in whose vases the sprays of Asparagus plumosa nana seemed a trifle heavy.

Mr. L. H. HART, Hertford, showed the best three sprays, and Mr. W. H. PARTON was similarly successful with three flowers for buttonhole wear. The vase of seedlings which won the 1st prize for Mr. A. SPURLING, Borough Green, was a very charming arrangement.

PREMIER BLOOMS.

Suitable cards were awarded to the exhibitors who showed the blooms which were adjudged to be the best in the show of their sections. These were as follow:—

Bizarre: Black Diamond, shown by Mr. H. R. TAYLOR.

Flake: Torchlight, shown by Mr. J. DOUGLAS.

Fancy: Becky Sharp, shown by Mr. H. MATHIAS.

Self: Maud Allan, shown by Mr. H. MATHIAS.

Heavy-edged White-ground Picotee: Amy Robsart, shown by Mr. J. DOUGLAS.

Light-edged White-ground Picotee: Fair Maiden, shown by Mr. PRICE.

Heavy-edged Yellow-ground Picotee: Mrs. J. J. Keen, shown by Mr. DOUGLAS.

Light-edged Yellow-ground Picotee: Eclipse, shown by Mr. TAYLOR.

Bizarres or Flakes: 1st. Messrs. A. R. BROWN, who showed Joseph Jester, a very good scarlet flaked bloom.

Selfs: 1st, Mr. H. MATHIAS, whose plum-purple variety Irma is a decided acquisition.

Fancies: 1st, Mr. TAYLOR, Cheam. This bloom, which was unnamed, is very large, of good shape, and has heavy crimson marking on a yellow ground.

White-ground Picotee: 1st, Mr. H. MATHIAS, for the variety "Bill," which has a light edge and clean ground.

Yellow-ground Picotee: Mr. H. MATHIAS also won the 1st prize in this class. The variety Dago is a splendid flower, and was selected for a Certificate.

CERTIFICATES.

Dago.—A Yellow-ground heavy-edged Picotee, with a bright crimson margin; an exceedingly good bloom. Shown by Mr. H. MATHIAS.

Gloria.—A pale Yellow-ground heavy-edged Picotee. The pale pink edging makes this a very charming flower. Shown by Mr. H. MATHIAS.

Eclipse.—A Yellow-ground Picotee, with light crimson edge. This desirable variety was shown by Mr. H. R. TAYLOR.

Mrs. J. J. Keen.—A heavy-edged yellow-ground Picotee, with a good rose-pink margin. A very delightful flower. Shown by Mr. J. DOUGLAS.

Peggy.—A White-ground light-edged Picotee. A very good form, with red-purple margin. Shown by Mr. H. MATHIAS.

NON-COMPETITIVE EXHIBITS.

Mr. MAURICE PRICHARD, Christchurch, Hants., made an effective display with border flowers.

Mr. CHARLES TURNER, Slough, also made an attractive exhibit of border flowers; the herbaceous Phloxes were exceedingly bright.

Messrs. PHILLIPS & TAYLOR, Lily Hill Nurseries, Bracknell, Berks., floated blooms of various hardy Nymphæas in a shallow tank, and exhibited cut blooms of border flowers. On a side table they also showed a great variety of cut Carnations. Mr. H. LAKEMAN, Thornton Heath, Surrey, arranged blooms of Carnations with sprays of Asparagus and Gypsophila paniculata.

Messrs. WEBB & BRAND displayed exceedingly well-flowered cut spikes of Hollyhocks.

Messrs. H. B. MAY & SONS, Upper Edmonton, exhibited a great number of their greenhouse Ferns, and a few Ixoras.

BRIGHTON ROSE AND SWEET PEA.

JULY 23, 24.—The twenty-first annual exhibition of this society was held on these dates in The Dome and Corn Exchange. Owing to the vagaries of the season, the show was not so successful as usual. The late date proved unfortunate, for although the entries in the various classes were numerous, many exhibitors were compelled to withdraw their entries.

Mr. FRANK WOOLLARD, Brighton, was the chief prize-winner in the open classes, his successes including the silver cup, silver-gilt medal, and 1st prize for a group of Roses (either plants or plants and cut blooms), gold medal and 1st prize in the class for 36 cut blooms, distinct, 1st prize in that for 24 blooms distinct, the premier award in the classes for 18 blooms, Teas or Noisettes, for 25 long-stemmed Roses, five sorts in separate vases, and the silver medals for the best H.P. and best H.T. in the show. In the class for a circular group of miscellaneous flowering and foliage plants, S. C. WITTING, Esq., was 1st, for the third successive time, thus winning outright the handsome silver cup offered in the competition. This exhibit also received the Corporation challenge bowl, to be held for one year.

In the Sweet Pea classes, Mr. W. R. HAMMOND, Burgess Hill, was placed 1st for 24 varieties in 24 vases. For 12 varieties, Mr. W. H. SMITH won the 1st prize and the silver medal. Mr. H. RAMSBOTTOM won the premier awards in the classes for 30 stems of crimson or scarlet flowers and for 30 stems of blue or mauve Sweet Peas, showing the variety Maud Holmes in the first and Flora Norton Spencer in the latter class. For 30 stems of pink Sweet Peas, Mr. W. H. SMITH was 1st with very fine sprays of Hercules. In the class for white varieties, Mr. C. A. WOOD was awarded the 1st prize for the variety Etta Dyke.

For the non-competitive exhibits the following well-deserved awards were given:—Messrs. BALCHIN & SONS, Brighton, and Messrs. SUTTON & SONS, Reading, received gold medals, the former for a beautiful arrangement of stove and greenhouse plants and the latter for a magnificent display of flowers, Melons, and vegetables. Silver-gilt medals were awarded to Messrs. WELLS & CO., Merstham, for Carnations and Phloxes; the CLURY NURSERIES, Langley, Bucks., for Carnations; the BARNHAM NURSERIES, LTD., for Roses; Mr. FRANK WOOLLARD, Brighton, for Roses; and Mr. G. W. PIPER, Uckfield, for Roses. Messrs. CHEAL & SON (Sweet Peas and miscellaneous flowers), and Messrs. BLACKMORE & LANGDON (Begonias), were awarded silver medals.

CHELTENHAM SWEET PEA

JULY 11, 12.—A Sweet Pea show, inaugurated by the *Cheltenham Looker-on*, was held in the Montpelier Rotunda, on these dates. The principal prize was won by Mr. W. JARRATT, Thorpe, and the Challenge Bowl for the best bunch of Sweet Peas in the show was awarded to Mr. JOHN PLAYER, of Thirlestane Hall, for the variety Mrs. Breadmore. Non-competitive exhibits were made by Miss HEMUS, Messrs. CYPHER & SONS, and Messrs. YOUNG & Co., of Hatherley.

Obituary.

WILLIAM COMFORT.—We regret to record the death of Mr. William Comfort, which occurred on the 15th inst., at the age of 65. He was one of five brothers, all of whom, like their father and grandfather, followed gardening as a profession. He served his time in his native county of Aberdeen, and afterwards became foreman at Altyre, near Forres. Mr. Comfort served as head-gardener at Maryhill, Elgin; Aberlour, Banffshire; Farnley Hall, Otley, Yorkshire; Knowle Hall, near Birmingham; and Kylemore Castle, Co. Galway, first under the late Mr. Henry, M.P., and latterly under the Duke of Manchester. About seven years ago he retired from service, and has since resided in Berwick-on-Tweed, where he carried on a business as fruiterer and seedsman. He leaves a widow, but no family. One of his brothers, Mr. Charles Comfort, is gardener at Broomfield, Davidson's Mains, Midlothian.

ARTHUR HATTON.—This well-known florist and fruiterer, of High Street, Tonbridge, died on the 9th inst., at the age of 64 years. Before engaging in business for himself Mr. Hatton was gardener to Mrs. Swanzy, at The Quarries, Sevenoaks, for more than 20 years. For 30 consecutive years Mr. Hatton had acted as one of the judges at the Sevenoaks flower show, and he frequently officiated in that capacity at Margate and many other places.

DEBATING SOCIETIES.

READING GARDENERS'.—The strongest muster of members for the society's annual excursion since the memorable trip to Welleck Abbey in 1907, assembled on the 18th inst, when Cliveden, the beautiful gardens and grounds of Mr. Waldorf Astor, near Maidenhead, were visited. The committee chartered the steam launch "Majestic" for the conveyance of the party, which, accompanied by the president, Mr. Alderman Parfitt and Mr. W. Pole Routh, started from Caversham Lock at 9.30 a.m., picking up outlying members at several locks and at Henley, until the number of guests was 150. Cliveden was reached at 1.40 p.m. At the landing stage the party was met by the gardener, Mr. W. Camm, and under his guidance at once proceeded by the steep winding path to the summit of the hill, then on to the huge covered tennis court, where luncheon was served. The mansion, which is situated immediately above the world famous Cliveden Woods which render the Thames at this point so singularly beautiful, claims as its founder George Villiers, Duke of Buckingham, and was for a time occupied by Frederick Prince of Wales, father of George III. Two former mansions having been destroyed by fire, the present handsome structure in the Palladian style was designed and erected by the late Sir Charles Barry, and stands in a beautifully timbered park of 300 acres. The gardens and glasshouses were inspected and the visitors were impressed with the delightful scenery and excellent crops.

GARDENING APPOINTMENTS.

Mr. JOHN B. CRICHTON, of Mr. JOHN DOWNIE'S Nurseries, Edinburgh, and previously Gardener to Earl CAIRNS, Farleigh House, Bath, as Gardener to CHARLES BROOK, Esq., Kinmount, Annan.

Mr. F. CROSBY, for the past 4½ years in Mr. L. O. WALTER'S Nursery, St. John's Wood, London, and formerly of Dane House Gardens, Shenfield, as Gardener to A. J. VAN PRAAGH, Esq., Arabin Dower House, High Beech, Essex.

Mr. G. HUDSON, for 3½ years Gardener to the late Mr. J. THOMAS, Wood Hall, Shenley Barnet, and previously for 13 months Gardener at Wood Hall, Hemel Hempstead, and for 8 months in the Nurseries of Mr. W. PUDEN, as Gardener to ARTHUR DE LISSA, Esq., Mistletoe Farm, Eastcote, Pinner.

Mr. F. LAKE, for the past 3½ years Gardener to H. F. COMPTON, Esq., Minstead Manor, Lyndhurst, Hampshire, as Gardener to the Hon. H. A. MILLES LADE, Nash Court, Faversham, Kent. (Thanks for contribution of 1s. 6d. for R.G.O.F. box.)—Eds.

Mr. H. PENNELLS, for the past 5 years Gardener to T. P. JACOMB, Esq., Hatch House, Winchfield, Hampshire, as Gardener to C. G. TURBERVILLE, Esq., Tilton, Catsfield, Battle, Sussex. (Thanks for contribution of 1s. 6d. for R.G.O.F. box.)—EDS.

SCHEDULES RECEIVED.

Kent Commercial Fruit Show Association.—The second annual show will be held at the Corn Exchange, Maidstone, on Tue day and Wednesday, October 29 and 30. Secretary, Mr. R. Wellington, The College, Wye, Kent.

Kingswood, Walton and Tadworth District Horticultural Society.—The nineteenth annual exhibition of fruit and flowers will be held in the grounds of Kingswood Manor, Kingswood, on Wednesday, August 7. Hon. Secretary, Mr. W. Cooper, Kingswood Manor Lodge.

Women's Agricultural and Horticultural International Union.—The show and sale of farm and garden produce and live poultry will be held at the Royal Horticultural Society's Hall, Vincent Square, Westminster, S.W. on Wednesday, October 23. On the same day at the Hall the National Poultry Diploma Examination will be held. Secretary Miss Ella Gill, 45, Queen Anne's Chambers, Westminster, S.W.

MARKETS.

COVENT GARDEN, July 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—There is a good selection of early Apples, both dessert and culinary varieties, from home growers, also Summer Pippin and French Crab from Tasmania. The Continental supply of Pears consists of Williams's Bon Chrétien and Jargonelle, large supplies of the former being now obtainable. English Plums, Early Rivers and Czar, are reaching the market. French consignments of Plums

consist principally of Orleans, Royals and Violets, with some Gages, which are also arriving from Spain, some of the boxes containing very fine fruit. Of English Cherries, Black and White Napoleons, Turks and Nobles, are the varieties now on sale; the former are of excellent quality. Raspberries and Currants are still plentiful. Gooseberries consist of the following varieties, Warrington, Sulphur, White Lion and Reds, and are to be obtained in half-sieves, strikes and punnets; these are a much better crop than was anticipated during the early part of the season. Grapes of all varieties are very plentiful and cheap. Peaches and Nectarines have been a short supply, especially the latter. Supplies of Melons and Figs have been fairly well maintained during the past week. Canteloupe Melons are very plentiful. Tomatos have been a full supply from all sources and are selling readily. Mushrooms are scarce and expensive. Vegetables sell profitably all round. *E. H. R., Covent Garden, July 24, 1912.*

New Potatos.

	per cwt. s.d. s.d.		per cwt. s.d. s.d.
Bedfords	4 0– 8 3	Blacklands ...	3 9– 4 3
Kents	5 0– 5 6	Lincolns	4 6– 5 6

REMARKS.—At the beginning of the week Potatos were scarce and their prices advanced considerably, but supplies are now more plentiful again. We learn that the blight has appeared in Lincolnshire. *Edward J. Newborn, Covent Garden and St. Pancras, July 25, 1912.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 20, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—The general conditions remained fair and dry throughout a large area in Scotland, Ireland and the north-west of England; but towards the end of the period they became unsettled over England generally, and some rain was experienced in almost all localities. Thunder was heard on the 14th at Douglas, Dungeness and Kew, and a thunderstorm occurred at Alnwick Castle on the 20th.

The *temperature* was above the normal generally, the greatest excess (4·3°) being experienced in England S.W. In Ireland N., however, it was below it, and in Scotland N. and E. and England N.E. it was in close agreement with the average. The highest of the maxima were registered on the 14th in most Scottish localities, but on the 16th in most parts of England and Ireland. In Scotland E. and in some English districts the thermometer rose to 87° or 88°, but in Ireland N. it only touched 75°, and in Scotland N. 74°. At Camden Square the instruments enclosed in a Glaisher's screen touched 90°. The lowest of the minima occurred at most stations in Great Britain on the 19th, but in Ireland on various dates. The values ranged from 37° in Scotland W. and 38° in Scotland E. and England S.E. to 46° in England N.E., and to 54° in the English Channel. The lowest grass readings were 33° at Marlborough and Wisley, and 34° at Hampstead, West Linton and Llangammarch Wells. The thermometer sunk in the earth showed a temperature in excess of the normal both at 1 foot and 4 feet.

The *rainfall* was less than the average in all districts except England N.E. In Scotland and the north-west and south-west of England the fall was very slight. On the 19th as much as 1·2 inch fell at Canterbury, and on the 20th the thunderstorm at Alnwick Castle yielded 1·4 inch.

The *bright sunshine* exceeded the normal except in England N.E. and Scotland E., but except in Ireland the excess was not very great. In Scotland E. and England N.E. the mean daily duration was less than 5 hours, but in Scotland W. and England S.W. it was more than 8 hours, and in Ireland about 9½ hours.

THE WEATHER IN WEST HERTS.

Week ending July 24.

A welcome rain after the previous hot and dry week.—The past week was quite cool, both during the daytime and at night. On the coldest day (the 19th) the temperature in the thermometer screen at no time rose higher than 66°, which is 14° below the average maximum temperature for the month, and an unusually low reading for the time of year. On the two coldest nights the exposed thermometer fell to within 7° of the freezing point. The ground, which had previously been very warm even for July, has become much colder, and is now rather below the average temperature, both at 1 and 2 feet deep. Rain fell on four days, to the total depth of nearly an inch, which is equivalent to 4 gallons on each square yard of surface in my garden. Previous to this there had been no rain worth mentioning for over a fortnight, and the weather had been, as a rule during that time, very warm. This fall has not affected the soil gauge on which short grass is growing, but during the last two days half a gallon of rainwater has come through the bare soil gauge. The sun shone on an average for only 2½ hours a day, which is 4 hours a day short of the mean duration for the same period in July. On the first day the sun was shining brightly for 12½ hours, but on two days there was no sunshine at all recorded, and on two others the sun shone for less than half-an-hour. This was a calm week; in fact, on the windiest day the mean rate of movement of the air at 30 feet above the ground was only 2½ miles an hour. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 16 per cent. *E. M., Berkhamsted, July 24, 1912.*

STEWART & Co., 13, South St. Andrew Street, Edinburgh—Bulbs.

ANSWERS TO CORRESPONDENTS.

ANTIRRHINUMS DISEASED: *G. T., Watlington.* The plants are injured by a fungus which is present in the soil. The ground should be treated with some fungicide, preferably gas-lime, before anything else is planted. The injured plants should be destroyed by burning.

BEGONIAS: *R. H. T.* You should have sent your name, not necessarily for publication, but as a guarantee of good faith. The rust on your Begonia leaves is caused by the Begonia mite. Dip the foliage in Tobacco water, or, if the leaves are too large, syringe them with a nicotine extract, taking care to wet both surfaces.

BOOK: *H. G. T.* A suitable book for your purpose is *Sweet Peas*, by Horace J. Wright (Present-Day Gardening Series). The work contains eight coloured plates and a chapter on Sweet Peas for exhibition, by Mr. Thomas Stevenson. It can be obtained from our publishing department, price 1s. 9d. post free.

BOTTLED PEAS AND TOMATOS FERMENTING: *J. H.* The reason the Tomatos and Peas fermented after having been bottled for six days may be due to either of the following causes:—1, the bottle's flange—upon which the rubber ring rests—being faulty, perhaps chipped; (2) the using of rubber rings made of a composition, instead of pure rubber; (3) insufficient sterilising. Special varieties of Peas are not necessary, those which are tender, and about half-grown, are considered the most suitable, and should be cooked for two or three minutes before bottling, in a copper saucepan with a little salt added to the water. Many who bottle vegetables make a practice of sterilising them two days in succession. Green Peas are considered the most difficult of all vegetables to preserve.

CARNATIONS UNHEALTHY: *R. W.* The Carnation is injured by aphis. Spray the plants with an insecticide. The other plants should be sprayed with liver of sulphur—1 ounce in 3 gallons of water.

CELERY LEAVES: *C. H., Oxon.* The Celery leaves should be sprayed with the Bordeaux Mixture.

CRASSULA COCCINEA: *T. H.* This plant requires abundant light and air. Very little moisture should be afforded the roots during the winter season. The cuttings should be inserted as soon as the plants have finished flowering, and they should be kept on the dry side, in a light and airy house, where they may be allowed to remain throughout the winter, affording only sufficient heat to keep out the frost. If too much moisture is afforded the plants will grow freely but will not flower well. Specimens frequently fail to bloom until they are two years old.

CROTONS: *A. B., Bristol.* There is no disease present. The plants require more air and less water at the root.

DOMESTIC SERVANT: *Enquirer.* Although the courts have decided that head gardeners are "domestic servants," so far as concerns a notice of dismissal, yet a gift of a legacy stands on a different footing, and a legacy by a man to his servants will not include "outdoor" servants, unless these are specially so described. For instance, in a lawsuit decided last year, the Court of Appeal held that where a man bequeathed legacies to each of his "indoor *and out-door* servants," a head gardener, a cricket-ground man, under gardeners, estate carpenters, estate labourers, a lodge-keeper, and an odd job man were all included in the gift. Every such case is decided on the supposed intention of the testator as expressed in the wording of his will.

FERNS DISEASED: *Albert.* The injury is caused by eel-worm. Your best plan is to dust the surface of the soil and the stems when damp with a mixture of tobacco powder and flowers of sulphur.

GOOSEBERRY BUSHES: *H. B.* The cause of the leaves falling is evidently Botrytis; as the fungus disease is present in the wood, there is no cure.

GRAPES: *Anxious* and *L. S. (Foreman).* The fungus disease attacking your Grapes is known as "Brown Rot." Spray the vines with liver of sulphur, and next spring with the Bordeaux Mixture before the flowers appear.

MILDEW ON ONIONS: *C. H., Oxon.* Spray the plants with a 3 per cent. solution of sulphate of iron in water, or with the Bordeaux Mixture at half strength. It is rather late to adopt remedial measures, as most of the damage is already done.

NAMES OF FRUITS: *Correspondent.* Peaches: 1 and 2, decayed; 3, Crimson Galande; 4, Alexandra Noblesse; 5, Dr. Hogg; 6, Dymond.

NAMES OF PLANTS: *L. W., Norfolk.* Spiræa Menziesii, Echium vulgare.—*Sir Arch. Buchan-Hepburn.* 1, Staphylea Bumalda; 2, The Geranium appears to be a form or hybrid of G. sylvaticum. It does not agree at all with G. rivularis.—*J. Mason.* 1, Thalictrum Cornuti; 2, Lysimachia ciliata (Steironema); 3, Nicotiana rustica; 4, Rubus xanthocarpus.—*Horticist.* 1, Anthemis tinctoria; 2, Helxine Solierolii.—*Millar Bros.* Lathyrus sativus.—*M. C.* 1, Ceanothus indigo; 2 and 3, C., garden var. The varieties of Ceanothus are now so numerous that we cannot profess to recognise cut sprays of them. No. 2 looks like "Gloire de Versailles." The unnumbered shrub is Spiræa canescens.—*W. T., St Albans.* Rose Mme. Hoste (sent out in 1887).—*W. W.* 1, Saxifraga sp., unable to name without flowers; 2, S. cæspitosa var.; 3, Campanula abietina; 4, C. rhomboidalis; 5, Lamium maculatum; 6, Saxifraga Geum var. crenatum; 7, Sedum pruinatum; 8, S. rupestre; 9, S. oppositifolium; 10, Saxifraga sp.; 11, Sedum maximum; 12, Lilium Martagon album.—*T. H. D.* 1, Silene Armeria; 2, Phacelia campanularia; 3, Lysimachia punctata.—*R. T.* 1, Oncidium pubes; 2, Brassia verrucosa; 3, Cœlia triptera; 4, Leochilus cochlearis.—*O. H.* 1, Adiantum hispidulum; 2, Blechnum occidentale; 3, Doodia aspera; 4, Lomaria l'Herminieri; 5, Cyperus laxus.—*T. B., Wimbledon.* Prunus myrobalana (Myrobalan Plum; Virginian Cherry).—*A. J. G.* Pavia californica; 2, Achillea Ptarmica "The Pearl"; 3, Tropæolum, probably T. Vesuvius, the specimen was crushed.—*R. Smith.* 1, Acer rubrum; 2, Veratrum nigrum.

ONIONS: *P. P.* The Onions are injured by the Onion mould (see reply to *C. H., Oxon*). The maggot present is not the Onion maggot, and is not injurious.

PÆONY: *H. R., Twickel.* Pæonia albiflora is sweetly scented, and especially its varieties Decandolle, fragrans, festiva, and maxima.

POTATOS: *Journeyman.* The millipede attacking your Potatos is Blanjulus guttulatus. Liming the soil appears to be the only treatment of practical use on a large scale; dusting the seed tubers with soot and lime is also beneficial. Poisoned baits formed by soaking Cabbage leaves in Paris green have also proved satisfactory in gardens, or the pests may be trapped by placing pieces of Mangel Wurzel just under the ground near the plants the millipedes are attacking.

STERILISATION OF SOIL: *Foreman.* This subject is fully dealt with in the issues for February 17, p. 97; 24, pp. 113, 130; and March 2, p. 146, of this year.

STRAWBERRIES: *C. H., Oxon.* We have handed your query as to the best first early varieties for your soil and neighbourhood to an experienced grower similarly situated, who recommends Vicomtesse Hericart de Thury, Royal Sovereign, Monarch, and Kentish Favourite, in the order named, remarking that these varieties usually give satisfaction, but the variety Monarch is not so consistently a good cropper as the other varieties, although our correspondent has had very satisfactory crops of large, good-flavoured fruits. The new variety, Tuckswood Early, is said to be valuable. The variety Black Prince is one of the best for bottling.

TOMATOS DISEASED: *C. S., Wrotham.* Eel-worm is present in the roots; soak the soil with a solution of sulphate of potash.

LILIUM CANDIDUM.

The white Madonna Lily (see fig. 34), emblematic of purity and one of the finest of our garden flowers, is endeared to us, especially by old associations. The "Lilies" of our childhood were Madonna Lilies. The Lilies we saw in pictures or read of in books were the same species, or were unhesitatingly classed as identical. In the old manor-house and rectory gardens, with their sundials, sombre Yew hedges, and ancient Mulberry trees, the white Lily grew in stately lines, while in the cottage gardens the clumps flourished of yore as they do at the present day, for there is no site where the fair Lily of the Annunciation shows such perfection of beauty as in the gardens of the poor. In such gardens, various kinds of soil and situation seem alike to suit L. candidum, for in sunshine and shade, in light and heavy soils, in dry and damp positions, it seems equally contented. To account for this the pretty conceit has been suggested that the Lily, following the example of her whose name it bears, loves rather to brighten the lives of the lowly and needy than to add its charms to the pomp and circumstance of the rich.

In almost all the allusions of poets to the Lily the Madonna Lily is evidently indicated. Shelley's

> "Wand-like Lily that lifted up
> Like a Mænad its moonlight-coloured cup,"

is without doubt the Lily in question. So are the "Lilies fair, the flower of virgin light," and "the milk-white Lilies that lead from the fragrant hedge," while the individuality of the flower that was in the writer's mind when the following verse was composed admits of no doubt:

> "And the stately Lilies stand
> Fair in the silvery light,
> Like saintly vestals, pale in prayer;
> Their pure breath sanctifies the air
> As its fragrance fills the night."

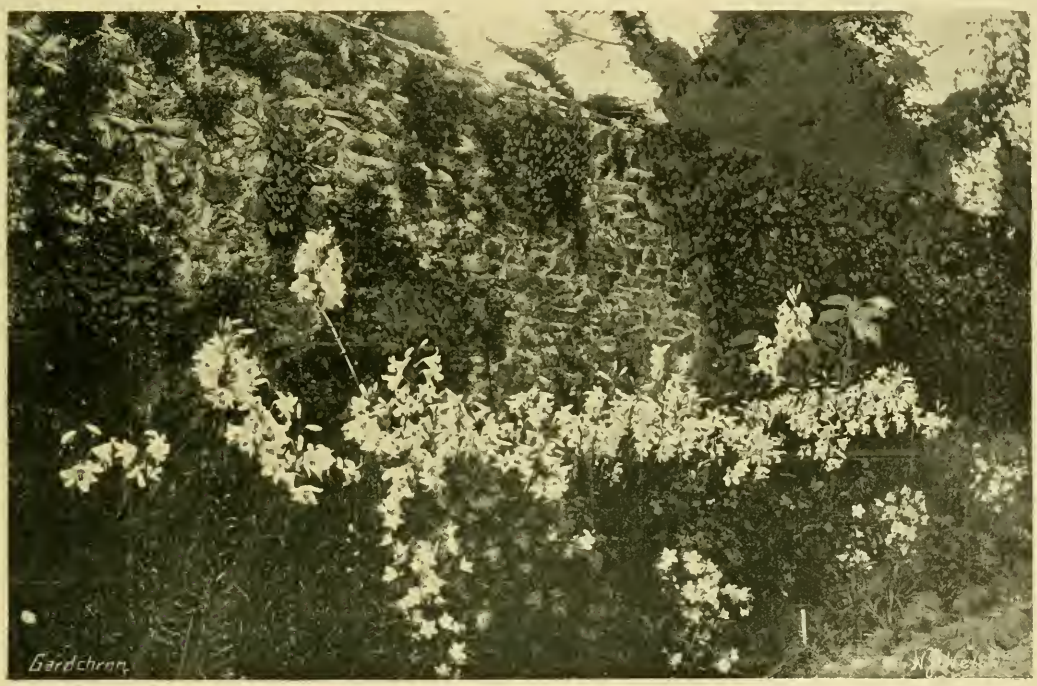
The beauty of the Madonna Lily is so pre-eminent that it retains its claim to be the queen of the garden, even though its blossoms come at midsummer, when Flora showers her gifts with lavish hands. All too short is its season of beauty, during which the tall, white flower-spires are in perfection and, in the dewy summer twilight, fill the air with perfume. For indoor decoration no flower can be used with better effect, yet one is chary of denuding the Lily-bed of even a portion of its charm and of diminishing the fragrance of the open air. *Wyndham Fitzherbert.*

LIME TREES IN THE ARNOLD ARBORETUM, JAMAICA PLAIN, U.S.A.*

The largest genus of summer-flowering trees here is Tilia (the Lindens). The genus is widely and generally distributed in all the temperate parts of the northern hemisphere with the exception of western North America and the Himalayas. Between 40 and 50 species and several hybrids are recognised, for hybrids and supposed hybrids in Tilia are common, and among these hybrids are some of the handsomest and most rapid-growing of all Lindens. Although Lindens are much planted for the embellishment of parks and as street trees, there is great confusion, especially in the United States, in regard to the different forms which are cultivated, and this confusion, in so far as it relates to the European species, was imported from Europe with the trees, for Linnaeus and many botanists after him believed that the Lindens of northern and western Europe were only forms of one tree, and so started the trouble.

In eastern North America there are seven species of Linden trees; four of these are from the extreme south, and either are not hardy in the Arboretum, or have been tried here during such a short time that they need not now be considered. The Linden of the north, T. americana, is a splendid tree, growing to its largest size on rich hillsides and moist bottom-lands, and showing its greatest beauty in the forests of New Brunswick, northern New England, and the valley of the St. Lawrence River. This tree may be easily distinguished from the other Lindens by the green and shining lower surface of the leaves, which has no hairy covering, with the exception of rather conspicuous tufts in the axils of the principal veins. This tree has been planted in eastern Massachusetts, but less frequently than in the neighbourhood of more northern cities. Here, especially in dry summers, the leaves are sometimes made brown by the red spider, which, however, is easily controlled by spraying. Tilia spectabilis, which is believed to be a hybrid between this tree and Tilia tomentosa of eastern Europe, is a very vigorous and fast-growing tree of much promise. In some European nurseries it is sold under the name of Tilia Moltkii. Tilia flavescens, usually found in nurseries under the name of T. floribunda, is a supposed hybrid between T. americana and the European species T. cordata. This tree is remarkable for its rather small, thick, and very lustrous leaves, and large flowers. Plants only a few feet high flower profusely.

The second North American Linden tree, T. alba, or, as it is often called, T. Michauxii, although it was first distinguished and made known nearly a century ago, was long overlooked or misunderstood by botanists; and it is only in recent years that this handsome tree has been found to be widely distributed from the valley of the St. Lawrence River to Georgia and Arkansas. It may be distinguished from T. americana by the pale lower surface of the leaves, which is more or less covered with star-shaped clusters of white hairs. This tree is now



[*Photograph by Wyndham Fitzherbert.*

Fig. 34.—Lilium candidum in a Devon garden.

* *Bulletin of Popular Information*, No. 30. (Arnold Arboretum, U.S.A.)

well established in the Arboretum, although the plants are not old enough to flower.

The third of our northern Lindens, T. heterophylla, is a species of the Appalachian Mountains, and is distributed from western New York to northern Alabama, and through Kentucky to southern Indiana and Illinois, growing to its greatest beauty and to its largest size in the forests which cover the slopes of the mountains of North Carolina and Tennessee. The leaves of this tree are larger than those of the other Lindens, and as they are silvery-white on the lower surface, and hang on long, slender stalks, the slightest breeze makes them turn first one surface and then the other to the eye. This hardy and beautiful tree appears to be rarely cultivated.

All the European Lindens succeed in the eastern states, where they have been more generally planted than the American species, and where there are large and old specimens of some of the species in the neighbourhood of the seaboard cities. There are five European Lindens, and it is among these and their hybrids that exists the greatest confusion in the minds of the cultivators of these trees. Probably the most widely distributed of the European species, especially in the south, is Tilia platyphyllos. This tree may be recognised by the yellow tinge of the leaves and the thick covering of short hairs on their lower surface and on their stalks, and by the prominent ribs of the fruit. This is the earliest of all Linden trees to flower here, and it is this tree which now appears to be most commonly sold in American nurseries as the European Linden. There are varieties with leaves larger than those of the type (var. grandifolia), with erect branches forming a broad, pyramidal head (var. pyramidata), and with variously divided leaves (var. lanceolata and vitifolia).

A more beautiful tree is Tilia cordata, the common Linden of northern Europe, where it sometimes grows to a very large size, the old historic Lindens of the northern and central parts of the Continent being usually of this species. This tree is distinguished by its small, thin, more or less heart-shaped leaves, which are pale on the lower surface and furnished with conspicuous tufts of rusty-brown hairs in the axils of the principal veins. It appears to have been little planted in the United States, and in the neighbourhood of Boston it is the rarest of the Lindens of western Europe. It is, however, a hardy and desirable tree, especially valuable on account of its late flowers, which supply the bees with food after those of all other Lindens have passed. There is a large-leaved form of this tree (var. cordifolia), from western Europe, in the collection, which is a handsome and vigorous plant of much promise. This is sometimes sold in European nurseries as T. europæa or vulgaris.

The third European Linden, called variously T. vulgaris, T. europæa, T. intermedia, and T. hybrida, is considered by some of the best observers of European trees a natural hybrid between T. platyphyllos and T. cordata. Although widely distributed in Europe, it appears to be much less common than either of its supposed parents, and the variation in the size, shape, and colour of the leaves makes its hybrid origin possible. On some individuals the lower surface of the leaves is quite green, and on others it is bluish, or even whitish, but leaves on different parts of the same branch differ in this respect, and on shoots produced from the bases of old trees the large leaves are quite green. T. vulgaris is a fine, round-headed tree, with rather small, somewhat pendulous branches, and it appears to have been more often planted in the neighbourhood of Boston than any other Linden. There are a number of large specimens in front of an old house in Centre Street, near Orchard Street, Jamaica Plain, and in Olmsted Park. In its flowering time it is intermediate between its two supposed parents. There is another supposed hybrid of the same parentage and a native of Hungary, known as T. vulgaris var. pallida. This tree has larger leaves, pale on the lower surface, and in habit and general appearance resembles T. platyphyllos more than the commoner forms of T. vulgaris. It is propagated in some of the Dutch nurseries, where it is sold as T. vulgaris or europæa, and in the Arboretum collection it is the most rapid growing and the most shapely of all the species and hybrids, giving promise of becoming an excellent street tree for this region.

Two Linden trees are found only in eastern Europe, the Silver Linden, T. tomentosa or argentea, as it is sometimes called, and T. petiolaris. The Silver Linden is a tree with erect branches forming a broad, compact, round-topped formal head, and large erect leaves, dark green and lustrous above, and white and covered below with short thick felt. This distinct and handsome tree has not been much planted in eastern Massachusetts, but it can be often seen in the neighbourhood of New York and Philadelphia, and there are a number of good specimens in Central and Prospect Parks. T. petiolaris is a more beautiful tree; this also has leaves which are silvery-white on the lower surface, but they hang down on long, slender stalks, and flutter gracefully in the breeze. The branches, which are also pendulous, form a rather narrow but open head. This tree is not known in a wild state, and all the plants in cultivation have been derived from a single individual found 90 years ago in a garden in Odessa. This beautiful tree appears to have been more often planted near Boston than the Silver Linden, but is still rare and little known here. A supposed hybrid of this tree with T. americana, and sometimes sold in nurseries as T. alba spectabilis, is one of the most rapid-growing of the Lindens and a very handsome tree, with the leaves of the size and shape of its American parent, but silvery-white on their lower surface. Plants raised at the Arboretum from the seeds of a tree of T. petiolaris which was growing in the neighbourhood of T. americana, the two flowering at the same time, are identical with trees of this hybrid found in European nurseries. T. vestita is probably the proper name for it.

Much attention in late years has been paid in Europe to another supposed hybrid Linden, T. euchlora, or, as it is more generally known, T. dasystyla. This is a pyramidal tree, with large, dark-green leaves, lustrous on their upper surface. It grows rapidly; its habit is good, and it is now largely planted as a street tree in Germany and Holland. Its origin is uncertain, although usually considered a hybrid of the little-known T. rubra of the Caucasus. T. euchlora is perfectly hardy here, and promises to be a useful tree in New England.

As a rule the trees of eastern Asia grow much better in the eastern United States than the related species of Europe, but this is not true of the Lindens. All the European Lindens flourish here, but none of the Asiatic species gives much promise yet of being handsome or valuable trees in this climate. Those which have been tried here are hardy, but they suffer from various fungal diseases and are short-lived. It is too soon, of course, to form an opinion on the value of the Lindens recently discovered in western China, but of those of eastern Siberia, northern China and Japan, only T. japonica has proved really satisfactory here. This is a small tree with pendulous branches, related to T. cordata, of which it has sometimes been considered a variety. It has no special ornamental value, although it is perfectly hardy and healthy, and flowers and produces fruit in the Arboretum every year.

THE ROSARY.

CULTURAL NOTES FOR AUGUST.

Budding may be continued throughout the whole of August, but it is well to complete this work before September arrives as then the nights become cold, with heavy dews, that do not favour a quick and complete union of the stock and bud. Examine the earliest-budded stocks, making good any failures with fresh buds, and releasing the tying material on those that have "taken," to allow for the swelling of the stock. Remove all flowers as soon as they fade, as they weaken the plant, so that the successional crops of blossom are not so good. In most cases, I prefer to cut back the wood a little below the exhausted flower, as this not only results in stronger growths, but the plants retain a desirable shape.

It is necessary to cut away the old trusses of dwarf-growing Polyantha and China Roses, taking care not to injure the succeeding crop which develops below the older trusses. A little trouble in these matters will secure clean trusses throughout the summer and autumn.

The summer-pruning of climbers will be general now, and the work must be done with the utmost care. For a long time the summer-pruning of these Roses was almost ignored, but now it is practised far too rigorously. The main object in pruning is to provide increased room to the shoots so that the others may gain strength. It is better to practise a little judicious thinning-out now than encourage a mass of comparatively useless growth that must be cut away next spring.

In most seasons water should be more liberally supplied to Roses during August than in July, as a deficiency of moisture at the roots often results in mildew putting in an appearance; and this is the worst pest of Roses in late summer and autumn.

Cuttings of most free-growing varieties will root freely now if inserted in sandy loam in a partially-shaded border. If the ground is dry, I have found it an excellent plan to pour water into the hole before inserting the cutting. This is a great aid to callusing, and much more effective generally than applying water afterwards. Tread the soil firmly about the cutting, taking care not to bruise the bark. As the growth will be that of flowering wood, there is no need to remove the bottom eye, as in the case of stocks. In the present case, these lower eyes will form the most valuable part of the future plant.

I do not advise the insertion of cuttings of the various stocks until next month, when the wood of these stronger growers will be in a better condition for rooting. If it is intended to plant new beds of Roses, there is no better time than the present for preparing the ground, provided the site is vacant. Before commencing the work, ascertain the nature of the soil, especially at about 2 to 3 feet down, as the whole question of preparation depends upon this. If it is of poor quality at the bottom, remove a portion, and replace it with good loam obtained from a meadow.

Thoroughly incorporate farmyard manure with the soil at about 18 inches deep, and, if poor below that, add a good quantity of crushed or half-inch bones. The bones provide valuable food for a long time. The object should be to secure a rich and fairly well-drained medium, not less than 2½ feet in depth. Do not make the top soil over rich with animal manures, at the same time avoid using artificial fertilisers at this stage. Food may easily be applied to the surface roots when they are in need of it, but the lower portion of the soil can only be made suitable before planting is carried out.

After the ground has settled, it will be beneficial to turn over the top spit again, leaving it rough, so as to expose as much soil as possible to the influences of the air. But this second digging should be done in ample time for the ground to

settle again before planting. The advantages of preparing the ground early are obvious : it not only permits of earlier planting, but also, by being amongst the first purchasers, the early planter is likely to secure the best plants from the nurseries.

But these are not the only points in favour of early planting. The soil sets firmer about the roots before winter, with its drying winds, arrives, and undue shrivelling of the wood is obviated. *Practice.*

NOTES ON EARLY-FLOWERING RAMBLERS.

For the guidance of intending planters I give a short list of what I regard as the most desirable varieties for early flowering. Some will say that this is not the proper time to give lists for planting, but it is quite the right time, because preparations will have to be made shortly and the list selected, whilst those who order early get the pick of the nurseries.

Carmine Pillar is one of the earliest to open its rich, rosy-carmine, single blossoms. Although this Rose was distributed by Messrs. George Paul & Son so far back as 1896, it still retains its popularity. It shows to advantage when grown as a standard on the lawn, and is very beautiful either rambling over a pergola or climbing a tall pole.

Paul's Single White makes a charming combination with Carmine Pillar; growing in clusters the pure white, single flowers are freely produced, and in contrast with the deep green leaves make an attractive display. Although this variety is generally regarded as a climber, it may be planted in a bed in a mass and grown as a dwarf plant. By close pruning, as in the case of Hybrid Perpetual varieties, it may be induced to make vigorous shoots and continue flowering well into the autumn.

The Dawson is a rosy-pink variety that gives a full crop of flowers quite early. It makes a free, yet neat growth.

Aglaia, a Polyantha of a vigorous rambling habit of growth, was distributed in 1896, and it flowers especially freely when once the plant is established. Some are disappointed with its behaviour in this respect the first season or two, as it takes longer to become established than most varieties. When it does bloom it often gives more flowers than any other Rose. The bright yellow, shell-shaped flowers have a strong "Tea" perfume.

Claire Jacquier is the best of yellow-flowered ramblers, the compact buds are suffused strongly with orange.

Climbing Caroline Testout gives blooms as fine as the dwarf type, and its floriferousness is remarkable. The satiny-rose colour is especially pleasing early in the season.

Gardenia cannot be omitted from any list, no matter how small it is. I consider this Wichuraiana variety as the most useful of all Roses. A well-established tree will furnish not only early blossoms but also late ones, as the flowering continues into November. The rich yellow buds are useful as cut blooms, especially when accompanied by the dark green leaves. As the flowers expand they become pure white. For a pillar plant or for training over a screen or pergola no other Rose is superior.

Rêve d'Or will flower abundantly quite early in June if given a position on a south wall. When closely pruned to induce late flowering the blooms become much deeper in colour, and the foliage assumes a coppery tint which harmonises well with the deep-yellow petals.

Reine Olga de Wurtemburg was introduced by Nabonnand in 1881. It is a free and continuous bloomer of a vivid red colour, being more remarkable for its shade than for the shape of its blossoms.

Euphrosyne is a pretty carmine-tinted, single variety that produces its flowers freely in clusters. *E. Molyneux.*

THE FORESTS OF PROVENCE.

The coast and hills of Provence are as attractive to the botanist interested in the distribution of vegetation as to the lover of striking scenery and a glorious climate. Within a space of little over 30 miles all transitions between the typical Mediterranean vegetation of the coast and that of the high Alps may be traced. Leaving out of account the alluvial plains, the streamsides, and the cultivated land in general, the rock of which the country is composed, with a few notable exceptions, is almost everywhere limestone, and the hillsides present the same general type of habitat, so far as soil conditions are concerned, over and over again. Consequently the main factors differentiating the vegetation are climatic, and correspond with a decrease of temperature and an increase of atmospheric moisture as we pass from the low hills of the coast to the high mountains of the Maritime and Provençal Alps. The influence of aspect is very striking, the cooler and moister northern slopes frequently bearing quite a different flora from that of the sunny southern ones.

Fig. 35.—Forests of Provence.
Remains of Aleppo Pinewood on limestone plateau: "garigue" on slope: Olive cultivation on left. Near Rognac, Rhone Valley, 100 m. alt.

Broadly speaking, we can recognize four main zones of forest :—(1) The Mediterranean types of Pinus halepensis and of Pinus maritima (with Quercus suber locally); (2) a belt in which Quercus pubescens, a deciduous Oak closely allied to Q. sessiliflora, is dominant, (3) a belt of Pinus sylvestris extending into the sub-alpine region, and (4) forest of Picea excelsa and Larix europæa which form the uppermost forest belt, at least on northern slopes. These zones, of course, are all much influenced by aspect and there is a good deal of mingling in the transitional regions, but on the whole the zonation is exceedingly well marked.

I.—The Mediterranean Coniferous Forests.

Three species of Pine, apparently native, occur on the coast: each is dominant and forms pure woods in appropriate habitats. By far the most widespread is Pinus halepensis, the Aleppo Pine (figs. 35 and 36). This is the characteristic tree of the limestone hills of the coast and extends about 15 miles inland, where it reaches an altitude of 400-500 metres. Nearer the coast it may go considerably higher. This tree is considered by some authorities not to be native in the western Mediterranean, but, however this may be, there is no question that now it is the characteristic and well-nigh universal dominant of the limestone coastal hills of Provence, from the Rhone delta to the Italian frontier, and beyond. Associated with the Aleppo Pine are the common "Holm-Oak," (Quercus Ilex), and Quercus pubescens. The former, though exceedingly widespread and perhaps rightly considered the most characteristic Mediterranean tree, does not, so far as my experience in Provence goes, form extensive woods, and prefers somewhat sheltered places such as the sides of ravines. It also inhabits the clefts of steep rocks at considerable altitudes, where it is frequently no more than a shrub. In both these types of habitat it probably obtains more water than on the frequently very dry hillsides. Quercus pubescens (lanuginosa), the shoots of the current year of which are characteristically covered with a thick pubescence, is an occasional constituent of the pine woods. In the mild climate of the coast its leaves sometimes remain green till January, while in the most sheltered situations the new buds burst at the end of March. Further inland, at higher altitudes, the tree does not come into leaf till the end of April.

Pinus halepensis itself is not a very large tree, seldom exceeding 8 to 10 metres in height when full grown. It does not cast a deep shade and many of the Mediterranean shrubs flourish beneath it. While absolutely characteristic of the limestone, it grows quite well on siliceous soils. Thus in the neighbourhood of Hyères (e.g., on the southern edge of the Maurettes and on the island of Porquerolles), of St. Raphael, and of Cannes it is dominant on siliceous rocks, but it is noteworthy that these places are in the neighbourhood of great areas of limestone, from which the tree may well have invaded restricted siliceous areas or the edges of more extensive ones; it may also have been planted in such situations. I have never seen it in the interior of extensive siliceous areas, such as the Montagnes des Maures or the Esterel. In Algeria, it is true, Pinus halepensis is dominant on siliceous tracts such as the Forêt de Bainen, near Algiers, but there it has probably been planted, according to Prof. Trabut.

The shrubs accompanying the Aleppo Pine on

the coastal limestone hills include most of the common Mediterranean evergreen species, with the exception of those, such as Erica arborea and Arbutus Unedo, which are confined, or nearly confined, to siliceous soils. Rosmarinus officinalis, Cistus albidus, Juniperus oxycedrus, Spartium junceum, and (in western Provence, where it is frequently dominant below the Pines) the low spiny shrub Quercus coccifera, are the most abundant and characteristic (fig. 36). The grass Brachypodium ramosum is very abundant and characteristic of the more open places. Thymus vulgaris, too, is often very abundant.

The Aleppo Pine-woods pass into garigue, the Provençal name for the shrub association of the barer limestone hillsides. This, according to Professor Flahault, is often derived from forest by wholesale felling of the trees, and such certainly seems to be the case (see figs. 35 and 36). At the same time it may well be that where the soil is very scanty and shallow, woodland associations have never existed, and garigue is the original association. The garigue shrubs are on the whole identical with those of the undergrowth of the more open Pine woods.

Pinus maritima (Pinaster) is as characteristic of siliceous soils as its close ally, P. halepensis, is of calcareous. It dominates the woods of the siliceous regions, such as the Maures and the Esterel, where it is regularly exploited. Pinus maritima is a larger tree, and with its longer and stouter, darker green needles it casts a considerably deeper shade than its congener, and consequently when growing in close canopy there is little undergrowth. Quercus Ilex, Q. suber, and, to a less extent, Q. pubescens are the most commonly associated trees. In the more open parts of the woods and where the trees have been clear-felled, most of the Mediterranean shrubs occur, but, in place of Rosemary and Cistus albidus (which occur but are rarely abundant), Erica arborea, the beautiful tree Heath, usually growing to a height of 1½ metre, but in sheltered places attaining a greater stature, is very generally dominant, and in March fills the woods with the scent of its flowers. This plant, as is well known, is exploited for the making of "briar" (bruyère) tobacco-pipes, which is a considerable industry in some places, for instance at the little town of Cogolin in the Maures. Arbutus Unedo is also very abundant in the shrub association of the siliceous soils, scarcely occurring on the limestone. Other abundant shrubs are Calycotome spinosa, Cistus salviifolius and C. monspeliensis and Pistacia lentiscus, all of which are also very common on calcareous soils. The characteristic climbers are Smilax aspera and Lonicera implexa, each occurring on both types of soil. *A. G. Tansley.*

(To be continued.)

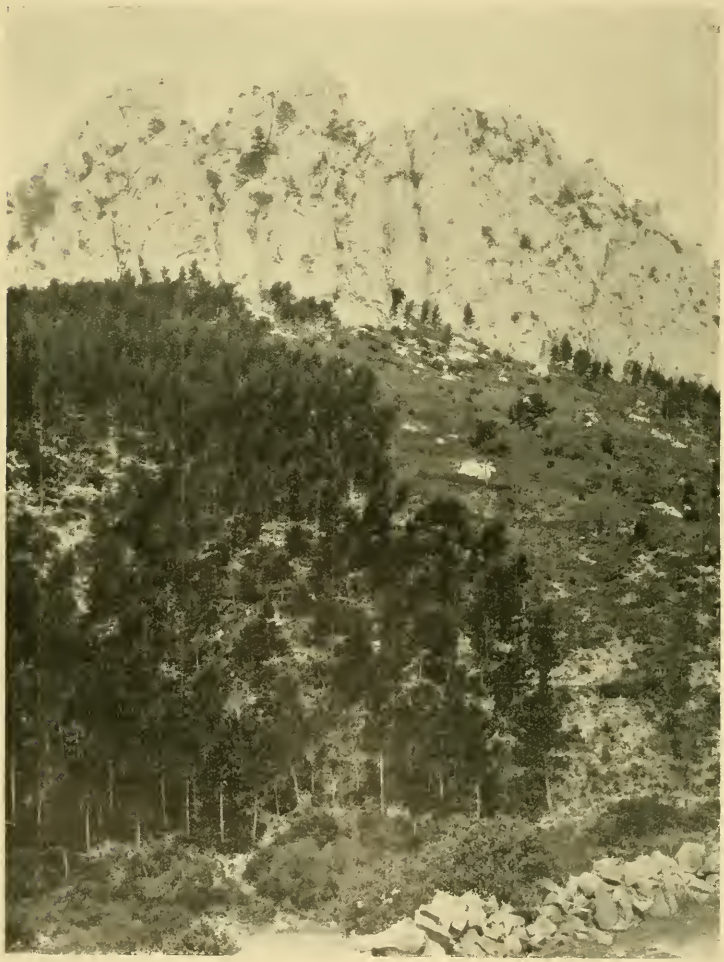


Fig. 36.—Forests of Provence.

Aleppo Pinewood on limestone talus: Undergrowth mainly of Quercus coccifera: Cistus albidus in flower in front: Pinus halepensis and Quercus Ilex in the clefts of the cliff above. Western portion of Ste. Baume range, near Gemenos. 200 to 400 m. alt.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 66-71.)

0, SCOTLAND, N.

Ross-shire.—The hardy fruit crops vary greatly, for whilst some kinds are remarkably good as to amount and quality, others are poor in these respects. Apples, for instance, though of great promise at the flowering period, are not equal to the average yield; the best varieties are Bramley's Seedling, Mr. Gladstone, Worcester Pearmain, Blenheim Pippin, and Stirling Castle. Pears are even a worse crop than Apples, but Jargonelle, Louise Bonne of Jersey, Colmar d'Été and Williams's Bon Chrètien are amongst the most fruitful. Plums are an excellent crop, and required thinning. Cherries, with the exception of Morellos, are poor. Small fruits, particularly Gooseberries and Raspberries, are fine average crops, whilst Strawberries were all that could be desired. It is difficult to account for the inequalities of the different varieties of fruits. The weather during the summer and autumn of 1911 was all that could be desired for the proper maturation of the wood and buds. The frost of February 5 (32½° Fahr.) must have caused considerable damage. Fine weather prevailed during April and part of May when Plums were in flower, and the fruits set well. The latter part of May and the whole of June was cold and wet, which adversely affected Apples, Pears and Cherries; thousands of the young fruits were destroyed by these unseasonable conditions, and 2° of frost on June 17 still further increased the damage. The walls in these gardens are devoted exclusively to Pears, Plums, and Cherries, Apples being grown either as dwarf standards or espaliers. The soil is a stiff loam, resting on a hard pan. The average rainfall is 42.04 inches. The fruit crops are this year a week to ten days later than usual. *William L. Minty, Ardross Castle Gardens.*

Sutherlandshire.—Strawberries were only about half the usual crop. Gooseberries also are very scarce, but Black Currants, Red Currants, and Raspberries are more than average crops. Apples vary; some trees have a fair number of fruits, whilst others have none, or very few. The out-door fruit crops generally are below the average. *D. Melville, Dunrobin Castle Gardens, Golspie.*

1, SCOTLAND, E.

Aberdeenshire.—All the fruit crops are three weeks later than last year. Gooseberries are a poor crop, having been much damaged by frost. Black and Red Currants are very heavy crops, but Strawberries were only an average quantity, and much later than last year. In some parts of this district the Strawberries were damaged by frost. Our soil is a medium loam, on a cold subsoil. *James Grant, Rothienorman Gardens.*

—— In this late district it is impossible to say yet what the quality of the fruit will be; it is far from maturity, and much will depend on the weather. In the early part of the season there were indications of heavy crops of all kinds of fruits, the blossom being unusually plentiful, owing, no doubt, to the fine season last year; but during the latter part of May we experienced several severe frosts, which damaged many of the blooms. In consequence, the fruit crops generally will be much below the average. *W. Henderson, Meldrum House.*

Banffshire.—The prospect of a good fruit year was very good in the early spring, but we

experienced four nights of frost from May 22 to 26, which destroyed most of the blossoms. *George Edwards, Ballindalloch.*

—— The fruit crops of all kinds, with the exception of Pears and Victoria Plums, are disappointing after the fine show of blossom, and the exceptionally fine weather whilst the trees were in flower. I attribute the scarcity this season to the heavy crops borne by the trees last year. *Chas. Webster, Gordon Castle, Fochabers.*

—— Taking the crops generally this is a very good fruit season. The Apple crop is alone deficient, and it is difficult to account for this, as there was plenty of blossom and fairly good weather whilst the trees were in flower. I noticed that the foliage on the trees was in a more advanced state than is usual at the time of flowering, and possibly that had something to do with the deficiency of fruits. I noticed the same thing obtain a few years ago. Our soil is a dark loam of a loose nature. *Alex. Morton, Cullen House Gardens, Cullen.*

Berwickshire.—The Apple crop is a partial failure owing to late frosts damaging the bloom. Never before have I seen better prospects at the time of blossom. The soil here is very light in texture, and the subsoil is gravel. The fruit crops generally in this district are very good. *Peter Smith, Duns Castle Gardens.*

——The Strawberry crop was a poor one. Frequent frosts between May 18 and May 27, when the thermometer registered from 3° to 8° of frost, wrought much mischief while the plants were blooming and coming into bloom. What fruit developed was very small and late in ripening. Raspberries gave promise of a heavy crop, while Gooseberries and Red Currants are about an average quantity, but Black Currants are almost a failure. The drought of April and May had much to do with the failure of the Black Currant crop. Cherries and Plums are average crops: the fruits of early Cherries, such as Early Rivers and Elton Heart, were especially fine in quality. Apples, with the exception of wall trees, are lightly cropped. Our soil is a red loam resting on a clay subsoil. *Robert Stuart, Thirlestane Castle, Lauder.*

—— The fruit crops of all kinds promised well when in blossom, the flowers being exceptionally large and healthy. The fruits apparently set well, but later they dropped, after an unusual period (about six weeks) of very dry weather. The Strawberry blossoms withered as they opened owing to the drought. Our soil is of a light nature with sand and gravel subsoil. *R. Henderson, Ayton Castle Gardens.*

Haddingtonshire (East Lothian). — With the exception of Strawberries there was an abundance of blossom on all kinds of fruits, and, with the exception of Plums and Black Currants, there are good crops of all kinds. The foliage is healthy and scarcely affected by any kind of disease or insect. Peaches are a failure in some cases, and Strawberries were, in general, a deficient crop. The soil is rather light, but that does not seem to have affected the crops as a whole. *R. P. Brotherston, Tyninghame, East Lothian.*

—— Owing to the drought of last summer Strawberry crowns did not develop properly, and many plants were almost killed by the excessive heat. Black and Red Currant bushes were greatly damaged by aphides, and in consequence many of these fruits dropped. Cherries promised exceedingly well at the flowering stage; the trees set a heavy crop, but one-third of the fruits dropped at the stoning period. Apples are good and clean. Apricots are a very heavy crop and of good quality. The soil of the district is mainly a medium loam of great fertility overlying, for the most part, gravel on the old red sandstone formation. A small portion of the county overlies a clay formation. *Thomas Macphail, Archerfield Gardens, Dirleton, East Lothian.*

Fifeshire.—All fruit trees were smothered in blossom, but owing to the cold, wet spring the Apple, Plum and Strawberry crops are very disappointing. The night temperatures were very low (from 40° to 46°) until the middle of July. We have a good depth of rich garden soil, but, unfortunately, a cold clayey subsoil. A July such as that of last year is best suited to this district. *W. Henderson, Balbirnie Gardens.*

Midlothian.—All fruit trees gave great promise at the blossoming stage, but the good prospects were not realised, whether owing to the long drought of last year or the exceptionally dry months of April and March of this year, it would be hard to say. The trees have suffered badly from aphis. Yet there were heavy rains in the month of June, 7.39 inches being recorded for that month alone; 2.26 inches of rain fell on June 12, no less than 1.67 inch being measured in 2¼ hours on that date. The shortage of fruit cannot, therefore, be attributed to the absence of rain or the prevalence of frost. The month of May was cold, the wind coming from an easterly direction all that month. June again was very damp and sunless, the daily maximum and minimum temperatures being 57.19° and 50.21° against 64.1° and 39.12° respectively of last year. Strawberries were a complete failure. Black Currants are a thin crop, but the fruits are good in quality. Red Currants are deficient and inferior, but Gooseberries are plentiful and exceptionally good. The soil here seems to suit all fruits, being a fine rich deep loam principally on gravel, but the subsoil is at a good depth. To sum up we have (omitting Strawberries) good average crops. *Benjamin Ness, The Gardens, Oxenfoord Castle, Ford, Midlothian.*

—— All fruit trees produced an extraordinary quantity of blossom. The Pear crop, which was a very poor one last year, is good this season. Frost and a succession of cold nights when the trees were in flower spoilt the Apple crop, and the extreme dryness in April and May gave Apple trees a miserable appearance through infestations of insect pests, which the heavy rains since have cleared off. The general failure in the North of the Strawberry crop seems accounted for by the extreme dryness of the previous summer and autumn. Our soil is of a light nature on a gravel subsoil. *James Whytock, Dolkeith Gardens, Midlothian.*

Peeblesshire.—The fruit crops in this high district are better than was at first anticipated. The wood of fruit trees and bushes, owing to the hot, dry summer of 1911, ripened prematurely, with the result that, although there was an abundance of blossom, a large number of the flowers appeared to be defective. A spell of cold, wet, sunless weather, during the time the Apples were in bloom, prevented the bees and other insects from pollinating the flowers, hence rather small crops; but the quality is all that could be desired. Pears and Plums are both good crops. Small fruits are, on the whole, good. Gooseberries set well, but a severe frost on April 15 caused numbers of the fruits to drop. Black and Red Currants and Raspberries are very plentiful. Strawberries bloomed exceedingly early this season; the thundery weather, accompanied with torrential rains and hailstorms, prevented the flowers setting. Later varieties fared a little better, but taken generally the Strawberry crop was a light one. All fruit trees and bushes are at present healthy, and growing luxuriantly. *George Haig, Garvald Gardens, Dolphinton.*

Perthshire.—Late frosts on April 12 damaged the Pear and Apple blossoms, which until that date looked promising. Early Strawberries were scarce on account of the drought of last year, as the crowns were very weak. Raspberries are a good crop. Our soil is of a heavy nature. *Andrew McAndie, Ruthven House Gardens, Meigle.*

6, SCOTLAND, W.

Argyllshire.—Apples are the most disappointing crop. There was a great display of fine blossom, but the fruits failed to set, due, I think, to frost and cold winds. Strawberries are a heavy crop and of fine quality. Raspberries also promise well. *D. S. Melville, Poltalloch Gardens, Lochgilphead.*

Ayrshire.—Strawberries were, for some unaccountable reason, a poor crop. Raspberries and Currants are plentiful, whilst Plums are better than they have been for some years past. Apples look very well, and are a good average crop. *William Priest, Eglinton Gardens, Kilwinning.*

—— Up to the month of April all kinds of fruits promised exceedingly well for splendid crops. Cold and dry weather, however, set in about the middle of that month, and lasted well into May, doing considerable damage to Strawberries and Black Currants especially; while 7° of frost on May 23 caused further harm to Strawberries, most of the plants being then in flower. Other fruits are good average crops. *D. Buchanan, Bargany Gardens, Daily.*

Dumbartonshire.—The Apple, Pear and Plum crops are practically failures in this district, owing to east winds prevailing during the flowering period. Raspberries, Currants, and Gooseberries are very heavy crops, and of good quality. Strawberries were plentiful, but lacked flavour, owing to an absence of sunshine. Our soil is a cold, shallow tilth on whin rock. *D. Stewart, Knockderry Castle Gardens.*

Dumfriesshire.—The Strawberry crop is decidedly below the average, and the Apple crop is below expectations, as the trees were covered with flowers. Small fruits are plentiful and good. *John Urquhart, Hoddom Castle Gardens, Ecclefechan.*

—— Small fruits are fair average crops, especially Raspberries and Red Currants. Gooseberries are very irregular, some bushes bearing heavy crops whilst others of the same variety are not so good. Warrington and Whinham's Industry are the best cropped varieties. Strawberries were a poor crop, the worst we have had for years past. Apples are poor compared with last year. Pears do not vary so much as Apples year by year. Plums are a fair crop, but a great many of the fruits are badly shaped and rusty-looking. We have fair numbers of both Sweet and Morello Cherries. Our soil is a sandy loam. *James McDonald, Dryfeholm Gardens, Lockerbie.*

—— The Apple crop is far short of last year, but certain varieties, such as Lane's Prince Albert, which is always a sure cropper, are bearing well. Pears do not do well in this locality outdoors. Raspberries and White, Black and Red Currants are very fine. Victoria Plums are good on walls, but Damsons are a failure. Strawberries were good: Givon's Late Prolific and Dumbarton Castle do well here. *David Inglis, Drumlanrig Castle Gardens, Thornhill.*

Kirkcudbrightshire.—The fruit crops are exceptionally heavy. Apples and Pears required vigorous thinning to reduce them to normal quantities. All small fruits, with the exception of Strawberries, are very heavy crops; Currants being of the finest quality I have seen for several years past. *James Deuchars, Kenmure Castle Gardens.*

Lanarkshire.—Strawberries looked promising at the end of May, but the excessive rainfall of June had a disastrous effect on the crop. Many fruits damped off before they reached the ripening stage. On some of the large fruit farms in Scotland the Strawberry crop was little short of a failure this season. Black Currants are a fine crop where the plants are healthy. "Big bud" still causes much harm in this district. June, 1912, will long be remembered as the wettest June on record. Rain fell on 27 days. The rainfall of the month being 7.43 inches, or three times the average quantity. *Jas. Culton, Dildawn Gardens, Castle Douglas.*

—— A severe hailstorm on June 11 did great damage to Apples, Strawberries, and other small fruits in the open. *John Shiells, Carstairs Gardens, Carstairs Junction.*

Stirlingshire.—If the amount of blossom were an indication of the crops, fruit this year should be abundant, but the prolonged drought during May was detrimental to the swelling of the young fruits, and numbers dried and fell to the ground. Apples suffered most in this respect. Strawberries have proved disappointing on certain soils. On light soils the crop was never promising owing to last year's drought, but on heavy soil, such as clay, the long period of wet weather during June was injurious, and tended to produce too much foliage at the expense of the fruit. *J. Middleton, Callendar House Gardens, Falkirk.*

(To be continued.)

The Week's Work.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Climbers.—All kinds of climbers are growing vigorously, and attention should be given them at intervals. They may need only the shoots looped out of harm's way, or the superfluous growths removed. In the wild or natural garden, where the plants are climbing over stumps of old trees or on rocks, the less the shoots are trained the better. Also where they are growing over tall gateways, or on terrace walls, but little attention is necessary unless the strong growers are encroaching on their weaker neighbours. But those on verandahs, porches, or the windows of dwelling-houses or pavilions must be restricted. In such cases it is advisable to thin and train the shoots regularly, as they would otherwise soon become a tangled mass.

Climbing Roses.—The intense heat experienced pretty generally during the greater part of July, shortened the Rose season considerably, blooms of the later varieties lasting but a few days, and losing their colour immediately after opening. After the plants have ceased blooming, some of the old growths should be cut out, to allow the young basal shoots to be trained in their places. There are usually many more shoots than are required, and the weaker ones should be cut clean away, retaining only sufficient of the stronger branches to furnish the wall or trellis. It is a mistake to tie in too many shoots, for, unless they are ripened properly, the results will not be satisfactory next season. Climbing Roses are unequalled for garden decoration, and there is now a profusion of charming varieties to select from. They rarely appear inappropriate, but are perhaps seen at their best when allowed to ramble at will up an old tree stump, or over a steep bank or wall. Many charming effects may be arranged, by introducing them freely into shrubberies, beds of Rhododendrons, and amongst evergreens of all kinds. In such surroundings they give a beautiful colour effect, at a time when the Rhododendrons and other shrubs are out of bloom. They should be planted in rich loam to enable them to get a good start.

Antirrhinum.—These are amongst the most satisfactory of bedding plants, and are now making a splendid show; they should not be omitted from any garden where masses of colour are required. Varieties can now be procured in many shades, ranging from white to crimson. Two especially charming varieties are Coral Red and Carmine Pink. Beds of these, edged with dwarf white or yellow varieties, make a pleasing combination. One great advantage in using the Antirrhinum as a bedding plant is that it does not require the protection of a glass house or frame in winter. By sowing seeds in January or February, strong plants may be had in April, and, if they are planted in the beds early, the plants have a long season in which to establish themselves, and are then sufficiently strong to give a good display the whole of the summer. To ensure continuity of bloom, the old flower spikes must be cut off as soon as the flowers have fallen. If the capsules are retained for the seed to mature on the plant, it will at once cease blooming. Lateral growths develop quickly, and it will greatly assist to this end if water is afforded the roots during periods of drought. The Antirrhinum thrives and makes a good show in shrubberies and other places, unsuited for many flowering plants, but in common with most things they repay for a generous treatment.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Newly-grafted Trees.—When the scion and stock have united thoroughly and the graft is growing well, remove the tying material entirely, but take care to see that the young shoot is secured to a stake to prevent it being damaged by strong winds. Remove suckers directly they appear.

Budding Fruit Trees.—August is the best month for carrying out this operation. It is not much practised in private gardens except in restoring the symmetery of trees that have become bare of fruiting wood. Where trees are bare at their bases they may be easily furnished with growth again by inserting a bud here and there on the branches. Budding fruit trees is a more simple operation than grafting, and it should be carried out in a similar manner as in budding Roses. Select a plump bud from the middle portion of a shoot of half-ripened wood, take it off with a shield about one inch long, and remove the wood carefully with the handle of the budding knife. After the shield is inserted as low down as it will go, bind it lightly round with raffia, leaving only the bud exposed. Select dull or showery weather for performing the work, and first see that the bark will part freely from the stem. If hot, dry weather follows the operation, syringe and shade the bud. If in a fortnight or three weeks the buds are still green, the ties may be loosened, and later removed altogether. The buds will remain dormant this season, but as soon as the sap commences to flow again next spring they will grow freely.

Black Currants.—As soon as the fruit is gathered the bushes should be partially pruned to encourage the young shoots to grow stronger from the base. No bush fruit responds better for severe pruning than the Black Currant; the plants produce a greater weight of fine fruits when pruned at this date than if left until the autumn or spring, as the shoots become better matured. No shoots should be allowed to remain more than two years; by this system strong, vigorous growths are produced each year from the base, and early thinning greatly assists the ripening of the wood. Collect all prunings and burn them to destroy any insect pests that may be present, including the mite that causes "big bud." The Black Currant is one of the best bush fruits to plant on a north border or other moist position, and when grown in such situations the season of fruiting is prolonged. The richest manure available should be spread over the roots liberally during the winter months and lightly forked into the soil.

Red and White Currants.—These are excellent fruits to plant on a north wall. Keep all the superfluous side shoots removed or a mass of foliage will be produced and prevent the ripening of the wood and the fruits from keeping well.

Gooseberries.—Bushes growing against walls will require attention. Where there is still space to fill, the leading shoots may be allowed to extend, while in other cases young shoots should be encouraged to grow from the base to take the place of worn out branches. Where the wall space is already filled, shortening the shoots so that the fruits may be fully exposed to the light is all that is necessary at this season.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Cyclamen.—Old corms of Cyclamen that have been rested for a time may be repotted. A considerable quantity of the old soil should be removed from them, taking care not to injure the strong, fleshy roots. They should be potted in receptacles a size larger than they previously occupied. Prepare a fairly rich compost of loam, rotted horse droppings, leaf-mould, sand, and a little old mortar rubble, and pot firmly. Grow the plants in cool conditions at the start, a cold frame placed in a semi-shaded position being suitable, removing the lights at night to give the plants the benefit of dews. By this date the young plants should be in their flowering pots. They should be afforded similar conditions as recommended for the older corms. If, however, they are grown in frames exposed to sunshine, shade must be provided. Spray between the pots both in the morning and afternoon of fine days, as moist conditions are essential to keep down yellow thrips. If this pest increases, notwithstanding sprayings, the plants must either be dipped in an insecticide or fumigated.

Cinerarias.—Seedling Cinerarias are large enough for transferring from the seed-pans to small pots. I prefer pans to boxes, which are used by some growers, as the foliage is not so liable to turn yellow during the winter as is the case when they are allowed to grow to a fairly large size in boxes.

Calceolaria.—Seedling Calceolarias also may be pricked out when the plants are large enough to handle. No advantage is gained by leaving them in the seed pots or pans, and a change of soil is beneficial. Both Cinerarias and Calceolarias require for some time to come as cool a treatment as it is possible to give them. When the young plants are well rooted, the lights should be removed at night: this treatment will help to keep them sturdy. The lights should be placed in position during stormy weather.

Humea elegans.—Seedling Humeas should be potted-up singly. If the seed was sown early, they may be in a fit condition for shifting into 4-inch pots. They should be grown in a cool, moderately dry pit or frame, as the foliage of plants with soft growth often suffers injury during the winter.

Hydrangea hortensis.—The single-stemmed specimens grown in pots may be discarded after they have flowered, unless they are required for purposes of stock, or to furnish large specimens capable of producing five or six heads of blooms. If saved, they should be cut down to three or four pairs of leaves, and as soon as they have started well into growth, pot them into large 32's, or even small 24 pots. If placed out-of-doors till the time for frost arrives, the young growths should mature sufficiently for each of them to develop a good head of bloom next spring, or early summer. Cuttings may be inserted to furnish single-stemmed plants. They may be rooted either in pots or in light soil in a frame. Fairly hard shoots should be selected, and they should be made very firm in the soil. After one good watering, slight dampings overhead daily should provide sufficient moisture till such times as the shoots are rooted. A slight shade is necessary during the day till roots have formed, at which stage the plants may be allowed all the light and air possible. Those rooted in frames should be potted in 48 size (5-inch) pots, in which they will flower successfully.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Lælia pumila.—Plants of Lælia pumila and its varieties are making new growth, and as young roots are produced from their bases they should be repotted or have fresh material applied at the surface as may be necessary. These plants require liberal supplies of water at the roots during their season of growth, therefore it is important that the rooting material be sweet and in a porous condition. Shallow pans without side holes are the most suitable receptacles to grow them in, and these should be fitted with copper wire handles for suspending the plants. Place a few crocks in the bottom of the pan with a few short pieces of Fern rhizome over the top; press the potting material moderately firm, leaving sufficient space when finished for a surfacing of living heads of Sphagnum-moss. A mixture of equal parts Osmunda fibre, A1 fibre, and Sphagnum-moss cut into short portions, with crushed crocks added to ensure porosity, provides a suitable compost. Plants that have sufficient rooting space for another season's growth and with compost in a good condition may have a little of the old soil removed from the surface, replacing it with some of the new compost. Water should be applied sparingly to newly potted plants until the roots have become re-established, when the plants should be dipped in tepid rain water. The plants should also be sprayed overhead whenever the weather is favourable. This treatment should be continued till after the plants have passed out of flower, when they should be kept slightly on the dry side, and this treatment continued throughout the resting season.

Dendrobium.—If the cultural conditions have been favourable, these plants should have made good progress this season. Many of the early species, such as D. Wardianum, D. crassinode, D. chrysanthum, D. aureum, and D. primulinum will have completed their growths, and very soon after the terminal leaf appears the plants should

be removed to a light, airy house where the plants will not make further growth, as the object is to have the new pseudo-bulbs ripened thoroughly. A vinery that has been cleared of its fruit is a suitable structure for them, as partial shade will be afforded them by the foliage of the vines. The plants should be syringed once or twice daily in order to keep down insect pests. Water should be applied to the roots whenever the compost appears dry, until the foliage begins to show signs of decay, when syringing should be discontinued and the supply of water at the roots reduced gradually. The new pseudo-bulbs may be loosely tied to neat stakes, or they may be allowed to assume their natural depending habit; D. Wardianum in particular flowers more freely, and its flowers are shown to better advantage when the pseudo-bulbs are permitted to droop naturally. Other species of Dendrobium and their numerous hybrids should be treated according to their stages of development; plenty of heat and moisture should be afforded growing plants. Aërial growths sometimes push forth from the pseudo-bulbs; these should be taken off, and if it is desired to increase the stock may either be potted singly in small pots or placed several together in larger receptacles. Cuttings that were inserted as advised in the calendar for March 30 last are developing roots from the new growths, and should be dealt with in a similar manner. After being potted they should be placed in a shady position in the house until they are rooted in the compost, when they should receive similar treatment to the established plants. The growths of D. Phalænopsis are in an advanced stage of development, and the plants should be supplied liberally with moisture, both at the roots and in the atmosphere. They should also be well syringed overhead on the afternoons of bright days, and the blinds should be drawn up after closing the ventilators, so as to promote a hot, humid atmosphere.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Hoeing.—This is a very important operation at this season, when the ground is dry, and between growing crops. The frequent stirring of the surface soil between the various subjects not only destroys weeds and prevents their multiplication, but loosens the surface and forms a natural mulch against drought. The dutch hoe is the most suitable implement to use between all kinds of small crops where the surface is fairly even, but for maincrop Potatos the draw hoe will be found the best tool for eradicating the larger weeds.

Chervil.—Occasional sowings of Chervil should be made at intervals. Select a piece of ground on a south border, and sow the seed thinly in drills drawn 10 inches apart. When large enough thin the seedlings until they are 6 inches apart.

Herbs.—Such herbs as Sage, Mint, Thyme, and Marjoram may now be cut, dried, tied in bunches and hung in an open shed for use during the winter months.

Gourds and Pumpkins.—To obtain large handsome fruits and a good growth, the plants should be provided with plenty of water at the roots and fed with drainings from the farmyard and artificial manures. The young fruits should be exposed to the light and air as much as possible, and, in the case of plants grown on trellises, supported before they attain too large a size. When grown on the ground like Marrows, the fruits may be elevated on boxes or pots. Aphis is often a troublesome pest to these plants. Place a fresh mulching of rotted manure if the materials of the former mulch are exhausted. The edible varieties are very palatable when cooked in a green state like Vegetable Marrow, and the largest of the Pumpkins, when thoroughly ripened and preserved, are often eaten during the winter months, being considered a great delicacy.

Autumn Sown Onions.—It is too early to sow the seed, but none too soon to select and get in readiness the piece of ground intended for the seed bed. The soil should be well and deeply dug, but no manure should be added, although a liberal dressing of soot and wood ashes may be applied, especially to the surface. Leave the ground in the rough state for the present, to be trodden down and raked level before the seeds are inserted. Draw drills at 9 inches apart and sow the seeds thinly but evenly. The following varieties are all excellent for sowing at the end of the present month:—White Leviathan, a splendid variety for exhibition purposes and immediate use, but not a good keeper; White Emperor, quite distinct from the former, and Giant Red Roccas, which is perhaps the best for keeping, whilst the bulbs attain to a good size.

Onions for Pickling.—Onions that were sown in March or April on poor ground are quite ripe and ready for lifting. In addition to their usefulness for pickling, their attractive silver skins make them well adapted for inclusion in salads. Improved Queen is an excellent variety.

Endive.—Another good sowing of Endive should be made to maintain a supply during the winter months. The seeds may be sown either in the open ground in drills or broadcast in a shallow frame, transplanting the seedlings when large enough. Oftentimes the seed fails to germinate freely, but frequent dampings will do much to assist in this respect. When grown in frames the damping and shading may be kept under better control.

Celery.—Excepting perhaps a small late sowing for flavouring, the whole of this crop should now be planted, and the various early and late batches will require periodical attention. During dry weather too much water can hardly be applied to Celery, whilst drainings from the farmyard should be given when the plants are well established. The Celery fly is usually troublesome about this season: frequent dustings of soot and pinching of the maggots between the finger and thumb or picking off the affected parts are the best methods of dealing with the pest. Continue to blanch the earliest supplies with brown paper as advised in a previous calendar.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Italy Wantage, Lockinge House, Wantage, Berkshire.

Early Peaches and Nectarines.—Attention must now be given to the ripening of the young fruiting wood. If the trees have not been pruned, the pruning should be done at once. Old-established trees will require a totally different treatment in this matter to younger ones. To keep old trees well furnished with good, fruit-bearing wood, it is necessary to cut out some of the older branches which are becoming bare at their bases. This will afford room for plenty of young growths, that will keep the lower parts of the trees furnished. All growth which will not be required next year should be removed. The remainder of the young shoots should be loosened from the trellis to expose them thoroughly to the light and air. During hot weather the foliage should be syringed freely late in the afternoons. See that the roots do not suffer for want of moisture. Old-established trees may be given diluted liquid manure occasionally.

Early Pot-trees.—The culture of fruit trees in pots is becoming very popular, which is not surprising, as, provided a suitable house is available, no system of indoor fruit-culture is more satisfactory. A house of pot-trees will give far more fruits, and furnish them over a longer period, than a similar house with trees planted permanently. The fruits may not be quite so large, but their colour and flavour are all that could be desired. Trees which were forced early in the spring may be repotted so that they will have time to make plenty of fresh roots before they are started again. Old-established trees may be repotted in the same receptacles. The roots should be shaken out carefully and the ball of soil reduced so that there will be plenty of room to ram the new soil firmly about the roots. A suitable rooting medium consists of loam, mixed with a good sprinkling of old lime rubble, crushed bones, wood ashes and soot. The trees need to be shaded till they have recovered from the disturbance and syringed three or four times a day. Afford water with great care till the roots are again active.

Mid-season Trees.—When all the fruits are gathered give the trees a thorough soaking with clear water. The foliage should be subjected to a vigorous washing with a hose or garden engine every afternoon, and should red-spider be present, spray the trees well with an insecticide several times at intervals of two or three days. Afford them the same treatment in regard to pruning as advised for the early trees. Examine the ties on the main branches, and cut those which are becoming too tight. The shoots of young trees swell rapidly during the autumn months, and, unless there is ample room for expansion, the ligature will cut into the bark and do great damage. Canker often follows upon neglect in this matter.

Late Trees.—Trees carrying heavy crops of fruit require stimulants till the fruits are approaching the ripening stage. During hot weather the foliage should be well syringed with rain-water twice daily. The walls and paths should be damped frequently to promote a moist atmosphere. Admit plenty of air to the trees at all times unless it is necessary to hasten the ripening of the fruits. Even in these circumstances the houses should not be closed entirely. Fruits which are nearing maturity should be slightly shaded; certain varieties, especially of Nectarines, are very liable to injury from scalding, but a little lime-wash syringed over the glass will provide suitable shade. The fruits on the latest trees should be propped up to the light, if this has not already been done. The crop will be more satisfactory in every way for this little extra trouble. When the fruits are ripening they should be examined every morning and gathered before they become over-ripe. When perfectly ripe they will keep longer if placed in a cool, airy room than if left on the trees.

THE APIARY.

By Chloris.

Honey at Shows.—The time of the year has arrived when agricultural and horticultural societies are holding annual exhibitions. Bee-keepers should lend a helping hand in this good work for two reasons: (a) to assist the local society and to help in educating the public in the pleasures of beekeeping and the utility of honey as a food, and (b) to advertise their own wares, and thus create a market for the products of the apiary. The prizes may not repay for the out-of-pocket expenses incurred, but a good market for the honey may more than compensate the exhibitors for many years to come. Some are afraid to exhibit because they are only learners, but so were all the greatest exhibitors once, and everyone must make a beginning. It is a good plan to visit the shows to judge the exhibits, so that one's own shortcomings may be rectified in the future; further, most beekeepers are very pleased to discuss beekeeping with anyone interested in the art, so difficulties that have cropped up in the past may be told to men who have, perhaps, overcome them. Those beekeepers who are more advanced than their brethren may render shows more attractive and of greater educational value by giving lectures and demonstrations in the manipulation of bees by rigging up a demonstration tent. Further, people should be taught that honey is a useful and necessary food.

The Second Honey Flow.—The rains of June, followed by the present warm weather, are causing the Clover to come into bloom, and the blooms will secrete a good quantity of valuable nectar. Those who have sections or frames containing dark honey will do well to extract and ripen this and replace the drawn-out combs for the bees to refill with delicious Clover honey. Those who wish to prevent the issue of a swarm, which often happens after a prolonged wet spell followed by very warm weather, should ventilate their hives by placing a wedge under each corner. Take off all sections as soon as they are completed, for they will become travel-stained if left on, and, to avoid injury to the sections, place the super clearer underneath the crate to be removed; this operation is best performed at noon, when fewer bees are in the hive and use as little smoke as possible. Shallow frames should be removed to a warm room and there extracted, while the honey is thin and very liquid. The combs should be returned to be refilled or cleaned during the evening, to prevent robbing.

Wax Moth.—This pest is very troublesome everywhere this season. Quilts should be carefully examined and all grubs killed, also any moths that are discovered.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—*Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants to naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, AUGUST 5—
Machen Fl. Sh. Bletchley and Fenny Stratford Hort. Soc.'s Sh. Cleveden Hort. Soc.'s Annual Sh. in Herbert Gardens.

TUESDAY, AUGUST 6—
Leicester (Abbey Park) Fl. Sh. (2 days). Scottish Hort. Assoc. meet. Barry Fl. Sh. Artindale's Sweet Pea Sh. at Sheffield.

WEDNESDAY, AUGUST 7—
Bridgend Fl. Sh. St. Fagan's Fl. Sh.

THURSDAY, AUGUST 8—Harrogate Fl. Sh. (2 days).

SATURDAY, AUGUST 10—
Aberdeen and Northern Counties Sweet Pea Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62·1.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, July 31* (6 P.M.): Max. 66°; Min. 51°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, August 1* (10 A.M.): Bar. 29·3°; Temp. 65°; *Weather*—Overcast.
PROVINCES.—*Wednesday, July 31*: Max. 63° Oxford; Min. 55° Preston.

First Steps in Fruit Culture.* The author of this particularly interesting book, describing the best American practice, is a member of the staff of the Massachusetts Agricultural College. The work is full of sound practical advice for the fruit grower of any country, although of course it is to be borne in mind that some practices usual in the United States are not quite suitable to other countries, particularly where bush fruit is grown among the taller trees. This latter method of cultivation is not common in the United States, and is not mentioned in the book under notice. Indeed, Mr. Waugh does not include bush fruit in the scope of his book.

The author begins by describing fully and clearly some of the best methods of grafting, putting root-grafting first, as one of the most commonly practised in his country. The stocks are taken up, grafted in the autumn, and stored in a cool cellar through the winter in damp sawdust, to be planted out in the spring in nursery beds. It might be supposed that the uprooting of the stocks would check severely the vigour which they impart to the scion in the first instance; but, probably, this tendency is counteracted by the advantage of grafting on to roots instead of on to stems. When planted in the nursery beds, they are covered with soil nearly to the tops of the scions, leaving only two buds above the surface. They are usually ready for planting out in their final quarters after two years' growth, but in fertile soil they may be ready in one year. Budding is also described, and, as with grafting, the description is helped by illustrations, as also are other branches of fruit growing. Among his references to stocks, Mr. Waugh does not mention the Crab. Nor does he refer to the selection of some favourite stock for grafting, such as Northern Spy. The stocks most commonly used are obtained by the bad practice of sowing mixed Apple pips from the cider mills, and this is not condemned, although the author believes that the stock influences materially the character of the variety raised upon it.

Mr. Waugh prefers maiden Apple trees to older ones, and urges, rightly, we think, that trees over two years old should be avoided. The old plan of planting trees three or four years old has gone quite out of favour in the United States. The fancy for leaving trees not cut back until the second season from the planting obviously does not find favour in that country, cutting back before planting being usual. In the case of a maiden tree, cutting back to the main stem at the height at which it is desired to form the head of the tree is advised, while for two-year-old trees cutting the young branches back to from 1 inch to 3 inches of the trunk is recommended. The preference for low-headed trees has grown greatly in the United States, and young Apple trees are frequently headed back to straight sticks 18 inches above the ground level, while stems 2½ feet to 3 feet are perhaps more common at present, though some growers prefer high-headed trees. It is usual to prune severely also in the second season; but after that there is as much diversity of treatment in the United States as there is in this country, advocates of non-pruning being found there as here. Mr. Waugh recommends continuous attention to pruning, with care for keeping the centre of a tree open to sun and air, and he is a strong advocate of summer pruning, which appears to be no more common in his country among commercial growers than it is in our own.

The author strongly recommends the cultivation of orchards in preference to allowing grass to grow around the trees, although good results are obtained from the "sod and mulch" system when liberally pursued. He greatly prefers cultivation with the growth of cover crops sown in August to stand until the following spring, when they are ploughed in. This plan, of course, cannot be adopted where bush fruit is grown among the trees, and ploughing where trees are as shallow-rooting as are those on the paradise stock in this country could hardly fail to injure the roots. Presumably, when a crop of Tares or Clover is ploughed in, the ploughing must be done twice, once in each direction, for otherwise there would be a wide row of the cover crop left in each row of trees. Even with cross-ploughing, there would be a square of the cover crop left untouched around each tree, and, presumably, this has to be dug in. Mr. Waugh strongly recommends the regular manuring of fruit orchards, but seems to us to underrate the value of farmyard manure, and to over-rate that of artificial fertilisers. It is hardly necessary to state that the importance of spraying against insect and fungous pests receives due attention.

* *Beginners' Guide to Fruit Growing*, by F. M. Waugh. London: Kegan Paul, Trench, Trübner & Co.) Price 3s. 6d.

FLOWER SHOW 80 YEARS AGO.—The first show of the combined Swansea and Neath Horticultural Societies was held in the Assembly Room at Swansea just 80 years ago. The *Cambrian*, in its report of the show, remarked: "A stage, 24 feet long, was well filled with about 100 choice plants in pots, interspersed with bouquets of beautiful flowers, and a table of the same length had laid out on it 70 dishes of fruit." As with so many other societies, the Swansea and Neath Horticultural Society has grown and the amount of staging which sufficed for the first exhibition would be totally inadequate nowadays.

GEFFRYE'S GARDEN.—London's latest open space, the garden attached to Geffrye's Almshouses, was formally opened for the use of the public on the 27th ult. by Mr. J. W. LORDEN, Chairman of the Parks Committee of the London County Council. The Council in May, 1910, sanctioned an expenditure of £24,000 in respect of the acquisition of the property, and in December of the same year a supplemental estimate of £10,000 was approved in respect of the purchase of adjoining property in Maria Street, Haggerston, which was acquired as an extension to the garden. It is now reported that the total expenditure incurred to date, has amounted to £34,289, the excess expenditure being due chiefly to the legal costs incurred being greater than was anticipated. To cover this excess expenditure the County Council has voted an additional sum of £300.

AUSTRIAN HORTICULTURAL EXHIBITION.—We have received the announcement of an exhibition which is to be held at Vienna in May, 1913, under the auspices of the Vienna Botanical Society. There will be awards for all classes of exhibits, and the show is expected to be one of considerable importance.

THE NATIONAL POULTRY ORGANIZATION SOCIETY.—The July number of the *Journal* of this society should be in the hands of all persons seriously interested in poultry-keeping. The notes on such subjects as "Egg Trains," "Brown-shelled Eggs," "Autumn and Spring Chicken Rearing," and "Infertile Eggs for Eating," are exceedingly good reading, and, to the thoughtful reader, cannot fail to suggest improvements in his methods. There is also a well-written article on "The Value of Poultry in Fruit Culture," and, at the end of the *Journal*, current poultry literature is reviewed.

THE WOMEN'S AGRICULTURAL AND HORTICULTURAL INTERNATIONAL UNION.—This month's leaflet (price 2d.) contains a report of the annual meeting of the union and various short notes. The spelling of plant names needs greater attention, in order to prevent such obvious errors as Ceinum Rattrayi and Gypsophilam paniculatum.

Loganberry Juice.—Prof. C. T. Lewis, of the Oregon Agricultural College, explains his method of making a delicious drink from Loganberries. "To prepare the juice, put the berries on the stove with just enough water to keep the fruit from scorching. Heat slowly, mixing and crushing occasionally with a large spoon. Be sure not to allow the berries to boil; 180° would be, probably, as much heat as necessary. After the berries have softened, put them in an ordinary cloth bag and drain out the juice. The process can be much simplified by using a small fruit press. In choosing the berries try to get those thoroughly ripe. Add one-third the amount of sugar when the juice is put on the stove, and stir occasionally until it is thoroughly heated, but if it boils the vinous flavour and high aroma are destroyed. In bottling the juice drive the cork in slightly and fill the space (above the cork) with hot, liquid fat. The juice makes a most healthful beverage. Half an inch to 1 inch in a glass of water will be enough. Some may wish to add more sugar, though the acid flavour is pleasant. It is, I believe, superior to Grape juice."

Dr. M. C. Cooke.—A recent number of the *Morning Post* contains an appreciation of Dr. Mordecai Cubitt Cooke, who celebrated his 87th birthday on the 12th ult. Dr. Cooke is well known to our readers and the botanical and horticultural world generally as being the oldest mycologist in Europe, and the author of many books and articles on fungi and plant diseases. His botanical works number upwards of 100, and contain many thousands of illustrations from his own drawings. The eight volumes of his best-known work *Illustrations of British Fungi* contain 1,200 full-page drawings prepared by himself for lithographic reproduction. His last published work, *Fungoid Pests of Cultivoted Plants*, was issued by the Royal Horticultural Society in 1906 when the author was 81 years old. Dr. Cooke was born at Horning in Norfolk, and at nine years of age he left home to live with an uncle, a dissenting clergyman in Ilford, with whom he remained for three years, during which time his uncle taught him Latin, Greek, and algebra, and "laid the foundation of every quality he was able to display in the way of work in after life." Dr. Cooke's uncle used to send him for daily walks down the Barking Road with instructions to make collections of the plants and flowers that grew by the wayside, and to classify and name them afterwards with such assistance as he could obtain from his small botanical library. Later on, after working at various callings, such as assistant in a drapery establishment, as a lawyer's clerk, and teacher in a National school, he obtained employment in the Indian department of the great exhibition of 1862 to compile a catalogue of the Indian exhibits, a work for which his previous studies on the economic value of Indian food plants particularly fitted him. After this work in connection with the exhibition was finished he obtained a position in the Indian Museum, and when this museum was abolished he was transferred, at the instance of the late Sir Joseph Hooker, to the Kew Herbarium. He retired from Kew in 1892, after having been first cryptogamic assistant for a number of years. In addition to writing so many books Dr. Cooke contributed frequent articles to the weekly Press, including the *Gardeners' Chronicle*. Of the many honours conferred on him, mention may be made of the Gold Medal of the Linnean Society and the honorary M.A. degree of the Yale University.

Manchester and North of England Orchid Society.—The secretary writes to inform us that the next meeting will be held on the 22nd inst., and not on the 8th inst. as stated in the report of the last meeting.

Fig. 37.—Begonia Florence Nightingale: flowers white.

(Received R.H.S. Award of Merit. See *Gardeners' Chronicle* for July 6 last, p. 15.)

Harrogate.—In their newest series of guide books, of which Harrogate is the first number, Messrs. A. & C. Black claim that these guides are constructed on an entirely original plan. The book is arranged alphabetically, so that the information needed can be easily found. In addition to 7 maps and plans of Harrogate and its environs, there are 12 attractive colour illustrations. This little guide book, published at the low price of one shilling, contains a deal of interesting information set out in an attractive manner. Nothing of importance seems to have been overlooked and the reader is informed how and when to take the famous Harrogate waters.

"THE BOTANICAL MAGAZINE."—The issue (No. 91, new series) for July, 1912, contains illustrations and descriptions of the following plants:—

AGAVE MARMORATA, tab. 8442.—This species was collected by ROEZL, in the province of Tehuacan, Mexico, and is rather rare in collections. Healthy leaves of A. marmorata are described as being glaucous, nearly white; they are extremely rough, especially on the undersides and near the points; the marginal and terminal spines are also tubercular and rough. The Indians of Mexico are said to use the leaves in veterinary medicine. The inflorescence is about 12 feet high, with a relatively slender scape. The bright yellow flowers, which have a somewhat unpleasant smell, are rather small, and are produced in dense clusters.

ERICA CILIARIS, tab. 8443.—The only counties in the United Kingdom in which this beautiful hardy Heath is to be found in a wild state are Dorset, Cornwall, and Galway. It extends thence to France, and is plentiful in Portugal and Spain. E. ciliaris was the subject of tab. 484 in the *Botanical Magazine*, and that figure of 112 years ago shows the species as found in the British Islands, in France, and in Spain, but the illustration in the present number depicts a form of E. ciliaris which is found in Portugal, and, although it has no botanical difference, is a much more desirable garden plant. This form, with large and brighter flowers, was introduced from Portugal by the late Mr. G. MAW in 1872. Ten years later this striking plant was re-introduced, and was described by Mr. BACKHOUSE as E. Mawcana. At this time most of the plants of the earlier introduction were lost, but, fortunately, some were preserved in an Edinburgh nursery, and plants were purchased for Kew. This Heath has since been largely propagated by cuttings, and has been planted in masses in various parts of the grounds, where, from July to October, they give bright displays of rich colour. For soils that are free from lime, Mr. MAW's Heath may be recommended as being perhaps the showiest of all the late-flowering sorts.

STYRAX WILSONII, tab. 8444.—Of the half-a-dozen species of Styrax in cultivation, S. japonicum is the hardiest and most desirable. S. Wilsonii has yet to be tested, and, should it prove to be generally hardy, will be a decided acquisition to our summer-flowering shrubs. Whilst being distinct from any other species, it comes nearest to S. japonicum, which was figured as S. serrulatum at tab. 5950, but is only one-half the size of that species. S. Wilsonii is described as being a compact shrub of shapely form, and flowers at a remarkably early age. A specimen at Kew flowered when only 17 months old. Although it is probably not quite hardy, it is recorded that during last winter, when 18° to 20° of frost were registered, young plants in the Kew nursery only sustained injury to the tips of the twigs. The alternate, elliptic-ovate leaves are a little over ½ inch long, and are irregularly toothed. The white flowers are borne in short, few-flowered terminal and axillary racemes. Propagation may be effected by layering, but since the seedling shrubs flower so freely at an early age, it will be preferable to rely on seeds.

COTYLEDON SUBRIGIDA, tab. 8445.—The illustration of this species shows a very handsome and distinct plant. The stout, glaucous-green leaves are about 4 to 6 inches long by 2 to 2½ inches wide, and have very attractive red margins. The flower-spikes become about 18 inches high, and the three to five secund racemes bear large yellow flowers with brilliant colouring on the spreading segments. C. subrigida was first discovered by Mr. C. G. PRINGLE in 1892, growing on ledges of cliffs in Tultenango Cañon, in Mexico. It grows vigorously, and, like other species, thrives well if placed out-of doors in a sunny position during the summer, and removed to a dry, frost-proof greenhouse or frame for the winter.

PSEUDERANTHEMUM LILACINUM, tab. 8446.—This dwarf tropical shrub is a native of Selangor, and is amenable to similar treatment to that afforded tropical Begonias. Its flowering season is usually in April, and, as a garden plant, it is of equal value to the other species of Pseuderanthemum, which have been longer in cultivation. P. lilacinum produces an erect panicle of long-tubed, lilac-blue flowers, which have a white or yellowish blotch with a number of minute red spots on the mid-lobe of the lower lip.

THE BIRMINGHAM SHOW AND OTHERS.—At the first exhibition of the newly-constituted Birmingham Horticultural Society Messrs. SUTTON & SONS were awarded a Gold Medal for an exhibit of fruit and vegetables, and Mr. H. N. ELLISON, Nurseryman, West Bromwich, was awarded Silver-gilt Medals for exhibits of Cactaceous plants and Ferns. These are in addition to the exhibits remarked upon in our last issue. Mr. ELLISON also exhibited Cactaceous plants at the Cardiff Show (Gold Medal) and at Southampton, where he gained the award of a Silver Medal.

OVERHANGING BRANCH OF A TREE.—The daily Press have reported an action recently brought before the Shoreditch County Court to recover £3 for trespass and damage from a neighbour. It appears that part of a tree which grew in plaintiff's garden overhung defendant's garden, throwing a shade on a considerable portion of the ground. Plaintiff stated that the defendant "cut off a large branch, injuring the wall at the same time. Some 30 or 40 feet was cut away, and the leaves on the remainder of the tree are fading, and the sap is running out." The usual recriminations ensued, and resulted in the County Court action. The report of the case in the *Daily Express*, dated July 24, states that it was submitted that a man had a right to go on another man's land in order to abate a nuisance. Judge SMYLY, in imposing a nominal penalty, without costs, agreed that this was so if it was absolutely necessary, but he did not think it was so in this case, and that the branch could have been cut off without getting on the trunk of the tree and cutting between it and the wall. Questions relating to the right of a person to remove portions of trees which overshadow their ground periodically reach this office, and so recently as July 20, in reply to a question relating to projecting portions of a fence, our legal correspondent pointed out that all cutting should be done from the operator's own side of the fence.

A KENT ESTATE FOR THE NATION.—It is reported that the owner of the house and 26-acre estate known as Chippens Bank, Hever, Kent, who does not wish her name to be published, has endowed the estate and willed it to the nation, in memory of the late Miss Emma Cons, the first woman alderman.

PACKING AND GRADING OF APPLES.—A representative association of fruiterers petitioned the Board of Agriculture to take steps to secure uniformity in the methods adopted by British growers in packing and grading their fruit and vegetables for market, in order that the British grower might be enabled to compete more effectively with foreign and colonial producers. As regards the packing of Apples, the Board recommended that the fruits should only be purchased in ½ cwt. boxes of the same type as those used in California, which state the name and address of sender, the net weight of contents, and name of Apple on each box. As regards grading it was recommended that when purchasing preference should be given to packers or growers who grade their Apples as firsts and seconds. It was also suggested that retailers should confine their purchases of cooking and eating Apples to a certain number of specified varieties in order to make grading practicable. The Board took the view that if a considerable majority of retail fruiterers were in favour of given methods of packing, their views should be brought to the notice of the growers, and they accordingly instituted an inquiry on the suggestions. In the course of this inquiry it was unfortunately found that there was considerable difference of opinion on the subject, and they decided to postpone further action until, by means of conferences or otherwise, they could ascertain with certainty the views of retail fruiterers.

QUEEN WASPS.—In response to an offer of 2s. per 100 dead queen wasps, no fewer than 3,850 were brought to the recent flower show at Witley (Surrey). The first prize-winner showed 1,205 specimens.

TAXATION OF LAND.—The following communication is addressed to us by the secretary of the Land Union:—"The Horticultural Advisory Committee of the Land Union, consisting of practical men engaged in the horticultural trade, emphatically protests against the proposal to impose further taxes on land (as distinct from other forms of property), and states without hesitation that the practical result of such taxation would inevitably be to compel many British growers, who necessarily cultivate considerable quantities of land, to close down (they being already hard-pressed by the competition of growers in other parts of Europe). The Committee further desires to point out that this result would not only ruin many nurserymen and market growers, but would throw out of employment many thousands of workpeople employed by them, and would also render it impossible for persons of moderate means to enjoy the benefits of a garden. Finally, the Committee urgently claims that land should be relieved from the crushing and increasing burden of rates and taxes at present imposed to cover the cost of various public services, which should properly be borne by the Imperial Exchequer."

FLOWER SHOWS IN IRELAND.—According to a correspondent, flower shows appear to have an increasing popularity in Ireland. The exhibition at Belfast, reported in our last issue, was a great success. At Killarney a successful exhibition of Sweet Peas and other flowers was held on the 25th ult. At the recent Longford Show there were more classes than last year; North Kildare had also a splendid exhibition of fruit, flowers and plants, which was held in the grounds of Leixlip Castle; and an excellent horticultural show was held at Cavan in conjunction with the Cavan Agricultural Society's exhibition. Important shows will be held at Portumna on the 7th inst., Ballinasloe on the 13th inst., and Nenagh on the 15th inst.

DESTRUCTION OF WATER WEEDS.*—In considering the question of the eradication of water-weeds from ponds, it is necessary to draw a distinction between the larger weeds, such as American water-weed, water crowfoot, duck-weed, &c., and the smaller algæ. The larger weeds are not only the most obnoxious, but are also the most difficult to eradicate, as they can only be kept down by cutting and dragging them out. In small shallow ponds this may be done by men wading in the water and using hand-scythes; or scythe-blades may be attached to ropes, which can be dragged through the weeds from a boat or from opposite banks of the pond.

* The *Journal* of the Board of Agriculture.

not swell up to any large size; hence, when it has been once or twice picked, the remaining fruits are small, and do not finish well. "Sir Joseph Paxton," so long the standard maincrop variety, is nothing like, either in constitution, size, or crop, what it was 20 years ago. "Laxton's Latest" is still one of the best lates, following Givon's by a few days. Of the perpetuals, "St. Antoine" and "Laxton's Perpetual" are the two best. "St. Antoine" should be planted in the spring and the bloom pinched out, and it will throw a large crop in September and October. "Utility" and "Rival" have both done well. "Utility" should be grown by all, as it is a very fine late variety, and, we think, better than "Givon's Late." The new variety, "George Monro," sent out by Messrs. Veitch as a forcing variety, is a very free cropper, but the fruits are small. Of the new ones, "King George V" has proved all that was expected of it as an early forcer, similar in all respects to "Royal Sovereign," but it is sweeter and four or five days earlier forced. It should, in the course of a few years, make its mark as a standard forcing Strawberry. "Maincrop" has done well as an out-door mid-season variety. "The Earl" (Waterloo × Royal Sovereign) is a finely-flavoured, dark Strawberry, very similar in foliage and colour to "Vicomtesse Héricart de Thury," but larger. "The Queen" (Waterloo × Queen of Denmark) is an enormous cropper, and of a flavour equal to the "British Queen," but will grow on any soil where Strawberries can be grown. *Edward Laxton, Bedford Nurseries.*

Strawberries v. Slugs.—On p. 41 *East Sussex* says, "It is no exaggeration to state that on the heavier soils tons of fruit have been spoiled by slugs alone, and the grower is practically powerless so far as preventive measures are concerned." This is rather a gloomy view to take of the situation, and I do not think we are quite so helpless in the matter. I cannot lay my hands on the paper now, but some years ago I saw galvanised netting recommended for the purpose of supporting the fruit and keeping it out of the way of the slugs, and the idea was considered a good one. True, it cannot be applied in the neighbourhood of large chemical factories, where the acid impurities in the air would act on the zinc and cause it to be injurious to plant life, but most Strawberries are grown in the comparatively pure air of country districts. I have not grown Strawberries for many years, and have had no opportunity of putting the idea into practice, but the plan I should suggest would be something like the following: Plant the rows in pairs, 2 feet apart, leaving a space of 3 feet between one pair of rows and the next one. Procure what is called galvanized sheep netting 3 feet in width, and place it over two of the rows in the spring when growth is commencing. Cut some stout wire, say about ⅛ inch in diameter, into lengths of 15 or 18 inches, and bend one end in the form of a shepherd's crook. Stick these wires in the ground about 1 yard apart, and rest the netting on the crooks. At first the netting should only be 2 or 3 inches from the ground, and be afterwards raised as the leaf-stalks and flower-stalks lengthen by merely raising the supports up to the required height. With the above arrangement there will be a width of 2 feet between one breadth of netting and another, which will be partly covered by the overhanging leaves and fruit. Stout netting of 4-inch mesh, 3 feet in width, with strong twisted wire running straight through the centre can be had for about 2½d. a lineal yard, 10s. 7d. per 50 yards roll was quoted to me to-day, and private growers should certainly use something of the sort. It would be an expensive item for trade growers to start with, but they would be recouped the first wet season. There would be no litter required, the fruit would be coloured all round, the flavour and quality would be better, the gathering would take less time because of the absence of vermin, the fruit would be sooner dry after a shower, and owing to the circulation of air under the foliage there would be less mildew; also there would be no fruit crushed by the feet of the gatherers, and the plants would fill less lateral space. If a stray slug should have the audacity to climb up a leaf-stalk, it would not be likely to cross the zinc-covered wire, for zinc is a perfect barrier against such an enemy. Where galvanized netting cannot be used, straw run through a chaff-cutting machine with the knives set about 2 inches apart will be found useful for covering the ground. Of this I have had practical experience, and where there is a machine driven by steam or gas it is an easy matter to get this done. Slugs do not like travelling over anything which moves under them. *Wm. Taylor, Bath.*

Vine Culture.—*R.P.B.*, in his review of *Vines and Vine Culture*, the 5th edition, p. 46, mentions a system practised in the north of growing Grapes by means of the primary leaves only. Will he explain what he means by this? As a successful Grape grower for 20 years, I have always allowed the leading growth to extend a fair amount, with the view of encouraging root action. I also pinch the sublaterals at the first leaf, which is, I believe, the system followed by the leading market growers. We are anxious to acquire improved methods, and the *Gardeners' Chronicle* is our means of learning of them. *Arthur W. Witt.* [It is a very simple method, and consists of the repression of all lateral growth, or, in order words, covering the trellis with primary leaves only, the one method which exposes the foliage to every possible ray of light. *R. P. B.*]

Campanula Allionii.—The illustration which accompanied Mr. Reginald Malby's interesting note on Campanula Allionii on p. 53 proved that even if the system of subterranean irrigation which he has arranged in his moraine is unnecessary, at least it is not harmful. In my own experimental moraine, composed of half very sandy loam and half granite chips, with no other provision for moisture than an occasional summer watering—from a can—and its own retentive properties, I find that Campanula Allionii grows with extraordinary freedom and flowers fairly well. A small specimen planted two summers ago has formed a carpet of foliage 2 feet across. So closely are the leaf rosettes packed that it would be difficult and tedious to count them, but on a rough estimate they must number between two and three hundred. This summer the plant bore only six or eight flowers, but it has spread much since then. At present I am cultivating three distinct forms of C. Allionii. The first bears flowers of a curious pinkish-lilac, and the bells are rather long and narrow, and pinched into a slight waist at the centre. The leaves are quite glabrous on both sides, but fringed with a distinct edging of soft, curved hairs, which are reflexed towards the base of the leaf. This form I collected at Mt. Cenis, where, with slight variations, it is the universal type. I have also a variety which I bought from Mr. Farrer's nursery, under the name of C. nana. It is the fine form of C. Allionii, which Mr. Malby saw on my rock exhibit at the International Show. The leaves are almost identical with my Mt. Cenis form, but the flowers are larger and fuller, and of a deep violet-purple colour. Lastly, I have a superb variety which came to me from Ireland. In this the leaf rosettes are very large and robust, and the leaves themselves, instead of being glabrous, and with hairy edges as in the two former varieties, are thickly covered with short, curved hairs lying close back in the direction of the base of the leaf. These hairs give the plant a silvery and very pretty appearance. The flowers are of enormous size, and of a glorious deep violet-purple. This last form of C. Allionii is, of course, by far the finest of the three. It is a strong grower, and I hope by next year to have sufficient of the plant to show it. Some time since I purchased a plant of C. Allionii alba, which arrived dead, or so nearly dead that even my moraine failed to revive it; but I doubt if it would have been as beautiful as my rosy-lilac and purple forms. Fortunately, all three of my C. Allionii forms are short stemmed, the flowers never rising more than a couple of inches from the ground, and usually keeping down to an inch. Mr. Malby's ran up to 2 or 3 inches, and at the Temple Show a year or two ago I saw one with flowers on stems quite 4 or 5 inches high. The plant had lost half its charm, which lies in a characteristic alpine dwarfness. I have planted several plants of C. Allionii in quite ordinary loam in different parts of my rock garden, and they have all grown and flowered well, though they have not run about and spread with the easy freedom of my moraine plant. Last winter I built a rock garden in Yorkshire, one section of which was moraine. For this I used blue limestone chippings, the most easily procurable material in the neighbourhood. As an experiment I put in a plant of C. Allionii, but as I had always understood that it was a lime hater, I little expected that it would do much good, even if it survived. I visited this garden a week ago, and was both delighted and surprised to find that C. Allionii had grown amazingly, and formed a good sturdy colony of healthy rosettes. C. Allionii is easily propagated by division of the underground stems in July. I have also raised a batch of seedlings, from seed which I collected at Mt. Cenis last September, and sowed in ordinary loam in the open. *Clarence Elliott, Stevenage.*

SOCIETIES.

ROYAL HORTICULTURAL.

July 30.—The usual fortnightly meeting of the Royal Horticultural Society was held on Tuesday last in the Society's Hall, Vincent Square, Westminster. The exhibits were fewer than usual. Delphiniums and Sweet Peas, which have been shown so finely, gave place to Gladiolus, herbaceous Phloxes, and Pentstemons.

There were fewer Orchids than usual, and the Orchid Committee made no award to a novelty.

The Floral Committee awarded ten medals and nine Awards of Merit to novelties.

The Fruit and Vegetable Committee awarded one First-class Certificate and two Awards of Merit to new Potatos.

At the three o'clock meeting in the Lecture Room, Mr. Cecil H. Hooper, F.S.I., delivered a lecture on "The Pollination and Setting of Fruit Blossoms."

Floral Committee.

Present: H. B. May, Esq. (in the Chair); Messrs. C. T. Druery, John Green, E. Bowles, R. C. Notcutt, W. J. Bean, R. Hooper Pearson, C. R. Fielder, C. Blick, John Jennings, J. F. McLeod, F. H. Chapman, J. T. Bennett-Poë, Chas. Dixon, H. J. Jones, Chas. E. Pearson, W. P. Thomson, E. H. Jenkins, W. Cuthbertson, and C. J. Lucas.

Messrs. H. B. May & Sons, Upper Edmonton, placed small groups of flowering plants amongst their exhibit of Ferns. The dark flowers of Heliotrope Madame Rodrigues and the medium blue shade of Campanula isophylla Mayi were enhanced by the pale-green fronds of the surrounding plants of Nephrolepis Neubertii and N. Whitmanii. (Silver Flora Medal.)

Messrs. Stuart Low & Co., Bush Hill Park, Middlesex, contributed a small group of Clethra arborea, also the Australian Lomatia silaifolia, and cut blooms of Carnations.

Messrs. J. Veitch & Sons, Ltd., Chelsea, again exhibited Fuchsias, Cannas and hybrid Rhododendrons. The small, blue Browallia viscosa is ornamental when the plants are massed. At the end of the table several plants of the hardy perennial Thalictrum dipterocarpum bore tall, erect racemes of pale-mauve flowers, with yellow anthers. (Silver Flora Medal.)

Messrs. H. Cannell & Sons, Swanley, Kent, set up a good group of Cannas, double-flowered tuberous Begonias, and Chironia exifera. (Silver Banksian Medal.)

Messrs. W. Cutbush & Son, Highgate, had an attractive table of Carnations just inside the entrance. The varieties Mrs. Mackinnon, Goldfinch, and Miss Winnie Pryor were fresh and good.

A small collection of Coleus was shown by N. L. Davidson, Esq. (gr. Mr. F. Cooper), Borlases, Twyford.

Gladiolus.

Messrs. Kelway & Son, Langport, Somerset, exhibited a large number of spikes of their Gladioli. From the many desirable varieties we noted Countess of Suffolk, Queen Wilhelmina, Queen Mary, Cybele, Lady Regnart, America, Princess Maud, Duke of Teck, Lady Muriel Digby, La Parisienne, Golden Measure, and Princess Louise as being exceptionally fine.

Messrs. Kelway also showed a few of their "Langprim" hybrid Gladioli, which have smaller flowers of delicate shades. (Silver-gilt Flora Medal.)

Collections of Gladiolus were also shown by several Dutch firms.

Messrs. P. Vos Firmen, Sasserheim, Holland, staged the blue-purple Baron Joseph Hulox, Ida (yellow, with crimson blotch), Mrs. Francis King, and other varieties.

Messrs. G. Zeestraten & Sons, Oegstgeest, Holland, showed, amongst other varieties, the bluish-mauve Badenia.

Messrs. Jean Barth Bos, Overeen, Holland, staged Fanny, Peace, and several other good varieties.

The largest collection was from Messrs. C. F. V. Zanten, Hillegom, Holland, which included the citron-yellow variety Glory of Noordwyk; Libesfeuer, a brilliantly-coloured flower, Badenia, and Empress of India, this last with rich, dark flowers.

Messrs. Aldersey & Marsden Jones, Tilston, Malpas, Cheshire, arranged a collection of Sweet Peas, amongst which the salmon-coloured variety Tortoiseshell was very conspicuous. (Bronze Banksian Medal.)

Mr. Maurice Prichard, Christchurch, Hants, arranged a large bank of Phloxes, Delphiniums, Gladiolus and other hardy flowers. Amongst the herbaceous Phlox the white-flowered variety Frau Ant. Buchner, the rosy G. Strohlein, and the lilac Albert Larteau were conspicuous. A few pot plants of Lysimachia Henryi amply displayed the creeping habit of this yellow-flowered species. The collection of Gladiolus contained some choice varieties. The purple shades of colour show a great advancement, and it seems that the day is not far distant when we shall see a real blue-flowered Gladiolus. (Silver Banksian Medal.)

Messrs. Webb & Brand, Saffron Walden, Essex, exhibited densely-flowered spikes of splendid double Hollyhocks. Lady Bailey (flesh-pink), Salmon Queen, Princess (rose-pink), Mrs. L. King (rich yellow), Peri (pure white), Exultim (rich maroon), and Apple Blossom are only a few of the varieties shown.

Mr. James Box, Lindfield, Sussex, arranged an enormous quantity of herbaceous Phlox, chiefly in very bold groups of distinct varieties, such as Lindfield Beauty, Baron von Dedem, Frau Ant. Buchner, and Le Mahdi. Smaller quantities of Walter Wright, Josephine Gerbeaux, Ringstroom, &c., were also finely shown. (Silver-gilt Banksian Medal.)

Messrs. T. S. Ware, Ltd., Feltham, Middlesex, made a very attractive display with Pentstemons and herbaceous Phloxes. Such varieties of Phlox as Gruppenkönigin, Selma, and Le Mahdi were arranged in tall bamboo stands, whilst other equally good varieties were placed between blocks of Pentstemons of great merit. (Silver-gilt Banksian Medal.)

Messrs. W. Wells & Co., Merstham, Surrey, also exhibited a collection of herbaceous Phlox in many varieties, and a few stands of Carnations. (Bronze Flora Medal.)

Messrs. H. J. Jones, Ltd., Ryecroft Nurseries, Lewisham, arranged many fine varieties of herbaceous Phlox in bold stands of distinct colours, which made an imposing display. The pale mauve Madame Paul Dubrie was especially good. (Bronze Banksian Medal.)

Mr. G. Reuthe, Keston, Kent, exhibited many interesting and uncommon plants, including Feijoa Sellowiana, bearing its pretty flowers, the sweetly-scented Chimaphila maculata, Geranium Endlicherianum, Primula capitata, and several interesting Campanulas.

Messrs. Bees Ltd., Liverpool, exhibited a group of Lobelia "Blue Bees." The colour is excellent, but there were not sufficient flowers to make this an attractive variety. Alongside the Lobelia Messrs. Bees placed a few well-flowered plants of Dracocephalum Forrestii.

The Guildford Hardy Plant Nursery Co. exhibited a varied collection of hardy flowers. The inflorescence of Yucca served to remind visitors how freely the members of this genus are flowering this year. Other interesting flowers were those of Hemerocallis, Veronica, and Helianthus.

Messrs. Rich & Co., Bath, exhibited a great variety of cut blooms of Pentstemons and herbaceous Phloxes.

Fig. 40.—Clethra arborea (half size): flowers white.

(Received R.H.S. Award of Merit on Tuesday last.)

Awards of Merit.

Lysimachia Henryi.—A Chinese Loosestrife with sturdy but prostrate growths and dense terminal whorls of large yellow flowers. Shown by Mr. M. Prichard.

Gladiolus "Crown Jewel."—A large, closely-flowered spike of soft pink flowers, which have lemon-yellow blotches on the lower segments. This beautiful variety was shown by Messrs. Kelway & Son.

Begonia "Decorator."—A double-flowered tuberous-rooted variety, with an uncommonly free-flowering habit. It is a very desirable variety for growing in baskets or for conservatory decoration. The flowers are scarlet. Shown by Messrs. H. Cannell & Sons.

Rhododendron Clorinda.—This is an addition to the javanico-jasmiflorum hybrids which require cultivation in a warm greenhouse. The parents were R. javanico-carminatum and R. Minerva. The plant bore good trusses of beautiful rose-pink flowers of good form, and larger than most in its section. Shown by Messrs. J. Veitch & Sons.

Clethra arborea (see fig. 40).—A well-known greenhouse shrub, introduced from Madeira in 1784. The plants shown were very good examples, and bore many racemes of beautiful white flowers. Shown by Messrs. Stuart Low & Co.

Eschscholtzia "Mikado" caniculata.—A valuable and very striking variety. The petals of the flowers are prettily crumpled. The dark-red colour shades to fiery orange in the centre of the flower. Shown by Mr. W. H. Gardiner, Mill, St. Osyth.

Rose "Danæ."—A free-flowering variety with neat, shining foliage, and small, double flowers. The buds are of a soft yellow colour, which fades to nearly pure white in the outer petals of fully-open flowers. This beautiful Rose was shown by the Rev. J. H. Pemberton.

Astilbe simplicifolia (see fig. 41).—A pretty little Alpine species from Japan; the delicate white flowers are borne on slender, curving panicles, which stand clear above the dwarf, compact foliage. The plant, which is said to be quite hardy, is only 6 inches in height. Shown by Mr. G. Reuthe.

Hæmanthus "Andromeda."—The seven plants shown were very healthy specimens, and each bore a stout umbel of beautiful salmon-pink flowers, reminding one of H. Katherinæ (see Supplementary Illustration, *Gard. Chron.*, February 1, 1908). Shown by Messrs. Harkness & Sons, Bedale.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Jas. O'Brien (hon. sec.), Sir Harry J. Veitch, Sir Jeremiah Colman, Messrs. J. Charlesworth, W. H. Hatcher, J. E. Shill, Arthur Dye, W. H. White, Gurney Wilson, de B. Crawshay, F. J. Hanbury, R. G. Thwaites, F. Sander, T. Armstrong, and C. J. Lucas.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), staged an interesting group, for which a Silver Flora Medal was awarded. Three good specimens of the clear, white-petalled Cattleya Warscewiczii Frau Mélanie Beyrodt, with two, three and five flowers respectively, were arranged in the middle of the group. Cattleya Dowiana aurea with five flowers; several hybrid Cattleyas; Cypripedium Maudiæ, C. Chas. Rickman, and other Cypripediums; Odontioda Charlesworthii; Angræcum Scottianum; Bulbophyllum barbigerum and a good selection of Odontoglossums were also included.

Messrs. Stuart Low & Co., Bush Hill Park, were awarded a Silver Flora Medal for a group. At the back of the exhibit were good specimens of Oncidium macranthum, O. varicosum, and other Oncidiums. With them were the scarlet Renanthera Imschootiana; the pure white Miltonia vexillaria Lambeauiana and M. v. Queen Alexandra; Dendrobium Dalhousianum, D. Falconeri, and other Dendrobiums; Cattleya Warscewiczii and hybrid Cattleyas; a selection of Odontoglossums, including the white-lipped O. Uro-Skinneri album; Masdevallia calura, M. Peristeria, M. simula; Disa grandiflora; Cycnoches maculatum; Vanda cœrulea; and Brasso-Cattleya Maronæ.

Messrs. Charlesworth & Co., Haywards Heath, were awarded a Silver Banksian Medal for

a select group, the most remarkable plant in which was their new Odontioda Madeline (see fig. 42), a worthy companion to the favourite O. Charlesworthii, with flowers of good size and shape and of a deep red colour slightly tinted with a golden hue. In front of the yellow crest of the lip is a blood-red disc, the apex being freckled with rose colour. Other good plants noted were Habenaria Susannæ, a fine specimen of Grammangis Ellisii, also Brassavola Digbyana, Miltonia vexillaria superba, Platyclinis filiformis, Bulbophyllum saurocephalum, hybrid Odontoglossums, and Cattleya Warscewiczii.

E. H. Davidson, Esq., Borlases, Twyford, was awarded a Silver Banksian Medal for a select group, containing Vanda Sanderiana "Borlases variety," a very large and handsome form, darker than the Chillingham variety; a fine plant of Cattleya Rex with two spikes; Odontioda Cooksoniæ with two flower spikes; Odontoglossum Harryanum, O. ardentissimum with a six-branched spike; and the white O. a. xanthotes.

Messrs. J. & A. A. McBean, Cooksbridge, were awarded a Silver Banksian Medal for an effective group, in front of which were some superbly-grown scarlet Cochlioda Noezliana, Odontioda Diana, O. Charlesworthii, Miltonia

Fig. 41.—Astilbe simplicifolia; flowers white.
(See "Awards of Merit" p. 100.)

vexillaria superba, Cattleya Gaskelliana alba, C. Hardyana, and some good hybrid Odontoglossums.

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, showed Brasso-Cattleya Thesis (B. Digbyana × C. Aclandiæ), a quaint flower with greenish sepals and petals and white lip, tinged with rose on the fringed front lobe.

De B. Crawshay, Esq., Rosefield, Sevenoaks, showed Odontoglossum Ethelreda (Edwardii × triumphans) of a reddish-chocolate colour with a pink margin to the lip; also a very fine form of O. Jasper.

Messrs. Sander & Sons, St. Albans, showed the new Lælio-Cattleya × Mauretania (Martinetii × Canhamiana), a beautiful large flower with silver-white sepals and petals tinged and veined with bluish-lilac, and fine violet-purple lip with a narrow margin of lighter shade.

Mr. Sidney Flory, Tracy's Nursery, Twickenham, staged a small group, containing the pretty Bulbophyllum cocoinum with three spikes; a good Cattleya Gaskelliana alba, Anguloa eburneum Tracy's variety, a large pure white flower; the singular little Maxillaria rufescens, Warscewiczella discolor, and a pretty hybrid Cattleya.

Cultural Commendation.

A Cultural Commendation was awarded to Mr. W. H. White, Orchid grower to Sir Trevor Lawrence, Bart., K.C.V.O., for a magnificent specimen of Cypripedium W. R. Lee (Rothschildiana × superbiens) bearing five flower spikes, bearing altogether 13 flowers.

Fruit and Vegetable Committee.

Present: Owen Thomas, Esq., in the Chair; Messrs. Edwin Beckett, J. Willard, Wm. Pope, A. R. Allan, A. Bullock, A. Grubb, J. Jaques, J. Harrison, and J. G. Fowler.

Three collections of vegetables, grown in the near vicinity of the hall, were exhibited by the Westminster Church Army City Gardens Association. These collections contained many meritorious vegetables. The largest collection was labelled Stillington Street No. 1, and included Kohl Rabi, several sorts of Lettuce, Red Cabbage, Shallots, and Mushrooms. Stillington Street No. 2 collection contained such vegetables as Cabbage, Peas, Beans, Vegetable Marrows, and exceptionally good Brussels Sprouts. The collection from Elverton Street contained very good Beet, Runner Beans, and Parsnips. These combined collections fully deserved the Silver Knightian Medal awarded them.

A dish of Apples, "Padnall Seedling," was submitted for inspection, and the committee expressed a wish to again see a dish in about a month's time.

Two Melons and a dish of Peas were also shown, but did not receive any award.

After cultural trials at Wisley several new varieties of Potato were submitted to culinary test, and the following received awards:—

First-class Certificate.

Witchhill Seedling (No. 73).—A kidney Potato of almost perfect shape, with shallow eyes and a slightly rugged skin. Shown by Messrs. Smith & Son, Aberdeen.

Awards of Merit.

King George V (No. 34).—A kidney Potato, with shallow eye and rough skin. *Irish Gem* (No. 16).—A pebble-shaped tuber, with smooth skin and very shallow eye. Both shown by Mr W. E. Sands, Hillsborough, co. Down.

Imperial Beauty (No. 61).—A long, kidney-shaped Potato, with clean, smooth skin. Shown by Messrs. Barr & Son, Covent Garden, London

HUDDERSFIELD HORTICULTURAL.

July 26, 27.—The seventh annual exhibition of the above society was held on these dates. Three large tents were well filled with good exhibits. The exhibition was held in the Greenhead Park, which occupies a fine site in the town. There were four large groups of plants, all of them tastefully arranged. Messrs. J. Cypher & Sons, Cheltenham, were awarded the 1st prize; Mr. W. Holmes, Chesterfield, being placed 2nd; and Mr. J. S. Sharp, Almondbury, 3rd. For 12 stove and greenhouse plants, to include six specimens in flower, Messrs. J. Cypher & Sons were again placed 1st with an excellent selection. Mr. J. S. Sharp, nurseryman, Almondbury, excelled in the class for six Palms, with fine Kentias in variety. These exhibits were placed in the centre of the tent in which the "Nature Study" exhibits were arranged. There was good competition in the classes for table plants and exotic Ferns. Mr. Sharp won the 1st prize in the former, and Mr. W. Simpson Selby in the latter class. For 36 bunches of Sweet Peas, Messrs. Castle Bros., Carnforth, were a good 1st, with a fine exhibit. Exhibits of cut Roses were splendid. Messrs. Alex. Dickson & Sons, Ltd., Newtownards, excelled in the three classes for 72 blooms, 24 blooms, and 12 Tea varieties, respectively. Messrs. Harkness & Co., Hitchin, were placed 2nd in each case, and Mr. G. Gibson, Bedale, 3rd. Good collections of hardy cut flowers were exhibited by Mr. G. Gibson and Messrs. Broadhead & Son, Huddersfield. Excellent stands of Cactus, Show, and Pompon Dahlias were shown. Mr. B. Stringer, Cross Gates, was placed 1st in the larger classes for Dahlias, followed by Messrs. Bottomley & Burton, Elland. There was a good competition in the open classes for fruits. Mr. J. Brennand, Baldersby, Thirsk (gr. Mr. Hathaway), was placed 1st for eight dishes of fruit, and he was also 1st for black and white Grapes and Peaches. His dish of Bellegarde Peaches was exceptionally fine. Lady Beaumont (gr. Mr. Nicholls), and Mr. G. H. Shaw Howden (gr. Mr. Blakey) were the other prize-winners in these classes. In the vegetable classes there was also a good competition. The Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. E. Beckett), won the leading prizes, followed by Lady Beaumont, Mr. G. H. Shaw, and Mr. Collins, a local amateur grower, who was also a successful exhibitor in the amateur classes. Both in the latter and in the local cottagers' class fine produce was staged.

SCOTTISH HORTICULTURAL.

July 27.—The annual excursion of this association took place on the above date, when, on the invitation of the Honorary President, Captain Archibald Stirling, 100 of the members, including the president, Mr. Massie, and several of the other office-bearers, visited the beautiful grounds of Keir. On arrival at Keir, the visitors were received by Captain and the Honourable Mrs. Stirling, and afterwards they were entertained to luncheon in a marquee on the lawn. Captain Stirling presided at the luncheon, and, after the loyal toast had been duly honoured, extended a hearty welcome to the party, and gave the toast of prosperity to the association. The toast was acknowledged by Mr. Massie, who said that the future success of the association was already assured by the result of the appeal sent out during Captain Stirling's year of office, which would be remembered as a red-letter year in the annals of the association. He conveyed to Captain and Mrs. Stirling the hearty thanks of the party for their hospitality. Thereafter Captain and Mrs. Stirling conducted the party over the principal apartments of Keir House, and the weather, which unfortunately had broken down early in the afternoon, having now improved somewhat, the gardens and grounds were afterwards inspected

LEAMINGTON AND COUNTY HORTICULTURAL.

July 24, 25.—The fourth annual show of the above society was held in Victoria Park, Leamington, on these dates. The exhibits of Carnations have never been equalled at Leamington, either in quality or quantity. Roses, Sweet Peas, hardy flowers, groups of plants and fruit and vegetables were all excellent. Amateur exhibitors appeared to be better represented than on previous occasions, but fewer trade growers were present. Unfortunately, many blank spaces were observed in the tents, but this we were informed was due to heavy rainstorms.

Additional interest was given to this year's show by reason of a deputation from the Council of the Royal Horticultural Society attending and making awards to meritorious exhibits (see list printed below). The arrangements made by Alderman Holt (chairman) and Mr. J. T. Hayes (hon. show superintendent) gave general satisfaction.

Plants (Open Classes).

The large group class is one of the features at Leamington. Each group occupied a space of 20 feet by 12 feet down the centre of a large tent. A rustic arch, decorated with choice foliage and flowering plants, was the central feature of each exhibit. The 1st prize of £20 was awarded to Messrs. James Cypher & Sons, Cheltenham, whose wonderfully fine exhibit was remarkable for the rich, reddish-coloured, narrow-leaved Codiæums and other choice foliage plants, displayed with great skill. Of flowering plants Ixora Duffii, Kalanchoë flammea, Clerodendron fallax, Lilliums, Humeas, Ericas, Fuchsia triphylla, Francoas, and a number of Orchids gave pleasing colour and variety to this meritorious group; 2nd, Sir George H. Kenrick, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), whose effectively-arranged group lacked the brightness and warmth of colour characteristic of the 1st prize exhibit; 3rd, Mr. Vause, Leamington.

There were four exhibits in the next class, which was for 12 stove and greenhouse plants distinct, at least four to be in flower, in pots not exceeding 10 inches in diameter. The 1st prize was gained by Messrs. James Cypher & Sons, who showed the following specimens in good condition:—Codiæum Queen Victoria, C. Warrenii, Phœnix Roebelinii (extra good), Ixora regina, Statice intermedia, S. profusa, Erica ventricosa Bothwelliana, Stephanotis floribunda, Clerodendron Balfouri, Chironia ixifera, Allamanda Williamsii, and Rondeletia speciosa; 2nd, Mr. W. Vause; 3rd, Mrs. Rayson, Newstead House, Leamington (gr. Mr. W. G. Jones).

The three best Fuchsias were exhibited by Mrs. Jenkins, Holly Walk, Leamington.

A. Cay, Esq., Kenilworth (gr. Mr. R. Denton), was awarded 1st prizes in classes for (1) three Coleus plants, distinct, and (2) a group of Ferns, arranged for effect on a space of 20 feet by 4 feet. The 1st prize in the last-named class consisted of a challenge cup, value 20 guineas, presented by H. Huggins, Esq.

The best of half-a-dozen exhibits, in a class for six tuberous-rooted Begonias, distinct, came from Mrs. Rayson (gr. Mr. W. G. Jones), who also had the winning exhibit in a class for six Gloxinias, and in another for three Zonal Pelargoniums, distinct.

There were seven entries in a class for six table plants, distinct, in pots not exceeding 6 inches diameter. The successful exhibitor was Mr. W. Vause, who showed four narrow-leaved Codiæums and two Dracænas; 2nd, J. H. Burley, Esq., The Grange, Leamington (gr. Mr. H. J. Finch), who had three Codiæums, two Palms, and one Aralia; 3rd, Sir George H. Kenrick, Edgbaston (gr. Mr. J. V. Macdonald).

Mr. Vause's specimen of Bougainvillea glabra was the best of six in a class for a single plant in flower; 2nd, Mrs. Rayson (gr. Mr. W. G. Jones), with a large Statice; 3rd, Alderman Holt, Leamington (gr. Mr. J. Fisher), with Begonia President Carnot.

Good plants of Cycas revoluta gained 1st and 2nd prizes respectively for C. C. Shaw, Esq., Leamington, and the Misses Robinson, Leamington (gr. Mr. A. J. Friend), led in a similar class for one foliage plant.

Roses and Other Cut Flowers (Open).

Roses.

Six classes were provided for Roses in the open section, and there was spirited competition in all of them. A silver challenge cup, value 25 guineas, presented by J. F. Shaw, Esq., was offered as 1st prize in the principal class, which was for a group of Roses, arranged on a space of 12 feet by 4 feet. The trophy was won by Messrs. Gunn & Sons, Olton, Birmingham, whose beautifully-arranged group contained bold masses of Liberté, George C. Waud, Irish Elegance, White Killarney, Gottfried Keller, Lyon, White Maman Cochet, Mme. Abel Chatenay, and Richmond. Tall pillars, decorated with Dorothy Perkins, Dorothy Dennison, and Excelsa were very effective; 2nd, Mr. W. Lowe, Beeston, Nottingham; 3rd, King's Acre Nurseries, Hereford.

The next important class was one for 24 Roses, distinct. The premier award was made in favour of Messrs. Perkins & Sons, Coventry, who showed grand blooms of J. B. Clark, Frau Karl Druschki, Lyon, Horace Vernet, Claudius, Suzanne Marie Rodocanachi, Bessie Brown, Edward Mawley, William Shean, Gustave Piganeau, Mrs. Theodore Roosevelt, and Comte de Raimbaud; 2nd, Mr. Henry Drew, Longworth, Faringdon, whose specimens of Ulrich Brunner, Alfred Colomb, Earl of Warwick, and Gladys Harkness were noteworthy; 3rd, King's Acre Nurseries.

Messrs. Perkins & Sons, excelled in a class

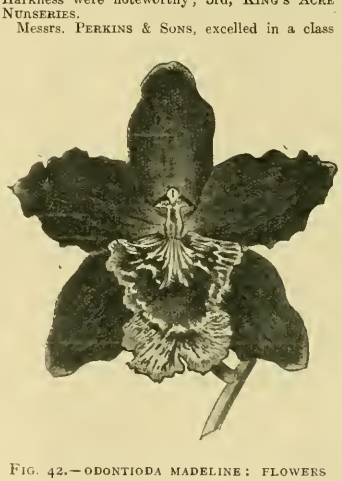

Fig. 42.—Odontioda Madeline: flowers deep red, slightly tinted with gold. (See Report of R.H.S. "Orchid Committee," p. 101.)

for 12 H.P. Roses, distinct; 2nd, King's Acre Nurseries.

Messrs. Perkins & Sons also took 1st prize in the next class, which was for six H.P. Roses, one variety. They showed Horace Vernet in splendid condition.

The best exhibit of 12 Tea Roses, distinct, came from Mr. H. Drew, who showed exquisite blooms of Mrs. Foley Hobbs, W. R. Smith, and Mrs. Herbert Taylor; 2nd, Mr. W. T. Mattock, Oxford.

Miscellaneous Cut Flowers.

In a class for 20 bunches of hardy flowers, distinct kinds (mixed bunches not allowed), the 1st prize—a silver challenge cup, value 25 guineas, presented by F. A. Chandler, Esq., Leamington, was awarded to last year's winners, Messrs. Gunn & Sons, Olton, Birmingham, who had a wonderfully fresh, well-set-up collection, in which Phlox Josephine Gerbeaux, Gaillardia Vulcan, Anthemis Kelwayi, Verbascum hybridum, Heliopsis H. B. Ladhams, and Lysimachia clethroides were of superior merit; 2nd, Frank Bouskell, Esq., Nuneaton.

The last-named exhibitor was awarded 1st prize for 12 bunches of hardy herbaceous flowers, distinct kinds, (bulbous plants not allowed). All the specimens were clean and fresh and well displayed; 2nd, Mr. W. Lowe, Beeston.

Messrs. Perkins & Sons won the 1st prize for (1) a bouquet for the hand, and (2) a bridal bouquet.

Messrs. Kimberleys, Kenilworth, were the only exhibitors in classes for (1) three sprays, suitable for a lady's dress, and (2) three buttonhole bouquets.

Messrs. W. Pemberton & Son, Walsall, excelled in classes for (1) 24 Dahlias, distinct, and (2) six varieties of Violas.

The class provided for Carnations, on a space of 10 feet by 4 feet, arranged for effect, produced strong competition. The coveted silver challenge cup, presented by C. T. Garland, Esq., and £4, offered by the Society, was won by Messrs. Young & Co., Cheltenham, whose flowers were arranged in bold masses. Such varieties as Duchess of Devonshire, May Day, Hon. Lady Nield, Enchantress, Rose Enchantress, Britannia and Lady Henderson were splendidly shown; 2nd, Mr. C. W. Wall, Bath. The outstanding varieties in this collection were Carola, Winsor, Beacon, Mrs. C. W. Ward, Mikado, and Rose Dorée; 3rd, Mr. C. F. Waters, Balcombe, Sussex. Exhibits in this class were also made by Mr. C. Engelmann, Saffron Walden, Mr. A. F. Dutton, Iver, Bucks., and J. B. Akroyd, Esq., Rugby.

The best of four exhibits in a class for 12 vases of Carnations in not fewer than six varieties, with Carnation foliage only, came from Mr. A. F. Dutton, Iver, Bucks. The varieties exhibited were of the American type, long-stemmed, nearly all pale-coloured varieties, and pleasingly arranged. The 2nd prize was awarded to W. H. Parton, Esq., Moseley, whose large, refined, heavy-petalled flowers were much admired; 3rd, Messrs. A. R. Brown, Ltd., King's Norton.

Mr. C. H. Herbert, Acocks Green, took the lead in a class for 12 fancy border Carnations in vases; 2nd, W. H. Parton, Esq., Moseley.

Sweet Peas.

The winning exhibit of 12 varieties of Sweet Peas came from Mr. W. H. Holloway, Port Hill Gardens, Shrewsbury. The flowers were large, substantial, and of splendid quality; 2nd, H. G. Twist, Esq., Coventry.

In the principal class for Sweet Peas, for collections occupying spaces of 20 feet by 4 feet, only two exhibits were placed before the judges, who awarded Alderman Holt's challenge cup, value 20 guineas, to Mr. T. Jones, Ruabon, whose long, strong-stemmed flowers were very meritorious.

Eleven entries were made in the "Robert Sydenham Limited" class for nine varieties of Sweet Peas. 1st, Mr. W. H. Holloway, Port Hill Gardens, Shrewsbury, for a very handsome set of flowers, prettily arranged; 2nd, J. Booth, Esq., Claverdon (gr. Mr. W. V. Wall).

Messrs. Webb & Sons offered prizes for eight bunches of Sweet Peas. 1st, J. W. Lamplough, Esq., Leamington; 2nd, Mr. A. Taylor, Olton

Table Decorations.

Three classes were provided for table decorations, which were accommodated in a tent specially set apart for those popular exhibits. All the tables were 8 feet by 4 feet. In the first class exhibitors were allowed to use any kind of flower. The 1st prize was gained by Mr. W. T. Mattock, Oxford. The centre vase was decorated with lovely sprays of Odontoglossums, Francoas, and Gloriosa superba, relieved with sprays of Selaginella and Asparagus. Smaller vases contained Orchids, Francoas and sprays of Selaginella; 2nd, Mrs. Batchelor, Hampton-in-Arden.

In another class for table decoration, to consist of not more than two colours of Sweet Peas, ten very handsome tables were placed before the judges, who awarded the 1st prize to Miss Deakin, Hay Hall, Hay Mills, for an arrangement of pink Sweet Peas, relieved with slender sprays of Selaginella. The 2nd award was gained by Mrs. Macdonald, Harborne, who also used pink flowers and Selaginella sprays, but the latter were rather overdone; 3rd, Miss A. S. Herbert, Acocks Green, Birmingham. The prizes in this class were provided by Robert Sydenham Limited.

The next class was reserved for ladies residing in the county of Warwick. Here, again, Miss Deakin, Hay Mills, took the lead with beautifully fresh Sweet Peas, lightly arranged; 2nd, Mrs. H. Anderson, Shirley, with pink Sweet Peas and white Centaureas.

Fruit (Open).

In a class for eight dishes of fruit, ripe and fit for table, decorated with plants and cut flowers, the Duke of Portland, Welbeck Abbey, Worksop (gr. Mr. Jas. Gibson), was the only exhibitor, and he was deservedly awarded the challenge cup, value 25 guineas, presented by R. E. L. Naylor, Esq., together with £7 given by the society. The collection was as follows: Muscat of Alexandria and Black Hamburgh Grapes (two bunches of each), uncommonly good Barrington Peaches, Pineapple Nectarines, Williams's Bon Chrêtien Pears, Brown Turkey Figs, large, well-coloured fruits of Apple "Rival," and Welbeck Seedling Melon. The decorations consisted of pink "Malmaison" Carnations and Humea elegans.

The Duke of Portland also gained 1st prizes in classes for (1) four dishes of fruit, distinct, with superb dishes of Peaches, Nectarines, one Melon, and a shapely bunch of Grapes; (2) two bunches of Black Grapes, showing well-berried bunches of Black Hamburgh; (3) two bunches of white Grapes with very fine Muscat of Alexandria; (4) six Peaches with handsome specimens of Barrington; (5) three dishes of dessert Apples; and (6) one dish of Plums.

Lord North, Wroxton Abbey, Banbury (gr. Mr. E. R. Jones), showed the best dish of Nectarines, as well as the best flavoured Melon.

Lord Willoughby de Broke, Compton Verney, Kineton (gr. Mr. J. Lloyd), won the 1st prizes in classes for (1) Red Currants and (2) Cherries.

H. E. Wise, Esq., Shrubland Hall, Leamington (gr. Mr. W. H. Casley), had some splendid Apricots.

The Manor Fruit Farm, Knowle, had the leading exhibits of (1) single dishes of dessert Apples and (2) kitchen Apples. W. J. Gresson, Esq., Pershore (gr. Mr. T. Parry), took the lead in a class for Black Currants; and Mrs. E. W. Everitt (gr. Mr. E. Allaway) showed the best White Currants.

Mr. P. Lucas, Esq., The Oaks, Leamington (gr. Mr. W. Wright), beat 12 contestants in a class for Gooseberries.

Vegetables (Open).

The society's prize of £4, offered for 10 distinct kinds, was won by Hugh Andrews, Esq., Toddington Manor, Winchcombe (gr. Mr. J. R. Tooley), who had splendid Tomatos, Cauliflowers, and Parsnips; 2nd, Lord North, Wroxton Abbey, Banbury (gr. Mr. E. R. Jones).

Messrs. Sutton & Sons offered prizes for six distinct kinds of vegetables. The best of seven collections came from M. P. Lucas, Esq., The Oaks, Leamington (gr. W. Wright), whose Celery and Tomatos were excellent; 2nd, Mr. E. Deakin, Hay Mills.

Messrs. Webb & Son's prizes were offered for six distinct kinds of vegetables. 1st, Mr. E. Winchester, Rubery; 2nd, Hugh Andrews, Esq. (gr. Mr. J. R. Tooley).

Messrs. Dickson & Robinson's prizes were offered for six distinct kinds. 1st, W. J. Gresson, Esq., Birlingham House, Pershore (gr. Mr. T. Parry), who had excellent Tomatos and Onions. Cauliflowers were rather past their best: 2nd, Lord Willoughby de Broke (gr. Mr. J. Lloyd).

Captain W. H. Starkey, Leamington (gr. Mr. G. L. Blackburn), won 1st prize in Messrs. Clibran's class for six distinct kinds of vegetables.

Plants, Flowers, Fruits, &c. (Open to Amateurs Residing in the County of Warwick).

The challenge cup, value 10 guineas, together with £5 offered as 1st prize, was again won by the Misses Robinson, The Newlands, Leamington (gr. Mr. A. J. Friend), whose beautifully-arranged group contained an excellent variety of foliage and flowering plants. The centrepiece consisted of a tall mound clothed with choice plants, surmounted with a graceful Palm. 2nd, Alderman Holt, J.P., The Oaklands, Leamington (gr. Mr. J. Fisher).

Mr. Frank Dennison, Leamington, showed Roses of superb quality, and was awarded the 1st prizes in classes for (1) 12 varieties; (2) six Tea Roses; and (3) six Roses, one variety. A few of Mr. Dennison's best varieties were C. J. Grahame, J. B. Clark, Horace Vernet, Earl of Warwick, Mrs. John Laing, and Ulrich Brunner.

In a class for six varieties of Sweet Peas J. Booth, Esq., Claverdon (gr. Mr. W. V. Wall), was placed 1st with excellent blooms; 2nd, Hugh Mitchell, Esq., Hampton-in-Arden (gr. Mr. T. Batchelor).

The class provided for six bunches of hardy flowers, distinct, brought spirited competition, no fewer than 10 really good exhibits being placed before the judges. 1st, J. Booth, Esq. (gr. Mr. M. V. Wall); 2nd, Mrs. E. W. Everitt (gr. Mr. E. Allaway).

The Rev. J. W. Mason, The Firs, Warwick, was awarded the 1st prize for six magnificent spikes of Gladioli.

Fruit and Vegetables.

The principal class for fruit was one for four dishes, distinct kinds, for which a challenge cup, value 15 guineas, offered by Messrs. F. Benson and F. J. Land, to which the society added £2 as 1st prize, was won by Mrs. E. W. Everitt, Leamington (gr. Mr. E. Allaway), who had large, well-finished Black Hamburgh Grapes, handsome Hale's Early Peaches, Brown Turkey Figs, and Blenheim Orange Melon; 2nd, Rev. F. Hodgson, Clopton House, Stratford-on-Avon (gr. Mr. W. Nichol)—the winner of the cup on two previous occasions—had very fine crimson Galande Nectarines and Bellegarde Peaches; 3rd, Mr. C. Randall, The Limes, Leamington.

Alderman Holt, J.P. (gr. Mr. J. Fisher), beat five contestants in a class for two bunches of black Grapes. The variety exhibited—Black Hamburgh—was remarkable for its shapeliness, large berry, and good finish; 2nd, Mr. C. Randall; 3rd, Captain W. H. Starkey, Bericote House, Leamington (gr. Mr. G. L. Blackburn).

Mrs. E. W. Everitt (gr. Mr. E. Allaway) excelled in a class for two bunches of white Grapes. He had Buckland Sweetwater in splendid condition; 2nd, Rev. F. Hodgson (gr. Mr. W. Nichol) with Muscat of Alexandria; 3rd, Mr. C. Randall.

The winning dishes of Peaches—Royal George—came from the Hon. Edmund Parker, Westfield House, Rugby (gr. Mr. J. Glen); 2nd, Captain W. H. Starkey (gr. Mr. G. L. Blackburn). The last-named exhibitor had the best dish of Nectarines.

Mr. T. Stevenson, Manor Farm, Blackdown, brought the best dessert Apples, and Lord Willoughby de Broke (gr. Mr. J. Lloyd) took the lead in classes for Plums and kitchen Apples.

Of the nine exhibits in a class for six kinds of vegetables, Mr. E. Deakin, Hay Mills, Birmingham, and Lord Willoughby de Broke (gr. Mr. J. Lloyd) were placed 1st and 2nd respectively. Both exhibitors showed well.

Royal Horticultural Society's Awards.

The following awards were made by the deputation from the Royal Horticultural Society:—

Gold Medals.—Messrs. James Veitch & Sons, for stove and greenhouse plants; Messrs. James Cypher & Sons, for group of plants; Sir George H. Kenrick (gr. Mr. J. V. Macdonald), for group of plants.

Silver-gilt Flora Medals.—Messrs. James Cypher & Sons, for stove and greenhouse plants; Mr. W. Vause, for group of plants; Messrs. Gunn & Sons, for Roses; the Misses Robinson (gr. Mr. A. J. Friend), for group of plants; Messrs. Young & Co., for Carnations; Mr. W. Wall, for Carnations; Mr. C. F. Waters, for Carnations.

Silver Flora Medals.—Messrs. Dicksons, for hardy cut flowers; Messrs. W. H. Simpson & Sons, for Sweet Peas and Antirrhinums; Mr. T. Jones, for Sweet Peas; Messrs. Aldersey & Marsden Jones, for Sweet Peas; Messrs. Gunn & Sons, for hardy flowers; Mr. W. Lowe, Beeston, for Roses.

Silver Knightian Medals.—Hugh Andrews, Esq. (gr. Mr. J. R. Tooley), for vegetables; Mrs. E. W. Everitt, for fruit; Mr. G. C. Warr, for vegetables; Mr. G. H. Hawkins, for vegetables.

Silver-gilt Banksian Medal.—Alderman Holt, J.P. (gr. Mr. J. Fisher), for group of plants.

Silver Banksian Medal.—Frank Bouskell, Esq., for hardy herbaceous flowers.

Bronze Knightian Medals.—Mr. E. Deakin, for vegetables; Mr. T. Noon, jun., for vegetables.

HAARLEM BULB GROWERS'.

We are informed that the following awards have been made at recent meetings of the Floral Committee of the above Society. The descriptions are those of the Society's officials:—

First-class Certificates.

Iris "*Anton Mauve.*"—The standards are blue-white and the falls white, with a yellow spot.

I. "*Van Everdingen.*"—The standards are pearl-white and the falls light yellow, with a dark-yellow spot.

I. "*Judith Lyster.*"—The standards are dark sky-blue and the falls light sky-blue, with a dark-yellow spot.

I. neglecta "*Tamerlan.*"—A very large flower, of exquisite form, with clear-blue standards and purplish-blue falls.

I. hispanica "*Empress of The Blues.*"—The standards are blue, and the falls blue, with yellow spot.

I. h. "*Giant.*"—The standards and falls are of clear yellow.

Astilbe Ceres.—The green leaves have brown margins; the panicles of the flowers are bright lilac-rose.

Hemerocallis luteola major.—A strong-growing variety, which has round, golden-yellow flowers.

Lilium Thunbergianum "*Peter Barr.*"—The flowers of this Japanese variety are bright orange-yellow, almost free from spots.

Awards of Merit.

Allium albo-pilosum.—A silvery-white lilac variety.

Anemone "*Don Juan.*"—Fiery scarlet, flower extra, very floriferous, peduncle very long.

A. "*Cornflower.*"—A very large flower, pure, raised from seed.

A. "*Duke of Clarence.*"—Of a purplish-blue colour, and large in size.

A. "*Feu brillant.*"—A single variety, with fiery-scarlet and orange-coloured flowers, paler in the centre.

Dodecatheon "*Eveline.*"—Flowers white, shaded rose.

D. "*James Cook*" and *D.* "*Sir John Foxburgh.*"—The flowers of these varieties are rose coloured.

Iris hispanica "*Bucephalus.*"—The standards are light violet-blue, and the falls blue, with orange-yellow spot.

I. h. "*Leonidas.*"—The standards are light blue, and the falls are dark blue, with yellow spot.

I. h. "*General Gordon.*"—The standards and falls are dark blue.

I. h. "*Pearson.*"—The standards are dark blue, and the falls a lighter shade of the same colour.

I. "*Adriaan van Ostave.*"—The standards are light blue, and the falls white, with dark-yellow spot.

I. "*Hackaert.*"—The standards are dark blue, and the falls light blue, with orange-yellow spot.

I. "*Pieter de Hoog.*"—The standards are bluish-white, and the falls yellow, with dark-yellow spot.

I. hispanica "*Glory of Overveen.*"—The standards are light blue, and the falls dark yellow with orange spot. A sweetly-scented variety.

I. h. "*Sofus Jacobsen.*"—The standards are white and the falls light yellow, with darker spot.

Iris amoena "*Rhein-Nixe.*"—The standards are nearly pure white, and the falls dark violet-blue.

I. squalens "*Isolina.*"—The flowers of this variety are very large; they have silvery-rose standards, and falls of rich mauve.

I. s. "*Nibelungen.*"—The standards are olive-coloured, and the falls dark purplish-violet; a very large-flowered variety.

I. s. "*Prosper Laugier.*"—The standards are claret-coloured, and the falls dark velvety-brown.

I. "*Joh. Bosboom.*"—The standards are white; falls very light blue with yellow spot.

I. "*Rembrandt.*"—Standards dark blue; falls greyish-blue with dark yellow spot.

I. albicans "*Riviera.*"—The flowers of this variety are pure white, and are larger in size than those of I. albicans.

Pyrethrum Excelsior.—A seedling variety with rose-coloured flowers.

Ranunculus Turbar Romano "Boule d'Or."—A pure yellow flower, the outer petals of which exhibit an orange shade.

Astilbe plumosa alba.—A good, pure-white, forcing variety.

A. Vesta.—The foliage is surmounted by large panicles of very bright, lilac-rose-coloured flowers.

A. Juno.—The large panicles of this variety are of a clear violet colour.

A. Kriemhilde.—The panicles are salmon-rose coloured.

A. Lachskonigin.—The flowers of this variety are also salmon-rose.

Kniphofia Goldfinch.—A golden-yellow variety.

K. Orange Queen.—An orange-yellow-coloured variety.

K. Prince of Orange.—The flowers of this variety are clear orange-red.

These Kniphofia are said to be hybrids from K. rufa × K. MacOwanii and corallina. The peduncles are smaller than those of K. MacOwanii, and the flowers more useful for decoration.

Phlox decussata Alphons Dicpenbrock.—Clear rose, with carmine eye.

P. d. Bernard Twyers.—Soft lilac, with white eye.

Ranunculus (French) "Carnation."—A rose seedling, from the white R. Mathilda Christina.

Gladiolus nanus "The Queen."—The flowers of this variety are of a clear rose colour.

G. n. "La Traicheur."—The interior of the flowers is of a pale rose colour; the outer surfaces of the petals are dark rose.

G. ramosus "Prins Hendrik."—The petals of the orange-scarlet flowers are spotted with white.

G. Pink Progression.—The rosy-white flowers have a dark carmine spot; a seedling from G. Pink Beauty.

G. "Adeline Patty."—A violet-blue seedling.

G. "Belle Mauve."—The mauve flowers have creamy-yellow spots.

G. Cajanus.—The flowers are salmon-red, with cherry-red spots.

G. gandavensis "Empress of India."—The dark brown-red flowers have numerous darker spots.

G. "Ideal."—The salmon-red petals have red-brown spots.

G. gandavensis "La perle du Jardin."—A creamy-yellow-flowered variety.

G. "Queen of the Whites."—The very large, rose and white flowers are very freely produced.

KILLARNEY SWEET PEA.

JULY 25.—The second annual show under the auspices of the above society was held on this date, in the grounds of Killarney House, the residence of the Earl of Kenmare, from the terraces of which very beautiful views of the Killarney Lakes are obtained.

The various classes were well filled. Some of the collections of Sweet Peas were exceptionally good, and, combining, as they did, great size of bloom, length of stem, and brilliance of colour, showed cultivation of a very high order. There were excellent collections of annuals, hardy plants, groups of stove and greenhouse plants, vegetables and fruits.

The principal prize-winners in the various classes were the Earl of KENMARE (gr. Mr. A. J. Elgar); Mrs. A. VINCENT, Muchross Abbey (gr. Mr. Nelson); Mrs. LEAHY, R. COLLIS SANDES, Esq.; Mrs. MACSWEENY, who also won the special prize offered for the best amateur's exhibit in the show; Mrs. D. W. O'BRIEN, Mrs. PALMER, Mrs. BRITTEN, Mrs. MACGILLICUDDY, and Miss GODFREY. T. D. CROSBIE, Esq., showed the best vegetables.

Among the trade exhibits was one shown by Messrs. ALEX. DICKSON & SONS, of Newtownards and Dublin, of seeds in various stages of germination; this firm also staged a collection of Sweet Peas. Messrs. JONES, of Kildenny, staged a magnificent exhibit of Gladioli and border flowers; and Messrs. BAYLOR HARTLAND, of Cork, were represented by a stand comprising Orchids, Carnations, and Alpine plants.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 11.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, H. Thorp, J. C. Cowan, D. McLeod, J. Bamber, C. Parker, Z. A. Ward, A. J. Keeling, W. Holmes, A. Warburton, and H. Arthur (secretary).

A large Silver Medal was awarded to R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), for a mixed group of Odontoglossums in variety; Silver Medals to Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), for a group of Cattleyas; J. McCARTNEY, Esq., Bolton, who showed a group composed principally of Cattleyas; and a Bronze Medal to the Rev. J. CROMBLEHOLME, Clayton-le-Moors, for a group of Cypripedinms.

Other exhibitors were R. LE DOUX, Esq., West Derby (gr. Mr. Fletcher); Messrs. CHARLESWORTH & Co., Haywards Heath; and Messrs. STUART LOW & Co., Enfield.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya callistoglossa splendens "Marlfield variety."—A large, well-set flower, with brilliantly-coloured lip, exhibited by R. LE DOUX, Esq.

AWARDS OF MERIT.

Odontoglossum × Miss Arline King (parentage unknown) and *Laelio-Cattleya "Purple Queen" (L.-C. Iona × granulosa)*, both from R. LE DOUX, Esq.

Cattleya Gaskelliana "Delicata," from J. MCCARTNEY, Esq.

Sophro-Laelia "Leda" (L. pumila × Sophro-Laelia Gratrixæ). from Messrs. STUART LOW & Co.

TRADE NOTICE.

MESSRS. J. CARTER & CO.

DURING the past week several notable visitors have inspected Messrs. Carter's trial grounds at Raynes Park. These included M. de Keyser, Belgian Minister of Agriculture, also the Under Secretary of the French Board of Agriculture and Mr. Lloyd George and Miss George. *H.*

GARDENING APPOINTMENTS.

Mr. H. BEST, until recently Gardener to F. D. LEYLAND, Esq., and previously in the gardens at Bowood, Deepdene, and Sandbeck, as Gardener to W. VESTEY, Esq., Bessemer House, Denmark Hill, S.E.

Mr. I. W. CHAPMAN, for the past 2 years Gardener to H. PRATT, Esq., Cleetborpes, Grimsby, and previously Foreman at Emo Park Gardens, Portarlington, Queen's Co., as Gardener to Col. KEMMIS, Everton Grange, Lymington, Hampshire.

Mr. R. C. HARRIS, for 2 years Gardener to Lady FOX, Bigswair House, Gloucestershire, as Gardener at Standish House, Stonehouse, Gloucestershire.

Mr. WM. EDWARDS, for 6 years Gardener to G. A. MCLEAN BUCKLEY, Esq., Worth Hall, Crawley, Sussex, as Manager of the Shinn Estate, Toberonochy, Argyllshire, for the same gentleman.

Mr. JOHN W. HART, late Instructor in Horticulture and Rural Science, County Intermediate Schools, Towyn, Merionethshire, as Horticultural Assistant to the Botanical Department, Bedford College, London.

Mr. G. HILLS, for 10 years Kitchen-garden Foreman at Eastwell Park, Kent, as Gardener to the Right Honourable LAURENCE HARDY, M.P., Sandling Park, Hythe, Kent. (Thanks for contribution to the R.G.O.F. box.—EDS.)

Mr. JAS. RICHARDSON, for nearly 6 years Gardener at Horefield, Romsey, as Gardener to Mrs. MOUNTGOMERY PATERSON, Eastley End, Thorpe, Surrey. (Thanks for 1s. for R.G.O.F. box.—EDS.)

Mr. G. H. TANSLEY, of Messrs. KENT & BRYDON'S Nurseries, Darlington, and previously Gardener to CHARLES BROOK, Esq., Kinmount, Annan, as Gardener to K. EATON WHITE, Esq., Boulge Hall, Woodbridge, Suffolk.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS'.—A meeting of this association was held on July 25, at St. John's Parish Rooms, Clifton. Mr. Thoday presided. The evening was devoted to the asking and answering of questions on horticultural topics. There was also a competition for the best bouquet of Sweet Peas arranged at the meeting; by under gardeners, for which prizes were offered by Mr. E. T. Parker. Mr. Coombs won the first prize, and Mr. Wiltshire the second prize. At the next meeting, to be held on the 29th inst., Mr. Rich will give a lecture on "Hardy Flowers."

CLEVEDON AND DISTRICT HORTICULTURAL.—The members of this association visited the Mendip Nurseries, at Langford, on the 12th ult., being the occasion of the annual outing.

MARKETS.

COVENT GARDEN, July 31.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—English Apples include plentiful supplies of dessert varieties. Of culinary varieties, Lord Suffield, Keswick Codlin and Lord Grosvenor form the bulk. Sturmer Pippin is the only Australian variety obtainable. English Pears include the following varieties, Hessle, "Chalks" and Jargonelle. Hessle or Hazel Pears are a very heavy crop. Continental (French) boxes of Williams's Bon Chrét en containing 36 and 48 fruits are arriving daily. It is reported that the crop of French Pears will not be so heavy as in some previous seasons. Grapes from all sources are an abundant supply; some of the bunches are exceptionally fine. The supply of Peaches and Nectarines appears to be about equal to the demand. Figs and Melons are plentiful. The supply of Cherries from the Continent is exhausted, and consignments from English growers are very limited; the crop is expected to finish this week or next. Plums, Early Rivers and Czar, are plentiful, and the fruits are meeting with a good demand. French and Spanish Gages and Plums are also plentiful. A heavy crop of Cobnuts is anticipated, several growers reporting as many as three tons to the acre, a wonderful crop when compared with an ordinary season, which averages about 15 cwts. to the acre. Many sales are being made at from 2d. to 2½d. per lb. Tomatos are a good supply from all sources and there is a brisk demand, especially from country buyers. With the approach of the holiday season there is, as usual, a general depreciation in prices. The vegetable trade is generally good for the present season of the year. *E. H. R., Covent Garden, July 31, 1912.*

New Potatos.

REMARKS.—Trade is very slow and prices are low. Large consignments have been received from Lincolnshire, Cambridgeshire, and Kent. We hear bad reports of the blight in Lincolnshire. *Edward J. Newborn, Covent Garden and St. Pancras, July 31, 1912.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 27, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather.*—Fair and dry over Scotland during the first few days of the period, and also over the south and east of England generally, after the middle of the week, but with the exceptions the conditions over the United Kingdom were mostly unsettled and rainy. Thunderstorms occurred in all districts, and generally they were of daily occurrence.

The *temperature* was slightly above the average over the greater part of England and in Scotland N. and W., below it elsewhere. The largest excess, 2.4°, was in England E., and the largest deficit, 1.4°, in Scotland E. The highest readings occurred on the 24th over the southern half of the country (79° at Kew and Margate), and on various dates later in the week in other districts. The lowest of the minima were registered on several days; the actual lowest were 31° at Balmoral, 35° at Glencarron, and 37° at Wick. The mean temperature of the soil at a depth of 1 foot and also at 4 feet was mostly above the average, but the difference was slight.

The *mean temperature of the sea* was rather above the average generally, slightly below it at a few northern and north-western stations. In nearly all cases the water was cooler than in the corresponding week of last year.

The *rainfall.*—Deficient in England S.E. and Scotland W. and N., but in all other districts there was an excess, that in Ireland N. being double, and in Ireland S. nearly four times the average. The largest total for the week was nearly 4 inches at Calne, and the smallest, less than 0.1 inch at Wisley. Roche's Point received nearly 5½ times the normal quantity for the week. Measurements of over an inch were recorded at a large number of stations in Ireland and the western districts of England on the 27th.

The *bright sunshine.*—Everywhere below the average. The percentage of the possible duration ranged from 10 in Ireland N. and 12 in England N.E. to 31 in England E. and 33 in England S.E.

THE WEATHER IN WEST HERTS.

Week ending July 31.

Frequent showers. The days proved as a rule cold, while the nights were, on the other hand, nearly all warm for the time of year. On the coldest day the temperature in the thermometer screen never rose higher than 58°, which is about 12° colder than is usual at the end of July. The ground is at the present time 1° colder at 2 feet deep, and 3° colder at 1 foot deep, than is seasonable. Some rain fell on each of the last five days, and on several occasions for a short time rather heavily. The total fall for the week, however, was less than half an inch. Only a few drops of rain-water have each day come through the bare soil percolation gauge during the last four days. The sun shone on an average for 4¾ hours a day, which is 1½ hours a day short of the mean daily duration for the same period of the month. The winds were as a rule rather high, but in no hour did the mean velocity exceed 12 miles. The direction of the wind has been almost exclusively some point between south and west. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 11 per cent. *E. M., Berkhamsted, July 31, 1912.*

Obituary.

HERBERT DOWOING.—We regret to record the death, on the 27th ult., of Mr. Herbert Dowding, for more than 20 years gardener to the Bishops of Winchester at Farnham Castle. Deceased, who was 58 years of age, was, at one time, gardener to the late Dean Hole, of Rochester. The Bishop of Winchester, referring to deceased at Farnham Parish Church, said he had served under four Bishops and he had won the confidence of each. He had been to them a familiar example of a good and faithful servant. Farnham had lost a good citizen and the Church a faithful member and worshipper.

ENQUIRY.

DOES any reader know if Rubus japonicus tricolor is still in cultivation? I have had it in abundance and have given it away to many, but it seems now to have entirely disappeared. *H. N. Ellacombe, Bitton Vicarage, Bristol.*

Answers to Correspondents.

*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

APIARY: *E. Cross.* Bumble bees are not regarded as robbers of honey. They cannot enter the hives if the entrances are as small as they should be, namely, not more than ⅜ inch deep, and this may easily be settled by measuring the entrance.

APPLE BEAUTY OF BATH: *Jaybee.* Beauty of Bath does not bear all its fruits at the ends of the branches; it is, however, one of those varieties that require careful attention in summer and winter pruning. It will easily form spurs. The shoots that must not be pruned either during summer or winter are those of a short, stubby growth, which are easily recognised by having their leaves disposed almost in a circle with a blossom bud in the centre. Such growths seldom extend more than 6 or 8 inches. All other shoots that are longer, except the leading ones should be shortened to about the third good leaf. Under this treatment, spurs will form freely. The leading shoots should be cut back about one-third their length in winter, according to the space available. Beauty of Bath is a variety that repays good culture.

APPLE, STIRLING CASTLE: *Dun.* A destructive fungus—Sphaeropsis malorum—is present. It is too late to spray now, but next spring, when the leaves are unfolding, use the Bordeaux mixture at half the usual strength.

BEGONIA LEAVES: *Ensign.* The leaves are not affected with a fungus disease. The trouble is due to excessive atmospheric moisture and insufficient ventilation.

BEST-FLAVOURED GRAPES: *C.* It is as impossible to enumerate the 12 best-flavoured Grapes as it is to give a list of the best books; but we fancy most people qualified to express an opinion on the point would select the following varieties: Muscat of Alexandria, Muscat Hamburgh, Chasselas Musqué, Canon Hall Muscat, Grizzly Frontignan, Madresfield Court, Mrs. Pearson, Muscat Champion, Chasselas Vibert, Black Hamburgh, Ferdinand de Lesseps, and Mill Hill Hamburgh. Paper bags, such as you require, may be obtained from Messrs. W. Wood & Sons, Wood Green, London.

BLACK ALICANTE GRAPES: *F. B. H.* The Grapes are scorched. This condition is due to insufficient ventilation in the house, or, perhaps, failure to open the top ventilators sufficiently early in the morning. When this is done at the proper time the leaves and berries become dry before the sun becomes powerful enough to cause scorching.

BLUE HYDRANGEA: *Hortensia.* A reply to a similar question was published in the issue for June 22, page 422. Watering the plants twice weekly with a solution of ammonia alum (½ ounce in 1 gallon of water) is recommended. It is desirable to water with this solution in the autumn until the plants pass into their resting stage. During their flowering period the plants should not be grown in the full sun, or the blue colour will become blotchy. Other cultivators have obtained similar results by the use of such substances as alum, iron, and slate chippings mixed with the soil.

BORONIA MEGASTIGMA AND PÆONY FROM SEED: *C. N. Knox-Davies, Johannesburg.* We have never before heard of anyone having continual failure in raising Boronia megastigma from seed. Probably the cause of your failure lies in the conditions in which the seeds have been sown. Too much or too little moisture just as the seeds are about to germinate would be sufficient to cause failure. Perhaps you have buried the seeds too deeply: a common mistake. A useful rule is to cover seeds the same depth as their narrowest diameter, which, in the case of fine seeds, means to sow them thinly on the surface, pressing them lightly with a flat piece of wood. The Pæony seed has probably received a check, either by drought or too low a temperature. All seeds, when germinating, are easily injured by excess of moisture, drought, or sudden fluctuations in the temperature.

CARNATIONS DISEASED: *P. W. E.* The injury has been caused by a fungus (Septoria dianthi). All diseased parts should be removed, and the plants sprayed with a solution of liver of sulphur, using 2 ounces in 3 gallons of water.

CHRYSANTHEMUMS: *J. E. Hatton.* A fungus, Sclerotinia, is present on the collar of the plants, and is ascending the stem. Infection has probably resulted from the soil. Your best plan is to water the plants with a solution of sulphate of potash; sterilise the soil when the plants are removed.

EMPLOYMENT IN THE LONDON PARKS: *J. T.* In the case of the parks and gardens under the control of the London County Council, application should be made to the Chief Officer, 11, Regent Street, London. If you wish to enter the Royal Parks, which include Hyde Park and Regent's Park, application should be made to the respective superintendents.

FLAG IRISES: *C.* As a manure for your soil, which is deficient in lime, basic slag would be preferable to superphosphate.

GRAPES UNHEALTHY: *A. M. S.* There is no fungus disease present. The injury is due to some wrong conditions at the roots.

GRAPES: *W. G. L.* Spray the vines twice a week with liver of sulphur, using 2 ounces in 3 gallons of water; also spray them again next spring before the disease appears. Soak every part of the house thoroughly when the plants are resting during the winter, with a solution of 1 lb. of sulphate of copper in 25 gallons of water. This specific must only be used when the vines are bare of leaves.

IRON AS A MANURE: *B. M. W.* It by no means follows that the yellow appearance of the leaves of your Pear trees is due to a lack of iron: it may arise through a deficiency of nitrogen. Iron sulphate should be added if you are certain that the soil is deficient in iron, but not more than 1 ounce to each square yard of ground. Light, chalky soils require liberal supplies of nitrogenous manures.

IVY-LEAVED PELARGONIUMS: *C. W.* If you send a specimen of the affected plants we will endeavour to assist you.

MELONS UNHEALTHY: *A. D.* and *W. L.* Eelworm is present. This is a very difficult pest to eradicate and insecticides are of very little avail. The best plan is to burn the plants and remove the soil in which they have been grown, either sterilising it by baking or burying it in some out-of-the-way part of the garden. The house should then be cleaned thoroughly with carbolic in solution, washing the woodwork with soft soap and carbolic acid in warm water. A correspondent in *Gardeners' Chronicle*, July 8, 1911, page 7, recommends top-dressing pot plants with rape dust, which acts as an exterminator of eelworms and as a fertiliser of the soil at the same time. See also an article in the issue for July 13 last, page 30.

NAMES OF FRUITS: *F. E. C.* All the specimens were decayed. Send fresh samples not so ripe, and pack them better.

NAMES OF PLANTS: *W. D.* 1, Indigofera Gerardiana; 2, Chimonanthus fragrans; 3, Rhus Cotinus; 4, Colutea arborescens.—*W. Lodge.* Buddleia variabilis var. Veitchiana.—*E. Humphrey.* 1, Cassinia fulvida; 2, Cupressus pisifera plumosa aurea; 3, Spiræa species; 4, Sambucus racemosa laciniata; 5, Phillyræa media; 6, Cupressus Lawsoniana erecta; 7, Please send a better specimen; 8, Nepeta Mussinii; 9, Polygonum amplexicaule; 10, Sedum oppositifolium; 11, Rhodotypos kerrioides; 12, Berberis Wallichiana.—*E. T. W.* Astilbe simplicifolia (see *Gardeners' Chronicle*, Oct. 22, 1910, p. 294, fig. 122).—*Anxious.* 1, Santolina chamæcyparissus; 2, Tunica Saxifraga; 3, Hypericum elatum.—*Cicester.* 1, Calamagrostis epigeios; 2, Apera Spica-venti; 3, Stachys betonica; 4, Œnothera fruticosa.—*Journeyman.* 1, Dactylis glomerata variegata; 2, cannot name without flowers; 3, Funkia Sieboldiana; 4, 5, 6, forms of F. ovata; 7, Berberis vulgaris foliis-purpureis; 8, Cornus alba.—*Esor.* 1, Ligustrum lucidum; 2, Spiræa japonica; 3, Lythrum salicaria; 4, Neillia opulifolia; 5, Veronica longifolia; 6, Ligustrum vulgare aureum.—*Constant Reader.* 1, Anthemis tinctoria; 2, Phlomis fruticosa; 3, Anaphalis margaritacea; 4, Nepeta Mussinii.—*Anxious.* Lotus siliquosus and Matricaria Chamomilla.—*M. S. P.* A, Caladium argyrites; b, Helxine Solierolii; c, Sedum Sieboldii variegatum; d, specimen too scrappy to identify; e, Rhœo discolor; f, Nepeta Glechoma variegata; g, Begonia semperflorens.—*X. Y.* 1, Bulbophyllum calamaria; 2, Pleurothallis picta; 3, Masdevallia simula; 4, Octomeria diaphana; 5, Oncidium barbatum; 6, Maxillaria rufescens.—*T. H.* 1, Selaginella Mertensii; 2, Pteris longifolia; 3, Begonia manicata.—*W. J. P.* Lygodium scandens, a climbing Fern.

NICOTINE EXTRACT: *Nicotine.* You will require a special permit from the Board of Inland Revenue before you are allowed to undertake the extraction of nicotine from your Tobacco plants. See *Gard. Chron.*, April 20, 1912, p. 260.

NYMPHÆAS DAMAGED: *W. E.* It is somewhat difficult to account for the injury to the Nymphæa leaves. It is probably due to insect pests, which may be water snails or other insects that abound in the water, or that have alighted upon the leaves. Water beetles are sometimes a source of trouble. There is also an aphis which infests both the flowers and foliage of hardy Nymphæas. This pest may be found upon flowers only one day old. It is also found on the lower and upper sides of the leaves, which seems to point to its being of an amphibious character. It is advisable to thoroughly spray the plants three times a week with a strong solution of quassia and soft-soap. This should be applied to the under as well as the upper surfaces of the leaves. To do this the syringe should be held about 1 foot below the water, then the insecticide will, to a great extent, rise to the under-surfaces of the leaves. At the same time force the insecticide downwards in the direction of the crown itself. If the presence of water snails is suspected, some finely-ground lime should be shaken under the leaves, so that some may sink towards the crown; some rising to the surface will reach the under sides of the leaves. Ground lime is much better for this purpose than slaked lime, the latter being too buoyant. It is advisable to remove all damaged and decaying foliage where the same is in any way dense and likely to impart disease to healthy growth. If waterfowl are kept on the lake these may account for the injury to the crowns. It has been proved beyond question that both swans, with their long necks, and ducks that dive, do irreparable harm to the crowns by pecking out the centre of the plant, thus causing premature decay.

PEACH LEAVES DROPPING: *Subor.* There is no disease present. The marks are caused by the use of too strong an insecticide which has caused the leaves to fall. To destroy red spider use equal quantities of liver of sulphur —2 ounces in 3 gallons of water—and ordinary quassia wash. This wash should be applied with some force; repeat the spraying next spring before the pest appears.

PEACH TREE: *I. S. E.* There is no disease present. The wounds and rusty spots are caused by excessive growth of the shoot.

PEARS: *W. P.* The injury is caused by thrips puncturing the fruit when very young. The thrips cannot be destroyed by spraying, but as they pass part of their time in the soil, a dressing of some ground insecticide, such as vaporite, may do good.

PLUMS DISEASED: *F. E. C.* The Plums are attacked by gumming or gummosis, which occurs in trees that have been worked on unsuitable stocks and in specimens growing in unsuitable or badly-drained soils, and sometimes in rich soils that cause them to make strong growths, which later have to be cut back. The cause of gummosis is not yet known, but it has been attributed to a fungus or bacterium, and is a common result of injury. A preventive is to afford the trees proper cultivation and to maintain a well-balanced growth in them, preventing any rupture of the bark. Remove all diseased leaves, and spray the shoots with self-boiled lime and sulphur wash. The other fruits were crushed in the post.

ROSE CRIMSON RAMBLER: *A. C. M.* This Rose was introduced from Japan by a Mr. Jenner, of Edinburgh. It was first named "Engineer," and afterwards "paniculata," before it appeared as Crimson Rambler.

TENNIS COURT: *J. M.* You do not read your *Chronicle!* The measurements of a tennis court were given on p. 40 of our issue for July 13 last.

TOMATO FRUITS: *Amateur.* The failure of your Tomato fruits to set is due to imperfect fertilisation. Tomato flowers rarely set unless they are well exposed to the light, which accounts for the bottom trusses often dropping. Being near to the damp soil, the conditions are not dry enough for the pollen to disperse, and, in the early stages, there are few insects abroad to effect pollination. You will find that, as the season advances, the upper trusses will set satisfactorily. Maintain fairly dry conditions, and tap the rods during the brightest part of the day to disperse the pollen.

TOMATO GROWING FOR PROFIT: *O. S., London.* A glasshouse, 200 feet long, of ordinary width, would not yield 8 tons of saleable Tomatos in one season. Indeed it is doubtful whether the 4 glasshouses would together yield a crop of 8 tons of marketable fruit. It is also doubtful whether Tomatos would realise £35 per ton, say, during the months of July, August, October, and November. This figure works out at 3¾d. per lh. or 5s. 9d. per peck of 12 lbs. This price is above the figure returned by the salesmen for one ton of graded Tomatos, including firsts, seconds, and thirds. A successful grower of Tomatos for the London Market once obtained 13 tons of Tomatos from plants growing in 12 houses, each 150 feet long and 15 feet wide, but he has never since been able under the same management to secure a similar weight of crop from the same number of houses. Two skilled men would be sufficient to attend to the cultural requirements of the Tomato plants growing in the 4 houses. The success or failure which would be likely to attend the purchase and working of the proposed acreage of land would depend on many circumstances.

WOODEN LABELS: *Wholesale Buyer.* Write to either Messrs. William Wood & Son, North British Wharf, Wood Green, London, or Messrs. Corry & Co., Ltd., 13, Finsbury Street, London.

SEEDING OF GERBERA.

I FREQUENTLY hear of failure to obtain seeds of Gerbera, notwithstanding careful efforts on the part of cultivators who have written me on the matter. The difficulty probably arises from a misunderstanding of the nature of the plant. In the first place it must be remembered that Gerbera, so far as many experiments have shown, is invariably self-sterile, just like the garden Cineraria. From one single plant of either alone it is impossible to obtain seeds, although pollen and stigmas may be in the best possible condition. Two individual plants in the case of many of the Compositæ are essential, and, given the two plants, seeds may be obtained upon both. In the second place, good pollen must be applied at the stage when the stigmas are in the right condition, which occurs in Gerbera almost immediately after the flower-head opens. This female condition, as it is called, gives way in two or three days to the male condition or pollen-producing stage. The styles have then disappeared, and pollen is produced within the anther cylinder. The anthers are syngenesious, i.e., they cohere in a ring. Usually the pollen is found issuing from the anther cylinder, but if scarce it can often be obtained by gently drawing up the anther cylinder between the two thumb-nails. Pollen may then be conveyed direct from the thumb-nails to the stigmas, which readily pick up every grain from any surface. I never find any difficulty in getting all the seed I require, and if the foregoing points are attended to, heads of seed ought to be obtained in nine cases out of ten, or it may be said, in every case. Healthy flower-heads are capable of producing seed, and it is unnecessary to consider whether the weather is sunny or dull at the time of pollination. Much more than has yet been done should be carried out in the crossing of Gerberas. I am sure that, if the same colours were crossed together, it would be possible to obtain a couple of dozen of the best shades true from seed, and, in order, therefore, to stimulate the activity of those who have time and means, I may say that some of the best and most charming colours are very rarely seen. It is probable that the necessary measures are not taken to secure them. From purest whites there should be shades of palest tints in pinks, salmon, and yellow to deep purple, orange and red, as many as are desired. Hybrid Gerberas are very easily grown in an intermediate house, or they may be planted out-of-doors close to a warm wall, but the delicate colours are not nearly so good when exposed to weather. Seed may be sown whenever it is ripe, but it is most conveniently sown, I think, in June. Sow as Nature seems to intend the seed to be sown, namely, stuck upright in the soil with the pappus and its stalk above ground. The young plants then grow straight up without having to bend from the horizontal to vertical. They must be grown on without check, either from drought or other cause, and they will then produce fine flowers in the following spring. The seedlings must be potted arranging the size of the receptacles so as to get the plants by two shifts into 5-inch pots for flowering. They should not be pricked off, because it involves an unnecessary disturbance of the roots in putting them into pots afterwards. Over-potting is worse than under-potting, and there is less danger in over-watering, perhaps, than there is in that care which arises from the knowledge that the plant comes from a country that is sometimes dry. The plants should be kept growing, as already remarked, without check, until they flower. The Begonia mite is a great danger to Gerberas, and must be guarded against. Fumigation before its effects can be seen is good, but dipping is also effective. *R. Irwin Lynch.*

THE MARKET FRUIT GARDEN.

Extraordinary differences in the weather of July were experienced in various parts of the country. My own register of rainfall for the month is just 1 inch, which fell in driblets on 15 days, three-fourths of the quantity being registered in the first three and the last five days. The intermediate portion of the month was a period of almost uninterrupted drought, during which time the land was extremely hard for hoeing, while the swelling of Plums and Apples must have been checked. On the other hand, heavy storms occurred in the Midlands, the north eastern counties, and parts of the north and west of England, and the weather was persistently rainy in some districts, including Evesham, in the latter half of the month, complaints of the splitting of Plums having been current in Evesham and Pershore. One or more of the heavy storms yielded in a few hours more than double my rainfall for the whole month. On July 28 a gale from the south-west set in, lasting, as usual, for three days, on the second of which the wind was most violent. The result was that in the Apple plantations the land was strewn with fruit, some trees of early varieties having lost one-third of their crops, which had to be sold at windfall prices. The gale appears to have been general throughout the greater part of England, and the loss from the meagre Apple crop must have been very serious. Late Apples were thin enough on the trees before the gale occurred, and now, of course, they are still thinner. At the time of writing, moreover, half a gale of wind is blowing, and this cannot fail to further reduce the Apple crop.

The American Apple Crop.

When high prices result from small production there is a measure of compensation to growers. This, however, is not likely to be the case in the present season, as the American Apple crop is reported to be one of the greatest ever grown. It is not secured yet, and results may disappoint expectations; but it is almost certain that our imports will be sufficient to secure cheap fruit for consumers at the expense of home producers.

The Plum Trade.

Prices for Plums started well, though not at prices higher than Early Prolifics have often commanded when the crop was at least double the very small one of this season. The fruit was generally undersized, while the weather was too cold to induce a full consumption of fruit. Still, at such early prices as 5s. to 5s. 6d. per half-sieve, growers who had even a quarter of an average crop might hope to pay expenses. But in the week ended on July 27 a tremendous supply of French and Spanish Plums—75,000 baskets, it was said—brought London prices down to 2s. 6d. to 3s. 6d. when Czars were in the markets. Growers, at the time of writing, are expecting a recovery in prices now that the French supply is nearly exhausted, as the home crop of Victorias is not a good one.

Continued Apple Dropping.

From all parts of the country complaints of the profuse dropping of Apples, even when the wind is light, continue to be current. In my own case, Duchess of Oldenburgh, which was a good crop, was gathered on the last day of July, because the fruits dropped daily. Such mid-season Apples as Lord Derby, Warner's King, and Worcester Pearmain are also falling from the trees more or less, while a moderate wind brings down late fruits. Many observers continue to attribute this dropping to the effect of the frost which occurred in most parts of the country when Apples were in blossom. But the evil could not well be worse than it is here, and no frost 4 feet above the ground level was registered by me after Apple blossom was expanded. In my opinion, the severe drought in May and the partial one in July should be held accountable for the misfortune. Allusion was made last month to Beauty of Bath as a variety peculiarly liable to dropping in any year, and doubt was expressed as to any fruit reaching full size this season. This fear was only too fully realized. Even when every coloured or striped fruit was gathered at frequent intervals, the ground under the trees was found strewn with fruit on the morning succeeding each partial picking, and at last the trees were relieved of the crops before any fruit had attained its full size. A portion of one orchard devoted to Beauty of Bath brought in over £48 last year, the trees being then 11 years old from the planting. This season, although more Apples than in 1911 set on the trees, the return was less than £13. From younger trees it was a mere trifle. On the other hand, The Gladstone and Irish Peach remained on the trees well, and the former was very fine fruit. Irish Peach was fine also on old trees, but half spoilt by scab and aphis on young trees. This variety is one of the worst for scab, and needs spraying for that disease two or three times. Duchess of Oldenburgh is also very subject to scab, and, although a great and regular bearer, it is not worth planting, partly on account of its liability to scab, and further because it is not big enough for cooking and not sweet enough for dessert.

Injury from Aphis.

The loss of value in the Apple crop due to aphis is probably even greater than that caused by dropping. Large proportions of my crops of Beauty of Bath, Irish Peach, Worcester Pearmain, Lord Grosvenor, and two or three other varieties less extensively grown were nothing better than what are termed "scrimps," and worth next to nothing for sale. As for the damage to young trees, it is pitiful. The trees have been gone over in my young plantations in order to thin out or spur superfluous shoots, and where shoots needed for permanent branches were found twisted and densely covered with leaves and spurs—common results of aphis attack—they have been cut back just below the twist, or at the bottom of it, and will be cut back to a sound wood bud on an untwisted part in the winter pruning. Many of the young trees of Worcester Pearmain and Beauty of Bath will need to be cut back to within a few inches of the trunks, if they are to have any chance of growing into trees of even fair size. This policy was pursued on the last occasion when there was a very severe attack of aphis, and the results were satisfactory. If the mutilated portions of trees are left to grow, the trees will never approach their proper sizes at maturity, while their shapes will be unsatisfactory.

Trees Stunted by Overcropping

Last autumn it was found that a number of Domino Apple trees, six years from the planting, were in danger of becoming permanently stunted in consequence of having fruited too profusely in three seasons. It was decided, therefore, to cut them back severely. Young shoots in the inside parts of the trees (Domino being liable to a great profusion of lateral growth) were cut out entirely or back to fruit buds, while those needed for extension growth were pruned just above the first or second wood, but from a main branch. The result exceeds expectations, though it must be mentioned that the trees had a liberal dressing of rotten cow manure. Vigorous young shoots have grown out this season, and the trees, or most of them, are bearing a moderate crop of very fine fruits after severe thinning. Some years ago a much more severe treatment of stunted Apple trees gave good results, in spite of the disadvantage of transplanting them. They were removed from the orchard in which they had been growing for four or five years, because it was believed that they were stunted beyond recovery, and they were planted thickly in the corner of another field on the chance of their bearing enough fruit to render them profitable. After being planted, or, rather, in the following spring, the trees were cut back to little more than stumps, and in many cases to wood buds so thoroughly dormant as to seem hopeless as sources of extension growth. The results exceeded the most sanguine expectations. Thickly planted as they were, the trees have had to be pruned somewhat severely to keep them from growing into each other. Otherwise they have had hardly any attention, and until this year they received no manure, while grass was allowed to grow around them three or four years after the transplanting. Yet, in proportion to area, this corner of once-despised trees has cropped as well as any other part of the fruit farm.

Suggested Meddling and Muddling.

Alarmed by the statement in the *Gardeners' Chronicle* of August 3 to the effect that the Board of Agriculture had made enquiries respecting a suggestion that Apples should be purchased only in ½ cwt. boxes, and that retailers should confine their purchases of cooking and eating Apples to a certain number of specified varieties, in order to make grading practicable, I wrote to the Board on the subject. The reply is to the effect that the Board did not recommend the proceedings referred to, but only made enquiries in order to ascertain whether they were desirable or not, which resulted in a general verdict against any such intolerable meddling and muddling. Growers would certainly resist any attempt to compel them to pay 6d. for a box, instead of ¼d. or ½d. for rail carriage or salesmen's baskets, in which to pack Apples worth, perhaps, only 2s. to 3s., the net prices per bushel received for great quantities of cooking Apples in many seasons. The boxes, it is to be borne in mind, are non-returnable, so that the grower, by using them for cooking Apples, would lose one-fourth to one-sixth of his return. The extra weight of boxes over that of wicker baskets would make his extra rail carriage about equal to the trifling reduction in salemen's commission. The uniform testimony of the salesmen whom I have consulted is that a given lot of Apples will not make a half-penny more in a box than in a wicker sieve or half-sieve. Indeed, they say that retailers, as a rule, prefer the wicker baskets. This fad for packing in boxes is an imitation of American and Colonial examples. For ocean transport of thousands of miles a rigid package is absolutely necessary, whereas for home transport of 5 to 50 miles, or even 100 to 200 miles, it is not necessary, and it would be a waste of money to adopt it in this country. Packing choice dessert Apples and Pears tastefully in boxes holding one dozen or two dozen fruits is a very different matter. As for the suggestion that retailers should boycott all but a small number of varieties of Apples, it is, fortunately, impracticable. If such a boycott could be established and sustained, it would necessitate the grubbing-up of thousands of acres of fine trees not in the list of selected varieties.

Uniform Grading.

We do not want uniform grading of fruit in this country any more than we need the like grading of Wheat. We grow too many varieties of Wheat here for grading to be practicable, as is universally admitted, and to grade Apples by size alone, firsts being such as would not pass through a ring of specified size, and seconds such as would be classed by means of a ring of a smaller size, would be equally unsuitable to our circumstances. Here, again, the demand for a strict system is an imitation of American and Colonial methods, without regard to circumstances. When dealers have to buy large quantities of Wheat or fruit unseen they must have precise grades to guide them. But in this country Wheat is bought by sample and fruit by bulk on sight, so that strict grading is not necessary. It is undesirable, because an Apple of medium size, if free from blemish, is a much better "first" than a bigger but imperfect Apple. No excuse is made for the unfair packing known as "topping." My own practice is to pack equally all through, but not with such strict uniformity as the tedious use of rings would involve. Moreover, I have not found it profitable to be too strict as to size, for on many occasions lots of fruit, all good enough for exhibition have realized no more than other lots less carefully selected. This applies to cooking Apples particularly, as buyers as a rule will not go beyond a certain price, even when every Apple is a fine specimen. When selling by the pound, retailers find it a convenience to have a few Apples of less than full size to make exact weight.
Southern Grower.

GAULTHERIA OPPOSITIFOLIA.*

Although nearly 60 years have passed since this beautiful evergreen was first described by Sir Joseph Hooker, it is still very rarely seen in gardens. We are indebted to Mr. T. Smith, of Newry, for the opportunity of illustrating the flowering spray shown in fig. 43. The species is found in mountainous situations in the northern island of New Zealand, and is only likely to be hardy in the milder parts of the British Isles, where it thrives in a soil and climate that suit the more tender Rhododendrons.

It is an evergreen shrub of dense, sturdy habit, found sometimes up to 8 feet high in its native habitat. From the other New Zealand Gaultherias it is distinct in having opposite leaves, which are sessile, heart-shaped, 1½ to 2½ inches long, concave, bluntly and sometimes doubly toothed. It may be added that, whilst the leaves are opposite on most of the shoots, they appear sometimes in whorls of three on the stronger, flowering growths. The flowers are white, urn-shaped, ⅛ inch long, very abundantly produced in a terminal panicle supplemented by axillary racemes, the whole forming a pyramidal inflorescence 3 to 4 inches long, and as much through. The fruit is a dry capsule.

RURAL DEPOPULATION AND ITS ARREST IN ENGLAND AND WALES.*

Although in England and Wales the tendency of the population of the rural districts to migrate into the towns or to emigrate abroad presented a serious problem during the latter part of the 19th century, the expression "rural depopulation" can only be applied to this movement in a relative sense. The population of the rural districts did not actually decrease, though it grew very slowly as compared with the urban population. Thus in 112 registration districts, which in 1901 were purely rural, there were 932,364 inhabitants in 1801, 1,324,528 in 1851, and 1,330,319 in 1901. Making a similar comparison for 105 of these districts which were still purely rural in 1911, we find that the population rose from 852,313 in 1801 to 1,212,548 in 1851, and 1,306,565 in 1911.

Meanwhile the population of England and Wales as a whole was growing with great rapidity, and, consequently, the proportion of the population living in towns was steadily becoming higher. In 1881 this proportion had already reached 67.9 per cent., and it rose to 72 per cent. in 1891, 77 per cent. in 1901, and 78 per cent. in 1911. It will be noticed that the increase in this proportion between 1901 and 1911 was only an additional 1 per cent., as compared with much larger increases in the two previous decades. It is apparent, therefore, that during the period 1901-11 the rate of increase in the rural districts can only have been slightly less than the rate of increase in the urban districts. The change which had taken place is, indeed, somewhat remarkable. Between 1891 and 1901 the population of the rural districts increased by 2.9 per cent., while the urban population increased by 15.2 per cent. Between 1901 and 1911 the rural population increased by 10.2 per cent., while the rate of increase of the urban population declined to 11.1 per cent. The rural depopulation had been arrested.

The significance of the foregoing facts is discussed in an article of which the first part appeared in the May issue of the *Bulletin of Economic and Social Intelligence*, published by the International Institute of Agriculture. The first part of the article endeavours to trace the causes of the slow growth of the rural population in the 19th century; the second part will discuss why the growth has been accelerated in the present century.

It was not on account of any diminution in the natural increase that the rural population grew so slowly, since the birth-rate is higher and the mortality lower in the country than in the towns. There was an actual exodus, a strong movement of population from the country to the towns or abroad.

The beginnings of this exodus are to be found in the "Enclosures" which took place in the 18th and early 19th century and completely revolutionised the agrarian system in England. Separate enclosed holdings were substituted for the old system of open fields divided into strips and common lands upon which all the villagers enjoyed rights of grazing cattle. The process was greatly accelerated by the introduction of improved agricultural methods—which could not have been successfully adopted on the scattered strips—and by the high prices which prevailed during the period of the Napoleonic wars. When lands were enclosed, many villagers were deprived of grazing rights of which they could not adduce legal proof, and others were obliged, for want of capital or tempted by the high price of land, to sell the holdings allotted to them. As a result, a large proportion of those who had previously had rights in the land became mere wage-earning labourers.

It was from this class that the rising industries of the towns drew their supply of labour, and though, as long as the prices of corn remained high, there was a large demand for agricultural labour, a movement towards the towns set in. When, at the close of the Napoleonic wars, the price of Corn fell, the industrial development became even more rapid. At the same time the demand for agricultural labour tended to decrease, since meat-production became more remunerative than Cereal-growing, and much land was laid down to grass.

It was not, however, until towards 1875 that the prices of Corn began to fall very seriously. About this time, owing to the development of the means of transport, the United States and other great Corn-producing countries began to send enormous quantities of Grain to England,

* Summarised from the *Bulletin of Economic and Social Intelligence*, published by the International Institute of Agriculture, 1912.

and prices rapidly dropped. The conversion of arable land into pasture became accelerated and, in the cultivation of Cereals, machinery or seasonal labour was largely substituted for the employment of regular labourers. Following upon foreign competition in Corn, came the importation of frozen or chilled meat, and an agricultural crisis resulted, in which much land went out of cultivation altogether.

The fluctuations in the fortunes of agriculture inevitably reacted on the rural population, but other causes were also at work to check its growth. Amongst these the article mentions the disappearance of manufactures from the rural districts owing to the centralisation of industry in the towns, and the decline of milling and other industries subsidiary to agriculture. The rise in wages tended to reduce the amount of labour which the farmers could profitably employ, while the spread of education and the general rise in the standard of living produced a discontent with rural conditions, which was aggravated by the dulness of rural life and the superior attractions of the towns. Yet another cause of the exodus has been a serious want of proper housing accommodation in the country districts.

FACTS AND FANCIES RESPECTING EARTH-WORMS.

Much attention has been paid to the study of the earth-worm during recent years. This is in part due to the interest aroused by Darwin's work on *Vegetable Mould*; in part also to the wonderful fillip which has of late been given to nature study. One of the old fancies which has given way before the march of science relates to the number of species. A few years ago it was popularly imagined that all earth-worms belonged to one species. This was called the earth-worm, the lob-worm or the dew-worm, and was entered by the learned in the up-to-date text-books as Lumbricus terrestris. It would surprise our grandfathers if they looked round our gardens today and heard us speaking, not of Lumbricus only, but of Allolobophora, of Octolasium also, and Eisenia, of Dendrobæna and Aporrectodea; while they would probably regard the statement that British earth-worms number no fewer than 40 species with open-eyed incredulity.

It is still popularly supposed by many people that, when a worm is found which has a swollen part near the mid-region, it is an indication that the creature has grown together after having been cut in two. We now know that this swelling is composed of special cells, and has as its function the secreting of a chitinous substance which forms the egg capsule or cocoon. We call it the girdle, or clitellum, and the position it occupies, the number of segments it covers, together with the presence or absence of tubercula on the ventral surface, are among the most reliable means of enabling the student to determine the genus and species. In each of our four species of Lumbricus, as well as in the genus Octolasium, the girdle always covers six segments, and has a band on each side ventrally.

Some of the most curious facts which have come under my notice relate to the variations and abnormalities to which worms are liable. The variations are frequently of value as suggesting how different species may have arisen; and it is curious to observe the stability of some of the species as contrasted with the instability of others. Some of our annelids are still in such an unstable condition that it is very difficult to draw up a satisfactory list of characters, while others, once seen, may be infallibly relied upon to turn up again true to type.

Sometimes one finds that the rings undergo fission. If the brandling—well known on account of its brown and yellow bands—is examined, it will be pretty sure to show one or more of the rings forking (fig. 47). I have found a specimen in which no fewer than four of the bands had the form of the letter Y. Equally liable to variation with the brandling is the green worm (Allolobophora chlorotica). In colour, shape, size, activity or sluggishness, and other particulars it is one of our most protean species. In addition to the more patent variations, there are others relating to the internal organs and the external tubercula on the girdle. Twenty years

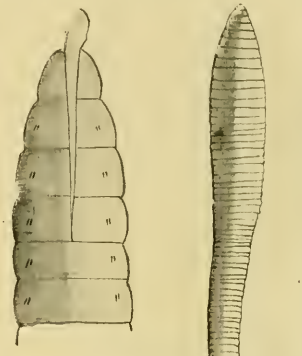

Fig. 44.—"hare-lip" in allolobophora chlorotica.

Fig. 45.—allolobophora longa, with forward pointing out-growth.

ago Woodward published some papers on the subject in the *Proceedings* of the Zoological Society of London, in one of which he gives the following list of species studied:—

Allolobophora longa Ude, 23 specimens: 17 normal, 6 abnormal. Allolobophora turgida Eisen, 13 specimens: 9 normal, 4 abnormal. Lumbricus terrestris Linn., 8 specimens: 6 normal, 2 abnormal. Lumbricus rubellus Hoffm., 4 specimens: 2 normal, 2 abnormal.

It is possible that some of the variations are induced by the action of parasites, of which a large number of different kinds are now known to infest all the various species of annelids.

Some years ago I discovered a specimen of the green worm which showed a peculiarity, whose character is best expressed possibly by the term "hare-lip" (see fig. 44). But perhaps the form of abnormality which most frequently occurs is that of the double-tail, or bifurcation. From the letters which I have received, the observations I have made, and the papers to which I have had access, I should say that one or other of these anomalous forms is not excessively rare. So long ago as 1779 Dr. Bonnet drew attention to such peculiarities, and from that time till this frequent allusions have been made thereto in English, Continental, and American literature. In 1888 Mr. Broom, of the Glasgow University, wrote an article on a *Monstrosity of the Common Earth-worm*. Like a good many other students in those times he confused Allolobophora longa with Lumbricus terrestris, but his details clearly indicate that it was not the latter. He alludes to a paper by Prof. Jeffrey Bell, relating to two specimens of earth-worms with bifid hinder ends, published in 1885, and a *Note on a Double Earth-worm*, by Mr. C. Robertson, which appeared in 1867, together with other similar notices.

But perhaps the most exhaustive account of bifurcated annelids that has ever been published is that by Mr. E. A. Andrews, which appeared in 1892 in the *American Naturalist*. His list of authors, which is far from complete, contains 15 items, and since that time the list has been greatly extended. The illustrations which accompany the article show twin heads as well as forked tails, and further illustrate the fact that the abnormalities are to be found among water-worms as well as among earth-worms, and among marine polychæts as well as terrestrial oligochæts. Broom and Andrews both attempt an explanation of the phenomena, but many points still remain obscure, and it is much to be hoped that our readers who may have the good fortune to find peculiar specimens will forward them to some expert for record, examination, and preservation. The bifurcations assume various forms, suggesting that the causes which underlie their formation are also various. Sometimes both tails point backwards (fig. 46); at other times one has the appearance of a forward-pointing branch (fig. 45). Most usually the two ends are of similar length, but occasionally they are not paired. This may be best understood by means of the illustrations.

Up till the present I have never met with a case in which the abnormal worm has reached maturity, which is determined by the presence of a girdle. This would seem to suggest that twin forms are not the best for success in life. It is easy to see that in most cases the double tail would be a serious handicap, and expose the animal to unusual perils. Hence we may assume

Fig. 46.—bifurcated annelid.

Fig. 47.—bifurcated bands in brandling.

that only a small percentage of abnormal forms come under the observation of gardeners and others, since their span of existence is usually much shortened.

As I have indicated, the subject is not without its value to the physiologist and others, and I will again express the hope that those whose attention is arrested by the sight of unusual forms will help us to make the study complete. It would be well to place specimens direct into wide-mouth bottles with strong methylated spirits, or a five per cent. solution of formalin.

Hilderic Friend.

TREES AND SHRUBS.

XANTHOCERAS SORBIFOLIA.

An exceptionally fine specimen of this tree, 22 feet in height with a bole of 16½ inches in circumference, may be seen in the Cambridge Botanic Garden on a wall of the Curator's house. It is, perhaps, the tallest specimen to be seen anywhere. Mr. Meyer, who has had a wide experience in plant collecting in Mongolia and Northern China, was greatly surprised at the height of this specimen, and told me that in its native country, namely, Mongolia, although it is often seen with a larger bole than the Cambridge specimen, it never becomes anything more than a stunted tree. When grown in the open ground in this country it generally forms a bush.

It is a valuable spring-flowering shrub, besides being a very handsome foliage plant throughout the summer. In April it produces a profusion of lateral racemes 8-10 inches long. The flowers are white, 1 inch in diameter, and the petals have a reddish tinge at the base. The leaves are of a fresh green colour, 12 inches long, opposite, pinnate, and the leaflets deeply serrated.

The species was first discovered by Dr. Bunge about 1827. It was not, however, until 1867 that the plant was introduced, when Abbé David sent plants to the Jardin des Plantes, Paris. In its native habitat it is found growing with Koelreuteria paniculata.

On account of its hardiness and free-flowering properties it is a very valuable plant for forcing. Small, sturdy plants 2-3 feet high may be lifted from the open ground in the autumn, potted up, and brought into the forcing house, and will be found very useful for decorative purposes during the early months of the following year.

Propagation may be effected by means of root cuttings or by seeds; the latter, however, are very scarce in this country. Stem cuttings are seldom successful.

Xanthoceras sorbifolia apparently is no more particular about soil than a Wistaria. The specimen at Cambridge flourishes with its roots beneath a gravel path. *R. Stewart Lynch.*

ABUTILON VITIFOLIUM.

There is something especially attractive about this handsome Abutilon (see fig. in *Gard. Chron.*, Sept. 29, 1894, p. 373), with its elegant habit of growth and the graceful manner in which its lovely lavender or lilac-coloured flowers depend from the branches. It is of doubtful hardiness in many places, and even in the south of Scotland it can only be planted in favoured districts and specially-selected positions. There is a well-grown specimen of great beauty in the gardens of Sir D. Carrick-Buchanan, at Corsewall, Stranraer, where many reputedly tender shrubs and trees grow to perfection. When in bloom it was very beautiful with its profusion of softly-coloured flowers. Personally, I prefer the type to the variety with white flowers, and, though I have failed to establish it in my own garden, which is not so favourably situated as Corsewall, I was delighted to see it flourishing so well there.

DESFONTAINIA SPINOSA.

The congenial character of the climate of a considerable part of the west of Scotland is particularly evident in the south-west, especially along the coast line, and in Wigtownshire there are many gardens which reveal this mildness of climate very strongly. For example, in the gardens of Corsewall House there are some fine plants of Desfontainia spinosa. The plant flowers well annually. *S. Arnott.*

THE ROSARY.

ROSE LADY WATERLOW.

Lady Waterlow, while one of the most beautiful, is also quite one of the most distinct of the perpetual-flowering climbing Roses. It is an H.T., said to have been raised as a seedling from La France de '89.

The foliage is a light shade of green, as also are the young stems; hardy, most attractive and unlike that of any other Rose. The buds are specially beautiful, of a very striking colour, which may perhaps be described as a brilliant mixture of orange and cherry colour; this changes entirely as the flowers open to a soft salmon blush edged and tinted with carmine. The flowers look very fresh, but are best before they are fully open, as they are only semi-double and when fully expanded are rather wanting in form.

It is one of the earliest of garden Roses, the first crop of bloom appearing usually about the last week in May and lasting till the third week in June. The second crop comes into flower in the middle of July, and a third crop of flowers is produced early in September. Its

Fig. 48.—Eucalyptus globulus at Torquay.
(Height 32¾ feet.)

normal periods of flowering just miss the usual dates of Rose shows, and consequently it is seldom seen, but this year has proved to be an exception to the general rule. My first crop of flowers began to appear on May 11 and the second crop the end of the first week in July. In consequence of the early season the flowers became available for the July shows, and so I was able to notice a good many fine bunches of this beautiful Rose in the decorative classes.

Lady Waterlow was distributed by Nahonnand as long ago as 1903, but has not become nearly so well known as it deserves. No doubt this is in part owing to its period of flowering, which is adverse to its being often seen by the public who frequent Rose shows, and partly to the fact that it never looks its best in a bunch. I think, in order to appreciate it at the exhibition one must have the memory of the charming combination of flower and foliage to be found upon the plant. Be this as it may, it certainly deserves a good place in the garden were it only for its freedom from diseases and pests. A French writer recently stated that it is happy in the sun and does not fear the shade, and, while quite exempt from disease, "whether white or red," its foliage is the first to come and the last to fall, and that even insects do not trouble it and neither aphis nor caterpillar will touch either leaf or flower. So far as my author goes I am with him, for I have never found Lady Waterlow to suffer much from mildew or rust, and though I should not like to speak positively about the caterpillars I certainly have noticed it is wonderfully free from aphis. But though proof against white or red disease, I must regretfully admit that it is not incapable of attack from the black one. Black spot is one of the worst and most infectious diseases that trouble the rosarian, and I have occasionally found it even on the variety Lady Waterlow.

On their recent visit to this country, some of our American friends told us the ravages of this fell disease were so great in their country that they had been driven to growing their Roses principally under glass. The English rosarian should take warning and lose no opportunity of combating this insidious and disfiguring enemy.

But though not immune, Lady Waterlow is not badly subject even to this disease, while its record in other respects is almost unique. Beside this it is wonderfully hardy. My French friend mentions that he grows 30 trees of this Rose in a garden fully exposed to the north, and has never lost a plant. It is equally hardy in this country, and I have never found any of my plants the least troubled by the harder winters. Then it is not at all particular as to soil. I have it growing excellently in a fairly rich south border against a low wall, and in an abnormally dry and poor soil against a west fence a young plant is making fair growth and holding its own among the roots of fruit trees, and, again, it will do well on an open pillar. I think it is best, however, where it can be managed, if the plant is trained more or less fan-wise. By this method the wood is better ripened and more flowers are produced from the joints than is the case when it is tied to a stake. But this is of comparatively little importance: it matters less where you grow it than whether you grow it, for it is very fairly accommodating.

In common with nearly all Roses of this soft pink colouring, Lady Waterlow is somewhat readily spoilt by rain. But it never balls, its thin flower prevents this, nor are the buds much damaged, and if the injured flowers are cut off the numerous buds soon supply their places, and curiously enough it is the early and late flowers which are best, not the summer flowers, when fine weather is most to be expected.

It may be thought strange that a Rose with the good qualities and beauty I have referred to should have found no place in the Nickerson awards, but it is to be remembered that from the conditions in which these were determined they necessarily went to well-known Roses which have proved their value beyond dispute, and that is perhaps not the case with Lady Waterlow.

To sum up, the strong points of this Rose are its fine and attractive foliage and the beautiful colouring of bud and flower, specially lovely when contrasted with their own foliage; and its hardiness and freedom from pests and diseases. The weak ones lie in the want of form in the expanded flower and its liability to damage by rain. *White Rose.*

EUCALYPTUS GLOBULUS IN THE OPEN.

The large specimen of Eucalyptus Globulus illustrated in fig. 48 is growing in the gardens at Manor House, Torquay, the residence of Sir Francis Layland Barratt. We are indebted to Mr. George Paul for the opportunity of figuring the plant, also for the following particulars:—"The circumference of the trunk at 2 feet from the ground is 4 feet 6 inches; the height is 32 feet 6 inches, and the diameter of the head 25 feet 6 inches. The tree would grow much higher if the top branches were not broken periodically by the wind, as the situation is an exposed one I understand that the tree was planted more than 25 years ago."

THE FORESTS OF PROVENCE.

(Continued from p. 90.)

Quercus suber, the Cork Oak, not only occurs as isolated trees among the maritime Pines, but also forms pure woods which are regularly exploited for their bark, and the preparation of bottle corks and sheet cork forms the staple industry of such towns as Collobrières, Grimaud, and La Garde Freinet in the Maures. I have seen no Cork Oak tree either in the Maures or the Esterel which was not exploited for its bark. The Cork Oak is apparently strictly confined to the siliceous tracts.

Just as "garigue" corresponds with Aleppo Pine-woods, so does "mâquis" (in which Erica arborea is frequently dominant, but which is often a mixed association of many shrubs) correspond with the woods of maritime Pine and Cork Oak. On some of the drier hillsides the "mâquis," like the "garigue," does not form a close scrub, but has its constituent bushes growing separately with bare soil or rock between. Where the soil conditions are better, however, the scrub is often thick, though never so high and luxuriant on the coast of Provence as it is said to be in Corsica and other Mediterranean islands. Calluna vulgaris is quite abundant in the mâquis and the more open woods in many places.

Pinus maritima is not confined to siliceous soils in Provence, though it is often stated to be one of the most pronounced of "calcifuges," and Fliche and Grandeau confirmed by experiment the antagonism of the tree to calcareous soils. Nevertheless, in eastern Provence at a certain height above the sea, near the altitudinal limit of P halepensis, on limestoue soils giving a strong calcareous reaction, P. maritima flourishes in considerable numbers, forming woods sometimes pure, sometimes mixed with P. halepensis. This fact has been observed repeatedly, though what its significance may be I am unable to suggest.

I do not know if hybrids between the two closely-allied Pines, P. maritima and P. halepensis, have been recorded. I have repeatedly examined the trees where the two species grow together, e.g., on the siliceous soil of the island of Porquerolles off Hyères, and on the limestone hills just mentioned. but apart from one or two obscure cases I have been unable to find any trees with a clear mixture of characters. It is true that P. halepensis flowers earlier than P. maritima : thus near the coast the former flowers in the middle of March, and by the end of the month this year (1912) the male cones were dry and shrivelled, while in similar situations on siliceous soil the cones of P. maritima were not yet ripe. At the end of the first week in April, however, at six or seven miles from the coast and at an altitude of 300 to 400 metres, where the two species were growing together near Vence, the male cones of P. halepensis had not lost all their pollen, while those of P. maritima had just dehisced; and at 500 metres altitude, 15 miles from the coast, the pollen of the former species was still being distributed, and the male cones of the latter, though not open, were evidently on the point of opening, while the female cones were apparently receptive. Hence we may conclude that in these latter habitats at least there is a certain overlap in the period of flowering, and it would indeed be strange if two such closely-allied species did not cross.

Fig. 50.—THE FORESTS OF PROVENCE.
Deciduous trees (Alders, Willows, &c.) along the banks of the Aille, with Pine wood on each side on the dry ground.

The third species of Pine which occurs wild on the coast of Provence is P. Pinea, the Stone or Umbrella Pine. This forms very characteristic woods (fig. 49) on the littoral sands at several places, e.g., at La Bocca and La Napoule west of Cannes, at La Foux (near St. Tropez) on the coast of the Maures, and at La Plage d'Hyères and on the neighbouring isthmus leading to the peninsula of Giens. The umbrella-shaped tops of these Pines cast a very dense shade, and little or nothing will grow beneath them. Both the other species, P. halepensis and P. maritima, also occur on the sands, often accompanied (e.g., on the Giens isthmus) by a luxuriant growth of the "mâquis" or "garigue" shrubs, e.g., Pistacia Lentiscus and Juniperus phœnicea, reaching a height of five metres, Spartium junceum, three metres, and so on. No doubt the maritime sands have some peculiar features in their vegetation, but I have only examined them in winter when the plants which perennate underground were not visible, and at that time the vegetation, with the exception of the conspicuous woods of Stone Pine, is much like that of the coastal hills. Pinus Pinea is not quite confined in Provence to the coastal sands. I have seen it apparently wild (at least in situations where it is unlikely to have been planted) on shales several miles inland, near Les Arcs and Le Muy in the valley of the Argens.

The banks of the rivers near the coast show a most striking difference in their vegetation from the coastal hills. Instead of forests of Pine and evergreen Oaks with evergreen shrubs they are lined with deciduous trees—Poplars, Willows, Elm, Ash, and Alder, just as in central and north-western Europe (see fig. 50).

If one ascends a hill 800 metres high a few miles only from the coast, the vegetation

Fig. 49.—THE FORESTS OF PROVENCE: ISTHMUS DE GIENS.
Wood of Pinus Pinea (Stone or Umbrella Pine) on maritime sand with salt lagoon in foreground.

undergoes a certain change as the summit is approached. Some of the common Mediterranean shrubs become scarce and disappear, and alongside of those which persist other species appear. Thus while Juniperus oxycedrus remains, J. communis comes in. Rosemary and Cistus albidus remain, while C. salvifolius and C. monspeliensis disappear. Lavandula Stoechas goes and is replaced by L. spica; and Genista cinerea and Cratægus appear. Thus a distinctly modified garigue in which northern types are represented is established. The appearance of Pinus maritima mixed with P. halepensis has already been mentioned. Sometimes, on the northern slopes, isolated trees of P. sylvestris occur, and it is rare for P. halepensis to co-exist with the northern species, though such co-existence does occur. The appearance of the former is usually the signal, so to speak, for the departure of the latter.

On such a hill, then, we have distinct indications of a zonation in many respects parallel to that which is developed on a large scale further inland as the general level of the country rises.

2.—The Deciduous Woods of the "Montane" Region.

Quercus pubescens, which has already been mentioned as an occasional tree of the typical Mediterranean forests, acquires a much greater vegetational importance as we pass inland. The low hills (circa 350 m.) to the south of Vence, about five miles from the sea, have this species freely mixed with Pinus halepensis, and in places pure woods of it are met with. The undergrowth is still purely Mediterranean. On northern slopes the Pine disappears, and mixed with the Oaks we have Ostrya carpinifolia in considerable quantity. Quercus Ilex is also associated in such situations. The same vegetation is met with on the sides of narrow ravines running north and south, such as the famous Gorge du Loup, Ostrya occupying the sites most protected from the sun. Further inland still and at higher altitudes Pinus halepensis disappears altogether, even on slopes with full south exposure, though it penetrates for some distance further along the sunny slopes of the larger valleys, such as that of the Var. Quercus pubescens is now the dominant tree, forming woods on the plateaux at 1,000 metres altitude, 10 miles from the coast. The true Mediterranean flora has practically disappeared, and the evergreen bushes are replaced by deciduous shrubs, such as Corylus Avellana, Prunus spinosa, Cratægus, Viburnum Lantana, Rosa and Rubus spp., with Lavandula spica, Helleborus fœtidus, Mercurialis perennis, Anemone hepatica, Primula veris, Potentilla verna, and Viola odorata on the ground.

On northern slopes at this level Beech is met with, and accompanying it Holly and Box, the latter being extremely abundant from this point northwards. The Beech forms local woods on these northern slopes, replacing Quercus pubescens, but its finest development belongs to a slightly higher zone, where on very steep northern slopes protected from the south by precipitous rocks it replaces Pinus sylvestris, as in the famous forest of Ste. Baume, not far from Marseilles. When denuded of timber a very characteristic plant association, a kind of modified garigue, occupies the rocky hillsides for many square miles. Ninety-nine per cent. of the low, shrubby vegetation, consisting of isolated bushes with bare rock between and rarely exceeding 2 or 3 feet in height, is composed of three plants, Buxus sempervirens, Lavandula spica, and Genista cinerea (fig. 51).

A. G. Tansley.

(To be concluded.)

NOTES FROM LEONARDSLEE.

Amongst rare and uncommon plants in flower at Leonardslee Gardens, Horsham, Sussex, is Osteomeles anthyllidifolia. This interesting Chinese evergreen grows from 6 to 10 feet high, and bears graceful, pinnate foliage and white flowers, resembling those of the Hawthorn, but with a pink eye. The flowers are succeeded by berries, which turn a hoary-black colour when ripe. Philadelphus purpureo-maculatus, a cross between P. Fantaisie and P. Coulteri, has large, pure-white flowers with rosy-purple centres, being altogether a very distinct and pretty shrub.

Cornus Kousa is bearing a mass of its lovely white, four-petalled flowers. A tree in the neighbouring garden at South Lodge, from 15 to 18 feet in height, is a beautiful sight.

Cornus florida rubra has been extremely beautiful this season, and, when gently shaken by the wind, the blooms look like so many pink butterflies. Several trees have bloomed finely in these gardens this season.

Chionanthus virginica, the North American Fringe Tree, is very pretty with its long, pendant clusters of pure-white flowers. The plant requires partial shade. Styrax Obassia is one of the finest flowering trees of Japan. It forms a tree of roundish shape from 10 to 15 feet high, and bears waxy-white Snowdrop-like flowers in long, dropping racemes. The blossoms are very fragrant and freely-produced, being set off by the large, lustrous-green leaves 6 to 8 inches across. It forms a beautiful shrub or tree for the background of a large border, and is apparently quite hardy; it does well planted in loamy soil. Styrax japonica is a dazzling mass of bloom; one specimen, 15 to 18 feet high, has many thousands of flowers, like pendant Snowdrops. The plant flowers when quite young.

Fremontia californica, against a wall, is flowering profusely nearly 20 feet high. The bright yellow, wax-like flowers are cup-shaped, being 2 to 3 inches across. The shrub remains in bloom for a long time.

Plants of Viburnum tomentosum Mariesii have been very full of bloom. The branches grow horizontally, and the flowers vertically, so that a flowering specimen may be likened to a table of flowers. A plant of Crinodendron Hookeri growing in an exposed position is covered with its brilliant coral-red, wax-like flowers. It is planted on a fairly high and well-drained situation. The plant requires plenty of water at the roots, but resents a stagnant soil. Carmichælia flagelliformis is covered with its pretty, small, Pea-shaped flowers. The beautiful Plagianthus Lyallii forms a fine ornamental plant; the flowers are white and 2 inches across, with a tuft of golden stamens. The rare Californian shrub Dendromecon rigidus has bright, glaucous foliage and yellow, Poppy-like flowers. It does best when planted in poor loam against a south wall. Olearia Gunniana has been splendid, and O. macrodonta and O. myrsinoides are wonderfully well flowered. O. nitida has flowered profusely, whilst O. insignis, which requires a warm and sheltered position, is just opening its flowers. We have also O. Forsteri, O. purpuracea, O. Haastii, O. nummularifolia, O. stellulata, O. moschata, O. odorata, O. dentata, O. illicifolia, O. pannosa, O. argophylla, O. Traversii, and O. oleifolia. A tree of Stuartia grandifolia nearly 30 feet high is just opening myriads of large, waxy-white flowers.

Ozothamnus thyrsoides has flowered so abundantly as to hide the graceful, narrow foliage. The species is perfectly hardy, and can be propagated easily from cuttings. The New Zealand Celmisias, C. Munroi, C. holosericea, C. spectabilis, C. Mackayi, and C. hieracifolia, have survived two winters and flowered very well. The large, Daisy-like flowers are very attractive in suitable positions in the Alpine garden. The extreme dampness of our climate will, I think, prove harmful to the plants.

Hudsonia ericoides is flowering freely in the Alpine garden. The plant has a partial trailing habit, and produces pretty yellow flowers.

Hypericum fragilis is a very free-flowering species, but not too robust. H. Coris grows about 18 inches high and produces myriads of small, golden-yellow flowers. H. Moserianum, H. Henryi, and H. cernuum are other desirable St. John's Worts. Fabiana imbricata, a Chilian evergreen, Heath-like shrub, produces large, waxy-white, tubular flowers which are developed in clusters on every shoot. Specimens at Leonardslee, from 6 inches to 6 feet high, are all bearing flowers. *W. A. Cook, Leonardslee Gardens.*

The Week's Work.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Campanula pyramidalis. — Although the chimney Campanula is largely grown in pots for conservatory decoration, this old-fashioned biennial is also a valuable plant for the flower-borders. It is quite hardy, and will succeed in any good garden soil; but if a little rich loam is added to the soil at planting time the plants will grow more luxuriantly. Seedling plants of Campanula pyramidalis exhibit slightly different shades of blue, and have a long flowering season. C. pyramidalis alba is also a desirable border plant, and may well be grown in association with the blue varieties. There is a dwarfer form known as C. pyramidalis compacta; this variety is useful for placing at the front of borders, and in other situations where the taller varieties would be inappropriate. The flower-spikes should be secured to slender but firm stakes, or they will be in danger of being snapped off at the base during stormy weather. As they have no decorative value during the first year, it is advisable to grow the seedlings in the reserve garden where they should be encouraged to make strong plants for placing in the permanent positions in the autumn. Keep the ground clean, and occasionally dust the plants with soot during showery weather.

Monarda didyma (Bergamot). — This favourite plant is now very ornamental in the hardy flower border. A few good clumps add a warm note of colour, in deep contrast to the many plants with yellow or white flowers which often predominate at this season. The improved variety "Cambridge Scarlet" has larger heads of deeper-coloured flowers than those of the type. On cold and wet soils the Bergamot has sometimes a tendency to die during the winter. In such situations a reserve stock should be lifted in the autumn, planted in boxes, and placed in a cold frame during inclement weather. In the spring this reserve stock of plants should be divided into small pieces and replanted in the borders. Advantage should be taken of this opportunity to add some rich soil before planting, as the Bergamot readily responds to generous treatment.

Gladiolus.—The flower-spikes of Gladiolus should be secured to suitable stakes without delay. Hoe the ground at frequent intervals, and, if very dry weather is experienced, apply copious waterings whilst the spikes are still developing, drier conditions being desirable when the flowers are actually open. Let the watering be followed by a mulch of some light material to conserve the moisture in the soil. Good varieties to name are procurable at reasonable prices, and when these are arranged in groups towards the front of the mixed borders they have a very fine effect.

Hollyhocks.—For some years the cultivation of the Hollyhock was next to impossible owing to the rust fungus "Puccinia malvacearum," which seemed chiefly to attack the old stools. In many gardens it is now found that, by growing fresh stock each season, the plants are not so badly affected by the disease. Though fairly good results can be obtained by sowing early in spring, stronger plants are obtained for early planting by sowing in August or September. The seed should be sown in pans of light soil, and placed in a cool, shady frame till germination has taken place. Prick out the seedlings in boxes and grow them quite hardy; as soon as the plants are large enough pot them into 5 or 6-inch sized pots, so as to obtain strong plants for planting early in April of next year.

The Water Garden.—Frequent attention should be given to Nymphæas and other water plants, removing all decaying leaves and flowers at frequent intervals. Where strong-growing plants, such as the sweet flag, Acorus calamus, and Cyperus longus, are associated with Nymphæas, care must be taken that the latter plants do not suffer from encroachment. Where space permits Arundo conspicua should be planted by the waterside, as this plant gives a fine effect long before the Pampas grass comes into flower.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Summer Pruning.—The work of summer pruning should be completed as soon as possible after this date, so that sun and light may have free access to all parts of the trees. If the directions given in previous articles have been carried out, little now remains to be done with the exception of removing any superfluous shoots which were overlooked at the time of pruning. Some of the trees will be found to be throwing out one or two extra strong extension shoots, and as these absorb a great deal of the sap they should be pinched back to above the sixth leaf, which will cause a more general diffusion of the sap and a proportionate extension of the trees: for if these grosser shoots are left to grow they destroy the balance of the tree. Cleanliness being essential to the health of the plants, thoroughly wash the trees with water from the hose at short intervals to rid them of insects.

Peaches and Nectarines.—It is necessary to frequently look over these trees and keep the lateral shoots persistently pinched in at the first leaf. The fruits should be fully exposed to the light and air by removing a few of the leaves covering them, or by fastening them back. Trees that are carrying heavy crops should be assisted occasionally with either liquid manure or applications of an approved artificial manure at short intervals after the fruits have been gathered, the best time to apply these stimulants being just before rain is expected. Carefully tie in all growths that are required for fruiting next season, and remove any other shoots that have been overlooked, in order to avoid overcrowding. The trees should be syringed every afternoon about 4 or 5 o'clock with soft water, and occasionally with an insecticide, to keep them free from the attacks of red spider, until the fruits have changed colour. The earliest varieties of Peaches require to be thinned freely in order to obtain good-sized fruits. In gathering the fruits these must be most carefully handled or they will suffer from bruising.

General Work. — The recent unsettled weather has been against the gathering of ripe fruits for preserving, and it is necessary that the fruit should be gathered for this purpose when dry. Extra help is needed when the weather is favourable, so that the fruit may be gathered quickly. All ripe and ripening fruits should be adequately protected from birds. A good washing with some approved insecticide should be afforded to sweet Cherries and other trees from which the fruit has been gathered, using an approved insecticide to destroy insects. Weeds have been very numerous this season, and much labour has been expended on hoeing to keep them in check. Examine all trees affected with American blight, and dress them as recommended in the calendar for July 27. It will be well to guard against earwigs on Apricot trees, as they are very destructive to ripening fruits. They may be trapped by means of pots and boxes filled with hay, examining the traps each morning to destroy the insects lodged in them.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Early Muscat Grapes. — When most of the Muscat Grapes have been consumed, the remaining bunches should be cut with a portion of the shoot and placed in bottles in a cool room, where they will keep in good condition quite as long as if left on the vines. The house can then be thrown wide open and the foliage subjected to vigorous syringing. If the leaves are affected with red spider or thrip, no effort should be spared to destroy these pests, it being important that the vines should retain their foliage as long as possible. Give the roots a good soaking with clear water, and follow this with some diluted liquid manure, provided the roots are in a healthy condition.

Late Muscat Grapes. — During cold, wet weather the hot-water pipes must be kept fairly warm to encourage a buoyant atmosphere. The weather during the past month has been very unfavourable for late Muscat Grapes, and should it continue for any length of time, every means must be adopted to encourage the bunches to finish well by the end of September. Where the foliage is so dense as to exclude light from the bunches, it must be drawn aside so that they may be partially exposed to the sun's rays. All lateral growths must be removed before they become too large. Do not distribute excessive quantities of water in the house during sunless weather, nor open the ventilators without exercising extreme care. When the roots are in need of water, let this be afforded on a warm, sunny day, when the ventilators can be thrown wide open. Outside borders should receive some protection during heavy and continuous rains, especially if the natural soil is heavy and retentive.

Other Late Grapes.—There is not much difficulty in ripening such varieties as Black Alicante, Appley Towers, or Gros Maroc, but Lady Downe's Seedling, Gros Colmar, and Lady Hutt need a longer season in which to ripen their fruit. I have found Lady Hutt far more difficult to finish than Muscat of Alexandria, and it requires to be perfectly ripe in order to be capable of keeping over a long period; indeed, I have never known it to keep longer than the Muscat. It is inferior in every way, and cannot be recommended as a late, white Grape. Lady Downe's and Gros Colmar should be grown in houses by themselves. Gros Colmar will continue to ripen its bunches right up to the end of the year. Any outside borders should be covered, as recommended for Muscats.

The Orchard House.—Place the pot-trees out of doors in a sunny situation when the fruits have been gathered. Plunge the pots in ashes, to prevent damage by rough winds and to keep the roots cool and moist. All lateral growths may be shortened, and where the branches are becoming too thick they should be thinned, so that the young fruiting wood may get thoroughly ripened by proper exposure to the sunshine and air. During hot weather the trees must be syringed frequently, and the roots will need plenty of moisture; diluted liquid manure may be afforded about twice a week. Later trees on which the fruits are swelling will require an abundance of moisture at the roots. Stimulants also must be given frequently till the fruits are actually ripening; at this latter period encourage a free circulation of air in the house, discontinue syringing, and keep the atmosphere somewhat drier. During cold, wet weather, the hot water-pipes may be slightly heated to encourage a more buoyant atmosphere. Young trees which were potted up as maiden trees last season may be given weak stimulants now that the pots are filled with roots. These young trees may be expected to carry moderate crops of fruits next year.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Cucumbers.—Seeds of Cucumber should be sown within the next ten days for raising plants to fruit in late autumn and winter. Sow the seeds singly in small pots, and place the pots in a hot house. For winter fruiting a free bearing variety that produces fruits of only moderate length should be chosen. After the young plants are once above the soil, every means should be taken to induce them to form a robust, sturdy habit of growth before they are planted in their final quarters. Immediately the pots have become full of roots, repot the plants into 6-inch pots, which should be well drained. Use a moderately light compost. Let the plants be afforded considerable heat, elevating them as near the glass as possible. They should be ready for planting out on well-prepared beds during the first half of September. Plants in full bearing should receive frequent surface dressings, and the young growths should be thinned and regulated frequently, whilst overcropping should be prevented. Damp the surfaces in the house and close the ventilators early in the day, in order to conserve all the sun heat possible. Those plants which are growing in portable frames on hotbeds will need much care and attention if the fruiting period

is to be prolonged as far into the autumn as possible, thinning out the old growths to prevent overcrowding. Apply a surface dressing over the soil, using a compost of two parts light loam, one part decayed leaf-mould, and one part half-spent horse droppings. An abundance of tepid water should be applied to the roots during hot weather. Ventilate early in the morning and syringe and shut down early unless the weather is extremely hot. If cold weather should occur, the outside of the frames should be lined with stable litter, and the glass covered with mats or other suitable material at night.

Tomatos.—In order to ensure a good result during the winter months, similar attention must be given to the Tomatos as I have recommended for Cucumbers. Stout, sturdy growth is essential at this season of the year; the plants should now be in a good stocky condition and ready to be transferred to their fruiting pots. Maintain a moderate temperature and a fairly dry atmosphere, exposing the plants to all the possible light. By the middle of September they should be ready for transferring to an intermediate house where it is intended they should fruit. Late-sown plants are seldom useful for supplying fruit in mid-winter.

Mushrooms.—Where Mushrooms are in constant demand, large supplies of horse droppings should be reserved at this season. Place them together in an open shed and turn over the heap at regular intervals. It is not necessary to be too particular in removing the straw, for a proportion of this material is beneficial rather than otherwise. All vacancies in the Mushroom house should be filled up forthwith as the supply of material becomes ready. Beds that are in full bearing will be much assisted if good drenchings of diluted farmyard manure are given them on the first signs of exhaustion. Maintain a cool, humid atmosphere, damping the walls and paths at least twice daily.

Cauliflowers.—The autumn varieties of Cauliflowers will now be turning in for use. Down to the time of writing, these have not been so good in quality as usual, but there is every indication that the supply will improve. The surface soil should be stirred frequently with the draw hoe, in all the growing quarters, and to ensure fine, white heads those plants that are turning in should be supplied liberally with manure water from the farmyard. Tie the leaves together directly a plant shows signs of developing a curd, in order to have the heads white and of the best quality. When it is found that they are coming into use too fast, some of the plants should be taken up and placed in a cool building where they will keep good for many days.

Seeds.—In order to provide for winter supplies, sow seeds of Endive, Lettuces, Radishes, Parsley and Short Horn Carrots at intervals.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Cleansing Operations.—At the present season, when very little repotting requires to be done, all spare time should be devoted to cleansing the plants, pots, and general surroundings. Cattleyas, Lælias, and their hybrids should be overhauled. The leaves should be sponged, and any scale insects detected on the rhizomes removed by an approved insecticide applied with a moderately stiff painter's brush, taking care not to injure the dormant eyes and rhizomes. Much damage may easily be done in this way by an inexperienced operator, but such injury may not become apparent until later when the buds are lost and the rhizomes turn black and decay. Where insects are not present the plants should be sponged with a weak solution of soft soap dissolved in tepid rain water; this is the safest and best wash for general purposes. Occasional fumigation of the houses should be carried out as a preventive measure. Periodical sprayings overhead with a solution of quassia extract at the rate of half-a-pint to 5 gallons of tepid rain water will, in most cases, keep insects in check. These sprayings should be done on fine afternoons when evaporation is likely to be quick, so that harm is not caused by any quassia water remaining too long in the partly developed growths. The above treatment applies to all Orchids. At this season a large number of young shoots are in various stages of development; support should be given to any that are likely to bend over by loosely tying them to small, neat stakes, which may be removed after the growths have attained their proper size and strength.

Matters of Watering and Ventilation.—At this season plants that are in full growth and well-rooted into the compost, require more liberal supplies of water at the roots than at any other period. This more especially applies to such subjects as Cypripediums, Calanthes, Angræcums, Vandas, Aërides, Saccolabiums, Renantheras, Bulbophyllums, Cirrhopetalums, Megaclinium, Bolleas, Pescatoreas, Phaius and Cymbidiums. Although the atmosphere must be moist, a little ventilation should be given to the warmest houses on all favourable occasions.

The Heating Apparatus.—During the early part of August is a favourable time for the overhauling of the hot-water system, as the fire heat may be dispensed with for a few nights even in the warmest houses. During this time the damping down might be lessened, the plants kept drier at the roots, and the blinds drawn up an hour or so earlier in the day than usual. Any points in which the heating arrangements have proved unsatisfactory, such as the water not circulating properly or an insufficient number of pipes, must be remedied. The boilers and pipes should be emptied and cleared of all sediment. If a new boiler is needed, select one larger than is recommended for the quantity of piping to be heated. This prevents the necessity of having to drive the fire at high pressure during frosty weather. Of the many types of boilers now on the market, I prefer one of the sectional kinds for heating Orchid houses. They are easy to clean, very economical, and quick in action. Give all flues and chimneys a thorough cleansing, and see that everything is put in working order ready for the winter season. Towards the end of the month a great many plants, such as Odontoglossums and others, will require repotting. Sufficient quantities of potting materials should be prepared ready for mixing.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq Woburn Place, Addlestone, Surrey.

Mignonette.—Sow a batch of Mignonette for flowering early in spring, and if a succession is desired, it will be necessary to make a further sowing after two or three weeks. I prefer to sow the seeds in 3-inch pots, and later shift the seedlings into 6-inch pots to flower.

Schizanthus.—Seeds of Schizanthus should be sown at the present time, and another sowing may be made early in September, in order to obtain two distinct batches of plants which will flower successively in the spring. There are very many strains to choose from, but for ordinary decorative purposes the "pinnatus" type of flower is most useful, while for dwarfer plants "retusus roseus" is to be recommended. Schizanthuses require a cool treatment, and for a month or so after germination the seedlings should be given partial shade.

Roman Hyacinths and Paper-white Narcissus.—A number of bulbs should be potted up at the present time for very early forcing, and others may be kept for another month or six weeks, to provide a long season of bloom. After potting, plunge the pots in ashes in a cool position, taking care first to soak the soil with water, especially if the soil is on the dry side at the time of potting. If Narcissi are desired very early, pot up a few hundred bulbs of the varieties Golden Spur, General Gordon, and Van Sion, or any other of the well-known early varieties, as soon as they can be procured. These subjects are especially welcome for decorative purposes early in the year, when it is a difficult matter to obtain flowers with fairly long stems.

Zonal Pelargoniums.—Plants of Zonal Pelargonium for winter blooming should now be well established in their flowering pots. Following upon the hot weather recently experienced, it may be desirable to give them a little soot-water, but do not give the roots much in the way of manure at the present season. The strongest shoots may be stopped to keep the plants shapely and bushy, but general pinching should now be discontinued if the plants are required to commence blooming in October.

Salvia splendens.—The early dwarf varieties, such as Gloire de Zurich and Boule de Feu, should be allowed to flower at will, but the later varieties should still be pinched over a time or two, treating the various batches at different dates, in order to make sure of having a good succession. These plants are particularly effective in the winter garden or conservatory during the autumn months. If the plants are thoroughly well rooted in their flowering pots, they must be well cared for in regard both to water and manure, and treated the same as Chrysanthemums.

Codiæum (Croton).—If small but brightly-coloured plants are required in autumn and winter, the present is a suitable time for propagating a batch of Crotons by means of cuttings. Select young growths and insert them in sandy soil in a propagating case in the stove. They will soon make roots, and may then be hardened gradually to the air of the house, placing them on a shelf for a month or two. These will form serviceable little plants that may be used for small vases on the dinner-table or on any other arrangement where a little bright colouring is desired.

Coleus.—Cuttings of Coleus may also be rooted at this date, some singly, in 3-inch pots, and others three in a pot. The plants, if given plenty of light after rooting, will develop fine colour, and if a little grouping is anticipated in the autumn months, whether at home, in the conservatory, or at exhibitions, they will be found to be invaluable, as the quaint colouring of the leaves associates well with many varieties of Chrysanthemums.

Winter-blooming Carnations.—The perpetual or winter-flowering Carnations are now growing apace, and if they are not already staked, this work should be done as time permits. Light bamboo stakes are probably the best to use, and these should be chosen from 2 to 3 feet in length, so that they will last the whole time the plant is growing. Lightly loop up all the leading growths sufficiently to keep the plant shapely, and in making the ties keep them below the point where the stems are likely to be cut, otherwise the process of cutting the blooms will be hindered. There are various wire arrangements on the market for attaching the plants to the stakes which save labour and last many years.

Chrysanthemum.—Cultivators of large blooms should now select the necessary buds as they appear, removing all others. This will ensure a good display of flowers from the second week in October onwards.

THE APIARY.

By Chloris.

The Show.—Observatory Hive.—Arboricultural shows exhibitors should be encouraged to show observatory hives of home make. Generally it is best to make one so as to accommodate three brood combs, which should be straight and wired, tiered one above the other, and above these room for three sections on a shallow frame. Those who contemplate making such a hive should employ oak, or, better still, mahogany. The hive should be very neatly made, and the side walls should be of double glass to secure greater warmth in the interior. Unfortunately some makers of observatory hives forget that it is necessary to provide ample ventilation. The space between a fully drawn-out comb and the glass should be a bee space and no more, so that bees may not be encouraged to build out brace combs, which is always the case when too much space is left. The tunnel through which the bees pass to the open should be covered with glass, so that the bees entering and leaving the hive may be closely observed by the visitors. Since the object is educational every phase of bee life should be visible. The top comb should be stored honey, and the two lower ones should have brood in every stage of existence, drone and worker, and the hive should show a queen, drones and workers. It is not uncommon to find observatory hives queenless.

Bee Products.—Much might be done in educating the public if local bee keepers could be induced to stage a trophy of honey. In the exhibit tablets of wax of varying sizes should find a place, but care must be taken to use the best and cleanest.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, AUGUST 12—
United Hort. Benefit and Prov. Soc. Com. meet.

TUESDAY, AUGUST 13—
Royal Hort. Soc. Coms. meet. and Exh. of Gladioli. (Lecture at 8 p.m. by Mr. Pulham, Jun., on "The Construction of the Wisley Rock Garden.")

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62·4.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, August 7* (6 P.M.): Max. 63°; Min. 59°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, August 8* (10 A.M.): Bar. 29·6°: Temp. 63°; *Weather*—Fair.
PROVINCES.—*Wednesday, August 7*: Max. 59° Windsor; Min. 56° Aberdeen.

The Colours of Flowers. The garden at the height of summer is full of rich and varied colour. To achieve this result has required long and arduous work, dating back it may be not to last season only but to many years ago. Even though the enchanting hues, delicate shades and masses of colour are produced from sundry annuals, yet the brilliance now enjoyed owes its origin to the enterprise and skill of the florists and the seedsmen who have devoted their lives to the improvement and purification of what, at first, were perhaps wayward weeds, the decorative possibilities of which none but a trained eye might realise. Now, with the results of his and others' forethought before him the gardener may enjoy one of those all too rare and brief pauses from his engrossing work and feast his eye on the loveliness which his labours have produced. Perchance he is content in his enjoyment, and is not concerned to vex his mind with questions as to the processes which plants employ in the compounding of the pigments, which result in so many perfect garden pictures. Or he may be of philosophic turn of mind, and ask himself to what are these flower colours due! How is it that some kinds of plants are so conservative, so constant to one shade of colour; whereas others are so catholic, that from a packet of mixed seed they will yield all the colours of the rainbow and more besides?

Though the former class of garden-enthusiasts care, like Galleo, for none of these things, yet they are as acute as are the latter class to notice not only the beauty of the garden but also a hundred facts of seasonal change; of the effects of bright light, or of cloudy skies, reflected, as it were, in the colours of the garden. They, however, accept the fact of such variability as a decree of nature, or as an expression of capriciousness on the part of the subjects over which they reign; but to the lips of the curious, ever asking questions, the eternal "why" comes constantly as they note the daily change in their charges, or compare the effects of this year with those of former seasons.

Far be it from us to play the part of the worst of bores—those who impose instruction on folk unwilling to receive it! When we visit the gardens of the incurious we make a practice of disguising our interest in the scientific features, and devote ourselves to the pleasant occupation of admiration; but on our visits to friends of the enquiring minds we are often happy in passing a pleasant hour exchanging speculations as to the causes which underlie the manifestations of colour-range and tint presented by their gardens. In this way we learn many facts which the observant gardener has noted; facts which have not found their way into the text books, which contain much about certain fashionable aspects of science, and have the air of being both infallible and complete. In return we are sometimes able to surprise the gardener by showing him that, although with respect to the origin of colour, much remains to be known, yet even now, in Nature's infinite book of secrecy, a little may we read. We know, for example, that flowers form their colours on two models; some adhering exclusively to one, others to the other, and others yet again building their colours on both.

The models are known to the expert as "sap" and "plast" respectively. In the former style the pigment which gives rise to colour is in solution in the watery sap of the surface layer of petal-cells. In the latter it is of a more solid consistency and, strange as it may seem, is produced from the same granular bodies or plastids which form the chlorophyll granules and give rise to the green colour of the leaf.

The sap pigments may produce a wide range of colours from blue to red. The plast pigments are never blue, but range from bright yellow through orange to an equally bright red.

To say much of the chemistry of the plast pigments would carry us far into the jungle of organic chemistry, in which only those bred therein may travel easily; but this we may say:—that the red plast colours which occur in flowers, and also in fruits and autumn leaves, are interesting because they lend a certain confirmation to the recent discovery that the green pigment of plants is a close chemical relation to the red colour of the blood of animals.

We know more, however, about the origin of the sap colours, and what we know is not so very difficult to tell in plain language. There is reason to believe that each sap pigment is produced by an oxidation process; that is, one brought about by the union of oxygen with some other constituent of the plant. The substance which unites with oxygen to form pigment is a colourless body, and this colourless mother of pigment is termed a chromogen. The chromogens are liberated but grudgingly from the living substance of the plant, and as they are liberated they become oxidized. Yet such is the intensity of the colouration of the pigments that, although they occur as a mere film in the surface layer of the flower, they suffice to produce the most brilliant colour effects.

A recent discovery, and one of far-reaching importance, seems to show that the exact colour presented by one of these sap pigments is determined ultimately by the presence of minute quantities of some third substance in the sap. Thus, for example, if a chromogen is oxidized it gives rise to a blue sap-pigment; but in the presence of a trace of a certain other substance the colour of the pigment becomes red. It is not improbable that the commercial dyes of the future will be obtained by copying Nature in this respect. Again, the rate and extent of the oxidation count also in the determination of the colour of the sap pigment, and the rate of oxidation depends upon the amount of the special oxidizing agents present in the cells of the petals and other parts of the flower.

Furthermore, it can now be proved that not only does the kind and depth of colour depend on the amounts of oxidizing agent and of chromogen present in the cell, but also on the conditions of light and heat to which the plant has been exposed. Thus we begin to understand how the colour of this year's flowers may be richer or poorer according to the weather not only of this year, but also of the preceding season.

The student of these matters recognises that as a dyer is particular to use pure materials of certain kinds, and to employ them under conditions which experience shows to give the best results, so the plant is meticulously careful of its chemical operations, leaving nothing to hazard, but bringing together within the minute space which constitutes each of its cells the mother of pigment, the oxidizing agent, and the substance which acts as a controller of the hue. But, even so, the sun which rules the destinies of gardens exercises also an influence in determining the colours which these plant chemicals produce.

And what of the white flowers which lend an especial grace, and give a sense of sacredness to the garden? They are white for the double reason that they form no pigment, and that below the surface of the petals are layers of cells with air-spaces between the neighbouring cells. So the Lily owes its whiteness to the same cause as that which makes white a mass of powdered glass. In either case the air entangled between transparent particles bends and rebends the waves of light out of their several courses. Bent and scattered, these light waves return to the eye, and produce upon our sense the effect which we describe as whiteness. But not all white flowers are true albinos. Some, as

Fig. 52.—Basket of Nelumbium flowers presented to Queen Mary.

(See p. 118.)

we have said, lack chromogen, the mother of pigment, and so cannot form pigmented products. Others possess this chromogen and also the agent which oxidizes it, but they possess also in their sap another substance which puts a veto on the action of the oxidizing agent, and so prevents the formation of the pigment. As a cheek may be pale for lack of blood or by reason of a thick coat of powder, so a flower may be white from lack of pigment or because some substance masks the fact that the producers of pigment are present. Which is the kind of whiteness present in any plant may be discovered by cross-breeding with a colour variety of the plant. If the whiteness be due to lack of pigment the offspring are all coloured; but if it be due to the masking action of an interferer with the pigment-making process, the offspring are all white. So by their fruits ye may know them.

IMPORTED FLOWERS OF NELUMBIUM SPECIOSUM (see figs. 52 and 53).—Owing to the enterprise of Mr. R. F. FELTON, the well-known florist, fresh flowers of the Sacred Bean (Nelumbian speciosum) have been imported from a distance of 1,500 miles. At first efforts were made to import the flowers by means of cold storage, but without success, and, finally, Mr. FELTON, being convinced that rapidity of transit was the only method by which he could hope to get over the difficulty, gave instructions for a trial batch to be sent by the quickest route possible, the shortened journey occupying five days. This consignment arrived in good condition, and Mr. FELTON at once placed it in a large van, and brought it in triumph to the *Gardeners' Chronicle* offices, so that we might have the first opportunity of admiring the lovely flowers direct after their long journey from the East. Queen MARY was graciously pleased to accept the basket of blossoms shown in fig. 52. The rich rose-coloured flowers were placed in a basket, and together the basket and flowers were 6½ feet in height whilst the bouquet measured 5 feet across. The largest individual flower had a diameter of 11½ inches, and the segments were reflexed, owing to the flower opening whilst in a cut state, giving the bloom a distinct appearance from those shown on the Kew plants on p. 119. The leaf shown with the flowers in fig. 52 measured 35 inches across. Mr. FELTON states that in favourable circumstances the imported flowers remain fresh in water from 10 to 14 days. Warm-house and tropical aquatics are not generally grown in private gardens, and the visitor must go to such botanical establishments as that at Kew to see the Nelumbiums growing and flowering as they are shown in fig. 53, which is reproduced from a photograph taken recently by Mr. RAFFILL. The large, round-table-like leaves, from which water will roll off like quicksilver, are borne high above the water on slender stalks; they have a lustrous green colour, and possess very great beauty. After the flowers have faded and the petals have fallen, there still remains the curious wasp-nest-like fruit to interest plant lovers. The oblong nut-like seeds, commonly called Beans, which are said to have the flavour of Almonds or Filberts, are imbedded in the circular cavities of the torus or receptacle, and are either eaten when young and tender or are dried; in the latter state the shells become very hard. These are the Beans which the disciples of Pythagoras were forbidden to eat. The Nelumbium has been an Eastern emblem of fertility from remote periods. When mature the head of seeds will often break off, and, falling on the water, float away until it lodges in some quiet spot, by which time the seeds have germinated, and the head becomes a little nursery of young plants, which eventually separate and fix their roots wherever circumstances permit.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday, the 13th inst. In the afternoon a lecture on "The Construction of the Wisley Rock Garden" will be delivered by Mr. PULHAM, Jun.

CALADIUMS AT THE LEAMINGTON SHOW.—At the Leamington Horticultural Show, of which a report was published in our last issue, Messrs. JOHN PEED & SONS, West Norwood, were awarded a Silver Challenge Cup, presented by Alderman HOLT, for a very fine collection of Caladiums. Some of the principal varieties were as follow:—Silver Queen, Comtesse de Brosse, Oriflamme, Rufus, Ville de Hambourg, Nai Lek, and Duchess of Teck. C. argyrites formed a pretty edging to the group. Messrs. JOHN WATERER & SONS were awarded a large Gold Medal for a group of hardy shrubs in tubs. The group comprised Gold and Silver Hollies, Golden English and Irish Yews, a central group of Cedrus atlantica glauca, and various other specimen Conifers.

THE WEATHER AT CHATSWORTH.—Mr. F. JENNINGS has sent us interesting particulars of the abnormal rainfall and the temperatures registered by him in the Chatsworth Gardens during the past month. The total rainfall measured 8.49 inches; rain fell on 21 days, the greatest rainfall in 24 hours was 2.48 inches on July 27. The maximum temperature was 85° registered on the 12th, and the minimum temperature was 58° on the 22nd and again on the 31st of the month.

CENTRAL CHAMBER OF HORTICULTURE.—We are informed that there is a movement on foot in influential circles to establish a Central Chamber of Horticulture on lines similar to the Central Chamber of Agriculture. It would include representatives from the leading horticultural societies and be representative of every branch of the business, and in addition Members of both Houses of Parliament, who are interested, would be invited to become members, so that when necessary direct Parliamentary influence could be exerted.

NURSERY EMPLOYÉS OUTING.—The employés of Messrs. W. P. LAIRD & SINCLAIR, LTD., Dundee, held their picnic on the 3rd inst. The company, which included the shop and nursery staff to the number of 50, drove in brakes to Red Castle, Lunan Bay, a distance of about 23 miles. After luncheon the younger members engaged in games of cricket and football.

IMPORTATION OF POTATOS INTO SOUTH AFRICA.—Although very stringent measures are to remain in force with the object of excluding from the Union Potatos infected with black scale or wart disease, it is notified that since July 1 last sorting has been discontinued, but each consignment is fumigated with formaldehyde gas.

SPRAYING FOR SCALE INSECTS.—Farmers and fruit-growers troubled by scale insects are advised by Mr. A. L. LOVETT, assistant entomologist at the Oregon Agricultural College, to spray with lime-sulphur, kerosene emulsion, and whale oil soap as follow:—"For scale insects of such a type as the San José use the lime-sulphur spray of winter strength. For the soft scales, such as occur on the Blackberry, Prune and Plum, use the kerosene emulsion or whale oil soap. Kerosene emulsion is prepared as folluws: Heat a gallon of water (soft if possible) to boiling; shave ½ lb. of soap into it (whale oil is preferred), and stir till the soap is dissolved. Remove from the fire and add 2 gallons of kerosene. Agitate vigorously till it is creamed, which is best done with a hand pump, forcing the solution through the hose and back into the container. For use in the dormant season this mixture should be diluted with 7 gallons of water, but for summer spraying, at the time the young insects emerge, with 11 gallons of water. To 1 lb. of whale oil soap 4 gallons of water may be used as a summer spray for soft scale. For plant lice on Roses and garden crops any of the tobacco solutions may be used. For plants having smooth foliage, or a specially bad attack of aphides, there should be added 1 lb. of fish oil soap dissolved in a gallon of hot water to each 8 gallons of the spray. On fruit trees, as the Apple and Peach, the spray used in early spring when the buds are starting should be a combination of winter strength lime-sulphur and 'Black Leaf 40,' using one part of the Black Leaf to 800 of solution."

THE BOARD OF AGRICULTURE AND FISHERIES.—Mr. RUNCIMAN, President of the Board of Agriculture and Fisheries, has appointed Mr. A. S. GAYE to be his private secretary in the place of Mr. H. G. MAURICE, promoted to be Assistant Secretary of the Fisheries Division of the Board.

PUBLICATIONS RECEIVED.—*Brazil in 1911*, by J. C. Oakenfull. February, 1912. (London: Butler & Tanner.)

LAW NOTE.

ALLEGED DEFECTIVE FLOWER-POTS.

AT the Nottingham County Court Samuel Barratt, of Radcliffe-on-Trent, a coal merchant, claimed from his cousin and namesake, Samuel Barratt, a nurseryman, also of Radcliffe, the sum of £33 4s. 7d., which he alleged was due to him as the price of goods sold and delivered.

The plaintiff, who said that he was the owner of a brick-yard at Radcliffe, declared that his cousin opened an account with him, and he delivered goods until a large sum was owing, and the defendant paid sums of £10 and £6 on account.

The defendant, in evidence, said that he had been in the nurseryman's business all his life. He used a large number of plant pots, and after his cousin had started in the "pot trade" he bought some from him. So long as the pots were made under the supervision of Ogden (formerly the plaintiff's manager) they were suitable, but after he left the defendant found them to be soft. None of them was of service to him a second time, whereas a good pot could be used time after time. The defendant produced a number of pots, and showed by demonstration how those that were said to have been made by the plaintiff were not of the proper size and shape, and how they broke very easily.

Richard Mansey, formerly in the employment of defendant at Radcliffe, said he superintended the general work. About 100,000 pots were used a year. Witness called defendant's attention to some pots which were soft and which came to pieces.

George Ogden, a practical pot maker, said he was formerly employed by plaintiff as manager. Witness had been over defendant's nursery, and found a number of pots badly made, of wrong shape, and badly burnt.

Horace Chas. Mee, a nurseryman, of Sherwood, said he inspected samples of various sized pots supplied to him by plaintiff. Witness would not have them at any price.

Judgment was given for the plaintiff for the sum of £24 and costs.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 66-71.)

(Continued from p. 91.)

2, ENGLAND, N.E.

Durham.—Being engaged in horticulture generally throughout Durham, my report concerns the whole county. Durham is a great mining centre, and wherever Currants and Gooseberries are grown, or, in fact, any hardy fruits, in the neighbourhood of a coal pit, the fumes given off from coke ovens and the like fumigate the crops so well that big-bud, Gooseberry-mildew, and American blight are very rarely found. *John Smith, County Council Lecturer, The Shire Hall, Durham.*

——The Pear crop in places is very heavy. Apples are much under the average. Plums, which are somewhat extensively cultivated, show heavy crops in only a few places. Gooseberries have been plentiful. Black Currants, owing to the Black-Currant mite, other insects, and fungous diseases, are generally very bad; the bushes, from these causes, have, in many places, made but little growth during the past few years. The Strawberry crop was unsatisfactory; many of the early flowers were destroyed by spring frosts, and the fruits have been much damaged by rain. Raspberries have done well. The character of the soil in the North Riding of Yorkshire is very variable. Much of it is unsuited to fruit culture. The best soils for Apples and Pears, and, in a greater or lesser degree, also for other fruits, are to be found in the Vale of York, extending eastward to Malton and Pickering, and along the banks of the Ouse to the Humber. *Alfred Gaut, The University, Leeds.*

——The fruit crops, with the exception of Apples and Nuts, are well up to the average. Pears and Gooseberries are very heavy crops. Apple trees showed a scarcity of bloom, and those that developed plenty were damaged by late frosts. The soil here is a heavy loam, overlying a layer of clay on red sand. *J. E. Hathaway, Baldersby Park Gardens, Thirsk.*

——Apples are generally a very thin crop, but the varieties James Grieve, King of Tompkins County, American Mother, Allington Pippin, Adams's Pearmain, and Worcester Pearmain are very good. Pears are plentiful. Plums, especially Victorias, and Damsons, are very plentiful. Black Currants are a failure, but all other bush fruits are good. Raspberries and Loganberries are the best crops I have had for some years past. Peaches in the open are an average crop. Strawberries looked very promising during the flowering and early stages, but owing to the continued and heavy rains during June, many of the berries rotted before they commenced to colour. *A. E. Sutton, Castle Howard, Welburn.*

——The hardy fruit crops in this district are very uneven. Apples and Plums are under the average, but since rain fell both trees and fruit have improved greatly. All small fruits have been heavy crops and of excellent quality. Strawberries ripened late and suffered in the early stages of ripening from the heavy rains and sunless days, but they improved later. I have never seen so much blossom on fruit trees, but the dry weather in April and May was all against a good set of fruit. The almost tropical heat during these months, with sudden changes to cold, favoured the spread of aphis and maggots, which did much damage to the foliage and fruits. These are amongst the possible causes of failures in the Apple and Plum crops in this district. The trees are now making excellent growth, and promise to thoroughly mature their buds and wood. Our soil is light and shallow, and the subsoil chalk. *F. Jordan, Warter Priory Gardens, York.*

[*Photograph by C. P. Raffill.*

Fig. 53.—Nelumbium speciosum in the lily-house at Kew: colour of flowers, rich rose.

(See p. 118.)

3, ENGLAND, E.

Yorkshire.—The promise in May for a good fruit year was generally favourable. Apple trees bloomed freely, but set comparatively scanty fruits. Pear trees flowered freely and the fruits set well. Gooseberries and small fruits generally promised well. In all but exposed areas spring frosts did less damage than usual. Areas in the smoke screen escaped. *A. S. Galt, Rutherglen, Lidgett Park Road, Roundhay, Leeds.*

——Pears on walls and small fruits are the only really satisfactory crops in this district. Gooseberries are the heaviest crop for 10 years past. Raspberries developed very few canes last season, so that this crop is short. Apples and Plums bloomed well, but frost damaged the flowers and prevented fertilisation. *J. G. Wilson, Chevet Park Gardens, Wakefield.*

Cambridgeshire.—The Apple crop, with few exceptions, is rather light, and the same may be said of Pears. Most of the Plum trees on walls have set enormous crops, and the fruits had

to be severely thinned. Standard trees are carrying average crops. Morello Cherries set their fruits well, but many afterwards fell. Peaches are an average crop, and clean. Apricots failed to set well owing to frost when the trees were in flower. All bush fruits are carrying heavy crops of good fruit. Strawberries were a poor crop on young plantations, but better yields were obtained from two-year-old plants. Both Cobs and Walnuts are plentiful. The soil in these gardens is a heavy, retentive loam, resting on clay. *W. J. Snell, Wimpole Holl Gardens, Royston.*

——The fruit crops generally are equal to the average, with the exception of Plums and Strawberries, which were damaged by tho frosts when in bloom. The drought of spring caused a great many Strawberry plants to dry; the fruiting season was a very short one. Walnuts are a good crop. Our soil being light and not very retentive, the drought caused many Apples and Pears to drop. The former could be well spared, owing to the exceptional quantity which set. Raspberries generally were a very heavy crop and of good quality. *Arthur Sewell, The Palace Gardens, Ely.*

——The fruit crops generally are under the average, particularly stone fruits. Greengages, for which this garden is noted, are very scarce, also Apples, of which more trees are being planted every year. The soil is inclined to be heavy, with a chalk subsoil, and never suffers from drought, being situated in the valley of the Cam, which is several miles in width in this district. *T. Spooner, Meldreth Court Gardens, Royston.*

——Early Victoria and Lord Grosvenor Apples are very plentiful; Bramley's Seedling, Lord Derby, Miller's Red Victoria and Worcester Pearmain are also satisfactory. Owing probably to frost on May Day, combined with the drought, many fruits have fallen. Pears are a disappointing crop after a full show of blossom. Doyenné d'Été is, however, a full crop. Plums Victoria, Czar, Monarch, and Belle de Louvaine are all failures. Rivers' Early was the only variety to bloom freely, but all the fruits dropped. Small fruits and Gooseberries are extra good. Raspberry Superlative is a particularly heavy crop. Strawberries Royal Sovereign and Sir Joseph Paxton both fruited freely. Black Currants are disappointing, after a very fine show of bloom, the failure being due to 4° of frost which occurred on May 1. Walnuts, even on young trees, are a very heavy crop. All small fruits, both on the open market and under contract, are higher in price than last year. There is a scarcity of labour in the district. *Stephen Castle, Walpole St. Andrew's, Wisbech.*

Essex.—The fruit crops are not so good as they promised earlier. Apples are disappointing. In the case of trees that have set well, much of the fruit is deformed and drops easily. But Pears are an excellent crop, and Peaches and Nectarines fair. Plums are a failure, and Apricots are scarce. Morello Cherries are an average crop. Of small fruits, Black, Red and White Currants are extra good. Raspberries and Strawberries were abundant. Most of the fruit trees showed plenty of bloom, but east winds and frosts, which prevailed at that time, prevented Plums from setting freely. Probably, too, the drought of last year had its effect upon them. Our soil is a stiff, yellow clay. *Arthur Bullock, Copped Hall Gardens, Epping.*

——All out-door fruit crops are very free from insect pests this season. The Apple crop is a very thin one Ecklinville Seedling and Lord Suffield being the best cropped varieties. Strawberries Royal Sovereign and British Queen have fruited well, but the season was soon over, owing to the dry weather. Gooseberries and Currants have been abundant, and very fine in quality. Pears are a fair crop, and the trees are looking well. The soil is rather heavy in texture. *John Arthurton, Debden Hall Gardens, Saffron Walden.*

——The Apple crop is a very light one, except in the case of a few varieties, such as Ecklinville Seedling, Stirling Castle and Sturmer Pippin. Most varieties of Pears are very promising. Stone fruits seem to have been thinned by frosts during the flowering period, but trees of Plums here and there are laden. Cherries are very good. Gooseberries and Currants have been clean, heavy crops. Strawberries were soon over. Our soil is a strong loam overlying boulder clay. *C. Wakely, County Gardens, Chelmsford.*

——Taken all round, the fruit crops are much below the average. In the spring there was a fine display of blossoms, as might reasonably be expected following such dry, semi-tropical weather as prevailed during the summer and autumn of 1911, and the consequent complete maturation of the wood of all kinds of fruit trees. But late frosts spoiled the promising prospect. Apples are a poor crop, and Pears only a little better; Plums also are very scarce. Bush fruits are average crops. Strawberries have been a light crop and were severely damaged by the heavy rains experienced during the ripening and harvesting stages of the fruit. King of the Pippins, Ecklinville Seedling, Stirling Castle and Early Julyan Apples are bearing fair crops, while a very large tree of Hambledon's Deux Ans, which during the last 14 years has borne heavy crops of good fruit, has only about a dozen fruit on it this year. The soil is a sandy clay resting on a substratum of clay, and the ground slopes gently to the south: an ideal soil and situation for all kinds of fruit and vegetable crops. *H. W. Ward, Lime House, Rayleigh.*

——Apple trees flowered early, but the fruits failed to set on several sorts, and the others that did set are dropping badly. Pears are an abundant crop and look like finishing well. Plums seem to have set well on some sorts, whilst other trees have scarcely any fruit. Cherries are a fairly good crop: Morellos are extra fine. Very few Peaches and Nectarines are grown out-of-doors in this district, and the same may be said of Apricots. Gooseberries, Raspberries, Red and Black Currants are all good crops. Strawberries were scarce in most places, owing to the drought of last summer. Nuts seem to be an abundant crop everywhere. *W. Johnson, Stansted Hall Gardens, Stansted.*

Lincolnshire.—Apple trees which had heavy crops last year are in many cases barren this season, especially dessert varieties, although I thinned the fruits severely last year. The trees flowered but little, and this I attribute to the dry weather in 1911. Bush Pear trees suffered severely from late frosts. Plums are scarce but Damsons more satisfactory; Strawberries failed to make a satisfactory growth last autumn owing to drought, and they have been but a poor crop. The soil is a brown loam on either clay or ironstone. *H. Vinden, The Gardens, Harlaxton Manor, Grantham.*

—— The Apple crop is extremely good, but unfortunately on Wednesday, June 19, a terrible hailstorm visited the district; the hailstones measured in some instances 1½ inch across. In the village, which has a population of some 800 people, between 450 and 500 panes of glass were either destroyed or badly cracked; the damage was done chiefly to windows facing the west. This storm very seriously affected the crops. Apples, in particular, on the west side of the trees, had pieces literally cut out of them, and others were badly bruised. Pears, too, suffered to some extent. Plums are scarce. Sweet Cherries are a fair crop, and Morellos are plentiful. Apricots are very good, but the crop is under the average. Black Currants and Gooseberries are very good. Strawberries were exceedingly poor, excepting the variety Givon's Late Prolific. *C. Frankish, Waltham Hall Gardens, Grimsby.*

—— The condition of the hardy fruit crops here is, on the whole, satisfactory. The only failure is in the case of Apricots, which flowered well, but were destroyed by the early spring frosts. Small fruits are specially plentiful and good. Strawberries suffered from the excessive rains, otherwise they were a good crop. The soil here is light and sandy, and the subsoil white clay. *Fredk. Barton, Hainton Hall Gardens, Lincoln.*

—— This has been a disappointing season, and April and May gave us sunshine far too hot for that early time of the year. Apple blossom proved very weak and failed to set fruits except in isolated instances. Black Currants failed from the same cause, and Royal Sovereign Strawberries were nearly all blind. Can any reader suggest the cause? (see p. 98). The soil here is a heavy loam resting on yellow clay. *H. Louth, Boothby Hall, Grantham.*

Norfolk.—The fruit crops here are very good. The soil is a good sandy loam. Late frosts in April and May never exceeded 3°, although the east winds at the time were very trying, blistering the tender leaves of Peaches and Currants, both red and black, severely. April proved a dry and sunny month, the rainfall only amounting to 0.32. In May the rainfall was 0.83, whilst June gave us 3.67. The foliage of fruit trees, also other trees and Roses and shrubs, I have never seen so clean and good; this must be owing to the two dry and sunny months, followed by a copious rainfall. With fine dry weather from this time, the prospect for excellent fruit crops and a good harvest are promising. *Wm. Allan, Gunton Park Gardens, Norwich.*

—— The Apple crops this season are very irregular, some of the early varieties such as Emneth Early, Stirling Castle, and the old Hawthornden are bearing heavily, whilst many are without fruit. Pears are in most places the crop of the year, being plentiful everywhere. The Strawberry crop was the most disappointing; in many places the yield was only a quarter of what was expected. Small fruits are plentiful and good. *William Orr, Stow Hall, Downham Market.*

Suffolk.—In this district the crops are very irregular. On some rather light soils Strawberries were a complete failure. With the dry season of last year Apple and Pear trees ripened the buds well, and this season there was an abundance of strong blossom which set well in these gardens. A mile or so from here, on heavy soil, Apples failed to set, owing, the grower thinks, to the very dry conditions existing when the trees were in flower. Trees mulched and watered well during the dry period of last summer have set a better crop this year than trees which were not given the same attention. *Thos. Simpson, Henham Gardens, Wangford.*

—— After the fine summer of last year a bountiful fruit crop was expected, and all kinds of fruit trees blossomed profusely this spring. Sharp frosts when the Plums were flowering have in most cases, resulted in a scanty crop. Apples are generally bearing a fair crop, but the growth has been badly crippled by Aphis. Strawberries were a disappointing crop, the drought of last summer killed many old plants or stunted the crowns. Very few new plantations were made owing to the difficulty experienced in procuring runners. *E. G. Creek, East Suffolk County Education Office, Ipswich.*

—— There was every prospect of an exceedingly good fruit crop when all kinds of fruits flowered freely last spring, but owing to cold winds and drought, many kinds of fruits failed to set, and many of those which succeeded in setting, fell from the trees subsequently. Plums, Peaches, Nectarines, Cherries, and Apricots suffered most in this respect. Our soil is light, sandy loam, overlaying gravel. *W. Messenger, Woolverstone Park Gardens, Ipswich.*

—— The soil in these gardens is inclined to be heavy, making it necessary to make special preparations for the planting of Pears, Cherries, and some other fruits. This season, bush fruits generally are good crops, but cold winds in the spring caused much harm to Black Currants. Plums are an extra good crop, and the fruits are of good quality. Pears are plentiful and good. They are principally young trees and doing remarkably well. Apples are a deficient crop owing to the trees bearing so freely last year. Morello Cherries succeed here, but Sweet Cherries are not satisfactory. *H. Coster, Ickworth Gardens, Bury St. Edmunds.*

—— The soil here is of a light description, consequently we suffered from the droughts of 1911 and this season, which account in a great measure for the sparse crops of Apples, Plums, Strawberries, and Raspberries. *George Taylor, The Gardens, Shrubland Park, Coddenham, Ipswich.*

—— Pears are an excellent crop. Gooseberries are a very fine crop. Cherries, both bush and fan-trained trees, are also good. Some varieties of Apples are well cropped, and others are carrying only a few fruits, but Strawberries were a light crop of very fine fruits. Plums are satisfactory, all the choice varieties of the Gage type being heavily cropped. The soil here is light, sandy loam, with a subsoil of gravel and chalk. *B. Goodacre, Moulton Paddocks, Newmarket.*

—— The year 1912 is not a good fruit year in this district. The heavy rains of March

encouraged the fruit buds to develop quickly, and the trees were in full bloom three weeks earlier than usual. The frosts experienced several nights early in May caused enormous damage when the trees were exposed, but Plums escaped, being protected by foliage where set. Strawberries were a failure, owing, probably, to the six weeks drought in April and May. Black Currants are scarce, and Raspberries good. The soil here is a mixed loam. Nuts promise well, and the harvest of the hedges is distinctly good. *R. Evans, Gt. Barton, Bury St. Edmunds.*

—In sending a report for this district, I must say it is astonishing we are able to furnish one so satisfactory, after the severe drought of last year and the early summer drought this season. Apple trees are casting their fruits very fast, and Plums are a failure. We cannot lay the blame of the latter to late frosts or cold winds, as the conditions here this spring were almost perfect. Peaches are an excellent crop. The following table of the rainfall recorded here during the past six months may be of interest, and will go far to show the cause of failure with crops on the light lands of this district. It will be seen that the total for the last three months is only 2.89 inches :—January, 2.53 inches; February, 1.20 inches; March, 2.89 inches; April, 0.28 inches; May, 0.69 inches; June, 1.92 inches. *A. K. Turner, Orwell Park Gardens, Ipswich.*

(To be continued.)

SCOTLAND.

PERTHSHIRE FRUIT CROP.

The disastrous weather of the past week or two has had a bad effect on the fruit crops in Perthshire, which is the leading district in Scotland for Raspberry culture, and this crop promises to be sadly deficient. Prices have been stiffening, and as much as £35 is said to have been asked for immediate delivery. Low weights are being chronicled, and the pickers complain that they are only able to earn small wages. Severe storms on the 4th and 5th inst. caused great losses. Much fruit was blown down and a great quantity otherwise injured.

LOCKERBIE SHOW.

In association with the annual show of the Mid-Annandale Agricultural Society a good exhibition of fruit, flowers, and vegetables was held in the show ground, Lockerbie, on August 2. The general horticultural exhibits were arranged in a large marquee, and a smaller tent was set apart for Sweet Peas.

Cut flowers were the strongest section in the gardeners' classes, and the principal prizes fell to Mr. T. W. James, Stainton, Carlisle; J. Wyllie, Esq., Elmbank, Dumfries (gr. Mr. Jas Henderson); Mr. D. Whitelaw, Locharbriggs; Misses Dobie, Broombush (gr. Mr. J. Tweedie); Mr. J. Crosbie, Dalswinton; Mr. J. Wilson, Eskrigg; Mr. J. French, Hetland Cottage; Miss Jardine, Dryfeholm (gr. Mr. J. M'Donald); J. Davidson, Esq., Summerville, Dumfries (gr. Mr. J. Wilson), and Messrs. Adamson & Hunter, Lockerbie.

The Sweet Pea classes were thin, owing to the stormy weather, but G. L. Moffat, Esq., Mayfield, Lockerbie, was an easy winner in the principal class, winning several 1st prizes in additional classes with grand flowers of new varieties and others. Pot plants were not numerous, and the principal prizes fell to Miss Jardine, Dryfeholm. Grapes were well shown, J. Wyllie, Esq., taking most of the prizes for these; Miss Jardine, Dryfeholm, and Mr. J. Wilson, Eskrigg, leading in other classes. Miss Jardine, Dryfeholm (gr. Mr. J. M'Donald), had the finest collection of vegetables.

Non-competitive exhibits consisted of florists' flowers from Messrs. E. F. Fairbairn & Sons, Edentown, Carlisle, and Messrs. Palmer & Son, Annan. *S. A.*

EDINBURGH PARKS' EXPENDITURE.

From the statement made by the City Treasurer to the Town Council of Edinburgh, it appears that the estimated expenditure in the Parks' Department will exceed that of last year by about £1,000.

GLASGOW PARKS' DEPARTMENT.

From the accounts of the City of Glasgow for the year ending May 31, we learn that the ordinary revenue of the city parks amounted to £88,214 as against £88,294. The ordinary expenditure was £79,613 as compared with £76,500. The balance sheet shows that the estimate for the year was within £5 of the actual amount expended. From a statement of the assets and liabilities of the department it appears that the assets amount to £1,154,837, and the liabilities to £940,416. It is explained, however, that the latter amount includes the sinking fund of £248,848.

DEATH OF A KEITH GARDENER.

A sad drowning affair took place at Keith recently by which Mr. William Fleming, a gardener, aged 74 years, lost his life. For some time deceased had been suffering from giddiness. He left his house shortly after 10 o'clock in the morning, stating that he was going for a walk. Some time afterwards as a man was passing along the bank of the Isla, he saw a coat lying, and on looking observed a body in the water. On the body being taken out it was identified as that of Mr. Fleming.

ORCHID NOTES AND GLEANINGS.

STANHOPEA OCULATA.

A photograph (see fig. 54) of a very fine specimen of this attractive species has been forwarded by C. Koettgen, Esq., Ceres, Bromley, Kent, with the following particulars, which support the opinion often expressed in our columns that, for many Orchids, a special Orchid house is not absolutely necessary. Mr. Koettgen says: "This plant has been grown in an ordinary conservatory. In the winter I keep the temperature at about 55°-60° Fahr. In 1909 the specimen had two spikes, bearing three and five flowers respectively; in 1910 it did not bloom; in 1911 it had one spike of six flowers. This year the plant has borne altogether six spikes: one with nine flowers, two with eight each, the others having seven, six, and five flowers respectively. The illustration shows the plant in a basket with four fully-expanded spikes of flowers, and two others not yet fully developed. A very interesting selection of Orchids is grown in the same conservatory with the most satisfactory results. For the conservatory, Stanhopeas and other Orchids which may be grown suspended from the roof are specially good. For the warm greenhouse, the strong-growing Selenipediums, Sobralias, Ansellia africana and Cymbidiums are valuable plants. Cymbidium Lowianum often flowers better in a conservatory than in the Orchid house."

Fig. 54.—Stanhopea oculata in Mr. Koettgen's collection.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

HORTICULTURE AND MANCHESTER. — The time is now ripe for a big movement at Manchester. What seems to be wanted is:—1, The Botanical Society to free itself from its round-about shows and menagerie; sell up, and "realise." 2, A horticultural hall for Lancashire and Cheshire in the town. 3, A library. 4, A home for the Manchester Orchid Society. If Lancashire and Chesire would take the matter up, I feel sure that with the requisite amount of energy, patience and tact the thing could be done. *H. B. J.*

THE EDUCATION OF THE GARDENER.—Mr. Aggett (p. 32) mentions the fact of employers calling in landscape gardeners when new gardens are to be made as a proof of the inability of the gardener to do this kind of work. In this connection the following incident may be of interest. The owner of an estate contemplated making extensive alterations in the grounds. A head gardener was wanted, and upon an application being made for the post the candidate was informed that it was feared his experience of landscape work was insufficient to enable him to carry out the work in hand. Eventually a firm of landscape gardeners were engaged. Meanwhile the applicant for the post of gardener had obtained employment with the firm of landscape gardeners, and this man was sent by the firm to supervise the whole of the work. I admit that many gardeners are not good draughtsmen, but others can produce excellent work as landscape gardeners. Many would be delighted with an opportunity to show their abilities in this branch. If employers would but have confidence in their men, and give them encouragement, this branch of the profession could often be carried out successfully, and with advantage to themselves by their own gardeners. It is well known that many gardens have been designed by private gardeners. Who would take more care and interest in the laying out of grounds than the man who expects to be entrusted with their future maintenance? *Roamer.*

WILLIAM PENN. — *C. T. D.*, who reported the outing of the Horticultural Club (see p. 79) is in error when he states that William Penn, the founder of Pennsylvania, had a pew at Stoke Poges Church. The great William Penn left the Establishment when quite a young man, and joined the Quakers. It was his son Thomas who resided at Stoke Poges. This fact is quite plain by the inscription on the monument in the church. *L. Graveson.*

THE BISSAGOS ISLANDS.—I regret that a mistake has been made in the name of the small Chili mentioned on page 46, col. 3. For Amomum Melegueta, read Capsicum frutescens. *F. W. Sears.*

BLACK CURRANT "BOSKOOP GIANT."—The writer has had a similar experience to Mr. Pearson (see p. 76). Out of a dozen good bushes, planted four years ago, three became barren, and were dug up last winter and thrown away. Beyond a slight thinning of the branches they had no pruning. My opinion was that perhaps the variety was a sport at first, and the barren form a reversion. The bushes are practically free from the Black-Currant mite. I may mention that for several years I have noticed some Black Currant bushes growing freely at the edge of a Willow bed. They are covered overhead with water at times in the winter, when the adjacent River Wharf overflows its banks. Being shaded by a Willow tree they do not fruit as a rule, though this year I noticed a few fruits on the top branches. No doubt they have grown up from seeds carried by birds or water. I have often thought it might be worth while trying a plantation on similar land exposed to sunshine. The main drawback would be keeping down the free undergrowth of strong grasses and other weeds. This would be best done by small sickles. Hoeing is out of the question. I have never seen any big-bud on the bushes under the Willow, though this pest is only too prevalent in the district. *Yorkshire Gardener.*

DAPHNE MEZEREUM.—This is one of the most cheerful of hardy shrubs, flowering, as it does, when most other plants are still resting. Like other members of the family, however, it is somewhat capricious, succeeding best in a fairly light loam which is well drained and porous. When the soil is suitable, a low temperature does not materially injure the plant. The beautiful variety alba rarely attains much size or age, but occasionally one finds an exception to this rule. One such plant I found recently flourishing in a mixed shrubbery at Shavington Hall, in Shropshire. This plant is 8 feet high and 4 feet or so through; a charming plant in the best of health. The Mezereum suffers quickly from drought, and should be well mulched during summer with farmyard manure to prevent the evaporation which inevitably takes place when the soil is fully exposed. *D. E.*

BRANCHED SWEET PEA.—I enclose a photograph of Sweet Pea Mrs. Wm. King (see fig. 55), grown by Mr. T. Ryder, market gardener, Burton. From one stem there

FIG. 55.—BRANCHED INFLORESCENCE OF SWEET PEA "MRS. WM. KING."

were 17 flowers. At the ninth flower the stem branched, but there was no sign of leaves. The plant was raised from seed saved from a specimen which carried a similar stem last year, with 18 flowers, which branched at the 12th flower. Of the other stems three carried four blooms each. The plant was grown naturally, not disbudded. *J. Herdman, Under Fell Gardens, Burton, Westmorland.*

VINE CULTURE (see p. 99).—The method advocated by *R. P. B.* is very interesting, but I do not think it would prove successful for market purposes. We market-growers pinch the sub-laterals at the first leaf, and thus maintain a good root-action. Grape-growers, in private gardens as well as in trade establishments, practise different methods, and much may be learned by visiting different vineries and noting the results obtained. I am of the opinion that the "simple method" of repressing all lateral growth will usually mean the breaking or bursting of the main eyes. In the case of the Muscat varieties, which need so much light, I have had the eyes break down to the joint above the bunch of fruit. I have stopped the sub-laterals three or more times, leaving one leaf at each stopping, but my experience convinces me that it is not good practice to confine the growths of the laterals to main leaves only. The experience of other growers would be valuable. *Stephen Castle, Walpole St. Andrews.*

———*R. P. B.'s* system of growing Grapes by means of primary leaves only and the suppression of all laterals is a step in advance of a method which I have practised for some years with much success. Personally, I allow two primary leaves to develop beyond the bunch; then the subsequent laterals formed are pinched at the first leaf, thus there are four leaves beyond the bunch, two primary and two secondary. All other laterals as they are formed are rubbed off (not pinched) weekly, and in a house 30 feet by 17 feet all the laterals can be held in one hand, so persistently are they watched to prevent them from making much growth. A few good, healthy leaves will do better work than a lot of small ones clustered together, which form a hiding-place for mealy bug. The berries of Muscat of Alexandria respond remarkably well to this treatment, but Madresfield Court is liable to crack if suppression is too close. If Mr. Arthur W. Witt will give this method a trial, I am sure he will not go back to the old practice of pinching sub-laterals, for in the method I advocate only laterals are allowed to form. *P. Clapham.*

SECRET COMMISSIONS.—The warning which you were good enough to publish twelve months ago with regard to secret commissions offered by foreign firms had the effect of setting many employers on their guard. I regret to find, however, from catalogues which have been sent to me that some firms abroad are still attempting to get round the provisions of the Prevention of Corruption Act; and, as the law is powerless to reach such offenders, who have neither offices nor agents in England, I hope you will allow me once more to suggest that those who own gardens should take steps to prevent their gardeners being tempted by bribes. If only a little trouble were taken, dishonest traders would soon have to abandon malpractices which handicap honest firms and cost employers dear. *The Secretary of the Secret Commissions and Bribery Prevention League, Incorporated.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 30.—*Present:* Mr. E. A. Bowles, M.A. (in the Chair); Messrs. E. M. Holmes, C. H. Hooper, A. Worsley, G. Wilson, J. T. Bennett Pöe, J. O'Brien, A. W. Hill, and F. J. Chittenden (hon. sec.).

Injury from smelter fumes.—Dr. VOELCKER reported that the leaves sent to him from the last meeting were damaged by smelter fumes, probably by hydrochloric and sulphuric acids in the fumes. Zinc and manganese were also present.

Hybrid Orchid.—Mr. O'BRIEN drew attention to a hybrid Orchid, Brasso-Cattleya × Thetis, shown by Messrs. J. VEITCH & SONS. It was raised between Brassavola Digbyana and Cattleya Aclandiæ, but practically all the spotting of the latter species had been eliminated by the cross.

Caterpillars on Hops.—Mr. E. M. HOLMES remarked upon damage done to Hops by the larvæ of the peacock Butterfly, Vanessa Io, in Herefordshire; Vanessa C.-album frequently damages them, but he had no doubt whatever that in this case V. Io was the culprit.

Mimulus moschatus almost scentless.—Mr. A. W. HILL showed specimens of Mimulus moschatus to draw attention to the almost scentless condition of the plants. It would appear

that under certain cultural conditions this plant fails to produce the essential oil to which its characteristic odour is due in any great quantity.

Delphinium macrocentron.—Mr. Bartholomew, of Reading, sent a specimen of this uncommon species of Delphinium from his garden. It is a native of Uganda and is somewhat poorly figured in *Bot. Mag.*, tab. 8151.

BISHOP'S WALTHAM HORTICULTURAL.

July 24.—The 38th annual exhibition of this society was held in the Palace Ruins, at Bishop's Waltham. This site is conveniently near to the railway station, and picturesque in its surroundings. The display was a remarkable one, especially in the floral department, in which this society excels. Much encouragement was given to decorators of tables, vases, &c., substantial prizes being offered for these exhibits.

Floral Classes.

Four classes were provided for decorated dinner-tables. The principal class was for a table 6 feet by 3 feet, in which the use of Orchids, Carnations, and Roses was prohibited. There were eight entries, and each exhibit made a fine display. Mrs. E. C. Pern, Droxford, Hampshire, was awarded the 1st prize for an arrangement of Sweet Pea "Melba," very harmoniously combined with suitable foliage, such as Berberis purpurea, Croton leaves, Asparagus grasses, and Selaginella. The effect produced was very pleasing, and the decoration was not too crowded. Miss Taylor, Bemerton Rectory, Salisbury, was 2nd, with pink Larkspur and Francoa ramosa prettily blended.

In the class for a table decorated with Roses or Carnations, Mrs. A. Bide, Highlands, Farnham, was successful with a gorgeous display of Lady Hillingdon Rose, relieved with its own dark foliage. Mrs. R. G. Bealing, Bassett Nursery, Southampton, came 2nd, with pink Carnations and suitable foliage.

There were eight competitors in the class for a table of Sweet Peas, Mrs. A. Bide won the premier award with a rich combination of yellow, white, and red blossoms, associated with Asparagus and richly-coloured trails of Ampelopsis. Mrs. Parvin, Winter's Hill, Bishop's Waltham, who was 2nd, used pink and white flowers.

Miss Taylor was successful with a prettily-arranged table of Clarkias, in the class confined to lady members, in a keen competition. Mrs. Pern, who was placed 2nd, arranged purple and white Centaureas. For a basket of flowers, Mrs. A. Bide was awarded the 1st prize, for a charming arrangement of Roses, including Mrs. A. Goodwin and a pretty, single-flowered variety named Mrs. W. Massey. Wild flowers were quite a feature of the show. Miss Taylor won the 1st prize in this class with a delightful collection, prettily arranged in a basket. There were nine competitors in the class for a vase of flowers; Mr. Ellwood won the premier award with Larkspurs and Tamarisk.

Mr. Bealing showed the best vase of Carnations, presenting Enchantress in fine form. Sweet Peas in vases were numerous. Mrs. Bide won the 1st prize in this class with some high-class blooms, well arranged. In the class for a bowl of Roses, Mr. Bealing was successful with a glorious mass of Mme. Abel Chatenay. Mrs. Bide won the 2nd prize with Sunburst.

Entrants in the class for cut flowers were, as usual, very numerous. Among other competitors, Dr. Pern, of Droxford, was placed 1st for 12 vases of Sweet Peas, showing excellent flowers. Mr. J. Peppler, Bishop's Waltham, won the prize for six vases, and Miss Gladstone, Hampton Hill, Swanmore (gr. Mr. A. Cooper), won Messrs. J. Carter & Co.'s prize for six bunches. Mrs. Macrae, Meonstoke House (gr. Mr. H. Childs), won Mr. Robert Sydenham's prize for six varieties, and T. C. Wilson, Esq., The Thickets, Bishop's Waltham (gr. Mr. G. Barnes), was equally successful in Messrs. Toogood's class. In all classes the blooms were of good quality.

Annuals made a great display. W. H. Myers, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), won the 1st prize for six varieties with a charming collection of Mallows, Larkspurs, Godetias, &c.

Mrs. Macrae won the premier award for 18 varieties of hardy flowers, and also for 12 bunches. Roses were numerous and good, especially Ramblers, which are here particularly encouraged. Mr. Myers won the chief award for six varieties with long trails of Lady Gay, Minnehaha, Flower of Fairfield, and Excelsa, and was also 1st in the class for six bunches of any other variety.

Cactus Dahlias, in bunches of four varieties, were distinctly good. Miss Gladstone won the 1st prize; there were five other competitors.

Fruits were not numerous, but the quality was good. For four kinds of fruit (Grapes excluded), Mr. Myers was successful with Peaches, Nectarines, Melons, and Plums. Mr. Macrae won the chief award for four dishes of fruit grown out-of-doors—a very commendable collection.

In the vegetable classes, which were a strong feature of the show, Mr. Myers was again successful in all classes in which he competed. This exhibitor secured the leading awards for collections in which the prizes were provided by Messrs. Sutton & Sons, Toogood & Sons, Carter & Co., Webb & Sons, and Dickson & Robinson. The Onions, Peas, Tomatos, Potatos, Cauliflowers, and Carrots he showed were remarkably fine.

Mrs. Macrae won the premier place in competitions arranged by Messrs. Daniels Bros. and Messrs. E. Hillier & Son, Winchester.

TAUNTON DEANE HORTICULTURAL.

July 25.—The 45th annual show of this society was held at Vivary Park on the above date. The weather, after the preceding day's heavy rainfall, was favourable, and the society can still boast of always having had fine weather for their show.

In the open class for groups of plants, 13 ft. by 10 ft., arranged for general effect, Messrs. J. Cypher & Sons, Cheltenham, won the 1st prize with a tastefully-arranged group; 2nd, Mr. W. Vause, Leamington, whose group was not so bright, but contained fine single-stemmed Codiæums (Crotons); 3rd, Mr. W. Brock, Exeter.

In the class for amateurs' groups, Mr. Cornelius, Weston-Super-Mare, won the 1st prize.

The best group of 12 stove and greenhouse plants in flower was shown by Messrs. J. Cypher & Sons; Mr. W. Vause was 2nd; and Mr. A. W. Brock, Exeter, 3rd.

In the class for six stove and greenhouse plants, three specimens in flower, Messrs. J. Cypher & Sons were again placed 1st; very closely followed by H. Cornelius, Esq., Weston-super-Mare.

Roses.

For 36 varieties, distinct, Messrs. Perkins, Coventry, were awarded the 1st prize, and also for 18 varieties, distinct, and for 18 blooms (Teas), in not fewer than nine varieties.

In the class for 24 blooms grown in the county of Somerset, Mr. Rowland Adams was placed 1st and Messrs. Jarman & Co. 2nd.

The class for dinner-tables arranged with decorations of fruit and flowers, and laid for dessert for eight persons is always keenly contested, and in this instance two equal 1st prizes were awarded to Mr. C. J. Ellis, Weston Nurseries, Weston-super-Mare, and Sir W. Howell Davies, Stoke Bishop (gr. Mr. Curtis). The arrangement of Mr. Ellis was the more novel; a looped centrepiece had at either side neat candelabra-like stands containing lightly-arranged bouquets and trailing foliage; the chief flowers used were Cattleyas, Oncidiums, Francoa, &c., whilst the other table contained a rustic epergne as a centrepiece, and the usual four corners with Cattleya Harrisoniæ and brown and yellow Oncidiums. In the circumstance of equal 1st prizes there was no 2nd prize awarded, and Mr. W. Cole, Bath, was placed 3rd. The fruit on the two first tables was of superb quality.

Fruit and Vegetables.

The display of fruit in the open classes was excellent. Mr. Harold St. Maur, of Stover Park, Newton Abbott (gr. Mr. G. Richardson), gained the premier honours for a collection of eight dishes, which included fine bunches of Muscat of Alexandria Grapes, Violette Hâtive Nectarine, Superlative Melon, and splendidly-finished Black Hamburgh Grapes. F. J. B. Wingfield Digby, Esq. (gr. Mr. Turton), 2nd, whose Grapes were not quite so good.

For a collection of four dishes, Mr. H. St. Maur was again placed 1st with equally good quality; 2nd, F. J. B. Wingfield Digby, Esq. The same exhibitor was also 1st with three bunches of Black Hamburgh and for Muscat of Alexandria Grapes.

For three bunches of any other black Grape, Mrs. Balliscombe Worle, Weston-super-Mare, was 1st with massive bunches.

For a collection of vegetables, of 10 distinct kinds, Mr. B. C. Shepherd, Bridgwater, was awarded the 1st prize for a magnificent collection; Mrs. Bernard was a close 2nd; and the Earl of Devon, Powderham, 3rd. The whole of the vegetables reached a very high standard of excellence.

Non-competitive Exhibits.

Messrs. Robert Veitch & Son, Exeter, arranged a magnificent display of herbaceous and Alpine plants, hardy shrubs and new and rare plants.

Messrs. A. A. Wallace showed Phlox in a choice and great variety, arranged in masses of each colour. Roses and herbaceous plants were also a fine collection.

Messrs. Young & Co., Cheltenham, exhibited a noteworthy collection of Carnations.

Messrs. W. E. & T. Cousins arranged floral designs, Carnations, &c.

Messrs. Rich & Co. staged Pentstemons in a good range of colours.

MIDLAND CARNATION AND PICOTEE.

July 31, August 1.—The weather on the opening day of the 22nd annual exhibition of the above society, held at the Botanical Gardens, Edgbaston, was very wet and cold. The classes were well filled with flowers of good size and general excellence. Fancy Carnations—both dressed and undressed—have rarely been seen in better condition. The show was more extensive than that held a year ago. The non-competitive exhibit of Roses and Phloxes from Messrs. Gunn & Sons well deserved the Gold Medal awarded.

Flowers Shown on Cards (Open).

Single Blooms.

The schedule required 12 varieties to be shown in each of the first five classes.

Self Carnations.—1st, Messrs. A. R. Brown, Ltd., King's Norton, who had exquisite flowers of the following varieties:—W. H. Parton, Albion, Wyatt, Theodore Galton, Alba, Scarlet Gem, Modesty, Daffodil, Burlington, Cambria, Longfellow, and Mrs. George Marshall. 2nd, Mr. H. Mathias, Stubbington, Hants., whose best varieties were Daffodil, Titan, Mrs. G. Howard, Elizabeth Shiffner, Kappa, Theta, and Irma. 3rd, Mr. C. F. Thurstan, Wolverhampton.

Fancy Carnations.—The stand which gained the 1st prize for Mr. H. Mathias was particularly good. All the specimens were large, shapely, and of good substance. The varieties exhibited were Mrs. Leo Hunter, Vandyck, Lord Steyne, Father O'Flynn, Donald Macdonald, Bombardier, Hercules, Erl King, Hecla, Zeta, Daniel O'Connor, and Linkman. 2nd, Mr. C. H. Herbert, Acocks Green, whose exhibit contained superb flowers of Lord Steyne, Mrs. Penton, Forester, Linkman, Alice Byron Stuart, Rony Buchanan, and Father O'Flynn. 3rd, Mr. A. W. Jones, Yardley. There were seven exhibits.

Yellow-ground Picotees.—Mr. H. Mathias also won the 1st prize in this class. He showed magnificent blooms of Ariel, Onward, Corona, Gloria, Santa Claus, F. W. Goodfellow, Gamma, Togo, Delta, Dago, Beta, and Alpha. 2nd, Mr. C. H. Herbert, whose blooms of Margaret Lennox, John Ruskin, Santa Claus, Onward, Togo, Corona, and Ophir were beautifully clean and fresh. 3rd, Messrs. A. R. Brown, Ltd.

White-ground Picotees.—Mr. C. H. Herbert excelled in this class. He showed the following varieties in splendid condition:—W. E. Dixon, Pride of Leyton, Mrs. Payne, Beaty, Fair Maiden, Mrs. Twist, John Smith, Hon. Mrs. Kenyon, Amy Robsart, Thos. William, Lady Louise, and Mrs. Openshaw. 2nd, Mr. C. F. Thurstan, whose exhibit contained dainty blooms of Molly, Carrie Goodfellow, Mrs. Gorton, Myra, Lavinia, Excelsior, and White Heather. 3rd, Messrs. A. R. Brown, Ltd.

Flake or Bizarre Carnations.—Mr. C. H. Herbert again led with an even lot of blooms of the following varieties :—Master Fred, Peter Pan, George Rudd, J. S. Hedderley, Admiral Curzon, Wm. Skirving, Bobbie, George Melville, S. S. Thomson, Sportsman, Gordon Lewis, and Meteor. 2nd, Mr. C. F. Thurstan, whose stand included very fine specimens of Sir Kenneth, Gordon Lewis, J. S. Hedderley, Mrs. T. Lord, Admiral Curzon, and Sportsman. 3rd, Mr. H. Mathias, whose flower of Peter Pan was particularly good.

Undressed Flowers Shown in Trebles (Open).

Six varieties were required in each of the four following classes. The flowers were staged in vases, and Carnation foliage and buds only were allowed.

In a class for Self Carnations there were six exhibits, against two last year. Messrs. A. R. Brown, Ltd., were the most successful exhibitors, showing the undermentioned varieties in excellent condition :—Mrs. George Russell, Sappho, Wyatt, Britannia, H. J. Thornton, and Albion. 2nd, Mr. A. W. Jones, who showed very good blooms of Daffodil, Mrs. George Marshall, and Mrs. Flight. 3rd, Mr. R. G. Rudd.

Messrs. A. R. Brown, Ltd., again took the lead in the next class, which was for Fancy Carnations, with exquisite blooms of Nomad, Queen Eleanor, Billy Barlow, Clement Jupiter, and Mandarin. 2nd, Mr. R. G. Rudd, whose best blooms were Lord Steyne, Pasquin, and Rony Buchanan. 3rd, Mr. C. H. Herbert.

Mr. R. G. Rudd was placed 1st in a class for Yellow-ground Picotees. He had splendid flowers of Agnes, Lady Gascoigne, Exquisite, Peter Pan, Santa Claus, and John Ruskin. In the 2nd prize stand, which came from Mr. C. H. Herbert, the varieties Togo and John Ruskin were superbly shown. 3rd, Messrs. A. R. Brown, Ltd.

In the next class, which was for White-ground Picotees, the last-named exhibitors gained the 1st prize with refined flowers of Mrs. Hammond, Silas Osbaldison, Dorothy, Scribonia, Amy Robsart, and Cynthia. 2nd, Mr. C. H. Herbert, whose best specimens were Mrs. Chaundy and Mrs. Payne. 3rd, Mr. H. Mathias.

Flowers Shown on Cards (Amateurs).

The best of eight exhibits in a class for six Self Carnations, dissimilar, came from the Rev. C. A. Gottwaltz, Hadzor Presbytery, Droitwich, whose flowers were remarkable for their even size, form, and good colour. The varieties exhibited were H. J. Thornton, Iberia, Albion, John Pope, Dean Swift, and Snow White. 2nd, Mr. C. F. Budenberg, Marple, with good blooms of Tubal, Cardinal, and Mrs. Howard Green. 3rd, Mr. F. Bayliss, Walsall.

The Rev. C. A. Gottwaltz won the 1st prizes offered in classes for (1) Yellow-ground Picotees and (2) White-ground Picotees. Sylph, John Ruskin, and Lady Douglas Galton were the best varieties in the first-named class. Margaret, Fair Maiden, and Lady Sybil were the best of the White-ground Picotees. Mr. C. F. Budenberg was placed 2nd in the first-named class, and Mr. W. H. Clements, King's Norton, 2nd in the latter class.

The winning exhibit of Fancy Carnations, dissimilar, came from Mr. A. H. Birchley, Selly Oak, who showed handsome flowers of Hercules, Lord Steyne, Linkman, Mrs. Leo Hunter, Gaiety, and Margaret Thurstan. 2nd, Mr. F. Bayliss, Walsall. 3rd, Mr. B. J. Willetts, Yardley.

Undressed Flowers Shown in Trebles (Amateurs).

Mr. C. F. Budenberg won the 1st prizes in the classes for (1) three varieties of Self Carnations and (2) three varieties of Fancy Carnations. Mr. W. H. Parton was 2nd in each class. Both exhibitors had flowers of great merit.

Mr. W. H. Parton beat five contestants in the next class, which was for Yellow-ground Picotees. His flowers of John Ruskin, Santa Claus, and Exquisite were uncommonly good. 2nd, Mr. A. H. Birchley. 3rd, Mr. C. F. Budenberg.

The Rev. C. A. Gottwaltz showed the best three varieties of White-ground Picotees. 2nd, Mr. C. F. Budenberg.

The most successful exhibitors in the classes reserved for those who do not grow more than 300 plants were Mr. W. Rogerson, Mellor; Mr. H. J. Thornton, Sutton Coldfield; Mr. E. J. Brookes, Bearwood; and Mr. F. Woodward, Bournville.

Premier Flowers (Dressed).

Bizarre Sir Kenneth, shown by Mr. C. F. Thurston; *Flake* Peter Pan, shown by Mr. H. Mathias; *Heavy-edged White-ground Picotee* Margaret, shown by Rev. C. A. Gottwaltz; *Light or Wire-edged White-ground Picotee* Fair Maiden, shown by Rev. C. A. Gottwaltz; *Heavy-edged Yellow-ground Picotee* Gloria, shown by Mr. H. Mathias; *Light edged Yellow-ground Picotee* Onward, shown by Mr. H. Mathias; *Yellow-ground Fancy* Hercules, shown by Mr. A. H. Birchley; *Self* H. J. Thornton, shown by Rev. C. A. Gottwaltz.

Premier Flowers (Undressed).

Self Wyatt, shown by Messrs. A. R. Brown, Ltd.; *Fancy* Linkman, shown by Mr. O. O. Weiss; *Yellow-ground Picotee* John Ruskin, shown by Mr. W. H. Parton; *White-ground Picotee* Fair Maiden, shown by Mr. F. Woodward.

First-class Certificate.

Scarlet Self Carnation H. J. Thornton.—Shown by Rev. C. A. Gottwaltz.

Winners of Medals.

The Silver Medal offered to the most successful exhibitor in the open classes was won by Mr. C. H. Herbert, with 144 points. Messrs. A. R. Brown, Ltd., gained the Bronze Medal with 143 points. Mr. C. F. Budenberg was awarded the Silver Medal offered in the amateur class, with 84 points. The Bronze Medal was won by Rev. C. A. Gottwaltz, with 79 points. The above medals were given by the Birmingham Botanical and Horticultural Society. The Midland Carnation Society's Silver Medal, offered in the smaller classes, was won by Mr. W. Rogerson, with 58 points, and the Bronze Medal by Mr. H. J. Thornton, with 52 points.

Sweet Peas.

Robert Sydenham Limited offered prizes for 12 varieties of Sweet Peas and the 1st prize was won by Mr. A. Taylor, Olton; 2nd, Mr. E. Deakin, Hay Mills; 3rd, Mr. J. Sceaney, Harborne.

Honorary Exhibits.

Messrs. Gunn & Sons, Olton, had an extensive and exceedingly pretty exhibit of Roses, each variety being represented by bold masses. Messrs. Gunn & Sons also contributed a grand collection of Phloxes (Gold Medal.)

Messrs. Dicksons, Chester, sent a large assortment of Roses and hardy herbaceous flowers. (Silver-gilt Medal.)

Messrs. W. H. Simpson & Sons, Birmingham, showed about 30 varieties of Sweet Peas, together with Antirrhinums. (Silver-gilt Medal.)

Robert Sydenham Limited, Birmingham, exhibited Carnations in rustic stands. (Silver Medal.)

Fig. 56.—Begonia "Decorator": colour of flowers, scarlet.

(R.H.S. Award of Merit on the 30th ult. when shown by Messrs. H. Cannell & Sons. See p. 100.)

ROYAL LANCASHIRE AGRICULTURAL.

August 1-5.—The annual exhibition of the above society was held this year at Moor Park, Preston, when the horticultural section, which is now one of the most important in the county, fully upheld its traditions by making a very fine display, although unfortunately many entrants were for various reasons compelled to withdraw their entries.

Plants.

For a group of miscellaneous plants arranged in a space not exceeding 300 square feet, Messrs. James Cypher & Sons, Cheltenham, who were awarded the 1st prize, arranged with their customary skill an admirable group, in which highly-coloured Crotons, healthy Kentias, Liliums, and a variety of Orchids were prominent. Mr. W. A. Holmes, Chesterfield, was 2nd, and Mr. J. Sharp, Aldmondbury, 3rd. The

values of the prizes were £25, £20, and £15 respectively.

Twelve stove and greenhouse plants, not fewer than seven in bloom.—Messrs. Cypher & Sons were the only exhibitors. Their specimens of Kentia Fosteriana, Croton "Queen Victoria," Statice intermedia, Ixora Regina, and Clerodendron Balfouri were very fine.

Twelve stove or greenhouse plants in pots not exceeding 10 inches in diameter.—Here again the 1st prize was awarded to the Cheltenham firm.

Twelve table plants.—This class brought five competitors, the awards going to Messrs. W. A. Holmes, James Sharp, and James Cypher & Sons in the order named.

Six Orchids.—Messrs. Cypher & Sons obtained the premier award; the plants of Lælio-Cattleya Wellsiana, Epidendrum prismatocarpum, and Anguloa Clowesii were especially noteworthy. Messrs. W. A. Holmes and C. Parker, Preston, received the remaining awards.

For the single specimen Orchid Messrs. Cypher won the 1st prize with Lælio-Cattleya callistoglossa; Messrs. Holmes and Parker were 2nd and 3rd respectively.

Cut Flowers.

Mr. W. G. Eastham, of Preston, won the 1st prize for a table of cut flowers showing a fine display; the Liliums were especially good. Messrs. W. J. Garner, of Altrincham, and J. Saul, of Preston, received the remaining awards.

Mr. W. J. Garner arranged the best bridal bouquet, in which Odontoglossums were principally used; the best ball bouquet was that shown by Mr. W. G. Eastham, and Mr. P. W. Heyes exhibited the best bouquet of Roses.

Mrs. J. Nixon and Miss Newsham were the chief winners in the class for dinner-table decorations (Orchids excluded), and in the open class Messrs. W. J. Garner and F. Newsham were the most successful exhibitors.

In the class for 18 vases of Sweet Peas, J. Herron, Esq., Freshfield (gr. Mr. W. Bond), showed the best exhibit; 2nd, Sir R. Graham, Bart., Carlisle (gr. Mr. G. T. Hallett).

The best 12 vases of Sweet Peas were shown by Mr. G. T. Hallett; Mr. F. A. Robinson, Manchester, was the most successful exhibitor in the similar class reserved for amateurs; and for another set of the same number, Mr. R. Kellett was the winner.

For a collection of cut Carnations, Mr. W. Waters, of Balcombe, won the 1st prize with a fine display; J. Brennard, Esq., Thirsk (gr. Mr. J. Hathaway), being a close 2nd.

For a collection of hardy perennials arranged in a space of 15 feet by 5 feet, Messrs. Harkness & Sons, Bedale, won the 1st prize with a grand display well staged; Mr. G. Gibson, Bedale, was 2nd.

For 12 bunches of hardy flowers (the trade excluded), Mr. R. L. Garnett was the most successful exhibitor.

Twenty-four cut Roses.—Messrs. A. Dickson & Sons, Newtownards, won the 1st prize in this class, their blooms of Mr. George Dickson being especially fine; Mr. G. Gibson was 2nd. These two exhibitors received similar awards in the class for 12 blooms; and for a like number (the trade excluded) Mr. R. L. Garnett and Mr. E. Brooks were placed as named.

The Silver Cups offered as special prizes to amateur competitors residing in the county for the most successful aggregate exhibits in their various sections were awarded to the Rev. A. R. Tomlinson, of Bolton-le-Sands, for Sweet Peas; to Mr. W. G. Eastham, of Preston, for hardy cut herbaceous and bulbous flowers; and to Mr. R. L. Garnett, of Wyreside, for cut Roses.

Fruit.

The Duke of Portland, Welbeck (gr. Mr. J. Gibson), won the 1st prize for a collection of 12 varieties of fruit, showing an admirable collection, which contained Grapes Muscat of Alexandria and Madresfield Court, Peaches Barrington and Crimson Galande, a seedling Melon, Kirke's Plum, Brown Turkey Fig, Nectarines, and a Pineapple. Mr. J. Hathaway, who was 2nd, showed well-coloured Muscat of Alexandria Grapes.

Vegetables.

The exhibits in this section were somewhat below the average. Mr. R. Moss, Preston, showed the best collection of nine distinct kinds; 2nd, Mr. G. Barrow, of Carnforth.

Six varieties.—The 1st prizes offered by Messrs. Sutton & Sons and Messrs. E. Webb & Sons were awarded to Mr. G. F. Hallett.

Non-competitive Exhibits.

The Horticultural Station, Hutton, of the Lancashire County Council, staged a collection of growing Peas, fruit trees bearing fruits, and vegetables well staged on a white groundwork. (Gold Medal.)

Messrs. Blackmore & Langdon, Bath, exhibited excellent Begonias. (Gold Medal.)

The King's Acre Nursery Co., Hereford, displayed a fine collection of fruit trees in pots, the Apples and Pears being heavily laden. (Gold Medal.)

Messrs. C. M. Young & Co., Cheltenham, made a fine display with Carnations, the variety A. S. Montgomery being especially good. (Gold Medal.)

Messrs. A. Dickson & Sons, Newtownards, arranged cut Roses in pillars and boxes; a new variety, Mr. Edward Bohanne, received a First-class Certificate and Silver Medal. The variety Mr. G. Dickson was conspicuous for its good colour. (Gold Medal.)

Messrs. H. B. May & Sons, Edmonton, arranged a fine bank of Ferns; the specimens Davallia tennifolia Veitchii was very pretty. (Gold Medal.)

Mr. R. Bolton, Warton, showed a large collection of Sweet Peas. (Gold Medal.)

Messrs. Dickson & Robinson, Manchester, arranged cone-shaped collections of Sweet Peas and culinary Pears in considerable variety. (Gold Medal.)

Messrs. Sutton & Sons, Reading, exhibited a very fine collection of vegetables and fruits. (Gold Medal.)

Messrs. Dickson, Brown & Tait, Manchester, set up a fine collection of Potatos. (Gold Medal.)

Mr. J. Saul, Preston, built a rock and water garden at the chief entrance, in which fountains, Water Lilies, with foliage and flowering plants, were utilised. (Gold Medal.)

Mr. H. Middlehurst, Liverpool; Messrs. Castle Bros., Carnforth; and Mr. W. Wright, Formby, were awarded Silver Medals for collections of Sweet Peas.

Mr. S. R. Crompton, Macclesfield, displayed Violas and Pansies. (Silver Medal.)

Mr. H. N. Ellison, West Bromwich, arranged a collection of Ferns. (Silver Medal.)

The following firms had effective displays at their several stalls overlooking the ring:—Messrs. Dicksons, Chester; Messrs. Dickson & Robinson, Manchester; Messrs. Toogood & Sons, Southampton; Messrs. E. Webb & Sons, Stourbridge; and Messrs. Dickson, Brown & Tait, Manchester.

PERTHSHIRE SWEET PEA.

August 2, 3.—There was a large attendance at the third annual exhibition of the Perthshire Sweet Pea Society, which was held on these dates in the New City Hall, Perth. There was a record entry, but owing to a severe storm of wind and rain about a week before the show, a great number of competitors could not fulfil their obligations. Notwithstanding this, the Hall contained many exhibits, and a fine display of Sweet Peas—certainly the best in Scotland—was to be seen. With few exceptions, the flowers were weather-stained, but the quality throughout was of a very high order. On this occasion there were no non-competitive exhibits from England, as at this late date most of the best flowers in the south are over.

The principal class was for a display of Sweet Peas arranged for effect, no restriction being made as to space, style of arrangement, vases, or number of sprays, and open to the trade only. The 1st place was awarded to Mr. D. McOmish, Crieff, for a pretty display of the most useful varieties in commerce; all the flowers were well grown and attractively staged. The 1st prize included the society's Gold Medal. Messrs. Thyne & Son, Dundee, were 2nd, and received the Silver-gilt Medal for a circular table, on which a large number of varieties were shown. Too many varieties, a great many of them differing only in name, were staged, and many of the flowers were weather-beaten. The 3rd prize was awarded to Messrs. Herd Bros., Penrith.

The Scottish Challenge Cup, presented by the National Sweet Pea Society, was easily won by Mr. John A. Grigor, Forres. His outstanding varieties were Dobbie's Cream and Dobbie's Sunproof Crimson, both varieties showing remarkable colour. The Rev. Harold Mayall, Comrie, was 2nd, and received the society's Silver Medal for 12 vases, very slightly inferior to the winning exhibit. The varieties May Campbell, Elfrida Pearson, and Dobbie's Cream were exceptionally fine. Third prize and the society's Bronze Medal were awarded to Mr. John Machar, Forfar.

The Challenge Cup presented by Sir John Dewar, Bart., M.P., induced a good competition, and the cup was awarded to Mr. Shaw, Boquhan, who showed 12 vases of flowers of even quality. The 2nd prize and the society's Silver Medal were won by Mr. Jas. Kennedy, Moness, his blooms of Edrom Beauty and Mrs. Cuthbertson being especially noteworthy. Mr. J. Farquharson, Kinfauns Castle, received 3rd prize and the society's Bronze Medal.

In the class for six bunches, the Rev. Harold Mayall was easily 1st; the Rev. Stewart Crasb, Cupar, 2nd; and Mr. Jas. Kennedy, Moness, third.

The National Sweet Pea Society's Silver Medal, offered in addition to the 1st prize in a class for small growers who do not grow more than 15 yards or clumps of Sweet Peas, was awarded to Mr. H. Rose, Aberfeldy.

In the class for a decorative display of Sweet Peas arranged on a table 4 feet 6 inches by 3 feet, the Rev. H. Mayall was 1st; Mr. Shaw, Boquhan, 2nd; and Mr. G. Reid, Downfield, 3rd.

There was keen competition in the class for the decorated dinner-tables. The 1st prize was awarded to Mrs. F. McKenzie, Perth, for a pretty arrangement of pink and white flowers; 2nd, Miss Morrison, Perth; 3rd, Miss King, Perth. Messrs. Thyne & Son, Dundee, were 1st in the bouquet class; and Mr. H. Sinclair, Aberdeen, 2nd.

The 1st prize presented by Mr. Robert Bolton, of Carnforth, was won by Mr. John A. Grigor, Forres, and Mr. Crossly, of Comrie, won the principal prize offered by Messrs. Dobbie & Co., Edinburgh. In the open class for the prizes offered by Robert Sydenham Limited, Mr. Drummond Hay, of Geggieden, had the best exhibit.

There were many other classes and all were contested.

Non-competitive Exhibits.

Messrs. Dobbie & Co., Edinburgh, filled the whole of the space in front of the platform of the Hall with a large and comprehensive display of their novelties, and older varieties of Sweet Peas. The same firm showed a small table of Collarette Dahlias. (Gold Medal.)

Messrs. R. Henderson & Sons, Perth, staged cut flowers, Ferns, and various fruits. (Gold Medal.)

Mr. M. H. Sinclair, Aberdeen, showed a small table of well-grown border flowers displayed in glasses. (Silver Medal.)

WEST DERBY HORTICULTURAL.

August 5.—This Bank Holiday exhibition was well supported in splendid weather. The entries were well up to the average, the show being held in the Rectory Grounds, Liverpool, by the kind permission of the president, the Rev Percy Stewart.

In the cut-flower section special interest was taken in this year's exhibition on account of the presentation of a handsome challenge cup by Messrs. W. Wright & Sons, for 12 bunches of hardy herbaceous cut flowers, which was well won by the Rev. Percy Stewart (gr. Mr. T. Edgar) with fine bunches of flowers; 2nd, Mr. G. Osborne. For 12 bunches of hardy and half-hardy annuals the winners were Drs. Tidsdale and Ingle (gr. Mr. G. Osborne); 2nd, Mr. C. Crossthwaite. Mr. G. Osborne was successful with 12 Gladioli, showing good spikes. The same exhibitor also won in the class for 12 Roses and 12 vases of Sweet Peas. Mr. T. Edgar exhibited the best 12 Cactus Dahlias, and Mr. R. S. Shepherd showed the best Carnations. In the class for a miscellaneous group of plants arranged for effect, Mr. G. Osborne was awarded the 1st prize. For one foliage plant Mr. G. Osborne excelled with a good Croton. Mr. Leith being placed second for a Palm. For a single specimen flowering plant, D. Cunninoham, Esq. (gr. Mr. Leith), secured the 1st

prize with a well-bloomed Fuchsia; 2nd, Mr. G. OSBORNE, who was successful in the classes for two Pelargoniums, for two Palms and for four stove or greenhouse plants, in which there was a well-flowered Lilium, Mr. LEITH was placed 2nd in the latter class.

In the vegetable section, Mr. G. OSBORNE excelled in the class for nine distinct varieties; 2nd, Mr. LEITH. For six varieties, Messrs. T. EDGAR and S. BASFORD were placed 1st and 2nd respectively. Mr. LEITH showed the best exhibit of Cucumbers and Tomatos, the latter being splendid fruits.

For the special silver cups offered for Sweet Peas the prize-winners were Mr. J. B. NICHOLLS, Mr. J. SKITT, and Mr. R. L. SHEPHERD. Mrs. V. YOUNG proved to be the winner in the classes for a basket of flowers, and for dinner-table decorations. Mrs. YOUNG was successful with Carnations.

Obituary.

JOHN ALLGOOD PETTIGREW.—The *Florists' Exchange* reports the death of Mr. J. A. Pettigrew at Boston, Mass., on July 2 last, at the age of 68 years. Mr. Pettigrew was one of the foremost park superintendents in America. He was born near Newcastle, England, on April 25, 1844, and gained experience at some of the principal English nurseries. Later he was at Berkeley Hall with the celebrated W. B. Latham, the raiser of Cypripedium Lathamii. The training thus received, combining, as it did, nursery work and practice with the management of roads and park, was invaluable in his future calling of park work. In 1865 Mr. Pettigrew left England and engaged in commercial floriculture in Chicago until he was selected to control several combined quarries near Chicago, and for some years was engaged in this enterprise, which brought him into close relation with contractors and their work. He left this position to assume the management of Lincoln Park, Chicago, which he superintended with conspicuous success. During his term the sea wall was built, with a lagoon skirting it for its whole length. It is a mile long, and, with the work necessary to grade the lagoon, build roads and plant trees, cost about 400,000 dollars. He also designed and built the celebrated Palm-house at a cost of about 80,000 dollars. Notable instances of his ability in garden work were the Lily ponds in Lincoln Park, one of them being artificially heated, and the planting and rockwork in the great Palm-house. Mr. Pettigrew remained in charge of Lincoln Park for many years before going to Milwaukee for a year or so, where he laid out Milwaukee Park. He was called from that service to Brooklyn to take charge of Prospect Park, which he made one of the notable parks in the country. On January 1, 1897, he proceeded to Boston as superintendent of parks, a position which he filled with signal distinction until he was stricken with his last illness.

WILLIAM BISHOP.—This well-known gardener died at Hemsley, Norfolk, on July 18, at the age of 87. Mr. Bishop was born at Burnham. For many years he had charge of several important gardens in Norfolk, notably at Bylaugh Park and Shotesham. He was a successful exhibitor of plants and vegetables in his early days, and frequently acted as a judge at the flower shows at Norwich, Yarmouth, and other places. At one time Mr. Bishop was also an occasional contributor to the *Gardeners' Chronicle*. In his declining years he was a pensioner of the Gardeners' Royal Benevolent Institution.

ANSWERS TO CORRESPONDENTS.

AUTUMN GIANT BROCCOLI CLUBBING *Wermhite*. The fungus attacking the roots of your Broccoli is club-root (Plasmodiophora brassicæ). The disease is caused by a slime-fungus, and the infection arises from spores present in the soil; when infected, the roots of the plants develop wart-like swellings or nodules. The plants are most susceptible to the disease during the first three weeks after germination, and care should be taken that the soil in which the seed bed is formed should be free from contagion. Following an attack of club-root, quicklime has been found to be a good cure, using 35 bushels of lime per acre, which will be found sufficient to arrest the disease. Every plant affected with the disease should be rejected when planting out from the seed bed, and those that are thus rejected should be destroyed by burning. Before planting these green vegetables in their permanent positions, it is a good practice to dip the roots in a puddle formed by mixing together mud, soot, and a little sulphur.

BERRIES: *J. T. R.* 1, The Lowberry generally ripens from the middle to end of August, a little earlier than the wild Blackberries. 2, The Phenomenal Berry has a little less core than the Loganberry, which it greatly resembles. 3, The Wineberry is an excellent fruit for cooking, prolific in bearing, and possessing a distinct flavour. 4, The American Blackberries are rather uncertain in this country, but many of the Black Cap varieties do well on heavy soils. On the whole they are generally reported upon unfavourably. Wilson Junior is one of the best varieties.

CYCLAMEN: *W. R.* Eelworm is present in the roots. Treat the soil by heat or with gaslime. See answer to *A. D.* and *W. L.* in last week's issue (August 3) in the first column of page 106.

DOUGLAS FIR: *W. E. A.* A root fungus is present. Your best plan will be to remove the soil and expose the roots as far as practicable. Then dust the exposed roots with a mixture of sulphur and quicklime in equal quantities, and mix same with the soil when filling in.

GLADIOLI DYING: *P. C.* The Gladiolus plants were killed by the fungus Heterosporium gracile. It is too late to spray the remaining plants, but next spring spray them with liver of sulphur. If the corms are left in the ground permanently, remove the surface soil 2 inches deep, during the winter, and replace with fresh soil mixed with lime.

GRAPES DISEASED: *Anxious Enquirer*. Brown rot is attacking your vines. Nothing can be done at present whilst the fruit is on the vines, but during the winter spray every part thoroughly with sulphate of copper, using 1 lb. of sulphate of copper to 25 gallons of water. This spray fluid must only be used when no green leaves are present.—*W. G. L.* The mildewed Grapes should be sprayed twice a week with liver of sulphur, using 2 ounces of sulphur in 3 gallons of water. Spray again next spring before the disease appears. For the treatment of brown rot see reply to *Anxious Enquirer*.

MIMULUS, POLYANTHUS AND ANTIRRHINUMS: *J. D. S.* Plants of Mimulus which have only recently been raised from seed will be much too soft to withstand the winter out-of-doors, and it is advisable on the approach of severe weather to place the seedlings in a cold frame or make another sowing next year in February or March. The Polyanthus, if pricked off in light soil, will probably live through the winter, but it would have been much better to have sown the seed last April, as the seedlings would now have been good plants, which would flower well next season. Antirrhinums will occasionally live through the winter in the open air, but the usual practice is to give the seedlings the shelter of a cold frame, planting them in their flowering quarters in April. Antirrhinums which have wintered in the open will often grow from the base in the spring, but they are not really hardy in all districts.

NAMES OF PLANTS: *W. W. W.* Kindly send fresh specimens; those received are too scrappy to identify.—*J. H.* 1, Stachys grandiflora; 2, Lamium maculatum; 3, Coronilla varia; 4, Tradescantia virginica; 5, Macrotomia echioides; 6, Stachys Betonica rosea.—*H. G.* 1, Aspidium angulare; 2, Asplenium Trichomanes; 3, Arundinaria Fortunei; 4, Urtica sp.; 5, Sedum Sieboldii variegatum.—*Old Subscriber*. 1, Centranthus ruber; 2, send in flower; 3, Nephrodium molle; 4, Begonia Weltoniensis; 5, Veronica longifolia; 6, Bocconia cordata.—*T. J. M., Cheshire*. 1, Asplenium bulbiferum; 2, Euphorbia splendens; 3, Arundinaria sp., material insufficient for identification; 4, Bougainvillea glabra; 5, Stephanotis floribunda; 6, Asparagus scandens; 7, Abelia grandiflora.—*H. B.* Lygodium scandens, a climbing Fern.—*R. O. Y.* 1, Pteris aquilina (Bracken); 2, Athyrium Filix-fœmina; 3, Lastrea rigida; 4, Asplenium viride.—*G. M. M.* Calycanthus floridus.

NYMPHÆAS AND THEIR PROPAGATION: *F. E. Hutchinson*. Nymphæas may not only be propagated by seeds, but also by division of the tubers and rhizomes. Propagation by division is usually adopted in the trade. It should be carried out at about the end of April when growth has commenced. By lifting the tubers it will be seen that in nearly every instance small offsets are formed upon the main stem. These should be cut away with a sharp knife, with some of the young rootlets attached at the base. Make these firm in small punnets rather than in pots by tying them in, over, and above the soil. Root action will soon take place, after which these young plants may be sunk in rather deeper water. N. Daubenyana —a pale blue variety—may also be propagated by the young plants that form on the top of the leaf close to the leaf stalk. We do not know of any other species that has this characteristic.

ONCIDIUM LEAVES: *Carnation, Leamington*. The Oncidiums are attacked by the "Spot" disease which is often spread by the presence of moisture on the leaves at a time when the atmospheric temperature is falling. The difference between the day and night temperatures is too extreme. If any of the Oncidiums are badly affected, they had better be destroyed by burning, for it is cheaper to buy healthy young plants than make attempts to bring the unsightly and diseased specimens back to health.

PELARGONIUM: *W. B.* The Pelargonium leaves are infested with the fungus Cladosporium epiphyllum, which can only attack plants when they are very moist. Spray the plants with a rose-red solution of permanganate of potash.

POTATOS: *M. C. R.* The stunted habit of the Potatos is due to the use of diseased tubers.

ROSES: *Hibernicus*. The fungus, Botrytis cinerea, is present on the Roses, and its spread is favoured by the flowers being too wet.

SPRAYING: *R. O. F.* Whilst forcible spraying with clear water will remove aphis, it is generally advisable to spray with a decoction of quassia or some other approved insecticide.

STOCKS: *W. B.* The soil in which your Stocks are growing is infected with the fungus Sclerotinia, and should be treated with gaslime.

SWEET PEAS: *G. G.* Even the best-grown Sweet Peas usually produce three-bloom sprays at first. It is probable that your plants will presently give four-bloom sprays in abundance. The culture you describe is excellent; we should have said it is too rich, but for the fact that you are on sandy soil. You say you have some of the best varieties. Doubtless you are aware that some varieties are more prolific of four-bloom sprays than others, and for next year's sowing you should select such varieties if you wish to have a greater proportion of these flowers.

SWEET PEAS DISEASED: *S. D., "Plympton,"* and *H. G. T.* The soil is affected with the fungus Thielavia basicola. In future, sterilise the soil before sowing the seed.

almost entirely of a deep maroon tint. O. crispum Bumble-bee (see fig. 57), shown by Lieut.-Col. Sir Geo. L. Holford, K.C.V.O. (gr. Mr. H. G. Alexander), at the Royal International Show, and of which we give a representation half natural size, is a variation in the same direction, an occasional dark spot appearing on the sepals, while the lip bears a bee-like, brownish-purple blotch, which occupies the greater part of its surface, the fringed margin being white.

POLYCYCNIS LEHMANNII.

This singular species of a very remarkable genus was first flowered by Sir Trevor Lawrence, Bart., K.C.V.O., who received a botanical certificate when it was shown at the Royal Horticultural Society, on Aug. 13, 1895. That plant was the sole specimen received from the late Consul Lehmann, and the spray was illustrated in the *Gardeners' Chronicle*, Aug. 31, 1895, p. 245. A single plant has again appeared and is flowering in Tracy's Nursery, Twickenham, with an elegant spray of 23 insect-like blooms, larger in size than shown in the illustration mentioned. The raceme is pendulous, after the manner of Gongora. The flowers, each about 1 inch across, are borne on downy, purple stems. The reflexed sepals and petals are whitish, evenly spotted with reddish purple; the very singular labellum, expanded in the middle and narrowed to a point in front, is white, spotted with rose-purple at the sides, the blade bearing numerous long, hair-like spines. The arched, slender column is green with an enlarged purple apex. It is nearest to P. barbata, and very distinct from P. muscifera, a fine plant of which with three spikes was shown from Lord Rothschild's collection, July 9, 1895, when it also secured a botanical certificate. The genus originally was included in Cycnoches, with which it has but little in common. The singular flowers, produced like a flight of insects, are very attractive, and to anyone interested in speculating as to the meaning of the singular arrangement of the lip, and its bearing on fertilisation by insect-aid, it affords useful study.

Fig. 58.—Watsonia meriana ardernei: flowers white.

WATSONIA ARDERNEI.

Watsonias are nearly allied to the Gladioli, and though their flowers are not so large as those of the majority of that race, they are very beautiful plants, well worth the attention of gardening enthusiasts. Curiously enough, however, they are almost entirely neglected, and it is rarely we see any of the species in the open, except in the south-west. It is true that, being natives of the Cape of Good Hope, they are not perfectly hardy, but if they are treated in the same manner as the Gladioli—namely, lifted in the autumn, stored in sand during the winter, and replanted in March, there is no reason why they should not succeed. In certain spots, however, such as South Devon and Cornwall, Watsonias may be left permanently in the open bed through the winter, though even in Devon this method does not always ensure success. The first white Watsonia was found by an employé of a Mr. Upjohn, a nurseryman living at Rondebosch, near Cape Town, on the slopes of Table Mountain, and eventually some of the produce of this bulb passed into the hands of the curator of Port Elizabeth Botanical Gardens, who consigned corms to Mr. James O'Brien, which led to their distribution under the name of Watsonia O'Brienii. Later on, Mr. H. M. Arderne, of Cape Town, an enthusiastic gardener, found a white Watsonia near Worcester, about 80 miles from Cape Town, and the produce of this corm has come into commerce under the name of Watsonia Ardernei. Practically speaking, the two may be considered identical, since both are white-flowered varieties of W. Meriana (syn. iridifolia), and were found growing among numbers of the pink-flowered type. However, some nurserymen catalogue them separately and at different prices, but it would be far better if the white forms were known simply as Watsonia alba. I have myself seen a white Watsonia growing at the Cape among masses of the common type some hundreds of miles distant from where W. O'Brienii and W. Ardernei were found, and intended to collect it on my return, but, unfortunately, never passed that way again. In a note on Watsonias which I read a short while ago, the writer stated that wet was fatal to the corms, but here the plants have not the slightest protection from the excessive winter rainfall, yet are in the most vigorous health, and Mr. Arderne found his white Watsonia growing in a "boggy marsh," so that I venture to think that this correspondent's theory on the culture of Watsonias stands in need of revision. This is, however, a favoured spot for the culture of Cape bulbs, Nerines and others growing and flowering well in the open, and I would not for a moment advocate planting Watsonias permanently in the open in cold districts. In such localities lifting and replanting in March is the only safe plan.

Wyndham Fitzherbert, Kingswear, Devonshire.

NURSERY NOTES.

THE WARGRAVE HARDY PLANT FARM.

The title of this firm being unfamiliar to some readers, it may be remarked that the owner is Mr. Bernard Crisp, a son of Sir Frank Crisp, of Friar Park, Henley-on-Thames. The Wargrave Hardy Plant Farm is situated a little over a mile from Twyford railway station, opposite a right-angled turn in the main road leading to Henley, where the passer-by cannot fail to notice the long, broad herbaceous borders on each side of the entrance drive, which, for many months of the year, have been gorgeous with beautiful flowers. It is difficult to realise that previous to last October the site of these borders and nursery was pasturage, and that, owing to the continued rains of the autumn and early winter, but few of the subjects were planted in position until the spring of the present year. It may be admitted that goodly-sized clumps were used, but the old-established appearance of the borders is largely due to the excellence of the soil. "We can dig two spits deep," said Mr. Richardson, the manager of the farm, "and not come to the end of the good, heavy loam, which suits so many herbaceous plants." Even the most casual visitor could not fail to be impressed with four of the plants in these show borders: these are Polygonum orientalis (Mr. Bowles's variety), which may be termed an improved P. amplexicaule; the bright-golden variety of Achillea eupatorium; Helenium cupreum, not more than 18 inches high and profusely flowered; and H. pumilum. "It would be difficult," remarked

Mr. Crisp, as we expressed our admiration for these plants, "to name four equally valuable border plants, for these are all very showy subjects, are useful for cutting purposes, and will remain in flower for fully four months."

On either side of the entrance gate there are masses of Nepeta Miltonii; cuttings were dibbled in the ground in the spring at 6 or 8 inches distant, and now the plants have completely covered the ground and are smothered with masses of pretty lavender-coloured flowers, which individually are not showy, but in the aggregate produce a delightful effect. In the middle of the border a huge mass of Anchusa italica "Dropmore variety" was just passing out of bloom, and the spent flower-racemes told of the wealth of colour which had been present a short time ago. In the background there are 150 Michaelmas Daisies for autumn blossoming.

We leave the show borders to inspect the stock of plants, of which there are 50,000 ready for dispatch, and, all being well, the number will have increased to 80,000 by the spring. Incidentally, we learn that the nursery has already outgrown the owner's original intentions. His idea was to commence in quite a small way and gradually build up a business. But even as the plants in the rich ground decline to spread slowly so the owner soon found it impossible to confine the nursery to the original limits. Walking between the nursery beds, we were impressed with the vigour of the plants, and the keen knowledge the promoter and his manager appear to possess of the characteristics of each species. In these beds are to be found practically every Alpine or herbaceous plant worth growing—many of them rare and valuable; prominence is given to improved varieties of old favourites, such as Anemone pusilla grandiflora, which has flowers twice the size of those of the type and of richer colour. Gypsophila dubia is a little gem for the rock-garden; the tiny, trailing stems become blood-red in colour early in the spring. Very many Violas are grown, and there is a good batch of the uncommon Pelargonium Endlicherianum, so brilliant when in flower. Of German Irises there are 150 new varieties, with dozens of each variety, besides very many of the standard sorts. Pentstemons of a splendid strain occupy a large piece of ground. There are a host of plants suitable for the "grey border"; water and bog plants are also largely grown; the Nymphæas are cultivated in long cement tanks, framed so that lights may be placed over them when necessary.

Half-hardy Shrubs.

One of the heavy showers which have been all too frequent this summer forced us to seek shelter, so we took refuge in the glasshouses, where there are many seedling and other plants, chiefly of species suitable for growing against warm outside walls. As is the case out-of-doors, the plants almost seem to grow themselves; the seedlings of Carpenteria californica and Fremontia californica will be embarrassing in their numbers. The propagating frames contain a host of desirable plants, the popular Lithospermum "Heavenly Blue" is present in great numbers, and there are also many plants of the true Saxifraga Boydii. In a warm border against the walls of the propagating house a trial is being made of various plants to test their hardiness. At present a batch of Salvia Grahamii seems to be perfectly hardy, but it has not yet wintered. This species may almost be termed a glorified, bushy Salvia rutilans.

Foresight and forethought—two indispensable qualities for success—are evident in this latest hardy-plant establishment. During periods of drought local water is not available for garden purposes, so Mr. Crisp sunk a deep well, installed a pumping engine, and built a large cistern at a considerable height, so that, whatever the weather may be, he has the command of an abundant water supply.

ANNUALS AT READING.

Passengers by the Great Western Railway Co.'s main line trains cannot fail to have noticed the blaze of colour in Messrs. Sutton & Son's seed trial grounds at Reading. As seen from the railway coaches, the predominant floral features are the long central borders which bisect the trial grounds; the glorious mass of dwarf Nasturtiums, which adjoin the railway, and the varied hues of the Snapdragons which, grown in so many different parts of the grounds, testify to the popularity of these valuable annuals.

The weather, on the occasion of our visit, was stormy, but this fact afforded an opportunity of determining the varieties of annuals which have the greatest value for dull seasons, and many flowers which are beautiful during bad weather are even more attractive when the conditions are enjoyable. The masses of dwarf Nasturtiums seemed to revel in the heavy showers; the raindrops glanced off the shining leaves, and the abundant flowers immediately recovered themselves, flaunting their rich colours. This huge bed of Nasturtiums provides a valuable object-lesson, showing the essential condition for obtaining plenty of flowers on the plants. The soil at the trial grounds is naturally very poor, shallow, and stony—gravel and sand are quarried on the nursery; at one end of the Nasturtium bed the soil was enriched last autumn for growing Narcissi, and the position of this ground can be definitely outlined, for here the Nasturtiums have grown luxuriantly, the leaves being rich and green, but the crop of flowers is only a moderate one. On unmanured ground the flowers quite hide the leaves, and on a bright, sunny day the brilliance would be dazzling. Lines of Godetia "Crimson King" in the central borders were very floriferous, and it is interesting to notice that the rains had caused the older petals to assume a pleasing magenta tint. The rose-coloured Godetia "Marquis of Salisbury" is another desirable variety, whilst Godetia Dwarf Pink makes exceedingly floriferous plants not more than 15 inches high. Godetia (double rose) is still the best of the taller-growing type. Behind the Godetia Crimson King there is a long row of dwarf, single Sunflowers. We were informed that they were sown where they are growing; the plants, which have been well thinned, are not more than 3 feet high. Each bears a surprising number of flowers, averaging 7 inches across. The annual Chrysanthemums also showed up well: the soft, yellow Morning Star and its rich, golden companion, Evening Star, are still the most desirable varieties of their type. Clarkia elegans Scarlet Beauty, about 15 inches high, was a blaze of colour, in spite of the unpropitious weather. Close by a large bed of a beautiful rose-coloured annual Larkspur was very effective. The seeds of this Stock-flowered Larkspur may be sown out-of-doors in September, or at about the second week in April. The plants grow to 2 feet 6 inches in height, and produce many spikes of delicately-scented flowers. The two varieties of Marigold chiefly grown, Lemon Queen and Orange King, are splendid sorts, being great improvements on the old garden Marigold. Candytufts of several kinds, notably Improved Carmine; Linarias, hybrid Dimorphothecas, and the annual Lupins are other valuable annuals for dull and wet seasons. Delphinium Queen of Blues, if sown in the flowering quarters in April, make dwarf plants and flower freely. Asters which were sown in the open in April, and transplanted, were just commencing to flower. The beds of Stocks provided masses of showy, sweet-scented flowers. A large bed of seeding Lobelias showed an interesting variation; many of the dwarf spreading varieties would be useful for filling temporary blanks in the rockery, as also would the dainty little Eschscholtzia "Miniature Primrose." The varieties of Lobelia tenuior, which are generally restricted to greenhouse cultivation, thrive splendidly at Reading in the open, making good, compact, very floriferous plants about 9 inches high.

Contrary to some gardeners' opinions, the hybrid Schizanthuses frequently make satisfactory plants as hardy annuals, and at Reading may be seen a large bed of these plants flowering freely. As a general rule the Eschscholtzias are not so satisfactory this year as usual; they require plenty of bright sunshine to be seen at their best, but the variety Mandarin, which bears large, yellow flowers, with deep-orange reverse, provided a fine patch of rich colour.

Fig. 59.—Forests of Provence.

Upper edge of wood of Pinus sylvestris on northern slope at 1,450 m Bois de Cheiron. The dark bushes are Buxus sempervirens.

THE FORESTS OF PROVENCE.

(Concluded from p. 113.)

3.—Montane and Sub-alpine Coniferous Forests.

In the right angle made by the valley of the Var, where it turns from an easterly to a southerly course, the country is formed of limestone strata, dipping steeply (40-45°) and regularly to the north, and the rivers have dissected this region into a series of steep, parallel ridges running east and west, whose tops are from 1,000 to 1,700 metres above sea level, and intervening valleys whose bottoms are about 400 or 500 metres above the sea. The sides of these valleys, except round the small towns and villages where Olives are cultivated, are thickly clothed with wood. Here the influence of aspect is extremely well seen. The north sides of the ridges bear forests of Pinus sylvestris, with Beech and deciduous Oak, and often with considerable tracts of Ostrya, while the southern slopes bear Quercus Ilex and many Mediterranean shrubs. Towards the mouth of a large valley, such as that of the Esteron, Pinus maritima and P. halepensis also appear, the last-named gradually becoming dominant as the slopes of the Var valley are reached.

The montane woods of Pinus sylvestris (see fig. 59), which, as has been said, mainly occupy steep slopes of north aspect, contain Quercus sessiliflora, Fagus sylvatica, Ilex aquifolium, and Ostrya carpinifolia. The shrubby undergrowth consists of Buxus, Daphne laureola, Juniperus communis, while Anemone hepatica and Erythronium dens-canis are the two most conspicuous ground species in early spring. Mosses are abundant, and Ferns moderately so. Cowslips and occasionally Primroses also occur.

On steep northern slopes protected from the south by vertical rocks, as at Ste. Baume in Western Provence, the Beech becomes dominant, replacing the Pine. The famous forest of Ste. Baume (700-900 metres) consists of a considerable area of finely-developed Beech, continuous with Pinus sylvestris on one side and Quercus pubescens on the other. The great feature of the Beech forest is the abundance of Yew and Holly, which form a regular layer below the crowns of the Beeches. Associated are Acer campestre, A opulifolium, Prunus avium, Viburnum Lantana, Euonymus europæus, and on the ground Daphne laureola, Ruscus aculeatus, Heracleum sphondylium. Mecurialis perennis, Anemone hepatica, Sanicula europæa, Euphorbia amygdaloides, Primula veris, Ranunculus ficaria, Polygonatum verticillatum, &c. Ivy is abundant on the ground and climbing on the trees, whose bark is thickly covered with mosses and lichens. If one climbs to the summit of the ridge, which reaches a height of 1,000 metres, one comes out on pure Mediterranean vegetation on the southern slopes.

The forests of Pinus sylvestris extend from the region described northwards into the sub-Alpine region, with but little modification of the undergrowth. As the Alps are approached, however, e.g., in the neighbourhood of St. Martin Vésubie, at an elevation of 1,200 to 1,500 metres, in the narrower east and west valleys, the Pine woods are confined to the southern slopes of the hills, while on the northern slopes the woods are composed of Picea excelsa and Larix europæa (see fig. 60). On these southern slopes the pine woods form the actual tree limit at a height of 1,700-1,800 metres. The ground vegetation includes Buxus, Genista cinerea, Juniperus communis, Anemone hepatica.

At the time of my visit (end of March) the ground vegetation of the Spruce and Larch woods on the northern slopes was entirely covered with snow from 1,400 metres upwards, while the southern (Pine wood) slopes from a similar height up to 1,800 metres at least, were quite free from snow (see fig. 60). *A. G. Tansley.*

NOTICES OF BOOKS.

A New Carnation Treatise.*

A volume, extending to more than 200 large octavo pages, with 20 or more full-page illustrations, devoted to one section of this popular flower, is a proof of the interest that the author deems the flower-loving people of Great Britain entertain for it. That he is an enthusiast no one who reads its pages can doubt, and almost every page bears witness to the fact that, like all enthusiastic florists, he believes that the cultural practices he pursues can alone give the very best results; else it might be asked, Why another book on a subject that most gardeners know pretty well? They know all that can be told about cuttings and their rooting, pottings, stopping on the short and long system, ventilating and other simple items of management. Some gardeners, it is true, and it is said they are an increasing number, are giving up propagation from cuttings for layering, but that system the author does not mention. Yet it is a point that requires to be settled, because plants rooted from cuttings and layers frequently exhibit marked peculiarities, and whether the new system will give as good results as the old remains to be proved. It will probably happen that most of us, as in other things, will determine the matter experimentally each for himself. A suggestive chapter is that on cutting the flowers, which the author insists must be done when the blooms are half-developed, their further expansion taking place in a cool room. He remarks "I venture to say that all the best blooms at our leading perpetual-flowering Carnation shows which carry off premier honours have been cut from three to six days previous to the show, the water being repeatedly changed, and stems recut at least every 24 hours." That is a point well worth the consideration of every grower. We all know how soon colours deteriorate, and shade our flowers accordingly, but we do not know that so simple a method, where it can be carried out, will give such good results. Mr. Allwood seems not to have quite made up his mind if the bench system is superior to the pot system. The former method of cultivation is no doubt spreading in private gardens, and a decisive opinion would have been welcomed by many of us who do not care to be responsible for the expense of alterations that may become monuments of our want of prescience. The author disclaims any literary merit, which he need not have done; the one fault of his book from that point of view being a looseness of style which leads to repetition, and here and there incorrect conclusions. He refers to a Carnation house, the limit of which it is stated should be 250 feet by 40 feet, and it is to contain eight benches and about 16,500 plants! A very simple problem in arithmetic will show the absurdity of the number. The author's brother, who writes a chapter on Carnation growing in America, proposes houses 200 feet by 47 feet, to contain about 7,000 plants, which works out more satisfactorily. The illustrations are from photographs, and many of them will prove practical helps to the full understanding of the text. *R. P. B.*

Fern Culture.*

Messrs. H. B. May & Sons have published a third edition of this useful book. The text was originally written by John Birkenhead, and the present edition is revised by Mr. F. Parsons. The little book is well arranged, and the advice on soils, potting, rockwork, light, &c., is excellent, as might be expected from such a capable cultivator as the reviser. The selections of Ferns for various purposes are most happy and judicious. Exception may, perhaps, be taken to the inclusion of such plants as Adiantum Capillus-veneris and Dicksonia antarctica among Ferns for the cold greenhouse, so far, at any rate, as regards the less genial parts of the country. The illustrations are numerous, and many of them are exceedingly effective, although all are not of equal merit. It is a pity that some attempt has not been made to indicate the scale of drawing, as this is very unequal. A glaring example of this disparity occurs on p. 43, where Osmunda regalis and Davallia parvula are shown as of approximately the same size.

There are a few mistakes, such as the use of Hymenophyllæ for the plural of Hymenophyllum, although in most cases the ordinary English plural is wisely and properly used. Opposite p. 112 is a fine figure of Polystichum aculeatum pulcherrimum, which is misnamed P. angulare pulcherrimum. The distinction is important as the two Ferns in question are entirely different.

Nevertheless, the book will be found useful not only to the beginner, but to many more advanced cultivators of Ferns. *F. W. Stansfield.*

Fig. 60.—Forests of Provence.

Effect of exposure at 1,500-1,700 metres. Pinus sylvestris on southern slope (left), which is free of snow. Picea excelsa and Larix decidua on northern, snow-covered slope (right). Col St. Martin, near St. Martin Vésubie.

HARDY FLOWER BORDER.

CAMPANULA PETRÆA.

YELLOW is a rare colour in Campanulas, and I have only cultivated two species which can be said to have flowers of this colour. C. petræa (see fig. 61) is a native of the South of France, and I procured seeds from that district two years ago. These have given me a good batch of plants, but they include two distinct forms. One of the varieties has not yet flowered, and I am unable to identify it, as the foliage and habit are distinct. The other is C. petræa, and its small yellow flowers, closely set together in short spikes, are now at their best. I find this Campanula thrives best on a border facing west, and the plants have the benefit of a half-shady spot, which seems to suit them admirably. I grew the young plants in small pots, and wintered them in a cold frame, planting them in their present position in the spring. The soil in the border was taken away and in its place was used a mixture of two parts turfy loam, one part well-decayed leaf-mould, and one part rough "sandstone chips." C. petræa is a beautiful Campanula, and extremely rare in cultivation. If seeds can be procured, the present is, I think, the best time to sow them, in order to get strong plants for flowering next season. I am afraid that in Scotland the saving of seed will be a matter of great difficulty, more especially when the kind of weather we are experiencing is considered. It may, I imagine, be easily propagated by division of the plant after the flowering season is over, and I intend to try this method of increasing the stock during the present autumn. The other yellow form of Campanula I have grown is much more common. Apart from its colour, it has nothing to recommend it. I refer to C. thyrsoidea, a native of the Alps of Europe, with its dense pyramidal spikes of small, greenish-yellow, fragrant flowers. It seems to thrive best on the rock garden, and by the end of June its flowers are over for a season. *George M. Taylor, Midlothian.*

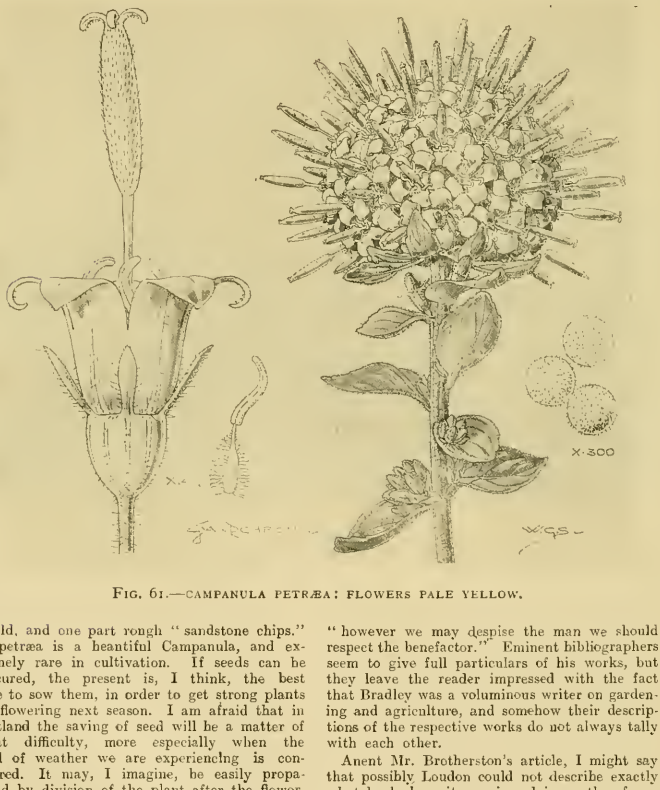

FIG. 61.—CAMPANULA PETRÆA: FLOWERS PALE YELLOW.

RICHARD BRADLEY.

AMONGST the horticultural writers of the early years of the eighteenth century, the name of Richard Bradley stands in high relief for simple and graphic accounts of gardening.

A welcome and interesting epitome of his work has been lucidly portrayed in these columns (see p. 41) by Mr. Brotherston, a savant in horticultural matters. The subject is a large and intricate one, pregnant with matter for discussion, verification, and correction.

The man himself, as Mr. Brotherston observes, has an unknown pedigree. The one that might have been able to make it known was Dr. Thomas Martyn, his successor at Cambridge, but, so far as I can trace, the only notice taken of Bradley by him was that he sinned in the means employed in procuring the professorship, that John Martyn might have had earlier.

G. W. Johnson gives an account of the affair from Pulteney's *Sketches of Botony*. Following the extracted account, Johnson says that Bradley laboured indefatigably and successfully to promote the improvement of horticulture, and "however we may despise the man we should respect the benefactor." Eminent bibliographers seem to give full particulars of his works, but they leave the reader impressed with the fact that Bradley was a voluminous writer on gardening and agriculture, and somehow their descriptions of the respective works do not always tally with each other.

Anent Mr. Brotherston's article, I might say that possibly Loudon could not describe exactly what he had, as it was issued in another form, for instance:—

New Improvements of Planting and Gardening, in three parts, bound in one, 5th Edition, 1726, each with separate and distinct title pages; Part 2, 1725; Part 3, 1726.

This edition has also the rare Herefordshire Orchards by Dr. Beale, with a postscript letter to Samuel Hartlib, Esq., followed by an appendix and having distinct title pages.

Part I was dedicated to Prince Henry; Part II was dedicated to Lord Parker; Part III was dedicated to Earl of Carnarvon; Appendix was dedicated to Knox Ward, Esq.

Mr. Brotherston states *inter alia* that:—

The Seedmen's Catalogue was attributed to Bradley and is *not* his.

I have not seen or heard of the title exactly like that. Does Mr. Brotherston mean—

A *Catalogue of Seeds and Plants*, mentioned in Townsend's *Tract*, and to be found in a Seedsman's Shop, London, 1720. Vide Johnson's *Hist. Gard.*, page 187, under Bradley.

Or again *ex*-Johnson, not under Bradley, page 202:—

The Complete Seedsman's Monthly Calendar, showing the most easy method of raising and cultivating every sort of seed belonging to the Kitchen and Flower Garden, with necessary instructions for sowing of Berries, Mast and Seeds of Evergreens, Forest Trees, and such as are proper for the improving of land.
Written at the command of a person of honour. London, 8vo., Anonymous.

The title page of the second, given as anonymous, is almost identical with my edition, thin 8vo., 1738, 63 pp., the difference being as follows:

The word "complete" is spelt "compleat," after the line—

"Written at the Command, &c."

My copy has—

By Richard Bradly, F.R.S.
(no "e" in Bradley.)
The Second Edition,
London.

Printed for W. Mears, at his Ware-House at the Lamb on Ludgate Hill, 1738.

(Price One Shilling.)

And before beginning the article with Dr. Bradley's (with "e") on the third page, the second page has:—

Advertisement.

The profitable usefulness of this little treatise sufficiently recommends it to the public.
The faults which escaped the Press in the former are in this Edition carefully corrected, and the whole piece has been revised and in many places improved by the late Author, Dr. Bradly (no "e").
This has been thought proper to intimate in justice to his memory the name of Mr. Townsend, a gardener, being only put to it by the Author, to do him a service, by bringing him into business.
Your obedient servant,
The Bookseller.

At the end of my copy of *New Improvements, &c.*, 1726, an advertisement of books published by W. Mears appears, giving a copy of the title page of the—

Compleat Seedsman (as I have already given in full—J.M.) and following the line—
Written at the Command, etc., by Benj. Townsend, formerly gardener to Lord Middleton, to which is added a catalogue of Seeds, Plants, etc., mentioned in the *Tract* and to be found in the Seedsman's Shop.
Recommended by R. Bradley, F.R.S.

So it is not surprising that the records we have are at variance, as the edition with Townsend's name might be the only copy known to the bibliographers, and Johnson has considered one of them "Anonymous." If Bradley really wrote the book, and for reasons explained by the bookseller it may be taken on good faith that he did, I think Dr. Bradley is entitled to the credit the publisher gives him. You will remember the Abercrombie-Mawe arrangement for authorship of *Every Man his own Gardener*, was a similar act of non-fraudulent collusion.

The Seedsman's Calendar is a most interesting and instructive book dealing exhaustively with species and varieties of garden seeds. Many sorts of Peas and Beans have curious names, and in numerous instances are prefixed by the name of Knight.

"Various Rounceval Peas, grey, blue and white, also the green Pea, for boiling when the Pea is dry; this is the same Pea as is eaten in Holland, cods and all, like Kidney Beans, and must be stick'd up for it grows high. The Bow Dye Pea is very hardy and stands the winter."

In a foot-note it is explained that Stratford-le-Bow, near London, is "a place famons for Dying Scarlets," also that Knight was a "curious nurseryman in Bedfordshire and a great collector of Peas." As an example of numerous details given by Bradley, I might pick out one on the Small Speckled Dwarf Kidney Bean. "I brought this from Holland and gave it first to the late Mr. Fairchild. It is a good Bean to boil, with smooth coat. Mr. Beacon, nephew of Mr. Fairchild, now has it." *J. Murison.*

NOTES ON HARDY PLANTS.

Is Geranium cinereum album a product of the garden or does it occur wild? Messrs. T. S. Ware, Ltd., had a fine patch of it in their rock garden exhibit at the International Show. G. cinereum has been blooming freely at Llanishen ever since the third week in May. Silene Hookeri was shown well by this firm and others: it is a more beautiful plant than S. Elisabethæ. I understand it is a native of the Rocky Mountains, and should much like to hear other people's experience with it, especially with regard to its capacity for withstanding English winters and the conditions which suit it best.

Everyone who inspected Messrs. J. Backhouse & Son's rockery must have been impressed with the beauty of Ranunculus Lyallii, and have subsequently welcomed the beautiful Supplementary Illustration that appeared with the *Gardeners' Chronicle* of June 29. The lover of hardy plants who had not before seen this Ranunculus, will also welcome the fact that the writer of the note accompanying the illustration suggests planting it on the moraine, although in Nicholson's Dictionary it is described as a greenhouse plant. Another feature of this exhibit was a spur of great limestone boulders, planted with the Queen of Saxifrages, the true S. longifolia, and Ramondia pyrenaica snugly lodged in the crevices. Looking at this spot alone, one would well imagine one was in the Gorge de Luz or by some tributary torrent near the Cirque de Gavarnie, rather than in the grounds of Chelsea Hospital.

The Caraway Thyme—shown by Mr. Clarence Elliott—will be very useful as a distinct aromatic plant for crevices in paths. It appears extraordinary that such a distinct scent should be borne by two such different plants as Thymus and Carum Carvi.

Libertia ixioides made a fine display in Mr. Maurice Prichard's rockery: it is taller, freer flowering, more elegant, and better in every way than L. formosa.

I made notes of the following German Irises in Messrs. Barr & Son's beautiful exhibit: Her Majesty, as near a true pink colour as any variety I have seen; Edward Michel, reddish purple; Ossian, with standards deep yellow and falls red; Princess Victoria Louise, pale yellow and red; Princess Beatrice, like a large pallida dalmatica and King of the Irises, with large reddish brown and yellow flowers.

Of the many striking plants in Messrs. Jas. Veitch & Sons' exhibit of new Chinese plants, perhaps Deutzia Veitchii will become the most popular. Deutzias are so easily grown, and this variety is of a beautiful pale pink—always a popular colour. Populus lasiocarpa, with great heart-shaped leaves a foot long, will make a most effective tree.

On the rockery at Kew Gardens, Erodium amanum, with white flowers and lovely silvery leaves, attracted my attention. Anemone sylvestris had evidently been flowering very profusely, which in some gardens it persistently refuses to do. At Kew the plant was labelled var. ochotensis, which may be freer than the ordinary form. I should be very glad to learn if this is the case. I believe Mr. Farrer in one of his books mentions a variety (major) which he states is freer than the type. Viola gracilis was very fine. Erodium supracanum, white with pink veins, was attractive, and E. guttatum, with large white flowers, the two top petals blotched and green leaves, is well worth growing.

In the Alpine House at Kew I was much impressed with the beauty of two Linums—L. salsoloides and L. s. nana—both pure white. I have since seen the former plant growing rampantly (but quite low): it seems a most desirable plant, having a long season of blooming. *Caltha.*

The Week's Work.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Propagating Bedding Pelargoniums.—Where large quantities of bedding plants are required annually, their propagation should not be delayed any longer. Many practical men have their own peculiar method of propagating and wintering bedding Pelargoniums, adapting their methods to the circumstances in which they are placed. At Eastwell Park, we propagate some thousands of these plants, and invariably use boxes, which we find particularly suitable for handling, enabling a large number to be moved in a very short time. These boxes, which hold about 50 cuttings each, are about 24 by 12 by 4 inches. The plants are wintered in the boxes till the potting is commenced in January. Any ordinary soil for filling the boxes will suit the plants, provided it is sweet, and made light and sandy. The gardener must use his discretion when removing the cuttings from the plants, or unsightly gaps will be made. A moderate number should first be secured from each bed, afterwards examining the beds each week or 10 days for further cuttings. After the cuttings have been taken from the plants, remove all decaying leaves that are exposed, hoe the beds over, and if the weather is dry apply a good watering. If the cuttings are very sappy, allow them to get dry before inserting them in the soil; flagging will not harm them. The cuttings should be planted firmly in the boxes or pots, and a moderate watering will settle the soil round them, after which they should be kept moderately dry. If the weather is hot and dry, the cuttings may safely be left out-of-doors and in the sun; but if frames or staging in empty fruit houses are available, these may be utilised, which will prove safer should wet weather prevail. If the cuttings are placed out-of-doors, provision should be made to protect them from heavy rains, or probably a large percentage will fail to root properly.

Alterations in the Flower Garden.—All through the summer, when the different sections of plants are at their best, notes should be taken of any intended alterations, whether in the shape and disposition of the flower-beds, or in discarding old varieties of bedding plants in favour of improved forms, or different plants altogether. There is no satisfaction in growing inferior varieties of flowering plants when there is such a wealth to select from. An important point to remember in considering any alterations is whether the staff is so constituted that the suggested alterations can be efficiently carried out. It is far better to undertake only a little, and to do it thoroughly, than to neglect the routine work in the flower-garden, which is sure to cause disappointment.

General Work.—Where carpet bedding is practised, the pegging-down and pinching of shoots must be undertaken at frequent intervals, in order to preserve the design. The beds should be kept scrupulously clean by hand weeding. All turf edges and grass must be kept in perfect order, as the best of flower-beds lose much in appearance if their immediate surroundings are not in keeping. Violets are now making capital progress. Pinch off all side shoots and runners as they appear in order to encourage the development of strong crowns for flowering in the frames during winter.

Pentstemon.—Pentstemons are proving one of the most satisfactory bedding plants this season. Each year we grow them in increasing numbers, and, given good cultivation, very few plants provide a more striking display. There are now such splendid varieties, giving long spikes, with large flowers, ranging from white to purple, that some may be chosen to suit all tastes. The scarlet and pink varieties are very effective, and the following selection includes a dozen of these beautiful shades:—Crimson Gem, George Home, Marquis of Linlithgow, Lady Noble, Lady Forbes, Garth, Mrs. Michie, Thomas Hay, William Bull, Alexander Brown, Sir Dighton Probyn, and Southgate Gem. Pentstemons can be strongly recommended for providing blocks of colour over a long period, whether grown alone in beds and borders, or in patches in the mixed flower-border. The main spike should be removed when it has finished blooming, which will allow the secondary shoots to make a good growth, and these will give a display till quite late in the autumn. Pentstemons are gross feeders, and revel in good soil. Manurial assistance should be given at intervals, and abundant waterings in dry weather.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Miltonia vexillaria.—Many plants of this species are now developing new growths, and at this stage are subject to the attacks of small yellow thrips, which secret themselves low down in the axils of the leaves. If these insects are not destroyed at once, the plants will suffer serious injury, the new leaves being permanently disfigured. When yellow thrips are found to be present, flowers of sulphur should be dusted into the axils of the leaves by means of a soft camel's-hair brush when the foliage is quite dry. This will have the effect of driving the pest nearer to the point of the leaves. The leaves of the plants and young growths should then be immersed in a solution of Quassia extract, the proportion being half-a-pint of extract to 3 gallons of tepid, soft water. After dipping, the plants should be laid on their sides in such a position as to allow the liquid to drain from the leaves without in any way coming into contact with the roots or compost, the leaves afterwards being rinsed with clean water. Any repotting that is necessary should be carried out at this stage of growth. The plants should be lifted from their pots, and all the old, loose material shaken from the roots, cutting away any which are decayed. Select pots of a size just large enough to accommodate each plant. The pots should be furnished with clean crocks to about three parts their depth for drainage, covering the crocks with a thin layer of Sphagnum-moss. Keep the base of the plants just above the level of the rim of the pots, and work the compost between the roots, pressing it moderately firm, and finishing with a surfacing of living heads of Sphagnum-moss. A suitable rooting medium for these plants consists of Osmunda fibre, A1 fibre, and Sphagnum-moss in equal quantities. The whole should be cut rather short, and a liberal addition of crushed crocks incorporated with the compost. After potting, the plants should be staged well up to the glass in a light, airy position in the intermediate house, shading them from the sun's rays. Water should be afforded only very sparingly at the roots, allowing just enough to cause the moss to keep green until the new roots are well into the new compost, when the supply should be gradually increased. The plants will be benefited by a light spraying overhead at least twice daily during bright weather, using clear, soft water for the purpose. They should also receive an overhead spraying once in every two weeks with Quassia extract water in rather a weaker form than recommended above for dipping.

Sophronitis grandiflora. — This cool-growing, bright-flowering Orchid is now developing its new growths, and at this stage any plants that require resurfacing or repotting should be given attention. The ordinary shallow Orchid pan, without side holes, is the most suitable receptacle in which to grow them. These should be filled to three parts their depth with small, clean crocks for drainage, using a compost of equal parts Osmunda fibre, A1 fibre, and Sphagnum-moss, cut up in small portions, to which should be added some crushed crocks. Pot the plants moderately firm, with a surfacing of clean Sphagnum-moss, and suspend them in an airy position in the cool Odontoglossum house. During the growing and rooting season, sufficient water should be afforded to keep the surface moss in a healthy condition, and when the plants are dormant they should not be allowed to become sufficiently dry at the roots to cause the pseudo-bulbs to shrivel. Sophronitis Rositeriana and S. cernua require similar treatment. Many of the hybrids of Sophronitis grandiflora, such as Sophro-Cattleya saxa, S.-C. Warnhamensis, and others, and Sophro-Lælia hybrids, such as S.-L. Marriottiana, S.-L. Psyche, and S.-L. Valda, are making new growths, and should be repotted

or resurfaced as is found to be necessary; they need a similar compost to that mentioned for Sophronitis. The smaller-growing kinds are best grown in shallow pans and suspended from the roof, while those of larger growth may be cultivated in well-drained pots on the stage, keeping them well up to the light. These plants are usually grown in a cool, airy position in the Cattleya or intermediate house, but many of our hybrids at Gatton are suspended from the roof of a seedling Odontoglossum house, where they grow and flower very satisfactorily.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Tydæa amabilis.—The dark, rose-coloured flowers (see fig. 62) of this beautiful and interesting stove plant resemble miniature Gloxinias in form, but are borne on slender stalks, and, like the remainder of the plant, are hairy. Spring of layering may gradually be removed. It is a good thing to cut the layers free from the parent plant a few days before potting. The compost to receive the young plants should consist of good loam, lime-rubble, sand, and a little wood ash. A small quantity of manure from an old Mushroom bed or some leaf-soil is often found advantageous to keep the compost porous, but neither is necessary if the loam is of the right quality. The potting should be done firmly, but the collar of the plant should not be too deeply buried. After potting, the plants should be placed, if possible, in a cool house. If this is impracticable, a cold frame is an efficient substitute, but the advantage of the house lies in the fact that the foliage retains a hardier nature, and is more likely to be immune from spot and rust throughout the winter than is the case with plants which have been kept in a frame, even for a few months. The plants should be well watered after potting, and light overhead sprayings are good for them until they are well rooted.

Fig. 62.—Tydæa amabilis, a neglected stove plant.

is the natural flowering season for Tydæas, but their period of usefulness can be prolonged by starting small batches of plants into growth at intervals until about midsummer. As most of these plants have now finished flowering water should be gradually withheld, and when the foliage has ripened the plants should be stored in the pots in a dry and warm place. As with the nearly-allied genus Gesnera, propagation is best effected by increase of the tubers in the spring. Leaf-cuttings readily form plants, and, in many instances, it is not yet too late to adopt this method of propagation.

Carnation Souvenir de la Malmaison.—Those plants which were first to be layered will soon be ready for potting. The young plants should be supplied with plenty of light and air, and the shading which was necessary at the time

Hippeastrum (Amaryllis.) — The early-flowering specimens of this plant will by this time have finished their growth, and the amount of water to be given them should be lessened. For a time the plants should be allowed all the sun and air available; the best position for them is a shelf in a cool house, but if this is not to be had, a dry frame in the full sun will do quite well. Some of the later flowering plants may not be showing as yet any signs of drying off; these should be separated from the others and kept watered until the foliage begins to turn yellow. Seedling plants should be kept growing freely in a fairly warm temperature. It may be found necessary to shift them into larger pots for the winter; if so, they may be re-potted now into a slightly larger size, and again shifted (say, into 32-pots) in the early spring. This should ensure the plants attaining full flowering size by next autumn, if generous treatment is accorded them throughout the season.

Solanum. — The brightly-berried Solanum capsicastrum is of high decorative value. If planted out in frames or in the open ground, the plants should be well watered, as the flowers set much more freely when the roots are kept fairly moist. This also applies to plants in pots, but these latter need rather more manure than those which are planted out. In order to secure good-sized berries, the points of the shoots should be taken out as soon as sufficient berries are set. Towards the end of the month those planted out should be cut round with a knife or a sharp spade, preparatory to lifting them early in September for potting.

The Conservatory.—It often occurs that when the owners of a garden are in residence for a long time, the conservatory cannot be thoroughly overhauled, especially if it is near the house. When the opportunity occurs, therefore, give it a thorough turn-out. The climbers are apt to become very dense, and these should be thinned out and tied, but not too stiffly—climbing plants always look best when left a little free. Many conservatories contain large Camellias in tubs—after these have made their growth, they may be placed out-of-doors for a month or so. If they are placed in a position where the sun will not be too powerful for them, they will be assisted considerably in the ripening of their wood and the setting of flower-buds. At this time of year, many plants may be introduced into the conservatory without fear of injury—for instance, large Crotons, some of the hardier Caladiums, Acalyphas, and Dracænas. These may often be left in the conservatory until they are unfit for further service, and then destroyed—that is, unless they are required for stock purposes. It is certainly an advantage to clear out some of the large plants from the greenhouses before the winter, and thus make room for younger specimens.

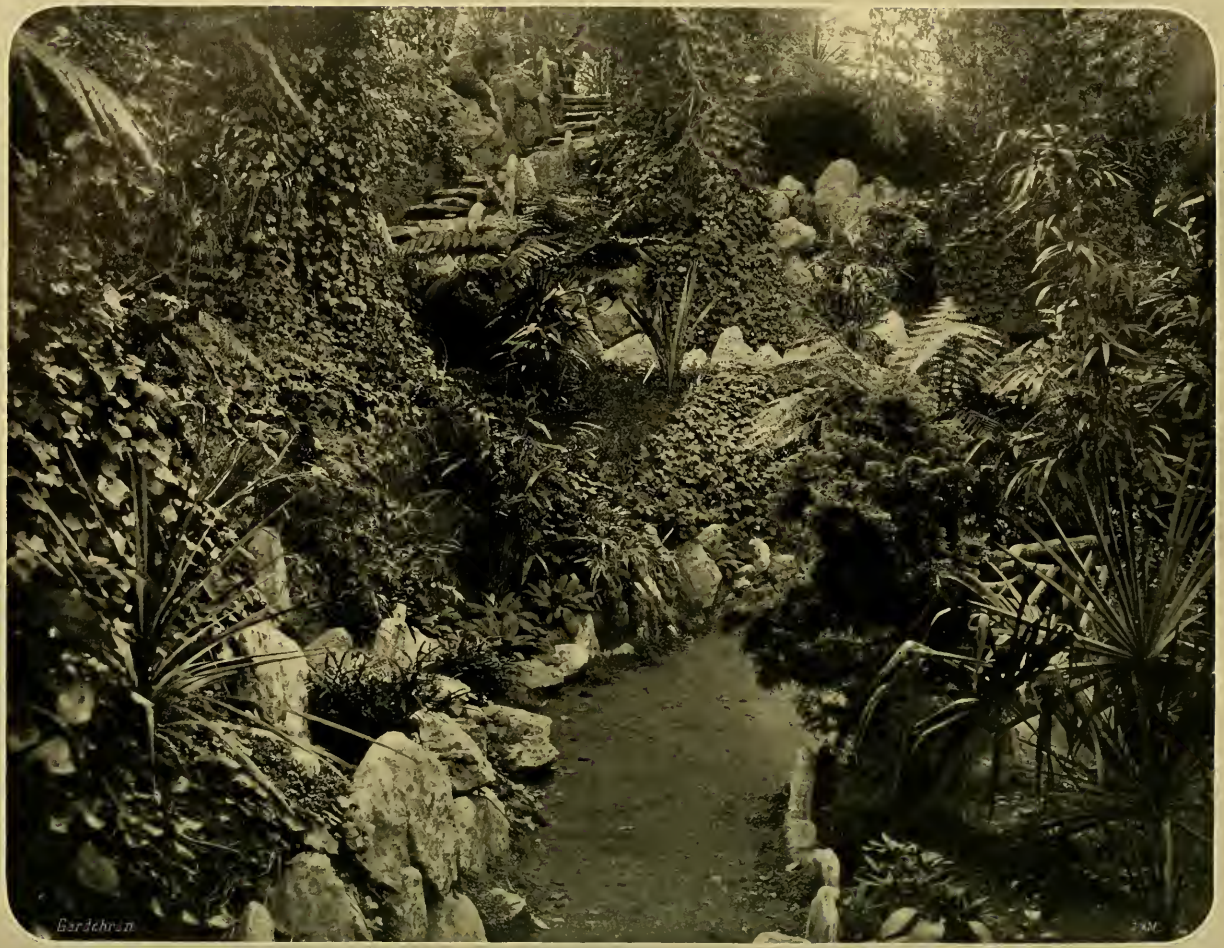
THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Hardy Vines.—The maturing of the fruit has been hampered of late by the wet and sunless weather. Mildew is attacking the fruit and foliage, and little can be done beyond cutting off the bunches, as the foliage is hardly ever dry for any length of time. It is well to cut off all laterals one leaf beyond the bunch, and leave only one bunch to a shoot; the bunches and foliage are thus as fully as possible exposed to the light and air. Leading shoots should also be checked or tied in, according to space, to encourage the ripening of the wood for next season's crop.

Raspberries.—Any old canes still remaining should be removed, and the number of canes for fruiting next season reduced. Those retained should be secured to stakes or wires to prevent any damage by strong winds. All suckers must be removed from autumn-fruiting varieties, and the canes tied up lightly, so that sunshine and air may reach all parts.

Strawberries.—Now that the fruit is removed from the young plantations, the sooner all runners, weeds, and damaged leaves can be cleared from those beds which are to remain until next season the better. It is well to avoid removing more foliage than necessary; but leaving the plants clean will encourage fresh growth, and good, healthy leaves will be produced before winter. Many of the plants have suffered badly from mildew this season, and all straw mulchings and mildewed leaves must be removed to the rubbish heap and burnt. The beds should afterwards be dusted over with a mixture of lime and soot, which will destroy mildew, slugs, and snails, and also stimulate the growth of the plants. Old plants which are to be destroyed should be taken away from the beds and burnt at the first opportunity. Runners which have been layered as recommended in a previous article will now be well rooted and ready for planting out. If the ground is well prepared, the soil in good condition, and the weather favourable, the sooner the planting can be done the better. A few plants might be planted on a south border, 15 inches apart each way, in cold frames.



ROCKERY AT FRIAR'S HOUSE, BARRY ISLAND, NEAR CARDIFF.

Printed by Temple Press Ltd., London, E.C.

These will be found very useful, as the fruit will be ready just before the ordinary crop is gathered. Two feet to 2 feet 6 inches should be allowed between the rows for general planting, according to the variety, and 1 foot between the plants; and next season, as soon as the fruit is cleared, every other plant should be removed.

Nuts.—Remove all suckers from the Nut bushes, and keep a sharp look-out for squirrels, or these creatures may soon clear the whole crop.

Figs.—These trees should be examined at short intervals, and all weak shoots removed. Short-jointed shoots should always be selected in preference to long, sappy growths, as the joints of the latter are generally injured in a severe winter. Trees carrying heavy crops of fruit should be watered with liquid manure, if growing in well-drained borders; but young trees which are making too much growth should not be allowed much moisture. The fruits should be protected from birds and wasps with muslin.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Pot Vines.—Young vines which have been grown for fruiting in pots next year should be strong canes by this time. In these circumstances the chief consideration now will be to get the wood well matured by the end of the season. For very early forcing it is essential to get the canes ripened as early as possible, or they will not respond kindly to forcing; therefore, during cold, dull weather, it is desirable to slightly heat the hot-water pipes. On such occasions syringing should be discontinued and the atmosphere kept less moist. Let there always be a free circulation of air, more or less in degree, according to the condition out-of-doors. When the vines have made sufficient growth and the wood is fairly well hardened, the ripening process will be greatly accelerated by placing the vines out-of-doors in a sunny situation, partly plunging the pots in ashes. The roots will still need frequent supplies of moisture, and stimulants must also be given them two or three times a week. The longer the foliage can be retained in a healthy condition, the better it will be for the vines. A sharp look-out must be kept for red spider, and, should it appear, syringe the foliage with a strong solution of soft soap and sulphur.

Figs.—There will be no difficulty in keeping up a continual supply of ripe fruits all through the autumn if the trees are allowed to develop a second crop. This crop will be as satisfactory as the first, except that the fruits will not be so large. Do not let the trees get overcrowded with growth, and give the fruits a further thinning if it is considered they are too numerous. Afford water and stimulants to the roots as often as appears necessary, discontinuing the stimulants when the fruits commence to ripen. During dull or wet weather, slightly heat the water pipes, and ventilate the house with extra care. When the fruits are ripening, it will be necessary to have a little heat in the pipes during cold nights, also in the day time when the weather is unfavourable.

Fig Trees in Pots.—The earliest trees required for placing into heat in November or December, with a view to obtaining ripe fruits early in the spring, should be overhauled now, and those which are in need of repotting treated in this manner without delay. Figs do not require to be repotted every year, therefore those which are already in very large pots or tubs will need only to be top-dressed with some rich compost. The drainage must be examined, and, if necessary, made good. Remove as much of the old soil as convenient to make room for the new materials. The compost should consist chiefly of fibrous loam, with a liberal mixture of lime-rubble, wood ashes, and crushed bones. A little well-decomposed horse manure will also be beneficial if the loam is poor. Young, healthy trees which need repotting may be given slightly larger receptacles. The roots will not then need so much disturbance as is the case when the trees are repotted into the same-sized pots. See that the pots are thoroughly cleaned and well-drained. The compost mentioned above for top-dressing will be suitable for the potting. If the compost is in proper condition, the soil must be rammed quite firm, and, to ensure that the whole of the space between the side of the pot and the ball of roots is perfectly filled with soil, a thin rammer should be used for the purpose. After potting, place the trees in a shady position until they have recovered from the check. They must be carefully watered till the roots are again active, but the syringe must be freely used during hot, dry weather. If heavy rains occur frequently, the trees should be given the shelter of a house.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Herifordshire.

Onions.—In many districts Onions sown in heat and planted out early in the year will now be nearing maturity. It is a mistake to allow these to remain too long on the land, though the showery weather may cause them to continue green and in a growing state. One of the principal points in relation to their keeping properties is that they should be ripened and lifted early, certainly during the present month, and they should be handled very carefully, so that the bulbs do not become bruised. The beds should be examined and all deformed bulbs taken out, also the rough skins carefully removed from the perfect bulbs to prevent them holding water, when the outer skin will ripen to a nice brown colour, which is so important to the future of the bulb. By about the 20th of the month the whole of the crop should be lifted and carefully harvested. Those that were sown in drills in the open ought by now to have their tops turned down, which is best done with the hands, exposing the bulbs as much as possible to the sun.

Late Peas.—These are doing remarkably well since the wet weather set in. To prolong the season as far as possible thin out the growths, and keep them well supported in an upright condition. Should there be dry weather keep the roots well supplied with moisture and damp over the growth late in the afternoon. Autocrat and Masterpiece are still amongst the best varieties for late supplies.

Runner Beans.—Runner Beans do best when the growths are not allowed to become overcrowded. After the top of the supports is reached, the shoots should be stopped to induce some of the bottom growths to break away strongly. Never lose sight of the fact that the bean is a moisture-loving plant, and it can hardly be given too much water at the roots, even though the weather may be showery. Excepting those required for seed purposes, the pods should be gathered immediately they become fit, as nothing tends to weaken the plants more than allowing the seeds to mature.

Spinach.—Continue to sow seed of the best varieties, at frequent intervals, on well-manured, deeply-dug ground in different parts of the garden. The ground should be broken down very finely, and the surface thoroughly dressed with soot and burnt garden refuse, and the whole raked down to a very fine tilth.

Parsley.—Make another good sowing on finely-prepared ground on a south border. These will furnish good plants for placing in cold frames for winter use. Thin out earlier sowings, and apply frequent dustings of fresh soot.

Lettuce.—Continue to plant out seedlings of both Cos and Cabbage varieties in the most sheltered parts of the garden, and make further sowings in skeleton frames for a winter supply. Amongst the best varieties of Lettuce for present sowing and later are three old favourites, namely, Hick's Hardy White Cos, a good selection of Brown Cos, and the old Hammersmith Cabbage. So far as I know, the latter variety is still the most hardy in cultivation, and may be successfully grown in almost any locality.

Potatos.—I hear most unfavourable accounts from many districts as to the prevalence of the Potato disease, the low temperature and continued rains being all in favour of this scourge spreading. Lose no time in lifting all varieties as fast as they mature, and place them under cover, sprinkling a little fresh lime between each layer of tubers.

Beetroot.—Immediately the roots of this crop become of a fair size they should be lifted and stored away in sand or fine cinder ashes for future use. It is a mistake to leave them in the ground after August.

THE APIARY.

By Chloris.

Hints to Exhibitors.—In exhibiting honey the first point to attend to is the flavour. This should be of a definite nature, mellow, and so well defined that the judge, on tasting it, can tell its source. The colour is important, for the novice often enters his honey in the wrong class through having no guide to enable him to judge it correctly. A mistake of this kind can be avoided by purchasing two grading glasses of the British Bee Keepers' Association. One piece of glass, held up to the daylight, not sunlight, gives the lightest shade desirable, and the two pieces together the darkest shade allowed in the medium-coloured extracted honey. Some imagine that water-white honey is the correct colour for the lightest class, but this is an error, bright amber being correct. The density needs attention, for the honey should be as thick as possible; thin honey has no chance of being placed in the successful division. There should be a delicate aroma observable immediately the cap is removed, so much so that a good judge can recognise from what plants the bees gathered it. For this reason the exhibitor should use screw-top jars, not tie-over, and insert a wad beneath the cap to make them airtight when screwed down, so that the delicate aroma may not evaporate. The honey for show purposes should have remained on the hive until it is quite ripe, i.e., sealed, and if ungranulated honey is desired the earliest production will supply this want. In order to secure the required density above mentioned, care must be taken to wipe the uncapping knife every time it is used after putting it in the hot water. Thoroughly strain the honey as it runs from the extractor. Care must be taken not to fill the honey with air globules as it passes into the bottle, and this can be best prevented by holding it at an angle. The air bubbles would eventually rise to the top and cause a scum, which judges regard a fault. Immediately after bottling place the honey in a cool, dark room or cupboard. The general finish of the exhibit tells in its favour; for this reason the bottles should be well polished before use, the metal caps should be similarly treated, and all tarnish rubbed off just prior to the show. When granulated honey is aimed at, it should be the very best and quite ripe. To make the honey granulate, avoid heating it, if possible, and place it, when bottled, in a cool, light place. When granulation has commenced turn the jars occasionally and stir it, as this makes it of a smoother grain. The process will take a year, and if warmth is applied in any way it may cause fermentation to take place. The best honey for granulation is obtained from Turnip flowers, Clover, Mustard or Charlock. When granulation is complete it should be pure white. If there is any tendency to flakiness this will tell against it. Sections should not be travel-stained, so those for exhibition should be removed as soon as they are capped. To prevent the bees puncturing the cappings use as little smoke as possible, and never omit to employ the Porter escape superclearer for the purpose. The cells should be of the worker type in preference to those constructed on drone base. There should be as few holes as possible, and should be worked to the wood all round if it can be managed. The cappings must be transparent, raised a little, and thin. If possible select sections of one colour of cappings, e.g., Sainfoin honey have yellow, while Clover and Heather have white cappings. The wood must be thoroughly freed of stains and propolis by scraping, and this can be best done by using a piece of glass rather than a knife. The sections are then ready for glazing, and in doing this an edging of white paper lace may be used by way of ornamentation, with a uniform width not exceeding ⅝ inch. To produce a good wax exhibit, cappings should be saved; when these are carefully melted there will be no sediment, and the resulting wax will be pale yellow. Cast the wax in pound cakes in plain moulds. Place the mould in a basin of hot water, and strain the molten wax into the floating mould. When the wax has set on the top of the mould, pour in more warm water to completely cover the wax. When the block floats out allow it to remain in the water until it is quite cold.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, AUGUST 21—
Shropshire Hort. Soc.'s Sh. at Shrewsbury (2 days). Caerphilly Fl. Sh. Weston-super-Mare Fl. Sh. Margam Fl. Sh. Cowbridge Fl. Sh.

THURSDAY, AUGUST 22—
Aberdeen Fl. Sh. (3 days). Peebles Fl. Sh. Preston Hort. and Industrial Soc.'s Sh.

SATURDAY, AUGUST 24—
West Birmingham and District Hort. Soc.'s Sh. Co-partnership Festival in the Brentham Gardea Suburb, Ealing.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—61°8.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, August 14* (6 P.M.): Max. 63°; Min. 49°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, August 15* (10 A.M.): Bar. 29·5°; Temp. 60°; *Weather*—Fair.
PROVINCES.—*Wednesday, August 14:* Max. 56° Aberdeen; Min. 52° Mayo.

SALES FOR THE ENSUING WEEK.

MONDAY—
Special Sale of Bulbs, &c., for the Trade, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

MONDAY, WEDNESDAY, AND THURSDAY—
Great Trade Sales of Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

Double Standards in Sweet Peas.

The disqualifications which took place at the recent Show of the National Sweet Pea Society have brought into sudden prominence the subject of double standards. Rightly or wrongly, the Society determined that in most of the classes the presence of flowers possessing more than one standard should be treated as a disqualification, an explicit direction which left the judges no option in the matter. Numerous groups of flowers, including some of the finest in the show, were ruled out of order for non-compliance with the regulation, and some of these were staged by well-known exhibitors, who have but little appreciation for double-standard flowers, and may be credited with having taken considerable pains to eliminate them from their collections.

The matter is certain to be brought up at the future meetings of the Society, and members should utilise the interval to think out what is best to be done in a situation of extreme difficulty. It may very well be urged that it is impossible to divide Sweet Peas into two clearly-defined classes consisting in the one case of varieties that have one standard only and in the other of varieties in which the standard is duplicated, for these characteristics are not fixed. There is no variety that can be depended upon to give double-standard flowers with anything like persistency; the so-called duplex varieties have disappointed those to whom this type appeals most, for they have always a tendency to produce single flowers. Whilst it may be claimed that, the conditions being equal, certain varieties are more capable than others of producing a greater proportion of flowers with double standards, nevertheless this particular duplication is very often merely an indication of high cultivation attended with a very liberal use of manures. There is no reason why the attempt to produce varieties with fixed habit of doubling should not be pursued by those cultivators thereto inclined; and provided such flowers are found to be popular for market and decorative purposes, a prominent place will doubtless be found for them in exhibition schedules. In the meantime it is irritating to exhibitors that a fine bunch of flowers of such varieties as Mrs. C. W. Breadmore or Elfrida Pearson should be disqualified because in a very few instances the specimens are found to possess twin standards. We have mentioned these two varieties on account of their proneness to produce double-standard flowers, and because they cannot be dispensed with for exhibition purposes, for they are the best of their respective classes.

We know that many object to the hard-and-fast rule contained in the schedule because they regard the presence of double standards as a sign of good culture; indeed, it has been said by those who opposed the inclusion of the rule that its adoption put a premium on bad cultivation. The opposite view is that in so far as doubling is the result of cultivation it is also the index of excessive culture. There are very few Sweet Pea lovers who would be willing to sacrifice beauty of form, grace and colour in their flowers in order to obtain mere size. Coarseness in any shape or form can never be tolerated in Sweet Peas, yet there is the danger of its appearance in the collections of those who seek after great size in their blooms, the frequent result being a collection of badly-placed flowers, too far apart on the stems to appear graceful or natural. We have heard of a proud grower who boasted that he had flower stems 27 inches long! Such an abnormality is most undesirable, and Sweet Peas have everything to lose and nothing to gain by high feeding.

It is not altogether impossible that the public will some day prefer double Sweet Peas to single flowers; indeed, many profess to think that if the regulation were withdrawn the single flowers would soon form but a minor feature at the exhibitions. Alterations of taste are not to be prevented by even such a stringent regulation as that of the Sweet Pea Society, but unless the fear referred to can be shown to be groundless the Society can scarcely relax the rule without some misgiving. At present there are three classes reserved expressly for double flowers.

Whilst writing on the subject of Sweet Peas, we may refer to the streak disease. From time to time, an outcry is raised in one quarter or another that the disease has broken out, and for a while there is a scare lest it assume the proportions of an epidemic. When, however, a visit is paid to the Royal Horticultural Society's garden at Wisley, and it is seen how splendidly Sweet Peas are grown on the light soil there, without a trace of disease, and when it is remembered that similar excellent results are attained by the best growers in every county of England, we suspect that methods of culture have more to do with the attacks of the disease than is commonly believed.

Park Gardening in America.

An interesting account is given by Mr. Schmitt in the *American Florist* of the progress of park gardening in America, as illustrated by Fairmount Park, Philadelphia. The account, which is based on a paper read by Mr. Schmitt before the Florists' Club of Philadelphia, describes the change which has come over park management in recent years, since the time when "keep off the grass" was the invariable order, to the present day, when visitors are not only encouraged but lured to inspect and study the plants grown for their pleasure. Fairmount Park exhibits all the various styles of gardening, from carpet-bedding to water-gardens. The tendency in recent years with respect to the former is to adopt narrower borders or beds than were in vogue formerly. The advantages of the newer method consist in economy of plants and reduction of the difficulty of preserving the formal shapes.

Cluster beds of evergreens for colour effect enter largely into the scheme of gardening adopted at Fairmount Park. Such beds, planted along the drives and interspersed with beds of annuals and perennials, make for the enjoyment of those who pass daily along the walks. The requirements for the annual bedding in this park are given in detail, and include:—

Pelargoniums (in eight varieties)	22,700
Coleus (in four varieties) ...	10,000
Ageratum	1,400
Alternanthera	47,000
Tulips	135,000

and correspondingly large numbers of such subjects as Echeverias (11,000), Sedum aureum, Eranthemum atropurpureum, Abutilon, Acalypha tricolor, Salvias, Cannas, Pansies, Chrysanthemums (4,000), and many others.

Among the aquatics are Nymphæas and Nelumbiums. Cacti and other succulents are grown largely (500 species and hybrids), and prove of fascinating interest to visitors. Rambler Roses are employed for covering embankments and unsightly cliffs, the chief varieties being Lady Gay, Dorothy Perkins, Gardenia, Evergreen Gem, and, indeed, all the Wichuraiana hybrids, as well as many others.

Mr. Schmitt concludes his interesting

article with the following wise remarks:—I believe from an educational point of view the public park and its system has much to do with the education of the people, as well as of that of the children of the many schools in and around our city. They visit the park very frequently by entire classes accompanied by their teachers, to study plant life from nature. The visitors imbibe civic pride, and adopt, as nearly as means will permit, better conditions surrounding their own homes. The recreational value of the opening of the whole park to the public and allowing the freedom of every part of the grounds for public use (with us there are only a few places where people are not allowed on the grass) cannot be over-estimated from the point of view of the health of the community. Park gardening requires many-sided abilities, which, when practised by the up-to-date gardener, give to the visitors from other cities impressions deep and lasting.

National Hardy Plant Society.—The second annual conference of the National Hardy Plant Society will be held at Shrewsbury on Thursday, 22nd inst., the second day of the Shropshire Horticultural Society's show, at the George Hotel, at 3.30 p.m. Mr. T. W. Sanders will read a paper on "Are Flower Shows Advancing Hardy-plant Culture as They Might and Ought to Do?" There will also be a discussion on the herbaceous species and varieties of the genus Veronica. All visitors to the show interested in hardy plants are cordially invited. Particulars of plants entered for certificates should be sent to the secretary, Mr. F. Bouskell, Market Bosworth, Nuneaton, not later than the 20th inst.

"The Botanical Magazine."—The issue (No. 92, fourth series) for this month contains illustrations and descriptions of the following plants:—

Hydrangea Sargentiana, tab. 8447.—This distinct species was introduced by Mr. E. H. Wilson from Western Hupeh, where he found it at an elevation of 5,000 to 6,000 feet above sea-level in 1907, but, unfortunately, it does not appear to be hardy, for several young plants at Kew failed to withstand the cold of the winter of 1909-10. Since then winter protection has been afforded the species, and it is just possible that older and more woody plants may survive winters out-of-doors. As its flowering season is towards the end of July, when flowering shrubs other than those with yellow flowers are scarce, the present tenderness is very unfortunate, for Hydrangea Sargentiana would be a valuable acquisition. From the gardener's point of view, this species is distinct on account of the conspicuous, bristle-like hairs which cover its stems and petioles, but, botanically, it is very near to H. Rosthornii. At maturity, H. Sargentiana becomes 6 to 7 feet high; the ovate-acuminate leaves are unequally toothed, and are often 12 inches long by 6½ inches wide. The corymb is composed of numerous flowers; some, sterile and white, are 1 to 1½ inch across.

Aloe Steudneri, tab. 8448.—The portion of inflorescence figured shows this to be a remarkably beautiful Aloe, the individual flowers being about 2 inches long, the three outer segments deep red, the inner ones recurved at the tip, rose-pink below with dark yellow on the recurved portions and with red veins. The species was originally discovered by Dr. Steudner in the Gbaba Valley at about 11,500 feet altitude. Its affinities have greatly perplexed botanists: one authority believes the plant to have a close relationship with A. Scholleri. A specimen in the Kew collection has failed to produce flowers; but a plant in the Cambridge Botanic Garden flowered in March, 1901, and another at La Mortola, Italy, in April, 1911. Notwithstanding its shyness in blooming, it is, like most other Aloes, a handsome plant, and well worthy of cultivation. The leaves are about 2 feet long, and margined with a narrow band of rose colour.

Muehlenbeckia complexa, tab. 8449.—This is an old plant in gardens, but it does not appear to be generally known; specimens are frequently received by us for naming. The plant is not perfectly hardy in Great Britain, but it survives the winters in favoured districts. It is usually met with as a climber in the rock garden, but there are forms which have a dense tufted growth several feet in diameter. Plants at Kew are liable to partial injury from frost, but the species grows well in Mr. Hill's garden at Herm Island, Guernsey, and this gentleman supplied the material for the *Botanical Magazine* plate. The stems are reddish-brown, and bear small roundish leaves, from the axils of which the spikes of greenish-white flowers are produced.

Pycnostachys Dawei, tab. 8450.—This species was first described by Mr. N. E. Brown in *Gardeners' Chronicle*, January 12, 1907, p. 18. The flowers are blue, of the shade seen in Coleus thyrsoideus, and produced in terminal elliptic-ovoid spikes from 1¼ to 5 inches long and from 1¼ to 1¾ inch across.

Agave disceptata, tab. 8451.—This plant was presented to Kew Gardens in 1893 by the late Mr. W. B. Kellock, of Stamford Hill, under the name of Agave Leopoldii, and was regarded by that gentleman as a hybrid between A. filifera and A. princeps. On flowering, there was no evidence of any such parentage, but the characters pointed to the plant being a distinct species. The scape is about 5½ feet high, the flowers being borne in a rather loose spike. The perianth lobes are greenish with rosy-purple edges. The plant grows well in the Succulent House at Kew.

A Neglected Garden.—The Parks Committee of the London County Council have had under consideration a memorial from some of the occupiers of the houses surrounding the garden or ornamental ground between Blenheim Crescent and Elgin Crescent, Kensington, praying that the Council will take charge of the garden, in accordance with the provisions of the Gardens in Towns Protection Act. The garden is neglected, and the Council is under a statutory obligation to comply with the request of the memorialists. It will eventually be vested in a committee of the rated inhabitants of the surrounding houses for the use of such inhabitants, the cost of maintenance, &c., being raised by the Kensington Royal Borough Council, by an addition to the general rate assessed upon the occupiers of the houses or in the borough council for the use of the public.

Importation of Beeswax into South Africa.—It is notified that the prohibition which has for some time past existed in regard to the importation of beeswax and foundation comb into the Union has now been annulled, but its introduction is still contingent on the issue of a permit by the Department of Entomology, which before doing so will require very definite and precise information regarding its purity and freedom from disease. Honey and second-hand bee appliances remain absolutely prohibited, and the right to introduce bees is reserved exclusively to the Government.

Winter Work in London Parks.—The General Purposes Committee of the London County Council recently asked the Parks Committee to consider what works at parks and open spaces under the control of the Council can be offered to the Central (Unemployed) Body for London for execution during the winter of 1912-13. A list of works, consisting chiefly of digging, levelling, and re-turfing playing and other grounds, has accordingly been prepared, but as such works could not be regarded as being required, or likely to be undertaken either in the immediate future or at any other time, the Council do not propose to make any contribution towards the cost of such works.

Influence of Light and Temperature on the Germination of Seeds.—According to the *Journal of the Board of Agriculture*, investigations recently carried out at the Munich Institute have shown many valuable and interesting facts concerning the behaviour of different seeds. Fresh seeds of Nigella sativa did not germinate in a seed bed when exposed to the light, but when darkened all the seeds germinated in 10 days. The seeds of many Liliaceæ behaved similarly, but in these cases germination was only seriously hindered by light when the temperature was over 68° Fahr. On the other hand, about 200 species (including Veronica officinalis) did not germinate in the dark; when brought suddenly into the light, however, after being kept for three years in the dark, they germinated in a very short time. In many cases only a small amount of light was necessary for germination. Lights of different colours were noticed to produce different results. A blue light was found to have the same influence as darkness, and had the additional effect of preventing the growth of harmful fungi and bacteria; 100 seeds of Tofieldia were kept for four years under a blue light and not one died. Germination ensued immediately on changing the blue to a red or white light. A blue light seemed to favour germination in the case of seeds which germinate in the dark, whilst red was unfavourable. The sudden appearance of large numbers of some varieties of weeds in fields seems to be explained by the fact that in many cases germination is more complete and rapid where seeds have been kept for a considerable time in unfavourable conditions, and then brought suddenly into conditions which favour germination. Thus it was found that seeds of Digitalis purpurea took eight months for the whole to germinate in the light in the ordinary way; but where they had been kept in the dark for three years the whole germinated in ten days after the admission of feeble light. Species of Veronica behaved similarly; only 50 per cent. germinated in three years, when the seeds were exposed to the light, but when kept in the dark for some time, and then suddenly placed in the light, the whole of the seeds germinated. In the case of Verbascum nigrum, 21 per cent. of the seeds kept in the light for three years germinated, while 75 per cent. germinated where the seeds had been kept in the dark for three years and then placed in the light. Rostrup's and Dorph Petersen's experiments have established the fact that the seeds of 350 species of wild plants need frost for germination. Gentians (as a rule) and Primulas are well-known examples of seeds requiring frost before germination can take place. It is considered to be practically certain that all species of Gentiana can be caused to germinate by a long period of frost if sufficient moisture is present, but if kept in a dry condition the full effect is not produced. A frost which lasted over eight days in April caused Cuscuta europæa and C. Viciæ to germinate. It is stated that a frost lasting over a whole winter would doubtless result in the germination of many species of seeds which had lain dormant for some considerable

time. A noticeable point in connection with these experiments was the different behaviour of different species of the same family, and it is evident that seeds are able to adapt themselves to varying conditions of climate, soil and light.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

The Weather at Lambay Island.—On Monday, August 5 we registered 2.04 inches of rain. The rain and strong winds were most disastrous to vegetation. Many plants in exposed positions, such as Antirrhinums, Gladiolus, and Dahlias, were broken. The weather continues showery, the amount of sunshine is small, and the conditions generally seem more in keeping with the month of October. The Apple crop is good here. Small fruits have been heavy crops, with the exception of Strawberries, which were only moderate. Potatos are a heavy crop and of excellent quality. All the Brassica family are now growing freely. Some time ago they were standing for want of rain, the land being light and porous. *C. Rusc. Lambay Island, co. Dublin.*

Storm of Rain and Hail at Redditch.—The district of Redditch was visited on the 4th inst. by the most severe storm that the "oldest inhabitant" can remember. The crops of different kinds were almost battered to pieces. Just before 1 p.m., rain started to fall in such torrents that it was difficult to see any object even a few yards distant. This was followed by large hailstones. I managed to get five, and the largest measured 1¼ inch long; the five placed in a row measured just 6 inches. Such plants as Brussels Sprouts have been completely broken down, and tender leaves, like Vegetable Marrow, have been riddled with large holes. Out-door Tomatos have had their leaves cut to shreds; the pods of culinary Peas have been pitted in a way that is difficult to describe. During the storm, which lasted 20 minutes, my rain gange registered just 1 inch of rain. The course of the storm seems to have been a somewhat narrow tract of country, not exceeding 2 miles in width, from south-west to north-east, and in its greatest severity extended about 10 miles. Owing to the drought last summer, and the rains this year, these have been the most difficult seasons of my lifetime. The rainfall for this year to date (August 10) has been 26.31 inches, and for the same period last year 7.62 inches, divided as follow:—

1911.		*1912.*	
January ...	0.72	January ...	4.40
February ...	1.52	February ...	2.80
March ...	1.82	March ...	3.88
April	0.90	April	0.01
May	0.57	May	3.98
June	1.43	June	5.07
July	0.30	July	2.97
To August 10	0.32	To August 10	3.20
Total ...	7.62	Total ...	26.31

J. G. Blakey, Holmwood Gardens, Redditch.

Peaches Out-of-Doors.—Duke of York and Peregrine, two of the newer varieties of Peach, promise well for culture out-of-doors. Young trees which were planted on a south-east wall three years ago have this season carried good fruits. Those of the first-named variety were gathered the third week in July, being of excellent flavour, quality and colour. This variety is a great improvement on the old early sorts, which have flesh of a woolly nature and poor flavour. The variety Peregrine is now ripe. The tree is a strong grower, and bears good-sized, well-flavoured, highly-coloured fruits. There is no other variety at present approaching ripeness out-of-doors, which is due to the unfavourable season. The fruits of Peregrine seem to withstand the effects of the wet weather. Hale's Early will not be ripe for a fortnight, but the trees are carrying good crops of fruit. Waterloo, which is one of the earliest, and Early Grosse Mignonne, we have discarded as useless both for kitchen and dessert purposes. Other sorts which are doing well in these gardens are Royal George, Crimson Galande, Violette Hâtive, Dymond, Stirling Castle, and Barrington. The variety named last is one of the best late Peaches. The trees have been afforded no protection since the fruits set, and are free from blister, which is probably owing to the protection afforded them in spring. The soil is loam or heavy clay. *A. B. Wadds, Englefield Gardens, Reading.*

Cassia corymbosa.—A fine plant of Cassia corymbosa was exhibited at the annual show of the Howden Horticultural Society, held recently. It was growing in a 12-inch pot, trained as a large bush, with a flattened upper surface, which was almost covered with the very effective yellow flower-spikes. I do not remember seeing the plant grown in this way before. The exhibitor was Mr. Charles Lawton, gardener at Welton House, Brough, who is probably the oldest grower of specimen stove and greenhouse plants in this county. This was the 41st year he had exhibited at the show in question. My first knowledge of Cassia corymbosa was gained in the late fifties of last century from a specimen growing up a part of the roof of a warm conservatory in a Yorkshire garden. Its cultural requirements are simple. It should be planted in a mixture of friable loam, a little good leaf-

Fig. 63.—An old illustration of Cassia corymbosa trained as a specimen plant.

Black Currant Boskoop Giant (see p. 122).—My experience is the same as that of *Mr. Pearson* and *Yorkshire Gardener*. In a garden under my charge eight years ago we planted a number of young trees in a good condition. From about the third year of planting and each succeeding year, one or more of them developed the same form of growth as Mr. Pearson described. Such growths produced no fruit, but they remained free from the bud mite which to some extent attacked the other bushes. It should be stated that none of the parent trees from which the stock was obtained showed the barren form, neither did the mite attack the bushes. *E. F. H.*

Meconopsis Wallichii in Ireland.—I was greatly interested in the notes on "Plant Collecting in Yunnan," printed in the issue for July 6, especially the remarks on the natural habitat of the Cambridge Blue Poppy. At Belvoir Park, Belfast, the residence of Mrs. W. H. Wilson, about 50 plants of Meconopsis Wallichii are growing in a shady part of the rock-garden in ordinary garden soil. The plants have attained a height of over 7 feet, and have borne over 300 blooms, each 3 inches across. The flowers are of a beautiful Cambridge blue colour. This Meconopsis is a hardy biennial, and thrives best in a cool, moist, shady situation. It is a lovely plant, with browny-green, velvety, hirsute foliage. The moisture clings to the leaves all the winter, producing a glistening appearance. The species is much hardier here than Meconopsis integrifolia. *T. Young, Belvoir Park, Belfast.*

Cassia corymbosa.—A fine plant of Cassia corymbosa was exhibited at the annual show of the Howden Horticultural Society, held recently. It was growing in a 12-inch pot, trained as a large bush, with a flattened upper surface, which was almost covered with the very effective yellow flower-spikes. I do not remember seeing the plant grown in this way before. The exhibitor was Mr. Charles Lawton, gardener at Welton House, Brough, who is probably the oldest grower of specimen stove and greenhouse plants in this county. This was the 41st year he had exhibited at the show in question. My first knowledge of Cassia corymbosa was gained in the late fifties of last century from a specimen growing up a part of the roof of a warm conservatory in a Yorkshire garden. Its cultural requirements are simple. It should be planted in a mixture of friable loam, a little good mould and sand, with good drainage. The roots should be afforded plenty of water in the growing season. *Yorkshire Gardener.* (We reproduce a figure which illustrates the same kind of bush described by our correspondent. It was grown by Mr. O. Goldsmith at Polesden Lacey, Dorking, in 1887.—Eds.)

The American Gooseberry-mildew.—A rapid spread of this disease here has to be noted, notwithstanding all our efforts to destroy the pest. Depending largely on "tipping," never once have we hesitated to adopt this method, but I find that the wet season is causing the "tipped" shoots to break into growth, and these fresh shoots are affected with disease. What will be the condition of the bushes for fruiting another season it is hard to foretell. This year, as last season, a bad patch has been rooted up and burnt, but burning cannot be done on a large scale. On July 29 the inspector informed me that he should be compelled to schedule a fresh portion of our farm. I cannot make out where the disease comes from. We have many acres of bushes free from infection. These are of the same variety, and they are growing in similar conditions. Why does one plantation escape contagion and not another? *Stephen Castle, Walpole St. Andrew, Wisbech.*

AN AUSTRALIAN BUSH HOUSE.

The illustration in fig. 64 represents a bush house, which is utilised for the cultivation of Ferns in Mr. Hutchinson's nursery at Brighton, Victoria, Australia. The roof is built on posts and Ti tree (Cordyline australis) branches laid on the top, but the sides are open to all weathers. It speaks well for the climate here when I say that Palms and hardy Ferns are grown in beds all the year round, as they are shown in the illustration. The Palms in the foreground are seven years old. Both the Palms and Ferns are lifted as required, and potted and established in pots before they are sold. Last year the extremes of temperature were 110° in the shade in summer and 29° in winter. *E. Hayler, Brighton, Victoria.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 66-71.)

(Continued from p. 121.)

4—MIDLAND COUNTIES.

Bedfordshire.—Most of the Apple trees produced a good crop of bloom, but many flowers were destroyed by frost early in May. The deficient crop of Strawberries is, I believe, due to the poor season we had last year, which prevented good crowns being formed, hence there have been many "blind" plants this year. The soil is Oxford clay. The nut crop is the heaviest I have ever seen. *W. H. Neild, Ridgmont, Aspley Guise.*

——The soil in these gardens is inclined to be of a light, loamy nature, with a very heavy subsoil of clay. It is difficult to keep fruit trees in a healthy condition more than three or four years, unless they are lifted and root-pruned, for as soon as they reach the clay the foliage shows signs of yellowing, and growth is greatly diminished. Currants and Gooseberries grow on the single-stem system do not answer here but for a short time, so young trees are grown without being disbudded, with the result that they last longer and fruit better. Strawberries generally do very well, but this season they were scarce, owing to the drought of last season. Two varieties provided good crops, namely, Bedfordshire Champion and Waterloo. Fruit trees of all descriptions are very free from blight this year. *Wm. Clayton, The Gardens, Melchbourne Park.*

——The season of 1912 is exceedingly disappointing to the majority of those having the management and care of fruit trees. Pears, Plums and Cherries flowered abundantly up to the late frosts of April, and gave the cultivator high promise of record crops. But, alas! sanguine hopes were shattered after registering 10°, 11° and 13° of frost. The garden soil here is of a sandy loam, resting on a subsoil of sand and gravel. *George Mackinlay, The Gardens, Wrest Park, Ampthill.*

Buckinghamshire.—The fruit crops in this district are greatly below the average this season, with the exception of Pears, Cherries, and bush fruits. There is an exceptionally large quantity of Filbert Nuts. I have counted as many as 18 in a bunch on a single stalk. The soils of this district include gravel, clay, and chalk. *G. Baston, Butler's Court Gardens, Beaconsfield.*

——Practically all the fruit crops in this neighbourhood are much under the average, the spring frosts having destroyed the greater part of the blossom. With the exception of green fly, the trees are fairly clean, and the growths healthy. At the time of writing, the Gooseberry trees in these gardens are entirely free of the dreaded American mildew, there being not the slightest sign of its presence. The trees have been kept under close observation for several months past. Our soil is of a very cold, heavy nature, resting upon clay. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

——The fruit crops in South Bucks. are under average. Cherries, which are largely grown, are not more than half a crop. Apples are a deficient crop, but the fruits are fine and the trees clean. Pears are a full crop, the fruit clean and good. Doyenne du Comice, Pitmaston Duchess, Durondeau, and Conference are good on pyramids and standards. Plums are very scarce, the only variety carrying a full crop here being Rivers's Early Prolific. Damsons are good in places. Strawberries were very scarce owing to the plants suffering from the intense heat during the autumn of 1911. The soil in this part of Buckinghamshire varies from light loam over gravel to strong loam overlying brick-earth. In this garden our Strawberries are grown on soil of the latter description. They were a good average crop of very fine fruit. *Chas. Page, Dropmore Gardens, Maidenhead.*

Cheshire.—The fruit crops in Cheshire appear fairly satisfactory, with the exception, in many cases, of late Apples and Plums. While these were in flower, exceptionally cold winds were experienced, and these hindered the process of fertilisation. *Charles Flack, Cholmondely Castle Gardens, Malpas.*

——This is a fairly representative Cheshire fruit district. Apples, Pears, Gooseberries, and Damsons are grown in large varieties. Pears are our best crop this season. Some varieties, such as Jargonelle, Hessle, Pitmaston Duchess, Easter Beurré, Louise Bonne of Jersey and Marie Louise, are laden to the breaking point. Apples were a grand show when in bloom, but the cold winds which occurred about setting time kept the bees in, and the blooms consequently, to a great extent, remained unfertilised, the result being only a very moderate crop. Plums, especially Victorias, are very good, also Damsons. Greengages set shyly, but are good in quality. Bush fruits flowered and set well, particularly Gooseberries and Black Currants. Strawberries set well, but the damp days early in June caused many fruits to rot whilst they were still green. Raspberries are a first-rate crop. Loganberries have fruited well, but the Loganberry is not earning a good reputation locally, being too acid. It may be noted that birds do not interfere with it. Morello Cherries are one of our staple fruits, hardly ever failing, and always good in quality. Sweet Cherries are adversely affected in this neighbourhood by the chemical fumes, as also are Peaches, Nectarines and Apricots. On the whole, the fruit crops in this part of Mid-Cheshire are good average ones *A. N. Jones, Marbury Hall, Northwich.*

Derbyshire.—In this district the fruit crops were much damaged by the heavy rainfall and storms of June. I measured rain on 24 days; there was 5.91 inches for the month. On the 10th, a very heavy hailstorm did much damage to Apples, Pears and Loganberries, and the leaves of many plants looked as if they had been riddled with shot. Royal Sovereign and other early varieties of Strawberries were most damaged by the wet weather. Black Prince and Givon's Late Prolific were the least damaged. The growth of plants since the end of June has been very rapid. Peas, Beans, Potatos, and other vegetables are looking remarkably well. *Bailey Wadds, Uttoxeter New Road, Derby.*

——Apples are a good average crop, and Pears are far above the average. Plums also are very good. Strawberries were less than an average crop, and the berries were small and deficient in flavour. Gooseberries are a heavy crop and doing well. Raspberries, Black and Red and White Currants are plentiful and good. Cherries also are a heavy crop, and the trees this season are wonderfully free from blight. The soil is of a light, gravelly nature, and the subsoil light clay and gravel. *J. Tully, Osmaston Manor Gardens.*

Fig. 64.—Method of cultivating Ferns and Palms in Australia.

Hertfordshire.—Fruit trees generally never looked better than during the flowering season; but no doubt the sharp frosts on the mornings of April 11 and 12 seriously affected the crops. With the exception of black fly on the Cherries, crops are clean and fairly free from pests. Strawberries, especially early varieties, suffered greatly in 1911, the result being that they produced very light crops this season. Later varieties, such as Givon's Late Prolific and Trafalgar have succeeded better. Gooseberries, Currants, and Raspberries are good. Nuts (Filberts and Cobs) are excellent. Walnuts are also good. Our soil here is chiefly a heavy, retentive loam on a clay subsoil. *Thomas Nutting, The Gardens, Childwickbury, St. Albans.*

——The fruit crops here are the best for several years. Apples and Pears are abundant and good. Small fruits are also heavy crops, especially Red Currants. Strawberries were almost a failure. Peaches are a moderate crop. The large-petalled varieties set like Damsons, whilst the small-petalled varieties almost failed. Twelve large trees of the latter, covering 18 feet by 16 feet of wall each, do not average a dozen fruits each. Luckily, they are in the minority numerically. I attribute this failure to set to a

hailstorm which occurred just as the flowers were opening, the smaller petals giving insufficient protection to the essential organs. The soil is a medium loam on a gravel subsoil. *J. G. Walker, Oak Hill Park, East Barnet.*

—— Apples at first promised to be better than they actually are. The fruits set freely, but many are deformed and are falling. However, there appears to be sufficient good fruits for a fair crop. Pears are a fine crop of very good quality. Stone fruits generally are good, Cherries particularly so. The early varieties ripened earlier than usual. Owing, possibly, to the hot, dry weather last year, and to the dry spring this year, when we registered only .92 rainfall from March 31 to May 31, Strawberries never remember seeing Pears more plentiful, both on the walls and bush trees. Apples are a good crop. Amongst the best are Blenheim Pippin, Ecklinville Seedling, Lane's Prince Albert, Scarlet Pearmain, Keswick Codlin, Dumelow's Seedling, King of the Pippins, and Small's Admirable. The rainfall during April and May was much below the average, and we have had to afford water copiously. The soil is a stiff, retentive clay. *Edwin Beckett, Aldenham House Gardens, Elstree.*

Leicestershire.—The fruit crops are not up to expectation after the wealth of bloom in the spring, and this is due to frosts which occurred in April. Raspberries are a full crop. Apples and Pears are variable; some trees have

Fig. 65.—Bowkeria gerardiana flowering in a Devonshire garden.

were only half an average crop, though some fruits were remarkably good. The Bedford, Utility, Given's Late Prolific, and Laxton's Latest were amongst the best varieties. *H. Prime, Hatfield House Gardens, Hatfield.*

—— The fruit crops generally in this district are quite up to the average, especially Apples and Pears. The trees bloomed abundantly, and I never remember seeing the foliage so healthy at this season. The Plums on walls suffered much more severely from spring frosts than standard trees in the open, on which we have good crops of Monarch, Desire, Early Rivers, Victoria, and all kinds of Damsons. Peaches and Apricots, though protected, failed to set satisfactorily. Strawberries were good, though the season was somewhat short. Gooseberries and Currants were plentiful and good. I numerous fruits, others none. Bramley's Seedling has failed completely. The best flowers of Strawberries were blackened by frost, consequently the crop was limited to the secondary flowers, which were small. Of stone fruits, Peaches and Cherries are the best. The soil is of rather a heavy loam, with a subsoil of red clay. *D. Roberts, Prestwold Gardens, Loughborough.*

—— The soil here is a heavy clay on middle lias formation, and the situation—260 feet above sea-level—is sheltered by timber trees, &c. Apples flowered abundantly, as did all other fruit trees. The partial failure of Apples and Plums is not easily explained; very little frost occurred during the flowering period, and the weather was bright and dry. Pears are the heaviest crop we have had for several years. Plums on walls have good crops, but standard trees in orchards have very few. Damsons have a heavy crop. Peaches and Nectarines are bearing well. Apricots are a thin crop, with the exception of the Roman variety, which generally bears well. Cherries have the heaviest crop we have had for a long time. Strawberry plants were much exhausted by the drought last year, and a large proportion of the fruit decayed, owing to frequent rains. Raspberries and Loganberries are bearing heavily. All kinds of fruit trees are remarkably free from insect pests. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

Nottinghamshire.—Apples are an average crop. Pears are a very heavy crop, and the fruits are of good quality. Apricots, Peaches, Nectarines, and Plums are scarce, although all the trees were covered with blossom, and at one time promised to yield heavy crops. Owing to the cold winds which prevailed the flowers failed to set. Strawberries looked well for a time, but, owing to the wet weather when they were ripening, many of them rotted. Sweet Cherries were a heavy crop, but Morello Cherries and Black Currants are only average. All other small fruits are plentiful and of good quality. Early Potatos were injured by frost while coming through the soil, consequently the crop is deficient; second earlies are splendid. All crops are quite a fortnight earlier this season than usual. Our soil is light and porous, and rests on a sandy subsoil. *James B. Allan, Osberton Gardens, Worksop.*

—— There was an immense set of nearly all hardy fruits, but most of the fruits fell off during the drought in April and May. *J. R. Pearson & Sons, Lawdham, Notts.*

(To be continued.)

BOWKERIA GERARDIANA.

This rare South African shrub was formerly known as Bowkeria triphylla, owing to its leaves being borne in threes, and this name is such a descriptive one that it seems a pity that it has been superseded by that of B. Gerardiana. The leaves, borne in groups of three, are lanceolate in shape and deeply corrugated. The flowers are pure satin-white and shaped somewhat like those of a Calceolaria with a hood and a lip. The blossoms are borne at the axils of the leaves on the old wood, sometimes singly and sometimes as many as seven on a branching raceme. The lower lip is three-lobed, the three lobes being closely folded over the tube of the corolla, thus effectually preventing the access of insects. The pollen is shed while the flower is still in the bud. The blooms measure an inch across and the same from the top of the hood to the base of the lip, and are flattened in shape, being not much over ¼ inch in depth. Plants flower in a very small state; my specimen bloomed freely when it was only a foot high. To show the freedom with which it flowers, it may be stated that a spray 13 inches in length, which was cut, carried 30 fully-expanded flowers and 21 buds. The Bowkeria is a very rare shrub and, as far as I know, is catalogued by only one firm. Kew possesses a plant which is grown in the temperate house, but it does not appear to flower freely. The species is a native of Natal, where it is said to flower in the month of December. Here it generally blooms early in August, but this year it was in full flower before the end of July. The blossoms, which are gummy to the touch, have a peculiar faint odour, disliked by some people. The specimen illustrated in fig. 65 has been in my garden for eight years, and is rather over 8 feet in height and 7 feet through. It is fairly hardy, as the severe frost which was experienced here on February 2, though it killed numbers of rare and tender plants, including two examples of Leonotis Leonurus, also a native of South Africa, had no injurious effect upon the Bowkeria. It is said that this species was cultivated at Messrs. Bull's nursery at Chelsea 20 years ago. *Wyndham Fitzherbert.*

SOCIETIES.

ROYAL HORTICULTURAL.

August 13.—The Vincent Square Hall, on the occasion of the fortnightly exhibition of the Royal Horticultural Society, on Tuesday last, was much better filled than was the case at the previous meeting. The outstanding floral features were the large collection of cut shrubs shown by the Hon. Vicary Gibbs; the magnificent Montbretia "Star of the East," which evoked the greatest admiration and was awarded a First-class Certificate, and Messrs. Felton's imported Nelumbium blooms. The Floral Committee awarded seven medals, one First-class Certificate, three Awards of Merit, and one card of Cultural Commendation.

The Orchid Committee awarded one Silver Banksian Medal, two First-class Certificates, and four Awards of Merit.

The Fruit and Vegetable Committee awarded one medal, two First-class Certificates, and four Awards of Merit.

With the exception of three pairs of Vegetable Marrows from the Wisley trials, which received Awards of Merit, there was no exhibit of vegetables.

The exhibits of the affiliated National Gladiolus Society made a very attractive display.

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); and Messrs. G. Reuthe, Chas. T. Druery, John Dickson, E. H. Jenkins, J. T. Bennett-Poë, W. P. Thomson, R. W. Wallace, W. J. Bean, George Gordon, John Jennings, John Green, Chas. E. Pearson, R. Hooper Pearson, and C. R. Fielder.

The Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. Edwin Beckett), filled one end of the Hall with an enormous collection of sprays of flowering and fruiting shrubs. The varieties of Buddleia variabilis, with long, densely-flowered spikes of sweetly-scented blossoms, were one of the features of this very large exhibit; the varieties rosea, lilacina, and superba were especially fine. There were also sprays of various sorts of Ceanothus, such as C. azureus "indigo" with flowers of a beautiful shade of blue. The branches of a Bladder Senna (Colutea) bore very large bladder-like fruits, and Coriaria terminalis was well furnished with its interesting racemes of transparent, yellow berries. The true Service Tree (Pyrus domestica) had plenty of its distinct fruits, and other species of the same genus present were P. lanata and P. baccata; the latter bears large, rose-coloured fruits. Sambucus pulverulenta has more silver-white on its leaves than green. (Silver-gilt Flora Medal.)

Messrs. R. Wallace & Co., Colchester, staged some exceedingly fine Montbretias. The varieties Hereward, Lady Hamilton, King Edmund, and Gem, which have shades of rich yellow, and Nelson and Germania, deep orange-yellow, are splendid varieties. (Silver Flora Medal.)

Messrs. T. S. Ware, Ltd., Feltham, Middlesex, again showed many of their splendid Pentstemons. (Silver Flora Medal.)

Mr. L. R. Russell, Richmond, staged many Fuchsias, growing in relatively small pots. These were mostly of the varieties seen so often in the milder parts of the country, and included F. americana elegans, F. pumila Thompsonii, and F. coccinea Florian; of the small-flowered section, F. Riccartonii Elysée, F. Brightoniensis and F. myrtifolia minor have larger flowers. The rare F. globosa, which is a valuable plant for the rock-garden, was also represented, and at the end of the collection there were several plants of Tecoma grandiflora.

In another part of the Hall Mr. Russell furnished a table with Celosias growing in 6-inch pots. The plants represented a very good strain of this pretty flower and exhibited excellent cultivation. (Silver Flora Medal.)

Mr. Amos Perry, Hardy Plant Farm, Enfield, Middlesex, exhibited a large quantity of cut flowers of Delphinium and Gladiolus. Considering the time of the year, the Delphiniums were excellent.

Mr. A. Ll. Gwillim, Cambria Nursery, Sidcup, Kent, staged border flowers and many excellent double-flowered tuberous Begonias; the varieties Lady Cromer, Seashell and Dragon were especially good.

Mr. G. Reuthe, Keston, Kent, exhibited a selection of hardy plants and shrubs, amongst which were Clethra alnifolia, Robinia neo-mexicana, and Serissa fœtida, a neat-growing Japanese shrub with small double-white flowers; the specific name denotes the smell of the crushed leaves.

The Guildford Hardy Plant Nursery staged a very pleasing variety of border flowers, which comprised good spikes of Dracocephalum virginicum, Tritoma (Kniphofia) Yellow Hammer, Phygelius capensis and various Phloxes.

Messrs. Warnhaar & Co., Sassenheim, Holland, exhibited a dozen vases of decorative Dahlias; the flowers were large, but had not travelled well.

Messrs. Wm. Fells & Son, Hitchin, arranged a small rock-garden and planted it with appropriate plants.

Messrs. W. Wells & Co., Ltd., Merstham, Surrey, contributed stands of various cut border flowers such as herbaceous Phloxes, Heleniums, Linaria dalmatica and Gaura Lindheimeri.

Messrs. S. Bide & Sons, Farnham, Surrey, exhibited a beautifully fresh display of fine Sweet Peas interspersed with pot plants of Kochia triphylla. The most noteworthy varieties of Sweet Pea were R. F. Felton, Prince Edward of Wales, Lancashire, Edna Harland, Edrom Beauty, Mrs. Stewart Champion and Mrs. Hardcastle Sykes. (Bronze Flora Medal.)

Messrs. A. & M. Jones, Tilston, Malpas, Cheshire, also exhibited a collection of Sweet Peas.

Messrs. Felton, Hanover Square, London, exhibited imported Nelumbium blooms in varying stages of development, which attracted much attention; these were similar to those illustrated and described in the last issue of the *Gardeners' Chronicle*. (Silver Flora Medal.)

Messrs. H. B. May & Sons, Upper Edmonton, arranged a fine collection of shrubby Veronicas; the varieties Pearl (shaded rose-lilac), Lavinia (blue, large spike), Violette, Favourite (rich dark leaves), Conquete (mauve), Admiration (stout spikes of pale purple), Mont Blanc, and Eveline (rose) are especially desirable. (Silver Banksian Medal.)

Messrs. H. Cannell & Sons, Swanley, Kent, exhibited very attractive foliage Begonias of such good varieties as Mme. Marie Pernelle, Mrs. H. G. Moon, Marshaltin, Reta Schmeiss, and Meteor. Besides the Begonias, the firm showed various Coleus hybrids.

Messrs. Stuart Low & Co., Bush Hill Park, Enfield, showed a small collection of highly-coloured Codiæums (Crotons), Dracænas, and cut blooms of Carnations arranged with fronds of Nephrodiums.

Mr. Philip Ladds, Swanley Junction, staged a bright group of his new zonal Pelargonium "Champion."

AWARDS.

First-class Certificate.

Montbretia, Star of the East.—This splendid variety marks a great advance in this beautiful border flower. The widely-opened flowers, which are accompanied by stout foliage of corresponding size, measure 4 inches across, and are of a rich yellow colour, with a slightly paler shade in the centre. The under sides of the petals are of a deep orange-yellow. Shown by Mr. Davison, Westwick Gardens, Norwich.

Awards of Merit.

Kniphofia Unique.—A very floriferous variety, with medium-sized spikes of coral-red flowers. Shown by Messrs. Wallace & Co.

Cosmos White Queen.—A pure-white variety, with round flowers of good substance and 3½ inches across. Shown by Messrs. Dobbie & Co., Ltd.

Rhodostachys andina.—A Bromeliad of compact growth, bearing a small head of rosy-lilac flowers with orange-coloured stamens. Shown by J. T. Bennett-Poë, Esq.

Cultural Commendation.

Messrs. Barr & Sons were awarded this honour for well-grown specimens of Acæna microphylla, a rare and attractive dwarf, shrubby plant, suitable for culture as an Alpine in the crevices or flagstones of paths. The plant makes dwarf, cushion-like growths surmounted with round heads of crimson burr-like fruits.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Jas. O'Brien (hon. sec.); Sir Harry J. Veitch, Messrs. Gurney Wilson, W. Bolton, W. H. White, A. Dye, H. G. Alexander, J. E. Shill, W. P. Bound, W. H. Hatcher, W. Cobb, T. Armstrong, A. McBean, and W. Thompson.

Sir Trevor Lawrence, Bart, K.C.V.O., Burford (gr. Mr. W. H. White), staged a small group of rare species, which included the pretty little Theodorea gomezoides, with ten spikes of small greenish flowers with white labellums, a splendid specimen of the scarlet Lælia monophylla, Dendrobium glomeratum with 65 pretty rose flowers, a singular Bulbophyllum with compressed spikes of small flowers concealed in chaff-like bracts, a good specimen of the white Bulbophyllum odoratissimum, and two hybrids, namely, Odontioda Thwaitesii and Brasso-Cattleya Joan.

E. H. Davidson, Esq., Borlases, Twyford, was awarded a Silver Banksian Medal for a neat group of exceptionally well-grown plants. We noticed Lælio-Cattleya Feronia superba, a distinct flower of good shape and substance; Odontioda Thwaitesii Davidson's variety, the largest form with deep claret-coloured sepals and petals, and lilac-tinted lip; Lælio-Cattleya Venus Golden Queen, with flowers resembling a good Cattleya Dowiana aurea; L.-C. Colmaniana; two forms of Odontioda Schröderi, one of a very deep red colour, and several hybrid Odontoglossums.

Messrs. Charlesworth & Co., Haywards Heath, staged a select group, in which were noted Vanda Sanderiana, the rare and singular Stanhopea convoluta with yellowish flowers of peculiar construction, Platyclinis filiformis with many spikes, Angræcum Chailluanum, the true Oncidium luridum guttatum, Cypripedium Rossettii and C. Maudiæ. Among other hybrids was an interesting cross, Oncidioda cinnabarina, said to be raised between Oncidium monachicum metallicum and Cochlioda Noezliana, with red flowers about equal in size to the latter parent, but with stalked, Oncidium-like segments.

Mr. Sidney Flory, Tracy's Nursery, Twickenham, staged a small group, in which were Cattleya Gaskelliana alba, a white flower with a slight pink tinge on the lip, the dwarf Brazilian Oncidium Crœsus, Dendrobium Regium, a large form of Brasso-Lælia Helen with greenish sepals and petals and large white fringed lip prettily veined with purple, and a dark coloured Lælio-Cattleya.

AWARDS.

First-class Certificates.

Lælio-Cattleya Glaucus (L. purpurata × L.-C. Rubens), from Lieut.-Col. Sir George L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A remarkable and showy hybrid, adhering closely to the dwarf habit and perfect shape of L.-C. Rubens, but superior to it in every way. The sepals and petals are bright rosy-mauve with darker veining, and the lip intense ruby-red, with bright, yellow disc.

Lælio-Cattleya Godmanii (C. Iris × L.-C. callistoglossa), from F. Ducane Godman, Esq., South Lodge, Horsham.—Flower of fine substance, large, and very distinct, especially in its massive, plain-edged labellum. Sepals and petals broad, of a deep purplish-rose. Front of the lip ruby-crimson, with yellow disc.

Awards of Merit.

Lælio-Cattleya luminosa var. Mandarin (L. tenebrosa Walton Grange variety × C Dowiana aurea), from Lieut.-Col. Sir George L. Holford, K.C.V.O.—A darker form of the Westonbirt L.-C. luminosa aurea, which previously secured a First-class Certificate. Sepals and petals bright chrome-yellow, lip claret-purple lighter towards the margin.

Brasso-Cattleya Ilene (C. Dowiana × B.-C. Mme. Chas. Maron), from Messrs. Jas. Veitch & Sons, Chelsea.—A grand flower, showing the advantage of second crossing of good primary hybrids. The large and well-formed flowers have the sepals and petals of a clear rose colour, with obscure silver veining. The broad-fringed lip is of a light rose tint with yellow disc, and purple rays from the base.

Odontoglossum Empress Eugenie (parentage unrecorded), from E. H. Davidson, Esq., Borlases, Twyford.—A large flower of beautiful shape, and probably a secondary hybrid of O.

Rolfeæ. The wax-like sepals and petals are white with a pale mauve or heliotrope ray and darker spotting. The lip is broad and flat white, with showily-arranged bluish spots in front of the yellow crest.

Odontoglossum nigrescens (Edwardii × *cirrhosum)*, from Messrs. J. & A. McBean, Cooksbridge.—A very remarkable, small-flowered, attractive hybrid, unique in colour. In form it shows O. cirrhosum, but the segments are shorter and broader. The sepals and petals are velvety black, the recurved apiculata tips white at the backs, the petals also having small, white bases. Lip bronzy-chocolate with white tip and yellow disc.

Cultural Commendation

to Mr. H. G. Alexander, Orchid grower to Lieut.-Col. Sir George L. Holford, K.C.V.O., for a magnificent plant of Cattleya Tacitus (bi-color Grossii × Germania superba), showing rapid increase in stature and bearing a fine flower-spike on a growth 4 feet long.

Fruit and Vegetable Committee.

Present: Jos. Cheal, Esq. (in the Chair); and Messrs. W. Bates, H. H. Williams, J. Willard, Henry Hooper, A. W. Metcalfe, A. R. Allan, A. Bullock, James Vert, H. Markham, Owen Thomas, and Edwin Beckett.

Messrs. S. Spooner & Sons, Hounslow, displayed a meritorious collection of hardy fruit. The Apples included good samples of Early Strawberry, Worcester Pearmain, Red Quarrenden, Lady Sudeley, and Williams' Favourite. The fruits of the Japanese Strawberry-Raspberry possess rich, deep-red, vinous colouring. The American Blackberry had suffered somewhat from the persistent rains. (Silver Banksian Medal.)

Mr. H. Chandler, Easebourne, Midhurst, Sussex, submitted fruiting branches of "a natural hybrid between the wild Raspberry and the wild Blackberry." The exhibit, which was accorded a vote of thanks, did not appear to be of surpassing garden value, but in a better season may prove to be desirable.

The Superintendent, Mr. S. T. Wright, showed eight varieties of Melon that had been grown under trial at the Society's garden at Wisley.

AWARDS.

First-class Certificates.

Melons Hero of Lockinge and Frogmore Scarlet.—These well-known varieties were sent for trial by Messrs. J. Veitch & Sons, Ltd.

Awards of Merit.

Melon Royal Favourite.—A richly-flavoured, green-fleshed variety, sent by Messrs. Sutton & Sons.

Vegetable Marrows Moore's Cream (shown by Messrs. R. Veitch & Son), *Bush Green* (shown by Messrs. Barr & Sons), and *White Bush* (shown by Mr. Nutting, Southwark Street, London). The two last varieties are described by their names: the fruits shown were exceedingly good samples. The variety Moore's Cream appears to have all the merits of a popular exhibition variety. All these Awards were made after trial at Wisley.

Trials at Wisley.

A sub-committee of the Floral Committee inspected trials at Wisley, on the 26th ult., and recommended Awards of Merit to the following plants, which were subsequently confirmed by the Council:—

Hollyhock "Newport Pink" (strain) (Messrs. Dreer, Philadelphia, U.S.A.). *Sweet Peas*: "Hercules" (G. Stark & Sons), Great Ryburgh; "Isobel Malcolm" (Dobbie & Co., Edinburgh); "Mrs. Routzahn" (Dobbie & Co.); "Premier" (G. Stark & Sons); and "Tennant Spencer (Dobbie & Co.). *Violas*: "Bessie" (A. Dickson & Sons); "Edina" (Dobbie & Co.); "John Quarton" (J. Forbes & Co., Hawick); "Jubilee" (Mr. Cuthbertson, Rothesay); "Kingcup" (A. Dickson); "Lavender Queen" (Mr. Cuthbertson, Rothesay); "Maggie Mott" (Dobbie & Co.); "Mrs. Chichester" (Mr. Cuthbertson, Rothesay); "Mrs. Davidson" (John Forbes, Ltd., Hawick); "Palmer's White" (Mr. Palmer, Derby); "Snowflake" (Mr. Cuthbertson, Rothesay); "Walter Welsh" (Dobbie & Co.); and "W. H. Woodgate" (John Forbes, Ltd.).

THE BORDER SWEET PEA.

August 3.—This northern society held its second annual show at Culdstream on the above date. The entries were double the number of last year, and the exhibits showed a high standard of excellence.

The Landreth Silver Cup, open to all members, was won outright by Mr. J. Loan, Bughtrig.

The Challenge Cup offered by Mrs. Ronald Milvain, of Eglingham, for competition amongst amateurs only was won by Mr. W. T. Landreth.

The medal offered for seedling Sweet Peas was won by Mr. G. Little, of Ladykirk, for a dark purple variety with violet keel and named "Ladykirk."

Open Classes.

The best 12 bunches of Sweet Peas were shown by Mr. J. Loan, Bughtrig (who won the Landreth Cup); 2nd, Mr. J. J. Elliot, Pallinsburn.

In the class for six bunches of varieties put in commerce in 1911 and 1912, the Gold Medal was won by Mr. J. Loan, and the Silver Medal by Mr. J. J. Elliot.

Mr. W. T. Landreth arranged the best table decoration of Sweet Peas, and also won the 1st prize for a basket of Sweet Peas.

Amateurs' Classes.

Mr. J. D. Logan showed the premier collection of this year's novelties. The best three bunches of varieties taken from a published list were shown by Mr. J. J. Elliot.

This year classes for Carnations and Roses were included in the schedule. Mr. W. T. Landreth won the 1st prize for Carnations in the open as well as in the amateurs' class. Mr. J. Loan was the most successful exhibitor of Roses.

Messrs. Laing & Mather, Kelso, were awarded the society's Silver Medal for an exhibit of herbaceous Phloxes, new varieties of Sweet Peas and Roses.

BRITISH PTERIDOLOGICAL.

August 5.—The annual meeting of this society was held at the Albion Hotel, Arnside, Westmoreland, on the 5th inst.; Mr. Alex. Cowan, Penicuik, presided. Many of the members assembled on the Friday preceding the meeting in order to arrange Fern-hunting expeditions in the vicinity, but owing to the distance which it was necessary to travel to reach good ground, and still more to the cold and wet weather which prevailed during their stay, no "finds" of any special note are to be recorded. It was resolved that Devon or Dorset should constitute the area for hunting on the occasion of the next meeting, since the species in those counties are far more numerous than in the north. At the meeting the hon. secretary, Mr. Chas. T. Druery, reported that the membership was 150, and that the funds were in a very satisfactory position, fully justifying the establishment of the *British Fern Gazette*. A vote of thanks to the president and officers was supplemented by a special vote to the Editor, together with a testimonial in recognition of the services rendered by him to the society. A large number of fronds of very beautiful Ferns were exhibited. The hon. secretary's address is 11, Shaa Road, Acton, London, W.

DUMFRIES AGRICULTURAL.

August 6.—In conjunction with the show of the Dumfries Agricultural Society, which took place on the above date, a Sweet Pea exhibition was held in a marquee. There was a good competition, and in the leading class confined to professional gardeners, the flowers were excellent for the season, especially after the torrential rains. In the other leading class—that for those who had not won a first prize previously—there was also a good competition and some capital flowers. In the former class, the 1st prize was won by H. Keswick, Esq., Cowhill Tower, Dumfries (gr. Mr. C. Murray); 2nd, Mrs. Rankin, Dalswinton (gr. Mr. R. A. Grigor); 3rd, C. R. Dudgeon, Esq., Cargenholm (gr. Mr. T. Carruthers). In the other leading class, J. Smith, Esq., Netherholm House, was 1st, with J. M. Wyllie, Esq., Cresswell Place, Dumfries, 2nd.

SCOTTISH HORTICULTURAL.

August 6.—The monthly meeting of the above Society was held on this date, at 5, St. Andrew Square, Edinburgh. Mr. Massie presided, and 60 members were present.

The evening was devoted to a discussion on the training and education of young gardeners; the proceedings were opened with short papers by Mr. C. Comfort and the Secretary, on the practical and technical sides respectively.

Mr. Comfort stated that fewer lads were now offering themselves as apprentices than was the case some years ago. He suggested that they should be engaged at an earlier age than was usually the case. Lads who intended to become gardeners often became engaged at odd work for two or three years after they left school, until they reached the age at which they were generally taken as apprentices, with the result that the best of them often turned their attention to something at which a start could be made at an earlier age. The only reason for this putting back of the age in gardening, so far as he (Mr. Comfort) could see, was in order to obtain the services of a lad who was able to do a man's work at a boy's pay. There were few gardens, however, in which a boy of fifteen could not be profitably employed. The change suggested would be of great advantage to the young gardener, and if it were to come into vogue, the term of apprenticeship might, with advantage, be extended to four years, instead of three as at present.

Having secured his apprentice, the head gardener should realise that, not only had he taken upon himself the responsibility of teaching the lad his craft, but also of looking after his moral and physical welfare. The bothy, the place in which the young gardener had to live, and which for the time being became his home, should be in keeping with modern ideas of health and comfort, and a place to which an intelligent young man would not be ashamed to take his friends. Bothies should also be provided with some literature, and there should be facilities for recreation. During part of his time the apprentice should have the opportunity of seeing everything that is to be seen in the establishment, though it might not be practicable in a four years apprenticeship to take part in every operation. The establishment in which the young man serves his apprenticeship need not necessarily be a large one. In a well-appointed moderately-sized garden, under the charge of an efficient gardener, more would be found than the smartest apprentice could take advantage of, even in a four years apprenticeship. There was often a diffidence about asking questions, which might arise from natural shyness or from the fear of being considered ignorant. But those having the charge of young lads should so cultivate their relationships with them that they would have no fear of asking what might appear to the older person a silly question, so long as it was asked sincerely. His apprenticeship being completed, it would, as a general rule, be well for the young gardener to spend some time in other establishments where certain subjects calling for skill in their cultivation were treated as specialities. He should also visit other establishments and interchange views with his fellow-gardeners, whilst visits to flower shows should be made from time to time. The student should read at least one good gardening paper.

After contrasting the position of the young gardener of to-day, as regards the advantages which he enjoyed in the way of technical education and cheap literature, with forty to fifty years ago, the Secretary said that, though they had to find out many secrets of their success as cultivators by rule of thumb methods, and their knowledge was therefore largely empirical, the old gardeners would hold their own with the younger ones, either as cultivators or otherwise. Their average education, too, when they left school was better, he thought, than that of the average of boys leaving the elementary schools at present, and their efforts at self-instruction afterwards were more persistent than those of the present-day gardener. Mr. Comfort said it was a mistake to assume that teachers of practical subjects, such as horticulture, should be merely college graduates. All the better if they were college graduates, perhaps, but they should first of all be practical men, and the better they knew the practical part of their subject, the more successful would they be as teachers.

Awards to Exhibits.

The exhibits were:—A new Pentstemon, "Mrs. F. Fulford," and spikes of Kalanchoe flammea, cut from plants raised from leaf cuttings, inserted in July, 1911, and grown on in 3-inch pots, shown by Mr. F. Fulford, Montgomerie Castle Gardens, Tarbolton, Ayrshire (awarded a Cultural Certificate for Kalanchoe); Acalypha Sanderiana, from Mr. James Fraser, Bonaly, Colinton (awarded a Cultural Certificate); Ox-eye Daisies, from Mr. F. Baillie, Liberton; Strawberries, Gooseberries, and Black Currants from the City of Edinburgh Distress Committee's Farm at Muriesston, Mid-Calder, per Mr. Cairns (awarded a Cultural Certificate); new Tomato, from Mr. G. N. Simpson, Edinburgh; Nephrolepis todeoides Smithii and Pteris incisa, from Messrs. James Grieve & Sons, Edinburgh (awarded a Cultural Certificate); plants of Onopordon Acanthium and Dipsacus fullonum, each about 6 feet high, from Messrs. Todd & Co., Edinburgh.

Seven life and 69 ordinary members were elected, being the largest number enrolled at any one meeting since the foundation of the association.

At the meeting to be held on September 3, Mr. J. Highgate, Hopetoun Gardens, South Queensferry, will read a paper on "How to produce effective displays with hardy plants."

NORTH OF ENGLAND HORTICULTURAL.

August 8, 9.—The above society held a show at Harrogate on these dates. The weather was beautifully fine, and as Harrogate was filled with visitors there was a good attendance. The exhibition was not of large dimensions, but the quality of the exhibits was better than was anticipated, in view of the unfavourable season. Mr. H. Webster, Chairman of the Harrogate Local Management Committee, offered a cup for the best exhibit from Yorkshire. There was no stipulation as to what class or kind of exhibit, and it was won by Messrs. Mansell & Hatcher, Rawdon, for a choice group of Orchids. In addition to the cup, Messrs. Mansell & Hatcher also received a small Gold Medal from the Orchid Committee. Lord Faber's Cup, offered for the best exhibit of fruit shown by an amateur employing a regular gardener, was won by J. Brennand, Esq., Baldersley Park, Thirsk (gr. Mr. J. E. Hathaway), and a small Gold Medal was also awarded this exhibit. The Challenge Cup, presented by Mr. Webster for the best exhibit put up by an allotment holder in the borough of Harrogate, was awarded to Mr. T. Wardman, St. George's Cottage.

Awards to Novelties.

First-class Certificate to Hybrid Tea Rose Danæ, and Third-class Certificate to Hybrid Tea Rose Moonlight, both shown by Rev. J. H. Pemberton. First-class Certificate to Cattleya Gaskelliana alba magnifica, and Second-class Certificate to Lælio-Cattleya Ivernia Muriel Wilson, both shown by W. P. Burkinshaw, Esq. (gr. Mr. J. T. Baker).

Trade Exhibits.

Gold Medals were awarded to Messrs. E. J. Batchelor & Sons, Harrogate, for a group of well-grown Ferns, Liliums, and Spiræas, and to Messrs. Sutton & Sons, Reading, for an exhibit of flowers, fruit, and vegetables.

Large Silver-gilt Medals were awarded to Messrs. Young & Co., Cheltenham, for a collection of Carnations, including A. S. Montgomery, a variety of a beautiful shade of lilac-pink; Mr. A. J. Hall, Harrogate, for a collection of hardy and other flowers; Messrs. W. & J. Brown, Peterborough, for a group of Roses; Messrs. Jas. Backhouse & Son, Ltd., York, for a rock garden; Messrs. G. Gibson & Co., Bedale, for a group of hardy flowers, in which varieties of Chrysanthemum maximum were shown well; Messrs. Clibrans, of Altrincham, for a collection of vegetables; Messrs. Harkness & Sons, Bedale, for a collection of hardy flowers (Gaillardia Mrs. MacKellor was well shown in this exhibit); and Messrs. Wm. Bonsall & Son, Harrogate, for Carnations.

Large Silver Medals were awarded to Messrs. Dobbie & Co., of Edinburgh; and Messrs. Dickson, Brown & Tait for Carnations.

Silver Medals were awarded to Mr. Wm. Lawrenson, Yarm-on-Tees, for Phloxes and Carnations; and Messrs. Charlesworth & Co., Haywards Heath, for a small but choice collection of Orchids.

Large Bronze Medals were awarded to Messrs. Dicksons, Chester, for hardy flowers; Messrs. Kerr & Sons, Liverpool, for greenhouse plants; and Messrs. Jos. Firth & Sons, East Keswick, for a new Zonal Pelargonium named Rising Sun.

SOCIÉTÉ ROYALE D'HORTICULTURE DE BRUGES.

August 11-18.—The exhibition of this Belgian Society, opened on the 11th inst., was a most remarkable one. The cultivation, as evidenced throughout the show, was of a high degree of merit, and the extent of the exhibits was specially noteworthy. Bruges is renowned for its cultivation of the Bay Laurel (Laurus nobilis), but Palms were also exhibited in large numbers, these rivalling the Bays in health and vigour. Large numbers of Orchids were shown, although these plants are not usually seen at their best in August. The nurserymen around Bruges excel in the cultivation of plants suitable for terrace gardens; the Pomegranate, Clethra, Eugenia, Orange, Metrosideros, Myrtle, Araucaria, and allied subjects were shown in large numbers. Of other choice foliage plants there were many fine examples of Cordylines, hardy Palms, and Phormiums. The hardier plants were chiefly arranged within an enclosure fenced off in the market place, which provided ample room for diversity in arrangement, the effect being enhanced by the picturesque appearance of the houses surrounding the square, with the well-known belfry of Bruges on one side. The stone-paved square was covered by a good depth of sea sand, which afforded some assistance in the grouping and effective display of the plants by means of broad walks and turfs laid down to form the beds. This large square was lighted by electricity at night, and presented a gay appearance. An overflow exhibition of hardy plants was held in the courtyard of the building connected with the belfry. The tender or exotic plants were all arranged in the large rooms of the same building, which suited the purpose admirably, the only disadvantage being the inadequate light during the evening.

In the section for Bay trees 20 classes were provided. Messrs. Sander & Sons, St. Albans and Bruges, were awarded the 1st prize in the class for specimens of diverse forms and sizes, showing a magnificent collection of plants; 2nd, The Flandria Co., Bruges, who also won prizes in other classes. Messrs. Sander & Sons were also successful in several other classes for pairs of Bay trees grown as standards and varied forms of pyramids. M. Vincke-Dujardin exhibited large specimens of Laurus nobilis, not for competition. Messrs. Sander & Sons exhibited the best specimens of hardy Palms, terrace plants, and specimen Cordylines. The Flandria Co. exhibited the finest collection of diverse varieties of Cordyline australis and its forms: this was a fine exhibit, and the plants were well grown, C. lentiginosa, C. lineata, C. Parryi, and C. Doucettii being conspicuous. The best pair of plants of Clethra arborea was shown by M. Ch. Steinmetz, the same exhibitor being successful in the classes for Pomegranates, Eugenias and Myrtles. Specimen Palms staged in the large rooms entered by the belfry were of immense size and in the most robust health. The 1st prize was won by Messrs. Sander & Sons in the class for a collection of 10 specimen plants; these included Latania aurea, L. borbonica robusta, Phœnix canariensis, Raphis flabelliformis, Kentia Belmoreana, K. gracilis, and Phœnix Roebelinii. The Flandria Co. were placed 2nd with well-grown plants, consisting, for the most part, of Kentias. These exhibitors won in the same order in the class for 10 new or rare Palms. Messrs. Sander & Sons included in their exhibit Linospadix Petrickiana, the young leaves being of a beautiful bronzy-red colour), Kentia Belmoreana gracilis, Chamædorea stolonifera, Ptychoraphis sp., and Rhopaloblaste hexandra, with narrow leafage closely set upon the leaf-stalk. The Flandria Co. exhibited the very distinct Cyrotostachys Renda "variety Duvivier," with the stems and base of the leaves of a bright-red colour, the rare Veitchia Johannis, Kentia Lindenii, Ravenia Hildebrandtii, Phœnicophorium Sechellarum, and Kentia compacta.

Classes for Palms were also provided for amateurs. Mons. Dumon de Menten showed well in the class for 10 specimens. In the classes for single specimens of Palms, the Flandria Co. and Messrs. Sander & Sons were keen competitors, whilst M. Vincke-Dujardin showed large plants of Rhapis humilis in the best of condition.

Orchids.—In the section devoted to Orchids, the finest individual group was shown by Messrs. Sander & Sons, part of this group being for competition and part non-competitive. This firm also excelled in the class for 50 Cypripediums; they also showed the finest Cattleyas and Lælias and the best single specimens of a Phalænopsis and of a Cypripedium. This firm had also plants in flower of Dendrobium superbiens and a new species of Acineta. Messrs. Charlesworth & Co., Hayward's Heath, exhibited a group of choice hybrid Cattleyas and Lælias, also Odontiodas and Odontoglossums. The plants had all travelled well. Fine plants of Miltonia vexillarium were shown by M. Vuylsteke and M. Jules Hye. M. Lambeau exhibited hybrid Cattleyas. A good group of Orchids was also shown by M. Vincke-Dujardin.

Besides many new plants Messrs. Sander & Sons showed specimens of Disa grandiflora, Dendrobium Sanderi, and Crossandra undulæfolia, all freely flowered. With these were Fourcroya Watsonii, a fine plant of Dracæna Broomfieldii, a distinct Alocasia, a good plant of Coccoloba pubescens, another of Dracæna Sanderi, and Vanilla aromatica variegata.

Cut flowers were not shown in large variety. There were, however, several fresh and bright collections of Roses and Gladioli. Those who exhibit cut flowers at Bruges need a little more insight into the best methods of staging them. Bottles were used in many instances, and these receptacles, unless placed on the ground, are not attractive.

Fruit and vegetables were scarcely represented. *J. Hudson.*

ABERDEEN SWEET PEA.

August 9, 10.—A successful exhibition was held under the auspices of the Aberdeen and Northern Counties Sweet Pea Society on these dates in the Music Hall Buildings, Aberdeen. The entries exceeded those of last year, when the first exhibition of the society was held. In a speech made at the opening ceremony, Major Davidson, of Dess, deplored the loss of scent in the newer varieties, and expressed the opinion that when two exhibits were otherwise of equal merit preference should be given to the more fragrant flowers.

Despite the exceedingly bad weather, the blooms shown were of excellent quality. The silver cup presented by Lady Fleming, and offered for the 12 best vases of waved Sweet Peas, was won by Lady Burnett, Crathes Castle, Aberdeenshire (gr. Mr. J. Petrie), with a very fine collection, which included such varieties as R. F. Felton, Nubian, Elfrida Pearson, Thomas Stevenson, Edrom Beauty, and Charles Foster. Mrs. Dunbar Dunbar, of Seapark, Forres (gr. Mr. J. Grigor), was placed 2nd. 3rd, Mr. A. M. Williamson, Monboddo (gr. Mr. J. Tullo).

In most of the other professional classes, Mrs. Dunbar Dunbar was very successful.

For the best three vases of novelties for 1911-1912, Lady Aberdeen was awarded the 1st prize.

Amateurs' Classes.

The Rev. E. V. Kissack, Aberlour Orphanage, Banffshire, won the 1st prize in every class but one, that for the best bunch of white Sweet Peas, when Mr. James Mitchell, Arbeadie Terrace, Banchory-Ternan, was the successful exhibitor, with exceedingly choice flowers.

The section devoted to floral decorations, which was restricted to ladies and judged by ladies, proved to be one of the most attractive features of the show, many good arrangements being displayed. In the class for best decoration of a dinner table, the premier award was won by Miss May Fleming, Dalmuinzie, for a simple and attractive arrangement. The flowers used were all of creamy-pink-coloured Sweet Peas, interspersed with sprays of Gypsophila. 2nd, Mrs. Porter, Monaltrie Gardens, Ballater, Aberdeenshire.

Mrs. Sinclair, Wellbrae Terrace, Aberdeen, who was placed 1st in the class for the best bowl of Sweet Peas, showed a good arrangement of lavender and mauve varieties.

Good taste was shown in the class for the best display of Sweet Peas arranged for effect. Mrs. DUNBAR DUNBAR was placed 1st.

NATIONAL GLADIOLUS.

AUGUST 13.—An exhibition of late-flowering Gladioli was held at the Royal Horticultural Hall, under the auspices of the National Gladiolus Society, in conjunction with the R.H.S. fortnightly meeting and exhibition. The show was far better than the exhibition last year; the Continental exhibits, especially from the Dutch Society, were especially good. The management of the Gladiolus Society leaves much to be desired; the judging was not completed until a late hour, and in many cases there was no indication of the classes to which the exhibits belonged.

Messrs. KELWAY & SON, Langport, Somerset, were awarded a Gold Medal and the Silver Cup offered for the premier group for a splendid collection of 24 varieties of named late-flowering Gladioli. Amongst the choicer varieties were Princess Louise, John Churchill Craigie, Prince of Orange, Lady Francis Cecil, and Brooklands. The Silver-gilt Medal offered in the same class was awarded to Mr. WILHELM PFITZER, Stuttgart. This collection included Goldquelle, a yellow-flowered variety, and "Schwabeu," a Gandavensis hybrid of much merit.

Messrs. WARNAAR & Co., Sassenheim, were awarded the Silver Trophy offered for the best collection of 12 varieties. The varieties Princeps, Willy Wigman, America and Ida were especially fine.

The Silver Cup offered for two spikes of a new seedling Gladiolus was awarded to Mr. PFITZER for the variety Goldfinder, a beautiful yellow flower.

Mr. K. VELTHUYS, Hillegom, Holland, received Awards of Merit for Gladiolus Empress of India, a very dark variety, and Baron Hulot, a fine flower of a blue-purple shade.

A Silver-gilt Medal was awarded to Mr. E. STEWART, U.S.A., for Michigan, a bright-red variety with purplish lines on the falls.

THE DUTCH GLADIOLUS SOCIETY sent an exceedingly fine exhibit, which was attractively arranged; the spikes of the varieties Badenia, Rosea superba, Faust (uncommon crimson shade), Empress of India, Willy Wigman and Sulphur King were splendid.

A Silver-gilt Medal was awarded to Mr. WILHELM PFITZER for a very good group of Gladioli arranged in their different shades of colour.

Messrs. BARR & SONS, Covent Garden, displayed numerous varieties of Gladioli pleasantly arranged with sprays of Bocconia cordata, Gypsophila paniculata fl. pl., and purple Statice. The Gladioli were nearly all hybrids of G. gandavensis, and included such valuable sorts as La Comète, Etincelle, Michigan, Vèdrines, and Safrano, a nankeen-yellow flower with crumpled petals. The Primulinus hybrids, which are derived from that species crossed with G. Nanceanus and G. Lemoinei, are very dainty flowers of chaste and attractive colouring. Messrs. BARR exhibited good stems of Lilium sulphureum, L. tigrinum splendens and several Crinums.

Messrs. KELWAY & SON, Langport, Somerset, displayed a great variety of large-flowered Gladioli, filling two lengths of tabling. Of the many sterling varieties shown in this collection, Capt. Clive Coates, Alexander Edward, Hazelbeech, Richard Milner, Lady Haddo, Pius X., Lemberg and Rienzo were amongst the best. The large, stout spikes here very large flowers of clear and distinct shades of colour.

PREMIER SPIKES.

In four classes a Silver Medal was awarded as a 1st prize and a Bronze Medal as a 2nd prize for the premier spike of Gladioli grown naturally without shade. The awards were as follow:—

Yellow.—1st, Schwaben, shown by Mr. W. PFITZER; 2nd, Golden Measure, from Messrs. KELWAY & SON.

Pink.—1st Panama, exhibited by Mr. F. BANNING; 2nd, Evolution Perfection, shown by Mr. H. H. GROGG, Canada.

White.—1st, Europa; the exhibitor's name was not given.

Blue.—1st, Badenia, shown by Mr. VELTHUYS; 2nd. La Nuit, shown by Messrs. KELWAY & Son.

STREATHAM SWEET PEA AND ROSE.

JULY 11.—The fourth annual exhibition of this society was held on the above date in the Streatham Town Hall.

The Challenge Cup, open to competition amongst all growers in the British Isles, was won by Messrs. D. PRIOR & SONS, Colchester; 2nd, Messrs. F. CANT & Co., Colchester.

The best collection of 12 Roses was shown by Mr. W. HALL, who also exhibited the best two vases of Roses, and Mr. W. MARTIN won the 1st prize in the class for six distinct varieties.

In the class for 18 bunches of Sweet Peas, the President's Cup was awarded to Mr. A. WINTER; 2nd, Mr. W. HALL.

Mr. J. W. AYRES showed the best nine bunches and the best six bunches of Sweet Peas.

There was very keen competition in the class for a vase of 25 sprays of Sweet Peas, in which Mr. WINTER won the 1st prize; 2nd, Mr. MARTIN.

In the class for a miscellaneous group of plants, excluding Orchids, Mr. F. STANLEY exhibited the best arrangement; 2nd, Mr. W. WEATHERBY.

In the ladies' classes, Mrs. A. CURTIS won the 1st prize for a decorated basket of any flower and foliage, and Miss MARY RATHBONE arranged the most tasteful epergne.

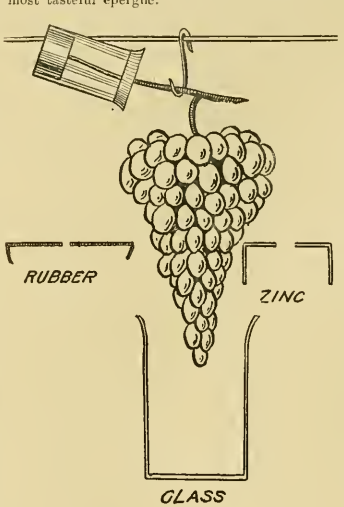

FIG. 66.—BOTTLE FOR PRESERVING GRAPES.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

AUGUST 12.—The monthly committee meeting of this society was held at the Royal Horticultural Hall, Westminster, on this date. Ninety-one new members were elected, making about 300 enrolled since July 8. Mr. W. Collins is resigning the secretaryship on September 9, and Mr. A. C. Hill, of 35, Alexandra Road, West Kensington, W., has been appointed temporary secretary.

NEW INVENTION.

A NEW GRAPE BOTTLE.

MR WM. TAYLOR, of Bath, has provisionally protected a very ingenious receptacle for preserving cut bunches of Grapes in a fresh condition (see fig. 66), which appears to be an excellent contrivance. The bottle measures only 3 inches high, and is about 1½ inch wide. A rubber cap, which closes the mouth of the bottle, has a small perforation to admit of the Grape stem, and the bottle is then perfectly water-tight, so that it can be safely tilted at any angle. Evaporation is said to be very trifling, so that time is not expended in refilling, and there is no likelihood of the berries being rubbed, which often happens when replenishing the water in ordinary bottles.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 10, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—The general condition was again very inclement. Rain fell daily in the south-east of England, and on most days over the Kingdom as a whole. Thunderstorms occurred frequently in some parts of the country, and were fairly general over England on the 4th, 7th, 8th and 10th.

The *temperature* continued below the average, the deficit being more than 5° in Ireland, and about 4° over all the southern and south-western counties of England. The highest of the maxima were registered on various dates, and ranged from 72° in England S.E. and 71° in England E. to 65° in Scotland E. and Ireland S. The lowest of the minima, which were also recorded on irregular dates, varied from 36° in Ireland N., and 37° in Scotland E. and Ireland S., to 46° in England S.E., and to 48° in the English Channel. The lowest grass readings were 32° at Markree Castle, 33° at Dublin and Crathes, and 34° at Balmoral. At 1 foot below the surface of the soil the temperature was considerably below the normal, and at nearly all places it was also below it at a depth of 4 feet.

The *rainfall* exceeded the average, and in Scotland E. and most of the English districts the excess was very large. Falls of an inch or more in 24 hours were experienced in many parts of the Kingdom. On the 4th 1·14 inch fell at Douglas (I.o.M.) and Crieff, 1·5 inch at Dublin, 1·6 inch at Armagh, and 1·7 inch at Crathes; on the 5th 1·9 inch at Newquay and Plymouth, and 2·0 inches at Scilly; on the 6th, 1·2 inch at Arlington; on the 7th, 1·3 inch at Killarney; and on the 8th, 1·0 inch at Wick.

The *bright sunshine* was much below the normal. The percentage of the possible duration ranged from 34 in the English Channel and 25 in England S.E. to below 20 in Ireland, Scotland, and the north-east of England, and to only 5 in Scotland E. In the last-mentioned district the mean daily duration was less than an hour, and in Scotland generally only about 2 hours, while it was less than 4 hours in all districts except the English Channel.

THE WEATHER IN WEST HERTS.

Week ending August 14.

Another exceptionally cold and gloomy week.—Since the present month began there has not occurred a single unseasonably warm day, and only one warm night. During the past week the temperature in the thermometer screen never rose above 66°, while on the last three nights the exposed thermometer fell respectively to within 1°, 7° and 5° of the freezing-point. At 2 feet deep the ground is at the present time 4° colder, and at 1 foot deep 6° colder, than is seasonable. Rain fell on each of the first five days, but the total measurement only amounted to about half-an-inch. On the morning of the 7th rain was falling for eight minutes at the average rate of nearly 1 inch an hour. During the week 1½ gallons of rainwater has passed through the percolation gauge on which short grass is growing, and 2 gallons through the bare soil gauge. The sun shone on an average for less than 3½ hours a day, which is only about half the usual duration for the second week in August. The winds proved, as a rule, light, the mean velocity in no hour exceeding 9 miles. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 5 per cent. *E. M., Berkhamsted, August 14, 1912.*

GARDENING APPOINTMENTS.

[*Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

Mr. S. GILTHORPE, for 14 months Gardener at Yeo Vale, Fairy Cross, Devonshire, as Gardener to G. S. LYSAGHT, Esq., Nynehead Court, Wellington, Somerset.

Mr. W. ADAMS, from VEITCH & SONS, Chelsea, and late of Dorin Court, Warlingham, and Weir House, as Gardener to J. A. LEVY, Esq., The Mount, Maidenhead, Berks. (Thanks for 1s. 6d., which has been placed in the R.G.O.F. box.—EDS.)

Mr. C. J. JONES, for the past 6 years Gardener to G. KIRBY, Esq., Woodview, Watford, as Gardener to J. W. PYMAN, Esq., Raithwaite, Penarth, S. Wales.

Mr. WM. ATKIN, for 20 years Gardener to the late R. W. MONRO, Esq., Oakfield, Kingston Hill, as Gardener to Mrs. KYRLE CHAPMAN, Shillingstone Grange, Blandford.

Mr. T. WARRINGTON, for the past 3 years General Foreman to His Grace the Duke of SUTHERLAND, Lilleshall Gardens, Newport, Salop, and previously at Osmaston Manor, and Temple Newsam, as Gardener to H.S.H. Princess HATZFELDT, Draycot House, Chippenham, Wiltshire.

Mr. W. G. NEWMAN, for the past few months temporary Gardener to the Hon. A. G. DAVEY, Esq., Ockford House, Godalming, and previously at Fallbrooks, Worcester Park, as Gardener to G. W. STEPHENS, Esq., Cuckoo Hill, Pinner, Middlesex.

Mr. J. RADLEY, for the past 10 years Gardener to J. HELLERBY, Esq., Alderslade House, Aston-on-Trent, as Gardener to F. SWINDELL, Esq., White Cottage, Aston-on-Trent, near Derby.

DEBATING SOCIETY.

CARDIFF GARDENERS'.—The annual outing of the members of this association took place on the 12th inst., when a visit was made to The Hendre, the seat of Lord Llangattock. The party lunched at Abergavenny, and then drove to The Hendre, a distance of 14 miles. Mr. Coomber conducted the party through the residence and gardens.

MARKETS.

COVENT GARDEN, August 14.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—Trade is quieter this week. There is a good supply of tubers, and prices remain about the same as last week. *Edward J. Newborn, Covent Garden and St. Pancras, August 14, 1912.*

REMARKS.—English culinary Apples appear to be a very heavy crop, 2s. per bushel being the highest price obtainable. Dessert varieties consist principally of Worcester Pearmain, Quarrenden (a record crop), Lady Sudeley and Langley Pippin. All early varieties of English and French Pears are very plentiful, and meet with a good trade. English and Channel Island Grapes remain a very heavy supply. The holiday season and cold, wet weather are unfortunately limiting the demand for Melons and Figs, and the supplies are exceeding the demand. Cherries are finished, with the exception of a few Morellos. Filberts and Cobnuts are arriving. The consignments of Peaches and Nectarines are much in excess of the demand. Tomatos, both home-grown and from the Channel Islands, have been a much shorter supply, with a consequent rise in prices. The market is well supplied with Plums, Victoria and Prince of Wales, which appear to be much larger crops than was anticipated. English and Dutch Scarlet Runner Beans and outdoor Mushrooms have been very plentiful during the past week. *E. H. R., Covent Garden, August 14.*

LAW NOTE.

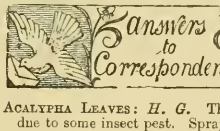
CLAIM FOR HEDGE TREES.

AT the Godalming County Court on the 8th inst., Robert Donkin, nurseryman, Cranleigh, sued F. H. Barrodale, architect, of Waverley, Cranleigh, for £11 14s., the price of 78 trees at 2s. 6d. each, and £1 19s., for the labour of planting them.

It appeared from the evidence that defendant purchased from plaintiff trees to make a hedge. The trees, or most of them, died, and plaintiff attributed this to the bad season, and to the lack of proper attention. Defendant, on the contrary, alleged that Mr. Donkin was negligent in the planting of them, the ground not being properly prepared, with the result that under the roots, when the trees were taken up, were found large lumps of clay and turf, so hard that it would be impossible for the trees to take root. After evidence had been given at some length on behalf of both parties, his Honour Judge Harrington said it seemed to him that the plaintiff's responsibility for the state of the trees ended as soon as he planted them. It appeared that a month or so after they were planted they began to die, and it was found when they were removed, a long time afterwards, that the condition of the ground was such that it might have been due to had planting, or it might equally have been due to other circumstances. The onus was on the defendant to satisfy him (the judge) that there was neglect, but he had failed to discharge his onus. On the other hand, plaintiff failed to supply trees of the stipulated height, and therefore, a reduction would he made in the amount claimed. He gave judgment for the plaintiff for £7 8s. 10d.

ENQUIRY.

NYMPHÆA FLOWERS.—Can any reader recommend me a good means of preventing Nymphæa flowers closing? I know that when a solution of a salt, unknown to me, is injected with a syringe into the flower-stalk closely beneath the cut flower, the flower is made very durable. Are there any other means of preventing the closing of Nymphæas? *P. W. Magdeburg.*



ACALYPHA LEAVES: *H. G.* The punctures are due to some insect pest. Spray the plants with an insecticide, or, if practical, dip the foliage in the specific. If this treatment proves unsuccessful, send us fresh specimens for a more critical examination.

BOOKS: *G. D. G. Fruit Ranching in British Columbia*, by J. T. Bealby.—*F. H. P., Oxon. A Handbook of Tropical Gardening*, by H. F. Macmillan, 12s., or *Gardening in the Tropics*, by G. Marshall Woodrow, 11s. Either may be obtained from our publishing department. —*J. D. H.* The best inexpensive work of value to teachers and lecturers on practical gardening is *The Calendar of Garden Operations* (price 7d.). Other useful works are *The Book of Garden Pests* (price 2s. 10d.), *A Primer of Horticulture* (price 1s. 1½d.), and *The Chemistry of the Garden* (price 1s. 1½d.). These may be obtained from our publishing department. The price includes postage.

CYANIDING GLASSHOUSES: *Dianthus.* This can he done by the use of either potassium cyanide or sodium cyanide, but it is preferable to use the latter. Hydrocyanic acid is liberated when sulphuric acid is poured on to the cyanide of soda. The operation requires great

care, owing to the *extremely poisonous* nature of the acid. The chemical is placed in an earthenware vessel, and the acid arranged above it in a bottle or other glass receptacle, with a string attached leading outside the building, say, through the keyhole. This is to enable the operator to liberate the acid from the outside. For delicate subjects, and for vines in full leaf 1½ ounce of the cyanide, 3½ ounces of sulphuric acid, and 10½ fluid ounces of water may be used with safety. The work should be done in the evening and not in the strong sunlight, whilst the temperature of the house should not exceed 60°, and the plants and surroundings should be dry. The glasshouse should be kept closed during fumigation from three-quarters of an hour to an hour, and then the ventilators and doors should be opened from the outside, the operator taking care not to inhale the escaping fumes. It is best to do the work on a calm day. Close any crevices in the house through which the fumes might escape. The horticultural sundriesmen supply outfits and material for the purpose.

Employment in Kew Gardens: *A. K.* Application for admission as gardener in the Royal Botanic Gardens, Kew, must be made on a form furnished by the Director of the Gardens. Applicants must be unmarried, between the ages of 19 and 24, and must have been employed for not less than four years in good gardens or nurseries. They must be healthy, free from physical defects, and not below the average height. Applicants are informed whether their names have been entered for admission, and on a vacancy occurring will receive a notice to that effect. Should an applicant not be appointed within three months after the date of his application, he should write again, if he still desires admission. Those selected for appointment as gardeners, who are British subjects, if they render approved service, are eligible to remain at Kew for a period of two years from the date of joining. At the termination of two years' experience in the Royal Botanic Gardens, a gardener ceases to be employed at Kew, unless he has in the meantime been selected for service as a subforeman for a further definite period of strictly limited duration. Gardeners whilst at Kew receive an allowance of 21s. per week to meet the cost of subsistence. Sub-foremen are paid 27s. per week.

Exhibiting Hardy Herbaceous Flowers: *Anxious.* It is not correct to exhibit Hydrangea hortensis in a class for six bunches of hardy herbaceous flowers. Hardy herbaceous flowers, for some reason or another, are generally regarded as perennials, notwithstanding the fact that many annuals and biennials are both hardy and herbaceous. According to the R.H.S. *Code of Rules for Judging*, annuals and biennials are excluded from a class entitled hardy herbaceous plants.

German Gardeners' Society: *H. Z.* The Secretary is Mr. E. Morell, 41, Upham Park Road, Chiswick, London, W.

Grapes Spotted: *F. C. N.* Probably the minute punctures are caused by some winged insect, or it may be the commencement of a fungus disease. If the spotting spreads send further specimens, when the fungus disease may be identified.

How to Make a Lawn: *Dianthus.* After having selected the site for your lawn, it will be advisable, unless the soil is naturally well-drained, to provide for the free passage of superfluous water. The soil should be well worked, bearing in mind that good cultivation is as necessary for grass plants as for those in the borders. Bastard-trench it, and add well-rotted farm-yard dung at the rate of 15 cartloads to each half-acre of land. If chemical manures are preferred, use superphosphate of lime, Peruvian guana, and bone-dust, or one of the special lawn manures sold by the nurserymen. Whenever possible it is a great advantage to allow the land to lie fallow for a short period before sowing the grass seed. When dealing with very weedy soils we have found it useful to plant the ground intended for lawns with early Potatos in the spring so as to thoroughly clean the soil before sowing the grass seed in the autumn. The surface of the ground must be levelled perfectly and made fine, so that the seed may be lightly covered with fine soil. About two bushels of seed will suffice for half an acre of land. Choose a dry, calm day for sowing, and when this is done lightly rake over the surface again and roll it. It is often necessary to cover newly-sown lawns with fish-netting to protect the seeds from birds. Mice, especially field mice, must also be guarded against. The kinds of grass (for a mixture of several different species is advisable) to sow will depend on the nature of your soil, and the use for which you intend the lawn. You should send a small sample of the soil to one of the leading nurserymen who specialise in lawn mixtures, telling him the kind of lawn you intend making, and seeking his advice as to the selection of the seed. The after-treatment of the lawn consists of weeding, rolling, and mowing. At least the first and second cuttings should be done with a sharp scythe, and not with a machine.

Insects Feeding on Nymphæa Leaves: *G. W., Surrey.* From your description we suspect that you are troubled with the larvæ of the Caddis fly, but if you will send specimens of the insects we will identify them for you.

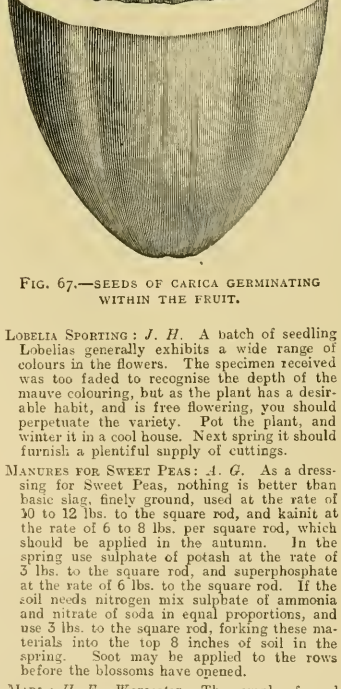


Fig. 67.—seeds of carica germinating within the fruit.

Lobelia Sporting: *J. H.* A batch of seedling Lobelias generally exhibits a wide range of colours in the flowers. The specimen received was too faded to recognise the depth of the mauve colouring, but as the plant has a desirable habit, and is free flowering, you should perpetuate the variety. Pot the plant, and winter it in a cool house. Next spring it should furnish a plentiful supply of cuttings.

Manures for Sweet Peas: *A. G.* As a dressing for Sweet Peas, nothing is better than basic slag, finely ground, used at the rate of 10 to 12 lbs. to the square rod, and kainit at the rate of 6 to 8 lbs. per square rod, which should be applied in the autumn. In the spring use sulphate of potash at the rate of 3 lbs. to the square rod, and superphosphate at the rate of 6 lbs. to the square rod. If the soil needs nitrogen mix sulphate of ammonia and nitrate of soda in equal proportions, and use 3 lbs. to the square rod, forking these materials into the top 8 inches of soil in the spring. Soot may be applied to the rows before the blossoms have opened.

Marl: *H. F., Worcester.* The sample of marl you send is not at present suitable for top-dressing a lawn. If you use it, it will be advisable to first expose it to the influence of the sun and winter frosts, but unless the soil of your lawns is of an exceedingly light nature, we should not recommend you to use any of the substance. Any finely-sifted soil that is free from the seeds of weeds would be preferable as a top-dressing. Your sample bears only a superficial resemblance to the Nottingham marl which is used for top-dressing cricket pitches.

Melon Seeds Germinating within the Fruit: *J. E. C.* Intracarpellary germination is not unusual in Melons. It also often takes place in other plants, including Carica (see fig. 67), Citrus, and Pernettya.

Names of Fruits: *W. Evans.* Emperor Alexander.—*J. M. Ireland.* Mr. Gladstone.—*C. H. P.* Mr. Gladstone.—*Arthur Horton.* 1, Decayed; 2, Dymond.

Names of Plants: *Rubrum* 1, Sedum hybridum; 2, S. stoloniferum; 3, S. hispanicum; 4, Oxalis corymbosa.—*J. H. a*, Lychnis coronaria; *b*, Geum coccineum; *c*, Veronica spicata alba; *d*, Sedum spurium; *e*, Vincetoxicum japonicum; *f*, Epilobium angustifolium. —*F. R., Warblington.* The tree is the common Hornbeam, Carpinus betulus. The other specimens were insufficient. If you send again please pack them so that they will reach this office in a fresh condition. Certain kinds of herbaceous plants in flower wither very quickly after packing in dry materials.—*Hurlock.* The Carnation blooms were faded beyond recognition. Send fresh specimens, packed in damp moss, to some grower who makes a speciality of these flowers.—*P. H. R.* Gongora armeniaca.—*F. T.* 1, Pleurothallis Barberiana; 2, Octomeria diaphana; 3, Gongora portentosa; 4, Odontoglossum aspidorhinum; 5, Bulbophyllum rufinum.—*Orchis.* Dendrobium Pierardii. —*R. V., Exeter.* The form of Morœa iridioides well illustrated in the *Gardeners Chronicle*, February 8, 1908, and a variety of Tritonia crocata.

Orchid Leaves Diseased: *Anxious.* The leaves are affected with "spot," which generally arises from some defect in the houses or unsuitable temperatures, and more particularly excessive warmth at night-time. Non-observance of drier and cooler conditions during the plant's resting season is a contributory cause. Remove the damaged leaves and old pseudobulbs. After the plants have completed their growth, afford less water to the roots.

Potatos: *A. K. D.* The Potatos are affected with the warty disease (Edomyces leproides), which is illustrated and described in *Gard. Chron.*, July 31, 1909, p. 79, figs. 33, 34. You cannot save affected tubers by any treatment. Remove and burn diseased plants before they produce resting spores.

Rose: *R. Powell, Sherring.* The variety appears to be that known as Cloth of Gold, and the foliage is particularly healthy.

Sweet Pea "Countess Spencer": *M. A. F.* The unusual number of blooms on your spike of Countess Spencer Sweet Pea is due to fasciation, an abnormal development resulting from a monstrous growth of several stems into one. Fasciation is often found in Sweet Peas, and is common amongst many other plants.

Tomatos Diseased: *J. B.* The unhealthy condition of the plants is due to a disease, most probably "sleepy disease." It is too late to adopt remedial measures, but to prevent the spread of the disease the plants should be destroyed by burning. Do not grow Tomatos in the same house again until the old soil has been removed and the house disinfected by spraying with a solution of iron sulphate or some other strong fungicide.

Worms in Lawns: *H. T.* (1) Dissolve half-an-ounce of corrosive sublimate (poison) in 15 gallons of water, and apply it over the lawn; when the worms come to the surface sweep them up. Do not allow fowls to eat the dead worms as they are poisonous. (2) If you mix a peck of freshly-made quicklime in 40 gallons of water, allowing it to stand until clear, and then apply the liquid from a rose watering pot, it will serve to bring the worms to the surface, and the fowls may eat them.

MISTLETO IN SHENSI.

THE Sin-ling range, which reaches substantially across China from Tibet to the coast, separates not merely the two greatest rivers of China, but divides the country into northern and southern halves, both as regards its people, fauna, and flora.

I need not institute comparisons between northern and southern floras, but it may be interesting to note one feature in particular which came under my notice when crossing the Sin-ling range in the province of Shensi, western China.

The range here consists largely of limestone in the valleys and on the lower slopes, with granite capping the higher ridges, as though it had been squeezed up from below, bursting through the limestone.

Ascending from the Han river, one of the largest tributaries of the Yangtze, I passed through mountain valleys which had been entirely deforested by the people, and even at the very sources of the smallest torrents evidence of terrible destruction by the rains was not lacking; but the more appalling results of the ruthless deforestation showed themselves lower down, in the disastrous floods of the Yangtze itself. I was surprised at the number of flowers in bloom in these mountains, though we were already well into November, with sharp frosts every night; but the radiant autumn days were warm yet, and the bitter winds with driving snow do not come till mid-December.

The mountains are covered on their lower slopes with "Spear Grass," a species of Stipa, and one of the most widely-distributed plants in China. Certainly it is the bane of the traveller, for not only do the needle-pointed fruits attach themselves to one's clothes, but they work right through and penetrate the flesh sometimes to a depth of a millimetre or more, causing most painful sores. The long awn breaks off as soon as the fruit has got a purchase, and every movement drives the latter further in, for the backward projecting hairs which occur just behind the steel-hard point prevent any movement in that direction.

Higher up on the tops of the ridges is a dense scrub of Oak, Birch, Hazel, Castanea, Rosa multiflora, and many other shrubby genera, with such climbers as Smilax and Clematis, and a rich undergrowth chiefly composed of Monocots, such as Iris tectorum, species of Lilium, and numerous Grasses; here and there are spinneys of Fir trees, Oaks, or mixed deciduous forest, and on the graves occur such species as Cupressus funebris, Taxus baccata, and other sombre Conifers.

In the inhabited valleys are Pears, Persimmons, Walnuts, Rhus vernicifera, Aleurites and other specially-cultivated trees, with Poplars and Willows planted along the stream sides, and an occasional Ginkgo hidden away in some old temple court. In the lower valleys are Rice fields, but Millet and Maize are the chief autumn crops in the mountains; both are cultivated at over 8,000 feet, and occur in tiny patches in the steepest places.

On the hillsides there were still in flower species of Gentian, Dianthus, Sedum, Salvia, Primula, Anemone Pulsatilla, and purple Asters, the last making a brave show; by the streams, Myosotis, Cardamine, and other marsh plants; and in more rocky places species of Delphinium 5 or 6 feet high, numerous Ferns, chiefly Polypodiaceæ, and Lycopodiums.

FIG. 68.—MISTLETO, CHIEFLY VISCUM ALBUM, ON A PERSIMMON TREE IN SOUTHERN SHENSI.

But it is of the Mistleto rather than of the general vegetation that I wish to write.

Before crossing the main watershed by a low pass 4,500 feet above sea-level, I did not see, so far as I remember, a single plant of the Mistleto.

From the pass I descended into the broad alluvial valley of the Lo river, and, continuing northwards, began the ascent of the next ridge, entering a picturesque region of limestone developed into towers and gorges. It was here that the Mistleto made its appearance in such extraordinary abundance as to constitute quite a feature of the landscape; never previously have I seen trees attacked by this pest with such virulence. The foliage of the tree was, in fact, hidden completely by that of the parasite.

Three species were observed: our native Viscum album, a very similar species but with much larger leaves, and lastly, and most beautiful of all, a deciduous-leaved species bearing great numbers of almost orange-coloured berries in dense terminal spikes.

Many, perhaps all, species of trees were attacked, especially Poplars, Willows, Walnuts, Pears and Persimmons, the cultivated fruit trees being commonly attacked most viciously of all, though the Poplars also ran them close in this respect.

The large-leaved species seemed to occur exclusively on Willows, but the other two species were much less fastidious and occurred indiscriminately everywhere and frequently both together on the same host. Viscum album was, however, the commonest of all. Continuing northwards over this secondary, though more lofty ridge, we descended to the Loëss plain of Shensi, where these parasites again became far less common, and crossing the plain from east to west, eight days' journey, I noticed very few plants of V. album on the Persimmon trees. Even when plunging once more into the Sin-ling range further west I came across no such outbreak again, but here the range was much higher and wilder, and covered with vast Conifer forests. Once, indeed, I came across a fourth species with beautiful scarlet berries like Holly.

The interpretation of the facts is by no means easy, though we may be tolerably sure, since Mistleto is distributed exclusively through the agency of birds, that any explanation is likely to be bound up with problems of bird distribution.

In this connection I may mention that no sooner did we cross the pass, than starlings, which we had not seen since some distance down the Han river, suddenly appeared again in flocks, and it was just these birds which invaded the Mistleto trees. Their absence from the mountains on the other side of the pass may account for the lack of Mistleto there, but will not alone account for the peculiar distribution of Mistleto over China and its absence (I believe) from the whole Yangtze valley. Moreover, the starling is of course capable of crossing this low range when it likes, hence the problem of the restriction of the range of the plant, though connected with that of the birds, is at present only partially solved. *F. Kingdon Ward, F.R.G.S.*

NEW OR NOTEWORTHY PLANTS.

KOELREUTERIA HENRYI,* DÜMMER, SP. NOV.

WHILE examining the material appertaining to the genus Koelreuteria at Kew, my attention was drawn to a fruiting specimen gathered by Dr. Augustine Henry on the Bakinsing Mountains, in Formosa (No. 1594), which was identified by him as K. bipinnata, Franchet, but which, on comparison with the type specimen of the latter species, appears to be wholly distinct, nor does it afford any agreement with the remaining species known, viz., K. paniculata, Laxm, and K. minor, Hemsley. It must therefore be regarded as new, and as such I have pleasure in associating it with the name of one intimately connected with the exploitation of the Chinese and Formosan floras.

K. Henryi exhibits affinities to the species hitherto confounded with it, but is easily distinguished by the smaller, fewer-leafletted leaves, the absence of any indumentum on the midrib and lateral nerves of the leaflets and the reduced state of their axil-tufts, the shorter, less-spreading panicles and much smaller capsules and correspondingly smaller seeds. Flowering specimens may subsequently reveal additional correlative differences.

Its salient characters are incorporated in the following diagnosis: A spreading tree 50 feet high; ultimate branchlets stout, glabrous and terete towards the base, slightly puberulous and angulate at their extremities, rich reddish-brown, dotted with conspicuous pale brownish lenticels; leaf scars broadly oval-crescentic, buds small, depressedly hemispheric with densely ciliolate scales. Leaves bipinnate; rachis compressedly tetragonous, dorsally ridged, 9 inches long, reddish brown, glabrous except for a minute yellowish pubescence in the vicinity of the nodes; secondary axes opposite, 5 inches long, composed of 5 to 11 leaflets, entirely glabrous or pubescent at the insertion of the leaflets. Leaflets alternate petiolulate, obliquely narrowly ovate, caudately and acuminately cuspidate, 3 inches long, 1 to 1 1-12th inch broad, subcoriaceous, wholly glabrous except for the reduced axil-tufts on the lower surface, the margin coarsely serrate with slightly incurved serratures, entire towards the base (rarely quite entire on the posterior margin); petiolule 1-12th to 1-10th inch long, crimson-red. Panicle short, sparingly branched, 4 to 5 inches long, minutely puberulous. Capsules borne on short pedicels, ⅛ inch long, membranous, three-winged, when compressed oval and rounded or almost orbicular, 1 to 1½ inch long, 1 to 1 1-10th inch broad; seed solitary in each loculus, ovoid-globose, smooth and black, ⅓ inch diameter. *R. A. Dümmer.*

* K. bipinnatae, Franch., affinis sed foliolis paucioribus subtus costa et nervis lateralibus glabris, paniculis abbreviatis, capsulis seminibusque minoribus distat.

Henry, *List Plants of Formosa*, 28 (1898). Matsumura and Hayata, *Enum. Pl. Ins. Form.*, 94 (1906).

PLANT NOTES.

BROWALLIA VISCOSA.

A BROWALLIA that has advanced a good deal in popular favour within the last few years is B. speciosa major, a native of Colombia. It is of a half shrubby character, and flowers with more or less freedom throughout the greater part of the year. The flowers, which are about 1 inch in diameter, are, when first expanded, of a purplish-blue colour, but they become pale somewhat afterwards and also increase in size. For the embellishment of the greenhouse during the summer, or of a somewhat warmer structure at other seasons, this Browallia is of considerable value, while it is also sometimes used in mixed beds for summer bedding. The species which is the subject of this note (Browallia viscosa) is not nearly so well known as the other, but it is quite distinct therefrom and decidedly attractive. The flowers are smaller than those of B. speciosa major, and of a much deeper and richer blue, with a small clear white centre. The habit of growth is somewhat looser than that of B. speciosa major. The contrast between the two colours forms a notable feature of B. viscosa. It has been referred to as an annual, but though it can be raised from seed, cuttings may also be employed for propagating purposes. B. viscosa is a native of Colombia; indeed, nearly all the members of the genus occur in the Andean region of South America.

FIG. 69.—TWO SPECIES OF MISTLETO (VISCUM ALBUM ABOVE) ON A PERSIMMON TREE IN SOUTHERN SHENSI.

ISOLOMA HIRSUTUM.

THIS is a comparatively old-established garden plant, having been introduced from Colombia and distributed by the late Mr. William Bull, of Chelsea, in 1881. It is an exceedingly useful decorative plant, and one that has of late gained many admirers. By some authorities the Tydæas are merged into the genus Isoloma, but from a garden standpoint they may well be kept distinct, though the cultural requirements are the same for both. The flowers of the Tydæas grown in gardens keep the mouth of the tube open, the spreading lobes are usually marked with dots or

flakes. Isoloma, on the other hand, has a more contracted mouth, with small lobes and a more uniform colouring. I. hirsutum forms an upright-growing plant, which will flower freely when from 18 inches to 3 feet in height. The flowers, which are 2 inches long, are of a bright vermilion colour, and are consequently very attractive when seen in masses. A notable feature of this Isoloma is the fact, that the entire plant—stems, leaves, and blossoms—is thickly covered with brownish hairs. Its flowering season is not limited to any particular period of the year; its bright-coloured blossoms being produced at almost any time. Throughout the summer the plants will bloom in the greenhouse, but in winter an intermediate temperature suits them best. Propagation is readily effected by division of the underground rhizomes or by cuttings, which strike readily in a gentle bottom heat. Before removing them from the propagating case care must be taken that they are well rooted, as they often grow at the points before any roots are produced. A compost made up of equal parts of loam and leaf-mould with a liberal dash of sand suits this Isoloma and its numerous allies. Though the specific name of hirsutum is in common use in gardens and in many works of reference, it is, according to the late Col. R. Beddome, in *Gesneraceae, Annotated List of Genera and Species*, published a few years ago in the *Journal* of the Royal Horticultural Society, not the true hirsutum of Humboldt and Bonpland, but really I. erianthum.

PAVETTA CAFFRA.

This is a very pretty, freely-flowering greenhouse shrub, introduced from South Africa about 90 years ago. Though seldom seen, it is well worth employment for the decoration of the greenhouse or conservatory. It forms a freely-branched bush, clothed with smooth obovate leaves, while the flowers, which are borne in compact, rounded, terminal heads, are white, with long, prominent anthers. The usual season of blooming is during the summer months, and extends over a considerable time. The plant is not at all difficult to cultivate, and succeeds in an ordinary greenhouse during the summer. In winter it should be given a minimum temperature of 50°. A mixture of loam, peat, and sand will suit it well. Though now a little-known plant it was formerly grown fairly frequently in the form of large specimens. In the *Floricultural Cabinet* for 1845, in a description of the summer show at Chiswick, mention is made of a specimen of P. caffra, shown by Mr. Robertson, gardener to Mrs. Lawrence, of Ealing Park. The specimen referred to was 3 feet high and 4 feet in diameter. These ancient specimens must have demanded a good deal of attention and trouble. W. T.

NEWLANDS, HARROW ON THE HILL.

Sir Arthur Fenton Hort's charming garden at Newlands, situated on a sunny slope of the hill, is very interesting to the lover of rare hardy plants. A friend of the late Sir Michael Foster, and sharing with him the love for Irises and the interesting pursuit of crossing the different species, Sir Arthur has of late years brought together a remarkable and beautiful collection of Irises, which in the springtime furnish a most varied and delightful spectacle. The genus being widely distributed and the different species requiring different conditions, it is only in the garden of an enthusiast who studies each of his subjects that a general collection is to be found in a thriving condition. In his efforts to get the best results, Sir Arthur Hort is materially aided by his knowledge of the conditions in which many of the species grow in their native habitats, and some of the most beautiful Irises and other Alpine plants in the garden have been collected wild by Sir Arthur and Lady Hort. Earlier in the year there was a fine show of Oncocyclus Irises, together with some charming hybrids; large clumps of the germanica section produced a wealth of showy flowers; I. juncea and its allies; I. Albertii, introduced to England by the late Sir Michael Foster, and some promising hybrids; I. ensata, I. kashmiriana, I. Hookeri, I. longipetala, I. balkana, I. Leichtlinii and variety vaga, I. Korolkowii, and scores of other species and pretty hybrids have continued an interesting show of flowers. The garden has spacious borders for the stronger-growing hardy perennials, with beds of flowering shrubs, rockeries arranged to suit the requirements of the plants, and lately a moraine has been arranged which promises to be a great success.

Earlier in the year the Tulips made a fine show, some of the species, such as T. Sprengeri, seeding freely and coming up in patches between the clumps of Iris.

The old walled-in garden is mainly devoted to the Irises, every section being well represented, and hybrids of some of the most important arranged with the species. Several new crosses have flowered for the first time this year. A huge mass of a large form of I. ochroleuca, which had a dozen or so heads of bloom all open at the same time, was a charming object.

The soil of the district is clay, hence the advantages of the rock and moraine garden, which provide nooks with suitable aspects. On the occasion of a visit, Rosa indica ochroleuca, growing against a wall, was well furnished with its large, salver-shaped blooms, the bright-scarlet Pentstemon cordifolius was blooming freely, and other interesting wall shrubs were noted.

On the terrace, with many lesser beauties, was a fine specimen of Lactuca Bourgaei, with large heads of stellate, pale-blue flowers.

In the rockery and moraine the most striking objects were the large collection of species of Saxifraga of the S. Aizoon and S. longifolia class, many of which, from small scraps, have now become dense tufts. Gentians, also collected wild, brought experience, for those planted in the grassy tufts as collected soon got smothered by the grasses, while those from which the grasses had been removed became strong tufts. One of the arts in growing G. verna, G. acaulis, and others of the class, is to keep them firm in the soil and to sprinkle a little gritty soil among the growths when they tend to run up. G. septemfida was well in bloom.

The Alpine Pinks have made a fine show, and were still blooming in great masses; a charming set of dwarf Campanulas gave a profusion of flowers; C. carpatica (white and blue), a fine form of C. rotundifolia collected in the Pyrenees, and others of the C. pulla class being specially bright, while in a sheltered nook a patch of Platycodon grandiflorum Mariesii gave bright-blue colour. All the hardy Primulas thrive well: P. Auricula, P. rosea, P. Cockburniana, P. japonica, and P. farinosa have all bloomed unusually well. On one side of the rock-gardens is an interesting collection of varieties of Iris Pseudacorus, a common species which is not supposed to vary much, but specimens of which here show the most extraordinary dissimilarity in the width of the leaves and in the size and colour of the flowers. Among a large number of very interesting plants noted as being unusually well represented were Meconopsis Wallichii, with 6-foot stems of blue flowers; Geranium pratense flore pleno; G. Robertianum alba, studded with white blooms; Œnothera Nuttallii, with its pretty flowers nestling among its Fern-like foliage, Catananche caerulea alba, a mass of white flowers; some showy Potentillas and scarlet Geums; a collection of Cistus, a batch of Cyclamen europæum in bloom; Veronica salicifolia, a bush with narrow, green leaves and slender sprays of white flowers; patches of blue Sisyrinchium Bermudiana, and S. chilense; fragrant cushions of the different rock Thymes, Silenes, and Androsaces; the bush Convolvolus Cneorum; and innumerable other floral treasures.

THE ROSARY.

ROSES IN SOUTHERN SCOTLAND.

In previous contributions I have occasionally endeavoured to emphasise the value of many of our older Roses—especially at this season—such as La France, Caroline Testout, Capt. Hayward, Clio, Viscountess Folkestone, and Margaret Dickson. They are for the most part distinguished by vigorous growth, floral reliability, and freedom in flowering. Some of the newer varieties, which, when they appeared, were greatly overrated, by reason probably of their brilliant colouring, have not since given evidence, after adequate culture, of possessing the essential attributes to which I have referred. There are, nevertheless, among comparatively recent introductions, some notable exceptions; these include Pharisaer, General McArthur, Viscount Carlow, and Florence Haswell Veitch. Pharisaër is a very desirable variety, and even in the month of September its flowers are often very beautiful. No sooner are its first blooms over than its beautiful chocolate-coloured shoots appear for the approaching autumnal bloom. As much may be said of a Rose of radiant colour and wondrous floriferousness, General McArthur, to whose great merits I was attracted last autumn by a eulogium by *White Rose* in the *Gardeners' Chronicle*, which, as I have since discovered, did not over-estimate the importance of this Rose. Florence Haswell Veitch, though not quite so full in the centre as its predecessor Salamander, is an extremely beautiful and trustworthy Rose. Among Irish Roses of this colour that have achieved great distinction, my favourites are Hugh Dickson, Lady Helen Stewart, and the radiant Leslie Holland, which, for intense colour, fine form, and exquisite fragrance, could not easily be excelled.

Noisette Roses do not, as a general rule, succeed well in the south-west of Scotland. I have tried both Cloth of Gold and Maréchal Niel in my garden without success; their constitution is much too delicate and exacting for our climate and in this region they require conservatory cultivation. Some years ago there was a splendid specimen of the lovely Maréchal Niel at Chapel Rossan, the residence of Mr. David A. McClew, factor on the Logan Estates, which in one memorable season had several hundred glorious flowers, but it was grown under glass. Lamarque, I have found, is much more satisfactory, and has been grown here very successfully for many years on a sheltered south wall. Very reliable also are Aimée Vibert, Rêve d'Or, Bouquet d'Or, L'Idéal, Mme. Pierre Cochet, and William Allen Richardson. Among Tea Roses the most effective this season have been the White Maman Cochet, a large and exquisitely-tinted Rose, though somewhat sparing of its beautiful flowers; Lady Roberts, which may be similarly described; Anna Olivier, almost equally beautiful, and much more floriferous, and Comtesse de Nadaillac, extremely effective, but difficult of culture, unless the weather be exceptionally fine.

No Roses are more valuable, especially at this season, than the Hybrid Teas. It is hardly too much to say that they have, to a great extent, superseded the so-called Hybrid Perpetuals, by reason chiefly of their marvellous flowering facility, their splendid dimensions and attractive fragrance; qualities strikingly exemplified in such varieties as Viscountess Folkestone, Caroline Testout, Clara Watson, and the incomparable La France. The latest acquisition is a white Caroline Testout, recently introduced by Messrs. Dobbie and Co., which, though not so commanding in aspect as its parent, is nevertheless a beautiful and fascinating Rose. The chief glories of our gardens at the present period are the Wichuraianas, of which some of the loveliest and most luxuriant

are Hiawatha, Christian Curle (pale salmon-pink in colour), Dorothy Perkins, the White Dorothy Perkins, and the graceful Lady Gay. *David R. Williamson, Manse of Kirkmaiden, Wigtownshire.*

HYBRID WICHURAIANA ROSE MINNEHAHA.

In the Dorothy Perkins shade of colour I know of no Rose amongst the Hybrid Wichuraianas that stands better, and flowers in greater profusion, in cold and exposed situations, than Minnehaha. It thrives and blossoms in positions where neither Dorothy Perkins nor Lady Gay are capable of giving a good account of themselves. In the National Rose Society's *Annual* for 1911, this Rose is described as a sport from Dorothy Perkins. It is fairly obvious that this cannot be the case, as the wood and foliage are distinct from the reputed parent, and the characters of the two Roses are altogether different. I have made some enquiries regarding the parentage of Minnehaha, and find that it was distributed by Walsh, the raiser, as a Hybrid between R. Wichuraiana and the Hybrid Perpetual Paul Neyron. There is strong evidence in the general character of this Rose of such a parentage, and the strong, broad foliage is altogether different from that of Dorothy Perkins. I am quite aware that Hybrid Perpetual blood is reputed to be present in Dorothy Perkins, for Mme. Gabriel Luizet has been credited as the pollen parent, but on this point there does not appear to be any satisfactory evidence. Minnehaha is a very vigorous grower, and is earlier in flowering than Dorothy Perkins. There is little, if any, difference between the colours of the two Roses, but, on the whole, I think Dorothy Perkins is the brighter of the two. Minnehaha, however, is the better variety where a Rose is required for an unsheltered position, either upon an arch or grown as a hedge. In a very cold, open aspect in Midlothian, this Rose never fails, and is decidedly more attractive than Dorothy Perkins upon an adjoining pillar. *George M. Taylor, Midlothian.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 66-71.)

(Continued from p. 140.)

4, MIDLAND COUNTIES.

OXFORDSHIRE.—Apples are a poor crop, but Gooseberries, Raspberries and Currants were fine and plentiful. Pears, Plums and Peaches are disappointing. Strawberries, owing to the extreme dryness of last year, were only half a crop, but the fruits we have are very fine. The soil here is a light loam, on gravel and chalk. *J. A. Hall, Shiplake Court Gardens, Henley-on-Thames.*

—— The hot, dry summer of last year was very favourable for the formation of fruit buds, and the result was an abundance of bloom on all kinds of fruit trees—especially Plums and Pears—but the cold winds and frosts damaged the blossom. The dry spring was also harmful, especially to stone fruits. A heavy crop of Strawberries could not be expected when it is remembered that the plants were dried up last July and August; but the quality was good. The Raspberry crop is very good and prices are high. Gooseberries and Currants also are good and clean. The Apple crop is variable; occasionally one sees a tree well cropped, but usually fruits are few or nil. *A. J. Long, Wyfold Court Gardens.*

—— All kinds of fruit trees bloomed freely, but were badly damaged by the spring frosts, except those that were protected. Morello Cherries, on a north wall, were not in flower, and so escaped the frost. The first blooms on the Strawberries were all killed before opening, and owing to heavy rains many of the Strawberry fruits rotted. The soil here is a light loam. *C. E. Munday, Nuncham Park Gardens.*

—— We have a very heavy clay soil, and the drought of last year was very detrimental to the Strawberry plants, but the buds of fruit trees ripened well. Apple trees promised to give good crops, but many failed to set their flowers. Pears are not a heavy crop owing to the ravages of the Pear midge (Diplosis pyrivora), which pest destroyed quite three-quarters of the fruits. The winter wash (alkali) does not seem to prevent the fly from attacking the fruit. Plums are almost a failure, and, owing to the continuous wet weather, the trees are forming large shoots, which will not ripen, and will result in next season's crop being small. Cherries cracked very badly; this also was due to the wet weather. The trees of Peaches and Nectarines are also making more growth than usual; these fruits are good, as also are Apricots. Gooseberries, Raspberries and Loganberries are very heavy crops. Currants of all kinds are not so good, and Strawberries proved the most disappointing crop of all. *F. W. Pearce, Eynsham Hall Gardens, Witney.*

—— With the exception of Pears, the orchard trees, which carried good crops last year, are disappointing. There was a splendid show of bloom and plenty of fruit set, but it dropped later. The soil here is of a very sandy nature. *T. W. Whiting, Shotover Park, Wheatley.*

SHROPSHIRE.—On April 1 we registered 6° of frost, followed by dry, cold winds. On April 6 there was a little frost, and on the 8th 2° of frost. These periods of cold were followed on the 10th by storms of hail and rain. On April 11 the thermometer registered 6° of frost after rain, and on the 12th 8° of frost. Many fruit trees were in full bloom during those 12 days, and, excepting those on walls or such as were sheltered from winds, they suffered severely. Later blossoms gave a small crop on many trees, whilst others are almost fruitless. As usual, there are exceptions; the varieties Bismarck, Ecklinville Seedling, and Duchess of Oldenburgh are laden with good fruit. In one orchard there are no Damsons, whilst in gardens two miles away trees are bearing an immense crop. The soil is a fairly heavy, clayey loam. *Alex. Haggart, Moor Park, Ludlow.*

—— Pears are the best crop of the season. Damsons are good in some districts, but very scarce in others. The crop of Apples is disappointing after the great promise in the spring. Young trees planted about 18 months ago set fruits so heavily that it was necessary to thin them severely, but the ground around them was hoed regularly during the dry weather of 1911. The poor crop of Apples this year may be attributed to dryness at the roots. Apples and Plums have suffered from attacks of aphis, and autumn spraying will be necessary as soon as the crops are gathered. The soil is a stiff loam and better suited to Apples and Plums than to Pears, and Black Currants, Raspberries and Strawberries thrive better than Gooseberries and Red Currants. *G. T. Malthouse, Harper-Adams Agricultural College, Newport.*

—— Apples are scarce generally in this neighbourhood; the trees bloomed well, but the flowers did not set. The trees which are carrying good crops are those that did not bear well last year. It is many years since I saw standard and bush Pears so heavily fruited. A remarkable crop of Damsons is reported throughout this locality. Strawberries were a complete failure owing to the effects of the drought last year. Insect pests have been very troublesome; we have used different insecticides, some of which have done more harm than the insects. *J. Taylor, Hardwicke Grange, near Shrewsbury.*

STAFFORDSHIRE.—The fruit crops are, on the whole, below the average. Apples are only a moderate crop, and Pears are scarce. The Strawberry crop has been very good; the berries were large and of good quality. Small fruits, such as Gooseberries, Currants, Raspberries and Morello Cherries, are satisfactory and of good quality. The soil here is of a light nature, and the subsoil is gravelly. *E. Gilman, Ingestre Gardens, Stafford.*

—— Of Apples, Cox's Orange Pippin, growing on medium loam, is a failure this year. King of the Pippins is bearing moderate crops. The varieties Newton Wonder and Bramley's Seedling fruited magnificently last year, but are bearing no fruits this season. Allington Pippin, James Grieve, and Warner's King are very good. Lane's Prince Albert and Blenheim Pippin are both poor crops, whilst Ecklinville Seedling is a moderate crop. Gooseberries were plentiful but poor in quality, and were a failure in many gardens. Of Pears, Doyenné du Comice is very good, but there are only moderate crops of Pitmaston Duchess and Williams's Bon Chrétien. The crops in the county experimental fruit plot are practically a failure. Most varieties of Apples and Pears flowered splendidly, but many varieties failed to set fruit, and in other instances the fruits dropped after setting. The soil is of a gravelly nature. *J. Stoney, Horticultural Instructor, Staffordshire County Council.*

WARWICKSHIRE.—The continued wet, cold weather just after the fruit had set was very unfavourable to Apples; the swelling of the fruits was delayed, and, in consequence, many dropped. The crop was further thinned by the sawfly grub, and in some districts by leaf-curling aphides. The prospects are therefore not so good as earlier in the season. As a rule, the only varieties of Plums cropping well are Magnum Bonum and Pershore, but in the Bidford-on-Avon district the Plum crop is in many instances a heavy one, including the varieties Victoria and Early Prolific. Black and Red Currants and Raspberries are in splendid condition. *H. Dunkin, Warwick.*

—— The fruit crops generally in this locality are very disappointing, especially those of Apples, Pears, and Plums, but Damsons are a heavy crop, and bush fruits are good. Strawberries were an average crop, but owing to the wet, sunless weather the fruits rotted. Our soil is light and sandy, with a gravelly subsoil. The gardens are situated 150 feet above sea level. *Chas. Harding, Ragley Hall Gardens, Alcester.*

—— The fruit crop generally promised well. The Apple crop is not nearly so heavy as last year, but it appears to be much earlier. Pears are very plentiful, being the heaviest crop in this district for some years. Plums and Apricots flowered freely, but were spoilt by frost and east winds. Strawberries were good in quality, but the quantity was much under the average. Small fruits are plentiful, and very good in quality, especially Black Currants and Gooseberries. *H. F. Smale, Warwick Castle Gardens.*

5, SOUTHERN COUNTIES.

BERKSHIRE.—Pears here being grown chiefly on walls escaped the frost, but standard Apples suffered greatly. Ten degrees of frost, just as the trees were in full bloom, damaged large numbers. The sweet Cherries suffered from the same cause, but Morello Cherries on north walls are very good. I had scarcely a Black Currant; this crop being destroyed in the same way. Red Currants, Raspberries and Loganberries are very good. Figs outside, on a south wall, are fruiting well. Our soil is a mixture of gravel and clay. With the aid of farmyard manure we usually have an abundance of fruits of the finest quality. *F. Capp, Charters, Ascot.*

—— The fruit crops generally vary in the immediate neighbourhood, but although there are a few exceptions, Apples are very much below the average. In these gardens they are very deficient, even Lane's Prince Albert (a dependable variety) is almost a failure. Most kinds of stone fruits promise well. Bush fruits are good crops, although Black Currants dropped freely. Raspberries are a good crop, but Strawberries were much below the average, and owing to the unsettled weather many rotted before they came to maturity. Walnuts are very scarce with me, but Cobnuts and Filberts are both fair crops. *J. Howard, Benham Valence, Newbury.*

—— The fruit crops generally are fairly good. Apples are not a heavy crop, but the quality is good. This also applies to Strawberries; the earliest blooms here were destroyed by the frost. Pears are a good, clean crop, especially the variety Doyenné du Comice on cordon trees. Peaches and Nectarines are

rather thin but good; all bush fruits, including Raspberries, are good and clean. The soil here is light on a clay subsoil. *A. B. Wadds, Englefield Gardens, Reading.*

Dorsetshire.—Apple trees which failed to crop last season are heavily laden, whereas those which fruited well are carrying few fruits. As cider orchards generally were heavily cropped last season, the crop is now a partial failure. The Pears are in every respect better than last season; and this applies more particularly to such varieties as Doyenné du Comice, Thompson, Marie Louise, Glou Morceau, and Josephine de Malines. Of Plums, the varieties Victoria, Early Prolific and Czar are heavily cropped, but the choicer dessert kinds are not so good. Sweet Cherries are an enormous crop, but Morellos are under the average. Peaches, Nectarines and Apricots are disappointing after the fine autumn of 1911. Of small fruits, Gooseberries are an enormous crop, as also are Red Currants. Raspberries are the best crop that I can remember. This I attribute to the continuous rains. Young plantations of Strawberries were the greatest failure I have known. The hot, dry weather at planting time last season prevented the plants making satisfactory growth, with the result that they lacked sufficient foliage to protect the bloom from the severe frosts in April. Nuts of all kinds are abundant. *T. Turton, Castle Gardens, Sherborne.*

—— Apples of such sorts as Beauty of Bath, Belle de Pontoise, Coronation, Duke of Devonshire, James Grieve, Keswick Codling, Houblon, Irish Peach, Lady Henniker, Lord Derby, Peasgood's Nonesuch, Ribston Pippin, Rival, and Striped Beefing are very good. Pears are mostly a heavy crop, the varieties Beurré Alexandre Lucas, Beurré Diel, Catillac, Le Lectier, Fondante de Thirriot, Glou Morceau, Marie Louise, Madame Treyve, and Williams's Bon Chrétien are all bearing well. Plums of the culinary sorts are a very heavy crop; such varieties as Orleans, Pond's Seedling, The Czar, and Victoria are very plentiful; and there is a fair crop of Belgian Purple, which hardly ever fails. The variety Golden Drop and the Gages are not so plentiful. Damsons are an enormous crop. Both Sweet and Morello Cherries are heavy crops. Gooseberries bear exceptional crops; Currants are very fair, Black Currants being especially fine. Strawberries, owing to the drought last season and to the frosts when the plants were in flower, have been a light crop, fair in quality, but soon over. *Thos. Denny, Down House Gardens, Blandford.*

—— Black Currants are nearly a failure, but Red and White Currants are plentiful, and Gooseberries and Raspberries very plentiful. The Apple blossom made a splendid show, but the fruits set badly, and many have dropped since. This is, I believe, due to the extraordinary weather experienced in April and in early May, when hot sunshine and east winds in the daytime were followed by frost at night. Pears promise well, as also do Figs. The Pears are on walls. This garden slopes sharply to the south-east. The soil is rather shallow, with subsoil of chalk and flints. *J. Jaques, Bryanston Gardens, Blandford.*

—— The fruit crops are very uneven. In a few cases good all-round crops, with the exception of Strawberries, which were a failure generally, are seen. Apples flowered splendidly, but in most cases the greater number of the blooms either did not set or fell shortly after setting. This is, I think, attributable to exhaustion, the result of general overcropping and the climatic conditions of 1911. In most districts the weather was favourable at blooming time, but in a few cases the flowers of Pears and Plums were badly frozen. Gooseberries are a very heavy crop, and Raspberries and Currants are well above the average. In those few gardens where thinning was practised during 1911, the top fruit is a good crop, and where labour conditions allowed effective watering, the Strawberries were fairly satisfactory, although lighter than usual. *E. C. Parslow, Dorchester.*

—— There are many complaints of a shortage in the Strawberry crop, due, no doubt, to the drought of last summer. Our best results have been obtained from young plants, which were well looked after, the variety Louis Gauthier excelling all others. Gooseberries have been plentiful, also Raspberries. Currants have been much infested with aphides, owing, no doubt, to drought and cold weather in the early part of the season. Apples looked splendid when in blossom, but the trees have not all set fruits freely. There was an abundance of Pear blossom, but we experienced from 5° to 8° of frost on several occasions when the flowers were fully out; still, many Pear trees look well. Plums seem to be our lightest crop. Peaches and Nectarines are not grown out-of-doors here. Our soil is fairly light in texture and on friable clay. *A. Shakelton, Forde Abbey Gardens, Chard.*

Hampshire.—Strawberries suffered from the effect of last season's drought, and have been a light crop; the quality was good. Royal Sovereign and Sir Joseph Paxton are still the best sorts, although the latter does not succeed so well as formerly. Plums are variable. In some plantations the crop is a very heavy one; in others there is a deficiency. Apples also are variable; the trees suffered much from infestation of aphis. The best crops are on trees of Lord Grosvenor, Worcester Pearmain, Warner's King, Bramley's Seedling, Golden Spire, Allington Pippin, and Ben's Red. Black Currants (Boskoop Giant) have borne extra heavy crops of fine fruit. Red Currants and Gooseberries are also very satisfactory. The soil in this neighbourhood is very variable, being heavy, light and chalky in different places. *E. Molyneux, Swanmore Park Farm, Bishop's Waltham.*

—— The Apple crop generally is, after such fine promise at the blooming season, somewhat disappointing. We have a good average crop of Apples, but more particularly of the earlier and more regular-bearing varieties, such as Ecklinville Seedling, Stirling Castle, and Lord Derby. The trees are very clean and healthy, and growing strongly. Pears are a full average crop of good, clean fruits, as also are Plums. Apricots are a failure. Peaches and Nectarines are not grown outside. Small fruits were good, especially Gooseberries and Raspberries. Strawberries were the worst crop I have known during the twelve years I have been here. This may be attributed in part to the drought of last season, which very much enfeebled the plants, and to the frost during the blossoming period. Our soil is of a clayey nature, resting on London clay. *H. G. Nichols, Strathfieldsaye Gardens, Mortimer, R.S.O.*

—— The Apple and Strawberry crops were badly damaged by severe frosts during April. Small fruits are abundant crops, with the exception of Raspberries, which suffered through drought in April and May. The soil is gravelly, resting on clay. *R. Learmonth, Sherfield, Basingstoke.*

—— Our general fruit crops are especially good. Pears are a splendid crop and of good quality. Apples are fairly plentiful, but the fruits of many sorts are of inferior quality. Plums are an average crop; much of the early blossom was spoiled by frost in April. Strawberries were a good crop, but the rains damaged the berries considerably. All small fruit crops are abundant and of excellent quality. The soil is light and sandy with a subsoil of sand and gravel. *A. Legge, Dogmersfield Park Gardens, Winchfield.*

—— Apples are on the whole below an average quantity, but Pears are very plentiful. Loganberries, Raspberries, and Gooseberries were all very good, whilst Filberts and Cobnuts are both heavy crops. Figs are the heaviest crop we have had for many years past. *Henry Martin, Bartley Lodge Gardens, Cadnam, Southampton.*

—— The Apple crop varies considerably; in some districts the fruit is very plentiful, whilst in others the crop is almost a failure. Plums, Peaches, and Nectarines flowered well, but, as usual, far too early to ensure a good crop. Cherries, with the exception of Morellos, have not done well this season. Apricots never do well out-of-doors in the Isle of Wight, and are not planted in quantity. Owing to the long spell of drought last summer the crowns of Strawberries did not develop sufficiently to produce a good crop this season. Gooseberries have done exceedingly well on gravelly soils; the heavy rainfall during June assisted the crops to develop far above the average in size. Raspberries and Loganberries also have done splendidly. Pears in many instances have had to be very severely thinned. *Charles Martin, County Council Gardens, Newport.*

—— Nearly all varieties of Apples flowered well, but only the early sorts set a crop. This applies to the varieties Ecklinville Seedling, Stirling Castle, Lord Grosvenor, The Queen, Mr. Gladstone, Irish Peach, Worcester Pearmain, James Grieve, and a few young trees of Cox's Orange Pippin that carried a thin crop last year. Late sorts, such as Newton Wonder, Bramley's Seedling, and Annie Elizabeth, are a complete failure. Plums, Pears, and Cherries on walls are full crops, as also are bush fruits and nuts. With regard to Strawberries, Royal Sovereign gave only one-third a usual crop; 10° of frost at the end of April blackened all flowers that were open and a quantity of the most forward buds. Givon's Late Prolific, Utility, and Laxton's Latest gave full crops. Laxton's Latest, which is at its best about the middle of July, does well in our garden, which has a rather retentive soil overlaying clay and flint. *A. W. Blake, Castle Gardens, Highclere.*

(To be continued.)

THE MARKET FRUIT GARDEN.

Fruit Crops in Kent.

A drive through a large fruit district in Kent, and visits to some fruit farms, have confirmed the impressions as to the fruit crops described in my recent notes. Cherries not gathered were thick on the trees, but long rows of Plum and Apple trees, practically destitute of fruit, were passed repeatedly in the course of the journey, while here and there a good crop was to be seen. In the excellent orchards thoroughly inspected it was found that, as in my own, crops of early Apples were good, and those of late varieties very thin or non-existent. Some fine crops of Early Julyan, Domino, Lord Grosvenor, and early dessert varieties were seen, while very little fruit was found on Lane's Prince Albert, Bramley's Seedling, Newton Wonder, and other late sorts. In one orchard there were hundreds of very fine trees of the variety last named quite bare of fruit. Worcester Pearmain was bearing freely wherever it was seen, but was sadly attacked by the aphis in some cases. Warner's King, Lord Derby, and Queen, which may be termed mid-season varieties, were fruiting fairly in some instances, and only moderately in others. A somewhat striking exception to the shortness of fruit on late varieties was noticed in the case of the Royal Jubilee, the latest of all Apples to develop foliage and blossom. In two orchards excellent crops were found on it, as there are in my own plantations. The explanation probably is that rain came in abundance just before Royal Jubilee was off blossom, whereas other late varieties suffered from the full severity of the spring drought when their blossom was setting. The Plum crop as a whole was found to be miserably light, great numbers of trees of Early Prolific, Victoria, and Black Diamond being quite destitute of fruit, while the crops on Monarch and President were generally very thin. Czar was the only variety found to be fruiting well on the whole, though some exceptions to the shortness of Victoria and Monarch crops were noticed. Damsons were fairly covered with fruit, and so were Pears. The few Black Currants seen bore very light crops. Strawberries had proved short, and the few Raspberries seen were only moderate. Nuts were promising. *Southern Grower.*

THE EUGENIAS OF SOUTH AFRICA.

(Continued from p. 128.)

2. E. GERRARDII, Sim, *Forests and Forest Flora of Cape Colony*, 226, 1907.

A spreading, densely-leafy tree, about 15 m. high, with a whitish trunk about 1.2 m. in circumference; third year's branchlets subterete, greyish, scaly-barked, the ultimate branchlets short, conspicuously angular or obsoletely winged, brownish, glabrous and densely leafy. Leaves opposite, shortly petiolate, ascending or spreading, elliptic, ovate or rarely obovate, acuminate-cuspidate, with the cusp either obtuse or acute and often recurved, tapering from the middle and ending somewhat abruptly into the grooved petiole, which is 5 to 10 times as short as the blade, 3½ to 5 cm. long, 1½ to 2½ cm. broad, coriaceous, minutely puberulous at first, subsequently glabrous, dark green and shining above with a sunken midrib, paler and dull green on the lower surface, with the midrib prominent; lateral veins parallel, close, more conspicuous on the lower surface and interspersed with inconspicuous dark glands; margin slightly undulate and recurved, but scarcely thickened. Flowers numerous, white, subsessile, crowded in 3 to 10 flowered heads, which are disposed in a trichotomously-branched panicled cyme scarcely exceeding the upper leaves, 2.5-7.5 cm. through; axis compressedly four-angled or obsoletely winged, glabrous, dark brown. Receptacle depressedly turbinate, glabrous, with the sepals rounded, erect or repand. Petals glandular about the middle, unitedly calyptriform, falling off at the expansion of the stamens. Stamens numerous, 1 to 6 mm. long. Style stout, erect, subulate, exceeding the stamens; stigma minute. Immature fruit not unlike the hip of a Dog Rose, 12 to 13 mm. long.

Wood in *Trans.* Phil. Soc. S. Africa, XVIII. ii. 1908, 157. Aomena Gerrardii, Harvey. *Gen. S.A. Plants*, 112, 1868. Sim in *Cape of Good Hope Agricultural Journal*, XVI, 41, 1900. Burtt-Davy in *Transvaal Agricultural Journal*, V, 1906-07, 429.

Eastern Region.—Natal. Gerrard and M'Ken, 1571. Gerrard, 1571. Inanda, Wood, 1295. Zululand, Gerrard, 1571. Entumeni, Wood, 3965?

Kalahari Region.—Transvaal. Forbes's Reef Bush, Burtt-Davy, 2758.

Swaziland, Devil's Bridge, 1350 m. Galpin, 1338.

This species, like E. Zeyheri, Harvey, flowers in January, and occurs in the wooded ravines in the localities cited, and according to Sim is not uncommon in the Egossa Forest in Eastern Pondoland and the Drakensberg, Natal, where its white trunks (not unlike the Cape Holly, Ilex capensis, whence the name Forest "Waterwood" is doubtless derived) form a conspicuous feature of the landscape. To the Kaffirs it is known as Umjom and Umjomi-bomva. Its timber is reputed to be similar to that of Eugenia cordata, Lawson. The fruits are purplish when ripe, and have a sweet flavour, but are not eaten by birds or baboons.

3. E. FOURCADEI, Dümmer, sp. nova, ab E. Gerrardii, Sim, foliis longioribus late lanceolatis acuminatis aut cuspidato-acuminatis nervis lateralibus distantioribus, inflorescentiis gracilioribus distinguitur.

An evergreen, glabrous, small (?) tree or shrub; third year's branchlets terete, ashy-grey, rough, and scaly-barked, marked with conspicuous oval-crescentic leaf-scars; twigs flattened, sub quadrangular, obsoletely winged, dark grey. Leaves opposite, ascending, spreading, coriaceous, with a deeply-grooved, stout petiole about 5 mm. long; blade broadly lanceolate, acuminate-cuspidate, with an obtuse cusp, narrowing from below the middle into the petiole, 6 to 10 cm. long, 1.5 to 3.5 cm. broad, dark green, and shiny on the upper surface, with a sunken midrib, paler dull green and obsoletely glandular below, with the midrib correspondingly raised and the principal lateral veins 3.5 to 4 mm. distant; margin slightly undulate and recurved. Flowers white or cream-coloured, subsessile, invariably in threes, disposed in terminal trichotomously-branched, cymose, depressed panicles, usually 3 to 5 cm. in diameter, ordinary leaves subtending the lowest branches of the inflorescence, smaller and deciduous bracts; the axis, like the branchlets, flattened and sub-quadrangular, but more slender. Receptacle obconic, rugulose and inconspicuously glandular, 5 mm. long. Sepals broadly triangular and thickish, scarcely exceeding 1 mm. Corolla calyptrate dotted with large, dark glands, falling off at the expansion of the stamens, the latter about 30 to 35 in number, 8 to 10 mm. long, with rounded filaments and yellow, ellipsoid anthers. Style erect, filiform, nearly equalling the stamens in length. Fruit unknown.

Natal and Zululand. Without precise locality, Gerrard in Kew Herbarium and British Museum, 1641.

A species exhibiting affinities to the preceding but differing from the latter in the longer, broadly-lanceolate leaves, with acuminate or cuspidate-acuminate apices. The principal lateral nerves, which are 2 to 3 mm. apart in E. Gerrardii, are more distant in this species, usually 3.5 to 4 mm. I have pleasure in associating this species with the name of Mr. H. G. Fourcade, who has added considerably to our knowledge of the Natal forests.

Specimens of a closely-allied and undescribed species, hailing from Natal, Zululand and the Transvaal, with dark, chestnut-brown twigs, relatively shorter and broader leaves (5 to 8 cm. long, 2 to 3 cm. broad), and more spreading panicle, are to hand at Kew, but, owing to the abortion of the flowers, due in each case to fungous or insect attack, the status of this plant must remain doubtful until more complete material is received.

4. E. ZULUENSIS, Dümmer, sp. nova., E. natalitia, Sonder, affinis sed foliis costa utrinque prominente (haud superne impresso-costatis), floribus paucioribus breviter pedicellatis, petalis eglandulosis, fructibus majusculis distinguenda.

A divaricately-branched and densely-leafy glabrous shrub or tree, with opposite or whorled, ascending or spreading branches, which are terete and ashy-grey, the bark exfoliating in small, thin scales; twigs short, compressed, angulate, brownish. Leaves opposite, ascending and subimbricate, elliptic, narrowing abruptly from the middle into a very short grooved petiole, obtusely cuspidate, 2.5 to 3 cm. long, 1 to 1.5 cm. broad, subcoriaceous, green and scarcely shining above, paler below, with the midrib conspicuously elevated on both sides, the lateral nerves scarcely prominent; margin slightly undulated and recurved. Flowers axillary, few, white, invariably solitary (rarely in pairs); pedicels 2 to 3 cm. long and with the receptacle and calyx glabrous;

FIG. 70.—COLCHICUM AUTUMNALE: DOUBLE WHITE VARIETY.

(See p. 153.)

bracteoles two, triangular, shorter than the receptacle and appressed to it. Calyx cruciate; sepals concave, ovate, eglandular, ciliolate. Petals spreading, ovate to oblong, 3 mm. long, twice as long as the sepals and like them, without glands, ciliolate. Stamens 8 to 10. Style erect, stout, slightly exceeding the stamens. Fruit globose, purplish, tolerably fleshy, 1.5 c.m. in diameter; stone large, globose, brownish.

E. natalitia, Wood in *Trans.* Phil. Soc. XVIII, ii, 157, 1908 (in part).
Eastern Region.—Zululand, Qudeni Forest. 1800 m. Davies 95. Ex Herb., M. Wood and Kew, 9022, 8275.

Allied to, and with the facies of E. natalitia, Sond., but differentiated by the leaves, which have an elevated midrib on both surfaces, fewer flowers borne on shorter pedicels, eglandular petals, and relatively larger fruits, which appear to be of a more fleshy consistency. The species was collected by Mr. G. H. Davies in the Qudeni Forest in Zululand at elevations of 1,800 metres, but, unfortunately, no information accompanies the specimen as to the approximate height of the species or its value in forestry. The flowers appear in November, and are of a dingy white. *R. A. Dümmer.*

(To be continued.)

[*Photograph by S. Arnott.*

FIG. 71.—THE WHITE VARIETY OF COLCHICUM SPECIOSUM.

COLCHICUM.

MEADOW SAFFRONS or Colchicums are, with the autumn-flowering Crocuses, the most valuable of our bulbous plants that brighten the concluding months of the year with their blossoms. The common Meadow Saffron (Colchicum autumnale), which bears single, narrow-petalled flowers of a pinkish-purple tint, looks well in the grass, as, indeed, do all the members of this family; but the rarer species are too scarce for planting except in tilled ground. As the flowers are produced in the autumn, and the leaves do not follow until the succeeding spring, the blossoms have the bare earth for a setting, which somewhat detracts from their appearance, and it is therefore advisable to surface the ground in which they are planted with some dwarf, loosely-growing subject. I say loosely-growing, because I have found that a particularly close-growing carpeting plant, such as Arenaria balearica, is injurious to them. Some years ago I surfaced colonies of several species of Colchicums with this Arenaria, lifting large patches of it, and fitting the patches together above the groups of Colchicums, so that they were entirely covered with an unbroken mass of green. This was done immediately the flowers died down in the autumn. I paid no attention to them in the spring, but, on looking at them in the summer, found that not a single Colchicum had pierced through the carpet of Arenaria, but that a few had thrown up growth around the edges of the green covering. I came to the conclusion that the growth of the Arenaria was so close that it prevented the air from reaching the soil, and that this was the cause of the Colchicums failing to throw up foliage. I at once removed the Arenaria, but in the autumn the only flowers that were produced were a few where the leaves had appeared round the edge of the Arenaria, in place of the many dozens that generally brightened the ground in the autumn.

Of the various species, C. Bornmuelleri (see fig. 72) is very handsome and effective. It is very pale mauve-pink, height 10 inches, length of petal 3½ inches, breadth of petal 1⅝ inches. This is the earliest of the Colchicums, being at its best here on September 5. Colchicum autumnale album plenum (see fig. 70) is another very beautiful form. It is 6 inches in height, pure white, flowers very double, about 5 inches across, petals long and strap-shaped, and ½ inch in breadth. Each bulb of this variety produces numerous flowers, so that a colony of two or three dozen bulbs will bear a hundred or more blossoms. Though a comparatively old introduction, the plant is still scarce, bulbs being usually catalogued at about 5s each.

C. speciosum usually comes into flower about the second week in September. In colour it is rose-purple, height 9 inches, length of petal 3 inches, breadth 1 inch. The white variety of this species (see fig. 71) is an extremely beautiful flower, and corms may be purchased at a reasonable price.

C. speciosum maximum, which is supposed to be a variety of C. speciosum, is the queen of the race, but as its foliage does not appear above the ground until that of C. speciosum is fully developed, it is probably a distinct species. It is also quite a fortnight later in blooming. Its flowers resemble a port wine glass in shape, and are fully 3 inches across at the top, while those of C. speciosum are more like a sherry glass in contour, and less spreading. In colour it is a rich rose-purple, with a well-defined white base to the cup. It is 9 inches in height, the petal being 3 inches long, and 2 inches broad. The petals are of great consistency, and the flowers retain their beauty for a considerable period, often until the middle of October. The widespread, cupped blossoms have almost the appearance of Tulips, and are excellent for indoor decoration. It is a rare plant, and scarcely ever met with in catalogues. *Wyndham Fitzherbert, Kingswear, Devonshire.*

TREES AND SHRUBS.

FENDLERA RUPICOLA.

FENDLERA RUPICOLA is one of the many beautiful spring-flowering shrubs which are as yet little known in gardens. During the past three weeks a fine specimen in the Cambridge Botanic Garden has been the subject of much admiration. The plant is about 7 feet high, and the white, four-petalled flowers which are borne in arching sprays are its chief attraction.

There are two known species of this genus, the other being F. utahensis, Greene (Whipplea utahensis, S. Wats.). Professor Greene describes F. rupicola as being "a beautiful shrub of the mountains of Texas and New Mexico, putting forth in May a profusion of large white or rose-coloured flowers, which give it the aspect of a small Peach tree." The flowers produced at Cambridge are pure white, and about 1½ inch across. The leaves are ¾ to 1 inch long, scabrid above and silky on the under-surface, and are often borne in clusters upon short lateral shoots. The plant is a native of Texas, Utah, Arizona and Mexico, and is found growing in the dry arid regions, consequently it likes a warm, sheltered position and a sandy, stony soil. The specimen in question is growing on the south side of the plant houses. It thus gets the full benefit of the sun, and is also sheltered from cold winds.

Fendlera belong to the natural order Saxifragaceæ—tribe Hydrangeæ. *R. Stewart Lynch.*

NOTICES OF BOOKS.

A YEAR'S GARDENING.*

THIS is a serious attempt to apportion the work of the garden throughout every day of the year, Christmas day excepted, on which day the amateur is requested to rest from his exacting labour. The method of the volume, like some of the methods it embodies, is quite novel, "A Calendar" occupying more than a third of its pages. There are brief chapters on Alpine, rock and wall gardens, the wild garden, fruit trees, and insect and other pests, succeeded by month-by-month details for the vegetable garden, and a list of flowers. The novelty and value of its teaching will be gathered from extracts culled here and there from its pages. On February 5, "Make a fresh potting of Strawberry plants for fruiting in April." February 15, "Sow seeds of Tomatos in pans and apply water carefully day by day until the young plants appear." Endive, "Sow in April in moderate heat." September 16, "New plantations of Asparagus may suitably be made." September 30, "Plant out prickly Spinach." In July "Sow Spinach to stand the winter." November, "Leeks should now be earthed up." December 7, "Start some young vines now. Pot the roots carefully in leaf mould." Eryngium giganteum is recommended for its brilliant colouring, and—passing to philology—the author assures us that Pansy is Pan's-eye, and that Heart's-ease should be Heart's-eye. It is only fair to would-be purchasers to say that they must not expect to find every page of the book filled with the author's special instructions. Some are on old-fashioned lines, and the reader must judge for himself which he will follow, the old or the new, as here described in very plain English. The volume is illustrated with 48 half-tone reproductions.

* *A Year's Gardening*, by Basil Hargrave. (London: T. Werner Laurie, Clifford's Inn.) 6s. net.

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

THE EARLY VINERY. — Vines which were started at the beginning of November will require attention to encourage the ripening of the wood. The shoots should be shortened to about one-third of their present length, and all laterals cut away as they appear. If the rods are infested with mealy bug or red spider, they should be scrubbed several times during the autumn with a stiff brush, dipped in a strong mixture of soft soap and sulphur. Mealy bug is very difficult to eradicate when once established, but if the remedy is persevered with from now onward, it will save a great deal of time during the spring months, when other work is more important. The mixture must be well worked into all holes and crevices, care being taken not to damage the buds. If the roots are in need of moisture, the borders should receive a good watering with diluted liquid manure.

CUCUMBERS.—The weather during the past few weeks has not been favourable to Cucumbers growing in cold frames, and the plants have needed more than ordinary attention in respect of ventilation and watering. If they have not succumbed to unfavourable conditions, they may be expected to supply good fruits for some time to come. The growths should be pinched regularly, and all exhausted leaves removed. A light top-dressing of some rich materials should be applied about once a week, and the plants should be given manure-water frequently. Discretion must be used in admitting air to the frames, and when the nights are unusually cold (which has been the case on several occasions during the present month), the lights may be covered with mats. Another batch of plants should be raised for supplying fruits during late autumn and early winter. The seed should be sown in a mixture of loam and leaf-mould, placing the seeds singly in 3 inch pots. The soil should be sufficiently moist to ensure germination without the further addition of water, and should be placed in a warm house, to become thoroughly warmed. A sheet of glass placed over the top of the pots will assist germination. When the seedlings appear, they should be placed on a shelf near to the roof-glass in a house having a minimum temperature of 70°. Keep the seedlings growing in a moist atmosphere, syringing them twice daily with luke-warm water. Red spider must be guarded against, for if this pest should establish itself on the young plants they will suffer irreparable damage. When the plants have made sufficient roots they should be planted out on a hot-bed, which should be prepared several days in advance, so as to allow of the escape of injurious gases from the fermenting materials. A suitable hot-bed may be made with short stable litter and decayed leaves in equal parts. These ingredients should be well mixed together, thrown into a heap, and left for several days to become heated. The materials should be turned at intervals to sweeten them. The bed should be placed as near to the trellis as possible, so that the plants may be quite near to the glass when they are planted. A few inches of decayed leaves placed all over the bed will be highly beneficial to the roots, which will at once permeate them. The plants should be planted in small mounds made of turfy loam and leaf-mould mixed together. Although it will be necessary to keep the plants in a brisk temperature whilst they are growing, fire heat should be used with discretion. "Dreadnought" and "All-the-Year Round" are two excellent varieties to grow for winter cropping.

MELONS IN FRAMES.—The season has been most unfavourable for this method of Melon culture, and the plants will need constant care and attention if the crop is to be successful. Air should be admitted to the plants with discretion during bad weather, and water should be applied sparingly. When the fruits are ripening the atmosphere must be kept quite dry or they will crack.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

APRICOTS. — These fruits are ripening, and should be protected from birds and wasps; woodlice also must be guarded against, as these insects damage the best fruits, especially those growing on walls which have faulty joints. The best plan is to trap and kill the pests before the fruits are ripe. Apricots always form an acceptable dish for dessert, but it is a difficult matter in dull, sunless seasons to obtain them in a thoroughly ripe condition. If the fruits are to be used for bottling, it does not matter whether they are perfectly ripe; if bottled when not quite ripe they are not so liable to fall to pieces. The ripest and finest fruits should be gathered every other day, and placed in a box with a closely-fitting lid. The box should be laid in a warm, dry room, when the fruits will soon become thoroughly ripe. The branches should be trained well apart, and all laterals which are not required should be closely pinched to induce spurs to form. The roots should not be watered whilst the fruits are ripening unless moisture is absolutely necessary, but they may receive a liberal watering afterwards, especially, if the borders are planted with vegetables. Succulent vegetables should never be planted close to Apricots, as excess of manure causes fruit trees to make gross wood, which is often followed by canker.

PLUMS.—The trees have been badly attacked with aphis this season. All sub-laterals should be removed, and barren trees and those from which the fruits have been gathered syringed with an insecticide. Unless the foliage is kept clean and fresh, the flower-buds cannot be expected to mature properly for the following year.

MORELLO CHERRIES.—These fruits are, for the most part, ready for bottling, and the necessary quantity should be gathered as soon as possible, since when over-ripe they are quite useless for the purpose. Those which are retained on the tree should be protected from the attacks of birds and insects.

FRUIT ROOM.—If this has not been cleansed already, the shelves and other woodwork should be well washed, and the walls limewashed or distempered in readiness for storing the fruit.

GENERAL WORK.—At this season of the year, when fruit-trees are in full growth, notes should be taken concerning their condition. Hardy fruit trees have seldom made better or cleaner growth than this year, and, although the season is a somewhat late one, the wood and buds have still time to ripen well. Peaches and Nectarine trees have made unusually clean shoots, and if they are closely trained and all crowding of the branches avoided, they should be in a splendid condition by the end of October. Apricots also are clean, but the wood is getting a little too strong as the trees have so few fruits. However, with careful attention to pinching and training the wood should ripen properly before the end of the season. Any trees which are growing too strongly should be noted that they may be lifted or root-pruned later. Those which seem to be growing weakly should be attended to in the early autumn, when a good portion of the top soil should be removed and replaced by a rich compost to encourage a stronger growth.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

VASES.—These ornaments are usually placed in prominent positions in the garden, therefore it is essential that the plants in them should be maintained in the best possible condition. All subjects will not thrive in vases, and only those which have been found suitable should be employed. Very frequently vases are placed on walls or terraces, where the plants are exposed to strong winds. In such cases plants of tender growth should not be employed, but should rather be used for sheltered corners and enclosed positions, where they will thrive and be attractive. Daily attention should be paid to plants in vases, removing all decaying leaves and old flower-heads. Water should be afforded the roots as often as required; and especial care is necessary in this respect during hot weather, for, as a rule, plants which have once suffered from dryness at the roots when in full growth rarely recover their vitality, and are unsatisfactory for the remainder of the season. Well-furnished vases contain a mass of roots in a small space, so that the soil soon becomes exhausted. It is therefore necessary to afford diluted manure water or some chemical plant food on frequent occasions. If the latter is used, it will be well to mix it with a little fine soil and apply as a top dressing.

PLANTS IN TUBS.—Plants in tubs should be treated like those in vases. Many plants, such as Palms, Myrtles, Cordylines, Phormiums, Oranges, Agaves and Camellias, which are grown in tubs for furnishing corridors, winter-gardens and conservatories, are usually placed on terraces or broad gravel paths during the summer months. As these plants usually occupy the same receptacles for several years, the soil becomes filled with roots, and frequent supplies of water and stimulants are necessary to their well-being. But such subjects must not be stimulated by too much manure in the autumn, or growth will be made at a time when the plants should be approaching the dormant stage.

BUDDLEIA VARIABILIS.—This beautiful flowering shrub, and its varieties Veitchiana, magnifica and superba, are becoming very popular in gardens. The majority of other choice flowering shrubs bloom in the spring or early summer, therefore these Buddleias, which flower during the late summer and autumn, are especially valuable. The variety magnifica has flowers of a deep, rose-purple colour; superba is also a very desirable variety; Veitchiana has flowers of a bright mauve shade, with a yellow throat. B. Colvilei is recommended for planting at the foot of a warm wall, but a specimen in these gardens, planted for some years in such a position, has flowered very sparsely. B. globosa is a distinct species, the flowers being round and of an orange-yellow colour, a shade which contrasts well with that of the other species and varieties.

HYDRANGEA PANICULATA. — This is also a very useful late-flowering shrub, and should be grown in quantity in suitable situations in the garden. The plant does best in a rich, moist soil. It looks particularly well by the water-side, especially against a dark background, such as is provided by a Yew or Holly hedge. In such situations the stately white panicles of bloom are very attractive.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

HIPPEASTRUM. — As the earliest batch of Hippeastrums have completed their growth, water should be gradually withheld, and the plants exposed to the sun in order to ripen the bulbs. At this period a lower temperature is advisable, and fresh air should be admitted freely whenever the conditions permit. The foliage of later-flowering plants is still green, and these should be watered till the foliage commences to turn yellow. Seedling plants should be grown in a moderate temperature throughout the winter, and, if necessary, repotted into slightly larger receptacles.

SOLANUMS.—In gardens where berried plants are valued for winter decoration, the Solanums are especially useful. At this season the plants must not be allowed to become dry at the roots, as the flowers set much more freely when in a fairly moist condition. Plants which are growing in pots require more manure than those which are planted out. To secure large berries the points of the shoots should be taken out as soon as sufficient fruits are set. Towards the end of the month cut with a knife or sharp spade around those plants which are growing in the open ground, preparatory to lifting and potting them early in September.

SOUVENIR DE LA MALMAISON CARNATION. —As the earliest-layered plants will soon be ready for potting, the young plants should be given plenty of light and air, gradually removing the shading supplied at the time of layering. It is advisable to cut the layers from the parent plants a few days before lifting them. The compost for the young plants should consist of good loam, lime rubble, sand, and a little wood ashes; some growers add leaf-mould or a little

manure from a spent Mushroom bed, but these ingredients are not necessary if the loam is of the right texture. Pot very firmly, keeping the collar of the plant above the soil. When possible, the plants should be placed in a cool house after they are potted, but, failing this, a cold frame will do; the advantage of the house is that the foliage grows hardier and is more likely to remain free from spot and rust throughout the winter than is the case with plants grown in a frame. Water the plants well after potting, and spray them lightly overhead until they have recovered from the check to the roots, when overhead moisture should be gradually withheld.

The Conservatory.—The conservatory cannot often be overhauled thoroughly, especially when the structure adjoins the dwelling-house, but the fullest advantage should be taken of any opportunity which offers. Many of the climbers have become dense, and should be thinned and regulated, but the thinning should be done judiciously, so that the plants do not look bare. In many conservatories Camellias are grown in tubs, and plants so cultivated when they have completed their growth should be placed out-of-doors for a month or two to ripen wood and set the flower-buds. But the shrubs must not be exposed to the full sun or their leaves may be scorched. At this season there are many subjects which may be introduced into the conservatory without fear of injuring them, such as large Codiæums (Crotons), certain of the more hardy Caladiums, Acalyphas, and Dracænas. If they are not required for stock purposes, these plants may be left in the conservatory until they are unfit for further service.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Cœlogyne cristata.—Plants of Cœlogyne cristata and its varieties are making rapid growth, and established specimens will need a copious supply of water at the roots whenever the compost shows signs of dryness. An occasional watering with a weak solution of liquid cow-manure will also be beneficial. Plants which have been potted recently should be watered rather sparingly until the new roots have become established in the compost, and, during the whole of the first season after potting, they should be afforded only clear water. The surroundings of the plants should never be permitted to become dry. These conditions should be maintained until the pseudo-bulbs are mature and the flower-scapes are pushing forth, when the supply of water should be gradually lessened.

Calanthe.—The deciduous Calanthes are in full growth and forming new pseudo-bulbs. If healthy and well rooted, they will require more water at the roots at this season than at any other time of the year. It is important that they should be exposed to as much light as possible, without being scorched by the sun. They should be placed near to the roof-glass, and whenever possible should be allowed plenty of fresh air.

Cypripedium.—Cypripediums, including C. insigne and many of its varieties and hybrids, are in full growth; these plants should be freely supplied with water at the roots, and on bright days should be syringed overhead. As much fresh air as possible should be admitted to them during the day, whilst on warm nights both the top and bottom ventilators may be opened. If the plants are in too close an atmosphere, the growths will become soft and the flowers weak.

Lælia anceps and its varieties are fast developing their pseudo-bulbs, and the flower-scapes are also making good progress. Liberal supplies of water at the roots and overhead syringings should be afforded twice during bright days. A light shading may be required, but only for a few hours during the hottest part of the day; the shading material should be removed at about three o'clock in the afternoon, when the ventilators should be closed. The latter may be opened again later in the evening if the weather is warm, as the night air is very beneficial to these plants.

Cattleya Bowringiana.—Plants of Cattleya Bowringiana and its many hybrids, including C. Portia, C. Wendlandii, and C. Mrs. J. Whiteley are in full growth, and require plenty of water at the roots until the new pseudo-bulbs are formed. Care must be taken that the water does not settle in the bracts that surround the bottom of the young pseudo-bulbs, as such deposits of water would inevitably cause them to rot at the base

Pleione.—The various Pleiones are completing their growth, and should be increasingly exposed to the light. They should also be allowed more liberal ventilation than heretofore; they will need just sufficient water at the roots to keep the compost moist until the foliage falls. After this occurs, they will need very little moisture until the flower-buds appear, when the supply should be increased until the blooms are fully developed. After the flowers have faded, the plants should be given just enough water to keep the pseudo-bulbs from shrivelling, until they recommence their growth in the spring. Cooler-growing species, such as P. Hookeriana and P. humilis, will require liberal supplies of water at the roots until the season's growth is completed.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

French Beans.—To ensure a succession of pods as late in the season as possible seeds of a quick-fruiting variety should be sown singly in small 60-sized pots, planting the seedlings either in heated pits in a sunny position or in forcing houses. Plants raised from seeds sown last month in cold frames should be afforded as much warmth as possible during the night, closing the lights fairly early in the afternoon. The plants, however, should not be coddled, and air should be admitted early in the mornings.

Winter Onions.—The ground, having been manured and deeply dug or trenched some time previously, should be raked level, and made very firm by treading. Afterwards the surface should be thoroughly dressed with burnt garden refuse. Sow the seeds in shallow drills, made from 12 to 15 inches apart. Two sowings should be made, one towards the end of the present month and another early in September; if the sowing is made too early in the season many of the plants will run to seed prematurely in the spring. Leviathan, Lemon and Blood Red Rocca are all excellent varieties for sowing at this season. Many of the summer varieties will do as well as those I have named in favoured parts of the country.

Cardoons.—The plants have made splendid growth during the past few weeks, and means should be taken to blanch them; but before doing this the roots should be well watered. The bottom foliage should be removed, and the remaining leaves drawn fairly closely together with strong raffia. Place brown paper round the base of the plants, and bind it closely with hay bands, after which the soil should be banked up. It takes a long time to blanch Cardoons, and the banding and binding must be done at least three times till the top of the plant is reached.

Cabbages.—Ground should be got in readiness to receive plants of the earliest sowings of Cabbage. The soil should be enriched with good farmyard manure, and either trenched or dug deeply. This crop generally does remarkably well on land that has carried a crop of Onions. Plant the seedlings as thick again in the rows as is necessary, to allow for failures. Plant very firmly, and rake the soil level.

Maize or Indian Corn.—Though the plants have made splendid growth, the dull weather has been unfavourable for the development of the cobs. Remove as much foliage as can be spared to allow the air and sunlight to reach the cobs. During hot, dry weather this crop will be much benefited by liquid manure from the farmyard.

General Work.—All exhausted crops should be removed and burnt. The ashes will provide excellent material for dressing the soil later. The growing crops should be hoed constantly, and everything, including the paths and roadways, kept neat and tidy. The watering of the crops must not be neglected, even should the weather continue showery, and liquid manure should be given freely to such plants as Celery, Leeks, Runner Beans, French Beans, and Cauliflowers. Where seeds of special stocks are required they should be gathered when ready on a dry day, and placed under cover to ripen. If a superior stock of any kind of vegetable is obtained, means should be taken to secure the seeds for perpetuating the stock. This applies especially to Beans and Peas. Frequent small sowings of the various kinds of winter and spring vegetables should be made to ensure constant supplies.

THE APIARY.

By Chloris

Seasonable Hints.—The weather is so very bad that there is not much hope of more honey being stored in the supers. Hence there is a danger that stores may be so low in the brood chamber that the bees will be driven to rob the supers to meet the daily wants of the hive, because during this wet season it is impossible for the bees to venture out to gather nectar. In exposed situations where little honey is stored, there is a further danger that the bees will be compelled to make excursions on undesirable days, and get so buffeted that they may fall from sheer exhaustion. It will be wise to remove the supers, and after taking them indoors, the shallow frames should be extracted without delay. If the honey has been allowed to get chilled, it should be placed in a temperature of 70° or more, so that it may become liquid. When the beekeeper attempts to extract honey after it is cold, a great deal remains in the cells to be cleaned out by the bees, thus entailing considerable loss.

The sections should be thoroughly cleansed by scraping off all propolis, taking care to remove it from the top and bottom, sides and edges. It will be found most convenient to do this with a piece of glass. Sometimes small balls of propolis are found in the corners of the sections: this may best be removed with the point of a very sharp knife. The best place to store the sections is a warm, clean, dustproof cupboard. It is well to wrap them in paper parcels, allowing the sections to stand in a similar position to that in which they stood in the hive.

Feeding.—No time should be lost in feeding the bees so that they may have 20 to 25 lbs. of sealed stores in the hives before the cold weather arrives. Further, if breeding ceases in consequence of shortness of food, cold weather, or any other cause, it may be impossible to cause the bees to recommence feeding the queen on the stimulating food which is necessary to excite the ovaries to action, for she is fed by her retinue, during the active season, on pre-digested honey and pollen, to which one or more liquids are added, at will, from four separate glands; when the queen ceases to oviposit her retinue disperse and she roams about the hive unattended, sipping honey, &c., like any other occupant of the hive.

Food.—Since disease has been so common, it will be prudent to take care that cane sugar only is used for feeding. Where colonies have sufficient sealed stores, stimulations may be resorted to with advantage, because it is necessary to make stocks strong with young bees that are not worn out with foraging, so that the colonies may come out strong next spring, because the bees raised now are those which will live through the winter. Take 10 lbs. of lump cane sugar, add 7 pints of water, 1 ounce of vinegar, and the same quantity of salt. Boil the whole for a few minutes, taking care not to allow it to burn. Use a proper feeding bottle, giving the bees access to one or two holes, so that only enough syrup is carried down for each day's needs, because this syrup is too watery for storing. Where bees are being fed because their larder is low, use 5 pints of water instead of 7, and ½ ounce of salt instead of 1 ounce. In either case feed in the evening, use warm syrup, take care to contract the entrances, and spill no syrup, because while feeding is proceeding, there is always a danger of robbing.

Quilts.—Whether feeding is resorted to or not, the bees should have plenty of warm quilts These should be so cut that they leave no gaping spaces at the corners. If robbing has commenced take care to check it at once and exercise constant vigilance, for neglect to do so may result in complete demoralisation of the apiary.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 27—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. James Hudson on "Recently Introduced Water Lilies.")

THURSDAY, AUGUST 29—Sandy Fl. Sh.

FRIDAY, AUGUST 30—
Dunfermline Hort. Soc.'s Autumn Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—60·6.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, August 21* (5 P.M.): Max. 61°; Min. 48°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, August 22* (10 A.M.): Bar. 30·0°: Temp. 61°; *Weather*—Fair.
PROVINCES.—*Wednesday, August 21:* Max. 66° Cambridge; Min. 54° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY, WEDNESDAY, THURSDAY, AND FRIDAY—Trade Sales of Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

WEDNESDAY—
150 Phœnix Canariensis, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

Crown Gall and Cancer.

We have already drawn the attention of our readers to the remarkable and thorough-going investigations made by Dr. Erwin F. Smith, of the U.S.A. Bureau of Plant Industry, into the cause and distribution of the plant disease known as crown gall. Dr Smith has shown that this disease is of parasitic origin, that it is due to the presence of a micro-organism, Bacterium tumefaciens, in the plant, that the micro-organism gains access to its victim through wounds in the latter, and that it may affect a large number of different kinds of plants.

In a recent publication on "The Structure and Development of Crown Gall" (*Bureau of Plant Industry*, Bull. iv, 255, June, 1912), Dr. Smith reviews the evidence which he has brought forward in support of his view that the progress of this disease is such that it must be regarded as of the nature of a vegetable cancer. Dr. Smith is properly careful not to suggest that the cause of cancer in animals is by any means the same as that responsible for this vegetable cancer; but he is emphatic in pointing out that, inasmuch as the cancerous crown gall has been demonstrated to be of parasitic origin, the cancers of human beings and of animals may prove also—despite the general view to the contrary—to be due to a parasite.

The evidence on which Dr. Smith relies in support of his hypothesis cannot be reviewed at length here, for the reason that it would involve a description of the phenomena presented by the disease, but we may mention the striking fact that in both crown gall disease and in cancer the cells of the plant or animal affected with the disease are characterised by an extraordinary and abnormal growth. This overgrowth leads to the formation of aggregates of cells which express themselves as tumours. Further, from the primary tumour, strands of affected tissue may be found spreading through the organism and giving rise to secondary tumours in situations far removed from the primary tumour. Dr. Smith regards the excessive growth of the affected cells as the outcome of a symbiosis and a struggle, as it were, between the cells of the organism and the micro-organisms which have gained access to them. The parasite secretes substances, probably acids, which stimulate the cell to abnormally vigorous growth. The secreted acids are poisonous to the bacteria themselves. Hence the development of the bacteria is checked and some are killed. On their death the bacteria liberate other poisonous substances which pass into the vegetable cells. Under the stimulus of these poisons the cell nucleus divides, and the material of the nucleus, passing during the division of the latter into the general protoplasm, awakens the surviving bacteria to renewed activity. Thus a vicious circle is established. The bacteria, resuming activity once again, stimulate excessive cell growth; once again the bacteria are checked and in part killed, and, liberating their toxin, provoke once again cell division.

Whether Dr. Smith's parallel between crown gall and cancer will prove to be a true parallel or not it is premature to say; but it cannot fail to have a considerable effect in directing the attention of the medical profession to the possibility that cancer may prove, in spite of all the evidence to the contrary, to be—like crown gall—attributable to a micro-organism.

The conclusion of immediate horticultural importance with respect to crown gall at which Dr. Smith arrives is that nurserymen should be careful to plant on uninfected land; for if they are not, the disease is bound to make its appearance in their trees.

The Bearing of Apples.

It is a fact well known to fruit-growers that a tree which bears a heavy crop one year is apt to prove relatively barren in the following year. This alternation of fruitfulness and unfruitfulness is exhibited not only by fruit, but also by forest trees. The Beech, for example, may require several years before one large crop is succeeded by another. The gardener has this phenomenon in mind when he intervenes to prevent young fruit trees from ripening more than a nominal amount of fruit, and when, as was practised formerly more often than now, he sacrifices altogether the year's crop by cutting back young and recently-planted vines.

Whereas it is easy to understand that in the case of annuals seed-production spells exhaustion and death to the plant, it is by no means easy in the case of trees to account for the sterilising effect of luxuriant fruit-production. The annual plant lives, as it were, from hand to mouth. Within one brief season it must perforce crowd all the incidents of its life, and its flowering period follows close and restlessly on its growing period. Hence it follows that all the constructive materials which it has succeeded in collecting from the air and soil are used in manufacturing food-stuffs, which in turn are all employed in the work of building the plant and of forming the seeds and fruits. So pressing are its daily needs that the annual is never in a position to put by a portion of its income in the form of material savings against the needs of the future. Wherefore its scanty resources fail it in the hour of seeding, and when its fruits are set it dies.

The tree, on the other hand, lives more spaciously, and more time is vouchsafed to it before it is called upon to justify itself by its works of seed production. During its years of immaturity the tree is enabled to save. The sugar and other manufactured food-stuffs which it makes from the ingredients of the air and soil more than satisfy the immediate needs of the tree, and accordingly they are placed on deposit in the wood cells and other convenient elements of its tissues. Nevertheless, despite these large reserves, on which it may draw at need, the tree, no less than the fugitive herb, experiences the strain and exhaustion incident upon fruitfulness.

Why this should be is not known. It may be that certain precious and scanty materials, made by the tree with difficulty and in small amounts, are used up in the formation of fruit and seed; if so, appropriate manuring might repair the loss and restore the missing substances. But it is more likely that the fruit-bearing condition is attended by a change of state in the tree, and that this change of state is antagonistic to active work: that it leads, as it were, to a kind of languidness which rest alone may dispel.

Whatever be the cause, the fact is notorious, and is illustrated in the most forceful manner by the records kept by Mr. Macoun, the Dominion horticulturist, and published in the annual report of the Experimental Farms, Ottawa (1911). We will cite but one example given by Mr. Macoun of the fluctuation in fertility of Apples. The produce of a certain tree of the variety Wealthy, planted in 1888, was recorded from the 10th to the 22nd year of the life of the tree. The yields were as follow:—

Year ...	10th	12th	14th	16th	18th	20th	22nd	
Gallons ...	83	52	93	111	96½	75	118	= 578½
Year ...	11th	13th	15th	17th	19th	21st		
Gallons ...	0	2	0	22	1½	5		= 30½

Or, omitting the 10th year, 545 gallons in the six fat years and 30½ gallons in the six alternating lean years.

No matter how much we may be disposed to put all crop-failures to the account of the weather, no one will suggest that the even, heavy years were all fine

and that the odd, light years were all bad. Evidently the cause of the striking fluctuation is to be sought not in external but in internal conditions, not in the weather, but in the alternating state of the tree itself.

No less interesting are Mr. Macoun's statistics of the individual yields of different trees of the same variety (Wealthy). The data extend over 11 years (1899-1910). Of 14 trees kept under observation, the total yield in the case of the least fruitful was 57 gallons and that from the most fruitful 203 gallons. The yields from each of four other trees totalled less than 100 gallons; five yielded each from 100-125 gallons and three from 125-150.

There is no doubt that similar results would be obtained if corresponding records were kept in this country, and if the differences in yield of our trees are at all comparable with those of the Canadian trees of which we have the records, it will be evident that practical means are at hand for augmenting the produce of our orchards. We hope that the fruit stations which are in course of establishment in this country will direct their attention to this subject and will undertake a statistical inquiry into these fluctuations of fruitfulness. The inquiry must be planned with care and associated with experiment in various directions, especially in relation with different modes of treatment, manurial and other. Properly planned and carried out, such an investigation should prove of no small practical value.

Royal Horticultural Society.—The next meeting of the Committees will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday, 27th inst. At the 3 o'clock meeting of the Fellows, Mr. J. Hudson, V.M.H., will give a lecture on "Recently Introduced Water Lilies."

The Women's Agricultural and Horticultural Union.—The articles of horticultural interest in the monthly leaflet of the above union, dated August 15, 1912, deal with the Potato wart disease and the Union's Diploma Examination in Practical Horticulture.

Mr. Harry Foster.—Mr. Harry Foster, Director of the *Times* Experimental Station, Sutton Green, Guildford, has been appointed assistant to Mr. Walter P. Wright, Horticultural Superintendent and Instructor in Practical Gardening to the Kent Education Committee.

Fig. 72.—Colchicum bornmuelleri: flowers mauve-pink.

(See p. 153.)

Fossil Plants.—The naming of fossil plants by palæontologists, from Unger's *Neuholland in Europa*, down to Professor Fontaine's descriptions of 40 "species" of Thyrsopteris, from a deposit "not over 15 feet in diameter," has been a puzzle to students of the living vegetation of the world. Therefore any attempts to bring the nomenclature of fossil botany more in harmony with that of modern systematic botany is to be welcomed. Among others Mr. E. W. Berry, of the John Hopkins University, Baltimore, is very active in this direction, especially in the revision of the plant fossils from the Potomac group. His latest paper is on Ferns which have been referred to the genera Cladophlebis and Thyrsopteris. Following Prof. Seward, Mr. Berry refers the fossil Thyrsopterides of Fontaine and others to Onychiopsis, and reduces the number of Potomac species to five! An interesting fact in connection with the later investigations of fossil plants is the very wide distribution recognised of not only generic but also of specific types.

The Propagation of Conifers.—The second of a series of Saturday evening lectures to the working classes to be given during the present month by the Regius Keeper of the Royal Botanic Gardens, Edinburgh (Professor Bayley Balfour), was delivered on Saturday August 17, in the lecture hall of the gardens. The subject of Professor Balfour's address was the propagation by cuttings of coniferous and other plants. The lecturer, as reported in *The Scotsman* (August 19), pointed out that many Gymnospermous plants do not callus freely—Pine trees, for example, do not form stool shoots because the healing by callus is replaced by healing by resin. The two critical points in striking cuttings of such resinous plants are:—To prevent the drain upon the plant's resources through excessive outflow of resin when the cutting is made—this may be achieved by plunging in boiling water; and to provide easy exit for new roots by scraping off the protecting resin skin. Photographs and specimens of callussed and rooted cuttings of species of Pinus were exhibited, special attention being directed to them because, alike in gardening and botanical books, the striking of Pinus by cuttings is said to be impossible. The cuttings were struck by Mr. Laurence Stewart, plant propagator of the Botanic Garden. Professor Balfour also drew attention to the differences between monocotylous and dicotylous plants with respect to their behaviour as stem cuttings: In Dicotyledons the cut segment of the parent plant elongates as the new plant, but in Monocotyledons the upper part dies off, except in the few

genera which produce cambium, and a basal latent bud grows out as the new plant. This has a double interest—practical and phyletic. It explains possibly the reported failure of propagation of such plants as Bamboos—the rotting of the top having been regarded as evidence of failure to strike—and it is reminiscent of the seedling development in the groups, terminal plumular growth characterising the dicotyledon, lateral plumular growth the monocotyledon. Inarching as a propagative method has been learned from its occasional appearance in nature. The seedling inarch is now of recognised economic importance because of the rapidity with which desirable fruit plants can be brought to the bearing stage. Grafting is an offshoot from inarching, and the occurrence of graft hybrids, such as Laburnum Adamii, of which specimens are not uncommon in gardens about Edinburgh, raises interesting biological questions of transmission of characters. Roots and leaves, like stems, may be used as cuttings, and recent work in propagation by leaves seems to suggest a correlation between alkalinity of medium and root development on the one hand, and acidity and stem development on the other. The environmental conditions required for successful vegetative propagation will be the subject of the next lecture.

THE GROWTH OF SCHOOL GARDENS.—Some interesting particulars concerning school gardens are contained in the volume of *Statistics of Public Education in England and Wales* for 1910-11, which have recently been issued as a Blue Book. In England the number of schools in which boys received instruction in gardening was 2,175 as against 1,816 in the previous year. The instruction was given at 14 centres. The number of boys who attended the classes was 38,066 as against 32,173 in the previous year, and of the boys who qualified for grant 11,164 attended at least 20 hours but less than 40 hours, and 21,437 for at least 40 hours. Gardening for girls was taught at 176 schools and one centre as against 111 schools in the previous year. The total number of registered scholars was 1,465 as against 1,022, and of the number who qualified for grant 465 attended for at least 20 hours and less than 40 hours, and 618 at least 40 hours. In Wales, scholars at 106 boys' schools received instruction as against 80 in the preceding year. The number of boys registered was 1,692 as compared with 1,307, and of the number who qualified for grant 772 attended at least 20 hours but less than 40 hours, and 666 at least 40 hours. In Wales gardening was taught to girls at 19 schools as against nine in the previous year. Altogether 171 girls received instruction as against 71, and of the number who qualified for grant 84 attended at least 20 hours and less than 40, and 53 at least 40 hours. In every county in England gardening was taught, but in the Welsh counties—Anglesey, Brecknockshire, and Monmouthshire—there were no gardening classes for boys or girls.

THE NORTH AMERICAN SPECIES OF NYMPHÆA.—Mr. GERRIT S. MILLER, Jun., and Mr. PAUL C. STANDLEY are the authors of a monograph bearing this title *(Contributions from the United States National Herbarium*, xvi. (1912), pp. 65-108, with illustrations in black and white and maps), in which 16 species are defined, including 10 regarded as new. It should be explained that these so-called Nymphæas belong to the genus Nuphar, as generally understood in this country, and current in horticultural literature. An explanation of the reasons given for these changes would fill half-a-column, and the name Nuphar would still survive in our gardens, just as Geranium does duty for some of the Pelargoniums. On the other hand, it should be mentioned that Linnæus included our Nuphar lutea and our Nymphæa alba in his genus Nymphæa, and the first American Nuphar cultivated in this country was described as Nymphæa advena by Aiton, 1789, and was figured under the same name in the *Botanical Magazine*, plate 684. A second American species was figured and described in the *Botanical Magazine*, plate 1243 (1809), under the name of Nymphæa Kalmiana. Both were soon transferred to Nuphar (founded on N. lutea by J. E. Smith in 1808); probably before they were known outside botanic gardens. In the work before us, Nuphar Kalmiana bears the obscure name of Nymphæa microphylla. Should a florist use this name without explanation, it might cause disappointment and dissatisfaction. Nuphar, as, for the sake of intelligibility, we must continue to call it, has been little cultivated as compared with Nymphæa, and practically still awaits the cultivator's skill. Judging from the variety exhibited by the American forms good results might be expected, and this monograph

FIG. 73.—PEAR BORNE ON MATURE WOOD.

should prove very useful to the intending cultivator. The leaves of the American species are either erect or floating, and from narrow oblong (a foot long by 2 inches wide) to orbicular, and a foot to 18 inches across. The flowers and seed-vessels vary in size from less than an inch to 3 inches in diameter, before the sepals are spread out. Colour is the first thing required, especially the development of red.

FOOT AND MOUTH DISEASE IN SUSSEX.—The existence of foot and mouth disease has been confirmed by the Chief Veterinary Officer on the premises of two small-holders at Hurst Green, near Etchingham, East Sussex. The Board of Agriculture and Fisheries have issued an order prohibiting the movement of animals along, over, or across a highway in a wide area surrounding the new disease centre. Up to the present no information is available as to the manner in which infection has been carried to infected places.

THE DAHLIA SHOW.—The annual exhibition of the National Dahlia Society will be held at the Crystal Palace on September 17 and 18. This is the first special floral show of the year, and in spite of the general unfavourable climatic conditions, Dahlias appear to be quite equal to the standard of former seasons. Every year new specimens of the Dahlia are produced, and, judging from this year's catalogue, the September exhibition will prove no exception. The Society has three distinguished patrons in Sir TREVOR LAWRENCE, Bart., K.C.V.O., V.M.H., Sir JOHN T. D. LLEWELYN, Bart., D.L., F.R.S., F.L.S., and LEOPOLD DE ROTHSCHILD, Esq. The president is GEO. GORDON, Esq., V.M.H.

WHAT TO DO WITH THE HAY CROP.—In view of the unsettled character of the weather, and of the consequent difficulty in securing the Hay crop in some districts in which the crop is late, the Board of Agriculture and Fisheries invite the attention of farmers and others to Leaflet No. 9, which describes the process of making ensilage. Copies of the leaflet may be obtained free of charge and post free on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

ADVENTITIOUS PEAR FRUIT.

IN tropical countries it is not an uncommon occurrence to see fruits growing on the trunks of trees; in fact, some trees, such as the Cocoa and Coffee, often bear many flowers on the mature wood, and these, in due course, are followed by fruits. Other examples may be cited, such as trees of Grias cauliflora, various Browneas and Theophrastas. But in this country the phenomenon is not so common. In the *Gardeners' Chronicle* of September 10, 1904, we illustrated an Apple growing on a trunk of a 14 year old tree of the variety Potts's Seedling in the Frank Fruit Farm, Maidstone, and, in the same issue, we recorded an instance of a vine bearing a perfect bunch of Grapes on its main stem. In fig. 73 we show an example of a Pear growing on mature wood. The photograph from which the illustration is made was taken in the garden of Mr. G. G. Covington, at Kettering.

The Judas Tree (Cercis siliquastrum), which has this year flowered so abundantly, may, in some gardens, be seen with its reddish, Pea-like fruits hanging from the trunk and main branches, and the observant gardener will recall other similar instances, chiefly with leguminous trees. Trees of the genus Pinus, especially of the species insignis, often bear clusters of cones, at least 25 years old, on their branches, but it must be remembered that these are instances of persistence of fruits, and not of their production from adventitious buds.

CAMPANULA SPECIOSA.

This is one of the many beautiful members of the Campanula family that are so useful and welcome in the rock garden during the summer months, after the majority of the spring flowers are over for the season. It is a Pyrenean plant, and belongs to the same section of the genus as the charming C. Allionii and C. barbata. It is more closely allied to the former and possesses the same type of rambling root system. C. speciosa (see fig. 74) grows from 6 inches to 1 foot in height, and is a beautiful plant with stout, erect stems branching from the base upwards. The radical leaves, which, like the stems, are hairy, are long and linear-lanceolate, narrowing towards the base and have undulate margins. The leaves are produced in rosettes close to the ground, and die off with the flower stems, other rosettes being formed some distance away for flowering the following year. The large flowers, solitary on single stalks, are produced in June, and have bell-shaped corollas, which vary in colour from light to deep purple. C. speciosa is only found in the Pyrenees, where it grows in high limestone cliffs and rocky places among debris, in which situations the roots wander about amongst the loose stony soil. Although a strong-growing perennial in its native habitat, it is not often met with in good condition in gardens, for in ordinary soil it has an unfortunate tendency to die off. To grow it successfully, C. speciosa should be planted in strong, well-drained soil, moraine conditions being very suitable for its cultivation. It is easily raised and increased from seed, which it sets freely. A plant is figured in the *Botanical Magazine* under the name of C. speciosa, at tab. 2649, but it is evidently a form of C. glomerata, known as var. dahurica, and also as C. aggregata. *W. I.*

SCOTLAND.

MONTBRETIAS.

Last winter appears to have been an unusually trying one for Montbretias left in the open ground, and, as a consequence, plants have practically disappeared from many gardens this season. This has been a great disappointment, as there were many Scottish gardens in which the Montbretias have previously wintered for many years without loss. Of those which have survived the cold, M. Pottsii seems to be the most common. The newer varieties have proved the least hardy, and, as a rule, it is only in gardens where they were wintered in frames that they have survived, though plants at the foot of south walls have often lived where those in the open have been killed. The wet winter, rather than the frost, which was not so prolonged as in many seasons, is probably responsible for most of the losses. As a result of the past season's experience, it will be advisable to lift the newer and finer varieties, and winter them in frames, a practice already adopted by many Scottish cultivators of this flower.

SWEET PEAS.

The cultivation of the Sweet Pea has greatly increased in Scotland, and has induced the formation of a number of Sweet Pea societies in all parts of the country. The untoward weather, however, greatly restricted the number of exhibits, and, in more than one show of importance, the exhibits have been disappointingly small. Still, the number of growers is on the increase, and in every district the Sweet Pea is receiving special attention in the way of cultivation. The new varieties are keenly sought after, and in some shows varieties were exhibited which are not in commerce. King White is a variety which may be named as having been shown in excellent form.

HOME CORRESPONDENCE

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

"Nettleleaf" or "Reversion" in Black Currants (see pp. 122, 138).—It seems uncertain if this may be considered a new "disease," or if it is merely that more attention is now paid to such matters than in former days. Too much stress cannot be laid upon the point that more facts are needed as to its distribution and development before any opinion can be formed as to its cause. In the hope that a suggested explanation may stimulate the production of these facts, I venture to place before your readers a tentative solution of this question. The facts which I have observed and gleaned are as follow:—(1) It may be seen in one-year cuttings and in bushes of all ages. (2) It is not confined to any one variety. (3) It is often followed by "big bud." (4) It is reported to have a tendency to spread from a given centre in a plantation, that is, where in one year one bush may be affected, the following years show neighbouring bushes also suffering. (5) A close examination shows that in all cases (in the writer's experience) the leading bud of that shoot has been damaged by birds or breakage, and this has caused the side buds to develop fresh shoots, and it is these shoots which show the well-known "nettleleaf" appearance. Conversely it, of course, holds that in no case is it seen on a main shoot which has its leading bud growing and undamaged. (6) A similar leaf variation may be seen occasionally in Red Currants. One other consideration must be put forward, and that is that the Black Currant is subjected to a very severe method of pruning, and all fruit is borne upon vigorous wood of the current year. The explanation I suggest is this:—The damage to the leading bud may be caused by various means, of which no doubt the "big-bud" mite is the chief. The twig-cutting weevil (Rhynchites coeruleus) may also cut a whole shoot across whilst soft and growing. When this is done the side buds at once send forth weak branches instead of developing into fruit buds, and these are the so-called "reverted" branches. The fruit which may appear on these secondary shoots will naturally be small and weak, as there has not been time to mature fruit-buds, such as would have been produced naturally on the strong main branches. If the bud damage is caused by mite, its spread to neighbouring trees is easily understood. It is unfortunate that the term "reversion," with its implication of throwing back to a remote or "wild" ancestor, has been used, as it begs the question entirely. The idea of a single bud variation is well known, but

Fig. 74.—Campanula speciosa.

I doubt if a case of a whole tree "reverting" in one jump has ever been known to occur. I suggest that what has happened is that the normal course of pruning and bud development having been upset, the fruit suffers in size. If this is so, it would follow that entire removal of old branches and the resultant forcing up of young growth from below would overcome the "reversion," and the tree would, in the absence of a recurrence of the cause, produce fruit once again of a normal size. It will be interesting to know if any of your readers has tried this remedy, which, if it proved successful, would offer a conclusive proof of the truth or falsity of the above suggested explanation. *E. A. Bunyard.*

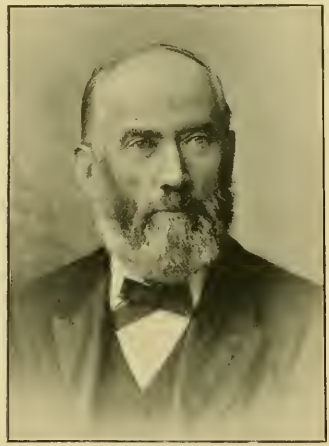
Preserving Ripe Grapes.—Many growers must have observed that when they have bottled Grapes during the summer the stems do not keep fresh for so long a time as when the bunches are cut later in the season. I think I have discovered the reason of this. In experimenting with a closed vessel from which no water could evaporate, I found that about a tablespoonful of the water was taken up during the first two or three days, and after that there was no visible loss. The trial has now lasted three weeks, and the stems are commencing to shrivel a little, but not so much as is the case with bunches which had been cut three days before being placed in water. These bunches are exposed in a shop window, so the test is rather severe. It is only a partial test so far, but I suggest that owing to the vines being still in vigorous growth, the sap in the portion cut off is so abundant that in its downward passage it clogs the pores at the cut end and prevents the absorption of moisture. The suggested remedy is to cut the stem afresh after it has been in the water a couple of days or so. In using open-mouthed bottles, there would be continual evaporation of the water into the atmosphere, especially during warm weather, and the quantity taken up by the Grapes could not be ascertained. Another lesson has been taught me by my experiments. The end of a stem on which there was a fully-sized leaf was inserted in a closed vessel, and 1½ fluid ounce of water was taken up in 24 hours. Whilst a stem on which there half-a-dozen leaves, some of them quite young, was inserted in water in the same way, and the water was taken up so fast that the rubber covering was drawn down in the shape of a deep cup, there being no air to fill the vacuum. I have frequently said that vines require more water during the ripening of the fruit than at any other time, and it would appear that my assertion was only halfway towards the truth. *Wm. Taylor, Bath.*

Melon King George V.—I should like to call the attention of your readers to the new Melon known as "King George V." It is one of the best of which I know; a most luscious fruit, in flavour something like a Pineapple. The fruits set well, grow to a good size, and are extremely numerous. It is a very early variety. We have had two crops here this season, and have found the fruits far better flavoured than any of our other varieties. It was sent out by Messrs. James Carter & Co. *W. A. Cook, Leonardslee Gardens, Horsham.*

Richard Bradley.—If Mr Murison (see p. 132) will look under "The Mushroom," where "The manner of making the beds—may be found in Mr. Bradley's book," and under Sweet William—"But Mr. Bradley calls them Mules," he will find evidence that Bradley was not the author. Besides, a comparison of the book with those books known to be Bradley's affords convincing proof from the style that whatever part he played in its production he could scarcely have written it. Edition 1750 has merely "By a Gardener" on the title page. I have met with five editions, or so-called editions, because a new title page served in many cases for a new edition in those days when bookselling was a notoriously corrupt business. See *The Dunciad* for notices of Mears. One is "Mears, Warner, Wilkins, booksellers and publishers of much anonymous stuff." Bradley, I am afraid, was one of those who, unfortunately for his reputation, lent himself to practices from which some of his contemporaries kept themselves free, and after his death they traded on his reputation as a professor. *R. P. Brotherston.*

Obituary.

Alexander Dean, V.M.H.—By the death of Mr. Alexander Dean—which took place on August 20—there has passed away one of the most venerable and distinguished of horticulturists, and a gap which will not be filled has been left in the ranks of gardeners. For Alexander Dean was not only a great practical exponent of the art of growing plants—he was a man of striking and unique personality. Although throughout his long life he was absorbed by the engrossing work of his profession, he displayed, both in his personal character and in the versatility of his talents, that indefinable quality which is known as culture. It was the rare combination of skill in growing plants, with an artist's appreciation of the science of horticulture, which made him so remarkable. Such a man—devoted passionately to his profession and possessed of a natural acuteness of mind sharpened by continual observation—could not fail to be at times a severe critic. His criticisms, expressed both in these pages—to which he was for many years a valued contributor—and elsewhere, though they may have given momentary pain, never rankled. For Dean's criticisms always were made in good faith. He possessed a mastery of his subject



THE LATE ALEXANDER DEAN, V.M.H.

which sometimes betrayed him into impatience; but we—who, in common with many others, have had our words and actions criticised by him—are able to look back on his comments with gratitude, and to recognise that the vigour of the criticism was but the sign of the depth and sincerity of his convictions. Dean was especially severe on the man of science who, lacking, it may be, a thorough appreciation of the technical side of the problems under consideration, intervened in horticultural discussions. Nevertheless, it is a fine tribute to the character of Alexander Dean that almost as many of his friends were to be found among men of science as among gardeners, of whom he was the chosen champion. He expressed the point of view of the gardener with a completeness and directness which was equalled by few, if any, of his contemporaries. In his own domain he was supreme; and it is no undue tribute to his qualities to say that he would have been distinguished in whatever walk of life he might have chosen. But his career was marked out for him from birth. He came of a family of gardeners, and was, as it were, dedicated to the profession from his earliest years. Born on March 22, 1832, at the nursery at Hill, near Southampton, Dean was the son of the foreman of that famous establishment. At Hill, under his father, and afterwards with John Colthart, he received his first training in the art of gardening. As a young man, he travelled in the West Indies, and soon after his return he settled down to garden work—first in Bucks., next in Berks., and then for some years at Shirley, in Hampshire. At the last-named place he established the Shirley Horticultural Society, which existed till 1912. Later on he went to Bedfont, in Middlesex, and took charge of Mr. R. Dean's seed-growing grounds, which position he occupied for 20 years. During that time he exhibited frequently at the R.H.S. and other shows, and acted as judge at various exhibitions, gradually becoming known as a recognised authority on the culture of fruit and vegetables. He was for 20 years a member of the Fruit and Vegetable Committee of the R.H.S., and, needless to say, was one of its most active members. Dean also served on the committees of the National Dahlia and National Potato Societies, and was instrumental in founding the National Vegetable Society, of which he acted as chairman. Alexander Dean was a prolific writer, and although the volumes which he published were confined to his special subject—that of vegetable culture—his miscellaneous writings treated of so many aspects of gardening that it might be said of him with truth and without ill-nature that "omniscience was his foible." The future historian of horticulture will be amazed at the frequency with which he meets with the initials *A. D.* in the files of 19th and 20th century horticultural journals, and will not fail to recognise that the writer for whose name these initials stood played an important and valuable part in directing the horticulturist and in advancing the horticulture of his time. Dean's most remarkable journalistic feat was to contribute for 32 years, without intermission, the weekly article on gardening which appears in the pages of our contemporary, *Reynolds' Newspaper*. Dean rendered noteworthy services to the cause of horticultural education as assistant instructor, under Mr. John Wright, to the Surrey Education Committee. Alexander Dean received the Victoria Medal of Honour for his distinguished services to horticulture; and his name will be held long in remembrance by horticulturists as that of one of the most devoted and distinguished members of their profession.

William Frederick Thompson.—We regret to record the death of the eldest son of Mr. William Thompson, the well-known nurseryman of Sheen, Richmond. Mr. Thompson, junior, was on his holidays at Heyst, in Belgium. On Tuesday, the 13th inst., he was bathing, and although a proficient swimmer, he was seized with cramp and drowned. The body has not yet been recovered. Mr. Thompson, who was only 37 years old, leaves a wife and two children to mourn his loss.

James Shepperd.—We regret to record the death of Mr. James Shepperd, gardener at Shannaburn House, Maryculter, N.B., as the result of an accident on August 15.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

August 13.—*Present:* Messrs. E. A. Bowles, M.A., F.L.S. (in the Chair), J. P. Bennett-Poë, Sir Everard im Thurm, Jas. O'Brien, and J. W. Odell.

Black Currants sporting.—Messrs. J. R. Pearson & Sons wrote that their plants of Black Currants were similarly affected, but that the trouble was not due to pruning. A letter on the same subject was read, in which the writer suggested that forcing by too much manure or too hard pruning was the cause of the "throw back" in Black Currants, and that the trouble is common amongst the Worcestershire growers.

Hazel.—Mr. O'Brien showed Hazel Nuts with very large foliaceous bracts, a condition he had found fairly common in the neighbourhood of Haywards Heath.

Primula pycnoloba.—Messrs. H. Veitch & Sons showed a new Western China Primula, P. pycnoloba, a species with small, dark purple flowers, very large sepals, and foliage resembling a Megasea.

Dinanthe.—Mr. Bennett-Poë showed open flowers of the genus Dinanthe; the flowers are a deep blue, somewhat like Meconopsis Wallichii in form.

SHROPSHIRE HORTICULTURAL.

Exhibition at Shrewsbury, August 21 and 22.

The thirty-eighth annual exhibition of the Shropshire Horticultural Society was opened on Wednesday last in the Quarry Grounds, Shrewsbury, in excellent weather. So far as the general exhibition is concerned there was every indication that the Society has still the full support of the numerous exhibitors who have contributed to the Shrewsbury Shows for many years past, and have made them amongst the most important exhibitions held in this country. With their help the committee and their excellent secretaries, Messrs. Adnitt and Naunton, have produced a standard of exhibition that is unequalled in the provinces, and one of which the county of Salop may be justly proud. It is this fact that makes it exceedingly difficult for the committee to introduce features of novelty from year to year. The schedule has been amended from time to time with the view of making it the best possible for the month of August, and the compilers have so far succeeded that they find it almost impossible to introduce changes with the certainty that they will be improvements. They are well aware that many of the better-informed visitors desire novelties in the effects presented, but they do not see how to provide them without altering the season of the show.

Therefore it is that the Shrewsbury Show of 1912 is that which we are accustomed to see in the Quarry Grounds, maintained as well as ever it was, and representing many of the horticultural products of this country and its wealth of August flowers at their very best. We have always said that the Shrewsbury Show provides the best display of indoor fruits to be seen at exhibitions in these islands, and the statement is justified by the exhibition now under notice. Allowing for the character of the season, the dull skies and lack of seasonable warmth, the exhibition of Grapes was all that could be desired. Some of the bunches showed a slight deficiency of finish, as is pointed out in our remarks, but in all other respects they were magnificent specimens, and in so far as the 1st prize exhibit in the class for 12 bunches is concerned we have no criticism to offer, even in regard to the quality just referred to—the finish of the berries. Nor could anyone be other than delighted with the standard of quality exhibited by the fruit shown in the 1st and 2nd prize displays of the fruit table competition. The groups of plants arranged for effect were as attractive as usual, but they had no suggestion of novelty.

Roses were as good as we ever remember to have seen them at the Shrewsbury Show. On the present occasion the president, Mr. G. W. Phillips, offered a Silver Rose Bowl in the principal class for cut blooms, which was won in a very keen competition by Messrs. Gunn & Sons, of Olton. Although the bowl was offered after the publication of the schedule, it was competed for by some of the principal growers, so that next year it may reasonably be expected that the number of competitors will be even greater. Reviewing the show as a whole, we cannot do better than quote the official report of the judges, who said:—"We think the exhibits generally are above the average, and the taste in arranging shows a decided advance on that exhibited in previous years."

Champion Decorated Fruit Tables.

This popular class for decorated tables of choice fruits was represented by three exhibits. The tables were placed, as usual, near one of the entrances to the large fruit tent. A disposition is shown sometimes to criticise this class because it is not a dessert table, inasmuch as room is allowed only for fruit and flowers, but as the word "dessert" no longer finds a place in the schedule in the description of this competition, the tables must be regarded merely as "displays" of choice fruits suitable for dessert and for floral decorations that, with modifications, are also suitable for the adornment of the dinner table. The 1st prize was won by the Duke of Portland, Welbeck Abbey, Nottinghamshire (gr. Mr. James Gibson). The quality of the fruit generally was beyond praise. In the first place the Grapes were grand, especially two bunches of Prince of Wales, shown with an extraordinary amount of "bloom," Madresfield Court represented by three bunches was heavy, shapely and well finished, and Muscat of Alexandria heavy and fairly well coloured. We proceed to enumerate the varieties of fruit contained in the exhibit and the points awarded. Apples Washington, Rival, Gascoyne's Scarlet Seedling, and James Grieve (6 points each); Figs Brown Turkey and Negro Largo (6 and 5½); Grapes Muscat of Alexandria (8, 8, 7 an 7½), Buckland Sweetwater (6½ and 6), Madresfield Court (8, 7, 7½ and 7½), Prince of Wales (8½ and 7½), Mrs. Pince (7½ and 7); Melons Ringleader, Seedling and two Royal Sovereigns (7, 7, 7, and 6½); Nectarines Humbolt, Pitmaston Orange and two dishes of Pineapple (7, 6, 5½ and 4½); Peaches Crimson Galande, two dishes of Bellegarde and Royal George (7, 7, 6 and 6½); Pears: two dishes of Souvenir du Congrès, Marguerite Marillat and Triomphe de Vienne (6, 6, 5½ and 5½); Plums: Kirke's (4). For beauty of flowers and foliage, 5½ points were awarded, and for general arrangement for effect 5½ points. The total number of points was 2[illegible]. The 2nd prize was awarded to the Earl of Harrington, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre). The judges found it almost impossible to separate the two exhibits: so excellent were the details in the fruit display that the number of points awarded was almost exactly the same in each case, the point that eventually determined the 1st prize being lost to the Earl of Harrington in the floral decorations. There were three glass vases holding huge bouquets of Lilium speciosum and Francoa ramosa that dwarfed the fruit, almost hiding it. The Duke of Portland's decorations were quite full enough, but they were held well above the fruits, and were more appropriate from every point of view. But these remarks must not prevent us from commenting on the excellence of the Grapes, Apples, Pears, Plums, Peaches, Figs (Osborne's Prolific and Brown Turkey) and Melons, for these deserve every praise. The 3rd prize was awarded to Lady Henry Somerset, Eastnor Castle, Ledbury, who gained a total of 235½ points.

Collections of Fruit.

The arrangements for collections of fruit showed no alterations from those which have obtained at previous exhibitions. Substantial prizes were offered for collections of 12 dishes and nine dishes respectively. Each collection was decorated with flowers or plants to produce a good effect, but the decorations constituted a competition in themselves for additional prizes.

Collection of twelve dishes.—This class was for twelve distinct varieties of fruit in not fewer than nine kinds, and no exhibit to include more than two varieties of a "kind." Black and white Grapes were considered distinct "kinds." Pineapples were not admissible in these collections. Of the four exhibits presented for judging, that from the Duke of Newcastle, Worksop (gr. Mr. S. Barker), was adjudged the best, and it worthily won the 1st prize of £10. For Grapes, the exhibitor selected Madresfield Court, Muscat of Alexandria, and Black Hamburgh. The Black Hamburghs were heavy, well-shouldered bunches of rather uneven-sized berries, moderately well, but not perfectly, "finished," and the Muscats were good-sized bunches, lacking the best colour. The fruits of Madresfield Court, on the contrary, were rather small, certainly below good exhibition weight, but each bunch possessed the appearance of refinement so universally admired in this handsome variety, and, except for a few berries at the top of the bunches, the colour and "finish" were admirable. Of the fruits arranged on the table in front of the Grape stands, Ribston Pippin Apple and Triomphe de Vienne Pear stood out prominently for their large size and good appearance; Dymond and Goshawk Peaches were excellent; Pineapple Nectarines slightly above the ordinary size, and brilliantly coloured; Negro Largo Figs of extraordinary size; and Kirke's Seedling Plum completed the exhibit, except for two fine Melons, Royal Sovereign and Jubilee. The 2nd prize was awarded to Lord Biddulph, Ledbury Park (gr. Mr. H. Cotton), for another very fine exhibit, in which Madresfield Court Grape was shown grandly in large, well-berried bunches of superb colour; Muscat of Alexandria was less good, owing to unevenness and lack of perfect ripeness; whilst Black Hamburgh, though fairly heavy, of large berry, and well coloured, had not the correct shape for this variety, losing in consequence much of its attractiveness. Cox's Orange Pippin Apple was represented by half-a-dozen very large brilliantly-coloured fruits (we have but seldom seen more excellent specimens); Pineapple Nectarines were good; Brown Turkey Figs, superlative; and the exhibit also included Kirke's Plum, Bellegarde Peaches, Marguerite Marillat Pears, Ringleader and Emerald Gem Melons, and a moderate bunch of Duke of Buccleuch Grapes. 3rd, Alderman Bewley, Rathgar (gr. Mr. D. M. McIntosh), who exhibited large bunches of Mrs. Pince Grapes and very fine fruits of Emperor Alexander Apples as prominent features in his collection. 4th, Lord Belper, Derby (gr. Mr. W. H. Cooke).

The prizes for floral decorations were awarded as follow:—1st, Lord Biddulph (Francoa ramosa and Montbretias); 2nd, Duke of Newcastle (Cattleyas and Lily of the Valley); 3rd, Alderman Bewley.

Collection of nine dishes.—There were four exhibits in this class, and the premier position was obtained by Captain Heywood Lonsdale, Shavington (gr. Mr. J. Mills). He had very heavy bunches of Muscat of Alexandria Grapes and large-berried examples of Madresfield Court. Nectarines included Pineapple and Stanwick Elruge, Peaches Barrington and Royal George, Apple Rival, Melon Countess, and a dish of unnamed Figs, probably Brown Turkey. The 2nd prize fell to A. H. Heber-Percy, Esq., Hodnet Hall (gr. Mr. W. Catt). 3rd, Col. Mainwaring Jacson. The 1st and 2nd prizes for floral decorations were won in the same order as already given.

Grape Classes.

Champion Grape Class.—The most important of the 18 classes for Grapes was for 12 bunches in four or more distinct varieties, but not more than four bunches of any one variety. The 1st prize was £20, the 2nd £16, and the 3rd £12. There were six prizes in all. The bunches were required to be shown on boards arranged on a table-space measuring 8 feet by 4 feet 6 inches, in two tiers. The judging was by points, a maximum of 11 points being allowed for Muscat of Alexandria, 10 points for all other Muscat varieties and Black Hamburgh, and nine points for all other varieties. Each collection was required to be decorated with flowering and foliage plants in pots, not exceeding 5 inches in diameter, and cut flowers and foliage in glass-ware or loose at the discretion of the exhibitor. Prizes were offered specially for the decorations.

There were seven exhibits, and it may be imagined that collectively they made a very imposing and attractive display, the floral decorations being all in good taste.

The 1st prize was awarded to the Duke of Westminster, Eaton Hall (gr. Mr. N. T. Barnes), who also won the 1st prize for decorations. The bunches and points awarded were as follow:—

No.	Variety.	Maximum No. of points.	Points awarded.
1	Black Hamburgh ...	10	7½
2	Muscat of Alexandria ...	11	10
3	Appley Towers	9	7
4	Appley Towers	9	7
5	Muscat of Alexandria ...	11	10
6	Black Hamburgh ...	10	7½
7	Madresfield Court ...	10	9
8	Madresfield Court ...	10	8
9	Muscat of Alexandria ...	11	10
10	Muscat of Alexandria ...	11	9
11	Madresfield Court ...	10	8
12	Madresfield Court ...	10	8
	Total ...	122	101

It will be seen that the Muscats were the finest bunches; their quality was superb, the bunches being well shaped, with berries not over-large, but admirably finished. Madresfield Court was also shown splendidly, and the Black Hamburgh were very large bunches.

The decorations included small glass vases of Gloriosa flowers with Asparagus Sprengeri and a single spike of Francoa ramosa, interspersed with similar vases of the manvc Lælia anceps, with taller vases at the back, furnished with sprays of Oncidium, Francoa, and Chelone barbata.

2nd, Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre), whose strongest bunches were his black varieties. The varieties and pointing were as follow:—

No.	Variety	Maximum No. of points.	Points awarded.
1	Black Hamburgh ...	10	9
2	Black Hamburgh ...	10	9
3	Muscat of Alexandria ...	11	7½
4	Muscat of Alexandria ...	11	7
5	Madresfield Court ...	10	8
6	Muscat Hamburgh ...	10	9
7	Muscat Hamburgh ...	10	9
8	Muscat of Alexandria ...	11	7
9	Madresfield Court ...	10	8
10	Muscat Hamburgh ...	10	8½
11	Muscat of Alexandria ...	11	7
12	Black Hamburgh ...	10	9
	Totals ...	124	98

3rd, C. A. CAIN, Esq., Welwyn (gr. Mr. T. Bateman), with 97½ points. This collection included very large bunches of Muscat of Alexandria, but the berries were not well finished. Muscat Hamburgh was excellent. 4th Lord BELPER (gr. Mr. W. H. Cooke), with 95 points. Gros Maroc was shown especially well by this exhibitor.

The 2nd prize for decorations was awarded to the Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker), who was placed sixth for Grapes with 89 points. The scheme of decoration consisted in pink Carnations and Lilium speciosum rubrum, with sprays of Francoa and grasses.

There were nine exhibits in the class for four bunches of Grapes, including two bunches of a black variety and two of a white variety. There was a good competition, and the 1st prize was awarded to the largest bunches, shown by R. J. CORBETT, Esq., Towyn (gr. Mr. J. Jones). The varieties were Gros Maroc, large berried and of good colour, and Muscat of Alexandria, that needed a little deeper amber colour, but good in size of berry and shape. 2nd, Capt. HEYWOOD LONSDALE, Shavington (gr. Mr. J. Mills), who showed excellent Madresfield Court and very beautifully-finished Muscat of Alexandria. 3rd, Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert), for Muscat of Alexandria and very long bunches of Madresfield Court.

Black Hamburgh.—The best two bunches of this variety were exhibited by J. R. BRINTON, Esq., Stourport (gr. Mr. W. H. Wilson); 2nd, Lady HENRY SOMERSET, Eastnor Castle (gr. Mr. G. Mullins); 3rd, Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre).

The best single bunch of this variety was shown by Lady HENRY SOMERSET. It was a compact bunch, with exceptionally large jet-black berries. 2nd, Earl of HARRINGTON. 3rd, J. R. BRINTON, Esq.

Black Muscat varieties.—There were only three entries in a class for two bunches of black Grapes of Muscat varieties, and the prizes were awarded as follow:—1st, Madresfield Court, shown by G. E. LOMAX, Esq., Huyton (gr. Mr. E. Jones); 2nd, Madresfield Court, shown by Mr. BRINTON; 3rd, Muscat Hamburgh, shown by the Earl of HARRINGTON.

Madresfield Court.—The best of four exhibits of this variety was shown by Col. H. C. LEGH, Knutsford (gr. Mr. A. J. Cook); 2nd, Duke of WESTMINSTER; 3rd, Earl of HARRINGTON.

Black Alicante.—This was a well-contested class, eight exhibitors all showing splendidly. Large, well-balanced bunches, exhibited by J. W. RAYNES, Esq., Old Colwyn (gr. Mr. J. Barker), were adjudged the best, and Lady BIDDULPH, Ledbury Park (gr. Mr. H. Cotton), had the second best, with Mr. LOMAX, 3rd.

In the class for any other variety of black Grape, Lord HARLECH won the 1st prize with very heavy bunches of Alnwick Seedling of splendid finish of berry; 2nd, Mr. CORBETT, with Gros Maroc.

White Muscat varieties.—The 1st prize for two bunches of White Muscat varieties was won by the Duke of WESTMINSTER, who showed heavy-shouldered bunches, with beautifully-finished berries. 2nd, D. W. GRAHAM, Esq., Hilston Park (gr. Mr. J. Newton), with long, tapering bunches of a fine amber colour. 3rd, Duke of NEWCASTLE.

The largest bunches were shown by Mr. W. WILKINS, Manor Fruit Farm, Knowle, but they were not ripe.

The finest single bunch in this class was shown by the Duke of WESTMINSTER; 2nd, Mr. CORBETT.

In the local classes for Grapes, the prizes were awarded as follow:—*Black Hamburgh:* 1st, Lady MARY HERBERT, The Styche (gr. Mr. J. Birch); 2nd, Lord HARLECH (gr. Mr. T. Lambert). *Madresfield Court:* 1st, Lord HARLECH; 2nd, Capt. HEYWOOD LONSDALE. *Other black Grapes:* 1st, Lord HARLECH; 2nd, Mrs. F. ALDERSON, Oswestry (gr. Mr. Geo. Davis). *White Muscats:* 1st, Capt. HEYWOOD LONSDALE, with well-finished bunches of Muscat of Alexandria; 2nd, Lord HARLECH; 3rd, Lord TREVOR, whose bunches excelled all others, save only in ripeness. *Any other white Grapes:* 1st, Lord HARLECH; 2nd, Mrs. ALDERSON. *Two bunches of black Grapes:* 1st, G. BURR, Esq., Shrewsbury (gr. Mr. A. Jones), with Black Hamburgh. *Two bunches of white Grapes:* 1st, Major R. A. NEVILL, Admaston (gr. Mr. W. Ashwood).

OTHER KINDS OF FRUITS.

Peaches.—There were 15 exhibits in a class for eight Peaches, and there was not a weak dish amongst them. The 1st prize was awarded to the Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker), who showed large fruits of Crimson Galande, coloured to a remarkable degree. The 2nd prize was won by the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes), for the variety Royal George, and the 3rd to the Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. Searle), for Crimson Galande.

Nectarines.—There was a similar class for Nectarines, and nine competed. The 1st prize was awarded to Lady HENRY SOMERSET, Eastnor Castle (gr. Mr. G. Mullins), for a superb dish of Pineapple—large, even, highly-coloured fruits. 2nd, Duke of NEWCASTLE, and 3rd, Duke of WESTMINSTER, both with the variety Pineapple.

Apricots.—These fruits were not remarkable. The best of nine dishes was shown by A. H. HEBER-PERCY, Esq., Hodnet Hall (gr. Mr. W. Catt), who staged moderate-sized fruits of Large Early; 2nd, Dr. RAMBAUT, Bicton Heath (gr. Mr. J. A. Nuttall); 3rd, Major-General Sir FRANCIS LLOYD, Aston (gr. Mr. W. T. Staward).

Melons.—There was a large array of these fruits, and the prizes were awarded as follow: *Green flesh:* 1st, Emerald Gem, shown by Mrs. JENNER, Cardiff (gr. Mr. H. Wheeler); 2nd, Seedling, shown by JOSEPH SHAW, Esq., K.C., Brampton Brian (gr. Mr. H. Fisher). *Scarlet flesh:* 1st, Seedling, shown by the Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre); 2nd, Seedling, shown by Lord HOWARD DE WALDEN, Saffron Walden (gr. Mr. J. Vert). *White flesh:* 1st, Hero of Lockinge, shown by Mrs. JENNER, Cardiff; 2nd, a very large fruit of Golden Wedding, shown by Lord HOWARD DE WALDEN.

Plums.—There were eight exhibits in the class for 12 Gages, and considering the unfavourable season, the fruits were very good. The 1st prize was awarded to a magnificent dish of Reine Claude de Comte Althan, shown by Lord HOWARD DE WALDEN; 2nd, Reine Claude Bavay, shown by Lord O'NEILL, Shane's Castle, Antrim (gr. Mr. W. G. Wadge); 3rd, Golden Transparent Gage, shown by the Duke of NEWCASTLE. In the class for yellow Plums other than Gages, Lord HOWARD DE WALDEN beat five other competitors with splendid fruits of Jefferson; 2nd, Coe's Golden Drop, shown by the Duke of WESTMINSTER; 3rd, Jefferson, shown by the Marquis of NORTHAMPTON. There were 11 exhibits in the class for 12 purple or red Plums, and here the Earl of HARRINGTON excelled with choice fruits of Kirke's; 2nd, Lord HOWARD DE WALDEN, with President; 3rd, Duke of PORTLAND, Welbeck (gr. Mr. Jas. Gibson), with Kirke's.

Cherries.—Morello Cherries were awarded all the prizes; the premier dish contained magnificent fruits. The exhibitor was Lord HOWARD DE WALDEN; 2nd, Lady HENRY SOMERSET; 3rd, Capt. T. A. M. DICKIN, Lappington House (gr. Mr. G. Gilbert).

LOCAL CLASSES.

The 1st prize in the class for a collection of hardy fruits (Apricots, Peaches, Nectarines and Plums excluded) was shown by Capt. HEYWOOD LONSDALE, Shavington (gr. Mr. J. Mills), who staged Peasgood's Nonesuch labelled Emperor Alexander; 2nd, BERNARD HOWSON, Esq., Market Drayton (gr. Mr. A. Townsend), with Lord Suffield; 3rd, Mr. J. B. DAVIES, Greenfields.

A dish of James Grieve exhibited by Capt. HEYWOOD LONSDALE was adjudged the best exhibit of dessert Apples; 2nd, Irish Peach, shown by NICHOLAS ROBINSON, Esq., Ellesmere (gr. Mr. W. Roberts); 3rd, Worcester Pearmain, shown by Mr. BERNARD HOWSON.

Pears.—There were 11 exhibits in a class for six Pears, and the prizes were awarded as follow:—1st, Jargonelle, shown by Mr. R. RICHARDS, Knockin; 2nd, Dr. Jules Guyot, shown by Capt. HEYWOOD LONSDALE; 3rd, Jargonelle, shown by Major R. A. NEVILL, Admaston (gr. Mr. W. Ashwood).

Plums.—Excellent Plums were shown by local exhibitors; the finest by Lady MARY HERBERT, The Styche (gr. Mr. J. Birch); 2nd, F. BIBBY, Esq., Hardwicke (gr. Mr. W. Taylor).

GROUPS OF PLANTS.

The two classes for groups of plants arranged on the ground were well filled, and in the class which permits the use of miscellaneous and fine-foliage plants, arranged to produce the best effect, and occupying a space of 250 square feet, the grouping was very graceful and effective. Messrs. JAMES CYPHER & SONS, Cheltenham, again won the 1st prize, and it would be difficult to conceive a more beautiful display. The tall, highly-coloured Crotons were models of cultivation, and, indeed, all the plants used reached a high degree of merit. The background of this beautiful group was so cunningly arranged that it gave the impression of far greater distance than was really the case. Various Orchids, such as Oncidium flexuosum and O. oblongatum, with tall, arching sprays of bloom, and many Cattleyas were disposed amongst such foliage plants as Alocasias and Nandina domestica, which had uncommonly rich colouring. A tall specimen Kentia Fosteriana at the back and a smaller plant of Cocos Weddeliana nearer the front added a dignity to this charming group. The 2nd prize was awarded to Sir G. H. KENDRICK, Edgbaston (gr. Mr. J. V. Macdonald), for a very fine exhibit. The Orchids, Liliums, Caladiums, and Selaginellas in this group were especially fine. The only fault one could fine would be that the Moss around the pots of the raised Crotons—which, by the way, were excellent plants—was a little too obtrusive. 3rd, Mr. W. VAUSE, Leamington. Special prize, Mr. W. R. MANNING, Dudley.

There were six competitors in the class for a group of hardy plants with a pool of water and aquatics, occupying a space not exceeding 300 square feet. The use of cut flowers is permitted and the groups were to be arranged for natural effect. In most of the five groups the pool was the weakest part of the arrangement. In some cases the level of the water was higher than that of the body of the group. Notwithstanding this and the fact that none of the groups possessed the natural effect mentioned in the schedule, it must not be inferred that they did not possess any merit, for such is far from being the case. On the whole, they were very bright and attractive, and it was the brightest group—that arranged by Messrs. GUNN & SON, Olton—which won the 1st prize. This exhibit contained a large number—rather too many—of excellent flowers, and the frontal rockery was well planted. The 2nd prize was awarded to Mr. J. E. KNIGHT,

Wolverhampton, whose group was arranged on circular lines. Mr. T. R. Hayes, Keswick, won the 3rd prize. The general arrangement was good, but the plants of Nertera depressa, set across the middle of the pool, were incongruous and not strictly permissible. Special prizes were awarded to Messrs. W. Artindale & Son, Sheffield, and to Mr. W. Vause, Leamington; the conception of the Sheffield group pleased us most of all, but sufficient attention was not paid to detail.

As usual, the 1st prize in the class for 15 stove and greenhouse plants, not fewer than 10 in bloom, was won by Messrs. James Cypher & Sons, Cheltenham, and it is difficult to imagine anyone exhibiting better examples of the particular skill and art required for the production of first-class trained plants. The specimen Statice intermedia was an immense plant, and carried an enormous quantity of flowers. The Ixoras shown were two plants of I. Duffii, with large trusses of scarlet flowers, and I. Shawii. The large plant of Chironia ixifera was a dainty and graceful specimen, and amongst the Crotons C. Mortefontainensis was very highly coloured. The 2nd prize was awarded to Mr. W. Vause, Leamington, who arranged smaller but fresh specimens. Plants of Dipladenia and Bougainvillea were especially meritorious. 3rd, Mr. W. R. Manning, Dudley, who showed a good specimen of Tabernæmontana.

Messrs. James Cypher & Sons arranged six magnificent stove and greenhouse plants in bloom or foliage. The six were all flowering plants, and each specimen deserves mention: Ixora Duffii, Pondeletia speciosa major, Statice profusa, S. Gilbertii, Clerodendron Balfouri, and Allamanda nobilis. 2nd, Mr. W. Vause. 3rd, Mr. W. Manning.

The two exhibits of 30 stove and greenhouse plants (Orchids excluded) in pots not exceeding 10 inches in diameter were one of the brightest and most attractive features of the show. Almost every plant was a model of skilful cultivation, and the arrangement was excellent. As elsewhere, Messrs. Jas. Cypher & Sons won the 1st prize; in this class their most noteworthy plants were Croton inimitabilis, C. Sunset, Phœnix Roebelinii, Chironia ixifera, and various Ixoras. 2nd, Mr. W. Vause, who included two large-flowered Bougainvilleas in his exhibit.

The best 12 stove or greenhouse plants in pots not exceeding 10 inches, also excluding Orchids, were shown by Lord Harlech, Brogyntyn (gr. Mr. T. Lambert). Specimens of Ixora amabilis and I. Duffii were very fine. 2nd, Mr. Jas. Farrant, Shrewsbury; 3rd, G. Burr, Esq., Oaklands, Shrewsbury (gr. Mr. A. Jones).

In the class for four exotic Ferns the 1st prize was awarded to Lord Harlech; 2nd, Capt. Heywood Lonsdale; 3rd, Mrs. Jowett.

Lord Harlech was awarded the 1st prize for Dracænas, his specimens being very fine; 2nd, Mr. W. R. Manning. Lord Harlech also showed the finest six Caladiums; 2nd, Mr. B. Howson.

There was only one exhibitor in the class requiring greenhouse Ferns to be arranged in a space of 80 square feet. The 2nd prize was awarded to Capt. Heywood Lonsdale, Shavington Hall (gr. Mr. J. Mills), who exhibited a pleasing group.

The 1st prize for four Fuchsias was won by Messrs. J. Wright & Sons, Leicester; 2nd, Mrs. Jowett, Henston (gr. Mr. E. Bridge); 3rd, Mr. J. Farrant.

The zonal Pelargoniums were especially good; both the singles and the doubles were nearly all large, healthy plants bearing very many trusses of bright flowers. Mrs. Jowett was 1st and Messrs. J. Wright & Sons, Leicester, were 2nd in each class.

The groups of tuberous-rooted Begonias, arranged for effect on a table 15 feet by 4 feet, contained amazingly fine plants. All the Begonias shown had double flowers. The 1st prize was awarded to Messrs. Blackmore & Langdon, Bath, whose collection was decidedly the more effectively arranged. This delightful collection included splendid hanging baskets of the varieties Golden Shower and Lena. The 2nd prize group, set up by Messrs. T. S. Ware, Ltd., Feltham, Middlesex, contained even larger blooms, but the arrangement was not so good.

The six tuberous-rooted Begonias shown by Messrs. Blackmore & Langdon were excellent plants, the crested varieties being splendid; 2nd, Mr. T. Hammonds.

The best 12 Gloxinias were shown by Lord Harlech; 2nd, Col. F. W. Robinson, Claremont (gr. Mr. S. Harding); 3rd, Mr. J. Farrant.

There was a very strong competition in the class for dinner-table plants. Lord Harlech, who won the 1st prize, exhibited 12 splendid plants in pots, 6 inches in diameter; 2nd, Mr. W. Vause; 3rd, F. R. Dixon Nuttall, Esq. (gr. Mr. J. W. Barker), Eccleston Park, Prescot.

There were three exhibits of Rock and Alpine plants staged in the ground on a space of 100 square feet. The 1st prize was awarded to Mr. T. R. Hayes, Keswick, Cumberland, for an unostentatious, gently-sloping rockery, in which such plants as Erica cinerea atrosanguinea and Dianthus Mrs. G. Bradshaw were very effective. 2nd, Mr. Robert Hayes, Grasmere, who showed many interesting plants. 3rd, Messrs. W. Artindale & Son.

The classes open only to exhibitors in the county of Salop were well contested. The prize-winning groups were very dainty, and contained excellent specimens. The collections of 12 miscellaneous plants in small pots were very fine, and showed evidence of high cultivation.

The group of plants which won the 1st prize for B. Dowson, Esq., Market Drayton (gr. Mr. A. Townsend), was admirably arranged; 2nd, Mrs. Bird, Shrewsbury; 3rd, Mrs. Drew, Oswestry.

The 1st prize for six stove and greenhouse plants was awarded to Lord Harlech, who showed good examples of Clerodendron Balfouri and Acalypha hispida; 2nd Mr. J. Farrant.

The best four Begonias were shown by Mr. E. W. Cooke; 2nd, Mrs. Drew.

In the class for three double Pelargoniums, the 2nd prize was awarded to Major R. A. Nevill.

The 1st prize for three single Pelargoniums was won by Lord Harlech; 2nd, Major R. A. Nevill.

In the class for 12 miscellaneous plants, growing in pots not exceeding 5 inches in diameter, Lord Harlech showed excellent plants, especially of Ixoras and Cordylines; 2nd, B. Howson, Esq., Market Drayton; 3rd, Mrs. Drew, Oswestry.

Sweet Peas.

The exhibits of Sweet Peas were accommodated in a special tent, which was crowded with visitors at all times. In the premier class for 18 distinct varieties, arranged in a space of 8 feet by 3 feet 6 inches, there was a splendid competition amongst 10 exhibitors. The 1st prize collection was probably the best ever exhibited at these shows, the flowers being large, clean and very bright. The varieties King Alfred, White Queen, Lady Evelyn Eyre, Thomas Stevenson, Prince George, Hercules and Scarlet Emperor are deserving of special notice. The exhibitor was Mr. G. Bowness, Busby, Glasgow. Mr. John Smellie, Busby, Glasgow, followed closely. He showed grand vases of Hercules, Elsie Herbert, Thomas Stevenson, May Campbell and Florence Nightingale; 3rd, Lord O'Neill, Shane's Castle (gr. Mr. W. G. Wadge). This also was a fine collection, but the effect was marred by the inclusion of two vases of very stale blooms. Mr. T. Jones, Bryn Penylan, Ruabon, also showed well, and was awarded the 4th prize, but his flowers showed the effects of the unfavourable weather. Blooms of Wenvoe Castle, Charles Foster and Dorothy exhibited splendid colours. 5th, Mr. G. L. Moffatt, Lockerbie, N.B.; the stems were of exceptional length, but the flowers were not correspondingly good.

In the class for 12 varieties, the competition was not so keen, but the flowers were good. The 1st prize was awarded to Mr. D. Gardiner, The Manse, Lockerbie, N.B. Rosabelle, Hercules and Prince George were the best varieties; 2nd, Mr. E. Price, Skipton-in-Craven; 3rd, P. Davis Cooke, Esq., Mold.

For six bunches there was again a very strong competition, and the 1st prize was well won by S. Robinson, Esq., The Ovals, Kington. He showed excellent bunches of Elsie Herbert, Nubian, Mrs. Hugh Dickson, John Ingman, Elfrida Pearson and Asta Ohn; the 2nd prize was awarded to Mr. W. H. Holloway, Port Hill Nursery; this exhibitor showed Melba and Mrs. Routzhan in fine form; 3rd, Mr. E. Price, Skipton-in-Craven.

Roses.

The Rose classes again proved to be exceedingly popular, and in spite of the fact that the month of Roses has long since passed and that heavy thunderstorms have been very general during the last few days, the exhibits were exceedingly good. The class requiring nine baskets of cut Roses did not attract an exhibitor, but the class which allows a space of 12 feet by 4 feet for a collection of cut Roses attracted a very strong competition. The quality of all the many exhibits was good. Messrs. Gunn & Sons, Olton, who were awarded the 1st prize in this very strongly-contested class, arranged a great number of exceedingly fine blooms. The arches of Lady Hillingdon and Arthur R. Goodwin contained many richly-coloured flowers. The 1st prize iocluded a silver bowl, given by the President, Mr. G. W. Phillips. 2nd, Mr. John Mattock, New Headington, Oxford, who made a special feature of the varieties Irish Elegance and Lady Pirrie; 3rd, Messrs. W. and J. Brown, Peterborough.

Messrs. Alex. Dickson & Sons were awarded the 1st prize for 12 vases of decorative Roses. The vases of Lady Pirrie and the Lyon Rose were especially noteworthy. 2nd, Mr. John Mattock, New Headington.

The best 18 Roses were shown by Mr. G. Speight, Market Harboro'. The blooms of the Lyon Rose, Caroline Testout, and Hugh Dickson were very fresh and good. 2nd, Mr. A. W. Meakin, Tillington, Stafford.

Miss H. Leeke showed the best 12 Roses in the County of Salop class; 2nd, Lord Harlech.

Cut Flowers.

The best 12 trusses of single Zonal Pelargoniums were shown by Mr. A. Myers, Shrewsbury; and Mr. A. Bewlay was the most successful exhibitor in the class for a similar number of double and semi-double Pelargoniums.

Messrs. J. Mair & Sons showed 24 very meritorious spikes of Gladiolus in a class for those flowers, and easily won the 1st prize; 2nd, Messrs. Harkness & Son. The best 12 spikes were shown by the Marquis of Northampton, Castle Ashby (gr. Mr. A. R. Searle); 2nd, Capt. Heywood Lonsdale; and in the county class Lord Harlech was the most successful exhibitor. Mr. W. A. Ballard, Leicester, was awarded the 1st prize for 12 bunches of summer-flowering Chrysanthemums.

The 1st prize in the class for 12 bunches of cut flowers of annuals was won by Mr. W. H. Banks, Kington; 2nd, Mr. A. W. Meakin.

The best 12 bunches of stove and greenhouse cut flowers were shown by Mr. B. Cromwell, Hunts Cross; and Mrs. Jowett won the 1st prize for the best six bunches in the amateurs' classes.

There were splendid collections of 24 bunches of hardy flowers. The 1st prize was awarded to Mr. H. Bull, Frome; 2nd, Messrs. Harkness & Sons, Bedale; 3rd, W. H. Banks, Esq., Kington. Mr. R. Hayes won the 1st prize in the class for six herbaceous Phloxes, three spikes of each.

The best 12 bunches of hardy flowers were shown by F. Bibby, Esq., Hardwicke Grange; 2nd, Mrs. F. Alderson, Welsh Frankton.

Carnations.

The collection of cut Tree Carnations which won the 1st prize for Mr. Charles Wall, South Down, Bath, contained a great number of exceedingly good, fresh blooms; 2nd, Mr. Wallace, Saffron Walden.

Messrs. M. Campbell & Son, High Blantyre, N.B., were awarded the 1st prize for a collection of cut Carnations and Picotees.

The best amateur's collection was shown by Mr. W. H. Banks, Kington; 2nd, Mr. R. B. Waite, Birmingham.

Mr. C. Wall, Bath, showed 12 excellent vases of Carnations and Picotees; 2nd, Messrs. M. Campbell & Son.

Dahlias.

The class for a collection of Cactus or decorative Dahlias arranged on staging with a frontage of 8 feet 6 inches was a splendid success. There were six beautiful collections, all staged very effectively, and containing choice blooms. The 1st prize was won by Messrs. Keynes, Williams & Co., Salisbury, who had large exhibition boxes filled with choice blooms and epergnes attractively

arranged. A selection of the varieties includes C. E. Wilkins, Success, H. L. Brousson, Glory of Wilts., Mary Furrier, Sweet Briar, Mrs. A. Dyer, Arthur Pickard, Ethel Yeatman, and Dr. G. Kendle. 2nd, Mr. John Walker, Tbame. In this exhibit we noticed Conrad, Iolanthe, Red Admiral, Snowdon, H. Peerman, Aviator, Beryl, Evening Star, and Ivy Shoesmith. 3rd, Mr. H. Woolman, Shirley, near Birmingham.

The Dahlias shown on exhibition boards were exceedingly fine, and many of the blooms, especially of the Cactus varieties, were quite as good as we have seen at the autumn shows. The best 24 blooms of show or fancy Dahlias were arranged by Mr. D. Walker, Thame. 2nd, Messrs. Bottomley & Burton, Elland, Yorkshire.

Colonel Cornwallis West, Ruthin Castle, was the most successful exhibitor in the class for 12 show or fancy Dahlias.

The 24 Cactus Dahlias shown by Mr. H. Woolman, Shirley, Birmingham, were exceedingly good, and the 2nd prize exhibit of Messrs. Keynes, Williams & Co, Salisbury, was also good.

In the class for 18 Cactus blooms, Mr. H. Peerman was awarded the 1st prize.

The 1st prize for 12 Cactus Dahlias (trade excluded) was awarded to Mr. H. Peerman, Nantwich. 2nd, Mr. F. Bunn.

Messrs. Bottomley & Burton staged a splendid collection of 12 varieties of Cactus Dahlias, six blooms of each, and were deservedly 1st.

Mrs. Scott, Becton Strange, was awarded the 1st prize for 12 reflexed Asters, and Messrs. Harkness & Sons, Bedale, Yorkshire, showed the best six bunches of Gaillardias.

Decorative Classes.

The best display of floral designs, arranged for effect on a space measuring 12 feet by 3 feet 6 inches was made by Messrs. Dicksons, Chester. The exhibit included bouquets, baskets of flowers, floral harps, and other devices. The top was surmounted by a crown and the King's monogram worked in white Asters and red Carnations. 2nd, Mr. F. W. Johnston, Manchester. 3rd, King's Acre Nurseries, Ltd.

The best bouquet of flowers for the hand was arranged by Messrs. R. F. Felton & Sons, Hanover Square, London. It was a delightful posey, composed of Orchids, including Odontoglossums, Odontioda Charlesworthii, Phalænopsis Rimestadiana, Lælias, and Cattleyas. 2nd, Mr. A. Adshead, Gatley, Cheshire, who employed Oncidiums.

Of the numerous stands of cut flowers for table decorations, the best was shown by Mrs. Jno. Nixon, Alderley Edge, who arranged a charming epergne with flowers of Gloriosa superba, Croton leaves, and Asparagus plumosus nanus. 2nd, Mr. W. J. Garner, Altrincham.

There were 16 dinner tables arranged with cut flowers, and the 1st prize was won by Miss F. Jenks, Codsall, who used pink and yellow Roses, with red Rose shoots and trails of Selaginella. 2nd, Mrs. J. Nixon, for an arrangement similar to that in the previous class.

New Plants.

First-class Certificates were awarded to *Montbretia "Star of the East,"* shown by Mr. G. D. Davison, Westwick Gardens, Norwich, and imported blooms of *Nelumbium speciosum*, exhibited by Messrs. R. F. Felton & Sons, Hanover Square, London.

Vegetables.

Open Classes.

The Society offered four prizes, the 1st of £10, for a collection of 12 distinct kinds, arranged on a space measuring 6 feet by 4 feet. There were seven exhibits. The Hon. Vicary Gibbs was placed 1st with the following points :—

	Maximum No. of plants.	Points awarded.
Cauliflowers ...	7	6
Celery	7	7
Leeks	7	7
Carrots ...	7	6
Onions	7	6½
Potatos	7	7
Tomatos	7	6½
Peas	7	6½
Beans (Runner) ...	7	7
Cucumbers ...	7	6
Beet	7	5
Parsnips ...	7	6½
Totals ...	84	77

Carter's Giant Pink Celery, Holborn Model Leeks, Carter's Emperor Potatos, and Scarlet Emperor Beans all gained the maximum number of points. Ailsa Craig Onions, Quite Content Pea, Carter's Model Cucumbers, and Holborn Marrow Parsnips were also of unusual quality. 2nd, Mr. J. Hudson, Leicester, with 72½ points. Potatos Goldfinder, Cucumber Commander, and Exhibition Runner Bean were the finest dishes in this exhibit. Cauliflowers, Celery, and Leeks were also good. 3rd, H. Andrews, Esq., Winchcombe (gr. Mr. J. R. Tooley). 4th, Mr. F. J. Barratt, Ellesmere, with 60 points.

The Society also offered prizes for a collection of nine kinds of vegetables, open only to growers in the county of Shropshire. The 1st prize was won by Mr. F. Bibby, Hardwick Grange; 2nd, Capt. Heywood, Lonsdale; 3rd, Mr. A. H. Hebeb-Percy.

Numerous classes were provided for different kinds of vegetables, the 1st prize winners in the more important classes were as follow :—*Tomatos.* —Mr. J. Hudson, Leicester, with the variety Conqueror. *Six dishes of Potatos.*—Col. Cornwallis West. *Brace of Cucumbers.*—Marquis of Northampton (gr. Mr. Searle), who exhibited splendid examples of Royal Favourite. *Peas.*—Mr. E. W. Winchester, Rubery, Birmingham. *French Beans.*—T. J. Yates, Ombury, with the variety Magnum Bonum. *Runner Beans.*—Mr. J. Hudson, Leicester, who exhibited New Exhibition variety. *Cauliflowers.*—Mr. J. Hudson, Leicester, with Early Mammoth. *Celery.*—Mr. J. Wainwright, Nantwich; the variety, a white sort, was unnamed. *Onions.*—Mrs. Jenner, Cardiff (gr. Mr. H. Wheeler), for fine bulbs of Ailsa Craig. *Parsnips.*—Rev. J. Davies, Pembroke (gr. Mr. T. Phillips), with Tender and True. *Carrots.*—Mr. W. Bedford, Port Talbot, with New Red Intermediate. *Turnips.*—Mr. J. Hudson, with Silver Ball.

Nurserymen's Classes.

Messrs. Clibrans provided five prizes, of which the 1st was the sum of £8, for a collection of nine kinds, arranged in a space measuring 4 feet 6 inches by 4 feet. There were 12 entries, and the Marquis of Northampton, Castle Ashby, Northampton (gr. Mr. Searle), was placed first. His collection embraced Exhibition Onions, Lord Kitchener Tomatos, James's Intermediate Carrots, New Pink Celery, Centenary Peas, Exhibition Leeks, and Potatos Scottish Triumph. 2nd, Crawford Logan, Esq., Wellington (gr. Mr. H. Turner). This exhibitor showed splendid Prizewinner Carrots. 3rd, The Misses Howell, Berriew (gr. Mr. E. Jones).

Five competed in Messrs. James Carter & Co.'s class for a collection of six distinct kinds, and the produce generally was of magnificent quality, especially in the 1st prize collection. The exhibitor was Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. Ed. Beckett), and the vegetables were of the usual magnificent quality seen in Aldenham garden produce. The kinds were Red Elephant Carrots, Duke of York Tomatos, Giant Pink Celery, Ailsa Craig Selected Onions, Snowball Potatos and Early Autumn Giant Cauliflowers. The 2nd prize was awarded to Mr. F. J. Barrett, Ellesmere, and the 3rd to Col. Cornwallis-West, Ruthin Castle (gr. Mr. H. Forder).

In Messrs. Webb's class for a collection of nine distinct kinds, in which prizes totalling 19 guineas were offered, the 1st prize was awarded to Mr. J. Hudson, Leicester; Early Mammoth Cauliflowers, Stourbridge Marrow Peas, of exceptional size and quality; Ailsa Craig Onions, Conqueror Tomatos, a fine sample; New Exhibition Beans, nearly a foot long; New Chieftain Potatos, Champion Prize Leek, and Pink Perfection Celery were all alike of superb quality. 2nd, H. Andrew, Esq., Winchcombe (gr. Mr. J. R. Tooley). This exhibitor showed Parsnips more than a yard long. He had magnificent Celery of the Aldenham Prize variety, fine Carrots, and Cranston's Excelsior Onions. 3rd, Mr. A. T. Rainbow, Northfield.

A strong class was that for a collection of nine distinct kinds, in which the prizes amounted to £25 4s., were provided by Messrs. Sutton & Sons. There were eleven competitors, and the class attracted some of the finest vegetables in the exhibition, especially those shown by Capt. H. Spender Clay, M.P., Lingfield, Surrey (gr. Mr. D. Gibson), who was awarded the 1st prize. Celery Solid White and Leeks Prizetaker were both magnificent, whilst in the centre of the display were extra large, solid Ailsa Craig Onions. Centenary Peas were of an unusual size, whilst the Runner Beans were of exceptional length. Best of All Tomatos, Sutton's Supreme Potatos, New Red Intermediate Carrots, and Early Giant Cauliflowers were all good. 2nd, H. T. Tatham, Esq., Elstree (gr. Mr. H. Gaiger), with fine Onions, Peas and Leeks. 3rd, Capt. A. Briscoe, Newtown (gr. Mr. H. Smith).

Prizes were also offered by Messrs. Dickson & Robinson for nine distinct kinds, the 1st prize being eight guineas. There were 10 exhibitors, and the Marquis of Northampton, Castle Ashby (gr. Mr. A. R. Searle), won, followed closely by Mr. Tom Jones, Ruabon. The premier exhibit included Perfection Intermediate Carrots, Exhibition Runner Beans, Premier Onions, Snowdon Cauliflower, Prize Pink Celery, Exhibition Leeks, Peas, and Potatos. Mr. Jones showed splendid Premier Onions and stout-stemmed Leeks. 3rd, Mr. H. T. Tatham.

Messrs. Robert Sydenham Limited, Birmingham, offered the very liberal sum of £21 as prizes in a class for a collection of nine distinct kinds. There were seven exhibits, and the 1st prize was awarded to Mr. E. Deakins, Hay Mills, Birmingham. All the produce was of exceptional quality, and comprised magnificent New Scarlet Intermediate St. Valery Carrots, long Hollow Crown Parsnips, Ne Plus Ultra Beans, Windsor Castle Potatos, Holmes Supreme Tomatos, Ailsa Craig Onions, Clayworth Celery, Lyon Leeks, and Autumn Giant Cauliflowers. 2nd, Mr. F. J. Barrett, Ellesmere, Ne Plus Ultra Beans, Ailsa Craig Onions, Gladstone Peas, and Windsor Castle Potatos being the finer dishes; 3rd, Rev. J. Davies, Pembroke.

In Mr. Edwin Murrell's class for a collection of nine kinds the 1st prize was awarded to Mr. T. Sanderson, Whittington, and the 2nd to Mr. T. H. Pugh, Newtown.

Mr. Murrell also offered prizes for a collection of six distinct kinds, the 1st prize for which was awarded to Mr. E. E. Arnold, Wellington, and the 2nd to Mr. W. Astlett, Hadnall.

Non-Competitive Exhibits.

Messrs. Dobbie & Co., Edinburgh, showed Sweet Peas, Roses, Collarette Dahlias, and varieties of Cosmos. The Sweet Peas were remarkably fine, especially the varieties Edrom Beauty, Inspector, May Campbell, Etta Dyke, and Rosabelle. The Dahlias embraced remarkably pretty varieties in numerous colours, Antwerpia (scarlet and yellow), Crimson Queen, Diadem (rosy-purple and white), and Princess Louise (crimson and white) are a selection. (Gold Medal.)

Messrs. Hobbies, Ltd., Dereham, Norfolk, showed Roses and Dahlias, the latter including Cactus and Collarette varieties, the whole arranged in the form of a semi-circle. (Gold Medal.)

Messrs. Sutton & Sons, Reading, showed flowers, fruits, and vegetables, the produce of their seeds. The exhibit was arranged with excellent taste, and included choice Melons, Tomatos, Carrots, Onions, Beans, Celery, Peas, &c., set off with banks of Celosias, Begonias, Liliums, with floral borders and with festoons of flowers along the top at the back. (Large Gold Medal.)

Mr. Albert Myers, Shrewsbury, showed Zonal Pelargoniums of fine quality against a background of tall plants of Coleus and Abutilon Thompsonii. (Silver Medal.)

Messrs. Dicksons, Royal Nurseries, Chester, displayed border flowers in great variety, Gladioli, Lilium auratum, Romneya Coulteri, Roses, and Delphiniums being especially good. (Silver-gilt Medal.)

Mr. H. N. Ellison, West Bromwich, exhibited greenhouse Ferns in great variety, the plants being remarkably healthy. The new Pteris Parkeri, P. scaberula, Gleichenia discarpa longipinniata, Adiantum Farleyense, and the newer varieties of Nephrolepis were included. Mr. Ellison also showed on behalf of Mr. F. A. Haage, a collection of remarkably healthy Cactaceous plants. (Silver-gilt Medal.)

Messrs. Bakers, Wolverhampton, showed a very large collection of border flowers, Dahlias and summer-flowering Chrysanthemums. A bank of Delphiniums was a prominent feature in this fine exhibit. (Gold Medal.)

Messrs. Caldwell & Sons, Knutsford, staged a small collection of hardy border flowers. (Gold Medal.)

King's Acre Nurseries, Ltd., Hereford, showed splendid Roses set up very attractively, with arches of Ramblers at the back, also border flowers and a fine collection of pot fruit trees, with baskets of choice-gathered fruits. Apples, Pears, Plums, Peaches, Grapes, Figs and Nectarines were all good. Emperor Alexander Apple was magnificent, some of the fruits having a circumference of 15 inches. (Large Gold Medal.)

Messrs. John Forbes, Ltd., Hawick, showed fine Pentstemons, border Phloxes, border Carnations, Pelargoniums, and miscellaneous border flowers. (Silver-gilt Medal.)

Messrs. Harkness & Sons, Bedale, had remarkably good vases of Gaillardias in the newer varieties. (Bronze Medal.)

Messrs. G. Gibson & Co., Leeming Bar, Bedale, showed border flowers and Roses, all of choice quality. Chrysanthemum maximum Mrs. F. David was prominent in this fine exhibit. (Silver Medal.)

Messrs. Isaac House & Son, Westbury-on-Trym, Bristol, showed a rock-garden exhibit and varieties of border flowers; a comprehensive collection of border Phloxes was a feature of this group. (Gold Medal.)

Miss S. S. Thompson, Alfred Road, Handsworth, showed Cactaceous plants in variety. Mammillaria bocasana cristata was unusually good.

Messrs. H. B. May & Sons, Upper Edmonton, arranged a choice selection of stove and greenhouse Ferns in a very tasteful manner. In the centre of the pot plants were specimen fronds of different forms of Nephrolepis exaltata, varying from the mossy Marshallii compacta to the plain fronds of Rooseveltii. (Gold Medal.)

Mr. L. R. Russell, Richmond, Surrey, filled a long stretch of staging with excellent Celosias growing in relatively small flower-pots. The colours of the dwarf and exceedingly floriferous plants were very clean and distinct. At one end of the Celosias, Mr. Russell arranged some baskets filled with small pot plants of varieties of hardy Fuchsia. (Silver-gilt Medal.)

Mr. Edwin Murrell, Shrewsbury, showed vases of Roses against a rather too-formal background of lattice-work, which was insufficiently furnished with Ramblers. The quality of the blooms is deserving of high praise. The firm also showed Clematis in variety. (Silver-gilt Medal.)

Messrs. Ed. Webb & Sons, Wordsley, Stourbridge, put up a very imposing exhibit of flowers, fruits and vegetables. High-quality produce showed to the best advantage in a pretty setting of flowers and greenery, a triumph of fine exhibiting. (Large Gold Medal.)

Messrs. Jones & Sons, Ltd., Shrewsbury, showed floral decorations, in which skill in arrangement and colour blending was evidenced in a high degree. This firm also showed beautiful Ferns of the type used for indoor decorations and a group of tuberous-rooted Begonias. (Gold Medal.)

Messrs. R. F. Felton & Sons, Hanover Square, London, exhibited an imposing vase of the beautiful Nelumbium speciosum, magnificent bowls and vase of Roses and, at the back, epergnes of the fine white and yellow Chrysanthemums Countess and Mercédès. (Silver Medal.)

An exhibit of unusual interest was a collection of 25 varieties of Grapes from the Royal Horticultural Society's Gardens at Wisley. The varieties were White Frontignan, Grizzly Frontignan, Muscat Hamburgh, Duchess of Buccleuch, Black Hamburgh, Bowood Muscat, Alnwick Seedling, Gros Maroc, Foster's Seedling, Syrian, Madresfield Court, Appley Towers, Golden Champion, Chasselas Napoleon, Lady Hastings, Trebbiano, Black Prince, Muscat Champion, White Tokay, Prince of Wales, Directeur Tisserand, Buckland Sweetwater, Lady Hutt, Mrs. Pearson, and Duchess of Buccleuch. Taking the collection as a whole it was a remarkable one, all the bunches being shown superbly, and it only needed to have been shown a little later in the season, when some of the varieties would be better finished. The Grapes were presented by the Council of the R.H.S. to the local hospitals. (Large Gold Medal.)

Messrs. Clibrans, Altrincham, showed magnificent vegetables; the exhibit being crowned by a mammoth bundle of Clibran's Pink Celery, Blood Red Onions, Cabbages Winningstadt Improved, Lettuces in variety, Walcheren Cauliflowers, Peas, Beans, Carrots, Globe Artichokes, Aubergines, and many other kinds were all shown splendidly. (Large Gold Medal.)

Messrs. Barr & Sons, King Street, Covent Garden, showed choice vegetables, displayed in the best exhibition style. There was a great assortment of subjects, including Carrots, Beets, Cauliflowers, Radishes, Potatos, Chilies, Tomatos, Lettuces, Beans, Cucumbers, Onions, and Marrows. (Silver-gilt Medal.)

A large exhibit of vegetables was shown by Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. Edwin Beckett). The sterling quality, method of staging, and variety of subject are all deserving of the highest praise; not only was it an object lesson in high-class culture, but it was representative of all the best kinds and varieties. (Large Gold Medal.)

Messrs. Dickson & Robinson, Manchester, made a very imposing display of flowers, fruits, and vegetables. There were large stands of Lilium longiflorum giganteum, L. auratum, and many different Carnations rising from a groundwork of Nephrolepis Whitmannii, amongst which were arranged Melons, many mounds of excellent Peas, and other good vegetables. (Gold Medal.)

Beautiful Roses were shown by Messrs. Alex. Dickson & Sons, Ltd., Newtownards, co. Down. The Lyon Rose, George Dickson, Lady Ursula, Bertha Gaulis, Lady Hillingdon, Viscount Carlow, and G. C. Waud were displayed with others in large numbers. (Gold Medal.)

Messrs. Jarman & Co., Chard, Somersetshire, had a varied and interesting exhibit, which consisted of Dahlias, Roses, Pelargoniums, fruit and vegetables. The attractive arrangement was enhanced by the graceful sprays of Humea elegans, which arched over the fresh, sweetly-smelling Roses and the Dahlias. (Gold Medal.)

Mr. W. A. Manda, New Jersey, U.S.A., exhibited good plants of the large-fronded Polypodium Mandaianum, the delicate-leaved Asparagus elongatus, and various stove foliage plants. (Silver Medal.)

Messrs. Isaac House & Son, Westbury-on-Trym, Bristol, showed hardy cut flowers. (Gold Medal.)

Messrs. Fred Smith & Co., Woodbridge, arranged a large quantity of cut flowers of hardy herbaceous plants. Achillea millæfolia rosea, Montbretia "George Davison," Scabiosa caucasica and Romneya Coulteri were very attractive. (Silver-gilt Medal.)

Messrs. Rich & Co., Bath, exhibited cut sprays of border flowers. (Silver Medal.)

Messrs. Young & Co., Hatherley, Cheltenham, displayed a splendid collection of cut Carnations. The bright-pink variety Lady Henderson contrasted finely with the dark-crimson Duchess of Devonshire and the orange-yellow Golden Glory. Older varieties, such as Mrs. C. W Ward, Rose Enchantress, Mayday, and Royal Purple were also exceedingly good. (Gold Medal.)

Messrs. Thomas Rivers & Son, Sawbridgeworth, Hertfordshire, showed many excellent fruit trees in pots. The trees were all examples of cultural skill, and bore good crops of splendid fruits. The Peaches included the varieties Crimson Galande and Dymond. Amongst the Nectarines, Humboldt and Milton call for especial mention. A seedling black Plum (No. 135) had a very attractive appearance. In the front of the group there were two boxes of immense fruits of Apple Peasgood's Nonesuch and a basket of excellent Clapp's Favourite Pears. This splendid exhibit was, unfortunately, cramped. (Large Gold Medal.)

Messrs. R. Wallace & Co., Colchester, gave especial prominence to a large number of cut spikes of the magnificent Montbretia "Star of the East," which received a First-class Certificate at the last R.H.S. meeting. Besides other varieties of Montbretia and many good spikes of Gladiolus, there were flowers of Tritoma, many Liliums, and hardy Cinerarias. (Silver-gilt Medal.)

Messrs. Gunn & Sons, Olton, Warwickshire, made a fine exhibit, composed solely of herbaceous Phloxes. The trusses of bloom were arranged on large stands of distinct colours harmoniously blended. (Gold Medal.)

Messrs. Pritchard & Sons, Shrewsbury, showed small plants of various Alpines attractively arranged in Cocoanut fibre and separated into compartments by pieces of cork-bark. The scarlet flowers of the many pot-plants showed well against the background of greenhouse Ferns. (Silver-gilt Medal.)

The exhibit from Mr. Amos Perry, Enfield, Middlesex, filled a bay in one of the large tents. A spacious tank contained many fresh blooms of various hardy Nymphæas. The front of the pool was screened by a rockery planted chiefly with hardy Ferns. In the background very many excellent varieties of Delphinium and other border flowers were attractively displayed. (Large Gold Medal.)

Messrs. Webb & Brand, Saffron Walden, Essex, exhibited many stems and single flowers on showboards of their excellent double-flowered Hollyhocks. (Silver Medal.)

Messrs. Hogg & Robertson, Mary Street, Dublin, showed many good spikes of Gladioli. (Silver Medal.)

Messrs. Hewitt & Co., Ltd., Solihull, Warwickshire, arranged cut blooms of such shrubs as Genista tinctoria, Spiræa Anthony Waterer and Hydrangea Lindleyana and of many hardy herbaceous plants.

Mr. Robert Hayes, Grasmere, showed many good varieties of herbaceous Phloxes and vases of Heather arranged amongst dwarf Japanese Maples. (Silver Medal.)

Messrs. Conways, Ltd., Halifax, arranged a group of hardy border flowers, including stands of Roses. (Silver Medal.)

Mr. Reg. Prichard, West Moors, Wimborne, displayed an interesting collection of Alpines, such as Androsace lanuginosa, Linaria alpina rosea, and Wahlenbergia vincæflora. (Bronze Medal.)

Mr. Vincent Slade, Staplegrove Nursery, Taunton, arranged a very attractive collection of Zonal Pelargoniums and a batch of Polypodium cambricum. (Bronze Medal.)

The Lipworth Nursery Co., Hockley Heath, exhibited a good collection of Pentstemons. (Silver Medal.)

Mr. Fred. Cross, Daybrook, Nottinghamshire, exhibited stands for floral decorations. (Bronze Medal.)

Mr. J. H. Marsden, Malvern Link, displayed early-flowering Chrysanthemums and other hardy flowers. (Bronze Medal.)

Messrs. Robert Sydenham Limited, Birmingham, displayed rural table decorations filled with Carnation blooms. (Bronze Medal.)

Mr. W. L. Pattison, Shrewsbury, exhibited a great variety of Viola flowers. (Silver Medal.)

Mr. Geo. Underwood and Messrs. J. R. Compton & Sons, Macclesfield, also showed Violas. (Silver Medals.)

Messrs. Rich & Co., Bath, displayed a collection of border flowers, in which prominence was given to spikes of Gladiolus and Pentstemons. (Silver Medal.)

Messrs. A. R. Brown, Ltd., King's Norton, Birmingham, showed many Carnations and Picotees in a light and graceful manner. (Silver Medal.)

Mr. A. W. Thorpe, Lichfield, was awarded a Silver-gilt Medal for Chrysanthemums.

Mr. Robert Bolton, Warton, Carnforth, put up a large exhibit of Sweet Peas, comprising most of the leading varieties; Lancashire, Hercules, Agricola, Tom Bolton, Thomas Stevenson, and Nancy Perkins were, with others, shown in excellent condition. (Silver-gilt medal.)

Messrs. S. Bide & Sons, Farnham, Surrey, also had an excellent exhibit, pleasingly relieved with small plants of Kochia; the following varieties of Sweet Peas were of outstanding merit: Scarlet Emperor, Dorothy Thomas Stevenson, Aquita, Mrs. Stewart Champion, Premier, Orange King, Elfrida Pearson, and Stirling Stent. (Silver Medal.)

Mr. G. W. Miller, of Wisbech, showed Apple "Miller's Red Victoria," sprays of Viola cornuta, and Pyethrum "Queen Mary." (Bronze Medal.)

Answers to Correspondents

A Legal Point: *Constant Reader.* You are not entitled to leave on the Saturday, and you are certainly liable to do any work necessary to preserve the greenhouse plants on Sunday. Strictly speaking, you should not leave until the Monday evening, but your employer ought not to stand in the way of your entering your new situation on the Monday morning if you cannot arrange to start on the Tuesday. Try and settle the matter amicably with him, as the question of a few hours can scarcely make any difference to him, and may mean a great deal to you. We assume that there is no special custom in your locality affecting the point.

Antirrhinums Diseased: *Reader.* The plants are so badly affected by fungus derived from the soil that it is advisable to burn them and treat the soil with gas-lime. Do not plant Antirrhinums in the same soil next year.

Carnation Leaves: *A. G. B.* The leaves you send show the early stage of the Carnation rust (Uromyces caryophyllinus). As a preventive of this disease, spraying with potassium sulphide is recommended. You should remove, with a sharp knife, all diseased leaves and pay especial attention towards keeping the foliage on the plants perfectly dry. During the coming winter, the plants should be kept moderately dry at the roots, but they should at no time be allowed to suffer from want of water.

Cattle Poisoned: *H. P.* The specimen was withered; plants sent through the post should be packed in damp moss; but there is little doubt that it is the common Chicory (Cichorium Intybus). We have never heard of this plant being poisonous to cattle. If you have any trees of Laburnum, Yew or other Conifers we should rather suspect these as the cause of the trouble.

Celery Diseased: *J. A.* The leaves sent are badly affected with the fungus Septoria petroselini, which also affects the leaves of Parsley. We fear it is too late to save this year's crop. Next season the Celery plants should be sprayed with a solution of ammoniacal carbonate of copper when they are young, repeating the sprayings occasionally during the period of growth.

Gooseberry Shoots for Examination: *J. H.* Gooseberry-mildew is not present on the specimen submitted. The appearance of the shoot, however, suggests the presence of Botrytis.

Lilium auratum: *W. N. C.* After your plants, which are growing in pots, have finished flowering you should afford plentiful supplies of clear water, with an occasional application of weak liquid manure, until the foliage commences to turn yellow, when water should be gradually withheld. When the leaves have fallen, cut away the stem to within 3 or 4 inches of its base and store the pots in a dry, frost-proof place. In the spring, carefully shake the bulbs free from soil, and repot them in suitably-sized pots, keeping the bulbs low, and leaving ample room for applying top-dressings, which should be done when the stems are about 1 foot high.

Melons Failing: *Anxious One.* We suspect that the plants are affected with eel-worm, and if you care to send portions of the Melon roots we will definitely inform you. An illustrated article dealing with eel-worms appeared on pp. 30 and 31 in the *Gardeners' Chronicle* of July 13 last.

Names of Plants: *P. H. R.* The Black Broom (Cytisus nigricans).—*La Cloche.* Symphytum officinale variegatum.—*M. C.* Euphorbia Lathyris, "Caper Spurge."—*The Country Gentleman Association.* The name of the plant sent is Spergula arvensis. "Corn Spurry," a common Cornfield weed. It is an annual, and can be got rid of by the usual means of clearing the land, hoeing, &c. The nature of the soil has little to do with its presence, which is due to lack of attention in weeding.—*F. C. L.* 1, Possibly Ranunculus sceleratus; 2 and 3, it is not possible to name umbelliferous plants from description only; send specimens.—*F. R.* Lychnis Haageana.—*H. Manton.* 1, Monarda didyma; 2, Calamintha alpina.—*J. W.* 1, Lysimachia quadrifolia; 2. Veronica austriaca var. prenja; 3, Inula Helenium; 4, Phacelia tanacetifolia.—*A. E. J.* Ranunculus bulbosus.—*Enquirer.* 1, Carthamus tinctorius; 2, Erigeron canadensis.—*W. E. J., Hull.* Lysimachia vulgaris.—*W. M.* Not recognised; send when in flower.—*J. McD.* Oncidium flexuosum and Gomesa planifolia.—*R. O.* 1, Epidendrum polyhulbon; 2, Epidendrum fragrans; 3, Oncidium barbatum; 4, Stelis ophioglossoides; 5, Dendrobium moniliforme; 6, Brassia verrucosa.—*A. F., Cardiff,* 1, Catalpa bignonioides; 2, Magnolia conspicua.—*F. W. C., Ware.* Vanda cœrulea; not a rare species, but one of the most beautiful of the Vandas.—*T. T.* 1, Pteris longifolia; 2, Adiantum trapeziforme; 3, Blechnum corcovadense; 4, Pteris cretica.—*Co. Longford.* Aconitum Napellus. *J. F. J., Bromley.* Your Pelargonium is very bright in colour, but probably not sufficiently distinct from some varieties already in cultivation to make it of special commercial value.—*J. H. S., Carnarvon.* Clematis Flammula.—*P. E. C., Yalding.* The Potatos you mention will probably have acquired a bitter, somewhat stringent flavour, which will render them disagreeable. They are certainly not poisonous, and if peeled rather thickly, so as to remove all the discoloration, may be used.

Patent: *A. P.* Your best plan would be to consult a reputable firm of patent agents—there are several such—who would tell you if there is a similar article already patented. If there is not, they would advise you as to future procedure, and would undertake to place the article with a reliable firm of manufacturers. Inventions are often provisionally protected (in which case the fee is much less than when the invention is fully patented), and the inventor or his agent then approaches a manufacturer who, if he undertakes to make the article, completes the patenting and pays the inventor a royalty, or offers to buy the invention outright.

Pears Diseased: *Miss R. W.* The fruits are badly affected with the Pear scab (Venturia pirina pirina). If possible remove and burn during the winter all diseased shoots, since it is on them and on the leaves that the fungus develops and produces spores which infect the fruit. During the winter thoroughly syringe the trees with a solution of sulphate of iron, and in the spring spray them with Bordeaux Mixture at half strength when the buds are beginning to open, repeating the operation when the petals are falling from the flowers, and again when the fruits have attained the size of Peas. If the trees are very old, it would be advisable to replace them by young specimens.

Phalænopsis Esmeralda: *A. E.* If the roots of your imported plants are sound, they should not be cut away from the plant. The best receptacles in which to grow this plant are teak-wood baskets, shaped similarly to ordinary flower-pots. Place as many of the roots inside the baskets as possible, leaving sufficient room for the potting material, some of which should be worked in between the bars, and the remainder may hang over the sides. Place short portions of Fern rhizomes between the roots in the lower part of the basket as drainage, and fill with a mixture of Osmunda fibre and Sphagnum-moss, cut rather short, with the addition of broken crocks, and finish with a surfacing of living heads of Sphagnum-moss. These plants may also be grown in pans about 4 inches deep without side holes. Use clean crocks for drainage, and, in potting, place small lumps of charcoal amongst the compost; otherwise use the compost as for baskets. The plants may either be suspended from the roof or stood on the stage near to the roof glass, on inverted pots, standing in saucers of water. Phalænopsis require a summer night temperature of 70°, rising from 75° to 80° by day, and during the winter a temperature of from 60° to 65° by night, rising to 70° by day. The plants should at all times be shaded from bright sunshine. After being potted, they should be watered very sparingly, until the fresh roots have entered the compost, when water should be given freely. Syringing between the pots should be done at least twice daily during bright weather, at the same time directing a little water on the under-sides of the leaves. These plants flower in spring and early summer.

Rose Diseased: *M. B. G.* The leaves are affected with "black spot" (Actinonema rosæ), due largely to the wet summer. Spray the plants with potassium permanganate—5 grains to 1 gallon of water—and collect and burn all affected fallen leaves.

Samples of Sand: *Plants.* We do not consider either of the three samples of sand you submit suitable for general use; they are all too fine, but we place them in the following order of merit:—red, white, grey.

Shrubs for a Pergola: *Gloster.* The following is a list of 20 hardy shrubs, other than Roses, which will be suitable for your pergola:—Actinidia chinensis, Clematis montana, C. m. rubens, C. Flammula, C. Jackmanii rubra, C. Mme. Baron Veillard (lilac-rose), C. Princess of Wales (bluish-mauve), C. La Lorraine (rose), Jasminum officinale, J. revolutum, Lonicera sempervirens, L. Late Dutch, Vitis Coignetiæ, V. Henryana, V. Thunbergii, Wistaria sinensis, W. multijuga, Ceanothus Veitchianus, Laburnum Vossii, and Eugenia Ugnii.

Silver Elm: *S. G.* Trees and shrubs with variegated foliage frequently revert to the green-foliaged types, and probably the very wet season is largely responsible for the excessive reversion displayed by your example. Branches which have reverted rarely, if ever, again produce variegated leaves, so your best plan would be to remove as many green-leaved branches as you can without disfiguring the tree.

Twin Dahlia: *J. C.* The example is interesting and somewhat uncommon. It results from an abnormal development of the growing point of the flower-bearing shoot. The latter underwent division, branching, as it were, at its tip, with the result that two inflorescences were formed instead of one. The evidence that this took place at a very early stage is to be found in the closeness of the two apposed flower-buds.

Uncommon Shrubs for Quadrangle: *Arbor.* The selection of rare trees and shrubs for your Oxford garden would depend on the size of the ground at your disposal; there are very many interesting species with which you may experiment. The *Gardeners' Chronicle* contains numerous lists and descriptions of rare, half-hardy trees and shrubs. So recently as August 10, in "Notes from Leonardslee," and July 13, in the description of "Nuneham Park," which is in your immediate neighbourhood, mention is made of many such plants. As you intend planting Ginkgo biloba, you should insist on having seedling trees, as grafted specimens and those raised by layering are never satisfactory. The Gleditschia is preferable to the so-called Acacia. Wistaria multijuga produces much larger racemes than W. sinensis, but it does not flower so freely. Acer palmatum atropurpureum, A. p. dissectum, A. p. linearilobium atropurpureum, and A. p. sanguineum are good forms of Japanese Maples.

Woodlice in Glasshouses: *G. S.* Traps may be made to catch this pest by hollowing out pieces of Potato, Turnip, &c., and placing them hollow-side downwards. If the baits are examined every morning it will be found that they contain woodlice, which must be killed, afterwards replacing the baits. Another method of killing woodlice is by placing baits which may be poisoned with Paris green or white arsenic. There are also other effective poisons on the market:—Steiner's "Vermin Paste" is recommended by Mr. H. W. Ward, who has used it in his nursery at Rayleigh. The paste should be mixed with Barley-meal or middlings and set on pieces of glass, wood or tin, and then placed in the haunts of the woodlice. This means has been found sufficient to eradicate the pest in a week or ten days.

LA MORTOLA.

THOUGH the garden at La Mortola is well known to most visitors to the Riviera, its full significance is perhaps not universally appreciated. It is primarily a garden of beauty and loveliness, due in part to its unique situation, and in greater measure to the genius and care of its founder, Sir Thomas Hanbury. Yet it has another value; in the words of Sir Joseph Hooker, it is "a garden of exotic plants, which, in point of richness and interest, has no rival among the principal collections of living plants in the world." It is a sub-tropical garden of great scientific and economic importance.

Occupying the slope of a hill (see fig. 76), the garden ends in a rocky point, formerly covered with Myrtle*, and jutting out into the blue waters of the Mediterranean. On the east rise the terraces, on which the Vine and Olive grew in bygone days; on the west a deep ravine descends from the high mountains; and on the sides of this valley, which in 1860 were sparsely clad with Aleppo Pines, an abundant exotic and indigenous vegetation now luxuriates. Nearly 6,000 different species of plants are cultivated. The garden, which is mostly limestone, is 112 acres in extent.

An early account of La Mortola was given in the pages of this journal† by Dr. Masters, who refers to it as "a real garden of acclimatisation" seven years after its purchase in 1867. Assisted in the beginning by his brother, Daniel Hanbury, who was a distinguished botanist especially interested in medicinal and other useful plants, Sir Thomas Hanbury continuously developed the scientific side of the garden, which is now provided with a botanical museum, herbaria of indigenous and cultivated plants, and a good reference library. Seeds and plants are distributed to almost every botanic garden in the world, and to many private gardens as well. Fresh and dried specimens for study and investigation are liberally sent to numerous scientific laboratories. Students are admitted freely. The introduction of new plants is steadily pursued. Lady Hanbury continues with zeal the aim of Sir Thomas, who often said that to distribute seeds and plants and to encourage others in their love of nature was his mission in life. We owe to Lady Hanbury the publication recently of a most valuable Catalogue‡ which has been prepared during the past few years by the learned curator, Mr. Alwin Berger.

The Catalogue is a handsome volume of 468 pages, with portraits of Sir Thomas Hanbury and Daniel Hanbury, and six plates of different views of the garden and its characteristic vegetation. The main part of the book, 350 pages, is an alphabetical list of the plants which are cultivated, with references to the books and journals which give good descriptions and figures of the plants enumerated, and with notes on the native country and time of flowering of each plant. These references render the book of great use to amateurs, who are directed at once to sources of information that are often sought for in vain in ordinary lists.

The Catalogue proper is prefaced with an interesting account of the history of the garden and of the soil and climate of La Mortola. Those who desire more information on certain points should consult a fascinating chapter in the late Prof. Strasburger's book, *Rambles on the Riviera*, the English translation of which was made by O. and B. Casey and published in 1906.

Appended to the Catalogue are 85 pages of most interesting Notes, which contain valuable but succinct information. Taking as an example the genus Acacia, we learn from the Catalogue that 69 species are cultivated at La Mortola. Mr. Berger states in the Notes that a large number, especially of Australian species, were already planted in 1867. Some species, as A. dealbata, A. decurrens, A. harpophylla, and A. melanoxylon are long-lived trees, with excellent hardwood, the last-named forming a fine erect stem. Most other species do not attain any considerable age. A. dealbata and several other species dislike lime in the soil, and are therefore generally grafted on A. retinodes. The following species, commonly called "Mimosa," are extensively planted on the Riviera for the exportation of their flowers:—A. dealbata, A. pycnantha, A. cultriformis, A. podalyriifolia, A. obliqua, and A. Baileyana. Three hybrids, which originated in Mr. L. Winter's garden at Bordighera, are also mentioned. A long account is given of A. sphærocephala, the large hollow spines of which are inhabited by small colonies of ants, which at La Mortola are frequently observed feeding on the liquid that exudes from the large black glands present on the petioles of the leaves.

The information contained in the Notes will prove useful to gardeners in the south-west of England and the south of Ireland, where species of Acacia like A. dealbata and A. melanoxylon make fine trees which flower freely and produce good seed. The Catalogue, of course, contains the names of many plants which cannot be grown in the open air, even in the most favoured spots of the British Isles. In this respect there is a great difference between La Mortola, on the shores of the Mediterranean, and places on the Italian lakes. Most, if not all, of the trees and shrubs at Pallanza, on Lake Maggiore, thrive in gardens in Cornwall and Kerry. Casuarina may be instanced as a genus which cannot be grown out-of-doors in any part of this country; yet, at La Mortola, six species thrive, one of which, C. robusta, is represented by a tree 55 feet in height and 7 feet in girth.

A few notes are given concerning indigenous species, such as Lavandula Spica, from which Lavender oil is distilled, Phillyrea augustifolia, and species of Cistus. Mr. Berger enumerates four varieties of Chamærops humilis, the dwarf Palm, which was formerly wild on the Riviera, but appears to have been extirpated about 1841. It is scarcely hardy at Kew, although it endured without injury, on the Riviera, the severe winter of 1820, when the thermometer fell to 14° Fahr. It is now generally said to be only indigenous far south, as in Andalusia in Spain, on the south cape of Corsica near Bonifacio, in Sicily, Algeria, Morocco, &c.; but I saw it a year ago growing in plenty on the coast of Spain, about 18 miles south of Barcelona.

La Mortola is very rich in succulent plants, and to these Mr. Berger has paid special attention. No fewer than 114 species of Agave are cultivated, of which 66 are especially referred to in the Notes, where some new species are described. We are promised by Mr. Berger a full account of this important genus, like the monograph that he has already published on Aloë. The latter genus is equally rich in species at La Mortola. Of Mesembryanthemum, a genus specially studied and beloved by Mr. Berger, there are no fewer than 115 species in the garden. The plants of this genus are of extraordinary interest, many of them assuming quaint forms, and resembling pebbles, the throats of animals, paper mouthpieces of cigarettes, and other queer objects; whilst some bear capsules, provided with a beautiful mechanism, by which the seeds are thrown to a considerable distance. Mr. Berger's notes on the Cactaceæ are very valuable, especially his account of the genus Opuntia or Prickly Pears, many

* La Mortola probably derives its name from the Myrtle, which is known in Italian as mirto or mortella; murta in the local dialect.

† *Gard. Chron.*, July 11, 18, 1874, pp. 35, 68.

‡ *Hortus Mortolensis*: Alphabetical Catalogue of plants in the garden of the late Sir Thomas Hanbury, K.C.V.O., at La Mortola. Compiled by Alwin Berger. London: West, Newman & Co., 1912. Price 4s. paper, 6s. cloth.

species of which are valuable as food for stock and fruit for man.

The Orange family is represented at La Mortola by the most complete collection in existence, which is enumerated by Mr. Berger under 10 species, comprising many varieties and sub-varieties. Of these, the most curious, perhaps, is the Bizarria (Citrus Aurantium, var. amara, sub-var. Bizarria), which is said to have originated before 1674 as a graft hybrid in Florence. The leaves are very varied, while the fruits show mixed characters of Orange, Lemon, and Lime. This plant was lost to science for a long time, but was found by Prof. Strasburger in the Royal Horticultural School at Florence.

The conifers, which succeed best at La Mortola, are certain species of Pine. The finest is Pinus canariensis, one example of which is 77 feet high and 8 feet in girth. This tree is remarkable for producing epicormic branches on the trunk, after the manner of P. rigida. The native or Aleppo Pine, P. halepensis, now covers with a dense forest the western slope of the valley, and is a good instance of the recuperative power of a forest when not interfered with. It has grown from a few sparse trees without other care than protection from man and goats, cutting or grazing having been prohibited for many years. There are many species of Araucaria, Cupressus and Juniperus. It is remarkable that of the three Cedars, it is the Deodar which succeeds best in the climate of La Mortola, which is noted for its long-continued summer drought. Cedrus atlantica and C. Libanii

SWEET PEA, "MAY CAMPBELL,"

COLOUR OF FLOWERS, PALE CREAM MARKED WITH CARMINE.

Printed by Temple Press Ltd., London, E C.

are apt to die suddenly. The Silver Firs which are most thriving are Abies cilicica and A. Pinsapo. Picea excelsa manages just to exist in the shadiest part of the valley, and is not so successful as the Himalayan P. Smithiana.

There is a large collection of Roses at La Mortola, among which may be seen Rosa damascena trigintipetala, from the Rose fields of Kasanlik, in Bulgaria, where it is cultivated for the production of Attar of Roses (see *Gard. Chron.*, April 20, 1912, p. 253).

The Catalogue is accurately printed, the only error which I have noticed being on p. 277, where the varietal name of the Rose just mentioned is wrongly given. In conclusion, we thank Lady Hanbury for the style in which this book has been printed and for issuing it at a price so low as to make the Catalogue accessible to working botanists and gardeners; and we also congratulate the author, Mr. Berger, on a work of signal merit. *A. Henry.*

SOME RECENT DEVELOPMENTS IN SWEET PEAS.

(See Supplementary Illustration.)

The variety Charles Foster, distributed by Mr. Robert Bolton some two or three years ago, is quite distinct in form and growth from the Spencer varieties, the flower being of exceptional size and substance, though very prone to produce double standards. The colouring of Charles Foster marked it at once as a distinct break, and several varieties, including Afterglow, Dorothy, Prince George, Red Chief and Florrie, that have emanated from it bear the same characteristics insomuch that the colours are totally distinct from anything we have had previously. The habit of growth is also distinct, the plants being probably from 1 foot to 2 feet dwarfer in growth than such varieties as Mrs. C. W. Breadmore and John Ingman. In addition, the haulm is considerably stronger and shorter jointed. Unfortunately, all these varieties require somewhat cool conditions to bring them to perfection. But given such conditions their colouring is extremely beautiful, and for decorative effect they are unsurpassed.

Another very decided break in colour was obtained by Messrs. Dobbie and Co. a year or two ago in the variety May Campbell (see Supplementary Illustration), for although there was a cream-ground flake of the old grandiflora type, May Campbell was, I believe, the first of its type of the Spencer class to be distributed. When well grown, May Campbell is a wonderfully striking variety, as, apart from the unique colouring, which is rose or carmine flake on a cream ground, the form of the flower is so good as to commend it to all lovers of Sweet Peas. It is a first-class exhibition variety, as well as being suitable for decorative purposes. For some reason or another the striped or flaked varieties do not appeal to all growers of the flower, and many judges do not regard them with favour in competitions. Nevertheless, several of them, such as Mrs. W. J. Unwin, Birdbrook, Spencer America, Miss B. Gilbert, Loyalty and Aurora Spencer, furnish exceptionally good bunches, which are not surpassed in size, quality, or form of flower by the best of the self-coloured varieties.

Another decided break in colour was obtained in the deep-orange variety Stirling Stent, which is even deeper in colour than Earl Spencer, though the blooms are somewhat smaller. It is regrettable that all varieties of this colour need to be shaded from brilliant sunshine. There are already signs that in the near future raisers will give us sunproof varieties in this colour. *Thomas Stevenson.*

DIMORPHOTHECA ECKLONIS.

This plant, generally treated as a greenhouse subject, is far more effective in the open than under glass. In the open air it makes sturdier growth and flowers profusely. Growing rapidly, effective plants for the outdoor bed may be raised from cuttings in one year if occasionally stopped. Good plants 2 feet in height and as much through can be easily lifted in the autumn, placed in large pots, kept where severe frost will not harm them, and planted out in the spring. This practice is quite applicable to any district in the British Isles. In favoured sites in the south-west the Dimorphotheca may be left undisturbed in the open through the winter, though if the weather should prove unusually severe the plants will probably die. It is certainly a tender plant, far more so than Hakea suaveolens, Calceolaria Burbidgei, Bowkeria Gerardiana, Abutilon vitifolium, Buddleia Colvilei and Callistemons, but in mild winters it will not be harmed in the open in Devon and Cornwall. The plant here illustrated was put out in the open border in April a few years ago. The first year it was lifted in November, potted and placed under a balcony, where it remained uninjured through the winter. It was replanted in the open the following April. The next winter it was left undisturbed, but was covered with a mat in times of frost and came through unharmed. It eventually became bare at the base and was destroyed, but the year after its removal self-sown seedlings sprang up around the site it had occupied and grew well. A fair-sized bush has a pretty effect when in full bloom, being covered with Marguerite-like flowers, each rather over 3 inches in diameter. When expanded, the ray florets are pure white, and form a pleasing contrast with the violet-purple of the central disc. The golden anthers which appear in the purple discs enhance the beauty of the flowers. The reverse of the petals is purple-blue, and when some flowers are fully expanded and others are in bud, the contrast of colour is very pleasing. In dull weather the blossoms remain closed, but even then a plant covered with countless, tapering, purple buds is by no means unattractive. A good bush will bear some hundreds of flowers. The foliage is not unlike that of some of the Candytuft family, and is inclined to be fleshy. This species is easily raised from seed, and cuttings strike as readily as Willows, so that its propagation is extremely simple. Plants grown on sturdily for a year under glass, hardened off in the following spring and planted out in May, will be attractive in the border for a lengthened period and may either be lifted and repotted in the autumn or thrown away. When grown in the conservatory the plants should be kept close to the glass, or they will become drawn and will then compare very unfavourably with specimens grown in the open. On its first introduction this Dimorphotheca was styled the Transvaal Daisy, a title which confused it with Gerbera Jamesonii, sometimes known by the same name, but which, when an English appellation is given it, should be called the Barberton Daisy. *Wyndham Fitzherbert.*

Fig. 77.—Dimorphotheca ecklonis: flowers white with violet-purple disc.

SEZINCOT HOUSE.

Sezincot House (see fig. 78), the residence of J. T. Dugdale, Esq., is situated in one of the most picturesque parts of the Cotswold Hills, at a distance of three miles from Moreton-in-the-Marsh. It is approached by a long, winding drive which crosses a richly-timbered and undulating park; on either side of the roadway overhanging trees, mostly of Oak and Elm, form an avenue of striking beauty. Here and there in the park clumps of Oaks have been planted so closely that from a distance each group resembles one huge tree with several trunks. The mansion was erected by the late Sir Charles Cockerell, Bart., in the early part of the 19th century, and is in the style of an Indian palace. It is surmounted by a magnificent copper dome, from which extensive views of the Warwickshire hills may be obtained. Attached to the mansion is an imposing conservatory, of a semi-circular shape (see fig. 79). Growing in this conservatory are unusually fine specimens of Clethra arborea (the Lily-of-the-Valley tree) and Brugmansia sanguinea, whilst baskets of Achimenes in variety are suspended from the roof.

Proceeding from the conservatory, the visitor enters the flower garden, which is situated to the south of the mansion. Since Sezincot became the property of Mr. Dugdale, the flower garden has been largely remodelled, and, at the time of my visit, was a mass of bloom. The owner is a great lover of gardens, and has a wide knowledge of plants. Roses are largely employed in the scheme of decoration, and the Rose beds are in several instances carpeted with Violas. I noticed fine beds of Lady Ashtown, Caroline Testout, Lady Roberts and Richmond, whilst the Lyon, Hugh Dickson, and Molly Sharman Crawford are also extensively planted. One large semi-circular flower-bed was planted with such subjects as Calceolaria Burbidgei, Abutilon Andersonii, Eucalyptus globulus, Chamæpeuce Casabonæ, Iresine Lindleyi and Cineraria maritima, creating a beautiful effect. Two beds filled with Begonia Corbeille de Feu and carpeted with Veronica Andersonii were especially noteworthy. Various other subjects, including Lantana salvifolia and standard Heliotropes are also largely utilised, the latter for their fragrant perfume. During the spring bulbous plants and other early-flowering subjects provide a bright display of colour. One of the features of this garden is a handsome stone fountain. The beds are all surrounded by grass, which invariably gives a more restful and pleasing effect than a gravel setting. Well-flowered specimens of Hydrangea hortensis in stone jars on a terrace-wall adjoining the mansion contribute largely to the floral display. From this point Mr. J. H. Dines, the head gardener, pointed out a handsome specimen of Quercus lucombeana, and a well-shaped tree of Araucaria imbricata, while near by was an unusually fine plant of Magnolia Soulangeana.

An ornamental stone bridge spans a wide stream, which feeds a seven-acre lake (fig. 81) some distance below. The bridge affords one of the most charming views in these delightful gardens. On the high ground in the distance stands an Indian temple, containing a stone idol and overlooking a sparkling stream, which is widened into three pools at intervals, with a fountain (see fig. 80) playing in the centre of each. On either side of the temple, two figures of oxen, exquisitely carved, keep guard in solemn silence. Near the water's edge, Japanese Irises, Spiræa palmata and S. Aruncus grow with especial freedom; while lower down plants of Gunnera manicata and Saxifraga peltata have developed to an enormous size. In the background tall specimens of Cedrus atlantica glauca, C. Libani, and Cupressus Lawsoniana elegans attract attention, whilst near the stream is a beautiful plant of Arundinaria nitida. Near this is a young tree of Ginkgo biloba in splendid growth, and Clematis montana rambles freely on the adjacent forest trees. Large breadths of Erica carnea and E. stricta have been naturalised on the slopes towards the left, while in the spring the broad expanse that meets the eye is gay with countless bulbs. On the lower side of the bridge the banks have been planted with Bambusa palmata and such Rhododendrons as Pink Pearl, Cynthia and Cunningham's White, all of which are flourishing in specially-prepared soil; while Hypericum calycinum and Viola cornuta purpurea luxuriate on the adjoining slopes. This portion of the pleasure grounds is known as the "Thorneries." Beyond it is a representative collection of

[Photograph by J. W. Farrall.

Fig. 78.—SEZINCOT HOUSE, GLOUCESTERSHIRE, THE RESIDENCE OF J. T. DUGDALE, ESQ.

Japanese Maples, and near them fine beds of Deutzia crenata fl. pl. and Diervilla rosea. A specimen of Pinus Cembra, 72 feet in height, is a notable object, and there are fine trees of Taxodium distichum, Abies nobilis glauca and A. Pinsapo. A collection of hardy Ferns adds to the interest of this portion of the grounds. Among other subjects noted were Leycesteria formosa, Escallonia macrantha, Cytisus nigricans and Spiræa Lindleyana, all flowering freely.

noticed Spiræa ariæfolia, Rhus Cotinus, Olearia Haastii, Cratægus Crus-galli and a large bed of Berberis Thunbergii near to the lake side. Adjoining the wild garden a picturesque rock and water garden has been formed beside an overflow from the lake. This is furnished with plants for successional flowering. On the higher portion, Gentiana acaulis appeared in excellent health, while Senecio clivorum and S. tanguticus were growing freely near to the water. Large masses of Primula japonica have been naturalised, and contribute a rich display of bloom. A picturesque summer house is located in this part of the grounds, from which a view is obtained of woods beyond the lake. Numerous weeping standard Roses are planted hereabouts, some of the varieties, such as Mrs. F. W. Flight and Blush Rambler, growing over forest trees.

The glasshouses are situated on rising ground some little distance to the south-east of the mansion. Upon entering them one is impressed by the high standard of cultivation of the various subjects. Scutellaria Mociniana especially attracted my attention, and a fine batch of seedling Amaryllis appeared promising. Vinca rosea, Browallia speciosa major and Verbena Miss Willmott were flowering freely. In addition to the plants named, batches of all the more useful decorative subjects are grown, including a large quantity of Chrysanthemums. Grapes and Peaches are well cultivated. Young vines of Muscat of Alexandria and Madresfield Court, planted in 1908, were bearing large, well-finished bunches. Peaches are grown out-of-doors on a south wall furnished with glass copings. Mr. Dines informed me that the varieties which succeed best are Waterloo, Royal George, Bellegarde and Dymond. There are numerous flower-beds near to the plant houses filled with Carnations, Pentstemons and Celsia cretica.

The herbaceous borders in the kitchen garden (see fig. 82) are planted in bold masses, and among the subjects in flower I noticed Cimicifuga racemosa, Anchusa italica Dropmore variety, Geum coccineum Mrs. Bradshaw, and a number of Gaillardias. Some fine specimens of Hydrangea paniculata and Buddleia varia-

[Photograph by J. W. Farrall.

Fig. 79.—CONSERVATORY AT SEZINCOT HOUSE.

A wild garden was completed about 12 years ago. It is approached over a rustic wooden bridge spanning a streamlet overhung by evergreens. The trees include Liquidambar styraciflua, Quercus coccinea, Abies pungens glauca and Retinospora squarrosa, while of shrubs I bilis magnifica were about to produce their beautiful blossoms. Buddleia Colvilei was flowering freely on a west wall. Clematis Jackmannii in several varieties and climbing Roses are grown on poles at the back of a long flower border, and form a pleasing feature. *J. G.*

THE ROSARY.

CULTURAL NOTES FOR SEPTEMBER.

Roses nowadays often make a good display throughout the month of September. A few of the best varieties for autumn blooming are found in the following list, and I have arranged them according to their primary colours as a guide to intending planters.

Very dark: Victor Hugo, Chatèau de Clos Vougeot, Fisher Holmes, Sarah Bernhardt, and The Dandy. *Dark red:* Captain Hayward, Mme. Victor Verdier, Marquise de Salisbury, Grüss an Teplitz, General McArthur, and Etoile de France. *Red:* Ulrich Brunner, Dupuy Jamain, Lady Battersea, Corallina, Richmond, Liberty, Ecarlate, Mrs. B. R. Cant, Tom Wood, Oscar Cordel, Hugh Dickson, and Ben Cant. *Pink:* Lady Ashtown, Caroline Testout, Mme. Abel Chatenay, Killarney, Mrs. John Laing, Mrs. R. G. Sharman-Crawford, Zéphirine Drouhin, Mrs. Edward Mawley, Mina Barbanson, and William Shean. *Orange-yellow:* Mrs. Aaron Ward, Lady Hillingdon, Mme. Ravary, Duchess of Westminster, Edu. Meyer, Lady Roberts, William Allen Richardson, Gustave Regis, Mme. Falcot, Mme. Hector Leuilliot, and Rêve d'Or. *Pure yellow:* James Coey, Miss Alice de Rothschild. Souvenir de Pierre Notting, Le Progrès, Mrs. Peter Blair, Sénateur Mascurand, Mme. Pernet-Ducher, Beryl, and Harry Kirk. *Salmon-yellow:* G. Nabonnand, Betty, Dr. Grill, Jacques Vincent, Theresa, and Safrano. *White:* Frau Karl Druschki and Molly Sharman Crawford. *Flesh-white:* Viscountess Folkestone, Countess of Derby, and La Tosca.

The preparation of the ground was dealt with last month, but as planting can often be done in October, it should be continued wherever possible.

The preparation of stocks for Roses is of great importance, and the present is an excellent time to take cuttings of the Manetti or any of the Briars which are fairly ripe. Regarding the latter, I favour cuttings from the seedlings rather than from the shoulders of standards. There appears to be considerable difference between these two, and as the majority of our seedling briar stocks are purchased from the Continent, there is probably something in it. At all events, although cuttings from our own hedge briars when cultivated in standard form callus very freely, and look promising for a time, they do not give nearly the same percentage of successes in the end: many failing to withstand the early spring winds. Another advantage in cuttings rooted from the seedling briar stocks is that they not only provide a straighter barrel upon which to work the Rose-buds, but also contain scarcely any of the pith found in the cutting-stocks obtained from hedge briars.

[Photograph by J. W. Farrall.

FIG. 80.—THE SERPENT FOUNTAIN, SEZINCOT HOUSE.

(See p. 170.)

It is well to take the cuttings of stocks before the sap descends too much; this ensures a quick and almost certain callus. Nine inches is not too long, and it is important to make sure that the lower eyes are cut out. Two sound buds left at the top are ample. Set the cuttings in fairly firm soil; at any rate, they should always rest well upon the bottom of the trench or hole. The following is an excellent routine:—Turn over—not deeply—enough of the soil to allow of a line being set. Then cut down beside this, and before removing the spade draw it towards you. Having opened this slit-like trench, put in the prepared cuttings 3 inches apart, carefully pressing them to secure a firm bottom. Should the soil not be naturally of a sandy nature, it is well to put a little sand into the bottom of the trench, or slit, before the cuttings are inserted.

Now put up a little of the soil towards them, and tread firmly. Proceed to turn over more of the soil until there is sufficient to allow of the line being reset 15 inches from the first row. The soil should then be dug over about 18 inches from where the line was first set, and a fresh row of cuttings inserted. Continue this process until the desired number is planted. Cuttings of De la Grifferæ and Polyantha stocks may be rooted in the same manner.

Should the ground be dry at the time of inserting the cuttings, pour water into the trench before putting them in. This is far better than any subsequent watering.

The planting out of stocks will be dealt with in due course. Here we frequently begin to insert our cuttings while a great deal of foliage remains, provided about three parts of the shoot be partially ripened. The leaves are easily stripped off with an old glove of fairly stiff leather. Grasp the glove firmly, and work from the point of the shoot downwards. A little damage to the eyes does not matter, since they are to be cut out immediately.

The Wichuraianas, also most of the climbing Polyanthas, can be rooted easily now. In this case it will not be necessary to cut out any of the eyes or buds; nor need the cuttings be made longer than 6 inches. They should be planted 9 inches to a foot apart in the rows, the latter 2 or 3 feet away from each other, according to the habit of growth of the several varieties.

A few ripe plants may be lifted by the end of the month, and (if carefully potted, kept well sprinkled overhead, and placed in some cool, shady, and preferably close position, such as a deep pit or frame), they will be very useful for late forcing next spring.

Remove the leaves at once if they are at all succulent; otherwise they quickly absorb the sap, and cause injurious shrivelling of the wood. The pruning and after-treatment of these will be dealt with later on.

A small batch of established plants in pots may be pruned at once, and placed for a time in a similar house to that advised for newly-lifted plants. They will soon start into growth, and will develop under a gentle treatment much better than if hurried at first and started later.

As the season gets colder, this first batch will need a slightly warmer atmosphere. I should advise a choice of such readily-opening varieties as those generally utilised by the large growers for market. Any suspicion of doubleness will end in the buds damping off and failing to expand from lack of light during the winter. Killarney, White Killarney, Richmond, Mrs. W. J. Grant, Molly Sharman Crawford, and Lady Hillingdon afford a good range of colour. Climbers growing in borders under glass should be well ripened by the end of this month, if not kept too wet at their roots. These will be almost sure to grow a little quicker than those in pots in the open. There is little to do as regards pruning if thinning out the wood was done in the late spring, as suggested in previous notes. Any immatured tips, however, should be cut away. I do not favour the plan of cutting off the leaves of these unless they are more than half-

ripened. They will naturally be forced off as the buds develop.

All pot Roses need a general overhauling now, whether they have been in pits or in the open. Worme and drainage are the chief things to look to; and it is a good plan to finish all necessary repotting.

It will be advisable to look over all budded Roses and loosen any ties that have not rotted or are not already loosened. *Practice.*

NOTICES OF BOOKS.

A New Guide to Kew Gardens.*

The official and semi-official publications of Kew are numerous and comprehensive, meeting almost every possible want in connection with the Establishment and in relation to horticulture and economic or applied botany generally. But a very large percentage of the 2,000,000 annual visitors require something which, though less expensive, covers as wide a field as the combined special guides and catalogues. This want has now been met in most particulars, except in the price of the new guide. Sixpence is not much, yet many thousands of the visitors, who would like to possess the book, cannot afford even so much as sixpence. At half the price the sale would probably be so much larger that the cost of production would be more quickly realised. The cost of maintaining Kew is a very small item in the nation's expenditure, and a small increase which would render the treasures of Kew yet more widely instructive would be amply justified.

The authorship of the present guide does not appear, but the book is evidently the work of a person, or persons, intimately acquainted with every nook and corner of the gardens, with every notable tree, shrub and herb, with every museum object of importance, and with the history of it all! Yet we miss any reference to the noble specimens of the Evergreen Oak, which constitute a striking feature in the vicinity of the North Gallery, and are the admiration of so many visitors, especially those from foreign parts. A few pages are devoted at the beginning of the guide to the main facts of the history of the gardens and its buildings and departments, its functions and its duties. Then follows a description of the "Botanic Gardens," as distinguished from the "Arboretum," which appears to us not quite a happy distinction to maintain, since the dividing fences between the old botanic garden and the "Pleasure Grounds" disappeared long ago, and some very fine trees of the old arboretum still exist near the main entrance. Further, the new arboretum is essentially botanical. The visitor is supposed to enter by the main gates on Kew Green, and is thence conducted over the lawns to the interesting plantations, trees and structures. The wild garden, the herb garden, the rock garden, the pond, the Iris garden, the aquatic garden, and the like are visited in succession, and their treasures and peculiarities pointed out. The glasshonses come next, and their principal attractions are reviewed, prominence being given to plants of economic value. The same may be said of the four museum buildings, the contents of which are skilfully summarised, about 30 pages being devoted to this section. Finally, there is a description of the arboretum or collection of trees and shrubs arranged in families.

We welcome the appearance of this excellent, popular guide, which is sure to be in great demand.

A few misprints have been noted, and the somewhat frequent employment of the expression "with its" as: "Hippophaë rhamnoides, with its orange berries, should be noticed," is a blemish.

* Popular *Official Guide* to the Royal Botanic Gardens, Kew, including an Historic Notice and Descriptions of the Collections in the Botanic Gardens Proper, the Glass Houses, Museums and Arboretum. Small 8vo., pp. 108 with a key-plan. Price 6d.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 66-71.)

(Continued from p. 151.)

5, SOUTHERN COUNTIES.

Kent.—The fruit crops generally are quite up to the average. Two or three varieties of Apples, viz., Lord Suffield, Stone's and Ecklinville Seedling, which have been condemned as worn out, are carrying first-rate crops of fruit, very free from scab, although the trees were not winter washed. A slatey-coloured aphis has done much damage to the young growths. As a remedy I have been obliged to dip the young growths in a nicotine wash; and in some cases washing has had to be practised. Lane's Prince Albert is carrying heavy crops, even after having fruited heavily last season. Other varieties doing well include Golden Spire, Lord Derby, Stirling Castle, Worcester Pearmain, Barnack Beauty, Tower of Glamis, Charles Ross, Bismarck, and Cox's Orange Pippin. I have never seen Pears looking better. The variety Doyenné du Comice has not only set well, but the fruits promise to be large specimens. Michaelmas Nelis is of splendid flavour, but will not keep more than a few days when ripe. Le Lectier is not so well known as it should be. It is in good condition during December, January, and February. When ripe it is of a straw-colour. Damsons are a heavy crop, but Plums are scarce. Raspberries, of which there are several acres near here, are an enormous crop. Gooseberries also are very plentiful. *George Woodward, Barham Court Estate, Maidstone.*

——The soil is derived from the lower greensand. The frost of April 10-11 was fatal to many Apples and Plums. Strawberries were so dried up in 1911 that they were not strong enough to fruit, and consequently were the shortest crop for 50 years. *Geo. Bunyard, Maidstone.*

——The fruit crops in these gardens are very good, but they are indifferent in many places in the district. Apples are not looking healthy, but Pears and—in sheltered places—Plums are good, whilst Cherries were very fine. Strawberries were poor in places owing, no doubt, to the dry summer of 1911 and the late frosts this spring. Raspberries are excellent. Gooseberries were extra fine. Figs out-of-doors are a fine crop. *J. H. Shann, Betteshanger Park Gardens, Eastry.*

——Some varieties of Apples, and Blenheim Pippin particularly, are bearing abundantly. Others, Cox's Orange Pippin, for example, are almost a failure. Although a considerable number of Pears dropped their fruits after the late frosts, the crop generally is above the average, and the trees are clean and healthy. In many instances there are no Plums, and the foliage is badly infested with aphis. Strawberry plants suffered from the severe drought of last year. Cobnuts are, perhaps, the heaviest crop on record. *Geo. Fennell, Bowden, Tonbridge.*

[Photograph by J. W. Farrall.

Fig. 81.—view of the lake at sezincot.

(See p. 170.)

—— Black and Red Currants were very good. This is the case everywhere. Strawberries were much under the average. The causes are two-fold : (1) late frosts of considerable severity ; (2) the persistent drought of 1911 when the runners put out, and the one-year-old plants suffered immensely. Runners were planted out in what was practically dry dust, so they and the older plants made no growth. They simply struggled through the year. Usually I annually destroy all the plants and replant early with very early-rooted runners; but last season, anticipating the probable effect of the drought on the planted-out runners, I left a number of one-year-old plants, and it was these which gave this year's crop. The runners scarcely bore at all, but what fruit there was was very fine both in size and flavour. The soil here is stiff, deep loam. Exposure, N. and N.E., but with plenty of light. *Charles E. Shea, The Elms, Foots Cray.*

—— Strawberries were about a third of a crop in this district, and not of good flavour, probably owing to the cold and drought. Raspberries were very fine; Gooseberries were a large crop; Currants were more abundant than usual and were very clean. Two very late frosts caused a shortage and, in some cases, almost entire loss of crops, especially in the case of Strawberries, and, during the protracted drought, many breadths had their foliage lying on the ground. It is not surprising, therefore, that this season will be noted for lack of flavour in the fruits. Pears are the best crop of the year. Apples are a good average crop, and the fruits are clean. Bush fruits of all sorts are abundant, but the flavour is poor. The soil is loamy, overlaying gravel. *W. E. Humphreys, Blendon Hall Gardens, Bexley.*

—— The Strawberry crop suffered in a great measure from the drought of last summer; many plants never recovered their vitality, and if not actually killed, were so weakened as to be unproductive. The amount of the crop was therefore considerably reduced. On the other hand, the weather in May and June was favourable for the development of the crop, and we had a few fine fruits of good flavour. The season was two or three weeks in advance of the average. Plum bloom suffered severely from late frosts, but where the trees are protected by walls from frosts they are carrying heavy crops. Pears are an exceptional crop; the trees are very healthy, and the fruit large and clean. Although an average crop, Apples are not uniform, and the trees have suffered from an attack of aphis. Nuts are a very large crop, the hedgerows being a mass of fruit. The soil in this district is a rather heavy and retentive clayey loam. *J. G. Weston, Eastwell Park Gardens, Ashford.*

Middlesex.—As an all-round good season, this is one of the best I have experienced for many years. Peaches and Nectarines have never been better. Early Apples are good, but late varieties are not so plentiful. Pears are numerous on most trees. Plums very fair. Strawberries were plentiful, but lacking in flavour. Raspberries were good; in fact, all small fruits were good average crops. I never had better Gooseberries. Nuts are an average crop; Apricots are poor. Our soil is light, and the roots of all fruit trees require much feeding. *H. Markham, Wrotham Park Gardens, Barnet.*

—— All over the county of Middlesex there seems to be a very heavy crop of Apples—good, clean fruit on the whole. Pears are much under the average, due, I believe, more to attacks from the Pear midge maggot (Diplosis pyrivora) than to frost. I have examined many trees in various parts of the county this season, and found this pest in great abundance in the young, swelling fruits. Morello Cherries in the Feltham and Ashford districts have been excellent, and sweet Cherries in the western parts have been abundant. Gooseberries and Currants are below the average, but Raspberries appear to be up to the average and of good quality. *John Weathers, Isleworth.*

—— The fruit crops in this immediate neighbourhood are somewhat disappointing, especiall

[Photograph by J. W. Farrall.

Fig. 82.—Flower borders in the kitchen garden at Sezincot House.

(See p. 170.)

Strawberries, which was the worst crop for 18 years. The failure may be attributed to the excessive heat of last autumn. Newly-purchased plants gave no better results than our own runners. The variety Epicure did fairly well, also the new Utility. King George V did not come up to expectation, either in earliness or cropping qualities. Amongst Apples, Lane's Prince Albert has failed this season. Peaches out-of-doors are a failure. Pears are a very good crop, Souvenir du Congrès and Pitmaston Duchess being among the best varieties. Many Plums dropped from the trees in April and May owing to the drought. The soil in these gardens is a light loam overlying gravel. *Jas. Hawkes, Osterley Park Gardens, Isleworth.*

Surrey.—The fruit crops are below the average, owing, no doubt, to late spring frosts. Aphis has been most troublesome this spring, especially on Apples, Cherries, Peaches, and Nectarines. As a result, much of the new growth is damaged, especially on Apple trees. The Strawberry crop was a very erratic one, late varieties ripening with the early ones. We grow Royal Sovereign, Givon's Late Prolific, Louis Gautier, St. Antoine de Padoue, Waterloo, The Leader, Sir Joseph Paxton, Vicomtesse Héricart de Thury, Laxton's Latest, and Bedford Champion. The last-named variety gave the best crop of any. Plants of this variety withstood the intense heat of last summer better than any other sort, developing the best crowns. Laxton's Latest was our second best variety; this also withstood the great heat of 1911 fairly well. Stone fruits generally out-of-doors are below the average, Cherries being the most numerous. Small fruits are only average crops, Gooseberries being the best. Nuts of sorts are a large crop. Our soil is a very porous light loam, with a gravel subsoil. *Geo. Kent, The Gardens, Norbury Park, Dorking.*

—— The early prospects of a good fruit year were practically ruined by frosts in April and May. In some cases trees that were entirely covered with bloom have not set a single fruit, but, generally speaking, Pears are a little better than last year. With the exception of Strawberries, all small fruits were good crops, particularly Gooseberries. Sweet Cherries were a poor crop, but Morellos were satisfactory. The season has been very favourable for early vegetables. *W. H. Honess, Hopedene Gardens, Holmbury St. Mary, Dorking.*

—— Royal Sovereign Strawberries on light soil were a poor crop owing to the drought in April, but Leader and later sorts on clay land were very fine. Small fruits are very good, but Plums are a failure. Last season's drought disabled the trees. Pears set a splendid crop, and Apples required thinning. Birds destroyed the buds of Peach and other trees where the latter were not protected. Apricots do not succeed here, owing to the heavy rainfall in winter. The Black Currant mite is not so pronounced on bushes that receive plenty of manure water from cow sheds. *James Watt, Mynthurst Gardens, Reigate.*

—— The fruit crops are very indifferent, although at one time the prospects were good. Strawberries were badly injured by spring frosts; almost before the flower trusses could be discerned the frost had done damage. Apricots gave full promise for a fine crop, but frost destroyed the prospects. Plums are worse, with the exception of two early trees of the variety Rivers' Early. Apples are an average crop, but fruits of several varieties, Blenheim Pippin for instance, are very scarce, and the trees generally have suffered from blight. To say that the Pear crop is good is rather misleading, for though many varieties set well, the fruits show signs of injury from frost, presenting a rusty appearance. Currants are an average crop, but Gooseberries were damaged by late frosts. *James Lock, Oatlands Lodge Gardens, Weybridge.*

—— We registered 5° of frost on April 10 and 11°. on the following day, which destroyed the greater part of the early Pear blossom and practically the whole of the flowers on Cherry and Plum trees. No frost was registered during the period when late Pears and Apples were in flower, consequently these are full crops. Strawberries were seriously injured by heavy rains in June; many of the early fruits decayed before they were ripe. Raspberries and Black Currants have been heavy crops of first-class fruits. The soil here is a medium to sandy loam with a clay subsoil. *Thos. Smith, Coombe Court Gardens, Kingston Hill.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

BRASSO-CATTLEYA MONETA.

A very beautiful hybrid between Brasso-Cattleya Mme. Chas. Maron (Brassavola byana × C. Warscewiczii) and Cattleya Gaskelliana, under the above name, is flowering with H. S. Goodson, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day). The plant bears a spike of three very large and finely-shaped flowers, of better substance than most Brasso-Cattleyas the superiority in that direction being attained through C. Gaskelliana, which has a good reputation for imparting fine proportions and firm texture to the flowers of its hybrids, as well as fragrance. The flowers are of a delicate mauve-pink on white ground, which shows at the base of the segments and in a thin veining on the petals; the broad, fringed lip is bright rose colour, with a white base and greenish yellow disc.

The Week's Work.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

THE UNSEASONABLE WEATHER.—The dull weather has been very unfavourable for operations in the kitchen garden. Up to the time of writing (22nd inst.) rain has fallen on all but seven days of the month. Notwithstanding this, only 2.36 inches have been registered, the maximum being on the 18th inst., when .44 was recorded. On several days recently, there have been thunderstorms with heavy showers, and the nights and early mornings have been cold, with scarcely a gleam of sunshine. But Runner Beans have grown well and carry abundant pods. The plants are remarkably clean. The Celery crops are looking satisfactory, and also the crops of Winter Greens. Weeds have grown freely, and on heavy land hoeing has been of little use in their destruction. The first favourable opportunity should be taken to stir the surface of the soil between the various crops.

TOMATOS.—Doubtless after last season's success with outdoor Tomatos, large numbers have been planted this year, but the results have been almost a failure, even where the plants have had the protection of a wall or fence. Unless the weather changes soon, very few fruits will be obtained. The growth should be kept well thinned, and the leaves, where too dense, shortened to admit of a free circulation of air amongst the trusses and to mitigate the attacks of disease. As soon as the fruits commence to colour, they should be gathered and placed on a shelf in a dry, warm structure to ripen. Waterings and stimulants have been quite unnecessary, but, in the event of a change next month, the plants should be given some assistance to encourage the crop to mature. Stop the leading growths.

CELERIAC.—The showery weather has suited this vegetable, and every encouragement should be given the plants to complete their growth within the next week or two. Take every opportunity to loosen the surface soil, first giving a light dusting of soot over the foliage. Towards the middle of next month, when growth is completed, the plants should be lifted and stored in fine ashes or sand. This is much better and much less trouble than lifting a few plants at intervals. All the leaves should be taken off except those in the centre of the crown.

BRUSSELS SPROUTS.—Keep the hoe at work, especially amongst the earlier plantings, and support the plants if necessary, at the same time removing any yellow or decaying foliage. If plenty of sewage water is at hand, the plants will greatly benefit by an occasional soaking.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

CATASETUM, MORMODES AND CYCNOCHES.—Plants of these genera which have bloomed or completed their growth should be removed from the warmest house to a cooler one, where they may be allowed air during the hottest part of the day. The roots should be supplied with water whilst the foliage remains green, but after the leaves have fallen, and the growth is fully matured, very little water will be needed, and the plants should be given a long season of rest in a dry, sunny position in an intermediate temperature.

ODONTOGLOSSUM CRISPUM.—From now onwards for the next few weeks, many plants of O. crispum and its hybrids will need attention at the roots, either re-potting or replenishing the surface materials as may be necessary. Plants that have grown to the sides of the pots, and those in compost that is exhausted, should be re-potted. The best time for the operation is when the young growths are from 2 to 3 inches in length, as at this stage young roots are developing. The plants should be turned out of the pots and the old material shaken from the roots. Any of the latter that are decayed should be cut away; also the old, leafless pseudobulbs, leaving 2 or 3 behind the young growths. Select a clean pot of a size that will accommodate the plant for two seasons, and fill it to one-quarter of its depth with clean crocks, to ensure efficient drainage. Over the crocks place a layer of Fern rhizomes cut into short portions. Hold the plant in position, keeping the back part near to the side of the pot and the base just level with the rim. Work the compost firmly between and around the roots to within ½ inch of the top and on the surface place a layer of chopped Sphagnum-moss. On no account should the front portion of the rhizome be buried; it should rest on the surface of the moss so that when the new roots develop, they can enter the material at once. The plants should be sprayed overhead on bright days, and the surroundings kept moist at all times. Plants which are growing satisfactorily and have sufficient room in the pot for another season's growth, may, if the compost is good, remain undisturbed, but some of the old moss should be carefully picked from the surface and replaced by fresh. This will be a great aid to the new roots. A good rooting medium for Odontoglossums consists of short pieces of Osmunda fibre and A1 fibre, in equal proportions, with a liberal addition of chopped Sphagnum-moss, crushed crocks, and a little coarse silver sand. After the potting is finished, the plants should be watered through a fine rose and stood in the shadiest part of the house. Watering must be done with extra care until the roots have grown well in the new compost. The compost should be kept moist and this may best be accomplished by spraying the surface each morning; this will cause the moss to grow, an important factor to the well-being of the plant. Many other Odontoglossums, including O. Pescatorei, O. trinmphans, O. Harryanum, O. cordatum, O. polyxanthum, O. cirrhosum, O. luteo-purpureum and their hybrids, will need attention at the roots from now onward through the autumn months, and should be potted in the same manner as advised.

ODONTOGLOSSUM SEEDLINGS. — Seedling Odontoglossums, in their many stages, should also receive attention at the roots, and should be potted in a similar mixture to that recommended above with an equal proportion of half-decayed Oak leaves added. Young plants should not be potted so firmly as the older specimens. When new moss is used, slugs frequently make their appearance and should be trapped by Lettuce leaves placed on the stages among the plants. The slugs should be sought with a lantern when it is dark.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

PINEAPPLES.—Young plants which require re-potting should be attended to at once. If they are plunged in a fairly warm hot-bed they will form roots before the winter arrives. Keep the atmosphere moist by frequently damping the paths and walls in the house, and spray the plants two or three times daily with tepid rain-water. Watering must be done with extra care for some time to come. Suckers of the Charlotte Rothschild and Smooth Cayenne varieties which are large enough to place in pots should be taken off and potted. They will be better for planting out, or potting into larger pots, if they are taken from the parent stock directly they are ready. If they are left too long on the old plants, they become drawn and weak, and this may delay the fruiting of the plant for a whole season. The young plants, when potted, should be plunged into a hot-bed and kept in a close, moist atmosphere. During hot weather they should be shaded, and syringed frequently with tepid rain-water. They should not require watering till they have rooted; even then moisture must be afforded with extreme care. When the winter-fruiting plants are producing their Pines, they must be liberally treated in regard to watering and feeding. Liquid manure from the farmyard and guano-water are both excellent stimulants for Pines, and may be given alternately, increasing the strength as the growth of the fruit advances. A top-dressing of fibrous loam, mixed with a little well-decomposed horse manure and concentrated fertiliser, will also be beneficial.

QUEEN PINES.—In the fruiting of Pines, so much depends on the amount of progress which the plants make during the season preceding the fruiting time, that growers will be alarmed at the continued dull, sunless weather which has been generally experienced through the greater part of July and August. This will undoubtedly have a prejudicial effect on the plants, and probably a large percentage of them will fail to fruit next year. They will need much care during the remainder of the growing season. Every effort should be made to create a suitable atmosphere in the house by careful attention to ventilating the house, the damping of all bare surfaces, and the proper use of artificial heat. During fine, sunny weather, a little air should be admitted to the plants early in the morning, gradually increasing the amount as the sun gains power. Close the ventilators early in the afternoon, after spraying the plants and charging the house with moisture. The temperature should not be allowed to fall below 70° until the growing season is finished. The pots will now be full of roots, therefore the plants should be examined frequently to ascertain if water is needed. Stimulants may be given more frequently and with increased strength.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

RICHARDIA AFRICANA.—These plants are very useful for decorative purposes during the winter and early spring, and they are well worth any pains which are bestowed on them. Plants which have been resting in pots should be shaken free of the soil surrounding the roots and potted in a fairly rich compost, consisting of a mixture of loam, well-rotted manure, and sand; adding, if desired, a little charcoal and bonemeal. The exact size of the pots should be determined by the use to which the plants are to be put; but, generally speaking, one good tuber in a 6-inch and three in a 9½-inch pot would be right. Where the plants are to be used in a conservatory or winter garden, the former will probably be found the most convenient receptacle. Firm potting is an important point, and with regard to drainage, I always provide plenty, although the roots will live in water. The variety "Little Gem" is, as its name indicates, a small plant, and does not require so much pot-room as the others. A single tuber will grow well in a 4½-inch pot, or three to five in a 8½-inch pot; small, well-grown specimens are often more useful for ornamental purposes than larger plants. Plants which have been put out in the open ground after flowering should be lifted before the roots have had time to spread too far; otherwise, if the weather after lifting is very warm, much of the foliage may be lost. The pots to be used for these plants must be decided chiefly by the size of the ball of soil on the roots. Any small, superfluous growths should be pulled off the flowering stems; if desired, these may be potted up separately for increase of stock. After potting, they usually do very well when placed under the shade of a wall, but they should be removed under cover at night when the weather is cold.

REHMANNIA ANGULATA.—This plant is not difficult to cultivate, and it serves a useful purpose during May and June. Plants may be grown in a cold frame up to the time when the flower-spikes begin to show, which is a great advantage to those who have only a limited amount of house-room. Seedlings raised during the early part of the summer should be growing freely, and an endeavour should be made to get them into 4½-inch pots by the end of September. Early in the spring they should be transferred to 6-inch pots. A fairly light, fine compost suits them, and they are materially assisted by a little shade during the first stages of growth.

GLOXINIA.—The earliest-flowered plants of Gloxinias are losing their foliage, and the pots may be turned on their sides in a pit. After thoroughly drying off the tubers may be removed to the shed or house where they are to be stored until the spring. Plants of later batches will also be showing signs of maturing, and these must be gradually inured to less water at the roots.

Tuberous-rooted Begonias. — If these plants are required to continue in flower for some time longer, they must be given frequent supplies of liquid manure, as well as a little artificial manure. If cold, damp weather continues a little fire heat should be provided, in order to keep the air dry; the plants are very liable otherwise to rot at the stem. Seedlings which are planted out in beds should be regularly inspected as they come into flower, and labelled according to colour. In the event of any exceptionally good variety being perceived the plant may be lifted at once, and placed in a pot where it may be more convenient to keep it under close observation.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Autumn-fruiting Strawberries.—These plants have grown rather freely this season and made a good deal of foliage. Two-year-old plants will begin to ripen their fruits, and will continue to give a supply until the seedling plants commence to bear. If the damp weather continues lights should be placed over the plants where possible, or many of the best fruits will rot before they are ripe. Fix the lights well above the plants, so that the air may pass in freely. Remove all runners until the fruits are set, and keep the surface of the ground lightly stirred between the plants to keep down weeds. Apply a sprinkling of soot before the fruits ripen to protect the plants from slugs, and place a light mulching of short straw or similar material between the rows to keep the fruits clean. If necessary, the trusses may be thinned, removing all small and malformed fruits. Gather the fruits carefully into small baskets, and send direct to the table to avoid handling more than is necessary.

Gathering Fruit. — Extra care should be taken in gathering Apples and Pears. Early varieties of both these fruits should be gathered before they are quite ripe. Later varieties which may be worth netting should be protected from birds; Apples especially will be of extra value this season on account of their scarcity. Early Pear trees should be frequently examined; it is a great mistake to gather all the fruits at once. It can easily be ascertained which fruits are ready for gathering; if carefully lifted to one side, a ripe fruit parts freely from the wood. Later fruits should be exposed to sun and air, and the largest fruits, which may be required to hang late, should be secured to the tree by placing a piece of raffia around the stalk. This will prevent their being blown off by the wind. If extra large specimens are required feed the trees with liquid or artificial manure. Protect the fruits from birds with netting, or many of the best specimens will be spoiled. Plums should be examined at short intervals, for they soon crack and are spoiled, especially during showery weather.

General Observations. — It is too early as yet to commence root-pruning or root-lifting. There will be more of this work than usual this season, as all fruit trees, especially those that are lightly cropped, are making too much wood. A good deal may be done by getting together materials of all descriptions, including loam, lime-rubble, wood ashes, and bonemeal, ready for use when required. The heavy rains have penetrated both south and west borders, and wall-trees generally are making a great quantity of wood, which renders it all the more necessary to keep the shoots thinly trained to ensure them ripening well. Those who are contemplating planting during the coming season should not delay any longer the selection of the trees. It is a great advantage to order early, and it should be borne in mind when making the choice that the strongest and largest trees are not always the best. Moderately-grown trees should rather be selected, as the wood of very strongly-growing trees seldom ripens satisfactorily. Weeds have been unusually numerous this season, and have been most difficult to destroy. Every effort should be made during next month to clear all fruit quarters by hoeing while the weeds are small, as each week of delay means extra labour and expense in carrying out the work.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Herbaceous Borders.—The continued wet, dull weather experienced during the past few weeks has caused all late-growing plants to make soft, weedy growth. Late-sown annuals are often used in mixed borders to fill up the gaps caused by the removal of early-flowering plants, such as Lupins, Poppies, and Delphiniums. These annuals are making a lot of soft growth, and it is necessary to look over the borders at frequent intervals to see that they do not encroach on any plant of small, weak growth. These may be extremely valuable, and will be much injured, if not killed outright, by being allowed to become smothered by grossly-growing annuals. Where the border has an edging of turf all plants must be kept quite clear of the grass. Constant attention is necessary during stormy weather to see that all stakes and ties are secure. Much damage may result from a single night's storm if this is neglected. Cut off all decaying flower-spikes and stems at frequent intervals, and, if the ground is not sufficiently dry to hoe, weeding must be done by hand in order to keep the beds clean and attractive. Seedling weeds grow very rapidly during wet weather.

Perennial Asters.—The early varieties of perennial Asters, more especially those of the Amellus type, are now making a good show, and the main batch will soon be in full bloom. With the great number of varieties now in existence the flowering period has been extended over several months, and if the weather improves the later varieties will be charming in October and November. The heads of the strong growers get very heavy as the season advances, and good, firm stakes must be supplied to keep them secure; these should be kept out of sight as much as possible. The prolonged damp weather has caused the plants to grow very strongly, abundance of moisture being particularly suitable to perennial Asters, so that if the weather is favourable there should be a magnificent show of bloom in September. They thrive in almost any situation, but are seen to the best advantage when cultivated in a border entirely by themselves, where a comprehensive collection may be grown, and the varieties tested and compared. Such a border is particularly interesting, even if only on a small scale. They are also indispensable in the mixed border, especially the blue and lavender varieties. These provide a shade of colour which is a pleasing relief from the yellows, scarlets, and whites of the average border.

Early Bulbs.—If the usual supply of bulbs for early outside planting has not already been procured, no time should be lost in sending the order, as those who order early have undoubtedly the pick of the season's stock.

Daffodils.—In gardens, bulbs often have to be lifted from the beds before they are properly ripened in order to make room for the summer bedding plants. They are usually laid thickly in ashes or soil, and when thoroughly dry are cleaned and stored till planting time arrives. Owing to the extra rainfall recently the ground is unusually soft for the time of year, and where planting in turf or woodland walks is contemplated, the present affords a good opportunity to carry out the work. It is a good plan to plant any which are already in stock as early as possible; not only are they thus safely out of hand before the press of autumn planting comes, but the bulbs will otherwise deteriorate, and the flowering will not be nearly so satisfactory. Daffodils of all sorts, Muscari, and Crocuses may be planted now.

Lilium tigrinum Fortunei. — This magnificent autumn-flowering Lily may be recommended as a most satisfactory variety, and one worthy of extended cultivation. It is very hardy, and will thrive almost anywhere and in any ordinary soil. Even if planted in a garden where Liliums do not thrive as a rule, the price of the bulbs is so moderate that a supply can be procured annually at a small outlay. The plant has a very strong habit, growing to a height of from 4 to 6 feet, and bearing immense spikes of orange-scarlet flowers. Whether planted in clumps in the mixed border, in the shrubbery, or in the wild garden, this Lily is most effective, and is one of the most satisfactory varieties flowering out-of-doors just now.

THE APIARY.

By Chloris

Position of the Apiary.—Since some may desire to commence beekeeping at this season of the year, a few notes may be of great assistance, because a good beginning will be essential to success. Provided that it does not contain a river or lake, the lower part of a valley is best. The disadvantage of the water is that when bees are returning home heavily laden during stormy weather, they are liable to be beaten down and drowned, whereas if no water existed, after taking a rest, the bees would be able to resume their journey. If possible, there should be good protection on the north and east, such as a thick hedge, copse or high wall. This shelter has two advantages: it prevents the bees from being tossed about when nearing home in an almost exhausted condition, and it is a great protection in the coldest part of the winter, thus helping to economise the internal heat of the hive. A high position is very unsuitable because it is exposed, and the bees during the busiest portion of the season would be unable to rise to the height necessary to reach home. If possible, the hives should be situated near a clear brook or spring, failing this water must be supplied, because a large amount of water is required to raise brood, and if a pure source is not at hand, then that from a tainted source, such as manure heap, will be utilised, and this cannot be good for the successful raising of healthy brood. The ground under and around the hives should be cleared of all grass and weeds, and if a good coating of fine ashes be strewn on each side occasionally, hoeing will suffice to destroy all weeds. It will be found a good plan to drive tarred stakes into the ground, and to nail on them four battens, making all four perfectly level, about 1 foot above the soil, by the aid of the spirit level. When this plan is adopted the hives may be securely roped to the stands, and there is not the slightest danger of them being blown over during the stormiest portion of the winter, as often happens when hives are on four legs. By having the ground cleared of weeds, should the queen be lost during manipulation, she can be easily found. It is necessary that the path should be formed at the back of the hives so that work may be performed in the apiary without interrupting the workers as they pass in and out of the hives.

Suitable Sites.—It is useless to choose a good position as far as climatic conditions, &c., are concerned, if there is not suitable foraging ground, or better still, a succession of nectar yielding plants near. Early breeding will be encouraged where there is an abundance of early-flowering pollen-bearing trees, such as Hazel and Willow. These should then be followed by fruit trees, Apple, Pear, Cherry, Gooseberry, Raspberry, &c. The fruit trees yield honey which, in the estimation of many experts is without equal. These will be followed by the Plane tree, Clover (white), Sainfoin, Mustard, Alsike Clover, and Lime. Then to make all complete, if Heather be within easy access, an excellent harvest will be assured, and of Heather honey, that from Ling is better than that from the common bell Heather.

Fitting up Hives.—After driving the bees place them in a hive with five or six drawn-out combs, and feed the bees on good syrup, made as directed in our issue of the 24th inst., place in a dummy board, and see that the bees crowd the frames, then place on plenty of warm quilts and never allow the feeding bottle to get empty until the bees have stored and sealed between 20 and 30 lbs. of syrup. This must be thick, or they will not seal it, and thin food at this season, when stored, will cause dysentery. Keep the entrances as narrow as possible to ensure greater warmth and to prevent robbing, which is very common when bees are being fed with syrup. It will be a great advantage if a suitable shed to serve for storage purposes is near the hives. In it the honey may be extracted and the frames quickly returned to the hives to be cleaned out.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS FOR SEPTEMBER.

TUESDAY, SEPTEMBER 8—Scottish Hort. Assoc. meet.
WEDNESDAY, SEPTEMBER 4—
Glasgow and West of Scotland Centenary Sh. (3 days).
Carlisle and Cumberland Hort. Assoc. Fl. Sh. in connection with Northern Counties Fruit Congress (3 days).
British Assoc. meet at Dundee.
THURSDAY, SEPTEMBER 5—Dundee Fl. Sh. (3 days).
SATURDAY, SEPTEMBER 7—Soc. Française d'Hort. de Londres meet.
MONDAY, SEPTEMBER 9—
Nat. Chrys. Soc. Floral Com. meet. United Hort. Benefit and Prov. Soc. Com. meet.
TUESDAY, SEPTEMBER 10—Royal Hort. Soc. Coms. meet. (Lecture by Miss Troyte-Bullock on "Cape Pelargoniums.")
WEDNESDAY, SEPTEMBER 11—
Royal Caledonian Hort Soc. Autumn Sh. (2 days).
THURSDAY, SEPTEMBER 12—
Nat. Rose Soc. Sh. at R.H.S. Hall, Westminster.
TUESDAY, SEPTEMBER 17—
Nat. Dahlia Soc. Sh. at Crystal Palace (2 days).
WEDNESDAY, SEPTEMBER 18—North of England Hort. Soc. Sh. at Leeds.
MONDAY, SEPTEMBER 23—
Nat. Chrys. Soc. Floral and Executive Coms. meet.
TUESDAY, SEPTEMBER 24—Royal Hort. Soc. Coms. meet Vegetable Sh. (Lecture by Mr. C. Hermann Senn on "How to Cook Some of the Root Vegetables.")

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—59·6.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, August 28* (6 P.M.): Max. 64°; Min. 45°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, August 29* (10 A.M.): Bar. 29·4"; Temp. 64°; *Weather*—Raining.
PROVINCES.—*Wednesday, August 28:* Max. 59° Cambridge; Min. 54° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, at Stevens' Auction Room, 38, King Street, Covent Gardeo, at 12.30.
WEDNESDAY—
Trade Sale of Bulbs, &c., at 1; Palms and Plants, at 4, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

The Havoc of the Rain.

A year ago, and we were all complaining of the heat and drought, and longing for the gentle trouble of the rain. The whirligig of time has indeed brought about its revenges, and we have now and with even greater reason to deplore the havoc of the rain. Following on the finest August on record, we have one which is without doubt the foulest experienced within living memory. Already it rivals the infamous years of 1860 and 1879, and the forecasts of the meteorologists, as cheerless as the weather itself, give no hope of immediate improvement. During the first 24 days of this month the rainfall in London was almost 200 times as great as that of the whole month of August last year. The rain has fallen with a pitiless impartiality in the north and in the south, though, as is natural with the prevailing wind, the western part of this country has received most. In Southport, the rainfall for 24 days was 5½ inches; at Rhyl this amount was exceeded by ½ inch; Jersey recorded 6½ inches; Bournemouth slightly more; in parts of Cornwall the rain gauge measured during the 24 days 7½ inches. In those western outliers, the Isles of Scilly, there has been no less than 7½ inches. Even this amount was surpassed in Darwen, where the rainfall has been 8 inches. As we write we receive the news that East Anglia, which had hitherto fared better than other parts of the country, has been visited by a rainstorm, the severity of which may be gauged from the fact that in 12 hours, 6 inches of rain fell at Norwich. There is a certain grim humour in the reflection that in ruling the fruit-farms of East Anglia out of bounds during the manœuvres, the War Office, with prophetic insight, ordered them to be regarded as impassable swamps. We fear that this will entail but little imagination. From all parts of the country come the tales of disaster: rivers overflowing their banks, hay floating over hedges, Potatos blackened by blight, and Corn sprouting in the ear. Lack of warmth and sunlight has conspired with the rain to work this damage on the crops. Indeed, the temperature readings and sunshine records for this woeful month are no whit less deplorable in their defect as is the reading of the rain gauge in its excess. Thus the maximum shade temperatures during the present month are as much as 20°, 25°, and, in one case, 32° below those of August of last year. For example, the maximum shade temperature on August 9, 1911, was 97°, and that for the corresponding day of this year was 65°. The extent of the actual loss due to the intemperate weather is hard, if not impossible, to estimate, but there is reason to fear that our agriculturalists will suffer to the extent of millions of pounds. These losses will, of course, be felt in enhanced prices and shorter supplies by all members of the community. The blight has taken a heavy toll of the Potato crop, and with the prospective rise in the cost of food-stuffs, commodities such as bacon are advancing already in price. With the continuation of the present weather the outlook for fruit in the coming year is not propitious, and having regard to the fact that all Western Europe lies under the dark pall of the rain, it would seem probable that many seed crops will be light and that the price of seeds will rule high. Even now, however, were the weather to take a turn for the better, we might be spared some of the worst evils which threaten, and, despite the adverse prognostications of the weather office, we must continue to hope that such a change will come soon. It is but a poor comfort to the grower who sees his produce and profits washed away to be asked to observe how different are the effects of the present weather on the growth of the various plants of the garden. Nevertheless, a rapid visit to the garden made during the intervals between the well-nigh incessant showers shows that, whereas many flowers are hanging their heads in despair of any lightening of the grey skies above them, others persist in being beautiful in spite of the gloom of their surroundings. Many of the later Roses are the pale ghosts of their true selves. The Sweet Peas have ceased, at all events in the garden we have in mind, from attempting to develop their proper colours. The fragile flowers of Petunias and Mimulus are shrivelling in the bud; but, on the other hand, masses of dwarf Antirrhinum have never been more beautiful, and sturdy plants like Zinnias bear their prim heads of blossom bravely. In the vegetable garden the root and stem crops are growing with amazing luxuriance, and even Runner and Dwarf Beans are bearing far better than might have been expected. Perhaps the most remarkable effect of the present spell of rain and greyness is shown by the Grass under trees. Where in normal years are bare or brown patches there is at present a rich greensward extending to the foot of the trees. This is in part due to the plentiful supply of moisture in the soil; but it would appear to be due also to the fact that the cloudy skies, scattering the light of the sun in all directions, provide the ground under the trees with so much diffused light that, although the days are so sunless, the Grass beneath the trees actually receives in a diffused form more light than falls on it in summers with a far greater amount of sunshine. Be this as it may, the non-professional gardener may at all events derive a certain slight cold comfort from the contemplation of the diverse behaviours of the plants which he cares for, though we cannot expect reflections such as these to divert the mind of the grower from the gloomy broodings on the losses which threaten him. To offer such consolation to him were but a form of insolence, and all that may be done is to deplore with him his losses and to admire the fortitude with which he bears them.

R.H.S. Spring Bulb Show.—Subject to the general rules of the Society, the R.H.S. Council offer prizes presented to them by Mr. Robert Sydenham in three classes, open only to amateurs, for bulbs grown in moss-fibre or similar material (not earth) and without drainage. The classes are (a) for six single Hyacinths, in separate vases, not exceeding 6 inches in diameter, to be selected from any one of the following varieties:—Boerhave; City of Haarlem, Enchantress, General Vetter, Innocence, Ivanhoe, Jacques, Johan, King of the Blues, Koh-i-Noor, Lady Derby, La Grandesse, Queen Mary, Schotel, Totula, and Victory; (b) for six vases of Tulips (vases not exceeding 7 inches in diameter, no restriction as to the number of bulbs in a vase), to be selected from the following:—Fabiola, Joost van Vondel, Keizerskroon, Le Rêve, Mon Tresor, Pink Beauty, Prince of Austria, Queen of the Netherlands, Red Admiral, Rose Luisante, Van der Neer, Vermilion Brilliant, and White Joost van Vondel; (c) for six vases of Narcissi (vases not exceeding 7 inches in diameter, no restriction as to the number of bulbs in a vase), to be selected from the following:—Albatross,

Bianca, Blood Orange, Bullfinch, Cardinal, C. J. Backhouse, Cresset, Dairymaid, Diadem, Emperor, Firebrand, Glitter, Gloria Mundi, Golden Bell, Goldfinch, Horace, Mrs. H. J. Veitch, Lilian, Lucifer, Lulworth, Mme. de Graaff, Seagull, Victoria, Wheatear, White Lady, and Will o' the Wisp. Five prizes are offered in each class, and if there are more than six exhibits and not less than eight in either of the classes, an extra prize of 7s. 6d. will be given; a further 7s. 6d. if there are 10 exhibits, and so on in the proportion of one prize for every two exhibits exceeding six in each class.

Viola Trials. — The Royal Horticultural Society has this season carried out a trial of Violas at Wisley, and the report of the Floral Committee is now before us. Fourteen varieties have been honoured with awards of merit—not novelties, but already known varieties which have proved their superior merit in competition with other varieties. The society has granted in all since 1897 twenty-nine awards of merit to Violas, and with very few exceptions all the varieties are still in commerce, showing that the decisions of the society have been confirmed by the experience of cultivators. The most useful colours in Violas are the whites, yellows, blues, and purples. In whites, Marchioness (A.M. 1898) was largely grown for several years, but Snowflake (A.M. 1912) and Palmer's White (A.M. 1912) are purer in the flowers than Marchioness. White Swan, so largely cultivated around London, has never been recognised by the society, possibly because it has never been sent to the trials. Pencaitland (A.M. 1899, confirmed 1912), is a white flower with a large yellow eye, and the plants have almost a perennial habit. In yellows, two excellent varieties received the award of merit this summer—Kingcup and Walter Welsh—the latter giving an especially rich note of colour. Royal Sovereign (A.M. 1905) is also one of the best of the yellow varieties. Mosley Perfection (A.M. 1911) is the largest yellow Viola obtainable, but it is most to be recommended as an exhibition variety as is A. J. Rowbery (A.M. 1895). Archibald Grant (A.M. 1899) has remained practically unchallenged as the best of the violet-purples for a long time, but Edina (A.M. 1912), which seems a better grower, will prove a serious rival. We should like to know if it is an earlier bloomer? Councillor Watters (A.M. 1905), like Archibald Grant, is likely to have its supremacy challenged. Jubilee (A.M. 1912) is a crimson-purple self of undoubted value, having a better spreading habit than Councillor Watters. Among light blues Maggie Mott has no compeer, and it is remarkable that this most beautiful variety was awarded the A.M. at the trial last month for the first time. W. H. Woodgate (A.M. 1912) is a charming and distinct shade of blue and possessed of a good habit. John Quarton (A.M. 1912) is another good blue flower which is largely grown for market, and this is an undoubted testimonial to the value of any flower. Mrs. Chichester (A.M. 1912), though not a self, is a flower of many good qualities, and popular alike with market cultivators and amateurs. The Royal Horticultural Society's trials serve to call attention to varieties of flowers and vegetables which can be relied on to give good results, and we are glad that the Floral Committee has had the courage to commend varieties of Violas for other reasons than novelty.

Gardener's Fatal Accident. — William John Smith, aged 46, a gardener, lately living at Carew Place, Northwood, Middlesex, died in the University College Hospital on the 22nd inst. from lockjaw, following injury through a stake entering his arm whilst picking Peas.

National Gladiolus Show. — We have received the following letter from Mrs. K. Atkinson, the hon. secretary of the National Society:—"I have noticed that in the report of the Gladiolus Show, held on August 13, there appear several errors, and I have been asked by one or two of the competing members to correct them. I should, therefore, be greatly obliged if you will publish the enclosed official list. Considerable confusion was occasioned by the fact that one of the members who competed for, and won, several of the prizes, removed his exhibits and award cards from the society's stand to another part of the hall, and this made it very difficult for members of the Press to obtain a correct list. Steps have been taken to prevent this occurring again."

The following is the official list of awards:—

The President's Cup for the best collection in the show, Messrs. Kelway & Son.

Class 1, for 24 varieties: 1st, Messrs. Kelway & Son; 2nd, Mr. Wilhelm Pfitzer. Class 2, for 12 varieties: 1st, Messrs. Waarner & Co. Class 3, for new seedling variety: 1st, Mr. Wilhelm Pfitzer, with 'Goldfinder'; 2nd, Mr. E. E. Stuart, U.S.A., with 'Michigan.' Class 7, for the best group: 1st, Mr. Wilhelm Pfitzer. Class 8, for the best yellow spike: 1st, Messrs. Kelway & Son, with 'Golden Measure'; 2nd, Mr. Wilhelm Pfitzer, with 'Schwaben.' Class 9, for the best pink spike: 1st, Mr Frank Banning, with 'Panama'; 2nd, Mr. H. Groff, with 'Evolution Perfectus.' Class 10, for the best white spike: 1st, Messrs. Kelway & Son, with 'Duchess of Wellington'; 2nd, Mr. K. Velthuys, with 'Europea.' Class 11, for the best blue spike: 1st, Mr. K. Velthuys, with 'Vadenia'; 2nd, Messrs. Kelway & Son, with 'La Nuit.'

The Shrewsbury Show.—The attendance on the first day of the show at Shrewsbury was very good, and the receipts amounted to £938 18s. 1d., as compared with £799 13s. 1d. last year. The record takings on the first day was £1,203 3s., in 1907. The weather this year was fine throughout the day, but, unfortunately, rain fell heavily in the evening. On the second day it was very fine throughout, and the takings were £1,632—just £650 below the record amount of 1907. Most of the visitors seemed to be townfolk, and it may be inferred that fine weather has been so rare this year that agriculturists feel bound to take the fullest advantage of the few fine days which do occur. The *Shrewsbury Chronicle* Cup, offered for the highest aggregate points made by a county of Salop exhibitor, was won outright by Mr. T. Lambert, gardener to Lord Harlech, Brogyntyn, Oswestry.

The late Mr. Alexander Dean. — The funeral of the late Mr. Alexander Dean took place on Monday last in the Kingston Cemetery. Notwithstanding the inclemency of the weather a large company attended the ceremony. In addition to the members of the family and representatives of the Kingston Corporation, including the Mayor (Councillor G. E. J. Street, J.P.) and the ex-Mayor (Alderman G. Huckle, J.P.), the following members of the horticultural profession were among those present:—Messrs. J. Cheal (representing the Royal Horticultural Society), John Crook, Owen Thomas, E. H. Jenkins, T. Gibbons, W. Hayward, W. G. Smith, S. Mortimer, W. J. James, W. Poupart, W. Bates, W. Haywood, Brian Wynne (secretary of the Royal Gardeners' Orphan Fund), E. G. Quick (secretary of the National Vegetable Society), F. W. Harvey (Editor of *The Garden*), A. E. Burgess, H. J. Wright, J. Naylor, J.P., Wimbledon (representing *Gardening Illustrated*), and G. F. Tinley (*Gardeners' Chronicle*). There was a large number of wreaths and other floral tributes from members of the family, the National Vegetable Society, Sir Harry J. Veitch, the Editor of *The Garden*, The Kingston Humanitarian Society, The Kingston and District Liberal Association, The Kingston Coffee Tavern Co., members of The Old Kingston Saturday Popular Entertainment Committee, the Kingston tradesmen, Mr. and Mrs. Crook and family, and Mr. E. H. Jenkins.

Northern Counties Fruit Congress and Show.—A fruit show and congress will be held at Carlisle, on Wednesday and Thursday, September 4 and 5, in conjunction with the Carlisle and Cumberland Horticultural Association's annual show. The congress meetings will be held in the Arcade Room, adjoining the markets. The subjects for discussion include demonstrations in "The Bottling of Fruit," by Mr. J. S. Chisholm, Horticultural Instructor to the Northumberland County Council, and Mr. G. P. Berry; "Soils, in Relation to Fruit Growing," by Mr. G. P. Berry, Horticulture Instructor, Edinburgh and East of Scotland College of Agriculture; "The Washing and Spraying of Fruit Trees as a means of Combating Insect Pests and Diseases," by Professor F. V. Theobald, Wye College, Kent; "Canker and other Bark Diseases of Fruit Trees," by Mr. F. J. Chittenden, Director R.H.S. Laboratory, Wisley; and "The Pruning of Fruit Trees and Bushes," by Mr. Chisholm. Spraying demonstrations will be given by various firms during the mornings of both days in the Victoria Park.

Potato Imports in Jersey.—The Board of Agriculture and Fisheries desire to inform Potato growers and merchants that the States of the Island of Jersey have adopted an Act authorising the importation of Potatos from the United Kingdom, as from the 17th inst., on the following conditions:—Each consignment must be accompanied (a) by a declaration by the shipper, indicating the farm where the Potatos were grown, and certifying that no case of wart disease of Potatos has occurred on such farm; and (b) by a certificate of the Board of Agriculture and Fisheries, the Board of Agriculture for Scotland, or the Department of Agriculture and Technical Instruction for Ireland, as the case may be, to the effect that no case of the said disease has occurred within five miles of the farm where the Potatos were grown. Intending exporters of Potatos to Jersey should forward the declaration from the grower of the Potatos referred to above, when applying to the Board for a certificate. The declaration should state the name of the farm on which the Potatos were grown, the parish in which it is situate, and the nearest post town, in order that its exact position may be readily identified.

Agricultural Appointments in Uganda and Nigeria.—Mr. S. Simpson has been appointed Director of Agriculture, Uganda, in succession to Mr. P. H. Lamb, who has been appointed Director of Agriculture, Northern Nigeria. Mr. F. Evans, Curator, Royal Botanic Gardens, Trinidad, has been appointed Assistant Superintendent in the Agricultural Department, Southern Nigeria.

Hospital Charities and Vegetable Marrows.—A writer in the *Pall Mall Gazette* describes a novel method of collecting funds for St. John's Hospital at Twickenham. A huge Vegetable Marrow is exposed in the window of a shop in the neighbourhood, and the public is invited to make a guess—at a small charge—as to the weight of the monster Marrow. The best guesser gets the Marrow and the hospital the proceeds.

Research Scholarships in Agricultural Science.—The Board of Agriculture and Fisheries have awarded research scholarships in agricultural science to Messrs. A. W. Ashby, Univ. Dip. Economics and Political Science (Oxford), (Economics of Agriculture); W. Buddin, B.A., Univ. Dip. Agric. (Cambridge), (Plant Nutrition and Soil Problems); A. E. Cameron, M.A., B.Sc. (Aberdeen), (Agricultural Zoology); F. Cook, B.Sc., M.B., B.S. (London), (Animal Nutrition); A. Cunningham, B.Sc., Agric. (Edinburgh), (Bacteriology); J. Davidson, M.Sc. (Liverpool), (Agricultural Zoology); F. C. Minett, M.R.C.V.S. (London), (Animal Pathology); P. A. Murphy, A.R.C.Sc. (Dublin), (Plant Pathology); M. S. Pease, B.A., Univ. Dip. Agric. (Cambridge), (Genetics); W. W. P. Pittom, B.A., Univ. Dip. Agric. (Cambridge), (Animal Nutrition); J. A. Prescott, B.Sc. (Manchester), (Plant Nutrition and Soil Problems); and F. Summers, B.Sc. (London), M.Sc. (Liverpool), (Plant Physiology). The scholarships, which are of the annual value of £150 and are tenable for three years, have been established in connection with the scheme for the promotion of scientific research in agriculture, for the purposes of which the Treasury have sanctioned a grant to the Board from the Development Fund, and they are designed to provide for the training of promising students under suitable supervision with a view to enable them to contribute to the development of agricultural science.

School Gardens in Monmouthshire.—In a paragraph in last week's issue of the *Gardeners' Chronicle* dealing with a recently-issued Blue Book, "Statistics of Public Education," it was stated that there are no gardening classes for boys or girls in Monmouthshire. Though this is to be inferred from the tables published on pages 353 and 354 of the Blue Book, we are glad to hear from Mr. W. J. Grant, Director of Agricultural Education to the Monmouthshire Education Committee, that, as a matter of fact, gardening instruction has been given in that county for 20 years. Rather than be hampered, however, by the restrictions under which they would have to work for the purpose of obtaining a small grant at each school from the Board of Education, the Monmouthshire Education Committee have provided all the necessary funds for the work. This, presumably, is the reason why the Board of Education's Blue Book contains no reference to the work. At the beginning of the present year, horticultural instruction was being given at 30 schools in the county, at which 466 lads were receiving practical lessons. The gardens are worked on the one general-plot and single-plot systems, and the boys receive instruction on the raising and growing of fruit, flowers, and vegetables upon the most modern and approved principles. The instruction is given and the general arrangements are made in such a manner as to fit in with the work of each individual school. We are glad to learn from Mr. Grant the true position of affairs.

Gardens and How to Sell Them.—Messrs. Watkins & McCombie, who will be remembered by visitors to the International Exhibition as the printers in charge of the stationery section, have published a booklet, which bears the ingeniously-attractive title of *Gardens and How to Sell Them*. Among the illustrations are numerous colour-prints and pictures in half-tone representing some of the more striking gardens which were laid out at Chelsea during the time of the Exhibition. Thus, in so far as colour photography can represent the natural beauty of these admirable works of horticultural art the illustrations of this booklet help to carry out the wish expressed by Her Majesty the Queen during her visit to the Exhibition that those gardens might be permanent.

Rainfall at Dolgelly.—Mr F. G. Brewer, of Bryntirion Gardens, Bont Dhu, Dolgelly, sends particulars of the rainfall measured at Bryntirion during the present month. Up to the morning of August 26 the total rainfall was 10.29 inch. A measurable quantity of rain fell on 24 of the 26 days, and more than 1 inch fell on each of three different days. The greatest fall in one period was 4.60 inches, which fell in 36 hours on the 23rd and 24th inst.

The World's Corn Crops.—The August number of the *Bulletin* of Agricultural Statistics published by the International Institute of Agriculture, contains four tables showing preliminary estimates of the production of Wheat, Rye, Barley and Oats for all countries from which estimates had been received up to the time of publication. The total of the estimates for Wheat amount to 543,664,789 quintals as against 562,141,600 quintals in 1911 (96.7 per cent.), the countries considered being: Prussia, Belgium, Bulgaria, Denmark, Spain, England and Wales, Hungary, Italy, Luxemburg, Switzerland, Canada, United States, India, Japan, Egypt and Tunis. Some of the principal variations as compared with last year's figures are: Spain 30,595,000 quintals (40,414,000 quintals in 1911); Hungary 49,968,000 (51,737,000); Italy 47,108,000 (52,362,000); Canada 51,145,000 (58,746,000); United States 185,069,000 (169,100,000); India 99,862,000 (102,016,000). The production of Rye amounts to 102.5 per cent. of last year's production, being estimated at 134,300,000 quintals against 131,065,000. The countries included in the estimate are: Prussia, Belgium, Bulgaria, Denmark, Spain, Hungary, Italy, Luxemburg, Switzerland, Canada, United States, and Algeria. The estimated production of Barley is 144,557,000 quintals or 99.9 per cent. of last year's production (144,747,000) in Prussia, Belgium, Bulgaria, Denmark, Spain, England and Wales, Hungary, Italy, Luxemburg, Switzerland, Canada, United States, Japan, Egypt, and Tunis. The production of Oats is estimated at 333,038,000 quintals as against 298,707,000 quintals, i.e., 111.5 per cent. of last year's production in Prussia, Belgium, Bulgaria, Denmark, Spain, England and Wales, Hungary, Italy, Luxemburg, Switzerland, Canada, United States, Japan, Algeria, and Tunis. Estimates are, however, still missing for a few important countries, among which Russia should be specially mentioned. The totals and percentages given above will, therefore, undergo further changes when estimates for these countries are received. In two tables which are given showing the area and production of Maize and Rice, this year's production in the United States is estimated for these two crops respectively at 714,022,000 quintals (111 per cent. of last year's production) and 4,695,000 quintals (100.3 per cent.), and in Egypt at 19,418,000 quintals (112.6 per cent.) and 2,960,000 (76.9 per cent.) respectively. Short reports as to the progress of the crops in a number of countries follow the tables; among these, that for Russia is of special interest, and states that, although the weather has not been very favourable in European Russia, an over-average yield is anticipated for all the cereal crops. The *Bulletin* also contains five other tables showing the area, crop condition, and, for a few countries, a preliminary harvest estimate for Flax, Sugar Beet, Vineyards, Tobacco, and Cotton. Among others, the production of linseed in the United States is given as 7,112,000 quintals, i.e., 144.6 per cent. of last year's production, and the production of Cotton in Egypt as 3,328,702 quintals (133 per cent.), the production of Grapes in Spain as 24,134,551 quintals (89.5 per cent.), and the production of Tobacco in the United States as 4,445,182 quintals (108.3 per cent.). A table relative to the silkworm industry reproduces the date published in the *Bulletin* for July, with the addition of the figures showing the production of summer cocoons in Japan, which amounts to 17,195,000 kilogrammes or 86.9 per cent. of last year's production. The total production of cocoons in 1912 is given as 157,574,000 kilogrammes, as against 161,901,000 in Austria, Bulgaria, Spain, Hungary, Italy, Switzerland, Japan and Algeria.

Flowers in Season.—The wet, cold summer has had very serious effects upon many of the flowers which are usually at their best this month; but Sweet Peas seem to have suffered but little. We have just received a large box of these popular flowers, comprising over 40 of the finest varieties, showing an excellence of culture and condition seldom equalled, even in Essex. The flowers were grown by Mr. G. B. Blackwell, of the Wood Green Park Estate, Cheshunt, and Mr. Blackwell is certainly to be commended for the care he has bestowed upon them. Rainbow Spencer is a particularly fine mottled variety, of a delicate shade of pink. Maslin Spencer is a self-coloured flower of a deeper shade of pink, very suitable for decorative purposes. Of the purple selfs, Arthur Green gives a fine effect, especially when blended with Helen Pierce, a mottled purple variety with well-marked, irregular streaking. All the flowers are particularly well developed, with fine, upstanding stems, and graceful, well-shaped blossoms. One variety, an interesting sport from America Spencer, with bright pink standards and wings, and white keel, is specially noteworthy.

Australian Botanists.—Mr. J. H. Maiden is indefatigable both as a systematist in botany and as a historian of Australasian botanists. He has now published (*Australasian Association for the Advancement of Science*, iii., pp. 224-243, with four portraits) the first supplement to his "Records of Australian Botanists." The present contribution consists largely of additional information respecting botanists previously noticed. It also contains an alphabetical list of all the botanists mentioned in the seven previous papers published by the author, with references to the places of publication. The portraits are: Amalie Dietrich, Ronald Gunn, Carl Wilhelmi, and Sir William Macarthur.

Sun-dried Strawberries.—A berry grower of the State of Washington is stated, in an American Consular report, to have discovered, after many experiments, a sun-drying process for Strawberries which has proved so successful that he now receives orders for the product from many States in the Union, and also from Alaska. He intends later to organise a company, and turn out the fruit on a large scale.

Publications Received.—***The Harvest of the Hives***, by the Rev. Gerard W. Baneks, M.A. Second edition, price 6d. (London: Unwin Brothers, Ltd., 27, Pilgrim Street, E.C.)—***Sugar Cane Experiments in the Leeward Islands.*** Reports of Experiments conducted in Antigua and St. Kitts in the season 1910-11. Part I, Experiments with Varieties of Sugar Cane. Part II, Manurial Experiments with Sugar Cane. Imperial Department of Agriculture for the West Indies. Barbados. Issued by the Imperial Commissioner for the West Indies, 1912. Price 1s.—***Bulletins of the Agricultural Experiment Station of Nebraska, U.S.A.*** 129, Results of the Douglas County Cow Testing Association, by A. L. Haecker and J. H. Frandsen; 130, Forage Rations for Growing Horses. Report of Experimental Sub-station. North Platte, Nebraska, by W. P. Snyder and E. A. Burnett; 128, Studies in Water Requirements of Corn, by E. G. Montgomery and T. A. Kiesselbach; 127, Competition in Cereals, by E. G. Montgomery; 126, Native Seed Corn, by E. G. Montgomery; 125, Wheat Breeding Experiments, by E. G. Montgomery; 123, 124, Fattening Hogs in Nebraska, by W. P. Snyder and E. A. Burnett; the Germination Test for Seed Corn, by T. A. Kiesselbach, &c.

THE EUGENIAS OF SOUTH AFRICA.

(Continued from p. 153.)

5. E. NATALITIA, Sonder, in Harv. and Sond. Fl. Cap. II., 522.

An erect, divaricately-branched, glabrous shrub, 1.5 to 3 m. high; second and third year's branches, slender, roundish, greyish-white, and marked with longitudinal striae, the ultimate twigs short, flattened and subangulate, brownish, densely leafy. Leaves opposite (rarely alternate or ternate), patently spreading, usually twice or three times as long as the internodes, elliptic, narrowing to the base into a very short, grooved petiole, apex obtusely triangular, or obtusely cuspidate, 3 to 4.5 cm. long, 1 to 2.5 cm. broad, membranous or thinly coriaceous, dark lustrous green, smooth or slightly puckered above, the midrib sunken, but the lateral veins slightly elevated on both sides and coalescing into an intra-marginal band, the lower surface pale and dull green, dotted with minute glands; margin undulate and usually recurved towards the apex of the leaf. Cymes or racemes, axillary or appearing in fascicles on the older wood, 3 to 10-flowered, or by abortion one-flowered, with the slender, compressed and angular, brownish peduncles 2 to 5 mm. long. Flowers white, staminate or perfect, 5 to 8 mm. in diameter, subtended by two minute, deltoid, concave bracteoles. Receptacle obconic, glandular; sepals four, broadly ovate, concave, rounded, slightly exceeding the receptacle. Petals spreading, oblong or broadly ovate, rounded, and, like the sepals, dotted with large glands, ciliolate. Stamens, 20 to 25. Style stout, erect, exceeding the stamens; stigma subcapitate. Fruit globose, thinly fleshy, 1 to 1.3 cm. in diameter; stone large, globose and pale brown.

Wood in *Trans.* S.A. Phil. Soc., XVIII, ii, 1908, 157 (in part).

Eastern Region.—Natal, Port Natal, Gueinzius, 3C. Mrs. K. Saunders. Gerrard, 558. 73. 1644. Inanda, 540m., Wood, 1145. Zululand, Qudeni Forest, 1800 m. Davies, 54. Ex Herb. Medley-Wood, 7893.

E. natalitia, Sond., appears to be confined to Natal and Zululand, where its flowering season is from October to December. Its omission, both from Sim's and Fourcade's contributions to the *Forest Flora* indicates that it does not play an important part in the economy of that region. Whether the fruit is edible or not I am unable to say. An excellent figure of this species is given by Thonner in his *Blütenpflanzen Afrika's*, t. 115, 1908.

6. E. SIMII, Dümmer, sp. nov. (see fig. 83); E. Zeyheri, Harvey, affinis sed ramulis haud dense foliosis, foliis fere duplo longioribus tenuioribus, marginibus recurvis haud incrassatis, floribus saepe solitariis longe pedicellatis, sepalis corollisque glandulosis facillime distinguenda.

An evergreen tree? Ultimate branchlets, straight, slender, subquadrangulate, smooth, whitish and dotted with blackish lenticels. Leaves opposite, subsessile, patently spreading, twice or three times as long as the internodes, narrowly elliptical, obtuse or rounded at the apex, gradually tapering from the middle to the base into an almost imperceptible flattened petiole, 5 cm. long, 12 to 15 mm. broad, shiny green above, paler and dull beneath, with the midrib and reticulations prominent on both sides, thinly coriaceous and glabrous, the margin slightly undulate but not thickened. Inflorescence axillary, invariably one-flowered (rarely cymose). Flowers white, with a slender peduncle 5 to 10 mm. long; bracteoles two, opposite, deltoid, acute subtending the receptacle and about half as long as it. Sepals four, concave, dotted with spherical sessile dark glands, two broadly and shortly ovate, rounded and about 2 mm. long, the remaining broadly oblong and nearly twice as long; petals four, glandular, broadly oblong with rounded apices, 4 mm. long; stamens about 15, as long as the petals; anthers oval with blackish connectives. Style erect, subulate; stigma capitate. Fruit not seen.

FIG. 83.—EUGENIA SIMII, DUMMER.

Natal. Gerrard, in Kew Herbarium and British Museum, 47.

More material and information are required as to the habit of this species, the nature of its timber and whether it forms an important constituent of the forests of Natal. It is not unlikely that Sim and also Wood, in stating that E. Zeyheri, Harvey, extends to Natal, are alluding to this species, which is, however, quite distinct from the preceding, differing mainly in the less leafy, ultimate branchlets, longer and thinner leaves, which are not thickened and recurved at the margins, and in usually solitary flowers with conspicuously glandular calyces and corollas.

7. E. INCERTA, Dümmer, species nova distincta, E. Woodii, maxime affinis sed ramulis juventute albidis, foliis longius petiolatis majoribus caudato-cuspidatis tenuioribus fere bullatulis, racemis 5-10 floris distat.

A shrub or small tree; second and third year's branches terete and brownish, with prominent nodes and cicatrices; ultimate branchlets straight, subcompressed, whitish, dotted with brownish lenticels, 10 to 15 cm. long; internodes 3 to 4 cm. long. Leaves opposite, shortly petiolate, spreading, thinly coriaceous and glabrous; blade 5.5 to 8 cm. long, 3 to 3.7 cm. broad, elliptic, caudately and obtusely cuspidate, with the cusp 1 to 1.5 cm. in length and narrowing from below the middle into the grooved petiole, which rarely exceeds 5 mm.; dark green and shining above, with a sunken midrib and the principal lateral veins 4 to 8 mm. apart, slightly raised and looping into an intra-marginal band, which is succeeded by a secondary band in closer proximity to the margin of the leaf; lower surface dull and paler green, with the costa and nerves more prominent, obscurely glandular-dotted, and irregularly puckered, the margin slightly undulate. Racemes or cymes 5 to 10-flowered, much shorter than the leaves, axillary, and with the exception of the stamens and style, glandularly puberulous; bracts small, ovate, and concave. Flowers whitish, 8 to 10 mm. in diameter, borne on slender pedicels 5 to 8 mm. long. Receptacle obconic or infundibuliform, subtended by a pair of small, thickish, ovate, concave bracteoles, united at the base. Sepals unequal with rounded apices. Petals free, spreading, broadly ovate, concave and dotted with large glands rounded at the apex. Stamens 20 to 30, rarely exceeding the petals, with flattened filaments and small, oblong anthers. Style filiform, erect or slightly uncinate, 2.5 to 3 mm. long.

Natal Botanic Gardens, Block, B2. Medley-Wood, 1813.

The uncertainty as regards the precise origin of this plant is implied by its specific name. It is cultivated in the Natal Botanical Gardens, and was raised from seed probably gathered on one of the periodic excursions into the interior of the colony, which have been instituted to investigate its flora. At first I was inclined to suspect its nativeness, believing it to be like E. Fambos, Linn., one of the species introduced in the early days by the East Indiamen from India, but this is not supported by an examination of foreign material.

8. E. CAPENSIS, Harvey, Genera South African Plants, 416 (1838).

A much-branched, densely-leafy, evergreen shrub, averaging 1 to 2 m. high, usually with opposite branches, which are roughly striate or scaly-barked and ashy grey or brownish in the second or third year; twigs short, distinctly flattened and four-angled, chestnut-brown, with short, minute, erect pubescence. Leaves small, imbricate or patent, opposite or sometimes in threes, very shortly petiolate, shortly elliptic or rarely obovate or orbicular, rounded at both ends or subcordate at the base, 8 to 20 mm. long, 5 to 13 mm. broad, coriaceous, glabrous, glaucescent and shining above, paler and dull below, with the midrib and reticulations upraised on both surfaces, but most prominent on the lower surface, which is, moreover, thickly dotted with obscure pellucid glands; margin thickened and reflexed, but scarcely undulate. Flowers white, axillary, or appearing on the old wood, solitary, in pairs or threes (rarely more), about 1 cm. in diameter, disposed on slender, glabrous, ascending, nude peduncles, 5 to 15 mm. long. Receptacle shortly obconic, with two small ovate bracteoles subtending it. Sepals concave, rounded, sparingly glandular and ciliolate. Petals spreading, broadly ovate or oblong, eglandular. Stamens numerous, as long as the corolla or exceeding it. Style stout, erect, equalling

the stamens, with a peltate oval stigma. Fruit oblong or globose, purplish, 1 cm. long, crowned by the persistent sepals; stone large.

Sonder, l.c., 522. Sim in *Agric. Jour. Cape of Good Hope*, XVI, 1900, 41; Forest *Fl. Cape Col.*, 227, pl. lxxi, f. ii; Wood, l.c., 156; Sim, *For. Fl. Port. East Afric.*, 68. Memecylon capense, Ecklon and Zeyh. *Enum.*, Pl. 274. Myrtus capensis, Harvey, l.c., 99 (not of Burmann).

Coast Region.—Uitenhage Div.; at the mouth of the Bushman's River, Ecklon and Zeyher, 1772; sandhills near the seashore, between the Zwartkops River and the Coega River, Zeyher, 7; 8. Linch Post, Bowie. Bashurst Div., near Port Alfred, Burchell, 3910. At the mouth of the Great Fish River, on the western side, Burchell, 3749. Albany Div., Albany, Bowker. Grahamstown, MacOwan.

Eastern Region. Transkei; Kentani, near Rock Cove, Miss Alice Pegler, 872. Natal: Gerrard, 93. Near Durban, Haygarth, ex Wood, 1629.

Var major, Sonder, l.c. 523.

Leaves 22 to 25 mm. long, 13 to 22 mm. broad. Flowers 1.3 cm. in diameter.

Eastern Region. Natal; between Umzimkulu River and Umkomanzi River, Drège, 5367b. Natal, Cooper, 1261. Durban, Rehmann, 8970.

This shrubby species is of considerable importance as a sand-dune binder, and forms a conspicuous feature of the maritime vegetation along the eastern coast from Uitenhage to Natal, where it usually covers the dunes, down to watermark. The variety frequents a similar locality, and is only distinguishable from the type by the broader, longer leaves and slightly larger flowers. The latter appear between February and May, and are succeeded by oblong, purplish drupes, which are, however, not edible, according to Sim (l.c.). Sim also remarks that the species abounds on the sand-dunes in Portuguese East Africa up to Inhambane, where the natives know it by the name of Ngoba. *R. A. Dummer.*

(To be concluded.)

FLORISTS' FLOWERS.

PRIMULA SINENSIS.

Primula sinensis and its many varieties can be had in flower over an extended period. Seeds may be sown as early as March, and with proper treatment the resulting plants will flower in the following autumn. Later sowings may be made until the end of August; if properly attended to, the seedlings from the later sowings will supply good plants for flowering during the following spring. For general purposes it is best to sow the seed during June. The seed should be sown thinly in shallow, well-drained pans, filled with a light compost, consisting of leaf-mould and sand, with the addition of a little loam; the pans should be placed in a warm frame or pit, and shaded until the seed germinates. If sown thinly, the seedlings may remain in the seed-pans until they are large enough to pot into thumb-pots; but if they show any signs of damping they must be at once pricked off into fresh soil. During their earlier stages they should be kept in a warm pit, for preference on a shelf close to the glass, as it is essential that the plants should be kept sturdy.

When well established they may be placed in cold frames, where they should receive ample ventilation during mild weather, and the plants be dewed with the syringe and the frames shut early in the afternoon.

When the plants have filled the small pots with roots they should be shifted into 3-inch pots, using a light, rich compost, consisting of two parts loam to one each of spent manure from a Mushroom bed, and leaf-mould, with the addition of sufficient sand to render the whole porous. Some old mortar rubbish is also excellent. The final shift should be into 5-inch or 6-inch pots; the former size is best, unless large plants are required. In potting, the base of the plant should be kept well down, as if this is neglected the plants later on will tumble over if not kept supported. During their growing season success depends on proper attention to watering, shading and ventilation. During the summer the plants will require plenty of water, especially when well established; during autumn and winter they will need less, and care must be taken not to over-water at that time. Some slight shading will be required during the hottest part of the day, but this should not be too dense, or the plants will become weak and drawn, and ventilation must be given according to the weather, but it should always be ample. During winter and spring, when the plants are in flower, a temperature of 50° to 55° will be most suitable. When the plants are growing and the pots are well filled with roots, frequent applications of liquid manure or soot-water will be found beneficial. The above treatment will be suitable for most of the other greenhouse Primulas, such as P. obconica, P. malacoides, P. kewensis and P. verticillata.

CINERARIAS.

Like Primulas, these plants may be sown over an extended period. If wanted in flower during November and December, they must be sown as early as April; but for general purposes June is sufficiently early. The seed should be sown in shallow pans, containing a light compost, and stood in a cool frame or on the shady side of a greenhouse, shading until the seeds germinate. When large enough to handle, the seedlings should be potted singly into thumb-pots, returning them to a close frame, where they should be syringed mornings and afternoons until they are established, when more air should be given. When the pots are filled with roots the plants should have another shift into 5-inch pots. Cinerarias are rapid, coarse-growing subjects, and, therefore, require frequent repottings; in fact, at no time during their growing period must they be suffered to become pot-bound, but should be potted on, whenever necessary, until they are in their flowering pots, which may be 8 inches or 10 inches in diameter if large specimens are required.

The potting compost should consist of rough, lumpy loam, with leaf-mould and spent manure from a Mushroom bed, or well-decayed farmyard dung. The plants should be grown on in cold frames during the summer, keeping them closed for a few days after repotting. At all other times ample ventilation, with shade during the hottest part of the day, should be afforded, syringing freely mornings and afternoons, except during dull weather, when care should be exercised in applying water, as Cinerarias are subject to mildew, though this is generally caused by overcrowding. A sharp watch must be kept for aphis, which must be destroyed by fumigation. The plants may be kept in the cold frames until the end of September, when they should be removed to a cool greenhouse, where abundance of light and air may at all times be admitted. When the flowering pots are well filled with roots the plants must be afforded plenty of liquid manure, alternated with some approved artificial fertiliser. Cinerarias do not generally come true from seed, so, if it is desired to increase any particular sort, it is best done by means of cuttings, which are thrown up from the base of the old plants.

SCHIZANTHUS.

For flowering in pots during early spring, seeds should be sown during September in pots or pans of light compost, and stood in a cold frame, where they should be shaded until they germinate. When large enough to handle, the seedlings may either be pricked off singly into thumb-pots or into pans or small seed-boxes, until they are large enough to be transferred to 3-inch pots. Schizanthus are easily grown in cold frames, or, better still, on a shelf close to the glass, in a cool greenhouse. The secret of success is to keep the plants strong and sturdy from the beginning, and for this plenty of air is necessary at all times, though the amount must be regulated according to the out-door temperature. A too-close and warm atmosphere ruins the plants, especially during mid-winter, when they should be kept growing as little as possible, as during the dull days growth is weak and spindly. The young plants, when well rooted, should be transferred from the thumbs to 4-inch pots, using a light, rich compost; this size should be large enough to carry them over the winter. When a few inches high the plants should have their growing points pinched out to induce a more bushy habit. In the case of S. Wisetonensis this is not necessary, as it is naturally of a bushy habit. Early in the new year the plants should be shifted into their flowering pots, which should be 6 inches or 7 inches in diameter. They should have a position in a cool greenhouse, where they can have ample light and air. They should also have plenty of room, as overcrowding soon results in weak, drawn growths.

In the London area lack of light during the winter months renders it almost impossible to grow these or any other annuals with hopes of good results; thus it is best to start in the new year, sowing the seed early in January. The resulting plants, if grown on without any check, will not be much behind the autumn-sown ones in point of size and time of flowering. They can be successfully grown outdoors during the summer months, sowing the seeds in an open, sunny position towards the end of April or early in May. When thinning, care should be taken to allow plenty of room, as, in common with all annuals, they are not seen at their best when overcrowded. *J. C.*

PLANT NOTE.

POTERIUM OBTUSATUM.

This species, which was recently introduced from Japan, is a desirable addition to summer-flowering border plants. Poterium obtusatum has handsome pinnate foliage of a pleasant light green colour. The flower stems grow to a height of about 3 feet, and bear charming drooping inflorescences of rose-pink flowers from July to September. It is quite hardy, and will flourish in ordinary garden soil. *Iris.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

A Family of Gardeners.—Reading the obituary notice of the late Mr. Alexander Dean, I was reminded of another family of gardeners who received their early training at the same then well-known, Hill Nursery of Mr. Page, Southampton. Some of them were contemporaries of the late brothers Dean. They, too, were sons of a gardener long connected with the same firm. I first met their father, James Barter, when I was at Hackwood Park, in the late 'sixties of last century. He was then manager of the cemetery at Basingstoke, having been sent to carry out the plan supplied by Mr. Page. On its completion, the authorities engaged him permanently. He had five sons, all gardeners, viz., Charles, Frederick, Walter, Edward and William, four of whom I knew personally. Charles went out from Kew about 1858 on a botanical expedition up the river Niger, in West Africa. He died there, and his body was interred by his comrades under a Palm tree. I believe one or more soft-wooded stove plants he sent home were specifically named Barteri, but as I am writing from memory, I forget their generic name or names. Frederick also had a Kew training, and was sent out from there first to the Isle of Ascension, with a view to establish arboreal vegetation thereon, and so attract moisture, and bring about a supply of fresh water for the Pacific fleet. I believe the idea came from the late Dr. Lindley. On his return home, he was sent out to Bengal, India, in order to establish experimental plantations of Cotton, and to teach the natives how to cultivate this crop. This was about 1870. A few years after he was invalided home, but died on the s.s. *Seenda*, and was buried at sea. Walter was gardener to the Earl of Gosford, in Ireland. Afterwards he became gardener at Culzean Castle, in Ayrshire. Later he became manager of an estate and garden near Rio de Janeiro. He, too, died abroad. Edward was for a time gardener at

Bolton Hall, Bedale, in this county, about 1871. William was gardener to the late Mr. Mark Firth, near Sheffield. I have lost sight of them for many years. Such are the chances and changes in some gardeners' lives! *Yorkshire Gardener.*

Storm at Henham Gardens, Wangford.—Great damage was done by a storm which visited this district on the 26th inst. Rain commenced to fall about two o'clock in the morning; the wind increased in strength as the day advanced until, about 11.30 a.m., it blew with hurricane force from the north-east and it was at about that hour that most damage was done. A fine tree of Ailanthus glandulosa, standing at the east side of the residence, was uprooted and blown down. Its height was 75 feet, and at 6 feet from the ground it was 12½ feet in circumference. It has been seen at various times by the leading arboriculturists of England, and only two years ago was inspected by Sir Hugh Beavor, of Norfolk, and Mr. H. J. Elwes, F.L.S., of Colesborne Park, Gloucestershire, who considered it the finest specimen north of the Thames, if not the finest in England. Various other trees on the estate were blown down, including a row of 11 very fine Poplars. In the kitchen gardens bush Apple trees planted seven and eight years ago, and carrying heavy crops, were blown on their sides and almost uprooted. Bushels of Apples and Pears were strewn all over the ground, all kinds of green vegetables were laid flat, whilst plants of Paul Crampel Pelargonium were blown completely out of the ground. To-day we have picked up nearly a ton of Apples which have been blown off the trees. The rainfall for the 24 hours was 3.77 inches, a record for the past 10 years. *Thos. Simpson, Henham Gardens, Wangford, Suffolk.*

House Flitting by Wasps.—A powerful nest of wasps established itself among the Alpines last July in the garden of H. T. Mennell, Esq., Park Hill Rise, Croydon. One afternoon, as hundreds of the insects were flying in and out, Mr. Mennell and his daughter stood within two yards for some while, unmolested and unmolesting. They decided to treat the nest that night with boiling water and paraffin oil, for it was in level ground. Coming back a quarter of an hour later, they were astonished to find the wasps busier than ever, but all flying off in one direction over a fence, laden with eggs, grubs and pieces of the nest. In about an hour the place was practically deserted, as it has remained to date (August 22), though the hole has not been touched. *J. Edmund Clark, Asgarth, Riddlesdown Road, Purley, Surrey.*

Apples in Prize Collections of Fruit.—I notice in the report of the Shrewsbury show that the first prize collection of dessert fruit contained four varieties of Apples, these receiving as many, and in some cases more, points than Figs, Grapes, Pineapples, and Peaches. I am not suggesting that more points were given them than they deserved, but I ask: can a dish of Apple Gascoyne's Scarlet Seedling be in any way compared to any of the fruits named above for dessert purposes? At this time of the year and for some time to come this Apple has little to recommend it beyond its brilliant colour. I note also that Apple Emperor Alexander was included in one collection of twelve dishes. But this is an Apple of little worth beyond its beautiful appearance. If these inferior sorts of Apples had been replaced by Cox's Orange Pippin no objection could be raised. The R.H.S. code of rules in judging fruit allows more points for Apples than for Plums, and as many as for Figs. No one, I think, will say Apples are equal to either of these fruits when in equally good condition. I would reduce the number of dishes and restrict Apples to two dishes, which are quite sufficient in a collection. *E. M.*

Reversion in Gladioli.—When walking through the gardens at Grimston Park recently, Mr. Bound, the gardener, drew my attention to two rows of Gladioli Lemoine's Seedling. The corms were purchased in the spring of 1911. They flowered well, and were very varied and interesting. This year, fully nine-tenths of them have thrown flower-spikes very much alike, but not nearly so good as last year. The corms were lifted last November, stored in a dry place, and planted on fresh ground last spring. Is this degeneration a usual occurrence? *H. J. C.*

A New Carnation Treatise (see p. 131).—In reply to Mr. R. P. Brotherston's somewhat unfavourable review of my new book, *The Perpetual Flowering Carnation*, I would point out that he, out of 19 reviewers, stands alone in his opinion. My first book, of which 5,000 copies were sold, is now out of print, hence this new and enlarged work, which is selling far in excess of our expectations. My brother and I have spent 32 years in the cultivation of Perpetual-flowering Carnations with some of the leading firms in England and America. At the recent International Horticultural Exhibition, Chelsea, our firm beat every British firm in the premier Carnation competition class, receiving the silver cup. We also won the American Floral Societies' Medal, offered for the best American Carnations in the show. This indicates that our methods must be fairly reliable, and we question if any combination can claim such wide experience of the subject. *Montagu C. Allwood, Haywards Heath.*

Rose Minnehaha (see p. 150).—Mr. Taylor describes the colour of Minnehaha and Dorothy Perkins as being almost identical, whereas the former is of a pure salmon shade, and the latter rose-pink. A beautiful and harmonious combination of colour is obtained by planting Minnehaha and Hiawatha together, but the charm would be lost by substituting Dorothy Perkins for Minnehaha. The writer does not mention that Minnehaha possesses strong flower stems, thus enabling the large panicles to be gracefully displayed. That much maligned variety, Veilchenblau (or so-called Blue Rambler), when planted in combination with Débutante (mauve-pink) will appeal to æsthetic tastes, both being in flower at the same time. *R. W. Proctor, Junr., Chesterfield.*

Preserving Ripe Grapes.—With reference to Mr. Wm. Taylor's experience, if he will turn to my paper on "The Absorption of Rain and Dew by the Green Parts of Plants" (*Journal*, Roy. Hort. Soc., 1908), he will find a quotation of Dr. Hugo de Vries, and a paragraph on Sach's observations on the withering of plants, which may perhaps explain the phenomena he experienced. I have also added my own experience of leaves on cut flower shoots absorbing water. It is recommended to leave one or two leaves on the stalk below the water. In striking certain cuttings, it has also been suggested to bury a leaf or two to assist the cutting to absorb water. *George Henslow.*

The Bearing of Apples.—Your leader on this subject (p. 156) furnishes interesting food for thought to fruit growers. From my own experience, extending over a period of 25 years, I incline to the belief that some varieties of Apples are not strong enough in constitution to produce and mature annually the necessary fruit buds to bear a crop of fruit every year. I am of the opinion, however, that annual crops of most leading sorts grown in this country can be secured provided the trees are treated properly and judiciously fed in the autumn when the fruit buds are maturing. On taking charge of these gardens several years ago, I found that the majority of the Apple trees were in an unsatisfactory condition. But by lifting, root-pruning, branch-pruning, and attending to their annual wants as to feeding, &c., we have not failed to secure good crops of Apples from the majority of the trees every season for the past nine years, and it is only in the case of two or three varieties that average crops are alternated with light ones. The variety you cite, "Wealthy," is no doubt of delicate constitution. I planted trees about 10 years ago, and they soon died from canker. The variety Lady Henniker grows well here, is unaffected by canker, but bears good crops only in alternate years. Another variety of this character is September Beauty. Among varieties which have borne good crops continuously for the past nine years here are Irish Peach, Worcester Pearmain, The Queen, American Mother, Keswick Codlin, Duchess of Oldenburgh, Bramley's Seedling, and Tower of Glamis. Other sorts might be mentioned which have done equally well, but the variety last mentioned has never ceased to bear very heavy crops of Apples each year during the above period, and this year is no exception, the trees being covered with fruit, necessitating thinning, which has also been done during past years. One constantly comes across fruit trees that are badly pruned, but if the roots are attended to and the branches thinly and properly trained, much can be done towards assuring average crops of good fruit annually, excepting in the case of a very few varieties. *Wilmot H. Yates, Rotherfield Gardens, Alton, Hants.*

Pavetta Ceciliæ.—On p. 149, *W. T.* recommends Pavetta caffra for the greenhouse or conservatory, and it may interest your readers to know of another very pretty Pavetta, which I was fortunate in finding in South Africa, and which, so far as I know, has not yet been grown in England. The species was named at Kew after me, Pavetta Ceciliæ (see *Kew Bulletin*, No. 4, 1906, Diagnoses Africanæ, xvi., description No. 832, N. E. Brown). I found it in Rhodesia, near Selukwe, in 1889. I have often thought that the plant would be found useful if grown in the same manner as the Bouvardia, which it greatly resembles. It has white flowers, in loose terminal heads, with long, conspicuous styles. I should be interested to hear if anyone has met with this plant in cultivation in this country. *Alicia M. Cecil, Weycombe, Haslemere, Surrey.*

Double Standards in Sweet Peas.—In your interesting leader (see p. 136) on the above, the following passage occurs: "Whilst it may be claimed that, the conditions being equal, certain varieties are more capable than others of producing a greater proportion of flowers with double standards, nevertheless this particular duplication is very often merely an indication of high cultivation attended with a very liberal use of manures." The first part of this sentence is entirely in accord with my experience; the latter is not. In a soil notoriously poor and shallow—we touch gravelly marl at 15 inch deep, and may then descend 12 feet into nothing but gravel and sand—and which in times of drought is rendered into dust-dry particles by reason of the excessive and rapid filtration of all moisture, a great number of flowers having double standards have appeared this year on plants grown in the ordinary unmanured soil. The chief offenders—if this duplication is to be regarded as an offence—has been Aurora (Spencer), though other varieties have contributed their quota. Nor is it a question of standards alone; there are evidences, if in lesser degree, of duplication in other parts of the flower. Hence one not unnaturally inquires whether these increased floral parts do not rather represent a stage in evolution which the very absence of uniformity or fixity would suggest is as yet but in the infantile stage? I think so. To what extent high cultivation might develop the sportive tendency is a moot point. At the moment, however, experience tends to show that it is inherent in the plant. *E. H. Jenkins.*

SOCIETIES.

ROYAL HORTICULTURAL.

August 27.—The Hall in Vincent Square, Westminster, was well filled at the meeting held on Tuesday last, and there was a much larger attendance than is customary at this time of the year. The chief interest was centred in the magnificent collections of hardy fruits growing in pots. The Fruit and Vegetable Committee awarded the Hogg Memorial Medal, one Gold, three other Medals, one First-class Certificate, and one Award of Merit. The Orchid Committee granted five Medals, five Awards of Merit, and one Card of Cultural Commendation. The Floral Committee awarded 12 Medals, one First-class Certificate, and, in conjunction with the National Dahlia Society, seven Awards to Dahlias.

The Chairman of the Fruit and Vegetable Committee, in proposing a vote of condolence and sympathy with the relatives of the late Mr. Alexander Dean, V.M.H., expressed the great loss which horticulture in general and that Committee in particular had sustained by his death.

At the 3 o'clock meeting in the Lecture Room Mr. James Hudson, V.M.H., read a paper on "Water Lilies."

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); and Messrs. Chas. T. Druery, John Green, George Gordon, W. J. Bean, G. Reuthe,

W. Bain, John Dickson, Charles Dixon, H. J. Jones, J. T. Bennett-Poë, Chas. E. Pearson, W. P. Thomson, George Paul, Wm. J. James, E. A. Bowles, R. C. Notcutt, F. Herbert Chapman, C. Blick, and E. H. Jenkins.

Leopold de Rothschild, Esq., C.V.O., Gunnersbury House, Acton (gr. Mr. J. Hudson, V.M.H.), exhibited blooms of tropical blue-flowered Water Lilies. These were the Berlin variety of Nymphæa stellata and N. pulcherrima, with large, long-petalled flowers, and N. gigantea var. Hudsoniana, which has large, round flowers; the circular, golden filaments nestling in the middle of the broad-petalled, blue flowers were very charming. For this exhibit and the large number of blooms used to illustrate Mr. Hudson's lecture a Silver Flora Medal was awarded.

Mr. L. R. Russell, Richmond, made a very large display of Celosias, in blocks of distinct colours, and many excellent foliage Begonias. At the end of the hall under the clock, Mr. Russell exhibited a group of exceedingly good standard plants of the lemon-scented Verbena, Aloysia citriodora. These well-grown plants, which were in flower, attracted considerable admiration, and illustrated an excellent means of providing a change from the standard Fuchsias and Heliotrope which, beautiful though they be, are too frequently used in summer bedding schemes.

Messrs. John Piper & Sons, Barnes, Surrey, showed a large number of Lilium speciosum magnificum in pots. The plants were exceedingly fine examples, but the sage-green colour of the background did not enhance their beauty. (Silver Banksian Medal.)

Messrs. James Veitch & Sons, Chelsea, filled a long table with ornamental greenhouse plants. A batch of Streptocarpus, raised from seed sown seven months ago and arranged in distinct shades of colour, was excellent. Standard plants of Fuchsia "Thalia" displayed the floriferousness of this variety. The greenhouse hybrid Rhododendrons were quite as good as ever; the flowers of R. Ne Plus Ultra were exceedingly rich in colour. The large block of Cannas in very small flower-pots bore astonishingly fine heads of bloom. (Silver Banksian Medal.)

Messrs. H. B. May & Sons, Upper Edmonton, arranged sturdy plants of Ixora Williamsii, I. Fraseri, I. salicifolia and Codiæum edmontoniense amongst many excellent Ferns and Selaginellas. Ixora salicifolia is an uncommon and very ornamental species. As the specific name suggests, the leaves are long and narrow, and the bright-red flowers are borne in a large truss. (Silver Banksian Medal.)

Mr. James Box, Lindfield, Sussex, made a very pleasing show with large stands of herbaceous Phlox tastefully disposed and many other hardy border flowers. The small white Gladiolus-like spikes of Watsonia Ardernei alba were unusually good. Other desirable flowers were those of Galtonia (Hyacinthus) candicans, many Gaillardias (including the clear-yellow Lady Rolleston), Lobelia cardinalis Queen Victoria, and Aconitum Wilsonii. The Phloxes, which formed the chief feature of this fine exhibit, were exceedingly good, and the colours were skilfully arranged. (Silver-gilt Banksian Medal.)

Messrs. Wm. Cutbush & Son, Highgate, London, had an imposing collection of cut border flowers. A very large vase of the terra-cotta-coloured Gladiolus Hollandia was especially noteworthy. Other large stands contained Crinums, Pentstemons and Tritonias, whilst the groundwork was composed of various Heleniums, standard bushes of Rose "Jessie"—rising above small fruiting bushes of Skimmia japonica—Rudbeckias and Gaillardias. In the front there were choice flowers of hardy Nymphæas. (Silver Flora Medal.)

Mr. Ernest Dixon, Putney, showed hardy flowers edged by a row of Viola cornuta purpurea.

Messrs. George Bunyard & Co., Maidstone, Kent, displayed border flowers in great profusion. The spikes of Tritoma (Kniphofia) Star of Baden, T. nobilis and T. erecta were very fine, as also were the spikes of Delphiniums. (Silver Banksian Medal.)

Messrs. W. Wells & Co., Merstham, Surrey, arranged many spikes of Delphiniums, Phloxes, and other border flowers.

The Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. E. Beckett), showed an interesting collection of species and varieties of Buddleia, mostly of B. variabilis, which bore very large racemes of honey-sweet flowers. (Silver Banksian Medal.)

The Rev. Chalmers Hunt, Willian Rectory, Hitchin, contributed a very fresh collection of Roses. Some vases of Asters contained fine but somewhat weather-strained flowers, a regrettable but not unexpected condition.

Mr. A. Ll. Wwillim, Cambria Nursery, Sidcup, Kent, showed many blooms of this year's seedling tuberous-rooted Begonias set out on exhibition boards. The flowers, which had been grown in the open ground, showed signs of the weather, but were of large size and distinct colours. A few pot plants of named double Begonias were very good specimens. At the end of the Begonias there was a collection of border flowers in vases. (Bronze Banksian Medal.)

Mr. G. Reuthe, Keston, Kent, arranged small pot plants and cut sprays of various hardy shrubs and plants. Amongst the lesser-known plants there were Linaria alpina, Gentiana havarica, Campanula grandiflora Mariesii, and Polygonum Brunonis.

Messrs. Wm. Fells & Son, Hitchin, Herts., showed Violas, various cut border flowers, and arranged a small rock garden, in which they planted Origanum hybridum, the rich purple-flowered Myosotis azorica, and Tunica saxifraga.

Mary Countess of Ilchester, Holland House, Kensington (gr. Mr. A. Dixon), contributed a collection of fruiting branches of ornamental Crabs. The sprays of Pyrus Malus, P. M. pendula, P. prunifolia, P. Niedzwetzyana, with large purple fruits; P. Dartmouth and P. spectabilis, which have smaller rosy flushed fruits, and the green-fruited P. salicifolia were very ornamental.

Mr. Amos. Perry, Enfield, Middlesex, arranged a very attractive collection of Delphinium sprays. The blue and purple-coloured varieties Perfection and Mrs. Brower; the pale blue Persimmon and Lizzie and the darker flowers of King of Delphiniums, Lemartin and Sister Lugden were attractive. The group was lighter by a row of Achillea "The Pearl" at the front and Japanese Maples in the background.

The Misses Hopkins, Shepperton-on-Thames, contributed a small rockery in which were planted Hypericum olympicum, various half-hardy Mesembryanthemums and Convolvulus althæoides.

Dahlias.

Messrs. H. Cannell & Sons, Swanley, Kent, arranged a very attractive collection of Dahlias in stands of different varieties. The single-flowered varieties Mrs. L. de L. Simonds, Mr. Walter Jackson, Cannell's Favourite, and Hall Caine were especially good. The blooms of the Cactus and decorative varieties were exceptionally fine. Messrs. Cannell also showed plants of Crassula falcata with beads of vivid scarlet flowers, and many good blooms of double and single tuberous Begonias. (Silver Flora Medal.)

Messrs. J. Cheal & Sons, Crawley, exhibited many varieties of Dahlias. The Cactus Mrs. Winstanley, Mrs. Edward Mawley, Avoca, and the Pæony-flowered blooms were very large, and such varieties as Eleanor possessed good colouring. At one end there was also a collection of Collarette and single-flowered varieties and three heavily-fruited plants of the Siberian Crab. (Silver Banksian Medal.)

A representative collection of cut blooms of Dahlias was sent by Reg. R. Cory, Esq. The Pæony-flowered and Collarette varieties arranged in large Bamboo stands with branches of Japanese Maple and Taxodium distichum were exceedingly decorative. There were also many good examples of Pompon Dahlias. (Bronze Banksian Medal.)

Messrs. Dobbie & Co., Edinburgh, showed a splendid collection of Collarette Dahlia blooms in a large number of distinct varieties of the many sorts. Antwerpa (crimson, with yellow collar), Queen Mary (rose-purple, with white collar), Holyrood (red and yellow, with yellow collar), Princess Louise (carmine, with pale yellow collar), Queen Bess (fiery orange, with yellow collar), and the now well-known Maurice Rivoire are a representative selection.

AWARDS.

First-class Certificate.

Cotoneaster divaricata.—A low, compact and spreading bush, from China, with a profusion of erect, oval, bright-red berries. Shown by the Hon. Vicary Gibbs, Aldenham House, Elstree.

Dahlias.

A joint sub-committee of members of the Floral Committee, R.H.S., and the National Dahlia Society inspected a large number of Dahlia blooms, and each of the following varieties received the Award of Merit of the Royal Horticultural Society and the First-class Certificate of the National Dahlia Society:—

Princess Louise.—A collarette variety which has rich crimson florets and a pale primrose collar. Shown by Messrs. Dobbie & Co., Ltd., Edinburgh.

Edith Carter.—A long-petalled Cactus variety with a yellow centre, merging to rosy-purple at the outside. Shown by Mr. H. Shoesmith, Woking.

Leopold.—A deep-crimson, single-flowered variety.

Marion.—A buff and rose-coloured single variety.

Irene.—A mauve Pompon. The three foregoing were shown by Messrs. J. Cheal & Sons, Crawley.

Pegasus.—A compact-flowered Cactus variety; the rose ground is striped and spotted with crimson; the centre greenish-yellow. Shown by Messrs. J. Stredwick & Son, St. Leonards-on-Sea.

Antwerpa.—An exceptionally good collarette variety of crimson colour set off by a yellow collar. Shown by Mr. Riding, Chingford.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), W. Bolton, Gurney Wilson, de B. Crawshay, A. Dye, W. Cobb, H. G. Alexander, J. E. Shill, W. H. Hatcher, A. A. McBean, T. Armstrong, F. J. Hanbury, Stuart Low, R. A. Rolfe, Sir Jeremiah Colman, Bart., and Sir Harry J. Veitch.

E. H. Davidson, Esq., Borlases, Twyford, staged the most remarkable group, for which a Silver-gilt Flora Medal was awarded. The plants were very well grown, and included several new hybrids, which will show their beauty more fully in a year or two. Three of the best received Awards of Merit. In the centre of the group was a fine specimen of Odontoglossum Rolfeæ with three branched spikes, a perfect fountain of bloom; O. crispo-Harryanum had two spikes each 4 feet long; a small plant of the new O. Nathaniel bore an inflorescence of well-formed, dark claret flowers with white margins. O. Ceres "Davidson's variety" is a pretty hybrid of O. Rossii. O. percultum, O. ardentissimum and other hybrid Odontoglossums were included. Sophro-Cattleya Pandora had a large, rich red flower; Lælio-Cattleya Lord Rothschild "Borlases variety" is a good white-petalled form; L.-C. Colmaniana "Borlases variety" resembled a dark Cattleya Hardyana, and there were good varieties of C. Fabia, C. Adula, and C. Dowiana aurea.

Messrs. Sander & Sons, St. Albans, were awarded a Silver Flora Medal for an effective group, principally hybrids, among which were a very pretty form of Lælio-Cattleya Walter Gott, with a remarkably broad mauve lip; L.-C. Wellesleyæ (C. Warscewiczii × L.-C. Martinetii) of very rich colour and good shape; L.-C. Fabius (L.-C. Bletchleyensis × L.-C. elegans), a bright flower and very distinct; Cattleya nobilis (granulosa × Warneri); varieties of C. Lord Rothschild; Brasso-Cattleya Mme. Chas. Maron, and other Brasso-Cattleyas; and a showy selection of Odontoglossums and Odontiodas. Among the species noted were Bulbophyllum virescens, B. galbinum, B. cylindraceum, B. congoense, Catasetum maculatum and others.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a Silver Banksian Medal for an interesting group, in which were noted Cattleya Source d'Or (Forbesii × Pittiana), a distinct and pretty hybrid, C. Dowiana, C. Suavior, C. Clarkiæ; Lælio-Cattleya Argus (C. intricata × L.-C. Ingramii), and L.-C. Delicia (C. Harrisoniana alba × L.-C. Constance Wigan), white with yellow disc to the lip; a selection of good Cypripediums, including Baron Schröder var. Ardens, Neptune, Maudiæ, Wootonii, Chas. Richman, Felicity, and Fascinator; Miltonia vexillaria rubella, Brassia brachiata and B. Lawrenceana longissima, Chondrorhyncha Chestertonii, Bulbophyllum barbigerum, Angræcum Scottianum, and hybrid Odontoglossums.

Messrs. Charlesworth & Co., Haywards Heath, received a Silver Banksian Medal for a very select group of rare species all in fine condition, and including Houlletia Wallisii, with four spikes of its large yellow flowers spotted with purple; the singular Polycycnis muscifera with two tall spikes densely set with its curious insect-like blooms; the white Mormodes luxatum; a grand specimen of the rare Miltonia Schröderiana; Angræcum falcatum, with a head of pure white flowers; Cœlia macrostachya; the violet Calanthe violacea; two fine forms of Pescatorea Roezlii; a noble specimen of Aërides Lawrenciæ Sanderiana, with three spikes; and various Cypripediums.

Messrs. Stuart Low & Co., Bush Hill Park, received a Silver Banksian Medal for an effective group, at the back of which were graceful plants of the white and mauve Oncidium incurvum and the yellow O. varicosum. In the centre was a fine specimen of Lælia crispa, with good Dendrobium, Phalænopsis Schröderianum and various Cattleyas and Lælio-Cattleyas. We also noted good plants of Odontioda Charlesworthii, Anguloa Ruckeri, Physosiphon Loddigesii, and Catasetum Darwinianum.

Messrs. J. & A. A. McBean, Cooksbridge, staged Vanda Sanderiana, with two spikes; three plants of good varieties of Cattleya Dowiana, C. Iris, Maxillaria grandiflora, with eight large white flowers; a very brilliant scarlet Cochlioda Noezliana; two Oncidium Mantinii; and some pretty Odontoglossums.

Messrs. A. J. Keeling & Sons, Westgate Hill, Bradford, showed the rare and pretty Eria rhyncostyloides, four plants of Vanda cærulea, Cattleya Harrisoniana violacea, Cypripedium A. de Lairesse, and C. Ultor.

Messrs. Armstrong & Brown, Tunbridge Wells, showed Cypripedium Clara Armstrong (Germaine Opoix × Prewettii), a finely-formed large flower near to C. Germaine Opoix. The large dorsal sepal is yellowish at the base, from which ascend feathered and dotted dark purple lines into the rose-coloured zone below the white margin. The petals and lip are pale yellow, veined and tinged with purple; and C. Memoria Alma Gevaert (Lawrenceanum Hyeanum × Maudiæ), larger than C. Maudiæ, emerald-green, with pure white upper part to the dorsal sepal.

J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), exhibited a grand plant of Cypripedium Daisy Barclay (Godefroyæ leucochilum × Rothschildianum), white, beautifully marked with claret-purple.

J. S. Bergheim, Esq., Belsize Court, Hampstead (gr. Mr. H. A. Page), showed a very singular Bulbophyllum of the B. Calamaria section, with a black fringed labellum, the petals whitish spotted with black; also Angræcum O'Brienianum. (See Awards.)

J. J. Neale, Esq., Lynwood, Park Road, Penarth (gr. Mr. H. Haddon), sent the curious Epidendrum laterale, with two spikes of greenish flowers produced from rudimentary growths as in E. Stamfordianum.

Messrs. Mansell & Hatcher, Rawdon, Yorks, showed Brassia caudata, Trichopilia laxa, and the clear yellow Acineta densa.

AWARDS.

Awards of Merit.

Odontioda Euterpe "Davidson's variety" (Odontoglossum Uro-Skinneri × Cochlioda Noezliana), from E. H. Davidson, Esq., Borlases, Twyford.—A very free-flowering hybrid, with the sepals and petals dark bronzy-red, the showy labellum vermilion-red, with a whitish zone on the front lobe.

Lælio-Cattleya amabile "Borlases variety" (C. Luddemanniana × L.-C. Fascinator), from E. H. Davidson, Esq.—The large flowers are of fine substance. The sepals and petals are broad, white with a pearly blush. Front of lip purple, disc yellow.

Odontoglossum Helene (parentage unrecorded), from E. H. Davidson, Esq.—A fine hybrid of the O. Lambeauanum class. Flowers heavily blotched with claret colour; front of lip white.

Lælio-Cattleya Golden Fleece (L.-C. Golden Gem × C. Dowiana aurea), from Lieut.-Col. Sir Geo. Holford, K.C.V.O. (gr. Mr. H. G. Alexander).—A beautiful, bright yellow flower, with dark red markings at the base of the lip.

Angræcum O'Brienianum, from J. S. Bergheim, Esq., Belsize Court, Hampstead (gr. Mr. H. A. Page).—A fine species from Western Uganda. It is a strong grower, with broad, strap-shaped leaves borne on stout, erect stems. The plant had six spikes, five of them bearing arching racemes of pretty, pure-white, wax-like flowers, with curved spurs tinged with cinnamon-brown. The segments are recurved, and lip included nearly equal. A single plant of this species was shown by Messrs. Sander & Sons on June 21, 1892, since when it had not appeared again until now.

Cultural Commendation

to Mr. H. G. Alexander, Orchard Grower to Lieut.-Col. Sir Geo. L. Holford, K.C.V.O., for a splendid plant of Cattleya Euphrasia "Westonbirt variety" (superba × Warscewiczii), with a spike of 10 rose-coloured flowers with showy ruby-crimson labellums.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the Chair); and Messrs. A. H. Pearson, W. Poupart, John Harrison, Owen Thomas, George Wythes, A. Scrubb, James Vert, Joseph Davis, George Kelf, A. R. Allan, W. E. Humphreys, J. Willard, Edwin Beckett, George Woodward, and Jos. Cheal.

Messrs. James Veitch & Sons, Ltd., Chelsea, arranged a magnificent collection of hardy fruit trees in pots. All the plants of this superb collection, which was composed chiefly of Apples and Pears in a variety of shapes—as bushes, standards, pyramids, cordons and espaliers—had the short-jointed wood and firm foliage which tell so eloquently of first-class cultivation. The tall standard John Downie Crab trees in the back row had a profusion of bright fruits. The many varieties of Apple, among which were wonderfully prolific bushes of the variety the Rev. W. Wilks, bore splendid fruits, and the Pear trees were heavily laden. The Apples in boxes, placed along the front of this group, included the following varieties:—Worcester Pearmain, Lady Sudeley, and Feltham Beauty. (Hogg Memorial Gold Medal.)

Messrs. Bunyard & Co., Maidstone, showed many splendid fruit trees in pots. The fruits of one young tree of the variety Rev. W. Wilks were of great size. Other fine examples were the trees of Emperor Alexander, Gascoyne's Scarlet Seedling, Cox's Orange Pippin, Wealthy, Golden Noble, and Baumann's Red Winter Reinette. The Pears of such varieties as Beurré Superfin, Beurré de Jonghe, Marguerite Marillat, and Fondante Thirriot were especially good, and the Plums were heavily laden with yellow and deep-red fruits. At the end of the group there was a heavily-fruited Black Hamburgh vine in a pot. On a side table Messrs. Bunyard exhibited many baskets of very good Apples and Pears, and in the annexe a collection of Filberts, Cob-nuts, and fruits of Crabs. (Gold Medal.)

Messrs. H. Cannell & Sons, Swanley, Kent, staged a collection of hardy fruit. The dishes of such Gages as Jefferson's, Denniston's Superb, and Decaisne were superb examples. Amongst the many splendid Apples, the dishes of Duchess of Oldenburgh, Worcester Pearmain, Zitowka, James Grieve, and Lady Sudeley were of more than ordinary merit. (Silver Banksian Medal.)

The Hon. Mrs. Merry (gr. Mr. G. Kelf), Danesbury Park, Welwyn, Herts., exhibited 17 varieties of Plum which had been grown out-of-doors. The boxes of Jefferson's, Kirke's and Belgian Purple Plums and Transparent and Greengages were especially good in this fine collection. (Silver Banksian Medal.)

Messrs. Stuart Low & Co., Bush Hill Park, Middlesex, exhibited a large number of good pot fruits. The Grapes included Royal Muscadine and the Sloe-black variety Strawberry. Amongst the varieties of Figs Black Ischia, Brunswick, Bourgasotte Grise, and Brown Turkey bore plenty of fruit, as also did the Apples Stirling Castle, Bismarck, and Duchess's Favourite. (Silver Knightian Medal.)

The Rev. L. C. Chalmers Hunt, Hitchin, showed nine dishes of Runner and French Beans and four of Peas. There were fine pods of Gladstone, Sutton's Selected, and Duke of Albany Peas. Of the Beans, Prize Winner, Best of All, and Scarlet Emperor were very large and succulent, and the small pods of Ne Plus Ultra and Canadian Wonder were equally good. (Bronze Banksian Medal.)

A very meritorious collection of Potatos was exhibited by S. Hardy, Esq. (gr. Mr. G. H. Chitty), Highgate. The tubers were clean, of good shape, and free from grossness. The coloured varieties included King Edward VII, Mr. Bresse, and Reading Russet; prominent amongst the white-skinned sorts were noted Express, Duchess of Cornwall, and Ringleader as being especially good. (Vote of Thanks.)

A collection of Carrots shown by Mr. G. Gray, Sandy, was composed of perfectly-formed roots of rich colour, and included the varieties Early Market, Gray's All the Year Round, and Carter's Red Elephant.

AWARDS.

First-class Certificate.

Melon John Massey.—A scarlet-fleshed, well-netted Melon, which has been grown for trial at Wisley. The Committee were unanimously of the opinion that this variety, which has a very rich flavour, is one of the best Melons submitted to them for a long time. From Messrs. Wm. Rowlands & Co., Liverpool.

Award of Merit.

Apple "Padnall Seedling."—The fruits of this culinary variety so favourably impressed the Committee when shown on August 3 last that a deputation visited Chadwell to see the tree, when its vigour and tremendous crop amply justified the Award. Shown by Mr. R. Roberts, Chadwell Heath.

Roger Leigh, Esq., was awarded a Card of Cultural Commendation for a dish of Brown Turkey Figs.

THE LECTURE.

Mr. E. A. Bowles occupied the Chair, and some 60 members were present. Mr. Hudson dealt with the newer as well as the older varieties of Water Lilies. Of the newer varieties he enumerated a dozen that had been tested at Gunnersbury House Gardens. These were Nymphæa Mrs. Richmond, Formosa, Attraction, Conqueror, Newton, Escarboucle, Meteor, Masaniello, Colossea, Somptuosa, virginalis, and suavissima. He classified the hardy hybrid Nymphæas into various sections, including those of vigorous, medium and smaller-growing habits, and gave advice respecting insect pests and remedies. Mr. Hudson also treated upon the floral beauty produced by collective grouping in various colours. An exhibit of some 36 varieties of hardy hybrid Water Lilies grown at Gunnersbury House served to illustrate the lecture.

CO-PARTNERSHIP FESTIVAL SHOW.

August 24.—There were between 800 and 900 exhibits at the Co-partnership Flower Show held on the above date at the Brentham Garden Suburb of the Ealing Tenants Ltd. The 1st prize for the best-kept garden on the estate was awarded to Mr. E. J. New, 23, Meadvale Road, Ealing, who is one of the hon. secretaries of the Ealing Tenants Horticultural Society. In addition to the exhibits for competition, Leopold de Rothschild, Esq., Gunnersbury House, Acton (gr. Mr. James Hudson), sent a beautiful display of Ferns, Palms and other decorative plants. In the open classes there was a fine show of table decorations. The 1st prize for annuals was won by Mr. W. Nye, Acton; while Miss Bashford, of Carshalton, arranged the best epergne of cut flowers. The table decorations of fruit and cut flowers on spaces of 8 feet by 4 feet were particularly fine, the prize-winners, who were local exhibitors, being Mrs. Mole, Mr. W. Owen, and Mrs. Whitmore in the order named. The most successful exhibitors of vegetables were Mr. D. W. Bedford, of Berkhamsted, and Mr. J. Fossey, of Hendon. The classes restricted to members of Co-operative and Co-partnership Societies attracted entries from Harborne, Leicester, Ealing, Letchworth and Hamostead. Some excellent collections were submitted. The prizes offered by Messrs Sutton & Sons for collections of vegetables were won by Messrs. D. W. Bedford, Berkhamsted; J. Rowlett, Leicester; W. Gulliver, Leicester; and W. Owen, Ealing. The first three of these exhibitors also won the prizes offered by the Agricultural and Horticultural Association.

HAARLEM (HOLLAND) GENERAL BULB GROWERS'.

The following awards were made at the recent meetings of the Gladiolus Committee :—

FIRST-CLASS CERTIFICATES.

Gladiolus Glory of Noordwyk.—Flowers soft-yellow.

G. Red Emperor.—Flowers scarlet-red, shaded brownish-red.

G. Panama.—Flowers of an exceedingly fine form, colour pink, shaded lilac; imported.

G. Sieger.—Flowers orange-vermilion, the lower petals lilac with white; a cross from G. Brenchleyensis × G. princeps.

Cactus Dahlia "Richard Box."—A large, soft canary-yellow variety.

AWARDS OF MERIT.

Gladiolus Dorling.—Flowers violet, spotted white; raised from seeds in 1905.

G. Eldorado.—Flowers clear yellow, spotted reddish-brown.

G. Loveliness.—Flowers creamy-white, shaded rose and pink; obtained from seeds.

G. Météor (Pfitzer).—Flowers orange-scarlet, spotted velvety-red.

G. Apollo.—Flowers dark salmon-rose, shaded carmine.

G. Badenia.—The clear, lilac-blue flowers are striped with dark blue.

G. Johanna.—Flowers dark brown-red.

G. Martha.—Flowers purplish-violet.

G. L'Immaculée.—Flowers white, the lip yellow; raised from seeds.

G. Princepine.—Flowers bright scarlet-red, with a large white spot.

G. Sulphur King.—Flowers clear yellow.

G. Carmen.—Flowers dark violet.

G. Dr. Dotter.—Flowers clear sulphur-yellow.

G. Empress.—Flowers dark red; raised from seeds.

G. Scheybeek.—Flowers orange-red, spotted white and carmine; obtained from seeds.

Cactus Dahlia "Florid."—Flowers bright scarlet.

C. D. "Flossie Wells."—Flowers violet-red.

C. D. "Stability."—Flowers lilac-red.

Pæony-flowered Dahlia "White Lady."—Flowers white, in the centre creamy-yellow; raised from seeds.

Montbretia "Fire King."—Flowers bright scarlet, shaded orange. Obtained from seeds by E. H. KRELAGE & SON, Haarlem. Shown by E. H. KRELAGE & SON, Haarlem, and N. H. ROOZEN & Co., Overveen.

PORTUMNA HORTICULTURAL.

AUGUST 7.—The members of Portumna (County Galway) Horticultural Society held their annual exhibition of fruit, flowers, plants and honey on the above date. The exhibits in all the classes were exceedingly good, and entries were more numerous than usual. The "Jones" Challenge Cup, offered for Sweet Peas, was won by Mrs. SEGRAVE, Partlaw House. The cup offered for nine varieties of hardy herbaceous plants was won by Capt. G. H. BURDETT, Coolfin (gr. Mr. W. R. Maxwell), who also excelled in the class for annuals.

COUNTY GALWAY HORTICULTURAL.

AUGUST 17.—The second exhibition of this Irish society was held at Ballinasloe on the above date, when there was some splendid exhibits of plants, flowers, fruits and vegetables. The competition in the several classes was very keen. Silver cups were awarded to Lord CLONBROCK for 12 vases of hardy flowers, and to Miss ARMSTRONG, Ballinasloe, for hardy annuals.

Sir J. MAHON, who excelled in the classes for fruit, showed some magnificent bunches of Muscat of Alexandria and Black Hamburgh Grapes.

ROTHESAY HORTICULTURAL.

AUGUST 15.—The entries at the annual show of the above society were more numerous than last year. Considering the unfavourable season the exhibits in the flower section were very meritorious; there was not so much fruit shown as usual, but the quality of most of the exhibits in this section was excellent.

The John Reid Cup was won by Mr. S. THORNBURN; Mr. JOHN KIRKHOPE proved to be the winner of the Harry Hope Cup; and Sergt. ALEX. GRAY won the Lamont Cup.

OPEN CLASSES.

The best display of cut flowers was shown by Messrs. A. LISTER & SON; 2nd, Mr. M. CUTHBERTSON. In the class for 12 bunches of Sweet Peas the 1st prize was awarded to Mr. JOHN SMELLIE. The 1st prize for 12 vases of early-flowering Chrysanthemums was awarded to Messrs. A. LISTER & SON, who also won the 1st prizes in the classes requiring 24 Show Pansies, 24 Fancy Pansies, 24 Cactus Dahlias, and 36 Roses. The best 12 vases of Carnations were arranged by Mr. DUNCAN PENNEY.

AMATEURS' CLASSES.

The 1st prize for a shower bouquet was awarded to Mr. DUNCAN MACFIE. Mr. S. THORNBURN won the premier prize in the class for three lady's sprays and for the best epergne of flowers. Mr. JOHN GILLIES was the most successful exhibitor in the classes for 12 Roses, 12 Dahlias, and 12 Pompon Dahlias. The most effective group of plants was arranged by Mr. DAVID PENNEY, who also exhibited the best six table plants.

In the fruit classes Mr. JOHN DAVIDSON was the most successful exhibitor; he won the 1st prizes in the following classes: two bunches of black Grapes, two bunches of white Grapes, one bunch of Grapes, one Melon, dish of Red Currants, six dessert Apples, dish of red Gooseberries, dish of green Gooseberries, and collection of fruit.

The 1st prize for a collection of vegetables was awarded to Mr. DUNCAN MACFIE.

LANCASTER AGRICULTURAL.

AUGUST 21.—There were more entries than usual in the horticultural section of the above society's exhibition. Unfortunately, the death of Mr. R. L. Garnett, of Wyreside, deprived the Rose classes of some of the best exhibits. The Sweet Peas were especially fine. Cactus Dahlias and herbaceous flowers were also good. The table decoration arranged by Miss FOSTER, of Hornby Castle, who used various Orchid blooms, was especially good. She also gained the 1st prize for an epergne of Sweet Peas. Fruit testified to the backward season, but the vegetables, especially the collections, were very fine.

Messrs. SHAND exhibited a capital display of floral designs. In the centre was a crown of purple Asters outlined with white Chrysanthemums. On either side were bouquets of Raby Castle Carnations, Lilies of the Valley, &c. Ferns and Conifers were grouped on each side. (Gold Medal.)

Another fine exhibit was of Violas, shown by Mr. S. PYE, of Bowgreave. There were 30 varieties, including the following:—Jessie Greenwood, Miss Fulton, Mrs. Morrison, Rob Roy, Gladys Finlay, Bessie Finlay and Mr. Pell. (Gold Medal.)

Mr. ROBERT BOLTON, Warton, showed many splendid Sweet Peas, including the varieties Mrs. Hardcastle Sykes, Clara Curtis, Queen of Norway, Tom Bolton, W. R. Beaver, and Charles Foster.

Messrs. CASTLE BROS., Warton, also exhibited Sweet Peas.

Mr. BOLTON also exhibited a splendid collection of British Ferns. (Gold Medal.)

Messrs. MAWSON, of Windermere and Lancaster, had an artistically-arranged stand of hardy flowers, including Gladioli, Liliums, and Phloxes.

OPEN CLASSES.

The 1st prize in the class for Cactus Dahlias was won by Mr. A. E. CORLESS, Lancaster, who also had the best Show Dahlias. Mrs. E. HUNTINGTON, Bay House, was the most successful exhibitor in the class for the Pompon Dahlias, and she also won the 1st prize for a collection of decorative Roses. The best 12 Roses were shown by the Rev. A. R. TOMLINSON, and Mr. R. B. JACKSON won the chief prize offered for six Roses. The best collection of hardy herbaceous flowers was arranged by Mr. W. ROBINSON. The 1st prize in the class for 12 vases of Sweet Peas was won by the Rev. A. R. TOMLINSON. Miss H. L. FOSTER, Hornby Castle, arranged the best epergne of Sweet Peas, and she also won the 1st prize for a decorated table. The best three dishes of culinary Apples were exhibited by Mr. W. ROBINSON, whilst Mr. A. E. CORLESS showed the best dessert Apples. Mr. W. ROBINSON won the 1st prize offered for a collection of vegetables; 2nd, Mr. W. GOODWIN.

NATIONAL HARDY PLANT.

SECOND ANNUAL CONFERENCE.

AUGUST 22.—The second annual conference of the above Society was held at the George Hotel, Shrewsbury, on the second day of the Shrewsbury Show. Mr. W. H. Paine presided over a large attendance. A letter was read from the Chairman, Mr. A. J. Macself, regretting his inability to be present.

Mr. T. W. Sanders, F.L.S., read a paper on "Are Flower Shows Advancing Hardy-plant Culture as They Might and Ought to do?" Mr. Sanders contended that horticultural societies and those responsible for flower shows were not doing justice to hardy plants, and that substantial prizes should be offered to trade, professional, and amateur growers for hardy plants. He advocated the formation of new classes, and stated that in this direction the National Hardy Plant Society had been already of some assistance with their model schedule. Prizes might be offered, said Mr. Sanders, for a collection of hardy flowers staged in various colours, say six of each colour. Such a class would be of value to people who visited flower shows for the purpose of selecting new plants to add to their borders. Classes might also be included for a group of hardy plants. Classes for Alpine and other plants grown in cool houses would show the amateur the number of beautiful subjects which might be grown without the expense of a heated glasshouse. The present methods of showing and judging were also discussed.

Mr. G. Gibson, who agreed with most of the suggestions, thought that with regard to the colour scheme it would be a difficulty, owing to the limited number of colours available in any one month, but Mr. J. Harkness thought that the difficulty as to a colour scheme could be surmounted. The wording of the schedules should be absolutely definite, and in the big classes he considered that the money should be pooled and allotted to all the exhibitors by points. Culture should be considered first and effect second.

Mr. Edgington thought that the large classes of hardy plants were badly defined, and, as the schedules were framed at present, it was impossible to exhibit in a space of 300 feet for natural effect. He criticised the wording and the judging of several classes at recent shows, and instanced, as examples of natural effect, the exhibiting of Gladiolus America in May, and Lilium umbellatum cut down to 6 inches in height. He thought that rock-gardens would be more natural if made on a space of 600 square feet, with two fronts, and containing the same number of plants which are at present crowded into 300 feet. Backgrounds of Bamboo should be discarded.

Mr. T. R. Hayes agreed with the lecturer, and also endorsed Mr. Edgington's remarks. He thought that the National Hardy Plant Society should communicate with the Shrewsbury Committee as to more clearly defining their grouped class.

Mr. Bouskell also agreed, and thought that from the exhibits at Shrewsbury, any large grower could have arranged a colour-scheme class. Individual members of the Society should endeavour to influence societies in their districts.

Mr. Quick thought that it would be a step in the right direction if non-competitive, as well as competitive, exhibits were judged on their merits, and if it were the rule that no trade cards be displayed until after the judging is finished.

The Chairman said that they should demand proper treatment for hardy flowers. Gladiolus America exhibited in May was not advancing

hardy-plant culture, and would be calculated to deceive persons who would regard the group as typical of plants in bloom at the period. He should like to see a class for Delphiniums, 12 spikes of each, staged for natural effect. With regard to the wording of a class, he thought it would be better to have a given number of sorts, with a given number of spikes of each.

AWARDS.

The following Awards to new plants were made:—

Awards of Merit.

Erica cinerea atro-coccinea.—Shown by Messrs. Hayes, Keswick. *Bidens dahliodes.*—A fine plant, with pink flowers, very similar to those of Cosmos. Shown by Messrs. Artindale. *Gaillardia Mrs. Mackella.*—A large, yellow bloom, with carmine centre. Shown by Messrs. Harkness, Bedale. *Primula japonica "Autumnale."*—A local variety from Japan, which flowers in the autumn; robust habit and fine flower trusses. Shown by the Tully Nursery Co., Kildare. *Lobelia "Glory of St. Ann's," L. "Glow,"* and *L. "W. H. Paine."*—The last-named was considered the finest of recent introductions. As only one spike was exhibited, the Committee expressed a wish to see it again. The Lobelias were shown by the Tully Nursery Co. *Thalictrum dipterocarpum,* which was introduced by Messrs. James Veitch & Sons.

Messrs. J. Kelway & Son exhibited some fine spikes of Delphiniums, which the Committee desired to see again.

There was a discussion on the herbaceous species of the genus Veronica, about 50 species and varieties being exhibited. The confusion in the genus was pointed out by Messrs. Bouskell and Paine, who had made a list of every species exhibited at the show, many of which appeared under several names, and many under wrong names.

ABERDEEN ROYAL HORTICULTURAL.

August 22, 23, 24.—The annual show of this important north of Scotland society was held on these dates in the Duthie Public Park, Aberdeen. Favoured with magnificent weather—the best since August came in—and situated in ideal surroundings, the exhibition proved very successful. The entries numbered over 1,600. The secretary is Mr. J. B. Rennett, advocate, Aberdeen.

Pot Plants.

There was a very fine display in this section, Pelargoniums, Fuchsias, Begonias, Gloxinias, and early-flowering Chrysanthemums making a capital show. One gratifying feature here was the fact that the majority of the exhibitors took some place in the prize list, proving the general equality of the exhibits. For the four best specimen plants in flower, Mr. Alexander Ledingham, S.S.C., Queen's Road, Aberdeen (gr. Mr. W. Dick), won the 1st prize with a very meritorious exhibit. Both the 1st and 2nd prizes in the class for a specimen plant in flower were won by Colonel W. S. Gill, Dalhebity, Aberdeenshire (gr. Mr. A. Brebner), with well-grown specimens of Disa grandiflora. There was a somewhat keen difference of opinion amongst the experts over the placing of Mr. Thomas Ogilvie, Kepplestone, Aberdeen (gr. Mr. A. Douglas), 3rd in this competition, the feeling being that the fine Eucharis grandiflora entered by that gentleman deserved higher honours. The plant was well grown, and showed eight spikes, but the writer once saw a specimen at this show with 43 spikes, grown by the late Sir William Henderson, of Devanha, Aberdeen (gr. Mr. John Proctor). Foliage plants were a very attractive feature, there being shown some fine Palms (Phœnix canarensis), Dracænas, and Asparagus deflexus and A. decumbens. The 1st and 2nd prizes for Palms were won by Mr. Ogilvie, of Kepplestone. Colonel Gill, of Dalhebity, showed the best Ferns; his Adiantum cuneatum and gracillimum varieties and a fine Nephrolepis Whitmanii were particularly good. Professor Baillie, of Norwood, Aberdeen (gr. Mr. J. Elder), showed the best four foliage plants. Mr. J. W. Brechin, Ardo, Belhelvie, Aberdeenshire, led for best specimen foliage plant. Lord Provost Maitland, Rubislaw Den House, Aberdeen (gr. Mr. A. Duncan), won the 1st prize for hardy Ferns. Zonal Pelargoniums were well shown; premier honours were won by Mr. Brechin, Ardo. Mr. Ledingham, Queen's Road, was successful with Pelargoniums and Begonias (single and double). The Summerfield Hospital Committee (gr. Mr. James Burnett) won the 1st prizes for Fuchsias and Petunias. Mr. James Anderson, Constitution Street, Aberdeen, was 1st for early-flowering Chrysanthemums. Sir Thomas Burnett, Bart., of Crathes Castle (gr. Mr. John Petrie), was 1st and 2nd in the class for six plants for dinner table decoration.

Cut Flowers.

The effects of the adverse weather were most noticeable in this section. Nevertheless some very fine exhibits were shown in the professional classes. Roses were good, and Colonel Gill, of Dalhebity, won the Silver Challenge Cup presented by Messrs. James Cocker & Sons, Aberdeen, with very choice blooms. The other honours for Roses were divided between Sir Thomas Burnett and the Summerfield Hospital Committee. Mr. Lockhart, Cragiebuckler Cottage, Aberdeen, was 1st for Tea or Noisette Roses. Sweet Peas have always been a good feature at Aberdeen, and despite the untoward season there were some very fine entries. Sir Thomas Burnett had a very meritorious collection, the intense colouring of the blooms evoking much admiration, especially of the varieties Dobbie's Cream, Scarlet Empress, Thomas Stevenson, Rosabelle, Hercules, Edrom Beauty, and R. F. Felton. Mrs. Dunbar Dunbar, of Seapark, Forres (gr. Mr. J. A. Grigor), was placed 2nd, while Mr. T. Ranken, Dalswinton, Dumfries (gr. Mr. R. A. Grigor), was 3rd. The last-named was 1st for six bunches, Lady Aberdeen being 2nd. Mr. A. Cumming, Rubislaw, Aberdeen, also showed well in the Sweet Pea Classes. Dahlias were well shown. Mr. J. W. Brechin, Ardo, Mr. W. Lockhart, and Mr. J. M. Dunn, Aberdeen, won the leading prizes, whilst Mr. Brechin was also principal winner for Gladioli and Asters, his entries being specially noteworthy. Marigolds were very good, Mr. John Grieve, Woodside, Aberdeen, leading. Colonel Gill's Pelargoniums were much admired. For 20 varieties of cut flowers and fine foliage bedding plants Mr. Ledingham, Queen's Road, had a greatly-admired exhibit, which won the 1st prize. Sir Thomas Burnett gained similar honours for his fine stove and greenhouse cut flowers. Mr. Lockhart's Carnations well deserved their prize, as also did the Begonias shown by Mr. J. McCombie Brown, Park House, Aberdeenshire. Phloxes, Stocks, Pansies (show and fancy), Violas, and Chrysanthemums were well shown, the leading prizes being won by Mr. Brechin and Mr. John Garden, Inverurie.

Fruit.

The display here was very good. For the best collection of hardy fruit Mr. W. Harper, Tulliebelton, Perthshire, won the 1st prize, his collection including Peaches (Hale's Early), Pears (Beurré Boussoch), Plums (Victoria and Kirke's Purple), Apples (Stirling Castle), and Cherries (Morello). Mrs. Dunbar Dunbar, of Seapark, was placed 2nd. Neither Apples nor Pears were numerous; the leading prizes were won by Mr. John Davis, Ballathie, Perthshire, Mr. W. Harper, and Mr. H. B. Smith, Burdshaugh, Forres. Gooseberries were of great size, but owing to the wet season the berries were soft; the chief prizes were won by Messrs. Pegler, Aberdeen, and Mr. Taylor, Inchgarth, Aberdeen. Sir Thomas Burnett and Mr. J. Ferguson, Linton House, Cluny, Aberdeenshire, showed the best Red and Black Currants. Grapes, both black and white, were very good, the chief honours going to Mr. T. Ranken, Dumfries, and Sir Thomas Burnett; Lord Aberdeen made a good 2nd. Melons were poorly shown, the best by Misses McLennan, Springhill, Aberdeen (gr. Mr. W. Scorgie). Many of the Peaches had but little flesh on them, but those from Ballathie, Perthshire, were very good. Nectarines were fairly good; the best were shown by Lord Sempill, Fintray House, Aberdeenshire (gr. Mr. W. Smith). Tomatos were very well finished, those from Mrs. Dunbar Dunbar's garden being the best.

Vegetables.

This section was undoubtedly the outstanding feature of the show, the excessive moisture being suited to the crops. Mr. T. Ranken, Dalswinton, Dumfries (gr. Mr. R. A. Grigor), had a very meritorious win in a class for a collection; Cauliflower (Autumn Giant), Turnips (Golden Ball), Peas (Gladstone), Purple Beet, Potatos (Abundance) and Cabbage were especially good. For Salads the Misses McLennan, Springhill, won the 1st prize; Mr. W. Harper, Tulliebelton, Perthshire, who has in past years shown remarkably fine produce at Aberdeen shows, was successful for Carrots and Cauliflower, while Mr. J. Davidson, Aberdeen, had the best Cabbages. The Turnips were good, clean, well-grown examples, and Mr. Ferguson, Linnton Gardens, won the 1st prize. Peas were good, Leeks well grown, and Onions were specially fine, the prize-winners being Mr. W. Harper and Mr. T. Ranken. Beetroot were well shown, Mr. John Garden, Inverurie, having fine roots. Celery was also good, and little difference could be detected between the 1st and 2nd exhibits, which were shown by Mr. T. Ranken and Mr. J. McCombie Brown. As usual at this show, the outstanding feature in the vegetable section was the excellent Potatos; the display evoked great admiration. The chief prize-winners in these admirable classes were Mr. J. McCombie Brown, Mr. J. W. Brechin, Mr. John Yule, and Mr. Ferguson, Linton House.

Nurserymen and Florists.

The section devoted to the trade growers was one of the most delightful in the show. For the fourth year in succession Messrs. Cocker & Sons, Springhill Nurseries, Aberdeen, won the Silver Cup in the class for 36 Roses, H.P. and H.T., or either, named, distinct varieties, with a magnificent entry. Last year the same exhibitors gained outright the cup offered as a prize in the premier class. Messrs. Adam & Craigmile, Fernielea Nurseries, Aberdeen, were a very close 2nd.

Amateurs' Classes.

These made a very creditable display in all departments. For pot plants the honours were divided between Mr. John Davidson, Hardgate, Aberdeen; Mr. Alexander Gillespie, Northfield Place, Aberdeen; and Mr. Alexander Kemp, Stoneywood, near Aberdeen. In the cut flowers section, the competition was very keen. Some capital arrangements were shown by Mr. G. Maclennan, Forres, N.B.; Mr. George Harper, Huntly, Aberdeenshire; Mr. W. Farquharson, Cults, Aberdeenshire; Mr. John Davidson, Mr. John M. Dunn, Aberdeen; Mr. J. M'Laren, Aberdeen; and Mr. R. Maenoch, Kintore, Aberdeenshire.

The cottagers' exhibits were, as usual, exceedingly meritorious.

Non-competitive Exhibits.

The local florists, nurserymen and seedsmen had capital displays. Messrs. Cocker & Sons, Springhill Nurseries, Aberdeen, showed a magnificent and greatly-admired collection of herbaceous and hardy perennial flowers and Roses. Messrs. W. Smith & Sons, Burnside and Silverhillock Nurseries, Aberdeen, had a very prominent exhibition, as had also Mr. M. H. Sinclair, seedsman, Aberdeen; Messrs. Ben Reid & Co., Aberdeen; Mr. James Robertson, seedsman, Aberdeen; Messrs. Leslie & Macdonald, West End Nurseries, Aberdeen; and Mr. P. McHardy, Green, Aberdeen.

Obituary.

Harry Dodd.—The death of this promising young gardener is announced in the *Kew Bulletin.* Mr. Dodd entered Kew as a gardener in March, 1904, and left in July, 1906, to take up the post of curator at Onitsha, Southern Nigeria. Before entering Kew he spent some three years in the Liverpool Botanic Gardens. He resigned his post in West Africa in June, 1910, at the close of his fourth year of service, partly with the object of obtaining a post in the East. In February, 1911, Mr. Dodd was appointed a probationer gardener in India, and, after spending some time at the Royal Botanic Garden, Calcutta, was transferred to Delhi, where he died of enteric fever on July 3.

R. L. Garnett. — The death occurred on Monday, the 19th inst., of Mr. Richard Lawrence Garnett, Wyreside, Lancaster. Deceased, who was aged 66, was a well-known rosarian, and a prominent exhibitor at the Ulverston shows.

ANSWERS TO CORRESPONDENTS.

Acreage under Fruit and Vegetable Crops: *F. A. Glaefer.* We regret the delay in answering your letter, but we have been awaiting a reply from the Board of Agriculture, to whom we sent your query. They say, however, that there are no official statistics of the acreage under fruit and vegetable crops grown in nurseries as distinct from other kinds of holdings in this country. The Board of Agriculture and Fisheries inform us that the areas under small fruit and orchards in Great Britain and the Channel Islands, as returned on June 5, 1911, by occupiers of more than one acre of land, were 84,574 acres and 251,974 acres respectively. Of the area under small fruit, 29,320 acres were returned as being grown between the trees in orchards.

Begonias: *P. M.* The plants from which the Begonia leaves were taken have been subjected to excessive moisture and insufficient ventilation.

Begonias and Streptocarpuses Unhealthy: *W. Moore.* There is no trace of any fungus or insect on the specimens of Begonia and Streptocarpus; the scorched appearance of the leaves must be due to some cultural fault.

Begonias Unhealthy: *Ensign.* The rusty-looking spots are not due to disease or insect pests, but to excessive atmospheric moistnre.

Carnations Diseased: *R. R.* The stem submitted is injured by the maggot of the Carnation fly (Hylemia nigrescens), and the roots by the maggots of the crane fly (Tipula oleracea)—both of them deadly pests to the Carnation. In potting the young plants, do not employ fresh turf or the outsides of old compost heaps, as such material often contains the grubs of the crane fly. Destroy all the old plants so soon as the young layers have been removed.

Celery Diseased: *H. F. Z.* Your Celery plants are badly affected with Septoria. See reply to *J. A.* in the last issue.

Celosias for Examination: *Ajax.* The specimens of Celosias have not been injured by any fungus or insect. It seems probable that, as you suggest, wrong cultural treatment has been the cause of injury.

Chrysanthemums: *W. H. M.* On some of the leaves of the Chrysanthemum there are pustules of spores of the rust (Puccinia chrysanthemi). Spray the plants with liver of sulphur solution (1 ounce dissolved in 2 gallons of water). Use the solution as soon as it is mixed, and take care woodwork painted white is not wetted, as liver of sulphur blackens white paint. The blackened Chrysanthemum leaves do not show any fungus.

Conifers: *D. C.* The branch of Abies nordmanniana is infested with the bark-louse (Chermes pini), and it is highly probable that this insect has caused the injury to the trees in question. We would strongly advise you not to plant other species of Abies between the infested trees, as this pest also attacks other species of the genus, notably A. nobilis and the Silver Firs.

French Gardening Journals: *C. F. P.* Jardinage, 90 bis, Avenue de Paris, Versailles; *Le Jardin*, 84 bis, Rue de Grenelle, Paris (VII^{e} Arr); or *Revue Horticole*, Rue Jacob, 26, Paris—6.

Grapes: *E. G. W., Dorset.* There is no mycelium in the tissues of the Grape; the roughness of the skin is probably to be attributed to the action of the spray fluid. (There is a surface growth of purely saprophytic fungi.)

Growing Cut Flowers for Market in an Acre of Land: *C. T.* In the circumstances indicated in your letter there is every chance of your making a living by growing flowers on an acre of suitable land for cutting for market purposes. In the first place, the ground should be ploughed deeply, the cultivator should then be worked over it lengthwise and crosswise in order to thoroughly cleanse the ground of all deep-rooted weeds, these being picked up and burned in the process of scarifying, harrowing, and re-harrowing of the land. Previous to planting perennials the soil should receive a good dressing of manure. Land intended to be used for selected annuals should not be attended to in these respects until a week or so of planting-out time. Meanwhile you should carefully consider and determine what kinds and varieties of flowers—perennials and annuals—are most suitable to grow for cutting for marketing, bearing in mind in doing so the kinds and varieties that find a ready sale in the towns referred to in your letter, growing most, as a matter of course, of the flowers in greatest demand. The following, among other perennials, should be grown in more or less quantity: Pyrethrums (double and single-flowered varieties), Scabiosa caucasica, Phloxes, Gaillardias, Coreopsis grandiflora, Delphinium (approved varieties), Gypsophila paniculata alba plena, Centaurea montana (perennial Cornflower), Aster (Michaelmas Daisy) ericoides, Decorator and other approved varieties; Chrysanthemums (Shasta Daisies) King Edward VII, Mrs. Head, and Mrs. Charles Bell, Rudbeckia nitida magnifica, early and mid-season Chrysanthemums; yellow Marguerites and red and white Dahlias are also desirable plants to grow for cutting from for marketing. Annuals which pay for good cultivation are Asters Comet (tall section), Ostrich Plume, Vick's Branching Late White, Snowball or Princess White, Daybreak and Salmon Queen; Centaurea (Sweet Sultan) Imperialis hybrids, Sweet Peas, Sweet Scabious, and a good bed of Mignonette (new Giant Crimson). The utilisation of your glasshouse, as suggested, is quite right and practicable, though you could very well avoid the expenditure involved in the purchase of flower-pots by planting your late-flowering Chrysanthemums out-of-doors and transplanting with good balls under glass in October, when cleared of the Tomatos.

Grubs Infesting Fruit Trees: *B. Gallop.* The so-called "grubs" are the caterpillars of the common vapourer moth (Orgyia antiqua). The female is wingless and sedentary, remaining upon the cocoon from which she emerged, and thereon she also lays her eggs. Collect the cocoons within the egg masses and destroy them. The caterpillars are easily destroyed by spraying the trees with Swift's arsenate of lead in paste form. Instructions are issued with this preparation.

Lilac Diseased: *Foliage.* The disease on the Lilac foliage is caused by the fungus Cladosporium herbarum. This fungus attacks leaves weakened by adverse weather conditions (continued wet weather and cold nights). The trouble will disappear under normal weather conditions. It would not be worth while to spray; the damage done will not be sufficient to affect next season's growth.

Names of Fruits: *F. E. C.* Plums: 1, Guthrie's Golden; 2, Early Blue; 3, Early Mirabelle; 4, Prince Englebert.—*J. Smith.* Apples: 1, The Queen; 2, Ecklinville Seedling; 3, Duchess of Oldenburgh; 4, Bismarck; 5, Nanny; 6, Worcester Pearmain.—*Alty.* Apples: (a) Tippet's Incomparable; (b) Duchess of Oldenburgh; (c) Old Hawthorden.—*J. S., Ross-shire.* 1, Lord Napier; 2, Peach, not recognised.—*J. MacD.* Plums: Yellow, Oullin's Golden; Red, Prince of Wales.—*F. Denny.* Plum, Pond's Seedling.—*T. Summerfield.* Plums: 1, Diamond; 2, Goliath; 3, Pond's Seedling.—*Anxious.* Pear, Jargonelle.—*W. C. Bishop.* Pears: 1, Hessle; 2, Green Chisel. The Apples are too small to name.—Correspondents sending Peaches and Nectarines for naming should enclose leaves of each variety, and state whether the flowers are large or small, and if the trees are grown under glass or in the open.

Names of Plants: *J. MacD.* 1, Steironema ciliatum; 2, Cornus sanguinea.—*W. H. Baker.* 1, Acanthus mollis; 2, Kerria japonica variegata; 3, Acæna microphylla.—*C. J.* 1, Spiræa japonica; 2, Sauromatum guttatum; 3, Artemisia vulgaris; 4, Viburnum Tinus; 5, Symphoricarpus racemosus; 6, specimen too scrappy to identify.—*Ceux.* Either Fabvier or Crimson China; the bloom was too shattered to determine which.—*W. H. & Co.* Hippeastrum equestre.—*W. G., Sidmouth.* 1, Abelia floribunda; 2, Myrtus Ugni (commonly known in gardens as Eugenia Ugni); 3, Indigofera Gerardiana.—*Fulford, Castle Eden.* The Pelargonium with the lightest coloured flowers is the variety King of Denmark.—*J. M.* Chelidonium majus.—*J. S., Ross-shire.* 1, Tecoma jasminoides; 2, Asparagus scandens.—*C. M.* 1, Cratægus tanacetifolia. The plant may be propagated by seeds or by budding on stocks of the common Hawthorn or Quickthorn; 2, Ailanthus glandulosa (Tree of Heaven); 3, Cupressus sempervirens. — *Correspondent.* Cratægus nigra.—*H. A. S.* Oncidium longipes (syn. O. janeirense).—*H. T.* 1, Trichopilia luxa; 2, Oncidium trulliferum; 3, O. pubes.—*F. O.* 1, Pteris geraniifolia; 2, Adiantum hispidulum; 3, A. formosum; 4, Dracæna congesta; 5, Cyperus laxus; 6, Caladium argyrites.—*W. H. Lee.* Aneimia (Anemidictyon) phyllitidis.—*H. F. Z.* Clethra alnifolia.—*J. R.* Humulus lupulus ("Common Hop").—*P. P., Crawley.* 1, Polygonum affine; 2, Spiræa japonica; 3, Leycesteria formosa; 4, probably Cornus sp, specimen too scrappy; 5, Stephanandra flexuosa; 6, Rhus cotinus; 7, Neillia opulifolia; 8, Spiræa Menziesii.

Rhododendrons: *I. W. T.* The leaves are infested with a small species of plant-bug belonging to the family Tingididæ, characterised by the large reticulations of the wings and thorax. The adults are very few in number and not in very perfect condition, but we believe that they are referable to Derephysia foliacea, which is usually found upon Ivy. Spray the undersides of the leaves with a rather weak paraffin emulsion.

The Mummy Pea: *C. E. F.* The specimen which you send has the characters of the Crown or Mummy Pea. This variety occurs in two forms—a white and a purple-flowered race. The peculiarity of the race consists in the fasciation of the stem near the top, and in bearing on the fattened and thickened upper part of the stem a close bunch of many flowers. The legend that the Mummy Pea was derived from seed found in a mummy case and brought to England is as old as it is absurd, and was, as it would seem, first promulgated by a Mr. Grimston. As is stated in an article in these pages (*Gardeners' Chronicle*, p. 45, 1873), "it is really most amusing to find with what circumstantiality this tale is repeated—how that the retailer knows somebody who knows somebody else who knew the party who actually picked the Pea out of the mummy." We should recommend you to draw the attention of your friend to the article from which we have quoted, and can assure you that the idea that the seed came from the source ascribed to it is erroneous. It is as certain as things in this uncertain world can be, that no Pea or other seed ever taken from a mummy case proved capable of growth unless it had been put there after the case was opened. Certain seeds possess the power of retaining their vitality for a considerable number of years. Thus in experiments made with seeds stored in a museum, some known to be over 80 years old were found to germinate. It is a far cry, however from 80 years to many centuries, and the legend of the viability of Peas from mummy cases must be put in the same category with that of toads hopping out of quarried stone, wherein we are asked to believe they had remained potentially lively for hundreds of centuries.

Under Gardener's Notice: *F. B.* In the absence of an agreement, custom rules the length of notice which must be given or taken to terminate an engagement. The general rule is a month's notice in the case of headgardeners, a fortnight's notice for foremen, and a week's notice for under-gardeners. The periods at which the wages are paid is immaterial. In the future you should have the terms of any engagement set down in writing.

Vine Leaves Spotted: *D. C.* The variegation of the vine foliage is not due to fungous or insect pests. The appearance suggests scalding.

JOHN KENNEDY.

KENNEDY was a gardener, and appeals to us on the ground of having written a book on gardening. From it we gather that he was a Scotsman, that he had engaged in gardening, forestry and agriculture for a period exceeding 30 years, and that the cultural methods he exploited were different from and superior to those of his contemporaries. His book appears never to have been common. It is absent from the lists of Weston, Dr. Martyn, and J. C. Loudon, while Johnson merely mentions it, and that in a manner which is conclusive of its never having passed through his hands. Not improbably its scarcity is due to the custom stated by Lackington in his *Autobiography* to have prevailed among booksellers of arranging among themselves to destroy remainders which were not in great demand; to which custom is due the scarceness of many books of the period within which Kennedy's book appeared. The volume is entitled *A Treatise on Planting and Gardening and the Management of the Hothouse, &c., &c.* By John Kennedy, Gardener to Sir Thomas Gascoigne, Bart. York: Printed by A. Ward for the Author, 1776. A second edition followed in two volumes in 1777, but that I have not seen, and another in one volume, Dublin, 1784. The first edition contains a lengthy list of names of subscribers.

The volume, an 8vo., extends to 420 pages, exactly half the number being occupied with matter relating to sylviculture, and the remainder to a few garden plants, and to Cabbages and Carrots as farm crops. The horticultural section consists of essays on the Vine, Pineapple, Mushroom, and Asparagus. Though Kennedy regarded himself as in advance of his generation, it is painfully evident that, compared with those of Speechley, or even of Abercrombie, his methods were antiquated. Yet it is not unpleasing nor unprofitable to possess a record of the horticultural opinions and beliefs of a bonâ-fide middle-class gardener of the latter part of the 18th century. The remarks on the Vine and the Pineapple indicate a transition stage between modern methods and the very crude systems that obtained 40 or 50 years before Kennedy's time.

He treats of viticulture on walls, forcing Grapes in the open on walls, covering Vines partly with glass in vineries and in Pine pits. The cutting he recommended for propagating contained three eyes, and it was dissevered with a portion of the main rod attached, long pieces being usual at the time, though Speechley used eyes. A stone flag was so placed that the roots of Vines could not enter the subsoil, a custom which Sir Walter Scott mentions in *The Antiquary* as having been derived from pre-Reformation times. Kennedy distinctly objected to covering Vines which were being forced on walls till the flowering stage was past; this, though the wall-flues had been in active operation many weeks previously. In vineries the Vines were also set with flags under them, and the whole floor-space was covered with similar material. Once the crop was gathered, the sashes were removed, and the Vines exposed till "boisterous" weather supervened, when they were replaced. Kennedy seems not to have recognised the propriety of reducing the berries in a bunch of Grapes as an expedient of first-rate importance in Grape-growing, and merely notes that very close-set bunches ought to be partially thinned, and advises the selection of "loose" growing varieties for the hothouse in order that thinning might be obviated altogether. He, indeed, appears to have looked upon the practice as only a less evil to leaving the clusters to nature, and is solicitous that his students should operate only early in the day, so that "the wounds may be dried before night by the heat of the sun." The extent of glass esteemed adequate may be comprehended from the remark that few cared to possess more than one vinery. Seventeen varieties of Grape-vines are described.

The vast distance we have travelled since Kennedy's day is even more obvious when we turn to his directions for growing Pineapples. The pots he recommends were half-penny, penny, three half-penny, and twopenny; denominations which afford no idea of their size or capacity. He advised repotting at all seasons, winter included, and root-burning seems to have been a usual experience. Composts and their preparation form no small item in Pine growing as practised by Kennedy. He calls them "moulds." Each stage of the life of the plant had a "mould" suited to its age and condition. The ingredients consisted of light loam, rotted dung, "as small as mould," wood earth "turned four or five times," rotten bark (tan) sifted, and sharp sand. What we should now call the lightest compost was made up of one part tan, two parts wood earth, one part dung, half part sand; and the heaviest—four parts loam, two parts wood earth, two parts dung, half part sand. Like many another, Kennedy had discovered an infallible recipe for the destruction of mealy bug, which consisted of 4 lbs. brimstone, 1 lb. Scotch snuff, and 2 ounces leaves of Walnuts dried and ground to powder. The preparation was applied dry, dusted thickly over the plants and the surface of the soil. The pits were fumed with burning sulphur, the plants for the time being removed. After these measures, "properly administered, the future will discover no bug to the most patient searcher." He favours his readers with the result of his observations on the life history of the abovenamed insect, of which the following may be given as an example:—"The white speck on the leaves of Pines is the spawn of the white, creeping insect, and is deposited on the leaves of the Pines much in the same manner as the caterpillars on the leaves of Cabbages."

The treatment accorded to Mushrooms, which were an indispensable crop in a garden of any account, differed materially from that in general use. Three beds sufficed for a year's supply; one made up in July for winter gathering; a bed was formed in March for summer, and another in December for spring cropping. For the bed he used ten loads of stable manure, with three loads of tan made up in layers, with 3 inches of horse-droppings superimposed, and after the lapse of six or eight weeks the bed was covered with soil. Each bed was productive for six months, and he disapproved of Mushroom spawn, because, though when it was used Mushrooms were produced in shorter time, the beds were much sooner exhausted. This was a very old-fashioned cultural system, and it is interesting to find a gardener persisting in it so long subsequent to the time when Bradley had endeavoured to introduce the Continental method of spawning the beds.

We learn in the chapter on Asparagus

that Battersea and Gravesend were the chief centres for its production, and that the finest was grown in the vicinity of Pontefract. Size was everything, and though no data are supplied from which a comparison may be made, it is obvious from the immense labour involved and the care taken that very fine growths must have ensued. The beds were 2 feet wide, excavated to a depth of 2½ feet, and filled with a compost that took two years to prepare. The ingredients were "two loads of river or pond sludge, one load soft peat-mould, one load loam, two loads rotten dung, and two loads sand. When the materials had settled seeds were sown, and as soon as the seedlings were large enough they were thinned to a proper distance apart. At the end of each year the beds were covered with a layer of compost till 12 inches had been added to the bed as at first made. Cutting commenced in the third year, though Kennedy preferred not to cut till the fourth. The space between each bed was 3 feet in width, and this was highly cultivated to afford a suitable root-run as the plants gained in age. The remarks on Cabbages and Carrots exhibit the same capacity for taking pains, and the tone of the book as a whole demonstrates that though its methods have changed, gardening was no less in Kennedy's day than it is in our own an exacting and laborious profession. *R. P. Brotherston.*

GIANT CHINESE PRIMROSES.

THE giant strains of Primula sinensis characterised by massive foliage and large heads of imposing flowers are well known and widely grown; but, as is so often the case with interesting garden subjects, little is known as to the origin of these giants. That they breed true is appreciated by all seedsmen, as is also the fact that they owe their gigantism to nature and not to nurture: in other words, the gigantic habit is not induced by, nor dependent upon, methods of cultivation. A recent article by Dr. Keeble in the *Journal of Genetics* gives an account of the origination of a giant race from an ordinary normal-sized race of Primulas. The variety from which the giant originated is a white-flowered race of "stellata" habit known as White Queen Star (fig. 84). Plants of this variety were grown at Reading for some years, and seed was saved from flowers which possessed more than the usual number of petals. After several years of "selection" from plants bearing six or seven-petalled flowers, there arose suddenly and in one instance a giant variety. Eleven plants grown from the seed of one capsule taken from a normal plant all exhibited the giant habit. An examination of figs. 84 and 85—which by the courtesy of the Syndics of the Cambridge University Press we are enabled to reproduce from the *Journal of Genetics*—shows that the giant race is distinguished from the normal not only by larger and more massive flowers, but also by the fact that its petals meet and overlap. The giant race which originated in this way breeds true to its habit. No difficulty is found in obtaining seed from its flowers; but what is remarkable is that, though many attempts have been made to cross it with other varieties of Primula sinensis, all have failed. Even when crossed with normal White Queen Star it fails to produce seed. In addition to putting these facts on record, the article produces evidence both from the experiments of the author and from those carried out by Messrs. Sutton and Sons at their Trial Grounds to show that the character of gigantism in Primula sinensis depends on no fewer than three Mendelian factors, and that the gigantic appearance is produced only when the plant contains at least two of these factors in the pure state, or, to use the ordinary terminology, when the plant is homozygous for these two factors. If it is also pure for the third factor, the giant breeds true; but if the plant is impure for the third factor it throws when self-fertilised both giant and normal offspring. This behaviour may throw light on the failure of certain races of giant P. sinensis to breed true, for the imperfect giant presents much the same appearance as the true-breeding giant, and it is only by their respective offspring that the one may be distinguished from the other. The results of crossing giant with normal varieties are by no means always the same. Sometimes the first generation of the cross presents the gigantic appearance of the one parent; sometimes the giant habit appears to be lost altogether. The key to the explanation of this apparently capricious inheritance of the habit is to be found in the fact that certain so-called normal races of P. sinensis are semi-giants, and carry, say, two of the factors concerned in the production of the giant character. In that case the first generation of the cross between giant and "normal" has the giant habit. Other normal varieties lack at least two of the factors for gigantism. Hence when they are mated with a giant the offspring do not possess the necessary two pure factors, and so cannot exhibit the giant character.

FIG. 84.—PRIMULA SINENSIS "WHITE QUEEN STAR," NORMAL VARIETY.

NEW OR NOTEWORTHY PLANTS.

GAULTHERIA VEITCHIANA.*

THE Chinese plant for which the name Gaultheria Veitchiana is here proposed is a very close ally of the Sikkim G. Hookeri. So closely allied are they that, from a purely systematic point of view, the Chinese plant might be regarded as a geographical race of the Sikkim one. The best distinguishing character noticed by the writer in the herbarium specimens is to be found in the calyx lobes, which in G. Veitchiana are acuminate and acute, and slightly longer than the rather obtuse lobes of G. Hookeri. Unfortunately, the Sikkim plant is unknown in cultivation—at least, so far as the writer is aware—but, according to the collector's field notes, the corolla is pinkish, whereas in the Chinese plant it is white.

G. Veitchiana was collected in W. China by Mr. E. H. Wilson, who sent seeds of it to Messrs. Jas. Veitch, in whose nurseries it has flowered and fruited. The description has been drawn up partly from the herbarium specimens and partly from specimens grown by Messrs. Veitch. *W. G. Craib.*

* GAULTHERIA VEITCHIANA, Craib, sp.n., G. Hookeri, Clarke, persimilis sed calycis lobis acuminatis acutis differt. Suffruticulus 0·3-1·8 m. altus; ramuli primo parce longe brunneo-setosi, tenuiter compressi, mox glabri, leves vel setarum basibus persistentibus verrucosi. Folia obovata, obovato-oblanceolata vel fere oblonga, apice breviter obtuse punctata, basi late cuneata vel cuneato-rotundata, 2–9·5 cm. longa, 1–3·8 cm. lata, subcoriacea, supra glabra, viridia, subnitentia, subtus setosa, pallidiora, nervis lateralibus utrinque circiter 4 longe ascendentibus subtus prominulis supra leviter impressis, margine setoso-serrulata, petiolo brevi supra canaliculato suffulta. Inflorescentia e racemis circiter 3 cm. longis simplicibus axillaribus vel terminalibus vel simpliciter paniculatis constituta; bracteae ovato-ellipticae, ad 6 mm. longae et 3·5 mm. latae, acuminatae, acutiusculae, ciliatae; bracteolae 2, cucullatae, 3 mm. longae, scariosae, ciliolatae; pedicelli breves. Calycis lobi deltoidei, acuminati, acuti, ciliolati, circiter 1·75 mm. longi et 1 mm. lati. Corolla, stamina pistillumque iis G. Hookeri similia; corolla alba haud puniceo-alba. W. China, 1800–3000 m., Wilson, 3916, Herb. Kew, et cult. Hort. Veitch, Wilson, 1627.

THE ROSARY.

AUGUST ROSES.

The Roses of August are quite different from those of early summer, which we find in June and the first weeks of July, and they differ again from the autumn Roses, though in a way they seem to be approaching the latter. In August we less often see the voluptuous form of the exhibition or specimen Rose. The Hybrid Perpetuals, save for a few belated blossoms, are over, and the Hybrid Teas, many of which in the June flowering put up single-flowered shoots carrying fine flowers, now often push up strong panicles carrying, if they are allowed, numerous and small flowers, coming into bloom in succession from the top. We might almost fancy these Roses as conscious of an obligation to provide material for our exhibition boxes, exhibiting a certain restraint in their first flowering, but now that the shows are over throwing off the restraint and revelling in exuberant flower production. The Teas are now even more prodigal of flower-buds; no sooner is the crown bud formed than two or three side buds are pushed out, which soon get beyond the crown bud, and are in turn attended by satellites of their own. In a normal year we find plenty of flowers and plenty of colour in our August Rose beds, but the flowers are small and generally inferior in quality to both the June and autumnal blossoms. As compared with the autumn flowers, however, those of August are often of better colour. The days are longer, the Roses get more sun, and in most years (not in this) they have less rain falling upon them to wash, as it were, the colour out of the petals.

Many who are compelled by the calls of duty to spend the early part of the summer in London, absorbed in their profession or business, much as they may love their gardens, may catch but few and hurried glimpses—possibly in some week-end visit—of their Rose beds in June and July. In August, however, they hope to enjoy their garden and their Roses, in a short but doubtless well-earned leisure, and for these it is of some importance that they should take care to obtain varieties of a sort which will naturally flower freely during the holiday month.

This will rule out all or nearly all the Hybrid Perpetuals. If there are to be exceptions, they must be found in Frau Karl Druschki, which gives a few August flowers, in Hugh Dickson and Commandant Félix Faure, and perhaps Mrs. R. G. Sharman Crawford. These will afford no wealth of blossom in August, but all will give a certain number of flowers from time to time, particularly if instructions have been given for the removal of all the early buds as they form. Most of the Ramblers, also, will be over, but Dorothy Perkins and Minnehaha will often last till the middle of the month, and Coquina even later, while in some seasons Hiawatha may still be in flower at the close of August.

Fig. 85.—PRIMULA SINENSIS "WHITE QUEEN STAR," GIANT VARIETY.
(See p. 188.)

Chief reliance, however, will be placed on the Hybrid Teas, Teas, and Chinas. Can I pick out a small list of good garden Roses among the H.T.s, practically certain to be in flower through the greater part of the month? I am by no means certain that I could do so for all gardens, but I know what I can reasonably count on in my own. For red Roses I should take without hesitation Richmond and Ecarlate; both are nearly continuously in flower throughout the season, while Gruss an Teplitz could be also counted upon in three years out of four. Some of my friends, whose gardens lie on heavy land, would substitute General MacArthur for Richmond. It is a stronger grower, but not so beautiful a flower. In the pinks I think the two most certain to be in flower the month through are Dr. J. Campbell Hall and Mrs. E. G. Hill. The first is as continuously in flower as Richmond, and, being dwarf, is an excellent bedder, but it should be syringed carefully early in the year with some fungicide, such as Abol, to check the first approach of mildew. If this is done, it gives no trouble, at all events with me. Mrs. E. G. Hill is, I think, best in a cool, moist position in half shade; it has the advantage of fine foliage, nearly mildew-proof, and its loosely-arranged trusses require no dishudding. Very reliable, too, is Gustav Grünerwald, which has the advantage of a delightful perfume; the full flowers hang their heads, and, but for this, which seriously detracts from its value, it would be a first-rate garden Rose. Princess Marie Mertchersky has been specially good with me this August. At this time its flowers, thinner and smaller than those of June, have a particularly charming effect when arranged on the breakfast table. The petals have a curious translucent appearance, which enhances their soft and delicate colouring. Lady Ashtown has this year been in flower most of the month, but in many years there is a considerable gap between its first and second flowering, which often includes the early part of August.

In shades of blush I would take three Roses as reliable in August: Pharisaër, Mme. Léon Pain and La Tosca. The first two are special favourites in this garden, for the upright carriage of their flowers and the beautiful contrast between flower and foliage. I must make another group for Roses with a deeper shade of salmon than the last, and I will select two from this group, namely, Betty and Mrs. Alfred Tate. Both are with me first-class garden Roses, and, if Betty is the freer in bloom, Mrs. A. Tate has the merit of being less readily spoilt by wet, a consideration in an August such as this. Irish Elegance will appear some time during the month, but is not quite continuous. It is a charming Rose for a bed of tall Roses, and pays for being massed into a large bed. I think it the best of its class, and would place next to it Irish Glory.

Of the yellows I will take but two also: Mme. Ravary and Duchess of Wellington. Both are good bedding Roses. Mme. Ravary is the better flower and less easily spoilt by wet, but the Duchess keeps her colour better, and is, I think, even more free and continuously in flower. The attraction here lies chiefly in the half-open buds.

Of the Teas I must write more briefly, and, in fact, the number of really good garden Teas is few. Pre-eminent among them all is Molly Sharman Crawford. It blossoms continuously the season through, carries its flowers erect, and is, in my opinion, the best white bedding Rose at the present time. It may find a rival in Mrs. Foley Hobbs, but I have not yet grown this Rose in sufficient quantity to judge. Mme. Antoine Mari is also a good garden Tea, and may be relied on to flower during most of the month, so, too, will Mme. Henri Berger, and in a normal year Mme. Lambard and Mme. Jean Dupuis. This year, however, they came too soon, and I have had few flowers since the beginning of August.

Lady Hillingdon is quite worth growing for its brilliant colour, which contrasts charmingly with the brown or chocolate tint in the foliage. It seems to be fairly vigorous and of quite good enough a habit for the garden. The colour, unfortunately, varies, and when the deep apricot is absent the flowers look washed-out and uninteresting, but they are well carried on the plant.

I will conclude with the China Roses. Perhaps the two or three which we may count on with most certainty are Comtesse du Cayla (orange red), Queen Mab (pale apricot pink), and Charlotte Klemm (scarlet). I think Charlotte Klemm is more showy in the garden than Fabvier and quite as reliable. Some time in the month we shall also get Mme. E. Resal and Laurette Messimy,

both good garden Roses. A very brilliant-red China is Leuchtfeuer, but at present it is hardly so free flowering as Charlotte Klemm; it may, however, improve in this respect.

In this selection I have tried to confine myself to varieties that have proved in my garden generally to be counted upon to flower well for a considerable part of the month, and to be really of value for the adornment of the garden. There are many other good Roses which will often flower then, but I hope the Roses in my list will always be more or less trustworthy for the purpose I have in view. *White Rose.*

FRUIT REGISTER.

PLUM REINE CLAUDE COMTE ALTHAN.

To those about to plant Plums, I would recommend this choice Gage as one of the finest sorts for culture out-of-doors. I lately saw in a nursery bush trees not more than a yard high crowded with fruits. The plants were growing in the open nursery quarter. The flavour of the fruits was all that could be desired.

GRAPE PRINCE OF WALES.

I was glad to see how well Mr. Gibson staged this Grape at Shrewsbury; he evidently understands its requirements. I note he received more points for that variety than he did for its parent, Mrs. Pince. Prince of Wales was sent out by Messrs. J. Veitch & Son many years ago, and has taken a long time to come to the front as an exhibition variety, although its fine quality is undeniable. It should receive similar treatment to that which is given, under favourable conditions, to its parent, viz., a restricted rooting space in an inside border, whereby the roots are under full control in the matter of both moisture and warmth. *E. M.*

RUSTIC ARCHES.

An ill-built and badly-placed arch or arbour is nothing but an eyesore in the garden; superfluous in summer and emphasising the inevitable forlornness of winter. When new and bare of vegetation, such a structure exposes its stark ugliness all the year round, and when climbers have at last succeeded in clothing it with gracious foliage and blossom, the ill-built arch decays and collapses. On the other hand, it is becoming recognised more and more that arches, arbours, screens, and pergolas may, if made well and employed judiciously, add very considerably to the amenities of the garden.

Even though such structures had not been used in gardens previously, the recent introduction of so many beautiful climbers from China and elsewhere would have forced the garden architect to evolve them for the support of these most desirable aliens. No one who seeks to introduce into the garden the effects of semi-tropical luxuriance and of autumnal colour can dispense with representatives of the newer species of Vitis and Clematis; for instance, Vitis armata, V. armata Veitchii, V. Cognetiæ, V. Thomsonii, the evergreen C. armandii, C. montana Wilsonii, which flowers in August, and all the array of coccinea hybrids.

These and others of the climbing kind, Aristolochias, Ivies of many kinds, Jasminums, Loniceras, Passifloras, the quick-growing Polygonum baldschuanicum, Wistarias, and, last, but not least, the Wichuraiana Roses, demand to be represented in the garden, and riot in the ample spaces of pergolas and arches. It is true that the most effective of garden structures are often those which are built on the most simple lines. Nevertheless, it must not be forgotten that arbours and arches and the like must be strongly constructed, and in contriving that they possess these two qualities of simplicity and strength, the designer has his opportunity to produce works of art. A simple, average style of rustic work is illustrated in fig. 86 (A), an examination of which will at once reveal the fact that the design suffers from the close monotony of the panels. If the latter were reduced in numbers and spaced out more, a better effect would be produced. Further improvement without oppressive elaborations could be brought about by the introduction of simple designs in the spandrel pieces and of a double rail at the top, thereby producing a frieze-like appearance. These additions are shown in the designs illustrated in fig. 86 (B-F), wherein the timbers are represented as being halved, pinned together, or notched on to one another and nailed. Seats for work of this kind should be made of fairly straight timbers, which should be dressed smooth, and not, as is so often the case, left rough.

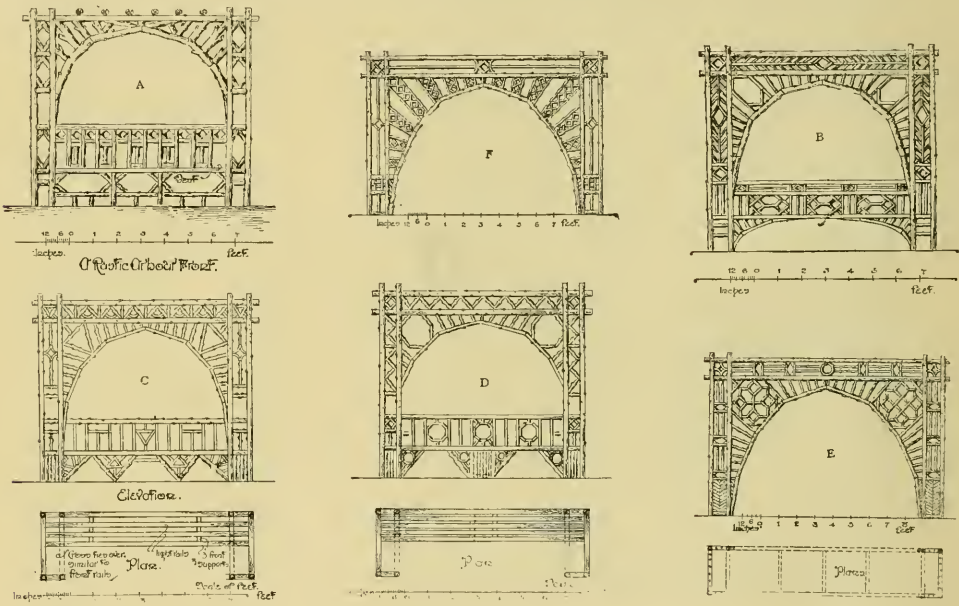

FIG. 86.—(A-F) DESIGNS FOR RUSTIC ARCHES.

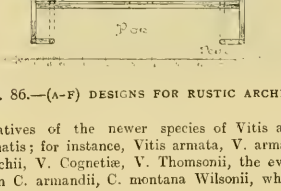

FIG. 87.—(G-H) DETAILS OF DESIGNS (IN FIG. 86 AND TEXT).

Larger arches of designs similar to those illustrated in fig. 86 (B-F) serve as admirable boundary screens. The arches shown at E and F are double, as is illustrated by the plan in fig. 86 (E). Needless to say, the double arch is not only stronger, but has also a better appearance than the single structure. If the latter be used, it requires struts, as shown in fig. 87 (G). Or a good combination may be effected by making the arch itself in single work across the centre and providing the structure with square ends, as shown in fig. 87 (H). Thereby a better effect and finish are produced than is possible by the use of the model illustrated in the preceding figure.

NOTICES OF BOOKS.

THE NEW GARDENING.*

ONE need not extend one's researches beyond last century to discover that gardening is subject to ever-changing fashion. The authoress of *The Florist's Manual* thought she had discovered in "The Mingled Flower Garden" the ultimate in garden design, her queer-shaped flower-beds being like nothing imaginable. Donald Beaton, in the same way, imagined that the style of bedding he did so much to extend could never be superseded. The carpet bedders, a few decades later, were happy in having reached perfection, and then came the struggle, renewed after a long armistice, between the natural stylists, who seem to have believed themselves inspired, and the severe formalists who to-day are triumphing over the suppression of endless curves and the re-introduction of straight lines. It need not therefore be remarked that "new" in gardening is a vague expression. There have always been men who work out ideas which the gardening public scramble to put into practice, the leaders meanwhile advancing, or not impossibly retrograding, but anyhow working apart from the vast majority. What was novel last year may therefore be thrown aside this, and both may embody principles and methods that were known and practised long ago. In this new book of Mr. W. P. Wright's, the reader will discover much that is old, 50 to 300 years old or more, and not a little that is novel. It is in the nature of things that it should be so, and no one need grumble that every plant that is named is not a recent introduction, nor every practice that is recorded should mark a new development. But if, in the strict sense of the word, he does not find everything brand new, the reader will at least have it presented in a new way, burnished and shining, after Mr. Wright's best manner, and his best manner, as his readers are aware, is very good. Mr. Wright has developed a picturesque style, and, apart from the gardening notes, his books are always a pleasure to read. No other of his books is quite so fascinating as *The New Gardening*. It is more starred with epigram than any former production. He assures us that "Formalism is not dead," that "Humanity is a being of form," "Beautiful gardens come from beautiful plants." It is conventional to "talk flowers." "What is design but the harmonious arrangement of plants?" "The sum of achievement is invariably in inverse ratio to the amount of inefficient labour applied to it." "Gardening is living art." It is true that we may disagree with many of his propositions, e.g., that in large places nothing save grass and trees should be close to the windows, or that in border planting, every group must stand clear of the next and every plant in a group must show its individuality. The new border gardening insists, on the contrary, that there shall be no clear spaces, and no plant individuality in groups. There may be for the single plant, but not when the plants are employed in numbers. Exception might also be taken to the lists of novelties. The Carnation man, the flower gardener, the Alpinist, and the shrub grower will look in vain for the latest and the best achievements with his favourites; but those novelties which are recommended are, so far, good, and it is one of the impossibilities that one person can be up-to-date with everything.

The best chapters in Part I are those on Rose growing and Sweet Pea growing. In this part, besides many chapters on other phases of gardening—Alpine, Japanese, water, &c.—is one on the new gardener which is interesting, but in endeavouring to do justice to the new, the old gardener has been painted in colours that do him injustice. Of course, an individual is to you just what you think him to be, and it is the old gardener, as seen by Mr. Wright, that is presented to us in this chapter; but the writer cannot say that he ever met him. Part II is devoted to new fruit growing, cordon and quick-fruiting bushes being lavishly praised for their extraordinary cropping qualities. But the system was not new 50 years ago, and 250 years ago it was not unknown, and even with the better stocks now employed it has failed to hold its own in gardens where large supplies are demanded. In Part III. "French" gardening is rather severely handled; none too severely perhaps, because not a few have suffered from its too hasty adoption. Mr. Wright reckons it requires £1,000 per acre to equip a "French" garden, with three men to work it, but these figures are perhaps exaggerated. At the same time, the light in which the system as a commercial undertaking is presented can do nothing but good to those who with a little capital might be tempted to invest their all in a rash undertaking. The volume is profusely illustrated in half-tone reproductions of photographs of unequal merit, and six in colours which are not worthy the rest of the book, the get-up of which is otherwise deserving of all praise.

DAIRY FARMING FOR SMALLHOLDERS.*

THIS book is full of interesting and practical information, and is written in plain, concise language, a feature which will appeal to the class of reader for whom it is intended. We are convinced that the less that is said with regard to bacteriology and the fewer the technical terms employed the more a work of this kind is approved by the practical man. Also, while the compounding of albuminoid ratios is instructive to the student it is exceedingly difficult, and in many cases impossible, for the smallholder to grasp its intricacies. The advisability of keeping milk records has been well impressed, and this is a subject which to our minds is of paramount importance to all cowkeepers, as there is unlimited evidence to prove that a cow yielding less than 500 gallons per year, when adequately fed, is unprofitable. The hygienic treatment of milk is another feature with which the book deals in able manner. The varieties of cheese referred to are somewhat numerous. Hard-pressed and blue-veined cheeses, such as Cheddar, Stilton, and Wensleydale, peculiar to certain districts, can undoubtedly be made with advantage by smallholders in those districts, but it is rarely that they are in a position to deal with a sufficiently large quantity of milk to warrant their engaging to any extent in this branch of dairy farming. We agree with the author with regard to his remarks on soft cheeses, such as Pont l'Evêque, Conlommiers, Cambridge, and Cream Cheese, all of which are easily made and prove highly remunerative. The book is of a type that should prove useful to gardeners who are responsible for the management of small private dairies.

TREES AND SHRUBS.

ARUNDINARIA ARISTATA.

THE heavy rains experienced this season have suited Bamboos admirably, and plants of Arundinaria aristata have made exceptionally vigorous growth. The erect culms have grown to a height of 16 feet, which is probably a record growth for this plant. It is a distinct and handsome Bamboo, with purplish stems and tesselated leaves, and is perfectly hardy. In the North-eastern Himalayas, A. aristata is found growing at an altitude of 11,000 feet above sea-level. In common with the other species of Arundinaria, it resents drought, which necessitates planting it in a moist situation. This fine Arundinaria is deserving of extended cultivation. *J. Gardner, Batsford Park Gardens, Gloucestershire.*

COLONIAL NOTE.

THE GENUS FICUS ON THE GOLD COAST.

THIS genus is well represented on the Gold Coast, and there must be a considerable number of distinct species and varieties as yet undetermined. Ficus Vogelii seems to be the most common; it grows on many of the large forest trees, developing very quickly, and its roots soon strangle its host. Birds carry the seeds and drop them in the branches or crevices of large trees, where they quickly germinate under the very favourable tropical conditions. The genus includes F. elastica, the Indiarubber tree, which yields a rubber of only fair quality. All the trees in the genus yield latex, but it contains only a very small percentage of rubber, and the trees are very hard to tap. It is thus of little importance from a commercial point of view. Ficus carica, the Fig, does not appear to be distributed in this part of Africa.

"HORTICULTURAL EDUCATION."

I HAVE read with interest the views expressed by Mr. W. H. Divers on this subject, in the issue for July 6, p. 7. Surely it is not essential for a lad to pass through a secondary school in order to qualify for training as a professional gardener. This is hardly a practical view to take, and it does not say much for the education obtained in the council schools, which have made considerable progress of recent years. I consider that a gardener's education begins, not always at school, but with a love for Nature. The horticulturist who combines scientific and practical experience gained from observation is the successful one. The experience may have been gained under varied conditions, but provided it begins on a practical basis and there is a desire for knowledge, things will work out all right. From my own experience in private gardens, I am aware that very few trouble to gain a knowledge of the scientific side of their profession. In our Colonies, agricultural and horticultural education is making rapid strides, even on the West Coast of Africa. *A. B. Gould, Curator, Agric. Dept., Coomassie, Gold Coast.*

PLANT NOTE.

MIMULUS ROSEUS.

MIMULUS ROSEUS (syn. M. Lewisii) is said to be a native of California, but I have found it to be quite hardy in Scotland, and have grown it in the open border for nearly 20 years. I obtained my plants from an old florist in the West of Scotland, and he informed me that this Mimulus was of garden origin. I am inclined to believe this statement, because I have raised seedlings from my stock of plants, and I find that they vary considerably from the parent, and one or two forms of M. luteus were present when the young plants flowered. No other Mimulus, other than M. roseus, was under cultivation when the seed was saved, so that cross-fertilisation was impossible. This fine Mimulus, be it hybrid or species, is at its best during August, and is a very attractive and beautiful plant in the flower border. It does not appear to be much grown, and it is evident that it is not known as well as it should be. The pale rose-coloured flowers, with their white throats, have a decided resemblance to Regal Pelargoniums, and the pyramidal habit of the plant is very pleasing and pretty. On a light soil, exposed to full sunshine, I have had plants 2 feet high, with the foliage almost completely hidden by flowers. Well-flowered specimens always compel attention, this Mimulus being distinct from any other. I find that a mulch of well-decayed manure applied in early summer is of great benefit to the plants, and they do not appear to need the same moist conditions as other kinds of Mimulus. A stock may be propagated easily from cuttings inserted now and made from

* *The New Gardening*: A Guide to the most Recent Developments in the Culture of Flowers, Fruits and Vegetables, by Walter P. Wright. (London: Grant, Richards, Ltd.) Price 6s.

* *Dairy Farming for Smallholders*, by James Long. Published by C. Arthur Pearson, Ltd. Price 2s. 6d.

shoots at the base of the old plants, and these are readily rooted in a cold frame. Under the name of Mimulus Lewisii I obtained a few plants last spring, as they were catalogued as synonymous with M. roseus. I was anxious to grow the two varieties together for trial in order to see if any difference exists between them, but both seem similar in every respect. *George M. Taylor, Mid-Lothian.*

THE EUGENIAS OF SOUTH AFRICA.

(Concluded from p. 180.)

9. E. ZEYHERI, Harvey, Genera of South African Plants, 416 (1838).

A shrub or small, umbrageous, evergreen tree, attaining to a height of 9 m., with a short trunk 36 cm. in diameter; bark thin, grey, longitudinally rent and exfoliating into thin scales, the second and third year's branchlets terete and striate, and the ultimate subquadrangulate, ashy-grey or chestnut-brown, dotted with blackish lenticels. Leaves opposite, very shortly petiolate, spreading (emitting a perceptible odour when rubbed), elliptic or narrowly elliptic (rarely obovate), obtuse or rounded at the apex, shortly attenuate at the base, 2 to 3½ cm. long, ¾ to 1½ cm. broad, at first minutely puberulous, ultimately glabrous, coriaceous, dark green and lustrous above with an impressed midrib, paler and dull green on the lower surface with the midrib prominent; lateral nerves approximately six pairs, coalescing into an intramarginal band most conspicuous above, more or less obsolete below; margins slightly thickened and recurved. Inflorescence axillary or terminal, short, 1 to 12 flowered with the shortly pedicelled white flowers cymosely or racemosely arranged; peduncle rarely exceeding 1 cm. Flowers staminate or perfect, white. Receptacle glabrous, subtended by a pair of appressed subulate bracteoles equalling it. Sepals short, rounded; petals spreading, four, or occasionally with accessory smaller ones, broadly ovate or oblong, obtuse, 6 to 7 nerved, 3.5 mm. long; stamens 13 to 20, as long as the petals, with oval anthers; style very short, conic, with a minute stigma. Fruit globose, crowned by the persistent calyx-lobes, 1 to 2 cm. long, scarcely fleshy, bright red or purplish; stone invariably solitary, large, globose, horny; kernel black, cotyledons unequal in size.

Sonder, in Harvey and Sonder *Fl. Cap.*, II, 522: Pappe *Silva Capensis*, 19; Sim in *Cape of Good Hope Agric. Jour.*, XVI, 1900, 41, and *Forest Flora Cape Col.*, 226, pl. lxxi, f. 1; *Forest Fl. Portuguese East Afr.*, 68, 1909. Memecylon Zeyheri, Harvey, l.c. 99

This handsome small tree, owing to its simulation (both in flowers and foliage) of the Myrtle, has been named, not inappropriately, the Wild Fambos or Wild Myrtle by the colonists, and to others it is known as the Black Tea Bush, but for what reason, is obscure. Sim records the Kaffir name as Isiduli-we-hlati.§ The flowers appear from December to May, and are followed by fruits not unlike a small Cherry, which are edible and have a slight acidulous flavour, but, owing to the largeness of the stone, they are not much in demand. The trunk and branchlets are often encrusted with Lichens, such as Usnea barbata, &c.

The species abounds in light forests along streams in the coastal regions of Cape Colony, extending from Uitenhage to Natal (Sim), and is also frequent in the Egossa forests in Pondoland, where it reaches an elevation of 1,200 m., but, being a poor wood-producer, is not included in the Conservation Act; its more precise geographical distribution is suggested by the specimens quoted, which are in the Kew Herbarium, Sim records it also for Portuguese East Africa, where it occurs sparingly along the coast from Maputa to M'Chopes, but the author may be alluding to a different species, as herbarium specimens do not suggest so northerly a distribution.

§ We-hlati usually signifies "forest form": isiduli, "mountain form."

Coast Region.—Uitenhage Div., Forests near the Vanstadenaberg River, Zeyher, 681. Drège, 5366a ‖ Port Elizabeth Div., around Krakakamma, Burchell, 4558. Bathurst Div., near Barville Park, between Rietfontein and the source of the Kasuga River, Burchell, 4152. Near Barville Park, between Rietfontein and the seashore, Burchell, 4061. Albany Div., Albany, Zeyher, 681. In woods near Grahamstown, 690 m. MacOwan, 289.

Central Region.—Carnarvon Div., at Carnarvon, Schlechtfontein, Burchell, 1563. Somerset Div., Somerset, Bowker.

Of its wood Pappe (l.c.) states:—"Wood white, hard, heavy, fine-grained, somewhat resembling white Maple; fit for the manufacture of carpenter's tools, ploughs, axles, &c." Woodcutters claim that for spokes it is not excelled (Sim, l.c.). It takes a good polish and with age becomes a pale ochre-yellow. A block in the Kew Museum, presented by Governor Wodehouse, of a pale chocolate colour, may belong to a different species.

Burchell's specimens (Nos. 4,061 and 4,152), from Barville Park, must be taken with reserve, owing to the absence of flowers; of its fruit (No. 4,061) the collector says:—"Fructus drupa gratissima ab abstringens avide quasitur ab omnibus (Wilde Abrikoos)?" viz., Wild Apricot. The habit of these specimens of Burchell is eminently suggestive of E. albanensis, Sond.

FIG. 88.—EUGENIA PUSILLA: BROWN.

VAR. ANGUSTIFOLIA, Dümmer, sp. nov., a typa foliis angustioribus recedit.

Eastern Region.—Bathurst Div., at Rietfontein and vicinity, between the Kasuga River and Port Alfred, Burchell, 3948.

Habit of the species: Leaves shortly petiolate, elliptic, lanceolate, averaging 2 cm. in length, ½ cm. broad, shiny above, with a recurved margin.

10. E. WOODII, Dümmer, species nova, E. zuluensi, Dümmer, peraffinis nisi foliis late ellipticis vel obovatis, supernc costa impressa (haud elevata), gemmis calycibusque sericeis.

A shrub with opposite branchlets, the second and third years' terete, ashy-grey and eventually brownish; the ultimate slender, flattened and slightly angular, brownish and slightly serice towards their apices; buds appressedly pubescent. Leaves opposite (rarely in threes), spreading as long or longer than the internodes, subcoriaceous and entirely glabrous, elliptic to obovate, broadly and bluntly cuspidate (rarely rounded and emarginate), tapering from the middle to the base into a stout, short, grooved petiole; the blade 3.5 to 5 cm. long, 2 to 3.2 cm. broad, glaucescent green and lustrous above, the midrib sunken and correspondingly raised on the reverse side, which is a dull green and more prominently reticulated; margin slightly wavy and reflexed. Cymes or racemes solitary, axillary, or appearing on the older wood, two to six-flowered (rarely one-flowered), peduncles 5 to 10 mm. long, and with the receptacle covered with white appressed hairs. Flowers white, subsessile or shortly pedicellate, 5 to 7 mm. in diameter, invariably in pairs, subtended by two minute, lanceolate, acute bracteoles. Receptacle obconic, with whitish appressed hairs. Sepals unequal in size, half as long as the receptacle, thickish, broadly ovate and concave, rounded, ciliolate. Petals spreading, oblong, or broadly ovate, with a rounded apex, almost eglandular, ciliolate. Stamens usually 10, half as long or equalling the petals. Style stout, subulate, erect or slightly uncinate, 3 to 4 mm. long. Fruit not seen.

Natal and Zululand. Without precise locality, Gerrard, 1643. Natal. Between bushes near Durban, 15 m., Wood, 132.

This species approximates most closely to E. zuluensis, Dümmer, but is easily distinguished by the larger, broadly elliptic or obovate leaves, which have a sunken and not elevated midrib; the vegetative buds and receptacles of the flowers are, moreover, covered with whitish appressed hairs, which constitute an additional distinctive character. In its general facies the species is not unlike the Mascarene E. cotinifolia, Jacq., and was first detected by Gerrard, and subsequently on the sand dunes near Durban, in October, 1883, by Director Medley-Wood, in whose honour I have named the species.

11. E. PUSILLA, N. E. Brown, in *Kew Bulletin*, 1912.

A plant scarcely exceeding 16 cm. in height, with a profusion of annual, leafy, flowering shoots, which arise from a perennating twisted root-stock; shoots ascending, slender, terete, and glabrous below, flattened and inconspicuously serice above, brownish (fig. 88). Leaves opposite, subcoriaceous, light shiny green,

‖ The locality of Drège's specimens (No. 5366a) is uncertain.

subsessile, ascending, twice or three times as long as the internodes, narrowly lanceolate to lanceolate, tapering at both ends with an obtuse apex, 2 to 3 cm. long, 2 to 3 cm. broad, glabrous at maturity and conspicuously gland-dotted on both surfaces, with the midrib sunken on the upper surface, and correspondingly raised on the lower, the margins strongly revolute. Flowers axillary, solitary, white, borne on slender, flattened, glabrous and warted pedicels, 5 to 10 mm. long; bracteoles two, opposite; filiform and recurved, at the base of the receptacle, and nearly equalling it in length. Receptacle abbreviate, appressedly puberulous. Calyx about 5 mm. in diameter; sepals spreading, broadly ovate and concave, acute, tuberculate and glabrescent, with ciliolate margins. Petals white, exceeding the sepals.

[Photograph by J. A. James.

FIG. 89.—MALVASTRUM CAMPANULATUM: FLOWERS PURPLISH-ROSE.

Kalahari Region.—Transvaal, Ermelo District, Amsterdam, Athole, M. O. Forbes ex. Col. Herbarium, Transvaal Department of Agriculture and at Kew, 6748.

VAR. LATIOR, Dümmer, var. nova, a typa foliis latioribus recedit.

Eastern Region.—Natal; without precise locality, Gerrard, 1645.

The photograph reproduced in fig. 88 conveys a good impression of the general facies of this species, which was discovered by Mr. M. O. Forbes, in December of the preceding year, on the farm "Athole," in the Transvaal, where it is known in the vernacular as Lomo: it is suspected of being concerned in the poisoning of sheep. The variety, which has not been rediscovered since the time of Gerrard, in Natal, differs only in the relatively broader leaves, viz., 4 to 5 mm. broad, and slightly larger flowers. A fungus is parasitic on the latter, which Mr. G. Massee identifies as Pestalozzia decolorata, Speg.

12. E. ALBANENSIS, Sonder, l.c. 522.

A plant resembling E. pusilla in habit; shoots ascending, simple or rarely branched, subwoody and slender, 10 to 18 cm. high, flattened and sparingly covered with appressed hairs above, terete, glabrous and chestnut-brown towards the base. Leaves opposite (rarely alternate or ternate), subsessile, imbricate, or occasionally equalling the internodes, coriaceous and glabrous, narrowly elliptic to elliptic (rarely obovate), broadly cuspidate with a blunt cusp; blade 2.5 to 3.3 cm. long, 1.3 to 1.7 cm. broad, olive or bluish lustrous green and smooth above, with a sunken midrib and obsolete lateral veins, dull and pale green on the lower side, with the costa and veins more prominent; margin slightly thickened and recurved (glands inconspicuous on older leaves). Peduncles solitary, axillary, flattened, 10 to 20 mm. long, one to three-flowered. Flowers white, often staminate, 10 to 15 mm. in diameter, the obconic puberulous receptacle subtended by two lanceolate acute bracteoles 2 to 4 mm. long. Sepals coriaceous, four to five, ovate, with involute margins. Petals spreading, oblong, or broadly ovate, nervate and eglandular, ciliolate above. Stamens 25 to 30, equalling the petals or exceeding them. Style often reduced to a slight protuberance. Fruit unknown.

Wood, l.c., 156.

Central Region.—Somerset Div., Somerset, Mrs. Bowker.

Eastern Region.—Natal Div., Natal, Sandersoo. Gerrard, 48. On the Umbilo River, Field's Hill, Sanderson, 923. Inanda, Wood, 1020, partly.

Medley-Wood remarks that this plant is common on hillsides and sandy flats in the coast and midland districts of Natal. It is figured in his *Illustrations of Natal Plants*, III, t. 205.

13. E. GUEINZII, Sonder in Harv. and Sond. *Fl. Cap* II, 523.

A glabrous plant, developing short, annual, flowering shoots from a woody, perennial base; shoots unbranched, about 20 cm. high, ascending, flattened above, terete below, dull brown and striate. Leaves opposite or ternate, coriaceous, subsessile, patently spreading, elliptic or broadly ovate, obtuse or rounded at the apex, rounded or subcordate and nearly clasping the base, 3.5 to 6 cm. long, 2.5 to 4 cm. broad, as long as the internodes or longer than them, bluish-green and lustrous on the upper surface, paler and dull green on the lower, and dotted with conspicuous glands, the midrib and veins slightly elevated on both sides; margin undulated and slightly recurved, but not thickened. Flowers white, solitary, geminate or ternate, 1 cm. in diameter, pedunculate, not perfectly axillary, but arising from just above the axil, the peduncles ascending, slender, compressed, 8 to 15 mm. long, bracteoles two, deltoid, minute. Receptacle obconic. Sepals four, concave, unequal in size, ovate, rounded, with ciliolate margins. Petals spreading, broadly ovate, like the sepals, dotted with large, dark glands. Stamens about 20 to 30, with terete filaments. Style scarcely exceeding the stamens, or occasionally aborted. Fruit unknown.

Wood in *Trans.* Phil. Soc., S. Africa, XVIII, ii. (1908), 157.

Natal, Port Natal, Gueinzius. Gerrard, 205. Inanda, Wood, 1020, partly.

A dwarf species with the peculiar habit, shared by several of its congeners, of developing annual flowering shoots from a woody rootstock, characterised by the shortly petiolate, broad, patently-spreading leaves, which are invariably rounded or subcordate at the base. Medley-Wood's No. 1020 is evidently a mixture, the Kew portion being E. albanensis, Sonder, the remaining, the species above, which is at the British Museum. *R. A. Dümmer.*

MALVASTRUM CAMPANULATUM, NICHOLSON.

THIS beautiful plant (see fig. 89) is but seldom seen in British gardens. A fine plant has thriven well for some years past under a south wall in Canon Ellacombe's garden at Bitton. It is also grown at Glasnevin, but I have not seen it elsewhere. The plant illustrated belonged to the late Mr. W. E. Gumbleton, and I purchased it last autumn when his plants were offered for sale. I believe it came to him from Glasnevin. M. campanulatum appears to be difficult to increase, for neither here nor at Bitton have I seen good seed formed, and every growth that appears above ground rapidly develops into a flower-stem and is useless for cuttings. Lindley states in the *Botanical Register* that it increases very little by the root, but produces seeds in dry seasons. He described it under the name of Malva purpurata, and in t. 1362 it is shown somewhat larger than the form I know, and also rather deeper in colour, the lilac being redder than in my plant. It is also figured in the *Botanical Magazine* in t. 3814, but the illustration, although quite true as to size, is too blue in colour.

A charming plant for a choice spot, it begins to flower in June and continues throwing up fresh flower-stems until stopped by autumn frosts. The flower-stems soon fall over and trail on the ground, forming a mass some 2 feet or more across. It was raised in the R.H.S. garden from seeds collected by Mr. McRae in the Cumbre, a pass in the Chilian Andes, in November, 1825. There is another figure of it in vol. ix, p. 173, of *Paxton's Magazine of Botany*; but here also the tint is too blue. *E. A. Bowles.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

POT FRUIT TREES.—The chief consideration in connection with this method of cultivating fruit is to grow the right varieties; the grower should aim at securing a few good varieties of each kind rather than too many sorts. Nectarines seem to do more satisfactorily than Peaches, and the yellow varieties are especially suitable for pot culture. Rivers' Early Orange, Darwin, Pineapple, and Humboldt are all excellent yellow sorts. Cardinal and Dryden, too, will be found suitable for the purpose; their fruits, especially those of the former variety, ripen much earlier than those of the yellow kinds. Of Peaches Duke of York, Royal George, Crimson Galande, Bellegarde, and Marchioness of Downshire are all reliable varieties. Plums will give great satisfaction if the best varieties are chosen, Brandy Gage, Early Transparent Gage, Jefferson, Kirke's Green Gage, and Coe's Golden Drop are all suitable for pot culture. Of Apples Lady Sudeley, James Grieve, Emperor Alexander, Cox's Orange Pippin, Ribston Pippin, Peasgood's Nonesuch, and Gascoyne's Scarlet Seedling are some of the most useful varieties to grow in pots. Pears, Williams' Bon Chrétien, Souvenir de Congrès, Triomphe de Vienne, Marguérite Marillat, and Doyenné du Comice may all be relied upon to give good results. If it is intended to purchase the trees from a nursery they should be procured at once. A good plan is to obtain a few maiden plants each year, as this enables the grower to maintain a good stock of trees without much expense. Most fruit trees growing in pots need to be repotted annually. Trees which have been grown in pots for several years may be potted in the same receptacles, reducing the ball of old soil to make room for a good quantity of fresh compost. The removal of the old soil is best done with a pointed stick, and requires care and patience. Younger trees may be afforded slightly larger pots, and their roots need not be disturbed quite so much as in the case of larger specimens, although they should be carefully "teased" out. Before commencing the potting procure a sufficient quantity of soil to repot the whole of the trees and place it under cover. For convenience of working, the soil should be on the dry rather than the wet side. For Peaches, Nectarines, and Plums the compost may consist chiefly of good fibrous loam, manure from an old spent Mushroom-bed, old lime-rubble, wood ashes, and crushed bones. A little artificial manure may be included if the loam is of poor quality. For Apples and Pears less lime rubble should be used. Pot firmly, and when the work is finished place the trees in a position where they will be sheltered from bright sunshine. Water must be applied to the roots with extra care for some time after the potting is finished.

STRAWBERRIES IN POTS.—The plants should not be too much crowded together, or they will not be well ripened by the end of the autumn. Let the pots stand quite clear of each other, so that the sunshine and air can circulate freely about them. Remove all runners and side growths, and turn the pots occasionally to prevent the roots from growing through the drainage holes. During continuous spells of wet weather, the pots should be placed on their sides to prevent the soil from becoming too wet. The earliest-potted plants will now be sufficiently well rooted to need stimulants. This may be given in the form of weak liquid-manure and soot-water, the strength of which may be increased as growth proceeds. An occasional syringing with a mixture of soft soap and sulphur will keep the plants free from red spider and mildew.

TOMATOS.—When the autumn-fruiting plants have set three or four trusses of fruits the leading growths should be stopped, and some of the stronger leaves removed. A rich top-dressing will be of great assistance in swelling up the fruits, and the plants should be given plenty of stimulants. Plants intended for winter-fruiting are large enough for placing in their fruiting pots or for planting out. The latter is much the better method for growing the latest batch of these plants. They set their fruits for a much longer period than when grown in pots, and in consequence give a far larger supply of Tomatos. The plants should not be allowed much soil at first, or they will grow too strong. It is better to leave space for occasional top-dressings as the crop develops. Strict attention must be given to the setting of the fruits. Fumigate the plants occasionally with a nicotine compound to keep them free from the white fly.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

LACHENALIA, — A quantity of these useful spring-flowering bulbs should be potted at once, using, for ordinary decorative purposes, 4½-inch pots. Where the plants are required for furnishing vases in the dwelling-house small pans may be used, according to the size of the vases to be filled. For hanging baskets, these plants are particularly suitable. There are many varieties under cultivation; tricolor, aurea, Delight, Cawston Gem, and Milsonii are the most useful; L. Milsonii is perhaps the most attractive of all. After potting, the plants should be placed in a cold frame and watered. They should not be covered with ashes, as is the practice with most bulbs. The lights may be placed over them during very wet weather. A cool treatment suits them best until the turn of the year; then, if they are wanted early, they may be moved to the intermediate house; but it is best, if possible, to leave them where they are. If the pots are well filled with roots, a little liquid manure should be given every time they require water—this, of course, does not occur often during the winter months. If this treatment is pursued, and the bulbs are of a fair size, they will produce strong flower-spikes, which will last for a considerable time.

ROSES.—The cultivation of Roses under glass becomes more popular year by year. There are not many large establishments without at least one house which is devoted to the production of these flowers from Christmas onwards, and in many instances even earlier than this. Twenty years ago, Tea Roses were perhaps the most popular for pot culture, but the craze for long stems has, in many instances, caused them to be supplanted by the Hybrid Perpetuals and Hybrid Teas, which, being of stronger growth, furnish the class of flower which is desired. Certainly, such varieties as Captain Hayward, Mrs. John Laing, Frau Karl Druschki, Mrs. R. G. S. Crawford, Joseph Lowe, Mme. Abel Chatenay, Lady Hillingdon, Liberty, and Kaiserin Augusta Victoria all respond well to this system of cultivation, and, with proper care and attention after blooming, will continue to give good crops of blooms for many years. A friend of mine—a noted grower of pot Roses—informed me this spring that his best crop of flowers is produced when the plants are from six to nine years old; an age at which a great many cultivators are thinking of discarding their plants. In the present month, all pot Roses should be taken in hand and prepared for next season. It may not be absolutely necessary to repot them every year, but it is an advantage; and if the time can be spared it should certainly be done. A fairly binding compost of good rich loam, well-matured horse droppings, lime rubble, wood ashes, and a little bonemeal suits Roses well. It may be used for all kinds, whether Teas, Hybrid Teas, Hybrid Perpetuals, or climbing varieties. For producing cut blooms for ordinary purposes, such varieties as those enumerated above will do well in 9 or 10-inch pots; there is no great advantage in having larger ones, except in the case of very big plants. When repotting, a fair amount of the old soil should be carefully removed, to allow the plants to go back into the same size pot as before. The potting should be done firmly, and a fair amount of room should be allowed for water. During the later part of the season Roses require a good deal of moisture at the roots. The dwarf Polyantha Roses are much used for decorative work, but they should be kept in as small pots as possible; those having diameters of 6 or 8½ inches are the best receptacles. The size of the pot in which the climbers are to be grown must naturally be governed partly by the size of the plant, and partly by that of the vases in which they will be stood when in bloom. There is no advantage in having the pots too large, as Roses are plants which can be given a good deal of manure during their growing season. At the time of potting, if the work has not been done already, the climbers should be pruned, leaving only those shoots which are required for blooming. These should be re-staked and tied. After potting, it is well to plunge the pots up to the rims in ashes, allowing plenty of room between each plant to admit the light and air. The plunging induces increased root action, and the plants soon recover from the disturbance at the roots. They require very little water when once the soil has been thoroughly soaked; in fact, as the autumn advances, it is wise to cover the pots with straw or some such material to ward off the rains. As advised some time ago, every effort must be made to keep down mildew, as, if it is avoided now, there is little likelihood of its appearance in the spring. Plants of the variety Maréchal Niel, which have been cut back after flowering, should now be making good growth, and every inducement to development must be given, until the space allotted to them is covered. When this is accomplished, more air must be admitted in the house so as to thoroughly ripen the wood. This is quite essential if a good crop of bloom is wanted in the spring.

HOUSING PLANTS.—The cold, wet weather of the past month has been very detrimental to many plants which are usually left out-of-doors till the middle or end of September. If wet weather continues, such plants as Carnations, Zonal Pelargoniums, and Salvias will be better for being placed immediately under cover.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to SIR JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

MASDEVALLIA.—September is the most suitable month for repotting or resurfacing the majority of Masdevallias, as the roots are more active during September and October than at any other season. In addition the weather conditions are cool and moist, favouring a quick re-establishment of the plants. New leaves are developing and young roots will soon be produced; the latter will quickly grow into the new compost and establish themselves firmly before the winter arrives. Healthy specimens that have sufficient room in their receptacles for another season's growth will, provided the compost is in a good condition, not require repotting. This will be an advantage if well-flowered specimens are required, as the plants seldom flower well the first season after they are potted. Where the soil has become sour it should be picked carefully from between the roots down to the drainage materials and substituted with fresh, taking care not to disturb the roots more than is unavoidable. Large plants which have lost a number of their leaves, and have in consequence become bare in their centres, may be divided, and the dead portions having been cut away, they may either be potted for increase of stock or made up into specimens again. Masdevallias of the stronger growing kinds are vigorous-rooting plants, and require plenty of rooting space; they are best grown in pots or deep pans. M. Veitchiana, M. ignea, M. Lindenii, M. coriacea, M. macrura, M. elephanticeps, M. torta, M. Gargantua, M. Mooreana, and the numerous varieties of the Harryana type are plants of this class. Others that have not such a vigorous habit, such as M. Courtauldiana, M. chelsonii, and M. stella, should not be allowed too much rooting space. All those I have mentioned may be grown on the stage, and near to the roof-glass. The dwarf-growing kinds, such as M. Arminii, M. Shuttleworthii, M. Estradæ, M. picturata, M. muscosa, M. melanopus, M. Wageneriana, and M. O'Brieniana, should be placed in shallow pans, and suspended close to the roof. M. platyglossa, M. leontoglossa, and those of the Chimæra section that develop their inflorescences in a downward direction should be grown in teak-wood baskets. A suitable compost for Masdevallias consists of half-decayed Oak leaves rubbed through a ½-inch sieve, Osmunda fibre, Al fibre cut up rather roughly, and Sphagnum-moss in equal proportions, with a quantity of crushed crocks and coarse silver sand,

incorporated well with the other materials. In repotting, fill the pots to within half their depth with clean crocks to ensure efficient drainage; place a thin layer of Sphagnum-moss over the crocks. Keep the base of the plants level with the top of the pot, and carefully work the compost among the roots, pressing it moderately firm but not so hard as to prevent the water from passing through freely. Fill the pot to within half an inch of the rim, and finish with a layer of peat and Sphagnum-moss cut into short portions. During the first few weeks after potting afford water very sparingly, sprinkling it around the edges of the pot. As the plants become re-established the amount of moisture should be gradually increased. During the late autumn and winter the plants should not be watered until the soil has become quite dry, for if the plants are in a saturated condition at those seasons the leaves will become spotted and unsightly. Newly-potted plants should be shaded from the bright sunshine and grown in a moderately moist atmosphere, damping the house two or three times daily according to the weather. If a special house is not available for these plants, they may be placed in the warmest and shadiest part of the Odontoglossum house. The white flowered M. tovarensis, the yellow-flowered M. Davisii, and those of the Chimæra section are best repotted in February, and may be kept rather warmer during the winter months than the others.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

PEACHES AND NECTARINES. — The fruits of the earliest varieties of Peaches growing on south walls, such as Alexander and Amsden June, having been gathered, the trees should, if necessary, be syringed with an insecticide. This will clear them of red spider and other insect pests. Additional free syringings with clear water each afternoon when the later varieties are sprayed, will be of much benefit. The fruits of both Peaches and Nectarines are of good average size this season and of splendid colour; Nectarines, especially, are clean of skin and finer than usual, especially those that have had the leaves partially removed or turned aside to expose the fruit to the sunlight. Late varieties are carrying good crops, and the fruits will be exceptionally useful this season, owing to a scarcity of good dessert Apples. Such varieties as Walburton Admirable should be afforded every attention to obtain the best results. All breastwood should be removed to let in the sunlight and expose the fruits as much as possible. Leading shoots with fruits that are swelling may be shortened if they are not required for extension; this will increase the size of the fruits and let in more light to the remaining growths. Both Nectarines and Peaches should be gathered early in the day, a little time before they are ripe. They should be handled with the greatest care and placed on an airy shelf in the fruit room until they are ready for consumption. When a Peach becomes dead ripe, it is past its best condition, and this applies also to Nectarines. Guard against woodlice, earwigs, and other insect pests, as they soon spoil many of the best fruits.

FIGS.—Many of these trees have cast nearly all their fruits and are, in consequence, making too many gross shoots. To counteract this the spade should be inserted deeply in the soil at some little distance from the stem, to sever some of the stronger-growing roots, and fresh soil of a calcareous nature applied. Lime rubble or brick rubbish mixed freely with the soil is very beneficial to Fig trees. The harder this is rammed into the trench the better will be the results, provided the soil is in a good condition at the time of carrying out the work. Mulches of animal manure should be cleared away. Suckers and weak, useless shoots should be removed to prevent overcrowding. Young Fig trees must not be planted in rich soil nor be given stimulants to excess, as this would cause them to form gross and unfruitful wood. The grower should aim at securing short-jointed shoots that will ripen well, and thus be capable of withstanding severe winters.

STRAWBERRIES. — Strawberries may still be planted, but unless the runners are extra strong and the soil dry and in a good condition generally, the plants must not be expected to produce much fruit next season. By planting early the roots have a much better chance of becoming well established, and the crowns ripen before winter arrives. If delay in planting is unavoidable, the runners should be planted in nursery beds where they will be fully exposed to sunlight and air. Allow about 6 inches between the plants and 9 inches between the rows. Permanent beds may be made from these plants the following spring.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

POTATOS.—The main crop of Potatos is somewhat late in maturing, compared with that of last season, and I hear reports of disease in various districts. As soon as the haulm has ripened, it should be cut off and removed at once to the garden fire to prevent disease, should it be present, from spreading to the tubers. Do not hesitate to lift the tubers as soon as they are fully matured, choosing fine weather, if possible, for the work. If tubers are required for exhibition purposes at a later date, they should be selected now. They should not be exposed to the air a minute longer than is absolutely necessary, but stored at once in fine soil in a cool, dark place until required. They should then be washed, and will be found equal to newly dug tubers. Where large quantities have to be stored, the best method is to pit or clamp them, and in such a season as the present, it is a good plan to scatter a little freshly-slaked lime between them as the work proceeds. The small tubers, and those required for seed, should be stored in a cool but frost-proof shed and laid as thinly as is convenient. The value of a change of seed, and especially Irish or Scotch grown, is most apparent this season; reports show that where new seed was planted the disease is much less prevalent. This was also the case where the tubers were sprouted before planting; it is well worth the little extra trouble to sprout the sets before they are planted.

CAULIFLOWERS.—The sowing of Cauliflowers during September, and wintering the plants in cold frames are not nearly so much practised now as formerly, owing to the numbers of new varieties that may be raised in heat during the early spring and quickly forced. But the results from autumn-sown plants are infinitely better than from those raised in the spring. For this reason I make two sowings, one about September 1 and another towards the middle of that month in a cold frame. Both sowings should be made thinly in shallow drills and in poor soil. As soon as the seedlings are large enough, they should be transplanted in cold frames; they should not be set deeply, but should be planted in sufficient soil of not too rich a nature. The chief aim is to procure sturdy plants; therefore, whenever possible, the fullest amount of air should be given, even in the winter. We grow the varieties Walcheren and Duncourt. The last-named is of exceptional merit. The weather has suited Cauliflowers, and we have cut curds, which are first-rate in every respect. Examine the plants frequently, and bend the foliage over the flowers. Those not required for immediate consumption should be pulled up by the roots and placed in a cool shed before they get too old: they will keep fresh for a week or two.

CAPSICUMS AND CHILIES. — Plants that have been grown in cold frames should, ere long, be removed to a warm house. This will be especially necessary in cold districts, so that the fruit may continue to swell and ripen freely. They should receive plenty of stimulants, and if there is any trace of aphis on them the plants should be lightly fumigated with a nicotine compound. Keep the plants as near to the roof glass as possible, and admit air freely on warm days.

MUSHROOMS.—Continue to collect and prepare the materials for fresh beds, which should be made as soon as sufficient manure and leaves are procured. These beds will furnish a supply of Mushrooms during the late autumn and winter months. The Mushroom house should be requisitioned for this crop, as artificial heat may be necessary, though the greatest caution should be exercised in turning on the hot-water valves, for the less fire heat that is used at any season the better. The materials, after the longest of the straw has been removed, and the rank gases allowed to escape by turning the bed as often as necessary, should be placed very firmly together by treading or ramming, and the beds formed not less than 2 feet in thickness. Insert a thermometer, and when the heat begins to decline spawning may be done. Break the cakes of spawn into pieces about as large as a hen's egg, and insert them 3 or 4 inches deep and about 9 inches apart over the bed. A day or two afterwards soil should be spread over the beds, using fine loam to the depth of about 2 inches. The soil should be well beaten down. Cover the surface with clean straw to prevent evaporation of moisture; if this is done water will not be required until the beds come into bearing. As soon as signs of Mushrooms appear, remove the mulching of straw. In gathering the Mushrooms, do not cut them with a knife, but twist them out of the ground and cut the ends of the stalks afterwards. Endeavour to maintain an even temperature of from 55° to 60°. Trap or search for slugs, woodlice, and other pests at night-time. Beds may also be constructed in the open at this season, and even in the winter plentiful crops may be cut from beds out-of-doors, provided a suitable covering be afforded them. Good results may be obtained by the free use of freshly-fallen leaves, preferably of Oak or Beech. The directions for spawning are much the same as for indoor beds. Make the beds ridge-shaped, with the base slightly above the level of the soil; 5 to 6 feet will be found a convenient width. Make the materials very firm as the work proceeds, gradually narrowing the heap towards the top. Good spawn is essential for early cropping and productiveness. Sutton's Twentieth Century spawn is to be highly recommended.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

STANDARD FUCHSIAS. — Standard flowering plants are very popular for both indoor or outdoor decoration, and few subjects are so well adapted for this style of training as Fuchsias. These plants are employed largely for furnishing beds and borders. They are very effective in large beds as dot plants, with suitable dwarf plants underneath, and a groundwork of Violas of the lighter shades. Those who intend to employ Fuchsias for this purpose next season should lose no time in inserting the cuttings. Strong, healthy shoots should be dibbled in 60 pots, filled with a light, sandy soil. The cuttings should be placed in a propagating house, and rooted in a little bottom heat. Roots will develop quickly, and a few days after the cuttings have been taken from the propagating frame, they may be potted singly in a suitable compost. Place the plants in a light position near to the roof-glass. Select the stronger plants for training as standards, and do not stop the leading shoots until they have grown to a sufficient height. They should then be pinched, and the resulting shoots pinched again as soon as they are sufficiently advanced. Keep the plants growing in a warm, light house all through the winter, without a check. The temperature of the house should be maintained at 60°. Plants once trained may be retained for years, lifted from the beds each autumn and repotted. During the winter they should be stored in a cool and moderately dry house. A fruit-house with the trees at rest is a very suitable place in which to winter them.

HARDY FUCHSIAS. — The wet season has suited these plants, and they are now a mass of bloom. The flowers are not damaged by heavy rains. Greater use might be made of hardy Fuchsias, as they grow well in almost any soil, and under all sorts of conditions. Young specimens planted in good soil make rapid progress, and when once established, are best left undisturbed. A quantity of well-rotted manure and leaf-mould should be forked in the soil amongst the roots during the winter or early spring. The variety M. Corneillson is very attractive, the scarlet and white flowers being produced in great profusion. Other good varieties are Riccartonii, coccinea, sanguinea microphylla, and Thompsonii. These plants are suitable for the mixed border, and the front of shrubberies; they may also be planted in clumps in woodland walks. The plants may be increased by division, by root cuttings, and by cuttings. Division is not the quickest method of securing large plants.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 9—
Nat. Chrys. Soc. Floral Com. meet. United Hort. Benefit and Prov. Soc. Com. meet.

TUESDAY, SEPTEMBER 10—Royal Hort. Soc. Coms. meet. (Lecture by Miss Troyte-Bullock on "Cape Pelargoniums.")

WEDNESDAY, SEPTEMBER 11—
Royal Caledonian Hort Soc. Autumn Sh. (2 days).

THURSDAY, SEPTEMBER 12—
Nat. Rose Soc. Sh. at R.H.S. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—58·2.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, September 4* (6 P.M.): Max. 68°; Min. 56°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September 5* (10 A.M.): Bar. 29·9°: Temp. 69°: *Weather*—Fine.
PROVINCES.—*Wednesday, September 4*: Max. 61° Lincoln; Min. 52° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY—
Twenty-seventh Annual Sale of Pot Plants, at the Nurseries, Chingford. By order of Messrs. H. B. May & Sons, by Protheroe & Morris, at 11.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY AND WEDNESDAY—
Bay Trees and Palms, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 3.

MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

TUESDAY—
Trade Sale of Winter-blooming Heaths, at the Burnt Ash Road Nurseries, Lee, Kent. By order of Messrs. B. Maller & Sons, by Protheroe & Morris, at 11.

WEDNESDAY—
Trade Sale of Dutch, French and other Bulbs at 1; Palms and Plants at 4; at 67 and 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY AND THURSDAY—
Sale of Winter-flowering and other Plants, at the Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.

THURSDAY—
Thirty-first Annual Trade Sale of Winter-blooming Heaths and Ferns, at Longlands Nursery, Sidcup. By order of Messrs. H. Evans & Sons, by Protheroe & Morris, at 11.

FRIDAY—
Imported and Established Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Book of the Links.

History is silent as to the circumstances which led a distinguished politician of a bygone day to utter the ill-natured epigram, "Life would be very tolerable if it were not for its amusements." Nevertheless, it is not difficult to imagine the kind of conditions which might provoke a man of caustic wit to give vent to the outburst. An indifferent caddie, several lost balls, an August such as that of 1912, and a course of golf conversation in the club smoking room—none of these misfortunes might justify the cynicism. But if after escape from this sea of trouble he sought to while away an hour before the train by dipping into the volumes on the game of golf which lie on the tables of every well-equipped club-house, then might this golfing Job at last lose patience and condemn even life's amusements. For there is a curious dreariness of repetition in the literature of games in general and of golf in particular. To the enthusiast, indeed, this repetition is an essential charm of games; for is not a game itself a constant repetition, and do we not in playing games resume our childhood and revel in repetition, like children who clamour for an oft-told tale to be repeated yet once more? Wherefore, though to write a book on golf for the enthusiast would appear to be easy, to produce one which will appeal not only to golfers, enthusiastic and normal, but also to those who never touch a club, would seem at first sight impossible. This all but impossible task Mr. Martin H. F. Sutton has accomplished with brilliant success in his substantial and well-illustrated volume entitled *The Book of the Links*. It was a happy inspiration which led Mr. Sutton to conceive the idea of inviting a number of prominent experts in the various aspects of golf and golf links to join with him in this symposium on golf. The result is no less happy than the inspiration, and we predict with confidence that *The Book of the Links* will provide a wide circle of readers with both pleasure and instruction. The enthusiast will delight in such chapters as that contributed by Mr. Bernard Darwin on what may be called the august trivialities of the game. The normal golfer, the man in charge of the links, and those who take delight in the perfection of green swards, will find most pleasure in the articles which deal with the horticultural aspect of golf links. The authors of these latter chapters are to be congratulated no less than the editor on the excellence of their several contributions. Among these authors are A. D. Hall, F.R.S., who writes on the manuring of golf greens and courses; H. S. Colt, who contributes two chapters on the construction of new courses and on golf architecture; W. Kirkpatrick, who supplies a valuable essay on green keeping; an anonymous writer, the style of whose article on "The Vegetation of Golf Links" enables us to make a shrewd guess of the identity concealed by the signature "Golfing Botanist;" and M. H. F. Sutton, whose chapters on grasses and grass seeds and on the formation and maintenance of putting greens, &c., are among the most valuable of all. As we have said, each of these articles is excellent, and we could have wished to be able to notice them all. Lack of space, however, prevents us from doing more than making a passing mention of the striking bird's-eye view presented by "Golfing Botanist" in his description of the vegetation of golf links. Nor can we give the attention they deserve to the excellent chapters written by Mr. Colt on what may be described as the landscape gardening of links. Nevertheless, we are constrained to express our delight in learning that the stupid and ugly formality which used to be the ideal aimed at by so many golf architects is becoming a thing of the past. The primness of the pot bunker is giving place to the picturesqueness of the grass hazard, and the links of the future, thanks largely to Mr. Colt's influence, will look less like remains of Roman encampments and more like untouched landscape. Of the articles which demand fuller notice, that by Mr. Hall is altogether remarkable. None but a master, both of his subject and of expression, could have compressed within the narrow limits of the space allotted to him a luminous essay on the philosophy of manuring, together with a precise and thoroughly practical description of the uses of artificial manure on grass land.

Mr. Sutton's account of grasses and grass seeds is well and simply written, and contains a large amount of valuable information. Both the layman—whose knowledge of grasses is equal with that of Mr. Colt's fellow committee man, who thought that grasses are of two kinds, Rye grass and other grass—and also the experienced gardener will derive profit from a careful study of this article. The brief descriptions of the species employed in mixtures show how remarkably the various grasses differ from one another, and demonstrate that it is only by taking advantage of these differences that the putting greens and fairways of golf courses may be clothed with suitable herbage. One grass differs from another in habit and habitat, in rate of growth and time of flowering, in depth of root and extent of spreading, in resistance to drought and in toleration of shade and moisture, and in a hundred other ways. Moreover, each species of grass has a certain waywardness, and refuses, except in certain conditions and on certain soils, to behave in a perfect and normal manner. Even the perennial Rye grass refuses on certain soils to justify its name, and dies down every year or two. In other soils it grows so coarsely as to draw down upon it the scorn of golfers, and where it takes on this habit, though it may serve as a covering grass to give protection to the finer and more slow growing grasses, it must be allowed no place on the putting green. Facts, many and precious to green keepers and lawn makers, are to be found in these pages, and in taking leave of them we congratulate Mr. Martin Sutton on the admirable manner in which the third generation of that name has sustained the reputation of the first as an authority on the difficult subject of grasses. Mr. Kirkpatrick's essay, to which reference has been made, shows that the writer has profited by his long experience as green keeper at Rye. The essay is written with a simplicity and directness which will appeal to all practical men. It may even produce a beneficial effect on that bugbear of green keepers, the over-sure secretary or member of green committee who is prepared out of the inexhaustible fund of his inspired omniscience and in his leisure moments to advise the green keeper how to do his work. No better antidote could be found for this sort of poisonous self-confidence than Mr. Kirkpatrick's essay, and were it not that we are sure that he is far too tactful to adopt the suggestion, we would recommend him to prefix his essay with Oliver Cromwell's famous rebuke to the over-confident—"I beseech you . . . to think that you may sometimes be mistaken."

The scheme of a symposium adopted by Mr. Sutton is adapted admirably for the purpose of *The Book of the Links*. What is generally a defect of this method—a certain amount of repetition and overlapping—is in the present instance by no means a defect but rather an advantage, for it is well to hear the opinion of several authorities on the vexed and difficult problems connected with the establishment of proper grasses on the fairways, tees, and putting greens of links.

Supplementary Illustration. — Amongst the numerous kinds of aquatic plants in the Water-Lily house at Kew Gardens the most conspicuous is Typhonodorum Lindleyanum, which belongs to the natural order Aroidæ. The plants which are shown in the Supplementary Illustration are growing in a large bed of rich loam and cow manure beneath the water, and are only 2½ years old, having been raised from seed produced by a plant obtained from the Botanical Gardens, Dahlem, in 1905. The plant on the left-hand side flowered when two years old, by which time it was 10 feet high to the tips of the centre leaves, which at first are almost erect. From a distance it greatly resembles Musa Cavendishii. The large, stout, stem-like structure which supports the leaves is formed of the sheathing leaf bases, exactly the same as in the Banana. The stem proper is only 6 inches or a foot high, and conical in shape. The leaf blades are from 3 to 4 feet long, and nearly 2 feet broad. They are broadly ovate, acute, with a sagittate base. The upper surface of the leaf is of a rich, dark-green colour, and there are prominent veins on the underside, which is dull green. The margins are wavy. The petiole is stout, terete in the upper part, the long sheath being carried up to within a few inches of the leaf base. The false stem formed by the sheathing leaf stalks is about 10 inches in diameter, the upper part green, striped with dull violet, and the lower part is covered with the brown remains of the older leaves. The peduncle is a foot or 15 inches long, stout, terete and green. The spathe is 18 to 24 inches long, erect, lanceolate, arching at the tip, and of primrose-yellow colour. The lower part is saccate; the upper part reflexed. The spadix is slightly shorter than the spathe, erect, the upper sterile portion being bright orange-yellow, and some 8 or 9 inches long. The basal portion of the spadix consists, for some 2 or 3 inches, of female flowers, and then follows an inch or so of neuter flowers, and above this are the male blossoms. After fertilisation the peduncle becomes pendulous, and the upper part of the spathe falls away, but the lower saccate portion surrounding the female flowers persists, closes tightly around the developing seeds, and becomes filled with mucilage. The seeds are closely packed together, broadly ovate in outline, and 1 to 2 inches long when mature. They possess the unusual character of germinating on the plant, a large amount of the endosperm being used up in the formation of a roundish mass of tissue long before germination takes place. This tissue disappears at quite an early stage in the development of the young plant. The genus is monotypic, the solitary species growing in swamps and other wet places in Madagascar. Under cultivation the plant grows luxuriantly, when planted a few inches deep in water, and kept at a temperature of 70° F. When bearing three or four of its large primrose-yellow spathes it is a very interesting plant. The species is well figured in the *Botanical Magazine*, tab. 8307, but in the accompanying description it is incorrectly described as a shrub!

Royal Horticultural Society.—The next meeting of the Royal Horticultural Society will take place on Tuesday, the 10th inst. At 3 o'clock a lecture on Cape Pelargoniums will be delivered by Miss Troyte Bullock.

American Embargo on Potatos.—Mr. Wilson, U.S.A. Secretary for Agriculture, has announced his intention to prohibit, from September 16, the importation of Potatos from Newfoundland, St. Pierre and Miquelon, England, Scotland and Ireland, Germany and Australia, on account of the wart disease.

National Vegetable Society's Show.—The annual exhibition of the National Vegetable Society will be held in the Clarendon Hall, Watford, on Wednesday, October 2. Prizes of the value of nearly £200 are offered in the various classes. Entries close on the 23rd inst. Copies of the schedule and full particulars concerning the show may be obtained from the hon. secretary, Mr. E. G. Quick, Kelmscott, Lockett Road, Wealdstone, Middlesex.

Autumn Rose Show.—The National Rose Society's autumn exhibition will be held in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, September 12. There is promise of a magnificent display of autumn-flowering Roses, which are by far the best and most satisfactory Roses to grow, and those that have made the greatest advances in recent years. Full particulars may be obtained from the hon. secretary, Mr. Edward Mawley, Rosebank, Berkhamsted, Hertfordshire.

Flowers in Season.—A number of hardy Heaths have been sent us by Dr. MacWatt, Morelands, Duns, including Erica cinerea and its variety alba, E. ciliaris, E. vagaris and Calluna vulgaris in many varieties. In a note which accompanied the flowers, Dr. MacWatt refers to the value of hardy Heaths for the border, "seeing they are so easily grown in any good garden soil, and may be had in flower practically throughout the year." The box also contained a fruit of Podophyllum Emodii and flowers of the double Primrose. A new dwarf decorative Dahlia named "Marianne" has been sent us by Messrs. Dobbie & Co., who state that it is not only a new variety but it represents a new and in every respect a desirable type. The plants are from 18 to 20 inches in diameter and about 2 feet tall to the top of the flowers. The blossoms are rather loosely formed, of the decorative type, about 4 inches in diameter, and of a distinct buff-orange colour. In any stage, when quite young or full grown, they are charming as cut flowers. They are produced on wiry stems of good length, and are carried quite upright. With a range of bright colours in this new type, we venture to predict a greatly-increased interest in Dahlias.

The Food of the Bullfinch.—That the increasing numbers of Bullfinches are a serious nuisance to fruit growers, few will be inclined to doubt; nevertheless, in these days of law and order, no individual may be condemned unless the evidence is overwhelmingly conclusive. Hence Mr. Walter E. Collinge has undertaken to collect the necessary evidence, with the result that out of the bird's own mouth—or stomach—it is judged and found guilty. The précis of the evidence is published by Mr. Collinge in the *Journal of Economic Biology* (June, 1912). It is based on an examination of the contents of the stomachs of 484 birds, and demonstrates that during 5 months of the year the Bullfinch feeds largely on fruit-buds and young fruits. Nor does there appear to be much to be said in favour of the defendant. It is true that the Bullfinch devours the seeds of certain weeds, but even this Mr. Collinge will not allow to count as a mitigatory fact, for the bird helps materially to spread the weeds. Finally, and worst in the catalogue of the Bullfinch's misdemeanours is the notorious fact that this bad bird glories in his destructive naughtiness. He not only devours the buds of Plums, Currants, Gooseberries, &c., but wantonly tears off more fruit-buds than he can eat. The indictment appears to be complete, and we fear that, notwithstanding his charming appearance, measures must be taken to reduce the numbers of this aggressive bird.

Mr. Forrest's Chinese Plants. — Notes from the Royal Botanic Garden, Edinburgh, for July, 1912, contain the numerical catalogue of all the plants collected by Mr. G. Forrest during his first exploration of Yunnan and Eastern Tibet in the years 1904, 1905, and 1906. The catalogue is the result of the labour of Professor Diels, of Marburg, who has undertaken the task of naming Mr. Forrest's plants and of describing new species. The catalogue contains 1120 numbers.

The Ubiquitous Aphis.—Mr. F. V. Theobald has issued a pamphlet naming 69 species of the family Aphididæ found in or near Hastings, and he hopes that the publication of the list will stimulate the collecting of these insects in the district, in which case he expects that many more species will be added. With the list a leaflet has been issued describing a new Strawberry aphis, named by him *Myzus fragariæ*, discovered at Hounslow in Middlesex, and Rudgwick in Sussex.

Clearing Land in Western Washington.—The attention of the Bureau of Plant Industry, U.S.A., is directed in *Bulletin* No. 239 to the problem presented by the "logged-off" lands of Western Washington. These lands represent sometime forests, left derelict after the operation of the lumberman. The latter strips off the timber from the forest land, and leaves the stumps standing, with the result that the land can only be brought under cultivation at the expense of considerable time and money. Thus it is that in a State which is increasing in population at a rapid rate there is a large area of land so thickly studded with "stumps, snags, and trees unfit for lumber" that it remains out of cultivation. Recognising the lack of economy in a system which, on the one hand, causes utilisable land to lie idle, and which on the other requires the importation of vast quantities of farm produce, the Bureau of Plant Industry has made a careful examination of the problem of clearing the "logged-off" lands and of bringing them into cultivation. It finds that the expense of clearing is so considerable, averaging about £40 per acre, that it cannot be undertaken by the poor settler, and the opinion is expressed at the conclusion of the *Bulletin* that the work of reclaiming this land ought to be done on a large scale, at a small profit, for the public good. Readers in this country will find the *Bulletin* of considerable value, owing to the fact that it goes with thoroughness into the question of methods of clearing land of tree-stumps. Among the methods which were tested are the char-pitting method, slow burning with the aid of a blowing machine, blasting by powder, and hauling the stumps by means of a new type of donkey engine. Where the soil is favourable the char-pitting or charcoaling method appears to be the most economical; but it can only be practised in places where the soil contains a considerable proportion of clay; this, of course, because sandy soils, when used as covering for the fire round the stump break up and run, and so put the fire out. In this method the bark is removed some time before the fire is lit, kindling is put around the stump, and covered with earth to a depth of 2 or 3 inches. The small opening left in order to allow of the lighting of the kindling is covered in about half an hour after the fire has been left. The burning stumps require attention for the first two or three days, the addition of more clay being necessary for covering in the stump. The success of the method depends also on the amount of water in the wood of the stump. The Firs are readily destroyed, but Cedars, of which the roots are wetter, are less amenable to the treatment.

NURSERY NOTES.

BEGONIAS AT BATH.

FROM the railway station at Bath to the foot of Twerton Hill is a short ride on the tramcar. Leaving the car and passing through a short street one comes to the bottom of Twerton Hill. To the top, where Messrs. Blackmore & Langdon's nurseries are situated, it is a continuous ascent. In many of the cottage gardens which line the roadway are to be seen Begonias—excellent varieties thoroughly well grown. It is only about 10 years since Mr. Blackmore and Mr. Langdon entered into partnership, but what has been done in this short time is remarkable. Messrs. Blackmore & Langdon have made a strong position for themselves by concentrating their efforts on the cultivation of one flower. At all the great exhibitions the open with 100,000 seedlings. Two beds of scarlet double seedlings are remarkably effective, quite a number of the plants giving flowers equal to William Marshall. For many months each summer these beds are one mass of brilliant colour, and the many visitors in September and even in October express their wonder and delight at the brilliant show which the flowers present.

The named varieties are for the most part grown under glass, and one secret of their fine condition is that at no time of their growth are they forced in any way. Mr. Langdon believes in slow growth, because the sturdier the plants, the finer is the display of flowers. He is also a strong believer in the practice of picking off all flower-buds as they appear until the plants are well established. Twelve of the finest doubles in flower at the time of our visit last autumn were Duchess of Cornis dwarf and stocky, and the flowers, which are of good form and medium in size, are produced in great profusion. The colours embrace crimson, salmon, pink, scarlet, white and yellow—three of the very best being Argus (bright scarlet), Hilda (deep salmon), and Marquis of Stafford (deep crimson). These formed perfect pictures in their respective beds, the height of the plants to the top of the flowers being about 15 inches. A class of Begonias which was most charming was that for hanging baskets. Nothing is more effective in suitable situations than this type of Begonia—graceful in form and attractive in colouring. One of the varieties, named Fleur de Chrysantheme, is a Continental introduction. The flowers are a lovely salmon-pink shade, and the foliage is a bright vivid green. Carminia is a carmine-red. Mrs. Bilkey is salmon-orange, and a novelty not yet sent out is Golden Shower.

FIG. 90.—BEGONIAS AT TWERTON HILL NURSERY, BATH.

each year, from the Temple onwards, their collections of Begonias are a feature.

What has been the secret of such a rapid and certain success? It is not only Mr. Langdon's 30 years' practical experience, but it is that experience backed by Mr. Blackmore's keen commercial instinct; for to-day the latter quality is as essential as the former to success in nursery work.

Beside working incessantly to perfect the types already in commerce, Messrs. Blackmore & Langdon work for new types, believing that novelties contribute largely to keep up the interest in any flower. In the ordinary single and double forms every effort has been made to obtain varieties which persistently give good flowers on erect stiff stems. Thousands of crosses have been made and records carefully kept. It generally takes five years to work up a sufficiently large stock from a seedling before the variety can be offered for sale. Three acres are planted each season in wall, dark crimson, of fine form, A.M., R.H.S.; Kennerley Rumford, rich apricot; Mrs. W. Weston, Indian yellow; Rose Queen, rich bright rose, slightly serrated petals, A.M., R.H.S.; Empress Marie, Camellia shaped, white, A.M., R.H.S.; Pink Pearl, lovely salmon-pink, A.M., R.H.S.; Winsome Partner, reddish-salmon; Millicent, flesh-pink, A.M., R.H.S.; Mrs. J. Booth, pale salmon blush, rose-like form, grand habit and foliage; Purity, pure white, with frilled petals, A.M., R.H.S.; William Marshall, a beautiful scarlet flower; and Yellow Hammer, pure clear yellow on long stiff stems.

Messrs. Blackmore & Langdon do not offer single varieties to name. They make selections and grade them from the finest exhibition sorts to the different classes for beddings. Crested and frilled singles are treated in the same way.

Special attention is given to double-flowered plants for bedding, and about two dozen sorts are grown in large quantities in long beds. The type

Though Begonias are the leading feature of these splendidly managed nurseries, a number of other subjects are grown well—Cannas, Carnations, Delphiniums, Violas, and Violets being much in evidence. *Traveller.*

NOTES ON THE HISTORY OF THE JARGONELLE.

THE name "Jargonelle" has been stated by Ménage and Duchat, who have been freely copied in England, to be derived ultimately from græcum; and Merlet, unable or unwilling to raise damaging philological objections, identifies the well-known Pear with the Pyrus tarentinum of Cato Major, Columella and Celsus, the Numidianum græcum of Pliny and the Græcum of Macrobius. This view cannot be held in the light of modern knowledge. Professor Skeat follows Littré (who was no doubt helped by personal

acquaintance with the grittiness of the French Jargonelle), and derives the word from jargon, a yellow diamond or small stone, "perhaps from Persian zargūn, gold-coloured." This, however, does not quite exhaust plausible conjecture. The French word jargon, which occurs in English with identical form and meaning, is of quite uncertain origin; all that we know about it being that it occurs in Old French. I suggest that it is this word, and not the descendant of the Persian zargūn, which forms part of the name; and that it was applied to a Pear introduced from a country where "jargon" was spoken, which country was probably Italy.

It has long been recognized that the Jargonelle of old French writers was not the Pear we know to-day. Hogg and other authorities agree that our variety is the French Grosse Cuisse Madame; but the adjective "grosse" seems to be a late addition, almost certainly applied within the last 150 years to an improved form of the Cuisse Madame, to which we have abundant references far back into history. We may, I think, safely assume that in tracing this Pear we are also researching into the origin of the modern Jargonelle.

Jacques Dalechamps (1513-1588) imagines the Pirum onychinum of Pliny (*Hist. Nat.* XV, 16) to be the Cuisse Madame, and Hordouin, a century later, adopted his view. With regard to the speculations of Merlet, it is enough to say that the "Tarentine" sort is definitely stated by Celsus (III 24, IV 19) to be a keeping Pear. It is not, of course, impossible that Dalechamps may be right; but his statement is only an interesting guess. There is no doubt that the Italian sorts were introduced by ecclesiastics into Northern Europe, and there rapidly improved. We have a list, dated 812, of Charlemagne's Pear trees, but no definite names, the sorts being merely classified. In *The Care of Gardens*, a poem by the monk-horticulturist Walahfrid Strabo (d. 849), he tells us he picked in July "Volemian" Pears, each of which quite filled his hand. They may have been Cuisse Madame.

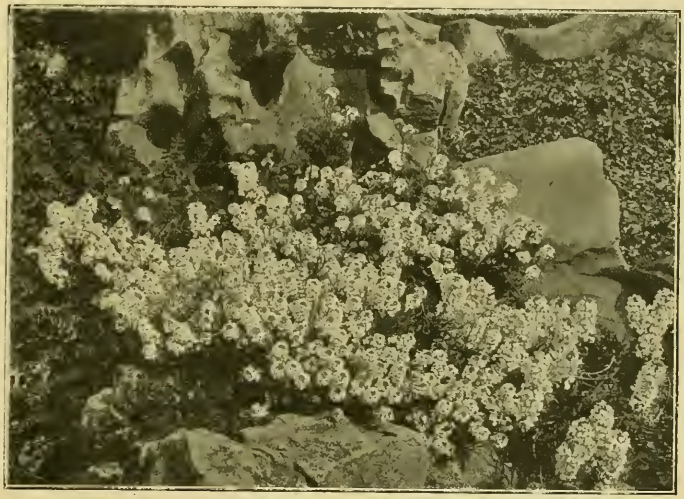
Reverting for a moment to Skeat's derivation of the name, it is interesting to note the mention of "caloel" Pears in a late 13th century account of the manors of the Earl of Lincoln. The name appears frequently elsewhere as cailloel or callaewell, evidently the French caillou; but this fact does not help Skeat's theory in the least, since Quintiorge (17th century) mentions the Pear as distinct from either Cuisse Madame or Jargonelle.

John Parkinson (1629) speaks of "Pear Gergonell." This is the first definitely English mention I have been able to find; the honour is ascribed by Hogg to Switzer, a century later. The fruit referred to was probably the Pear called by that name in France, not the Jargonelle we know; the same Pear, indeed, which is included by Quintiorge in a list of those not worth planting. Our form was, according to Richard Bradley (*A General Treatise of Husbandry and Gardening*, ii, 63), called in France "La Suprême, i.e., the Supreme, or Poire de Figue, or Fig-Pear, or Grosse Jargonelle, i.e., Great Jargonelle, or Giberish Pear. It is a large, long Pear of a reddish-yellow; its juice very sweet, and not subject to be stony; it must not be overripe for eating, for too much ripeness makes it mealy." From the correctness of the French and comparison with Bradley's other efforts in that language, I imagine the names to have been copied from some French work. It will be noticed that he thinks it necessary to translate the name Jargonelle, which he would scarcely have done had it been very familiar in his day. In this connection it is interesting to note that Miller does not mention the name; nor does Mortimer include it in the somewhat long list in his *Whole Art of Husbandry*, 1707. The adjective grosse would seem to indicate an improvement of an older kind; the Suprême may have found its way to England, and from its general similarity in shape and date of ripening have become confused with the Cuisse Madame, then known here as "Kiss Madam." In this case minor distinctions of colour and size possibly yielded to wider and more constant points of resemblance.

Sydney H. Kenwood, B.A.

ÆTHIONEMA AMŒNUM.

The genus Æthionema consists of about 40 species of somewhat low-growing plants, native chiefly of the Orient, although one or two are found in Southern Europe. Many of them are of great beauty, very free-flowering, and well suited for dry, sunny positions in the rock garden. Perhaps the best-known member of the genus in cultivation is Æ. grandiflorum, one of the best perennial kinds. It forms a bush 1 foot or more in height, and during the summer months gives a profusion of rich, rose-coloured flowers in long racemes. Another well-known species is the beautiful little Lebanon Candytuft, Æ. cordifolium, one of the dwarfest of the family, with fleshy, glaucous leaves, and dense, flattened racemes of delicate pink flowers. The Armenian Æ. pulchellum is probably one of the freest-flowering species, growing about 8 inches high, with glaucous leaves and flowers, also of a pink shade. Æ. amœnum (see fig. 91) is a new species, also from Armenia. It is similar in habit to Æ. pulchellum, but has rather longer foliage, and much larger flowers of pale-pink. Commencing in April, its racemes of flowers are produced throughout May and June, making it a very attractive plant for a sunny ledge. Except in the case of the annual kinds, seeds are not produced very freely, but all the perennial species may be increased by means of cuttings inserted in the summer as soon as the flowering season is over and the plants commence to form fresh shoots. The cuttings should be inserted in pots in sandy soil, and kept in a close frame till they are rooted. Thorough drainage is essential for all the members of this family, otherwise they frequently die off in the winter. Æ. Kotschyi is another new species. The plant is only an inch or two high, but very free-flowering, and is well worth growing. *W. I.*



[*Photograph by Wyndham Fitzherbert.*

Fig. 91.—Æthionema amœnum on the rock-garden at Kew: flowers pale-pink.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(*See Tables and Summaries, ante, pp. 66-71.*)

(*Continued from p. 173.*)

4, MIDLAND COUNTIES.

Hertfordshire.—The late frosts destroyed the prospects of good crops of stone fruits both on the walls and in the open, except in a very few cases where there was special shelter or protection by large trees. Our wall trees were protected with a double or treble thickness of netting, yet the frost did harm. Pears were the least affected. The drought of May and early June ruined the Strawberry crop; there was an abundance of bloom, and we protected the plants from frost, yet the fruits failed to swell. Our soil is of a very heavy nature, overlying a thick bed of tenacious clay. The garden is on the flat, and exposed to the south and south-west. *E. F. Hazelton, North Mymms Gardens, Hatfield.*

5, SOUTHERN COUNTIES.

Sussex.—A splendid show of bloom on all fruit trees was completely spoilt by the excessive rainfall of March (4.41 inches) and the heat of April, when only 0.03 inch of rain fell. We have only half crops of Apples, Apricots, Peaches and Plums. Small fruits were plentiful and good, with the exception of Strawberries, which ripened very early and were soon over. Our best results were obtained from runners one year planted. We had little or no frost during the blooming season. Our soil is a strong loam over clay. *Thos. Tyson, Wykehurst Park Gardens, Haywards Heath.*

—— Our soil varies from lightish loam over sand to somewhat heavy loam over a mixed clay and sand subsoil. Apples have been badly injured by the worst attack of aphis ever known. The setting of fruit was prevented to a great extent by the spring drought, which severely damaged late varieties, and a very large proportion of the fruit has since been spoilt by attacks of aphis. Further, there is extensive dropping of the fruit of some varieties, and others showed hardly any blossom. The yield of late Apples is the worst I have ever had. Pears are generally the best crop ever grown here, although some varieties were badly damaged by the midge maggot. Some varieties of Plums were devoid, or almost devoid, of blossom. I have good crops of Czar, Victoria, and two or

three dessert sorts, and very light ones of all other varieties. Gooseberries and Red and Black Currants were very full crops and the fruit was very fine. Strawberries had not recovered from the effect of the drought of 1911. Raspberries fruited well. There is a full crop of nuts. *William E. Bear, Hailsham.*

—— The Apple crop is an erratic one, but Pears are the best crops we have ever had. The trees are grown in a field with no shelter. The soil is of a heavy, tenacious nature. *W. Goaring, Agricultural and Horticultural College, Uckfield.*

—— Hardy fruits all round are very good this season, Strawberries being the worst crop. The drought of last season and of April this year is responsible for the failure of the Strawberry crop: Royal Sovereign and Givon's Late Prolific gave the best results. Apples are a fine crop, but not regular, some varieties being destitute of fruit, whilst others required an extra amount of thinning. Fortunately the better varieties are cropping well, if we except Cox's Orange Pippin, which is scarce in places. Pears are a fine crop of splendid fruits. Cherries were excellent, though not regular, but of very fine quality. Gooseberries and Currants were immense crops and of fine quality. Raspberries also were very good. Peaches and Nectarines are only average crops, but promise well. Much labour was entailed in keeping the trees clean in the early stages. Cobnuts and Filberts are very plentiful; Walnuts are not so numerous. The soil is a heavy clay. *W. A. Cook, Leonardslee Gardens, Horsham.*

—— Generally speaking the fruit crops are very satisfactory, the only exception being Strawberries, which, in my opinion, failed through the effects of the continued drought of last season, though in this district it was not so bad, as the soil is in most cases of a heavy, retentive nature. There is no doubt but that this season has proved the value of deep and thorough cultivation for Strawberries. Pears, Plums, Nuts, and the majority of small fruits are very satisfactory, and these crops have more than compensated for the loss of the Strawberry crop. *W. J. Langridge, Ote Hall Gardens, Burgess Hill.*

WILTSHIRE.—Pears are extra good, the result of dressing the ground under the trees in winter for the Pear midge, which was increasing rapidly. The early blossoms of Strawberries were destroyed by frost and drought in April and May, consequently we had a very poor crop. Currants, Raspberries and Gooseberries are extra good. Our soil is shallow, rather heavy, and overlies a cold, yellow clay. *Henry Gandy, Longleat Gardens, Warminster.*

—— Nearly all fruit crops in these gardens are poor. The garden slopes due north, and we suffered very much from frosts on April 7 and 8, and more so on April 23 and 24, when 9° and 10° were registered. The soil is a medium to heavy loam on a subsoil of chalk. Potatos in the district are very badly attacked with disease, and in many instances the foliage is already entirely destroyed. *A. J. Morris, Compton Bassett Gardens, Calne.*

7, ENGLAND, N.W.

CUMBERLAND.—In spring the Apple trees promised to furnish a good crop as blossom was abundant, but from various causes, such as spring frosts and dry weather, the fruits failed to set. This applies to Apples on heavy, light and lime soils. In several districts I noticed that the unopened flower-heads of Bramley's Seedling Apples were completely frozen, whilst other varieties took no harm. The noted Kendal Damsons, which are grown on the limestone in Lyth, promise to be abundant. Gooseberries are very abundant and of good quality. Black Currants were severely damaged by attacks of aphis. Strawberries were unsatisfactory owing to the wet weather. *W. B. Little, Carlisle.*

LANCASHIRE.—The general prospects of the fruit crops were good in the spring, but, owing to late frosts and severe attacks of insect pests, the crops generally are small. The dry weather in April checked the development of all fruits considerably. The soil in Lancashire is of a very varied character, and on the east side it is mainly of a cold, clayey nature. *R. F. Howarth, County Offices, Preston.*

WESTMORELAND.—Pears and Plums flowered abundantly, and some varieties of Pears are heavily fruited, whilst Victoria Plums are a heavy crop. Apples are very disappointing after last year's brilliant summer. Black Currants and Raspberries were plentiful and clean, but Strawberries were very poor, due to continuous rains for six weeks. *W. A. Miller, Underley Gardens, Kirkby Lonsdale.*

—— The Apple crop at one time looked most promising, the trees having an abundance of bloom, but cold winds and low temperatures experienced at the end of April and early in May, as well as the Codlin moth, were the principal causes of the failure. Black Currants are very thin and poor, being the worst crop we have had for years; the bushes were badly infested with insects during the time of flowering. Strawberries were a good crop of fine fruits. Raspberries also were a full crop, as well as Red Currants and Gooseberries. Plums on walls, especially the variety Victoria, and Gages are heavily cropped, but standards and bush trees in the open are a failure. Morello Cherries were a full crop. Loganberries are a good and useful crop. Our soil is a heavy loam resting on clay. *F. Clarke, Lowther Castle Gardens.*

—— We had good prospects for abundant crops of all fruits when the trees were in bloom. The trees also were free from blight. There was not much frost in spring, save in March when Apricots were in bloom, consequently this crop is almost a failure. In May we had heavy showers of rain and hail which thinned the fruits very much. The Apple crop varies; King of the Pippins, Lane's Prince Albert, and Keswick Codlin have full crops, other sorts have about half a crop, and many sorts have none. Small fruit is not of the best quality with the exception of Raspberries, the variety Superlative being very fine. Black Currants were a light crop. Our soil is on the limestone gravel. *J. Moorhouse, Dalton Hall, Burton.*

8, ENGLAND, S.W.

CORNWALL.—The hardy fruit crops are very disappointing. Apples, with a few exceptions, are a failure. Plums and Morello Cherries are thin. Peaches are poor, the variety Dymond being the best. Pears are the only crop that is at all satisfactory; most varieties are very good, and the fruits promise to be of good size. Bush fruits are more satisfactory, with the exception of Red Currants. Strawberries were a poor crop owing to the drought of last summer; the plants are small, and the continued rains early in the season caused many of the berries to rot. *W. Andrews, Tregothnan, Truro.*

—— Apples in this district are an average crop, and probably would have been better but for the fact that when the trees were in blossom we experienced strong winds varying from south-east to south, accompanied with sea fog, which is very detrimental to the foliage and fruit (of Apples especially), and causes many fruits to become deformed. The Codlin moth (Carpocaspa pomonella) is very prevalent this season, and has caused much damage. It should be the duty of every grower to see that all small fruits are picked up and burnt, as thereby thousands of the larvæ are destroyed. The Government should do something to assist in the destruction of the moth early in the season, and see that it is properly carried out in every orchard throughout the country. The majority of Pears dropped when of a good size; Pears trees are more healthy than Apples. Respecting small fruit, Gooseberries were a splendid crop and of good size. Raspberries were an average crop; the young canes grew well and healthily, but the berries were not of good flavour. Currants of all kinds were fair crops of good fruit. Strawberries were an average crop, the flavour being good, and size and colour excellent. The plants are doing well. The soil in this district varies; some places have rich loam with a fair amount of drainage, while others have decomposed granite. The soil generally is of good quality. *G. H. Maddern, Trewidden, Buryas Bridge.*

—— The fruit crops in this district are variable, especially the Apple crop. In these gardens we have a fair crop of these fruits, whilst in others they are very thin. Many of the trees were badly attacked by aphis early in April and May, and on these the fruit is small and deformed, but since the change in the weather the trees are making a more healthy growth. The following varieties are carrying good crops: Lord Grosvenor, Grantonian, Bismarck, Bramley's Seedling, Small's Admirable, Sandringham, Stone's (syn. Loddington), White Transparent, Early Victoria, Lady Sudeley, Jas. Grieve, and Worcester Pearmain. Peaches are about average, also Pears. Williams' Bon Chrétien Pears are more numerous than usual. Plums, with the exception of Victoria, are light crops. Strawberries were rather below the average, many of the yearling plants being barren, owing I think to the heat and drought of the previous year. Gooseberries and Currants were good crops. Raspberries were extra good, both in quantity and quality. The soil here is light, resting on a slatey subsoil. *W. Brown, Prideaux Place Gardens, Padstow, Cornwall.*

DEVONSHIRE.—With the exception of Strawberries (which suffered from drought during April and early May) the fruit crops in this district are good. Plums are very satisfactory. The Apple orchards were a record as regards blossom; the fruits are clean and are swelling freely. The soil is mostly of a sandy nature yet a good loam, resting on the old red sandstone so prevalent in Devonshire. *James Mayne, Bicton Gardens, Budleigh Salterton.*

GLOUCESTERSHIRE.—The Apple crop in these gardens is under the average; numbers of trees are bare of fruit. Pears are better than for several years past, whilst Gooseberries were abundant and good. Raspberries also were very satisfactory, but Red Currants were deficient. Strawberries suffered from wet weather, and many berries rotted on the ground, especially those of the variety Royal Sovereign. The rainfall for June was 5.11 inches, which fell on 24 days. The soil of the kitchen garden is a friable loam over the old red sandstone. Cider fruits are planted in clay land. Soils near the Severn generally produce good crops of these fruits, which make excellent cider. *John Banting, Tortworth Gardens, Falfield.*

—— In some districts good crops of Apples are recorded, but in others they are light. Blenheim Pippin, a favourite orchard Apple in Gloucestershire, is yielding well on trees that cropped lightly last year. Bad attacks of insect pests, particularly the Apple blossom weevil, spoiled the prospects in many orchards. Cider Apples appear to be an average crop. Pears are very good. Perry Pears which bore lightly last year will be an abundant crop. Plums, particularly the variety Victoria, were damaged by frost in some districts, but other varieties and other localities escaped injury and an average crop of stone fruit is expected. Gooseberries and Currants were very plentiful; Black Currants being good in both gardens and plantations, and the bushes free from "big bud." American Gooseberry-mildew does not appear to be spreading much; only one or two fresh cases are reported this season. Strawberries were disappointing, bad weather being chiefly responsible for light crops and poor flavour. Prices, however, have been good. *C. H. Hollingworth, Gloucester.*

—— The fruit crops in this district are fairly satisfactory. Pears are above the average, whilst Apples are a fair crop. Cherries were above the average, and of good quality. Apricots are very scarce. Plums are carrying good crops of fruit, and the trees are very free from blight. Small fruits were much above the average, Raspberries being especially abundant. Strawberries were very good in these gardens, whilst in the neighbourhood the Strawberry crop was a failure. *F. Walton, Stanley Park Gardens, Stroud.*

—— Some Apple trees are bearing good crops, but the majority of the trees are bare. Lane's Prince Albert, Stirling Castle, and Worcester Pearmain are the three best-fruited varieties. Pears are an abundant crop, and it has been necessary in many instances to thin them freely. Peaches and Nectarines are, up to the present, bearing good crops. Bush fruits are also good, but the Strawberry crop was the worst I have experienced for years past. Givon's Late Prolific is still our best late sort. Apricots are bad, although I never saw the trees more promising; but the late spring frosts crippled the blooms. Plums are abundant, particularly on wall trees. *Arthur Chapman, Westonbirt, Tetbury.*

(To be continued.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

RAINFALL AT DAVENHAM GARDENS, MALVERN.—The rainfall for August in these gardens is the heaviest on record. Rain fell on 27 days to the total depth of 8.73 inches. The heaviest fall in 24 hours ending at 9 a.m. occurred on the 6th ult., when 1.04 inch was recorded. On the 25th and 26th the amounts were 0.97 inch and 0.84 inch respectively. *C. A. Bayford, Davenham Gardens.*

THE LATE ALEXANDER DEAN. — In the obituary notice of this eminent florist it is said that he was "especially severe on the man of science," &c. Personally, I never found him so. I remember discussing with him the advantages of self-fertilisation over continued crossing. He told me that the latter ended in failure to produce seed, and that he lost a whole stock of Primulas in consequence. I put the same question to Mr. H. B. Smith, of Ealing, as to Cyclamens. He corroborated Dean, and added that he always kept a stock of the most "weedy" Cyclamens, as they were so abundantly self-fertile. From these, by crossing them, he kept up a constant supply of the best kind. *George Henslow.*

VIOLA "EDINA."—The query is raised in the note on Viola trials (see p. 177) as to whether the variety Edina is earlier in blooming than Archibald Grant. It is earlier by two or three weeks. Archibald Grant is one of the latest blooming Violas, and that quality has always been, in our consideration, an objection to an otherwise fine flower. *Dobbie & Co., Edinburgh.*

THE BEARING OF APPLES (see p. 156).—The varieties of Apples vary in respect to their cropping amazingly. Some, such as Warner's King, seldom fail to crop, whilst others, even when thinned regularly year by year, are intermittent croppers, and others, whether thinned or not, consistently produce a crop. It is clear, therefore, that no dependence can be put upon figures which are confined to one variety. Wealthy, which fails altogether here, is a variety which from the data should be discarded. There are, too, the local proclivities of varieties. I do not mean local in the sense of districts, because a variety may be a success or a failure in gardens a mile apart, so that absolute dependence cannot be placed upon Apple trials, just as one cannot say because a Strawberry succeeds in one garden it will be equally successful throughout a county or a parish. There is yet another determining factor, the cultivator. Just as a nurse has by her good or bad management an influence which lasts the life of her charges, so the grower, by the treatment of fruit trees, influences their future, and this personal equation will always remain. Though I have no dislike to a large Apple, I imagine the preference for large fruits has in many cases been carried to extremes. Than the small Cockpit there is, in our collection, no more delicious Apple for stewing. The tree hardly ever fails to bear a large crop, and it is singularly free from Apple afflictions; yet how many if planting a garden would think of including this variety? Northern Greening is almost as fine in quality, though possessed of similar disabilities. Still, though I question the wisdom of discarding old and tried sorts, I have to confess to introducing novelties which on trial may prove unworthy, and the place for this work is the home garden. While on this subject the question of colour crops up. I have never seen deeper-coloured fruits of Apricots than are ripening this year, and such Apples as King of the Pippins are showing colour quite as intense as last season, when the high colour was attributed to the great amount of sunshine. Apricots for a few years, like the Apples in question, are growing in grass, or, in other words, the borders are in grass with Narcissus; can it therefore be that the grass is the sole predisposing cause of deep colouring, or is it the excessive amount of rain? The value of water, and especially manure water, as an agent of colouring may be proved from the behaviour of black Grapes; a light crop if deprived of a sufficiency of water at the roots will fail to colour, while a heavy crop, if freely watered, will colour deeply. Here, too, the question of locality comes in, because a heavy soil will require much less water than a light soil and give perhaps better results; nevertheless, the fact remains that water with sufficient manure is essential for the production of colour. *R. P. Brotherston, Tyninghame Gardens, Prestonkirk.*

REVERSION IN BLACK CURRANTS (see pp. 122, 138, 159).—I was interested in Mr. E. A. Bunyard's letter on this subject, but I fear I cannot follow his conclusions in all points. Nevertheless this is a subject of such importance to growers that any facts, or even suggestions bearing upon it, must be welcome. I quite agree with his points (1) I have found it amongst one-year cuttings and bushes of all ages, but only a very minute proportion. (2) It is not confined to one variety, though by far more frequent in Boskoop Giant than any other. (3) I cannot speak so confidently about, though in the trees I have personally examined there is no big bud present, either before or after this "reversion." (4) The plantation in question (about ¾ acre) had, in 1911, the second year from planting, some 12 or 15 reverted bushes, which were allowed to stand. This year quite 50 per cent. followed the behaviour of these 12 or 15 trees. The trees were not pruned last winter, and were only shortened when planted in 1909, so hard pruning is quite out of the question, and I think I may say that the shoots have not been injured. The trees under my observation bore a grand crop of fruit, for young bushes, last year, and gave every promise of cropping well again this season, but after an absence from home, I found on my return that the so-called reverted bushes had dropped every particle of fruit, and nothing but the stalks of the bunches remained. This occurred whilst the fruits were green. I thought at first that the long drought was the cause, but upon examination found that the bushes which had not "reverted" were carrying good crops, which came to perfection in due course. This is my first experience with trees planted out for market. But during 40 years of growing young stock I can never remember seeing trees go off in this way before, nor can my foreman, who is a good observer, and has been with us 62 years. I hear from market growers that no treatment they have tried has been successful in restoring their reverted trees to a normal condition. One grower has lost half his trees from this cause, but most of them say that their loss is 5 to 10 per cent. So far, all the cases reported have been of recent date, and the majority of bushes of the Boskoop Giant variety. As your paper is read by many of the leading market growers we should all be greatly interested if they would relate their experience of this subject through your columns. *A. H. Pearson, Lawdham.*

BOWKERIA GERARDIANA. — Your correspondent, Wyndham Fitzherbert, page 140, may rest assured that this plant is correctly said to have been cultivated at Messrs. Bull's nursery at Chelsea, 20 years ago. In the catalogue of Mr. William Bull for the year 1892 it is, under the name of Bowkeria triphylla, announced as a new plant with the following description:—"A handsome ornamental flowering plant, with lanceolate corrugated leaves, arranged in threes on reddish stems. The flowers are white, nearly an inch long, inflated and bi-labiate, suggesting Scrophularia, to which the genus is allied; these are borne in subterminal cymes, usually nine flowers on each cyme. The plant is a native of Natal, where it flowers in December, so that it will doubtless prove a very useful winter-flowering plant for the greenhouse. Price, half-a-guinea." The description, which is fairly accurate, was drawn up from dried specimens forwarded with the seeds about two years before the plants were distributed. Being of very easy propagation by means of cuttings, Mr. Bull had an extensive stock of it, but the demand was so small that it was gradually dropped. I question if a dozen plants were sold during the 10 years or so that it was kept in stock. They were given ordinary greenhouse treatment, and, as bushy plants in 5-inch pots, they used to flower freely in the summer. Another plant that your correspondent may be surprised to learn was at one time stocked by hundreds in the same nursery is the Chilian Nut (Guevina Avellana), which would be very difficult to obtain nowadays. *W. T.*

WEATHER AND MARKET GARDENERS.—Owing to the heavy rains the market gardens in this district are flooded and no work is possible. For four days we have not gathered any fruit for market, and the employees are absent. Corn is still uncut, and the fields are covered with water. Potato furrows are filled with water, and the outlook is hopeless. *Stephen Castle, Walpole St. Andrew's, Wisbech, August 27.*

HIGH COLOUR IN HARDY FRUITS. — Last autumn there was a very interesting controversy in these columns on the colour of hardy fruits in wet and dry seasons. Various theories were advanced by correspondents, but no decisive view was expressed. Surely after the record heat of last summer and the abnormal rainfall this season some definite conclusion may be arrived at. After having compared the fine fruit, both in this neighbourhood and that of North Devon with that of recent years, I consider that the coloration of fruit this year is equal to that of last. It would prove of great interest if gardeners and fruit growers would contribute to this journal their views, and so settle a problem which has hitherto remained obscure. Amongst the fruits here which particularly attract attention for brilliant colouring are Worcester Pearmain, Red Astrachan, Red Quarrenden, Beauty of Bath, Scarlet Nonpareil, Fearn's Seedling, Mère de Ménage, Bismarck and Lady Sudeley. Peaches and Nectarines have splendid colour, though they have not good flavour, owing no doubt to the continuous rains and the soddened cold condition of the soil. Grapes, under glass, have both good colour and flavour. Judging also from various reports of the leading shows, there is no apparent deficiency in the colour or quality of the fruit exhibited. This supports the theory that high colour is as pronounced in a wet as in a dry season. *N. Gilthorpe, Nynehead Court Gardens, Wellington, Somerset.*

SENECIO SMITHII.—I saw this plant at the end of July in the garden at Park House, Banffshire. It was in full flower on the bank of a brook, and formed a most striking and picturesque subject for such a position, growing about 3 feet high in the rough grass and weeds by the brook-side. Unlike the small figure of the whole plant in the *Bot. Mag.*, tab. 7531, it carries its corymbs of large, wite-rayed flowers on stout stems well above the foliage. The plant is a native of Tierra del Fuego and seems to like the cool, moist climate of Banffshire, but it would probably do well as a water-side plant further south. *Alfred O. Walker, F.L.S., Ulcombe Place, near Maidstone.*

SCOTLAND.

PERTHSHIRE FRUIT-GROWERS AND THE INSURANCE ACT.

By an order of the Scottish Insurance Commissioners, issued in June, fruit pickers were exempted from the operation of the Act, but persons who were insured persons, or were possessed of the exemption certificate to Irish migratory labourers were not so exempt, and the employers are liable for the contributions in the ordinary way. Objections to this order were lodged by Messrs. Keay & Hodge, Blairgowrie, on their own behalf and that of other fruit growers, and they asked that all fruit pickers should be exempted from the operation of the Act. An enquiry was held by Miss M. M. Paterson, one of the Commissioners, at Perth on August 29. A strong case was presented on behalf of the objectors, and Miss Paterson adjourned the enquiry, stating that the question would be fully gone into by the Commissioners, who, with the Joint Committee, might determine to continue it in some other district. *Correspondent.*

GARDENING APPOINTMENTS.

Mr. J. HOWES, for 12 years Gardener to WALTER COBB, Esq., Dulcote, Tunbridge Wells, as Gardener to WILLIAM THOMPSON, Esq., Walton Grange, Stone, Staffordshire.

Mr. H. F. WARREN, for the past 13 years Gardener to the late F. M. BURTON, Esq., Highfield, Gainsborough, Lincolnshire, as Gardener to WILLIAM ROSE, Esq., at the same place.

Mr. L. F. VESEY, for the past 12 months Gardener to Mr. C. J. BILLSON, Silchester House, Silchester, near Reading, as Gardener to Mr. BILLSON, at the Priory, Martyr Worthy, near Winchester.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

AUGUST 27.—A. W. Hill, Esq., M.A., in the Chair.

Sweet Peas from Mr. Dipnall.—Mr. ODELL reported as follows:—"The specimens submitted to the Committee were damaged by the 'Streak' disease, due to Thielavia basicola. Many of the leaves and parts of the stem had also patches of Botrytis cinerea growing on them. The roots were poorly developed, and showed signs of some check earlier in the season, probably caused by overwatering in the early summer. As a method of preventing the attack, deep and early-autumn cultivation of the soil intended for next season's crop of Sweet Peas is recommended; also a very moderate use of organic manure, thin seeding, and frequent use of the Dutch hue in place of watering during early droughts."

Epidendrum laterale.—Mr. O'BRIEN showed for Mr. NEAL, Penarth, a plant of Epidendrum laterale (Central America), and remarked that the inflorescence is produced on a rudimentary pseudo-bulb, as in E. Stamfordianum (probably the only similar case), a peculiarity that seems to show that the normal mode of flowering is from the base of the mature pseudo-bulb. A Botanical Certificate was awarded to this plant on the proposition of Mr. O'BRIEN.

Mummy Pea.—Mr. A. SUTTON showed a series of photographs illustrating several crosses with the so-called Mummy Pea, Pisum umbellatum.

Lily fasciated.—Mr. BOWLES presented a remarkable photograph of Lilium candidum showing a fasciated double form, a condition figured in Dr. MASTERS' *Teratology*.

Armeria: abnormal.—Mr. VAN DER WYRE sent specimens of Thrift with abnormal pollen and petals.

Variation.—Rev. GEO. HENSLOW wrote with reference to non-scented Musk, a condition due to the cold and wet weather. Mr. HENSLOW also drew attention to the tendency to variegation in Aspidistra when removed from a partly-shaded position to the full light of a conservatory.

Pear with axial growth.—Mr. OCKENDEN sent a Pear with elongated axis, showing the formation of three fruits, as a result of the elongation. Messrs. BUNYARD sent a drawing of a Pear fruit showing a similar elongation, resulting, however, in a tuft of leaves beyond the fruit.

ROYAL HORTICULTURAL OF IRELAND.

AUGUST 27.—The attendance at the autumn show of the above Society was much greater than usual, and the exhibits were so numerous that the capacity of the tents was taxed to the utmost. The chief features of the exhibition were the displays of Roses, Gladioli and the collection of vegetables shown by Mr. NATHANIEL HONE in the "Mackey" Challenge Cup class.

AMATEURS' CLASSES.

The 1st prize in the class for 12 stove and greenhouse flowering plants was won by the Right Hon. T. W. RUSSELL, M.P.

Alderman BEWLEY showed the best six Zonal Pelargoniums; 2nd, Mr. S. SODEN.

The best Fuchsias were shown by Mr. F. V. WESTBY; 2nd, Mr. S. SODEN.

In the class for four specimens of Coleus the 1st prize was awarded to Mr. GOODBODY; 2nd, Mr. WESTBY.

The Rev. H. KINGSMILL MOORE won the 1st prize for six British Ferns; the 2nd prize was awarded to the Right Hon. T. W. RUSSELL, M.P.

The challenge cup presented by Lord Ardilaun, and 1st prize in the class for 24 Cactus Dahlias was won by Mr. MEEHAN; 2nd, Mr. R. H. STUBBER.

Mr. R. J. C. MAUNSELL won the 1st prize in the class for 12 Cactus Dahlias.

Mrs. MEEHAN was the most successful exhibitor in the class for six vases of Cactus Dahlias; the best 24 Show varieties were shown by Mr. R. H. STUBBEN, who also won the 1st prize in the class for six vases of Pompon Dahlias, and for 24 blooms of double-flowered tuberous-rooted Begonias. Lady CLONBROCK showed the best 12 blooms of double-flowered, tuberous-rooted Begonias.

The 1st prize for 12 vases of China Asters was won by Mr. E. KELLY; 2nd, The Rt. Hon. T. W. RUSSELL, M.P.

There was a strong competition in the class for a collection of hardy cut flowers (excluding Sweet Williams and Antirrhinums), to be shown in vases on a space not exceeding 16 feet by 4 feet. The 1st prize was won by Captain LEWIS RIALL; 2nd, Mr. C. M. DOYNE; 3rd, Mr. KEITH.

Mrs. BEAUMONT NESBITT won the 1st prize in a strongly-contested class for 12 vases of annuals; 2nd, Dr. O'DONNEL BROWNE; 3rd, Colonel CLAUDE CANE.

The best 12 trusses of single Zonal Pelargoniums were shown by Judge BIRD; 2nd, Alderman BEWLEY, who won the 1st prize in the class for 12 double or semi-double trusses of Zonal Pelargoniums; 2nd, Mr. E. C. HARDMAN.

The Watson Challenge Cup, offered for the best 12 vases of Carnations or Picotees, which was won outright by the late Andrew Armstrong, Esq., J.P., and re-presented by him, was won this year by Mr. R. T. HARRIS; 2nd, Mrs. H. HUTCHINSON; 3rd, Mrs. M'INTOSH. There was also strong competition in the class for 12 vases of Carnations or Picotees, containing three blooms of one variety only. The 1st prize was won by Mr. E. C. HARDMAN; 2nd, Mrs. B. NESBITT; 3rd, Mr. R. H. STUBBER.

ROSES.

Mr. HUGH DICKSON, Belfast, won the Society's Silver-gilt Medal offered in the class for 72 blooms of Roses; 2nd, Messrs. ALEX. DICKSON & SONS, LTD., Newtownards. The Silver-gilt Medal offered as 1st prize in the class for 12 Roses introduced since January 1, 1909, was won by Messrs. ALEX. DICKSON & SONS; the Silver Medal was awarded to Mr. HUGH DICKSON.

In the class for 24 Roses, not more than three of any one variety, Mr. T. J. CROZIER was awarded the 1st prize and Dr. O'DONEL BROWNE 2nd, and these two exhibitors were similarly placed in the class for 12 Hybrid Tea Roses. In the class for 12 Tea and Noisette Roses, Mr. E. D'OLIER and Mr. CROZIER were placed 1st and 2nd respectively. The best six vases of Rambler Roses were shown by Mrs. BUTLER; 2nd, Colonel Sir W. H. POË, C.B.

The championship prize for a collection of 18 bunches of Sweet Peas—a Gold Medal—was won by Lord O'NEILL, Shanes Castle. The challenge cup presented by Sir J. G. Nutting, Bart., for nine bunches of Sweet Peas, was won by Miss FIELD; 2nd, Miss ROWLEY; 3rd, Mrs. MCVEAGH. The Rev. A. DAVIS showed the best 12 bunches of Sweet Peas; 2nd, Mr. R. E. ODLUM. The best six bunches of Sweet Peas were shown by Mr. S. BROWNE; 2nd, the Rev. J. GRIFFIN. In the classes for single bunches of Sweet Peas, of different colours, Lord O'NEILL won most of the 1st prizes. Miss J. ROWLEY, Miss OSBORNE, Miss MARKEY and Alderman BEWLEY also won 1st prizes in these classes.

FRUIT AND VEGETABLES.

In these classes the competition generally was exceedingly keen, and the judges awarded many extra prizes. Alderman BEWLEY was awarded a Silver Medal for a splendid collection of fruit. The Earl of MEATH won the 1st prize in the classes for two bunches of white Grapes and for two of any black variety except Black Hamburgh; Alderman BEWLEY was awarded the 2nd prizes in these classes. The 1st prize for Black Hamburgh Grapes was won by Lord DECIES; 2nd, Mr. LANGLEY. In the class for six Peaches, Lord DECIES was placed 1st; Viscount DE VESCI was 2nd; and the Earl of MEATH, who won the 1st prize for six Nectarines, 3rd. Lord DECIES won the 2nd prize for Nectarines. The best green Melon was shown by the Earl of MEATH, and the best scarlet-fleshed variety by Lady TALBOT. The 1st prize for six dishes of Apples grown in the open was won by Lady ANNALY; 2nd, Mr. TEDCASTLE. Mr. A. CLAUDE ELLIS showed the best dishes of (a) Ecklinville Seedling, (b) Early Victoria, and (c) any variety of cooking Apple not mentioned in the schedule. The best dishes of Beauty of Bath and Lord Grosvenor Apples were shown by Lady ANNALY. Mrs. MARKEY showed the best fruits of Lady Sudeley; whilst Mr. W. T. STEWARD excelled with Irish Peach Apple. The 1st prize for five dishes of dessert Pears was won by Alderman BEWLEY; 2nd, Mr. R. TEDCASTLE. The Marquis of ORMONDE won the 1st prizes for (a) black or purple Plums and (b) red Currants. Lord RATHDONNELL won the 1st prize in the class for a dish of red Plums.

The silver challenge cup offered for the best collection of vegetables was won by Mr. NATHANIEL HONE; 2nd, Mr. S. BROWN. The 1st prize for six distinct kinds of vegetables was won by Dr. O'DONEL BROWNE; 2nd, Miss FIELD.

NON-COMPETITIVE EXHIBITS.

Messrs. ROBERT JAMESON & SONS, Royal Nurseries, Sandymount, exhibited a group of floral designs, for which the Society's Gold Medal was awarded. Messrs. S. H. JONES, Kilkenny, made a splendid display of Gladioli, attractively arranged with sprays of Gypsophila (Gold Medal). A Silver Medal was awarded to Messrs. HOGG & ROBINSON, for a collection of Gladioli. Messrs. CHARLES RAMSEY & SON, Ballsbridge, received a Silver Medal for a collection of flowering and foliage greenhouse plants. Messrs. W. DRUMMOND & SONS arranged a stand of hardy flowers, shrubs, &c. (Gold Medal.) Messrs. PENNICK & Co., Delgenny, were awarded a Bronze Medal for a collection of hardy flowers. Messrs. BAKERS, Wolverhampton, were awarded a Bronze Medal for a collection of early-flowering Chrysanthemums and Dahlias.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AUGUST 22.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. J. C. Cowan, J. Evans, W. Hatcher, W. Holmes, J. Lupton, D. McLeod, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

Silver Medals were awarded to Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), for a group composed of Cattleyas of the Iris section; Rev. J. CROMBLEHOLME, Clayton-le-Moors (gr. Mr. Marshall), for a group of Cypripediums; ERIC F. DAVIDSON, Esq., Twyford, Berkshire (gr. Mr. Cooper), who showed Cattleyas; Messrs. CHARLESWORTH & Co., Haywards Heath, for a group of Cattleyas; and Messrs. A. J. KEELING & SONS, Bradford, who showed a mixed group of Cypripediums.

A *Bronze Medal* was awarded to Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton).

Other exhibitors were J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes); Messrs. SANDER & SONS, St. Albans; and Messrs. HASSALL & Co., Southgate.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Astonii (C. Harrisoniæ × C. gigas), shown by Z. A. WARD, Esq.

AWARDS OF MERIT.

Cypripedium Leyburnense magnificum and *C. Frau Ida Brandt*, exhibited by the Rev. J. CROMBLEHOLME.

Cattleya Iris var. "rubra," Odontoglossum Empress Eugenie (unrecorded parentage), *Odontioda Thwaitesii "Davidson's" variety*, and *O. Schröderi "Davidson's" variety*, all shown by ERIC F. DAVIDSON, Esq.

Cypripedium Hassallii (C. bingleyense × C. Charlesworthii), exhibited by Messrs. HASSALL & Co.

BRITISH GARDENERS' ASSOCIATION.

A meeting of this society will be held in the Goold Hall, St. Andrew's Square, on the evening of the first day of the Royal Caledonian Show, the 11th inst. Addresses will be given by Mr. James Harris, Liberton; Mr. W. B. Little, Carlisle; the Secretary, Mr. Cyril Harding, and others.

FINCHLEY CHRYSANTHEMUM.

AUGUST 29.—At a special general meeting of the Finchley Chrysanthemum Society, held on the above date, a timepiece was presented to Mr. J. Kirkwood (who is moving to Hampshire to take charge of the gardens at Wallington, Lymington) as an appreciation of his services to the society. Mr. Kirkwood was a member of the committee for many years, and one of the society's most successful exhibitors.

Obituary.

Professor John Craig.—We learn with profound regret of the death of Professor John Craig, one of the best-known horticulturists of the United States. Professor Craig, who at the time of his death occupied the Chair of Horticulture in the New York State College at Ithaca (Cornell University), was both a keen practical horticulturist and a cultivated man of charming personality. Born in 1864 at Lakefield, Quebec, Mr. Craig was educated at the Iowa State College, in which he subsequently held the post of professor of horticulture. From Iowa he proceeded to Ottawa, acting for some time as horticulturist in the Central Experiment Station which post he relinquished in order to take up the professorship at Ithaca. Professor Craig possessed a wide and thorough knowledge of horticulture, and was active in promoting the interests of that science. He was editor of the *National Nurseryman*, secretary of the American Pomological Society, and his services were in great demand as a judge at exhibitions. He was the author of *Practical Horticulture* and other scientific works. John Craig will be remembered by his friends in Europe no less for his scientific attainments than for his genuine kindness and courtesy, which made a visit to him at Cornell an event not readily to be forgotten.

Francis A. Baller.—*The American Florist* records the death of Mr. Francis A. Baller, wholesale florist, of Bloomington, Illinois, U.S.A., from heart failure at his home July 10. Mr. Baller was a native of England and was formerly engaged in the Botanical Gardens, Birmingham. After settling in America he was engaged at different times at Rochester, N.Y., Niagara Falls and finally Bloomington. He started in business for himself in 1871. He was a proficient botanist and was known throughout the country as an authority on American horticulture.

Thomas White.—Mr. Thomas White, for many years superintendent of Riverside Cemetery, died at his home in Fairhaven, Massachusetts, U.S.A., after a long illness. Our American contemporary *Horticulture* states that he was a member of the New Bedford Horticultural Society and contributed articles to several of the horticultural magazines, including *Horticulture*. Mr. White was a native of England.

William McIntosh.—*Horticulture* also announces the death of William McIntosh, florist 6, Percy Street, Charleston, U.S.A. He was a native of Scotland and 79 years of age. He retired from business some years ago. He is survived by two sons and two daughters.

John W. Richmond.—Mr. John W Richmond florist and landscape gardener, died at New York on July 22. He was a native of England, and emigrated to America 20 years ago.

Answers to Correspondents.

Address: *H. E.* Messrs. Van Tubergen, Bulb Growers, Haarlem; Holland.

Begonias: *A. J. F., Berks.* The plant you send is affected with the Begonia mite. Dip the foliage in Tobacco water, or, if this is impracticable, syringe the leaves with a nicotine extract, taking care to wet both surfaces.

Celery Unhealthy: *F. E. C.* The Celery leaves sent are quite free from any insect or fungous disease. The injury is due to some external influences.

Decay in Tree Trunks: *P. J.* In an article by Mr. W. J. Bean in the *Gardeners' Chronicle* for April 21, 1906, p. 244, on pruning trees and shrubs, he states that all, or as much as possible, of the decayed wood should be removed; then the surface should be washed with a strong solution of carbolic acid, and, after this has become quite dry, the surface should be smeared with coal tar. This antiseptic treatment is intended to destroy parasitic fungi and arrest the decaying process. The hole should then be filled up and made watertight. If it be small, the best "stopping" is formed of a piece of Oak made to fit; but large holes should be filled with cement. In either case a final coating of tar should be given. Except when the hole is very large, a new layer of bark will grow over the cavity when treated in the way described.

Eucalyptus: *J. S. H.* The pendulous, strap-shaped leaves represent the adult foliage, and when Eucalyptus trees reach this stage, they are generally hardier than usual. Such species as E. coccifera, E. coriacea, and E. Gunnii often develop three distinct forms of leaves on the same tree.

Gloxinias: *P. J.* There are a few thrips present on the leaves of Gloxinia sent, which may possibly have done the damage. A nicotine wash, such as Nicotine "Woburn Wash," will kill these pests.

Grapes Diseased: *W. W.* The berries are affected by "Grape rot" or Anthracnose (Gloeosporium ampelophagum), which attacks the shoots, leaves and fruit, and may generally be detected first on the leaves in the form of greyish spots bordered by a dark line. Flowers of sulphur may be dusted on to the leaves and shoots at intervals of 10 days while the disease appears to be spreading. On the second application, a small quantity of quicklime should be mixed with the sulphur, and the quantity of lime should also be increased on every successive occasion until the proportions of lime and sulphur are nearly equal, but always with just a little more sulphur than lime. The branches should be washed thoroughly with a solution of sulphate of iron in winter, and rich stable manures should be employed very sparingly. Leaves, shoots and fruit which show signs of disease should be removed from the tree and burnt.

Grapes Unhealthy: *S. S.* The discoloration of the berries is not due to disease.

Lily of the Valley: *E. B.* The Lily of the Valley roots are suffering from a rot caused by bacteria. Various saprophytic fungi are present as secondary agents in causing the decay. It is not possible to say if the bacteria were present in the plants before storage or not. All affected stock should be destroyed by burning.

Melons Failing: *Hillfield* and *H. W.* In both cases the stems of the Melon plants contain a fungus, the spawn (mycelium) of which is very abundant in the large "vessels" of the stem and root. No other stage of the fungus is present, consequently identification is impossible. Send a whole diseased plant in a tin or wooden box, when we will make a further investigation and suggest remedies.

Names of Fruits: Correspondents sending Peaches and Nectarines for naming should enclose leaves of each variety, and state whether the flowers are large or small, and if the trees are grown under glass or in the open.—*J. Tobin.* Red Astrachan.—*W. T. S.* 1, Grosse Calabasse; 2, Williams' Bon Chrétien; 3, Marie Louise; 4, Catillac; 5, Malster; 6, Potts's Seedling.—*Bude.* The fruits were too ripe when packed, and arrived in a condition of pulp.—*M. M. K.* The Plums arrived in a very bad condition. So far as we were able to judge, they are not superior to varieties already in commerce.—*H. H.* Doyenné de Merode (syn. Doyenné de Boussoch).—*J. G. W., Goring.* 1, Dean's Codlin; 2, Cox's Pomona; 3, Duchess of Oldenburgh; 4, Stirling Castle; 5, Peasgood's Nonesuch; 6, Fearn's Pippin.

Names of Plants: *J. A.* You should number your specimens (white-flowered climber) Trachelospermum (Rhynchospermum) jasminoides. (Orchid) Lælia anceps. (Honeysuckle) Lonicera affinis var. hypoglauca, (Herbaceous plant) Brickellia cardiophylla.—*A. B. C.* 1, Sedum spurium; 2, S. spectabile; 3, Escallonia rubra; 4, Aspidium angulare; 5, Polypodium vulgare.—*J. S., Norfolk.* Agrostemma flos-Jovis.—*A. E.* 1 and 2, tuberous-rooted Begonias of no special merit; 3, Origanum Tournefortii.—*H. A. C.* Rubus spectabilis.—*N. F. P.* Polygonum dumetorum.—*R. V. & Son.* Antholyza paniculata. The Moræa is probably M. iridioides, which varies much in size and also in its distribution.—*F. F.* 1, Sonbritis violacea; 2, Hartwegia purpurea; 3, Cœlia macrostachya; 4, Oncidium longipes; 5, Masdevallia simula; 6, Pleurothallis conanthera. *E. W. S.* Olearia Haastii.

Peaches and Nectarines Dropping: *C. G.* There are no traces of any fungus present in the unexposed tissues of the Peaches, Nectarines or Grapes. In the case of the Peaches and Nectarines, after the skin cracks or is punctured various "moulds" enter and cause rotting. With regard to the Grapes some cultural error is probably responsible for the discoloration.

Water Lilies Failing: *W. W.* Either of the following may have been the cause of the Water Lilies failing to grow. (a) The plants may have been weakly, with but few roots when planted; (b) they may have been put into running water, which is very prejudicial to the successful establishment of the plants; (c) the unfavourable summer. Your best plan is to take them up carefully about the end of September, if by that time no growth has been made, and store them for the winter in tubs sufficiently large to receive them. They should be wintered in a cool greenhouse. It is advisable to plant Water Lilies not later than the end of May. When the conditions are not altogether favourable at the time of receiving them from the nursery it is best to keep them in tubs of water in a greenhouse or similar structure until they are fairly established in the baskets into which they have been planted. With fine weather in September the plants may yet make a certain amount of growth.

White Flowers for Easter: *E. M. M.* The following is a list of white-flowered plants that may be had in bloom at Easter:—Eucharis grandiflora, Pancratium fragrans, P. expansum, Gardenias, Schubertia grandiflora, Stephanotis floribunda, Orchids: Cattleya intermedia alba, C. Trianæ alba, Cœlogyne cristata alba, Cymbidium eburneum, Dendrobium Kingianum album, Lælia albida, L. purpurata alba, Miltonia candida, Odontoglossum citrosmum album, O. gloriosum album, O. Roezlii album, Thunia alba, Plumbago alba, Lapageria alba, Jasminum nitidum, Pleroma candida, Nerine white vars., Hæmanthus candidus, Clethra alnifolia, Rhynchospermum (Trachelospermum) jasminoides, Azaleas, including Daviesii, Deutsch Perle alba plena, Mlle. Marie Planchon, Niobe, Perle de Ledebery, Perle gendbrugge, Raphael, and Sakuntula, Camellia japonica alba plena, C. Sasanqua alba, Rhododendrons (greenhouse varieties), Cunningham's white, albescens, exoniense, Lady Alice Fitzwilliam, and nivale, Spiræa astilboides, S. compacta multiflora, S. floribunda, Lilium lancifolium album L. longiflorum Harrisii (Easter Lily), L. speciosum album, L. candidum Lily-of-the-Valley, Richardia (Calla) africana, Tuberoses, white-flowered Carnations (including white Enchantress and Gloire de Nancy), and Pinks (Mrs. Sinkins, Her Majesty, and Modesty). Shrubs include Deutzia gracilis, Lilacs Madame Casimir and Madame Lemoine, Philadelphus hybridus Lemoinei, Prunus sinensis alba plena. Of bulbs you may select white-flowered Hyacinths, and Tulips alba maxima, Boule de Neige, Albion (White Hawk), Snowhall, La Candeur, and Royal White; Narcissus albo-pleno-oderata and others; Iris hispanica (Spanish Iris), British Queen, and Blanche Fleur; Iris Anglica (English Iris), Mont Blanc; Gladiolus Colvillii alba (The Bride), and Freesia refracta alba. No time should be lost in obtaining and potting the bulbs. East Lothian white Stocks and dwarf white Chrysanthemum-flowered Asters—Comet (dwarf), Bridesmaid, and Empress Frederick. Comet Empress. Early Branching White Dwarf Queen, and Eclipse—may also be selected. The seeds of the Stocks and Asters should be sown early in September in shallow boxes filled with a light, rich mixture passed through a fine sieve. Place the boxes in a cold frame and water with a fine rose can. Transplant the seedlings at 2 inches apart and pot them in small pots before they become crowded in the boxes. Later on shift them into 4½-inch or 6-inch pots, and place them in a light position near to the glass to ensure sturdy growth.

MARKETS.

COVENT GARDEN, September 4.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—Trade is not quite so good and prices are lower. Larger consignments have been received, although many parts of the Fen district are still flooded. *Edward J., Newborn, Covent Garden and St. Pancras, September 4, 1912.*

REMARKS.—Large quantities of dessert and culinary English Apples continue to reach the market. There are also ample supplies of English Pears. French consignments consist of the varieties Beurré Hardy, Williams's Bon Chrétien and Louise Bonne of Jersey, and the supply appears to be unlimited. Beurré Hardy Pears from California have arrived this week in excellent condition. Home-grown Plums are not so plentiful as hitherto, but fairly large quantities of Californian Plums will be obtainable for the next few weeks. Large quantities of Damsons, which sell at reasonable rates, are now available. Grapes of all varieties are in excess of the demand, and, as a consequence, prices show a downward tendency. Figs and Melons arrive in limited quantities and their prices are high. Peaches are fairly good, but lack colour, and are difficult to sell. The demand for Nectarines is greater than the supply. Cobnuts and Filberts are exceedingly plentiful. Tomatos from English, Dutch, and French growers arrive in large quantities daily, and prices are very low. There are abundant supplies of all vegetables except Potatos. *E. H. K., Covent Garden, September 4, 1912.*

REMARKS.—Trade is not quite so good and prices are lower. Larger consignments have been received, although many parts of the Fen district are still flooded. *Edward J., Newborn, Covent Garden and St. Pancras, September 4, 1912.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending September 4.

The third wet, cold, and sunless week in succession.—The days, as was the case in the previous four weeks, were all more or less below the average in temperature. The nights were again variable as regards temperature, but on the coldest night the exposed thermometer fell to freezing-point. The ground still remains cold, and is now 2° colder than is seasonable, both at 1 and 2 feet deep. Rain fell on all but one day, and to the total depth of three-quarters of an inch. In the last three weeks there have been only two days without rain, and the total measurement has amounted to over three inches, which is equivalent to 18½ gallons on each square yard of surface in my garden. During the same period 10 gallons of rain-water has come through the bare soil percolation gauge, and also through that on which short grass is growing. The sun shone on an average for four hours a day, which is 1½ hour a day short of the mean duration for the same period of the year. Light airs have as a rule prevailed during the week. The average amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by three per cent. *E. M., Berkhamsted, September 4, 1912.*

THE MARKET FRUIT GARDEN.

ALTHOUGH the misfortunes of fruit-growers in connection with the phenomenally bad weather pale into insignificance in comparison with the veritable calamity suffered by Corn growers, still the season has been one of the worst ever experienced. In the winter we had mild weather when frost would have been seasonable, in the spring frost when mild weather was desirable, and drought when plenty of rain was needed, while in the summer there was an alternation of drought and flood which was highly injurious in one way or another. Further, great gales in August brought fruit down in showers. In short, fruit crops at one time or another suffered from almost every adverse weather condition that could occur. It is not necessary to repeat the old story as to many varieties of fruit trees failing to blossom or to set the blossom which they did produce, the great damage done by spring frosts, and the tremendous and sustained attack of the aphis. But the weather conditions of the last of the summer months and the results claim attention.

A Wet and Cold August.

Some writers have compared the weather of last month with that of the disastrous summer of 1879. I have not any record of the rainfall of August in that year, but the wreck of the Corn harvest then was due to the prolongation of wet weather through September and October, great quantities of Corn having been exposed in the fields until November. I cannot call to mind, however, any previous August both as wet and as cold as the past month, or one in which as much fruit was blown off the trees by gales. At my own place rain was measured on 23 days amounting to 5.48 inches, or more than double the average for the month. This was a very small total in comparison with the measurements in some parts of the country. Nearly half as much again, or 7.34 inches of rain, fell at Norwich in 29 hours, and a friend just over the Norfolk border, in Suffolk, registered 5 inches. Thousands of acres of land were inundated in the eastern counties, the midlands, and other parts of England or Wales, doing an incalculable amount of damage to Corn and belated Hay crops. One Suffolk grower states that the Victoria Plums left at the time ungathered were spoilt, while Monarchs were greatly injured. Even with my less amount of rain much splitting was caused in Plums. It was not safe to leave any to become nearly ripe, as those in that condition split or rotted at the stalk-ends. Nearly every Greengage on some large trees was split, while the condition of Cox's Golden Drop, a fair crop, was nearly as bad. Still, by picking Plums as soon as they were fairly coloured, and before they became soft, whenever rain held off for a few hours, the bulk of the fruit was got into the markets in good condition. Growers in some districts were less fortunate, and had much fruit rendered unmarketable.

Results with Apples and Pears.

The chief cause of loss in the Apple crop during August was that which was due to gales. The fruit was ready enough to drop without any strong wind, and it fell in showers when gales occurred. Pears also were blown off the trees to a great extent, while some varieties became badly spotted with scab as the result of the continuous wet weather.

The Weather and the Markets.

It was stated last month that the demand for fruit was greatly reduced by the coldness of the weather in the latter part of July, and these conditions were continued during the whole of the marketing season for Plums. Accordingly, prices, although well up to average, were not nearly so high as they would have been in a normal season, taking the lightness of the crop into account. Large quantities of Victorias of fair size were sold at 3s., and some smaller fruit at 2s. 6d. per half-sieve, while the prices of Pond's Seedling and Monarch ranged from 3s. to 5s., mostly going at 4s., with all rail and market expenses to come off. As for Apples, the markets throughout the month were glutted with windfalls, and a salesman of long experience states that the trade for this fruit was worse than he had ever known it. Great quantities of good cookers were sold at 3s. a bushel, fair ones at 2s. 6d., and small fruit at 1s., while dessert varieties, such as Worcester Pearmain, made only 1s. 6d. to 2s. 6d. per half-sieve. Even at such low prices it was often impossible to clear the markets. Pears, partly in consequence of their extraordinary abundance, and partly on account of a small demand, sold at prices lower than any I remember. Good fruits of Williams's Bon Chrétien and Clapp's Favourite, which in an ordinary season would have made 1s. per dozen, realised only 2s. 6d. to 3s. 6d. per half-sieve, while inferior lots were sold as cheaply as Apples. Cobnuts, a tremendous crop, soon fell from 3d. to 2½d. and 2d. per lb., or about half their usual prices.

Good Result of the Wet Period.

Perhaps the only benefit of the wet weather of the latter part of July and the whole of August, so far as the fruit-grower is concerned, is the fine growth made by young Apple trees, which at one time seemed to be nearly ruined by the great and prolonged infestation of aphides. The shoots above the damaged portions of the trees have grown long and strong, and where those parts were not twisted it may be safe to leave them at the winter pruning. But it seems to me that the best results will be those following the experiment of cutting the aphis-injured shoots back early in July below the injured parts. The new wood, I believe, will withstand the frosts of winter, as it is very vigorous, though a dry and sunny autumn would greatly increase its chances in this respect.

The Weediness of Fruit Plantations.

Such a mass of rampant weeds as is to be seen in most fruit plantations has rarely been witnessed before. It has been simply impossible to clear the land of them. During the whole of August the land has been too wet for effective hoeing, and the work done has only checked weeds, without killing them, as they were reset commonly on the day after they were chopped out of the soil. The chief good done has been the prevention of seedings, and even this has not been effected in the case of some weeds. If September, which has begun badly, should prove a rainy month, there will be no chance of cleaning the land before the digging time comes, and that operation is never satisfactory when the land is in a very foul condition.

Tobacco-growing on Fruit Farms.

It is too soon to congratulate fruit-growers upon the announcement that, just before the Finance Bill passed through the report stage in the House of Commons, Mr. Charles Bathurst succeeded in inducing the Government to accept a clause authorising the Commissioners of Customs and Excise to issue licences to persons in the United Kingdom to grow Tobacco for insecticides and sheep-dips without payment of duty. In the first place, it is not

by any means certain that the Commissioners will do what they are authorised to do. They are extremely cautious gentlemen, and they may come to the conclusion that they cannot issue the licences without the danger of loss of revenue; or, if they issue them, the conditions may be so onerous as to be in effect prohibitive to the growing of Tobacco. On inquiry, I have been informed that the Government chemists are not satisfied that my suggestion of having the crop sprayed, in the presence of a police officer, with lime-sulphur, just before cutting it, would prevent its steeping and cleansing afterwards for the adulteration of imported Tobacco. Really, this objection seems far-fetched. Considering what a vast benefit to the fruit industry it would be to allow growers to produce the best of all insecticides, now sold at a price almost prohibitory, the very slight risk of the abuse of the privilege might be taken. An extremely heavy penalty on the sale of Tobacco from farms without a special licence, and then under stringent conditions, would render any loss to the Revenue so extremely improbable that it might be regarded as negligible. As stated on a former occasion, there would not be any need of going to the expense of extracting the nicotine. The Tobacco crop might be harvested and stacked as Beans are, and, when required for use, it could be cut into small pieces, stalks included, with a chaff-cutter or otherwise, and boiled in a large copper to make Tobacco-wash.

RABBITS IN ORCHARDS.

The mischief done by rabbits in orchards is not limited to the injury they do to the bark of trees not protected by wire netting. They gnaw and spoil windfall Apples. Some very fine fruit dropped this season, even of varieties which should not need to be gathered for weeks to come, and nearly every fruit was gnawed if left for a single night on the ground, although rabbits are kept down very closely on my farm.

"REVERSION" IN BLACK CURRANTS.

Like Mr. Pearson and others, I have been troubled with reversion in Boskoop Giant Black Currants, though not to the extent of even five per cent. My original stock was raised by me from cuttings, and after the first season all the cuttings were taken from healthy maidens. It must be suspected that the enormous extent of "reversion" in Mr. Pearson's bushes is due to raising plants from cuttings obtained partly from bushes already affected. I have some thousands of maiden and two-year-old bushes in a nursery patch, and a walk through them has not shown me a single case. Every affected bush in the established plantations is trodden down when detected, for replacement by a good one; the small fruits are not gathered, as they would injure the sample. "Reversion" is not infectious, but affected bushes never recover, and therefore should not be allowed to cumber the ground. In plantations younger than the one which contains some purchased bushes, there are extremely few cases. The defect is easy to detect, as the bushes are much more bushy than the normal ones, and have smaller and more pointed leaves. The suggestion that injury to the bushes causes the trouble seems to me unwarranted. The case appears to be simply one of reversion to the wild state.

[*Photograph by W. Irving.*

FIG. 92.—TULIPA DASYSTEMON: FLOWERS DEEP YELLOW WITH LIGHTER COLOURED TIPS.

COLOURING OF APPLES.

Contrary to the experience of Mr. Gilthorpe (p. 201), I find there is less colour in Apples generally this season than for many years past. As a rule, Apples in my soil and climate are conspicuous for good colour; but this season early varieties dropped to an extraordinary extent, and had to be picked before the proper time. Except in a small grass orchard, the colouring of nearly every variety is deficient, in consequence of lack of sunshine. Rain, as well as sunshine, may be necessary for the highest colouring; but the sunshine is essential, as indicated by the fact that the colour on each fruit is fully developed only on the portions most exposed to the sun's rays. A completely-shaded Apple is almost entirely devoid of red or brownish-red colouring. *A Southern Grower.*

VEGETABLES.

CULINARY PEAS.

PEAS have done splendidly this season; in fact, I never remember them being better. Among some of the best varieties is one named Harvestman, a grand Pea, said to be a cross between Express and Duke of Albany. The pods are distinct in shape, more regular in growth, not so tall, and altogether much superior to Duke of Albany. It is one of the best Maincrop varieties in cultivation, and a more profitable Pea it would hardly be possible to imagine. The flavour is splendid.

Commonwealth is a fine Pea of dwarf habit rarely exceeding 2 feet in height, but its prolific bearing habit, together with its fine cooking qualities, place it in the front rank. It is a fine Pea for a small garden.

Another novelty is Carter's International, a cross between the famous Early Morn and Duke of Albany. The variety does remarkably well in this district. It is very distinct, both in shape and habit. The pods are a rich, deep green, and contain from 9 to 11 Peas of large size and rich Marrow flavour.

Dreadnought is another rare, good Pea, and as an addition to the Maincrop varieties, it is good for amateur exhibitors and market growers. The pods are a deep-green colour, and they have a rather blunt top. The variety is not affected by drought or mildew, and it should become popular amongst all classes of growers.

Carter's Latest Giant is a late Marrowfat variety, a cross between Gladstone and Exhibition. The pods are large, and contain generally 10 or 11 large Peas of the best flavour. The plants crop well in October in a suitable season. This variety is succeeded by Michaelmas, a moderately dwarf Pea (3 feet), which produces well-filled pods up to October. I have gathered both old and new pods at Michaelmas. Late Peas should be given plenty of room both in the rows and between the plants, so that the sun and air may reach all parts of the plants. As a specific for mildew, I have found nothing so good as spraying with sulphur mixed with milk. In dry seasons a good heavy mulch should be placed over the roots to keep the ground cool and prevent cracking of the soil. *W. A. Cook, Leonardslee Gardens, Horsham.*

TULIPA DASYSTEMON.

THIS little-known Tulip (see fig. 92) belongs to the Orithyia section of the genus, which includes species that are nearly all of small stature and possess comparatively small flowers. T. dasystemon is a charming plant, growing only about 6 inches high. The flowers have yellow segments edged with white. When fully open in sunny weather a group produces a brilliant effect, and it is one of those small bulbous plants that are most appropriate for the rock-garden planted between other low-growing plants. The bulbs may be left undisturbed in the ground; a group planted amongst Alyssum spinosum in the rock-garden at Kew flowered quite as freely the second year as the first. It makes a splendid subject for the Alpine-house, being easily grown in pans, and flowering about the end of March or beginning of April. T. dasystemon is a native of Eastern Turkestan, where it was discovered by Dr. A. Regel in 1879, at elevations of from 8,000 to 10,000 feet. We are indebted to Messrs. Van Tubergen for the introduction of this species to cultivation. *W. I.*

NURSERY NOTES.

NOTES FROM COOMBE WOOD.

The large valley which constitutes the greater part of Messrs. Jas. Veitch & Sons' nursery at Coombe Wood admits of arrangement that would not be possible on level ground, and viewed from above the blocks of green in different shades, relieved by masses of colour, either of foliage, fruit or flower, present a charming appearance. Owing to the conformation of the ground suitable spots can be found for plants of very diverse requirements, including sheltered nooks for the more tender subjects. The bottom of the valley being well supplied with water, forms a congenial home for numerous moisture-loving plants.

With the advent of September the number of shrubs in flower compared with those in bloom three months earlier is decidedly fewer; still there is sufficient to make a goodly show. The hardy Fuchsias are so beautiful that their comparative neglect in many gardens is difficult to account for while, as might be expected, the different forms of Buddleia variabilis are laden with their semi-pendulous racemes of beautiful flowers. Sambucus canadensis, with its massive heads of blossoms, stands out as the finest of all the Elders when viewed from a floral standpoint, and the little Daphne-like Rhododendron intricatum is still sprinkled over with its pretty Lilac-coloured flowers. Though only distributed last year, Potentilla Veitchii has already gained many admirers owing to its pretty snow-white flowers, which are produced from spring till autumn. Hibiscus syriacus, represented by several of the finest varieties, is also very beautiful, while many of the Cistuses and varieties of Ceanothus are also in bloom. Others that contribute to the floral display are Abelia chinensis (syn. A. rupestris), Indigofera floribunda, Tamarix peritandra (syn. T. Pallasii rosea and T. hispida æstivalis), Escallonia langleyensis (an autumnal crop), Spiræas of sorts, Dicrvilla (Weigela) Eva Rathke, Veronicas, Lespedeza Sieboldii (syn. Desmodium penduliflorum), and Eucryphia pinnatifolia.

Brightly-coloured berries are strongly in evidence just now, the brightest of all being that form of Cratægus Pyracantha known as Lælandii. Numerous examples are absolutely laden with berries, which are so much appreciated by birds that it is necessary to protect the bushes with nets. Beside the generally cultivated species, especial mention must be made of Cotoneaster rugosa Henryi, a loose-growing shrub, with leaves and branches of a drooping habit. The berries, which are freely borne in clusters, are scarlet. In C. applanata the long, partially weeping branches are wreathed throughout the greater part of their length with bunches of scarlet fruit, while the fruits of C. pannosa, though borne freely, are much duller in colour. An evergreen species, which from its procumbent habit is well fitted for clothing steep banks or for planting on the larger arrangements of rockwork, is C. humifusa, whose vigorous branches lie flat on the ground. They are clothed with small, dark-green leaves. The scarlet berries are freely borne, but mainly on the undersides of the shoots, so that they are scarcely visible unless the branch is lifted clear of the ground. Numerous examples of the Sea Buckthorn are laden with their bright orange-coloured berries. At Coombe Wood the specimens of the two sexes are planted together to ensure the flowers being fertilised.

Viburnum rhytidophyllum is at all seasons remarkable for its handsome rugose leaves; in the spring the large flattened corymbs of flowers form a notable feature, but its most attractive stage is in early autumn, when the berries change from green to bright red. They remain in this stage for a considerable time, ultimately becoming of a deep purple hue. Several of the Barberries are also very pretty; also the white-fruited Symphoricarpus occidentalis which is, from an ornamental standpoint decidedly superior to S. racemosus, the common Snowberry.

An immense number of climbing plants are grown at Coombe Wood. The many Chinese vines with which Messrs. Veitch's name has been so closely identified in recent years are to be seen in great quantities and in all sizes. The huge leathery leaves of Vitis Coignetiæ and V. Thunbergii have already assumed their brilliant autumn tints. Perhaps the finest of all these vines is Vitis armata Veitchii, and a particularly striking member of the smaller-leaved forms is V. Henryana, with leaves of a velvety green and a silvery midrib. Beside the many Chinese kinds, the cut and purple-leaved varieties of the common Grape are also largely grown. Other rapid-growing climbers with handsome foliage are Actinidia chinensis, Aristolochia moupensis, A. Sipho, Celastrus hypoglaucus, Cocculus heterophyllus and Polygonum multiflorum. A notable feature of the beds filled with young plants of Clematis was the freedom with which some of them are flowering, especially the pretty and distinct Clematis montana rubens. Besides the different subjects above named, Ivies, Honeysuckles, Jasmines and others are represented by large numbers of the very finest kinds. Polygonum baldschuanicum is justly valued for its free-flowering qualities.

Conifers thrive remarkably well at Coombe Wood, and they are so varied in colour that amongst evergreen trees their beauty is unequalled. Viewed in a mass some of them are of a decidedly sombre green tint, whilst others have brighter tones. Silvery grey or bluish tones are represented by Abies pungens glauca, Cedrus atlantica glauca, Cupressus Lawsoniana, Allumii, C. L. Triumph of Boskoop, and Juniperus virginiana glauca. Golden tints are more numerous, there being beside the several forms of Golden Yew, Cedrus atlantica aurea, Cupressus Lawsoniana lutea, C. L. Stewartii, C. (Retinospora) obtusa aurea, C. obtusa Crippsii, C. pisifera filifera aurea, and C. plumosa aurea.

Of other Conifers the numerous fine examples of Sciadopitys verticillata merit at least a passing notice, and the new Chinese species, Pinus Armandii, belonging to the Cembra section.

Of trees and shrubs of recent introduction, I noticed Berberis Gagnepainii, B. verruculosa, and B. Wilsoniæ, three charming Barberries; Catalpa Fargesii, with purplish flowers, Davidia involucrata, with white bracts; Decaisnea Fargesii, a tree with pinnate leaves and blue fruits; Ilex Pernyi, a pretty, small-growing Holly; Juglans cathayensis, a very distinct Walnut; Ligustrum Henryi, a neat, much-branched evergreen; Lonicera nitida, a compact little shrub; Magnolia Delavayi, a grand evergreen Magnolia; Populus lasiocarpa, with huge leaves; Rubuses of sorts; Sarcococca ruscifolia, and S. humile, both evergreen shrubs that will thrive under trees; Schizophragma hydrangioides, S. integrifolia, Viburnum Henryi, and V. utile.

There is a fine collection of hardy Heaths at Coombe Wood, as, indeed, there is of American plants in general. Just now the numerous forms of the Ling or Heather (Erica vulgaris) are at their best. By some the white Heather is looked upon as a rarity, but here there are several varieties with white blossoms. A particularly good white form is Searlei, and a suitable companion to it is the purple Alportii. The double-flowered variety must on no account be omitted in any selection of the best varieties. Dabœcia (Menziesia) polifolia is, as it has been for a long time, in full flower. Beside the ordinary form there are also the white and the parti-coloured varieties, while a striking kind not so well known as the others is atropurpurea, with blossoms much more richly coloured than those of the type.

The bottom of the valley is an ideal spot for hardy Bamboos and being sheltered from the east winds forms a congenial home for a representative collection of Camellias, all in robust health. Of herbaceous plants several of the newer introductions from China are grown in large quantities, including Primulas, Meconopis, Astilbes, Rodgersias, Senecios, and the pretty Rheum Alexandræ, with large, pale-yellow leaf-like bracts in the spring.

Unlike most nurseries, Coombe Wood possesses some specimens that may be regarded as of historic interest, that is to say, either the first, or one of the first of their kind introduced into this country. These specimens, which are for the most part scattered about on the slopes of the valley, include a tree 25 feet high of Acer palmatum, the produce of seed sent home by the late Mr. John Gould Veitch about 50 years ago; Pinus parviflora, from the same collector; Laricopsis (Pseudolarix) Kæmpferi, one of the oldest trees in the country; a 15 feet specimen of Eucryphia pinnatifolia, from seed sent home by Richard Pearce; the original plant of that pretty hybrid, Escallonia langleyensis, and the following introduced by Charles Maries—Acer distylum; A. carpinifolium, 15 feet high; Quercus acuta, a very large specimen; Stuartia pseudo-Camellia, just out of flower; and Cornus brachypoda, a tree 25 feet in height. Beside these there is the tree of Davidia involucrata, brought home by Mr. E. H. Wilson in his cabin, and a 10 feet high specimen of Magnolia Delavayi. *W. Truelove.*

THE ALPINE GARDEN.

CAMPANULA STENOCODON.

This very rare Campanula is practically unknown in gardens; in fact, I doubt whether, apart from the batch of specimens which I have at Stevenage, it is in cultivation anywhere else in the country. As, however, it is an easy grower and exceedingly pretty, I have little doubt that it will soon become a well-known and well-loved garden plant. Campanula stenocodon belongs to the "rotundifolia" section. In general habit it has the appearance of the common Harebell, refined, more slender, and with much narrower stem leaves. The outstanding characteristic of C. stenocodon from the garden point of view is the shape and colour of the flowers, which are long, narrow and tubular, instead of bell-shaped, more tubular even than in C. Tommasiniana (Waldsteiniana). In colour they are a rich and very beautiful lilac-purple.

I collected the plant two years ago in the Miniera Valley of the Maritime Alps, near Tenda. It was creeping about in a rather diffuse manner on a stone slide, and the task of collecting the frail and threadlike underground stems from the coarse rubble and large stones, and getting them alive to England, seemed a hopeless one. Rather to my surprise, and greatly to my joy, they survived, and have since done exceedingly well. One piece was planted out on the rock-garden in a rich, turfy loam, where it has spread and flowered profusely. The others were potted in a gritty compost, and have done equally well. In fact, so catholic do the tastes of C. stenocodon appear to be that I should not be surprised if it consented to endure moraine treatment, but until it is a little more common I shall continue to let it enjoy the loam it seems to love so well.

I find that C. stenocodon in a much more attractive and valuable plant in cultivation than it is in the wild state. Its habit of growth is more compact, and it is freer flowering, yet it retains its very characteristic tubular blossoms, and also its curious wiry charm, which is akin to the charm of C. excisa. *Clarence Elliott, Stevenage.*

PROPAGATION OF STRAWBERRIES.

APPARENTLY few growers of Strawberries fully realise the importance, and the immense advantages of an occasional change of stock for propagating purposes. Proper attention is seldom given to this matter, yet change of stock is necessary to produce annually large crops of fine fruit, both by forcing and outside cultivation. The value of a change of Potato sets is generally acknowledged, and my experience convinces me that it is just as necessary to periodically change the stocks of Strawberry plants. The present is the best time of year for introducing fresh plants, preferably those that have been grown in 3 or 4-inch pots. The practice in these gardens is as soon as the new plants are received to prepare nursery lines and plant them in rows made 2 feet apart, allowing a distance of 1 foot between the plants in the rows, planting very firmly, and affording a mulching of short manure. In the spring, when the plants show flower, the beds are inspected and only those plants which show good strong spikes of bold flowers are retained; all sterile or doubtful plants are destroyed. The earliest runners are layered for forcing purposes, and the next best are selected for forming fresh beds. It is only by this continued process of selection, aided by change of stock, that crops can be kept up to standard. There is a tendency amongst all cultivated plants to revert to the original type, hence "rogueing" and selecing must be constantly practised. It often happens that certain Strawberry plants become barren or sterile and show few or no flowers, yet produce the earliest and best-looking runners. But to propagate from such plants is wrong, and the inexperienced or careless propagator does not observe this fact until it is too late for remedy. Strawberry plants kept on the same ground for any considerable length of time deteriorate very considerably both as regards the quantity and the quality of the fruit. The constitution of the plant is affected and shows a worn-out appearance and evident debility. It is advisable to plant one or more new varieties each season, so as to ultimately secure a selection of those best adapted for the particular soil and locality, for it is well known that all varieties will not succeed on every kind of soil or in every district. I have tried hard to grow in three counties, namely, Kent, Oxfordshire and Worcestershire, the well-known variety Sir Joseph Paxton, but have never yet resided where I was able to grow it to my satisfaction. As regards new varieties, it is advisable not to arrive at too hasty a conclusion as to their merits, for sometimes the constitution of a new variety is impaired for a year or two by forced propagation. *W. Crump, Madresfield Court Gardens, Malvern.*

NOVEL METHOD OF FORCING MELONS.

THE illustration reproduced in fig. 93 is copied from a Japanese horticultural journal, and shows a remarkably fine crop of Melons grown under unusual conditions. The frame is heated, but not by the usual system of hot-water pipes, the warmth being derived from a natural hot-water spring, situated beneath the frame. The first experiments in forcing crops in this way were made at Matsumoto, Shinshinu, a few years since. There are innumerable hot springs in Japan, and as the venture has proved so successful it is probable that these will be made large use of for forcing vegetables and such crops as Melons on commercial lines. There is a danger to vegetation when sulphur is present in the water, which is often the case with these hot springs. But we are informed that there are plenty of the geysers in Japan which contain no such minerals and are perfectly safe for the purpose.

ASHBURNHAM PLACE.

As I peer through the mists of well-nigh half a century a vision rises before me which is of peculiar interest. In those days I was living somewhere within the borders of the Ashburnham estate, which extended from Pevensey Bay iuland almost to the Kentish boundary. I was asked one day to carry a letter to the park, and deliver it at the house of one of the officials. After a walk of some length I came upon the tall, oaken palings which enclosed the mansion with its ample grounds. When I reached the large gateway by which I was to gain admission, what was my consternation and dismay to find the enclosure filled with a herd of antlered beasts such as I had never seen before. To my youthful mind the flattened horns were formidable in the extreme, and as no lodge was near, no keeper in sight, and no human being within earshot, my alarm was great. To retreat was to court ridicule for my cowardice; to proceed was to invite disaster. So I climbed the fence and shouted. To my joy the splendid creatures lifted their heads, pricked up their ears, and then cantered off in the safe direction with a grace of movement which was a revelation and an encouragement to a timid country youth.

I have on many occasions since those early days had the pleasure of visiting this delightful spot. Once, on some great occasion, I was, in common with an army of boys and girls from the schools on the estate, the guest of the noble earl, and enjoyed a bounteous repast in the beautiful grounds. In my early manhood, when I was laying in stores of nature-lore and gardencraft in the sunny south, I was frequently at Ashburnham, and never during the long years which have elapsed since I first gazed upon the antlered herd has any great length of time expired without my passing through the park or making a visit to the gardens.

Although the house itself has a modern appearance, its foundation was laid in the hoary past. The name is Saxon, with the Celtic name for flowing water as its base. The first syllable, "Ash," does not refer, as some writers suppose, to the native tree. It is found everywhere in England under the most varied forms. Chameleon-like, the syllable changes at its will. We have it in Ashford and Oxford, in Uxbridge and Easeburne, in Isis, Exe and Ouse, as well as in Wash. The second syllable is, therefore, simply the Saxon equivalent of the first, and the name signifies the house by the limpid stream. The burn or brook which supplies the beautiful lakes near the mansion flows southward till it enters the sea near Pevensey.

As the visitor stands on the bridge and gazes into the placid water, with its reflection of the stately trees which make the outlook from the house too circumscribed, his eyes alight upon the beautiful Water Lilies, blossoms of which are opened to the summer sun, and form a striking contrast to the emerald leaves. The Bog Bean (Menyanthes trifoliata) also flourishes here, while many kinds of fish would afford the knight of the gentle craft delight if he could cast hook and anchor there.

The nature lover would find much to interest him at Ashburnham. Hereabout grows the Tutsan (Hypericum), known by the older natives as Amber, the scented leaves of which every boy and girl in my youthful days placed between the leaves of his Bible or Prayer-book. I notice that the Twayblade (Listera ovata) has just run its course, while the Rose-bay (Epilobium angustifolium) is yet in splendid form. The ancient Oaks and large-boled Chestnuts rise in stately beauty from an azure carpet formed of the wild Hyacinth, while youth may tread a Primrose path among the forest trees. Many and curious are the fungi which flourish here, and the student would soon fill his vasculum with the parasitic growths to be found on the Hawkweed, Woodbetony, Thistle, and a host of other plants. Only once during all my years of gleaning have I come upon the Daisy cluster-cup, and that was at Ashburnham.

He who takes an interest in British industries would also find much to arouse his curiosity and give him pleasure here; for this was during long ages the Black Country of England. Some of the choicest specimens of ironwork in South Kensington, as well as much of the finest hammered work in many southern cathedrals and churches, were produced in this locality. Ashburnham forge continued to supply the market till 1809, and was, together with the sister forge at Penshurst, which is embraced by the Ashburnham estate, the last to give up the industry.

The antiquary, too, will find at Ashburnham many things to occupy his thoughts, the more so if his tastes lie rather in the study of letters and history than in that of old bones and stones. It is true that the church attached to the place is in many ways disappointing. But the sight of the Pelham buckle among the mouldings will be

FIG. 93.—MELON FRAME HEATED BY A NATURAL HOT-WATER SPRING.

enough to suggest many memories. The mind travels to Crowhurst, Dallington, the Dicker and elsewhere, and in every direction finds traces of the buckle which became the badge of the Pelhams after Poitiers, as the chape or crampette was assigned to the De la Warrs. Formerly certain relics of Charles I were kept in the church, in order that those who suffered from the King's-evil might seek their efficacy. These are now, for greater safety, removed to the mansion. Ashburnham was, till recent years, the repository of many ancient manuscripts and costly tomes, but a large proportion of these have found homes elsewhere.

While we turn reluctantly from these fascinating themes, we have yet another pleasure in store; for the gardens will well repay our attention. Owing to the fact that there is no large family in residence, and but few guests to make demands on fruit, vegetable, and flower, we find here less of that devotion to the culture of special products than may often be found in gardens of similar rank.

The usual varieties of Black and White Grapes are freely grown. There is also a good deal of attention devoted to the Sultana variety, which is quite unknown in many of the largest gardens.

The Cranberry is grown extensively here, and at the time of my visit the beds were laden with the young green fruit. It is the cultivation of these unusual plants by the side of those in everyday use which proves the best test of the gardener's skill and knowledge.

It would be impossible for me to enumerate all the varied products of these extensive gardens and houses. I content myself, therefore, with the particularisation of the more important, rare or novel.

Figs come to a high state of perfection here, both in and out-of-doors. A tree of the variety Brunswick, in the open, last year produced fruits, the individuals of which scaled anything up to 8 ounces. True the summer was exceptional, but I saw some fruits which bid fair to reach almost as great a size again during the present season. The variety Brown Turkey also was fruiting freely. Apricots, Peaches and Nectarines usually thrive here, but Apricots, as is generally the case, are a failure this year. Peaches Princess of Wales and Royal George were specially to be noted. Exceptionally fine this season were the Pears. The varieties grown are very numerous, and almost without exception the trees were laden with fruits. Doyenné du Comice, Beurré Hardy, Beurré Giffard, Triomphe de Vienne, President Drouard, Catillac and many others were heavily fruited. Clapp's Favourite also is largely in evidence, with Jean de Witte.

Apples and Plums are comparative failures this year, the Victoria being the best of the latter. But the crops of sweet and Morello Cherries have been excellent, while Nuts are abundant. About 50 Pineapples were in fruit in one house, and these had already begun to ripen in early July, while a second house of later Pines gave good promise. Melons and Tomatos were in excellent condition.

Ashburnham Place may be reached from Battle Station, from which it is distant about four miles. *Hilderic Friend, Swadlincote.*

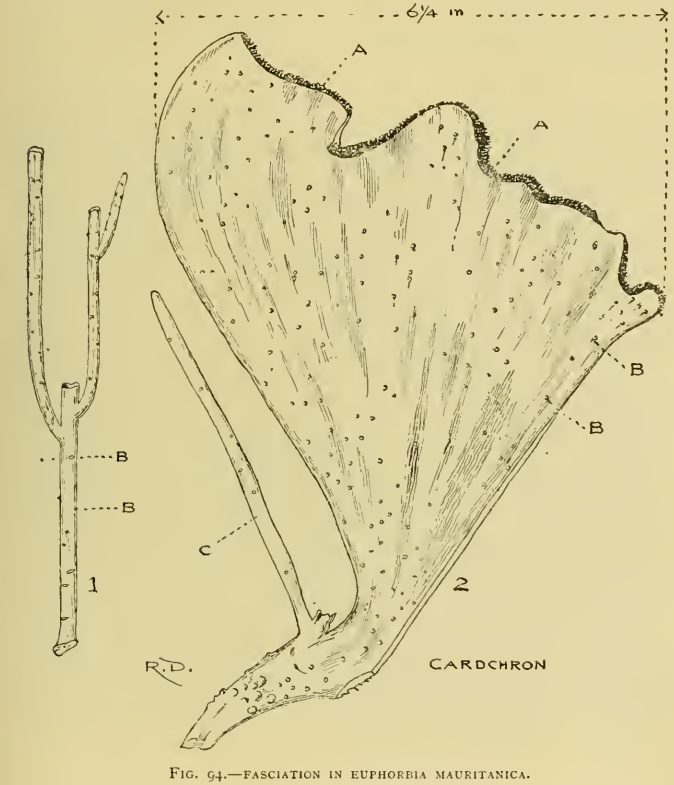

FIG. 94.—FASCIATION IN EUPHORBIA MAURITANICA.

1. Normal shoot. 2. Fasciated shoot. A. Leaves and floral rudiments. B. Leaf scars. C. Normal branch.

EXTRAVAGANT FASCIATION IN EUPHORBIA MAURITANICA, LINN.

DESPITE the prevalence of fasciation in the vegetable kingdom, the rarity of its occurrence in structures essentially xerophytic has not escaped the notice of observers, and in this respect the Cacti and Cactoid Euphorbiaceæ are cases in point. Both Masters and Penzig, in their respective works on *Vegetable Teratology*, allude to instances of fasciation in the European Euphorbias, but omit any mention of South African species exhibiting this phenomenon. These latter collectively represent a case of polymorphism and tendency to mimicry which perhaps is only paralleled by members of that peculiarly isolated South African Order Bruniaceæ, where analogues to the Compositæ, Rhamnaceæ, Thymelæaceæ, Santalaceæ and Diosmeæ obtain.* Euphorbia mauritanica, a much-branched shrub attaining a height of 5 feet, in conjunction with several species of Myrica (Waxberry) and grasses, constitutes almost the sole vegetation of the sand-dunes of Table Bay, where it plays an important part in ensuring the stability of these dunes. The species is easily recognised by its glaucous aspect, the peculiar mode of branching, and the erect, slender, terete twigs, which are furnished with leaf-scars but in fasciated specimens, of which the accompanying illustration (fig. 94) depicts an extreme type, this phase is entirely lost. Here the fasciation is of that type which finds its analogue in that peculiar form of Ash designated Fraxinus excelsior v. monstrosa, and is rather prevalent in another species also of the Tirucalli section, of which Mr. N. E. Brown has not as yet succeeded in fixing its status. The figure has been prepared from a specimen in the Kew Herbarium, gathered by Mr. E. G. Alston at Garies in Namaqualand in 1892. *R. Dümmer.*

SCOTLAND.

THE LILY SEASON.

IN one of the many interesting and instructive letters I had the privilege of receiving from the late Dr. Wallace, of Colchester, he wrote:—"Lilies for the most part have been very vigorous in their growth this year, owing chiefly to the heavy rains." The season through which we are at present passing is one of an exactly similar kind, and most of the Oriental and American Lilies, including L. Szovitzianum (nearly 9 feet in my garden), have attained to their utmost possible height. The largest Lilium giganteum of which I have heard for several years is a remarkable specimen of this Indian Lily 12 feet high, which reached this extraordinary stature this season in the "Wild Garden" of the Viscountess Dalrymple, at Lochinch Castle.

L. sulphureum, also called Wallichianum superbum, I tried, first of all, in the garden, in a position somewhat similar to that of the Lochinch specimen of L. giganteum, when, having shown no sign of activity, even after the glorious sunlight of April (the only "summer" influence we have experienced this year), I have placed it in a pot in loam and leaf-mould, and transferred it to a warm window in the Manse, where L. longiflorum Wilsonii had been, just previously, grandly successful. In that new and sunny situation the Burmese Lily began to grow without delay, and is now (September 2) 5 feet high. I do not suppose that it will have many flowers; but it is consoling to reflect that they will be all the larger and lovelier on that account. L. Humboldtii var. magnificum, which I grew in the garden, has been exceedingly effective this year. If I wished to give this grand Lily an expressive name I would probably call it Pardalinum gloriosum; for its colour is superb. There is no American Lily with which I am acquainted that approaches it in this direction.

It is also, like L. Szovitzianum, a plant of great potentialities in the direction of growth; growing stronger and flowering more luxuriantly every year. Another Lily of infinitely beautiful colour, to whose first appearance I look forward with great interest, is L. speciosum Melpomene var. magnificum; the striking colour is carmine, intensified with dark ruby, and margined with white. Planted in a sheltered position, in ordinary garden loam, slightly enriched, it has grown very vigorously, and promises to flower well. It will form an effective contrast to L. speciosum Kraetzeri, which is snowy-white, of an exquisite feathery character, with a radiation from the centre of luminous green rays. I sometimes think that L. speciosum and its varieties—which are by no means arduous of cultivation, requiring only a fibrous soil, implying good drainage and a moderately sunny situation—are among the loveliest of all Lilies, and the most refinedly fragrant of all flowers. Under precisely the same conditions, two of the finest varieties of L. auratum, viz., platyphyllum, and the most beautiful of its derivatives, virginale, are almost invariably an entire success.

So far as my observation has hitherto extended, the Lilies that have been most successful in Scotland this season have been Hansonii, candidum, monodelphum var. Szovitzianum, chalcedonicum, tigrinum splendens, pardalinum var. Burbankii, Humboldtii, giganteum (at Lochinch Castle), Henryi, auratum, and speciosum. *David R. Williamson, Manse of Kirkmaiden, Wigtonshire.*

FABIANA IMBRICATA.

THIS extremely handsome shrub was introduced into this country from Chili in 1838; but, though easy of increase, it is even at the present day quite a rare plant in many districts. It thrives better, as a rule, in seaside localities than in inland positions, and along the southern and western coasts grand examples are often met with. In many parts of the country, however, it needs the protection of a greenhouse, but where this is not necessary it forms a first-rate wall plant. F. imbricata (fig. 95) is a fairly quick-growing shrub, of somewhat upright habit, clothed with very small, crowded leaves, and bearing a good deal of resemblance to a Heath, from which, however, it differs widely from a botanical point of view, since, instead of being in any way related to the Erica family, it belongs to the Order Solanaceæ, or Potato tribe. The flowers are pure white, tubular, and borne in great profusion. They remain in good condition for a fairly long time. Though it cannot be considered absolutely hardy, it is practically so in the south-west, where it often assumes very large dimensions, specimens 8 feet in height and almost as much in diameter being sometimes found. Such plants are objects of great beauty in early June, when every spray is thickly covered with countless white flowers. Wall protection is absolutely unnecessary in southern Cornwall, or in the more sheltered spots in south Devon, and the loveliness of the Fabiana when in bloom is best appreciated when the shrub is seen standing in the open backed at some little distance by evergreens, which, by their darkness, enhance the purity of the blossoms. Culture such as is usually accorded to the Heaths is best adapted to its requirements, and it flourishes in a peaty compost. A peaty soil, though, is not indispensable, and examples are often to be seen growing well and flowering magnificently in a compost of leaf-mould and loam, and in pure loam. The plant is easily raised from cuttings inserted in August. Prepare the number of 6-inch cutting pots required, fill them a quarter full of drainage, and place a layer of moss or fibrous peat above the drainage. Then fill up with a fine compost of yellow, fibrous loam and leaf-mould, well mixed with sand. Press all down rather firmly, and put a little sand on the top. Select the cuttings from the sides of the leaders of the summer's growth, about 2 inches long, and trim off six or eight leaves. Fill the pots with the cuttings, and tighten them well in. Give a good watering, and place them in a close frame or under a hand glass, in a northern aspect, under a wall or hedge. Let them remain there till the second week in September, when they will be well callused. Then take them into the propagating house and cover with bell-glasses. About the middle of January they will commence to grow, when the glasses may be taken off by degrees, and the plants removed to the greenhouse and gradually hardened off ready for potting in March. *Wyndham Fitzherbert.*

NOTICES OF BOOKS.

VINES.*

THIS work is an American production which, had it been indigenous, would probably have been entitled "Climbing Plants," the Grape vine occupying only a small portion of the volume, embark in a general scheme of wall plants, many of them tender, such as is usual in this country, but confines himself to the treatment of climbers and trailing plants exclusively: the Honeysuckles, Clematises, Jasmines, Wistarias, Vitises, Tecomas, Convolvuli, Hydrangea petiolaris, Pueraria Thunbergiana, Celastrus orbicularis and C. scandans, Apios tuberosa, Dolichos Lablab, Dioscorea bulbifera and D. divaricata, Ipomœas, and Boussingaultia baselloides are some of the favourite climbers for out-of-doors. For indoors we are perhaps in advance of America, the list of plants being much restricted as compared with those grown in our conservatories and stoves. The chapter on Roses is one of the best, though here again we are in advance as regards the number and variety of climbing Roses in general cultivation, hybrids of multiflora, setigera, and Wichuraiana coming in for the largest share of attention, many of our best old Roses being passed without allusion.

The chapter on Grape vines is of much interest. It is stated that the average annual pro-

FIG. 95.—FABIANA IMBRICATA: FLOWERS WHITE.

Though the climate of America is so dissimilar to ours that Melons are successfully cultivated in the open air by the author, and plants which are immune to frost here are killed there, the contents of the book are, notwithstanding, of much interest to the Britisher, and exceedingly informative. Its perusal introduces us to a number of beautiful flowering and foliage plants of the very existence of which most of us are ignorant. Not that the American is much better, for he is chided for his neglect of the many climbers, hardy and tender, which he ought to cultivate, but does not. To us it is strange to be assured that Vinca major is not hardy, and English Ivy (Hedera Helix) is cut down by frost every winter for the first two or three years of its existence. The author does not

duction of Grapes amounts to 80,000,000,000 lbs., the most of which is derived from vines growing in the open. The author esteems European Grape vines to be the only ones suitable to cultivate in vineries, the culture he affects being in some respects different to that pursued in this country. For instance, he sprays his vines sometimes several times daily until colouring commences, with a brief intermission at the flowering period. When in flower, the temperature is lowered to 60°, which is quite opposed to our practice of then raising it a few degrees. He allows one bunch of Grapes to every foot, but does not mention the weight of the individual clusters. It is interesting to find a short discussion of the merits of all lateral suppression and the employment of less or more secondary leaves. The author appears to recommend the value of the latter, but it would appear that in America their value is not

* *Vines and How to Grow Them*: A Manual of Climbing Plants, by William C. McCollom. (London: William Heinemann.) 1912.

recognised by many cultivators, a fact which is perhaps not generally known in this country.

In the matter relating to the destruction of parasitic vegetation and insects there is much helpful suggestion, and it is in particular noteworthy that Mr. McCollom employs hydrocyanic gas to an extent we never dream of here, only he uses it much less strong than we do, the strongest application he recommends being two ounces of cyanide of potassium to 2,000 cubic feet of air.

STRASBURGER'S TEXT BOOK OF BOTANY.*

BOTANISTS, and particularly those engaged in teaching, will welcome the appearance of a new edition of this admirable text book. The success of Strasburger's text book may be judged from the fact that it is the fourth edition to appear in English. The present work has been prepared from the 10th German edition, and a study of its 767 pages will show that the work of producing it in its English form has been thoroughly well done. The most notable change presented by the new edition consists in the section devoted to physiology, which has been entirely re-written by Professor Jost. This text-book of botany may be recommended without reserve to all serious students of the science, and the only direction in which we could wish a change would be in the lowering of the price in order that the book might be brought within the reach of a yet wider public: though having regard to the size of the book and to the fulness with which it is illustrated, both by black and white and coloured figures, it cannot be suggested that the present price is other than moderate. Its appearance will strike a chord of sadness in reminding English-speaking botanists of the loss which they have sustained in the recent death of the great German botanist, Professor Edward Strasburger, to whom this text-book owes its origin.

CHRYSANTHEMUMS.†

THIS new volume, by a Transatlantic writer for Transatlantic growers, is interesting to those on this side of the Atlantic, chiefly on account of the methods of cultivation it propounds, many of them being different from those pursued in England. The methods of exhibiting are also different, as many as 25 to 100 blooms of one variety being shown on long stems, and the pointing is on quite another system from ours, as well as a distinct scale, 100 points in all being given instead of our few. The illustrations exhibit even more than the text how wide apart are the systems pursued in the two countries. An illustration of a specimen trained plant (opposite page 62) shows a framework of wires, which completely spoils the effect, and one could hardly imagine anyone daring to exhibit such a plant at any of our exhibitions. Specimen blooms in America are exhibited as they grow—undressed—though he must be a queer cultivator who could refrain from removing imperfect petals and arranging those where a slight change would produce a prettier bloom. The book teems with information on many cultural points, and is profusely illustrated in half-tone. *R. P. B.*

THE FORCING OF PLANTS BY ELECTRICITY.‡

THE author of this little book has performed a useful service in bringing together the results of experiments made by various investigators on the forcing of plants by means of electricity. Miss Dudgeon, whose work on the electro-culture of plants has been noticed in these pages, is properly cautious with respect to the possibilities of the method, and admits in her introduction that it has not yet passed beyond the experimental stage. It is true that there is a general agreement between those who have used electrical methods of forcing that crops grown by the aid of electricity mature somewhat earlier and yield somewhat more freely than those cultivated in the ordinary way; but it has yet to be proved that the increased return will pay for the outlay necessary for the installation of the electric plant.

After a brief account of Lemstrom's experiments, made at Durham College in 1902, Miss Dudgeon describes those which have been made in recent years both by herself and by others. The table of yields of Potatos shows that a considerable increase of yield was obtained when the growing plants were subjected to electrical treatment. Whilst acknowledging the usefulness of Miss Dudgeon's book, we regret that she has not included in it a full account of the Lodge-Priestley experiments, and also that she has not supplied a bibliography, the lack of which is a serious blemish on a work of this kind.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 66-71.)
(Continued from p. 200.)

8, ENGLAND, S.W.

HEREFORDSHIRE.—Apples are under the average, the trees being badly attacked with blight. In a few cases the trees will not recover from the attack. Pears are a good crop, and very clean and healthy. Plums are much under the average, excepting Egg Plums, which are a full crop. Strawberries have been unsatisfactory, and a large number of the plants were quite barren. Small fruits were plentiful and very good. Nuts also are a very full crop. The soil is a red, sandy loam. *Thos. Spencer, Goodrich Court Gardens, Ross.*

—— The trees produced plenty of bloom, but, owing to frosts and rains, the flowers suffered severely. This was especially the case with Peaches and Nectarines, although the trees were covered with nets and canvas. There was a little more blister than usual, but with careful attention on the first appearance we soon got rid of this disease. All the trees at the present time look well. Pears set freely, both on walls and in the open, and apparently all varieties are doing well. Apples are very patchy; such varieties as Cox's Orange Pippin, Blenheim Pippin, Lane's Prince Albert, and Bramley's Seedling are thin, but Worcester Pearmain, King of the Pippins, Ecklinville Seedling and Tom Putt are fairly good. The Strawberry crop was a total failure. Many plants died off after making a start into growth, and plants that survived did not set their flowers satisfactorily. Our soil is a heavy loam, resting on limestone. *George Mullins, Eastnor Castle Gardens, Ledbury.*

MONMOUTH.—Apples, Pears, Plums, and small fruits especially, blossomed freely. Apples were, to some extent, injured by the blossom weevil, Pears by the midge, and Plums and Black and Red Currants by aphis. Peaches and Nectarines suffered badly from leaf-curl, and the crops of these fruits are very thin. Strawberries were damaged by wet weather, though those grown for dessert were greatly benefited by supporting the fruit trusses with stakes. The continuance of cold, wet weather has been injurious to the fruit trees, which are planted in a heavy, cold soil, and the leaves of some, particularly Pears, are pale in colour. Our soil is of a clayey nature, resting on marl. *Thos. Coomber, The Hendre Gardens, Monmouth.*

—— The fruit crops in Monmouthshire as a whole, excepting Pears, Plums, small fruits and Nuts, are disappointing as to quantity and quality. The hope raised by the magnificent blossom was dispelled by uncongenial weather at the time of flowering, followed by several weeks without rain. In some parts of the county, where conditions were favourable, the fruit crops are fairly satisfactory, while in others, where the cultivation has been of the highest type of excellence, they are a failure. *W. J. Grant, County Council Offices, Newport.*

SOMERSET.—In the early spring there was again promise of abundant crops of all kinds of fruit, but owing to the unfavourable weather in April and May much of the bloom failed to set. Apples, Pears and Plums were most affected, and many of these trees have not a single fruit. Others growing quite near have set their fruit abundantly. This applies also to the cider Apple orchards, which are numerous in this district. *George Shawley, Halswell Park Gardens, Bridgwater.*

—— We had a wealth of blossom on all kinds of fruit, excepting Strawberries, but much of it was injured, and failed to set, owing to the unfavourable weather. Strawberries were almost scorched up during the drought of last summer, which no doubt accounted for the scarcity of blossom. Apples in some cases are well cropped, including such varieties as Beauty of Bath, Lord Suffield, Charles Ross, and Allington Pippin. But Blenheim Pippin, Cox's Orange Pippin, and Dumelow's Seedling (Wellington) are very scarce. Certain varieties of cider Apples are cropped very heavily. *G. H. Head, The Gardens, Kingsdon Manor, Taunton.*

WORCESTERSHIRE.—Apples and Pears are abundant all over the county. Plums are variable, but the quantity is under the average. Cherries have been very fine. Raspberries have been abundant, and Currants good. Strawberries were scarce, mainly owing to last year's drought. Nuts are plentiful on the western side of the county. *James Udale, Experimental Garden, Droitwich.*

—— In one part of these gardens the Apple crop is heavy. This quarter is on rising ground, and sheltered from the north and east. In another portion, in a low-lying part of the garden, the crops are almost a failure. Pears are a good crop. Plums are very plentiful, and have had to be thinned severely. Gooseberries and Red Currants bore enormous crops. Damson trees are breaking down their branches with the weight of the fruit. Strawberries would have been good, but wet and cold weather caused the ripening fruits to rot. Cherries in the open split with the wet, but on wall trees they were better. Morello Cherries, trained against a north wall, cropped heavily. The soil bereabouts is on the new red sandstone formation. *A. Young, Witley Court Gardens, Worcester.*

—— Apple trees flowered profusely, but the fruits set very badly. The trees generally are healthy, being fairly free from insect or fungous attacks. Pears are the best crop we have had for years, with much less "midge" than usual. This I attribute to the drought also, which occurred during the hibernating period. Strawberries were the worst crop. Plums are very partial. We have many on some trees and none on others. Cherries were very poor, and Apricots scarce. Peaches and Nectarines are good crops on open walls, and the trees are healthy. Small fruits were abundant, and very good. *W. Crump, V.M.H., Madresfield Court Gardens, Malvern.*

—— I believe there is a large percentage of iron in the soil here, as Apples colour so well. A small Apple tree will live with but one root, and it is a difficult matter to get the common Laurel to grow. We have a variety of soils. In some parts of the gardens it is a sandy loam, with a subsoil of marly clay; other parts consist of light surface soil and clay subsoil 15 inches from the surface. In our new kitchen garden, which is not quite an acre, the different varieties of soils are very pronounced: one part is, both surface and subsoil, of stiff clay; another part consists of a good loam with a clay subsoil, whilst another portion consists of a mixture of grey sand and marl, with varying subsoil. Pears are good and clean, and the same remark applies to Cherries. Blenheim Pippin Apples are very scarce. The early sorts of Apples are, on the whole, the best, including Worcester Pearmain. Gooseberries were a patchy crop. Plums are very clean, and Pears are a good crop. Damsons in one orchard are good, in others very patchy. Strawberries were the worst crop I have ever seen. *Thos. Watkins, The Grange Gardens, Claines.*

(To be concluded.)

OUTDOOR PEACH CULTURE.

THE cultivation of Peaches and Nectarines on open walls is not so well understood now as it was by the older generation of gardeners, say 50 years ago.

It was therefore a real treat to see them, on the occasion of a recent visit, so exceedingly well done by Mr. G. Woodward at the Barham Court gardens, where they seem to succeed on walls of all aspects. The late varieties are mostly grown, as they suit the purpose best, the produce of the gardens being marketed. I noted a few "points," which, by Mr. Woodward's permission, I will describe for the guidance of those who have not been successful with outdoor culture, but I must first refer to the situation. The gardens, which are on the Kentish rag-stone, fall gently to the south; the soil is naturally warm, and at the same time admits of heavy waterings being given without adversely affecting the roots. Water is pumped up from the Medway, half a mile below, to very large tanks at the top of the gardens, and there it is exposed to the sun, so that it is practically of the same temperature as the soil, or very nearly so. I state this as the evils of freshly-pumped cold water on the delicate feeding roots of Peaches is not always considered. Trees trained one year are preferred to start with; they are carefully planted and cut back early, and then make what many would look upon as wild growth, so strong are the branches, and the foliage is very robust (I measured leaves 9 inches in length). The following winter this exuberance is checked by root-pruning, and the operation is again performed in two years' time, thus over-luxuriance is checked and grand bearing wood is formed. Quite early in the season stopping is done and new wood laid in where needed, and thinning is rigorously carried out. One tree carried 40 dozen of fine fruit, each Peach having a square foot of space to itself. As soon as the fruits are gathered all fruiting wood not required for extension is cut out, and the sunny days of autumn finish the ripening of the wood. I noted foliage within a foot of the ground. Mr. Woodward endeavours to lay in a few shoots to cover the main stems close to the soil, or, if this is not possible, he uses a piece of Oak-bark to prevent the sun drying the main stem. Thus the main stem swells materially and is not constricted as one so often sees, to the detriment of growth. When the winter moisture in the soil becomes exhausted in the spring, water is applied to the borders by hose, in copious quantities, for half a day at a time, and when the Peach fruits are of the size of Walnuts a layer of Moss-dung litter is placed on the borders and watered as needed, throughout the summer. Although this summer has been so cool, there is no mildew to be seen on the leaves; this pest is prevented by dusting with sulphur freely on the walls. Earwigs are trapped merely by crumpling Rhubarb or Horse-radish leaves and laying them between the branches close to the wall. Every second day they are examined and the earwigs shaken into a tin vessel and afterwards killed with scalding water. From time to time the trees are gone over and any superfluous shoots removed, so that at the time of my visit (August 24) the branches were all flat against the wall and not a fore-right shoot was to be seen. I noted Peregrine, Goshawk, Dymond, Princess of Wales, but Sea Eagle is the main variety, with Hale's Early on an east wall.

The same liberal culture is given to the Pears on the walls, and the crop is clean and unusually abundant, whilst Apples of many sorts are grand samples. Those trees only which crop are freely mulched with the moss-dung.

One is always learning. Mr. Woodward finds that trees of Warner's King Apple after some years growth canker and fail to bear satisfactorily, so he re-grafts them with the same variety 3 to 5 feet from the base. They then make less vigorous growth, and fruit freely. *George Bunyard, Maidstone.*

The Week's Work.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

SEEDLINGS. — Seedlings of Cattleyas and Lælio-Cattleyas raised from late-sown seed should be far enough advanced in growth for transplanting. It is important that each plant be planted separately at the earliest possible time. Those pricked off now will have time to make roots before the winter. Where space is limited so that the plants cannot be accommodated singly in very small pots, several may be pricked out together into small pans. The ordinary shallow Orchid pan, without side holes, is the most suitable receptacle for the purpose. Seedlings that have matured their first pseudo-bulb will be sending out new roots from the base of the growths. These should be repotted in larger pots and given every encouragement to grow as quickly as possible. They will not make much growth in the winter and do not require so much water at the roots or in the atmosphere as in summer, but they must not be rested until the flowering stage is reached, nor must they be allowed to become root-bound. A suitable rooting medium consists of equal parts Osmunda fibre, A1 fibre, and Sphagnum-moss chopped into short portions, with a quantity of crushed crocks, and the whole mixed well together. The materials should not be pressed tightly in the receptacles, as it is important that water should pass quickly away. If a house is specially devoted to seedlings of this type of Orchid, it should be kept a few degrees warmer than the one in which the older plants are grown. Should it be necessary to grow them with the older plants, they should be placed in the warmer and shadier part of the house and near to the roof-glass. Seedling Cypripediums should be treated in the same manner as described above. Very young plants should be potted in a mixture of Osmunda fibre or A1 fibre, Sphagnum-moss, and fibrous loam from which all the small particles have been removed. Chop all the materials into short portions and incorporate a quantity of crushed crocks. The compost should be pressed moderately firm. Seedlings of more advanced growth and those nearing the flowering stage that have filled their pots with roots should be shifted into larger pots. These should be given a more substantial compost; it should consist of at least one-third its bulk of fibrous loam. After the seedlings are repotted, they should be afforded a warm, moist atmosphere and a shady position. Water should be applied sparingly, only keeping the compost just moist by frequent, light, overhead sprayings. Seedling Cymbidiums should be repotted in a similar compost to that recommended for Cypripediums. The plants should be kept growing actively at all seasons until they reach the flowering stage. They should occupy a position near the roof-glass in a house having an intermediate temperature.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

RENOVATING PEACHES AND NECTARINES.— The present is the most suitable time to attend to trees which have given unsatisfactory results during the past season. In extreme cases it may be necessary to lift the whole of the roots and replant them in fresh soil. This involves a great deal of labour, and needs to be done with great care. The advantage in doing this work now is that the trees will have time to make new roots before the end of the year, and in consequence will have somewhat recovered from the check caused by disturbing the roots before growth commences next season. The work of renovating may be commenced by taking out a trench about 3 feet wide down to the drainage materials. This will admit of a thorough inspection of the roots. The soil should be removed by a fork, working gradually towards the trees. As many roots as possible should be preserved, and whilst exposed they should be covered with mats kept regularly damped. The general condition of the border will be the best guide to the operator as to what extent it is expedient to disturb the roots. In all cases it must be seen that the drains are perfectly free, and the drainage materials ample and clean. This drainage should be placed on a concrete bottom to prevent the roots from entering the subsoil. It is not good practice to fill the whole of the border space at one time with fresh soil. If it is done by degrees, the trees will not grow too strong. The soil must not be too rich, therefore if new loam is used a quantity of old soil should be mixed with it, also plenty of old, coarse lime-rubble. The border should be made quite firm, and the roots arranged towards the surface as the work proceeds. Give sufficient water to soak the soil through and syringe the trees several times daily until they have recovered from the disturbance. Shade should be provided during times of bright sunshine until the trees have made fresh roots.

LIFTING YOUNG TREES.—Most young trees require to be lifted occasionally to encourage the formation of fibrous roots, and to keep the wood from becoming too gross. Before commencing this work see that the soil about the roots is thoroughly moist, but not too wet. Commence by digging a trench a few feet from the trees, then carefully fork the soil from about the roots, thus reducing the size of the ball so that it can be conveniently lifted. All strong-growing roots should be cut back, especially those growing in a downward direction. Before replanting see that the soil at the bottom of the hole is rammed quite firm, and allow a few inches for the soil to settle or the trees will be planted too deeply. Do not shake the soil from about the roots more than is unavoidable. Keep the foliage well syringed and shade the trees till they have recovered from the check.
