**WATERFORD.**—The fruit crops have turned out better than was expected, yet there was bitter, harsh weather at the time of the trees flowering. Small fruits and Pears are our best and most plentiful crops. The Apple crop may be put as under: The varieties of Apples that are fruiting most abundantly are: cookers—Bramley's Seedling, Annie Elizabeth, Hambling's Seedling, and Stone's; dessert—Beauty of Bath, James Grieve, and Blenheim Pippin. Small fruits were very plentiful and good. Green fly is troublesome. The soil is on a rather hard pan and of a light texture. *D. Cronbie, Curraghmore Gardens, Portlaw.*

CHANNEL ISLANDS.

**JERSEY.**—All fruit trees started into growth rather later than usual, and all flowered profusely, but not vigorously, most of the blossom dying on the trees, so that we have crops under the average. *Jas. Harper, Springfield Nurseries, St. Heliers.*

—The fruit crops this year are very poor. The trees blossomed well, but the fruits did not set, and much of what did set fell later, so that on the whole it is a very poor fruit year indeed. The trees seemed to have suffered much from the dry weather of last year and again this spring. *Thomas Sharman, The Imperial Nursery, St. Mark's Road, St. Heliers.*

## ADVERTISING BRITISH FRUITS.

GROWERS of Tomatos and other crops under glass are satisfied that the sale of their produce in a season which was not conducive to a strong demand has been helped very much by the big advertising campaign which they financed and supported with such commendable enthusiasm. Unfortunately the similar scheme for advertising outdoor-grown fruit, which made a very promising start, has not been able to secure anything like the same success, simply because it has not been properly supported by growers. A halfpenny in the pound sterling deducted by the salesman from the gross return for all consignments cannot be called an extravagant sum to spend on advertising; yet comparatively few growers have agreed to it. The promoters have found it very much more difficult to reach the orchardists than the glass-house growers. The bulk of the latter are concentrated in the Lea Valley, Worthing, and Guernsey; and they proved ready to attend meetings and quick to appreciate the value of propaganda. The orchardists, on the other hand, are scattered, and it has been found impossible to obtain a good attendance at meetings or to arouse enthusiasm for what is undoubtedly a sound scheme. Something is being done to advertise outdoor-grown fruit, but on nothing like the scale that would have been possible had more growers given their support. Valuable assistance in disposing of the enormous crop of Plums might have been secured if the scheme had been taken up enthusiastically. *Market Grower.*

## VEGETABLES.

A POTATO COMPETITION.

SOME very large crops were produced in a potato competition held by the Dale Abbey Allotment Association. Twenty-three of the members took part in the competition and each was supplied with one pound of seed tubers, the crop varying from 193 lb. to 44 lb. The second best yield was 191 lb., and there were also other yields of 110½ lb., 107½ lb., 103 lb. and 101 lb. respectively. The variety was Prosperity, a flattish-oval main crop variety, raised by Messrs. WEBB and Sons, Ltd., of Stourbridge.

## NURSERY NOTES.

## A FRUIT NURSERY.

WHEN the famous Veitchian nurseries, which included, beside the central establishment at Chelsea, others at Coombe Wood, Feltham, and Langley, were dissolved by the firm in 1914, much of the land was sold for other purposes, but the Langley nursery continued in its original use, a very large portion being acquired by Messrs. Sutton and Sons for the growing of flower seeds, whilst the section devoted to fruit and Roses passed into the hands of Mr. J. C. Allgrove, who was for forty years in the employ of Messrs. James Veitch and Sons. Mr. Allgrove was for very many years the manager of this particular section of the Veitchian business, and was, in a large measure, responsible for the high standard of quality for which Messrs. Veitch's fruit trees and other subjects grown by him at Middle Green were famous, and, although this nursery is changed in proprietorship, it is in name only, for the same high standard of quality and the best traditions of his old firm are continued by Mr. Allgrove, whose name stands high amongst his patrons and fellow-nurserymen for the quality of his wares, as well as for his integrity of business and sterling character.

Middle Green is one of three villages to which the name of "Green" is appended—George Green, Middle Green, and Horsemore Green—and is easily reached from Slough on the Great Western Railway. The nursery is about forty acres in extent, the major part being used for the raising and growing of fruit trees, a considerable portion for Roses, and the remainder for hardy herbaceous plants and alpiners.

All manner of fruit trees are cultivated by Mr. Allgrove, including pot specimens for orchard houses, as well as such subjects as Vines, Figs, and Nuts. Stone fruits in pots, including Peaches, Nectarines, Cherries, and Plums, are grown in a long lean-to house, and how well may be seen on reference to Fig. 104, which represents a splendid specimen of Jefferson Plum at the time it was in fruit. The greater portion of the nursery is devoted to the raising and growing of Apples and Pears, which do remarkably well, the soil being brick-earth, which is so suitable for fruit cultivation, and every year a considerable area of the nursery is trenched with the spade, the better to prepare it for the growth of the trees, which are lifted and replanted every few years. As the trees are sold and the ground cleared in any particular part each season, it is trenched and then devoted to Potatoes for the express purpose of clearing it and giving it a rest from fruits for a season. This leaves the soil in an excellent condition, and, when the young stock is planted, the trees make healthy, fruitful growth, as we saw at the time of our visit, specimens only two or three years old having relatively enormous crops. This was, perhaps, the most pronounced in Rev. W. Wilks Apple that was raised at Langley and is one of the most precocious of all fruit trees, for it bears well and gives fruits of enormous size, even when only two or three years old. The vigorous fruiting of this variety in a young state tells on its rate of growth, but slow development of the tree may be obviated by removing the fruits from young plants. This excellent Apple was raised from Peasgood's Nonesuch crossed with Ribston Pippin, and, whilst the first parent has given large size, the Ribston Pippin has contributed high quality. It is not a dessert variety, but it is a culinary Apple of high quality, although rather soft, for which reason it is not very suitable for transit unless picked at an early stage. It is sure to rank high in the list of culinary Apples, and will become a general favourite when better known and more plentiful. Langley has given us several other fine Apples beside this one. What in the opinion of some is the best early dessert Apple was raised in this nursery; we refer to St. Everard, a cross between Cox's Orange Pippin and Margil, a variety of very high quality and likened by many to an early

Cox's Orange Pippin; the fruits are ripe in September.

Another splendid Apple named S. T. Wright, not yet in cultivation, has been raised by Mr. Allgrove from Peasgood's Nonesuch crossed with Bismarck. Mr. Allgrove exhibited fruits of this new variety at the Holland Park Show, and they were conspicuous for their high colouring and general fine appearance in a collection of the best varieties, but they did not appear nearly so handsome then as when we saw them growing on two, three, and four year old plants in the nursery, where each fruit seemed as though covered with a glowing rose tint. It is gratifying to know that this new Apple is a prolific cropper, for appearance

large as those of Blue Pearmain, but very highly coloured.

The stock of Pear trees is equally large, and, like the Apples, the young Pears are healthy specimens, with strong, fruitful growth. One of the most interesting is the variety Mrs. Seden, that was raised from Seckle. It is a late keeping Pear of first-class quality, with the high flavour of Seckle, and melting, juicy, buttery flesh, with rich, aromatic flavour. It is a round fruit about 2½ inches in diameter, and coloured with pale yellow speckled with brown, the side exposed to the sun sometimes taking on a crimson tint. Those who appreciate the old Seckle Pear will find in Mrs. Seden a similar variety, but available much later in

FIG. 104.—PLUM JEFFERSON; A FINE EXAMPLE OF POT CULTURE.

and high colouring are not always accompanied by good bearing.

It was very interesting to observe the large blocks of Apple trees in various stages of development, from those which had been worked this year, maidens, two-year-old trees, many of which were fruiting, and so on to the trees ready for sending out to customers this autumn. Almost all varieties were represented, but the greatest numbers were those of the most popular varieties, such as Rival, Bramley's Seedling, Crawley Beauty, Charles Turner, Cox's Orange Pippin, Allington Pippin, Blue Pearmain, Christmas Pearmain, Ellison's Orange, James Grieve, King of the Pippins, Langley Pippin, St. Edmund's Pippin, and Wealthy, these including some of the best sorts in cultivation for all purposes. Our attention was directed to a very showy variety named Swedish Reinette, which has fruits as

the year. Another Pear that attracted our notice was Beurré de Mortillet, a most handsome fruit, with bright red, almost scarlet, cheek. Other excellent Pears included Beurré Superfin, Charles Ernest, Comte de Lamy, Conference, Dana's Hovey, Doyenné du Comice, Durondeau, Easter Beurré, Emile d'Heyst, Forelle, Glou Morceau, Josephine de Malines, Louise Bonne de Jersey, Marie Louise, Marguerite Marillat, Olivier de Serres, Seckle, Thompson, and Winter Nelis. The Apple and Pear trees are trained in a variety of shapes, including bushes, standards, espaliers, single, triple, and double cordons.

Plums are very extensively propagated for sale by Mr. Allgrove, and his new Allgrove's Superb is a valuable addition to the list of dessert varieties. It is like a coloured Jefferson, of large size, with a beautiful dark purple colouring and very high quality. Splendidly

fruited trees in pots of such sorts as Coe's Golden Drop, Transparent Gage, one of the choicest of all dessert Plums, Coe's Violet, Denniston's Superb, Kirke's, Golden Transparent, and President were observed, but those in the open were mostly over, although there were some remarkable crops of the Langley Bullace, a seedling from the Farleigh Damson and Black Orleans Plum. Other stone fruits, such as Cherries, Apricots, Peaches, and Nectarines were noticed, trained in a variety of shapes; the stock of trained Peach trees is one of the best in the country. Mr. Allgrove is sometimes called upon to despatch, say, a Peach tree at a time when it would be impossible to lift it from the open ground, and, to meet this demand, trees are grown in large tubs or boxes, to permit of them being transported bodily and planted against a wall or in a glasshouse, even in the height of summer, it being merely necessary to knock away the boards that enclose the roots and to set the latter in the border. A very fine stock of young Vines and also of pot Figs is grown in an enclosed garden, a little distance from the nursery proper, where there are several fine glasshouses for the purpose.

Most growers are aware that Mr. Allgrove makes a speciality of Gooseberries, for his exhibits of these fruits at the R.H.S. fortnightly meetings have earned high encomiums; indeed, no one of the present day shows Gooseberries so well as this nurseryman. Several fine sorts have originated at Middle Green including Langley Beauty and Langley Gage, two of the finest dessert varieties, the former a yellow and the other a white fruited sort. Gooseberries are trained in a variety of forms; cordons are most prolific cropping and very profitable. The stock at Langley includes nearly all the best varieties such as Dan's Mistake, Broom Girl, Leveller, Trumpeter, Fearless, Langley Gage, Talfound, Whinham's Industry and Whitesmith.

A brief reference may be made to the fine stock of Roses, which at the time of our visit presented a feast of floral beauty in their wealth of autumn flowers. The collection embraces all the popular sorts in cultivation and the plants evidently find the soil to their liking, judging by the splendid growth they make. Mr. Allgrove has made a speciality of Rose species that are ornamental through their fruits. Several Roses with attractive hips have been introduced from China in recent years and the best of these is probably R. Moyesii, but Mr. Allgrove informed us that there were two types of this plant, one much superior than the other. It is darker in foliage and berry than R. Fargesii and the fruits have only a few hairs, while those of Fargesii are hairy all over; the berries also are a brighter scarlet. R. setipoda is another beautiful species of this type. Herbaceous and alpine plants are cultivated extensively by Mr. Allgrove and his collection of these plants includes many gems of these easily grown and popular plants.

## DAHIA CONFERENCE.

UNDER the auspices of the National Dahlia Society, a Conference was held at the Royal Horticultural Hall, Westminster, at 4.30 p.m., on Tuesday, the 17th inst. Sir Frederick Keeble, F.R.S., presided, and was supported on the platform by Mr. Joseph Cheal, Mr. John Green, and Mr. A. C. Bartlett, respectively Chairman, Treasurer, and Hon. Secretary of the N.D.S. The attendance was good, and two admirable papers were read—the first, on "Dahlias for Parks and Gardens," by Mr. T. Hay, Superintendent of Regent's Park, and "Exhibiting Dahlias," by Mr. J. T. West, of Brentwood. Mr. Hay's contribution was particularly interesting, and his advice should prove of immense value to those who desire to use the Dahlia as a garden plant in public parks or private gardens. At Regent's Park, Mr. Hay has shown how valuable the Dahlia is for the production of fine colour effects in the autumn, and by a process of careful selection he has discovered the varieties most suitable for his purpose. A note on the Dahlias at Regent's Park last year, in *Gard. Chron.*, October 29,

1921, showed that very large numbers of varieties are grown there, yet they are all suitable for the purpose, although probably not representing a tithe of those that are fitted for massing on a grand scale.

Mr. West confined his attention to advice on the cultivation of Dahlias for exhibition purposes and the staging of flowers when produced, and, as he is one of the oldest of exhibitors, he had many interesting comments to make upon methods adopted in the past and many suggestions to offer with regard to the future.

In opening the discussion on Mr. Hay's paper Mr. J. Cheal expressed his great pleasure in it and agreed with the lecturer that the Dahlia was eminently suitable for the decoration of such public places as Regent's Park and even those in less favoured places, citing Germendsey, where Mr. W. H. Aggett has for many years grown a large collection of Dahlias with great success, and these have given immense pleasure to the public. Mr. Cheal stated that in his own garden he had experimented with various Dahlias in beds, and of all the combinations he had tried none gave greater pleasure than the bed of the dwarf Crimson Flag edged with a still dwarfier yellow Mignon variety.

Mr. J. B. Riding, in congratulating Mr. T. Hay on the great success of the Dahlias at Regent's Park, said he looked upon Mr. Hay as a real Dahlia apostle, as he had also induced a great many others to love and to grow Dahlias. Mr. Riding said he had an intimate acquaintance with Regent's Park over a long period and he was greatly impressed by the enormous improvement Mr. Hay had effected in so short a time. In his opinion, the floral effect of the bedding Dahlias at Regent's Park was simply wonderful and was a great incentive to others to go and grow likewise. He was glad that at last public park superintendents had realised the great value of Dahlias in the scheme of floral decoration. With regard to the possible value of Dahlia imperialis as a parent, he could not agree with the lecturer, as this species flowers much too late in the season to be of value in this country. The Dutch varieties, he remarked, were in some instances improvements on previous varieties, but, as a rule, English raisers were sending out superior varieties.

Mr. R. H. Holton was especially glad that the lecturer emphasised the long period of flowering the Dahlia enjoys even in an average season and he was of the opinion that in giving it as three months, the lecturer was not guilty of exaggeration. Often it was distinctly longer and far too many persons were under the erroneous impression that as soon as the Dahlias come into flower frosts destroy them.

Speaking as an amateur of long experience, Mr. G. Stanbridge said he quite agreed that the Cactus varieties were inferior to the other types for garden decoration. Their flowers are hidden in the foliage, and with the possible exception of Britannia, he found that none would consistently produce their flowers above the foliage—the Cactus varieties were all too weak in the stem. His experience with Collette Dahlias was that after the second year they all produced a double row of ray florets. He did not agree with Mr. Hay's estimate of the value of Coltness Gem, but preferred Lemur, which he considered to be the ideal bedding Dahlia. With regard to the Star Dahlias, these he found were not a true type: there was a spare, poorly formed floret in every flower.

Mr. A. W. Vasey felt that Mr. Hay had earned the gratitude of all Dahlia lovers by his successful endeavour to popularise the flower. With regard to the diverse opinions on Coltness Gem, he was of the opinion that it has a great future. No other variety is quite identical, though Brentwood Yellow comes near to it. The paucity of foliage, which met with the disapproval of a previous speaker was, in his opinion, a great asset, as the plants were all a blaze of colour. He had derived great pleasure from the Mignon Dahlias at Regent's Park, where they were dwarf plants not more than 18 inches high, bearing a profusion of bloom. Although the Cactus varieties are the least attractive when growing they appeal to many, and

of the sales, of Dahlias by his firm, 47 per cent. were of Cactus varieties. In addition to Mary Purrier, mentioned by Mr. Holton, there were numbers of good Cactus varieties that produced their flowers above the foliage, and he instanced Border King and Sweet Briar. Mr. Vasey said he had seen all the Dutch varieties growing in Holland, and he was impressed by the fact that nearly all produced masses of flowers on long, stout stems, but as decorative varieties, Mr. West's dwarf Paony-flowered type and Messrs. Burrell's novelties were the more charming and would be largely grown in the future.

Mr. W. Stephens was of the decided opinion that the place for Cactus Dahlias was in the kitchen garden, though after a long experience of them he stated that, even if he again possessed a large garden, he would not grow even one Cactus Dahlia. For a small garden and for general usefulness, he preferred the Star and Miniature Paony varieties.

In closing the discussion, Sir Frederick Keeble said he felt that the difference of opinion that had been expressed was a most healthy sign for the future of the Dahlia, and he reminded the gathering that "In matters of taste, there is no disputation." Expressed dislike of a plant or flower may often imply ignorance of its beauties, for all are beautiful in their own sphere, and those who could not see superlative beauty in Dahlias had only to visit Regent's Park to be converted. He felt that the Dahlia, whether grown massed in beds, or the tall varieties against the background of green trees, or as cut flowers in a smart room, has no fear in comparison with other flowers. Even though the English raisers of Dahlias have, as has been seen at the R.H.S. so many times, raised most fascinating varieties, Sir Frederick Keeble often wondered why the raisers of new Dahlias did not send a collector to that mountain-side in Mexico where, he was told, there grows a hardier Dahlia than ours, which will withstand a few degrees of frost. This species would be of great value as a parent of hardy varieties.

## ON "EXHIBITING DAHLIAS."

Mr. West's paper was also listened to with great attention. Mr. W. Stephens, who opened the discussion, said he was sorry to hear the use of wire frames recommended, as he hoped the day would not be far distant when the N.D.S. abolished the use of wires at its shows. He had been troubled greatly by earwigs and had found trapping them in small flowers pots to be most useful. By this means he had often caught as many as 150 in a single morning amongst a small collection of Dahlias.

Mr. C. R. Skillin said he had been greatly enlightened by Mr. West's remarks on cultivation. The difficulties of amateurs who, like himself, had to grow their Dahlias in small London gardens, were greater than those more fortunately placed realised, and such knowledge as that so freely given by Mr. West was most helpful. Replying to Mr. Skillin's question, Mr. West said that pot roots would flower three weeks earlier than those from tubers, but they did not make such pretty plants in the earlier stages of their growth.

Referring to artificial support for Dahlias, Mr. Stanbridge expressed the opinion that the use of such foliage as Berberis should not be allowed, as this handicapped the small grower.

In proposing votes of thanks to the lecturers, Mr. W. Stephens said that he hoped both excellent lectures would be published by the National Dahlia Society, as they contained much advice which would be helpful, particularly to young growers. Mr. J. B. Riding, in seconding, again referred to the great work Mr. Hay has done for the Dahlia and agreed with Mr. Skillin that any advice given by Mr. West out of his long and careful experience was well worth following.

In reply, Mr. Hay stated that he had found that sheets of newspaper rolled into loose balls and placed around the Dahlia plants made most efficient earwig traps.

A hearty vote of thanks was accorded to Sir Frederick Keeble for presiding.

[We hope to publish the papers read at the conference, in subsequent issues.—Eds.]

## HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

**Mentha piperita vulgaris.**—I have been told that no one has collected this plant since W. Sole did so. Sir James Edward Smith records that Dale, a collector of Mints, found it in Essex; and he also found a specimen in Sherard's herbarium, collected by the river at Wandsworth. According to his records, for Sole's finds of it, the plant must have been fairly frequent about Bath, between Wells and Glastonbury, and also at Chilern Bottom, Wilts. Last year I had a specimen from a young man named William Nelmes, from the valley of the Severn, near Alveston, Gloucestershire. I was greatly interested in it and got him to send me a root, which flowered this year. It differs from *M. piperita* in having broader, more ovate leaves, rounded or subcordate at the base, instead of being wedge-shaped as in the typical *M. p. officinalis*, and in having much shorter oblong spikes of flowers, often almost capitate, especially on the branches. It agrees in every particular with the description by Sole and other authors. I have also seen dried specimens in two different herbaria. In my opinion it is a hybrid, namely, *M. hirsuta* × *piperita*; and I also venture the opinion that *M. piperita* could not produce seedlings of its own, because it is always a female plant so far as my observations go and the descriptions I have read. Sole's *M. p. vulgaris* was female; so is my plant. *J. F.*

**History of the Moss Rose.**—It is really difficult to guess what useful purpose Mr. Mark Mills fancies he is rendering by his contribution under the above heading (see page 217). His comments are mainly irrelevant so far as the Moss Rose is concerned, and to widen the scope of the subject under consideration by importing into it such questions as to the Provence, the Musk and the monthly Roses having been grown in English gardens is to state a self-evident fact that has not been called into question. Of course they have—and everybody is aware of it. But when he naively suggests that an original edition of Culpeper's *Complete Herbal* may "probably" contain a reference to the Moss Rose, which his later editor does not, he is passing beyond the bounds of probabilities. Why "probably"? Mr. Mills's concluding remarks are: "It appears that monthly Roses have been grown many years in our English gardens." Was it necessary to consult Culpeper's ancient work to be assured of that fact, and, if so, what has that to do with the Moss Rose? *C. Harman Payne.*

**Branch Cuttings of Apples.**—In reply to Mr. E. F. M. Hewat's letter, in the issue for September 16, p. 169, asking for further information respecting Apple cuttings, all the cuttings that I have been successful with have had a number of burr-knots on them, or aerial roots, as we call them in Cornwall. I make the cutting just below where it is producing the burr-knots; whether it be below the elbow bend or above it, I have not discovered that it makes any difference. About nine inches is a very good depth to plant the cuttings; in the case of very large ones, one foot would not be too deep. The soil should be made firm after the cuttings are inserted. I prefer rather small cuttings to large ones. *J. Treloar, Trevarno Gardens, Helston, Cornwall.*

**The Hibernation of Wasps.**—No, *Market Grower*, it is not a fact that the vast majority of the wasps taken in the spring are "drones that have been in hibernation." Only in a very exceptionally mild and open autumn and winter could drones survive until the spring. In the ordinary course, all the drones and workers perish in the autumn and only the fertile queens survive the winter. The wasp supply in any year depends on three factors: (1) The number of queens surviving the many dangers of hibernation; (2) the character of the weather in March and April when they are awakening from their winter torpidity; and (3) the general character of the weather during the summer. If all these are favourable, it will

be a good wasp year, but if any one of them is unfavourable, the chances are that wasps will be scarce, or, at any rate, not abundant during the season. *C. Nicholson.*

**Wasps' Nests.**—Mr. Geo. Bayliss asks, in *The Gardeners' Chronicle* of September 30, if any of your readers have exceeded the record of 75 wasps' nests this season. We have exceeded his figures by a large margin. Up to August 10, our boy staff obtained 160 wasps' nests for exhibition at the Madresfield Horticultural show; up to date (October 9) the total number of nests taken is 178, in addition to three hornets' nests. All these were taken within a mile radius of Madresfield gardens. We usually have a plague of wasps here in a good Plum season; there seem to be several different kinds, but though their distinctive names are unknown to us, we are able to state from experience that they all have stings! *R. Summers (Foreman), Madresfield Court Gardens.*

**The Cult of the Bonfire.**—Whether it is due to a disposition for tidiness or a craving for destruction inherent in mankind, it is difficult to say, but the fall of the leaf and the ingathering of autumn crops appear to be signals for the creation of innumerable bonfires throughout the kingdom. One of the greatest problems that horticulture has to face is the supply of organic manures, and with the growing substitution of machinery for animal power this problem becomes more acute; yet the habit of disposing of vegetable refuse by burning seems to be ingrained in gardeners, and few realise how seriously the potentialities of soil fertility are affected by this destruction. During the past year I have collected sufficient vegetable refuse to make 200 loads of manure for the supply of these gardens. This manure has been used for almost every kind of crop, and the results are in every way satisfactory. If anyone is sceptical, a visit to these gardens to see the system in practice should prove convincing, and a heap of manure now lying ready for use made from last year's Rose-prunings should prove additionally interesting. *W. Auton, Pyrford Court Gardens, Woking.*

**Acclimatisation** (see pp. 224-225).—After reading the concluding paragraph in the article on "Acclimatisation," we must admit that but little progress has been made in evolving frost-resisting races of certain garden plants—for example, Kidney Beans, Potatos, Dahlias. The Kidney Bean is mentioned in the article, and certainly it would appear to be as tender now as it was when Sir J. D. Hooker reviewed the *Origin of Species* in *The Gardeners' Chronicle* sixty-three years ago. This year, in these gardens, Kidney Beans were cut by frost on September 9, before a single pod had been pulled. Of Potatos, Epicure, while not completely frost-resisting, is a variety which very quickly recovers from frost-bite and grows away again, little the worse. This is one of the reasons why this variety is so extensively planted for early lifting on the Ayrshire littoral. And because of this, and not for quality, it comes out near the top in Mr. Cuthbertson's Scottish Potato acreage, published in your columns some little time ago. *Fred W. Jeffery, Dalsarf, N.B.*

**Garnations for the Garden** (see p. 155).—Mr. W. J. Farmer will probably find what he requires among the perpetual-flowering Border Carnations. I send blooms gathered from plants that were raised from cuttings in 1921, the cuttings in turn being taken from seedlings that were raised in 1920. The plants make erect growth up to 30 inches tall; they are free flowering, and will bloom until frost stops them. A few of last autumn's flower buds withstood the winter and expanded early this season. *D. S. Fleming, 44, Maples Street, Nottingham.*

**A New Grape.**—The Grape exhibited by Mr. W. Butcher at the meeting of the R.H.S., on October 17, will, if new, prove especially valuable for amateurs with cool conservatories and green-houses. The definite statement was made that it was raised from a pip of a white variety, so that it is scarcely possible that it is a Grape already in cultivation. *G.*

## SOCIETIES.

## ASSOCIATION OF ECONOMIC BIOLOGISTS.

PROFESSOR E. B. POULTON, F.R.S., the President, took the chair at a meeting of the Association of Economic Biologists, held in the Imperial College of Science, on Friday, October 13, 1922. A discussion on "Virus Diseases" was opened by Dr. E. J. Butler, Director of the Imperial Bureau of Mycology, who spoke on "Virus Diseases in Plants," and by Dr. J. A. Arkwright, of the Lister Institute of Preventive Medicine, who spoke on "Virus Diseases in Animals and Man." In both animal and plant pathology diseases, due to filterable viruses, enzymes, ultramicroscopic organisms, or whatever the causal agents may be, are assuming greater and greater importance, and many of these maladies are among the most insidious and destructive known. Among diseases of plants, the following may perhaps be mentioned: All the diseases known as "mosaic," which are found in Potatos, Tobacco, Tomato, Cucumber, Sugar-cane, Mangolds, and a great variety of cultivated and wild plants; Peach yellows, degeneration of Potatos, Potato leaf roll, and many other obscure troubles. Animal and human virus diseases include typhus, foot and mouth disease, pleuro-pneumonia of cattle, infectious anaemia of horses, fowl-pox, vaccinia, rabies, etc. During the past decade, a great deal of attention has been focussed upon these diseases, and much is now known of their symptoms and the physical and biological properties of the causal agents. Thus, no virus disease of plants is transmissible apparently through an unbroken skin. In certain cases, the grafting or budding of a diseased portion upon a healthy stock is necessary for the transference of the disease, others must be carried by certain insects, whereas, in a third group, the expressed juice of diseased plants, even diluted to one in ten thousand, and lightly rubbed on young leaves, is sufficient to transmit the disease. Furthermore, the whole problem is complicated by the fact that plants may contain the disease-causing virus in quantity and act as a centre of infection without themselves suffering in any way. One of the most important observations of recent years, if confirmed, is that on the obligatory incubation period of the virus of curly-top of Sugar Beet in the body of *Entettix tenella*. A disease-causing agent with a life cycle, one moiety of which is spent in the host plant and the other in an insect, would be something entirely new in plant pathology, and throw open to investigation a very wide territory indeed. In one or two cases, such as Bean Mosaic, and very rarely in Mosaic of Cucumber, the virus is carried in the seed, whilst in the quercina disease of Thorn Apple, it is passed by the pollen. There is no evidence that any virus exists in the soil or has a life apart from the plant.

There has in the past been considerable, if somewhat sterile, discussion as to the actual nature of the virus, whether it is a kind of self-augmenting ferment or a definite organism too small to be seen under the microscope, the balance of opinion leaning to the latter view. Many years ago, Iwanowski described bacterial-like bodies in mosaic tissues, and within the last year three observers have described bodies of various kinds in Maize and Tobacco suffering from mosaic disease. Mr. Kenneth Smith, of Manchester University, has also found what may be an organism in the tissues of Potato plants suffering from leaf curl, and demonstrated it to this meeting. Taking a wide view of the whole subject of virus diseases in plants, one cannot help but feel that extremely difficult, and at times almost disheartening, as these investigations are, great progress has already been made, and that we are on the eve of a much fuller understanding of this vastly important, and hitherto very obscure, group of diseases.

In his paper on "Virus Diseases in Animals and Man," Dr. Arkwright briefly reviewed the chief points of interest common to plant and animal virus diseases, and then considered the causal relationships of the principal diseases coming within the sphere of the discussion. The

physical and biological properties of the viruses were discussed, and the interpretation of certain of the viruses considered on the analogy of Twort's lytic substance and the bacteriophage of d'Herelle. In the discussion which followed, Dr. Jackson Clarke described his observations and experiments on the causal organisms of molluscum tumours, and Mr. Kenneth Smith and Dr. W. F. Bewley their work on virus diseases of Potatoes and of Tomatoes respectively.

### BRITISH MYCOLOGICAL

THE twenty-sixth autumn foray and annual meeting of the British Mycological Society was held at Keswick, September 15th-21st. Over sixty members and friends were present.

The first day's outing was to Thirlmere. Fisher Crag and Great How were explored in what was described as Lake District weather. The woods were much too rocky for good hunting, but several interesting species were found:—*Synchytrium Taraxaci*, *Leotia lubrica*, *Taphrina aurea*, *Gymnosporangium clavariaeforme*, *G. Juniperi*, *Coleosporium Melampyri*, *Thecopora Vacciniorum*, *Lactarius uvidus*, *Entoloma griseocyanum*, *Cortinarius saturninus* and *Diclyolus muscigena*.

In the evening the annual meeting was held. Professor O. V. Darbishire, of Bristol, was elected President, Mr. W. N. Cheeseman Vice-President and Dame Helen Gwynne-Vaughan and Mr. Somerville Hastings members of the Council. The remaining officers of the Society were re-elected. Mr. J. Ramsbottom was appointed delegate to the British Association at Liverpool next year. The Spring Foray was fixed for Bristol, but the locality of the Autumn Foray was left for the Council to arrange. Other matters decided during the meeting were the drawing-up of a list of popular names for plant diseases, and the arrangement of a day's phytopathological excursion on the recommendation of the sub-committee for plant pathology; and the purchase of systematic works, and one or more microscopes for use at the forays on the recommendations of the library committee. Sunday morning was free.

In the afternoon the Pine woods on Latrigg were worked and gave several interesting additions, including *Tricholoma leucocephalum*, *T. psammopus*, *Pholiota flammans*, *Galera mycenopsis*, *Inocybe cervicolor*, *I. Godevi* and *Exidia nucleata*. On Monday the members drove to Lodore and then split into sections, some working through Barrow Wood to Great Wood, others working Borrowdale and the remainder coming back round the other side of Derwentwater through Manistev Park and Brandlehow and on to Portinscale. The main additions were *Trichoglossum hirsutum*, *Elaphomyces granulatus*, *Xenodocheus carbonarius*, *Milesina Blechni*, *Hygrophorus obrussens*, *Pluteus nanus*, *Flammula rubicundula*, *F. scamba*, *F. gummosa*, *Inocybe proximella*, *I. calamistrata*, *Cortinarius armillatus*, *C. bolaris*, *Boletus rugosus*, *Clavatia fumosus* and *Lycoperdon umbrinum*.

In the evening Mr. F. T. Brooks gave a stimulating presidential address on "Some present-day aspects of mycology." In it he discussed the origin and phylogeny of the fungi, maintaining their derivation from protist organisms without direct relationship with the algae and emphasising their development upon novel lines as an entirely separate and characteristic group of plants. Arguments were advanced against the ideas commonly held that the fungi are phylogenetically related to the green and red algae, or that they have been evolved from trans migrant seaweeds in ancient times. A monophyletic origin of the fungi was favoured, and the inter-relationships of the constituent groups were discussed.

The relation of mycology to plant pathology was considered, a matter of considerable importance seeing that most plant diseases are caused by fungi. The need of a broad outlook, both physiological and morphological, upon the fungi was stressed, and an appeal was made for closer co-operation in future between systematic mycologists and plant pathologists. Attention was called to the inadequacy of the diagnosis of certain genera and species of pathological importance, and to the great influence

of environmental conditions upon the growth of all kinds of fungal organisms.

Finally, the training of mycologists and plant pathologists was discussed. The view was held that the mycologist or plant pathologist must be essentially a botanist with the necessary training in chemistry and physics. For the plant pathologist a sense of crop values and of the important phases in the growth of crops should be inculcated. Any tendency, however, to divorce mycology and plant pathology from botany was, in his opinion, a profound mistake, and should be resisted to the uttermost.

On Tuesday, Bassenthwaite Woods were worked—again in Lake District weather. Interesting additions to the list of fungi were:—*Leotia chlorocephala*, *Cordyceps ophioglossoides*, *C. militaris*, *Milesina Dieteliana*, *Russula nitida*, *Hygrophorus turundus*, *Pleurotus mitis*, *Psalliota haemorrhoidaria* and *Aleurodiscus amorphus*. In the evening Mr. Somerville Hastings gave a short account of certain observations he had made in the Alps on the growth forms of *Anellaria separata* occurring on old pads before the cows were taken up. The lantern slides showed the fungi to have large caps and very short stems. It was suggested that the characters shown were adaptational and could be compared with those exhibited by Alpine-flowering plants.

Professor A. H. R. Buller followed with a paper on "Luminosity in *Panus*," in which he described the results of his investigations upon *Panus stypticus*, which occurs both in Europe and in North America. There are about thirty species of luminous bacteria and about twenty luminous fungi known. The commonest of the latter is the common *Armillaria mellea*, of which the mycelium emits light, and is the principal agent causing the luminosity of touch-wood. In the American form of *Panus stypticus* the mycelium and fruit body are both luminous. Photographs were exhibited made with the fungus light, and an apparatus was described which permits of the turning off and on of the light instantaneously by controlling the supply of oxygen. Fruit bodies give out light at, and even just below, the freezing point of water. Mycelium grown on blocks of Birch wood remained luminous for six months. The fact was mentioned that many rotting leaves are known to emit light, and the following evening a dark seance was held and rotting Oak leaves were seen giving out a faint glow.

The last day of the foray was spent at Whythop Woods, and the following species were added to the lists:—*Spathularia flavida*, *Helvella crispa*, *Cheilymenia dalmeniensis*, *Russula fragilis* var. *fallax*, *Inocybe praetervisa*, *Cortinarius uraceus*, *C. myrtilinus*, *C. largus*, *Radulum mucidum*, *Echynia faginea*. Other interesting species found by members in the Keswick district were *Hypomyces atroiridis*, *Microglossum viride*, *Amanitopsis adnata*, *Lactarius spinulosus*, *Boletus calopus* and *Nidularia confuens*.

On Wednesday evening Miss E. M. Wakefield gave a general account of observations she had made during six months spent in the Lesser Antilles and Trinidad. The paper aimed at giving a brief general sketch of the fungus flora of these islands, using its characteristics to illustrate the distribution of fungi as affected by climate and the differences between tropical and temperate fungus-floras in general.

Dr. J. C. Walker, of the Bureau of Plant Industry, U.S.A., was invited to give a short address and described the distribution in the States of *Phoma Lingam* and *Urocystis cepulae* and how they are dependent upon climatic factors—rain in the case of the former and heat in the latter. It is of interest to plant pathologists in this country to learn how such natural barriers come into play in immense tracts of country.

Mr. Carleton Rea read an interesting and amusing paper on Edible Fungi. In it he commented on about one hundred species of the larger kinds—a valuable list but far too lengthy to enumerate here. It is not so necessary for a mycophagist to discriminate nearly related species as it is for a systematist, but he should be well within the limits of variability. A fungus should not only be edible, but should be palatable. It was recommended that all edible

fungi should be cooked in an earthen casserole, having a lid, with a plentiful supply of butter, margarine or other fats and the addition of salt and pepper. To appreciate thoroughly the distinctive flavour of each species they should be cooked separately; the lid will retain the aroma in the food. The length of time necessary for the cooking of different species varies from ten to fifteen minutes for *Amanitopsis vaginata* to over five hours for *Marasmius oreades*; a little experience enables one to judge the approximate time that should be allowed for each species. In practice it is often quite impossible to restrict the trial to one species, and it is then advisable to deal with nearly related forms. *Marasmius oreades*, although excellent, is best dried and reserved for winter use or as a flavouring for soup.

Before *Boletus* spp. are cooked the tubes should be removed. In the case of viscid species it is advisable also to remove the pellicle of the cap. The stems are just as good as the cap if cut in thin transverse slices. *Fistulina hepatica* is best cut up and placed in vinegar much in the same way as Beetroot. *Hydnum repandum* and *Cantharellus cibarius* should be sliced before cooking, and are greatly improved by being soaked for a time in milk. *Clavaria* spp. should only be eaten when in a fresh, growing condition—when dried by wind or sun they are leathery and tough. *Lycoperdon* spp. should be gathered only when the flesh is quite white inside. The skin and sterile bases should be removed and the flesh cut into slices about one quarter of an inch thick. All species of *Morchella* and *Helvella* are delicious, and their flavour is improved and their flesh made more tender if they are cooked in good stock; they can then be served on toast—the liquid being rejected, as it would contain an irritant acid.

The last paper of the meeting was a very brief account by Professor M. C. Potter of preliminary experiments made with the object of testing whether the acidity or alkalinity of the soil had any influence upon the prevalence of wart disease in Potato. The results obtained appear to indicate that if the soil is rendered sufficiently alkaline (approximately Ph. 10.5) wart disease does not develop. Incidentally it may be remarked that soil alkalinity while preventing wart disease has a tendency to diminish the crop.

The foray was a great success. Although from a collecting point of view the quantities of individual species did not reach those of the best years, there was an exceedingly good number found, many of which were quite rare. The present season appears to have been at its best about August; the decrease in numbers towards what is usually considered the most prolific period seems to be analogous to the "flush" in Mushroom growing. A remarkable fact is the large numbers of *Cordyceps militaris* seen in some parts (e.g., Keswick), and in many others the great abundance of species of *Helvella*.

### ROYAL CALEDONIAN HORTICULTURAL.

OCTOBER 3.—The ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. W. J. Thomson, vice-president, in the chair.

A paper on "Exotic Plants," by the late Mr. Osgood H. Mackenzie, of Tournai, Poolewe, West Ross-shire, in which the remarkable mildness of the climate in that part of Scotland was amply demonstrated by the record of large specimens of introduced plants, which in the eastern parts of the country are only cultivated under glass, but flower profusely, and in most cases fruit, annually in that district, was read by the secretary. The late Mr. Mackenzie was an enthusiastic cultivator of these plants, and the results he obtained were, in many instances, remarkable.

Among the largest were the *Eucalypti*, of which some 50 to 60 specimens were grown, the oldest (25 years) being about six feet in circumference near the base. *E. coccifera* and *E. unguera* formed almost perfectly cylindrical boles three feet in girth and about 35 feet high, and Mr. Mackenzie considered that, for such purposes as pit timber, they could be grown

more profitably than either Japanese Larch or Sitka Spruce. The most interesting species were *E. coccifera* Gunnii, *urnigera*, *cordata*, *Muelleri* and *vernica*, all of which were laden with seed annually. Besides the *Rhododendrons*, which were the special feature of the place, such plants as *Pieris formosa*, *Hydrangea Sargentiana*, *Myrtus Luma*, *Azara Gillesii*, *A. microphylla*, *Griselinia littoralis*, *G. lucida*, *Leptospermum Nicholii*, *Olearia insignis*, *O. semidentata*, *Abutilon vitifolium*, *Embothrium coccineum*, *Magnolia conspicua* (Yulan), *M. Kobus*, *M. Lennei*, *M. sonlangeana*, *M. stellata*, *M. parviflora*, *M. Watsonii*, *Plagianthus Lyallii*, *Eucryphia pinnatifolia*, *Aristolotelia racemosa*, *Drimys Winteri*, *D. aromatica*, *Tricuspidaria lanceolata*, *Calceolaria violacea*, *Beschorneria yuccoides*, *Guevina Avellana*, and *Eryngium pandanifolium*, all of which succeeded admirably, most of them flowering and fruiting profusely. *Cordylina australis* and *Trachycarpus excelsa* were as hardy as the Scots Pine, and others which grew vigorously were the new Chinese Willow, *Salix magnifica*, *Populus lasiocarpa*, *Podocarpus Totara*, *Cornus capitata*, *C. Kousa*, *Arundinarias*, especially *A. anceps* and *A. nitida*, and the Tree Ferns (*Dicksonia*).

The exhibits were:—From Messrs. DOBBIE AND Co., LTD., Edinburgh, *Antirrhinum* (awarded a Cultural Certificate), and *Marigolds* (awarded a Cultural Certificate); from Mr. ROBERT FIFE, Duddingston, Apples James Grieve and Rev. W. Wilks; from Mr. A. McLEOD, Yester, Seedling Dahlia; from Mr. A. INNES, Dean Cemetery, Edinburgh, Apples and Carrots; from Mr. D. THORBURN, Airdrie, Seedling Potato; from Mr. HAL JONES, Letchworth, Apple The McCoy; from Mr. R. CATHIE, Pilrig House, Edinburgh, Siberian Crabs; from Mr. J. CAMERON, Auchterarder, Plums.

## ROYAL HORTICULTURAL.

### TRIAL OF DAHLIAS AT WISLEY.

The following awards have been made to Dahlias by the Council of the Royal Horticultural Society after trial at Wisley. The Dahlia trials at Wisley were judged by the Joint Dahlia Committee, consisting of members of the R.H.S. Floral Committee and the National Dahlia Society.

#### CLASS 1.—FLOWERS SINGLE.

*Award of Merit*.—No. 2, *Clematis*, and No. 4, *Bishop Crossley*, both sent by Messrs. TRESSEDER.

*Highly Commended*.—No. 3, *Mamie*, sent by Messrs. J. CHEAL AND SONS; and No. 72, *Amy Barrillet*, sent by Mr. BOWLES.

#### CLASS 2.—MIGNON SINGLE.

*Award of Merit*.—No. 9, *Albion*, and No. 12, *Janet*, both sent by Messrs. J. CHEAL AND SONS.

*Highly Commended*.—No. 11, *Kathleen*, sent by Messrs. J. CHEAL AND SONS; No. 14, *Colt-ness Gem*, sent by Mr. PURDIE; and No. 13, *Mincio*, sent by Messrs. J. CHEAL AND SONS.

#### CLASS 3.—COLLERETTE.

*Award of Merit*.—No. 24, *Rona*, No. 26, *Linnæ*, and No. 27, *Tuskar*, all sent by Messrs. DOBBIE AND Co.; No. 30, *Lolah*, sent by Messrs. J. BURRELL AND Co.; and No. 34, *Scarlet Queen*, sent by Messrs. DOBBIE AND Co.

*Highly Commended*.—No. 22, *Tiger*, sent by Messrs. DOBBIE AND Co.

#### CLASS 4.—ANEMONE-FLOWERED.

*Highly Commended*.—No. 18, *M. C. II. Dupont*, sent by Messrs. J. CHEAL AND SONS.

#### CLASS 5.—PAEONY-FLOWERED.

*Award of Merit*.—No. 41, *Aphrodite*, from Mr. CHARLES TURNER; No. 43, *Faithful*, No. 49, *Enchantress*, No. 51, *Scarlet King*, and No. 78, *Psyche*, all from Messrs. J. BURRELL AND Co.

*Highly Commended*.—No. 53, *Nelson's Xanifa*, from Mr. R. H. BATT; No. 99, *Vesuvius*, sent by Messrs. VELTHUYS; No. 145, *Extase*, sent by Mr. HORNSVELD; and No. 83, *The Rose*, sent by Messrs. VELTHUYS.

#### CLASS 6.—SMALL-FLOWERED PAEONY.

*Highly Commended*.—No. 65, *Trixie*, and No.

66, *Norah Dell*, both sent by Messrs. J. BURRELL AND Co.

#### CLASS 6.—DECORATIVE.

*Award of Merit*.—No. 80, *Mrs. Courtney Page*, from Messrs. J. BURRELL AND Co.; No. 87, *Salmonia*, sent by Messrs. VELTHUYS; and No. 90, *Hanny van Waveren*, sent by Messrs. VAN WAVEREN.

#### CLASS 9.—SMALL-FLOWERED DECORATIVE.

*Award of Merit*.—No. 105, *Aglai*, and No. 104, *Vida*, both from Messrs. J. BURRELL AND Co.

*Highly Commended*.—No. 152, *Mariadne*, from Messrs. DOBBIE AND Co.

#### CLASS 11.—CAMELLIA-FLOWERED.

*Award of Merit*.—No. 102, *Fedora*, and No. 106, *Mrs. F. J. Sage*, both sent by Messrs. J. BURRELL AND Co.

*Highly Commended*.—No. 94, *Artis*, sent by Messrs. TOPSVOORT.

#### CLASS 12.—SHOW.

*Award of Merit*.—No. 116, *Dorcen*, sent by Messrs. J. CHEAL AND SONS.

#### CLASS 14.—STAR.

*Highly Commended*.—No. 61, *Seafield*, sent by Messrs. DOBBIE AND Co.; and 137, *Reigate Star*, sent by Messrs. J. CHEAL AND SONS.

#### CLASS 16.—DWARF CACTUS.

*Highly Commended*.—No. 153, *Reg*, sent by Mr. W. TRESSEDER.

### TRIAL OF STOCKS (OUTDOOR) AT WISLEY.

The following awards have been made to Stocks (outdoor) by the Council of the Royal Horticultural Society after trial at Wisley:—

*Award of Merit*.—No. 4, *Bianca Beauty*, and No. 18, *Mammoth Pyramidal White* (Ten Week), sent by Messrs. HURST AND SON, and considered identical; No. 11, *Pure White* (Ten Week), from the WALLER SEED Co.; No. 17, *White* (Ten Week), from Messrs. HEINEMANN; No. 21, *All the Year Round*, from Mr. S. MORTIMER, and No. 24, *East Lothian White Wallflower-leaved*, from Messrs. FORBES—these two were considered identical; No. 30, *Canary Yellow* (Ten Week), from Messrs. HEINEMANN; No. 31, *Canary Yellow* (Perpetual Branching), from the WALLER SEED Co.; No. 33, *Mammoth Pyramidal Yellow* (Ten Week), from Messrs. HURST; No. 45, *Flesh* (Ten Week), from the WALLER SEED Co.; No. 54, *Mammoth Pyramidal Salmon Rose* (Ten Week), from Messrs. HURST, and Nos. 55, *56, Heatham Beauty* (Ten Week), from Messrs. BARR AND SONS and Messrs. WATKINS AND SIMPSON—Nos. 54, 55, and 56 were considered identical; No. 64, *Rose* (Perpetual Branching), from the WALLER SEED Co.; No. 76, *Rose of Nice* (Beauty), from Messrs. HURST; Nos. 81, 82, *John Bright* (Ten Week), from Messrs. DICKSON AND ROBINSON, and Mr. DICKS; No. 97, *Blood-Red* (Ten Week), from Messrs. HEINEMANN; No. 100, *Mammoth Pyramidal Blood-Red* (Ten Week), from Messrs. HURST; No. 124, *Light Blue* (Ten Week), from Messrs. WATKINS AND SIMPSON, and 132, *Light Violet* (Beauty), from Messrs. HURST—Nos. 124 and 132 were considered identical; No. 117, *Silvery Lilac*, from the WALLER SEED Co.

*Highly Commended*.—No. 10, *Snowdrift* (Ten Week), from Messrs. WATKINS AND SIMPSON; No. 58, *Bright Pink* (Ten Week), from the WALLER SEED Co.; No. 60, *Giant Perfection Rose* (Ten Week), from Messrs. TOOGOOD; No. 66, *Brilliant Rose* (Ten Week), from the WALLER SEED Co.; No. 83, *La Brilliant* (Beauty), from Messrs. HURST; No. 123, *Light Blue* (Ten Week), from Messrs. HEINEMANN; and No. 145, *Summer Night* (Ten Week), from Messrs. WATKINS AND SIMPSON.

### TRIAL OF LATE CULINARY PEAS AT WISLEY.

The following awards have been made by the Council of the Royal Horticultural Society to Late Culinary Peas after trial at Wisley.

#### FIRST-CLASS CERTIFICATE.

No. 131, *No Plus Ultra*, re-selected, sent by Messrs. J. CARTER AND Co.

#### AWARD OF MERIT.

Nos. 67, 68, 69, 72, 73, and 74, *Autocrat*, sent by Messrs. DOBBIE AND Co., Messrs. TOOGOOD, Messrs. BARR AND SON, Messrs. WATKINS AND SIMPSON, Messrs. W. NUTTING AND SON, and Messrs. J. CARTER AND Co. No. 82, *Freedom*, sent by Messrs. HURST AND SON.

#### HIGHLY COMMENDED.

No. 4, *Glory*, and No. 10, *Perfection*, both sent by Mr. UNWIN; No. 14, *Passport*, sent by Messrs. HURST AND SON; No. 66, *Queen*, re-selected, sent by Messrs. SHARPE; No. 77, *Glory of Devon*, sent by Messrs. R. VEITCH AND SON; No. 97, *Wm. Richardson*, and No. 106, *Alliance*, both sent by Messrs. J. KELWAY AND SON; No. 140, *Goliath* or *Improved Mammoth Sugar*, sent by Messrs. ZWAAN AND DE WILJES.

#### COMMENDED.

No. 7, *Dwarf Giant*, No. 9, *Renown*, and No. 17, *Conquest*, all sent by Mr. UNWIN; No. 40, *Michaelmas*, sent by Messrs. J. CARTER AND Co.; No. 48, *Captain Cuttle*, sent by Messrs. J. R. PEARSON AND SONS; No. 59, *Matchless Improved*, sent by Messrs. HURST AND SON; No. 127, *Alderman Selected*, sent by Messrs. DOBBIE AND Co.

## UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

The monthly meeting of this Society was held in the R.H.S. Hall, on Monday, October 9, Mr. W. H. Divers presiding. Three new members were elected, and two members withdrew interest amounting to £7 3s. 2d., while two other members withdrew £27 from their deposit accounts. The sick pay for the month on the ordinary side amounted to £40 6s. 1d., and on the State side to £49 19s.; maternity benefits came to £2. Mr. H. Prince, of Polesden Lacey, was co-opted a member of the Committee in the place of Mr. A. Turner, recently resigned.

## NATIONAL CHRYSANTHEMUM.

The Floral Committee met at the Royal Horticultural Hall on October 16. There was a good attendance, but only one award was made. Baron SCHROEDER was an exhibitor, and his old-bronze variety named *Luna* attracted attention. From the Bridgewater Nurseries came two single varieties; the one named *Unique*, golden bronze, was very good.

The next meeting of the Floral Committee will be held at the Royal Horticultural Hall, Westminster, at 3.15 p.m., on Monday, October 30.

#### FIRST-CLASS CERTIFICATE.

*Viscount Chinda*.—A large, loosely incurving, broad-petalled variety of a pleasing golden-yellow shade of colour. This variety has been shown on several previous occasions, but never so finely as on this. Shown by Messrs. W. WELLS AND Co., Merstham.

## BARNET AND DISTRICT.

The Barnet and District Allotment Holders' Association held its 4th Annual Show in the Pennefather Hall, Barnet, and the exhibits in all classes were extremely good. A Challenge Cup was offered by Mr. W. Mather, and valuable prizes by Mr. Cutbush, for the best collection of vegetables (nine kinds), and the competition in this class was unusually keen; there were four entries, and each exhibit showed a high standard of excellence. The Cup was won by Mr. NEARY, and as this is the third time he has won it, it now becomes his property; Mr. JACKAMAN ran him very close, and Mr. P. H. BARRETT was 3rd. There were prizes for children under 10 years, and from 10 to 16 years for wild flowers, and a drawing competition for those under 16 years: (1) A pen and ink sketch (any subject), and (2) a water colour drawing of Roses. Honorary exhibits were limited on account of space, and the committee regretted they had not more space at their disposal.

## TRADE NOTES.

The King's Root Crop Trophy, offered for the best root crops of 1922, has been won by Mr. Robt. E. Purser, Sutton Farm, Langley, Bucks, whose produce was from seeds grown and supplied by Messrs. Toogood and Sons, Southampton.

A meeting of the Council of the Chamber of Horticulture was held on the 18th inst., at 18, Bedford Square, W.C.1, the President, Mr. G. W. Leak, being in the chair.

Mr. P. F. Bunyard again raised the question as to the agitation which is on foot to stop the sale of poisonous weed-killers by seedsmen and sundriesmen. This matter is engaging the close attention of the Horticultural Trades' Association, report of which will be made to the Chamber in due course.

The Secretary submitted his report, which dealt, amongst other things, with the following matters:—

The adjourned conference with affiliated associations took place on September 27, Mr. W. G. Lobjoit presiding, when the report of the committee appointed at the conference of March 29 last was presented, stating, that by reason of that committee as assembled holding practically only one view, it would be futile to propose any new constitution in accordance with the terms of reference given to the Committee. Further, the committee recommended the advisability of a round-table conference of all parties concerned. After discussion, it was unanimously agreed that the report be received and the committee discharged.

The Conference also unanimously agreed "That the whole question of organised horticulture be referred to a committee to report to an adjourned conference." This new committee is to consist of five members of the Chamber, three of the Federation of British Growers, and two of the Horticultural Trades' Association, the meeting to take place at the Ministry of Agriculture on October 20.

Representatives of the railway companies and traders are meeting and discussing in detail all objections to the companies' proposals, with a view to arriving at agreement on as many points as possible and so lessening the number of objections to be heard by the Railway Rates Tribunal.

The railway companies have recently notified the Chamber that they agree to carry, as from November 1, 1922, non-poisonous and non-inflammable insecticides by passenger train, as enumerated by the members of the Chamber's Insecticides Committee, provided the same are packed in accordance with a specification submitted, no consignment containing more than 112 lb. of insecticide.

The re-classification of nicotine is under consideration, and a decision promised within a few days, which is anticipated to be favourable.

Application was made through the Tribunal for a further reduction in the new classification for plants and shrubs in 30 cwt. lots. The Railway Clearing House have since notified the Tribunal that the request has received very careful consideration, but that the companies cannot agree to any further reduction. The Chamber's sub-committee will reconsider this matter with a view to stating a case before the Tribunal.

Mr. Brunton referred to the point raised from time to time by commercial associations as to the admittance of non-trading societies' representatives to the Council, and suggested that the difficulty might be overcome by such representatives being actual traders and attendance requisitioned only when matters concerning these bodies were down for discussion.

A letter was read from the Ministry of Agriculture, stating that following representations to the French Government as to the heavy duty imposed on British cut flowers into France, the Ministry is informed that as the duty was only imposed as recently as April, 1922, the question of its revision cannot be considered at the present time, but that the representations put forward on behalf of British interests will be borne in mind when

review is possible. It was resolved that the matter be referred to the British Florists' Federation, to prepare a case for presentation by the Chamber.

The question of railway charges and horticultural produce was adjourned from the last meeting, and the Secretary explained that a deputation from the National Federation of Fruit and Potato Trades' Associations, the National Farmers' Union, and the Federation of British Growers, was shortly interviewing the companies as to charges for vegetables.

## ANSWERS TO CORRESPONDENTS.

**CLEARING A POND OF WEEDS:** *G. A. S.* Only the lower orders of plants can be destroyed by copper sulphate in a pond, in quantity that would not be harmful to other vegetation. Running water soon cleans itself, but if much copper sulphate were used it would get deposited to a greater or less extent upon the vegetation in its passage, and that would make it dangerous for horses and cattle still being pastured there. It would be possible to kill weeds by means of common or agricultural salt, which is not poisonous; but it is doubtful even if that would kill the roots, because many of the common water weeds can live in water that is quite brackish. A good depth of water limits the variety and number of weeds. Shallow water and plenty of mud increases both number and variety. Few plants, except Water Lilies, can come up from a depth of four or five feet, so it might be possible for you to deepen the water. Floating weeds get blown to the sides wherever the pond is exposed to gales, and can be cleared out. If none of these suggestions apply, the pond could be run dry and the mud wheeled out, and that alone would remove most of the weeds growing in the bottom. If the springs are strong there will be deep pools, but in such cases there are usually no weeds in them, on account of the shifting sand or gravel. By running out the water now the whole winter would be available for clearing the pond, even if Water Lilies are grown in it. They would be quite safe covered with a few spadefuls of mud.

**FASCINATION OF AGAPANTHUS UMBELLATUS:** *H. St. Quintin.* We presume the portion sent is a branch from the scape of the main umbel of flowers. In that case it is clearly a case of fasciation, or union of two scapes. The several flowers from the side of this secondary scape are part of its umbel of flowers. The first branch carrying three or four flowers carries three inner bracts at its base, so that the two primary ones forming the involucre of the umbel were most likely to be found at the base of the umbel, which was not sent. The two flowers carried higher up the scape were part of the same umbel, and had a tiny third flower at their base, together with the inner bracts, in the axils of which they grew. The uppermost of these three flowers was the most interesting, because one side of it got carried up the scape for an inch higher than its growing point, which was thus reversed on the axis. The larger of the two coloured flowers was in its natural, erect position; but the smaller one, as well as the embryo flower, appeared growing towards the base of the scape, owing to the above unequal-sided growth. It might be suggested that all these scattered flowers were the umbel of a third small scape, but the absence of the two large involucral bracts does not support that idea.

**GARDENERS' NOTICE TO LEAVE:** *Constant Reader.*

1. You must accept a month's notice from the day when it was given, irrespective of the time. A notice for less than a month would be bad and a new notice must be given. 2. An employer cannot be compelled to give a reference, but if he gives one it must be honestly given without malice; otherwise the servant can claim damages if he can prove the libel. Your difficulty would be that you cannot compel your present employer to disclose the source of his information.

**GREENGAGE-TREE PRODUCING SMALL RED PLUMS:** *J. R. B.* The small red Plums have doubtless been produced on a shoot arising from the stock below the union with the scion.

**GRAPES FAILING TO COLOUR:** *J. T. W.* The trouble is due to shanking, which is generally due to an unsatisfactory condition at the roots. Seeing that the border is an outside one on which you are cultivating crops of other things, it is probable that the upper surface is very impoverished and the roots have grown into the cold, wet sub-soil. Later in the autumn, when the vines are defoliated, make an examination of the border, and if the conditions are such as we suspect, endeavour to bring the roots nearer to the surface by lifting them and planting them in a suitable compost for vines. It may also be necessary to provide drainage.

**GRUBS IN SOIL:** *C. F. G.* The grubs are the larvae of Cockchafer and not very easily got rid of, but hens penned on the border for a week or two in spring, when the border is beginning to get dry, might considerably lessen their numbers. If this is impossible, aim at the following conditions: (a) firm soil underneath, i.e., digging should be done early in the winter; (b) deep summer cultivation, i.e., a soil mulch of at least three inches should be obtained by surface cultivation. A heavy dressing of soot in early spring would be helpful.

**NAMES OF FRUIT:** *J. McC.* 1, Cox's Orange Pippin; 2, King of the Pippins; 3, Beurré Hardy; 4, not recognised; 5, James Grieve; 6, Le Lectier.

**NAMES OF PLANTS:** *A. N.* 1, *Berberis vulgaris* var. *purpurea*; 2 and 5, *B. subcaulialata*; 3 and 4, *B. polyantha*; 6, *B. pruinosa*; 7, *B. virescens*; 8, *B. aristata*; 9, *B. sinensis*; 10, *B. Lycium*; 11, *Ribes Diacantha*; 12, *Pyrus eleagrifolia*; 13, *Pyrus Ringo*; 14, missing; 15, *Rosa moschata* hybrid; 16, *Clematis ligusticifolia*.—*II. B.* We cannot undertake to name florists' flowers.—*A. S. I.* *Staphylea colchica*; 2, *Berberis stenophylla*; 3, *Viburnum Tinus*; 4, *Pernettya mucronata*; 5, *Olearia Haastii*.—*E. B. I.* *Cotoneaster frigida*; 2, *C. bullata*; 3, *C. horizontalis*; *C. Simonsi*; 5, *C. bacillaris*; 6, *Begonia* President Carnot.

**PEAR TREE SHOOTS ATTACKED BY FUNGUS:** *T. G.* The Pear tree shoots show a very bad attack of the scab fungus, *Fusicladium pirinum*. All the young wood similarly attacked should be cut away and burnt. The fruits were badly bruised and soft-rot fungus (*Rhizopus*) had attacked them.

**VIOLETS AND BEGONIAS:** *Constant Reader.* Violet leaf spot is caused by the fungus *Ascochyta violae*. Very badly diseased plants should be burned, and fresh stock obtained from a new source, planting them in ground as far away from the old bed as convenient. The disease may be kept in check by spraying the plants with potassium sulphide at a strength of ½ oz. in two gallons of water. This specific turns white paint black, and should not be allowed to come in contact with painted woodwork. The rust on your Begonias is probably caused by a mite. Dip the plants in an insecticide, such as nicotine in solution.

**YOUNG GARDENER AT KEW:** *Amateur.* Many important positions in the gardening world are held by men who have been trained in the Royal Botanic Gardens, Kew, but it does not necessarily follow that you would be successful in obtaining a position as a lecturer in gardening after having completed a two years' course. Much would depend on your abilities and the advantages you took of the opportunities while serving as a young gardener. In addition to practical training at Kew, you would have the advantage of a course of lectures in sciences pertaining to gardening, such as botany and chemistry.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 46.9.

### ACTUAL TEMPERATURE.—

Gardeners' Chronicle Office, E, Tavistock Street, Covent Garden, London, Wednesday, November 1, 10 a.m. Bar. 30.2; temp. 52°. Weather—Raining.

### The Naturalisation of Plants in New Zealand.

No more useful service to natural history could be performed than that which the Hon. Geo. M. Thomson has undertaken\* in tracing the history of the efforts made by Nature and by man to acclimatise new plants in a new land. It is a work of urgent importance, for with every passing year the records, never complete, grow fainter, and, also with the passage of years the foreign element of the New Zealand flora increases. Though the imported lean kine may not devour the native fat kine, they have in many cases, in establishing themselves firmly in the land of their adoption, dispossessed native plants. Thus, whereas Sir J. D. Hooker enumerates in his *Handbook to the New Zealand Flora*, written in 1864, one hundred and sixty-five species of introduced plants, Mr. Thomson's lists contain the names of over six hundred species which reproduce themselves by seed and appear to be naturalised in the islands. The isolation of New Zealand by over one thousand miles of sea from the nearest land-mass—Australia, its comparatively recent settlement by Europeans and the existence of records of attempts at acclimatisation (albeit far from complete) make it possible to do for New Zealand what is perhaps impossible for any other country, namely, to trace in some detail and with

some fidelity, the story of its colonisation by plants. The part played by Nature, though more obscure and extending over vastly greater periods of time, is indicated by the computation of the native New Zealand flora. According to Mr. Cheeseman, the flowering plants of New Zealand number 1,396 species, of which 1,069, of 76.6 per cent., are endemic. The non-endemic species, 327, consist as to 134 of species found also in Australia and Tasmania, 129 species common to New Zealand, Australia and also other countries, leaving only some 64 species of Antarctic, Polynesian or other origin. Thus, eighty per cent. of non-endemic forms are also found in Australia, and it is therefore to be inferred that Nature has bridged the oceanic gulf between the southern continent and the islands, and that winds, birds and other natural agencies have been the cosmic carriers, bringing, at long intervals and at much loss, yet nevertheless with ultimate certainty, the Australian contingent to New Zealand. As for man's part in introducing plants, it dates from long before Captain Cook's first voyage thither in 1769, for according to Maori tradition, Polynesian settlers reached New Zealand about eight hundred years ago, and the Polynesians were great cultivators. It is believed that the Hue Gourd (*Lagenaria vulgaris*) was introduced and cultivated by them at an early date and that they brought *Pomoea Batatas* in the fourteenth century, from which period also may date *Colocasia antiquorum* and *Cordyline terminalis*. The modern history of plant introduction begins in 1772, when the French expedition under Marion du Fresne reached New Zealand. Crozet, who succeeded him "formed a garden on Montonaro Island in which I sowed the seed of all sorts of vegetables, stones and the pips of our fruit, Wheat, Millet, Maize, and in fact every variety of grain which I had brought from the Cape of Good Hope. . . . I planted stones and pips wherever I went in the plains, in the glens, on the slopes and even on the mountains." Captain Cook, on his second voyage in the "Resolution," 1773, also cleared ground and planted seeds, Cabbage, Onion and Leeks among others. Other later explorers did the like and so when the first settlement schemes were launched in 1839, a goodly number of plants had already been introduced, though how many had established themselves is not known. Between 1840 and 1850, settlers came apace, and the paucity of wild animals, the emptiness of the streams and, as it seemed to them, of wild flowers also, led them and those who came after them to make unsystematic attempts to introduce animals and plants of their native countryside. Of these many plants, the Primroses and Bluebells, Heather and Wood Violets failed, but the Briar Rose remains as a monument to their effort to clothe the New Zealand landscape with the wild flowers of Great Britain most pleasing to countrymen. The change which has taken place in the New Zealand flora is, however, due no less to the grazing by animals than to the introduction of foreign plants. Hence it is good to have Mr. Thomson's assurance that the total extinction of no species is to be attributed to this cause. Many, however, are becoming increasingly rare—*Pomaderris apetala*, as a consequence of goats' voraciousness, *Myosotidium nobile* browsed almost out of existence by cattle and pigs, *Marattia fraxinea* by the Maoris and also by pigs. Fires, also overstocking with sheep and rabbits have conspired to create a desert of thousands of acres in Central Otago which once supported heavy tussock grasses, but it is satisfactory to know that the land is being won back for vegetation by enclosure. In

the closely settled districts the introduced plants dominate over native plants and change the aspect of the land; but in the wilder districts the endemic plants maintain themselves, though they may be often hard pressed. The danger of extinction becomes less as the distinguished band of New Zealand botanists come to have greater weight with authority:

**Test of Fruits for Commercial Purposes.**—We are glad to learn that the Ministry of Agriculture and Fisheries and the Royal Horticultural Society have set up a Joint Committee to administer a scheme for the official testing of new varieties of fruit for commercial purposes. Under the scheme the Royal Horticultural Society's gardens at Wisley will serve as the Central Station, at which all varieties will be tested in the first instance. In later years varieties selected as showing merit will be sent for further testing to sub-stations, which the Committee hope to establish in various fruit districts throughout the country. Tests will be confined for the present to hardy fruits (Apples, Pears, Plums, Cherries, Nuts, Gooseberries, Currants, Raspberries, Strawberries, etc.). The Committee is now prepared to receive applications for the reception of plants, buds, and grafts sufficient to allow the following number of trees, bushes and plants to be grown of each variety. Apples and Pears, 20 half standards, plus 20 bushes; Plums, Cherries and Nuts, 10 half standard; Currants, Gooseberries, Raspberries and other berries, 20 bushes; Strawberries, 100 plants. Buds or grafts will be worked on approved stocks. In no circumstances will be central station or a sub-station permit trees, buds or grafts to be taken off the station. The Committee will, after a consideration of the reports of the recording staff and selected specialists, issue reports in which recommendations of special varieties will be made. No report on a variety will, however, be issued until sufficient time has elapsed to enable a fair test to be carried out. The Committee for this purpose consists of:—Professor W. Bateson, F.R.S. (Chairman); Mr. W. G. Lobjoit, Mr. H. V. Taylor, Mr. J. C. F. Fryer, and Professor B. T. P. Barker, appointed by the Ministry of Agriculture; the Chairman of the Wisley Committee, the Director of Wisley, the Chairman of the R.H.S. Fruit Committee, Mr. E. A. Bunyard and Mr. Cuthbert Smith, appointed by the Royal Horticultural Society. All communications concerning the scheme should be addressed to the Director, Royal Horticultural Society's Gardens, Wisley, Ripley, Surrey.

**Association of Economic Biologists.**—A general meeting of this Association will be held at 2.30 p.m. on Friday, November 10, in the Botanical Lecture Theatre of the Imperial College of Science, Prince Consort Road, South Kensington, when Dr. E. S. Russell will read a paper on "The Work of the Fisheries Laboratory at Lowestoft." At 3.30 p.m., Sir Sidney F. Harner, F.R.S., will read a paper on "The Present Position of the Whaling Industry." The Council will meet at 2 p.m. on the same day.

**Royal Society of Edinburgh.**—At the meeting of the Royal Society of Edinburgh held on the 23rd ult., Prof. Frederick O. Bower was re-elected President, and delivered his presidential address, his subject being "The Primitive Spindle as a Fundamental Feature in the Embryology of Plants." After reviewing the embryology of the lower plants he stated that the end of all higher embryology was the establishment of a leafy plant with its shoot pointed upwards. Where the archegonium pointed downwards endoscopic orientation would lead directly to this result. But if the archegonium be inclined or inverted the spindle would have to be inconveniently curved to secure that end. Many Lycopods, Selaginellas and some Ferns showed awkward curvatures of the embryo to carry it out. But some of them had no suspensor; in these the awkward curves were absent. It was suggested that the inconvenience had been removed by abortion of the vestigial suspensor, which tied their ancestors down to

\* The Naturalisation of Animals and Plants in New Zealand. By the Hon. Geo. M. Thomson, M.L.C., F.R.S., Cambridge University Press, 1922. Pp. 607. Price 4s. net.

the endoscopic orientation so inconvenient where the archegonium pointed obliquely or actually upwards. The Horsetails, Isoetes, and the Lep-tosporangiate Ferns would all be derivative in this respect. Having no suspensors, their initial polarity could be freely determined so that the apex would point from the first in the convenient direction. Upon the spindle thus defined, whether complete or abbreviated by abortion, straight or curved, the appendages were attached. The leaves were possibly in phyletic origin, results of distal dichotomy of the apex. But in fact they were attached laterally, and together with the axis they constituted the terminal bud. The first root was always of lateral origin in Pteridophytes, and phyletically it was an accessory organ, absent in fact in the most primitive types. It was only in seed plants that it appeared to continue the axis downwards. Lastly, the "foot" which was so inconstant in its development was clearly accessory also, in fact, a sucker formed laterally where it was required. And so the primitive spindle, defined on the one hand by the apex of the shoot and with the tip of the suspensor as its base, appeared to be a real and constant feature in the embryos of plants. But as it was liable to be ab- viated by the abortion of its base, and complicated at the apex and also lower down by the formation of lateral appendages of various sorts, it was often effectively disguised. Nevertheless, an adequate morphological and biological comparison of plants showed that all their embryos were referable in origin to a filamentous source, such as was prefigured in the Algae.

**Flowers in Season.**—Mr. H. Juniper has sent from Dryham Park Gardens, Barnet, some excellent flowers of *Trachymene (Didiscus) coerulea*, Queen Anne's Lace Flower. Mr. Juniper writes "this pretty Australian annual was cut from the open border, and is a welcome addition amongst flowering plants, being especially valuable for use as cut blooms, as the flowers remain fresh for a long time in water. The plants were raised in gentle warmth in May and transplanted, when of a suitable size, into boxes, and subsequently hardened ready for planting out at the end of May in a sunny, well-drained border."

**Flowering Plants of South Africa.**—The October issue of the *Flowering Plants of South Africa* (No. 8, Vol. 2), is no less interesting than the preceding issues, all of which have been noticed in these pages. Part 8 brings the second volume to its conclusion, and it is dedicated to Senator the Honourable Charles G. Smith, of Durban, Natal, to whose generosity botanical science in South Africa is much indebted. Ten plants are described in the issue under notice, and the first of these is *Daubinya aurea*, var. *coccinea*, a rare and interesting Liliaceous plant and the representative of a monotypic genus. The plant is bulbous, of low stature, and the inflorescence consists of two white outer bracts and two inner, broad, greenish bracts, around a ten-flowered capitulum. The outer flowers are two-lipped, brilliant scarlet, and altogether more important and attractive than the small, inner flowers. Another bulbous plant illustrated is *Ornithogalum Roodeae*, a handsome species, with an inflorescence of purple, white margined flowers. Other plants included are *Stapelia Pillansii*, var. *attenuata*, with large, dark purple flowers, each segment tapering to a long, revolute point; *Mesembryanthemum crassipes*, a beautiful plant when in flower owing to the contrast between the deep pink petals and the rugose, grey leaves; *Roodia digitifolia*, an interesting plant closely allied to *Mesembryanthemum*, and fully described by Mr. N. E. Brown, who has established a new genus for it; it is a succulent plant with *Mesembryanthemum*-like flowers of bright magenta hue; *Leucospermum tottum*, var. *glabrum*, a South African Protead, which makes a spreading bush five to six feet high and carries large heads of broad, reddish bracts and slender flowers with elongated red and yellow styles; *Protea recondita*, with greenish heads; *Crossandra Greenstockii*, an Acanthad with spikes of orange-pink flowers, the latter appearing from amongst numerous green bracts;

*Banhamia Galpinii*, a semi-climbing shrub known in the Transvaal as the Pride of de Kaap, and a common plant in the low veld east of the Drakensberg; it has the usual twin leaves common to this genus, and the chief attraction of the flowers is the long-clawed, bright reddish-pink petals; and *Klattia Stokoei*, a quaint and remarkable plant discovered near Somerset West by Mr. T. P. Stoko, and belonging to the tribe Sisyriaceae of the Natural Order Iridaceae.

**Henry Eckford Memorial Medal.**—The award of the Henry Eckford Memorial Medal to Mr. S. B. Dicks is a very pleasing recognition by the National Sweet Pea Society of many services Mr. Dicks has rendered in connection with the popularisation of the Sweet Pea. Before the bi-centenary of the introduction of the Sweet Pea into England, Mr. Dicks had consulted old and rare books and compiled a most interesting history of this popular annual flower, and ever since that time he has continued his researches and is now recognised as the historian of the Sweet Pea. In many other ways, such as the classification of varieties, Chairman of Com-

MR. S. B. DICKS, AWARDED THE HENRY ECKFORD MEDAL OF THE NATIONAL SWEET PEA SOCIETY.

mittee, and a member of the Floral Committee, Mr. Dicks has shown himself to be an ardent florist, and advanced the cause of the flower he loves so well, and the Society which makes the Sweet Pea its special concern. About a year ago we published an appreciation of Mr. S. B. Dicks, in which we referred to his work among garden vegetables, and other activities on behalf of the seed trade during his long service with Messrs. Cooper, Taber and Co. His numerous friends in many countries where he has travelled, no less than his friends at home, will add congratulations to those he has already received in connection with the above award, which was made on the 31st ult.

**Ghent Horticultural Exhibition, 1923.**—Although six months are to elapse before the opening date of the Ghent "Florales," the organising committee is already making active preparations for the event. During the past few days several important meetings have been held, for instance, with the railway authorities, on the subject of the decoration of the South and St. Pierre stations during the continuance of the exhibition, and also with M. Van Werveke, the curator of the Archeological Museum, to make arrangements for visitors to the exhibition to view the numerous objects of archeological interest in the city. It is announced that in addition to large numbers of the finest and rarest plants cultivated in Belgium, there will

be whole sections from France, England and Holland, which will constitute a new departure. Mr. Brunton, while on a visit to the organisers of the exhibition, assured them of the hearty support of the English. Mr. Krelage, of The Hague, promises a large and important contribution from Holland, so that the foreign sections bid fair to be a great success. Not only England and Holland, but also France, thanks to the kind efforts of the Consul of Fourmestreaux, promises a contribution worthy of the high horticultural traditions of that country. Applications for space in the horticultural sections are very heavy, and the best positions are being rapidly booked. Horticultural societies, both Belgian and foreign, are already making arrangements for their members to visit the exhibition, and everything points to a record attendance. Information on all points will be sent, on application, to the Secretary, Florales Gantoises, Palais des Fêtes, Ghent, Belgium.

**Mr. B. S. Faudel-Phillips.**—The Hertford Horticultural Society gave a dinner in honour of the retiring President, Mr. B. S. Faudel-Phillips, on the 18th ult. Mr. Faudel-Phillips has occupied the post of President of the Society for ten years, and for a much longer period has taken a deep interest in its welfare. The chair was occupied by the new President, Sir Brodie Henderson, K.C.M.G., and he was supported by Sir Edward Pearson, who was also a President for many years. In proposing the health of Mr. Faudel-Phillips, the Chairman stated that they were all very happy to join in this festive gathering to show some little appreciation of their guest, whose gardens at Balls Park were amongst the most beautiful in the country. He associated with the toast Mr. Faudel-Phillips' father and sister, both of whom, ever since the foundation of the Society over thirty years ago, had done everything they could to promote its welfare. The Hertford Horticultural Society is a very flourishing association with a membership of about 320, and much of its success is due to the interest taken in it by the members of the Faudel-Phillips family, whose beautiful gardens at Balls Park were described and illustrated in *Gard. Chron.*, March 21, 1914.

**Lectures on Potatoes, at Sheffield.**—The programme of lectures to be given on November 10, on the occasion of the joint exhibition of the National Potato Society, and the Sheffield Chrysanthemum Society, in the Artillery Drill Hall, Sheffield, is as follows:—At 4 p.m.: Lecture by Mr. F. J. Chittenden (R.H.S. Gardens, Wisley, Ripley, Surrey), on "The Cultivation of Potatoes"; chairman, Mr. W. G. Lohjoit, Ministry of Agriculture and Fisheries. At 6 p.m.: Lecture by Mr. A. D. Cotton (The Herbarium, Kew Gardens, Surrey), on "Leaf Curl and Diseases of Potatoes"; chairman, J. R. Poad, Esq. (of Messrs. Isaac Poad and Sons, Ltd., Walmgate, York). At 8 p.m.: Lecture by Mr. W. Cuthbertson (of Messrs. Dobbie and Co., Edinburgh), on "The Story of the Varieties of Potatoes," illustrated by specimen tubers; chairman, Mr. H. V. Taylor, Ministry of Agriculture and Fisheries.

**Export of Potatoes to Algeria and Uruguay.**—The Ministry of Agriculture states that all exporters of Potatoes should remember that many of the Dominion and foreign Governments place restrictions on the entry of Potatoes, therefore, before making arrangements, exporters should ascertain the requirements, if any, of the country to which they propose to export, and should satisfy themselves that they are procuring Potatoes from a district free from Wart Disease. The Ministry will be happy to furnish inquirers with all available information on these points. Numbers of inquiries have recently been received with regard to the export of Potatoes to Algeria and Uruguay; both these countries require consignments of Potatoes to be accompanied by a certificate of health, which can only be issued after an examination of the actual Potatoes. The Ministry is prepared to arrange for the necessary examination of Potatoes grown in England and Wales on payment of a fee, provided that application is made at least ten days before the consignment is shipped.

**South African Plants.**—The *Kew Bulletin*, Vol. xxxiii., Part 7, is fully occupied by a "Revision of South African Species of *Dianthus*," by Mr. J. Burt Davy. Seventeen species are fully described and three are illustrated. In addition to this issue, we have received, in the form of *Bulletins*, Parts 1, 3 and 4 of "New or Noteworthy South African Plants," by Mr. J. Burt Davy, and we understand that Part 2 appeared in the *Kew Bulletin*, 1921, p. 191; ten species are described in Part 1, ten in Part 3, and twenty in Part 4.

**Loans for Allotments Purposes.**—The Ministry of Agriculture and Fisheries has been informed by the Treasury that the rate of interest on loans advanced on or after October 2 from the Local Loans Fund under the Allotments Acts has been reduced from five and a half per cent. to five per cent. per annum, whatever the period of the loan.

**Appointments for the Ensuing Week.**—Tuesday, November 7: Birmingham Chrysanthemum Society's Show (three days); St. Neots Chrysanthemum Show; Surbiton and District Chrysanthemum Society's Show (two days); Bournemouth Gardeners' Association's meeting. Wednesday, November 8: East Anglian Horticultural Society's meeting; Sheffield Chrysanthemum Society's meeting; Wimbledon and District Gardeners' Society's Show; Eastbourne Horticultural Society's Show (two days); Bromley Chrysanthemum Society's Show (two days); Sevenoaks Gardeners' Chrysanthemum Society's Show; Marlow Chrysanthemum Show. Thursday, Nov. 9: Bristol Gardeners' Association's meeting; Gloucestershire Root, Fruit and Grain Society's Show, Hitchin Chrysanthemum Society's Show; Gange-over-Sands Horticultural and Chrysanthemum Society's Show; Nottingham and Notts Chrysanthemum Society's Show (three days); Bedford and District Chrysanthemum Society's Show; Finchley Chrysanthemum Society's Show (2 days); Doncaster and District Chrysanthemum Society's Show (three days). Friday, November 10: Sheffield Chrysanthemum Society's Show (two days), in conjunction with the National Potato Society's Show, at the Artillery Drill Hall. Saturday, November 11. Ringwood Society's meeting.

"The Gardeners' Chronicle" **Seventy-five Years Ago.**—*Ornamental Planting.*—I am surprised that *Crataegus* are not more extensively planted, as ornamental trees, than they have hitherto been. It is rare to meet with anything like a good collection, except in an arboretum; and yet how ornamental *Crataegus* appear in shrubberies or plantations. Even at this season their foliage is handsome, and exhibits various pleasing tints; for example, *Crataegus Crus-galli* and its varieties are more or less beautiful glossy sub-evergreens, while *C. flava* and its varieties are now assuming a beautiful rich red and yellow colour; again, there exists great variety in the shape of their leaves. *C. tanacetifolia* and its varieties are pinnatifidly cut, while *C. pyriformis* and some varieties of *Crus-galli*, as well as other sorts, possess a somewhat round and ample foliage. *Crataegus* are also our first shrubs which assume the green leaf in spring. *C. oxyacantha praecox* often puts on its summer dress in January, in mild winters; the fragrant blossoms of this tribe, too, should not pass unnoticed, than which what is more agreeable? Their fruit is likewise another object of much interest; for how beautiful are these! and being different in colour, they contrast well with one another. *C. Aronia* (var. *Azarole*) bears large yellow fruit in abundance; and *C. cordata* (var. *microcarpa*) is another equally beautiful variety, which bears fruit in corymbs, that are well shown off by the dark green foliage. With merits like these, surely *Crataegus* deserve to be more generally planted in shrubberies, etc., than they are, the appearance produced by their intermixture with other things being very effective. *S. Hood, Brooklands Nursery, Gard. Chron., November 6, 1847.*

**Publications Received.**—*Beautiful Flowers and How to Grow Them.* By Horace J. Wright and Walter P. Wright. Illustrated. T. C. and E. C. Jack, Ltd., 35 and 36, Paternoster Row, E.C. Price 10s. 6d. net.

## TREES AND SHRUBS.

### LONICERA HILDEBRANDTII.

READERS of the *The Gardeners' Chronicle* will remember the interest shown in the raising of *Lonicera Hildebrandtii* from seed when the matter was discussed in these pages during 1920 and 1921. Mr. Sydney Morris, of Earlharn Hall, Norwich, has been particularly successful in cultivating this handsome Honey-suckle, and in the issue of October 30, 1920, his experiences in the successful raising of plants

It is a tall, wide-spreading bush up to ten or twelve feet high, with arching branchlets. The leaves vary very much in size from  $\frac{1}{2}$  inch long and  $\frac{1}{4}$  inch wide to  $1\frac{1}{2}$  in. long and  $1$  inch wide. The rich yellow blossoms are freely borne in drooping panicles during June and early July, fifty to one hundred flowers in a panicle being not uncommon. The greatest beauty of the bushes is reached in the autumn, when the leaves are falling, and the panicles of fruits assume their rich salmon-red colour. As a lawn specimen and for the back of the shrubbery border *Berberis polyantha* is a distinct addition. *A. O.*

FIG. 105.—FRUITING SPRAY OF BERBERIS POLYANTHA.

from seed were given at some length. At the exhibition of the Royal Horticultural Society held at Holland Park Skating Rink on October 3, Mr. Morris showed flowering and fruiting branches of *Lonicera Hildebrandtii*, and probably this was the first occasion on which many gardeners had the opportunity of seeing the fruits, specimens of which are illustrated in Fig. 108.

### BERBERIS POLYANTHA.

AMONG the many *Berberis* introduced to cultivation from China during recent years, *Berberis polyantha*, the subject of the accompanying illustration (Fig. 105), is one of the most distinct and valuable additions to our gardens. The spray illustrated was cut from a bush grown from seeds collected by Mr. E. H. Wilson in Western Szechuan in 1904.

### INTERESTING TREES AND SHRUBS IN AUTUMN.

THE following trees and shrubs have been especially beautiful in these gardens this autumn. *Clethra Fargesii*, *C. alnifolia*, *Kirengeshoma palmata*, *Rhododendron micranthum*, *Buddleia Veitchii* magnifica superba, *Caryopteris Mastacanthus*, *Ceanothus Gloire de Versailles*, *Coriaria japonica*, *Desmodium penduliflorum*, *Pavia macrostachya*, *Lonicera Halliana*, *Nandina domestica*, *Olearia Haastii*, *Prunus Pissardi*, *Romneya Coulteri*, *Tamarix aestivalis*, *Rosa Moyesii*, *Eugenia apiculata*, *Iibiscus* (*Althaea*), in variety, *Abelia chinensis*, *Euonymus europaeus*, and the Blue Cedar, *Cedrus atlantica glauca*, which, on our light soil, has been one of the most attractive objects in the garden. *W. A. Cook, Drynham, Walton-on-Thames.*

## NOTICES OF BOOKS.

## Plant Materials of Decorative Gardening.\*

The book is designed for the identification of plants by their stems, leaves and other visible parts, as well as by the general structure of the wood and pith, without the aid of the floral organs. It includes 247 genera, 782 species, 375 minor forms, or 1,150 distinct kinds, falling under 83 natural families. The list is meant to cover the cultivated trees, shrubs and woody climbers in the Eastern United States and Northern Europe. The plan followed is the use of a key, consisting of two contrasts or alternatives (sometimes three) placed under each figure of successive numbers from 1 onwards till each group is diagnosed. The four groups are trees, shrubs, under-shrubs and woody climbers. The reviewer runs down the common Lilac in seventeen contrasts, ranging between 1 and 203. There was a hitch at 200 as to which of the two contrasts should be taken. Both of them, however, led to *Syringa*, which includes two groups. The genus *Acer* was found under five contrasts; the Ivy under four and *Prunus* under fourteen. Turning to the page where the species of *Syringa* are described with a key to separate the species, there was no difficulty in tracing the specimen examined to *S. vulgaris*. Fifty-three species and varieties of *Acer* are described, and amongst them the specimen in hand agreed with *Acer Pseudo-platanus*. Under *Prunus* a specimen of the Morello Cherry was traced till the contrasts used were percurrent and deliquescent. This being a new meaning of the words applied to trees, the glossary at the end had to be consulted. Here deliquescent means that the tree soon breaks up into numerous small branches, instead of having a main trunk with a leader like a pyramidal tree. This pointed to *Prunus Cerasus*. Under woody climbers the Ivy was easily run down to *Hedera* in four contrasts. The key is quite simple, but those who use it must make a close and correct observation of the specimens they wish to identify.

## Winter Botany.†

This volume, by the same author who wrote keys for the groups of trees, shrubs and woody climbers in summer, is meant for the identification of the same woody plants in winter. The writer of this note run down the Goat Willow to *Salix* in thirteen contrasts, and the common Oak to *Quercus* in eighteen contrasts. Both trees run through eight contrasts before the Oak took a separate course. The identification of the species *Salix Caprea* and *Quercus Robur* can be traced on the page where they are described under the genus. The Oak is the more difficult in the last contrast, because the twigs are described as reddish, which is not always the case, and may depend on exposure. A specimen of *Euonymus japonicus* was traced through nineteen contrasts; and *Ligustrum ovalifolium* through twenty-one. Both kept company through the same figures till the sixteenth contrast was reached. They parted company on the question whether the pith was spongy or continuous. After the *Euonymus* twig had been cut open for an hour or less the pith shrunk considerably. The twigs of the Privet are really more woody and the pith very narrow; so these contrasts show how necessary it is to be careful in such a simple observation. It is astonishing to find how many differences the author of the book asks the reader to observe; and the observation often makes the most common trees or shrubs interesting. In winter it is necessary to examine the leaves (evergreen) or their scars, with the leaf trace of the woody bundles, the presence of spines, prickles, or their absence, the pith, the sap sometimes, whether the twigs are aromatic or not, etc. The extent to which this study can be carried is, of course, limited to the plants described in the book.

## Fruit Packing for Market.\*

THE packing of fruit for market has received increased attention from growers in recent years, but there is still much to be done before the marketing department of their business rises to the level of the cultural. Experts have long known that Britain can produce fruit fully equal to the best in the world, but this fact has been obscured to the general public by the absence of proper grading and by inferior packing. Imported fruit sells best, not because it is better than home-grown, or even so good, but simply because it is graded and packed on honest and businesslike lines.

The Worshipful Company of Fruiterers, whose publications have always gained the respect of growers by their sound practical value, have done further service to the industry by issuing this book on modern methods of packing fruit for market. It is of the same sound character as their previous publications, and deserves to be accepted as the standard handbook on the subject.

No better choice of author could have been made than Mr. W. P. Seabrook, who, as a commercial grower, has been boxing Apples for both home markets and export for many years, and, as vice-president of the Federation of British

FIG. 106.—*BONATEA UGANDAE*.  
(SEE P. 265.)

growers, and chairman of its Packing and Grading Committee, has done the lion's share of the work of preparing the Federation's Grading and Packing Schedule. That schedule, which has been approved by the Ministry of Agriculture and the leading market salesmen, lays down standards for the proper grading and packing of all kinds of fruit grown in this country. It represents the first attempt ever made to standardise our marketing methods.

The author has naturally followed the Federation standards closely in this book, but he has amplified them with clear working instructions for the packing of each kind of fruit. Readers can accept his directions with confidence that they indicate correct modern commercial methods; and they will find the numerous illustrations helpful.

The packing of Apples in British standard non-returnable boxes receives full attention. Rules are given for quickly finding the correct pack for any particular sample, and handy tables show at a glance the number of Apples in any properly-packed box. In these boxes we undoubtedly have the ideal package for high-grade dessert Apples, as few will gainsay after a

\* *Fruit Packing for Market*. By W. P. Seabrook. Issued by the Worshipful Company of Fruiterers, with the editorial assistance of Walter P. Wright. London: George Allen and Unwin, Ltd. Illustrated Price 2s. 6d. net.

visit to the Imperial Fruit Show at the Crystal Palace. Every grower, in his own interests, should learn how to pack his fruits. Packing in sieves, chip "bonnets," barrels, and Peach boxes is also described. The author, whilst recognising that the returnable baskets supplied by the salesmen must still remain with us, makes out an unanswerable case for non-returnable packages wherever their use is possible. But no matter what package is in use, he rightly urges the necessity for perfect grading and guaranteed sizes, weights, and quantities. The secret of the freer sale of imported fruit, he claims, does not lie so much in the choice of a particular package, as in the fact that the merchant, the retailer, and the consumer all know by a glance at the label what each package contains, both as to quantity and quality; and not only that, but they can rely on getting other packages of the same quality and quantity if they want them. Home growers have really no other course to adopt than to organise similar methods if they are to regain and extend the home markets. Mr. Seabrook also writes hopefully of our chance of establishing a lucrative export trade.

A chapter dealing with our present system of distribution contains a very interesting contribution from Mr. Duncomb Gibbs describing the working of the Pershore Co-operative Market, the success of which appears to render it worthy of imitation in other districts where similar conditions obtain. The Editor, Mr. Walter P. Wright, has written a thoughtful supplementary chapter on "First-class Hardy Fruit for Market," in which he touches on varieties, pruning, manuring, pests, and diseases, and cold storage.

## GARDEN KALENDARS.

THERE are a few omissions in Mr. Jacob's list of calendars, some of which I may be able to supply the titles of, but I do not go much beyond the beginning of last century. To take them by dates, seriatim, the first is that in London and Wise's *Complete Gardener*, 1699, "*The Gardener's Kalender*. Directing what is to be done in the Kitchen Garden, Every Month in the Year." In 1706 *The Husbandman's Kalender* is appended to Mortimer's *Art of Husbandry*, in which are lists of many strange Apples and Pears, local sorts, no doubt. I have not seen Bradley's *Calendarium Universale*, 1718, which may be the same as Whitmill's as noted in Mr. Jacob's list. *The Complete Seedsman's Monthly Calendar* is rather a catalogue of garden plants with descriptions, in 1725, 1738, etc. Switzer has a calendar appended to his *Practical Kitchen Gardener*, 1727, and Part II of Batty Langley's *New Principles of Gardening* is arranged as a calendar, not monthly, however, but in quarterly sections. *The Flower Garden Display'd* (1732), and *The Fruit Garden Display'd*, so far as they go are both arranged in monthly sequences, very much in the same way as the *Seedsman's Monthly Calendar* noted above. *Eden*, published anonymously in 1757, but by John Hill, a very large illustrated folio, is also similarly arranged. The sections are Flora, Chloris, Pomona, the Greenhouse and the Seminary.

In 1771 "James Meader, late gardener to the Earl of Chesterfield," published, from MSS. left by T. Hitt, *The Modern Gardener*, or *Universal Kalender*, arranged in the same manner as Abercrombie's *Every Man his own Gardener*. *The Planter's Guide* by Meader, of which I have a copy, too, is dated 1779, and is an oblong folio with two large, folding plates, the letterpress being simply a series of tables of trees and shrubs, but there is no calendar. Abercrombie's *Gardener's Daily Assistant* (1794) is arranged as a calendar, and very much condensed in comparison with his first book. In 1809 Walter Nicol published in calendar form *The Villa Garden Directory* and, in 1810, *The Gardeners' Kalender*. He died the same year and left partly written what was published in 1813 as *The Planters' Kalender*, which was continued and finished by his relative Sang, a nurseryman of Kirkcaldy. R. P. Brotherston.

\* *Plant Materials of Decorative Gardening: The Woody Plants*. Second edition, revised. By William Trelease, Professor of Botany in the University of Illinois, Urbana. Price 1 dollar.

† *Winter Botany*, a companion volume to the author's *Plant Materials of Decorative Gardening*. By William Trelease, Professor of Botany in the University of Illinois, Urbana. Price 2.50 dollars.

**SOME UGANDA ORCHIDS.**

(Continued from p. 239).

**EULOPHIA.**

*EULOPHIA* (*Eria*) *guineensis* (see Fig. 107) is another terrestrial Orchid of great beauty. It had been collected and named from other parts of Africa, but I believe I discovered the first specimen in Uganda in 1913. Its manner of discovery is interesting.

It was my custom to place my Orchid finds on the shady earth verandah of my bungalow. Early in 1913 appeared two growths from a small pseudo-bulb lying on the floor. I had not seen this before, but I cultivated the plant, which eventually flowered and proved to be *Eulophia guineensis*. Part of the plant I sent to Sir Frederick Moore, the other part I cultivated to increase it, and eventually sent it to Kew, where it flowered last year. Where the bulb really came from I never knew. I must have brought it in unnoticed amongst other plants, but all search in likely places to find it growing wild was unsuccessful.

The plant flowers from the new growth as the leaves unfold. The spike runs to 1 foot in height, and bears up to 10 flowers. The lip of the flower is 1½ inch across, and a beautiful pink in colour. The base of the growth forms into a round bulb 1½ inches through, and the resting period is complete. I found the plant responded to rich soil and manure when growing, and the fullest sunlight.

**BONATEA UGANDAE.**

This is another terrestrial species of great interest. I found the plant first in 1904 within a stone's throw of the source of the Nile. Dried specimens were sent to Kew, where it was found to be a new species. Later, roots were sent to Kew, Glasnevin, and the late Sir Trevor Lawrence, and the plant has flowered in all three collections. Its habitat was restricted to a very small spot on the Nile bank, and, as soon after this the banks of the river were cleared and burnt off to destroy tsetse fly, *Bonatea* no longer exists there.

In 1907 I found a solitary plant of a *Bonatea* in Unyoro, 200 miles away, and this was referred by Mr. Rolfe to *B. ugandae*, but not decisively named. Possibly the plant may not be found again for many a long day.

This Orchid has tubers and a growth similar to those of *Habenaria*. The plant in flower is 3 feet in height; flowers greenish white, with a spur over 6 inches long. After flowering, resting is complete. It is a sun lover, and was found associated with *Aloe* and *Euphorbia*.

*Habenaria zambesiaca* is a pretty swamp Orchid. It reaches ½ foot in height, the spike being crowded with white flowers spotted with purple. This Orchid grows wild in full sunlight.

*W. Brown, F.L.S.*

(To be concluded.)

**ORCHID NOTES AND GLEANINGS.**

**HYBRIDS FROM BROCKHURST.**

FLOWERS of four excellent new hybrids raised in his gardens are sent by Frederick J. Hanbury, Esq., F.L.S., Brockhurst, East Grinstead.

**CATTLEYA MARIE MCLEOD.** Raised between *C. illustris* (*iridescens* × *Acis*) and *C. Dowiana*

white column, which they enfold at the base; the narrow isthmus is striped with yellow and the expanded front lobe is reddish violet.

**CATTLEYA JESSIE C. MURRAY** (*Chamberlainiana* × *Octave Douin*). A very pretty flower with some resemblance to *C. Hardyana alba*, the *C. Leopoldii* in *C. Chamberlainiana* not appearing. The sepals and petals are white, the lip Tyrian purple, with large, clear yellow disc

FIG. 107.—EULOPHIA GUINEENSIS.

*aurea*; the well-formed flowers of this hybrid have clear, chrome-yellow sepals and petals. The lip, which shows strongly the influence of *C. bicolor* and *C. velutina* in its ancestry, has short, rounded, orange-coloured side lobes that are only half the length of the fleshy, wax-like

on a white ground and with gold lines from the base.

**CATTLEYA MURIEL HENDERSON.** By crossing his useful winter-flowering hybrid of 1913, *C. Thomasii* (*Bowringiana* × *Peetersii*) with *C. Fabia* (*Dowiana* × *labiata*), a good combination has been effected, the form of the flower being nearest to *C. labiata* and the colour to *C. Bowringiana*. The sepals and petals are bright violet-mauve, the lip darker in tint and with thin gold lines from the base to the centre, which has an orange shade.

**CATTLEYA JANET P. CRAWFORD** (*Mantini* × *Dorothy Bushell*). In colour this hybrid is of the *C. Mantini* class, the sepals and petals being rosy-mauve, the white mid-ribs appearing at the base. The lip, which is broadly expanded in front, has short side lobes coloured rosy-mauve, the base having yellow lines to the ruby-purple coloured front. The stout column is white and is an effective feature.

**CATTLEYA DUPREANA ALBA.**

The original *Cattleya Dupreana*, raised between *C. Warneri* and *C. Warszewiczii*, is one of the finest richly coloured *Cattleyas* of its class and flowers of a large white form raised between albinos of the two species named, and now flowered by Messrs. Sanders, St. Albans, show that the new combination gives a remarkable addition to the large-flowered, white, hybrid *Cattleyas*, the shape and broad expansion of the lip carrying on the characters for which *C. Warneri* is noted as a parent, but with clear white flowers of fine substance. The disc of the lip is tinged with chrome yellow.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the Duke of Marlborough, K.G., Bleheim Palace, Woodstock, Oxon.

**Cymbidium.**—Strong, healthy plants of *C. Tracyanum*, *C. Lowianum*, *C. giganteum*, *C. insigne*, and many other hybrids are developing their flower spikes, and should have plenty of water at the roots. Others which have completed their growth, and which are not yet showing their spikes, should be kept rather dry for some little time longer, otherwise growth will commence and the plants fail to bloom. *C. grandiflorum*, which is generally a most difficult Orchid to flower satisfactorily, has also finished its growth, and flower spikes are developing from the pseudo-bulbs of the previous year. To ensure success in flowering this beautiful species, the plants should be fully exposed to the light, in a cool house, and the roots kept on the dry side during the winter. The many hybrids of this family comprise a most interesting and beautiful class of plants, which produce fine spikes of bloom that last a considerable time fresh, either as cut flowers or on the plants. They do not require a very high temperature.

**Phalaenopsis and its Allies.**—With the shorter days this bulbless group of Orchids, which includes *Vanda*, *Aerides*, *Saccolabium*, and *Angraecum*, will need less water, both at the roots and in the atmosphere. When the tips of the roots are sealed over, the plants will only need water in sufficient quantities to prevent the leaves showing signs of distress. All should enjoy a light position during the dark days of winter. The species of *Phalaenopsis* which produce their spikes early should have sufficient water to keep them plump and healthy. Although these Orchids never entirely cease to make leaf growth, it is important that they should enjoy a short season of rest. When in active growth, sufficient moisture should be afforded to keep the compost moist, and the Moss on the surface green and in a growing condition. During the resting period the Moss may be allowed to become of a whitish green colour before water is applied. *Angraecums* that are in full growth may still be watered whenever they become dry, but care must be taken that they are in need of moisture before it is applied. Any species of these plants that are pushing forth their flower spikes require to be kept moist at the roots until their flowers are open.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Nede, Codicote, Welwyn, Hertfordshire.

**Freesia.**—The earliest batch of *Freesias* are growing freely, and the young shoots need some support. Place four neat stakes around each receptacle, and tie the shoots round with raffia at intervals; or twigs from an old Birch broom may be inserted in the pots amongst the shoots. The plants should be grown on a shelf in a cool greenhouse. Keep the roots well supplied with water. The later batches should be grown as sturdily as possible, admitting air to the house on all possible occasions.

**Souvenir de la Malmaison Carnation.**—Young plants of this Carnation, raised from layers rooted in July and August of the present year and growing in 60-sized pots, may be transferred to pots 6 inches in diameter, in which they may be allowed to flower; the compost for this final potting should consist chiefly of good, open loam. Pot with medium firmness and incorporate with the soil a quantity of wood ash, old mortar rubble and silver sand, adding a 6-inch potful of bone-meal to each barrow load of soil. If the loam is inclined to be of a heavy nature, a little spent mushroom manure should be added after passing it through a fine sieve. After

potting them the plants should be stood in a cool, airy house, using only sufficient fire heat to expel damp. Afford the roots water sparingly during the dull, winter months.

**Humea elegans.**—Young plants of *Humea elegans* raised from seed sown as advised in a previous calendar should be potted off into small receptacles as they become ready, using a light, open compost. The plants should be grown under cool conditions and fresh air should be allowed to circulate freely around them whenever the outside conditions will permit of ventilating. *Humeas* should be kept at an even state of moisture at the roots, as they are somewhat impatient of extremes of drought and wetness.

**Camellia.**—Where it is found that the flower buds of *Camellias* have set too freely they should be thinned to a single bud, or they will be liable to drop. Bud dropping is also often caused through excessive dryness at the roots; the soil should therefore be kept in an even state of moisture.

**Retarded Plants.**—All retarded plants required for blooming at Christmas and in the early winter months should now be placed in a house having an intermediate temperature; syringe the plants freely until the flowers begin to open.

### HARDY FRUIT GARDEN.

By H. MARRHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Pruning Large Standards.**—Although the work of pruning and thinning large Apple and Pear trees is usually done after the leaves have fallen, it may safely be commenced as soon as the fruits have been gathered. The heads should be moderately thin, but not excessively so, as if the branches are too open and far apart they are very apt to sway during stormy weather, and if carrying good crops the fruits are liable to get bruised on the trees. Neglected trees soon become thickets of useless wood which cannot possibly bear good, clean crops of fruit except probably at the tips of their top and outside branches. To keep the trees in a good bearing condition and the heads evenly balanced a certain amount of pruning should be done annually. All trees that are in good bearing, and more especially those growing in a rather light porous soil should have their roots well supplied with nourishment. A heavy mulching of rich farmyard manure will greatly assist the trees. The manual properties of the dung will get washed well down to the roots during the winter. If manure for use as mulching is not available, a few applications of liquid drainings from the stockyard will prove highly beneficial to the growth of wood, and increase the size of the fruits the following year.

**Winter Moth (*Cheimatobia brumata*).**—Grease bands should be employed where this pest is troublesome, and those who placed them around the trunks early should examine them at frequent intervals to remove and destroy any of the insects that have been caught and make good the grease if its adhesiveness has been destroyed by heavy rains and exposure to the weather. With constant attention many of the wingless females may be caught and killed. In this way the crop will be little affected with maggot, that takes such a large toll of the best fruits in many orchards and gardens.

**Apples.**—Those who are planting Apples this autumn will find in the following list of varieties suitable sorts for furnishing a supply of fruit over a long season: Dessert: Quarrenden, Ellison's Orange, Worcester Pearmain, Beauty of Bath, Egremont Russet, Cox's Orange Pippin, King of the Pippins, Allington Pippin, Ribston Pippin, Wyken Pippin, Claygate Pearmain, Dnke of Devonshire and May Queen. Cooking: Lord Grosvenor, Lord Derby, Ecklinville Seedling, Warner's King, Lodington, Round Winter Nonesuch, Crawley Beauty, Bismarck, The Queen, Chelmsford Wonder, Bramley's Seedling, Newton Wonder and Lane's Prince Albert. To those planting on a large scale I would strongly advise the planting of comparatively few early varieties, the later kinds being more useful.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Broad Beans.**—On a warm border make a sowing of Broad Beans. The soil should be well worked and made moderately firm afterwards when it is in a suitable condition. Sow the seed in double rows in drills made 3 feet apart, placing the beans 6 inches apart, and allowing a space of 9 inches between each row. Long-pod varieties are best suited for this sowing.

**Leeks.**—The main crop of Leeks should be earthed up for the last time. Make the soil fine by breaking it up with a fork.

**Broccoli.**—Where these plants have made leggy growths they should be heeled over before severe weather sets in. This may be done by removing the soil on the north side, placing the spade its full depth on the opposite side and gently levering the plant over until it rests in a slanting position. Cover the stems with soil and make them firm; the latter will protect the stems from frost.

**Potatos.**—Sets intended for forcing should be set up in boxes and placed in a warm house. As soon as the sprouts are large enough the tubers may be placed in 12-inch pots half filled with old potting soil. The forcing may be done in heated pits or any house where a sufficiently warm temperature can be maintained. If heated pits are available, the tubers may be planted in rows 15 inches to 18 inches apart on a gentle hntbed. Sets intended for planting in spring should be examined on wet days, and if the sprouts get too large they should be rubbed off. All seed tubers should now be set up in boxes and kept in a cool place until required for planting.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Vineries.**—The pruning and cleansing of vines and vineries will now be continuous until all the vines are ready for starting for next year's crop. Soap and water and Gishurst compound are old-fashioned mixtures and better than strong insecticides, which often do more harm than good. When the colonies of mealy bug have been greatly weakened, daily attention with a camel's hair brush dipped in methylated spirits will crown the labour with success from the time the vines break in the spring.

**Succession Houses.**—Vineries containing the remains of crops should now be cleared of the bunches to economise fuel, and allow the vines to be rested before they are pruned. All thin skinned Grapes will now keep as well, and, possibly better, in the Grape room, as on the vines. The grape room should be cleansed and the walls lime-washed before the Grapes are brought into it. Muscat Grapes are perfectly ripe, and the house must not be overdone with fire-heat, neither must the berries be allowed to suffer from damp, to which they are so liable during the fall of the leaf. A temperature ranging from 50° at night should be suitable, but much depends on the house and its surroundings, whether it is in a low, damp situation or on very heavy soil. Of two evils, it is better for the Grapes to be allowed to shrivel a trifle than rot, but by careful attention to details, there should be no difficulty in maintaining a middle course.

**The Late House.**—If Lady Downes and other thick-skinned Grapes are not well finished, the water-pipes should be kept sufficiently warm to justify a steady circulation of fresh air, care being taken that sudden fluctuations in the temperature do not produce a check. Give the surface roots a moderate watering with diluted liquid manure or soot water warmed to 80°. Choose a fine, bright morning with warmth in the pipes and a circulation of air through the house. Houses, on the contrary, in which the vines were started early, and the Grapes are now finished, should be kept dry and not too warm, an excess of fire-heat being liable to destroy the colour of the berries. Every lateral may now

be pinched or cut out, as this late growth will keep the roots in action, and retard the ripening of the premier leaves.

**Figs.**—Figs in pots should now be placed on pedestals or inverted pots, and receive repeated supplies of tepid water until the balls of soil are thoroughly moistened through. Fermenting material, consisting of Oak or Beech leaves, and a little well-turned stable litter may be introduced, loosely at first, until it touches the bottoms of the pots, and the heat begins to decline, when the whole mass may be made more firm. Another layer of leaves may then be added, and so on until the pit is full, and the crooked part of the pots receives genial warmth. The temperature of the pit may then range from 50° at night to 55° by day, always with a little ventilation, unless the weather is very severe, and these temperatures cannot be maintained. The trees may be syringed with tepid water once or twice during the early part of the day. As the days are decreasing in length, and severe weather may set in, there should be no attempt at forcing, as it is better to allow the warmth to decline a few degrees at such times, and redeem lost time after the turn of the year when the conditions will be favourable for rapid development.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Herbaceous Borders.**—Herbaceous borders should be replanted every two, or, at most, three years, whilst some of the more rampant growers amongst the plants should be lifted and divided every year in order to prevent them overrunning and possibly smothering their more delicate neighbours. As a commencement to this work, a spare piece of ground should be selected into which the plants can be laid as they are lifted from the flower borders. Select a fine day for this work, when the soil is in good condition for working; lift the plants and lay them in, taking every possible care that the labels are securely attached to them. When the borders have been completely cleared of the plants, the ground should be heavily dressed with well decayed manure, and, for preference, carefully trenched to a depth of, say, 30 inches. If trenching is not possible, then digging should be resorted to, but practise the former method if means will permit. Leave the borders for a time to allow the soil to settle again, and when this is sufficiently effected, then break the surface well down by means of a fork to render it fine enough to plant in. Before planting, the arrangement of the border should be carefully considered, and the factors governing this are the height of the plants, the colour of their flowers, the strength of growth, so that ample room for development may be permitted to obviate crowding; and the season of flowering.

**Planting.**—The old plants should be broken up for replanting, and the younger and more robust outer portions used, discarding altogether the probably worn-out centres. To break up large stools, two forks should be inserted back to back through the plant, and by pulling the handles together the portions will be levered apart, and suitable-sized pieces can thus be selected for replanting. This is far better than chopping up old stools with a spade as is too frequently done. If large clumps are required of particular subjects, it is far better to plant a number of small portions a little distance apart, say, three or five pieces, than to insert one large plant. The ultimate result will be far better, the work of staking more easily controlled, and the need of breaking up the clumps each year obviated. Plant carefully and firmly, and label each item as it is inserted. Some of the plants will need covering entirely with soil, and their positions should be marked by means of a few short sticks or old labels. When all is completed, the ground should be levelled as neatly as possible and the surface receive a top dressing of such material as manure from a spent Mushroom-bed or leaf-mould. The surplus plants may be grown in a reserve border from which a supply of cut flowers can be obtained.

## HARDY FLOWER BORDER.

### VERBENAS.

In the *Gardeners' Chronicle* of March 29, 1845, p. 209, under the heading "Verbena," a writer states: "I am a great lover of the Verbena, and to no flowers are our gardens more indebted for gaiety and brilliance of colour than to this little favourite." The writer expressed the general opinion of gardeners of that period, and for many years after the Verbena played a very important part in flower gardens and pleasure grounds.

It was used by Squire Holford in the long, raised, terrace border, with Bath stone edging at Westonbirt, under a wall clad with rare flowering shrubs and climbers, many years before and after 1860. This border was always planted with Verbenas of distinct showy colours, and was one of the most attractive features in the fine gardens there.

In the same gardens the little Argentine Verbena venosa, used both for beds and for growing in pots for decorative purposes, was always much admired. One of the best com-

### CONVALLARIA.

The present is a suitable time to transplant Lily-of-the-Valley. Thoroughly trench the ground, and freely incorporate well-rotted manure and sand with the soil. Select and separate the crowns singly and plant them 2 inches apart. Previous to planting, make the ground moderately firm; afterwards apply a light mulching of rotten manure to the surface. This beautiful flower is a favourite with everyone and should be planted extensively to supply cut blooms. A shady part of the kitchen garden may be set apart to form a bed of Convallaria, the usual place being along the path, near the espalier fruit trees. T.

### PAPAVER UMBROSUM.

SEEDS of this showy annual may be sown during the next few days to secure strong plants for flowering in the early summer of 1923. Sow the seeds where the plants are required to flower, and give early attention to the thinning of the seedlings. If required for early flowering, all annual Poppies may be sown now. Grown in irregular masses by the

FIG. 103.—FRUITS OF LONICERA HILDEBRANDTII (SEE P. 263).

binations with it was in beds of the trailing Mangles' Silver bedding Pelargonium, the numerous slender stalks with terminal heads of bright magenta flowers, above the green and silver foliage beneath, forming a perfect picture.

Named varieties of Verbenas, which were mostly grown in order to make sure of the colours desired, were struck late in summer or autumn and winter under glass, care being taken not to keep them in a temperature above 60° or 65°, or red spider and rust disease would cripple the stock for the year. Seeing this, some grew Verbenas from seed annually, sowing them in pans, covering the seeds lightly, and placing them in the temperature named in the end of February or beginning of March; the plants were duly pricked off and hardened ready for planting in the beds in May.

My many years of pleasant recollections of the Verbena, and the knowledge that it has declined in favour in large gardens, prompt me to call attention to these pretty plants, which are extensively planted in the Harrow Council's Estate, the owners of whose small gardens probably bought the plants from market stalls.

Since Squire Holford's time florists have greatly improved the Verbena, and we have in such varieties as Helen Willmott, bright salmon rose, with a white eye; and Defiance, dazzling scarlet, easily raised and inexpensive plants with beautiful flowers suitable for a variety of purposes in the garden. J. O'Brien.

sunny side of woodlands, Poppies are very attractive. S. L.

## THE ALPINE GARDEN.

### VERONICA CHATHAMICA.

The peculiar merits of this distinct and beautiful species of Veronica should be born in mind by all who are planting rock-gardens. It is a dwarf, creeping shrub, with thin, wiry branches and clean-cut, oval-pointed leaves that will hug the face of a rock as closely as Ivy. The smooth foliage is an unusual shade of glaucous green, approaching emerald, and the clinging veil with which it drapes the face of the stone becomes in late summer covered with little cone-shaped spikes of rosy-lavender flowers. V. chathamica appears to be hardy enough in most places; it is very easily propagated from cuttings, and rooted portions set-out in spring will cover several square feet in their first season. Though it will creep on the flat, a downward direction would seem to be the natural inclination of the plant, which means that the latter should be set above the rock face which it is intended to cover. Full exposure, with a cool soil, or half-shade seem to suit this species equally well, but a well-drained, stony root-run is desirable. A. T. J., N. Wales.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangements. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

## MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.\*

## THE START.

AFTER several weeks spent in Rangoon in a vain endeavour to find a suitable travelling companion, I left Bhamo solitarily on February 26 on my seventh journey to China. Having safely covered the first stage by the main road, however, my muleteers took fright at rumours of a Lashkar operating on the frontier, and dashed off at a tangent. Thus we proceeded to climb the high ranges to the south, instead of keeping to the river gorge—a change of tactics in harmony with my own wishes. Nevertheless, it was only by marching long hours that we succeeded in reaching T'eng-yueh in the regulation eight days. Crossing the strip of plain, where the huge papery leaves of the Teak crashed down at intervals, and the flaring flowers of the Cotton Tree (*Bombax* sp.) were snapping off one by one, we soon reached the foot of the hills. The rock is all granite, very coarse grained, and crumbling to a white powder, which is most distressing. It was the beginning of the hot weather, so there were few flowers visible in the monsoon jungle. Orchids are quite rare till about 5,000 feet is reached; and then, of course, it is scarcely monsoon jungle. Lower down, the first flush was stealing over the bracts of *Congea tomentosa*, and an occasional "Flame-of-the-Forest" (*Butea frondosa* in Burma, *Goldmohur* in Africa; something else in Java) was seen. In the undergrowth were merely a few mean *Acanthaceae*, which, however, always intrigue me, their flowers are so pleasing. But do not ask me to name them!

By the time we reached the summit of the range, at about 5,000 feet, two species of Violet, almost identical as regards their flowers, but with very different foliage; *Hemiphragma heterophylla* (in fruit); a wee blue *Gentian*; and a *Chirita* (not in flower), had introduced themselves.

On one of the large, isolated boulder-like outcrops I found a plant in fruit, flattened against the wall, and thoroughly desiccated, which might pass for a *Didissandra*; but as it was like no *Didissandra* known to me, I collected seed of it. Masses of Orchids also carpeted these hot and cold rocks, though none of them was in flower. At this altitude the open, park-like slopes were chequered with masses of snowy white Apple blossom, sweetly fragrant; the villages smothered in a mist of Peach blossom.

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 11, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 22, May 6, May 20, June 3, June 17, July 1, July 15, July 22, August 5, August 26, September 9, September 23, October 7, and October 21, 1922.

One of the commonest shrubs was a Labiate growing sometimes as much as 25 feet high. It possesses stout, erect spikes, about four inches long, of small, cream-coloured flowers, each of which, as it opens, gradually becomes filled with a brownish purple fluid exactly like *Condy's Fluid* in appearance. What is more, it smells like it! A plant which can disinfect itself is a novelty, to me at any rate! Up on the summits the streams take their rise in bogs filled with Rushes; but flowers there was none. However, on one of the high banks of granitic sand I found a *Rhododendron* seedling. After crossing the first range, we descended to the plain of the Nam Wan, and marched all day through typical Shan country; here rolling grassy downs, with a *jhil* or two enveloped in clumps of Bamboo; there across paddy land, dull and colourless. Derelict pagodas, *Ficus* trees, and slatternly villages were scattered over a corrugation of Rice fields and river terraces.

On the fifth day out, having followed the Nam Wan to its puny source, we crossed another range. Here the opium Poppy was rampant in all its glory. And now came that startling change in the appearance of the country, familiar to all who have crossed the Burma-Yunnan frontier in this region. The forest ceased abruptly. Grass and Bracken clad hills, honey brown, spread away in front of us. Patches of Alder copse, and, higher up, a mangy fur of Pine trees, alone relieved the herbage.

We descended to another river, which, like the Nam Wan, is also a tributary of the Shweli—a sufficient tribute to the fright of my muleteers. It necessitated another boring march up the almost level valley. In the damp ditches a small, rosy-leaved *Drosera* was about to flower.

On March 4 we entered a narrower valley, which presently became a ravine. Here and there a flamboyant *Melastoma*—or is it *Osbeckia*?—displayed itself, and there was a white flowered *Buddleia*, which recalled the fragrance of Cowslips, dear to an Englishman. But there was nothing else to relieve the stony monotony, except for a few weeds by the stream, truly of no nationality, cosmopolitans in the worst sense of the word. Not knowing their names, I refuse to invent nonsensical names for them. They are *Ishmaelites*.

Crossing an imperceptible pass, we presently caught sight of the gravelly bed of the many-channelled *Taping* below us, and rejoined the main road a day's march from T'eng-yueh. The city was reached next day, March 5.

I met Mr. Forrest in T'eng-yueh, and we compared notes of last season's work. By means of sketches and description I elicited the names of some of my plants; he had long names ready for them, and reduced me almost to tears and chagrin by mentioning casually that some of my finest discoveries at Mu-li had been in cultivation since the year one. Being an optimist, of course, I did not believe him—perhaps I described them ambiguously. Moreover, he left me a possible *Rhododendron* or two, and maybe two or three *Primulas*, besides odds and ends. Nor was Mr. Forrest by any means convinced that my glorious *Primulina Meconopsis* (No. 4421) is *M. Henrii*—a suggestion of my own, provisionally endorsed by Sir David Prain. If it is not *M. Henrii* it certainly ought to be called *M. Wardii*. I have suffered enough humiliation from having vulgar and obtuse plants associated with my name. Here is an opportunity, perhaps, to right a great wrong. I want a *Cyanthus Wardii*, too—my No. 4730. But this species may be known, though it is not in cultivation. By the way, my dwarf *Primulina Poppy*, No. 4008, is *M. lanceifolia*, as I am informed by Sir David Prain. *Meconopsis*, No. 4640, is, therefore, all the more likely to be new. Another opportunity to do something graceful. If no one takes the hint, presently, as in the case of a well-known queen who was particularly fond of *fleur-de-lis*, the word "Calais" will be found engraved on my uprooted heart. *P. Kingdon Ward*.

## HOGG ON FLORIST FLOWERS.

AMONG the first out-of-date books on gardening that I had an opportunity to purchase was that of Thomas Hogg, florist, of Paddington Green, Middlesex, relating to the culture of various florist flowers, etc. It is the second and best edition, published exactly 100 years ago, and following the first edition by two years, though London says ten. In addition to the one coloured plate in this, there are several in the second considerably better, of other flowers besides the Carnation. The author was a schoolmaster previous to turning nurseryman, and his book shows him to have been a pleasantly humorous individual, not acrimonious, like some later florists, nor so vastly conceited, but he could confess in an apophthegm, in Latin, as became one who daily had thought in that tongue. We cannot all succeed in everything.

Like John Parkinson, who called the Carnation the "Queene of Beautie and of flowers," Hogg loved it best. "The Carnation," he declared, "may justly be said to hold the first rank." Rea, however, was nearer the truth than both when he put this aspiration into rhyme:—

"If ask and have were in my power,  
After the Rose, give me the Gilloflower."

We conclude, therefore, that Hogg was more interested in the Carnation than the Auricula, Tulip, or any other flower of which he treats, and the Carnation, accordingly, is found holding first place, and most space in his book. Though very precise directions are given regarding composts in the finely-graded fractional proportions usual at the period, Hogg allowed that growers might attain as happy an end without being so meticulously exact.

He agreed that it was important, perhaps essential, to dress Carnations, but he himself never dressed them. Whether he employed Kit Nunn, the barber of Enfield, whose ability to change the appearance of a bloom must have been uncanny, and whose mantle seems to have descended on the late Ben Simonite, he does not say, but if he showed his blooms, they must have been dressed by someone else, in his own words, he must have been "obliged to return home without either silver cup, silver spoons, punch ladle, copper kettle, or set of china."

Hogg used a great variety of manurial agents in addition to leaf-mould, which he esteemed very highly. Night-soil, soap boilers' lye, sugar-bakers' scum, cow dung, wood shavings "when rotten and decayed, sawdust, tan, the bark and small branches of trees, in general—make a good ingredient in compost for many plants." Soot and salt were also used, and blood laid up for two years before using. But these strong manures were apt to cause the colours to "run," unless they were applied with much discretion. Hogg was aware of the value of old turf laid up long enough for the grass to decay, and afterwards turned so that it might be partially pulverised. Rich soil was judged by the pleasant smell it emitted, and was soft and oily to the feel.

Knowing how beautifully and regularly *Picotees* were marked less than twenty years subsequent to the date of this book, one is somewhat amazed to learn that florists excluded them from gardens where show Carnations were grown on account of a dread lest these should be spoiled by intercrossing. Hogg, however, was so little of a bigot, that he admitted them, and that because he admired them. They were "pencilled and marked by the inimitable hand of Nature in her more sportive mood: at one time, on a snow-white ground, a vast profusion of small, irregular spots appear—red, black, or purple." This reminds one of the marking of Mrs. A. Brotherton—"at another, a few straight lines or dashes of the pencil only are seen on some of the larger petals; then a fanciful mixture of both together, most beautifully blended; at another time the edges or extremity only of the flower leaves shall be tinged and laced all round, or the whole covered with a netted and mottly mixture of shining colours." Not unlike these, our fancy Carnations! A coloured illustration of a "yellow *Picotee*"

demonstrated how poor were these, yet, in the next decade, illustrations show really beautiful flowers. Hogg mentions how they were constantly imported from the Continent "by the families of the nobility and gentry," and Queen Charlotte and her daughters had a "very superb collection" at Frogmore, obtained principally from Germany.

Of the "true old Clove," he states, if the testimony of very old gardeners may be credited, it "is now lost," yet to-day we hear of it repeatedly, and indeed, I have seen it produced in quantities for sale—if the "old" Clove. In the very lengthy list of Carnations and Picotees, not one is now in cultivation; while, in the fairly good chapter on the Auricula, several names are familiar. It is noteworthy that Hogg retains for Auriculas the very old name of edged flowers—"painted or variegated." Sometimes there might be a difficulty to understand just what the early writers mean by these terms, and we are indebted to Hogg for making it once and for all clear.

A gardener by profession named Matthew Kenny was the doyen of Auricula growers in the early years of that century, and we learn that Maddocks was not esteemed highly as a florist. The green-edged Auricula illustrated is rather a poor specimen, perhaps the fault of the artist. There is not much said about the Tulip, and it may be gathered from remarks that though Hogg admired Tulips, he could not afford to get a collection together, which he states would cost one thousand pounds!

The rest of the flowers may be passed over, with one or two exceptions. Of Moss Roses, he notes, red, white, single, scarlet, bluish, Mossy Rose de Meaux, and Mossy Sweet Briar; these, and the few others named, he states, present "a select catalogue of the finest sorts distinguished alike for varied tints, fragrance and beauty." Of the Russian and Danish Stocks, which were the familiar ten-week German of a later date, he remarks that no flowers "are sought after at this moment with greater avidity." There were eighteen distinct colours in all, and before their introduction, he was acquainted with only the scarlet, purple, and white. He states also that some biennial or winter Stocks had lately been introduced. On the testimony of a gardener, the ten-weeks had been introduced from Germany 30 years previously, so difficult is it to get reliable information.

The volume is concluded by an essay on Prize Gooseberries and their weights, and this is included because "several florists are great cultivators of Gooseberries."

Previous, however, to discussing the qualities of Gooseberries, several of which maintain their popularity to this day, e.g., Crown Bob, Langley Green, Whitesmith, Roaring Lion, and a few more, Hogg presents his readers with the history of a "Flower Christening," a humorous account of Sam Greenhorn's visit to a London tavern, where a meeting was held to contend for a silver cup and to celebrate the annual feast. The owners of the Carnations met with their flowers in an upper chamber of the inn, and their gardeners, or helpers, downstairs. There Sam finally gravitated where, at his expense for wine to drink to their prosperity, the flowers were supplied with names appropriate to their supposed qualities. Much of it fictitious, no doubt, but enough of fact to illuminate for later generations the doings of select gatherings of florists a century ago. R. P. Brotherston.

## NOTES FROM GLASNEVIN.

### COLQUHOUNIA VESTITA.

This interesting shrub has been one of the surprises of the late autumn weeks. Planted at Glasnevin against a wall with a western aspect, it has flowered more freely than ever before. Hitherto the same plant has produced but an occasional weak spike of small flowers, but this autumn nearly all the shoots are terminated by numerous flowers of orange scarlet. An interesting Labiate from the Himalayan region, it would probably flourish in

many places if planted against a warm wall, and in soil not too rich. Its value lies in its late flowering season.

### CARYOPTERIS MASTACANTHUS.

Although very well known in gardens, this delightful October flowering shrub is always welcome. In favoured situations it may succeed as a bush in the open, but here it flourishes best against a wall with much the same treatment as suggested for Colquhounia. Planted near the latter it would make a pretty contrast with its panicles of small blue flowers. A Labiate also, *Caryopteris Mastacanthus* hails from China and Japan, and should be hard pruned back in spring to encourage strong summer shoots.

FIG. 109.—LILIUM PHILIPPINENSIS VAR. FORMOSANUM.

### CORNUS PAUCINERVIS.

This interesting and pretty shrub is one of Mr. Wilson's introduction from China. Here it passed out of flower in the middle of October, although it is reputed to flower earlier in some districts. During late September and early October it attracted considerable attention from lovers of shrubs by reason of its corymbs of white flowers. It is distinct in its narrow leaves, and is suitable alike for a bed or shrubbery.

### ELSOLTZIA STAUNTONII.

This, too, is an October-flowering shrub of comparatively recent introduction from China. At mid-summer it would not perhaps excite much admiration, but at this season it has claims to inclusion in the garden. It likes a position similar to *Caryopteris*, and where sunny, low walls are available for shrubs it may well be included for its interest late in the year. The small pink flowers are borne in panicles at the ends of the current year's shoots. It should be pruned in spring.

### LILIUM PHILIPPINENSE VAR. FORMOSANUM.

This is the latest of all the Lilies to flower here, and for the past two years it has made a beautiful display in October. The position is a shaded one facing north, and the soil is cool and moist. It is very likely that in a sunnier position the flowers would be produced earlier, but our experience points to the need for a fairly moist rich soil. The plants illustrated (Fig. 109) were raised from seeds sown in March, 1919, and have been in their present position for 2½ years; they were planted out as soon as large enough to transplant from boxes. Since being planted in the open they have not experienced any prolonged hard frost, but they do not apparently mind a soil that is certainly cold, and wet both winter and summer.

### ZIZANIA AQUATICA.

The "Wild Rice" is an interesting annual aquatic, and is rather attractive when grown in the shallow water close to the margin of lake or pond. In the spring of 1921 a quantity of seed imported from America was sown in the pond at Glasnevin. Plants grew well during the long, warm, summer months, and produced good seeds which were allowed to fall in the water naturally. Seedlings appeared in profusion this summer, and they in turn have developed seed, which is now dropping in the water.

The perennial *Zizania latifolia* also grows vigorously, but flowers very sparsely. The broader leaves, however, are ornamental, and a good group by the edge of the pond forms a pleasant variation along with groups of Bulrushes, Reedmace, *Glyceria aquatica* and a large mass of *Cladium Mariscens* in which, for some time, an Otter has made his lair, spending his time between the pond and the river near by. W. J. Besant, Glasnevin.

## DAHLIAS FOR PARKS AND GARDENS.\*

BECAUSE I am interested keenly in Dahlias and have tried to provide a good display in Regent's Park, my reward is this ordeal of speaking to a large number of experts who know far more about Dahlias than I do. It is not my task, however, to discuss the history of the Dahlia—is this not written by my friend, Mr. Harman Payne, with his usual thoroughness and erudition?

Though much has been written that is interesting on the early history and introduction of the Dahlia, the development of the Dahlia is equally fascinating. We had an opportunity recently of seeing several of the Dahlia species exhibited from the Royal Gardens, Kew, and no one with any imagination at all could fail to marvel at the race of flowers these small though elegant wildlings had given birth to.

Among the species shown *Dahlia imperialis* was not exhibited, no doubt for the reason that this gigantic plant does not flower till late in the year. I wonder if this noble species has borne any part in the development of the Dahlia? The flowers are displayed in the form of a branching panicle, thus differing from all our modern varieties. It might be worth while to consider whether such a type could be developed that would flower at the ordinary time. In the *Botanical Magazine* for 1870 it is stated that Messrs. Salter, of Hammersmith, grafted this species on to the tubers of a dwarf Dahlia, and on the authority of Mr. Fitch it is stated that the plants flowered luxuriantly at a height of from 6 feet to 8 feet. The method of grafting, however, is not very clearly stated, and I have twice failed in my attempt to dwarf this fine plant. Even without flowers *Dahlia imperialis* is a fine subject for a sub-tropical bed or a group on the grass. *Dahlia imperialis* is not difficult to procure if anyone wishes to experiment with it, and I may add that it is easily flowered by the common method of starving the roots.

It is a common observation that the modern Dahlia is as near perfection as it is possible for any plant to be, which is, of course, quite a mistake. There is room yet for several new types, and I hope to see single Paeony-flowered Dahlias closely resembling the single Paeony, with the petals cup-shaped and overlapping, as in the case of our lovely single garden Paeonies; and why should we not expect Dahlias with thread-like florets like the Chrysanthemums?

What has been achieved is much more remarkable than what is suggested. A few weeks ago I paid a visit to a new garden not far from London, and in this garden there was a bed of seedling Dahlias. I glanced at the plants in passing, and one single red Dahlia struck me as being peculiar. I turned back to see what made the plant look so odd, and at once noticed that all the flowers were borne flatly and quite erect; when I reached home I looked at thousands of Dahlia blooms, and with the exception of an occasional flower on the Pompons and on that fine Dahlia of Messrs. J. Cheal and Sons, called *Crimson Flag*, the whole lot faced sideways. This erect flat habit gave the plant a most distinct appearance, and it appeared to be a feature worth encouraging.

Dahlia Mercki is, perhaps, the most elegant of the Dahlia species, and ought to be used to see if a class of real miniature Dahlias could not be produced. Nothing could be more desirable than this little Dahlia in a variety of colours.

During the ten years or so that I have had to do with park gardening I have given the public displays of such flowers in named collections as Phloxes, Pentstemons, Sweet Peas, Gladioli, and Roses; but I am sure nothing gives the park frequenter so much pleasure as a named collection of Dahlias. I account for this from the fact that Dahlias are so easily grown, and they are also cheap. As town plants, they are not half so much grown as they deserve to be.

It is a remarkable fact that while the part of the Dahlia above ground is very tender and is destroyed by a few degrees of frost, the root, with the slightest of protection, will come unharmed through any average winter such as we get in London. There are Dahlias in Regent's Park growing along the edge of a shrubbery that were planted five years ago, and never have had any protection further than that provided by the shrubs; to-day they are huge plants several yards in circumference bearing sheaves of bloom. I think they represent the old variety called *Empress of India*.

It was my privilege while at Greenwich Park to judge the gardens attached to many working-class homes; this property belonged to a wealthy and very old Trust, and prizes were given annually for the best displays. In many of these quite small gardens Dahlias were the chief occupants; these were never lifted during the winter, and they often were in flower before the plants I had propagated for the park. The hardness of the Dahlia in town gardens at least has not yet been appreciated; further, what other plant that can be purchased for a few shillings per dozen will provide a household with flowers for at least three months, and which require very little skill to grow?

Nor has the Dahlia yet come into its own as a park plant. Although the border in Regent's Park contains 500 plants and over 200 varieties, I would like to see if double the length, as there is the greatest difficulty in deciding which to grow among such a wealth of fine varieties as is available nowadays.

I have also a vision of a border planted exclusively with Dahlias, Michaelmas Daisies, and Chrysanthemums; such a combination, skilfully arranged, would, I think, surpass in effect any other possible combination. I hope to achieve it one day.

Having little knowledge of the Dahlia trade, I hope I shall not be considered presumptuous when I express doubt about the planting of Dahlias being advocated with sufficient enthusiasm. I took the trouble to turn over the advertisement pages of three of the chief gardening papers for May and June, and found that little was done by the trade in the way of keeping the Dahlia in front of the public. It some enterprising grower or combination of growers would occupy a page of the *Times* with an attractive advertisement, I am certain Dahlias would be sold by the million. Our Dutch friends chartered an aeroplane to bring over their Dahlia flowers to a London show, and are not afraid to ask prices for their novelties in excess of any asked at home. Our Press were far too extravagant in their praise of these Dutch Dahlias. This season I have seen many Dutch and American varieties, but the home raiser has nothing to fear from the raisers of either country. I hope to see British raised Dahlia blooms go by air route to America and sweep the boards at some great show.

In discussing the planting of Dahlias in parks and gardens, I have already stated that it is the mixed border of all types that appeal to the public, and the interest taken is much greater when each variety is named. Beds of one variety, however brilliant, do not attract like the mixed collection. This is very strikingly apparent at Greenwich Park, where the superintendent has planted in one border a choice collection of Dahlias; the grass fronting this border has vanished long ago, being trodden out of existence, while fine beds of one variety seem to have escaped notice.

For general autumn effect, however, no plant can excel the dwarf Dahlias when massed together. Among scarlets, West's Dazzler is a wonderful plant; *Crimson Glow*, from Messrs. Burrell and Co., will make a striking bedder; and *Crimson Flag*, from Crawley, is already greatly in evidence in public gardens. No doubt there are many other good dwarf scarlet ones of different types, and I might mention *Oriole* as one of the brightest of all dwarf Dahlias.

Among yellows I have gone back to *Brentwood Yellow*, one of the finest of all dwarf Dahlias. I know of no Dahlia so effective as this when massed; it is now an old variety, but distinct in habit from any other, and a type worth trying to increase. I have had a bed of

250 plants, which I am certain will do much to give this old variety a new turn of popularity. Another notable yellow Dahlia of good habit is *Dobbie's Bedder*; for quantity of flower it is one of the very best, and the shade of yellow is very delightful.

(To be concluded.)

## FLORISTS' FLOWERS.

### SELECTION OF UP-TO-DATE SWEET PEAS.

THE Floral Committee of the National Sweet Pea Society presents the following as an up-to-date selection of varieties placed in alphabetic order. \*The "asterisk" indicates the variety which the Floral Committee considers the best in each of the Colour Classes. †A "dagger" indicates a variety of special value for cultivation under glass.

BICOLOR (Light).—\*Dora (A.M., 1915), Mrs. Cutbertson, and Sparkler.  
BICOLOR (Dark).—Adelaide, †\*Magic, and Marks Tey.

BLUE.—\*Mrs. Tom Jones (A.M.).  
BLUE (Light).—\*Colne Valley (A.M.), and Margaret Fife (A.M., 1915).

BLUE (Dark).—\*Commander Godsall, and Jack Cornwell, V.C.

BLUSH (Pink).—Mrs. Hardcastle Sykes (A.M., 1905), and †\*Valentine.

BLUSH (Lilac).—Agricola (A.M., 1912), and \*Elegance.

CARMINE.—John Ingman (F.C.C., 1904), \*Mascott's Ingman, and \*Renown.

CERISE (Pale).—Doris, †\*Hawlmarm Cerise (A.M.), and Glory.

CERISE (Deep).—Brilliant, Fiery Cross (Silver Medal, 1915), and \*Royal Salute.

CERISE (Scarlet).—Alex. Malcolm, and †\*Royal Scott.

CREAM.—†\*Matchless, and Majestic Cream.  
CREAM PINK (Pale).—Bridesmaid, Cecily, and \*Mrs. Arnold Hitchcock.

CREAM PINK (Deep).—Giant Attraction, Market Pink, and †\*Picture (A.M.).

CRIMSON.—\*Charity (A.M.), Field Marshall, and Sunproof Crimson (A.M., 1909).

FANCY.—†\*Artistry, and Prince George.

FLUSHED.—Conquest, †\*Fairy Queen, and Mrs. J. T. Wakefield (A.M.).

LAVENDER.—Austin Frederick, Powerscourt (A.M., 1921), and †\*R. F. Felton (A.M., 1912: S.M., 1913).

LAVENDER (Pale).—†\*Elsie Dene, Lavender (King's), and Victory (Bolton's), (A.M., 1915).

LILAC.—Dorothy, Italia, and †\*Mascott's Helio.

MARbled AND WATERED.—\*Birdbrook, Helen Pierce Spencer, and May Campbell (A.M., 1911).

MAHOON (Red).—Hawlmarm Maroon, Maroon (Dobbie's), and \*Splendour.

MARoon (Dark).—Ravenswing, The Sultan (A.M., 1921), and \*Warrior.

MAUVE.—†\*King Mauve, Queen of Norway, and Shamrock.

ORANGE.—Golden Glory, Orange (Dobbie's), and †\*Tangerine Improved.

ORANGE (Pink).—†\*Geo. Shawyer (A.M.), and King Alfred.

ORANGE (Scarlet).—†\*Gloriosa (A.M.), The President, and Thos. Stevenson (F.C.C., 1911).

PICOTEED EDGED (Cream Ground).—Cherub, and \*Jean Ireland (F.C.C., 1915).

PICOTEED EDGED (White Ground).—\*Annie Ireland, and Elsie Herbert (A.M., 1906).

PINK (Pale).—†\*Daisybud (A.M.), Mavis, and Pink Pearl.

PINK (Deep).—†\*Hawlmarm Pink (A.M.), Hebe, and Pink (Unwin's).

PURPLE.—Le Madhi, \*Royal Purple (A.M., 1914), and Royalty.

ROSE.—Private Jack Smellie, Rosabelle, and \*Sunset (Bolton's), (A.M., 1921).

SALMON.—†\*Barbara (F.C.C., 1911), Liberty, and Melba.

SCARLET.—†\*Hawlmarm Scarlet, Mascott's Scarlet, and Scarlet (Dobbie's).

STRIPED AND FLAKED.—Loyalty, Phyllis, and \*Senator Spencer.

WHITE.—†\*Edna May Improved, King White (A.M., 1912), and Mascott's White.

WHITE (Tinted).—These are dark seeded varieties. \*Constance Hintan, and Miss Burnie.

\* A paper read by Mr. T. Hay, Superintendent of Regent's Park, at the Dahlia Conference, held at the Royal Horticultural Hall, Westminster, on October 17.

**FIRST EARLY POTATO TRIALS.**

An interesting feature of the Royal Agricultural Society's show at Cambridge this year, was the National Institute of Agricultural Botany's elaborate plot trial of First Early Potatoes arranged in the form of a chequer board. The results of the trial are now to hand, but their full significance is marred both by the prevalence of wireworm in the ground, the spring drought, and the dissimilarity of soil and climate under which the stocks of the eight different varieties were raised by their respective owners.

Each variety was represented by five separate plots in the chequer board, which, of course, helps to reduce the margin of error in a cropping test. Even so, the statistical analysis of the result showed that any difference of less than 28 per cent. could not be considered as indicating inherent superiority of one variety over the others.

The eight varieties yielded the following crops, calculated as tons per acre:—

1 Duke of York (Messrs. Daniels, Bros., Norwich ... ..)	7.4
2 Dunnotar Castle (Messrs. Sutton and Sons, Reading) ... ..	7.4
3 America (Messrs. Dobbie and Co., Edinburgh) ... ..	6.7
4 Colonist (Messrs. E. Webb and Son, Stourbridge) ... ..	6.7
5 Immune Ashleaf (Mr. A. W. McAlister, Dumfries) ... ..	6.7
6 Di Vernon (Messrs. I. Poad and Sons, York, and Messrs. Dobbie and Co., Edinburgh) ... ..	3.6
7 Sharpe's Express (Messrs. Sharpe and Co., Sleaford) ... ..	2.7
8 Dunvegan (Messrs. Sutton and Sons, Reading) ... ..	1.9

From these figures it is only possible to say that the group containing the varieties 1-5 displayed a definite superiority in cropping over that composed of the varieties 6-8, and No. 6 a definite superiority over No. 8.

The unfavourable conditions mentioned above were the cause of much irregularity in the growth of the plants of every variety, consequently the estimation of the relative times of maturity of the different varieties had to be abandoned.

The problem of measuring and comparing the cropping of different varieties of Potatoes with any degree of accuracy is one of peculiar difficulty. The National Institute of Agricultural Botany has attacked it on a large scale and in detail this year at its Potato Testing Station at Ormskirk. Full particulars of all the Potato and other trials carried out by the Institute in 1922 will be published in the early spring of 1923.

**FRUIT REGISTER.**

**APPLES OF QUALITY.**

I ALWAYS follow with interest the awards recommended by the R.H.S. Fruit and Vegetable Committee to new Apples, and no doubt it interests all pomologists that these new fruits should be brought forward annually for consideration, and I would not have things different. We must confess, however, that not many of these new introductions are of such outstanding merit as to rival such old, tried sorts as Blenheim Pippin or Cox's Orange Pippin; indeed, it seems to be a most exceedingly difficult thing to raise a really good new Apple.

I have myself experimented in a modest way for some years, and out of very many seedlings, I have found only one really worth considering, and that is not in any way superior to the great majority of passably good Apples. Blenheim Pippin, though not quite equal to Cox's Orange Pippin in quality, may be taken as a very good standard of what a really satisfactory, general purpose Apple should be, its chief fault being the long time required to get it into profitable bearing, but well grown, it is of the most admirable quality, delicious as a cooker, requiring no added sugar, and very good for dessert purposes.

The effort to get new Apples of merit is to be encouraged, but it seems little use to keep adding to the list of mediocre varieties. The raiser who can produce an early Blenheim Pippin and a late Blenheim Pippin will deserve to be ranked with the greatest benefactors of mankind; Kempster, who raised Blenheim Pippin, deserves to be held in honour. He must have possessed exemplary patience to have waited so long for his famous seedling to fruit, and I can well imagine his delight when he found he had drawn such a prize in Nature's lottery. Unless we can equal or excel such an Apple, although we may interest each other by showing our results, we have really accomplished nothing very valuable. Could we raise a Blenheim Pippin that would fruit more quickly, that would, indeed, be a distinct advance worthy of everlasting fame.

There are many Apples that I like, each possessing various degrees of merit, but if I were restricted to growing a few, I would have St. Edmund's Russett, Blenheim Pippin, Cox's Orange Pippin, King's Acre Pippin, Rosemary Russett, and Court Pendu Plat. I used to think

**APPLE ELLISON'S ORANGE.**

AMONGST the newer Apples the variety Ellison's Orange (see Fig 110) is becoming increasingly popular with growers, and especially those in private establishments, on account of its excellent flavour and handsome appearance. It was raised by the Rev. C. C. ELLISON, of Bracebridge, Lincoln, and received the R.H.S. Award of Merit on October 10, 1911, when shown by Mr. WILLIAM CRUMP, of Madresfield Court Gardens, Malvern, who found the tree to be a good grower and very fruitful. In the same year Messrs. PENNELL AND SONS, of Lincoln, introduced the variety to commerce. The fruit somewhat resembles Cox's Orange Pippin, but it is rather more conical. The skin is a beautiful golden colour striped with crimson, and there is a slight flush on the side exposed to the sun. The flesh is tender, of yellow colour, and has much of the flavour of Cox's Orange Pippin. An average fruit measures about 2½ inches high, and rather slightly less around. The variety is in season from September to October, and those who desire an early dessert Apple of the Cox's

FIG. 110.—APPLE ELLISON'S ORANGE; HALF NATURAL SIZE.

well of James Grieve, but experience shows that it is most prone to fall from the tree in an unripe state, and that this fault is too grave to make it valuable. Cox's Orange Pippin is very subject to scab. Orleans Reinette is a superior sort of Blenheim Pippin for flavour and worthy of a place in all collections. Gravenstein I like very much; it is a sweetly scented fruit of good size. The tree is a strong grower. I often see Ben's Red recommended, but I can only wonder greatly that anyone should waste good land on such a rubbishy fruit. Reinette du Canada is excellent as a cooker, and in seasons that suit it, very good for dessert. It is not generally grown, but it is worthy of a place in the garden or orchard. It is good till May or June, then fine for dessert. The tree is a grand cropper; the shape of the fruit is somewhat angular, or probably the variety would be more grown.

What should be looked for in new varieties of Apples are prolific, healthy types of such sorts as Blenheim Pippin, Cox's Orange Pippin, and Gravenstein, and until we can equal or excel these, we must write ourselves down as men who have failed to attain the ideal. Yet, if an ideal has been set so high, we have failed worthily, and the more who engage in this fascinating quest the better, even if all fail, but all will not fail, for some day another obscure Kempster will draw a prize and bless the world with an Apple of surpassing nobility. W. J. Farmer, *Ye Hive, Redruth.*

Orange Pippin type are recommended to plant this excellent sort. T.

**APPLE CHRISTMAS PEARMAIN.**

I RECENTLY saw a very excellent crop of Apple Christmas Pearmain grown in a small orchard belonging to a small-holder, and the thought occurred to me why this excellent late Apple is not grown more extensively, especially for the shops. The tree is an excellent grower and not susceptible to canker. It bears with great freedom, and for this reason is one of the best varieties for small gardens. The fruit is very attractive in appearance, somewhat conical in shape, and coloured dull yellow with a brownish-red flush, overlaid with a pleasing russet brown. G.

**DAMSON MERRYWEATHER.**

I RECOMMEND those who have not grown this variety of Damson to do so. At Wrotham Park gardens young trees have borne heavy crops of large, firm, good flavoured fruit, that keep sound and good on the trees long after other sorts. The tree grows freely, making strong, fruitful shoots. The individual fruits are as large as small Plums, but have the true Damson flavour. So highly pleased am I with the behaviour and usefulness of this Damson, that I hope to plant more trees this autumn. I feel sure that any grower who includes this Damson in his collection of stone fruits will have no cause for regret. H. Markham, *Wrotham Park Gardens, Barnet.*

## HOME CORRESPONDENCE.

**Acclimatisation.**—Mr. R. Irwin Lynch has done good service in his article on this subject (p. 224, in your issue of October 14). For centuries we have been acclimatising plants from all parts of the globe. Can we say they are all naturalised? For instance, the Fig and Peach have become acclimatised; are they yet naturalised? The Rhododendron and Aucuba have been acclimatised and naturalised. They reproduce themselves from seed if allowed to do so. I have yet to see the Cupressus or the Arancaria from self-sown seed in this climate. The question is mainly one of environment. At Bitton Rectory, near Bath, much was done to acclimatise plants. On p. 226 Mr. Thatcher cites a case of the Rhus from Japan and from China, bearing on the subject. In his very delightful notes on p. 193, September 30, Sir Herbert Maxwell mentions a case of Genista from Sicily flowering in "Bonnie Scotland" this year. When we consider the very local and restricted habitat of many exotic plants, it is wonderful the number that have become acclimatised. Can we say the Eucalyptus is acclimatised? I have had plants stand two or three mild winters and even flower on one occasion, but all were killed when severe frost came. Yet I know of a tree near the sea coast in the same county, 20 years of age, its stem 15 inches in diameter. Is that tree to be considered as acclimatised? J. P.

**"Fungal" or "Fungous"?**—Once more I put the above question. I do so because in a recent short article of mine the word "fungal" was altered to "fungous." I had previously made up my mind to use the former as the adjectival rendering of the noun, fungus. Mycologists generally appear now to adopt it. Some may complacently consider either correct, but alternatives of this kind are not usual; and further, it would surely be foolish for science to adopt one form and horticulture the other. "Fungoid" has been used also in place of the above two renderings, but this plainly is incorrect, as the "oid" ending signifies resembling only. A fungoid growth, for example, really means a growth resembling that caused by a fungus, but not one actually due to it. J. P. Carlisle.

[*Hester's Dictionary* defines fungal, of or pertaining to fungi, and fungous, of the nature of fungi; in *A Glossary of Botanic Terms* fungal is defined, relating to fungi, and fungous (1) spongy in texture, (2) relating to a fungus, (3) produced by a fungus.—Eds.]

**Rosa Species with Ornamental Fruits.**—Rosa Sweginzowii, which was illustrated in Fig. 54, is one of the best of the ornamental fruited species, but there are others almost equally beautiful when in fruit. Some of the more notable species include Rosa omeiensis, which has very elegant foliage of Fern-like grace and small, scarlet fruits with yellow stalks; R. Moyesii, an exceedingly handsome species both in flower and in fruit. The blooms are deep blood red and are succeeded by deep red fruits that are very similar in shape to those of R. Sweginzowii. R. sertata has showy, rosy-purple blossoms and develops a number of deep red fruits, each about three-quarters of an inch long. R. setipoda, which Wilson in *Plantae Wilsonianae* states is closely related to R. Sweginzowii, has showy flowers about two inches across developed in loose, corymb-like cymes of a pale rose colour, and the flowers are succeeded by deep red ovoid fruits. T.

**Wasps.**—I am at a loss to understand how a "cold, wet spring" (see p. 197) can be held responsible for "a large number of wasps' nests later," as it usually has just the opposite effect, especially if followed by such a very cool summer, as we have had this year. Perhaps, however, the Criccieth wasps revel in that sort of spring, and although Mr. Bayliss noticed very few queens at that time, evidently those that survived were very prolific! I believe N. Wales is noted for its prevailing wetness, so no doubt the wasps have become inured to that sort of thing. What does Mr. Bayliss mean by "spring"? Queen wasps are usually on the move in my district in April and May. C. Nicholson.

## SOCIETIES.

## IMPERIAL FRUIT SHOW.

THE second Imperial Fruit Show at the Crystal Palace, organised by the *Daily Mail* in association with the Ministry of Agriculture, was opened on the 27th ult. by Sir Arthur Griffith-Boscawen, Ministry of Agriculture in the late Government and now Minister of Health. This year the scope of the show was somewhat enlarged and provision was made for Grapes, Citrus fruits, Pears, Tomatos, and Potatos, whilst classes have been added for Australia, Canada, Channel Islands, and Ireland. There were also many exhibits of a scientific nature in the gallery and displays of implements, baskets and other necessary appurtenances for fruit growers, whilst several Cider firms had imposing stands on which they displayed their beverages, with much information as to the process of converting Apple juice into Cider. Specimens of old Cider presses were particularly interesting. An extensive exhibit illustrated the work of the *Daily Mail* Young Farmers' Club, and included a model of a garden, poultry houses with an exceptionally fine pen of birds, and beehives.

The opening ceremony was performed, as stated, by Sir Arthur Griffith-Boscawen, who was introduced by Mr. Thomas Marlowe, the Editor of the *Daily Mail*. Mr. Marlowe stated that the Ministry was responsible for all technical matters and the *Daily Mail* for the organisation and finance of the exhibition. He stated that 8,000 parcels of fruit were entered in the 152 sections and that in most cases the competition was very keen. In one case, only half a point separated the first and second prize-winners, and half a point the second and third prize-winners. Mr. Marlowe, on behalf of the organisers, especially thanked Mr. W. G. Lobjoit, Controller of Horticulture at the Ministry of Agriculture, Mr. H. V. Taylor, Deputy Controller of Horticulture, and Mr. P. G. Dallinger, Chief Inspector.

Sir Arthur, in declaring the show opened, stated that he had hoped to have brought with him the new Minister of Agriculture, Sir Robert Sanders, but Sir Robert was unable to be present. He had, however, sent him a letter in which he greatly appreciated the public spirit of the *Daily Mail* in organising the exhibition. Sir Arthur Griffith-Boscawen stated that the show had a great educational value and its main object was to try and help the British grower to help himself. He was glad to know that the efforts of his old officials of the Ministry of Agriculture had brought home to the British grower the importance of packing and grading, and these shows have greatly assisted them in this direction. He understood that the Irish exhibitors were greatly in fault in these respects to-day, and by these methods they hope to help their Irish friends.

Although it was officially stated that the show was larger and the exhibits greater in number than last year, it was difficult to agree with this estimate, while from a spectacular point of view, the competitive show was distinctly depressing. The arrangement of the Apples on the main floor was sadly suggestive of sheep pens, and small wonder that many of the visitors contented themselves with passing down and returning to seek attractions elsewhere. Those who were interested in fruit from a business point of view did examine the many very fine exhibits critically, but such do not require educating, and we take it that the primary object of the show was to educate and to enthuse the lay public in all matters appertaining to fruits produced in our great Empire. This being so, everyone concerned must have regretted that the fullest advantage was not taken of so great an opportunity.

The bright spot amongst the competitive exhibits was the amateurs' section, and this, unfortunately, was tucked away at one end of the gallery, which only a small proportion of those who attended visited.

The nurserymen's non-competitive collections were, of course, attractive in every way. We write, "of course," advisedly, because, as the show-attending public is well aware, our trade growers have long been in the habit of staging

superb fruit in a highly attractive manner. The graceful stand of Messrs. G. BUNYARD AND Co., Maidstone, for instance, at once took the eye and compelled the visitor to realise the merits of the many dishes of Apples, Pears, and other hardy fruits. Even the most casual amongst them could not fail to admire the beautiful colour of the Roosevelt Pears, a variety which also carries high flavour, while others admired the Beurré Alexandre Lucas and the uncommon sheen on the shapely fruits of Double de Guerre, a particularly good culinary Pear. Many of the Apples were especially highly coloured. On the other side of the main floor Messrs. LAXTON BROS. also had in an especially attractive setting a large collection of hardy fruits. Apples predominated, and amongst them were to be found all the best varieties; Rival was in really beautiful colouring, though the greatest prominence was given to their new variety Laxton's Superb.

Splendid little pot trees, bearing perfect fruits, was the dominant feature of an exhibit by the KING'S ACRE NURSERY Co., and of these, Gascoigne's Scarlet was the most attractive. There were also many baskets of superb Apples and Pears. Gathered fruits of high quality were freely shown by Messrs. SEABROOK AND SONS and the BARRHAM NURSERIES Co., while Messrs. ISAAC HOUSE AND SONS had branches and gathered fruits of their showy Apple, John Standish.

The only exhibit of vegetables, other than in the Potato competitions, was a fine collection of the reasonable kinds of Messrs. J. CARTER AND Co., who also showed good samples of spring bulbs for present planting.

The best traditions of Covent Garden Market were exemplified by the leading salesmen. Messrs. GEORGE MONRO, LTD., again had a representative exhibit of market fruits of high quality in the packages as received from the best growers. In another place they had a comprehensive stand of horticultural sundries. A representation of an enormous wicker hamper of Apples was the central feature of an interesting exhibit by Messrs. J. BRADNUM, LTD.

Messrs. RIOLEY AND HOULDING combined shop and market most successfully (Fig. 111), and this attracted many of the visitors as much through the novelty of the arrangement as the very high quality of the Apples. The enormous quantity of fruits of many kinds shown by Messrs. T. J. POUPART, LTD., had a very imposing appearance, while just inside the door the stall of the Chamber of Horticulture was very attractively decorated with flowers and fruit. The only displays of flowers in quantity were the beautiful Carnations staged by Messrs. ALLWOOD BROS. and Mr. C. ENGELMANN, and a generous bank of decorative blooms of Scabiosa caucasica interspersed with Michaelmas Daisies by Mr. W. Wells, jur.

## COMPETITIVE EXHIBITS.

The British Empire classes for Apples, which require 20 boxes each of any dessert or culinary variety, resulted in a very large competition. There were 21 entries from Australia, Canada and South Africa, while the 24 entrants from Great Britain included such well-known fruit growers as Sir WALTER BERRY, Lt.-Col. A. C. BORTON, Messrs. W. J. LOBJOIT AND SON, Mr. HERBERT MOUNT, Mr. S. W. MOUNT, Messrs. W. SEABROOK AND SONS, besides various associations, including the HORTICULTURAL DEPARTMENT (Mr. A. J. Cobb), UNIVERSITY COLLEGE, Reading. This competition was a triumph for Nova Scotia in that both first prizes were won by Messrs. H. L. MORSE AND SONS, Berwick, Nova Scotia. Messrs. W. SEABROOK AND SONS were second, and Mr. S. W. MOUNT was third in the class for culinary Apples, while in the dessert class, the second prize was won by the POMOLOGICAL AND FRUIT GROWING SOCIETY of the Province of Quebec, and the third prize by Mr. F. P. NORBURY. The classes for Citrus fruits were disappointing, but the first prize six shallows of Black Grapes, shown by the MENPES FRUIT FARM, were very good, though these growers were beaten by Messrs. DOUGLAS BROS. in the Great Britain section. In this section Mr. S. W. MOUNT was a very successful competitor in the Apple classes.

The general quality of the Apples in the various district sections of England was very high, but far too often the packing of the boxes was faulty and, as packed, they would not travel well. A noteworthy exception was the half a dozen boxes of Cox's Orange Pippin, which won the first prize in the Kent and Southern Counties Section. These were exhibited by Mr. A. J. COBB from the Horticultural Department, University College, Reading, and he informs us that the excellent packing was mostly done by the students. It was admirable in every way and served to display the splendid fruits to the best advantage. In the class for Worcester Pearmain, their packing was again excellent. The best Blenheim Pippin was a splendid sample by Lt.-Col. A. C. BORTON. The barrels of Apples in this section were also of high quality, and Mr. S. W. MOUNT was a frequent first prize winner. The classes for any other variety of Apple, in most sections, brought forward an interesting variety of admirable sorts, but to the general public, the value of these classes was lost because the varieties were not named. In the Kent and Southern Counties section, the three prize half barrels, were of excellent fruits of King Edward VII., Mère de Ménage, and Lord Derby, but the exhibits bore no indication of these names.

The poor quality of the Irish Apples was very noticeable, and in the words of a well-known expert, "They would disgrace a coster's barrow." This was literally true and in addition to this very poor quality, the packing was exceedingly bad.

As we have previously remarked, the disposition of the amateurs' exhibits in the gallery was deserving of high praise, and the general quality was excellent. There was a great improvement on last year's show in that for the most part it was the very best varieties that were shown. Unfortunately, there was no collection of fruit.

#### POTATOS.

Classes, arranged and organised by the National Federation of Fruit and Potato Trades' Association and the National Farmers' Union, were included on this occasion for Potatoes, and the tubers were shown in bags of one hundred-weight. The exhibits were not of the quality we are accustomed to see at horticultural exhibitions, and large size seemed to be regarded by the exhibitors as of more importance than evenness of tuber, cleanness of skin, shallow eyes and other qualities usually associated with exhibition Potatoes by gardeners; moreover, most of the tubers were in a very dirty condition. Each winning bag was spread out for inspection and much the finest sample was Arran Comrade, shown by Mr. G. HOWARD, East Walton, Kings Lynn. Another remarkable exhibit was a bag of Golden Wonder, shown by the NEW TOWN AGRICULTURAL GUILD, Welwyn, Hertfordshire. The specimens of King Edward were not nearly so good as we are accustomed to see, even at local flower shows. The English counties were grouped in four sections and there was a separate section for Scotland. Messrs. W. TASKER AND SONS, Meikle, Perthshire, easily beat all other competitors in five out of the seven classes for Scotland, with tubers of very high quality. The Scottish tubers generally were of small size, better graded, and more suited for the table than the English produce.

#### EDUCATIONAL EXHIBITS.

The educational exhibit from the UNIVERSITY OF BRISTOL was of especial interest. The Director brought from Long Ashton pot plants and other specimens of Strawberries, Gooseberries, and Black Currants grown in pure silver sand with the object of discovering the effect caused by the elimination of one of the essential plant foods. Perhaps the most striking result was shown in the examples grown without calcium. The plants make short, sturdy growth and retain their foliage longer than normally, but, while flowers are freely produced, no fruit develops. With regard to Apples, the experiments show that without nitrogen, the fruits have an acid taste and produce a large number of pips, while when potash is eliminated, there are few, if any pips, scorching of the margins of

the leaves occurs, and here again no sugar is formed. The absence of phosphoric acid reduced the keeping properties of the Apples. In the control, where no manure was given, the fruits were larger, flavourless and contained many pips.

From the UNIVERSITY OF LEEDS there were valuable data on the cutting of Potato tubers, which showed that "sets should never be cut in sunlight, nor planted in dry soil. But they may be cut, well in advance of planting, if in shade and left scattered in shelter and moist air." The exhibit from the UNIVERSITY OF CAMBRIDGE SCHOOL OF AGRICULTURE gave interesting information and contained specimens affected with Silver Leaf Disease. The EAST MALLING RESEARCH STATION had valuable tables showing which varieties of Apples benefit, or otherwise, from the practice of tipping and from the thinning of the shoots.

#### ROYAL HORTICULTURAL.

OCTOBER 31.—A bright autumn day, with a brisk atmosphere, brought out large numbers of Fellows and friends to see the brilliant exhibition provided at Vincent Square. The

FIG. 111.—MESSRS. RIDLEY AND HOULING'S DISPLAY AT THE IMPERIAL FRUIT SHOW (P. 272).

best autumn display of Orchids yet seen at Westminster was the feature of the show, and there were no fewer than eleven attractive and interesting groups of these showy flowers, while twenty-one novelties were placed before the Orchid Committee. Next in importance were the Chrysanthemums, and Mr. H. J. JONES won another gold medal, which, we believe, brings his record up to six of these awards in about a dozen weeks. Grapes were also excellently shown, and for his exhibit of these fruits the Hon. VICARY GIBBS secured a gold medal.

There were numerous novelties, and perhaps the best was the beautiful Barberry named after its raiser and exhibitor, Lady BEATRICE STANLEY.

#### Orchid Committee.

Present: Sir Jeremiah Colman, Bart (in the chair), Messrs. Jas. O'Brien (Hon. Secretary), Gurney Wilson, T. Armstrong, J. E. Shill, Stuart H. Low, F. J. Hanbury, E. R. Ashton, Pantia Ralli, A. McBean, W. H. White, C. J. Lucas, F. K. Sander, H. G. Alexander, Chas. H. Curtis, S. W. Flory, A. Dye, J. Cypher, W. H. Hatcher, H. T. Pitt, and R. G. Thwaites.

#### FIRST-CLASS CERTIFICATES.

*Odontoglossum crispum Beauty Spot*.—From PANTIA RALLI, Esq., Ashtead Park, Surrey

(Orchid grower, Mr. Farnes). A remarkably fine *O. crispum* of the Pachy type, but improved by being home-raised. The noble spike bore large, pure white flowers of fine substance, with a large reddish spot on each of the sepals.

*Vanda luzonica dulcis*.—From Messrs. SANDERS, St. Albans. A superb variation from the type originally imported from the Island of Luzon by Messrs. Sanders. The fine spike bore several large, pure white flowers, with mauve bands inside the margins of the segments.

*Laelio-Cattleya Dodona (Haroldiana × Neltorpe Beauclerk)*.—From Messrs. COWAN, Southgate. A brilliant flower of very remarkable colour, large size and good form. The ground colour is orange with a rosy-red glow, the broad labellum being violet purple with gold shading around the yellow disc.

#### AWARDS OF MERIT.

*Odontoglossum Princess Yolande (eximium × l'Empereur)*.—From R. GERRISH, Esq., Milford Manor, Salisbury (gr. Mr. W. Sorrell). A showy flower of reddish claret colour with white tips and margins, and white front to the lip.

*Laelio-Cattleya Venada Rosslyn var. (L.-C. Baron Schröder × C. Dowiana aurea)*. From H. T. PITT, Esq., Rosslyn, Stamford Hill (gr.

Mr. Thurgood). A very attractive flower of good shape, the soft rose and red of the sepals and petals being shaded with orange. The effective lip is well formed.

*Odontoglossum crispum Silver Moon*.—From PANTIA RALLI, Esq. A true crispum of the finest form, with clear white flowers of perfect shape.

*Odontoglossum crispum The Marquis*.—From H. T. PITT, Esq. A splendidly grown plant with flowers of the true crispum type.

#### PRELIMINARY COMMENDATIONS.

*Odontoglossum Emma (eximillus × Ashteadense)*, from PANTIA RALLI, Esq. A promising flower of rich colour.

*Odontoglossum Bonar Law (nitidum × amabile splendens)*, from Messrs. CHARLESWORTH AND Co. Three very dissimilar forms of this superb hybrid with their large first flowers were shown, varying from white to rose ground with dense spotting of clear claret red.

#### CULTURAL COMMENDATIONS.

To Mr. FARNES, Orchid grower to Pantia Ralli, Esq., for a well-flowered specimen of *Trichosma suavis*.

To Mr. THURGOOD, gardener to H. T. Pitt, Esq., for a fine specimen of the claret red *Epidendrum (Nanodes) Medusae*.

## GROUPS.

The 30-guinea Challenge Cup offered by Orchid traders for a collection by an amateur and a Silver-Gilt Lindley Medal were awarded to Baron BRUNO SCHRÖDER, The Dell Park, Englefield Green (gr. J. E. Shill), for a superb group in which *Cattleya Tiresias* with a dozen spikes and other *C. Bowringiana* hybrids, with good specimens of that species, were arranged at the back. The Dell forms of *Laelio-Cattleya Ivanhoe* represented the best possible types of *Laelio-Cattleyas* in rich and varied colours and form; the finely coloured *C. Portia* in large specimens being very effective. *Brasso-Cattleya Rutherfordii*, with large, fragrant white flowers, and other *Brasso-Cattleyas* and *Brasso-Laelio-Cattleyas* were also represented, arranged with pretty forms of *Dendrobium Phalaenopsis*, superb *Odontoglossums* and *Cypripediums*, and several specimens of *C. Mandiæ*, each with twenty or more flowers.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. J. Collier), was awarded a Silver-Gilt Flora Medal for a very remarkable group, in which a large number of species and hybrids was displayed. *Cattleya Bowringiana*, including the blue-tinted *C. B. lilacina*, *C. Portia coerulea* and other blue-tinted *Cattleyas* of the class raised at Gatton, were prominent features; the collection also contained *Laelio-Cattleya Countess Torby*, and other *Laelio-Cattleyas*; *Cattleya Venus Prince of Orange*, *C. labiata coerulea*, and the fine form *Tbe Empress*; a selection of white *Cattleyas*, numerous *Odontiodas*, and *Odontoglossums*, including *O. crispum* Gatton Park var., *O. Gatton Princess* and other forms raised at Gatton, with a selection of pretty species.

Messrs. CHARLES WORTH, Haywards Heath, were awarded a Gold Medal for a fine group which included their grand forms of *Laelio-Cattleya Athene*, *Pyramus* and *Dr. M. Lacroze*, with *L.-C. Britannia* in variety, the best white being the variety *Melanie*. Some very fine white Orchids, including *L.-C. Schröderæ alba*, and *Cattleya Eva*, white with a dark lip; also a fine selection of yellow forms and *Odontoglossums* were also shown, one of the best novelties being *Brasso-Laelio-Cattleya Truffautiana* var. *Distinction* (*L.-C. luminosa* × *B.-C. Mrs. J. Leeman*), with greenish-yellow petals and large mauve lip.

Messrs. J. AND A. McBEAN, Cooksbridge, were awarded a Gold Medal for one of the best arranged trade groups yet shown, every plant being worthy of the show stand and staged to present it at its best. The Cooksbridge establishment is noted for *Odontoglossums*, and *Odm. crispum* and hybrids were well displayed. Forms of *Cattleya Venus* were of remarkable beauty, their *C. Dinah* (*Eliua* × *Dupreana*), which had previously secured an award, well sustained its high character; *C. Fabia* varieties, including *alba*, were good, and the brilliant *Odontiodas* gave colour to a very praiseworthy group.

H. T. PITT, Esq. (gr. Mr. Thurgood), was awarded the 20-guinea Challenge Cup offered by traders, and a Silver-Gilt Flora Medal for a very fine group, comprising the best *Odontoglossums* and *Odontiodas*, including his superb *Odontoglossum Bullecourt*, a grand selection of winter-flowering *Cattleyas*, and many remarkable species.

Mrs. MARY JOICEY, The Hill, Witley, was awarded a Silver-Gilt Flora Medal for a select group of rare Orchids, all in fine condition. At the back was the rare *Vanda luzonica* arranged with white *Odontoglossums*, yellow *Laelio-Cattleyas*, including *luminosa aurea* and *Carmenita aurea*, all attractively displayed. The old *Odontoglossum grande* and a good selection of hybrids and *Odontiodas* contributed rich colour.

Messrs. SANDERS, St. Albans, were awarded a Silver-Gilt Flora Medal for a very fine group, in which some of the beautiful species of which they were the original introducers were well shown. Various *Vandas*, now rare, and other species were shown, together with a varied selection of hybrids, several of which were new. White forms, including varieties of *Cattleya Puritan* and hybrids of *C. Lady Veitch*, were staged; among the *Brasso-Cattleyas*, the new *B.-C. R. Seymour Fannin*, a grand cream bluish flower with yellow zone to the lip, was the best; *Cattleya Peerless* (*Lady Veitch* × *Gaskell*

*liana alba*) is a good white variety. Messrs. Sanders also showed a pan of the remarkable *Macodes Sandermanianus*, with beautifully coloured leaves, and others of this class.

Messrs. J. CYPHER AND SONS, Cheltenham, were awarded a Silver Flora Medal for a pretty group arranged in their usual artistic manner, and composed of plants that exhibited highest culture. Among the very handsome *Cattleyas* was a superb specimen of the coloured form of *C. Peetersii* and some splendid white forms of it; there were also various white *Cattleyas*, richly coloured *Laelio-Cattleyas*, a showy selection of *Odontoglossums*, some grand *Brasso-Cattleyas*, and a very interesting selection of species of *Masdevallias*, with graceful sprays of *Oncidium* arching over from the back.

Messrs. COWAN, Southgate, were awarded a Silver Flora Medal for a very fine group of good hybrids, most of them raised by the firm (formerly Messrs. Hassall and Co.). The *Laelio-Cattleyas* included many crimson and yellow forms, the latter including their type of *L.-C. luminosa aurea*. Specially good *Cattleyas* were also shown.

Messrs. FLORY AND BLACK, Slough, secured a Silver Flora Medal for an exceptionally good group of hybrids, including a form of their showy *Brasso-Cattleya Viscount Toda*.

Mr. HARRY DIXON, Wandsworth Common, was awarded a Silver Flora Medal for a good and representative group, in which the best white Orchid was *Cattleya The Bride*, of a distinct type.

## Floral Committee.

Present: Messrs. H. B. May (in the chair), Sydney Morris, R. C. Noteutt, Reginald Cory, H. V. Warrender, John Heal, J. F. McLeod, W. B. Gingell, J. Jennings, W. Howe, Donald Allan, C. R. Fielder, G. Harrow, G. Reuthe, E. A. Bowles, W. P. Thomson, Chas. E. Pearson, W. B. Cranfield, Chas. E. Shea, Hugh Dickson, Arthur Turner, M. C. Allwood, Jas. Hudson, and Gerald Loder.

*Chrysanthemum Wycombe Pink*.—A large-flowered single variety with twisted ends to its slightly drooping florets. The colour is lilac-rose pink. Shown by Mr. W. N. TYZACK, High Wycombe.

*Chrysanthemum Mrs. B. Carpenter*. This beautiful Japanese variety is described on p. 275 in connection with the N.C.S. report. Shown by Mr. B. CARPENTER, Crouch End, Finchley.

*Chrysanthemum Miss A. Hozell*. This fine crimson and gold Japanese variety secured recognition from the N.C.S. the day previous, and is a brilliant flower. Shown by Baron SCHRÖDER (gr. Mr. Henderson), The Dell, Egham.

*Pelargonium Fascination*.—An interesting variety of the Cactus-flowered type, which has pointed-petalled flowers. The colour is deep and bright rose pink, and when a mass of flowers is presented the effect is pleasing. The variety is a seedling from the more brilliant *Fire King*. Shown by Mr. W. BUNN, Colwall.

*Carnation Thos. C. Joy*. To good form and size this white, fringed-petalled variety adds the merit of fragrance; it is distinctly clove-scented. Shown by Messrs. ALLWOOD BROS., Hayward's Heath.

*Crataegus Fulleriana*. This is a large, fruited Thorn with Cherry-like open-eyed fruits of a reddish scarlet colour. No doubt when seen growing and as a good-sized tree, it is most effective, but the leafless branches shown did not do it justice. Shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree.

*Crataegus Elwangeriana*. This has much in common with the foregoing, but has slightly smaller and duller fruits. The branches have spur-like thorns. Shown by the Hon. VICARY GIBBS.

*Nerine Glitter*. In this robust variety the flowers are rich orange-scarlet, and the segments are all waved. Shown by Messrs. BARR AND SONS, Covent Garden.

*Nerine His Majesty*. A very showy variety of good size and with slightly wavy flowers of a glowing light scarlet colour. Shown by Messrs. BARR AND SONS.

*Rhodostachys andina splendens*. A large growing Bromeliad with spiky leaves that have a silvery under surface, and are grey-green above. The specimen shown had several rounded heads of flowers, pink, with prominent gold-anthers.

*Berberis Lady Beatrice Stanley*. An exquisitely beautiful Barberry, with pendulous racemes of rounded, bright coral red fruits, which hang in profusion like Currants, along the arching growths. We understand this and several other pretty varieties shown were raised from a packet of seeds distributed from Wisley. It is certainly the finest Barberry we have seen, considered only from its effectiveness in the fruiting state. Shown by Lady BEATRICE STANLEY, Market Harborough.

## GROUPS.

Chrysanthemums were in such quantity and high quality as to augur well for the success of the National Chrysanthemum Society's Show on November 16 and 17. Mr. H. J. JONES had an interesting collection arranged in his customary imposing manner. There were many excellent Japanese varieties of the best exhibition size and type, and these included Wm. Rigby, Mrs. R. C. Pulling, Mona Davis, H. E. Converse and the new Viscount Chinda. Amongst the single-flowered sorts, Phyllis Cooper, large, rich yellow, and the pure White Gem, were very beautiful. Bronze Uxbridge and Red Emperor, of decorative size, were also noteworthy. For the sixth time this year Mr. H. J. Jones has won the highest award for a collection of flowers, which certainly must constitute a record (Gold Medal).

Large-flowered Japanese Chrysanthemums of merit were also prominent in a collection staged by Messrs. W. WELLS AND CO., whose chief sorts were Arthur Winter, Mrs. Sidney Dove, Mrs. R. Luxford, James Stedwick and Mrs. G. Monro. They also showed useful sprays of decorative varieties (*Silver Flora Medal*). In an attractive group by Messrs. KEITH LUXFORD AND CO. there were several very good types of the Anemone-flowered Chrysanthemums, such as Mabel Weston, pale blush, and Thora, rosy mauve (*Bronze Flora Medal*).

The best collection of winter-flowering Begonias that has been exhibited for a very long time was set up by Sir CHAS. NALL-CAIN, Bart. (gr. Mr. T. Pateman), The Node, Welwyn. There was a very large collection of 14 varieties and many of the large and floriferous plants were growing in small pots. The most striking sorts were Winter Beauty, deep crimson semi-double flowers, of slightly pendulous habit; Emita, large single orange; Ideala, very free-flowering and of deep rose pink colour, and Flambeau, rich orange, semi-double flowers (*Gold Medal*).

A better collection of stove plants than the award represents was displayed by Messrs. L. R. RUSSELL, LTD. Practically every plant was a model of cultural skill, and it included various *Codiaeums* (*Crotons*), *Cordylines* (*Dracaenas*), such handsome foliaged *Anthuriums* as *A. christallinum* and *A. Fitzerii*, the beautiful blue-flowered *Tillandsia splendens* and the old-rose coloured *Ruellia macrantha* (*Silver Banksian Medal*).

The large quantity of especially well-grown plants of the double-white greenhouse *Primula*, similar to that which in former years enjoyed a wide popularity, was shown by Gen. Sir CHAS. HADDOX, Berkhamstead. These illustrated a good strain and first-class cultivation (*Silver Flora Medal*). A small collection of seedling *Nerines* was staged by Messrs. F. H. CHAPMAN, LTD. (*Bronze Flora Medal*).

Fresh and bright Carnations were displayed by Messrs. ALLWOOD BROS., who included the fragrant Mrs. C. F. Raphael, and a delightful vase of mixed Perpetual-Malmaison varieties (*Silver Flora Medal*). Mr. C. ENGELMANN had the rich crimson Topsy and Nigger, the vivid scarlet Tarzan, and the deep heliotrope fancy Circe in his collection (*Silver Banksian Medal*). In a set by Messrs. STUART LOW AND CO., the beautiful pink Eileen Low, Red Ensign and White Pearl were very prominent (*Silver Banksian Medal*).

The new Cactus-flowering *Pelargonium Fas-*

ination, shown by Mr. W. BUNN (see Awards of Merit), was exceedingly attractive as a cut flower arranged with Maidenhair Fern. In this form it competed successfully with the spikes of Nerines (Bronze Flora Medal).

An exceedingly interesting collection of dwarf alpines grown in pots and pans was contributed by Messrs. G. G. WHITELEGG AND Co.; this filled an entire length of staging, and was composed chiefly of Saxifrages, Sedums and Sempervivums. Amongst the first-named *S. pectinata*, *Aizoon* and hybrids were particularly noteworthy for the autumn colouring on the outer leaves, while the rosettes of *S. longifolia* were beautifully silvered. Other silvery plants were *Raoulia australis*, of graceful creeping habit, and *Teucrium anreum* (Silver Banksian Medal).

Shrubs with glaucous foliage were prominent in an exhibit by Messrs. J. PIPER AND SON, and these were *Juniperus pachyphloea*, *Pittosporum Tobira variegata* and *T. Silver Queen* (Silver Banksian Medal). A neat little collection of hardy Opuntias in the group by Mr. G. REUTHE attracted attention, and he also had flowering sprays of *Hoheria populnea* and the brilliant *Salvia Grahams* (Silver Banksian Medal). Mr. F. G. WOOD had a small collection of his little rockeries and hardy flowers (Bronze Banksian Medal). The Misses HOKKINS set up a small rock garden and planted it with appropriate species, while Mr. J. J. KETILE showed bunches of Violets.

Roses in very good condition and of beautiful colouring were shown. Mr. G. PRINCE included Golden Emblem and Mrs. W. Christie Miller, of exceptional merit (Silver Flora Medal), while the Rev. J. H. PEMBERTON had good vases of The General and Mary Monro (Silver Flora Medal).

#### Fruit and Vegetable Committee.

*Present:* Messrs. C. G. A. Nix (in the chair), J. Cbeal, Geo. F. Tinley, Owen Thomas, S. B. Dicks, G. Reynolds, A. Bullock, W. F. Giles, F. Jordan, J. Wilson, A. Metcalfe, E. Beckett, T. Pateman, E. Neal, J. C. Allgrove, A. C. Smith, E. A. Bunyard, W. H. Divers, J. Harrison, W. Wilks, and A. N. Rawes.

Several seedling Apples were submitted for award, but none was considered equal to varieties already in commerce.

A selection of the best varieties of Beetroots grown at Wisley under trial this year were shown from the WISLEY GARDENS and Messrs. KELWAY BROS. also showed their Perfect Model Globe Beet and Kelway Barrel-shaped Beet, both of which figured in the trial.

A Gold Medal was awarded to the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), for a splendid exhibit of Grapes, including the varieties, Alwrick Seedling, Muscat of Alexandria, Lady Hutt, Alicante, Appley Towers, Gros Maroc, Lady Downes, Prince of Wales, Cooper's Black, and Madresfield Court. This splendid exhibit was one of the best collections of Grapes seen in the hall for a long time; Mr. Beckett is to be congratulated in adding to his other honours the winning of the Gold Medal of this Society for Grapes grown at Aldenham.

Mr. F. J. CHITTENDEN, Director of Wisley, referred to a scheme under the joint auspices of the Royal Horticultural Society and the Ministry of Agriculture, by which hardy fruits would be tested in the Wisley Gardens under trial as to their suitability for commercial purposes, and asked the Fruit and Vegetable Committee to appoint members to represent that body on the General Committee. The scheme will be a very comprehensive one, and it is proposed to devote some forty acres of land to the trial. The Ministry of Agriculture will make a grant covering two-thirds of the cost and the R.H.S. will provide the remainder.

#### MANCHESTER AND NORTH OF ENGLAND ORCHID.

TUESDAY, October 5.—*Present* The Rev. J. Crombleholme (in the chair), Messrs. B. J. Beckett, A. Burns, J. Evans, W. Giles, A. Hamner, J. Howes, J. Jackson, A. Keeling, J. McLeod, E. W. Thompson and H. Arthur (Secretary).

#### FIRST-CLASS CERTIFICATES.

*Odontioda Renown* (Odm. 'Coronation' × Odm. 'Victory'). A large, reddish-brown flower with lighter tips; *Laelio-Cattleya J. Ansaldo magnifica* (L.-C. Hildegard × L.-C. Lustre). A large flower of even colour with deep crimson lip. From S. GRATRIX, Esq.

*Brasso-Cattleya British Queen* (B.-C. *Empress of Russia* × C. *Lord Rothschild*). A fine flower, probably the best of the type yet seen; *Odm. Fabia* (*eximium* × *Aglaon*). From Mrs. GRATRIX.

*Odm. crispum Fairy Queen*. A white flower with occasional spots; *Odm. crispum xanthotes Sunstone*. A variety with small yellow spots on the sepals. From A. HANMER, Esq.

*Cypripedium Psyche Daisy Bank var.* From B. J. BECKTON, Esq.

*Miltonia Lord Lambourne*. A fine flower of the vexillaria type and of intense colour. From P. SMITH, Esq.

#### AWARD OF MERIT.

*Cattleya Venus Stonehouse var.* From S. GRATRIX, Esq.

#### GROUPS.

S. GRATRIX, Esq., West Point (gr. Mr. J. Howes), was awarded a Gold Medal for a group in variety.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), staged a group of Orchids, for which a Gold Medal was awarded. A. HANMER, Esq., Buxton (gr. Mr. C. Giles), was awarded a large Silver Medal for *Odontoglossums* in variety. A. T. COUSSENS, Esq., Prestwick, was also awarded a Silver Medal for a miscellaneous group.

#### NATIONAL CHRYSANTHEMUM.

The Floral Committee of this Society met at the Royal Horticultural Hall on Monday, the 70th ult., and had the pleasure of finding a very large display of flowers ready for consideration. No fewer than thirty-eight novelties were submitted, and awards were made as follow:—

#### FIRST-CLASS CERTIFICATES.

*Mrs. B. Carpenter* (II. I.A.). A particularly beautiful, large Japanese variety of very refined appearance. It has long, gracefully reflexing florets of a charming shade of rose-pink, and is a sport from Mrs. Algernon Davis. Shown by Mr. B. CARPENTER, Crouch End, Finchley.

*Helmath* (II. I.A.). A handsome, deep velvety-crimson, Japanese variety with a pale gold reverse to its broad reflexing florets.

*D. B. Crane* (II. I.A.). A variety of deep chestnut-red colouring and with flattish, reflexing florets.

*Bertha* (II. I.A.). A deep velvety-crimson variety, somewhat like Helmath, but with narrower florets. The foregoing three varieties were shown by BARON SCHRÖDER (gr. Mr. Henderson), The Dell, Egham.

*White Gem* (II. I.B.). An elegant, medium-sized, pure white variety, which appears to be particularly well suited to cultivation for market, and the certificate was awarded in that connection. Shown by Mr. H. POULTON, Pipbrook, Dorking.

*Godfrey's Triumph* (V. I.A.). A bright, large-flowered single variety with broad florets of rich buttercup yellow shade. Shown by Messrs. W. J. GODFREY AND SON, Exmouth.

*Miss A. Hazell* (V. I.A.). A beautiful single variety of large size and excellent form, with a peculiar shade of colour, which may best be described as rosy-terra cotta.

*Golden Marvel* (II. I.B.). A fine variety for decorative purposes. It has handsome, golden-orange coloured flowers of good size, borne on stiff stems. It gained a certificate for market use. These two varieties were exhibited by Mr. G. CARPENTER, The Gardens, West Hall, Byfleet.

*Rose Day* (II. 2.A.). A very pretty Japanese variety of large size and loosely incurving form. The colour is silvery lilac-rose. Shown by Mr. KEITH LUXFORD, Sheering, Harlow.

*David Bennett Nicoll* (II. I.A.). This variety is of rich amber colour, heavily shaded with red; its broad florets incurve a little at the tips. Shown by Messrs. W. WELLS AND Co., Merstham.

*Felix* (II. I.B.). A handsome, decorative variety with clear, light chestnut-red colouring. Evidently an excellent variety for market purposes.

*Alfred Durbin*. Another excellent market variety of good form and with stiff stems. The colour is reddish-terra cotta. These two varieties were shown by Messrs. CRAGG, HARRISON AND CRAGG, Heston.

#### COMMENDATIONS.

*Clytie* (V. 2.A.). A bright canary yellow single variety of good form, which produces its flowers in elegant sprays. It is therefore suitable for cut flowers and market purposes. Shown by Messrs. CRAGG, HARRISON AND CRAGG.

#### AWARD FOR COLOUR.

*Purple Emperor* (II. I.A.). A medium-sized, reflexing, Japanese variety, with probably the deepest purple-amaranth colour yet seen in Chrysanthemums. Shown by BARON SCHRÖDER.

#### NEWCASTLE HORTICULTURAL MUTUAL IMPROVEMENT.

At the annual meeting of this society, held on the 24th ult., Mr. R. E. Nicholson was appointed chairman and Mr. A. Standing, 9, York Terrace, Felling-on-Tyne, hon. secretary. The Treasurer's report showed a balance in hand of £7 7s. 5d. There was a capital attendance, and the numerous exhibits of vegetables were of excellent quality. Every effort is being made to ensure the success of the Apple and Chrysanthemum show, which is to take place on November 10 and 11.

#### NATIONAL SWEET PEA.

THERE was a large attendance at the annual general meeting of this Society held at the offices of the Chamber of Horticulture on the 31st ult. Limitations of space prevent us from presenting a full report of the proceedings in this issue, but we may observe that the Society has a cash balance in hand of £47, in addition to an investment of £100. Mr. S. B. Dicks was awarded the Henry Eckford Memorial medal for services rendered in connection with the popularisation of Sweet Peas. Mr. Robert Bolton was elected President for the ensuing year, and Mr. A. C. Bartlett was appointed Secretary in succession to Mr. H. D. Tigwell, who has resigned, and to whom a presentation was made by the members in token of their respect and esteem. The presentation took the form of a purse of £50. Arrangements are being made to hold the exhibition of 1923 at Bath.

#### ROYAL HORTICULTURAL OF ABERDEEN.

The annual meeting of the members of this Society was held in the Music Hall Buildings, Aberdeen, on Saturday evening, October 21. There was a good attendance, and Mr. William Anderson occupied the chair.

In moving the adoption of the annual report, which appeared in our issue of October 21, the Chairman expressed the satisfaction they all felt that the Society, thanks to members and friends, was now in a sound financial position, with a credit balance in their favour. From a horticultural point of view, their annual show was decidedly good, and some of the exhibits would have done credit to the International Exhibition in Glasgow. Mr. Robson seconded, and said that exhibitions without bands or other side-shows had attracted people who were really interested in horticulture. He hoped the annual show would again be held in Union Terrace Gardens, which he considered well adapted for the purpose, being central and easy of access. He drew the attention of members to the fact that in 1924 the Society would attain its centenary, and he thought that something special should be organised for that year in recognition of the event and to mark the importance of the Society. The report was unanimously adopted. Mr. William Grant, Cruickshank Botanic Gardens, Aberdeen, moved an alteration of the rule governing the election of directors, whereby, instead of electing twenty-one every year, seven would

retire by rotation and be eligible for re-election, and that those should be elected irrespective of class. Mr. W. B. Clark, superintendent of the public parks in Aberdeen, opposed the motion, and by a majority of over two to one the proposal was rejected. Affiliation with the Royal Horticultural Society was suggested, but it was unanimously agreed to remit the matter to the directors, with power to act.

The hon. president and vice-presidents were re-elected, while Colonel Gill and Mr. Anderson were reappointed chairman and vice-chairman respectively. Thereafter twenty-one gentlemen, representative of the various classes, were elected directors, and with the re-election of the auditors and the secretary and treasurer a pleasant meeting closed.

## Obituary.

**W. Wiseman.**—A well-known and highly-respected nurseryman, Mr. Wiseman, Forres, N.B., was found dead in bed this week. He had been for a long period the victim of acute rheumatism, and the doctor stated deceased must have passed away in his sleep about four hours previously. About 40 years ago Mr. Wiseman went from Elgin to Forres to take charge of the nurseries which were then the property of the late Mr. Grigor, and ultimately became proprietor. An exceedingly hard worker and a shrewd business man, Mr. Wiseman soon established a very wide connection in Scotland and England. Although keenly interested in the welfare of his adopted town, he took no active part in public affairs. Mr. Wiseman, who was a brother of Mr. Wiseman, seedsman, Elgin, was in his 69th year, and is survived by a widow and grown-up family.

**R. Lewis Castle.**—We learn with regret of the death of Mr. R. Lewis Castle, which occurred at Kingston about a fortnight ago. For some considerable time Mr. Castle has been ill and in somewhat reduced circumstances, but in his earlier years he occupied a very prominent position in the horticultural world. Born at Chelsea, he spent his earlier years near Edgware, in Middlesex, and later served with his father, who had a nursery at Clapham, and under whom he gained a wide experience in practical horticulture. As a young man he pursued his studies with great enthusiasm and attended lectures given by Profs. Huxley, Tyndall, Dewart, and others. Seeking further experience he entered service at the Royal Gardens, Kew, in 1874, where he won the highest appreciation of Sir Joseph Hooker and other members of the staff during his three years' stay. Subsequently, he became gardener at Holmbury, near Dorking, and while there he commenced his career as a journalist by writing for *Science Gossip*. His writings attracted the attention of the late Dr. R. Hegg, who offered him a position on the editorial staff of the *Journal of Horticulture*, a position he held for over twelve years, and during that period he travelled throughout England, Wales, Scotland, Belgium, France, and Switzerland, on behalf of his paper. At one time he was an enthusiastic member of the executive body of the National Chrysanthemum Society, and he assisted in the production of the first Official Catalogue of Chrysanthemums published by that Society. He was a prolific writer and wrote books on Orchids, Cactaceous plants, and Flower Gardening, and he won the Fruiterers' Company's gold medal for the best essay on "Gathering, Packing and Marketing Fruits and Vegetables by Cottagers and others with Small Holdings." After his retirement from the *Journal of Horticulture* he became manager of the Nevill Court Gardens, Tunbridge Wells, and in 1894 he became manager of the Duke of Bedford's Experimental Fruit Farm at Woburn, and held this important position for a number of years. Mr. Lewis Castle was an excellent lecturer, as well as a clever writer, and many years ago he made a tour in Ireland for the purpose of studying and encouraging the fruit-growing industry in that country. He was a most versatile and likeable man, and his old acquaintances deeply regret that ill-health and misfortune attended his later years.

## ANSWERS TO CORRESPONDENTS.

**APPLE STEM WITH BURROWING INSECT:** *C. A. B.* The insect present is the larvae of the Goat Moth, as you suspect. The best way to destroy the grub in the stem is to insert a piece of stiff wire into the cavity made by the larvae.

**BEECH DISEASED:** *Fagus.* The white material on the bark of your Beech trees is not caused by disease, but the Beech Coccus. The Beech Coccus is often confined to the trunk and main branches of the tree, when it may be eradicated by scrubbing the bark with a strong insecticide. In cases where scrubbing may not be practicable, the trees should be sprayed. The following treatment is recommended:—1, the trees should be sprayed, when in the dormant condition, with the following emulsion-soda wash, as used at the Woburn Fruit Farm: Paraffin, 2 gallons; soft soap, 1½ lb.; caustic soda (98 per cent.), 6 lb.; water, 28 gallons. In order to prepare the wash the soft soap should be dissolved in a gallon of boiling water; the paraffin should then be added, and the mixture churned thoroughly until a cream-like mass results. The thoroughness of the churning is important. The 6 lb. of caustic soda should next be dissolved in the remaining 27 gallons of water, and then poured into the paraffin emulsion. The whole should be well mixed and used immediately. Experimental work at Woburn, however, indicates that there are advantages in using a wash composed of sulphate of iron, ½ lb.; lime, ¼ lb.; paraffin (solar distillate), 5 pints; caustic soda (98 per cent.), 2 lb.; and water to make 10 gallons. This may be prepared for use by proceeding as follows: (a) Dissolve the sulphate of iron in about nine gallons of water; (b) shake the lime in a little water and then add a little more water to make into a "milk"; (c) run (b) into (a) through a piece of coarse sacking to remove grit; (d) pour the paraffin into the mixture (c) and churn the whole thoroughly; (e) add the caustic soda in powdered form just before using, and stir thoroughly. In using either of these mixtures the face and hands must be protected, as the mixtures are caustic in character. One advantage of the caustic soda is that it helps to clear the tree of such growths as lichens and algae.

**CELERY LEAVES UNHEALTHY:** *C. W.* The diseased condition of your Celery is not due to a fungus and there is no red spider present. It is possible that the specific you employed to destroy red spider was used at too great a strength.

**CYANIDING VINES.**—*Edwards.* After the Grapes have been cut and the foliage ripened, the house should be fumigated with 4 oz. of potassium cyanide (98 per cent.) to every 1,000 cubic feet, the operation being done in the evening and the house left till the next morning, when the ventilators should be opened and left so for an hour.

**HERBACEOUS PLANTS FOR SHADY GARDEN:** *D. Dawson.* Suitable herbaceous plants for shade are *Campanula persicifolia*, *C. p. alba grandiflora*, *C. p. Telham Beauty*, *Rudbeckia speciosa*, *Troilus enopaeus*, *Platycodon grandiflorum*, *Poterium obtusum*, *Iris pallida dalmatica*, *I. Queen of May*, *Monarda didyma Cambridge Scarlet*, *Helenium pumilum*, *H. autumnale Riverton Gem* (4 ft.), *Astilbe Davidii*, *A. Queen Alexandra*, *Anemone japonica alba*, *Achusa italica Dromore var.*, late-flowering Phloxes, and long-spurred Aquilegias. All the above will thrive looking out to any aspect of the sky, and not too closely shut in by houses or trees at a short distance away. Nor should they be directly under the drip of trees. Shrubs that thrive in partial shade are *Kerria japonica flore pleno*, *Daphne Mezereum*, *D. M. alba*, *Berberis Darwinii*, *B. stenophylla*, *Pyraeantha coccinea Lalondei*, *Spiraea japonica Anthon Waterer*, *S. j. alba*, *S. salicifolia*, *S. Douglasii*, *S. Menziesii*, *Pieris japonica*, *P. floribunda* (the two latter are often named *Andromeda*), *Hypericum patulum*, and *Olearia Haastii* (Daisy Bush of New Zea-

land). Bush Roses to grow in a mixed border are *Caroline Testout*, *Madame Ravary*, *Mrs. John Laing*, *Hugh Dickson*, *General McArthur*, *J. B. Clark*, *Madame Leon Pam*, *Gustav Grünerwald*, *La Tosca*, *Duchess of Wellington*, *Lady Pirrie*, and *Mrs. Herbert Stevens*. The last is white, but if you do not object to a tall one, *Frau Karl Druschki* may be selected.

**JAPAN AND CHINA:** *Anzac.* The hottest months of the year in Japan and China are July and August, the best time to travel to these countries being April and May.

**LEAVES OF INDOOR PLANTS DYING:** *J. H. T.* The leaf was so dried up when it reached us that it was impossible to determine the cause of its failure, but the under surface was covered with the dead remains of white fly pupae. White fly may be eradicated by fumigation with hydrocyanic acid gas or tetrachlorethane, but which of the two methods is most suitable for your requirements depends upon the kind of plants present in the house to be fumigated.

**MOSSY LAWN AND ALPINES:** *A. H.* (1) There is no need to wait till spring before applying lime to a lawn. Sift some soil to take out the stones, and mix two parts of it with one part of newly slaked lime, and give the lawn a fair dressing. This will not be strong enough to bring out the worms, so you should get rid of them first. Put a peck of quicklime in a barrel of water, let it stand for twenty-four hours, and then dip out the clear liquid, giving the lawn a good watering. Fill up the barrel with water again, and after twenty-four hours water another portion of the lawn, if necessary, according to size. If enough is given to sink deeply in the lawn, the worms will come to the top and can be swept up and removed. The lawn can then be top-dressed. (2) Suitable Alpines for the limestone rockery are *Dianthus caesius*, *Tunica Saxifraga*, *Alyssum saxatile compactum*, *Anhretia Dr. Mules*, or any other variety, *Cypripedium repens*, *Helianthemum*, *Veronica Teucrium dubia*, *V. spicata*, *V. Royal Blue*, *Iberis correaefolia*, *Campanula Portenschlagiana*, and *Linaria pallida*. Shrubs to plant amongst them are *Juniperus communis compressa*, *Retinospora obtusa pygmaea*, and *Cotoneaster congesta* (syn. *microphylla glacialis*).

**NAMES OF FRUIT:** *J. J. T.* Red Astrachan.—*Gardener, Herts.* (Numbers detached.) Pear, *Beurré Capiaumont*; 2, *Ribston Pippin*; striped Apple, *Cellini*; greenish Apple, *King of the Pippins*.—*J. W.* 1, *Marie Benoist*; 2, *Beurré Bose*; 3, *Zéphérin Grégoire*; 4, *Allington Pippin*; 5, *Yorkshire Greening*; 6, *Small's Admirable*; 7, *Lady Henniker*; 8, *Court Pendu Plat*.—*S. T.* *Queen Apple*.—*J. T. R.* 1, *Hitchin Pippin*; 2, *Tom Putt*.—*B. M.* 1, *Waltham Abbey Seedling*; 2, *Washington*; 3, *Detling Pippin*; 4, *Sturmer Pippin*.—*W. B.* *Lady Apple*.—*W. T. P.* 1, *decayed*; 2, *Golden Spice*; 3, *Bramley's Seedling*; 4, *Peasgood's Nonpareil*; 5, *Cox's Pomona*; 6, *Emperor Alexander*; 7, *Ellison's Orange*.

**NAMES OF PLANTS:** *P. N.* *Berberis vulgaris*.—*M. O. S.* *Crataegus Crus-galli*. *W. A.* *Barnet*. *Caesalpinia* sp. probably *C. Benducella*, which is widely spread in the Tropics.—*D. C.* *Nerine curvifolia*.—*J. H.* A variety of *Begonia Rex*, very near the type plant.—*J. C. B.* *Peristrophe speciosa*.—*G. W.* We cannot undertake to name florists' flowers.

**PHOTOGRAPHS OF FLOWERS IN NATURAL COLOURS:** *A. H.* There are processes by which flowers can be photographed in their natural colours. Your best plan would be to apply to the editor of some photographic paper such as *The British Journal of Photography*, 24, Wellington Street, Strand, W.C.2.

**PORTUGAL LAUREL DISEASED:** *Mrs. B. M. B.* The plant is affected with silver leaf disease, for which no certain cure is known. See *Gard. Chron.*, March 6, 1920, p. 123.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 45.0.

ACTUAL TEMPERATURE:—  
Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, November 8. 10 a.m. Bar. 29.9; temp. 60°. Weather—Dull.

### Soil Temperature.

Everyone concerned with the cultivation of plants is aware that the temperature of the soil plays an important part in determining the rate of growth and ripening of crops. It is a commonplace of horticultural knowledge that some soils are early and others late, and it is recognised that early soils owe their property of precocious crop production not only to their situation in sunny districts, and to their aspect, but also to their texture. For a heavy soil, even if well drained, will hold more water than a light soil, and will in consequence warm up less rapidly in the spring. It is no less well known that the temperature of the soil has a remarkable effect on root action. If it falls below a certain minimum absorption of water it is checked and growth is retarded. It does not matter whether there is or is not ample water present in the soil, for as the temperature falls roots become less and less efficient at absorbing it. Temperature, therefore, determines the availability of water in the soil. Although knowledge of effects of soil temperature on plant growth is fairly satisfactory, it has many gaps and as a first step towards the filling of these gaps, Messrs. Keen and Russell have carried out a very complete series of observations\* at Rothamsted on the daily fluctuations of soil temperature throughout the year. The results of their records are of great value both to the botanist and to the horticulturist. They show

that the roots of plants enjoy a more congenial climate than do the aerial parts, for the soil is on the average both warmer and moister than the air above it. As would be expected, the soil-temperature shows a daily periodicity. At a depth of six inches it begins to rise at about 9.30 a.m. and reaches a maximum at about 4.30 in the afternoon. From that time the soil temperature falls slowly and is at its minimum at about 8.30 a.m., so that the roots of a plant remaining at six inches below the surface enjoy a rising temperature for about 7-8 hours and have to submit to a falling temperature for the rest of the twenty-four hours. The soil reaches its daily maximum temperature some three hours later than the air. The maximum in summer is about 22° C. (71½° F.), though this figure is occasionally surpassed. The summer minimum ranges from 18-21° C. (64-69½° F.). In both summer and winter the minimum soil temperature is well above that of the air; so much as 6-8° C. (43-46½° F.) in summer and about 3° C. (37.4° F.) in winter. It is not surprising, therefore, that root growth of many plants should continue throughout the winter months when stem growth is entirely or almost entirely arrested. An interesting fact brought out by the records made by Messrs. Keen and Russell is that maximal soil temperature on a given day is not closely correlated with the number of hours of sunshine on that day. When, however, instead of a sunshine recorder, an instrument for measuring the total solar radiations is employed, the observations show a close connection between maximum soil temperature and amount of solar radiation. Rain reduces the maximum but wind apparently does not. Another observation of great interest is that the transition from winter to summer values is generally quick—a quickness which is reflected in the growth of plants in spring. The rapid rise in soil temperature is to be ascribed in part to the increased solar radiations and in part to the drying of the soil. Similarly, the cooling of the soil in early winter is rapid, and is attributable to clear October nights when the amount of radiation of heat from the soil becomes considerable. The transition from summer to winter state which our plants exhibit is a complex one, beginning early in the summer and extending over a long period of time. The first sign of the approaching change—this going into winter quarters—is, perhaps, the formation of cork in the stems. This is known to begin well before summer is past. Other changes follow in due course and order; the vessels of the wood become thick-walled with narrow cavities, in sharp contrast with the thin-walled, wide vessels of early spring. Growth of tree vegetation also slows down early, while summer is still here; later, the winter buds make their appearance and the leaves prepare themselves for their fall by forming a layer of corky tissue in their stalks. Only too little is known of the immediate causes of these advance preparations for the winter state—though the significance of the changes is evidently the need of the aerial parts to prevent a loss of water which the roots, also becoming less active, could not make good. It is not unlikely that the signal to the plant to set going in the hey-day of summer the work of preparing for winter consists in the change of soil temperature. As each day in spring and early summer brings a somewhat higher soil temperature, the plant's activities wax, but the moment the change comes, slight though it be, when to-morrow's soil temperature is a little lower than today's, the growth of the plant wanes and the orderly and leisurely preparations for winter rest begin.

Mr. E. H. Wilson.—We learn that Mr. E. H. Wilson has returned to the Arnold Arboretum from his recent plant-collecting expedition, in the course of which he visited India, Ceylon, Australia, New Zealand, Tasmania, the east coast of Africa, and the Cape. During his itinerary he visited important horticultural and botanical institutions and the scenes of some of the older famous plant collectors. He has gathered a large amount of material, some of which may confidently be expected to prove of value in gardens.

**Royal Horticultural Society's Examinations in 1923.**—The dates for the examinations in horticulture conducted by the Royal Horticultural Society in 1923 will be as follows:—Written examinations—general examination (seniors and juniors), Wednesday, March 28; school teachers' examination (preliminary and honours), Saturday, April 21; national diploma, May 26. Practical examinations—teachers' honours, Friday, June 22, and possibly also Thursday, June 21; national diploma, preliminary, June 26 and 27; national diploma, final, June 28 and 29. Entries for the diploma must be made before January 1, 1923. Other changes are that no specialisation will be allowed in the teachers' honours examination and that there will be no sub-division of section 1 in the final diploma examination.

**The Surveyors' Institution.**—The first ordinary general meeting of the Surveyors' Institution of the new session will be held on Monday, the 13th inst., when the President, Mr. J. M. Clark, will deliver his opening address. The chair will be taken at 8 p.m.

**New Public Park.**—The Central Committee of the Miners' Welfare Fund has approved a grant of £4,000 for the purchase and development of an estate at Bedworth, Warwickshire, as a public park and recreation ground. The property will be vested in Bedworth Parish Council, and the management will be in the hands of five representatives each of the Parish Council, Warwickshire Miners' Association, and local mine-owners. The estate is nearly fifty acres in extent.

**"Gardens in Sun and Shade."**—This is the title of an attractive booklet\* issued by Miss Minnie Aumonier, who shows paintings of garden subjects from time to time at the Royal Horticultural Society's meetings. There are ten short poems, interspersed with some pretty floral pictures reproduced from water colour drawings by the authoress.

**Society of Arts.**—Among the many interesting lectures to be given before the Society of Arts, at John Street, Adelphi, during November and December, those of special interest to horticulturists and botanists include "The Economy of Smoke Abatement," by Bailie Wm. Smith, of Glasgow (November 27), and "The Fading of Museum Specimens," by Sir Sidney Harmer, F.R.S., Director of the British Museum (December 13). The lectures commence at 8 p.m.

**Horticulture at the British Empire Exhibition.**—At Wembley Park, where the British Empire Exhibition will be held in 1924, considerable space will be devoted to horticulture, and it is hoped that the gardens will provide a worthy setting for the great exhibition and show a record of the development and progress of our horticultural industries. The extent and importance of the grounds of the exhibition site have already been referred to in these columns, as have the sylvan beauties of the estate, which we are glad to learn are to be preserved. To these latter, it is proposed to add displays of bog and water-loving plants, hardy trees and shrubs, herbaceous perennials and summer flowers of all kinds, and facilities for making these displays will be offered to nurserymen, who will be assisted by the exhibition staff with regard to planting and upkeep. It is anticipated that the grounds will be ready for such planting by the spring of 1923, so that all hardy plants and trees may be well established by the time the exhibition is opened in April, 1924. In addition to these facilities, pro-

\* The Factors Determining Soil Temperature. Journal of Agricultural Science. XI. 3. July, 1921.

\* Gardens in Sun and Shade. By Miss Aumonier O. Ancker, Ltd., London, price 1s 6d.

vision will be made for exhibition of tender plants, i.e., Orchids, Ferns, Palms, etc., and the authorities hope that the special floricultural societies will hold their exhibitions in the spacious hall, which will have a floor space of 12,000 square feet, and an abundance of top light. Arrangements will be made for the exhibition of horticultural buildings and machinery, sundries, manures, and insecticides, and these may be of permanent character or of short duration, as may be desired; for these exhibits, a charge for space will be made, but for the exhibits planted in the grounds in accordance with the plans now being prepared, there will be no charge. In either case, application for space should be made as early as possible to the British Empire Exhibition (1924), Horticultural Section, 16, Hobart Place, London, S.W. We understand that Mr. W. Watson, V.M.H., late Curator of Kew, is organising secretary of this section.

**Chauca Potatos.**—These hardy Potatos are stated in *Plant Immigrants*, July, 1922, to mature in about five months from the time of planting. They are grown in the Ecuadorian highlands at elevations of between 8,000 feet and 12,000 feet, and give tubers of good size, some of the sorts being of good quality. They have the defect of not keeping well, but are useful for growing for home consumption, and are largely cultivated for that purpose. As soon as the plants come into bloom, the tubers are considered to be mature, and are then dug for eating. The yield is said to be heavy, but not so large as the ordinary type of late main crop varieties. The seed may be set as soon as the tubers are lifted. This strain of Potatos may have a value in this country for very early supplies, especially if the haulm proves to be resistant to injury by late spring frosts.

**Horticulture and the General Election.**—Under the title of "Horticultural Legislative Programme," the Chamber of Horticulture has set out a list of questions which it hopes horticulturists will put to candidates for Parliament at the forthcoming general election, with a view to obtaining answers thereto, and, if possible, written answers to be returned to the Chamber. The questions are as follow:—(1) Do you agree that the crushing burden of taxation now imposed upon traders is largely responsible for decreased production, diminished trade, and unemployment, and that the general reduction of taxation on industry is vital to the revival and welfare of our horticultural industry? (2) In view of the serious diminution in the quantity of jam manufactured in this country owing to the high sugar duty, will you support a reduction in this duty in order that more home-grown fruit may be utilised for jam making? (3) Are you in favour, given ample safeguards for the protection of the public, of some regulation of the import of foreign horticultural produce, at such seasons and times as there is a sufficiency of home produce to meet all necessary public demands? (4) Do you consider that the Merchandise Marks Acts, 1887, 1894, 1911, should be amended so as to prevent the fraudulent sale of imported foreign horticultural produce as British, and would you be prepared to support an amendment in the House of Commons? (5) Will you support any action that may be taken to obtain further reductions in the postal rates, especially for business catalogues, circulars, and trade papers, and traders' goods despatched by parcels post, together with any action that may be taken with a view to the extension of the telephone service in rural areas? (6) Will you support action that may be taken for providing:—(a) That the various Railway and Canal Traffic Acts be consolidated? (b) That the Ministry of Agriculture be substituted for the Board of Trade in all sections of the Railway and Canal Traffic Acts as regulating the settlement of all differences or disputes arising in respect of the conveyance of horticultural traffic? (c) That neither party shall be allowed to appeal from the decision of any court of law on any matters relating to the Railway and Canal Traffic Acts where the amount in dispute is under £20. (d) For

effectual means of preventing railway companies from according any preferential treatment to foreign horticultural produce? (e) That the railway companies be compelled to supply adequate and suitable rolling stock to transport promptly and properly all horticultural produce to market? (7) Do you consider:—(a) That the whole question of local taxation as affecting land used for food production should be revised. (b) That the cost of national services should be defrayed wholly or to a much greater extent from the National Exchequer? (c) Will you offer all possible opposition in the House of Commons to the financial clause of any measure throwing additional burdens on the rates for purposes of a national character?

**Mr. James J. Guttridge.**—The City of Liverpool is fortunate in having no fewer than seventy-six open spaces with a total area of 1,517 acres. During recent years remarkable horticultural progress has been made by the Corporation, until now the city can boast of as fine a series of parks and pleasure grounds as any provincial centre. The acquisition of

MR. J. GUTTRIDGE.  
SUPERINTENDENT OF THE LIVERPOOL PARKS.

so many open spaces is due to the foresight of the members of the Parks and Gardens Committee, while the horticultural success which has followed is due, in large measure, to the fact that the Corporation has a thoroughly qualified superintendent for its parks and gardens in the person of Mr. James J. Guttridge, whose portrait we have pleasure in reproducing. Mr. Guttridge commenced his gardening career in the gardens of the late Dowager Countess of Ellesmere, at Burwood House, Cobham, Surrey, where he remained four years. Experience in several other private establishments followed, and then came a period of three years spent in the Royal Gardens, Kew, where he eventually became sub-foreman of the tropical propagating department. Mr. Guttridge left Kew to fill an appointment at the Botanic Gardens, Glasgow, where he remained for six years. His next position was that of Curator of the Botanic Gardens and Deputy-superintendent of the parks and gardens at Liverpool, and so successfully did he fulfil the duties of that dual position that in 1906, when the higher position became vacant, he was appointed on the fullest recommendation of the Parks and Open Spaces Committee to the superintendency. Those of our readers who know Sefton Park, the Botanic Gardens, and other open spaces of Liverpool, will agree that Mr. Guttridge has done a large amount of very excellent work in improving

the amenities of this great city and in brightening the surroundings of many homes, in addition to providing playing areas for the youthful members of the population. Mr. Guttridge has won golden opinions from all under whom he has served, as he combines the fullest practical qualifications with first-class organising ability.

**Non-Returnable Packages for Fruit.**—Judging from the markets and the British Empire Fruit Show, there is no doubt that the British standard box has come to stay as a package for the higher grades of dessert Apples. As it holds about a bushel (40 lb.), it is not too dear at the present price of 8d. or 9d. for fruit of this class; but it is too dear for cooking Apples in most seasons, and it is not suitable for large samples of this section, nor for varieties of irregular shape like Bramley's Seedling. It was hoped that the half-barrel would take the place of the box for cooking varieties, but it now seems unlikely. If made new for the purpose, the half-barrel is much too dear, and it is unnecessarily substantial. If second-hand Grape barrels are used, there is the trouble of getting supplies, and second-hand empties are certainly not ideal. Then the barrel is bulky to store, as it cannot be kept in the flat like boxes. Lastly, it is a wretched thing to pack in, and does not find favour in London and southern markets. Thus we seem as far away as ever from finding a suitable non-returnable package for cooking Apples. All the non-returnable containers on the trade stands at the Empire Fruit Show were, apart from any other faults, too dear. Generally speaking, in sizes to hold only half a bushel of fruit, they cost as much as the British standard box, which holds double the amount. There should be a class at such shows for new inventions in the way of non-returnable packages.

**National Chrysanthemum Society.**—The annual exhibition of the National Chrysanthemum Society, which is fixed for Thursday and Friday, the 16th and 17th inst., will be held, as in recent years, in the Royal Horticultural Hall, Vincent Square, Westminster. The schedule has been amended slightly in order to revert to the old conditions of allowing amateurs to compete in one of two distinct sections in the amateurs' classes for cut blooms; thus there are five classes for those who employ only one assistant and do not grow for sale, and a similar five for those who employ no paid assistant whatever. In other respects the schedule shows little alteration; it caters for all types of the flower, and the prizes include many valuable challenge trophies, in addition to money prizes. The show last year was a great success, and it may be confidentially anticipated that this year's show will be even better, for the membership is increasing, and growers everywhere are taking the same keen interest in this beautiful exhibition flower as in pre-war days. Although the date is somewhat late for the show, Chrysanthemums also are late this season, and everything points to the quality being exceptionally good.

**Pachira macrocarpa flowering at Kew.**—For several weeks past many visitors to Kew have marvelled at the exotic beauty of the tall tree of *Pachira macrocarpa* in the Palm house. The flowers, which are easily seen from the gallery, when fully open have much the general appearance of gigantic flowers of the Myrtle or, even more so, those of Feijoa Sellowiana. The long, slender, greyish column of a trunk, slightly buttressed at the base, carries at its head branches furnished with digitate leaves the size and shape of those of the Horse Chestnut, but more leathery and shining. From the axils of the leaves spring silky, cylindrical flower buds, nearly a foot long and about an inch across. These open into five petals, curling well back to disclose their white inner surfaces and release numerous filaments as long as the petals, but straw coloured at the base and generously tipped with rosy purple. *Pachira macrocarpa* was introduced from Mexico in 1840 and for a time was known by the generic name of *Carolinia*, which was given by the younger Linnaeus in ignorance of the fact that the genus had been named by Aublet in 1775.

**Appointments for the Ensuing Week.**—Monday, November 13: United Horticultural Benefit and Provident Society's meeting; Bath Gardeners' Society's meeting; Purley and District Horticultural Society's meeting. Tuesday, November 14: Royal Caledonian Horticultural Society's meeting; Royal Horticultural Society's Committees meet; Masters' Memorial Lecture by Dr. Harold Wager, on "The Colours of Flowers and Fruits," at 3 p.m. Wednesday, November 15: Hertford Horticultural Society's meeting; Bristol Chrysanthemum Society's show (2 days); Ayr Chrysanthemum Show. Thursday, November 16: National Chrysanthemum Society's Show at the Royal Horticultural Hall, Vincent Square, Westminster (2 days); Aylesbury Chrysanthemum Society's show; Manchester and North of England Orchid Society's show. Friday, November 17: Paisley Florists' Society's meeting; Bolton Hort. and Chrysanthemum Society's show (2 days); Eastbourne Horticultural Society's meeting; Leeds Paxton Society's Chrysanthemum show (2 days); Dunfermline Chrysanthemum Society's show (2 days); Blackburn and Dis. Horticultural Society's show (2 days). Saturday, November 18: British Mycological Society's meeting at University College, London; Morley and Dis. Paxton Society's Chrysanthemum show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Landscape Gardening.* The style of garden to which I intend appropriating the word gardenesque is that most generally known under the appellation of the English, natural, or picturesque style, which terms, it must be acknowledged, are very ambiguous and convey but a faint idea of the subject they are intended to express. It is impossible to say from whence some of our common words have their derivation. They are, doubtless, many of them coined at particular times to suit particular cases, and many of them are found to answer the purpose extremely well; thus the modern term landscape gardening has now become familiarised to our ears, and its full import is very generally understood. As I wish to show the difference of meaning between the words gardenesque and picturesque, I may add that the latter epithet is chiefly applied to the works of Nature, and especially to those objects which are disposed with an admixture of varied rudeness, simplicity, and grandeur. There are, without doubt, picturesque objects among works of art, and it is possible to make objects so; but the grand scene of picturesque beauty is Nature in all its original variety and in all its irregular grandeur. Some of our eminent painters have taken up this subject with astonishing effect, for who can witness the inimitable productions of Nicolas Poussin, the gloomy grandeur of Salvator Rosa, the old and romantic scenery of the great Titian, the elegant compositions of our own Wilson, and the brilliant simplicity of Gainsborough, without being struck with the vast amount of picturesque beauty which they portray. A flower garden of limited extent, with little variation in its plan, and symmetrical in all its position, although very beautiful in itself, and the combinations of its objects harmonious, cannot properly be designated as picturesque; hence, I wish the term gardenesque applied, as being in character with that style of garden which is free from all apparent formality, and where the exercise of refined taste and artistical skill have been abundantly displayed to the best advantage. It is to a beautiful English flower garden of this description that I propose applying the word gardenesque, and, if necessary, I could quote many examples where the principles of this style of taste could be seen. Of course, it is not to be inferred from the above remarks that I object to the exclusively geometric, or any other style of gardening, as all can be employed at times with the best effect. I have been merely endeavouring to attach a specific meaning to a term which, if adopted in the right sense, I have little doubt would be found of practical utility as an adjunct to the nomenclature of landscape gardening. W. H. Rogers, Grosvenor Villa, Shirley, near Southampton, Nov. 10. *Gard Chron.* November 13, 1847.

**THE ROSE GARDEN.**

**PLANTING AND MANURING ROSES.**

THE time for Rose-planting is again with us, and a few hints may be useful to those whose soil is not quite up to the standard for Roses.

Roses prefer a medium to a heavy loam, and in a sandy soil old turf should be packed round the roots of the new and old bushes; the fibrous medium thus provided will produce bloom of the finest quality.

When the soil is very heavy, it may be made porous by the addition of road grit, littersy manure, or anything similar that will allow

litter, which is also excellent for preventing damage to the roots by frost

Quick-acting artificials should not be used at this time of the year, but basic slag and kainit may be applied now. The former may be used at the rate of half a pound, and the latter at a quarter of a pound, per square yard. The basic slag, while yielding phosphates, will also supply lime. If basic slag cannot be procured, lime (three-quarters of a pound per square yard) may be substituted.

Kainit contains potash, and should be scattered over the soil now, in order that the potash may become available as plant food next spring. W. Miller, Mill, House, Horse and Groom Lane, Wartye, Esser.

FIG. 112.—CHRYSANTHEMUM MRS. B. CARPENTER, N.C.S. FIRST CLASS CERTIFICATE, OCT. 30; AND R.H.S. AWARD OF MERIT, OCT. 31 (SEE P. 275).

superfluous moisture to drain away readily. Should the ground be in a sodden condition, deep holes should be dug, and stones, clinkers, or ashes from the kitchen fire placed in the bottom.

Freshly planted Roses need no manure the first year, but a little litter on the surface around the stems will serve to keep frost from the roots and help them to become established in the ground. Lime is essential in all soils for Roses; one pound per square yard should be dug in before planting commences.

Newly planted roses should not be pruned this autumn, but long growths may be well cut back. By planting early in the autumn, new fibrous roots will soon take hold of the soil, and the plant will be well established by winter.

The present is also a suitable time for manuring Rose bushes. For this purpose nothing surpasses good cow or pig dung that has been well matured, but, if these are not available, the grower must rely on stable

**INDOOR PLANTS.**

**CINERARIAS FOR AUTUMN FLOWERING.**

At this season of the year a well-flowered batch of the florists' Cineraria provides a welcome touch of colour in the show house or conservatory. Cinerarias will commence to flower in September, and continue in bloom over a long period. The plants should be grown under cool conditions at all stages from seed sowing to flowering. In conservatories they should be placed well apart in order to retain the foliage in good condition. Any ordinary compost will suit them; it is a mistake to use too large a proportion of leaf mould, or decayed manure, in the compost as these materials encourage a rank, sappy growth, especially in the case of plants grown for spring flowering. When the plants are established in their flowering pots the roots should be fed with soot water and weak liquid manure. Fred. W. Jeffery, Dalserf, N.B.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARRELL, Gardener to His Grace the DUCHE OF MABLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

**Cattleya and Laelio-Cattleya.**—Although the flowers of this most delightful family of Orchids are available the whole year round, those of the autumn and early winter flowering sections are doubly valuable. The plants retain their flowers in good condition at this season for a considerable time, yet it is not advisable to allow them to remain until they completely fade, for the plants thus weakened often require a considerable time to regain their former vigour, and in the case of those with a weak constitution to allow the flowers to remain may mean their death. Flower spikes cut before the flowers are fully expanded and set quickly fade when placed in a dwelling-room, whereas if cut when fully expanded they last for a week or ten days in good condition. Cattleyas, when well grown, produce flowers more freely than many other kinds of Orchids, and even weak plants will send up flower spikes. These should be removed at once, unless it is desired to see the flower for some particular reason, and then, as soon as it is open, it should be cut off. The removal of these poor flower spikes is of the greatest benefit to all Orchids, and will assist the plant in regaining its lost vigour. In the case of healthy and vigorous plants I do not advocate the removal of the flower spikes until they are fully developed, as when this is done it is often the means of the plant making secondary growth. After removing the flower spikes at this season, Cattleyas need special care, and particularly *C. aurea* and its hybrids, as they are very liable to be injured through the thick, fleshy flower stem decaying, which often destroys the leaves and pseudo-bulbs they spring from. To prevent this, it is well to cut or break the scape clean out from the base as soon as the blooms are over, and prevent moisture being held in it until the cut surface is healed over. A little powdered charcoal placed on the top of the cut surface will help to dry up any moisture that may be present, and be the means of preventing rotting.

**Resting Cattleyas and Laelio-Cattleyas.**—The resting season of the members of this section which produce their flowers from the pseudo-bulbs made this year commences soon after the plants cease to flower, and the majority will remain dormant until the spring, when any necessary repotting should be done. The reduction of water to the roots should be gradual, for so long as the roots of any plant are sufficiently active to take up moisture it should be applied. The watering of Cattleyas, Laelias, and Laelio-Cattleyas during the winter is a matter calling for the greatest care. It is much easier at this season to water a plant than to get it dry again, therefore water should be withheld until the grower is satisfied that it is dry; but do not let it shrivel for the want of water. Plants of the spring and early-summer flowering kinds should be given every encouragement to complete their season's growth, after which they should be rested until the flowers commence to develop next year. Unflowered seedlings that are approaching a flowering size should be treated in a similar manner. Younger plants are always more or less active, and need more warmth and moisture, both at the root and in the atmosphere. For this reason they are best grown in small structures by themselves.

### THE KITCHEN GARDEN

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Horse Radish.**—Roots of this crop should be lifted in sufficient quantities to maintain a supply if very frosty weather sets in. Roots for planting should be saved and cut in lengths of about 9 inches. The soil of the new bed

should be trenched deeply and enriched with well-rotted manure; if the ground is of a heavy texture plenty of grit or road sweepings, and wood ash should be added. The sets should be planted in rows made 1 foot apart, allowing 10 inches between each set in the row. Store the large roots in ashes in a cool place.

**Celeriac.**—These roots should now be lifted and stored in sand or ashes in a cool shed. The leaves should be carefully trimmed off with a sharp knife before the roots are stored.

**Parsnips.**—Lift sufficient of these roots to maintain a supply for use, and store them in sand in a cool shed. The others will improve by being left in the ground until they are required for use. The decaying tops of the plants and weeds should be cleared away, and the roots protected by litter or ashes in very severe weather.

**Chinese Artichokes.**—A supply of these roots should be lifted and stored in sand, leaving the remainder of the crop in the ground. Care should be taken to gather all small roots, otherwise they will grow next season, and be a nuisance to the succeeding crop.

**Hotbeds.**—Plenty of fallen tree leaves will now be available, and these should be gathered, mixed with stable litter, and thrown into a heap to ferment for the making of hotbeds. If the leaves are dry throw water over the heap to aid fermentation. Fallen tree leaves are valuable for a variety of purposes in the garden. When allowed to decay they form valuable material as leaf mould, which forms a substitute for animal manure, by contributing humus to the soil, although they are not so rich in fertilising properties as dung.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Cucumbers.**—Plants in full bearing require liberal feeding and rich top-dressings applied little and often. If the bottom-heat is furnished by fermenting leaves and water-pipes combined, the drainage being ample, the roots will respond to more stimulating liquid fertiliser than many growers imagine; but it should be weak and varied, and from 5° to 10° warmer than the bed. Liquid manure, guano water, and soot water provide good changes, both for root watering and damping purposes, but they should be weak and used only in a clear state, otherwise the surface of the compost will soon become clogged and the entrance of air in the soil hindered. The materials used for top dressing can hardly be in too rough a condition. Moderately light turf with the finest particles beaten out, rough pieces of lime rubble, and charcoal should be carefully placed around the stems. Direct syringing having been discontinued, and with a brisk bottom-heat from the water-pipes, frequent damping of the floors and beds will be necessary according to the outside conditions. Careful attention to pinching is necessary; old leaves that look rusty invite removal, but it is better to retain these for a time than run the risk of the plants bleeding, until after the turn of the year. When the trellis is furnished, or nearly so, room may be found for the best laterals by removing the points of weak growths as soon as they can be seen. As no seed is required at this season of the year, all male blossoms should be removed. The latest plants put in after Melons were cleared from the house will be rather more backward than they should be, but they will come in extremely useful at a time when the plants now in bearing are on the wane. If these plants are kept growing steadily through the winter they will furnish Cucumbers in February and March. A temperature ranging from 65° to 70° at night, and 75° to 80° on fine days is sufficient, and a few degrees lower will keep the plants in good health in cold weather provided the bottom-heat is steady at about 75°. These plants should not be pinched much until the turn of the year; the foliage should be kept well away from the roof-glass and not syringed, but if possible the lights should be well covered through the night to maintain the requisite amount of warmth without resorting to the use of much dry fire heat.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Currants.**—Those who intend to plant Currant bushes this autumn may do so as soon as the leaves have fallen. I prefer to grow Currants in quarters by themselves, so that the bushes may be netted easily against birds. Set the bushes 5 feet to 6 feet apart, and see that the roots are made firm, especially in light, porous soils. If the land is of a strong, heavy nature, it should be well prepared, employing a good quantity of burnt garden refuse, potting soil, or any other light material to improve the texture. Defer the pruning until the spring, when the young shoots should be cut back to a bud pointing outwards, and at equal distances apart, to form an even shaped head. Very little, if any, manure should be employed, except in light land, when a good quantity of well-decayed manure will prove exceedingly helpful in promoting growth and fruitfulness. Reliable varieties include Fay's Prolific, New Red Dutch, Raby Castle, Victoria and La Versailles. To prolong the season of Currants plants may be grown and trained as cordons on north walls.

**Pruning Bushes.**—As soon as most of the leaves have fallen pruning may be commenced with a view to completing as much as possible of this work before frosty weather sets in. Full-sized bushes need to be rather closely pruned all along the branches, and if the heads are crowded some of the branches may be removed entirely. Young bushes not having attained the height required should be pruned back more or less each year. If the leaders are shortened to an outside bud and left about 12 inches long the plants will quickly make good, fruitful heads.

**Sweet Cherries.**—If a few sweet Cherries are desired the following varieties are all good, especially when grown on a west wall: May Duke, Knight's Black, Early Rivers, Governor Wood, Waterloo, Napoleon, Bigarreau, Black Eagle, Elton, and Black Tartarian. In planting these fruit trees see that ample drainage is provided, and the soil sweet and fibrous with plenty of old mortar, wood ash, and a little decayed manure well mixed with it. Healthy young trees should be purchased, of a fan shape for preference, and care should at all times be taken not to injure the bark, as this frequently leads to gumming and the loss of the whole branch.

**Late Apples.**—All late Apples should now be gathered and stored. Bramley's Seedling, Newton Wonder, and other late keepers last in good condition much longer if they are allowed to remain late on the trees. Keep the Apple room well ventilated in suitable weather.

### PLANTS UNDER GLASS.

By T. PAZEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Gladioli.**—The early-flowering varieties of Gladioli should be potted; placing six corns in a six-inch pot, this being the most useful receptacle to grow them in for decorations in pots, but where the spikes are required in quantity for use as cut bloom it will be found much better to plant them thickly in fairly deep boxes. Plant the bulbs about three inches apart each way, covering the pots and boxes with finely sifted leaf-mould to the depth of two or three inches.

**Lilium Harrisii.**—Newly imported bulbs of this Lily should be potted immediately they arrive from the bulb merchant, for they quickly deteriorate if left exposed to the air for any considerable length of time. After potting stand them in a frame from which frost can be excluded, until root action takes place. These bulbs may be had in flower over a long season, but much will depend on the treatment given them. They may be grown cool in the same frame, or a portion of them may be introduced into heat at intervals and brought into flower as required. Other Lilliums, such as *L. auratum*, *L. speciosum album*, and *L. s. rubrum*, that have been grown in pots for one season

should, if they are considered worth it, be turned out of their old receptacles and repotted. When potting Lilies leave sufficient room in the pot for applying top dressings during their growing season.

**Stocks.**—These are useful subjects for winter and spring flowering, but to be successful with them, and to secure fine spikes of bloom they should never be allowed to get starved. Plants raised from seed sown at intervals, as advised in a previous calendar, should, as they become ready, be transferred to the receptacles in which they are required to flower, and grown in frames from which frost can be excluded, and where they can obtain the maximum amount of light.

**Begonia Gloire de Sceaux.**—This plant delights in plenty of heat and moisture during the time it is making its growth, and now that the receptacles are well filled with roots, the latter will require some assistance in the form of liquid manure, to keep the plants growing actively. Any check to growth now, caused by starvation of the plants, will be very evident when the plants are expected to flower at a later date. Once growth is completed and the flowering stage reached, a little less warmth and moisture will suffice. Attend to the necessary staking as growth develops.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Evergreens.**—The judicious use of evergreens in shrubberies is very necessary to obtain interest in winter when the majority of subjects are defoliated. Unfortunately, too great a use is made of the commoner evergreen shrubs, such as *Euonymus japonicus*, *Aucuba japonica*, and the common Laurel, though these, undoubtedly, should be included in reasonable numbers. There is a great variety of other most interesting evergreen shrubs of which skilful employment should be made, and the great sameness of character by the too frequent repetition of those first mentioned obviated. These evergreens also serve as shelter for more tender subjects. The members of the *Arbutus* family include shrubs and small trees with charming foliage, in addition to the beauty of their flowers and fruits. The dainty arching growths of *Arundinarias* and *Phyllostachys* also are of great charm, and a place for these Bamboos should be found in all gardens, for they serve to break the monotonous effect of straight lines. *Berberis*, *Cotoneaster* and *Viburnum* have the three same points in their favour as the *Arbutus*, and when one considers such evergreen species as *Berberis Bealei*, *B. japonica*, *Cotoneaster Simonsii*, *C. Franchetii*, *C. sahicifolia*, and varieties; *Viburnum rhytidophyllum*, *V. Tinus* and its varieties, and *V. utile*, one wonders they are not planted more frequently. Others of value include *Choisya ternata*, which is charming when in flower; *Daphniphyllum*; *Elaeagnus* in variety; *Ericas*; low-growing *Cotoneasters*, such as *C. humifusa* and *C. microphylla*; *Escallonias* in variety; *Garrya elliptica*, of which male and female specimens should be planted closely together, for the male plant catkins, of silvery grey colour, are most charming, whilst the fruit borne by the female plant is reminiscent of bunches of grapes of very small size; *Olearia Haastii* (of fair hardness); *Phillyreas* in variety; *Pyracanthus*, evergreen Oaks, *Rhododendrons* in variety; *Rosmarinus*; *Lavandulas* in variety; *Skimmias* and *Veronicas*, the last with greatly varying foliage and heights, and nearly all free flowering.

**Evergreen Trees.**—There are also numbers of evergreen trees that are similarly desirable, and most noteworthy of these are *Arbutus Menziesii*, *Castanopsis chrysophylla*, *Eucalyptus*, *Hollies*, of which there are fine gold and silver variegated forms; *Magnolia grandiflora*, with its fine flowers; and the evergreen Oaks, such as *Quercus densiflora*; *Q. Ilex*, with its many varieties; and *Q. suber*. In addition, a few of the very slow growing and choice Conifers may be included.

### ABNORMAL LEAVES OF THE HIMALAYA BERRY AND RASPBERRY.

So far as I am able to ascertain there is no record of a mite attacking the buds of the Himalaya Berry.

About the middle of September, my attention was drawn to the abnormal foliage on two plants of the Himalaya Berry. The two plants in question were then considered to be merely sporting plants, or as an alternative, plants attacked by mosaic disease. The fact that these two plants were said to have been propagated along with many more, all originally grown from the same stool, created considerable interest.

On closer examination, however, it was noticeable that the buds on these so-called sports were greatly shrivelled, discoloured, and of a very unhealthy appearance. Being interested from an entomological point of view, I thought of the possibility of the buds containing some sort of pest. After close examination mites were found in shrivelled buds. This

and the cephalo-thorax is covered above by a protection, and is marked by longitudinal furrows. Length 1-200th of an inch. At present, this particular mite does not appear to be very common. The following varieties of correctly named Raspberries, The Devon, Bountiful, North Ward, Red Cross, and Penwill's Champion, have been examined, and some of the buds found to contain mites. Abnormal foliage was also noticeable in many cases on the above varieties.

It seems to me to be very interesting that mite should be found in conjunction with abnormal foliage, and I wonder if any reader has had the same experience. *A. M. Massee, East Malling Research Station.*

### THE ALPINE GARDEN.

#### SAXIFRAGA TRIFURCATA.

*SAXIFRAGA TRIFURCATA* (syn. *S. ceratophylla*) is a particularly good species of the mossy section, and is well worthy of a good position in any rockery where there is space to use it

FIG. 113.—RASPBERRY FOLIAGE. LEFT, NORMAL LEAVES; RIGHT, ABNORMAL LEAVES ON YOUNG FRUITING WOOD.

result led to a systematic examination extending over four bushes, two bushes being chosen with apparently normal foliage and healthy in appearance, and two bushes with abnormal foliage. All buds examined from the apparently normal bushes were absolutely free from mites, whilst 62 per cent. of the buds from abnormal bushes contained many mites.

The mite, so far as I have discovered, has not been recorded, and at present it is not identified. The mite is elongated and cylindrical in shape. There are two pairs of legs, one pair situated on each side of the head. The body is semi-transparent, and of a dirty whitish appearance.

The conclusions arrived at from the above investigation, led me to examine other plants botanically related to the Himalaya Berry; amongst them was the Raspberry. To search for abnormal leaves was the chief point I had in mind, and before long it was noticeable that the foliage on young fruiting canes of a few plants was irregular and malformed. A typical example of the abnormal foliage is seen in Fig. 113. All abnormal material collected was taken to the laboratory for examination. All buds were examined, and in many cases mites were present. This mite, so far as I have discovered, has not been recorded or identified. It is reddish-brown, oblong and cylindrical in shape, has two pairs of legs, one pair situated on either side of the head, long anal processes,

boldly in large clumps. It is easy of culture and a great spreader, flowering in early summer in somewhat loosely branched panicles in great profusion. It is 6 to 8 inches in height. We have a fine specimen of this really good *Saxifraga* in the rockery here, and when in bloom in July its mass of pure white flowers quite dominated its surroundings. This plant was placed in its present position two years ago, and now measures 4 feet 6 inches across. *T. Craddock, Middleton Park Gardens, Bicester.*

#### DIANTHUS MICROLEPIS.

One would be justified in including *Dianthus microlepis* among the best half-dozen *Dianthi* for the rock garden. It has not the large and brilliant flowers of some of its congeners, but it has, on the other hand, a modest beauty all its own, at least, if we include with it *D. Freynii*, which is of the same character and differs but little from some of the forms of *D. microlepis*. In the few varieties comprised in the offspring of *D. microlepis* and *D. Freynii* we have lovely little plants. They form close tufts of small foliage, composed of broadish leaves closely set with star-like flowers of pink in the case of the typical *microlepis*, and prettily spotted with rose. There is also a charming white variety, *albus*, and a rather bigger one named *D. rumelicus* or *D. microlepis rumelicus*, with rose-coloured flowers. *S. Arnott,*

### EDITORIAL NOTICE.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

**Local News**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

**Illustrations**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Special Notice to Correspondents**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Editors and Publisher**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Letters for Publication**, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

## A SELECTION OF HARDY GERANIUMS.

IT is not an easy matter to decide which of the hardy Geraniums is entitled to first place in a selection of the most noteworthy kinds, since all have good points, though they may not all make the same appeal to everyone. Confining oneself mainly to the larger kinds, *G. anemoneifolium* must, I think, be given precedence, for it is not only unique in form and blossom, but it has one peculiar attribute, i.e., it is evergreen, and the big, glossy, palmate leaves are produced in succession throughout the autumn and winter months. These handsome leaves are carried on long stalks from a short, thick stem of about 2 inches in height, from which also appear in the later spring and summer the freely branching 2 foot flower stems which bear at their several extremities the twin blossoms. These latter are rather more than 1 inch across, and of a rich rosy pink, deepening to an intense crimson eye of the same brilliant tint, yet the whole flower has a peculiarly soft and satiny appearance, which seems to be enhanced by the beautiful iridescent hairs which clothe their stems. *G. anemoneifolium*, though a Madeiran species, is hardy enough to withstand an average winter, with frost up to 20°, in any free soil in sun or half-shade, and sufficient young plants crop up from self-sown seed to maintain a stock and replace the parents, which (though certainly not biennial) are not long-lived.

*G. arvense* must also rank high among the best of its race, notwithstanding the magenta hue of its petals. But this blemish—if it be a blemish—is not enough to mar the unquestionable splendour of a plant of *G. arvense*, 3 feet or more in height, and 4 feet to 5 feet in diameter, when laden with its gorgeous blossoms. In some lights the latter appear a vivid crimson-purple. They are velvety of texture, and the extraordinary depth of colour is so intensified by the shining jet of the eye and veining that even the most brilliant *G. sanguineum* must give way to it. This fine Geranium is perfectly hardy anywhere and easy of culture. Though it never produces seed with us, propagation is simply effected by division, and the plants which are herbaceous, are the better for being lifted and replanted every third year.

*G. sanguineum*, a native of our limestone cliffs, is well enough known, though among its many garden forms some are inferior to the type. The variety known as *G. lancastriense* is a charming little plant with a spreading mat of

glossy, green foliage, which it adorns with short-stemmed, rose-coloured blossoms netted with veins of a darker hue; it is a gem for the rock-garden. And then there is the large and robust *G. sanguineum* var. *alba*, which, to the non-scientific eye, bears but little resemblance to the typical plant. This white form will make a mound 18 inches high and 2 feet across, its deeply cut foliage forming a fine setting for a long succession of flowers which are white of unusual purity.

*G. Wallichianum* is in a class by itself, and demands special notice. A notable characteristic of this species is its preference for cool soil and shelter from the mid-day sun. It will thrive in full exposure, but there its flowers, though numerous, are small, and the fine clear blue of the best form (var. *E. C. Buxton*) is not seen to perfection save where there is partial shade. From the bluish purple of the typical species one gets in seedling plants of *G. Wallichianum* every gradation of colour through purple and rosy-purple to an almost pure low-toned pink. The blossoms are rather more than 1 inch across, saucer-shaped, and in all forms the large white eye is conspicuous. In habit this species is herbaceous and a trailer, a single plant covering three or four square feet. The usual time of blossoming is from July to autumn. It is a true perennial, hardy, and long-lived, and may be easily propagated from seeds.

Another species no less distinct than the foregoing is *G. Traversii*, from New Zealand. This is a most delightful plant, of 8 inches or so in height, with broadly-lobed silvery leaves, and, in the best form, has widely-open blossoms of a soft rosy pink shade. Whilst this species appears to be able to endure many degrees of frost, it dislikes wet, and is happiest in well-drained soil with full exposure. *G. Traversii* spreads by underground runners, a providential habit, since these may be lifted and given winter protection where there is fear of losing the parent plant.

*G. grandiflorum*, which soon makes a broad mat of roots from which rise the 10-inch stems, each bearing the big and blue twin flowers, is well known; but, despite its familiarity, this is a fine old species, a rare plant for semi-shade, and one that needs no attention beyond an occasional lifting and replanting.

The rich violet-purple *G. ibericum*, with its bold and woolly foliage, which colours so well in early autumn, is a worthy and well-tried favourite which must also be included here, though its season is short. Of somewhat lower stature, and with smaller blossoms of a vivid rose shade, is *G. Endressii*, a hardy plant almost anywhere; and there is *G. pratense*, some forms of which are as worthless as others are good and beautiful. Among the latter may be mentioned the best of the single whites, and an old double variety, now uncommon, in a cool and delicate blue. J

## GARDEN NOTES FROM S.W. SCOTLAND.

BEFORE me as I write, on October 31, is one of the most satisfying bouquets that I have enjoyed of late—a jar filled with half-opened blooms of the hybrid Tea Rose Lady Pirrie, and rounded spikes of *Aconitum Wilsonii*. The said Wolfsbane is an invaluable autumn flower, of easiest culture and lasting long in bloom. The blossoms, borne in lavish profusion, are soft blue, tending to violet, and strike a soothing note in the borders at this season. A large clump of this plant standing beside an eight-foot *Cercidiphyllum japonicum* draped in carmine and backed by a mass of the lace-work flowers of *Polygonum cuspidatum*, present an accidental feast of colour that could not have been bettered by elaborate forethought.

For combined brilliancy and delicacy of tints the said *Cercidiphyllum* stands without rival at this season. Having raised a large number of plants from seed some years ago, and being unable to get information about the stature attained by this tree in its native woods, we planted it about the grounds as a shrub. Later, I ascertained that it is, in fact, about the largest

deciduous tree in the forests of Japan. The Gean, the Rowan, some American species of *Vaccinium*, and *Parrotia persica* are its equal in fiery autumnal colour, but none of these displays the same soft, rich tones of carmine. Moreover, the foliage of *Cercidiphyllum* remains at its brightest for a longer time than most trees, the *Parrotia* being especially tiresome in this respect, dropping its gorgeous leaves almost as soon as it is brought into the house.

There must be varying strains of *Cercidiphyllum*, as is to be expected in a species that ranges indigenously from Japan to Western China, else Mr. Bean would not have dismissed it with the bare comment that "Its leaves die off yellow." I have never known the young foliage, which has a charming roseate tint, to be cut by spring frost; so I think the seeds from which our plants were raised must have come from a colder region than those used at Kew. As yet, we have none here above fourteen feet high, which is not far on the way to the dimensions of the giant recorded by Wilson, whereof the trunk measured 55 feet in girth! *Aconitum Wilsonii*, by the by, harmonises beautifully with its clear blue spikes of flower rising in front of a carmine pillar of *Cercidiphyllum*, which, in turn, is backed by a tall yellow *Helianthus*.

What is the origin of *Geum Borisii*? Is it a true species or of garden origin? I bless the day on which, a few years ago, I first beheld its generous glow of rosy-orange blossom at a R.H.S. show, and promptly secured a plant. The colour is brilliant, but does not shriek at one like that of *Habranthus pratensis*. It is not fastidious in the matter of soil (we have not tested its feelings about lime) and is easily increased by division; while its neat carriage, disdaining a stake, its handsome radical leaves and prolonged flowering season entitle it to a place in the first rank of herbaceous plants. Beginning to flower here in the latter half of May, it is still blooming freely at the very end of October, and will so continue till the first really sharp frost.

*Senecio Huntii*, from the Chatham Islands, is well worth growing in mild districts. Cheeseman described it as a small tree six to twenty feet high. Here it has already risen to five feet in three years from cuttings. Beginning to flower in June, with long panicles of yellow blossom very freely produced, it yields a second crop of bloom in autumn. The foliage is dense, consisting of linear-obovate or lanceolate leaves, glabrous and green on the upper surface and clothed with tomentum beneath. *S. Hectori*, being from the south island of New Zealand, ought to be as hardy, and is said to be a finer thing than *S. Huntii*, but the ray florets are white instead of yellow. It has not yet flowered here, though several plants of it came through last winter without protection.

*Rudbeckia maxima* is a quaint species, capricious, and rather shy in flowering until well established in a sunny place, but well worth some extra trouble to make it happy. From a cluster of large, oval, glaucous, radical leaves on longish stalks rises a shining stem to a height of six feet, clasped at long intervals by leaves of great substance, and crowned by a handsome cone-flower with yellow rays round the dark brown-madder centre *Herbert Maxwell, Monroith*.

## NOTES FROM WISLEY.

WHEN autumn is merging into winter, and the more orderly sections of the garden have played their part for the year, one may still turn to the wild garden for pictorial effects, though, even here, some of the best colour pictures are further evidence of coming winter.

At Wisley the golden leaves of the Oaks and Birches are fast falling to the ground; here they remain to decay and serve as a mulch to the plants beneath, which have gone out of flower. This comparatively flowerless period is but short, and it will not be long before the pale blossoms of the Hellebores will mark the commencement of a fresh cycle of continuous bloom.

Many of the *Vacciniums*, such as *V. corymbosum* and *V. pennsylvanicum*, have turned a beautiful bronze red, and in contrast with dark green Hollies provide many pleasing autumnal pictures which are intensified during the rather brief glory of the crimson Maples.

In the field garden the scarlet-leaved *Quercus coccinea* (Knaphill variety), and the red brown *Quercus rubra*, arrest attention, while in the grass the leaves of the Rosebay (*Epilobium angustifolium*) have also taken on a red colour, which is an unusual attraction in a herbaceous plant. This Willow Herb, although a pretty plant, is apt to become a nuisance in the garden.

Many of the shrubs of recent introduction lately planted in the borders of the field garden are of interest. Among others is a *Cotoneaster* (Wilson 5567) with leaves and fruit similar to that of *C. Simonsii*, but many times more prolific in fruit than the latter. Here is also a *Crataegus* sp. with scarlet fruits as large as Cherries, to which the birds are unfortunately very partial. Many of the *Berberis*, massed over a large mound in this part of the garden, have not been in the least affected by the spring

pandanifolium are visible. This noble plant is not pleasant to handle owing to the long and sharp spines on the leaves.

Among the Roses, which continue to bloom Cynthia Ford, Gustav Nabonnand, and the excellent old General MacArthur are specially noticeable. The wet weather has caused prodigious growth, 7 feet or 8 feet long, in some varieties, notably in the thornless Zephyrine Drouhin. *J. E. G. White.*

### PALMS OF THE RIVIERA.\*

SABAL is a genus of hardy Palms exclusively American, but very sparsely represented in Riviera gardens on account of their exceedingly slow growth. I have tried to obtain of these, as of other hardy Palms, as many species as possible, and up to now all have proved absolutely hardy, that is to say, even the frost of December, 1920, the worst known on the Riviera since 1820, did not in the least affect any Sabal, not even a leaf showing any sign of having suffered. The remarkable re-

possible to refer them to the same species; still, since Prof. Beccari, to whom I had sent materials, was disposed to maintain all under the species *Sabal Adansonii*, I shall not insist. In any case, some of these forms have leaves three or four times as large as others; some bear leaves with the rachis prolonged to the end of the leaf blade, while others have leaves which appear to be intermediate in shape between flabelliform and pinnate, and yet others have leaves hardly to be distinguished from ordinary flabelliform leaves, so that, horticulturally speaking, it is possible to make a selection of small Palms of the greatest hardiness.

There seem to be other, as yet imperfectly known, species of dwarf Sabal, but to the genus belong some of the most strikingly beautiful tall Palms. I have always tried to obtain such, but up to now I fear I have sometimes received the same species under different names. Readers who live where Sabal and other Palms grow wild may be kind enough to send me fresh seed of wild Palms, for which I would gladly send in exchange seed of other Palms, as desired.

FIG. 114.—FRUITING BRANCH OF BERBERIS LADY BEATRICE STANLEY: R.H.S. AWARD OF MERIT, OCT. 31 (SEE P. 274).

transplanting, and their coral fruits are conspicuous at a considerable distance.

Near by are some white-stemmed *Rubus* sp. The effect of this character is somehow lessened by the tints of green, purple and orange acquired by the foliage at this season.

A few shrubs are still in bloom, including Farrer's *Potentilla fruticosa*, *Abelia grandiflora* and the fragrant-flowered *Clerodendron trichotomum*. A handsome *Arbutus* will shortly be in flower, viz., *A. Andrachne hybrida*. The stem is of the rich brown colour of *A. Menziesii*, and the leaves dark and evergreen.

*Fuchsia discolor* is still blooming on the rock garden, where the fine blue *Gentiana sino-orata* and the dwarf *Solidago brachystachys* are also "carying on." Some of the *Erodiums* seem unwilling to retire, and are continually sending up new flower stalks, although they commenced flowering before June. One of the largest is *E. Manescavi*, a native of the Pyrenees, with flowers of that rosy-purple hue which does not appeal to everyone. The markings on the petals, however, are most attractive. Another smaller species is *E. hymenodes*, having white petals with red delineations. The fault of most of the members of this family is the casual habit of the inflorescence and the brief persistence of the petals.

At the base of the rock garden, near the ponds, the tall flowering stems of *Eryngium*

assistance to cold of the Sabal has led me already to make the reflection in "Les Palmiers de la Côte d'Azur, leur résistance du Froid" (*Bulletin de la Société Nationale d'Acclimatation de France*, 1906-1907), that the phylogenetic origin of the Sabal may have taken place probably in the northern hemisphere during ages when the climate was colder than now, and that these Palms have spread southwards, now being found even in equatorial regions, but that they have retained their original character of resistance to cold. The difficulty of recognising fossil Palms from their imperfect remains makes it often open to doubt to which genus such remains have to be referred, but with time more knowledge will, of course be acquired.

The species of Sabal least rare in the Riviera Gardens is *Sabal Adansonii* from the south-eastern parts of the United States; a Palm, which never produces a trunk, however old. Prof. Beccari distinguishes six forms, but adds that all manner of transitional characters can be found, so that it is very difficult to recognise these forms. I have here plants so utterly different from others, that it would seem im-

Of Sabals which form a trunk, almost the only species met with is Sabal Palmetto, from Florida, and this, like the other Sabals, is very slow-growing, ultimately attaining a height of twenty metres. My own plants of the genus Sabal, received under many different names, few of which correspond to any scientific description, are as yet too small to appear of any great horticultural interest, but on account of the very great hardiness of the Sabals, it seems well worth while to plant them in gardens, where immediate effect is not the principal object. We should always remember that a garden should be created not only for our own enjoyment, but for generations to come, and when we know that some Sabal species have leaves, the blades of which are nearly two metres in diameter, and that these blades are borne on long, gracefully arching leaf stalks, it should seem well worth while to give them a place in Riviera gardens and elsewhere.

Once I received some fruits of a Sabal, having a quite pleasant sweet taste, so good as that of many other fruits, somewhat resembling the taste of dried Dates. I find no such character mentioned in Prof. Beccari's descriptions of the different Sabals, which, as he himself admits, are imperfectly known, as are so many other genera of Palms. *Dr. A. Robinson Proschowsky, Jardin d'Acclimatation, Les Tropiques, Nice, France.*

\* The previous articles by Dr. Proschowsky were published in our issues for May 1, June 12, July 10, September 4, November 29, December 18, 1920; March 12, April 30, June 11, October 8, November 19, 1921, January 21, February 11, April 1, June 17, July 29 and October 14, 1922.

## TREES AND SHRUBS.

## ACER GRISEUM.

This interesting new Chinese Maple, illustrated in *Gard. Chron.*, October 28, p. 251 (Fig. 102), belongs to a small group of species with compound leaves, the best known of which is the Box Elder, *Acer Negundo* and the variety variegata. Other notable examples are *A. cissifolium*, *A. Henryi* and *A. nikoense*.

A griseum is a deciduous tree up to 30 or 40 feet in height, and very distinct by reason of the bark flaking off and hanging in loose strips, a character common and attractive on the trunks of many Birches. The contrast between the colour of the old and the new orange-coloured bark beneath is very fine. The leaves consist of three leaflets, the centre and larger one averaging 2 in. to 2½ in. long by 1½ in. wide, coarsely toothed; leaf-stalks and veins conspicuously downy. The fruits have very pubescent nutlets and wings.

The fact that although the tree at Warnham Court, from which the sprays were cut which gained the Award of Merit by the R.H.S. on October 17, and also a tree growing at Kew, fruit freely, no fertile seeds have been found, may possibly be attributed to self sterility, or it may be only a question of age, as seedlings have been raised from a tree in Cornwall. We know to our cost, when trying to raise certain species of *Acer* from seeds, that they cross pollinate very readily. In writing of self-sterility, only individual specimens are of course suggested, as groups of native trees must produce good seeds to make it possible for Mr. E. H. Wilson to introduce this beautiful Maple to our gardens, when collecting in Central China on behalf of Messrs. J. Veitch and Sons in 1901.

Attractive throughout the year by reason of its trunk, when leafless, and the beautiful trifoliolate leaves in summer, *Acer griseum* is also a most attractive tree in October, when the leaves turn a rich orange or bronzy orange-scarlet. *A. O.*

## AMERICAN THORNS AT ALDENHAM.

ALTHOUGH Aldenham plants have been somewhat prominent in the *Chronicle* of late, I should like a few lines to appear concerning our American *Crataegus*. As is generally known, I owe their presence here to the generosity of the distinguished Director of the Arnold Arboretum. This year they have fruited even more profusely than usual, and I really think a visit to see them would repay any of your readers who are interested in the genus; any who wish to come will be very welcome.

The wild, autumn gales have stripped off the varied and beautiful autumn foliage, but on a sunny day the fruits stand out all the more vividly in the absence of leaves. As has been recorded in your pages (p. 274), I was lucky enough to secure Awards of Merit for two of the five of which I exhibited fruiting branches on October 31, viz., *Crataegus Ellwangeriana* and *C. Fulleriana*. Both are certainly fine plants, with nothing really to choose between them, and neither of them is better, I venture to think, than a dozen others which are growing here. If I were to regard fruits alone and neglect autumn colour, habit, form of leaf, etc., and if I had such Thorns as *C. coccinea splendens*, *C. matura*, *C. tenuis*, that old favourite *C. Carrieri*, etc., I could quite well do without these two comparative novelties in England. They both have bright red, nearly spherical fruits, and that is the case of ninety-nine out of a hundred American *Crataegus*.

With *C. mollucula*, which I also showed, but which gained no award, the case is very different; the colouring, a rich dark yellow, is, so far as my experience goes, unique in the genus. I certainly grow a bright lemon-yellow berried form of our native Thorn, and a very good subject that is, too, but in tone and effect the two are miles apart. I think that credit should be given by judges for rarity in colour. Most of us would welcome a good yellow Aster, blue Phlox, or scarlet Delphinium, and *Pyrus munda subarachnoides* holds its high position because, alone among the Mountain Ash group, its fruit is pearly-white. Outside red, the range of colours known to me among the various *Crataegus* fruits is not large.

This year our two eighty-year-old trees of *C. orientalis* have been the joy of all, bowed down with their rose and amber berries. The variety *C. o. sanguinea* has not fruited so well this year as usual, but when it does the colour is a Plum-purple.

The only two coal-black fruiting sorts I know are the North American *C. Douglasii* and the Caucasian *C. melanocarpa*. Of these, the latter is far preferable, for whereas the birds take the former even before the fruit has had time to colour properly, they neglect the latter, so long, at any rate, as there is other food to be found; consequently it can still be seen at its best to-day (Nov. 2), though branches of it were much admired at Holland Park Skating Rink four weeks ago. *C. brachycantha* is said to have bright blue fruit, but the Aldenham plant has not yet borne any. I have also a white-fruited form of the native *C. Oxyacantha*, but that too has not yet fruited here. One other colour can be given; *C. cuneata*, the dwarf Japanese Thorn, usually a shy bearer, has this year carried large, light green Apple-like fruits the size of a Cherry.

In conclusion, I know of no genus which is at once more decorative, more hardy, more showy, more indifferent to the nature of the soil, and which gives less trouble to cultivate than *Crataegus*. The only charge that can be fairly brought against the family is, that it is too big, but that does not prevent a judicious selection being made to suit the size of the purse, or grounds, of the individual. *Vicary Gibbs, Aldenham, Herts.*

## THE DIERVILLAS OR WEIGELAS

THOUGH some of our most beautiful late spring and summer-flowering hardy shrubs, *Diervillas* are by no means so freely planted in our gardens as their value deserves. As this is the season for planting, a few notes on their culture and the best varieties may be useful. The confusion in the names originated through the American species being called *Diervillas*, and those from Asia having the generic name of *Weigela*. Most authorities now regard them all as species or varieties of the one genus *Diervilla*.

These shrubs are so readily propagated by cuttings made of the half-ripened young growths in late summer, there seems no necessity to layer or graft *Diervillas*, a means of increase sometimes recommended. Inserted in sandy soil in a slightly heated propagating case during July, or under handlights in August, cuttings root readily.

In common with quite a number of free-growing shrubs, *Diervillas* luxuriate in a deeply-trenched and well-manured loamy soil of a moist, rather than a dry nature.

As garden shrubs, we are most concerned with the Asiatic section, which are the more ornamental. Pruning of these should be done immediately after flowering and consists in the cutting out of the old flowering wood, leaving the new growths free to develop and produce next year's blossoms. In contrast to these, the American species flower on the current season's growths and should have the stems pruned back in March.

Where to plant the *Diervillas* in the garden and pleasure grounds is an easy matter to decide. In addition to positions in the shrubbery, which should be sunny to ripen the growths, they are excellent shrubs for lawn beds in groups of three, five, or more bushes. Perhaps the happiest plantings of *Diervillas* are by the waterside, where, though usually open, they make excellent growth, which means an abundance of flowers.

The following twelve comprise a representative collection of the best varieties:—*Abel Carrieri*, crimson; *Conquerant*, carmine, wine-pink throat; *Conquete*, deep rose; *Esperance*, rosy white, salmon-pink tint; *Eva Rathke*, blood-red; *Heroine*, rosy white; *Le Printemps*, pale rose; *Mont Blanc*, pure white; *Praecox*, carmine rose; *Richesse*, pink; *Saturne*, carmine-red; *Stelzneri*, bright pink.

Anyone making extensive new plantings of shrubs, especially in moist soils and by the waterside, or who already cultivates some of the above, may like to have an additional list of thirteen sorts, making twenty-five in all: *amabilis*, pale pink; *Bouquet Rose*, satiny-pink;

*Buisson Fleuri*, carmine-pink; *Fleur de Mai*, rosy-red; *Floral*, soft pink; *Glorieux*, dark rose; *Pascal*, blood-red; *Pavillon Blanc*, fleshy-white; *Profusion*, clear carmine; *rosea purpurea*, purple foliage, rosy-purple blossom; *rosea variegata*, an attractively variegated shrub; *styriaca*, red, one of the latest flowering. *A. O.*

## SHRUBS FOR WINTER BEDDING.

BEDS in shady or rather cold positions that are not likely to suit spring bedding plants may be planted with small shrubs, both evergreen and deciduous, the latter for the bright colours of the stems. Small plants of *Abies*, especially *A. Veitchii*; *Piceas*, including *P. Albertiana*, the glaucous blue form being especially suitable; *Yews*, *Daphnes*, *Phillyracas*, *Lavendulas*, *Santolina Chamaecyparissus* (the two last named yielding fine grey tones), *Ruscus*, *Veronicas* in variety; *Gorse*, *Enonymus* in variety, *Berberis* and *Rosemary*, are all suitable. When these subjects are carefully interspersed with small shrubs of a deciduous character that supply colour in their bark, such as *Willows*, *Dogwoods* and *Rosa lucida* and *R. nitida*, the effect is charming in the winter. *E. Beckett.*

## MOLES IN THE GARDEN.

THERE is no greater pest in the garden than the mole, and it is at this season that the mole begins to show signs of activity. Contrary to popular belief moles are not difficult to catch. They are, indeed, among the least cunning and least suspicious of creatures, and there is not the slightest need to protect the hands when setting the trap, lest the mole should scent an enemy, or to give credit to any of those mysterious notions with which the mole-catcher once invested his trade.

Last winter I caught five full-grown moles in four successive days in the same hole. An ordinary pincer trap was used, and no special precautions were observed in the setting of it beyond seeing that the run was clear of loose soil on both sides of the trap. This particular run was one which led from a woodland into a piece of rock-gardening, in which moles can be particularly harmful, and the explanation of my success lay simply in the fact that I had found a main run, a highway, by which moles usually travel to and from their feeding grounds.

The location of such a run is essential to success. It is seldom of any use putting a trap in those tortuous surface tunnelling one so often sees in loose soil, for the mole rarely travels these a second time, and if he does the chances are that he pushes as he goes enough soil to spring the trap before his nose gets into it. The main runs are much deeper; anything from 6 inches to a foot. The best way to find them is with an iron spike, or narrow spud, which is thrust into the ground at various places suggested as likely by the disposition of the soil heaps thrown up, the feeding tunnelling or other workings. A little experience and observation will soon enable one to discover the run sought for, and once it has been located and moles have been caught, the spot should be marked for future use. I usually put a portion of slate over the trap-hole.

On setting a pincer trap little need be said. The hole made for it should not be any wider than is necessary to take the trap easily with the nippers expanded. Nor should it be deeper than the base of the actual run. The nippers are placed astride the latter, so that the mole must pass between them, and the hole must be quite free from crumbly soil. When the trap is in position a bit of sod is loosely placed on either side of it, so as to roof the run and exclude light, but not so as to interfere with the outward spring of the upper part of the trap. That is all that is necessary. If a mole comes that way he will walk into it, and the garden will be rid of a pest whose skin, I may add, is worth a shilling. Though I have caught hundreds of moles in this way, only once have I known one to endeavour to make his way round outside the trap, and that was because he himself had blocked the way into it with a stone! *Cambria.*

## MARKET FRUIT GARDEN.

ON the average of years, October is the wettest month, but in this extraordinary season it was the driest up to date, with the single exception of May. At my place rain fell on seven days only, the total rainfall amounting to 1.25 inch. There were night frosts and severe gales towards the end of the month, but on the whole it was a very favourable time for work on the fruit farm.

## CLEANING WEEDY ORCHARDS.

The land dried sufficiently to allow of some much-needed cleaning operations. There were times when hoeing could be done quite usefully, and the motor cultivator got over a lot of ground. This was a great boon, as it will reduce the amount of winter work, which threatened to be exceptionally heavy. Weeds grew so freely during the wet summer, and the land was so seldom dry enough to cultivate, that most fruit plantations became as green as a pasture. Considerable improvement may be seen now, but there is still much to be done. Amongst bush-shaped trees that are almost meeting between the rows, there is nothing for

## LATE APPLE HARVEST.

The picking of Apples was not finished until November 3. The fruit matured so late that there was everything to be gained by leaving it on the trees so long as possible, particularly as the market was so bad. It was remarkable how quickly the Apples coloured under the influence of the October sunshine. The difference in a week was quite noticeable, though several varieties still lack their normal colour.

So much of the Apple harvest being retarded intensified the usual difficulty at this season of finding accommodation for all the fruit. I always pick into Potato-sprouting trays, which hold nearly half a bushel, and store in them too. I have hundreds of these trays, and the supply is ample during the greater part of the season; but they generally run short at the end, and there is nothing for it but to turn the fruit out into heaps. I have now several heaps in various buildings, and a large clamp of Bramley's Seedling in the open. Packing from heaps is unpleasant, but can hardly be obviated when there is a heavy crop. I find that many growers are experiencing the same difficulty this year. Some of them store, so far as possible, in various kinds of boxes, others in half-sieves; but

## APPLE BLLENHEIM PIPPIN.

I have never before had such a heavy crop of this variety. It is, of course, one of our best market Apples, but is not very extensively planted now, because it is slow to come into bearing. I think, however, that this need not be feared on light land, particularly if the trees are on a good type of Paradise stock. On very light soil Blenheim Pippin is not much slower to come into profit than Bramley's Seedling or Newton Wonder, and it is much more worth having when it does crop. This year I had a very full yield from trees planted thirteen years ago, although they are on the Crab stock. They have borne fair crops before, but never a quarter what they carried this year.

Blenheim is, I consider, distinctly a variety for light land, not only because it crops sooner than on heavy soil, but also because it comes of moderate size and good colour. Big Blenheims are commonly packed in bushel baskets and sold as cookers in Covent Garden, which seems a shame, considering the dessert quality of the variety. I always find a strong local demand for moderate-sized Blenheims for dessert purposes at much better prices. It seems to be a favourite with the public.

FIG. 115.—GOLD MEDAL EXHIBIT OF GRAPES FROM THE HON. VICARY GIBBS' GARDENS AT ALDENHAM; SHOWN AT THE R.H.S. HALL ON OCTOBER 31.

it but to fork over the whole surface, but wherever possible this must be avoided on the score of expense. Where horses can get between the trees I have withheld the motor cultivator and left the work for the fruit farm plough. This implement is so designed that the handle and head can be off-set, allowing the horses and man to walk mid-way between the trees, whilst the plough works close up to the stems. If the furrow-slice is turned up to the stems, a narrow strip of land on which the trees actually stand should be dug first. If the soil is ploughed away from the stems, this strip should be dug afterwards. It is usual to change the direction of the ploughing in alternate years, so as to keep the surface level. Another plan, and, I think, a better one, is to plough up to the trees in autumn, and again away from them in spring. After the winter pruning, spraying, etc., the surface is always trampled down hard, and it is often difficult to work the land without the second ploughing.

I do not altogether like ploughing in orchards, because of the danger of injuring roots, but it can hardly be dispensed with altogether now that digging is so expensive. In a dry season most of the land can be kept clean and open enough by surface cultivation, but after a wet summer something more drastic in the way of cleaning operations is essential. The great thing is to plough as shallowly as possible, and then I doubt whether the plough does any more harm than the fork.

a good many have heaps and clamps this season. I have not heard of any more convenient receptacle than the Potato trays, which are handy to lift about and can be stacked any height without excluding all ventilation from the contents.

## APPLES IN CLAMPS.

Very few growers have enough storage accommodation. There is little doubt that an underground store is best, as the temperature keeps so even. I find that Apples always keep well in the cellar under my house. They keep better there than in a specially-made fruit room above ground, which has an earth floor and double walls. When I build a new fruit room it will be on the cellar principle.

Clamping can hardly be regarded as anything but a rough-and-ready substitute for storing in a proper building. I have never clamped any Apples before, but have often read that they keep very well indeed when so treated. But that is not everything. They are likely to be bruised to some extent, and they will all need wiping when they are taken out for sale; and the work of getting them out on a cold day will not be popular.

I have clamped them just like Potatoes. They were turned out in a long, ridge-shaped heap on short grass in a dry situation, covered with a good thickness of straw, and finally with soil, the several ventilation shafts being formed along the top.

## IMPERIAL FRUIT SHOW AT THE CRYSTAL PALACE.

It will be a pity if this event is allowed to lapse, if only because of its great educational influence amongst growers. It is generally admitted that it has brought about a marked improvement in packing methods during the past year. As an exhibitor for the first time I found the experience most stimulating. I am fired with ambition to grow still better fruit and bring the packing to a higher pitch. The show gives a grower an opportunity to see how his fruit compares with that of other growers, and he realises any mistakes he is making in grading or packing when he studies his score card and sees where points were lost, with a view to correcting them in the future.

An outsider might not be greatly impressed with the competitive sections of the show so far as the packing is concerned. Non-technical journalists are fond of writing in their reports: "The English grower has still much to learn about boxing Apples." But it should be realised that hardly any of the boxes on view were in proper order as originally packed. They had been tumbled about by the judges, who are bound to dive below the top layer to test uniformity of size and colour, neatness of wrapping, and other details for which points are given. This is unfortunate from the spectacular point of view, but inevitable to obtain a correct decision. *Market Grower.*

## HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

**The Hibernation of Wasps.**—Under this heading Mr. Nicholson (p. 257) gives three factors upon which the wasp population of the year depends. But there is still another—a fourth—which we have to reckon with, and it is this: The entomologists tell us that a large number of queen wasps in spring does not necessarily imply that nests will be numerous, nor *vice versa*, because the sex of many of these insects is so arranged that they can be turned into use as either males or females (drones or queens), as the circumstances of the time or season decide. To put the matter in a still more convincing way, we are informed on the highest scientific authority that parthenogenesis is a regular part of the social code among virgin wasps, which means that the population of the nest need not of necessity be jeopardised by the destruction of queens or drones. *A. T. Johnson, Talycafn, N. Wales.*

**Wasps.**—I read with interest the correspondence on Wasps on pp. 197 and 272. Wasps have been a plague in these gardens this summer, and did an enormous amount of damage to Cherries and Plums; in fact, they were so numerous that it was a very difficult matter to gather the fruit in the daytime. I noticed very few queen wasps here in the spring. April was rather wet; 3.79 inches of rain fell, but May was rather dry, with 1.21 inch of rain. *J. S. Higgins, Glynllivon Gardens, Llanwnda, Carnarvonshire.*

**Dahlia Conference** (see p. 256).—I was much interested in your report of the proceedings of the Dahlia Conference under the auspices of the National Dahlia Society on 17th ult. I feel sure that the papers read will assist in extending the cultivation of this plant, the modern and greatly improved varieties of which are so admirably adapted for growing in gardens of every extent, whether in town or country. Mr. Cheal alluded to the many Dahlias grown in Bermondsey, and I should like to add that these plants have this year been a very attractive feature in the gardens of Finsbury Circus, within five minutes' walk of the Bank of England. A charming and comparatively new class of Dahlias, of which there are several delightful novelties to be introduced next season, is the Miniature-Paeony flowered type, all the members of which are exceedingly floriferous, perfectly erect, in habit, and charming in their colouring, whilst the flowers are of a size that renders them equally well adapted for table decoration as for garden effect, moreover their compact growth, 2½ feet to 3 feet high, is a further good quality. Messrs. Coal's Star varieties possess similar merits and both these classes may be highly recommended. An error appears in the abridged report of my remarks at the discussion when I referred to Brentwood Yellow, not as resembling Coltness Gem, which is totally distinct, but to express my appreciation of the display made with Mr. Hay's planting of the former variety in bold quantity, as had been done with the latter. It may be of interest to those contemplating growing these varieties for bedding to know that in Regent's Park the plants of Coltness Gem set at 16 inches apart, entirely covered the ground as did those of Brentwood Yellow at 20 inches, both producing much admired effects. *Alfred Vasey, Messrs. Carter Page and Co., 52-53, London Wall, E.C.*

**A Useful Border Flower.**—A good many years ago I was lucky in receiving a few corms of a plant named *Antholyza paniculata*, but I am not sure that the name is quite correct. It is not only for the beauty of its reddish orange, tubular, and hooded flowers that it attracts attention from people who see it for the first time, but, even when yet unflowered, the handsome, sword-shaped foliage is not passed unnoticed. The clumps require to be broken up every other year or so, because it becomes so matted at the roots as to lose strength to

flower freely, or even to produce its foliage in the attractive condition it ought. Hitherto it has proved hardy here, but its hardiness is not without suspect. Its somewhat dumpy panicles are of value for furnishing large flower vases, the flowers continuing to open successively for a long time. *R. P. B.*

## DAHLIAS FOR PARKS AND GARDENS.\*

(Concluded from page 270).

AMONG white varieties of this bedding class the old Kaiserin Augusta Victoria is still much in evidence; but among all the dwarf varieties that I have seen I like *Windermere* best.

Among pink, salmon and rose shades there are dwarf sorts in abundance. I find it difficult when looking at a trade collection to make any selection at all, but I was impressed with a new dwarf pink called *Daydream*. I have a bed of *Our Annie*, which is greatly admired. *Rhoda*, too, has great merit. *Olivia* is delightful when massed; but every raiser has special varieties in this shade, and one cannot try them all; indeed, there are very many types of these dwarf Dahlias, and it is almost impossible to group them into colour classes, but I am certain for small beds, and also for house decoration, this is the right class of Dahlia to grow, as they are light, airy and graceful, and, above all, free flowering. Several varieties of these dwarf Dahlias have dark-coloured leaves; there is one brilliant scarlet called *Lemur*, and another *Moorkop*, but I cannot see that dark leaves are any improvement.

The large-flowered Paeony and Decorative classes appeal very strongly to the park frequenter. I do not agree with those who say that they are too big, for being big does not mean that a thing is vulgar, and I have a great liking for these Dahlias. I remember one Sunday morning some years ago seeing an unusual number of cyclists entering Greenwich Park, and on asking a park keeper the reason, he told me that a note had appeared in the Saturday paper that there was a Dahlia as large as a soup plate in flower in the park, and Londoners were turning up in great force to see and admire this flower.

Grouped as back row plants this class makes a noble show, and every garden should have plants of such varieties as *Papa Charmet*, *Futurity*, the lovely *Delce*, *Mina Burgle*, *Sulphurea*, *Cambrai*, *The Prince*, and *President Wilson*, which is superb. There are, of course, many others, but these are all magnificent. I do not like this class in open beds, they are too tall and unless edged with a dwarfier variety present to the eye too great a wall or hedge of foliage from the ground up before the flowers are reached.

If I were asked what is the type of Dahlia most admired by the general public I would have to reply that it is the Cactus, but it is the class of least use to the park superintendent. A week or two ago I went to see a great trade collection of Dahlias, and the area devoted to the Cactus varieties was a most depressing sight; but hidden away among the foliage were to be found some of the most lovely flowers that Nature and art have yet provided. I agree that the Cactus Dahlia is the aristocrat of the tribe. Last year I planted many of the best varieties and discarded most of them at the end of the year, but found myself at every fortnightly meeting of the R.H.S. during the Dahlia season being persuaded by the lovely blooms of Messrs. Stredwick and Son to make notes for future planting.

Being anxious to include a fair proportion of Cactus sorts in the park, I asked my friend, Mr. Vasey, a great Dahlia enthusiast, to give me the names of Cactus varieties that threw their flowers well above the foliage; varieties of his selection are still in flower, and include such as *Amos Perry*, *Sweet Briar* and *Conquest*. But it

appears evident that those Cactus varieties that make a good display in the park are poor in the quality of their blooms compared to those that hide themselves among the foliage. It would appear that the Cactus Dahlia is modestly conscious of its superiority. I have been often asked, particularly by foreign visitors, why we grow so few Cactus sorts, and the question seems to show that they are most popular abroad.

Another class that do great things for the Dahlia border are the *Collerette*; many of these are quite barbaric in their splendour and of great effect, and their admirers are many. I do not regard them as possessing the refinement we find in other classes, but for general effect they are of great value. I have nearly all the varieties sent out from Edinburgh, and the new sorts show a steady improvement. Among the latest *Goldendale* has been much commented on, *Harris*, *Arran*, *Hussar*, *Glencoe* and *Black-watch* are of the best. Some are not free flowering, of which *Bonfire* is one; it is shy of bloom, while *Taskar* is the freest of all. This last is quite a remarkable *Collerette* variety; it has very little foliage, the stems are thin and wiry, and it bears more flowers in a season than any other *Collerette* sort I know.

Single-flowered Dahlias seem to have gone out of favour, and it is a strange thing that long before the end of the season, the flowers have dwindled greatly in size and make no effect. Whether this is common to all single Dahlias or not I can't say, but it is quite apparent in London. Notable exceptions are the variety called *Fireflame* and a white one called *Wm. Tilley*; there has been a bed of this fine, single, white Dahlia for several seasons at Kew.

Of Pompon Dahlias we grow quite a number, and they are not without admirers, and probably appeal to owners of small gardens and that prim exact type of garden lover who likes everything exactly to scale.

My experience of the Star Dahlias is not extensive, but nothing can be more suitable for growing for cut flowers, and they are effective as garden plants.

My collection at Regent's Park is without any representatives of the old Show and Fancy Dahlia, but I think some must be included another year.

There is still another type of Dahlia, one variety of which great things will be heard. This is the dwarf Single or Mignon Dahlia. My English friends tell me that my native country has but two articles of commerce. Scotland, they say, imports cash and exports whisky; this is no longer true, for a little Dahlia has been raised in Scotland called *Coltness Gem*, and already there are, I am certain, more tubers of this Dahlia in existence than of any other variety. It has largely superseded the scarlet *Pelargonium* in the parks of the City of Glasgow, and the roof garden on the Waverley Market, Edinburgh, has been bedded out with it this year. I have answered more inquiries about this Dahlia than any other plant in the park, and in a season or two it will be as common as the "Geranium." About 18 inches in height, it blooms in a wet or dry season, from May till frost comes. From spring cuttings it comes into flower very quickly, and there is no long wait as there is with most Dahlias. There are several varieties very similar to *Coltness Gem*; I have grown some and seen others, and I strongly recommend the genuine article.

It is not my duty to say anything about cultivation. The Dahlia is one of the easiest plants to grow, and any position except one directly under trees will suit it. It is, however, seen at its best with a background of shrubs, but is equally effective when grouped on the lawn. It adds greatly to the brightness of the herbaceous border, and the dwarf varieties look particularly well when planted wide apart with a groundwork of another plant. It is practically a disease-proof plant, it brings no profit to the sundriesman, for the Dahlia requires no washes, fumigants, insecticides, or physic of any sort. It is a perfect joy to watch its healthy, happy growth, and its admirers are to be found in every land whether the climate be temperate or tropical.

\* A paper read by Mr. T. Hay, Superintendent of Regent's Park, at the Dahlia Conference, held at the Royal Horticultural Hall, Westminster, on October 17.

## SOCIETIES.

### NATIONAL SWEET PEA.

THERE was a good attendance at the annual general meeting of this Society, which was held at the Chamber of Horticulture offices on October 31, when, in the absence of the President, the chair was taken by Mr. J. Stevenson.

By some misfortune the copies of the annual report had gone astray between the printers and the offices, and, as the parcel contained the original manuscript, the report could not be presented fully in the customary form. Mr. J. S. Brunton, speaking from memory, gave the meeting a résumé of the report, which commented on such salient points as the exceptionally long and favourable season for Sweet Pea culture; the success of the annual show at Eastbourne, which was opened by H.R.H. Princess Alice, Countess of Athlone; the great trade displays, in competition for the magnificent Eastbourne Challenge Trophy, the winning outright of challenge cups by Mr. THOS. JONES and Mr. H. J. WELLCOMBE; and the contents of the Society's *Annual*.

The financial statement was very satisfactory, as it showed a profit on the year's working amounting to £47 17s. 8d., while the balance in the bank totalled £236 7s. 5d. This latter sum appeared to be subject to some un-presented cheques, but the immediate financial future may be viewed with equanimity. On the income side the chief items were:—Members' subscriptions for 1922, £177 0s. 6d.; affiliated societies, £47 5s.; advertisements in publications, £34 14s. 6d.; prize fund, £61 18s.; and Eastbourne Horticultural Society, £60. The chief expenditure items were:—Prizes and medals, £121 16s.; printing and stationery, £193 3s. 7d.; secretary's salary, £75; postages and telegrams, £28 17s. 1d.

As we briefly reported in our previous issue, Mr. Robert Bolton was elected President for the year, and Mr. A. C. Bartlett, 318, Kew Road, Kew, was elected Secretary. Mr. C. H. Curtis was again elected Chairman of Committee, and Mr. A. J. Cobb was re-elected Trials Superintendent. The vacancies on the General Committee were filled by the election of Messrs. F. J. Cashinella, A. L. Cosham, A. E. Garrod, H. H. Perkins, H. L. Simms, and H. D. Tigwell. The following were elected as the Floral Committee:—Messrs. R. Bolton, A. Ireland, C. W. J. Unwin, J. Stevenson, H. D. Tigwell, E. H. Christy, Geo. Burt, C. H. Rundle, and J. Ness.

Especially pleasing portions of the business were presentations to Mr. S. B. Dicks and to Mr. H. D. Tigwell. To Mr. Dicks was handed the Henry Eckford Memorial Medal, which is annually presented to someone who has done particularly good work in connection with Sweet Peas and the N.S.P.S. This year the choice fell unanimously on Mr. S. B. Dicks, who has long been esteemed for his untiring labours on behalf of the flower and the Society. Mr. Dicks assisted in the bicentenary celebration of the introduction of the Sweet Pea into England, and the N.S.P. was the direct outcome of that meeting. Mr. Dicks initiated one of the first trials of Sweet Peas, and these were held in the trial grounds of Messrs. Cooper, Taber and Co. He has also been chairman of the General Committee and the Floral Committee. But, great as have been these services, he has done even more for the Society in his untiring research work, and will long be known as the historian of the Sweet Pea. On receiving the medal, Mr. Dicks said that he did not anticipate such an honour as that. What he had done was purely a labour of love, which had brought its own reward, for through it he had come into contact with a great many people in such diverse places as British Columbia, South Africa, and Egypt. He was confident that the Sweet Pea exerted a great influence, for he had always found Sweet Pea people to be especially nice people.

The occasion of the presentation to Mr. H. D. Tigwell was his retirement from the post of secretary, which he had held for many years. In making the presentation of the Society's

Gold Medal and a wallet containing £50, Mr. Stevenson spoke of the great regret all the members felt that the force of circumstances compelled Mr. Tigwell to resign. His long association had included most trying years, and during that time Mr. Tigwell had done work of inestimable value to the Society, its present position being largely due to his efforts. In accepting the Gold Medal, Mr. Tigwell voiced his great pleasure in the gifts, but even more in the spirit in which they were made, and said that whatever he had done could not have been without the whole-hearted support he had received from the members of the Society and the exhibitors at the shows.

On behalf of Messrs. Carter and Co., Mr. A. Gardiner offered the Society a silver trophy to be awarded each year to the new Sweet Pea which most nearly approached Gentian-blue in colour until that desired colour is reached.

important class for twenty-four Japanese blooms in not fewer than eighteen varieties.

The best exhibit of six Chrysanthemums, distinct, shown in a vase was staged by Mr. J. PERRETT, gardener to J. Goddard, Esq., Crawley; second, G. P. WALFORD, Esq. Mr. APTEO excelled in the class for three vases of single Chrysanthemums, twelve blooms in each receptacle, distinct. The best single vase of six Japanese Chrysanthemums, distinct, was shown by Mr. APTEO, and the best vase of twelve single Chrysanthemums, disbudded, by Mr. J. PERRETT. Mr. W. H. SCOTT showed the best bush Chrysanthemum of a single variety and the best specimen Chrysanthemum plant in a pot.

There was keen competition in the fruit classes and very good Grapes were staged in a class for two bunches of a black variety, for which the first prize was won by Mr. W. H. PARKER; second, Mr. E. CARPENTER. Mr. PARKER also

FIG. 116.—PART OF MESSRS. G. BUNYARD AND CO.'S EXHIBIT AT THE IMPERIAL FRUIT SHOW (SEE P. 272).

### BRIGHTON, HOVE AND SUSSEX HORTICULTURAL.

THE Chrysanthemum show of this Society was held in the Dome and Corn Exchange on October 31 and November 1. The exhibition was a great success and the number of entries, 610, surpassed all previous records, the next best being 419 entries at the show held just after the armistice in the Aquarium. The most notable increase was in the fruit and vegetable section. On the first day of the show, the President, Alderman J. Colman, entertained the officials of the Society, judges, and a number of prominent supporters, to luncheon in the Royal Pavilion. The guests included the Mayor of Brighton, Alderman E. J. Pankhurst, the Mayor of Hove, Councillor F. W. A. Cushman, and the Mayor-elect of Hove, Alderman Jago. It is interesting to record that one of the judges, Mr. J. Bunney, has acted as judge of this show for forty years.

In an open class for a circular group of Chrysanthemums arranged on a space 10 feet in diameter, with Ferns and other foliage plants for effect, the first prize was won by G. PAGET WALFORD, Esq., Hove (gr. Mr. W. Read); second, W. H. VORIKINS, Esq., Withdean (gr. Mr. W. J. Scott); third, Mr. W. H. APTEO, Worthing. This last exhibitor excelled in the

showed the best two "shallows" of Black Grapes. Mr. A. H. PARSONS had the best culinary Apples, and Mr. F. RUSH the best dessert Apples. The latter also excelled in the class for two dishes of dessert Pears, in which Mr. PARSONS was second. In the classes for vegetables, Mr. W. HUMPHREYS had the best six distinct kinds in Messrs. SUTTON AND SONS' class, and also the best six distinct kinds in the PREMIER SEED CO., LTD., class. There was also a class for six kinds of vegetables, distinct, produced with the aid of Maskell-Harris "Prize-Crop" Fertiliser, in which Mr. F. DOWN was successful. Mr. E. CARPENTER showed the best four dishes of Potatoes, distinct, and was placed second for two dishes of Potatoes, one round and one kidney sort, in which Mr. W. HUMPHREYS was first. Mr. G. GANDER showed the best Brussels Sprouts, Mr. W. SINFIELD the best Long Beet, Mr. T. WEST the best Round Beet, Mr. E. CARPENTER the best Celery, Mr. G. CRONE the best Leeks, and Mr. A. JUPP the best Cabbages.

### DERBYSHIRE GARDENERS'.

THE 15th annual Chrysanthemum exhibition of the Derbyshire Gardeners' Association was held in the local Drill Hall on the 27th and 28th ult. The Mayor, Councillor W. R. Raynes, presided,

and the show was opened by J. G. Shields, Esq. The R.H.S. Bronze Banksian Medal was awarded to Mr. W. LOCKIE, Wingfield Park Gardens, for winning most points in classes I to 19, and he also won the prize offered for the best bloom in the show, for a bloom of Mrs. A. E. Roope. A fine non-competitive display of Chrysanthemums was staged by Messrs. BARRON AND SON, Borrowwash, together with Roses and fruit, for which a Gold Medal was awarded. Messrs. ROBINSON BROTHERS, Derby, set up a table of Salvias, Nephrolepis and Cacti, for which a Silver Medal was awarded. A Silver Medal was also awarded to Messrs. BAKERS, Wolverhampton, for hardy herbaceous plants. Two prominent groups of miscellaneous plants were set up on a space of 12 square feet, Mrs. WALTER EVANS (gr. Mr. Maxfield) was placed first for excellent specimens; but many considered the arrangement on the heavy side. F. N. SMITH, Esq., Wingfield Park, Ambergate (gr. Mr. W. Lockie), was second.

The first prize for six vases of Japanese Chrysanthemums was won by Mr. G. POTIER, an exhibitor who showed at this exhibition so long as 37 years ago. For three vases of Japanese varieties the first prize was won by Mr. J. H. COLEY, Outwoods Gardens, Duffield; second, Mrs. PRESTON JONES (gr. Mr. J. A. Bacon); third, Mr. G. POTTER. The best table of single Chrysanthemums was shown by Mrs. W. EVANS, Darley Abbey (gr. Mr. Maxfield); second J. H. COLEY.

In a class for six varieties of perpetual flowering Carnations the first prize was won by F. N. SMITH, Esq. (gr. Mr. W. Lockie); second, Mrs. WALTER EVANS (gr. Mr. Maxfield).

In the Derbyshire members' classes the Silver Challenge Cup offered for 24 single Chrysanthemums and 12 Japanese blooms was won by F. N. SMITH, Esq., Wingfield Park (gr. Mr. W. Lockie); second, J. A. AITON, Esq., Duffield Park (gr. Mr. G. Neale).

The best 18 Japanese blooms were shown by Major ANLEY (gr. Mr. Thorn); second, J. A. BACON. Mr. W. HORSLEY showed the best 12 incurved blooms; and Mr. J. H. COLEY the best 12 Japanese blooms.

The finest group of Chrysanthemums was shown by Mr. G. POTIER.

In the open fruit classes a Silver Cup was offered for a collection of six varieties. F. N. SMITH, Esq. (gr. Mr. W. Lockie), was successful, showing Apples, Pears, black and white Grapes and a Melon; second, Lord BELPER, Kingston Hall (gr. Mr. McCartney).

For three varieties of Pears, Mr. J. BACON was awarded the first prize and Mr. J. H. COLEY the second. Lord BELPER (gr. Mr. McCartney) showed the best two bunches of Black Grapes and of White Grapes.

#### READING YOUNG FARMERS' CLUB.

The opening meeting of the Reading branch of the Young Farmers' Club was held on Friday, the 20th ult., in the Club Room of the Abbey Hall (by kind permission of Messrs. Sutton and Sons).

The Secretary reported on the progress made during the summer months in the gardens, and stated that 16 of the 20 members who had been allotted plots had kept them well cultivated, and had realised considerable sums by the sales of produce to their parents and friends.

Several plots would be available for new members in the coming year, on account of some of the lads having commenced work.

A winter programme of fortnightly lectures and discussions was arranged, the first to take place on Friday, November 10, when Mr. E. R. Jones, the manager of Messrs. Sutton's Experimental Grounds, promised to give a lecture on "Soils and Manures."

The Treasurer reported that up to the present he had received about £14 from members for the sale of produce.

Master M. Cousins, aged 12, the winner of the first prize for the best kept garden, had paid in over £2 realised for the sale of produce from his 3 square poles, which is at the rate of £106 per acre. Another member had raised 1½ cwt. of Abundance Potatoes from his six rows, which was at the rate of 15 tons per acre.

#### SOCIETE NATIONALE D'HORTICULTURE DE FRANCE.

THE Autumn Exhibition of the French National Horticultural Society, which partook this year of an international character, was held from October 27 to November 5, in the large Palmarium of the Jardin d'Acclimatation in the Bois de Boulogne, Paris.

On account of the unfavourable weather, there was not, perhaps, quite such a wealth of flowers as usual, but fruits were very numerous, and the vegetables in fine condition. The extreme cold which prevailed on the eve of the exhibition was responsible for some losses among the exhibits, but these were, happily, quickly replaced.

The premier award, the "Grand Prix d'Honneur," was won by Messrs. VILMORIN-ANDRIEU ET CIE, Paris, whose exhibit occupied nearly half the Palmarium, and was composed entirely of specimen Chrysanthemum plants, in pyramids, cones, and spheres. Among other varieties there were Général Pau, rosy lilac; Mme. Gaston Fourré, yellow; Symphonie, pink; and Colonel Linel, bronze yellow.

Mme. MARTIN, Champigny, showed a very fine collection of Chrysanthemums in unnamed or new varieties, among which were Chrysanthémiste Violetté, violet, with paler reverse; and Tika, bright red. M. G. TRUFFAUT, Versailles, had a big group of cut blooms in groups, of one colour, such as Paul Odout, yellow; Undaunted, violet; Salonica, red, with paler reverse; and R. C. Pulling, yellow. M. FERON, Garches, showed a fine collection of cut flowers, including Mrs. Gilbert Drabble, white, and Edith Cavell, reddish brown. M. FERARD, Paris, had a large exhibit of single varieties, including many unnamed seedlings, all very suitable for decoration; two of the named ones were Bretois, red, and Orléanais, yellow. M. LOCHOT, Pierrefitte, showed a fine collection of cut flowers, for which, with flowers of the variety Daily Mail, he shared honours with M. LAVEAU, Boissy St. Léger.

M. MORIN, La Rochelle, showed also a very fine collection of Chrysanthemums, and M. LELOUP-GRIMOUX, Le Mans, exhibited large-flowered varieties, including Orientale, red, with yellow reverses to the florets; Ma Gloire, salmon pink; and Mrs. Monro, dark red. M. MARTIN, Digoin, showed single varieties well, and among these were Suzon, pink, and Souvenir de M. A. Colcombet, with its curious, bright pink, rolled-back florets. MM. LEVEQUE ET FILS, Ivry, had a pretty exhibit of dwarf varieties, including M. Maurice Pain, pink, and Dufresnoy, rose-hued.

Among other plants shown, the cut Dahlias of MM. CAYEUX ET LE CLERC, Paris, notably the fine copper yellow Mme. Ferdinand Cayeux, were prominent; also the pretty and curious single varieties shown by M. MARTIN, Digoin, with long petals showing the characteristic recurving of the race known as "Digoin Star." M. LOCHOT, Pierrefitte, showed Carnations, including the fine variety Jeannine Beer; Carnations were also exhibited by MM. VACHEROT ET LECOUPLE, Boissy St. Léger, and by MM. LEVEQUE ET FILS, Ivry.

M. AUBERT-MAILLE, Tours, displayed, as usual, a noteworthy exhibit of Cyclamens; tuberous Begonias were shown by the usual specialists, M. VALLERAND, Taverny, and M. BILLARD, Le Vésinet. M. WEISS, St. Cloud, had a small collection of alpine plants; and in one of the small, side greenhouses, showed a set of the miniature Japanese gardens which are just now very fashionable in Paris.

There were three fine exhibits of Roses; those of MM. NONIN ET FILS, Châtillon sous Bagneux, of MM. LEVEQUE ET FILS, Ivry (who showed very attractive plants in pots), and of M. HONORE DEFRESNE, Vitry. Among the varieties shown by MM. NONIN, the fine dwarf polyantha Joseph Gny bore large clusters of bright red blooms.

Excellent floral compositions were contributed by M. DEBRIE and M. DEBRIE-LACHAUME; there were also several attractive baskets of fruit, and happy combinations of fruit with flowers.

As at previous exhibitions, the Orchid Com-

mittee of the Society had a creditable display, among which were particularly noted Brasso-Cattleya Dietrichiana, bright purplish red; Brasso-Cattleya Dr. J. Gralot, pure white, with a greenish centre; Laelio-Cattleya Jeannine Potin, with purplish red labellum; and Cattleya Souvenir de Mme. A. Leclerc, a fine pink variety. This latter was shown by M. MARÇOZ, and was awarded a Certificate of Merit.

The exhibits of fruit were numerous and of good quality. M. NOBLEOT-BRUNEAU, Bourg-la-Reine, had a very complete collection of autumn fruits, comprising nearly 600 varieties, and MM. CROUX ET FILS, Chatenay, and MOSER ET FILS, Versailles, also showed excellent collections. M. PESTEL, Normandy, exhibited a large series of cider Apples; and among the numerous exhibitors of commercial varieties were the MONTEUIL AND DISTRICT HORTICULTURAL SOCIETY, whose exhibits comprised Pears Charles Ernest, Notaire Lepin, and Merveille Ribet; the ABOICULTURAL COLLEGE at the Luxembourg, who sent fine specimens of Doyenné du Comice and Doyenné d'Hiver, and Apples Delicious; M. BRION, Thorigny, who had the finest display of Pear Passe-Grassane; MAISON DUPONT-BARBIER, a good display of mixed fruits; M. SALOMON, Thomery, who showed Grapes; M. WEIN, Deuil; and the THOMERY GRAPE GROWERS' SYNDICATE.

In one of the smaller houses, the IGNY HORTICULTURAL COLLEGE staged a very attractive exhibit of fruits and vegetables, and the ORLEANS RAILWAY COMPANY exhibited a large collection of the products of the regions served by their lines—Grapes from Montauban, Truffles from Périgord, Apples from Cantal, early produce from Touraine, etc.

The journal *L'Agriculture Nouvelle*, which is the agricultural supplement of the well-known daily *Le Petit Parisien*, had assembled a very interesting collection, the results of a competition in fruit production.

The big collection of vegetables staged by MM. VILMORIN-ANDRIEU ET CIE made a very decorative exhibit, with its pyramids of Kale, circles of Pumpkins, piles of salads, and baskets of Cauliflowers, comprising practically everything that could possibly be called a vegetable. There was also a collection of curious or fantastic vegetables, such as Antilles Cucumbers, Florence Fennel, Trichosanthes colubrina, etc. M. DAVY, Juvisy, also staged an interesting collection of vegetables, and so did M. G. TRUFFAUT, Versailles.

Outside the large greenhouse, a model fruit garden was arranged, showing all the different forms of trees. This was a joint exhibit by the principal fruit growers in the environs of Paris—MM. NOBLEOT, Bourg-la-Reine; CROUX, Chatenay; MOSER, Versailles; CHAUFFOUR, Versailles, etc.

Among ornamental trees and shrubs, the exhibits of MM. CROUX, Chatenay, LECOLIER, La Celle St. Cloud; THUILLEAUX, La Celle St. Cloud; and MARTIN-LECOINTE, Louveciennes, were particularly noticeable, especially the specimens of Abies concolor, Cupressus Lawsoniana, and Tsuga canadensis pendula.

Many Certificates of Merit were awarded for Chrysanthemums—no fewer than fourteen to Mme. MARTIN, and ten to MM. VILMORIN.

Among the most interesting of the novelties were Secrétaire Maurice Lhuile, golden yellow, tinted with red (Mme. Martin); Ville de Paris, pink, yellow reverse (M. Lochot); Président Jules Grec, pink, suffused with carmine (M. Roman); Mlle. Mylène Laugier, pale pink (M. Hous); Mon Rêve, a single variety, yellow, with brick red aureole (M. Martin, Digoin); L'Armagnac, pale pink; La Bûe, reddish brown; L'Argonne, old rose (Vilmorin); Jeanne d'Arc, snow white (Mme. Martin).

A Certificate of Merit was also awarded to Dahlia Sénateur Gerbe, a single, deep garnet variety, of the "Digoin Star" strain, shown by M. MARTIN, Digoin.

The jury was international, and included, besides the French members, the following well known horticulturists:—Mr. C. HARMAN PAINE, London; SIGNOR MOLON, Milan; M. PYNART, Ghent; M. JANKOWSKI, Warsaw; SENOR CORTADI, Bilbao; M. HERTZSCHUCH, Geneva; and M. KERKWOODE, Wetteren. A. M.

CARDIFF GARDENERS.

EXHIBITS of Chrysanthemums were staged at the last meeting of the above Society for the "Harry Gillet" Challenge Cup and money prizes of £2 6s. 6d.

Mr. F. WEBBER gained the highest award in the class for six vases of decorative varieties arranged with the plants' own foliage.

Mr. H. R. Farmer opened an interesting discussion on points of interest in Chrysanthemum culture. He advocated raising stock from plants which showed all the qualities of the variety, and advised not cutting the plants so hard as is usually done, but high up, so as to obviate the risk of bleeding.

Obituary.

Charles Page.—It is with very great regret that we learn of the death of Mr. Charles Page, which occurred at Dropmore on the 31st ult. The funeral took place at Dropmore Church on November 4. Mr. Charles Page occupied a prominent position in the horticultural world for a considerable part of his seventy years of life, as he was a clever gardener and a successful exhibitor of Roses, Chrysanthemums, fruits and vegetables.

TRADE NOTES.

A MEETING of the Technical Committee of the Chamber of Horticulture was held on the 25th ult., Mr. F. C. Moseley in the chair.

A letter from Mr. George Pyne, of Topsham, was read, giving further particulars as to lime and sulphur treatment for Black Currant mite. The success stated to have been obtained was considered exceptional, and the letter is to be filed as a record of such success.

A letter will be sent to all horticultural colleges and universities not already represented, inviting them to appoint a representative to this committee, who would attend when there were matters of special interest to them on the agenda.

Professor Lefroy introduced to the notice of the committee a chlorine preparation with which he had experimented in surface sterilisation of Pears and Plums with a view to preservation. Results had proved that after the lapse of a certain period fruit that had been dipped in the preparation showed only about 6 per cent. losses as against 30 per cent. losses for similar fruit not treated.

The committee considered the matter with much interest, and thought that this method of sterilisation would be of great value in certain classes of fruit.

At Downham, Essex, 26 Oaks planted by relatives of the fallen and a nursing home will constitute the local war memorial. The trees were planted on October 21, and were supplied by Mr. Webster, nurseryman, Stock, an adjoining village. The inscriptions on each tree were on a special label presented by Mr. Webster, sen., the inventor and patentee of the tablets. The cost of the combined memorials was defrayed by the originator of the scheme, Mr. W. E. Leslie, of Downham House.

MARKETS.

COVENT GARDEN, Tuesday, November 7, 1922.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.

Fruit: Average Wholesale Prices.

Table listing fruit prices including Apples, English, per bus. 2 0-3 0; Allington Pippins, 2 0-3 0; Benheim Pippins, 7 0-10 0; Bramley's, 6 0-8 0; Seedling, 6 0-8 0; Cox's Orange, Pippin best, 7 0-12 0; ordinary, 4 0-6 0; King of the Pippins, 3 0-4 0; Lord Derby, 5 0-6 0; Mackintosh Red, 12 0-14 0; Warner's King, 0 0-7 6; Worcester, half bushel, 2 3-4 0; bushel cases, 6 0-10 0; Nova Scotian, Blenheim Pip, 22 0-24 0; Cox's Orange, Pippin 1/2 barrel, 28 0-30 0; King of the Pippins, 24 0-28 0; Ribston Pippin, 22 0-24 0; Tyrolan 40lb box, 7 0-14 0; Bananas, singles, 12 6-20 0; doubles, 17 6-20 0; Grapes, Alicante, 0 10-2 6; Almeria, barrel, 20 0-21 0.

Table listing potted plant prices including Afiatum, cuneatum, per doz., 10 0-18 0; elegans, 10 0-12 0; Aralia Sieboldii, 10 0-12 0; Arancarias, 30 0-48 0; Asparagus plumosus, 12 0-15 0; Sprengeri, 12 0-18 0; Aspidistra, green, 48 0-72 0; Asplenium, per doz., 12 0-18 0; 32s, 24 0-30 0; nidus, 12 0-15 0; Cacti, per tray, 12s, 15s, 5 0-6 0; Chrysanthemum, white, per doz., 10 0-18 0; coloured, 9 0-15 0; Cinerarias, per doz., 12 0-18 0; Crotons, per doz., 30 0-42 0; Cyclamens, per doz., 18 0-24 0; Cyrtolium, 10 0-15 0; Erica gracilis, 48 per doz., 24 0-36 0; 60, 12 0-15 0; Thumbs, 6 0-8 0; Erica nivalis, 48, 24 0-30 0; 60, 10 0-15 0; Thumbs, 6 0-8 0; Genistas 48s, per doz., 15 0-18 0; Marguerites, per doz., 15 0-18 0; Nephrolepis, in variety, 12 0-18 0; 32s, 24 0-36 0; Palms, Kentia, 24 0-30 0; 60s, 13 0-18 0; Cocos, 24 0-36 0; Pteris, in variety, 12 0-21 0; large 60s, 5 0-6 0; small, 4 0-4 6; 72s, per tray of 15s, 3 6-4 0; Solanum, per doz., 10 0-12 0.

Cut Flowers, etc.: Average Wholesale Prices.

Table listing cut flower prices including Acacia (Mimosa), per bunch, 1 3-1 6; Adiantum decuratum, doz. bun., 10 0-12 0; cuneatum, per doz. bun., 6 0-8 0; Asparagus plumosus, per bun., long trails, 6s, 4 0-5 0; med. sprays, 2 6-3 6; short, 1 0-1 6; Sprengeri, per bun., long sprays, 2 6-3 0; med., 1 3-1 6; short, 0 9-1 0; Camellias, white, per box, 4 0-4 0; Carnations, per doz. blooms, 3 6-5 0; Croton leaves, var., per bun., 2 6-4 0; Chrysanthemum, pink, per doz. bun., 15 0-18 0; bronze, 13 0-18 0; white, 24 0-26 0; yellow, 13 0-18 0; per doz. blooms, white, 3 6-8 0; yellow, 3 0-6 0; pink, 4 0-8 0; bronze, 4 0-8 0; single varieties, disbud, boms, per doz., 3 0-5 0; Spray coloured, per doz. bun., 18 0-30 0; Spray white, 24 0-30 0; Fern, French per doz. bun., 1 0-1 3; Forget-me-not, per doz. bun., 9 0-10 0; Gardenias, per box, 6 0-9 0; Heather, white, per doz. bun., 4 0-10 0; Liliun longiflorum, speciosum long, per doz., 3 0-4 6; short, 4 0-5 0; Lapageria, per doz., 4 0-4 6; Lily of the Valley, per doz. bun., 24 0-36 0; Narcissus, paper buds, per doz., 8 0-9 0; Oranids, per doz., 12 0-18 0; Cypridediums, 6 0-9 0; Pelargonium, per doz. bunch, double scarlet, 10 0-12 0; Richardias (Arums), per doz., 9 0-10 0; Roses, per doz. blooms, Frau Karl Drusenki, Madama A., Chateaux, Meopias, Nipietos, Opnelia, Luerty, Sunround, Richmond, White Crawford, Sunlux, per doz. trails, Stepanotis, per 72 pips, Violets, single, Parma, per bun., 7 0-8 0.

REMARKS.—After a general shortage in this department during the past week or so, there appeared to be a general improvement in supplies this morning. Chrysanthemums of all grades were more plentiful, and prices showed a tendency to fall. Similar remarks apply to Carnations, but Roses from home growers will be a limited supply for some time to come. Liliun longiflorum is again falling in price; there was a sudden rise at the beginning of last week, but Richardias (Arums) remained firm, the supply at present being very short. Amongst the English flowers there are no fresh lines to record this week. The French flower season has now started, and prices at present are high, but further supplies are expected this week which, no doubt, will bring them down. Acacia (Mimosa) is arriving in good condition, as also is Paper White Narcissus. At present the largest consignments consist of baskets of pink Heather, Chilies and Solanum Parma Violets have advanced from 4s. to 8s. per bunch during the past week.

GARDENING APPOINTMENTS.

Mr. H. F. Maidment, for the past two years and ten months at Cannington Court, Bridgwater, and two years Manager and Horticultural Instructor at the Cannington Court Training Centre for disabled ex-Service men, and for ten months Gardener and Instructor at the Somerset Farm Institute, as Gardener to Lord ALINGTON, Crichele Estate, near Wimborne Dorset. (Thanks for 2s. for R.G.O.F. Box.—Eds.)

Mr. T. H. Bolton, for the past ten months Gardener at Allerton Park, Knaresboro' and previously 15 years at Powderham Castle, Exeter, as Gardener to CAPT. W. D. HALL, Gwernyfed Park, Three Coeks, Breconshire.

CATALOGUES RECEIVED.

## ANSWERS TO CORRESPONDENTS.

**APPLE SHOOTS DISEASED:** *E. E.* The foliage is affected with a physiological trouble known as Apple leaf-scorch, which is sometimes due to a lack of potash in the soil and sometimes to wrong cultivation, whilst others attribute it to the influence of the stock. The complaint was fully dealt with in the last annual report of the Long Ashton Fruit Research Station, Bristol.

**CUCUMBERS FAILING:** *W. G. C.* The portion of the plant sent us is free from disease, and there is no eelworm present in the roots. In these circumstances the trouble must be looked for in some wrong cultural treatment, or, very possibly, the use of poor soil, for that which was attached to the roots appears to be of very poor quality.

**FAILURE WITH POTATOS:** *A Constant Reader.* The fact of the seed tubers remaining hard and giving no yield points to the sets having been over-ripe. In your other case apparently the seed of Arran Chief variety was in a more suitable condition, as the yield of this sort was satisfactory.

**GARDENERS' NOTICE:** *E. B.* It is customary for a head gardener to give and receive a month's notice on terminating an engagement, but the custom varies in different parts of the country, as was described by a solicitor in an article published in our issue of March 22, 1919, p. 143. If you are in any doubt, your best plan is to consult a local solicitor.

**GRAPES SPLITTING AROUND THE STALKS:** *H. L.* The trouble is not due to lingous disease, but to faulty culture of some kind. It is not shanking, but would appear to be a nearly allied type of trouble. You will probably find that the roots are in an unhealthy condition, and we would advise you to make an examination of the border when the vines are defoliated. Another cause might be the presence of too much moisture in the atmosphere.

**LAWN SAND:** *H. S.* Lawn sand, by stimulating the growth of the grasses, serves to keep down weeds, as the luxuriant growth of the grass smothers the weeds. The most active property in lawn sand is nitrogenous fertiliser, and, like all quick-acting manures of this nature, lawn sand is best applied in the spring. You will find directions for using it given by the makers on the packets.

**MUSCAT GRAPES DECAYING:** *F. L. and G. S.* The trouble is not primarily due to a fungous disease, although the fungus *Botrytis* is present and causing the decay. The *Botrytis* obtained an entrance either through a minute crack or wound, or by means of areas which had damped or were over-ripe. By maintaining a dry, buoyant atmosphere in the house the spread of the disease will be checked, although once *Botrytis* affects a vinery with great seriousness it is exceedingly difficult to check.

**NAMES OF FRUIT:** *G. P. J.* 1, Beurré Sterckmans; 2, Durondeau; 3, Le Lectier; 4, Bellissime d'Hiver; 5, Fondante de Cuerne; 6, Beurré Diel; 7, Old Nonpareil; 8, Melon Apple.—*J. H. B.* 1, Small's Admirable; 2, Warner's King; 3 and 5, Worcester Pearmain; 4, Mank's Codlin; 6, Cox's Orange Pippin; 7, French Crab; 8, Blenheim Pippin; 9, Lane's Prince Albert; 10, Baxter's Pearmain; 11, King of the Pippins; 12, Lord Derby; 13, Ribston Pippin.—*W. R. S.* 1, Cellini; 2, Golden Noble; 3, Sam Young; 4, Duchess of Oldenburgh; 5, Lord Derby; 6, English Codlin; 7, Newton Wonder.—*W. L.* 1, Bramley's Seedling; 2, Herefordshire Beefing; 3, Afriston; 4, Wealthy; 5, Claygate Pearmain; 6, Kerry Pippin; 7, Court Pendu Plat.—*J. C. B.* Green Apple, Keswick Codlin; red, Scarlet Pearmain.—*F. J. M.* Apples: 1, James Grieve; 2, Cellini; 3, Warner's King; Pears: 1, Durondeau; 2, Beurré Hardy; 3, Conference.—*C. F. G.* 1 and 10, Cox's Orange Pippin; 2, Herefordshire Pearmain; 3, Keswick Codlin; 4, Wilson's Prolific; 5, Flower of Herts; 6, Annie Elizabeth;

7, Dumelow's Seedling, syn., Wellington; 8, Winter Hawthornden; 9, Warner's King.—*F. G. M.* Fondante d'Antonne.—*H. F. Z.* 1, 2 and 5, decayed, overripe; 3, Beurré d'Amanlis; 4, Beurré de Capiaucant; 6, Fondante d'Antonne; 7, Duchesse d'Angoulême; 8, Louise Bonne of Jersey; 9, Easter Beurré; 10, Beurré Hardy; 11, Hacon's Incomparable.—*C. E. F.* 1, Williams' bon Chrétien; 2, Marie Louise; 3, Doyenné du Comice; 4, Louise Bonne of Jersey; 5, Olivier de Serres; 6, Lodgemore Nonpareil; 7, Keswick Codlin; 8, Cellini; 9, Bramley's Seedling; 10, Warner's King; 11, Napoléon.—*C. H.* 1, 2 and 3, Ribston Pippin; 4, Mabbot's Pearmain; 5, Franklin's Golden Pippin; 6, Duchesse d'Angoulême.—*G. R.* 1, Catillac; 2, Williams' Victoria; 3, British Queen; 4, Warner's King.—*G. A. P.* 1, Striped Beefing; 2, Radford Beauty; 3, Annie Elizabeth; 4, Golden Spire; 5, Cellini; 6, Beurré Hardy; 7, Beurré Sterckmans; 8, Triomphe de Vienne; 9, Beurré d'Amanlis; 10, Vinense; 11, Vicar of Winkfield.

**NAMES OF PLANTS:** *Ensign.* 1, *Thuya plicata*; 2, *Cupressus pisifera*, var. *plumosa aurea*; 3, *C. Lawsoniana*; 4, *Taxus baccata*, var. *fastigiata*; 5, *Cupressus pisifera*, var. *squarrosa*; 6, *Juniperus chinensis*; 7, *Cupressus macrocarpa*; 8, *C. sempervirens*; 9, *Pittosporum undulatum*. *F. C.* Asters: 1, Purple Prince; 2, Blue Gem; 3, Edwin Beckett; 4, Juno; 5, Brightest and Best; 6, *diffusus horizontalis*; 7, Sensation.—*G. B.* *Aralia chinensis*, Chinese Angelica Tree.—*H. S.* 1, *Cotyledon valida*; 2, *C. gibbiflora* var. *metallica*; 3, *C. Milleriana*; The *Alternantheras* had no foliage, therefore it was impossible to identify them; they are all varieties of *A. ficoidea*.—*T. S.* 1, *Abelia floribunda*; 2, *Diplappus chrysophyllus*; 3, *Santolina Chamacyparissus*; 4, *Rhus Cotinus*; 5, *Artemisia lactiflora*; 6, *Asperula montana*; 7, *Erigeron mucronatus*.—*J. E. I.* *Galega officinalis*.

**PLANTS DYING:** *Anxious.* The plants you sent were not affected with a fungous disease. They are in a very bad condition and may have been treated with the material you suspect, but it is impossible for us to determine here what you cannot ascertain on the spot. If you had saved some of the water, an analysis of it would have proved the presence or not of weed killer.

**PLANTS:** *R. G.* You can obtain plants of the *Scabiosa* you mention from Messrs. Godfrey and Son, Exmouth, and the bulbs you require from Messrs. Barr and Sons, King Street, Covent Garden, W.C.

**PRUNING YOUNG FRUIT TREES:** *Amateur.* Maiden (one year) trees are always pruned on planting if they are tall enough to give the required length of stem. The difference of opinion arises when two or three-year-old trees are planted; and it is probably this to which you refer. Some prune at once, or some time before the first season of growth, arguing that the roots have been damaged and disturbed by transplanting, and that the head should be reduced to restore the balance. Others prefer to leave the head unpruned for one season, claiming that this helps the roots to establish themselves, and that a better response to the knife is obtained in consequence when the tree is cut back the next winter. This is a very old controversy which will probably never be settled. In practice, you will find that it is quite safe to prune the first year if the trees are planted before Christmas on well-prepared land; but if they are not planted till February or March, it may be better to defer pruning till the next winter.

**RED SPIDER IN AN EARLY VINERY:** *G. W. S.* If proper attention be given to ventilation, and the vines are never allowed to suffer from want of water at the roots, red spider need not be feared. The spread of red spider is favoured by a dry, warm atmosphere, caused by the use of too much fire-heat, and dried at the roots. Wash the vines with Gishurst compound, and coat the walls with hot lime,

adding a handful of sulphur to each gallon of wash. The first signs of spider are a brownish appearance of the leaves, generally in dry corners and nearest to the hot water pipes. On its first appearance, sponge the leaves with warm, soapy water; this is a tedious and slow process, but if carefully done never fails. In addition to sponging the foliage, syringe the vines with clean, soft water. As a last resort paint the pipes when they are hot with a mixture of sulphur, soft soap and milk.

**RHODODENDRON AND HYACINTHUS CANDICANS:** *F. H.* After an examination of *Rhododendron* Lady Eleanor Cathcart we have come to the conclusion that root trouble is the cause of failure. The plant made a good start to grow, but the leaves failed to thicken, and the shoot is soft instead of becoming woody. The brown deposit you mention does not give any clue to its composition. If a natural deposit, it may be badly drained with stagnant water at no great depth below. If the soil has been made up it may contain too much clay or lime. All or any of these defects should be made good, if present. Peat in considerable quantity would improve the staple whether clay or limo is present, and sand may be added to advantage in the case of clay. The variety is a hybrid of *R. arboreum*, and in that respect may be a little exacting in its requirements; but it is an old and beautiful variety that has given satisfaction for thirty-five to forty years, so it is worth a little trouble to get it to thrive. The plants will take no harm if they are lifted while the ground is being prepared, provided they are taken up with the original ball of soil. It is always safer in the Eastern and Midland counties, as well as further north, to lift, dry, and store *Hyacinthus candicans* and *Gladioli*. The former may be replanted in February or March.

**ROSES ATTACKED WITH BLACK SPOT DISEASE:** *F. O.* The Rose leaf blotch, or spot, may be controlled by the use of any of the copper sprays, such as sulphate of copper or Bordeaux mixture. The latter, of course, will not affect your copper sprayer. Gather all the fallen leaves and burn them, and take the precaution to spray the plants early in the season, previous to the blossoming period.

**SEEDLING PEAR:** *H. C.* The fruit reached us almost in a condition of pulp. We agree that it has a superficial resemblance to Citron des Carmes, but as it was raised from a pip it is, of course, not that variety, but a distinct one which may or may not be worthy of a name.

**SOIL FOR CARNATIONS AND CHRYSANTHEMUMS:** *H. K.* The disease may have been introduced with the soil, and you will be advised to sterilise the compost used for these plants or to obtain the loam from a fresh source. In order to make doubly sure, we would advise you to cleanse the house thoroughly. Wash the wood-work well with soapy water, using carbolic soap for the purpose, and coat the walls with hot lime wash.

**SOIL FOR EXAMINATION:** *H. K.* We do not undertake to analyse soil for correspondents. Write to the Director of the Royal Horticultural Society's Gardens, Wisley, Ripley, Surrey. The presence of small, white worms in the soil points to an excess of organic matter and the need for liming.

**SWEET WILLIAMS AND CLOVE CARNATIONS DISEASED:** *D. M.* The Sweet William plants are affected with disease caused by a species of *Meterosporium*; the Clove Carnations are attacked by *Septoria Dianthi*. Affected leaves of both plants should be picked off and burnt, and the plants afterwards sprayed with a solution of liver of sulphur at a strength of one oz. to two or three gallons of water.

**WALNUT SHELLS PERFORATED:** *L. T. H.* The damage to the Walnut shells has been caused by birds, probably Starlings. Your Walnut is the thin-shelled variety, which is easily perforated by birds.

**Communications Received.**—*F. W. D.*—Bzno—*T. T.*—*J. R. A.*—*G. W.*—*W. C.*—*J. S. B.*—*T. E. W.*—*A. G.*—*C. H. W.*—*C. E.*—*J. T.*—*W. C.*—*H. J. C.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 43.0.

ACTUAL TEMPERATURE:—  
Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, November 15, 10 a.m. Bar. 30.2; temp. 47°. Weather—Foggy.

**On Growth.** The microscope has revealed to botanists the minute structure of the cells of plants and the manner in which cells grow and divide; but the physiological processes which evoke the growth and differentiation of the cells and tissues of plants remain almost entirely unknown. When conditions are favourable, a plant pursues the tenor of its way so steadily, and by such continuous, though scarcely perceptible, stages that its growth becomes one of the accepted things of nature—calling forth no comment and provoking little curiosity. When, on the other hand, conditions are unfavourable and growth ceases or becomes disordered, we say "the plant has had a check," and are perforce satisfied with this mere statement of fact. Why an arrest of growth—say in the spring of the year—should leave its mark on a plant throughout the whole of the growing season, is a question which we make no attempt to answer. Yet such marks are to be observed in most gardens in years like the present one. For example, some Zinnias—healthy seedlings which were planted out just in time to catch the end of last spring's drought—remained, in spite of a summer favourable to growth, puny things six inches in height and with flowers no larger than halfpence. Evidently, knowledge of the physiology of the growth of plants is very imperfect. Recent discoveries in the animal world have shown that the regulation of the rate of growth and development of cells and tissues is mainly, if not entirely, brought about by specific chemical substances, some of which act as accelerators, hastening growth, and others, of which doubtless some act as inhibitors, checking its rate. That there exists a similar chemical control of the growth of plants can scarcely

be doubted, although at present experimental evidence is almost altogether lacking. At a given moment of the year active growth begins, and at a given moment growth ends. Between these times, many phases of growth intervene. The cambium becomes active and produces new wood and bast. Presently, groups of cells of the cortex which hitherto had show no sign of division, begin to divide and differentiate a cork cambium, from which cork is produced. Stimulation of growth in spring, arrest in autumn, and the initiation of successive phases of growth are, of a certainty, not mere direct reactions of the living substance to external conditions, but responses to specific chemical stimulators or inhibitors which the plant itself makes and uses for the purpose of growth-regulation.

Recent experiments have made a beginning in the direction of discovering the existence in plants of growth-regulatory substances or hormones. For example, it has been shown that the change in rate and distribution of growth, which takes place and exhibits itself by curvature when a plant is illuminated only from one side or when it is displaced from the vertical line, is brought about by a specific chemical substance excreted in the sensory region and distributed to the bending region. It has been shown, for instance, that the sensory tip of the first leaf of an Oat seedling may be cut away, and then "glued" on again by means of gelatine without destroying its power of sending signals to the lower part of the leaf, which is the seat of curvature. By such treatment any structure of the nature of nerves would be put out of action, and we are, therefore, forced to the conclusion, which is also supported by other evidence, that the curvature in response to a stimulus of light or gravity is brought about by the secretion in the sensory or perceptive region of a growth-distributing substance which passes to and affects the motor region. A similar transmission of a chemical stimulator has also been shown to occur in sensitive plants, *Mimosa pudica* and others. A branch of *Mimosa pudica* in an active state may be cut off, its cut end put in a tube containing water and left till it has recovered from the shock. If there be fixed in the lower end of the water-filled tube, another branch of the plant, and if that branch is repeatedly stimulated, a substance diffuses from it through the water into the cut end of the upper branch and presently the leaflets of that branch begin to show the familiar movements. It is true that these movements are brought about not by the growth of the tissues of the pulvini, but by change in size of their constituent cells. That, however, does not affect the argument. Again, recent experiments in Germany have shown that cork formation after wounding a tissue is due to a chemical stimulus emanating from the wounded cells. If a wound be made in a bulbous or tuberous plant (*Kohl rabi* for example), cork formation follows in the course of a short time in cells lying a little way behind the wound. If, however, the wound be washed with clean water, the formation of wound-cork does not take place; but if, after washing, some wounded tissue from another cut surface of the bulb or tuber be spread on the wound, wound-cork formation occurs as in the normal plant. Though slender, the evidence is stimulating and encourages the speculative plant physiologists to predict that the rate and regulation of growth of cells and the differentiation of the tissues of plants will be found to be governed by specific chemical stimulators and regulators. There are some grounds for expecting that the seat of formation of

these hormones will be found to be localised; that although any groups of living cells may perhaps secrete them, the work of manufacturing them may be found to be the task of special tissue. The tissue which may prove to be the secretor of hormones—corresponding to the special glands for internal secretion in animals—is the bast. Long regarded as the channel for the distribution of elaborated sap, the most recent view repudiates this opinion and inclines to the belief that the elaborated sap passes from one part of the plant to another along the vessels of the wood. If so, the phloem or bast would for the moment appear to be cut of work, and therefore it is not perhaps improper to lay on it the burden of the secretion of growth stimulators. It is well placed for such a task. Close within it lies the cambium which needs to be quickened periodically into activity. Outside it lies the cortex, and if there emanates from the phloem a cork-forming hormone, then it would no longer be surprising that in each species of plant, primary cork forms at a fixed distance from the phloem, either in the epidermis itself, in the layer below the epidermis, or in a certain layer of the cortex. The old observation of the effect of ringing branches lends support to this view of the functions of the phloem. If a ring down to the wood be removed from the stalk bearing a fruit, the fruit grows larger than it otherwise would. This is ascribed generally to the accumulation of food materials in the fruit. But there is no ground for such a view. Accumulation of food materials will not necessarily make a tissue grow any more than greedy eating will make a thin man fat. It is more probable that the effect of cutting into the bast brings about an increase in the production therein of growth-accelerating hormones which, diffusing into the tissues of the fruit, cause their cells to increase beyond the normal size. Needless to say, this hypothesis will require to be tested by experiment before it can be accepted; but a new hypothesis, whether true or false, has this merit that it suggests lines of experimental investigation which before its promulgation are not apparent.

**Honour to a Gardener's Son.**—Amongst the honours conferred by the late Government is a peerage for Sir John Bethell, Bt., Bushey House, Bushey, Hertfordshire. Sir John Bethell is one of the sons of the late Mr. G. Bethell, who was for many years gardener to the late Sir Greville Smyth, of Ashton Court, Bristol. He was Member of Parliament for the Romford Division of Essex, the largest single-member constituency in the country, from January, 1906, to December, 1913, whilst from December, 1913, until the dissolution he was member for the East Ham North Division. Sir John is a director of Barclay's Bank, Ltd., and of the Royal Exchange Assurance Corporation.

**French Chrysanthemum Society.**—It was decided at the Paris Congress of the above Society that the annual gathering for 1923 shall be held at Limoges. To those who have not visited that part of France there will be much to interest them in the journey. Further details will be announced in due course.

**The Botanical Magazine.**—Gardeners, no less than botanists, will welcome the reappearance of the *Botanical Magazine*, the continuation of which has been undertaken by the Royal Horticultural Society, who have been enabled to carry on this work owing to the liberality of some of the Fellows who are contributing part of the cost. Besides new proprietors, the work has a new publisher and new editor, Messrs. H. F. and G. Witherby, 326, High Holborn, and Dr. O. Stapf, late Keeper of the Herbarium and Library, Kew, respectively. The issue under notice comprises part 1 of Vol. CXLVIII.; the

price is 17s. 6d. net, per part, and the annual subscription 63s. net. The new issue contains illustrations and descriptions of twelve plants. The plates are well produced, although we notice in one or two instances that the colour register is hardly perfect; although we are aware of the difficulty of perfect colour reproduction, we do not think such great success has been achieved in this respect as in some of the earlier colour reproductions of plants, and especially in the *Botanical Register*; yet the plates are, on the whole, better than in the immediate past. Much useful detail has been embodied in the plates, making for easy identification of the species. The text has been greatly enlarged, and this will be very much appreciated by subscribers. The following are the plants illustrated:—*Jasminum Rex*, tab. 8,934, a white-flowered species described as one of the finest of the genus; *Rhododendron Williamsianum*, tab. 8,935, an especially successful plate of this beautiful, rose-coloured species from Western China; *Podanthum floribundum*, tab. 8,936, a perennial herb with spikes of dark violet-coloured flowers; *Mesembryanthemum fragrans*, tab. 8,937, an old species from South Africa, long lost in gardens and rediscovered by Dr. I. B. Pole-Evans in the Karoo east of the town of Ladysmith; *Aeschynanthus sikkimensis*, tab. 8,938, a Gesneraceous shrub with clusters of scarlet flowers and fleshy, pale green leaves; *Primula sino-Listeri*, tab. 8,939, a member of the *obconica* group; *Stapelia tsoensis*, tab. 8,940, which was first sent to this country in 1878 by Sir Henry Barkley; *Philadelphus sericanthus*, tab. 8,941, a beautiful, floriferous shrub, producing loose racemes of five to ten white flowers; a most valuable plant for gardens and perfectly hardy; *Rhododendron Baileyi*, tab. 8,942, a very distinct species forming a small shrub up to one metre high and producing terminal, racemose inflorescences of reddish-purple flowers with violet-purple interiors; *Bulbophyllum triste*, tab. 8,943, described under *B. alopecurum* by Reichenbach in *Gard. Chron.*, July 17, 1880, p. 70; *Symphytum grandiflorum*, tab. 8,944, a pale, yellow-flowered species with characteristic cymose inflorescences of the genus, the younger buds being tinged with brick red; and *Phellodendron Livallei*, tab. 8,945, a deciduous tree with inconspicuous, greenish flowers, followed by large clusters of berries, somewhat like a loose bunch of Grapes, and coloured bluish black.

**Appointment.**—The Earl of Ancaster, Parliamentary Secretary to the Ministry of Agriculture and Fisheries, has appointed Mr. D. B. Toye, O.B.E., to be his private secretary.

**Exploring the Sahara.**—A Danish scientific mission, under the leadership of Prof. Olfson, is to undertake a scientific mission to Northern Sahara. The party will include a botanist, Dr. Gram, and it may be expected that some interesting new species of plants will be met with in that desolate and unfrequented region.

**Proposed Testimonial to Sir Frederick W. Moore.**—With the retirement of Sir Frederick W. Moore from the Botanic Gardens, Glasnevin, it is felt that an opportunity is afforded to express the high appreciation and esteem in which he is so deservedly held throughout the whole gardening world. Sir Frederick's widely spread activities and ever ready, courteous helpfulness are well known, as well as his vast practical experience and knowledge. His helpfulness has always been at the disposal of those who have ever had occasion to require it, as well as the educational facilities of those now far-famed Botanic Gardens at Glasnevin under his management. It is, therefore, with unqualified pleasure we now invite those who feel with us in the matter to join in the privilege of expressing our appreciation of him and his great work. In consideration of what is felt, under present circumstances, would be Sir Frederick's own feelings on this matter, it has been decided to limit subscriptions to the testimonial to sums not exceeding one guinea, which should be sent to the Marquis of Headfort, President of the Royal Horticultural Society of Ireland; or to Mr. E. Knowlton, Secretary of the Society, 5, Molesworth Street, Dublin.

**Price of Oranges One Hundred Years Ago.**—A paragraph reprinted from the *Times* of November 15, 1822, states: "Oranges are selling at the principal fruiterers of the metropolis at 1s. and 2s. each. We understand they arrived from South America with some that were lately presented to His Majesty; that they are of different species from any hitherto known in England, the inside being nearly as pale as a Lemon, but when full ripe, they are deliciously sweet and in flavour resemble a Pine."

**Mr. George H. Hollingworth.**—The serious horticultural education of Mr. George Hollingworth commenced at Woodseat, Uttoxeter, when his father, the late Mr. J. Hollingworth, was head gardener and bailiff to J. F. Campbell, Esq. But Mr. Hollingworth, senior, understood the value of experience away from home and he soon sent his son to Alton Towers, where the late Mr. T. H. Rabone was then gardener, and the establishment was one of the finest, horticulturally, in the country. While at Alton Towers Mr. George Hollingworth felt constrained to express in writing his views on horticultural practice and affairs, and as he

MR. GEORGE HOLLINGWORTH.

was general foreman at Alton when only twenty years of age, it was evident he had ability above the ordinary. His notes in the gardening Press attracted the attention of Mr. John Wright, V.M.H., then editor of the *Journal of Horticulture*, and eventually he was offered a post on the staff of that paper. Here he gained further experience in horticultural affairs while visiting gardens and exhibitions in various parts of the country. Later, Mr. G. Hollingworth became assistant lecturer in horticulture under the Kent County Council, and after serving in that capacity for nearly eight years, he secured the important post of Horticultural Instructor under the Gloucestershire County Council, a post he still holds, with the additional office of Agricultural Organiser, to which he was appointed in 1914. Mr. G. Hollingworth has great faith in the possibilities of fruit culture in Gloucestershire, notably on standard trees on grass and his faith is justified seeing that some of the finest Apples at the Imperial Fruit Show were grown on such trees in the western county. Mr. Hollingworth has done much to encourage the cider making industry in Gloucestershire and he has a wide knowledge of cider Apples and perry Pears. His work brings him into contact with farmers and market gardeners as well as allotment holders throughout Gloucestershire and he is everywhere received with pleasure and recognised as an authority on matters concerning the land and its cultivation. His sound practical knowledge and ability are also recognised

outside Gloucestershire and thus we find Mr. Hollingworth has been called upon to act as examiner in horticulture at University College, Reading, on several occasions, and examiner in agriculture and horticulture at the Agricultural Institute, Usk, Monmouthshire. Notwithstanding his many duties Mr. Hollingworth still writes for the Press and has contributed, on occasion, to these pages.

**Tait Chair of Natural Philosophy at Edinburgh.**—The Edinburgh University Court have appointed Mr. Charles Darwin, F.R.S., as the first incumbent of the recently instituted Tait Chair of Natural Philosophy. Prof. C. Darwin is the son of the late Prof. Sir Geo. Darwin, F.R.S., and grandson of Chas. Darwin. He was born in 1887 and educated at Marlborough and Trinity College, Cambridge.

**The Antiquity of Wisley.**—During excavations for the development of sewage works at Wisley, a complete, ancient village of the stone age has been discovered. It is assumed that the village was devoted to the manufacture of pottery, and a deep bowl was amongst the pottery discovered. The outline of the village was quite regular and the excellent state of preservation was due, it is suggested, to the fact that the soil is sand.

**Horticulture and the General Election.**—The horticultural legislative programme, in the form of a questionnaire, as referred to in our issue of November 4, was sent direct to over 1,000 candidates for Parliament, and up to the first post Monday (13th inst.) morning, 152 replies were received by the Chamber of Horticulture. Of those replying, 79 accepted the programme without reservation and pledged their support if returned to Parliament; 61 promised to support the programme, with slight exceptions, in most cases the Regulation of Imports (Question No. 3) being the stumbling block; and a few were unable to give any definite pledges, but expressed strong sympathy with the programme. Replies to the Railway questions show that further consideration is required, and in many instances some lack of knowledge was apparent. In addition to the valuable assistance given by the Press, the questionnaire was widely circulated among horticulturists with a request that the programme should be brought to the notice of all candidates. Notification has also been sent to over 500 local newspapers, and candidates' replies have been published when time permitted. The politics of candidates from whom replies have been received are:—Unionists 55, Liberals 25, National Liberals 10, Labour 56, others 6.

**The Fall of the Leaf.**—"The Fall of the Leaf" was the subject of a most interesting lecture delivered recently in Aberdeen University buildings before the local branch of the Educational Institute of Scotland by Dr. Macgregor Skene, Lecturer on Plant Physiology. Dr. Macgregor Skene said that the fall of the leaf in autumn was not really so much a passive fall as an active casting-off of an old garment. There was an act of preparation for it, and it was not simply a case of withering and dropping off. It appeared to be conditioned by the change of environment, and it was certainly adapted to the change from summer weather to that of winter. What was the exact adaptation of leaf fall to the change of climate? In the first place, it might be a method by which the plant got rid of outworn tissue, but scientists had little exact knowledge in that connection; however, a leaf could only have a definite period of life, and became unable further to carry out its functions, and it was necessary for the plant to get rid of it. By getting rid of its sensitive leaves in winter a tree safeguarded itself against various dangers, principally freezing and the excessive loss of water. Some evergreen trees cast their leaves, as they suffer severely, not from frost, but from the sun succeeding the frost. It was not quite so certain that the leaf fall was caused by the climatic conditions, as in deciduous trees the preparation for the change took place before the climatic conditions became severe. Even in the mildest autumns the change began to take place before the weather changed, and it was

also found in greenhouses and bothouses; where the conditions were even more favourable than during the summer months. Therefore, it cannot be said that leaf fall was actually conditioned by the external change. The probability was that the change was caused by some rhythm or periodicity which swung in unison with the change in the conditions, but was really a property of the plant itself, and ultimately independent of these conditions. Proceeding, Dr. Skene described various methods of forcing and keeping back the growth of different plants. For commercial purposes, plants were placed in cold storage chambers for late development, and immersed in a hot-water bath or in ether vapour for forcing purposes. The effect was purely local, as they could force one-half of a Lilac or other plant, and in the half so forced the buds would burst and the flowers develop, while the other half remained completely at rest. They therefore concluded that the periodical leaf fall in plants and trees was inherent, and the outside condition had only a regulating effect. That that was so was shown by the fact that when they transplanted their trees to the tropics they still showed a periodical fall, but out of gear to that shown in this country, so that our climate had a regulating effect, although not primarily causative, and, therefore, periodicity was inherent and inherited. Dr. Skene was very warmly thanked for his instructive and interesting address.

**Gift of Books and Portraits to the Linnean Society.**—Dr. W. Rushton Parker has presented to the Linnean Society the last edition (11th) of *The Encyclopædia Britannica*, 32 4to vols. on thin paper, and case; the *New Oxford Dictionary*, complete to date, with shelves to accommodate the set; Sonnini's edition of Buffon's *Histoire Naturelle*, 127 vols., with six vols. of *Suite à Buffon*, and 106 additional portraits of naturalists and patrons of botany.

**Appointments for the Ensuing Week.**—Thursday, November 23: Royal Botanic Society's meeting. Friday, November 24: Dundee Chrysanthemum Society's show (2 days).

**"The Gardeners' Chronicle" Seventy-five Years Ago.**—*Pelargonium*.—If anyone compares the *Pelargonium* flowers that were known in 1827 with those common in 1847, he will find it difficult to believe that they can all have had the same origin, and that twenty years have sufficed to produce so great a change as has really been effected. But if the varieties produced between 1842 and 1847 are examined the ground of surprise will be changed, and the wonder will then be that the improvement which was so rapid in the first fifteen years should have become so slow in the last five. Yet the reason is obvious; hybridising in the direction followed by the raisers of *Pelargoniums* has reached its limit; we have obtained all the result that is obtainable. Therefore, we have said: "Gentlemen, you should now sail on another tack. Put your ship about; it is of no use to cruise any longer in these seas; you have done all that man can do in this quarter, and if you are wise you will steer in another direction." Some took the advice and discovered new land, or, to drop metaphor, altered the breeds they were crossing, and immediately hit off the new and popular class of *Pelargoniums* commonly called "Fancies." Others were of opinion that no reasonable hope can be entertained of excelling or equalling the varieties procured by the school of which Mr. Beck may now be regarded as the head, and, like the Clare gentlemen, they have contented themselves with "doing nothing—but trying to exist." We are greatly mistaken, however, if growers with the acuteness and zeal of the chiefs of that school are the men to sit with their hands folded while others sow the land and reap the harvest that should be theirs. On the contrary, we are persuaded that English gardeners will be as triumphant in the new track as in the old. The only difficulty they can experience is to know how to set about a change without the loss of time risked upon needless experiments. *Gard. Chron.*, Nov. 20, 1847.

## THE ALPINE GARDEN.

### CORONILLA CORONATA.

ALTHOUGH the above species was introduced to this country in 1776, and figured in the *Botanical Magazine*, t. 907, it is far less common in gardens than several others, both shrubby and herbaceous. The most common in my experience is *C. cappadocica*, sometimes named *C. iberica*. Some time ago I saw *C. coronata* in the garden of Miss Willmott, as *C. montana*, Jacquin's name for it. Under this name it was offered in a recent Irish catalogue, but I fail to find it in other lists. It is in the country, however, for I saw it shown recently doing duty for *C. cappadocica*; though it is easy to recognise by its upright habit, and stems twelve to fifteen inches high, bearing umbels of deep yellow flowers in the axils of the upper leaves. The plant is of bushy habit, yet compact and quite suitable for cultivation on the

troublesome but quite a good method, and some of the best plants I have seen were in the garden of a most successful amateur grower, who lifted a plant of each of his *Pratias* and kept them in a frame with other choice or delicate flowers.

The *Pratias* grow best in very sandy or gritty and exceedingly well-drained soil, with plenty of water in spring and summer, and comparative rest in winter. When succeeding these *Pratias* form charming little carpets of neat, small leaves, and are adorned with tiny Lobelia-shaped flowers in summer, followed by small berries containing the seeds.

The best garden species are *P. angulata*, *P. perpusilla* and *P. ilicifolia*, which have white and lilac flowers. The others are negligible, with the possible exception of *P. macrodon*, recorded, but not, I fear, obtainable, at least I have never seen it offered by nurserymen. It has yellow flowers, and would, I am confident, be sought

FIG. 117.—BEES TRAPPED AND KILLED BY FLOWERS OF *PHYSIANTHUS ALBENS*.

rockery. The flowering stems are herbaceous, dying away completely every year, leaving only the evergreen radical leaves. The odour of the flowers and that of the subterranean parts is rather disagreeable in the fresh state, but when dried the plant becomes agreeably aromatic. It is a rather rare plant in France, occurring on the hills, in woods and in mountainous districts of Savoie, Dauphiné, Jura and Bourgogne. It also occurs in Jura and the canton of Grisons, in Switzerland, and in the south-west of Asia. *J. P.*

### PRATIA.

It is difficult for the enthusiast in alpine flowers to forget the pleasure he receives on first seeing a good plant of any of the *Pratias*, charming alpine plants from the Himalayas and New Zealand. If any reader comes across one in bloom let him take time to look at it and admire it. It will not be too often that he will have the opportunity, for, truth to tell, the *Pratias* are not frequently grown, as many folks find that they require some care in winter, and that they are liable to be lost at that season. It is useful to cover them with a sheet of glass, a slate, or a thin board, raised about 6 inches above the plants from October until March or April; or, otherwise, to pot up a plant or two and put them under glass. The latter is a more

after by growers of alpine plants if it were offered by the trade. It should be fairly hardy, coming as it does from the alpine regions of the South Island of New Zealand. *S. Arnott*.

## PHYSIANTHUS ALBENS.

The Brazilian Bladder flower is a quick growing and free flowering plant, and a most interesting subject for growing on walls in favoured localities. Bees, moths, and flies are attracted to the pink or white flowers in great numbers, and in many instances held captive, the imprisonment finally proving fatal, owing to a part of the flower closing around its victim and eventually strangling it. The illustration in Fig. 117 shows several blooms gathered in these gardens with dead bees in them.

The fruit, which is freely produced, is somewhat similar in shape and size to that of the Cocoa tree. The plant is propagated either by seeds or cuttings inserted in late spring or early summer. The plant here, which is about six years old, has been once cut down to the ground by frost; it is about 30 feet high. *W. H. Housess, Walthampton Gardens, Lymington, Hants.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Bulbophyllum and Cirrhopetalum.**—These genera include some of the most extraordinary of all flowers, and their blooms always attract attention. In addition to their remarkable structure some claim attention for their wonderful colouring. These plants are usually classed as botanical Orchids, and much pleasure is derived from the cultivation of these fascinating and peculiar plants. In certain cases their growth is somewhat slow, yet they must not be classed among the difficult Orchids, provided they are not coddled and suitable quarters are provided for them. The plants require careful attention to details, and by close observation the cultivator will soon learn their requirements, and anticipate their wants. Their season of growth is practically the year round, but a beneficial rest may be given them by keeping them on the dry side after their growth is completed and until they start into growth again. At the present time *Bulbophyllum virescens*, *B. Ericssonii*, *B. grandiflorum*, *B. Dearei*, and *B. Lobbii* are all growing freely in the warm-house. Although these plants are all shade-loving, especially during the brighter portions of the year, at this season they will be benefited considerably by being placed in a light position. *Cirrhopetalum appendiculatum*, *C. Medusae*, *C. Cumingii*, *C. refractum*, *C. retusiusculum*, and others, with *Bulbophyllum Dayanum* may be grown in a corner of the *Cattleya* house. The three first named are now active, and although they do not need copious supplies of water at any season, they should not be allowed to remain dry for any considerable length of time.

**Potting.**—The most suitable time for potting these Orchids is when new roots are developing from the last made pseudo-bulbs. The time of year does not make much difference, provided the compost is kept on the dry side until the new roots have entered it freely. A mixture of fibrous peat, AI fibre, and Sphagnum moss, in equal parts, is suitable for them. Being in most cases surface rooting plants, there is nothing gained by giving much depth of material, and the receptacles should be half filled with drainage materials. Small pans, which may be suspended, are the best receptacles for the smaller growers. Those with a long rhizome, such as *B. virescens*, or *B. Ericssonii*, are best placed at the back part of the receptacle to allow the leading growth ample room to develop, and root into the new material.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. Vicarary Grass, Aldenham House, Hertfordshire.

**Winter Protection.**—Early frosts have already occurred in most districts, and again it is necessary to emphasise the need for the protection of tender plants. In the herbaceous borders such subjects as *Kniphofias* and *Montbretias* should, where they are left in position throughout the winter, be protected as previously advised. By the water Gunneras will require trimming, and the crowns protected by matting. Very tender subjects should either be lifted and potted, and given the protection of frames or if this is not possible protected well with ashes piled around the roots, and the tender stems bound round with hay bands. Even in the Rose garden some of the more delicate growers should be protected from severe frosts by inserting branches of Yew or similar evergreens around them.

**Border Chrysanthemums.**—These plants are hardy and may safely be left in the open ground in many places, if desired, through the winter; but our practice is to lift them annually, placing the roots in boxes of a convenient size with sufficient soil to cover them, and winter them in

a cold frame. By this method we are able to obtain a good supply of material for propagating, in the early months of the year, utilising for this purpose the healthy, young growths that are produced in early spring, after which, the old plants are split up, if necessary, and replanted in the open. Air should be freely admitted to the frames on fine days, removing the lights altogether when considered advisable, but they should be placed on again at night, so that the plants do not get frozen, otherwise the supplies of young material for propagating may not be produced. When lifting the plants care should be taken to see that the labels are attached.

**Christmas Roses.**—*Hellebores* growing in the open should have attention occasionally, and be protected by some means when near their flowering period, to ensure good, clean flowers for decorative purposes. This protection may take the form of covering the plant with a hand-light or a sheet of glass of sufficient size to

FIG. 118.—*LISTRSTACHYS BROWNII* (see p. 295).

prevent rains splashing the flowers with soil. *Hellebores* may easily be forced in a cold frame. Plants that are not too forward should be selected for the purpose, lifted carefully without too much root disturbance, placed in the frame, and bedded in a good layer of leaf-mould. Place the lights in position on the frames, and beyond occasional airings on fine days, and preventing the plants becoming too dry at the roots, little attention will be required.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NAIL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Perpetual-Flowering Carnation.**—The Perpetual-Flowering Carnation is one of the most desirable plants to cultivate, and with ordinary treatment will furnish a wealth of bloom during the winter. Another good point in its favour is that the flowers last well in water when cut. At this time of the year a little extra care is needed in watering and feeding the plants. Although I recommend careful watering, the roots should never be allowed to become dust dry before water is applied, or the blooms will suffer. Admit air both day and night whenever the outside conditions will allow, and maintain sufficient warmth in the pipes to dry up exces-

sive moisture. Weak soot water may be given to the roots frequently, provided the receptacles are well filled with them. An occasional sprinkling with a suitable Carnation manure will greatly assist in the development of the flowers, but for the next two months care should be taken to prevent excessive feeding of the plants. A minimum temperature of 50° is sufficient, but rather than cause too dry an atmosphere by excessive heating of the pipes during times of severe frost, the temperature may be allowed to fall to 46°.

**Propagation.**—Perhaps the best time to propagate these Carnations is during the next three months, as good cuttings become available. The choice of suitable cuttings is an important detail, and they should be taken from healthy plants only. The young growths should be about 3 inches in length and taken from the central part of the stems, as those taken too near to the flower bud generally fail to make good, stocky specimens. The compost for the cuttings may consist of equal parts of loam, leaf-mould, and silver sand; some growers recommend rooting them in clear sand. Insert the cuttings firmly in small pots five or six around the edge of the receptacle, and water them in with a fine rose can. Afterwards place them in a light position in a propagating frame with a temperature of 55° where they will soon root. Very little air is needed beyond removing the sash each morning and wiping off the condensed moisture by means of a sponge. This is an important detail, for if the sash is not removed for several days the cuttings will probably be found to damp off. Cuttings inserted at this season of the year will root in from four to five weeks. When rooted they should be stood near the roof glass in a house having a minimum temperature of 50°.

### THE KITCHEN GARDEN

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Jerusalem Artichokes.**—The stems of these plants should now be cut to within a foot of the ground, the crop lifted, and the largest and best-shaped tubers picked out and stored in sand in a cool shed, or clamped in pits in the open. The small tubers should be selected for planting next year.

**Onions.**—Owing to the unfavourable season this crop is late, but Onions which have been dried and ripened on frames should now be fit for storing in a dry place where the frost cannot reach them. It is essential that the bulbs be perfectly dry before storing them, otherwise they will not keep. Where room is scarce they may be tied in ropes and hung from the rafters of a roof.

**Salsify and Scorzonera.**—These crops should be lifted and stored in sand. The tops should be trimmed to within a few inches of the crown, but the small roots should not be trimmed off until they are wanted. The roots may be left in the ground, but it is best to lift at least a portion of the crop in case frosty weather makes the ground too hard for digging.

**Seasonable Work.**—The present is a suitable time to undertake extensions in the kitchen garden, renewing paths, and draining soil where it is required. In frosty weather all old garden refuse should be burnt, and the ash carefully preserved for use next season.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor Lingfield, Surrey.

**Pot Strawberries.**—The most important need of these plants is safe storing for the winter. As the crowns have not ripened well, a number of growers will feel inclined to delay the operation of plunging until autumn weather gives way to decided winter. This work, however, should be done now, and if the pots are plunged in the open the crowns may still have full exposure to the air. Single boards placed on their edges, back and front, will form a plunging pit, and the boards may be kept in position by short stakes driven into the ground. The stakes

should be a foot above the beads to serve a second purpose of carrying the protecting material when severe weather sets in. Good drainage is necessary; if the winter proves thoroughly wet the plants will then take no harm when plunged in ashes. The worst of all methods is piling the pots on their sides, as the balls of earth and roots will, in due course, become dry, and pot Strawberries should never suffer for want of water.

**The Orchard House.**—If very early forcing of the trees in orchard houses is contemplated, the compartment usually devoted to this work should now be cleansed, as the time for placing the trees in position will soon arrive. In selecting Peaches and Nectarines for starting next month, choose trees of early varieties that are well set with buds and the wood thoroughly ripened. Duke of York, James Walker and Duchess of Cornwall are good early Peaches suitable for forcing, and Cardinal and Early Rivers reliable Nectarines. When each tree has been carefully cleansed, the requisite number may be taken indoors and placed in position ready for starting. The heads of the trees should be kept well up to the light, with plenty of room for the full development of summer growth. Mild bottom-heat is a great advantage, and if the trees are stood on inverted pots, fermenting leaves may be worked amongst the pedestals.

**Pruning.**—If the trees were disbudded carefully in the spring and all superfluous shoots removed after the crop was gathered, they will require but very little pruning now. They should, however, be examined, as some of the strong shoots may need to be cut back to the triple buds, a matter of 12 inches from their origin, whilst others may require harder pruning to ensure a succession of young growths for another year. The leaders, too, may require shortening; an experienced person will shorten each shoot to a nicety, but those who lack confidence will act wisely in deferring the pruning until there can be no question as to the position of the wood buds, one of which must be left at the point of each shoot.

#### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Root-pruning.**—Advantage should be taken of favourable weather to carry out the work of root-pruning and lifting young, strong growing trees bodily and relaying their roots in suitable soil. Very old trees that have failed to produce satisfactory crops of fruits, with roots in a cold, clayey subsoil should be attended to at once, and if the work of root-pruning is carried out judiciously good results will follow. Take out a deep trench several feet from the stem and then gradually fork out the soil from amongst the roots, severing those that are growing in a downward direction. Put the drainage in proper order, trim the damaged tips of the roots, and relay the latter in fresh, sweet suitable compost. Place a mulching of strawy manure over the roots for the winter. Very large trees may be root-pruned on two occasions, completing one-half of the work at a time.

**Young Trees.**—Very strong-growing, young trees should be lifted bodily out of the soil and replanted afresh. If the soil is good only a very little fresh compost in which to relay the roots need be added. Young Peach, Nectarine, Plum and Cherry trees that have grown too strongly should be lifted two years after they have been planted, to check the roots. After this has been done the wood produced annually will be more sturdy and fruitful, and quite young trees will bear good average crops of the best quality.

**Planting Young Trees.**—All kinds of fruit trees may be planted forthwith, and the work should not be delayed. Do not bury the roots and stems too deeply, for deep planting is most detrimental to the welfare of the future heads. In some soils it is necessary to plant on mounds a little higher than the surrounding soil.

### SOME UGANDA ORCHIDS.

(Concluded from page 265.)

#### A SHADE LOVER.

THE interesting *Eulophia ugandae* is the only terrestrial species I shall mention which is a shade lover. It is found on the floor of the wettest and densest forest. It was sent by the writer to Sir Trevor Lawrence, who flowered it. Its flowers are blue and insignificant, but the habit of the plant is peculiar. The new pseudobulbs are produced not at the base of the old one, but at some distance up, and often near the top. The new bulb then sends down one thick root to the ground. A plant several years old has thus increased its height considerably and raised itself out of its wet surroundings. Mr. Rolfe described the habit as resembling that of a Mangrove. An old plant with its several aerial roots would surely be taken for an epiphytic species, were its peculiar habit not known.

I now come to the epiphytic section of Orchids.

#### ANGRAECUM.

*Angraecum infundibulare* is the largest flowered species of the genus; in fact, of all

Orchid house exactly as received, and in 1909 a cultural certificate was awarded for the plants at the R.H.S. hall. In nature the plant gets practically no rooting material. In cultivation it grew equally well without it.

*A. Rothschildianum* is a pretty Orchid that seems rather scarce in its wild state, and I have never been fortunate enough to find it in flower, although I flowered it in my garden. The plant is small in growth. The racemes of flowers are about 6 inches long, and bear about six flowers each. These are white with a dark, almost black, blotch at the base of the lip. They are about 3 inches across, and have a rather pleasant smell. It is a shade lover.

#### LISTROSTACHYS.

*Listrostachys fimbriata*, the commonest epiphytic plant in Uganda, is a giant among Orchids. The growths extend to 9 feet in length, and single plants are as much as a man can lift. It is a sun lover, and I have seen it growing luxuriantly on almost dead trees that gave no shade at all. The leaves are long and narrow, and in texture almost like an Agave leaf. The unbranched racemes of flowers hang down to a length of 2 feet, and are produced at every leaf. They bear each a hundred or two of smallish white flowers. It is a

FIG. 119.—POLYSTACHYA SP. WITH BRIGHT YELLOW FLOWERS.

the Uganda Orchids. A good flower has a funnel over 4 inches long, and 3 inches across the lip. This is purest white, the rest of the flower being white, tinted green. The spur is 4 inches long, and grips a growth or a leaf to support the flower.

It is shade-loving. The growths run to many feet in length. Some of the finest clumps I have seen were growing over stone boulders in a forest. It appears to flower much more abundantly in some years than others, and seems to be a plant which should hang in the shadiest part of the Orchid house, and its growths be allowed to extend as they wish. Any attempt at keeping the growths short or in an upright condition would probably hinder flowering.

*A. Kotschy* is the prettiest by far of the Uganda Orchids, and apparently very free-flowering. It should be in every Orchid collection on account of its ornamental value. It grows only on trees providing a very light shade. The scanty foliage of the *Mimesa* just breaks the fierceness of the sun, and it is generally found on that tree. It has no pseudobulb and very little stem; its growths being similar to those of *Phalaenopsis*. The flowers are produced in slender racemes about 2 feet long. They are a pretty pale pink in colour, about 2 inches across, and have a long spur.

In 1908 I sent a consignment of plants attached to the branches on which they were growing to Sir Trevor Lawrence. Following my suggestion, he had them hung up in an

handsome plant when in flower. Cultivators should remember it grows to a very large size without any compost. The Succulent House at Kew seems a likely place in which to grow it.

*L. Whytei* is another sun loving epiphyte. It grows to about half the size of *L. fimbriata*, and its flower racemes are shorter. The flowers are less numerous but much larger, and they are pure white in colour, with long spurs.

*L. Brownii* (Fig. 118) a pretty species, was found by the writer in 1907. It grows in dense shade. The growths are 8 inches long, leaves small, fleshy and closely packed. The flowers are pure white and very sweetly scented. The illustration shows the plant half natural size.

*L. Montroei* is a large-growing species and a shade lover. The growths reach 6 feet in length, but are mere slender than those of *L. fimbriata*. The leaves are short, wide, and not succulent. The flower spikes are short and numerous. The flowers are white, changing to yellow and orange later. It is a showy plant when in flower, and was bloomed by Sir Trevor Lawrence in 1914.

#### POLYSTACHYA.

The genus *Polystachya* has many species in Uganda, and most of them are unnamed; an unidentified species is illustrated in Fig. 119. *Polystachya paniculata* is remarkable for its orange red flowers. The spike is branched, and contains thousands of tiny flowers crowded closely together. It has bloomed in several collections in this country, and was much admired. It is a shade-loving plant. *B. Brown*.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements, should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

## CHOICE INDOOR FLOWERING PLANTS.

MANY choice flowering plants that were great favourites thirty and forty years ago for the decoration of conservatories and floral exhibitions are almost lost to cultivation. The fashion in flowers, as in many other things, has greatly changed, and many fine flowering plants that were cultivated and admired in former days are almost forgotten. Those named in this note are all worthy of cultivation.

*Luculia gratissima* is a very beautiful plant with large heads of sweet scented, pink flowers produced throughout the autumn. It will flower freely when quite small. This plant is easily cultivated, but unfortunately it is seldom met with in ordinary collections of warm conservatory plants. It requires an intermediate house temperature of about 50° to 55° in winter, and is most suitable for planting out for training up a pillar, or for covering the back wall of the house. It thrives and grows more freely planted out than when grown in a pot. The soil most suited to this *Luculia* is a mixture of equal parts light, turfy loam and fibrous peat, or leaf mould, with silver sand added. Pieces of charcoal, broken potsherds, or brick rubble form a valuable addition to the compost for planting. Cuttings made from well ripened shoots in June, inserted singly in small pots in sandy soil, and placed in a frame or handlight, with a moderately moist atmosphere, will root readily if not allowed to flag. When rooted the young plants should be gradually hardened off, then potted on, and given a good position in an intermediate house. They should be shaded from bright sun, and syringed lightly two or three times during the day and when weather permits. During the winter the plants should be kept moderately dry at the roots with just sufficient water to keep them growing. The plant requires to be potted firmly, for this encourages sturdy, steady growth. When the *Luculia* has finished flowering the growth may be moderately shortened, and, after resting throughout the winter, restarted again in the spring by giving more water to encourage fresh growth. Syringing with clear water will generally suffice to keep down attacks of insects, such as red spider and thrip.

*Medinilla magnifica* is a remarkable stove evergreen shrub bearing numerous trusses of pink flowers that last a very long time on the plant. The trusses are produced in a dense, drooping panicle 1 foot or more in length, and their beauty is greatly enhanced by the large, delicately coloured bracts, which are at their best before the full perfection of the flowers, when the large imbricated bracts separate and allow the buds to be partially seen. As the blossoms expand the upper bracts fall, but the

lower ones remain and reflex. It is one of the most attractive of stove plants, and is invaluable as an exhibition plant or for conservatory decoration. It flowers freely in a small state, or may be grown as large specimens with 18 to 24 drooping panicles in flower at the same time. The plant is easy to cultivate, merely requiring a moist atmosphere and a temperature of about 55° in winter, and from 60° to 70° in summer. Cuttings made from side shoots produced from stock plants root best, but cuttings from half-ripened young shoots will root freely if they are kept free from damp in sandy soil and placed in a moist bottom heat under a hand light or frame, with the temperature of about 70° to 75°. The compost should consist of two-thirds rich turfy loam, and one-third fibrous peat, or leaf mould lightened with silver sand. Other species that are very interesting are *M. amabilis* (syn. *M. Teymannii*), with rose-coloured flowers, and *M. Curtii*, with ivory-white flowers, purple anthers, and coral-red flower-stalks, a very distinct species, and of a graceful habit.

*Amasonia punicea* (syn. *A. calycina*) is without exception one of the most beautiful of stove flowering plants. It is of great value on account of the brilliantly-coloured bracts, which are richest vermilion-crimson, like the bracts of a *Poinsettia*. They are arranged in pairs along the entire length of the racemes, and about 4 inches long; they are very persistent, remaining in perfection for two or three months. From the base of each bract are produced pendulous, tubular, creamy-white flowers, offering a pleasing contrast to the rich colouring of the other parts of the inflorescence. The plant commences to flower in September, and after flowering should be kept moderately dry at the roots until the spring. Cuttings of half-ripened wood root freely in gentle bottom heat, or a stock may be raised from seed. The winter temperature should be 55°, and the summer temperature 60° to 70°. The soil should consist of a mixture of rich turfy loam, peat, or leaf mould in equal parts, with silver sand.

*Gloneria jasminiflora* is a very compact, free flowering, evergreen, warm-house shrub, bearing a profusion of pure white trusses of flower, on every branch, the blooms being invaluable for the making of wreaths and sprays. This species should be included in every collection of warm-house plants, and is most suitable for growing in an ordinary small glasshouse or conservatory on account of its dwarf, compact, bushy and free-flowering habit. Cuttings of ripened shoots root freely in sandy soil in moist bottom heat under a hand light, or frame. The summer temperature should be 60° to 70°, and the winter temperature 55°. The soil should consist of two-thirds light loam, and one-third fibrous peat, or leaf mould with sand added. It is necessary to shade this plant from bright sunshine in summer.

*Reinwardtia tetragyna* is a pretty, free-flowering plant, in habit very much resembling *Linum trigynum*, but a great improvement on that species, both in foliage and flower. The flowers are of a richer and deeper colour, and fully 1½ inch in diameter; the individual flowers are of short duration, but there is a continual succession over several weeks during the winter. It is a plant of easy culture, and a most attractive subject for the decoration of the warm conservatory. Cuttings root freely in a warm, close frame, in spring and early summer.

The *Franciseas* (*Brumfelsias*) are most beautiful and free-flowering evergreen shrubs suitable for any ordinary warm stove, and remaining in flower for several months in the spring and summer. The light and dark blue varieties, with their bright green foliage and compact habit, are very handsome. The following species are amongst the best for gardens:—*F. confertiflora*, soft blue; *F. calycina major*, large pale blue; *F. calycina floribunda*, a charming plant with mauve flowers, nearly always in flower; *F. Hoopiana*, purplish blue, with a yellow throat; *F. acuminata*, purple; and *F. eximia*, purplish blue. Cuttings of these plants root freely in sandy soil, placed in moist heat. Care must be taken not to over-pot them, and the pots should be furnished with plenty of drainage material. *John Neal, F.M.H.*

## MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.\*

## No. II.—FIRE AND CIVIL WAR.

We left T'eng-yueh on March 9, following the main road to Ta-li. I had hoped to go by a different route, but time would not allow of side-shows; it was now necessary to make straight for the scene of main action.

Just ten years have elapsed since I first passed this way, and though it is by this time fairly familiar to me, yet the Yunnan road always holds surprises, as the day does unexpected incidents.

*Primula pseudodenticulata* (?) was the first flower encountered. It grows on the open, grassy downs above the Shivel, and also well sheltered and shaded spots on shrub-led banks at the summit of the Salween divide. It grows further west, too, on the Burma frontier, seven to ten thousand feet being about its range. Plants growing on the open, wind-swept downs are naturally smaller and more compact than those found in sheltered situations. It is a pretty little species, but nothing very special. It fulfils its destiny on these scorched and wind-swept uplands, forming drifts of sweet colour in the brown grass. In England it could never delight us in quite the same way.

*Rhododendron Delavayi* next demanded attention. On every range from T'eng-yueh to Ta-li it was flaming into flower. To see it at its best it needs to be seen in the early morning or late afternoon, with the sunlight slanting through the flowers, and darkness behind. Perhaps it was a hush of *R. Delavayi* that attracted the attention of Moses on a certain occasion, when he turned aside to study the phenomenon more closely; but the plant does not grow in India to this day.

It is a variable species. Some forms have the inside of the corolla pencilled all over with grey black markings, which in others is lacking. Again, the usual type is a compact truss of deep crimson flowers, pressed closely together so that the corolla comes to be more or less tubular in shape; but in some specimens met with the truss is more elongated and looser, the corollas, in consequence of greater freedom, are larger, the limb more expanded, and the colour tending to carmine rather than crimson. The fruit trees were now all swathed in blossom, Apple, Almond and Peach. Every village loomed through a mist of white or pink petals, floating on the breeze. Ahead, the many-toned, green wall of the Salween divide was chequered with the deeper pink of Cherry blossom.

Surely nowhere else in all China is there anything quite like this Salween divide, for over five degrees of latitude it bestrides the frontier, presenting a rampart of impenetrable forest, semi-tropical below, temperate above. *Rhododendron*, *Oak*, *Magnolia*, *China*, *Bucklandia*, and a hundred more genera contribute to its rich confusion. And away up north, where the mountains are highest, it is virgin soil! In the trough of the valley *Bauhinia variegata*, as yet leafless, pervaded the air with its fragrance, and bushes of an *Acanthad* with pale, yawning flowers, lined the path.

After we had crossed the river, the sun swam down in mist behind the lofty peaks, and the valley was filled with violet shadows. Going up towards the Yung-Ch'ang plain by an excruciating road, the hedges were brightened by the tall lemon yellow pyramids of *Caesalpinia nepalensis*. Thereafter we got on to the first patch of limestone, which is such a feature of the country from Ta-li northwards. The Opium Poppies were small here, as though starved in the somewhat sterile soil; but in another month even the Yung-ch'ang plain itself would be an amazing bottle-green sea of foam-capped waves!

Descending from the range, the view of the plain, gripped between long, groin-like spurs, was charming. The clouds cast purple shadows on waving wheat fields, emerald green where they caught a glance from the sun; but the

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 22, May 6, May 20, June 3, June 17, July 1, July 15, July 22, August 5, August 26, September 9, September 23, October 7, October 21, and November 4, 1922.

foreground was striped with the colder green of Poppies and Beans. Beyond rose the indigo mountains, dimly outlined in the haze.

After Yung-ch'ang, the Mekong gorge. There was nothing much here except banks of *Ceratostigma Griffithii*, which boasts as clean and pure a blue as any *Gentian*. But, despite its wide distribution in Sino-Himalaya, it appears to be a very stable plant, well satisfied with itself as it is, and therefore averse to experiments. Notwithstanding all its immense floral treasure, large areas of Yunnan are monotonous—scorched hills, clothed with long grass, with a thin fur of Pine woods clinging patchily higher up. Probably two-thirds of the total known number of species occur only above 10,000 feet.

For a couple of days after crossing the Mekong we saw nothing very striking, though many shrubs were in flower. Pink-flowered *Camellias*, their polished leaves glossy in the sunshine; another *Rhododendron*, with creamy white flowers speckled with purple; an untidy-looking *Buddleia* with small, pungent smelling flowers; hedges of white-whiskered *Capparis*; occasionally a ragged *Berberis* with large sessile heads of small

the gap in the Ta-li range, where the torrent pours down from the lake above. Fields of Poppy and Beans everywhere, with miniature thickets of *Primula malacoides*; and then, as we approached Hsia-kuan, rumours of war.

As we went up the ravine, came the first rain for two months; the crops at Ta-li are suffering from shortage of water, though the lake lies there, cool and tranquil, at the gates of the city, so to speak. But that is not the worst of the story. On March 21, the day we reached Hsia-kuan, at the foot of the lake, a disastrous fire broke out in Ta-li, only ten miles distant. Hundreds of houses were reported to be destroyed. And everyone asks with a sinking heart, "What will happen next?" All the soldiers are gone; at any time the brigands may sweep down on the defenceless city. And away in the east, drawing ever nearer the capital, civil war rages. Anxious times!

But despite fire and drought, brigandage and civil war, the flowers bloom in Yunnan as of yore. Near by grows a bush of *Rhododendron* smothered in scented flowers, milk white with a streak of lemon yellow on the upper petal.

Paquin, Capt. Fox, Undaunted, and Ami Paul L'Abbé. A large space in front was covered with soft green moss, and at intervals were arranged large circular groups of pot plants bearing some fine exhibition blooms of a high excellence in culture. We specially noted Mrs. Alg. Davis, Wm. Mease, Paul Oudot, Mrs. G. Monro, Undaunted, Majestic, Mrs. G. Drabble, Edith Cavell, Salonica and Mrs. Chichester. As a whole, it was a magnificent and original display of a high order of merit, to which the jury very properly awarded a *Prix d'Honneur*.

Madame Veuve Martin is to-day the leading *Chrysanthemum* seedling raiser in France, and her exhibit strongly reminded me of the pre-war days when Ernest Calvat carried all before him. Her novelties were awarded twelve *First-Class Certificates*. They were of the Japanese type, big, solid-looking blooms named *Secrétaire Maurice Lhuile*, *Chrysanthémiste Violeté*, *Pékin*, *Chrysanthémiste Chantrait*, *Dr. Dauchelle*, *Belle Hélène*, *M. Ph. Rivoire*, *Gaston Colin*, *Madeleine Debrie*, *Zika*, *Mme. Clémence*, *Jeanne d'Arc*.

FIG. 120.—M. TRUFFAUT'S EXHIBIT OF CHRYSANTHEMUMS AT THE PARIS SHOW.

flowers, tightly packed, brilliant gamboge in colour and very fragrant; these and many more filled the high valleys. And then we stepped down in the locus classicus of *Primula malacoides*, and learnt a lesson in plant variation as an effect of environment.

After that, by the poor little Shun-pi river, came Oak woods of a delicious pale, silky green, fresh as the morning. They were in vivid contrast to the melancholy Pine woods which darkened the hot south slopes. Youth and age they represented. Sometimes the two were woven into a mosaic.

The wind in the Pines! How it recalls home! The daintily clad Oaks tremble and dance in the zephyr breeze, but the fretting Pines shudder and sigh deeply.

March 19 was like the first young day of summer in England—an early summer in May. The air was filled with lazy sounds, the pleasant hum of bees, the cooing of doves, the cry of a pheasant. Every breath of wind was charged with the sweet perfume of Jasmine. Roses were in flower everywhere, bushes of Roses, hedges lined with Roses, Roses sweeping in cataracts of blossom from the tree top. Straight before us, just across the valley, the Ta-li range lifted its bulk to clasp the clouds.

Then the march down the Yang-hi river to

The whorled leaves and the curious beaked capsule, opening by slits in the bulging centre, the valves remaining attached at base and apex. identify it. *F. Kingdon Ward*.

## NOTES FROM THE PARIS AUTUMN SHOW.

LAST year *The Gardeners' Chronicle* published an illustration of a typical exhibit of the famous French firm of Vilmorin, Andrieux and Co., such as they usually put up in Paris and other great horticultural centres. This year attention is drawn to a remarkably imposing exhibit from M. Georges Truffaut, of Versailles. Although both these exhibits were of *Chrysanthemums*, the difference in their installation was enormous.

As the illustration shows (Fig. 120), M. Truffaut's display consisted of five huge columns of large blooms about 15 feet in height. In the middle column, which was composed entirely of the variety *W. Turner*, there were 200 blooms. The other columns were built up of about 150 blooms. They were all pot plants, carrying a single bloom, and arranged on a stand to carry them. The varieties in the column each side of *W. Turner* were *Mme.*

Beyond these I also noted *Louis Cornu*, a large yellow; *Reine de Beauté*, a very large flower of a lovely shade of pale lilac pink or amaranth, and *Ceres*, grooved florets, a rich shade of ochre yellow. A *Prix d'Honneur* was awarded.

A most striking and beautifully arranged exhibit came from M. Paul Féron. I should like to see it repeated by an exhibitor at the N.C.S. On a square plot of ground, edged with turf and filled in with rich autumn foliage, were set out at intervals large vases full of monster blooms. In the middle a tall porcelain pedestal supported an enormous bowl containing about thirty of the biggest blooms of Mrs. R. C. Pulling I ever saw. Then some vases containing six to twelve blooms of one variety each, as *Ami Paul L'Abbé*, *Undaunted*, *Daily Mail* and *Mrs. G. Drabble*. In the mixed vases were *Edith Cavell*, *Mme. J. Paquin* (golden chestnut), *Armistice*, *Capt. Fox*, and more of those previously named. Some dainty little vases, with a single bloom in each, completed this very choice exhibit. A *Prix d'Honneur* was also awarded to this exhibitor.

It is unfortunate that, the night before the show opened, a sharp frost caught the author

ties napping and inflicted much damage, the Begonias and Chrysanthemums both suffering severely. Coke brasiers were stood about at intervals to prevent further damage.

M. Leloup-Grimoux staged a most comprehensive collection on each side of the path at the entrance leading to the main building. The frost served him very unkindly, but we noted some fine specimens of Edith Cavell, Majestic, Viscount Chinda, Mrs. Algernon Davis, Queen Mary, Peace, Salonica, Louisa Pockett, W. Rigby, W. Turner, Gen. Pétain, Victory, Yellow W. Turner, Undaunted, Mrs. R. C. Pulling, and scores of others, for which he also received a Prix d'Honneur.

Quite standing by itself for variety and decorative effect was the corner group of singles shown by the Maison Féard. A Prix d'Honneur was awarded.

There were many other fine Chrysanthemum exhibits. M. Laveau staged Daily Mail, Mrs. G. Drabble, Reg. Vallis, His Majesty, and others in fine form.

During a tour of the show it was manifest that in most of the groups (for at a French show there are no classes for 6, 12, 24, and 36 cut blooms on boards or in vases as with us) the superiority of modern English seedlings was beyond question. Everywhere I found in fine form such varieties as Mrs. R. C. Pulling, W. Rigby, Capt. Fox, Undaunted, Louisa Pockett, W. Turner, Mrs. G. Drabble, His Majesty, Daily Mail, Reg. Vallis, Queen Mary, Edith Cavell, Victory, and many others of similar quality.

Some excellent French varieties that might well be added to English collections are Mme. J. Paquin, Ami Paul L'Abbé, Ami Ph. Rivoire, Ville de Phénicie, Ville de St. Germain, Henri Lemaire.

Of the other flowers, Orchids, Carnations, Cyclamen, Begonias, Dahlias, exhibited in quantity, I need add nothing to the report already published (p. 288). The fruit and vegetables shown in abundance by the most famous French cultivators were remarkably fine, and the whole show seemed to promise a speedy return to the beautiful exhibitions of the National Horticultural Society of France, which in pre-war days were held on that very desirable site, the Cours-la-Reine. *C. Harman Payne.*

## DO PLANTS REASON?

THROUGH the patient accumulation of facts during many generations, naturalists have brought together a mass of material bearing on this problem. It was customary in other days to deny reason to plants and animals, reserving it entirely for man. Then men came grudgingly to admit that such highly developed creatures as a dog, horse or elephant might sometimes show traces of reasoning powers. Now we are discussing the possible possession of mental powers by plants.

I was first led to speculate on the subject by a little incident that occurred to me in the Malay Archipelago—a field rendered classical by the researches of Wallace and many others. Climbing a hill one day to see a priest officiating at the temple on its crest, I observed that the "grass" made obeisance to me. This was something new, and I recalled Joseph and his sheaves. But on bending down to observe the reason, I found it was not reverence for me, but fear of my heavy foot, which caused the movement. The sward was composed of *Mimosa*, and the sensitive plant was telegraphing the message to all its neighbours to seek such protection as they could from the danger of being crushed and injured. Is this the instinct of self-preservation? Is it instinct or reason; if not, by what name shall we call it?

Many years ago, before gardeners and biologists had learned how extensive is the habit among plants of cultivating a friendly spirit of co-operation, an Orchid grower remarked to me that it was necessary, in order to grow Orchids successfully from seed, to sow in soil which had already produced Orchids, and not in virgin mould. "The fact is (he said), Orchids seem

to need sympathy." What was the explanation? Every student of plant life now knows the meaning of symbiosis. There are many plants, alike wild and cultivated, which cannot grow except in partnership with others. It may be that what is required is the mycelium of some lowly fungus, which is able in some wonderful way to assist the larger or nobler form to come to perfection. Is not this again an illustration of my theme, and an indication either of instinct or of the power to reason out a problem?

Everyone who has spent time on the study of the so-called insectivorous plants must have been amazed at the selective power some of them display. There is no more fascinating subject for study and experiment than our own native Sundew, especially the common, round-leaved form. If it is fed with little snippets of raw meat, or if it is visited by an insect, the glands secrete their viscid fluid, and the digestive organs set to work. But the tentacles do not respond to dust, grit, or bits of inorganic material which will not serve as food. Here we have the power to choose, the faculty of selection. It looks less like instinct and more like reason.

It is not necessary to discuss experiments carried out in the laboratory when there are so many field observations from which to draw. Nor need we here discuss those wonderful mechanical devices, possessed by such flowers as the Barberry, Orchids of different kinds, Vallisneria, and a host of others, by means of which cross-fertilisation is secured. Let us rather take one or two illustrations from the trees and plants of tropical lands, where the struggle for life is often fierce and intense, and all kinds of devices are employed for securing existence, even though it be at the expense of others. It has been said that there is no jealousy in Nature. Granted its truth, there is much that looks like the most terrible selfishness and arrogance, and the plants seem at times entirely absorbed with the questions: How can I use my powers to my own advantage; and how can I bring my neighbour to serve me? Here is the direct antithesis to symbiosis.

Look, for example, at a forest in which the growth is so dense that the roots cannot spread and give support to the trunk. As the tree grows, it finds the weight becoming excessive, and unless it can find a prop, it must sooner or later collapse. Now the roots come to the rescue, for they grow upwards and form aerial buttresses, which gather around the bole, leaving stall-like open spaces between themselves and the trunk, and thus recalling the flying buttresses which the builder flings out to sustain a high wall or top-heavy piece of masonry. It used to be said that roots grew downwards because of gravity. What law do they obey or defy when they grow upwards? And what is it that teaches the root to forsake its natural function for one so opposed to its nature? Has the tree reasoned the matter out, and solved the problem.

Every traveller in tropical lands is aware of the struggle for existence which is perpetually going on in sweltering forest, and moist morass. All the conditions conducive to excessive growth are present, and the only thing that is needed is room to grow. To save themselves from extinction, many plants become parasites, and to such an extreme do they carry this habit that they often kill their hosts, and so bring to an untimely end their own life-history. These parasites belong to a great variety of genera and orders, and a favourite method is to send out claspers, which surround the bole of the tree on which they intend to stay themselves, and thus afford them support. They often have the appearance of monstrous vegetable centipedes, whose legs embrace their host, and eventually strangle it. In the normal way, however, the death of the host does not ensue until the parasite has found a place for itself in the sun, and has flowered and set its fruit.

It would be difficult to find a more fascinating subject for contemplation, and one has only to turn to the pages of those Nature-loving travellers of a past generation, when everything of this kind possessed a novelty and freshness which fascinated the observer, to have that interest created anew. *H. F.*

## CASTLE KENNEDY.

THERE are, I presume, few places in Great Britain more attractive from a scenic or botanical point of view than Castle Kennedy, the proud possession of the Earl of Stair. In botanical attractiveness it has probably only two rivals in Scotland, viz., Logan and Monrieth, whose proprietors are earnest and devoted horticulturists.

One of the most memorable vistas of the place is what may be termed the eastern avenue, across the beautiful expanse of the White Loch; which, as I have often beheld it, under inspiring atmospheric conditions, is like a vast mirror, throbbing in the transfiguring radiance of the twilight, and inverting all the manifold charms of the enviroing scene. There is nothing in Scotland, so far as I have seen, to match the combined beauty and reposefulness of this sequestered region.

Lochinch Castle, the stately seat of the Earl of Stair, is seen in all its architectural and grandly scenic dignity, across the unruffled surface of the lake. Nearer still, encircled by woodlands and gardens, the magnificent ruin of Castle Kennedy, once the abode of one of the most powerful and most dreaded families in Scotland, seems to tower majestically out of the past, amid the most exquisite sylvan beauties that cluster around its base.

Another view of the most artistic character is that which is obtainable from the charming, miniature oval lake, whose environment is ennobled by a splendid affluence of Rhododendrons, Azaleas and Oriental Lilies (conspicuous among which is the great Himalayan *Lilium giganteum*), during the supremely attractive months of May and June. In "the Basin," as this lake-gem has been entitled through many generations, are planted varieties of *Nymphaea* *Mariaceae*. In no other region, so far as I have learned, have those superb aquatics ever found a fairer home. For there they are, in the language of Herbert Spencer, in perfect correspondence with their environment. No marvel that, to the inspired imagination of the lover of Nature, who experiences there a presence that "disturbs him with the joy of elevated thoughts," the ancient castle, from its serene heights of history, seems to look down lovingly, on such an artistic, incomparable scene! "The art itself is Nature," as Shakespeare would have said, that conceived such a picture, guarded on every side from adverse elements by gracious groves of Elms and Oaks, glorious *Araucarias*, forming stately, dense green avenues towards Lochinch Castle—like the transcendent nave of some august cathedral. Fragrant Hawthorns, and snowy-flowering Magnolias, render the deep charm of this scene irresistible in the summer twilight.

Lochinch Castle has a private flower garden of great fascination, arranged in two divisions: one of them fronting and adorning the mansion, the other creating autumnal radiance by its side. There are two extremely picturesque gardens also at Castle Kennedy, where Grapes, Nectarines, Peaches, Figs, Pears, Apples, and other fruits are grandly grown. One of these, which has the abiding charm of an old-world orchard, and would be notable if only for its splendid representative trees of Lane's Prince Albert Apple, is within the shadow of the venerable and majestic castle of the Kennedys, which towers above it.

It is in this romantic garden that the famous collection of *Lilium giganteum*—perhaps the most impressive in Great Britain—is grown. It is not essential that, in addition to recalling the fame, and emphasising the attractiveness, of the world-renowned Coniferous trees of Castle Kennedy, I should enumerate the fair flowers that adorn its domains, but two contrasted beauties in the grounds and gardens reign supreme: *Glearia* *Haastii*, much beloved by Sir Herbert Maxwell; and *Lobelia cardinalis*.

Mr. R. Findlay, the gardener, is to be congratulated on the condition of these beautiful gardens, which were allowed to fall into comparative decadence during the momentous period of the great war. *David R. Williamson.*

## VEGETABLES.

### THE POTATO CROP.

GROWERS of Potatoes in all parts of Great Britain have had exceptionally large crops, and it is estimated that the total yield this year exceeds that of 1921 by one million tons. As prices are so low, many growers will be compelled to clamp their tubers, for, if they were all placed on the market now, the returns would be even lower. In view of this, the Ministry of Agriculture has issued some useful hints on the clamping of Potatoes.

In arranging for clamping, the careful grower should see that his Potatoes are in a dry state and are as free from soil as possible, that they contain no injured or blighted tubers, nor any that have been frozen or flooded; if he is wise, he will also exclude immature or green tubers, both of which classes are likely to decay early in the clamp. A good plan is to clamp these doubtful and slightly injured tubers separately and use them earlier than the others. Large clamps tend to develop more heat than the smaller ones, and are, therefore, undesirable. In ordinary cases the base of the clamp should not exceed 7 feet in width, and great care should be taken to see that it is in a dry and well-drained spot. In making a clamp, pile up the Potatoes on the site, and straw them over thickly before hard frosts occur, and then earth them up. Only a thin layer of earth should be applied at first, and the apex left, for a time, without soil. It is a wise precaution, too, to examine them periodically in the course of the autumn and winter. If much disease or decay is found on any such occasion, it may be advisable to take the whole clamp down and reclamp. When heating is taking place, there is a choice between two methods of ventilation. The first is to make a series of ventilation holes about 1 foot square along the bottom on both sides of the clamp, and at the same time to open out the whole top ridge of the clamp. The bottom of the ventilation holes should be sloped so that the rain runs away from the clamp. The second method is to remove the soil from the side of the clamp in strips, 1 foot wide, extending from the ridge to the base on both sides of the clamp at distances of every 10 yards, or, on the south side only, at distances of 5 yards. The ridge of the clamp should also be opened out, but, if severe weather sets in, these ventilation spaces should be filled with straw.

## FRUIT REGISTER.

### APPLE THE MCCOY.

A REMARKABLY fine dish of The McCoy Apple was one of the exhibits at the monthly meeting of the Royal Caledonian Horticultural Society, held at Edinburgh on the 7th inst. This Apple received the honour of a First-Class Certificate on this occasion, and I think it is well worthy of that distinction. I have seen this variety several times this season, and it has always impressed me as a fruit of considerable merit. Its history is interesting. In the plantation of Mr. Hall Jones, a fruit-grower of Letchworth, there appeared, in 1916, on a normal tree of James Grieve, a branch which was bearing bright red fruits. Mr. Jones submitted fruits of this sport to several experts, all of whom advised him to make every effort to perpetuate it. Scions from this branch were worked in order to see if they would come true, and in 1918 the trees fruited and maintained the character of the sport. The McCoy is a replica of the famous James Grieve variety in everything but colour. I have tasted the fruits many times this autumn, and they have the pronounced and distinctive flavour of the parent variety. The fruits of The McCoy are almost wholly coloured with brilliant red, and are more richly endowed in this respect than Worcester Pearmain. The specimens shown at Edinburgh were particularly attractive, and were even more highly coloured than those exhibited by the raiser at Holland Park Hall in early October.

As an Apple James Grieve has one serious fault so far as commercial fruit growers are concerned, and that is its want of colour. The complaint is that the public will not look at it in the market, and prefer such high-coloured sorts as Worcester Pearmain. There are two forms of James Grieve in commerce. One, the true form—or what may be assumed to be the true form—is pale in colour and is thinly striped with red, but its flavour is excellent. The other has a much larger fruit—the two sorts are quite distinct in shape—and is not nearly so rich in flavour, but it attains a much higher colour. From the latter standpoint it is the most attractive fruit, and is in favour for exhibition purposes. I have often seen it shown in a class for James Grieve, and I cannot imagine how the judges cannot differentiate between the two sorts. The shape of the fruits should be sufficient demonstration that two distinct Apples are being grown under one name. It is my hope that the Wisley trials will prove that there are two sorts under the name of James Grieve.

FIG. 121.—CORDON PEAR TREES FRUITING IN AN ORCHARD HOUSE.

The McCoy is an Apple of wonderful colour and first-class flavour, and these attributes will be sufficient to make it a fruit of considerable popularity. It is interesting, too, from the fact that it is a bud variation and not a seedling. I may be wrong, but I believe it is the first authentic sport of this kind. *George M. Taylor, Edinburgh.*

[Mr. E. A. Buyard refers to the Red Bramley's Seedling and other coloured forms in his article on Variegated Fruits in *Gard. Chron.*, September 16, 1922, p. 168.—Eds.]

## DESSERT PEARS IN UNHEATED HOUSES.

SOME eight years ago I acquired a piece of land with about 800 ft. run of glasshouses on it and decided to fill these houses with cordon Pear trees, planted out and run up close under the glass. To utilise the floor space until the cordons had reached the top of the house I potted up some small pillar-shaped trees. I took the advice of a well-known nurseryman as to the selection of varieties, and after several experiments and some mistakes, have achieved a certain amount of success, as the illustration in Fig. 121 demonstrates.

My best houses run north and south; they are double-spans, with plenty of top ventilation. Bottom ventilation does not seem important; in fact, I seem to secure a better distribution of

blossom and fruit in the houses that have none. I expect the temperature is more even. A lean-to house against a south wall I found too hot, and so substituted Peaches for Pears in it.

My soil is clay, and I find the Pear trees do best where planted in borders bricked up a foot above the general level, and with plenty of brickbats put about 18 inches beneath the borders. We made up the borders with old turves from our heavy soil, mixed with a goodly supply of bonemeal, but manure was not added. Planting in such houses should be done in late autumn as I find their first summer under glass is a great trial to spring-planted trees.

To ensure cross-fertilisation I planted one side of one of the houses, alternately two Doyenné du Comice to one William's Bon Chrétien, and on the other side two Doyenné du Comice to one Durondeau. The flowers set well. In the photograph (Fig. 121) the house shown is filled entirely with trees of Doyenné du Comice, and to ensure cross-fertilisation, I stood on the floor of the house during the blossoming season about twenty little two-year-old plants of Josephine de

Malines, in pots, with the result that the trees of Doyenné du Comice set full crops.

I have tried and am still trying various Pears in cold houses, but the following, in order of ripening, I find do well.—1, Petite Marguerite, about 4 oz. weight each; 2, William's Bon Chrétien, 8 to 16 ozs. (Jules Guyot I do not think good enough for the purpose); 3, Marguerite Marillat, 8 to 16 ozs.; 4, Beurré Hardy, 8 to 10 ozs. Beurré d'Avalon, 8 to 16 ozs.; Princess, 5 to 18 ozs.; Conference, about 16 ozs.; 5, Doyenné du Comice, 8 to 24 ozs.; and 6, Josephine de Malines, 4 to 10 ozs.

In our unheated houses Durondeau has much of its blossom damaged by frost, so I would not recommend it. There may be many more first-rate sorts for a similar method of cultivation, but I have not discovered them yet.

As regards pruning, in summer I keep the points of the new growth nipped out, and cut clean away all strong "water" shoots; and in winter cut away all upward and downward growths and prune the side shoots back as near to the main stem as possible. If fruit sets on upward growths it generally turns over, droops downward and becomes too shaded to develop well. Thus the trees assume the pattern of a simple Fern frond.

Caterpillars of the spring Usher moth and a brown tortrix are our worst pests, but spraying, hand-picking and fumigating keep them in check. The Pear slug-worm gets into our houses sometimes, but the Pear midge has not done

so yet; indeed, I think our blossom is over before it has hatched out. Best of all, scab does not trouble us, though outside trees have scab. On one occasion I found a few leaves on a Doyenné du Comice indoors affected by it; I cut them off at once and the disease did not spread.

The trees are sprayed every winter with lime sulphur. A few trees, when young, gave russet fruit, but they have all outgrown this weakness; now the fruits are all clean skinned, and without much red flush, but golden-yellow, clean Pears look very attractive. When growing the trees are "syringed" daily with a powerful hose jet.

I have in this note given a very brief account of my own experience, chiefly for the purpose of promoting interest in and discussion on a branch of fruit culture which I believe is not largely carried on in this country. Several people who have seen my houses have decided to grow cordon dessert Pears in cold houses and have been pleased to see the result of my efforts. I raise my own trees and always keep a good stock on hand. Anyone wishing to see my houses in the fruiting season, say, September, may do so. *C. H. Bryant, Hassocks Orchards, near Hassocks Station, Sussex.*

## HOME CORRESPONDENCE.

**Fruit-Packing at the Imperial Fruit Show.**—I venture to offer the following remarks on packing, which, void of any hostility or prejudice, I think may be worth noting by those concerned. In regard to packing, I would state that the best exhibit in the British section—six boxes of King Pippins—lost marks owing to the scantiness of the paper used, there being none at the ends of the boxes. Not one British grower was liberal enough with the quantity or the quality of his paper, to the detriment of the exhibit in "freedom from blemish" or in "general presentability." To sum up, the ship was almost invariably spoiled for the sake of a halfpenny-worth of tar. It will pay to "do it better." Old newspapers as first lining, with fair quality white for second, will cost a halfpenny per package and will not prove a loss. *Ernest L. Vinden* (one of the judges).

**Testing Fruit for Commercial Purposes.**—Although, doubtless, the extensive trial of fruits to be undertaken by the Royal Horticultural Society in conjunction with the Ministry of Agriculture will serve a useful purpose, it seems to me that such trials are already conducted by nurserymen and others who grow fruit trees extensively. Even many gardeners in private establishments purchase a few of the newer sorts to ascertain their qualities, so that the merits of most varieties are not unknown. What seems to be most needed is to educate the public as to the merits of some of the little-known sorts, for it is a notorious fact that varieties unknown to the public have no chance in competition with varieties that are household names. Every grower knows how readily the public will buy Worcester Pearmain Apples and Hesse Pears, whilst varieties far superior fail to obtain a purchaser or sell for less value. It must also be remembered that certain qualities are required in market fruits apart from great fruitfulness; one of the most important of these is suitability to stand rough usage in handling and transit. *B.*

**"Fungal" or "Fungous"?**—These terms are certainly not synonymous, because their meanings are quite different. "Fungal" means pertaining to fungi—i.e., it is applicable to anything connected with them as *fungi*. "Fungous" on the other hand, specifically refers to their outstanding peculiarity—i.e., their spongy nature. These I take to be the basic meanings of the two words, but, of course, like many English adjectives, they are often used loosely and with somewhat different meanings. Other adjectives are:—Fungic = derived from fungi, as fungic acid; funginous = fungous; fungoid = like, or resembling, a fungus—i.e., in general appearance (shape, etc.). I trust this will satisfy *J. P.* (p. 272). *C. Nicholson.*

## SOCIETIES.

### BIRMINGHAM CHRYSANTHEMUM.

November 7, 8, 9.—Bingley Hall, the headquarters of the Birmingham Agricultural Society, has an unenviable reputation at this time of the year for being cold and draughty, but on the occasion of the above Society's 58th annual exhibition the conditions were altogether different; in fact, the atmosphere in the huge building was quite warm and comfortable. We have seen Chrysanthemums of better quality and in greater numbers in Bingley Hall in previous years, but when we consider the lack of sun heat during the summer, together with the lateness of the season and the almost daily fall of rain, the all-round excellence of the exhibits was quite up to expectations. Fruit was largely and well shown, especially the contributions from the neighbouring counties of Herefordshire and Worcestershire. Vegetables were numerous and good. Some of the principal classes and prize-winners are noted below.

### CHRYSANTHEMUM GROUPS.

The first class was for cut flowers displayed on a floor space of 10 feet by 10 feet, to face four ways. The highest point was restricted to 8 feet. Foliage plants for edging were allowed, and any vaso or stand could be used at the discretion of the exhibitor. Mr. H. WOOLMAN, Shirley, Birmingham, who was the only entrant, had many good blooms, but they were not equal to those he showed in the same class a year ago. His was, however, a very imposing group and a great attraction to the show. The raised centre-piece was decorated with big blooms of W. Turner, Pink Turner, Miss A. E. Roope, Mrs. Geo. Monro, Mrs. G. Morris, etc. At the four corners he had such varieties as Edith Cavell, Lord Stuart of Wortley, Mrs. Peter Murray and Mrs. J. T. Fleming, while Pamela, Mrs. G. Rundle, Mrs. Algernon Davis, Mrs. J. B. Bryse, Lloyd George and Mrs. George Glenn were used for filling in. Ferns, Berberis and sprays of Beech gave pleasing variety.

There were two local amateurs in the plant class for Japanese, Incurved and Decorative varieties arranged as grown, with Ferns and foliage plants, on a ground space of 10 feet by 10 feet, to face four ways. The first prize was won by J. A. KENRICK, Esq., Berron Court, Edgbaston (gr. Mr. A. Cryer), whose cone-shaped arrangement included good examples of each section. The bulk of the varieties consisted of white or quite light-coloured sorts. The centre of the cone was crowned by a healthy Kentia, and a pleasing edging to the group included Ferns, Bamboos, and Cinerarias; 2nd, Alderman W. A. CADBURY, West Hills, Kings Norton (gr. Mr. H. A. Bick), whose group contained a good assortment of well-flowered Decorative varieties.

In the class for a group of cut single Chrysanthemums arranged on separate tables, 8 feet by 5 feet, there were two entries. The size and form of vases were left to the discretion of the exhibitors, who were Mr. H. WOOLMAN and Mr. A. H. HICKMAN, Cookley, Kidderminster, and the awards were made in the order named. The first prize collection was one of the best ever seen in Bingley Hall; the large, broad-petalled flowers were substantial and of good colours. The centre-piece consisted of unusually large, richly coloured flowers of Mavis, surrounded by Phyllis Cooper, Miranda, Jessica, Bertha Fairs, Gem, Mrs. Loo Thompson, Catriona and Mensa.

There were only two competitors in the three classes provided for pot plants, and one of these had to be disqualified. NEVILLE CHAMBERLAIN, Esq., Edgbaston (gr. Mr. Percy Catt), was awarded first prizes for (1) Three Decorative Chrysanthemums, and (2) six single-flowered varieties.

### CUT BLOOMS.

The EARL OF LICHFIELD, Stafford (gr. Mr. G. Smith), was awarded first prize for 12 Japanese blooms, in not fewer than 9 distinct varieties, arranged on a table 6 feet by 3 feet. A few of the best varieties were Mrs. Geo. Monro,

Princess Mary, Dawn of Day, Louisa Pockett and Mrs. Algernon Davis. Plants of Asparagus, Colens and Grevilleas gave increased variety and good effect; 2nd, Mrs. J. B. BROOKS, Bromsgrove (gr. Mr. E. Avery), who showed the varieties Princess Mary and Sir Edward Letchworth in splendid condition.

The EARL OF LICHFIELD also had the best six vases of a crimson-coloured Japanese variety. He showed exquisite flowers of Mrs. Geo. Monro; 2nd, J. H. WHEATLEY, Esq., Berkswell Hall, Coventry (gr. Mr. W. H. Westbury). There were seven splendid entries in the class for 3 vases of Japanese varieties, distinct, 3 blooms of each. The last-named exhibitor was placed first with heavy, well finished specimens of W. Turner, Mrs. R. C. Pulling and Louisa Pockett; 2nd, Mrs. J. B. Brooks (gr. Mr. E. Avery), whose best flower was a magnificent example of Princess Mary; 3rd, EARL OF LICHFIELD. J. H. WHEATLEY, Esq., also showed the winning vase of a white Japanese variety. His specimens of W. Turner were large and of good form. The same exhibitor's blooms of Majestic were placed first in a class in which colour was optional. F. HAMER, Esq., Erdington (gr. Mr. F. Croome), was second in the same class with Dawn of Day.

W. C. ROBINSON, Esq., Coventry, took the lead in the class for a pink-coloured Japanese variety with very large refined blooms of Mrs. Algernon Davis; 2nd, J. H. WHEATLEY, Esq.; 3rd, Mrs. J. B. Brooks, also with Mrs. Algernon Davis. The last-named exhibitor beat six contestants in the class for a vase of a yellow Japanese variety with beautifully shaped specimens of Mrs. R. C. Pulling; 2nd, J. H. WHEATLEY, Esq., with the same variety. H. F. KEEP, Esq., Edgbaston (gr. Mr. T. W. Davis), won first prize in a class for four vases of twelve incurved varieties. Although there were only two entries in the class for six vases of single Chrysanthemums, some excellent flowers were shown by Mrs. GUTHRIE, Northampton, who was awarded first prize. The varieties were Mrs. W. Godfrey, Estelle, Jessica, Sandown Radiance, T. Barnes and Sweet Auburn; 2nd, Mr. A. H. HICKMAN, who showed good vases of Phyllis Cooper, Stuart Smith and Unique.

Mr. A. H. HICKMAN won first prize for six varieties of Decorative Chrysanthemums. His blooms of Vivian Morel, Uxbridge Pink and Romance were of outstanding merit.

The most successful competitors in classes reserved for local exhibitors were Messrs H. F. KEEP, E. WINCHESTER, J. W. MOORE, J. MOORMAN, W. ALLTON and J. S. PEARSON.

The seven exhibits in the class for Dinner Tables, 6 feet by 4 feet, decorated with Chrysanthemums, Ferns and other foliage were on much the same lines as in previous years. 1st, Mr. E. WINCHESTER, Rubery, who used yellow and bronze-tinted single varieties in silvered stands. Well coloured sprays of Selaginella and a small-leaved Sedum were introduced with good effect; 2nd, Sir GEORGE H. KENRICK, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), with a well-conceived design that found many admirers; 3rd, H. W. SMITH, Esq., Stourbridge (gr. Mr. H. Davis). In the next class, which was for the same sized dinner table, Chrysanthemums and other flowers were admissible, arranged in bowls and vases. Here, again, the first prize went to Mr. E. WINCHESTER, who had pink Carnations and white Chrysanthemums; 2nd Mr. C. HOLDER, Erdington, with yellow Chrysanthemums and pink Carnations; 3rd, Mr. W. E. BALL, Erdington.

Mr. H. WOOLMAN, Shirley, offered prizes for: (1) Three vases of nine Japanese blooms, in not fewer than six varieties. 1st, Mr. T. BLOWER, Perry Barr; 2nd, Mr. W. F. HUDSON, Selly Oak; 3rd, Mr. W. ALLTON, Ward End. (2) Four Japanese varieties, three blooms of each. 1st, Mr. W. C. ROBINSON, Coventry; 2nd, Mr. H. F. KEEP, Edgbaston. Mr. W. C. ROBINSON won the special prize of a guinea offered by Messrs. W. Wells and Co., Merstham, for the best Japanese Chrysanthemum in the show (Trade excluded). The variety was Mrs. Algernon Davis.

Mr. H. N. ELLISON's prizes for Ferns were won by Mr. E. J. KEELING and J. A. KENRICK, Esq.

MISCELLANEOUS PLANTS.

The best dozen plants of Begonia (Gloire de Lorraine came from the gardens of L. SPIERS, Esq., Edgbaston (gr. Mr. Farmer), whose large pyramidal plants were covered with flowers; 2nd, J. A. KENRICK, Esq.; 3rd, NEVILLE CHAMBERLAIN, Esq. LIONEL SPIERS, Esq., also took the lead in a similar, but smaller, class than the above; 2nd, NEVILLE CHAMBERLAIN, Esq.; 3rd, J. A. KENRICK, Esq. Mrs. O'HEA, Barford, Warwick (gr. Mr. A. Sharnbrook), won first prizes for: (1) 12 Cyclamen, and (2) 6 Cyclamen. H. F. KEEP, Esq., was awarded first prize for six Primula sinensis, and Mr. E. J. KEELING had the best lot of Primula obconica. The half-dozen plants of Salvia which gained first prize for J. W. MOORE, Esq., of Kings Norton, were very dwarf, stocky and profusely flowered. J. A. KENRICK, Esq., won first prizes for: (1) Three Palms, (2) one Palm, and (3) one Tree Fern.

FRUIT (OPEN).

The class for a collection of British-grown fruit has been a feature at Birmingham for many years, and this year's four exhibits were better than on many previous occasions. The first prize was won by LORD SOMERS, Eastnor Castle, Ledbury (gr. Mr. G. Mullins), whose Apples were large and of surprisingly good colour. The varieties Emperor Alexander, Rival, Peasgood's Nonesuch and Honblon were noteworthy. Grapes, both black and white, together with Melons, Peaches, Plums (Coe's Golden Drop and President), Morello Cherries and Pears helped to make a particularly attractive table of choice fruits; 2nd, The EARL OF LICHFIELD, Stafford (gr. Mr. G. Smith), who had a representative collection, but many of the specimens were lacking in size and colour; 3rd, Mr. C. W. POWELL, Warham, Herefordshire, whose collection consisted mainly of beautifully coloured Apples and Pears; 4th, HUGH ANDREWS, Esq., Toddington Manor, Winchcombe (gr. Mr. J. R. Tooley).

In the classes for single dishes of Apples, LORD SOMERS won first prizes for Allington Pippin, Charles Ross, Emperor Alexander, Honblon and The Queen. HUGH ANDREWS, Esq., was first for Bismarck, Annie Elizabeth, Bramley's Seedling, Cox's Pomona, Gascoyne's Scarlet, King of the Pippins, Lane's Prince Albert and Rev. W. Wilks. Mr. C. W. POWELL showed the winning dishes of Blenheim Pippin, Cox's Orange Pippin, Newton Wonder and Peasgood's Nonesuch Captain R. T. HINCKES, Hereford (gr. Mr. R. Currie), had the best fruits of Warner's King.

PEARS: The last named exhibitor led with Beurré Clairgeau and Dovené du Comice. LORD SOMERS was first with Beurré Superfin and Pitmaston Duchess. Mr. C. W. POWELL won first prizes for Catillac and Conference, and Captain H. B. TATE, Alcester (gr. Mr. A. E. Moss), showed the winning dish of Emile d'Heyst.

Half a dozen fruit classes were reserved for amateurs and gentlemen's gardeners. Of five entries in a class for three bunches of Black Grapes, LORD SOMERS was placed first with well-shouldered bunches and perfectly finished berries; 2nd H. R. PADMORE, Esq., Edgbaston (gr. Mr. T. Batchelor); 3rd, HUGH ANDREWS, Esq. The best three bunches of White Muscats were exhibited by Captain R. T. HINCKES (gr. Mr. R. Currie), whose long, tapering bunches and amber-coloured berries were in splendid condition; 2nd, LORD SOMERS; 3rd, EARL OF LICHFIELD. H. R. PADMORE, Esq., beat J. A. KENRICK, Esq., in a local class for two bunches of Black Grapes.

Seven exhibits of 3 dishes of Culinary Apples were placed before the judges, who awarded the first prize to LORD SOMERS for large examples of Mère de Ménage, Gloria Mundi and Peasgood's Nonesuch; 2nd, Mr. C. W. POWELL; 3rd, HUGH ANDREWS, Esq. In the corresponding class for Dessert Apples, Mr. C. W. POWELL led, followed closely by LORD SOMERS. Mr. E. J. KEELING was successful in the local class for Culinary Apples.

VEGETABLES.

The best collection of six varieties of Potatoes came from Mr. W. J. HORTON, Quatt, whose tubers of Majestic and King Edward were very handsome; 2nd, H. W. SMITH, Esq., Stourbridge (gr. Mr. H. Davis).

HUGH ANDREWS, Esq., excelled in the single classes for: (1) Nine Onions, (2) six Carrots, (3) six sticks of Celery, and (4) six Kidney Potatoes. Mr. W. P. ORRILL, Hinckley, had the best Round Beet and Brussels Sprouts, and Mr. E. WINCHESTER had some fine Long Beet and Leeks.

Messrs. Sutton and Sons offered prizes for nine distinct kinds of Vegetables. 1st, HUGH ANDREWS, Esq., whose collection included excellent Celery, Leeks, Carrots and Parsnips; 2nd, Mr. E. WINCHESTER.

Messrs. Webb and Sons' prizes were offered for six distinct kinds. 1st, Mr. E. WINCHESTER, who showed splendid Celery, Tomatoes and Onions; 2nd, Mr. W. P. ORRILL.

Messrs. Dickson and Robinson's prizes were offered for nine distinct kinds. 1st, Mr. W. P. ORRILL; 2nd, H. W. SMITH, Esq.

staged by Mrs. G. H. MORRELL (gr. Mr. A. Gibson) not for competition, on a space of about 50 feet in circumference. The most noticeable varieties were Majestic, Daily Mail, Mrs. Sargent, Mr. T. Lunt, R. C. Pulling, Mr. G. Monro, Louisa Pockett and Mrs. Algernon Davis. Mr. GIBSON also staged along the whole length of the platform a fine array of Cattleya Bowringiana, Gesneras and Cyrtipediums, together with more splendid Chrysanthemums. The whole arrangement gave a charming and pleasing effect, and was awarded a large Gold Medal. In the centre of the hall Mr. GEE, of Banbury Road, Oxford, exhibited a splendid non-competitive group of Chrysanthemums, and was awarded a Gold Medal. Mr. T. MASSIE CHARLTON, Lee, Headington, had an effective group not for competition, and was also awarded a Gold Medal. Miss MATCOCK, Market Street, exhibited a splendid collection of fruit, and Mr. JOHN MATCOCK put up a beautiful bank of Roses. Messrs. WEST AND SONS exhibited Topiary trees and evergreens. In the class for a group of plants, Mr. T. H.

FIG. 122.—EXHIBIT OF FRUIT AND POT FRUIT TREES, SHOWN BY KING'S ACRE NURSERIES, AT THE IMPERIAL FRUIT SHOW (SEE P. 272).

HONORARY EXHIBITS.

Gold Medals were awarded to Messrs. WATREFF, SONS AND CRISP for Hardy Shrubs; Messrs. HEWITT AND Co. for Hardy Shrubs; Messrs. TOOGOOD AND SONS for Fruit and Vegetables; Messrs. KENT AND BRYDON for Fruit, Vegetables and Begonias; STUDLEY HORTICULTURAL COLLEGE for Fruit and Chrysanthemums; KING'S ACRE NURSERIES for Fruit; and Messrs. GUNN AND SONS for Fruit and Roses.

Silver Gilt Medals to Messrs. W. J. GODFREY AND SON for Chrysanthemums; Messrs. W. HOPWOOD AND SONS for Fruit; Mr. H. N. ELLISON for Ferns; and BOURNVILLE VILLAGE TRUST for Fruit and Chrysanthemums.

Silver Medals to Mr. C. J. PARSONS for Fruit; Miss S. S. THOMPSON for Cacti; and Messrs. LEGG for Chrysanthemums.

ROYAL OXFORDSHIRE CHRYSANTHEMUM.

NOVEMBER, 1922.—This Society is to be congratulated on the splendid show of flowers, fruits and vegetables staged in the Town Hall, Oxford, on November 8 and 9. The attendance beat all records for these shows. Some grand Chrysanthemums were on view. The outstanding feature of the show was the magnificent group of Chrysanthemums

Rose was placed first for Begonias, Codiaeums, Cyrtipediums and Exacum affine; second, Mrs. LESSING.

In the class for nine varieties of Chrysanthemums, three blooms in each vase, H. BALFOUR, Esq. (gr. Mr. Hewlett) won the first prize. His best flowers were Mr. G. Monro, Mrs. R. C. Pulling, Princess Mary and Mrs. Algernon Davis. For 24 Japanese distinct Mr. Balfour was again successful. For 12 Japanese blooms, distinct, the first prize was won by Mrs. LESSING. This same exhibitor excelled in the classes for 16 blooms of a white and six of a yellow variety respectively. For six Japanese blooms of any other colour, Mr. BALFOUR was awarded the first prize with specimens of His Majesty. Mrs. GEE was first in the class for decorative varieties, New Sunshine, Sorcerer, and Golden Cranfordia being especially good. For six bunches of single Chrysanthemums, Rev. E. H. ALINGTON was first and Mrs. LESSING second.

Competition was very keen in the classes for Apples and Pears. Mr. E. L. K. ELLIS was first for six dishes of culinary and six dishes of dessert Apples. Mr. A. S. B. TULL showed the best six dishes of Pears. The two bunches of White Trebbiano Grapes which secured first prize for Mr. A. S. B. TULL in the Grape classes were very good, as also were his bunches of Gros Maroc.

## ROYAL HORTICULTURAL.

NOVEMBER 14.—The fog which prevailed in the London district on Monday and Tuesday of the present week was no doubt partly responsible for the absence of numerous exhibitors at the fortnightly meeting, and the display of more vacant tables than has been seen for a long time past at the Royal Horticultural Society's shows. There were two outstanding exhibits; one from Mr. H. J. JONES, who set up the finest group of Chrysanthemums we have seen and for which he gained the congratulations of the President and Council, in addition to a Gold Medal. The other notable exhibit was of many plants of *Calanthe Harrisii*, carrying magnificent spikes of white flowers.

## Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Messrs. Jas. O'Brien (hon. secretary), Frederick J. Hanbury, Pantia Ralli, E. R. Ashton, T. Armstrong, S. W. Flory, J. E. Shill, Fred. K. Sander, H. T. Pitt, J. Crombleholme, and Gurney Wilson.

## AWARD OF MERIT.

*Cypripedium Gwen Dixon* (parentage unrecorded), from LEONARD DIXON, Esq., Pitlochrie, St. Albans. A very pretty hybrid with a close approach in its perfect form to one of the best *C. Spicerianum*. The dorsal sepal is pure white and of fine form, the petals and lip greenish yellow, tinged with rose.

*Brasso-Cattleya William Pitt* (B.-C. *Digbyano-Warneri* × *C. Octave Doin*), from H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood). A grand *Brasso-Cattleya*, with the features of that best of all forms of *C. labiata*, *C. Warneri*, and its perfect shape. The large and finely shaped flowers are rich rosy-mauve, the front of the lip crimson, and the disc with yellow lines.

*Brasso-Cattleya Alma*, Charlesworth's variety (B.-C. *Mrs. J. Leemann* × *C. Octave Doin*), from Messrs. CHARLESWORTH AND CO., Haywards Heath. One of the most perfect of the light forms, large in size and of fine shape. The sepals and broad petals are cream white, the fine lip light rose beautifully veined with gold.

*Cypripedium Linda* (*Actaeus Bianca* × *Moonbeam*), from Messrs. COWAN AND CO., Southgate. A very fine addition to the dwarf, large-flowered *Cypripediums*, and improving the fine form and delicate colours of *C. Actaeus Bianca*. The broad, white dorsal sepal had some violet spots, and finely-formed petals; the lip, which was primrose tinged with mauve, was well displayed.

*Cattleya Our Prince* (*C. Dowiana aurca* × *C. King George*), from Messrs. FLORY AND BLACK, Slough. One of the best of yellow-petalled *Cattleyas*. Two varieties were shown each with yellow sepals and petals and fine lip with rosy-crimson markings, the variety *aurca* being the darker.

## GROUPS.

Baron BRUNO SCHRÖDER, The Dell Park, Englefield Green, was awarded a Silver-Gilt Flora Medal, and his Orchid grower, Mr. J. E. SHILL, a Silver-Gilt Lindley Medal, for one of the largest and most perfect groups of white *Calanthes* yet shown—marvels of cultural skill and perfect flowering. The group was of *C. Harrisii* alone, and contained over one hundred and thirty grand specimens with spikes over four feet long, and each averaging forty blooms. These superbly grown plants were admirably arranged with *Adiantum* Ferns and moss and gave a great relief to the eye contrasted with the foggy atmosphere outside.

A Silver Flora Medal was awarded to Messrs. COWAN AND CO., Southgate, for a very effective group of good things, in which were noted several novelties, including *Cypripedium Ophis* (*Fairriannum* × *Germaine Opoix*) the superb *Laelio-Cattleya Cornelius* (*St. Gothard* × *Purple Emperor*) a grand flower of vivid colour, a good selection of *Odontoglossums* and *Cattleyas*. Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. J. Collier), was given a vote of thanks for a most beautiful exhibit including six fine speci-

mens of his remarkable *Brasso-Laelio-Cattleya Antoinette* (B.-L. *Helen* × *C. Portia*), a very fortunate cross resulting in varieties of perfect form in which the colours of *C. Portia* are generally displayed. Also six specimens of his *Cattleya Portia coerulea* (*Bowringiana violacea* × *labiata*), with bouquet-like heads of bloom of silver-white tinged with light blue, the lips being the darker.

Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells, showed *Cattleya Portia* *Ochid-hurst* variety (*Bowringiana* × *labiata*), one of the largest and richest in its deep mauve-crimson colour. Also *Cattleya labiata alba* variety *Princess of Wales*, the best white form of the winter-flowering true *C. labiata* type.

Messrs. FLORY AND BLACK, Slough, again showed their bright violet-purple *Potinara Royal Purple* (B.-L.-C. *Gerald* × S.-C. *Westfieldensis*); *Cypripedium Upton Gem* of fine shape, the very dark *Odontoglossum Llewellyn*, and other hybrids.

Messrs. SANDER, St. Albans, showed the fine *Laelio-Cattleya Princess* (*C. King George* × *L.-C. Thyone*), yellow with a crimson lip; and *Brasso-Cattleya Crotiana*, a beautiful creamy-white flower with crimson lip and yellow disc.

## Floral Committee.

Present: Messrs. E. A. Bowles (in the chair), Gerald Loder, Chas. E. Pearson, W. B. Gingell, M. P. Allwood, Reginald Cory, Sydney Morris, R. C. Notcutt, John Jennings, C. R. Fielder, Amos Perry, John Heal, G. Reuthe, Jas. Hudson, W. R. Dykes, J. F. McLeod, H. R. Darlington, D. B. Crane, H. V. Warrender, and G. W. Leak.

## AWARDS OF MERIT.

*Carnation Eileen Low*.—This deep pink perpetual-flowering variety was shown in fine condition. The blooms are large, with broad, fringed petals, and carried on good stems. The growth appears to be somewhat slender. Shown by Messrs. STUART LOW AND CO., Enfield.

*Carnation Master Michael Stoop*.—A handsome, large-flowered, perpetual-flowering variety of light and bright salmon colour. The plant shown suggests that the variety grows and flowers freely. Shown by Mr. G. CARPENTER, West Hall Gardens, Byfleet.

*Chrysanthemum Miss M. Hunter*.—A large-flowered single variety of great beauty and grace, the florets reflexing lightly at the lips. The colour is sulphur yellow with a faint suffusion of red at the ends of the florets. Shown by Mr. G. CARPENTER.

*Chrysanthemum Oriole*.—A most beautiful variety that may best be described as a Japanese single. The big flowers have several rows of narrow, almost tubular florets of a pleasing shade of light canary yellow. Shown by Mr. KEITH LUXFORD, Harlow.

## GROUPS.

Both in quantity and quality Chrysanthemums were the most important feature of the meeting. Following his unparalleled successes this season Mr. H. J. JONES secured another Gold Medal, and to this, his seventh of the year, was added the special congratulations of the President and Council. It was a stupendous exhibit, and, although arranged on somewhat conventional lines, was particularly effective. Such large-flowered Japanese varieties as *Princess Mary*, *Majestic*, *Wm. Rigby*, *Mrs. Gilbert Drabble*, *Mrs. Geo. Monro, junr.*, *Mrs. Spencer*, *Louisa Pockett* and *Victory* predominated, though there were many others of decorative type. As this magnificent collection is intended to remain for the annual show of the National Chrysanthemum Society, we defer further comment for that occasion (Gold Medal).

A large and pleasantly arranged exhibit of Chrysanthemums was made by BARON BRUNO SCHRÖDER (gr. Mr. E. Henderson), The Dell, Egham. With the exception of a stand of *Crimson Seedling*, an enormous broad-petalled single, of rich deep crimson colour, the group was composed of *Caprice du Printemps* and varieties of that type. *Greenway's Caprice*, *White Caprice*, *Yellow Caprice* and *Kathleen Thomson* were all

very decorative and shown in quantity (Silver-Gilt Banksian Medal).

Besides many large-flowered Japanese varieties Messrs. KEITH LUXFORD AND CO. had a vase of the fascinating little *Pompon Chrysanthemums* and the beautiful rosy-mauve *Anemone*-flowered *Thora*. Amongst the *Pompons* were *Mary Rickford*, *Baby Doll* and *Golden West* (Silver Flora Medal).

Carnations were particularly good. The blooms were large, of perfect form, and in clear, characteristic colours. Messrs. ALLWOOD BROS. had in *Benora*, *Wivelsfield Fancy*, *Eastern Maid* and the beautiful yellow ground *Marion Willson* especially good representatives of the *Fancy Perpetual Carnation*. *Mary Allwood* and *Triumph* added brightness to the collection (Silver Flora Medal). Their new beautiful pink variety *Eileen Low* was massed in delightful fashion by Messrs. STUART LOW AND CO., who also freely displayed the varieties *Lord Lambourne* and *Red Ensign*, and *Amos Grove*, an uncommon *Fancy Carnation* of mauve-violet and red colouring (Silver Flora Medal). The varieties mostly grown for market predominated in the collection by Mr. C. ENGELMANN, who showed *Carola*, *Thor* and *Tarzan* of great merit. The relatively new *Perpetual-Malmaison Jessie Allwood* was also included (Silver Banksian Medal).

An attractive collection of well-flowered greenhouse *Cyclamen* in variety, and an especially good strain of *Primula obconica*, were displayed by Mr. E. H. CAUSER, a new exhibitor who has made a very promising debut. The flowering plants interspersed useful greenhouse Ferns, amongst which there were perfectly grown plants of the feathery *Nephrolepis exaltata Marshalli compacta* (Silver Flora Medal).

Vases of, apparently hardy, Chrysanthemums and his fascinating miniature rock gardens were staged by Mr. F. G. WOOD, who also included a pan of the free-growing *Mentha rotundifolia variegata* (Bronze Banksian Medal). A number of vases of *Violet Princess of Wales*, of especially good quality, were arranged by the HAYDON VIOLET GROUNDS COMPANY, Blandford. The flowers were exceptionally large and very fragrant (Bronze Banksian Medal).

On behalf of Miss MARY E. EATON, of the New York Botanic Gardens, was shown a very large collection of water-colour paintings of native plants of the U.S.A. This exhibit was of great value, as the examples of the numerous trees, shrubs and plants were so faithfully delineated that they gave the impression of living specimens.

## Fruit and Vegetable Committee.

Present: Messrs. C. G. A. Nix (Chairman), J. Cheal, E. A. Bunyard, Geo. F. Tinley, G. Reynolds, A. Metcalfe, E. Beckett, W. Bates, W. H. Divers, W. Wilks, T. Pateman, P. A. Tuckett, W. F. Giles, E. Neal, H. Markham, and A. N. Rawes (Secretary).

## AWARD OF MERIT.

*Apple Joy Bells*.—A large variety of the *Emperor Alexander* type, but with distinct knobs around the eye. It is a dark red variety with a little bluish bloom at the base. The stalk is short and the fruit is set close on the branches. The tree is a good grower, with vigorous, dark green foliage and dark shoots, which are relatively short jointed. It is a dessert Apple in season in November. The flesh is very juicy and sweet and with a pleasant aromatic flavour; quite an agreeable Apple in November. The fruit is of large size for a dessert variety (see Fig. 140, Dec. 18, 1920), but probably from older trees the fruits would be much smaller and of a more suitable size for dessert. Shown by Mr. WILL TAYLER, Godalming.

Several seedling Apples were submitted for award, but none was considered superior, or even equal to, existing varieties. The most promising sort was *George Carpenter*, raised from *Blenheim Pippin*, and *King of the Pippins*, a very attractive fruit about the size, but not the shape, of *Christmas Pearmain*, although the colour is somewhat similar.

Sir CHARLES NALL-CAIN, The Node, Welwyn (gr., Mr. T. Pateman), was awarded a silver-gilt Hogg medal for a magnificent exhibit of

Apples and Pears, comprising seventy-eight varieties in all, twenty-five of Pears and fifty-three of Apples. The collection was very attractively staged, a few foliage plants being used for relief. Of the Pears were noticed Emile d'Heyst, Le Lectier, Durondeau, Conference and Beurré Bachelier, and of Apples, Cox's Orange Pippin, Adams's Pearmain, The Queen (exceptionally fine), Wealthy, Lord Derby, and Peasgood's Nonpareil.

Messrs. CHEAL AND SONS, Crawley, showed a collection of Apples and Pears totalling altogether forty varieties. The Apples were exceptionally finely coloured and included such well-known sorts as Crawley Beauty, Gascoyne's Seedling, Lane's Prince Albert, Cox's Orange Pippin, Adams's Pearmain, Brownlee's Russet, Arthur Turner and Crawley Reinette. There were splendid Pears of such varieties as Beurré de Naghan, Beurré Clairgean, Catillac, and Glou Morceau.

An exhibit of exceptional interest was displayed by Messrs. H. P. BULMER AND Co., LTD., Hereford, in vintage fruits used for cider and perry making. Of the cider Apples there were such well-known sorts as Yellow Norman, Médaille d'or, Vine Apple, Strawberry Norman, Fox Whelp, Lady's Finger, and Eggleton Styre, whilst Perry Pears included Butt, Blakeney Red, and Aylton Red sorts (Silver Hogg Medal).

**ROYAL SCOTTISH ARBORICULTURAL (ABERDEEN BRANCH).**

THE quarterly meeting of the Aberdeen branch of the Royal Scottish Arboricultural Society was held in Marischal College, Aberdeen, on the 21st ult., Sir John Gladstone, Bart., of Fasque, Kincardineshire, presided. After the formal business was transacted. Mr. Ian A. Clarke, M.A., B.Sc. (Agr.), District Officer, Forestry Commission, Aberdeen, gave an address on "Methods of German State Forestry." Mr. Clarke dealt with the work in one of the State forests in Germany, as he saw it when studying there before the war, and with reference more especially to the cultivation of Oak and Beech. The district he had studied in was part of the Spessart, although not the Spessart proper. It is some 40 miles to the north-east of Frankfurt-on-the-Main, and was called the forest of Salmunster. The area amounted to nearly 12,000 acres, of which 7,000 were State forests, 3,000 communal, and nearly 2,000 private. In Germany, about 50 per cent. of the private forests and all the communal forests were under State control. The most important timber tree grown in the district he had referred to was Oak. The locality was pre-eminently suitable for Oak and Beech, and wherever possible the Oak was grown as the chief crop, with Beech as an auxiliary. What was specially aimed at was a high-grade Oak, and the rotation for the crop was 200 years. Oak was now practically never grown pure, but always in mixture with Beech. The Beech was, however, absolutely subordinated to the needs of the Oak, and the functions which it was called upon to perform were two. The first was to keep the soil well covered with leaves, thus maintaining a supply of humus and preventing the growth of weeds. The second was to keep the boles of the Oak clean by preventing the growth of side branches. The form of the Beech when grown thus along with the Oak was of no importance, as it was accepted that it would yield only firewood at the end of the rotation. The only other species which might take the place of Beech for these purposes was Hornbeam, which, being frost-hard, was used in valley bottoms and frost holes. Many different ways of growing the two trees—Beech and Oak—had been tried, but that which was now most generally favoured was an equal-aged mixture. That was established whenever possible by natural regeneration; artificial regeneration being resorted to only when the conditions were not suitable for natural regeneration. Lantern slides were shown illustrating the planting of a forest till the time for cutting operations, some 200 years later. Concluding, Mr. Clarke drew attention to three points which had emerged in the course of his description of the work in

Germany, and which were, he thought, all applicable to forestry as much in this country as in Germany. The first and most obvious was the use of Beech as an even-aged auxiliary with a light-demanding species. That combination might be practised with great advantage to a much greater extent than it was now, particularly in the formation of Larch woods, and also, but possibly to a lesser extent, of Scots Pine woods. It might not be desirable to disregard the timber possibilities of the Beech in such a mixture. The second point was the use of natural regeneration. That might be used, he thought, much more widely than at present, especially with the Scots Pine. There were, of course, difficulties to be overcome—for example, the rabbit question—and it was an operation which required careful, skilled supervision, but there were corresponding advantages, the chief, perhaps, of which was the elimination of bad planting. The third, and he thought the most important of the three points, was the importance of careful thinning.

Mr. Sydney J. Gammell, of Countesswells, and Sir John Gladstone took part in the discussion, the latter agreeing that the Germans, from their longer experience, did grow finer timber than foresters in this country.

During the course of the day, the members visited the sawmills and packing-box and case-making factory of Messrs. John Bissett and Sons, Ltd., North Esplanade, Aberdeen.

**HITCHIN CHRYSANTHEMUM.**

NOVEMBER 9.—Delightful weather attended the holding of the Hitchin Society's Show, which took place in the Town Hall on the above date. The exhibition was arranged in very pleasing fashion and the quality of the exhibits was very high.

The twenty guinea Challenge Cup and money award, offered as first prize for six vases of Japanese blooms, three blooms of a variety in each vase, was won by Sir C. NALL-CAIN (gr. Mr. T. Pateman), The Node, Welwyn, with fine flowers of Mrs. A. Davis, Majestic, Mrs. R. C. Pulling, Princess Mary, Queen Mary and Mrs. J. Gibson; 2nd, E. MARTIN SMITH, Esq. (gr. Mr. S. J. Milton), Codicote Lodge. A six-guinea Challenge Cup was offered as the premier prize for four vases of Japanese blooms, three blooms of one variety in each vase, and this was won by H. MARKHAM, Esq., London Road, Stevenage, with excellent flowers of Mrs. A. Davis, Edith Cavell, Mrs. J. Gibson, and Princess Mary; 2nd, O. L. JAMES, Esq. (gr. Mr. Kellaway), The Hoo, Hitchin. E. MARTIN SMITH, Esq., showed the best six Japanese blooms, and M. HANSCOMBE, Esq. (gr. Mr. H. W. Eyeers), Penton Hall, led for five white Japanese blooms of one variety; he showed Louisa Pockett and one of his blooms was adjudged to be the best flower in the show. E. MARTIN SMITH, Esq., won first prize for five blooms of a coloured Japanese variety with Thos. Lunt.

Sir C. NALL-CAIN was the most successful exhibitor in the class for six vases of single Chrysanthemums, and led in a close competition with fine blooms of Phyllis Cooper, Gem, Catriona, and Sandown Radiance; 2nd, F. RANSOME, Esq., Newlands, Hitchin.

There were six entries in the class for a table decorated with Chrysanthemums and the chief award was made in favour of Mrs. W. G. P. CLARK, for a pleasing arrangement of single varieties; 2nd, Mrs. ABBISS, Hitchin; 3rd, Mrs. CREASEY. Mr. F. RANSOME showed the best decorative vase of single Chrysanthemums; 2nd, Mr. HANMER; 3rd, Mr. VICKERS. For a vase of decorative varieties Messrs. F. RANSOME, HARRISON and ABBISS won prizes in the order of mention.

Only one group was staged and this, from Messrs. ABBISS BROS., was awarded a first prize; it was a pleasing arrangement of Chrysanthemum, Begonias, and other greenhouse flowering plants. For three winter-flowering Begonias Major HARRISON beat Sir C. NALL-CAIN, showing superb plants of Optima and Flambeau.

Sir C. NALL-CAIN won the Silver Cup he himself offers for the best collection of fruit

arranged on a space 6 ft. by 3 ft. There were five competitors, but Sir C. NALL-CAIN came out ahead with a considerable margin of points. He showed finely coloured Apples, a good selection of Pears, and well coloured Grapes; 2nd, the Rt. Hon. Viscount HAMPDEN, The Hoo, Welwyn (gr. Mr. A. J. Gillings), who had capital Melons and Grapes. Col. PRYOR led in the class for six dishes of culinary Apples, and he was first prizewinner for two bunches of black Grapes; in the former class Sir C. NALL-CAIN came second, and Viscount HAMPDEN was second for Grapes. In the class for white Grapes Sir C. NALL-CAIN and Major HARRISON were placed as named. Col. PRYOR won first prize for three dishes of dessert Pears and a similar award for culinary Pears.

Vegetables were shown in very fine condition and the competition was keen in nearly all classes. Messrs. J. CARTER AND Co.'s Cup, offered for the best nine distinct kinds of vegetables, was won by Major HARRISON (gr. Mr. Hartless), Kings Walden Bury, but he only beat Sir C. NALL-CAIN by one or two points. In Messrs. SUTTON AND SONS' class for six kinds of vegetables, the same two competitors entered, but in this case their positions were reversed. Col. PRYOR (gr. Mr. Crockford), West Park, Stevenage, was a successful exhibitor in the single-dish classes, winning first prizes for Potatoes, Carrots, Leeks, Cauliflowers, Beet and Turnips; Sir C. NALL-CAIN led for Parsnips (a wonderfully fine dish), and Brussels Sprouts; C. VICKERS, Esq., had the best Onions.

**MANCHESTER AND NORTH OF ENGLAND ORCHID.**

TUESDAY, October 19.—Present. A. Hanmer, Esq. (in the chair), Messrs. R. Ashworth, B. J. Beekton, A. Coningsby, J. C. Cowan, A. T. Cussons, J. Cypher, A. G. Ellwood, J. Evans, W. Giles, J. Howes, J. Jackson, A. Keeling, D. L. Thorpe, D. McLeod, E. W. Thompson, J. Whitham and H. Arthur (Secretary).

**FIRST-CLASS CERTIFICATES.**

*Brasso-Laelio-Cattleya Amber, West Point var.* A well shaped flower with sepals and petals of rich yellow colour and a fine anreal-like lip; *Odm. crispum Daphne*. A flower of the Pacho type; *Odm. eximium Iona*, a heavily blotched variety of good shape; *Brasso-Cattleya Lisette*, a very dark coloured flower. From S. GRATRIX, Esq.

*Cattleya Lamberhurst alba (intermedia alba Parthenia × Cattleya citrina)*. A creamy white flower resembling intermedia alba, but the plant mostly resembles Cattleya citrina; *L.-C. Daphne rotunda*, with mauve sepals and petals and deep magenta lip; *Odm. Thwaitesiae Haddon House variety*. From P. SMITH, Esq. *Cypripedium Creyji magnificum*. A large, round flower with white ground, covered with small, reddish dots. From Mrs. GRATRIX.

*Cypripedium Duchess of Marlborough (Lord Ossulton × Lecanum Chinkaberryvarum)*. With large, broad, dorsal sepal, and clear, waxy-white flowers, with bright green base, the petals and pouch being light green shaded brown. From B. J. BECKTON, Esq.

*Cypripedium Madame Albert Favier, Chardwar var.* A well shaped flower of the Germaine Opiox type. From Dr. CRAVEN MOORE. *Odm. crispum Edgemoor var.*, with red blotch on the lip. From A. HANMER, Esq.

*Odm. St. George Loshville var.* The flower is heavily blotched all over with deep red. From D. L. THORPE, Esq.

**AWARDS OF MERIT.**

*Odm. Radiant and Odm. crispum rotundum*. From A. HANMER, Esq.

*Laelio-Cattleya Athene var. purpureum; Sophro-Cattleya Boltonii (S. grandiflora × C. Percivaliana)*. From P. SMITH, Esq.

*Cypripedium Henry Blues (Germaine Opiox × Goliath)*. From Dr. CRAVEN MOORE. *Odm. crispum Naomi*. From S. GRATRIX, Esq.

*Cattleya Edithae var. Stella*. From Capt. W. HONRIDGE.

Obituary.

**George P. Berry.**—It is with the deepest regret we record the death of Mr. George P. Berry, Senior Instructor in the Horticultural Division of the Ministry of Agriculture. Mr. Berry had been ailing for several weeks and was granted special leave of absence, but he gradually became worse, and died on Saturday, the 11th inst., at his home at Stamford Brook, near Hammersmith. He was buried on Wednesday last in Hammersmith Cemetery. Mr. Berry was a gardener by profession, by training and inclination, and his appointment at the Ministry of Agriculture was especially pleasing to horticulturists, who regarded it as a sign that the Ministry was taking more interest in horticulture. Mr. Berry proved a sterling man for the post and gave his whole energies to his duties. A short biography of this capable gardener, together with his portrait, was given in *Gard. Chron.* so recently as September 30, 1922.

**William Grant Innes.**—Many members of the wholesale seed trade will have read with much regret the announcement of the death of Mr. W. Grant Innes, which occurred on November 12, at 4, Blenheim Gardens, Willesden Green. Mr. Innes, who was seventy years of age, came over from New Zealand about forty years ago and established himself in London as representative for Messrs. Nimmo and Blair, seedsmen, Dunedin. He was always an extensive buyer of agricultural seeds, by the ton, and in later years, as New Zealand became a seed-producing country he was also a seller of seeds of Peas, Grasses and Clovers, in large quantities. He had a reputation for being keen, clean and straightforward in all his business dealings, and he was a man one could not help liking. His interest extended to ships and shipping generally; he was also associated with the well-known Covent Garden firm of Messrs. Slaymaker and Co., sundriesmen; and for several years was a member of the Council of the British Florists' Federation.

LAW NOTE

PEA-PICKERS.

A CASE of considerable interest to the horticultural trade was decided in the High Court on November 15. As is well known, under the Unemployment Insurance Act, 1920, it is necessary to insure workpeople in most trades against unemployment, but the Act provides that this is not to apply to persons engaged in agriculture, horticulture or forestry. The Minister of Labour contended that women employed as Pea-pickers, i.e., in sorting out defective Peas and Beans and removing foreign substances, were not engaged in a horticultural process, but, on the contrary, were engaged in a commercial process. Messrs. Daniels Bros., Ltd., seed growers, Norwich, took the contrary view and, with the support of the Horticultural Trades' Association, appealed to the High Court.

Mr. Justice Roche, after hearing the arguments of Counsel on both sides, held that the Minister of Labour was wrong in his contention and that Pea-pickers are in fact engaged in a process of "horticulture," and that accordingly premiums for insurance against unemployment are not payable either by the employers or the employed. Curiously enough, the Government officials have always contended that Pea-pickers are engaged in horticulture within the meaning of the Corn Production Act and are accordingly entitled to the minimum scale of wages thereunder, and the attitude of the Government Department concerned in desiring to have the matter both ways has been scarcely consistent. Mr. Lilley, instructed by the solicitor to the Ministry of Labour, appeared as Counsel for the Minister, and Mr. Du. Cann, instructed by Messrs. Morgan, Veitch and Bilney, appeared for the horticultural traders concerned. Persons who have paid insurance premiums by reason of the erroneous decision of the Ministry can now apply for a refund, and in the case of large firms considerable sums will be recoverable.

REMARKS.—Demand has been on the small side and, generally speaking, there has been little or no activity in business during the past week. Large supplies of imported Apples have been offered, and prices have receded somewhat. Home-grown Apples are only moderately plentiful, and a fair demand rules for coloured dessert varieties. Large cooking Apples are a steady trade, but quoted slightly lower in value. The English Pear season is almost finished, except for Doyenné du Comice, of which fair supplies are available. Californian Winter Nels Grapes are on sale in the market. Hothouse Grapes are in good demand, and with smaller quantities available, their values should improve. New crop well coloured English Tomatoes sell well, but trade is very bad for Tomatoes that lack colour. Large quantities of outdoor Jersey Tomatoes have been totally unsaleable at any price. Increasing shipments of Tenerife Tomatoes are coming to hand. Cucumbers have sharply advanced in price, due to more restricted consignments by growers. New season's Denia Murcia Oranges are available. Forced vegetables, such as Guernsey Beans, Peas and Potatoes are selling well. Beans from France and Madeira also move freely, but their prices are only moderate. Forced Mushrooms are quoted at lower prices, owing to increased quantities, but colder weather should shorten supplies. The Potato trade is steady with an improving tendency.

ANSWERS TO CORRESPONDENTS.

**CANDLE CACTUS (KLEINIA ARTICULATA); E. B.** The plant represented in the photograph received is *Kleinia articulata*, a succulent plant native of South Africa. It is not a Cactus, although commonly called the Candle Cactus. It grows quite well in any ordinary greenhouse, and should be kept on the dry side during the winter months; if kept somewhat dry at the roots and in a fairly dry atmosphere, it should winter quite well in a temperature of 40° to 50°.

**POTATO DISEASE: W. A.** Although late blight disease of Potatoes has been less frequent than usual, there have, nevertheless, been attacks in various parts of the country, the same as in your case.

**NAMES OF PLANTS: W. T. L.** *Anemone japonica*.—A. J. P. 1, *Holosteum umbellatum*; 2, *Impatiens Roylei*.—H. G. W. 1, *Pyrus Aria*; 2, *Cornus capitata*; 3, *Berberis Darwinii*; 4, *Ribes sp.*, send in flower; 5, *Abelia floribunda*; 6, *Arbutus Unedo*; 7, *Azara microphylla*; 8, *Colletia cruciata*; 9, *Lonicera involucrata*; 10, *Spiraea Lindleyana*.—H. M. *Bryophyllum calycinum*.

**NAMES OF FRUITS: D. I.** Ashmead's Kernel. P. N. 1, James Grieve; 2, Chas. Ross; 3, Striped Beefing. W. G., Reading. Josephine de Malines. W. H. **PEACH AND NECTARINE TREES MAKING GROSS GROWTHS: H. J.** If there is room in the house for the further extension of the trees, do not remove the strong shoots, but lift or root-prune the trees at once, adding strong loam, lime rubble and a little bone meal to the soil, making the latter very firm about the roots as the work proceeds. It is doubtful if the strong shoots will fruit next year, but no good will be done by removing them; the trees are growing in soil that is too rich or too light in texture.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 42°.

### ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, November 22, 10 a.m. Bar. 30.6; temp. 49°. Weather—Foggy.

### Potato Synonyms.

Everyone interested in the cultivation of the Potato will read Dr. Salaman's article on "Seedsmen's Catalogues" (published on p. 311) with interest and profit. The article, which reproduces Dr. Salaman's recent address at Ormskirk, draws attention in vigorous language to the frequency with which one and the same kind of Potato is offered to the public under different names and not infrequently at different prices. In the old days when there were no official means of determining the identity of or difference between two manifestly similar varieties there was excuse for these errors; but, as Dr. Salaman points out, now that a Synonym Committee is in existence, and has pronounced on many of the similar varieties, and has also published its results, there will be no excuse for a continuation of these multiple and erroneous descriptions. It was long ago said that botany is easier to learn than its nomenclature, and similarly it may be averred that it is easier to learn the characters of different kinds of Potatoes than to master the series of superfluous names which have gradually gathered about the chief varieties of this vegetable. Like all missionaries, Dr. Salaman preaches reformation in emphatic terms, and like most of them he is particularly strong in commination. Whilst concurring in his view that root and branch reform is required and that the exuberance of growth of nomenclature should be pruned completely away, we are inclined to think that a good deal of the

confusion introduced into the naming of varieties of Potato has arisen from a cause which he ignores; namely, the great differences which exist between different strains of one and the same kind of Potato. Growers are not concerned with morphological niceties. They want a crop. Having, for example, obtained in different years a good yield from Sir John Llewelyn, and let us suppose, a poor yield from Eclipse, they would henceforth cleave to the one and eschew the other. Moreover, if this experience should happen to be general over one or two seasons, the tubers sold under one of these names would command a higher price than those sold under the other name. It is, however, of less interest to judge the past than to help to promote the future development of Potato growing in this country. In that, Dr. Salaman's lecture will, we are convinced, prove a potent power. He has drawn attention to mistakes and mis-descriptions and has shown how frequent they are. Still more important, he has indicated that means now exist, and are available to all, whereby new varieties—including varieties which the sanguine and inexperienced may think are new—may be tested and pronounced upon by expert and unimpeachable authority. No one who has experience of the high standard of the services rendered to the horticultural community by the seedsmen will doubt but that they will give heed to Dr. Salaman's observations and play a decisive part in extirpating these superfluous and misleading names—the weeds of the Potato plot—from their catalogues and from general use. We gardeners derive so much pleasure and profit by the study of seedsmen's catalogues and by the cultivation of the plants they recommend that we need not be perturbed by Dr. Salaman's introductory banter about Pumpkins and poetry. We know that if we go to good British seedsmen, the materials they supply are the best that the world can offer. We are grateful to them for the increasing care and enterprise which they exercise in introducing new and improved varieties, and our gratitude will be increased when, in the unique case of the Potato, they follow Dr. Salaman's cogent advice and delete the names of synonymous varieties.

**Imperial Fruit Show, 1923.**—The Ministry of Agriculture has been informed that the board of directors of the *Daily Mail* cannot see their way to organise an Imperial Fruit Show next year. The Ministry feels that members of the fruit growing industry might like an opportunity of meeting together to discuss means for continuing these shows, and especially that for 1923; it therefore invites all those who are interested to a Public Conference at 2 p.m., on Friday, December 1, 1922, at 10, Whitehall Place, London, S.W.1.

**Chrysanthemums in a Public Park.**—An excellent display of Chrysanthemums has been staged in the large greenhouse in Chalkwell Park, Westcliff. The glasshouse is a recent addition to the park and the Chrysanthemum show is the first occasion on which it has been opened to the public. The exhibition was well advertised in the local trams and elsewhere, with the result that many thousands of the townsfolk made a special visit to the park to inspect the flowers. So great a success has resulted from the innovation that it is proposed to make a feature of the Chrysanthemum display each season. The greenhouse will be utilised as a show house generally, thus adding a very attractive feature to the amenities of this pretty park, which is already noted for its beautiful Rose garden. The superintendent, Mr. Keeling, and his staff are to be congratulated on the excellent results attending their first efforts in the cultivation and display of Chrysanthemums.

**Acacia Seedlings.**—In the 55th volume of *The Journal and Proceedings of the Royal Society of N.S. Wales*, p. 105, is an interesting article by R. H. Cambage on the germination and precocious flowering and fruiting of a number of species of Acacia. The article is illustrated by four plates showing young plants of about a dozen kinds, including such diverse species as *A. asparagoides*, *A. Bancrofti*, *A. difformis*, *A. cultriformis*, *A. trineura*, *A. Oswaldii*, *A. pendula*, *A. polybotrya*, *A. longifolia*, *A. floribunda* and *A. discolor*. The figures are of plantlets three to six inches high, together with their flowers, seed pods and seeds; a most interesting series of examples of what plants are capable of doing under certain climatic conditions. The author also has a note on the vitality of some seeds of *Acacia melanoxylon*, which, after having been immersed in sea-water for four years and one month, germinated when planted.

**Flowers and Fruits for Charities.**—A beautiful exhibition of flowers and fruits was arranged a few days ago in the Cotton Exchange, Liverpool, by Mr. Bert Ker (Messrs. Ker's, Ltd.), and Mr. Mousley, gardener to George Couvelas, Esq., Heswall, on behalf of the Wallasey Central Hospital and the Gardeners' Royal Benevolent Institution. Mr. Ker obtained the fruit and Mr. Mousley the flowers, the latter including some exquisite Orchids from Sir George Holford. The various exhibits were drawn for by members of the Exchange and the proceeds, after paying expenses, amounted to about £150, one-third of which will be handed to the Gardeners' Royal Benevolent Institution. Mr. Ker and Mr. Mousley are to be congratulated upon this, another successful effort in the cause of charity.

**National Rose Garden.**—Mr. Courtney Page, hon. sec. of the National Rose Society, writes:—"You may be interested to know that my Council had recently under consideration the question of the setting up by amateur rosarians of Rose Test Gardens in different parts of the country. The Council on October 30 last unanimously passed the following resolution: 'That if and when a trial garden for Roses is set up by the National Rose Society, such garden shall be run by and under the direct control of the Society.'"

**A New Apple Weevil.**—Mr. J. C. F. Fryer, M.A., records in the November issue of the *Journal of the Ministry of Agriculture* a new pest of the Apple, allied to the Apple Blossom Weevil, but even more destructive in its habits. The pest is *Anthonomus cinctus*, and it is suggested it be called the Bud Weevil to distinguish it from the Blossom Weevil. The insect is known in France as the Pear *Anthonomus* and also the Winter Worm, and in Germany as the Pear Bud Killer. Its introduction to Great Britain is possibly due to the importation of nursery stock from the Continent. The larvae feed on the unexpanded leaves and truss buds of the Apple and not on the actual blossom buds themselves. Investigations in Germany show that the eggs are laid in September and October, that the larvae are found in the buds, chiefly of Pear trees, from the middle of February, and that they pupate at the beginning of May, the beetles emerging from eight to ten days afterwards.

**Chrysanthemum Society of America.**—The proceedings of this Society have usually been published annually, but the issue just to hand contains the details of the Society's work for the years 1920 and 1921 in one neatly printed brochure, which is always welcome. It is interesting to record that the membership list shows a slight increase over that of 1919. Today 148 members are on the roll as against 119 two years before. The contents vary but little, and comprise the usual reports of the annual meetings, with the text of the presidential addresses. Reports by the Secretary and Treasurer are given. Lists of new introductions and reviews of the work of the Examining Committee for the two seasons show particulars of the awards made to novelties. The leading exhibitors appear to have been Elmer D. Smith and Co. and Chas. H. Totty.

**Ornamental Nicotianas and the French Tobacco Regie.**—The Director of the Botanic Gardens at Nantes, France, has written to the *Revue Horticole* complaining that the French Excise authorities are making difficulties about the cultivation, purely for ornament, of a few beds of *Nicotiana glauca*, *N. glauca*, and *N. glauca*. Similar difficulties were experienced in 1906, when the local Horticultural Society of Nancy sought permission of the authorities to cultivate a number of species of *Nicotiana*, which are "Tobacco plants" only in name, and which had clearly been shown by M. Philippe de Vilmorin to contain no nicotine whatever. The Excise authorities were adamant, however, and sustained their decision on the wording of the law of 1816, which forbids the cultivation of "any varieties of Tobacco, without distinction of those intended for industrial uses, and those grown as ornamental plants." In face of such implacability, the *Revue Horticole* remarks, it is a lucky thing that the *Petunia*, formerly known as *Nicotiana axillaris*, was subsequently renamed by Jussieu. Otherwise, this charming plant might be for ever banished from French gardens!

**Rain and Snow as Fertilisers.**—Mr. F. T. Shutt, Chemist of the Dominion of Canada, in a report in *Rapport des Fermes experimentales Du Dominion*, sums up the results of his investigations of the sum of available nitrogen supplied annually to the land by rain-water and snow. The experiments were limited to determining the amount of free ammonia, albuminoid ammonia and nitrons and nitric nitrogen. During the year some 79 samples of rain and 25 of snow were analysed. The total precipitation amounted to 844 mm., of which 594 mm. were rain and 250 mm. snow (10 mm. of snow equals 1 mm. of rain), and the total amount of nitrogen applied by these precipitations was 7,971 kilograms per hectare (a kilogram equals 2 lb. 3 oz., and a hectare 11,960.33 square yards). It was found that the total amount of nitrogen supplied by rain and snow over a period of 10 years averaged 7,375 kilograms per hectare annually.

**Raising Orchid Seedlings on a Sugar Medium.**—Professor Kundson, of Cornell University, has successfully raised Orchid seedlings by sowing the seeds on a sugar agar in tubes. He conceived the notion that Orchid seedlings are not so dependent on certain fungi as upon the nourishment which the fungus provided. Nearly 100 per cent. of the seeds sown on the agar and kept in closed tubes germinated. The special process calls for expert knowledge such as only those engaged in bacteriological research possess and requires special tubes and sterilising apparatus. As the method ensures almost perfect germination and a quicker growth of the seedlings in the early stages it would repay practical growers to study the method.

**Kew Post Office.**—Kew occupies such a prominent position in the world of horticulture that anything connected with this famous little Surrey village is of interest to horticulture, and even the local post office has a quasi horticultural importance, for apart from it being the office where all the postal business of the Royal Gardens is conducted, the proprietor is a well-known horticulturist, Mr. A. C. Bartlett, who himself is an old employe of the gardens. This particular post office was robbed on Saturday last of money and stamps to the value of over £186, and the announcement that the whole of the sum was recovered through the capture of the thief will be a matter of congratulation to Mr. Bartlett by his numerous friends. Mr. Bartlett's appointment as Hon. Secretary of the National Sweet Pea Society was announced in our issue for the 11th inst., p. 287, and his appointment as Garden Superintendent at Wembley Park on p. 233. Beside holding these offices, Mr. Bartlett is Hon. Secretary of the Kew Guild, and the National Dahlia Society. He has received many congratulations from his friends in the horticultural world on the capture of the thief and the recovery of the property, for which he was responsible to the postal authorities.

**Memorial at Wisley to the late Mr. S. T. Wright.**—The handsome sundial illustrated in Fig. 123 has been erected by the past and present members of the Royal Horticultural Society's Fruit Committee in memory of the late Mr. S. T. Wright. It is of Portland stone and bears on the table the following inscription:

Erected by members of the Fruit Committee of the Royal Horticultural Society, in memory of Mr. S. T. Wright, V.M.H., Superintendent of the Society's Gardens, 1895 to 1922 and Secretary of the Committee from 1899 to 1922.

The site chosen in the R.H.S. Gardens, Wisley, for the memorial is near the Superintendent's house and the laboratory, and the sundial will be readily seen by all those entering the gardens

FIG. 123.—SUNDIAL ERECTED TO THE MEMORY OF THE LATE MR. S. T. WRIGHT.

in which Mr. Wright laboured so faithfully and well for many years. It is particularly appropriate that the Fruit Committee should be the first to erect a memorial in honour of this worthy gardener, for, apart from his labours on behalf of the Committee, he had a high reputation as a fruit grower before he entered the service of the R.H.S. and wrote an excellent work on fruit growing for amateurs, whilst his splendid essay on hardy fruit culture, which gained the R.H.S. prize in 1896, won high encomiums, and its excellence doubtless largely influenced the Council in their selection of a new superintendent for their gardens. It is a coincidence that two such famous pomologists as Mr. Barron and Mr. Wright should have held the office of Superintendent of the R.H.S. gardens, the one in succession to the other.

**The Royal Horticultural Society's Challenge Cups.**—We understand that the Council of the Royal Horticultural Society has decided to abandon the anomalous conditions whereby a competitor was precluded from winning the

Challenge Cups of the Society in successive years, and that in future these may be won year after year by a competitor until he is beaten. It will be remembered that Mr. Elisha Hicks drew attention on p. 242 to the confusion which the former rule caused, whereby an exhibitor was prevented from winning the Wigan Cup for Cups two years in succession, and that under those conditions the statement in the schedule that a certain cup was to be awarded to the best exhibit was often an anomaly, as it might go to the second best.

**The Capuchin Orange.**—This is a dwarf form of the common, sweet Orange, and is cultivated in the vicinity of Santiago de Chile, where it may have originated. *Plant Immigrants*, No. 197, gives an excellent illustration of a tree in full bearing, about the height of a man, and states that this small Orange is a promising subject for cultivation in tubs and other receptacles as an ornamental fruiting plant. The ordinary type of Orange is often cultivated in glasshouses in this country, although not so extensively as formerly, and this dwarf form, which is said to bear fruits of excellent quality, about two inches in diameter, with a thin skin, few seeds, and a flavour similar to that of the Washington Navel Orange, might prove an acquisition for cultivation in conservatories and greenhouses.

**Importation of Plants into the United States of America.**—The following extract from a notice issued by the U.S.A. Department of Agriculture on October 17, 1922, is being circulated for the information of all persons interested in the export of plants to U.S.A.:— "Secretary of Agriculture Wallace has approved an amendment to Regulation 7 of the regulations under Quarantine 37, providing for the freeing of imported plants from sand, soil, or earth by washing or other means. The requirement hitherto has been that such plants shall be thoroughly freed from earth by washing. The condition of freedom from sand, soil or earth is, however, to be strictly maintained. The amended regulation will shortly be distributed to importers and others interested. This action was taken as a result of an informal conference of the Federal Horticultural Board, October 3, with the Advisory Committee of the American Association of Nurserymen. It was represented by the conferees that the washing of the roots, particularly of certain classes of plants, as performed abroad, was a source of injury to importations and of considerable losses. Many instances of such injury were presented. On the other hand, it was brought out that this injury was due not to the fact of washing, but more often to the method of washing, and more particularly to the subsequent methods of packing and shipping. It was shown that such washing had been done in the case of certain countries without any injury whatever to classes of plants which were supposed to be most susceptible to such injury. Nevertheless, the importers were convinced that it would be more practicable to permit the removal of earth by shaking or other means where such removal could be thus effectively accomplished. As a result of a full discussion of this subject, the Board agreed to the modification of the regulations now authorised: This is a return substantially to the original requirement under Plant Quarantine 37 with respect to imported plants. The specific requirement of washing was a later one necessitated by the continuing increase of earth with plant importations, and the difficulty of setting up a definite standard of cleanliness which would be perfectly clear to the foreign shipper and determinable by the inspector of the United States Department of Agriculture. Hereafter all importations must, as hitherto, be freed from sand, soil, or earth by washing or other means. In other words, the condition of freedom from sand, soil, or earth is to be strictly maintained. Any importations not so cleaned will be refused entry."

**Memorial Trees.**—In an article on memorial trees in the *Bulletin of Popular Information* published by the Arnold Arboretum, reference is made to rows of *Cryptomerias* which shade the road leading to the temples in Nikko, Japan.

These trees were planted between 1631 and 1651, and extend for a distance of 24 miles along the road. A few of the trees have been killed by fire, but by the latest reports 18,508 trees are still standing and in good health. The story of their planting is interesting. When the Temple at Nikko, which is the burial place of Ieyasu, the founder of the Tekugawa Dynasty, was built, his successor in the Shogunate called upon the Daimios of the Empire to send each a stone or a bronze lantern to decorate the ground about the mortuary temple. All complied with the order but one man, Matsudaira Masatsuma, who, too poor to send a lantern, offered instead to plant trees by the roadside that visitors to the temple might be shaded from the heat of the sun. He did his work so well that these trees promise to live for centuries longer, and this memorial to Ieyasu is one of the important sights of Japan.

**Mineral Phosphates as Fertilisers.**—An article by Professor Gilchrist\* summarises the results obtained by using ground mineral phosphates on pasture. Provided that the mineral phosphate be finely ground, say 80 per cent. to pass through a 120 mesh (14,400 holes to the square inch), the results are as good as those obtained by the use of basic slag. At present prices the cost for treating an acre with mineral phosphate would be considerably below that of basic slag.

**To Destroy Cockroaches.**—*The Quarterly Bulletin* issued by the Agricultural Experiment Station of the Michigan Agricultural College, gives methods for eradicating Cockroaches. The author states that the most satisfactory method of getting rid of these pests is to scatter sodium fluoride about their haunts, and every individual which comes in contact with the fluoride will be killed. This is a very poisonous material and should never be used where children or domestic animals can reach it. A substitute is pure borax, and its effectiveness is increased if it is mixed with one-fourth of its bulk of fresh pyrethrum. A useful poison bait is made of three cups of linseed meal boiled in water until it is a consistency of "thin mush," one cup of molasses, and one yeast cake softened in a cup of water and permitted to stand until fermentation commences. These ingredients are mixed and two tablespoonfuls of arsenate of lead added. The poison may be spread on tins or plates in places where the cockroaches will have access to them. This poison is especially efficacious where cockroaches have access to little or no water.

**Appointments for the Ensuing Week.**—Monday, November 27: National Chrysanthemum Society's Floral and Executive Committees meet. Tuesday, November 28: Royal Horticultural Society's Committees meet; lecture by Mr. B. Crane on "Self-sterility and the Pollination of Fruit Trees." Wednesday, November 29: British Carnation Society's show; Irish Gardeners' Association's meeting; Elgin Horticultural Society's meeting. Thursday, November 30: London and North Western Railway Horticultural Society's annual meeting; Bristol and District Gardeners' Association's meeting. Friday, December 1: Paisley Florists' Society's meeting.

**"The Gardeners' Chronicle" Seventy-five Years Ago.**—*Chrysanthemums.*—At the Norfolk and Norwich Horticultural Society's late exhibition, I observed with pleasure a collection of dwarf Chrysanthemums, exhibited by Mr. A. Mackie, of the Norwich Nursery, affording as they did a striking contrast to the over-sticked plants generally exhibited. Most of the other plants were about four or five feet high, with about ten or twelve flowers, and staked out as formally as possible, while these in question were about nine or twelve inches in height, with from fifteen to twenty flowers on a plant; and what was of mere importance, they were nearly all without a stake, a feat which seemed to be duly appreciated. Should not this be a pattern to cultivators of this beautiful autumnal flower? *James Wensum, Norwich, Gard. Chron., Nov. 27, 1847.*

\* *Journal of the Ministry of Agriculture*, Vol. XXIX., No. 8, Nov., 1922.

## THE ALPINE GARDEN.

### GENTIANA SINO-ORNATA.

I AM afraid this handsome Gentian is in bad repute with many people who have tried to grow it and failed to establish it. This is undoubtedly due to failure to realise that this species in nature is a meadow plant, insisting on a covered surface and ample moisture during the growing season, and dislikes lime in soluble form. What the plant is capable of when understandingly treated is well shown by the accompanying illustration (Fig. 124) of a colony planted two years ago in the rock garden of Viscountess Northcliffe at her residence at Crowborough.

So late this autumn as November 2 there remained 645 open flowers and large buds upon this fine patch, in spite of two days of snow and high, blustering winds with which an otherwise sunny October departed. This should speak volumes for the powers of resistance

FIG. 124.—GENTIANA SINO-ORNATA, IN LADY NORTHCLIFFE'S GARDEN AT CROWBOROUGH, SUSSEX.

possessed by this plant and its great value for furnishing colour and attraction in the rock garden from September to, sometimes, late in November.

At Crowborough this Gentian grows in a delightfully natural piece of outcropping rock-work of waterworn limestone, constructed by Mr. Clarence Elliott, and Ericas grow well in the natural soil; a considerable amount of moisture drains through the slope upon which this rock garden is situated and upstanding boulders provide a certain amount of welcome shade.

Mr. Fulford, Lady Northcliffe's gardener, takes a keen and intelligent interest in the many fine and rare hardy plants under his charge and the collection of pan-grown Alpine plants for use in a sensibly constructed Alpine house will become notable before long. Mr. Fulford saw to it that no weeds were allowed to trouble this colony of *Gentiana sino-ornata* and that it did not suffer for want of moisture during dry and sunny weather. Lady Northcliffe is to be congratulated upon the unique effect achieved in an English garden, which could scarcely be equalled in the cool Alpine districts of the Chinese Alps where this choice plant is at home. *W. E. Th. I.*

## HARDY FLOWER BORDER.

### PHLOX DECUSSATA

THERE is a subtle charm in the hardy herbaceous border, with its irregular lines of plants of varying heights and constant change of colour from week to week. One of the most pleasing of all hardy border perennials is *Phlox decussata*, in its numerous varieties, that bloom over a long period. The beauty and usefulness of this border plant entitle it to the most prominent position in either large or small gardens. The extraordinary range of colour, so exceedingly bright, includes all shades from the snowy whiteness of *Tapis Blanc*, *Mia Ruys*, and *Mrs. Jenkins*, to the delightful pink of *Selma*, *Pantheon*, *Hodur*, and *Freya*, and others of shades of salmon, rich scarlet, crimson, purple, lilac and mauve.

The delicate fragrance emitted by the flowers is most refreshing and agreeable, being somewhat of a cinnamon odour.

The soil for Phloxes should be deeply trenched and richly manured, and if the plants are set in clumps of one colour, of from 3 to 6 plants, from 9 inches to 1 foot apart they will give a most glorious effect the following season.

It is advisable to lift, divide, and replant them the third season, when the ground should again be trenched and manured. Phloxes are also much benefited by a mulching of decomposed manure in the spring, and during periods of dry weather by occasional soakings of water.

During recent years many new and beautiful varieties have been sent into commerce by nurserymen, and the following list includes 28 of the most meritorious sorts:—

Pure white: *Mia Ruys*, *Mrs. Jenkins*, *Frau Antonin Buchner* and *Tapis Blanc*. White with a crimson eye: *Flora Hornung* and *Josephine Gerbeaux*. Soft pinks: *Mrs. Van Hoboken*, *Mrs. Scholten*, *Elizabeth Campbell*, *Freya*, *Hanny*, *Pfeiderer*, *Pantheon*, *Selma*, and *Sommerkleid*. Salmon, orange red to scarlet and crimson: *Veld Jensen*, *Coquelicot*, *Etna*, *G. A. Strohleim*, *Genl. Von Heutz*, *Rijnstroom*, *Thor*, and *Septemberglow*. Mauve, lilac, and shades of purple: *Marie Jacob*, *Antonin Mercier*, *Dr. Charcot*, *Iris*, *Le Mahdi*, and *Widar*. *W. Logan.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the  
DUKE OF MARLBOROUGH, K.G., Blenheim Palace,  
Woodstock, Oxon.

**Cypripedium.**—Warmth-loving Cypripediums, such as *C. Stonei*, *C. philippinense* (laevigatum), *C. Lowii*, *C. Parishii*, *C. Rothschildianum*, and hybrids, such as *C. Morganiae*, *C. T'Ansoni*, *C. Shillianum*, and others of this class, are growing freely, and need an ample supply of moisture, both at the roots and in the atmosphere. Syringing and spraying is not to be recommended during the winter, as water is apt to settle in the growths and cause decay. Although this class of plant requires plenty of moisture at the roots whilst in active growth, an excess of moisture must be carefully guarded against, as the loss of roots results from plants becoming saturated and in a waterlogged condition. Where Cypripedium flowers are appreciated, the summer flowering kinds are valuable, and make a strong contrast to the different varieties of Orchids which flower at that season. Winter-flowering Cypripediums are now in full bloom, and will make a good display far into the New Year. Varieties of this popular family of Orchids are very numerous; some are appreciated more than others, yet all are beautiful, and as winter flowering plants stand unrivalled for their lasting qualities, either as cut flowers, or upon the plants. Being of easy growth, their culture may be undertaken by anyone, and in foggy districts near large cities they repay perhaps better than any other plants the trouble taken with them.

**The Selenipedium Section.**—Members of this section, although not so popular as once they were, are still worthy of a place in collections. Plants that are root-bound and require repotting may be attended to, using similar compost to that recommended for the green-leaved section. The usual caution in watering newly-potted plants must be followed. Each plant should be kept moist at the roots, for if the leaves are allowed to lose their fresh and plump appearance through lack of water they rarely, if ever, recover.

**Resting Cirrhopetalums.**—Plants that have their new pseudo-bulbs developed may, with advantage, be kept on the dry side, but in the cultivation of these plants the resting period should be whenever they are ready for it, irrespective of season. The best time to afford them a period of rest is as soon as the new pseudo-bulbs are fully developed, when they will soon push new roots into the partially dry compost.

### THE KITCHEN GARDEN

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND,  
Esq., Balderahy Park, Thirsk, Yorkshire.

**Cucumbers.**—These plants will now require close attention, and the roots should be kept well fed with liquid manure and a concentrated fertiliser. On no account should the soil be over-watered. In mild weather a night temperature of 65° to 70° will be suitable. The pipes should not be overheated in very cold weather. Keep a sharp watch for red spider, but this pest will not appear if a moist atmosphere is maintained. The water used for syringing should be warmed to a temperature of 80°.

**Climbing French Beans.**—These plants will now be cropping heavily, and their roots should be stimulated with weak manure water and artificial manure. Maintain a moist atmosphere and admit air on every favourable occasion to assist the setting of the pods.

**Gas Lime.**—The present is a favourable time for using gas lime on the land. It should be spread at the rate of 2 tons to the acre, and allowed to remain on the surface for three

weeks, and then forked or dug in. This is a good remedy for club root, and where the land is infested with that disease all old stumps of vegetables should be cleared away and burnt before applying the lime.

**Shallots.**—These bulbs need frequent examination, as diseased specimens quickly infect the sound ones. Keep them spread out thinly in a cool shed.

**Rhubarb.**—Crowns of Rhubarb should be placed in warmth to ensure leaf-stems for Christmas. A Mushroom house is a suitable place in which to force Rhubarb, and the roots should be packed about with leaves, kept well moistened, and syringed every day.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY,  
M.P., Ford Manor, Lingfield, Surrey.

**Mixed Orchard House.**—If not occupied with Chrysanthemums, the mixed orchard house may be put into working order at leisure, as the trees need not be housed before Christmas. Washing the houses and lime-washing the walls are annual operations that may be performed in wet or wintry weather, whilst once in three years the inside woodwork should be painted. When this work is finished the trees may be introduced at any time. The house cannot be kept too cool and airy when the weather is not unusually severe, but the roots of the trees must not suffer for want of water, as drought is the most frequent cause of buds dropping. Birds are troublesome in some places, therefore the trees must be carefully watched. If potting has been neglected, it is not too late to complete arrears of this work, although if done at an earlier date the roots have more time to become re-established in the fresh compost. Maiden trees may also be lifted, potted, and again plunged in open borders. In the selection of Peaches, Pears, Plums, and Cherries for potting, no second-class variety should be chosen, as it is better to have a dozen duplicates of one good sort than one each of a dozen inferior varieties. Pears, Plums and choice Apples are specially adapted for cold house culture, especially in the northern counties, and will give good returns with careful treatment.

**Early Pot Strawberries.**—Assuming that these plants were stored for the winter, as recommended in a previous calendar, and the crowns have ripened well, they will not derive further benefit from exposure to heavy rains. The main batch may remain plunged and exposed to the elements, but plants intended for starting within the next few weeks will be the better for the shelter of a cold pit. Where a regular supply of forced berries is needed, a Strawberry house should be provided, and if this house is ready the shelves may at once be filled with suitable varieties in the small pots. The temperature during the early stages of forcing need not exceed 40° to 45° by night and 50° by day. A good body of fermenting leaves cast in beneath the shelves, whilst giving out a continuous moisture and gentle warmth, will very often maintain these temperatures for a long time; but, free ventilation being desirable, the pipes, as a matter of course, must be warmed when absolutely necessary. Early morning in the first stages is the best time to apply fire heat, and also to water the plants and, if necessary, to syringe the foliage. Tepid water should be carefully and judiciously used for watering through the early stages. In gardens where there is no special Strawberry house the first batches of plants may be introduced to warmth when the early Peach houses and vineries are closed for forcing. Strawberries are undesirable occupants of fruit houses, and the plants and pots should be cleansed with great care. All loose surface soil, weeds and dead leaves should be removed, and the apertures of the pots opened to ensure the free passage of water. Top-dress the plants with a rich compost, and dip the plants and pots in sulphur water as a preventive measure against red spider and mildew. The foliage should be regularly moistened with the syringe, and the roots watered carefully through the early stages of growth.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY  
GIBBS, Aldenham House, Hertfordshire.

**Roses.**—The Rose is an accommodating plant that puts up with a deal of hardship, yet, when the soil for its accommodation is properly prepared, it certainly yields superior results that amply repay for the extra trouble. Light, sandy loams are better for a good dressing of cow or pig manure, which should be applied prior to trenching, so that when the trenching is done, the dung may be well worked into the soil, helping to bind the lighter particles together, and forming a more suitable medium of firmer texture for the plants to thrive in. Heavy soil should be lightened, as closely textured ground holds water to an extent that is not likely to prove suitable to the well-being of the Roses. Chalk and gravel soils require other treatment. A certain proportion of chalky matter in the soil is beneficial rather than otherwise to Roses, but an excess is a disadvantage, therefore in each of these instances it is as well, if beds of Roses are to be formed, to excavate the existing soil to a good depth, and replace this with a suitable soil mixture, especially in the case of gravel soil, as this is, as a rule, very deficient in plant food. After the preparation of the site comes the question of obtaining the plants, and here I would strongly emphasise the necessity of getting the best plants possible, that is from a reliable source, and of good constitution. Cheap Roses are not necessarily those of low price, but those which give proper results, for the poor, low-priced plant is likely to fade away where the higher-priced ones would thrive, and thus the latter eventually prove the cheaper. Order the plants early, for the rule "first come first served" also means that the early comer often gets the best choice. Finally, do not select varieties merely from notes made at shows, for show blooms are picked specimens that do not exhibit the sturdiness or otherwise of the variety. The grower should choose good, sturdy, free-flowering varieties that will make the garden a thing of beauty. When the plants arrive from the nurseryman, trim the damaged roots carefully, making the cut from the underside, and plant in a hole of sufficient width to permit the roots to be spread to their fullest extent, and do not plant too deeply. Work some of the finer soil around the rootlets, and make the roots firm in the ground, treading the latter well to ensure this. Stake standards carefully, protecting the soft bark of the plant by a small lining of soft cloth from rubbing by the stake or cutting from the string. When planting is completed mulch the surface of the bed with long stable litter. Never plant in frosty weather, and do not form the beds in a position where drip from overhead will reach the plants during wet weather. If the roots are dry when the plants arrive from the nursery, puddle them in a mixture of soil and water for a few days until the Roses can be planted out into their positions, or, as an alternative, bury the plants in fairly moist soil for a day or two, the latter being the best when the whole plant appears dry, as it prevents the growths shrivelling up.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart.,  
The Node, Codicote, Welwyn, Hertfordshire.

**Chrysanthemums.**—As these plants pass out of flower the stems should be cut down to within six or eight inches of the pots and the plants arranged in a cool house, to furnish cuttings for propagation. I find it is advisable to spray the plants with Quassia extract or some other insecticide to keep the young shoots free from aphid, which is very partial to the young growths. Should mildew be present on the plants dust the young leaves with sulphur. To be successful in the rooting of Chrysanthemum cuttings the plants should be free from both these pests before any attempt is made to propagate them. Plants not yet in flower should be placed in a light position in a cool house and fed occasionally with weak liquid manure.

**Propagating Chrysanthemums.**—Certain varieties of Chrysanthemums that are grown to produce large flowers demand a long season of

growth, including Mrs. G. Drabble, W. Rigby, Queen Mary, and its sports, Majestic, and Mrs. J. Gibson. In their cases early propagation is necessary. The cuttings may be inserted singly in a small thumb pot or three may be inserted around the edge of a small 60-sized pot. After watering the cuttings with a fine rose can they should be stood in a propagating frame in a cool house. Many good varieties are very shy in producing cuttings, and it is a good plan, with these shy varieties, to shake the greater part of the soil from their roots and re-plant them in a light, open compost. The newly-potted plants should be grown in a house or frame having a temperature of 55°, when they will, in most cases, produce good strong shoots suitable for use as cuttings.

**Begonias.**—Begonias of the Gloire de Lorraine type that were allowed to bloom early are making a fine display. Another batch of the later plants may now be allowed to develop their blooms. Later batches of the varieties Optima, Ideale and Erita type should be allowed to develop their flowers, which should make a fine display towards the end of the present month. The plants should be grown in a temperature of 55° to 60°, admitting air in the forenoon whenever the weather is favourable. Continue to feed the plants lightly with a little concentrated fertiliser, which will greatly assist them to open their flowers at this dull season of the year.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barret.

**Bush Fruits.**—Where there is not sufficient head room for standards, young, healthy bushes should be planted. These will, with due care and attention, quickly grow to a good, fruiting size and produce heavy crops of fruits. In many gardens both bushes and pyramids are planted along the sides of paths, taking up very little room and yielding good crops annually. They may be planted 6 feet to 8 feet in from the path and 12 feet asunder in the lines. If the soil is naturally drained very little need be done in the matter of preparing the site, but if the soil is waterlogged in winter it will need to be drained. Do not plant when the soil is in a wet condition. Apples, Pears, Plums and Cherries may all be grown in bush form in this way with excellent results.

**Pruning.**—In pruning young trees select the best placed shoots to form the foundation of the tree. Prune to an eye pointing from the centre of the tree and repeat this operation annually till the desired height is reached. The main branches should be at fairly wide and equal distances apart so that both light and air may reach the centre of the tree freely. Prune to within a couple of buds inner shoots that are not required for extension; those selected to form the main branches may be left about 12 inches in length, a little more or less according to the length and strength of the growth. Bush trees that were planted a few years ago, if making gross growth, should be lifted or root-pruned; this attention is especially necessary when the soil is rich and deep.

**Plums.**—Probably the most profitable system of training the Plum, and that which is commonly adopted, is in fan shape. In this way young shoots may be retained both for fruiting and filling gaps should any of the main branches die; young growths trained in at intervals usually produce excellent crops of large, clean fruits in two years. Spur back laterals that are not required for extension to within a couple of buds of the main branches and see that the ties and other fastenings do not injure the bark. Plums require an ample quantity of lime in the soil, a sweet root run and plenty of moisture at the roots during the summer when the trees are bearing heavily. Those intending to plant desert varieties should not overlook the merits of Early Transparent, Jefferson's, Oullin's Golden Gage, Washington, Coe's Golden Drop and Comte d'Althaus's Gage.

## ORCHID NOTES AND GLEANINGS.

### CATTLEYA SNOWCAP.

A FINE flower of this beautiful cross between *C. Claesiana alba* (intermedia *alba* × *Loddigesii alba*) and *C. Saturn* var. *alba* (*O'Brieniana alba* × *Gaskelliana alba*) is sent by Messrs. Armstrong and Brown, Orchidhurst, Tunbridge Wells, who raised and flowered both the parents in 1916 and crossed them again with the object of securing improvement in white Cattleyas, an endeavour which, judging by the flower sent, has been successfully accomplished. This first flower is six inches across, the petals broadly ovate; the distinctly three-lobed lip has the highly developed side lobes turned back at the margins, the almost circular front lobe being slightly serrated. The whole flower is of the firm substance of *C. O'Brieniana alba*, the faintest suggestion of sulphur-yellow only appearing on the lip.

## FOREIGN CORRESPONDENCE.

### FORESTRY IN FRANCE.

WHAT France has lost by disafforestation was the subject of a spirited address delivered by M. Paul Descombes at the inaugural meeting of the recent annual gathering of the French Association for the Advancement of Science at Montpellier.

Before the Revolution, 27 per cent. of the soil of France was forest land. The abolition of vast estates and the passing of the land into the hands of the peasant class which followed the great upheaval of 1789-93, was, on the whole, a benefit to France. But it was fatal to the forests, which were ruthlessly cut down till they represented only 17 per cent. of France's area. In 1860 the matter was seriously studied by the Minister of Finance, and plans prepared for replanting on a large scale. But only about one-seventh of the pro-

FIG. 125.—CYPRIPEDIUM GWEN DIXON, R.H.S. AWARD OF MERIT, NOV. 14 (SEE P. 302).

### LAELIA DAYANA COERULEA.

MR. E. W. THOMPSON, gardener to Philip Smith, Esq., Haddon House, Ashton-on-Mersey, Manchester, sends a flower of the pretty blue-tinted *Laelia Dayana coerulea*, and also a very interesting flower of a variety of it raised from seeds obtained by fertilising the var. *coerulea* with its own pollen. The flower of the home-raised seedling closely resembles that of the parent plant, although not sufficiently developed to show the beauty which it will attain when fully matured.

The sepals and petals of the variety are pure white tinged with sky blue. The lip has the dark lines in the centre characteristic of the species, but Tyrian purple in colour, the same tint being shown on each side of the front lobe of the lip, the middle of which is white with blue margin.

It is an interesting case, proving that well-marked varieties may be perpetuated in this way, and other variations of the type produced by selfing.

grauame was executed. The wonderful work done in reclaiming the marshes of the Landes, now one vast forest of Pine trees and a centre of the resin and mine-prop timber trade, is familiar to all who know that part of the country. Less known, but also important, are the plantations in Sologne, the Dombes, and on the mountains, where the denuded slopes were (and too often still are) a source of continual catastrophes and devastation along the courses of their torrents. But the war of 1914-18 broke out ere much had been done, and once more the French woodland was impoverished for fuel, wooden huts, trench props, and even road-making. Had France kept her 27 per cent. of woodland, said M. Descombes, she could have utilised her water-power, and thus avoided the payment of immense sums abroad for the purchase of coal during the war. He estimates the loss caused by disafforestation at 50 milliards of francs, which represent £1,000,000,000 sterling at present exchange. F. Ashford White, 8 bis, Rue Jouffroy, Paris.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the Editors. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## MISS MALING ON FLOWERS.

IT was surely a sign of the times that in one year two books on cut flowers should have been published, especially when these were the first to discuss the subject. I have already made a few notes on Mr. March's book (in the issue for September 23, 1922), which, though published in the same year, 1862, must give place as to priority to Miss E. A. Maling's *Flowers for Ornament and Decoration and How to Arrange Them*, which appeared earlier in that year. Moreover, it had already seen the light in the pages of the first and second volumes of *The Journal of Horticulture*, in which the authoress wrote under the letters *E.* and *E. A. M.* She was the authoress of other books, one on song birds and two on plant growing, and besides her aviaries she had four plant cases and Wardian cases to attend to, as well as the experiments in bouquet making which she records, so that these domestic pursuits could have left her leisure for little else. Her flower-book extends to 142 pages in small 8vo, and was republished in 1867 along with two other of her writings as a *Handbook for Ladies*. It is perhaps worth noting that the chapters in *The Journal of Horticulture* are differently arranged from those in the book, and, more strange still, that the composition is considerably altered and never for the better, grammatically.

The flowers she employed were mostly different from those popular to-day. Camellias were the super-flowers. Of Roses there were de Meaux, Geant des Batailles, Maiden's Blush, Banksia, and a few others, Carnations, Pinks, Tulips, Hyacinths, Heaths, Azaleas and Pelargoniums, and others. There were also such things as Lobelia, Scilla, Thorn, Verbena in great variety, Lilac, Gloxinia, Calceolaria, Achimenes and Fuchsia, and here we get the correct spelling of the dainty Madame Cornelissen Fuchsia. She fondly imagined that she treated flowers in a natural manner, and, indeed, provides very excellent maxims. But when she descends to the practical, or, as she terms it, the mechanical part, her talk is seen to be all sentiment: nothing, indeed, could be more artistic and unnatural than the method she advises for the arrangement of flowers.

I think she must have been the very first to advise using flowers nearly stemless, a hint of which she obtained from a French bouquetiere. Flowers were cut with half an inch of stem, and were prepared with a little wet cotton wool, fastened with a bit of wire, and attached to a "wooden stick" for a stem. Preparatory to the flowers being arranged, a light framework of wire was constructed, and covered with fine netting, through the meshes of which the sticks were thrust, and, if a bouquet, tied together underneath. There were various styles of making up. For one, in concentric rings, take

this as an example. The centre, a bunch of a pink flower, next a ring of white Lilies, then another ring of Rose de Meaux, a favourite flower at that period. The next ring, flowers in mixture, and the outer ring of blue Scillas, with an edge of Fern fronds and Lily leaves. Another example is one composed entirely of Verbenas in many colours. These to be shaped on cardboard in "points," and any flowers over high or that overlap to be trimmed level and to shape with a pair of scissors. Others were composed all of one colour, with a wreath of many colours superimposed, while the most desirable of all was that into which a monogram was worked, a very difficult style to succeed with in a bouquet; but, if in a vase you could fill it with sand and mark the letters thereupon, and quite easily carry out the scheme by sticking in the proper flowers in the proper places!

For a dinner table, since the Russian style came in, nothing was so excellent for a centre piece as a boy, or two boys, or even a girl in Parian supporting a flower receptacle, and a few small vases *en suite*. She had recently invented a coloured glass vase standing in a dish for holding fruit that she thought would please. A figure of this centrepiece is given as a coloured frontispiece.

For the decoration of drawing-rooms flat dishes were "charming ornaments," and even a soup plate was not to be despised, and these again were furnished in a manner that we, in our day, would esteem fantastic. And what will readers think of this:—"For standing in the centres or corners of conservatories, for staircase windows, or for little ante-rooms, nothing can be more beautiful than an enormous sort of stand made of majolica, and lighted up in the most remarkable manner by a ring of Auriculas or Daisies set closely round the edge. One tall flower in the centre place, with low growing flowers all round, with a bed of Moss would be truly beautiful." In recesses and for window niches it is recommended to place such flowers as Lilies, Irises, Hyacinths and Narcissi, and also Gladioli in bottles of water tricked out with Moss to hide the receptacles. But of all the things she recommends, "Floral Pavements" are the most curious. The idea originated in Italian church decorations. For England they would be suitable for village feasts, "gay weddings in little country places," and "little conservatories—not intended to be walked in." The patterns are numerous: A mere tile pattern, a tessellated pavement, coats of arms, etc. "The Lily is a most lovely pattern," "the Union Jack would seldom come amiss, and the Red-cross banner of St. George would be always welcomed." And she concludes: "It really seems surprising that such a decoration should have remained so long untried." Very complete directions are given how these pavements were to be composed.

Miss Maling, with all these vagaries, had, however, very good ideas. She thought Water Lilies floating in water to be the proper way to use these, and the remarks on colours and on preserving flowers are correct. And, indeed, a manual published 35 years ago, subsequently perused to-day along with Miss Maling's, reads far more extravagant in its methods, and the accessories recommended. Long lists of varieties of then popular flowers are given, and she mentions an "exquisite pale rose-coloured Carnation" which bloomed "almost continuously from July to February," and The Bride as being a strongly Clove-scented as the old red Clove. To conclude, Miss Maling wrote for the middle-class lady, in this differing from Mr. March, who was an official in one of the royal palaces, and viewed floral decorations from a somewhat different standpoint.

It cannot be disputed that immense strides have been made in the arrangement of floral decorations since the times of Miss Maling and Mr. March, yet, whilst their work would appear to be stiff and ungainly compared with the light and artistic methods employed nowadays, they were pioneers in the art, and we owe a great debt to them, for we have been enabled to use their work as a foundation on which to evolve something more graceful and pleasing in the arrangement of flowers. R. P. Brotherton.

## TREES AND SHRUBS.

## THE BEST FRUITING THORNS.

UNLIKE many trees and shrubs which are gay with autumn fruits in favourable seasons, the Thorns or Crataegus produce abundant crops of fruits most years. When it is remembered that considerably more than one thousand species have been described, chiefly natives of Eastern and Central North America, it is not an easy matter to select the best dozen distinct Crataegus to plant as specimen lawn and pleasure ground trees. Thorns thrive in most soils and positions and are readily raised from seeds. Trained with a single stem, they form attractive, round-headed specimen trees 15 to 20 feet or more in height.

First on the list I should place the Oriental Thorn, *C. orientalis* (Fig. 126), with rich, light red, globose fruits  $\frac{3}{4}$  inch in diameter. It was first introduced in 1810, and there are quite a number of good specimens in several London parks and gardens. *C. mollis*, the Red Haw, with fruits up to one inch in diameter, is a wonderful sight in autumn, the branches thick with brilliant red fruits. *C. Carrierei* is a hybrid Thorn of doubtful origin. It is particularly valuable because the large, globose, orange-red fruits hang on the tree far into the new year. Being a hybrid, this Thorn must be increased by grafting. The Washington Thorn, *C. cordata*, with its quantities of small scarlet fruits, is suggestive of *Pyracantha coccinea*. It is one of the latest Thorns to flower, and one of the last to provide food for the birds, long past Christmas. *C. succulenta* is very conspicuous, with quantities of globose, bright red fruits  $\frac{1}{2}$  to  $\frac{3}{4}$  inch wide.

*C. Oxycantha* var. *Gireoudii* (Fig. 127), a form of the Hawthorn or May, is notable because the younger leaves are streaked with white and pink in summer. No Thorn, however, surpasses it in the regularity and quantity of dark-red fruits produced on the small, wide-spreading trees. *C. macrantha* is a wonderful sight in November, with its giant thorns protruding among the hosts of dark red fruits. *C. Crus-galli*, the Cockspur Thorn, and *C. prunifolia* have points in common as ornamental trees. In some seasons one is better than the other, but if space can be found, both ought to be grown, though it is not easy to put both in a list of the best twelve.

*C. elongata* is one of the best and most distinct of the newer American Thorns, with scarlet roundish oval fruits fully an inch long. In habit the tree is open and wide-spreading, the fruits hanging later than on many other species. *C. coccinea*, the Scarlet Haw, is said to be the first North American Thorn introduced to Britain, 1683 being the reputed date. It produces an abundance of brilliant red, globose fruits,  $\frac{1}{2}$  inch or rather more in diameter. *C. arkansana* promises to be one of the most distinct of the newer American Thorns, the large red fruits being among the first to colour in autumn. A. O.

## CORNUS KOUSA VAR. CHINENSIS.

AMONG the many new trees and shrubs introduced to our gardens from China by Mr. E. H. Wilson, this bush or small tree, in flower or fruit, attracts everyone by its distinctive beauty. I should place it among the best six of Mr. Wilson's introductions.

*C. Kousa* is a widely distributed shrub or small tree in North-East Asia and shows considerable variation. Of those in cultivation from Central China, Corea and Japan, by far the best form is No. 223, Wilson, introduced from W. Hupeh in 1907 and named var. *chinensis*. This is a bush or small tree up to 20 feet high with a wide, spreading top. The flowers are inconspicuous, being closely crowded in a small cushion-like mass three-quarters to one inch across. The beauty lies in the four creamy-white bracts surrounding the head of flowers, which are  $3\frac{1}{2}$  inches across. Lasting for fully two months (May and June), the bracts change with age from white to a pink flush. In autumn the bushes attract very considerable attention when carrying a good crop of the long-stalked red, Strawberry-like fruits  $1\frac{1}{2}$  inch across.

We have long envied the comparatively few counties where the Strawberry Cornel, *Cornus capitata* (syn. *Benthamia fragifera*) thrives. In the subject of this note we have a most promising and attractive substitute.

Propagation so far has been by layering and cuttings, but now that fruits have ripened with apparently good seeds embedded in the fleshy portion, increase should be more rapid. A. O.

### SEEDSMEN'S CATALOGUES.\*

In the short time at my disposal I do not intend to go into the origin and growth of the seedsmen's catalogues, though that, doubtless, has interest, but rather will deal with the latest development of the same, especially in respect to the Potato trade.

My first approach to the subject had a curiously upsetting effect. I had studied several of the illustrated catalogues of some of our most famous houses, when it suddenly

For this is just the crop which is to be inferred from many of our contemporary catalogues, and it is no wonder that not only the king's daughter, but her parents too, are led to visit the resplendent nurseries where such wonders are.

But my object in studying catalogues was not primarily literary. I had often spent a happy hour looking over the numerous catalogues which nurserymen so kindly sent me for my enjoyment and edification. Often have I replanned my garden in my imagination, planting it with all the latest glories of the seedsmen's art, that it was almost with a feeling akin to sacrilege that it occurred to me to make a study of these same delightful catalogues with the cold, prosaic object of discovering whether the promise given in the descriptions approximated at all closely with the final product one grew. With that end in view, I have confined my attention wholly to the question of Potatoes, a subject to which I have devoted 17 years of close study and research.

manifold synonyms, duplicate prices, and self-laudation with which they have disfigured those sections of their catalogues devoted to the Potato—and after the funeral we will turn to and praise.

I dare say some of my audience will be astonished at the somewhat sweeping accusations implied in this statement. But I will soon show you that I am not overstating the facts. Let us first deal with the question of synonyms. Of all the catalogues examined, only one entirely avoids classing the same variety under two or more different names. Indeed, this catalogue carefully points out the synonymy of such varieties as Duke of York and Midlothian Early, Eclipse and Sir John Llewelyn. With this exception, every single catalogue falls into this pit. Indeed, it is a problem of psychological interest, for 19 out of 20 of the firms know perfectly well that Duke of York and Midlothian Early are one variety, as Eclipse and Sir John Llewelyn are another, and yet, year in, year out, firms of

FIG. 126.—FRUITING BRANCHLET OF CRATAEGUS ORIENTALIS.

dawned upon me that I was on the verge of making a great discovery. From the days of youth till now I have been interested in the origin of nursery rhymes and tales, and lo! here, staring me in the face, were the origins of some half-dozen of the most famous. Surely the key to the problem was that they were not nursery rhymes, but rhymes of the nurseryman! For no author would ever have conceived the mighty Beanstalk of the hero Jack, had he not received the notion from a study of seedsmen's catalogues, where one Bean out-views the other in its efforts to reach high heaven.

Who could have conceived of a coach being evolved from a Pumpkin if he had not really intended to introduce the fact that just such a prodigious Pumpkin was pictured in his catalogue.

If my subsequent studies somewhat damped my first enthusiasm for literary discovery, they did at least lead me to see the deep meaning attached to that earliest of nursery ditties:

"I had a little Nut tree,  
Nothing it would bear  
But a silver Nutmeg  
And a golden Pear."

\* A paper read at the Potato Conference, Ormskirck, Nov. 2, 1922, by Redcliffe N. Salaman, M.A., M.D.

Entirely uninterested as I am financially in the Potato trade, I should not even now venture to place before you the results of this review of the annual catalogues, were it not for the fact that I have a very great regard for many of those who are leaders in the trade, and feel sure that it is only necessary to point out the disquieting state of affairs that I shall describe for an improvement to follow. Although I have studied series of catalogues reaching back to 1864. I intend to limit myself to those English, Scotch, and Irish catalogues issued in the years 1921 and 1922, of which I have carefully examined 30 examples. I would say at once that the general appearance and get-up, the illustrations and the paper have all improved beyond recognition when compared with the catalogues of even 20 years ago. It was also with no small satisfaction that one observed how greatly the English catalogues surpassed in these respects their French, German, Dutch, or Japanese competitors.

But I came here to "bury Cæsar, not to praise him"—to point out certain glaring faults which disfigure our seedsmen's catalogues, to induce my friends in the trade to root out the evil and bury in one grave the whole pompous collection of false descriptions,

the highest standing, whose catalogues are otherwise unexceptionable, are guilty of this solecism. I presume it is in answer to some subtle demand on the part of the public, which objects to its cherished convictions being flouted. Yet, even so, it is hardly necessary to go to the length of describing the Duke of York as a "forcing variety" and Midlothian Early as just an "early," or reversing the process, as one dealer does, and describe Midlothian Early as a "1st early" and Duke of York as "2nd early or main crop." If we allow the inclusion of the synonyms of these two varieties to pass as a sop to public sentiment, it must not be thought that extenuating circumstances can be pleaded for a further synonym of these varieties. There is really no room for Eclipse, Sir John Llewelyn, and First Crop in any catalogue, no matter how distinguished the firm that issues it. However, I find there are only three of the remaining 29 catalogues which include no further examples. Indeed, the remainder may be classed into a small group, which, in addition to the Duke of York—Midlothian Early and Eclipse—Sir John Llewelyn synonyms, only bow the knee to what would seem to be the very god Rimmou of the Potato trade. I speak, of course, of Up-to-Date. Our most representative firms

insist on listing Factor as if it were a distinct variety, and attach to each separate and startlingly attractive descriptions. The larger group contains those who are not content with the venial errors of synonymy, but rather seem to pride themselves in listing the same variety under the greatest possible number of names. Let me give a few examples. In one catalogue, out of 20 main crop varieties under different names, no fewer than 6 are Up-to-Date. But let no one think that Up-to-Date is the only victim. Potato dealers have catholic principles, and there is no variety worth growing which some dealer, more enterprising than accurate, will not dub with an attractive name and send out as a new variety with a fascinating description and an enhanced price.

To take only a few cases: Sharpe's Express masquerades under the name of Early Bird and Perfection. British Queen, as befits a Queen of Britain, has endless titles, such as Royalty, Beauty of Essex, Colleen and Mainstay. Abundance has, as one might expect, and as its virtues indeed command, an abundance of counterfeiters, such as Bloomfield, Kerr's White, Culders Castle, Bountiful, Crofter, Colossal Beauty; whilst one dealer introduces Abundance under the name of White Rose, dilating on the novelty of his discovery. But when we turn to Up-to-Date, the names under which this splendid variety is presented to the public by the trade are legion. The Scotch Board of Agriculture, I believe, has discovered no fewer than 150 such synonyms, and there are at least another 50 whose appearance on the market has only been hindered by the good offices of the Synonym Committee at Ormskirk. The extent to which this deplorable practice is prevalent may be gauged by the fact that in one catalogue there are 3 synonym varieties amongst the earliest, and no fewer than 6 in the main crops, all of which latter are Up-to-Date; whilst in another, out of 13 first earliest 4 are synonyms; of the 11 second earliest 3 are synonyms; out of the 20 main crops 7 are synonyms, of which 5 are Up-to-Date. These are, perhaps, extreme cases, but I have already stated that, if one excludes the Duke of York and Eclipse synonyms, there are still 26 out of 30 catalogues which contain a greater or less number of palpable pretenders to their assumed titles.

There is another and still less pleasant aspect of this subject to which I must allude. It might be thought that, as "a Rose by any other name would smell as sweet," it does not matter whether the public buy their Up-to-Date under the name of Factor or Duchess of Cornwall, or their Abundance, let us say, as Bloomfield. They will get the variety they want and the crop they deserve. True! But what about the season to which the synonym is ascribed and the price which is demanded for it? A few examples will suffice to show the position which has been allowed to grow up.

In one catalogue, Duke of York is described as 2nd early, and its synonym, Midlothian Early, as an early. In another, Duke of York is described as a forcing variety, and its synonym, Midlothian Early, as an early. In another we find Eclipse described as an early, and its synonym, Sir John Llewelyn, as a 2nd early. And in a further case we find Duke of York described as an early, and its synonym, Success, as a main crop. And, finally, Up-to-Date is described as a main crop, and its synonym, Lord of the Isles, as a 2nd early.

We find the same misleading statements made in respect to such innate characters of a variety as its immunity to disease. Thus one catalogue describes Factor as being "like Up-to-Date, but more robust and much less prone to disease." Another states that Dalmatian Hero, which is Up-to-Date, is "an excellent Potato from every point of view," and that Duchess of Cornwall, which is likewise Up-to-Date, "is a grand cropper and free from disease," and a third describes Duke of York as a "first early and still a first favourite," whilst its *alter ego*, Midlothian Early, is a "great disease resister."

It is, however, when one turns to the question of prices asked for these false varieties that one grasps the full inwardness of the whole thing. Let me give some

examples. In one and the same catalogue we find Duke of York at 5s. 6d. per 7 lb., and its synonym Midlothian Early at 3s. per 7 lb.; in another, Eclipse at 6s. per bushel, and its synonym Sir John Llewelyn at 8s. per bushel. Good examples are Queen Mary at 2s. 8d. per 7 lb., and its synonym Royal Kidney at 2s. 3d. per 7 lb.; British Queen at 2s. 3d. per 7 lb.; and its synonym Beauty of Essex at 2s. 6d. per 7 lb. Again, Up-to-Date at 2s. 6d. per 7 lb., and its synonym Factor at 2s. per 7 lb.; in another, Up-to-Date at 9s. per bushel, and its synonym Factor at 11s. per bushel. But perhaps the best example is Up-to-Date at 2s. 8d. per 14 lb., and its synonym Sensation at 3s. 6d. per 14 lb., a difference of £6 13s. per ton, indeed a sensational sum even for so masterful a brain effort!

It would be as easy as it would be unpleasant to extend this list, but I feel I have done enough to show how serious is the condition of affairs.

I will only briefly refer to one other matter—the rather blatant "puffs" which several seedsmen give to their new varieties—puffs which are as strident when describing an old variety they have "lifted" and rechristened, as of a really new but all untried one. But a study of catalogues of past years would be found, I think, to have a sobering effect in this respect. As one turns over the pages of these records of the new varieties of the last generation, one realises how few of them have stood the test of time, for in these records one meets examples both of the genuine new variety, which, like a timid debutante, blushing takes its place in the thronged mass of its competing sisters, conscious of its quality and birth, and of that other type which, with storm and bluster, elbows its way into notoriety, conscious, indeed, of its quality—for has it not been stolen?—but which smotherers its illegitimate origin by some high-sounding title. Yet both alike have their short day and pass into oblivion. Have we already forgotten the days of the Potato boom, when the public were robbed of their hundreds of thousands of pounds by the boosting of a bad stock of Evergood and calling it Eldorado? However great the use may be of advertisement, Shakespeare knew best when he said, "Sweet are the uses of adversity!"

Of course, it may be argued, the question is very largely a matter of taste, and there I would gladly leave it, were it not essential to point out that real scientific cropping and maturity tests have in this country only been applied to the Potato during the last year or two, and that none of these new varieties have been put through the mill, and many would give but a sorry account of themselves if they were.

Before very long the report on the trials instituted at Ormskirk will be published, but, as I have myself had some considerable experience in this direction, I can assure you that it is no easy matter to determine whether any given variety is earlier or more prolific than any given standard one. Yet in our catalogues it would appear to be the simplest of matters.

I fear I have trespassed somewhat severely on your patience, but I rely on the sound common sense of the trade to realise that the state of affairs which I have discussed is, to use not too severe a term, a scandal, and one which no great self-respecting trade of national import, such as is that of our Potato seedsmen, can long endure in these days. Indeed, I much doubt whether in any other trade such unblushing misdescription of the goods offered to an unsuspecting public has been suffered to continue so long.

In respect to synonyms amongst these varieties sent for trial to Ormskirk, the reports which the Synonym Committee of the National Institute of Agricultural Botany have published have brought about a rapid and welcome amelioration. This Committee, of which I have the honour to be chairman, is composed for the most part of members of the Potato trade. I am convinced that, if the trade can assert itself, as it has already done at Ormskirk, in regard to one aspect of the evil, it surely can and will assert itself

in the matter of synonyms and false descriptions with which the catalogues of so many of its members are disfigured. I have, perhaps, spoken more openly and directly than some will care for, but it matters not if by so doing I have awakened the trade to the existence of an evil unworthy of the high standards of the English seed trade in general.

## GARDEN NOTES FROM S.W. SCOTLAND.

THE immense and yearly increasing multitude of beautiful shrubs from among which every owner of a private garden, even the most extensive, has to make a selection, renders it more and more necessary to choose none of indifferent merit. Judged from a decorative point of view, Corokia Cotoneaster, a bizarre member of the Cornel family, was hardly worth bringing from New Zealand nearly fifty years ago; the proper place for it is a botanic garden. But Corokia virgata, a more recent introduction, is a very different proposition. It came here a few years ago under the name of *C. buddleoides*, another New Zealand species; but I fancy it is the plant which Cheeseman collected at Spirits Bay in the North Island, and which he mentions in his *Flora*, of 1906, as likely to prove a new species. Here, it is already 6 feet high, of erect habit. The leaves, dark olive green and glabrous above, are clothed with white tomentum below, as is also the young growth, contrasting with the black, older wood. It is a pretty object in spring, when thickly set with yellow, starry flowers, to be followed, in ordinary seasons, by yellow berries. In the present ungenial season, no fruit has matured. Long after November gales have despoiled the Rowan and Gean of their splendour, the Caucasian *Zelkova crenata* (still known sometimes as *Planera Richardii*) remains conspicuous in its ample autumn mantle of rich gold. It is a pity that this tree is not more commonly planted for effect in the fall. The foliage remains green till the very end of October, when it changes quickly and lasts in splendour for a full month. *Nothofagus ubliqua*, the Roble Beech from Chile, is also valuable for late display. A seedling between 2 and 3 feet high was sent here from Kew in 1906 to test its hardiness. It is now 40 feet high, of very graceful habit, and has never suffered from spring frost, although it comes into leaf a fortnight before the European Beech.

The unless summer which we have had to put up with this year has caused the Pampas Grass (*Cortaderia argentea*) to be very late in flowering. Only now—in mid-November—is it pushing forth its snowy plumes, which are bound to meet with rude buffeting in these shortening days. A native of Brazil, although perfectly hardy and of vigorous growth on our west coast, it needs more sun-heat than we can provide to bring it forward, and I strongly recommend the New Zealand Silvery Reed-grass (*Cortaderia conspicua*) as much better adapted for northern gardens. This plant, usually known as Arundo conspicua, does not produce the mountainous tussocks of foliage that distinguish Pampas Grass, but makes a handsome sheaf of bending leaves, a suitable setting for the arching wands—8 to 10 feet long—that bear the noble heads of silky-white flowers. One cannot pronounce one of these great grasses to be handsomer than the other, but the New Zealand species comes into flower far earlier than the Pampas Grass, and lasts longer in beauty. It began the display this year in August, and the waving plumes are still untarnished.

Last August, when noticing in the *Gard. Chron.* the beauty of *Dierama* (*Sparaxis*) *pulcherrimum*, I offered to send seeds thereof to anyone who cared to send a stamped directed envelope. I have a large bundle of envelopes sent in response to that notice, but I regret to say it is very doubtful whether I shall be able to fulfil the undertaking. Owing to the extraordinary cold of last summer, and the consequent lateness of the season, a very poor crop of seed has formed. What there is, is not yet ripe, nor does it seem likely that it will ever ripen properly. However, correspondents may be sure that I will do my best. *Herbert Marwell, Monreith.*

**THE CARE OF LAWNS.**

ONE of the principal aids to the general attractiveness of the flower garden and shrubbery is a well-kept lawn. The perfect lawn should consist of fine grasses, be dense, uniform, elastic, evergreen and free from extraneous vegetation. It is easier to appreciate such perfection than to attain it, particularly on the light, hungry soils of this part of Surrey. Nevertheless, even under the most adverse conditions the best results may be obtained if the treatment is conducted on the right lines. Patience is, however, essential, as it is impossible in one year to convert a bad lawn into a good one.

The causes of failure with lawns are not far to seek. Instead of being, as in the case of the vegetable and flower gardens, continually enriched by the addition of manure, fertilisers and decayed vegetation, the lawn is constantly impoverished by the removal of the mowings, and frequently no manure is added. It must be borne in mind also that the grasses are not able to store food reserves in their root systems and consequently suffer much more quickly from impoverishment of the soil than many of the tap-rooted weeds. Hence a secondary result of the deterioration of a lawn is the appearance of a more vigorous type of unwanted vegetation. These intruders, it is true, give the lawn a luxuriant greenness at certain seasons, but they crowd out the finer grasses and are finally the cause of unsightly, bare patches. Such vegetation, however, would have little chance of establishing itself in a lawn where the grass is kept in a robust and healthy condition.

Another matter deserves special mention. One of the principal causes of failure to obtain or maintain a good lawn is deficiency of humus. This applies especially to the light, sandy soils of this neighbourhood. One cannot, in this locality at least, maintain a lawn in a state of perfection simply by feeding, even generously with artificial fertilisers. Humus is continually removed by the process previously described, and it is, therefore, essential to replenish it frequently. These remarks would have less force in the case of a deep, rich loam.

It is thus obviously desirable when preparing for a fresh lawn to incorporate into the soil as much organic manure as possible. This may be in the form of farmyard manure, if available, but that derived from decaying vegetable matter from the compost heap is equally good. In the case of existing lawns similar material is very suitable, but as it must be given in the form of a top dressing it is essential that it should be well-decayed, free from weed seeds and stones, and in a fine state of division. Due thought must be given beforehand to the preparation of this material. In the winter all available leaves should be collected and stacked in the open, taking care that no seeding material is included in the heap. In the following year this partly-decayed material may be mixed with an equal quantity of lawn mowings as these become available and a sprinkling of finely-ground limestone added. By this means a heap of ideal compost equal to the famous *terreau* of French gardens becomes available, and if one wishes to use artificial fertilisers, such as kainit or bonemeal, these may be incorporated with the heap and the whole applied in one dressing.

The best time to apply this material is in the autumn, as soon as mowing becomes no longer necessary. All intruding weeds should, so far as possible, be removed; the lawn should then be thoroughly prodded with a spiked turf-maul, and the top dressing be swept into the holes where it becomes immediately available to the roots. This top dressing should be given at least once annually and very weak places may be encouraged by being given a further dressing during the growing season, if the operation is carefully carried out.

Lawns treated in this way respond much more readily to the application of nitrogenous or other stimulating manures during the summer and resist drought much longer than those not so treated. *W. Auton, Pyrford Court Gardens, Woking.*

**GREENWICH PARK.**

By far the most important lung of South London, Greenwich Park, may rightly claim supremacy for the wealth and variety of its flora, the magnificence of its trees, its areas of undulating grassland, its unique collection of shrubs; but, most of all, for that sequestered corner which can boast, in the truest sense, the name of the flower garden.

The latter garden is so enclosed by the judicious planting of tree and shrub, that once in it, one finds it difficult to realise that it is only a mile or two from London Bridge. Its shape is something of an irregular triangle, and its area about 4 or 5 acres. The arrangement of the place is simple, yet artistic; a long, curving border running from one end to the other on the south side, a very wide herbaceous border on the west, while on the other side are borders which are used to display the merits of one species of plant alone, and the effect of this can only be judged by those who watch the development of the several subjects used through the whole summer.

pany with *Lantana delicatissima*; *Lilium auratum* and *L. speciosum*, with *Fuchsia Amy Lye*, and the golden-leaved *Fuchsia*; *Leucophyton Brownii* and *Verbena Ethereal*; *Kochia* and *Celosia*; *Fuchsia gracilis* and *Begonia semperflorens*; *Salpiglossis*, blue and gold, and golden; *Godetia*, *Lavender* and *Gladiolus primulinus*. A border filled with *Antirrhinums* has been a blaze of colour the whole summer, and was charming even late in the autumn. During July a very fine display of *Delphiniums* filled another border, every plant being a specimen of good culture; all the very best varieties were used, which, as they were labelled very distinctly, proved a boon to the visitor, and, incidentally, to the trade. The border of *Dahlias*, too, may claim to have excelled anything attempted with them before. The use of all sections of the *Dahlia* in filling the border must have been a matter of difficulty, but it has been quite a success, some of the smaller pompons being literally covered with flowers.

Every credit is due to the Superintendent, Mr. Campbell, for maintaining the high standard of excellence set in Greenwich Park during the past ten or twelve years. *J. S. D.*

FIG. 127.—*CRATAEGUS OXYACANTHA GIREOUDII* (SEE P. 310).

The lawn of splendid turf, which fills practically the whole of the area between these borders, is devoid of any gravel paths, and is broken up only by the formation of large, oval, or circular beds, and some of the slower-growing Conifers, planted in twos and threes, which are tall enough to afford shade from sun and shelter from the wind. The beds are large, but do not appear so when viewed from a distance, as the whole garden has been kept well in proportion; but the size allows the garden artist to provide noble examples of summer bedding effects. One pleasing combination this season was *Pentstemon Lady Mary Hope*, with *Gladiolus White Giant*, and another of *Lilium tigrinum Fortunei*, and *Verbena venosa*, edged with *Centaurea*.

A bed of *Dahlia Moorcap*, with its dark foliage and deep crimson flowers, was a very striking object this autumn. Another bed, which the whole summer has been very bright, was filled with plants, about 3 feet high, of *Fuchsia Ballet Girl*, *Abutilon Thompsonii*, and a groundwork of single *Begonias*, *Alyssum*, and *Cineraria maritima*; whilst a companion bed was furnished with *Begonia fulgens* associated with *Leucophyton Brownii*.

In the long border, equally charming associations were obtained, many being original, and both the plants and the way in which they were looked after spoke volumes for those responsible.

Here was seen *Trachelium coeruleum* in com-

**AMERICAN NOTES.**

**THE DOUBLE SAPONARIA.**

THE note on the Double *Saponaria*, on page 149, interested me. I cannot recall ever growing this plant or even seeing it in any garden I visited in England, although I believe it is a native of some parts of Great Britain.

I was somewhat surprised to observe on the New Jersey railroad banks, which are mostly composed of ashes, great masses of pale pink double flowers the first summer I was here. For a time I was puzzled, until one day I observed among the Brambles and weeds near my garden a plant bearing the same flowers. It proved to be *Saponaria officinalis*, fl. pl., and I have not seen any but this one plant here except the great masses along the railroad tracks. Oddly, too, these latter are all double; the single form I have not noticed, and, according to some, the single is much less common than the double. I am planting this weed; and I have other American weeds in my garden, including that gorgeous Butterfly Weed, *Asclepias tuberosa*. I have even a seedling batch of the commoner Milk Weed. Of these there are a multitude of forms, including some of most exquisite pink shades. I have also several forms of *Asters*, apart from some named English varieties. *T. A. W., New Jersey.*

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**An Unusual Crop of Strawberries.**—The recent frosts have brought to an end a rather unusual little crop of Strawberries in my garden. Because I think the foliage is so beautiful I planted in a rocky near the house a few roots of the ordinary red wild Strawberry obtained from the woody part of our grounds. The plants established themselves but did not flower or fruit in the early summer. This September they began to fruit, and through the whole of September and to near the end of October they have been bearing berries twice or three times the size of those of the wild plant and ripening not red, nor even pink, but quite white fruit, that was perfectly sweet and juicy and of delicious flavour. I do not know whether this is of any particular interest, or is merely the result of the very overcast rainy weather of the year; but it must be, I think, quite unusual to have Strawberry plants only yielding their crop in September and October. *Marie C. Stopes, Givons Grove, Leatherhead, Surrey.*

**Wasps** (see p. 286).—I have taken a special interest in wasps for nearly fifty years and find there is a lot to learn about them. Individual experiences are well worth recording. This year, up to the end of May, the weather evidently was suitable to wasps, for I do not remember queens being more numerous. From June onwards cold, wet weather prevailed, with the result that hardly a wasp was to be seen. The weather of 1920 was similar, with nearly the same result. The summer of 1921 was so dry and hot as to constitute a record, and wasps were extremely plentiful. It is puzzling that, following a scarcity of wasps, they should be very plentiful the succeeding year, and this has occurred more than once. We know that from a single nest many hundred queens are distributed, yet evidently very few survive, or, in a few years, there would be legions of wasps. Fortunately natural checks balance such an evil. I find similar checks in the case of *Tortrix viridiana*. Previous to 1920 Oaks were defoliated by this destructive caterpillar. The summer of 1920 was very wet and to that I attribute the scarcity of the *Tortrix*, for although 1921 was favourable to the pest, few survived from the previous year. The wet summer this year again proved a great check to it so that we have such an abundance of acorns as has not occurred for five seasons previously. The above remarks refer to Stonerwood Park and its neighbourhood. *G. Abbey, late of Stonerwood Park, Petersfield, Hampshire.*

**White Fly.**—The following method, which I have adopted and found very successful in dealing with White Fly, may be of interest to readers of the *Gard. Chron.* I select a dull morning and fumigate the house early, using an ordinary cup and lamp fumigator and X.L. All nicotine fumigant; afterwards, as soon as it is possible to enter the house, I spray the plants, the tops of the pots and stagings with X.L. All nicotine liquid spray, using a fine nozzle sprayer. The spray should be used as hot as is possible without causing injury to the plants, also at a strength which is recommended for killing red spider. I find that, if this is done on three occasions, allowing a fortnight to elapse between each application, there is very little trouble with White Fly afterwards. There was a very bad attack of the pest in these gardens during the latter end of 1920, and I tried several so-called remedies, but by the early part of 1921 the warmer houses were crowded with the fly. I fumigated and sprayed the houses on four occasions during February and March of that year, at intervals of a fortnight, and I am very pleased to state that I have now no trouble in keeping the pest under control. I have only had to spray twice since then, and our houses and plants are at present quite clear of this tiny but very persistent pest. *W. Parry, Auchentorlie Gardens, Bowling, Dumbartonshire.*

## SOCIETIES.

## NATIONAL CHRYSANTHEMUM.

NOVEMBER 16 AND 17.—This old-established Society was fortunate in holding its exhibition at a comparatively late date, as Chrysanthemums are about ten or fourteen days later than in a more normal season. As a consequence, the Royal Horticultural Hall was filled to its utmost limit with exhibits of wonderfully high quality. There were nearly two hundred separate exhibits. Even in some of the most difficult classes, such as the one for twelve vases of Japanese blooms, three blooms in a vase, the competition was so keen that many very fine displays failed to secure a prize. Many judges fully competent to express an opinion agreed that for size and quality the blooms shown on this occasion set a new standard of excellence, and there was also a consensus of opinion that no finer show of Chrysanthemums had ever been seen. All classes of the flower were represented, but Japanese and Single sorts predominated. In addition to the competitive exhibits, there were very good trade displays, these filling the whole of the space next the wall all round the hall, and the finest exhibit was the magnificent one from Mr. H. J. JONES, who, through it, added two more gold medals to the eight he had previously won this season. It was estimated that there were 15,000 blooms in the hall, but we imagine this did not include the small single and decorative blooms shown so largely by the trade.

In spite of the fog, the attendance was large, and from 2 p.m. to 4.30 p.m. on the opening day the hall was crowded with Fellows of the Royal Horticultural Society (admitted free), members of the N.C.S., and visitors.

The number of novelties brought before the Floral Committee at its meeting during the morning of November 16 was forty-eight, a number which demonstrates the activity of raisers, and also suggests that private and market growers are keenly on the look-out for new and meritorious varieties. We congratulate the N.C.S. upon its highly successful show.

## AWARDS.

## FIRST-CLASS CERTIFICATES.

**Nero.** A Japanese variety, II.1.b, of rich crimson colour, suitable for market. It is of fine reflexing form and most effective. Shown by Mr. H. SHOENSMITH.

**Wellington Wack.** A charming decorative variety of great grace and beauty. Although of Japanese form, II.1.b, the florets are comparatively narrow, firm, but not stiff, and the colour is clear Primrose yellow. Shown by Mr. E. JONES.

**Mrs. R. Harris.** A lovely big single variety, V.2.a, of excellent form. The broad florets are of a pleasing shade of light yellow. Shown by Mr. WALTER JINKS.

**November Cheer.** For its rich rose pink colour and its neat, loosely incurving flowers this is of great value for decorating in November. It belongs to section II.1.b, and was shown by Messrs. WELLS AND CO., Merstham.

**Hilda Shoebridge.** This is an elegant large-flowered single variety, V.2.a. The ends of the broad florets are bluntly pointed and droop a little, thus giving grace to the blooms. The colour is soft silvery pink. Shown by Mr. J. SHOEBRIDGE.

**Floria.** A strong-growing single variety (V.2.a), with heavy, dark foliage. The flowers are of good size and fair form and deep pink colour. Shown by the BRIDGWATER NURSERIES.

**Sunset.** A showy single variety, with pointed florets of a clear light amber colour, the flowers of medium size and form (V.2.a). Shown by the BRIDGWATER NURSERIES.

**Absolute.** One of the handsomest of single varieties, the flowers being broad-petalled, of good form, and glowing bronze red colour, with yellow bases to the florets (V.2.a.). Shown by the BRIDGWATER NURSERIES.

**Poulton's Climax.** A big yet graceful Japanese variety, with narrow, slightly curling and drooping florets. It is a refined addition

to the white section. Shown by Mr. H. POULTON, Pipbrook, Dorking.

**Radiant.** A handsome reflexing Japanese variety, II.1.b, that is of great decorative value and very promising for market use. The colour is a rosy shade of terra-cotta. Shown by BARON SCHRÖDER (gr. Mr. Henderson), The Dell, Egham.

**Crimson Perfection.** A decorative variety of much merit. It is of pleasing reflexing Japanese form and of rich velvety crimson colour. The blooms are of medium size, II.1.b, and carried on good stems. Shown by BARON SCHRÖDER.

## OPEN CLASSES.

The William Wells Memorial Class, which is open to competition amongst amateurs, attracts a great deal of attention—and the present occasion was no exception to the rule. The many vases of three blooms of the largest exhibition size and highest quality made a most impressive display. The best twelve vases were shown by Mr. E. H. PEARCE, Lord Wandsworth Agricultural College, Long Sutton, and this was a superb collection of such sorts as *Majestic*, *Sir E. Letchworth*, *Wm. Rigby*, *Mrs. R. C. Pulling*, *A. F. Tofield*, *Helena Margerison*, and *Mrs. Gilbert Drabble*. *Capt. R. B. BRASSEY* (gr. Mr. J. G. Quinn), *Cottesbrooke Hall*, Northampton, won second prize, and his best vases were of *His Majesty*, *Mrs. Geo. Monro*, *Majestic*, *Golden Champion*, and *Princess Mary*. *Baron SCHRÖDER* (gr. Mr. E. J. Henderson), *The Dell, Egham*, who won third prize, had fine blooms of *Majestic*, *Mrs. Geo. Monro*, and *Princess Mary*.

*Baron SCHRÖDER* was easily first prizewinner in the class for 18 Japanese blooms in six varieties, where he included splendid blooms of *Mrs. Geo. Monro*, *Princess Mary*, *Mrs. Gilbert Drabble*, *Mrs. R. C. Kelly* and *Gen. Petain*; second, *Mrs. HAMILTON FELLOWES* (gr. Mr. C. Hebbourn), *Langley Park, Warpleston*, showing *Mrs. Geo. Monro*, *Mrs. A. Davis* and *Louisa Pockett* of high quality; third, Mr. E. H. PEARCE.

The Holmes Memorial Challenge Cup, which requires 36 Japanese blooms, distinct, shown on boards was won by E. G. MOCATTA, Esq. (gr. Mr. W. Holden), *Woburn Park, Addlestone*, with a collection of blooms so large as to overlap. Besides this exceptional size, the quality was first rate. *Princess Mary*, *Mrs. Geo. Monro*, *Mrs. C. Edwards*, *Victory*, *Queen Mary*, *Gen. Allenby*, *Wm. Rigby*, and *Peace* are the names of a few of the varieties so well set up; second, *Col. THOMSON* (gr. Mr. D. Barnard), *The Manor House, Ebbingham*, who had superb blooms of *Edith Cavell*, *Majestic*, and *Wm. Rigby*; third, Mr. E. H. PEARCE.

Mr. E. G. MOCATTA also had the best twenty-four Japanese blooms, and these were equal, if not superior in merit to his magnificent collection in the large class. The depth of colour in *His Majesty*, *Mrs. Geo. Monro* and *Mrs. J. Bulmer* was unsurpassed in the whole of the show. *Princess Mary*, *Wm. Rigby* and *Peace*, amongst the yellow varieties, were also of great merit; second, *Major DALGETY* (gr. Mr. W. Baxter), *Lockersley Hall, Romsey*, who had splendid blooms of *Mrs. Geo. Monro*, *Wm. Rigby*, *Mrs. A. Davis*, *Mrs. J. Bulmer* and *Victory*.

*Major DALGETY* was the foremost of the many exhibitors of twelve Japanese blooms, and his excellent collection included *Mrs. A. Davis*, *Helena Margerison*, *Louisa Pockett* and *Norman Chittenden*; second, *F. C. STROOP*, Esq. (gr. Mr. G. Carpenter), *West Hall, Byfleet*, whose admirable collection included *Queen Mary*, *Golden Champion*, *Mrs. A. Davis*, and *Shirley Golden*; third, *Mrs. HAMILTON FELLOWES*.

Competition was very keen and the quality exceptionally high in the class for twelve distinct Japanese blooms in which *Major DALGETY* won the first prize. His most excellent set contained wonderfully fine blooms of *Mrs. A. Davis*, *Helena Margerison*, *Victory*, *Louisa Pockett* and *Norman Chittenden*. *F. C. STROOP*, Esq., was a worthy second in this great class, and he included magnificent blooms of *Queen Mary*, *Golden Champion*, *Mrs. A. Davis* and *Shirley Golden*; third, *Mrs. HAMILTON*

**FELLOWES.** The quality of this class was even surpassed in that for six Japanese blooms, where Major DALGETY also won first place. His splendid blooms were of Victory, Louisa Pockett, Majestic, Mrs. A. Davis, Helena Margerison, and Wm. Rigby; W. H. ALLEN, Esq. (gr. Mr. H. Blakeway), Bedford, second; and Mrs. H. FELLOWES was third, while many very meritorious exhibits were unplaced.

The best vase of three white Japanese blooms was of immense specimens of Louisa Pockett, shown by Sir JEREMIAH COLMAN (gr. Mr. J. Collier), Galton Park, Reigate, and these were also of high quality; Mrs. McDOWELL NATHAN (gr. Mr. H. Newton), Little Heath Wood, Potter's Bar, second, with Mrs. Gilbert Drabble of quality equal to any of this variety in the show. In the similar class for yellow varieties Mrs. R. C. Pulling and Wm. Rigby were the most popular varieties; first, W. H. ALLEN, Esq., with the former, while Mrs. McDOWELL NATHAN was second, with Princess Mary. The best vase of any other colour was Majestic, shown by Mr. E. H. PEARCE; Mrs. NATHAN second with Mrs. A. Davis.

Incurved varieties were very well shown. The best vase of six blooms was staged by E. WORMALD, Esq. (gr. Mr. R. Lay), Sheepwell House, Potter's Bar. In the classes for twenty-four and for twelve varieties, on boards, J. P. HIGHAM, Esq., Drury Hill, Notts, had most praiseworthy collections of such varieties as Boccace, G. F. Evans, Le Peyron, Mrs. Judson, Souv. de W. Clébran, Clara Wells, Frank Trestian and Master C. Hall. L. E. CHALMERS, Esq. (gr. Mr. A. B. Hudd), Farrants, Bickley, was second in the large class with a collection of equally large blooms which lacked finish, and he was first with six incurved varieties, where he had almost perfect blooms of Mrs. P. Wiseman and Godfrey's Eclipse.

The MARQUESS OF RIPON was awarded the first prize in the class for six vases of Anemone blooms, showing Ceres, Cordelia, Arthur Coombe and Snow Queen. The best six vases of Pompons were excellent examples of such sorts as Miss Elise Dordan, Mrs. W. Sabey, W. Westlake and Black Douglas, shown by Mr. J. W. HUSSEY, Matford Lodge, Exeter. Miss DEBENHAM (gr. Mr. A. Porter), Ivy House, St. Albans, who came second, was first with six vases of undisbudded varieties. The first prize for six vases of Anemone singles was awarded to J. C. JAY, Esq. (gr. Mr. J. Osman), Barnet.

The class for nine vases of large singles brought very good competition. The first prize was won by L. E. CHALMERS, Esq., with a superb exhibit of Molly Godfrey, Susan, Stewart Smith, Margaret, Esme Waters and Sandown Brilliance; second, Mrs. MINCHIN, who staged vases of Sandown Radiance, Mrs. J. B. Minchin, Mavis and Isobel Felton. The best six vases of large singles were shown by F. G. YARROW, Esq. (gr. Mr. A. Robertson), Abbey Road, St. John's Wood, who had splendid examples of Sandown Radiance, Crimson Velvet and Molly Godfrey; second, Mr. CHALMERS, who showed an elegant vase of mixed varieties. The MARQUESS OF RIPON was awarded the first prize for a vase of small-flowered singles.

A splendid competition resulted in the class for twelve vases of large single Chrysanthemums, distinct, for which the George Monro Challenge Cup was offered. The trophy was won by Mr. H. WOOLMAN, Sandy Nursery, Shirley, Birmingham, with splendid blooms of Lizzie Robertson, Phyllis Cooper, Rycroft Crimson, Mavis, Mrs. W. Smith, Sandown Radiance and Coronet; second, F. G. YARROW, Esq., Abbey Road, St. John's Wood (gr. Mr. A. Robertson), who had choice blooms of Reginald Godfrey, Emma Walters, Sandown Radiance and Crimson Velvet; third, Sir CHARLES NALL-CAIN, The Node, Welwyn (gr. Mr. T. Pateman).

There were three entries in a class for three vases of large single Chrysanthemums, distinct. Excellent blooms shown by Mrs. J. B. MINCHIN, Terrilands, Pinner (gr. Mr. W. J. Taylor) were adjudged the best. The varieties were Molly Godfrey, Bronze Molly and Mrs. J. B. Minchin.

In the class for a vase of single Chrysanthemums, the judges awarded the first prize to

the biggest exhibit, shown by R. BARBER, Esq. (gr. Mr. J. Bedson), Bromley. It was rather formal in arrangement, but prettily decorated with Asparagus and Berberis, and included blooms of fine quality. Many preferred the second prize exhibit, shown by the MARQUESS OF RIPON, Kingston Hill (gr. Mr. T. Smith). The arrangement was delightful, and every bloom was displayed to the best advantage.

The class for one vase of large exhibition Japanese blooms was a great success, and the premier exhibit, shown by G. RICHARDSON, Esq., Holly Mead, Tulse Hill (gr. Mr. J. Vanstone) was of outstanding merit. The varieties

#### NON-COMPETITIVE EXHIBITS.

The trade growers supported the Society in their customary wholehearted manner, and their generous groups of splendid blooms contributed in no small degree to the success of the show. Mr. H. J. JONES made history, and created a record which will be hard to equal. He made this show the occasion for winning his tenth gold medal in fourteen weeks, and we have recorded above that his magnificent group of Chrysanthemums won the enthusiastic praise of the committee. Along the back of the group there were large stands of Japanese varieties of such quality as to be worthy of a

FIG. 123.—CHRYSANTHEMUM ORIOLE, R.H.S. AWARD OF MERIT, NOV. 14 (SEE P. 302).

were Mrs. W. Rigby, Mrs. G. Drabble, Mrs. G. Monro and Majestic. The blooms were arranged in a handsome pedestal vase. Second, Mr. F. YARROW.

The MARQUESS OF RIPON showed the best vase of incurved blooms, mixed varieties, arranged with Privet sprays, Codium foliage and Fern fronds; second Mr. J. HIGHAM, Nottingham, who showed Nelly Threlfall only.

#### AMATEURS' CLASSES.

The best vase of five blooms of Japanese Chrysanthemums in the Amateurs' classes was shown by Miss DEBENHAM, Ivy House, St. Albans (gr. Mr. A. S. Porter), the variety being Daily Mail; second Miss DARNELL.

Mr. G. RICHARDSON, Tulse Hill (gr. Mr. J. Vanstone), excelled in the class for a vase of Chrysanthemums, open to amateurs only; 2nd, Mr. G. H. BENTLEY, The Swallows, Long Park, Chesham.

place on any exhibition board. The chief sorts were Majestic, Wm. Rigby, Princess Mary, Mrs. Spencer, Louisa Pockett, Mrs. Geo. Monro, and Mrs. Gilbert Drabble. Besides this great array of large blooms there was an almost countless collection of decorative Japanese varieties, but good as were these, they were eclipsed by the baskets of singles, of which Bronze Beauty, Hilda Shoebridge, and Phyllis Cooper were in superb form. All the other types were well represented, and the green blooms of Mme. C. Roger attracted a deal of attention (Special Large Gold Medal and the Clay Medal for the best non-competitive exhibit).

Just inside the hall door Messrs. W. WELLS & Co, set up an admirable collection of representative varieties. Amongst the exhibition Japanese we specially noted Majestic, Edith Cavell, Mrs. Geo. Monro, Mrs. Gilbert Drabble, Louisa Pockett, and Wm. Rigby. Besides these

the single-flowered varieties, particularly Ceddie Mason and Winifred, were excellent, while the graceful Anemone-flowered Mabel Weston was an admirable example of that highly decorative type (Gold Medal).

Near the left-hand annexe, Messrs. KEITH, LUXFORD AND Co. staged a worthy collection of the various types of Chrysanthemum. Such single-flowered sorts as Mrs. Loo Thomson, Flossy, Florrie King, Oriole, Margaret Davis and Catriona were admirable, as also were the many large-flowered Japanese varieties, amongst which there were several sterling seedlings. In the centre of the group a large vase of the dainty little Pompons included Baby Doll, Golden West and Mary Pickford (Gold Medal).

Such varieties as Mavis, Winifred Howe and Mrs. W. Smith amongst the singles he grows so well were finely shown by Mr. H. WOOLMAN, who also had beautiful blooms of the Japanese Ida, Miss A. E. Roope, and Mrs. J. T. Henry (Silver-Gilt Medal). An exceedingly attractive group was arranged by Mr. Wm. YANDALL, who had beautiful baskets of Bronze Molly, Josephine Bernier, Mavis, Mrs. W. Smith, Golden Glory and other varieties (Silver-Gilt Medal).

BARON BRUNO SCHRÖDER, The Dell, Egham, left his valuable group of Chrysanthemums from the previous Tuesday's R.H.S. show. These were chiefly of decorative plants of Caprice du Printemps and its varieties (Silver Medal). Messrs. W. J. GODFREY AND SON had many singles of their own raising which possessed much charm of grace and colouring (Silver Medal). Messrs. J. W. COLE AND SON had elegant little collections arranged on either side of the clock, and these contained good blooms of such sorts as Mrs. Geo. Monro, Nadine, Mrs. R. C. Pulling, and Mrs. Chas. Davis (Silver Medal).

#### SHEFFIELD CHRYSANTHEMUM.

NOVEMBER 10-11.—The thirty-fifth annual exhibition of this Society was held in conjunction with the National Potato Society's show in the Drill Hall, Edmund Road, Sheffield, on these dates. While Chrysanthemum growers were sympathising with each other because of the lateness of the season, they nevertheless put up creditable displays of blooms.

The principal class was for eight vases of Japanese blooms, distinct, three blooms in each vase. The 1st prize was awarded to Lieut.-Col. SIR RANDOLF BAKER, D.S.O. (gr. Mr. A. E. Usher) for monster blooms of Mrs. J. Gibson, W. Rigby, Victory, Mrs. G. Monro, Queen Mary, Shirley Aristocrat, Edith Cavell, and Mrs. Algernon Davis; 2nd, Mr. H. WOOLMAN, Shirley, Birmingham, with fine specimens of Mrs. R. C. Pulling, Mrs. A. E. Roope, Majestic, W. Turner, Mrs. Spencer Chichester, Mrs. T. J. Fleming, and Princess Mary; 3rd, Brig.-Gen. Sir J. F. LAYCOCK (gr. Mr. G. W. Musk). In the class for four vases, Mr. A. E. USHER again excelled with massive, deep blooms of Victory, W. Rigby, Salonica, and Mrs. G. Drabble; 2nd, G. CHAMBERS, Esq. (gr. Mr. E. G. Bonyer), his best sorts being Mrs. R. C. Pulling, Mrs. A. Davis, and Mrs. G. Monro; 3rd, Mr. G. W. MUSK.

For one vase of a pink variety three competed. They all staged the variety Mrs. A. Davis, and Mr. A. E. USHER was successful with perhaps the best three blooms in the show; 2nd, Mr. G. W. MUSK; 3rd, Mr. W. C. FLETCHER. In the class for a vase of a yellow variety, Mr. USHER again excelled with handsome blooms of W. Rigby; 2nd, Mr. A. FLETCHER; 3rd, Mr. W. C. FLETCHER. Mr. USHER also won the first prize for a vase of a white variety.

Competition was not keen in the class for incurred varieties, and Mr. G. W. MUSK had matters much his own way. Keener rivalry was evident in the class for a basket of Chrysanthemums arranged for effect; R. PALMER MOREWOOD, Esq. (gr. Mr. G. W. Staward) was placed first with a light arrangement of perfect blooms of the decorative and single type and foliage; 2nd, Mr. W. SMITH.

Fruit in the open classes lacked the colour of last year, and in the absence of the usual

decoration the general effect in the table class was not pleasing. The TODDINGTON ORCHARD Co. were successful with Apples and Pears of large size in considerable variety; 2nd, HUGH ANDREWS, Esq. (gr. Mr. J. H. Tooley). In the class for two bunches of white Grapes the winners were in the same order as in the last class, with E. DYON, Esq. (gr. Mr. H. J. Nicholson) a good third. In a similar class for black Grapes R. J. NELSON, Esq., excelled with large, well-coloured bunches of Barbarossa; 2nd, TODDINGTON ORCHARD Co.; 3rd, Mr. J. H. TOOLEY. The last two exhibitors won most of the prizes in the single classes for Apples and Pears.

Competition was keen in the open vegetable classes. The principal class was for a collection arranged for effect on 30 sq. ft. of tabling, and the winner, H. ANDREWS, Esq. (gr. Mr. J. H. Tooley), excelled with large Ailsa Craig and Improved Reading Onions, Hollow Crown Parsnips, Prizetaker Leeks, Gem Cauliflowers, Long Red Carrots, Improved Abundance Potatoes, Best of All Tomatoes and Giant Celery; 2nd, MAJOR HARCOURT WEBB (gr. Mr. G. W. Gaiger). For the special prizes presented by Messrs. Sutton and Son there was fair competition and the winners were Mr. W. PERKS, Mr. C. H. WILLFORD and Mr. G. JESSOP in this order. Mr. PERKS also won the first prize in Messrs. Webb and Son's class; 2nd, W. BINGHAM.

Trade displays contributed largely to the success of the show. Mr. H. WOOLMAN had two stands of Chrysanthemums, one on each side of the hall. Messrs. KEITH, LUXFORD AND Co., Harlow, showed the leading varieties of Chrysanthemums in the best possible condition. The BRIDGWATER NURSERIES also had a good display of Chrysanthemums. Messrs. W. ARTINDALE AND SON, Sheffield, showed a good group of Primula obconica.

#### STAFFORDSHIRE COUNTY FRUIT SHOW.

AN exhibition of fruit, grown in Staffordshire, was held in the large Lecture Hall at the County Technical School on Saturday, November 11. The exhibition was arranged under the auspices of the Staffordshire Horticultural Sub-Committee. Mr. J. Stoney, the horticultural superintendent, was responsible for the organisation of the exhibition and the display emphasised the possibilities of various parts of Staffordshire for the growing of dessert and cooking Apples. There were exhibits from all parts of the county, including the evening school gardens, which have an eighth of an acre devoted chiefly to Apples, and which are used as small demonstration centres in their respective areas. Exhibits were also sent from the county demonstration fruit plots, including three exhibits from County Council small holdings, and orchards which are in the process of renovation, and from private growers, including LORD STAFFORD, who sent some excellent examples of commercial Apples packed in half-sieves. These included Lane's Prince Albert, Newton Wonder, Annie Elizabeth, Lord Derby, Bramley's Seedling, Allington Pippin and Cox's Orange Pippin. These Apples were gathered from a seven-acre orchard which was planted about seven years ago on up-to-date lines. He also showed thirty dishes of Apples and Pears in fine form.

Other interesting exhibits were the boxed Apples shown by Mr. MENZIES, of Tittensor, an enthusiastic grower who cultivates thirty acres within a few miles of Stoke-on-Trent. His boxes of James Grieve, Charles Ross, and Newton Wonder were excellent examples of boxed fruit, which were readily purchased by the buyers present. Other boxed specimens included Newton Wonder, shown by Mr. BARNES and Mr. IVESON from Liebfeld, and Mr. PERCIVAL of Penkridge, who combines fruit growing with poultry farming. Mr. PERCIVAL showed excellent boxes of Allington Pippin. Major MOAT, J.P., O.B.E., chairman of the Horticultural Sub-Committee, also exhibited excellent examples of Newton Wonder (boxed), as well as a dish of the new variety named Queen Mary.

Amongst the best exhibits from private

growers were those from Lieut.-Col. MEYNELL, D.S.O., Hoar Cross. This collection included all the best varieties of Apples and Pears, which were remarkably well coloured. Other exhibitors in this section were the Rev. Preb. DUNKLEY, the chairman of the Staffordshire Education Committee, who put up exceptionally well-coloured Blenheim Pippin, Newton Wonder, and some fine specimens of Hambling's Seedling. Sir GRAHAM BALFOUR, M.A., exhibited the finest coloured Ribston Pippins, and Mr. FRANK SMITH, Wheaton Aston, exhibited superbly coloured Lane's Prince Albert; these were from a grass orchard. A large collection of Apples and Pears from the STANDON BOYS' INDUSTRIAL HOME, as well as bottled fruit from that institution, showed that instruction in fruit growing and preserving forms a valuable part of the curriculum.

A large collection of fruits from the COUNTY FARM INSTITUTE at Rodbaston, along with diagrams illustrating the pruning of trees, and methods recommended for the cleansing of trees, occupied the end of the large hall.

Major Moat presided at the opening ceremony, and was supported on the platform by Mr. Lobjoit, the Controller of Horticulture; the Rev. Preb. Dunkley, Chairman of the Education Committee; Sir Graham Balfour, Director of Education; several members of the Agricultural Committee; Dr. Crowther, Principal of Harper Adams College; Mr. J. C. Rushton, Principal of the Farm Institute and Assistant Director for Agricultural Education; Mr. J. Stoney, Horticultural Superintendent; Mr. Whiting, Ministry of Agriculture; and Mr. A. T. Rudge, Instructor in Horticulture.

Mr. Lobjoit complimented the Horticultural Sub-Committee on the excellent exhibition, and particularly on the fruits in boxes and sieves, which demonstrated that many parts of Staffordshire were excellent for fruit production. After comparing the importation of fruit from overseas with home-grown fruit, especially with fruit shot into baskets or any other container without sorting, he dwelt upon the importance of keeping trees clean from insect pests and disease by spraying. The life histories of some of the most destructive pests were explained, including the winter moth, woolly aphis, scab, and silver leaf. The pruning of trees he considered was of immense importance, and it was imperative that a good foundation be laid, but after that stage had been reached it was essential that the grower should observe the general characteristics of the tree, as many varieties required careful consideration, otherwise they might easily be spoiled by over-pruning. Methods of heading orchard trees and regrafting them were also described.

During the afternoon and evening Mr. Whiting demonstrated the grading of Apples and various methods of packing, and several growers packed boxes under his supervision. The largest consignments of fruit were sold after the demonstration, and the smaller quantities were packed and sent to the local hospitals.

#### NORWICH CHRYSANTHEMUM.

THE autumn three-days' show of the Norfolk and Norwich Horticultural Society was held in St. Andrew's Hall and the adjacent Blackfriars' Hall. A great improvement was noticed in the class for a circular group of Chrysanthemums and foliage plants. The first-prize collection, from Mrs. BARKER-HAHL, of Langley Park, included some very fine specimens of large flowered Chrysanthemums brought down to an edging containing some well coloured Coleus. The Misses McCLINTOCK, Catton Grove, struck a lighter and more varied vein, and made a pretty effect.

Large blooms of Chrysanthemums are still popular with growers, and again the gardener to the LOWESTOFF CORPORATION did himself great credit by showing some extraordinary well-grown specimens. In the miscellaneous section Mr. SYDNEY MORRIS, Earlam Hall, staged some wonderful specimens of berried shrubs both in a competitive class and one not for competition. Carnations were a greatly im-

proved feature. The first-prize collection, from Mr. J. A. CHRISTIE, contained fine examples of White Pearl, and a new pink seedling of his own raising, which we learn is to be named Mrs. Christie.

Of pot plants the winter-flowering Begonias staged by Mr. J. E. MOXEY were worthy of special mention. The Lorraine type were not so good as we have seen them before. Primulas of the chinensis type were a bright feature, as also were Salvias and zonal Pelargoniums. Nerines, a flower not often seen at local shows, have a great advocate in Mr. CHRISTIE, who staged some charming coloured seedlings of his own.

Fruit was the most attractive feature of the show. Lord HASTINGS won first place for a collection of 12 varieties of fruit of splendid quality, his bunches of Muscat Grapes being superb. This being the third time he has secured this honour, he becomes the possessor of the challenge cup presented some time ago by Sir F. Adair, Bart. Coming to the general classes for Grapes, that old veteran fruit grower, Mr. WM. ALLAN, gardener to Lord Suffield, deserved every praise for his three bunches of black sorts and also for his Muscats. In Pears also he had a wonderful exhibit of 6 varieties—Doyenné du Comice up to 18 ounces and Charles Ernest up to 22 ounces each. Mr. CHRISTIE was a large exhibitor and winner in the competitive classes for Pears, and, further, he staged in Blackfriars' Hall a collection of Pears in such variety as has not been seen at any show before in this district. They were put up mainly to demonstrate the utility of the Lorette system of pruning, in which Mr. Christie is a great believer, for the production of good crops of fine fruit. The arrangement of the collection with Nerines reflected great credit upon the gardener, Mr. S. High.

In the classes for Apples it was well demonstrated that the soil of Norfolk can produce this fruit equal to any in England for quality and colour. Mr. SYDNEY MOURIS staged a fine collection of nine dishes of dessert kinds and similar praise applies equally to the six dishes, distinct, staged by Mr. J. A. CHRISTIE. The best dish of the popular Cox's Orange Pippin was from Mr. WM. ALLAN. At Framingham Manor (Mr. Christie's) a great feature is made of Ribston Pippin, and we admired the fine dish of these Apples that secured for him the premier place in the class for this variety. The Rev. W. L. STOCK, Haynford, a somewhat new exhibitor, had some very notable exhibits in several classes.

Vegetables were quite up to the standard of old-time days. The best collection was set up by Mr. S. HIGH, gardener to Mr. Christie, and the superb quality of the ten varieties, with most effective arrangements, well warranted the premier position.

The trade growers, as usual, helped by their exhibits to make the show attractive and educational. Messrs. DANIELS BROS., LTD., Norwich and Tunstead, had a very fine display of flowers, fruits, and vegetables grown at their nurseries. The best Apples for the district were well in evidence on their stand, and the fruits all the products of two and three-year-old trees. This exhibit was awarded a Gold Medal. Messrs. SUTTON AND SONS, Reading, made a large and varied display of well-grown vegetables, embodying the more rare and choice kinds not always met with. Messrs. WINDER AND THOMPSON, Lingwood, had a fine array of Roses of the leading and newest sorts, really wonderful for a November show, the blooms all coming from the open. Mr. LUKE BOYCOTT, Upton, had a stand devoted to implements. An exhibit worthy of special mention was that of the EAST NORFOLK FRUIT GROWERS' ASSOCIATION, consisting of uniform boxes with properly graded and packed Apples from local growers. The owners of Westwick Gardens (Colonel B. J. Petre), Honing Fruit Gardens (Mr. E. G. Cubitt), Hoveton (Mrs. Blofield), Lingwood (Mr. Frank Neave) have done great service by their persistence in this work of educating others to follow their example.

#### CARDIFF GARDENERS.

A MEETING of above society was held at Cardiff on Tuesday, November 14; Mr. P. MYERS presided. The Association's cup was awarded to Mr. F. WEBBER, for six boxes of single Chrysanthemums, Mr. T. EDWARDS gaining second place. Mr. T. THOMSON, The Cottrells, Glamorgan, gave an address on "Spring Flowers." He referred at some considerable length to spring bedding, early flowering plants, shrubs and trees.

#### ROYAL CALEDONIAN HORTICULTURAL.

NOVEMBER 7. The ordinary monthly meeting of this society was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. David King, president, in the chair.

A paper on "Modern Methods of Culture and New Varieties of Hardy Fruits Introduced in Recent Years," by the late Mr. G. P. Berry, Ministry of Agriculture and Fisheries, was, in Mr. Berry's unavoidable absence, read by the Secretary.

In dealing with the influence of the stock on the graft, Mr. Berry said that he had frequently been puzzled to give a satisfactory explanation to growers for the diverse behaviour of particular varieties of Apples growing together under precisely similar conditions as to soil and climate, some even in the same row ripening later, and others failing to colour, while others made meagre growth and produced indifferent crops compared with their neighbours, and this applied both to bush plants on dwarfing stocks and to others on the free stock. This diversity, however, was easily explained when one took into account that stocks raised from seed might produce a large number of different types, and that if any particular variety was worked on these seedling stocks as many different types of plant would result. Where tree stocks were used this variation would not disappear until standard types were selected and reproduced vegetatively—by layering or cuttings. He referred to the research work which had been carried out in this direction in connection with Paradise stocks at the Wye College, where Pear and Plum stocks were also being dealt with. The result of these researches showed that the dwarfing stocks could be reduced to a definite number of types, of which four were outstanding, namely, (1) the broad-leaved English Paradise, (2) the Doficin, or "English Paradise," (3) Nonsuch, (4) the very dwarfing French Paradis Juane de Metz. Quantities of these types had been distributed to the various county institutes and agricultural schools, as well as to the nursery trade, and it was hoped that the time was not far distant when the grower would be able to procure the particular stock he desired when he purchased his plants. Investigations had also been carried out in connection with Black Currants, and it had been found that these could be classified into four groups, namely, (1) French, (2) Boskoop Giant, (3) Victoria, and (4) Baldwin.

Mr. Berry also referred to the experiments which were being conducted at the Wye College in connection with pruning, which, he said, would seem to indicate that our orthodox methods in private gardens were too severe, and reduced the fruit crop, and that the vigour of the plants appeared to have an influence on the setting of the flowers. With reference to the Lorette system, which takes the form of repeated very drastic summer pruning, or pinching, which starts when the shoots are about two inches long, and is carried back to the ring of scales, he had come to the conclusion that the success of the system was largely dependent on the operator being able to control the water supply to the root system, and that it had yet to be proved that it was economically sound. Experiments which he had made personally showed that in a season with an average rainfall, equally distributed over the period, it worked very well; but when copious rains fell after a spell of dry weather it was otherwise. Where, however, the plants were under glass or on a very light, porous soil, incapable of holding much moisture, it offered fair prospects of success.

Mr. Berry stated that of the large number of new varieties of hardy fruits, especially Apples,

which came before the Royal Horticultural Society's Fruit Committee in the course of a few years many were never more heard of, and a large percentage of them were no improvement on existing kinds. Of those Apples which seemed to give promise of eventually becoming good commercial kinds he mentioned Ellison's Orange, a dessert variety resembling Cox's Orange Pippin, but more fertile and more reliable as a cropper, and other promising varieties were Laxton's Superb, Laxton's Premier and Peerless. Of Plums, Laxton's gage, an abundant bearer which always carried a crop, was likely to become a commercial variety in the Gage-growing districts, and President was a commercial Plum of the future.

The exhibits were: Begonia Emily Clibran, from Mr. John Downie, Edinburgh (silver medal); Gloxinias, from Messrs. Dobbie and Co., Ltd., Edinburgh (silver medal); Dessert Apple Red-coat Grieve, from Mr. Hal Jones, Letchworth (First-class Certificate); and Onions, from Mr. J. A. Sword, Inverlornmond, Cramond (Cultural Certificate).

#### HENLEY-ON-THAMES AND DISTRICT HORTICULTURAL.

A NON-COMPETITIVE exhibition of fruit was held in the Congregational Hall, Henley-on-Thames, on November 2, under the auspices of the above Association. Just over 380 dishes of Apples and Pears were staged from the principal gardens in the district, and the exhibits called forth general admiration. The exhibition was open to the public free, its chief object being to point out what can be done in the district in fruit growing. In the evening a lecture on Apples and Pears was given by the County Instructor in horticulture, and questions were invited at the close of the lecturer's remarks.

#### Obituary.

Charles Frost.—The American horticultural papers record the death of Mr. Charles Frost, florist, of Kenilworth, New Jersey. He was a native of Newmarket, and settled in America shortly after his marriage in 1867. After some years he acquired a farm in Kenilworth, N.J., and engaged in business as a market gardener. Subsequently, he commenced specialising in Pansies and ultimately developed a famous strain of these flowers, and sent out such varieties as Giant Masterpiece, Kenilworth Show, and Princess Upright. He was regarded as an authority on Pansies in the United States, and wrote the article on Pansies in the *Cyclopedia of Horticulture*. He was also engaged in writing a book on Pansies, their growth and development, but he did not live to complete it.

#### TRADE NOTES.

THE premises, stock and business of the well-known firm of Hassall and Co., Orchid growers, Southgate, London, which, owing to the death of Mr. A. Hassall, had to be disposed of, have been purchased by Mr. D. A. Cowan and Mr. J. C. Cowan, who will trade under the name of Cowan and Co. Messrs. D. A. and J. C. Cowan have also purchased the business of John Cowan and Co., Orchid growers, Gateacre, Liverpool, and have removed the best of the stock to Southgate. Owing to advanced years Mr. John Cowan senior is retiring and the Gateacre premises have been closed. In future the business will be conducted entirely from Southgate, London, N.14. The new proprietors of the fine Orchid nurseries at Southgate are two of the best-known and generally respected men in the trade and their wide experience should make the venture a great success.

THE Rural Industries, Ltd., have received a second order from H.M. King George for wattle hurdles, the making of which keeps a large number of rural workers employed throughout the winter.

MARKET.

COVENT GARDEN, Tuesday, November 21, 1922.

Cut Flowers, etc.: Average Wholesale Prices.

	s. d. s. d.		s. d. s. d.
Aliantum decorum, doz. bun.	10 0-12 0	French Flowers

—Acacia (Almisa) per bunch	1 6-2 0		
—Lilac, white, per doz. sprays	6 0-7 0		
—Narcissus, paper white, pr. doz. bun.	4 0-4 6		

REMARKS.—Supplies have been much heavier during the past week, and the demand fairly good, owing, doubtless, to reduced prices. Chrysanthemums of all grades are more plentiful, and their prices considerably lower compared with those of the previous week. Single varieties are now at their best, and are making a very brilliant show. Some excellent sorts are being marketed, both sprays and disbudded blooms. Of the larger Chrysanthemums, incurved varieties are most in demand including Mrs. Roots, Enfield White, and Money Maker, white; Romance and Liverpool, yellow; Bronze Hortus, November Bronze, Ivy Gay, December Pink, Market Red, and Mrs. Brooker. Carnations are a trifle cheaper than last week, although supplies are not large. Lily-of-the-Valley keeps firm in price owing to a limited supply. Richardias (Arums) are again on the down grade. Lilium longiflorum is again cheaper, but the pink and the white forms of L. speciosum are getting dearer. Good Roses are getting gradually fewer, especially red blooms, which were very scarce one or two mornings last week. The newest subjects in this department are Bomae Hyacinths, Poinsettias and Camellias. Larger consignments of flowers are being received from France. They consist of Carnations, Marguerites, Narcissus, scarlet, white and carmine Racunculus, Acacia (Almisa), large bunches of Parma Violets, and many baskets of single Violets; Safrano Roses, single mixed Anemones, baskets of pink Heather, Eucalyptus, Chilies and Solanum berries.

GARDENING APPOINTMENTS.

- Mr. W. E. Murray, for the past two years General Foreman at Soone Palace Gardens, Perth, as Gardener to W. D. GRAHAM MENZIES, Esq., Hallyburton House, Coupar Angus, Forfarshire.
- Mr. E. Durham, previously for four and a half years Gardener to H. J. Mason, Esq., Holme Park, Ashburton, S. Devon, and one year seven months to G. DE LISLE BUSH, Esq., Eastington Park, Stonehouse, Glos., as Gardener to Geo. F. Moore, Esq., Chardwar, Bourton-on-the-Water, Glos. (Thanks for 2s. for R.G.O.F. Box.—EDS.)
- Mr. R. Edwards, for the past twelve months Second Gardener at Stretton Hall Gardens, near Stafford, as Gardener to H. R. COOKE, Esq., Davenport House, Bridgnorth, Shropshire. (Thanks for 2s. for R.G.O.F. Box.—EDS.)
- Mr. G. Abbey, for the past five years at Stonerwood Park, and previously for eight years at Aston Rowant, as Gardener to V. F. THOMPSON, Esq., Norton Manor, Sutton Scotney, Hampshire.
- Mr. W. E. Talboys, for the past 33 years Gardener at Rayleigh, Croydon, and previously six years at Downswell Court, Gloucestershire, as Gardener to W. HOLMES REDDAN, Esq., Thurington Priory, Notts. (Thanks for 3s. for R.G.O.F. Box.—EDS.)
- Mr. T. W. Webb, for 25 years Gardener to the late Mrs. G. A. BIRKS, Kingsbridge Vicarage, South Devon, as Gardener to H. E. CAMPBELL, Esq., Coombe Royal, Kingsbridge.

ANSWERS TO CORRESPONDENTS.

EVERGREEN CLIMBER WITH FRAGRANT FLOWERS: W. J. P. Evergreen climbers with fragrant flowers suitable for an exposed, draughty situation are not very numerous. The Mexican Orange Flower, *Choisya ternata*, is perhaps the best subject, if it will succeed in your district. If your garden was in the south or west we should recommend *Osmanthus Delavayi*. *Jasminum officinale* major, the White Jasmine, though deciduous, or nearly so, produces such quantities of thin, green branchlets, it may very well be used as an evergreen. The deliciously fragrant blossoms are freely produced from June to October. There are also two evergreen or semi-evergreen Honeysuckles, *Lonicera flexuosa* and *L. Halliana*, which are worth trying.

LARGE APPLES: Rev. C. The largest fruits of the varieties you mention, of which we have record, are, Warner's King, 2 lb., shown by Mr. Robert Smith at the Ledbury Exhibition in October, 1888; Gloria Mundi, 2 lb. 5½ oz., sold in Covent Garden Market in October, 1913; Peasgood's Nonesuch, 1 lb. 12 oz., shown by Mr. Bannister in October, 1893.

LILIES: F. W. H. Your bulbs have evidently suffered through insufficient root room and a cold, tenacious soil. For the successful cultivation of Lilies, the soil should be trenched deeply; in the case of heavy land, from 1½ ft. to 2 ft. deep, to permit of effective drainage. Your small bulbs of *L. auratum* are not worth planting, as flowering bulbs are very cheap, and may be depended on to flower their first season. These Japanese Lilies do not take kindly to our capricious climate, hence they are imported in large numbers annually. *Lilium regale* is of good constitution and equal to *L. Henryi* in vigour. Plant the bulbs of this species at once in deeply trenched soil in their flowering quarters, in a compost of loam, well-broken peat, and sharp sand. Plant at twice the depth of the bulbs, and protect them during wet weather by placing a hand-light over them to ward off rains. Liliams of all kinds should never be allowed to become dry at the roots or to have the latter damaged.

NAMES OF FRUIT.—H. C. P.: Apples—1, Lord Derby; 2, missing; 3, Royal Jubilee; 4, Lord Suffield; 5, Yorkshire Beauty; 6, Winter Greening. Brown Pear—Beurré Diel; yellow, Doyenné Boussoch. L. S.: 1, King of the Pippins; 2, Huyshe's Prince Consort; 3, Marie Louise; 4, Baumann's Red Winter Reinette; 5, Bergamotte Espere; 6, Columbia; 7, Vicar of Winkfield; 8, Franklin's Golden Pippin; 9, Summer Golden Pippin; 10, Langton's Nonesuch; 11, Warner's King. F. A. A.: 1, Fearn's Pippin; 2, Court Pendu Plat; 3, Lady Henniker; 4, Dumelow's Seedling (syn. Wellington); 5, Twenty Ounce; 6, Marie Louise. W. A.: Apples—1, Stone's; 2, Warner's King; 3, Winter Hawthornden; 4, Dumelow's Seedling (syn. Wellington). Pears—1, Beurré Bosc; 2, Comte de Lamy. T. O. C.: 1, Northern Greening; 2, Round Winter Nonesuch; 3, Cellini; 4, Dutch Mignonne; 5, James Grieve; 6, Jolly Beggar; 7, Ribston Pippin; 8, Sam Young. G. B. Apple—Small's Admirable. Pears—1, Beurré Hardy; 2, Beurré de Jonghe; 3, Uvedale's St. Germain. E. D.: 1, Brown Beurré; 2, Autumn Bergamotte; 3, Beurré Sterckmans; 4, Le Lectier; 5, Beurré Bachelier; 6, Doyenné Gris; 7, Délices d'Anger. W. R. G.: 1, Bess Pool; 2, Gloria Mundi; 3, Passe Colmar; 4, Aromatic Russet; 5, Beurré Bachelier; 6, Maltster; 7, Warner's King; 8, Lord Derby.

NAMES OF PLANTS: W. M. 1, *Pinus Banksiana*; 2, *P. Murrayana*; *Cupressus Lawsoniana*; 4 and 5, *Abies lasiocarpa*; 6, *Magnolia Soulangeana*; 7, *Pinus Pinaster*; 8 and 12, *Abies Nordmanniana*; 9, *A. pectinata*; 10, *Cupressus sempervirens* var.; 11, *Tsuga Pattoniana* var. *glauca*.

HARDY MAPLES, AND PRIVET FOR A HEDGE: J. E. H. The following twelve Acers (Maples) are attractive trees, most of them producing quantities of ornamental fruits. *Acer capillipes*, *A. griseum*, *A. Heldreichii*, *A. Lobelii*, *A. macrophyllum*, *A. monspessulanum*, *A. nikoense*, *A. pennsylvanicum*, *A. Pseudoplatanus* vars. *erythrocarpum*, *Pilgrig* and *Prinz* handjery. The best Privet for a hedge is *Ligustrum ovalifolium*.

OXALIS EDULIS TUBERS: W. A. You may be able to obtain tubers of *Oxalis edulis* from Messrs. Cooper, Tabor and Co., Southwark Street, or Messrs. Vilmorin-Andrieux and Co., 4, Quai de la Megisserie, Paris.

PEACHES ON THE BACK WALL OF A VINERY. Puzzled. You do not state at which season of the year your employer saw a fine crop of Peaches growing on the back wall of a vinery. We have seen fair crops of Black Hamburgh Grapes and Peaches grown together in a cool house late in the season. Failure would result in planting the back wall of your Muscat vinery with trained Peaches. No sun could reach the latter, and very little air, and the temperature of the Muscat house would be altogether too high to grow Peaches successfully.

TOMATOS AND CUCUMBERS: J. W. W. With regard to the weight of marketable fruit a Tomato plant will carry, much depends on the variety, character and length of the season, space at disposal, and more or less on attention in regard to feeding, etc. Bunches of Tomatoes vary in size from 1 lb. to 3 lb. each, and each plant may be allowed to carry from 6 to 12 bunches, according to the length of shoot. In a short season 6 or 8 bunches would be all that would ripen, therefore 10 lb. or 12 lb. of fruit would be a good average crop. The same remarks apply to Cucumbers under glass. With care and attention, one batch of plants may be kept in a healthy and fruitful condition all through the season. More fruits would be obtained by having young plants in readiness for replanting the same house two or three times during the season.

WEIGHTS IN COVENT GARDEN MARKET: H. C. The following fruits and vegetables, if consigned for sale at the Covent Garden Market, should weigh (nett)—Half-sieves: Gooseberries, 28 lb.; Cherries, 24 lb.; Currants, 24 lb.; Plums, 28 lb.; Damsons, 28 lb.; Mushrooms, 12 lb.; Brussels Sprouts, 20 lb. Bushels: Apples, 46 lb. to 50 lb.; Walnuts, 48 lb.; Pears, 55 lb.; Scarlet Beans 40 lb. A "flat" of Cucumbers depends entirely upon the size of the graded fruit, and varies from 24, 30, 36, 42, 48, to 60 fruits. Early in the season, say, in February and March, the flats generally contain three dozen Cucumbers. Later, when the plants have increased in vigour, occasionally flats consisting of 24 and 30 fruits are included in each consignment. English Carrots, Turnips and Beetroots are sold in dozen bunches, the latter consisting of from six to twelve roots, according as the roots are large or small. A market bundle of Asparagus consists of 100 sticks. Parsley, Mint, and Sage should be made into good-sized bunches.

YOUNG VINES: R. S. Cut your young Black Hamburgh vines down to about 8 inches from the soil. Train the strongest shoot that develops as a leader, and stop this when it is about 6 feet long. Prune the rod again next winter to, say, 4 feet. The vines may be allowed to carry two bunches the following year, or three, if they are small ones, and about six bunches the second year, according to their size and strength, increasing the number as the vines gain strength. Retain one or two shoots which break below the leader, and stop them about the sixth leaf; these will strengthen the base of the vines and favour root action.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 41.2°.

### ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, November 29, 10 a.m. Bar. 30.3; temp. 51°. Weather—Fine.

In the death of Henry John Elwes on the 26th ult. at Colesborne, at the age of seventy-six, there passed away one whose name is well and widely known. To state that he was perhaps the greatest living traveller of the day, an authority second to no one in Europe on trees, a lepidopterist whose collections enrich our national museum at South Kensington, the author of what is still the authoritative work on Lilies—though published so long ago as 1880, and a big game hunter and ornithologist of great repute, by no means exhausts the list of his activities.

After leaving Eton Elwes spent five years in the Scots Guards, but the spirit of adventure which was strong in him to the end caused him to resign his captain's commission and begin that life of scientific travel and adventure from which such a rich harvest has resulted. His journeys were made in Turkey, Asia Minor, Tibet, in India four times, in North America and Mexico three times; in Chile; in Russia and Siberia three times; in Formosa, China and Japan twice; in Nepal and Sikkim. He was the official representative of Great Britain at the Botanical and Horticultural Congresses at Amsterdam in 1877, and at Petrograd in 1884. He was the Scientific member of the Indian Embassy to Tibet in 1886. Few, if any, men knew every country of Europe so well as he, and he greatly benefited by his excellent knowledge of French and German. For nine years Elwes was a member of a

wild-boar shooting syndicate in the Ardennes, and he stalked chamois regularly in the Austrian Tyrol.

He was a past president of the Royal English Arboricultural Society, and of the Entomological Society of London; past vice-president of the Royal Horticultural Society, and a Victoria Medallist. In 1921 he was elected president of the British Ornithological Union, having been a member for 55 years. In 1897 the Royal Society elected him a Fellow.

Elwes' first publication appeared in the *Ibis* of 1869, the subject being "The Bird Stations of the Outer Hebrides." Four years later, in June, 1873, he published in the *Proceedings of the Zoological Society* his paper "On the Geographical Distribution of Asiatic Birds," his most important contribution to Ornithology, and to it he attributed his subsequent Fellowship of the Royal Society. In 1880 his great monograph on the Genus *Lilium* appeared, a book which has long been out of print, but is still the recognised authority on the subject. From 1880 to 1906 he published 27 papers on the lepidoptera of many regions, and described numerous new species of his own finding. In 1888 there appeared in the *Transactions of the Entomological Society* his "Lepidoptera of Sikkim," a very valuable record of the numerous species of that country. He was in Formosa in 1912, and succeeded in bringing home alive several specimens of the splendid Mikado Pheasant.

Mr. Elwes' botanical discoveries in all the many countries he visited were very numerous, and he introduced many species. The *Botanical Magazine* has figured no fewer than 87 plants of his growing or finding; many fine plants now familiar in most gardens we owe to him. It is not unfitting to add here that largely through his generosity, and by his active interest, that venerable publication (*Bot. Mag.*) has now been launched again on what we all hope will be another century of unbroken prosperity and even greater usefulness. The School of Forestry at Cambridge has greatly benefited by his munificence, and owes many of its finest timber specimens to him. In 1900, with his friend, Prof. Augustine Henry, as collaborator, Elwes began the preliminary labours which resulted in the production of that monumental work, *The Trees of Great Britain and Ireland*. The first of the seven volumes appeared in 1906, and the last in 1913. Never before has a book on European trees been attempted on such a scale, and with so lavish an expenditure of money in its preparation. Indeed, it can only be compared with Sargent's *Sylva of North America*, that great fourteen-volume record of American arboreous species. Elwes especially undertook the task of visiting every place in this country where remarkable specimens exist, as well as every European collection of note. The number of trees described which Elwes himself had seen and measured is overwhelming evidence of the untiring zeal he devoted to this work, well-nigh impossible except to one in whom the boyish spirit of adventure survived. The fact that both he and Henry had seen almost every species in its native land gave great additional value to their descriptions of the cultivated plants. Never was a great labour more fittingly divided, Elwes making incessant journeys to see and take particulars of specimens, and Henry, the exact botanist, writing the scientific descriptions. To the writer the ubiquitous character of their researches was vividly brought home when in 1917, during war service in France, he had occasion to visit a little known property in

the Medoc. He saw there some remarkable Oaks, Pines, and other trees of the S.E. United States, grown from seeds sent home by Michaux 100 years ago. Though the existence of these trees was scarcely known in France, the proprietor stated that a few years previously two gentlemen had come from London to see them, a Monsieur Elwes and a Monsieur Henri! Some twelve years ago the writer paid a visit to Grasse, in the Riviera, on the business of a public company; Elwes accompanied him solely to see two individual natural hybrid Oak trees which he believed could be found within a few miles of that place. It is needless to add that the two trees were duly found and photographed on the very day following that of arrival! This is not the place to describe the great book in detail or enlarge on what it has meant for arboriculturists generally. Its scientific accuracy, expressed in plain, straightforward and admirable English, has given an incalculable impetus to forestry and arboriculture in this country, and has inspired with enthusiasm everyone fortunate enough to possess it. Elwes, indeed, had a ready pen, and was master of an easy, vigorous style rarely surpassed in botanical literature. No slipshod statement of fact or hearsay evidence would satisfy Elwes' critical faculties, indeed, there are some who think he at times expressed his dissent with needless emphasis. He had little knowledge of the arts of compromise or how to agree with his adversary in the way. When in pursuit of a subject he sometimes urged his views on his hearer without giving him an opportunity to express his own, a failing not uncommon in those of masterful intellect in whom the sense of humour is, perhaps, somewhat deficient. He had difficulty in realising the point of view of others; no one was more ready to acknowledge their achievements in his publications, but the judgments he expressed of the character of men, or the merits of plants, were sometimes precipitate and prejudiced. A charming characteristic was his readiness to admit when he was wrong, and he combined a chivalrous courtesy with a self-assertiveness which those who did not know him well were apt to misjudge. No sketch of Elwes' life should omit mention of his amazing powers of assimilation of knowledge and of his prodigious memory.

As a West Country squire the handsome, burly figure of Elwes was well known, in the hunting field and elsewhere, among his more stay-at-home neighbours. His estate of Colesborne in the Cotswolds is, unfortunately, situated for the most part on the cold oolitic formation of that district, and he deplored, as indeed we all may, that he possessed no acres of green-sand or old red sandstone on which to make his plantations and pinetum. Had such been available, it is safe to say that his would by now have been the most complete collection of trees hardly in Great Britain. In a frosty valley near his house he formed a "Centenary Plantation" of trees of many species grown from seed collected for the most part in this country in 1900, a year remarkable for the ripening of tree seeds of all kinds. Here careful temperature and other records have been kept, and the origin of the trees in each plot is known. It was a delight to Elwes to show his guests the results, and he was as much interested in, and as careful to point out, the failures as the successes. Truth to tell, the former were almost as numerous as the latter. In his garden, however, he was more fortunate. His glass-houses were full of plants rarely seen elsewhere in cultivation, many of them introduced by himself.

In 1890 his friend Max Leichtlin gave

him his collection of South African Nerines. Elwes grew these successfully ever since, and did more than anyone else to improve them by hybridisation. In recent years he took a keen interest in the cultivation of succulent plants, and succeeded remarkably with many species of Mesembryanthemum, Haworthia, and other desert species. For many years his garden contained a fine collection of bulbous plants; in 1874 he discovered six new Crocuses in Asia Minor, and ever since, with many species of Fritillary, Tulip, and Snowdrops, they have flourished at Colesborne. He had always taken a keen interest in Alpine plants, and near the end of his life contemplated writing a book on these at a time when most of his friends would have preferred him to devote all the energies of his declining years to an autobiography.

Elwes was at his best in his own home. An admirable host, he imparted information to his guests on all scientific subjects, with such kindly insistence that even the most indifferent could not fail to catch his enthusiasm. Like most amateur gardeners, he was generous with his plants.

Elwes succeeded to Colesborne on the death of his father in 1891. He was the eldest of a family of seven. One of his sisters married, as his first wife, Sir Michael Hicks Beech (afterwards Lord St. Aldwyn), and another was the first wife of the late Frederick du Cane Godman, F.R.S., who shared all of Elwes' botanical and zoological interests, and was his greatest friend. A story Elwes was fond of telling was of when in the 'seventies he and Godman were on a coach on the way to the Yosemite Valley in California. They were sitting on a back seat and named to each other every butterfly and tree they passed. The driver was becoming more irate every minute at hearing two "tender-foot" Britishers identify things of which he knew nothing unless it was the occasional local name. On coming to a tree of *Fremontia californica*, covered with its yellow blossoms, the lady at his side asked what it was. "I call it Slippery Elm," was his reply, "but I don't know what the pair of bug-fiends back of me will say it is!" Elwes married in 1871, Margaret Susan, the second daughter of the late W. S. Lowndes-Stone, of Brightwell, in Oxfordshire, who, with an only son, Colonel Henry Cecil Elwes, D.S.O., M.V.O., survives him. F. R. S. Balfour.

**Coloured Plate.**—With the present issue we present our readers with a supplementary coloured illustration of Apple Guelph. This handsome and useful variety was raised by the late Mr. Chas. Ross from a cross between the varieties Charles Ross and Rival. Fruits were exhibited by Mr. W. Pope, Welford Park Gardens, Newbury, before the Fruit Committee of the Royal Horticultural Society on October 7, 1913, when the merits of the variety were recognised by the award of a First-Class Certificate. Guelph is a large, round Apple, of the Chas. Ross type, suitable for dessert or culinary purposes. The flavour is first-rate and very suggestive of that found in Cox's Orange Pippin. The colouring is very beautiful, being rich yellow, which on the sunny side is heavily flushed with crimson. The calyx cavity is shallow and saucer-shaped and the calyx segments short, while the short stem is somewhat deeply inserted. The original tree has maintained its character as a healthy and free grower and regularly produces heavy crops of handsome fruits of excellent quality. Mr. Pope informs us that it has never once failed to crop at Welford Park since it first fruited in 1911. The variety was introduced to commerce by Mr. Whiting, of Faversham, Kent.

**"Transactions" of the National Chrysanthemum Society.**—The special floricultural societies are gradually returning to their pre-war importance

and several are resuming publication of their useful transactions and year-books, which, taken over a series of years, are the best records of progress in the particular flower with which the Society is associated. We are glad to see that the National Chrysanthemum Society is in a position to again issue its *Transactions*, and although the work is still of modest proportions compared with those of pre-war years, the thirty odd pages are filled with matter of interest to Chrysanthemum lovers. There are two excellent illustrations, the one of the Society's cup that was won by Mr. H. J. Jones at the Holland Park Hall show, and the other of Mr. H. J. Jones' superb group of Chrysanthemums to which it was awarded. An article on "Early-flowering Chrysanthemums," by Mr. Harold Wells, shows the importance which this type of Chrysanthemum has in gardens and records how many of the best varieties were raised. It is interesting to know that sports of white varieties usually revert to yellow, and many of these sports give short-petalled yellows. Yellows do not sport to white, although those that have sported from white to yellow may revert to the white form. In his remarks on "Chrysanthemums in Floral Decoration," Mr.

THE LATE MR. HENRY J. ELWES, F.R.S., V.M.H.

Mark Mills gives some valuable hints on the arrangement of these beautiful flowers that are useful to exhibitors, and he emphasises the importance of every flower being given sufficient space so that it may be seen to the best advantage. Owing to the season of Chrysanthemums autumnal foliage is largely used with the flowers, but Mr. Mills points out that pink blooms seldom show to good effect if mingled with autumnal foliage. Mr. C. Harman Payne's remarks on the Le Mans Chrysanthemum Exhibition, 1921, will be read with interest by all lovers of the flower, and it is gratifying to know that Mr. H. J. Jones was the winner of the second grand prize of honour of that show, at which other English growers were represented. Sympathetic reference to the death of the president, Sir Albert Rollit, shows the great loss the Society has sustained in his decease. Other pages are devoted to a list of awards made by the Floral Committee in 1921, the report of the Executive Committee in 1921, and the financial statement.

**Horticultural Executive Committee of the British Empire Exhibition.**—The horticultural features of the British Empire Exhibition of 1924, at Wembley Park, will be more or less under the control of a Horticultural Council, of which Lord Lambourne is President, but it appears that the major part of the business will be delegated to an Executive Horticultural Committee, which at present consists of four representatives from the Royal Horticultural Society, four from the Horticultural Trades' Association, and two other gentlemen, a somewhat severe

limitation having regard to the great floricultural interests which the exhibition authorities hope to attract to Wembley. The members of the Executive Committee are: Mr. R. W. Wallace, Tunbridge Wells; Mr. W. A. Bidney, Weybridge; Mr. W. Cuthbertson, Duddingston; Mr. W. R. Dykes, secretary Royal Horticultural Society; Mr. M. C. Allwood, Haywards Heath; Mr. A. G. Jackman, Woking; Mr. Owen Murrell, Shrewsbury; Mr. C. E. Pearson, Lowdham; Mr. G. Monro, Covent Garden; and Mr. H. V. Taylor, Deputy Controller of Horticulture; with Mr. W. Watson, Branstone Road, Kew, as the Organising Secretary.

**National Dahlia Society.**—We are glad to know from the report of the Committee for 1922, read at the annual meeting of the National Dahlia Society on Tuesday last, that this old floricultural Society is making steady progress. There is a small increase in the membership and the finances are satisfactory, showing a credit balance of £15 17s. 10d. The past season was a most favourable one for Dahlias and the annual exhibition was one of the most successful held during recent years. The show for 1923 has been fixed for September 19, a later date than usual, but, judging from experience over several years, a time when the flowers are at their best. We congratulate the Society on its efforts to improve the Dahlia from a garden point of view, and plenty of evidence was forthcoming at the meeting that this beautiful autumn flower is being used more and more extensively each year for garden decoration.

**Retail Prices for Agricultural and Horticultural Produce.**—Sir R. Saunders, Minister of Agriculture, announced in the House of Commons, on Monday last, the 27th ult., that his department was appointed a Departmental Committee to inquire into the methods and cost of selling and distributing agricultural, horticultural and dairy produce, and to consider whether, and, if so, by what means the disparity between the price secured by the producer and that paid by the consumer may be diminished. The great disparity between producers' prices and those charged by retailers is a common grievance amongst growers and the purchasing public, and while every allowance may be made for the greatly increased cost of establishment charges, the difference of sometimes several hundred per cent. between growers' and retailer's prices is far too great, making not only for discontent by the public, but for a curtailment of trade.

**Association of Economic Biologists.**—A general meeting of the Association will be held at Manchester on Friday and Saturday, December 15 and 16. On the 15th inst., in the Botanical Department of the University, Dr. W. Lawrence Balls will open a discussion on "Genetics in Relation to Applied Biology." After tea there will be a demonstration of specimens and research, apparatus, etc., and Dr. S. G. Paine will read a paper on "Internal Rust Spot (Sprain and Net Necrosis) in the Potato and the possible Association of this Disease with Leaf Roll." After dinner in the University Refectory, there will be informal discussions on "The Place of Applied Biology in Universities," and "The Relation of Biology to Medicine." Saturday's programme will include a visit to the British Cotton Industry Research Association, Shirley Institute, Didsbury, Manchester.

**The Survey of Fruit Soils.**—An investigation is being undertaken by the horticultural stations at Cambridge University and Long Ashton, to ascertain the extent to which fruit growing can be correlated with soil type in two very distinct districts, viz., East Anglia and West Midlands. In East Anglia fruit is grown on a variety of soils, whilst in the West Midlands it is grown on, apparently, a single definite soil type. Other factors in fruit growing, such as climate, altitude, aspect and water table, appear to be relatively uniform in the first area, although they differ widely in the second. It would appear to be necessary to examine the soil to a depth of two feet, which seems, from a pre-

liminary examination undertaken by the Long Ashton Station, to be the extent and depth of root range of fruit trees. The main survey will include an examination at each plantation visited of soil character and the behaviour of the trees. A small grant has been recommended by the Development Commissioners and sanctioned by the Treasury, and if satisfied with the working of the scheme these authorities are prepared to recommend further grants.

**Appointments for the Ensuing Week.**—Tuesday, December 5: Royal Caledonian Horticultural Society's meeting; Bournemouth Gardeners' Association's meeting.—Wednesday, December 6: Royal Agricultural Society's Council meeting; National Viola and Pansy Society's meeting; Glasgow and West of Scotland Horticultural Society's lecture on "Our allotments—as they are, and what they might be," by Mr. Alex Buist.—Thursday, December 7: Manchester and North of England Orchid Society's meeting.—Saturday, December 9: Ringwood Society's meeting.

"The Gardeners' Chronicle" Seventy-five Years Ago.—*Dr. Hooker's Botanical Mission to India.*—The increased and increasing patronage which the Government of this country affords to science is a subject of high satisfaction to all naturalists. This patronage is peculiarly evinced in the liberality with which the treasures contained in the British Museum, and those in the Royal Gardens of Kew, are rendered available to the public good. In connection with the latter establishment, we have to announce that one of the most enthusiastic votaries of botany, whose name stands at the head of the present article, has just quitted this country to further its interests. Dr. Hooker, having brought his *Flora Antarctica*, part of the results of a previous voyage, to a close, has been appointed by H.M. Government to investigate the vegetable productions of India, and especially of the Himalaya mountains; and as a treaty is now in progress of negotiation between the British powers in Hindustan and the Chinese, with reference to the boundaries of Thibet, it is possible even the latter interesting region may be visited by Dr. Hooker in the course of his journey. The most important assistance, in exploring the botany of Northern India, is promised to our traveller by His Excellency the Governor-General, Lord Dalhousie, and by the Court of Directors of the Honourable India Company. After spending about twelve months in this undertaking, Dr. Hooker's instructions are to return in 1849 to Calcutta, and thence proceed to Singapore and Borneo. At the latter island, the valuable aid of His Excellency, Mr. Brooke, and the protection afforded by H.M.S. Meander (commanded by the Hon. Capt. Keppel, to which ship Dr. Hooker will be attached as supernumerary medical officer), will enable Dr. Hooker to fulfil the designs of the noble and enlightened First Lord of the Admiralty, Lord Auckland, who directs that he shall pursue his botanical researches and draw up a report on the vegetable productions of the British settlement of Labuan and such parts of Borneo as can safely be explored. It is especially his object to ascend, if possible, the great mountain of Keeney Baloo, supposed to be 14,000 feet in height. Dr. Hooker embarked at Portsmouth on November 11 in H.M. steam frigate Sidon, which conveys His Excellency, Lord Dalhousie, to Alexandria, en route for Calcutta, and he may be expected to arrive there towards the latter end of this month (December). Two or three months will probably be devoted to investigating the plains of Bengal, and particularly the fossil vegetable remains in the coal formations at Burdwan; and then Dr. Hooker will journey northward, perhaps to Sikkim; but his exact route must considerably depend upon circumstances which it is impossible yet to foresee. *London Journal of Botany Gard. Chron., December 4, 1847.*

**Publication Received.**—*The Fungicidal Properties of Certain Spray-Fluids.* III. By Messrs. E. Horten and E. S. Salmon. Reprinted from the *Journal of Agricultural Science*, Vol. XII, Part III. University Press, Cambridge.

## TREES AND SHRUBS.

### PSEUDOLARIX FORTUNEI.

THE Golden Larch, the popular name given to *Pseudolarix Fortunei* because of its gloriously coloured foliage in autumn, was first introduced by Robert Fortune, from China in 1855. In some nursery catalogues the name *Pseudolarix Kaempferi* appears, and still more rarely the name of *Larix Kaempferi*. From a true Larch the subject of this note differs in having clustered male catkins (in the Larch they are borne singly); and in the cones falling to pieces when ripe (those of the Larch fall and remain intact). The leaves are larger and stouter than in the Larch, the largest exceeding two inches long and  $\frac{1}{2}$  inch wide. Compared also with the tall, quick-growing Larch the *Pseudolarix* is a sturdy, thick-set tree with stiff, horizontal branches, and it is of slower growth.

## THE ROSE GARDEN.

### ROSA SPECIES.

THERE are many species of *Rosa* of great beauty, and where space permits they should find inclusion in the garden in greater or lesser degree in accordance with the space at command. Some have beauty of flower and perfume; others beauty of wood; and most have the great charm of producing pretty fruit, generally known as hips.

*Rosa lutea*, the Austrian Briar Rose from which originated the fine race of Pernetiana Roses; *R. alba*, the White Cottage Garden Rose; *R. blanda*, *R. Brunonis*, *R. Hugonis*, *R. Jundzillii*, *R. pomifera*, *R. rugosa*, The Rhamnus Rose of Japan, of which there are many lovely hybrid forms; *R. Giraldui*, *R. Helenae*, *R. Moyesii* and its variety *R. M. rosea*, *R. Pratii*, *R. Soulieana*, *R. omeiensis*, and *R. Will-*

FIG. 129.—CONES OF PSEUDOLARIX FORTUNEI.

In autumn the leaves fall and reveal thickly set clusters of woody cones, some two inches broad and deep (Fig. 129). Taken from the branches and placed in soil they might pardonably be passed by as Houseleeks.

As a lawn specimen *Pseudolarix Fortunei* is a most beautiful and interesting tree. The best means of increasing it is to raise plants from imported seeds. So far we have failed to obtain good seeds from the Kew trees. *A. O.*

### ACER NIKOENSE.

THE Nikko Maple in its glorious autumn foliage is this year the most beautiful tree among the large collection of Acers near the flag-staff at Kew. This clean-growing, upstanding young tree, some 20 feet in height, has leaflets of a rich, dark red or crimson hue, and provides a gorgeous display of glowing colour in the autumn sunlight.

*Acer nikoense* was first introduced by Mr. Chas. Maries, who sent home seeds from Japan to Messrs. James Veitch and Sons, in 1881. It is also a native of Central China, and wild trees grow up to about 50 feet in height. The leaves consist of three leaflets with a densely hairy stalk, the centre leaflet up to  $4\frac{1}{2}$  or 5 inches long, 2 to  $2\frac{1}{2}$  inches wide at the centre, oval, tapering to the ends, the side leaflets being rather smaller and stalkless, densely hairy beneath and with shallow, wide-toothed margins. The small, yellow, pendent flowers are mostly developed in threes, and they are followed by thickly felted, brown nutlets. *A. O.*

*mottiae* are all worthy of inclusion for their floral beauty; whilst for coloured wood, such species as *R. lucida*, *R. nitida* and *R. Pratii*, with their bright red stems in winter, *R. longicuspis* with chocolate-coloured growths, *R. omeiensis pteracantha*, with wonderful translucent red spines, and *R. rubrifolia* with plum-coloured foliage and wood, all have their claim to decorative effect, especially during the winter.

Rose species producing ornamental hips are numerous. Two old favourites are *Rosa pomifera*, the Apple-fruited Rose, with large, red fruits; and *R. rugosa*, with large, flat-shaped, deep red fruits that at first glance look something like red-coloured Medlars. Other good fruiting species are *R. Moyesii*, with bright red, bottle-shaped fruits; *R. Helenae*, that develops many bunches of red fruits; *R. setipoda*, one of the most beautiful of fruiting Roses; *R. Soulieana*, with medium-sized, egg-shaped, orange-red fruits; and *R. Giraldui*, which carries masses of long-shaped, scarlet hips. Further species that are almost as good as those already mentioned for their pretty hips, are *R. acicularis*, *R. alpina*, *R. altaica*, *R. bracteata*, *R. humilis*, *R. macrophylla*, *R. nitida*, *R. Webbiana*, *R. caudata*, *R. Davidii*, *R. nipponensis* and *R. Willmottiae*.

Some of the kinds named are rampant growers, and where it is possible to devote space entirely to these wild Roses a very interesting collection may be formed. *E. Beckett.*

## The Week's Work.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Espalier Trained Trees.**—The pruning of these trees should be done in mild weather, whether they are trained on walls or on wires stretched along the sides of paths. Neglected trees which may have useless snags will need extra care and judgment in reducing their number, so that those left to fruit may develop strong fruit buds for some few years to come. It is not uncommon to see espalier trees crowded with useless shoots that weaken those that should bear fruits. All fruiting wood should have ample space to develop strong, fruitful flower buds which will be strong enough to set their fruits in adverse weather. Prune the young shoots of the current season to a couple of buds; any that are required for extension should be left 10 inches to 12 inches in length.

**Planting Young Trees.**—Plant young trees 14 feet apart, and very strong growers 16 feet asunder. Plant in good soil that is efficiently drained. Choose only useful varieties that will maintain a supply of fruits over a long season. In laying the foundation of a young tree, be very careful to select shoots at equal distances apart to build up an evenly balanced tree. The leaders will need to be shortened to one bud above where the next pair of branches or tiers is required. In some cases, with good attention, two pairs of tiers may be made in one season by allowing the leader to grow a suitable length and resorting to what is known as notching—that is, by cutting well into the wood just above the buds required to form the bottom pair of branches.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARRLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

**Laelia anceps and its Varieties.**—These Orchids and all the inmates of the Mexican house should be examined. Those developing flower spikes should be neatly staked, cleaned, and so arranged that they receive the maximum amount of sunlight. These Orchids delight in an abundance of light, air, and moisture whilst making their growth, but need a decided rest after flowering. At this season they should be watered whenever they become dry, until their flowers are fully developed. Care should be taken that the long spikes do not touch the glass, or many flowers will be spoiled. In houses where the head room is limited the flower spikes should be tied down, so that they do not reach the roof.

**Laelia harpophylla.**—This bright orange-red Laelia is not so extensively cultivated as its merits deserve. The flowers are very attractive, especially when seen in the mass, and when arranged in a group these plants always command attention. They should now be removed to a light position in the Cattleya house, and afforded plenty of water at the roots only, until the flowers open, when the plants should be kept on the dry side in a cool, intermediate house.

**Trichopilia.**—*Trichopilia fragrans*, one of the best white sweet-scented Orchids, is developing its flower spikes, and will soon be in bloom. It is a plant worthy of a place in any collection, for spikes of deliciously-scented white Orchids suitable for any kind of decoration are not plentiful, and undoubtedly Orchids will be grown in the future for decorative purposes more than they have been in the past. This plant requires a trifle more heat than *Odontoglossum crispum*, and may be grown in the warmer end of the cool house, or in any moist house where the winter temperature does not fall below 50°. *T. suavis*, *T. coccinea*, *T. tortilis*, *T. crispata*, and *T. marginata* require a few degrees more heat and are best wintered

in a house having a cool intermediate temperature. Most of these plants have completed their growths, and should not receive too much water, or their pseudo-bulbs and leaves will quickly become spotted. So long as the pseudo-bulbs remain plump, very little or no water will be required, but if they show signs of shrivelling, a moderate amount of moisture may be afforded.

**Resting Trichopilia.**—Whilst at rest these Orchids should be grown in a moderately dry position, where they may enjoy a certain amount of light, but not actual sunshine, as the sun will quickly turn the leaves from the deepest green to a sickly, unhealthy hue. When about to open their flowers, the plants are best removed to a shady position in the Cattleya house, where the blooms will open better and be less likely to become spotted than if left in the cool, damp atmosphere of the cool house. *Trichopilia* should be repotted soon after growth commences, and they will succeed in a similar compost to that used for *Odontoglossums*. In potting, keep the plants well elevated up in the pots, as, should moisture lodge in or about the young growths, there is a danger of them rotting. The plants now flowering will be best potted when the days lengthen in the early spring. When growing freely they delight in an abundant supply of water at the roots. In cases where, from any cause, the plants are late in making their growths, and are in consequence now growing, they may be given a light position in the Cattleya house so that they may become matured as speedily as possible. Some of the small growing kinds are best grown suspended from the roof rafters on the shady side of the house.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Lily-of-the-Valley.**—Where this charming, sweetly-scented flower is in constant demand good strong crowns should be obtained for forcing. They may either be grown in 5-inch or 6-inch pots, or they may be placed thickly in boxes, from which they may be removed, when in flower, to ornamental bowis. These will be found to take no harm, as they will have formed no fresh roots at this stage. To be successful with the early forcing of this flower a temperature of 75° to 80° is necessary. The soil or fibre in which they are grown should never be allowed to become dry; the pots or boxes may be covered with moss to conserve the soil moisture.

**Violets.**—Since they were placed in frames Violets have made good growth and are now well established in the soil. Give attention to pinching out all runners, and remove all decaying leaves. Disturb the soil between the plants lightly at intervals, as this will keep the atmosphere about the plants sweet. To be successful with Violets in frames plenty of fresh air should be admitted to the latter on all favourable occasions, and whenever frost is not expected air should be admitted even at night, for Violets resent a close atmosphere.

**Primula malacoides.**—Seedlings of this *Primula* raised from seed sown as advised in a previous calendar are ready for transferring to their final pots. I do not favour the use of large receptacles for these plants; I have found them to flower more profusely in pots 4½-inch in diameter than in those of a larger size, provided stimulant is given the roots in the form of liquid manure; moreover, they are less liable to rot off at the collar in small receptacles. These *Primulas* should be grown in a cool house where heat is only employed to exclude frost.

**Schizanthus.**—Plants of *Schizanthus* of the large flowering hybrids raised from seeds sown as advised for flowering in the greenhouse next spring should be ready for placing in 5-inch or 6-inch pots. Place them on a shelf near the roof-glass, and use only sufficient fire-heat to keep out frost. A light, open compost is the most suitable for these plants. When they have well filled their receptacles with roots, give the latter a little concentrated fertiliser.

### THE KITCHEN GARDEN.

By JAMES E. HATRAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Tomatos.**—Plants in bearing require careful attention. Those which are carrying fruits that are ripening should not be given too much water; the temperature should be maintained at 60°, and air admitted on all favourable occasions.

**Carrots.**—A sowing of Carrots of the Early Horn type should be made in frames or on a hot-bed. If sown in drills, Radishes may be sown thinly between each row. Before sowing the seed see that the heat of the hot-bed is not too strong.

**Salads.**—To maintain a regular supply of salads, small quantities of Dandelion and Chicory should be introduced into heat every week. Mustard and Cress should be sown every week; these salads are easily grown in shallow boxes, sowing the seed on the surface of the soil and covering the box with paper until the plants have germinated. Lettuces growing in frames should receive careful attention, admitting plenty of fresh air or the foliage will damp-off. Blanch sufficient Endive to meet the requirements of the establishment.

**Mint and Tarragon.**—These herbs may be lifted, placed in boxes and forced. They both force readily.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Pot Vines.**—These have largely gone out of fashion, but the majority of growers who are required to furnish ripe Grapes in May still grow or buy a few pot vines annually to ensure a longer rest to the vines in the earliest permanent house. Pot vines, provided they are ripe and well rooted, yield good crops of fruit. Successful forcing depends more on the preparation of the vines than on the detailed operations of forcing. I have seen very strong vines a complete failure, whilst weaker, but thoroughly ripened canes have developed plenty of good bunches. Ripened wood is very desirable; well rooted vines, with hard, brown stems, which have had a good rest, may now be started with every chance of success, by those who understand the routine of forcing. The pit or house should not be too large, but light and well heated; a span-roof admits most light, and this type of house requires most fire heat, so that often a good lean-to house facing south is the best for early forcing. If the house or pit is deep enough to receive it, a good body of fermenting material is useful, not only as a stimulant to the roots, but also for keeping the house supplied with atmospheric moisture. See that the drainage hole is not stopped, and then lightly top dress the roots with a mixture of loam and bone-meal. Stand the plants in position, and let the temperature range from 48° to 53° at night, and as high as 60° by day; admit a little fresh air to keep the atmosphere of theinery sweet and healthy. Tepid water applied to the roots plays a very important part, but of two evils, it is better to give too little moisture than too much, as an excess before the buds break often destroys the most valuable roots.

**Early Peaches.**—In a recent calendar I mentioned the importance of pruning the trees early in the early Peach-house, cleansing the house and trees and making ready generally for starting forcing. If ripe Peaches are required from trained trees in May or early June, the house should be closed forthwith, as it is better to start early at a low temperature with plenty of air than to force hard against time and spoil the flavour at the finish. Inside borders should be carefully examined to ascertain if they are in a moist condition down to the drainage, and although late to remedy a common defect, they should be well watered with tepid water if the soil is found to be dry. For some time after the house is closed it will not be necessary to use fire-heat, especially if fer-

menting material is employed and frequently turned. Fresh air is most important to the welfare of the trees before the buds break. Therefore it is better to utilise the hot-water pipes than to keep the house shut up and full of cold vapour. Many experienced growers think that ventilation through the early stage is of trifling importance; this is a mistake, as trees that are started with a free circulation of fresh air expand stronger and more perfect flowers than others which do not receive this attention. On fine, bright days the ventilators may be opened, and, when the buds become prominent, gentle fire-heat will permit of the admission of more air, also gentle dewing of the trees with the syringe once or twice during the brightest part of the day. A temperature of 40° to 45° is suitable at first, then, as the buds swell, 45° may be taken as the minimum, and 55° as the maximum, rising to 60° with sun-heat in the middle of the day.

**THE FLOWER GARDEN.**

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Antirrhinum.**—Antirrhinums raised from seed sown last month should be pricked off into boxes and placed in cold frames, where protection can be afforded them for a time. Keep the frames close for a few days to enable the plants to become established in their new quarters, and thereafter gradually admit air to them, increasing the amount so that in time the lights may be removed, and only utilised during very severe weather.

**Roman Hyacinths.**—The earliest batch of these bulbs should be well rooted, and may be removed from their plunging material and stood in a cold frame for a week or ten days before introducing some of the stronger specimens into the forcing house. To insure fairly long spikes the pots should not be arranged too close to the roof-glass.

**Rose Planting.**—Rose growers from now onwards will be engaged in the preparation of the ground and the planting of Roses. Select, if possible, a south or south-western aspect, for Roses love sunlight, and choose a situation protected from the north and north-east, so that keen winds from those quarters do not harm the plants. Let the aspect otherwise be open, for it is not necessary to have a closed-in site for Roses, and possibility of stagnant atmosphere should be avoided, as that would be likely to favour attacks of mildew on the plants. Where protection has to be devised against winds, close-growing hedges are ideal for breaking the force of winds, whilst permitting a free passage of air.

**Drainage.**—An important point, especially on heavy, tenacious soils, is the ridding of these, by some effectively improvised drainage, of surface water in times of heavy rains, as Roses are harmed by stagnant water around their roots.

**HARDY FLOWER BORDER.**

**ORIENTAL POPPIES.**

**PAPAVER orientale** is an old garden favourite of true regal splendour; for a gorgeous display and combination of colour it is a distinct rival to the best of the Darwin Tulips or the Chinese Paeonies.

Flowering during May, June, and frequently into July, the plants reign supreme for general garden effect, the different varieties producing a glorious combination of colour from pure white to silvery pink, through salmon-pink to the darkest shade of blood crimson; indeed, all shades are represented except blues and yellows.

These beautiful oriental Poppies are indispensable to any phase of gardening, whether it be the planting of round or oval beds, or for massing in clumps. When planted with a groundwork of Yellow Alyssum, Phlox subulata variety Leha or Achillea mongolica, over which these giants throw up their numerous stout stems, crowned with crimped, shimmering,

satin-like flowers from amidst huge masses of handsome foliage, they are exceedingly effective.

On October 21 I had a dozen or more flowers of the most beautiful shades on my table, which is proof of the plants' persistence in flowering. The varieties included the gorgeous salmon-pink, Mrs. Perry, also Lady Frederick Moore, a large flower, with translucent colouring of the most delightful shade of pink, suffused with salmon; Princess Ena, one of the most charming sorts, with dainty orange-salmon coloured, Tulip-shaped flowers; Mrs. Lockett

in October for the second time this year, the moist season evidently proving of great benefit to them. Both foliage and flower stems were quite as showy as during May and June. Other meritorious varieties are Col. Bowles, Goliath, Beauty of Livermere, bracteatum, multiflorus, Brilliant, Mogul, and Royal Scarlet, all shades of rich scarlet to blood crimson and most effective; King George and Lord Lambourne are departures from the general form in Poppies, having characteristics quite distinct from all others in their prettily-fringed petals

FIG. 130.—CHRYSANTHEMUM NOVEMBER CHEER. N.C.S. FIRST CLASS CERTIFICATE, NOV. 16. SHOWN BY MESSRS. W. WELLS AND CO. (SEE P. 314).

Agnew, another shade of salmon, shaded orange, in shape resembling Papaver tuliferum; Enfield Beauty, a variety with stout stems, and one that should be in all collections, as it produces numerous flowers of rich salmon colour; with conspicuous maroon-coloured bases well into July; Private Gerald Perry, a tall-growing variety of exceeding merit, producing soft apricot-pink flowers, with large crimson spots; Immaculata, a perfectly spotless flower of bright scarlet, and very distinct; Crimped Beauty, prettily crimped flower, of a delightful shade of orange scarlet; Miss Julia James, a pretty dwarf-growing variety, of sturdy habit, with rich salmon-pink flowers, distinctly cup-shaped, and with a conspicuous maroon blotch; and Betty, a distinct variety of miniature habit, with flowers a delightful shade of apricot, passing to shell pink.

The above and several other varieties flowered

(resembling a Parrot Tulip), with rich orange-scarlet flowers.

In the salmon, apricot and silvery pink shades, Countess Stair, E. A. Bowles, Jenny Mawson, Marie Studholme, Princess Victoria Louise, Lady Haskett (Pigny), and Mrs. Maurice Bevan are all effective. For dark maroon or mahogany purple shades, Mahogany, Ameliore and Menelik are distinct and showy.

To Mr. Amos Perry, of Enfield, we owe the introduction of the pure white oriental Poppy, which formed the subject of a supplementary illustration in *Gard. Chron.*, and it is certainly one of the most important additions to this family. The flowers are unique in shape, of a pure white, with a crimson maroon central blotch at the base of each petal.

These Poppies are of the easiest culture; almost any kind of soil suits them, but they succeed best in a deep, rich loam. W. Logan.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arises when letters are misdirected.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## OLD ENGLISH HERBALS.

IT is somewhat difficult to form a just estimate of this new contribution to the literature dealing with herbals.\* So many of its pages are such delightful reading that one almost hesitates to criticise it in any way. Nevertheless, it is of importance, in considering such a book as this, to recognise fully the writer's motives for writing it. In the present instance, it is an intense interest in herb-lore and folk-medicine which has guided the author in her selection from, and comments on, the old English herbals from the earliest times down to 1715, which is the date of the latest work dealt with in the text. In several places this intense interest has led the writer to express her own opinions in very poetical and mystic phrases, which may or may not meet with the approval of the serious student. Her attitude towards the old books is expressed thus: "There is only one way of understanding these old writers, and that is to forget ourselves entirely and to try to look at the world of nature as they did. It is not 'much learning' that is required, but sympathy and imagination." Regarding the medicinal value of herbs, the writer holds that "Even the most cursory reading of the book [Gerard's *Herbal*] suggests how much we lose by the lack of the old simple belief in the efficacy of herbs to cure not only physical ills, but also those of the mind and even of the heart. . . . Doctors are cautious folk nowadays, but it is wonderful to think of a time when the world was so young that people were brave and hopeful enough to imagine that mere humans could alleviate, even cure, the sorrows of others. If ever anything so closely approaching the miraculous is attempted again one feels very sure that we shall turn, as the wise men of the oldest civilisations did, to God's most beautiful creations to accomplish the miracle." Further, the book ends with a long paragraph, in which a belief in brownies and other fairies is advocated, intermingled with some references to the mystic connection between flowers and stars. It is, indeed, plainly evident that the writer is not interested in the study of herbals from the point of view of the history of botany; and although many interesting examples of the early medical beliefs and cures are given, there is no systematic attempt to trace the evolution of early medical science in England.

\* *The Old English Herbals.* By Eleanor Sinclair Rohde. Longmans, Green and Co. 21s. net.

Of the seven chapters of the book, the longest is the first, on the Anglo-Saxon herbals, and is, perhaps, the most successful portion. Basing her researches upon four of the oldest MSS., the *Leech Book of Bald*, the *Lacnunga*, and the Saxon translations of the *Herbarium of Apuleius* and the so-called *Peri Didaxicon*, the writer reconstructs with much sympathy and imagination the picture of our Anglo-Saxon ancestors in their relations to the plant life around them. A careful study of these MSS. of the tenth and eleventh centuries has shown that the beliefs they contain are far older than the MSS. themselves, and take us back to the dawn of history: "It is almost overwhelming to recognise that possibly we have here fragments of the plant lore of our ancestors who lived when Attila's hordes were devastating Europe, and that in the charms and ceremonies connected with the picking and administering of herbs we are carried back to forms of religion so ancient that, compared to it, the worship of Woden is modern." These ancient beliefs in relation to herbs are amply explained, and those in relation to the origin of disease, the doctrines of "elf-shot," "flying-venom," and the "worm," are presented to our minds with much skill. However, much appears to have been done by the aid of simple herbal remedies, without any reference to the mystic charms and amulets, which were a feature of all early medicine. A description is given of an Anglo-Saxon vapour-bath, which may have suited our hardy ancestors, but would probably prove fatal to a modern!

Among many of the interesting prescriptions quoted is one that contains a touch of the humour of those early times: "Against bite of snake, if the man procures and eateth rind out of Paradise, no venom will hurt him. This said he that wrote this book that the rind was hard gotten"! A glimpse of some of these ancient medical beliefs in practice is given in the form of an imaginative visit to an Anglo-Saxon hamlet. One slight error occurs in this chapter on p. 9, where among several garden plants said to be common both to Anglo-Saxon and modern cottage gardens, the Sunflower is inadvertently included.

Between these early MSS. herbals and the next original writings on herbals by Englishmen there appears to be a considerable gap, the next of any importance being the *De Proprietatibus Rerum* of Bartholomaeus Anglicus, the encyclopaedist of the Middle Ages. The chapters dealing with the English printed herbals naturally assume the character of a compilation from other sources, but the quotations from the herbals themselves are mostly those dealing with the survivals of ancient herb-lore and folk-medicine. The greater part of the third chapter is devoted to William Turner and his *Herbal*. The account of Turner's life has been compiled from the detailed biography by Dr. B. Daydon Jackson, which is attached to his facsimile edition of Turner's *Libellus de re herbaria novus*. Many minor errors appear to have crept into the transcription made for the present book, notably on p. 79, where the date of the letter, January 24, 1559-60, is obviously an error for March 25, 1563; and in the same letter the word "vterly" is omitted. Further, "Doctor Wolton" should be "Doctor Wotton."

A whole chapter is devoted to Gerard's *Herbal*, but the more important second edition by Thomas Johnson is dismissed with a mention. An attempt is made to excuse Gerard for his perfidy, by an appeal to the great fascination of his *Herbal*; but in this detail in the history of botany I think that the verdict of previous writers will be upheld, namely, that Gerard condemned himself when he stated in his address to the reader that Dr. Priest's translation (which formed the basis of the *Herbal*) had perished. The chapter ends with a reference to Shakespeare being a neighbour of Gerard, when the former is said to have lodged with a Huguenot named Mountjoy from 1598-1604, at the corner of Magwell (now Monkswell) Street. Among the

The proper name of it amongst the Indians is *Piciele*, for the name of *Tabaco* is given to it by our Spaniards, by reason of an Island that is named *Tabaco*. It is an herbe that doth growe and come to bee very greate: many times too bee greater then a Lemmon tree.

FIG. 131.—REPRODUCTION OF THE FIRST PRINTED ILLUSTRATION OF THE TOBACCO PLANT, FROM NICOLAS MONARDIES' "JOYFULL NEWES OUT OF THE NEWE FOUND WORLDE" (1577).

few authentic facts concerning the life of Shakespeare, has this one ever been included?

In the chapter dealing with "Herbals of the New World," reference is made to a little-known book by John Josselyn, *New England's Rarities Discovered*, London, 1672, from which is printed in full a most interesting list of the garden plants and vegetables grown by the Pilgrim Fathers. A slight error occurs in this chapter, where Petiver's herbarium is stated to be at present preserved in the Victoria and Albert Museum; it is, however, to be found in the British Museum (Natural History).

The remainder of the book deals with Parkinson's works in a very appreciative manner, also with those of Culpeper and William Coles. The three bibliographies placed at the end of the book will be found useful to students, comprising as they do the MS. Herbals to 1400, the English printed Herbals, and a selection of the foreign Herbals.

The illustrations comprise a coloured frontispiece from a twelfth century MS., and seventeen other illustrations in half-tone. One of the latter, showing the first printed illustration of the Tobacco plant is reproduced in Fig. 131. *S. Savage.*

## MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.\*

### No. III. TO LICHANG.

We left Ta-li on March 26, a beautiful spring day. The recent rain had brought out the smell of the rust-red earth, and hedges of Roses, Honeysuckle and *Elaeagnus* scented the lanes.

The main road to Lichang-fu, by Ho-ch'ing, is not followed by the muleteers, except by request, as there is a high mountain to cross. Instead, they follow the north road as though going to the Mekong river, then turn off abruptly above the Yangtze. This latter route I had followed nine years ago, so I decided to go by Ho-ch'ing this time.

The narrow valleys north of the Ta-li lake, overflowing with rich crops of Rice, Beans, and Opium, are a picture of peace and plenty in spring. By the roadside are whispering brooks, trimmed with weeds, amongst which a dark-flowered form of *Primula malacoides* is prominent. In the hedges, Jasmine, both canary yellow and snow white, Barberry, and a smother of Roses, greet the eye. The villages are shaded by Paulownia and Walnut trees; a gentle hum rises from the bees in the fruit trees. Three marches brought us to Nui-kai, or "cow market," where the roads diverge. We were now in the limestone country (a hot spring gurgles from the foot of a cliff hard by), which stretches northwards in lofty crumpled ranges for many leagues, a paradise of flowers. But above the alluvium of the valley, opulent with crops, the mountains are still rather bleak at this season.

On March 29, we turned in towards the 12,000 foot range, powdered with freshly fallen snow, which separates the Chien-ch'nan valley from the Yangtze; and after the mid-day halt, entered a limestone ravine, and began to climb in earnest.

The sides of this ravine were clothed with scrub Oak, amongst which flowered an occasional bush of *Rhododendron Delavayi*, with *R. decorum*, the latter not yet in flower. The sunniest scarps, however, were pocked with the tightly closed spheres of *Selaginella*, and with *Didissandra*, amongst which a tender vine just coming into leaf was the only green thing.

On the sheltered slope, an abbreviated form of *Primula lichiangensis* was struggling into flower. Higher up, a streak of golden yellow caught my eye. I turned away, unwilling to be "drawn." "A Barberry," I said to myself, "or a weed." Then I repented, and climbed the cliff, ashamed of my slackness. In a few minutes I stood gazing at a beautiful *Suffruticosa Primula*! Speechless with delight, I could only stare. Presently, "*Primula Forrestii*, what a splendid thing." (I had never seen it before, except in a photograph.) I looked at it curiously. "Fancy *Primula Forrestii* at 8,000 feet! And I always thought it came from high up on the Lichiang range! The plant is not very like its portrait (see Fig. 132), but I suppose this is a dwarf form." Thus I soliloquised. Then I collected a few specimens, saved what seed I could from the old capsules, and went my way.

We climbed another thousand feet and found the slopes pink with *Rhododendron racemosum*, the brilliant silver under surface of whose stiff leaves unfortunately does not show readily.

An hour's climb next morning brought us to the pass, which has an altitude of about 10,500 feet. In the Oak forest a small tree *Rhododendron* was in full bloom. The rather narrow, tubular corollas, in moderate trusses, are cream coloured, with dark speckles all over the inside; or, frequently without speckles, flushed with flesh pink. The stiff leaves are glabrous. (K. W. 5,019; probably 5,010.) I think I found this species in fruit last year, near Yang-pei; but I do not know its name.

There was another species of *Rhododendron* just coming into bloom—a bush or small tree, with little purple flowers in trusses of five or

six. I had collected foliage, fruit, and seed of this plant last year at Mu-li (it was known to me as *R. "rusty leaf"*), but I had not then seen the flowers. It had snowed in the night, and a sprinkling of snow still lay on the sheltered slope.

Descending from the pass, we found a shallow, marshy trough, with patches of dwarf *Rhododendron* (*R. intricatum*?) and Bamboo scattered over the slopes. This was backed by Oak forests, in which grew specimens of a large-leaved tree *Rhododendron*, not in flower. Further west, on the Burma frontier, this valley would have been filled with alpine meadow; here it was only turf, showing as yet no sign of returning life. After a descent of about 1,500 feet, we entered another limestone ravine, and here, without a doubt, was *Primula Forrestii* in all its glory. There was no mistaking it after seeing a photograph and reading a description; for half a mile it coloured the cliffs in amazing profusion. It grew under ledges, under Pine trees, in thickets, well sheltered, in a thoroughly drained loamy

putvinata, form cushions studded with flowers nestling down amongst the leaves. Its gay gamboge-coloured flowers, enveloped in an elusive fragrance, are as charming as anything in the *Suffruticosa* section. By the way, *P. pulvinata* is the only other short-stemmed form with yellow flowers I know.

Continuing the descent to Ho-ch'ing, we crossed a barren spur, covered with sharp edged outcrops of grey limestone. *Androsace spinuliflora* was in fruit here, and the small blue *Nivalis Primula* collected last year. (K.W. 4,154). Tufts of *Rhododendron racemosum*, bushes of Barberry, and low thickets of *Rosa sericea*, with tiny flowers, besides *Daphne*, added the only touch of colour. Lower down, violet-flowered *Primula pseudo-denticulata* reappeared.

On the Ho-ch'ing plain, *Chionanthus chinensis* was in full blossom. Well is it named the Snow-drop Tree!

Ho-ch'ing, a small walled city with several handsome buildings, was reached at dusk. Here we put up at an extremely dirty inn.

FIG. 132.—PRIMULA FORRESTII.

marl. I am beginning to think that some of the finest plants—amongst which I include *P. Forrestii*, grow by the wayside, and require no search. Certainly it would be impossible to go to Ho-ch'ing by this road, summer and winter, and miss it!

Imagine my surprise on comparing *P. Forrestii* (K.W. 5,017) with my first *suffruticosa* mentioned above (K.W. 5,014) to find that they were quite different species!

To compare them shortly. *P. Forrestii* is a bigger plant in all its parts than *Primula 5,014*, and has twice as many flowers on the truss. It is hairy all over—*P. 5,014* is quite glabrous. The calyx and bracts are of a different shape, and are not mealy, at least, not in the mature state, whereas in *P. 5,014* they are enveloped in meal. The leaves are larger, with longer petioles, and a more crenate margin; and the meal on the under surface is dead white, or silver. In *P. 5,014* the meal on the under surface of the foliage is pale greenish silver.

I am well satisfied that *P. 5,014* is not even a variety of *P. Forrestii*. In habit it is intermediate between those forms which, like *P. Forrestii* and *P. redolens*, hoist the flowers well above the foliage; and those which, like *P.*

On March 31 we completed the journey to Lichiang, covering 25 miles, and not reaching the city till 9 o'clock at night, having been thirteen hours on the road, including the mid-day halt. A high limestone ridge is crossed between Ho-ch'ing and Lichiang, but the stream from the latter valley flows direct into the Ho-ch'ing valley, issuing from the base of the cliff. Both valleys are ancient lake beds, and streams from the boundary range have cut deep "chines" through the Pine-clad alluvium. *F. Kingdon Ward.*

**New Name for a Hybrid Berberis.**—On October 31, a hybrid *Berberis* received an Award of Merit from the Floral Committee of the Royal Horticultural Society when shown by Lady B. Stanley, under her name. It was illustrated in Fig. 114, p. 283, and described in our issue of November 4, p. 274; we now learn from Mr. W. R. Dykes, Secretary of the Royal Horticultural Society, that it was not Lady Stanley's intention that the *Berberis* should bear her name, and the Committee has agreed that the plant should be called, in future, *Berberis Sibbertoft Coral*.

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 22, May 6, May 20, June 3, June 17, July 1, July 15, July 29, August 5, August 26, September 9, September 23, October 7, October 21, November 4, and November 18, 1922.

ORCHID NOTES AND GLEANINGS.

CATTLEYA MARITA.

MR. J. T. BARKER, gardener to his Grace the Duke of Marlborough, Blenheim Palace, Woodstock, sends a fine flower of a new cross between *Cattleya* President Wilson (*Fabia* × *labiata*) and *C. Dowiana aurea*, raised at Blenheim. It may be classed with *C. Hardyana alba*, the mauve colour of *C. labiata* having been obliterated by the second introduction of *C. Dowiana*. The sepals and petals are white, with a very slight sulphur shade. The broadly expanded lip is very finely coloured. The front half is bright Tyrian purple, and the base reddish-purple, with numerous gold lines extending to the patches of bright yellow which are on the middle area. A narrow purple margin extends over the side lobes. The flower is very fragrant, and the hybrid will doubtless prove constant as an autumn and winter blooming form.

CATTLEYA ADULA, GLEBE VARIETY.

CATTLEYA ADULA, first flowered by Messrs. Charlesworth in 1905, resulting from a cross between *C. bicolor* and *C. Hardyana*, has been a great favourite, and displayed considerable variety in its flowers, which vary in form and in colour from the varieties of *C. Iris* (*bicolor* × *Dowiana*), flowered by the same firm in 1901. None of the forms compares favourably with the beautiful specimen of *C. Adula*, Glebe variety, shown by Mrs. Mary Joicey, The Hill, Witley (Orchid grower Mr. J. Mackall), in her admirable group at the Orchid Show of the Royal Horticultural Society on October 31.

This variety probably resulted from the reverse cross, for its sepals and petals, which are of a charming shade of gold-bronze, with rose veining, and the round, flatly-displayed, ruby-purple lip has a much nearer approach to the *C. Warszewiczii* in *C. Hardyana* than other forms. The flowers of all this section are fragrant and last a considerable time in perfection.

DR. FRED BEDFORD'S ORCHIDS.

THE catalogue of the very remarkable collection of Orchids of the late Dr. Fred Bedford, Eslaforde, Marden, Kent, received from the sale agents, Messrs. A. J. Keeling and Son, Westgate Hill, Bradford, Yorkshire, shows the loss which the Orchid interests have sustained by the death of this sincere lover of Orchids. He had many rare species which he retained in good condition.

Though rare species formed the bulk of the collection, hybrids were well represented by the best obtainable in those sections in which the owner took the greatest interest, and these are well set forth in the admirable catalogue. The completeness of the collection of species may be understood when it is stated that it embraces over one hundred species of *Masdevallia*; thirty of *Bulbophyllum*, and nearly as many of *Cirrhopetalum*, a good number of *Catasetum*, a very large number of species of *Dendrobium*, and proportionate representation of smaller genera. It is to be hoped that these will obtain good homes. The Orchids were one of the chief pleasures of their late owner.

LAELIO-CATTLEYA PORTIA-PUMILA.

AS an example of his success in continuing the blue tint which he has so successfully developed in a large number of *Cattleyas*, into the *Laelio-Cattleyas*, Sir Jeremiah Colman, Bt., Gatton Park, Surrey (gr. Mr. J. Collier), sends a flower of his *Laelio-Cattleya Portia-pumila* (*C. Portia* × *L. pumila*) which, with *L.C. Parysatis* *coerulea*, he first flowered in 1918. In the *Laelio-Cattleya* now set the dominating factor is the *C. Bowringiana* *violacea* shown from Gatton Park in 1902. The flower sent is light mauve-blue, the lip being of a darker violet tint. That the importance of these Gatton blue hybrids for giving novelty of colour cannot be over-estimated was shown in the fine groups staged from Gatton Park, both at Holland Park Hall and still more prominently in that arranged at the Royal Horticultural Hall on October 31.

NOTES FROM A WELSH GARDEN.

ONE of the most beautiful and satisfying shrubs in this garden is *Pieris formosa*, which is at this season developing its generous racemes of drooping buds. These elegant sprays, which tip almost every branch, may break into the lovely waxen-white globes at any time between January and spring, the actual flowering date being largely governed by the weather. Indeed, we have had *P. formosa* in full bloom at Christmas, and on another occasion it wisely held back until so late as May. Unquestionably the finest of its race, *P. formosa* has proved hardy enough to withstand anything up to 20 deg. of frost here (we are six miles from the sea), and although it is liable to have its more exposed flowers injured, it has a convenient habit of sheltering many of its bloom clusters with a canopy of its large and rich green leaves. A western aspect is desirable, as is protection from wind, the latter being especially apt to mar the beauty of the young leaves which succeed the flowers in bold tufts of bronzy crimson with a brilliant gloss. This is not of necessity a peat shrub. It has flourished here for some years in light woodland loam, with a little rough leaf mould intermixed at planting time.

Another winter-flowering shrub which at this season gives promise of flowering is *Berberis Bealii*, with its large yellow-green, horny foliage abundantly furnished with formidable spines. In much the same manner as those of *P. formosa*, the one-sided racemes of Plum-coloured buds rise in a cockade at the extremities of the new shoots, the bright yellow flowers opening early in the year. These blossoms have a delicious fragrance, a distinctive and pleasing feature in a winter-flowering shrub, and it has been our experience that the fully expanded inflorescence is much less liable to injury by frost than are the buds of late autumn. *B. Bealii* is here afforded the partial protection of tall Oaks, and this does not appear to have any ill-effect upon the general well-being of the shrub.

But one can hardly pass over the *Barberries* without adding a word in praise of *B. vulgaris*, which, in spite of its many rivals, still can claim a place of distinction in the autumn and winter garden. It is not only that the pendant racemes of its fruit are borne in such abundance and with such unfailing regularity every year. Nor is the amazing brilliance of the berries the most noteworthy feature of this fine old shrub. One has to give *B. vulgaris* full credit for the fact that its fruit will hang in full splendour for three, four, and sometimes even five months, defying the birds and weather.

Among the *Cotoneasters*, a species which here carries its large, blood-red berries later than do most members of the genus, is *C. bullata*. Long after the majority of its kind have been stripped by birds *C. bullata* will remain in fruit. To assign a reason for this is difficult, for the big and luscious berries are not distasteful to all birds, since there have been a few occasions upon which a stray visitor—probably a jay—has wrought much mischief. But as a berry-bearing species and one that can be relied upon to carry its crop well into winter I know of no member of this fascinating group that can rival *C. pannosa*. The countless clusters of little Pear-shaped fruits which this fine evergreen produces with such extraordinary prolificacy every season do not attain their full crimson until the autumn is well advanced, and they almost invariably remain to adorn the drooping branches until the end of January or later. The closely allied *C. Franchetii* possesses in a lesser degree many of the good points of *C. pannosa*, but it has not that remarkable grace of form which accords the latter so prominent a place among its kind.

A sharp white frost in early November appeared to cause *Buddleia alternifolia* to shed most of its older leaves, these falling without changing colour. Or is it the natural habit of this shrub to be semi-deciduous? The tender growths were quite uninjured, which says something for the hardiness of the species in a frost that was keen enough to destroy completely all hope of bloom on *Desmodium penduliflorum* and other fairly reliable subjects.

NEW HYBRIDS

Erratum.—Cattleya Janet P. Crawford, *Gardeners' Chronicle*, Nov. 4, p. 265, should read Crawford.

Throughout the autumn *Vinca acutiloba* has given a succession of its delightful blossoms, the clean-cut, sharply pointed segments having just enough blue in them to accentuate their glacier whiteness—a really charming plant for a half-shady corner.

Although we are half-way through November and the weather has lately been anything but mild, *Sollya heterophylla* is still flowering cheerfully on a south wall. The dainty, clear blue bells, poised on hair-like stems, of this twining shrub look as if they ought to belong to something much more fragile and delicate than the ample, leathery, Myrtle-like leafage of this species suggests. *A. T. Johnson, Taly-cofn.*

## COLONIAL CORRESPONDENCE.

### NOTES FROM AUSTRALIA.

AUSTRALIAN Daffodil displays for 1922 are events of the past, and have further emphasised the progress being made by Victorian seedling raisers; particularly so in the approach towards buff pink colouring in the cups and trumpets. A very fine incomparabilis seedling from Mr. L. Buckland secured the blue ribbon as the best bloom at the Royal Horticultural Society of Victoria's show; and at the Canterbury display the best bloom was a Leedsii seedling from Mr. A. Clark. A Leedsii seedling from the latter raiser also carried off champion honours at the Daffodil and Sweet Pea show in Sydney. Mr. D. V. West further established his lead in trumpet sections, so that Poeticus was the only section in which an imported variety won.

The Canterbury Committee caters for growers of Australian flora, and amongst the many exhibits staged in these classes were some 37 species of Acacia, and a collection of Orchids, mostly terrestrial.

On page 325 of your Vol. LXXI, Mr. W. R. Dykes refers to the neglect of Iris species by raisers.

Few will argue against the tall Bearded Irises being the leading class of to-day, but countless flower lovers value the varied groups and species which make it possible to have Iris flowers every day in the year. The best of the newer sorts shown in 1922 are, as yet, unknown to me, but Dominion favoured me with four spikes in 1921, and I very much value such as *Isoline*, *Magnifica*, *Mercedes* and *Quaker Lady* from the 200 odd tall, bearded varieties which have flowered in my garden. Still I place *Iris unguicularis* (syn. *I. stylosa*) as indispensable; its first blooms freely appearing weeks before tender plants, such as Dahlias, yield to the autumn frosts—and not until *I. Vartani*, *I. reticulata*, *I. tingitana*, *I. tuberosa*, *I. Susiana*, *I. fimbriata*, and many *pumila* seedlings have flowered and passed by do the fragrant flowers of the Algerian Iris become scarce—surely each clump must develop a hundred blooms during its 5-6 months of flowering. On p. 294 Mr. E. A. Bunyard refers to the native habitat of this Iris being in the Orange and Grape districts—with me the commercial production of these two fruits is prevented by the night temperature dropping at times to 24.5 deg. The *Regalis-Cyclus* group and the Cushion Irises also are worthy a place in any garden, although with the former one could wish that seedling raisers would not label with a separate name each minute variation. *I. anglica* Giant, *I. hispanica* (syn. *Niphium*), and *I. juncea* are magnificent Irises, and the gorgeous blooms of *I. Kaempferi* seedlings have their own special charm.

With respect to the question of conveying Iris blooms a distance, I have tried tying a woollen thread around the swelling bud, but if kept tied thus for, say, 24 hours after the petals were due to expand, the wool cuts into the fragile bud or seriously deforms the flower; I roll waxed tissue paper completely around the bud and twist or screw the top end of the paper. This will suppress expansion for several days without injuring the flower, and treated thus I have had excellent results in sending Iris buds over 1,000 miles by parcel post. *G. Errey, Warburton, Victoria.*

## GLASSINESS IN APPLES.

THIS peculiar condition in the texture and appearance of Apples is not so prevalent this season as in 1921. The cause of glassiness has never been explained, and it is not due to fungous or insect attacks. It seems, therefore, to be due to either climatal or cultural conditions or to a combination of both; is it possible to discover the cause through notes from cultivators in *The Gardeners' Chronicle*?

As some growers are not acquainted with it I would briefly describe it as a dark coloration of portions of the fruit when approaching ripeness, the glassy parts being often more conspicuous in the centre of the fruit, although it is sometimes evident on the outside near the eye. The firmness of the fruit remains for several weeks, and no change is noticed in the flavour, although I find that some persons object

and not one glassy fruit has been found. Trees of Lane's Prince Albert and Rival, growing near to the above tree, but in a fully exposed situation, produced glassy fruits in 1921, but this season they are all sound. These trees are grafted on the Paradise stock. Fearn's Pippin worked on the free stock carried very heavy crops in 1921, and not one fruit was glassy; this year the three trees only averaged two fruits each, and the Apples were as sound as in 1921. If other cultivators who have suffered would describe the conditions under which the fruits were grown, with the name of the variety, and the kind of stock they are grafted on, it may be possible to determine some means of counteracting this complaint. *W. H. Divers, V.M.H., Westdean, Hook, near Surbiton.*

[Glassiness in Apples is a purely physiological condition and results from water penetrating the intercellular spaces, instead of air. The majority of Apple trees are grown on stocks of a dis-

FIG. 133.—CHRYSANTHEMUM ABSOLUTE. N.C.S. FIRST-CLASS CERTIFICATE, NOV. 16. SHOWN BY THE BRIDGWATER NURSERIES (SEE P. 314).

to eating glassy Apples, thinking they may be injurious, yet there is no cause for alarm on that point, as I have eaten dozens without experiencing any ill effects. The trouble is seldom, if ever, heard of in gardens in the Midland and Northern districts, but in 1921 it was very prevalent in the Southern Counties. Certain varieties are more liable to be affected than others. Two fruits of Roundway Magnum Bonum shown to the R.H.S. Fruit Committee on November 14, were badly affected and the grower reported that this variety always suffered in his garden. A tree of Cornish Aromatic growing here had almost every fruit affected in 1921, this particular tree is a half standard, growing in a shady position, open only to the North and East. The soil is London clay that has not been cultivated to any extent; the situation is low and very wet in rainy seasons, but 1921 was very hot and dry, and the tree carried a heavy crop of fine fruits. This year the crop has been lighter; the rainfall this summer was too plentiful at times, whilst the temperature was moderate,

and the roots of grafted trees may appropriate more water than the variety on its own roots might do. The trouble seems to be akin to that of splitting in such fruits as Grapes and Peaches when trees are copiously watered following a period of drought.—Eds.]

## POTATOS IN INDIA.

DR. BURNS, who was leader of the Indian Delegation at the International Potato Conference in London a year ago, took out with him to India in May last twelve of our leading British varieties of Potatos for trial. He informed us at the Conference that the Potatos they use for seed in Bombay are all imported from Italy. It is therefore a great pleasure to hear from the Director of Agriculture, Bombay Presidency, that the results obtained by Dr. Burns are better than have been secured by any seed from Great Britain hitherto.

Dr. Burns gives a full account of the culture

adopted and how the plants withstood the diseases and pests prevalent in India. All that information will doubtless appear in the official *Bulletin*, but the actual figures are interesting and may be helpful to your readers abroad, and I therefore append them:—

Variety.	Weight of seed planted in lbs.	No. of cut sets made	Weight of crop in lbs.
The Bishop ...	3.55	64	7.80
The Ally ...	3.25	65	25.61
Roderick Dhu ...	3.45	69	15.20
Arran Comrade ...	3.34	74	37.60
America ...	3.50	88	24.00
Groot Scot ...	3.25	80	39.19
Witch Hill ...	2.89	87	58.71
Tinwald Perfection ...	3.50	64	25.35
Majestic ...	3.36	68	33.10
Immune Ashleaf ...	3.50	66	42.41
Midlothian Early ...	3.55	75	39.10
Crusader ...	3.25	84	39.75

In another table Dr. Burns sets forth the ratio of seed to yield. Arran Comrade is 11.95; Great Scot, 10.82; Witch Hill, 20.31; Immune Ashleaf, 12.11; Midlothian Early, 11.01; Crusader, 12.23. These returns would be good in this country. In India they are wonderful when we consider the temperature at growing time is never under 85° and the average crops about four tons per acre. I have only one comment to make, and that is on the smallness of the cut sets. They were all under 1 oz. in weight; the average was about  $\frac{3}{4}$  oz. This is too small for ordinary use. W. Cuthbertson, Duddingston, Edinburgh.

## FOREIGN CORRESPONDENCE.

### MELONS AND TOMATOS IN SWEDEN.

WHICH are the best ten sorts of Melons? This is, I realise, a rather wide question, also, I am sure, a very interesting one, as tastes differ in Melons as in other things. Of course, one must reckon on new and better sorts being raised every year. At least, some are better flavoured, but are they good growers and easy to set fruits and of good constitution? I grow eight or ten sorts here, principally to advise the students as to which are disease resisters and of the best flavour. The following is a list of sorts grown here this year:—Green Gem, Al, Golden Champion, Superlative, Emerald Gem, Hero of Lockinge (a very old favourite of mine), King George, Goodrich Champion, Petterson's Net (a Danish variety of very large size, but not much flavour), and Stanley.

The last-named variety is of English origin, and one of the best as regards growth, constitution, and flavour; moreover, it is a free setter—in fact, the fruits show almost too soon, and must, of course, be plucked off to allow the plants to gain strength, especially early in the year. The fruit is of medium size, green fleshed, and of very fine flavour. It has not been a good summer here for Melons this year, but I am glad to have had Stanley to fall back on. The first fruits were ripe in the early part of May, and after the first crop was finished, which was about midsummer, the plants were still green and healthy. I cut all the side shoots back to one leaf, then kept the house closed and syringed the plants four times daily. About the middle of July we began to harvest the second crop, and up to the middle of September I cut about forty fruits averaging from two to four pounds each. To have Melons until the end of October is a great asset in furnishing dessert for the elk-shooting season, which is a big sport in Sweden. I do not advocate that Stanley Melon is the only one which will give the results above stated, but my experience with many sorts is that they are subject to canker, and oftentimes it is difficult to ripen the one crop. Is this canker in the constitution of the Melon? I grow Melons in frames after a crop of early vegetables; here we have to depend on frames from February until July for most of our vegetables. I should like to obtain seeds of the Countess Melon. I used to consider it the earliest and best Melon in cultivation.

With regard to Tomatos, the varieties are so numerous, it is difficult to decide which to grow, and oftentimes, as is well known, the

best will fail. I have grown Princess of Wales with good results. The fruits are of fine flavour and colour. Stirling Castle is also a good variety; it is early, a free setter, the fruits smooth, well-formed, of medium size, and weighty, and, of course, for commerce, weight is a great consideration. I have had clusters of fruit of Stirling Castle with from eighteen to twenty-four fruits. Comet is still good.

The earliest Tomatos I grow on the back stage of a three-quarters span Melon house. They set well early in the season, and we have ripe fruit the last week in April. These plants are from seed sown in October, and grown in small pots until the end of January, when I plant them in a shallow border.

I consider too much soil is oftentimes the cause of disease and bad setting; it is much better to feed the plants with a well-tryed manure. I use Thomson's vine and plant manure with good results. The people in this country are beginning to use Tomatos more freely, and consequently, of course, more people grow them. I have sold Tomatos at the end of April and early May for nine kroner per kilo, or five shillings per pound, which I consider is a very good price indeed. It would be very interesting to hear which are the best sorts grown in England. By this I mean the earliest, best-flavoured, richest-coloured, best-shaped, heaviest fruits, and plants able to resist disease. James Page, Adelnas Tradgard, Sweden.

## HOME CORRESPONDENCE.

**Trial of Commercial Fruits at Wisley.**—It is good news (page 261) that the Ministry of Agriculture and the Royal Horticultural Society are going to undertake the testing of new varieties of hardy fruit from a commercial standpoint. In Apples particularly I consider that there is plenty of opening for better varieties. Several of those that we have at present are not of the best type for boxing. At the Imperial Fruit Show one could not help envying the overseas growers some of their fine, bold Apples, mostly of a rounder type than ours, which are very suitable for boxing. Varieties of pearmain shape are always awkward, because they vary so much in height or length. Market Grower.

**Irish Apples at the Imperial Fruit Show.**—As a regular exhibitor of hardy fruit from Ireland at the autumn fruit shows of the R.H.S. I was naturally interested in the recent Imperial Fruit Show organised by the *Daily Mail*, and keenly regretted that the rules governing the staging of exhibits precluded me—and, I am sure, many others—from attending, and showing fruit there. In the classes open to amateurs in Great Britain and Ireland rule II states that exhibits must reach the building 4 clear days before the show was to open. This would have involved starting from here nearly a week before the opening day, whilst rule 12 provides for the unpacking and staging of all exhibits by a reception committee and, as I was further informed on inquiry, under no circumstance would exhibitors be allowed to stage their own fruit. Now this rule may work very well in the commercial classes, where the fruit is exhibited in the receptacles and as packed at the farm—the removal of the lid being all that is required in presenting it for judgment. But in the case of collections of fruit, packed, perhaps, six varieties in one box, and having to be unpacked and set up in the different varieties on plates, I maintain that it is impossible for any reception committee to deal fairly and satisfactorily with hundreds of different dishes of fruit, and indeed few growers of exhibition fruit would care to risk the results of a whole season's labour and skill being, perhaps, nullified at the last moment by unsympathetic treatment. My reason for writing is to express the hope that, in the event of an imperial, or even a national, show being held next year, it may be possible to have the rules for this section drafted on more practical lines,

such as those governing similar classes in the great autumn fruit shows of the R.H.S., where the hundreds of exhibitors bring and stage their products with the greatest order and punctuality, thus enabling judging to start "to the minute," besides making it possible for the exhibitors themselves to stay on for the opening of the show without the loss of several days valuable time. T. E. Tomalin, Bessborough Gardens, Piltown, Co. Kilkenny.

**Acclimatisation.**—The true meaning of this word is best defined by R. Irwin Lynch (p. 224), when he quotes Darwin as saying: "Acclimatisation must be readily effected during a long course of descent," that is, by the repeated reproduction of a plant from seeds. If it comes from a warmer country than ours, descendants may give rise to individuals that are better able to resist the rigours of our climate. How many generations it would take to do this no one can predict in the case of any individual plant. The Potato has gone through an indefinite number of generations in this country, yet no one variety seems to be harder than when first introduced. Selection is usually directed on different lines than for hardiness, namely, utility to man as food. It would have called for extraordinary patience, on purely scientific lines, to have selected varieties for hardiness from the time of its introduction till now, with doubtful issue. J. P. (p. 272) enquires whether the Eucalyptus is acclimatised. The answer is in the negative, according to my observations. I have seen Eucalyptus globulus about 60 ft. high in Guernsey, and 12 ft. high in a garden near London, yet this latter specimen was killed by the first severe frost. J. P. introduces the word "naturalised" on the same page, but does not define what he means by it. Botanists use the term for plants that sow and maintain themselves in this or any other country, in spite of climate, competition with other plants, or other agencies. Nowhere have I seen a wild Peach. Seedling Figs frequently arise from imported fruits. J. F.

**Gardeners' Kalendars.**—I was greatly interested in Mr. Jacob's list of Garden Kalendars on pp. 20, 136, 252. Looking through my gardening books I find I have one of Bradley's and three volumes of Miller's. I enclose copies of the front pages of these works, in the hope that they may prove of interest to readers:—*New Improvements of Planting and Gardening, both Philosophical and Practical. In Three Parts.*—(1) Containing a new system of vegetation, explaining the motion of the sap, and generation of plants, of soils, and the improvement of Forest Trees, with a new invention whereby more designs of garden plants may be made in a hour than can be found in all the books of gardening yet extant; (ii) The best manner of improving flower gardens or parterres, of raising and propagating all sorts of flowers and of the adorning of gardens; (iii) Of improving Fruit Trees, Kitchen Gardens and greenhouse plants, with the Gentleman and Gardeners' Kalendar. To which is added the scarce and valuable tract intitled Herefordshire Orchards. Illustrated with Copper Plates. By Richard Bradley, Professor of Botany in the University of Cambridge and F.R.S. Printed for F. and F. Knapp in St. Paul's Churchyard. A. Bettesworth and C. Hitch in Paternoster Row, F. Pemberton in Fleet Street, and D. Browne Without Temple-Bar. M.DCC.XXXI. The second is:—*Gardener's Dictionary.*—Containing the Methods of Cultivating and Improving the Kitchen, Fruit and Flower Garden, as also the Physic Garden, Wilderness, Conservatory and Vineyard. In which likewise are included The Practical Parts of Husbandry; and the method of making and preserving Wines, according to the Practice of Foreign Vignerons. By the Author, Philip Miller, F.R.S. Gardener to the Worshipful Company of Apothecaries at their Botanic Garden in Chelsea. In three Volumes. Printed for the Author, and Sold by C. Rivington at the Bible and Crown in St. Paul's Churchyard. M.DCC.XLI. A. S. Walker, East Lane, Dedham, Essex.

## SOCIETIES.

### ROYAL HORTICULTURAL.

NOVEMBER 28.—The severely cold weather of the several preceding days had the effect of reducing the exhibition of Tuesday last to very modest proportions, while the gloomy day reacted upon the attendance. Orchids, Carnations, Chrysanthemums, Cyclamen, and Alpines were the leading subjects on view, and novelties were limited to the three first-named.

#### Orchid Committee.

*Present*: Sir Jeremiah Colman, Bt. (in the chair), Prince Shimadzu, Messrs. Jas. O'Brien (hon. secretary), R. Broman White, Frederick J. Hanbury, J. Wilson Potter, Pantia Ralli, W. J. Kaye, T. Armstrong, C. J. Lucas, A. McBean, Chas. H. Curtis, J. Cypher, J. T. Barker, J. E. Shill, H. T. Pitt, S. W. Flory, Fred. K. Sander and Arthur Dye.

#### FIRST-CLASS CERTIFICATE.

*Odontoglossum Armstrongii* var. *Aureole*, from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. The second to flower of the wonderful hybrid for which Messrs. Armstrong and Brown for the original form obtained a First-Class Certificate in October last year. That form had the clear yellow markings on the pure white ground in blotches on the inner parts of the segments. The variety *Aureole* with its first flower showed the inner two-thirds of the segments entirely bright chrome yellow, the margins and outer thirds being pure white. A remarkable break of great beauty.

#### CERTIFICATE OF APPRECIATION.

To *Odontoglossum Armstrongii*, as a recognition of one of the most remarkable breaks yet made in Orchid hybridisation. The only regrettable incident being that the parentage is not yet disclosed.

#### AWARDS OF MERIT.

*Odontoglossum eximillus* var. *Tintoretto* (*eximium* × *illustrissimum*), from J. J. BOLTON, Esq., Claygate Lodge, Claygate (gr. Mr. S. Lyne). A superb hybrid with sepals and petals clear Tryian purple with a narrow pure white margin and white front to the lip. The plant bore a spike of six well-developed flowers.

*Odontoglossum Magnificent* (*majesticum* × *Magali Sander*), from Messrs. SANDERS, St. Albans. A very showy flower of large size and fine substance, dark ruby purple with white tips and ruby blotch in front of the yellow crest.

*Cypripedium Godefroyae splendens*, from Messrs. SANDERS. A very remarkable variation, the flower, while being of true *Godefroyae* shape, having the broad proportions of *C. bellatulum*; it is clear white uniformly blotched with dark claret-red.

#### CULTURAL COMMENDATION.

To Mr. J. E. SHILL, gr. to Baron Schröder, for a magnificent plant of *Laelio-Cattleya Schröderæ grandiflora* (L.-C. *Bella alba* × *C. Maggie Raphael alba*). The plant was the finest yet seen of this remarkable hybrid raised at The Dell, and bore two spikes of five and four flowers respectively. The sepals and petals are white and the broad lip dark violet.

#### GROUPS.

Sir JEREMIAH COLMAN, Bt. (gr. Mr. J. Collier) was awarded a Silver Banksian Medal for a very interesting group, including some good hybrids, and specially noteworthy species, among which were the extremely rare *Coelegyne miniata* with orange scarlet flowers, unique in the genus; *C. Veitchiana*, with long drooping sprays of white flowers; *C. barbata* with fringed, blackish lip; the rare *Laelia Lindleyana*, the tassel-like *Bulbophyllum lemniscatum*, the red *B. cupreum*, *Restrepia striata*, the singular *Dendrobium Coelegyne* and others rarely seen. Messrs. STUART LOW AND Co., Jarvisbrook, Sussex, were awarded a Silver-Gilt Flora Medal for a very fine group with good blue *Vanda coerulea*, yellow *Oncidium*s, and elegant *Dendrobium Phalaenopsis*, including the pure white form, arranged with showy *Laelio-Cattleyas*, among which their fine form of L.-C. *Luminosa aurea* and other fine forms were noted.

MESSRS. SANDERS, St. Albans, were awarded a Silver Flora Medal for an excellent group remarkably well set up. Among the novelties *Brasso-Cattleya Boadicea* (B.-C. *Digbyano-Schröderæ* × *C. Warszewiczii*) is a large new type with mauve flowers and dark lip of quite new shape; *Laelio-Cattleya Enchantment* (L.-C. *Isabel Sander* × *C. Rex*) has a very showy violet lip with white margin; *Odontoglossum eximium* var. *Diana*, a pretty form; *Brasso-Cattleya Hercules* (B.-C. *The King* × *C. Luddeniana*), a very good novelty, and the charming *Odontioda Fairy* (*Oda Vuylstekeae* × *Odm. Magali Sander*) good both in form and marking. Messrs. COWAN AND SONS, Southgate, received a Silver Banksian Medal for a group of splendidly grown *Cypripedium*s with a fine specimen of the new and very beautiful *Brasso-Cattleya British Queen*, and a good example of *Odontoglossum crispum xanthotes* in the centre.

MESSRS. CYPHER AND SON, Cheltenham, were awarded a Silver Banksian Medal for a fine group of *Cypripedium*s, the best noted being *Cyclops*, a grand form of *Nydia Corsair*, *Priam*, *Leeanum Gratixia*, the best form of this fine old hybrid; *King of the Belgians*, *Actaeus Bianca*, than which no better yellow and white has yet appeared.

R. WINDSOR RICKARDS, Esq., Usk Priory, Monmouthshire, showed *Cypripedium Chrysoctens* (*chrysoctoxum* × *nitens*), a large flower of fine shape and beautifully marked; and *C. Draco* Usk Priory var., with a very large, heavily blotched dorsal sepal.

MESSRS. ARMSTRONG AND BROWN showed *Odontoglossum Nora* (*ardentissimum* × *Dora*), a pretty flower and finely coloured; *Cypripedium Pacavia* of the same class as *Pyramus*, but lighter, and other hybrids.

MESSRS. FLORY AND BLACK showed two good *Brasso-Cattleyas*. H. T. PITT, Esq., showed *Brasso-Cattleya Lloyd George* (B.-C. *Marguerite Fournier* × *C. Lord Rothschild*), and two very fine *Cypripedium*s.

#### Floral Committee.

*Present*: Messrs. E. A. Bowles (in the chair), Chas. E. Pearson, H. J. Jones, W. B. Gingell, M. C. Allwood, D. B. Crane, Clarence Elliott, H. V. Warrender, Gerald Loder, R. C. Notcutt, Sydney Morris, C. R. Fielder, W. Howe, John Heal, Jas. Hudson, W. J. Bean, and A. G. Jackman.

#### AWARDS OF MERIT.

*Carnation Topsy*.—This is a deep, rich, velvety crimson, perpetual-flowering variety of considerable merit. The flowers are large and substantial, and the petals are fringed. Calyx and stem are alike good. Shown by Mr. C. ENGELMANN, Saffron Walden.

*Chrysanthemum Pink Favourite*.—An incoming Japanese variety of great substance. It is a sport from the popular white variety *Favourite*, and is of a soft silvery pink shade. Shown by Mr. NORMAN DAVIS, Framfield, Sussex.

*Chrysanthemum Mrs. A. Robertson*.—A large single variety of clear pink colour; fine form and substance. Shown by Mr. NORMAN DAVIS.

*Chrysanthemum Robert Collins*.—A single variety of the largest size, and of rich and glorious orange bronze colouring. A graceful variety. Shown by Mr. G. CARPENTER, West Hall Gardens, Byfleet.

*Chrysanthemum Golden Butterfly*.—This is a free-growing market variety, carrying somewhat stiffly-petalled, golden yellow flowers of Japanese type. The plant shown, in a 24-sized pot, carried eight large flowers. Shown by Messrs. SCOTT AND WICKHAM, Witley Nurseries, Witley, Surrey.

*Chrysanthemum Dr. J. M. Inglis*.—A handsome large, late-flowering Japanese variety of rose purple colouring, with silvery reverse to the broad, curling forets. Shown by Mr. KEITH LUXFORD, Sheering Nursery, Harlow.

#### GROUPS.

In view of the anticipated winter show of the British Carnation Society which was abandoned, Carnations were an important floral feature of the meeting. Three large groups of even merit were arranged, and these contained goodly numbers of fresh and, in many instances,

fragrant Carnations. An interesting part of the collection arranged by Messrs. ALLWOOD BROS. was the selection of Perpetual-flowering Border Carnations. These were shown in vases and also as specimen blooms on boards in the old-time fashion. The chief varieties were *Sussex Crimson*, *Sussex Purple*, *Sussex Bizarre*, and *Sussex Beauty*, and all were of considerable garden beauty. Their *Allwoodii* varieties were, of course, well represented, and prominent amongst the true Perpetual varieties of Carnations were *Edward Allwood*, of vivid colouring, *Salmon Enchantress*, *Triumph* and *Wivelsfield Apricot* (*Silver Flora Medal*).

Bright colour and high quality were noticeable in the collection displayed by Mr. C. ENGELMANN. The brilliant *Laddie*, which has received an Award of Merit, was very prominent. Thor also attracted deserved attention, as also did *Marion Willson* and the fragrant *Mary Allwood* amongst the many varieties so well shown (*Silver Flora Medal*).

Adjoining their attractive collection of Orchids Messrs. STUART LOW AND Co. set up an extensive collection of very good Carnations. Their large white *Pearl* was splendidly represented, and the new *Eileen Low* attracted attention amongst several other valuable pink sorts. *Boadicea*, a new Perpetual *Malmaison* of a distinct shade of rosy cerise, has great decorative value (*Silver Flora Medal*).

A particularly good collection of Chrysanthemums was well arranged by Messrs. KEITH LUXFORD AND Co. There were many large-flowered Japanese varieties shown in generous quantities. These were apparently mostly new sorts of American raising and included *H. V. West*, deep golden yellow with long, broad petals; *F. Spring Watts*, chestnut and gold; the new *Dr. J. M. Inglis*, and *Mrs. R. C. Pulling*. Amongst the many singles were *Baby Jack*, in graceful sprays of yellow flowers, *Catrina*, rich old Rose, *Molly Godfrey*, *Mensa*, which holds its own as the best medium-sized white, and *Flossy*, a large, pure white sort of much merit (*Silver-Gilt Banksian Medal*). Mr. NORMAN DAVIS displayed a good quantity of his new *Pink Favourite* with the parent, *White Favourite*, and *Cream Favourite*, all valuable decorative sorts. Messrs. W. GODFREY AND SON showed various single-flowered varieties.

A considerable number of well-grown greenhouse Cyclamen were contributed by Messrs. BLACKMORE AND LANGDON. These included *Salmon King*, *Salmon Scarlet*, and *Giant White* (*Silver Banksian Medal*). A group of splendidly grown plants of the old favourite *Plumbago rosea*, which in former years found a place in most hot-houses, was shown by Mrs. F. B. SUMMERS (gr. Mr. J. Branded), Alton, Hants. These were particularly bright and had travelled unusually well (*Silver Banksian Medal*).

An attractive collection of Winter-flowering Sweet Peas was displayed by the ROLVENDEN NURSERIES. Although these are decidedly smaller than the summer-flowering varieties, they made a decorative display. The chief varieties were *Flamingo*, pink shades; *Princess*, mauve; *Mrs. Kerr*, salmon shades; and *White Star* (*Silver Banksian Medal*).

MESSRS. F. H. CHAPMAN, LTD., showed a selection of their seedling *Nerines*. These were mostly under seedling numbers, and one, a compact truss of large, waved, salmon-pink flowers, was very uncommon (*Bronze Flora Medal*).

A large collection of double and single Violets of great merit was displayed by Mr. J. J. KETTLE (*Silver Banksian Medal*). Messrs. W. CUTBUSH AND SON contributed a small rockery planted with Conifers and Alpines. Mr. F. C. WOOD staged various Alpines in pots, principally *Saxifrage*s and *Sempervivum*s (*Bronze Flora Medal*). The Misses HOPKINS exhibited succulent plants in small pots, and early Polyanthuses.

#### Fruit and Vegetable Committee.

*Present*: Messrs. C. J. A. Nix (chairman), J. Cheal, W. Poupert, W. Seabrook, S. B. Dicks, G. Reynolds, J. Wilson, Geo. F. Tinley, E. Beckett, E. Neal, W. H. Divers, E. A. Bunyard, W. Wilks, F. Jordan, T. Pateman, A. Metcalfe, G. Harriss and A. N. Rawes.

A few seedling Apples were submitted for award, and beyond this there was no further business. An unnamed Apple, which suggested the parentage Lord Derby crossed with Warner's King, was shown by Mr. C. F. LAWRENCE, County Education Office, Northampton; Apple George Carpenter, which was exhibited at the last meeting, and a seedling from Wellington, somewhat like Chelmsford Wonder, were all recommended for inclusion in the new trial of market varieties at Wisley.

### NATIONAL CHRYSANTHEMUM.

NOVEMBER 27.—The Floral Committee met at the Royal Horticultural Hall, Westminster, and had a number of novelties to consider. The following received awards:—

#### FIRST-CLASS CERTIFICATES.

*Mrs. Collins.*—This is a Japanese variety with somewhat small but neat and firm flowers of a rich clear chestnut red colour. A useful decorative sort. Shown by Mr. G. CARPENTER, West Hall Gardens, Byfleet.

*Fernandez.*—A showy Japanese variety with large flowers of a pleasing shade of chestnut bronze. Shown by Mr. KEITH LUXFORD, Harlow.

*Ethytha.*—A small decorative variety of the richest reddish purple or wine red colour. The flowers have a dish, but the central petals incurve and hide it. Shown by Mr. NORMAN DAVIS.

*Golden Butterfly.*—Shown by Messrs. SCOTT AND WICKHAM.

*Robert Collins.*—Shown by Mr. G. CARPENTER.  
*Mrs. A. Robertson.*—Shown by Mr. NORMAN DAVIS.

*Pink Favourite.*—Shown by Mr. NORMAN DAVIS.

These last four varieties received the Award of Merit of the R.H.S. on November 28, and are described on the preceding page.

The Committee desired to see again the varieties West Hall Pink (Mr. G. Carpenter), and Mrs. F. J. Yarrow, a handsome single (Mr. A. Robertson).

### MARLOW CHRYSANTHEMUM.

NOVEMBER 8. The enthusiasm of the president, A. L. Lawrence, Esq.; the vice-president, Captain H. B. Wright; and the hon. secretary, Mr. Fred Todd, has been the means of creating a fine exhibition at the well-known Thames-side town of Marlow, and we feel sure their enthusiasm will continue and stimulate others with a desire to grow and show Chrysanthemums and add a pleasant educational feature to the winter attractions of the town.

The show held on the above date was so successful that the Public Hall was not large enough to permit of the most effective arrangements. Nevertheless, the display was good and the quality of the flowers excellent.

Captain WRIGHT (gr. Mr. Stowe), The Rookery, Marlow, won the first prize in the class for eight vases of Japanese varieties, three blooms in each, and he showed giant flowers of W. Rigby, Mrs. K. Luxford, Lord Stuart of Wortley, Mrs. G. Monro (extra good), General Petain, W. Turner, Mrs. Algernon Davis, and R. C. Pulling; 2nd, Mrs. HORNBY LEWIS (gr. Mr. French), who staged grand flowers of R. C. Pulling. For a vase of three blooms of one Japanese variety Mrs. HORNBY LEWIS led with superb blooms of R. C. Pulling, one of which was adjudged to be the best bloom in the show; 2nd, W. H. LAMB, Esq. (gr. Mr. Evers).

Captain WRIGHT was successful in the class for two vases of Japanese blooms with fine flowers of R. C. Pulling and Mrs. G. Monro. He was also first prize winner and cup holder in the class for twelve Japanese blooms shown on boards, his best flowers being of R. C. Pulling, Mrs. G. Monro, Jas. Stredwick, and Mrs. A. Davis; 2nd, W. H. LAMB, Esq. For six blooms, on a board, A. R. HEATH, Esq. (gr. Mr. Platt), was the most successful competitor, Mrs. HORNBY LEWIS gaining the second prize.

The last-named exhibitor secured first prize for a vase of Japanese blooms, and Mr. J. LANGLEY came second, each showing R. C.

Pulling. The best vase of single varieties came from A. R. HEATH, Esq., who showed Ceddie Mason; 2nd, Mr. J. LANGLEY, with Florrie King. Captain WRIGHT was first prize winner in the class for six vases of single varieties, with Pylilis Cooper, Bertha Fairs, Catriona, and Jessica in fine form; 2nd, Mrs. HORNBY LEWIS.

In an open class Mrs. ALEX. ROBINSON, Bourne End, exhibited the best hand-basket of Chrysanthemums and ornamental foliage, and she contributed a very artistic design in which yellow and bronze flowers and autumn-coloured foliage were the leading features; 2nd, Captain WRIGHT. In the ladies' class for a hand-basket Mrs. J. PLATT and Mrs. ALEX. ROBINSON were first and second prize winners respectively. Mrs. S. GREEN showed the best bouquet of Chrysanthemums, winning with the variety Rayonnante.

Mr. H. BROWN, Maidenhead, had the best trade display, and put up a fine group of floral designs in a variety of flowers (silver medal); Mr. BLACKMORE 2nd (bronze medal). Mr. W. Yandell was also an exhibitor, but a non-competing one, and his strong group of Chrysanthemums was awarded a silver medal. A similar award was made to Lady TERRINGTON (gr. Mr. Berry), Spinfield, Marlow, for a large group of well-grown plants of Begonia Gloire de Lorraine.

Plants and groups were not very good. Mr. ELKINGTON had the best display of flowers arranged for effect, and he was easily first prize winner; 2nd, Captain WRIGHT. In the amateurs' section Mr. C. H. YATES had the best collection of blooms arranged for effect.

Although not extensively shown, fruits were well displayed, especially by Mr. H. ELKINGTON, who secured first prize for eight dishes of fruits—four each of Apples and Pears—and exhibited capital specimens of Nouvelle Fulvie, Durondeau and Doyenné du Comice Pears; 2nd, Mr. W. H. LAMB; 3rd, Mr. MORAKE.

Mr. M. J. THATCHER showed the best collection of six kinds of vegetables.

### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this Society was held in the R.H.S. hall on Monday, November 13, Mr. Chas. H. Curtis presiding.

Four new members were elected.

Two members over the age of 70 years withdrew £87 7s. 6d. from their deposit accounts, and the sum of £49 3s. 1d. was passed for payment to the nominee of one deceased member; the sum of £7 3s. 3d. was also passed for payment to the nominee of a lapsed member.

The sick pay for the month on the private side was £35 2s. 5d., and on the State section £46 8s. 6., whilst maternity benefits amounted to £6.

Grants towards dental treatment amounted to £16 0s. 6d., and for optical treatment £1 5s.

The Trustees reported that they had invested £1,500, and were instructed to invest a further £500.

The Secretary produced the Government Auditors' certificate for the year 1921, certifying the accounts as correct.

### NOTTINGHAM CHRYSANTHEMUM.

THE annual exhibition of the Nottingham and Notts Chrysanthemum Society was held in the Albert Hall, Nottingham, on the 9th, 10th and 11th ult. The schedule included thirty-seven classes for Chrysanthemums.

The Society's Certificate for the champion incurved and the champion Japanese blooms were both won by Nottingham growers, Mr. J. P. HIGHAM and Mr. W. COX respectively. Amongst the principal prizewinners in the open classes were Lord BELPER. Sir HAROLD BOWDEN, Bart., Mrs. CORDEAUX, Mr. R. HALLAM, Radcliffe, Mr. C. W. CATT, Duffield, and Mr. R. H. SWAN, East Bridgford. Splendid dwarf plants of Chrysanthemums were exhibited by Mr. T. HANCOCK, Mansfield; they are known as "Midget" Chrysanthemums, and were stated to have been raised from leaves.

In the fruit classes many prizes were won by

Major-General CULLEY, Swindon, whose Apples and Pears were splendid.

Trade exhibits were very fine, especially those of Messrs. SKINNER and ROOK, who showed floral designs; Mr. T. ROBINSON, Porchester Nurseries, who had Roses and other flowers; Mr. W. C. WICKS, floral decorators; and Mr. T. HANCOCK, Mansfield, who showed Chrysanthemums.

In the open class for a floral display the Society's Gold Medal and First-Class Certificate were awarded to Mr. THOMAS HANCOCK, Mansfield, and similar awards were made to Lord BELPER, Kingdon Hall, for a display of fruit or vegetables. Mr. R. HALLAM showed the best Japanese Chrysanthemums, and Mr. J. P. HIGHAM the best incurved Chrysanthemums, and Lord BELPER the best single Chrysanthemums. The best vase of Chrysanthemums decorated with Chrysanthemum foliage was shown by Mr. R. HALLAM, who had also the best basket of Chrysanthemums.

Major-General CULLEY excelled in the class for a collection of fruit.

The finest dessert and the finest culinary Apples in three varieties were shown by W. M. C. HERRICK, Esq., Beau Manor, Loughborough (gr. Mr. J. J. Staward).

### MANCHESTER AND NORTH OF ENGLAND ORCHID.

THURSDAY, NOVEMBER 2.—Present: The Rev. J. Crimbleholme (in the chair), Messrs. R. Ashworth, B. J. Beckton, A. Burns, A. Coningsby, D. A. Cowan, J. Cypher, A. G. Ellwood, J. Evans, J. Howes, W. M. Jackson, D. McLeod, F. K. Sander, E. W. Thompson, and H. Arthur (Sec.).

#### FIRST-CLASS CERTIFICATES.

*Odontoglossum crispum Pharo*, a fine flower of the Doin type; *Odm. crispum Snowdrift*, one of the best forms of the virginate section; *Odm. St. George var. Solum*, a form with curiously marked segments; *Cypripedium Cavalier West Point var. Eurjades (New Hall Hey × Earl of Tankerville)*, a flower with well-spotted dorsal sepal; *C. Madame Fervier var. Mastiff*. All from S. GRATRICK, Esq.

*Cyp. Earl of Chester (Lord Roberts × Choritonii)*, a brilliantly coloured flower, almost solid red; *Cyp. West Point Solum (Bianca × Sanderac)*, a fine flower of the Bianca type; *Odontoglossum crispum West Point Triumph*, heavily blotched Plum-purple on a white ground; *Odontioda Colinge var. Gratriciae*, a very bright flower with "Peacock eyes" on each petal. From Mrs. GRATRICK.

*Brasso-Laelia-Cattleya Truffautiana var. Distinction (Lecmania × Luminosa Rosita)*; *Laelia praestans var. Queen Alexandra*, a chaste variety with a flush of colour through the sepals and petals; the lip is slate blue; *Odontioda Ganesa Haddon House var.*, a large flower coloured dark purple-red with rosy white margin and tips; *Odm. crispum Zeno magnificent*. From P. SMITH, Esq.

*Cattleya Alcimedea var. Fair Lady*; *Laelio-Cattleya Rossendale*, a richly coloured flower with dark lip, and throat golden lined. From R. ASHWORTH, Esq.

*Dendrobium Phalaenopsis alba Beckton's var.* From B. J. BECKTON, Esq.

#### AWARDS OF MERIT.

*L.-C. Carmencita var. Sunbeam*; *Cattleya Annette West Point var.* From S. GRATRICK, Esq. *Brasso-Cattleya Ashworthii (B. Dietrichiana × C. Fabia)*. From R. ASHWORTH, Esq. *Cyp. Chrysostum Coningham var. (Hera Mrs. Mostyn × Christopher)*. From Dr. CRAVEN MOORE.

#### GROUPS.

S. GRATRICK, Esq., West Point (gr. Mr. J. Howes), was awarded a Gold Medal for a group of *Odontoglossums* in variety.

A. T. CUSSENS, Esq., Prestwich (gr. Mr. F. Cookson), staged a miscellaneous group, for which a Silver Medal was awarded.

## NATIONAL POTATO.

THE National Potato Society held its exhibition this year in connection with the Sheffield Chrysanthemum Society's meeting at the Artillery Hall, Sheffield, on November 10 and 11. The entries for all the single-dish classes and for the collections in dishes were very good indeed, nearly a thousand entries being made; but the competition in the classes for bags of ware Potatoes was small. The arrangements were in the hands of the Secretary, Mr. W. H. Morter, and of Mr. A. Griffith, and both for staging and for judging left nothing to be desired. The judges were Messrs. Bryan, Chittenden, Clarke, Cuthbertson, Lasham and Lobjoit.

Not only were the classes well filled, but competition was keen, and in many cases the exhibits were practically perfect, although the season made its effect felt in a certain proportion being somewhat coarse, and lacking in the fineness of appearance and clearness of skin that so commends an exhibit to the judge's eye.

Furthermore, the exhibits were drawn from a very wide area in England and Scotland, and the keenness of the competition, both in the open classes and in those reserved for allotment holders and the small-grower, showed that the interest in our premier vegetable is in no way diminished. It was pleasant to see also that the vast majority of the exhibits represented varieties of garden or commercial value; there were far fewer Potatoes "suitable for exhibition"—and of little use for anything else—which were so often seen in exhibitions a few years ago. Some exhibitors have yet to learn that slight greening of the tubers detracts greatly from an exhibit, and a few that mere size does not carry great weight with the judges.

The exhibition was well attended by the public on both days, and the fine trade exhibits, as well as the competitive classes, were a great source of attraction. Several short lectures were given during the afternoon and evening and were well attended. Unfortunately, there was no convenience for them outside the exhibition-room, and that made it rather difficult for the speakers. Mr. F. J. Chittenden dealt with some of the main points in the Cultivation of Potatoes, especially in allotments and gardens; Mr. A. D. Cotton lectured upon Leaf-curl and Mosaic Diseases; and Mr. W. Cuthbertson, who dealt with present-day varieties, illustrated his lecture by specimens. This feature of the exhibition was evidently greatly appreciated by those who attended, and who asked numerous questions of the lecturers. The chair was taken at the lectures by Mr. Lobjoit, Controller of Horticulture, Ministry of Agriculture; and Mr. Taylor, Deputy Controller.

The principal prize winners in the open classes were Mr. R. A. GRIGER, Dumfries; Mr. W. J. GRESSON, Severn Stoke; Mr. W. C. COLEMAN, Buckingham; Mr. W. P. ORWIL, Hinckley; Mr. J. HUDSON, of Leicester; Mr. D. NORMAN, Wolverton; and Mr. W. PERKS, Stourbridge. In the classes for farmers and market gardeners (single dishes) the principal prize winners were THE TODDINGTON ORCHARD Co., Winchcombe; SIR JAMES DOTGLAS, Coupar Angus; and Mr. J. RIMMER, Cadishead.

## BRITISH MYCOLOGICAL.

A MEETING of the British Mycological Society was held in the Botany Department, University College, Gower Street, on Saturday, November 18; the president, Mr. F. T. Brooks, presided.

The first paper was by Dr. M. C. Rayner, on the Mycorrhizal Fungus in relation to Calluna "Cuttings," illustrated by specimens, preparations and lantern slides. Experimental work was undertaken in order to study the behaviour of the mycorrhizal fungus known to be present in the vegetative tissues of the shoots—when cuttings of Ling are rooted in sterilised sand under controlled conditions. Cuttings strike readily during the summer, although some difficulty was experienced in devising a closed apparatus in which they would root satisfactorily. The adventitious roots produced, not from a callus, but grown from the leafy region of the stem, show early infection by mycelium from the shoot tissues. The results obtained are

completely at variance with those reported by Christoph, whose work on Calluna was criticised by Dr. Rayner at the meeting of the Society in January last.

Miss G. Gilchrist followed with an account of Bark Canker Disease of Apple Trees, caused by *Myxosporium corticolum*, Edgar. This is the first record of the fungus in this country. A characteristic of the disease is the formation of large longitudinal scars on the sides of branches, on the dead tissue of which numerous acervuli are found. The scars increase rapidly at one period of the year only, and that usually towards the end of the summer. The fungus is most abundant in the cortex, but also occurs in the phloem and the wood. In wood infected by the hyphae wound gum is formed in large quantities in the vessels and in the thick-walled wood parenchyma, but not in the medullary rays, the phloem, or the cortex. Wound gum is formed in advance of the hyphae. Conidia are produced in acervuli; they are oval or slightly allantoid in shape and germinate easily. In pure culture hyphae grow very slowly, preferring gelatine to agar. On certain media the hyphae secrete drops of brown liquid which contains oxalic acid. Crystals of calcium oxalate are invariably found in the media in which the fungus has been growing. In pure culture conidia have only been formed on Apple twigs and 2 per cent. malt agar. In the latter case they are formed inside a dark green body, in appearance like a sclerotium. Judging from the inoculation the fungus seems to be a weak parasite, except under certain conditions, when much permanent damage is done to the trees, and they may be killed outright. The fungus in some cases enters through a dead spur; in other cases infection comes from the region of the ground; it may also take place through grafting wounds.

Mr. R. J. Tabor gave a paper on a fungus disease destroying fruits of Cocoa and Coffee cultivated on the Gold Coast, by attacking the pericarp. The fungus responsible is a *Phycomycete* which permeates the intercellular spaces of the host tissue, and enters the cells, which are thereby killed. Conidial fructifications rupture the epidermis and form pustules on the surface of the fruit, coalescing to form a mealy covering. The fungus is considered to be a member of the *Perisporiaceae*, but belonging to a new genus of which a diagnosis will be published shortly. Further investigation in the parasitism of the fungus is being carried out by Mr. R. H. Bunting, by whom the disease was discovered.

In the afternoon Miss E. S. Moore described her work on the Physiology of *Fusarium coeruleum*, well known as the cause of dry-rot disease of Potatoes in storage. The existence of seasonal and varietal differences in susceptibility, reported by previous workers, has been confirmed, but so far only negative conclusions have been reached in the attempt to explain the cause of these differences. The fungus is extremely variable in its cultural characters, and a close study has been made of its behaviour on various synthetic media based on Coon's formula. The amount and type of fungal growth is closely related to the nature and concentration of the carbohydrate and nitrogen supply, to the reaction of the medium and to the temperature of incubation.

The last paper of the meeting was by Professor A. Castellani, on Mycology in Tropical Medicine. The subject of medical mycology is of great importance, but it is only possible to give here a short resumé of Professor Castellani's stimulating lecture, which was illustrated by lantern slides and by cultures of the fungi he mentioned. The study of bacteria is so engrossing and has given results of such magnitude that there has been perhaps a tendency somewhat to overlook the importance from a medical point of view of vegetable organisms higher than bacteria, though fungal diseases were the first to be studied. Lagenbeck, in 1839, discovered the "thrush" fungus in examining the white patches of "thrush" found, at the autopsy of a case of typhoid, in the oral mucosa, the pharynx and the whole of the intestine. He believed at first that the fungus was the cause not only of the white patches, but of the typhoid infection of which the patient had died. Berg, in 1842, gave a good description of the organism which was named *Oidium albicans* the following

year by C. Robin, who made a complete investigation of it. Robin's book, *Histoire Naturelle des Vegetaux Parasites qui Croissent sur l'Homme et sur les Animaux Vivants*, a copy of which was exhibited at the meeting, became a classic. In 1839 Schoenlein discovered the fungus causing favus. Gruby, in 1841, described the fungi causing ring-worm—one with small spores and one with large spores. Other fungi were described, the interest continuing until the discoveries of Pasteur and Koch focussed the attention on bacteria. Fungal infections of various human systems were passed in review.

## THE WEATHER.

## THE WEATHER IN OCTOBER.

This was the most north-easterly, and by far the driest, October of the fifty-two for which local records are available. It was also exceptionally sunny, with still clearer skies at night, and therefore the daily range of temperature was considerable. Barometric pressure was high and steady, wind movement slight, and ozone deficient. After the 5th, there was no sea wind until the 31st, when the weather broke. The persistence of currents from easterly points was remarkable; the duration of those from the north-eastward had not been approached since the year 1880, and then was not equalled. The first six days and part of the middle of the month were warm; but the closing week was very cold. The mean temperature of the entire period was  $47^{\circ}$ , or  $1\frac{1}{2}^{\circ}$  below the average. More than 135 hours of bright sunshine were recorded, the normal being exceeded by nearly 42 hours—the best October result since 1899. Rain was restricted to 6 days, or 12 fewer than usual, and three fewer than in any previous October, while the total amount was only 0.58 inch, or no less than 3.18 inches below the average, and 0.55 inch under the smallest previous record for the month (viz., that of 1920); moreover, half this small quantity fell on November 1 (before 9 a.m.). Frost occurred in the screen on 3 nights, and upon the grass on 10 nights. There were no gales. Joseph Barendell, *The Fernley Observatory, Southampton*.

## NEW HORTICULTURAL INVENTIONS.

## LATEST PATENT APPLICATIONS.

- 30855.—Bull, G. F.—Lawn-mowers November 11.  
 30910.—Carter, E. R.—Water-cans, etc. November 11.  
 30596.—Jorgensen, P.—Method of manufacturing a nitrogen-assimilating manure. November 8.  
 30369.—Libbey, H. C.—Appliance for striking plants before severing the stem. November 7.  
 29835.—Brown, A. M.—Garden seats. November 1.  
 29619.—May, H.—Hedge-clipping machines. October 30.  
 30215.—Ritchie, Hart and Co., Ltd.—Means for inserting manures, seeds, etc., in the soil. November 4.

## SPECIFICATIONS PUBLISHED LAST MONTH.

- 187,251.—Prase, E. L.—Manufacture of production of material suitable for use as fertilising material.  
 187,270.—Barbezieux, A.—Portable tool for cutting branches, stalks, etc.  
 187,423.—Sams, E. H.—Fertiliser and process of making same.

## ABSTRACT PUBLISHED LAST MONTH.

*Dibblers*.—Patent No. 185,172.—A new pattern of dibbler that can be forced into the ground with the foot has recently been patented by Mr. A. J. Porter, of St. Clair, Hunters Grove, Swindon, Wiltshire. It consists of two hollow conical-shaped portions pivoted by the ears and having tongues of uniform width with straight edges. The handles are riveted to the tongues and to the conical-shaped portions, the upper edges of which are substantially at right-angles to the handle, in order that foot-pressure may be used. The distance between the ears is preferably greater than that between the tongues and the point portion may be elongated parallel to the axis joining the pivots so that a rectangular hole is formed on opening the two parts.

This list is specially compiled for *The Gardeners' Chronicle* by Messrs. Rayner and Co., Registered Patent Agents, of 5, Chancery Lane, London, from whom all information relating to patents, trade marks, and designs, can be obtained gratuitously.

MARKETS.

COVENT GARDEN, Tuesday, November 28th, 1922.

Fruit: Average Wholesale Prices.

Table listing fruit prices including Apples, English, Pear, and various other varieties with their respective prices per bushel or dozen.

Table listing vegetable prices including Asparagus, Beans, Carrots, Cabbages, and various other types with their respective prices per bunch or dozen.

Vegetables: Average Wholesale Prices.

Table listing vegetable prices including Asparagus, Beans, Carrots, Cabbages, and various other types with their respective prices per bunch or dozen.

Table listing vegetable prices including Parsnips, Peas, Potatoes, and various other types with their respective prices per cwt or bushel.

REMARKS.—A very moderate demand rules all round, and the general conditions of trade are slow. Apples, both imported and home grown, are not moving freely, and their prices are lower. Hothouse Grapes are not quite so plentiful, and quotations remain steady. A few choice vegetables from Guernsey, such as Peas, Beans, and Potatoes, are selling well. In addition to Asparagus from France, the first arrival of forced English Asparagus is recorded. Consignments of Oranges from Denia and Murcia show improvement in condition. A few new crop English Tomatoes are still available, but most of the trade now look to Canary Island Tomatoes for their requirements. Tunis Dates have been selling well. There has been a slightly better inquiry for Pines. Beans from Madeira have not been arriving in very good condition, and their prices have, in some instances, been low. Trade in green vegetables shows a slight improvement. The Potato trade has also a slightly better tendency.

Plants in Pots, etc.: Average Wholesale Prices.

(All 48's except where otherwise stated.)

Table listing prices for plants in pots, including Adiantum, Caneum, Aralia, and various other species with their respective prices per dozen.

Table listing prices for plants in pots, including Erica, Marguerites, Nephrolepis, and various other species with their respective prices per dozen.

Cut Flowers, etc.: Average Wholesale Prices.

Table listing prices for cut flowers and other plants, including Adiantum, Asparagus, Carnations, and various other types with their respective prices per dozen.

Table listing prices for cut flowers and other plants, including French Flowers, Roses, and various other types with their respective prices per dozen.

ANSWERS TO CORRESPONDENTS.

CLEARING A LAKE: T. U., D. Seeing that you are troubled with Elodea canadensis, which you call American Water Weed, it would indicate that the water is rather shallow. Lakes and ponds tend to fill up with sand and mud brought down by the stream or ditch that feeds them. Leaves also blow into them if there are trees about; and water weeds themselves add to the accumulation of mud. If much rubbish is brought down by the stream, a deal of it could be stopped by making a barrier of wooden or iron rods across the inlet and clearing the rubbish away occasionally. An effort might also be made to rake up leaves to prevent them blowing into the lake. The stems and leaves of the water weed itself could be destroyed by a good dressing of salt, as suggested; but it is doubtful if this would kill the roots in the mud, because the salt quickly gets diluted. Many weeds can live in water that is stagnant and quite brackish, so that this remedy would only be temporary. It could be tried once a year in winter, if you like. Water birds of many kinds devour large quantities of water weeds, grass, and other vegetation, which constitute an important part of their food. We would suggest that you keep some of the larger waterfowl on the lake, such as swans or geese, which forage in deep water for food with their long necks. Geese might be made a useful asset by breeding and keeping a good number in summer when the weeds make their tender young growth. The excess number could be penned in early autumn and fed for the Christmas market. The rest would not do much harm in surrounding grass, even if closely mown, and would require little feeding, except when the lake is frozen over.

CYCLAMEN UNHEALTHY: T. G. The petioles of the leaves have damped off, due, doubtless, to a check to growth, either through growing the plants in a low temperature or an excess of moisture in the soil. Keep the plants drier both at the roots and in the atmosphere, and admit plenty of fresh air to the house. Planting the corms at too great a depth would be likely to set up decay in the petioles.

NAMES OF FRUIT: B.ao. Mitchelson's Seedling.—W. C. 1, Bietsheimer; 2, Yorkshire Beauty; 3, Yellow Ingestre; 4, Fondante d'Antonne; 5, Williams' Victoria; 6, decayed; 7, Dartmouth Crab.—J. R. A. 1, Beurre Sterckmans; 2, Sandringham; 3, Verulum.—T. T. 1, Marie Louise; 2, Bramley's Seedling; 3, Herefordshire Pearmain; 4, Winter Strawberry.—R. D. 1, Napoleon; 2, Thompsons; 3, Beurre Superfin.—G. W. 1, Warner's King; 2, King of the Pippins; 3 and 7, Claygate Pearmain; 4, Annie Elizabeth; 5, Cellini; 6, Winter Hawthornden; 8, St. Edmunds Pippin; 9, Dutch Mignonne; 10, Worcester Pearmain; 11, Marie Louise.

NAMES OF PLANTS.—A. P.: Liriope spicata; Kleinia repens. W. W.: Cobaea scandens (Cup and Saucer plant). J. G.: A fine form of the common Spindle tree, Eonymus europaeus.

PEAR TREES SHADING A SMALL GARDEN: R. E. M.—You will not be likely to kill the trees if you cut them down severely. They will, of course, send out vigorous branches again, and these can easily be kept in bounds by subsequent pruning.

WAGES FOR FOREMAN GARDENERS: B. M. Gardeners' wages vary greatly, especially in different parts of the country, and there is no fixed standard of wages to which we can refer you except those recommended by the National Union of Horticultural and Agricultural Workers, 72, Acton Street, W.C. Average wages at the present time would be: inside and outside foreman with bothy accommodation, 39s. weekly; outside journeyman with bothy accommodation, 36s; without bothy, 33s.; inside journeyman 36s. with bothy accommodation.

Communications Received.—E. T.—C. S.—G. F.—J. C.—H. B.—D. H. D.—G. H. D.—H. L. F.—H. C.—H. H.—J. R.—A. K.—J. S. D.—W. B.—Taughlin—H. G. R.

GARDENING APPOINTMENTS.

Mr. Payne, for the past six years Gardener to Sir Wm. Cory, Bart., at Norbury Park, Borking, Surrey, as Gardener to the same gentleman at Claremont, Esber, Surrey.

Mr. H. Wenman, for the past 11 years Gardener to Hon. F. L. Wood, M.P., Temple Newsam, Leeds, as Gardener to Viscount Halifax, Hickleton Hall, Doncaster. (Thanks for R.G.O.F. Box.—Eos.)

Mr. L. D. Edgar, for the past three years and six months in the Royal Botanic Garden, Edinburgh, as Gardener to G. CRAIG SELLAR, Esq., at Ard-tornish, Morvern, Argyll. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds.)

Mr. W. Greentree, as Head Gardener to J. RAILTON, Esq., St. Leonards, near Windsor. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds.)

Mr. Wm. Tizzard, for nearly three years Foreman at Thorsby Park Gardens, as Gardener to G. H. CARON, Esq., Southwick Hall Gardens, Oundle, Northampton. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds.)

Mr. R. Ward, previously Foreman at Layer Marney Hall, Kelvedon, Essex, as Gardener to WM. ANOUS, Esq., The Manor, Teudring, Essex. (Thanks for 1s. 6d. for R.G.O.F. Box.—Eds.)

CATALOGUES RECEIVED.

CLERANS, Altrincham.—Ornamental trees, Shrubs and Climbers, Herbaceous and Alpine plants. SALE AND SON, Wokingham.—Bulb Nursery stock. H. J. JONES, Ryecroft Nurseries, Lewisham, S.E.—Chrysanthemums, Michaelmas Daisies, Hardy Pblox. etc.

NEW DESSERT APPLE, GUELPH  
(R.H.S. First-Class Certificate, October 7, 1913).

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, December 6, 10 a.m. Bar. 30.4; temp. 48°. Weather—Fine.

### Weather and Crops.

It is a manifest commonplace of agriculture and horticulture that weather plays a great part in determining the yield of crops. It is also only too well known to cultivators that in certain seasons an individual grower or, indeed, a large group of growers, in a district may lose the whole of certain crops, or, what amounts to the same thing, may have so poor a yield as to find it not worth the while of harvesting. Yet in spite of such experiences it is probable that very few among those who cultivate the land could give an estimate of the average amount of loss of crop caused by adverse weather conditions. In order to fill this gap in general knowledge, inquiry has been made into the weather effects on the chief crops grown in the United States. According to this inquiry, an account of which is published by Mr. Warden Smith\*, the average injurious effect of weather on crops ranges from about 21 per cent. to about 28 per cent. in the case of cereals. Of these crops Oats escape with an average penalty of 20.8 per cent. Wheat suffers on the average a weather loss of about 23 per cent.; Barley on the average has to forego about 25 per cent. of its crop because of adverse meteorological conditions; and Maize, the most susceptible of all, loses on the average about

28 per cent. The average toll which adverse weather takes of the Potato crop is, curiously enough, rather less than that exacted from any cereal, namely, a little less than 21 per cent. Apples, on the other hand, lose on the average about a quarter of their crop—25 per cent.—as a result of bad weather. The crop which suffers least is Rice, 14.1 per cent., and next to it stands Tobacco with an average loss of nearly 16 per cent. Thus, with occasional exceptions, adverse weather is a very impartial enemy of cultivators, though some plants get off rather more lightly than others, and some, for example, Flax, seem to be particularly prone to weather trouble, its average loss being nearly 32 per cent.; so that in any year the grower has no reason to expect more than two-thirds of a full crop. Perhaps the most interesting point of this statistical inquiry is that which estimates the average losses incurred as the result of insect and fungous attack. Insect pests and parasitic fungi combined only succeed in doing on the average less than a quarter of the damage which bad weather may do. In the case of the Wheat crop the average destruction is estimated at—by weather, 22.9 per cent., by fungous diseases 2.7, and by insect pests 2.1 per cent. In the case of the Potato, adverse weather reduces the crop on the average by 20.7 per cent.; fungous pests only decrease it by 4.4 per cent., and insect pests by 3.2. The loss from these latter causes is greatest in the Apple crop, for beside the average loss of about 25 per cent. from weather, fungous pests reduce it by 3.7 and insect pests by 3.6; so that the average loss from all causes of the Apple crop is nearly 40 per cent. Needless to say, the losses from weather and from pests have to be viewed differently, the one from the other; for whereas weather loss is in large measure beyond the control of the grower, loss caused by pests is also in large measure within his control. Perhaps the most satisfactory aspect of the statistics on this subject is that relating to loss due to defective seed. In the chief cereals it is almost negligible, ranging from one-tenth to two-tenths of one per cent., and even in the Potato the average loss from this cause only reduces a ten-ton crop by about five stones. As is to be expected, the chief factor in the weather as a limiter of crop production is deficient moisture. Lack of sufficient water is, indeed, the limiting factor of crop production, and the loss from this cause is greater on the average than that wrought by the combined maleficent action of all other adverse meteorological conditions. Thus in the case of Wheat deficient moisture accounts for a loss of from 12.4 per cent., and all these other conditions combined for only some ten per cent. With the Potato, to an even greater degree, if only the soil be adequately supplied with water, the crop will on the average be a good one, but if the supply be defective, although other conditions are favourable, there is a loss on the average of 14.4 per cent.—that is, an eight-ton crop would be reduced to one of less than seven tons. Wherefore, the chief conclusion to be reached from these statistical investigations is the one which all good gardeners have reached as the result of their experience, namely, that a thorough cultivation of the soil is the best system of insurance for large crop-production.

**Our Almanac for 1923.**—We propose to publish in an early issue of the New Year a *Gardeners' Chronicle* Almanac for the year 1923. In order to make it as useful as possible for reference,

we shall be obliged if secretaries of horticultural, botanical and allied societies, or any of our correspondents, will send us immediate information of all fixtures for the coming year.

**Imperial Fruit Show, 1923.**—The proprietors of the *Daily Mail* having announced that they will not organise an Empire Fruit Show in 1923, a meeting of fruit growers and brokers, convened by the Ministry of Agriculture, was held at 10, Whitehall Place, on the 2nd inst., to consider the holding of an exhibition of this nature by the growers, and others interested themselves. Mr. W. G. Lobjoit, who presided, stated the Ministry thought that the proper thing to do was to establish an organisation which should carry on the movement. The meeting was in favour of this, and resolved to hold a show next year in Manchester. The exhibition will be of an Imperial nature, as heretofore. The executive organisation will consist of a joint committee consisting of three members of each of the various federations of growers and brokers and allied bodies; and members will be co-opted representing the Dominions, the Manchester Corporation, the railway companies, and the Royal Horticultural Society; two representatives of the Ministry (the chairman and Mr. H. V. Taylor) will act as conveners of the committee. The question of raising the necessary financial resources was left to this joint committee.

**Gift of a Public Park.**—At a recent meeting of the town council of Dalbeattie, a letter was read from W. J. Herries Maxwell, Esq., of Munches, Dalbeattie, offering as a gift to the burgh the ground known as Rummell Wood, extending to about five acres, for a public park. The gift was unanimously accepted, and the best thanks of the council given to Mr. Maxwell for his generosity. The land, formerly occupied as woodland, has been cleared of the timber, and will only require a comparatively small outlay to make it suitable for a public park. It is admirably suited for the purpose, being on an elevation overlooking the town and in every way an ideal position. Dalbeattie already possesses two public parks, one the gift of Mr. Maxwell, of Munches, the other given by Miss Copland, of Colliston.

**Food Production in War-time and After.**—At the next meeting of the Surveyors' Institution, to be held in the lecture hall of the institution, George Street, Westminster, on Monday, December 11, a paper will be read by Major E. Meacher entitled "Food Production During the War," and another by Mr. Harry German entitled "The Agricultural Position and the Possibility of Stimulating Economic Production in the Future."

**Horticultural Club.**—The members of the Horticultural Club will meet at dinner on Tuesday, December 12, at 6.45 p.m., at the Connaught Rooms, Great Queen Street, W.C. After dinner Mr. R. A. Malby will exhibit a series of lantern slides showing scenes in beautiful gardens, in their natural colours, and following the pictures there will be a musical programme.

**The Botanical Society and Exchange Club of the British Isles.**—The report of this society for the year 1921, together with the balance sheet for 1920, has just been issued as Part III of Vol. VI. of the society's transactions. It is a most interesting issue, especially to students of British botany, as it includes a large number of plant notes dealing mostly with plants new to the British Isles, and there are several references to notes which have appeared in the *Gardeners' Chronicle*. These are followed by notices of books and other publications of botanical or horticultural interest, while numerous pages are devoted to appreciative notices of men who, after contributing materially to our knowledge of plants, have passed away. The County and other Records of British Plants fill about thirty-six pages, and are followed by a critical review of the Nigra group of British Centaureas by Mr. C. E. Britton. Notes on Vivipary in *Festuca ovina*, by Mr. T. J. Jenkin, of the Welsh Plant Breeding Station, Aberystwyth, are of peculiar interest and scarcely less interesting are the

\* Monthly Weather Review, 47, No. 8, Washington, August, 1922.

Notes on the Seeds of the British Dactylorehids, by Mr. T. A. Dymes. The "Flora Zetlandica," by Mr. G. Claridge Druce, the Secretary of the Society, occupies ninety pages, and forms a valuable supplement to this publication, the price of which is 10s.

**Gifts of Land to Crieff.**—Provost Mungall has presented the town of Crieff with a portion of land along the west bank of the River Turret as an additional pleasure ground and adjunct to the MacRosty Park. Sir William Keith Murray has also offered the town a strip of woodland and a wood adjoining the public park for use as a public ornamental and pleasure ground.

**Time of Tuber Formation in Potatoes.**—Experiments conducted at the Colorado Experiment Station, Greeley, U.S.A., and also subsequent observations made at Maine, give valuable data as to the time of the beginning of tuber formation in the Potato. It was shown that the greater part of the tubers which grow to exceed half an inch in diameter are formed at the start of tuber development. The maximum rate of growth of the tubers was found to occur at approximately eighty days after planting. At this time nearly one-third of the total period of tuber development has been completed. The tubers on the upper stolons show, generally, a tendency to a decrease in size, although individual plants exhibited considerable diversity in this respect. The greatest average weight of crop was produced by the lower stolons. Bearing on the debatable question of planting cut "seed" and whole "seed," with one exception a larger weight of tubers per stem was obtained when whole sets were used. The experiments brought out a valuable point in cultivation, for the application of water before tuber formation had begun increased the numbers of tubers, although increasing the numbers of waterings afterwards appeared to have little effect in this respect.

**R.H.S. Rose Trials at Wisley.**—The Director of Wisley, informs us that the land set aside for the Rose-trial grounds in the Gardens of the Royal Horticultural Society is now ready for planting. He would be glad if those desiring to send Roses for trial this season would let him know as soon as possible, and he will be pleased to send the necessary entry forms. All types of Roses will be included in the trials.

**"Trees of Great Britain and Ireland."**—A copy of this classical work by the late Mr. H. J. Elwes and Prof. A. Henry was sold at Messrs. Sotheby's on Tuesday, the 28th ult., for £45, the purchasers being Messrs. Quaritch. The book was from the Leighton collection.

**Swanley Horticultural College.**—The annual general meeting of the members of the Horticultural College, Swanley, will be held at 31, Curzon Street, W.1, on Tuesday, December 12, at 4 p.m., when the principal business will be the consideration of the annual report and balance-sheet, the election of governors and auditors, and the confirmation of the nomination to the governing body of Mr. E. A. Bunyard, Maidstone; Mr. W. G. Lobjoit, Controller of Horticulture; and Miss MacQueen. The retiring governors are Viscountess Northcliffe, Dr. Barratt, and Miss Cracknell. The new Principal of Swanley College is Miss Barratt, D.Sc., lecturer at the Imperial College of Science. Dr. Barratt was formerly a student of the College and for three years a member of the staff. Since then she has been in close touch with the work of the College, and has served on the governing body for the last five years.

**Pear Wood.**—Mr. Dallimore draws attention in the *Kew Bulletin*\* to the value of Pear wood for the making of draughtsmen's apparatus, and especially for T squares and set squares. The wood is also in demand for the making of camera shutters, it being stained black for this purpose. The timber of the Pear is also suitable for use in carving and turnery on account of its very smooth surface, whichever way it is worked. The supply is small, as most old Pear trees are used as firewood when felled.

Those who have only a few trees for disposal are recommended to offer them to makers of cameras or scientific instruments.

**Appointment of Assistant-Director of the R.H.S. Gardens, Wisley.**—The Council of the Royal Horticultural Society has appointed Mr. A. Simmonds to be Assistant-Director of their gardens at Wisley. Mr. Simmonds was trained at the Wisley School of Horticulture, and in 1913, when the National Diploma was instituted, he was one of the first batch of candidates to sit for the examination, and so well did he please the examiners that he was placed at the head of the pass list. Later, he was appointed as demonstrator at Wisley, and left the service of the Royal Horticultural Society to take up the appointment of Assistant Horticultural Instructor under the Surrey County Council. Subsequently he became Horticultural Instructor under the Hertfordshire County Council, and in 1919 became Assistant Horticultural Superintendent in Kent. Mr. Simmonds has always taken a keen interest in the educational side of horticultural activities, and is now the Hon. Secretary of the Horticultural Education As-

MR. A. SIMMONDS.

THE NEWLY APPOINTED ASSISTANT-DIRECTOR OF THE R.H.S. GARDENS, WISLEY.

sociation. His practical training at Wisley fits him particularly well for the position to which he has now been appointed, while his success at the R.H.S. examinations shows that he is well acquainted with the theoretical and scientific aspects of horticulture. It will interest our readers to know that Mr. Simmonds served with the Army in France during the war period. He enlisted as a private and was given a commission after six months' service. He was mentioned in dispatches on two occasions and received the Military Cross; he rose to the rank of Major, and on the cessation of hostilities retired with that honorary rank. We congratulate Mr. Simmonds upon his war record, his horticultural successes, and upon his appointment at Wisley.

**Diatomaceous Earth.**—This material is used in the United States of America, amongst other purposes, for filtering unfermented Apple juice in the making of Cider. The following account of this organic earth is given in *Farmers' Bulletin*, No. 1264, of the United States Department of Agriculture in an article on the "Farm Making of Unfermented Apple Juice." Diatomaceous or siliceous earth consists of the cell walls of microscopic 1-celled plants, diatoms, which exist in a great variety of forms in both fresh and salt water and in damp soils. Exten-

sive deposits of this earth are found in various parts of the United States. A number of these deposits are being worked, as the earth has many industrial uses, the principal ones being as an abrasive and metal polisher, as an insulating and sound-deadening material, as an absorbent for nitroglycerine in the manufacture of dynamite, and as a clarifying agent in the manufacture of cane sugar. The earth is marketed under various names after it has been subjected to grinding and screening; among these may be mentioned kieselguhr, infusorial earth, infusorial silica, fossil flour, diatomite, tripolite, and tripoli powder. Some of the earths on the market instead of consisting of silica contain varying quantities of calcium carbonate. As obtained from manufacturers and dealers, diatomaceous earths contain some organic matter which will give a disagreeable foreign or "earthy" flavour to the juices unless it is removed. The most satisfactory method of purifying the earth is by heating it to redness for a short time. Diatomaceous earth can be used repeatedly merely by heating it after each use for the same time and in the same way as at first.

**Certified Stocks of Immune Varieties of Potatoes.**—During the past season, inspectors of the Ministry of Agriculture have examined many fields of growing Potatoes of varieties immune from Wart Disease, with a view to certification of the crop as true to type and free from "rogues." A list of the growers of these certified stocks is available at the Ministry, who will supply on application the names and addresses of growers of certified stocks of any particular variety, together with the numbers of the relative certificates issued to them. Growers are reminded that only "seed" from crops which have been so certified may be planted on land which is infected with Wart Disease.

**New Coffee and Cocoa Disease.**—Mr. J. Ramsbottom draws our attention to an error on p. 331 in the résumé of Mr. R. J. Tabor's paper, which places the new Cocoa and Coffee disease both in Phycomyces and Ascomycetes! The fungus is one with sexual organs much resembling those of certain species of Phytophthora, with amphigynous antheridia; the oogonia are, however, thick-walled, with a number of blunt processes. The conidial stage is very unlike that of Phytophthora, or, indeed, of any known Oomycete, being more suggestive of Zygomycetes, such as Choanophoraceae. The fungus is, therefore, considered to be a member of the Peronosporiaceae.

**The Late Mr. Henry J. Elwes.**—The following is a list of plants figured in the *Bot. Mag.* and introduced or grown by the late Mr. H. J. Elwes: In 1875: t. 6166, *Galanthus Elwesii*, from Asia Minor; t. 6168, *Crocus Creweii*, Island of Syria; t. 6176, *Crocus Fleischeri*, Asia Minor; t. 6187, *Crocus Boryi*, Asia Minor; t. 6191, *Tulipa Eichleri*, and t. 6220, *Calochortus citrinus*, California; the first five of these plants were collected by Mr. Elwes. In 1876: t. 6242, *Tulipa Hageri*, Greece; t. 6244, *Bongardia Rauwolfii*, Asia Minor (collected by Mr. Elwes); t. 6255, *Serapias papilionaceo-lingua*, S. France; and t. 6269, *Muscari aestivale*. In 1877: t. 6281, *Dracocephalum speciosum*, Sikkim; t. 6295, *Tigridia lutea*, Peru and Chili; t. 6308, *Tulipa undulatifolia*, Asia Minor; t. 6321, *Fritillaria acmopetala* and *F. dasypphylla*, Asia Minor; and t. 6335, *Gladiolus Eckloni*, South Africa. Colesborne was a museum of his collections of butterflies, big-game trophies from all countries, and his remarkable collection of timbers, and what he could tell about them, rendered a visit to Colesborne an experience none of his friends will forget. In recent years he devoted much time to the bringing together at Colesborne and the hybridising of sheep of primitive breeds from all parts of these islands, and published an interesting paper about them. He sent pens of these sheep to the Royal Agricultural Show at Bristol in 1913. The qualities of various wools induced him to take up this subject, and from what they learned at Colesborne many have started flocks of their own, and go clad, as he did, in cloth of "Moorit" Shetland, or Black Welsh of their own raising.

\* *Bulletin of Miscellaneous Information*, No. 9, 1922.

**Cornwall Flower Show.**—The Cornwall Daffodil and Spring Flower Society has decided to revive the society's annual flower show, and an exhibition will be held on May 1 and 2, 1923. Several of the members were in favour of the dates being April 17 and 18, and it was only by the casting vote of the chairman that the May dates were selected. These flower shows in the past have been especially noted for fine exhibits of Daffodils, but it is hoped that flowering shrubs, and especially Rhododendrons, will be the main features of the exhibition next year. It was stated that the society has a balance at the bank of some £130, and subscriptions promised for the show amount to £64 4s. 6d.; some seventy growers have consented to support the exhibition. We understand that since the meeting further subscriptions have been received, and there is every prospect of the society being able to hold a first-class exhibition.

**The Hop Crop.**—The total production of Hops during the present year is estimated at 301,000 cwts.; 77,000 more than last year and 26,000 cwts. above the average of the ten years 1912-21. Except in East Kent, the yields per acre were above the average for the south-eastern counties, especially in Sussex, where a heavy crop of 14.2 cwts. per acre was obtained. In the western counties yields were not so satisfactory, being half a hundredweight below the average in Herefordshire and just average in Worcestershire. Results this year were, therefore, the reverse of those of last year, when the western counties had good crops and the south-eastern counties lighter crops than usual. The Kent crop totalled 206,000 cwts., as compared with 143,000 cwts. in 1921. The next largest yield was in Sussex, where 33,500 cwts. was produced, closely followed by Hereford with 30,000 cwts.

**Appointments for the Ensuing Week.**—Monday, December 11: National Chrysanthemum Society's Floral and Executive Committees meet; United Horticultural Benefit and Provident Society's meeting; Bath Gardeners' Society's meeting; Purley Horticultural Society's meeting.—Tuesday, December 12: Royal Horticultural Society's Committees meet; Horticultural Club Dinner, Connaught Rooms.—Wednesday, December 13: East Anglian Horticultural Society's meeting; Sheffield Chrysanthemum Society's meeting.—Thursday, December 14: Bristol and District Gardeners' Association's meeting.—Friday, December 15: Paisley Florists' Society's meeting; Eastbourne Horticultural Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Chrysanthemum Show at Newcastle.*—The first exhibition of the above much-admired flower was held on the 24th ult., at Jesmond Gardens. The collections were splendid, and amongst them were several specimens as large and as brilliant as Dahlias; indeed, the exhibition had much the appearance of a Dahlia show. The following is a list of the winning flowers in the principal stands:—First, eighteen flowers, Mr. J. Deans, Empress, Golden Yellow, Maria, Queen, Venus, Vesta, Duc de Camigliano, Madam Pompadour, Arabella, Annie Salter, Superb White, Tasselled Yellow, Paper White, Elegans, and four others; second, ditto. Mr. W. Kelley, Magnet, Victory, Adventure, Ranunculiflora, Tasselled Yellow, Minerva, Elveria, Cleopatra, Annie Salter, Madam Pompadour, Princess Maria, Maiden's Blush, Bicolor, Wheeleriana, General O'Donnell, Marshal de Craque, Queen, and Demesthenes. First twelve, Mr. Deans, Tasselled Yellow, Duc de Camigliano, Queen, Annie Salter, Arabella, Empress, Elegans, Golden Yellow, Cleopatra, Madam Pompadour, Maria, and Paper White; second ditto, Mr. Clay. Best blooms of any colour, Mr. Deans, with Annie Salter. *Gard. Chron.*, December 11, 1847.

**Publications Received.**—*Pests of the Garden and Orchard, Farm and Forest*, by Messrs. Ray Palmer and W. Percival Westell. Illustrated. Henry J. Drane, Danegeld House, Farringdon Street, E.C.4. Price 25s. net.—*Our Birds: their Haunts and Nests*. First and Second Series. Illustrated. T. N. Foulis, Ltd., 91, Great Russell Street, London.

## CHRYSANTHEMUMS IN THE GLASGOW PARKS.

In several of the Glasgow City parks there are displays of Chrysanthemums each season, and these flowers are so popular with the public that on Sundays the approaches leading to the greenhouses are thronged with visitors.

### QUEEN'S PARK.

Here the collection, numbering fifteen hundred plants, is arranged on the floor, around the sides of a span-roofed greenhouse, in undulating banks from four to eight feet deep. Opposite the entrance they are massed to a much greater depth. There are also groups in the centre of the house, and sufficient plants of each variety are grouped together to enable one to

Suspended from the roof in one of the houses are pans of *Columnnea gloriosa*; the large, hooded, scarlet flowers are of a size out of all proportion to the light trails of foliage. The supports of the gallery around the Winter Garden are covered with a variety of climbing plants.

### BOTANIC GARDENS.

At the Botanic Gardens the Chrysanthemums are displayed in the two wings of the Kibble Palace, the large conservatory so called, originally erected by Mr Kibble at Couplart, in the West Highlands. "The Kibble" is now well furnished with Palms, Bamboos, Tree Ferns, and semi-hardy shrubs, all planted out.

In the succulent houses also the plants are all planted out, the larger and more vigorous, such as *Cereus speciosissimus*, *Aloe Bainesii*, *Opuntia vulgaris*, *Doryanthes Palmeri*, and other

FIG. 134.—SINGLE CHRYSANTHEMUM ROBERT COLLINS. N.C.S. FIRST CLASS CERTIFICATE, NOVEMBER 27; R.H.S. AWARD OF MERIT, NOVEMBER 28; SEE PP. 329, 330. SHOWN BY MR. G. CARPENTER.

form a good idea of the characteristics of each. In addition, large quantities of decorative and single varieties are grown.

Of other plants in flower a batch of an unnamed *Pelargonium* is a glowing mass of scarlet. **SPRINGBURN PARK.**

At Springburn there is an imposing three-sided group, occupying the central position in a house, the side stages being filled with dwarf, late-struck plants in six-inch pots, each carrying one bloom of exhibition size. The collection is up to date, the blooms massive and of fine colour. The most noticeable varieties are *Majestic*, *Daily Mail*, *Mrs. Sargeant*, *Mrs. R. C. Pulling*, *Princess Mary*, *Mrs. A. Davis*, *Edith Cavell*, *William Rugby*, *Queen Mary*, *Keith Luxford*, *Louisa Pockett* and *William Turner*.

A feature at Springburn is the large and healthy collection of perpetual-flowering Carnations, and the hatch, filling one side of a long house and well furnished with bloom, has flowered continuously during the past six months. Other flowering plants in this house are *Salvia splendens*, *Cineraria Moorei*, and a late batch of *Schizanthus*.

giants, being planted on the ground level, with the dwarfier and less robust species on raised benches. Strewn about the borders are boulders of various sizes, simulating desert conditions. On the roof there are growths of the curious *Testudinaria Elephantipes*.

Uncommon flowering plants noted here were *Abelia chinensis*, a very floriferous shrub covering a pillar, for which purpose it is well suited; the flowers are small, pink, tubular, and borne at the tip of the current year's growth. *Candollea cuneiformis*, an evergreen of neat habit, with conspicuous yellow flowers one inch across; *Hibbertia dentata*, flowers dark yellow, trained on a trellis under the roof; *Calliandra haematocephala*, a Leguminous shrub of striking aspect, the flowers borne in a small head and concealed by the filaments, which form a ball of scarlet threads.

### TOLLCROSS PARK.

In the conservatories here there is also a display of Chrysanthemums, details of which would be a repetition of much already noted. *Fred W. Jeffery, Paisley, N.B.*

## The Week's Work.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Peaches and Nectarines.**—Although in many gardens the pruning and training of these trees are usually deferred until late in the winter, I have for several years commenced and carried out these operations before Christmas, with good results. In fact, as soon as the leaves have fallen we commence the work and hasten its completion as fast as time and labour will admit, and so far I have never experienced failure. Large fruiting trees that were carefully disbudded last summer, and divested of surplus shoots to prevent crowding, will need but very little pruning at the present time. The branches should be well apart to obtain good crops of large, clean, highly-flavoured and richly-coloured fruits. Remove shoots that can be spared, and train in young or fruitful growths all over the trees, both for fruiting and for filling the places of older wood that is cut out. It is not necessary to remove all the branches from the walls annually if they are well balanced, but the fastenings should be carefully examined and renewed if necessary. In training the young shoots use only sufficient ties and nails to keep them in position.

**Spraying.**—The old method of treating fruit trees with lime is not so much practised now that there are several good proprietary washes on the market. Those who have not used alkali spray need not be timid in its application, as there is nothing to fear if the spraying is carried out according to the directions given by the makers. In spraying see that every part of the trunk, branches, etc., is thoroughly treated, and use gloves to prevent the mixture from touching the hands. If lime is used dust every part of the tree when the bark is damp, or mix the lime into a wash and apply it by means of a syringe. In old orchards lime not only cleanses the trees of lichen, etc., but when washed off the branches by rain it benefits the roots and sweetens the soil, and is especially valuable where poultry is allowed to run under the trees.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MALBOROUGH, K.G., Blechington Palace, Woodstock, Oxon.

**The Resting of Orchids.**—All Orchids possessing pseudo-bulbs require a rest at some period of the year, in order to bring about the maturation of their growths, and also that they may recuperate after flowering. By rest is not implied absolute drought for long or short periods at the roots, but the application of little or no water, a lowering of the temperature, less moisture in the atmosphere, and last, but not least, an increased amount of light, if this can be obtained. It is easy to give either too much or too little water during the winter, but very difficult to say when or how often to water, for the conditions of the weather and circumstances of each plant differ greatly. Even individual plants of the same species or hybrid of the same sort vary in this respect to a considerable extent. The grower should give the plant sufficient moisture to keep it in a plump and sound condition; shrivelling of the pseudo-bulbs must be prevented, and provided no shrivelling of the pseudo-bulbs takes place it is much the best practice to err on the side of giving too little water during the winter months than too much. In varied and mixed collections it is often a difficult matter to give each individual plant an ideal position, but this may often be overcome by placing the various species, or hybrids, in batches by themselves, thus giving each section a position suitable for its requirements in respect to light, moisture and warmth. In order to facilitate the winter-

ing of Orchids it is advisable to place them into three groups.

**Deciduous Orchids.**—Firstly, we will consider the deciduous ones, amongst which will be found the following: *Thunia*, *Mormodes*, *Cycnoches*, *Catasetum*, *Chysis*, *Anguloa*, *Cyrtopodium*, and deciduous *Calanthes*. These are all more or less capable of withstanding drought from now onwards until new growth appears in the spring; they may therefore occupy the driest and lightest positions in their respective compartments, and receive only sufficient water to prevent excessive shrivelling. Secondly may be included the other pseudo-bulbous genera, for instance, *Cattleya*, *Laelia*, *Coelogyne*, *Oncidium*, *Epidendrum*, *Lycaste*, *Maxillaria*, *Stanhopea*, some *Odontoglossums*, and many others. These will not withstand so much drought as the former genera, but should be given a fairly dry treatment, yet not be allowed to suffer for the want of water at the roots at any time of the year.

**Orchids that are Never Dormant.**—Thirdly, we have those species and hybrids which are growing more or less all the year round, and have no season of inactivity; some of these have pseudo-bulbs such as *Zygopetalum*, *Miltonia*, *Cymbidium*, *Cochleoda*, and various species from other genera, such as *Laelia purpurata* and *Odontoglossum crispum*, together with a number of those having no pseudo-bulbs, such as *Cypripedium*, *Saccolabium*, *Vanda*, *Sobralia*, *Phalaenopsis*, *Phaius*, *Masdevallia*, *Angraecum* and *Aerides*. These should not be allowed to become too dry at the root, but, on the contrary, should not be watered too freely. The knowledge of giving water at the right time to any particular plant in order to keep it healthy, and in a sound condition, depends so much on the house in which it is grown, and is only acquired by practical experience; but to the careful observer each plant will soon tell its own requirements.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAN, Esq., Baldersby Park, Thirsk, Yorkshire.

**Potatoes.**—The earliest sprouted sets intended for forcing should be planted in large pots or in heated pits to obtain early tubers. Use old potting soil; that which has been used for *Chrysanthemums* is suitable, mixed with a few wood ashes and horse droppings. The soil should be in a moist condition and warm, so that no watering will be required for some time to come.

**Spring Cabbage.**—If these plants are long in the stem soil should be drawn up to them to protect them from severe weather.

**Celery.**—If the latest batch of Celery has not been earthed up finally, it should be attended to at once, and a supply of bracken or litter kept in readiness to apply as protection in the event of very severe frosts.

**Broccoli.**—These plants have formed good heads during the recent open weather, but they should be examined every afternoon, and protected by turning the outside leaves over the curds. Where a deep frame is available it is a good plan to lift Broccoli with good balls of soil and place them in it, where they will receive protection during severe weather.

**Tomatoes.**—Make a sowing of Tomato seed in well-drained 6-inch pots. As soon as the seedlings appear place them well in the light. Prince of Wales and Ailsa Craig are two of the best varieties for present sowing. A temperature of 60° to 65° is sufficient for germinating the seed. During bad weather seed that was harvested this year should be picked over, cleaned, and carefully labelled, and a few seeds of each variety sown to test them for germination.

**Next Year's Cropping.**—A plan of the kitchen garden should be made, and the different plots marked for the various crops and treated accordingly. Certain crops do best in particular parts of the garden, and this should be considered in drawing up the cropping scheme.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Adiantum.**—*Adiantums* that have been used for the decoration of the dwelling house, and are in consequence somewhat shabby in appearance, may be rested preparatory to restarting them into growth early next year. Provided most of the fronds are ripe no harm will be done if the whole of them are cut off. Water supplies to the roots should be reduced gradually, but not to such an extent as would cause the soil to dry completely, for at no time should Ferns be subjected to what is termed drying off, although a partial rest is necessary. By resting a certain number of plants now, in about a month's time they will be in a suitable condition for repotting in rich, friable soil, and will soon produce plenty of fresh green fronds. Other hatches may be treated in the same manner later to ensure a succession of fronds.

**Specimen Ferns.**—Large specimens of most kinds of Ferns should be kept slightly on the dry side for the next few weeks by reducing the amount of water at the roots and in the atmosphere of the house. Many species and varieties are evergreen, and the fronds should not be cut off as advised for *Adiantums*; only the decaying fronds need to be cut away. Neither should they be kept so dry as advised for the deciduous kinds. Should thrip be present on the plants a light fumigation with XL All fumigant three times in succession will help considerably to check this pest, but great care in fumigating is necessary owing to the extreme tenderness of Fern fronds. It is always essential with Ferns to prevent insect pests from spreading. Owing to it not being safe to use strong specifics to destroy pests the winter is a good time to thoroughly cleanse both plants and the structure in which they are grown.

**Nephrolepis.**—During the past few years several beautiful crested varieties of *Nephrolepis* have been raised, and they are all useful for decorative effect or for supplying cut fronds for decorations, as they retain their freshness for a long time when cut and placed in water. Most of these varieties may be readily increased either by division or by the stolons. The latter should be carefully removed from the parent plant and inserted in very small pots; afterwards placing them in a propagating frame until they become established in the new soil, when they should be removed to a warm house and grown in a light position.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICAR GENERAL GIBBS, Aldenham House, Hertfordshire.

**Plants in Frames.**—Plants growing in pots in cold frames should be carefully examined. Water should be afforded the roots sparingly; but whereas an excess of moisture would be injurious, so also would it be harmful to allow the soil to become dried out completely. The potting on of seedlings and cuttings should be done before very severe weather sets in, so that the young plants may not be likely to receive a sudden severe check. Opportunity should be taken to re-surface the pots with soil to leave them in good condition through the winter. See that each plant is labelled, as the possibility of the names being lost will be much increased when the frames are shut up close during spells of very cold weather. Have all the necessary covering material ready to hand to apply when frosts threaten, or some of the more tender subjects may be injured unexpectedly.

**Work in Wet Weather.**—It is sometimes a difficult matter to find work for the staff at times when the weather is too severe for outside operations. Pot washing, the preparation of crocks, stoppers, etc.; mat tying; the preparation of sticks, stakes, and labels; the checking of name lists; clearing out sheds, and sorting the lumber that invariably accumulates in them during the busy period of summer and autumn.

and many other similar jobs will give useful employment when operations in the open are temporarily checked by untoward weather.

**General Remarks.**—Where the plants in herbaceous borders do not need replanting, opportunity should be taken of fine, open weather to clear away all dead growth, and stakes, and reduce rampantly growing clumps of plants. After this is completed, the surface of the borders should be carefully forked over, first applying a suitable top dressing, such as fine leaf-mould, and leaving the surface on the rough side for the weather to act upon. Beds required to provide room for surplus plants for cutting purposes should also be got ready by trenching the soil. A little extra care in preparing these in a good and effective way will be well repaid by the better results attained from the plants. Lawns should receive attention by brushing and rolling them at this season, a care that will bring the turf into good condition for the coming year. Bad patches on lawns should be repaired by taking out the faulty parts and furnishing them with fresh turf. This is often necessary where portions have become shabby by much walking on, or where the drip of trees has caused the grass to die, and to replace this, good, strong meadow turf will be found the best material. Before placing the turves in position, prepare the ground for their reception, by applying a shallow layer of fine soil, and raking it level for the roots of the new turf to grow into. Make the new turf firm, and, early next season, sow it with good grass seed, protecting the latter from the birds. Wherever new turf is laid, employ some device to defend it from being walked on or knocked out of position until such time as it has settled and become firmly established. Lawns should be lightly top-dressed now with a slow-acting, stimulating manure such as a light sprinkling of horse-manure, or old potting soil with a little bone-meal added.

#### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Starting Early Vines.**—The very early forcing of permanent vines has been discontinued or greatly modified by many gardeners. Late Grapes have done good service to the gardener whose vineries are none too plentiful, as they have enabled him to postpone the starting of his early houses until Christmas, with the prospect greatly in favour of better crops than could be obtained from the same vines started early in November. There are still a few growers who are obliged to start their vines of Black Hamburgh and other thin-skinned varieties as early as they did before bottling was practised. Success in forcing depends more on the preparation of the vines than on the detailed operations of forcing, as very strong vines may be a complete failure, while weaker, but thoroughly ripe canes will furnish good bunches in profusion. The vines having been shortened to a suitable length some weeks ago, there will be but little danger of them bleeding; a touch of styptic will do no harm, but scarcely anything will stop the sap after it is active. If the vines are young and strong clear water warmed to a temperature of 75° to 80° will be best to use, especially if the border was well watered previous to applying the top dressing. A temperature of 50° is safe to commence with, with a little warmth, more or less, according to the outside atmosphere. The syringe should, as a matter of course, be used and the moisture should be applied to the old stems, especially near the pipes in dry corners, to the walls, floors, and other surfaces. When well started and all the buds are on the move young canes which have been bent down should be tied to the wires without delay, otherwise the shoots will grow backwards to the light, and later will give unnecessary trouble in training. The temperature of the vinery at this stage may range from 50° to 55° by night, and from 60° to 65° by day, rising a few degrees higher with bright sunshine; but no advance in the night temperature should be made for the present.

#### HARDY FLOWER BORDER.

##### PINK AND ROSE-COLOURED MICHAELMAS DAISIES.

It surprised nearly everyone who visited my collection of Michaelmas Daisies this autumn to see the number of rose and pink varieties. Probably in no other direction have any more important improvements in the race been accomplished. Independently of either Chrysanthemums or Dahlias, the English autumn garden may now have its fair share of colour. In the sunlight the effect of a goodly muster of the more rosy Michaelmas Daisies is very fine. The bright light does for them what the dull days of November and December do for our clothes. It hides defects. The rose tone of Brightest and Best seems as pure as that of Dainty, and Mons appears as the

Among the pinks my choice would certainly be Louvain. It is a rare combination of tall, majestic bearing with a sweet and beautiful flower. When it first began to bloom I thought I had a deeper-toned counterpart in Mrs. Wheeler Bennett, but after it had been out some time I hardly knew it, the flower had gone so mauve. Excluding this, after Louvain I place Lady Lloyd, Ethel Ballard (although it has the spidery type of petal which as yet I have not got used to), Thelma Perry (a little on the "spidery" side, but a lovely shade), and, if a St. Egwin bush is not anathema, Namur. It is a pale, true pink. Of the variety Rose de la Toussaint, which came from Messrs. Barr and Sons, I reserve my opinion. In its general appearance it reminds me very much of that useful variety Esther, but it is of taller growth. It did not come into flower until October 20, but my second

FIG. 135.—ODONTOGLOSSUM ARMSTRONGII VAR. AUREOLE. R.H.S. FIRST-CLASS CERTIFICATE AND CERTIFICATE OF APPRECIATION, NOVEMBER 28 (SEE P. 329).

equal in purity of General Leman or Harold Reuthe. Just as in the hybrid Tea Roses, there is much still to be done before the disagreeable blue tint is entirely eliminated, so is it with regard to the rose-coloured Asters. So far as I have been able to judge, the variety which remains purest in colour to the end is Mr. Beckett's Sunset, but this can only be called a soft or pale rose. In the deeper shades I place General Leman, Dainty, Hilda, Sirius, Perry's Pink (why not Perry's Rose?), and, especially when it is seen from a distance, Walloon. It was not in my collection, but, if "eye deceive me not," from my observation at exhibitions this autumn, I consider that Harold Reuthe might be included in this select list of Novi-Belgii varieties. My present selections are entirely confined to this section, for the simple reason that I have had none of the Novae-Angliae type. Somehow they do not appeal to me in the same way, and, I take it, I am not singular in this, or we would not have eighty-five varieties of Novi-Belgii in Mr. H. J. Jones's 1922-23 list to only eight of Novae-Angliae. When we come to the pink sorts, extended observation confirms my first-sight opinion that there is nothing to equal Louvain.

plant, which made a far better show, was not at its best until November was well in.

If the beauty of the individual bloom was the only factor to be taken into consideration, I hesitate to say where I might not have placed Roddy. It has pretty, rosy pink, Daisy-like flowers, with a small, pronounced halo of white round their centres, and they are so exquisitely arranged on the numerous side stems that if I only wanted it for cutting to place in small vases I would ignore its unfortunate, weak, main stem. It will be tried by me next year, and special care taken to see that it is tied up every few inches, when I hope for better results. I had what I believe to be the same variety from another source under the name of R. E. Hay. No Hay appears in this firm's list for 1923.

Mention must be made of Milky Way, raised by Messrs. Barr and Sons at their Taplow nurseries. It is very light-looking and dainty with its wealth of small, rosy pink flowers. Cattleya, the last I shall mention, is a pretty semi-double rose variety, with rather more than a suspicion of mauve in its composition. It has a good habit, and, whenever I have seen this variety it has appealed to me. *Joseph Jacob.*

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard Chron.," Rand; or by telephone, to Gerrard 1543.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents should obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## EMILE BURNAT, 1828-1920.

AMONG the numerous bygone botanists connected with Geneva from the time of de Saussure to that of the late Augustin de Candolle, whose death occurred so recently as 1920, not two years after his father Casimir died, the name of Emile Burnat, born at Vevey, of an old Valdois family, will never be forgotten. Apart from his earlier associations with the town and several of its famous botanists, it is largely through Burnat that even before the great de Candolle herbaria were presented to Geneva, the municipal Conservatoire Botanique had the largest collection of dried European plants in the world.

Educated at Genève and Paris, Burnat became engineer to a firm of manufacturers, in which his uncle was a partner, at Dornach, near Mulhouse, in Alsace. Emile remained there from 1852, when he married his cousin, until 1870. In 1870, he returned with his wife to Vevey, in Switzerland, built a house, and devoted to botany most of the time not occupied with his public duties. He had begun to collect plants in 1842, and for years made numerous botanical excursions in Switzerland and France.

When at Cannes with his family, in 1871, he met Thuret and Bornet, and was induced by them to take up the study of the flora of the Maritime Alps, including the whole Department of les Alpes Maritimes, with a view to publication. Right up to June, 1914, he made very numerous visits to those intensely interesting districts, and he frequently camped out among the mountains. He was often in the company of other botanists, such as Boissier, Wm. Barbey, Reynier, Grenli, Micheli, and more recently the two writers of the so-called *Autobiographie*\* Dr. John Briquet, Director of the Conservatoire Botanique at Genève, and François Cavillier, now the first Assistant at that place, and formerly the Keeper of Burnat's herbarium. From 1874-1899 the herbarium was in charge of Grenli, of Swiss Flora fame. Frequently Burnat's coachman was his travelling companion; and in that respect Burnat resembled his friend and mine, the late Clarence Bicknell,

of Bordighera, whose constant companion and helper was his faithful Italian man.

But the Maritime Alps and adjoining seaboard did not absorb the whole attention of this active botanist. To better comprehend the flora of those southern mountains he saw that a critical work, such as his *Flore des Alpes Maritimes* was destined to become, should be aided by visits to the Alps of Styria and Carinthia, to Spain, the Balearic Isles, Algeria and Corsica. He travelled over Italy, Greece and Turkey, as far as the Bosphorus. Readers who have visited both the Maritime Alps and some of the foot hills of that department or of the Var, will have noticed something of the wonderful way in which the Mediterranean influence is seen intermingling with that of the Alps, in those southern lands. I made some reference to such characteristics in this journal (1915, p. 49 *et seq.*) in a descriptive article on "The Chain of Saint-Baume," that picturesque limestone range in the neighbourhood of Marseilles and Toulon. Few things are more interesting in the realm of geographical botany, and not least because the Alpine and Mediterranean floras have so many elements of beauty.

There is a good mezzotint portrait as frontispiece to this well drawn up memoir; and on p. 83 the authors tell us: "Without any doubt whatever the material in an herbarium gives generally all that is necessary for the morphological and anatomical study of plants (*végétaux*); their comparison warrants interesting conclusions from the point of view of geo-botany. But when he who uses these materials has had opportunity to study living plants in their natural habitats and not from gardens where conditions of existence are more often artificial, and to repeat his observations not once, but a great number of times, what authority does not that give to the author! *Pour bien herboriser il faut beaucoup observer.* Well, Burnat had herborised much and well, and from that point of view it is his friend Edmond Boissier with whom he can be best compared."

The above paragraph could with advantage be read and re-read; not only by those who see nothing useful in herbaria: but by nurserymen and gardeners who are sometimes deceived into thinking certain hardy plants of their rock-gardens and "moraines" are necessarily typical of the plants in their natural haunts; or they may be too hastily tempted to coin some new varietal name for a mere unstable form due to altered conditions. Again, the mere collector of dried plants with limited opportunity of travel and with access to but few books and no great herbarium, can only be excused if sometimes he jumps to a wrong conclusion, owing to his lack of knowledge of a plant growing under a diversity of natural conditions.

In this volume the autobiography occupies only 39 of the 185 pages; and in part II, we find far more about Burnat's extensive botanical work. There is a list of his numerous publications; a full, tabulated account of his travels from 1834 to 1917; a list of the two genera and all the species and varieties dedicated to him; the botanists who visited or worked at his great herbarium; an alphabetical list of some 370 botanical correspondents from 1871 to 1920, of whom only a dozen are British! and an enumeration of the principal collections which constitute l'herbier Burnat. This totals 219,384 numbers, of which Bicknell, J. W. White, of Bristol, and the late Prof. Babington are the largest and almost the only English contributors. And as few of Bicknell's specimens would be English, we see once more how sparsely represented is the British and Irish flora in most of the great herbaria of the Continent.

Of the six published volumes of the *Flore des Alpes Maritimes*, Burnat said he received such eulogy on the appearance of the last two, by his collaborators, Briquet and Cavillier, that it was a proof to him that the completion of his great work is in good hands.

Many of Emile Burnat's botanical books which were duplicates when presented to the Conservatoire Botanique at Geneva, recently came into the British market and were gladly secured by various botanists. *H. S. T.*

## GARDENING IN THE INDIAN HIMALAYAS.

RAIN has been more or less incessant here for the past four weeks; the river in the valley is a raging torrent, and vegetation does not linger, but jumps. It is nothing unusual to get 4 inches of rain here during twenty-four hours, consequently atmospheric moisture is abundant. Ferns are growing everywhere, on the road-sides, clinging to rocks, and even on the branches of forest trees, which are often clothed with them; sometimes it is possible to count eight different kinds of Ferns on one branch of a single tree.

Rhododendrons grow wild here, 30, 40 and even 50 feet high, with trunks 15 inches in diameter. Their flowers are small, the buds being of a deep crimson colour. At the moment the mountain forests are ablaze with wild Geraniums, many Anemones, including *Anemone japonica*, which covers acres of ground; *Spiraea Aruncus*, with flower stems 3 feet and 4 feet long; wild Delphiniums; *Helianthus*; a very lovely *Salvia*, unknown to me; *Epimediums*, *Potentillas*, *Thalictrums*, *Achilleas*, *Hedichims*, and others.

The rocky sides of the mountains are particularly interesting just now; masses of *Saxifraga Megasea*, and many other smaller species; *Sedums*, *Arenarias*, *Sempervivums*, *Lysimachia*, *Thymes*, *Herniaria*, *Geum*, *Panicums*, *Agaves*, many *Primulas* not yet in flower, and *Ramondias* are all to be seen in thousands.

I am writing these notes at an altitude of 8,400 feet, 18 miles from the nearest railway station; Kandajbat, and 40 miles by road east of Simla, which is visible in clear weather. There are many State gardens in the neighbourhood at various altitudes, from 10,000 down to 4,000 feet, which enable us to grow almost every kind of fruit and forest tree. At 4,000 feet altitude we are able to produce most Indian vegetables, Mangos, Pomegranates, and very good Grapes; while those gardens higher up, give us splendid crops of Apples, Pears, Plums, Peaches, Apricots, and most English vegetables.

At 8,000 feet altitude *Cedrus Deodara* reigns supreme. I cannot imagine anything more peaceful than to rest for a few minutes in one of these Cedar forests; but, unfortunately, they abound with panthers and snakes of a very dangerous kind. At 10,000 feet elevation we have our forest and fruit tree nurseries; these are very necessary, as I have some 54 gardens to maintain and many square miles of forests under my charge, but most of the gardens are on the plains, where, at the time of writing, the temperature is well over 100°, while here in the mountains, 150 miles away, we are glad of a good fire and thick woollen clothes. Although I have between five and six hundred under-gardeners under my care, their pay only averages 12 rupees per month; some of them are very clever men. Sundays are not observed as at home; work goes on just the same as on any other day, but every State employee is allowed a month's holiday each year, in addition to the 48 religious holidays. Vegetables are brought here every morning from the three nearest vegetable gardens, 2 miles, 10 miles, and 18 miles away respectively, along mountain tracts, by the gardeners, or Malis, as we call them.

Travelling from one garden to another is done on ponies, or by rickshaw, and is sometimes very dangerous, the roads being in places only 3 feet to 4 feet wide, and cut out of the mountain sides with, sometimes, a perpendicular drop on one side of 2,000 feet; and on the other, overhanging rocks which might fall at any minute.

We have an excellent cricket ground close to my house, which is the highest in the world, made some five years ago by blasting the top of the mountains and levelling it down. The turf, which is of excellent quality, was carried by coolies from the valleys below, several thousand feet down. *George Burrows, Superintendent of State Gardens, Patiala, India, August 15.*

\* Emile Burnat: *Autobiographie publiée avec une étude sur le botaniste et son œuvre.* Par John Briquet et F. Cavillier. Genève: Conservatoire botanique, 1922.

## NOTES FROM GLASNEVIN.

## AUTUMN COLOUR.

DURING the end of October and early November we had a remarkable display of Autumn colouring. The beautiful clear yellow of the Birches and various species of *Rhamnus* made a rare picture, while nothing could be finer than the rich scarlet of the leaves of *Acer griseum*. The foliage of *Euonymus alatus* becomes distinctly pink, and persists for two or three weeks standing out conspicuously among other shrubs.

Fruits, too, are abundant and of good colour. Barberries and *Cotoneasters* are aglow with their berries: of the former *B. aggregata* is conspicuous, but *B. Pratii*, *B. Wilsoni* and *B. Staphana* are all attractive. *Cotoneasters* are exceptionally fine in fruit this year, and the heavily-laden branches of *C. applanata* are conspicuous from afar. *C. frigida*, *C. Franchetii*, and the older species such as *C. horizontalis*, *C. luxifolia*, and *C. rotundifolia* are all strikingly good in fruit at the present time. *Pyruses* have carried large crops, and

have been planted while the rockwork has been made to crop out next the walk as seen in the illustration (Fig. 136). Alpine plants in variety will fill the spaces between the rocks, and in time it is hoped this will form an interesting and instructive feature of the garden.

## NERINE BOWDENI.

In the middle of November *N. Bowdeni* was in full flower in a narrow border adjacent to the plant houses. This charming plant has proved a great success in the open, and although only planted a few years the groups have increased enormously. This year the leaves remained green unusually late, and only began to decay as the flower spikes were pushing up. The same species cultivated in pots is nothing like so fine as it is where left to itself in the open, and I am inclined to think that most bulbous plants grown in pots are too quickly and too thoroughly "dried off." The typical *N. Bowdeni* has pale pink flowers of large size, while the variety *Exonia* is much deeper in colour.

Here these *Nerines* flourish under the same conditions as *Crinums*, and I think it is quite

## INDOOR PLANTS.

At this season of the year indoor plants claim rather more attention than they do in summer, when outdoor flowers are plentiful.

One of the most beautiful plants flowering here recently and for many weeks past is *Passiflora racemosa*, with pendulous racemes of deep, coral-pink flowers, produced from both young and old wood. A Brazilian species, it is grown planted out in a border in a warm corridor.

The handsome *Bromeliad*, *Tillandsia Lindeni*, attracts attention on account of its large blue petals. Requiring a stove temperature, this plant is not common in private gardens nowadays, yet it has much beauty, and the *Bromeliads* are so interesting, it is to be hoped that their cultivation will not be discarded entirely.

*Aphelandra tetragona*, a Colombian plant, is a useful stove subject producing handsome orange-red flowers in a terminal four-angled spike: the leaves are elliptic oblong, tapering to the apex. Requiring stove treatment, at least in the growing season, this, like other species of the same genus, may be grown to a

FIG. 136.—COLLECTION OF DWARF CONIFERS AT GLASNEVIN.

the many varieties of *P. Aria* were magnificent until lately, but the thrushes have almost finished them now. Certainly there has been no lack of interest for gardener and botanist alike during the late autumn and early winter period.

*Lithospermum rosmarinifolium*, profiting by the genial weather of the last few weeks, is flowering freely. The charming Gentian blue flowers attract considerable attention at this season. A sunny position in rather poor, dry soil suits this species, although during summer it will grow to a larger size in a richer medium, only to be killed in winter. Hard, well ripened shoots give the best results in all but the mildest locations.

## DWARF CONIFERS.

A very fine collection of dwarf Conifers is now grown here, due largely to the generosity of Mr. Murray Hornibrook, who has made a special study of them for some years. In order to accommodate his latest large contribution and to keep the collection contiguous to the general collection of Conifers a considerable extension has just been made to the rock garden. This is formed on a slope planted for the most part with *Thuyas*, *Cupressus* and *Juniper*. In front of these the dwarf forms

possible some of the more vigorous hybrids commonly grown under glass would also thrive in sheltered borders in the open.

## IRIS UNGUICULARIS ALBA.

The white variety of the Algerian Iris is an easy first this year, and has been flowering freely since October 14. The coloured varieties are only beginning to show signs of flower. At the time of writing none is actually open. A collection of these Irises, of which there are some seven or eight varieties or geographical forms, is a most useful possession, providing flowers throughout the winter and early spring. All they require is a well drained soil in a hot, sunny position.

## PARROTIA PERSICA.

Already the red stamens are showing on this interesting cousin of the *Wych Hazels*. Although never giving enough colour to be conspicuous the shrub is interesting, and one comes to look for the flowers every year, and finds pleasure in noting the bursting scales and the appearance of the stamens which are the only conspicuous part of the flower. In some gardens the leaves take on a wonderful colour in autumn, but here they never do more than turn to a pleasing golden yellow.

single stem or cut back to form several stems, thus forming a more floriferous specimen. Under the name *A. cristata* this species was figured in the *Bot. Mag.* t. 1578.

*Impatiens Hawkeri*, figured in *The Gardeners' Chronicle* so long ago as June 12, 1886, is a handsome, strong-growing species. It flowers continuously throughout summer and late into the autumn, bearing abundance of deep carmine flowers. A native of the South Sea Islands, it requires a warm house, and rejoices in generous treatment.

## ORCHIDS.

Interesting species at present flowering are *Cirrhopetalum Micholitzii*, *C. longissimum*—attractive in its long petalled pale pink flowers—and *Cypripedium Fairrieanum*. *Coelogyne barbata*, *C. Mooreana* and *C. ocellata* make an interesting trio. *Cattleya labiata*, *C. Ariel-coerulea*, *C. gigas* × *C. Mossiae*, *Laelio-Cattleya Canhamiana* and *L.C. Serbia* are showy and attractive. *Epidendrum vitellinum* gives a lively note of colour, while *Bulbophyllum cupreum* and *Stenoglottis longifolia* add to the interest of the collection. *Cypripediums*, or as they should now be called, *Paphiopedilums*, are numerous, and include most of the best known hybrids. W. J. Besant, *Glasnevin*.

## GARDEN NOTES FROM S.W. SCOTLAND.

In the *Gard. Chron.* of November 25 I expressed doubt whether I should be able to fulfil the undertaking given in a previous number to supply seed of *Dierama pulcherrimum* to those readers who might wish for it. I am glad to say that the drought and extraordinary warmth of November have so far compensated for an ungenial summer and early autumn, and a good crop of *Dierama* seed has ripened, enabling me to meet all the numerous applications, including those from India and Australia.

The aforesaid spell of November warmth has lured some Antipodean plants into precocious and precarious bloom. The majority of shrubs and herbs from the southern hemisphere manage to conform seasonally to the change of calendar. Thus *Clianthus puniceus* flowers in its native North Island of New Zealand from September to November, a period corresponding to our spring months of March and May. As a rule, the chill of a British autumn is enough to hold back its myriad racemes of flower-buds until, if they escape destruction by severe frost, they burst into bloom in March. But this year there has been no autumn chill, and a large plant here on a west wall is already, at the end of November, thickly hung with clusters of scarlet lobster-claws. These are bound to perish during the first real sharp frost; but there is good store of undeveloped flower buds to renew the display when winter shall be past. There is no shrub known to me more profuse in bloom than this magnificent Pea-flower. The exuberance of one year has no reactionary effect on the following year's bloom. It is not grown nearly so often as it deserves to be in mild districts near the sea; the brilliant scarlet flowers and graceful, grass-green foliage contrast in a manner as beautiful as it is unusual. There is a white-flowered variety which would rank high as an attractive wall-shrub, were it not quite eclipsed by the royal scarlet splendour of the type. Cheeseman reports that in New Zealand this *Clianthus* is "exceedingly rare and local in a wild state, and fast becoming extinct"; but he adds that it is commonly cultivated in gardens throughout the colony. Luckily it is very easily propagated by seeds and cuttings, and grows very fast. *Herbert Maxwell, Monreith.*

## EXHIBITING DAHLIAS.\*

THE love of flowers is inbred in the British people, but while certain people grow flowers for their natural beauty, others cultivate them chiefly for exhibition purposes. This desire to excel in the exhibition of flowers has resulted in our country standing out more prominently than any other in the production of what are known as florists' flowers of the highest quality. The Dahlia is an illustration of this fact.

Dahlias have been grown for exhibition purposes for scores of years, and present-day Dahlia growers owe a great debt to those who grew and exhibited their favourites long years since. It was by the weavers and spinners of Spitalfields and Lea bridge and the workers in Midland towns, and in the north of England that the Dahlia was evolved into a grand show flower, marvellous in its construction, and to the raisers of those days very difficult to obtain. Many seedlings must have been grown before one was produced that nearly satisfied the florists of those days. I say nearly, for the reason that raisers are never quite satisfied. Had there been no exhibitions of flowers there would have been no special societies like the National Dahlia Society, and that would have been a national loss. When we think of these things and realise what the special societies have done for their flowers, one wonders why it is the National Dahlia Society receives so little support.

The Dahlia is a flower for everyone; it will grow in any soil and in nearly any place. As an instance, Dahlias may be seen growing on a

balcony not far from the Royal Horticultural Hall. It is in the small growers that more interest should be taken, for if these grew a plant or two, and the plants did well, it would not be long before more were grown, either in the back garden, or the allotment.

Modern Dahlias bloom earlier, more freely, and take up less room than those of years ago. Whatever section of the Dahlia family a grower takes in hand, the desire after a time will be to exhibit, and endeavour to beat one's neighbour—a friendly rivalry which has often been an introduction to more lasting friendships, some of them lifelong. When a grower makes up his mind to exhibit it is always advisable to go slowly at first. It is a mistake to grow too many varieties or attempt big things straight away. It is much better to grow two or three plants of a good variety rather than one each of several sorts just to make up a collection.

Not every variety is suitable for exhibition purposes any more than every variety is suitable for garden decoration. This has been the trouble for some years with those glorious Cactus varieties; blooms have been set up on the exhibition tables, amateurs have fallen in love with them and made purchases, expecting the next season they would have in their gardens blooms as good or better than those they saw. Alas, they have often been disappointed, and the cult of the Dahlia has suffered as a consequence. If the amateur grower and "hoped to be" exhibitor does not know which are the best varieties to grow for exhibition, let him ask a friend who has had experience with Dahlias. Personal experience is worth very much more than notes made at an exhibition.

If an amateur hopes to grow and exhibit, say, twelve blooms or twelve bunches, as the case may be, it will be necessary for him to grow eighteen varieties, as one cannot be sure that all the plants will be in flower at one time, or will all behave as one would like. Seasons vary greatly, no two being alike; certain Dahlias are best in a hot and dry season, others in a cool and moist one. Therefore a good margin must be allowed. Dahlias should be grown in as open a space as possible, as they need plenty of air and sun, and an abundance of moisture at the roots. Allow the plants as much room as can be spared—the more the better; but even where growers cannot afford much space they need not be discouraged, as some of the more moderate growing varieties may be selected.

The popular idea that the Dahlia delights in strong manure is a harmful one. Good ground is necessary to promote good growth and flowers; beyond that nothing is gained, as plants may always be assisted as necessary by a good mulch, liquid manures, soot, or by a small application of artificial manure. Deeply digging the ground in autumn is far more important than the addition of manures, especially if a good dressing of small bones is dug in at the time. Bones are slow acting, but by the time the Dahlia plants need help the bones will have decayed sufficiently to provide manurial assistance. The bad effect of over-manuring is seen in coarse and strong growth, that produces rough and coarse blooms, which, if put on the exhibition table, have no chance whatever of winning a prize, provided a competent judge is adjudicating.

In all sections of the Dahlia family quality and refinement should be the chief qualities of exhibition blooms.

A Show or Fancy flower should be deep, two-thirds of a ball in shape, and the eye or centre well up (not sunk as though someone had pushed a thumb in it). Each floret should be shell shaped, smooth, not ridged or reflexed, and without a point. These florets should be in circles, one within the other, until the centre is reached, to form an "outline."

The Pompon blooms should be exact miniatures of the Show flowers, but as small as possible consistent with quality. The Cactus varieties, which are, perhaps, the most beautiful of all, should have long, tapering florets radiating from the eye or centre; the latter should be filbert-shaped and full, with good depth, but not flat and dumpy. The florets should incurve towards the centre, more or less according to the variety. Certain varieties incurve almost as

much as an incurved Chrysanthemum, whilst other grand varieties hardly incurve at all, but both sorts are equally useful on the exhibition table, displayed either on boards or in bunches. Both methods of exhibiting—boards and bunches—have their adherents, and both are good; that which will give the greatest pleasure to the grower should be adopted.

An exhibitor should always aim at getting flowers "up" so that each shows its individual beauty. Good flowers badly staged cause much disappointment to the grower, and cause severe criticisms to be passed on them by visitors at the exhibitions, especially when good flowers fail to receive awards simply through carelessness and want of taste on the part of the exhibitor.

The other sections of the Dahlia do not come so much within the scope of this paper. These flowers are exhibited generally as grown, with little or no thinning. Both Colletterettes and Singles are very beautiful exhibited in bunches with long stems—or in wire frames. Paecony-flowered, Decorative and Miniature varieties are only in the early stages of their exhibition career, and exhibitors of these modern sections should devise some new method of displaying the flowers. There is plenty of scope for new ideas. The stems of the modern Dahlia are long and strong enough to allow the blooms to be exhibited without any artificial support. But when a grower has to travel some considerable distance to an exhibition wires are sometimes necessary as supports for the blooms until they reach the exhibition, then they should be removed. Whether brought by road or rail, unless supported, the flowers get shaken about until the "necks" of the blooms become strained, and the flowers cannot be made to stand up again. Of course, flowers of these classes may be cut and laid in boxes without water, and especially if the exhibition is near where they are grown. In hot and dry weather, try how one may, the blooms and stems will become soft and droop on the way to the exhibition. Cutting the flowers early in the morning or very late in the evening is necessary for exhibition purposes. The blooms should be as young as one can cut them with safety, as they will grow in water after being cut, as well or better than on the plant. Where blooms are left too long on the plant wild bees will often injure the centres of Colletterettes and the semi-single varieties, whether Paecony-flowered or others; in their search for pollen they will force the centre open and cause it to become discoloured, thus making the blooms unfit for exhibition.

I am often asked how many flowers for exhibition a show or Cactus Dahlia plant will produce. This depends upon the variety; an easy-growing and large-flowering variety will carry more good flowers than a smaller-growing and perhaps more beautiful and refined variety. Assuming a plant to have four basal side growths, each of these should produce two good blooms, while the main stem, after breaking at the top into four growths, should produce four flowers. This gives twelve blooms for an average strong grower; a weaker-growing sort should only be allowed to carry eight flowers. Arrange so that the flowers do not all open at one time. Seasons are very capricious; the weather in one year may be so hot that a bud taken for a show a month hence is over long before that date arrives. In another season, as in the present, a bud of similar size will take six or seven weeks to open. An endeavour to secure two or three sizes of buds on the same plant is the wiser and better plan to adopt. "Taking a bud" means selecting the terminal bud on the stem or branch, and removing all other growths as they appear in the axils of the leaves; the stem leaves should not be removed, as they are the source of strength for the coming flower. Choose buds that are perfect in shape. These, if double-flowered, should have a small hole in the centre, like a pin hole; if of a Cactus variety the bud should be high. Buds that do not answer to these descriptions rarely make good flowers. Buds taken in the early stages of growth do not show these characteristics, but a grower has to take some chance when selecting buds, and hope for the best.

(To be concluded.)

\* A paper read by Mr. J. T. West, Brentwood, at the Dahlia Conference, held at the Royal Horticultural Hall, Westminster, on October 17.

## TREES AND SHRUBS.

## PYRUS TRILOBATA.

As the illustration (Fig. 137) indicates, the rare and uncommon *Pyrus trilobata* might be very well named the Maple-leaved *Pyrus*. So distinct is it that botanists at various times have placed it under the generic names of *Cornus*, *Crataegus*, *Eriolobus* and *Sorbus*, but always with the specific name *trilobata*.

A native of Mount Lebanon and other parts of Syria, *P. trilobata* is by no means a common tree in a wild state. Upright in habit, the trees are comparatively slow in growth, useful as lawn specimens, and in the shrubbery border, and said to be ultimately about 20 feet in height. The leaves are divided into three main lobes, these being again partially divided, so that in the main they are generally seven-lobed. In autumn the leaves turn a rich crimson, forming a delightful contrast to the pale yellow fruits. The white flowers are borne in terminal corymbs, only two or three of which develop small, Pear-shaped fruits, each  $\frac{3}{4}$  inch in diameter. A. O.

## VIBURNUM PHLEBOTRICUM.

BERRIED branches of *Viburnum phlebotricum* have been a very pleasing feature in these gardens for the past six weeks. Our plant, which was obtained from the Donard Nursery Co., is about 6 feet high, and is one of the brightest and most interesting Chinese berried shrubs I know. The deep bronze foliage forms a striking contrast to the unusually bright-coloured and shapely berries. The plant forms a deciduous shrub of erect habit, attaining a height of 12 feet. It has smooth, grey stems, ovate lanceolate leaves that are rounded at the base, long taper pointed, widely and sharply toothed. 6 inches long,  $1\frac{1}{4}$  inch to  $2\frac{1}{2}$  inches wide, dark green above and turning to bronze by the time the berries have attained their bright glittering scarlet colouring in the autumn. The foliage is smooth on both surfaces, with the exception of long hairs on the midrib and on the parallel veins beneath, and these hairs mostly drop by the end of the season. The leaf stalk is  $\frac{1}{2}$  inch to 1 inch long and hairy like the midrib. The cymes are  $1\frac{1}{2}$  inch to 2 inches across, branched, terminal, on short, lateral two-leaved twigs. The flowers are white and  $\frac{1}{4}$  inch wide. The fruit is scarlet, egg-shaped, and nearly  $\frac{1}{2}$  inch long. The plant was introduced by Mr. E. H. Wilson in 1901, and is a native of Central China. W. H. Hones, Walthampton Gardens, Lymington.

## ERICA CILIARIS.

*ERICA CILIARIS*, the Dorset Heath, as it is familiarly called, is a shrub of outstanding merit, for not only are the rich, rose-purple blossoms the largest of any native Heath, but they are borne in bold, upright racemes which stand well above foliage of singular beauty. In habit *E. ciliaris* is semi-prostrate, the long, thin branches making a dense mat of pale green foliage, which is suffused and softened with the delicate greyish hue of the pubescence which covers the young leaves and shoots. Though a native of Dorset and Cornwall this Heath appears to be tolerably hardy, for it has never been injured in our severest winters. It grows to perfection in ordinary woodland loam in which most other *Ericas* do so well. There is a fine white variety of *E. ciliaris*. N. Wales.

## SELF-SOWN CUPRESSUS.

In a note on "Acclimatisation" in *The Gardeners' Chronicle* for November 4, J. P. writes:—"I have yet to see the *Cupressus* or the *Araucaria* from self-sown seed in this climate." It is not clear to what species of *Cupressus* he refers. It may be of interest to record the case of two self-sown seedlings of the Nootka Cypress, *Cupressus nootkatensis*, which I found in the grounds of a country house in Cumberland. Strange to say, both these, when discovered, were growing out of stone walls a few feet from the ground, and were then three years old. There is just one tree of this Cypress at this place, and no other, to my knowledge, within at least three or four miles. Consequently there can be little doubt but that these young plants have arisen from

seed from this tree, which produces cones freely every year. No other seedling has been seen. One might have expected some springing up from the ground in the vicinity of the tree; but gardening operations, such as the raking up of leaves, the mowing of grass, and the digging over of the ground below the tree would militate against seedlings advancing beyond the diminutive stage. Then, again, the percentage of fertile seed is probably very low, though this point has not been thoroughly tested. From a casual examination, many of the seeds seem sterile, and from a quantity sown, though left in the soil two years (the

of being on the west, it is on the east side of the wall; consequently the seed could hardly have been carried directly there by the wind. An explanation occurs to me. It has been customary to make temporary heaps of fallen leaves on the east side of this wall, and a seed occurring in such a heap may have become lodged in a mortar joint of this wall and there germinated. Of course, it is possible, but not so likely, that the seed was first carried by a west wind beyond the wall, and later blown back by an east wind into a crevice in the wall. This seedling is still growing *in situ*. J. Parkin, *The Gill, Brayton, Cumberland*.

FIG. 137.—FRUITING BRANCH OF *PYRUS TRILOBATA*.

seed of the Cypress, I believe, usually taking two years to germinate), only very few seedlings were raised. The low percentage of good seed may, of course, be due to self-pollination, as there is very little chance of cross-pollination, owing to the isolated position of the tree.

As regards the above two discovered seedlings, one was found in the wall of a summer-house about 100 yards north-east of the tree. Its position can readily be accounted for by assuming that the seed, which is winged and so wind-distributed, was blown into a crevice in the wall by the prevailing wind. This seedling was removed and planted elsewhere, and is growing well.

The position occupied by the other seedling is contrary to what might have been expected. It is growing out of a garden wall about 50 yards nearly due east of the tree; but, instead

## DIPELTA FLORIBUNDA.

This is perhaps the best-known of a small group of shrubs, allied to the *Heneyesuckles*, recently introduced from China. It is a deciduous species, said to attain a height of 6 ft. or more, with broad, sharply-pointed leaves, somewhat like those of *Philadelphus*, and red stems. The tubular, fragrant blossoms, produced from the leaf axils in May, are about  $1\frac{1}{2}$  inch long, 1 inch wide at the lip, and of a pale, pinky white, with a conspicuous orange-yellow throat. In a fairly good, but rather dry, loam, *D. floribunda* here made rather slow progress at first. But the addition of some lime appeared to give what it needed, for after this it not only flowered, but made fresh growth from the base. Since it is apparently quite hardy and by no means difficult to grow, *D. floribunda* should become one of the most popular of flowering shrubs. A. T. J.

## INDOOR PLANTS.

### SHOW PELARGONIUMS.

PELARGONIUMS are more generally known in gardens as Geraniums, but whereas the Geranium has, as a rule, ten stamens, the Pelargonium has only seven. Pelargoniums are classed under tricolor, gold and silver variegated, Ivy-leaved, sweet scented and zonal sections, with flowers of various shades of scarlet, crimson, white and pink. They are largely used for bedding purposes, for furnishing window-boxes, and for cultivation under glass, both for summer and winter decoration.

The rough-leaved Pelargoniums are valuable for conservatory decoration throughout the spring and early summer; also for all kinds of indoor decoration, or use in miscellaneous groups of plants, and they are classed as show, French and English spotted, and fancy varieties. The French and English spotted varieties are particularly to be recommended as being exceedingly vigorous and free flowering. They are extensively grown for market purposes.

About a century ago hybridists commenced to improve Pelargoniums, and it is marvellous what has been accomplished, when we compare the original species with the beautiful flowers of the present-day varieties. Unfortunately, there does not seem to be any record as to the original species that were used for the purpose; we only know they are the product of careful hybridising, and crossing, and represent the perseverance of the hybridist.

Pelargoniums are not so popular as they were thirty or forty years ago, when they were to be found in almost every collection of plants, and when fine specimens were exhibited at flower shows. If a collection of specimen show and fancy varieties were to be exhibited at the R.H.S., Chelsea, or other important show they would cause quite a sensation amongst the present generation, and add to the brightness of the exhibition. With many people there is an inherent disposition to throw aside old friends in the plant world for something fresh. Change is the fashion of the day, and regret it as we may, we no longer see in the greenhouses and conservatories, or at exhibitions, the beautiful specimens of Pelargoniums, Ericas, and New Holland plants which we were accustomed to see a generation or more since. Many of them are almost unknown, and ungrown nowadays, and where they are grown they are in many gardens, both large and small, very much neglected, particularly as regards their requirements for growing and flowering successfully. Doubtless many gardeners of the present day have neither the time nor the space wherein to grow large specimen plants on account of the demand for cut flowers and foliage plants for indoor and other decoration. One advantage with this class of plants is that they do not require much fire heat, and consequently do not involve a large expenditure in fuel.

They are increased readily by cuttings; the general and best time to insert them is when the plants have done flowering, and require cutting down to make bushy specimens for the next season. After the plants are cut down place them in a frame or house, and syringe them once or twice daily, according to the weather, until they break into growth. At that stage they should be repotted. Shake all the old, loose soil from the roots, and when re-established, place them on a stage or shelf as near the roof-glass as possible. Admit plenty of air, but keep the plants from draughts.

Where special houses cannot be devoted to them they may be grown on shelves in a Peach house. It is not advisable to retain all the old plants; it is much better to grow on a fair quantity of young stock, when one is in a position to judge whether the young plants are likely to realise one's expectations. If they are all that could be wished the best of them may be potted. The soil should consist of rich, turfy loam, mixed with sand, and one-sixth of its bulk well decayed cow manure. The compost should be pressed firmly in the pots: firmness of soil is essential, yet there is no need to resort to ramming it. Let the pots be well drained, and be careful not to over-pot the

plants. Water the roots with care; too much water will ruin them during the winter. In the spring, when they are well rooted in the pots, and just when they begin to show their flower buds, a little liquid manure applied once a week will be beneficial.

A good plan in rooting the cuttings is to place them singly in a small thumb pot; it has this advantage, that the cuttings, after they are rooted, may be transferred to larger receptacles without disturbing the roots. Another plan is to insert several cuttings around the edge of a 4 inch or 5 inch pot. The pots should be well drained with broken potsherds. Place the cuttings in a propagating house or in a frame set on a spent hot-bed. Admit a little fresh air when the temperature exceeds 55° to 60°. During hot weather they may be rooted out of doors in a partially shaded position.

The fancy varieties are more difficult to increase, as the cuttings are not so strong or so numerous, and are generally very short, requiring more care to root them. Cuttings made from shoots that have not flowered make the best plants. Pelargoniums are often increased from root cuttings; the roots are cut into pieces about 1½ inch to 2 inches long, inserted in sandy soil, leaving the top just showing, and placed in slight heat. They will soon make fresh roots, and top growth will soon appear. When the cuttings are rooted shift them into small 60-sized pots, place them in a warm house, and give them a gentle watering. When they commence to grow the top should be pinched off to ensure bushy specimens; they will throw out side shoots, which again should be stopped when they have made two or three more leaves. Admit more air to make them sturdy and strong. The cuttings should be strong enough to receive their final shift before winter sets in. Keep them as near the roof-glass as possible, and admit air on every fine day, but guard against cold draughts. The temperature at night during the winter should be about 40° to 45°.

Specimen plants require a house to themselves; a span roofed house, with side lights, is the best type of house, as the plants may be developed on all sides alike, with a free circulation of air.

A good selection of named show varieties includes Monarch, Achievement, Trumpeter, Maid of Honour, Rayon d'Or, Nimrod, Magnate, Triumph, Outlaw, and Dauntless. French and English spotted: Prince of Novelties, Portia, Black Prince, Florian, Olivette, Decorator, Rob Roy, Masterpiece, and Jubilee. Fancy varieties: Fanny Gair, Indian Chief, Juliet, Lady Carrington, Rosy Morn, and Cherry Ripe. Pelargoniums need at all times an abundance of air, and frequent fumigation to keep them free from green and white aphid. *John Heat, F.M.J.*

### BIENNIALS IN POTS.

It often happens that after the beds and borders are furnished with biennials a surplus is left in the nursery ground, and it would not be a very difficult matter to grow these in pots if a conservatory or greenhouse is available, and they will serve to keep these houses gay with flowers.

Canterbury Bells, for instance, lend themselves especially to this mode of culture. Lift them with a ball of soil, and pot them carefully in a 7-inch or 9-inch receptacle, using a fairly rich soil. Place the plants in a cold vinery or Peach house for the present, and when growth shows signs of commencing they may be introduced into gentle warmth, in a position as near the roof glass as possible.

Aquilegias, Antirrhinums, Geums, Coreopsis and seedling Delphiniums may all be treated in the same manner, and for all these a rather good loam should be used. A sharp watch must be kept for aphid, and priddical syringing of the plants with a weak insecticide is advised, especially during early spring.

Liberal feeding with manure water will be necessary when the pots are full of roots; but success will depend on slow, sturdy growth, which can only be obtained by using very little fire heat, and admitting air on all favourable occasions. *J.*

## THE ALPINE GARDEN.

### COTYLEDON SIMPLICIFOLIA.

COTYLEDON SIMPLICIFOLIA is a rock garden plant which will be appreciated by lovers of Alpines when it becomes better known. It is a charming plant, with pretty, succulent foliage, resembling that of some of the Stonecrops, to which it is allied. In summer it produces drooping racemes of yellow flowers, likened by some to those of a Laburnum. With me the whole plant grows about 6 inches or 9 inches high. It is planted in a low terrace of a rockery facing almost due west.

A light, well-drained, porous soil suits it, but a little fresh compost should be well worked about the plant in spring and autumn. It may be a trifle tender, although I feel inclined to consider it quite hardy. It is in commerce, and its comparative inexpensiveness points to its ease of culture in nurseries in the British Isles. *S. Arnott.*

### ERYTHRAEA MASSONII.

This is an elegantly formed, slender plant about a quarter-of-an-inch high, that bears numerous small, beautiful flowers, and is exquisite for a long time in summer. It is increased by division when large enough, but I found seeds the best way of securing a clump in a short time. Seeds germinate well in pots under glass. *S. Arnott.*

## FOREIGN CORRESPONDENCE.

### ROSA ROULETTII.

A FEW years ago, a friend of mine, Dr. Roulet, found in a little village near Grandson, a very minute Rose grown in pots in the windows. It was a minuscule shrub, five centimetres high, bushy, and covered with small Roses not exceeding one and a half centimetre broad (just like a sixpenny piece). He told me about the plants and I went to see them; but, just at that time the whole village of Mauborget had been burned, so we could not find a single plant. Local people stated that a woman in another village, Onnens, five miles away, had a similar plant. So we went there, and my friend obtained a little growth of the Rose, which he gave me. We increased it, and soon had hundreds of plants which I named Rosa Roulettii, after my friend. This is the most liliplum of all Roses, but where these good people got it from nobody can say. "It has been grown here for centuries," but only in windows and never out in the garden, as it is too delicate a plant,"—so say the peasants. After studying the subject I found in de Candolle's *Prodromus*, Vol. 2, p. 600, that there was in the beginning of the nineteenth century a form of Rosa indica called humilis by Seringe, and pumila by Redouté, which is said to be minutis. But mine is minutissima.

In her classical Rose book, Miss Willmott mentions a Rose chinensis var. minima, Rehder (The Fairy Rose), but she means the Lawrance Rose we grow at Floraire, which is not the same as my plant. Who can tell me anything about it? The village of Mauborget, where this tiny Rosa has grown "for centuries," is not far from Champagne, above Grandson, where de Candolle had his garden. Did M. de Candolle grow the plant in his house, and has it been thus distributed in the neighbourhood? I could not find any trace of this Rose elsewhere in the country, and nobody, not even old people, could give me any further explanations. They all seem to believe that the minute Rose is an old kind grown from a time immemorial in Mauborget. Of course, it is better for pot culture in windows than in the open ground. We planted some in a bed in order to get material for cuttings, and there it lost something of its character of a dwarf, compressed shrub, and grew higher (ten centimetres high). But the flowers and the leaves are never larger than in the case of window plants, and it remains the smallest of all shrubs. It flowers perpetually, and I have just been out to gather little buds from under the snow covering my garden at Floraire, which I send you herewith. *Henry Corroton, Geneva.*

## FRUIT REGISTER.

## APPLE ORLEANS REINETTE.

SEEING in your issue of November 4 Mr. W. J. Farmer's commendations of this Apple, I venture to mention my own experience and to ask for advice. I have young bush trees in a private garden, healthy and good croppers. The fruit is sound when gathered, but, once in the fruit-house, it shrivels rapidly, so that by the first week in November it is quite unfit for the table, though the catalogues give its season as December to February. The fruits were gathered in the third week of October, and then only because they were dropping. Last year my experience was similar. The fault can hardly rest with the fruit-house, as other sorts do not suffer there. *East Kent.*

## A VERY LATE APPLE.

I AM forwarding you a few Apples of a variety unknown to me. As a long keeper this variety is of exceptional merit, and will keep until many months after the next year's crop has been gathered. The green ones are of the 1922 crop, and the mellow ones of the 1921 crop. They were grown by Mr. A. Brown, The Laurels, Acton, who merely stores the fruits in a large barrel.

If this variety is in commerce, the grower would be pleased to know the name. We believe it to be a local variety, and I know of no other tree. *Charles Hodgson, Acton Place, Acton, Suffolk.*

[Our correspondent enclosed fruits of the Gooseberry Apple, an old and well-known variety remarkable for its late keeping qualities. It is extensively cultivated in Kent and Sussex, and especially around the neighbourhood of Faversham and Sittingbourne, in Kent. Hogg, in the *Fruit Manual*, describes it as a very valuable late-keeping culinary Apple, which comes into use in November and continues "until Apples come again."—Eds.]

## SEEDLING APPLES AT GODALMING.

THIS autumn we were invited by Mr. Tayler, who will be remembered by most of our readers as a successful trade grower of fruit trees, to inspect a number of seedling Apples, which he has under cultivation in his new garden at Peace, Godalming. While at Osborne Nursery, Hampton, Mr. Tayler enjoyed a high reputation as an exhibitor of hardy fruits, and his collections at exhibitions always merited high praise. Since relinquishing the nursery, he has in his new home made a hobby of fruit growing, and has some three or four acres of garden almost entirely devoted to fruit trees. The latter are now well established and the majority of the trees cropped splendidly this season. Mr. Tayler has built long walls on the south and west aspects of his garden for the express purpose of growing Peaches, Nectarines, Apricots, Cherries and Plums, and the excellent condition of all these trees shows the master hand of the owner. Beside Peach trees on walls, he has a number of splendid Peaches in the open, and many of the varieties are similar to those trained against the walls. The behaviour of the standard trees, and especially in the matter of fruiting, was very interesting, and seemed to prove that standard Peach cultivation in an exposed situation was scarcely profitable. For instance, the fruits of Dymond Peach on the wall trees were splendid specimens, of large size, very highly coloured, and the quality and flavour were all that could be desired, yet fruits of the same variety on the exposed trees were quite pale and almost insipid in flavour. It was evident that Mr. Tayler had made a rigid selection of the varieties of fruits grown in his new garden, for the following list of Apples which were noted include some of the best varieties in cultivation: Pine's Golden Pippin, one of the most attractive varieties of Apples, for it has a beautiful appearance, and is an abundant bearer; Ellison's Orange, one of the newest dessert varieties, with Cox's Orange Pippin parentage, and very much like Cellini in shape; St. Edmunds Pippin, with skin of rich golden-apricot colour; Holland-bury, a large irregular fruit of bright red

colour; Beauty of Kent, a long, conical fruit, flushed and streaked with red; Michael Jaegar, which has a superficial resemblance to Cox's Pomona; Carter's Pearmain, a very free-cropping variety, which may be classed as a late Claygate Pearmain, although in general appearance it suggests a pale coloured Allington Pippin; Braddick's Nonpareil, Reinette du Canada, Emperor Alexander, Cox's Orange Pippin, King of Tompkins County, Warner's King, and Bedfordshire Foundling, all of which are well-known and popular varieties.

The most interesting of the Apples, however, was Joy Bells (see Fig. 133), which received the R.H.S. Award of Merit on November 14. Mr. Tayler was not able to tell us the parentage of this new late dessert variety; in shape it somewhat resembles Emperor Alexander, but there are five distinct knobs around the eye, which is partly closed and set in a shallow, pleated basin. The skin is dark red on the side next to the sun, the shaded portion being mellow yellow with a faint suspicion of the red colouring, and there is a bluish bloom on the basal portion. The stalk is short, so

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Squirrels.**—Have squirrels been more numerous generally this year than usual? They are much more so here, and I recently saw a grey squirrel by the garden, the first I have seen so far from their home in Regent's Park. I had heard of them being in the woods a year or two ago, but have not seen one until now. As we all know, they are very destructive to the young branches of Conifers, and here they often cut off the large cones of Pine trees, I suppose in the hope of being able to get the large seeds when they fall, although I cannot remember finding seed in any of the cones of the Stone Pine. But the hard nut may deceive them and raise their hopes of getting a nice, fat kernel. You will be interested to hear that the squirrels here have developed a carnivorous habit. On one occasion a keeper, sitting up a fairly high tree waiting for the deer to pass near-by, was amused by a squirrel in the same tree objecting to his pre-

FIG. 133.—APPLE JOY BELLS. R.H.S. AWARD OF MERIT, NOVEMBER 14, 1922.

that the fruits set well on the branches, and are not so liable to drop during storms, as are some varieties. The tree is of vigorous growth and has very short jointed shoots and dark foliage. The quality is excellent, the only defect that can be urged is that the fruit is on the large size for a dessert variety, but as there are at present only young trees, it is expected that when older they will produce smaller fruits more suitable for the table.

In addition to Joy Bells, Mr. Tayler has several other seedlings of merit, but so far he has only named two. These are Springtime and Connoisseur. These two Apples exhibit some interesting characters, for, while both are so much alike that they could not be told apart when gathered, yet the trees are entirely different. Both fruits resemble Cox's Pomona, but without the high colour of that variety. Springtime is named from the season in which it is available, for it keeps good until April. The tree of this variety is of spreading habit and has downy stems and leaves; Connoisseur is, in habit, totally different, the growths being upright, and there is no down on any part of the tree or foliage. We understood from Mr. Tayler that both these varieties were raised from pips out of the same fruit and form another interesting example of two excellent varieties being raised in this way, others being Red and Yellow Ingestre, Laxton's Pearmain and Laxton's Superb.

sence, and showing its objection by a lively chattering, and as he, in the avocation of his duty, had to sit quite still, the squirrel ceased to bother about him, and made his way to a fieldfare's nest, and, taking out a fully fledged bird, proceeded to devour it—all but feathers. The keeper was horrified, having in mind his young pheasants and other game, and vowed he would shoot squirrels after this. The other day one of the young men in the garden was astonished to see a squirrel on the grass with a mouse in its mouth. On seeing him it ran towards a wall, and when it reached the top, gave the poor mouse a good shaking. *J. D. Colledge, Cobham Hall Gardens, Kent.*

**Geum Borisii.**—My inquiry in *The Gardeners' Chronicle* of November 11 as to the origin of this plant has brought me a note from a correspondent who refers me to Mr. C. F. Bell's paper on "Botanizing in Bulgaria" in the *Journal* of the Royal Horticultural Society, xxxix (part 1, 1913), where it is stated that *Geum Borisii*, named after Prince Boris, is a natural hybrid between *G. bulgaricum* and *G. reptans*. *Herbert Maxwell, Monreith.*

**Potato Synonyms.**—In your leader dealing with my paper on "Seedsmen's Catalogues," in your issue of November 25, you throw out the suggestion that a good deal of the confusion introduced into the naming of varieties of Potato has arisen from a cause which I ignore, namely,

"the great differences which exist between different strains of the same kind of Potato." It is true that one batch of seed tubers of any given variety may produce a weak plant, and another hatch a good. The difference, however, is not one of strain, but is dependent on whether the particular stock is or is not infected with one of the virus diseases, viz., Leaf Roll or Mosaic. The term "strain" suggests an innate heritable distinction within the stock of a given variety, which certainly does not exist. If really healthy stocks of the same variety be compared under like conditions they will invariably be found to be identical. *Redcliffe N. Salaman, Royston.*

**Lack of Encouragement for Scottish Chrysanthemum Growers.**—It is encouraging and interesting to read the reports of the various Chrysanthemum shows held throughout England, and to learn of the increasing popularity of the large specimen blooms. At present in Scotland growers find little encouragement, and there are many who would be delighted to show their produce in a good centre. The Royal Caladonian and Scottish Horticultural Societies have been amalgamated, but it appears as though the expense of those fine Scottish Horticultural Society's shows of the past is too great. Some of the successful exhibitors of the past have ceased exhibiting, but there are many keen young growers awaiting their chance. I am sure the executive of the united societies would receive every support in a venture to revive the Edinburgh Chrysanthemum show. *N. B.*

**Moles in the Garden** (see p. 284).—Last spring I was much troubled with moles in my Cabbage plot. The following experiment proved successful, and may help others to get rid of these troublesome animals. I dug a hole into the burrow at one end of the bed, and in it I placed a few pieces of carbide. This operation was followed by pouring into the hole a few gallons of water. The gas arising from the diluted carbide, being forced through the burrow by the pressure of the water, compels the mole to make hurriedly to the surface, when it can easily be destroyed with the garden spade or other implement. It is remarkable how wary they sometimes are of the trapper. A friend informed me that he has noticed, after fixing his traps, some of the moles, more wary than others, fill the traps with soil and make another burrow alongside the trap. After fixing his trap several times, with the same result, he tried the following experiment. Having obtained an empty 7-lb. jam-jar with a fairly wide opening at the top, he dug into the burrow and placed the top of the jar on a level with the bottom of the burrow. He next placed a piece of paper on the top of the jar and lightly covered it with the soil. The experiment proved successful, the mole being made a prisoner in the jar and was easily killed. *S. W. J.*

**Wasps.**—On page 286, Mr. Johnson gives an additional factor to Mr. Nicholson's three, on page 257, on the wasp supply for the year. Mr. Nicholson's three factors are feasible, but I cannot comprehend Mr. Johnson's fourth factor. Does Mr. Johnson mean by parthenogenesis that a queen wasp is hermaphrodite? There are three kinds in a colony—queen, drones, and workers. Workers are undeveloped females, and are not capable of breeding, only in cases where the queen has ceased to exist and there is no egg, or grubs young enough to raise another queen. Once a grub is sealed over, its sex is determined, although an egg can be hatched to be either a queen, drone, or worker. If an egg is intended to hatch a queen, it is laid in a special cell and fed on special food. Queens that hibernate through the winter are fertilised before doing so. If a queen is not fertilised before hibernating, and no drone survives the winter, the eggs are not fertile. This may be the reason why wasps were scarce in *Market Growers'* district. No doubt, the reason why wasps were a plague in parts of Wales is that the queens were very late in coming out, and the flowers they usually found expanded were over, and they found others elsewhere. *D. H. Dunn, Hafod, Devil's Bridge, Cardiganshire.*

## SOCIETIES.

### SMITHFIELD CLUB.

THERE are one or two occasions during the year when the country invades the metropolis and seems to hold the Londoner spellbound. Perhaps the two outstanding events of this nature are the Chelsea exhibition of the Royal Horticultural Society and the Cattle Show at Islington, both of which provide red-letter days for townsmen as well as countrymen. The Cattle Show is to the farmer what the Chelsea Exhibition is to the gardener, and, in their respective spheres the gardener and the farmer seem to be pre-eminent on these occasions. The town dweller is so in the habit of regarding the country folk as being slow and inferior in intelligence and smartness that it is well there should be occasions when the country should see the town folk marvelling, and who is there amongst them that would not marvel at the results of a Chelsea Exhibition or a Smithfield Cattle Show. We were reminded what stupid persons townsmen appear when one of the largest bulls at the Cattle Show became excited last Monday and threatened destruction to those near him, and yet how patiently and easily its owner was able to compose the beast, and cause quiet to reign again, for, however slow and broad of speech these farmer men appear, they are wonderful fellows in their way and are as keenly alive to the smallest detail as the sharpest citizen of any town. As *The Times* aptly expressed it in its issue for Tuesday last, "Here man and beast seem to belong to one another much more closely than exhibitor and exhibit commonly belong to one another when the latter is a piece of inanimate machinery." Who can look on what farmers have accomplished in their cattle, sheep and pigs without being impressed with their cleverness and skill, or but admire their fine sense of judgment in the way they are able to pick out the qualities which decide superiority in animals. What a revelation this show is for the townsmen, too, in the variation of size, colour and shape of the various breeds which the skill of the farmer has evolved in his animals. This is as striking amongst the sheep and pigs as amongst the cattle, and a visit to the Smithfield Show makes one realise why the British farmer's pedigree stock is sought by breeders in all parts of the world. The champion beast, a steer, Blue Bill, won also the highest honours at Norwich and Birmingham, a feat that no beast has accomplished since 1897. Taking the collection of live stock, it was the largest and best since the war, and amongst the large attendance on the opening day was His Majesty the King, who was received by the Prince of Wales in his capacity as President of the Show. These monster beasts and prize pigs and sheep represented not only skill in breeding, but also care in feeding, and the seedsmen have been no whit less clever in evolving from primitive types feeding stuffs of a vastly superior quality. The seedsmen's displays were mostly accommodated in the gallery, and some of them were amongst the most interesting in the show. For instance, Messrs. SUTTON AND SONS had an exhibit of great interest to gardeners, as well as farmers, for in the front of their display, show cases bordered with very artistic metal work contained magnificent garden vegetables, including the Sutton Globe and Ailsa Craig Onions, White Queen Broccoli, Dwarf Gem Brussels Sprouts, Tomato Winter Beauty, Scarlet Horn and Inimitable Forcing Carrots, Celeric and numerous other kinds. The exhibit was mainly built up with farm roots, there being exceptionally large Up-to-Date Swedes, which won the first prize at the recent Birmingham show; Perfection Aberdeen Turnips, equally as large as the Swedes, a selection of Mangolds, White Belgian Carrots, larger than the biggest Parsnips; New Red Intermediate Carrots of similar proportions; Sugar Beet, and a cross between Kohl Rabi and Thousand Headed Kale, a vegetable that forms a valuable green food for stock. There was also much more of interest, including pans with growing grasses, Clovers and other fodder crops. Messrs. JAMES CARTER AND SONS had a very similar

exhibit, their Swedes, Turnips and Mangolds being of exceptionally large size. Roots of all these from a competition were displayed, the most notable being one of Turnip Golden Globe, weighing some twenty lb., for which a prize of £25 was won by Mr. J. GARNER, Carlisle; another of Lord Warden Mangold, for which a prize of £50 was won by Mr. A. T. STRONG, Ockham, Surrey; Carter's Invicta Elephant Swede, for which a similar prize to the last was won by Capt. LIPSCOMBE, Denham, and a thirty-two lb. root of Purple Top Mammoth Turnip, the biggest root in the show. This firm also exhibited garden vegetables of the best exhibition quality, and they also staged, in a very attractive manner, their specialities in cereals.

Messrs. E. WEBB AND SONS, Stourbridge, also showed an exhibit of this nature, in which we noticed some fine roots of their new Southfield Yellow Globe Mangold, which was awarded the first prize at the Birmingham show. Other roots of exceptional merit were New Empire Swede, and Webb's Red Globe Turnip, but we were most impressed with the Carrots, Leeks, Onions and Potatoes, their Prize Winner and Long Red Surrey Carrots, and Champion Prize Leeks being exceptionally good.

Messrs. E. W. KING, Coggeshall, in a general collection of farm and garden vegetables, made a feature of their Perfection Brussels Sprouts, which were the finest in the show. Prize-winner Onions and Scarlet Model Carrots were also exceptionally good. Other exhibits of this nature were shown by Messrs. H. J. SPEED, Evesham; Messrs. LITTLE AND BALLANTYNE, LTD., Carlisle; Messrs. GARTONS, Warrington; Messrs. KENT AND BRYDON, Darlington; Messrs. TOOGOOD AND SONS, Southampton; and Messrs. J. K. KING, Coggeshall. Seed Potato merchants were represented in large numbers; in some cases they displayed seed tubers, and in others first-class samples of "ware."

### MANCHESTER AND NORTH OF ENGLAND.

THURSDAY, NOVEMBER 16.—*Present:* A. T. CUSSONS, Esq. (in the chair), Messrs. R. Ashworth, B. J. Beckton, J. Birchenall, A. Burns, A. Coningsby, D. A. Cowan, A. G. Ellwood, T. Evans, W. Giles, J. Howes, J. Jackson, D. McLeod, E. W. Thompson, and H. Arthur (Secretary).

#### FIRST-CLASS CERTIFICATES.

*Odontoglossum crispum Beta*, a fine, blotched variety of a very deep colour; *Odm. Challenger*, a flower with broad sepals and petals heavily blotched with reddish-brown; the large lip is also heavily blotched; *Cypripedium Cavalier Perfection*, a bold flower; the lower part of the broad dorsal sepal is heavily marked with rosy-pink and has a broad, white margin; *C. Linda (Bianca × Moonbeam)*, a fine flower with a broad, white dorsal segment and a green base; the sepals and pouch are of a bright greenish-yellow colour; *C. Godfreyae West Point var.* From S. GRATRICK, Esq.

*Odontoglossum crinum Agincourt*, a large, beautifully blotched flower; *Odm. Dorothea rubrum (Doris × crispum)*, a rich, reddish-brown flower with rose margins; *Odm. Beryl Haddan House var.*; *Odm. Elvasca*. From P. SMITH, Esq.

*Odontioda Lerna var. Joyce Hammer (Odm. Joan × Odm. Dusky Monarch)*, a variety of rich Chestnut-red colour with a narrow white margin; *Odm. Jasper Edgemoor var.* From A. HAMMER, Esq.

*Cypripedium Olympia var. Oriel*, a flower having an exceptionally large white dorsal sepal with a green base. From Mrs. GRATRICK.

*Lycaste cruenta Beckton var.* From B. J. BECKTON, Esq.

#### AWARD OF MERIT.

*Cattleya Weedonaura (Dowiana aurea × weedoniensis)*; *Brasso-Laelio-Cattleya King Emperor West Point var.*; *Laelio-Cattleya The Baroness West Point var.*; *Odm. crispum West Point Radiance*; *Cypripedium Alciades westpointense*. From S. GRATRICK.

*C. Christopher var. St. Andre*. From B. J. BECKTON, Esq.

GROUPS.

S. GRATRIX, Esq., staged a group of Orchids for which a Gold Medal was awarded.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were awarded a Silver Medal for a group.

A. HANMER, Esq., Buxton (gr. Mr. G. Giles), staged a group in variety, for which a Silver Medal was awarded.

Mr. McLEOD, Chorlton-cum-Hardy, received a Silver Medal for a group.

NATIONAL DAHLIA.

ANNUAL MEETING.

The annual meeting of this floricultural Society was held on Tuesday, the 28th ult., in the Horticultural Hall, Vincent Square, Westminster. Mr. J. Cheal presided over a company numbering about twenty. The minutes of the previous annual meeting were read and a paragraph referring to a resolution passed last year, limiting the number of vice-presidents to six, was the subject of discussion, with the result that the resolution was rescinded.

At this stage Mr. Stevens drew attention to the absence in the rules and by-laws of any reference to the aims and objects of the Society, and it was decided to insert a paragraph before the by-laws, the secretary being left to draft it.

The secretary then read the statement of accounts and report of the committee for 1922. The latter referred to the exceptionally favourable season for Dahlias in 1922; the success of the Society's exhibition; the outing to Messrs. J. Cheal and Son's nursery, and the need for increased membership.

Mr. John Green moved the adoption of the report and balance-sheet and, as treasurer, took the occasion to refer in detail to some of the financial items. He was glad to know that the Society was in a position to pay all its liabilities and have a small balance of £13 17s. in hand. The total receipts amounted to £103 17s. 9d., of which £48 14s. 6d. represented subscriptions. The principal items on the expenditure side were £36 5s. for prizes and £26 2s. 4d. for printing and stationery.

The adoption of the report and balance-sheet was seconded by Mr. West and carried unanimously.

The chairman stated that there was every prospect of the Society becoming more popular and having an increased membership. The work of the committee had been very difficult in the past few years, but they had gone steadily forward, and he was glad they were able to resume the holding of a conference in 1922, for the papers did an immense amount of good and were of especial interest to foreign members. The paper by Mr. T. Hay, which was published in full in *The Gardeners' Chronicle*, was especially valuable, for the growing of Dahlias in public parks and gardens was one of the best means of popularising the flower with the general public.

Mr. Stevens supported the chairman's remarks and made an appeal for increased membership. He offered to obtain six new members if five others present would do the same, and his offer was at once accepted, five promising to obtain six members each.

The election of officers was the next business. Mr. Reginald Cory was reappointed president; the vice-presidents were also re-elected, and the name of Mr. Arthur Turner added to the list. Mr. Cheal was reappointed chairman, Mr. J. Green treasurer, Mr. Emberton show superintendent, Mr. D. B. Crane auditor, and Mr. A. C. Bartlett hon. secretary. The committee was also appointed, Messrs. T. Hay, C. Goldring, H. J. Jones, and F. G. Tresider being nominated to fill vacancies.

The hon. secretary was especially thanked for his services and on the proposition of the chairman, the sum of £8 8s. was given him as an honorarium.

Yorkshire Gala, 1923.—We are informed that the next Grand Yorkshire Flower Show and Gala will be held on June 13, 14 and 15, 1923, at Bootham Park, York.

REMARKS.—Business should, in many lines, show signs of improvement, but at the moment the tone of the market generally is dull. Ample stocks of Apples from the United States and Canada are on offer at easier rates. The demand for English Apples has, for the past week, been very poor, a feature being the large quantities of medium and small Cox's Orange Pippins that have been available. A rather better inquiry has existed for bothhouse Grapes, supplies of which are not very plentiful. Doyenné du Comice Pears are in demand at firmer prices. Better supplies of Oranges from Spain have brought about rather lower quotations. A fairly satisfactory demand rules for choice vegetables, such as Peas, Beans, new Potatoes, and Asparagus. Mushrooms are more plentiful owing to milder weather, and values are lower. The new crop of Cucumbers is selling well at improved prices. Except for a few fruits of the new crop, English Tomatoes are finished for the season. Canary Island Tomatoes are in variable condition. No arrivals of Madeira Beans are reported yet. Green vegetables remain abundant and cheap. The Potato trade is steady, with a slightly better tendency.

REMARKS.—Trade in home grown flowers is similar to that of last week. Chrysanthemums constitute the chief supply, and some of the late varieties are now on sale, including Heston White, Winter Cheer and Framfield Pink. White disbudded blooms are more numerous. The best white blooms offered are of Chesnut White, Western King, and Mr. Turner. The best coloured varieties are Ada, Brook, Ivy Gay, Mrs. Duckham, W. H. Lincoln, Liverpool Yellow, December Bronze, Edith Cavell, Mr. T. Page and Rosalind. Single varieties are fine; but disbudded blooms are the best in quality. Other important subjects are Roman Hyacinths, Camellias, and Poinsettias. The first consignment of Freesias reached the market last week. Supplies of Lilies are again on the short side, especially Lilium longiflorum, which is again dearer. Similar remarks apply to Lily-of-the-Valley. French flowers are arriving in large quantities, the newest arrivals being Narcissus Scieil d'Or, pink Anemones and single mixed, scarlet yellow and red Ranunculuses. The last are arriving in good condition. Prices for French flowers are easier, owing to larger supplies. Violets are coming to hand in good condition.

GARDENING APPOINTMENTS.

Mr. F. C. Tribble, previously Gardener at Stowell Park, Foss Bridge, Gloucestershire, is Gardener to Mrs. Walter Manso, Rhinefield House, near Bockenhurst, Hampshire. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds.)  
Mr. Wm. Hatherall, for the past six and a half years Gardener to Sir ANTHONY THORNTON, Bart., Moreton Lodge, Mauds Moreton, Buckinghamshire, as Gardener to Sir FREDERICK BURNBY, M.P., Warneford Place, Highworth, Wiltshire. (Thanks for 2s. for R.G.O.F. Box.—Eds.)

## Obituary.

**Sir Isaac Bayley-Balfour.**—The death of Sir Isaac Bayley-Balfour, F.R.S., which occurred from heart failure on Thursday, November 30, at Haslemere, will affect all horticulturists who know and appreciate his worth with a sense of irreparable loss. It was but recently that reviews of Bayley-Balfour's life and work appeared in these columns—on the occasion of his retirement from the offices of Professor of Botany at Edinburgh, King's Botanist for Scotland, and Regius Keeper of the Royal Botanic Gardens, Edinburgh. These posts he held with great and increasing distinction for 34 years, and in them he succeeded Professor Dickson, who in turn was the successor of Sir Isaac's father, John Hutton Balfour, whose tenure of office lasted also for thirty-four years. From the sketch of Bayley-Balfour's life and work and from the account of the Edinburgh Botanic Gardens (see *Gard. Chron.*, April 8 and April 29, 1922), those who knew him only by repute may form some impression of his outstanding personality; but only those who knew and worked with him can have an adequate understanding of his great worth and influence. For them words are vain to express the admiration and affection in which they held him and now hold his memory. Throughout his long career he was strenuous in the pursuit of knowledge; generous in imparting it, and imbued with a jealous love for science. In the service of science he wore himself out and counted himself happy in the sacrifice. Yet there was nothing extreme or unbalanced in Bayley-Balfour's nature. A suave wisdom was one of the chief of his many gifts, and he possessed powers of resolution and conciliation so nicely balanced that he was able to win victories without imposing defeats. Those whom he persuaded were glad to be persuaded and pleased that he should have his way. No man who devotes his life to special studies can fail to amass a large body of knowledge; but no one of our acquaintance was such a fine connoisseur of knowledge; that which he had was the best—matured by time and ripened by wisdom. In spite of his readiness to impart it, much of that great store of learning and experience is now lost to us; for, though he wrote much, much remained unwritten, and his death impoverishes horticultural knowledge. Born on March 31, 1853, he studied at the Edinburgh Academy and at the Universities of Edinburgh, Strassburg, and Würzburg. In 1879, at the age of twenty-six, he became Regius Professor of Botany in the University of Glasgow. In 1884 he was elected to the Sherardian Professorship of Botany at Oxford, and to a Fellowship of Magdalen. Four years later, in 1888, he proceeded to the Professorship and garden at Edinburgh, which post Bayley-Balfour held until the present year. The funeral service was held at Woking, on Saturday, December 2. It was Sir Isaac Bayley-Balfour's wish that the service should be attended only by relatives, and hence it was that the universal sorrow and regret which his death has caused among scientific friends and colleagues could find no expression on that occasion; a few among them had, however, the sad privilege of testifying by their presence to their affection and admiration for a great botanist and a great man.

## TRADE NOTE.

MESSRS. KELWAY AND SON have sent us the following communication: "In view of a statement in the *Times* newspaper a few months ago referring to the new race of Gladioli, the result of crossing *Gladiolus primulinus* with existing varieties, we would like—in justice to ourselves—to say that Mr. James Kelway was the first to commence this work, and that our firm was the first to produce and distribute results.

"It is necessary to put this on record, owing to the *Times* having stated that the Dutch and American nurserymen were responsible for the production of this beautiful new race of Gladioli, and because we wrote to the *Times* a letter on

the subject, which they refused to insert. We then wrote to Sir Francis Fox—who sent us the first bulbs of *G. primulinus*—and in reply he stated that Mr. Townsend was in charge of the Zambesi Bridge in 1903, and that he (Sir Francis Fox) sent us the corms of *Gladiolus primulinus* in 1905. Our corms flowered in 1906—when we began crossing—and by 1912 we were exhibiting several named crosses before the Royal Horticultural Society and the National Gladiolus Society in London. In that year the former gave us an Award of Merit and their Silver Floral Medal for the strain, and the latter an Award of Merit to the variety Golden Girl.

"The first varieties we listed were Ella Kelway, Golden Girl, Josephine Kelway, Wraith, Friendship, Banshee and Elf. They were offered to the public in 1915. Certainly no hybrids of *primulinus* were ever listed in any other catalogue so early as this.

## LAW NOTE

### A NURSERYMAN'S FAILURE.

At the offices of the Official Receiver, Russell Square, W.C., on Friday last, the first meeting of creditors was held of John Ponsford Taverner and John Homan Taverner, trading as J. P. Taverner and Son, both of Finchley Farm, Farnborough, Kent, nurserymen, against whom a Receiving Order was made on debtors' own petition on November 3, 1922.

A joint statement of affairs, submitted by the debtor J. H. Taverner, showed liabilities expected to rank £1,225, and assets estimated to produce £732, thus showing a deficiency of £491.

Mr. T. Gourlay, Official Receiver, presided, and having dealt with the proofs of debt lodged, said the assets included cash £11, stock £75, growing crops £600, book debts £3, surplus from securities £115, making a total of £804, from which £71 had to be deducted for preferential claims.

Mr. F. W. Davis, who had been appointed Special Manager, reported that he had kept the business going. As blooms grew to the right size they were sent to the market, but up to the present he had been obliged to pay out more than he had received, although during the next three weeks the income from the business would considerably increase.

A resolution was passed for the appointment of Mr. F. W. Davis, chartered accountant, 28, Theobald's Road, W.C., as trustee, assisted by a committee of inspection. The trustee's bond was fixed at £600.

## ANSWERS TO CORRESPONDENTS.

**ABNORMAL GROWTH OF CABBAGE:** *Miss E. F.* The "extraordinary" growth which you send is merely a large bud, of a similar nature to the Brussel Sprout. If the plant has not been destroyed you should allow it to flower and seed, and see if the abnormality can be perpetuated.

**APPLES ROTTING ON THE TREE:** *M. L. R.* We cannot state what is the cause of the trouble from the shoots you sent. Next season, send specimens of the decaying fruits.

**APPLE STOCKS:** *Constant Reader.* The Paradise is a form which possesses a very fibrous root system, and there are others of this type such as Doucin. The free stock has a much stronger and deeper growing root system, and is usually employed in the grafting of standard and other large forms of trees. Paradise stocks are propagated from suckers and layers, while the free stocks are usually raised from seeds.

**CHRYSANTHEMUM SPORT:** *Sport.* Your Chrysanthemum having produced a branch carrying different flowers has, what is termed, sported, a fairly common occurrence in Chrysanthemums, and one which has given rise to many new varieties of merit. You should perpetuate the sport and submit it to some Chrysanthemum expert for opinion as to whether it is worth retaining.

**DISCONNECTING FOUR-INCH GREENHOUSE PIPES:** *R. I. H.* From your description we suspect

the pipes are fitted with rubber rings, for these are used with coupling joints. If this is so, you could use a blow-lamp to heat the bolts and then unscrew them. Rusted filings are used for filling in the joints of plain socket pipes, and where these filings are used it is a most difficult matter to detach the pipes, and there is a danger, in using the hammer or anything to force them apart, that they may be broken. The difficulty can be solved by cutting the pipes through with a file close up to the joint and utilising them again with collars packed with yarn and cement.

**NAMES OF FRUIT:** *C. P.* 1, Round Winter Nonsuch; 2, Bismarck; 3, Le Lectier; 4, Sturmer Pippin; 5, Norfolk Beefing; 6, Baurré Diel. *R. I. H.* 1, Lady Sudeley; 2, Worcester Pearmain; 3, Dutch Mignonne; 4, Norfolk Stone Pippin. *G. R. N.* 1, decayed; 2, Peasgood's Nonsuch; 3, Fearn's Pippin; 4, Baumann's Red Winter Reinette; 5, Margil; 6, Melrose. *J. R. M.* Hambling's Seedling, raised by Col. Hambling. *H. E.* Old Crasanne. *G. T. T.* Pears: 1, Pitmaston Duchess; 2, Buerré Hardy; Apples: 1, Roi d'Angleterre; 2, Orange Goff; 3, Newton Wonder; 4, Malster. *C. H.* Gooseberry Apple; (see p. 343). *H. C. P.* 1, Lord Suffolk; 3, Warner's King; 4, White Westling; 5, Radford Beauty; 6, Doyenné Boussoch.—*T., Sutton.* Apple: Newton Wonder. Pear: Catillac. *G. A. I.* Beauty of Kent; 2, King of Tompkins County; 3, Queen Caroline; 4, Golden Noble; 5, Flower of Herts; 6, Lord Derby; 7, Twenty Ounce; 8, Ross Nonpareil.—*W. M.* Emperor Alexander.

**NAMES OF PLANTS:** *E. J. Coates.* 1, *Picea excelsa*; 2, *Pseudotsuga Douglasii* var. *glauca*; 3, *Abies nobilis*; 4 and 5, *Cupressus Lawsoniana*; 6, *Pseudotsuga Douglasii*.—*Tanglin.* *Eucalyptus globulus.* *F. H. K.* The specimen was too withered when it reached us for correct determination, but it is probably *Senecio Jacobaea.* *J. T., Olley.* *Leycesteria formosa; Senecio laxifolius* (yellow flower).

"NICHOLSON'S DICTIONARY OF GARDENING": *J. C.* This work is out of print, and can only be obtained from the second-hand booksellers. Second-hand copies are sometimes offered for sale in our advertisement columns.

**PARENTAGE OF HEMEROCALLIS:** *F. V. Norway.* *Hemerocallis Aureole* was received from Japan by Messrs. R. Wallace and Co., and we believe its parentage is unknown; *H. Gold Dust, H. Orangeman, and H. Sovereign* are all derived from *H. flava* × *H. Sieboldii* (syn. *Dumortieri-rutilans*; *H. Luteola* is from *H. Thunbergii* × *H. aurantiaca* major. *H. Dr. Regel* is very like *H. Middendorfi*, except that it flowers very regularly during August and probably it is a seedling from *H. Middendorfi*. The parentage of *H. Ajax* is not known to us.

**PRUNING FRUIT TREES:** *C. S.* The question of pruning fruit trees at the time of planting or deferring the operation until later is debatable one. In the case of small fruits and Roses it is certainly advisable to leave the pruning until the spring, as in the case of Currants and Gooseberries birds sometimes destroy the buds, and if the pruning of the branches is left until the spring the birds will not be able to enter the bushes so readily, and there will be more buds left should they destroy a few. Roses, again, are best pruned in the spring, because the plants often start into growth after the turn of the year, and this young growth gets cut back by frost later. The end of March or April is soon enough to prune Roses.

**SEEDLING APPLE:** *A. K.* When your seedling Apple is at its best condition, send specimens to the Fruit and Vegetable Committee of the Royal Horticultural Society, Vincent Square, Westminster, and if of sufficient merit it would probably obtain an award.

### The National Institute of Agricultural Botany: Annual Report, 1921-22.

The Council and Fellows of the National Institute of Agricultural Botany are to be congratulated on the work accomplished by the Institute in the first year after its establishment in its permanent quarters at Cambridge. The confidence of agriculturists and horticulturists in the power of the Institute to fulfil its ambition to assist in the supply of better seeds and in the raising of better crops is indicated by the fact that among the Fellows of the Institute, who now number over 400, are many of the leading men in these professions. His Royal Highness the Prince of Wales and H.R.H. the Duke of York have graciously consented to become Honorary Fellows, and the example thus set will doubtless lead to a large augmentation of the Fellowship of the Institute. As everyone knows, the work of crop improvement is arduous and costly. New varieties of possible merit have to be put to prolonged and searching test before a guarantee of their superiority over older varieties can be obtained. Such tests require land, labour and no small expenditure of money. It is, therefore, to be hoped that everyone interested in the progress of agriculture will associate themselves with the work of the Institute by becoming Fellows thereof. The Council

are to be congratulated particularly on the valuable and generous assistance which they have received from many quarters. Mr. Fred Hiam, who placed the Hiam Farm at the disposal of the Council, has undertaken to manage the Hiam Farm on their behalf for four years, has guaranteed the Institute from any losses on the farm during this period, and has volunteered to provide any additional capital required, and has expressed his intention to pay over to the Institute any net profit that the farm may make without deduction for his personal services—truly one of the most generous gifts which it is possible for any man to make. The work of the seed-testing department of the Institute during the period under review has been heavier than in any previous year. In the period 1921-22, 25,822 samples of seed were tested—an increase of nearly ten per cent. over the number tested in any previous year. The Crop Improvement Branch has got well under weigh with the all-important work of testing promising new varieties. Four new Barleys, tried first in 1921, all proved worthy of being put to full trial in the present year, when they were tested at four different stations. The results of the final trial in 1923 will be awaited with interest. Of new Wheats offered, one has been judged as of sufficient promise for further tests, and the Crop Improvement Branch has also, as the result of preliminary trials, arranged to sow some eighty acres with a new Wheat raised by Prof. Biffin, so that if the final trial confirms the earlier praise, a sufficient bulk of seed will be available for distribution in the course of the next two years. Of great value is the living museum of varieties of Cereals, Grasses and Clovers, etc. It includes some four hundred varieties of Cereals and about sixty varieties of Grasses and Clovers, and it is intended to grow these and any other new varieties year by year in order to ensure that none shall drop out of cultivation and so become unavailable for breeding or other scientific purposes. The work of the Potato Testing Station, Ormskirk, owes much to the time and attention given to it both by the Superintendent, Mr. Bryan, and by Dr. Salaman, the Chairman of the Potato Committee. The immunity trials included three hundred and fifty entries, and beside the usual tests of established varieties, the Station also undertook to assist Potato breeders by testing new seedlings for their immunity from or susceptibility to Wart Disease. That this work is of great benefit to the community is indicated by the fact that no fewer than two thousand entries were received. Beside the work on immunity and on the recently-discussed subject of Potato synonyms, the Station has been engaged in carrying out a very important series of maturity trials with the object of determining the times of ripening of second early varieties, and has also undertaken no less important yield trials. Needless to say trials such as these are only useful if thorough, and for them to be thorough they must be continued over a series of years. Hence it is as yet too soon to look for the results. There can be no doubt, however, that when in the course of time they are forthcoming they will prove of great and permanent value to all growers of the Potato. We are glad to learn from the Report that a special medal has been struck in memory of the late John Snell (see Fig. 139) whose services at Ormskirk on behalf of the Potato industry will ever be held in grateful memory. This medal will be awarded annually, and the first recipient is Mr. Ezra Miles, of Leicester, who has rendered national service in the raising of new varieties of Potatoes.

**Our Almanac for 1923.**—We propose to publish in an early issue of the New Year a *Gardeners' Chronicle* Almanac for the year 1923. In order to make it as useful as possible for reference, we shall be obliged if secretaries of horticultural, botanical and allied societies, or any of our correspondents, will send us immediate information of all fixtures for the coming year.

**R.H.S. Gardeners' Diary, 1923.**—We have received a copy of this excellent diary\* for 1923, this being the twelfth year in succession in which it has been published. It is a most useful diary for gardeners, and is especially valuable for those who attend the R.H.S. exhibitions, for every meeting of the Society is recorded. There is much useful material on matters of gardening interest covering a wide scope. Recipes of common sprays and washes for combating various pests and diseases, planting tables, garden weights and measures, a vegetable grower's calendar, income and wages table, plants worth growing, plans of tennis courts and croquet lawns, and a list of composts for various purposes, are a few of the many subjects included.

**Flower Shows and the Entertainment Tax.**—In reply to a question by Lieut.-Col. Howard-Bury, the Chancellor of the Exchequer stated in the House of Commons on the 5th inst., that the Commissioner had power to remit the tax in the case of flower shows organised for the encouragement of horticulture and where the profits were devoted to the encouragement of horticulture and not for individual profit. In reply to a further question as to bands at flower shows, he said that the presence of a band meant the imposition of the tax. The effect of the entertainment tax on horticultural exhibitions was shown at a meeting of the Durham County Flower Show Secretaries' Union, when it was stated that every show represented at the meeting reported heavy losses, mainly, and entirely in some cases, due to the entertainment tax. Several secretaries stated that their societies were entirely without funds owing to the money paid away for this tax, and it was doubtful whether they would be able to hold exhibitions in the coming year. The secretary of the Thornley Society reported a loss of £205 on their last show, notwithstanding a sum of £925 was taken at the gate. The secretary of the Shildon show, who reported a loss of £157, stated that his Society had paid £1,688 11s. in entertainment tax in four years. The solution seems to be to dispense with bands and other side shows entirely, and to run floral exhibitions entirely with horticultural produce.

**National Carnation and Picotee Society.**—The annual general meeting of the members of this society will be held at the Royal Horticultural Hall, Vincent Square, Westminster, on Saturday, December 16, at 3 p.m. The secretary is Mr. J. J. Keen, 54, The Avenue, Southampton.

**Presentation to Mr. Hugh M. Mackie.**—On the occasion of his retirement from the offices of secretary and treasurer to the Glasgow and West of Scotland Horticultural Society, Mr. Hugh M. Mackie was presented by the members of the society with a handsome writing bureau and two easy chairs, in recognition of the services he had rendered during twenty-three years of office. Sir J. Reid, president, who made the presentation on December 6, observed that the society was not in a very flourishing condition when Mr. Mackie entered upon his duties. There was considerable debt, and the membership had dwindled to a comparatively small number. Mr. Mackie, with characteristic energy, soon began to improve matters, and with the assistance of the directors and other friends the debt was wiped off, and the society put upon a sound basis. Sir John said he felt sure it must be a source of much satisfaction to Mr. Mackie that upon his retiral the finances of the society were in a very satisfactory state, and that now the roll contained over 700 names. The credit for that was largely due to Mr. Mackie. Mr. Mackie, in thanking the members for their gifts, said that for a time the society had many ups and downs, but recently they had experienced a considerable amount of prosperity. While he much appreciated Sir John

\* R.H.S. Gardeners' Diary. Obtainable from our Publishing Department, price 2s. 3d., post free.

Reid's very flattering remarks about his work, he thought the credit was really due to the presidents, chairmen and directors with whom he had been associated during his term of office. He was greatly gratified when he thought of what the society had done for allotment-holders, and he thought the fact that they had so many allotment-holders among their members was evidence that these men felt their interests were being well looked after by the Glasgow society. He was also proud of the fact that during the war, the society, by its shows and sales, had been able to raise about £3,000 in aid of Red Cross funds.

**Pictures made with Leaves and Flowers.**—A correspondent to the *Glasgow Herald*, states that Mr. W. J. King, an official of the Ministry of Health, has a hobby which is shared by very few. "It is the making of pictures from the leaves of trees, and even vegetables and the petals of flowers. For 20 years he has been bringing his idea to perfection, and now, with nature's pigments alone, he has produced pictures which at a few feet distance will pass for oil paintings. The leaves and petals are used in their natural state, and no colouring matter is added. The range of colours and the distinctiveness of tones gathered from wood and garden are almost bewildering, but more remarkable

FIG. 139.—THE JOHN SNELL MEMORIAL MEDAL (SEE PAGE 347).

still is the manner in which they have been utilised. He has produced the picture of a jug entirely from cabbage leaves. There are in a collection I saw to-day pictures of a dog and a cat, the former of the Yorkshire terrier type, shaggy and long-haired, in which even thistle down has been included. Snow, for instance, white sky, and waterfalls are created from pith. Mr. King's theory is that the vegetable kingdom—which is his palette—provides all the tints and tones required, and that if properly dried and tested the colours are permanent." We should like to see some of Mr. King's pictures exhibited at one of the fortnightly meetings of the Royal Horticultural Society.

**Allotments Advisory Committee.**—In accordance with the recommendation of the Departmental Committee on Allotments, the Minister of Agriculture has appointed a Committee to advise the Ministry on matters affecting allotments in England and Wales. The constitution of the Committee is as follows:—The Rt. Hon. the Earl of Ancaster, Parliamentary Secretary to the Ministry (chairman); the Rt. Hon. the Earl Stanhope, representing the Central Landowners' Association; Sir Kingsley Wood, M.P., representing the Parliamentary Allotments Committee; Francis Dent, Esq., representing the County Councils' Association; H. A. Learoyd, Esq., Town Clerk of Hull, representing the Association of Municipal Corporations; Reginald C. Graves, Esq., LL.B., Clerk and Solicitor to the Tottenham Urban District Council, representing the Urban District Councils' Association; C. Crofton Black Esq., barrister-at-law, representing the Land Union; the Rt. Hon.

F. D. Acland, George Nicholls, Esq., and Walter West, Esq., representing the Agricultural Organisation Society; and Robert Norman, Esq., Alderman H. Berry and J. Forbes Esq., representing the National Union of Allotment Holders. The Secretary of the Committee is Mr. E. Lawrence Mitchell, Ministry of Agriculture, 10, Whitehall Place, London, S.W.1.

**Old and Rare Books on Gardening and Botany.**—The lover of rare and old books, and the student of botanical and horticultural literature, cannot fail to find interest and delight in the illustrated *Catalogue of Rare Books*, which Messrs. Wheldon and Wesley have commenced to publish. Part I. is now before us, and the publishers state that the catalogue will be completed in about six parts and a title page and index will be issued in due course. A perusal of this catalogue will arouse in many readers the desire to purchase some of the valuable books described therein, but the fulfilment of such a desire will depend entirely upon the financial resources of individual purses, as in many instances the works are necessarily expensive, because of their rarity and interest. The works listed are not wholly confined to those dealing with horticultural and botanical subjects, but among these latter we find Andrew's *Coloured Engravings of Heaths*; Bateman's *Orchidaceae*

favourable conditions. The tubers generally are large and of good quality. They have mostly been stored in clean and dry condition, and so far are keeping well, though occasionally they are reported to be unsatisfactory in this respect owing to the wet weather during the period of growth. There are few reports of disease. The yield per acre over the whole country is estimated at 7.1 tons, or  $1\frac{1}{2}$  tons per acre more than last year and rather more than 1 ton per acre above the average of the ten years 1912-21. This year's yield is the highest recorded since these returns were first collected in 1885, the previous best being 6.9 tons per acre in 1908. The total production on agricultural holdings in England and Wales is estimated at 3,986,000 tons, or more than a million tons greater than in 1921 and 50 per cent. above the pre-war average.

**The "Botanical Magazine," 1845-1920.**—In order to meet the demands of those who wish to purchase a complete set of Curtis's *Botanical Magazine* from 1845 to 1920, the Royal Horticultural Society is making arrangements to have a few complete sets made up. These sets, each consisting of 76 volumes bound in cloth, will be available at the price of £175 net. The price of single volumes of the *Bot. Mag.* is 3 guineas per volume, but special terms have been arranged for sets of ten or more consecutive volumes, as follows:—10 to 20 volumes, £2 15s. net per volume; 20 volumes and over, £2 10s. net per volume. All orders for single volumes, sets of volumes or single parts, from 1845 to 1920 should be sent direct to the Secretary, Royal Horticultural Society.

**British Empire Exhibition.**—On the 12th inst., in the House of Commons, Capt. Berkeley asked whether a number of Crown Colonies had expressed their inability to take part in the British Empire Exhibition owing to financial difficulties. In reply, the Under-Secretary for the Colonies regretted that Fiji, Barbados, Ceylon, Gibraltar, St. Helena, Somaliland, and Nyassaland had decided not to take part, while Trinidad was withholding decision in the hope of improvement in financial matters. In his view the benefits likely to accrue were doubtful, considering the limited economic resources of the Colonies and Protectorates mentioned, and he thought it would not be justifiable to ask the House to vote moneys for the purpose of assisting these Colonies to take part in the exhibition.

**Ginkgo biloba as a Town Tree.**—The attention drawn by Lord Plymouth to the suitability of *Ginkgo biloba* as a town tree has induced Mr. A. D. Webster to contribute a letter to the *Times*, in which he refers to a healthy tree growing in very unfavourable conditions, close to Commercial Road, while other specimens are to be found in Chelsea, Lambeth, St. Paul's Churchyard, the grounds of Bedford College, and Regent's Park. We would remind readers of the old and somewhat injured specimen that still exists in High Street, Brentford, close to the gasworks and other factories; this is a wonderful example of the vitality of the *Ginkgo* as a town tree.

**Horticultural Club.**—A very pleasant evening was spent by members of the Horticultural Club on Tuesday last, on the occasion of a dinner at the Connaught Rooms, Great Queen Street; after the dinner there was a display of lantern slides, followed by a musical programme. Mr. J. F. McLeod presided, and the company included several ladies. The pictures, in natural colours, of beautiful garden features, were displayed by Mr. R. A. Malby, and included scenes in such famous gardens as Gravetye, Aldenham, Warley Place, Kew Gardens, Earham Hall, Paddock House, Abbots Wood, and Mounthou House, Chepstow. The entrancing beauty of these floral pictures was a revelation to many, and they offered valuable hints and suggestions in the grouping and disposition of plants to obtain the best effects. The accuracy of the colours of the various flowers was the subject of general comment, and Mr. Malby was heartily congratulated on obtaining such splendid results in colour reproduction.

of Mexico and Guatemala; *Biologia Centrali-Americana*, edited by F. Ducane Godman, a work in fifty-two volumes; *A boke of the properties of Herbes called an herball*, 1555-1561, variously ascribed to William Copland and Walter Cary; Boycean's *Traité du Jardinage* (1638); Brookshaw's *Pomona Britannica*; Castelli's *Hortus Messanensis*; *Wilton Garden*, by I. de Caus, 1650-55, a rare book, of which only two perfect copies are known; Decaisne's *Le Jardin Fruitié du Muséum*; Duhamel du Monceau's *Traité des Arbres et Arbustes*, and *Traité des Arbres Fruitiés*; *L'histoire des Plantes*, by A. du Pinet; *A Monograph of the Genus Lilium*, by H. J. Elwes; Robert Furber's folio works on flowers and fruits (1732), with engravings after Peter Casteels' drawings; a first edition copy of John Gerarde's *Herbal*; Hill's *Art of Gardening* (1572); Jacquin's *Hortus botanicus Vindobonensis*, and the same author's four volume folio work entitled *Plantarum rariorum Horti Caesarei Schoenbrunnensis*; Mollet's *Le Jardin de Plaisir*, and his *Théâtre de Plans et Jardinages*; Oeder's *Flora Danica*, a complete set; Parkinson's *Paradisi in Sole Paradisus terrestris*; Redouté's *Les Liliacées*, and his *Jardin de la Malmaison*; Repton's *Sketches and Hints on Landscape Gardening*; Sibthorp's *Flora Graeca*, in ten volumes; Sweet's *Geraniaceae*, and the same author's *British Flower Garden*; and Weinmann's *Phytanthoziaconographia*, 1737-45, in four volumes.

**The Potato Crop.**—According to the "Monthly Agricultural Report" of the Ministry of Agriculture, the lifting of Potatoes was completed under

**Proposed Flower Show in Glasgow, in 1923.**—The success which attended the great flower show held in Glasgow this year under the auspices of the Glasgow and West of Scotland Horticultural Society and the Glasgow Corporation was so encouraging that the Executive Committee of the Corporation and the Directors of the Horticultural Society have been requested to confer on the proposal to hold a flower show in the autumn of 1923 in Kelvin Hall. A dairy show is also proposed.

**Begonia socotrana hybrids at Kew.**—In the conservatory (No. 4 greenhouse) at Kew a most interesting group of *Begonia* species and hybrids illustrates the valuable work of the hybridist in raising a useful race of winter-flowering greenhouse plants. From typewritten particulars on a card placed above the group visitors may read the "family history" of the plants in flower. *Begonia Dregei* was first introduced from South Africa in 1856. This species, and *B. socotrana*, introduced from Socotra in 1880 by the late Sir Isaac Bayley-Balfour, are the parents of *B. Gloire de Lorraine*. The latter was raised by Messrs. Lemoine, of Nancy, in 1892. There are plants, from the same cross, of the Turnford Hall and Mrs. Leopold de Rothschild varieties, and also the American raised Mrs. Peterson and Glory of Cincinnati, the last named showing very distinctly the influence of *B. socotrana*. About 1883, Messrs. James Veitch and Sons first crossed *B. socotrana* with pollen from the tuberous-rooted *Begonias*, and a group of the variety Mrs. Heal, represents one of the best of the earlier hybrids. The later hybrids, however, as seen at Kew—*Optima*, *Fascinator*, and *Exquisite*—are more showy. The one regret in connection with this latter race of hybrid *Begonias* is that the plants require special treatment, while, on the contrary, *B. Gloire de Lorraine* is grown by the thousand in private gardens, and by hundreds of thousands in market nurseries for the florists' shops.

**Appointments for the Ensuing Week.**—Wednesday, December 20.—Hertford Horticultural Society's meeting. Thursday, December 21.—Manchester and North of England Orchid Society's meeting. Saturday, December 23.—Dunfermline Horticultural Society's annual meeting.

**"The Gardeners' Chronicle" Seventy-Five Years Ago.**—*Education of Gardeners.*—I have watched anxiously for some time past the progress of education and improvement amongst gardeners, and from your observations last week, I am inclined to think that you, at least, would willingly remove the impediments that oppose themselves to the advancement of an object which, no matter how disagreeable to certain individuals, must be hailed by the thinking portion of the community with delight. Truly you have arrived at the right conclusion. It is to those men, self-styled "practicals," that we, the rising generation of gardeners, owe our backward position. You have boldly stated the fact; I could prove it. From the time I first entered the business I have heard your motives aspersed. I have known you only as the enemy of the working gardener until more close attention to facts set me right. Now, I can discover a miserable attempt to paralyse us in our progress, and hold us in that state of mental ignorance which characterises the old school. My employer has not allowed his influence to remain inactive in endeavouring to prove that the means adopted in the establishment with which you are connected, are only superficial, or, at best, unnecessary. What an outcry was raised against mutual instruction amongst these very practicals. I have visited a mutual instruction society, and knowing that no better principle could be adopted, was grieved to see the manner in which it was supported; and he it remembered that this society is under the patronage of an influential metropolitan association. It is full time that young men who propose to raise the science of horticulture from its present condition should be in arms against this attempt to stay their progress; and that the facts should be manfully stated. Public opinion will be our judge.—*Philo. Gard. Chron., December 18, 1847.*

## NOTICES OF BOOKS.

### \*Cyclopedia of Hardy Fruits.

THE literature of American pomology is growing fast, and there exists already a goodly number of descriptive works which are indispensable to the student of fruits. In the work before us Prof. Hedrick has condensed a large amount of information and description from his well-known "New York" series, and has provided a book of great utility for the amateur and nurseryman. It is, of course, intended for the American fruit grower, and describes mainly varieties of native origin, and it is very noticeable how few of our British varieties succeed in the United States, and conversely how few

The Himalaya Berry is said to become almost barren in the mild regions of Pennsylvania, as does the vine in Africa, and the Mammoth Berry, in this country often called the Low Berry, is self-sterile, but is pollinated by the Loganberry. The Superlative Raspberry is largely grown on the Pacific Coast, and there considered the most profitable variety.

A few slips are noted; Pear Doyenné Boussoch was not raised by Van Mons, as it existed before his day, and he changed the name to Beurré de Merode. The Pear Duhamel du Monceau is said to keep longer than Winter Nelis, but its season is given as October-November. The Pear Roosevelt is described as being 2 $\frac{7}{8}$  inches in length, and having the faintest trace of a blush, and in such a description we can

FIG. 140.—CHRYSANTHEMUM WELLINGTON WACK. N.C.S. FIRST-CLASS CERTIFICATE, NOV. 16 (SEE P. 314). SHOWN BY MR. H. J. JONES.

transatlantic varieties are really happy in our moist and comparatively sunless climate. We may best measure this difference by remembering that the bulk of American Apples are grown where the Vine and Peach thrive in the open. This means a great amount of summer heat, and it is for want of this that so many American varieties fail in this country.

The fruit grower will nevertheless find much to interest him in Prof. Hedrick's *Cyclopedia*. It is a large 8vo volume of 370 pages, each fruit being briefly described and its orchard behaviour treated more fully. Outline drawings are given in many cases and there are four coloured plates.

Such a book can only be criticised after a year or two of constant reference, but a few points were noted in the course of a glance through its pages. It is curious to see that only two English Peaches are considered of value, and not one British Strawberry figures in a long list. We see that the American Gooseberries are now considered as derived from *Ribes hirtellum*, and not from *R. oxycanthoides*.

\**Cyclopedia of Hardy Fruits.* By U. P. Hedrick. The Macmillan Co., 27s.

hardly recognise the rubicund and obese President! Can Prof. Hedrick have the true variety? Peach George IV. is not our Royal George, as the text would lead one to suppose.

These are the accidents which befall every author, and it is but a poor spirit which sets them in the foreground of a criticism. A more serious matter is the size of the outline drawings, most of which are half-size, and have ( $\times 1$ ) placed beneath them. In the Cherries, however, they seem to be drawn full size, but still have the ( $\times 1$ ), which makes Napoleon 2 $\frac{1}{2}$  inches broad and 3 inches deep—which is absurd, even for America!

The most original feature of a work of this popular character is the very interesting discussion of the species from which fruits have probably been derived.

The value of the book to British gardeners will be mainly as a handy reference book to American hardy fruits, some of which are already being tried in this country, and in some cases a study of its pages will check enthusiasm raised by florid catalogue descriptions.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Odontoglossum citrosimum.**—Plants of this beautiful species have completed their growth, and water should be withheld gradually, and in a few weeks entirely. Owing to dryness at the root during the resting period, the pseudo-bulbs will probably shrivel considerably, but this will do no harm unless carried to excess, it not being injurious to the plant, as when the flowering period arrives they quickly return to their normal condition of plumpness after receiving water a few times. This Orchid requires a long season of rest, and if not thoroughly ripened rarely produces flowers.

**Other Odontoglossums.**—*O. Reichenheimii* and *O. laeve*, having also finished their growths, should receive but little water at the roots during the winter. *O. Uro-Skinneri* is pushing up its flower spikes, and should be watered until the flowers open, when the amount of moisture should be gradually diminished and the plants induced to rest. When the new growths commence to develop fresh roots, the plants may be repotted. These distinct *Odontoglossums* should be placed in the lightest and coolest part of the Mexican or intermediate house during their season of rest, and be grown in slightly more heat (whilst they are making their growth) than *Odontoglossums* generally.

**Sophranitis grandiflora.**—This little gem, which has been used by hybridists for imparting its wonderful colour to many hybrids, is now in bloom, and its brilliant flowers are always appreciated. The spikes are produced on partly-matured pseudo-bulbs, and care should be taken that no water lodges in the crown, as it may set up decay of the flower spike and the new growth. At this season it is advisable to remove the plants to slightly warmer quarters, which will favour the development of the flowers, and be the means of avoiding the dangers of damping, both of the flowers and growths. Until the flowers are produced, the plants may be afforded water at the roots whenever they are seen to require moisture. After the flowering period is over, any plants needing fresh rooting material may be given attention when new roots are seen to be pushing from the young growths. A similar compost to that used for *Cattleyas* is suitable, but owing to the small size of the plants the material should be cut into small portions. The plants are best grown in small pans suspended from the roof, where they will receive all the available light during the winter. Hybrids of *Sophranitis grandiflora* include some of the most beautiful Orchids in existence, and comprise hybrids with *Laelias*, *Cattleyas*, *Laelio-Cattleyas*, *Brasso-Cattleyas*, and others. These should be treated as *Cattleyas*, and should be grown under similar conditions to those usually given the predominant partner. Many of them are bad growers; but, to my mind, it is only a question of finding a suitable place for them, and making conditions suitable to their requirements. The hybrids vary considerably as regards size and stature, but all will succeed under the conditions named.

### THE KITCHEN GARDEN.

By JAMES E. HAYBRAW, Gardener to JOHN BRENNAN, Esq., Baldersby Park, Thirsk, Yorkshire.

**Asparagus.**—This vegetable forces very readily; the easiest plan is to make a hothed of litter and leaves, and if made a good depth the bed will provide sufficient warmth to force two or three batches. Place on the bed a portable frame, and put in the latter about 4 inches of old potting soil of a light texture. The crowns should not be inserted until fermentation declines, by which time the rank gases will have passed off. Place the roots closely together and cover them with about 5 inches

or 6 inches of soil. Keep the bed well syringed with tepid water, and admit air in mild weather. Protect the frames from frost.

**Preparations for Seed-sowing.**—During bad weather seed-boxes should be overhauled and repairs made good. Any boxes that are of no further use should be replaced with new ones. Soil for seed sowing should be mixed and placed in a shed, where it will be handy to get at in bad weather. Labels should be made and stakes prepared, as this will save time in the busy season.

**General Remarks.**—Attend carefully to all crops in frames; keep all decaying leaves and weeds picked off, and the soil between the plants stirred on the surface. Admit air at every favourable opportunity. A close watch should be kept for mice, as they often spoil crops when the frames have to be kept covered with the lights in very severe weather; mice will soon ruin Cauliflowers in frames. Continue to sow plenty of French Beans, and expose the plants to all the light possible. Suttons' Forcing, Ne Plus Ultra, and Maggie are good varieties for present sowing. Keep a sharp watch on all roots in store, and remove any decayed ones.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lient-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Mid-season Vineries.**—The vines in mid-season vineries may now be pruned, cleansed, and put in working order ready for starting, but they should be kept cool and theinery airy to ensure a long and decided rest to the vines. If other plants are being grown temporarily in these houses they should be of the hardiest kinds, as constant shutting of the house at night and turning on a little fire-heat will react injuriously on them. Very few growers can afford to keep their fruit houses entirely idle, but they should be helped in this matter to the fullest extent possible until after the turn of the year. When the vines are pruned and washed the wounds may be dressed with styptic, especially if there is any danger from bleeding. All operations at the roots will have been finished by now; the roots should be kept sufficiently moist, but should autumn watering have been neglected, it will be well to allow them to remain on the dry side for some time after pruning.

**Late Vines.**—Houses in which ripe Grapes are hanging cannot be kept too cool and airy in mild, dry weather. A temperature of 50° is suitable for black Grapes, but Muscats need a little more warmth. A little fire heat should be used when there is danger from frost, or the atmosphere stagnant with moisture. The fall of the leaf is the most trying time, especially for vines in low houses, but damp in these houses may be counteracted by picking up the leaves each day. Damp, which fosters mould, does the greatest harm to ripe Grapes, and must be counteracted; but the lighter the firing and the steadier the temperature, the better will the Grapes retain their colour, and fresh, plump condition. Houses in which only a few bunches of ripe Grapes are hanging may now be cleared of the fruits with the greatest advantage, not only to the fruit, but also the vines. Opinion prevails that Christmas is the time for bottling Grapes, but no particular date will ensure them keeping well, unless they are fully ripe, and when ripe they may be cut and bottled at any time. When cutting Grapes before the leaves fall, the latter should be left to ripen and drop, as every fresh cut in the removal of leaves or laterals forms an outlet for the sap, as may be proved by the rapid absorption of water from the bottles.

**The Grape Room.**—This useful structure is often utilised for the storing and ripening of choice Pears; the gentle warmth, so essential to developing flavour in the Pears, will render it suitable for the reception of long-keeping Grapes, when the time arrives for cutting and bottling them. The bottles in the meantime may be filled with soft water in empty store-rooms.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. Vicar of GIBBS, Aldenham House, Hertfordshire.

**Primulas.**—Plants of the earliest batch of Chinese *Primula* are sending up their flower spikes, and a little light feeding with liquid manure will greatly assist them to develop their inflorescences. In watering *Primulas*, take care not to wet the foliage, as this would probably cause damping. An excessive amount of warmth is also harmful.

**Lily-of-the-Valley.**—Very often this sweetly-scented flower is left in the beds too long without proper attention. The plants should not be allowed to grow on year after year without breaking them up and replanting them, or the results will gradually be more and more poor, not only from soil exhaustion, but also owing to the growths crowding and injuring one another. Every four or five years at most the clumps should be divided, and the ground well prepared for replanting by trenching it and applying a good quantity of well-decayed manure and plenty of leaf mould, to make the soil as light as possible. Thereafter select the strongest of the crowns and replant them at a shallow depth—just sufficient to cover them with soil—then cover the surface of the bed with about 2 inches of leaf-mould. Some of the very best crowns may be selected for forcing, and in after years others may be similarly selected. Where it is desired to leave the bed for longer periods than the four or five years, the crowns should be set 8 or 9 inches apart, and the bed mulched with manure. The roots should be fed with manure water each season. A shady, cool position should be selected for forming a plantation of *Lily-of-the-Valley*.

**Solomon's Seal.**—This old favourite perennial is valuable for decorative work, and should be dealt with somewhat similarly to *Lily-of-the-Valley*. Though this plant will grow well in almost any kind of soil, it does best when planted in deeply worked, well-manured ground. The present is the best season for forming fresh beds. *Solomon's Seal* is a useful plant for forcing for winter decoration.

**The Water Garden.**—This is a suitable time to attend to various operations in the water gardens. Streams that are overhung by trees will require cleaning out, as many fallen leaves will have collected at the bottom; if the streams are formed with concrete beds, and are capable of being emptied, the concrete should be examined for damage possibly caused by roots of adjacent trees, and the necessary repairs attended to. Water plants, such as *Nymphaeas*, may be planted during open weather, and waterside plants divided, reduced, and replanted under similar climatic conditions.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codiote, Welwyn, Hertfordshire.

**Eranthemum pulchellum.**—This beautiful old plant is very seldom met with in private gardens, yet when well grown there is none other better in its colour. The blue flowers do not show to advantage under artificial light, but for brightening up the stove or intermediate house it is one of the best subjects at this season, and the plant remains in flower for a considerable time.

**Lapageria.**—The present is an excellent time to attend to this beautiful climber in such matters as top-dressing, re-potting, and cleansing the foliage. The shoots of *Lapagerias* are very brittle, therefore great care is needed in handling them, but now that the growths are hard and matured, they may be unfastened from the wires or trellis, and, after removing all the weakest shoots, the remaining growths should be thoroughly cleaned. After cleaning the plants, and before training them into position again, ascertain if it is necessary to re-pot them or renew the soil if they are planted out in borders. The *Lapageria* thrives best in a restricted root space; a suitable rooting medium consists of a mixture of good peat and fibrous loam, with

sufficient broken charcoal and coarse silver sand added to render the compost porous. *Lapageria* will grow well in a cool greenhouse, while in some favoured localities they will thrive against a warm wall in the open, provided some protection is afforded them during the winter. Slugs are very fond of the young shoots, and means should be taken to trap the pests.

**Richardia.**—Where Arum Lilies have been grown in a cool house to retard their flowering, while *Chrysanthemums* have been plentiful, a few of the more forward plants should be placed in a warm house, and the roots well fed with liquid manure twice weekly. Keep the plants free from aphids, and spray them regularly with tepid water to promote a moist atmosphere.

#### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Young Trees.**—When planting young trees see that the soil is thoroughly drained. The compost should consist of the best fibrous loam, mixed with old brick mortar, wood ash, and a little decayed manure. Make the soil rather firm. Remove the tips of damaged roots, spread the latter at different angles and cover them with soil, but not too deeply. Place a little straw manure over the soil, and defer

### TREES AND SHRUBS.

#### THE BEST FRUITING BARBERRIES.

TWENTY-FIVE years ago our native *Barberry* (*Berberis vulgaris*) had few rivals among shrubs cultivated in our gardens for their attractive autumn fruits, but explorations during the present century in China have introduced a considerable number of rivals, and these, grown in our gardens, have cross-pollinated freely. That some of the seedlings surpass in beauty any species we already possess among the fruiting *Barberries* is very evident, judging by the fruiting sprays sent to the R.H.S. exhibitions at Vincent Square from the Wisley gardens. Several of these, including *rubrostilla*; Coral, The Sparkler, Fireflame, and Autumn Cheer were given Awards of Merit. Even more beautiful than any of these, at least as shown at the last R.H.S. meeting on October 31, is the variety *Lady Beatrice Stanley* (see Fig. 114), one of a number of seedlings grown from seeds obtained from Wisley.

In the raising of these seedlings we are only in the early stages of progressive development. What the future holds in store when the hybridist systematically cross-pollinates the different species and varieties we can only conjecture, as so far the crossing appears to have been more or less a matter of chance, through the

ends of the stiffer branches. *B. Pratii* differs in having a round rather than an oval-shaped fruit. *B. Wilsonae* is dwarf in habit compared to those previously named. It is seen to the best advantage planted on a sloping sunny bank or hanging over boulders in the rock garden. As previously mentioned, the best forms of the Common *Barberry*, *B. vulgaris*, make gloriously beautiful fruiting bushes.

One of the new Chinese species, *B. Francisii Ferdinandii*, is not unlike our Common *Barberry* in growth and fruit, producing quantities of bright red berries along the vigorous growths. *B. Beaviana* (Fig. 141) with slender branches and dark fruits, is also worthy of note.

When planting *Berberis* with the idea of obtaining a wealth of fruits sunny positions must be chosen to ripen the wood and develop the brilliantly beautiful colour of the fruits.

#### COTONEASTER HORIZONTALIS VARIEGATA.

ONE of the most noteworthy additions that have been made to the *Cotoneaster* group for some years is the variegated form of *C. horizontalis*, which comes from a French nursery. This variety is similar to the type in habit of growth, fruiting, and all other respects save the colour of the foliage, the green of which is clearly and

FIG. 141.—*BERBERIS BEAVIANA*.

the pruning and training of the trees until the spring. The main point to be observed when pruning young trees is to select the best-placed shoots to form a well-balanced specimen.

**Gooseberries.**—If not done already, complete the thinning and pruning of these fruits. Gooseberry bushes should be well thinned, removing annually a few of the oldest and worst placed shoots, especially if the heads are crowded with branches. In dealing with these fruits it has been my practice for some years past to remove and thin the bushes soon after the fruits have been harvested, and, later, when the leaves have fallen, to complete the pruning. Spur back all young shoots in the centre of the bush to within a couple or three buds, and leave all short and sturdy fruit-bearing shoots their full length. Long shoots may be shortened to about two-thirds their length. The main points to be observed are to keep the heads well thinned, evenly balanced, and furnished with plenty of young, fruitful shoots. Dust the bushes freely with soot, lime, and wood ash occasionally, and fasten a few strands of black cotton at intervals over the bushes and others about 2 feet above the heads to prevent birds destroying the buds. This should be done early where birds are troublesome and destructive, as neglect in this respect may mean the loss of almost every bud.

**Black Currants.**—Thin the branches well, feed the roots, and top dress the latter with rich material on light, shallow land. The Black Currant thrives best in a deep, mellow, cool soil. Keep the bushes well furnished with young, healthy growths, but not too thickly.

action of insects and, or, wind pollinating flowers of *B. polyantha*, *B. Wilsonae*, and *B. subcaulialata* growing in close proximity.

Unlike some hybrids which either fail to produce seeds or comparatively few, the Wisley hybrid *Berberises* may be raised freely from seeds. We cannot hope, however, that there will be more than a very small percentage of seedlings equal in beauty to *Lady Beatrice Stanley* or *The Sparkler*. To reproduce these true they must be propagated by means of cuttings or layers. At first sight this may not appear an easy matter, but when we remember that the hundreds of thousands of *Berberis stenophylla* bushes in our gardens have all been grown from a chance seedling which appeared in a nursery near Sheffield about 1860, we may assume that propagators will soon get to work on the vegetative increase of the best fruiting kinds.

Five hybrid *Berberises*, excluding the one illustrated in the issue of November 11, have already been named. To complete a list of the best twelve fruiting *Berberises* for our pleasure grounds and shrubbery borders the following species are desirable:—

*B. subcaulialata*, a Chinese *Barberry* with angled branchlets and vigorous, arching growths laden with carmine-red fruits with a slight bloom. *B. polyantha*, the species with the longest and widest panicle of fruits yet seen among the species, these hanging like bunches of small salmon-red Grapes (see Fig. 105). *B. aggregata*, which belongs to the same group as the last-named, but does not grow so tall, with fruits borne in smaller panicles towards

very strikingly variegated with white. So far *C. h. variegata* has not proved to be quite so vigorous as the common form with us, nor so easy to strike from cuttings; but it is, nevertheless, a good and steady grower almost anywhere, and one that will be most welcome in rock-gardens, where a grey effect is desired. Admirable as it is in spring when the leaves are developing, and throughout the summer fruiting period, *C. h. variegata* is, I think, most delightful in November when its foliage becomes suffused with the rich tints common to the type. But instead of the leaves changing to crimson, their green parts assume a mauve hue, which strikes an uncommon note of colour in conjunction with the white, which deepens to ivory.

#### CELASTRUS ARTICULATUS.

ALTHOUGH seeds of this vigorous climber were first sent to Kew by Professor Sargent so long ago as 1870, *Celastrus articulatus* is comparatively little grown. This is surprising, for when the leaves turn a rich golden yellow in autumn previous to falling, and the yellow capsules open to reveal the scarlet-coated seeds, it forms an object of considerable beauty. Though thriving best in deeply dug garden ground, this latter is by no means essential, for the shrub does quite well in a shrubbery border, with vigorous growing bushes or trees around up which the strong, vigorous shoots can twine. Just now (early December) a specimen on the Flag-staff Mound at Kew, twining up a Lime tree to a height of 25 feet, is resplendent with hundreds of open yellow capsules, showing the scarlet-coated seeds within. J. O.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHERS, 5, Tavistock Street, Covent Garden, W.C.2.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.\*

No. IV.—ON TO YÜNG-NING.

AFTER spending a week in Lichiang, we started northwards on April 9, travelling up through the great loop of the Yang-tze. I had sent out my collectors from the city, more with a view to see what was in flower than with the expectation of finding plants I wanted; for I was on classic ground. They returned with three Rhododendrons and two Primulas in flower, all familiar, besides a few shrubs; it was early for flowers yet, they reported. Still, we had a long journey before us, so we started.

For the first two days we marched at the foot of the snowy range, crossing spur after spur; spiteful gusts of wind whistled through the rocks. They tore rain from the fringes of the cloud wrack which muffled the Lichiang range, and flung it rudely in our faces. Even the proud Pines bent to the onslaught. Winter and spring succeeded one another abruptly.

In the dry limestone ditches Primula Forrestii was a wonderful sight, gilding the banks; but we soon lost it. Like all the members of the Suffruticosa group, it seems to have a very restricted area of distribution, though abundant within that area.

We crossed a bleak, brown meadow surrounded by Pine forest—a marsh during the rainy season, evidently. Not a blade of green, nor a flower was in sight; only the melancholy-looking Conifer forest stretching up to the white slopes of the Lichiang range. Yes, one! Here and there the brown was dotted with the mealy purple heads of Primula sphaerocepala. Then, descending to one of the glacier torrents, we found protection from the wind, and all was changed again. The Larch trees were tipped with emerald green, and a sea of foliage, coppery red for Poplar and Apple-green for Willow, splashed with waves of milk white Azalea, appeared. The afternoon sunlight danced in and out amongst the trembling leaves.

The next sight was Primula sonchifolia just coming into flower; not one of the best forms, though. It seems to enjoy life most when growing at about 12,000 feet, in the trickle from lingering snow, in deep shade, of course. Alas! that all attempts to introduce this plant should have failed. In nature, the ripened seeds are never dry until the winter snow covers them; then they may be—unless they have already germinated towards the end of the rainy season.

Whether it is that the seeds have no vitality, or that they are short-lived, or that they cannot withstand being dried—and, of course, they can hardly be expected to survive a journey through the tropics while still damp—the fact remains that all attempts to raise plants from seed in England have failed so far. Farrer and Cox sent home from Burma resting plants; for the plant forms a sort of Brussels Sprout in winter. What the out-

come of this bold experiment was I do not know. However, be the difficulties what they may, they will doubtless be overcome some day.

In the forest, on sheltered slopes, the big silver-leaved Rhododendron (*R. argenteum?*), of which I had collected seed the previous year (K.W. 4995) was now in full bloom. The flowers are very fine, blush pink, frosted inside, each with a single purple spot at the base, like a drop of Plum juice; the trusses are large, and fairly loose. The species grows on limestone slopes buried under forest; but I suppose I ought not to say that. It is a well-known fact that Rhododendrons do not grow on limestone—except in Yunnan!

Now we began to diverge from the Lichiang range, which, trending west of north, is cut through by the north-flowing limb of the Yang-tze; our road lay east of north, within the river loop, which now closely invested us on three sides.

Pine forest succeeded Pine forest, for we were not very high up, generally between 9,000 feet and 10,000 feet, with passes up to 11,000 feet. On April 12 we crossed a marsh full of a beautiful Lavender blue, dwarf Rhododendron which was just coming into flower. This is not the same as my "Lavender dwarf" of 1921 (K.W. 4184), also a peat bog plant, but growing several thousand feet higher. It differs from the latter in foliage, indumentum, and length of style.

On the dry, Pine-clad slopes Rhododendron racemosum was everywhere abundant. It is a most variable plant, but the varieties all fall into two groups: (1) Dwarfed under-shrubs, the inflorescence condensed. The axillary flower buds are massed under the terminal bud, so that, though the truss carries only three flowers, the effect is that of a large truss. Found on open slopes. (2) Tall, slender shrubs, 8-10 feet high, in shady situations. There is only the terminal flower bud to begin with, the axillary flower buds either aborting altogether or opening later. Truss three-flowered; flowers loose or nodding, having ample room for expansion.

Other shrubs in flower included a leafless Lonicera with dull purple flowers, which, though rather twiggy and awkward, is pretty when the leaves come out and the dangling scarlet berries are ripe; and a common Daphne.

On April 14 we crossed some high plateau country where many Rhododendrons flourished; but there was no sign of spring here yet, and, in fact, they all drooped their foliage dejectedly, as though it were mid-winter. After a long march we began the long descent towards the arid Yang-tze gorge, and reached a village after dark.

The only thing of note found on the scorched slopes of the Yang-tze was a hairless form of Primula malacoides, which may, indeed, prove sufficiently distinctive to be called something else. It grew in the long grass fringing the irrigation channels, on the cultivated terraces of Feng-k'ou. This may be the same plant that I found in the gorge of the Sho-lo river last year, in seed (K.W. 4232), but I collected more seed here.

There were several bushes on the rocks above the river, a lemon-yellow-flowered Acacia, and a bleary-flowered Acanthad, a Rose, a Bauhinia, and other stiff, thorny shrubs. But only in the villages were there trees—beautiful weeping Willows and shady Walnut trees.

Even thus early in the year, the heat at the bottom of the gorge was most exhausting. We camped the night on a sandbank, the ferry-boat not being in condition; in short, it leaked, and they were patching it up. We crossed on the following day, and it took nearly the whole day, the boat being so small that only two mules could be taken across each trip. The river being very low and the water quite tranquil, the passage itself was a simple affair and presented no thrills.

On April 17 we began the ascent of the range which separates the Yang-tze from the Yung-ning basin.

There are peaks on this range, in the immediate neighbourhood of Yung-ning, of over 14,000 feet, but the passes are 2,000 feet lower and present no difficulties.

We reached the summit of the divide after nightfall, and camped there. In the forest—chiefly Picea, Rhododendron, and Bamboo—there was nothing new in flower.

On April 18, ten days after leaving Lichiang, we descended to the small mountain-girt plain of Yung-ning. It burst into view quite suddenly as we cleared the forest—the cultivated, octopus-shaped plain, still brown and bleak; the Lion Rock, which looks very much like Gibraltar; the conical-shaped hill above the Monastery, and over the ridge a glimpse of the sapphire lake.

Early in the afternoon we reached the monastery and settled down to work. F. Kingdon Ward.

## "A COMPENDIOUS HERBAL."

It could almost safely be asserted that the above-named Herbal is not mentioned in the book criticised on page 324. It is obviously the "puff" of a seventeenth century empiric and as a Herbal has very little to recommend it. The entire title page reads:—*A Compendious Herbal, Discovering the Physical Virtues of all Herbs in this Kingdome, and what Planet Rules each Herb. And how to gather them in their Planetary Hours.* By John Archer. London. Printed by E. C. for the Author, 1673.

In a brief address to the "good reader" it appears that Archer wrote also a book called *Every Man His Own Doctor*. The "Directions for the Gathering of Herbs" is included in part of two pages, in which the uninitiated are informed that "every Planet governs the first Hour after Sun Rise" on the day assigned to it. "And if you gather herbs in their Planetary Hour, you may expect to do Wonders, otherwise not."

As a brief Herbal, it is a very long way inferior to Culpeper's, though arranged similarly. In glancing through its pages such notes as these are found: "Beanes ought to be eaten with Fat Meat or Butter"; "French Beanes are very profitably eaten green in the Husk, as the manner is boyled"; "The leaves of the Beech Tree are good to be applied to hot swellings," and the Birch Tree "is a very good Water for a Sore Mouth or Throat; the Coal of the green Wood beat to Powder stops Blood presently." Of Garlick the use is said to be dangerous to the Brain. Clove-Gilliflowers on the contrary "strengthen both Brain and Heart and is one of the most approved Flowers in our Garden." Nettles were greatly esteemed for the "tender tops in spring boiled in broth" and for the cure of many diseases, while Onions, as now, were "very attractive and drawing the Corruption of any thing to itself; being bruised and applied."

These examples may suffice to show the quality of the instructions given. The reason for production of the little volume is, however, only discovered when the Herbal portion ends, three leaves being appended, one to commend an Elixir Proprietatis, "being the Quintessence of the best of Vegetables . . . esteemed as the greatest Cordial Preserver of the Body from Corruption, and the best Antidote against Diseases of all kind, and Infection, and if any Medecine may be said to be universally good for all Persons, Constitutions and Diseases it is this . . . It cures all Agues or Feavers, quartan, tertian or quotidian; also all astmahs, Palsies, Convulsions, Falling Sickness, Consumptions of the Lungs, all decays in the vital and noble Parts"—and so on to an extensive and varied list of diseases, and concludes with the information that the preparation is to be had "at the Rate of five shillings the Ounce. From my House in Winchester Street, being the sign of the Golden Ball near Broad Street, London."

The other two leaves refer the reader to "three experiments," first "a Hot Bath by Steam, Most delightful and powerful in cure of most Diseases." Secondly, a "New invented Oven which doth bake, distill and boil a Pot or stew all with the same charge of fire and is moveable." The third, "a compleat Chariot capable of being moved by one Horse as easily as other Chariots by two Horses." Another leaf is occupied by verses in praise of this invention. R. P. Brotherston.

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 22, May 6, May 20, June 3, June 17, July 1, July 15, July 22, August 5, August 26, September 9, September 23, October 7, October 21, November 4, November 18, and December 2, 1922.

## KEITHIA ON THUYA PLICATA.

In 1918 and 1919 the occurrence of *Keithia thujina* on *Thuya plicata* was recorded more or less generally throughout Ireland, specially bad attacks being noted on seedbeds in Queen's County and Wexford, and on older plants in various parts of the country. Strange to say, the only case reported in Great Britain was apparently at Leonardslee, where the late Sir Gerald Loder found it attacking a plantation in the spring of 1919, the trees at that time being nine years planted. The fatal effect of the disease on seedbeds and young plantations gave rise to considerable anxiety lest it should prove a menace to the cultivation of *Thuya* in Ireland, where on certain soils and situations this species has proved of economic value.

Since 1918, therefore, the occurrence of *Keithia* has been carefully watched, and it is satisfactory to note that the disease has not only ceased to spread to any serious extent on old trees, but numbers of young plants badly affected in 1918 and 1919 show partial or complete recovery. Seedlings and transplants which showed signs of disease were, of course, destroyed more or less generally in these years, and no means exists of proving their powers of recovery.

One experiment, however, which was tried in Co. Wexford, throws some light on this question, where a number of affected plants were purposely retained and planted out in the spring of 1920. These plants were four years old, and as badly affected as trees of that age could be without actually being killed. Before moving them from the nursery the plants were sprayed with copper sulphate, and then planted on a low-lying piece of ground in a moist situation, and in the type of soil in which this tree succeeds best. During the summers of 1921 and 1922 these trees have gradually regained a healthy appearance, although traces of the disease still exist; but unless the latter reasserts itself there is every reason to believe they will develop in a normal manner.

A similar improvement during the last two years has been noticed on affected trees generally throughout Ireland, chiefly on those which had been attacked when about eight or ten years of age. Weakly or thickly shaded individuals have usually succumbed, but strong plants or those exposed to the light are now growing at their usual rate, and the disease is apparently no longer affecting their vigour.

The explanation of the 1918-20 attack of *Keithia* is more or less a mystery. As already noted, in the autumn of 1920 the disease appeared simultaneously in widely separated districts, and without any possibility of transmission by artificial agency. If it existed previously in a mild and unnoticed form its sudden virulence in a particular year, and in different districts in which climate and soil conditions vary greatly, is equally difficult to explain. One thing is quite evident, and that is the serious nature of the disease to nursery stock, and probably seedbeds and young transplants should be periodically sprayed as a precaution against attack. If this is done, we may possibly be able to continue growing this species without serious risk.

Another way in which disease may be kept in check is by sowing the seed sufficiently thin to prevent overcrowding in the beds. *Thuya* seed is produced in such abundance on home grown trees, and is so light in weight, that the tendency is always to sow thickly, on the assumption that a large proportion of the seed consists of scales or infertile material. The result of this is that seedlings often come up so thickly that the individual plants have not room to develop, and the lower branches and leaves are continually in a moist condition.

Seedlings standing thinly in the beds are not only usually free from disease, but are more robust and better rooted than crowded plants, and better able to resist attacks of *Keithia* should they occur.

Nurseries in which the disease has appeared should not be used for raising seedlings for several years, after which probably the ground has again become sterilised as regards this particular organism. *A. C. Miles, Rathdrum.*

## THE ALPINE GARDEN.

### LITHOSPERMUM PROSTRATUM.

One would like to get at the truth as to the cultural requirements of this beautiful plant. There is a widespread belief that it dislikes lime in the soil, but early in October of this year, at Oxted, in Surrey, I found it growing in great vigour and flowering profusely in a mixture consisting of one part of lime refuse

a spade in August, to cut off the roots and reduce its feeding capacity, but all to no purpose. I also exchanged a specimen of my plant for one from the Edinburgh Botanical Gardens, but whilst the plant I sent to Edinburgh flowered, the one I received in exchange simply grew and grew and seems to me to be better adapted for cattle feeding than garden decoration! I wonder if any of your readers found it thus with them, and if so have they found a cure? My gardens are in Renfrewshire, a district fairly wet and not too liberally supplied with sunshine. *Formakin.*

## PLANTS NEW OR NOTEWORTHY.

### JASMINUM REX.

This distinct Jasmine from Siam (Fig. 142) occupies the first plate, t. 8954, in the recently issued volume 148 of the *Bot. Mag.* *Jasminum rex* was first discovered by Mr. Henry James

FIG. 142.—JASMINUM REX; LIFE SIZE; FLOWERS PURE WHITE.

to two parts of loam. Again there is a question as to whether it wants full sun or, as many believe, that it grows best in partial shade, and yet in another garden in Oxted, at the same time of the year, I found many plants growing magnificently on a retaining wall facing full south. In the latter position it was not only flowering but seeding freely, and I have in a pot a number of seedlings raised from seed then collected. *Wm. Somerville.*

### GENTIANA SINO-ORNATA.

I was much interested in the article on *Gentiana sino-ornata*, in your issue of the 25th ult., as also in the illustration of the plant bearing such profusion of bloom. I have possessed this charming little Alpine for quite a number of years now, having been presented with a specimen from the Edinburgh Botanic Gardens shortly after its introduction, but do as I will, I cannot get it to flower. It grows most luxuriantly, and makes large tufts and, though I have tried it in sunshine and shade, dampness and drought, in peat, leaf-mould, loam, sand, lime, ashes and every conceivable soil and situation, it absolutely refuses to flower with me. I have also chopped round the plant with

Murton, an old Kewite, who was gardener to the King of Siam from 1830-1882. The Herbarium specimen at Kew is dated "February 1882, Kao Soy Whow, 7,000 feet," Chantabun being his headquarters at that date. It is only, however, so recently as 1921 that a living plant in a Wardian case was received at Kew from Mr. F. S. Sanitwongse, Bangkok, Siam. This gentleman describes it as a most beautiful climber on a pergola in his garden at Bangkok.

In a stove or warm, moist greenhouse, growing in a pot, *Jasminum rex* does not appear at present to be a rampant climber. Rather does it suggest a plant for training balloon fashion. The leaves are broadly oblong up to 4 inches long by 2½ inches wide, dark green above, paler beneath. The pure white flowers are borne in drooping cymes of two to four flowers, and are 1 inch to 1½ inch across, with a peduncle about ¾ inch long. Most of the flowers are eight-lobed, rarely seven or nine-lobed, though, curiously enough, in the spray figured, both a seven and a nine-lobed flower are represented. The name *rex* or "king" fittingly denotes the size and purity of the flower, and the only regret is that the blooms lack fragrance. *A. O.*

## EXHIBITING DAHLIAS.

(Concluded from page 340.)

As the selected bud grows, and reaches the stage of showing colour, the anxiety of the exhibitor increases. Earwigs and caterpillars are ready to damage the bud by eating all round the tips of the florets or boring holes into the bud, thus rendering the flower useless for exhibiting. Many remedies have been, and are, tried, with varying success, such as bagging the bud, the bag being made of soft muslin, or other similar material. This is well up to a certain point, but if the bud is kept too long in the bag the shape of the bloom is spoiled, as the petals become fluted and hug one another. In the case of show flowers, white Cactus Dahlias are likely to have the tips of the florets broken by dew settling on the muslin bag, or by rain. Another plan is to put a box round the buds and put a glass top on the box; this is to draw up the bud or flower, and is an everlasting nuisance that would deter many folk from exhibiting. A simpler and better way is first to tie the bud to a stick to prevent damage from wind (and we generally get wind about show time), then get a sheet of good cotton wool, pull out the fleecy part, and tie it loosely around the stalk of the bud, say about 6 inches down; it must not be tied so tightly as to stop the flow of sap or to cause a wound. Earwigs and caterpillars do not like cotton wool, as it impedes their progress towards the bud or flower. This is an easy, lasting, and cheap method of protection, and one that has been practised by exhibitors for many years. Moreover, it will not cause disfigurement as a box or bag does. Another method, though not so often practised, is to get a piece of good rubber, melt it over a lamp or candle, and let the liquid drop into a little vessel; when so melted, it will be like treacle and will continue soft. When it is cold daub a little on the stem of the bud, about the same distance as recommended for cotton wool, and it will remain sticky for a long time. Insects cannot crawl over it, and there is no need to remove it, or the cotton wool, until the bloom is cut. Flowers grown in the open are more natural and beautiful than those grown under the artificial methods some growers adopt.

It will often be found necessary to shade the flowers to protect them from strong sunshine, or to retard them; but when shading is practised the material used should be tied securely to a stake, otherwise the wind will blow it about and damage the bloom. Shades may be made or purchased; but, as a rule, exhibitors do not consider the cost so much as the production of good blooms. Very often blooms of the best quality are shown by those who do not use special protectors, but simply give their flowers consistent care and attention.

The smaller varieties need no shading or protection; they produce their blooms so freely that if some are spoiled it is not an important matter; but the adoption of the same methods as advised for the larger flowers would be safer, especially for a very small exhibitor.

Some folks have an idea that a Dahlia plant should be defoliated and otherwise mutilated, or exhibition blooms cannot be produced. I am repeatedly asked whether the leaves should be cut off, or the plants be reduced to one stem; all this is nonsense, and where the idea came from is a mystery. If common sense is applied to the growth of the Dahlia, and after the exhibitions are over the plants are "let go," they will produce a large number of flowers suitable for cutting or remain in the garden as decorative subjects.

We need hardly wonder that the Dahlia has been banished from many gardens; flower-pots set on stakes to catch earwigs are not beautiful, and at times a real nuisance. Dahlia plants with many stems grown from old stools are frequently neglected, or all the growths are tied together like a faggot! Rightly grown a Dahlia plant should be a beautiful object and worthy of a place in any garden, producing grand

\* A paper read by Mr. J. T. West, Brentwood, at the Dahlia Conference, held at the Royal Horticultural Hall, Westminster, on October 17.

flowers for exhibition or for decorative purposes; and a grower will learn in a very short time that some of the best exhibition sorts are also the best for decoration in the garden and in the home.

I hope that a better idea of the usefulness of the Dahlia for all purposes may be the result of the forward policy of the National Dahlia Society.

Whatever section of the flower is grown for exhibition, extreme care must be taken in cutting the blooms. Cut those flowers that will improve rather than "go off." A weak eye or centre will cause loss on the exhibition table, as the "eye" is the first thing the judge looks at. If the centre is weak, with the florets showing signs of drooping, however large the bloom may be, the chance of winning a first prize is reduced to a minimum; younger and fresher blooms are always given the preference, at any rate by a competent judge. Exhibitors should endeavour to set up their blooms apart from other exhibitors; for it is easy to make mistakes, and there is the danger of an exhibitor getting into a discussion concerning the name or quality of a flower and so on, and thus time is wasted, and the judges are ready to do their work before the exhibitor is ready. The exhibitor gets flurried, bad staging is the result, and prizes are awarded elsewhere. Exhibiting is like everything else that is worth doing: it must be done well. On the morning of the exhibition it is a good plan to mind one's own business first and compare notes afterwards, if time permits. The display of Dahlias, as with all other flowers, is subject to varying tastes. Some exhibitors use small, and others large, vases, some prefer stands and other wired frames; still others show their blooms on boards, but whichever plan is adopted, let each flower show off its individual beauty. If on boards, let every bloom stand well up and without touching the board. The blooms may be shown in vases with long stems, and not held up or supported by anything, such as Berberis or other hardy foliage. If the latter is used, let it be the garnishing, not the chief item, as flowers can now be shown quite free of all extraneous foliage and yet support themselves.

The object of this paper is to persuade the smaller grower to exhibit his flowers in as practical a manner as possible. Prizes may come at the first effort or they may not; it is certain they will come if he keeps on trying. Our Society needs the support of small exhibitors. At one time in its history it was not an uncommon thing to see sixteen or eighteen small growers showing in one class; to-day one rarely sees more than three. Competition is needed in everything if the best is to be obtained, and the Dahlia will continue to improve if everyone does his best to secure plenty of new members—some for sympathy, but many more as exhibiting members. The trade growers are quite able to look after themselves as regards exhibiting, and they will gladly advise the smaller growers if asked to do so, as will all workers on behalf of the National Dahlia Society.

## INDOOR PLANTS.

### LEPTOSYNE STILLMANII.

This is one of the quickest flowering annuals in cultivation. Its yellow flowers are used for decorations, as they last well when cut, but the use of the plant as a pot specimen is not so well known.

Make a sowing in January, placing the seed pan in a house having a temperature of 50°. Prick out the plants when they are about half an inch high, into 3-inch pots, placing about five plants in each receptacle. As soon as the pots are filled with roots, transfer them to pots 4½ inches in diameter, using nearly all loam and sand, and a very free drainage.

As much air as possible should be admitted, and the plants grown near the roof-glass. Do not over-water them, and if artificial manure is used it must be given in very small doses. Keep the dead flowers picked off, and the plants will continue blooming for some considerable time. J.

## ORCHID NOTES AND GLEANINGS.

### ABNORMAL CYPRIPEDIUMS.

SEVERAL cases of abnormal flowers of *Cypripedium* have appeared this season. The departure from the regular form is due largely to the very complicated ancestry of the plants, and the excessive vigour now in many cases imparted by high cultivation. The changes are of two kinds, those with regular arrangement of the misplaced segments, such as the dividing and spreading laterally of the lower sepals, which usually retain their normal greenish colour on the lower sides, while the upper ones are enlarged and coloured like the dorsal sepal; and those which have mainly diverted and twisted organs, in which the parts are confused, and in some of which parts of two flowers appear in one abnormal head. Those of the first, with regular features, have enhanced floral beauty, and, unfortunately, are tolerably constant; but those of the latter, while being highly interesting, are not desirable except as curiosities.

Harold Wigan, Esq., Belmont Park, Bedhampton, showed at the meeting of the Royal Horticultural Society on the 28th ult. a specially interesting specimen in which the bract of the flower was normal and spotted with purple in the usual way, but from the apex was continued a true green leaf about 3 inches in length—a foliaceous bract, but with the parts distinct. One petal was normal, and the other incorporated in the sepals, which also bore spotting obtained from the malformed dorsal sepal. The lip was perfect on one side, but the other resembled a crumpled lower sepal.

Messrs. Sanders, St. Albans, have sent us two flowers of the *C. Pyramus* class, one of which is very showy. In the regular position there are three dorsal sepals, all white, heavily blotched with claret-red. The petals also are of the usual shape, but the lip and staminode very much distorted. The other flower has all the segments abnormal, the dorsal sepal being reduced in size by the part which has joined a lower sepal.

### CYPRIPEDIUM ONON.

A FLOWER of a new hybrid raised between *Cypripedium* Lord Ossulston (*Charlesworthii* album × *Leeanum* virginale) and *C. Psyche* (*Lellatulum* × *niveum*) is sent by Mr. J. T. Barker, gardener to the Duke of Marlborough, Elenbeim, Woodstock, Oxfordshire. The dorsal sepal is like that of *C. Charlesworthii* album, white with dark purple band, and some thin rose lines at the base. The petals are broad and curved slightly. They are cream-white, with feathered mauve lines. The short lip is coloured like the petal externally, but the infolded side lobes are white. The column and staminode are white, with a ruby-red blotch.

### CATTLEYA JULES SERRU.

MESSRS. SANDERS send a grand flower of this showy hybrid raised in their Bruges' establishment between *C. Warscewiczii* Sanderiana and *C. Dietrichiana*, and named after their clever Orchid grower at Bruges, M. Jules Serru, who thinks it is the finest of the large-flowered *Cattleyas* yet raised there. The flower measures 7 inches across the extended petals, which are over 3 inches in width, and of bright mauve colour with dark veining. The lip, which is 4 inches across and well displayed, is crimped at the margin and slightly fringed; its colour is intense violet purple, the base of the tube being Apricot yellow with fine gold lines.

### BRASSO-LAELIO-CATTLEYA LEMONIANA.

This fine novelty, which was raised by Messrs. Flory and Black, Slough, between *B.-L.-C. The Baroness* (B.-C. Mrs. J. Leemann × *L.-C. Ophir*) and *Cattleya Schröderae* album, continues the handsome set of which the collection of Baron Schröder has always held special interest. The flower has the main features of *B.-L.-C. The Baroness*, but enlarged and made more *Cattleya*-like by the introduction of the white form of *C. Schröderae*. The sepals and broad, crimped petals are cream-white, and the fine labellum at the fringed margin cream-white, the base and middle area being orange colour, changing to lemon yellow towards the margin.

## HARDY FLOWER BORDER.

### ANOMATHECA CRUENTA.

LOOKING back upon the flowers which I have seen during the past season, I have been impressed by the infrequency with which the bright little Irid, known as *Anomatheca cruenta*, has come under my notice. It seems, indeed, as if but few are acquainted with its beauty, and this is, I think, especially true of the many amateurs who own town and suburban gardens. These have comparatively infrequent opportunities of seeing such flowers. Were they acquainted with this bright little Cape bulbous plant they would, I feel sure, cultivate it to their great gain. Much of the neglect it is at present experiencing is, no doubt, due to the fact that it is not absolutely hardy, except in the warmer parts of the kingdom, and, although it has been in past days recommended for even more districts than I should feel justified in doing, it has not justified the optimistic advice to plant it more largely as a permanent occupant of the hardy flower border.

Apart from the warmer districts, such as the south of England and Ireland, and favoured places along the coast line further north, it is advisable to treat it as a half-hardy bulb, planting it in March, and lifting the bulb when the foliage is ripe.

In the warmer parts, grown in well-drained, sandy soil, it is hardy and increases rapidly, so that in a year or two the clumps may be divided; while in some places where it ripens its seeds well, these may germinate even in the open; but it is more prudent to save them and to sow them in pots or pans when ripe.

I have seen some charming, informal groups of the plant in borders, where this *Anomatheca* is hardy and seeds well. Coming up among other and dwarfier herbage, the brilliant carmine-crimson flowers on short spikes gave a most delightful effect for a long time in summer and autumn. In this connection it is well to mention that this flower looks better in the shade than in the sunlight, so that it may with advantage be planted in a position shaded from the sun at a time of the day when the garden is most frequented.

I am anxious that the *Anomatheca* should become once more a favourite, and I am confident that those who know it best will not think that I am according it too high praise. It varies in height from about 6 to 12 inches, according to the nature of the soil and other conditions. The depth at which to plant may vary with the nature of the soil. In a light compost about 3 inches would be a suitable depth; in heavier soil a depth of 2 inches will be ample, but if intended for permanent planting it is well to have the bulbs not less than 3 inches below the surface. In addition to the typical carmine-crimson *Anomatheca*, there is a rare white variety; this possesses the coloured spot at the base, which, in a deeper form, adds distinction to the type. A rose-pink *Anomatheca*, named *A. juncea*, is recorded, but I do not think this species is in commerce.

### ARABIS LUCIDA VARIEGATA.

It is possible to visit many gardens without finding the old *Arabis lucida variegata*, which, at one time, was much employed as edging or as a carpet bedder in conjunction with other plants of distinctive foliage. Now it is but rarely cultivated at all, and is becoming far from plentiful even in nurseries. In this respect it has shared the fate of many plants with variegated leaves, which are not so popular as they were at one time. Personally, I do not care much for *Arabis lucida variegata*, but there are some who may be in want of such a plant, and who may care to know something about it. It is excellent in its way for edging borders or beds, as it makes good rosettes of shining, longish leaves, distinctly edged with gold or silver, the former, I think, being more plentiful than the latter. It does not like a hot, dry soil, and I know one good garden in which it was employed rather largely along the edges of some formal beds, and where the surplus, after annual division and replanting, was disposed of to English nurseries in exchange

for other plants. In the south, this *Arabis* does not thrive so well as in the cooler north. It seems to prefer a fairly heavy and rich soil. It needs to be divided annually, and the offsets planted separately, to form larger rosettes for another year. Its variegation is more pronounced and the plant is much better adapted for its purpose as a variegated edging subject, if the flowers are pinched out as soon as they can be seen in the heart of the plant. The blooms are worthless from a garden standpoint. Annual division is desirable, as has been suggested, and any plants which show a tendency to revert to the normal green leaves should be discarded. *S. Arnott.*

## THE BULB GARDEN.

### IXIA AND SPARAXIS.

THE *Ixia* is a native of the Cape; it has a small corolla and is a member of the Iris family. The plant abounds so freely in its native land

FIG. 143.—SPARAXIS FIRE KING.

as to constitute much of the herbage, and it is commonly known as the African Corn Lily. The flowers are of various colours, red, white, yellow, and, strange to say, green, and when the sun shines on them, and the blooms open wide, a gorgeous picture is revealed. The height is about 12 inches, and it is surprising that such a small corn is capable of producing a large spike of bloom. The roots are cheap, and for a trial one hundred or fifty of the mixed varieties might be planted at a cost of about 5s. per hundred.

The name of *Sparaxis*—also from the Cape—is derived from "sparasso," to tear, because of the torn appearance of the spathes. These also have flowers of white, yellow, and red colours, and they are not more than 6 inches in height; but, perhaps, equally as beautiful as the Corn Lily.

Both need practically the same cultivation. They are not quite hardy, but will bear a little frost. As they start into growth early, it is not wise to plant the corns until December or January. A light, sandy soil, fairly rich, in a dry, sunny situation, suits them, and the corns should be planted 3 inches deep and the same distance apart. Should all go well, a wealth of bloom may be expected in the early summer, and no buyer will regret investing in a few of these charming occupants of the garden.

Good varieties of the *Ixia* are Beauty of Norfolk, pale yellow; Emperor of China, deep yellow; *Bucephalus*, crimson; White Swan, white; and *Viridiflora*, green; whilst of the *Sparaxis*, Scarlet Gem and Fire King (Fig. 143) are both excellent. *T. D. T.*

## MARKET FRUIT GARDEN.

As compensation for a wet summer we have had a dry autumn. Only 1.76 in. of rain was measured during November at my place; and it would have been a very dry month indeed if there had not been a rather heavy shower on the last day. The land is now drier than it usually is at this time of year, and wells are low. It is clear that the wet summer was hardly enough to make up for the drought of 1921.

### CONDITION OF FRUIT TREES.

In some ways fruit trees have not behaved as one might expect in a wet season. They have not made a lot of growth. Newly-planted trees, in some cases, have almost stood still. This is probably because May and June were dry months. Fruit trees make their most active growth from the middle of May to the middle of June; and the extent of it depends partly on moisture stored in the soil during the previous winter, but also on the rainfall of April and May. We had a wet April, it is true, but the moisture did not penetrate far; and a dry May followed. July, August and September were months with over-average rainfall; but that came after the most active growing period, and would not have much influence on the wood growth of this year.

It seems to me that the weather of one year influences the behaviour of fruit trees in the next more than we are apt to think. We evidently had to get a long way into 1922 before the trees fully recovered from the severe drought of 1921. It seems quite possible that we may next year see the result of the rainfall of the recent summer. Although it came too late to force growth this season, it was probably the reason of the leaves hanging on late, which is always a good sign, and of the well-budded appearance of the trees now. Prominent fruit buds in autumn are likely to give strong bloom in spring.

On the whole, orchard trees are looking very well at present. There is not much scab on the young shoots of Apples, and less dead or diseased wood to be cut out of Plums than usual. Plums have made more growth than Apples, in spite of their heavy crop.

### END OF APPLE SALES.

I have finished selling Apples for this year, but have stored all the late cooking fruit that is sound enough to keep. This will probably realise considerably higher prices in February. Prices generally drop during late November and early December, owing to the heavy supplies of imported fruit. Fortunately, Apples promise to keep very well.

It has been one of the worst marketing seasons on record. Several causes have combined to bring this about. Cheerless summer weather and general scarcity of money spoil the demand for fruit, whilst supplies were heavy both from home and overseas growers. Bad trade in most other countries diverted to England more than her normal share of fruit from all over the world, so that imports were on an unusual scale. These are adverse conditions which will pass in the course of time. There is another factor which growers are almost unanimous in blaming as a potent cause of slow trade: our present system of distribution. This will remain unless organised efforts are made to bring about an improvement. It is to be hoped that the inquiry promised by the Ministry of Agriculture will prove to be the starting point. The problem will not be easy of solution, but it must be tackled for all that. No one can doubt that there is far too wide a margin between the price of fruit to the grower and the cost to the consumer. Between these two stand the railway company, the salesman, and the retailer. The inquiry should discover which of these, if any, is getting too big a share of the spoils.

Meanwhile, the grower will find his best remedy to lie in the improvement of the quality of his fruit and his packing. Never has a season shown more forcibly the importance of these matters. Good fruit well packed has sold fairly; poor or badly-graded fruit has been difficult to sell at any price. I have found

it best, this year, to send high-grade fruit only to certain markets, and dispose of the lower grades in a market recognised as having little appreciation of quality. The financial result of the year's work has been far more satisfactory than in 1921, largely because of better management of the marketing.

#### WINTER MANURING.

One of the first jobs to consider as soon as the fruit harvest is ended is the manuring of the plantations. As all my bearing trees received in August a mixture of fertilisers supplying nitrates, phosphates and potash, intended for feeding the fruit buds, I conclude that a bulky nitrogenous manure is all that is needed as a winter dressing, the object being to assist growth during the next season. Results of American investigations indicate that nitrates are the most important food for fruit trees; so I am trusting to the August dressing to supply enough of the other two foods, phosphate and potash. Slow-acting organic manures are generally preferred, and are certainly best on my light land, to improve its water-holding capacity. Only a very small amount of farmyard manure is obtainable locally, and town stable manure is dear when its poor quality is considered. The choice, therefore, rests between certain bulky organic manures. There are several of these, but only four or five of them are purely nitrogenous. These are dried blood, ground hoof, greaves, waste hair, and wool shoddy. Dried blood is more suitable as a spring than as an autumn dressing, being fairly quick-acting; and it is not bulky enough for my purpose. Ground hoof is freely used by growers, but it is such indestructible stuff that it must be very slow-acting indeed. Greaves, hair, and shoddy are materials of a very similar character, and the choice really depends on a comparison of the price of the unit of ammonia in each. Quotations made to me indicate shoddy as the cheapest at present. I have used this material with much satisfaction before, and have ordered it again.

Shoddy needs buying with care. The fairest method is at so much per unit of ammonia per ton, the vendor and purchaser sharing the analyst's fee. I do not want shoddy of too high quality. I would sooner apply two tons per acre of a 7 per cent. shoddy than one ton of shoddy showing double the percentage of ammonia, because it is easier to distribute the heavier dressing, and it supplies more organic matter. Then there is the mechanical condition to consider. This varies enormously. I have had shoddy moist and in large lumps, similar in appearance to farmyard manure. This was good stuff, but impossible to spread at a lower rate than three or four tons per acre, which makes an expensive dressing. A wool dust is preferred, as this is generally dry and quite easy to distribute at the rate of two tons per acre or less. It ought to be ploughed or dug in as soon as possible after application.

#### MANURING GRASS ORCHARDS.

I have one grass orchard which must be treated in a different way. Shoddy is unsuitable here, as it would be an endless time working its way in through the turf, if it ever did. The usual way of manuring a grass orchard is by grazing cake-fed stock on it. This is easy where the trees are standards, but mine have only 3 ft. stems. Pigs or sheep suggest themselves, but there is always the trouble of finding a different run for them when spraying is in progress; so I prefer to do without stock. Farmyard manure has generally been used in this grass orchard; but it seems to me that there is no need to go to the expense of an organic manure, considering that the grass is mown annually and allowed to rot on the surface. This must supply plenty of organic matter. Therefore, I am going to rely on mineral fertilisers. This orchard received the same complete mixture of bud-feeding artificials in August as the rest of the farm; so I consider that it needs only nitrates as a winter dressing. I shall give it 2 cwt. per acre of nitrate of soda in early spring, just before the flowers expand. *Market Grower.*

## FORCING VEGETABLES.

GROWERS with sufficient houses and frames at their command should have no difficulty in producing choice vegetables much in advance of the ordinary outdoor crops. Fallen leaves, which are now plentiful, should be raked together and carted to the frame yard ready for making into hotbeds. The leaves mixed with long stable litter, form excellent material for the making of hotbeds for raising early crops in frames, and the quick growth made under these conditions is very tender and succulent.

The short and stump rooted varieties of Carrots, Turnips, Beets, and Radishes may all be forced in this way, and be available for use in the early months of the coming year. Two parts of leaves to one part of litter, well mixed two or three times, and built up into a solid bed, will promote a steady warmth for a long time after the excessive heat of early fermentation has declined. A bed ten feet wide and twenty feet long will accommodate two frames six feet by eight feet each, and allow two feet all round the outside for adding more fermenting material as required.

Larger beds may, if desired, be made to accommodate more frames; in fact, the larger the bed the longer will the warmth be maintained. After the material has been placed in position and well trodden, allow it to stand for a few days and then place the frames upon it. At the same time thrust a stick into the centre of the bed and examine it daily, and when the heat is seen to be on the decline fill the frames with the soil required. Place the lights in position and again leave the frame for a few days. The covering of soil will probably cause the temperature of the bed to rise again through conserving the heat. Therefore, plunge the testing stick in again to ascertain when the warmth is suitable. Potatoes, provided suitable varieties are selected, may be forced with success under these conditions. The "seed" for this purpose should have been set up previously in boxes or trays, containing a little leaf-mould for them to stand in, and placed in a cool greenhouse to sprout.

Frames intended for forcing Potatoes should be half-filled with a compost consisting of one part good fibrous loam, well broken apart; one part leaf-mould and two parts old potting soil, such as that in which Chrysanthemums have been grown, with a liberal sprinkling of wood ash and a little soot added. As soon as the tubers have made sprouts about half an inch long, they should be planted in the frames about one foot apart, and covered with two or three inches of soil. Make the latter fairly firm, and do not water it until the Potatoes have commenced to grow, and not then if the weather should be very cold; there will be sufficient moisture from the hot-bed to satisfy the plants' wants for some time. A little air should be admitted to the frames in the daytime, but the lights should be closed early in the afternoons to conserve the warmth. In the event of severe, frosty weather, the frames should be well protected with mats, on the top, and by plenty of leaves and litter placed around the outside.

As the season advances and the weather becomes warmer, more air may be given, and if the soil requires watering use tepid water from the greenhouse tank. When the top growth is about six inches or so high, place a little more soil round the plants, and slightly lift the frames to allow the growth more head room.

Potatoes may also be forced in pots or boxes, placing three tubers in a ten-inch pot. The forcing may be done in a Peach house or vinery. This method has one advantage; the receptacles may be removed to frames if the room is required, and from thence to the foot of a south wall, where they may be protected at night. Good crops may be had in this way, and the pots will be available when they are needed for growing Tomatos or Chrysanthemums. Asparagus may also be forced

quite easily in frames on hotbeds, by employing much the same methods as for Potatoes, except that the crowns will not require so much soil on the surface, and this should be kept fairly well watered with tepid water. The flavour is not quite so good as of that grown outdoors, but, nevertheless, the heads are very acceptable at this early season. The crowns are not of much use after being forced. Suitable varieties of Turnips, Carrots and Beet may all be forwarded by sowing seeds in frames on a hotbed, drawing drills about six inches apart in a similar compost to that advised for Potatoes. The frames may be nearly filled for these, and two or three inches of sifted soil placed on the surface for the reception of the seeds. Sow thinly and water in, and then close the lights and shade from the light until the seeds have germinated, taking care to watch the temperature of the bed. Admit a little air to allow the ammonia from the manure to escape, and cover at night in the event of frost. Thin the seedlings out as soon as large enough to handle, and draw a little soil up to them to afford support. Syringe them with tepid water on bright afternoons, and close the frames to encourage quick growth; and as the plants gain strength admit more air to prevent them becoming drawn and weakly.

Young, forced roots of Carrots are particularly useful, and are always much appreciated, whilst round Beet is much in favour for the making of early salads.

Radishes may be grown very quickly in warm frames. Sow a few seeds at a time and not too thickly, so that the largest roots may be pulled and used, leaving room for the others to swell. There are many varieties which may be used for this purpose, and nearly all are good.

Lettuce is another crop which responds readily to forcing in frames, and especially the small Cabbage varieties. These may be obtained by sowing a pinch of seed in a warm house, pricking the seedlings out into boxes, and growing them on in a warm temperature until they have made two or three rough leaves, when they may be transferred to the frames and placed about six inches apart. Plant firmly, and well water the roots. Damp them overhead every afternoon, and keep the frame closed, for the roots must never be allowed to become dry. The plants will mature quickly. Fresh, young Lettuces are appreciated perhaps as much, if not more, than any other forced vegetable, and every effort should be made to produce them as early as possible. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

## HOME CORRESPONDENCE.

**The Late Sir Isaac Bayley-Balfour.**—Sir Isaac Bayley-Balfour was more than a great botanist, for he excelled in practical knowledge of plants and their ways, their cultivation and propagation. He was, too, an admirable administrator endowed with acute judgment, tenacious of his objective, yet knowing well when to yield. He was trusted alike by a succession of official chiefs and by his staff, and he would have scorned to "let down" any of the latter. The present status of the Edinburgh Botanic Garden as standing proof of his administrative powers. It is also an adequate memorial to the man who re-created it. Londoners have a constant reminder of Balfour's wide practical influence in the training of the trees in the Mall. Balfour's unique position as Regius-Keeper of the Edinburgh Garden was largely due to his very human qualities. He interpreted the duties of his office in a most courteous and liberal spirit, and although overworked of late years, was always accessible. His accessibility, coupled to an aversion to the delegation of his work, no doubt shortened Balfour's life. Although he might have had a hundred and one pressing matters on hand, the pilgrim who journeyed to Inverleith Garden for advice or assistance was never allowed to know it, and it was impossible

to discuss botanical or horticultural matters with him for ten minutes without learning something fresh. Of late years, as interest in horticulture increased and the fame of the garden spread, pilgrims grew more numerous and interruptions more frequent. At the same time botanical material for identification came pouring in from Western China and elsewhere. He was continually consulted on arboricultural, botanical and horticultural matters. The working day was not long enough, and in the result, the small hours of the morning often found "The Professor"—as he was affectionately known to his staff—still at his table, secure from interruption. It is small wonder that his not over-robust frame should have rebelled at last, but rather that it should have borne the strain so long. If ever a man sacrificed himself in the cause of science, it is he. Balfour had a warm corner in his heart for the keen horticultural amateur and made him especially welcome. He held that amateurs are the backbone of horticultural progress in Britain and that they should be encouraged; further, he took the view that it was part of the duty of the head of a national Botanic Garden to encourage them. He practised his principles in generous fashion, taking care to see that amateurs specially interested in any genera or species of plants were offered such specimens of new or old species as he had it in his power to give. He applied the same rule to the horticultural trade, merely stipulating that they should furnish him with plants needed in the Garden on reasonable terms. Largely through the generosity practised there in the distribution of plants, the influence of the Edinburgh Botanic Garden has spread to private gardens throughout the country. Though much hampered of late by ill-health, Balfour had been working on a subject which lay very near his heart, the elucidation of *Rhododendron* material collected by George Forrest—an old Edinburgh boy—for Mr. John Williams, of Caerhays. It is to him that we owe the inception of the method of determination of *Rhododendrons* by the character of the indumentum on the under side of the leaf, a discovery of which the importance is not perhaps fully realised. Those who have had the privilege of association with Prof. Balfour in his retirement know how his physical disability galled him, and yet with what courage it was borne. G.

**Potato Synonyms.**—Dr. Salaman, in his remarks on *Seedsmen's Catalogues*, p. 311, has taken the easy course of criticising an effect—which "looks the whole world in the face"—instead of manfully tackling the cause, of which he must be very well aware. Seedsmen, in general, did not raise, name, or put on the market the "new" varieties of Potatoes of which Dr. Salaman complains; this was done by so-called raisers. Seedsmen are therefore not responsible for the multiplicity of names. When a new variety was "boosted," they invariably accepted the raiser's description in good faith. No other course was possible. There was no Synonym Committee to refer to, and when the "new" variety was grown in the seedsman's own trial grounds alongside older sorts, it was probably distinct in habit, vigour, growth, or cooking quality. These differences may, of course, have been due to the "seed" having been grown in widely separated localities; still, the results were different, and Dr. Salaman must remember that no one had, as yet, taken the trouble to record the morphological characteristics of commercial varieties of Potatoes. Likewise, seedsmen are not responsible for the variations in price. It is the grower and the wholesale dealer—and generally of the Scottish variety—who put enhanced prices on the "sensational" stocks of Up-to-Date. And can it be wondered at if the seedsman said to themselves: "It must be a better sort; it costs more money." Let me quote from the 1921 Report of the Synonym Committee, of which Dr. Salaman is Chairman. In referring to the adoption of a "definition of synonymy" in 1920 (please note how very lately even these learned men were able to decide the question—"when is a synonym not a synonym?"), the Report says:—"They (the Committee) regard two Potatoes as

synonymous not only when they present precisely similar morphological characters as regards the flower, foliage, habit of growth, colour of stem, stolon formation, size, shape and colour of tuber, but also when the two varieties possess identical physiological characteristics as exhibited by identity of maturity and resistance, or susceptibility to Wart disease. Even then by this term they do not necessarily imply that these two varieties are of identical origin, though doubtless in the majority of cases they are. The possibility of two seedlings of different parentage presenting such a close, if not complete, similarity as to

FIG. 144.—DAHLIA IMPERIALIS.

mask their individuality has not been lost sight of. But the Committee have to deal with facts as they are; they have, therefore, regarded as synonymous all Potatoes which are identical in the sense used above, even when they knew that the origins were different." It will thus be seen that Dr. Salaman has unwarrantably expected of seedsmen in general a considerably greater degree of Potato wisdom and presence than is collectively owned by himself and his colleagues on the Synonym Committee, because Dr. Salaman has based his remarks on the contents of catalogues issued in 1921 and 1922, which were all printed and circulated before the issue in January or February of 1922 of the printed report referred to above. Another point, I do not find in any of the reports which I have by me a complete list of synonyms, which would enable seedsmen to identify Eclipse with Sir John Llewelyn, Midlothian Early with Duke of York, or Sensation

with Up-to-Date. It might, though I do not know that it would, be possible to get the necessary information by collating all the reports which have been issued from time to time, but surely this is expecting too much of the average seedsman, who is not in touch with the work of the Ormskirk trials, and sees only such abbreviated reports as appear in the trade Press. Finally, is the National Institute of Agricultural Botany doing its best to enlighten seedsmen by confining its discoveries to these reports whose existence is so little suspected, and for which the absurd price of 1s. 6d. is charged, the printing of which should not cost one-third that sum? Candidly, Dr. Salaman seems to me to be looking at this matter as through a pair of binoculars, focussing his attention and venting a good deal of vituperation on a selected portion of the landscape. Might I suggest that seedsmen will welcome reform in this matter, provided they are put on the right track, and can feel assured that the root of the trouble is receiving the necessary attention? E. Horton.

**Iris unguicularis.**—What a wonderful season this is for *Iris unguicularis*. The blooms are constantly expanding, and may be cut with a good length of stalk. The dry weather of late autumn has suited the plants admirably. James A. Paice, Aldenham Vicarage Gardens.

**Dahlia Imperialis.**—Mr. T. Hay's suggestion (see p. 270) that *Dahlia Imperialis* should be used for hybridising in order to obtain a new type of flower seems to me to be a valuable one, for the hybrids may be much dwarfer and yet show some of the striking characteristics of the parent. The species seems to be too tall (see Fig. 144) for general garden decoration, but, seeing that some of the modern varieties—for instance, those of the Mignon type—have a stature of only a few inches, there appears to be no reason why garden forms, with *D. imperialis* as a parent, should not be evolved of a size and habit more in keeping with garden requirements. The flowers are pure white and bell-shaped; they have been likened to small, white Water Lilies. But perhaps the value of *D. imperialis* is greatest for indoor cultivation, for, when specimens grown in the old orchard house at Chiswick were moved into a warmer house as the blooms were developing, they are said to have developed magnificent, pyramidal panicles of dazzling white flowers. The bell-shaped heads differ in form from the flat, disc-like single Dahlias, and the broad, white ray florets taper from the middle to the tip into very acuminate points, and are sometimes suffused with pink. Some years ago, in order to overcome the objection of exceptionally long stems, young shoots were grafted on the tubers of one of the dwarfier Dahlias, but Mr. Hay stated that he had tried this method and had failed. A better method, perhaps, than grafting would be to adopt that described by Mr. S. Mottet in his note on the plant in *Gard Chron.*, January 8, 1916, of pinching the main shoots when they are one or two feet high, in order that side shoots may develop. The species was sent from Mexico by Roetzl, but there is no record as to whether he found it growing wild or only as a cultivated plant in Mexican gardens. As the flowers begin to appear in December, and are said to last until Christmas is over, *D. imperialis* or its hybrids might make a useful addition to indoor flowering plants for winter. T.

**Lonicera Hildebrandtii** (see p. 263).—Some years ago we were successful in layering this plant, but not without great difficulty. I have since raised it from seed four or five years in succession. I find it best to sow when the seed is soft and green, over a brisk bottom heat of 75°. Some years ago we sent a plant to Messrs. J. Cheal and Sons, and last year we sent a two-year-old plant to the Earl of Crawford. Our specimen is in a cold house facing due south and trained against a wall. It was planted 14 years ago, and now covers a space of about 20 feet. H. Cunningham, Bishops' Hall Gardens, Romford, Essex.

## SOCIETIES.

### ROYAL HORTICULTURAL.

DECEMBER 12.—The concluding meeting of the year 1922 was held on this date, and the exhibition proved to be a somewhat small one, and, indeed, would have been very small but for the several excellent displays of Orchids. In addition to these, there were a few exhibits of Chrysanthemums, some of shrubs and alpines, and one of Begonias. Novelties were scarce, except among Orchids, and the attendance was small.

#### Orchid Committee.

*Present*:—Sir Jeremiah Colman, Bart. (in the chair), Prince Shimadzu, Messrs. Jas. O'Brien (hon. secretary), C. J. Lucas, R. Brooman White, Arthur Dye, H. T. Pitt, H. G. Alexander, J. Cypher, J. E. Shill, F. K. Sander, Chas. H. Curtis, S. W. Flory, T. Armstrong, Pantia Ralli, E. R. Ashton, Frederick J. Hanbury, J. Wilson Potter and G. F. Moore.

#### FIRST-CLASS CERTIFICATES.

*Vuystekeara Aspasia* (*Odontioda Charlesworthii* × *Miltonia Charlesworthii*), from Messrs. CHARLESWORTH, Haywards Heath. A superb development of their famous strain. The flowers are *Miltonia*-like in form. The sepals and petals are bronzy-crimson; the lip white with spotted lines of dark ruby crimson and a lighter flush in front.

*Odontoglossum Vega* (*King Arthur* × *Midnight*), from Messrs. J. AND A. McBEAN, Cooksbridge. One of the richest in colour of any *Odontoglossum* of the section. The plant bore a strong spike of large, claret-purple flowers with delicate silvery margins and pure white tips to the petals and front of the lip.

#### AWARDS OF MERIT.

*Odontioda Royal Scot* (*Odm. King Arthur* × *Oda. Coronation*), from Messrs. McBEAN. A charming flower of the class approaching *Odontoglossum*. The plant bore a spike of eight large flowers of rich reddish purple colour on the inner part, the outer being pure white.

*Cypripedium Etta* (*Mrs. Rickards* × *Chardwar*), from R. WINDSOR RICKARDS, Esq., Usk Priory, Monmouthshire. A superb addition to the dark class and of model form. The perfect dorsal sepal is white on the upper part and has large, confluent, blackish claret blotches changing to rose upwards. The broad petals and lip are tinged with purple, the petals being also spotted.

*Cypripedium Golden Fleece* (*insigne Sanderæ* × *Antinous*), from Lt.-Col. Sir GEO. L. HOLFORD, Westonbirt (gr. Mr. H. G. Alexander). A charming yellow form of the class of Westonbirt *Actæas Bianca*, but larger. The flowers are pale lemon-yellow with pure white upper part to the dorsal sepal.

*Sophro-Laelia-Cattleya Lustre* (*S. grandiflora* × *L.-C. Sandhage*), from Messrs. CHARLESWORTH. The flowers have very broad petals, coloured rosy-mauve with an orange-scarlet shade. The front of the lip is deep ruby-red.

*Cypripedium J. M. Black* (*Beryl* × *Hera Euryades* var. *Mirum*), from Messrs. FLOYD AND BLACK, Slough. A very distinct dark form of fine shape. The dorsal sepal is heavily blotched with blackish purple and is white in the upper half. The petals and lip are tinged and spotted with dark chocolate.

#### CULTURAL COMMENDATION.

To Messrs. J. AND A. McBEAN, Cooksbridge, for a noble plant of the rich claret red *Odontoglossum Orosius* (*Solon* × *Maillaneanum*), with three spikes bearing together thirty-six flowers.

#### GROUPS.

A Gold Medal was awarded to G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr. Mr. Page), for one of the best exhibits of *Cypripedium* yet staged. The plants were raised by Mr. Moore by following special lines in crossing, and the result is all that could be desired, the flowers being of the largest, the dorsal sepals developed to a surprising degree, and the colouring clearly defined.

A Certificate of Appreciation was also awarded for the remarkable advance in size and form in these hybrids. The crosses of C. Christopher were especially noteworthy.

A Silver-Gilt Flora Medal was awarded to Messrs. CHARLESWORTH, Haywards Heath, for a fine group of *Odontoglossums*, *Odontiodas*, *Miltonia* crosses and new hybrids, among which specially noteworthy were *Odontonia Luna* (*Odontonia Magali Sander xanthotes* × *O. crispum xanthotes*), a pretty white flower with straw-yellow markings, curiously following the colour suppression in the parents. The *xanthotes* *Odontoglossums* in the group were very effective and the *Laelio-Cattleyas* fine and various. H. T. PITT, Esq., was awarded a Silver Flora Medal for a very interesting group of hybrids and rare species. Among the best were the fine *Odontoglossum Solon Pitt's* variety, a model flower of rich colouring; *Laelio-Cattleya Majestica*, with a rich head of showy blooms; *Cypripedium Etta* *Resslyn* variety, and the tall carmine rose *Eulophiella Rolfei* (*Petersii* × *Elisabethae*).

MESSRS. J. AND A. McBEAN, Cooksbridge, were awarded a Silver Flora Medal for a compact group in which their high cultivation of *Odontoglossums* and *Odontiodas* was well displayed.

MESSRS. SANDERS, St. Albans, were awarded a Silver Flora Medal for a fine group, all the exhibits being good. A new *Cymbidium* and a new *Angraecum*, provisionally named *A. muribile*, with pretty, pure white flowers with a purple spot at the base of the lip; a good series of rare *Coelogynes*; the new green and white *Cypripedium Emerald* (*Curtisii Sanderæ* × *Maudiae*). Messrs. COWAN, Southgate, were awarded a Silver Flora Medal for a group of splendid *Cypripediums*, with various *Laelio-Cattleyas*, including a lighter form of their *Laelio-Cattleya Dodona*.

#### OTHER EXHIBITS.

Lt.-Col. Sir GEO. L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), sent *Sophro-Laelia-Cattleya Nada* (*C. fulvescens* × *S.-L.-C. Marathon*), a charming flower of a bronzy-orange tint; and the pretty *Cypripedium Ballet Girl*, with the lower sepals white and extended on each side.

PANTIA RALLI, Esq., Ashted Park (gr. Mr. Farnes), showed *Odontoglossum eximium* *Arghiro* of fine form and colour.

MON. HENRI GRARE, St. Fuscien, Amiens, sent *Odontocidium Graireanum* (*Odon. Thompsonianum* × *Oncidium macranthum*), a very interesting hybrid, intermediate between the parents, bearing a graceful spike of dark chocolate-red flowers with a few yellow markings.

#### Floral Committee.

*Present*: Messrs. H. B. May (in the chair), J. Heal, J. E. McLeod, H. J. Jones W. J. Bean, Sydney Morris, E. A. Bowles, Jas. Hudson, W. G. Baker, W. B. Cranfield, R. C. Notcutt, C. R. Fielder, W. B. Gingell, E. Harrow, R. Cory, C. E. Pearson, W. P. Thomson, and A. Turner.

#### AWARDS.

##### AWARD OF MERIT.

*Stranvaesia undulata*.—A low-growing evergreen shrub introduced to cultivation in this country from China by Messrs. Jas. Veitch and Sons, through their collector, Mr. E. H. Wilson, about 1901. It is a hardy species and very attractive when, in autumn, it carries a profusion of roundish, rich red fruits about the size of small Peas. The leathery, glossy, ovate-lanceolate leaves have wavy margins, hence the specific name. A few fruiting branches shown on this occasion indicated the attractiveness of this spreading shrub late in the year. Shown by LIONEL DE ROTHSCHILD, Esq., Exbury, Southampton.

#### CULTURAL COMMENDATION.

To Maj.-Gen. Sir C. HADDEN (gr. Mr. Oliver Hayles), Rossway, Berkhamstead, for finely grown plants of a pink-tinted form of the old, double *Primula sinensis*, with large blooms, and named *Rossway Beauty*.

#### GROUPS.

Bright weather was to open the numerous flower buds on the well-grown plants of *Ipomaea rubro-coerulea*, grouped by Messrs. SUTTON AND SONS, but, unfortunately, the sun did not shine and never a flower opened. Mr. G. W. MILLER provided a foretaste of spring with pans of Primroses and Polyanthus. Dwarf Conifers and branches and canes of interesting and rare species of Conifers were displayed in considerable number by Mr. G. REUTHE. Mr. F. G. WOOD showed a collection of alpines, including Saxifrages and Sedums.

MR. KEITH LUXFORD was the largest exhibitor of Chrysanthemums, and his handsome group (*Silver Banksian Medal*) contained vases of fine flowers of the yellow, Japanese variety *Ida*; the bronzy-amber *Teresa*; the crimson, decorative *Dr. Jacobs*, a new sort; *Mrs. Heneage*, an interesting *Anemone* variety, and numerous well-grown singles. Messrs. SCOTT AND WICKHAM, Witley, showed their new Chrysanthemum *Golden Butterfly*, of very brilliant colour, and suitable for market. Cream and pink varieties of *Favourite*, together with the white type, and vases of the new, amber-coloured *Winter Gem*, were shown in fine form by Mr. NORMAN DAVIS, while Mr. ISAAC GODBER, Willington, Bedford, contributed large flowers of his new deep golden-coloured Chrysanthemum named *Golden Star*, a decorative flower of good form, but a trifle soft in texture.

*Begonia Gloire de Lorraine* is always attractive when in flower, and the two dozen finely grown specimens exhibited by J. B. BODY, Esq. (gr. Mr. C. Hay), Hindhead Court, Hindhead, were greatly admired. Many of the plants were nearly a yard through and 2½ feet high, and smothered in flowers (*Silver Flora Medal*). A similar award was made to Messrs. STUART LOW AND Co., for their pleasingly arranged group of Carnations, in which we noted fine examples of such pink varieties as *Laddie*, *Mrs. T. Ives*, *Eileen Low*, *Lady Inverforth*, and *The Hon. Nita Weir*, displayed among white, yellow and scarlet sorts. Mr. C. ENGELMANN and Messrs. ALLWOOD BROTHERS also contributed groups of Carnations, the former showing *Laddie*, *Benora*, *Cupid* and *Saffron* in fine form, while the *Wivelsfield* firm had *Wivelsfield Apricot*, *Edward Allwood*, and *Dianthus Allwoodii* var. *Hugh* with deep crimson-purple, semi-double flowers.

Fragrant Violets, including especially good blooms of *La France*, were shown by Mr. J. J. KETTLE; a smaller group of Violets was submitted by the HAYDEN VIOLET GROWERS, Blandford. In one corner of the hall the ROLVENDEN NURSERIES showed small but elegant blooms of winter-flowering Sweet Peas, among which the varieties *Flamingo*, *Mrs. Kerr* and *Blue Bird* made the strongest appeal to us (*Silver Banksian Medal*).

MR. SYDNEY MORRIS, Norwich, brought up some splendidly fruited branches of a seedling form of *Cotoneaster frigida*; the fruits were of brilliant red colour, produced in wonderful profusion and extremely attractive.

#### Fruit and Vegetable Committee.

*Present*: Messrs. C. G. A. Nix (chairman), H. S. Rivers, E. A. Bunvard, Geo. F. Tinley, A. Smith, W. F. Giles, S. B. Dicks, G. Reynolds, A. Bullock, A. Metcalfe, E. Beckett, E. A. Merryweather, W. H. Divers, W. Wilks, J. Cheal and A. N. Rawes.

The only awards made by this Committee were a *Silver Banksian Medal* to Mrs. MILLER, Mowle, Marlow, for a collection of preserves; a *Silver Banksian Medal* to Messrs. WESTMACOTT AND Co., 368, Strand, for tinned and preserved fruits from South Africa; and a *Bronze Banksian Medal* to Miss SEWELL, 67, Harcourt Terrace, South Kensington, for marmalades and jams.

The deputation which inspected the seedling Grape shown by Mr. W. BUTCHER, of Ecclesdon Manor, reported very favourably on the variety and recommended it to be tried with standard varieties at Wisley. The name *Ecclesdon* has been given to the variety, the fruits of which keep well to the end of February. It is stated that the vine is a remarkable specimen, with

the main rod some twenty-two feet long from which short, fruiting rods ascend to the top of the vinery, which is only heated on very rare occasions. The vinery is shaded by Elm trees, and receives only two or three hours' sunshine each day. The vine is stated to be absolutely distinct, especially in leaf, and the pips are bright red. With regard to the origin, it is stated that some white Grapes were given to the owner thirty years ago during an illness, and a pip was saved from the biggest berry, which, when sown, gave rise to the seedling.

Mr. W. F. EMPTAGE showed a coloured fruit of Newton Wonder, said to have originated as a bud sport with Mr. C. DICKER, Holwell Bury Fruit Farm, Hitchin.

**ROYAL CALEDONIAN HORTICULTURAL.**

DECEMBER 5.—The last monthly meeting of this society for the session was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. David King, president, in the chair. In opening the proceedings, the CHAIRMAN made sympathetic reference to the deaths of Sir Isaac Bayley Balfour and Mr. George P. Berry, and it was resolved to send letters of condolence to Lady Balfour and Mrs. Berry.

The meeting was an open one, and interesting discussions took place on the decline of the show Pansy as an exhibition flower; the Chrysanthemum leaf-miner grub and its ravages; and the most suitable trees for town planting.

Office-bearers were nominated to fill the vacancies caused by retirements by rotation, at the annual business meeting, which will be held on January 10, 1923, and at which the elections will take place, Lord Elphinstone being nominated for the honorary presidency, and Mr. McHattie for the presidency.

The exhibits were: Gloxinias from Messrs. DOBBIE AND CO., LTD., Edinburgh (awarded a Silver Medal); large blooms of Chrysanthemums from the City of Edinburgh Parks Department, per Mr. McHATTIE (Cultural Certificate); Begonia Bowden Beauty from Mr. JOHN DOWNE, Edinburgh (Cultural Certificate); Pansies and Violas from Mr. C. COCKBURN, Pencaitland (Cultural Certificate); fruits of Amygdalus communis persicoides from Mr. M'ROBERTS, Dean Park House, Edinburgh (Special Appreciation).

**NEWCASTLE AND DISTRICT HORTICULTURAL.**

A LARGELY attended meeting of this society was held on the 28th ult., when Mr. Weidon, of the Agricultural Department of Armstrong College, gave a lecture on "Diseases of Potatoes." The lecture was followed by an interesting discussion. A special Chrysanthemum competition was arranged at this meeting, and Mr. J. Haley won the special prize for three splendid blooms of Norman Chittenden, Mrs. R. C. Pulling and Queen Mary.

**READING AND DISTRICT GARDENERS'.**

The fortnightly meeting of this Association was held in the Recreation Club Room, Abbey Hall, on Monday, Nov. 20, when Mr. H. N. Cook presided over the largest attendance of members assembled for many years past. The subject for the evening was "Onions." Mr. Dalby, Greenham Lodge Gardens, Newbury, gave a most instructive lecture on this popular vegetable. The lecturer dealt first with the preparation of the soil, and laid great stress on the importance of deep cultivation; following with other cultural details, including seed-sowing, transplanting, and after treatment. Watering and the use of artificial manures, excepting soot and wood ash, were strongly deprecated. He stated that during thirty years' experience he had never watered an Onion bed. An excellent discussion followed. In the competition for Six Onions the 1st prize was awarded to Mr. D. TURNER, the Gardens, Coley Park; 2nd, Mr. F. J. GREEN, Aldermaston Court Gardens; and 3rd, Mr. W. GOWER, Calcot Grange Gardens. In the non-competitive section a 1st Class Certificate was awarded to Mr. W.

SHARPE, Sidmouth Grange Gardens, for a vase of about three dozen Mary Allwood Carnations, and an Award of Merit to Mr. H. WYNN, Querns House Gardens, Goring Heath, for three vases of Chrysanthemums, and to Mr. G. GODDARD, Reading, for three dishes of spring-sown Onions.

At the meeting held on the 4th inst. there was again a large attendance of the members. The subject for the evening was "The Rockery as a Home for Alpines and Rock Plants," and this was introduced by Mr. P. Wiseman, Hare Hatch, Twyford. The lecturer dealt with suitable soil, rock materials, types of rockery, moraines, general effect of the rockery, with its surroundings; planting, propagation, including the raising of plants from seed, and closed with list of various kinds of plants for different positions and purposes in the rockery.

A competition for Apples resulted in sixty dishes being staged. Mr. H. Goddard, Bear Wood Gardens, showed the finest three dishes of dessert Apples, in which there were eleven entries, and also the finest three dishes of culinary varieties, in which class there were nine entries.

REMARKS.—There are little or no signs of increased demand for the Christmas trade, and conditions generally are dull. Trade in hothouse Grapes shows some improvement, and prices have hardened. The Apple market is feeling the effects of the large quantities available, and even low prices do little to stimulate the demand. It is likely, however, that the low prices prevailing should restrict future consignments of Apples from the United States and Canada. Bananas have advanced sharply in value owing to a considerable shortage due to storms in the Canary Islands. Tomatos from the same source have also advanced considerably in price. Oranges from Spain are a steady trade, with fair supplies on offer. Considerable quantities of Pineas are on the market, and their prices are moderate. Cob nuts, Brazils, Chestnuts and other nuts are all comparatively moderate in price. Choice vegetables, such as Asparagus, French Beans, Peas, new Potatos and Seakale, are all a fairly good trade. Green vegetables remain plentiful and cheap. French and English Lettuces and other salads are meeting a fairly good demand. Potatoes are in steady demand, but show very little improvement in value.

REMARKS.—Supplies of flowers from home growers appear to be even shorter than last week, and prices are gradually rising, especially for white blooms. It will not be surprising if Chrysanthemums are very scarce for the Christmas trade. Roses are gradually finishing, and certain varieties are getting very poor in quality. The colder weather is also retarding the development of Carnations. These, like other blooms, will advance in price during the next few days. Liliun longiflorum has been very scarce during the past week, whilst the white L. speciosum has been poor in quality. Tulips, Daffodils, Primroses, and large white Hyacinths have already made their appearance. Christmas Roses (Hellebores) are also arriving in fair quantities. Larger supplies of flowers are being received from the South of France. Paper white Narcissus, also Narcissus Soleil d'Or, single Violets, Anemones, Ranunculus and Acaacia (Mimosa) are all arriving in good condition. Larger supplies of white Lilac are being received from Holland. Large consignments of Mistletoe are advised to reach the market at the end of this week; several crates from France are already on the market, and there are also small quantities of Mistletoe from Cornwall. Holly appears to be fairly plentiful and well carried, but there will be no great demand for it until the end of the present week.

**GARDENING APPOINTMENTS.**

Mr. A. J. Wells, for nearly three years Gardener to Capt. GASCONE, Southbrook House, Devizes, Wiltshire, as Gardener to Colonel KNOWLES, Staunfield, Southmead, Wimbledon Park. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds.)

Mr. Wm. Taylor, formerly Gardener to Col. W. S. KINCAID, C.B., Priory Cottage, Braham, Bucks, as Gardener to S. F. MONTAGUE STONE, Esq., Northfields, Barrow-on-Soar, Leicestershire.

- SLUIS AND GNOORS, Enkhuizen, Holland.—Vegetable and Flower Seeds (wholesale).

## Obituary.

Mr. David Wood, Assistant Park Curator, Pietermaritzburg, Natal, and a native of Torquay, died very suddenly on Saturday, November 4, at Pietermaritzburg, at the age of sixty years. Mr. Wood was seized with sudden illness at the close of a speech made by him against Communism, during a debate on the previous Thursday evening, at the local debating society's meeting. Mr. Wood had spoken with his accustomed deliberateness and cogency, and his sudden seizure was totally unexpected. He never regained consciousness, and was taken to Grey's Hospital, where he died. Mr. Wood left Torquay for Natal a quarter of a century ago, and was for some years in charge of the gardens at King's House, Durban. Ten years ago he was appointed assistant curator of the Alexandra Park, Pietermaritzburg. Mr. Wood bore the reputation of being an exceptionally able horticulturist, his aptitude in this respect being, in part, inherited from his father, who was a horticulturist of note, and well known as a writer on horticultural subjects. The deceased gentleman was a Wesleyan local preacher, and was highly esteemed by a large circle of friends. He was one of the principal speakers at the meetings of the debating society of the city. He leaves a family of four sons and three daughters. Natal has lost in Mr. Wood one of the best type of colonists.

## TRADE NOTES.

WE are informed that the old-established and well-known business of Shand, Mason and Co., fire-engine makers, of Blackfriars, has been purchased by and is now incorporated with Messrs. Merryweather and Sons, of Greenwich.

In the open competitions for pulled roots at the three great cattle shows this year, Messrs. Sutton and Sons' customers have obtained no fewer than 25 out of a possible 35 first prizes. At Edinburgh they gained the champion award, viz., the gold medal offered for the best root exhibited, as well as 8 firsts; at the Dairy Show 9 first prizes (out of 10), and at Birmingham 6 First Prizes.

In the "Northern Ireland" Supplement of *The Times* for December 5, special reference is made to Rose growing in Ulster. It states "the world's greatest Rose firm is domiciled in Ulster, and it is natural that Ulster patriots should see in this a national bond of union. For over a century the Ulster firm of Alex. Dickson and Sons, Ltd., have been producing these beautiful flowers. Hawlmare Roses, as they are called, have brought to Ulster this season alone the National Rose Championship trophy, the King's Cup, presented by His Majesty, the Wigan Cup, the highest award of the Royal Horticultural Society, the gold medals of the Royal Agricultural Society and the Royal Lancashire Society, their highest awards, together with numerous other distinctions."

## THE WEATHER.

### THE WEATHER IN NOVEMBER.

AFTER an opening week or more of very unsettled weather, the drought of October returned, and it continued until the afternoon of November 30. The winds, however, were from southerly to westerly and north-westerly points, instead of from the easterly ones, which so especially characterised the previous month. There was, therefore, more cloud, but very little fog or haze at Southport; although, after the 10th, air pressure was exceedingly high and steady. Calms were frequent, and the amount of evaporation small. Fortunately, however, owing to a very unusual prevalence of north-westerly winds by day, there was no shortage of ozone, or excess of humidity. The mean temperature of the complete month was 44.3°, or 0.9° above the average. There were 57 hours of sunshine, or just the normal number. Notwithstanding a fall of 1.17 inch of rain on the 6th, the total precipitation scarcely amounted to 2½ inches, and was 0.67 inch below the average. The underground water at last sank to a normal level. Frost in

the screen occurred on three nights, and ground-frost on five nights. Brief, moderate gales were experienced on the 1st and 2nd. Hail fell on the 2nd, 3rd, and 4th. Mist and haze prevailed on a few dates, but thick fog was confined to the night of the 15th to 16th. There was no thunder. *Joseph Bazendell, Borough Meteorologist, The Fernley Observatory, Southport.*

## ANSWERS TO CORRESPONDENTS.

**BEGONIAS "DAMPING OFF": A. C.** The Begonias are suffering from "damping off," caused by too much atmospheric moisture and lack of ventilation. Use less water and open the ventilators on all favourable occasions.

**BERRIES, POISONOUS OR OTHERWISE: H. H.**  
(1) There does not appear to be any record of the berries of *Aucuba japonica* being poisonous. The pulpy portion is sweet, but the large kernel or seed is bitter. The nearest European allies are the species of *Cornus*. The berries of *C. Mas* are, or used to be,

FIG 145.—GEASTER IRIPLEX, JUNG (SYN. G. MICHELIANUS W. G. SM.).

made into jam in Russia. The berries of *C. sanguinea* are used as a febrifuge. (2) The berries of *Lycycteria formosa* do not appear recorded as poisonous. The berries of the near ally, the Honeysuckle, are sometimes eaten by children without harm. (3) The berries of *Hippophæ rhamnoides* have been largely used by the Tartars for making jam, jelly, etc.; by fishermen around the Gulf of Bothnia for giving a relish to fresh fish; and by people in the south of France for making sauce. Birds eat the berries in this country, and sheep eat both leaves and berries. (4) The berries of *Skimmia* are not recorded as poisonous in this country, but the Japanese name *Skimmi* means hurtful fruit, but this may refer to their bitter character. Few people would care to eat any of the above, except, perhaps, *Lycycteria*. The berries of *Skimmia* are most doubtful, but their flavour would prevent many being eaten.

**GARDENERS' AGREEMENT AND NOTICE: S. G. F.** In the absence of any agreement to the contrary, you are entitled to a month's notice as head gardener, and a week's notice would be bad. This applies also to the rooms you were to have as part wages, but you cannot claim for cost of removing your goods, nor can you insist on a reference being given. If you cannot get justice you should consult a solicitor.

**LILIES AND GHENT AZALEAS: W. E. Field.** Most or all of the hardy Lilies could be grown in beds or plantations of Ghent Azaleas, where there is room without undue crowding. The Azaleas should just shade the ground sufficiently to keep it cool. Peat is often used for making beds for Azaleas, but sandy soil would suit both them and the Lilies, if not too dry. Between the bushes you can plant *Lilium auratum*, *L. speciosum*, or any of their varieties. Other first-class species are *L. tigrinum*, *L. pardalinum*, *L. chalcedonicum*, *L. pomponium*, *L. regale*, *L. elegans*, *L. testaceum*, *L. Hansonii*, *L. Henryi*, and *L. monadelphum Szovitzianum*, or any of their varieties. A number of them may be grown in an ordinary border, such as *L. candidum*, *L. croceum*, *L. umbellatum* and *L. pyrenaicum*. The first named likes sunshine, but all the others can be grown on the shady side of trees, a little distance away, to allow of them receiving plenty of diffuse light, without direct sunshine.

**NAMES OF FRUIT: J. G. M.** 1, Cornish Gilliflower; 2, Lincoln Codlin; 3, Shepherd's Fame; 4, Broad Eyed Pippin; 5, Sandringham; 6, Scarlet Golden Pippin; 7, Herefordshire Beefing; 8, not recognised (shrivelled); 9, Reinette van Mons; 10, Duchesse de Bordeaux; 11, Huyshe's Prince Consort.—*J. H. R.* 1 and 2, Marie Louise; 3, Catillac.—*T. R. L.* Shepherd's Newington.—*J. S.* 1, Bietigheimer; 2 and 5, Bramley's Seedling; 3, Norfolk Beefing; 4, Prince Bismarck; 6, Annie Elizabeth; 7, Golden Noble.—*C. F. G.* A, Dumelow's Seedling (syn. Wellington); B, Lord Lennox; C, Dutch Mignonne; D, Lady Henniker; E, Baronne de Mello; F, decayed; G, Fondante de Noël.—*R. P. S.* 1, Worcester Pearmain; 2, Court Pendu Plat; 3, Lane's Prince Albert; 4, King of the Pippins; 5, Tom Putt; 6, Prince Bismarck; 7, Stirling Castle; 8, Lady Henniker; 9, Passe Colmar.—*T. W. B.* 1, Lane's Prince Albert; 2, decayed; 3, not recognised; 4, Ribston Pippin; 5, Chelmsford Wonder.

**NAMES OF PLANTS: C. R.** 1, *Thalictrum adiantifolium*; 2, *Pteris serrulata*; 3, *Nephrolepis exaltata Piersonii*; 4, *Cupressus pisifera squarrosa*; 5, *Cupressus pisifera plumosa aurea*; 6, *Pyracantha Lalanda*; 7, *Pieris japonica*; 8, *Pieris floribunda*.—*C. E.* *Pyracantha coccinea* var. *Lalanda* (syn. *Crataegus Pyracantha*).—*J. R.* *Geaster triplex*. Jung (syn. *G. Michelianus*. W. G. Sm.) (see Fig. 145).

**RATEABLE VALUE OF GREENHOUSES: F. M.** The rateable value of your two greenhouses would vary according to the district. In the Cheshunt area the rateable value of two greenhouses, each 120 ft. by 30 ft., if used for trade purposes, would be gross £12, net £8. In another district we could mention the assessment would be gross £18, net £12, and the latter figures would be the more likely to apply in your case.

**SEEDLING SINGLE CHRYSANTHEMUM: E. P.** Your seedling is unlike any variety we know, and its shade of yellow colouring is very effective, but the shape of the flowers leaves something to be desired and the florets appear to lack substance. However, you should grow the plant again and adopt various methods of cultivation in an endeavour to find which will suit it best.

**VIOLET LEAVES DISEASED: H. G. R.** The leaves are affected with Violet leaf spot, caused by the fungus *Ascochyta violae*. Very badly diseased plants should be burned, and fresh stock obtained from a new source, planting them in ground as far away from the old bed as convenient. The disease may be kept in check by spraying the plants with potassium sulphide at a strength of ½ oz. in two gallons of water. This specific turns white paint black, and should not be allowed to come in contact with painted woodwork.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39.1°.

ACTUAL TEMPERATURE:—Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, December 20, 10 a.m. Bar, 30.2; temp., 38°. Weather—Dull.

### Colour in the Garden in Autumn and Winter.

To utter dispraise of the English landscape at any season of the year is to risk the displeasure of those whose eyes find delight not only in its pageantry in spring, and in the more sombre yet still rich tones of autumn, but also in the grey-black December phase. Nor is it to be denied that even the funereal sootiness of Elms in December has a mournful charm. Yet there are those who find our English winter landscape apt at times to look a little desolate. It is for the latter that these lines are written in order to suggest that if they possess even a small garden they may conjure away the desolation, and by the judicious planting of suitable, small-growing subjects, create an oasis of colour in the desert of winter greyness. What, for example, can rival the rich hue of the coral-like fruits of the many hybrid *Berberis* commonly grown under the name of *B. polyantha*? A group of such plants with fruit-laden branches, pendulous, beside a flight of grey steps or among a mass of leafless shrubs will convince the most despondent that gardens are not meant only for summer use. Unless birds are troublesome, the berries last long, and this year they bid fair to bring in Christmas. The beauty of *Cotoneaster horizontalis*, the leaves of which die a flaming red, is more fugacious, but very vivid, and the lace-like framework of the leafless plant is gracious. Nor are the Slec-coloured fruits of other *Berberis* species—

*B. Bealii*, *B. canadensis*, *B. Gagnepainii*, etc., to be despised, nor the bronze beauty of the autumn foliage of the common *Berberis*, or of *B. Thunbergii*. *Rosa nitida* deserves a special mention. Its stems stand up so brightly and boldly red after the leaves have fallen. The yellow of the old *R. rugosa* leaves is not to everyone's taste, but in our opinion is very beautiful. *Lonicera nitida*, which makes such a charming low hedge, takes on, at all events in damp places, a dull bronze tone, which in sunlight is striking and effective. Nor, to desert shrubs for a moment, is there anything more lovely in the rock garden in late autumn than the rosettes of *Androsace sarmentosa*—collars of rubies surrounding the emerald centres of young leaves. Of the Heaths, which flower bravely in the winter, there is no need to speak; they are known and grown wherever soil conditions admit. Nor is it our present purpose to speak of flowers which are proper to winter garden decoration, but rather of shrubby plants whose stems and leaves make bright display. Of Cornuses, there are *C. Kousa* and the damp-loving *C. sanguinea*, and *C. argentea*, and with them, where space and situation allow, the bright-stemmed *Salixes*, red and yellow and plum-coloured, may be planted; but they are rather for the waterside in large wild gardens than for the small garden. Among other relatively small growing plants with striking autumn colour are *Euonymus alatus*, the leaves of which turn to an almost purple-red before they fall; and reverting again to the rock garden to cite them in sheer gratitude for a wonderful autumn display of flower and leaf, mention must be made of *Polygonum vacciniifolium*, a winter harmony, still persisting, of pink and red, growing beside a white bank of *Cardamine gibraltarica*, which persists in flower regardless of season, frost and rain. The red berries of *Skimmia japonica* and the white of *Symphoricarpos* make bright and pleasing contrast; and against walls—provided the latter be not red—the crimson berries of *Pyracantha coccinea* make a wonderfully persistent show, and those of the variety *Lalandei*, look well even when the wall is of red brick. The grey of the Cotton Lavender and of *Senecio laxifolius* make welcome masses of sober tone showing up brighter specimens such, for instance, as *Stranvaesia undulata*—not so very bright, but not unpleasing. Of course, the Lavender and Rosemary harmonies of grey and green grow well together, and the latter plant at all events retains in its youth all its freshness of green colour even in winter. Brooms of all kinds, late flowering—*Genista aetnensis*, *Cytisus Andreanus* and *C. Dallemorei*, as well as the Common White Broom give a rich greenness to the place where they grow, and some of them continue to throw a stray flower, solitary, like a butterfly, on green stems. It is easy to enlarge the list and to include the many evergreen plants, *Pernettya* with its berries of varied colour; *Myrtle*, where shelter can foster it; *Lonicera pileata*, *Cotoneasters*, which retain their well-groomed appearance, and relieve the untidiness of deciduous things; but more difficult to say where these plants of special winter beauty should find a place in the small garden. That, indeed, is a hard problem. Some are tempted to form beds of the choicest of them near the house; but somehow, in such situations they seem out of focus, and tend rather to direct attention to the leafless gaps between them rather than to rivet the eye on their own beauty. Though each gardener must solve the problem for himself, we, for our part, think that the shrubby plants or

small trees planted for colour effect must stand at some distance from and obliquely to the house windows, in splendid isolation; as, for instance, in the most conspicuous part of shrubberies of flowering trees and shrubs, or in the case of the trees, rising from mounds of evergreen shrubby plants, such as *Cistus*. Much has been written on planting for autumn and winter effect; but generally from the point of view of the large garden. With the present wealth of suitable subjects, there is no reason why the small garden should not be so laid out as to include the best of them; but in spite of the desirability of admitting them, it must be confessed that to do so with full effectiveness must entail some departure from the usual planning. To dot them here and there in herbaceous borders is, of course, unpleasing and unpractical; but to plant small groups of "winter shrubs" in it, though it should break the stately impressiveness of the summer effect, might by relieving their general dreariness in winter prove to be good practice. Now, at all events, is the time when the gardener can begin to experiment. The plants are available in plentiful variety. Probably the best course is to proceed warily, conscious of the possibility of erroneous planting, and to proceed by the old method of trial and error till each plant or group finds its proper place and contributes its full effect to making the garden beautiful in defiance of the seasons.

**Golden Wedding.**—The golden wedding of Mr. and Mrs. Alfred Tomalin was recently celebrated at Oakwood, Crayford, Kent. Mr. Tomalin was appointed head gardener at Oakwood in 1874, and is thus within a year or so of completing a half century of continuous service in one garden. During this period the estate has changed ownership three times, and it was during the residence of the late Stephen White, Esq., that Oakwood reached its highest point of interest as a garden, and became well known for its extensive collection of Orchids. An interesting report on these appeared in the *Gard. Chron.* many years ago from the pen of Mr. Jas. O'Brien. In addition to Orchids, Ferns, Caladiums, and other stove and greenhouse plants were very successfully grown at, and exhibited from, Oakwood. Chrysanthemums also were largely grown and exhibited, over 1,000 plants being grown for large blooms each season. In this connection it is interesting to recall that Mr. Tomalin was one of the founders, and the first secretary, of the West Kent Chrysanthemum Society, which flourished for over 30 years. On their departure from Oakwood in 1918, the family of the late Stephen White, Esq., showed their appreciation of Mr. Tomalin's ability and integrity by presenting him with a cheque for £100 and a gold watch inscribed—"1881—1918, Presented to Alfred Tomalin in recognition of long and faithful service at Oakwood, Crayford." On the same occasion Mrs. Tomalin was presented with a handsome brooch. Mr. Tomalin has for many years taken a great interest in Dahlias, the variety Oakwood Beauty having been raised by him a few years ago. Of their family of four sons and five daughters only one has adopted horticulture as a profession, viz., Mr. T. E. Tomalin, who has been for fifteen years gardener at the Earl of Bessborough's seat in Co. Kilkenny.

**Departmental Committee to Consider Agricultural and Horticultural Prices.**—The Minister of Agriculture has now set up the Committee which is to inquire into the methods and costs of selling and distributing agricultural, horticultural, and dairy produce in Great Britain, and to consider whether, and if so by what means, the disparity between the price received by the producer and that paid by the consumer can be diminished. The constitution of the Committee is as follows:—The Marquess of

Linlithgow (Chairman), Sir Basil Mayhew, Mr. A. W. Ashby, Mr. Ernest R. Debenham, Dr. Charles M. Douglas, Mr. Percy A. Hurd, Mr. Rowland R. Robbins, Mr. R. J. Thompson, and Mrs. Margaret Winttingham. The secretary of the Committee is Mr. A. W. Street, and the assistant secretary, Mr. F. Grant, both of the Ministry of Agriculture.

**Prince Shimadzu.**—At the last meeting of the Orchid Committee of the Royal Horticultural Society, in 1922, the chairman, Sir Jeremiah Colman, Bart., announced that Prince Shimadzu, who had regularly attended the meetings for more than a year, was about to return to Japan, and he expressed regret on his own part and in the name of the members of the Committee at the loss of such an admirable representative of Japanese horticulture, and especially of Orchidology. The Committee hoped to maintain communications with the Prince, who had given interesting information about Japanese Orchids and Japanese Orchid cultivation, and had shown the Committee admirable drawings and photographs of Orchids flowering in Japan. Prince Shimadzu, in saying farewell, expressed his intention of conveying news on Orchid subjects from time to time, and thanked the chairman, the Committee and the Royal Horticultural Society for the valuable information he had acquired while enjoying the privileges of a seat at the Orchid Committee table.

**Garden Features at Wembley Park.**—Many of the natural features of Wembley Park are to be retained within the grounds of the British Empire Exhibition, and displays of flowers, trees, and shrubs will be contributed by horticulturists who are responsible for laying out the gardens and avenues. Rows of Lime trees will form a feature of the grand avenue leading between the main exhibition buildings from the north entrance to the terrace of the stadium, and midway up this avenue three ornamental lakes are being made for boating, diving, and swimming competitions. Until 1894, Wembley, forming part of the Harrow district, was almost entirely agricultural land. That portion known later as Wembley Park, consisting of 280 acres, was acquired about 50 years ago by a company of which Sir Edward Watkin was director and the Metropolitan Railway Company the principal shareholders. Part of the estate, about 180 acres, was enclosed, and Mr. E. Milner, of the firm of Milner, Sons and White, was engaged to lay it out as a playground for Londoners. Under Milner's direction, the area was transformed from meadowland into a combination of pleasure gardens and sports grounds, beautified with groups of trees and shrubs, flower-beds, a lake of eight acres for boating, cricket and football grounds, a racing track, and a pavilion for entertainments and refreshments. There are several groups of healthy Pines which Milner planted, and there is a good example of the American Blue Spruce, *Picea pungens glauca*, growing near the old lake which is now being drained and converted into a sunk flower garden. The best trees, however, are Oaks, Elms, Horse Chestnuts, Poplars, Willows, Hawthorns, Cherries, Prunuses, and Pyruses. It is intended to plant, as permanent features of the British Empire Exhibition grounds, many of the newer trees and shrubs which are known to thrive in heavy, clay soil, and no doubt others that prefer a lighter soil can be provided for by using the top soil which has been removed where buildings, roads, and new lakes have been formed.

**Aberdeen Memorial to Professor Trail.**—At a meeting of the Aberdeen Natural History and Antiquarian Society, held in Aberdeen University Buildings, on 15th inst., Professor J. Arthur Thomson presiding, a letter was read from the secretary of the Professor Trail Memorial Committee, communicating a scheme for the publication of Professor Trail's "Flora of the City Parish of Aberdeen," as part of the proposed memorial, and asking for the consent and co-operation of the society. The committee unanimously agreed to give the MS. for publication, on the understanding that the society would be entitled to obtain further copies, if desired, for supplying to the public,

as one of its own publications. The printing of the volume, which has been prepared for the press by Professor Craib (successor to Dr. Trail in the Chair of Botany at Aberdeen University), Mr. Anderson, Dr. Skene, and Dr. Clark, all of Aberdeen University, is now near completion, and will be issued at the time of the presentation of a memorial plaque, probably in April next.

**Sir Lawrence Weaver.**—The resignation of Sir Lawrence Weaver from the Ministry of Agriculture, in order to assist in the organisation of the British Empire Exhibition, is a severe loss to the Ministry. His colleagues and friends know even better than the general agricultural community how important are the services which Sir Lawrence rendered, both during the war in the Food Production Department, and subsequently in the Ministry. The feelings of admiration and regard with which Sir Lawrence inspired his colleagues found expression at the farewell dinner recently held in his honour and in the presentation of books made to him by his colleagues of the Ministry. The dinner, which was held at the Hotel Cecil, was presided over by the new Minister of Agriculture, and in addition to the permanent staff there were also present the

Photo by Campbell Gray.

SIR LAWRENCE WEAVER.

Parliamentary Secretary and the late Minister, Sir Arthur Griffith-Boscawen. The speakers—Sir Arthur, who proposed the health of Sir Lawrence, the Minister, Sir Francis Floud, the permanent Secretary, Lord Ancaster and Mr. French, who of all Sir Lawrence's colleagues were perhaps most closely associated with him—bore eloquent testimony to Sir Lawrence's extraordinarily versatile ability and to the affectionate regard in which he is held by the staff of the Ministry. It must be a source of satisfaction to Sir Lawrence to feel that the great work which he has done is appreciated, and a yet greater source of satisfaction to know that in doing it he has won the deep and lasting regard of his colleagues. No one who has worked with him and who has any knowledge of men can fail to realise that Sir Lawrence possesses one of the rarest of human qualities—genius for organisation. That genius found wide scope for activity during his tenure of office at the Ministry of Agriculture, but of all its manifestations the establishment of the National Institute of Agricultural Botany is probably the most remarkable and enduring. It is good, therefore, to learn that Sir Lawrence will continue to hold the office of Chairman of the Council, so that the

Institute which owes its origin to his initiative will continue to enjoy the advantage of his leadership.

**Yorkshire Gala, 1923.**—The schedule of the Grand Yorkshire Flower Show and Gala for 1923, is before us, and includes over seventy classes. The dates are fixed for June 13, 14 and 15, and the show will be held as usual in the Bootham Park, just outside the old walls of the City and close to Bootham Bar. The issue of the schedule at such an early date will enable intending exhibitors to make their arrangements in good time, and the secretary is to be congratulated on his Society being one of the first to issue its schedule for 1923. The York Gala is one of the best of the provincial exhibitions and has in the past set the fashion in certain classes, especially those for rock gardens and water gardens. The collections of plants, too, are of great importance at York shows, and as much as £70 is offered in money prizes for a group of miscellaneous plants in or out of bloom, arranged for effect, in which the awards are £20, £15, £12, £10, £8 and £5 respectively. For a rock garden with alpine plants only, a sum of £35 is offered in four prizes, and a similar sum is offered in the class for an ornamental rock work decorated with hardy plants and flowers. Very substantial prizes are also offered for a water garden arranged with water plants and sub-aquatics. No fewer than eight classes are allotted to Orchids, of which the most important is for a table of Orchids, 12 feet by 5 feet, in which the prizes are £12, £10 and £7 respectively. Florists flowers, including Roses, Carnations, Begonias, Calceolarias, Gloxinias and Sweet Peas are important features of this exhibition, and the aggregate value of the prizes offered for these flowers amounts to a very considerable sum. No less important are the classes for hardy flowers, which number nine, there being special classes for Delphiniums, Lupins, Paeonies, Poppies and Irises. The fruit and vegetable classes are also numerous, the chief one being for a decorated table of ripe fruit, for which a first prize of £10, a second of £8 and a third of £5, are offered. The York Gala is not only one of the most extensive flower shows in the country, it is also one of the best managed, for the Council not only undertakes the conveyance of exhibits free to the show ground from the railway station, but also offers every facility in its power to exhibitors and their assistants.

**Changes at Hyde Park and Regent's Park.**—We learn that early in the New Year Mr. J. A. Gardiner will retire from the Superintendency of Hyde Park, a position he has held for many years, following a successful period as Superintendent of the gardens at Hampton Court. Mr. Gardiner's successor will be Mr. T. Hay, Superintendent of Regent's Park.

**Estate of a Noted Horticulturist.**—The late Sir Albert Kaye Rollit, who died on August 12 last, aged 80, member of the Council of the Royal Horticultural Society and President of the National Chrysanthemum Society, left an estate of the gross value of £104,544, with net personalty £88,510. Sir Albert Rollit was a solicitor and a former President of the Law Society. Like that of many other famous lawyers, his will, which was made on two sheets torn from a scribbling-block, was not properly prepared, and an affidavit of due execution from an attesting witness was required before it could be admitted to probate. He left the whole of his property to his daughter.

**Coloured Sport of Apple Newton Wonder.**—When visiting Mr. J. C. Allgrove's fruit nursery at Middle Green, near Slough, this autumn, our attention was drawn to a remarkable case of colour sporting in Apple Newton Wonder. The tree (see Fig. 145) was cut down when a maiden for the purpose of training it as a single cordon, and it has been cut back subsequently each season at varying heights to obtain fruit spurs along the main stem. This year the tree cropped freely, and as the season advanced all the fruits on the portion of the tree above the part where it was first cut down developed a deep red colour, and by the end of August the fruits were a deep crimson

over the whole of the surface. The Apples on the lower part of the stem were of the typical Newton Wonder colour, green, with a red flush on the side exposed to the sun. There are several other well-known Apples that have given highly coloured forms by sporting, such as the Crimson Bramley, which originated as a bud sport in an orchard in Southwell, Notts, and The McCoy, a bright red form of James Grieve, which originated in the fruit plantation of Mr. Hall Jones, a fruit grower of Letchworth. Mr. E. A. Bunyard, in an interesting article on "Variegated Fruits" in *Gard. Chron.* September 16 last, dealt with this subject and showed that some of these chimeras cannot be kept true by vegetative propagation, stating that "if it be that the selection of buds from a 'coloured or plain' area is the cause of such variation, it is obvious that striped, coloured varieties will continue to give pale forms, while the pale forms should give only their own type."

"Gardeners' Chronicle" Seventy-five Years Ago.—*Plantations.* One of your correspondents has introduced into your pages some very valuable remarks on plantations and wood; not respecting their internal treatment, whether it is best to keep them in the dark, excluding by their numbers the sun and light; not in depriving a tree of its branches, and consequently leaves, by which it can get its living; but respecting their boundary fences, whether formal or irregular. To the latter subject I will add a few words. The eye dislikes to be fettered with a straight line or any other formal figure. It is this consideration which makes a wild river superior to a formal pond, which never, at any time, whether large or small, added to the picturesque. The eye hath a sort of enjoyment in winding walks and serpentine rivers, and all sorts of objects whose forms are composed of the waving line of beauty. Intricacy of form is that peculiarity of lines which compose it—that leads the eye to a wanton kind of chase, and from the pleasure which it gives the mind entitles it to the name of beautiful; the poet knows it as well as the painter. I have, with a wood, taken the natural forest as my guide. As soon as the age of the trees allowed me, I destroyed the outer fence and placed it thirty or forty yards within the wood, and the trees outside I thinned as irregularly as possible. The fence is now the common iron hurdle, which at even a very short distance is invisible to the naked eye. The man of taste is gratified at beholding the forest cattle going in and out without any apparent obstruction, each tree unfolding itself as Nature has taught it. It was observed by some that I had placed too weak a fence against wild Scotch cattle, but the experience of a few years has taught me they were wrong, and their apprehensions vain. I have as mischievous animals to contend with as possible, such as would almost break through any fence to obtain shade and shelter, but now when they get within the protection of the outer trees they remain contented, and will stand for hours, and keep the flesh on their bones; but when they cannot obtain shade they gallop about the park, overheat themselves, catch cold, and suffer a considerable depreciation in price ultimately in the market. When the weather is cold, with wind and rain, they come to seek shelter, which is food; as I think Professor Playfair has said, if a man was stripped naked he would require more food, more carbon; so it may be said of a beast, if warm he will do with less food. In a mountainous country shelter is not sufficiently valued, nor sufficiently known, by the grazier and others also, where it is a sufficient distance not to interfere, by its roots, with the growth of farming produce. *Fraxinus.* *Gard. Chron.* December 25, 1847

**Publications Received.**—*Potato Growing in Australia.* By G. Seymour. Whitcombe and Tombs, Ltd., 9-10, St. Andrew's-hill, Queen Victoria Street, E.C. Price 3s. *Chrysanthemums and Dahlias.* How to grow them and how to show them in South Africa. By W. J. Kightley. The Specialty Press of S.A., Ltd., Johannesburg, S. Africa.

## PLANTS NEW OR NOTEWORTHY.

### SOME NEW SPECIES FROM SIAM.

RECORDS of the introduction of good horticultural plants, and of the first flowering of these plants are usually supplied by the larger and more fortunate establishments further south. It gives me, therefore, no little satisfaction to be able to record the successful introduction of a few desirable plants.

Among those who have of recent years been adding so extensively to our knowledge of the flora of Siam the name of Dr. A. F. G. Kerr stands out pre-eminently. To his indefatigable labours we owe hundreds of new records for that country. As opportunity has occurred, Dr.

FIG. 145.—CORDON TREE OF NEWTON WONDER APPLE BEARING FRUITS OF TWO DISTINCT COLOURS; UPPER FRUITS HIGHLY COLOURED, LOWER FRUITS OF NORMAL COLOUR.

Kerr has also been sending home seeds. Among the plants introduced through his agency I may mention *Streptocarpus orientalis*, Craib, which flowered some years ago at Kew, and which was figured in the *Bot. Mag.*; *Aeschynanthus macrocalyx*, Hosseus; *Ornithoboea Wildeana*, Craib; *O. lanata*, Craib; and *Kalanchoe Dixoniana*, Hamet, all of which have flowered in the plant houses at Trinity College Botanic Gardens, Dublin.

Last year *Chirita tubulosa*, Craib, flowered here, but, unfortunately, did not set seed, so that for the time being it is lost to cultivation. All of these, with the exception of the *Aeschynanthus* (which was first introduced to the Continent by Dr. Hosseus, and later to Dublin by Dr. Kerr) have been described from Dr. Kerr's collections.

To this list have now to be added four species which have been raised in the Cruickshank Botanic Gardens, Old Aberdeen, from seed or tuber sent by Dr. Kerr, and which have flowered this year, i.e., *Stephania erecta*, Craib; *Petrocosmea Kerri*, Craib; *Didymocarpus Wattiana*, Craib, sp.n.; and *Barleria siamensis*, Craib.

#### STEPHANIA ERECTA.

Of *Stephania erecta* we possess but the one tuber. *Stephania* is an interesting genus of the Menispermaceae, and this particular species is exceptional as being an erect plant in a genus of typical twiners. Horticulturally, the plant may not be of much account; but, in any case, propagation would, I think, present a somewhat difficult problem.

#### PETROCOSMEA KERRI.

The genus *Petrocosmea* (Gesneraceae), so far as I am aware, has not previously been in cultivation. Although probably not the most desirable of the genus, yet *P. Kerri*, with its white, Boea-like flowers and its habit (at least so far) of continuing in flower for a considerable time, is an attractive little plant. Its foliage may be rather on the large side, but although the flowers are by no means obscured, they are not carried up very far.

#### DIDYMOCARPUS WATTIANA.

*Didymocarpus Wattiana* has just finished flowering. I have described it here as a new species, and have named it in honour of James Cromar Watt, one of the keenest and most successful amateur horticulturists whom it has been my good fortune to meet. To him also I am greatly indebted for a considerable number of additions to the Cruickshank Botanic Gardens.

The attractiveness of *D. Wattiana* lies in its inflorescence. The flower in bud is of a dark wine colour, with a very lustrous surface. When fully open the corolla is slightly paler, passing from pale wine colour at the base to a rich wine colour at the tip. The flowers are carried well up above the leaves, and the corolla itself is of a good size (c. 7 cm. long).

A full description of this plant\* is appended to these notes.

#### BARLERIA SIAMENSIS.

*Barleria siamensis* will, I think, compare very favourably indeed with any *Barleria* in cultivation. It forms a nice, bushy, well-foliaged plant, and the flowers, of a very pleasing lavender colour, are of good size, well exerted, and are borne in considerable numbers.

Of these newer plants *Barleria siamensis* and *Didymocarpus Wattiana* especially are to be regarded as novelties which, when known, will easily hold their own. The former at present gives promise of a good crop of seed, and, further, it is very easily multiplied by cuttings. The latter has failed to set seed, but it would probably present no difficulty in propagation by cuttings. Wm. G. Craib, Botany Department, University, Aberdeen.

\* *Didymocarpus Wattiana*, Craib, species nova caule evoluto, foliis oppositis, pedunculis circa 7-floris, corolla circa 7 cm. longa, vixosa plus minusve pendula cognoscenda.

*Caules* sat robusti, circa 6 cm. alti, pilis albis divergentibus tecti. *Folia* opposita, oblongo-cliptica, elliptica, vel ovato-lanceolata, apice acuminata, subcauta, basi parum inaequilateralia, cordata, ad 9 cm. longa et 5.5 cm. lata, subtus pallidiora, supra pilis erectis albis et squamis aureis tecta, subtus ad nervos erectis albis, parce squamosa, nervis lateralibus utrinque circa 12; subtus prominentibus supra impressis nervulis supra impressis subtus prominentibus, margine denticulata, reticulo sat valido circa 8 mm. longo suffulta. *Pedunculus* communis 6 cm. longus, pilis albis divergentibus glanduloso-capitatis et squamis aureis sessilibus tectus, flores circa 7 gerens, pedunculis parvis albis 1 cm. longis indumento ei pedunculis communis simili tectis, pedicello floris terminalis 5 mm. longo unda vel sparse aureo-squamoso; bractea decidua; alabastra pendula, nitida, fusco-vinosa, mox parum palliscentia. *Calyx* nitidus, glaber, 19 mm. longus, apice circa 1 cm. diametro, lobis brevibus rotundatis dorso truncatis. *Corolla* 5 cm. exserta, tubo apicem versus gradatim ampliato apice 1 cm. diametro, lobo antico haud reflexo 8 mm. longo 9 mm. lato alio paulo longiore, lobis lateralibus recurvis, posticis parum recurvis, omnibus apice rotundatis. *Filamenta* glabra, antheris barbatis, staminodis filiformibus. *Pistillum* glabrum vel sparse squamosum, basi disco conspicuo laevi, cinctum.

Hort. Bot. Aberd. ubi floruit Nov. 1922, e seminibus siamensibus a Dr. A. F. G. Kerr lectis.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Cypripedium.**—Species and hybrids of *Cypripediums* are invaluable for winter blooming. They deserve to be largely grown, especially in localities where fogs occur frequently, as they are easy of growth, and their blooms are much less delicate than the majority of Orchid flowers. The potting of *Cypripediums* should be done soon after the blooms are over, at whatever time of the year that may be, but these remarks refer especially to those which are in flower, or about to flower at the present season. Whenever a plant has outgrown its pot, or whenever it is desirable to divide the roots in order to increase the stock, they may be repotted. In the case of any special variety that it is desired to propagate extensively, it is advisable to cut the rhizome through with a sharp knife some little time before repotting is contemplated, so that the divided portion may make fresh growths, which will soon root in the new material.

**Compost for Cypripediums.**—The nature of the compost has much to do with the production of large flowers. If loam fibre is used it should be of the best possible nature, and if inclined to run together in a solid mass, should be employed sparingly, placed well down in the pot, and be surfaced with peat or A1 fibre and Sphagnum-moss. A suitable compost consists of a mixture of peat, A1 fibre, Sphagnum-moss, and loam fibre, in equal parts; where large specimen plants are grown it is advisable to intermix with the materials some broken bricks to keep the texture open. The pots should be well drained, and pots used of a size according to the strength and vigour of the plants. These plants are never inactive at any season of the year; therefore they should never be allowed to become dry at the roots for any considerable length of time, or much injury will accrue to them. Excessive application of water to the soil during the winter is not to be recommended, whilst a hot, dry atmosphere will favour thrip and other insect pests, which will soon disfigure the foliage, and eventually be the means of the plant declining in health.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Red and White Currants.**—Keep a watch for birds, and protect the bushes with cotton if they attack the buds. If the gardener is not very watchful in this respect this danger may not be apparent till a great amount of damage has been done.

**Loganberries.**—As the Loganberry fruits best on the young wood, cut out all last year's fruiting canes, and train strong, well ripened shoots of the current year in their places, but not too thickly. See that the roots are well mulched with rich manure, especially if the soil is of light, sandy character. When grown in lines and trained to wires, Loganberries usually produce excellent crops of large fruits. They may be grown and trained on poles 9 feet high, or on old walls, arches, etc., where other fruits might not succeed.

**Vines.**—Outdoor vines may be pruned, dressed, and put in order for the winter. Spur back to within a couple of plump buds all laterals intended for fruiting next year; thin the branches where they are crowded, and train up young wood where there is still room for extension. Well-ripened shoots of vines grown on the extension system, intended to take the place of those having borne fruits the past season, may be shortened to a plump bud, leaving from 4 feet to 6 feet of growth to furnish

the wall space. These young rods should be trained at about 3 feet apart, and dressed with a mixture of Gishurst compound, or soft soap sulphur at a reasonable strength. See that the roots are protected with manure, and not allowed to get too wet and sodden during the time they are practically dormant. All vines need a top dressing annually, but this is best applied in the early part of November or March.

**Figs.**—Figs that have made too much wood to be fruitful should be root pruned. When Figs are planted in a restricted border and in firm soil, the young shoots are sturdy, short jointed and fruitful. Do not allow the branches to become crowded, and train in at their full length fruitful shoots, only shortening useless ones that are not required. Cut out all suckers. In the colder parts of the country Figs growing in the open need protection in winter.

**Grafts.**—Those intending to graft Pears, Apples, Plums, etc., of useful kinds next spring should select suitable young shoots from the prunings, tie them in small bundles, correctly and securely named, and heel them in on a border. When grafting Apples do not overlook the merits of Ellison's Orange (early) and May Queen (late), both of which are useful and dependable varieties.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Godicote, Welwyn, Hertfordshire.

**Coleus thyrsoideus.**—This is undoubtedly one of the best blue flowering indoor plants for winter and early spring decoration of the greenhouse. The plants are developing their flower spikes, and should be given some manurial aid in the form of liquid manure to assist them to open their flowers freely. Plants judiciously fed with this material will be found to develop a much richer tone in the flowers than those that are allowed to become starved during the time when they are developing their flower spikes. A minimum temperature of 55° will be found suitable for the plants at this stage of their growth.

**Euphorbia pulcherrima.**—As the bracts of *Poinsettias* attain their full development they will be found to remain in better condition when kept in comparatively little warmth, provided a dry atmosphere is maintained. Continue to water the plants as needed, but do not use any more stimulants to those that have fully developed their bracts.

**Hippeastrum (Amaryllis).**—Where numbers of these plants are grown a supply of bloom may be obtained over a considerable period, by selecting a few of the best plants and placing them in warmth at intervals. *Amaryllis* bulbs do not require repotting each year, therefore, after selecting some of the best specimens, thoroughly soak the pots in water, afterwards top dressing the plants with a rich compost. During the process of removing the surface soil, examine the bulbs carefully for mealy-bug, which is a great pest of the *Amaryllis*. Arrange the plants, if possible, on a mild hot-bed, and for a time use very little water at the roots, or leaf growth will be too much in advance of the flower spike. A moist atmosphere is essential, therefore the floor of the house should be damped frequently with water by means of a fine rose can.

**Azalea indica.**—Plants of the early varieties of *Azalea*, such as *Deutsche Perle*, *Fielder's White*, and *Hermosa* may, if well set with bloom buds, be placed in a little warmth and forced gradually into flower. Spray the shoots with tepid water twice daily, and, should thrip be present on them, thoroughly syringe the plants with a solution of nicotine. When watering these plants see that they are well supplied with moisture; a light stimulant, consisting of a soluble plant food, liquid manure, or soot water will assist them to develop their flowers to perfection.

### THE KITCHEN GARDEN.

By JAMES E. HATRAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Carrots.**—Prepare a hot-bed, and as soon as the temperature is suitable place about 10 inches of sited soil on the dung for sowing Early Nantes or Inimitable Forcing Carrots. Do not sow until the temperature of the fermenting material has declined to about 80°. Admit air in favourable weather as soon as the seeds have germinated. Carrots are easily grown in frames and they are always in demand.

**Onions.**—To obtain extra large bulbs of Onions a start should be made by sowing the varieties Premier, Cranston's Excelsior and Ailsa Craig in shallow boxes. Fill the boxes with a mixture consisting of two parts loam, one part leaf-mould, and part old decayed manure, with sufficient fine lime rubble to render the soil porous. Sift the soil through a ½-inch sieve, fill the boxes to within about ½ inch of the top, and make the soil firm. Sow the seed thinly, as the plants will grow spindly if they are crowded. The seed should be lightly covered with very fine soil. Place brown paper over the boxes until the seeds germinate, when the seedlings should be exposed to plenty of sunlight.

**Seakale.**—Forcing pots should be placed over the crowns of Seakale, and the pots in turn should be covered with leaves and litter sufficient to create a gentle heat, but not more than 55°, or the stems will grow spindly, and the flavour will be impaired. This is the best way of forcing this vegetable.

**Lettuce.**—A sowing of Lettuce should be made now. Golden Ball, All-the-Year-Round, and Early Paris are suitable sorts. These will follow the crops in frame. Keep the seedlings well up to the light, and prick them off as soon as they are large enough to handle.

**Peas.**—Make a sowing of a dwarf variety of Pea in frames and another in pots. Early Giant is a suitable variety for growing in pots in cool houses.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Management of Late Vines.**—The borders having been kept without much moisture for two or three months, the grower may be tempted to water them, and right freely would the vines take copious supplies of moisture. But time is on the wing, and pruning must be thought of first, for if the roots are watered before the pruning is done, the vines will bleed, therefore prune first and dress each cut with styptic. After a week has passed the roots growing in inside borders may have their first watering. The vines, meanwhile, should be cleansed, also the house, the borders pricked over, and all loose and inert soil removed, when another watering may be given, and so on until the borders are restored to a moderately moist condition. The house will, as a matter of course, be kept dry, airy, and cool by abundant ventilation.

**The Early Orchard House.**—Where the development of the very early trees has been assisted by mild fermenting material, the past month having been mild and favourable for growth, the buds will develop rapidly, but no change in the temperature from 45° to 50° should be made until the trees come into flower. When the petals begin to show colour, the house should be moderately fumigated on a calm evening, and well syringed the following morning to ensure immunity from fly during the time the trees are in flower. When this stage is reached, a little more fire-heat will be necessary, particularly through the hours of daylight, as Peaches always set best when a free circulation of fresh air favours the ripening and dispersal of the pollen. Use less moisture at this stage, but unless the weather is dark, wet, or foggy, the walls and floors may be damped, when gentle warmth from the pipes is

turned on for the day. From this time forward the maximum temperature may range from 60° through the day, and 50°, more or less, by night.

**The General Orchard House.**—The end of December is early enough to start this house, meantime the cleansing of the pots and trees, and their proper arrangement should be completed. The main object of this house, which often includes all kinds of fruit trees, is to obtain good crops of fruit, which will provide supplies for use until the crops in the open are ripe. The buds, as the natural season of flowering comes round, are sure to be in advance of those in the open, and when this stage is reached, retarding should be discontinued, and a temperature suitable to the opening of the flowers and the setting of the fruit maintained.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Trees and Shrubs for Swampy and Shady Places.**—The choice of trees and shrubs for planting in swampy ground is limited; for trees one has to rely on such subjects as *Alnus* (Alders) of various species, and of these *A. glutinosa* and its many varieties; *Alnus incana* and its varieties; *A. nitida*, *A. japonica*, *A. rugosa*, *A. subcordata*, *A. firma*, and *A. cordifolia*, all thrive well in wet ground, being especially good when growing alongside water. Many of the Poplars do well under similar conditions, including the common *Populus albus*, *P. canescens*, *P. serotina* and *P. szechuanica*. The Willows comprise another group of trees that do well in wet land, and their coloured bark in winter forms a decidedly interesting feature. *Salix alba*, and especially its fine variety *S. a. argentea*; *Salix babylonica* and the improved variety that has such fine golden wood, *S. b. ramulis aureis*; *S. daphnoides*, *S. purpurea*, *S. Salomonii* and *S. viridis*, are a few that we find especially useful at Aldenham. Two other trees that call for mention are *Hippophae rhamnoides*, the Sea Buckthorn, that presents a fine sight in autumn with its many fine golden berries, but care should be taken to plant a male specimen in close proximity to the females in order to ensure the fruits setting; whilst the other is the deciduous Cypress, *Taxodium distichum* and its pendulous form, which look so dainty with their pretty, fine, light green foliage in summer. Bush plants are not many, but there are the smaller growing Willows such as *Salix Bockii*, *S. hypoleuca*; the dwarf Birch, *Betula nana*; *Myrica Gale*, with its spicely foliage, and various members of the *Oxycoceus* group. Many Bamboos also thrive in damp ground. For shady places, the list is even more meagre, and many plants which need only a minimum amount of light will not grow where there is overhead drip from trees. *Rhododendrons* grow well in woods where the light is poor, the air fairly stagnant and drip inevitable. *Aucubas* and *Hollies* seem to thrive under practically any condition and treatment. *Berberis Aquifolium* (*Mahonia*) is another good plant for a shady spot, and it is remarkable how many self sown seedlings of this plant appear at the foot of trees, strong evidence of their not heeding shade, etc. *Euonymus japonicus* and *Privet*, two fairly common shrubs, are also suitable for planting in shady places, and others that do well are *Ruscus aculeatus* (Butcher's Broom), *Hypericum* in variety, *Vincas* or *Periwinkles*, and *Rubus irenaeus*, a species introduced in recent years by Mr. E. H. Wilson, from China. The foliage of the last is reminiscent of that of a Coltsfoot, and has a pretty metallic sheen. This *Rubus* is a prostrate grower, and soon spreads, making an interesting carpet under a tree.

**Gynerium.**—Pampas Grasses have done wonderfully well this year, despite the somewhat poor weather conditions. We grow them chiefly as specimen plants on lawns, and after a year or two they form fine specimens of great ornamental value; we also plant them in the shrub-beries.

## TREES AND SHRUBS.

### COTONEASTER FRIGIDA.

AMONG the strong-growing species of *Cotoneaster*, *C. frigida* is the most ornamental and useful for our garden borders, pleasure grounds and open woodland. Naturally a free and robust growing bush, or small tree, it attains to 20 ft. or even more in height, and as much in diameter. By restricting the young plants to a single stem, *Cotoneaster frigida* may be trained to form a standard tree of medium size (30 ft. to 40 ft.), with a clean trunk 3 ft. to 5 ft. in girth at 1 foot from the ground.

As a lawn specimen in bush or tree form, *C. frigida* is deserving of attention. In common with other members of the *Cotoneaster* family, it thrives in most soils, and appears almost, if not quite, as happy in the town garden as in the pure air of the country. In spring the woolly underside of the leaves is noticeable, and the large, flattish corymbs of white

is not surprising. The species is a native of the Himalayas, and was first introduced in 1824. The behaviour of the birds in some districts and in different seasons in connection with berried trees and shrubs is very striking. Some years the berries of *C. frigida* remain undisturbed at Kew until January or February, but though there are plenty of Holly berries, the blackbirds and thrushes have already feasted freely, and in a few days no fruits will remain. A. O.

### AZALEA OCCIDENTALIS.

In California, its native habitat, I have seen this beautiful species covering to shoulder height acres of the woodland floor, beneath the interlacing boughs of Oaks and other trees. But the behaviour of a plant in the shade in such a climate as California, with its wonderful sun and clear air, cannot always be taken as a guide in treating the same subject in this country. There is probably more actual light beneath the trees where I found *A. occidentalis* at home

FIG. 146.—COTONEASTER FRIGIDA, EARLHAM VARIETY.

flowers open in April and May. But it is in autumn and winter, when the branches are heavily weighted with the large clusters of rich red berries, the size of garden Peas, that *C. frigida* is most attractive. It is fairly widely planted, though its name is not generally known—no berried shrub is so frequently sent to Kew for name.

During recent years several prolific fruiting and brilliantly coloured forms have been named and exhibited at the fortnightly meetings of the Royal Horticultural Society. The one named *Vicaryi* was raised at Aldenham House, and at the meeting on December 12, the Earlham variety (Fig. 146), raised by Sidney Morris, Esq., Earlham Hall, Norwich, was exhibited in fine condition. This had notably large individual fruits, richly coloured and borne in large clusters. I remember seeing in the Daisy Hill Nurseries at Newry a particularly prolific fruiting variety named *montana*. There is also a distinct form, var. *fructu-luteo*, with yellowish or creamy-white fruits. Though not particularly attractive at present, yet by a selective process of raising successive seedlings this should be the forerunner of a rich yellow-fruited variety.

When it is considered that *C. frigida* is so readily raised from seeds and so free in growth, the introduction of improved varieties

than in full sunshine in this country. Nevertheless, this pretty *Azalea* prospers with us under the partial shade of tall, deciduous trees.

It is naturally a rather thin-habited, deciduous bush, attaining about 5 ft. in height, and bearing in July or August small, terminal clusters of large, pure white, fragrant flowers that are often delicately flushed with pink. There are several forms of *A. occidentalis*, differing mainly from the type in the amount of pink or red present in the blossoms. Whether these are some of the results of hybridising I do not know, but that *A. occidentalis* has been used to a considerable extent in the raising of late-flowering *Rhododendrons* is common knowledge. As a matter of fact, these forms of *A. occidentalis* now appear to be much more easily obtainable than the type. A. T. Johnson, *Talycafn, N. Wales.*

### JUNIPERUS CHINENSIS VAR. SARGENTII.

This form of Chinese Juniper was found by Prof. Sargent in Japan, and it is stated\* to be generally considered the handsomest of the numerous Junipers with prostrate stems. Plants raised from seed, in the Arnold Arboretum, have formed dense mats of bright green foliage 10 feet across, and only a few inches high.

\* Bulletin of Popular Information, No. 17, Vol. VIII. Arnold Arboretum, Harvard University.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## WET WEATHER ROSES.

THE great contrast between the last two summers has afforded the observant Rose-grower useful opportunities for the selection of varieties which, on the one hand, revel in sunshine and warmth, and, on the other hand, delight in coolness and are proof against rain. This article is concerned with the latter class.

Too little attention has been given to the varieties of Roses especially suitable for growing in districts with a heavy rainfall. As regards any individual variety of Rose, the question whether its flower bud will continue to unfold its petals undamaged or will "ball" and rot during a spell of wet weather is largely left unanswered in books and catalogues dealing with this flower. Even the National Rose Society's publication, *Select List of Roses, 1921*, amid its many selections of Roses suitable for various purposes, supplies no list of varieties especially good in wet weather.

It may not be of great concern to growers living in the south and east of England whether they choose what may, in contrast, be called fine or wet-weather Roses; but in the western parts of the kingdom, and especially from my experience in this N.W. corner, it is most desirable to plant largely the latter class. In Cumberland July rather than June is the summer month for Roses, and this at the same time is usually a rainy one; consequently, if mainly fine-weather Roses have been planted, much disappointment in the way of spoilt blooms will ensue. The Rose bushes may be vigorous and full of flower buds, but if none or few of these later expand into presentable blooms, the main object in growing the plants fails of achievement. Disappointment of this nature can be largely avoided by a careful selection of varieties. I will not promise no unblemished blooms from wet-resisting Roses should the weather continue for long exceptionally rainy, but such periods are unusual.

Why, it may be asked, does rain cause the opening flower bud of one variety of Rose to "ball" and rot, while it does not interfere with the further expansion of that of another variety? Broadly speaking, it may be correct to state that the fuller the Rose the more difficulty it has of opening in the wet, and vice-versa. Single Roses are rarely spoilt by the weather. But some full Roses may be mentioned that expand undamaged by rain, e.g., *Avoca*, *Juliet*, *Mme. A. Chatenay*, *Los Angeles*, and that useful old-fashioned, garden Rose, *Julia Margottin*. While others, sparse of petal, open badly in the wet, e.g., *Mme. Ed. Herriot*, *Mrs. Alfred Tate* and *Pax*.

Foster-Melliar (*The Book of the Rose*, 2nd edit., 1902) refers incidentally to the effect of rain on Rose-blooms (see pp. 227, 297 and 314), and states, what no doubt was correct then, that Tea Roses are peculiarly liable to be injured by rain. He also adds that thin-petalled suffer less than stout-petalled Tea Roses in wet weather. *Mme. Lambert* is a case in point of a thin-petalled Tea Rose opening well in the wet, and such old show favourites as *Catherine Mermet*, *Maman Cochet* and *Ethel Brownlow*, which are stout of petal, illustrate the opposite tendency. But it cannot be true for Roses generally to

state that thin-petalled varieties stand the rain better than thick-petalled ones, and is not, I think, invariably so for pure Tea varieties. *Mrs. Herbert Stevens* can hardly be considered stout in petal, yet in my experience it is impatient of wet. Personally, I should be more inclined to the view that stout-petalled varieties stand the rain better than those with flimsy petals; but this rule will not hold entirely. *Frau K. Druschki* can hardly be classed among the thin-petalled Roses, yet it is by no means a good wet-resisting Rose. White Roses are, on the whole, probably less patient of rain than coloured ones; but here again exceptions can be found. *Augustine Guinoisseau*, a white bud-sport, is a much better wet-weather Rose than its parent, the pink *La France*. *Mme. Pernet Ducher*, a cream-white when expanded, is a fine Rose for a cool, wet climate.

Apart from great fullness, it would seem that no hard-and-fast rules can be laid down as to the features in the bloom that make for wet-resistance. I write, however, in an inquiring rather than a dogmatic spirit. Why, for example, should the petals of *Henrietta* resist wet, while those of *Mrs. Alfred Tate* rot in the rain? Both Roses are fairly similar in build, differing chiefly in colour. Of two yellow Roses, why should *Mme. Ravary* be uninjured and *Mrs. Aaron Ward* badly spoilt by rain? Why should *Ophelia* be a fairly good wet-weather Rose and *Prince de Bulgarie* quite a bad one? Both are somewhat similar in colour and shape.

A suggestion occurs to me that may bear on the matter. A Rose may be a wet-resister because it is capable of expanding its flower buds in cool weather, which in summer is usually accompanied by rain. On the other hand, a Rose may behave badly in wet weather because it needs considerable warmth (i.e., sunshine) to expand its blooms. Unable to unfold quickly enough in cool (i.e., rainy) weather, the arrested bud becomes so soaked in moisture as to rot. This idea would explain why pure Teas are, on the whole, poor rain-resisters. They, as a class, require the most heat for free blooming. If there be any truth in the above suggestion, then Roses that do well in cool seasons are those which withstand the rain best; and thus are eminently suitable for the wetter parts of the British Isles.

In conclusion, I append short lists of Roses which have proved with me to be respectively good, moderate, and bad wet-resisters. Very likely certain readers may be inclined to disagree in detail with these lists; but no one, I fancy, who has studied the varieties from this point of view would transfer any from the first to the third category, or vice-versa. If rosarians would study Roses from this aspect, and give their experience, sufficient data might be forthcoming to include in the N.R.S.'s List a selection of the best wet-resisting Roses. The lack of knowledge on this point led me to add last summer to my garden a Rose which has been a complete disappointment. A pink Rose was wanted, and from its description *Mrs. Charles Russell* seemed especially suitable; but, alas! it did not perfect one bloom. The plant has grown well, and bore upwards of 50 flower buds, but not one unfolded itself sufficiently even to reveal the character of the variety; all rotted off in the bud-stage. If to the description of this variety had been added, "bad in wet weather," or some such phrase, I should have shunned it.

GOOD WET-RESISTING ROSES.—*Avoca*, *Betty*, *Capt. Hayward*, *General McArthur*, *Gustave Grünerwald*, *Henrietta*, *Juliet*, *Lady Pirrie*, *Mme. A. Chatenay*, *Mme. Ravary*, *The Queen Alexandra Rose*, and *Richmond*.

MODERATE WET-RESISTING ROSES.—*Augustine Guinoisseau*, *Cherry Page*, *Hugh Dickson*, *Hoosier Beauty*, *Lady Ashtown*, *Lyon Rose*, *Mme. Ed. Herriot*, *Mélanie Soupert*, *Mrs. J. Laing*, *Mrs. Wemyss Quin*, *Ophelia*, and *Pharisæer*.

BAD WET-RESISTING ROSES.—*Caroline Testout*, *Duchess of Wellington*, *Earl of Warwick*, *Frau K. Druschki*, *La France*, *Léonie Lamesch*, *Mme. Alfred Corrière*, *Mme. Léon Pain*, *Mrs. Alfred Tate*, *Mrs. Chas. Russell*, *Pax*, and *Prince de Bulgarie*. *J. P., Carlisle*.

## NOTES FROM WISLEY.

CONSTANT inconstancy of aspect is one of the fascinations of a garden. Not only do we get different effects during different seasons, but an entirely new picture may be evolved in a few hours.

One of the chief factors in bringing this about is sunlight, though there are others, such as frost. Although the latter is sometimes unwelcome, beautiful pictures may be produced by the freezing of moisture which has collected on plants.

Such pictures are often seen at Wisley, particularly in the rock garden, where these frost effects are often visible for a considerable time, since the ground, owing to its aspect and the proximity of a line of tall Oaks, fails to get the early morning sun. On a recent occasion many shrubs assumed an entirely new beauty owing to the conspicuous delineation of foliage by the frost, such, for instance, were *Cotoneaster thymifolia*, *Olearia Haastii*, *Berberis buxifolia* and *Arctostaphyllum nevadensis* and certain Conifers like *Retinospora obtusa*. The common *Droopwort*, *Spiraea filipendula*, *Asperula hirta* and *Androsace lanuginosa* were also interesting, while the unusual shape of the leaves of the *Anemone Hepatica* was accentuated by the ice crystals, and the fine scarlet berries of *Stranvaesia undulata* covered with frost appeared to possess a bloom such as is found on the fruits of the new *Berberis* hybrids.

Among the *Pyracanthas* the red-berried *P. Gibbii* and a Wisley seedling with yellow berries are following on the large orange-fruited *P. Lalandei*, which has passed its prime. Later still comes *P. crenulata yunnanense*, the berries of which are not yet fully coloured. Another late species is *Pyraecantha angustifolia* (at one time known as *Cotoneaster angustifolia*). This handsome shrub has yellow fruits and narrow, strap-like leaves, as its name implies.

As a rule these *Pyracanthas* do not naturally form good-shaped bushes, but this may be brought about by judicious pruning. Standards may even be formed. Certain varieties have a pendulous habit and may be used with good effect on the side of a pool, or be planted around a tank, as has been done at the top of the rock garden at Wisley. They are also valuable for clothing bare walls or fences, and their suitability for use in small suburban gardens is fortunately widely appreciated.

A remarkable study in bright autumn colouring is to be found in *Berberis coccinea*, a small shrub rarely exceeding 2 feet in height and bearing large, red sealing-wax fruits. The under side of the leaves, which are small, is a silvery grey, and the upper side ranges from deep green to orange and scarlet. This plant is liable to be killed by prolonged frosts, and is best placed in a sheltered position.

The beautiful *Viburnum fragrans* is now in flower. At present it is leafless, and the warm, brown stems are exposed. Numbers of sweet-scented pink-white blossoms, bright rose in bud, occur at the tips of the side shoots. This shrub should be an admirable subject for forcing under glass (though the flowers stand bad weather in the open extremely well).

On my last visit to Wisley there were still some autumn Crocuses in flower in the alpine frames, such as *Crocus Salzmanii*, *C. erectophyllus*, the paler *C. sativus Thomasii* and the white *C. ochroleucus* with a yellow flush at the base of the petals. Autumn Crocuses flowering in the open have not had a very happy time this year owing to damp weather. Rain, however, seems to have left little impression on the ground, which is in many places astonishingly dry. For the second year in succession it has actually been too dry at Christmas to transplant certain large shrubs with safety.

The Carnation trial under glass has been continued, and there is plenty of bloom to be seen. The plants are now two years old and were re-potted last spring after flowering through the winter of 1921-22. Among other good varieties *Triumph* with deep red and finely formed and scented flowers, *Nora West* (pink), *White Wonder* and *Enchantress* are attractive. *J. E. G. White*.

## FLOWERING PLANTS FOR CHRISTMAS.

DURING the week preceding Christmas Covent Garden Flower Market is a place of unusual interest and much activity. Quite apart from the immense business in cut flowers, there is invariably at this season a big trade in pot plants, and although the usual foliage plants are very much in evidence, such as Palms and Ferns in great variety of size and species, Aspidistras, Arancarias, Cordylines, Dracaenas, Codiaeums, Selaginella and Tradescantia, the chief attraction is provided by the flowering plants in pots and boxes.

The growers of pot plants for the Christmas market contend—and with good reason—that for an equal expenditure, the plants are better value and give a more lasting effect than cut flowers. The difficulty, of course, lies in the fact that a pot plant is not so easily carried or despatched to a friend as are cut flowers, and the handicap of railway charges for the former is considerable. Be that as it may, there is no doubt that a well-grown flowering plant in a pot is a charming and graceful Christmas present. The bulk of the pot plants sent into Covent Garden Market are grown in the home counties and come into London in specially-constructed motor-vans, and to see these vans unloading overnight or in the early morning is worth the inconvenience of an early or late visit. Most of the growers bear names that are very familiar in the market and among florists generally, as, in most instances, the firms have had several generations of experience in their work. A private gardener visiting the market is invariably surprised at the wonderful likeness each plant of a given species or variety has to any other of the same kind. There may be thousands of *Erica hyemalis* (Fig. 147) on the market, in 48 sized pots, and yet the difference between one plant and another is infinitesimal; the common remark from such an observer is, "they look as though they were all turned out of the same mould." There is probably no more popular plant than this Heath for the Christmas trade, and it is supplied in various sizes; other kinds are *Erica gracilis*, white and coloured, and *E. melanthera*. Swanley and Whetstone are the chief sources of supply of Heaths. Other "hard wood" plants which find a place in the market at this season are *Epacris*, *Acacias*, *Correas* and *Genistas*, but these are variable in quantity according to the variation of autumnal weather.

White Marguerites are usually supplied in fine condition and full of their Daisy-like flowers. There are *Cinerarias*, but it is a trifle early for them. The demand for *Cyclamen* appears to have increased during late years, and plants in 48 and 60 sized pots, with handsome foliage and attractive flowers, sell freely at good prices. Large-flowered *Hyacinths*, some in 48s, others in 60s, do not lack buyers, as the plants are presented for sale just as the spikes show one or two open flowers; consequently the ultimate purchaser or "consumer"—a market phrase as common in the flower trade as in the fruit and vegetable trade—is able to enjoy the beauty of expanding and fragrant blossoms over a long period. Roman *Hyacinths* with the bulbs closely packed in smaller boxes sell freely, and they are used by florists for filling bowls, with the addition of Ferns or *Selaginella*; these *Hyacinths* are, of course, just opening their white, sweetly-scented flowers, and have other spikes to provide a succession. One of these little boxes will sell for 10s. in the market. Tulips of the dwarf Duc van Thol group, in various colours, are supplied in similar fashion, in shallow boxes, and they are most effective when removed and placed in pots or bowls. A few early *Daffodils* are also generally obtainable at Christmas time, grown in similar fashion.

Dwarf, bushy *Chrysanthemums*, chiefly white and yellow-flowered varieties, are popular at this season, and, if well grown, the salesmen's art is not drawn upon to effect a sale. Very beautiful are the *Azaleas* (*indica* varieties) in various sizes, and the public is ever ready to purchase these bright-hued, shapely plants for Christmas presents. The several varieties of *Begonia Gloire de Lorraine* arrest a visitor's

attention, especially the large specimens, as fine as any seen at the R.H.S. Hall.

This by no means closes the list of pot plants in flower at Christmas time; indeed, "flowering" has a wide meaning in Covent Garden, and applies to *Solanum capsicastrum* and *Ardisias*. *Poinsettias*, *Euphorbias* and *Primulas* are other plants brought up for the Christmas trade, but the two first-named are chiefly represented as cut flowers. C.

*castrum* "takes" well with the public; they also have the choice of others—*Genistas*, *Azalea indica*, etc.

The majority of these are English grown, a portion of the huge stocks which supply Covent Garden and the provincial markets. Large consignments of cut flowers are despatched to Glasgow each day in the week or so before Christmas. There is a big business with *Chrysanthemums*, *Hyacinths*, *Tulips*,

FIG. 147.—*ERICA HYEMALIS*; THE MOST POPULAR HEATH FOR CHRISTMAS DECORATIONS.

## THE GLASGOW FLOWER MARKET AT CHRISTMAS.

WITH the approach of Christmas, the special flowers associated with the season appear on the stands in the wholesale flower market—the Bazaar, as it is called.

New Year's Day is the National Festival in Scotland, and salesmen report maximum business during the week before the New Year.

Inquiry, with the retailer, is for the old favourites, the well-known selling lines, and, as usual, the flowering plant in most demand is one or another of the *Ericas*—*E. gracilis*, *E. g. nivalis*, or *E. hyemalis*. *Solanum capsica-*

*Roses*, *Carnations*, and French flowers—*Acacia* (*Mimosa*), *Narcissus*, *Lilac*, and *Violets*.

While Glasgow absorbs the major portion of supply, the adjacent country towns, the industrial towns of Lanarkshire, and the Clyde coast resorts, draw most of their supplies from the Bazaar.

After orders for the day have been despatched, flowers remaining are sold by auction to small retailers and street vendors.

In the three weeks before the New Year, many thousands of bowls of bulbs are disposed of. The bowls, plain or fluted, are made up with a central Fern, usually *Pteris Wimsettii*, and half a dozen *Tulips* or *Hyacinths*. It is finished with a surfacing of green moss. The most popular *Tulips* for bowls are the Duc

Van Tbol varieties and the yellow Montresor. The variety Proserpine forces well and makes an uncommon bowl, but the bulb is an expensive one.

The Hyacinth mostly favoured for bowls is the prepared miniature white, L'Innocence, and this has largely superseded the Roman Hyacinth. These bulbs are grown in boxes, and the bowls made up as they come into flower. Despite this rough-and-ready treatment, they remain in good condition over a long period. Most of the local growers dispose of the bowls direct to the retailer, those seen in the Bazaar being from growers not so fortunately situated. Supplies reach the market from a wide radius. In most cases growers find it cheaper to send their produce by their own motor-lorries than by the railways.

Foliage plants in pots include the indispensable Aspidistra and the Norfolk Island Pine, *Araucaria excelsa*, of which quantities are shipped from Belgium. Hanging pans of Asparagus, well grown by Messrs. Finlay Brothers, local growers, are in demand; also *Aralia Moseri*. The last are bushy plants, composed of several seedlings potted together and grown on. *Kentia Forsteriana* and the more graceful *K. Belmoreana* are popular Palms. Mistletoe, well-berried Holly, and other evergreens; dried foliage, sprays of *Ruscus* and *Cycas* leaves, are all in demand at Christmas time. *Fred W. Jeffery, Dalserf, N.B.*

## JANE WELLS LOUDON.

MRS. J. C. LOUDON was a native of Birmingham, but the year of her birth I do not know. Her father left her in rather straitened circumstances, and in order to make ends meet she took to writing books for children, and novels. One of the latter designated *The Mummy* had its scenes laid in the twenty-second century, and the authoress allowed herself to propose some very extravagant things that should happen in that far-away future. When I name some of them it will be seen that her fancies were not all so fantastic as they appeared about a hundred years ago:—"Everybody will then travel by air. Cows will be milked by machinery. Ireland and Scotland will have separated from the predominant partner. The most enlightened part of society will believe in ghosts and goblins, and ploughs will be operated by steam."

Loudon got to know of this book, and its weird imaginings impressed him so much that when an opportunity presented itself to meet the author, whom he thought to be a man, he accepted it with pleasure, with the result that they formed a friendship which ended in the closer relationship of man and wife six months later—September, 1830.

A few months subsequently her initials, "J.W.L.," were appended to a note in the *Gardeners' Magazine*, and right on till Mr. Loudon's death, thirteen years later, she helped him in everything, acting as his amanuensis, and working with him often till 2 and 3 o'clock in the morning. Wherever Loudon went she went with him, and he died standing on his feet with the arms of his wife supporting him. She had the highest opinion of her husband, morally and intellectually, and he reciprocated the sentiment, and in announcing the publication of one of her books he recommended the authoress as being superior to the majority of writers for the lucidity and perfectness of her style. With this estimate, I think, most will agree who are acquainted with her writings. *The Lady's Country Companion*, for instance, is so well written that the part devoted to cookery may be read with pleasure, even by a mere man. Or what can be more engaging than her preface to *Botany for Ladies*, in which the reader cannot but sympathise with the fruitlessness of asking questions about flowers, the answers to which were soon forgotten? Then she relates how on admiring "a mass of the beautiful crimson flowers of *Malope grandiflora*" she received the careless reply to her query as to its identity that it was "some Malvaceous plant." She forthwith went in search of other plants of the same genus, and in turn learned to know, unaided, Cruciferous and Umbelliferous plants. Everybody must be

aware that natural history at second hand is apt to fade from memory in the course of time, while what one learns oneself is retained. I recollect how pleased I was to discover for myself that the part of the Christmas Rose that calls for our admiration was not the flower but the calyx, the flower itself being an inconspicuous portion of the floral array. That I have never forgotten.

Once Mrs. Loudon started on botanical discoveries on her own account she soon became expert enough to write simply worded books on botany and gardening, and was greatly helped in compiling the latter subject by her long co-operation with her husband as his amanuensis—as she herself admitted. The active period of her writing was from 1839 to 1845. *Domestic Pets* in 1851 is not worthy her pen and, like it, *Facts from the World of Nature*, a little earlier, is also mostly a compilation of anecdotes.

Her first adventure in horticultural literature was *The Ladies' Flower Garden of Ornamental Annuals*, which was issued in parts at 2s. 6d. each; part 1 on January 1st, 1839, and was completed in 16 parts, containing 48 coloured plates, costing, bound, £2 2s. In 1840, *Bulbous Plants* followed, and when that was completed, *Hardy Perennials*, all in 4to. The figures are drawn on zinc, and none of much excellence. A series of six volumes was contemplated, but those on the Stove and Shrubs were never executed, though she added, later, one on *British Wild Flowers*. The letterpress of these consists in synonyms of the plants, a note of previous illustrations, a description, and brief cultural remarks. I have a suspicion, and only a suspicion, that the copyright of these was confiscated by the creditors of her husband at his death, who, as is well-known, died insolvent owing to the great expense incurred in the production of the *Arboretum et Fruticetum Britannicum*. Another edition, however, was brought out in 1849, but from other types. In 1840 she produced *The Lady's Flower Garden*, ostensibly to afford increased information to those who found the volumes just mentioned to be too meagre for their requirements. It is an 8vo of 406 pages, and was sold on the day of publication to the number of 1,350. In the same year *Gardening for Ladies* was published, and up to 1851 as many as eight editions had been asked for. Also in this year appeared the *Companion to the Lady's Flower Garden*, and an enlarged edition in 1842. This was a very popular book, over 20,000 copies of it having been sold. This output for one year is certainly extraordinary, especially when it is remembered that it occupied only part of her time. In January, 1841, *The Lady's Magazine of Gardening* was launched, of which she was editress. It was a monthly, with coloured plates, at 1s. 6d. each part, but I think this venture did not survive the second year. The illustrations, as a matter of fact, in all the books were not of first-rate quality. *Botany for Ladies*, already referred to, came out in 1842, a 12mo, and was re-issued in 1851, and *The Lady's Country Companion* in 1845, with a second edition in 1846. She also saw her late husband's *Self Instruction for Gardeners* through the press, for which she wrote a brief sketch of his life, also a few more books on subjects unconnected with gardening.

As already stated, Loudon died insolvent, and Mrs. Loudon not long subsequent to his decease received an annuity of £100 from the Civil List. There was one daughter, Agnes, of the marriage, who also wrote books—*Tales of School Life*—and others. Her mother lived in widowhood fifteen years, and it is stated in *The Gardeners' Chronicle* of 1853, in an obituary notice, that she died at an advanced age. Various circumstances, however, indicate that her age could only be about 70, or perhaps a little more.

In gathering material for this brief sketch, I have been impressed by the perfect unanimity of sentiment existing between Mrs. Loudon and her husband. Notwithstanding his superabundant energy it is doubtful if he would have been able to produce his books, and to complete the *Arboretum*, without her help. *R. P. Brotherston.*

## PALMS OF THE RIVIERA.\*

I WILL now deal with some fan-leaved Palms that are among the very hardest of these plants, none of them having suffered the least, even from the severe frost of December, 1920, the worst which has been known on the Riviera since 1820—just one hundred years before. As I stated in a previous article, the temperature on that occasion, though only for some few hours, was as low as  $-8^{\circ}$  or  $-10^{\circ}$  C., but this exceptional cold was by no means general in the Riviera, as to the east of Nice, the most sheltered part of this very privileged country, the temperature at certain parts hardly fell much lower than  $0^{\circ}$  C., and even the most delicate plants suffered but very little.

*Trithrinax brasiliensis*, Mart, a slow growing Palm, known usually here under the name of *Thrinax Chuco*, is but rarely found in gardens of the Riviera. The leaves are somewhat stiff, of a dark green colour, and the rather slender trunk is covered with yellowish spines originating from the fibrous covering surrounding the bases of the petioles. The spines are at first erect, then horizontal, and at last bent down close against the trunk, giving a characteristic appearance to this Palm, so that it can be recognised at first sight. It is a rather small species, reaching only some 4 metres to 5 metres in height.

*Trithrinax campestris*, Dr. A. Gr., from South Brazil and adjoining regions, exists, so far as I am aware, in the Riviera only in my garden, where I have about a dozen rather young plants. The leaves are exceedingly stiff, so much even that the points of the divisions of the blade have the character of spines; their colour is distinctly greyish. It is a small species like the foregoing, and very slow-growing.

A third equally hardy species, *Trithrinax acanthocoma*, Drude, exists in the botanical gardens in Rome. The director of this famous establishment, Prof. Pirotta, has sent me seeds on several occasions, but for some reason or another, none has ever germinated. I do not know of the existence of this Palm in any other garden, botanic or private, and have never seen it listed in any catalogue, scientific or commercial.

*Nannorhops ritcheiana*, H. Wendl, is a small, attractive Palm found in Afghanistan and adjoining regions. It forms, by its shoots from the base of the trunk, a group of low stems, while the above-mentioned species of *Trithrinax* forms only a single stem. The leaves are very glaucous, almost as much so as the famous "Blue" Palm, *Erythea armata*, Wats; they are rather stiff, though much less so than the leaves of *Trithrinax campestris*. When this slow-growing Palm has arrived at the stage of forming a tuft of stems it produces a fine ornamental effect. Many years ago I bought, under the name *Nannorhops Comesii* (a name which I have not found in any scientific publication) some seeds, which produced Palms that much resemble *Nannorhops ritcheiana*, and may be a variety of this Palm. Prof. Bearri also considered that several varieties exist, though he does not describe any in his numerous writings dealing with Palms.

*Rhapidophyllum hystrix*, H. Wendl, is a native of Florida, and, like the foregoing, produces numerous shoots from the base, forming a tuft of stems clothed with dark-green leaves, which much resemble those of the well-known *Rhapis flabelliformis*, so often met with in green-houses. When left with all its offshoots this Palm does not often reach a height of more than 1 or 2 metres, but when allowed to retain only one or two, it will grow to a height of some 3 to 7 metres. The stems are brittle, and have long, thin, black spines, from which it is named. These spines originate from the fibrous bases of the leaf-stalks, like those of *Trithrinax brasiliensis*; they do not, however, assume characteristic positions, but bristle in all directions.

\* The previous articles by Dr. Proschowsky were published in our issues for May 1, June 12, July 10, September 4, November 20, December 18, 1920; March 12, April 30, June 11, October 8, November 19, 1921; January 21, February 11, April 1, June 17, July 29, October 14, and November 11, 1922.

It is a very slow-growing Palm, and more interesting for gardens by its curious appearance than by its ornamental value.

*Serecoa serrulata*, Hook, is a very common Palm found in the south-eastern parts of the United States, so far north as South Carolina, and as far south as southernmost Florida, though there may be local forms. For some thirty years I have tried to obtain fresh seeds of this Palm from all these different regions (it is, for instance, quite common around New Orleans, in Alabama, and many other places), but I have never succeeded. I shall take advantage of this opportunity to ask readers of the *Gard. Chron.* living in the South-Eastern United States, to kindly send me fresh seeds of this small Palm especially from the northern and western limits of its distribution, in exchange for other seeds. It is usually found forming a tuft of quite low stems, or, rather, stemless shoots from a common base. The leaves are glaucous and the petioles are lined with tiny spines, which are rather inoffensive. Notwithstanding these very small spines the popular name of the plant in the United States is Saw-Palmetto. *Dr. A. Robertson Proschowsky, Jardin d'Acclimatation, Les Tropiques, Nice, France.*

## FRUIT REGISTER.

### APPLES OF RECENT INTRODUCTION.

DURING the past four years several new varieties of Apples have been brought before the notice of the public. It is early to estimate the true merits of these novelties, as soil and climatic conditions have to be reckoned with. I am inclined to think some of them may be susceptible to "bitter pit," this disease being most noticeable in varieties similar in flesh texture to the Lord Suffield type.

The variety John Standish is a pretty fruit of medium size, well coloured and of perfect contour. The flavour is very good, the flesh being firm, full of juice, and acceptable to most palates. As shown, the branches were laden with Apples, and, being of a desirable dessert size, the variety will probably be grown for market sooner or later. The keeping qualities are greatly in its favour, Messrs. J. House and Sons, who introduced the variety to commerce, having kept specimens quite sound until the end of March.

Redcoat Grieve should prove most acceptable for its high colour. The appearance of the specimens shown to me brought to memory the fine finish of the Colonial Apples. The flesh of this highly coloured Apple appeared to me to be more yellow and much longer keeping than that of the typical James Grieve. The growth of the tree is identical with the variety James Grieve, from which it originated.

Pershore Pippin, a variety brought to my notice whilst judging at Birmingham recently, is an Apple of the best dessert size, and in appearance resembles a small form of King's Acre Pippin. The assumed parentage is Sturmer Pippin × Ribston Pippin. The variety was shown by Messrs. Hopwood, of Cheltenham.

Tibberton Codlin is another variety grown by the latter firm. The fruit is of medium to large size, conical, yellow, flushed red, with russet patches, the qualities being so good as to make it useful for dual purposes. The tree is a strong grower and prolific cropper. The fruits keep sound until the end of March.

Herring's Seedling (see Fig. 148), shown by Messrs. J. R. Pearson and Sons, is a Lincolnshire raised variety and destined to take a prominent place amongst early sorts, the appearance of the fruits being most pleasing. They are highly coloured and large. For growing as a pot tree, this variety is unsurpassed. The flavour is not in the same category as that of Cox's Orange Pippin, nevertheless, it compares favourably in quality with most early Apples. The foliage is large, the growth strong, and the tree should make a splendid standard for orchards. The season is the end of August to the end of September.

Harling Hero, of Messrs. Daniel Bros., is a late Apple, of hardy constitution, the fruit large in size and beautifully coloured. The tree is stated to be a very heavy cropper, a strong grower, very hardy, and thrives in most soils. As a culinary sort it is excellent, the fruits keeping sound until the end of February.

Madresfield Court is a very choice Apple, the colour and contour of the fruit being very attractive. The fruits are of a suitable size for dessert, and as delicious as they appear. The flavour is of the Ribston type, with a sugary juice. This variety is in season until January. This fine Apple makes a good tree in all forms, and will doubtless be planted extensively. Mr. Parsons is to be congratulated on introducing this fine variety.

Superb is a fine new Apple raised by Messrs. Laxton Bros. The fruits as taken from the trees are certainly not inviting, but by the description given by the raisers and the test

brook's introductions; the fruits are large and coloured yellow, with a bright red flush, splashed with crimson. The flesh is firm and of excellent cooking qualities, and, although a culinary sort, it is quite useful late in the season for dessert. The growth of the tree is strong and spreading; the variety will make a fine orchard tree. The fruits keep until the end of March, or even later, and came out top in an Apple-cooking competition last season. The raisers have a high opinion of this Apple as a market variety.

Queen Mary, which some consider synonymous with American Mother, is an early, excellent Apple, raised by Mr. Parsons. It has every quality of a first-class mid-season variety. The skin is yellow, streaked and shaded with crimson scarlet; the fruit is of splendid shape and ideal for packing. The flavour at its best is excellent, the flesh being yellow, firm, juicy, and very sweet, with an aromatic quality. The tree makes healthy growth, forming an abundance of clear fruit spurs. *Pomona.*

FIG. 148.—APPLE HERRING'S SEEDLING.

qualifications of several it is evidently a variety of high merit. I did not have the opportunity of tasting a fruit whilst at the Crystal Palace, but the appearance of the fruit suggested an Apple after the Ribston-Blenheim type, with less colour than either. The variety is claimed to be of a rich Cox's Orange Pippin flavour, and will keep long after that variety.

Excelsior (Seabrook) is an early, showy Apple of very large size, and at early exhibitions would make a notable dish. The fruits are highly coloured, and nearly entirely covered with bright red; they are conical in shape. The tree is very fertile and of a strong constitution. This variety is useful for both culinary and dessert purposes, and I predict a future for this "paeker."

Mr. Prothero is a late variety introduced by Messrs. Seabrook and Sons. This medium-sized Apple should prove an acquisition, and it is a long keeper. The flesh is yellow, crisp, and sweet. The fruits should pack and travel well, owing to the toughness of the skin. It will keep for twelve months if stored under cool conditions. The colour is green-yellow, with a red flush. The tree is fertile, and very useful for growing in small gardens.

Monarch is one of the best of Messrs. Sea-

## MARKET FRUIT GARDEN.

### ECONOMY IN CULTIVATION.

WITH fruit down to pre-war prices, and no justification for any substantial reduction in wages, strict economy in cultivation is essential. I do not want to grass down any more orchards, because this system is not the best in a district where the soil is light and the summer rainfall likely to be inadequate. But I am going to try doing without hand work (hoeing and digging) in the older plantations. The spaces between the rows can be kept in an excellent state of cultivation with the plough, horse and motor cultivators, etc., leaving only a narrow strip down each row in which the trees actually stand. The grass on this strip will be mown every year, instead of being kept down by hoeing several times in summer and digging in winter. I do not believe that this work is worth its cost. The trees cannot suffer if the wide space between the rows is well cultivated and manured. Most of the useful roots are certainly there. The plan will allow of more frequent hand cultivation of the younger plantations of trees and bushes, which cannot have too much of it. *Market Grower.*

## FLORAL NOVELTIES FOR 1923.

INTERESTING floral novelties promised for the coming year include several of which Messrs. Watkins and Simpson are the wholesale distributors. Two of these appear to be very distinct; they are *Dahlia Stella* (Fig. 149), a variously coloured single variety in which the seven or eight wide ray florets have their lateral margins incurved so much as almost to meet, thus making each segment more or less funnel or tube-shaped. This is a distinct curiosity and shows that the possibilities of the *Dahlia* in regard to new types have not yet been fully exploited. The second novelty to which reference is now directed is an early double-flowered form of *Cosmea* (Fig. 150), in which the disc florets are petaloid, flattish and spreading, making up a rosette that in a *Chrysanthemum* would be called an *Anemone-centre*; this will be offered in three colours—pink, crimson and white, and should prove a very welcome addition to plants of elegant growth which produce flowers as suitable for cutting as for garden decoration.

FIG. 149.—DAHLIA STELLA.

## THE ALPINE GARDEN.

### ARISARUM PROBOSCIDEUM.

LOVERS of the quaint and curious among rock or bog plants, may be glad to be reminded of the existence of *Arisarum proboscideum*, one of the most odd-looking of hardy flowers, even among its numerous singular fellow-members of the Aroidae. It has been called "a miniature *Calla*," but that does not convey to any degree the true character of this *Arisarum*. It is only some three or four inches high at the most, and has pretty little shiny green leaves of much the same form as those of the popular *Richardia aethiopicum*, but, of course, very much smaller. Then there rise from the base small, curiously shaped miniature flowers of chocolate and white. *Calla*-like in form, yet distinct in numerous points and with a proboscis-like extension which is about two or three inches long, ending in a curiously twisted portion of deep brown, dwindling at the point to almost nothing. The flowers are pretty well hidden, but often the end of this proboscis-like appendage peers above, and is a guide to the searcher for the blooms. Some have likened these to the tails of mice which were disappearing into a hole in the ground, but they are much thinner than the appendages of the rodents. This little *Arisarum* grows well in sandy soil, but its favourite spot is a moist, shady place, where it soon increases by runners at the roots. *S.*

### PHLOX STOLONIFERA.

ONE of the most distinct and certainly the most beautiful of Alpine *Phloxes* is *P. stolonifera*. It is quite distinct from the *subulata* section, in having distinctly ovate tufts of light green leaves; that are conspicuously hirsute. The flowers are quite as large as those of many of the *decussata* section; their colour is a showy, brilliant rose carmine, and they are produced during early spring. Having a prostrate, spreading habit, it makes a most charming rockery plant. *L.*

### SAXIFRAGA GUTHRIANA.

*SAXIFRAGA GUTHRIANA* is understood to be a hybrid between *S. Andrewsii*, itself a hybrid, and *S. aizoon*. The plant is smaller and prettier than *S. Andrewsii*, and has a more stunted, though proportionate flower stem. To keep it in character it should be planted in somewhat poor soil, otherwise it will grow coarsely. In beauty, however, it is by many considered inferior to its variegated form, *S. Guthriana variegata*, which is now a rare plant in commerce. This is not surprising in view of

## HARDY FLOWER BORDER.

### ANEMONES.

AN interesting, romantic and mythological story is recorded of the *Anemone* or *Windflower* springing up from the tears shed by *Venus* over the corpse of *Adonis* after he was gored to death by the horny tusks of a boar.

*Bion*, the Sicilian poet, writes of the *Anemone* thus:—  
"Where streams of his blood, there blushing sprung a *Rose*,  
And where a tear has dropped, a *Windflower* blows."

However, the *Anemone* of to-day is not the fragile flower as depicted by this old poet, the persistency of the *Windflowers* being most remarkable, considering the graceful and delicate texture of many of their flowers.

From early spring until autumn, the rockery, borders and woodlands may be adorned by the many-coloured flowers of *Anemones*; all possess a charm quite their own in rich and delicate shades, and graceful elegance of their Fern-like foliage. When established, it is impossible to over-estimate the beauty of the plants.

The following *Anemones* are all exceedingly beautiful, and delight in a slightly shady position in deeply trenched, well worked sandy loam:—

*A. ALPINA*, one of the most beautiful of the Alpine *Anemones*. The flowers are snow white, with a faint tinge of purple on the outside. The plant grows to a height of 15 inches. *A. alpina sulphurea* is equally pretty, but has sulphur yellow flowers.

*A. PULSATILLA* (the Pasque flower) is a native of this country. Few plants are more handsome during the early spring, and a patch of the lovely, nodding, violet-purple flowers, with golden anthers, is not easily forgotten. When the flowers are over, the silvery grey seed heads are very ornamental. A calcareous soil and fairly sunny position suit this *Anemone* admirably. *A. Pulsatilla alba* is an equally showy plant, with white flowers.

*A. NEMOROSA ROBINSONIANA*: This is one of the most charming of our wood *Anemones*. The flowers are a pretty lavender blue colour. The plant is remarkably free in blooming, and the flowers last for a long period, fresh ones opening each day successively. *A. nemorosa Allenii*, a form also with lavender blue flowers, is an improvement on *Robinsoniana* in its larger blooms. *A. nemorosa alba grandiflora* has snow-white flowers; the variety *alba plena* has double white flowers.

*A. RANUNCULOIDES* produces numerous small golden yellow flowers, and is a good subject for the rockery.

*A. RIVULARIS* is a very beautiful Himalayan species, with pretty white flowers that have violet stamens.

*A. SYLVESTRIS* and its variety *PLENA* have pretty, nodding, snow white, sweetly scented flowers. †

*A. PALMATA* has distinct, palmate, shining green leaves and golden yellow flowers, produced on naked stems; *A. palmata alba* is similar to the type, except that it has snow white flowers.

### EREMURUS (KING'S SPEAR).

THE genus *Eremurus* comprises a magnificent group of hardy plants from Central Asia, and they are worthy of the most prominent position in the garden. When established they do not require transplanting, and they adapt themselves to almost any soil and situation. However, they grow best in deeply trenched, well drained soil, composed of rich fibrous loam and coarse sand, and a situation facing south is preferable, with a covering of six inches of fine soil over the crown.

Undoubtedly the finest species are *E. robustus*, which grows from seven to nine feet high, and has an inflorescence four feet to five feet long, of a pretty rosy-peach shade; *E. himalaicus*, which bears dense racemes of beautiful, snow white flowers on spikes, six feet tall, and *E. Bungei*, which has grass-like foliage, and slender spikes of bright yellow flowers. *W. Logan*.

its slowness of growth and the difficulty of retaining it under the ordinary conditions of the rock garden. It is most satisfactory in the alpine house, where its delicacy is not a hindrance to the same degree as in the open, and where it is not so liable to be destroyed by birds, which often pull it up by the roots. There, also, its variegation is purer than in the open. It has rosettes of fleshy leaves, which are charmingly striped with white, pink and yellow. The flowers, which are a shade of pink, are of less consequence than the foliage.

### COLCHICUM SPECIOSUM AT ARGATY, PERTHSHIRE.

A PLANTING of *Colchicum speciosum rubrum* made at Argaty, Perthshire, about three years ago, has been quite pretty this year in the rough grass by the side of a loch near the mansion. A proportion of the plants have not the red tube of the true variety *C. speciosum rubrum*, but the effect of the large group is most pleasing. Fortunately the Meadow Saffrons have remained untouched by rabbits, just as if the destructive creatures by some mysterious intuitive faculty understand that the *Colchicums* are poisonous. By the way, this fine Meadow Saffron looks exceedingly beautiful when cut or pulled at the base of the tube and lightly arranged in a crystal bowl together with the leaves of the *Montbretia*. Fairly rough grass is best for the Meadow Saffron. *S. Arnott*.

## THLADIANTHA DUBIA

I REGARD *Thladiantha dubia* as the most ornamental of all the Cucurbits that are hardy in Britain. It has elegant, softly hairy, light green heart-shaped leaves on slender stems, which attain a height of 6 feet or 8 feet, and the female plant, if the flowers are artificially pollinated, produces numerous scarlet fruits the size of a bantam's egg, and these are brilliant in colour for long after the rest of the plant is dead. I am anxious now, however, to draw attention to a remarkable feature in which it differs from every other perennial plant I have been able to find after a search of many years. It is perennial by means of its true roots, while every other plant I know is perennial by means of its stem system. It is the only perennial I know, Cucurbitaceous or otherwise, that is without a single bud in winter from which to grow in spring. The only note I have previously made upon this subject is in the *Bulletin* of the Botanical Congress of the Imperial Horticultural Society of Russia, held at Petrograd in 1884, at which I read a short paper, and as this must now be an almost forgotten publication, I desire to publish a further note on the subject in *The Gardeners' Chronicle*.

It would be remarkable if there were no other plant possessing the same feature, but I must leave the quest for it to those who have opportunities for search and observation. On the germination of the seed, the radicle quickly penetrates the ground and usually near its end it makes a tuber. Presently the seedling dies back to this root tuber, and from it the plant makes its next year's growth. It has no bud until one is made when growth recommences in spring. It is entirely a different case with every other plant I know that makes a tuber from which it is to grow after the resting period. In the case of the Potato, for instance, the seeds germinate in the same way; the root makes no tuber, however, but from the axils of the seed leaves tiny stems appear, which produce tiny tubers provided with scales and buds, from which future growths are made. Tubers, indeed, are defined as stem and bud formations, and never as a "root-tuber" supposed to grow. Its function, as in the case of the Dahlia, is the storage of food only. I have many times raised seedlings of *Thladiantha*, and have found that the plant invariably grows from the tuber of the radicle root as described above.

But the question still remains whether the plant is ever subsequently perennial by means of its stem system, and in order to answer it with recent knowledge, I have, during the past summer, made a fresh cultivation of tubers. They send out fibrous roots, some of which again produce the same kind of tuber, but sometimes a true root does proceed from the internode of an ascending stem when a tuber is also formed, but the result is quite the same, and it never happens that a plant is perennial by means of any stem growth. The case of *Thladiantha* is not at all to be compared with any other in which stems grow up from the root. In the case of the Elm, for instance, there is quite a freedom of growth from the roots, but the Elm tree does not die down every year to these roots, and depend upon them entirely for its existence.

*Thladiantha dubia* is a native of China, and is figured in the *Bot. Mag.*, t. 5469. It is well known in Botanic Gardens, and does well in the open supported by a few sticks, but at Cambridge, when Curator there, I found it do remarkably well against an east wall, with wire netting on which it could climb. The flowers are bell-shaped and yellow. In this position the female plant could grow by itself without any danger of getting mixed with the males, by the intermingling of its tubers, male flowers being brought as required from another part of the garden. The female flowers are very easy to set, and the fruits have been found to hang for a long time on the netting, forming a very attractive feature. They are said in the *Treasury of Botany* to be eaten in the Himalayas. R. Irwin Lynch, V.M.H.

## HOME CORRESPONDENCE.

*[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]*

**Carnivorous Squirrels.**—Your correspondent's note on this subject (see p. 343) is interesting, though it is fairly well established that squirrels are to some extent carnivorous in their habits, but it is rather a shock to an ornithologist to hear of young "fieldfares" in Kent, as the fieldfare has never been known to nest in the British Islands. Chas. W. Pearson, M.B.O.U.

**Memorial Sundial at Wisley.**—In reference to your article on the above, in your issue of November 23rd, whilst the conception of a sundial as a memorial to some departed garden lover is a very happy and charming form of remembrance, that illustrated on page 306 is wretchedly miserable and ill-conceived, and to my mind reflects not an atom of credit upon those responsible for its erection. What a poor

**Hibernation of Wasps.**—Although parthenogenesis occurs in several orders of insects and hermaphrodites have been recorded commonly amongst ants, moths and butterflies, I am not aware that any cases of hermaphrodites amongst insects functioning sexually have been met with. Consequently I read Mr. Johnson's letter on p. 314 with considerable surprise, and at once wrote privately to him for chapter and verse. He replied that his remarks were based on a statement by Sir Herbert Maxwell, to whom I accordingly applied for further information, and he favoured me with the following reply:—

"I am greatly obliged to you for bringing to my attention the blunder whereof I was guilty in *Memories of the Months*, 4th Series, p. 273, where, in a note about social wasps, it is stated that 'in wasps the distinction of sex is fluctuating; unlike bees, their nature is so plastic that there are individuals intermediate between male and female, possibly destined to become one or other, as circumstances arise.' This, of

FIG. 150.—EARLY, DOUBLE-FLOWERING COSMIA.

(SEE P. 370.)

little base and badly proportioned column! Wisley ought to teach the garden world what is fine in gardening, but an erection like that illustrated makes one shudder. Properly treated and placed, a sundial may be made to form one of the very finest garden features, around which may be woven some of the most beautiful sentiments in life. If I might hazard an opinion, I think a dial embodying a memorial might, if possible, be more suitably placed on some sunny wall or building, which would tend to give a more permanent feeling and would allow of more space, alike for an inscription and motto. Many mottoes are very charming, for example, would one of the following not be appropriate?

"In life, like you, I marked the passing hours,  
Now I have passed away, the task is yours."

or

"A span is all that we can boast,  
An inch or so of time."

or

"Man is but vanity and dust,  
In all his flower and pride."

—John A. Holms, Formakin, Bishopton, N.B.

course, is quite incorrect. I have not got the original note upon which the statement was founded; but it probably was made in comparison with the fact that the queen wasp's earlier brood consists entirely of imperfect females—workers; whereas the later brood contains males and perfect females. *Herbert Maxwell, Monreith.*

This seems to clear up the question very effectively! With reference to D. H. Dunn's letter in the issue of the 9th inst., he is not correct in saying that a wasp's egg "can be hatched to be either a queen, drone or worker." The drone eggs are unfertilised, and can become nothing but drones; whereas the worker and queen eggs are fertilised. Whether a worker egg can be reared into a queen by special feeding amongst wasps as amongst hive bees, is, I think, doubtful, because once a wasp nest has been deprived of its queen in any way, a new queen is, I believe, never reared, and the wasps become indifferent, and gradually forsake the nest. I do not follow Mr. Dunn's argument about the flowers. C. Nicholson, 35, The Avenue, Hale End, E.4.

## SOCIETIES.

### ROYAL SCOTTISH ARBORICULTURAL SOCIETY—ABERDEEN BRANCH.

THE annual meeting of this branch was held in the Douglas Hotel, Aberdeen, on December 9. Sir John R. Gladstone, Bt., of Fasque, Kincardineshire, president of the branch, occupied the chair, and there was a good attendance.

Mr. G. D. Massie, secretary and treasurer, submitted the annual report, giving details of the various meetings and excursions held during 1922, and stating that the membership was now 165. The financial side of the report showed credit balance of £26 8s. 2d., in the general account, and £1 3s. 6d. in the library account, and a debit balance of £3 6s. 8d. in the excursions account—leaving a net credit balance of £24 5s. The reports were unanimously adopted. Of four retiring vice-presidents, Mr. John Michie, M.V.O., Kineairn, Kincardineshire; Mr. S. J. Gammell, of Countesswells, Aberdeenshire; and Mr. Donald Munro, Banchoy, were re-elected; and Captain R. J. Nicol, of Ballogie, Aberdeenshire, was appointed in room of the late Mr. A. F. Irvine, of Drum Castle, Aberdeenshire. Major J. D. Ramsay, the King's Commissioner at Balmoral Castle, and Mr. Peter Leslie, of the Forestry Department, Aberdeen University, were re-elected members of the committee, and Mr. J. F. Annand, Forestry Commissioner, Aberdeen, and Mr. James Davidson were appointed new members. Mr. Massie was unanimously re-elected secretary and treasurer of the society, warm tributes being paid to his worth and work by the proposer. Lord Forbes and Mr. Michie were appointed to represent the branch on the parent society, Edinburgh, and it was decided to request representation on the board of the North of Scotland College of Agriculture. Mr. Michie to fill the post should the request be granted.

#### THE NORWAY SPRUCE.

Colonel John Sutherland, C.B.E., of the Forestry Commission, Edinburgh, was then called upon to give an address on "Spruce in Scottish Forestry." In his opening remarks, Col. Sutherland said that Aberdeenshire was noted as one of the northern county units in which the true Scots Pine had rightly gained a high reputation. If sylviculture was to be undertaken as a serious commercial venture, the first consideration must be the ultimate financial result. It was not wise to be content with one crop of a certain species if in a hundred years they could secure two crops of another species, even if the market value of the latter was lower than that of the former. Both Norway and Sitka Spruces should, where cultural conditions were favourable, yield a fairly early return of timbers of commerce. They might give first place to the Norway type. In Scotland it could not claim to have had a reasonable chance. It had seldom been planted pure, and it usually was placed in ground deemed unsuitable for any other species. The returns from Norway Spruce were never compiled, and no one was astonished when it failed to make a crop.

The statistics of Norway Spruce so far compiled were particularly interesting. At Glendye (on Sir John R. Gladstone's estate), at an elevation of 350 feet, in a 12-inch coat of peat over boulder clay or granite, the tree gave 5,965 cubic feet per acre at 54 years of age. At Ballogie (Captain Nicol's estate on Deeside), at 650 feet above sea level, it was found that 4,335 cubic feet was the quantity at 43 years of age, with similar soil conditions. At Durriss (near Aberdeen), at 600 feet, the volume was 4,360 cubic feet in 40 years. At Mar Lodge (the Princess Royal's property at the head of the Dee valley), at 1,500 feet the volume was 7,180 cubic feet at 84 years, growing on a sandy loam over a quartzite formation. Considering the very indifferent treatment accorded to Norway Spruce in the past, those results were encouraging and it was fair to anticipate better crop yields with later day knowledge. For example, while it re-

quired moisture, it did not need a copious supply of water. It did not necessarily prosper only in the wet flats of the valley. It would grow on the hill-slopes, and it accommodated itself to shallow mild peats, but it did require a reasonable proportion of free mineral soil. Another valuable attribute of the Norway Spruce was its seed-bearing capacity, and the hardihood of the seedlings and plants in the nursery. It was a cheap plant to raise, and it was not a victim of any very serious attacking enemy of the forests.

#### THE SITKA SPRUCE.

The Sitka Spruce was brought from the Western American continent, and our knowledge of it, as a real part of any afforested area, was comparatively limited. At an age approaching 60 years it was found to make large specimens in moderate soil, giving a height of over 100 feet. He thought they could predict that it would grow rapidly in this country. Although discovered at an elevation of 3,000 feet and more, it seemed of no consequence as marketable timber above about 1,000 feet, and the best stands were universally in the valleys and low slopes under 500 feet. In Aberdeenshire, at 43 years of age, it grew 5,740 cubic feet; in Dumfries, at 20 years, 2,340 cubic feet; in Argyllshire, at 20 years, 2,560 cubic feet. Like the Norway Spruce it was prolific in seeding power, but in the nursery it was sensitive to frost, and somewhat difficult to protect and raise.

Under proper forestry conditions, both Norway and Sitka Spruce should produce a larger quantity of timber in less time than either Scots Pine or Larch. It did not follow that the productive power of Spruce would rival that of the Douglas Fir, but the planter had to anticipate his market, and there was no timber more generally in demand than Norway Spruce. For paper pulp it had special advantages, and if once obtainable in bulk there would be no limit to its market. The Forestry Commission were much impressed with the importance of Spruce, and at present they were planting about 50 per cent. of their plantations with Norway or Sitka Spruce.

A hearty response was given by the meeting to Sir John Gladstone's call for a warm vote of thanks to Col. Sutherland for his admirable address.

### GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

THE monthly meeting was held on Wednesday, the 6th inst. Mr. John Cairns, chairman of the directors, presided.

The chairman introduced the newly elected secretary and treasurer, Mr. J. Cairick Kerr, assuring him a hearty welcome and every support from the members.

A lecture on "Allotments—as they are, and what they might be," was delivered by Mr. A. Buist, Gryfe Nursery, Bridge of Weir.

In the course of his address, the lecturer criticised the methods of some allotment holders, and described as unsightly or untidy some of the wooden erections and small greenhouses to be seen on allotments in districts where no restrictions were imposed with regard to the placing of greenhouses on the plots. With the aid of plans and illustrations he described how a section of allotments should be laid out. The Corporation or local authority, he thought, should put up a good fence, and also drain the land so as to prevent disputes about main drainage. The fence did not require to be expensive, provided it was strong. If the city adopted a scheme of town planning, he said, provision should be made for allotments and open spaces among the new houses. The allotments would thus become a permanent feature of the district, and tenants would be in no danger of losing them. The scheme should provide for wide, short streets and two-storey houses, which were much better than the system of semi-detached villas already in vogue. If the land was drained and fenced all other work might well be left to the allotment holder under the superintendence of the Park Department, which would make regulations for the

paths and roadways, the width of borders, so that there might be uniformity of design. The department should also provide a border of trees round a section, the trees to be of as great variety as possible, and be correctly named, so that teachers from neighbouring schools might take their senior pupils there occasionally for nature study. It was sad to hear of city children being poisoned by eating berries or the pods of such a common tree as the Laburnum. With regard to size, he did not think that plots should be larger than 10 yards by 20 yards. He was in favour of a central greenhouse for each group of plots.

An interesting discussion followed, and on the motion of the Chairman, Mr. Buist was given a cordial vote of thanks.

At the close of the lecture Mr. Hugh M. Mackie, who retired recently from the position of secretary and treasurer of the society after 23 years' service, was presented by the members with a handsome writing bureau and two easy chairs in recognition of his services.

### CARDIFF GARDENERS.

A MEETING of this Association was held on November 28, Mr. P. Meyers presiding. Carnations were staged very creditably. First, second and third prizes were awarded to Messrs. P. MEYERS, FREEMAN, and CROUCH respectively.

Mr. A. Fry gave a lecture on "Liliums" and compared his experiences of growing these flowers in Glamorgan and in the Eastern Counties. It was agreed that satisfactory results cannot be obtained without recourse to great preparation. *Lilium candidum* was accorded the highest position in the discussion, and *L. auratum* was referred to as useful in combination with *Rhododendrons*. In the average Glamorgan soil *Liliums* require soil that is well drained, and it is often necessary to dig a hole 3 ft. deep, place 6 inches of ashes in the bottom and add old potting loam mixed with old mortar and lime rubble; the bulbs are placed on this material, covered with 2 inches of coarse sand, and then the site is levelled up with good loam.

—At the meeting of this Association held on the 12th inst. Mr. L. T. Smith delivered a lecture on "Winter-flowering Begonias." He recommends propagation of these Begonias from cuttings taken from plants that have previously flowered well. The plants should be cut down and the new shoots used as cuttings, which should be inserted from March onwards. When rooted sufficiently the plants should be potted in a compost consisting of turfy loam, dry cow-manure and leaf-mould. The lecturer strongly advocated keeping the house close and well shaded until the flower appears.

### DUMFRIES AND DISTRICT HORTICULTURAL.

THE annual meeting of this society was held in the Wesley Hall, Dumfries, on November 25, when there was a good attendance of members, presided over by Mr. A. W. M'Alister, the retiring president. The chairman reported the results of the work of the past year and reviewed the financial position, which was a satisfactory one, although there had been some reduction in the number of members and in the total income. The income exceeded the expenditure by fully £27, and the credit balance is now upwards of £75. He referred to a suggestion which had been made to launch out on a more elaborate scale, but deprecated doing so at the present time. He also referred to the desirability of giving more power to the committee regarding dealing with exhibits not grown by the exhibitors. Mr. M'Alister also stated that the cups presented by the two local newspapers had been won outright, and that one of these had again agreed to provide a cup for competition, and he expected a satisfactory reply from the other shortly. A discussion followed in which there was a general agreement that it was desirable to introduce some additional attractions, which might take the form of an industrial section, and

this and the question of an effort to increase the membership were left to the committee. Mr. A. W. M'Alister was re-elected president, and Miss J. Young was reappointed secretary and treasurer.

**UNITED HORTICULTURAL BENEFIT AND PROVIDENT.**

The monthly meeting of this society was held in the R.H.S. Hall on Monday, December 11, Mr. Arthur Bedford in the chair. Three new members were elected. One member over the age of 70 years withdrew from his deposit account the sum of £70 19s. 2d. The death certificate of one deceased member was received, and the sum of £25 15s. 7d. was passed for payment to his nominee. The sick pay for the month on the ordinary side amounted to £70 6s. 2d., distress grants came to £11 10s.; on the State Section the sick pay was £59 2s., and Maternity benefits £6.

**EAST ANGLIAN HORTICULTURAL CLUB.**

THE thirty-third annual meeting of this club was held at Norwich on December 13. The secretary, Mr. G. Todd, in his report, stated that great progress had been made in the past year's working; the net gain of membership was 12, which brought the total up to 244. On the financial side, income from all sources was £95 15s. 2d., and expenditure £87 2s. 2d., this being the first time for four years that the club has not drawn upon its reserve funds. The year's work on the educational side by means of lectures, essays and exhibitions, had been quite a success. A further list of lectures, etc., was announced, which indicated an interesting session during 1923, and special prizes are offered for a variety of subjects at the monthly meetings.

At the election of officers, Mr. J. E. Fitt, gardener to Sydney Morris, Esq., Earham Hall, Norwich, was elected president; Mr. J. W. Chapman, Mangreen Hall Gardens, vice-president; Mr. G. Todd, secretary; and John Clayton, Esq. (of Messrs. Daniels Bros., Ltd.), treasurer.

**ROYAL HORTICULTURAL.**

**TRIAL OF BEET (LONG VARIETIES) AT WISLEY, 1922.**

The following awards have been made to Beets by the Council of the Royal Horticultural Society after trial at Wisley.

**FIRST-CLASS CERTIFICATE.**

To No. 58, *Cheltenham Green Leaf*, sent by Messrs. WATKINS and SIMPSON.

**AWARDS OF MERIT.**

To No. 67, *Northumberland (Dewars)*, sent by Messrs. WATKINS and SIMPSON; to No. 72, *Dell's Crimson Leaved*, sent by Messrs. BARR and SONS; to No. 81, *Covent Garden Red*, sent by Messrs. WATKINS and SIMPSON; to No. 84, 86, *Praeger's Exhibition*, sent by Messrs. BARR and SONS and Messrs. WATKINS and SIMPSON; to No. 97, *Dark Red Improved*, and to No. 98, *Exhibition No. 1*, both sent by Messrs. DICKSON and ROBINSON.

**HIGHLY COMMENDED.**

To No. 18, *Omega*, from Messrs. COOLING; to No. 61, *Cheltenham Green Top* (similar to 58, but not quite so regular), from Messrs. HURST and SON; to No. 76, *Dwarf Red (Nutting's)*, from Messrs. BARR and SONS; to No. 77, 78, *Long Purple*, from Messrs. DOBBIE and Co. and Messrs. HURST and SONS; and No. 80, *Volunteer*, from Messrs. WEBB and SON—all these last three considered identical; to No. 79, *Dark Red Improved (Dell's Crimson type, see 72)*, sent by Messrs. WEBB and SON; to No. 87, *Dell's Black Leaved*, from Messrs. HURST and SON; to No. 91, sent as Middleton Park but is Elcombe's *Victoria*, from Messrs. WATKINS and SIMPSON; to No. 104, *Victoria*, from Messrs. BARR and SONS; to No. 96, *Long Red Selected*, from Messrs. NUTTING and SONS; to No. 101, *Market Favourite*, from Messrs. DICKSON and ROBINSON.

REMARKS.—Trade has been rather more active owing to the Christmas demand, and values in some sections have improved. Imported Apples have slightly advanced in price for best packs, and best English Apples have shared in the improved conditions to some extent, although, generally, values are on the low side. Ample supplies of Oranges have been available at moderate prices. Bananas have continued to advance in price, and finished a firm trade. The usual brisk demand at Christmas for household Grapes has resulted in better prices for the growers. Choice vegetables, such as Peas, Beans, new Potatoes, Asparagus and Seakale sold well in response to a good inquiry, although their values tended to slacken towards the end of the week. Mild weather has been responsible for increased quantities of Mushrooms. Salads have met a fair demand. Early consignments of forced Rhubarb are available. Canary Tomatoes are scarce, and their value firm. Green vegetables are plentiful. The Potato trade is fair, with ample supplies available. The fine weather has been favourable to trade, but the volume has not been so large as in some previous years.

REMARKS.—Business is very brisk in this department, and it is very doubtful if supplies will be sufficient to meet all requirements for the Christmas trade. There promises to be very limited supplies from home growers. Scarlet and white flowers will be most in demand, and prices are likely to rise considerably before the week-end. Tulips and Hyacinths on bulbs constitute two of the most attractive lines for this week-end. Golden Spur Daffodils are increasing in quantity, but prices, like those for all other subjects, are sure to be firm during the next fortnight. It is difficult to give correct quotations of values for the next few days. Richardias (Arums) and Lilium longiflorum will be much in evidence. Lily-of-the-Valley is arriving in excellent condition, and supplies of this flower are likely to be good, also of Poinsettias, which are much in demand. Roses are gradually lessening in quantity, and prices are much higher for red, pink and yellow blooms. The most attractive sorts are Mme. Abel Chatenay, Melody, Ophelia, and Richmond. The consignments of Roses from the South of France consist of the varieties Ulrich Brunner, Frau Karl Druschki, and Safrano; all are arriving in good condition. According to present reports, Paper White Narcissus is likely to be reduced in quantity for a few weeks, owing to heavy storms in several districts. Prices for this flower have already doubled during the past week. Acacia (Mimosa) is arriving in better condition. Anemones, scarlet and white Ranunculus, and white Lilac will all be much in demand this week. There is a very fair demand for pot plants, and Palms, Ficus and Ferns are selling freely.

**GARDENING APPOINTMENTS.**

**Mr. W. H. C. Bevan**, late Gardening Instructor at Monmouth Reformatory School, Pontypool, and previously at Redegar Park Gardens, Newport, Monmouthshire, as Gardening Instructor at Central London District Schools, Hanwell, W.7.

**Mr. B. Allen**, for three and a half years Foreman at Down Hall, Harlow, Essex, and previously Foreman at Ferners, Fulmer, Slough, as Gardener to J. R. Hangeravens, Esq., Drinkstone Park, Bury St. Edmunds, Suffolk. (Thanks for Is. 6d. for R.G.O.F. Box.—Eds.)

**Mr. W. Everett**, for the past five years Gardener to Miss Darius, St. George's School, Ascot, and previously seven years at Nalder Hill, Newbury, as Gardener to the Misses Drury, 73, Benlsh Hill, Upper Norwood, S.E.19. (Thanks for Is. for the R.G.O.F. Box.—Eds.)

## Obituary.

**Sir William Cameron Gull, Baronet.**—The death occurred on Friday, December 15, of Sir W. Cameron Gull, Bart., formerly M.P. for the Barnstaple Division of Devonshire. He was the son of the distinguished physician, Dr. William Gull, who attended the late King Edward in his serious illness, when Prince of Wales, and was created a baronet in recognition of his services. Sir Cameron Gull, who was sixty-one years of age, twice married, his first wife being a daughter of the late Lord Lindley, and grand-daughter of Dr. John Lindley, one of the founders of *The Gardeners' Chronicle*. Sir Cameron Gull was himself for many years on the Board of Directors of this paper, and interested himself in it right up to the time of his last illness. He had a large garden at his home, Frilsham House, Yattendon, Berkshire, in which he took the greatest interest, being especially keen on the subject of fruit growing.

## TRADE NOTES.

A COUNCIL meeting of the Chamber of Horticulture was held at 18, Bedford Square, London, W.C.1, on the 13th inst., Mr. C. W. Leak (President) in the chair. The Secretary's report was read and discussed. The report dealt with the following subjects:—(a) General Election and the action taken by the Chamber in inviting candidates to answer a questionnaire based on the horticultural programme of the Chamber, 187 favourable replies having been received. The Council expressed its approval of the action taken and directed that the replies be tabulated for reference, which would probably result in securing much help in Parliament with future legislative work. The question of forming a stronger Horticultural Committee in Parliament was debated at length, some members expressing an opinion that better work would be done by forming a horticultural section of the existing Agricultural Committee in the House, thus strengthening this Committee and in return receiving their support, as interests of both industries were analogous in many instances. The following resolution was subsequently passed:—

"That it be an instruction to our Parliamentary Committee to meet early in January to formulate a programme and submit the same to the next meeting of the Council."

(b) Conferences re Horticultural Organisation held on October 20th, when the following resolutions were passed unanimously:—

(1) That a co-ordinating body in horticulture is necessary.

(2) That this conference is of the opinion that with certain alterations in its constitution, the Chamber of Horticulture could meet the need.

Proposals for such alterations are to be submitted at a future meeting, probably early in January.

(c) Imperial Fruit Show, 1922.—The best thanks of the Council were tendered to Messrs. Geo. Mount and Sons, W. E. Wallace and Sons, Mr. Frank Ladds and Mr. G. W. Leak for flowers and fruit supplied in respect of the decoration of the Chamber's Stand.

(d) Imperial Fruit Show, 1923.—That a public meeting had been held and it had been decided to hold this show at Manchester, organised by a Committee consisting of three representatives each from the National Farmers' Union, Federation of British Growers, Chamber of Horticulture, National Federation of Fruit and Potato Trades Association, National Federation of Retail Fruiterers and Florists, and the Manchester Salesmen.

It was proposed and carried that Messrs. G. W. Leak, Geo. Monro and A. W. White be the representatives of the Chamber.

(e) Technical Committee held on October 25th, when experiments as to surface sterilisation of fruit were reported. Also, that addi-

tional representatives from horticultural colleges and universities be invited.

Mr. Engelmann called attention to a serious pest attacking Chrysanthemums in the U.S.A., and it was referred to the Technical Committee to obtain information from the Cornell University, with a view to investigation.

(f) Lord Mayor's Show—Fruit Car.—In conjunction with the National Federation of Fruit and Potato Trades Association the Chamber organised a Fruit Car Trophy, accompanied by carters and cultivators.

(g) Ghent Exhibition, 1923.—Mr. J. S. Brunton reported that a sub-committee of the Exhibition Committee had that morning been in conference with representatives of the Royal Horticultural Society as to organising a collective British exhibit. Preliminary arrangements were discussed, and it was agreed that the Royal Horticultural Society organise amateur interests and the Chamber trade interests.

It was proposed that Sir Douglas Newton, M.P., be asked to represent the Chamber on the Horticultural Council of the British Empire Exhibition, 1924.

A motion that the Chamber should make a request for direct representation on the Executive Council of this Exhibition was not carried.

The Secretary invited opinions as to the Chamber taking space on behalf of prospective exhibiting members, who would not be prepared to exhibit for the whole period of six months, but who might care to exhibit for a lesser period. It was not thought expedient to move in this direction until further information could be obtained from the organisers, and this point was therefore left over.

The Secretary asked the Council to consider the Government action in appointing a Departmental Committee to inquire into the methods and cost of selling and distributing agricultural, horticultural and dairy produce, having regard to the disparity between the price secured by the producer and that paid by the consumer.

Mr. Du Cann stated that the Horticultural Trades Association Executive had already considered this matter, and that it was decided to take no action either way on behalf of the Horticultural Trades Association.

The Chairman replied that it was a serious matter to other sections of the Chamber and affected them considerably. He suggested that investigation should be made with a view to making a request to be heard by the Departmental Committee.

After several opinions were stated urging action to be taken, it was agreed that the Secretary communicate with the various trade organisations in order to ascertain if they would be willing to attend a special conference thereon to decide upon definite lines of procedure.

Mr. Seymour Copley briefly outlined a case for the revision of passenger traffic rates on flowers packed in boxes consigned from the Spalding area stations. This case was considered to be a strong one, and was referred to the Transport Sub-Committee for immediate action.

## ANSWERS TO CORRESPONDENTS.

**AMERICAN BLIGHT ON APPLE SHOOTS:** *M. Y. F.* and *W. E.* The Apple shoots are attacked by American blight or woolly aphid. The tree should be sprayed now with the following dressing: 1 lb. caustic soda,  $\frac{3}{4}$  lb. carbonate of potash, 10 oz. of soft soap, and ten gallons of water, adding the soft soap last of all. Another good plan is to brush the main branches of the young tree infested with woolly aphid with a strong solution of Calvert's carbolic soap, thereby dislodging the aphids at once. The treatment may be continued in summer by spraying the parts affected with a weaker solution of Calvert's carbolic soap, not exceeding one ounce of the soap to each gallon of water.

**APPLE LEAVES SCORCHED:** *J. W.* The discussion on Leaf Scorch, to which you refer, appeared in the *Annual Report* of the Agricultural and Horticultural Research Station, Long Ashton, Bristol, for the year 1921, under the title of "Leaf Scorch on Fruit Trees." The article was the joint contribution of Messrs. Barker, Lees, Wallace and Wiltshire.

**CAUSTIC ALKALI WASH:** *C. P.* A good caustic alkali wash is made of 1 lb. of caustic soda (70 p.c.);  $\frac{3}{4}$  lb. carbonate of potash (80 p.c.);  $\frac{1}{2}$  lb. of soft soap and ten gallons of water. Dissolve the caustic soda and carbonate of potash in water and then add the dissolved soft soap.

**CELERY:** *F. G. B.* It is probable that you made the trench too deep, which in the case of your heavy, sticky soil would be liable to accumulate too much moisture, which would have a difficulty in draining away. The head sent inclines somewhat to coarseness, and this may be partly due to over-feeding with the manure water you mention. While Celery is a moisture-loving plant, it is possible to over-water it, especially on such land as yours. In future we would advise you to use less liquid stimulant and substitute a concentrated fertiliser.

**FALLEN LEAVES IN SHRUBBERIES:** *J. M.* If the leaves are not required for the making of hot-beds or leaf-mould, they should be lightly forked below the surface, as they will supply valuable material to the shrubs, etc., in the form of humus. This will be better than allowing them to remain on the surface, for, apart from presenting an untidy appearance, they would be blown into heaps and not enrich the ground evenly. Shrubberies that are lightly forked and left moderately rough on the surface present a very neat appearance, even in winter.

**GRAPES FOR A VINERY:** *A. S.* As you require from four to six different varieties of Grapes in your new vinery, we advise you to plant one vine of Black Hamburg, one of Madresfield Court, two of Muscat of Alexandria, and either one or two of Alicante and one of Appley Towers. There are no new varieties of Grapes to compare with these for quality, and all are easily grown.

**NAMES OF FRUIT:** *E. H. W.* 1, Beauty of Kent; 2, Lane's Prince Albert; 3 and 4, Dumelow's Seedling (syn. Wellington).—*A. G.* Apple Cox's Orange Pippin; Pear Catillac.—*T. E. W.* 1, Ellison's Orange; 2, Cellini; 3, Cornish Aromatic; 4, decayed; 5, Vicar of Winkfield; 6, Burre Clargeau.

**SCHINUS MOLLE:** *F. T.* The fruits are those of Schinus molle, a shrub or small tree bearing the popular name of Pepper Bush. The species is not hardy in this country, but has fruited under glass in several establishments; the bunches of reddish-pink berries are very ornamental, the individual fruits being about the size of Peppercorns. The plant grows freely in the south of France, and graceful fruiting branches are exported thence to British flower markets during early December. These are used by florists for special forms of indoor decoration.

**SAINTPAULLIA IONANTHA:** *J.* This charming little warm-house plant belongs to the same family as the Gloxinia, and requires practically the same treatment, from the time the seed is sown until the flowering stage. Good plants may be grown in 3-inch pots, and they form a charming edging material in the stove. Their chief requirements are a very peaty soil, perfectly clear drainage, a moist atmosphere, and syringing to ward off attacks of the plant's greatest enemy—red spider.

**TOMATOS WITH HARD, GREEN PATCHES:** *Constant Reader.* The hard, green patches on Tomato fruits is generally ascribed to a lack of potash in the soil. In future use plenty of wood ash, or a little sulphate of potash, in composts for Tomatos.

**Communications Received.**—*D. T. S.*—*W. S.*—*J. W. B.*—*F. A. F.*—*F. G. B.*—*J. E. I.*—*M. M. B.*—*L. W.*—*R. R. G.*—*R. E.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 38.6°.

ACTUAL TEMPERATURE:—  
Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, December 27, 10 a.m. Bar. 30.1; temp., 46°. Weather—Rainy.

A useful summary of the present state of knowledge on the effect of electrical discharge on the yield of crops is published in the *Journal of the Ministry of Agriculture* for December, 1922. As those interested in the subject are aware, careful and large-scale experiments in what bids fair to be known by the unpleasing name of electroculture have been carried out during the past few years by the Committee appointed in 1918 "to advise the Ministry of Agriculture in regard to all electrical questions in connection with the carrying out of experiments in electroculture." Sir John Snell, the Chairman, has taken a great interest in the experiments, the carrying out of which has fallen mainly to Professor V. H. Blackman. The field experiments with Barley and winter Wheat, Potatos, etc., were made at Rothamsted, and pot cultures have also been made at that station. These trials, together with laboratory experiments to determine the effect of electric currents on plant growth, appear to hold out hope that the application of the electrical discharge to growing crops may prove sufficiently beneficial to make it of commercial value. For technical details of the mode of production of the current, reference should be made to the *Journal of Agriculture*. As to the results: of eighteen experiments, of which records are tabulated, fourteen gave positive results and four negative. The average

increase of yield in the former amounted almost to thirty per cent., and the average percentage decrease in the latter to slightly more than six per cent. Oats have given increased yields—as compared with those of control plots—so great as fifty per cent. (in 1918), thirty-five per cent. (in 1919), and fifty-seven per cent. (in 1920). On the other hand, similar experiments with the same crop at the Harper-Adams College gave only two per cent. increase in 1919, and a nine per cent. decrease in 1920. Winter-sown Wheat gave at Rothamsted, in 1919, an increased yield of thirty-eight per cent., but in the following year the electrified crops were four per cent. smaller than the controls. Clover-hay grown at Rothamsted in 1919 gave increases of fifty per cent. in the first crop and thirty-four per cent. in the second; but in 1920 the increased yield in favour of the electrified crops was only two per cent. That the electrical discharge may exert a considerable and beneficial effect on crop-yield—at all events in the case of certain crops—would appear from these results to be probable, and it is noteworthy that in no case did the application of the discharge result in more than a six per cent. decrease. With results at once so encouraging and so variable, it is evident that thorough investigation into the strength and time of application of the current are necessary. Such experiments are being made, and have already led to interesting results. Thus, experiments made in 1920, and repeated in 1921, show that alternating current is usually as effective as, or more effective than, direct current. They also indicate that plant growth may be increased by an upward current through it as well as by a downward current. So long ago as 1918 it was discovered that if a current of more than a certain amperage was used, seedling plants (Maize) sustained injury, but that current of lower amperage had an accelerating influence on their growth. What, however, bids fair to prove of even greater importance is the evidence that an electrical discharge applied for the first month only of the growing season may be as effective as one continued throughout the growing season. If this be confirmed, it cannot fail to prove of the greatest value, and particularly so to horticulturists. For they, at all events, often find it profitable to practise transplantation on a large scale, and if seedlings or cuttings when raised under conditions which admit of their being subjected to electrical discharge give larger crops than untreated plants, it might prove commercially advantageous to establish electrical nurseries for treating plants in this manner. Those interested in the subject will look forward to the publication of the fifth interim Report of the Committee, in which the results obtained in 1922 are to be described. The previous four Reports may be obtained free of charge on application to the Secretary of the Committee, Mr. W. R. Black, B.Sc., Ministry of Agriculture, 10, Whitehall Place, London, S.W.

**Edinburgh Market Gardeners.**—In the course of his remarks at the annual meeting of the Edinburgh Market Gardeners' Association, the president, Mr. David King, stated that the flower trade had been fairly satisfactory during the year, but for vegetable growers the season had been one of the hardest ever experienced. He considered the suggested new home for the Vegetable Market, near the Edinburgh Gas Works, was a most undesirable site, and thought the old market was large enough for present business. In his opinion, unless a new market encouraged an increase of business the present arrangements were to be preferred. Mr. David Watt, convener of the

Markets Committee of the Edinburgh Town Council, opined that unless the need for a new market was clamant it would be foolish to proceed with the suggested scheme, as its success depended entirely upon the good will of those who would use it.

**The Colour of Citrus Fruits.**—Apparently the colour of, say, an Orange or Grape Fruit is no real index as to the ripeness of the fruit, for a high colour may be artificially produced by exposing the fruits to certain gases. According to some particulars sent us from the Porto Rico Agricultural Experiment Station, Mayaguez, artificial colouring of Citrus fruits is resorted to by growers in that country by exposing them to gases produced by the combustion of gasoline or kerosene without raising the temperature, that is at a temperature of 76° to 86°. Chemically active gases such as chlorine or sulphur dioxide are also used for producing colour in the rind, but in all such cases the rind of the fruit may be spotted by the action of the gas unless the air is agitated in the colouring room by means of a fan or some such other means. It is also necessary to force fresh air into the colouring room and in such quantity as to keep the oxygen supply at about fifteen per cent. of the atmosphere, otherwise the stems loosen on a large percentage of the fruits, resulting in Diplodia decay. The effect of a gas upon the chlorophyll may be directly chemical, that is, it may act as a bleaching agent; the bleaching produced by sulphur dioxide is a typical example. The effect produced by the combustion products of oil is not of that kind. These latter gases may have present a little carbon monoxide, hydrogen and hydrocarbons, as well as some acid gases, the amount of which depends upon the completion of the combustion. Such gases are those which principally cause the change in colour of the chlorophyll. In Porto Rico it is unlawful to offer for sale Grape Fruit that has been artificially coloured, the juice of which has more than one part acid to seven parts total solids; in the case of Oranges the ratio must be one to eight.

**The "Fruit Grower" Directory and Handbook.**—From Messrs. Benn Bros., Ltd., of Bouverie Street, we have received a copy of their "Fruit Grower" Directory and Handbook for 1923, a work of reference for the fruit-growing and fruit-distributing industry. It is a large quarto volume, comprising nearly five hundred pages, the majority of which are devoted to addresses of fruit nurserymen, salesmen, etc., in alphabetical order—a most valuable list to those engaged in the fruit-growing industry. There is also a useful list of fruit traders in the Colonies, and another forming a Continental section. As showing the great usefulness of this part of the work, one may, for instance, find lists of firms exporting Figs from Turkey, Nuts from Spain and Oranges from Italy. Much general information of value to fruit growers is given in the early pages of the book, including an illustrated article on packing and grading produce for market; packing flowers for market; the best kinds of fruits and flowers for market; a fruit grower's calendar of work; hints on spraying; data relating to railway regulations, rates and transport; legal points affecting the horticultural trade and the various orders of the Ministry of Agriculture that have a special bearing on fruit growing. There is also a list of the trade organisations of the United Kingdom, and another of the various retail associations. The book has an attractively designed cover in stiff boards, and is sold at 10s. net.

**International Co-operation in Seed Testing.**—Mr. Edgar Brown, who has charge of the seed testing laboratories of the United States Department of Agriculture, recently made a journey to Europe and visited the seed testing stations of Great Britain, Denmark, Germany, France, Holland, Czecho-Slovakia and Switzerland. He is of opinion that, following the recommendations made at the International Seed Testing Congress, at Copenhagen, in 1921, all the countries having dealings with each other should make such modification in their methods of testing as will ensure a closer agreement in

the results of the analyses made by different nations. Mr. Brown has a high opinion of European seed testing stations, and observes that "most of the stations in Europe are housed in modern laboratory buildings designed for their special use, and fitted with modern equipment."

**A Florists' Magazine for the U.S.A.**—The proprietors, Messrs. C. E. Falls Service Company, 703, East 40th Street, Chicago, have forwarded us a copy of their magazine for retailers of flowers, entitled *The Progressive Florist*. The work is issued monthly, and the copy before us includes sixty pages of advertisements and text, and both advertisements and literary matter are freely illustrated. American florists are apparently much more alive to the value of advertising than growers in this country, and they are to be commended in the manner in which they draw attention to the best methods of utilising flowers, in the many excellent illustrations accompanying their advertisements. The magazine is admirably printed on art paper, and includes a very dainty frontispiece in colours. The Editor and proprietors are to be congratulated on the attractiveness of this publication.

**The Ontario Grape Crop of 1922.**—The Grape-growers of Ontario, Canada, have had a splendid season this year. It is estimated that between 15,000 and 20,000 tons were marketed, the growers receiving from £16 to £25 per ton. The most popular variety with Ontario growers is Concord.

**Colour Sporting in Apples.**—On page 362 of last week's issue we referred to a case of colour sporting in Apple Newton Wonder in Mr. J. C. Allgrove's nursery at Middle Green, Langley, and stated that there were coloured sports of several other well-known varieties. We learn from *The National Nurseryman of the U.S.A.* that the famous American Apple Stark's Delicious has also sported. A farmer named Louis Mood, of Ferrell, noticed a limb of one of his Stark's Delicious Apple trees with dark red fruits, while those of the other limbs were of the ordinary light colour. The attention of a nursery firm in Missouri was directed to the sport, with a result that the farmer was given \$5,000 "for the tree, limb, the scions, buds and cuttings." In addition to this, the farmer will receive a royalty on the sales of the trees of the new variety. An engineer has taken the measurement of the tree, with its exact location, and a legal agreement said to cover many pages of typewritten matter has been drawn up. The sporting is doubtless in accordance with the procedure described by Mr. E. A. Bunyard on page 168, and not, as believed by the local nurserymen of Ferrell, caused by "a blossom blown from some other variety of Apple, which lodged on the limb, took root and yielded the new fruit."

**Closing of a Famous U.S.A. Nursery.**—One of the best-known nurseries in America, that of Messrs. Thomas Meehan and Sons, Germantown, Philadelphia, has been sold for building developments. Mr. Thomas Meehan, the owner of the nurseries, was assisted by his brothers, Joseph and Edward, and the firm sent out rare trees and shrubs to all parts of the world. Thomas Meehan was later assisted in the business by his three sons, and the whole of the Meehan family were specialists in their respective spheres, Edward Meehan being a most skilled propagator and a man who could tell one plant from another at any season of the year. Thomas Meehan for thirty years edited the *Gardeners' Monthly*, and he was the author of *Native Flowers and Ferns of the United States*. In 1853 he wrote *The American Handbook of Ornamental Trees*, dedicated to the memory of John Bartram, the patriarch of American arboriculture, which described about three hundred plants with which he was personally familiar. By his writings and popular articles, Mr. Thomas Meehan interested and educated plant buyers, and his nursery attained considerable fame. The many rare specimen trees retained for propagating purposes are destined to be destroyed, including one of the first Japanese-leaved Maples that Mr. Meehan introduced into America about 1876. Before his death in 1901 he took his three

sons into partnership, and the eldest, Thomas B. Meehan, is now engaged with his son under the name of T. B. Meecher and Co., at Drecher, where they have over two hundred acres of hardy trees and plants. Another son, J. Franklin, conducts a landscape business at Mount Airy, while the third son, Mr. S. M. Meehan, has retained the name of the old firm, Thomas Meehan and Sons, and also succeeded his father as the editor of *Meehan's Monthly*.

**Mr. J. Shelton.**—Few, if any, gardeners who specialise in fruit cultivation have such a wonderful record of prize winning for Grapes as Mr. J. Shelton, gardener to Lord Hillingdon, at The Wilderness, Sevenoaks. In 1916 Mr. Shelton won five first prizes for Grapes at the Royal Horticultural Society's fruit show, four in 1917, four in 1918, seven in 1919, seven in 1920, three in 1921, and nine in 1922. In view of these records it is hardly necessary to state that Mr. Shelton is a clever cultivator of indoor fruits, but it should be added that his record is not confined to Grapes, as he has been awarded a Silver Banksian Medal for forced Strawberries, and Knightian Medals for collections of Apples and Pears shown in December and January. He has also won other medals

MR. J. SHELTON.

and several silver cups at autumn fruit shows. Mr. J. Shelton's wide experience in horticultural matters commenced in 1839, at Shipley Hall, Derbyshire, under the late Mr. W. Elphinstone. In 1893 he entered service at Osberton, under the late Mr. S. Woods and Mr. T. H. Crisp. Four years later he moved to Berkeley Lodge Gardens, Burton-on-Trent, and in December, 1897, he became general foreman under Mr. A. R. Allan, at Hillingdon Court, Uxbridge, where he remained until October, 1903, when he entered upon the responsible position he still holds. Mr. Shelton has made a speciality of Carnations, which are grown very extensively and well at the Wilderness, and that he has won a Silver Flora Medal for Souvenir de la Malmaison Carnations is evidence of his skill with a section which is invariably regarded as a test of cultivation.

**A New British Calamintha.**—Mr. H. W. Pugsley showed a specimen of *Calamintha boetica* at the meeting of the Linnean Society on the 14th inst. The new form was first found in this country near Swanage, in Dorsetshire, in 1900, and again in 1912. It is of interest as being an additional unit in the Lusitanian element in the British Isles. *Calamintha* was placed in the genus *Melissa* by Linnaeus; the other three recognised British species are *Calamintha ascendens*, Jord., *C. Nepeta*, Savi, and *C. sylvatica*, Bromfield.

**Cherries from South Africa.**—A consignment of Cherries recently reached Covent Garden from growers in South Africa. The fruits, which formed part of a small experimental consignment, were of exceptionally good quality, and met with a ready sale. They were of the White Heart type. We believe this is the first time in the history of the market that Cherries have been on sale a week or so preceding Christmas.

**Presentation to Mr. J. K. Ramsbottom.**—A very pleasant function took place at the Red Lion Hotel, Spalding, on Wednesday evening, December 20, when Mr. J. K. Ramsbottom was made the recipient of a gold watch and chain by the members of the Spalding and District Bulb Growers' and Market Gardeners' Association. In making the presentation, Mr. O. D'Alcorn, the president, referred to the great services rendered by Mr. Ramsbottom to the Daffodil growing industry in this country, and especially to his ability to place before the growers a successful method of treatment for the eelworm disease, which, at one time, had reached very alarming proportions in the district. In accepting the gift Mr. Ramsbottom said that several years ago it fell to his lot to investigate the Daffodil disease, and it was the aim of every investigator in pathological plant research to place before the growers economical treatments in order to keep the many plant pests and diseases within reasonable limits. He was of the opinion that the hot-water treatment of Daffodil hulbs had given a new lease of life to the Daffodil industry, which at one time was certainly threatened with extinction. He urged growers to still keep a careful eye on their stocks, and in thanking the members for the very acceptable gift, he wished them every success in their business of flower and bulb production.

**Rattan Trade of Singapore.**—Not only does the Singapore district produce large quantities of Rattan canes, but it imports from 26,000 tons to 34,000 tons per annum, for re-export. The principal purchases are made in the Dutch East Indies. America is a large buyer of Rattan canes, and in 1920 imported 6,480 tons to the value of 1,362,000 dollars, chiefly for use in furniture factories in Michigan.

**Appointment for the Ensuing Week.**—Thursday, January 4: Manchester and North of England Orchid Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Calendar of Operations.* In taking leave of my portion of the *Calendar of the Chronicle*, after a two years' probation, I may perhaps be permitted a few extra remarks. In the first place, I would offer an apology for any errors into which I may have fallen during my course. Horticulture is a profession so multifarious in its bearings, and its principles capable of such varied application, through circumstances frequently of a merely local character, that no Calendar writer may hope to escape errors, or at least what may appear errors to some persons. I have made it a point from the first to recommend nothing as mere opinion, but to confine myself to suggestions based on well investigated principles. A Calendar is not the place for whimsical speculations; its great business is, I conceive, to direct attention to all matters of importance at the respective periods in which they should be carried out. I therefore venture to express a hope that my advice has frequently proved of service to the uninitiated; and it now merely remains for me to bid my successor, whoever he be, God speed, and to wish him success. Horticultural matters are making rapid advances, and the go-ahead maxim—to borrow a transatlantic phrase—must indeed henceforth be the order of the day. Mere practical routine will not long suffice, although sufficiently estimated. Horticulture, like agriculture, is determined to invoke the aid of science, and both will, I am assured, at no distant day, assume a much more important position. Robert Errington, Oulton Park, December 23. *Gard. Chron.*, December 25, 1847.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Seasonable remarks.**—Although the past season has been far from an ideal one, owing to the lack of sunshine, Orchids have made much finer growth than at one time seemed possible. The growths not being so fully matured as after the bright weather of last year, care must be taken that no serious fluctuations of temperature are allowed, as immature plants suffer much sooner than properly ripened ones. Where seedlings have been raised during the summer there will always be plenty of work, as constant handling and attention will be necessary to ensure good results. The work of raising hybrid plants is of a most engrossing nature, and a few successes atone for many disappointments. The spring and summer entail an amount of routine work, such as shading, airing, and spraying, which will now be curtailed, and the repotting of many seedlings, which had to be held over then, may be proceeded with. It is a matter of gratification that small seedlings of the whole of the evergreen Orchids do not resent being disturbed during the winter, provided the operation be done carefully, and they are accommodated afterwards in suitable quarters. In repotting any members of the *Cattleya* family it is essential that the small pseudo-bulbs should be completed before disturbing them. It is worse than useless to attempt the repotting of small *Dendrobiums* and deciduous Orchids during the winter.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAN, Esq., Baldersby Park, Thirsk, Yorkshire.

**Shallots.**—As soon as the ground can be got into suitable condition the bulbs of Shallots should be planted, as the longer season they have the better, and frost will not harm them. Trench the ground and manure it well, if this has not been done already. Plant the bulbs in rows 1 foot apart by slightly pressing them in the soil, and then draw some of the latter over them.

**A Retrospect.**—In some respects the past season has not been the best for certain classes of vegetables. The showery weather and lack of sunshine were unfavourable to Peas and Onions, the latter running too much to top, and especially those sown out of doors. Peas for want of sun, after the earliest batch, filled their pods badly. Potatoes have been exceptionally heavy crops. Our best sorts were King Edward, Majestic, Rhoderick Dhu and Arran Comrade; the last is a Potato of fine quality. Cauliflowers and Cabbages suffered very much in the early part of the year from grub, but the autumn has been very favourable to all kinds of green vegetables, and Cauliflowers are still turning in, owing to the very mild autumn and winter. Amongst the varieties of vegetables I have tried and found do well this season are Peas: Peerless, Delicacy, Rival and Supreme. Onions: AI and Premier Cabbage Tender and True, Cauliflower Purity. Lettuces: White Chavigny and Non-such. Dwarf Beans: Evergreen, Superlative and Magpie; and Brussels Sprouts: Solidity and Dwarf Gem.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Potting.**—If pyramids or hushes have not already been bought or lifted for potting they should be secured at once. I strongly advise owners of late orchard houses to purchase a few trees annually and grow them on for at least one year in the reserve garden, and when well set, with buds pot them at the fall of the leaf. Pears, Cherries and Plums may be left

out of doors until the end of the year, when they should be housed, not for forcing, but for the protection of the swelling buds from attacks by birds. A few Cherries and Plums may be taken indoors and grown in a little warmth from fermenting leaves. The house should be ventilated to the fullest extent, and the trees will make rapid progress without resorting to the use of fire-heat. As the buds swell the trees may be gently syringed once during the forenoon of bright days. The roots will require plenty of tepid water, especially if they are pot-bound, as all stone fruit trees should be before they are in the best condition for early forcing. As the buds swell and show signs of expanding, the usual enemies of these trees, grubs and aphides, should be looked for and checked. Trees planted out in inside borders require

FIG. 151.—ATHROTAXIS LAXIFOLIA (SEE P. 320).

similar attention as regards fresh air and the most limited use of fire-heat. A good soaking of the roots with water warmed to a temperature of 70° will be of great help to the trees when the buds are on the move. The temperatures for Cherries and Plums may range from 40° to 45° at night, and 50° to 55° by day; no harm will happen to the trees if the temperature is a little higher in very mild weather, provided the house is liberally supplied with fresh air.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Planting.**—Any planting that still remains to be done should receive attention on favourable occasions in order that the work may be completed as soon as possible. Where the soil is of a somewhat heavy character and in a sticky condition scatter a few shovelfuls of rather dry and finer soil amongst the roots before covering them with the ordinary soil of the garden. See that all the stems are well protected against rabbits and hares, otherwise, where these animals are troublesome, they may do much harm to the bark in a single night.

**Raspberries.**—If not mulched or top dressed already, Raspberries should receive this attention. Good mulchings of manure and old top soil from vine borders placed over the roots will greatly benefit the future crops. The Raspberry is a gross feeder, and being surface rooting, suffers quickly on light land from drought. The latter can only be overcome by mulching and constantly feeding the plants with rich materials.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Roses.**—Roses that were re-potted or top-dressed, as advised in a previous calendar, should, if they are required to bloom early, be placed in a house near the roof glass. Very little fire-heat is needed in their early stages of development, but once growth becomes active the amount of warmth should be increased. Care is needed in ventilating; cold draughts must be prevented, or mildew may attack the foliage; a further preventive of mildew is to spray the plants in the morning with weak, soapy water. As the plants advance in growth and the buds are formed, the roots may be given a little concentrated fertiliser.

**General remarks.**—At this season of the year the roof glass of all houses should be cleansed in order that the plants may receive the maximum amount of light. It will be necessary to wash the glass at short intervals. Plants growing in cold frames are so nearly hardy that the sashes should only be entirely closed in times of severe frost. At other times air should be admitted both day and night, and always in accordance with the outside temperature. Damp is the greatest enemy of plants in frames, and the latter should never be coddled, but kept sturdy by ventilating the frame on all favourable occasions. Examine the plants frequently, and remove all dead and decaying leaves. Slugs are sometimes troublesome, and means should be taken to trap these pests. Continue to propagate Chrysanthemums as strong cuttings become available, and remove from the propagating frame early cuttings that have made roots; after a few days stand them near the roof glass.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**The Aster Border.**—By this date the growths of the Perennial Asters will have died down, and after gathering any seed that is required, the old stems should be cut low down, removed and burned. The seed should be sown as soon as it is gathered, in boxes filled with a light, moist compost, and should be placed in gentle heat to germinate, not allowing the soil to become dry. When the seedlings appear the boxes should be placed in a cold frame, where they should remain until the seedlings are pricked out in the early spring.

**Planting Hedges.**—After the position of the hedge has been decided on, the ground should be thoroughly well prepared for the reception of the plants. Too often this preliminary preparation is overlooked, and the plants merely dumped into a shallow trench. Drainage also should be provided, if necessary, and if the soil is very poor, it should be enriched with well decayed manure. Given these attentions the hedge should soon form an object of interest, as well as utility. There are many plants that form good hedges, and of the evergreen sorts, few are better than Holly, Yew, Cupressus, Viburnum Tinus (in mild localities) and Box, whilst in the warmer districts of the country, such as the south-western counties, Olearias may be employed for the purpose with success. Deciduous subjects that are useful are Beech, Berberis, Hornbeam and Thornus. One of the prettiest hedges is formed of strong growing bush Roses, giving them sufficient space to develop properly; the low growing polyantha Roses make a very pretty dwarf edging, and are a pleasing change from the dwarf Box edgings commonly met with.

**EDITORIAL NOTICE.**

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

## MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.\*

No. V.—Lion Rock.

WINTER is as tedious as a twice-told tale in these regions; even in mid-April it is reluctant to give way to spring.

I loosed several doves, in the guise of collectors, to see how the vegetation was faring, and the few Rhododendrons they returned with did not hold out much promise of flowers in bulk for some time.

On April 24 we visited Lion Rock—an isolated limestone cliff between the plain and the lake, rather like Gibraltar in appearance. Camp was pitched in a ravine which divides the mountain from the main range. Next day we made our first assault on the peak, whose summit rises about 3,000 feet above the plain.

However, we were stopped by precipices and bad weather, but found in flower a Rhododendron I wanted—probably the same plant of which I had collected seed at Mu-li the previous year; anyhow, it is closely allied. This species (K.W. 4486), though I had not then seen it in flower, I nicknamed, prophetically, "limestone beauty." It was in flower, a beautiful sight, the flowers brilliant heather purple, with brown anthers, the leaves silver-grey. It is a low-growing shrub, clinging to the cliffs, in deep shade, easily recognised by the large, leafy calyx and loose four-flowered trusses. We had already found two other closely allied species of the same group.

Another plant which caught the eye was a Veronica; it was only last season's fruits, really, but the tall spikes looked promising, and I saved a remnant of seed on the chance that it might prove a good garden plant.

When we returned to camp rain set in. It rained till the small hours, then ceased suddenly. Everything was very still. The temperature fell ten degrees with astonishing swiftness, and when we woke up it was snowing heavily, and the forest was already white. The snowstorm continued all day, and we could do nothing. The mules had to be sent down to the plain.

In the circumstances there was no alternative but to go down ourselves, and next morning—April 27—down we went, soon getting clear of the snow. It was obvious, however, that it would lie in the forest for a week.

Nevertheless, the weather now began to mend and the snow disappeared from the tops of the 14,000 foot ranges to the west in a few days; or seemed to. Two days later we set out for the summit of the divide which separates the Yung-ning basin from the Yang-tze.

We had, of course, just crossed this range; but there are peaks along its length over 2,000 feet above the pass, and it was towards these we directed our steps.

After passing through the Pine forest we entered a narrow valley, where the only thing in flower was *Primula sonchifolia*; a wilderness of down-trodden, brown stems and leaves told of high meadow here in the summer.

Next day, April 30, we entered the Rhododendron forest and the snow, the latter deep and soft. After a tiring climb we came out into the alpine region, a maze of bleak, glaciated valley heads, eaten out of the limestone range. Camp was pitched on a grassy fell at 14,000 feet. Patches of snow lay about, and a keen wind hummed amongst the rocks. A glance round was enough; we should be able

to tell from the withered sticks and cushions what to expect here, but we certainly should not find any flowers. I decided to spend May day here and then return to the plain.

After a sharp frost, May 1 dawned, the sky turquoise blue, the air clear as crystal. It was a wonderful day. I climbed the highest peak at hand, 14,800 feet, and saw the whole panorama of snow peaks to the north, alas, inaccessible! Right at our feet lay the plain of Yung-ning, and the sapphire lake, separated by Lion Rock. A day's search even revealed a few flowers which could not resist such a day. A purple *Nivalis Primula* was up, and the blue veined petals of *Solms-Laubachia*, anticipating the foliage, brightened the thick, woody stems of this curious Crucifer. The foliage of a *Rhododendron* unknown to me was brought in, but, unfortunately, there was no hint of flowers. On the whole it was a day more full of promise than of actual achievement.

On May 2 we returned to the monastery, and a few days later we attacked Lion Rock once more, and in beautiful weather reached the summit. There was not much to be seen except the view, however, and a *Rhododendron* with orange felted leaves and pinkish-purple flowers,

at first sight it looked more like a *Gentian* than a *Primula*. Unfortunately, we could not find the place where it grew.

We now turned northwards towards Mu-li, following the divide between the Yung-ning basin and the rivers to the west. For the most part we were in Pine forest, and there were few flowers. At last we began to climb again, and on the fourth evening we pitched camp at 14,000 feet, below a group of limestone peaks which rose a thousand feet higher. The mountains here had been extensively glaciated. Rhododendrons were scarcer than ever, and few of the dozen or so species which were to be found here were as yet in flower. I added one more to my list, a purple flowered shrublet allied to "*Limestone Beauty*" already referred to; but this was not a limestone plant, nor did it seek shade.

After a brisk frost in the early morning May 14 dawned clear as crystal, and we spent the day climbing the limestone peaks. It was disappointing to find so little in flower, but as there was scarcely a vestige of snow, even at 15,000 feet, except in the deepest gullies, it was hardly surprising. In fact, it must be confessed that these high, limestone towers were

FIG. 152.—SPECIMEN HOLLIES IN THE HOLLY WALK AT KEW. (SEE P. 379).

which had escaped discovery the previous year. So we descended.

We had now been nearly three weeks at Yung-ning, and it was time to be moving on. Consequently, on May 10, we started for Mu-li by a roundabout route, first crossing the range to the west. The Pine-Oak forest here was carpeted with a small pink *Androsace*, a genus which, though not nearly so prolific as *Primula*, is nevertheless represented by a good many species in this part of the world. The ubiquitous *A. spinulifera* of course grows everywhere. If it was rare instead of common, or local instead of widespread, its extreme forms would doubtless rank as distinct species, or at any rate as well marked varieties. The cinnabar red *A. Bulleyana* (or *A. coccinea*?), of the dry river gorges further west, is one of the most striking species. In the high alpine zone are several cushion plants, of which *A. Chamaejasme* is the most familiar. In the woods, besides the species above referred to, was a procumbent weed with small, yellow-eyed, white flowers.

We crossed the range at about 14,000 feet, and found the open pastures strewn with purple flowered *Nivalis Primula*. *P. vincaeflora* and *P. secundiflora* were also just coming into flower. One of my collectors, some days previously, had found on this range a small, blue flowered *Primula* quite unknown to me—indeed, I could not call to mind any species which it resembled;

almost barren of vegetation. A *Nivalis Primula*, with flowers of Tyrian purple—probably a dwarf variety of the plant found in alpine pastures—and the beautiful little *Nivalis P. minor* (or near; K.W. 4081 of 1921) shared the highest alpine slopes. Sometimes it became a little difficult to distinguish between them, as the former was at its highest limit as dwarfed as the latter. But *P. minor* always has a white eye (though the flower colour may be anything from lilac to purple) and is fragrant; *Primula Nivalis* purple has a dark eye and no scent. Moreover, the latter has more flowers in the truss, and a larger capsule than *P. minor*—as I must continue to call it, no doubt erroneously. However, K.W. 4081 is said to be germinating well, and should flower this year; it will then be possible to compare it with true *P. minor* from the A-tun-tzu region, which has been in cultivation from my seeds for some years. The two plants are not likely to be identical.

Another *Primula* just coming into flower under the bushes with reflexed petals, K.W. 4179 of last year, also germinating well. This must be one of the Maximowicz section, though what it is doing down here was a mystery. The Maximowicz *Primulas* are said to belong to north China, and by no stretch of the imagination can latitude 28 deg. be called north China,

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 22, May 6, May 20, June 3, June 17, July 1, July 15, July 29, August 5, August 26, September 9, September 23, October 7, October 21, November 4, November 18, December 2, and December 16, 1922.

which means Kausu, Shensi and the most northern parts of Tsu-chuan. Can this be *P. szechuanica*, a yellow-flowered species found, I believe, by Wilson? It seems hardly likely, though I do not know that plant.

In any case, K.W. 4179 *Primula* S. Maximowiczii is not a plant of much garden merit; the yellow is rather muddy, and the sleek-looking flowers are small. But it is certainly a curiosity.

We continued the march to Mu-li on May 15, keeping along the irregular crest of the divide at an average altitude of 14,000 feet, with huge walls and towers of limestone, now on one side, now on the other. There were vast exposures of bare rock, which never would support a plant. The bush *Rhododendron* was all of one species, and that was not in flower. There was a lot of purple *Nivalis Primula*, but not much else. In the evening, however, we descended through a belt of forest, where *Rhododendron* "giant rose" (K.W. 4211) was blooming magnificently. The small lavender-blue *intricatum Rhododendron* was also in flower here (K.W. 4184). Flowers which lack the blue pigment are not uncommon; they are then, however, not white, but a glowing rosy pink.

One more march brought us down to Mu-li, after crossing a high pass. As we came down into the lower woods, chiefly evergreen Oak and *Picea*, with a few shrubs, ribands of white *Clematis* appeared trailing from the bushes. On the rough, limestone outcrops, a small, violet *Nivalis Primula* (K.W. 4141) appeared in masses. This may be *P. pulchella*, a somewhat variable species, which seems to demand the visible outcrop of limestone before it will deign to grow. Its A-tun-tzu representative is *P. pulchelloides*, which I found some years ago, and so far as I remember it is not a common plant; whereas *P. pulchella* is abundant, between Mu-li and Li-chiang. With it were two purple-flowered plants, a *Roscoea* and *Morina betonicoides*.

The slopes here were covered chiefly with Pine and scrub Oak, but a touch of colour was added by *Rhododendron decorum* and *Azalea*, coming into flower on the dark green background. In one of the deep gullies which gash the cliff just above the monastery I found a *Decaisnea* in flower, a plant which I had missed the previous year. At dusk we reached our quarters, which we had left exactly six months previously; a lot of things had happened since then, though. *F. Kingdon Ward*.

## TREES AND SHRUBS.

### THE HOLLIES.

In many ways *Ilex Aquifolium* with its very numerous varieties and hybrids is our most useful and showy evergreen, but it is surprising how few public parks and private gardens contain a representative collection of the best forms. The idea has been, apparently, to plant large numbers of the common green Holly and a few varieties, thus losing the beautiful effects it is possible to obtain with a good selection of varieties that requires no more trouble. While a fine feature at all seasons of the year, it is in winter that the Hollies are seen to the best advantage.

The fact that considerable transplanting is in progress in the Holly collection at Kew suggested the writing of a note for the festive season. Other evergreens are used to decorate the home, but the Holly is the one mostly associated with Christmas.

It was in 1874 that the late Sir Joseph Hooker planned the Holly Walk (Fig. 152), which is 880 yards in length, and commenced the formation of the national collection of Hollies at Kew, which to-day numbers some one hundred and twenty species, varieties and hybrids. The continued growth of the plants and of the number of specimens means the expansion of the collection from time to time; it is one of these periodical extensions, and the largest during its forty-eight years of existence, that is now in progress.

That the Holly will thrive in most soils can be very readily gathered by watching the hungry-looking yellow sand dug out in the process of transplanting the Kew Hollies, though

good loamy soil is always worked in with the sand when filling in the holes. The Holly, more especially its green varieties, is a good town shrub. In the Liverpool Botanic Garden the variety *Shepherdii*, named in compliment to the first Curator of those gardens, is one of the very few satisfactory evergreen shrubs. These gardens are not far from the Edge Hill Railway Depot and in a smoky district that is most unsatisfactory for gardening.

Though useful for hedges, screens, and shrubberies, it is as specimen trees or bushes that Hollies are seen to the greatest advantage.

FIG. 153.—*ILEX AQUIFOLIUM WILSONII*; A NEW HYBRID HOLLY.

Starting with a central growth, the training of the trees by a periodical shortening of those side shoots which grow too long, while limiting the top to one leader, is easy. Do not, however, except in the formal garden and hedges, use the shears, or adopt a method of hard pruning with the secateurs, as this at once destroys the distinctive beauty of growth, which varies in such a marked degree in the many different species, varieties and hybrids.

To those who regard showery weather in September, or April and May, as the best times for planting evergreens it will be rather surprising to learn of the work in progress at Kew, but at both normal seasons for planting Hollies Kew is thronged with visitors. Transplanting machines are now available, which will readily move balls of soil weighing five, ten, twenty or more hundred-weights, attached to the roots, according to the size of the specimens, and thus the plants feel no ill-effects from transplanting.

Propagation of Hollies is by seeds, cuttings, layering, budding and grafting. Seeds are employed to raise the species and provide stocks on which to bud or graft the varieties and hybrids. Holly seeds usually take from one to two years, occasionally longer, to germinate. Cuttings made from half-ripened wood of the current season's growth, with a thin beel of old wood attached, are best inserted during July and August. A length of about 4 inches is suitable. The cuttings should be placed in pots of sandy soil in a close propagating case, with slight bottom heat. If inserted in a cold

frame or under a handlight, a length of about 6 inches is preferable. In nurseries, grafting in spring under glass and budding in summer are preferred to cuttings, as the plants reach a saleable size quicker, but in later years it is difficult to see any difference between plants propagated by layering and cuttings or grafting and budding. The beautiful specimens of Weeping or pendulous Hollies are obtained by grafting or budding on stocks of the common Holly at a height of 6, 8 or 10 feet. In addition to the "weeping" form (var. *pendula*) of the common green Holly, there are variegated forms, two of the best being Perry's Silver Weeping (var. *argentea pendula*) and Waterer's Golden Weeping (var. *aurea pendula*).

The average height of the Holly is from 40 to 50 feet. Several specimens at Kew exceed 50 feet. Loudon records a tree at Claremont as 80 feet high; this example does not exist now, but there is one approaching that height at Mount Edcombe in Cornwall.

The following twelve varieties and hybrids comprise a representative and distinct selection of the best sorts in cultivation:

*Ilex Aquifolium argentea regina* (Silver Queen), the best white or silver variegated Holly; male.

*I. A. aurea medio-picta* (Golden Milkmaid), centre of the leaf golden with a thin irregular margin of green; male and female.

*I. A. aurea regina* (Golden Queen), a very showy golden Holly with richly coloured leaves; male.

*I. A. camelliaefolia*, one of the largest-leaved green varieties, vigorous and free in growth, forming a large, shapely specimen; it has extra large berries and dark green leaves 4 or 5 inches long by 1½ to 2 inches wide.

*I. A. flavescens* (Moonlight Holly), has leaves more or less flushed with bronzy-yellow, especially when young, thus giving the trees a very distinct and attractive appearance on the closely cut turf of a well-kept lawn; female.

*I. A. Golden King*, the finest of all the golden variegated Hollies

*I. A. handsworthensis* (Handsworth New Silver), perhaps even more valuable than Silver Queen, as it produces berries freely.

*I. A. Lawsoniana*, a variegated form of *Hendersonii*; it has a fairly large leaf with a large, irregular, yellow blotch in the centre.

*I. Mundyi*, one of the most distinct of the large-leaved green Hollies, is now generally regarded as an *Aquifolium* × *platyphylla* hybrid; broadly ovate leaves are about 4 inches long and 2 inches wide; a free-growing male Holly.

*I. A. recurva*; this belongs to the small-leaved, spiny group with dark green leaves, and a close-growing habit, but it has a strong leading shoot.

*I. A. Watereriana* (Waterer's Holly), a compact, slow-growing, golden-variegated Holly, often growing as much in width as height (if not pruned to any other shape); this is a particularly useful variety for the formal garden and terrace.

*I. A. Wilsonii* (see Fig. 153) is one of the best hybrid Hollies—*I. Aquifolium* × *I. platyphylla* (or *baleatica*). It is vigorous in growth and has large, glossy, green leaves of exceptional substance, up to 4 or 5 inches long and 3 inches wide, with spiny edges. This is among the largest of the red-berried Hollies.

Additional varieties to complete a list of twenty-five, including the three pendulous varieties mentioned, are:—*argentea marginata*, *argentea marginata elegantissima*, *aurea marginata*, *doringtonensis*, *ferox* (Hedgehog Holly), *fructu-luteo* (yellow-berried Holly), *Madame Briot*, *Marnockii*, *scotica* and *Smithiana*.

The reason why many Holly trees never produce berries is that as a rule male and female flowers are borne on different trees. *A. O.*

**ATHROTAXIS LAXIFOLIA.**

ALL three species of *Athrotaxis* are suitable only for the more favoured parts of the country, but where the climate permits them to be grown, they disclose a charm of distinct habit together with considerable beauty. In general appearance and character *A. laxifolia* comes nearly midway between the two others, so much so, that Kent, in the *Manual of Coniferae*, remarking upon this, wrote, "This form is so nearly intermediate between *A. cupressoides* and *A. selaginoides* as to suggest the possibility of being a hybrid between them." And while there seems no reason to doubt that *A. laxifolia* is a true species, it does suggest a hybrid origin. The leaves are decidedly longer and freer than those of *A. cupressoides*, which favours a *Cupressus* in its closely adpressed leaves; it is also quite distinct in this respect from *A. selaginoides*, which has a likeness to several of the tender *Araucarias* and to *Cryptomeria*, but its leaves are distinctly softer and more tender than any of them. The curved leaves of mature specimens of *A. laxifolia* are somewhat sharp-pointed, but this character is usually absent in young specimens, which often bear their foliage somewhat adpressed, simulating a stouter and less whipcord-like *A. cupressoides*. This peculiarity is

well seen in the illustration of a young plant (Fig. 151), and has induced some growers to consider such to be a distinct species, and to give it Maule's name of *A. Doniana*, which is merely a synonym of *A. laxifolia*.

The intermediate *Athrotaxis* is usually quite distinct in habit, and while the other two species generally make quite regular and narrow pyramids up to 20 ft. or a little more in height, *A. laxifolia* is less formal in appearance and makes rather a spreading, large bush. So far as I have seen, it does not cone nearly so freely as the other two species, consequently seedlings from home grown seeds are rare.

Some years ago, I was shown a large batch of splendid seedlings of *A. selaginoides* raised from seed collected from the fine example at Coldretnick, in Cornwall.

In hardiness, *A. laxifolia* also continues its intermediate character. I have known *A. cupressoides* successfully withstand frost which browned the tips of the leaves of *A. laxifolia* and killed *A. selaginoides* outright.

Where there are any climatic doubts, it would be well to plant in a well-drained position, facing west for choice, and to follow the commendable custom that obtained when it was fashionable to plant Conifers on a slight mound. *A. C. Bartlett.*

**ORCHID NOTES AND GLEANINGS**

**Laelio-Cattleya EXIMANTIN.**

*CATLEYA MANTINI* (Bowringiana × Dowiana) is one of our brightest winter Orchids, and the crossing of it with *Laelio-Cattleya Eximia* (*C. Warneri* × *L. purpurata*) by Frederick J. Hanbury, Esq., Brockhurst, East Grinstead, gives another and a larger-flowered addition to the class. The sepals and petals of the newcomer are clear mauve colour; the lip, which approaches that of *L.-C. Eximia*, is Tyrian purple, with an orange base that has light yellow lines.

*Cypripedium Gainsborough* (Thomsonii × Fairrieanum) from Mr. Hanbury, has a white dorsal sepal with Apple green base, from which ascend dark, branching, claret lines. The

petals are gamboge yellow with dark lines; the lip is tinged with purple.

*Cypripedium Emily Brown* (G. F. Moore × Fairrieanum), also raised at Brockhurst, is a large flower, showing *C. Fairrieanum* in the broad decurved petals, and the dark lines on white in the dorsal sepal. The petals and lip are honey yellow tinged and lined with purple.

**ORCHIDS FROM WARNHAM COURT.**

C. J. LUCAS, Esq., Warnham Court, Sussex, sends flowers of seedlings flowering in his collection, three of which are new.

*Odontoglossum Mandarin* (McNabianum × Jasper) is a very remarkable flower of a rare type. All the segments are broad, the sepals being heavily blotched with chocolate purple, with thin bars of Primrose yellow and yellow tips. The petals are similarly marked, but the inner halves and base of the lip are pure blue, a feature which is rare and very attractive.

*Odontoglossum Zenarden* (*Zena* × *ardentissimum*) has the sepals nearly covered with large chocolate purple blotches, the petals white with chocolate purple blotches on the inner half, and the broad lip white with purple base.

*Odontioda Brightness* (*Odm. Eva* × *Oda. Charlesworthii*) is of uniform ruby red colour, with a prominent gold crest on the lip.

The known varieties received are *Odontoglossum Purple Queen II.* (*Delta* × *Corona*) with perfectly formed and attractively marked flowers, and *Odontioda Margaret*, a large red flower with white margin.

**GARDEN NOTES FROM S.W. SCOTLAND.**

*CYNOCLOSSUM amabile*, a Chinese Hound-tongue of much merit, has received of late much favourable notice in gardening journals, and deserves all praise for the beauty of its sky-blue flowers and the freedom with which they are produced. But care should be taken not to plant it where dogs or cats are likely to come, for it bears innumerable little burrs of a peculiarly adhesive and irritating quality, which, if they get into the fur of an animal, inflict intolerable torment. I received a timely

reminder of this last night, when, after working in a border where this plant grows, I found my nether garments densely peppered with them. Viewed under a strong lens, the prehensile mechanism of these hurls is interesting. *C. nervosum*, a Himalayan relative of the other, with deep blue flowers, is practically innocuous in this respect; its seeds are neither so aggressive nor so multitudinously produced.

The past autumn has made itself memorable for an abundance of Roses. Even now, on the eve of the winter solstice, it is possible to fill a vase with fresh blooms. Were I asked to name a brace of varieties for late flowering, they should be the thornless *Zéphirine Drouhin* and *Lady Pirrie*; neither of them show blooms, but invaluable at this season. I have seen *Corallina* make a fine November display in a Surrey garden, but it does not seem to relish our west coast conditions.

In mild districts *Griselinia littoralis* makes a beautiful hedge, especially near the sea. It makes an admirable shelter for subjects that shrink from strong wind, and at this season its shining grass-green foliage is a refreshing sight. In its native New Zealand, where it is known as *Kapuka*, it grows to a tree 30 to 50 feet high; but, in this country, like the *Cherry Laurel*, being usually propagated by cuttings, it is most often seen in bush form.

In ordinary seasons we have learnt to rely on the hybrid *Rhododendron Nobleanum* for gaiety. In 1921 it began to flower in October and continued at intervals till March; but this year, though profusely set with flower buds, not a bloom has opened before mid-December. There are several forms of this excellent old hybrid, a cross raised at Knap Hill between *R. arboreum* and *R. caucasicum* well nigh a century ago. The best form, more arboreal in habit than the others, has become very scarce; indeed, it seems to have passed out of the trade altogether. Those who have it (and it flourishes in many old country places) would do wisely to put down layers.

Another effect of the backward season has been to defraud us of bloom on *Fatsia japonica*, one of the chief ornaments of early winter. Plenty of massive flower spikes have been formed amid the foliage, but too late to allow of their development into the semblance of carved ivory. This shrub ranks among the finest evergreens, and, strange to say, the great leaves stand considerable exposure to wind with impunity. *Herbert Maxwell, Monreith.*

## THE BULB GARDEN.

### BULBOUS IRISES.

SPANISH and English Irises may now be planted. These are useful subjects for many purposes; in the herbaceous borders they may be utilised for filling bare spaces in the foreground, or they may be grown in beds by themselves. Ordinary, well-drained soil on the gritty side suits them well, the members of the Spanish group requiring soil of a little lighter texture than the English Irises.

They are valuable for furnishing cut blooms early in the year, and their many beautiful shades of colour and dainty appearance render them suitable for a position in any garden, large or small.

There are also many beautiful species of bulbous Irises that are suitable for planting in the rock garden. As some of these plants flower in winter, it is advisable to grow them under glass to prevent the blooms being damaged by inclement weather. Artificial warmth is not necessary, and where a house is devoted to the protection of Alpine plants, these lovely Irises should be included. They may be planted in pans for the purpose. By this means a supply of pretty flowers may be had from the different bulbous Irises from October through the winter and spring to June. The plants should be placed in the pans in September or October. Two of the choicest species are *I. pumila*, which produces its deep purple and violet toned flowers in April, and *I. reticulata*, a species producing violet flowers in February and March. *E. B.*

## FRUIT REGISTER.

### PEAR WINTER NELIS.

THIS small-fruited variety is one of the very best of late Pears, and was classed by the late Mr. Archibald Barron as amongst the finest of all Pears. It seems to require a warm district, as in the colder parts the rather weak growth does not ripen well, and because of its somewhat feeble growth it does best on the more vigorous Pear stock, rather than the Quince. Imported fruits are, this winter, of very luscious quality, and they seem extra fine in this respect, probably because home grown Pears have been so poor in flavour this season. Intending planters should include this choice Christmas Pear in their lists. *T.*

## HOME CORRESPONDENCE.

Mrs. Jane Wells Loudon (see p. 368).—I was greatly interested in Mr. Brotherston's article on this accomplished authoress, and surprised to find he omits any reference to her work entitled *The Amateur Gardener's Calendar*. This book deals with work in the garden for each month of the year, somewhat in the style of the *Calendar of Gardening Operations*, but much fuller, there being very copious extracts from articles by writers in the gardening Press, many from the *Gardeners' Chronicle*. It is a very valuable work, although much of the matter is now out of date; the copy I have is a revised edition by Mr. William Robinson. There is need for an

FIG. 154.—CHRYSANTHEMUM MRS. A. ROBERTSON, N.C.S. FIRST CLASS CERTIFICATE, NOV. 27; R.H.S. AWARD OF MERIT, NOVEMBER 28. SHOWN BY MR. NORMAN DAVIS. (SEE PP. 329 AND 330.)

### APPLE ORLEANS REINETTE.

A RECENT writer complains (p. 343) that this Apple does not keep in the fruit room without shrivelling. May I point out that like most other Reinettes its keeping qualities entirely depend upon thorough ripening on the tree. I was eating Orleans Reinette in March this year, quite firm and crisp, thanks to the sun of 1921, but even after the present summer I have this Apple in the store quite firm and hardly ready for use at present. A few experiments tried last year showed that fruits gathered so soon as they were fully grown and well coloured were a little lacking in flavour, and those left on the tree so long as they would hang were a little mealy in texture. I would recommend anyone who grows this Apple to wrap the fruits in paper and put them in a box directly they are gathered. They can then be kept in any shady or cool place without the slightest danger of shrivelling. *Edward A. Bunyard, Maidstone.*

up-to-date edition of a work of this character and although the title is *The Amateur Gardener's Calendar*, professional gardeners would find it extremely useful. The energy both Loudon and his wife possessed must have been far in excess of the average person, for it has always astonished me how they were able to accumulate the vast number of references given in their works. Take, for example, either of Loudon's works, *Arboretum et Fruticetum Britannicum*, *Encyclopaedia of Gardening*, or *Encyclopaedia of Plants*. They teem with details, and in the case of the first it would appear that every tree of note of any particular kind standing in his time was recorded. His references to Grecian gardens, Roman gardens, French gardens, etc., must have involved years of research. No fewer than 18 pages of small type are devoted to the list of works referred to in compiling his *Encyclopaedia of Gardening*. Loudon is justly entitled to be known as the doyen of garden authors. *T.*

## SOCIETIES.

### READING GARDENERS'.

At the last fortnightly meeting of the 1922 season, held in the Recreation Club Room, Abbey Hall, Mr. H. H. Cook presided over an excellent attendance of members.

The subject for discussion was "The Cyclamen," and this was introduced by Mr. W. Broomfield, The Gardens, Cliffe House, Maple-Durham. He mentioned that the Cyclamen gave a brilliant display in the greenhouse during the winter and spring months; it is of varied colours, exceedingly useful for table decoration, and may be grown as a perennial for several years, but it is advisable to grow a batch of seedlings each year. Cultural details were given, such as sowing of seed, soil, potting, watering, manures, etc. A good discussion followed, in which Messrs. Cook, Blackwell, Alexander, J. Wynn, Young, M. Goddard, Townsend, Carter and H. Goodges took part, the latter moving a vote of thanks to Mr. Broomfield for his instructive lecture.

In the competition for Potatoes, both Kidney and round varieties, many finely coloured tubers were shown. For three dishes of kidneys the first prize was gained by Mr. W. GOWER, The Gardens, Calcot Grange; second, Mr. D. TURNER, The Gardens, Coley Park; and third, Mr. J. WYNN, The Gardens, Hammonds, Checkendon. Mr. GOWER was also successful in winning the first prize in the class for three dishes of round Potatoes; second, Mr. G. GODDARD, Reading; and third, Mr. F. ALEXANDER, The Gardens, Kennetts Lodge, Theale.

In the non-competitive section an Award of Merit was awarded to Mr. W. TOVEY, The Gardens, Leighton Park, for two vases of fine blooms of Chrysanthemum Edith Cavell, and the judges directed special attention to a seedling Carnation raised by Mr. Broomfield. The *Gardening Illustrated* Bronze Medal offered for the competitor gaining the highest number of points in the various competitions held during the autumn session was won by Mr. J. WYNN.

### NATIONAL CARNATION AND PICOTEE.

The annual general meeting of the National Carnation and Picotee Society was held on the 16th inst., in the small committee room of the Royal Horticultural Hall, Vincent Square, when a number of members were in attendance, with the president, E. Charrington, Esq., in the chair.

The report and statement of accounts for 1922 were passed unanimously, the accounts showing a balance in hand of £51. The committee's action in adventuring to hold two exhibitions, one on July 10 and the other on July 24, 1923, was confirmed.

Edmund Charrington, Esq., was re-elected president, and H. R. Taylor, Esq., a vice-president. The committee was reappointed with the addition of Mr. Ernest G. Lowe, Messrs. J. J. Burnett and Sons, chartered accountants, of Southampton, were reappointed auditors and thanked for their past services. Mr. J. J. Keen was re-elected honorary treasurer and secretary.

Some discussion took place as to the desirability of issuing with the annual report a Carnation Year Book, and a small sub-committee was appointed to consider the matter and report at a future meeting.

### NATIONAL CHRYSANTHEMUM.

This Society's Floral Committee held its concluding meeting for the season at the Royal Horticultural Hall, Westminster, on December 11, when the following awards were made:—

#### FIRST-CLASS CERTIFICATE.

*Cream Favourite*.—A delicate cream coloured sport from Favourite, the latter a popular pure white market variety. The new-comer is said to be an even greater favourite with florists than this type, and it has been on the market for some time past. Shown by MR. NORMAN DAVIS.

*Dr. Jacobs*.—A medium-sized Japanese variety that promises well for decorative use and the

supply of the market. The colour is rich crimson, with dull gold reverse. Shown by MR. KEITH LUXFORD.

*Teresa*.—This is an attractive market variety, and for this purpose received the present award. It is already fairly well-known, and its bronzy apricot colour is most effective. Shown by MR. KEITH LUXFORD.

#### COMMENDATION.

*Winter Gem*.—This medium-sized Japanese variety should prove useful for market work and for general decorative purposes. The colour is a pleasing shade of golden amber. Shown by MR. NORMAN DAVIS.

### NORTH OF ENGLAND PANSY AND VIOLA.

THE annual meeting of the North of England Pansy and Viola Society, held at the Market Tavern, Bradford, on the 16th inst., was well attended. The President, Mr. A. S. Croasdale (Colne) presided. The Secretary (Mr. F. E. Sutcliffe) thanked the exhibiting members for their excellent support at the four shows held at Leeds, Saltaire, Sheffield, and Nelson. The members had received this season in prize-money close upon £70. The balance-sheet showed a loss of £5 on the year's working, which was subscribed before the meeting closed. An interesting function was the presentation of a gold watch and Albert to the Secretary, Mr. F. E. Sutcliffe, in appreciation of his services as general secretary and organiser. The President made the presentation. The retiring officers were thanked, and their successors elected.

## NEW HORTICULTURAL INVENTIONS.

#### LATEST PATENT APPLICATIONS.

- 33792.—Grant, W.—Flower pots. December 11.  
 34075.—Kipling, W. R.—Machine for cutting grass, and for removing overgrowing grass, etc. December 14.

 32050.—Russell, W. A.—Trellis for training Peas, etc. November 23.

#### SPECIFICATIONS PUBLISHED THIS MONTH.

- 168317.—Gand, P. J.—Process for directly treating seeds and the like to increase the productivity thereof.  
 189311.—Glover, J. A. J., and Burn, L.—Garden and like rollers.  
 189345.—Savage, A. J.—Hand tool for cultivating and scarifying land.  
 188746.—Kelly, J. R.—Shovels, spades, digging forks, and the like.  
 188941.—Gardner, A.—Handy instrument for the sowing of small seeds.  
 189037.—Walkey, J. W.—Preparation for preventing blight in fruit trees and for destroying blight in trees infected therewith.  
 189044.—Pugh, Ltd., C. H., and Bull, G. F.—Lawn mowers.

#### ABSTRACT PUBLISHED THIS MONTH.

- 187711.—Grease, etc., bands for tree trunks.  
 A portable device for applying the material to form a sticky band for a tree trunk to protect it from insects has been devised by Mr. J. A. Sears, of Barn End Lane, and A. E. Martin, Post Office, both in Wilmington, Kent. It comprises a portable receptacle in the form of a bellows with a nozzle carrying a guide plate, the upper hinged member of the bellows having an opening provided with a cover. Instead of a guide plate, a roller may be used.

The material is forced out through the nozzle by operating the handles, or the bellows may be operated by a screw.

This list is specially compiled for *The Gardeners' Chronicle*, by Messrs. Rayner and Co., Registered Patent Agents, of 5, Chancery Lane, London, from whom all information relating to patents, trade marks and designs may be obtained gratuitously.

## ANSWERS TO CORRESPONDENTS.

**BERRIED PLANT AGAINST A WALL:** J. W. The plant you refer to is *Pyraecanthus coccinea*, formerly known as *Crataegus Pyraecantha*. It is evergreen, and forms a small tree up to fifteen feet high. The plant does not cling to the wall, but needs to be attached in some way. There appear to be superior forms, for the one we possess has much larger and brighter berries than those of some of our neighbours. There is also a yellowish-orange fruited variety, known as *Lalandei*, and this is suitable for growing against red brick walls, on which the ordinary scarlet form does not show to advantage. Birds sometimes attack the fruits, but this may be prevented by spraying them with a distasteful mixture, such as *Quassia* extract mixed with bitter Aloes. The plant does not transplant easily, except when in a young state, and you should obtain small specimens in pots.

**CELERIC TURNING BLACK AFTER COOKING:** N. R. The cause of the roots turning a black colour when cooked is probably due to them being bruised before cooking; or it may be due to bacteria.

**FROST ON VEGETABLES:** K. R. Certain vegetables, including Celery, Savoys, Parsnips and Jerusalem Artichokes, are usually considered much better eating after they have been subjected to frost on one or two occasions. Celery is always crisper and sweeter after it has been exposed to a little frost, due, probably, to the changes brought about in the cell contents by the influence of frost, and this also may be the reason why Parsnips are sweeter, as the frost seems to favour the production of sugar in the roots.

**FRUIT TREES AND FROST:** G. F. It is not advisable to prune fruit trees during frosty weather, as the freshly exposed tissue may receive such injury from severe cold that may result in decay setting in. Frost is especially harmful to fruit trees when the latter are trained direct to wires, but in the case of warm walls the injury from this cause is not likely to be very serious.

**PLANTING BULBS:** F. T. It is not too late to plant certain kinds of bulbs, including Daffodils, Tulips, Hyacinths, bulbous Irises, and Anemones. Crocuses also may be planted, but these and such kinds as *Scillas* and *Muscari* are much better planted in October or November. The winter has not been very severe and the ground is not exceptionally cold, so that if the planting of bulbs is done forthwith, the plants will probably make a considerable amount of root growth during the winter, should the weather continue favourable.

**TREE FERNS:** E. These Ferns will do well in the usual compost employed for Ferns and should be grown in comparatively small receptacles in keeping with the size of the root system. It is very beneficial to syringe the stems frequently, and, instead of removing the old fronds, to draw them down to the stems and secure them by a band of string. By this means the stems will keep moist longer after syringing. Some of the tree Ferns are exceedingly impatient of drought at the roots, and if the soil is allowed to become very dry on one occasion only, it will react very injuriously upon the plant.
