The lexicographer Cotgrave (1650) lists "Pomme Poire, a pear apple, a little russet apple, and, as some hold, a Pearemaine," showing some confusion between Apple and Pearmain. At an earlier date, Dalechamp, 1586 (*Leroy, Dict. IV., p. 575*) identified the *Melapium* of Pliny with the pomme-poire, perhaps through a resemblance between types of Apple and Pear, as is to be seen in such varieties as the Pear Olivier de Serres of the present time. De Paulmier, however, gives another reason for the association; he gives "Pomme-Poire on Roussette ou Oignonnet. Pomme-poire est plus longue et plus ronde que Chevalier, ayant neantmoins mesme gout et presque mesme couleur au dedans et autant de jus . . . le sidre de ces deux especes de pommes, pillées ensemble est si peu coloré qu'il seroit pris pour poire, si on n'en goustoit . . . (called) Roussette ou Oignonnet parqu'elle est ronde comme un oignon et rousse." Chevalier he describes as streaked with red, as large as or larger than an egg and a somewhat red flesh. Here it will be observed that the association of the words Apple and Pear rests upon the apparent similarity of the cider obtained from the Pomme-Poire to perry, and is entirely apart from any similarity in appearance of the fruits. It must be doubtful whether the Onion-Apple, a synonym for the Marigold-Apple recorded by Worlidge (1676), is identifiable with the Pomme-Poire or Oignonnet, but it is interesting that it was called "sometimes Johns Pearmain from its likeness to a Pearmain." Mayer, in 1776 (vide Leroy) seems to have been much troubled to find the Pomme-Poire and obtained trees from French, Dutch and German sources, all of which yielded fruit of a flattened, rounded shape and resembled the Reinette Grise, thus agreeing with that of Cotgrave, though he was so disappointed at its want of Pear-shape that he surmised he had not obtained the right thing.

A knowledge of the virtues of perry has considerable antiquity, Duval (*Essai Historique sur le Cidre et le Poiret*, Doin, Paris), relates that St. Rhadegund selected it as her sole

beverage more than a thousand years ago, and it might well be that an Apple which gave a perry-like cider may have attracted attention even before the days of J. de Paulmier. Thus light from another aspect is thrown on the nature of the Pomme-poire and helps to dissociate a spurious linking of Pearmain and Pear-apple. *H. E. Durham.*

## HARDY FRUIT GARDEN.

### THE PLUM CROP.

FOLLOWING my remarks on p. 201 in *Gard. Chron.*, April 22, 1922, re the cross-fertilisation of Plum blossoms, I am now able to give the results of experiments made this season. Pollen was taken from trees by means of a rabbit's tail and transferred to the stigmas of shy fruiting varieties. The results show that cross pollination is essential for most varieties, for trees which have had only very meagre crops in the past are this season plentifully furnished with sound fruit. Although this is a good Plum season, there have been equally good seasons when the same trees have been almost failures. Care was taken not to cross-pollinate varieties which were proved at Wisley to be incompatible, viz., Coe's Golden Drop and Rivers' Late Orange; but a free use of the pollen of such varieties as Monarch, Victoria, Czar, and Denniston's Superb Gage was made. It would be wise for those who intend planting during the coming autumn to make a note of these sorts, and to plant them freely in close proximity to others, especially where large plantations are in anticipation and where artificial pollination would be almost an impossibility. *R. H. Crookford, Weston Park Gardens, Stevenage.*

## VEGETABLES.

### THE SOWING OF BEANS.

LAST year attention was called to the depth of sowing for Beans by Mons. Mottet and myself (*Gard. Chron.*, July 16, 1921), and shallow sowing was controverted by a subsequent writer. This year, as usual, the early sowings in the greenhouse were mainly quite on the surface and, as usual, the few seeds that were buried were later in their germination. Out of doors a ten-yard run was divided into four parts, one fourth was sown without burying the seeds at all; by means of a dibber, marked at 1, 2 and 3 inches, the other three-fourths were sown at the depths indicated. This row was not watered, and owing to the extreme dryness which supervened all but one of the superficial seeds failed; the remainder are now showing the deterring effect of deep sowing, for the three-inch lot has only three fully formed divided leaves, whilst those sown one inch deep have five or, in some cases, six such leaves; the two-inch deep ones are intermediate, and show three or four; these are Yellow Dwarf Chinese.

In another sowing (of French Climbing Mangetout), one row sown quite superficially and watered have all come up and show the first pair of leaves, large and fully developed, and the first and second divided leaves nearing full size. In parallel, a row was sown at the same time two inches deep; several of these seeds have failed, probably from some underground pest, and those that have appeared have not fully developed their first pair, and the later leaves are only just appearing. It is obvious that the deeply-sown ones are heavily hand-capped, and that in very dry weather (without watering) one inch deep is enough to protect the young rootlet from getting scorched; where there is enough dampness the seeds need not be covered. Several rows of different varieties of dwarfs, the seeds of which were hardly covered, are coming up sturdily; but when sowing no deeper lots were put in, as the confirmation of the desirability of shallow sowing seemed to need no further proof. *H. E. Durham.*

## HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

**White Runner Beans.**—In *The Gardeners' Chronicle*, of July 15, p. 58, Mr. Clark recommends using the White-seeded Runner Bean as a winter vegetable. During the war, we commenced to grow Carters' White Monarch, especially for that purpose, and found it very useful. My employer prefers it now to the imported Butter Bean. The method of cooking is to soak the beans for 24 hours, and then boil them without squeezing them from the case, and they are quite a success. *J. Bundy, The Grange Gardens, Farnborough, Hants.*

**Plants from the Antipodes.**—My good friend Mr. Elwes, to whom I owe so many choice plants, has somewhat misunderstood (page 34) the problem which I propounded in your columns some weeks ago. It was not the difficulty of acclimatising in the northern hemisphere plants from the southern hemisphere that I submitted for consideration, nor is the question one of the power of any southern species to resist cold and wet. The problem consists in the readiness with which plants from the northern temperate zone colonise lands in the southern temperate zone, sometimes actually suppressing the indigenous flora, contrasted with the absence of any counter invasion, notwithstanding the abundance of seed produced by such southern shrubs and herbs as *Olearia* and *Senecio*. I cited our experience on the south-west coast of Scotland, where the climate and soil have proved peculiarly congenial to a great variety of species from South America and Australasia, most of which ripen plenty of seed. I mentioned four species—*Berberis Darwini* and *B. buxifolia*, *Veronica Traversi* and *V. parviflora*—as the only plants which had become thoroughly naturalised, *i.e.*, propagated themselves freely in our woods. I ought to have added a fourth, namely, the Chilean *Tropaeolum speciosum*, which has long been a most prolific, but much esteemed, weed in our borders, and has now escaped into roadside hedges, where it escapes the attention of rabbits. Seedlings of many southern species may spring up in garden borders (we have recovered a single self-sown seedling each of *Olearia nummularifolia* and *Desfontainia spinosa*), but outside the cultivated ground no species, except the five mentioned above, have succeeded in establishing themselves in competition with our native flora. Our experience in Spain seems to bear on this question. A mining company in Andalusia, whereof I am a director, has considerable plantations of Blue Gum and Jarra-Jarra; the former gives us pitwood in ten years from planting, and railway sleepers in twenty. The Blue Gum ripens plenty of seed, but our forester informs me that he has ceased to use it in the nursery because Australian seed produces far more vigorous plants. *Herbert Maxwell, Monreith.*

**Dunkeld Larches.**—The following note from *Coniferous Trees* (2nd Edition, Constable and Co., 1913) may throw further light on the history of these trees. The date of planting coincides with that given by Mr. Clinton Baker (page 337) and also with the measurements recorded by Sir Herbert Maxwell: "After a life of one hundred and seventy years, it has been found necessary to remove one of the parent larches situated near Dunkeld Cathedral. The uprooting of this magnificent tree is the more regretted when it is remembered that it was considered the finest specimen larch in existence. Brought from the Tyrol by Mr. Menzies, of Culdees, with a few other specimens, this tree, with another, was planted at the west end of Dunkeld Cathedral, in 1738. Five of the trees he left at Dunkeld, and eleven at Blair Atholl, for Duke James, the grandfather of 'the Planting Duke,' as he was familiarly called. Two of the five were felled by Duke John, in 1809, and one had been cut down by mistake about twenty years before. Of the two felled in 1809, one contained 147 cubic feet of timber, the other contained 163 cubic feet. Though originally treated as greenhouse plants, the trees proved so hardy as to be long recog-

nised as the best and largest specimens that exist, although they are closely approached by those grown at Menzie, near Crieff. In 1883, the measurements of both were taken and recorded on boards placed at the foot of each tree. The record of the larger of the two, which has just been cut down, is as follows:—

Planted in 1738.		Measured in 1883.	
			ft. in.
Total height ...	...	...	102 4
Girth at 5 feet from ground ...	...	...	17 2
" 17 "	...	...	15 1
" 51 2 "	...	...	12 10½
" 63 "	...	...	8 8
" contains 643 cubic feet with bark.	...	...	6 1
" 532 "	...	without bark.	...

After the tree was cut down the measurements were found to be practically the same as twenty years ago. The tree, which was struck by lightning two years ago, was allowed to stand to see if it would come round. The size of the tree and the difficulty of its removal may be to some extent understood when it is mentioned that some of the roots cut off measured 9 feet in circumference. The Duke of Atholl, the Marquis of Tullibardine, and the Earl of Mansfield visited the place, and expressed great regret that a tree with such a history should have to be removed." *A. D. Webster.*

## SOCIETIES.

## NATIONAL SWEET PEA.

JULY 12 AND 13.—Held in conjunction with the Eastbourne Horticultural Society's show, in the Devonshire Park, and favoured with delightful weather, the National Sweet Pea Society's twenty-second show was a great success. If any fault can be found with the conditions it would be that the lighting in the Winter Garden was not good, being far too subdued to allow the colours of the flowers to show up well; moreover, the table decoration classes occupied an unfortunate position where the light was bad even when the electric lights were on.

After the gales of the previous week expectations of a first-class show were very poor, but, so quickly do Sweet Peas recover, these melancholy anticipations were not fulfilled, and the result was a grand display of competitive and non-competitive exhibits of flowers of good quality and colour. It would not be correct to state that the N.S.P.S. has never before held so fine a show in the provinces, but it was a grand show, nevertheless, and filled the spacious Winter Garden with elegant beauty, exquisite colouring and delightful fragrance.

The President of the Eastbourne Society generously entertained the N.S.P.S. officers and Committee, as well as his own Committee, to luncheon in the Indian Pavilion on the opening day. Princess Alice, Countess of Athlone, very graciously opened the exhibition during the afternoon, and with Sir C. O'Brien Harding, Lady Northcote, Mr. Peyman, Mr. J. Stevenson and Mr. C. H. Curtis, made a tour of the show, inspected the flowers and accepted a handsome bouquet of Sweet Peas. At the opening ceremony the Mayor of Eastbourne officially presented to the N.S.P.S. the very handsome Eastbourne Cup, presented by the borough as a memento of the visit, and to be held yearly by the exhibitor of the best trade exhibit of Sweet Peas at the N.S.P.S. Show.

During the evening a dinner and re-union was held in the Indian Pavilion under the presidency of Mr. B. Peyman, who presided in the unavoidable absence of the President, Mrs. Macnamara. There was a large attendance and the numerous cups and pieces of plate were presented to the winners. There were a number of speeches and several musical items, and a very pleasant evening was enjoyed by all present.

## OPEN AMATEURS' CLASSES.

The "Daily Mail" Cup, one of the leading awards on this occasion, offered as first prize in an open class for twelve bunches, distinct, was won by F. W. FRANKS, Esq. (gr Mr. W.

Humphrey). Loampits, Tonbridge, with beautiful fresh and bright blooms of Hebe, Jean Ireland, Tangerine, Royal Purple, Elegance, Mascotts Ingman, Constance Hinton, King Manoel, Picture (also the best bunch in the show), Royal Scot, and Valentine. There was a very keen competition in this class; W. H. WALKER, Esq., Lewes, 2nd, with fine flowers a little marked by the weather; Sir RANDOLPH BAKER (gr. Mr. A. E. Usher), Ranston, Blandford, 3rd.

Sir RANDOLPH BAKER won the Sutton Challenge Cup for eighteen varieties with fine flowers which showed signs of the recent inclement weather; Miss RUSSELL, 2nd. Premier award in the Cory Cup class for six vases was won by Mr. TOM JONES, Ruabon, with superb blooms of Tangerine Improved, Picture, R. F. Felton, Elegance, Matchless and Hebe; 2nd, Mr. E. GIBBS, Gore Park Road, Eastbourne; 3rd, Mr. W. MARTINEAU.

In Messrs. WEBB AND SONS' class for nine vases, distinct, Mr. F. W. FRANKS won first place with Hebe, Orchid, Fair Lady, Valentine, Hawmark Pink, Mascotts Ingman, Mrs. T. Jones, Constance Hinton, and La France. Sir RANDOLPH BAKER won the Stevenson Cup for a display of new Sweet Peas with handsome bunches of Tangerine Improved, Salmon Queen, Matchless, Sunset, Colne Valley, Conquest, Frilled and Beauty; Miss RUSSELL (gr. Mr. C. H. Rundle), Barton Court, Canterbury, 2nd. In the Woodcock class for three varieties, distinct, D. H. ABBOTT, Esq. (gr. Mr. C. Fry), Ardene, Farnham, led in a close competition with Royal Rose, King White and Faith; 2nd, Miss RUSSELL; 3rd, Sir R. BAKER.

## TRADE CLASSES.

MESSRS. IRELAND AND HITCHCOCK, Marks Tey, won the Munro Cup for varieties raised or introduced by the exhibitor, with a fine collection of Flame, Mascotts White, Mascotts Ingman, Tangerine Improved, Primrose Queen, Annie Ireland, Mrs. A. Hitchcock (new selection), Mascotts Helio, New White, and Mascotts Cream; Messrs. E. W. KING AND Co., Coggeshall, 2nd; Mr. J. STEVENSON, Wimborne, 3rd.

Tremendous interest centred in the competition for the Eastbourne Cup, presented by the County Borough of Eastbourne, and to be competed for each year by trade growers who have to make a display on a space 15 ft. by 4 ft. 6 in. There were ten exhibits, and these alone made a fine show. They were arranged all round the competition exhibits, as is usual when the Society holds its exhibition at the Royal Horticultural Hall. The competition was very keen and eventually resolved itself into a final tussle between Messrs. DOBBIE AND Co., Edinburgh, and Messrs. IRELAND AND HITCHCOCK, Marks Tey. Each of these firms made a grand display and showed fine blooms admirably set up. The four judges had no ordinary task in appraising the merits of the stands, and their final award showed that Messrs. DOBBIE AND Co. won the cup with a margin only of a half-point. The Edinburgh firm obtained 3½ points out of 44, and Messrs. Ireland and Hitchcock 38. The latter firm won points for colour, but lost some on arrangement, as their group lacked the frontal finish which was a good feature of the Edinburgh group.

The same judges made the medal awards as follow:—

**Gold Medal.**—To Messrs. DOBBIE AND Co., Edinburgh; Messrs. IRELAND AND HITCHCOCK, Marks Tey; and Messrs. SUTTON AND SONS, Reading.

**Silver-Gilt Medal.**—To Messrs. MORBEY, Lindfield; Mr. J. STEVENSON, Wimborne, whose group was composed almost entirely of varieties of his own raising; Messrs. S. BIDE AND SONS, Farnham; and Mr. W. J. UNWIN, Histon, Cambridge.

**Silver Medal.**—To Mr. JEWELL; Messrs. JAS. CARTER AND Co., Raynes Park; and Mrs. W. ABBOTT.

## OPEN TO ALL.

The President's prize for the best dozen varieties was won by Mr. A. H. PARSONS, Lewes, with very large blooms of Renown, Mrs. A.

Hitchcock, Picture, Royal Scot, Colne Valley, and G. Shawyer.

Messrs. S. BIDE AND SON, Farnham, led for three bunches of seedlings, distinct, with the rose and white bicolor Nancy; the bluish fancy named Unique, and a pink-edged cream sort named Alma Bide; Messrs. E. W. KING AND CO., 2nd; and Mr. J. STEVENSON, 3rd. Messrs. E. W. KING AND CO. led in the class for a vase of one new seedling, with Rosemary, a very pleasing variety.

In the Raisers' Class for six varieties raised by the exhibitor Mr. J. STEVENSON was successful with his varieties Wild Rose, Lavender Bell, Crimson Glow, Splendour and Fair Maid, a very pretty set.

The Burpee Cup offered as first prize in the class for a table display of waved Sweet Peas was won by Messrs. E. W. KING AND CO., Coggeshall, with an attractive exhibit of flowers arranged in baskets and vases; Tangerine, George Shawyer, Mrs. A. Hitchcock, Austin Frederick, Warrior, Orchid, and Gladys were among the leading varieties. It was a great pity there were no other competitors, as a "walk over" is a most unfortunate happening in this competition. LAURENCE HORTON, Esq., Glenthorne, Wolverhampton, secured the E. W. King Cup, with a dozen fine bunches, his Austin Frederick, Elegance and Mascotts Helio being especially good.

Mr. W. H. WEEKES showed the best bunch of a novelty introduced in 1921-22; this was Mascotts Ingman.

Numerous single bunch classes were provided and in these Mr. A. O. COSHAM won for a white variety with Constance Hinton, for a lavender or mauve variety with Orchid, and for an orange variety with Royal Scot. Mr. F. W. FRANKS was successful for a pink variety with Hawlmark Pink, and for a crimson and scarlet variety with Field Marshal. Mrs. PALMER led for a cream variety with Matchless, a very fine form, and for a Picotee-edged sort with Jean Ireland, also finely represented.

#### DISTRICT CLASSES.

These classes were not well filled. In the Southern class Mr. W. H. WALKER, Malling Street, Lewes, led with grand bunches of G. Shawyer, Constance Hinton, Royal Scot, Mrs. Arnold Hitchcock, Colne Valley, and La France. Mr. E. KEITH, Cambo, Morpeth, won first place in the Northern class with very fine blooms of the old Edrom Beauty, Gloriosa, and others.

#### SMALL GROWERS.

Mr. G. W. WELLCOME, West End Gardens, Marlow, secured the Bide piece of plate for a dozen bunches in a class open only to single-handed gardeners; the competition was excellent. The Broomere Challenge Plate for six bunches was won by Mr. W. MARTINEAU, The Chestnuts, Boxmoor, with fresh blooms of large size, his Royal Purple being especially good. Mr. S. COLE, Beeston, had the finest set of three bunches.

In other classes Mr. E. WILLIS, Swindon, had the best six vases grown by an amateur, and Mr. E. G. GRIBBS, Eastbourne, was also eminently successful in winning the Hamilton Cup and Gold Medal for twelve varieties, distinct.

The Amateur Gardening Challenge Cup offered for a dozen bunches was won by Mr. T. CASHNELLA, Cambridge Place, Bath, with Austin Frederick, Cecily, Royal Purple and Picture in excellent condition. Mr. L. E. SIMMS, Eastbourne; Mr. C. R. LEGG, Hertford Heath, were also successful prizewinners.

#### DECORATIVE CLASSES.

The competition was excellent in the decorative classes. Mrs. RUFF, Sharnbrook, Bedfordshire, led for a dinner table decoration with a pretty association of Annie Ireland, Melba and Tangerine; Mrs. A. R. BIDE, Farnham, 2nd, with R. F. Felton and a pink variety; and Mrs. C. FOX, Tunbridge Wells, 3rd. Mrs. FOX also showed the best bowl of Sweet Peas, and Mrs. BIDE the best basket of Sweet Peas. Mrs. RUFF was equally successful in another class for table decoration.

#### LOCAL CLASSES.

Mr. A. O. COSHAM, Ringwood Road, Eastbourne, led in the local classes for a display of Sweet Peas with an attractive exhibit in which a large basket of Orchid was conspicuously good; 2nd, Mr. R. S. HORTON, Pennfield, Wolverhampton. Mr. C. GRINSTEAD, West Cottage, Eastbourne, and Mr. W. H. WALKER, Malling Street, Lewes, were also successful in this section.

#### NATIONAL ROSE.

##### PROVINCIAL SHOW, WOLVERHAMPTON.

JULY 11 AND 12.

THE Provincial Show of the National Rose Society was held on the above dates in the West Park, at Wolverhampton, in conjunction with the annual floral fête of the city. It was generally agreed that this was the finest and largest provincial show yet held by the National Society. There was fairly keen competition in many of the larger classes, and the blooms were all staged in grand condition. The representative groups of cut Roses, shown on a space not exceeding 30 feet by 4 feet, were particularly fine, and there were five entries in this class, and there were four entries in the class for a collection shown on a space of 15 feet by 4 feet. These groups commanded a great deal of attention from the visitors, the tents being thronged with admirers during the two days of the show. In responding to the toast of the National Rose Society, which was proposed at luncheon, Mr. Courtney Page (secretary of the National Rose Society) stated that he never remembered having attended such a wonderful show of Roses in the provinces as was staged that day.

#### GOLD MEDAL ROSES.

The classes for New Seedling Roses is always an interesting one. On this occasion four Gold Medals were awarded to new varieties, and we certainly think that the judges were far too liberal. Messrs. FRANK CANT AND CO., Colchester, received a Gold Medal for H.T. Rose *Captain P. S. Harvey Cant*. This is a large pink variety of good shape. It was awarded a certificate at the National Show at Regent's Park. The judges here, however, thought it worthy of the higher award. The colour may be described as a bright pink, of a deeper colour towards the centre of the flower.

*Penas*, shown by Messrs. BEES, LTD., Liverpool, which also received a certificate in London, qualified here for the Gold Medal. This is a pink Rose flushed with reddish-salmon. We think the certificate award already made at London correctly indicated the value of these two Roses.

Messrs. HUGH DICKSON, LTD., Belfast, gained a Gold Medal for *H. E. Wallace*, a large Hybrid Tea Rose of a subdued tone of yellow. This Rose was also awarded a certificate in London, and the judges there thought this award high enough. Opinions differ, however, and the judges at this show appeared to have different ideas from their colleagues in London.

Messrs. G. MCGREY AND SON, Portadown, were awarded a Gold Medal for H. T., *Mrs. Courtney Page*. This is one of the high-coloured Roses already represented by Lady Inchiquin and Messrs. Chas. E. Shea. It is a flaming rosy-cerise. The flowers are of medium size.

#### CERTIFICATES OF MERT.

*Chastity*, a white climber shown by Messrs. F. CANT AND CO. This is a very beautiful flower in the bud stage, and it is delightful when fully opened. The colour is a chaste white, which is enhanced by the yellow boss of stamens in the centres of the expanded flowers. We think there is room for this variety, and it is a potential winner of the Cory Cup in the autumn.

*Lord Allenby*, from Messrs. ALEXANDER DICKSON AND SONS, LTD., Newtownards, a large crimson-scarlet exhibition Hybrid Tea Rose.

*Harriet Easton*, from Messrs. MCGREY AND SON. This is very similar in colour to The Queen Alexandra Rose, but the flowers, although they are somewhat smaller, are of

better shape than those of the older sort. This Rose, too, is more Hybrid Tea in character than The Queen Alexandra, and in it we are getting away from the spines and foliage of the Pernetiana groups.

None of the other seedlings is worthy of detailed notice. One or two of them have already received certificates and have been described before. Some of the seedlings staged were very poor, and their raisers must improve their ideas about the type of flower that is required for a Gold Medal award. We observed that most of the seedling Roses were wired. We think the National Rose Society should prohibit this practice.

#### TRADE CLASSES.

In Class 1, for 36 blooms, distinct, the trophy went to Messrs. F. CANT AND CO. for an even lot of flowers. We noticed fine blooms of Mme. Jules Gravereaux, Capt. Harvey Cant, Pharisæer, H. V. Machin, Nellie Parker, and Colleen. Second place was awarded to Messrs. HUGH DICKSON, LTD., Belfast, who had good examples of E. Godfrey Brown, Coronation, George Dickson, Rev. Page-Roberts, and Molly Bligh. Third prize was taken by Mr. W. SLINGER, Newcastle, Co. Down. There were five entries in this class. Class 2 was for 24 blooms, distinct, and there were eight entries. Premier place was gained by Messrs. ALEX. DICKSON AND SONS, Newtownards, for a remarkably fine collection. Outstanding flowers were Molly Bligh, Earl Haig, Candeur Lyonnaise, Bessie BROWN, and Marcella. Second and third prizes were taken by Messrs. F. CANT AND CO. and Mr. CHAS. GREGORY, Chilwell, Notts., respectively. In Class 3, for twelve distinct Teas or Noisettes, Mr. GEORGE PRINCE, Oxford, easily won first prize with flowers of his usual supreme quality. This grower excels in the cultivation of Tea Roses. His flowers of Maman Cochet, Mme. Constance Soupert, and Lady Plymouth were very fine. Second place went to Messrs. F. CANT AND CO., and third to Mr. E. J. HICKS, Twyford. In the latter's stand we observed fine flowers of W. R. Smith and Mrs. Foley Hobbs.

Class 4 called for twelve blooms of new Roses distributed since January 1, 1918, all to be distinct. Mr. E. J. HICKS won first place with a choice lot of flowers. Bessie Chaplin, Frank W. Dunlop, Mrs. Henry Bowles, and Mrs. Henry Morse were exhibited in fine condition as to size, shape and colour. Mr. GEORGE PRINCE took second place with an almost equal lot, comprising fine flowers of Mrs. G. K. Rindye—a somewhat pallid form of Golden Emblem—Premier, and Edith Cavell. Third prize fell to Messrs. HUGH DICKSON, LTD., who had fine examples of Marjorie Bulkeley, and Earl Haig.

In Class 5, for one basket of cut Roses, one variety, there were three entries. First prize was won by Messrs. D. PRIOR AND SON with noble blooms of George Dickson; second by Mr. CHAS. GREGORY, for finely coloured Queen Alexandra, and third by Mr. GEORGE PRINCE for shapely flowers of A. H. Gray. Class 6 was for three baskets of cut Roses, distinct varieties. Honours were easily won by Messrs. ALEXANDER DICKSON AND SONS with glorious baskets of Lady Inchiquin, Sunstar, and Betty Upritchard. All were supremely fine in colour, and arrested the attention of every visitor. Second prize was awarded to Mr. C. GREGORY, who had splendid examples of Golden Emblem, Los Angeles, and Mrs. Henry Morse; third, Mr. JOHN MATTOCK, Oxford, with Los Angeles, Mrs. H. Morse, and Margaret D. Hamill.

In Class 7, for 24 distinct varieties of decorative Roses, not fewer than three, nor more than seven, stems of each variety, Mr. JOHN MATTOCK excelled with, amongst others, fine specimens of Padre, Geverine, Sheila Wilson, Lady Pirrie, and K. of K.; second, Messrs. F. CANT AND CO. For 12 distinct varieties, in Class 8, Mr. C. GREGORY was first, and Mr. GEORGE PRINCE second. Class 9 was for one basket of Roses not yet in commerce. There were two entries, and first place was awarded to Messrs. HUGH DICKSON for a variety named Marjorie Webb, and second to Mr. E. J. HICKS for John Hart. We do not see any opening in commerce for either of these varieties.

## GROUPS OF ROSES.

The principal class in this section was No. 10, for a representative collection of cut Roses, to be placed on a staging in a space not exceeding 50 feet by 4 feet. There were five entries. The premier prize, a piece of plate, value twenty-five guineas, was won by Mr. E. J. HICKS with a group staged in his usual style, combining variety, lightness and freshness. His group was flanked with bunches of Joanna Bridge, R. moschata alba, and Mme. A. Chatenay, and backed with stands of such sorts as Isobel, Red Letter Day, Dr. Van Fleet, Lady Reading—a red Wichuraiana, after the style of Excelsa—and Climbing Lady Hillingdon. There were also noble pyramids of Margaret D. Hamil, K. of K., Mrs. George Shawyer—which was exceptionally fine—and Lady Pirrie. He had also grand specimens of Golden Emblem, Mrs. Chas. E. Shea, and the new single, Ethel James. Messrs. GUNN AND SONS, Olton, were second with a somewhat similar arrangement. This was a well-staged exhibit, but the flowers lacked the freshness of the first lot. We noted Golden Emblem, Ophelia, Mme. E. Herriot, Isobel, and Paul's Scarlet Climber in good colour and condition. Third place fell to Mr. THOS. ROBINSON, Nottingham, for a good arrangement, in which there were fine pillars of Lamia, Mrs. H. Morse, Emma Wright, Colonel Oswald Fitzgerald, The Queen Alexandra, Donald Macdonald, and K. of K. Fourth prize was awarded to Messrs. A. DICKSON AND SONS. We noted choice blooms of Clara Curtis, Capt. Kilbee Stuart, Sunstar, Lady Inehquin, and Betty Uprichard on their stand. Fifth award went to Mr. A. S. DUNTON, Wolverhampton.

Class 11 was for a similar collection, staged on a space of 15 feet by 4 feet, and Mr. GEORGE PRINCE was easily first with a representative group, comprising The Queen Alexandra, Lady Ashtown, Isobel, K. of K., and Mrs. Henry Morse. Second prize was taken by Messrs. ENGLISH AND SONS, Gloucester. The third and fourth prizes, which went to KING'S ACRE NURSERIES, Hereford, and Messrs. WHEATCROFT BROS., Gedling, Notts., in the order named.

For a bowl of cut Roses, Mr. JOHN MATTOCK took first place with an arrangement of Mrs. Redford and Irish Fireflame; and Mr. E. J. HICKS was second with Joanna Bridge.

## AMATEUR CLASSES

In the amateur section of the schedule the principal class was No. 15, for 24 blooms of distinct varieties. The first prize and Jubilee Trophy was won by G. SPEIGHT, Esq., Market Harborough. He had fine flowers of Coronation, Lemon Pillar, H. V. Machin, and Mrs. Geo. Marriot. Second prize fell to H. E. FENTON, Esq., Walsall; and third to F. DENNISON, Esq., Leamington Spa. For 12 blooms, distinct (open only to growers of fewer than 1,000 plants), Mrs. HENRY BALFOUR, Oxford, was first; P. F. RAYER, Esq., Worcester, second; and H. E. FENTON, Esq., third. Mrs. C. E. WHITCOMBE excelled in the next two classes, for twelve blooms and six blooms; and G. SPEIGHT, Esq., was easily first in Class 19, for 12 blooms, open to those who, without assistance, grow and stage their own Roses. Mrs. HENRY BALFOUR was first in the class for Tea and Noisette Roses. There were several small classes.

## DECORATIVE CLASSES.

There is always keen competition in the Artistic Classes in the amateur section. For a Dinner Table decoration of cut Roses, Mrs. COURTNEY PAGE, Enfield, won with a graceful arrangement of Sunstar. Miss ETHEL JAMES, Abingdon, was second with the new single, Ethel James, a flower of the Isobel type, but with more refinement. Third place fell to Mrs. COLSTON HALE, Warminster, for Lady Pirrie and Irish Elegance; and fourth to Mrs. BLAIR, Congleton, for Irish Fireflame.

For a bowl of cut Roses, H. E. FENTON, Esq., was winner with a beautiful lot of Ophelia, and Mrs. COURTNEY PAGE second with Golden Emblem; third, Miss ETHEL JAMES, with Joanna Bridge; and fourth, Mrs. COLSTON HALE, with Ophelia and Irish Fireflame. For

the vase of cut Roses, Miss ETHEL JAMES occupied premier place with Ophelia; Mrs. COLSTON HALE second with Lady Pirrie, and Mrs. COURTNEY PAGE third with Red Letter Day.

## SILVER MEDALS.

A Silver Medal for the best Roses exhibited by a nurseryman was won by Messrs. F. CANT AND Co., with Mrs. Cornwallis West, a large, creamy-white Hybrid Tea. A similar medal for amateurs was awarded to Mrs. HENRY BALFOUR for H. V. Machin.

## ROYAL HORTICULTURAL.

## TRIAL OF BROAD BEANS.

THE following awards have been made by the Council of the Royal Horticultural Society to Broad Beans after trial at Wisley:—

*Awards of Merit*.—No. 4, *Multiple*, sent by Messrs. RYDER AND Co.; No. 14, *White-eyed Early Large*, sent by Messrs. ZWAAN AND DE WILJES; No. 15, *Early White-eyed*, sent by Messrs. VAN DER VELD; No. 18, *Broad Windsor Selected*, sent by Messrs. DOBBIE AND Co.; No. 23, *Giant White Windsor Improved*, sent by Messrs. WATKINS AND SIMPSON; \*No. 46, *Shirley Long-pod*, sent by Mr. POUND; No. 54, *Exhibition*, sent by Mr. A. DICKSON; No. 67, *Champion Long-pod*, sent by Messrs. DOBBIE AND Co.; No. 70, *Hangdown Selected*, sent by Messrs. ZWAAN AND DE WILJES; and No. 79, *Green Leviathan*, sent by Messrs. J. CARTER AND Co.

*Highly Commended*.—No. 6, *Green Gem*, sent by Messrs. J. CARTER AND Co.; No. 10, *Victory*, sent by Mr. DICKS; No. 11, *White Giant Four-seeded*, sent by Messrs. BARR AND SONS; No. 34, *Harlington Windsor*, sent by Messrs. R. VEITCH AND SON; No. 35, *Green Harlington*, No. 1, sent by Messrs. DICKSON AND ROBINSON; No. 41, *Kinver Mammoth Long-pod*, sent by Messrs. ED. WEBB AND SONS; \*No. 45, *Aldenharn Invincible*, sent by Mr. E. BECKETT; and No. 59, *Eclipse Long-pod*, sent by Messrs. WATKINS AND SIMPSON.

## UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this society was held in the R.H.S. Hall on Monday, July 10, Mr. Arthur Bedford in the chair. Five new members were elected. Three members were allowed to withdraw double the amount of their interest upon their deposit accounts, amounting to £13 1s. 8d. Two members over the age of seventy years withdrew from their deposit accounts sums amounting to £117 8s. 5d., and the sum of £26 17s. 6d. was passed for payment to the nominee of one deceased member.

The sick-pay for the month on the private side amounted to £57 4s. 9d., and in the State section to £58 14s.; maternity benefits, £10. The committee has pleasure in stating that Mr. Leonard Sutton will preside at the society's annual dinner on October 4, 1922.

## RICHMOND HORTICULTURAL.

THE forty-fourth annual flower show and fête of the Richmond Horticultural Society was held in the Old Deer Park, on Wednesday, July 12. The exhibits were of a very varied character, such as one frequently sees in rural districts. The best and largest exhibits were shown by nurserymen in the honorary section. The best exhibit in the show consisted of stove and greenhouse plants, and the best plant was a well-grown specimen of Miconia (Cyanophyllum) magnifica, shown by Messrs. L. R. RUSSELL. Most of the exhibits were placed in four large tents.

Mrs. H. E. GREEN, Devonshire House, Strawberry Vale (gr., Mr. N. A. Primrose), won the first prize in the class for three exotic Ferns; she was also awarded the second prize for three greenhouse plants, and the third prize for three stove or greenhouse plants.

Lady MAX WAECHTEL, Richmond Hill, was awarded the first prize for six Gloxinias, which were well flowered.

\* Nos. 46 and 45. These two Beans are alike, but No. 46 is the better stock.

The premier award for 36 blooms of Roses, in triplets, was awarded to Messrs. FRANK CANT AND Co., Colchester, who had fine blooms of Lyon Rose, Mildred Grant, Modesty, and British Queen.

For twelve varieties of Roses, in triplets, the same firm took the lead with grand blooms. They were followed by Mr. F. J. JEFFERIES, Thornton Heath, for second place. This order was maintained in the class for twelve blooms in two varieties. Messrs. FRANK CANT AND Co. were the only exhibitors of twelve blooms of one variety, showing grand flowers of A. Hartmann.

Mr. J. H. HART, Potters Bar, was awarded the first prize for six bunches of garden Roses, and Mr. F. J. JEFFERIES the second prize for twelve varieties of garden Roses. Mr. J. H. HART was awarded the first prize for twelve blooms distinct; and he also excelled in the class for twenty-four blooms distinct. Mr. G. J. FAVEL was awarded first prize for twelve blooms distinct.

The best twenty-four vases of hardy herbaceous plants were shown by CHARLES WILSON, Esq., Petersham, who put up a fine assortment in excellent condition. He also had the best six vases of hardy and half-hardy annuals.

Mr. J. LOCK, Otlands Lodge Gardens, Weybridge, excelled in the class for six dishes of fruit, showing excellent Grapes, Peaches, Nectarines, Plums and a Melon. He won the first prizes in the classes for two bunches of black Grapes; two bunches of white Grapes; one Melon; one dish of Peaches; and one dish of Nectarines.

The leading prize for nine dishes of vegetables was won by Mr. A. COOMBS, Windsor, who had good Cauliflowers, Onions, Dwarf Beans, Peas and Potatoes. Mr. R. KENE, Richmond, was a good second, his Onions being of first-class quality. Mr. E. WATTS, Richmond, was third.

Mr. R. KENE took the lead for nine vegetables, open only to allotment holders. He was followed by Mr. G. E. BEST, Twickenham, and by Mr. J. DENTON, Lower Mortlake Road, in this order. Mr. W. SOLLONS, Richmond, had the best six vegetables; Mr. J. TOWER, Richmond, was first for six vegetables in another class for allotment holders. Mr. R. J. KENE had the best four vegetables in the class for novices. Mr. H. WATTS had the best collection of eight vegetables; and secured the first award for six in a special class. There were numerous classes for single dishes of vegetables, which were a strong feature of the show.

## HONORARY EXHIBITS.

Messrs. CARTER AND Co., Raynes Park, London, put up a large group of annuals. They also staged Broad Beans and Peas (Silver-gilt Medal). Messrs. L. R. RUSSELL, Richmond, displayed a large and beautiful group of stove and greenhouse plants in one of the tents. In the open this firm showed Japanese Maples, Laurus nobilis and the Pomegranate in bloom. (Large Gold Medal.)

Mr. WILLIAM THOMPSON, Sheen Nurseries, Richmond, built up a high group with tall Palms in the centre, surrounded by Japanese Maples, Hydrangeas, Eurya latifolia variegata, etc. (Small Gold Medal.)

MESSRS. S. SPOONER AND SONS, Hounslow, exhibited a group in the open of cordon Red and White Currants, Gooseberries, and standards of the latter. In a tent they had an exhibit of Roses, on stands and in boxes. (Silver Medal.)

Sir JOHN ARCHER, Devonshire Lodge, had an exhibit of vegetables in great variety. (Small Silver Medal.) Sir JOHN ARCHER also staged a group of stove and greenhouse plants. (Bronze Medal.)

Mr. J. G. ROMER, Sandycombe Road, Richmond, staged an exhibit of dwarf Japanese trees. (Bronze Medal.)

## ROYAL CALEDONIAN HORTICULTURAL.

JULY 4.—The ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. David King, President, in the chair. Two short communica-

tions were submitted, one by Mr. Charles Comfort, late of Broomfield, on "Some of the Less Popular Bulbous Plants," and the other, entitled "The Classicality and Inspiration of Gardening," by the Rev. David R. Williamson, which was also read by Mr. Comfort.

The exhibits were:—Collection of Delphiniums, Violas, Gloxinias and Roses, from Messrs. DOBBLE AND Co., LTD., Edinburgh (Gold Medal); Pansies and Violas, from Mr. C. COCKBURN, Pencaitland (Cultural Certificate); *Anonatheca cruenta*, from Mr. D. Armstrong, Drum; border Pink "Princess Mary," from Messrs. JAMES GRIEVE AND SONS, Edinburgh; Figs grown out of doors in Edinburgh, from Mr. CATHIE, Pilrig House, Edinburgh.

**HORTICULTURAL CLUB.  
ANNUAL OUTING.**

On Friday, July 14, the members of the Horticultural Club visited Wisley Gardens and Pyrford Court, Woking, on the occasion of the annual outing. The programme made provision for a two hours' trip on the river by the "Merrie Thames" launch, but, owing to delay in starting and unfavourable weather, the river trip was abandoned and the journey was made direct to The Hut Hotel, Wisley, where forty-two sat down to an excellent lunch. The morning was wet, but the weather cleared at intervals and it was dry when the Wisley Gardens were reached. Mr. Chittenden was waiting to welcome the visitors, and several having expressed a wish to first inspect the laboratory, the various rooms and their uses were explained by the Director. A tour of inspection of the gardens was next made, a few making a special visit to the trial of Raspberries which had been judged on the day previous by a sub-committee of the Fruit and Vegetable Committee. The main party, with Mr. Chittenden as guide, proceeded to a general tour of inspection, past the glass-houses, to the magnificent border of herbaceous flowers, the trial quarters of Phloxes, Asters and Dahlias. The greatest interest, however, was taken in the trial of Violas, for the plants were in full flower and presented a gorgeous spectacle of rich and varied colouring. The rock garden and wood were next visited, but when the latter was reached the weather broke again and rain fell in torrents. As soon as this cleared, the majority made their way back to the laboratory, but some completed the inspection of the rock garden and the fruit trees on the higher ground.

The visit to Pyrford Court was made under more agreeable conditions, and the journey, through some of the most beautiful parts of Surrey, was very delightful. The sun shone brilliantly when the members stepped from the coaches and were welcomed by Lord and Lady Elveden, who were awaiting to receive their guests. Lady Elveden entertained the party to tea in the beautiful hall hung with seventeenth century tapestries representing the Battle of Solebay, on May 28, 1672, between the Dutch and British navies. The view from the terrace of the mansion is exceedingly beautiful over miles of the richest landscape. The gardens at Pyrford Court are in the best dressed style and included handsome Pergolas, Lily pools, Rose gardens, Iris borders, rich lawns and a series of colour gardens, including white, blue, grey, yellow and scarlet, the most novel of these being the yellow garden, which has a background of golden Catalpas, golden Elms, golden Poplars, with golden Conifers of a little dwarfier stature, golden Hollies, Privets and others, with broad borders of herbaceous plants, amongst which Tansy, Senecios in variety, Coropsis, *Lychimachias*, *Anthemis*, and other yellow-flowered species contributed to a very effective scheme. A tour of inspection was also made to the extensive wild garden, under the guidance of Mr. Auton, the gardener, on to the Iris garden, where several acres of marshy land are planted with varieties of *Iris Kaempferi*. A large sheet of water, with great patches of water Lilies on the surface and Willows by the bank reflected in the water, contributed to a scene that was imposing in its grandeur. The journey to London was made by road in beautiful weather, and Charing Cross was reached about 9 p.m.

**NORWICH ROSE SHOW.**

This fixture of the old Norfolk and Norwich Horticultural Society was held on July 13th, in the grounds of Bracondale Woods, on the outskirts of the ancient city of gardens. From a general aspect the exhibits were better than for the past year or so, but the number of competitors seemed to be fewer.

The chief prizes in the open competitive classes were won by growers from Colchester. The Rev. JOHN FELLOWES maintained his position as the best home county exhibitor, while Captain J. H. MANDER, Dr. DEACON, and Mr. H. JOHNSON staged praiseworthy specimens. In the section for Sweet Peas the outstanding feature was the triumph of Mr. G. L. MILLER, schoolmaster, of Scarning, Norfolk. He made ten entries and secured nine first prizes, and he staged perfect blooms throughout. Mr. G. S. SIDELL, gardener to the Hon. Mrs. Petre, had a charming collection of herbaceous flowers, winning easily in that section. A notable feature of the show was the success achieved by Mr. G. HIGH, gardener to J. A. Christie, Esq., Framlingham Manor. This exhibitor won the first prizes in both classes for Liliiums, staging exquisite spikes of *L. Henryi* and *L. auratum*. He was first also for Carnations with a vase of choice blooms, which included several home-raised seedlings. In the Iris class he also excelled with a splendid group of three distinct types. He also won several prizes in the vegetable and fruit classes. His fruits of Raspberry Pyne's Royal were exceedingly fine, and his collection of vegetables was placed first in a strongly contested class.

Mr. ULPH, gardener to J. E. Moxey, Esq., Framlingham, deserved great praise for his fine exhibit of double tuberous Begonias in pots; he also staged the best Peaches.

Trade growers contributed fine exhibits. Messrs. DANIEL BROS., LTD., Norwich, showed new Roses, hardy herbaceous flowers, Sweet Peas, and other subjects in season.

MESSRS. A. J. AND C. ALLEN, Earlham, Norwich, had a magnificent display of the newest and best Roses for the garden, H.T.'s predominating. Mr. HENRY MORSE, Eaton, Norwich, contributed a display of new Roses, special mention being due to his blooms of Queen Alexandra. Messrs. WINDER AND BOUSFIELD, Lingwood Lodge, and Messrs. A. REEVES AND Co., Catton, also had good banks of Rose blooms, and Messrs. G. STARK AND SON made a feature of Sweet Peas and Poppies.

**ELSTREE AND DISTRICT HORTICULTURAL.**

THE name of Elstree will occupy a prominent place in the annals of contemporary horticulture, as much for the remarkable exhibits contributed to flower shows from the gardens of the Hon. Vicary Gibbs at Aldenham House, as for the classical collection of plants and especially trees and shrubs that those celebrated gardens contain. It is not surprising that two such famous gardeners as the Hon. Vicary Gibbs and Mr. Edwin Beckett have lent their patronage and support to a local flower show, which is one of the finest village flower shows held in this country. The exhibition this year was held on Saturday, the 15th inst., and it may possibly have an historic interest, for the collection of vegetables staged by Mr. Beckett from the Hon. Vicary Gibbs' gardens was undoubtedly the largest and best ever shown in Great Britain and may never be excelled. Those who have seen Mr. Beckett's previous efforts in this direction were quite unprepared for an exhibit of this extent and quality and when we state that every dish was as near perfection as is possible to obtain, that the arrangement, colour blending and general effect, were even better than anything that Mr. Beckett has previously attempted, some idea may be gained of its merit. The subjects embraced almost everything the kitchen garden affords, either in season or out of season, and every dish would have held its own in the keenest competition.

Next to this outstanding exhibit the principal subjects shown were Sweet Peas and Roses,

both of which reached a very high standard, but the schedule made provision for other subjects, including hardy flowers, Antirrhinums, Stocks, Carnations, fruits, vegetables, artistic decorations and special sections for cottagers and allotment holders.

Probably the finest floral exhibits were the Roses in the special class open to all, in which a silver challenge cup and money prize were offered for the premier exhibit. The winners were Messrs. Chaplin Bros., who displayed their blooms in tall stands of which there were three tiers and they very cleverly blended the colours to harmonise, the result being one of the finest displays of Roses we have seen this season. The principal sorts shown were Mrs. Henry Bowles, Mrs. Wemyss Quin, Mrs. H. Stevenson, Margaret Dickson Hamill, Christine, and K. of K. Messrs. HARKNESS AND Co., were placed second and Messrs. FRANK CANT AND Co., third.

The best exhibit of six bunches of garden or decorative Roses in six distinct varieties, shown in vases, was contributed by W. E. Moon, Esq., High Wycombe. His blooms were exceptionally fine, especially the varieties Miss May Marriott, Ophelia and Margaret Dickson Hamill. Mr. J. A. HART, Potters Bar, who won the second prize in this class, showed a remarkably fine bloom of Mme. Léon Pain.

Five competed in the class for twelve varieties, distinct, in which a silver cup was offered as the first prize together with money. The last-named exhibitor was successful with good examples of Candeur Lyonnaise, Molly Bligh, Saint Helena, and Bessie Chapman. Mr. W. E. Moon, who won second prize, had especially choice specimens of Candeur Lyonnaise and Coronation.

Sweet Peas also call for special comment and, taking the nine classes for these flowers, competition was keen and the quality good all round. The silver challenge cup in the class for twelve distinct varieties was won in strong competition by Mr. PALMER with magnificent spikes of such varieties as King White, Dora, Hercules, Orchid, Jean Ireland, Arnold Hitchcock, Royal Purple, Sunproof Crimson and Picture. The second prize was won by Mr. E. THORNTON-SMITH (gr. Mr. J. W. Gutteridge), and this exhibitor was not far behind the premier collection in quality. Mr. Palmer also won the prize in the class for six distinct varieties, in which Major Edgecombe, Aldenham Grange, was second. Mr. ANSTEE had a very fine win in the class for three bunches, with splendid flowers of Hawmark Pink, R. F. Felton and Royal Purple. In the colour classes the best pink variety was Hawmark Pink shown by Mr. HASSARD, Harpenden; the best white variety, Constance Hinton, shown by Mr. PALMER; the best crimson or scarlet variety, Charity, shown by Mr. ANSTEE; the best lavender variety, Lavender George Herbert, shown by Mr. Palmer; the best cerise or scarlet cerise variety, Hawmark Cerise shown by Mr. Thornton-Smith, and the best cream, buff, or ivory variety, Black-Seeded Cream, shown by Mr. Palmer.

Mr. JAMES PAICE, gardener to the Vicar of Aldenham, again won the first prize, including the Silver Challenge Cup, for the best collection of six kinds of vegetables. He has previously won one cup in this competition outright.

Several excellent non-competitive groups added variety and interest to the exhibition. Messrs. CURBUS AND SON arranged a very pretty group of Polyantha Roses and Carnations, using the former as a ground work to good effect. Mr. J. C. ALLGROVE exhibited splendid Gooseberries, Currants, and Raspberries, with small pot trees of Rev. W. Wilks Apple bearing good crops of large-sized fruits. The Rev. J. H. PEMBERTON showed a collection of Roses, including many of his raising, and Messrs. Ireland and Hitchcock contributed a remarkable collection of Sweet Peas, which included such fine sorts as Mascotts Ingman, the new Shanrock, of rosy mauve colour; and Buntzy, a fine, orange pink variety. Messrs. A. SCRIVENER AND SON, Watford, showed flowers, plants and floral designs.

The show was favoured by fine weather and visitors were numerous; the gardens at Aldenham House were open to inspection and thousands availed themselves of this privilege.

## ANSWERS TO CORRESPONDENTS.

**BOTTLING TOMATOS:** *F. E. B.* Medium sized fruits, which are just on the point of ripening, should be selected for this purpose. Tomatos are as easy to bottle as any fruit, and there are few, if any, that retain their flavour better. Some folk add salt to the water as a preservative, but this is not necessary, and we do not agree with the practice; sugar, of course, should not be used. Put the Tomatos into the preserving bottle, packing as closely as possible without damaging them, and then fill the bottle with clean, cold water. Affix the sealing cap, and then, placing the bottles in the medium used for heating for sterilizing purposes, bring gradually up to a temperature of 160 deg., and maintain this for about five minutes. After removing the bottles from the sterilizer, stand them in a draught-proof place to cool, and thereafter examine the sealing cap to make sure the bottle is air-tight, and then store in the usual way in a cool larder, or similar repository.

**CORDON FRUIT TREES:** *G. B.* The correct depth at which to plant cordon fruit trees may be determined by observing the ground line of the trees when they were growing in the nursery. It is not advisable to place the part where the stock and scion were grafted below the ground.

**DUCK WEED IN POND:** *A. S. R. and Co.* The weed sent is the common Duck weed, *Lemna minor*. This can be disposed of by skimming it from the water by means of a canvas net attached to a stout rod, and once the weed is fairly cleared, water fowl, such as ducks, ornamental or domestic, will keep it down.

**GARDENERS' WAGES:** *A. J. B.* The wages paid to gardeners vary according to the district, the amount of responsibility and other circumstances. In private establishments they range from 55s. to £3 10s. in small gardens; Foremen from 45s. to 50s.; Journeyman 35s. to 40s.; Boys from 20s. to 30s., according to age.

**NOTICE TO QUIT AND INCREASE OF RENT:** *F. D.* If you hold your premises on annual tenancy, your landlady should have given you notice to quit, and a further notice of intention to raise your rent when she increased the rent, two years ago. Even assuming that she complied with the necessary formalities, she would not be entitled to raise the amount by 40 per cent, *i.e.*, £10, unless she did both the internal and the external repairs. If, however, you still do the inside repairs, you are entitled to a reasonable deduction from the 40 per cent. on that account, and you should point this out to her. If she insists on the full £10 increase, you should consult a solicitor.

**NAMES OF PLANTS:** *P. R. S.* *Orchis maculata*.—*A. E. W.* 1, Too scrappy to identify; 2, *Cianthus puniceus*.—*T. H.* 1, *Syringa Emodi*; 2, *Cotoneaster frigida*; 3, Not recognised; 4, *Spiraea arifolia*; 5, *Euonymus Europaeus* (Spindle Tree).—*W. D.* *Rhus Cotinus*.—*F. K.* 1, *Tilia platyphyllos* var. *asplenifolia*; 2, *Rhus Cotinus*; 3, *Jasminum revolutum*; 4, Too withered to identify. —*H. S.* 1, *Azara microphylla*; 2, *Pyrus lobata*; 3, *Crataegus coccinea*; 4, *Rhamnus Frangula*; 5, *Diervilla sessilifolia*.—*E. R. U. P.* 1, 2, 3, 4 and 6. We cannot undertake to name florists' flowers; 5, *Cupressus macrocarpa*.—*G. S.* 1, *Allium Moly*; 2, *Jasminum revolutum*.—*W. E.* 1, *Sidalcea caudata*; 2, *Polemonium coeruleum*; 3, *Phuopsis stylosa*.—*H. B. M.* 1, *Menyanthes trifoliata*; 2, *Sisyrinchium angustifolium*; 3, *Veronica gentianoides*.—*W. J. C.* 1, *Periploca graeca*; 2, *Linaria bipartita*. The seeds are those of *Abrus precatorius* "Crabs Eyes"; a tropical plant.

**PEAR TREE FAILING TO FRUIT:** *An Old Reader*: You can summer prune the shoots, but we fear that this will not result in fruitfulness, unless the tree is root pruned. Seeing that the tree blossoms freely each year but sets very

little fruit, and always makes a considerable amount of wood growth, the roots have probably penetrated into the sub soil. In summer pruning, stop the shoots a few inches now and again in about a fortnight's time. Root pruning should be done in the autumn directly after the leaves have fallen.

**PEAT MOSS LITTER:** *N. E. C.* Manure containing peat moss is serviceable, and may be recommended for general purposes in the garden, but it is not so good as manure in which straw is used as a litter.

**PINK-FLOWERED CHESTNUT:** *N. E.* The bark you sent us is quite dead, and if the whole of it is in the same condition we are afraid that the tree is doomed. If, however, there is a considerable portion of the bark still healthy, remove all the diseased part and apply a coating of Stockholm tar to the wound.

**POTATOS FAILING:** *G. A.* We can find no trace of disease present in the seed tuber, but it was hard and over-ripe, which probably accounts for the failure.

**POTATOS GOING "OFF":** *T. W. S.* In one of the tubers you sent the mycelium of a fungus was present, which agreed with the characters of a *Phytophthora*. In the other tuber no organism was present in the discoloured flesh. The weak stems point to unsatisfactory condition of the seed tubers, which were probably over-ripe. It would be advisable to spray the plants with Bordeaux mixture as a preventive of blight disease caused by the *Phytophthora*.

**TOMATO LEAVES MOTTLED:** *W. F.* Tomato plants showing mottled leaves are not uncommon, but so far as we are aware this condition of the foliage does not have a serious prejudicial effect upon the crop. The precise conditions which give rise to mottling of the foliage are not known, but the general opinion is that want of aeration in the soil is the primary cause. It is supposed that in badly aerated soils certain chemical products arise which upset the normal physiological processes of the plant. At the Chestnut Experimental Station it is known that badly aerated soils which have produced plants with mottled foliage, will produce normal plants after steam sterilisation.

**TOMATOS ATTACKED BY WHITE FLY:** *H. S.* Whatever fungous trouble there may be is quite overshadowed by the very bad attack of White Fly. The eggs of this pest are laid usually on the under-side of leaves, and hatch in from 11-14 days. The very young larvae (small, louse-like insects) are active for from 2-4 days, wandering about the leaf. They then settle down on the underside of a leaf, usually close to a rib. This stage lasts from 10-12 days, when the insect casts its skin. In about 14-20 days after this change it again casts its skin, and subsequently lives from 5-36 days before changing to the pupal, or resting stage. With the exception of the very young larvae, the insect in all these stages somewhat resembles a small, rather transparent scale insect. The pupal stage lasts from 21-59 days, and the imago, the "White Fly" itself, may live about a month. Temperature regulates the duration of all stages, except the egg stage, which is not affected, cold increasing the length of the life-cycle. In the larval and adult stages the insect is protected by a waxy secretion, and in the pupal stage by long, waxy, bristle-like processes. This protection makes the insect a difficult one to kill by ordinary contact insecticides. Apart from fumigation with hydrocyanic acid gas—the most satisfactory remedy—repeated fumigations with Pyrethrum cones or nicotine preparations have been stated to destroy the flies, while some have had success with sulphur vaporisers. Frequent sprayings with a soft-soap wash (the more potash in the soap the better), or a paraffin emulsion, have also been recommended. These milder measures, however, are only likely to be successful when applied before the attack has become serious. Tetra-

chlorethane is suggested as an excellent remedy in small greenhouses, and especially in those attached to dwellings, as it is not a very poisonous substance like cyanide. At the same time, no one should attempt to work in a greenhouse where it is exposed, or even to enter it, except to open the ventilators. It does not damage Tomato plants or interfere with the setting of fruit. Certain kinds of greenhouse plants will suffer from it, and it should, therefore, be used with care in the first instance. The liquid (tetrachlorethane) is simply poured down the centre of the house in the evening at the rate of half a pint to 1,000 cubic feet, and the house is closed for as long as possible. If the house can be kept closed through the next day and night without airing, the operation will kill all the fly and all the scales, but not the eggs, and the operation should be repeated at the end of a fortnight in the summer, or at the end of three weeks in the spring and autumn. If the weather is such that the house has to be opened the day after the fumigant has been put down, some of the scales will survive, and a few flies will be seen a day or two after the fumigation, which must then be repeated at weekly intervals three or four times.

**TOMATOS DISEASED:** *E. H.* In the absence of specimens we cannot determine the disease the plants are suffering from, but, from your letter, we suspect that they are affected with both rot and stripe diseases. Rot or Tomato leaf rust may be checked by spraying with either one per cent. Burgundy mixture or one per cent. Bordeaux mixture. Liver of sulphur at the rate of one ounce to four gallons of water is also recommended, or, if preferred, you may use ammoniacal copper carbonate at the rate of one ounce of copper carbonate and five ounces of ammonium carbonate in sixteen to eighteen gallons of water. The copper carbonate and the ammonium carbonate should be mixed and dissolved in about a quart of hot water. When thoroughly dissolved, sixteen to eighteen gallons of cold water may be added. Stripe disease is caused by a small, yellow bacillus, and the plants are generally attacked from the soil, the bacterium being introduced into the outer tissues of the root or stem through wounds caused by biting insects. In the upper parts of the plant, wounds, and even the cut surfaces caused by pruning, may be the centres of infection. Certain varieties are more susceptible to the disease than others: Ailsa Craig has been found more resistant than some. In future sterilise the soil by heating, and do not use an excessive amount of nitrogenous manure, but mix plenty of potash with the compost. Where the upper part of a plant only is attacked the removal of the diseased part and the development of a lateral shoot will often lead to a complete recovery and to a clean crop of fruits.

**TOMATOS AND PEACH STONES SPLITTING:** *Urgent.* Improper watering of the roots is usually the cause of Tomatos splitting. Certain varieties of Peaches are more prone to stone splitting than others. It may be due to sudden changes in the temperature, or dryness at the roots during the winter months, bad stocks, or planting the roots in unsuitable media.

**WOOD WASP:** *A. E.* The insect received from you is a specimen of the Giant Sirex or Wood Wasp (*Sirex gigas*). The female bores a hole through the bark of old or felled Coniferous trees and deposits her eggs therein. The larvae feed on the timber and remain therein during their larval, pupal and chrysalis stages. In the case of an early brood the adult insect emerges in early autumn, but in the case of late egg laying the chrysalis stage continues through the winter, the perfect insect appearing early the following summer.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.5°.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, July 26, 10 a.m. Bar. 30.3; temp, 65°. Weather—Fine.

A Naturalist's Calendar.\*

The people of these islands have too great a love for nature ever to run the risk of letting their science pass entirely into professional hands. They will always find pleasure in their gardens and in the country-side, caring at least as much for the beauty which is to be discovered therein as for the scientific explanations of the manifold and intricate phenomena which the plants and animals present. To all who take this pleasure in the manifestations of Nature calendars, such as that of Mr. Blomefield, cannot fail to appeal. Though the elucidation of the rules according to which Nature's time-table is drafted must be left to the patient and prolonged investigation of trained researchers, everyone may observe the facts which illustrate the orderliness of natural phenomena and find pleasure in the exercise. As Sir Francis Darwin points out in his delightful preface to Mr. Blomefield's Calendar, even though seasons vary, the orderliness of the unfolding of flowers and of the advent of birds is not greatly affected. Not till the Larch is tipped with its emerald leafage does the Black Cap appear in the north of England, and only when the Oaks and Elms are green does the Wood Warbler make its appearance. With

astonishing seasonal punctuality, the Box tree and the ground Ivy (*Nepeta Glechoma*) open their flowers together—on or about April 3rd. The rules which compel the times and seasons of plants are as obscure as they are complex. People have been known to follow the ripening Strawberry northward in order to satisfy their gourmet's taste, yet there are plants, like *Spiranthes autumnalis*, which exhibit the paradox of flowering later in southern than in northern regions, and others, like *Calluna* and *Artemisia*, which flower simultaneously in north and south. In the face of facts such as these the efforts of the older phænologists to predict times and seasons by multiplying time and temperature were manifestly destined to fail. Nature is not to be "cribbed, cabined, and confined," or bound in by any such simple arithmetical sum. It is a pleasure to find that Sir Francis Darwin and Mr. Blomefield are able to testify to the accuracy of poets' observations. Shakespeare's Daffodils which come before the swallows dare and take the winds of March with beauty, are also Nature's Daffodils, the latest of which opens its flowers on April 4th, five days before the earliest advent of the Swallow. Those who lead lives in the country and those who, though their bodies are confined in towns, have left their hearts in the country, will find pleasure in every page of Mr. Blomefield's calendar. The records recall memories which defy the seasons. As you turn the pages you can hear the convincing song of Thrush, Wren and Redbreast in January, and see in the same months the pale perfoliate Honeysuckle coming into leaf. *Daphne Mezereum* in flower with the Gorse and Hazel, Winter Aconite and Stinking Hellebore, and as the first month of the year draws to a close and the Daisy and the Snowdrop blossom, the Missel Thrush commences its song. In February—the fill-dyke month of wet and wintry weather—Mr. Blomefield records the waking of the Hive Bee and—doubtful joy—the appearance of the house-fly, the first sight of the Pied Wagtail, the songs of the golden crested Wren, Yellowhammer, Blackbird and the flowering of no fewer than fourteen plants and earliest among these is *Daphne Laureola* (the Spurge Laurel), followed two days later (February 4) by the Field Speedwell (*Veronica agrestis*); in the second week, Butcher's Broom, Elder, *Pyrus japonica* and Primrose, with the spring Crocus a week later (February 20) and presently the Dandelion, sweet scented Coltsfoot (*Tussilago fragrans*), Lesser Periwinkle (*Vioca minor*), *Kerria japonica*, which amateurs always call the japonica "tout court," the Alder, *Ranunculus Ficaria* and the Yew. And so the pageant of spring advances, swelling to more than double its magnitude in March and yet double again in April—a multitude which will show no sign of waning until July is past.

**New Assistant Director at Kew.**—We learn that Major Chipp, B.Sc., F.L.S., M.C., has been appointed Assistant Director of the Royal Botanic Gardens, Kew. Some years ago Major Chipp was a member of the garden staff at Kew; he served with His Majesty's forces during the war, and has latterly held the position of Assistant Conservator of Forests on the Gold Coast. This appointment is of special interest, as Major Chipp has risen from the ranks in a horticultural sense, to occupy the high position at Kew, as did Dr. W. B. Hemsley, Mr. W. J. Bean, and the late Mr. R. A. Rolfe.

**Bletchley's Bank Holiday Show.**—The eighth annual show of the Bletchley Horticultural Society will be held on Bank Holiday, August 7, and bids fair to eclipse all former successes. It

will be held, as usual, in the beautiful grounds at Bletchley Park, once again kindly lent by Sir Herbert Leon, Bart., and Lady Leon. In addition to all the old attractions, new and popular features will be added.

**American Plant Importation Regulations.**—Mr. W. G. Lobjoit, O.B.E., Controller of Horticulture, has returned from his visit to America. As a result of the Public Conference held on May 15, and the subsequent private discussions with the Secretary of Agriculture and the Federal Horticultural Board, Mr. Lobjoit thinks it unlikely that the American Federal Horticultural Board will impose any further restrictions upon the trade in horticultural produce from this country. Officially, nothing has been settled, but the *Florists' Exchange* of June 17 contained a letter signed by Mr. H. C. Wallace, Secretary of Agriculture, in which he stated that it is proposed to permit the entrance without restriction, for a period of three to five years, of certain additional kinds of bulbs and tubers, particularly tuberous-rooted Begonias, Gloxinias, Galanthus, Chionodoxas, Muscaris, Scillas, and Eranthis. This concession, if made, would be in addition to the existing facilities should these remain unmodified.

**Ken Wood, Hampstead.**—The Ken Wood Preservation Council has paid to Lord Mansfield a deposit of £10,000 towards the purchase of nearly one hundred acres of the Ken Wood estate, which adjoins Hampstead Heath and Parliament Hill fields. The purchase price is £1,350 per acre, a lower figure than was originally asked. It would appear that after overcoming many difficulties, the Ken Wood Preservation Council has now almost achieved its object, and that London will have a large and beautiful tract of land added to one of its most popular open spaces.

**Forster Memorial Park at Lewisham.**—On Saturday, the 2nd inst., the Hon. Mrs. D. C. Lubbock opened the Forster Memorial Park, twenty-four acres in extent, which was presented to the Borough of Lewisham by Lord Forster, Governor-General of Australia, in memory of his two sons who fell in the war. The park, laid out by the Lewisham authorities at a cost of about £8,000, comprises about eleven acres of woodlands and thirteen acres of grass land. A brief dedicatory service was conducted by the Bishop of Woolwich.

**Trial of Early Strawberries at Wisley.**—The Royal Horticultural Society proposes to carry out a trial of early Strawberries in its gardens at Wisley during the coming season. Twenty plants of each variety to be tried should be sent to reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, on or before August 15, 1922. Only early fruiting varieties should be sent.

**Flowering Plants of South Africa.**—Part VII., Vol. II. of *The Flowering Plants of South Africa*, just to hand, contains illustrations of ten plants, many of them very handsome and deserving of consideration by British cultivators. *Corycium crispum* (p. 61), a yellow-flowered, tuberous-rooted terrestrial Orchid, is the first Orchid to be figured in this work. As bulbous plants are fairly common in South Africa, it is not surprising to find them figuring largely in this publication; Part VII. gives illustrations and descriptions of *Ornithogalum Thunbergianum*, a species with flame-coloured flowers, and a black, diamond-shaped mark at the tip of each of the three outer segments; this should prove an attractive plant if cultivated in pots. *Gladiolus Pritzeltii* (p. 68) is a slender growing, yellow-flowered species, but has only two to four more or less complicate flowers on a spike. *G. alatus*, var. *namaquensis* (p. 65), is a more handsome plant, with deep pink upper segments, and small, bright yellow, pink-tipped lower segments—"in the veldt groups of plants are usually found together, each forming a corm which has developed as an off-shoot from the parent corm. This character renders the plant easy of propagation." *Aloe excelsa* (p. 62), a Rhodesian plant, that would need to be grown in a warm house here, is aborescent, sometimes

\* A Naturalist's Calendar, kept at Swaffham Bulbeck, Cambridgeshire, by Leonard Blomefield. Second edition. Edited by Sir Francis Darwin. Cambridge University Press, 1922. 3s. 6d. net.

growing upwards of 15 feet high, with a crowded rosette of leaves, which are spiny along the margin. The inflorescences are branched, and each ultimate raceme or head carries a large number of cylindrical, rich carmine red flowers, and presents an appearance suggesting a red Kniphofia. *Gazania pygmaea* (p. 64) is a common plant in the veldt around Pretoria, which it carpets with its white, yellow-centred flowers in September; it is a low-growing, stemless plant, 3 to 4 inches high, and has narrow, linear leaves, pale green above and silvery beneath. *Ferraria antherosa* (p. 66) is an interesting but not very beautiful Irid, with dull orange-yellow flowers, large, leafy bracts and discoid corms arranged "one on top of the other." *Harveya squamosa* (p. 67) is a herbaceous parasite on the roots of plants not enumerated; the species belongs to the Order Scrophulariaceae, and its dense, erect raceme of cylindrical, yellow-tubed and red-mouthed flowers, is quite handsome. Lastly, there is *Ochna pretoriensis* (p. 70), a bushy plant, bearing white, sweet-smelling yellow flowers in September; the flowers are followed in due course by black fruits in a setting of crimson sepals, therefore the plant is attractive when in flower and also when in leaf and fruit.

**Importation of Onion and Leek Seed.**—The importation of Onion and Leek seed into this country is subject to the provisions of the Destructive Insects and Pests Order of 1922, and all consignments should be inspected in the country of origin before shipment, and certified to be free from disease. Large quantities of this seed are imported from the United States, and as a result of representations made by the Controller of Horticulture during his recent visit to Washington it is understood that the American Authorities propose to arrange for the examination, while growing, of Onion and Leek crops intended for the production of seed for export. It is probable that the American Authorities will refuse to grant certificates for seed from crops which have not been inspected whilst growing, and importers should therefore take immediate steps to warn their growers in America to ask for the inspection of Onion and Leek crops now being grown for the production of seed for export to this country.

**Export of Orchids to America.**—The Ministry of Agriculture has received inquiries from time to time as to whether Orchids grown in other media than soil should have their roots washed clean before export to the United States, in order to comply with the Plant Import Regulations of that country. Mr. W. G. Lobjoit, the Controller of Horticulture, while in Washington, took the opportunity of consulting the chairman of the Federal Horticultural Board on the matter, and was informed that Orchids grown in a mixture of leaves, Sphagnum moss and fibre dust need not have their roots washed prior to export.

**Standardized Baskets for Strawberries.**—At a conference held at the Ministry of Agriculture on the 25th inst., a number of fruit package manufacturers and fruit growers, together with representatives of railway companies, agreed to adopt a standard size for baskets for the carriage of Strawberries. The new basket will be constructed on the basis of sixty cubic inches as the necessary space for one pound of Strawberries, and it is proposed to construct baskets to hold respectively three and four pounds of fruit. Such baskets will be officially labelled according to their capacity.

**Marking of Foreign Produce.**—At a meeting of the Parliamentary and Transport Committee of the Chamber of Horticulture, presided over by Mr. G. W. Leak, President, on the 20th instant, the Merchandise Marks Bill was examined and discussed from the horticultural trade point of view. This Bill has been read a second time in the House of Commons and is now before Standing Committee C, on which Committee the Chamber is fortunate in having several of its Parliamentary Committee in the House. The main principle of the Bill, giving power to require indication of origin where the make-up gives a false impression, is regarded with satisfaction. This power is obtained through

the medium of the Board of Trade, which is empowered, after making the necessary inquiries, to issue an Order giving effect to such power, so that in the event of this Bill becoming law, the Chamber may make strong representations on behalf of the trade. In the meantime, the present Bill is being supported having regard to an amendment to Clause 14 (2), in which the Chamber asks for the marking of containers in the case of goods or produce on which it is not practicable to place a brand or mark.

**Mr. P. C. M. Veitch.**—The head of the firm of Messrs. R. Veitch and Son, Exeter, whose portrait we have much pleasure in presenting to our readers, is as well known for his geniality as for his wide knowledge of trees and shrubs. He is the son of Mr. Robert Tosswill Veitch, and the grandson of the James Veitch who founded the house of Veitch at Exeter. Mr. P. C. M. Veitch was born in the Cape of Good Hope, and his mother's name, Massyn, a Dutch corruption of Massena, shows that he has Huguenot blood in his veins. After education at Exeter under Dr. Ingle and Dr. Roper, and a period at Oundle Grammar School, Mr. P.

MR. P. C. M. VEITCH, J.P., V.M.H.

C. M. Veitch entered the seed department of his father's firm at Exeter at the age of sixteen years. During the busy seed season of 1866-7, he was with Messrs. Jacob Wrench and Sons, and in the following seed season with Messrs. J. Carter and Co., High Holborn, but in the summers of 1867 and 1868 he was engaged at the famous Coombe Wood nursery, and in the winter of 1868 at the Chelsea nursery. From the spring of 1869 to the autumn of 1870 he was employed in a German seed house, and in the following year was engaged in a French establishment. From 1871-1875, Mr. P. C. M. Veitch was with Messrs. J. Veitch and Sons at Chelsea, in their seed warehouse, and in the nurseries, and he attended the principal shows of that period, including the International Exhibition of 1873, at Florence, where he had charge of *Nepenthes* and other interesting stove plants. He was overtaken by an illness early in 1875, and was ordered to take a sea voyage, and Mr. (now Sir) Harry Veitch very kindly arranged that his trip should take the form of visiting customers in Australia and seeing something of the world in general. He was away for a period of three years, and during that time visited most parts of Australia, New Zealand, the Fiji Islands, New Caledonia and Borneo, and in the latter island, together with the late Mr. F. W. Burbidge, he ascended Mt. Kina Balu in search of *Nepenthes* and Orchids. Unfortunately, on two occasions, his collections of plants were lost, and in 1877 he

was himself shipwrecked. Soon after his return to England he joined his father at the Exeter nursery, and the firm became R. Veitch and Son. He especially devoted himself to the development of that section of the business concerned with Himalayan Rhododendrons, Magnolias, Camellias, Nerines and all kinds of hardy and half-hardy shrubs, for which the Exeter firm is now famous. His interest in plants is, however, far wider than this would suggest, as he has raised such subjects as *Calceolaria*, Golden Glory and *C. Veitchii*, Magnolia *Veitchii*, several Nerines which succeed out of doors, Late Devonian Peach, and Glory of Devon and Exonian Peas. He was also the introducer to commerce of Rhododendron Dr. Stocker, Hydrangea *Veitchii*, Erica *Veitchii*, and Veitch's Climbing French Beam. Mr. P. C. Veitch is a member of the Fruit and Vegetable Committee of the Royal Horticultural Society, a past president of the Horticultural Trades' Association, and a member of the Committee of the Gardeners' Royal Benevolent Institution, and for services rendered to horticulture he was awarded the Victoria Medal of Honour in 1916. In addition to his horticultural activities Mr. P. C. M. Veitch is a member of the Council of the Devon Agricultural Association and is on the Agricultural Education Committee of his county, while his interest in sport may be gathered from the fact that he is president of the Exeter and County Cricket Club and past president of the Rugby Football Club. Since the regrettable loss he sustained by the death of his son Mr. J. Leonard Veitch—who was killed during the war after becoming major in the Devonshire regiment, and gaining the M.C.—Mr. P. C. M. Veitch has been assisted in his business by his daughter, Miss A. M. Veitch, B.A. All his friends trust that he may preside over the Exeter business for many years to come.

**Appointments for the Ensuing Week.**—Tuesday, August 1: Royal Caledonian Horticultural Society's meeting; Bournemouth Gardeners' Association's meeting; Turiff Flower Show. Wednesday, August 2: Royal Agricultural Society's Council meeting. Thursday, August 3: Taunton Deane Horticultural Society's exhibition; Chesterfield Horticultural Society's show; Slinfold Flower show. Friday, August 4: Bradford Hospital and Convalescent Fund's Show in Lister Park (two days). Saturday, August 5: Auchencairn Horticultural Society's show; Illogan Gardening Society's show.

**"Gardeners' Chronicle" Seventy-Five Years Ago.**—*Large Chestnut Trees.*—Perhaps the following account of two Chestnut trees may not be uninteresting. The first I shall notice grows in the nursery grounds of Mr. Allan, of Stirling. The diameter of the stem, about two feet from the ground, is four feet three inches; the main branches of the tree are twisted in a remarkable manner, and extend to about sixty feet in diameter; the tree may be about sixty or seventy feet in height, and is still in a healthy condition. The place where it grows was formerly part of the Royal Gardens, and is very steep, but is easily got at by means of winding walks through the grounds; and from the rustic erection under its spreading branches a beautiful view is obtained of part of the rich alluvial land in the neighbourhood of Stirling. Here, and there the Forth may be seen winding its course among luxuriant fields; the steamers and other vessels half hid among rich vegetation; the ruins of Cambuskenneth Abbey; the basaltic columns of the Abbey crag; the near view of the Ochil mountains; and, in the distance, the Saline hills, all combine to form a picture which the eye delights to look upon. The other tree grows in the wood of Bannockburn, and is of larger dimensions; the diameter of the trunk, about two feet from the ground, is five feet eight inches. The tree is still in a healthy state; it is not far from a spot called the "Bluidy fauld." *Peter Mackenzie, Gard. Chron., July 31, 1847.*

**Publication Received.**—*Plant Pests and Parasites.* By Horace J. Wright. "Country Life," Ltd., 20, Tavistock Street, W.C.2. Price 9d net.

NOTICES OF BOOKS.

Woodland Notes.\*

THE title of this interesting volume is somewhat misleading, forasmuch as, according to Webster's Dictionary, a romance is "a tale of extravagant adventures, of love and the like," and the term is accounted to be a synonym of "fiction." Howbeit, Mr. Wilson's pages may be searched in vain for anything in the nature of fiction; they teem with notes upon the less obvious features and characteristics of forest trees of the northern temperate zone, and there can be few readers, however well versed in forest lore, who will fail to gain knowledge and fresh suggestion from their perusal. For instance, it has not escaped the trained observation of the far-travelled author that Asia suffered far less drastic denudation during the great ice age than did the rest of the northern hemisphere. Vegetation, which in Europe and North America was planed off and destroyed nearly so far south as the Mediterranean, suffered little harm in China and Japan. This, of course, profoundly affected the distribution of trees and plants which ensued upon the retreat of the land ice, so that "the net result is that the existing flora of the Chinese Empire and of Central Japan southward, is really a miniature of the whole flora of the northern hemisphere in pre-glacial times" (page 19).

The story of the Ginkgo or Maidenhair tree furnishes, perhaps, the most interesting chapter in the book, for it explains how this species—unique in its isolation from any family or group of existing vegetation—is the sole survivor of the forests which harboured the giant lizards of Triassic times. Abundant remains of several species of Ginkgo, some of them hardly distinguishable from those now flourishing, have been identified in the Permian rocks, older than the chalk. It is remarkable that this tree has never been discovered growing wild, although, having been closely associated with Buddhist institutions from earliest times, it has been most extensively planted beside both temples and dwelling-houses in China and Japan. The occurrence of Ginkgo in wild forest has been reported by more than one traveller; but Mr. Wilson remains firmly of opinion that such statements were made in error, and his intimate acquaintance with Chinese and Japanese forests entitles him to speak with confidence.

In treating of the Yew, Mr. Wilson estimates the age of the Ankerwyke Yew at "probably more than a thousand years old," but does not cite any evidence in support of that figure. Dr. John Lowe, who went very closely into the question of the ages of British and Irish Yews, was more sceptical about the reliance to be placed on tradition in connection with this and other old specimens. There is a printer's error on page 86, where the girth of the bole of a Cedar of Lebanon at Petworth is given as 149 feet instead of 14½ feet, as recorded by Elwes and Henry.

There is no British tree more popularly known than the Holly, but probably there are few, except trained botanists, who are aware that, as Mr. Wilson explains, it differs from almost every other forest tree, in that it forms no true bark. The usual process is that the layer of cells underneath the outer rind forms the bark that protects the tissues of the cambium; but in the Holly and the striped-bark Maples the outer cells continue to live and grow concurrently with the new inner tissue. Facts such as this, told in plain terms without technical verbiage, render this fully illustrated volume well worthy of attention from all persons interested in trees.

THE WREXHAM DELPHINIUMS.

I RECENTLY spent half a long afternoon with Mr. Samuel in the midst of his Delphiniums. It is a rare treat to see all his splendid varieties and to hear him talk about them and his ideals. Before he has finished with them he intends to do with the stiff, tightly packed spikes of the

\* The Romance of Our Trees, by Ernest H. Wilson, M.A., V.M.H., Assistant Director, Arnold Arboretum, Harvard University. Doubleday, Page and Co., New York 1920.

past much the same that Bridgeman and Kent did to the old formal gardens of England. A "Samuelised" Delphinium spike will be something four feet long and of attenuated sugar-loaf shape, with each individual flower held by a strong pedicel well away from the main stem, and each of these pedicels getting regularly shorter and shorter as they near the apex. The lower flowers are to be three to four inches in diameter, with broad overlapping guard petals, and the interior ones, as Mr. Samuel expresses it, "frilled." It would appear to be immaterial whether there is an eye or not, for he pointed out an exquisite pale blue and mauve as his choice of the 1922 seedlings which had bloomed up to the date of my visit, which had no eye. To me it looked as if there was something wanting. I do not think I will ever care for

FIG. 26.—DELPHINIUM ADVANCEMENT.

a Delphinium without the bee-like centre, which I look upon as one of its chief characteristics. As a rule I am bound to admit Mr. Samuel admires good centres and gives them full weight in forming his judgment of a variety. In what I have written above I have tried to answer in a rough way what is always an interesting question, "What is the fellow after?"

To come to hard facts, it will interest many readers to know what is being done at King's Mills. The essential difference between what I saw this year and last has been produced by the "bursting up" (I again use Mr. Samuel's own expression) of the clumps. He found out last year it was inconvenient and aggravating to have all his eggs in one or two baskets, so any clumps that would divide up—even in the one-year-olds—has been "burst up." One result has been that I saw the splendid sight of a mass of a hundred and forty Jenny Jones's with their shapely spikes and rich colouring of purple and deep blue. Close by this were two newer beauties: Joy Bells, with still larger individual flowers (one I measured was a good 3¼ inches in diameter) of Pleroma violet and small blue

with a dark bee-like centre, and with the inner petals "frilled," that is, standing up after the type of a Crawley Star Dahlia; and, secondly, there was another dark-eyed beauty called Second Thoughts, with a looser-arranged spike and with three-inch flowers of Hyacinth purple with small blue colouring. Second Thoughts.—Yes: if a reader had Mr. Samuel's job of choosing out of the many hundreds of seedlings that are to be found in his garden he would realise something of what is behind this name. I know it full well after an apprenticeship with Lachenalias and Freesias. Every seedling raiser knows it. The famous rose Lady Pirrie was a second thought. It was marked to be discarded, and it was only upon the solicitation of Mr. Wallace of Eaton Bray, as he himself told me, that Mr. Dickson gave it another trial. After a time our eyes seem to get surfeited and our critical acumen goes, and we form wrong judgments. I only hope I have not made my good friend uneasy by my enthusiasm over one of his first-time-of-blooming cast-offs, which I chose from among others in a big vase on the tea table. Naturally the spike was but small, as befitted its age, and there was a gap or two on it, but the beautiful flat flowers with their three or four rows of deep blue petals just tinged with deep red purple lying prone one upon another round an ideal, deep brown non-protruding, centre, were to me very lovely, and, at any rate, ought to have secured for the variety another year's trial. It has gone the way of all flesh. Never mind, there are many lovely things left.

Of the very new ones my selections were: Dare Devil—a tall plant with a large dark eye and massive petals of deep rich violet with splashes of hays blue (Ridway's Colour Chart, 1912). The inner petals were flat and not frilled. Chic, at a distance superb and most effective with large flowers of a pale cadet (the chart again) blue—nearly a Cambridge blue—with khaki eye evenly set on a shapely spike; Blue Darling (Mr. Samuel's pick of the 1921 flowers)—the individual blooms have the look of loosely formed, delightful pale blue rosettes with dark centres. Here and there a petal is tipped with black, which gave the flower that look of pleasing hauteur which patches gave to our great grandmothers. Climax has such a very long snake-like spike of Uppingham blue colouring that as a contrast to all the wide-bottomed ones it stood out as something distinct and with a character of its own. The individual flowers are semi-double and have a darkish eye. Advancement (Fig. 26) is noteworthy on account of its spike. The original plant of 1921 had been divided last spring—an important point to remember when I tell readers that the spikes of flowers as I saw them measured a good 3½ feet. As an American wrote of some second-quality seed that Mr. Samuel had sold him: "If your second quality produces such flowers as it has given me what on earth must the results of your first quality be like?" What length of spike, I wonder, will an undivided Advancement give? There is a small khaki eye, and Ridway gives the colouring as Chinese violet with diver's blue on the exterior and in the centre of the blooms. Most Delphinium lovers know the Rev. E. Lascelles with its striking white eye; in The Bishop we have a glorified Lascelles. Wrexham—its name vouches for its quality—is a beautiful single with a dark eye and with rich small blue petals delicately tipped with Matthew's purple.

Just a few words in conclusion about old varieties, in order to say that Amazement, which most unaccountably was passed over last year by the R.H.S. Floral Committee, was better than ever. It is so very bright looking with its pretty pale blue, set off with just a sufficiency of what I can only call pale pink, to give it a most uncommon and distinguished appearance. If Jenny Jones ever has to take a back seat, I think it may be Wales that will take the front place. This is a grand variety with rich Mulberry purple and hays blue flowers, the petals of which somewhat curl back at their edges. They are carried on long pedicels and the spike has a wide base. It is a milestone on the road to the ideal which may not be so far away after all. Joseph Jacob.

## The Week's Work,

### THE ORCHID HOUSES.

By J. T. BARKEE, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

**Temperatures.**—Owing to the dull, wet, and sunless weather of late, a certain amount of fire heat has been necessary in all the houses, with the exception of the *Odontoglossum* house. Artificial warmth is always necessary during such periods, especially after bright, warm weather such as we had previously enjoyed; a damp, stagnant atmosphere is harmful at any time, and doubly so following bright and free-growing weather.

**Cypripediums.**—The warm-growing species of *Cypripediums*, which comprise *C. Rothschildianum*, *C. Stonei*, *C. Sanderianum*, and other similar kinds, with the hybrids raised from them, require the temperature of the warmest house, and liberal treatment at all times. The present is a suitable time to undertake a general overhauling of the plants, with a view to the providing of new rooting material to the specimens that are in need of it. The drainage should be perfect, and the compost such as was advised for the winter-flowering varieties. Ordinary flower pots provide suitable receptacles. As each variety of these useful plants passes out of bloom, it should be attended to, and when all are done, the plants should be thoroughly cleaned, and stood in a position where they may be shaded from strong sunshine. Water may be given directly after the repotting, especially if the compost is at all dry, to settle it around the roots; but care must be used in the application of water afterwards, until the new roots are growing freely through the compost. When established, copious supplies should be given whenever the roots become dry, and especially when the plants are in active growth. Light overhead sprayings of soft, tepid water, when the weather is favourable, are beneficial, and aid in keeping the plants clean and healthy. *Cypripediums* thrive in plenty of atmospheric moisture, and are very rarely attacked with thrip and other insect pests, where it is supplied.

**Warm Cypripediums.**—*C. Lawrenceanum*, *C. callosum*, *C. Curtisii*, and their lovely albino varieties, grow better at the warmer end of the intermediate house, but care must be taken that the position is not too dry. These beautiful and popular kinds if grown in too much heat are apt to damp off and gradually die away; there is much in the study of plants and their environments, as greater success may often be obtained in one part of the house than in another.

### HARDY FRUIT GARDEN.

By H. MARSHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Vines.**—To be successful with Grapes in the open the shoots and leading growths should receive every care and attention at reasonable intervals. Keep the leaders neatly secured in their required positions where extension is required for filling up the allotted space; shoots bearing bunches should be stopped at two joints beyond the bunches, and stopped again as soon as the fresh laterals are sufficiently advanced. This second stopping should be done at one or two joints above the new growth. See that the ties near the bunches are sufficiently strong to keep them safe without breaking as the bunches get larger. As soon as the berries are the size of small peas, the bunches should be thinned, removing any of the inner berries and others not properly fertilised with the aid of proper Grape scissors. After the thinning is finished a gentle syringing with clean soft water will remove any grit or dust which may have settled in the bunches without doing any harm whatever to the remaining Grapes.

**Raspberries.**—Remove the nets and other protection as soon as the fruits have been harvested, cut out all the old canes and let the best and strongest of the young canes take their places. After sufficient have been tied to the wires or other supports, remove all the rest with the exception of any that may be required for increasing the stock. Give the roots a good mulch of rich manure, if obtainable, and a thorough soaking of water if the soil is not sufficiently moist. The old variety *Superlative* still holds its own at Wrotham, and crops very heavily.

**Autumn Fruiting Raspberries.**—If not thinned sufficiently remove any of the canes that are not wanted, destroying the weakest rods and those not likely to be fruitful. See that the roots are well supplied with suitable nourishment, and especially should this be done on light land and where the beds have been fruiting for some few years and are showing signs of weakness.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codiote, Welwyn, Hertfordshire.

**Trachelium coeruleum.**—Where large plants of this popular greenhouse plant are required, seed should be sown now and the seedlings grown on steadily and repotted as needed up to 10-inch or 12-inch pots. The seed may be sown in 6-inch pots filled with a good open compost and germinated in a cool house. Shade the pans from bright sunshine until the seedlings appear above the soil, and as soon as the latter are large enough to handle, prick them out into a box, to be transferred to small pots when they have reached a suitable size and grown on in a cool house.

**Seedling Ferns.**—Seedling Ferns are often found in quantities under the stages of plant houses, and if some of them are potted now they will make useful specimens by the autumn. They should be lifted carefully and potted into small pots. The compost should be of an open nature, containing a mixture of loam and peat in equal parts, with a good dash of sand added to ensure a free drainage. After potting, they may be stood under growing Cucumbers or Melons, where they will be shaded from the direct rays of the sun. They will soon make plenty of roots under these conditions, the warm temperature and moist atmosphere being favourable to them.

**Eydrangea.**—If suitable young shoots are available, now is a suitable time to insert cuttings of *Hydrangeas*. They should be inserted singly in small pots, or three may be placed in one large 60-sized pot and grown on intact. The receptacles should be filled with a light compost, with plenty of sand added, and stood in a close propagating frame. Immediately roots form, they should be removed to a house or frame having a lower temperature. Cuttings inserted now will, provided every encouragement is afforded them to make good growth, produce excellent inflorescences next season. As the older plants pass out of bloom, they should have their flower growths cut hard back and be stood out of doors in a sunny position to thoroughly ripen them.

**Regal Pelargoniums.**—These plants have finished flowering, and should be stood in the open to thoroughly ripen the shoots. If it is desired to increase the stock of these plants, cuttings from the old plants may be inserted now. In selecting the cuttings, choose growths that are well ripened, as these will root readily in a cold frame, where they can be protected from heavy rains. No shading will be needed, as they will be found to root much better when exposed to the sun. Plants intended to be grown on again next season should not be cut hard back until such time as the wood is well ripened. Afterwards, they may be pruned hard and allowed to rest for several weeks before being repotted in readiness for another season.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Potatos.**—Early varieties should be lifted before the tops have died down and planting sets carefully selected, as these are far better if they are not allowed to become too ripe. Tubers from any plant that shows a tendency to disease should be rejected. The cold weather and heavy rains will have been favourable for the spread of Potato disease, but the plague has come too late to affect early varieties very much. Place the selected seed sets in boxes to harden, afterwards putting them in a cool, light shed.

**Onions.**—Autumn-sown Onions will now be ready for pulling, for if left much longer they will burst. They should be laid out on trellises to ripen, and will then keep up a supply till the spring-sown crop is ready.

**Tomatos.**—Plants out of doors which have set four or five trusses of fruits should now have the leading growth removed, to ensure the crop ripening, as fruits set later are of little or no use. Remove all side shoots and see that the stakes are in good order.

**French Beans.**—A batch should now be sown in cold frames and also in 8-inch pots, and grown on as cool as possible to provide late autumn supplies.

**Carrots.**—A sowing of stump-rooted Carrots should be made on a warm border and treated as previously recommended. These will supply small succulent roots, which are much in demand in the kitchen.

**Herbs.**—Many kinds of herbs will now be ready for gathering; these should be cut when dry, tied up in bunches, and hung, head down, on a wall in the sun to dry; turn the bunches round occasionally.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Cucumbers.**—Where Cucumbers are in daily demand and failing plants are removed before spider becomes troublesome, now is a good time to make a sowing of seeds for securing a full supply of fruits up to Christmas. Light, compact and efficiently heated pits are essential to the growth of good Cucumbers after September, but hot-water heating will not be needed up to that date. Sow the seeds as recommended in previous calendars in a moderate temperature to ensure short-jointed growth. The best compost for the young plants is rough turf, lime rubble, and burnt refuse, with a dash of bone meal and soot, and considering that the stems can be earthed up to almost any extent, it need not be more than nine inches deep to start with. As the plants will grow fast through August and September, they should not have less than 25 to 30 square feet of trellis to allow for their full development. Anyone who has tried close planting and failed will do well to give the plants more room, avoid the use of animal manure, and try extension training. As the plants grow and the roots rise to the surface, more rough, turfy compost must be added, little and often, but nothing in the way of stimulants will be needed until the plants come into full bearing. Water must be given in abundance, and weak soot water may be freely used for syringing purposes. To ensure fruit of good quality, the bottom-heat must be maintained by frequent renovation. Gross manure as a mulch should not be used, and the health of the plants preserved by inside cleanliness and liberal ventilation.

**Melons.**—Good seedlings of a free-setting variety may still be put into 12-inch pots for giving a supply of late fruits, the most important provision being the means of giving plenty of top and bottom heat when the crop is swelling and ripening. The best compost for late Melons is strong, friable loam, old lime rubble, a little soot, and a few handfuls of

bone meal, but on no account should it be rich enough to encourage gross leafage, as the growths must be healthy and woody. The laterals should be pinched and the flowers fertilised as recommended in previous calendars. Two fruits to a plant are ample, and these, if possible, should be set on the same day. Weak liquid feeding may be commenced later. Late Melons may be well syringed when shut up early with sun-heat until the flowering stage, when wetting the foliage should be discontinued, and each leaf carefully preserved from damage.

**Frame Melons.**—The fruits in frames should now be well advanced, if not actually ripening, and when the plants are grown on conical hills of soil, upon which moisture cannot lodge, each fruit should be elevated upon an inverted pot to keep it clear of woodlice and water. It is not a good plan to expose the swelling fruits to the full influence of direct sun, but once they have attained full size, heat and light should reach them indirectly. If the plants are thinly trained, a few laterals will assist the fruit and keep the plants in health. Melons vary considerably in the ripening stage, but if over-feeding has been avoided, good quality fruits of medium size will be produced. These should be cut and placed in a dry, airy room until needed for use.

**THE FLOWER GARDEN.**

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Propagation.**—This work will be in full swing in gardens where it has to be undertaken on a large scale. The supplies of the various cuttings are far better this season than they were last. Care should be taken to keep the frames containing the pots of cuttings close until the plants have rooted, affording shade during sunny days; but the frames should be opened wide for about half an hour first thing in the morning, in order to dry up the surplus moisture that will have accumulated. Before shutting up the frames, syringe the contents lightly.

**Staking and Tying.**—This work is calling for very particular attention after the recent heavy rains. Very free growth has resulted and is of a brittle character, and very prone to snap off during wind storms. Dahlias especially require this attention, and unless they are carefully supported and tied one heavy wind would probably cause irreparable damage. Growths should be thinned out as considered necessary, bearing in mind that a limited number of strong healthy growths will give better results than a number of poor ones. Where flowers of Dahlias are being grown for exhibition purposes, the individual blooms should also be supported to prevent them breaking. Whilst dealing with this group of plants it should be remembered that they suffer from the attacks of earwigs, and these pests should be trapped by means of inverted flower pots, or lengths of Broad-Bean stalks tied along the stakes, into which the earwigs will crawl. Such traps should be cleared of their occupants each morning. Delphiniums require careful staking and tying, as will also Hollyhocks, both being easily liable to damage in bad weather. Perennial Asters need similar attention, and should be thinned out to leave about five growths to the stronger-growing varieties, such as those of the Novi-Belgi, and Novae-Angliae sections, whilst for the plants of finer habit, such as those of the cordifolius and ericoides sections, up to ten growths may be permitted. This does not seem a large number, but it will be sufficient to form very beautiful plants, inasmuch as the stems thus left will be able to develop their side growths properly, and give a far finer show of flowers than numerous shoots will. Other free-growing plants, such as Amellus Asters, the larger Achilleas, etc., are best supported by working brushy tops from pea sticks among their growths, as this is a less conspicuous method than employing stakes and string. A considerable amount of ingenuity may be displayed in the supporting of plants, but it should always be borne in mind that as natural a habit of growth as possible should be encouraged.

**REVERSION IN BLACK CURRANTS.**

In your issue of July 15, in an article by *Market Grower* on the "Market Fruit Garden," there appears a paragraph relating to reversion in Black Currants in which my name is mentioned in connection with a method of identifying the disease. *Market Grower* writes, "No doubt the method is accurate, but it indicates some bushes as being reverted which appear quite normal as far as the crop is concerned." Permit me to add a few words of explanation, as the statement by itself might lead to the assumption that the method is valueless. The first point is that under certain conditions, especially when the terminal growing point of the shoot has been destroyed, a few leaves of a reverted type may be produced from the secondary shoots which take up the growth. The leaf type, however, soon recovers, and such plants, not being truly reverted, bear normal crops.

The second point is that true disease reversion usually appears quite gradually, though the grower frequently does not notice it until it is

material remains in the plantation and the disease is liable to spread suddenly, with the result that the whole plantation becomes unprofitable. *A. H. Lees, Long Ashton, Bristol.*

**CULTURAL MEMORANDA.**

**WATERING OUTSIDE FRUIT BORDERS.**

ALTHOUGH a good deal of rain has fallen, the amount is quite inadequate to the requirements of Vines and Peaches, whose roots are in borders two feet to three feet thick with a foot or more of drainage beneath them. Late Grapes and Peaches need any reasonable quantity of water just now, and if tepid water can be supplied, so much the better. Where water is scarce, its application can be economical and its temperature raised by passage through a good layer of fresh stable litter; indeed, timely mulching, especially after heavy rains, often renders artificial watering unnecessary. The spread of spider, the premature dropping and ripening of Peaches, and the shanking of Grapes,

FIG. 27.—SUPERB COLLECTION OF VEGETABLES EXHIBITED AT ELSTREE SHOW BY MR. E. BECKETT, ALDENHAM HOUSE GARDENS (SEE P. 59).

well marked. The first sign of reversion in the leaf is the coarsening of the margin points, and following this is a reduction in the number of sub-main veins running from the mid-rib to the margin. In practically every case, by the time the number of sub-main veins has been reduced to four, the crop shows a distinct reduction. In working the method, however, care should be taken that the small sub-main veins arising from the apex of the mid-rib should be included. The criterion is that any vein to count must leave the mid-rib and run to a point in the margin, the said point not being one of the five main points of the leaf.

The third point is that reverted bushes nearly always bear some crop. The amount depends primarily on the amount of reversion, and the grower must himself decide how long it is worth while to keep such bushes.

There are, therefore, two methods which may be followed. In the first, every bush that shows the slightest sign of disease—reversion—is grubbed as soon as the crop is picked and is replaced by a healthy young bush. This method is drastic, but is reasonably safe, since disease never has a chance of spreading.

In the second method reverted bushes are allowed to stay for a year or two until the crop becomes not worth picking. They are then grubbed and replaced. Under certain conditions this method may be pursued with profit, but it is far more risky than the first, since infected

may often be traced to watering in dribblets, but the mischief does not end here, as the roots denied water near the surface descend in search of moisture into the subsoil. Vines and Peaches with roots growing down in the subsoil soon become unmanageable, and produce fruit of inferior quality; root-lifting is then the only way out of the difficulty. There is little danger of overwatering a well-drained Vine or Peach border at this season of the year. *F. J.*

**INCREASING ALPINES.**

At this season progress should be made with the propagation of Alpine and rock-garden plants, of which a large number, such as Phloxes, Violas, Saxifragas, Androsaces, Veronicas, Lithospermums, Aubrietias, Achilleas, etc., are raised from cuttings. Saxifragas of the *Kabschia* group should be increased by dibbling single rosettes, without the usual trimming process, into about half an inch of pure sand, moist, and placed "padding fashion" on top of a pot of the compost, the "padding" portion rising from the rim of the pot towards the centre. Put the rosettes in thickly, firming them as well as the sand will permit. These pots form charming ornaments for the Alpine house in early spring, the plants making one compact cushion of growth in a comparatively short while, and thereafter may be divided into single plants of fine, regular, sturdy growth. *E. B.*

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## PALMS OF THE RIVIERA.\*

I MENTIONED in my last article the well-known *Livistona chinensis*, R. Br., still often called *Latania borbonica*, a name given it by Lamarck, who thought this Palm indigenous of the island of Bourbon, and, probably without having seen the fruits, referred it to the genus *Latania*. The genus *Latania* belongs to the sub-family *Borassinae*, and is botanically distinct from the genus *Livistona*, R. Br. Being engaged, as I mentioned in my last article, in the determination of the plants in the famous old park of the Villa Venetienne at Nice, recently acquired by the Count and Countess de Mileant, I have thought it useful to indicate, besides the name actually agreed to by science, the various synonyms by which the plants are known in the trade. It seems to me very desirable that traders should at least place in parenthesis the correct names of their Palms so that the public should become used to them. The new owners of the park of the Villa Venetienne are quite disposed to allow their park to be visited by any person who takes an interest in plants; the Countess de Mileant is passionately fond of natural history objects, and, having travelled extensively in many countries, especially in tropical Asia—from whence she has brought back many important collections—has the intention of adding to the botanical attractions of the park, as well as to the zoological collections.

Another species of *Livistona*, which is found a little more frequently in Riviera gardens, though not nearly as often as it should be, is *Livistona australis*, Mart. (Fig. 28). This Palm is also known under a synonym, viz., *Corypha australis*, R. Br., and up to now in the trade and by gardeners almost only by the last name. Though the genus *Corypha* belongs to the same sub-family of Palms—*Coryphiae*—as the genus *Livistona*, it is not so fundamentally distinct botanically as the genus *Latania* mentioned above; still, there are quite notable botanical differences, all *Corypha*, so far as I know, flowering only once in their final state of development and then dying, while the *Livistonas*, which do not produce terminal inflorescences, but as most Palms do, lateral ones, continue to flower and fruit for many years. I may add that possibly no species either of *Latania* or *Corypha* would exist on the Riviera: at least all tried in my garden have failed, though, of course, trials of such plants from warm climates should be made in more sheltered situations, as, for example, a little east of Nice. *Livistona australis*, of which, as of many other Palms, the oldest specimens of the Riviera are found in the park of the Villa Venetienne, where some attain the height of fifteen metres, is said to grow up to twenty metres high in its native country, East Australia, where it is found both in the tropical and extra-tropical parts. This is a Palm of much quicker growth than *Livistona chinensis*, and of the same resistance to frost, if not of even greater resistance. Still, there lingers a belief to the contrary, which may be due to raising the Palm from seeds intro-

duced from very tender plants growing in tropical parts of Australia. It is obvious that in trying to acclimatise a plant in a cooler country, seeds should be selected from specimens growing in the coldest parts of its native country, and not the warmest. However, be this as it may, I have always found this beautiful tall, quick-growing Palm to be quite hardy here, even in places of the lowest temperature, and it is unharmed by cold, except where the rays of the morning sun reach the leaves when they have been exposed to frost, causing the foliage to be sometimes slightly blackened, but hardly ever destroyed. The trunk of *Livistona australis* is of medium thickness, like that of *Livistona chinensis*, and its leaves have longer

## PLANTS NEW OR NOTEWORTHY.

## COOPERANTHES.

COOPERANTHES is a bigeneric cross between *Cooperia* and *Zephyranthes*. The seed parent is the *Cooperia Drummondii*, a white-flowered bulb, slightly Primrose-scented; but, as the flowers open late one afternoon and fade before noon next day, it is not surprising that the plant is seldom cultivated. *C. Drummondii* is a much finer type than *C. Oberwettii*, and for this reason was used in making the *Cooperanthes* cross.

The other parent, *Zephyranthes*, is quite distinct, not only as regards time of opening

FIG. 28.—LIVISTONA AUSTRALIS.

petioles, which are furnished on the edges with closely set, small, jet black spines. The blade of the leaf, about the same size as that of *L. chinensis*, is much more frequently divided, but the partitions do not hang down gracefully like fringes as in the case of *L. chinensis*, while, of course, the undivided part of the leaf blade is much smaller than that of *L. chinensis* and is rather irregularly folded instead of forming a dome. Thus the total effect of the shape of the leaves is less ornamental than the strikingly ornamental leaves of *L. chinensis*. The colour of the upper surface of the leaves of *L. australis* is darker than that of *L. chinensis*, and has a somewhat metallic gloss. The fruits are about the same size as those of *L. chinensis*, and not ovoid but globular, and in ripening pass from green to red and at last to a violet-blackish colour, large bunches producing an ornamental effect. Dr. A. Robertson Proschowsky, *Jardin d'Acclimatation, Les Tropiques, Nice, France*.

of the flower, but in general structure. *Cooperia Drummondii* has foliage about 12 inches long by a quarter inch wide, covered with a grey bloom. The flower is erect, with a long, narrow perianth tube and the anthers pressed close against the style, but below the stigma. In *Zephyranthes* the flowers are semi-erect or nodding, and are more or less funnel-shaped, with a very short perianth tube; the anthers are free and the stigma trifid.

I cannot claim to have raised the first *Cooperanthes* hybrids, for, after my father's death in 1904, I discovered in his note-book a reference to three seedlings raised from *Cooperia* × *Zephyranthes*, but, not discovering the plants, attempted the cross myself. In 1909, two of the seedlings flowered, but, as I was separated from my work for a few years, these were lost sight of, and my present hybrids are the result of crosses made subsequently. In addition to the list of named

\* The previous articles by Dr. Proschowsky were published in our issues for May 1, June 12, July 10, September 4, November 29, December 18, 1920; May 12, April 30, June 11, October 8, November 19, 1921; January 21, February 11, April 1, and June 17, 1922.

varieties given below, there are numbers of unnamed seedlings which are under observation, while a batch of plants raised during the past two years have still to flower.

It was with a view to introduce coloured varieties of *Cooperia* that experiments were undertaken, but when the first seedlings flowered and proved their superiority over both parents as regards a longer period of flowering, with a greater profusion of bloom, I worked toward a "super" race of *Zephyranthes*.

The monsoon in this part of India generally lasts from June 15 till the middle of September, and during normal seasons Bengal can count on receiving at least one shower of rain during the remaining months. *Zephyranthes* bloom only during the monsoons, giving three to four flushes of flower; *Cooperias* cannot be depended on, and do not produce more than three flowers from each bulb during the season. *Cooperanthes* are certain to produce flowers after every shower of rain during the "off" season, and in the rainy weather are good for three to four flushes of bloom. The plants are very hardy, form large bulbs and good foliage.

The photograph enclosed (not suitable for reproduction) gives but a poor illustration of the beauty of the *Cooperanthes*, of which there are erect and semi-nodding types. The erect forms are chiefly first generation hybrids, having *C. Drummondii* as their seed parent (C.D.), while the semi-nodding forms are derived from re-crossing the *Cooperanthes* with either *Zephyranthes*, or selfing (Z.R.). None of the hybrids has inherited the unfortunate evening opening tendency of the *Cooperia*.

**YELLOW.** Working with *Andersonii* and *sulphurea*, I have not obtained very many seedlings. *Sydney*, deep yellow fading cream, and *Percy*, pale creamy yellow, have both small-sized blooms. *Evening Star*, however, is a Z.R. type as large as *Z. robusta* and a deep creamy yellow in colour. Several other yellow seedlings differ too slightly from *Z. sulphurea* to warrant naming. *Z. Andersonii* has given *Alipurensis*, buff fading to yellow, and *Lancasteri*, yellow and brown. Both these are C.D. type, white or white, shaded pink. All these are Z.R. type, and differ in size, width of petals, etc.—*White Queen*, *Ida*, *The Bride*, *The Governor*, and *Mrs. Geo. Girard*.

**PINK.** These varieties are to be found in shades varying from the softest rose to a deep pink. The following take after the *Cooperia* (C.D.), and are arranged in shades, deepening from Alpha, Beta, *Mary*, *Delta*, *Psi*, to *The Viceroy*. Of the (Z.R.) type are *Alipore Beauty*, *Mrs. F. G. Clarke*, *The President*, *Sweetheart*, and *Mrs. Lancaster*.

**RED.** Only one red seedling has been raised (Z.R.) type, deeper in colour than *Z. robusta*. This has been named *King Emperor*.

I may add that though *Z. candida*, *Z. rosea*, *Z. carinata*, *Z. Treatae*, and *Z. verecunda* were also used as pollen parents, none of the seedlings that have flowered up to date show signs of these parents.

I shall be very pleased to correspond with readers of *The Gardeners' Chronicle* and furnish information on this subject. My experiments in hybridising—I am using this term in the broad sense of the word—have not been confined to these bulbs alone. *Canna*, *Hedychium*, and many flowering shrubs have yielded variations distinct enough to be recognised. *S. Percy-Lancaster*, *F.L.S.*, *Agricultural and Horticultural Society of India*, I, *Alipore Road, Calcutta*.

SPIRAEA HENRYI.

This is one of the many beautiful Chinese shrubs discovered by Prof. Augustine Henry, and introduced by Mr. E. H. Wilson in 1900 when collecting on behalf of Messrs. James Veitch in Central China. It is recorded from Ichang and Western Hupeh.

*Spirae Henryi* (Fig. 29) forms a large, wide-spreading bush 8 or 9 feet in height, and with age 12 to 14 feet, perhaps more, in diameter. Although not altogether suitable for the average

shrubby border, it is a fine shrub for a lawn specimen, and on the edge of pleasure grounds or woods. In such positions the long arching growths are wreathed with white flowers in June. The leaves vary from about 1 inch long on the flowering shoots to 3½ inches on the barren shoots. The rounded corymbs of small white flowers develop at the ends of short leafy twigs, along the wide-spreading, vigorous shoots.

Seeds and cuttings provide ready means of propagation. The latter, made of the moderately firm young shoots, root readily under a bell-glass in July and August. In common with other *Spiraeas*, *S. Henryi* thrives in most soils. A. O.

CYNOGLOSSUM AMABILE.

"P. R." does well to sing the praises of *Cynoglossum amabile* in your issue of July 15, page 51, but is he correct in calling the plant a pretty perennial? It is certainly pretty and to all outward appearance it might well pass for a perennial, but, unfortunately, it appears to be annual, or at the most biennial. In this

FIG. 29.—SPIRAEA HENRYI.

respect it is like most other *Cynoglossums*, including our native *Hound's Tongue*, *Cynoglossum officinale*.

*C. amabile* is a Chinese *Hound's Tongue* introduced by that wonderful collector, Mr. G. Forrest. Plants from seed sown even less than a year ago are now in full bloom, producing masses of light blue flowers, beloved by bees. Unlike "P. R.," who remarks that he has not seen this plant in gardens, the writer has lately seen it planted freely in front of selected *Delphiniums* and *Anchusas* in "blue borders," and with just the desired effect. The flowers are of a pure and beautiful tone of blue of that rare quality so much desired in gardens of to-day. The tall, leafy spike of flowers, like those of the *Forget-me-not*, are well portrayed in the accompanying illustration (Fig. 30). *C. amabile* is a plant all may grow, and sooner or later it is sure to find its way into gardens all over the country. *Herbert Cowley, Tunbridge Wells*

EVELYN'S KALENDARUM,

The following notes, most of which are extracted from old articles of my own, may serve to elucidate those portions of Mr. Jacob's notes (p. 20) about which he expresses some dubiety. Though I do not

possess the second edition of Evelyn's *Kalendarium*, which I believe to be exceedingly scarce—probably as a result of the great fire of London—it is clear it must have been issued in 1666 or early in 1667, in which year Cowley died, July 23. And it appears from a remark of Evelyn's that Cowley had transcribed the calendar, no doubt as published in *Sylva*. It should be remembered that the poet Cowley himself wrote a rare book on gardening in 1662, and "The Garden" was published in 1667. The *Kalendarium*, it may be noted, was not solely Evelyn's; two gardeners, Rose, of Pineapple fame, and one Turner, having supplied him with material for its composition, and Dr. Sharrock, another authority on Horticulture, furnished lists of fruits.

The first edition of old Philip Miller's *The Gardener's Kalender*, directing the "necessary work to be done every month in the kitchen, fruit and pleasure gardens, as also in the conservatory and nursery," was published in 1734, price 4s. Fifteen editions in 8vo were published in Miller's lifetime, and one edition in 12mo after his death. The *Kalender*

is included in the 3rd, 4th, 5th and 6th editions of *The Gardener's Dictionary* occupying 25 folio pages in the last-named.

The discrepancy regarding the dates given for the initial publication of Mawe's *Every Man His Own Gardener*, is obviously due to the volume never having been in the hands of the various authorities. It is said to be very scarce. There is no doubt, however, as to the date, the copy which I possess being dated 1767. It is a small volume in 12mo and in many respects a great improvement on Miller's, as the latter's was on Evelyn's. Without counting editions subsequent to Abercrombie's death, nineteen were published in his lifetime, so that counting from 1664 to 1806, when Abercrombie died, a space of 142 years elapsed.

There was, however, a gap between 1706 and 1734, part of which was filled up by the publication of a more interesting volume than any of the above. This was *The Gentleman and Gardener's Kalender*, "directing what is necessary to be done every month in the kitchen garden, fruit garden, nursery, management of forest trees, greenhouse and flower garden, etc.," by Richard Bradley, 1718. It passed through several editions, both as a volume and bound with other works of Bradley's. Besides the chatty gossip common to Bradley's books, it was illustrated with copper plates, and cannot justly be omitted in treating of early gardening calendars. *R. P. Brotherston, Tynninghame Gardens, Prestonkirk.*

ORCHID NOTES AND GLEANINGS.

COCHLIODA AND ITS HYBRIDS.

THE bright-hued Cochlioda Noetzliana, with C. vulcanica and C. sanguinea, are best grown in shallow pans suspended from the roof rafters of the Odontoglossum house. There are now many fine hybrids which have been raised from Cochlioda crossed with the species and hybrids of Odontoglossum and other genera, and it is a great difficulty to trace their ancestry. In a family so large and varied, individual plants naturally show much disparity constitutionally, some being more vigorous than others. They succeed under similar conditions

to Odontoglossums, and in a similar compost. They supply a colour which is not obtainable from any other source, and, as none is especially difficult to cultivate, the plants may be grown by all who are successful with Odontoglossums.

MILTONIA BLEUANA.

THIS handsome Orchid and other hybrids, of which M. Roezlii is one parent, enjoy slightly more heat than M. vexillaria; therefore, they are best grown in the warmest part of the house, whilst the species itself does best in a house where some few degrees more heat is maintained. As regards other cultural matters, they all succeed under the same conditions as M. vexillaria. J. B.

HARDY FLOWER BORDER.

MIMULUS BARTONIANUS.

I was very glad to see Sir Herbert Maxwell's note (p. 21) about Mimulus Bartonianus. I have grown it for the last five or six years, and I consider that it is one of the finest introductions amongst hardy herbaceous plants that we have had for a long time. I quite agree that it is infinitely superior to the old Mimulus Lewisii; I was very fond of that Californian species, but it never would winter satisfactorily with me, and I generally lost my stock of plants each winter. In order to keep up a supply, seed had to be saved and sown annually. M. Lewisii, however, need not now be considered when we have such a fine plant as M. Bartonianus. This hybrid Mimulus was raised a few years ago by Mr. H. O. M. Barton, of County Antrim, and I believe it was sent out by Mr. Thomas Smith, of Daisy Hill, Newry. It is really a remarkable plant, for it will flower continuously from June to October. The colour, too, is very pretty. Sir Herbert Maxwell, I observe, states that the flowers resemble those of Incarvillea Delavayi, but I used to say they had a likeness to Regal Pelargoniums. M. Bartonianus was raised from M. Lewisii x M. cardinalis, and it has proved to be thoroughly hardy, easily grown, and requires no special treatment.

I was always sure of a crop of seed of M. Lewisii, but I have never yet been able to save any of M. Bartonianus. It seems to me to be sterile. I have employed pollen of many other forms of Mimulus without effect. I anticipate that M. Bartonianus will have a great future as a bedding plant when its merits become known to growers. George M. Taylor, Edinburgh.

In your issue of July 8, page 21, Sir Herbert Maxwell refers to Mimulus Bartonianus. Surely this should read Mimulus Bartoniana. The plant was raised by the best amateur gardener in Ireland, Mr. H. D. M. Barton, of The Bush, Antrim, Ulster, whose success with Primulas is well known in this country. In addition to having the best known Himalayan, and most difficult Chinese species, Mr. Barton has raised many fine seedlings. A visit to his garden is a revelation of what can be done in a cold, damp climate. W. P. Moore, Willbrook, Rathfarnham.

ANEMONE CYLINDRICA.

THE genus Anemone comprises so many exquisite and in every way worthy plants that those of us who are devoted admirers of the Windflowers generally obtain any species which may possibly contain potentialities of beauty, in the hope that the novelty may be one with at least a large proportion of the charms of the vast majority of the Anemones. It is well, therefore, when we have had experience of some species not commonly grown but sometimes offered in catalogues, that we should act the part of friendly adviser to fellow flower-lovers and warn them to avoid expending their cash on worthless flowers. I know that A. cylindrica is only occasionally offered in catalogues, but I trust that plant-dealers will refrain from acquiring and distributing it, and, if ever offered, that the garden lover will shun its purchase, unless out of curiosity to see what A. cylindrica is like.

To the writer it seems to be one of the plants absolutely worthless in the garden. It is of interest, certainly, as showing how inferior a plant may be, although included in a genus which is, as a whole, of the highest charm for our gardens, but as a flower it is worthless and unattractive. A writer of high authority dismissed it with the verdict "A. cylindrica turns out to be a really worthless weed with flowers of a feeble yellowish green, carried singly on long, naked foot-stalks." It is now a good few years since I acquired it from the late Mr. Max Leichtlin, of Baden Baden, but I am sure that that real plant-lover would not have sent it had he known its poverty of attractions. I grew it for a few years so that I might know it well, but the rubbish-heap was its ultimate destination. S. Arnott.

FIG. 30.—CYNOGLOSSUM AMABILE (SEE P. 67).

NEW HYBRIDS.

(Continued from June 17, page 323.)

Name.	Parentage.	Exhibitor.
Brasso-Laelio-Cattleya Ancona ...	B.-L. Jessopii x L.-C. Luminosa ...	Stuart Low.

## THE ALPINE GARDEN.

## AJUGA GENEVENSIS BROCKBANKII.

THE ultra-critical cultivator of rock plants will be inclined to pass over this note with an exclamation such as was wont to be applied by the late Mr. W. E. Gumbleton, who characterised a plant he did not care for by the expressive word "pooh"! But those who know it well and who have realised its value will be much less contemptuous and will assert that it is a good plant, not in the first or even in the second rank, yet worthy of appreciation by those who want an easily grown, deep blue-coloured plant which can be put into a fairly rough place without danger of being lost. It is ranked as a variety of *Ajuga genevensis*, but it is superior in respect of the deeper colour of its foliage and of the finer blue of the flowers, in good close spikes. It is excellent for a rough, moist or shaded spot. There it will spread quickly and give plenty of its little spikes some six or nine inches high, pleasing, but not showy, with its deep foliage and bright blue flowers. It is one of the best of the Bugles, and must, I think, have been selected originally by the late Mr. Brockbank. It is stocked in many nurseries, and can be grown in practically any soil. Its failing (according to some) is that it spreads very freely, yet it is not too dangerous in this respect, and can be kept in reasonable bounds by exercising a little care. S.

## LINARIA ALPINA.

ENTHUSIASM is hardly a strong enough term with which to designate the feelings of the true admirer of hardy flowers as he looks upon a clump or mass of *Linaria alpina*, the Alpine Toad-flax, and studies its beauties collectively and individually. Colour and form and habit all combine to afford a picture of charm, impossible to gainsay. Yet this feeling of enthusiasm is not unmingled with pain, for, to many of us, this picture of beauty is given by plants of short life.

"Whom the gods love die young" may be written of many flowers, and *Linaria alpina* is among the number. Almost all growers agree that it is not an annual, it is true, but we are, perforce, by bitter experience driven to the conclusion that it lasts with us but a year or two, probably exhausting itself by seed-bearing, and leaving us to regret its loss and to endeavour to replace our lost plants by a younger generation. This is worth while, for it is not easy to do without these charming plants with their narrow, glaucous little leaves and exquisite flowers of glorious violet, tipped with glowing orange. A group of good plants a few inches high and full of bloom constitutes a floral picture of great beauty.

Of all the colours—for there are a few to be had—I prefer the ordinary one, but others like to have variety, and some delight in the possession of the rose-coloured one, *Linaria alpina rosea*. A few are the happy possessors of an albino variety, *alba*, with exquisite white flowers tipped with orange. Others have a delicate pale blue variety, and some few cherish the self-coloured one, unbrightened by the orange lip which warms up the blooms of the other varieties.

*Linaria alpina* is easily raised from seeds, and these may be sown very thinly either in pots or pans under glass, or in the open. I think the best plants are from those sown in the open where they are to bloom, the seedlings afterwards thinned out to about six inches apart. Seedlings raised in pots should be transplanted as soon as they can be handled, grown on and then planted out in their permanent places about the end of June.

I do not think that *L. alpina* is difficult to suit with soil. It stands best in very gritty soil or in the chinks of an old wall. It is not, however, a limestone plant, though it is not a lime-hater, and a compost of loam and grit and sand will suit it quite well. An old plant in British rock gardens, it is not at all too common, and may well be restored to some of its earlier popularity. S. A

## THE HISTORY OF THE MOSS ROSE.

(Continued from page 48.)

If the reader will turn to the Preface to Vol. I. of the *Hortus Kewensis*, 2nd Edit., he will see it stated that throughout the whole of that work an attempt is made to trace back so far as possible how long each plant has been cultivated in British gardens, and to fix with as much precision as the nature of the subject would allow the date of its introduction. Those plants known to have been grown by Gerard in 1596 are indicated, and as the *Hortus Kewensis* was the only available standard for dates for a very long time, many subsequent writers and compilers fell back on that authority for their dates, accepting it without hesitation. This is where we get the starting point, not only for the Moss Rose, but also for those other Roses referred to by William Paul as being introduced in 1596, although it must be quite obvious that they had probably been grown for many years in this country before John Gerard had collected them into his garden.

Unfortunately, varietal or specific names before the date first mentioned are difficult to obtain or verify, but, at any rate, Roses were grown in England as garden flowers long before the dawn of our garden literature.

From Gerard to Furber, the evidence is purely on the negative side. It may be assumed that so devoted and capable a florist as John Rea would have appreciated the Moss Rose if it had been known and grown here in his day. Yet, although he mentions in his *Flora* (1665), in the Chapter IV. headed "Rosa," thirty-one different kinds, there is not the faintest indication of a Moss Rose among them. Samuel Gilbert, his son-in-law, London and Wise, Leonard Meager, William Salmon, Richard Bradley, and other English floricultural writers in the interval never once refer to anything like a Moss Rose, but only to its near relative or parent, the Provence Rose, of which there were several varieties; and we now approach what must be considered the first ascertained or direct mention of the introduction of the Moss Rose into England.

Major Hurst is dubious about the date of this occurrence, and prefers to think, on extremely slender grounds, that Philip Miller must have been the original importer, notwithstanding the fact, and a very plain one, too, which cannot be controverted, that the Moss Provence Rose was actually offered for sale in a catalogue of plants, etc., by Robert Furber, the eminent nurseryman, of Kensington, as early as 1724.

There are several considerations to be taken into account in dealing with this point, and I must confess inability to endorse the unwarrantable suggestion of Major Hurst when he states (*Rose Annual*) that it may be that its inclusion in Furber's catalogue was merely "an intelligent anticipation" of a promising novelty, introduced three years later by his colleague Miller. Both in the *Rose Annual* and in the *Journal of the R.H.S.*, Major Hurst tells us, on what ground I cannot understand, nor does he explain, that it seems safer to accept Miller's date of 1727.

This expression of opinion is, to my mind, a most unjustifiable aspersion on the integrity of an eminent nurseryman like Furber, and, if it means anything at all, it is equivalent to saying that Furber was so inventive a genius and possessed such a fertile brain that he could not only invent the name of Moss Provence Rose, but also had the wonderful intuition that when a Moss Rose, a flower never previously heard of, should be introduced, it would not be a Moss Belgick Rose, nor a Moss Frankfort Rose, nor, indeed, a Moss Rose of any of the other twenty-eight varieties included in his catalogue, but that it would be none other than a Moss Provence Rose. Truly, not only "an intelligent anticipation," but a marvellous preconception of a floral novelty, if, indeed, it were a fact that Furber had not already acquired the flower which he offered for sale.

And how could the Moss Provence Rose have been a creation of Furber's imagination? He was offering it, with other Roses, for sale. To have been in a position to do so, he must not only have acquired a plant, but have bloomed it to ascertain what it was, and also to have propagated it and worked up a stock long before 1724. Why, then, are we to give preference to Miller's date of 1727?

I have seen the suggestion, which will be examined somewhat fully when we come to the Moss Rose in France, that it was grown in or near Carcassonne. There is no pretence that it originated in Boerhaave's garden at Leyden. It must, therefore, have been a subject of commerce before Miller saw it there. Miller was in charge of a Physic Garden, and not a dealer or importer of novelties for sale. The Chelsea garden was not run on business lines, where new and rare plants were introduced and propagated for trade purposes. Furber, on the contrary, was, and had been a dealer and importer of such things for many years before, but there is a stronger reason to be advanced in support of the claim that to him must be attributed the credit of the first introduction.

In the absence of older mention, it must be conceded that Boerhaave's reference in his *Index alter Plantarum*, etc., of 1720, is the first botanical or horticultural one. It is No. 12 *Rosa*, and reads: "*Rosa*; rubra; plena; spinosissima; pedunculo mucoso." Thirty-nine *Roses* are mentioned, some having details appended as to origin and references by previous writers. I have no knowledge where Boerhaave's Moss Rose—he does not tell us—came from, or how it originated, and all the writers of that century are agreed in that respect; and Miller's own comment upon it, when he relates that Dr. Boerhaave gave him a plant is: "From whence it originally came. I could not learn" (Miller's *Figures*, etc., 1760).

Major Hurst remarks (*Rose Annual*) that it is significant that Furber's Latin description of the Moss Rose is identical with that of Boerhaave of 1720. What other Latin description could Furber have used? It was the only botanical description of it then current, and every writer of that period used it until somebody enlarged it by adding the qualification "provincialis." It is far more significant that Furber, who, in his *Catalogue*, gave the English names of the twenty-nine *Roses* he offered for sale, in one column, with their Latin equivalents, in another, should have designated this particular variety, the Moss Provence Rose. Why the Moss Provence Rose? Did he coin the name himself? If not, who did? Whence did he get it. Was it ever used in English prior to 1724? We know it was accepted afterwards. How can the name have been the result of Furber's imagination, and then, curiously enough, corresponded with the actual flower when it was subsequently introduced by his colleague Miller? Boerhaave's Latin descriptive name gave no indication that the novelty with "pedunculo mucoso" was of the Provence Rose type, although, at least, seven other *Roses* in the Dutchman's list have the adjective "provincialis" as part of their description; it might have been a moss variety of any other kind so far as his name went. The supposition is plainly untenable, and there is not an iota of evidence in its favour.

I hold no brief to claim credit for Furber if he does not deserve it. All I want, so far as the documentary material will enable me to judge, is to arrive at the truth.

Miller's *Gardeners' and Florists' Dictionary* of 1724 is not universally accepted as being the great man's own unaided work. It is sometimes erroneously referred to as the first edition, a claim that properly belongs to his *Gardeners' Dictionary*, in folio, dated 1731. The octavo, in two volumes, published in 1724, is considered to have been compiled by a Society of Gardeners, to whom Miller acted as secretary. And some colour is given to this view by the fact that the preface contains the following guarantee of the book's excellence: "We whose names are underwritten do approve and recommend this book intitled the

Gardeners' and Florists' Dictionary, etc., as highly useful and necessary for all lovers of gardening. Tho. Fairchild at Hoxton; Rob. Furber at Kensington; Rob. Smith at Vauxhall; Sam. Driver at Lambeth; Moses James at Standgate; Obadiah Low at Battersea; Christ. Gray at Fulham; Benj. Whitmil at Hoxton; Fran. Hunt at Putney; Will. Gray, junr., at Fulham; Gardeners and Nurserymen."

The chapter on Rose trees is largely a compilation, for numerous quotations are made from Bradley, Liger, and Mortimer. In the aggregate, 37 varieties are dealt with, in numerical order. Upon a careful scrutiny of this chapter, it is evident that Major Hurst commits a verbal inaccuracy when he writes of the Moss Rose (R.H.S. *Journal*, p. 32). "For Miller (1724) states that it is included in Robert Furber's catalogue of plants cultivated for sale at Kensington." Neither Miller nor the compiler of that chapter on Rose trees, if it were another, even mentions Furber in that connection. Furber's catalogue, entitled *A Catalogue of Curious Trees, Plants, etc.*, was an independent addition or appendix to the *Dictionary*, not an integral part of it. It is not uncommon to find nurserymen's catalogues bound up at the end of horticultural books, even in those days. And so there seems to be no valid reason why Furber's catalogue, as the advertising medium of a nurseryman, should not have been brought close up to date by the inclusion, not of "an intelligent anticipation," but of the recent and most up-to-date introductions into his nursery stock.

According to contemporary evidence, Furber's claim is not challenged by any British gardener or nurseryman. No one else takes credit for its introduction previously. Robert Furber was a reputable and prominent man in his profession. He had a high-class and influential clientèle, as can be easily understood when we scan the names of the subscribers to his very valuable and rare series of large folio plates of Fruits and Flowers which he published in 1730 and 1732, and which it is self-evident that not only Major Hurst, but other modern writers on the Rose, cannot have consulted during the course of their researches. *C. Harman Payne.*

(To be continued.)

## FORESTRY.

### DOUGLAS FIR *versus* WHITE PINE.

THE praises of the Douglas fir have been so often sounded that one feels considerable diffidence in introducing a discordant note into the almost universal chorus of approval with which it has been received by planters in this country. But while nothing can be said against it as a fast-growing tree which, on the whole, has adapted itself well to our British climate, the idea that its timber will ever supplant that of the American White Pine (*Pinus Strobus*) for the best classes of constructional work—as has sometimes been assumed—is, I think, out of the question. In fact, with the single exception that, like that of the White Pine, the timber of this tree, which is imported as Oregon Pine, or Columbia Red-wood, can be got in large sizes, it has no other qualification to recommend it for the purposes for which White Pine has hitherto been used in the finer kinds of constructional work, and it has one or two serious defects which put it out of court in competition with that timber for the best work. The most serious objection to it is that it tends to shrink after the work is finished, and as this goes on for a considerable time afterwards, it is a very serious drawback to its use in high-class work. It has also a slight tendency to warp, or "wind."

For the best internal work in building construction, hitherto there has been no Coniferous timber which has met the requirements of the architect so satisfactorily as that of the White Pine, and, as it seems to me, the only timber which is likely to become a substitute for it is its near relative, the

Siberian Pine (*Pinus Cembra*), of which there is sufficient in Siberia to meet the requirements of the world for a long time to come, were it possible to get it out of that country.

Many years ago I saw in the yard of the Granton Timber Company here a large cargo of Oregon Pine, which had just been discharged from a large iron sailing ship, consisting of planks 40 feet in length and 24 inches by 9 inches on the side. The planks were die square throughout, without a knot, and, as seen on the radial face, the layers of wood ran perfectly straight from end to end of the planks. I have never seen anything else to compare with it in this respect, but of course this is a quite different aspect of the matter from the other. *A. D. Richardson, Edinburgh.*

## COLONIAL CORRESPONDENCE.

### MATRICARIA SAUVEOLENS.

I FOUND this plant growing luxuriantly along the roadsides and paths in Auckland, New Zealand, eleven years ago, but failed to meet with it either at Wellington, Napier, or Gisborne. Requiring a plant lately to illustrate a point when addressing a squad of Boy Scouts, I visited a road where the plants formerly grew in great profusion, and was disappointed at finding only one miserable specimen, about three inches high, growing in a little used foot-path; this I used, and the Scouts agreed to look out for others; but our combined efforts have only succeeded in locating about a score of plants, two only being above three inches high. *F. Fuller, Auckland, New Zealand.*

### PICEA SITCHENSIS.

PICEA sitchensis (the Sitka Spruce, or Tideland Spruce) forms about one-third of the Conifers growing within a hundred yards of the shore line on the west coast of Vancouver Island; the other two-thirds are made up about equally of *Tsuga plicata* (Cedar) and *Tsuga heterophylla* (Hemlock). In the winter of 1919-1920, for a distance of some 10 miles on each side of Amphitrite Point, at the western entrance to Barclay Sound, a blight attacked a noticeable proportion of the Piceas, killing some large trees and mortally injuring many others, and to-day those that were least hurt are only just showing a few bright green leaves on their otherwise bare branches.

Perhaps, as showing that they belong to the same group as *P. sitchensis*, a young tree each of *P. Engelmannii* and *P. pungens* growing in a sheltered part of the garden lost the leaves on the lower two-thirds of their branches, while *P. excelsa* growing under the same conditions was untouched.

Neither the Hemlocks nor the Cedars growing among the Spruce were the least injured, nor were some twenty other species of evergreen Conifers from different parts of the Northern Hemisphere growing in the vicinity; therefore, this is one instance where *P. sitchensis* almost failed to adjust itself to conditions which were quite satisfactory to other species of similar character, and it is just possible that through old age it has lost the ability to resist the influence of blight and that its days are numbered, "though each day may be as a thousand years."

We are acquainted with "blight" only from its effect on vegetation; in this case the conclusion arrived at when the damage was first noticed was that the trees were blasted simultaneously and without regard to their exposure to wind from any one particular direction, reminding one of Byron's poem on "The Destruction of Sennacherib," wherein he wrote: "The angel of death spread his wings to the blast, and breathed on the face of the foe as he passed."

In a letter to the writer, Mr. W. F. Gibson, a saw-mill owner of Ahoorat, states that six years ago blight struck the same species of Spruce in Stanley Park, Vancouver, B.C. *George Fraser, Uclulet, B.C.*

## VEGETABLES.

### TURNIPS.

IN most gardens the demand for succulent turnips never ceases, and to cope with this demand several sowings of seed must be made during the season. Our first outdoor sowings are usually made in a warm, sheltered position, but the summer crop is grown on a north border in good, cool, rich soil, while for supplying roots during the winter and early spring months, an open position is preferable.

Tender, well-grown Turnips are as highly valued in winter as at any other time, and for keeping up a supply, two or three sowings of suitable varieties should be made at this season, the first now, a second early in August, and another about a fortnight later, and from such sowings we have experienced no difficulty in maintaining a regular and constant supply.

In winter time, to keep the roots fresh and sweet, I prefer to pull the most forward when they are about the size of a cricket ball and bury them in trenches. The trenches are made deep enough to allow the tops of the bulbs to be covered with two or three inches of soil (the tops being left intact); in this way roots keep very sound and fresh, and the only further protection afforded is a slight covering of long litter should frosts be very severe. *H. Markham.*

### WINTER CUCUMBERS.

To be successful with Cucumbers during winter, properly constructed houses should be provided, well furnished with hot water pipes to provide top and bottom heat. The house should be thoroughly cleaned inside and out, special attention being given to the glass, so that the maximum of light is afforded the plants during the dull days of winter.

Having prepared the beds of fermenting material, such as leaves or long stable litter, mounds of good loamy soil should be placed thereon. A suitable compost consists of three parts turfy loam and one part leaf soil, to which is added some mortar rubble or road grit. The Cucumber plants should not be planted until the mounds have been in the house for a few days, so that the soil is first thoroughly warmed through. To maintain a succession, seeds should be sown during the first weeks of September, October and November; those sown in September should provide plants for fruiting in November.

Sow two seeds in each three-inch pot, in a light compost that has been previously warmed through. Place the pots in a propagating frame, or plunge them in a warm bed of leaves, and when the young plants appear, draw out the weakest in each pot. At this stage place the pots on a shelf near the roof glass, and when the plants have filled the pots with roots, pot them into five-inch pots. From thence the plants will require carefully staking and watering, and a temperature of about 75° at night, with a rise of 10° from sun heat. When the plants are ready for planting, which should be about a month from sowing the seed, they should be well watered with tepid water, and firmly planted in the ridge of soil. Skillful training, stopping, and the thinning of the shoots will be necessary in order to expose all growth to sun and air. Avoid overcropping.

When new roots appear on the surface of the mounds, top dressings of loam and decayed droppings, or old potting soil, will prove beneficial to the plants. A temperature not lower than 70° at night, with a rise of 15° from sun heat, will suit them very well when established and fruiting. To promote atmospheric moisture, damp the walls and paths down, and syringe lightly on sunny days. A little top ventilation is necessary, but the house should be closed early, after damping down, to promote a growing atmosphere. Avoid a too high temperature saturated with moisture, as such conditions encourage leaf blotch disease. Spraying with one ounce of potassium sulphide in three gallons of water, adding two ounces of soft soap, will act as a preventive to disease. *C. H. Harris, Red Lodge, Capel.*

## MR. W. WATSON AND KEW.

No more able or more appropriate pen than that of Sir Frederick Moore—late keeper of Glasnevin Botanical Garden—could have done anything like justice to the great work done by Mr. W. Watson, A.L.S., V.M.H., who has just retired from the Curatorship of the Royal Gardens, Kew (see p. 30). To those who, like myself, can compare Kew now with what it was 40 years ago, the changes and improvements that have been brought about in that period have been truly marvellous. Forty years ago Kew was little more than a by-word amongst gardeners in large nurseries and private places. I remember, in 1880, when working in a then famous nursery, being told that if I ever joined Kew, I should be ruined as a gardener. I should become a mere "botanical" gardener and learn a few "crack-jaw" botanical expressions which would never be helpful in growing plants. There was some reason in the criticisms levelled at the Kew of 40 to 50 years ago, owing perhaps to the horticultural side being submerged in the botanical. With the advent of Mr. Watson to Kew in 1879, matters gradually began to change in every way for the better.

Mr. W. Watson was above all things a gardener, with the true horticultural instinct of growing plants as well as they could possibly be grown, and then displaying them to the best advantage. One must not, of course, look at Kew for thousands of one species, or for variety of plant such as is customary in large market gardens or nurseries, because Kew, after all, is non-commercial, and aims only at displaying a few worthy specimens of plants under glass representing the flora of the world in a comparatively small space. In the open, however, where more scope is available, what magnificent landscape pictures are presented to the horticultural (as distinct from the botanical) public from one year's end to the other! Owing chiefly to the influence of Mr. Watson, the keynote of Kew for many years past has been change, change, change. Old beds or borders are suppressed and new ones take their place. Mounds and dells and miniature lakes spring out of level patches and are furnished with appropriate vegetation. The wilderness that used to exist in the pleasure grounds has been tamed into a beautiful garden replete with the choicest and most ornamental trees and shrubs from all quarters of the temperate hemispheres. The ridiculous old wire fence that used to separate the "botanical" garden from the rest of the gardens has disappeared, and its tri-lingual admonition "not to smoke on this side of the fence" has disappeared for ever. Nature is copied and improved by care and cultivation, until one feels that there is no place in the world so peacefully glorious as Kew.

Good gardeners who used to "sniff" at Kew in the old days, now look upon it as the Mecca of horticulture, and visits are paid with the obvious intention of learning something new in the way of gardening. All of which shows that Kew is the most progressive gardening establishment in the world; while it also stands unrivalled for its botanical treasures and teaching. Indeed, one might say that unless a "botanical" garden has a good "horticultural" or practical gardening basis, it is not likely to be of very much value to either gardener or botanist. And it is just because the horticultural side of Kew has been so ably developed under the guidance of Mr. Watson that it carries such a great weight also as a botanical establishment. Practice and science—in other words, gardening and botany—have marched hand in hand during the past 40 years, and similar work is being carried out by all Kew men in the various botanical and horticultural gardens throughout the British Empire. It matters not to what part of the world one goes, wherever a botanical garden exists, it is almost certain to be in charge of a man trained at Kew under the late Curator. And we may expect his spirit to live for years to come in those who are now to carry on his work, and who are likely to do their utmost to make Kew even better in the future than in the past.

Improvements have also taken place in the status and working conditions of the staff. Never again will a young gardener be paid 16s. for a 72-hour week; nor the labourers 17s., as in my time. Nor will a foreman be "scrapped" with a wretched "bonus" on attaining the age of 65. Thanks largely to Mr. Watson's influence, the latter are now all Civil Servants, and will, in due course, enjoy a pension, which they will thoroughly deserve. The young gardeners have more time to themselves now and, consequently, better opportunities than their predecessors of 20, 30, or 40 years ago, and they also must thank Mr. Watson for fighting their battles with the authorities for the privileges they now enjoy. I hope Mr. Watson will live for many years to enjoy his well-earned rest, and I am sure I am only echoing the views of the hundreds of gardeners who have known him and worked with him during the past 43 years of his public life. *John Weathers, Park View, Isleworth*

## HOME CORRESPONDENCE.

*[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]*

**R.H.S. and Kindred Societies.**—My Council has had under consideration the charges sought to be imposed on kindred societies for the use of the R.H.S. Hall—which, as you know, was built by public subscription and intended to further horticulture—and has made arrangements to hold its shows elsewhere in 1925. *Courtney Page, Hon. Secretary, N.R.S.*

**Trees Damaged by July Gales.**—I wonder if you have had reports from other parts of the coast regarding the excessive damage done to the foliage of trees and shrubs where exposed to the sea, by the gale of July 5, and following day? On the east coast here, at such places as Felixstowe, Aldeburgh, and Southwold, the whole of the trees, on their south side, are absolutely brown, the worst being Chestnuts and fruit trees, while on the sheltered side (or where sheltered) they are unharmed. I enclose a few sprays which I took from the cliffs at Felixstowe this morning (July 19). They are not the worst, as, of course, the upper parts of the trees suffered most, but they will be sufficient to show the damage. You will notice Sycamore, Willow, and Arbutus; even such hard things as Elms and Laburnums are just as bad. What I should like to know is if the damage is caused by the force of the wind, or through the salt spray. From what I noticed I think it is the force, but I should be interested to hear if other readers have ever experienced such damage. *R. C. Notcutt, Woodbridge.*

**The Spetchley Primroses.**—In the spring I found myself in London again after a few years' absence, and I went to the fortnightly meeting of the R.H.S. at Vincent Square. I was much impressed by the many new and beautiful varieties of Narcissi, but more especially was I struck by the magnificent exhibit of Primroses, which so far surpassed anything I had ever seen that I wondered whether I had forgotten the great beauty of the garden Primrose during my sojourn amidst tropical vegetation. However, on walking round the hall I saw that the Primroses elsewhere staged were like those I formerly grew myself in England, and I then realised that the Spetchley strain was of outstanding excellence. It was not only the wide range and combination of new and beautiful colouring, but the perfect form of flower, coupled with such excessively floriferous plants of vigorous constitution. Surely there can be no other race of hardy plants which has attained to such a high degree of development! To have carried the cross fertilisation and selection along such successful lines, an infinity of care and attention must have been expended, combined with rare judgment and keen intelligence. I was told that this strain was the unaided effort of a plant-loving amateur Mrs. Berkeley of Spetchley, who had devoted some twenty-five years to this labour of love. Many plants have been developed upon lines which have turned them into monstrosities, even many of the new

Roses and Carnations have lost their fragrance and constitution in the desire for new colours and variety. These Spetchley Primroses, whilst losing nothing of the incomparable beauty of the English Primrose, have taken on an infinite wealth of new charm and superb variety. I inquired of the man in charge of the exhibit if any of the individual plants had been named, and he gave me a list of those which had been selected for multiplication and to which saints' names had been given—a truly fitting way of differentiating such heavenly colours. Should I, as I hope, be in England next spring, it would be a great privilege to see these Primroses in their growing state, when they would be, if possible, an even more glorious sight than they were at Vincent Square. Would it be possible to obtain permission to see these Primroses in their home at Spetchley Park? *J. Manston, Claridge's Hotel.*

**Dianthus Ailwoodii.**—Having invested in eight varieties of *Dianthus Ailwoodii*, I am asking for information before propagating them for next year's display. A great many believe the plants to be Pinks, and look forward to a wealth of blooms something similar to what that beautiful old flower produces. Having grown these eight varieties on a border facing south, each plant 2 feet apart from its neighbour, I am very much disappointed with the results, and have therefore tabulated a few points and remarks which may prove useful to others:—Betty, 5 plants, 1 ft. 4 in., single; Hugh, 3 plants, 1 ft. 8½ in., double; Marion, 3 plants, 1 ft. 6 in., double; Jean, 3 plants, 1 ft. 3 in., double; Harold, 3 plants, 1 ft. 11 in., double; Joan, 5 plants, 1 ft. 5 in., double; Susan, 4 plants, 1 ft. 4 in., semi-double; Ruth, 3 plants, 2 ft., double. The heights given are those to the top of the flower spikes; but the plants are sprawling on the ground and need sticks for support. All the "grass" or foliage shoots are 7 to 8 inches high, and, of course, these may give flower spikes later. The plants have been well grown. I want to learn other readers' views about these varieties before going to the trouble of growing them another season. *Mark Mills.*

**Dunkeld Larches.**—With the exception of those relating to the measurements, etc., of the tree which was struck by lightning in 1909 (not 1916), and cut down later, which are, of course, of more recent date, the particulars given by Mr. A. D. Webster at page 56 occur largely word for word, in Hunter's *Woods, Forests and Estates of Perthshire* (1883). Mr. Webster states that the larger of these trees "was considered the finest specimen Larch in existence"; but if he will consult Hunter's work he will find that the largest of the Monzie (not Menzie) Larches, to which he refers, as closely approaching the Dunkeld trees, and which, according to Hunter, are "said to have been brought or sent by Mr. Menzies, of Culdres, who brought the ones at Dunkeld," had in 1883 a girth at 5 feet from the ground, which exceeded that of the larger of the Dunkeld trees by 1 foot 4 inches, and the ultimate girth of the latter by 1 foot 2 inches, the girth given by Hunter for the Monzie tree being 16 feet 3 inches, and the height as "fully 100 feet." But while Mr. Webster's note adds nothing new, there is one thing which, to my mind at least, seems perfectly clear. It is that if the Dunkeld Larches were really brought from London in a portmanteau in 1738, it is absolutely certain that the Arniston Larches come next to the Dawyck ones in point of age. They were supplied on February 8, 1736, that is, before that year was six weeks old, and of the fourteen plants charged for in the account, two were 4 feet and 5 feet respectively. If the Dunkeld Larches were planted in 1738, it does not matter whether it was before or after this date, for if the legend about their being carried from London in a portmanteau and afterwards planted in a greenhouse be true, they must have been younger plants than at least the two largest of the Arniston plants. If this be the case, then Midlothian, not Perthshire, would seem to be the county which can lay claim to the second oldest Larches in Scotland. *A. D. Richardson, Edinburgh.*

## ROYAL HORTICULTURAL.

JULY 25 and 26.—Although the exhibition held on these dates at the Royal Horticultural Hall was not so large as those usually experienced, it was an interesting one, and included many novelties. Sweet Peas, border flowers, Roses, Orchids and Carnations were the subjects chiefly shown. The attendance was not so large as usual.

## Orchid Committee.

Present:—Sir Jeremiah Colman, Bart. (in the chair), Prince Shimadzu, Messrs. Jas. O'Brien (hon. secretary), Fred. K. Sander, S. W. Flory, Chas. H. Curtis, J. E. Still, H. T. Pitt, T. Armstrong, Pantia Ralli, J. T. Barker, Frederick J. Hanbury, and Gurney Wilson.

## AWARDS.

## AWARD OF MERIT.

*Odontoglossum Tapaz* (regale × *Lambeavianum*) from R. GERRISH, Esq., Milford Manor, Salisbury (gr., Mr. W. Sorrell). The plant shown represented not only one of the finest hybrid *Odontoglossums*, but also a grand example of cultural skill. The plant bore a strong spike of flowers of large size and broad in all the parts, the broadly ovate labellum being a great floral feature. The ground colour of the petals is white with a central maroon blotch; sepals Primrose yellow with dark maroon blotches; lip broadly ovate white, with deep purple base and yellow crest.

*Odontoglossum Tagus* (*Othello* × *Doris magnificum*), from R. GERRISH, Esq. A very richly coloured hybrid of the dark class. Sepals and petals white, heavily blotched with Tyrian purple. Lip broad and flat white with purple base and zone. It is a good example of the influence of small, but distinct species, the little *O. Hunnewellianum*, through the *O. Adrianae* in *O. Othello* enlarging the lip in a remarkable degree, as we have already recorded.

*Disa Julia A. Stucky* (*Italia* × *grandiflora*) from Messrs. FLORY and BLACK, Slough. A selection of this new hybrid was shown, the plants flowering in small sixty pots and bearing flowers superior to those of *D. uniflora* (*grandiflora*) which, however, in the main they resemble. The broad lateral sepals are brilliant dark scarlet, the very large dorsal pink with purple lines. It is a fine example of the hybridists' improvement of desirable garden plants.

## GROUPS.

Messrs. CHARLESWORTH AND CO., Haywards Heath, were awarded a Silver Flora Medal for an excellent group in which were noted the handsome *Odontoglossum Agapetum* (*amabile* × *Maillardianum*), a grand outcome of the firm's favourite of their fine form of *O. Maillardianum*. *O. luridum* (*Harryanum* × *Olympia*), a grand light yellow, heavily blotched, the showy *O. Penelope* and *O. majesticum* (*eximium* × *percultum*), a fine flower with peculiar window-like opaque blotches on the segments; the rich scarlet *Odontioda Sheila*; some good white-petalled *Cattleya Hesta*; *C. Warszewiczii* Mrs. E. Ashworth with blush-white flowers and some fine *Laelio-Cattleyas*.

Messrs. J. and A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a group of *Miltonias*, all splendidly grown, the spikes of the *M. Charlesworthii* bearing ten or twelve flowers each, a remarkable effort for *Miltonias* of the *M. vexillaria* section, several forms of which were also shown, and notably *M. vexillaria The Bridge*, a noble white of the Queen Alexandra class. Other forms of *vexillaria* were *Candide*, white; and *H. Milner*, blush-white with light violet flush on the sepals and petals.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, sent *Laelio-Cattleya Aphrodite* var. *Eclipse* (*C. Mendelii* Low's variety × *L. purpurata*), a very remarkable form of good type, but bearing on the broad white petals a heavy band of purple colour and differing from any variety yet shown; and *Brasso-Laelio-Cattleya Everest* var. *Venus* (*B.-C. Mrs. J. Leeman* × *L.-C. Camhanniana*), a fine cream-white flower with rich crimson-purple lip with gold lines in the centre.

## Floral Committee.

Present:—Messrs. H. B. May (in the Chair), John Heal, G. Reuthe, W. Howe, Amos Perry, W. B. Gingell, A. Turner, Chas. E. Shea, D. B. Crane, Chas. E. Pearson, W. P. Thomson, J. T. Bennett Poë, W. G. Baker, G. W. Loder, E. A. Bowles, W. J. Bean, R. C. Notcutt, Reginald Cory, W. B. Cranfield, John Jennings, H. A. Darlington, G. W. Leak, Wm. Cuthbertson, R. W. Wallace, C. Williams, and J. W. Barr.

## AWARDS OF MERIT.

*Delphinium Nymph*.—A delightful variety with very shapely modest sized spikes of large, finely expanded, semi-double flowers of a clear and attractive cream colour, with pale sulphur yellow petaloid stamens. Shown by Messrs. PRICHARD AND SONS, Christchurch.

*Campanula R. B. Loder*.—A charming little bell flower about five inches high, bearing six to nine little bells on a stem, each about a half-inch in diameter, soft blue, and with one corolla fitted closely inside the other. It is, therefore, semi-double, but not inclegantly so. The parentage was not given. Shown by Messrs. M. PRICHARD AND SONS.

*Eryngium prostratum*.—A quaint little plant, quite diminutive, the leaves lying on the ground and the flower heads rising about one inch above. The latter are dull blue, with a silvery involucre. Shown by Mr. AMOS PERRY, Enfield.

*Lilium sulphurgale*.—This is a strong growing hybrid from *L. regale* and *L. sulphureum*. As shown it was nearly 5 feet high, with an abundance of narrow leaves and a head of eleven trumpet-shaped flowers. The latter are white with sulphur coloured throat, and purplish red on the outer sides of the outer three segments. We prefer *L. regale* to the hybrid. Shown by Mr. AMOS PERRY.

*Gladiolus primulinus Firecrest*.—A gorgeous hybrid with the elegance and hooded character of *G. primulinus*, but the colour is bright velvety scarlet with splashes of deeper hue towards the ends of the segments. Shown by Major CHURCHER, Alverstoke.

*Lavender Lady Violet*.—An interesting Lavender with creamy white leaves, each with a pale green centre. A few of the leaves have the grey-green colouring of the type. Shown by Mrs. V. CHARRINGTON, How Green, Hever-Keat.

*Lavender Prudence*.—A beautiful variety with stiff spikes of large deep lavender blue flowers that stand further out from the stem than in the usual form. Very fragrant. Shown by Mrs. V. CHARRINGTON.

*Carnation Jessie Murray*.—A white ground, fancy variety of fine shape and size. Each petal is marked down the centre and at the end with violet-rose; fragrant. Shown by Messrs. LOWE and GIBSON, Crawley Down, Sussex.

*Pyrus Aucuparia* var. *moravicus*.—A handsome tree of rather stiffer habit than the type, and apparently the leaflets are narrower. The fruits are deep yellow and when freely borne render the plant very effective. Shown by Messrs. R. VEITCH AND SON, Exeter.

## OTHER NOVELTIES.

In addition to the seedling Lavender which received an award of merit, Mrs. CHARRINGTON, How Green, Hever, exhibited a number of other seedlings including those named *Patience* and *Lettice*. These, we understand, were recommended for a certificate of appreciation, but unfortunately they were not on view in the hall. It appears that these Lavenders were to be placed before the Scientific Committee, but as that body does not meet until 4 p.m., there should have been time for them to be first placed in the hall so that the visitors might have had the opportunity of appraising their merits. Some excellent pot-grown *Cannas* were submitted by Mr. H. J. JONES. The varieties *Ami Max Kolb*, vivid crimson-scarlet and *J. B. van der Schoot*, yellow, with bright vermilion spotting, were exceedingly beautiful. A selection of very good *Antirrhinum* seedlings from their trial beds at Raynes Park were shown by Messrs. J. CARTER AND CO., and these were recom-

mended for trial at Wisley. Good seedling *Godetias* were also sent by Messrs. CARTER AND CO. *Kniphofia Rouge et Souffre*, from Messrs. M. PRICHARD, bears gorgeous spikes of vermilion-scarlet and soft yellow flowers. It was of exceedingly striking appearance, and seems worthy of a better fate than being "passed." In the hall Messrs. ROBERT VEITCH AND SON showed well flowered sprays of such half-hardy shrubs as *Notospartium Carmichaelia*, *Pentstemon cordifolius*, *Gaya* (*Plagianthus*) *Lyalli*, *G. glabrata*, *Hydrangea avernifolia* and the large-flowered *Lonicera Hildebrandtii*.

## GROUPS.

An excellent collection of Sweet Peas was staged by Messrs. SUTTON AND SONS, with their usual skill and perfect taste. The pink-flowered sorts were especially delightful, and these included *Doris Usher*, *Fripped Beauty*, *Giant Attraction*, *Picture* and *Mrs. Arnold Hitchcock*. There were also equally well-grown spikes of such brightly coloured sorts as *Tangerine*, *Charity* and *Edward Cowdy*. Adjoining these superb Sweet Peas Messrs. SUTTON AND SONS had an interesting collection of annual *Scabious* in pots. These plants bore plenty of graceful flowers, and were in named sorts. *Black Prince*, *Sutton's Mauve* and *Sutton's Pink*, with a bordering of *Four Thumb* in various colours. A smaller collection of *Dianthus* included the beautiful variety *Salmon Queen* (Gold Medal).

A smaller collection of Sweet Peas from Mr. J. STEVENSON was also of great merit. Besides many standard sorts he displayed several sterling novelties. *Poppy*, which is said to be absolutely sun-proof, is a glowing orange-red; *Cynthia*, a delightful soft-lavender; *Diana*, a darker toned bi-colour, and *Wild Rose*, of fascinating shading, are the names of only a few of the noteworthy novelties (Silver Flora Medal).

In a corner space Mr. H. J. JONES arranged especially good herbaceous *Phloxes*; *Jules Sander*, which was shown in quantity, is an excellent bright rose-coloured variety, while *J. J. Ryan*, blush lilac, and *Rhineland*, pale terra-cotta, are of more than average merit (Silver Flora Medal). Near by Messrs. L. R. RUSSELL, Ltd., had a collection of hardy trees and shrubs, which included a splendid standard double-flowered *Pomegranate* in bloom, well-coloured bushes of *Acer aureum*, the old favourite *Erythrina Crista-galli* and a beautifully golden *Jasminum aureum variegatum* (Silver Banksian Medal).

A long stretch of tabling was filled by Mr. M. PRITCHARD with a number of interesting hardy border plants and alpine. *Lavatera Olbia rosea*, in mass, was exceedingly effective. There were many border *Pinks*, *Mesembryanthemum roseum*, *Platycodeon Mariesii*, various half-hardy *Crimums*, herbaceous *Phloxes* and *Campanulas*. Of the last-named *Campanula Zoysii* is a very distinct and charming little plant, which flourishes in the moraine (Silver-gilt Banksian Medal).

*Lavatera Olbia rosea* was also well shown by Messrs. B. LADHAMS, LTD., who included in their large exhibit vases of *Alströmmeria revoluta*, *Stokesia praecox*, *Nepeta okranica* and *Scabiosa caucasica* varieties (Silver Flora Medal). Mr. AMOS PERRY had desirable vases of Lavenders, especially *Lavendula spica alba*, *Eryngium Zabelli*, *E. planum*, *Betonica spicata rosea*, *Polygonum Brunonis*, very reminiscent of *P. amphibium*, and *Spiraea crispifolia*, a neat species of truly crisp habit both in the sturdy flower spike and the fern-like leaves (Silver Banksian Medal).

Excellent *Delphiniums* were displayed by Messrs. BLACKMORE AND LANGDON. Many vases of *Gen. Sir D. Haig* were especially effective (Silver Banksian Medal). Messrs. BARR AND SON showed many spikes of *Lilium sulphureum* and *Watsonia Ardenae* (Bronze Banksian Medal). Mr. F. G. WOOD had masses of *Statice incana* with various border flowers and alpine (Bronze Banksian Medal).

Herbaceous *Phloxes* in variety, with various interesting shrubs, were set out by Messrs. J. CHEAL AND SONS. The latter included *Hedysarum multijugum* *Rhamnus Alaternus*, and there was a good lot of *Astiles* (Silver Flora Medal).

*Cytisus aetnensis* was a prominent feature in a collection by Messrs. WATERER, SONS, AND CRISP, who also showed *Phloxes*, *Delphiniums*, *Sidalcea Rose Queen*, and various *Campanulas* (Silver Banksian Medal). Mr. W. A. COLLIER had several vases of the elegant, frilled *Chrysanthemum maximum* Marian Collier, while Mr. CHAS. TURNER had an excellent strain of the same species (Bronze Banksian Medal). Messrs. MAXWELL AND BEALE showed dwarf Lavenders, with many border flowers and alpinas (Bronze Flora Medal). Mr. W. YANDELL had a large collection of *Violas*.

Various border flowers and Alpines were shown by Mr. G. REUTHE, who included several late *Rhododendrons* and a little collection of *Liliums* (Silver Banksian Medal); Mr. W. WELLS junr. (Bronze Flora Medal), Messrs. W. H. ROGERS AND SONS (Bronze Banksian Medal), the Misses HOPKINS (Bronze Banksian Medal), and Messrs. MAXWELL AND BEALE (Silver Banksian Medal).

Carnations were shown in quantity, and of good quality. Messrs. ALLWOOD, BROS., had beautiful vases of *Jessie Allwood*, *Edward Allwood* and *Destiny* (Silver Flora Medal). Mr. C. ENGELMANN included such sorts as *Tarzan*, *Nigger* and *Circe* (Silver Banksian Medal). Messrs. STUART LOW AND CO. had a large quantity of *White Pearl*, and also showed the Hon. C. Knollys and various *Roses* (Silver Banksian Medal). Messrs. J. B. GROOM AND SON had an interesting exhibit of their new hardy variety, *Mrs. G. R. Groom*, which appears to be exceedingly free flowering. It is stated to be a cross between a *Malmaison* and a *Perpetual* variety, and equally suited for pot culture or for the open border. The colour is a warm salmon rose, much like that of *Mary Allwood*, and it is pleasantly clove scented (Silver Banksian Medal).

Roses were better than might have been expected, in view of the recent inclement weather. Messrs. G. BUNYARD AND CO. had many good yellow sorts, such as *Christine*, *Golden Emblem*, *Margaret Dickson*, *Hamill* and the beautiful single varieties *Isobel* and *Sheila Wilson* (Silver Flora Medal). The Rev. J. H. PEMBERTON included goodly vases of *Ruth*, *Mermanid* and *Isobel* in his collection (Silver Flora Medal). Messrs. D. PRIOR AND SON had baskets of *George Dickson* and *Mrs. G. Marriott*, with vases of many other desirable sorts (Silver Banksian Medal). Messrs. F. CANT AND CO. included their good new varieties *Henry Nevard* and *Mrs. Alfred West* in their collection of beautiful *Roses* (Bronze Flora Medal).

In addition to their new variety, Messrs. LOWE AND GIBSON had a good collection of border Carnations, of which Mr. George Marshall and Jas. Griggs were excellent, and they also showed a few spikes of *Gladiolus* (Silver Banksian Medal).

#### Fruit and Vegetable Committee.

Present: Messrs. C. G. A. Nix (in the chair), J. Cheal, Owen Thomas, G. P. Berry, S. B. Dicks, W. F. Giles, F. Jordan, W. Harriss, E. A. Bunyard, J. Bates, W. H. Divers, P. C. M. Veitch, A. Bullock, and the Rev. W. Wilks.

Beyond the usual fruits for naming, the Committee had only a dish of Blackberries and a small collection of culinary Cherries to occupy their attention.

The Cherries, which were from Messrs. G. BUNYARD AND CO., were illustrative of several types of culinary fruit, but it was not complete, and Mr. E. A. Bunyard expressed the hope that he would be able to submit a better collection in the future. In the committee room there were dishes of such sorts as *Early May*, *Gros Gobet*, *Flemish Red*, *Montmorency* (short stemmed) and *Triaux*, and these were supplemented, in the hall, by fruiting branches of several of the sorts. The varieties *Triaux* and *Early May* were very prolific.

The dish of Blackberries was of the variety *Best of All*, and showed by Mr. CHARLES TURNER. It appears to be very free fruiting. The long, quite black "berries" were very juicy, but lacked flavour, which may be due to the excessive rains and absence of sunshine.

#### BIRMINGHAM HORTICULTURAL.

July 21 and 22.—This Society's annual floral fête was held in the Handsworth Park, although opinions were divided as to the advisability of holding a show during the present summer, seeing that last year's efforts resulted in a loss of about £1,500 when the venue was changed from Handsworth to Cannon Hill Park. The committee and officers have had a most anxious time, and are to be congratulated upon getting together such a wonderfully varied and good exhibition. The plant groups were a fine feature. Cut Carnations, Sweet Peas and hardy herbaceous flowers were excellent, and *Roses* have never been equalled at any previous show held under the auspices of the Society, the extensive display of new and well-known varieties of these favourite flowers from Messrs. DOBBIE AND CO. being of outstanding merit and well worthy of the highest award—a silver challenge cup offered for the best exhibit in the show.

The entries in the competitive classes set up a record, there being 650—a hundred more than last year, whilst in the non-competitive section, including sundries, there was similar gratifying progress. The attendance of visitors on the first day of the show was very satisfactory, and it is reported that most of the 10,000 tickets available for sale were sold prior to the opening of the show.

#### GROUPS AND PLANTS.

There were four splendid groups, each arranged on a circular space down the centre of the main tent. The first prize was won by Messrs. J. CYPHER AND SONS, Cheltenham, whose display was noteworthy for the artistic arrangement of *Orchids*, *Ixoras*, *Kalanchoes*, *Francoas*, *Clerodendrons*, and highly-coloured *Codiaeums*, over which tall *Humea elegans* waved their graceful flowering sprays; 2nd, Sir GEORGE H. KENRICK, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), whose group included the familiar arch decorated with choice foliage and flowering plants. The body of the group contained some beautifully flowered *Ixoras* and well-coloured *Codiaeums*, *Nandina domestica*, *Selaginellas* and *Begonias*; 3rd, Mr. W. R. MANNING, Dudley; 4th, H. GREEN, Esq., Gravelly Hill (gr. Mr. G. W. Marsh).

E. J. KEELING, Esq., Small Heath, won first prize for six well grown specimen *Coleus*, and C. T. BARLOW, Esq., Handsworth (gr. Mr. F. J. Davies) took the lead in a class for six *Fuchsias*—all remarkably well grown and profusely flowered. The class for tuberous-rooted *Begonias* only attracted one exhibitor, Mr. L. H. MARTYN, who was awarded 2nd prize.

#### CUT FLOWERS.

Dinner tables decorated with flowers are always a feature at Birmingham. The first prize this year was awarded to W. J. GRESSON, Esq., Stoke Severn, Worcester (gr. Mr. T. Parry), for a light arrangement consisting principally of *Francoa*, *Gloriosa* and *Streptocarpus*, relieved with narrow reddish-coloured *Codiaeum* leaves and sprays of *Selaginella*; 2nd Sir GEORGE H. KENRICK, whose flowers included *Orchids*, *Gloriosa*, *Oleander*, *Pancreatium* and *Eschscholzia*; 3rd, Mr. C. GREGORY, Chilwell. In a decorated dinner table class reserved for ladies, Mrs. J. V. MACDONALD beat Mrs. W. E. BALL, of Edgbaston. The best epergne of flowers was arranged by Mrs. E. COLLETT, of Handsworth.

#### ROSES.

The leading class was one for a collection of cut blooms, arranged on a space of 20 feet by 5 feet, for which a silver challenge bowl, value twenty guineas, presented by Alderman W. A. Cadbury, and £15, were offered as first prize; this award was won by Messrs. GUNN AND SONS, Olton, for a wonderfully fine display, which included a number of pillars about 9-10 feet high clothed with first quality blooms, and backed by large masses of *Padre*, B. W. Walker, Modesty, *George Dickson*, *Lyon*, *Queen Alexandra* and *Ophelia*; 2nd Mr. ELISHA HICKS, Hurst, Berks, whose general arrangements followed on pretty much the same lines as those of Messrs. GUNN AND SONS. He had effectively clothed pillars of *Mrs. Herbert Stevens*, *John*

*Hart*, *Madame Abel Chatenay*, and handsome clusters of *Mrs. Henry Morse*, *Los Angeles*, *Golden Emblem*, and *Queen Alexandra*; 3rd Mr. JOHN MATTOCK, Oxford. An extra prize was recommended to Mr. THOMAS ROBINSON, Nottingham.

The best of five exhibits of twelve bunches of garden *Roses* distinct, came from Mr. ELISHA HICKS, who had handsome examples of *Melody*, *Henrietta*, *Charles E. Shea* and *Los Angeles*; 2nd Mr. JOHN MATTOCK, whose best bunches were *K. of K.*, *Ophelia* and *Queen Alexandra*; 3rd Mr. CHARLES GREGORY, Chilwell, Notts. The last-named exhibitor excelled in classes for (1) a bowl of *Roses* and (2) twenty-four *Roses* with beautifully fresh specimens of *George Dickson*, *Mrs. H. Morse*, *Queen Alexandra* and *Mrs. H. R. Darlington*. Messrs. HUGH DICKSON, Ltd., Belfast, were second in the last-named class and first for (1) 18 *Roses* and (2) 12 *Tea Roses*.

Of the two contestants in the class for 12 self Carnations, Mr. H. WOOLMAN, Shirley, took the lead with large, fresh blooms. The other exhibitors were Messrs. A. R. BROWN, Ltd., Kings Norton. The same two exhibitors were placed as named in the class for 12 yellow ground fancy Carnations, but in the class for 12 fancy Carnations other than yellow or buff grounds, Messrs. A. R. BROWN were the only exhibitors, and they were deservedly awarded first prize for rather small but perfect blooms.

The best display of *Sweet Peas* on a space of 20 feet by 4 feet, for which a 20-guinea challenge cup and £8 were offered as first prize, came from Messrs. E. W. KING, Coggeshall, who had splendid flowers. Another challenge cup, value 6 guineas, and £2, offered for 24 bunches of *Sweet Peas*, was well won by the Misses RUSSELL, Barton Court, Canterbury (gr. Mr. C. H. Rundle), whose stout-stemmed, substantial flowers were of great merit; Sir R. GRAHAM, Netherley, Carlisle (gr. Mr. F. C. Hallett), was second, and W. E. WARDER, Esq., Earlswood (Mr. W. HOPSON) was placed third.

The winning exhibit of 24 bunches of hardy border flowers (annuals and shrubs excluded) came from THE CHALK HILL NURSERIES, Reading; 2nd, H. WATSON SMITH, Esq., Stourbridge (gr. Mr. H. Davis); 3rd Mr. E. J. KEELING, Small Heath.

The three sets of 12 vases of *Violas* of exceptional merit, and there was very little difference between the first and second prize stands, which were beautifully clean, fresh, well set up, and of good substance; 1st, Mr. W. T. DESMOND, Moseley; 2nd, Mr. J. R. BASTOCK, Moseley; 3rd, Mr. W. J. CONDRY, Harborne. The class reserved for a tastefully arranged display of *Violas* on space of 9 feet by 3 feet, was disappointing. 1st, Mr. J. R. BASTOCK; 2nd, Mr. H. J. TANNER, Sparkhill; 3rd, Messrs. A. R. BROWN, LTD., Kings Norton.

#### AMATEURS' EXHIBITS.

The best display of cut flowers arranged on a space of 9 feet by 3 feet, was shown by H. WATSON SMITH, Esq., Stourbridge (gr. Mr. H. Davis); 2nd, Mr. E. J. KEELING. The most successful exhibitors of *Roses* were Gulliver Speight, Esq., Market Harborough, who won first prize for 18 varieties, and second prizes for (1) 12 varieties, and (2) 6 varieties; C. B. WORSEY, Esq., Edgbaston (gr. Mr. A. Davis), who was 2nd in the first-named class and first for 12 varieties; C. DIXON, Esq., Sheffield, who showed the best half-dozen varieties.

The Misses RUSSELL, Canterbury, had the winning stand of 12 border Carnations, and beat five contestants in the class for 12 vases of *Sweet Peas*. J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), won first prizes for (1) a group of plants, (2) three Ferns, (3) six *Begonias*, (4) collection of Ferns, and (5) 12 *Streptocarpus*. Sir GEORGE H. KENRICK showed the best 6 table plants.

#### FRUIT.

In the classes reserved for soft fruits, C. T. BARLOW, Esq. had the best Black Currants, and Miss J. SMITH led with Red Currants and Loganberries. W. J. GRESSON, Esq., sent the

winning exhibit of Gooseberries, and Sir R. GRAHAM (gr. Mr. C. F. Hallett) showed the best lot of Strawberries.

## VEGETABLES.

W. J. GRESSON, Esq. (gr. Mr. T. Parry) was awarded first prizes for two collections of vegetables, as well as first prizes in single dish classes for Runner Beans, Carrots, Onions, Cucumbers, Cauliflowers and Tomatos.

## NON-COMPETITIVE.

*Large Gold Medal.*—To Messrs. DOBBIE AND Co., Edinburgh, for Roses; to Mr. C. ENGLEMAN, Saffron Walden, for Perpetual Carnations; to Messrs. BAKERS, Wolverhampton, for hardy flowers; to Messrs. WEBB AND SONS, Stourbridge, for Sweet Peas.

*Gold Medal.*—To Messrs. RYDERS, St. Albans, for vegetables and cut flowers; to Messrs. STUART LOW AND Co., Enfield, for Orchids and Carnations; to Mr. C. H. HERBERT, Acocks Green, for Pinks; and to Mr. C. VICKERS, Leicester, for bouquets.

*Silver Gilt Medal.*—To Mr. H. H. ELLISON, West Bromwich, for Ferns and Cacti; to Messrs. ISAAC HOSE AND SON, Bristol, for Scabious and Gaillardias; to Messrs. BOWELL AND SKARRATT, Cheltenham, for rock plants; to Messrs. JARMAN AND Co., Chard, for Centaureas and Roses; to Messrs. LOW AND GIBSON, Crawley Downs, Sussex, for Border Carnations; to Messrs. T. B. GROVE AND SONS, Sutton Coldfield, for hardy flowers; to Mr. W. WELLS, JUNR., Merstham, for hardy flowers; and to THE CHALK HILL NURSERIES, Reading, for hardy flowers.

*Silver Medal.*—To Miss S. S. THOMPSON, Handsworth, for Cacti; and to Messrs. MAXWELL AND BEALE, Broadstone, for Rock plants.

## ABSTRACT PUBLISHED THIS MONTH.

*Spraying Powder.*—Patent No. 180,468. A new portable plant for spraying insecticides and similar powders on to fruit trees, etc., has been designed and brought out by Mr. S. Ballard, of Grovesend Fruit Farms, Colwall, Malvern, Worcestershire.

It comprises a wheeled truck on which is mounted a small petrol or paraffin engine. The truck may be drawn by hand or animal power, or may be propelled by gearing from the engine. The exhaust gases from the engine are conveyed through a pipe ending within a larger pipe in an ejector nozzle, the pipe being continued slightly diminished in diameter and terminating in a branch piece, to which flexible hoses are attached. Powder contained in a hopper is kept agitated by a vane wheel, which may be driven by gearing from the engine, and passes down through a rotary feed box fitted with a revolving brush or roller and having an adjustable outlet to ensure an even feed, and enters the pipe adjacent to the nozzle of the pipe through a branch pipe. A pressure chamber fitted with a gauge may be interposed between the engine and the injector nozzle, so that the engine speed may be regulated to produce an even pressure.

This list is specially compiled for *The Gardeners' Chronicle*, by Messrs. Rayner and Co., Registered Patent Agents, of 5, Chancery Lane, London.

## ANSWERS TO CORRESPONDENTS.

**BLUE HYDRANGEAS:** *A. J. B.* Hydrangeas often develop inflorescences in which the bracts are perfectly blue. This colouring is sometimes due to the particular nature of the soil, and in other cases it is induced by feeding the plants with a special preparation.

**CARNATION RUST:** *N. McM.* The plants are attacked with Carnation rust. Spray the plants with potassium sulphide, but if the disease is very severe burn the diseased plants and obtain fresh stock.

**GALLS ON CONIFERS:** *G. J. M.* The galls on the Conifers are the result of the working of the Pine chermes, *Chermes abietis*. This insect is one of the aphids, but the group to which it belongs has a much more complicated life history than most aphids. The founders of the colony hibernate during the winter, but on the approach of spring they begin to feed and subsequently lay eggs in the axil of the young leaves. This causes the base of the young leaves to thicken, forming cavities, in which the young larvae feed. They thus form a sort of false cone. In June the scales of the cone separate and the pupae crawl out. These soon change to the winged state and fly away to infest other trees.

**HEATING AN AMATEUR'S GREENHOUSE:** *Biscuit Reading.* You could utilise an oil lamp or oil stove for the heating of your greenhouse, but this would not be so satisfactory as the use of hot water by means of boilers and pipes.

**MAPLE LEAVES WITHERED:** *E. J. R.* The shoots are not affected with disease due to fungus or insects, but apparently are suffering from the effects of drought. Doubtless, last season's dry summer has been partly responsible.

**NAMES OF PLANTS:** *G. H. 1.* Probably *Cistus salicifolius*; 2, *Pentstemon heterophyllus*; 3, *Glaucium flavum tricolor*; 4, *Phacelia tanacetifolia*; 5, *Sedum hispanicum*.—*L. C.* *Arum Draconculum*.—*L. S. A. 1.* *Senebiera didyma* (Swine's Cress); 2, *Arrhenatherum elatius* (Oat Grass); 3, *Sisymbrium officinale* (Hedge Mustard).—*A. C. P.* *Salvia virgata*, var. *garganica*.—*H. H. S.* and *W. N.* We cannot undertake to name florists' flowers.

—*A. G. 1.* *Iris graminea*; 2, *Polygonum capitatum*; 3, *Asarum europaeum*; 4, *Sedum altissimum*; 5, *S. spurium*.—*L. S. A. 1.* *Linaria purpurea*; 2, *Hordeum murinum* (Wall Barley); 3, *Veronica lobeloides* (often named Blue Gem).—*F. E. W.* Probably *Aconitum vulpularia*, and *Salvia verbenaca*. The Rose was too withered to recognise.—*S. C. H.* *Phormium tenax* (New Zealand Flax).—*A. T. S. 1.* *Cistus oblongifolius*; 2, *Centranthus ruber* and *C. r. alba*; 3, *Anchusa italica*; 4, *Juniperus communis*; 5, *Tamarix aestivalis*; 6, *Clematis tangutica*; (un-numbered), *Verbascum Thapsus*.—*G. S. 1.* *Alströméria peruviana*; 2, *Hypericum Androsaemum*; 3, *Olearia Haastii*; 4, not recognised.

**RASPBERRY FRUITS FAILING TO MATURE:** *C. H. L.* The trouble is due entirely to drought. The Raspberry develops numerous surface feeding roots and during the hot summer of last year and the spring of the present year the conditions were too dry, with the consequence that these feeding roots were in many cases killed. In order to obviate the trouble next season, apply a mulch of manure to the roots early in the season.

**TOMATOS:** *H. T.* The disease on the leaves is known as Tomato rust, caused by the fungus *Cladosporium fulvum*. Spray the plants with Bordeaux mixture. The fruits with hard, yellow patches at the base are not affected with fungous disease. The trouble is said to be purely a physiological one and due to a lack of potash in the potting compost. Use wood ash or sulphate of potash in the soil for Tomatos.

**Communications Received.**—*A. C. B.*—*A. R.*—*J. G. J.*—*E. R.*—*H. B.*—*Anxious.*—*G. R.*—*C. B.*—*Constant Reader.*—*W. G. D.*—*A. B.*—*C. E.*—*O.*—*C. L.*—*N. O. R.*—*Reading.*—*Woodcroft.*—*J. M. W.*—*T. J. B.*—*W. L. W.*

REMARKS.—The lower values now prevailing in most departments should stimulate demand for the better supplies now becoming available. English Tomatos are plentiful, and, with large quantities arriving from Holland, prices are considerably lower. Better weather conditions should tend to improve inquiries for Cucumbers, which are moderate in price. Choice fruits are quoted lower, the demand for Peaches, Nectarines, Graps, Melons and Figs being weaker. English Apples increase in supply daily; for them there is a fair demand. The few Early River Plums, moderately ripe, have sold well. Cherries are not so plentiful, but still ample for the demand at present prices. Gooseberries, both dessert and cooking, move fairly freely, although values are not very high except for a few choice, large, dessert berries. The Australasian Apple season is almost finished, the last cargo having arrived. Green vegetables are plentiful and cheap. French and Runner Beans are also selling at low prices. The competition of field-grown Mushrooms is keeping down the prices of indoor-grown Mushrooms. New Potatoes are in ample supply, and very moderate in price.

REMARKS.—In the flower department there is no great demand for any special line, and many kinds show a further reduction in price. Carnations are again the most plentiful, and there are some very cheap grades amongst Roses. Asters are getting more numerous, and a return of summer-like weather would bring in abundant supplies of these blooms. Other kinds also show a further increase. Delphiniums are finishing, but there are large supplies of *Statiche incana*, *S. latifolia* and *S. sinuata*. Lavender is also arriving in excellent condition, and the supplies appear sufficient for the demand. *Lilium longiflorum* is again falling in price; pink and white *L. speciosum* are good in quality. The general conditions throughout the market show no improvement on last week, practically all supplies exceeding the demand.

## GARDENING APPOINTMENTS.

**Mr. P. W. Ambrose**, for nearly seven years Gardener to Lady Maryam at Henon Castle, Saundersfoot, Pembrokeshire, as Gardener to the Governors, Imperial Service College, Clewer Manor, Windsor, Berkshire (Thanks for 2s. 6d. for R.G.O.F. Box.—Edb.)

**Mr. A. Ballard**, previously Gardener at Barford House, Warwick, as Gardener to Mrs. Noble, Kingswood House, Hare Hatch, Twyford, Berkshire.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.1°.

**ACTUAL TEMPERATURE:—**

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, August 2, 10 a.m. Bar. 30.2; temp. 63°. Weather—Fine.

**Photosynthesis of Nitrogen Compounds.** The mode of manufacture of organic nitrogen compounds by plants has been the subject of much experiment and more conjecture, but has nevertheless remained one of the major mysteries of the plant world. It has, of course, long been known that the nitrogen found in the complex organic compounds contained in plants—the amino compounds and the proteins—is derived from inorganic sources. The roots of plants absorb nitrates, and in some cases salts of ammonia. Nitrates may be traced in the plant to the leaves, but of the chemical change whereby the nitrogen of these nitrates becomes combined with carbon and other elements to form organic nitrogen compounds, nothing certain was known. Recently, however, Profs. Boly, Heilbron and Hudson have published in the *Journal of the Chemical Society* (June, 1922) the results of a series of investigations which appear to elucidate the phenomena of nitrogen assimilation. Their previous researches had led them to conclude that in the assimilation of carbohydrates by the green parts of plants exposed to sunlight, the raw

materials involved in this process—carbon dioxide and water—are decomposed with the formation of formaldehyde and oxygen. The latter substance is given off by the plant, but the former substance undergoes further change with the result that sugar appears in the green leaf. From this substance all the various carbohydrates and similar carbon compounds—starch, cellulose, etc.—of the plant are derived. According to the new researches already referred to, the formaldehyde thus formed photosynthetically is in an active state, that is, able to enter readily into combination with other substances. It is claimed that in the leaf it reacts with potassium nitrate to produce substances which may be described as forerunners of proteins. On this view the formation of the organic nitrogen compounds of the plant is no less dependent on radiant energy than is that of the sugars. In the absence of light, plants are still able to combine simpler nitrogen-containing organic compounds into the more complex proteins, but apparently it is only in the green leaf that the synthesis of these simpler compounds is effected. The most novel aspect of these researches lies in the evidence which they adduce for one and the same product of photosynthesis—formaldehyde, as the starting point for two divergent and fundamentally important lines of chemical construction—one, the line which leads to the appearance of sugar, the other that which leads to the production of proteins.

**Presentation of the Forrest Collection to Kew.**—We learn from the current issue of the *Kew Bulletin* that the important and valuable collections of dried plants made by Mr. George Forrest during the period 1916-1919, when he was engaged on his botanical explorations in N.W. Yunnan and S.E. Tibet—chiefly on the ranges which divide the three great rivers, the Yangtze-kiang, the Mekong, and the Salween, draining these regions—have been very generously presented to the Royal Botanic Gardens, Kew, by the syndicate under whose auspices Mr. Forrest carried out his explorations. Out of the 6,000 numbers collected during those years, an almost complete set has been presented to Kew, all labelled with Forrest's numbers and determined at the Royal Botanic Gardens, Edinburgh. Previous collections by Forrest are already well represented in the Herbarium, and the present consignment, which keeps up to the former standard in excellent selection and preservation, will form a valuable addition to the national collections from these mountains.

**R.H.S. Teachers' Honours Examination in Horticulture.**—For the Teachers' Honours Examination in School and Cottage Gardening, held by the Royal Horticultural Society, on April 22 and June 23, 1922, seven candidates presented themselves, of whom one has satisfied the examiners in section (a) and two in section (c). The examiners, Messrs. A. Simmonds, A. D. Turner and A. J. Cobb unanimously reported that the practical work was below the standard that they expected of the candidates, and pointed out that without experience in practical work no candidate can expect to satisfy them. They urged that all candidates should show a sound knowledge of general horticulture before being allowed to specialise in any particular branch. The Council has therefore decided that the examination shall for the present be concerned with the general principles of horticulture and with their application to practical work, and that no candidate shall be allowed to specialise. The following are the successful candidates:—Section (a): A. E. Sims, 3, Green Side, Ripley, Surrey; Section (c): R. Lock, Gaunts Common, Wimborne, Dorset; J. C. Thompson, The Holme School, Leybourne, West Malling, Kent.

**Examination for the N.D. Hort. Diploma.**—The Royal Horticultural Society's National Diploma in Horticulture has been awarded to the following as a result of the written and practical examinations for the Diploma held this season:—Section 1: General Horticulture.—Miss D. F. Cavalier, c/o Major E. Macdonald, Littlecote Hall, Burgess Hill, Sussex; S. J. Channing, Norton Manor Gardens, Sutton Scotney, Hants; Miss C. Choules, 5, The Avenue, Hornchurch, Essex; H. Gethen, Mondamin, West Mersea, Essex; Miss M. H. Henning, The Cottage, Park Hall, Hayfield, Derby; Miss K. L. Syer, Charlton, East Sutton, Maidstone, Kent. Section 1 (b): Fruit and Vegetable Growing.—C. J. Glead, 31, North Walls, Winchester, Hampshire; H. F. Maidment, The Gardens, Somerset Farm Institute, Cannington, Bridgewater, Somerset. Section 1 (c): Fruit Growing.—J. W. Hall, 13, George Square, Edinburgh; D. G. Henry, 18, Pitt-street, Portobello, Midlothian. Section 6: Public Park Gardening.—F. Baker, Parks Department, Mesnes Park, Wigan, Lancs.; L. E. Morgan, Queen's Park, Victoria Avenue, Crewe. Section 7: Horticultural Inspection.—C. H. Oldham, Ivy Dene, Chandlersford, Southampton. The following have also passed the preliminary examination, and will be eligible to take the final examination when they have completed the necessary six years of practical experience in gardening:—W. G. Ayres, The Nook, Enham Village Centre, Andover; S. Baker, 14, Victoria Parade, Kew Gardens, Surrey; W. E. Cole, 1, London Road, Reading; Miss W. A. Crafer, Oakcroft, Parkgate Road, Saughall, Chester; F. H. J. Fanner, Drayton Manor Nurseries, Chichester; I. Dowding, 20, Rising Brook, Stafford; Miss V. G. Hartley, Hockerill Training College, Bishop's Stortford; Miss D. M. Harger, Studley College, Studley, Warwickshire; H. B. Impett, Higher Lane, Fazakerley, Liverpool; J. R. Lewis, c/o Mrs. Bennett, 150, Church Road, Burgess Hill, Sussex; Miss L. D. Millen, Leiper's Building, Crossford, Carlisle, Lanarkshire; Miss L. I. Milne, Ballyoukan Lodge, Pitlochry, N.B.; J. S. Mitchell, 49, Belvedere Road, Bexley Heath, Kent; W. R. Pearson, 43, Clarence Road, Moseley, Birmingham; J. T. Peers, Clayton Manor Lodge, Clayton-le-Dale, Blackburn; A. J. Purser, 1, Hewlett Place, Cheltenham; Miss A. Redfern, Park Hall Cottage, Hayfield, Derbyshire; Miss N. Surman, Walmor College, Chester; R. Wightman, 46, Victoria Road, Aldeburgh, Suffolk.

**Preservation of Plums.**—The Plum crop in this country during the last few years, and particularly in 1919 and 1920, was small and few householders were able to obtain a sufficient supply to enable them either to preserve the fruit by bottling or to turn it into jam. This year in most districts of England, heavy crops of Plums are expected, especially of those varieties which are eminently suitable for bottling and for jam making, and prices are likely to be low. As the season commences early in August, and is of short duration, advantage should be taken of the opportunity to secure a large supply of Plums, in order to preserve them, either by bottling, canning or jam making, for use until the Plum season comes round again. Bottles are in plentiful supply, and the process of bottling is quite simple. A useful leaflet giving a full account of the process of bottling is issued by the Ministry of Agriculture, single copies of which can be obtained free of charge on application to the Ministry's Office, 10, Whitehall Place, S.W. 1.

**Potato Trials in Midlothian.**—On the 26th ult., a public demonstration was held at East Craigs, Corstorphine, the Scottish Board of Agriculture's Plant Registration Station, on the varieties of Potatoes under observation this season, and there was an attendance of over one hundred Potato growers from all parts of Scotland. The station is adjacent to the newly-established Scottish station for research in plant breeding, and is about five miles west from Edinburgh. The Plant Registration Station, which is intended to supply, *inter alia*, information to agriculturists and others regarding

the susceptibility or immunity of Potatoes to Wart Disease, and as regards type, season, cropping properties, etc., is in the charge of Mr. Thomas Anderson, B.Sc., the Director of the Seed Testing Station. A Synonyms Committee has also been appointed to deal with new varieties sent in, and to recommend for registration such as are immune and are likely to be acceptable. Notwithstanding the Board's repeated warnings, however, the number of old varieties sent in for immunity test this season was larger than ever before, and included British Queen (seven varieties under different names), Up-to-Date, Sharpe's Express, President, Ally, Eclipse, Great Scot, Northern Scot, and others, and eight varieties were mixed up in combinations like Eclipse, Great Scot and British Queen, and Ally, Arran Chief and Up-to-Date. Mr. Anderson explained that the Seeds Act of 1920 required sellers of seed Potatoes to disclose the variety, and to state whether or not the stock was pure, and that at the instance of the Farmers' Union and the Seed Trades' Association the Board had decided to include all varieties in their inspection this season. The area to be inspected amounts to 40,000 acres, and it was necessary to give the temporary inspectors a thorough training before they could be entrusted with the work, for which there is material at East Craigs. There were also exhibited commercial stocks of common varieties for information purposes; maturity and cropping tests for the comparison of varieties, and to obtain information as to the best methods of comparing new varieties with old ones; and plots of varieties submitted for registration and for immunity tests, the latter being conducted at another station. A reference collection for the instruction of the inspectors, and samples of the "rogues" found in the course of inspection last year, many of which have been found not to belong to any known variety, were also exhibited. The Potato plots were looking well, but owing to the backward season the crops were late.

**Official Seed-Testing Charges for England and Wales.**—As from August 1, 1922, the following increases will be made in the fees charged by the Official Seed Testing Station for testing samples of seeds:—Grasses and Clovers (old fee) 4s., (new fee) 5s. per sample; mixtures of Grasses and Clovers (old fee) 4s., (new fee) 10s. per sample. Mixtures of Perennial and Italian Ryegrass, and mixtures of Alsike and White Clover, when stated to have been grown together, will not be regarded as mixtures, and will be tested for 5s. per sample. Special facilities will be offered for carrying out tests on payment of the ordinary fee, plus an additional charge of 50 per cent. thereof, and the cost of telegraphing the result of the test if a telegram is asked for. These facilities will only be granted to samples which are plainly marked with the word "Rapid." No other form of words will be recognised. All other fees, including the farmer's fee of 6d. per sample, will remain unchanged. A leaflet giving full particulars of the fees and conditions of testing can be obtained post free on application to the Chief Officer, Official Seed Testing Station, Huntingdon Road, Cambridge.

**Plagianthus Lyallii.**—From Messrs. Robert Veitch and Son we have received splendid sprays of *Plagianthus Lyallii*, the beautiful form which they exhibited at the Royal Horticultural Hall on July 25. Three years ago they exhibited it at the R.H.S. under this name and received an Award, and when specimens were submitted to Kew the authorities considered it to be the type plant. The Exeter firm considers their form to be "quite distinct, with its hirsute, silvery leaves, while the old form has shiny green leaves and is distinguished by the name *glabrata*. Our large plant is 14 ft. high and very upright. It is a mass of pure white bloom, and this, with the silvery leaves, gives it a delightful appearance."

**New Secretary of the Kew Guild.**—Mr. A. Osborn, who for many years has acted so ably as Honorary Secretary of the Kew Guild, and Editor of the *Kew Guild Journal*, has resigned these positions owing to pressure of business.

Fortunately the Guild Committee has prevailed upon Mr. A. C. Bartlett to take up these duties. Mr. Bartlett resides at Kew Road, Kew, and is in close touch with the gardens and present Kewites by virtue of his residential proximity, but as he travels about a good deal in the course of his business as a tree expert and landscape gardener, and attends the principal metropolitan exhibitions, he also meets many old Kewites. As Mr. Bartlett has always been an ardent "Guilder" and possesses considerable journalistic ability, the appointment is in every way a suitable one. Mr. Bartlett hopes that old Kewites in various parts of the world will send him interesting notes of their doings and experiences for use in the *Journal* of the Kew Guild.

**M. Alexis Callier.**—Those who visited the exhibitions of the Société Royale d'Agriculture et de Botanique de Gand, at Ghent, during the latter half of the last century, will remember that for a considerable period Comte Oswald de Kerchove was the President of the Society and took a very prominent part in everything connected with the great quinquennial exhibitions

M. ALEXIS CALLIER.

of his time. After the Comte de Kerchove's death the responsibilities of office were placed upon M. Alexis Callier, who carried them out to the great satisfaction of all concerned and made an admirable successor to the Comte. M. Alexis Callier has remained President throughout the disturbing period of the war, and his many friends are delighted to know that he is entering into the arrangements for the exhibition to be held in 1923 with all the zeal and graciousness that characterise his activities. He is extremely popular in Belgium, and very many British horticulturists who remember his courtesy and courtliness are looking forward to meeting him and his confrères at the next "Ghent Quinquennial."

**Report on the Condition of Outdoor Fruit Crops.**—In our issue for August 12, we hope to publish our annual, tabulated report upon the condition of the outdoor fruit crops in England, Ireland, Scotland, Wales, Isle of Man, and Channel Islands. This will be accompanied by the usual summaries and a leading article dealing with the most important features of the general report.

**Empire Forestry.**—*Empire Forestry*, the journal of the recently formed Empire Forestry Association, contains in its first number, issued in March, an interesting summary of the magnitude of the Empire's forest resources. Canada owns 932,420 square miles of forests, of which about one-third are merchantable; British India

possesses 126,310 square miles of merchantable forest; Nigeria 50,400, and Anstralia 37,840 square miles. Of these vast forest areas about 75 per cent is the property of the State.

**Philadelphus argyocalyx in the Arnold Arboretum.**—Described by Wootton in *Bull. Torr. Bot. Club*, in 1898, *Philadelphus argyocalyx* has flowered this year for the first time in the Arnold Arboretum. We learn from the *Bulletin of Useful Information*, issued by the Arnold Arboretum, Jamaica Plain, Mass., U.S.A., that the specimens of this handsome plant which have flowered recently were gathered in 1916, on the Sacramento Mountains, New Mexico, at an altitude of 8,500 ft. It is a small shrub with small elliptic leaves; the flowers are solitary, an inch across, and the calyx, like the lower surface of the leaves, is covered with a thick mat of snow-white hairs. It flowers late, at the same time, or only a little earlier than the hybrid *P. insignis*, which blooms later than any other *Philadelphus* in the collection at the Arnold Arboretum.

**Sleepy Disease of Tomatos.**—A detailed and interesting account of the Sleepy Disease of the Tomato, contributed by Dr. W. F. Bewley, Director of the Experiment and Research Station, Cheshunt, Herts, to the *Annals of Applied Botany*, has been reprinted and issued in booklet form. The accounts of experiments conducted at Cheshunt in the endeavour to find a cure for this disease are supplemented by informing illustrations. Dr. Bewley considers the Sleepy Disease or "wilt" of Tomatos may be caused by one of two fungi, *Fusarium lycopersici* or *Verticillium albo-atrum*. The fungi attack the roots of the plant and grow up through the vascular bundles into the stem, leaves, and sometimes into the fruits. Experiments show that *F. lycopersici* grows best in an average temperature of 27.8°-28.9° C., but if the temperature remains constantly much below this, little infection results. On the contrary, *V. albo-atrum* develops well at temperatures from 15.6°-24.0° C., and is most active at 21.1°-22.8° C., but above an average temperature of 25° C. little infection occurs. It will be found that wilted plants soon die under conditions of low temperature, but may recover if the average temperature is raised above 25° C., and will then carry on a crop so long as the high temperature is maintained. Most varieties of Tomatos cultivated in this country appear to be susceptible to *Verticillium*, but Manx Marvel has proved to be practically immune and Bide's Recruit highly resistant. Varieties resistant to *Fusarium* wilt disease have been raised in America and an attempt is being made at Cheshunt to raise a strain resistant to *Verticillium*. Further investigations concerning soil sterilisation in connection with wilt disease are also being made by Dr. Bewley.

**Scholarships for the Sons and Daughters of Rural Workers.**—We learn from the Ministry of Agriculture that, in accordance with the Corn Production Acts (Repeal) Act, 1921, a scheme has been approved for awarding scholarships in higher agricultural education to sons and daughters of agricultural workmen or of other rural workers, including bailiffs, foremen, and small-holders, whose financial circumstances are comparable to those of agricultural workmen. The scholarships are of three kinds—Class I, which will enable the holder to attend the degree courses in agriculture at certain University Departments (including the School of Rural Economy, Oxford, and the School of Agriculture, Cambridge); Class II, which will be tenable for two years at certain University Departments of Agriculture and Agricultural Colleges, and Class III, which will allow students to attend courses of one year's duration, or less, in agriculture (or horticulture, or dairying or poultry keeping) at Farm Institutes or similar institutions. Ten scholarships in Class I, ten in Class II, and a limited number in Class III, probably not exceeding 100, will be awarded this year if a sufficient number of suitable candidates is forthcoming. Candidates for Class I and Class II scholarships must be 17 years of age or over, and must satisfy a selection committee that they have sufficient ability to pass the entrance examination to the

university or college at which the scholarship will be tenable, and also that they are in a position to derive educational benefit from the course of training. Class III. awards are intended for boys and girls whose educational opportunities have been more limited. Candidates for these scholarships must be over 16 years of age and must have spent at least a year in all on a farm or in a horticultural establishment. Evidence may be required as to the means of the candidate's parents or guardian. Applications should be lodged with the Secretary, Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1, not later than August 31, 1922. Forms of application and all other information regarding the scholarship scheme can be obtained from the Ministry.

**Appointments for the Ensuing Week.**—Monday, August 7.—Swanage Horticultural Society's show; Boston and District Horticultural Society's show; Keynsham and District Horticultural Society's show (two days); Chippenham and District Horticultural Society's show; Seaham Harbour Horticultural Society's show; Drayton Horticultural Society's show; Lichfield Horticultural Society's show; Ringwood Society's show; Bletchley and Penny Stratford Horticultural Society's show. Tuesday, August 8.—Northampton Municipal Horticultural Society's show (two days); Leicester Abbey Park Society's show (two days). Wednesday, August 9.—Royal Horticultural Society's Committees meet; East Anglian Horticultural Society's meeting; Sheffield Chrysanthemum Society's meeting; Tighnabruach Flower Show. Thursday, August 10.—Yorkshire County show at Huddersfield; Cheshire County show at Stockport; Lancashire County show at Manchester; Bristol and District Gardeners' Association's meeting; Market Bosworth Horticultural Society's show; Hornsey and District Chrysanthemum Society's meeting; Port William Flower Show. Friday, August 11.—Paisley Florists' Society's meeting; Brechin Flower Show. Saturday, August 12.—Ringwood Society's meeting; Aberdour Flower Show; Auchencrow Flower Show; Dumbartonshire Sweet Pea show at Helensburgh; Dysart Flower Show; Fossoway Society's show; Meigle and District Flower Show; Stonehaven Flower Show.

"The Gardeners' Chronicle" Seventy-Five Years Ago.—*Examination in Botany at University College.*—The following examination paper was used in University College, London, for the senior class of Botany, Midsummer, 1847: (1) What is protoplasm? and what its chemical difference from the cell-wall? (2) Describe briefly the structure, station and supposed origin of starch, and the use of it in the vegetable economy. (3) What are hairs? (4) Can hairs be used advantageously in distinguishing plants from each other? Give examples. (5) Describe the nature of the fibro-vascular tissue of a leaf, its origin, its position, and its use. (6) What is the use of leaves to plants? (7) How does it happen that some plants, although incapable of forming leaves, nevertheless perform their functions perfectly in their absence? (8) What is albumen? How does it originate? What physiological purpose does it serve? (9) What is vitellus? and in what natural orders does it occur? (10) What are the most usual properties of Leguminous plants? (11) How would you distinguish Marants from Gingerworts? (12) State briefly the botanical differences between Myrtleblooms, Citronworts, Tutans and Rueworts, all of which have dotted leaves; and mention the usual properties of each. (13) Suppose that Allspice (*Eugenia acris* and *Pimento*) were mixed with Pepper (*Piper nigrum*), and the two were roughly pounded together, by what mark would you expect to detect the mixture? (14) Let Pepper and Larkspur seed be pounded together, could you then detect the mixture? and how?—*John Lindley, Ph.D., F.R.S., Professor. Gard. Chron., August 7, 1847.*

**Publication Received.**—*Planning the Suburban Garden.* By Norman Humphrey. St. Clement's Press, Ltd., Portugal Street, Kingsway, W.C.2. Price 1s.

## GARDEN NOTES FROM S.W. SCOTLAND.

THE coldest, darkest July within my recollection has been of advantage in one respect—that of prolonging the bloom on shrubs and herbs. For clear, sheer, fulgent yellow, *Trollius patulus* has not many rivals. *T. yunnanensis* is its equal in that respect, and rises to a greater height, the other not exceeding a foot in height. Both species demand cool, moist soil, and both belie the popular name of the genus, Globe Flower, by laying out their five great golden sepals flat to the sun, not cup-wise like our native species. In this genus, display is undertaken by the sepals, the true petals being either linear and inconspicuous, as in our own British Globe Flower, or absent altogether.

How comes it that the true scarlet Turk's-cap (*Lilium pomponium*) is so difficult to come by? It is said to be a fairly common wilding

*Cordyline australis*, which some Antipodean visitors here hailed lately as the New Zealand Cabbage, has flowered extravagantly this year. The enormous panicles are borne at a height which makes it difficult to photograph them, but we managed to get a picture of the top of a plant growing at the foot of a terrace (Fig. 31). The flowers are said to be very fragrant, but are carried so far aloft and are so formidably fenced around with bayonets that one has to take that on trust. *Herbert Maxwell, Monreith.*

P.S.—Since writing the above note, Aster Lipskii has been submitted to fresh examination in the Edinburgh Botanic Garden, with the result that it appears to have acquired a "ghost name," arising from the defacement of a temporary wooden label. It belongs to the series of A. Farreri and A. Delavayi, and is probably identical with A. Vilmorini from Szechuan. *H.M.*

FIG. 31.—CORDYLINAE AUSTRALIS FLOWERING AT MONREITH.

in the Maritime Alps, but no nurseryman seems to stock it now, and anyone who inquires for it is apt to be supplied with the red variety of *L. pyrenaicum*, a Lily not to be despised, but of marked inferiority to the other. The Pompon Lily is not difficult to cultivate if it is allowed plenty of sunshine and some lime in a stiff loam; but he who has it thriving will do well to let it alone, for it does not relish disturbance and increases very slowly. I moved a good clump of it which was being overgrown by a *Fatsia* some years ago, and it has never since yielded the same liberal galaxy of scarlet globes as before.

Among late-flowering Rhododendrons, *R. pholidotum*, one of Mr. Forrest's discoveries in Yunnan, deserves attention. The flowers are not large, but they are borne so profusely as to make the only specimen here—a bush 3 feet high—a fine sheet of light carmine. This species likes an open situation; but *R. crassum*, which is just opening its great fragrant blooms (July 27), is of more woodland habit, preferring partial, but not overhead, shade. It is one of the Maddeni series, and has proved to be quite hardy here.

The immense family of Aster harps so persistently on the symphony of violet and yellow that any new species must possess some outstanding merit to entitle it to distinction. I have no hesitation in pronouncing Aster Lipskii to be a valuable acquisition. That is the name under which the plant came to me from the Edinburgh Botanic Garden, where, I am informed, it came from some Continental garden before the war. The solitary flowers are freely borne on stiffly upstanding stems 2 feet high, the rich purple ray florets encircling a disc of soft rosy orange. In habit and general appearance it is near A. Farreri, but is of finer colour.

## THE BULB GARDEN.

### CROCUS SPECIOSUS.

ONE need make no apology for urging readers interested in hardy bulbous flowers to secure some of the autumn-flowering Crocuses whenever dealers will undertake to deliver them.

Of all the autumn-flowering Crocuses—as distinct from the Colchicums, or Meadow Saffrons, so often called erroneously "Autumn Crocuses"—the Blue Crocus, *C. speciosus*, is among the very finest. It flowers in September and October, and gives us big, handsome flowers of a fine purplish blue, lined or feathered with deeper lines, and exceedingly handsome. The flowers of most Crocus species have beautiful interiors, and only reveal all their charms upon close inspection.

*C. speciosus* has provided us with several forms and varieties. For instance, *C. speciosus* Aitchisoni, from Afghanistan, etc., is a large-flowered, later and very beautiful form. Then there is a choice variety, called *C. s. Artabir*, of a lighter colour, but with deep coloured featherings outside. A great beauty, too, is *C. s. albus*, pure white, but, unfortunately, it is liable to be stained by autumnal weather unless protected.

When it is mentioned that this Autumn Crocus is as easily grown as our spring Crocuses, its value will be recognised by all lovers of such flowers. In clumps or lines in the border; in the grass; or in groups in the rock garden, this Blue Crocus is simply magnificent. Bulbs should be planted about an inch deep in rather light, but rich soil, and in a sunny, sheltered place. A.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Cypripedium bellatulum.**—Many fail to grow the bellatulum section of *Cypripedium* successfully, or retain the plants in a healthy condition over a series of years. This also applies to *C. niveum*, *C. Godefroyae*; in fact to the whole section, and also to some of the hybrids which have either of these species as a parent. Others, again, are just as free in growth. The plants succeed best when grown close to the roof-glass, where they are free from drip, and out of the way of the syringe, and a warm, moist atmosphere is necessary to their well being. During the growing season they need liberal supplies of water at the roots, but during the winter, when they are at rest, much less moisture will suffice, although even at that season they must not be allowed to suffer for the want of it. Watering overhead is not to be recommended, and, in most cases, is decidedly harmful. The most suitable time for repotting these plants is soon after they have passed out of flower, but disturbance at the roots should not take place unless the condition of the compost and drainage make this necessary. A similar mixture to that advised for other kinds, with a little more loam fibre added, makes a suitable compost for these plants.

**Schomburgkias.**—The different species of *Schomburgkia*—*S. tibicensis*, *S. Kimballiana*, *S. Sanderiana*, *S. Humboldtii*, *S. Thomsoniana*, *S. Galleottiana*, and the rare *S. chionodora*, which have hollow, horn-like pseudo-bulbs, require much sunshine at all times. These plants have now commenced to grow, and should be placed in the lightest positions available in the hottest house. They thrive equally well either in pots or baskets, but are more easily managed under pot culture, except *Humboldtii*, which is more at home when securely fastened to upright teak rafts and suspended close to the roof-glass. *Schomburgkias* prefer a shallow rather than a deep rooting medium; this should consist of hard, coarse *Osmonda* fibre only, and potting should be done with considerable firmness. Abundance of water is necessary all through the growing season, but when the new pseudo-bulbs are fully made up, considerably less moisture should be given. Grow the plants where they may enjoy uninterrupted sunshine and plenty of fresh air at all times. To ensure their flowering regularly it is essential that the new growths should become thoroughly matured, also that the plants be afforded a long and decided rest. The ripening or maturing of the growths of Orchids is one of the greatest aids to the production of satisfactory flowers. When the new growths commence to push out their bunches of roots, see that cockroaches and woodlice do no harm. Species with fusiform pseudo-bulbs, as *S. undulata* and *S. Lyonsii*, will thrive under similar conditions, but prefer a great depth of material to root in. *S. crispa* succeeds best in the Cattleya or Mexican house if given a very light position.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Winter Greens.**—All kinds of Winter Greens, including Coleworts, should be planted out in large batches as the ground becomes available.

**Spinach.**—Sow seeds of Prickly Spinach in a well-sheltered position; draw the drills 15 inches apart, and thin out the seedlings as soon as large enough to handle to about 6 inches apart.

**Leeks.**—A batch of Leeks planted now will come in extremely useful in late spring; set the rows 15 inches apart.

**Onions.**—Where Onions are required for pulling green in the autumn, Sutton's Improved Queen and Paris Silver Skin are good for present sowing. Treat the crop in the same way as for early sowing.

**Endive.**—At least two batches of both types of Endive should be sown during this month, in drills 15 inches apart, and as soon as large enough the seedlings should be planted one foot apart on a south border.

**Lettuce.**—Sow seeds of black-seeded types of Lettuce to supply plants for winter use. Thin the seedlings freely and encourage them to grow as sturdily as possible.

**Tomatoes.**—Plants intended for winter cropping should be potted on as soon as ready and given every encouragement to make sturdy growth.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Pot Strawberries.**—The cool, showery weather during July suited newly layered runners, the whole of which have rooted without the aid of watering. Growth has been so rapid that the majority of the plants will have been detached, and those layered direct into their fruiting pots can be placed where they are to remain until the crowns are ripe in the autumn. The latest plants may not be so far advanced, but they should be detached as soon as the roots reach the sides of the pots. If mildew and red spider have been troublesome, the young plants should be dipped in a sulphur mixture before potting takes place. The great point to aim at always is to get a good start and maintain it. The potting compost should be fibrous loam to which has been added some lime rubble, a little bone-meal and soot. Stand the plants on a bed of cinders, open to sun and light and free from worms, so that roots as well as crowns enjoy the most favourable conditions. Watering from this time forward is an important operation, as Strawberries from the beginning to the finish should never feel the want of water. Frequent changes of position being favourable to growth, they may be placed moderately close together at first and gradually given more room as the foliage increases. Remove runners and weeds as necessary. An occasional syringing with soft water cleanses the foliage, but careful watering by hand will keep the foliage fresh and healthy, no matter how hot the weather. Pot-bound plants may be lightly fed through late August and September if the roots show through the apertures.

**Early Orchard House.**—As the bulk of Peaches and Nectarine trees in pots will now be cleared of their fruits, provision should be made for another year by potting and getting them thoroughly established without loss of time. The first thing to be considered is the compost; as all stone fruits need lime, the loam should be dry, rather heavy, and of a calcareous nature. Bone-meal, lime rubble, burnt earth and a dash of soot are desirable additions. The pots should be clean, dry, carefully crocked and sufficiently large to admit the potting stick, as the compost must be thoroughly rammed. The ball of roots should be well soaked in tepid water the day before they are turned out, as no after watering will suffice to moisten it. Remove all crocks and inert soil, shorten straggling roots and loosen others with a sharply pointed stick. When placed in the pot, resting upon some of the roughest compost, the top of the ball of roots should be quite two inches below the level of the rim of the pot to allow room for top dressing, and for liberal supplies of water. If the newly potted trees are rearranged in the house, so much the better. The structure may be kept rather close and moist by frequent damping and spraying when the weather is hot and the outside air dry. This treatment, however, should not be carried to excess, and later, when the foliage becomes crisp and the laterals commence fresh growth, ordinary treatment for a week or so may precede removal to the open air.

### HARDY FRUIT GARDEN.

By H. MADHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Bnnnet.

**Early Peaches.**—The earliest Peaches are almost ripe, and, as the very early fruits are best gathered a little under-ripe, the trees should be examined at intervals and the most forward fruits removed very carefully, placed on soft material in shallow boxes, and taken to a dry, well-ventilated fruit room; or the boxes may be stood on a stage in a cool glass-house. In either position the fruit will ripen right through and the flavour will be much better than if they were left on the trees to ripen. See that all Peach fruits on the trees are thoroughly exposed to the sun so that they may develop high colour, keep a sharp look-out for earwigs, and, should they appear, place pieces of hollow Bean-stalk at intervals behind the branches; examine these daily and shake out the trapped insects into a pail containing hot water and paraffin.

**Nuts.**—Many of the bushes are bearing fairly good crops of nuts. Remove all suckers springing up at the base, and any soft growth, so that the bushes do not become crowded with useless wood. Keep the land frequently hoed around the bushes to destroy weeds.

**Black Currants.**—Our crop of Black Currants is much below the average. In our rather light soil much artificial feeding at the roots is necessary to keep the bushes in fairly good condition. This we afford after all the fruits have been gathered, and where the bushes are too thick we thin out some of the wood. A cool, rather deep loamy soil suits these fruits best. Feeding and mulching are necessary on light, porous land, and should be practised as freely as possible. We find Baldwin, a variety that is much grown in Kent, one of the best varieties. Boskoop Giant gives the largest berries and is very useful if the fruits are gathered before they are too ripe.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Nede, Codsicote, Welwyn, Hertfordshire.

**Cineraria.**—To ensure fine specimens of Cinerarias, the plants should be kept growing actively and never allowed to become pot-bound in their early stages. Greenfly is very partial to this plant, and on its first appearance means should be taken to destroy it, or the plants will be ruined; a good preventive is to spray the plants fortnightly with *Quassia* extract. Grow the plants in cold frames, for preference under a north wall. Where this position is not available, shading must be resorted to, for Cinerarias dislike the direct rays of the sun.

**Calceolaria.**—If seed of *Calceolaria* was sown as advised in a previous calendar, the seedlings will be ready for pricking off into boxes or pans filled with a light, open compost. Stand the seedlings in a cold frame, keep their surroundings moist and afford shade from bright sunshine. Guard against over-watering the young seedlings; at the same time they should never be allowed to suffer from lack of moisture.

**Roman Hyacinths.**—To obtain an early supply of blooms the bulbs must be secured at the earliest possible date, so that they have a good opportunity to become well rooted before being placed in heat. When grown in pots those about five inches or six inches in diameter are generally found the most convenient size. Use a fairly rich, open compost for these Hyacinths, and place five or six bulbs in each receptacle. Where large supplies of flowers are required for decorating purposes the bulbs may be grown in boxes, allowing them to touch each other. After potting or boxing, stand them in a cold frame and plunge the pots in leaf-mould, ash or cocoanut fibre. They must, however, be removed immediately top growth takes place.

**Freesias.**—To obtain good results from these beautiful subjects the corms should be potted

up during the month of August. They should be shaken from the old soil and graded, the largest being selected for potting. If it is found necessary to increase the stock the smaller bulbs may be grown on in boxes. Freesias delight in a fairly rich, porous compost over good drainage. Use 5-inch or 6-inch pots, and allow from eight to ten bulbs to each pot. After potting, stand them on a bed of cinders in a cold frame and cover the pots lightly with finely-sifted leaf-mould. For general purposes the old variety *F. refracta alba* is useful, but some of the new and beautiful hybrids should be included if possible.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**The Shrubberies.**—At this season of the year it is desirable to examine the shrubberies for the purpose of marking plants to be moved later on; in a well-kept shrubbery no plant should be allowed to encroach on another. Where space permits, the surplus shrubs and trees should be found positions in the woodland or wild garden, where they may have plenty of space to develop, thus relieving more choice subjects. Especially is this attention required in the case of trees in shrubberies, for it is not an infrequent occurrence to find that a young standard, overtopped by a larger and possibly more robust neighbour, has inclined from the perpendicular in its search for air and light, or has developed only on the side where good conditions prevail. Growths on the stems of standard trees should be removed, and, in the case of grafted plants, suckers from the base should be immediately got rid of. When marking shrubs or trees for removal, make careful note of their height and width, so that before the time arrives to move them suitable positions may be found for them, and they may be taken direct to their new quarters.

**Various Operations.**—There are many other items calling for attention, especially weeding. Keep the hoes going on all suitable occasions. Feeding will also benefit many plants that are in full flower, such as Roses, Sweet Peas, Dahlias, Gladioli, etc., and liquid manure should be applied to them whenever the weather is dry. Hedges should be trimmed, grass verges attended to and clipped, paths swept and rolled, and lawns mown frequently; after the rain we have had light rolling of lawns will prove of benefit to them, firming the soil, and promoting a fine, close growth of grass. Trailing plants, especially of bedding subjects, of such kinds as Violas, Verbenas, etc., should be pegged down from time to time, and now and again the other bedding plants should be trimmed when required.

**Ornamental Grasses.**—It will be recalled that reference was made at an earlier date to the large collection of hardy Bamboos at Aldenham. There is another feature of the Bamboo garden that is worthy of mention at the present period. In order to lessen somewhat the bareness of the site when the young Bamboos were first planted, a number of other plants were set out, such as some of the more rampant-growing herbaceous plants. Included with these, and intended to act as a complement to the Bamboos, were a large number of ornamental Grasses of perennial character, and these have flourished exceedingly. From large clumps of Pampas Grass of different varieties these range downwards, and include *Agrostis*, *Avena*, *Hordeum*, *Arundo*, *Carex*, *Cyperus*, *Elymus*, *Eulalia*, *Glyceria*, *Luzula*, *Phalaris*, *Stipa*, and last, but not least, the pretty little *Festuca glauca*. The collection is interesting and beautiful. Where space permits, it might be reproduced in other gardens. A few such collections may exist, but they are few and far between.

**Pentstemons.**—These are fast coming into flower, and the spikes should be carefully supported, as they are somewhat brittle. These beautiful plants are well worthy of the most careful attention, for, with their fine colours and habit, they certainly rank amongst the finest of garden plants. Hoe round them care-

fully from time to time, and as side growths are made loop them up with raffia.

**Phtoxes.**—These are doing well after the rains, and their brilliant colouring is now showing. Should the weather prove hot and dry, give them plentiful supplies of water and liquid manure, hoe the ground around them well, and mulch the surface.

## NOTICES OF BOOKS.

### The Massachusetts Library.\*

WHEN the Massachusetts Horticultural Society issued Part I. of the Catalogue of its most extensive library, we drew attention to the fact because of its great value as an authoritative work of reference in matters bibliographical. Pritzel is, of course, a volume of prime importance in its way—but its value is more botanical than horticultural; and since the date

this place to be able to acknowledge our indebtedness to it on numberless occasions. It is a most invaluable book for the literary worker in horticulture, and it has no equal. The only exception that might come at all into rivalry with it is another great American Library Catalogue, i.e., the very handsome work in two large quarto volumes, entitled *Catalogue of the Library of the Arnold Arboretum of Harvard University*, 1914, but this, although containing quite a considerable number of works on floriculture and gardening in general, is more particularly devoted to books on dendrology and kindred subjects. Nevertheless, this most important catalogue should, with the other, find a place in every horticultural library of any pretensions in this country, either private or public.

A library catalogue that contains a list of books arranged only under the authors' names is but half a catalogue. It is useful when the seeker after knowledge is acquainted with the names of the authors for whose works he is seek-

FIG. 32.—ERYNGIUM PROSTRATUM; R.H.S. AWARD OF MERIT, JULY 25 (SEE P. 72).

of its publication many rare works on botany and on horticulture have been discovered in out-of-the-way corners, and therefore the position once occupied by Pritzel is to an extent modified. The library of the greatest and oldest American horticultural society is known and esteemed the wide world over for its extent and value. It contains no fewer than 22,000 volumes, and what is still more remarkable, the Society possesses a collection of trade catalogues that may well be described as unique. We have perhaps yet to learn the real value of the old nursery and florists' trade catalogues. None but the independent research worker in horticulture can properly appraise at its full value the information often only to be found in such little considered horticultural literature. The American Society's library contains 11,000 items in this category, dating back to 1776.

The first part of the Massachusetts Horticultural Society's *Library Catalogue* is a list of authors' names and titles, with other necessary detail as to size, date and place of publication, and it was published in 1918. We are glad in

\**Massachusetts Horticultural Society's Library Catalogue*, Part II.: *Subject Catalogue*. Massachusetts Horticultural Society, Horticultural Hall, Boston, Mass., U.S.A.

ing. But if, on the other hand, he is interested in any special subject and does not know by whom that subject has been treated, it becomes a *sine qua non* for the catalogue to have a second division or a subject index.

This necessity has been foreseen by the Library Committee of the Massachusetts Horticultural Society, so that now, after a two years' interval, the book-lover and horticultural journalist can rejoice in the possession of that which completes and perfects this very handsome volume of bibliographical lore.

Part II. is simply entitled "Subject Catalogue." It consists of about 200 pages and contains: Table of contents, subject catalogue, corrections and a most comprehensive index; and when bound up together the two parts form one volume of the greatest possible utility to those who may have occasion to consult it.

To those persons already in possession of Part I. the new volume is essential. We assume it can be supplied in separate form—at any rate the two parts are issued in one volume, so that any of our readers who have not already procured the first part can now obtain the complete work in one volume.

The terms upon which it can be supplied can, of course, be ascertained by application.

**EDITORIAL NOTICE.**

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

**Editors and Publisher.**—Our correspondents would oblige by delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## MR. KINGDON WARD'S SIXTH EXPEDITION IN ASIA.\*

No. 21.—SUMMER FLOWERS.

THE start on July 23 was tardy, and a three-hours halt in the middle of the day while waiting for fresh transport curtailed the march, so that we eventually camped in the forest where on our former journey we had lunched. We passed masses of pink-flowered *Primula blattariformis* with its tall, one-sided spikes, growing on shady banks where the road swung round a ravine. Higher up, species of *Andenophora* and *Campanula* appeared. Camp was pitched close to a marsh, golden with large-flowered *Trollius*—*T. yunnanensis*, no doubt—and here, too, was an *Orchid*, a *Habenaria*, deliciously fragrant. Rain came on, and the forest was chilly and dismal.

Next morning dense mist came rolling up from the heated valley as usual, and before long down came the rain in spasmodic showers. Our road led us up a narrow forest-clad valley behind the Mu-li cliffs, which towered above us on the right. Many *Primulas* were still in flower here—forms of *P. likiangensis* and *P. septemloba*, the small purple-flowered *Soldanelloid*, and, in bogs, the crimson *Candelabra*, now on the wane; but *P. scandiflora* and *P. pseudo-sikkimensis* were already over, their tall stems cumbering the streams. We found a few plants of another *Muscarioid* in the forest—a poor creature; and on the limestone peaks, near the summit, a pretty *Nivalis* with silver-dusted leaves, now much larger and finer than when we first knew it in June, was still growing strongly. The common *Nivalis* of the meadow, *P. sino-plantaginea*, was long over—indeed, its seeds were almost ripe; but the fragrant violet-flowered *Muscarioid* was still in flower under the bushes and in the high alpine valleys was flowering afresh.

The forest, enveloped in swirling mist, was most gloomy; its dripping glades were now full of fantastic toadstools, many of which my men gathered for food, though they seemed to be quite tasteless. There was one horrible thing with a greenish-yellow lace-work cone balanced on a stalk, which poisoned the air for yards. The men seemed to know instinctively which kinds to avoid, though they gathered three or four species; but this unwholesome-looking fungus would have kept the most confirmed Burian eater at arm's length without further question.

A pretty lemon-yellow *Cremanthodium*, with long, fringing petals, nodded from the cliffs, and the rocky path was lined with a tall *Campanula* dangling its slender columns of pale blue bells. We had found one plant of this species on the Mu-li side of the cliff, and had searched in vain for more, but here it grew in abundance.

We lunched in the rain, and then the sun came out. There were patches of meadow milk-white with a very large-flowered *Parnassia*

mingled with *Trollius*, but the meadows here are poor in flowers compared to those of the wetter western ranges. The plants grew barely 3 feet high, whereas on the Mekong-Salween divide or on the North-West frontier of Burma they grow twice as tall.

That night we camped by the pass amongst scrub *Rhododendron*, that we might climb the limestone cliffs from behind next day. From this side the cliffs present a row of barren spires pricking the sky, but below there is a wide, grassy valley with the usual lakelets, where Yak graze in the summer. There were many golden-flowered *Saxifrages* in bloom, all very much alike, though two species were noteworthy. One of these had unusually large flowers, each plant—and they grew separately—ending in a single flower. The other was a chocolate-coloured affair springing from a close rosette of tiny, silver leaves, the flowers being white, overlaid with chocolate and orange spots; it grew on the most arid-looking limestone boulders.

On July 26 we moved on to Glacier Lake Camp, and settled down for a week's plant hunting; but we found very few fresh plants, and still fewer of any horticultural merit, though we climbed every peak and explored every valley. The best finds were two more species of *Cremanthodium*—one with slender, nodding heads of palest purple flowers; an alpine *Aster* with charming flannelly foliage; a woolly, scree *Labiata* with shell-pink flowers hiding coyly beneath the arched leaves (I found this species at A-tun-tzu in 1913); a big, woolly *Saussurea*, which will probably refuse to grow at home; a lavender-blue *Codonopsis*, lacking the purple throat of the one found on the Litang-Yalang divide; a striped, pale blue and white trumpet *Gentian*, its flowers nesting amongst moss-like foliage—quite a charming species, this; and another dwarf *Meconopsis*, with golden instead of white anthers. Although this little blue *Poppy* was not really very like the one previously described, yet had it not been for the yellow centre I believe one might have passed it by for days, taking it to be the plant we had already seen in abundance. The fact that they grow in different situations both suggested individuality and denied comparison. Our former friend haunted grassy slopes, facing south as often as not, the new one kept to the bolder screes, peeping up from under rocks. It was rather a bigger plant, and, what was more striking, bore far more flowers, all springing from the axils of the leaves on single-flowered scapes—there was no central axis at all. If further differences need be cited, besides some quality of colour in the petals, the capsules furnished convincing proof of distinction. Both dwarfs belong to the section *Primulina*.

The sky-blue, prickly *Poppy* was now at its best, and showed up well against the white limestone rocks, where it was infinitely more abundant than on the slate and schistose ranges. In size it varies so considerably—as, also, to some extent in habit—that for long I was puzzled as to whether there are two or one species; even now I am undecided, though inclining to the belief that a distinction cannot be maintained, even though the dwarf form is almost invariably associated with purplish or pinkish flowers and more rounded, shorter capsules. Any other than sky-blue flowers are quite the exception, but where the plant is so extremely abundant other shades are found. There are nearly always a few basal one-flowered scapes in addition to the central compound scape, and sometimes these predominate to such a degree that the plant comes to look like a *Primulina*. All these four blue *Poppies* that we found ought to prove quite hardy, but a plant's constitution is more or less of a gamble. There are few external guides to lead one to prophesy without trial, and of these altitude is the least reliable of all.

*Primula bella* was still in flower, and in a few places *P. dryadifolia*, which last grows in thick beds of damp moss under the *Rhododendron* bushes. On the screes were a few *Lactneas*, *Crepis*, *Aconitum*, *Larkspurs*, and *Pedicularis*, but it was clear there was not to be found here that wealth of alpine which

carpet the Mekong-Salween divide; the poverty of dwarf *Rhododendrons* alone was an index to the larger penury. We had to work hard for our plants, and even then be content with little. The best we could hope for was that in such a different country our plants would be correspondingly interesting, as I truly think many of them were. At the same time, one could recognise many A-tun-tzu species. On the other hand, we were between seasons, about the worst time we could be on the Alps looking for new flowers. The early summer flowers, which depend for their life on the melting snow in April and May, were already over; the late summer flowers, recalled to life by the July rains, were barely opening. August and September, when the rainfall had been tempered with a little honest sunshine, would, I felt sure, prove a better season, and we would again see the rocky ranges carpeted with quite a different association of flowers. Consequently, though the weather was now improving, I was not altogether sorry when the Grand Lama sent up a request that we would return to Mu-li, as he was about to depart for a new seat of government. On August 2, therefore, we broke camp several days before our time and descended leisurely, camping for a day behind the Mu-li cliffs and ascending to the summit—a lucky trip which yielded one of the most lovely *Gentians* I have ever seen, but not, I fancy, a true *Gentiana*. The plant lies prostrate on the steep limestone rubble, sending out arms like a starfish. The stems are covered with tiny leaves, from amongst which spring the flowers, the narrow tube of the corolla being enclosed by a bladderly calyx, while the large limb, of the clearest turquoise blue, spreads out above, the throat being stuffed with a pompon of hairs.

A scree *Crucifer* was shedding its seeds, but we had not seen it in flower and were left guessing. Dwarf bushes of *Caragana*, *Rhododendron*, *Cotoneaster*, and a few other shrubs crouched amongst the rocks on the sheltered side of the peak, while *Campanulas*, *Saxifrages* and small *Caryophyllaceae*, with species of *Saussurea*, *Pedicularis*, *Primula*, and the prickly *Poppy* clothed the summit. Drenching rain and dense mist spoil a view which would have been striking.

On August 4 we returned to Mu-li and found a delightful *Muscarioid* *Primula* springing up amongst dwarf *Rhododendrons* on the south-facing slopes; never have I come across a *Primula* with such a wonderfully sweet fragrance—penetrating as it was, there was nothing sickly about it. The big heads of soft violet flowers, too, bulky rather than long, and the large rugose—nay, almost bullate—leaves were striking features. The stems often grew in a corkscrew fashion, probably owing to the fact that they had to make their way through a thick growth of unyielding scrub. This species appeared to be one of which we had found a few ill-grown plants across the river some three weeks earlier.

On August 6, the Grand Lama, who had been a good friend to me ever since my arrival, left Mu-li with the rest of the hierarchy, and from then onwards our troubles began. *P. Kingdon Ward.*

## ORCHID NOTES AND GLEANINGS. }

### DENDROBIUM FORMOSUM AND ITS ALLIES.

THE section of *Dendrobium* known as *Formosae*, and commonly called the *Nigro-hirsute Dendrobiums*, by reason of their stems being clad with short black hairs, is well known in gardens. The type species of the class, *D. formosum*, Roxb. *Pl. Ind.* III, p. 435 (1832), was introduced to British gardens by plants collected by Gibson in the Khastha Hills and sent to Chatsworth in 1837, where it flowered in May of the following year. Since that time it has been imported from a wide range in Burma, Monheim, and other parts of India, where it was generally found growing on trees in sunny situations, and often on the coast line within a short distance of the sea.

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 24, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 23, May 6, May 20, June 3, June 17, July 1, July 15 and July 22, 1922.

Major-Gen. E. S. Berkeley, who sent many interesting notes on Indian Orchids to the *Gardeners' Chronicle*, and who did much to get this section better known, found a very fine form of it growing in the Mangrove Swamps of the Andaman Isles in 1881, and this was described by Reichenbach as *D. formosum* Berkeleyi. It appears that the several varieties of the species grow on low hills. In their native habitat the season of rest is short, the hot months of January and February, and part of March, stopping all possibility of growth, often reducing the plants to a low condition, and giving that period of inactivity which under cultivation we provide by a low temperature and dry conditions. March, April and May are recorded as increasingly hot, and the other seven months of the year have rain and early morning dew at some seasons. These are conditions which have to be modified to suit cultivation in glass-houses in our climate, but whereas many growers fail to keep their plants vigorous for more than two or three years, others grow them successfully for very long periods, the only explanation being that errors in treatment—of the failures—takes place, and hence the notes on the climatic conditions in their own habitats should be helpful, especially if considered with successful records in our gardens.

In the gardens of the late Mr Leopold de Rothschild, at Gunnersbury House, Acton, Mr. Jas Hudson, his gardener, always had a fine show of *D. formosum* and its variety, *giganteum*, during August, September and October, the plants being grown in shallow baskets suspended from the roof of an airy, sunny and warm intermediate house. He also grew some in summer in a Fig house, which did equally well. Plants of these were frequently shown from Gunnersbury at the Royal Horticultural Society's meetings, and on September 11, 1900, he showed a fine specimen with seedlings growing on it from seeds imported on the roots of the plant, one of which was also in bloom and another showing flowers.

In Sir Frederick Wigan's collection at East Sheen, plants were also flowered, raised from seeds contained in a capsule on an imported plant.

In Sir Geo. Holford's collection at Westoumbert the species was grown to unusually large-sized specimens, one of the best examples being that shown by Mr. H. G. Alexander before the Royal Horticultural Society, November 4, 1902, with stout stems two feet in height and bearing over sixty flowers, each bloom four inches across and of the purest white with a rich yellow disc to the lip.

The species varies considerably in size and the depth of yellow colour on the lip, the largest Moulmein variety known as *giganteum* being the most frequently imported, but some of the smaller forms are of better shape, and all are worthy of the best attention which can be given them.

Thousands have been imported, to perish, and as we know that such mortality is not necessary, it will be well to try to point out probable causes of failure. There is no doubt that the majority of the departed were grown in pots and placed on the staging among other plants. If pots must be used, the shallow kind, for suspending, afford a good chance of success, but shallow baskets with a moderate quantity of peat and Sphagnum, allowing air to reach the roots, are better. Major-Gen. Berkeley advocated blocks, but plants so grown require more attention than those in baskets.

The main point is to watch the plants for the appearance of new growth, after a short rest, and give them a liberal supply of water when roots are active. Where rain water is stored, a marked advantage is gained by using it.

*D. Jamesianum*, Rehb. *Gard. Chron.* 1869, p. 554, which has been referred to by some authorities as a form of *D. formosum* or *D. infundibulum*, in the true plant is amply distinct, its leafy stems bearing pure white flowers with orange-red disc to the lip. Like all the section, the flowers last long in good condition, which make them much sought after for decoration both in gardens and in their native habitat.

*D. Jamesianum* was discovered by Col. Benson in the mountains west of Prome, and sent to Messrs. J. Veitch and Sons in 1869, and afterwards imported from Burmah and other localities, where it was found growing on rocks and trees at a high elevation. It will grow in a lower temperature than *D. formosum*, but a genial warmth during active growth is essential.

*D. Jamesianum* var. *Donnesiae*, shown by Mr. Bradshaw before the Royal Horticultural Society (A. M., March 26, 1895) as *D. Donnesiae*, is the extreme highland form, with very dwarf habit of growth and flowers equal to those of *D. Jamesianum*. It was suggested that it was a natural hybrid between *D. formosum* and *D. infundibulum*, which is not considered possible by those who know the

when mature, with reddish orange lines of tufted hairs on the lip.

*D. Lowii*, Lindl., *Gard. Chron.* 1861, p. 1046, is a native of Borneo and a very distinct member of the section, requiring more heat than most of the others. Flowers buff-yellow, with lines of red hairs on the lip.

*D. scabrilingue*, more commonly known in gardens as *D. hedyosmum*, is of dwarf habit, generally not more than six or eight inches in height. The ivory white flowers are delightfully fragrant. The only proved hybrid of the section is *D. formoso-Lowii*, flowered in the Burford Collection in 1898. *J. O'B.*

CATTELEYA DUPREANA.

A MASSIVE flower of their fine strain of *Cattleya Dupreana* from Messrs. Charlesworth

FIG. 33.—DISA JULIA A. STUCKEY VAR. SUPERBA; R.H.S. AWARD OF MERIT, JULY 25 (SEE P. 72).

distribution of the species, and as batches of it were imported by Mr. H. A. Tracy and Messrs. Low and Co., its position as a variety is well established.

*D. infundibulum*, Lindl. (1858), is a more slender species of the same class, native of mountains in Moulmein and Burmah.

*D. longicornu*, Lindl. (1831), *Bot. Reg.* t. 1315, native of the lower Himalaya Zone, is allied to *D. infundibulum*. It flowered in the Horticultural Society's gardens at Chiswick in 1828.

*D. Draconis* (*D. eburneum*, *Bot. Mag.* t. 5459) is of *D. formosum* habit, with stout pseudo-bulbs bearing white flowers with red lines on the lip. It was a very common species in gardens at one time.

*D. cariniferum*, Rehb. in *Gard. Chron.*, 1869, p. 611, is of the same class, and has flowers with the sepals distinctly keeled, ivory white

and Co., Haywards Heath, shows it to be one of the finest hybrid Cattleyas in size, form, and colour. It was raised between special forms of *C. Warneri* and *C. Warscewiczii*, the quality of the parents being well shown in the hybrid. The flower is nearly 8 inches across the broad expanded petals, which, like the sepals, are bright rosy mauve. The large labellum well indicates *C. Warneri*, the front being deep purplish crimson, the light-coloured disc having some crimson markings. Some authorities class all the large-flowered section as forms of *Cattleya labiata*, and some confusion has been caused when the hybridists' records are made on those lines. In this case there is a vast difference in favour of *C. Dupreana* as compared with *C. amabilis* (*labiata* × *Warscewiczii*), and so, also, with crosses between *S. Warscewiczii* and others of the *labiata* section, the *C. Warneri* cross is generally the best.

## WINTER-FLOWERING STOCKS.

Few flowers make so strong an appeal for favour as Stocks, but most people associate these flowers with the summer gardens on account of their delicate colouring and beautiful scent. Given the right varieties—which may now be ascertained by referring to any seed catalogue—Stocks may be grown in pots to flower in any cool greenhouse in late winter and early spring, and a well-grown batch of plants not only attracts attention, but at the same time proves most decorative and useful.

Seeds may be sown at any time during August, in pans of light, sandy soil passed through a fine sieve. Place the seed-pans in a cold frame and cover them with a sheet of glass and paper to conserve the moisture. As soon as the seedlings appear, remove the glass cover and raise the pans close up to the roof glass to induce sturdy growth. Stocks should not be hurried or forced, as the finest plants are always those grown under the coolest and most natural conditions. Great care should be taken to preserve the young plants from the dangers of overwatering, as they have a vexing habit of damping off wholesale if kept too wet.

When the plants are large enough to handle, prick them off singly into small pots, using a compost of two parts loam, one part leaf soil, and one part old mortar rubble. Stocks are very partial to the latter material, and there is no need to use sand if this can be obtained. Continue to grow the plants in a frame on a bed of cinders. When they have made a good start, remove the lights. Stocks are very quick-rooting plants, and before they become pot-bound should be shifted into 5-inch pots, using a slightly rougher mixture, with the addition of a little bone-meal and soot. Keep them in the frame until there is danger of harm from frost, and then put them on a shelf in a greenhouse for the winter. Afford just enough water to keep the plants growing, and allow as much fresh air as the weather permits.

Early in the New Year, examine the plants, and, if the pots are well filled with roots, pot them into 6-inch pots, using soil similar to that recommended for the previous shift.

I should have stated that, when pricking out the seedlings into the small pots, the small plants should be used, as these are those most likely to give double flowers. Those with large fleshy leaves will most likely prove single-flowered, but this really cannot be determined until flowering time. Indeed, it is always necessary to grow more plants than are needed, to allow for a few which come single and have to be rejected. Some varieties do best if the points are pinched out during the early stages of growth, and the plants are allowed to branch out, while others make a better display if grown to one stem only. The latter will need a neat stake and tie after the final potting.

When the pots become full of roots, afford some diluted soot-water or weak liquid manure, and on bright days damp the plants overhead lightly with the syringe, and shade them if the sun is hot.

A second batch should be raised in September if plants are required to flower later. These seedlings may be wintered in small pots or boxes, and afterwards potted up and flowered in 5-inch pots. Late plants will make very useful material for decorating, and after flowering, if they are cut back and planted out in the reserve garden, first thoroughly moistening the roots, they will bloom again during the summer, particularly some of the perpetual-flowering sorts, of which the best is the Wallflower-leaved variety, *All the Year Round*. This has pure white blossoms. *Riviera Market*, white and rose, is also good. *Empress Elizabeth*, carmine pink, and *Sutton's Christmas Pink* are splendid for winter flowering, and grow about 18 inches high. *Beauty of Nice* is also very useful, and has varieties with pink, Primrose, Apricot, rose, white, and crimson flowers respectively. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

## INDOOR PLANTS.

### SELAGINELLAS.

ALTHOUGH Ferns hold premier place in the favour of the general public, yet in the genus *Selaginella* there are found species which equal Ferns in grace and beauty. Indeed, some kinds surpass in elegance many of the Ferns. These plants are Fern-like in form and general appearance, and seem the more beautiful the more closely they are inspected, while their lace-like frondage, together with the many shades of green they display, make them invaluable for purposes of decoration. They are mostly plants of easy culture, and succeed if well grown in any warm, moist temperate

FIG. 34.—DELPHINIUM NYMPH; R.H.S. AWARD OF MERIT, JULY 25 (SEE P. 72).

house; all prefer a shady position. Many of them succeed well in a room grown in a Wardian case. Some are tall-growing, and others creep upon the ground and form a carpet-like covering. They vary much in shades of colour, and make charming objects in a warm fernery.

To keep up a good collection, cuttings should be inserted two or three times in the year, putting in the first batch of cuttings at the beginning of March, but they may be rooted almost at any time, providing the right cuttings are taken, these being the young growing shoots. Put the cuttings into small pots, and place the latter in a warm, moist, close case or hand-light until rooted. Any house that has a fair supply of heat and moisture will suit them.

Broad, shallow pans are the best to grow specimens in, as large plants require room to spread. An important point is to have the pots or shallow pans well drained, so that a good supply of water may be given to the roots, especially during the summer months. A good plan is to plant five or six newly rooted cuttings in the pan, as these will soon make up as specimens. The soil for *Selaginellas* should be of a light character, consisting principally of fibrous peat, a little light, turfy loam, chopped Sphagnum moss, and silver sand.

The following are amongst the best and distinct sorts:—*S. grandis*, one of the most beautiful in cultivation, remarkable for the deep green colour and great width of its fronds; requires a stove temperature. *S. apus* is a charming little creeping plant, growing only one or two inches high, but it spreads very rapidly, forming a carpet-like covering of a light green. *S. uncinata* (*caesia*), a creeping species, succeeds well in baskets if kept from direct sunshine; it is most interesting with its bright blue-green foliage. *S. caesia arborea* (of gardens) is a beautiful climber, a tall species growing from one to five feet long and of a splendid metallic hue; requires heavy shade. *S. caulescens*, a very elegant species, grows from eight inches to twelve inches in height, and is of a neat and compact habit. *S. atrovirens*, one of the most beautiful of the sub-erect kinds, is of dwarf habit, and the fronds are of a dark glossy green colour. *S. Vogelii* (*africana*), a strong-growing species, is dark green. *S. Lobbii* is a fine, robust species, with Fern-like branches and rich, lustrous, metallic hue. *S. amoena*, a variety of *caulescens*, grows from six inches to eight inches high, and is invaluable grown in small pots for small vases. *S. emiliana*, a charming kind, with light green fronds, is a good plant for small vases in rooms. *S. Griffithii*, a dwarf, elegant species, has pale, erect fronds, with a beautiful metallic lustre, and grows eight inches to ten inches high. *S. lepidophylla* (the Resurrection plant) throws out branches in a horizontal manner, forming a flat top like a table; if allowed to shrivel and appear dead and afterwards placed in water, it will revive again. *S. Martensii* is a most ornamental species, from eight to ten inches high, with stems densely clothed with broad, dark, shining fronds. *S. Martensii variegata* is similar in habit to *S. Martensii*, but it is profusely marked with pure white. *S. Kraussiana* (*denticulata*) is a most useful plant for rock-work, for edging stages or walks, for pot culture, or for carpeting soil in the stove or greenhouse. *John Heal, V.M.H.*

## HARDY FLOWER BORDER.

### CEPHALARIA TATARICA.

THERE is a good deal of confusion among the *Cephalarias*, and some of the species are known by various names. This is not surprising, as several of the species bear a strong resemblance to each other. A number of years ago, when the late Mr. Bruce Findlay was curator of the Manchester Botanic Gardens, I paid a visit to the gardens there, and was interested to find a collection of *Cephalaria* species grown together in a bed. I examined these carefully and came to the conclusion that the best was that called *C. tatarica*, and Mr. Findlay kindly sent me a plant, from which all I have grown since have descended. It is quite an old plant with no pretensions to brilliancy of colour, this being of a creamy-yellow more than anything else. It is a tall grower, and I have had it varying from about six to eight or nine feet. It has quite large flowers, which seem to look you in the face and compel you to notice them. They are like *Scabiosa caucasica* in form, but larger than the blooms of that favourite plant. This *Cephalaria* is not difficult to cultivate in any common soil, and in the garden looks best at the back of a border with a background of the foliage of trees or against a high, creeper-clad wall. It is inclined to spread at the roots, but not to a degree which makes it too aggressive. *S. A.*

**MESEMBRYANTHEMUM AND SOME NEW GENERA SEPARATED FROM IT.**

(Continued from page 54.)

46. *C. altile*, N. E. Br. Growths 10-12 lines long, 8½-12 lines broad and 7½-10 lines thick, with the lobe on each side of the notch half globose, without a keel on the faces of the notch, giving the plant a more bloated appearance than any of its allies, of a slightly shining grass-green, tinted with purple on the basal part, and thickly marked on the top with rather large separate dark green dots and a cross-shaped marking or a single line on each lobe formed of confluent dots. Calyx 4-5-lobed; tube included. Corolla 10-15 lines in diameter; tube not exceeding the calyx; petals 60-65, spreading right and left as if the flower were parted down the middle, somewhat lax, pink, fading into white at the very base. 1½ line long; stigmas 4, plumose-filiform, pale greenish.—M. *altile*, N. E. Br. in *Journ. Linn. Soc. Bot.*, Vol. 45, p. 92.

South Africa. Locality and collector unknown. The bloated appearance of this plant seems constant year after year and readily distinguishes it from the other species.

47. *C. odoratum*, N. E. Br. (Fig. 35). Growths 5-13 lines long, 6-12 lines broad and 4-9 lines thick, with the ridge on the faces of the notch distinct (type Q); usually the lobules on each side of the notch are short and very broadly rounded in the dorsal view, but sometimes they rise conically into an obtuse ridge, varying from green to grey-green according to sunlight, sometimes tinged with purple, sprinkled with separate dots and a line of confluent dots over the top on each side of the orifice and

FIG. 35.—*CONOPHYTUM ODORATUM*, N. E. BR. NATURAL SIZE.

usually a doubly-arched line of them crossing each lobule. Calyx 4-5-lobed, partly exserted. Corolla 10-14 lines in diameter; tube about as long as the calyx; petals 65-80, in about 4 series, overlying each other, not lax, bright magenta pink, white at the very base. Style ¾-1½ line long; stigmas 4-5, about 1 line long, greenish-white.—M. *odoratum*, N. E. Br. in *Kew Bull.*, 1917, p. 113. *M. jugiferum*, N. E. Br. in *Journ. Linn. Soc. Bot.*, Vol. 45, p. 94 (1920).

Worcester Div. On a mountain near Worcester, Cooper, and without locality, Pillans.

When the plant I described as *M. jugiferum* was sent to me it seemed so very distinct from *C. odoratum* in shape and general appearance that I had no suspicion that it was that species, and was assured that its ridged lobules was a permanent character: in two years, however, it altered completely, and is now quite indistinguishable from *C. odoratum*. The more crowded petals overlying each other at once distinguishes this from *C. altile* and *C. pallidum*.

48. *C. pallidum*, N. E. Br. Growths 8-15 lines long, 6-11 lines broad and 4½-10 lines thick, with a faint or distinct ridge on the face of the notch (type P), pale chalky-green, marked on the top with some indistinct scattered dots of a darker green, and a line of confluent dark green or purple dots crossing the top transversely to the orifice, with or occasionally without an

elliptic ring of confluent dots enclosing the notch and passing over the lobe on each side midway between the orifice and margin. Calyx 3-5-lobed; tube included or partly exserted. Corolla 12-15 lines in diameter; tube usually not longer than the calyx; petals 45-55, lax, usually divided into two groups spreading right and left, pink at the upper two-thirds, white at the basal third. Style about 1 line long; stigmas 4, rather longer than the style, plumose-filiform, pale greenish.—M. *pallidum*, N. E. Br. in *Journ. Linn. Soc. Bot.*, Vol. 45, p. 96.

Worcester Div. On a mountain near Worcester, Cooper.

The pale chalky-green colour of this species readily distinguishes it from its allies. In the

FIG. 36.—*CONOPHYTUM BILOBUM*, N. E. BR. NATURAL SIZE.

laxity of its petals it is similar to *C. altile*, but they are paler in colour and white for a greater length at the base.

49. *C. placitum*, N. E. Br. Growths of newly-imported plants 4-8 lines long, 3½-6½ lines broad, and 2½-4½ lines thick, becoming much larger under cultivation, with the faces of the notch keeled (type Q), some plants entirely green, others more or less tinted with or entirely purple, with a line of confluent dark green or dark purple dots on the keel of the notch with its outer end forking into arched lines enclosing the notch, outside of this enclosing line are one or two short lines and some scattered dots. Calyx 4-lobed, usually considerably exserted. Corolla 7½-10 lines in diameter; tube finally exceeding the calyx, white; petals 40-60 in 2-3 series, regularly spreading, not arranged in two groups, and not so crowded as in *C. odoratum*, entirely white or pale-lemon yellow, or with the tips on the back or on both sides tinted with pink, or entirely very pale pink, varying on different plants; stamens about 15-16, in 3 series. Style less than 1 line long; stigmas 4, about 1 line long, pale yellowish-white.—M. *placitum*, N. E. Br. in *Journ. Linn. Soc. Bot.*, Vol. 45, p. 99.

Robertson Div., near Robertson, Marloth, 7985.

II.

Growths two-lobed at the top (very shallowly in *C. quaesitum*), and the lobes or top of the growth compressed and keeled somewhat as if pinched between the finger and thumb, with flat sides to the notch separating the lobes, except in 57. *C. tritigerum*, which has cylindrical lobes convex or subtruncate at the top. Types R-T. (Species, 50-57).

F.

Surface feeling slightly and harshly puberulous to the touch, and when viewed with a lens seems to be covered with minute points, scarcely hairs, best seen on the sheaths. (Species, 50-51).

50. *C. quaesitum*, N. E. Br. Growths 4-7½ lines long, 4½-7½ lines broad, and 3½-4½ lines thick, in side view somewhat truncate obovoid, with a small notch ½ line deep at the centre

of the keeled top (type R), light greyish-green with a faint bluish tint, with or without a few dots of a slightly darker green, that are sometimes conspicuous, at others scarcely perceptible without a lens and sometimes quite absent. Flowers unknown.—M. *quaesitum*, N. E. Br. in *Journ. Linn. Soc. Bot.*, Vol. 45, p. 65.

Namaqualand, Jackals Mountains, near Sendlings Drift, Pearson, 6123.

This is the smallest species of the group. I have not yet succeeded in getting it to flower.

51. *C. apiatum*, N. E. Br. Growths 1-2½ inches long, 9-13 lines broad and 6½-10 lines thick, compressed-oblong, with lobes 3-8 lines long (type S), whitish-green or light glaucous-green, often reddish on the margins and keel of the lobes, very conspicuously marked all over with dark green scattered dots. Calyx 5-lobed. Corolla an inch in diameter, somewhat funnel-shaped, with 45-60 widely spreading yellow petals. Stamens numerous in 5 or 6 (or more) series, the upper exserted, yellow. Style nearly as long as the corolla-tube; stigmas 5-6, finally 2-2½ lines long and exserted beyond the stamens, dull orange.—M. *apiatum*, N. E. Br. in *Journ. Linn. Soc. Bot.* v. 45, p. 64.

Namaqualand. Western slopes of a ridge between Daunabis and Bethany Drift, Pearson, 6058.

This is readily distinguished from all its allies by its chalky-green colour, conspicuous dots, and peculiar surface.

FF.

Surface quite glabrous, smooth to the touch. All the species distinctly two-lobed.

52. *C. bilobum*, N. E. Br. (Fig. 36). Growths 1½-2 inches long, ¾-1¼ inch broad, and 7-10 lines thick, cuneately oblong, compressed, with lobes 4-9 lines long (type S), light bluish-green (glaucous-green, ex Marloth), dotless, with a wedge-shaped area of rather darker dull green under the notch, and the margins and keel of the lobes often reddish or purplish tinted. Calyx 4-6-lobed. Corolla 10-15 lines in

FIG. 37.—*CONOPHYTUM CAULIFERUM*, N. E. BR. NATURAL SIZE (SEE P. 84).

diameter, expanding in bright sunshine, scentless; tube longer than the calyx; petals 40-45, somewhat laxly recurved-spreading, bright yellow stamens in 4-5 series, the upper exserted, yellow. Style varying from 1-4½ lines long; stigmas 4-6, varying on the same plant in different years from 3½-6½ lines long, sometimes only equalling the stamens, sometimes exserted much beyond them, dull orange.—M. *bilobum*, Marl. in *Trans. S. Afr. Phil. Soc.* v. 18, p. 44, pl. 5, f. 2 (1907), and *Fl. of S. Afr.* v. 1, p. 201, pl. 49, f. F; Berger, *Mesemb.*, p. 280, f. 63 (copied from Marloth's

original figure); *L. Bolus* in *Ann. S. Afr. Mus.* v. 9, p. 141. *M. stylosum*, N. E. Br. in *Bot. Mag.* t. 9595, f. B (1915).

Little Namaqualand. Plains between Stinkfontein and Chubiessis, Pearson 6203, and without precise locality, Marloth 3750.

53. *C. cauliferum*, N. E. Br. (Fig. 37, p. 83). Plant with age forming distinct branching stems up to 3 inches (or more?) long, above ground under cultivation, but probably covered with drifting soil under natural conditions. Growth 1-1½ inch long, 8-10 lines broad and 6-7½ lines thick, cuneately oblong, with lobes 1½-4½ lines long (type S), light bluish-green, perhaps glaucous-green in S. Africa, distinctly pellucid dotted when held against sunlight, with a wedge-shaped area of darker green under the notch, with a purplish spot at the apex of the lobes, or with their margins and keel dull purplish. Calyx 4-5-lobed. Corolla ¾-1 inch in diameter, expanding in the morning in bright sunshine, scentless; tube about as long as the calyx; petals 50-55, in 2-3 series, bright yellow. Stamens numerous, in 4-6 series, the upper just exerted, yellow. Style nearly as long as the corolla-tube; stigmas 4, filiform, 3-4 lines long, shorter than or exceeding the stamens, varying from orange-red to pale greenish-yellow.

Little Namaqualand. Upper north-western slopes of hills south-west of Chubiessis, Pearson 6176.

Although similar to *C. bilobum*, this constantly differs by developing stems, by its much shorter lobes, and in being pellucid dotted. It also grows on hill-tops, while *C. bilobum* grows on plains.

54. *C. nuciforme*, N. E. Br. Plant developing branching stems with age, which become subterranean under natural conditions. Growth 7-12 lines long, 6-10 lines broad and 5½-8½ lines thick, ovoid or subglobose slightly compressed, with the short lobes 1½-2½ lines long, uniformly glaucous-green, with a purplish keel to the lobes. Flowers not seen; according to Miss Kensis the calyx is 6-lobed, and the petals of the corolla about 6 lines long, rosy, striped. Ovary convex at the top. Stigmas 6, about 3 lines long filiform. *M. nuciforme*, *Haw. Obs. Mesemb.*, p. 129, 440 and 450 (1794), *Misc. Nat.*, p. 22, and *Rev. Pl. Succ.*, p. 84. *M. cryptocodium*, Kensis in *Trans. Roy. Soc. S. Afr.*, v. 1, p. 150, pl. 21, f. c. (1909).

## THE HISTORY OF THE MOSS ROSE.

(Continued from page 70.)

THE year 1730 is a landmark of supreme importance in the history of the Moss Rose, for, in spite of what Miss Willmott tells us in her beautiful book, *The Genus Rosa*, about the first illustration of the flower being published thirty years later, it can be shown that the two earliest coloured ones appeared almost simultaneously in 1730, and that others followed before the one to which she alludes.

Which of the two is entitled to precedence will be difficult, if not impossible, nowadays to determine. If Furber has no right to be regarded as the first person to publish a coloured figure of the Moss Rose, he can, at any rate, claim to be the second, for his figure of the flower was one of the two published in 1730.

The first figure of the Moss Rose that I can trace, states Major Hurst, in the *Rose Annual*, is in *Hortus Anglus* (1730). There is some mistake in that title, for there is no such book, but some enlightenment is given in his article in the R.H.S. *Journal*, where he writes, "Martyn (1807) refers to what is apparently the first figure of the Moss Rose in *Hort. Angl.*, a Catalogue of Trees, Shrubs, Plants, and Flowers cultivated for sale in the Gardens near London, 1730 (folio)," which in his list of authors cited at the end of the

article in the R.H.S. *Journal* undergoes a transformation and appears as "Furber, R., 1730. In *Hort. Angl.* Catalogue of plants, 66. n. 14. t. 18." Furber is surely not intended here, but what is meant is the "*Catalogus Plantarum*, published by a Society of Gardeners," in that year. It is in this last-named publication where the other coloured figure of the Moss Rose is given.

It is apparent, as already intimated, that Major Hurst and other writers on the Rose are unacquainted with the very important series of imperial folio plates of flowers, one for each month of the year, January to December, with an engraved list of subscribers, published by Furber in 1730. This was followed two years later by a similar one on fruits. It is a misfortune that this very valuable collection is not recorded in any garden bibliography I know. Weston makes no reference to it. Neither Johnson nor the Hon. Mrs. Evelyn Cecil has any record of it in their bibliographical lists; and yet 450 complete sets were subscribed for by 423 of Furber's customers and business acquaintances, without taking into account any of the sets that were disposed of through the ordinary channels of the bookselling trade. It is equally unfortunate that we do not know where a copy of this important floricultural collection can be consulted. Certainly not in the R.H.S. Lindley Library, nor at Kew, according to the catalogue of the Library there (1899), and, it is believed, not at the Natural History Museum. The only copies I know of are in private hands. Quaritch, the well-known bookseller, in recent years, has had only two copies pass through his hands, and at the time of writing is cataloguing one set for £60.

For the purpose of reference there are no more authentic and trustworthy contemporary pictorial representations of florists' flowers than this series of Furber's subscription folio plates of flowers for the twelve months of the year. The subjects chosen to be depicted in them are no figment of Furber's imagination, but faithful copies from the life of actual examples grown at the time. The plates were designed by P. Cassteel, and engraved by H. Fletcher, and measure to the edge of the plate mark 16½ by 12½ inches. As a matter of fact, they were reproduced, in a reduced form, more than once, and are the originals from which the plates in *The Flower Garden Display'd*, 1732, were rather indifferently engraved. It is in the plate for the month of June of Furber's series that we find what may in all probability—and I say so guardedly—be the first coloured figure of a Moss Rose in English horticultural literature; if it is not, the only other one that appeared in 1730 which can compete for the premier place is a very excellent coloured figure in "*Catalogus Plantarum*, etc. A Catalogue of Trees, Shrubs, Plants and Flowers . . . by a Society of Gardeners," 1730. The plate is No. 18, and the Rose is named *Rosa provincialis spinosissima pedunculo muscoso*, Moss Provence Rose, and described in the text under *Rosa* No. 14.

This work, like *Miller's Dictionary* of 1724, has its preface signed by a number of well-known gardeners. In this case there are twenty of them—Thomas Fairchild, Robert Furber, Philip Miller, Benj. Whitmil, and others almost equally well known. And this little extract from the preface subscribed to by Furber and his colleagues is too significant to pass over: "Nor will we mention any particular Tree, Plant, Flower or Fruit which is not in our own Garden." Furber's bona-fides after that ought not to be called into question, either expressed or implied.

In opposition to any suggestion that Furber advertised the Moss Rose before it was actually in his possession, we cannot ignore the fact that for trade purposes there is good ground for believing that he had business relations with foreign nurserymen, and that the plant must have been grown and bloomed, the flower drawn, and engraved on steel, not by itself alone, but with about 400 other flowers, and then printed, coloured, and published in 1730. The world moved slowly in

those days; cheap process engraving and other mechanical means of illustration were not known, and, if Furber did not receive the first plate till after Miller's return from Holland in 1727, it would have been almost a practical impossibility to have done all that was needful to have figured it in 1730. It is to be noted that the coloured figure in the *Catalogus Plantarum* of that year was a single figure only.

After the publication by Furber of a similar set of plates of fruit in 1732, he issued a little handbook by way of explanatory text to the two series of Flowers and Fruits. This very scarce little book is entitled *A short introduction to Gardening . . . being several useful catalogues of fruits and flowers by Robert Furber of Kensington. London, 1735*. It is important to take note of what he states in the preface: "And that the subscribers to my former Work of Flowers may be furnished with Directions how to chuse the properest for every purpose, I have annexed a Catalogue of Flowers, wherein is shewn not only the Season of their blowing, but also whether they are most fit for open Borders, Edgings, Pots, etc." Does this look like the action of a man who advertises plants before being in actual possession of them? He goes on to say: "I have spent many years in collecting, cultivating, and improving all the different Kinds of Trees, Plants, Fruits, and Flowers that I could possibly obtain. . . . I have from time to time published Catalogues containing a large Variety of Trees, Plants, Fruits, and Flowers, both Foreign and Domestic, cultivated by me for Sale."

Alas! where are those catalogues to-day? Gone, no doubt, where thousands of other nurserymen's catalogues have gone since. Being of merely ephemeral interest, they served their purpose for a few seasons, perchance, at the most, and then were ruthlessly relegated to the waste-paper basket by Furber's customers who had ceased to have any further need of them. It is certain that there is none accessible to-day, and, with one exception, not any are recorded in our garden bibliographies. And yet to-day they, like those of many other old-time nurserymen and florists' catalogues, would be invaluable records for reference, and priceless. One only of such catalogues issued by Furber can be traced to-day, except that in *Miller's Dictionary* of 1724; its title is *Catalogue of Trees which will thrive in the natural ground in England. 8vo. 1727.*"

The year 1731 marks the beginning of a continuous series of references to the Moss Rose by Miller. In that year what is more properly known as the first edition of his *Gardeners' Dictionary* was published—the big folio that passed through nine separate editions up to the one edited by Martyn in 1807. In the first of these is enumerated among the forty-seven species described by Miller, "No. 14, *Rosa*, provincialis, spinosissima, pedunculo muscoso. The Moss Province Rose." In the abridgment, too (second edition, 1741), Miller gives precisely the same descriptive name, but in 1768, when he published the eighth edition, Miller had come to the conclusion that the Moss Rose was an independent species, so that he abandoned Boerhaave's Latin name and called the flower, under No. 22, "*Rosa muscosa*. Commonly called Moss Province Rose."

It may be gathered from Major Hurst's observations that he regards the year 1735 as one of some importance, and rightly so, in spite of the somewhat contradictory and irrelevant quotation from Shailer, which, we shall see presently, is of no historical value. As a further instance of second-hand information, he tells us that Miss Willmott mentions that there is a specimen of the Moss Rose in the British Museum, from the Chelsea Physic Gardens (Miller's), with the date 1735. What of it? He tells us nothing more. And yet, if it had occurred to Major Hurst to verify this very simple allusion, he would have made a singular discovery which may have an important bearing upon another question—the cultivation of the flower in the north of France. *C. Harman Payne.*

(To be continued.)

## ALDER WOOD FOR CLOG SOLES.

The making of clog soles is a quaint and little known industry, and the "cloggers" are quiet, self-respecting folk, though looked at askance by the gamekeeper. The expert clogger is now a difficult man to find, and an independent, highly-paid man when found. Successive members of the same family have been known to follow the occupation for several centuries, as, like charcoal-making, "clogging" is distinctly a skilled industry and confined to few.

Clog-making is also amongst the oldest industries of our country, for we learn that in 1200 the English archers petitioned the King to prohibit the clog-makers using Aspen, or there would be a shortage of wood for their bows and arrows.

All good clogs are made of Alder, which has been found the best material both for holding the nails and supplying the resistance to heat and damp. Having bought a suitable lot of trees, usually with permission thrown in that they can be roughly converted into clog soles either within the wood or on a suitable piece of waste land convenient, the cloggers fix up a temporary canvas shelter for themselves, with a log for a seat and bench, and heated by a fire of chippings or waste of the clog soles.

The cloggers' tool resembles a stout, short scythe blade, which is worked on a swivel joint attached to a stout bench about 2 feet in height. One end of this rudely constructed knife is fitted with a handle for ease in working, while the other is securely fixed between iron uprights to the bench, these being sufficiently far apart to allow room for plenty of play. With dexterity born of long practice, it is surprising how, with a few well-directed movements of the knife, the roughly-split block of wood is converted into the clog sole; indeed, the rapidity of workmanship is marvellous, for I have watched an expert clog-maker turn out twenty pairs of these soles in an hour. The various sizes of clog soles are from 6 inches to 12 inches long, 2 inches to 3 inches wide, and 1 inch to 1½ inch thick.

This is the first process, the next is to build up these soles in a cone-shaped stack, admitting as much air as possible to the pile, so that drying may be brought about as quickly as possible.

When fresh felled, the timber of the Alder is of a yellowish-white colour, which, however, quickly changes to a bright red, and afterwards to a pale pink, the latter colour being permanently retained. For the making of clog soles, Alder timber is preferred to any other because it is light for its bulk, easily worked, and does not readily splinter by nails being driven into it, the latter property being a necessity on account of the large number of sprigs that are used in fastening the upper to the sole. In the Midlands especially, large quantities of Alder timber are consumed in the manufacture of clog soles, these being roughly hewn out in the woodland, and finished off by the clog manufacturers in the Lancashire towns, where the trade is principally carried on. Before the war it was estimated that fully 7,000 men were employed in the clog-making industry.

The wearing of clogs has to be acquired, for they are not nearly so adaptable to the feet as the softer, springy leather, and as the changes of temperature affect the shape, they are not taken to kindly by the man accustomed to shoes. Although many attempts have been made to popularise the use of clogs in boot-wearing districts without much success, yet in a few parts of the country, especially in Ireland, their use is general amongst the poorer classes of people.

Strange as it may sound, not only the best Alder, but the cheapest clogs were, until the war, exported from Germany, and large numbers of trees have been planted in the State forests by the German Government. It has proved a profitable speculation, considering that the timber at the age of twenty years may be utilised and is worth at least 5d. per cubic foot. Alder timber sells at an average price in this country of 8d. per foot, and cleft blocks of this wood cost about 2s. 6d. per dozen pairs delivered, though at the present time, with

greatly increased cost of labour, the price is much higher. What is known in the trade as "patterns," or overclogs, have never been used to any great extent, and at one time the clogging industry nearly became extinct, those who had spent a life-time in connection with the cleft Alder block taking to shoe-dealing instead. It was during this lull in the business that a trade sprung up with Germany, and the lighter factory or garden boot was introduced at a much cheaper rate than we were able to produce the same in England. German clogs were, however, found to be inferior, after a fair trial, to those of British production, and have on that account, as well as the war, gradually fallen into disuse.

We have plenty of excellent Alder and Birch timber that makes the best type of clog sole, and as this particular wood is only in use for a limited number of purposes, there is no reason why we should not utilise to the fullest our native production in connection with a trade for which it is peculiarly suited. If Germany could supply at a price round about 5s., why, it may be asked, cannot our manufacturers do the same? Our machinery and labour are certainly not inferior to those of other countries. A. D. Webster.

## EVELYN'S KALENDARUM.

Through the kindness of a correspondent in Cornwall, who has sent me the third edition of the *Sylva*, I am able to throw a little light on the question of the dedication of Evelyn's *Kalendarium*, for bound up with it are (1) part of Rapin's poem, "Englished," by Evelyn's son; (2) *The Terra*, and (3) the fifth edition of the *Kalendarium*. In this last the dedication begins "To Abraham Cowley, Esq., Sir.—This second edition of my Hortalan Kalendar is yours, mindful of the honour once conferr'd on it, when you were pleased to suspend your nobler Raptures, and think it worthy your transcribing." This fixes the second edition as being the one which was first dedicated to Cowley. But the interest does not stop here. The *Sylva* begins with the usual laudatory poems of the period. In the first edition there was but one. Now, in this third edition, there are four, one of which is Cowley's poem, "The Garden. To J. Evelyn, Esquire." The poet and the gardener seem to have been doing a little mild scratching of one another's backs. Thus; Cowley reads the first edition of the *Kalendarium* (1664) and tells Evelyn how interested he had been in its perusal and that he has made a copy of it. Evelyn is very pleased at this and when he publishes the second edition in 1666 (?) dedicates it to Cowley. Cowley takes this as a great honour and promptly sits down and writes (August, 1666) his poem, "The Garden," which he, in turn, dedicates to Evelyn, and in the short preface says some nice things about him. "I know nobody that possesses more private happiness than you do in your Garden; and yet no man who makes his happiness more publick by a free communication of the Art and Knowledge of it to others." It was now the gardener's turn to be pleased and, if my surmise is correct, he appends the poem to his second edition of the *Sylva*, which is dated 1666. Whether this be so or not, at all events it appears in the third (1679). Would some one who has a copy of the second tell us if I am correct? It is in the nature of a digression, but a paragraph in the dedication of this third edition to the King (Charles II) is one of very great interest as it shows how soon the publication of the original edition bore fruit and began to fulfil, as it were, its purpose in life. "I need not acquaint (1679) your Majesty how many millions of Timber-Trees (beside infinite others) have been propagated and planted throughout your vast Dominions, at the instigation and by the sole direction of this work (1664)." The dates in parenthesis are my addition. Upon this planting depended the very existence of the English navy. The picture painted in this dedication, of king and subjects setting to work with a hearty will to

make good the losses caused by cutting down too much timber for fuel recalls the occasion of the building of Solomon's Temple, when, likewise, king and people "offered willingly" at a great crisis in their national existence. Nor can we forget 1914 to 1918.—Joseph Jacob.

## SPRING CABBAGES.

GROWERS who secured a good crop of Spring Cabbages this season were well repaid, as in no previous season do I remember such excellent prices ruling for early Cabbages. The season was about the most disastrous one for Spring Cabbage ever experienced in this district, hardly any garden having anything approaching a decent bed. In the early part of the year growth was much retarded by severe, cutting, north-east winds, which, coming after much rain, crippled growth and made the crop much later than usual.

Of the small, early Cabbages, Harbinger heads the list, and many growers who, in the past, relied on the larger varieties, now find the small, early ones more profitable; indeed, when space is taken into account, and the small percentage of waste, such as useless outer leaves, the advantage over the large, coarse varieties is great. With Harbinger, April and Springtide, it is rare to find a "belter" if proper conditions are observed as regards sowing and planting. I do not say that growers are immune from failure if they grow these sorts, but in nine cases out of ten, if proper treatment is given, losses are rare.

Sowing is one of the most important details. These small, early varieties should not be sown before August, and in the south I have found the second week of that month quite early enough, but with this proviso—there must be quick germination, therefore in hot, dry soils sufficient moisture must be supplied to ensure this. Sow the seeds thinly, in drills, and transplant the seedlings when a few leaves have been formed. Should land not be available for planting, it is far better to prick out the seedlings when quite small, into nursery beds, and by so doing get sturdy plants. If there is no check to the seedlings, there will be total freedom from bolting. Prepare the soil thoroughly and feed the crop with a quick-acting fertiliser early in the new year, just as new growth commences. James A. Paice, Watford.

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Dunkeld Larches.—Mr. A. D. Richardson has quoted many authorities in *The Gardener's Chronicle* (see page 258), concerning the introduction of the Larch into Scotland. I have in front of me *Arboriculture*, by John Grigor, The Nurseries, Forres, N.B., who dedicated the book to the Highland and Agricultural Society of Scotland, in 1868. It appears that John Grigor was a cultivator and distributor of Larches, and he mentions, on page 207, a report published in 1813 by the Rev. James Headrick, minister of the parish of Dunnichen. "It is generally supposed that Larches were first brought to this country by one of the Dukes of Athol about eighty or ninety years ago. But I saw three Larch trees of extraordinary size and age in a garden near the mansion house of Lockhart of Lee, on the northern banks of the Clyde, a few miles below Lanark; the stems and branches were so covered with lichens that they hardly exhibited any signs of life or vegetation. The account I had of them was that they had been brought there by the celebrated Lockhart of Lee, who was ambassador for Oliver Cromwell at the Court of France, soon after the restoration of Charles II." John Grigor also mentions, on page 206, that "the first account we have of the Larch introduction into England is given by Parkinson, an apothecary in London. This author also states that there were two sorts of Larches, one variety red and the other white." This book also contains valuable information on the Duke of Athol's Larch plantations, and on

page 207 the author states: "From the accounts we have of the introduction of the Larch into Scotland, some state that it was first planted in 1725 at Dalwick in Tweeddale, and several years afterwards at Dunkeld, Monzie, and Blair; but the states of the various reports do not exactly correspond." *Mark Mills*.

—I was glad to read Mr. Webster's letter, which verifies my statement (p. 337) that the largest Larch had a girth of 13 feet in 1817. This tree it appears was cut down in 1888, and measured at 5 ft., 15 feet 1 inch, an increase of 2 ft. 1 in. in 71 years. *A. Clinton Baker, Bayfordbury.*

**Plants from the Antipodes.**—In his note on page 56, Sir Herbert Maxwell mentions *Veronica Traversi* and *V. parviflora* as the only Veronicas which have become thoroughly naturalised in his locality. Hereabouts the species which seems to reproduce itself most freely is *V. salicifolia*. *A. D. Richardson, Edinburgh.*

**Pruning Grape Vines.**—In my notes on the "Grape Vine" (see p. 232, Vol. lxxi), I pointed out that several varieties resent hard pruning, better results being obtained by leaving eight inches of the current year's wood and removing the buds to one at the base of each shoot, so as to conserve the food in the last year's wood. Some very old vines here have responded wonderfully to this treatment, and produce more bunches than they could possibly finish properly, the bunches having to be thinned out before flowering. I am indebted to Mr. C. A. Jardine for this and other information in connection with the pruning of the vine, the result of experience he has gained in French vineyards. To obviate bleeding in the spring when the sap is rising, we find it is better to rub out buds and cut back the shoots while the leaves are still on the vine, so that the wounds have time to heal before the leaves fall in the autumn. *Malcolm Macnaughton, Scotch Palace Gardens, Perth.*

**Phormium tenax.**—The New Zealand Flax, *Phormium tenax*, is now flowering in my garden. It has been planted in its present position just over six years, and has only failed once during that time to produce three spikes of blooms. *G. J. Warren, The Gables, Balcombe, Sussex.*

**Too-Much-Alike Names of Roses.**—In your report of the N.R.S. Provincial Show (p. 57) mention is made of a gold medal awarded to a new Rose called Mrs. Courtney Page. I think it was only last year that a Rose called Courtney Page was placed on the market. It is surely a great pity, in naming a variety after the wife of a man whose name has already been affixed to a Rose, that the prefix "Mrs." is used instead of the lady's Christian name. Only keen rosarians who closely follow the various new introductions from year to year and become familiar with them in their gardens are likely to distinguish between Mr. and Mrs. So-and-So, while, in the minds of men gardeners and the great bulk of the public only confusion follows the rather stupid practice to which I allude. Although a lady on marriage surrenders her surname for that of her husband, she retains a Christian name, which is usually much more distinctive than "Mrs.", and I am sure that, if the matter were brought to the notice of our leading raisers, a more distinctive method of naming novelties would be adopted. *Red Rose.*

**Dianthus Allwoodii.**—In your issue of July 29 (p. 71) there is a letter from Mr. Mark Mills commenting upon varieties of *Dianthus Allwoodii*. It is evident from his remarks that he has not proved a successful cultivator, although this may be because he has the plants growing in a shaded position or has added leaf-mould or something similar to the soil. Furthermore, this would account for them growing to the height he describes, because such varieties as Joan, Susan, etc., grown under correct conditions, never exceed a foot in height. It seems rather late in the day to ask whether the race is successful or no, considering that we first commenced disseminating it in 1917, and this season we have sold over a million and a half plants;

we are preparing to sell double that number next year, so there can be no possible doubt whatever as to their success with the multitude. We consider no transaction complete which does not meet with the entire approval of the buyer, and if Mr. Mark Mills has procured his stock from us, then we shall be happy to compensate him with fresh plants; but if he has procured cheap, over-propagated stock from unscrupulous nurserymen who sell plants cheaply, irrespective of their quality, we wash our hands of the whole affair. We have no such name as "Mark Mills" on our books, but, of course, this may be a *nom de plume*. *Allwood Bros., Hayward's Heath.*

—Most of the varieties of *Dianthus Allwoodii* mentioned by Mr. Mark Mills (see p. 71) are unknown to me, but those I know, Harold, for instance, and Jean, are splendid plants. I do not go further among novelties than Rufus, which also is uncommonly floriferous and a lovely flower. Plants of the latter are from cuttings rooted last October, but I find the plants should be let alone for a second year to enable one to ascertain their full value and reap the full extent of their beauty. I have had some splendid specimens of Harold, in 7-inch and 8-inch pots, and, in my opinion, this is one of the most desirable additions made to our hardy plants of recent years. They have to be staked here too, and, unfortunately, so have many other good things. *R. P. Bratherton, Tynningham Gardens.*

—Mr. Mark Mills's experience with, and opinion of, *Dianthus Allwoodii* (*Gard. Chron.* p. 71) coincides with that of other growers of individual or few plants. To properly appreciate the value of *D. Allwoodii* varieties for garden decoration, they require to be grown in quantity, planted in the mass, in order to obtain what painters call "breadth of effect." *Fred W. Jeffery, Dalsef, N.B.*

—I can endorse what Mr. Mark Mills states in your issue of July 29 (p. 71) about this new type of *Dianthus*. I thought I was obtaining perpetual-flowering Pinks, but I seem to have got inferior Carnations! The cold, wet season may be partly responsible for the poor display the plants have given so far, therefore I may be prejudging the merits of this new introduction for a north-west garden. *J. P., Carlisle.*

**Puya chilensis.**—A large number of plants have been introduced to this country under the name of *Puya*, but most of them have now been referred to the allied genus, *Pitcairnia*, including most of them with showy flowers, or bracts. *Puya* is characterised by more expanded flowers, and seeds surrounded by a complete wing. In gardening books they are classed as stove plants, but some of them are sufficiently hardy to be grown outdoors in Cornwall without protection. I recently had part of an inflorescence and a leaf from Penzance. The plant had been in the garden for thirty to thirty-five years. In general appearance and habit the plant resembles *Yucca recurvifolia*, but the leaves are far more formidable, being armed with strong, hooked spines on the margin. These spines are directed backwards in the lower part of the leaf and forward on the upper part, so that if one were to get entangled in the plant it would be no easy matter to get clear. The flower stem was four feet high to the base of the inflorescence, and the latter sixteen inches high. It carried about forty of its large greenish-yellow flowers. A remarkable feature of the panicle is that the outer half of each branch is simply covered with bracts without flowers while the plant is in full bloom. The species is figured in the *Botanical Magazine*, t. 4715, and was introduced in 1820. *J. F.*

**The Carrot's Crimson Eye.**—I was interested in the note concerning the small red flower in the centre of the umbel of the Carrot (see p. 45), because a few days previously I had been looking at two wild Carrots, side by side, on the chalk downs. One bore umbels with the ordinary white flowers, while all the umbels on the other plant had pale rose flowers. The colouring pigment extended to the margins of the secondary umbellules, which are usually colourless or hyaline. This variation may also be found in

*Caucalis Anthriscus*, a near ally of the Carrot; and it is not necessary to go to Cornwall to find these variations. The red pigment of the Cornwall plant may have been more highly developed, for I can only describe the flowers coming under my observation as rosy pink. Whether or not this may be reversion to an ancestral type, I am unable to give an opinion; but if so, it is not confined to the two plants above mentioned. Hitherto, I have been wont to regard the presence of pigment as a development, and not a retrograde phenomenon. In my opinion, it would take a far greater number of years to evolve an umbel than a colouring pigment. I have never seen a dark pigment in the wild non-bearing Cabbage; yet we have red Cabbages, that is, purple, many shades of it in Borecole, and a considerable amount of purple in Cottager's Kale. Just now the leaves of some bushes of *Cornus sanguinea* are wholly bronzy-purple, though possibly not permanent. In Surrey, *Achillea millefolium* varies with pure white, pink, pale rose, and red-purple or cerise flowers. *J. F.*

**Cynoglossum amabile.**—The way I am now growing this lovely little plant (see pp. 31, 67) is to sow the seeds, immediately they are ripe, in boxes, transplanting the seedlings in spring into their flowering positions. I have grown it for several years, and it came to me from a dual garden. Moreover, many people have had seeds or plants from here, and I presented the surplus supply of last year's seedlings to a leading seed firm, so that it will soon be as common as Mr. Cowley hopes it may. Too common, perhaps! I seem to recollect having sent a note recording its beauties to *The Gardeners' Chronicle* a year or two ago. *R. P. B.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

#### Trial of Antirrhinums.

The following awards have been made by the Council of the Royal Horticultural Society of Antirrhinums grown in pots under glass at Wisley.

#### AWARD OF MERIT.

No. 1, *Snowflake*, sent by Messrs. BARR AND SONS; No. 6, *Canary Yellow*, sent by Messrs. BARR AND SONS; No. 7, *Yellow*, sent by Messrs. DOBBIE AND CO.; No. 15, *Crimson-Scarlet*, sent by Messrs. BARR AND SONS; No. 24, *The Bride*, sent by Messrs. BARR AND SONS; No. 27, *Queen of the North*, sent by Messrs. TOOGOOD; No. 36, *Canary Bird*, sent by Messrs. BARR AND SONS; No. 39, *Yellow Queen*, sent by Mr. A. DAWKINS; Nos. 47 and 48, *Golden Gem*, sent by Mr. A. DAWKINS and Messrs. SIMPSON; No. 65, *Rose Queen*, sent by Messrs. SIMPSON; No. 107, *Maize Queen*, sent by Messrs. DOBBIE AND CO.; No. 119, *Captivation*, sent by Messrs. BARR AND SONS; Nos. 125 and 126, *Prima Donna*, sent by Messrs. BARR AND SONS and Messrs. R. VEITCH AND SON; No. 151, *Amber Queen*, sent by Messrs. DOBBIE AND CO.; No. 133, *Morning Glow*, sent by Messrs. BARR AND SONS; No. 167, *Firelight*, sent by Messrs. DICKSON AND ROBINSON; No. 199, *Elegance*, sent by Messrs. BARR AND SONS; No. 206, *Queen Victoria*, sent by Messrs. SIMPSON; No. 218, *Esmé*, sent by Messrs. SIMPSON; No. 221, *Cerise King*, sent by Messrs. WATKINS AND SIMPSON; No. 223, *Coral Red*, sent by Messrs. R. VEITCH AND SON; No. 229, *Maize Queen*, sent by Messrs. R. VEITCH AND SON; No. 231, *Moonlight*, sent by Messrs. DOBBIE AND CO.; No. 251, *Lilac Queen*, sent by Messrs. R. VEITCH AND SON; Nos. 84 and 85, *Bonny Lass*, sent by Messrs. BARR AND SONS and Messrs. WATKINS AND SIMPSON; No. 120, *The Fawn*, sent by Messrs. WEBB AND SONS; and No. 121, *The Fawn Improved*, sent by Mr. W. H. SIMPSON.

#### HIGHLY COMMENDED.

No. 29, *White Beauty*, sent by Messrs. DOBBIE AND CO.; No. 69, *Rose Doré*, sent by Messrs. WATKINS AND SIMPSON; No. 82, *Salmon Queen*, sent by Messrs. DICKSON AND ROBINSON; and No. 155, *Admiration*, sent by Messrs. BARR AND SONS.

## HULL SHOW.

THE Horticultural Committee of the Yorkshire Agricultural Show, assisted by Mr. P. Blair, is to be heartily congratulated on the admirable arrangements made for exhibitors and visitors, and upon the splendid success of the Horticultural section at Hull, on July 26, and following days. It is very doubtful if the East Riding of Yorkshire has ever seen finer horticulture exhibits. Thousands of visitors willingly paid the extra charge to see one of the finest floral exhibitions ever held in Hull. No less than seven thousand passed through the turnstiles on the second day, besides ticket-holders. The exhibits were splendidly staged in one very large tent, with plenty of space, and the general effect was brilliant. The chief features of the show were the grand groups of plants, Roses, Carnations, Sweet Peas, and the collections of hardy perennials and cut flowers.

In the principal class for a group of flowering and foliage plants occupying a space not exceeding 350 square feet, Messrs. J. CYPHER AND SONS, Cheltenham, won the premier award of £40 with a beautiful group, most artistically arranged; Mr. W. A. HOLMES, Chesterfield, was a capital second. Mr. C. ENGELMANN won the first prize of £15 for a collection of cut Carnations with a well arranged stand of good quality flowers; Mr. W. LAWRENSEN AND SON, Yarm, was a very close second with flowers of equal quality.

Five exhibitors competed in the class for a group of hardy perennial plants and cut flowers, and they produced a brilliant display. The prizes offered were £22, £18 and £15 respectively, but the unplaced groups were so good that the Committee awarded extra prizes of £12 10s. and £10. We have never seen such fine quality of bloom as was staged by Messrs. HARKNESS AND SON, Bedale, and much pains had been taken to give a good finish to their display; crowding was the only fault to be found with their wonderful first prize exhibit. The second prize was won by Mr. MONTAGUE STATHER, Cottingham, Hull, whose group arrangement was entirely distinct from others and must have run the first prize winner very closely indeed. It was an artistic arrangement with a lightness and elegance which societies and judges have long been asking for, and in our estimation it is a style which will supersede the rather flat and often overcrowded exhibits we have become accustomed to in these most interesting classes. Messrs. GEO. LONGSTER AND SONS, Malton; Messrs. GIBSON AND SON, Bedale; and Messrs. W. ARTINDALE AND SON, Sheffield, followed in the order named, all with excellent groups.

Excellent prizes were provided in five different classes for Sweet Peas, but competition was not keen. The chief prize winners were Messrs. R. BOLTON AND SON, who won the first prize of £10 for a very fine exhibit on a space 20 ft. by 5 ft. Mr. W. WADSWORTH, Bishop Wilton, led for 18 distinct varieties, and Mr. T. W. SHERRBURN, Selby, for 12 varieties, each with flowers of fine quality.

Mr. MONTAGUE STATHER won the first prize for a dinner table decoration with a most pleasing arrangement of Carnations; Mr. F. E. WARD, York, second, also with Carnations.

Gold Medals were awarded as follows:—To Messrs. SUTTON AND SONS, for a very fine collection of vegetables and flowers; Messrs. ALEX. DICKSON AND SONS, Newtownards (two), for magnificent collections of Roses and Sweet Peas; Messrs. ALLWOOD BROS., for an excellent exhibit of Carnations; Messrs. JOHN FORBES, Hawick, for Phloxes, Pentstemons, Border Carnations, and other hardy flowers; and Mr. R. V. ROGER, Pickering, for Alpine plants and clipped trees; Messrs. LITTLE AND BALLANTYNE, Carlisle, for ornamental trees and shrubs, arranged with great effect near the main entrance and around the president's and other official offices.

Silver Medals were awarded to Mr. H. V. ELLISON, Birmingham, for Ferns, Palms, and Cacti; Messrs. JOHN K. KING AND SONS, Essex, for Sweet Peas; and to Messrs. BAKER, Wolverhampton, for Herbaceous flowers and plants.

## Obituary.

**Dr. F. Bedford.**—We learn with deep regret of the death of Dr. F. Bedford, of Eslesforde, Marden, Kent, who passed away at the early age of 43 years at his residence on the 13th ult., after a very short illness. The funeral took place at Sleaford, on July 17, amid many expressions of sympathy and regret. The death of Dr. Bedford means a very great loss to horticulture generally, and more especially to the Orchid world. He got together a very valuable collection of Orchids, and one especially rich in botanical and other species, while living at Dovecote, York, and had recently removed his plants to his new residence, Eslesforde, Marden, where he had erected special houses for the accommodation of his favourites.

**M. Rene Momméja.**—It is with profound regret that we learn, just as we are going to press, of the almost sudden death of this distinguished French amateur horticulturist. M. Momméja is best known for the part he has played in connection with the Chrysanthemum, of which flower he was a most enthusiastic and devoted cultivator. For many years he was a prominent exhibitor at the Paris autumn shows and a successful prize taker. Besides being interested in the flower from a cultural point of view, the deceased gentleman was a keen collector of all kinds of literary and artistic curiosities bearing the imprint or in any way connected with his favourite flower. It was mainly through his exertions that the Paris Retrospective Chrysanthemum Exhibition was held in conjunction with the Paris Autumn Show of 1908. Visitors will not readily forget the extraordinary and valuable collection of art treasures and bibliographical rarities, largely of oriental origin, that he staged on that occasion. Our old correspondent Mr. C. Harman Payne also contributed to the success of that exhibition, and both he and M. Momméja were each awarded a handsome silver plaque by the National Horticultural Society of France—the only awards made on that occasion. At Le Mans, last autumn, in the Art Section of the International Horticultural Exhibition, M. Momméja again exhibited a fine collection of drawings, prints, engravings, and Japanese curios of all kinds having reference to the popular autumn flower. There can be no doubt that M. Momméja's idea to hold such an exhibition in Paris in 1908 was the reason why two years later the eminent rosarian M. Jules Gravereaux did the same thing for the Rose. After the death, during the war, of M. Max de la Rocheterie, who held the presidency of the French Chrysanthemum Society from its foundation, in 1895, a new president was sought for as soon as the Society again began its operations. Although the headquarters of the Society are at Lyons, it is no small tribute to the respect in which M. Momméja was held to know that a Parisian should have been invited to stand for the high position of president. When the annual election of officers took place, M. Momméja received 210 votes out of 213, an almost unanimous election. The new president, in his response, pointed out how sadly the raising of new Chrysanthemums had declined since the death of Calvat and promised to do all he could to encourage new seedling growers. He was a frequent contributor to the Press on matters relating to the Chrysanthemum and for many years he had been gathering together from all sources material for writing a book on the flower he loved so much. We have heard the MS. has practically been completed and hope, in spite of the unforeseen misfortune that has befallen the Society, that it will sooner or later be our pleasure to see the work in print, for it will be something quite out of the ordinary in Chrysanthemum literature, if only the publication can now be effectually carried out without his masterly supervision. We little thought when we last saw him, calm, impassive and earnest, presiding over the Chrysanthemum Conference at Le Mans, that we should never see him again. He was a gentleman in every sense of the word, modest and unassuming, but courteous and hospitable.

## ANSWERS TO CORRESPONDENTS.

**CALCEOLARIAS:** *W. H. C.* These bedding plants frequently suffer during dry weather when they are planted out late. As they are almost hardy, they should be planted into their flowering quarters in April or in May, so that they may become established before hot weather sets in. There appears to be no disease present, so we can only suggest that the plants affected suffered from some kind of check, which, of course, might have been emphasised by the ravages of wire worms or by disturbance due to moles.

**CLIMBING ROSES FOR GREENHOUSE WALL:** *J. G. J.* Marechal Niel is the best of all Climbing Roses for a greenhouse. Fortune's Yellow is another good greenhouse Rose, and when well grown is suitable either for growing on the wall or roof of a greenhouse. Firm soil is the best foundation for constructing a crazy-paved path; the stones should be bedded in sand or fine soil, not cinder ash, as no alpine plants like such rooting medium.

**COMPENSATION FOR BROKEN ENGAGEMENT:** *H. B.* Assuming that you are correct in stating that the letter you mention *definitely* engaged you, you are entitled to a month's wages plus the rental value of the cottage for one month.

**FIGS UNSATISFACTORY:** *P. D.* The specimens received showed no trace of fungal infection or of attack by insect pest, so we can only conclude that the unsatisfactory condition of the plants is due to unfavourable conditions.

**FRUIT TREES OVERHANGING NEIGHBOUR'S GARDEN:** *R. P.* The portions of the fruit trees which overhang your neighbour's garden are your property, as also is the fruit upon them; but, in the absence of permission, you have no right to enter your neighbour's garden to gather the fruit. Your neighbour can order you to cut back the trees to a perpendicular line continuous with the fence, or, should you fail to remove the overhanging parts, he may, after giving notice, remove them himself and return the cut branches to your side of the fence.

**MARKET GARDENING:** *H. R.* We think you would find *Commercial Gardening*, edited by John Weathers and published by the Gresham Publishing Co., Southampton Street, Strand, London W.C., the kind of work you require. It deals with the market garden culture of fruits, flowers and vegetables of all descriptions in the open air and under glass. The pre-war price was 36s for 4 volumes, but if it is new out of print, you may be able to obtain a secondhand copy by advertising. The questions of soils and manures, rotation of crops, market garden book-keeping, estimates of receipts and expenses for important crops, etc., etc., are dealt with, and should be of great use to you. A series of works on Orchard Tree Culture, Market Nursery work, Special Glasshouse Crops, etc., is published by Messrs. Benn Bros., Ltd., 8, Bouverie Street, E.C.4, at 4s. 6d. per volume. *French Market Gardening*, by John Weathers (John Murray, 5s. 6d.), may also be helpful to you in the cultivation of salads and vegetables for market.

**MICHAELMAS DAISIES DISEASED:** *C. J. W.* If you will send specimens affected by the disease referred to in your letter, we will endeavour to determine it.

**NAMES OF PLANTS:** *J. E.* 1, *Rosa lutea*; 2, *Tropaeolum polyphyllum*; 3, *Rubus bambusarum*; 4, *Medicago lupulina*; 5, *Lycchnis vespertina*; 6, *Ligustrum lucidum coriaceum*. The white flower is *Robinia Pseud-acacia*. We do not recognise the Butterfly.

**ORNAMENTAL SWIMMING POOL:** *W. A. E.* It depends very much upon the composition of the brown sediment hiding the tiles of the swimming pond as to whether you can bleach it out or not. Water in still ponds may remain more or less permanently green, but this in-

dicates the presence of organic matter, which should not apply in this case. Green scum often consists of microscopic plants which can be seen, but not felt with the fingers. One named Euglena viridis seems on the borderland of animal life. It should be possible to bleach or whiten such organic matter by distributing bleaching powder all over the surface of the pool. This powder consists of a mixture of calcium chloride and calcium hypochlorite, the latter being the bleaching agent, but the already prepared bleaching powder would serve the purpose best, because free from lumps and the impurities of quicklime. It would have been good policy to have washed and flushed the pool before filling it. Another point to see to is that dust does not blow into the pool in any quantity, if this can be prevented. The chloride of lime can only remove colour and does not destroy the substance; but it does not bleach particles of sand.

POPLAR LEAVES DAMAGED: M. J. A. Possibly the dry weather earlier in the season caused the leaves to shrivel. No disease was present.

ROSES FOR EXHIBITION: J. W. H. To secure large flowers all except the leading bud should be removed at an early period. No. 3 is a Briar; but No. 2 is a Rose growth.

SINGLE PELARGONIUMS: H. W. The specimens sent were very good samples. Single varieties are useless for market, the semi-double sorts being mostly in demand. The demand for single Pelargoniums varies greatly.

SPOCKS UNHEALTHY: J. I. The roots contain the mycelium of some fungus, and also a bacteria. Infected plants should be destroyed.

TOMATOS FAILING TO COLOUR: J. McP. The lack of colour, together with the firmness of the flesh on the pale parts of the fruit of your Tomatos is probably due to lack of potash in the soil. Top-dress the root area with wood ash and follow with a good watering.

TRANSPLANTING IRIS SIBIRICA: E. B. H. As your plants of Iris sibirica have been allowed to develop into large clumps it would be advisable to defer lifting and replanting them until the end of September. The clumps should then be lifted and divided by inserting two forks into the middle, back to back, and pulling them apart; choose the best pieces from the outside of the clump and replant as the work proceeds. If possible, place a heavy mulch of some decaying material round the clumps now. This will encourage the new roots near the surface and enable you to conserve a larger portion of roots undamaged when dividing the specimens.

THE WEATHER.

THE WEATHER IN JUNE.

The exceptionally fine weather of May continued until the middle of June, large amounts of sunshine being experienced, only two days yielding a millimetre or more of rainfall, and the winds being mainly light and variable, consisting chiefly of diurnal land-and-sea breezes. The ground became very dry, and crop and garden prospects declined seriously. A great change then occurred, and the last fortnight was stormy and dull, with some substantial, and many smaller, falls of rain. In most respects the two widely different periods practically balanced each other. For the complete month, however, the mean temperature was only 55.7°, or 0.7° below normal. There were 204 hours of bright sunshine, or only 7 fewer than usual. The total rainfall amounted to 2.16 inches, or a trifle of 0.13 inch under the average. Westerly winds were nearly twice as frequent as normally, and the easterly airs common in June were almost absent. A moderate gale from the westward prevailed during the middle of the day on the 25th. No thunder occurred, and during the hot spells over much of the country the maximum thermometer at Southport only twice rose above 72°—viz., to 78.8° on the 7th and to 79.5° on the 1st. On the early morning of the 14th the minimum thermometer upon the grass fell to 28.3°. Joseph Bazendell, F.R.Met.Soc., Borough Meteorologist, The Fernley Observatory, Southport

MARKETS.

COVENT GARDEN, Tuesday, August 1, 1922.

Vegetables; Average Wholesale Prices.

Table with columns for vegetable names and prices. Includes items like Arti chokes, Aubergine, Beans, Carrots, Cauliflower, Cucumbers, etc.

Fruit: Average Wholesale Prices.

Table with columns for fruit names and prices. Includes items like Apples, Grapes, Lemons, Melons, etc.

REMARKS.—The requirements for Bank Holiday trade have slightly improved the demand of some fruit, although values remain comparatively low in other instances. Large arrivals of Dutch Tomatos have adversely influenced prices of home-grown supplies. Cucumbers are not so plentiful and selling fairly well. Early English Apples, such as Beauty of Bath and Gladstone, are inquired for and expected in quantity daily. Large cookers are also wanted, but the bulk of arrivals are on the small side. English Plums, such as Czar and Early Rivers, are meeting a good demand. Cherries are less plentiful, and firm, well coloured fruits sell at better prices. There is a fair demand for large dessert Gooseberries, while small red berries are not much wanted. Choice fruits, such as Melons, Grapes, Figs, Peaches and Nectarines meet a fair demand at slightly lower quotations. Plums and Gages from France and Spain are moving freely in moderately large quantities. Green vegetables and salads remain plentiful and cheap. French Runner Beans are also wanted low. Mushrooms are in shorter supply and advanced in price early in the week. The supply of new Potatos is heavy and values low.

Plants in Pots, etc.: Average Wholesale Prices.

(All 4's except where otherwise stated.)

Table with columns for plant names and prices. Includes items like Adiantum, Heliotrope, Hydrangeas, etc.

Cut Flowers, etc.: Average Wholesale Prices.

Table with columns for flower names and prices. Includes items like Achillea, Alstroemeria, Asparagus plumosus, etc.

REMARKS.—In this department trade still remains at a very low ebb. Country orders appear to be falling off, and many lines are much above requirements. Carnations and Gladiolus are most prominent, and some fine blooms of the latter are arriving from Holland in fine condition, but they are over-supplied, and consignments are difficult to clear even at greatly reduced prices. The Bride (white) is more limited in quantity, and prices remain normal. Roses mostly consist of second-rate blooms, and prices are firmer for better quality blooms. All outdoor blooms are abundant, the double white Gypsophila paniculata being one of the most popular kinds. The supply of all Statice exceeds the demand. Asters are improving in quality, and a few bunches of white and bronze Chrysanthemums are on sale, but there is no demand for them or for the few Dahlias also offered. Sweet Peas vary considerably in quality and price, and the best blooms are soon cleared. The supply of Lilioms appears to be shorter, and prices show a tendency to rise, especially for L. longiflorum. White and pink L. speciosum are still in excellent condition. Lily-of-the-Valley has also been reduced in quantity, but Stephanotis is more plentiful, as are white and mauve Sweet Sultans. Orchids are scarce and the supply very irregular.

GARDENING APPOINTMENTS.

Mr. E. Jolley, previously Gardener to Mrs. MARIAM PONCELLI-CRIST, of The Wayside, Southbourne, Sussex, as Gardener to VISCOUNTESS PERL, Leydene, Petersfield, Hampshire.

Mr. H. Parkinson, for the past 24 years Gardener to the late P. S. MAYHEW, Esq., Duxbury Park, Chorley, Lancashire, as Superintendent to Chorley Corporation, at Astley Park. (Thanks for 2s. for R.G.O.F. Box.—Eds.)

Mr. Wm. Lewry, for the past 14 months Gardener at Snaiting Brook, Sheffield, as Gardener to THE BISHOP of COVENTRY, Bishopsholme, Coventry, entering upon his duties August 14. (Thanks for 2s. for R.G.O.F. Box.—Eds.)

Mr. F. J. Carter, for the past 18 months Gardener to J. P. EYRE, Esq., Heatherley, Balcombe, Sussex, as Gardener to E. V. WELBY, Esq., Rothbury, West Byfleet, Surrey.

Mr. E. Gilman, late of Ingestra Gardens, asks us to state that his new address is Hillside, Rugeley.

**The Hardy Fruit Crops.** The condition of the hardy fruit crops, as revealed by the tabulated returns on pp. 95 to 100, furnished us by growers in different parts of Great Britain and Ireland, is, with the exception of Strawberries, eminently satisfactory. Many of our correspondents have crops of all kinds of fruit in excess of the average, and a considerable number record quality above the normal. It is true that the tables reveal nothing of an exceptional nature in either abnormal yields or deficiencies, but they prove that it is a good fruit year generally, and very much better than was at one time anticipated. The most surprising feature the returns show is the splendid crop of Apples, which, after the record yield of last year, might have been expected to be small this year. Yet, of a total number of 183 returns for this fruit, no fewer than 52 of our readers record crops in excess of the average; of the remainder 87 are given as normal yields and only 44 growers report a deficiency. Pears are even better than Apples, for the great bulk of our correspondents have splendid crops of this fruit. Of the 183 returns sent in, more than one-third record an "over" crop, whilst nearly half are equal to the average yield, with only 26 "under" crops. Stone fruits come out exceedingly well and especially Plums. This year 94 of the 183 returns for this fruit are given as "over" compared with 4 in 1921, and the "average" crops total 61, with only 28 under crops, compared with 187 last season. Cherries also are plentiful, as is shown by the large

number of 99 average crops out of 160 returns, whilst 36 of our correspondents have crops of Cherries in excess of the normal. Peaches and Nectarines are bearing exceedingly well, and it is interesting to find that northern growers have unusually fine crops of these exotic fruits. This is doubtless due to the exceptionally fine weather late in May, when the blossom expanded under ideal conditions for setting. Apricots are also fruiting freely and the number of returns for this fruit over or equal to the average is far in excess of the number of "under" crops. Small fruits, which, taking one year with another, are by far the most consistently regular in cropping, come out exceedingly well with 114 average yields, 54 in excess of the normal and only 15 below the average. Strawberries are, as stated, the most disappointing crop of all, for which a variety of circumstances are responsible. It is probable that the exceptional drought of last summer is partly responsible, for in many districts the crowns were starved through an insufficiency of nourishment, and strong runners for planting were exceptionally scarce. At blossoming time, many of the flowers were blackened by frost and a period of exceptionally dry, hot weather prevailed at the time when the berries were swelling.

The last column in the tables shows that nuts are more plentiful than usual, with yields of 48 average, 47 over, and only 15 under crops of the 110 returns sent us.

Taking the various items in the tables collectively, the records point to a good fruit year generally, and show that northern growers are especially favoured. Only one of our Scottish correspondents has an under crop of Apples, and only one an under crop of Peaches and Nectarines. It is also interesting to find that this is exactly the same in the case of Ireland, although the number of returns from that country is relatively a small one. Such a year of plenty, without there being a glut of any kind of fruit, may be regarded as an ideal one, as very fat years are almost invariably followed by lean ones and, contrary to popular belief, are unprofitable to market growers, for the returns from glutted markets are always poor. Not for a great many years was the wood of our hardy fruit trees so thoroughly well ripened as in the autumn of 1921, therefore fruit buds were plentiful. As a consequence of this, fruit blossom was produced in abundance this spring, the Plum and Pear orchards especially being white with the flowers. Fortunately the season of blooming was late, for although the weather from Christmas to May was not exceptionally cold, the winds were chilly and much rain fell, making the soil cold and retarding root action. Thus, when the brilliant spell of weather set in on Saturday, May 6, vegetation was quite a month backward and only a few precocious blossoms expanded, for on Tuesday, May 9, the weather turned cold again and continued dull and cold until Saturday, May 20. Thereafter the weather was gloriously fine and the belated flowers opened and set freely, as the results in the Grand Summary table for 1922 prove.

**Rose Trials at Wisley.**—We learn that the Council of the Royal Horticultural Society has decided to establish a plantation of Roses in order to compare the behaviour of different varieties in the garden. The Council regrets that in spite of long negotiations, the National Rose Society has not seen its way to co-operate, but a confident appeal is made to Rose-growers for assistance in making this effort a success. A portion of the newly acquired farmland at Wisley has been set aside for the purpose, pro-

viding ample room with space to expand in the future, and while the primary object of the plantation will be the testing of new varieties of all classes against well-known standard varieties, it is hoped also to increase the collection of Rose species, which is already considerable. The varieties planted will be reported upon at intervals and awards will be made according to their value for use in gardens. The tests will be made, as a rule, with not fewer than six plants of each variety, and all varieties sent for trial should reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey (if by rail, L. and S.W. Rly., Horsley Station), on or before November 15. The Director will also be glad to receive offers of standard varieties for planting for comparison. The Council hopes that this Rose trial ground will eventually be developed into a National Rose Garden for Great Britain, where Roses of all types will be well represented.

**American Iris Society's Lists.**—The American Iris Society has compiled a list of names of about eight hundred Bearded Irises and graded the varieties according to merit. The highest possible rating was ten points, but the twenty-five jurors were instructed that "the recent work of breeders forecasts far superior development than known at present, so that no variety should be given ten." Standard varieties have been chosen and rated, and by the side of these the varieties introduced since 1916 are listed, according to their quality. Thus, the highest rated variety is Lent A. Williamson, which receives 9.6 points, and it is alone, with no standard variety of similar merit for comparison; Lord of June is a 9.1 variety; Alcazar, 8.9; pallida dalmatica, 8.8; Crusader, 8.7; Edouard Michel, 8.6; Lady Foster, 8.5; Anna Farr, 8.4; Ambigua, 8.3; Delicatissima, 8.2; Carthusian, 8.1; and Col. Candelot, 8.0; these, of course, are only the standard varieties which head the higher ratings. When the American list has been checked by English and French growers, and published with any amendments that seem desirable, it should prove a valuable guide to all who propose to plant Bearded Irises or keep their collections up-to-date.

**Bank Holiday at Kew.**—Although the weather was very unpromising in the morning, over 20,000 persons visited the Royal Gardens, Kew, on August Bank Holiday. It is pleasant to record that the notices, which were displayed at the chief entrances, requesting the public to place waste paper, etc., in the receptacles provided for the purpose and not to spoil the beauty of the gardens, were generally observed, so there was not the unsightly litter so commonly associated with Bank Holiday crowds. For the most part, the early visitors patronised the glasshouses and the museums, but later on in the day the outdoor departments received their full share of attention. In the herbaceous borders the tall Hollyhocks, Sweet Peas, and other seasonable flowers attracted great crowds, while those who have an eye for colour when associated with foliage admired the large shrubby bed near-by, where the golden forms of Catalpa bignonioides, Elm and Negundo contrast finely with the rich purple of Prunus Pissardii and the Purple-leaved Filbert. Flowering trees are not numerous at this time of the year, but those who discovered Aesculus parviflora by the T. Range, and again just beyond the ruined arch, were amply repaid. The Mount Etna Broom was still beautiful, and very soon the large bed of Tamarix pentandra, by the Broad Walk, will be a mass of soft, pinkish blossom. There were many features of interest along this chief approach, such as the beds of brilliant Pentstemon Southgate Gem and the delicately beautiful variety Daydream. The old favourite, Verbena venosa, is a mass of glowing purple flowers, and rich colour is provided by Begonia semperflorans Bonfire. An unusual summer bedding feature is the two large beds of perpetual-flowering Carnations bordered with Prichard's garden Pinks in the best varieties, and this is especially successful. The flower garden proper is not yet quite at its best, but the bright scarlet of Pelargonium Paul Crampel and the intense crimson foliage of Coleus Verschaffeltii

were greatly appreciated during the dull weather. Dahlia enthusiasts were impressed by the splendid appearance of the plants in the several large beds near the Timber Museum. Their condition augurs well for an autumn display. The "conservatory" has been especially bright during the holiday with Begonias of many types and sorts, Celosias, Lobelia tenuior, Plumbago capensis, Statice sinuata, and many other kinds. The principal attraction to the public in the T. Range is the Giant Water Lily (*Victoria regia*), and this is excellent just now. Several plants of *Nymphaea gigantea Hudsoni* have been bearing their large, rich blue flowers over a long period. On the roof there are Allamandas and *Aristolochia gigas Sturtivantii*, bearing its enormous, quaint flowers, while at one corner of the Lily tank the cotton of commerce (*Gossypium herbaceum*) has set a goodly number of pods, which soon will burst and disclose the hidden wealth of fibre. At the other end there are floating plants of the Water Hyacinth, which is reported to be again such a pest in the American tropical rivers as to render navigation wellnigh impossible.

**Potato Trials at Ormskirk.**—The Ministry of Agriculture's Wart Disease Immunity Trials which are carried out each year at the Potato Testing Station of the National Institute of Agricultural Botany, Lathom, Ormskirk, will be open for inspection by the public on Thursday, August 24; the demonstrations will begin at 10 a.m. Sir Daniel Hall, the Ministry's chief scientific adviser, will preside at lunch, which it has been arranged to provide on the grounds at 1 p.m. Tickets for lunch are obtainable from Miss Whitehead, at the Potato Testing Station Office.

**Mr. W. G. Brazier.**—For many years the exhibition of the Shropshire Horticultural Society, at Shrewsbury, has been regarded as the most important of the shows held in the provinces. Like many other large undertakings, it commenced in a very small way, and for a long period after its inception the exhibition was managed very largely by the inseparable friends, Mr. Adnitt and Mr. Naunton, who were co-secretaries. When, owing to advancing years, they retired, Mr. Brazier, who had been associated with them in many ways, was appointed secretary, and he has held office since 1913. Visitors to the great exhibitions held in The Quarry will readily understand that secretarial duties connected with such an exhibition and its numerous associated entertainments must be very onerous, but those who have the most intimate knowledge of affairs will readily concede that Mr. Brazier has proved an admirable successor to Messrs. Adnitt and Naunton, and that under his regime the high position of the Shrewsbury Fête has been maintained. Mr. Brazier does not rest satisfied with things as they are and is always looking out for improvements, consequently he is usually to be seen at Chelsea, York, Wolverhampton, and other large exhibitions, on the look out for new classes or for suggestions which may eventually materialise at Shrewsbury. In view of the exhibition to be held on the 16th and 17th inst., we have much pleasure in publishing Mr. Brazier's portrait.

**Appointments for the Ensuing Week.**—Monday, August 14.—United Horticultural Benefit and Provident Society's meeting; Bath Gardeners' Society's meeting; Purley Horticultural Society's meeting. Tuesday, August 15.—Clay Cross Horticultural Society's show; Dublin Horticultural Society's show (two days). Wednesday, August 16.—Fraserburgh Horticultural Society's show; Derbyshire Agricultural and Horticultural Society's show (two days); Keymer, Clayton and Hassocks Society's show; Shropshire Horticultural Society's show (two days); Banff Flower Show. Thursday, August 17.—Bembridge Horticultural Society's show. Friday, August 18.—Perthshire Royal Horticultural Society's show (two days); Eastbourne Horticultural Society's meeting; Forfar Flower Show (two days); Rothesay Flower Show (two days). Saturday, August 19.—Felling and District Horticultural Society's show (two days); Laurencekirk

Flower Show; London and North-Western Railway Horticultural Society's show at Belle Vue, Manchester; Falkirk Horticultural Society's show; Dollar Flower Show; Kippen Flower Show; Burnley and District Horticultural Society's show; Maybole Flower Show; Alyth Flower Show; Beattock Flower Show; Blackwood Flower Show; Burntisland Flower show; Coupar-Angus Flower Show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Pruning the Banksian Rose.* This Rose differs widely in appearance from other Roses, and the difficulty experienced by many in inducing it to grow and flower freely points out the error of treating it as other Roses. It is met with in the regular course of business, and the question that it is a Rose being satisfactorily determined, it is pruned as a Rose; the how, when and where being never once thought of. Hence the cause of the disappointment that so frequently ensues. Now, how pleasant it would be if, with a little management, the many barren plants could be induced to change their character, and thus convert barrenness into a source of admiration and delight. To accomplish this end, do not prune the Banksian

MR. W. G. BRAZIER.

SECRETARY OF THE SHROPSHIRE HORTICULTURAL SOCIETY.

at set seasons as with other Roses. It is disposed to form strong shoots in the summer time. Watch for the appearance of these, and so soon as they are about a foot long, pinch off their tops. In consequence of this check, they will form laterals, which become well ripened and flower with certainty. It is necessary to cut their tops off early in spring, and from this period the plants should be watched throughout the growing season. Where too many shoots arise from one spot, let some be broken out entirely when young, and let the others be stopped when they attain the length before mentioned. There was a plant which covered one side of a house in this neighbourhood, but which was unfortunately destroyed by the severe frost during the winter of 1837-8. It was subjected to the treatment mentioned above, and produced annually thousands of its beautiful blossoms. *A. Z., Gard. Chron., August 14, 1847.*

## NOTICES OF BOOKS.

### The Dahlia.\*

THIS attractive, well printed and brightly written manual on a very popular American floral favourite deserves a special word of recognition, for many years have elapsed since anything similar has been published on the Dahlia. The book is adorned with a coloured frontispiece of a decorative variety raised by the author; there are several photographic process blocks neatly and artistically executed, and no fewer than 314 pages of text contained within its dark green cloth and gilt-lettered covers.

Being written for American growers, we can scarcely be expected to criticise the cultural methods recommended, but a brief résumé of the contents will help readers to form an idea of the general scope of the work so pleasantly discoursed upon by the lady who has undertaken, and with success, the production of so important an addition to Dahlia literature.

The book is divided into fifteen chapters without counting the Chart and Index. History and early Dahlia culture are superficially dealt with. Then follow special chapters on Situation, Soil Propagation, Breeding, Planting, Staking, and Fertilising, Cultivating, Watering, etc., Frosts, Pests and Remedies, Cutting, Packing and Shipping, under all of which headings the details are more or less elaborated.

We then get one on Dahlia Shows, another on Colour Combinations, and still another on Varieties in Alien Soil and Climate, each of which will raise in the reader's mind some idea of the matter under treatment.

It is curious that this book, which is a first attempt on the part of its author, should be by a lady enthusiast. The same remark applies to the very handsome work on the Paeony, by Mrs. Edward Harding, and so we must, of course, make allowances for little faults which might not be so readily excused on the part of more experienced authors. It would have been well for Mrs. Stout to have consulted *The Gardeners' Chronicle* before compiling her little hit of Dahlia history. In "the Pompon Dahlia," which appeared in the issues for September 2, 9, and 16, 1916, and also in another article entitled, "When Was the Dahlia First Introduced into England," which appeared in the issue for the 23rd of the same month, much information is contained which would have prevented Mrs. Stout from falling into the errors she has committed in matters historical.

Her somewhat effusive paragraph relating Cervantes' despatch of Dahlias to Cavanilles of Madrid is ambiguous, and we are tempted to ask were "seeds" really sent to Europe or were tubers? The reader is certainly left in a dilemma when, following the year 1787, we are told, "At that time the Marquis of Bute was British Ambassador to Spain, and his wife . . . begged a few seeds and sent them home for trial there." As a matter of fact, this story is apocryphal. There was no such person as the "Marquis" of Bute at that time, as the title was not created till 1796. The Earl of Bute was not then British Ambassador at the Court of Madrid, and it was not while Lord and Lady Bute were at Madrid that the Dahlia was introduced into Kew Gardens, but in 1798, when they had returned. Lady Bute obtained the Dahlia, with other plants, for Kew Gardens through the kindly offices of Ortega of Madrid. No one has any right to falsify history.

It is perfectly certain that the author's allusion to Hartweg of Karlsruhe and the Pompon Dahlia are at variance with the facts. She states, "In 1870 . . . appeared a tiny ball-shaped blossom, originating probably with Hartweg of Karlsruhe, which he called 'Pompon.'" The Pompon Dahlia was never known in Hartweg's lifetime; he died about 1830, after labouring to bring about duplication in the old single-flowering Dahlias, originally introduced from Mexico into Madrid and thence into England. The Pompon first made its appearance in 1850. It was the product of a well-known German raiser of Dahlias—Sieckmann of Köstritz.

\* *The Amateurs' Book of the Dahlia.* By Mrs. Charles H. Stout. Wm. Heinemann, 20-21, Bedford Street, W.C.2. Price 10/6 net.

There are some curious typographical errors requiring alteration in a new edition, viz., "Icones et Descriptions Plantarum," on p. 12; then "Paradiseus londincensis," on p. 16. One would have thought that the great Frenchman, André Thouin, was well known enough, yet three times, on one page and once in the Index he is erroneously referred to as "Thuin." Casually turning over the pages, we observe the systematic use of the mongrel word Collarette in place of Colletterette, but some English writers are also guilty of this malformation. Our old Belgian friend Jules Closon appears on p. 216 as Jules Cllossen, but excuses may be made perhaps for unfamiliar foreign names, though why does Mrs. Stout illtreat her fellow countryman Ridgway, when she erroneously tells us she always uses "Ridgeway's Colour Chart"?

## HARDY FLOWER BORDER

### THE DOUBLE CARDAMINES.

ONE of the brightest plants in bloom in May is the double lilac variety of *Cardamine pratensis*, our Lady's Smock, which forms a compact little plant about a foot high, almost covered with its bright lilac flowers. I was for some time under the impression that this was simply an old form which, with the white variety of the double *C.*, was grown in gardens long ago, and which had flowers of a warmer hue than the white. I had lost sight of this old, coloured one for some years and had not an opportunity of comparing it with *C. pratensis* *lilacina plena*, but I now feel sure the latter is a brighter and better plant for the border or rock garden. The old one more nearly approaches the description of Shakespeare, who says:—

"And Lady-Smocks with silver white

Do paint the meadows with delight."

Its colour is more "silvery" than pure white, and if we examine the flowers of the wild single form we shall see white and several shades ranging from the faintest to a deeper lilac. But *à nos moutons*, as my object is to speak of the double varieties as garden plants, not to discuss the variations of the wildings. All the three double varieties I know are very pretty border plants with many flowers of quite doubleness and very symmetrical in their formation, yet not in any way stiff. One is pure white, another the very palest lilac, and the third, which I have had in flower, of a warm lilac. While the plants naturally like a moist place, they do not resent a dry soil, and I have grown them quite satisfactorily in that medium. When April and May come they help with other flowers "to paint" the garden "with delight," and are most satisfactory plants in every way. S. Arnott.

## CULTURAL MEMORANDA.

### CUCUMBERS IN PITS AND FRAMES.

OLD Cucumber plants which have been in bearing a long time will now begin to show signs of failing vigour, no matter how well they may have been cared for. If these cannot be dispensed with, their vigour may be improved by cutting them over and top-dressing the roots with fresh turf and bone-meal, by feeding with tepid liquid manure and by syringing. F. J.

### LACHENALIA.

LACHENALIAS will now have thoroughly ripened up their bulbs, and these should be shaken from the old soil, graded and repotted. The largest bulbs should be chosen, and six or seven placed in a 4-inch pot, while to increase the stock the smaller bulbs may be grown in shallow boxes. *Lachenalias* also make a fine display when planted fairly thickly in shallow pans. The potting compost should be fairly rich and made porous by the liberal use of silver sand. After potting, stand the pots of bulbs on a bed of cinders in a cold frame, and give water sparingly until growth commences. Afterwards they should be stood on a shelf near the roof glass in a cool greenhouse. T. P.

## TREES AND SHRUBS.

### SYCOOPSIS SINENSIS.

THIS interesting member of the genus Hamamelidaceae was introduced by Mr. E. H. Wilson, in 1901, when collecting for Messrs. J. Veitch and Sons. It is an evergreen shrub or small tree, and is said to grow to the height of twenty feet in its native home in central China, where it was found at an altitude of 4,000 feet. It has somewhat leathery leaves, either entire or toothed towards the apex, dark green above and paler green beneath.

The small unisexual flowers are borne in short dense clusters (Fig. 38) rather less than an inch long, but the modestly showy part of the inflorescence is provided by the reddish-brown bracts and the yellowish stamens. *Sycopsis sinensis* flowers in February and March, and has proved quite hardy at Kew and Aldenham; sprays of it were exhibited

ripen? They are so inaccessible that we will have to wait for them to fall. M. J. Woodward, Arley Castle, Bewdley.

### OLEARIA NUMMULARIAEFOLIA.

THE above species was introduced from New Zealand, in 1899, by Messrs. J. Veitch and Sons, yet to-day there are many who regard it as too tender to withstand our climate outdoors. It has been omitted by Mr. W. J. Bean from his book, *Trees and Shrubs Hardy in the British Isles*, probably for this same reason. Soil and situation may have something to do with the matter of hardiness, but it certainly looks hardy enough in the garden of Miss Willmott, at Warley Place, Great Warley, where a clump of it measures six by six feet. The plants are the tallest I have seen, and are perfectly healthy. Amongst other shrubs, in full exposure, it looks different from anything else with its small, roundish, evergreen leaves, densely arranged on the shoots.

Contrast in foliage and its compact habit are its most striking features, and if it behaves

FIG. 38.—SYCOOPSIS SINENSIS.

from the latter gardens at one of the spring meetings of the Royal Horticultural Society this year. The neat habit and evergreen character of the shrub make it a useful plant for the garden, but its flowers must be regarded as interesting rather than beautiful.

### PINUS LAMBERTIANA AT ARLEY CASTLE.

IT may interest your readers to know that the *Pinus Lambertiana*, in the Arley Castle grounds, is now, in the 96th year of its age, bearing its first cones.

There are four long, slender, pale green cones hanging from the topmost branches. This tree is said to be the only survivor, in this country, of plants from the original seeds sent over by Douglas from Oregon in 1826, and distributed by the Royal Horticultural Society in 1827. It is now a fine specimen, being 98 ft. high and having a girth at 3 ft. of 12 ft. 2 inches. It seems strange it should wait so long to bear fruit, as trees of the same species planted at Kew and other places in 1872 had cones in 1920. The two specimens of *Pinus ponderosa* of the same date and origin as *P. Lambertiana*, in the Arley Castle Arboretum, have borne cones for many years.

Are any of your readers able to state how long the cones of *P. Lambertiana* will take to

elsewhere as it does at Warley Place it would deserve a place in any garden where evergreen shrubs like *Phillyrea* and *Osmantus* are grown for the sake of their foliage. J. F.

## ORCHID NOTES AND GLEANINGS.

### BULBOPHYLLUM GALBINUM, RIDLEY.

SPRAYS of this singular, large-flowered, Malayan species, each with two flowers, are sent by Messrs. Armstrong and Brown, Orchidhurst, Tunbridge Wells, where the species thrives well in a warm house in company with its nearest ally, *B. Reinwardtii*, and others of the evergreen species, with distant pseudobulbs on running rhizomes and natives of the Malay Archipelago.

The flowers have wax-like, greenish-yellow sepals with a few red markings, and they incline forward over the column. The petals are small, and the main attraction of the flower is the comparatively large front lobe of the lip, which is delicately hinged and moves with the slightest touch or change of position, the bright purple colour, no doubt, acting as an attraction to the insects necessary to secure fertilisation, an operation which the tilting of the lip facilitates.

# The Week's Work.

## THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Bleheim Palace, Woodstock, Oxon.

**Platyclinis.**—Plants of *P. filiformis* are most delightful objects when in flower, their graceful spikes of beautiful yellow flowers having earned for this species the name of the Golden Chain Orchid. This family of plants is subject to attack of red spider. The plants will derive benefit from a daily spraying overhead, and on the underside of the foliage until their tiny flowers open. Specimens of *P. glumacea* that have finished their growth will need little water at the roots, but must not be allowed to suffer from drought. *P. Cobbiana* and *P. uncatra* require similar treatment. All are plants of easy culture, and may be grown in an ordinary plant house, where the delicate perfume of *P. glumacea* will be greatly appreciated. All the species of *Platyclinis* thrive well in a shady position in the intermediate house the whole year round. Formerly these plants, like a great many other Orchids, were coddled and ruined by being grown in too much heat and given too little fresh air; but since more rational treatment has been adopted much better results have been attained. Being natives of the Philippine Islands, it was considered necessary to give them very warm, moist, tropical treatment, but the plants, as a rule, deteriorated under it. These pretty Orchids may be repotted after the flowers fade, or at the commencement of growth. Shallow pans are preferable to pots, as they are more easily suspended from the roof, where the plants will enjoy all the light possible, which is a considerable factor in their cultivation; but they should be shaded from strong sunshine. They root freely in a compost of equal parts of chopped *Osmunda* fibre and *Sphagnum* moss. Freshly potted plants should be very carefully watered, merely spraying the surface of the compost to keep it moist, and giving a little extra shade until they become re-established.

## THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Herbaceous Borders.**—Whilst the shrubberies are being dealt with, the hardy flower borders should not be neglected, but examined from time to time, staking and tying the plants where necessary, and clearing away dead flowers, as well as untidy foliage when it has ripened off, such as that of Oriental Poppies, which is better shortened than left spreading around in unpicturesque fashion.

**Tropaeolums.**—There are two species of this genus that deserve mention now. Firstly, I would refer again to *T. speciosum*, that wonderful little climber that is doing so wonderfully well this year with its countless small flowers of vivid scarlet hue. This was a difficult plant to get established at Aldenham, but our struggles with it have been amply repaid, for it is a wonderful picture threading its way through the growth of a tall Yew, or wandering in and out of a hedge, and forming what are practically long lines of scarlet blooms. Those who have seen it growing in Scotland will know that I am not too extravagant in my praise of it, for it does wonderfully well north of the Tweed. The other species is *T. majus*, commonly known as "Nasturtium," a term properly applicable to *Watercress*. This is an old cottage garden favourite, and we grow both the climbing forms and the Dwarf, or Tom-Thumb, varieties. The former we generally grow after the manner of Runner Beans—up poles—with good effect.

## HARDY FRUIT GARDEN.

By H. MARSHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Strawberries.**—Plants raised in small pots for producing large, early fruits next season should be planted at once—if the pots are filled with roots—on suitably prepared land. Plant them firmly and not too far apart in the rows. Keep runners removed and the soil amongst the rows clean and free from weeds. If the land is in good condition the plants should do well and by the end of the season have developed the strong, sturdy, well-ripened crowns which are necessary for the production of large fruits. Keep all the earliest sorts together, following on with the later varieties. Those intended for supplying very early fruits should be planted on a sheltered border in a sunny position.

**Summer Pruning.**—Push forward this work as fast as possible, taking great care to preserve all leaders and other young shoots needed for filling up space. Give the foliage a thorough washing before the fruits ripen. All trees have greatly improved since the rains and those trees that are bearing light crops should build up good buds for next year's supply.

**Pears.**—Where trees are bearing very heavy crops some amount of thinning is desirable both for improving the size and quality of those left to mature and to assist the trees in forming stronger buds by the end of the season. Although much rain has fallen do not overlook the roots of trees on walls and supply both water and liquid manure if necessary.

**Young Bush Trees.**—Young trees that are making rather weakly growth should be encouraged by mulching the root area with well-decayed manure. Trees bearing heavily should have the smaller and ill-placed fruit removed; quite small Apples make very good jelly, so the fruits removed need not be wasted. It is advisable to regulate the crops according to the strength of the growth. Bush trees should be largely planted where there is insufficient room for standards, as they usually crop freely when quite young.

## FRUITS UNDER GLASS.

By F. JOHNS, Gardener to Lieut.-Col. SPENCER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Early Vineries.**—The growth on early vines from which the Grapes were cut last month will now be getting ripe, and the foliage changing colour, which will indicate a satisfactory condition of the roots. If they are quite clean and free from insects the use of the syringe may be somewhat relaxed. Laterals that have had full liberty must now be checked by partial shortening, a few only being left to keep the roots in action to plump up the buds for another year. Examine inside borders, and if well drained do not be afraid of watering them for a few hours by means of a hose, as the roots of Vines should not want for water. The mulching must not be removed until the time arrives for top-dressing in October, when all should be raked off, the surface pricked up, and well dusted with bone-meal, vine manure, and lightly covered with fresh compost.

**Late Vines.**—The scalding period having passed away, houses containing Lady Downe's and other late varieties may now be ventilated freely, but by no means excessively. The house may be closed, with sun-heat, early in the afternoon for a few hours, fresh air being admitted throughout the hours of darkness. Treated in this way, the Grapes will swell fast with a minimum of fire-heat and in warm districts without it. If not already done the thinning scissors should be used for the last time, especially on bunches inclined to "bind," a very serious defect in Grapes expected to hang through the winter. Generous supplies of weak liquid manure, not only to the roots but also for damping purposes, should be given for a month after this date, but when colouring is well advanced, pure water may be substituted.

## PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-GAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Richardias.**—Plants that have been dried off in their pots should now be shaken out of the old soil and repotted. If the same receptacles are to be used they should be washed clean and allowed to become dry again before potting takes place. The compost may consist of good loam, leaf-soil and sand, with a moderate sprinkling of bone meal. The tubers should be placed in their flowering pots at once, after potting arrange them on an ash bed in a cold frame, for preference under a north wall, and during fine weather the lights should be left off both day and night. Very little water is needed until the plants show signs of active growth. Richardias that have been planted out of doors should be lifted in due course and placed in their flowering pots, but it is not advisable to allow them to make excessive growths before lifting them.

**Cyclamen.**—To obtain an early batch of Cyclamen for flowering in the autumn of next year seeds should now be sown in pots or pans thoroughly well drained with broken crocks or some other rough material. The soil may consist of good, open loam, leaf-soil, and a liberal supply of sand, and the mixture should be passed through a very fine sieve. After filling the receptacles water the soil with a fine rose can and allow it to drain for several hours before sowing the seeds, which should be placed about half an inch apart. This method of sowing will greatly facilitate the potting up of the young seedlings when they are sufficiently large. The soil should always be kept uniformly moist, and the receptacles covered with a sheet of glass and shaded from bright sunshine until germination takes place.

**Violets.**—Violets placed in beds out of doors to produce plants for flowering in frames during the winter and spring months are now growing freely, the recent rains having greatly benefited them. Remove runners as they appear and keep the soil lightly moved between the rows. A dusting of soot occasionally will be found very beneficial and during dry weather the plants should be sprayed, taking care that the moisture reaches the underside of the leaves; by this means red spider will be kept in check.

## THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Runner Beans.**—These should have the points of growth pinched out as soon as they reach the tops of the rods. This will induce the plants to branch out and to produce finer pods. Plants which produce the longest and best shaped pods should be marked, and the seed saved from them. Give the roots plenty of liquid manure, but, if the weather is wet, dress the ground with a good fertiliser.

**Spring Cabbage.**—Sow a batch of Ellam's Early and Sutton's April on a bed of finely prepared soil, in rows one foot apart. Scatter in some old lime rubble, finely sifted, and also wood ash, over the seed bed. If birds are troublesome, cover the bed with netting. Another sowing should be made a fortnight hence, as a good deal depends upon the weather. If a very hot autumn follows sowing, the early batch often runs to seed in spring.

**Onions.**—Choose a well-drained site, prepare the soil as recommended for spring-sown Onions, sow the seeds in drills drawn one foot apart, and use Giant Rocca, Tripoli, Ailsa Craig, and Cranston's Excelsior varieties. Make a second sowing a fortnight later.

**Watering.**—Celery, Leeks, Runner Beans, and Cauliflowers require abundance of water, and even during showery weather the soil should be examined at intervals to ascertain what depth the rain has penetrated, as rainfall is often deceptive in this respect. Give liberal supplies of liquid manure occasionally or a dressing of some good fertiliser.

## THE HISTORY OF THE MOSS ROSE.

(Continued from page 84.)

THE specimen referred to by Miss Willmott can be seen to-day. It will be remembered by those familiar with the history of the Chelsea Physic Garden that, when Sir Hans Sloane conveyed the freehold of the Garden to the Society of Apothecaries, a covenant was inserted in the deed, binding them to present to the Royal Society every year fifty dried specimens of distinct plants grown in their garden the same year until the number of 2,000 should have been delivered. It was in accordance with that covenant that Miller, as gardener to the Apothecaries Company, made the presentation, and the specimen No. 681, 1735, is still preserved in the British Museum, with a reference to Boerhaave's description, and presumably from the plant which was given to Miller by Boerhaave.

But this is not all. At the time I was shown the specimen No. 681, another one of Miller's specimens was produced for inspection, and this not a Dutch one, but a French one. It would appear that this second specimen, received some years later, was the type upon which Miller founded the specific name of *R. muscosa*, the name first used by him, as already mentioned, in the eighth edition of his *Dictionary*, No. 22, in the article *Rosa*. A very remarkable interest attaches to this specimen. Pasted on the sheet upon which it is mounted is a little note in a cramped, old-fashioned handwriting in Latin, viz., "*Omnium rosarum maxime distincta ab Armórica in Europam immutabilis tamen a Linneo confusa cum Centifolia.*" It was not Dutch, as the specimen came from Armorica, and Armorica is the old Latin name for that region in the north of France which lies between the Seine and the Loire, otherwise Normandy and Brittany as we know it to-day. Here, then, is some food for reflection with regard to Major Hurst's theory that the Moss Rose was grown by Fréard du Castel in Normandy in 1746, about which I shall reserve comments till I come to the question of the Moss Rose in France.

A few lines are necessary in regard to Major Hurst's ready acceptance without criticism of Shailer's palpable misstatement in his article which appeared in *The Gardeners' Chronicle* for 1852, in *The Midland Florist* for the year previous, and possibly in several other contemporary horticultural publications. Both in the *R.H.S. Journal* and in the *Rose Annual*, Major Hurst states that this is the year, 1735, which Shailer gives as the date of the first introduction of the Moss Rose. I cannot understand what useful purpose is served by dragging into what should be a history such irrelevant, contradictory, and false statements as Shailer's. He had no personal knowledge of the event, and was writing about it considerably more than a century after it happened. He evidently took but little trouble, like many others, to verify his dates and facts. It explains, amplifies, or proves absolutely nothing. Shailer's opening paragraph (see *The Gardeners' Chronicle*, 1852, p. 759, and *Midland Florist*, Vol. V., p. 182) is obviously an egregious blunder, and begins thus: "On the first introduction of the old red Moss Rose, in or about the year 1735, it was sent over . . . from the Italian States to Mr. Wrench, then a nurseryman and gardener at Broomhouse, Fulham." Is this the sort of evidence to be accepted without question? It has been shown that Furber offered it for sale in 1724, that Miller brought it from Holland in 1727, that at least two publications figured it in 1730, and that in the following year, 1731, it was described in Miller's *Dictionary*, and that it had been already grown at Chelsea and a specimen of it presented to the Royal Society in 1735; most of which facts had come to the notice of Major Hurst, who tells us—with what object in view it is difficult to understand—that Darwin (1893) quotes this reference of Shailer, and states the common double Moss Rose was imported into England from Italy about 1735. If Darwin did say so,

it is self-evident that he was misled and quite unaware of the facts, and there is no point in Major Hurst quoting the great scientist's error if the original introduction be meant, for it is absolutely contrary to ascertained facts and has no bearing on the main question, which is to establish the date of the first introduction of the Moss Rose into England.

This acceptance of irrelevant or unconfirmed matter is further exemplified in the statement on p. 34 of the *R.H.S. Journal*, where Major Hurst states: "We have seen that it was in cultivation in Holland in 1720, in England in 1727" (why not 1724?), "and in Italy in 1735." So far as the last-named country is concerned, we have seen nothing of the kind. All we have seen is that Shailer's opening paragraph is an obviously erroneous statement about the year of introduction, with the addition that the flower came from the Italian States. And, considering his ignorance of the date, it is not by any means convincing to be told that we have seen that the flower was cultivated in Italy in 1735. We can only be assured of the

the widow of the Comte de Vandes, himself an enthusiastic amateur horticulturist, should be referred to as the Countess de "Vanda's" garden. The famous Bayswater botanic garden contained a great number of horticultural rarities, and from it came many specimens which were figured in the horticultural and botanical publications of the early part of the nineteenth century. It may be mentioned that it was here that the single-flowered Moss Rose originated in 1807 or thereabouts, and was subsequently introduced into France by that great lover of horticulture, M. Boursault. (C. Harman Payne.

(To be continued.)

## THE ALPINE GARDEN.

### CAMPANULA ZOYSII.

THIS charming little alpine bell-flower is so exquisitely beautiful that it deserves to be cultivated by all lovers of alpine plants, even though one has to go to considerable trouble

FIG. 39.—CAMPANULA ZOYSII.

truth of this illogical conclusion by reference to contemporary Italian horticultural writers, not the *ipse dixit* of an elderly nineteenth-century Battersea nurseryman.

There is some little difficulty in keeping my criticisms in chronological order, and that is due to the fact that some of the evidence to be considered was published long after the events took place which it purports to record, but so far as can conveniently be done I have endeavoured to treat the questions seriatim.

Miss Willmott, in the chapter on the Moss Rose in *The Genus Rosa* makes the most unfortunate assertion that "the first illustration is certainly that in *Miller's Icones*." If by that title—and Major Hurst uses it too—is meant Miller's *Figures of the most beautiful plants described in the Gardeners' Dictionary, etc.*, published in 1760, it would have been much better to have quoted the title correctly, for in such matters verbal accuracy must be insisted upon, so that the independent investigator be not needlessly thrown off the track. But this gifted lady amateur is just as certainly wrong, for at least half a dozen coloured figures of the Moss Rose were published between 1730 and 1760. It is a pity that the text of so beautiful a book should also contain in the same chapter such blemishes as the misprint of "Faber," where Furber is intended, and that the garden of another well-known lady amateur of about a century ago,

to cultivate it. It is a native of the Austrian Alps, and according to Nicholson was introduced from Carniola in 1813. It is an alpine gem that thrives in a sunny position in British soil and appears to be most satisfactorily accommodated in the moraine. The light blue flowers are very distinctly shaped from those of any other *Campanula*, the tube being somewhat angular and flask-shaped, contracted at the throat, with five short, triangular, connivent lobes.

In the *Gardeners' Chronicle*, August 15, 1896, the late Dr. M. T. Masters pointed out that the inner surface of these lobes is studded with hairs, the stamens being short and occupying the bottom of the flower tube. An insect visiting the flower would therefore have to push aside these segments, which would be more or less obstructed by the hairs on the inner surface, and would come into contact with the stigma on the elongated style. If the insect had come from another flower, most probably it would be dusted over with pollen, and that pollen would be deposited on the stigma.

In the young state the flowers are pendulous, but they become erect as they grow older. The tiny, roundish, green leaves form little flat tufts from the midst of which the slender flower stems rise. Several finely flowered examples in small pots were exhibited by Mr. M. Prichard, of Christchurch, at a recent meeting of the R.H.S., and one of these is illustrated herewith (Fig. 39). C.

**EDITORIAL NOTICE.**

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

**THE MARKET FRUIT GARDEN**

JULY seemed to be a wet month, because of the number of rainy days (16); but in reality the rainfall (2.91 inches) was not much over the average. The weather was mainly dull and unseasonably cold, so that

instructed to discard any cracked or damaged fruit, but it is impossible to get them to do that kind of thing thoroughly, particularly if they are on piece-work. Wherever I have had occasion to unpack a basket, I have found a number of Plums which were not fit for sale. This season, as I am packing in accordance with the marketing scheme of the Federation of British Growers, and so giving a guarantee that all fruit is sound when packed, I am bound to be more particular.

In spite of the bountiful crop, all our Plums are being passed over a sorting table, and any that are cracked or otherwise unsound or abnormal are thrown out. Much of the discarded cracked fruit is rotting by the following morning, which shows how desirable it is that it should not be included. The sorting, of course, involves extra work, but it should be well worth it. I have made a long, narrow table, with canvas top, with a gently sloping shoot at each end. A half-sieve is placed under each shoot, and the Plums are very quickly sorted over and run into the baskets by two girls. This is an example of the kind of improvement in marketing methods

I began to rogue my cutting bed by the leaf method, but the number left as healthy was so very small that I lost confidence and abandoned the task. Is it possible that an exceptional number of bushes are showing signs of reversion as a result of the abnormal drought of last season, and that they will recover? I should like to have Mr. Lees' opinion on this point. He mentions the spread of reversion from one bush to another. Is this a proved fact?

Mr. W. P. Seabrook tells me of another method of detecting reversion which has been practised with success in his firm's plantations for many years, and was their discovery. In this case the blossom is the criterion. On a normal bush the calyx is covered with a bright lavender-coloured down. On a reverted branch or bush the bloom is rather smaller, and the calyx is smooth, shiny, and dark chocolate-coloured, the petals being yellower than usual. The distinction is said to be very easily made. I must wait until next year for an opportunity to put this method to the test.

**CHLOR-CRESOL AS AN INSECTICIDE.**

I have previously (p. 324) mentioned the failure of chlor-cresol in a small trial against Currant leaf blister aphid. I now find that the Red Currants on the bushes sprayed with chlor-cresol are flavoured, so that they are quite unusable. Even the birds, which rapidly strip any unsprayed bushes that are left unprotected, fight shy of this fruit. The spraying was done whilst the fruit was quite small and green, and much rain has fallen since. This long-lasting taint might be counted in favour of chlor-cresol for use as a deterrent to birds and possibly insects in certain conditions; but apparently the material is not suitable for use on fruit in anything like an advanced state. *Market Grower.*

FIG. 40.—LILIUM GIGANTEUM FLOWERING AT CASTLE KENNEDY.

crops were kept in a backward state. The week before August Bank Holiday is often a very busy marketing week with me, South Coast towns being full of visitors; but this year only Rivers' Early Prolific Plums and Early Victoria and Early Julyan Apples were ready to gather. However, a wet season really suits my light land, and the rainy July has done a great deal of good.

Plums, Apples, and Pears are now certain to be of good size. Apples look particularly well, and promise to have plenty of colour, whilst there is hardly a speck of scab to be found. Practically every variety having been thinned, the trees look very attractive with the fruit evenly spaced and all very much of a size. The gale on July 5 did a good deal of additional thinning, but most varieties could stand it.

**SORTING PLUMS.**

Plums often go to market in a very unsatisfactory condition. I have never hitherto been satisfied with my own. The pickers are

which is bound to result where the Federation's scheme is adopted and carried out in a conscientious manner.

**REVERSION IN BLACK CURRANTS.**

Mr. A. H. Lees' remarks on reversion (p. 65) are of much interest. As mentioned in my last notes (p. 38), I have been using Mr. Lees' method of detecting reversion. Rightly or wrongly, however, I gave it up, because it meant the sacrifice of so many bushes that are still bearing a useful crop. Instead, I had to fall back on the second method, which he, no doubt correctly, describes as more risky, namely, examining the bushes when in fruit and marking for destruction any that are obviously reverted, as shown by their general appearance and the lightness of their crop. All these bushes, I admit, showed the reverted type and leaf venation; but, then, so did a great many others which are still in profitable condition. Probably some of the latter are only temporarily producing leaves of reverted type, and may recover, as Mr. Lees says happens in certain conditions, in which case I was right to spare them.

**LILIUM GIGANTEUM AND MECONOPSIS WALLICHII.****TWO GOOD PLANTS FOR THE SOUTH-WEST OF SCOTLAND.**

PROBABLY no two plants are giving more pleasure and satisfaction than *Lilium giganteum* and *Meconopsis Wallichii* in the milder districts of the south-west of Scotland at present, early August.

The noble *Lilium giganteum*, with its handsome, shining, heart-shaped leaves, is just passing out of flower, and a group of it with fifty-two flowering spikes, many of them 10 feet high and bearing from 8 to 12 white, funnel-shaped flowers, has been a distinct feature in these gardens for some time. *L. giganteum* is easily grown either from off-sets when the old bulb dies after flowering, or from seeds; the former method has much to recommend it once there is a plentiful supply of flowering bulbs. *L. giganteum* delights in a cool deep soil containing a very high percentage of humus, and a position sheltered from high winds. The illustration (Fig. 40) shows a small group in these gardens, and the average height of the plants is about 11 feet.

*Meconopsis Wallichii*, the beautiful Himalayan Poppy, seems to delight in our humid climate, for on measuring several plants in a group, I found they had attained a height of 7½ feet before opening their first flowers. This plant also seems to thrive best if grouped among shrubs in rich, well-drained soil. No prettier object than a group of these handsome Poppies with their beautiful, drooping, pale blue flowers, can be desired, and although only a few flowers open at one time, the display continues for many weeks.

Unfortunately, like many other interesting plants, this Poppy is of biennial habit, and for that reason is not so often seen as it ought to be. A few seeds sown every year will ensure a number of flowering plants, and even before they reach their flowering stage they possess a most attractive appearance. *R. Findlay, The Gardens, Castle Kennedy.*

# REPORT ON THE CONDITION OF THE OUT-DOOR FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP; AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

## HOME CORRESPONDENCE.

**Dianthus Allwoodii.**—Early in the spring, after carefully noting the various advertisements, I recommended my employer to purchase plants of *Dianthus Allwoodii*. Eight varieties of this hybrid were received from Messrs. Allwood Bros., Haywards Heath, which I unpacked. I gather from Messrs. Allwood's letter (p. 86) that they resent my remarks upon these eight varieties, grown in Coombe House Gardens. The border where the plants were grown is 114 feet long and receives the sunlight from early morn till late in the evening and we have not placed leaf mould in it. In this border we have successfully grown seedling border carnations from Messrs Sutton and Sons, and many years ago the Old Clove did exceedingly well on the same site. After forty years' experience in these gardens I have yet to meet a reputable nurseryman who supplies "cheap, over-propagated stock." Messrs. Allwood Bros. will find in their books the name of my employer, Frank Lloyd, Esq., Coombe House, Croydon, Surrey. I am forwarding a few flower sprays and their "grass" for the Editors' examination. Mr. R. P. Brotherton has made some useful remarks anent the pot culture of these *Dianthus*, but I am seeking information with regard to outdoor border cultivation. Mr. F. W. Jeffery recommends *Dianthus Allwoodii* for planting in masses, but admits the inferiority of the individual plant; he also writes of the painter's "breadth of effect," but this seems to rule out small gardens. "J. P., Carlisle" supports my remarks. What I want to know is under what conditions varieties of *D. Allwoodii* become good garden plants.—*Mark Mills*.

—When I first read Mr. Mark Mills' letter in your issue of July 29 regarding *Dianthus Allwoodii*, I was under the impression it was written by someone who was not a skilled gardener, or who was prejudiced, because in the gardens here we have beds of *D. Allwoodii* in the most prominent positions. We grow plants extensively in lawn vases in place of *Pelargoniums*, and for the last two years I have forced the varieties Harold, Joan and Betty, for Easter and early flowering, in fact, my employer insists upon *D. Allwoodii* being used from April to November in one way or another for decoration in the hall. We have propagated considerably over 3,000 *D. Allwoodii*, and as every new variety is sent out I intend to buy it, as I am sure we have only just begun to see the beauty of this marvellous plant.—*Jack Palmer, Holmside, Surrey*.

**The "Golden Elder."**—Why is it that in practically all the works on trees and shrubs, including the very latest ones, this very common plant is designated as a variety of the common Elder (*Sambucus nigra*)? So far back as July, 1896, at a meeting of the Botanical Society of Edinburgh, and subsequently in the columns of *The Gardeners' Chronicle*, I pointed out that this was wrong, and that it was a variety of the Canadian Elder (*S. canadensis*), but the fiction that it is a variety of the common Elder seems to cling to it as tenaciously as ever. Is it not time it was put in its proper place? *A. D. Richardson, Edinburgh*.

**Branch-cuttings of Apples.**—Have any of your readers heard of a burr-knot method of raising Apple trees? I am a Norfolk gardener and occasionally prune neighbours' fruit trees. Some of the trees I have operated upon appear to have been in bearing for some years, and yet are not old, so I asked for their history and was told they were "burr-knots," or Apple cuttings struck from a full-grown tree, quite large branches being taken off below a burr-knot or elbow-like bend and inserted firmly in the soil between October 11 and December 25. Such trees bear 30 or 40 Apples the first season, if allowed. I saw a fine tree of Bramley's seedling from such a cutting, but I have only heard of the Mulberry treated in this way before. *E. F. M. Hewat, Lessingham, Stalham*.

## SOCIETIES.

## ROYAL HORTICULTURAL.

AUGUST 9.—Coming so soon after the Bank Holiday, a large meeting was not expected on this date, nevertheless the Royal Horticultural Hall was fairly well filled, but in no sense crowded with exhibits, whilst Fellows and visitors were few in number. Hardy flowers predominated, and of these the annuals, Phloxes, Hollyhocks, Gladioli and Kniphofias were particularly attractive. Orchids were sparingly displayed, but Carnations were well represented. Gooseberries and Currants were well shown from a Northumberland garden. Comparatively few novelties were shown.

## Orchid Committee.

Present: Pantia Ralli, Esq. (in the chair); Messrs. Jas. O'Brien (hon. secretary), Fred. K. Sander, Charles H. Curtis, J. E. Shill, H. T. Pitt, S. W. Flory, T. Armstrong, Gurney Wilson, Stuart H. Low, and Oliver Lines, of Massachusetts, U.S.A.

## AWARD OF MERIT.

*Cattleya Eleanor var. Prince of Wales (Hardyana alba × Warscewiczii Frau Melanie Beyrodt)* from Messrs. HASSALL and Co. Southgate. The plant shown had three flowers on the spike, each about nine inches across. Sepals and petals pure white; lip broad, violet purple with a yellow disc and lines from the base.

## OTHER EXHIBITS.

A Silver Banksian Medal was awarded to Messrs. HASSALL and Co., Southgate, for a group of their fine forms of *Cattleya Eleanor*, six varieties of their excellent strain of *Cattleya Hardyana alba*, a good selection of a new batch of *C. Dupreana*, and the new *Laelio-Cattleya Minos var. Hero* (*L.-C. Rubens × Tityus*, rosy-mauve with claret lip).

PANTIA RALLI Esq., Ashstead Park, Surrey (Orchid grower, Mr. Farnes), sent *Odontioda Manora* (*C. Noezliana × Oda*, Coronation) with well formed, bright red flowers, tinged with rose. Messrs. SANDER, St. Albans, showed the handsome yellow *Anguloa Cliftonii splendens* which had claret markings in the centre of its yellow flower; *Cattleya Dowiana Glory*, *C. Thisbe* (*micans × Pittiana*), and the charming little *Cirrhopetalum Andersonii* with an umbel of twelve pretty cream flowers with pink spotting.

H. HANCHET, Esq., Bankholme, Purley (gr., Mr. Birrel), sent *Cypripedium Mrs. C. J. Hanchet*, of unrecorded parentage, but which evidently had *C. superbiens* in its ancestry. The well-formed flower had blackish lines on the dorsal sepal and chocolate spotting on the broad mauve-tinted petals. Messrs. FLORY and BLACK, Slough, sent the new *Laelio-Cattleya Rosita* (*L.-C. Ingramii × C. Tityus*) with mauve sepals and petals and ruby purple lip; and a fine form of *Cattleya Hardyana alba*.

## Floral Committee.

Present:—Messrs. H. B. May (in the Chair), Jas. Hudson, H. V. Warrender, W. R. Dykes, R. W. Wallace, Gerald Loder, J. F. McLeod, W. P. Thomson, G. Reuthe, Amos Perry, Geo. Harrow, John Heal, W. Howe, Thos. Stevenson, C. R. Fielder, M. C. Allwood, W. B. Gingell, H. J. Jones, D. B. Crane, Chas. E. Pearson, E. A. Bowles, Reginald Cory, Sydney Morris, and W. B. Cranfield.

## AWARDS OF MERIT.

*Kniphofia C. M. Prichard.*—A magnificent form, with stout spikes carrying big heads of deep yellow flowers. The heads of flowers are about ten inches long. Shown by Messrs. M. PRICHARD and SONS, Christchurch.

*Kniphofia Rouge et Souffre.*—This handsome *Kniphofia*, passed by the Floral Committee a fortnight previously when in finer condition, gained an award on this occasion. The noble spikes carry pale yellow flowers on the lower half and coral red ones above. Shown by Messrs. MAURICE PRICHARD and SONS.

*Astilbe King Albert.*—This bold erect growing

*Astilbe* is about 6 ft. high when in flower, as shown. It should be a fine plant for the bog, for the water side, or for a moist border. The flowers are greenish white, and freely borne in long erect spikes. Shown by Messrs. M. PRICHARD and SONS.

*Gladiolus Red Fire.*—This brilliant variety has rich velvety scarlet flowers, with a short dull yellow throat. Shown by Messrs. LOWE and GIBSON, Crawley Down.

*Gladiolus Butter Boy.*—A very fine primulinus hybrid with large, light yellow flowers, the two smaller, lower segments being deeper yellow, and each having a thin central rosy line. Shown by Messrs. LOWE and GIBSON.

*Athyrium f. angustatum mediocrepis corymbiferum.*—An elegant Lady Fern, has pale green arching fronds which are crested at the apex and also at the end of each of the pinnae. A very graceful plant. Shown by Mr. AMOS PERRY, Enfield.

*Stokesia cyanea praecox Perry's Purple.*—A free-flowering form, and varying from the type in having bright bluish purple flowers. Shown by Mr. AMOS PERRY.

*Astilbe simplicifolia hybrida rosea.*—A charming form, and very like an enlarged *A. simplicifolia* in habit. The trifoliate leaves are deep green, the two lower leaflets usually being bilobed; all the margins are deeply serrated. The whole plant is about 15 in. high, and carries neat feathery plumes of rosy flowers. Shown by Mrs. G. REUTHE, Keston.

## BOTANICAL CERTIFICATE.

*Lewisia Wisley Seedling.*—This interesting little plant is a hybrid between *Lewisia Cotyledon* and *L. oppositifolia*. The small specimen exhibited carried three spikes, and one of these bore nine flowers, each  $\frac{3}{4}$  in. across, with greenish cream ground, pale mauve lines, and yellowish stamens. This hybrid, probably the first recorded, was raised at the R.H.S. Gardens, Wisley, and the Floral Committee recommended that a Botanical Certificate be awarded.

## GROUPS.

At the end of the hall Messrs. SUTTON and SONS, LTD., had an extensive and most artistic display of annuals. An enormous variety was shown, and this included nearly all the best annuals for summer display. In view of the recent inclement weather, this monster display of flowers of high quality must have astonished many of the visitors. There is an ever-present danger of "over doing" a very large exhibit of any type of flower, but in Messrs. SUTTON's skilful hands a most fascinating display was presented, Annual Lupinus, of which the Reading house has so many valuable sorts, were freely shown, and the most useful *Lavatera Sutton's Loveliness*, arranged in low baskets of elegant design, were also an admirable feature of this memorable display. The various sets of Poppies included Shirley mixed singles and doubles in many delicately beautiful shades of colour. Marigolds were very prominent, and in addition to a fine strain of Orange Marigolds of the old favourite type, but of improved quality, there were the double African, bearing large fully double flowers, and the Legion d'Honneur, which is such a valuable, compact little plant for bordering or as groundwork in a summer bed. Larkspur Pink Pearl is a very elegant annual either as a growing plant or, as on the present occasion, as a cut flower. Besides these there were cases of the Cineraria-like *Jacoba*, *Viscaria Pink Beauty*, *Coreopsis* of many sorts, the sun-loving *Eschscholzia*, annual *Chrysanthemums*, and the indispensable *Mignonettes* in several most excellent varieties (Gold Medal).

Immediately opposite the entrance Mr. H. J. JONES had another of the splendid exhibits of herbaceous Phloxes such as he has contributed on several recent occasions. As before, these were excellent, sturdy, well-flowered plants, set in shallow baskets for convenience of handling. A great many most desirable varieties were displayed, but on such a dull day it was those of bright colours that received most attention. The brightest were Scarlet Gem, W. Robert-

son, Jules Sandeau, Homeland, C. Edwards, Imperator, and Mrs. Scholten (Gold Medal).

Gladiolus were freely shown by several exhibitors. Messrs. KELWAY AND Co. had an extensive collection of large-flowered hybrids, which included Banat, Painted Lady, Lady Muriel Digby, Earl Compton, and J. W. Kelway, while of the elegant "Langprim" hybrids Maculatus, Countess Torby, Golden Girl, and Wraith were especially charming (Silver-Gilt Banksian Medal).

Besides their two certificated varieties Messrs. LOWE AND GIBSON had many excellent primulinus hybrids, of which the following is a selection:—Linton, Argo, Fieldmouse, Zenobia, Regulus and Insurpassable (Silver Banksian Medal). Near the New Plants' space Major G. Churcher showed an interesting collection of Gladiolus hybrids; Mary Pickford, Liberty, Thoth, Ragten, and Salmon Plume are the names of only a few of the very good sorts (Bronze Flora Medal).

A fascinating garden, composed solely of grasses, was made by Messrs. J. MACDONALD AND SONS. The "lawn" of seedling grasses was perfect in all respects (Silver Flora Medal).

Carnations of high quality were shown by Messrs. ALLWOOD BROS. (Silver-Gilt Banksian Medal), Messrs. Stuart, Low and Co., and Mr. C. Englemann (Silver Banksian Medals). The former included Toreador, Marian Willson, Edward Allwood, and Enchantress Supreme. Messrs. Stuart, Low and Co. again had many vases of their white Pearl, with the glowing scarlet Lord Lambourne. In the last-named collection Laddie, Iona, Sunstar, and Tarzan were very prominent.

A handsome collection of herbaceous plants shown by Messrs. M. PRICHARD AND SONS included Kniphofia Royal Standard, K. magnifica, K.C.M. Prichard, and K. Rufus in the back row, with smaller vases of Poterium obtusatum, Dracoccephalum virginicum, and many Phloxes of merit (Silver-Gilt Banksian Medal).

An uncommon exhibit was the tall spikes of Hollyhocks by Messrs. J. VERT AND SONS. These were all of double-flowered varieties and possessed the distinctive guard petals so desired by florists of a bygone age. Of the many sorts we greatly admired Palling Belle, Alfred Chater, Constance, Apple Blossom, Walden Yellow and Sunset (Silver Banksian Medal).

MESSRS. WATERER, SONS, AND CRISP had various herbaceous Phloxes, Lupins and a grand collection of Campanula White Star (Silver Banksian Medal). A collection by Mr. G. REUTHE included several interesting Liliium seedlings (Silver Banksian Medal). Mr. W. WELLS, Junr., had Phloxes, Alströmarias and Asclepias tuberosa (Silver Banksian Medal).

A massed vase of Monarda didyma Cambridge scarlet was prominent in a group of border flowers by Mr. AMOS PERRY, who also had the equally effective Polygonum amplexicaule atrosanguinea, with other herbaceous plants (Silver Banksian Medal).

Bronze Flora Medals were awarded to Messrs. J. CHEAL AND SONS, for border flowers with their graceful Star Dahlias, and they also showed excellent blooms of Cactus and Decorative varieties; and to Mr. F. C. WOOD for a neat rock garden, appropriately planted. The Central Garden Supplies were awarded a Bronze Banksian Medal for Violas. Several vases of the valuable Lupin Pink Pearl and a quantity of blooms of Romneya Conlteri were included in an exhibit by Mr. J. R. DOWNER.

Roses of quality were shown by Messrs. D. PRIOR AND SON (Silver Banksian Medal), and the Rev. J. H. PEMBERTON (Silver Flora Medal). The former included Geisha, a new Pernetiana Rose of orange-yellow shades, with such sorts as George Dickson, Isabel, Premier, and Climbing Ophelia. In Mr. PEMBERTON'S collection the beautiful single-flowered Mermaid was very prominent. There were also good vases of K. of K., Ruth and Aurora.

#### Dry Bulbs.

As we have already reported, the R.H.S. has abandoned the idea of holding a special show this year of home-grown bulbs, and in its place

invited exhibits for the present and the next meeting. Only Mrs. WALLIS TOLLER (gr. Mr. G. Crabb), Woodside, Weybridge, Surrey, responded on this date, with an interesting collection of home-grown bulbs.

#### Fruit and Vegetable Committee.

Present: Messrs. J. Cheal (in the chair), S. B. Dicks, W. F. Giles, J. Wilson, A. Bullock, W. Bates, W. H. Divers, E. A. Bunyard, J. C. Allgrove, F. Jordan, and the Rev. W. Wilks.

#### GROUPS.

In the corner by the gallery steps Messrs. G. BUNYARD AND Co. displayed a select little collection of splendid pot fruits. The most prominent were the trees of Pear Marguerite Marillat, bearing very large, perfectly formed fruits. Plums, Late Orange, Monarch and Victoria were well represented—the last-named had large, healthy leaves without any signs of the devastating silver-leaf disease. Amongst the Apples were well-fruited bushes of Rival, Peasgood's Nonsuch and Rev. W. Wilks, and there were several Figs bearing green fruits (Silver-Gilt Hogg Medal).

An interesting and very extensive collection of Gooseberries of great merit was shown by Sir JAS. KNOTT, Bart. (gr. Mr. W. E. Arden), Close House, Wylam-on-Tyne. Over 60 dishes were set out, and they included such large-fruited sorts as London, Collie's Lane, Speedwell, Lord Derby, Dr. Woolley, Broom Girl, Sir G. Brown, Overseer, Leveller, Leader, and Matchless, with the smaller but high-flavoured Yellow Champagne and Glenton Green. There were also several dishes of excellent Red and White Currants (Silver-Gilt Hogg Medal).

From the R.H.S. trials of Turnip-rooted Beet at Wisley, were sent dishes of the nine sorts that received Awards of Merit.

#### WHITEHALL AND DISTRICT.

THE sixth annual show of the Whitehall and District Horticultural Society, Bristol, was held on the 28th and 29th ult. in the magnificent grounds belonging to Messrs. H. J. Packer and Co., Ltd., chocolate manufacturers. A large and representative gathering of citizens attended the opening ceremony, at which Mr. Horace Walker, the president of the society, presided, and was accompanied by the Lord Mayor, the Lady Mayoress, the Sheriff, Alderman Sir John Swaish, and others.

The entries exceeded in number those of all previous shows, the total number being 1,231. The entries for flowers and vegetables were more than double those of last year. One of the most picturesque features of the flower and plant displays was the large number of groups and banks, there being fifteen competitive groups. The three large "island" groups, each occupying a space of 150 square feet, were a fine feature of the show. The trade exhibits occupied a large marquee. The marquees covered a space of over 15,000 square feet, and the show was the largest and finest seen in the west of England for many years. The society was started in 1917 with the object of stimulating interest in food production on allotments, and as each successive year has produced an exhibition greater than its predecessor, the annual event bids fair to become one of the largest in the provinces.

The following Medals were awarded:—  
*Gold Medal.*—To Messrs. SUTTON AND SONS, Reading, for Sweet Peas; Messrs. J. CYPHER AND SON, Cheltenham, for Orchids and stove plants; Messrs. BLACKMORE AND LANGDON, Bath, for Begonias, Delphiniums and Border Carnations; Messrs. A. J. KEELING AND SONS, Bradford, for Orchids; and to Messrs. I. HOUSE AND SON, Westbury-on-Trym, for Scabious, etc.

*Silver Medal.*—To Messrs. BAKERS, Codsall, for Hardy Perennials; Messrs. RICH AND Co., Bath, for Phloxes; Messrs. A. A. WALTERS AND SON, Bath, for Roses and perennials; Mr. C. WALL, Bath, for Carnations; Mr. ROWLAND ADAMS, Bath, for Roses and Perennials; and to Messrs. T. CULLEN AND SON, Bristol, for Violas.

#### ANSWERS TO CORRESPONDENTS.

**ALPINE PLANTS FOR SOUTH AFRICA:** *E. O.* If plants are sent, the best time for sending them would be November. They should be packed firmly in nearly dry moss, but even under the best conditions it is very doubtful if they would arrive in a satisfactory condition. The far better plan would be to send seeds of the different species.

**APPLE SHOOTS DAMAGED:** *W. H.* It is probable that the damage to the young Apple shoots is due to an attack of some insect, but, as we could find no insects on the specimens received, we are unable to decide what species has caused the trouble.

**BOOK:** *E. J. V.* The best book on trees and shrubs is *Trees and Shrubs Hardy in the British Isles*, by Mr. W. J. Bean, which can be obtained from our publishing department, price three guineas; two volumes.

**CALCIUM CARBIDE REFUSE:** *H. S., India.* The calcium carbide refuse remaining after the manufacture of acetylene gas may be used on land in very much the same way as lime, but it should be sweetened somewhat before use.

**CLAIM FOR COMPENSATION:** *C. R.* In the circumstances which you mention you can only claim compensation for:—(1), Planting of standard or other trees permanently set out; (2), planting of fruit bushes permanently set out; (3), planting of Strawberry plants; and (4), planting of Asparagus, Rhubarb and other vegetable crops which continue productive for two or more years. The subjects which you mention do not appear to come botanically within the limitations of the foregoing definitions. As to your claim for disturbance, we assume you gave due notice beforehand of intention to claim compensation as provided by the Agriculture Act, 1920.

**GRAPES DISEASED:** *G. K. and E. H. H. V.* The Grapes are affected with spot disease, caused by the fungus *Gloeosporium ampelophagum*. Spray the vines and bunches with liver of sulphur at the strength of  $\frac{1}{2}$  oz. in two gallons of water, or dust flowers of sulphur on the leaves and bunches, and again at intervals of ten days. Thoroughly wetting the rods with a solution of iron sulphate when the vines are dormant has been found of service. Do not feed the roots with an excessive amount of nitrogenous manure.

**MUSCAT GRAPES DISEASED:** *J. M. D.* The browning of the berries of Muscat of Alexandria Grape is due to the presence of the Botrytis form of *Sclerotinia Funkeleana*. Lack of ventilation in theinery encourages the disease, therefore fire heat coupled with ventilation should be used to produce a more buoyant atmosphere during dull and cool weather.

**NAMES OF PLANTS:** *J. P.* *Spiraea Aruncus*, var. *Kneiffi*.—*C. L.* *Zephyranthes carinata*.—*E. O.* White, *Cistus cyprius*; rose, *C. Sunset*.—*A. B. C.* (Unnumbered) white, *Philadelphus Falconeri*; yellow, *Senecio Crusii*; blue, *Veronica Autumn Beauty*. The fourth specimen was too withered to admit of identification.

**TOMATO LEAF RUST:** *C. B. and J. H.* The sappy condition of the growth and leaves suggests that the conditions under which the plants have been growing are unsuitable, as they produce growth which is extremely liable to disease. The disease present is *Cladosporium fulvum*, and where this is at all prevalent the plants should be sprayed with a solution of sulphide of potassium at intervals from the time they are established in their fruiting quarters. Remove and burn the most seriously affected portions, spray with sulphide of potassium, and by ventilation and other means secure a drier atmosphere.

**Communications Received.**—*H. M.*—*E. F. M. H.*—*J. P.*—*J. W. B.*—*E. W.*—*M. M.*—*J. C. S.*—*J. B.*—*S. A.*—*L. G. W.*—*J. M.*—*W. A. L.*—*F. K.*—Constant Reader.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.2°.

### ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, August 16, 10 a.m. Bar. 30.0; temp. 61°. Weather—Sunny.

Growers of Potatos will be interested in the account given by Mr. J. M. Hannah of the method of cultivation of Early Potatos in Jersey, Cornwall, Lancashire and Ayrshire. Mr. Hannah's paper, which created considerable interest when it was read at the International Potato Conference in 1921, is now published in full in the Report of the Conference, which has been drawn up by Mr. W. R. Dykes and issued by the R.H.S.\* Mr. Hannah points out that all the districts famous for early Potatos are characterised by a heavy rainfall. In Jersey, the annual rainfall is 30 inches, in Cornwall, 40, in the Cheshire and Lancashire early districts, 32 inches, and in Ayrshire 38-40 inches. The view that a uniformly high temperature is the essential meteorological condition for the cultivation of early Potatos is not confirmed by Mr. Hannah, who points out that no temperature difference exists between the E. and W. of Scotland, and yet it is only in the latter, along a narrow maritime strip of land running from Ballantrae in the south to West Kilbride in the north, that the industry flourishes. Rainfall and not high temperature appears to be the limiting factor

of early Potato cultivation. Needless to say the districts in which early Potato crops are raised are reasonably immune from spring frosts. Most favoured in this respect is Jersey, with a mean temperature of 60° F., and it is in this island that the industry reaches its maximum. One-third of the island—about 7,000 acres—is set apart for the cultivation of Potatos and the annual produce amounts to some 50,000 tons. If, as Mr. Hannah states, it is rainfall which determines whether early Potatos can be grown in a district, it would nevertheless seem to be true that temperature determines the amount of crop, for in Jersey, with a mean temperature of 60° F., the yield averages from 7-10 tons—on sets closely planted in rows sixteen inches apart, and sets 10-12 inches asunder; whereas with similar close planting, involving about two tons of "seed" per acre, the yield in Cornwall, where the mean temperature is 51° F., is not more than from 5-8 tons per acre.

The crop is treated liberally as regards manure. In Jersey, seaweed and stable manure are employed, together with a complete dressing of artificials. In Cornwall the same natural manures are applied lavishly—at the rate of forty to fifty tons per acre, and on these lands Potatos are planted year after year instead of, as in Jersey, for three years only following grain, hay and pasture for two seasons. The varieties grown in Cornwall are May Queen and Sharpe's Express. Heavy manuring is practised also in the Ayrshire district—30-40 loads of seaweed per acre, or 12-15 tons of stable manure with dressings of complete fertiliser of 11-12 cwt. per acre drilled with the seed, and consisting of sulphate of ammonia, superphosphate and potash. Medium sized seed is used, saved from last year's crop, and sprouting the seed is universal. Mr. Hannah insists that sprouting should be done in the light. In Ayrshire, Epicure is now almost the only variety grown for early work. Signs are to be met with in Ayrshire that prolonged use of the same land leads to deterioration of crop, the yield sometimes falling from sixteen tons (in July) to less than half that quantity. It would seem that the soil has grown "sick" of the crop, for seed from such fields planted on fresh land yields satisfactorily. Of catch crops in the Ayrshire Potato district, Italian Rye Grass, Rape and Barley are grown.

**Royal Visit to Westonbirt.**—Her Majesty Queen Mary has honoured Sir George and Lady Holford with a visit to their delightful home at Westonbirt, near Tetbury, Gloucestershire. The beautiful grounds at Westonbirt, together with the wonderful collection of trees and unique collection of Orchids, will appeal to Her Majesty, who, as is so well known, has a great love of gardens and flowers.

**Mr. E. H. Wilson, V.M.H.**—After spending some time in this country, following his tour round the world on behalf of the Arnold Arboretum, Mr. E. H. Wilson sailed for the United States on Tuesday, the 15th inst., to take up his duties again as Assistant Director of the Arnold Arboretum, Harvard University.

**Attack on the Director of Horticulture at Cairo.**—The news has reached us that Mr. Thomas William Brown, Director of the Horticultural Section of the Egyptian Ministry of Agriculture, was subjected to an atrocious outrage near Cairo on the 12th inst. It appears that Mr. Brown was driving his son from the Giza Gardens to catch the Port Said night train for England. His little daughter, together with a nurse and groom accompanied them. Some short distance from home five or six men, fired revolvers and one of the shots killed the groom.

Another shot wounded the nurse, and from other shots Mr. Brown was wounded in one leg and arm and his son in both legs and one arm. Unfortunately, owing to the loneliness of the spot and the darkness, the assailants escaped. Mr. Brown is an old Kewite, and from his many friends of the Kew Guild he will receive the utmost sympathy, together with good wishes for the speedy recovery of himself and his son.

**Golden Wedding of Mr. and Mrs. Owen Thomas.**—Mr. and Mrs. Owen Thomas completed fifty years of married life on the 14th inst., but owing to the absence of several of their family on holidays, the celebration of this auspicious event was postponed until to-day, the 19th inst., at 25, Waldeck Road, Ealing. We need scarcely remind our readers that Mr. Owen Thomas, V.M.H., was for many years gardener to Queen Victoria and to King Edward VII. We join with his many friends in congratulations to Mr. and Mrs. Thomas upon their golden wedding and in the hope that both may long be spared to enjoy health and happiness.

**New Park for Cardiff.**—We learn that Lord Plymouth, the Lord-Lieutenant of Glamorgan-shire, has presented to the Cardiff Corporation a beautiful new open space. This new park is known as the Great Wood of St. Fagans. Its position is on the southern slopes of the river, its area is about fifty acres, and it will provide ample room for walks among the trees and sufficient open space for recreation purposes.

**A Wild Flower Show in America.**—Almost every local flower show in the British Isles has its children's section for wild flowers and grasses, and there are certain museums—Norwich and Leicester, we believe—where a small, but continuous display of wild flowers is maintained from spring to late autumn. In South Africa two or three exhibitions of wild flowers are held annually, and they create a great deal of interest. In the United States of America, Mr. A. C. Burrage, President of the Massachusetts Horticultural Society, organised a wild flower show that was held at Boston in May and continued for seven days, the attendance per day ranging from 5,000 to 10,000. The preparation of the show was a big business, as the arrangement was as natural as possible, streamlet, bog and rocky hill-side being provided to form a natural setting for the various kinds of plants. We learn from one report to hand that one hundred and fifty tons of rock were used, with masses of Balsam Fir and Hemlock as background. Eighty-seven species of flowering plants and forty-three species of native Ferns were displayed in this extraordinary show, so ably arranged and carried out by the man to whom the George R. White medal was recently awarded, an award made only to "those who have in recent years done the most for horticulture" in America.

**Hop Cultivation in England.**—During the year 1920 there were 21,000 acres under Hop cultivation in England, and this area was advanced to 25,130 in 1921, while the preliminary return for the present year gives the acreage as 26,330. Hop growing is most extensively carried out in Kent. In East Kent there are 4,010 acres, in mid-Kent 5,520, and in the Weald of Kent 7,110, giving a total of 16,640 acres of Hops cultivated in the county. The county next in importance with regard to Hop cultivation is Hereford, with 3,950 acres. This is followed by Sussex with 2,330 acres, Worcester 2,030 acres, Hampshire 1,070 acres, and Surrey 220 acres, while the area under Hops in all other counties totals only 90 acres.

**Anthracnose of the Cucumber.**—One of the most destructive of the several "spot" diseases which attack Cucumbers grown under glass for commercial purposes is Colletotrichum oligochaetum. This fungus attacks young plants at about the ground level, and causes such a shrinkage of the tissues that they collapse. The disease spreads rapidly and gives rise to spore masses in about five days. According to an account given by Dr. W. F. Bewley in the current issue of the *Journal of*

\*The Early Potato Industry. By J. M. Hannah. Report of the International Potato Conference. Published for the R.H.S. by H. M. Pollett and Co., Fann Street, E.C.1. Price 3s. 4d., post free.

the Ministry of Agriculture, this disease does not appear generally until March or April, when the plants are well established in the house and some fruits have been cut. The necessity for cleanliness in connection with Cucumber culture is emphasised by the fact that this fungus will thrive upon such varied substances as new and rotten wood, straw, cotton wool, and manure. Dr. Bewley points out that the present method of cleansing greenhouses during the winter months is inefficient for the purpose of preventing further infection, and that infection is more abundant immediately after the diseased crop has been removed than after the period of winter rest, though in the latter case sufficient centres of infection remain to carry the disease over to another season. Dr. Bewley does not suggest means, other than cleanliness, whereby the disease may be combated; but he may do so in a subsequent issue of the *Journal*, and as this subject is of considerable economic importance, we shall look forward with considerable interest to his further contribution.

**Deciduous Japanese Hollies.**—Two deciduous Japanese Hollies flowered during July in the Arnold Arboretum. These are *Ilex serrata* and *I. geniculata*. The berries of the former are smaller than those of the American *Ilex verticillata*, but they are of a brighter colour and remain on the branches, although changed in colour by severe cold, until the leaves of the following year are fully grown. We learn from the *Bulletin of Popular Information*, published from the Arnold Arboretum, Harvard University, Mass., U.S.A., that in the autumn the leafless branches of these Hollies, covered with their brilliant red fruits, are sold in great quantities in the streets of Tokyo and other Japanese cities. *I. geniculata* is said to be a delightful little plant, with small, bright scarlet fruits gracefully hanging on long slender stems, and, although little known, is a good plant for any garden.

**An Alphabetical Avenue.**—Sir Wm. N. M. Geary has planted an alphabetical avenue at Oxonhoath, near Tonbridge. The trees composing it number sixty-eight, and are planted either in pairs or fours to form an avenue about six furlongs in length, and there is at least one kind of tree to represent each letter of the alphabet, which begins with the Aspen and ends with Zelkova.

**Massachusetts Horticultural Society.**—This old-established and leading American Horticultural Society, about two years ago, abandoned its long continued custom of issuing its transactions half-yearly. In place thereof it now publishes an *Annual Report*, with intervening "bulletins," which contain the text of various papers communicated to the Society. In the *Annual Report* for the past year, only just to hand, we notice that the Society, which will celebrate its centenary in seven years' time, now numbers 1,001 members. Reports of the various committees and officers are given, showing the scope of the Society's activities during the year. The membership comprises honorary, corresponding, life and annual members. Dr. Henry S. Pritchett, of New York, and M. Viger, the President of the National Horticultural Society of France, are the only two honorary members; but the next grade, *i.e.*, corresponding members, are drawn from the ranks of well-known horticulturists of various countries. Great Britain is represented by Sir Isaac Bayley Balfour, Sir W. T. Thiselton Dyer, Professor Henry, Lt.-Col. Sir Geo. Holford, Sir Fredk. Moore, Sir Daniel Morris, Mr. W. J. Bean, Mr. H. J. Elwes, Sir David Prain, Sir Harry Veitch, Dr. Ridley, Mr. William Robinson, Mr. F. Gomer Waterer, Mr. Wm. Watson, Mr. Harman Payne, Mr. J. C. Williams, and Miss Willmott. To these have been added during the past year Mr. W. R. Dykes, Mr. F. J. Chittenden, Mr. Gurney Wilson, and some of our prominent Colonial botanical and horticultural officials. France and other countries, are also represented in this list of persons chosen by the Society in recognition of their services to horticulture.

**Mr. Frank Cant.**—All who attend horticultural exhibitions, and especially Rose shows, will recognise in the photograph published below a portrait of one of the most genial personages in the horticultural world, Mr. Frank Cant, of Colchester. He is a member of a family which has been honourably connected with the borough of Colchester for very many generations, and his great success as a Rose grower is well known to the majority of our readers. Roses have made the name of Colchester known wherever Roses are cultivated, for it is the home of several important Rose nurseries, including the Braiswick Rose Gardens, which Mr. F. Cant established over forty years ago, and in 1876, the year following his debut as a Rose grower, he won the first prize for 36 distinct varieties in the open class at Colchester. At the National Rose Society's show in 1902, he won the champion cup and also the first prize for thirty-six distinct varieties of garden Roses shown in large bunches, a feat which we believe has never before, or since, been accomplished by anyone. Since establishing the Braiswick Rose Nurseries, Mr. F. Cant has enjoyed almost uninterrupted success with Roses, and has won challenge

ALDERMAN FRANK CANT.

trophies at all the principal Rose exhibitions both in the metropolis and in the provinces. In addition to the large number of trophies, medals, and other prizes that he has won, including challenge and other silver cups, he has secured awards for new Roses, and is recognised as one of the most skillful cultivators and exhibitors of all classes of these beautiful flowers. Mr. Cant owes his success mainly to two outstanding qualities: First, keen business ability, and secondly, a charm of personality that has won for him the esteem of all with whom he has come in contact. He is not less highly esteemed in his native town than in the horticultural world, and as evidence of this, it may be stated that his fellow citizens conferred on him the highest distinction in their power in selecting him as Mayor of their famous city during 1911, and appointing him an Alderman. We well remember the occasion when, in his official capacity as mayor, he presided at the annual Oyster Feast of the ancient city of Colchester, an event which marked the approaching termination of his year's office as mayor. The distinguished company on that occasion included men of importance in the church, law, politics, business, arts and civic life, and of all the company there, none gave greater dignity to the proceedings than Mr. Frank Cant, for his commanding presence was outstanding. He had also invited many horticulturists and prominent rosarians, including

the President and Secretary of the National Rose Society, an association with which Mr. Cant has been long associated and in which he holds the distinguished office of an acting Vice-President.

**The Cory Cup for Dahlias.**—The cup presented to the Royal Horticultural Society by Reginald Cory, Esq., Duffryn, Cardiff, will be competed for at the meeting to be held at the Royal Horticultural Hall, Westminster, on August 22. The cup was presented solely with the object of encouraging raisers to produce Dahlias, of any class or section, of decorative value, and in the competing exhibits all flower stems must touch the water in their receptacles, and no wiring or artificial support is allowed. Hardy foliage or grasses may be used in the decoration of the display, but every variety must be distinctly labelled and nothing but the name of the variety must appear on the label. Competitors are allowed a space twenty-five feet by three feet, and their exhibits must not exceed eight feet in height from the ground level to the top of the flowers.

**Appointments for the ensuing week.**—Tuesday, August 22: Royal Horticultural Society's Committees meet. Wednesday, August 23: Highland Horticultural Society's show; Helensburgh and Gareloch Horticultural Society's show; Calne Horticultural Society's show; Royal Tunbridge Wells Gardeners' and Horticultural Society's show; Biggar Flower show; Inverness Flower show; Lanark Flower show. Thursday, August 24: Royal Botanic Society's meeting; Royal Horticultural Society of Aberdeen show (3 days); Ayton Flower show; Dunoon Flower show; Kilmeggan, Cove and Roseneath Flower show; Peebles Flower show. Friday, August 25: Dunderline Horticultural Society's show (2 days); Paisley Florists' Society's meeting; Bargoed Horticultural Society's show (2 days); Blairgowrie Flower show (2 days); Carnwath Flower show; Holytown Flower show; Motherwell Flower show; Stranraer Flower show. Saturday, August 26: Dunbar Horticultural Exhibition; Dumfries and District Horticultural Society's show; Dalkeith Flower show; Langholm Horticultural Society's show; Daily Flower show; Alexandria Flower show; Thornhill (Perthshire) Flower show; Auchterarder Flower show; Bannockburn Flower show; Bridge-of-Weir Flower show; Carstairs Flower show; Chirnside Flower show; Kilsyth Flower show; Swinton, Duns, Flower show; Inverkip and Wemyss Bay Flower show; Gartmore Flower show; Gatehouse Flower show; Gateside (Beith) Flower show; Newmaison Flower show; Springside Flower show; Markinch Flower show.

**"The Gardeners' Chronicle" Seventy-five Years Ago.**—*Early Stewing Pears and Peaches.*—It is singular that with the greatly improved taste in and knowledge of cookery, we do not cultivate the early stewing Pears and Peaches so much used on the Continent. I never see in England a dish of stewed Pears, as a compôte, till November or December; whereas all the tourists in France, and up the Rhine, by this time must see at every table some one preparation or other of Pears and Peaches. The Peach used is a standard. The fruit, when raw, is austere and slightly bitter, but, when stewed, excellent, and without the *fade* flavour of the wall Peaches. I find that Mr. Rivers has imported one of the kinds of Peach used for this purpose in France under the name of *Pêche des Vignes*. It is grown as a standard in the vineyards; it is much more hardy than our cultivated sorts and is a free bearer. Those who would wish to see a good representation of the fruit need only go to the British Institution, Pall Mall, and look at the dish of Peaches in the fine picture of Rubens, in the middle room. *Dodman, Gard. Chron., August 21, 1847.*

**Publications Received.**—*Romance of the Flora of New Zealand.* By Sir George Fenwick. Otago Daily Times and Witness Co., High Street, Dunedin.—*The Flora of the Malay Peninsula.* Vol. — By Henry N. Ridley. L. Reeve and Co., Ltd., 6, Henrietta Street, Covent Garden, W.C.2. Price 6s.

## NOTICES OF BOOKS.

## Shakespeare's Garden.\*

This very attractive addition to the limited literature of Shakespearean gardening will unquestionably appeal to a large number of readers who have an interest in the home surroundings of the great writer. A well printed, neatly got-up thin octavo of thirty-four pages, most copiously illustrated with well executed photographic process blocks, *hors texte*, describes in a series of short articles much that is of interest concerning Shakespeare's garden in his lifetime and the restored garden of to-day, with its recently acquired stock of old-time plants and flowers. We select, as indicative of the scope covered by this excellent little book, a few of the chapter headings, which will be sufficient to whet the literary taste of those of our readers who occupy themselves with such matter, viz.: Shakespeare's Garden, its Origin and Extent; Shakespeare's Knowledge of Gardening; The Great Garden Since 1760; Scheme for an Elizabethan Garden; Flowers from Historic Houses and Castles; Old English Flowers with Old English Names; The "Knott" Garden; The Old Designs Carefully Followed; Bacon Echoes Shakespeare's Verse; Shakespeare and the Rose; Flowers in Shakespeare's Own Garden, etc.

The illustrations, in the main of unusual interest, are twenty-one in number, and we commend Mr. Law's work to the consideration of all literary horticulturists.

## A Handbook of British Basidiomycetes.†

The British students of Fungi have hitherto laboured under the serious disadvantage that they had no modern English handbook to enable them to "run down" species. This disadvantage is now remedied so far as one great group of Fungi—the Basidiomycetæ—is concerned. It is true that the author of this handbook has confined his diagnoses to the larger fungi of this group and has omitted consideration of the parasitic sub-orders, the Pucciniaceæ and Ustilaginaceæ—the rusts and the smuts; but, even so, his work occupies nearly 800 pages, and to have included the parasitic forms would have involved far larger space and possibly, also, a different method of diagnostic treatment. The great group of Basidiomycetous fungi, in which are included, of course, Mushrooms and Toadstools and Puff-balls, presents many difficulties to the systematist, and it is not surprising that numerous classifications have in the past been attempted. Mr. Carleton Rea separates the group into two main divisions, the Homobasidiæ and the Heterobasidiæ, the former characterised by an undivided basidium or spore-bearing cell and by the fact that the spores germinate to form a mycelium; and the latter distinguished by a septate basidium and indirect mycelium formation—the spores borne on a basidium germinating to form secondary spores (spori-diola), which in turn produce a mycelium. The classification of the Homobasidiæ follows physiological lines—one subdivision, the Exobasidiaceæ, comprises parasitic forms, and the other, the Eu-Homobasidiaceæ, the saprophytic forms. In this classification the Gasteromycetes, which previously were regarded as forming a division co-equal with the Hymenomycetes, are now ranked as one of the three orders of the Eu-Homobasidiaceæ (Gasteromycetales, Agaricales, and Aphyllophorales). This classification has much to commend it. A key of the divisions and genera, which precedes the description of species, greatly facilitates the work of the student in identifying species. Anyone with access to this handbook should find no difficulty in determining the name of any of the common or rare fungi indigenous to this country.

## WINTER-FLOWERING STOCKS IN THE LONDON AREA.

THE article by Mr. Thatcher (see p. 82) reminds me that the best time for sowing seeds of winter-flowering Stocks for withstanding the winter and flowering in the spring in North London is early August. I find the best varieties are Beauty of Nice and Queen Alexandra, preference being given to the first-named. Sow the seeds thinly in well-drained boxes of soil to which a sprinkling of wood-ash, lime and sand, and a little soot, has been added.

The soil should be made moderately firm and be well watered before the seeds are sown, allowing the boxes to stand and drain awhile. When ready for sowing, put a sprinkling of sand on the top of the soil, then sow the seeds and cover them with about one-eighth of an inch of

of rough sand, wood ash, leaf soil and a sprinkling of lime and soot. Place them back again on the shelf until the days become brighter and the atmosphere not so saturated with moisture, and then stand them in a cold pit or frame with a southern aspect. At the beginning of March plants so grown may be stood outside, after being staked, with lights over them, as this will allow the air to pass freely among them. Remove the lights in the day-time on fine days and replace them in the evening. When showing flower remove the plants to the conservatory, or wherever they are needed. If possible, keep them close to the roof-glass until the flowers open.

When the soil is full of roots water with liquid manure, soot water, or a solution of Clay's Fertiliser. I find these Stocks rather difficult to grow here an account of dull weather and fogs, but by perseverance and care I have had batches in flower

FIG. 41.—*ATHYRIUM FILIX-FOEMINA ANGUSTATUM* MEDIODECIPIENS CORYMBIFERUM; R.H.S. AWARD OF MERIT, AUGUST 9 (SEE P. 101).

fine soil. Place the boxes in a cold frame; but before doing so dust the floor of the frame with lime as a protection against slugs until the seeds have germinated. Place the boxes as near as is convenient to the roof glass, and when the seedlings appear give shade during the hottest part of the day to reduce the need of frequent watering. When the soil is dry dip the boxes in a vessel of water and allow the water to rise gradually through the soil.

When ready, pot the seedlings singly in small 60-sized pots. I find this a better method than first pricking out the seedlings, as the plants get established before the dull, damp weather arrives. Damp is the chief enemy of these Stocks, not cold. Careless watering, and heavy condensation of moisture in the frame due to lack of air, will soon play havoc with a batch of plants. Keep the Stocks in the cold frame until early in November, and never allow the frame to be closed entirely. Then move them to a cold, light house, with convenience for ample ventilation, and place the pots on a shelf near the roof-glass. The aim all through the dark days should be to keep the plants dwarf, sturdy, and "on the dry side."

At about the end of January pot the plants into 48-sized pots in a mixture of two parts of turfy loam, and the other part composed

each of the two seasons I have been here, almost perfect and a pleasure to all who saw them. *J. C. S., North London.*

## ERYNGIUM PANDANIFOLIUM.

THIS bold Sea Holly does not appear to do well in the north, where it is but little seen, but in the milder parts of the British Isles it is quite a striking and pleasing object. I have seen it in fine form, but with me it has never made any real progress, and this is quite a common experience in the colder parts of the kingdom. It is quite distinct from such well-known Sea Hollies as *E. planum*, *E. alpinum*, *E. amethystinum*, and others of that class. In the south it makes great plants with long narrow, spiny, glaucous leaves, and then throws up flower stalks which in favourable circumstances reach ten, twelve, and even fifteen feet in height. As a foliage plant it should be considered by those who can give it a rich, free, open, soil, with plenty of drainage, in the more southern counties of England and Ireland, but I regret that I cannot recommend it for the colder parts of the country. *S. Arnott.*

# The Week's Work.

## THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Dendrobiums.**—Many of the deciduous Dendrobiums will be completing their growth, and, when this has been fully made up, it is necessary to remove the plants to a cooler and drier atmosphere, where they may receive the benefit of extra sunlight and air, so as to thoroughly ripen and bring the newly made growth to maturity. It is not always advisable to remove Dendrobiums from their growing quarters immediately they appear to have finished growth, for it is at that time that the roots become very active, not only in lengthening themselves, but also in throwing out many lateral rootlets. Small as many of these latter are, they must not be despised, for it is through them that the plants gather strength both to flower and to bear uninjured the strain of flowering. It is better, where practicable, to select a position on one side of the house, where more air and light can be admitted and less moisture given, especially when damping down. This partial removal may be done immediately the leaf at the extremity of the new pseudo-bulb is completed, or where there is any fear of a plant starting into premature growth. The plants should be gradually exposed to the sun for a longer time than is usual in the morning, and the blinds pulled up earlier each afternoon. Should dull weather prevail, there will be no necessity for using the shading, but the plants should be gradually inured to withstand sunshine. Plants that have completed their growth should not suffer for want of water at the root or they may receive a check, which will cause them to finish up prematurely, and immediately afterwards start into growth. **D. Wardianum** and some of its hybrids are very liable to do this, with the result that the flowers of the following season are greatly weakened and much inferior to those on plants that have received careful attention.

**Resting.**—In order to retain a vigorous and healthy constitution, everything appertaining to the drying and resting stages must be gradual, as not only the successful flowering but the ultimate health of the plant depends upon its thorough ripening and consolidation. As far as possible, each plant should make but one set of growths annually, and, should they start into growth a second time, it is advisable to encourage them as far as possible by placing them in the most favourable quarters. After a week or two of such treatment in the growing house, the young shoots will have taken hold of the compost, and the plants may be removed to other quarters where they will be far less shaded and where a drier and less close atmosphere is maintained. It is generally easy to select positions for the Dendrobiums where they may gradually pass from moderate shade to clear sunshine, taking care to choose a position where they will be free from draughts or cold winds. When fully exposed to bright sunshine, the compost, being full of roots, dries out quickly, but careful judgment should be exercised in watering. Do not keep the roots in a constantly saturated condition. Plants well established in small pots will need water more often than the larger specimens; but in either case, when once a thorough watering has been given, they should receive no more until the whole compost has become dry again. The aim of the grower should be to water the plants sufficiently to keep the roots in a healthy condition, to prevent undue shrivelling of the pseudo-bulbs, and to prevent new growth by the admission of fresh air and sunshine. Among the earliest kinds to complete their growth are *Dendrobium aureum*, *D. Wardianum*, *D. nobile*, *D. crassinode*, and several hybrids.

## HARDY FRUIT GARDEN.

By H. MARHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Apples.**—Trees bearing heavy crops and making somewhat weak growth should be relieved of a goodly number of fruits, first removing those badly situated and deformed. Timely attention in this respect will allow the trees to develop finer fruit and also build up healthy growth and buds for producing a crop next season. Do not overlook the needs of the roots; a supply of liquid manure or guano water will do much to encourage both fruit and growth, and without such assistance at the right time the trees may need a season's rest in which to recover strength to fruit satisfactorily.

**Cordon Pears.**—Fruits of early Pears are best when gathered a trifle under-ripe, with the exception of a few very early kinds, such as *Doyenne d'Été*, *Citron des Carmes* and *Beurré Gifford*, which are usually at their best when and as gathered from the trees. William's *Bon Crétien* and others should be gathered at intervals of a few days and taken to the fruit-room to finish. All cordons worked on the Quince stock are bearing heavily, therefore later sorts should not be allowed to suffer from drought at the roots, otherwise the fruits will lack finish. *Nonvelle Fulvie*, *Duchesse de Bordeaux*, and *Josephine de Malines* were very good last year, and very late.

**Plums.**—These fruits are fast ripening, and should be afforded protection against birds. See that all the young shoots on wall-trees required for filling vacant space are neatly secured. Mice are sometimes very troublesome and destructive to Plums and other wall fruits, and should be duly checked by means of small traps. Examine fruits of dessert kinds that are ripening, and gather them when perfectly dry. Early *Transparent Gage*, *Oullin's Golden Gage*, *Jefferson*, *Washington*, and *Coe's Golden Drop* are all excellent dessert Plums, and will give satisfaction; but there are also other very good and dependable varieties. See that the roots of all trees bearing heavy crops are well supplied with moisture; a dressing of lime at intervals will prove very helpful both to growths and fruits. Plum trees growing in rather narrow borders and trained fan-shape against walls sometimes suffer at the roots when the border is cropped with vegetables too closely to the trees.

## PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Fuchsia.**—Fuchsia cuttings may now be inserted to produce plants for flowering early next summer. The cutting should be selected from plants that have nearly finished blooming; insert them close to the sides of small pots and stand them in gentle warmth under a hand light. As soon as roots have formed place the pots of cuttings on a shelf near the roof glass in a cool house; later, pot the young plants singly in small pots, after which they may be kept growing steadily throughout the winter. Good standard plants may be obtained in one season if allowed to grow unchecked through the winter and stopped at the desired height in early spring, but if bushy plants are required they must be pinched at intervals as growth permits.

**Hippeastrum.**—As the earliest plants of *Hippeastrum* have completed their growth water should be gradually withheld and the plant exposed fully to sunshine in order to ripen the bulb. At this period they may be allowed a lower temperature and abundance of fresh air whenever outside conditions permit. Seedlings should not be dried off but kept growing in a moderate temperature throughout the winter.

**Bush Chrysanthemums.**—These plants have filled the soil with roots and will require some assistance to keep them in a healthy condition. Liquid farmyard manure supplied alternately with soot water, and concentrated *Chrysanthemum* manure used according to instructions, will keep the plants in good condition, but should the weather prove wet and dull care

must be taken not to overfeed them or the results will be soft, sappy growth, which will neither produce flowers in quantity nor develop large blooms. It often happens during spells of wet weather that plants are overlooked with regard to watering, and it is during such times that great care should be taken to ascertain the requirements of the roots; the leaves will prevent small quantities of rain from reaching the roots. Attend to staking and tying of the young growths to prevent them becoming broken by strong winds. Plants grown to produce large blooms should have each growth staked separately to keep them erect, but bush plants may be tied to one or more sticks according to their growth.

## THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Beet.**—The recent wet weather has made this crop grow very fast, and the roots should be lifted before they become coarse. Store them in the coolest place available, in sand or ashes; the top of the "pie" should not be closed up, or the roots will heat and commence to grow again. Care should be taken not to damage the roots when lifting and storing them.

**Climbing French Beans.**—Seeds of the Princess of Wales variety of Climbing French Beans should be sown in gentle heat, placing three seeds in each  $3\frac{1}{2}$  inch pot. As soon as the plants are large enough, plant them out in rows in a house with a temperature of 65°; these plants furnish late supplies of excellent Beans.

**Thinning-out Crops.**—Carrots, Beet, Turnips, and other crops sown last month should be thinned out to the required distances as soon as the seedlings are large enough to handle, and kept free from weeds.

**Cucumbers.**—A batch of plants should be raised now from seeds, and grown on in a light airy house for winter fruiting. As good, strong plants are essential to success, keep the growths well thinned out, and do not allow cropping to commence until the plants are well developed.

**Corn Salad.**—To provide late autumn supplies sow seeds now in drills 16 inches apart; thin out the seedlings as soon as possible 6 inches apart.

## FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Succession Houses.**—Vines will soon be clear of fruit, and must receive generous treatment both as regards root-watering and careful late syringing. If the Vines are old and not over vigorous, early maturity is certain and ventilation must be liberal. Vigorous young Vines, on the contrary, may require a good deal of ripening and may be kept a little closer, with top and bottom ventilation left on for the night, as there is nothing like sun-heat and fresh air for ripening the wood. Vines upon which ripe Grapes are hanging should have plenty of natural shade during the hottest part of the day, and this is best afforded by a few well-arranged laterals; but if the natural shade is too thin, a double thickness of netting laid on the roof of the house will break the sun's rays whilst letting in light. White Grapes delight in plenty of light and some sunshine, but there comes a time when fully ripe berries scorch and show signs of shrinking, and when this happens sheets of tissue paper may be placed over the most exposed bunches.

**Early Muscats.**—Early Muscat Vines may be treated in a similar manner to the earliest Vines which are cleared of fruit, syringing being regulated by the healthy and clean condition of the foliage. If the wood is hard and approaching maturity gross laterals may be removed. Wash the foliage well occasionally and keep the borders thoroughly moist, but not too wet. The main crops of Muscats, like *Lady Downe's*, repay for liberal treatment, there-

fore the roots must be kept well fed with liquid manure. If laterals are abundant they may be gradually reduced or tied down, until the berries have done swelling.

**Pot Vines.**—Pot Vines intended for early forcing should soon be fit for full exposure, not by removal to the open air, but by throwing open all the ventilators on fine hot days and closing them only in wet weather. If the vines are rooting through the holes in the pots the roots should be disturbed or cut before the leaves fall, but this rarely happens where top-dressing and feeding have been generous. Pot Vines should never become dry at the roots, but the ripening of the leaves must be accepted as a signal for a gradual reduction in the quantity of water supplied. As the Vines ripen the removal of the first laterals close down to the main buds, from the base upwards, is an important matter, as the buds cannot be too well ripened.

**Vines for Planting.**—Vines now in 8-inch pots and which were stopped when about 6 feet high, will now be thickening their stems fast and pushing many laterals. These must be encouraged to a certain extent by frequent syringing and judicious watering, but they should be pinched when they have more than two joints.

**THE FLOWER GARDEN.**

By EDWIN BECKETT, Gardener to the Hon. VICAR GENERAL GIBBS, Aldenham House, Hertfordshire.

**Annuals.**—Late seedlings of Mignonette should be thinned out, as it will only retard development if they are left crowded together. Other annuals, as soon as their flowering period is over, should be cleared away to prevent any appearance of untidiness from spoiling the effect of borders. Pansy seeds should be sown now in light, sandy soil and germinated in cold frames. Only seed of the very best strains should be employed; there are many cheap and indifferent strains that will only disappoint the grower.

**Viola and Pansy Propagation.**—Raising Pansies from seed has just been dealt with, but such remarks apply equally to Violas. Where, however, a good stock of named varieties is needed, the method of raising from cuttings should be employed. Now is a good period to commence the work, as strong healthy young growths will be observed growing right from the base of the plants. These should be inserted as cuttings in the ordinary way, in good sandy compost; I prefer the use of shallow boxes, inasmuch as they can be placed in cold frames until the cuttings are rooted, and then stood in the open until such time as they are required for planting out, thus leaving the frames free for other things without disturbing the plants. Straggling old growths will not provide good cuttings, for once the stems become hollow the chance of their rooting is practically nil. Where plants are backward in throwing up the young growths, they may be encouraged to develop by trimming the old growths right back.

**Spanish and English Irises.**—When these have died down, it is a good plan to lift the bulbs, and ripen and dry them off prior to storing them. Replanting may take place in the spring or before the end of November.

**Montbretias.**—These very valuable ornamental flowers are now throwing up their fine spikes, and as the later introductions are somewhat heavy-headed at times, they should be supported when and where required. Planted in good breadths in a garden, they form very striking features at this time of the year. Plenty of water is essential to their well-being, and the soil around the corms should not be allowed to dry out in hot weather. Every two, or three, years at most, the beds of Montbretias should be lifted and fresh ones prepared on good soil, otherwise the plants deteriorate. Select only the best corms for replanting.

**Violets.**—As runners are formed from the plants bedded out for planting in frames later on, remove them, or they will weaken the parent plant.

**ORCHID NOTES AND GLEANINGS.**

**MORE ALLIES OF DENDROBIUM FORMOSUM.**

THE species here referred to belong to the section Formosae, and are in addition to those mentioned on p. 80.

*Dendrobium speciosissimum*, Rolfe, is one of the most interesting of the nigro-hirsute *Dendrobiums* and a close ally of *D. formosum*, but comes from a widely separated region. It was discovered by Sir Hugh Low on Mount Kina Balu, Borneo, in 1851, at about 6,000 feet elevation, who sent some dried specimens, one of which bore a short raceme of four flowers equal in size to *D. formosum*. The late Mr. F. W. Burbidge, in company with Mr. P. C. M. Veitch, also found it on the Marie Parie spur at 4,000 feet, the situation being described as similar to that of a warm Devonshire wood, the air being chilly at night. Beyond this, little was known of the exceedingly desirable plant until both the collectors of Messrs. Sanders and of Messrs. Low sent dried specimens which indicated the beauty of the

FIG. 42.—DENDROBIUM CRUENTUM.

species, and in 1895 both firms flowered specimens of it, and secured botanical certificates when it was in the immature stage and awards of merit later.

The announcement that it had been collected and some particulars given by Messrs. Low's collector, borne out by dried flowers from the same source, was given in *The Gardeners' Chronicle*, March 9, 1895, p. 295, where it is stated: "The flowers are pure white, except a blotch at the base of the lip, which is rich purple-red colour. The plant is of dwarf habit and very floriferous, bearing trusses of about four flowers, which are larger than those of *D. formosum giganteum*."

The description of the flowers of the plant which obtained the award of merit (*Gard. Chron.*, July 27, 1895, p. 103) states: "With large white flowers and orange and red base to the lip, the central yellow keel also having a red spot at the base." During 1895 and 1896 the plant was frequently shown and much admired, its flowers, although equal to those of *D. formosum*, proving quite distinct, especially in the rounded front lobe of the lip and the deeply cleft side lobes separating them from it. The colour also varied, some flowers showing more deep red at the base of the lip than others.

The species seems to have dropped out of notice as suddenly as it appeared, although it is to be hoped that specimens of it may yet be found in gardens. But it is very desirable that fresh importations of such a handsome

species should be obtained as soon as possible, and that it should be tried in the intermediate house, as its habitat, Borneo, probably induced growers to give the former importation too much heat.

*D. cruentum*, Rehb., *Gard. Chron.*, 1884, p. 604, of which Messrs. Sanders succeeded in getting a good importation from the West Coast of the Malay Peninsula in 1895, is another desirable species (Fig. 42), of rich and unusual colouring. The flowers are wax-like in substance, the sepals and petals ivory white tinged with green, the three-lobed lip having the lateral lobes crimson red, the middle lobe greenish, bordered with red, and having a large raised red crest. *J. O'B.*

**CYPRIPEDIUM NIVEUM SEEDLING.**

A VERY large and beautifully formed flower of the Snowy *Cypripedium*, raised in his collection, is sent by Clive Cookson, Esq., Nether Warden, Hexham (gr. Mr. W. J. Stables). Since the introduction of the species, over fifty years ago, it has been frequently imported, the plants showing some variation in their flowers, but none appear to have come up to the standard of Mr. Cookson's home-raised form. The broad dorsal sepal and petals are circular in outline, snow white, with some very small violet spots on the inner parts of the petals. The pure white lip is of larger size than usual in the species, and the whole flower a decided advance on the typical form, some of its excellence being probably due to the better root action of a home-raised plant than of an imported specimen.

**MILTONIA SEEDLINGS.**

THE specimens of *Miltonia Charlesworthii*, each with two spikes proceeding from the only mature pseudo-bulb, and bearing eight to eleven flowers of large size and fine quality on each spike, as shown by Messrs. J. and A. McBean, Cooksbridge, at the recent meeting of the Royal Horticultural Society, afford a remarkable instance of what may be accomplished on the first flowering of some hybrids. The small plant from which the rich floral display proceeds is greatly "in the minority." The fact is that in such cases the active flower spikes get their energy direct from the root crown without being diverted to the sustaining of the plant and building it up for next season's flowering.

**TREES AND SHRUBS.**

**LARGE TREES AND THEIR MEASUREMENTS.**

THE following list of large trees I have copied from an old book, kept by an ancestor. It would be interesting to know how many still survive, and what increase of girth they have put on. Oak: Thorndon, Essex (12 apostles), (1818), at 5 feet, 23.11; Tredville, Kent (1818), at 5 feet, 29.3; \*Panshanger, Herts (1828), at 5 feet, 18.4; Woodhall Park, Herts, at 5 feet (1822), 16.5. Ash: Edgcott, Northants (1818), at 5 feet, 12.1; (1825), at 5 feet, 19.0; Ashlyns, Herts (1825), at 5 feet, 16.9. Ehu: Tewin Water, Herts (1816), at 5 feet, 17.10; Tintern, Monmouth (1816), at 5 feet, 22.6; (1816), at 5 feet, 20.0; Kew (1825), at 5 feet, 15.4; (1825), at 5 feet, 20.7; Cheltenham, on road to Tewkesbury (1813), at 5 feet, 19.0. Spanish Chestnut: Broxborough, Herts (1816), 4 feet, 16.7; \*Portworth, Glos. (1759), 6 feet, 46.6; Digswell, Herts. (1816), 5 feet, 12.3. Scots Pine: Cats Hill, Stanstead, Herts. (1816), 5 feet, 8.4; Bayfordbury, Herts. (1821), 5 feet, 6.1. Yew: Thorpe, Northants (1817), at 5 feet, 15.5; Potteridge, Herts. (1823), at 5 feet, 25.4. Beech: Chipping Norton, Northants (1817), at 5 feet, 15.5. Cedar: The Palace, Enfield (1816), at 5 feet, 13.2; Physic Gardens, Chelsea (1816), at 5 feet, 13.5; Hex: Holkham, Suffolk (1816), at 5 feet, 6.5; (1816), at 5 feet, 6.8. *A. Clinton Baker.*

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## PLANTS OF MOUNT EVEREST.

IT is possible that those who hoped great things for the garden and conservatory from the Mount Everest expedition may be suffering from a sense of disappointment. The number of new discoveries among rare plants has conceivably fallen far below expectations, but it is extremely difficult to add new plants to our extensive lists; moreover, though no real attempt to climb Mount Everest has hitherto been made, the district around has been well and carefully explored for three-quarters of a century. Then there are limits to the height at which plants can produce blossoms that appeal to the aesthetic sense.

The flowering plant found at the highest levels for planerogams was a moss-leaved Sandwort (*Arenaria musciformis*), while at 20,000 feet a few grasses and mosses only were found. At present merely the records for 1921 are available, and it is not possible to state what additions may be in store when the results of this year's work are tabulated. Finally, some plants which were to have been revisited for the sake of their seeds last year had to be left without the seeds being collected on account of the difficulties of the season. This misfortune may have been remedied during the recent visit.

A few choice things, however, have been found. In an appendix to the delightful volume which has been published—\**Mount Everest: The Reconnaissance, 1921*—there is a list of some 250 plants, and this is not a complete record. Among them is a large number of old-time favourites, with names that are perfectly familiar. Many genera are represented by species which grow wild in this country, as the following names, taken at random, show. There are three Anemones, five Asters, six Senecios, nearly twenty Primulas, ten Gentians, and as many species of Lousewort (*Pedicularis*), about half a dozen Orchids, three Fritillaries, four Alliums, six Potentillas, a baker's dozen of Saxifrages, besides a large number of other plants belonging to the orders thus represented, and many have long been known, alike to the botanist and the gardener. There are also numbers of plants belonging to genera and orders whose names are less familiar, though many, even of these, have been in cultivation for years.

Two or three new Primulas are reported, and the brief descriptions supplied show that they maintain the record for charm which this fascinating genus has already secured.

While awaiting with interest the further revelations which are in store, it is worth while to look at a few of the facts which the naturalists have published. Scientists have long been familiar with the zones of growth in the Himalaya and other alpine ranges. Now we learn, among other things, that a wild

edible Rhubarb is found at a height of 14,000 feet, and a giant Rhubarb (*Rheum nobile*) at 16,000 feet. Two hundred feet higher flourishes a dwarf, blue, hairy Larkspur (*Delphinium*), which the Tibetans dry and use as a preventive against lice. A curious fact is recorded respecting this—a dead body to which this strong-smelling vermifuge is applied is left untouched by the vulture and wolf, which in the natural order of things would act as scavengers.

The smallest *Rhododendron* (*R. setosum*) disappears before the height of 19,000 feet is attained. After this, vegetation is almost non-existent, so that the last thousand feet yields little, if anything, which is attractive to hotanist or gardener. It is along the lower zones that interest chiefly centres. Thus a blue Scabious, reaching a height of 3-4 feet, together with a yellow Poppy and a dark blue Monkshood, may be found at 14,000 feet. A little lower, *Rhododendrons*, Birches, and Junipers are vigorous. At 12,000 feet the Juniper is in some parts the dominating feature. This grows into a tree of immense size and is of very even and perfect growth; specimens measured 20 feet and more in girth and 120 feet to 150 feet in height.

It is of interest to note how frequently the delightful perfume of the wild flowers is placed on record. This fragrance is found in many different species of plants, and suggests that an abundance of insect life is to be found among the mountains. Among the butterflies observed there were *Colias*, *Parnassias*, and *Lycaenas*, while it is recorded that in one place hundreds of moths were attracted by the light of the camp fires, and an entomologist properly equipped would have been able to make very extensive and valuable collections.

*Rhododendrons* are seen on the Himalaya in great perfection. There are frequent references in the book to their number and variety, and the mass of colour is said to be enchanting. The tubers of an *Arum* were found (though not the flower), from which the Tibetans make an inferior kind of bread. A curious dark blue Dead Nettle (*Dracocephalum speciosum*) was discovered, together with some lovely Gentians, a little purple and yellow Aster (*A. heterochaeta*), and a bright yellow Senecio with shining, glossy leaves. Three species of Edelweiss (*Leontopodium*) were collected at heights varying from 16,000 to 20,000 feet. Also very noticeable were the curious forms of *Saussurea*. These composite flowers are packed naturally with a kind of cotton-wool, and we read that, if they are opened on the coldest day, even when covered with snow, they are quite warm within, and a bumble-bee may come buzzing out! At about 13,000 feet the collectors found, towards the end of May, a yellow Primula covering the ground more thickly than Cowslips do in this country, while the air was laden with the scent of it. Growing with this Primula was a pretty Heath-like flower (*Cassiope fastigiata*) with snow-white bells.

In one region the most conspicuous plants were a little bushy Rock Rose or *Cistus*, with golden flowers the size of half-a-crown; a dwarf *Rhododendron* (*R. lanatum*) with hairy leaves; a white Potentilla with a red centre; a white Gentian (*G. robusta*); and a very remarkable Lousewort. This last species (*Pedicularis megalantha*) gave two quite distinct forms, one with purple and the other with yellow flowers.

It is impossible to draw attention to all the floral treasures to which this fascinating volume refers. The plants enumerated in the chapter on the Natural History of Mount Everest, and indexed in an Appendix, were collected between May and September of last year, from about 12,000 feet to 20,000 feet elevation. It does not fall within our province to write about the half-score of mammals, the three-score birds, or the toads, lizards, and two new species of flea recorded, interesting as these must be to the naturalist. It is a long time since a book has caused me so much genuine excitement as this one, and I can assure all those who undertake to read it that they have a delightful experience in store. *Hilderic Friend.*

## THE HISTORY OF THE MOSS ROSE.

(Continued from page 93.)

It was in Miller's *Figures, etc.*, 1760, that the exact date is fixed of his first acquaintance with the Moss Rose. The grand old gardener, emphatically styled by his admiring Continental friends *hortulanorum princeps*, was then close upon seventy years of age, and was writing about an event which happened thirty-three years before. I do not doubt his word or distrust his memory, but I fail to see any reason why, as Major Hurst does, it is safer to accept Miller's date of 1727 than Furber's earlier one. This is what Miller wrote: "This Rose has not been many years known in England. The first time I saw it was in the year 1727, in the garden of Dr. Boerhaave, near Leyden, who was so good as to give me one of the plants, but from whence it originally came I could not learn." The figure which illustrates the text is Fig. 1 on Plate CCXXI., and is the one Miss Willmott quite erroneously states to be certainly the first. Both on the plate and in the text Boerhaave's Latin descriptive name is given *verb. et lit.*

It may assist some of our modern writers on Rose history if their attention is directed to the earliest authentic pictures of the Moss Rose that can be traced prior to Miss Willmott's so-called first one. They are as follows:—

1730. The Moss Province Rose. Furber's Subscription Plates of Flowers. Jan.-Dec. Pl. for June. Fig. 18. (Folio.)

1730. *Rosa provincialis spinosissima pedunculo muscoso*. Moss Province Rose. *Catalogue Plantarum, etc.* A Catalogue of Trees, Shrubs, Plants, and Flowers, etc.; by a Society of Gardeners. (Folio.)

1732. Moss Province Rose (in the text Province). *The Flower Garden Display'd, etc.* 1st Edit. June plate, No. 18.

1734. Do., 2nd Edit.

1740. Moss Province Rose. *The Compleat Florist*. Pl. 47. 1st Edit.

1747. Do., 2nd Edit.

The Moss Rose may have been growing at Leyden, or even in other parts of Holland, long before the publication of Boerhaave's Index, or, in fact, it may have originated as a sport at any time or in any place without having been recorded. Whatever may have been the case, no previous mention of it can be proved. It is not referred to in any work either Dutch or French, published in Holland between Munting's *Nauwkeurige Bescheyving der Aardgewassen, etc.*, 1696 and *Nederlandsch bloemwerk*, 1794.

Miller was not alone in his ignorance of the country of origin of the Moss Rose. In *Planting and Ornamental Gardening*, 1785, the author states:—

"This Rose has not been many years in England, and from whence it was first brought is uncertain." The *Bot. Mag.*, Pl. 69, 1783, in the text to its first figure of a Moss Rose, also states: "We are ignorant of what country it is the product." And most of the eighteenth-century authors write in this strain until somebody in the next century started the apocryphal story about 1596 and Holland. Considering the position Miller occupied in the horticultural world, it would, indeed, be something approaching the miraculous if a Moss Rose had been in cultivation in England from 1596 and he never saw one till he went to Holland in 1727.

A few other direct mentions of the Moss Rose in English literature before the beginning of the next century (1800) may be useful. It is found in Benj. Whitmil's *Kalendarium Universale* in 1751, and doubtless earlier editions; in Weston's *Gardeners' and Planters' Calendar*, 1773; in Abercrombie's *The Gardeners' Daily Assistant*, 1786; in the same author's *The Garden Vade-Mecum*, 1789; in *Planting and Rural Adornment*, 1796; in *The British Garden*, 1799, etc. C. Harman Payne.

(To be continued.)

## NOTES FROM GLASNEVIN.

DURING the month of July, many interesting and beautiful plants flowered at Glasnevin, in spite of the dry and often cold weather. Even although the weather broke towards the end of the month, since when we have had many heavy showers, the soil is still very dry an inch or two below the surface.

The rock garden in July owes much of its attractiveness to the Campanulas, and even now, in early August, many are still in full beauty. During the end of July, *Campanula mirabilis* (Fig. 43) was particularly attractive, the flowers hanging in pendulous sprays down the face of rocks. They are almost as large as a Canterbury Bell and pale, milky blue in colour. Unfortunately, the plant is not perennial, but is easily raised from seeds; at first, a rosette of shining green leaves is formed which may go on increasing in size for two or three years before flowering. By sowing a pinch of seed each year it is possible always to have plants of flowering size.

Notwithstanding the drought of last year, and this year up to July, established trees and shrubs have made remarkably fine growth. I have never seen finer shoots on young trees of *Abies Delavayi*, *A. Forrestii*, *A. Faxoniana*, *Picea asperata* and other Conifers, and the same may be said of most broad-leaved trees.

Chinese plants, now so conspicuous in most gardens, have flourished and seem to have thoroughly enjoyed the sunshine of last year, especially in Ireland, where our skies are often overcast. *Liriodendron tulipifera* has lately flowered with remarkable freedom for this garden, and the Chinese *L. chinense*, which

month. The ample, pinnate leaves are, in themselves, of striking beauty, and when surmounted by the tall panicles of pink flowers the picture is complete.

*Iris Kaempferi* is said by some growers to dislike lime; here we have too much of that

FIG. 44.—LILIUM REGALE AT GLASNEVIN.

material for our comfort in gardening, yet with attention to occasional division in September and the addition of cow manure to the soil, they succeed fairly well by the margins of the pond.

Morning Mists, a variety bought some years ago from Messrs. R. Wallace and Co., Tunbridge Wells, is remarkably attractive by reason of its large white flowers; other colours, including deep purple, are also represented and now, in conjunction with the masses of pink *Astilbes*, they make a pretty picture.

An uncommon plant in flower is *Yucca glauca*, now in bloom on the rock garden (Fig. 45). This plant was purchased as *Yucca glauca variegata*, but shows no variegation whatever. The stiff, linear leaves are of a glaucous green colour and the flowers are, when fully open and fresh, almost creamy white. The inflorescence is simple, except for a few short branches at the base and about on a level with the leaves. I am not quite certain of the identity of this plant, as we have others called *Y. angustifolia stricta* which, though not in flower, seem remarkably similar in habit and foliage. The latter name is, of course, a synonym of *Y. glauca stricta*, and our plant seems to agree fairly well with the description given by Prof. Trelease in his fine "Monograph of the Yuccaceae" in the *Report of the Missouri Botanic Garden*, 1902, and with the figure of *Y. glauca stricta*, plate 26, of the same volume.

Of a different nature is *Pitcairnea spathacea*, a Bromeliad from the Argentine, and quite hardy here, planted outside at the base of the Cactus House wall. Last year, our plant produced one large, much-branched inflorescence; this year, it has three (Fig. 46), and being near a main walk, attracts a good deal of attention on account of its unusual appearance. The stiff, spiny leaves are themselves striking, but the beauty of the plant lies in the rose-coloured bracts and sepals, the latter tipped with green, and the bluish-green petals which overlap in such a way as to form a tube protruding half an inch beyond the sepals. *J. W. Besant, Glasnevin.*

## NOTES FROM WISLEY.

If the various trials at Wisley—Sweet Peas, Violas, Stocks, and Phloxes—could be deftly arranged in a single garden, they would create a beautiful picture. Even under the necessarily prim conditions of a trial they make a most attractive show. The Sweet Peas (which were

judged on July 31) are magnificent, and the results of the trial will be awaited with interest.

Although the herbaceous borders have not yet arrived at their full beauty, they are well worthy of attention. Large numbers of varieties of *Chrysanthemum maximum* are in flower, some of the blooms measuring six inches in diameter. Another good plant is *Malva Alcea fastigiata*, a pink Mallow, which maintains a profusion of bloom for a considerable time.

On the pond banks the Japanese Irises are over, but their place is to some extent taken by the great yellow and the purple *Loosestrifes*, which, however, do not belong to the same natural order, the former being a member of *Primulaceae*, and the latter of *Lythariceae*.

In the wild garden, *Gentiana asclepiadea* is beginning to flower. This is a most useful plant for providing colour from now onwards, and is not difficult to naturalise. A white form frequently occurs, but is not so attractive as the coloured ones. On the rock garden the bright orange *Cheiranthus Allionii* is very conspicuous, as also are the pure yellow flowers of a late-flowering *Cistus*, *C. halimifolius*, which are supported by very long, rigid peduncles, and show up brightly against the grey foliage. Rambling among a bed of *Primula rosea* is *Myosotis Welwitschii*, which is somewhat similar to *M. palustris*, except that it is dwarfer and more hairy. It is useful as a carpeting plant for damp places. Another plant of the same family is the annual *Cynoglossum Wallichii*, with flowers of a beautiful blue, much more intense than in *C. amabile*.

Yellow is not a common colour among

FIG. 45.—YUCCA GLAUCA (?) AT GLASNEVIN.

*Dianthus*, but *D. Knappii*, now in bloom, has flowers of a fine lemon shade. The unique inflorescences of *Primula Littoniana* are also to be seen. These greatly resemble the purplish spike of a wild Orchid, with the tip dyed scarlet. Lower down in the bog numbers of *Spiraeas* are flowering, notably *S. gigantea*, *S. g. rosea*, and the red *S. palmata*. An exceptionally beautiful plant is *Spiraea veuusta* with rosy pink flowers. Among the shrubby *Spiraeas*, *S. japonica*, with its many varieties, is common, and the graceful and feathery *S. ariaefolia discolor* which, though it has finished flowering, is still very handsome.

In the herb bed, *Atropa Belladonna*, the Deadly Nightshade, is in flower. It grows about 4 feet high and bears dingy purple flowers followed by Cherry-like fruits that change from green to a shining black. *J. E. G. White.*

FIG. 43.—CAMPANULA MIRABILIS AT GLASNEVIN.

has been very slow to establish, is now growing skywards rapidly, probably in response to the warm sun of last summer.

Among plants which have been conspicuous during the last month, none has gained more admiration than *Lilium regale* (Fig. 44) in a bed among young Japanese Maples. This I consider one of Mr. Wilson's best introductions. Owing to the ease with which it can be raised from seeds, it is now well known and will continue to be popular so long as it is propagated by that method—without doubt the best way of maintaining all *Liliums* in health. Another Chinese plant of great beauty is *Rodgersia pinnata*, which requires rich, moist soil for its full development. Here it flourishes in the bog garden, and has been a wonderful sight for a

## GARDEN NOTES FROM S.W. SCOTLAND.

THE Veronicas of New Zealand contain so many species closely similar to each other that I feel sure Mr. Richardson will excuse me if I ask whether he is sure that it is *V. salicifolia* that has colonised near Edinburgh (page 86). Of the two forms of *V. parviflora*, tall and dwarf, the former often passes under the name of *V. salicifolia*; in fact, it came here forty years ago under that title. In foliage and flowers the two species closely resemble each other, but the racemes of *V. salicifolia* are considerably longer than those of *V. parviflora*, and are pendent, whereas those of the other do not exceed five inches in length and are held horizontally. *V. salicifolia* is the handsomer shrub when in bloom, but passes out of flower much quicker than the other. It is not reckoned so hardy as *V. parviflora*; indeed, I have never seen it flourishing except in mild districts, but whereas it is indigenous to both the North and South Islands of New Zealand, much depends upon which island it is brought from to this country, plants from the South Island being less tender than those from the North Island.

We grow a Bell Flower here under the name of *Campanula amabilis* about which I should be grateful for information. It is not in the *Kew Hand List*, nor can I find mention of it in any work on gardening, except Mr. Reginald Farrer's (from whom I suppose I got the plant). He describes it as being "pleasant as its name: a stout rosette, with three foot spires, loose and graceful, of big, shallow cups, soft blue with a dark purple eye." (*Alpines and Bog-plants*, page 140). Here the whole flower is rich purplish blue, with a lustrous sheen on the petals, and the radical leaves are fleshy with undulate margins. It is a very choice border plant, and I would fain learn its origin.

Accidental harmony or contrast is always worth noting. Such has occurred by chance in the Orange Lily—*L. croceum*—having been planted beside the double-flowered form of *Geranium pratense*, which flowers a month later than the single form. Another happy accident consists in a spread of *Papaver umbrosum*, which furnishes a setting of blood-red to one of Lemoine's hybrid *Philadelphus*—a low growing variety with catarracts of snowy bloom.

No shrub is more generous of blossom than *Abutilon vitifolium*, where the climate is mild enough. Like so many Chilian plants, it revels in the humid atmosphere of the west coast. Our specimen continued covered with pale lavender flowers throughout June and July, and is only passing over now (August 5). It is not a case of "glut and famish"—profusion one year and scantiness the next—as is the habit of some good shrubs. This *Abutilon* repeats the display annually; but as it is not a long-lived species, it is well to keep up a young stock from seed, which it ripens in abundance.

If it were inexorably decreed that I should grow but a single species of Lily, I declare that it would be *L. Browni*—provided I could grow it. But I cannot. From all the many bulbs that have been coddled and coaxed here, we have this year only two flowering stems, and despair is deepened by remembrance of the splendid bed of this Lily which flourished of yore in the late Mr. York's woodland at Iver Heath. I was about to write that *L. Browni* had no peer, but before doing so I went out to compare it once more with *L. regale*, whereof the golden anthers turned the scale and restored my allegiance to that noble flower. Moreover, *L. regale* is as easily grown as the common *Martagon*. *Herbert Maxwell*.

## THE FLOWERING CRABS.

I READ with great interest an article by Lady Moore, under the above heading, in the May issue of *Irish Gardening*, and think that, complete as it is, there is still room for another paper on the same subject. Besides the wild

crabs, *P. sylvestris*, *P. mitis* and *P. paradiisica*, Lady Moore described about twenty-five ornamental species, hybrids, and varieties, all of which are growing at Aldenham except the double-flowered variety of *P. malus Halliana* and *P. m. theifera*, called *rosea*, which has, I presume, pink instead of white flowers. Lady Moore calls the former of these two *P. m. Parkmanni*, but I have always regarded the two names as synonymous, and on turning to Bean's standard work on British trees and shrubs I find that he, too, treats *Parkmanni* as being merely a synonym of *P. m. Halliana*, which tree he records as occasionally bearing double flowers.

I observe that Lady Moore has found *P. m. Sargentii* to dislike the knife, but, so far as my experience goes, I have not found this to be the case; its natural habit is to form a bush, and, having raised a great many from seed, I converted several of them into trees by very drastic cutting, without, so far as I can judge, their resenting the surgical operation at all. Lady Moore does not mention that the red fruit of this species is freely produced and no bigger than a small Pea.

Except for this trifling criticism I agree with every word Lady Moore has written, and especially do I confirm the high estimate which she has formed of the beauty of *P. m. theifera*, with its fine, Medlar-like flowers. To my thinking, Lady Moore hardly says enough in praise of *P. m. spectabilis* Kaido (Dippel). Here it bears double parti-coloured flowers, which I consider the most brilliant and showy of the seventy or eighty grown here. Setting aside the all red blooms, which are so different as not to be comparable, it certainly is superior to *P. Scheideckeri* and that at its best, as it was on May 19 last, takes a lot of beating.

It might also have been worth noting that the habit of *P. m. magdeburgensis* is strictly fastigate, for it is often convenient to know of a beautiful flowering tree which will take up little room. I have said that *P. m. magdeburgensis* is "strictly fastigate," but I should have been wiser if I had written my example has that habit, for, like most people, I have here fallen into the error of arguing from particulars to generals, and, whereas I am only familiar with one plant, I have written as if I had known many. This same failing has led to frequent praise and denunciation of the health, appearance, habit or vigour of plants, all ill-founded, because the basis on which true opinion can alone be formed has not been sufficiently extended.

Besides the long list of Crabs recorded by Lady Moore, there are between forty and fifty growing here of which she makes no mention, and some of them are so beautiful that it cannot be their unworthiness which has caused the omission. I will give all their names, as then the two articles, taken together, will enable your readers to have a fairly complete list of these beautiful fruiting and flowering subjects. However, out of consideration for your space, I will only comment on those which appear to me specially to deserve notice, and before beginning I will add a warning to the effect that with anything of the Apple class it is practically impossible to raise plants true to name from seed gathered in this country, and neglect of this truth has led to a great many mongrels masquerading, and, alas! being sold, under names to which they are at most only half entitled. I am not in favour of grafted plants when grafting can be avoided, but in the case of *Pyrus malus* the operation can be easily and satisfactorily performed on the Paradise or other good stock, and only by these means can many of these beautiful species and varieties be obtained with a certainty that no adulteration has taken place.

*P. m. abjecta*.

*P. m. aldenhamensis*.—A chance hybrid which first occurred here, it is the finest of the red-flowered ones, blooms three weeks later than *Niedzwetzkyana* and *purpurea*, and instead of having an ugly, Potato-like fruit, as has the former, it carries in autumn a bright, dark red Cherry.

*P. m. Arnoldiana*.—This is a handsome, vigorous hybrid produced at the Arnold Arboretum in Massachusetts.

*P. m. asiatica*.

*P. m. astracantha sphaerocarpa*.

*P. m. baccata fructu flavo*—as its name implies—is a variety bearing yellow instead of the usual red fruit.

*P. m. baccata* × *prunifolia*.

*P. m. baccata* × *sylvestris*.

*P. m. coronaria elongata*.

*P. m. crataegifolia*.—Makes an excellent little tree with Hawthorn-like leaves, and is a delightful sight when loaded with its yellowish-red fruit about the size of a Pea.

*P. m. Dawsoniana*.—A fine hybrid raised at the Arnold Arboretum, and named after the propagator there.

*P. m. domestica Rinkii* Koidzume.—This is one of Wilson's introductions under No. 7,619, and may be synonymous with *P. m. prunifolia* Rinkii mentioned below.

*P. m. Ellwangeriana*.—Named after the senior partner in the well-known firm of nurserymen at Rochester in New York State, and valuable principally for its bright red Cherry-like fruits.

*P. m. fol. arg. var.* and *P. m. fol. aur. var.*—Silver and gold variegated forms of the common Apple, not of special merit.

*P. m. formosana*.—I have not had this species long enough to report as to its ornamental value.

*P. m. glaucescens*.—Is a pretty, grey-leaved Crab with leaves like a Hawthorn, but larger. It flowers freely and has a good habit; the Apple-coloured fruit is the size of a large Cherry.

*P. m. kansuensis*.

*P. m. laurifolia*.

*P. m. Maximowiczii*.—Bears very showy blossom equal in merit and very similar to *P. m. Scheideckeri*.

*P. m. orthocarpa*.

*P. m. pendula* "Eva Rathke" and *P. m. pendula* "Excellenz Thiel".—These two are both weeping trees, but are very distinct in appearance. The former has large leaves like an ordinary orchard Apple, and has stiff, stout boughs which grow at right angles to the stem for about 3 ft. before they begin to droop. The large, yellowish fruit is like that of a Codling. The latter is a very graceful, narrow-leaved tree, of which the boughs hang down quite close to the trunk. It is a German product, and but rarely seen in English gardens.

*P. m. prunifolia coccinea*, *P. m. prunifolia edulis*, *P. m. prunifolia lutea*, and *P. m. prunifolia Rinkii*.—These four are all varieties of *prunifolia*, the last being, I suspect, a synonym of *P. m. domestica Rinkii* Koidzume above mentioned.

*P. m. Ringo fastigiata bifera*.

*P. m. Sieboldii*.

*P. m. Sieboldii arborescens*.

*P. m. spectabilis fl. pl.*

*P. m. spectabilis Riversii*.

*P. m. transitoria toringoides*.—This is one of Wilson's excellent introductions from China. The flower is white and freely produced, the fruit most showy, like a white-heart Cherry, and the foliage in the Hawthorn style, but more ornamental.

*P. m. Veitchii*.—I bought this from Coombe Wood, and, as might be expected, from Sir Harry Veitch having given his name to it, it has great ornamental value. Some regard it as synonymous with *P. m. yunnanensis*, but, though in the same style, it is certainly distinct from the plants which bear that name in this garden.

The following fourteen are for the most part hybrids of garden origin, and are mainly worth growing for their beautiful fruit, in which respect "Cheal's Crimson" and "Veitch's Scarlet" are unsurpassed. In nearly every case the fruits make excellent jelly, and "John Downie," which Lady Moore mentions, is often used for this purpose, and this kind also deserves praise for its graceful habit:—

*P. m.* "Cashmere Crab," *P. m.* "Cheal's Crimson," *P. m.* "Dartmouth Crab," *P. m.*

## LEAF SCORCH OF APPLES.

Two patches amongst my trees of Beauty of Bath are suffering severely from leaf scorch. The leaves at first showed the characteristic scorching at the margins and tips, but now many of the leaves have dropped. The first stage of the attack is much like spray injury, and is, no doubt, often mistaken for it; but that cannot be suspected in the present case, because these trees have not been sprayed since just before blooming, and then it was only with a harmless soap and nicotine wash.

A very interesting account of investigation into the causes of leaf scorch is to be found in the Report of the Long Ashton Research Station for 1921. It is shown that varied conditions may cause scorching. Usually, but not entirely, it is confined to trees on light soils. It seldom occurs on trees grown on grass land, or on Apples on free stocks. Although it takes place

Hermione (pale purple), and V. Autumn Glory (deep purple), are all glorious subjects just commencing their flowering periods, and they are accompanied by V. parviflora with its spikes of white-tinted purple flowers. One climbing plant calls for special note, Clematis coccinea, this being especially fine with its scarlet, pitcher-shaped, solitary flowers. Another beautiful plant that will soon come into blossom is Eucryphia pinnatifolia, which, with its wealth of white blossom, is undoubtedly one of the loveliest flowering shrubs in our gardens to-day.

Variegated subjects especially useful for the second portion of the scheme include Rhamnus alternata variegata, most handsome; Diervilla versicolor and D. floribunda variegata; Cornus alba Spaethii (golden); Acer Negundo fol. aureo marginata and Eucnymus radicans var. for bush plants of varying size; and Cornus brachypoda variegata. Ulmus campestris variegata and Quercus Cerris variegata as trees, are extra good.

"Fairy," P. m. "Golden Gem," P. m. "Hyslop Crab," P. m. "Lady Northcliffe," P. m. "Le Prey," P. m. "Marshal Oyama," P. m. "Mexican Crab," P. m. "Montreal Beauty," P. m. "Mrs. J. Seden," P. m. "Transcendent," and P. m. "Veitch's Scarlet."

There is one beautiful Crab which I have not mentioned because I am not fortunate enough to possess it, though my friend Mr. Charles Eley, at whose beautiful place, East Bergholt, in Suffolk, it originated, has promised to give it me this autumn. It has been named P. m. Eleyi, and is a hybrid between P. m. spectabilis and P. m. Niedzwetzkyana. In colour of flower it resembles the latter, being a bright red self, but in freedom of production it has the merit of its other parent; the fruit, again, is like the former, though much smaller, and is quite distinct from the Cherries borne by P. m. aldenhamensis. A full and good account of this valuable ornament to our gardens is given in the *Gardeners' Chronicle*, August 14, 1920.—*Vicary Gibbs, Aldenham, Elstree.*

## THE SHRUBBERY IN LATE SUMMER.

THE period of late summer is a trying one to the owners of shrubberies, inasmuch as there is probably a dearth of flowers. Philadelphus, Diervillas, Deutzias and other early flowering shrubs are over, and unless precaution has been taken to arrange for other kinds of flowering subjects, the whole appearance of the shrubberies may be dull and uninteresting. There are two ways of preventing this dullness; firstly, by planting suitable flowering shrubs for the later season, and, secondly, by the employment of variegated and coloured foliaged trees and shrubs, carefully associated with the others in such a way as to give a bright and interesting aspect to the scheme.

Dealing with the first point, I have looked carefully around to note some of the plants that are in flower and likely to continue for some little while, and also such as are coming into flower in the near future, as such a list may well prove a useful assistance to those who have come up against the dullness referred to above.

Among the many late-flowering subjects *Potentilla fruticosa* in all its varieties is very useful and flowers over a long period, making bushes of various sizes and habits, some being erect growing, some gracefully arching, and some quite prostrate, but all flowering well. One new variety which we owe to the efforts of that intrepid collector, the late Mr. Reginald Farrer, we still have under the number given when he sent it home from China, as there seems to be a little confusion as to its true nomenclature. "*Potentilla, Farrer 188*," is its record, and it has the most lovely pure golden-yellow flowers of practically any shrub I know.

Fuchsias, such as *F. Thompsonii*, *F. macrostemma*, *F. corallina*, and *F. conica*, are also in season; Lavenders of different sorts are carrying their many sweet-scented spikes; *Cytisus*, such as *C. Rochelii*, *C. horniflorus*, and various *Cistus* are flowering freely. *Geranias*, especially *G. tinctoria fl. pl.*, the double flowering form of the Dyer's Greenweed, and its near relation *G. tinctoria apennina*, are carrying their golden spikes, whilst *Hypericum* are also bearing a wealth of yellow blossom, some of the finest being those of the *Patulum* group. White flowers are provided by *Spiraea assimilis*, and the *Ligustrum*, *L. lucidum* being especially good, and will soon be followed by the giant-spiked *L. Quihoui*.

Blue and pink flowers are found in the *Ceanothuses*, notably *C. azureus* vars. *Topaze*, *Indigo*, and *Gloire de Versailles*, and *C. Fendleri* giving the former colour, and *C. azureus* vars. *Pinquet Guindon*, *Marie Simon* and *Perle Rose* the latter. *Deutzia corymbosa* is opening its pretty umbels of white bloom. *Spiraea glabrata* and its variety *rubra* are giving good tones of red. *Dorycnium rectum*, a pretty dwarf, half-shrubby plant, is lovely with its pale rose-pink flowers, and the hybrid *Veronicas* such as *V. Gauntlettii* (bright red), *V. Tunon Delux* (deep red), *V. Scarlet Gem* (scarlet), *V. Mt. Blanc* (pure white), *V.*

FIG. 46.—PITCAIRNEA SPATHACEA AT GLASNEVIN (SEE P. 109).

There is the bright yellow foliage of *Catalpa bignonioides aurea*, the silver of *Pyrus salicifolia pendula*, *Salix alba*, and *Populus alba Richardii* (as trees), and *Senecio laxifolius*, *S. Munroi*, and *S. Greyi*, *Santolina Chamaecyparissus*, *Convolvulus Cneorum* (also good for its bright pink bells), *Phlomis chrysophylla*—the "*Jerusalem Sage*" (yellowish grey), *Atriplex Halimus*, and *Perowskia atriplicifolia*, as small shrubs, while the purple leaves of trees of the *Prunus cerasifera* group, *Copper Beech*, and *Acer palmatum purpureum*, and shrubs of *Berberis vulgaris purpurea* and *Corylus maxima purpurea*, are all useful in the direction of brightening up otherwise uninteresting shrubberies. *B. Beckett.*

**Trial of Carrots at Wisley.**—The Royal Horticultural Society will carry out a trial of Carrots for cultivation in frames during the coming autumn and winter. The Director, R.H.S. Gardens, Wisley, Ripley, Surrey, will be glad to send entry forms to those desiring to enter varieties for this purpose, and one packet of seed of each variety should reach him on or before August 31.

during summer drought, and is nearly or quite absent during a moist season, it is not altogether a question of moisture supply, for Apples in water culture experiments have developed the trouble. It is probably caused by soil conditions which are unfavourable to healthy root development and action. This is indicated by the fact that the roots of scorched trees are nearly always loose in the ground, so that the trees can be swayed about easily. It is probable that the unsatisfactory state of the roots, however it may be brought about, prevents them from keeping up an adequate supply of moisture for the leaves. Thus, whilst the cause of leaf scorch has not yet been definitely decided, there is not much doubt that defective rooting conditions may usually be suspected.

With regard to remedies for leaf scorch, the liberal use of potash fertilisers is the most hopeful, for it has often proved successful. Grassing an orchard is said to have mitigated the trouble. Where the soil is known to cause scorch, Apples on free stocks only should be planted. *Market Grower.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante. pp. 95-100).

### SCOTLAND, N.

**ROSS-SHIRE.**—The promise of fruit of all kinds during the flowering season was never better, the wealth of blossoms being comparable only to trees covered with snow. On the whole the "set" was good, and no untoward circumstances happened to blast the blossoms during their all too short period of beauty. Apples are the crop of the season, and a few of the best fruited kinds are Mère de Ménage, Bramley's Seedling, Lady Sudeley, Beauty of Bath, Alfriston, Ribston Pippin, Keswick Codlin, Early Victoria, Golden Spire, Mr. Gladstone, Royal Jubilee, Wealthy, Irish Peach, Stirling Castle, and Hawthornden. Pears flowered remarkably well, but, as usual in such cases, failed to set satisfactorily; however, the crop is an average one, and good for the district. Amongst the best cropping varieties may be cited William's Bon Chrétien, Jargonelle, Beurré Diel, Pitmaston Duchess, Marguerite Marillat, Dr. Jules Guyot, Souvenir du Congrès, Clapp's Favourite, Louise Bonne of Jersey, Fair Maggie, Benvie, Swans' Egg, Hazel, and Early Crawford. Plums on walls carry an extra good crop, the most prolific being Czar, Victoria, Transparent Gage, Goliath, Jefferson's, Coe's Golden Drop, Monarch, and Kirkes. This is not an Apricot or sweet Cherry district, and the crop is disappointing, except for Morellos, which are usually good here—this year being no exception. Small fruits are remarkably good, and altogether the crop is a record one. This we attribute to the fine warm autumn of last year, and to the absence of severe frosts during winter and spring. The soil is mainly overlying a somewhat hard clay subsoil, rather impervious to water; the garden stands 450 feet above sea level. Grubs of the Gooseberry Sawfly, and aphid on Plums were rather prevalent, as were Apple Chermes or Psylla, but owing to the cold summer these were not so numerous as usual. *William L. Minty, Ardross Castle Gardens, Alesse.*

**SUTHERLANDSHIRE.**—Apples promise a wonder ful crop, Pears are excellent and good, while Victoria Plums have set splendidly. Sweet Cherries are a very light crop, although there was an abundance of blossom: Morellos are very good. Strawberries, Raspberries, Gooseberries, Red and Black Currants, are also bearing good crops. The soil is of a very light and sandy nature, the subsoil being gravel. The season is very late in the north of Scotland this year, Elton Pine Strawberry being hardly yet out of flower. *W. F. Game, Dunrobin Castle Gardens, Golspie.*

### SCOTLAND, E.

**ABERDEENSHIRE.**—Most fruit trees are yielding good crops, and Apples are the largest crop I have seen for years; this success I attribute to the very warm summer we had last year, the wood being finely ripened. *James Grant, Rothienormans Gardens.*

**BERWICKSHIRE.**—The fruit crops in this district are fairly satisfactory, most of them being over the average and fairly clean. Apples, Apricots, Peaches and Plums required thinning, especially Allington Pippin, Bailie Neilson, Bramley's Seedling, James Grieve, and Peasgood Nonsuch Apples, though the last is rather a shy bearer with us. Apples and Pears are swelling last after the welcome rains, although the nights were very cold in July. *William Clayton, Milne Garden Gardens, Coldstream.*

**EAST LOTHIAN.**—This has been one of the most remarkable years for fruit. Blossom was superabundant, and set more freely than usual, which necessitated much labour in thinning. The foliage of all fruit trees is clean and large, but Apples are much affected by American Blight. Strawberries were large and a great crop, but everywhere in this locality they have

failed to colour and ripen perfectly. Raspberries also promised well, but Black Currants are perhaps a smaller crop than usual. Figs constitute a large crop, and, notwithstanding the cold weather, are swelling satisfactorily. The soil is light, suited more for Apples than Pears, and Plums than Peaches. Apricots generally fruit satisfactorily. *R. P. Brotherton, Tynninghame Gardens, Prestonkirk.*

**FORTHFARSHIRE.**—All crops of fruit are very late in this district, but in most cases plentiful and of good quality. The dry summer of 1921 enabled all fruit trees to ripen their bearing wood, with the result that there was an exceptional amount of blossom and fruit is abundant. The long spell of cold, wet weather has kept all forms of insect life in check, and has also helped to swell and improve the appearance of most fruits. The soil here is of a medium nature, and very cold. *J. B. Peffers, The Gardens, Panmure, Carnoustie.*

**KINCARDINESHIRE.**—I have to report an exceptionally heavy crop of Apples, Pears, Plums and Cherries this year. I have three young Plum trees, about ten years old, and have taken off about six stones of fruit, and still they are too heavily cropped. I have seen nearly as good a show of flowers on fruit trees before, but never such a successful set. The rainfall here is a little over one inch more than the total for 1921, which was 18.38 inches. *William Thomson, The Gardens, Ury House, Stonehaven.*

**PERTHSHIRE.**—The Apple crop is the heaviest I have seen in this district, very few varieties having a light crop; indeed, the majority have had to be thinned considerably. Raspberries, Strawberries, and small fruits generally are at least a fortnight late this year, but are a good average both in quality and quantity. Owing to rain, the sweet Cherries are splitting badly. Morello Cherries promise well, as do Plums and Pears, but all require sunshine and heat to mature them properly. *Malcolm Macnaughton, Scene Palace Gardens, Perth.*

**AYRSHIRE.**—With a little protection for Peaches and Pears, the fruit crops here are promising well. Peaches have had to be severely thinned, while Apples are a bumper crop, if only a little warmth would come to swell the fruits. Insect pests were rather troublesome in May, but have now almost disappeared from the garden. *D. Buchanan, Bargany Gardens, Dailly.*

**BUTHESHIRE.**—In the early spring the prospects for fruit crops were good, but during the flowering period the weather was very variable. Plums and Pears suffered a good deal from very cold winds when in flower, and as a consequence crops are scarce, except in sheltered situations. Apples, however, had very good weather and carry an excessive crop of fruit, which necessitates a good deal of thinning. Since June 1, the weather has been very wet and cold, therefore all fruits are late. Strawberries especially suffered from the cold, as only on eight days during June did the maximum thermometer register 60° or over, and in July, up to the 17th, so far it has only reached 60° on two days. Our soil is heavy loam on marl rock. *T. Davidson, Ardencraig, Rothesay.*

**DUMBARTONSHIRE.**—In this district we had a fine, dry spring, with plenty of blossom, but the promise has not been fulfilled. We have had a poor and cold summer so far, and everything is at least a month later than the normal. *John Brown, Cairndhu Gardens, Helensburgh.*

**DUMFRIESHIRE.**—Apples are a good average crop; but, while some trees are heavily laden with fruit, others are almost bare. Pears and Cherries are poor. Small fruits are excellent, especially Red Currants and Gooseberries. Strawberries are a grand crop—fruit very large and the flavour good. Our soil is a medium sandy loam. *James McDonald, Dryfeholm Gardens, Lockerbie.*

(To be continued.)

## HOME CORRESPONDENCE.

**The Dunkeld Larches.**—I fail to see how the 1888 measurement of 15 ft. 1 in. at 5 ft. from the ground of the parent Larch which was destroyed by lightning in 1909, about the accuracy of which there can be no dispute whatever, verifies Mr. Clinton Baker's 1817 measurement of 13 ft. at that height. We have two 1831 measurements, namely, that made by Dr. Blackadder of 10 ft. 6½ in., at 5 ft. up, as given by Loudon, and that given by Hunter, of 12 ft., at 4 ft. above the ground, and if these measurements are correct, clearly Mr. Clinton Baker's must be wrong. As regards the remarks of Mr. Mark Mills, I need only say that before I sent the communication to the Arniston Larches to *The Gardeners' Chronicle* I had consulted Grigor and all the other modern writers I could discover, but all I found was the usual legend, with, of course, variations, about the Dunkeld plants having been brought from London as already described. All these modern authors have merely taken their data from one or other of the earlier ones, but none of them gives a single fact of importance which can be relied upon to settle the question. Dr. Walker (in whose opinion Loudon evidently placed great reliance) gives the year of their introduction as 1727, and he evidently was convinced that they were the first Larches to be introduced into Scotland. But if they were introduced in 1738, and assuming that the Dawyck Larches were planted in 1725 (which Loudon doubted), then it is quite clear that the Arniston Larches took precedence of them, and that they are not even entitled to second place. For if they were brought from London in a portmanteau in 1738, planted in a greenhouse, cast out on a rubbish heap as being dead, left to take root there, and subsequently planted in the open ground, all of this could scarcely have taken place before February 8 of that year, the date on which the Arniston Larches were supplied. *A. D. Richardson, Edinburgh.*

**Canon Hall Grape.**—When reading the notes on Vine Pruning in a recent issue of the *Gard. Chron.*, I remembered a promise to send further details of our failure or success in getting Canon Hall Grape to set its fruits satisfactorily, and of my son following a different mode of winter pruning, the summer pinching of the fruiting shoots, and also of feeding the vines. Firstly, as to pruning: on every alternate lateral we left seven or eight buds, but others were spurred back in the usual way. All broke strong and regularly and showed immense bunches, 15 inches to 16 inches in length and a mass of flower. These were not pollinated in any way, but dewed over very slightly, and the shoots carrying the bunches were allowed to grow on in place of stopping them in the usual way two or three leaves above the bunch. The result was a great improvement on last year. Some are plump bunches, yet the long-stemmed ones are thin and straggly, but carrying enormous berries like Greengage Plums, and of a lovely amber colour. No feeding was given, as the Canon Hall vine appears to be a very robust grower, making strong wood that may fail to get well ripened, which may account for its bad setting qualities. My son and I conclude that the Canon Hall vine requires unrestricted growth, not too high feeding, leaving it alone while in bloom, except for slightly dewing the branches while they are in bloom, a high temperature together with an inch or two of ventilation, careful watering, and no rank manure, but rich loam, old lime rubbish, ashes from the bonfire, and charcoal as rooting medium in a well-drained border. I consider this Grape, when in condition, the noblest of all varieties. I should like Mr. Macnaughton's or other growers' opinion of it. A certain large firm advertised for 300 buds of it last winter, which shows that this Grape is in demand. *William Irvine, sen., Bradley Gardens, Grimsby.*

## SOCIETIES.

### MIDLAND CARNATION AND PICOTEE.

JULY 28, 29.—The thirty-second annual exhibition of this once progressive Society was held in conjunction with the National Viola and Pansy Society at the Botanical Gardens, Edgbaston, on the above dates. Both shows were small, but many flowers of good quality were exhibited. The gold medal offered by Mr. W. Nevill for the best vase of Carnations in the show was won by Mr. H. WOOLMAN, with the variety Bookham Rose.

#### OPEN CLASSES.

Of the four contestants in the first twelve open classes for triplets, Mr. H. WOOLMAN, Shirley, was the most successful exhibitor, winning seven first prizes and four second prizes. He thus holds the Waters Butler twenty guinea Challenge Cup for another year. The second most successful exhibitor was Mr. C. H. HERBERT.

Mr. H. WOOLMAN's first prizes were for (1) yellow-ground Fancy, suffused type like Hercules, with superb flowers of that well-known variety; (2) Rose or Pink, with extra large well-shaped specimens of Bookham Rose; (3) yellow-ground Fancy, with Frank Woodward; (4) maroon, purple or heliotrope, with exquisite flowers of Grey Douglas; (5) yellow-ground Picotee, with F. W. Goodfellow; (6) yellow-ground Fancy, edged and marked like Linkman, with Peace Treaty—a magnificent flower; and (7) White-ground Picotee, with Mrs. W. H. Twist.

Mr. C. H. HERBERT, Acocks Green, had the winning vases of (1) Scarlet Red or Cherry self, with Fujiyama; (2) white self with delightful flowers of Prairie Belle; and (3) white-ground Fancy, with Mrs. G. D. Murray.

Mr. P. SMITH, Selby Park, led for the best vase of a buff, yellow, orange, or terra cotta self, with refined blooms of Glamour. Messrs. A. R. BROWN, LTD., Kings Norton, led in a class for White-ground Fancies, marked like Othello type, with excellent flowers of Sir Douglas Haig.

#### FIRST DIVISION.

Here again Mr. H. WOOLMAN took the lead. He won four first prizes and two second prizes. The principal awards were for (1) twelve vases of Carnations and Picotees, to include Selves, white-ground Fancies, yellow-ground Fancies, and yellow-ground Picotees, for which a Gold Medal was given by Mr. W. Nevill. He showed splendid flowers of Grey Douglas, Hercules, Lieutenant Shackleton, Bookham Rose, and The King; (2) three vases of yellow-ground Fancy Carnations, dissimilar, with Hercules, Lieut. Shackleton and Peace Treaty; (3) three vases of white-ground Picotees, dissimilar, with beautiful blooms of Edmund Shorthouse, Mrs. W. H. Twist, and Ganymede; and (4) one vase of Fancy Carnations, other than white or yellow grounds, with Saladin in splendid condition.

Mr. C. H. HERBERT had the best three vases of Self Carnations, showing Fireman, Prairie Belle and Bookham Rose; as well as the best set of yellow-ground Picotees with Neal Kenyon, Romance and W. E. Goodfellow.

From Messrs. A. R. BROWN, LTD., came the winning exhibit of white-ground Fancies, Mrs. G. D. Murray, Melton, and Mrs. Hawksbee. Other prize winners were Mr. P. SMITH and Mr. R. G. RUDD, of King's Heath.

#### SECOND DIVISION (AMATEURS).

Competition in the classes reserved for amateurs resulted in a duel between Mr. E. KENWRIGHT, Smethwick, and Mr. F. BAYLISS, Walsall. The first-named exhibitor was awarded six first and two second prizes, and Mr. BAYLISS won two first and four second prizes. Mr. E. KENWRIGHT's first prizes were for (1) six vases dissimilar, two each of Selves, Fancies, and Yellow-ground Picotees; (2) one vase of yellow-ground Fancies; (3) one vase of white-ground Fancies; (4) one vase of yellow-ground Picotees; (5) one vase of white-ground Picotees, and (6) two vases of Fancy Carnations.

Mr. F. BAYLISS's principal prizes were for (1) one vase of Selves; and (2) two vases of Selves.

The sole exhibitor in the Third Division, which is open only to those who do not grow more than 300 plants, was Mr. J. DAINTY, Wellington, who was awarded first prizes in five classes.

#### BLOOMS ON STANDS.

The dressed flowers shown on boards did not make a very big show, there being only fourteen entries in the six open classes. Mr. P. SMITH won first prizes for (1) twelve Self Carnations, with good quality flowers of Primrose Dame, Alpha, Titan, Gordon Douglas, Glamour, General French, Bookham Rose, Lapwing, Peach Blossom, The King, Grey Douglas, and Prairie Belle; (2) for twelve Yellow-ground Picotees in which Professor Burstall, Eclipse, Santa Claus, Jewel and Zena Dare were of outstanding merit. Mr. H. WOOLMAN excelled in a class for twelve Fancy Carnations, which included exquisite specimens of Lord Steyne, Skirmisher, Lieut. Shackleton (sport), Hercules and Peace Treaty; and in another class for twelve white-ground Fancies, his best varieties being Mrs. G. D. Murray, Mrs. Hawksbee, Jackie and Fair Ellen.

Mr. C. H. HERBERT was the only exhibitor in the classes for twelve white-ground Picotees and twelve Bizarre or Flake Carnations.

In the classes open only to amateurs, the first and second prizes were divided between Mr. E. KENWRIGHT and Mr. F. BAYLISS.

#### PREMIER FLOWERS.

Flowers shown in vases: Self Carnation, Grenadier, exhibited by Mr. H. WOOLMAN; Fancy Carnation, Peace Treaty, exhibited by Mr. H. WOOLMAN; yellow-ground Picotee, F. W. Goodfellow, exhibited by Mr. P. SMITH; white-ground Picotee, Mrs. W. H. Twist, exhibited by Mr. H. WOOLMAN; white-ground Fancy, Mrs. G. D. Murray, exhibited by Messrs. A. R. BROWN, LTD.

#### FLOWERS SHOWN ON STANDS.

Bizarre Carnation, Quakeress, exhibited by Mr. C. H. HERBERT; Flake Carnation, Cleopatra, exhibited by Mr. C. H. HERBERT; Heavy-edged White-ground Picotee, Mrs. W. H. Twist, exhibited by Mr. C. H. HERBERT; Light or Wire-edged White-ground Picotee, Clytie, exhibited by Mr. E. KENWRIGHT; Heavy-edged, yellow-ground Picotee, P. Burstall, exhibited by Mr. P. SMITH; Light-edged, white-ground Picotee, W. L. Hodgkinson, exhibited by Mr. E. KENWRIGHT; Fancy Carnation, Rhea, exhibited by Mr. F. BAYLISS; Self Carnation, Primrose Dame, exhibited by Mr. P. SMITH; white-ground Fancy Carnation, Mrs. G. D. Murray, exhibited by Mr. P. SMITH.

#### HONORARY EXHIBITS.

A Gold Medal was awarded to Messrs. W. H. SIMPSON AND SONS, Birmingham, for Antirrhinums and miscellaneous flowers; and a Silver Medal to Mr. C. H. HERBERT, Acocks Green, for Pinks.

### ROYAL CALEDONIAN HORTICULTURAL.

August 1.—The ordinary monthly meeting of this society was held at 5, St. Andrew Square, Edinburgh on this date, Mr. David King, president, in the chair.

A paper, on Rhododendrons, by Mr. James Cameron, Auchterarder House, was read by the Secretary.

The exhibits were:—Roses, from Messrs. DOBBIE AND CO., LTD. (Silver Medal); seedling Strawberry (Garibaldi × Givon's Late), from Mr. W. G. PIRIE, Dalhousie (First-class Certificate); Ox-eye Daisies, David King and Matthew Todd, and Hedgehog Gooseberry seedlings, from Mr. F. BAILLIE, Liberton; Statice Suworowi, from Mr. A. INNES, Dean Cemetery, Edinburgh; seedling Streptocarpus, from Mr. G. BROWN, Ashley Terrace, Edinburgh; Anemone glaucifolia, from the Royal Botanic Garden, Edinburgh.

### NATIONAL VIOLA AND PANSY.

The ninth annual show of the above Society was held at the Botanical Gardens, Edgbaston, Birmingham, on July 28 and 29. There was a record entry, especially in the Amateur Classes, no fewer than eight exhibits being staged in the class for 12 Vases of Violas, and nine exhibits in the 6 Vase class, which made a wonderful bank of bloom.

In the leading class, the blue riband of the Viola world was again won by Mr. W. H. C. TOOBY-DESMOND with a fine collection of flowers. The handsome 25 guineas Silver Challenge Cup, presented by W. Waters Butler, Esq., was won outright by Mr. TOOBY-DESMOND, together with a cash award, and the Society's Silver Medal. Mr. J. R. BASTOCK came second, there being very little difference between the first and second prize sets; both were admirably set up and consisted of extra large blooms. In the open decorative class for a display of Violas, 8 ft. by 3 ft., the first prize was won by Mr. H. J. TANNER, of Sparkhill; Mr. H. CLARKE, of Taunton, coming second. Much credit is due to Mr. Clarke, whose exhibit contained an abundance of excellent flowers, which arrived in good condition, but were staged rather heavily.

Exhibitors in the open decorative class should have paid particular attention to the amateurs' decorative class, in which the premier award was won by Mr. O. KINSMAN, of King's Heath, with one of the most effective and natural exhibits ever staged at the Society's shows. Mr. C. HARLAND also must be congratulated on his second prize exhibit in this class.

Flowers on boards were not so numerous as usual, but the vase classes easily compensated for their deficit. Mr. CHAS. COCKBURN, Pensatland, again gave the public a glimpse of his wonderful show Pansies: he was awarded the Society's Bronze Medal for a vase of these pretty flowers. The principal prize winners in the open classes were:—Messrs. TOOBY-DESMOND, J. R. BASTOCK, H. CLARKE, H. J. TANNER, MACALPINE, A. BASTOCK, G. W. SANDERSON, T. H. JUSTICE, and H. LEES. In the amateur classes:—Messrs. G. W. SANDERSON, T. MANTLE, S. BUSHELL, A. HOLBROOK, W. HALLDEARN, O. KINSMAN, T. H. JUSTICE, S. CARLESS, W. NEWMAN and H. LEES.

The Society's Medals were awarded as follow:—Silver-Gilt, to Mr. W. H. C. TOOBY-DESMOND, for most points in the open vase classes; Silver, to Mr. W. H. C. TOOBY-DESMOND, for most points in the open board classes; Silver-Gilt, to Mr. T. MANTLE, for most points in the amateurs' vase classes; Silver, to Mr. H. LEES, for most points in the amateurs' board classes; Silver to Mr. W. COWDARY, for the premier vase in the amateurs' classes (Milton Jumbo).

### ROYAL HORTICULTURAL.

#### Trial of Spring Cabbages at Wisley.

The following awards have been made to Spring Cabbages by the Council of the Royal Horticultural Society, after trial at Wisley:—

#### AWARDS OF MERIT.

No. 26, *Ellam's Dwarf Early Spring*, sent by Messrs. DICKSON AND ROBINSON; No. 34, *Early Feltham*, sent by Messrs. WATKINS AND SIMPSON; No. 56, *First Early Market*, No. 3, sent by Mr. J. L. CLUCAS.

#### HIGHLY COMMENDED.

No. 17, *Conqueror Selected*, sent by Mr. HOLMES; No. 20, *Chirton Selected*, sent by Mr. ORD; Nos. 40, 42, *Early Offenham*, sent by Messrs. WATKINS AND SIMPSON and Messrs. TOOGOOD AND SONS; No. 42, *Early Offenham Selected*, sent by Mr. HARRISON; No. 51, *Imperial (Wheelers)*, sent by Messrs. COOPER, TABER AND CO.; No. 52, *Early Market*, sent by Messrs. WATKINS AND SIMPSON; No. 67, *East Ham*, sent by Messrs. BARR AND SON; No. 75, *Yorkshire Market*, sent by Mr. F. DICKS.

#### COMMENDED.

No. 9, *Flower of Spring*, sent by Messrs. SIMPSON; No. 62, *First and Best*, sent by Messrs. DICKSON AND ROBINSON, No. 80, *Early Evesham*, sent by Messrs. NUTTING.

## SHROPSHIRE HORTICULTURAL.

AUGUST 16 AND 17.—It is a capital sign of the times that the Shrewsbury Floral Fete held in the Quarry Gardens on the above dates showed a marked advance upon the last two years, and approached within measurable distance to the grand pre-war exhibitions for which Shrewsbury is famed. We congratulate the executive of the Shropshire Horticultural Society upon its enterprise and initiative and upon its success. The exhibition was of large extent and the larger part was under one canvas roof, though two other large tents and some outdoor accommodation had to be provided for the horticultural exhibits. Judging commenced at 9 a.m., and subscribers were admitted at 11 a.m. and by 11.10 a.m. the place was crowded with interested visitors.

Groups and specimen plants were not up to the high quality nor were they so numerous as in well-remembered years before the war, but Roses, Sweet Peas, Hardy Flowers, and artistic groups were probably finer than ever, while vegetables were wonderfully fine and the rock garden group class a distinct feature. Floral designs fell below the previous average, but the non-competitive exhibits were numerous, extensive, interesting and diversely attractive.

The marvellously fine exhibit of vegetables from the Hon. VICARY GIBBS (gr. Mr. Edwin Beckett), Aldenham House, Elstree, Herts., was one of the wonders of a wonderful show. It is always a little difficult to know whether Mr. Beckett has beaten himself, but, having seen large numbers of his exhibits during a period of many years, we cannot remember one quite so attractive as this. It goes without saying that every specimen in the one hundred and twenty "dishes" was as perfect as the best of cultivators could get it, but, in addition, the colour effect was so fine that no group of plants and flowers received more attention or was more admired. Tomatoes, red and yellow, coloured Potatoes, Aubergines, Radishes, Beet, Kohl Rabi, Carrots, Marrows, Turnips, Beans and Onions provided the colour and set off to advantage the superb Runner Beans, Cauliflowers, Leeks, Peas, Artichokes, big, clean Onions, Cucumbers and many other kinds. In short, Shrewsbury show of 1922 will long be remembered as the one at which the Aldenham vegetables were such a striking feature. The Shropshire Society not only awarded the only large Gold Medal to this exhibit, but decided to make a special and personal award to the Hon. VICARY GIBBS as a memento of his grand contribution to the show.

## Groups.

Always a great attraction at Shrewsbury, the two principal group classes were even more attractive than usual on this occasion. The space allowed each competitor was 250 sq. ft., and if we remember rightly there was a wider frontage and less depth than usual. In the class for flowering and foliage plants grouped for effect Messrs. J. CYPHER AND SONS, Cheltenham, once again won the chief award of £35 with a beautiful exhibit in which grace and colour were combined in a most delightful manner. Tall Palms, Ixoras and waving Humeas occupied the background; in front of these brilliant Codiaeums, finely flowered Cattleyas and Laelio-Cattleyas, Ixoras, Liliiums, and Fuchsia triphylla were placed so that each plant did its duty without crowding or overhanging its neighbour. *Nandina domestica*, *Odontiodas*, *Cypripediums*, dwarf Ixoras, *Rex Begonias*, the variegated form of *Saxifraga sarmentosa*, and brightly berried patches of *Nertera depressa*, provided the material for the foreground. But tall spikes of *Francoa ramosa*, a few tall spikes of white *Odontoglossums* and two fine examples of *Lilium auratum* rose above all else and without hiding anything they added that gracefulness to the display which was its most charming feature. Sir G. H. KENRICK (gr. Mr. J. V. Macdonald), Edgbaston, Birmingham, gained second prize with a fine effort, but his *Codiaeums* lacked the brilliant colouring of those in the premier group, nevertheless he used On-

cidium spikes and *Lilium speciosum* to good effect. Mr. W. R. MANNING, Dudley, gained third prize.

In the class for a group of similar size, but where the desired effect had to be produced without the aid of flowers, Messrs. JAS. CYPHER AND SONS were again winners of the first prize. Here they used Palms, Bamboos and *Jacaranda mimosaefolia* as a background and secured their colour effect with bright *Codiaeums* and *Acalyphas*, while the ground work and the front margin consisted chiefly of *Nandina domestica*, *Dracaenas* in variety, various Ferns, *Rex Begonias* and small *Caladiums*; 2nd, Sir G. H. KENRICK; 3rd, Mr. W. R. MANNING, Dudley.

Sir JOHN LEIGH was awarded first prize for a smaller group of flowering and foliage plants; with Mr. A. M. BARBER 2nd, and Mr. H. HOWELLS, 3rd.

The plant classes are now but ghosts of former years. The principal prize winners were Mr. J. B. DAVIES, Upper Greenfields, for Pelargoniums; Sir JOHN LEIGH (gr. Mr. T. Young), Lilleshall, for *Begonias*; A. M. BARBER, Esq. (gr. Mr. T. G. Bremner), Wellington, for fringed and double *Begonias*; Mr. H. HOWELLS, Belle Vue, for six trained Pelargoniums; Mr. H. HOWELLS, for pyramidal *Fuchsias*; and Lady MARY HERBERT (gr. Mr. J. Birch), Styche, for Ferns.

## Hardy Flowers.

Three capital entries in the class for a collection of herbaceous flowers arranged naturally on a space of 250 sq. ft. produced a very fine effect, and were a great attraction to visitors. The £20 offered as first prize was won by Messrs. M. PRICHARD AND SONS, Christchurch, with a grand lot of flowers, bright in colour and pleasingly arranged. Outstanding features were the *Kniphofias*, of which K. E. M. Prichard, K. Royal Standard, K. July Scarlet, K. nobilis and K. Rulus were the finest. Other fine things were *Crinum Powellii*, *Galtonia candicans*, *Yucca filamentosa* and the *Montbretias*, but the lack of formality was what commended the display to most people, and in this connection we would add that the tall plumes of *Astilbes* and *Thalicttrum dipteroacarpum* rendered excellent service.

MESSRS. HARKNESS AND SON, Bedale, were awarded second prize, and they presented *Gailardias*, *Verbascums*, *Liliums*, *Phloxes* and *Gladioli* in good form, but had a far too formal arrangement; 3rd, Messrs. G. GIBSON AND Co., Bedale.

MESSRS. M. PRICHARD AND SONS were also first prize winners in the class for eighteen bunches of hardy flowers, while Mr. E. H. SHORTING, Bronley, led for a dozen bunches.

## Sweet Peas and Carnations.

Sweet Peas were shown in fine condition, the recent cool weather having favoured them. Competition, however, was not very keen. For eighteen bunches, distinct varieties, Mr. THOS. JONES, Ruabon, won the premier award of £8, with lovely blooms of *Conquest*, *Gloriosa*, *Mascotts White*, *Cicely*, *Jean Ireland*, *Tangerine*, *Sunset*, *Royal Purple*, *R. F. Felton*, *Hawmark Pink*, *Matchless*, *Mrs. T. Jones*, *King Mauve*, *Royal Scot*, *Hebe*, *Bunty*, *Picture* and *Warrior*; 2nd, Mr. A. DUNTON, Wolverhampton.

Mr. J. HAYCOCKS, Gyfelia, Wolverhampton, led in the class for a dozen bunches, but he had arranged his flowers in a too formal manner for good effect; 2nd, Mr. F. R. MINSHALL, Market Dravton, also with a formal arrangement; 3rd A. BRADBURY, Esq. (gr. Mr. H. G. Shaw, Llandudno).

There was keen competition in the class for six bunches, distinct varieties, and here Mr. W. DODD, Ruabon, gained the first prize with fine examples of *Bridesmaid*, *Conquest*, *Annie Ireland*, *Colne Valley*, *Glory* and *Mascotts Scarlet*; 2nd, Mr. A. BRADBURY; 3rd, Mr. F. R. MINSHALL.

The leading class for Carnations was one for a group of perpetual varieties, arranged on a space 18 ft. by 4 ft., and the chief award offered is a silver challenge cup, value 50 guineas, presented by the late Annabelle Lady Roughley, and to be owned by anyone winning

it three times, not necessarily in succession. Mr. C. WALL, of Bath, won it in 1920 and 1921, but on this occasion he had to take second place to Mr. C. ENGELMANN, Saffron Walden, who won with a grand display of fine flowers set up in bold masses of each variety, and yet arranged with great taste and elegance; the yellow Saffron, and the scarlet Thor were his outstanding varieties, but White Wonder and Laddie were also grandly shown. Mr. WALL's exhibit was a fine one, and prettily arranged, but he used double *Gypsophila* too freely among his Carnations flowers.

For a group of border Carnations and Picotees Mr. H. WOOLMAN, Shirley, Birmingham, was awarded first prize, and the feature of his display was a column of Border Yellow.

## Roses and Begonias.

For the second time in succession Messrs. GUNN AND SONS, Olton, won the Phillipps Silver Rose Bowl offered as first prize for a display of Roses arranged on a space 20 ft. by 4 ft. There were two entrants, and Messrs. Gunn and Sons were easily first with a superb arrangement, in which pillars of White Dorothy, K. of K., Dorothy Dennison, *Mdme. Abel Chatenay*, and Lady Gay were the outstanding features. Beneath these and also behind them were fine stands of Isobel, Mrs. John Laing, Cheerful, Queen Alexandra, George Dickson and James McArthur. Mr. A. J. S. DUNTON gained the second prize with a very formal design.

There were four entries in the class for three bunches of cut Roses, and here the leading award was won by Mr. J. MATTOCK, Headington, Oxford, with beautiful, clean flowers of Los Angeles, Mrs. Henry Morse and Irish Elegance; 2nd, Messrs. GUNN AND SONS, Olton, with George Dickson, Annie Crawford and Ophelia; 3rd, Mr. C. VICKERS, Leicester.

Cut blooms of Roses on boards were not a success; Mr. W. J. COLE, Treherbert, Mr. W. LEWIS, Llanelly, and Mr. T. JONES, Ruabon, being the most successful competitors.

A grand group of magnificently grown *Begonias*, representing superb double varieties, won for Messrs. BLACKMORE AND LANGDON the first prize in an important class. A space 25 ft. by 4 ft. was allowed. The Bath firm showed three of their "basket" *Begonias*, on tall stands, and showed wonderful plants of the big-flowered varieties Peace, Mrs. J. Davidson, Lord Lambourne, Mrs. F. Bedford, and Hilda Langdon; 2nd, Mr. F. DAVIES, Pershore.

## Rock Gardens.

An interesting class was the one for a rock and water garden, and the exhibits were arranged out of doors. The first prize of £50, together with the Lord Howard de Walden Cup, value 50 guineas, and to be won outright, was won by Mr. F. R. HAYES, Keswick, with a very pleasing arrangement in which no extravagant use had been made of rock, in fact, plants and rock were entirely in harmony, and the little stream running down the little ravine was a pretty feature. Some of the more important plants noted were *Erica vagans* St. Keverne, *Gentiana septemfida*, *Campanula White Star*, *Thalictrum minus*, *Daboecia polifolia*, and *Papaver alpina*. Mr. HAYES won with 89 points out of a possible 100. The second prize was awarded to Mr. P. GARDNER, Ilkley, who obtained 65 points; 3rd, Messrs. S. BROADHEAD AND SON, Huddersfield, with 62 points.

## Floral Designs.

First prize for a bowl of hardy flowers was awarded to Messrs. CHAS. HUNT, Baschurch, for a blue and white bowl filled with *Eryngiums*, cluster of *Barberies* and *Maple foliage*. As the class specification admitted hardy garden flowers, foliage, grasses, "etc.," no doubt the judges allowed the fruits to pass! It was a charming and unusual design; 2nd, Miss NEWSHAM, Ormskirk, with pale blue *Delphiniums* and *Montbretias*. In another bowl class Miss NEWSHAM led with brilliant *Roses* in a dark bowl; 3rd, Mrs. J. NIXON, Alderley Edge, with pink Carnations and *Francoa* sprays.

Premier position for one brides' and two bridesmaids' bouquets was won by Mr. C. J. VICKERS, Leicester, with pleasing designs in

Orchids, but in one or two instances the flowers were faded; Mrs. NIXON, 2nd.

The basket class was a good one, and here Mrs. J. NIXON led with a brilliant arrangement of Anthurium Andreanum, Odontiodas, Francoa sprays and Codiaenum leaves; Mrs. A. ADSHEAD, Gately, 2nd, with yellow Carnations, Anthurium Scherzerianum and Francoa sprays; 3rd, Mrs. C. J. VICKERS.

Eight competitors came forward in the class for a floral table decoration. To the surprise of many visitors the first prize was awarded to Miss NEWSHAM, Ormskirk, for four corner vases and a central bowl of Independence Day Roses; the arrangement was at once simple and effective, and though many judges would have given first prize to the elegant and light arrangement by Miss NIXON, Alderley Edge, we find no fault with the judges' decision; one lady put the case rather well when she considered the Rose table to be "so satisfying." A design in pink Carnations won third prize for Mr. E. WINCHESTER, Rubey, Birmingham. One competitor had a quaint and somewhat funereal design composed of four vases of "Travellers' Joy" Clematis and a central bowl containing two huge flowers of Magnolia grandiflora. Four white candles in black iron candlesticks completed the arrangement!

#### Choice Dessert Fruits.

A most attractive and interesting class at Shrewsbury of late years has been the one for a collection of thirty dishes of dessert fruits, not fewer than nine distinct kinds, not more than fourteen bunches of Grapes being admissible, and these in not fewer than four varieties; the whole to be arranged on a table 10 ft. by 4 ft., with floral decorations. In this class the chief prize is a Silver Challenge Cup, value £65, and £25 in cash.

The famous Cup now becomes the property of Lord HOWARD DE WALDEN (gr. Mr. Jas. Vert), Chirk Castle, as he has won it three times in succession, and on this occasion he led with 167 points out of a possible 200 odd. The table was admirably decorated with Carnations and Francoa sprays. The items were Muscat of Alexandria, Muscat Hamburg, Madresfield Court and Black Hamburg Grapes, two bunches of each; Emerald Gem, Countess and Hero of Locking Melons; Brown Turkey Figs (two dishes); Peregrine (2) and Crimson Galande Peaches; Byron Pineapple (2) and Humboldt Nectarines; Jefferson and Transparent Gage (2), Plums; Large Early and Moorpark Apricots; Red Astrachan, and Red Victoria Apples; Bigarreau Napoleon Cherries; and Marguerite Marillat Pears—a fine exhibit, in which the judges did not err on the side of liberality as regards pointing. Sir JOHN LEIGH (gr. Mr. Thos. Young), Lilleshall, 2nd, with 160½ points, his Grapes being in good condition, especially his Muscat of Alexandria; 3rd, Mrs. T. S. HALL (gr. Mr. G. Richardson), Chard, with 148 points, his Noblesse, Dymond and Royal George Peaches being particularly good.

Two competitors came forward in the class for nine dishes of dessert fruits, the leading prize winner being Col. HEYWOOD LONSDALE (gr. Mr. J. Mills), Shavington Hall, who staged small bunches of Black Hamburg and Muscat of Alexandria Grapes; Monro's Little Heath Melon; Lord Napier Nectarines; Sterling Castle Peaches; James Grieve and Duchess of Oldenburg Apples; Large Red Apricots and Clapp's Favourite Pears; 2nd, Capt. W. W. HAYES (gr. Mr. F. Maddock), Harcourt.

Apparently only a second prize was awarded in the class for twelve dishes of dessert fruits, the only exhibit we could find being the one from Major A. A. HUMPHREYS OWEN (gr. Mr. A. Oakley), Glansevern.

#### Grapes.

In the interesting class for a decorated display of twelve bunches of Grapes, there were three competitors, and the whole class produced a fine effect. The chief award of £20 was won by R. J. CORBETT, Esq. (gr. Mr. J. Jones), Townyn, with Black Hamburg, 8, 8, 8 and 8½ points (10); Appley Towers 5 (9); Muscat of Alexandria 8½, 8½, 8 and 8 (11); Mrs. Pince

5½, 7, and 6 (11); a total of 89 points out of a possible 124—the figures in brackets show the possible points and the other figures the points obtained. In this exhibit the bunches were of very even size and one of the bunches of Muscat of Alexandria (No. 8) was finely berried and beautifully coloured. The second prize fell to Lady MACALPINE (gr. Mr. S. H. North), Accrington, who had heavy bunches that would have been the better had they been thinned more. His points were: Madresfield Court 7½, 7, 6½ and 7 (11); Alicante 7, 7½ and 6½ (9); Muscat of Alexandria 6½, 6½ and 6 (11); and Black Hamburg 6½ and 7½ (10); total 82 points out of a possible 120. Messrs. J. WEBBER AND SONS, Minehead, 3rd, with 76 out of a possible 118 points.

Lt.-Col. LEIGH led for four bunches of Grapes with fair-sized, nicely finished clusters of Madresfield Court and Muscat of Alexandria; 2nd, the EARL OF COVENTRY with Black Hamburg and Muscat of Alexandria. The last-named competitor excelled in the class for a pair of bunches of Black Hamburg Grapes, A. BRADBURY, Esq., Llandudno, coming second; five entries.

Lt.-Col. LEIGH led for two bunches of black Muscat Grapes with large but rather small-berried clusters of Muscat Hamburg; Col. HEYWOOD LONSDALE, 2nd, with the same variety. Lt.-Col. LEIGH continued his successes in the class for two bunches of Madresfield Court Grapes. Messrs. J. WEBBER AND SONS led in the class for Alicante with finely berried bunches, well-coloured for the time of year.

Major ALDERSON, Franklin, and Capt. W. W. HAYES, Harcourt, were first prize winners in classes for Black Hamburg and Madresfield Court Grapes respectively.

The Rt. Hon. the EARL OF COVENTRY (gr. Mr. W. H. Wilson), Croome Court, had the best pair of bunches of white Muscat Grapes (Muscat of Alexandria), just beating Lt.-Col. H. C. LEIGH, Knutsford, in a class of four entries. In another class for white Grapes Messrs. J. WEBBER AND SONS, Minehead, led with well-furnished clusters of Buckland Sweetwater.

#### Hardy and Other Fruits.

Col. HEYWOOD LONSDALE won first prize for six dishes of hardy fruits in a class of four entries. Lord HOWARD DE WALDEN (gr. Mr. J. Vert) won first place for Morello Cherries in a severe competition. The Rev. J. DAVIES, Crowle, had the best purple or red Plums, and also the best yellow Plums, in Jefferson.

In the Melon classes Lt.-Col. DICKIN (gr. Mr. Gilbert), Loppington House, and Mr. A. BRADBURY were the leading prizewinners. R. J. CORBETT, Esq., Townyn, led for Peaches with Violet Hative in fine condition; Mr. S. WITHERS, Sandhurst, 2nd; Mr. CORBETT was also successful in the class for Nectarines with superly coloured fruits of Dryden; Mr. WITHERS, 2nd. T. F. KYNERSLEY, Esq. (gr. Mr. Phillips), Leighton Hall, had the best dish of Apricots.

In the Apple classes the fruits indicated the backwardness of the season. For culinary Apples Sir J. LEIGH led with excellent fruits of Peasgood's Nonsuch; E. C. TANNER, Esq., Eyton-on-Severn, 2nd, with Bramley's Seedling. Sir JOHN LEIGH was also first prizewinner for dessert Apples, with Lady Sudeley, and Col. HEYWOOD LONSDALE, Shavington Hall, was 2nd with small examples of James Grieve.

#### Vegetables.

Vegetables were grandly exhibited and presented in large numbers, one big tent being required to accommodate the splendid produce.

There were eight entries in the Society's open class for twelve dishes of vegetables; distinct kinds, and in this keen competition Mr. J. JONES, of Ammanford, won the chief award with Leeks, Cauliflowers, Onions, Potatoes, Turnips, Runner Beans, Peas, Carrots, Beet, Celery and Cucumbers; 2nd, Mr. E. MILLINGTON, Hadnall; 3rd, Mr. E. WINCHESTER.

In the Robert Sydenham class for nine kinds of vegetables Mr. W. TAYLOR, Grimsbill, led with excellent Celery, Ailsa Craig Onions and The King Tomatoes; 2nd, Mr. E. WINCHESTER, Rubey, Birmingham; four entries.

In Messrs. Webb and Sons' class Mr. W. J. JONES, Ammanford, led with nine splendid dishes in which the Onions were of outstanding quality; 2nd, Mr. E. WINCHESTER; six entries.

Lt.-Col. DAVID DAVIES (gr. Mr. F. H. Pugh), Llandinam Hall, won the premier prize in the class for six kinds, provided by Messrs. Jas. Carter and Co., and he had grand Giant Pink Celery and Ailsa Craig Onions; 2nd, Mr. T. BOWEN, Aberaman; five entries.

In Messrs. Cibran's class for nine kinds Mr. T. M. JONES, Llandilo, led, his Exhibition Runner Beans, Ailsa Craig Onions and Holme's Supreme Tomatoes being his best dishes; 2nd, Mr. T. BOWEN, Aberaman.

The prizes in Messrs. Dickson and Robinson's class for nine kinds were keenly competed for. J. THOMAS, Esq. (gr. Mr. David Jones), Kidwelly, led, and showed Standwell Cauliflowers, Kondine Red Tomatoes and King Edward Potatoes in fine condition; 2nd, Mr. T. M. JONES, Llandilo; four entries.

There were three fine entries in Messrs. Sutton and Sons' class for nine kinds, and here Mr. W. J. JONES was once again the leading prizewinner, showing fine Prizetaker Leeks, Prince of Wales Tomatoes, Prizewinner Runner Beans, and Ailsa Craig Onions; 2nd, Col. HEYWOOD LONSDALE; 3rd, W. MALCOLM WATSON, Esq. (gr. Mr. W. H. Jones), Clive Hall.

C. J. GWYER, Esq. (gr. Mr. H. Sowman), Hereford, had the best six dishes of Potatoes, his varieties being Eclipse, Stirling Castle, Victory, Midlothian Early, Abundance and Rhoderick Dhu—a grand lot.

In the numerous single-dish classes there were literally crowds of competitors, and the judges' task must have been a difficult one, as scarcely a poor dish was to be found.

Lt.-Col. D. DAVIES led for Tomatoes; R. C. PALMER MOREWOOD, Esq., Alfreton Park, for Cucumbers; A. H. HICKMAN, Esq., Cookley, for Peas; Mr. J. GRIFFITHS, Shepherd's Lane, for dwarf Beans; Mr. J. DAVIES, Weston Crewe, for Runner Beans; Mr. C. J. GWYER, Titley, for Potatoes (The Bishop); Mr. G. W. SHEPHERD, Bridgnorth, for Cauliflowers; Mr. W. WEAVER, Mold, for Celery; Mr. T. JONES, Ammanford, for Onions; Rev. J. DAVIES, Worcester, for Parsnips, and for Carrots; Lt.-Col. D. DAVIES, for Turnips; and Mr. J. JONES, Ammanford, for Spring Onions.

In cottagers' and local classes the vegetables were of a very high standard of excellence, and the competition was very keen throughout.

#### Awards to Non-Competitive Exhibits.

*Large Gold Medal and Special Additional Award.*—To the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree, for a collection of vegetables.

*Gold Medal.*—To Mr. E. MURRELL, Shrewsbury, for a miscellaneous group; to Messrs. JOHN PEED AND SON, West Norwood, for stove and greenhouse plants; to Messrs. ROBERT BOLTON AND SON, Halstead, for Sweet Peas, splendidly staged; to Messrs. E. WEBB AND SONS, Stourbridge, for vegetables and Sweet Peas; to Messrs. BEES, LTD., Chester, for Liliiums and herbaceous flowers; to Messrs. SUTTON AND SONS, Reading, for fruits, flowers and vegetables; to Messrs. DOBBIE AND CO., Edinburgh, for Roses; to Messrs. BAKERS, Codsall, for herbaceous flowers and water plants; to Messrs. ALEX. DICKSON AND SONS, Belfast, for Sweet Peas; to the KING'S ACRE NURSERIES, Hereford, for pot fruit trees and Roses; and to Messrs. GUNN AND SONS, Olton, for Phloxes.

*Small Gold Medal.*—To Mr. H. N. ELLISON, West Bromwich, for Ferns and Cacti; to Messrs. M. PRITCHARD AND SONS, Shrewsbury, for Ferns and flowers; to Messrs. J. CYRREN AND SONS, Cheltenham, for stove and greenhouse plants; to Messrs. STUART LOW AND CO., Bush Hill Park, for Orchids and Carnations; to Messrs. WM. CUTRUSH AND SON, Barnet, for Liliiums and other flowering plants; to Messrs. IFFR BROS., Penrith, for Sweet Peas; to Messrs. STOUTENBEEK VAN TIL, Hillegom, for Gladoli; to Mr. H. CLARKE, Taunton, for an-

nuals; to Messrs. JONES AND SON, Shrewsbury, for Sweet Peas, etc.; to Messrs. SANDER, St. Albans, for Orchids; and to Messrs. DICKSON AND ROBINSON, Manchester, for Gladioli and Tomatos.

**Silver Medal.**—To Mr. ALEX. W. THORPE, Lichfield, for early Chrysanthemums; to the CHALK HILL NURSERIES, Reading, for Antirrhinums, etc.; to Messrs. ISAAC HOUSE AND SON, Bristol, for Scabious and other hardy flowers; to Messrs. W. H. SIMPSON AND SON, Birmingham, for Antirrhinums; to Messrs. JAMES VERT AND SON, Saffron Walden, for Hollyhocks; to the Rev. J. H. PEMBERTON, Romford, for Roses; to Messrs. JOHN K. KING AND SONS, Coggeshall, for Sweet Peas; to Messrs. BLACKMORE AND LANGDON, Bath, for Delphiniums; to Messrs. BOWELL AND SKARRATT, Cheltenham, for Alpines, etc.; to Mr. C. ENGELMANN, Saffron Walden, for Carnations; to Mr. E. BAYLEY, Shrewsbury, for plants and flowers; to Mr. HENRY ECKFORD, Wem, for Sweet Peas; to Messrs. JARMAN AND Co., Chard, for Roses, Dahlias, etc.; to Messrs. RYDER AND SON, LTD., St. Albans, for vegetables; and to Messrs. J. FORBES (HAWICK), LTD., Hawick, for Pentstemons and Phloxes.

**Certificates of Merit.**—To Mr. E. J. PARSONS, Worcester, for the Worcester Berry; to Miss S. S. THOMPSON, Handsworth, for Cacti; to Messrs. MAXWELL AND BEALE, Broadstone, for a Rock Garden exhibit; to Mr. JOHN JONES, Wem, for Violas; and to the SALOP COUNTY COUNCIL, Horticultural Section, for an educational exhibit, including wild flowers.

**Award of Merit.**—To Mrs. A. O. PITCAIRN-CAMPBELL, Bangor, for Phlox decussata, Seedling No. 979; to Messrs. T. R. HAYES AND SON, Keswick, for Erica vagans, var. St. Keverne; and to Messrs. F. WOOLMAN AND SON, Leicester, for an unnamed Ivy-leaved Pelargonium.

### WOOLWICH WAR MEMORIAL HORTICULTURAL.

The Annual Show of the above Association, held on Bank Holiday Monday, beat all previous records, over 20,000 persons paying for admission. In addition to £150 in cash prizes, fourteen challenge cups, fourteen silver cups, and twenty-nine medals were offered. The entries numbered over 700, and there were also thirty-one trade exhibits. The promoters of the show have great ambitions, and it is possible that in the near future the event will rank in importance with the best shows in the country. There were numerous side attractions, and the 16-acre field at Shooter's Hill is admirably suited for such a show.

The chief prize-winners in the trade classes were as follows:—Group of cut Roses, 10 feet by 4 feet: 1st, Mr. ELISHA J. HICKS, Twyford challenge trophy and silver cup, also the "Sir Harry North" 50-guinea challenge cup for best Rose exhibit; 2nd, Messrs. CHAPLIN BROS., Waltham Cross; 3rd, Messrs. FRANK CANT AND Co., Colchester. For 36 blooms, distinct: 1st, Messrs. D. PRIOR AND SON, Colchester (challenge trophy and cup); 2nd, Messrs. CHAPLIN BROS.; 3rd, Messrs. FRANK CANT AND Co. For 12 distinct varieties: 1st, Messrs. D. PRIOR AND SON; 2nd, Messrs. CHAPLIN BROS.; 3rd, Messrs. FRANK CANT AND Co. For 12 distinct Tea Roses: 1st, Messrs. D. PRIOR AND SON; 2nd, Messrs. FRANK CANT AND Co.; 3rd, Messrs. CHAPLIN BROS.

For Sweet Peas: 1st, Mr. L. HORTON, Coalway Road, Wolverhampton (silver cup).

The chief non-competitive exhibits were those staged by Messrs. S. BIDE AND SON, LTD., Farnham, Sweet Peas (silver cup); Mr. H. J. JONES, Rycroft Nursery, Lewisham, Phloxes, Cannas, and Delphiniums (silver cup); Messrs. E. FISHER AND SON, Thornton Heath, Sweet Peas; Mr. J. ROBINSON, New Eltham; Mr. GEO. HERBERT, Ruislip, Sweet Peas; Messrs. R. TAYLOR AND SON, New Eltham; Messrs. WARD AND PRIOR, Bromley, Kent; and Messrs. POPE AND KING, Abbey Wood.

## Obituary.

**Sir Albert Kaye Rollit.**—The death of Sir Albert Rollit, LL.D., D.C.L., Litt.D., will be deeply regretted by horticulturists, for he took a keen interest in gardening and did much to advance its interest. He died at his home, St. Anne's Hill, Chertsey, on Saturday, the 12th inst., in his eightieth year. Sir Albert Rollit possessed a striking personality and his interests were remarkable and varied. He commenced life as a solicitor, and his success in that capacity may be gauged by the fact of his being appointed president of the Incorporated Law Society. Meanwhile, he became a ship owner, and his commercial career was equally successful. He became one of the most important citizens of Hull, where he had offices as well as in Mincing Lane, London. He next concerned himself with politics, and in Parliament he was regarded as an authority on commercial and legal questions. While at Hull he occupied the position of Chairman of the Hull Botanic Gardens, and closely identified himself with all the horticultural activities of the borough. As Mayor of Hull, he opened the first of the long series of magnificent exhibitions of Chrysanthemums that were held in that city. He maintained an especial interest in the Chrysanthemum, and for many years was president of the National Chrysanthemum Society, an office which he still held at the time of his death. He also served for very many years as a member of the council of the Royal Horticultural Society, and his wide knowledge, especially of business matters, was of the utmost value to that Society. He was always ready to lend his influence and patronage for the furtherance of gardening, and often presided at horticultural meetings. He made an ideal chairman, and his extensive knowledge, enlivened with witty remarks, generally resulted in some concrete proposals and sound advice for the furtherance of the interests of the particular association. The greatest debt, however, which horticulture owes to him is the institution of the National Diploma of Horticulture, which he brought about through his connection both with the University of London and with the Royal Horticultural Society. He gave powerful support to all aspects of education, and his effort to raise the status of horticultural education by the institution of this Diploma has had the happiest results. During the whole of his busy life he found pleasure and relaxation in practical gardening, and his gardens in the East Riding of Yorkshire were unsurpassed in beauty and extent by any other in the locality. Later, when he came South, he pursued horticulture with equal interest both at The Willows, Windsor, and in later years at St. Anne's Hill, Chertsey.

**David Storrie.**—It is with deep regret that we learn of the death of Mr. David Storrie, of Glencarse Nurseries, Perthshire, which took place at Dundee on the 3rd inst. Mr. Storrie, who was a native of the Lothians, entered the service of Messrs. Laird and Sinclair about forty years ago and after spending a few years with that firm set up on his own account as a seedsman and at the same time rented a nursery at Binrock. It is now some thirty years ago since Mr. Storrie went to Glencarse where he established a most successful business in the cultivation of fruit trees and in the production of very fine strains of Cinerarias, alpine Auriculas and other florists' flowers, all of which have been shown at various exhibitions in different parts of the country on several occasions. In 1920, the Royal Caledonian Society awarded Mr. Storrie the Neill prize, which is probably the highest honour in Scottish horticulture. This award was taken advantage of by many Scottish horticulturists, who gathered at Glencarse in July of 1920, to honour its recipient, and at the same time Mr. Storrie was presented with a handsome tea and coffee service on behalf of the Dundee Society in recognition of the valuable services he had rendered to horticulture over a period of many years. The deceased gentleman was a great advocate of training centres for young

gardeners and of educational facilities for all who desired to enter the horticultural profession. He was 67 years of age and leaves a widow, a son and daughter.

**Miss Lilian Masters.**—It is with deep regret we learn of the death of Miss Lilian Masters, who died of septic pneumonia, at 9, Mount Avenue, Ealing, on the 13th inst. Miss Lilian Masters, the youngest daughter of the late Dr. Maxwell T. Masters, F.R.S. (Editor of *The Gardeners' Chronicle* for many years), was at one time a frequent contributor to our pages, and rendered considerable help to her father in certain branches of his editorial work.

**J. H. Goodacre.**—It is with deep regret we learn, as these pages are being prepared for press, of the death, on Sunday last, of Mr. J. H. Goodacre, who was gardener to the Earl of Harrington at Elvaston Castle for a great number of years. Mr. Goodacre had a high reputation as a gardener, and his successes with choice fruits on the show board during the past forty years or so have been unsurpassed by any other gardener within living memory. We hope to publish details of Mr. Goodacre's professional career in our subsequent issue.

## ANSWERS TO CORRESPONDENTS.

**GARDENER'S HOUSING ACCOMMODATION: H. B.** Your present employer should find you fresh accommodation; but, if this is impossible, your late employer would find it very difficult to get an order for immediate possession. In any event, this would take him some time. You had better inform your late employer that you will give up possession of his cottage immediately you can find other accommodation.

**GOOSEBERRY SHOOTS SHRIVELLED: N. Q. R., Reading:** The shrivelling of the growth and the falling of the leaves are not due to a fungous attack. Drought at the roots is the probable cause, following an attack of the Gooseberry Saw Fly, or the caterpillars of the Magpie Moth.

**LARGE ORANGE: L. G. W.** The specimen received is a variety of Orange, but evidently quite unsuitable for dessert purposes, although possibly the tree might develop succulent fruits if grown in heat.

**MELON PLANTS DYING: Constant Reader.** The small plants received were kept under cultivation and did not die off as yours appear to have done. The trouble is certainly not due to bacterial rot, but may possibly be caused by unsuitable conditions of soil and atmosphere.

**NAMES OF PLANTS: E. W.** Inula Helenium (Elecampane).—*M. L.* 1, Spiraea Filipeodula (Dropwort); 2, Lychnis chalconica (Jerusalem Cross); 3, Geranium sanguineum; 4, Waldsteinia trifolia; 5, Aster acris; 6, Thalictrum aquilegifolium; 7, Verbascum nigrum; 8, Tradescantia virginiana (Flower of a Day or Virginian Spiderwort); 9, Veronica spicata hybrida (a garden form); 10, Potentilla, not recognised; 11, Echinops Ritro; 12, Mentha rotundifolia variegata. The Potentilla seems allied to *P. palustris*, but has no petals.—*Gardener.* *Herts.* Anelanchier canadensis (Snowy Mespilus, or June Berry).—*H. E. P.* Melilotus officinalis (common Melilot). It is fragrant as well as effective, and sows itself freely.—*J. F. I.* Campanula rapunculoides; 2, Felicia petiolata (also named Aster petiolatus in the *Flora Capensis*).

**PEACH FRUITS CRACKING: J. M. W.** No fungus could be found on the Peach fruits, and undoubtedly the cracking is due to some cultural error, such as excessive watering of the border following a period of drought.

**Communications Received.**—J. H. P.—L. Bros.—A. O. W.—H. S.—W. G.—C. J. W.—W. H. J.—J. C. W. & Son—A. J. S.—R. & Co.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.0°.

### ACTUAL TEMPERATURE:—

*Gardeners' Chronicle* Office, 5, Tavistock Street, Covent Garden, London, Wednesday, August 23, 10 a.m. Bar. 29.9; temp. 62°. Weather—Sunny.

The numerous experiments which have been carried out in the chief fruit-growing countries, and particularly in the United States and in Nova Scotia, have demonstrated that by spraying with suitable material at the proper times it is possible to hold in check the numerous insect and fungous pests which infest Apples and Pears. In spite, however, of the publication of these results, there is still considerable doubt in the minds of some growers as to the best means to employ. They require a spray fluid which is easily procured and one, moreover, which will destroy or hold in check as many as possible of the diverse pests which beset their trees. Recent experiments carried out by the French South Eastern Entomological Station\* had for their object the discovery of the most serviceable mixed insecticide and fungicide. Experiments were made with copper-arsenical and lime-sulphur-arsenical compounds. The copper salts used were sulphate or acetate and arsenic was added either as lead arsenate or lime arsenate. In the French experiments, good results were obtained with several combinations, copper acetate and lead arsenate, a preparation easy to make but liable to scorch

young leaves and fruit unless applied at the right moment; lime arsenate-Bordeaux mixture gave good results and produced less scorching than did lead arsenate-Bordeaux mixture; it should, however, not be used during the flowering period, when the spraying should be done with lead arsenate alone. By using these preparations yield was doubled and the percentage of scab on the fruits reduced from 50 to 4 per cent. Arsenical lime-sulphur mixtures, which have hitherto been but little employed in France, were also tried. One compounded of concentrated commercial liquid lime sulphur, lead arsenate and water proved useful in the control of scab and caterpillars on Pears, but was not so effective when used on Apples. The conclusion reached is that for control of pests there is little to choose between the copper and lime-sulphur mixtures, the latter possessing, however, the advantage of cheapness. Whichever is used, three sprayings are recommended, the first when the blossom buds are bursting, the second when the petals begin to fall, and the third from ten to fifteen days after the second when the fruit is distinctly formed. In the first spraying particularly, all parts of the tree, including the bark, should be covered. In the second it is important to get the fluid well into flowering clusters, and to ensure this a high-power spray is recommended and also the holding of the nozzle as near as may be to the blossoms. These conditions also apply to the third application.

### The King's Congratulations to a Gardener.—

Mr. Owen Thomas has, on the occasion of his golden wedding, to which we referred on p. 103 in last week's issue, received the following letter from Lord Stamfordham:—  
Buckingham Palace,  
18th August, 1922.

Dear Mr. Thomas.—The King has learned that on the 19th instant, you and Mrs. Thomas celebrate your golden wedding, and I am commanded to convey to you His Majesty's congratulations on this happy occasion, and trust that you are both in the enjoyment of good health.

It gives me much pleasure to be the medium of His Majesty's gracious communication.—  
Yours sincerely,  
Owen Thomas, Esq.

**Railway Station Gardens.**—The annual inspection of the station gardens on the system of the Portpatrick and Wigtownshire Joint Railways took place on August 15. The following is the order of merit in which the stations were placed:—  
Parton, Kirkcowan, Sorbie, Glenluce, Cross-michael, Millisle, Dunragit, Creetown, Castle Kennedy, Gatehouse, New Galloway, Wigtown, Newton-Stewart, Palnure and Stranraer.

**Centenary Celebration of Messrs. Vilmorin, Andrieux and Co.**—On Thursday, the 27th July, a double event was celebrated at the famous nursery of Messrs. Vilmorin, Andrieux and Co., at Verrières-le-Buisson. The fête was designed to mark the occasion of the nomination of Mme. Philippe de Vilmorin, the present proprietor, as a member of the Legion of Honour, and to commemorate the centenary of the establishment of the Verrières nursery. A special train from Paris to Verrières carried the guests and the employees at the Paris and Reuilly branches of the business—in all some 960 persons. It was in 1815, rather more than a hundred years ago, that the famous Verrières establishment was formed out of a plot of ground which then contained a pavilion built by Louis the Fourteenth for the use of Mlle. de la Vallière. This residence is now that of the Vilmorin family. Since 1815, the interest of the property has steadily increased, as more and more valuable plants and trees have been added to the original collections. The chemical laboratory was added in 1891, and contains every facility for agricultural

and horticultural research. In 1901 the Alpine garden was formed, by the late Philippe de Vilmorin, and is the admiration of every visitor to the nursery. The déjeuner, which was the principal feature of the celebration, was a great success, and everyone was gratified at the presence of Mme. Henry de Vilmorin, the widow of the late proprietor's father. Mme. Philippe presided over the chief table, at which were a number of distinguished guests. After the déjeuner she rose and addressed the company in well chosen terms, alluding with much feeling to her late husband, who died in 1917, and expressing gratitude for the presentation which had been made to her, of a gold *plaque* bearing a portrait of M. Philippe. She then proceeded to thank the personnel of the various branches for their devoted service to her since her husband's death. M. Sauvage, the Secretary of the Fédération des Syndicats Horticoles de France, congratulated Mme. de Vilmorin on her newly conferred membership of the Legion of Honour and on her excellent discharge of her duties as the mother of a family. Other speeches followed on the same lines, and all who spoke rendered a tribute to M. Philippe de Vilmorin, whose untimely death was such a loss to French horticulture in general.

**The Highest Waterfalls.**—Mr. F. E. Matthes, of the U.S. Geological Survey, has given in the American *Journal of Science* the height of some of the chief waterfalls of the world. The greatest descent is made by the waters of the Yosemite falls, which descend from the uplands to the floor of the valley, a vertical distance of 2,565 feet, by an upper and lower fall, joined by a series of cascades. The upper fall drops by a single leap 1,360 feet, and this is by far the largest single fall known in the world. Another large fall, in New Zealand, known as the Sutherland Fall, is 1,904 feet in height; it is broken midway by series of ledges. The Gavarnie fall, in the Pyrenees, drops some 1,385 feet, although this is interrupted by braided streamlets with only short, clear drops. The most imposing waterfall, of course, is the Niagara, which is really a huge river roaring over a precipice. Another waterfall of gigantic proportions is the Kaieteur Fall, in British Guiana, which is stated to have a drop of 804 feet, and still another notable fall, known as the Wooloomubi Fall, is found on a branch of the Macleay River, in New South Wales, the water of which drops about 900 feet.

**Pomological Congress in Paris.**—The arrangements for the Pomological Congress to be held by the French Pomological Society are now made, and it has been decided that the opening session will be held at 9 a.m., on the 11th September, at the offices of the Société Nationale d'Horticulture de France, in the Rue de Grenelle, Paris. Conferences, visits to gardens, and other activities will make up a full programme, which is to terminate on the 13th September.

**An Old Scottish Flower Show.**—Glenkens flower show, which was held at Dalry, Galloway, on August 17, has an interesting history. The Society was founded some years before 1831, the object being: "To improve the condition of the labouring classes in the parishes of Dalry and Kells by stimulating their exertions in their different occupations by means of premiums." In 1831, the late Mr. W. Grierson Yorston, of Garroch, left an annuity of £25 per annum to the Society. It did not begin its horticultural shows until 1848, when prizes were given for vegetables grown in cottage gardens, and classes for pot or window flowers were added in 1863. The exhibits in these cottage garden classes are limited to exhibitors paying not more than £8 rent.

**Amended Seeds Regulations.**—The Ministry of Agriculture and Fisheries informs us that the "Seeds Regulations, 1921," which were made in pursuance of the provisions of the Seeds Act, 1920, were withdrawn as from August 10, 1922, and have been replaced by the "Seeds Regulations, 1922." The terms of the new regulations are practically identical

\* Summarised in *Review of Applied Mycology*, Issued by the Imperial Bureau of Mycology, Vol. I., Part 4, April, 1922.

with those of the previous regulations, except as regards the following points:—1. Grass and Clover seed when sold, or exposed for sale, for other than agricultural purposes (e.g., as lawn grass seed) will be excluded from the operations of the Seeds Act. 2. A statement as to the percentage of pure germinating seed or "real value" of Grasses and Clovers is no longer required. 3. Alsike and White Clover, when grown together, may be treated for the purpose of the Regulations as one seed, provided they are declared to have been grown together. 4. Sprouted Cereal seeds are not to be treated as impurities for the purpose of testing, that is to say they are not to be picked out of the sample put up for the germination test. 5. The authorised minimum percentage of germination in the case of Broccoli and Cauliflower seed is reduced from 65 per cent. to 60 per cent. 6. Seed Potatoes the variety of which in less than the Standard Purity of 97 per cent. may now be sold as seed Potatoes, provided such Potatoes are declared as being of mixed varieties. Copies of the Seeds Act, 1920, and of the Seeds Regulations, 1922, may be obtained through any bookseller, or directly from H.M. Stationery Office, Imperial House, Kingsway, net price 3d. each.

**Sandy Flower Show.**—The annual exhibition of the Sandy and District Floral and Horticultural Society will be held on the 31st inst. The Secretary informs us that a very large number of entries have been received, and the exhibition promises to be a great success. Particulars may be obtained from the Secretary, Mr. F. W. Western, Sandy, Beds.

**Paris Autumn Show.**—The Autumn Exhibition of the French National Horticultural Society will take place from the 27th October to the 5th November, at the Jardin d'Acclimatation in Paris.

**Uses of the Common Chickweed.**—In an interesting article entitled "Good Services of our Commonest Weeds" in *Chambers' Journal* for August, Mr. H. Brierley refers to some of the uses to which the common Chickweed, *Stellaria media*, may be put. He states that it may be used for a cure of recent rheumatism of an inflammatory kind applied either as hot fomentations or in poultice form. The Gael of Northern Scotland has long used Chickweed for poulticing inflamed and even suppurated breasts. He refers to Nicholas Culpeper's statement that it is effectual for swellings and imposthumes, for all redness in the face, wheals, itch, and scabs, and states that Culpeper had faith in it even for virulent sores and ulcers of the legs. The use of Chickweed as a green food for cage birds is well known, and it is regularly hawked around Paris each morning; in pre-war times the Paris hawkers sold about one thousand pounds worth weekly.

**Forest Fires.**—Those in charge of large estates where there is much woodland will be interested in a leaflet issued by the Forestry Commission on Forest Fires. Such fires are usually due to careless people dropping lighted matches, cigarettes, etc., and setting fire to the dry grass, Heather, and other herbage in the vicinity of plantations. Considerable damage is also caused by sparks from railway locomotives and steam-driven vehicles on roads. The most frequent outbreaks of fire occur in coniferous woods, as these trees are usually grown in dry, sandy districts, but in the case of surface fires, the thick, corky bark of the Pine affords the tree some measure of protection, and it is not so easily injured as the thin-bark trees, such as the Beech. The best control measure is to make wide rides or roads, kept free from vegetation, running at right angles to the direction of the prevailing wind, and to border these rides with broad-leaved species, such as Birch, white Poplar, grey Alder, Acacia and Spanish Chestnut. The removal of lop and top from felling areas, and the branchwood where thinning has taken place, should be done early; and in the case of Scots Pine, the lower branches, which hold up large quantities of dry needles, should be trimmed off trees bordering rides. In the case

of surface fire, the digging of a trench is recommended, throwing up the soil to the side from which the fire is advancing. It is important to see that fires which are got under are thoroughly spent, otherwise a change in the direction of the wind frequently causes a fresh outbreak.

**Mr. James O'Brien, V.M.H.**—There are few men better known in the gardening world than Mr. James O'Brien, or with a greater experience of general gardening. Although his wide and varied knowledge of Orchids entitles him to be regarded as the doyen of Orchidists, and his name is almost inseparably bound up with that race of beautiful plants, it will be seen from the short account we give below of his career that he is almost as well acquainted with stove and greenhouse plants generally as with Orchids. This is evident from the ease with which he is able to recognise and name the most out-of-the-way plants, and to offer information on their cultivation; he has a remarkably retentive memory and never seems to forget anything.

Mr. O'Brien was born at Llanelly, in South Wales, on January 28, 1842, but his family settled in London whilst he was quite young, and he was educated with a view to entering

MR. JAMES O'BRIEN, V.M.H.

the Civil Service. However, one of his brothers was in charge of an important collection of Orchids, and on a visit to this brother during a holiday the younger man became so fascinated with these plants that he decided to accept an engagement in the same gardens. His next post was in Messrs. Parker and Williams' Paradise Nursery at Holloway; from thence he went to Chelmsford and spent three years with Mr. Robert Warner, being subsequently engaged in Messrs. Hugh Low and Co's nursery at Clapton, where he became greatly interested in the new and rare plants that this celebrated firm imported in large numbers at that time. Whilst at Messrs. Hugh Low and Co's he was offered the post of Orchid and plant foreman to Mr. R. S. Holford, of Westonbirt, the father of Lieut.-Col. Sir George Holford, who owned one of the most extensive private collections of indoor plants in the country. During all this time he added greatly to his knowledge of gardening, and especially of the cultivation of choice plants under glass, so that when he was offered the post of general manager to Messrs. E. G. Henderson and Son, of Wellington Road, St. John's Wood, and the Pineapple Nurseries, Maida Vale, he was recognised as one of the leading plantmen in the country. Our older readers will remember the high status this firm enjoyed, as the introducers and raisers of new

plants of all kinds; and many of the popular garden plants of to-day first passed through Mr. O'Brien's hands, whilst with Messrs. Henderson and Son. Ferns, Abutilons, Begonias, Nerines, Sonerilas, Dracaenas, Coleus, Gloxinias, and Hippeastrums, to mention only a few subjects, especially interested him, and much of the improvement of many of these plants is due to his pioneer work on them. Mr. O'Brien has been for so long the Orchid correspondent of this paper as to be almost one of the permanent staff, and his weekly visit to the office, an event which he never misses, is of very great service to the Editors. His connection with the Royal Horticultural Society extends over a large number of years, and he has been Secretary of the Orchid Committee since it was instituted in March, 1889. His high personal qualities are well known to a wide circle of friends and acquaintances, not only in this country, but abroad; he is always anxious to assist others and place his wealth of information on gardening matters at their disposal. In his eighty-first year, he is still hale and hearty and as energetic as ever. Our readers will join with us in hoping that he will be spared, to us yet for many years.

**Ghent Quinquennial Exhibition.**—We learn that the King and Queen of the Belgians have sent to the Secretary of the Ghent Quinquennial Exhibition, to be held in 1923, two Gold Medals, to be competed for at the Exhibition, with a very cordial note, wishing success to the show. The King's Medal is to be awarded for a collection of Orchids, the Queen's for a group of Azaleas, a speciality of the growers around Ghent.

**Appointments for the Ensuing Week.**—Wednesday, August 30: Glasgow, International Flower Show (4 days); Irish Gardeners' Association's meeting; Elgin Horticultural Society's meeting.—Thursday, August 31: Sandy and District Horticultural Society's show; Bristol and District Gardeners' Association's meeting; Dundee Horticultural Society's show (3 days); Islay Flower show.—Friday, September 1: Alloa Flower show; Darvel Flower show.—Saturday, September 2.—Kilmaurs Flower show; Metropolitan Vegetable and Flower show to be held at the Guildhall; Polmont Flower show; Renfrew Flower show; Cambuslang Flower show; Coldstream Flower show; Old Cumnock Flower show; Douglas (Lanarkshire) Flower show; Duns Flower show; Gairloch Flower show.

**"The Gardeners' Chronicle" Seventy-five Years Ago.—Potato Disease in India.**—We have had a disease in our Potatoes grown in the mountains, for the last four years at least. The tubers form well and are of large size, and to all appearance are fine healthy roots, but on cutting them open they are found to be studded with round, dark brown spots. When boiled, the healthy portion of the root is often very mealy, but the brown spots are disseminated through the meal, in the form of hard, round balls, about the size of shot generally, but often as large as Peas, and the Potato is useless. They do not rot, however, at all faster than the healthy tubers, but being occupied internally by so many of these hard spots, they are not eatable. Externally, the Potato thus affected has a smooth, white skin; is of lengthened form usually somewhat flattened, but not always so; the spots are not visible externally, and from the fine healthy appearance and large size of the Potato, strangers arriving in the hills are induced to buy them in preference to others until they find out their mistake. I attribute it, with what justice I know not, to all such white-looking Potatoes having been produced in stiff, red clay soils, holding much moisture during the rainy season; while, on the other hand, the Potatoes grown in black vegetable mould are always free from spots and perfectly healthy. In every case, where the spots have been present, I have ascertained that the Potatoes were produced in stiff clay soils. I mention this merely in case it may furnish a hint on the subject of our Potato disease at home. *T. Hutton, Mussoree, Gard. Chron., August 23, 1847.*

**HARDY FLOWER BORDER**

**INULA GLANDULOSA.**

ONE of the hardy flowers which it has been rather a surprise to see in gardens of the "highest inhabited village in Scotland," the highest house in which is said to be upwards of 1,500 feet above the sea level, is the noble *Inula glandulosa*. It has been long known to me as a splendid border plant of great hardiness and easily grown, but somehow its radiant, sun-like flowers have always conveyed to me the impression that this *Inula* would be happiest in warmer districts with a smaller rainfall. I was, therefore, surprised to see it in cottage gardens in this elevated district with flowers larger in size and, if possible, more brilliant in their superb orange colouring than in the lowlands. This does not occur in one or two plants alone, but in considerable numbers seen in different gardens. With a heavy rainfall and a correspondingly low temperature in this S. of Scotland district among the Lowthers, and in a season of little sun, one gains fresh ideas of how to grow this brilliant flower. The plants, though apparently the typical *I. glandulosa*, and not the superior form *I. g. superba*, are more magnificent than those of the latter in apparently more favoured localities. These "mimic suns," with their bright orange discs and thread-like ray florets, are magnificent indeed. They would have rejoiced the heart of that fine old flower-lover the late Rev. Charles Wolley-Dod, with whom I had at one time much friendly correspondence about the *Inulas*, and who had a special liking for *I. glandulosa*, of which he had some good varieties. *S. Arnott.*

**CHINESE TREES AT ALDENHAM.**

WHEN it is considered how comparatively short a time has elapsed since the seeds from which the under-mentioned trees have sprung were received, it will be seen from the heights given of each specimen that they have made most satisfactory growth. Notwithstanding the climatic disadvantages which exist at Aldenham, the majority of trees, when once established, and particularly members of such genera as *Ulmus*, *Crataegus*, *Quercus* and *Pyrus*, find the heavy, clay soil, after it has been thoroughly drained and well broken up, congenial to them, and, after reaching a sufficient height to escape the ground frosts, their growth is strong.

In the development of choice trees, it should be remembered that their training should be begun, in a young state, by the gradual removal of the lower branches, to obtain a clear stem, and by a moderate shortening back of those remaining, which tends more quickly to increase the height of the particular plants. This needs to be done until the tree becomes of sufficient size to support itself.

Of the large number of trees introduced by Mr. E. H. Wilson, and now growing at Aldenham, I have selected the following for their distinctness from previously grown varieties, their hardiness and vigour, and their satisfactory behaviour as ornamental objects in British gardens. I give the present heights of the plants:—

**ACER DAVIDII.**—Twenty feet. This species was originally introduced by Mariès in 1879, and later by Wilson, the Aldenham plant having been grown from seeds of the latter's introduction. The large, entire leaves and conspicuous striped stems (see Fig. 47), combined with its hardiness and free growth, make this one of the most striking and satisfactory of Eastern Maples.

**ACER ERIANTHUM**, twelve feet, and **ACER ROBUSTUM**, ten feet.—These are two distinct, small-leaved Maples, belonging to the same group as, the popular *Acer palmatum*.

**ACER TETRAMERUM TILIIFOLIUM.**—Ten feet. A species of graceful habit, with foliage resembling that of a small-leaved Linden.

**ESCULUS CHINENSIS** AND **E. WILSONI.**—These are two extremely rare Chinese Chestnuts,

giving promise of becoming satisfactory trees, and both have proved quite hardy at Aldenham. They are closely related to that fine species, *E. indica*.

**ALNUS CREMASTOGYNE** AND **A. LANATA.**—Now both thirty feet tall. These are two very distinct Alders, which, with moderate pruning, soon grow into shapely trees. The latter species is distinguished by the woolly covering on the under-side of the foliage, whilst both have solitary fruits.

**ARALIA CHINENSIS GLABRESCENS.**—Twenty feet. The bold foliage and strong growth of this

becoming equally valuable in gardens for its brilliant bark.

There are also to be seen at Aldenham examples of another variety of this Birch, viz., *B. japonica szechuanica*. These are from twelve to fifteen feet high, and from an ornamental standpoint are of about equal merit to the Mandschurian variety.

**CARPINUS LAXIFLORA MACROSTACHYA.**—Ten feet. The Hornbeams, when unfolding their pale green leaves in spring, are among the most attractive of trees, and also in summer when laden with their drooping bunches of fruit. This

FIG. 47.—ACER DAVIDII, SHOWING THE BEAUTIFUL STRIPING ON THE STEM.

variety render it a conspicuous object in the garden, and particularly when planted near the water's edge.

China has proved particularly rich in species and varieties of Birch, and many promising kinds are being grown at Aldenham.

**BETULA ALBO-SINENSIS SEPTENTRIONALIS.**—Twelve feet. This is one of the most attractive of all Birches, even in a young state. It is common on high mountains in Western Szechuan, and is remarkable for the rich orange-coloured bark, so much so that Mr. Wilson told me it is one of the handsomest trees he saw in China. Until the tree becomes of sufficient age for the bark to shed, the stem is of a singularly beautiful reddish-brown colour.

**BETULA JAPONICA MANDSCHURICA.**—Twenty feet. This is a striking tree, with a beautiful white stem. In general appearance it resembles the American *B. papyrifera*, and gives promise of

variety has the special merit that the second growth in late summer is of a bright red. In the North-Eastern United States the native representative, *Carpinus caroliniana*, although only a small tree, of somewhat straggling growth, produces a most beautiful effect, through the short spring and early summer months, especially when growing close to the edge of a stream, or pond, a position which it thoroughly enjoys. The Far-Eastern members of the genus are all desirable, and this Chinese introduction gives promise of becoming an elegant tree.

**CATALPA FARGESII.**—(See Fig. 48.) Eighteen feet. A free-growing tree, of upright habit, which will be undoubtedly, with age, as handsome as the other members of the genus. The flowers are pink, spotted with brownish-red, but they are not produced in the tree's young state. *A. E. Thatcher.*

(To be continued.)

## The Week's Work.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Gooseberries.**—As soon as all the berries have been gathered, remove the nets and other protecting materials forthwith and put them aside for another season. Clear the ground amongst the bushes of all weeds, rubbish, etc., and if the heads of the plants are very thick and crowded with useless wood, some amount of thinning should be done so that the fruiting shoots of next year may have a better chance to develop strong buds. After the work of thinning and cleaning is finished, fork the surface of the soil lightly. Should the ground be very light in texture and of a hungry nature, feed the roots of the plants with a suitable stimulant.

**Morello Cherries.**—Our crop of Morello Cherries this season has been very good, and the fruits of exceptional size and rich in colour. As fast as the trees are divested of their crop, wash them thoroughly with clear water; if red spider or other insect pests have been troublesome, spray them on two occasions with nicotine insecticide. Like the Peach, the shoots of the current year produce the best crops of fruits, and the trees will need timely attention as regards training in suitable young growths. I prune and regulate the branches of these trees very early in the season.

**Young Standard Trees.**—Examine these trees very carefully and make good any defective ties and stakes before the heads get damaged and probably completely broken asunder in stormy weather. Remove all suckers and other young, useless shoots that may be pushing forth from the stems. If the growths of this season are long and spindly they may be shortened more or less, according to circumstances. After the recent heavy rains, land of a somewhat clayey character should be lightly disturbed on the surface with a fork to prevent it cracking. Keep down all weeds as fast as they spring up amongst the trees; should the latter be planted in a grass orchard, keep the grass short and well clear of the stems and roots.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPRENDE CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Figs.**—Early trees from which the second crop of fruit has been gathered may be divested of all small fruits and useless shoots and well syringed to cleanse the foliage from all insects. If trained over fixed trellises and not too near the glass, tying down may now be omitted, as shoots which draw up to sun and light always become thoroughly ripened. If root-pruning is considered necessary, now is the time to commence operations by forking down the old turf walls, and removing some of the compost, care being taken that the soil is made thoroughly moist prior to the operation. If the trees are extra strong shorten back all the roots, but otherwise cut away all the strongest, shorten the weakest, and relay the points of the roots in rich calcareous compost. This process will hasten the ripening of the old leaves, but by keeping them well moistened, they will remain until fresh roots take hold of the new compost.

**Pot Figs.**—Figs in pots may be treated in a somewhat similar manner. Remove the crocks, cut away all roots among the crocks, and repot the plants in pots of the same size as those they previously occupied. These remarks apply to old trees when the use of larger pots would be impracticable. Young trees in small pots will not require such dras-

tic treatment if they were potted on at the proper time, as the new compost will not be too full of roots for successful forcing.

**Late Figs.**—Successional trees now producing highly-flavoured fruits will require an abundance of air by day and night, otherwise the fruits will become spotted. In the absence of fire-heat all watering should be done early, and if the trees are clean, syringing may be dispensed with altogether. Later trees now in full bearing require very similar treatment, but syringing and damping should be carefully done on fine mornings only.

### THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

**Cattleyas.**—Plants of *Cattleya Warscewiczii* (gigas) and other species that have recently gone out of flower, as well as those that have completed their season's growth without producing flowers, should now be exposed to more sunlight and air, and at the same time the supply of water at the root should be gradually decreased. The repotting of these Cattleyas should be done, if needful, immediately new roots are seen to be pushing from the last-made pseudo-bulb. After repotting, only sufficient water will be needed to prevent undue shrivelling of the pseudo-bulbs. They will then enter upon a long season of rest, so far as top growths are concerned, but the roots will continue to extend in the new compost all through the winter months, provided the proper conditions are maintained. A slight shrivelling in the bulbs may be allowed as they will readily plump again when the plants become re-established. The beginner should remember that overpotting is an evil to be guarded against; the smaller the pot the better the safeguard against injury from excessive moisture at the roots. The careful observer will notice great diversity in the nature of the roots of this complicated family; some kinds are very robust rooters, others quite feeble. The thick, robust rooters are generally plants of strong growth, and capable of filling a larger receptacle with roots than those which make roots of a finer nature. The latter should be placed in the smallest receptacle possible.

**Cattleya Warneri.**—Having passed its flowering period this species may be treated in precisely the same manner as the above, but as the plants are at rest only sufficient water should be given to keep them plump and healthy until they start into growth in the spring. To my mind this is the secret of flowering any of the so-called shy-flowering Cattleyas. *Cattleya Downiana*, *C. D. aurea*, *C. Rex*, and several of their hybrids are now growing freely, and some are already developing their flower buds; these should be kept at the warmer end of the house, so that the flowers may develop properly. The plants should be elevated closely to the roof-glass, so that they may receive the benefit of clear light and plenty of fresh air. After growth is completed, and the flowers have been cut, the plants should be treated as advised above. The idea that extreme drought is a means of making shy bloomers produce flowers is a fallacy.

**Sophrontis grandiflora.**—Plants of this delightful little Orchid may now be potted and treated as a miniature Cattleya, except that it is best grown in the cool house. *Soprocattleyas* and other complex hybrids in which the *Sophrontis* is one parent, may be treated in precisely the same manner as advised for Cattleyas, but being, as a rule, small, delicate growers, they should be grown in small receptacles, suspended from the roof of the intermediate house. Each hybrid has its own individuality, and, in order to make the best of them, their requirements must be closely studied and their wants supplied. Most hybrids in this class generally follow closely one parent or the other, and if cultivation follows the line of treatment given to the predominant partner success is generally assured.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Celery.**—If the plants show signs of Celery maggot, the affected parts should be picked off and burnt, and the plants well dusted with soot and lime. Celery that has been banded with brown paper to blanch the stems should be examined and the bands loosened if necessary. Where soil is used for blanching, the earth should be in a fine condition and packed closely around the stems with the hand; but before doing this see that the roots are moist and, if necessary, water them or apply liquid manure.

**Carrots.**—A sowing should be made in frames of Champion Scarlet Horn and Indomitable Forcing Carrots. The soil should be finely prepared and well dressed with soot and lime, as slugs are often troublesome to Carrots in frames. Arrange the soil close up to the glass of the light. Sow the seed in drills made six inches apart.

**Onions.**—Spring-sown onions were checked by the dry weather of May, and many varieties will soon be ready for harvesting. If the ground is wet when the crop is harvested, place the bulbs on trellis-work to get them well ripened. Large specimens should be examined and any decaying leaves should be removed; the bulbs should be pulled before they crack, which the recent wet weather will have a tendency to make them do. If the weather is wet place them in a frame or under spare lights to finish maturing.

**Spinach.**—Make a sowing of prickly Spinach in drills drawn 15 inches apart. Make the soil fine and add a good dressing of soot to it.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Gloxinias.**—As the earliest plants pass out of flower they may be removed to cold frame, but water must not be withheld so long as any foliage remains green. Once the leaves have died down the roots may be kept dry and finally stored in a moderately warm house.

**Perpetual Flowering Carnations.**—The earliest batch of these plants that have been grown outside in cold frames during the summer to produce flower in winter should now, if convenient, be removed to a cool house where they are intended to flower. If not already done, the plants should be staked and all growths made secure with a neat tie. These early plants have well filled their receptacles with roots, and should be given some assistance occasionally in the form of soot water and a reliable Carnation manure used on alternate occasions.

**The Conservatory.**—Where this structure adjoins the dwelling house, it cannot at all times be overhauled. But when opportunity avails, the fullest advantage should be taken to carry out this work. Where the climbing plants have become dense they should be thinned and regulated, but not to the extent as to cause them to look bare. At this season of the year flowering plants are scarce, but there are other subjects that may be used in the conservatory without much fear of injuring them. *Crotons*, *Acalyphas* and *Dracaenas* may be employed, especially if they are not required for stock purposes, and they may remain until no further use is required of them.

**Malmaison Carnation.**—Plants layered in July are ready for potting. The young plants should have plenty of light and air, therefore remove gradually the shading they received at the time of layering. It is also advisable to cut the layers from the parent plant several days before lifting them. A suitable compost for the young plants consists of good, open loam, lime-rubble, sand and a little wood ash. If the loam is inclined to be heavy in texture, a little manure from a spent Mushroom bed should be added, after first passing it through a fine sieve. The roots should be potted firmly, keeping the collar of the plant above the soil. After potting the plants should,

for preference, be stood in a cool house, but failing this they may be grown in a cold frame. The advantage gained by standing them in a cold house is that the foliage grows hardy, which makes it less susceptible to attacks of spot and rust diseases. Water the plants well after potting them, and spray them lightly overhead until they have recovered from the check to the roots, when overhead spraying should be discontinued. Older plants intended to be grown on for another season should now be potted into larger receptacles, using similar compost to that advised for the layers.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Rambler Rcses.**—Climbing Roses of all kinds have been particularly fine this season, no doubt owing to the wood being extra well ripened last summer and autumn; in all aspects and positions they have given a glorious display of flowers. Rambler Roses may be used in many ways, and brief consideration of a few may give guidance to those who desire to plant them largely this autumn, and wish also to do so to the very best effect. Trained on pillars, they constitute fine ornaments in shrubberies, and where, say, three plants are trained up supports attached to a central stout pole, the mass of flowers, when all the plants are in bloom, makes a most picturesque effect in the midst of a large group of shrubs. This method of training Roses up poles may well be adopted in the place of the more formal pergola to edge a garden path, and where more than one plant is used to a pole they should, for preference, be all of one variety, though, of course, for different poles varied sorts may be employed. Used for covering dead tree trunks, rambler Roses will soon transform an eyesore into an object of living beauty, and even when the tree lies prostrate this idea may be carried out; in fact, wherever large portions of tree trunks, roots, etc., are "dumped," the rambler Rose is an ideal plant to grow for covering purposes. On wire or wood arches, or pergolas, Roses are ideal subjects, and extensively employed for the furnishing of such supports. Another way in which we grow Ramblers at Aldenham is on an iron, five-rail boundary fence, about four feet high, and about 400 yards long. On this fence, despite the general belief that Roses should not be trained to iron supports, the plants flourish exceedingly well, and do not show signs of injury from frost. Rambler Roses may also, by judicious pruning, be grown as bush plants of varying heights.

**Delphiniums.**—Named varieties of Delphiniums may be propagated at this season of the year by taking off shoots springing from the base of the plants, inserting them as cuttings in good, sandy compost, and keeping them close in a cold frame until they have become well rooted.

**Propagation by Root Cuttings.**—It is not, perhaps, so well known as it should be, that many herbaceous plants may be propagated by means of root-cuttings inserted during the autumn. The operation consists in taking portions of the roots and cutting them, similar to the manner adopted for Sea Kale, into lengths of about an inch and a half, and inserting these pieces in sandy soil with the top just above the surface. Shallow pans, or boxes, are the best receptacles for the cuttings, which may be struck in a cold frame, though an even temperature of about 50 degrees is the most suitable. Anchusas may be increased from root cuttings inserted now, and later, say, about the end of October until the beginning of February, others, such as Gaillardias, Oriental Poppies, Statice, Japanese Anemones, Eryngiums, Stokesia, and the tall-growing Senecios, such as *S. Veitchii*. Even such plants as Phloxes and Primulas will respond readily to the treatment; in fact, when it is found that plants are difficult to increase by the ordinary methods of propagation, and the roots are "fleshy" enough, it is a good plan to try and raise them from root-cuttings.

### THE ALPINE GARDEN.

#### SAXIFRAGA PRIMULOIDES.

We have among the Saxifrages of the London Pride section a number of plants of the easiest possible culture. They have, perhaps, suffered in the estimation of certain growers, because the typical plant of the section, *S. umbrosa*, is so common in gardens. It is ungrateful of us to despise it. It was the "None-so-pretty," the "London Pride," of London and Wise, the florists, and the Queen Anne's Lace Work of its early days in our gardens, so it should not be

### THE BULB GARDEN.

#### PLANTING LILIES.

The present is a suitable time to plant bulbs of various Lilies, where they are required to grow in the open, and especially the beautiful Madonna Lily—*Lilium candidum*. Carefully selected, Lilies will give a long season of flowering from the different kinds; for instance, *L. bulbiferum* will come into flower in May and June; *L. croceum*, the Saffron Lily, in June and July; *L. candidum*, in June; *L. chalcedonicum*, during July and August, whilst *L. Alexandrae*,

FIG. 48.—CATALPA FARGESII AT ALDENHAM HOUSE GARDENS. (SEE P. 119.)

despised apart even from its intrinsic beauty. But there are others of the section which are distinct in their charms, either of foliage or flower, or of both; as easy to cultivate, and much less common, which we should consider well before excluding them from our gardens. Of such is *S. primuloides*, reputed to be the progeny of *S. cuneifolia* and *S. umbrosa*. If that is the case, the latter has had little influence, as *S. primuloides* is in every way a neat and beautiful little plant. It has small, prettily formed leaves and clouds of little bright carmine-rosy flowers. It grows only a few inches high, its stature depending on the soil. *S. primuloides* seems to be one of the most indomitable plants, caring little where it is planted, happy in poor soil or moraine, in sun or shade, but happier still in a moderate loam. It is one of the easiest and most obliging of the smaller Saxifragas in the border or in the rock garden, and may be recommended for planting in all collections. *S. Arnott*.

a variety of *L. japonicum*, and *L. Henryi* will flower from July to September.

There is a very large selection of fine Lilies that may be grown in the open, and most of them should be planted from the end of August and during September or October.

It is advisable to place a handful or two of sand at the bottom of the hole, and except in the case of stem rooting kinds, to fill the hole with sharp sand, which should be well pressed in position.

With regard to the proper depth for planting, a good general rule is to allow twice the depth of the bulb, so as to ensure the top roots being underground. It should be noted that the magnificent *L. giganteum* is best planted during the spring, leaving the top of the bulb just above the surface of the ground. Where Lilies are hardy enough to withstand the winter they do better if left for several seasons without disturbance, top-dressing the soil with a rich mixture during autumn to provide the necessary food for them. *B.*

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## MR. KINGDON WARD'S SIXTH EXPEDITION IN ASIA.\*

## No 22.—AN OLD CAMP REVISITED.

WHAT with the transference of the Mu-li government, religious and secular, to a place called Wa-kin, situated higher up the Litang river; and the conscription of all able-bodied men under the grand lama's jurisdiction, to cope with a threatened invasion by the Mantzw, we found ourselves completely immobilised for nine days. All transport was away. To add to our embarrassments, I found the lamas left in charge at the lamasery inostile, and at no great pains to conceal the fact. Evidently the grand lama was before his time; the smaller men did not hold with his liberal views.

There was nothing for it but patience and perseverance with the lamas; it is not much use trying to rush things in Asia.

The first time I sent to the monastery as usual for transport, the answer came back: "Return to Yung-ning!" This gave me the clue to the situation, and thenceforward I knew where I stood. Next day I myself went to the monastery. Transport was promised for the day following; but then came that unlucky letter saying that the Mantzw were preparing for their annual raid, and calling up the lama's soldiers, and the promise of mules was cancelled.

However, by dint of daily visits to the monastery a start was at last made on August 14; in fact, we got five miles that day. Five miles!

In the meantime, we had not been idle at Mu-li, and the cliffs received further attention at our hands.

One of the commonest weeds now scrambling through every bush to open its violet flowers in the sunshine was a *Codonopsis*; it was very similar to *C. convolvulacae*, but unless my memory of that gay plant is at fault, not the same. Down in the hot valley, where on sunny days the shade temperature probably reached 90°F. (it touched 85° at Mu-li), the shady banks were pink with *Begonias*. A *Hedychium* was in flower, and a bright crimson *Lythrum*. Another *Roscoea* with lemon-yellow flowers was opening its buds, and the narrow pale blue cylinders of a *Leptocodon* dangled from thread-like stems. Down below the monastery I found the first and last species of *Buddleia* we met with—rather a change after Western Yunnan, where the genus is in an expansive mood. A purple-flowered *Thalictrum*, growing amongst the shrubs on sheltered slopes, had now reached the astonishing height of ten feet in some cases; it appeared to be only *T. dipterocarpum*, very happily situated. A small, bushy *Berberis* was also in flower, but the flowers, though crowded, were very small, and it was a plant of no merit whatever.

Numerous *Compositae* and *Labiatae* were making themselves conspicuous, but none of them was attractive, save one *Composite* with pale, creamy-white, nodding flowers (rather like a *Cremanthodium* in habit) and dark, glossy green leaves, brilliantly silvered beneath, which grew upon the cliffs.

\* The previous articles by Mr. Kingdon Ward were published in our issue of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 23, May 6, May 20, June 3, June 17, July 1, July 15, July 22, and August 5, 1922.

However, there were not nearly so many plants on the cliff as I expected, or indeed as a cursory glance would lead one to expect; and this for a good reason. There were flowers down in the valley and flowers upon the mountain top, but none, or few, in between, simply for lack of moisture. Rain fell on the high tops, and kept the flora happy as it sank through the limestone and reappeared at the foot of the cliffs, watering the vegetation there.

On the 16th we pitched our tents at the old spot just below the pass to Yung-ning, where we had camped in June on our way to Mu-li; and here we spent the next nine days. A lot of rain fell—indeed, the weather was almost as bad as it had been in July, except that we did have a few fine days. On clear nights there was a sharp ground frost, though we were not above 13,000 feet; and this alternation of sunshine,

FIG. 49.—YUCCA VOMERENSIS. (SEE P. 123.)

rain, and frost rapidly ripened the seeds of many species. The *Primulas*, which had made such a brave show two months ago, were now but a wreck, and the seeds were tumbling out of their capsules. Few flowers had come forward to fill the breach, though the meadowed slopes facing south were now more generously clothed. We hardly found fifty new species of plants during our sojourn, and only a very small proportion of those were of sufficiently distinguished appearance to merit inclusion in an English garden. However, we found yet another *Rhododendron*, the under-surface of the leaves covered, as usual, with a thick, white, woolly coat. I must have walked past hundreds of bushes in June without noticing that it was a distinct species; but such is often the way—it is almost impossible with only one pair of eyes to see every vegetable even in this comparatively poor area. Then there were two brightly coloured *Saxifrages* growing by streams and in bogs and marshes—an odd place to find them, as though there was not room for them on the cliffs! One had bright lemon-yellow, the other dark orange flowers. Associated with the lemon-yellow species in open bogs was a sunny blue trumpet *Gentian*, which formed wide, spreading carpets

of slender foliage on which the flowers reclined; they clashed musically with the yellow *Saxifrage*. This, too, was quaint. I would as soon think of looking for *Anemones* in the sea as for *Gentians* in a bog!

On the cliffs were a few *Saxifrages*, mostly such as we had already met with. One of the most charming cliff plants which had at last broken out into flower, was a dwarf *Campanula*, whose tiny tufts of leaves had long since attracted my attention. These were reniform, of a dull obsidian green, veined with malachite. The violet bells hung from short stalks, and clung close to the foliage. It liked the sun, but cowered into crannies nevertheless, as though afraid to trust it too far. Poor mite! It saw little sunshine these days—its time was scarcely come.

Most splendid of all was the sky-blue *Gentian*, which on the scree here was seen at its best. Some plants bore upwards of thirty blooms, which, staring up to heaven from a bed of tiny crumpled leaves, put the very skies to shame. The southern slopes were now warmly clad with lanky herbs, chiefly *Compositae* of various kinds, with species of *Delphinium*, *Aconitum*, *Pedicularis*, yellow-flowered *Corydalis*, and a few *Labiatae*, with quantities of a crushed-*Strawberry* coloured *Impatiens*. At rather lower altitudes the rich violet *Gentiana detonsa* struck a colour note of its own, and the banks were lined with pale blue *Campanula*; but the blood-shot bells of the meadow *Codonopsis* were already withered.

On the whole, the journey was rather a disappointment, and might just as well have been omitted; yet it added variety to the life.

When we got back to Mu-li, on August 28, after a fortnight's absence, we found that the late summer rain had brought out quite a crop of flowers, far more than on the mountain tops as yet. Climbing plants were especially prevalent—indeed, there was quite an epidemic of them. Besides the large violet *Codonopsis*, and the dainty *Leptocodon*, with tubular, blue flowers, there were two species of *Clematis* recalled to life, several species of *Leguminosae*, including a violet-flowered *Kidney Vetch*, yellow *Convolvulus*, a dusky violet *Aconitum*, and a *Corydalis*. This last crept up inside the hedges, and having reached the summit, suddenly announced its arrival by spreading out and lying on top of the vegetation in all directions; it had bright yellow, pendent flowers in tight little clusters.

The two species of *Clematis* were in marked contrast to each other. One had flowers of a glowing crimson-purple—little inverted cups from the mouth of which projected a brush of silvery stamens. It grew everywhere, erect as often as not, and did not seem to care whether support was at hand or altogether wanting. When it was tired, it just fell over and lay on the ground. The other was a lazy, lanky plant which sprawled over the hedges; it had similar flowers, but of a straw-yellow colour, gracefully dangling. *Primula blaitariformis* was still in flower, and so was the last discovered muscarioid *Primula*, scarcely past its prime yet; both continued well into September. But *P. Littoniana*, which was flourishing in mid-August on our way up the mountain, was practically over on our return, though the long spikes still glowed dully, like cooling ore.

The cliffs above the monastery, which had on the whole yielded good spoil, were now almost bare of flowers; they had shot their bolt. A few seeds were ripe—the *Suffruticosa Primula*, a silky-leaved *Campanula*, and others; but the best things still waited, probably for a further bath of sunshine.

Two forms of *Didissandra lanuginosa* were still in lingering bloom. One—the smaller plant in all its parts, with more rounded leaves—has deep violet flowers and grows in the open, on crassy slopes and rocks; the other, with paler flowers, milk-white, splashed with watery violet, grows in shady places, with another species of *Didissandra*, and species of *Oreocharis*.

A couple of brilliant yellow starry *Sedums* were also much in evidence. *F. Kingdon Ward*.

## PLANTS NEW OR NOTEWORTHY.

## YUCCA VOMERENSIS.

GARDENERS are supposed to be never wholly satisfied with the weather; but now and again we have reason to be grateful when the beneficent baking of a previous season results in an unusual wealth of flower. Those who grow Yuccas should surely express their gratitude this season, and I here return thanks to the long-continued sunshine of 1921, and place on record the flowering for the first time in this garden of two very fine Yuccas. The first, *Y. glauca*, has grown slowly during the dozen or so years it has lived in the rock garden. The plant had outpaced its brethren and formed a fine rosette of the characteristic narrow, grey-green leaves on a stem of six inches. This June it threw up a fine spike of greenish-white globular flowers. Their arrangement in a simple central spike, with only a few short, branching spikes close to the base of the main one, is different from that of most other hardy Yuccas, which bear freely-branched flower spikes.

The subject of the accompanying illustration (fig. 49) is one of the hybrids raised by the late Carl Sprenger, of Naples. I bought it from him in 1904 as *Y. vomerensis*, which is stated in Trelease's *Monograph* to be a cross between *aloifolia* and *gloriosa*; but I feel certain there is some mistake, as my plant must have *Y. recurvifolia* as one parent, this being so clearly shown in the drooping, bent leaves of a well-grown specimen. By referring to one of Sprenger's lists of these hybrid Yuccas, I see he used the name *vomerensis* for various crosses with *aloifolia*, and mine may be what he named *Helioborns*, calling it a *vomerensis* variety, with *aloifolia gigantea* × *recurvifolia* as parentage. Anyway, it is a fine plant, and has proved hardier than any other of his hybrids. Its stem is now about four feet in height, and the central leaves stand up above it for another two feet, the lower ones bending over and reaching to the ground. The flower spike was one of the largest I have ever seen on a Yucca, being so densely crowded with side branches, and was a fine sight in the early weeks of July. The inflorescence itself measured a little over five feet in length, and so reached to a height of nine feet four inches from the ground. In the dusk of the evenings, when the flowers were more fully expanded than by day, it was a remarkably fine pillar of whiteness towering above the shrubs on a well-drained ridge of the rock garden.

*Y. rupicola*, a fine, stemless species, with strikingly blue leaves, flowered well last summer, and is now making a good central growth beside the dead flower stem, instead of from the underground tubers, as is the case with the commoner acaulescent species, *Y. filamentosa* and *Y. flaccida*. A. E. Bowles, *Myddelton House, Waltham Cross*.

## PETUNIAS AT KEW.

THE collections of Petunias in the glass houses at the Royal Botanic Gardens, Kew, admirably illustrate the origin of present-day varieties. The presence of neatly-typed cards setting forth the whole story is "good and laudable, and the practice should continue," as the Courts' leet officers would have put it. From these cards visitors may learn that *Petunia integrifolia* (syn. *P. violacea*), one of the parents of the garden Petunia, was first grown at the Glasgow Botanic Gardens in 1831, from seed sent from Buenos Ayres by John Tweedie. The other parent, *P. nyctaginiflora*, came from S. America eight years earlier, and after many hybrids of the two species had been raised, *P. integrifolia* was lost to cultivation until 1916, when seeds were sent to Kew through the instrumentality of Mr. C. E. Rowland when Vice-Consul of Monte Video. The examples of the early garden hybrids which are on view show really elegant plants bearing abundant, widely expanded, rosy or rosy-magenta flowers about 1½ inches across. The collections also include present-day forms in great variety. A. C. B.

## NOTES FROM AMERICA.

THE note on page 49 in *Gard. Chron.*, July 22, prompts me to mention that it is probably easier to find examples of this tree in the Eastern and Southern States of America than it is in England. I cannot recall ever having had my attention drawn to this tree in any garden or nursery in England, yet when I came to New Jersey the first garden I entered contained a specimen, some 18 ft. or more tall, with a trunk about 4 inches through. It was planted some 15 or 20 years ago on light, sandy loam on a slope, and doubtless has derived some protection from the surrounding trees. The tree blooms freely, and is one of the few subjects that is not pestered with one or other of the numerous "bugs" that infest these parts. That it is hardy is proved by the fact that this tree has passed through zero temperatures; in fact, this beautiful species is credited with being hardy as far north as Massachusetts, where the weather is much more severe than northern New Jersey.

One may find *Koelreuteria paniculata* in many

with seeds in the open after May. All kinds of greens are growing frantically; "bugs" have been no trouble at all. The new Bijou Runner Bean is giving us lots of fine pods. Peas are fairly good, not rotting as last year, but Sweet Peas gave out after giving me blooms over nearly two months, a thing thought impossible formerly by my neighbours.

My "Corn" gives them to think that I have learned more about Maize in three seasons than they have absorbed; anyway, it is 7 ft. to 10 ft. tall, at least one-third taller than it should be. T. A. H., *New Jersey*.

## METAMORPHOSIS OF RHODODENDRON INFLORESCENCE.

THE accompanying illustration of a curious freak may be of interest to the readers of your journal.

The "flower" illustrated, although closely resembling some double forms of *Camellia*, is really a metamorphosed inflorescence of a *Rhododendron*, and was recently found at Kew

FIG. 50.—ABNORMAL FLOWER OF RHODODENDRON CORONA.

nursery catalogues here, and it is invariably quoted as the Varnish Tree. A 5 ft. specimen may be bought for 75 cents.

I may add that two excellent illustrations of this tree, showing its habit and flower panicle, appear in *The Floral World*, January, 1876, with interesting notes regarding it by the late Shirley Hibberd. He mentions that some beautiful specimens were to be seen in his gardens at Stoke Newington, none of them being hurt by the severe winter of 1860-61.

This, my third summer here, is far wetter than the first; in fact, each summer, I am told has been abnormal, so that in time I may strike a season that is normal. New York City, which more or less covers the section of New Jersey where I reside, registered 7.86 inches of rain in June, and 6.54 inches in July, a total of 14.4 inches for two months. August 1 led off with a steady rain lasting about four hours, but usually our rains are not steady; the rain just comes down in sheets, lasting perhaps an hour or less. On the average, I imagine a fall of one hour means an inch of rain. I think in the two months we had a shower every two days, and five successive week-ends we had a storm.

However, the rains have prevented the temperature topping the nineties; in the main, about 75° has been nearer the average, so that everything has grown amazingly, that is, if it did not get washed out of the soil. Having got on to the ways of the rains, I take no chances

on a plant of *R. Corona*. There seems little doubt that the monstrosity is due to "progressive petaloidy," as the inflorescence in all probability consisted of a single flower, protected in the bud stage by what are normally the bud-scales, which had become petaloid and were arranged in whorls about a floral axis that had failed to elongate. Unfortunately, the lower parts of the "flower" are not shown in the photograph (Fig. 50), but they unite characters of both petals and bud-scales.

This type of *Rhododendron* has normally ten stamens to each flower, but only eight were present here, and it seems likely that the two somewhat distorted, petal-like bodies seen in the centre are the other two become petaloid. The flower was about 3 inches in diameter, beautifully veined, and of a rich carmine colour, faintly splashed with white.

Another extraordinary instance of progressive petaloidy in *Rhododendrons* was brought to the notice of the Kew authorities by Sir E. Loder some years ago. The corolla in this case bore curious fleshy, crimson, waved outgrowths at the base, the axis of the flower was somewhat elongated, and all the stamens, save one or two, had changed wholly or partially into large petals, of which the lower ones were free. This flower, like the one illustrated, was produced alone on the plant, and more than two months out of season. H. B. Trewithick, *Royal Gardens, Kew*.

## THE HISTORY OF THE MOSS ROSE.

(Continued from page 108)

WHEN Major Hurst, in one of the few instances where he tries to prove a point, attempts to fix the date of the earliest mention of the Moss Rose in France, he is singularly unfortunate in the authority upon which he relies. In his notes in the *Rose Annual*, 1922, he writes referring to Boerhaave's date of 1720, "But this is not the earliest date recorded for the Moss Rose, for in a rare little book entitled *L'École du Jardinier Fleuriste*, Fréard du Castel, of Bayeux (1746), states that the Hundred-leaved Moss Rose was in cultivation in the North-West of France, at Cotentin, Bessin, and a part of the littoral of La Manche, in 1746, and that it was brought there by him from Carcassonne, in the South of France, where it had been known for half a century (1696)." Major Hurst's statement of this fact in his article in the *R.H.S. Journal* is substantially the same, except for the very important admission that he quotes it on the authority of Paquet (1845) and Jamain and Forney (1873). Here we have a case in point where Major Hurst shows too ready a capacity for accepting secondhand information without verification, and consequently, his deductions, based on false premises, have in this particular instance resulted in wrong conclusions. Major Hurst arrives at his conclusion by erroneously assuming that *L'École du Jardinier Fleuriste* was published by Fréard du Castel in 1746, and that, on the authority of Paquet, he states that the Moss Rose had been then known at Carcassonne for half a century. Deducting fifty years from 1746, of course, leaves 1696, an arithmetical problem which seems to be quite simple, and as such is right; but which is nevertheless fundamentally wrong. It is not difficult to explain why. It is apparent that Major Hurst has never consulted the book first hand, and if he were at all familiar with old French floricultural literature, he would know that Fréard du Castel is only the reputed author of *L'École du Jardinier Fleuriste*. The book was published anonymously. It ran into several editions; three at least. The first was published in Paris, in 1764, and not in 1746. Consequently, fifty years from 1764 must be 1714, not 1696. The reader will easily see how that error is arrived at, but it does not end there, for every fact mentioned by Major Hurst in connection with the book will be found, when put to a practical test, to be inaccurate. Thus there is no reference, direct or indirect, to the Moss Rose in *L'École du Jardinier Fleuriste*, and there is consequently no mention of it having been grown in France for half a century. Stranger still, there is absolutely no mention at all, let alone an account, circumstantial or otherwise, that the Hundred-leaved Moss Rose was in cultivation in the three places named in the north-west of France. Nor is the supposed place of origin, Carcassonne, ever mentioned in the book. The story, in all its detail as related by Major Hurst, is a myth and he can never have had the book in his hands, or he could not have allowed himself to land in such a pitfall, and be the victim of such misplaced confidence, or exhibit such a want of critical acumen.

Presuming that Major Hurst has rightly interpreted what Paquet and Jamain wrote on this subject and that they did state what he attributes to them, we may fairly inquire who are these 19th century French gardeners whose literary performance is limited to several little cultural manuals, that credence should be unhesitatingly accorded to their version of historical matter which happened more than a century before they wrote; and be accepted on so important a detail in Moss Rose history without it being submitted to some process of verification, the need for which it has been abundantly demonstrated is unquestionable? When it is accessible, contemporary corroborative evidence must be of far higher value, and in every and any case whenever subsequent secondhand evidence is all that is forthcoming, it must be sifted and appraised at its proper value

before it is safe to build any kind of a theory upon it.

It is abundantly manifest that neither Major Hurst nor his French 19th century authorities, if correctly quoted, can ever have consulted first hand the work upon which they appear to rely not to prove their case, but to justify a mere passing remark which must have been picked up haphazard from some French source or other which we have no accessible means of discovering.

And yet it is quite within the bounds of possibility that the Moss Rose may have been known and grown in the neighbourhood of Carcassonne or elsewhere in the South of France towards the close of the 17th century, for we do not ignore the fact that it was the Moss Provence Rose. There are frequent allusions, more or less vague and unreliable, on the subject to be met with in French Rose literature, as an example of which may be quoted the short reference to the Moss Rose in a modern work, *Roses et Rosiers*, where is the astonishing tittle-bit, "In 1746 the Countess de Genlis introduced into her gardens in Paris the Moss Rose (commonly called Rose Mousseuse) probably of Carcassonne origin." There is something wonderfully elusive about that year 1746, but the difficulty of digesting that little bit of information is that it cannot be accepted because Madame de Genlis could not have done as stated, for the simple reason that 1746 happened to be the date of that lady's birth. *C. Harman Payne*.

(To be concluded.)

FIG. 51.—CONOPHYTUM ELISHAE N. E. BR.  
NAT. SIZE.

## MESEMBRYANTHEMUM AND SOME NEW GENERA SEPARATED FROM IT.

(Continued from page 84.)

55. *C. Elishae*, N. E. Br. (Fig. 51). Plant not developing stems with age. Growths 7-14 lines long, 6-10 lines broad and 5-8 lines thick, ovoid or oblong-ovoid, with lobes 2-4 lines long (type S), of a slightly bluish-green colour with a darker area under the notch, somewhat obscurely marked with scattered darker-green dots, and the keel often purplish. Calyx 3-5-lobed. Corolla  $\frac{1}{2}$ -1 inch in diameter, expanding in the morning irrespective of sunshine, if the temperature is warm enough; petals 35-48, in 3 series, bright yellow. Stamens numerous, in 3-4 series, the upper exserted, yellow. Style 2-3 lines long; stigmas 5-6, usually exceeding the stamens, 2-3 lines long, filiform, pale yellow or greenish. *M. Elishae*, N. E. Br., in *The Gardeners' Chronicle*, 1916, v. 60, p. 252; *Bot. Mag.*, t. 8776 B, a very poor figure.

South Africa. Locality and collector unknown.

This species increases more rapidly and flowers more freely than any other species of this group in cultivation, and a well grown plant in full flower is very charming. No idea of its beauty can be obtained from the bad representation of it in the *Botanical Magazine*.

56. *C. gracilistylum*, N. E. Br. Plant not forming stems with age. Growths 10-15 lines long, 6-8 lines broad and 4-5 $\frac{1}{2}$  lines thick, oblong, compressed, with lobes 2-3 $\frac{1}{2}$  lines long

(type S), glaucous-green or bluish-green, more or less distinctly dotted all over with darker green, and with a red keel to the lobes. Calyx 3-4-lobed. Corolla 7-10 lines in diameter, expanding in the daytime and remaining open irrespective of sunshine or cloudy weather, scentless; tube as long as the calyx; petals 25-30, in 2 series, bright pink or bright magenta on both sides, white at the base. Stamens about 40, in 4 series, with the upper anthers just showing at the mouth of the corolla-tube, yellow. Style 4-5 lines long, slender; stigmas 4, about 1 $\frac{1}{2}$  line long, exserted and recurving among the anthers. *M. gracilistylum*, L. Bolus in *Ann. S. Afr. Mus.*, v. 9, p. 141, pl. 3, f. 1 (1913).

Namaqualand. Hill south of Stinkfontein, Pearson 5572.

57. *C. turrigerum*, N. E. Br. Plant not forming stems with age. Growths 5-6 $\frac{1}{2}$  lines long, 4-6 lines broad across the top of the lobes and 3 lines thick; lobes 2-3 lines long, subcylindric and about 2-3 lines in diameter (type T), angularly convex from the presence of raised lines connected in a map-like manner and enclosing slightly depressed areas, light greyish-green or glaucous-green, with the raised lines of very dark green, and all the lower part more or less tinted with purplish and dotted with dark green. Flowers not seen. *M. turrigerum*, N. E. Br., in *Journ. Linn. Soc. Bot.*, v. 45, p. 102.

Malmesbury Div. Vicinity of Klibheuvell, Pillans.

EXCLUDED SPECIES.

*Mesembryanthemum nanum* Schlechter, in *Engl. Jahrb.* Vol. 27, p. 128, has been placed among this group of Sphaeroids, but the material and description are too imperfect to permit of a definite place under *Conophytum*, to which it may not belong. *N. E. Brown*.

(To be continued.)

## HORTICULTURE IN MID-WALES.

DURING the past few years horticultural shows in mid-Wales have become increasingly popular each season, and they are generally well attended. In some districts they are held in conjunction with other shows, and in nearly every case this season are proving greater attractions than ever, which the Builth Wells show last week clearly proved. There are several reasons for the rapid growth of the Builth Wells horticultural show, and much is due to the splendid work done by Mr. Watson, horticultural expert for the counties of Brecon and Radnor. Mrs. A. Wilson, of Garth House, and Mrs. Venables Llewelyn, of Llydsinam, have also done a great deal in encouraging cottagers and allotment holders in providing challenge-cup garden competitions.

The exhibits at the mid-Wales horticultural shows reflect great credit on amateur gardeners who have exhibited at several of them for the first time. A rural blacksmith won seven first prizes at Garth show about four weeks ago, as well as three second prizes, and last week at the mid-Wales great show, he carried off ten first prizes and seven second prizes, an achievement which even a professional gardener would have felt proud of. In the rural parish where this amateur gardener lives, the old practice of farmers giving free space to cottagers to plant a few rows of Potatoes in the open field still prevails, and Mr. Jones, of Nantyrarian forge, every year takes advantage of the farmer's generosity, but he provides his own manure, consisting of horse droppings and hoof parings from the blacksmith's shop, and his yield per row is much greater than that of any other cultivator on the same field.

Although this was only the second year of the Builth Show, the schedule included four divisions, comprising 90 classes, which, in spite of the unfavourable season, were well filled with splendid exhibits of remarkably good quality—a vast improvement on last year. Over two thousand people visited the show, and this second annual horticultural exhibition in the Wye Valley augurs well for the future of horticulture in mid-Wales. *Roger Williams, Builth Wells*.

**YELLOW DENDROBIUMS,**

In the yellow *Dendrobiums* the labellums are usually darker and brighter than the other segments, and where other colour is found in the labellum it is generally of maroon, claret, or chocolate tints, and without violet or mauve being present—interesting facts which are not readily observed when the species are viewed in company with others of their class, but which have differently coloured flowers.

Yellow-flowered *Dendrobiums* support the statement that true yellow-flowered Orchids do not give occasional albinos in nature as do those kinds with white or whitish ground colour and purple or other cyanic surface tints, as suggested in the article, "Albinism among Orchids in Nature," in *Gard. Chron.*, February 18, 1922, p. 75. In the hands of the hybridist, however, they may be used either to continue and improve yellow strains or to create new kinds with more or less white flowers.

Another interesting point is that, although the genus *Dendrobium* is more widely distributed than any other, but few true yellow *Dendrobiums* are found outside the Indian Himalayan region—Nepaul, Khasia Hills, Burma, Moulmein, etc. But two of the most important factors in the production of yellow hybrid *Dendrobiums* are *D. aureum* (heterocarpum), which has a wide range, including highland India, Ceylon, and the Philippine Islands, and which, except in its darker form, has no qualification for its golden title. Its Primrose-scented flowers in some localities are yellowish cream colour, one form being distinguished as *album*, although it is not white. All the forms have reddish markings on the more yellow lip. The other is *D. signatum*, a bright yellow species, native of Siam, and a very fortunate introduction for which the late Sir Trevor Lawrence received a first-class certificate on March 11, 1890.

*D. aureum* is a prime ancestor to a host of beautiful and fragrant hybrids, commencing with *D. Ainsworthii* (*aureum* × *nobile*), and comes directly and indirectly into a very large proportion of our garden *Dendrobiums*, but with little effect in producing yellow flowers until the introduction of *D. signatum*, which, when used as the pollen parent, with *D. nobile* as seed parent, gave *D. Wiganiae*, none of which could be called yellow, although some had a yellow tint. *D. aureum* crossed with *D. Wiganiae* brought out the yellow in *D. signatum*, and gave the rich dark yellow *D. chesingtonense* of Mr. R. G. Thwaites in 1903, and a similar combination (*Ainsworthii* splendidissimum × *Wiganiae*) gave the rich orange-yellow *D. Thwaitesiae*, raised, also, by Messrs. J. Veitch and Sons and Sir Jeremiah Colman.

The direct cross between *D. aureum* and *D. signatum* resulted in the equally satisfactory yellow *D. Ophir*, although, as with the other crosses, not all were equally good yellows. This flowered with Messrs. J. Veitch and Sons in 1902, and in February, 1903, Sir Geo. L. Holford obtained an award of merit for his fine variety of the same cross. Other instances of good yellows obtained through *D. signatum* are *D. Golden Ray* of Sir J. Colman, *D. Buttercup* and *D. Yellow Bird* of Messrs. Armstrong and Brown.

But that all the crosses of *D. signatum*, as with many other species, are not satisfactory either in good yellows or whites has been proved at Gatton, although some of the light colours, such as *D. Gatton Pearl*, give very good varieties.

*D. chrysotoxum* and its ally or variety *D. suavissimum*, *D. densiflorum*, and *D. Griffithianum*, all Indian upland, evergreen species, have clavate, grooved or angular pseudo-bulbs, with several bright green leaves at the top, and carry heavy racemes of bright yellow flowers, the flowers of *D. suavissimum* having a deep maroon blotch on the lip.

*D. chrysotoxum* was made good use of by crossing *D. Dalhousieanum* with it and obtaining the bright yellow *D. illustre*, which again crossed with *D. Dalhousieanum* *luteum* yielded

*D. Gatton Sunray*; whilst, also, in Sir Jeremiah Colman's gardens, the pretty yellow varieties of *D. Bartelsianum* proved the potency of the yellow *D. signatum* in *D. Wiganiae*.

*D. Brymerianum* has a heavily fringed lip, and *D. Harveyanum* has fringed petals, but, although the former has been crossed with three other species, no satisfactory yellow progeny resulted. Both, as clear yellow-flowered species of great interest, would be difficult to improve upon without destroying their chief characteristics, but, if crossed with other decided yellows, the results would, no doubt, be better than those already obtained.

*D. fimbriatum* and its variety *oculatum*, *D. Gibsoni*, and several others of the class are among the oldest introductions to our gardens, and in the earlier days of Orchid exhibitions formed leading features. Of this group only *D. fimbriatum* has been used for hybridising, and, so far, no specially good result has appeared.

*D. Hookerianum*, *D. chrysanthum*, *D. chryseum*, *D. capillipes*, *D. chrysocephis*, *D. dioxanthum*, *D. ochreatum* (*Cambridgeanum*), *D. senile* with its curious hairy stems, and others of the Himalayan species all have the

valuable for use in miscellaneous groups of ornamental foliage and flowering plants at exhibitions and other functions. It is not necessary to have special houses for their cultivation; they may be grown in any glass house having sufficient heat and moisture, provided they are not exposed to draughts and shaded from the bright sunshine. All Ferns need shade and plenty of moisture; during their growing season a liberal supply of water at their roots is necessary, for if the latter are allowed to get dry the fronds would shrivel, destroying their beauty and most likely killing the plant.

Ferns from tropical regions require a night temperature during the winter of 55° to 60°, whilst the temperate or cool-house varieties will do well in a temperature of 45° to 50° at night. During the summer very little or no artificial warmth will be required, but care must be taken to give the plants sufficient moisture. Ferns planted out in rockeries require less attention than those grown in pots, and if a suitable soil is used the majority will last in good condition for several years. In constructing a rockery indoors, tufa is by far the most lasting material to use. The pockets should be of various sizes, and of sufficient depth to receive the Ferns; vacant

FIG. 52.—DENDROBIUM AINSWORTHII.

pure golden yellow tints which might with advantage be used to secure a more extended series of bright yellow *Dendrobiums* of different shape from the *D. Ainsworthii* class, which form the bulk of our garden *Dendrobes*, and to which the introduction of yellow colouring would be a great advantage.

Sir Jeremiah Colman, at Gatton Park, has had more experience in this direction than any other amateur; and the late Mr. J. Charlesworth is known to have operated in the same direction; probably the great firm at Haywards Heath has good hybrids of the kind maturing.

For ordinary Orchid growers the *Dendrobiums* are among the best and easiest classes to grow, and good novelties would be eagerly sought after. J. O'B.

**INDOOR PLANTS.**

**FERNS.**

THERE is no class of plants so popular or more useful in so many ways as Ferns, or that can be used to so great advantage for all kinds of decorative purposes. They stand unrivalled in the beauty of their graceful, delicate fronds, and are appreciated by all lovers of plants. No plants are more easily cultivated than Ferns, provided they are watered and shaded carefully. They may be utilised for the decoration of the conservatory, Fern house, rockery, dwelling-house and ballroom; they are

spaces may be left for planting, from time to time, flowering subjects in bloom to brighten the house and make it more attractive. If a house cannot wholly be devoted to the purpose, rock work may be built at the end of the conservatory or plant-house and the Ferns planted in crevices to add to its beauty. If the conservatory or house is suitable, Ferns of a pendent habit may be suspended from the roof rafters.

The baskets should be lined with Sphagnum or other moss to keep the soil in place.

Ferns are much in demand for the decoration of the dwelling-house, and will keep fresh a long time provided they are given sufficient water and not exposed to cold draughts. They are very useful for table decoration, and may be grown in tiny pots suitable for placing in small vases. In certain conditions filmy Ferns may be successfully grown in a room, a Wardian case being most suitable for the purpose. The filmy Ferns are unique in their beauty and variety of form of foliage; their delicacy of outline, and in most cases their marvellous transparency places them in the foremost rank among Ferns. When laden with moisture, especially with moisture condensed on the fronds, nothing could be more beautiful, the drops of water which hang on the tips of the leaves enhancing the effect. They require a moist, close atmosphere, and need to be well shaded from the sun. The plant will succeed planted or potted in rough, fibrous peat and Sphagnum moss, with large lumps of sand-

stone partially covered by the soil. Those living in cities or towns may derive a great amount of pleasure by having a rockwork built in the recess of a window facing north and encased with glass to give protection to the Ferns in very cold weather. Filmy Ferns may be grown successfully under these conditions. *J. Heal, V.M.H.*

(To be concluded.)

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from p. 112.)

(See Tables and Summaries, Ante, pp. 95-100.)  
ENGLAND, N.E.

**DURHAM.**—The fruit crops all round this year would have been abundant, I think, had it not been for caterpillars, which were especially destructive to Apples and Black Currants, stripping many of the trees quite bare of leaves. We are surrounded by woods. *Edward Tindale, Ravensworth Gardens, Gateshead*

—Apple trees were covered with blossom and promised good crops, but caterpillars stripped some trees bare of their leaves, wall trees being most affected. Plum trees have had to be supported, as they are all laden with fruits. Blossom was very late in expanding this season, and thus escaped damage by severe frosts early in the spring. Black Currants have cropped well, with large, sound berries. Strawberries have been exceptionally large, but heavy rains spoilt many of the berries. The soil in these gardens is of a light, open nature, with a sand subsoil. *William McCombie, Redworth Hall Gardens, Heighington.*

—The Pear crop is again a failure. Apples promised to be plentiful, but, owing to caterpillars, the crop is a very light one, although the trees were twice sprayed. Possibly this may be owing to the orchard being on the border of a wood. Plums of every variety are an enormous crop—the best for very many years. No doubt the Strawberry crop would have been better but for the long period of drought. All bush fruits are exceptionally good. Our soil is of a very light nature, the subsoil sand, and in places of a gravelly nature. *J. A. Woods, Beamish Park Gardens, Beamish, S.O.*

**NORTHUMBERLAND.**—Apple, Pear, and Plum trees developed a wealth of bloom, and the fruits set remarkably well, necessitating much thinning. Insects and caterpillars were troublesome during the dry weather in May and June. Small fruits are plentiful and good. Strawberries were good, but late by about ten days. The soil here is a medium, sandy loam on the limestone, and about 200 feet above sea level. *James Winder, Howden Dene Gardens, Corbridge-on-Tyne.*

—The fruit crops are, on the whole, good in this district, which may be attributed to a large extent to the lateness of the trees coming into flower. Apricot, Peach, and Pear trees were quite five weeks later coming into bloom this season than in 1921, and all kinds of fruit set well and required a good deal of thinning. Apples are an average crop, as is only to be expected after the heavy crops of last season. Bush fruits are all plentiful and of fine quality. Pear trees are carrying grand crops on bush specimens. *Bourré d'Amanis, Bourré Hardy, Charles Ernest, Clapp's Favourite, Doyenné Boussoch, Durondeau, Fondante de Thirriott, and Marguerite Marillat* are varieties that do well in the open here. Insect pests have not been very troublesome this season. All trees are clean and the foliage is healthy. *W. E. Anderson, Close House Gardens, Wylam-on-Tyne.*

**YORKSHIRE.**—Apples are a fair crop, and would have been very plentiful but for the hot, dry weather at the end of May. Pears were similarly affected, but not to the same extent. Plums are a glut. Small fruits are

very good, but Gooseberries are fewer than usual. Strawberries were very good, but the crop suffered from the early drought. The soil here is a good loam resting on a layer of clay and red sand below. *Jas. E. Hathaway, Baldersby Park Gardens, Thirsk.*

—The fruit crops vary greatly. Cherries protected by Apple trees and a Beech hedge suffered from frost and cold winds. Apples shed a lot of immature fruit, owing to the dry spring. Strawberry plants suffered from excessive moisture in the winter. In a cottage garden on a hill top near here may be seen a good crop of Plums of fine quality. *J. G. Wilson, Newmillerdam, Wakefield.*

—Strawberries are always late in ripening in this district, and the long spell of cold, wet weather ruined the crop. Rasperry Lloyd George is not suited to our winters on the Yorkshire wolds. Small fruits generally are quite up to the average. Apples and Plums are both clean and good. Pear trees did not bloom profusely, and the crop of Pears is a very light one. Nuts promise to be very fine. *Sidney Legg, Warter Priory Gardens, York.*

ENGLAND, E.

**CAMBRIDGESHIRE.**—Cold east winds and early morning frosts were not so disastrous to the Apple and Pear blossom as was at first anticipated, and, although the drought of May and June caused some of the fruits to drop, there are still average crops of clean, good-sized fruits. Strawberries were greatly affected by the drought, the rains coming too late to save the crop. Raspberries also suffered, but not quite to the same extent as Strawberries, having benefited by the rains. Cherries are not grown to any extent in this district, but the few trees I have noticed seemed to be bearing average crops of small fruit. *Arthur Sewell, 32, Barton Road, Ely.*

**ESSEX.**—The fruit crops generally are satisfactory. Apples are a bit disappointing, for every tree, almost without exception, developed a wealth of bloom, but in several instances the fruits failed to set, and this I am inclined to attribute in a great measure to the intense heat at the flowering period. Such varieties as Newton Wonder, Annie Elizabeth, Sandringham, Dumelow's Seedling, and Alfriston are carrying heavy crops, while Lane's Prince Albert and Bismarck, usually so reliable, have this season almost entirely failed to set. Plums and Pears are good average crops, and the trees clean in growth. Gooseberries have been a heavy crop. Black, Red, and White Currants are good average crops, as also are Raspberries. Strawberries have been almost a complete failure, the rains having come too late to save the crop. The soil is a strong loam on clay. *Arthur Bullock, Copped Hall Gardens, Epping.*

—Peaches, Nectarines, and Apricots suffered to some extent by adverse weather when in bloom, though not as badly as was at first feared. Plum trees flowered profusely, and chiefly the commonest varieties are carrying enormous crops of good fruit. Gages and other choice varieties are not so plentiful. Apple trees are carrying much better crops of good fruit than at first seemed probable. Pears are the same. Small fruits and Strawberries suffered greatly by the early drought, and especially Strawberries, the recent rains having greatly helped Currants and Raspberries. The soil is a strong, retentive loam, overlying boulder clay, and it cracks very badly in times of drought. *E. F. Hazelton, Park Road, Elsenham, Stansted.*

—Late Apples flowered rather sparingly. Pears and Plums flowered very well, but many fruits dropped during the heat of late May and early June. Peaches and Nectarines also suffered in the same way. Gooseberries were a good crop in a few places. Strawberries suffered greatly from the drought of 1921. *C. Wakely, County Gardens, Chelmsford.*

—The Apple crop is not very satisfactory. Very hot sun in the daytime and cold at night when the trees were in flower had harmful effects, and the blossom was all over in a few days. The fruit that did set pro-

mises to be good. Pears are an abundant crop, as also are Plums. Cherries are under the average yield, but of good quality. Peaches and Nectarines are both very good crops, and Apricots also promise to be good. Gooseberries were abundant in places, but Red and Black Currants were not quite so numerous as usual. The early crop of Strawberries was almost a failure, but later ones, such as Laxton's Latest, were fairly good. Nuts promise to be a good yield. The soil around here is a medium loam. *William Johnson, Stansted Hall Gardens, Stansted.*

(To be continued.)

## BRANCH CUTTINGS OF APPLES.

THE method of propagating by means of planting branches ("large settings") or shoots was widely practised years ago, as is seen in the writings of the XVIIth century. Sometimes the pieces were simply planted in the ground, sometimes a previous ringing and dressing was done; the instructions given by Austen (*A Treatise on Fruit Trees, 1657*), as to "How to get Boughes with roots from Trees," are quoted in full in the *Journal of Pomology*, Vol. 2, 1921, p. 125. He notes that the process cannot be successfully practised on stone fruits nor well on many sorts of Apples and Pears, but it may be effected on all kinds of "Quoddings (= codlings) Nurs-gardens, Quinces, Gennet Moyles, and some other kinds—which more easily put forth Roots or some Knobs or roughnesses which turn to roots afterwards (= Burr-knots)." The method was practised as a means of getting stocks whereupon to graft as well as for direct raising of trees; it was thought that better quantities of fruit resulted from being grafted upon Gennet Moyles, etc.; but such trees had the reputation of not being long-lived, perhaps from transference of canker or other disease.

*Dr. Beale (J. B., Herefordshire Orchards, 1657)* apparently used simple cuttings without any previous treatment by ringing (p. 15), "for these four last Years, whereof two were very dry Summer, I laid the fruitful Sprays of natural Apple Plants" (N.B., by natural he seems to mean seedlings which had never been grafted) "in the ground, some very small, not two Foot above ground, all thereabout; and from the first Summer to this present Spring, they never failed to bear as thick as Traces of Onions. But it is better for the Plant, if you pull off the young Apples soon after they are knitted, the first year at least. Some I laid also four Yards length under the ground, the Sprays lying slope above ground: These grew and bear incredibly. . . . All natural Apples are not of this precocity: The more durable are much more sullen. Some require a Knot for the Root, others not: All three are better for it. To some a slice of the Bark is as good." And again, in dealing with planting (p. 13) "in a natural Plant, the Bowes should not at all be lopped, but some taken off close to the trunk. . . . The Branches that are cut off, may be set, and will grow, but slowly. . . . In so much that a Graft of the same Fruit doth meliorate the Fruit, as is lately much observed by our Welsh Neighbours, who do graffe the Gennet Moyle upon the same Stock, and thereby obtain a larger Apple, more juicy, and better for all uses. And some triplicate their Graffings (for a curiosity) upon the same account."

It is a common experience that shoots cut for grafts will give apparently much promise of growing for the first season, when they are left partly buried in the soil; but I have never yet seen any go further than one season. Judging by the useful effect of a previous ringing for striking Rose-shoots, many years ago I ringed a number of shoots of Jargonelle Pear; several looked quite full of promise at the end of the second season, but, unfortunately, they were dug up. A similar fate betook a number of cuttings which a neighbour had put in; they were planted obliquely fairly deeply, then

arched, leaving about a foot exposed, and the terminal end was buried; the idea was to give a double chance of absorbing moisture and possibly rooting at both ends.

The striking of shoots and rooting of larger cuttings might well form the subject of an inquiry into the nature and factors involved at one of the Pomological Stations that now exist. *H. E. Durham.*

—There is no doubt that all fruit-growing readers will, with myself, find considerable interest in Mr. H. F. M. Hewat's paragraph on this subject on page 101. It appears to me fairly certain that the variety is Burr Knot which I have frequently seen and grown on the east coast, especially in the northern parts of Lincolnshire and in Yorkshire. I have repeatedly proved that any piece of growth will root easily provided that it is severed beneath a burr, and that the insertion is done very firmly. Dr. Hogg's description in the *Fruit Manual* is as follows:—"Fruit, large, three inches wide, and two and a half inches high; in shape not unlike Cox's Orange Pippin, but sometimes with prominent angles on the sides, which extend to the crown; round, and even in its outline. Skin, smooth and shining, of a clear lemon yellow colour, and with a blush of red on the side next the sun, and thickly strewn with a few russet dots. Eye, open, with reflexed segments set in a narrow and plaited basin. Stamens, marginal; tube, deep conical. Stalk, half an inch long, inserted in a deep cavity. Flesh, yellowish white, tender, juicy, and of an agreeable acid flavour. Cells, roundish obovate; axile, open. A good kitchen Apple; in use during October and November."

Perhaps Mr. Hewat can compare fruits with this description and tell readers how they agree? Dr. Hogg gives Bide's Walking Stick as the one synonym and supports it by saying: "The tree is a close and compact grower, and a profusion of burrs are produced on the branches which emit incipient roots. If a branch furnished with these burrs is inserted in the ground it will take root and become a tree. The name of 'Bide's Walking Stick' originated from a person of that name having cut a branch for a walking stick in Cheshire and brought it to his place near Hertford, when having inserted it in the ground, it took root and became a tree." This sounds as though it might be apocryphal. Can any readers support or discount it? *H. J. W.*

## ANNUALS AT READING.

THE part which annuals may be made to play in the embellishment of the garden is well-known to the majority of our readers, and, since the war great use has been made of these beautiful flowers for reasons of economy, as they are very easily raised and may be obtained at a minimum of expense. But because they are cheap, it does not necessarily imply that they are inferior to the ordinary bedding plants; indeed, annuals are amongst the most beautiful of all flowers and are adapted for a variety of purposes.

The Antirrhinum, which for garden purposes may be regarded as an annual, is increasing in favour each season, and there are few gardens in which this beautiful and simply-grown plant may not be found.

Reading might almost be said to be the home of the present-day Antirrhinum, for Messrs. Sutton and Sons have long paid especial attention to this valuable flower. Even when seen from the windows of the Riviera express trains which thunder past the nursery, the colour feast provided by the generous breadths of the plants in the Antirrhinum trial is exceedingly fascinating. Inside the nursery the visitor cannot fail to be entranced by the vivid colours of such varieties as Bright Pink, Deep Crimson, and Fire King, to instance only a few sorts; while those with artistic leanings would be satisfied with Delicate Pink, Pale Apricot, Buff Beauty, and the like. To the not inconsiderable few who prefer uncommon tones in flowers, Mauve Beauty is bound to appeal: either when grown

alone or in association with the pale yellows or milky whites it is singularly effective. For general garden display it is these "Intermediate" varieties that have the greatest value, but there are many places in the herbaceous borders where Sutton's Tall Antirrhinums are especially appropriate, while on account of their tall stems and large blooms they are excellent as cut flowers.

The Tom Thumb Antirrhinums have an especial place in the scheme of garden decoration, but it must be confessed that this strain is not altogether satisfactory. When successful, no dwarf plant can be more valuable or effective in the summer beds or borders, but their very dwarfness seems to be their undoing, and disappointing floral blanks occur. Messrs. Sutton and Sons are as keenly alive to their partial failures as to their many notable successes, and this difficulty in the very dwarf Antirrhinum has long received anxious thought and attention. The general gardening public can have but little idea of the unremitting care and attention that is exercised on such matters. The raising of a new strain possessing all the merits of the Tom Thumb type without its failings has long been the goal of florists, and at last it is near attainment, for there is evidence that before long a Dwarf Intermediate strain will be available. It is now an open secret that the strain has been fixed—indeed, this is abundantly evident to the visitor, who can see long rows of dwarf plants each exactly like the other, so far as size and form are concerned, and they embrace practically all the delightful colours and tones of the older established types.

As with Antirrhinums so, in a great measure, with Phlox Drummondii. No longer is it the custom to grow this valuable annual as a few patches of mixed colours. It is at the Langley Trial Grounds of the firm that these are mostly to be seen, and there one can feast on extensive masses of varied colours and of delicious perfume. Every conceivable colour has been separated and, what is equally important, the three definite types—Large, Intermediate and Dwarf—are fixed. The graceful beauty of the first-named when skilfully arranged in vases was well demonstrated in the Gold Medal exhibit of annuals staged by Messrs. Sutton and Sons at a recent meeting of the Royal Horticultural Society.

The homely and indispensable Stocks and Asters are to be seen in large quantities of the different sorts, and while one cannot but admire the large, double-flowered varieties of Aster, it is borne upon one that such singles as Venus, Firefly, and the many distinct *A. sinensis* sorts are exceedingly graceful and decorative. In front of the glasshouses at Reading a large bed of *Nemophila insignis* is really "remarkable" in its bright blue colour, giving the appearance of Forget-Me-Nots in summer. A deeper shade of blue is provided by *Phacelia campanularia* and the perennial *Linum sibiricum*.

Amongst the taller annuals of spreading habit *Lavatera Sutton's Loveliness* was, at the time of our visit, pre-eminent. As is well-known, many of the Mallows are impatient of root disturbance, so that, as was the case with the plants under notice, the greatest success is attained when the seedlings are not transplanted but allowed to flower where the seed was sown. This, naturally, leads to a rather later-flowering period, but still sufficiently early to ensure an abundance of bloom long before summer is over. The value of this Mallow and several other tall varieties for use as cut flowers was well shown in the group referred to at Vincent Square, as also were the various Larkspurs, Lupins, annual Chrysanthemums, and many more, which, at the trials, are to be seen as growing plants that are even more beautiful than the cut blooms.

Besides the almost countless numbers of annuals—although Antirrhinums are perennials they are usually grown as annuals—certain biennials and perennials are associated with the trials. Hollyhocks are still in great beauty, and Sutton's Prize Doubles are especially noteworthy in the good form of the flowers and the large proportion that come double from seed. Near by, a breadth of Gladioli in many varieties is also very interesting. Few, if any, of the

plants under trial have flowered so freely this summer as the Improved Marguerite Carnations. It is claimed that 90 per cent of the seedlings come fully double, and while this contention was not checked, it seemed a difficult matter to find any really single flowers, and some of the plants bore exceptionally large flowers as well formed and as fully double as the best Perpetuals. The Prize Carnations were all that could be desired.

## HOME CORRESPONDENCE.

**Escallonia Hedges.**—Mr. A. D. Webster (p. 55) refers to the *Escallonia* hedges of Cornwall. I would add that *Escallonia macrantha* makes a splendid hedge for shelter purposes, and its roots are not so objectionable as those of some other hedge shrubs; if necessity requires, it may be cut back severely, and I have one that is cut back annually to a width of six inches. No wind can get through such a hedge, and its glossy, rich green leaves and pink flowers are very pleasing. *Cupressus macrocarpa* is another good hedge plant, but where animals have to be fenced out or in, the Whitethorn is the best of all subjects. Privet is the most objectionable hedge shrub I know; it looks most painfully formal and stiff and its roots are vile robbers of the soil. *W. J. Farmer, Redruth.*

**Dianthus Allwoodii** (see p. 101).—As a matter of fact, I do not admit the inferiority of the individual plant, for without the individual there can be no mass. In the mass, the individual merges in the whole, and, for garden effect, the result produced is more satisfactory. *Dianthus Allwoodii*, the most prominent plant of the present time, has been compared unfavourably with the Pinks as they grew in "grandmother's garden," but there were no individuals there. A noted grower has expressed the opinion in *The Gardeners' Chronicle* that the variety Susan is worth growing for its fine foliage alone. And eventually, even when the glamour of the novelty has worn away, I feel sure that varieties of *Dianthus Allwoodii*, like the *Chrysanthemum*, will find a place in every garden. *Fred W. Jeffery, Dalserf, N.B.*

**Mimulus Bartonianus.**—My reason for referring to the note of this *Mimulus* in Sir Herbert Maxwell's article on p. 21 was to draw attention to the error in spelling. You will notice on p. 21 the spelling is *Bertonianus*, possibly a printer's error (yes, Eds.), and it should read *Bartonianus*. *W. P. Moore, Dublin.*

**Robert Furber's "Flowers for the Months."**—(p. 84.)—I do not know by whom or on what grounds "it is believed" that this work is "not at the Natural History Museum," but an inquiry at the Department of Botany or a reference to the Library Catalogue would have shown Mr. Harman Payne that the "belief" is without foundation. The copy in the Department has the book-plate of Horace Walpole. *James Britten.*

**Collerette and Collarette.**—Again you do good service in bringing forward this matter of spelling. Far too long the corrupt, and quite obviously incorrect translation—or shall I say, incorrect spelling?—of the French word "collerette" as applied particularly to the Dahlia, has obtained. It is singular that the trade should have adopted and maintained the use of this illiterate and inelegant form, and refused, to my knowledge with only two exceptions, the literate and elegant. Art and beauty enter so profoundly into our trade, or profession if you will, that any term inartistic, inelegant, vulgar, illiterate, incorrect, if it creep in, should be quickly and relentlessly ejected. *W.*

**Grape Cannon Hall Muscat.**—The interesting note on this Grape on p. 112 reminds me how rarely its name is given correctly. It was named after Cannon Hall, in the garden of which it was first grown in England. The whole story is told in the journal of the R.H.S., vol. 45, p. 368. *Fred. J. Chittenden.*

[Dr. Hogg, in the *Fruit Manual*, states that it was raised at Canon Hall, Barnsley.—Eus.]

## SOCIETIES.

### ROYAL HORTICULTURAL.

AUGUST 22.—The usual fortnightly meeting was held on Tuesday last in the Vincent Square Hall, Westminster. The exhibition was a representative one of subjects in season, and included a magnificent display of Laelio-Cattleyas from the collection of Baron Bruno Schröder. There were also extensive groups of Dahlias, Gladioli, Roses, Scabious, Phloxes and other border flowers. The chief exhibit of fruit was a number of bunches of Black Hamburg Grapes from Mr. J. A. Nix's gardens.

#### Orchid Committee.

*Present:* C. J. Lucas, Esq. (in the chair), Messrs. Jas. O'Brien (Hon. Secretary), Gurney Wilson, Fred K. Sander, Frederick J. Hanbury, Richard G. Thwaites, E. R. Ashton, Pantia Ralli, A. McBean, H. G. Alexander, J. E. Shill, H. T. Pitt, Arthur Dye, Stuart H. Low, J. T. Barker and S. W. Flory.

#### AWARDS OF MERIT.

*Laelio-Cattleya Golden Light (Golden Fleece × Luminosa).* From Lt.-Col. Sir GEO. L. HOLFORD, Westonbirt (gr. Mr. H. G. Alexander). A superb hybrid, flowering for the first time and well worthy of the Westonbirt traditions. The plant bore a fine spike of three large flowers, the sepals and petals being reddish orange and the well-displayed lip clear claret colour tinged with ruby-red.

*Laelio-Cattleya Sargon Westonbirt variety (C. Hardyana × L.-C. Lustre).* From Sir GEO. HOLFORD. The cross has been shown on several occasions, Mr. Ralli's variety gaining an Award of Merit. The present form bore a spike of two flowers with broad, rosy-mauve sepals and petals, and showy ruby-crimson lip.

*Laelio-Cattleya Idina (L.-C. Soulange × C. Nena).* From Messrs. FLORY AND BLACK, Slough. A perfectly-formed flower with mauve sepals and petals and violet-purple lip with yellow disc.

#### GROUPS.

A Gold Medal was awarded to Baron BRUNO SCHRÖDER, The Dell, Englefield Green, and a Silver-Gilt Lindley Medal (for culture) to his Orchid grower, Mr. J. E. SHILL, for one of the finest groups of Laelio-Cattleyas ever staged, the noble specimens being either raised or developed at the Dell. The group extended some forty feet by six feet deep and contained over one hundred grand specimens; the greater part were of The Dell strain of Cattleya Hardyana alba, the specimens bearing five or six flowers on a spike and some of the plants having three or more spikes, the sepals and petals being pure white and the labellums various shades of ruby and violet. With them was a selection of The Dell form of richly coloured C. Hardyana, C. Hesperus in several grand forms; L.-C. Golden Glow and L.-C. Golden Queen, with rich yellow flowers and ruby-red lip, and many other fine and rare hybrids. The plants were staged in perfect condition and excellently well arranged.

A Silver Flora Medal was awarded to Messrs. STUART LOW AND CO., Jarvisbrooke, for an excellent group with white Phalaenopsis and blue Vandas at the back, arranged with showy Cattleyas and Laelio-Cattleyas. Among novelties were Laelio-Cattleya Victor (Purple Emperor × Rubens), a handsome mauve flower with intense ruby lip, and Cattleya illustris, of rich colour. Interesting species were Laelia xanthina, Aërides odoratum album and Dendrobium Dearei.

MESSRS. FLORY AND BLACK, Slough, secured a Silver Flora Medal for an excellent group of hybrids, including Laelio-Cattleya Glorita, a showy new cross between Cattleya Rex and L.-C. Thyone, and other showy crosses.

J. J. BOLTON, Esq., Claygate Lodge, Claygate (gr. Mr. S. Lyne), was awarded a Silver Flora Medal for a neat group of superbly-grown plants, including fine forms of Cattleya Hardyana alba; the large white-petalled L.-C. Salonica alba; the showy yellow L.-C. Appam, and C.

Naidia exquisita, with several fine golden C. Venus with ruby-crimson lip, and allied hybrids.

MESSRS. HASSALL AND CO., Southgate, secured a Silver Flora Medal for a good selection of white-petalled Cattleyas, the delicately-tinted Brasso-Laelio-Cattleya Muriel; L.-C. Soulange, and forms of C. Hardyana and C. Eleanore.

#### OTHER EXHIBITS.

His Grace THE DUKE OF MARLBOROUGH, Blenheim Place (gr. Mr. J. T. Barker), sent Laelia Charm (autumnalis × grandiflora), with rose-pink flower resembling the L. majalis (grandiflora) parent in a large degree; the golden-yellow petalled Cattleya triumphans Blenheim variety (Rex × Dowiana); C. we-donaurea, and Brasso-Cattleya Blenheim Gladys (B.-C. speciosa × Schroderae), one of the largest and most perfect of the blush white forms.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), showed an interesting selection of rare species, including Paphinia cristata, with large, pendulous, claret-striped flowers; Angraecum Scottianum, with curious white blooms; Cirrhopetalum miniatum, various Oncidiums and Chondrorhyncha Chestertonii, which blooms nearly all the year round with Mr. Pitt.

LT.-COL. SIR GEO. L. HOLFORD showed Laelio-Cattleya Spalatro (C. Ludemanniana × L.-C. Aphrodite), a perfect flower of large size and attractive colour.

MESSRS. McBEAN, Cooksbridge, showed Odontoglossum Arabic, a fine flower of good colour.

#### Floral Committee.

*Present:* Messrs. H. B. May (in the chair), J. T. Bennett-Poë, W. J. Bean, S. Morris, Reginald Cory, W. B. Cranfield, G. Reuthe, W. P. Thomson, John Heal, C. R. Fielder, J. F. McLeod, Wm. Howe, W. B. Gingell, D. Allan, W. H. Page, J. Jennings, A. Turner, D. B. Crane, Chas. E. Pearson, and G. W. Leak.

#### AWARDS OF MERIT.

*Rosa Sweginzowii.*—This spreading Rose was collected by the late Mr. R. Farrar. When the brilliant, shiny, inverted, urn-shaped fruits are freely produced, it is a handsome bush. The small Fern-like foliage is reminiscent of R. sericea. According to Wilson in *Plantae Ussonianae* this Rose is closely related to R. setipoda, and is perhaps nothing but a geographical form of that species. Shown by the DIRECTOR, WISLEY GARDENS.

*Dipteronia sinensis.*—The chief interest in this hardy, deciduous tree was centred in the abundant clusters, composed of winged-pairs of flattish seeds, which resemble those of the Wych Elm, and are tinted with purple. It bears opposite pinnate leaves about 10 inches long, and becomes a small tree about 25 feet in height. It was discovered by Wilson in Western Hupeh, Central China, when travelling for Messrs. J. Veitch and Sons in 1900. It flowered at Kew in 1912, but the flowers are inconspicuous, and its chief beauty lies in the graceful foliage. Shown by the Hon. VICARY GIBBS.

*Aster hybridus luteus.*—Under this name was shown a dwarf yellow-flowered herbaceous plant with heads of numerous small, clear yellow blooms on slender, rigid stems furnished with alternate, linear lanceolate foliage. The basal leaves were 3 ins. long and about ½ in. wide. Shown by Mr. AMOS PERRY.

*Helianthus multiflorus Loddon Gold.*—This is a much larger and more brightly coloured form of the well-known herbaceous double Sunflower. It would be of value for the back row of the hardy flower border. Shown by Mr. THOS. CARLLE.

#### New Dahlias.

#### JOINT DAHLIA COMMITTEE.

*Present:* Messrs. H. B. May (in the chair), J. F. McLeod, Wm. Howe, A. Turner, Jas. B. Riding, John Green and D. B. Crane.

This committee, which is composed of representatives from the National Dahlia Society and the Floral Committee of the R.H.S., met for

the first time this season. According to the arrangement entered into between the two societies awards are not made to new Dahlias when first shown, but the most promising are selected for trial at Wisley.

#### SELECTED VARIETIES.

*Gatton Star.*—A highly decorative Star Dahlia of medium size and sturdy, compact habit. The orange-buff ground colour is shaded with purplish-mauve.

*Bronze Star.*—This is a looser-made flower than the above, and the colour is a bronzy apricot. Both shown by Messrs. J. CHEAL AND SONS.

*Hysteria.*—A broad-petalled, Cactus variety which nearly approximates the Decorative type. The unopened central florets are milky white, which becomes a pretty mauve in the fully developed florets. It is a very decorative variety.

*Megantic.*—A perfectly formed exhibition Cactus variety, having long rolled florets which incurve at the tips. The colour is pale apricot with a primrose-coloured centre.

*Yellow Queen.*—A magnificent, rich golden yellow Decorative variety. The broad florets have plenty of substance, so that the flowers should remain fresh for a considerable time when cut.

*Noble.*—In size and form this is a fitting counterpart of the foregoing. The warm scarlet colour pales considerably at the tips of the florets. Both sorts have long, stout stems which carry the heavy flowers well above the foliage.

*Siren.*—A rather more than medium-sized Decorative bloom of good shape. The broad petals are regularly stippled with rosy-mauve, making a pretty flower.

*Skyrocket.*—An exhibition Cactus variety which has long, slightly curved, rolled florets. The centre is golden bronze, while the fully developed florets are shaded with rosy purple.

*Signal.*—A Star-shaped Cactus variety which has long, straight rolled florets of pale brick-red colour. It is a highly decorative flower. All shown by Messrs. J. STREDWICK AND SON.

#### THE CORY CUP.

The only entry for this valuable trophy was from Messrs. J. CHEAL AND SONS, but, apparently through not being fully directed, the Floral Sub-Committee judged it in connection with the ordinary floral groups, and it appears on the official list as "hardy plants." So far as we could learn the Cory Cup was not awarded.

#### GROUPS.

Gladioli were the dominant feature of the show. Immediately on entering the hall the visitors were confronted with a very large collection of excellent spikes arranged by Messrs. SUTTON AND SONS in their best exhibition manner. A great many varieties were represented, and all were of high quality. The brightly coloured sorts "took the eye," and of these Capt. Fryat, Elector and Red Emperor were almost dazzling in their brilliancy. Empress of India, of very deep maroon, Brimstone, yellow, Lucie, yellow, White Giant and Prince of Wales, rich salmon pink, are the names of only a few of the varieties so well displayed (Silver-Gilt Flora Medal).

A large stretch of tabling was amply filled by Messrs. KELWAY AND SONS with many splendid Gladioli. Amongst those of pink shades we especially noted Brooklands, Beauty of Langport and Aviator, though the most prominent were the varieties which have a vivid crimson blotch on white or creamy ground. Amongst these were Sunspot, Lady Montague, Mrs. Cecil Barry, Lady Faire and Golden Dawn (Silver-Gilt Flora Medal).

The graceful Primulinus hybrids predominated in a collection of Gladioli arranged by Messrs. R. H. BATH, LTD., and of these Papilio, Black Prince, Alaska and Alberta were especially decorative (Silver Flora Medal). Near the space allotted for new plants Major G. CHURCHER had an interesting collection of Gladioli, which included Blue Isle, Duc de Massa, Anna Ebert,

cus, Woodcote and Alice Tiplady (Silver Banksian Medal). A beautiful display of *Primulinus* hybrids was made by Messrs. LOWE AND GIBSON, whose outstanding varieties were Niobe, Butter Boy, Woodcote, Sonia, Altair and Maiden's Blush (Silver Banksian Medal).

A great variety of herbaceous plants was well displayed by Messrs. W. ARTINDALE AND SONS. Nearly every seasonable plant was represented, while the more prominent were perennial and biennial Poppies, Heleniums, Gladiolus and Dahlias (Silver-Gilt Banksian Medal). Mr. H. J. JONES contributed another collection of the herbaceous Phloxes that he grows so well (Silver-Gilt Banksian Medal). In a group of seasonable border flowers arranged by Messrs. B. LADHAMS, LTD., there were many Heleniums and an interesting collection of tall herbaceous Lobelias (Silver Flora Medal). Mr. J. C. ALLGROVE showed tall spikes of *Thalictrum* with many plants of *Astilbe simplicifolia rosea* (Silver Banksian Medal).

A very attractive group was arranged by Messrs. WM. CUTBUSH AND SONS solely with Pentstemons of great merit (Silver Banksian Medal). Amongst the collection of new and rare plants by Mr. G. REUTHE were several varieties of half-hardy Crinums and spikes of *Yucca* blooms (Silver Banksian Medal). Many good stems of Hollyhocks, Gladiolus and Phloxes were staged by Mr. AMOS PERRY, who also showed a tall inflorescence of *Eryngium agave-folium* (Silver Banksian Medal).

Hardy flowers were also shown by Mr. W. WELLS, JUNR., who had a goodly vase of *Senecio chivorum* (Silver Banksian Medal). Mr. F. G. WOOD (Silver Banksian Medal). Messrs. ISAAC HOUSE AND SON, who had their new perennial Scabious (Bronze Flora Medal). Messrs. SKELTON AND KIRBY (Bronze Flora Medal). Messrs. MAXWELL AND BEALE (Bronze Banksian Medal), and the MISSES HOPKINS, while Messrs. YANDALL AND SON showed some excellent *Violas* (Silver Banksian Medal).

Roses of considerable beauty were shown by Messrs. D. PRIOR AND SON, who included Ideal, a new velvety crimson *Polyantha* variety, and Alice Amos (Silver Banksian Medal). The Rev. J. H. PEMBERTON massed to good effect such Roses as Vanity, Aurora and Mermaid (Silver Flora Medal).

Carnations of high quality were splendidly arranged by Messrs. ALLWOOD BROS., who included various seedlings in their Allwoodii type (Silver Banksian Medal). Messrs. STUART LOW AND CO. (Silver Flora Medal), and Mr. C. ENGELMANN (Silver Banksian Medal). Messrs. L. R. RUSSELL, LTD., contributed a small collection of sturdy *Celosias* and a vase of *Clematis integrifolia Durandi* (Bronze Banksian Medal).

The collection of Dahlias by Messrs. J. CHEAL AND SONS was fully representative of the various types, and, in addition to decorative vases of Cactus, Collettertes, Paeony-flowered and Star Dahlias, they had vases of the more uncommon Anemone-flowered Mons C. Dupont and the Clematis-flowered variety Ada Finch (Silver Banksian Medal).

Messrs. JARMAN AND SONS also showed an interesting collection of Dahlias. The Cactus varieties were the most prominent, and these included Geraldine, Mary Purrier and Crepuscle, while there were various Colletterte and Pompon sorts. Besides the Dahlias Messrs. Jarman and Sons contributed an excellent collection of Sweet Sultans (Silver Flora Medal).

An extensive and admirable collection of dry bulbs was shown by Messrs. F. H. COOKE AND SONS. This included a great variety of Narcissus and Tulips of all types. The Rev. MEXER, Walton-at-Store, Herts., showed a very good collection of bulbs of May-flowering Tulips and of *Iris reticulata*. Mr. W. R. DYKES, Merton, exhibited bulbs of 36 Tulip species, and also interesting paintings of nearly all the species.

#### Fruit and Vegetable Committee.

Present: Messrs. A. H. Pearson (in the chair), F. Jordon, J. Gos. Cheal, G. P. Berry, S. B. Dicks, W. F. Giles, A. C. Smith, E. Neal, T. Pateman, H. Markham, A. Bullock, A. W. Metcalfe, J. C. Allgrove, W. H. Divers, W. Wilks,

J. Harrison, E. Beckett, G. Reynolds, Owen Thomas, Geo. F. Tinley, and H. S. Rivers.

The most important exhibit before this Committee comprised sixteen bunches of Black Hamburgh Grapes of a total weight of 41 lbs. from the gardens of Mr. J. A. NIX, Tilgate, Crawley (gr. Mr. Neal). The berries were well finished, and the bunches of excellent shape (Silver-Gilt Knightian Medal).

A Card of Commendation was awarded to the HIGH WYCOMBE HORTICULTURAL SOCIETY for a collection of vegetables. Most kinds in season were represented, and the quality generally was excellent. King Edward and Arran Comrade Potatoes, Long Surrey and new Intermediate Carrots and Exhibition Runner Beans were especially fine. A Cultural Commendation was awarded to Mr. A. WOOD, West Ham, for exceptionally long pods of Sutton's Exhibition Runner Bean. Messrs. DANIEL BROS. showed their late, large-fruited Black Currant, September Black, and Mr. J. J. KETTLE, Corfe Mullen, Wimborne, showed fruiting sprays of Raspberry Lloyd George.

#### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this Society was held in the R.H.S. Hall, on Monday, August 14, Mr. Chas. H. Curtis presiding. Fourteen new members were elected. One member withdrew interest from his deposit account amounting to £5 3s. 10d., and one member withdrew £39 18s. 1d. from his deposit account.

The sick pay for the month on the ordinary side was £44 11s. 8d., and on State Section £48 5s., and maternity benefits £10.

The Secretary reported that the extra benefits from the State Section which had been paid out up to July were: Dental £88 6s. 6d., Surgical £1, and Optical £2 11s. 3d.

The Society's annual dinner will be held on October 4 at the Imperial Hotel, Russell Square.

#### NORTHAMPTON MUNICIPAL HORTICULTURAL.

THE annual show of this Society was held at Abington Park, on the 8th and 9th inst., and it easily surpassed any show previously held in Northampton. A magnificent group of Roses, 40 ft. by 5 ft., staged by Messrs. DOBBIE AND CO., not for competition, was awarded the Society's large Gold Medal. Messrs. THOMAS PERKINS AND SONS, Northampton, were awarded a Gold Medal for a charming collection of flowers and plants. A Silver Medal was also awarded to this firm for a very pretty rock garden. A Gold Medal was awarded the NORTHAMPTON CO-OPERATIVE SOCIETY for a grand display of vegetables, fruit and plants. Mr. H. N. ELLISON, of West Bromwich, was awarded a Silver Medal for a display of Cacti and Ferns.

In the group classes Messrs. CYPHER AND SONS, of Cheltenham, easily gained first prize with a fine display of stove and greenhouse plants, in the form of a rustic bridge with a mass of rare and beautiful blooms. The second prize was awarded to Messrs. THOMAS PERKINS AND SONS. The Trade Challenge Cups, offered by Mr. T. D. Wren, "The Poplars," Northampton, together with miniature cups for perpetual holding, attracted five exhibitors. The cup for Carnations was won by Mr. C. WALL, of Bath, whose exhibit also won the special prize offered for the best exhibition of Carnations in the show. Competition was very keen for the Sweet Pea Cup. Messrs. E. W. KING AND CO., Coggeshall, Essex, were awarded the trophy, beating last year's holder, Mr. S. DUNTON, Wolverhampton, who was placed second; Mr. W. J. UNWIN, Histon, Cambridge, came third. Only one group of Roses was forthcoming; it was shown by Mr. A. S. DUNTON, and it received the highest award. In the classes for table decoration, first prizes were won by Miss ELSIE CURTIS, Abington Park, and Mr. T. D. WREN,

of The Poplars, Northampton (gr. Mr. A. D. Wright). For 12 vases of Sweet Peas, the first prize was won by the Misses RUSSELL, Canterbury (gr. Mr. G. Rundle); 2nd, Captain R. B. BRASSEY, Cottesbrooke Hall (gr. Mr. J. G. Quinn). The first prize winner in this class was also awarded the special prize for the best exhibit by amateurs.

For 9 vases of Sweet Peas, Mr. R. STEVENSON HENSHAW, Wellingborough, was placed first with capital blooms. Messrs. THOMAS PERKINS AND SONS were easy first prizewinners in the class for 36 Roses, and they also excelled in that for 18 Roses, in which they were followed closely by Mr. C. S. DUFFIELD, Abington Avenue, Northampton. Mr. G. R. FREER, Kettering, won the special prize offered for the best Rose bloom in the show exhibited by amateurs.

The principal prizewinners in the vegetable classes were Capt. R. B. BRASSEY, Sir A. K. MITR, C. KITCHENER, Olney, and C. GIBSON, Doddington. The last-named won the Challenge Medal offered for the best dish of Potatoes in the show.

#### EAST OXFORD HORTICULTURAL.

THE twenty-seventh annual show of this Society was held in South Park, Headington Hall, the residence of Mrs. G. Herbert Morrell, on Thursday, August 10. The entries numbered 620, and the general quality of the exhibits was exceptionally good. The *Oxford Times* Challenge Cup, offered for the best dish of twelve Potatoes shown by an amateur, was won by Mr. W. ING, who also received a gold medal for the exhibit from the Society. The show was favoured by fine weather, and many of the visitors availed themselves of the opportunity of inspecting the gardens and glasshouses at South Park.

#### MANCHESTER AND NORTH OF ENGLAND ORCHID.

July 13. — *Committee present*: — Rev. J. Crombleholme (in the chair), Messrs. R. Ashworth, B. J. Berkton, A. Burns, D. A. Cowan, J. C. Cowan, A. Coningsby, A. G. Ellwood, J. Evans, W. Giles, J. Howes, W. M. Jackson, A. Keeling, D. McLeod, Dr. F. T. Paul, E. W. Thompson, J. Whittton and H. Arthur (secretary).

#### AWARDS.

##### FIRST-CLASS CERTIFICATES.

*Odontioda West Point Beauty* (*Bradshawiae* × *eximium*). A flower of fine shape, coloured deep salmon and scarlet.

*Oda. Chantecler, var. Militaris*. A brilliant-coloured flower. *Oda. Genesa* (*Oda. Brewii* × *Odm. President Poincare*). Flower of good form and substance, coloured purple-blue, with lighter shade on the lip; *Cattleya Harold, var. Mont Blanc*. Sepals and petals pure white, with white lip and magenta-coloured centre. From S. GRATRIX, Esq.

*Odm. eximium, var. Joyce Hammer*. An intensely dark flower. From A. HAMMER, Esq.

*Rubrophyllum macrobulbum*. A fleshy, cream-coloured flower, spotted with reddish chocolate. From H. T. PITT, Esq.

##### AWARDS OF MERIT

*Odm. St. George, var. Papilio*; *Odm. West Point excellens*; *Odm. Conqueror, West Point var.*; *Oda Juno* (*Oda Coronation* × *Odm. eximium*). Mrs. Mrs. GRATRIX.

*Odm. Dorag, West Point var.*; *Odm. Eros magnificum*; *Cattleya Trevelia*; *Cypripedium niveum Perfection*. From S. GRATRIX, Esq.

*Cypripedium bellatulum, var. Gay*. From Dr. F. T. PAUL.

*Oncidium Gardneri, Haddon House var.* From P. SMITH, Esq.

##### GROUP.

S. GRATRIX, Esq., West Point (gr., Mr. J. Howes), staged a group, for which a Silver Medal was awarded.

Obituary.

**John Herbert Goodacre.**—The late Mr. John Herbert Goodacre, whose death was recorded in the last issue, was gardener to the Earl of Harrington at Elvaston Castle for nearly fifty years; he went to Elvaston from Brynkinallt in 1872, and retired in 1919. Elvaston at that time was one of the show places of the country, and was noted for its beautiful Dutch garden with specimens of topiary, which were unequalled in the country and said to have surpassed even those at Levens Hall, Westmorland. He was a born gardener, and although he had such a high reputation as a grower and exhibitor of choice fruits, he was equally successful in all branches of his profession, and his gardening experience was a varied and broad one. So long ago as 1876 he won his first cup at the Dundee show, and during the long period intervening, until he finished exhibiting in 1914, he met with almost unparalleled success. His exhibits of choice indoor fruits almost invariably secured the leading honours at the principal shows in the metropolis and provinces, and his Grapes were always the admiration of other cultivators. He had especially fine taste in floral decoration, and his designs with cut flowers were always prominent features of the Derbyshire shows. For many years he personally superintended and

THE LATE MR. J. H. GOODACRE.

directed the Easter decorations at Elvaston Church, for which the latter became quite famous, and many visitors from Derby made the journey by Elvaston across Stocker Flatts to the beautiful old church in the castle shrubbery, attracted mainly by the beauty of Mr. Goodacre's flowers. Amongst the number of cups and trophies which he won and of which he was especially proud we may instance the York Jubilee Clock, the Crystal Palace Cup, the Derbyshire Crown China Vase, the Edinburgh Cup, the Handsworth Cup and the Birmingham Cup. During his long career as a gardener he made many close friends, and the numerous young gardeners who served under him owe him a debt of gratitude for his kindly help, and the thorough training which they received under him. He is succeeded at Elvaston Castle by his son, who was formerly gardener to Sir Ernest Cassell at Moulton Paddocks.

**T. S. H. Down.**—It is with great regret I write to inform you of the death of Mr. Thomas Samuel Hutin Down, head gardener at Basing Park Gardens, Alton, Hants, which occurred on the 10th inst. The deceased was a most accomplished gardener, and was held in the highest esteem by his employer, Col. W. G. Nicholson, M.P., and other members of the Nicholson family. Mr. Down had served the present owner of Basing Park, and his late father, as head gardener, for a period of over 21 years. He had previously held a similar position to the late Mr. Strickland Constable, of "Wassand," Hull, and also to Lord Cloncurry, of Lyons House, Co. Kildare. His health broke down about 4 years ago, but his end came somewhat unexpectedly on the date above stated at the age of 60. *Wilmot H. Yates.*

REMARKS.—Business has not been good during the past week, and although the weather has been more favourable, selling has been difficult. Abundant supplies of English cooking Apples so depreciated values that arrivals fell off considerably, resulting in a slight reaction towards higher prices. Selected dessert varieties are also easier, but a fairly good demand is still recorded. Plums are moving fairly freely. Victorias are in moderate supply, but larger arrivals are expected each day. Price of Wales and Belle Gae Louvain are selling well, as are the available supplies of English Gages. Better supplies of English William's Bon Chrétien and Hessel Peas are being marketed, and prices are on the low side. The demand for choice fruits, such as Peaches, Nectarines and Grapes, has been very poor, and these fruits have been very difficult to clear. English Tomatos are selling moderately well, and with the outdoor Jersey supplies much overdue prices of home-grown are much in front of those ruling at this period last year. Cucumbers remain a steady trade with a good demand. Although a slight improvement is recorded on the very low prices that have been ruling for vegetables, the quantities are such that there can at the moment be very little increase in their value.

Plants in Pots, etc.: Average Wholesale Prices.

Heliotrope, per doz.	9 0-12 0	of 15's .. ..	3 6-4 0

REMARKS.—Trade does not show any improvement on that of last week, and the requirements of buyers are no larger. It is only the very best subjects that realize good prices. The recent heavy rains have checked the supply of *Aster*, *Gypsophila*, *Sweet Peas* and other outside blooms, but there does not appear to be any shortage of these flowers or any advance to their prices. *Gладиолы* are still a glut and difficult to dispose of, so heavy are the supplies. *Caranations* and *Roses* appear to be lessening in quantities. *Lilium longiflorum* is again on the down grade. White and pink blooms of *L. lancifolium* are in excellent condition and moderate in price. Larger quantities of *Lily-of-the-Valley* are being offered. *Chrysanthemums* are beginning to make a good display; some fine dis-budded blooms of white, yellow and bronze sorts are now obtainable, and similar colours are obtainable in bunches, those last being in excellent condition. The dis-budded blooms are of the varieties *Débutante*, *Sancity* (white), *Mercedes* and *Holly Cot* (yellow).

GARDENING APPOINTMENTS.

- Mr. H. Pescud**, for the past two and a half years' Foreman at Ashwicke Hall Gardens, Marshfield, Chippenham, Wiltshire. Gardener to J. H. Maitlow, Esq., Sedgebrook, Pitsford, Northampton. (Thanks for 2s. for R.G.O.F. Box.—Eos.)
- Mr. A. Matthews**, for the past two and a half years at Burrough Hill, Melton Mowbray, as Gardener to the Lady ELIZABETH RUSSELL, Chorley Wood House, Hertfordshire. (Thanks for 5s. for R.G.O.F. Box.—Eos.)
- Mr. T. Budgen**, previously of Holmkush, Horsham, and for the past four years' with H. A. LONGSTAFF, Esq., at Sandgate Park, Washington, Sussex, as Gardener to Captain J. CHRISTIE, Glynedebourn, Lewes, Sussex. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eos.)

ANSWERS TO CORRESPONDENTS.

**BINDING MATERIAL FOR GRAVEL PATHS.** *E. R.* From the trouble you are experiencing it would appear that the construction of your paths is at fault. Gravel such as you describe if spread loosely on the surface of a path could never produce a satisfactory walk. The only way to overcome your difficulty is to remove the top surface of the paths and pass the material so removed through a half-inch screen. Re-form the bed of the walks, giving a suitable camber—say not less than 1½ in 60; roll and then spread the rough screenings evenly over the surface. After giving another good rolling, cover the rough material with fine screenings and then thoroughly consolidate by means of a heavy roller. If you are short of fine screenings, use marly soil as a substitute. The surface should be well watered during the rolling and the more "slushy" it becomes the better will the gravel bind together. In dry weather a path constructed on these lines may be maintained in excellent condition by occasional light dressings of powdered calcium chloride.

**CORRECTIONS.**—We understand that Mr. Morbey, whose exhibit of Sweet Peas was referred to in our report of the National Sweet Pea Society's show at Eastbourne, is manager of the Preston Hall Nurseries (Industrial Settlements, Inc.), Aylesford, Kent. Mr. W. E. Anderson, of Close House Gardens, Wylam-on-Tyne, draws attention to an error in our report of his employer's exhibit at the meeting of the Royal Horticultural Society on August 9, in which his name was given as Mr. Arden.

**NAMES OF PLANTS:** *W. G. D.* Evidently a very poor form of *Lilium auratum*.—*F. M.* *Lilium elegans*.—*W. A. L.* *Benthamia fragifera*.—*R. J.* *Clerodendron trichotomum*.—*Roses, W. L. W., A. B. C., W. W.* We cannot undertake to name florists' flowers.—*T. A. C.* *Arum Dracuncul.*—*M. M.* We do not recognise the variety of *Paony*. Send to some grower who makes a speciality of these flowers.—*A. B. H.* *Lonicera quinquelocularis*, Hardw.—*J. L.* *Calycanthus floridus*.—*Correspondent, Aberley*, 1, *Olearia Haastii*; 2, *Euonymus fimbriatus*.—*J. B.* 1, *Pittosporum Mayi*; 2, *Fothergilla aluifolia*; 3, *Potentilla fruticosa*.

**ONION SMUT:** *T. J. B.* The white varieties of Onions are more susceptible to this disease than coloured ones, therefore the latter should be grown in a garden where the disease has appeared. Collect and burn all diseased plants, and next season be careful to transplant only those seedlings which are absolutely free from any evidence of attack.

**PEAS FAILING:** *W. M.* The Peas are suffering from a very bad attack of *Thielavia basicola*, and as nothing can be done to save them at this period they should be dug up and burnt.

**POISON IVY:** *G. R.* Some people are much more liable to be affected by the Poison Ivy (*Rhus Toxicodendron*) than others. The specimens received, were undoubtedly of this plant.

**VIOLA SEEDLING:** *T. J. B.* When we received the flowers they were too shrivelled to enable us to form an opinion as to their merits. You should grow plants in some quantity and exhibit them, or show them to some hardy plant specialist for an opinion as to the commercial value of the variety.

**TOMATO FRUITS CRACKING:** *P. T. C.* The cracking of the fruits of your Tomatos is due to heavy watering following upon the dry condition of the soil about the roots. It may also have been aggravated by the use of a nitrogenous fertiliser in solution at the time of watering.

**Communications Received.**—*W. C. G.*—*J. C. & Co.*—*J. H. P.*—*H. B. O.*—*A. B. C.*—*H. A. T.*—*U. K.*—*W. J. S.*—*J. O. N.*—*J. S.*

### Horticultural Research.\*

Horticulturists have ground for friendly complaint with respect to the title, "Agricultural Research," which, doubtless for the sake of brevity, is applied to the summary of researches recently published by the Ministry of Agriculture, and reviewed already in these columns. Unless they are familiar with the fact that the Ministry is a liberal promoter of horticultural research they may be tempted to refrain from procuring a copy of this work and from studying it with the attention it deserves. It should, therefore, be stated that the volume *Agricultural Research* contains in convenient form a large mass of information of great interest and importance to the horticulturist. This information would, however, be more accessible had the author—to whom we have already expressed our obligation for the excellent manner in which he has discharged a difficult task—been able to suffix to his work a full subject index in addition to the index of "Main Subjects of Research." Inasmuch as the object of this work is to disseminate knowledge of progress of research, it is desirable that every step should be taken to make the reader's task easy. It is, of course, right that the subjects of research should be grouped under the several Institutions responsible for their conduct; but after all the reader is generally more interested in the facts discovered than in knowing the

authors of the discoveries. We draw attention to this omission of a full general index because we think that the information contained in Mr. Wilkins' book is so valuable that it should be allowed to run no risk of failing to attract the attention of every gardener. Among the many subjects of horticultural importance may be mentioned those relating to plant pests and diseases. Growers will be specially interested in the remarks on wire-worm (pp. 91 and 93), for the eradication of which experiments at Leeds indicate that autumn dressings of crude naphthaline at the rate of 10 cwt. per acre provide a means of control. Other experiments at Newcastle are less convincing in that they suggest, what from experience we strongly doubt, that extra seeding and dressing with sulphate of ammonia may suffice even in land infested with wire-worm to produce a crop. That this is not always the case is certain from observations which we have made this year. Land dressed with sulphate of ammonia and sown with Maize failed to give a single plant, every seedling falling a victim to wire-worm. A further reference to naphthaline as a soil "disinfectant" is made on p. 97, and supplies some reason why this substance may not always be effectual as a remedy for wire-worm. The experiments in the suppression of White Fly made at Cheshunt are valuable to growers of plants under glass. This pest can be eradicated by fumigation with hydrocyanic acid gas. Details of mode of application and precautions to be taken are given on p. 96. Cyanide of sodium has also proved (*loc. cit.*) a sure means of ridding glass-house soil of Eelworm—a dressing at the rate of 10 cwt. per acre per one foot depth of soil destroys Eelworm without affecting such plants as Tomatos. The widespread disease of Potatos known as Scab has been the subject of investigation at Leeds. Green manuring serves as a protective measure, since the organisms which cause Scab find their natural pabulum in vegetable residues, and when these residues are present they leave the tubers alone. Liming, on the contrary, induces Scab, and hence it is particularly important, where for other reasons land destined for Potatos has to be limed, to grow a green crop for digging in or to add green manure in any convenient form. The subject of canker of fruit trees has been investigated with effect at Long Ashton, where it has been discovered that this pest, long regarded as only a wound parasite, generally gains access to the plant through the leaf scars left by the fallen leaves and by scars formed by a Scab fungus, *Venturia inaequalis*, or through the galls caused by Woolly Aphis. With respect to Woolly Aphis itself recent investigations in America and in this country throw light on the reason why winter spraying with caustic soap is not completely efficacious in eradicating Woolly Aphis from Apple trees. It appears that this pest is not confined to the Apple; but that in this country—according to observations made by the advisory entomologist to the South-Eastern Agricultural College, Wye—the aphid is to be found on the Elm during the winter. In early summer winged forms produced on the Elm migrate to Apple trees in the neighbourhood.

The researches at East Malling and Long Ashton relating to questions of fruit cultivation deserve special consideration by the horticulturist, and to them we shall hope to return on another occasion. Enough has been said here to justify our recommendation that every gardener should make himself familiar with the results of the investigations summarised so ably by Mr. Wilkins.

**Gift of Land to the Nation.**—Two hundred and twenty-one acres of down land in the Isle of Wight overlooking Ventnor and Bonchurch has been conveyed to the nation through the National Trust for Places of Historic Interest or National Beauty. The gift includes Littleton Down, St. Boniface Down and Bonchurch Down. St. Boniface is eight hundred feet above sea level and commands magnificent views over the Channel and the interior of the Island. A local committee has been established to manage the area.

**Sale of Historic Estates.**—Claremont, Esher, for long the home of the Duchess of Albany, has been purchased by Sir William Corry, Bart., who was the last owner of Norbury Park. This beautiful demesne, which comprises some 900 acres in the Box Hill district, has been purchased by Sir Edward Mountain, chairman of the Eagle, Star and British Dominions Insurance Co. The historic mansion of Cassiobury Park, Watford, with the park, extensive ornamental grounds, House Farm and Little Cassiobury, embracing an area of 435 acres, has been sold by the direction of Adèle, Countess Dowager of Essex. As far back as Saxon times Cassiobury was the home of royalty. History records that the domain was given by Offa to the Monastery of St. Albans, at the confiscation of which Henry VIII. bestowed the property on Sir Richard Morrison. On the marriage of Elizabeth Morrison, the only surviving child of Sir Richard's grandson, the family property passed to her husband, Arthur, Lord Capel, from whom the present Earl of Essex is lineally descended. On his return from Ireland in 1677 the first Earl of Essex built the present house, leaving only the north-west wing of the earlier building. This wing was demolished in 1799. The pleasure grounds lying to the east of the mansion are of great beauty. They occupy an area of about fourteen acres and were originally laid out and designed by Moses Cook.

**New Officer for Wisley Gardens.**—As will be seen from our advertisement columns, the Royal Horticultural Society is advertising for a practical horticulturist, in succession to the late Mr. S. T. Wright, to act under the Director in the administration and cultivation of the society's gardens at Wisley. The commencing salary is £400 per annum, with residence and other privileges.

**Rural Industries Intelligence Bureau.**—The Treasury, on the recommendation of the Development Commissioners, has made a grant towards the establishment of a Rural Industries Intelligence Bureau, with the object of giving skilled advice to all who are concerned in the promotion and extension of these industries. The Right Hon. Lord Erle has been appointed chairman of the committee, which is composed of trustees, in association with representatives from the Board of Trade, Ministry of Health, Ministry of Agriculture and Fisheries, Ministry of Labour, Board of Education, Board of Agriculture for Scotland, Ministry of Pensions, Forestry Commission, Labour Party Federation of Women's Institutes, British Legion, and other interested associations. The Director of the Bureau is Mr. E. Cecil Kuy, who has a practical first-hand knowledge of the rural industries in most European countries. The Bureau will be especially concerned with (a), the revival and extension of rural industries and crafts which, with proper organisation and improved methods, can be rendered sound and profitable; (b), the establishment of new industries, and of industries which up to now have not been carried on in this country, always provided that such activities are suitable to rural districts, that handier forms the chief element in them, and that they can be set up on an economic and reasonably permanent basis, yielding a fair reward to the worker; (c), standard of workmanship, price, economical production, the use of waste material, training in various crafts and in such subjects as dyeing, leather tooling, and polishing, and in the use of the latest mechanical aids, and (d), commercial subjects, such as marketing, foreign competition, and the importance of protective

\* *Agricultural Research and the Farmer.* By V. E. Wilkins, B.Sc., Ministry of Agriculture, London. H.M. Stationery Office. Price 2/6 net.

measures such as trade marks and registered designs. Advice will also be given as to the best means of developing a simple and efficient organisation on co-operative lines. In conjunction with the Intelligence Bureau, a co-operative trading society, known as the Country Industries Co-operative Society, Limited, has been registered under the Industrial and Provident Societies Act, and is situated at 258-262, Westminster Bridge Road, S.E.1. The functions of this trading society are (a), to supply raw material of every description or half-finished goods or parts at wholesale prices to isolated workers or groups engaged in rural industry and handicraft; and also to undertake, where needed, the hiring out of plant and equipment, such as looms, sewing machines, tools, etc; and (b), to sell the articles and materials made by rural workers and handicraftsmen to the best advantage in markets not always accessible to scattered workers. Anyone wishing to purchase raw material from the trading society will be at liberty to dispose of the finished goods elsewhere if they choose; similarly they can, if they wish, obtain their material from some other source, and still employ the trading Society to market their goods.

**National Dahlia Society.**—The annual exhibition of the National Dahlia Society will be held on Wednesday, September 6, in the Royal Horticultural Hall, Vincent Square, Westminster. This is the first time for many years that this Society has held a show on its own, its exhibitions in recent years having been held in conjunction with one of the Royal Horticultural Society's fortnightly meetings. The schedule includes fifty-three classes in various sections, and it is expected that these, together with the trade exhibits, will entirely fill the large building.

**Low Prices for Potatoes.**—The market report of the Ministry of Agriculture for the week ending August 26 records very low prices for Potatoes; with very heavy supplies and only a moderate demand, a further sharp fall in price is recorded at all markets. Sharpe's Express averaged 86s. per ton, a reduction of 4Is. over the previous two weeks, while best quality King Edward averaged 111s. and British Queen were 81s. per ton compared with 130s. and 105s. respectively in the previous week. First early Potatoes at Wisbech were quoted at 40s. to 50s. per ton f.o.r. Little business is reported in Dutch Potatoes, which average 75s. per ton for 1st quality.

**Show in Aid of a London Hospital.**—The Southgate Allotments Federation is organising a fête in aid of the Royal Northern and Passmore Edwards Hospitals, which will be held in Broomfield Park, Palmers Green, on Saturday, the 16th inst. The horticultural section promises to be most successful, no fewer than five challenge cups being available for competition. The exhibition fee is one shilling, which includes admission to the fête and entrance fee to any number of classes up to two. Particulars and entry forms are obtainable from the Hon. Secretary to the Horticultural Committee, Mr. J. T. Chivers, 81, Selborne Road, N.14.

**Royal English Arboricultural Society.**—This Society will make Monmouth its headquarters on the occasion of its summer meeting, and visits will be made to the Forest of Dean, High Meadow Woods, Tintern Woods and Abbey, and Eastnor Castle and Huntley Manor Estates. Members will reach Monmouth on the evening of Monday, September 4, and an instructive and enjoyable four days are anticipated, the meeting terminating on the Friday evening. The programme is likely to prove exceptionally attractive to all interested in sylviculture. The Crown officers are placing their services at the disposal of the members, and there will be ample opportunities for discussion on all points of interest that arise. The annual dinner will be held on September 7, at the Beaufort Arms Hotel, Monmouth, when it is hoped the Earl of Selborne (President of the Society) will be in the chair, and that the Earl of Plymouth (Vice-President) will also be present. Representatives of the Forestry Commission are expected to be present.

**Mr. Harry Curtis**, Superintendent of the Public Parks and Gardens of Northampton, commenced his professional career at the early age of twelve years in the gardens of Malvern House, Shirley, Hampshire, where he remained for three years. He gained further experience in Hollybrook gardens, where he remained for five years, rising to the position of first journeyman. He subsequently became foreman in the gardens at Terrace House Gardens, Southampton. From this place, at the age of twenty-three, he was appointed gardener to the late W. F. G. Spranger, Esq., of Spring Hill Court, Southampton. This was a new residence, and Mr. Curtis was responsible for the laying out of the gardens and pleasure grounds. He remained at Spring Hill Court for more than eight years, and during that time he won many prizes at exhibitions and gained twenty-six First-Class Certificates. During his time at Southampton he interested himself in the gardening activities of the neighbourhood and held the office of secretary to the Shirley and District Gardeners' Mutual Improvement Association; his services were also in request as a judge at local flower shows, and he gave lectures at various gardeners' societies in South Hants. In May, 1900, he was appointed Superintendent of the Parks and Gar-

MR. H. CURTIS, SUPERINTENDENT OF THE NORTHAMPTON PUBLIC PARKS AND GARDENS.

dens at Widnes, Lancashire. Here he accomplished much good work, and although the district had long borne an unenviable reputation owing to the almost entire absence of vegetation, the principal industry of the borough being the manufacture of chemicals, acids and similar products, he made the Victoria Park a place of great beauty and won prizes for some of the flowers grown there. In 1913 he was appointed general superintendent of the Parks, Gardens and Allotments to the Corporation of Northampton, his duties being very varied and including, beside the upkeep of the parks and recreation grounds, the supervision of the open-air bathing places, the municipal cemetery and the public allotments. In recent years he has had the supervision of a very large number of unemployed men who have been engaged in relaying the various recreation grounds after their occupation by the military. He is a lecturer of no mean ability, and for four years during the war he gave lectures and demonstrations in gardening to over sixty school teachers, as well as to allotment holders. He is one of the hon. secretaries of the Northampton Municipal Horticultural Society, and in various other directions he lends his interest and extensive knowledge to the furtherance of gardening in the Northampton district.

**Railwaymen's Flower Show.**—Flowers and vegetables grown in railwayside gardens on the London and North-Western Railway Company's system were exhibited at Crewe on Saturday, the 19th ult. There were over sixteen hundred entries from Lancashire, Cheshire, Staffordshire and Shropshire. The amalgamation of the Lancashire and Yorkshire Railway with the London and North-Western Railway brought that section of the line into competition for the first time this year, and growers from the smaller company carried off practically all the challenge cups and the challenge shield. The latter, together with a silver medal, was awarded to Mr. G. Bossons, of Ormskirk, as the most successful exhibitor of flowers and fruit. The challenge bowl in the classes for Carnations, Picotees and Sweet Peas was won by Mr. J. Mawdsley, of Formby. Mr. W. Allison, of Newton-le-Willows, secured the cup for Roses. Mr. R. Baldwin, of Aughton, won the Manchester challenge cup for vegetables, and Mr. H. Fletcher, Warrington, was awarded the cup for line-side allotments. In the district competition for a collection of vegetables the challenge cup went to Mr. Hope, of Crewe.

**Gifts of Vegetables from London Allotments.**—The allotment holders of greater London, of which there are estimated to be fifty thousand, are shortly to be invited to make an organised contribution in response to an appeal on behalf of the voluntary hospitals. It is proposed that each allotment holder in the area should give not less than one root of Potatoes, and as doubtless many will be anxious to make a large contribution of other vegetables, as well as Potatoes, it is expected that much useful produce will be forthcoming. All the produce exhibited at the Metropolitan Vegetable and Flower Show, which will be held to-day (Saturday) at the Guildhall, will be given to the poor of London.

**Legacies to Gardeners.**—The late Mrs. A. Price-Read, of Stamford Hill, who died on March 9, left a legacy of £150 to her gardener, Alderman William Bolton, of Mill Bank, Warrington, whose death was recorded in *Gard. Chron.*, November 26, 1921, left the sum of £200 to his gardener and Orchid manager, Mr. W. Cairn.

**Bermondsey Council Flower Show.**—A three days' exhibition under the auspices of the Bermondsey Council will be held on the 14th, 15th, and 16th inst., in the local Town Hall, Spa Road. It is a purely industrial district, and the Superintendent of the Bermondsey Gardens and Open Spaces, Mr. W. H. Aggett, appeals to owners of gardens to contribute material for the show. His address is Metropolitan Borough of Bermondsey, Thurland Road, St. James's Churchyard, Bermondsey, S.E.16. The primary object of the exhibition is to encourage and stimulate the love of flowers and of the beautiful in nature amongst Bermondsey people.

**Horticultural Exhibition in Berlin.**—The Horticultural Exhibition which is intended to mark the centenary of the founding of the German Horticultural Society (Deutscher Gartenbau Gesellschaft) is being opened this week (August 30) and will last until September 13. The circumstances of the country at the present time are not very auspicious and, naturally, with the serious decline in the standard of life in Germany, the horticultural trade has suffered severely. A great effort is being made, however, to ensure the success of the exhibition, for which the chief firms have been preparing for months—in some cases for years—beforehand. The exhibition is being held in the Schlosspark, Bellevue, Berlin—a suitable place, as the grounds are very extensive, and the Castle itself can be utilised for some of the exhibits. This place, which is about two hundred years old, has had an interesting and varied history. It is first heard of in the early eighteenth century, when the ground was granted to some French religious refugees to make a Mulberry plantation. The enterprise was not a success, and the place came in 1746 into the hands of Knobelsdorff, a well-known landscape architect, who designed the park of Sanssouci and several royal domains.

Here he built a residence for himself, and laid out the grounds. After his death, the place again changed hands several times, and became in 1784 the residence of Prince Ferdinand of Prussia, the younger brother of Frederick the Great. His youngest son, to whom in due time it passed, made many improvements, and at a much later date it was a favourite spot of the Kaiserin Augusta. During the reign of the last Kaiser, Wilhelm II., it was chiefly used as a winter holiday residence for the younger princes. Since the war it has unhappily been a good deal neglected, but it is hoped that one result of the great exhibition may be the restoration of this park, now nearly two hundred years old, to something of its former glory.

**Appointments for the Ensuing Week.**—Tuesday, September 5.—Royal Caledonian Horticultural Society's meeting; Royal Horticultural Society's Committees meet; lecture by Mr. E. A. Bunyard on "Fruit Trees for a Small Garden"; Bournemouth Gardeners' Association's meeting. Wednesday, September 6.—National Dahlia Society's show at R.H.S. Hall; Royal Lancashire Agricultural Society's show (4 days) at Preston; Royal Agricultural Society's Council meeting; National Viola and Pansy Society's meeting and exhibition; Avonbridge Flower Show; Belfast Horticultural Society's show (2 days). Thursday, September 7.—Greenock flower show; Manchester and N. of England Orchid Soc. meet; Kilkenny Flower Show. Friday, September 8.—Faisley Florists' Society's meeting; Newarthill flower show. Saturday, September 9.—Ringwood Society's meeting; Glasgow and West of Scotland Horticultural Society's outing to the nurseries of Messrs. Dobbie and Co., Edinburgh; Barrhead and District flower show; Kilbarchan flower show; Lochgelly flower show; Selkirk flower show.

"The Gardeners' Chronicle" **Seventy-five Years Ago.**—*The Radish.*—The late Mr. Knight very justly remarked that in spring, about May, the old Turnips were gone, and the new ones not come, and he proposed forcing Turnips to supply this deficiency. Here the Radish steps in to supply, and from year's end to year's end the veriest clown of a gardener may have an excellent succession of Radishes. I have had some cooked in the plainest manner possible, with only a little salt in the water, and they are delicious to eat, and very beautiful to look at upon the dish. To say anything to gardeners on the culture of Radishes would be superfluous; but for the sake of cottagers let me add, that those I ate were as thick as my finger, and were only about thirty days old from the day of sowing. The Potato ground will yield millions of Radishes, both before the Potato tops cover the ground in spring and after the Potatoes are harvested in autumn. I have long tried to get cottagers into the way of growing salad, being convinced of the comfort and importance of it in every family, not to speak of its economy; and when I see poor people with large spaces of ground in their gardens lying idle in summer for two or three months, I cannot help thinking that their poverty is a good deal to be attributed to their own fault; if, "ignorance of the law excuses no man," surely the ignorance of culture is equally inexcusable in those who pay rent for the use of land for a certain number of growing days, and then give a number of the best of these days to the growth of weeds. If, therefore, thirty days of growing weather can be got, good cultivation will secure a crop of Radishes in that time; but as I do not like to leave things vaguely, I will just weigh the crop and measure the land, and thus count the cost of this crop and its capabilities. "It is but a small root," the lazy man will say. True, friend; but its top is small too, and it will stand the closer on the ground, and its time is but short in coming to perfection, as compared with other crops. Three crops of Radishes may be raised in the time necessary to grow one crop of Potatoes; perhaps six in the time of one crop of Corn. "Six crops for one year's rent!" Aye, friend, and here lies the rub; and every bit, both top and tail, of the Radish is good pig food when boiled, for both have been eaten raw by Christians. *Alex. Forsyth, Alton Towers, August 31. Gard. Chron., September 4, 1847.*

## A ROCK-GARDEN COMPETITION BY POINTS.

By the courtesy of Mr. W. G. Brazier, Secretary of the Shropshire Horticultural Society, we publish in Fig. 53 an illustration of the beautiful cup presented by the President of the Society, the Right Hon. Lord Howard de Walden, for the best rock and water garden at the Society's exhibition on August 16 and 17 last. The cup was, as stated in our report of the show, won by Messrs. T. R. Hayes and Son, Keswick, Cumberland, Messrs. Gardner and Sons, Ilkley, Yorks, being placed second, and Messrs. Broadhead and Sons, Huddersfield, third. The competition was a novel one, in so much that the judging was done by points. The

FIG. 53.—CUP PRESENTED BY LORD HOWARD DE WALDEN FOR A ROCK-GARDEN AT THE RECENT SHREWSBURY SHOW.

judge was Mr. J. H. Wood, and he awarded the three firms mentioned 89, 65 and 62 points respectively out of a total possible number of 100. Points were awarded for the following qualities, the highest number of points obtainable being given in each case:—

The design, proportion and shape, 8; simplicity, direction, continuity of the main lines produced by the ridges of stone (the placing of rocks and plants to convey an illusion of distance is included in this, also the design connected with any display of water), 20 points; the setting of the stones (picturesque laying consistent with nature and general quiet effect), 14 points. The proportion of each colour used in planting the rockeries, 10 points; the colours chosen in planting and their relative placing in harmony with one another, 18 points; skill in regard to grass laying, careful planting, and hiding cement, background, etc., 6 points; quality and rarity of plants, 24 points.\*

## HARDY FLOWER BORDER

### ERYNGIUM AGAVIFOLIUM.

It is always interesting to read Mr. S. Arnott's notes on hardy flowers in the columns of the *Gardeners' Chronicle*, and I lament over his failure with *Eryngium pandanifolium*. It is a veritable "king" in the garden as a foliage plant, or where sub-tropical-like plants are used to make noble effects. At Mr. Amos Perry's nursery, Enfield, this plant simply revels. It is fully exposed to wind and rain, yet it survives, and frequently attains to the height of 5 feet to 6 feet. Another *Eryngium* akin to the above is *E. agavifolium*, with broader leaves of a bright green, and spines more deeply toothed than those of *E. pandanifolium*. The inflorescence is a glaucous green suffused with rose, and frequently grows from 8 feet to 12 feet high. It is a noble plant for isolated positions and sub-tropical gardening, blooming from July to September. *W. Logan.*

### ASTILBE DAVIDIANA.

THOUGH there are numbers of good border Astilbes, none better has come through my hands than the above, which came to me originally from France. At present plants in clumps are producing panicles of the distinctly coloured flowers up to 3 feet in length and the height of the plants to 6 feet, the general effect in the border being light and elegant. Like most members of the family, this species prefers a damp position, but by means of frequent division and a well-manured soil, nicely firmed in March or April, it gives a good account of itself, even in moderately light grounds. *R. P. B.*

### EUCOMIS PUNCTATA.

THIS bulbous plant is worthy of a place in the hardy flower border and should be planted in a situation where it will receive plenty of sunshine. It grows about two feet high and flowers from July to September; the dense, cylindrical trusses of creamy-yellow, star-shaped flowers are sweetly scented. Both the flower stalk and the leaves are spotted with purple, the latter on the undersides. A tuft of red-edged bracts on the top of the inflorescence is also an additional attraction. September is a suitable month for transplanting this bulbous plant, which produces a number of offsets. The offsets should be removed and the larger bulbs planted six inches apart and four inches deep. The most suitable rooting medium is a light, sandy soil which is dry and warm in winter. In cold districts it is advisable to place a covering of cinders over the plants to protect them from severe frost. Well-grown specimens of *Eucomis punctata* will develop leaves three feet long. There is a pretty variety named *striata*, in which the purple blotches on the leaves and flower stems are more in the nature of stripes. Liquid manure applied to the roots when the cylindrical flower spikes are developing will greatly assist the plant. *T.*

## THE ALPINE GARDEN.

### THE DOUBLE CARDAMINE.

MOST people who know the double form of *Cardamine pratensis*, with its delicate lilac flowers, will heartily endorse all that Mr. Arnott has to say of it (p. 91). It grows here profusely about the cooler parts of the rock-garden, appearing in all manner of unexpected places. For a long time we were at a loss to know how this plant that does not set seed reproduced itself so freely. It does not appear to be generally known that it manages to do this by layering its lower leaves. The latter, on coming in contact with moist soil, sends out a tiny root from its mid-rib. From this leaf a new plant springs up, and, the process being repeated, *C. pratensis* fl. pl. will, under congenial conditions, soon overrun a considerable space. Leaves which get detached from the main plant and lodge in moist crevices (often drawn by worms) will also root, hence the appearance of new plants at some distance from the parent. *A. T. Johnson, Ro Wen, Talycafn, N. Wales.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Sobralias.**—These are, as a rule, easily grown plants, but resent being disturbed at the roots; therefore special care should be exercised in repotting them. When the plants cease flowering, any that are declining in vigour, or that from any other cause are in need of fresh material at the roots, may have attention. A mixture of good fibrous loam and peat, with a sprinkling of broken crocks to keep the whole porous, forms a suitable compost. These Orchids should be potted moderately firmly and water should be applied sparingly to the soil until the new roots are active, as the succulent roots of this species soon decay in a saturated compost. Spraying or syringing once or twice daily in fine weather will assist the plants in recovering, and also be the means of preventing attacks of thrip and red spider, which will attack the leaves if the atmosphere is at all dry. When disturbing any plants by repotting, it is always advisable to take steps to counteract any check they may receive, by making the conditions around them conducive to growth, so that they may re-establish themselves as quickly as possible. Sobralias thrive best in the Cattleya house, and when their growth is completed enjoy a fairly dry resting season; but having no pseudo-bulbs, this must not be carried to extremes. Plants that have lost their centres are best divided, placing the portions in the smallest pots that will accommodate them.

**Epiphronitis Veitchii.**—This pretty bi-generic hybrid between *Sophrontis grandiflora* and *Epidendrum radicans*, is best described as a dwarf form of the latter, and owing to its bright colour is most attractive when in bloom. At the present time these plants are producing a number of aerial shoots from the flowering growths. Such growths should be taken from the parent plant and potted several together, when they will form neat little specimens. This Orchid, like *Sophrontis*, is one that many fail to grow satisfactorily, owing, in many cases, to being grown in too much heat. It is best to thoroughly overhaul the plants each year; as they have now passed the flowering stage, and the stems are about to develop fresh roots, repotting may be done. This Orchid is best grown in a shallow pan and delights in a fairly moist position near the roof-glass, with an even temperature the whole year round. The compost should consist of fibrous peat, Sphagnum moss and A.I fibre in equal parts, to which some partly decayed leaves may be added. This plant should never be allowed to suffer for want of water at the roots, as having no pseudo-bulbs it soon feels the effect of drought, hence the necessity of watering it carefully, especially when at rest during the winter.

### HARDY FRUIT GARDEN.

By H. MAREHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Fruit Trees.**—Where the planting of fruit trees is to be extensively carried out during the coming autumn the sites should be selected and preparations for planting commenced as early as possible, so that all may be in readiness for the reception of the trees as soon as they arrive from the nursery. In forming new plantations, the nature of the soil is one of the most important considerations, and the land chosen should be sheltered somewhat from the north and east winds. The soil should be of good quality and well drained—artificially, if the natural drainage is not good. The soil should also be well broken up to a depth of two or more feet, and especially is this desirable in mixed plantations. If standards are to be planted at 30 feet apart, the stations should

be prepared thoroughly, so that the roots may have ample room in which to ramify. Good varieties should only be planted for the different purposes, and when purchasing the trees secure healthy specimens that are likely to grow away quickly and form good fruitful heads. Although the best time for planting is not until the end of October, the trees should be selected and the orders dispatched as early as possible.

**Fruit Room.**—As the time is approaching for storing Pears and Apples, the fruit room should be thoroughly cleansed and put in order for their reception. Nothing spoils the flavour of fruits more than storing them in an ill-ventilated room with a musty atmosphere. The ceilings should be whitewashed, the walls, shelves and floors scrubbed, and the ventilators kept wide open for the present.

**Wasps.**—Up to the present there have been only a very few wasps this year; only one nest has been destroyed in these gardens; in fact, I have never seen fewer wasps at the present time. Where these pests are numerous a good plan to check their number is to smash up a little fruit, place small quantities of the pulp in flower saucers, and put a little Scot's wasp destroyer on the fruit. Place the saucers on the wall tops over-night. As a rule the wasps will eat the poisoned fruit early in the morning and many will be killed.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Coddicote, Welwyn, Hertfordshire.

**Schizanthus.**—This delightful annual is one of the finest that can be grown in pots, and will be found to give the best results from seeds sown during the present month to produce strong flowering specimens next spring. The seed may be sown in pots or pans filled with light, open soil, and care should be taken to sow thinly in order to obtain strong seedlings. After sowing, arrange the seed pans in a cold frame, and shade the soil from bright sunshine. The seeds will germinate in a few days, and, as soon as the seedlings appear through the soil, the receptacle should be placed near to the roof glass to prevent the plants becoming drawn. Prick off the seedlings into boxes as soon as they can be handled safely, and later pot them singly in small pots. When they have attained several inches in height, the centres should be taken out of each plant. Cool treatment should be given at all stages of growth.

**Grassula coccinea.**—These succulent plants having passed out of flower, the present is a suitable time for propagating them. In selecting the cutting, choose young, unflowered growths, and insert three or four around the edge of a 4½ inch pot, in which they may be allowed to flower. The receptacles should be filled with light, sandy soil. Arrange the pots on a shelf in a cool greenhouse and shade them from bright sunshine. Care must be taken not to keep the young plants excessively wet in the early stages of growth. The old plants will make a fine display if grown on for another season, but to induce them to break freely they should be cut fairly hard back and watered carefully during the winter.

**Bulbs for Forcing.**—All bulbs intended for forcing should be potted at the earliest possible date. For pot culture, the miniature Dutch Hyacinth is to be specially recommended for early spring flowering. Four bulbs of this Hyacinth may be placed in a 5 inch pot. While most Narcissi may be grown in 7 inch receptacles, much depends on the variety and size of bulb. Tulips may be grown somewhat similarly, but, where flowers are required in quantity, boxes will be found the most convenient receptacles, for the plants may be lifted from the boxes when in flower and placed in bowls. Darwin Tulips are becoming very popular for growing in bowls for decorating in spring, and, given good cool treatment, they will form a good succession to the early Tulips. The potted bulbs should be stood out-of-doors and covered with leaf-mould or coal ashes

### THE KITCHEN GARDEN.

By JAMES E. HATSWAY, Gardener to JOHN BAENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Cauliflowers.**—A sowing of Cauliflower should be made now, as plants raised in the autumn make better heads than those raised in the spring. Choose a border facing south, and prepare the soil finely. Sow in drills made 8 inches apart, and as soon as the seedlings are large enough prick them off in a cold frame, not less than 4 inches apart. Keep the seedlings shaded for a day or two after they are transplanted, until they are established, when plenty of air should be admitted. Walcheren, Magnum Bonum, and Veitch's Autumn Giant are suitable sorts for present sowing. A number of plants of the last variety will go blind, but those that do succeed will be valuable at a time when Cauliflowers are scarce. Another sowing should be made a fortnight later.

**Celery.**—The main crop of Celery should be earthed up. Remove all side growths and decaying leaves, and see that the soil at the roots is thoroughly moist. Choose a fine day for the operation, as the foliage should be perfectly dry. The soil should be broken between the rows finely before starting the work. Care should be taken to keep the leaves together to prevent soil getting into the hearts of the plants. Make the soil firm around each plant, and do not place it higher than the hearts; repeat the operation every fortnight.

**Tomatos.**—Plants out-of-doors should be stopped at the main shoot to allow the clusters of fruit to ripen. Keep all side growths pinched out, and, if the foliage is very thick, it should be thinned to allow the light to reach the fruits.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDEN CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Pot Vines.**—If these Vines are intended for starting in November, they should, by now, be nearly ripe and resting. They do not require much water after the foliage is ripe, but the soil should not be allowed to shrink from the sides of the pot, as sometimes happens if the weather is hot or windy. As the canes cannot be too well hardened and ripened, the grower should see that they are well matured before the leaves fall. Once the vines are defoliated they should be kept absolutely at rest by keeping them dry and cool. The present affords a good opportunity to place the vines for a short period in the open air; stand them under a wall facing west, always provided the pots are well packed, and the canes secured to the wall. All the laterals having been removed, close to the fruiting buds, the shortening of the rods to a suitable length may be delayed for the present. Years ago cultivators of pot vines invariably gave preference to plants they raised themselves, but many traders now make a speciality of raising pot vines, and superb specimens may be bought cheaper than they can be grown at home.

**Young Vines.**—Young canes raised from eyes of the current year will soon be ripe and fit for removal, either to a light, airy house or in the open against brick walls, where they will do equally well. The roots should not be allowed to suffer from want of water, hence the importance of plunging or covering the relatively small pots, in which they are growing, with some light material. The young canes should be securely fastened to the wall, not only to prevent injury by wind, but also to give the buds the fullest benefit of absorbed and reflected sun heat.

**Melons.**—Late Melon plants should be hastened forward with all speed by closing the house or pit about 2 p.m. or 3 p.m. with sun heat and more or less atmospheric moisture, according to the weather and the state of the fruit. If the latter are still swelling, the surface of the bed and floors of the house may be well syringed with tepid water, but on no account

should the foliage or stems be wetted. This early closing of the house will greatly economise fire-heat, but the time has now arrived for utilising the hot water system, first to maintain the requisite degrees of heat with night air, and, second, to prevent an accumulation of stagnant moisture in the lower part of the house. Watering will require careful attention, and here the advantage of having late plants in pots will be apparent, as all the feeding roots are close to the sides of the receptacles. A little tepid liquid manure may be given the plants until the fruits have attained their full size and are netting freely, but it is better to underfeed than to try and force the fruits beyond the normal size, especially at this late period. Plants on which the fruits are fully developed should not be allowed to flag, but the supply of water must be limited. The provision of bottom heat is another important matter that must not be overlooked, as there is no period when a brisk bottom heat is of more advantage than at the time when the fruits are finishing.

**THE FLOWER GARDEN.**

By EDWIN BECKETT, Gardener to the Hon. VICAR GENERAL GIBBS, Aldenham House, Hertfordshire.

**Seed Saving and Sowing.**—The careful gardener will watch for the ripening of seed on such plants as he desires to increase his stocks. Where not required, seed pods should be cut off so as to prevent the plants throwing their efforts into perfecting seed at the expense of flowering. Such plants as Poppies and Fritillarias are very quick in bursting their seed-pods and scattering the seeds. Seed of the smaller seedling subjects is best sown when it is ripe, as in storing it much of its vitality is lost. Antirrhinums may be sown freely at the present time in places where a good show is required during the summer. Sow lightly, press the seed gently into the soil, not covering it, and germinate it in gentle warmth, covering the seed pans with sheets of brown paper until such time as the seedlings appear. Thereafter remove the paper, and prick out the seedlings as soon as they are large enough to handle.

**Grouping of Plants.**—Generally, where there is a large collection of hard-wooded subjects, the different members of a group are scattered through the various shrubberies, and, when comparison is desirable, it necessitates the taking of specimens over a considerable area. At Aldenham we have adopted a different principle with some of the larger and more important plant families. The Taxads, for instance, have been grouped together at one prominent position on the lawns, and here, within view of each other, are gathered together over fifty species, varieties, and forms of the Yew. They present a most interesting group, and the variation they exhibit renders the spot a very attractive part of the garden. Oaks, of which there are something like 180 different sorts, are grouped in another part of the grounds, forming, with a collection of American Thorns planted alternately with the Oaks, an avenue along the principal walks of one part of the woodland. Species of Rosa have been planted as specimens in the wilderness, and present a pretty contrast to one another. Bamboos, of which there are over fifty sorts, have been grouped in the Bamboo garden, and in another part of the garden numbers of rare forms of Elms have been planted in a row. Another group has been formed of Crab Apples, and species of Pyrus allied to them, and the contrast in this case is one of the most interesting of all. Alders may be grouped along the ornamental banks of ponds, streams, and lakes. Planting the members of a particular family together in this manner makes a beautiful, interesting, and decidedly instructive feature of garden ornamentation, any tendency to crudeness being corrected by the judicious employment of a few other good trees and shrubs to form a setting to the whole. This "herbarium" plan of planting families of plants will greatly repay those who are interested in trees and shrubs

**THE HISTORY OF THE MOSS ROSE.**

(Concluded from page 124.)

The Dutch may have procured their first specimen of the Moss Rose, whether it were the one grown at Leyden in 1720 or elsewhere, from some remote region in France, but the probability after perusing all the available old French floricultural literature is against it, and I am therefore justified in asking Major Hurst for some more convincing evidence than he has already brought forward to prove his case.

It is curious at this point to observe that Jules Gravereaux, the great French rosarian, in his *Guide* to his exhibits at the Retrospective Rose Show in Paris in 1910 repeats, without quoting an authority, that the Moss Rose was grown at Carcassonne towards the close of the 17th century, on the authority of Fréard du Castel, a gentleman of that city, who settled down in Normandy in 1746, and introduced it there. Where, we may well inquire, did Fréard du Castel make this statement, for it was unquestionably not in *L'École du Jardinier Fleuriste*?

dinier, for 1784, as containing a reference, but the first I can trace is in Vol. 3 of the *Traité des Jardins*, Caen, 1785, by Le Berryais. De Grace, the author of *Le Jardinier Universel*, 1783, includes it, as also does Filassier in *Dictionnaire du Jardinier Français* (2 Vols.), 1791.

As further evidence of contradictory statements, Gravereaux, in opposition to what he says in his *Guide*, 1910, already quoted, mentions in *La Malmaison* (1912) that the flower was introduced, so it is said, from England, in 1777 by Mme. de Genlis, and this sort of unauthentic and unreliable matter can be quoted *ad lib.* and none of it is worthy a moment's consideration until passed through the sieve of critical examination and proved to be of historic exactitude and value. Much of the literary material that has passed through my hands in the course of this investigation may truly be said to have been "weighed in the balance and found wanting."

In conclusion I correct a few typographical errors that have been made in previous instalments of this article, which evidently escaped my attention when the proofs were read.

FIG. 54.—FRUITING SHOOT OF ROSA SWEGINZOWII: R.H.S. AWARD OF MERIT, AUGUST 22.

There is little more comment to make beyond this, that the Rose was but little regarded in France until the dawn of the 19th century; French floricultural literature prior to that date is, as is almost the case with English floricultural literature, very little occupied with the particular kind of Rose under consideration.

I have rapidly reviewed all the old French florists' books at hand. The earliest are mainly on bulbous flowers and other old-time florists' flowers, such as the Auricula, Carnation, etc. Even where Roses are mentioned, I can find nothing about the Moss Rose in the *Nouveau Traité pour la culture des fleurs*, 1674, and subsequent editions; *La Culture des Fleurs*, 1692; *Le Nouveau Fleuriste*, 1699; *Liger*, 1706, nor in the three English translations of Liger, nor in so late an edition of Liger as 1776. As already stated, it is not in *L'École du Jardinier Fleuriste*, 1764; nor *Buchoz' Dictionnaire Universel de Plantes*, 1770; which is a most remarkable omission if the Moss Rose were then known in France. *Le Jardinier Portatif*, 1769, and again in 1774, has no reference to it. Supposing its culture were known in Normandy at the period claimed for it, the Moss Rose could hardly have been widely known there, for in a book published in Caen, 1793, entitled *Abrégé du Traité des Jardins ou petit de la Quintinye* (2 vols.), quite a number of Roses are mentioned to the exclusion of the Moss Rose. Major Hurst gives *Le bon Jar-*

This on p. 69, the Moss "Provence" Rose should be spelt "Province" in the case of Farber's Catalogue (1724), that being the way in which it is given by him. Miller also, in the *Gardeners' Dictionary* (1731) adopts the same spelling. This is perhaps a matter of no great importance, because for many years writers of that period used the two forms indiscriminately. Probably "Province" was regarded as the better translation of the Latin "provincialis." On p. 84, in the 2nd col., the name Cassteel" should be "Cassteels." In the 3rd col., last paragraph but one "Rosa muscosa" should, of course, be "Rosa muscosa." C. Harman Payne.

**ROSA SWEGINZOWII.**

AMONGST the exhibits at the Royal Horticultural Society's meeting on the 22nd ult. were two interesting Roses in fruit from the Society's gardens at Wisley. One, named R. Sweginzowii (see Fig. 54), received an Award of Merit. This is one of the several new species introduced during the past few years from China, and it will be valued as much for its decorative fruits as for its pretty flowers and foliage. Most of these new Chinese Roses have very ornamental fruits, which are especially attractive in the shrubbery and wild garden in late summer and autumn.

## EDITORIAL NOTICE.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

**Letters for Publication**, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

## GARDENERS' CALENDARS.

## No. 2. ABERCROMBIE.

CONSIDERABLE personal interest attaches itself to John Abercrombie, with the mention of whose books, *Every Man his own Gardener* and *The Gardeners' Pocket Journal*, I ended my first article.\* He was a diffident man and distrusting his own powers arranged with the gardener of the Duke of Leeds, Thomas Mawe, to have his name, as if he were its author, put on the title page of the first edition of *Every Man his own Gardener*. All the same, the voice was the voice of Abercrombie. He really wrote every line, but wishing to give the work as good a start in life as possible, he paid £20 to have the name of the then much better known man appended to it. According to many modern students of the Old Testament, in doing this he would only be following an old custom of the ancient Jews, for whoever wrote or compiled the book of Proverbs appended to it the name of the famous and popular King Solomon, to ensure it having a favourable reception.

When we are told that Abercrombie had a family of two sons and sixteen daughters, his anxiety is explained. The first edition of *Every Man his own Gardener* appeared in 1767 in 12mo size, with the one name of Thomas Mawe on the title page as if he were sole author. When the name of Abercrombie was added to that of Mawe I am unable to say. It may have been in the second or third, or in a still later edition, but the work before very long became known as Mawe and Abercrombie's *Every Man his own Gardener*.

The twentieth edition was prepared for the press by Abercrombie himself. He says in the preface: "One great advantage which this book has over other books of the same kind is this: that whereas other gardeners' calendars, in a cursory manner, only set down what business is necessary to be done every month in the year, without giving sufficient instructions concerning the practical manner of performing it, here the method of proceeding is minutely explained." The author was continually improving its contents with every succeeding edition from his own personal experience and bringing the plants mentioned in it up to date. To these two factors its long period of ascendancy over all other books for use in English gardens must be ascribed. It was once Evelyn, then possibly for a short period Richard

Bradley, then Miller and, after Miller, Abercrombie for nearly as long a period of years as the other three of them together.

I possess an edition—the twenty-sixth—of the date 1857, on the title page of which we get an abridged history of its life. After Abercrombie's death in 1806, as the result of a fall as he was going home from some place of public entertainment near his residence in Somers-town, it was first of all taken in hand by James Main, A.L.S., who improved it and brought it down to 1839. In a preface to this edition, the twenty-fourth, he eulogises this work of Abercrombie saying "of the thousand and one books which have been published on the same subject no one has kept so strong a hold of public estimation as this has done." Since the first edition in 1767 the method of heating hot-houses had been much improved; the number of fruits and vegetables found suitable for forcing had been greatly increased; the culture of fruit trees in pots is especially noted as having become fashionable, and Lane, of Berkhamstead, and Rivers, of Sawbridgeworth, are mentioned as two nurserymen who always kept a number ready; many new flowers and plants had been brought from foreign parts; and so on. Main had no difficulty in making out an overwhelming case for his twenty-fourth edition.

After Main it was again brought up to date, but this time by a much more famous man—George Glenny. The extraordinary influence which he exercised on the development of all the more popular garden flowers almost passes belief. It did not much matter what it was, he was quite ready to lay down a standard of perfection for it. Rose or Lily, Tulip or Mimulus, Fuchsia or Petunia, Phlox or Potentilla were all alike fish in his net. His little booklet, *The Properties of Flowers and Plants*, I regard as, in a way, a great literary curiosity, a copy of which should be in every gardener's library. That Glenny should take up the work of Main I regard as an additional testimony to the worth of this calendar. The twenty-sixth edition is, on the title page, said to be brought down to 1857 "with notes and additions, and the catalogue of plants and fruits corrected by George Glenny, F.H.S." In the preface "he hopes he has preserved all the useful lessons of his great predecessor."

Abercrombie, under his own name, issued similar works at later dates; viz., *The Universal Gardeners' Calendar*, 1789, and *The Gardeners' Pocket Journal*, 1791. This last little book had an enormous sale. It is said two thousand copies were sold annually and a new revised edition appeared every year for a long time. I happen to have the twelfth edition. It is dated 1811. The fourteenth is dated 1815. Johnson, in his *History of English Gardening* (1827), says: "I know not how many have appeared since (i.e. 1815) but there is usually a fresh one every year." From all this and from other facts which may be gleaned from other sources, we may safely place John Abercrombie among the greatest gardeners of a past age. Before, however, we pass on may I point out a probable error in Mrs. Evelyn Cecil's bibliography in her *History of Gardening in England*. Under the date 1817 one James Mean is said to be the man who enlarged and brought Abercrombie's *Practical Gardener* and *Gardeners' Companion* up to date. I may be wrong, for I have no large library to go to to verify facts from the books themselves, but one James Main, A.L.S., did enlarge and bring up to date Abercrombie's *Every Man his own Gardener*, as the title page of my edition proves. Was this, I wonder, the James Main mentioned by Mrs. Cecil under the date 1833? She is wrong in spelling the name Maine; also may I say from the evidence of books in my possession 1835 is the date of the second edition of his *Villa and Cottage Florists' Directory*, the date of the first being 1830; and that in both editions he is described as James Main, A.L.S. Did both a Mean and a Main enlarge Abercrombie?

The nineteenth century does not seem to have been quite such a good time for the production of calendars as was the eighteenth, nevertheless no less a man than Sir Joseph

Paxton—the first of our garden knights—put pen to paper and wrote one. This first appeared in the columns of the *Gardeners' Chronicle* for February 5, 1842, under the title of "The Cottagers' Calendar of Garden Operations," and filled 16½ columns. When the first edition in book form appeared I am unable to say. The earliest in the R.H.S. Library is dated 1904, but I have one sent me by the *Gardeners' Chronicle* dated 1895 and called a "new edition." The question is: How many older ones were there? This 1895 edition has several points of interest in the subjects which are added to the calendar proper. First, in the pages devoted to Vegetable and Fruit Cookery one is carried back to a much earlier work, *Adam's Luxury and Eve's Cookery*, which was published anonymously in 1744, but which breathes exactly the same spirit as Paxton's, inasmuch as it was "designed for the use of all who would live cheap. . . particularly for Farmers and Tradesmen in the Country, who have but small Pieces of Garden Ground and are willing to make the most of it." There is a concise list and description of the usual vegetables; then a Kitchen Gardeners' Calendar; and lastly a "Collection of Receipts for dressing all Sort of Kitchen-Staff." These naturally arouse considerable curiosity as showing the differences between our present ways and customs and those of the past.

Secondly, in the lists of best varieties of fruit and flowers we are taken back to Evelyn, for this has been an adjunct of many of the best calendars and a most useful one, both for the present practitioner and the future historian. Thirdly, the page of prices of garden tools reminds one of *The Floral Calendar* of James Mangles, R.N., who sent Swan River flowers to Lindley. The calendar part of this extremely interesting little book occupies only 27 pages of the 156 of which it is composed. It is the contents of the 130 that give it distinction. They are nothing more or less than a miscellaneous collection of all manner of odd items of information, and very often prices are given, as on page 51, of Geraniums, and, on page 137, of seeds. On page 111 the contents of a pre-Biton Rectory garden are given in the list of rare trees, shrubs and plants then to be found in the Rectory garden at Hendon.

Space does not permit much to be said of the contents of the 1920 edition except that it has been brought as far as possible up to date, and contains a vast amount of information on all manner of subjects on which the beginner and even the more experienced gardener from time to time require help. *Joseph Jacob*.

## NERINE FOTHERGILLII MAJOR.

(SEE COLOURED PLATE.)

NERINE Fothergillii major is, without doubt, the finest of the old Nerines, before Max Leichtlin took them in hand, this hybridist's work being successfully carried on by Mr. H. J. Elwes, F.R.S., who made such a stir in 1897 with the fine and very varied forms he brought to the Floral Committee of the R.H.S., when no fewer than eight obtained Awards of Merit.

The culture of Nerines is by no means a difficult matter, if a few simple rules are carried out. The plants require a long, dry rest after their growth is completed, and the leaves have turned yellow and fallen off; indeed, the main success with these plants lies in resting the bulbs thoroughly and warmly after growth is completed. I place them in a frame, keeping the lights on, and, by the advice of one who has tested it, laying the pots on their sides with the small end towards the sun. Thus the heat reaches the bulbs and roots more directly. The result is a larger crop of bloom; twice as much as where the pots are stood upright. When in full growth after flowering, the plants may be given soot water or Clay's fertiliser occasionally, for, as Nerines are better left undisturbed for some three years, unless there are offsets to remove, growing so long in the same soil, they need some stimulant. A mixture of good loam,

\* *Gard. Chron.*, July 8, 1922, p. 20.

a little sand and leaf-mould, or some well-rotted manure provide a good compost for potting. Good cultivation is the key to good blooming, but it must be remembered that some of the hybrids flower more freely than others. *N. Fothergillii* major with me is the earliest to flower, and I count on its blooming in the last week of August. Last year, possibly on account of the long drought, I did not have the first blooms until September 15. Firm potting is essential, and the use of a blunt stick will be found very convenient for the purpose. The blooming season continues to the end of the year, many late-blooming varieties having been derived from *N. Mansellii*.

I have grown *Nerines* for quite forty years and always recommend people to take up their cultivation, for there is no other bulbous plant which can brighten up the conservatory or greenhouse as the *Nerine* does in autumn and early winter. I would advise anyone who intends growing these fascinating plants to attend, if possible, the autumn shows of the Royal Horticultural Society, where large groups in flower are shown by Messrs. Barr and Sons, Mr. Chapman, and Mr. Reuthe, and thus they can select those which appeal to their fancy. The most free-blooming variety I know is *N. cornusca pallida*, a Continental variety which never fails to give plenty of flowers; another, *Lady Howard de Walden*, is very free blooming; it is a rich purple-crimson colour, one of Mr. Elwes's raising. I could enumerate a large number of beautiful sorts, but as many are not in commerce, it would serve no useful purpose to give their names. *J. T. Bennett-Poe, V.M.H.*

**GARDEN NOTES FROM S.W. SCOTLAND.**

It does not seem to be generally known, even by those who grow New Zealand Flax (*Phormium tenax*), that it supplies the best and strongest material both for tying up growing plants and for binding parcels for dispatch. The leaves are best used green, but even when quite dry strips of the required thickness may easily be pulled off in lengths of four or five feet. It is preferable to bast, not only because of its far superior strength, but because its colour renders it practically invisible when it is used for tying up living plants.

The most graceful flower in our August borders is the South African *Dierama* (*Sparaxis*) *pulcherrima*. From a clump of long, reedy leaves rise slender, arching wands bearing a succession of bells of every tint from blood red to white, the choicest being soft rose-colour, waving and dancing in the lightest breeze. This plant is perfectly hardy near the sea; we have had plenty of it here for more than forty years; but it will not bear transplanting except at a very early stage of growth. It ripens plenty of seed, which I found accidentally retains vitality for a long time.

Sir Frederick Moore having sent me, from Glasnevin, seed of a very highly-coloured variety, the packet got mislaid and lay forgotten for three years. It was then sown, without much expected as the result; but every seed germinated and some of the plants are now in flower. A rather moist soil, without lime, suits this plant best. I shall be happy to send seed to any reader who cares to send me a stamped, directed envelope.

Among the New Zealand Groundsels *Senecio Huntii* stands conspicuous with large panicles of clear, yellow flowers which contrast amiably with the silvery foliage. It comes into blossom in July, just as *S. Greyi* is passing away. As yet, our plants are not more than between four and five feet high; but whereas they have never flinched under nine degrees of frost and stand exposure to wind without injury, we are encouraged to expect them to attain the stature of 20 feet, as this species does in New Zealand.

Farrer's *Cyananthus* No. 1220 (I do not know whether it has yet received specific designation) is a notable improvement on the Himalayan *C. lobatus*. It creeps about with so much freedom, and carries its good blue bells so jauntily on three-inch stems, as to encourage hope that it may be less impatient of winter wet than the other species, which we have given up as hopeless. Farrer's plant is a fitting companion

in habit and colour to *Erythraea Massonii*, and seems to relish similar conditions of cool soil and moisture.

I am indebted to a correspondent from East Molesey for a reply to my inquiry about *Campanula amabilis* (page 110), which he tells me is now to be known as *C. phytidocalyx*. Unfortunately his letter has got mislaid and I have forgotten his address. I hope he will accept this acknowledgment of the information supplied, and also for the seeds of *Phyteuma comosum*. *Herbert Maxwell, Monreith.*

**EUSTOMA RUSSELLIANUM.**

This charming member of the *Gentian* family, which was formerly known as *Lisianthus Russellianus*, provides an excellent subject for pot

season, before they have made fine specimens; neither should the sowing be delayed for too long, otherwise the rosettes will not grow sufficiently strong to throw up good flowering shoots. The best time to sow is May or not later than June, and the plant should be treated as a biennial. As the seeds are minute they should be sown on the surface of the soil (which should be of a light texture) and covered with a little silver sand, placing a sheet of glass over the pot. Germinate them in a temperature of 50°, and when the seedlings are large enough pot them singly in small pots in a compost consisting of loam, peat and leaf-mould with a sprinkling of sharp sand. They will require very little shade when the roots are established. Grow them near the roof-glass in a house having a temperature of 50°, giving them air on all possible occasions. Great

FIG. 55.—POT SPECIMEN OF EUSTOMA RUSSELLIANUM.

culture and for the decoration of the conservatory. The large, handsome flowers are three and a half inches across, coloured mauve with a deep purple eye and borne in terminal panicles on plants about two feet high. The leaves, which, like the stems, are glabrous and glaucous, are connate, ovate, or ovate oblong, three to five nerved, very acute, gradually becoming smaller upwards and more acuminate, till they pass into subulate bracteals at the base of the panicles. The species is a native of Texas and Mexico; seed was first introduced into this country by Drummond from San Félix d'Austin 1835, and the plant flowered for the first time in 1837, but for some reason it never appears to have become very common in gardens, probably due to the reputation it seems to have gained of being a difficult subject to cultivate, but with ordinary care and attention it is not difficult to obtain good results.

The seeds should not be sown too early or the young plants will attempt to flower the same

care in watering is needed in winter. In early spring the plants should be potted either singly, or two or three may be put in a six-inch or eight-inch pot, using similar compost as previously recommended. Cuttings which spring from the base of the old plants may be rooted in a little bottom heat, and when established may be given the same treatment as the seedlings.

At the Botanic Garden, Cambridge, it is a most attractive plant from June to the end of September, and for some weeks a batch of plants ranging from 18 inches to 28 inches in height has been a feature in the conservatory. The blooms remain fresh for a long time when cut, and a spray that has been in water three weeks is looking equally as fresh as when it was first cut. The colour of the type, as already stated, is mauve, but there are white as well as rose-coloured forms, but beautiful as these are, they are not so attractive as the type. *F. G. Preston, Cambridge Botanic Gardens.*

## CHINESE TREES AT ALDENHAM.

(Continued from p. 119.)

**CEDRELA SINENSIS.**—(See Fig. 56.) Twenty-five feet. This, which used to be called *Ailanthus flavescens*, closely resembles the "Tree of Heaven," and is a handsome species when clothed with its long, pinnate foliage. I do not know that it has flowered in this country, but the white blossoms are said to be fragrant, and produced in terminal panicles, one foot long. The tree grows rapidly, and at Aldenham may be seen some fine specimens twenty-five feet

it might have been taken for a tree form of *Forsythia* in full flower.

**CYDONIA JAPONICA WILSONII.**—Twelve feet. This plant is remarkable for the great size of the yellow, Lemon-like fruits, which are borne freely, and always attract attention. This variety is known in the United States as *Chaenomeles lagenaria Wilsonii*.

**DAVIDIA INVOLUCRATA.**—Mr. Wilson considers this the most beautiful tree he saw in China, and he has written some delightful articles about it. At Aldenham a fine specimen is now twelve feet tall, and, as it grows freely and the wood always becomes well ripened,

found in Japan (of which a specimen is also to be seen in the grounds of Aldenham) and the more common form, *P. trilobata*, which freely abounds in Syria. The height of the Aldenham plant is six feet, and it is quite hardy.

**ELAAGNUS UMBELLATA.**—Seventeen feet. This well-known shrub, or small tree, varies widely in time of flowering, and also in habit, and it is very interesting to see the tree-like appearance of an Aldenham specimen, which has now reached the height noted above. It is attractive in all shapes, but particularly, I think, in standard form.

**EUCOMMIA ULMOIDES.**—Fifteen feet. Considered by the Chinese of great value, from a medicinal point of view, this free-growing tree is of interest in English gardens on account of its being the only hardy tree known to contain rubber, or more properly gutta. It is perfectly hardy, and the foliage is ornamental, but the hope that it might prove of commercial value has already, as Mr. Gibbs informs me, had to be abandoned. This is a dioecious species, and Mr. Wilson, when recently at Aldenham, said that, though he had seen several specimens of the male plant in this country, he had not seen one female, and watch is being kept at Aldenham for such.

**EUPTELEA POLYANDRA.**—Ten feet. This is a very uncommon tree, of value for its ornamental foliage, which colours well in autumn. Its near ally, *E. Franchetti*, is also to be seen at Aldenham, but, owing to frequent injury by spring frosts, this latter species has never developed satisfactorily there.

**EVODIA RUPEHENSIS.** Twenty feet. This is a rapid grower, having been introduced by Wilson in 1908, and gives promise of developing into a very handsome tree. The foliage, divided into leaflets, is strongly scented, as are other members of the Order Rutaceae. The members of this genus will not bear removal unless transplanted when quite small.

*A. E. Thatcher.*

(To be continued.)

## NOTICES OF BOOKS.

## The Progress of Afforestation.

THE second Annual Report\* of the Forestry Commissioners covers the period ending September 30, 1921, and is a record of continuous progress in the acquisition of afforestable land and in actual planting operations. The Commissioners at the date just mentioned were in possession of 103,572 acres, but of this only 68,489 acres were classed as "plantable land," the remainder being either too poor to plant or required for other purposes. The land is acquired in two ways. Of the plantable land, 46,837 acres were obtained on lease at a rent of about 2s. per acre, and 21,652 acres were purchased at an average price of £1 8s. per acre. If the whole cost be charged against the plantable land, and the poor land be reckoned as valueless, the rent would be 3s. per acre, and the price £2 17s. per acre. Either set of figures shows that suitable land can be readily obtained at a very moderate cost, and in large quantity. The afforestation of cheap land is an accession to the real wealth of the nation, as the timber produced is much more valuable than the poor grass, Rushes, Ferns, Heather, and Furze which now cover the ground.

In the actual work of afforestation a good start was made, 6,377 acres having been planted in 1920-1921, and 1,417 acres in the preceding season. The species used have been mainly Conifers, only 393 acres being planted in the two years with broad-leaved trees. Progress in planting depends largely on having ready an adequate supply of young trees. The Commissioners have imported enormous quantities of tree-seeds, and have created extensive nurseries, which at the end of September, 1921, covered an area of 607 acres and carried a stock of 111 million seedlings and 33 million transplants.

The establishment of State forests and nur-

FIG. 56.—CEDRELA SINENSIS IN ALDENHAM HOUSE GARDENS.

high. Wilson was not the first discoverer of this tree, but re-introduced it to England, whither it was first brought some sixty years ago.

**CORYLUS CHINENSIS.**—The Chinese representative of the Turkish *C. colurna*, which, in a wild state, makes a fine tree. It grows quickly, the Aldenham specimen being fifteen feet tall, and has handsome foliage, six inches or more in height.

**CRATAEGUS MAXIMOWICZII.**—This Hawthorn is now eight feet high, whilst *C. Wilsonii* is six feet high, and both are ornamental and interesting Thorns. The former has the special merit of coming earlier into leaf than any other of the countless members of this genus which are to be seen at Aldenham, while, at the same time, this early growth will withstand 15° to 20° of frost without injury. Looking at a specimen towards the end of March in this year, the young leaves showed so bright a yellow that, at a little distance,

it may be expected to succeed. It has not yet produced its inflorescences with the striking white bracts.

**DIPTERONIA SINENSIS.**—(See Fig. 57.) Twelve feet. A most interesting, rare tree of medium height, belonging to the Maple family, with very ornamental foliage. The leaves, about one foot in length, are composed of seven or more leaflets, and the inconspicuous flowers are succeeded by large clusters of fruits like those of the Wych Elm, which have already proved fertile here. It was discovered by Wilson about the year 1900. The species received the R.H.S. Award of Merit on the 22nd ult.

**DOCYNIA DELAVAYI.**—I have given the American name of this plant, of which little is yet known. It is likely to prove of considerable interest, inasmuch as, belonging to the small section of the *Pyrus* family known as the *Eriolobus*, in accordance with the generally accepted British determination, it would appear to be a connecting link between the somewhat rare species *Pyrus Tschonoskii*

series is only one side of the work of the Commissioners. They were authorised by the Forestry Act of 1919, to assist landowners and corporations during the ensuing ten years in re-forestation 50,000 acres of old woodland, and in planting 60,000 acres of new land. The assistance was to be rendered by grants, loans, and proceeds-sharing schemes; but these are so hampered by onerous statutory conditions as to be quite unworkable. Encouragement to private forestry has been in abeyance, except during last winter, when, as an emergency measure of relief, small grants were issued to landowners for afforestation, the only condition imposed being that planting should be done by unemployed labour. These grants proved most attractive, and as a result, in six months, no fewer than 11,000 acres of private land were planted, and 11,500 acres were prepared for planting. This notable addition to the woodland area of Great Britain shows the efficacy of small grants in stimulating planting on ordinary estates. The Forestry Commissioners should be empowered to assist landowners in planting by direct grants without any restrictions. In this way, the forest area of the country might be most economically increased.

The Report gives much information in the form of tables about the area, cost, and species of the various plantations and nurseries that have been established. The positions of the different State Forests and Crown Woods are indicated in a sketch map.

Forestry Education cost during the year under notice £13,748, including grants to Universities and Colleges of £1,242. There are four Schools for apprentice woodmen, where sixty men received training during 1920-1921. These are situated at Parkend (Forest of Dean), Burley (New Forest), Chopwell (Co. Durham) and Beaulieu (Inverness-shire). The expenditure during the year on these four Schools amounted to £10,740.

Research cost during the year £7,737, and was carried on exclusively by six of the Commissioners' staff. Seventy-nine sample plots in England, Wales and Scotland were under observation in September, 1921. These plots will be thinned and measured periodically, and are expected to provide in due course much needed data as to the rate of growth and best methods of thinning plantations of different species. Numerous experiments were made on the germination and soaking of seeds, and on the protection of seed-beds from drought, frost and weeds. During a dry season, the benefit of overhead shelter is very striking. Beds covered with lath-grating (1 inch lath and ½ inch spacing) gave full germination, while in the unprotected beds the crop was almost a total failure. Overhead shelter is also efficacious against frost-lift in the nursery; and thin crops of Douglas Fir and Sitka Spruce in their first year require in addition the application of moss or humus to the beds. Investigation shows that seed extracted from Scots Pine cones at a temperature not exceeding 104 deg. Fahr. gives better germination and more vigorous seedlings than ordinary commercial seed from cones exposed to a greater heat.

Investigations on various insect pests have given useful results. *Chermes Cooleyi* has attacked Douglas Fir; but its destructive gall-form on Sitka Spruce does not exist as yet in Great Britain. To prevent this insect's further dispersal, measures for dealing with infected nursery stock have been devised. Experiments on the Pine-weevil have demonstrated the efficacy of bark-traps as compared with hand-picking, and showed that decay billets and pit-traps tend to prevent the migration of the weevil from its breeding ground.

Planting procedure is discussed; and the remarks on the organisation and efficiency of labour, and on the size and spacing of plants, will be found of considerable interest. Experience proves that almost all forest work can more economically be done by piece-work or by contract. This applies especially to fencing, preparing the ground for planting, and lining-out seedlings; and even to notch-planting, which, if efficiently supervised, does not suffer in quality.

A special account is given of the drought of 1921, which did considerable damage in England and Wales. Spring planting suffered severely. The death-rate among newly planted trees was very high indeed, as much as 35 per cent. Nearly 4,000,000 plants perished. The mortality varied in the different species, being 49 per cent. in European and Japanese Larches, 32 per cent. in Douglas Fir, 26 per cent. in Corsican and Scots Pines, and 9 per cent. in Sitka Spruce and Norway Spruce. Small transplants resisted much better than any other class of plant. As might be expected, areas with a southern aspect were much more seriously affected than those facing north or east. It is satisfactory to note that the plantations made by the Commissioners in the previous year did not suffer from the drought to any appreciable extent. *A. Henry.*

influenced by that decided species *C. bicolor*, although the two crossings with *C. Dowiana* might be supposed to counteract it. Mr. S. Lyne, the Orchid grower at Claygate Lodge, states that both the form with *C. bicolor* influence prominent and also that with the *C. Dowiana* shape have flowered, but he notices, as he did when with the late Mr. Gurney Fowler, where many forms were bloomed, that the struggle between the shapes of the species concerned is always evident and highly interesting.

LAELIO CATTLEYA ORIFLAMME.

THIS very handsome hybrid, which was raised by Messrs. Armstrong and Brown, Orchidhurst, Tunbridge Wells, between *Cattleya Rex* and *Laelio-Cattleya Thyone*, and which first flowered with them in 1915, passed

FIG. 57.—FRUITS AND FOLIAGE OF DIPTERONIA SINENSIS (see p. 138).

ORCHID NOTES AND CLEANINGS.

LAELIO-CATTLEYA VICTOR.

FLOWERS of this showy novelty of Messrs. Stuart Low and Co., Jarvisbrook, Sussex, present very interesting features. In its composition *C. Warszewiczii* enters three times, *C. Dowiana* once, and *Laelia purpurata* and *L. pumila* once each. The large size, fine form, and rich colour is dominated by *C. Warszewiczii*, but in the more tubular form of the base of the lip and in the clear separation of the white and yellow throat from the well-rounded claret crimson front the lesser species *L. pumila* clearly presents its characters, as so many of the well-defined smaller species usually do. It is that peculiarity which makes hybrid Orchids such an interesting study to the observant, for seemingly similar flowers to the casual observer are found to be very unlike if carefully examined, especially if the parentage is considered.

CATTLEYA VENUS VARIETIES.

SEVERAL fine forms of this showy hybrid between *C. Iris* (*bicolor* × *Dowiana*) and *C. Dowiana* have flowered in the important collection of J. J. Bolten, Esq., at Claygate Lodge, Claygate. A very distinct variety, with rich golden yellow sepals and petals and dark ruby purple lip, was included in the group shown by this gentleman at the last R.H.S. meeting. The lip in this case had a distinct isthmus in the middle, with the front lobe expanded, the form being

into the collection of the late Mr. J. Gurney Fowler, and was one of his most cherished plants. There were but few specimens, and some variation was shown, but all had the good form of *C. Rex* on a larger scale, the sepals and petals being clear citron yellow and the well-rounded lip magenta crimson, with cream white veining in front and an orange disc, with gold lines from the base.

At the meeting of the Royal Horticultural Society, on August 22, Messrs. Flory and Black, Slough, showed the same cross as *L.-C. Glorita*, the flowers of their form being nearer to *L.-C. Thyone* in shape than the original. In any form it is a very showy hybrid and evidently very floriferous.

ODONTOGLOSSUM DORAQ.

IN looking through the list of new hybrid Orchids contained in *The Gardeners' Chronicle* of August 27, 1921, I notice it reads *Odontoglossum Doraq* (*Dora* × *Aquitania*), which is an error, as the parentage is *Doris* × *Aquitania*. I am sorry I did not notice the mistake at the time it occurred. *E. W. Thompson, Haddon House Gardens, Ashton-on-Mersey.*

TRICHOPILLA.

THIS genus comprises several beautiful and easily grown Orchids. *T. nobilis* and *T. fragrans* are autumn-flowering species which produce their fragrant flowers in profusion at a season when flowers are very acceptable. They succeed and grow freely in a cool intermediate house, and may be grown suspended in pans, or on the stage in pots. *B.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from p. 126.)

(See Tables and Summaries, Ante, pp. 95-100.)  
ENGLAND, E.

**HUNTINGDONSHIRE.**—There was a profusion of fruit blossom of all kinds, and the weather generally at blossoming time was favourable to the fruits setting well, but the trees and bushes were, and are still, suffering from a shortage of moisture at the roots. Only 11½ inches of rainfall was recorded in these gardens last year, and, though the fall so far this year has been normal, the soil, except near the surface, is still much too dry for many feet deep. Apples are thinning themselves into a moderate crop. Pears are a little more promising. Plum trees carried a very light crop last year, but are so loaded now as to require propping. All bush fruits are lightly cropped, having made very little growth last year. Early Strawberries ripened during a dry spell and were a partial failure. Later varieties benefited by a good rain. The Fen soil is peaty, over clay, and the high land is a stiff loam generally, over a clay subsoil. *A. O. Coombe, Ramsey Abbey Gardens.*

**LINCOLNSHIRE.**—All fruit trees blossomed profusely. Apples in the grass orchards failed to set, but trees in cultivated ground are carrying full crops. Plum trees are yielding a very heavy crop. Raspberries and Red Currants are good. Strawberries proved better than they promised to be early in the season. The fruit was of good quality, especially the variety Givon's Late. *F. J. Foster, Grimsthorpe Castle Gardens, Bourne.*

**NORFOLK.**—In spite of the very dry time that prevailed during the early stages of fruit development, the fruit crops in general, with one or two exceptions, are quite satisfactory. Pears are disappointing, considering the trees flourished so luxuriantly during the spring. No doubt the sudden low temperature and cold winds experienced at that time account for the present deficiency. Louise Bonne of Jersey, Beurré Diel, Pitmaston Duchess, and Glou Moreau are four of our best cropping varieties. Gooseberries were a poor crop. Black Currants were very fine. Caterpillars on Gooseberries, aphid on Plums, and red spider on outdoor Peach trees were inclined to be troublesome during the hot dry weather. The nature of the soil is light and sandy. *D. McIntosh, Euston Gardens, Thetford.*

—All fruit crops are good and the trees wonderfully clean and healthy. Apples of all kinds, and especially dessert varieties, are carrying first-rate crops. Pears are carrying well-balanced crops on such varieties as Williams' Bon Chrétien, Souvenir du Congrès, Doyenné du Comice, Doyenné Boussock, Pitmaston Duchess, Durandean, and Conference. All bush fruits cropped abundantly. Raspberries were exceptionally good in size and flavour. Strawberries were below the average yield; the fruit was small and poor in flavour, owing to the prolonged drought. All varieties of plums are carrying heavy crops, such sorts as Pond's Seedling, Kirks, Victoria, Jefferson, Belle de Louvain, Prince of Wales, and Monarch being especially good. Sweet Cherries have been a fair crop, but Morellos are exceptionally plentiful this season. The soil is a sandy loam. *John Edward Pitt, Earltam Hall Gardens, Norwich.*

—All fruit trees flowered well. The very late spring was beneficial to Plums, as these set abundantly, both on walls and bush trees. No standard Plums are grown here, owing to our soil being very light, with a non-binding gravelly subsoil. Constant pinching of sub-laterals and root pruning are our only means of getting good fruitful trees. The crops of Apples, Pears, and Cherries are good and promise well. Bush fruits and Strawberries suffered somewhat from the drought and extreme heat during May and June, but they have benefited by the recent rains. *Isaiah Johnson, Catton House Gardens, Norwich.*

## MIDLAND COUNTIES.

**BEDFORDSHIRE.**—The fruit crops are good, with the exception of Apricots, which were in bloom during very cold weather from March 15 until April was well in, and we had bitterly cold north-east winds, with snow, on March 20 and April 3, which destroyed the blossom, in spite of protection. The cold weather, however, kept all other fruit blossom backward. The majority of fruit trees bloomed profusely, and all kinds of Plums and Pears set fruits freely. A few varieties of Apples failed, but there is a good average crop of these fruits. Peaches and Nectarines set freely, and very little "blister" was seen and no "die back," no doubt due to the trees being so well ripened last season. Black Currants were again a disappointing crop, the fruits "running off" again during the dry weather. Gooseberries and Red Currants were both excellent crops, and the rain came in time to save the Raspberry crop. Strawberries were excellent on one-year-old plants, but last year's drought affected the two-year-old Strawberries, which gave very small berries. The variety Laxton's Latest has again given us a wonderful crop of splendid berries. *W. G. Warner, Chicksands Priory Gardens, Shefford.*

—The fruit crops in general—with the exception of Apples—are highly satisfactory, yet there are many instances where some one or other crop beside Apples has failed entirely. In this particular garden, as an instance, Plums are a total failure, but in the district around they are plentiful. Strawberries have been freer from damp and decayed berries than for many years past; so, too, have Raspberries from the small maggots that usually appear in the fruits. The Jargonelle Pear promises exceedingly well this year with us. *C. Turner, Amphill Park Gardens, Amphill.*

**BUCKINGHAMSHIRE.**—All fruit trees bloomed fairly well, but the late spring frosts seriously affected the fruit crops in exposed positions. The Strawberry crop, owing to frost and drought, appeared to be affected more than any other. Red and White Currants were much over the average quantity, but Black were much under a normal yield. Certain varieties of Plums are carrying good crops of fruit, but the majority are much under. Contrary to what might have been anticipated during a season of such extremes in temperature, most of the trees are both clean and healthy. The Gooseberry caterpillar is absent from these gardens this season. Our soil is a heavy, retentive loam resting on clay, and the natural drainage is bad. *W. Hedley Warren, Aston Clinton Gardens, Aylesbury.*

—The fruit crops are very irregular and disappointing in some centres of Bucks. Pear, Plum, Apple, and Cherry trees gave a wonderful show of blooms, except in the case of those varieties that bore heavily last year. Many of the fruits dropped owing to drought at the roots and insufficient plant food. The frosts in the early part of May and the excessive heat in May and June did damage to the fruits. However, the outlook is not bad on the whole, and we shall have a fair quantity of fruit. *Philip Mann, Education Sub-Offices, Aylesbury.*

—The fruit crops are, on the whole, fairly good. Apples are under the normal yield, but the fruits are of good size and clean. Pears are a good crop, the trees being clean and healthy. Plums and Damsons are heavy crops. Bush fruits, with the exception of Black Currants, were very good. Cherries were very patchy, some orchards having a good crop, but others very few and the late rains caused the fruits to crack badly. Morellos are good on walls. Strawberries were very poor; the plants were weak from the drought of last summer, and the fruit was small and soon over. *Chas. Page, Dropmore Gardens, Maidenhead.*

—The fruit crop prospects are excellent; the trees are exceptionally clean and healthy, and should remain so. I cannot recall a season when insect pests were less prevalent, and to what this is exactly due is not easy to determine, unless it was the innumerable number

of ladybirds of last summer. It has usually been necessary to spray at least three times to keep our trees clean, but one application has been sufficient this year. The soil is strong loam on heavy clay. *G. F. Johnson, Waddesdon Gardens, Aylesbury.*

**CHESHIRE.**—Gooseberries, Black Currants, and Raspberries were all excellent crops, but Strawberries were much inferior to last year's, both in quantity and quality. Apples and Plums are never bounteous crops in these gardens. We are, however, grubbing up unprofitable trees and planting varieties that we find to be more dependable bearers. A great improvement is to be noted, and we expect better results in years to come. A better show of bloom I never witnessed during my ten years' service here, but some trees have scarcely a fruit. Ribston Pippin, Cox's Orange Pippin, and Northern Greening are amongst the more notable failures in Apples, and these varieties will be discarded this autumn. *T. A. Summerfield, Alderley Park Gardens, Chelford.*

—Outdoor fruit trees are looking well and carrying heavy crops of clean fruit. Early in May they were threatened with an attack of green fly, but a thorough syringing with Quassia extract killed out the pest. Apples and Pears are swelling freely. Plums, Cherries, Gooseberries, Black and Red Currants, Raspberries, and Strawberries are all clean and healthy, and carrying heavy crops. The spring was very dry—May with a total rainfall of 0.67 inch and June with a total of 1.55 inch. Our warmest day in May was 87° in the shade, and the warmest in June 86°. We had a heavy rainfall on July 4, which measured 1.18 inch, and it has rained almost every day since up to date. *James B. Allan, Tirley Garth Gardens, Tarporley.*

—Fruit trees promised bountiful crops when the bloom first developed, but the sun's rays in the very hot weather at blossoming time, day after day for three weeks, appeared to burn the bloom. The result is we have more fruit on north and east sides of the trees than on the south and west sides. The soil in this part of Cheshire is a good loam on sand and gravel. Where trees are planted in heavy clay, the crops are not quite so good. Late-blooming Apples and Pears have the best crops. Small fruits were all that could be desired. *James Atkinson, Torkington Lodge Gardens.*

—It is a pleasure to be able to report something like full crops of hardy fruits once more, due in great measure, I presume, to the exceptional dry and hot season of 1921, when the wood became thoroughly ripened. This was followed by a long, cold and sunless spring, which kept all blossom backward until it was safe from late frosts. I do not remember a greater wealth of bloom on fruit trees or flowering shrubs than this spring, and the genial weather from the middle of April onwards was favourable to the fruits setting, with very few exceptions among Apples, Pears, and Plums. The one exception in Apples with us is Lane's Prince Albert. This has a lighter crop than usual, yet this variety, as a rule, never fails us. The trees are remarkably clean and free from pests, and the growths strong and clean. At one time it looked as if continued dry weather would cause a lot of fruits to drop, but we still have abundant crops. The Strawberry crop was a poor one, owing to the dry season last year and this, but the quality of the berries was good. *N. F. Barnes, Eaton Gardens, Chester.*

—The fruit crops are, on the whole, very satisfactory. Apples are a good average crop, and many Apple trees are heavily laden with fruits, but others have scarcely any, owing, probably, to the heavy crops they carried last year. Nearly all Pear trees are bearing good crops. Stone fruits are plentiful, and the rain came just in time to prevent the fruits dropping. Small fruits were good and plentiful. Early Strawberries suffered from drought where they were not watered. *Edward Severn, Combermere Gardens, Whitechurch.*

(To be continued.)

## HOME CORRESPONDENCE.

**Grape Spot (Gloeosporium ampelophagum).**—Our vines have been badly troubled with this disease for several seasons. Last year it was very prevalent, and I attributed this to the excessive heat. The disease starts in a very small way, and gradually spreads in circles, and the berries have to be cut out until nearly all the bunches are spoilt. The great difficulty is having to keep the Grapes on the vines after they are ripe. I have had them in good condition up to Christmas. The trouble is not so great when one can cut the crop and market it. The varieties affected are Muscat of Alexandria and Cannon Hall. What are the experiences of other readers in regard to this disease? *J. L. Mottram, Cheshire.*

**Branch Cuttings of Apples.**—Regarding Mr. Hewat's note on page 101, August 12, all those varieties of Apples that have warty burrs on their branches, and which develop aerial roots therefrom, will grow with the greatest freedom from cuttings. Many of the old Cornish orchards were planted by just making a hole in the ground with a crowbar and sticking in a fairly large Apple branch. I have heard trees so propagated called "pitchers"; why, I do not know, but one of the names of the Manks Codling is Irish Pitcher. It would be interesting to know how this peculiar name originated. Are the trees called "pitchers" because they grow when "pitched down"? I cannot tell from actual experience whether most varieties of Apples can be so propagated, but I should say it would be more difficult to strike the smooth-stemmed varieties in this way. *W. J. Farmer.*

—With reference to Mr. E. F. M. Hewat's letter in your issue of August 12, I write to say that about 20 years ago I witnessed some cuttings of Apple branches inserted in the soil. They grew and bore fruit the first season and I still have them under my charge. They have grown into nice trees, and continue to fruit well. Since that time I have rooted a number of cuttings from several varieties, including Cox's Orange Pippin, with the same results. I have 10 trees now growing from cuttings and, so far as growth and fruiting are concerned, there is little or no difference between them and the grafted ones. *J. Treloar, Helston.*

**The Dunkeld Larches.**—In my letter published on p. 85 I gave a few extracts from John Grigor's *Arbiculture* on the Larch and its first introduction into Scotland. Mr. A. D. Richardson, on p. 112, passes this authority with contempt, and quotes Loudon. If Mr. Richardson had turned to p. 209 of Grigor's *Arbiculture* he would have noticed that Grigor never believed in the legend about the trees arriving from London, and I fail to find in Grigor's publication any mention of a port-manteau and the rubbish heap. Grigor states, on p. 209, "It is reasonable to believe that the Larches planted in Scotland during the early part of last century were the produce of seeds ripened in England, since many of the trees had, in that country, yielded seeds at least fifty years before the time of their insertion at Dunkeld." Grigor also lays stress on the Dunkeld, Menzie, Dalwick and Blair Larches and their reports, that do not exactly correspond. It would be very interesting to hear how Mr. Richardson demolishes the Rev. James Headrick's report published in 1813 about the Lockhart of Lee Larches; this gives Lanarkshire as the first county in Scotland where the Larch was found. Grigor states, p. 209, "Whatever may have been the size or age attained by the imported plants cultivated by Mr. Lockhart on the banks of the Clyde, it is certain they were of no use to Scotland, in a national point of view." In the *Magazine of Botany and Gardening*, published in 1833 by G. Henderson, 2, Old Bailey, Ludgate Hill, Vol. I., there is a report of John Grigor obtaining a premium offered by the Highland Society in 1830. Yet in Vol. II. criticism of Loudon is not in great affection or of his particular abilities. However, we find Loudon thanking John Grigor for his important communications to the *Arboretum et Fruticetum Britannicum*. *Mark Mills.*

**Peaches and Nectarines on the Same Tree.**—Mr. Baxter, gardener to Major Dalgetty, Lochlenley, Hall, Romsey, Hampshire, has called my attention to one of his outdoor Peach trees a short time ago which has one branch bearing Nectarines. This branch is one growing from another bearing Peaches and not direct from the graft. Neither Mr. Baxter nor myself have ever known this to occur before. I should be pleased to learn if anyone has had experience of this diversion. *F. Clipstone, Melchet Court Gardens.*

[In *Gard. Chron.*, August 2, 1902, some references from old authors on this subject are published, together with the illustration reproduced in Fig. 58, and another of a composite fruit, part Peach and part Nectarine.—Eds.]

**Dianthus Allwoodii.**—I have grown eight varieties of *Dianthus Allwoodii* for the

## INDOOR PLANTS.

## FERNS.

(Concluded from page 126.)

MANY Ferns are adapted for covering blank, moist walls. A few mixed spores of *Adiantum*, *Pteris*, *Davallia*, *Asplenium* and other small growing kinds distributed over the wall will produce a number of little plants that will serve to hide the bare bricks. They may also be grown in a framework of wire netting three or four inches from the wall, the intervening space filled with rough, turfy, light loam, peat and Sphagnum moss, in which the young Ferns may be planted. The essential attention is to keep the soil moist, but not sodden, by syringing or other means, for it is

FIG. 58.—A PEACH ON THE UPPER AND A NECTARINE ON THE LOWER PART OF THE SAME BRANCH.

past three seasons and thoroughly recommend them for use as garden plants, suitable for massing in herbaceous borders, and for planting on dry walls and rockeries, where I have found them to be more floriferous and effective than any of the *Dianthus* family hitherto used for this purpose. Planted for an edging, the smaller-growing varieties, viz., Joan, Jean, Susan, Dorothy, and Robert, they surpass the old garden Pinks. Harold and Rufus I root in January and February. I grow a batch in pots to flower through the winter, and find, if the plants are planted out about May, they flower the whole summer. The method of propagation is the same as for *Pentstemons*, *Violas*, etc., the cuttings being taken with a heel of old wood, wintered in the cold frame, and planted out about April. If the young plants are put into the reserve garden in April and lifted the following autumn with a good ball of soil they will give a brilliant effect from May to the autumn. The masses of bloom from a two-year-old plant and the usefulness of the blooms for decorative purposes, entitle these plants to rank as some of the most effectual in the flower garden. *H. Penfold, Greenhill Gardens, Warminster.*

courting failure to allow the roots of any kinds of Ferns to become excessively dry.

Tree ferns are beautiful objects for the decoration of cool conservatories. They have stems from 10 feet to 20 feet high, and with their fronds fully developed they give a grand effect when mixed with other plants.

The cool house varieties of Tree Ferns are imported from Australia, Tasmania and New Zealand in large boxes, and on arrival the plants should be potted in tubs or large pots and placed in a moist, temperate house. Keep the stems well syringed, and they will soon throw out a mass of roots and newly developed fronds. The best kinds are *Dicksonia antarctica* and *Cyathea dealbata*.

A good selection of *Gymnogrammas* should be in every collection. They are generally called Gold and Silver Ferns, from their bright gold and silver shaded fronds. A few are not decorated in this way, but all are beautiful. The plants should be grown in a light part of the stove or raised above the others by placing them on inverted pots or stands, where water from the syringe will not reach them, for if the dense powder on the

fronds is allowed to get damp it would cause the leaves to decay.

Ferns are increased by dividing the plants and by spores. Any species that send out creeping stems may be readily increased by division, but they should not be divided until the parts to be separated have a portion of roots to each. The best time for dividing them is February or March. They should be potted in small receptacles, given a gentle watering, and placed in a close frame till they are rooted, when they may be grown in a cooler house.

Some Ferns, such as *Asplenium bulbiferum*, produce bulbils or miniature plants on the fronds. These require to be pegged down in a pot or pan filled with soil and placed near the parent plant. When rooted, they may be detached from the parents and placed in small pots.

A few Ferns, like *Woodwardia radicans*, have buds or knobs on the end of the fronds, which, when in a sufficiently forward state, may be cut off and potted forthwith. In a moist atmosphere several species will vegetate and come up spontaneously on pots, blocks, damp stages or walls. Ferns are usually raised from spores. The best plan is to gather the frond just as the spore-cases are about to burst, place it in a piece of tissue paper, and hang it up in a dry place for a few days, by which time the spore-cases will have burst and the spores be ready for sowing. It is necessary that the soil should be baked before the spores are sown, as this process destroys any small worms or other insects, also any seeds that may be present in the soil which, if allowed to develop, would smother the young Ferns as they came up.

A successful plan of sowing the spores is to stop completely the drainage hole of a 5 inch pot, fill the latter about three parts with rough soil well pressed down, then add the prepared soil, pressing it down firmly. Give the soil a good watering through a fine rose can before sowing the spores. After sowing, place the pot in a saucer of water and keep the latter filled always, in order to keep the soil moist. Under no consideration should the spores be watered with a rose can. After sowing, place the pot in a close, moist atmosphere, and cover it with a piece of glass that should be tilted at the back about 1 inch; as soon as the spores begin to germinate, a little more air should be gradually admitted.

The soil for the general collection should consist of two-thirds turfy loam, one-third fibrous peat or leaf mould with silver-sand. Care should be taken not to over-pot the plants. Use plenty of drainage material. The best month for repotting is February; no Ferns should be potted during the winter. Certain kinds of Ferns are liable to attacks of thrip and green fly; if those pests appear, fumigate the house with Tobacco or Tobacco dust, or with a good vapouring compound, on two or three nights in succession. Care must be taken not to use the fumigant at too great a strength, or the young fronds may get damaged. Plants of *Adiantum Farleyense* should be removed from the house, as this Maidenhair will not stand fumigating.

The following is a good selection of Ferns for general purposes. For the warm house, *Adiantum reginae*, A. Farleyense, A. trapeziforme, A. cuneatum, A. gracillimum, *Davallia fejeensis* and varieties, D. effusa, D. Mooreana, D. parvula, D. tennifolia Veitchii, *Asplenium elegantissimum*, *Asplenium* (Neottopteris) *Nidus* (Birds' Nest Fern), *Gymnogramme* in variety, *Polypodium Knightiae*, *Platycreium* (Stag's Horn Fern) in variety, *Pteris ludens*, and others. For growing in hanging baskets *Goniophlebium subauriculatum*, *Davallia solida superba*, D. polyantha, *Asplenium longissimum*, *Drynaria diversifolia*, *Nephrolepis davallioides*. For greenhouse and indoor decoration, *Adiantum Mariesii*, A. cuneatum grandis, A. decornum, A. pubescens, *Doryopteris palmata*, *Cyrtomium falcatum*, C. anomophyllum, *Asplenium Zeyanicum*, A. viviparum, A. bulbiferum, A. praemorsum,

*Lomaria gibba robusta*, L. ciliata, *Davallia brasiliensis*, D. canariensis (Hare's Foot Fern), D. Mariesii cristata, D. bullata (Squirrel's Foot Fern), D. elegans, *Lastia cristata variegata*, *Pteris cretica major*, P. Childsii, P. Wirssettii, P. tremula, P. scaberula (Lace Fern), P. argyreae, *Osunda palustris*, *Nephrolepis superbissima*, *Todea arborea*, *Selaginella emiliana*, *Polypodium aureum cristatum*. For baskets, *Asplenium flaccidum*, A. diversifolium, *Adiantum dolabriforme*, *Nephrolepis exaltata furcans*, N. exaltata superba, N. Whitmannii, *Polypodium appendiculatum*, P. Mayii, and *Woodwardia radicans*. Filmy Ferns include *Trichomanes* in variety, *Hymenophyllum* in variety, *Leptopteris* (*Todea*) *pellucida* and L. (*Todea*) *superba*. The last is the gem of all Filmy Ferns, and should be grown in every collection. Filmy Ferns require to be kept in a closer and moister atmosphere than other Ferns, or they may be grown in a Wardian case. *John Heal, F.M.H.*

## DRY WALL GARDENING.

ONE of the most interesting and fascinating forms of gardens is a dry wall furnished with suitable plants. Either a terrace wall, or what is often a troublesome, sloping bank may be made one of the most beautiful features in a garden and also a source of pleasure the greater part of the year. One of the best dry walls I have seen was in Argyshire, in the garden of the late Mr. C. D. Rudel, who was a great lover of rock and Alpine plants, of which he had a unique collection. His plants were grown to perfection in walls, rock gardens and the moraine.

It is essential to plant the wall as it is being built; to build the wall first and leave spaces for the plants to be inserted later is to court trouble, as the plants more often than not in such circumstances prove failures.

A dry wall may be formed at any time of the year, and furnished with plants turned out of small pots and pressed between the stones filled in with good soil, composed of leam and leaf-mould. This will hold the moisture better than anything else. Good sandstone cut to a suitable size and thickness is the best material. The stones should be slightly sloping inwards as this will help to retain the moisture and keep the soil in position. Groups of plants from six to twelve of each kind or variety give a good effect, the plants being put in from twelve to eighteen inches apart. Care should be taken to intermix the early, mid-season and late flowering plants judiciously to give an even display throughout the season the whole length of the wall. The plants should be given a thorough soaking before turning them out of the pots. The following will be found a useful and interesting collection of plants for a dry wall and will flower from April until September: *Arbrietis* in variety, *Alyssum saxatile compacta*, *Arabis*, single, *Arabis* fl. pl.: *Acaena microphylla*, *Acaena adsurgens*, *Achillea Herba-rotta*, A. tomentosa; *Aethionema grandiflorum*, *Campanula muralis*, *Campanula garganica*, C. g. hirsuta, *Dianthus caesius*, D. arenarius, D. deltoideus, D. dependens, *Erinus alpinus Carmineus*, *Erysimum pulchellum*, *Cheiranthus Allionii*, *Gypsophila prostrata*, *Helianthemum* in variety, *Helichrysum bellidioides*, *Heuchera sanguinea*, *Hippocrepis comosa*, *Hutchinsia alpina*, *Iberis Little Gem*, *Linaria pallida*, *Linum flavum*, *Phlox setacea* in variety, *Ranonda pyrenaica* (for shade), *Saxifragas*, incrustated varieties, *Sedums* in variety, *Sempervivums* of sorts, *Thymus Serphyllum coccineum* and album, *Veronica Bidwillii*, V. rupestris, V. prostrata, *Zauschneria californica* and Z. splendens, *Arenaria balearica*, *Arenaria montana*, *Coronilla iberica*, *Dianthus graniticus*, *Campanula carpatica*, *Iberis gibraltarica*, *Iberis corraefolia*, *Plumbago Larpentae*, *Aplopappus chrysophyllus* and *Androsace lanuginosa*.

Bulbs may be planted freely on the top of the wall, and these will give a fine effect in spring when in flower. *R. H. Holton.*

## SOCIETIES.

### ABERDEEN ROYAL HORTICULTURAL.

AUGUST 24, 25, and 26.—The annual exhibition of the Royal Horticultural Society of Aberdeen was held this year on the above dates in the Union Terrace Gardens, Aberdeen. For many years the Society, which was instituted in 1824, held its show in the Duthie Public Park, but it was felt the remoteness of this park from the centre of the city militated against the public attendance, hence the change of venue to the Union Terrace Gardens, which are situated in the centre of the city, and were kindly granted the Society by the Aberdeen Town Council. The change turned out a happy one, the facilities for the attendance of the public proving excellent. The number of entries exceeded that of last year, and, considering the lateness and inclemency of the season, a remarkably good display was forthcoming in all the divisions. Lady Sempill, Fintray House, Aberdeenshire, opened the show.

A meritorious display was made in the pot-plant classes, the outstanding feature being the superb entries for a table of pot plants arranged for effect (not exceeding 7 feet 6 inches by 6 feet). The leading table was shown by LADY COWDRAY, Dunecht House, Aberdeenshire (gr. William Smith), the plants comprising a capital collection of *Begonias*, *Pelargoniums*, *Coleus*, centre piece; 2nd, Mr. WILLIAM HENDERSON, Morkeu, Aberdeenshire. For four specimen plants, two in flower and two in foliage, Colonel W. S. GILL, C.B., Dalhebit, Aberdeenshire (gr. Alex. Brebner), had a fine win with capitally grown *Disa grandiflora* and *Paucratium*. *Begonias* and *Fuchsias* were the outstanding features in this section, the sunless season notwithstanding. Mr. R. MURRAY Enfield, Cults, Aberdeenshire, won worthily for *Begonias*, both single and double. Honours for *Fuchsias* went to Mr. HENDERSON, while LADY COWDRAY secured the leading place for the best four plants for table decoration. Ferns were well shown, the honours being divided between Colonel GILL, LADY COWDRAY, and Miss M'LENNAN, Springhill House, Aberdeenshire (gr. Mr. Douglas Scorgie).

Some very fine exhibits were shown in the section for cut flowers. The Silver Cup presented by Baillie Charles Graham, Aberdeen, for the best 18 Rose blooms, H.P. and H.T., or other, named, distinct varieties, and the chief honours for decorative and tea or noisette Roses all went to Dalhebit, for beautifully-grown specimens. Miss M'LENNAN, Springhill House, was placed first for Dahlias, while Linton House, Sauchen (gr. Mr. Andrew Gardiner), and Longley House, Forres (gr. Mr. G. MacLennan), shared the chief honours for Asters, with superb blooms. Hardy herbaceous flowers were finely shown, the leading prizes for these being taken by LADY COWDRAY and Miss M'LENNAN, Springhill House. There was a fine entry for 20 distinct varieties of cut flowers, and fine foliage bedding plants, including annuals, and Miss M'LENNAN won the first and second prizes. *Geraniums*, also, were a feature of the show, and Colonel GILL and LADY COWDRAY shared the principal honours for these flowers. The latter also excelled with *Carnations* or *Picotees*. *Begonias* were well shown, Colonel GILL again leading for six single and six double, with finely-grown blooms. Mr. A. MASSON, 64, Menzies Road, Aberdeen, had the finest exhibit of twelve bunches of annuals. Springhill House again scored for twelve spikes of double Stocks with admirably grown specimens. Pansies were well shown, Mr. MACLENNAN carrying off the chief awards. Miss M'LENNAN took leading places for *Violas*, while Lord SEMPELL, Fintray House, Aberdeenshire (gr. W. D. Anderson) led for the best six bunches of *Chrysanthemums* from the open border. The outstanding feature of the cut flower division was the Sweet Peas. The winning blooms, sent by LADY COWDRAY, Dunecht House (gr. William Smith), stood out pre-eminently as far and away the best. The blooms were equal in colour and general quality to those which won the Burpee and Eckford Cups at the recent Glasgow show. Mr.

J. A. Grigor, Duff House, Banff, followed closely.

**FRUIT.**—There was a wonderfully good display of fruits. The entries of Raspberries, Red and Black Currants, and Strawberries were exceptionally good. It was the last-named fruit, however, which proved the outstanding attraction. The very fine specimens of Sir Joseph Paxton, Myatt's Seedling and Aberdeen Favourite, sent from Denmore House, Aberdeenshire (gr. Mr. George Tocher), were exceedingly well grown, and worthily gained the leading honours. The best collection of six dishes of hardy fruits came from Duff House, Banff, while Colonel DAVIDSON, of Dess, Aberdeenshire (gr. Mr. James Calder), and Mrs. MILNE, of Logie, Aberdeenshire (gr. Mr. P. F. McQueen), shared leading honours for Cherries. Mrs. MILNE and Colonel GILL divided the honours for Raspberries with finely-grown specimens. There were four classes for Gooseberries, and the fine collections staged by Messrs. DUNCAN AND SONS, Rubislaw, Aberdeen, Duff House, Banff, and Mr. W. WEBSTER, Muireisk also carried off chief honours for Red Currants. Balmedie House, Aberdeenshire (gr. Mr. Robert Pirie), led for Black Currants. Grapes, numerically, were a poor show, but there was no lack of quality in those sent from Morken (gr. Mr. W. Henderson), nor in the Black Grapes sent by Lord SEMPILL, both of which worthily secured the leading awards. LADY COWDRAY had the finest Melons and Plums, Denmore House the best Peaches, Castle-Fraser (gr. Mr. A. R. McRae), the best Nectarines, Raemore the best dessert and baking Apples, and Duff House the best Jargonelle Pears. Mrs. MILNE, of Logie, led for Tomatos, and Pears from Balmedie House gardens were placed first in a class for any other variety of Pears.

**VEGETABLES.**—There was some very keen competition in this division, and one wondered, considering the inclement season, that such fine specimens of the various vegetables could be produced. For a collection of vegetables, arranged on a table space 4 feet by 3 feet, and comprising nine varieties, viz., Peas, Cabbages, Cauliflowers, Potatos, Turnips, Carrots, Onions, Parsley, and Beetroots, Miss McLENNAN, Springhill House, as is her wont, had matters all her own way. Similar honours also fell to this lady for salads, Potatos, Turnips, and Celery. From Linton House (gr. Mr. Andrew Gardiner) came a superb collection of Potatos, including five of the old-fashioned varieties like Grampian, Snowdrop, Duke of York, and Prizetaker, and this exhibit was easily 1st in a very strong class. For the best dish of seedling Potatos not in commerce, the first and second prizes were also won to Linton House. Colonel GILL, Dalbeity, led for Cucumbers, Mrs. MILNE, of Logie, for Onions and Leeks, whilst the best Peas, round, coloured Potatos, and Beetroot, were shown from Duff House gardens.

**NURSERYMEN AND FLORISTS.**—There was not strong competition in this division, the nurserymen and florists evidently giving of their best in the non-competitive displays. Messrs. ADAM AND CRAIGMILE, Fernielea Nurseries, Aberdeen, had some magnificent Roses, and worthily won the Society's Silver Cup offered for the best collection of 36 Roses.

**AMATEURS.**—The leading prizes in this section were won by Mr. J. M. SIMPSON, Varvillbank, King Street, Aberdeen, for pot plants; Mr. G. W. ROBERTSON, Ness Bank, Cults, Aberdeenshire, for cut flowers; Mr. JOHN MIDDLETON, Alberta, Aboyne, Aberdeenshire, for fruit; and Mr. WILLIAM D. THOM, Woodside, Aberdeen, for vegetables.

**NON-COMPETITIVE DISPLAYS.**—Amongst the best non-competitive exhibits mention may be made of those shown by Messrs. KNOWLES AND SONS, Messrs. BEN. REID AND CO., Messrs. W. SMITH AND SON, and Messrs. ADAM AND CRAIGMILE, all of Aberdeen. Professor CRAIL of the Chair of Botany, Aberdeen University, as curator of the Cruikshank Botanical Gardens, Aberdeen, sent a most interesting collection of rare plants, which were admirably arranged by Mr. William Grant, the head gardener. This fine exhibit had great educational value.

### THE BRITISH PTERIDOLOGICAL.

THE twenty-seventh annual meeting of the above Society was held on August 14, at Llanberis. Members attended from Co. Dublin, Manchester, Reading, Horsham, Woodford and Brondesbury. The President (W. B. Cranfield, Esq.) presided, and nine certificates were awarded to meritorious varieties.

A long discussion took place on the question of the altered nomenclature of Ferns as part of the general revision of this subject at the Vienna Conference. Some doubt was expressed as to whether the settlement as presented by Dr. G. C. Druce, in the December *Gazette*, would be a stable one, and eventually it was resolved that a Sub-Committee, consisting of the President and Dr. F. W. Stansfield, be appointed to confer with the R.H.S. and the Kew Authorities in order that the Society should come in line with the leading scientific bodies on the question.

Amongst the new members who joined the Society during the past year is the eminent French botanist, Prince Roland Bonaparte. The Society cordially invites all lovers of British Ferns to join; particulars of membership and copies of the *Gazette* may be obtained from the Hon. Secretary, Mr. C. Henwood, 21, Clifton Road, London, W.9.

### ROYAL HORTICULTURAL OF IRELAND.

AUGUST 15 and 16.—The autumn show of this Society was held on these dates in the Covered Court, Earlsfort Terrace, Dublin, kindly lent by the Earl of Iveagh. The show was very successful, the number of entries being greatly in excess of those at pre-war exhibitions, and the building, with its natural draping of Ivy, was admirably adapted for the purpose of holding a flower show.

There was only one trade exhibit, that of Messrs. CHAS. RAMSAY AND SON, the Ballsbridge Nurseries, Dublin, owing to the present unsettled state of the country and especially the difficulties of transit. This trouble was circumvented in at least one case, for Mrs. J. G. TONER, of Monaghan, some eighty miles distant, won the prize for tuberous Begonias in the amateurs section; this lady finding all communication cut off, made the sea trip via Holyhead, and reached the show with her plants as fresh as they could possibly be. As there was no competition in the trade class for the President's Cup, it was not awarded. The best collection of hardy herbaceous flowers, shown on a space 24 feet by six feet, was exhibited by Capt. L. RIALI (gr. Mr. T. Webster), and in the smaller, similar class, for a group occupying a space sixteen feet by six feet, the Hon. A. E. GUINNESS, Glenmaroon, Dublin (gr. Mr. W. Stevens), was placed first, and Mrs. RAYMOND STEPHENSON, Cranford, Dublin (gr. Mr. M. Bugle), second. Mrs. ALFRED WEST (gr. Mr. C. Coster), showed the finest exhibit of twelve vases of hardy cut flowers distinct, in which F. V. WESBY, Esq., Roebuck Castle, Dundrum (gr. Mr. F. Simmons), was second. The finest annuals were shown by J. SWEETMAN, Esq., Longtown Salins, Kildare, while Lord ARDEE, Kiltruddery, Bray (gr. Mr. W. Barrett), excelled in the class for six vases of annuals distinct. For thirty-six blooms of Roses, not fewer than twenty-four blooms of each, the first prize was awarded to the DUBLIN NURSERY CO., Blackrock, Dublin, and this firm also won the first prize for twelve blooms of a new Rose. Mrs. WEST exhibited the finest twelve blooms of Roses, not more than three of any one variety. Major HAMILTON STUBBER won the Lord Ardilaun Challenge Cup offered for twenty-four blooms of Cactus Dahlias; second, T. RAY, Esq. This gentleman was first in the class for twelve vases of Decorative Dahlias. Other first-prize winners were: Begonias, Mrs. J. G. TONER; Antirrhinums, Messrs. W. DRUMMOND AND SONS, Dublin; twelve vases of Carnations, B. H. BARTON, Esq.; six vases of Carnations, E. KELLY, Esq., who also won the premier award for six vases of Carnations in another class; Violas, E. KELLY, Esq.; Montbretias, Major SEAGRAVE; 18 bunches of Sweet Peas, Viscount POWERSCOURT; 12 bunches of Sweet Peas, Mrs. WEST; six bunches of Sweet Peas, Hon.

Mrs. WHITE; and Hardy Ferns, Canon H. KINGSMILL MOORE.

In the fruit section F. V. WESBY, Esq., excelled for white Grapes and Black Hamburg Grapes, while Major VINCENT KELLY, Montrose, Donnybrook (gr. Mr. J. McDermott), was first for any other black variety of Grapes. Mrs. HAMILTON showed the best Peaches; Capt. RIALI the best Nectarines; Mr. C. WISDOM HELY the best Melons; and Major KELLY the best six dishes of early Apples, and also the best dessert Pears.

The vegetable exhibits were surprisingly good and there was excellent competition. The Hon. A. E. GUINNESS was placed first for twelve distinct kinds, closely followed by Lord CLONCURR. Mr. JAS. SWEETMAN excelled in the class for six distinct kinds.

### ROYAL HORTICULTURAL.

#### Trial of Violas at Wisley.

The following awards have been made by the Royal Horticultural Society to Violas after trial at Wisley:—

#### AWARDS OF MERIT TO BEDDING VIOLAS.

No. 1, *Snow Queen*, sent by Messrs. DOBBIE AND CO.; No. 5, *Purity*, sent by Messrs. FORBES; No. 6, *Snowflake*, sent by Messrs. FORBES; No. 9, *Suan*, sent by Messrs. DOBBIE AND CO.; No. 16, *Lady Knox*, sent by Messrs. FORBES; No. 22, *Royal Sovereign*, sent by Messrs. STARK AND SON; Nos. 26, 27, 28, *Moseley Perfection*, sent by Messrs. FORBES, Messrs. DOBBIE AND CO., and Mr. HARRISON; Nos. 33, 34, *Margaret Wood*, sent by Messrs. W. ARTINDALE AND SON and Messrs. DOBBIE AND CO.; No. 40, *Mary Burton*, sent by Messrs. DOBBIE AND CO.; Nos. 47, 48, 49, *Maggie Mott*, sent by Messrs. FORBES, Messrs. B. CRANE, and Messrs. DOBBIE AND CO.; Nos. 55, 56, *W. H. Woodgate*, sent by Messrs. FORBES and Messrs. DOBBIE AND CO.; Nos. 68, 69, *J. B. Riding*, sent by Messrs. FORBES and Messrs. DOBBIE AND CO.; No. 70, *Mrs. Alsop*, sent by Messrs. FORBES; No. 104, *Archie Grant*, sent by Messrs. DOBBIE AND CO.; No. 114, *Red Edina*, sent by Mr. SCARLETT; No. 168, *Dr. McFarlane*, sent by Mr. CRANE; No. 175, *President*, sent by Messrs. FORBES; No. 181, *Dorothea*, sent by Mr. CRANE.

#### HIGHLY COMMENDED.

No. 11, *Blanche*, sent by Messrs. FORBES; Nos. 12, 13, *Alexandra*, sent by Messrs. DOBBIE AND CO. and Messrs. W. ARTINDALE AND SON; No. 17, *Primrose Dame*, sent by Messrs. FORBES; Nos. 20, 21, *Kingcup*, sent by Messrs. DOBBIE AND CO. and Messrs. FORBES; No. 31, *Walter Welsh*, sent by Messrs. DOBBIE AND CO.; No. 39, *Tangerine Harrison*, sent by Mr. HARRISON; No. 52, *Bertha*, sent by Mr. CRANE; Nos. 50, 53, *John Quarton*, sent by Mr. HARRISON and Messrs. FORBES; No. 58, *Perdita*, sent by Messrs. FORBES; Nos. 60, 61, *Kitty Bell*, sent by Messrs. FORBES and Messrs. DOBBIE AND CO.; Nos. 62, 63, *Mauve Queen*, sent by Mr. CRANE and Messrs. DOBBIE AND CO.; No. 83, *Bridal Morn* (misnomer), sent by Messrs. FORBES; No. 66, *Newton Mauve*, sent by Mr. CRANE; No. 89, *John Forbes*, sent by Messrs. FORBES; No. 96, *Wm. Daniels*, sent by Messrs. FORBES; No. 102, *Admiral of the Blues*, sent by Messrs. DOBBIE AND CO.; No. 105, *Mrs. Mass*, sent by Mr. ELLIOTT; No. 108, *Councillor Waters*, sent by Messrs. W. ARTINDALE AND SON; No. 112, *Admiration*, sent by Messrs. FORBES; No. 113, *Jubilee*, sent by Messrs. DOBBIE AND CO.; No. 124, *Peace*, sent by Mr. CRANE; Nos. 131, 132, *Dunbryan*, sent by Messrs. DOBBIE AND CO. and Mr. CRANE; Nos. 139, 140, *Mrs. Chichester*, sent by Messrs. FORBES and Mr. CRANE; No. 142, *Pride of Damas*, sent by Mr. HARRISON; No. 171, *Annie Jobson*, sent by Mr. HARRISON; No. 179, *Jackanapes*, sent by Messrs. FORBES.

#### AWARDS FOR VIOLAS FOR EXHIBITION.

#### AWARDS OF MERIT.

No. 4, *Mrs. J. Lawrence*, sent by Messrs. FORBES; No. 18, *Master Banks*, sent by Mr. HARRISON; No. 123, *Mrs. Jas. Smith*, sent by Messrs. W. ARTINDALE AND SON; No. 126, *Nurse*

*Cavell*, sent by Mr. HARRISON; No. 134, *Bessie Ferguson*, sent by Mr. HARRISON; Nos. 26, 27, 28, *Moseley Perfection*, sent by Messrs. FORBES, Messrs. DOBBIE AND Co., and Mr. HARRISON.

## HIGHLY COMMENDED.

No. 128, *Mrs. D. Stevenson*, sent by Mr. HARRISON; No. 151, *Mrs. J. McEvan*, sent by Mr. HARRISON; No. 129, *Criss Littlejohn*, sent by Mr. HARRISON; No. 162, *Mrs. Andrew Stevenson*, sent by Mr. HARRISON.

## AWARDS TO VIOLETTA TYPES OF VIOLA.

## AWARD OF MERIT.

Nos. 190, 191, *Violetta*, sent by Messrs. FORBES and Messrs. DOBBIE AND Co.

## HIGHLY COMMENDED.

No. 186, *Princess Mary* (Violetta), sent by Messrs. FORBES; No. 192, *Gold Crest* (Violetta), sent by Messrs. FORBES; No. 203, *Queen of the Year* (Violetta), sent by Messrs. FORBES; Nos. 197, 198, *Lyric* (Violetta), sent by Messrs. FORBES and Messrs. DOBBIE AND Co.

## AWARDS TO VARIETIES OF VIOLA GRACILIS.

## HIGHLY COMMENDED.

N. 196, *V. gracilis J. B. Taylor*, sent by Mr. CLARENCE ELLIOTT; No. 200, *V. gracilis Lady Crisp*, sent by Mr. CLARENCE ELLIOTT; No. 208, *V. gracilis Purple Robe*, sent by Messrs. DOBBIE AND Co.

## EDINBURGH WORKING MEN'S FLOWER SHOW.

THIS annual show was held in Edinburgh on the 18th and 19th ult., and proved most successful; competition was keen, and a large number of entries of high quality were represented. On the 19th ult., Lord Provost and Mrs. Hutchinson visited the show, when several special prizes were presented by Mrs. Hutchinson, after Lord Provost Hutchinson had delivered a stimulating address. The following were the special prizes and the winners:—Corporation Jubilee Cup and Medal for highest number of points—1st, Mr. ROBERT KERR; 2nd, Mr. A. ARCHBOLD, who had 10 fewer points. Crichton Cup, Mrs. KINNEAR. Whytock Medal, Mr. JAS. G. YOUNG. M'Hattie Medal, Mr. JAMES MOIR.

## DUTCH BULB GROWERS' ASSOCIATION OF HAARLEM.

THE different Floral Committees made the following awards at their meetings during June and July, 1922:—

## AWARDS OF MERIT.

*Delphinium Mrs. Hemerick*, pure lazulite-blue with a white eye; *D. Kobalt*, dark indigo-blue, shaded violet; *D. Mercurius*, indigo-blue, with dark violet shading; flowers semi-double.

## Obituary.

**Alexander Gray.**—A well-known South of Scotland amateur gardener has passed away by the death, on August 16, of Mr. Alexander Gray, Kirkconnell, Dumfriesshire. Mr. Gray was a keen and successful exhibitor, and did much valuable work in promoting the exhibitions of the local horticultural society. He died in Dumfries Infirmary after a brief illness, and was buried in Kirkconnell churchyard on August 19.

## INQUIRY.

## SQUIRRELS AND CARROTS.

CAN any of your readers tell me if it is a common thing for squirrels to attack Carrots? This is the second season they have done so here, and just within a week of the date of last season's attack. They cut them over at the ground level and gnaw part of the root, destroying quite a number in a very short period. *R. Findlay, The Gardens, Castle Kennedy.*

## NEW HORTICULTURAL INVENTIONS

## LATEST PATENT APPLICATIONS.

21,891.—Raahange, S. A.—Apparatus for grading seeds, etc. August 11.  
21,678.—Rolph, H. M.—Plant markers. August 9.  
21,704.—Segal, A.—Preservation of perishables. August 9.  
21,727.—Segal, A.—Means for preserving Cereals, etc., in storage receptacles. August 9.  
21,431.—Hayes, C. F.—Sprays for flowers, plants, etc. August 5.

## SPECIFICATIONS PUBLISHED THIS MONTH.

183,623.—Constable, A. H.—Implement for sowing seed and distributing manure.  
183,742.—Wolgar, C. A.—Portable garden canopy.  
183,779.—Greenwood, H. J.—Plant support.

## ABSTRACT PUBLISHED THIS MONTH.

*Watering Plants.* Patent No. 180,967.—A novel method of automatically watering plants by capillary action has been devised by Mr. P. V. Pinson, of 209, Boulevard Devout, Paris. It consists of one or more tubes containing wicks which are arranged to conduct water by capillary action from a water container to the surface of the soil in which the plant is situated. Messrs. Rayner and Co. will obtain printed copies of the published specifications, and forward on post free, for the official price of 1s. each.

This list is specially compiled for *The Gardeners' Chronicle* by Messrs. Rayner and Co., Registered Patent Agents, of 5, Chancery Lane, London, from whom all information relating to Patents, Trade Marks, and Designs, can be obtained gratuitously.

*Rustless Weeding Irons.*—Mr. C. A. Jardine has sent us a sample of his new tool for weeding, which is known as the Rustless Weeding Iron. It is made in various lengths and about an inch wide. The one edge of the lower end is sharpened, which enables the deeper roots of weeds to be severed by means of a sharp twist. It is a useful tool for extracting such deep-growing roots as Convolvulus and Twitch, whilst the shorter irons are serviceable for removing Plantains, Daisies, and other weeds from lawns. These rustless weeding irons will be found very adaptable for removing weeds amongst plants that are growing closely together and where the hoe cannot be used, also for extracting weeds from paths, much in the same way as an old kitchen knife is sometimes employed.

## ANSWERS TO CORRESPONDENTS.

**AMERICAN GOOSEBERRY MILDEW:** *D. B. W.* Your best plan is to communicate with the Ministry of Agriculture, Whitehall Place, S.W., as the complaint is a notifiable one. The Ministry will advise you as to the best methods to adopt.

**ANTS IN A GARDEN:** *C. J. W.* As you state the surrounding fields are full of ant hills, it would be a very difficult matter to keep your garden clear of the ants. If you could gain access to the ant hills, boiling water poured over them would destroy many of the ants. There is a preparation known as Ballikinrain Ant Destroyer, which you can obtain from the horticultural sundriesmen.

**BEGONIAS DISEASED:** *H. C. C.* The Begonias are suffering from a slight attack of rust followed by damping, due to a low temperature and an excess of moisture.

**BLUE HYDRANGEAS:** *Grange.* It is claimed that a proprietary preparation known as Cyanol has the effect of causing the flowers of Hydrangeas to assume a blue tint. Others state that sulphate of iron and alum in solution, applied to the roots, has the same effect. Ammonia-alum is used by some growers for this purpose; this last is applied copiously twice a week at a strength of  $\frac{1}{2}$  oz. in one gallon of water. The blue colour develops

naturally in some cases, and especially in plants grown near the coast, but it is always found that the tone is richer when the flowers are not exposed too much to the direct rays of the sun.

**GARDENER'S REMOVAL EXPENSES AND HOUSING ACCOMMODATION:** *Perplexed.* (a) Your arrangement as to the removal expenses was apparently a little indefinite. Your employer may have intended to pay the remaining half of the expenses only in the event of your remaining six months at least. On the other hand, this might have been only to ensure that you did not give him notice within that period. On the whole, we consider that your employer should pay the remaining half, as you are leaving through no fault of your own. (b) Strictly speaking, your employer is entitled to the cottage at the end of the month; but, if it is impossible for you to find accommodation elsewhere, he would have great difficulty in getting an order for immediate possession. You had better try to come to some friendly understanding with him.

**HORTICULTURAL LECTURER:** *N. E.* Your best plan would be to study for the examination of the Royal Horticultural Society with a view to obtaining the National Diploma in Horticulture. This Diploma, together with good practical experience, will stand you in good stead in obtaining an appointment of the kind you desire.

**NAMES OF FRUITS:** *C. W.* Crab Apple Imperial.

**NAMES OF PLANTS:** *A. B. C.* (1) *Solanum rostratum*; (2) *Centaurea solstitialis*.—*Mrs. B.* A form of *Anguloa Ruckeri*.—*E. G. J.* (1) *Erica mediterranea*; (2) *Veratrum nigrum*; (3) *Amelanchier canadensis*.—*Sox, Stourbridge.* *Falcaria vulgaris* (Field-falcaria). It occurs in cornfields of this country, but is native to Western and Southern Europe.—*J. H. P.* We cannot undertake to name Roses; send them to some trade grower who can compare them with his plants.

**ORCHIDS FROM INDIA:** *E. H. H.* If the person you expect to send Orchids from India is resident there he should wait until the resting season, just after growth is finished before collecting the plants. If he is only travelling and has to take what he can get in passing, he should select the medium size, harder specimens, pack them, and send them off as soon as ready. Small packages are best. The kinds he will probably find may be divided into two classes, viz., the terrestrial Orchids growing on the ground, like our British Orchids. These should be dried in two ways, part being dried in a shady place for a few hours and then put in their sorts in small boxes. Fill the package with fine dry earth or moss, and close it down securely. The other part may be folded in paper separately and placed closely together in a leaf. The epiphytal species, that comprise the larger class, growing on trees, should be selected in the same way, choosing sturdy, hard plants of moderate size. These should be placed in boxes in layers, the roots of each layer being arranged the reverse of those of the former. Dry paper, or dry moss should be placed between the plants in packing, and a few small holes bored in the boxes before sending them off. Keep the packages as cool and shady as possible and send by the quickest route. Parcel Post is best where it is available. Either number the plants and send a numbered list with particulars of each, or attach tickets with names or descriptions to the plants.

**RUST OF HOLLYHOCKS:** *E. W. H.* Messrs. James Vert and Sons, Hollyhock specialists, Saifron Walden, are the makers of a powder for use as a specific against the disease. They claim that if their Hollyhock powder is used and the plants grown under liberal conditions, little fear need be entertained of the appearance of the disease.

**Communications Received.**—*W. H. R.*—*E. B.*—*H. B. O.*—*H. B.*—*Perplexed*—*J. J.*—*F. H.*—*A. W.* (Thanks for 1s. for R.G.O.F. Box, Eds.)—*H. H. O.*—*J. J.*—*W. G.*—*A. H.*—*F. A.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 59.1°.

### ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London. Wednesday, September 6, 10 a.m. Bar. 30.4; temp. 61°. Weather—Fine.

### The Rate of Growth of Trees.

Although a knowledge of the rate of growth of trees and of the influence of meteorological conditions on growth is of great importance to foresters, there is, at present, but little exact and detailed information on the subject. With the object of remedying this defect of knowledge, Messrs. Haley and Cunliffe commenced in 1920 a series of observations and measurements of trees in Bingley Wood, Oxford. Needless to say, some considerable time must elapse before a body of facts can be obtained sufficient to provide a basis for sure conclusions, and the authors, in presenting the results of measurements obtained in the years 1920 and 1921,\* are properly cautious in drawing no more than provisional conclusions from their records. The method adopted by Messrs. Haley and Cunliffe consisted in the measurement twice weekly of the rates of growth in height of selected trees of Sitka Spruce, European Larch, Corsican Pine and a few specimens of Douglas Fir and Beech. The method can, of course, be applied conveniently only to trees of relatively low stature, and those on which observations were made were not more than fourteen feet high. In order to obtain experimental evidence of the effect of water supply on growth, two expedients were adopted. One consisted in the removal of the top inch of soil, and the other in a reduction in the water-conducting capacity by cutting the stem half-way through near its base. Neither method seems to us to be free from objection, as the authors recognise.

The removal of the top inch of soil results not only in a reduction of the capacity of the soil as a reservoir of water, but also in a more rapid heating of the soil, which may produce a direct effect on rate of growth. Cutting through the stem of a dicotyledonous plant undoubtedly checks the rate of ascent of water, but in the case of certain Conifers—for example, the Yew—it is easy to show that, at all events for a time, the efficiency of the wood as a water-conducting tissue is not impaired. Therefore, before conclusions can be drawn profitably from the result obtained by this method, somewhat prolonged measurements of the rate of transpiration of young trees—intact and with stems partly cut—are required. Among the many striking observations made by the authors, the most interesting are those which record the period of maximum growth. Sitka Spruce, Corsican Pine, Douglas Fir and Beech all commenced to grow in 1921 on or about April 25 (April 25-29). Data are not given to show the meteorological events, soil, temperature and shade temperature immediately preceding this date, and it is to be hoped that, if information on these heads is available, it will be published when the full results of the research are presented. Larch begins its growth nearly a month later (May 23-26) than the trees just named. As to period of maximum growth, in the cases of the Pines (Corsican and Pinus ponderosa) growth is greatest at the end of May, whereas Sitka Spruce, Douglas Fir and Abies grandis grow fastest in the latter part of June. In both groups growth is completed by the end of July or beginning of August. As was to be expected, the effect of the abnormally hot weather of 1921 was to shorten the growing season and to reduce the daily increments. Clear evidence was obtained in the case of the Corsican Pine of the paramount influence of temperature in accelerating growth, whereas in the case of Larch, increase of temperature had no such effect in quickening growth. This latter result, the authors explain, as we think quite satisfactorily, by assuming that in the dry year of 1921 the growth of Larch was limited by lack of water. Finally reference must be made to the very suggestive considerations put forward to the effect that a relatively high soil temperature is detrimental to stem development—an hypothesis supported by striking evidence in the case of the Corsican Pine. The authors point out that soil temperatures in ground under a dense Douglas Fir plantation were at six inches 10° F. and at two feet 12° F. lower than in unsheltered ground near by. They suggest that the often observed improvement of growth in a young plantation at the time when it completes its canopy and the deleterious effect of opening up woods unduly, may be explained in the former case by the cooling effect on the soil, and in the latter by the warming up of the exposed soil beyond the temperature at which a high rate of growth can be sustained.

### Origin of the German Horticultural Society.

Interesting particulars of the history of the Deutschen Gartenbau Gesellschaft are given in the issue of *Gartenwelt* for September 1. The society was founded in 1822 under a statute of Frederick William III of Prussia, as a "Union for the Furtherance of the Art of Gardening in the Royal Prussian States." A Committee of twelve people was appointed to form the Society, among whom was Dr. Link; Herr Otto, of the Botanical Garden; a nurseryman named Bonché; a head gardener, Fintelmann; and other notables of the time. The early success of the Society was chiefly due to the untiring efforts of Dr. Link, who was a member from the beginning, and from 1834 till his death in 1851 acted as President. Another invaluable member of the

original Committee was Lenné, a landscape gardener, who was instrumental in founding a nursery near Potsdam which was able to supply the whole country with fruit trees. At the same time the Committee founded a horticultural college originally housed in a mansion in Neu-Schöneberg, near the old Botanic Garden, where also the office of the Society was established. It afterwards served as the nucleus of the Royal School for gardeners known as 'Wildpark'. In 1875 Dr. Wittmack became general secretary of the Society, and remained in this position thirty years. He also conducted the organ of the Society, which several times changed its name, beginning as the "Monthly Paper," continuing from 1881-1885 as the "German Gardening Times," for two years more simply as "Gardening Times," and from 1887 as "Gartenflora." Dr. Wittmack is now over eighty years of age, but still takes the keenest interest in the work of the Society. Of the Presidents, which have been many during the hundred years of the Society's existence, it suffices to mention only one or two. To Herr Walther Swoboda, of the Berlin nursery firm I. C. Schmidt, who was President in 1909 and 1910, is due the credit of having altered the name of the Society—which was hitherto generally known as the "Society with the Long Name!"—to the simple title it now holds. He died in 1916, at the early age of 43. He was followed by Dr. Hugo Thiel, who worked hard for the unification of the many small gardening societies scattered all over Germany, and which he thought would be more useful if closely affiliated to a large parent society such as the English Royal Horticultural Society. The present holder of the Presidential chair, Herr Braun, combines the business management of the Society with his presidential duties, and has worked very hard for the success of the centenary celebrations, now in full swing.

**Paris Autumn Show.**—The French Chrysanthemum Society will hold its Annual Congress in conjunction with the International Autumn Exhibition of the National Horticultural Society of France. This show will be held in the Palmarium of the Jardin d'Acclimatation, and will open on October 2 and close on November 5. A cordial welcome is extended to all British growers of the Chrysanthemum to take part in the show and Conference. Mr. C. Harman Payne, Foreign Secretary of the National Chrysanthemum Society, 195, Wellmeadow Road, Catford, S.E.6, notifies us that he will be pleased to give information to prospective exhibitors or visitors.

**National Rose Society.**—We understand that during the past two months the number of new members joining the National Rose Society is 200 per cent. greater than for the corresponding period of last year; compared with the pre-war year, 1913, the increase is even more remarkable, being more than 400 per cent. A record number of fifty-four new members joined on Tuesday, the 29th ult. The present membership is close on 9,000.

**The Allotments Act, 1922.**—This new Act, which came into force early in August, goes a long way towards meeting the objections of plot holders who were formerly liable to be dispossessed of their holdings at short notice. Prior to the new Act, although they were compensated for the value of the crops, they were not able to reap the full fruits of the time and labour which they had expended. The Act provides that the tenancy of an allotment garden cannot be terminated by the landlord at less than six months' notice, to expire at some period of the year which will not include the dates April 7 to September 28 inclusive. Moreover, in the case of notices terminating at Michaelmas, the tenant will be at liberty within three weeks afterwards to remove any crops which may be growing on the land. There are, however, certain exceptions to these provisions—for instance, where the land is required for building or some other industrial purpose only three months' notice need be given, but compensation for crops and manure will be awarded. Another important provision of the Act is that it requires every borough or urban district council with a population of more than ten thousand,

\* *Oxford Forestry Memoirs.* An investigation into the relation between height, growth of trees, and meteorological conditions. By W. E. Haley, B.Sc., Research Officer to the Forestry Commission, School of Forestry, Oxford, and Norman Cunliffe, M.A., Lecturer in Economic Zoology, Oxford. Clarendon Press, Oxford.

unless specially exempted, to establish an allotments committee, which will arrange all matters concerning allotments in the district. It will not, however, have power to raise money by means of a rate or loan.

**Lupins for Improving Poor Soils.**—The *Estates Gazette*, August 12, 1922, gives particulars of experiments with Lupins that have been carried out in Nottingham with a view to improving the quality of the soil. Lupins possess great advantages for green manuring purposes, since they produce a luxuriant crop (frequently three feet to four feet high) on very light land; being a Leguminous crop, they enrich the soil with nitrogen, and when ploughed in they bind sandy soil together and give body or humus to it, thereby supplying direct plant food and, perhaps most important of all in these soils, helping to conserve the natural moisture. An interesting test was made in 1920, when it was found that

presence in plants and vegetables not only of zinc, cobalt, iron and magnesium, but also of aluminium, cadmium, iridium, and nickel.

**A New Head Gardener at the Luxembourg.**—The post of head gardener at the Luxembourg, in Paris, having become vacant, candidates for the position were examined on July 24 and 25. Nine candidates presented themselves, and the post was finally awarded to M. Cuny, a former student at the School at Versailles.

**Plant Indicators.**—An interesting article under this title by Mr. J. M. Murray appears in the *Transactions of the Royal Scottish Arboricultural Society*, July, 1922. Mr. Murray has drawn up a table showing how the natural herbage indicates the nature of the soil, and gives a list of trees which are suitable for planting on land carrying certain flora. Thus, he points out that Heather or Ling indicates a peaty soil in which Scots Pine and occasionally the Larch

**Costermongers as Retailers of Fruit.**—According to Mr. James Bradnum, president of the London and Provincial Fruit Buyers' Association, fruit growers are feeling the effects of the dearth of costermongers, who before the war came forward when there was a glut and purchased the fruit for retailing on their barrows. The reason, he supposed, was that there was a certain element of risk to everyone engaged in the fruit business, and since a man could now stay at home and secure what he needed to keep body and soul together from the dole, there was lacking the impetus to purchase supplies of fruit or vegetables.

**Resignation of Principal of Harper-Adams College.**—Mr. P. Hedworth Foulkes, who has been Principal of the Harper-Adams College of Agriculture at Newport, Salop, for 22 years, since the opening of the College, has resigned. At a recent gathering of farmers at the College

OFFICIALS OF THE GLASGOW INTERNATIONAL SHOW AND MEMBERS OF THE DEPUTATION FROM THE ROYAL HORTICULTURAL SOCIETY.

Back row (left to right): Messrs. Jas. Whitton, J.P., V.M.H., Director of Parks and Gardens, Glasgow; John Cairns, Chairman of Committee; Hugh M. Mackie, C.A., Secretary; C. P. Hainsworth, General Manager, Kelvin Hall; Cecil Sommerville, Assistant Manager, Kelvin Hall.  
Front row (left to right): Mr. Gerald Loder; Mr. W. R. Dykes, M.A., Secretary, R.H.S.; the Right Hon. Lord Lambourne, President, R.H.S.; Sir John Reid, D.L., President Glasgow and West of Scotland Horticultural Society; the Rev. W. Wilks; Mr. W. Cuthbertson; Bailie W. B. Smith, Convener of Kelvin Hall Committee.

Oats after Lupins yielded  $7\frac{1}{4}$  qrs. per acre, while Oats after Buckwheat yielded only  $1\frac{1}{2}$  qrs. per acre. Corn growers in districts where poor, light land predominates could well memorise these facts. With reference to the tests made in 1921, it was found in the cultivation of Lupins that phosphatic and potassic manures gave good results, the poorest plot of any being the unmanured. As a general rule, the application of 3 cwt. of basic slag or basic phosphate per acre, or 2 cwt. bones per acre, as a phosphatic dressing, would be ample, while the potassic dressing would consist of from 1 cwt. to 3 cwt. per acre of sylvinitic or kainit. In the Nottinghamshire tests it is observed that in each trial a portion of the land adjoining was left without Lupins, so that in the following years throughout the rotation proper comparison could be made with the crops following the Lupin preparations.

**Metals in Plants.**—At a recent meeting of the French Academy an interesting communication was received from Professor Bierneske, member of the Academy in Russia which existed in pre-Soviet times. The Professor declared that researches instituted by him established the

may be successfully planted, and so on with various grasses, Rushes, Bracken, Bog Myrtle, Firs, Broom, etc., giving the trees suitable for planting on land occupied by them. He states that many of the natural forest tracts in Britain have been destroyed within the period of written history, and the place of these is now occupied by a sub-climax stage of grass-land, dwarf shrubs or cultivated land. In the grass-land, where man's influence is not too strongly felt, the various species would tend to sort themselves out so that each occupied the position that was best suited to its development. Within certain limits a normal form of succession would take place, and the same would occur among the dwarf shrubs. The forester, in forming his plantations, wishes to jump over these various sub-climaxes that would exist before forest was reached, and at the same time, to arrive at what could remain under natural conditions as a dominant association with societies in it dependent on habitat. When he achieves this end he may be sure that within the limitations imposed by migration barriers, he has got the best possible form of tree-growth for his area.

it was stated that the number of students had increased from four to a hundred and thirty. The reputation of the College had been built up in the face of great difficulties, until it was now known throughout the Empire. Mr. Foulkes had found the work tell seriously on his health, which was the cause of his resignation, but he has been recuperating for some months abroad, and is very much better.

**Stocks from Gethsemane.**—In December, 1917, a British officer of Lord Allenby's force visited the Garden of Gethsemane, near Jerusalem, where the monk in charge of the garden gave him some seeds of the beautifully scented Stocks which grow there. The seeds were not sown until early in the present year, and proved curiously capricious. Some remained dwarfed, others grew into bushy plants, but very few consented to flower. One group of three seedlings, however, which was planted in the garden of Mr. R. S. A. Housden, President of the London Rotary Club, at Shortlands, Kent, is flourishing, and the plants are blooming freely. The blooms are of a fine shade of pink, with a touch of mauve.

TREES AND SHRUBS.

OLEARIA INSIGNIS.

THIS beautiful species is the most distinct of all the Olearias, and is by no means common in gardens, due no doubt to the fact that, save in exceptional cases, it does not appear to be long-lived under cultivation. In its native state the plant is said sometimes to attain a height of five feet to six feet, but under cultivation I do not remember ever having seen it exceed two feet in height. The fine specimen illustrated in Fig. 59 is practically prostrate, the shoots spreading over the stones which are partly embedded in the soil. It is in an unheated conservatory in Killerton Gardens, near Exeter, the Devonshire seat of the Hon. F. D. Acland. When photographed the plant had some sixty-five flowers and flower buds, and is by far the finest specimen it has been my fortune to see. The specimen illustrated was, with others, raised from seed about ten or twelve years ago, and with others was originally planted out in the rock-garden, but they appeared to suffer from damp during the winter.

in stating that Mr. Bean does not mention it in his *Trees and Shrubs Hardy in the British Isles*. Mr. Bean includes it, along with several others which are not fully described in the text, namely *O. Forsteri*, *O. insignis*, and *O. nitida*, at page 104, and he states that *O. nummularifolia* and *O. nitida* "succeed well in the open in Miss Wilmott's garden at Warley Place, in Essex." The name is also given in the index to the work. It is not, however, included in the second edition of the *Hand List of Trees and Shrubs* grown in the Arboretum at Kew (1902). According to the *Index Kewensis* the correct spelling of the specific name is *nummularifolia*, i.e., without a diphthong. *A. D. Richardson, Edinburgh.*

CUPRESSUS FORMOSENSIS.

MR. H. CLINTON BAKER has sent me a branch bearing cones of the Giant Cypress of Formosa, of which there are several specimens fruiting at Bayfordbury. This is the first time that this species has produced fruit in Britain. It was introduced by Mr. Baker in 1911, when he received a living plant from Formosa, and

FIG. 59.—OLEARIA INSIGNIS FLOWERING IN AN UNHEATED CONSERVATORY.

The only ultimate survivor was lifted a few years ago and planted in its present position. I understand from Mr. J. Wilson, who is in charge of the gardens, that this plant usually produces quantities of good seeds, and when in fruit is almost as attractive as when in flower. *Olearia insignis* is figured in the *Bot. Mag. t.*, 7034, and is a native of New Zealand, where it is found on rocky river banks in the middle part of the North Island in the province of Nelson, where it was discovered by Capt. D. Rough about 1850. It is also reported as being found on the banks of the Karran River, in the N.E. part of the same island, occurring from sea-level up to 5,600 feet elevation. The large, oblong leaves are shiny and coriaceous on the upper surface, while the underside and stems are densely clothed with white or reddish felt. The white flowers are over an inch across, while the peduncles are one-flowered, and vary from six inches to one foot in length. *J. Coultis.*

OLEARIA NUMMULARIFOLIA.

WITH reference to the note by *J. F.* on this plant (page 91), I may say that it is perfectly hardy here. I have plants of it from cuttings which I received about ten years ago from a friend in the Murrayfield suburb of Edinburgh (who had several large plants of it growing in the open ground), another came unscathed through the severe frost of November, 1919, when several of the *Veronicas* were completely killed. It is rather a slow-growing subject, however, and is not so showy as most of the others when in flower, but, as *J. F.* remarks, it is a good foliage plant of its kind. I may also remark that *J. F.* is in error

also a quantity of seed, which was distributed to various gardens in England, Ireland, the Continent, and North America. A complete description by me of this Cypress, with drawings of the foliage, seed, and cone-scale, was published in *The Gardeners' Chronicle*, March 2, 1912, Fig. 53. Another illustration, Fig. 54, reproduced a photograph of a large tree, 67 feet in girth, growing on Mount Morrison in Formosa. Seedlings grow fast, but are tender to spring frost. The swelling of the branches at their junction with the main stem is a peculiar feature of this species. *A. Henry.*

LAVENDER.

THIS favourite old garden plant may be propagated from cuttings inserted now, making them like other cuttings, and striking them in sandy compost in a cold frame. A frequent cause of failure is the insertion of the cuttings insufficiently deeply in the compost. The cuttings should be put in the soil so far as the foliage, and made quite firm at the base. We generally employ the box method as being convenient for handling.

There are several fine varieties of Lavender in cultivation, and at Aldenham we grow *Lavandula spica*, *L. vera*, *L. vera alba* (the very attractive white-flowered form), *L. vera nana*, *L. Munstead blue*, *L. multifida*, and *L. Twickel purple*, the last a finely flowered, broad-leaved form.

A Lavender hedge is a fine feature in the garden, and the spikes of fragrant flowers are always appreciated, especially for their old-time use of placing amongst clothes to keep moths away, being as effective for the purpose and greatly to be preferred to carbon or camphor. *Edwin Beckett.*

**Allotments.**—According to Mr. F. Forbes, general secretary of the National Union of Allotment Holders, 1,250,000 people are cultivating allotments in England and Wales. He estimates that each allotment produces on an average ten hundredweight of vegetables annually, or an aggregate of 700,000 tons, of which about 200,000 tons are Potatoes. There is still a growing demand for allotments, the latest return showing no fewer than 50,000 applicants whose wants have not yet been met. It is computed that 250,000 people hold their allotments on land originally acquired under the temporary provisions of the Defence of the Realm Act. With the expiry of D.O.R.A. these allotments, as such, ought to be surrendered in March next. Some provision, however, has been made under the Allotments Act just passed by which, in the case of land that was unrated when originally taken over, local authorities may continue to use it for allotments until it is required for some other definite purpose by the owner.

**Appointments for the Ensuing Week.**—Monday, September 11.—United Horticultural Benefit and Provident Society's meeting; Bath Gardeners' Society's meeting; Purley Horticultural Society's meeting. Tuesday, September 12.—Auchencairn Horticultural Society's meeting. Wednesday, September 13.—Royal Caledonian Horticultural Society's show (2 days); East Anglian Horticultural Society's meeting; Sheffield Chrysanthemum Society's meeting; Elgin Horticultural Society's show. Thursday, September 14.—Bristol and District Gardeners' Association's meeting. Friday, September 15.—British Mycological Society's autumn foray (8 days) and annual meeting; Eastbourne Horticultural Society's meeting; Moffat flower show. Saturday, September 16.—Haddington flower show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Gathering and Storing of Fruits.* The summer fruit season being now nearly ended, attention must be paid to the gathering at a proper period, and storing away in a proper manner, the keeping winter stock, which is even more valuable than the preceding. It is a somewhat nice point to know when to gather the respective fruits, some being best at one stage of the ripening process and some at another. As a general rule, we would say that fruit of a precocious character and which ripen rather hastily, and those also possessing some aroma, should be gathered somewhat under-ripe; whilst those which ripen with difficulty, which are long in obtaining colour, and those which are scentless, should remain much longer on the tree. Certainly the way to obtain the greatest amount of flavour is to suffer fruit to become ripe on the plant, but we think that long keeping properties are secured by gathering rather earlier. The colouring of the pip or seed is, perhaps, after all, the most sure criterion; if this is one-half coloured, we think it will seldom be an erroneous proceeding to gather the fruit. It need scarcely be observed that care, much care, must be exercised in handling these for long keeping, especially the Flemish Pears. Some have advised them to be handled like eggs; the latter, however, will bear a much rougher handling than some of the Pears, many of which possess a fine skin, and are very susceptible of bruises. The Pears should only be placed one layer in thickness if possible, and for material we find nothing better than cap paper, where the shelves are solid placing the cap paper double. We think that Pears require less ventilation than Apples; the latter are apt to give out a vast amount of moisture on first entering the room, especially if surcharged with juices through a rainy period. The Pears for long keeping may in such case have something laid over them, in order to prevent excessive perspiration. *Gard. Chron., September 11, 1847.*

**Publication Received.**—*Catch Crops and Forage Crops.* Free on application to the Chilean Nitrate Committee, Friars House, New Broad Street, E.C.2.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BAKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

**Pleione.**—In the cool Cattleya house the Pleiones will now be completing their new growths, and will need more light and air to consolidate the pseudo-bulbs. Sufficient water should be given to keep the compost moist. The cool-growing varieties, *P. humilis* and *P. Hookeriana*, will still require liberal supplies of water until their growths are completed. The position most suitable to them is one close to the roof ventilators of the cool house. These old species of Orchids are not grown at the present time so extensively as their merits deserve, as there is a particular charm, all their own, in the different species of all classes of Orchids.

**Cool Orchids.**—The various members, both species and hybrids, of the genus *Odontoglossum* comprise the principal occupants of the cool house. This family of Orchids includes some of the most beautiful as well as most useful plants in cultivation. The late summer and early autumn is generally regarded as the most suitable season for attending to the roots of these plants, as the climatic conditions at this season are generally favourable to their re-establishment. Every effort should be made to repot plants at the season when they will receive the least check possible; and that is whenever the plant is about to develop fresh roots. *Odontoglossums* from now onwards commence to push new roots from the bases of the newly-made growths, hence the necessity of attending to the more forward specimens first, until all that are in need of new material are attended to. Should the old compost be sweet and the plants in small pots, they may be shifted without much disturbance of the roots; but should the compost be sour, pick out all the decayed material and place the plants in pots of the same size, or even in smaller ones.

**Potting Compost.**—As regards the kind of potting material for Orchids, there have been innumerable mixtures recommended for their cultivation, from leaf-soil to pure fibre. As I am a firm believer in a clean, open compost for these and all other plants, I recommend a mixture made up of equal parts of good Peat, fine A.1 fibre, and Sphagnum moss, with a slight addition of broken leaves. As the best compost that can be put together is easily ruined by faulty watering after repotting, too much care cannot be given in the application of water to newly potted plants. It is essential that the pots be well drained to ensure a free passage for water, and the compost should be made moderately firm.

### HARDY FRUIT GARDEN.

By H. MAREHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Lifting Unfruitful Trees.**—Although it is too early to commence root-lifting, preparations should be made as early as means will allow. Collect and prepare suitable soil for the different kinds of trees, so that when the proper time for lifting arrives all will be in readiness for carrying out the work as speedily as possible. The soil for all kinds of stone fruits should contain plenty of lime and should be sweet and fresh. For Pears and Apples use a good, medium quality, fibrous loam, enriched with a little manure and mixed with a quantity of brick rubbish to keep it open. Manure is sometimes not needed, but a little sweet decayed dung well mixed with the loam will greatly assist the trees to develop fibrous roots. Large trees that have hitherto borne little or no fruits may be

brought to a satisfactory state of bearing by lifting their roots, pruning them and replanting them nearer the surface in a sweet fertile soil prepared expressly for them. Whenever this work is undertaken take care not to miss severing a single tap-root, otherwise the work and trouble expended will be in vain. I have lifted unfruitful trees of very large size, carefully preserving as many of the roots as possible, and replanting the latter nearer the surface, where they could receive the full benefit of the sun's warmth, with excellent results and far beyond my expectations. Not only have such trees borne heavily after root-pruning, but the individual fruits produced have been large, exceptionally clean and good and well flavoured.

**Strawberries.**—Remove all runners from Strawberry plants as fast as they appear, and keep the beds free from weeds by running the hoe repeatedly along the rows. Do not disturb the soil too deeply, as many of the roots grow near the surface. Plants that were put out early are growing freely, the recent rains having benefited them greatly, and the same is true of plants in older beds. With a little care and attention the plants should develop fine, sturdy fruiting crowns by the end of the season, and produce strong flowers next spring. In some gardens young plants are set out expressly for supplying early runners; they are kept free of flowers and encouraged to grow for the production of strong runners early, an excellent method which is worth adopting by growers. The Strawberry crop this year was a very poor one, owing to a variety of untoward circumstances, and the plants should receive a little extra attention to compensate for these adverse conditions.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Coticote, Welwyn, Hertfordshire.

**Nerine.**—Plants of *Nerine Fothergillii* and some of the hybrid *Nerines* are pushing up their flower spikes and should be well exposed to the light in a cool greenhouse. At this stage of cultivation the plants should not be over-watered, but when the flower spikes are removed and the plants are making their foliage, every encouragement should be given them to make as much growth as possible. It is not necessary to repot these plants every year; once in three or four years will suffice. Some of the surface soil, however, may be removed, and a little rich soil used as a top-dressing.

**Swainsonia galegifolia.**—This species and its varieties *purpurea* and *alba*, are useful for training up pillars in the greenhouse, also for training around sticks or wires to form specimen plants. They grow very quickly and will, provided they are given manure water on frequent occasions, cover a large amount of space in a very short time, even when the roots are confined in receptacles of moderate size. Cuttings made from the young growths will root freely if inserted in light, sandy soil. Stand the cutting pots on a mild hotbed. This plant will grow in almost any soil, but a mixture of loam, leaf-mould and sand will be found the most suitable.

**Humea elegans.**—A sowing of this graceful plant should be made sometime during the present month. The seed should be sown in pots or pans filled with a light, open compost. When the seedlings are large enough to handle they may be pricked off singly into very small pots and stood near the roof glass in a cool greenhouse. To be successful with this plant it should be given cool treatment and great care must be exercised in watering it. It will be found to thrive much better when in the young stages of growth if kept a little on the dry side; when the young plants are overwatered the soil becomes sour, which probably causes the young plants to die quickly. The same treatment should be given whenever the plants are shifted into larger receptacles. Plants coming into flower now need the same care with regards to watering, but it will be readily understood that the plants should never be allowed to become dust dry before water is applied to the roots.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Mushrooms.**—The mushroom house should be well cleansed, the walls whitewashed and materials for new beds gathered and prepared as recommended in a previous issue to raise a winter crop.

**Cabbage.**—Choose a south border and make a planting of Cabbages, allowing 18 inches between the rows, and setting the plants 1 foot apart in the rows. This will ensure a good crop, as every other plant may be taken out in the spring for making good any that have bolted. Ground which has been cropped with Onions is suitable for the planting of the second batch.

**Rhubarb.**—No more stalks should be pulled after this date, as divesting the plants of the leaves tends to weaken the crowns. Any decaying stems should be cleared away, so that the crowns may receive all the air possible to ripen them. A good soaking with manure water will help to develop fine crowns for forcing.

**Endive.**—Plants of the earliest batches of *Endive* are now ready for bleaching, which may be done by tying the leaves together and placing a pot over them when the plants are perfectly dry. Another batch should be planted in a warm, sunny position, and some should also be transplanted in frames.

**Peas.**—The season for Peas has been a poor one in the north. We have had plenty of pods but, owing to cold, wet weather, they have not filled. Varieties that have filled their pods well should be carefully picked when ripe and saved for seed, which should be well dried before storing it.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Frame Melons.**—These will now be almost over, but where the fruit is still unripe, the bottom heat of the bed should be tested. Good Melons can be grown without fire-heat by renovating the fermenting materials of the hotbed as linings regularly, by closing the frame early in the day with sun-heat, and covering it with mats before nightfall. Discontinue syringing and feeding, admit a moderate amount of air early on fine mornings, gradually increasing the quantity, when gentle warmth in the top pipes will dry up superfluous moisture and prevent sudden fluctuations in the temperature of the frame.

**Winter Cucumbers.**—With the approach of autumn old Cucumber plants should be cleared out of the houses or pits with as little delay as possible. The houses should be thoroughly cleansed before they are replanted. Stout, healthy, young plants should always be available for planting, but at no time is this more desirable than in the autumn. The plants should, as the pits are cleaned, be put out in pots or upon hillocks of soil and their development hastened by affording them bottom heat of 80°, which will permit of ventilation of the pit. If there is no hurry for the fruit 4 feet apart will be close enough to set the plants, and the laterals may be allowed to extend a little more than usual. The compost should be rather more porous than that recommended for summer culture; it should be of the best quality and free from animal manure. Two sowings of *Telegraph* or another good winter variety should be made in September, the first early in the month, and the second towards the end. Where a steady supply of fruit throughout the winter is required the month of September should be devoted to the preparation of the plants and the pits in which they are to be grown. In pits without fermenting materials, gentle fire-heat should be used, even in September, as the proper temperature cannot be maintained without artificial warmth. Light, rich top-dressing, with a sprinkling of soot for the destruction of worms, may be applied, and poor compost may be enriched with bone-meal in preference to manure.

**Figs.**—The fruits from Fig trees under glass should now be over, and the trees in pots, tubs, or borders resting. What is gained by allowing a few more fruits to ripen will be lost when half-rested trees commence casting their fruits early next spring. If the autumn continues fine and dry, pot trees may be kept near the foot of a west wall until the house or pit in which they are to be forced is ready for them. The Fig being subject to attacks of red spider, scale and other pests, the trees should be most carefully washed and dressed with Gishurst compound, the house equally well cleansed with hot water, and the brickwork lime-washed before they are taken in. Sudden and severe autumn frosts do Fig trees no good, therefore the house should be ready for them at the shortest notice. The best trees for very early forcing are those 6 feet to 8 feet high; the fruits on such plants invariably swell to a large size, and are not so subject to dropping as so often happens when the roots are confined to small pots and irregularly watered.

**THE FLOWER GARDEN.**

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Propagating Summer Bedding Plants.**—The time has arrived when considerable attention must be devoted to the propagation of many of the more important plants utilised for the summer bedding. Those that call for attention during the next week or so comprise chiefly Pelargoniums such as the ordinary Zonals, Ivy-leaved, and the Cape, or Scented-leaved species, where these are used for bedding purposes, Fuchsias and Verbenas, these three being rooted within cold frames. The more tender plants may be struck in heated pits or frames, and of these the more important are Heliotrope, Swainsonia, Mesembryanthemum, Salvia, Streptosolen and Plumbago capensis. Zonal Pelargoniums will probably be rather more difficult to root this year than they were last, inasmuch as the wood is far more sappy. To overcome this drawback it will be advisable, when the cuttings are made, to lay them in a dry, sunny position for a short time, until they show evident signs of wilting. Thereafter they may be inserted in pots filled with sandy compost to strike in the usual way. Cuttings of summer bedding plants should be made from the shorter and more compact shoots rather than from longer, weaker ones. The cold frame method of raising Zonal and other Pelargoniums, Fuchsias, etc., is undoubtedly the best for the purpose if adopted now, inasmuch as if the work is left until later in the year, heat will be necessary in order to strike the cuttings, and though this may result successfully, yet the plants will be of weaker constitution than those struck without fire-heat. The more tender plants for striking in the pits or frames where heat is required should be made in the usual way, and inserted in 48-pots containing good, sandy compost. They should not be crowded too many in a pot, out made firm at the base, and, when rooted, removed to cooler quarters. Guard against any possibility of frost getting to them, though the grower should endeavour to have them as hardy as possible.

**Stock Plants.**—The propagation of certain tender subjects, used for bedding, should be left until early spring, and a number of stock plants should be reserved when lifting the summer bedding and potted up for the purpose of wintering them in warm frames. From these they can be introduced into mild heat at a suitable time later, and will rapidly then furnish a sufficiency of young, suitable growths that are most useful for propagation as cuttings in gentle heat. The best period for accomplishing this work is just about the advent of the New Year, and plants that can thus be dealt with include Irosines, Ageratum, Salvias, Lobelia and Mesembryanthemums. It will be seen that a certain repetition of plants occurs, therefore the propagator can choose the period most suitable to him. Watch the cuttings carefully, stirring the soil around them lightly from time to time to prevent them from damping off. The material taken from the beds for use as cuttings should be selected carefully so as not to spoil the plants, which will continue to prove attractive until the end of the season.

**THE BULB GARDEN.**

**WHITE GLADIOLI.**

THAT colour descriptions are difficult we all appreciate from our own experience, yet one would have thought that in the case of a white variety our troubles would cease. But it is not so, for we find many Gladiolus varieties with scarlet, blue, or purple blotches classed as white—such as Incontestable, Meteor, and Peace. There must be a large number who bought Peace, thinking it was a white variety, only to find that there was a good deal of colour in it.

In looking back among the whitest of whites, such as Alice Carey, Rochester White, Lily

FIG. 60.—GLADIOLUS PERFECT PEACE.

Lehmann (1909), Europa (1911), Chicago White (1913), White Glory (1915), Lily White (1916), Mary Pickford (1917), and Giant White, I give first place to the last-named as the purest white at present on the market.

There was Superb Peace (1918), which I have not seen, and now we have Perfect Peace (see Fig. 60), which obtained an award of merit at the R.H.S. meeting on August 22 last, when shown by Messrs. Kelway and Son. This last is not a pure white, but nearly approaches being so. There is yet another white, which is not yet in commerce, named Fern Kyle. This is a fine flower, but has the same defect as Perfect Peace. I should not be prepared to say which is the better flower of the two without seeing them together. Having seen both flowers, I think they run each other very close indeed.

There is still another white, which for purity and grace may excel all the other whites, but that is another story.

Apart from Mary Pickford, I have not touched on the creamy whites. These, again,

are very numerous, but, so far, I have not seen a variety more to my liking than Snow Glory, which was illustrated in *Gard. Chron.*, October 8, 1921, Fig. 74. *Smilax.*

**HARDY FLOWER BORDER**

**THE DOUBLE SAPONARIA.**

THE double form of *Saponaria officinalis* is an old inhabitant of the garden, and is as often found in an apparently wild state as the single one. The chief difference in their appearance is that the double one is mostly confined to a single colony, even if it is a large one; while the single flowered one scatters its seeds about and forms numerous colonies. Both require a deal of garden room on account of their underground stolons; and for that reason I have found outcasts by the seaside, river banks, and on commons. I recently conceived the idea of examining the double flowers, and found the buds so bulky that they split the calyx down one side, like a Carnation. Inside were numerous petals, numerous stamens, more or less perfect, and a number of seed vessels, forming several flowers within the original calyx. There are two carpels in the normal, single flower, completely united and surmounted by two styles. In the double one the carpels varied from three to eight, more or less united, sometimes wholly free, and in all cases open on the inner face. Each carpel was surmounted by one style, so that the ovary was apocarpous, and open at the ventral suture. Each carpel is, of course, the homologue of a leaf. In this case the extra number of petals cannot have originated from the stamens, because several separate flowers within the original calyx have petals, stamens and open carpels. *J. F.*

**ORCHID NOTES AND GLEANINGS.**

**LAELIO-CATTLEYA PRAXITELES.**

PANTIA RALLI, Esq., Ashtead Park, Surrey (Orchid grower, Mr. Farnes), sends a beautiful four-flowered inflorescence of this hybrid between L.-C. Mrs. Phayre (*C. Dowiana aurea* × *L.C. Norba*) and *C. Hardyana alba* var. *Countess of Derby* (F.C.C., September II, 1894). The plant was developed in his gardens from a very small seedling acquired from the collection of the late J. Gurney Fowler, Esq. The general form of the flower is similar to that of the *C. Hardyana* parent, and it is very fragrant. That useful little species, *L. xanthina*, which has played such an important part in yellow hybrids, imparts to this pretty novelty clear Cowslip yellow colour in the sepals and petals. The broad labellum, which has an undulated margin, is violet crimson in front, with gold lines on a purple ground running from the base to the two chrome yellow patches displayed on each side of the middle part as in *C. Warszewiczii*, which was one of the earlier parents.

**CATTLEYA MARGARET.**

A FLOWER of a cross between *C. Maggie Raphael alba* (*Dowiana* × *Trianae alba*) and *C. Iris* (*bicolor* × *Dowiana*) is sent by Pantia Ralli, Esq. The sepals and petals, which are sulphur yellow, are very well displayed, but the labellum, which in form has almost reverted to the narrow proportions of the *C. bicolor* in *C. Iris*, detracts from the floral effect, although it is very interesting. The short side lobes of the lip, folding over the lower half of the fleshy white column, are tinged with rose, the isthmus and front lobe reddish purple with a fringed sulphur margin.

**ODONTOGLOSSUM DORAQ.**

THE record of this hybrid in *The Gardeners' Chronicle* referred to (see p. 159) was taken from a report of the Manchester and North of England Orchid Society, in which *Odontoglossum Doraq* (*Dora* × *Aquitania*) was recorded as being shown by P. Smith, Esq. The same name and parentage is included in the *Addenda to Sanders' List of Orchid Hybrids*, September, 1921.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

## SELECT BULBS FOR 1922.

THE bulb grower must have a fellow-feeling with Persephone when the bulb catalogues come in. He turns over page after page, Hyacinths, Tulips, Daffodils, and then come all the lesser fry of Irises, Crocuses, Freesias and the rest, which go to give so many of us infinite pleasure during the coming year in anticipating the unknown, or later on in the enjoyment of the reunion with old friends. What garden lover with the autumn lists on his table is not touched with the tale of Persephone in the "Meadows of Enna"?

"Lo! one who marked of rarer growth  
Than Orchis or Anemone:

For it the maiden left them both  
And parted from her company.

Drawn nigh she deemed it fairer still,  
And stooped to gather by the rill,  
The Daffodil, the Daffodil."

Jean Ingelow here puts it in a nutshell. It is difficult to know when to stop marking.

"O fateful flower beside the rill—  
The Daffodil, the Daffodil."

Last week I had one of the surprises of my life. A man with snow-white hair and beard, whose knowledge of literature is vast and who can people many a city, town and village with the great figures of the past as Thomas Hardy peopled the streets of Oxford in *Jude the Obscure*, or as Justin McCarthy filled the House of Commons when Gladstone made his great Home Rule speech, who possibly knows how Redesa odorata came to be Mignonette, did not know this plant by sight when he saw it in the garden, and in a joking sort of way I said, "Well, you know this?" As Dr. Thompson, the Master of Trinity, Cambridge, once remarked, "Even the youngest of us does not know everything," so may I venture to suggest that there may be some even among our great amateurs and head gardeners who do not know all the flowers which have "found" me in 1922 catalogues.

Hyacinths come first. Their premier position in practically every list is a silent witness to their lordship in the past as the flower par excellence of Holland, from which country once upon a time all bulbs came. Britain and Ireland can produce as good Tulips and Daffodils, but not as good Hyacinths. The dream of James Justice in 1763 is still a dream. We have still to go to the successors of the Dirk and Pietre Voerhelms and the Von Zompels for our bulbs. I hope there are goodly stocks of the

exquisite double rosy pink Kastanjebloem. It is a very happy name, for the delightful spike certainly suggests a Chestnut flower. It is an old friend that I had not seen for years until a seven-inch pot with three handsome spikes of bloom was brought to my sick-room this last spring. It was very beautiful, and I am told that all visitors who saw it fell in love with it. I have always a fondness for the ultra-dark blue single Menelik and the delightfully fresh-looking pink Lady Derby, and I can never let a year go by without a few Oranje Boven, with its unique small ruddy-apricot bells arranged on spikes which have all the grace and lightness of the well-known Roman Hyacinths. I fancy my persistent advocacy has done something to rehabilitate this variety in public favour, for I know how the past generation of Dutchmen turned up their noses at it and grugged it the room it took up in their grounds. Just as the almighty dollar touched the mid-season Tulip Sarah Bernhardt and made yards into acres, in like manner the British sovereign is touching Oranje Boven, and thousands are becoming hundred-thousands. The Tulip has been grown as a florist's flower in Holland for a much longer period than the Hyacinth, but to a large extent it came to them ready made, whereas the big, fat spikes of the last-named are, I think I am correct in saying, the peculiar and exclusive work of the Dutch.

Both in England and Holland for some years now seedling raising has been quietly going on, and a sharp look-out has been kept for promising sports. Fantasy, which I saw for the first time at Chelsea this year, is a Parrot form of the well-known Darwin Clara Butt, and has the same pretty salmon-pink colouring, but the lacinated petals of Admiraal de Constantinople and lutea major. I am told it is just as easy to grow as its vegetative parent.

The exquisite lemon and primrose mid-season Canary Queen, which is the second bulb to be mentioned in Sutton's 1922 Catalogue, I know very well. For late forcing and for garden decoration it is splendid. It flowers about the same time as Le Rêve and White Swan, and has tall, wiry stems from eighteen inches to two feet in length. All down the ages one great desideratum among Tulips has been a good late-flowering pure white sort. Zwanenburg (a white Darwin), which I first saw in Mr. van Tubergen's nursery at Haarlem, when there were only three bulbs in existence, has now come on the market, and I for one am buying a bulb or two—it is very expensive at present—in the hope that in a few years I will be able to work up a stock of my own. Messrs. Dobbie and Co. this year have Zany in their list. Technically it is a rectified bizarre, with bright cerise markings on a straw-coloured ground. I like it immensely. It has this recommendation, that under glass it is more refined and beautiful than in the open ground. So far we have always been content to have it in flower in late March. Last Autumn we gave a good trial to the Darwin Hypolite, which I can only find in Messrs. J. R. Pearson's list. It is a grand variety, and equally good under glass and in the open. The colour is a rich deep mauve, which is set off by a good blue base. Two old favourite Darwins quite surpassed themselves this year. They were the large flowered rosy-mauve Melicette, and the magnificent, tall, rich red Teddy. It is a glorious shade. I cannot find the last-named in any list I have come across, but it exists all the same, and took rank here this year as one of the "What's that?" grade.

Coloured Freesias are catching on. Were it not so difficult to provide firing there would in all likelihood have been a boom in these flowers. Dainty, which is one of those which made its bow to the public as long since as the Jubilee Exhibition at Haarlem, still more than holds its own. It is so far one of the few rosy-mauves, mauve-and-pinks that with us have never become blotched. I am buying Apothéose to see if Van Tubergen's claim for it as "the best variety yet raised" is sober fact, or if the firm has mistaken a goose for a swan. "The best yet raised" is a big claim, but I

am bound to admit that when I saw it in London in 1921 it was something quite out of the ordinary.

Dutch and Spanish Irises have a very warm corner in my heart. No one welcomed more than myself the advent of the Dutch Irises. They are so similar to the older Spanish type that in a practical way they may be said to add ten days or a fortnight to their season. Try Voerman (white), Van Everdingen (white and yellow) and Rembrandt (blue) and do not forget the Spanish varieties, Prince Henry (bronze), True Blue (deep blue), Souvenir (pale silvery mauve) and Cajanus (yellow).

Now I have started again with Ixias, I hope never to be without half a dozen pots or so. All the same, they are rather a tantalising tribe, as they only show off their finery when the sun is shining. The pale straw-coloured Hogarth and the large old-rose coloured Englishton have both got my V.G., and I hope to see them again in 1923.

Daffodils have not been forgotten, but I saw so very few last season that I must pass them over. Just as my trial collection of Polyanthus and Poetaz varieties was beginning to flower under glass I was taken ill. However, I can just mention some favourites: Orange Blossom, Albert Vis, Admiration, Jaune à Merveille, Alsace and Orange Cup. I doubt if the first-named is to be found in any English list. To me it is the best of all the Poetaz section, with its white over-lapping perianth and large saucer-shaped, dull orange centre. It is only fit for glass culture. *Joseph Jacob.*

## MR. KINGDON WARD'S SIXTH EXPEDITION IN ASIA.\*

No. 23.—SATISFACTORY PROGRESS.

ON September 6, two of my men who had gone across the Litang river to collect seed of some flowers we had found in July (especially of the fine violet *Primulina Meconopsis*) returned with the spoil. They had secured a fair quantity of the Poppy seed—all there was at any rate—and it was thoroughly ripe; indeed, had they been only a few days later, they would have got distinctly less, for the capsules were breaking up. I was delighted to find that there were no grubs in the capsules destroying valuable seeds; nor were the other two *Primulina* Poppies we discovered so plagued. On the contrary, almost every capsule of the sky-blue *Aculeatae* species contained a hungry grub—we picked scores out of the seeds before we could pack them. I recollect it was the same with *M. speciosa* also of the *Aculeatae*. *M. pseudointegrifolia* again is ignored by these ravenous seed eaters.

The collectors also brought back seed of the new *Omphalogramma*—and by "new," I mean not the widely-spread *P. vincaeflora*, which is abundant everywhere in this locality; *Primula Cockburniana*, two or three Muscaroid *Primulas*—indeed, all my chief requirements, such as were ripe, besides some which were not.

Meanwhile, we had been working hard for seeds at Mu-li, and still adding a few plants daily to the herbarium. I say "working hard" advisedly, for though not many seeds were as yet ripe down below, such as were kept us busy.

There was the *Suffruticosa Primula*, for example. It grows on every limestone cliff, and is quite one of the commonest plants at Mu-li. Yet, when we came to collect seed of it, we found we had been forestalled—a small looper caterpillar had played havoc with it, and hardly a fertile seed could we discover. Whole plants were entirely bereft, others might yield one or two sound capsules to dozens of empty ones. It was a sorry

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 23, May 6, May 20, June 3, June 17, July 1, July 15, July 22, August 5 and August 26, 1922.

business until I sent two men up the Litang gorge to the cliffs where we had first found the plant. They returned with a fair haul of good seed—apparently the caterpillars did not do business in that locality. They also brought back some blooms, for the plant was enjoying a second childhood. The flowers are quite attractive, being purplish lilac with a large yellow eye; but the lingering lavender fragrance of the leaves is even more delightful. This second flowering of plants which open early in the year is not uncommon. Clearly, it is a rhythm inherent in the species, not to be confused with lingering blooms, or an individual plant flowering later than the majority of its kind. Many species which open to the warm sunshine in May or June flower again for a brief period in the mellow autumn weather, after the worst of the rains are over. This is particularly the case with alpine plants. I have noticed *Primula dryadifolia*, several dwarf *Rhododendrons*, species of *Iris*, etc., regularly flowering twice. And now at Mu-li we found the charming pink Briar, first seen in June, a mist of autumn blossom. It was also in fruit, and we collected seed from numerous neighbouring bushes.

To return for a moment to the *Suffruticosa* *Primula*. It may be remarked that it grows on

for support, and spreading abroad, was a *Silene* with deep, rose-pink flowers, borne in profusion. On the rocks and grassy slopes the dark violet *Didissandra* still flourished, as did its two paler companions in shady places. Pink *Begonias* still flowered under the hedges, where three or four species of *Clematis* lolled at ease. The most engaging of these last had creamy-white flowers and small, shining, pinnate leaves, brilliantly silvered beneath with silky hairs. All the tribe of *Campanulas*, *Codonopsis*, *Adenophora*, *Leptocodon*, and the rest, were still with us. The large *Codonopsis* (like *C. convolvulacea*, which possibly it is) produced three distinct types of leaves, though always on different plants, according to the situation in which they grew.

Thus, in the dry Pine woods, the stem was only a few inches long, coiled in a tense spiral around some small plant, and the leaves linear, coarse, and few in number. In shady gullies, on the contrary, where thickets of trees and bushes crowded the slope, it grew many feet in length, scrambling round any support in loose coils and hanging in festoons from above; on these plants the pale green, membranous leaves were more or less kidney shaped or heart shaped, and of moderate size.

The third type, found on the drier shrub

days we had an inch and a half of rain. It was warm enough down here yet, though, for when the sun came out the maximum shade temperature rose as high as 70° F., and at night the minimum never sank below 55° F.

On September 10 we returned to the mountains for a month's seed collecting, and of that more anon. *F. Kingdon Ward.*

## THE CEDARS AT COOMBE HOUSE, CROYDON.

COOMBE House, Croydon, Surrey, the residence of Frank Lloyd, Esq., is situated on the slopes of Addington Hills, near Croydon. These hills are 465 feet above the level of the sea, and Coombe House estate is at about 340 feet elevation. The site on which the magnificent Cedars illustrated in Fig. 61 are situated is a gentle slope, the soil formation constituting a good depth of sand, which is firm and close in its texture.

It will be seen on reference to the illustration that the four Cedar trees are planted almost in a straight line and all are distinct varieties. The smallest specimen on the extreme

FIG. 61.—THE CEDARS AT COOMBE HOUSE, CROYDON.

the driest cliffs in full sunlight, where nothing else can sustain life. On the other hand, it refuses to grow in company on more eligible sites. Where it does encroach on inhabited districts, it meets the fate already recorded.

Possibly, if it did not, the cliffs from base to summit would be one vast spongy cushion of *Primula*, crawling with beetles, spiders, flies, worms, and other fauna which would find a refuge under its persistent leaves.

When, as sometimes happens, the plant secretes itself in noisome nooks under the cliff, in places too dim for any self-respecting plant not afraid of wholesome daylight, it runs all to foliage, producing very large leaves, but no flowers. However, into the further vagaries of this quaint species I need not enter now. Cultivators will, I hope, be able to experiment with it, and discover its idiosyncrasies for themselves. It is well worth cultivating.

There was a species of *Ceratostigma* on the cliffs very like *C. Griffithii*, now in full bloom. The flowers are a rich cobalt blue, produced in such masses as to smother the little bushes. Another cliff plant found at this time was a creeping *Gentian* with rather large flowers of a dull purple colour, lying down on the rock.

Autumn had scarcely touched the valley yet, and there were numbers of flowers still in the open. Worming its way up through the bushes

clad slopes was intermediate between the other two; the leaves more pointed than in the last, crisper, and of a darker green. It is remarkable how groups of related plants flower simultaneously. Sometimes it is the species of a genus, sometimes the bulk of a whole order which flower at the same season. In the case of *Strobilanthes*, for example, an Indo-Malayan genus comprising a host of species, many of which grow socially, forming the chief forest undergrowth, this phenomenon is so striking that it long ago attracted attention. But we may observe the same thing, in a lesser degree perhaps, in many other more familiar groups of plants. The *Rhododendrons*, for instance, nearly all flower in April or May, *Primulas* in June, *Campanulaceae* in August—*Campanula*, *Codonopsis*, *Adenophora*, *Leptocodon*, and others, *Saxifrages* in August and September, likewise *Delphinium* and *Aconitum*; *Labiatae* and *Compositae*, very many of them, in August; *Gentiana* and its allies in September, and so on. The list might easily be extended—anyone who has lived amongst flowers must have observed this, and will be able to recall instances.

I had hoped for fine weather with the coming of September, but little promise of it was held out. The sky was always overcast by day, and rain fell frequently at night. In the first ten

right never bears cones, owing to its stunted growth. The tallest specimen is of the usual type of Cedar that is, or has been, found growing in the neighbourhood of Coombe, such as Beedington, Blunt House, South Croydon; Moorland Park, Croydon; Addington Palace, near Croydon; and Hayes, on the border of Kent. The deep velvety green is noticeable against the lighter green of the grass and the large branches hang down in a vertical position. The sunlight on the foliage of the new growth gives a light grey tone to the tree; the deep green tone appears later in the season. The third tree from the left (see Fig. 61) is a most remarkable specimen; the foliage is always a light grey colour, and the great branches lie upon the ground and spring upwards again, almost like separate young trees, as may be observed on the extreme right-hand of the tree. I feel certain that there cannot be a more beautiful specimen Cedar in the country than this one. Many horticulturists and others have admired it and remarked upon its graceful appearance.

Cones are very freely produced on the tallest specimen. There are numbers this year, and there would have been a great many more cones had not a hail storm stripped hundreds of young ones from the trees. *Mark Mills.*

## NOTICES OF BOOKS.

### Common Plants.\*

THIS book consists of a series of studies written around some common plant or more, discussing the why and the wherefore they have assumed such diverse forms or appearances, as we now find them, and the causes which have been at work in their evolution. The author thinks that evolution is still going on, and that the gay world of flowers may not all remain as they are, but that they may ultimately revert to the anemophilous condition, such as prevails amongst most forest trees, especially the Coniferous type, but says that the struggle is undecided. He states that many plants, notably the successful Hawkweeds and Dandelions, have already dispensed with sexuality. They still produce seed, but the embryo sex is not fertilised, and the pollen is useless. He cites *Matricaria discoidea* (better known as *Matricaria suaveolens*), a North American plant, that has become established round east coast villages, but he might have gone further. If it is not yet found in every county of Britain it soon will be, judging by its rapid spread. It has been recorded from the lighthouse under Herma Ness, the most northern point of the British Isles, yet it is self-fertilising, with only four teeth to the corolla, and no grappus to the fruit to help its distribution. The author states that several races of the Mistletoe seem to exist, for seeds of plants that grow on the Silver Fir will not come to maturity on the Pine, nor seeds of either on deciduous trees.

Dr. Macgregor Skene speaks of the ability of the amphibious *Persicary* to assume an aquatic habit, but says it is more difficult to understand why the land plant should be hairy. The hairs of the fully grown plant may not be of much use, but when the stems are young and the cuticle not fully developed, the hairs are more crowded at this stage and can be of essential service in reducing transpiration, as in the case of young Beech leaves and many others that usually grow in dry situations. It seems rather a sweeping statement to say that Docks, Nettles, *Persicary* and Dead-nettle are not part of our primeval flora, and that they can only follow the plough. Some of them exist on commons that have never been ploughed so far as we know, and on river banks, where natural causes provide suitable situations for them. In spite of these remarks the book abounds on every page with facts which cannot be disputed. The first two chapters and the last one are devoted to Wheat; and the student cannot fail to find much that is instructive. The book contains twenty-six illustrations, consisting of reproductions of photographs and line drawings. The editing and printing are excellent.

### RIBSTON PARK GARDENS, YORKSHIRE.

WHILST in these gardens recently my attention was drawn to a fine display of *Pentstemons*, and especially a deep red variety which Mr. W. Simpson, the gardener, selected some two years ago. Massed in two large beds on the lawn, the plants show up wonderfully well, especially towards the evening, and make a striking feature against a dark background of trees and shrubs. The beds had no special preparation, yet the *Pentstemons* were growing strongly and healthily, many of the spikes being from two to three feet tall.

A fine batch of *Crimums* was also noted, the plants carrying many spikes of bloom. These are growing in front of the greenhouses in a border facing south.

In the fruit houses Vines and Peaches were carrying excellent fruit, the latter trees particularly being models of successful culture. Ribston Park is the home of the Ribston Pippin Apple, and it may interest gardeners to know that the veteran tree still stands guard a few yards from the park gates, and at the present

moment is probably carrying a much heavier crop than many of its descendants. T. H. B.

[The tree of Ribston Pippin Apple, which our correspondent describes as fruiting so freely at Ribston Park, is probably the sucker which developed from the original tree that has died long since. In an article entitled "Old trees at Ribston Hall," as the place was then known, (in *Gard. Chron.*, February 16, 1889), an account of the old Apple tree and the sucker is given, and both are illustrated in the same issue. An editorial footnote states: "The old tree, represented in Fig. 39, is now dead, and the other, Fig. 38, a sucker from the old tree, is, as we learn from the courtesy of J. Dent-Dent, Esq., still living. This sucker tree, in its younger days, was delicate and grew but slowly, but as it has reached to the present day, we may assume that the kindly attentions bestowed upon it have not been without good results. Nothing is known with perfect exactness about the advent of the famous Apple at Ribston Hall, but the best credited story is that the seeds came from Rouen (another Conqueror from Normandy), and were sown at Ribston in 1787. From these sprang many trees which afterwards were planted about in the Park. Some—perhaps one—was the progenitor of our present Ribston Pippin, and others were Crab."—EDS.]

## FLORISTS' FLOWERS.

### EAST LOTHIAN STOCKS.

IT will be remembered how, in the course of a slight discussion last year regarding these stocks, I stated that they had originated with Campbell, a gardener at Traprain, East Lothian, and were distributed to a few gardeners in 1867, also that it is inferred they were derived from the Scarlet Intermediate. Since then I have gathered additional material which, without exhausting the subject, sheds fresh light on the history of the plant. Still, I am afraid some other investigator must take up the search before it can be established where and by whom the Intermediate Stock, of which the East Lothian is only a very fine strain, originated. The earliest writers on the plant assume the Scarlet Intermediate to be an English plant, which no doubt it may be, but it is disconcerting to find seedsmen cataloguing German seeds by a similar title, and therefore it cannot be certainly stated that the Scarlet, a very popular variety, as we shall see, was only chosen from among the other German varieties, or, on the contrary, was of English derivation. Anyhow, one Moss is recorded to have raised the plant as a cross between the Brompton and Ten-Week Stock, hence its designation, Intermediate, while it was also known as Buck's Intermediate.

As early as 1845 Hurst and Macmillan offered seed of scarlet and purple Intermediate Stocks, and a few years subsequently white, blue and rose coloured are noted as greatly inferior to the scarlet. This variety was cultivated by the thousand in pots by growers for the London trade previous to the middle of the 19th century, and the reason given for growing it to the exclusion of other colours was the large percentage of doubles it gave, one writer placing it at 80 per cent. This is very interesting, showing the large percentage of doubles to have been a quality of the strain.

Melville, the then gardener at Dalmeny Park, near Edinburgh, wrote to *The Cottage Gardener* in 1857 that he had a fine purple variety from the Scarlet and of the same dwarf, branching habit, another feature of the strain which it still retains, and later that he had obtained a white variety. He also stated that many more colours were in cultivation, but these were not true to type, and therefore unreliable. It is rather perplexing that Campbell, according to David Thomson in 1867, had been working on the plant for years, and had secured the purple and white varieties, to which the name of "East Lothian" was given. I think we can only conclude that the strain was altogether

superior to that of Melville's, which naturally it would supplant.

As stated in my remarks on doubling in Stocks last year (see *Gard. Chron.*, July 23, 1921, p. 50), the true East Lothian produces spikes up to ten inches in length, spurious strains producing non-spicate conglomerations of blooms, or at best very short spikes. I understand the strain is still in existence, but very scarce indeed.

Then there is the question of the percentage of doubles. We have seen that three-quarters of a century ago it threw 80 per cent. double. In 1845 an anonymous writer states that he got no seed one year on account of the whole of his plants producing double flowers, and this assertion is confirmed by other writers. In 1855 it is stated in *The Gardeners' Chronicle* that three-fourths of the plants come double, and as much as 90 per cent. has been quoted, and it may be accepted as near the truth that 85 per cent. is a fair average.

Another matter that emerged was how doubles were secured, and the statements one finds show how difficult it is to come to a right decision. It is to be understood that what follows does not refer to East Lothian Stocks always, but to Stocks generally. A very old practice, and one, curiously enough, recommended by Paxton, was to grow singles close to doubles, some even tying the spikes of these together. Another writer recommended the keeping of seeds for two or more years before sowing, and another to take the seeds from two-year-old plants, which is the usual practice with East Lothians, seasons being too short for seeds to mature in the first year. A writer in *The Horticultural Magazine*, 1848, asserted that doubling is a habit that continues from generation to generation. Glenny believed in starving the plants as a certain means of obtaining double flowers. Another recommendation was to choose "seed-pods" opposite to each other; another "pods in pairs" near the top of the stem; and yet another near its base. We find it also stated that German growers grow Stocks "very strong from seed to seed without check"; and a "Florist" in the *Horticultural Cabinet*, 1846, tells how he lived three years in Germany, "where the best mode of getting double Stocks was attempted I ever saw." Many thousands of various kinds were cultivated solely for seed, and the plants were kept in small pots till the first flower appeared. Single flowers with only four petals were destroyed, and those with five petals were repotted, "and from such only were seeds saved." But not only were flowers with five or more petals selected for seeding, but those with petals wider than usual were also regarded as a good type for a doubling progeny. To conclude this long list of opinions, an early writer on the subject remarks that doubling depended on cultivation, for one grower may have flowers all single, and another from the same seed packet flowers all double! R. P. Brotherston.

## SOME DESSERT CHERRIES.

THE purpose of this article is to bring to notice a few Cherries which are not yet so well known as their merits deserve.

The range of varieties grown in the average garden is often unduly restrained, partly from conservatism, but perhaps more frequently from a wise caution as to "new fruits."

There are, however, very few new Cherries, and those to which I direct attention are all of a respectable antiquity, and have stood the test of time in the countries of their origin.

Among the early Black Cherries, Bigarrean de Schrecken stands out as worthy of notice. This is a very large fruit, which comes in with Rivers' Early, but it greatly exceeds this well known variety in size, and seems a better cropper. It is of the tender fleshed class, and in appearance greatly resembles Black Tartarian, but its earliness alone serves to distinguish it from that well-known fruit. I have seen it doing well as a standard; for garden use the fan-trained style suits it well and on a wall it grows to a large size. The flesh is tender, fibrous and sweet, and the colour a rich red-black. The

\* *Common Plants*. By Macgregor Skene, D.Sc., Lecturer on Plant Physiology, Aberdeen University, Andrew Melrose, Ltd., London and New York. Price, 6s. net.

first reference I can find is in the *Illustrirte Monatshefte zum Obst- und Weinbau*, 1868, so it is, I presume, of German origin.

Another very fine Black Cherry from the same country is *Noir de Schmidt*, a rather hybrid name which it has gathered on its way to this country through France, but which we must accept in preference to its original designation—*Schmidt's Schwarzbraune Knorpelkirsche*. This is a large black heart-shaped fruit, firm in flesh and of good, but not quite first-class, flavour.

Its fine appearance and solid flesh make it worthy of notice as a market fruit or for any garden where fruit has to be sent away by rail. It is a good grower and regular cropper. A very late Black Cherry is found in *Géant d'Hedelfingen*, a variety which was raised in *Württemberg* about the middle of last century. This fruit follows *Tradescant's Heart* (syn. *Noble*) in season, and is a firm and hardy variety, with a rich flavour in good seasons. The skin is of a deep mahogany red, and the flesh quite black under the skin and dark crimson round the stone.

Like all late Cherries it is rather liable to crack in wet weather, but less than most. I have found this growing in orchards under various names, but the fruit is so distinct, both by its lateness and its remarkably lop-sided, flattened shape when viewed from the side that there is no mistaking it once seen.

It is very fertile, and much in demand among market growers in *Kent*.

Turning to the *Bigarreux* I should like to call attention to *Emperor Francis*, an excellent late Cherry too little grown.

This is a late *Bigarreau*, following *Napoleon*, and of a fine shining red, most attractive in bulk.

The tree is rather upright in its early stages of growth, but becomes more spreading later. The flesh is firm but not hard, very rich and sweet.

The origin of this fruit I have not discovered so far. It is probably Continental, and is recorded in 1869. Nothing more desirable in the way of Cherries can be found. *E. A. Bunyard*.

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from page 140.)

(See Tables and Summaries, Ante, pp. 95-100.)

### MIDLAND COUNTIES.

**DERBYSHIRE.**—The fruit crops here and in the surrounding district are very promising. Small fruits, including Black Currants, Red Currants, Gooseberries, and Raspberries were all extra heavy crops. Strawberries looked well until the dry weather set in and moisture came too late. The soil varies. Some parts are very heavy clay, other parts light and loamy, and still others a dark, black soil, more of the texture of peat. *W. Staward, Alfreton Park Gardens, Alfreton*.

**HERTFORDSHIRE.**—Fruits of all kinds, excepting Strawberries, have done better than was expected earlier. Two kinds of Apples, *Newton Wonder* and *Cox's Orange Pippin*, have behaved in a peculiar way. Some trees of the former, which bore average crops the previous season, had but few, if any, trusses of flower, and standard orchard trees have made no growth compared with that of last year. Trees of *Cox's Orange Pippin* which had a good quantity of swelling fruit have now suddenly dropped the latter and littered them on the ground. From an examination of the fruit it would seem to appear that this is due to imperfect fertilisation. We have been fairly free from Apple mildew and kindred diseases, and it could hardly be caused by either fungus or insect pests, as we have had but little trouble in this respect after late spring spraying. Indeed, as in other parts of this district, it is some years since trees have borne such robust and clean foliage. This in part may be due to the thorough ripening of the wood by last year's abnormal sunshine. Our Strawberry beds were badly spoiled by last year's drought; the surviving plants flowered again

in the autumn, weakening the stools. Raspberries and Black Currants were heavy crops. Red Currants, although good in quality, did not bear so freely. Abundant rains in July helped the fruit crops considerably. Our soil is a heavy loam, overlaying clay for the most part, the under strata varying and including chalk and sand. *A. J. Hartless, Kings Walden Bury Gardens, Hitchin*.

—Apples, our most important crop, are good, though variable. The best-cropped sorts are *Cox's Orange*, *Worcester Pearmain*, *Warner's King*, and *Peasgood's Nonesuch*. The trees are very healthy. Bush fruits were fairly good, but Gooseberries were not quite so good

ally on the larger trees. The flowering season was late, and the individual flowers were not nearly as strong as they should be, no doubt owing to the long drought last season. Black Currants and Strawberries were poor. Plums and Damsons are also very plentiful. Apricots are a good crop, and the trees appear to be very healthy. Most small fruits were good, including Raspberries, Gooseberries, Red and White Currants. Cherries, both dessert and Morellos, have never been better. Pests of nearly all kinds, except caterpillar on Apple-trees, have been less troublesome than usual, and the growth of fruit trees generally this

FIG. 62.—ONE OF THE FINEST CEDARS AT COOMBE HOUSE, CROYDON (SEE P. 151).

as usual. Raspberries were an excellent crop; Morello Cherries a fair crop. Strawberries were good, but the season was short, owing to the spring drought. The soil is chiefly a deep, light loam. *James A. Paice, Aldenham Vicarage Gardens, Watford*.

—The Apple crop is a poor one; some Apple trees have a good sprinkling of fruit, but few are bearing an average crop, many having no fruit at all. Being on top of a hill exposed to north and east, our trees were crippled severely by a cutting north-east wind while they were in blossom. Pears and Plums, being more advanced, were not injured to any great extent. Peaches and Nectarines are good and the trees making vigorous and healthy growths. We suffer in most seasons greatly from blistering of the foliage, owing to our exposed position. They are entirely free from this disease this year. Our soil is a shallow loam, with a deep clay subsoil, other parts being gravelly. *George H. Hill, Caldecote House Gardens, Bushey Heath*.

—The fruit crops in this district may generally be regarded as satisfactory. With two or three exceptions, there is an abundance. Apples flowered freely, but failed to set, especi-

ally on the larger trees. *Edwin Beckett, Aldenham House Gardens, Elstree*.

—The fruit crops are most satisfactory. Apples in most cases are an excellent crop, and with a great number of varieties severe thinning was necessary. Pears are above the average, especially on bush and standard trees. Plums and Gages, both on wall and standard trees, are producing heavy crops, and here again the fruits had to be severely thinned. Cherries, both sweet and Morello, have been quite up to the average. Strawberries have been plentiful, and Raspberries gave a heavy crop of berries. Bush fruits have all produced excellent crops, the fruit also being of very fine quality. Nuts are most plentiful. The soil is a heavy, stony clay. *T. Pateman, The Node Gardens, Welwyn*.

**LEICESTERSHIRE.**—With glorious weather in spring and no late frosts, fruit trees (except in the case of some Apple trees which had heavy crops last year) have set good and in some cases heavy crops. Pears are very numerous. Raspberries were plentiful, as rains came at a critical time for them. Strawberries were a thin crop owing to last year's drought having destroyed many of the plants, but in some

parts of this district somewhat heavy crops were secured. Bush fruits are very good. The soil varies from heavy to light in texture. *W. Coe, Prestwold Gardens, Loughborough.*

—The Strawberry crop suffered from the drought, and the berries were much smaller than usual. Red Currants were also small through the same cause. Fruit trees have been clear of caterpillars and aphid until now. We had a splendid crop of large fruits of Lloyd George Raspberry. The soil is a heavy loam on a clay subsoil. *A. H. Campin, Whetstone Pastures Gardens.*

**HAMPSHIRE.**—The fruit crops are above the average, all fruits setting extremely well in the absence of bees. Strawberries were soon over, owing to the drought in May. This had no effect on other fruits. Apples, Pears, Plums, Raspberries, Currants, and Gooseberries are all bumper crops; I have never seen more, and Apples and Pears had to be thinned considerably. Raspberries did not suffer very much last season, as most of them did in many parts of the country, making very sparse canes owing to the long-continued drought. This fruit should be planted in a moist situation, as our bed is here, and well mulched. Insects have not been so troublesome for many years, especially green fly. I still advocate the spraying of all trees and bush fruits, as this keeps the trees clean and healthy, and should be done every year. The soil is mostly chalky, and soon dries out. This applies everywhere in the district, as we are close to the South Downs, which are all chalk. *William Fulford, Ditcham Park Gardens, Petersfield.*

**NORTHAMPTONSHIRE.**—The fruit crops are, on the whole, very satisfactory. All fruit trees are exceptionally clean and healthy. Raspberries were an exceptionally heavy crop and the fruit of first-rate quality. Pears, Peaches, and Nectarines on walls are all excellent crops. I have never seen Peach trees more healthy and free from aphid. Apples are only an average crop, some trees being loaded, others barren. Our soil is a medium loam, containing much limestone, and fruit trees need much feeding to produce fruit in the best condition. *F. W. Gallop, Lilford Gardens, Barnwell, Peterborough.*

**NOTTINGHAMSHIRE.**—All kinds of fruits are good, both in quality and quantity in this locality, no doubt owing to their total failure last year, when we had three nights of sharp frost during the blossoming period. The usually light cropping varieties of Apples and Pears are bearing well, and the crop of Damsons is the heaviest I have seen for many years past. *William Rae Scott, Bunny Park Gardens, Bunny.*

—The fruit crops are above the average. Aphid and caterpillars have not been troublesome, and the quality of most fruits is very good. Peaches and Nectarines have never set so regularly or freely during the past twenty years. Pears and Morello Cherries are both heavy crops. Apples are rather irregular. Small fruits, and especially Raspberries, were plentiful and of good quality. *S. Barker, Clumber Gardens, Worksop.*

—All fruit trees blossomed profusely, particularly Pears; much of the young fruit dropped, but leaving a full crop. Raspberries looked bad at the commencement of growth, the foliage being pale in colour and growth unequal. A further pruning of the canes had the effect of all dormant buds breaking, resulting in a full and healthy crop of good fruit. The Devon is our best Raspberry. There has been a complete absence of late frosts in this district. Our soil is very heavy in texture. *James Gibson, Welbeck Gardens, Worksop.*

**OXFORDSHIRE.**—The fruit crops are well up to the average. Pears, Plums, and Damsons are all heavy crops, and have been greatly benefited by the recent heavy rains. Apples are well up to average, and the trees fairly clean. Peaches and Apricots were badly injured by frosts when in bloom. Small bush fruits were good, and especially Raspberries, which were very plentiful. Strawberries were

a complete failure, owing to the severe drought throughout May and early June, and evidently the plants were much weakened by last season's drought. Filberts, Cobnuts, and Walnuts promise to be heavy crops. *Ben Campbell, Cornbury Park Gardens, Charlbury.*

(To be continued.)

## HYBRID DIANTHI IN THE GARDEN.

MR. MARK MILLS (*Gard. Chron.*, July 29) wishes to hear how other growers have fared with varieties of Dianthus Allwoodii, and what has been their experience.

My experience with these hybrid Pinks was in my garden at Tresserve, in Savoy, and has extended over a period of some twenty years. It would have been continued had not the war, with its record of tragedy, also caused a bad set-back to the peaceful pursuit of gardening. About 1895 I started growing and selecting mixed Dianthus, such as those now known in England as Dianthus, Allwoodii. My first packet of seed came from Léonard Lille, seedsman, of the Quai des Célestines, Lyons. After this beginning I continued every season saving seed from the best plants and raising good batches of seedlings, sufficient to plant a piece of ground about 50 yards by 30 yards, putting the plants a foot apart, except in the four little paths which were left 2 feet wide from end to end for purposes of weeding and gathering.

As the plants flowered, I carefully dug up all those of a colour which I did not care to grow, and any plants which from extra weedy habit, sparse flowering, or any other defect, had to be eliminated. In this way I arrived at a very fine strain which excelled both in colour and in fragrance. The weedy habit persisted in a greater or less degree, therefore I let the plants grow their own way without let or hindrance or any attempt at staking or tying. Thus the drawback which would have been insuperable in specimen plants easily passed muster when the plants were grown collectively, for they spread along the ground, entwined and sent up their flowers and grass in erect profusion. This bed used to be the admiration of all visitors to the garden, and the general effect was certainly very beautiful. So floriferous were the plants that friends who came up from Aix went back laden with flowers, and the bed showed no trace of the raid made upon it.

The cultivation was perfectly straightforward, and we never had a season's failure, notwithstanding spells of unpropitious weather. A year's rest sufficed for the ground, which was utilised for some alternate crop, such as Cannas or Asters.

The great enemy was the *courtillière*, which Littré refers to as the greatest enemy of French gardens. In English dictionaries it is translated as Mole Cricket (*Gryllotalpa vulgaris*). I have not met with it in English gardens, although it is not uncommon in the South of England. Our Leather Jacket (*Tipula cleracea*) causes the same kind of depredation and is far more difficult to trap. The *courtillière* starts business in the small hours of the morning, and the witching moment for the chase is between 4 and 5 a.m. We used to look carefully for its traces and then run the finger along the gallery just under the surface, until it took a downward course. An improvised paper funnel was inserted, a little oil poured in, followed by a gill of water, and we then awaited developments. Presently a hideous, drenched creature would emerge, looking for all the world like a beast out of the Apocalypse. The oil had clogged its respiratory organs, and it had forced its way to the surface in search of air. After a few moments of gasping, it would turn on its back, suffocated. We often caught a score in one morning. Unless duly checked, these *courtillières* would make short work of hundreds of plants, eating them nearly through just below the collar.

I think if Mr. Mills will give his plants another season's trial and treat them as I did mine, he will think them well worth growing. He would, in all probability, get better results were he to save seed and raise his own plants, and so derive as much pleasure from his as I did from mine. *E. Willmott.*

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Grape Cannon Hall.**—I was interested in Mr. William Irvine's note (p. 112) on Cannon Hall Grape. Though not equal to Muscat of Alexandria, this is a very desirable variety, distinct and of fine Muscat flavour. We treat Cannon Hall in much the same way as other Muscats, except that more care is taken in selecting the bunches, only those with a thin mid stem being retained, generally the second bunch on the shoot, for it is practically impossible to set the large rough bunches. I find we get the best results from thin wood, as in the case of most of the Muscat varieties, consequently we prune to a bud in winter, leaving one shoot on each spur, the spurs being 18 inches to 24 inches apart on the rod. The shoots are allowed to meet on the trellis before being stopped; the rods are 3 feet 6 inches apart, so that there are from six to ten leaves beyond the bunch. All subsequent lateral growth is removed. The shoots increase very little in thickness, if at all, after being stopped, and are firm and ripe with the crop. Other cultural details coincide with those of your correspondent, the rooting medium being identical but for a quantity of rough material containing phosphates which I added in making up the border; that is made as firm as possible. Damping is discontinued as soon as the vines break into growth in the spring, and only resorted to for about a week after the crop is set, in order to cause the foot stalk of the berries to lengthen. By this means fewer berries have to be cut away when thinning takes place. At that time the house is kept fairly close, but afterwards the atmosphere in the house is kept continually dry and fresh. *Malcolm Macnaughton, Scone Palace Gardens, Perth.*

**The Carrot's Crimson Eye** (see p. 45).—Being recently in a chalky district, where the wild Carrot was abundant, I had an opportunity of seeing how the crimson eye varied from plant to plant (see pp. 45 and 86). I discovered that the eye of the Carrot, which usually consists of a single flower, represents an umbelule, often furnished with one to three bracteoles or secondary bracts. In one case there were three crimson flowers, representing the eye. In other cases I could see no eye at all, for two to four umbelules or ordinary white flowers were equally near the centre. I presume that in this case the eye was suppressed. In other cases the single flower stood up prominently in the centre above all the others, and was either cream, blush, pink, bright red, crimson, maroon-crimson or blackish crimson. Sometimes a flower would be half red and half white, exactly through the middle, or irregularly. The young fruits were green, brown or purple. In *Flora Française Suisse et Belge*, *Daucus Carota sativa* has a crimson eye, as has *D. maximus*; *D. gum-mifer* and *D. siculus* have red flowers all round the circumference of the umbelules; while *D. muricatus* has red fruits with bristles like a hedge-hog. If these are older types than *D. Carota* they would substantiate the claim that the latter has lost all its crimson flowers except the eye, where that still exists. *J. F.*

**Garden Carnations.**—I do not like most of the varieties of garden Carnations in commerce, as the flowers are far too heavy and the petals are easily spoiled by rain. I recently bought a set which were stated to need no supports, but they sprawl all over the ground. We need a smaller and more beautiful flower, fragrant, light, and elegant. It is not very likely we shall produce out-of-door Carnation blooms equal in size to the greenhouse perpetual varieties, that will not be top-heavy in growth or an eyesore in the

garden. I am entirely disappointed with the so-called first-class garden Carnations now produced: they need some stiffening of the stems to keep the flowers off the soil. *W. J. Farmer, Redruth.*

**A Warning.**—Last October I sent a cheque to a well-known and much advertised firm in Holland, ordering five hundred bulbs and forty-eight Roses. After some months the bulbs arrived, but not the Roses. I wrote repeatedly to ask for them, as I was most anxious not to lose the season. In April I received a card to say the forty-eight Roses would be sent the following week. They never appeared. I was tired of writing, so I told the firm unless they returned the money I would send a letter to your widely read paper stating exactly what had occurred. *F. Neville, Murtry, Frome.*

**Dianthus Allwoodii.**—Two years ago I had some fifty plants of *Dianthus Allwoodii*

FIG. 63.—PLANT OF *DIANTHUS ALLWOODII*, AS CROWN IN A SCOTTISH GARDEN.

in 4-inch pots sent to my private garden from our nurseries. They were plants which had flowered all the winter under glass, and I knocked them out of the pots and planted them along the edge of a good bed. Last year they were allowed to grow on, and, of course, were straggly, as was to be expected, but they yielded some good flowers. In the late autumn of 1921 I took a bagging hook and cut the plants over to within three inches of the ground. The photo sent herewith (see Fig. 63) shows the result, and proves what fine plants such sorts as Jean and Harold are in borders. My plants must be three years old at least. The minimum of staking is required—one thin strand of raffia keeping the stems upright and in their place. *W. Guthbertson, Edinburgh.*

**Frost in August.**—On Saturday morning, the 26th ult., we registered 4° of frost in these gardens. Marrows and Runner Beans were turned quite black, and ice the thickness of a sixpence, also icicles formed on the eaves of the glasshouses. This degree of cold in August must be a record. We suffer severely from early and late frosts each year, the garden being on the level with the River Severn. *W. Gaiger, Spring Grove Gardens, Bewdley, Worcestershire.*

## SOCIETIES.

### GLASGOW INTERNATIONAL SHOW.

AUGUST 30, 31, AND SEPTEMBER 1 AND 2.—The international flower show, promoted jointly by the Glasgow and West of Scotland Horticultural Society and the Corporation of Glasgow, was held on the above dates, in the famous Kelvin Hall. There were about 340 competitive classes, and a sum of £1,500 was offered in prize money, in addition to which several valuable cups and trophies were also awarded. There were 3,150 entries in competition, and over 70 honorary exhibits. The exhibition constituted a magnificent floral display, and easily ranks as the most important ever held in Scotland. There are three acres under the roof of the Kelvin Hall, and for the accommodation of the show it was necessary to utilise practically the whole of that space. This

never seen equalled. The second was the group of flowers staged by Messrs. DOBBIE AND CO., LTD., Edinburgh. It occupied a space of over 1,000 square feet, and contained what was freely characterised as the finest trade exhibit of Roses ever shown in the country.

#### POT PLANTS.

A grand display was made in the class for a group of miscellaneous stove and greenhouse plants. The first prize of £40 and the "President's Cup" was worthily won by Messrs. JAMES CYPHER AND SONS, Cheltenham, with an artistically arranged exhibit; 2nd, W. H. COATS, Esq., Woodside, Paisley (gr. Mr. P. McQuarrie); 3rd, COATBRIDGE AND AIRDRIE MATERNITY HOME (gr. Mr. Wm. Linton). For a group of stove and greenhouse plants, arranged for effect, the first and second prizes were awarded to two entries from Colonel GRAY BUCHANAN, Eastfield House, Cambuslang (gr. Mr. W. Ferguson). For a table of tuberous Begonias in flower, 15 feet by 5 feet, arranged for effect with foliage plants including Ferns, to be viewed from all sides, Messrs. R. WATSON AND SONS, Victoria Nursery, Lenzie, were easily first with a grand display of double-flowered varieties. This magnificent exhibit was awarded the Gold Medal of the Royal Horticultural Society; 2nd, Sir JOHN REID, Ardencraig, Craigmore (gr. Mr. John J. Davidson). The premier place for a group of Liliacs was taken by Mr. T. M. PETCH, Highfield Nursery, Great Horton, Bradford. Wm. DUNCANSON, Esq., Fenton House, Alloa (gr. Mr. C. Palmer), excelled for twelve plants suitable for table decoration in 18 varieties. There were 51 classes for pot plants.

#### CUT FLOWERS.

**ROSES.**—For a collection of cut Roses, artistically arranged, to occupy a space of 15 feet by 6 feet, there were three entries. Mr. ELISHA J. HICKS, Twyford, Berkshire, was placed first with a very graceful display; 2nd, Mr. THOS. ROBINSON, Porchester Nurseries, Nottingham; 3rd, Messrs. HUGH DICKSON, LTD., Belfast. In the class for six baskets of decorative Roses the award went to Messrs. S. MCGREY AND SON, Portadown. They showed fine examples of K. of K. and Ethel James. 2nd, Messrs. ALEX. DICKSON AND SONS, LTD., Newtownards; 3rd, HUGH DICKSON, LTD., Belfast; and 4th WILLIAM FERGUSON, nurseryman, Dunfermline. The last-named exhibitor excelled in the class for six ten-inch vases of cluster Roses. For 48 blooms of Roses, distinct varieties, Messrs. HUGH DICKSON, LTD., Messrs. ALEX. DICKSON AND SONS, LTD., and Messrs. T. SMITH AND SONS, Stranraer, were respectively awarded the prizes in the order named. Messrs. ADAM AND CRAIGMILE, Aberdeen, were placed first for 24 blooms, followed by Mr. W. FERGUSON and Messrs. G. PATON AND SON, Tayport. Messrs. HUGH DICKSON, LTD., Belfast, were first for 12 blooms of new Roses, and were also first for 12 blooms of any yellow Rose. In the latter class they showed their new variety, W. E. Wallace. Messrs. ALEX. DICKSON AND SONS were awarded the premier place for 12 red Roses, exhibiting their new variety Lord Allenby. Mr. ALEXANDER PARLANE, Row, was first for 12 white Roses with remarkably fine flowers of Mrs. Foley Hobbs. There were 17 classes in the Rose section.

**SWEET PEAS.**—Sweet Peas are always a strong feature of the Glasgow show, and on this occasion the entries were good, and competition was strong as usual. The most important class was one for a collection of Sweet Peas artistically arranged on a space of 15 feet by 6 feet. Mr. GEORGE BOWNESS, Busby, was first, followed by Messrs. E. W. KING AND CO., Coggeshall, Essex. Mr. JOHN SMELLIE, Helensburgh, obtained a first prize for 24 vases, whilst premier honours for 12 vases of new Sweet Peas were won by Mr. JAMES PAUL, Killearn. Viscountess COWDRAY, Duncricht House, Aberdeen (gr. Mr. William Smith), had a fine collection of 18 vases, and easily won first prize. There were 20 classes in the Sweet Pea section.

The principal class in the Carnation section was for a collection of Perpetual Carnations

was the first four days' show promoted by the Corporation and the Society, and in respect of size it is understood to be the greatest ever staged outside London.

The first show was held when the Glasgow and West of Scotland Horticultural Society was instituted 110 years ago, and from a somewhat small beginning the annual flower show has attained its national importance. The present venture has been a great success financially and otherwise; the attendance was very gratifying to the promoters.

A deputation from the Royal Horticultural Society, including the President, Lord Lambourne, was present, and made a series of awards to meritorious exhibits. The show was opened by Her Grace the Duchess of Atholl. Apart from the competitive classes the most noticeable feature of the show was the large number of excellent honorary exhibits. Two of these were outstanding, and both were awarded Gold Medals and Special Appreciation by the Royal Horticultural Society. The first was an exhibit covering about 3,000 square feet from the Glasgow Corporation Parks Department. It consisted of a wide range of plants, and was arranged under the supervision of Mr. JAMES WHITTON, V.M.H., Director of Parks. Lord Lambourne said it was an exhibit he had

occupying a space of 15 feet by 6 feet. The 1st prize was won by Mr. C. ENGELMANN, Saffron Walden, with a beautifully arranged collection of grandly grown flowers. Premier honours for a collection of border Carnations were taken by Mr. JAMES SMITH, Darvel.

The principal class for Chrysanthemums was won by Mr. GEO. BOWNESS, Busby, and in the herbaceous section Messrs. G. GIBSON AND CO., Leeming Bar, were first, followed by Messrs. HARKNESS AND SONS, Bedale; 3rd, Messrs. OLIVER AND HUNTER, Moniaive, Dumfriesshire. Dahlias were poor, as the season has been very late. The 1st prize in the principal class was won by Mr. H. CLARKE, Greenway Nurseries, Taunton. Messrs. MAIR AND SON, Prestwick, scored, as usual, for Gladioli. The fancy Pansies were very fine, and 1st prize for 48 blooms was won by Mr. ANDREW FRATEN, Kirkliston, with a grand lot of flowers. There were 112 classes in the Cut Flower section.

#### FRUIT.

The most important class in the fruit section was for a decorated fruit table to consist of 24 dishes. The first prize, £25 in cash, and a silver rose bowl, value £50, presented by the proprietors of *The Glasgow Herald*, was won by the EARL OF BALFOUR, Prestenkirk (gr., Mr. Geo. Anderson); second prize of £25 was won by WALTER CURRIE, Esq., Castle Levan, Geurock (gr., Mr. C. Traill); and the 3rd by Lord BELPER, Kingston Hall, Derby (gr., Mr. Jas. McCartney). Messrs. MALCOLM CAMPBELL, LTD., Glasgow, were first for the most artistic display of fruit (home and foreign) on a space of 12 feet by 6 feet. For a collection of 8 bunches of Grapes Mr. DAVID HALLIDAY excelled, and he also won the premier awards in several other classes for this fruit. Lady VIOLET ASTOR, Perth (gr. Mr. Jas. Chisholm), was first for four bunches. The effects of a late season were noticeable on the exhibits of Apples and Pears, all of which were below exhibition size. The best specimens had the appearance of having been protected by glass or some similar means. There were 70 classes for fruit.

Vegetables were not so finely exhibited as usual at Glasgow. There were 85 classes in this section. The principal prize-winners were Mr. JOHN GRAY, Uddingston; Mr. JOSEPH DEVOY, Stranraer; Mr. FRED J. BELL, Whiteley Bay; and Capt. A. G. GILMOUR, Eaglesham (gr. Mr. W. Jamieson). There were also 30 classes open to allotment holders.

#### AWARDS BY THE ROYAL HORTICULTURAL SOCIETY.

*Gold Medal and Special Appreciation* to the City of GLASGOW PARKS DEPARTMENT, for decorative groups; and to Messrs. DOBBIE AND CO., LTD., Edinburgh, for groups of cut flowers.

*Gold Medals* to Messrs. STORRIE AND STORRIE, Glencarse, for fruit trees; Messrs. R. WATSON AND SONS, Lenzie, for Begonias; Messrs. CYPHER AND SONS, Cheltenham, for groups of pot plants; Messrs. SUTTON AND SONS, Reading, for a group of flowers, fruit and vegetables; Messrs. AUSTIN AND McASLAN, Glasgow, for fruit and vegetables; Sir JOHN REID, Craigmore, for specimen Ferns; Mr. C. ENGELMANN, Saffron Walden, for Perpetual Flowering Carnations; and Messrs. ALLWOOD BROS., Wivelsfield, for Perpetual Flowering Carnations.

*Silver-Gilt Knightian Medals* to D. H. BARTON, Esq., Antrim, for vegetables; Messrs. KERR AND CO., Glasgow, for vegetables.

*Silver-Gilt Flora Medals* to Messrs. AUSTIN AND McASLAN, Glasgow, for trees and shrubs; Messrs. LAIRD AND DICKSON, Edinburgh, for Alpines and rock plants; Messrs. ALEX. DICKSON AND SONS, Newtownards, for Sweet Peas; Messrs. ALEX. DICKSON AND SONS, for Roses; and W. H. COATS, Esq., Paisley, for a decorative group.

*Silver-Gilt Banksian Medals* to Messrs. CHARLESWORTH AND CO., for Orchids; DONARD NURSERY CO., Co. Down, for shrubs and herbaceous plants; Messrs. SAMSONS, LTD., Kilmarnock, for Roses and fruit.

*Silver Knightian Medal* to Messrs. RYDER AND SON, St. Albans, for vegetables.

*Silver-Gilt Hogg Memorial Medal* to Messrs. MALCOLM CAMPBELL, LTD., Glasgow, for fruit.

*Silver Flora Medals* to Mr. E. J. HICKS, Twyford, for Roses; Messrs. RYDER AND SONS, for Gladioli; Messrs. SANDERS, St. Albans, for Orchids; Mr. W. LEIGHTON, Glasgow, for floral groups; Messrs. LOWE AND GIBSON, for Gladioli; Mr. ROBERT LAWRIE, Carnwath, for Begonias; Mr. DAVID KING, Edinburgh, for a rock garden; Messrs. JOHN FORBES LTD., Hawick, for herbaceous plants; Messrs. BLACKMORE AND LANGDON, Bath, for Begonias and Delphiniums; and Mr. H. N. ELLISON, West Bromwich, for Ferns and Cacti.

*Bronze Hogg Medal* to Mr. JOHN OGILVIE, Eitot, for fruit.

*Silver Banksian Medals* to Messrs. KENT AND BRYDON, Darlington, for herbaceous plants; Messrs. STUART LOW AND CO., Enfield, for Carnations; Messrs. FAIRBAIRN AND SONS, Carlisle, for Phloxes and other herbaceous plants; Mr. JOHN SMELLIE, Helensburgh, for Sweet Peas; Messrs. GEO. MAIR AND SON, Prestwick, for the cultivation of Gladioli; Messrs. G. GIBSON AND CO., Bedale, for herbaceous plants; and Mr. THOS. ROBINSON, Nottingham, for Roses.

*Silver Lindley Medals* to Hon. GODFREY CORBETT, Rowallan Castle, Kilmarnock (gr. Mr. Jas. Dixon), for special cultivation of Muscat Hamburg Grapes; and the WEST OF SCOTLAND AGRICULTURAL COLLEGE, Glasgow, for a scientific exhibit.

*Bronze Lindley Medal* to Messrs. OLIVER AND HUNTER, Moniaive, for cultivation of Primulas.

AWARDS BY THE GLASGOW AND WEST OF SCOTLAND SOCIETY.

*Gold Medals* to GLASGOW PARKS DEPARTMENT (large gold medal and special award), for groups of exotic Ferns and flowering plants; Messrs. DOBBIE AND CO., LTD., Edinburgh, for groups of Roses; Mr. DAVID KING, Edinburgh, for rock garden; Messrs. ALLWOOD BROS., Wivelsfield, for Carnations; Messrs. AUSTIN AND McASLAN, Glasgow, for groups; Messrs. CHARLESWORTH AND CO., for Orchids; Messrs. ALEX. DICKSON AND SONS, for Roses and Sweet Peas; Mr. C. ENGELMANN, Saffron Walden, for Carnations; Messrs. FAIRBAIRN AND SONS, Carlisle, for Phloxes; Messrs. KENT AND BRYDON, Darlington, for herbaceous plants; Messrs. BAKERS, Wolverhampton, for herbaceous plants; Mr. ROBERT LAWRIE, Carnwath, for Begonias; Messrs. RYDER AND SON, St. Albans, for Gladioli and vegetables; Sir JOHN REID, Craigmore, for specimen plants; Messrs. STUART LOW AND CO., Enfield, for Carnations; Messrs. SANDERS, St. Albans, for Orchids; Messrs. SUTTON AND SONS, Reading, for flowers and vegetables; H. D. BARTON, Esq., Antrim, for vegetables; WEST OF SCOTLAND AGRICULTURAL COLLEGE, Glasgow, for an educational exhibit of insect pests and fungous diseases; Messrs. STORRIE AND STORRIE, Glencarse, for fruit trees.

*Silver Medals* to Messrs. BLACKMORE AND LANGDON, Bath, for Begonias and Delphiniums; DONARD NURSERY CO., Co. Down, for shrubs and herbaceous plants; H. N. ELLISON, West Bromwich, for Cacti and Ferns; Mr. HENRY ECKFORD, Wem, for Sweet Peas; Messrs. JOHN FORBES, LTD., Hawick, for herbaceous plants; Messrs. ISAAC HOUSE AND SONS, Bristol, for Seabious; Messrs. KERR AND CO., Glasgow, for vegetables; Mr. W. BUNN, Malvern, for Geraniums; Messrs. LEARMONT, HUNTER AND KING, LTD., Dumfries, for fruit trees; Mr. WM. LEIGHTON, Glasgow, for a floral exhibit; Mr. D. McLEOD, Manchester, for Orchids; Mr. G. W. MILLER, Wisbech, for hardy plants; Messrs. OLIVER AND HUNTER, Moniaive, for Alpines; Mr. JOHN OGILVIE, Eitot, for fruit; Messrs. PRINGLE AND ALEXANDER, Glasgow, for topiary plants; Messrs. SAMSONS, LTD., Kilmarnock, for Roses and fruit; and Mr. W. WELLS, JUNR., Merstham, for herbaceous plants.

*Bronze Medals* to Mr. FRED J. BELL, Whiteley Bay, for Violas; Messrs. ALEX. LISTER AND SON, Rothesay, Messrs. LOWE AND GIBSON, Sussex, and Messrs. LAIRD AND DICKSON, Edinburgh, for Alpines.

#### ROYAL HORTICULTURAL.

SEPTEMBER 5.—The exhibition in conjunction with the fortnightly meeting on Tuesday last was extensive, and there was a good attendance. Dahlias predominated, in view of the Dahlia show on the following day, and many fine new varieties were forthcoming. A Gold Medal was awarded to Mr. H. J. JONES for Phloxes. There were fewer Orchids than usual.

#### Orchid Committee.

*Present:* Sir Jeremiah Colman, Bart. (in the chair), Messrs. Jas. O'Brien (hon. secretary), C. J. Lucas, Gurney Wilson, Fred K. Sander, J. E. Shill, H. T. Pitt, T. Armstrong, E. R. Ashton, W. J. Kaye, Pantia Ralli, and J. Wilson Potter.

#### AWARDS OF MERIT.

*Laelio-Cattleya Carmencita*, (Claygate Lodge variety (*C. Dowiana* × *L.-C. luminosa*)), from J. J. BOLTON, Esq., Claygate Lodge, Claygate (gr. Mr. S. Lyne). A fine hybrid, and one of the best of its class. The sepals and petals are citron yellow; the lip is well expanded, and coloured deep claret-crimson, with fine gold lines from the base.

*Cypripedium Albion* (*niveum* × *Astarte*) from Messrs. STUART LOW AND CO., Jarvisbrook, Sussex. A very desirable hybrid with pure white flowers of fine substance, a few very small purple spots appearing on the dorsal sepal. The *C. insigne* Sanderæ in *C. Astarte* improves the flower in size and shape compared with most *C. niveum* crosses.

#### GROUPS.

A Silver-Gilt Lindley Medal was awarded to a noble specimen of the remarkable *Arachnanthe Lowii* shown by Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier). This gigantic Bornean species has not been shown for many years, and the fine specimen, with three leafy stems, and three spikes, each six or eight feet in length, and bearing between them over one hundred and sixty flowers, was a great attraction. A singular feature in the species is that whereas the greater number of the flowers are cream white heavily barred with claret red, there are always from one to three larger totally dissimilar clear yellow flowers, sparsely dotted with purple at the base and which further fertilisation by insect aid.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, were awarded a Silver-Flora Medal for a very effective group in which white *Phalaenopsis*, the blue *Vanda coerulea*, the rare *Epidendrum Brassavola*, and other species were arranged with a good selection of hybrid *Cattleyas* and *Laelio-Cattleyas*, together with *Sophrontis* crosses, including the beautiful *Sophr.-Laelio-Cattleya Marmion* (*S.-C. Doris* × *L.-C. luminosa*).

Messrs. SANDER, St. Albans, were awarded a Silver Banksian Medal for a compact group in which the best subjects were the large and handsome *Cattleya Hentschellii* (*Dupreana* × *Warszewiczii*), a model flower of rich colour; the yellow *C. fulva*, in which the peculiar lip of *C. Forbesii*, an old ancestor, well appears; some fine *C. Warszewiczii* alba and other white-petalled hybrids; their fine mauve *Odontioda brugensis*, and among the species the rare *Stanhopea peruviana aurea*.

RICHARD G. THWAITES, Esq., Chessington, Streatham Hill, showed a selection of six of his new type of *Cattleya Hardyana* alba var. Mrs. Alan, the most mature plant with a flower with pure white sepals and petals and large, deep, claret purple lip representing the class.

#### Floral Committee.

*Present:* Messrs. H. B. May (in the chair), S. Morris, G. Reuthe, John Heal, J. F. McLeod, Wm. Howe, D. B. Crane, W. B. Gingell, C. R. Fielder, T. Stevenson, A. Turner, H. J. Jones, C. E. Pearson, W. P. Thomson, W. G. Baker, E. A. Bowles, W. R. Dykes, W. B. Cranfield, J. W. Barr, Jas. Hudson, W. Cuthbertson, G. W. Leak and Rev. J. T. Bennett-Poë.

#### AWARDS OF MERIT.

*Centaurea Cyanus Silver Queen*.—This is a silvery white variety of the well-known Cornflower, and no doubt will be equally valued as a cut flower, both for market purposes and

for home decoration. Shown by Messrs. BARR AND SONS.

*Gladiolus Rt. Hon. Countess Beatty.*—A strikingly beautiful *Gladiolus* of perfect form. The large, widely expanded blooms are of milk white colour, which is relieved by a largish crimson-lake blotch on the lower segments. Shown by Messrs. KELWAY AND SON.

*Primula Mooreana improved.*—Farrer states in *The English Rock Garden* that *Primula Mooreana* is the very best of the various *Primulas* grown in the gardens under the name of *P. capitata*, and as this is an improved form its great garden value is readily apparent. A good plant bearing several spikes of blue flowers in a head on powdered stems, was shown by LADY ABERCONWAY.

*Streptocarpus Princess Mary.*—A splendid example of the large-flowered hybrids, and very free-flowering. The widely expanded flowers are of rose shades of colour and their throat is straw-yellow. Shown by Messrs. R. and G. CUTHBERT.

**Joint Dahlia Committee.**

*Present:* Messrs. H. B. May (in the chair), D. B. Crane, H. J. Jones, John Green, Jas. B. Riding and Arthur Turner.

**NEW DAHLIAS.**

The following varieties were selected for trial at Wisley:—

*Protest.*—A large, Decorative variety of good shape and rosy mauve colour, which becomes paler at the tips. Shown by the CENTRAL GARDENS SUPPLIES.

*Warrior.*—A pretty, small Paeony-flowered bloom of flattish shape and velvety crimson colour, which is paler in the centre.

*Crimson Glow.*—A compact and effective small Paeony-flowered bloom, which has slightly rolled petals. The colour is vivid crimson.

*Zena.*—A small, yellow-flowered, Decorative variety, which is stippled with bronze at the margins.

*Sophie.*—A small, graceful, star-shaped, white Paeony-flowered variety.

*Marcella.*—A small, Paeony-flowered Dahlia of bright rose-pink colour. The above were shown by Messrs. J. BURRELL AND SON.

*Dorking Star.*—An elegant and valuable silvery mauve Star Dahlia, which has a fascinating crimson rayed centre. Shown by Messrs. J. CHEAL AND SONS.

*Richard Henckeroth.*—A large Decorative variety of vivid scarlet colour. This and the following were shown by members of the Dutch Dahlia Society.

*Flambau.*—A large Decorative variety of brick red colour flushed with scarlet.

*Wake Up.*—A small flower of Decorative type, coloured ruby-crimson and broadly tipped with white.

*Misses G. Wurflein.*—A large Decorative variety of claret crimson colour with a velvety maroon centre.

*Mr. Dresselhuys.*—A medium-sized flower of the Decorative section. The colour is rosy-lilac, paler at the tips of the florets.

*Guiveeltji.*—A very small Decorative variety, which approximate the Pompon in size. It is of rosy-lilac colour.

*Oranje boven.*—A large orange-apricot coloured Decorative variety.

*Prince of Wales.*—Another uncommon coloured variety of the Decorative section. It is of buff-orange shades of colour.

**GROUPS.**

Mr. H. J. JONES for the second time this year gained the highest award of a Gold Medal for herbaceous Phlox, and excellent as was the earlier exhibit, it was surpassed on the present occasion. It was a great exhibit of Phlox, in every sense of the word, for there was enormous quantity, high quality and admirable variety. Of the very many sorts the following is a short selection: Riverton Jewel, September Glow, Asia, Hollandia, Mrs. A. F. Godfrey, Snowdrift, Europe and Gloire de Marc. In another part of the hall Mr. JONES arranged a graceful and valuable collection of Montbretias (Gold Medal).

Equal in extent and also of great merit was a very large exhibit of Asters contributed by Messrs. SUTTON AND SONS. This extensive collection included all the different types of garden "China Asters," such as Sutton's Giant Comet, Giant French, Ostrich Plume, Mammoth, Victoria and the elegant, graceful, single-flowered type, and in these were a great many most desirable varieties in many shades of colour (Silver-Gilt Banksian Medal).

*Gladioli* were very prominent and the chief exhibit of these valuable flowers was by Messrs. KELWAY AND SON, who had a very representative collection. Amongst the yellow-flowered *Primulinus* sorts we noted Major, Golden Girl and Maid of the Mist; while amongst the large-flowered varieties it was perhaps those of brilliant colours that attracted most attention, and of these the following is a selection: J. W. Kelway, Colossal, J. L. Lucas, Star of Langport, Sir H. Talbot and Nonpareil (Silver-Gilt Flora Medal).

In a corner space Mr. W. F. GULLICK showed many *Gladioli* which illustrated the very highest skill in cultivation, and the method of arrangement was especially effective. Of his many sorts Red Emperor, White Giant, Proserpine, Yellow Hammer and Pink Perfection are the names of only a few of the varieties so well shown (Silver Banksian Medal).

Adjoining the handsome Dahlia exhibit of the Dutch Dahlia Society Mr. K. VELTHUYS had a tasteful display of excellent *Gladioli*. Goodly numbers of varieties were represented, and amongst them Proserpine, of the same dazzling colour as the well-known Tulip of that name, was most prominent (Silver-Gilt Banksian Medal). Against the end wall Messrs. R. H. BATH, LTD., had an interesting collection, which included Sappho, Red Emperor, Electra and Halley (Silver-Gilt Banksian Medal).

The Foremarke Cup "for 20 spikes of named *Gladioli* of the exhibitor's own growing" was awarded to Messrs. LOWE AND GIBSON for a praiseworthy collection, and in another place they had a graceful exhibit which included Salmoena, Alice Toplady and Woodcote. Mr. EDWARDS, a new exhibitor at the hall, had elegant spikes of such *Primulinus* sorts as Brilliant, Yellow Queen, J. P. Roen and Valuta (Bronze Banksian Medal).

*Gladioli* and Dahlias of good quality and pleasant variety were staged by the CENTRAL GARDEN SUPPLIES (Silver Banksian Medal). Mr. S. MORRIS had an interesting selection of Montbretias of which he has raised so many valuable sorts. The very best was His Majesty, large yellow flowers heavily edged with dull crimson. He also had Princess, Admiral Jellicee and a vase of seedlings (Silver-Gilt Banksian Medal).

Border flowers were also staged in goodly quantity. Mr. W. WELLS, Junr., had many valuable Phloxes, Asters, Lupins and other hardy flowers of great merit (Silver Flora Medal). Messrs. B. LADHAMS, LTD., again showed several interesting tall Lobelias, Veronicas, Montbretias, Pentstemons and Helianthemums (Silver-Gilt Banksian Medal). Mr. AMOS PERRY showed *Achillea Millefolium* Cerise Queen, many *Gladioli* and other seasonable flowers (Silver-Gilt Banksian Medal). Messrs. WATERER, SONS AND CRISP also had the brilliant *Achillea M. Cerise Queen*, with Lupins in variety, Pyrethrum and *Gladioli*. They also showed good Roses (Silver-Gilt Banksian Medal).

Mr. T. CARLILE showed Delphiniums and Phloxes (Bronze Banksian Medal). Mr. G. REUTHE had his customary collection of Alpines and shrubs (Silver Banksian Medal); the Misses HOPKINS staged a small rockery and an exhibit of border flowers (Bronze Banksian Medal). Mr. F. C. WOOD had a large collection of seasonable border flowers (Silver Banksian Medal); Mr. F. YANDALL showed *Violas* (Bronze Flora Medal); and Messrs. W. CUTLISH AND SON again displayed Pentstemons (Bronze Banksian Medal).

Roses in variety and in good condition were contributed by the Rev. J. H. PEMBERTON (Silver Banksian Medal). Messrs. D. PRIOR AND SON (Bronze Banksian Medal), and Messrs. B. R. CANT AND SONS, had goodly vases of Covent Garden, Royal Sovereign and Golden Emblem.

Mr. C. ENGELMANN had a collection of fresh Carnations in variety (Silver-Gilt Banksian Medal); Messrs. ALLWOOD BROS. and Messrs. STUART LOW AND CO. also showed Carnations (Bronze Banksian Medals).

Just inside the entrance Messrs. L. R. RUSSELL, LTD., arranged a good collection of pot-grown Clematis in such sorts as Nelly Moser, Lady Londesborough, Mrs. G. Jackman, Ville de Lyon and Lady Northcliffe, with heavily berried Fire Thorns (*Pyracantha coccinea*), the golden variegated Jasmine and other shrubs. On a table space they had many interesting Bromeliads (Silver-Gilt Banksian Medal). Messrs. R. and G. CUTHBERT staged a large collection of *Streptocarpus* which illustrated a splendid large-flowered strain (Silver-Gilt Banksian Medal).

Dahlias were, in view of the next day's show of the National Dahlia Society, prominently shown by several exhibitors, and these we shall mention in our report of the special show. The exhibitors were the DUTCH DAHLIA SOCIETY (Silver-Gilt Banksian Medal), Messrs. J. CHEAL AND SONS, who also had many interesting trees and shrubs, including fruiting crabs in variety, flowering branches of Veronicas, Yuccas, Tamarix, Myrtus Luna, and most brilliant fruits of *Euonymus latifolius* (Silver-Gilt Banksian Medal), and Messrs. CARTER PAGE AND CO. (Bronze Banksian Medal).

**Fruit and Vegetable Committee.**

*Present:* Messrs. C. G. A. Nix (in the chair), J. Cheal, G. P. Berry, Geo. F. Tinley, E. A. Bunyard, S. B. Dicks, P. C. M. Veitch, T. Pateman, J. C. Allgrove, W. Bates, W. Wilks and W. H. Divers.

Several new varieties of fruits were submitted for awards, but none was considered worthy. Messrs. LAXTON BROS., Bedford, had several new Apples, including Tit-Bit, raised from King of the Pippins and Blenheim Pippin, a fruit of high colouring after the style of Lady Sudeley; Pear Laxton's Cropper is a seedling from Marguerite Marillat crossed with Doyenné d'Été, a very pretty fruit with a red flush on the side next to the sun. Laxton's Supreme Plum, a new sort raised from Denniston's Superb × Victoria, is like a small, pale Victoria and of good quality. Mr. T. PATEMAN, The Node Gardens, Welwyn, showed a late Black Currant which he met with in a garden in the Midlands; this variety, also another seedling late Black Currant shown, were recommended for trial in the Wisley Gardens. Mr. J. C. ALLGROVE, Middle Green, Langley, showed his fine Gage Plum Allgrove's Superb, which received an Award of Merit on August 31, 1915. This nurseryman also exhibited fruit trees in pots, and choice gathered specimens of Apples, Pears and Plums. The fruit trees were remarkably well grown and finely cropped, the varieties including Allgrove's Superb, Jefferson, McLaughlan's Golden Gage and Denniston's Superb Plums, and Apple Rev. W. Wilks, the latter carrying several very large fruits each. Pears Dr. Jules Guyot, Marguerite Marillat and Triomphe de Vienne were of remarkably fine quality (Silver-Gilt Hogg Medal).

**METROPOLITAN VEGETABLE AND FLOWER SHOW.**

SEPTEMBER 2.—An exhibition of garden produce from allotment holders was held at the Guildhall, London, on the foregoing date, with the patronage of the Worshipful Company of Gardeners, and under the auspices of the Vacant Land Cultivation Society, the National Union of Allotment Holders, and the London Gardens Guild. The schedule included twenty-six classes, the great majority of which were for vegetables. Extraordinary numbers of entries were received in nearly all classes; the largest number, one hundred and thirty-two, was in Class 7, for twelve Potatoes, in two varieties, six of each. The number of entries in the 26 classes totalled 1,450; fifty societies entered in the societies' classes.

The show was opened by Lord Leverhulme, who, in his remarks, emphasised the importance of the allotment movement, and referred to the passing of the new Allotments Act, which will give allotment holders greater security of tenure than they have had in the past. Lord Leverhulme was supported by Sir Kingsley Wood, who has worked hard in the House of Commons in the interests of allotment holders. This gentleman referred to the great displacement of allotment holders, which would take place next March, and urged greater activity on the part of all such cultivators, by approaching the local authorities where evictions were likely to take place.

On the whole the show was a wonderful demonstration of the value of the allotment movement and the high quality of the produce which can be grown by enthusiastic cultivators in the London district. Several exhibits of flowers, in many cases grown in window boxes in the most congested areas of London, gave colour and variety to the exhibition.

One of the most important classes was that for a collection of six different kinds of vegetables, arranged on a space 4 feet by 3 feet. The number of entries was fifty-two. Competition was very keen, and many of the exhibits comprising the collections were of exceptionally high quality, and would have done credit to professional gardeners. The first prize was won by Mr. BENNETT, 78, Liverpool Road, Watford, his Celery, Carrots, Onions and Leeks being of outstanding merit. Mr. H. A. BANKS, West Norwood, followed closely.

In the classes for Potatoes, competition was especially keen, and the produce generally of a good quality, though we must confess we were a little disappointed to find nothing of particularly outstanding merit. The best tubers were seen in the class already referred to as having attracted the largest number of competitors. The winning varieties were Duke of York and Arran Comrade, the tubers of the former being large and of fine shape and finish, while the latter were also good in shape and quality. The successful exhibitor was Mr. W. WILLIAMS, Willesden. The collections of six varieties of Potatoes contained many excellent tubers, and the judges had considerable difficulty in making their decision.

Carrots, Celery, Vegetable Marrows, were all shown excellently. The premier prize for Carrots was won by Mr. NICHOL with almost perfect roots of the Long Red Surrey variety.

The principal award, which took the form of the Freedom of the Worshipful Company of Gardeners, and was given to the exhibitor obtaining the highest number of points in the show, was gained by Mr. J. R. SMITH, of Liverpool Road, Watford; the Silver Challenge Cup offered by the same company for the best exhibit in the Society's classes, was won by the WELL HALL ALLOTMENT SOCIETY.

## Obituary.

**John Morgan.**—We announce with regret the death of Mr. John Morgan, partner in the seed and nursery firm of Thompson and Morgan, Ipswich, which occurred at his residence on August 21 after a short illness. The deceased, who was a native of Ipswich, had from early life been engaged in horticulture, and had a very extensive knowledge of hardy plants and their seeds. Mr. Morgan was of a very retiring nature, and did not appear much in public; but he was a most enthusiastic worker in the Ipswich and District Gardeners' Association, frequently presiding in a vice-presidential capacity at their meetings, while for the current year he was president. His funeral took place at Ipswich Cemetery on August 24 amidst many manifestations of sorrow and esteem. The floral tributes were numerous and beautiful. Besides those from relatives and friends, emblems were sent by the Ipswich and East of England Horticultural Society, Ipswich and District Gardeners' Association, and the seed and nursery staff. The business will be carried on under the old name.

**Mrs. R. V. Berkeley.**—Garden lovers everywhere will learn with the deepest regret of the death of Mrs. Berkeley, wife of Mr. Robert Berkeley, of Spetchley Park, Worcestershire, and sister of Miss Ellen Willmott. The sisters shared a deep love of gardening, and Mrs. Berkeley gathered together in her beautiful gardens at Spetchley Park a notable collection of rare and interesting plants, for several of which she gained Awards at the Royal Horticultural Society's meetings. Mrs. Berkeley died of heart failure on Monday, the 21st ult., and was buried on Thursday, the 24th ult., at Spetchley.

## TRADE NOTES.

MR. TURNER is about to sever his long connection with the firm of Messrs. Hurst and Son, Wholesale Seed Merchants and Growers, 152, Houndsditch, London. He joined the firm in August, 1890, and was for two years in charge of the seed trials. He was after this transferred to the vegetable seed department, had some office experience, and eventually went to the flower seed department. Here he was very successful, and became head of the "shop" in 1897, and of the whole flower seed department in the spring of 1907.

Before joining Messrs. Hurst and Son, he was with Messrs. Mahood and Son, Putney, in both their nursery and seed departments, and his nursery experience was of considerable value to him in his subsequent work.

Mr. Turner has taken a nursery at Hastings, and his many friends will join with us in wishing him every success in his new venture.

Mr. Vernon Roscoe, who has been appointed to succeed Mr. Turner at Messrs. Hurst and Son's, has had the advantages of working under him for some years.

MR. H. STEWART PATON, who up till recently was a director of Samsons, Ltd., Kilmarnock, has joined the firm of Messrs. Austin and McAslan, Glasgow, as a partner, where he will undertake the management of the nursery department. Mr. Paton has had a lifelong connection with the trade, and his large circle of friends will wish him every success in his new sphere of activities.

## ANSWERS TO CORRESPONDENTS.

**APPLE LEAVES SCORCHED:** W. F. F. The disease is known as Apple Leaf-scorch, and is not due to a fungous attack, but to weather conditions, or, more often, unsuitable soil conditions.

**ASTERS ROTTING OFF AT THE ROOTS:** A. O. W. and W. A. L. The plants are attacked by stem rot caused by a fungus (*Phytophthora* sp.). All diseased plants should be lifted and burned and healthy specimens sprayed with Bordeaux mixture.

**GRAFTED APPLE STOCK INTENDED FOR BUDDING:** H. M. Do not cut away the head of the stock above the bud until the winter, or, better still, next February. Even then it is usual to leave a portion about 4 inches long above the bud to secure the new shoot to, so as to make it grow straight. No growth will start from the bud until next spring. Certainly budding can be done on two-year-old wood.

**MUSCAT VINE LEAVES TURNING YELLOW:** H. K. The fungus *Botrytis* is present on the foliage, but it is very possible that this is only secondary and not the actual cause of the complaint. The primary cause must be looked for in some wrong cultural treatment, which only those on the spot can determine.

**MISTLETO ON APPLE TREES:** D. H. Shoots of Mistleto have been grafted on to Apple trees by the ordinary method, but it is difficult, and many of the scions fail. You mention seeds, and that method is probably what you mean, and is certainly the natural way to establish this plant on trees. The mistake was in cutting cavities in the branches, possibly killing the only part to which the young

Mistleto could attach itself and grow into the wood. Select a smooth, live piece of bark on a branch of moderate age and rub the berries upon it with the fingers till the clammy or viscous juice makes them adhere. If this is done on the lower side of the branches birds are less likely to interfere with the berries; you could tie a rag loosely over them to keep the birds away. Apple, Lime, Black Poplar and the common Sycamore are the trees upon which the Mistleto grows most readily. The seeds take a year to push the root end of the embryo into the bark, so that leaves need not be expected to appear until the second summer. The seeds are quite mature in January or February and ready for fixing on the bark.

**NAMES OF FRUIT:** F. J. S. Peach Noblesse. —Somerton. 1, Warner's King; 2, not recognised; 3, Woodcock; 4, Grenadier; 5, Hawthornden; 6, Bess Pool.—W. H. J. 1, Red Astrachan; 2, Mr. Gladstone; 3, not recognised; 4, Potts's Seedling.—W. G. A Crab Apple.—J. C. W. and S. Col. Vaughan.—M. and C. Mr. Gladstone.—J. S. Apple Lord Derby; the Plum resembles Mirabelle.

**NAMES OF PLANTS:** S. P. 1, Escallonia illimita; 2, Send in flower; 3, Hedychium Gardenianum.—J. W. 1, Epilobium purpureum; 2, Veronica speciosa var.; 3, Eucalyptus Gunnii; 4, Acacia armata.—A. J. S. Hyoscyamus niger (Henbane).—L. E. The large mauve flower is *Dierama pendula*; the small blue one *Anchusa* species, possibly *A. tinctoria*, but material insufficient. H. B. O. 1, Heeria elegans; 2, Helixia Solierolii; 3, probably *Aster Linosyris*, but cannot determine without flowers; 4, *Aster acris*; 5, *Aster* sp. (send in flower); 6, *Aucuba japonica*; 7, *Euonymus japonicus*; 8, *Aucuba japonica*; 9, *Prunus Pissardii*; 10, *P. serrulata*; 11, *Saxifraga decipiens*; 12, *Antennaria dioica tomentosa*.

**NECTARINES EATEN BY INSECTS:** W. J. S. It is quite possible that earwigs and woodlice are the cause of the damage. Place hollow Bean-stalks amongst the branches, and also some small pots with a little loose hay in them, and examine these every morning, and destroy all insects that collect in them. The cracking of the fruits is no doubt due to the recent heavy rains following dry conditions of the soil about the roots.

**PEACH AND ROSE TREES DAMAGED:** Anxious. The material supplied was quite insufficient to enable us to form any opinion as to the cause of the damage to your Peach and Rose trees.

**PEACHES WITH NO FLAVOUR:** H. A. T. The fruits sent were not affected by any disease caused by a fungus. The trouble has been caused by some wrong method of cultivation, which only those on the spot can determine. We think, however, that your gardener's conclusions are probably correct.

**POTATOS IN STORE:** M. The tubers in store are not very likely to become infected with disease unless they are in actual contact with the diseased ones. Sprinkling the tubers with a mixture of quicklime and flowers of sulphur is sometimes advised.

**ROSES FAILING TO OPEN SATISFACTORILY:** Constant Reader. The reason of your Roses making such poor blooms is due to the cold, wet weather, in conjunction with a bad attack of mildew on the foliage.

**SECOND BLOOMING OF AN APPLE TREE:** Greenway Gardens. The second blooming of Apple Trees is not unusual. It is generally the result of some check the plant has received, and may be attributed to the long period of drought and heat last summer and autumn.

**TOMATO LEAVES DISEASED:** F. K. The disease is caused by the fungus *Botrytis*, which attacks the stem through dead leaves and shoots. Burn all dying and dead vegetable matter in the house and ventilate the latter as much as possible.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 57.8°.

**ACTUAL TEMPERATURE.—**

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, September 13, 10 a.m. Bar. 29.2; temp. 58°. Weather—Fine.

**The Garden in 1922.** It is probable that there never has been a greater contrast between the climatic conditions of successive gardening years than that between 1921 and 1922. Up till the end of June, however, the present was a repetition of the previous year. A spring drought made many seed beds sterile and led to gloomy prognostications of a recurrence of the losses which gardeners suffered in 1921. Unresourceful gardeners who do not make a practice of successional sowing, and who do not take the precautions of shading, cultivating, and, in the last resort, watering seed beds, found that the drought at sowing time rather delayed their operations of sowing and transplanting or led to not infrequent failures. Those with more ample resources, material and mental, were, however, able in large measure to get the better of adverse conditions and, with their young flower and vegetable plantations in a good condition, they reaped the reward of their skill when the rains came in July. Even so, however, not a few plants never recovered from the check which they experienced as seedlings, and in some gardens such plants as Zinnias are now making miserable efforts to flower on stems scarcely a foot high. Since the end of June, an almost unbroken succession of wet days and a large deficit of sunshine have left their mark on the garden. Top fruit, which is not unprofitful, is ripening but slowly in all but specially favoured localities. Victoria Plums, for example, on trees under our observation were not fully ripe in the first week

of September. Bush and small fruits, on the contrary, caught the early sun and ripened well enough. Potatoes are generally a very heavy crop, though disease has appeared in wet lands and is likely to take its toll of tubers during storage. Not only is the crop large, but the tubers are extraordinarily large, particularly in such early varieties as Epicure and Witchill Seedling. Tomatos, which ripened out-of-doors last year and produced a large crop, have given up trying either to swell or ripen their fruit and reflect in their belated condition the sunlessness of the season. On the other hand, although trees and shrubs were late in starting into full growth, the wet season has caused a remarkable luxuriance of later growth and in particular recently transplanted trees and shrubs have done extremely well. They may not ripen their wood well, but they have firmly established their root systems. The wet season has also been responsible for a marked extension of the flowering season of many herbaceous (and shrubby) garden plants—Catmint, Stocks, Campanulas, Antirrhinums and particularly Cistuses seem unable to cease from flowering and make the season memorable in that these and many similar subjects are blooming side by side with more autumnal subjects such as Asters and Golden Rods. Even more vigorous than that of garden plants has been the growth of weeds, and heavy and ceaseless labour has been required to keep them down. No review of the garden in 1922, however brief or partial, may omit reference to the wonderful display which Roses have made. Under conditions which might have been expected to make for all manner of diseases, they have flowered and are still flowering in unusual luxuriance. Only La France, of the many varieties growing in the garden on which these observations are based, has succumbed to climatic conditions; all the others, in spite of mildew and other fungous pests, have both flowered profusely and made great growth. Adepts in summer pruning of fruit trees have had, in not a few cases, difficult work in judging of the time when to perform this operation. Late growth and subsequent rapid extension of the shoots have produced a state of affairs on trained Apple trees which to remedy will require much judicious pruning in the winter, particularly if, as bids fair to be the case, there is a deficiency of fruit buds to permit of the adoption of the excellent practice of spur pruning. Happy is the gardener who, in these sunny September days, can spare the labour to keep the soil stirred so that the warmth of the sun can penetrate into the ground and warm it somewhat before winter comes. Perhaps of all garden crops, the Nut crop is the most prolific. For that the fine weather of February is no doubt to be thanked.

**The British Mycological Society.**—The twenty-sixth autumn fungus foray of the British Mycological Society opened at Keswick, in the Lake District, on Friday, the 15th inst., and will continue until the 21st inst. The headquarters of the foray will be at the Royal Oak Hotel, Keswick. The following arrangements have been made:—Friday evening.—Council meeting at 8.45; Saturday.—Start at 10 o'clock for Thirlmere. Fisher Crag and Great How will be explored; in the evening, at 8.45, the annual meeting of the Society will be held; Sunday.—Walk in the afternoon, at 2.30, via Gretna Bank to Latrigg. Monday.—Start at 11 o'clock for Borrowdale, through Great Wood and Barrow Wood. In the evening, at 8.45, Mr. F. T. Brooks will deliver his presidential address, entitled, "Some Present-Day Aspects of Mycology." Tuesday.—Leave at 11 o'clock for Bassenthwaite Woods. Papers for the

evening at 8.45:—"Luminosity in Panus," by Professor A. H. R. Buller, D.Sc., F.R.C.S.; "Notes on Fungi in the Alps," by Mr. Somerville Hastings, M.S., M.R.C.S. Wednesday.—Start at 11 o'clock for Whinlatter and Wythop. Papers for the evening, at 8.45:—"Fungus Hunting in the West Indies," by Miss E. M. Wakefield; "Edible Fungi," by Mr. Carleton Rea. There will be conveyances from headquarters to the woods when distance requires.

**Mendel's Centenary.**—Celebrations of the centenary of Gregor Mendel will take place at Brünn, Czecho-Slovakia, on the 22nd, 23rd and 24th inst. The programme will include addresses on the personality and work of Mendel, and papers will be read by prominent Mendelian students from various countries. There will be an excursion to neighbouring caves and to Mazocha. In 1910, a monument was erected to Mendel's memory at Brünn, of which town he was abbot when he enunciated his celebrated principles of plant breeding.

**Trials of Raspberries and other Rubi at Wisley.**—The Royal Horticultural Society desires to make a test of (1) Raspberries (both summer and autumn fruiting) and (2) other kinds of Rubi. Five plants of the former and three of the latter, of each variety to be tried, should be sent to reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey (Horsley Station, L. and S.W. Rly.), by November 30, 1922. The Director would be obliged if those proposing to send varieties for these trials would let him know the names of the varieties to be sent, on the entry forms (which may be obtained from him), by the end of October.

**Ghent Quinquennial Exhibition of 1923.**—The Organising Committee of the Ghent Exhibition is appealing to horticulturists to prepare their exhibits for this demonstration of horticultural art, to be held in Ghent in April next. The programme of the exhibition, which comprises no fewer than 778 classes, will be sent on receipt of a request addressed to "Palais de l'Horticulture et des Fêtes, Ghent, Belgium." An advertising stamp, to affix to the outside of envelopes, has just been issued. The wording is supplied in French, Flemish and English, and the design represents the three principal towers in the centre of the city of Ghent. These will also be sent, in sheets, to anyone interested, on request. The XVIIIth Quinquennial Exhibition, organised by the Royal Agricultural and Botanical Society of Ghent—the oldest on the Continent—promises to surpass its predecessors, which for more than a century have marked the progress of horticulture.

**Rot in Apples.**—In a paper recently published in the Scientific Proceedings of the Royal Dublin Society, Mr. H. A. Lafferty, A.R.C.Sc.I., and Dr. G. H. Pethybridge (of the Seeds and Plants Disease Division of the Department of Agriculture), describe an unusual form of rot in Apples, found on specimens submitted for examination in 1920. The diseased fruits were apparently healthy when gathered, but began to rot about ten days later. After prolonged study of the disease, during which certain new scientific discoveries as to various types of rot in Apples were made, it was found that the specific disease under investigation was caused by a species of fungus. The source from which the fruits became infected is not known, but, as in other cases of Apple rot, it had been observed that the affected fruit was confined to the lower branches of the tree, near the ground, it is believed that infection came from the soil as a result of rain splashes, etc. Judicious propping up of hanging branches would probably, it is suggested, suffice to prevent infection. Fortunately, in the opinion of the authors, there is no reason to suppose that the particular form of Apple-rot described in the paper is likely to become a serious menace to fruit growers in Ireland.

**Walnut Industry in France.**—Although the Walnut industry is an important one in France, the production of Walnuts decreased by about one half during the quarter of a century following the year 1885. From 1885 to 1916

the production averaged from 500,000 to 800,000 quintals per year, but the annual variation during that period was from 210,000 to 1,590,000 quintals. We learn from the *International Review of the Science and Practice of Agriculture* (XII., No. 11), that efforts are being made in France to secure the safeguarding of Walnut trees by the State, to increase the returns by skilful cultivation, by combating disease and insect pests, by the improvement of varieties suitable for dessert purposes and oil production, and by extending the area under this crop. One author, M. L. Rigotard, advises the formation of a special organisation for the study of the Walnut tree, the founding of a "Station for the study of Walnut trees," equipped with chemical and pathological laboratories, an observation field and an experiment field.

**Grading and Packing Apples.**—A demonstration in the grading and packing of Apples will be given at the South Eastern Agricultural College, Wye, Kent, on Friday, 22nd inst., at 2 p.m. All who are interested in this important matter are cordially invited to attend the demonstration.

**Crop Rotation for Allotments.**—The Middlesex Education Committee is issuing, through allotment associations, a plan showing a model scheme of rotation of crops, with the object of stimulating interest in systematic cropping and raising the standard of cultivation in allotments. The points emphasised are the use of catch crops and intercropping, the practice of green manuring, and the clearance of the ground before the winter so as to permit of winter cultivation. In order to encourage plot holders to cultivate their holdings more systematically the Committee will issue certificates to individuals who cultivate allotments most successfully, and also to associations whose plots show general excellence. The whole scheme is to be explained in detail in lectures given throughout Middlesex by the County Horticultural Instructor, Mr. G. W. Pymon.

**Municipal Rose Gardens.**—In an address delivered before the Convention of the American Institute of Park Executives, Mr. Robert Pyle, President of the American Rose Society, urged the formation of Rose Gardens in public parks, and gave evidence of the popularity of the municipal Rose garden at Hertford. No fewer than 23,000 visitors entered this Rose garden on July 4, 1920, and this number was largely increased on July 11, popularly known as Rose Sunday in America, when visitors come from a radius of 100 miles of the park. In the two succeeding years the attendance has steadily increased, no fewer than 149,600 people visiting the gardens in one year, the highest total on one day being 35,000. Such splendid results should stimulate our own National Rose Society to hasten its efforts in the formation of the proposed National Rose Garden in this country, for we cannot believe that the people of this country are less interested in this beautiful flower than the citizens of America.

**Land Drainage.**—The Ministry of Agriculture and Fisheries announces that, subject to the sanction of Parliament, funds will be available for carrying out drainage schemes for the alleviation of unemployment, primarily in rural districts, during the coming winter. The bodies to whom advances will be made for this purpose are—(a) drainage authorities; and (b) county agricultural committees. The latter are intended only to deal with those portions of the country for which no drainage authority has been set up. The Ministry, in the case of each scheme submitted to it and approved, will be prepared to advance the whole of the money required, subject to certain conditions, of which the following are the most important:—All the work must be done so far as possible by hand labour. Seventy-five per cent. of the labour must be ex-Service men, if available. Of the remaining 25 per cent., the majority must be married civilians, if available. The wages payable for ordinary labour will be the agricultural rates for the district, as fixed by Conciliation Committees or otherwise. All work must

be completed by March 11, 1923, as no public money will be available after March 31, 1923. On the conclusion of the work, a proportion of the net cost, up to 33 1-3 per cent., will be refunded to the Ministry. Preference will be given to schemes in which a number of owners or occupiers will combine for the cleansing of main drainage channels and brooks. Owners or occupiers of land who desire to participate in the scheme should apply to the county agricultural committee for their county, and not to the Ministry.

**Mr. Owen Thomas, V.M.H.**—Mr. Owen Thomas has lately been the recipient, on the occasion of his golden wedding, which occurred last month, of congratulations from the whole of his wide circle of friends, from their Majesties the King and Queen down to the humblest member of the horticultural world, for during his long life he has gained distinctions of many kinds. Born in 1843, in a little village on the outskirts of the Bodorgan Estate of Mr. Owen Fuller Meyrick, in the Isle of Anglesey, he began to earn money at ten years old, being employed as errand boy at a wage of 3s. per week. He was one of eleven children, and as the average wage of a labourer was at that time about ten shillings per week,

MR. OWEN THOMAS, V.M.H.

he was obliged to begin to get his own living as soon as possible. Mr. Owen Fuller Meyrick, in whose service young Thomas started his gardening career, was a rich bachelor who was extremely fond of his garden, and was one of the few who cultivated Orchids in those days. One department of the garden was a nursery for the propagation of fruit trees and shrubs, and it was here that young Thomas was employed. He stayed at Bodorgan for nine years, passing by turns through all the departments, and in 1863 he left home and accepted a situation in the Chester Nurseries of Messrs. F. and A. Dickson and Sons. He only remained at Chester for a fortnight, being then sent as a journeyman to Little Aston Hall, Sutton Coldfield, where extensive alterations and renovations were being carried out. In 1865 he moved to London, entering the service of Messrs. James Veitch and Sons, by whom he was sent to the gardens at Drayton Manor, near Tamworth, where he remained for seventeen years. He next went as head gardener at Impney, Droitwich, where parts of the estate were quite new, and needed considerable laying out, but not quite two years afterwards Mr. Thomas left Impney to take charge of the celebrated gardens at Chatsworth, Derbyshire, in succession to Mr. Thomas Speed. In 1891, Mr. Thomas Jones retired from his position as head gardener at Windsor to the late Queen

Victoria, and the position was offered to Mr. Thomas, who had now reached the front rank of gardeners. Needless to say, he accepted the great honour conferred upon him, and served the late Queen for ten happy years, until her death, in 1901. To quote Mr. Thomas' own words: "No man has ever had so kind, so considerate, or so thoughtful an employer as I had during those years, and no gardener had a happier or a better home than I had at the Royal gardens. The same kindness was continued to me for six months after Her Majesty's death, by His Majesty King Edward VII., until arrangements were completed for my successor." Six months afterwards he retired on a generous pension, and has lived quietly at Hanwell ever since.

**National Chrysanthemum Society.**—The National Chrysanthemum Society commences its 1922-3 session on Monday, September 18, when the first meeting of the Floral Committee will be held at the Royal Horticultural Hall, Westminster, at 3.15 p.m. The other meeting of this Committee will be held on Tuesday, October 3, at Holland Park Rink, Kensington, and at the Royal Horticultural Hall on Mondays, October 16, and October 30; Thursday, November 16; Mondays, November 27, and December 11; all the meetings except the one on November 16, commence at 3.15 p.m. The Executive Committee meetings have been arranged for Mondays, September 18, October 16, November 27, and December 11, at 6 p.m. at the offices of the General Secretary, 5, Tavistock Street, Covent Garden, W.C.

**Home Production of Timber.**—In an interesting paper read before the Botany Section of the British Association on the 12th inst., Lord Lovat stated that although private forestry saved the timber situation during the war, it could not do so again in the absence of State aid. With State encouragement, however, as last year, under the unemployment grant, individual and corporate enterprise would be continued. Lord Lovat showed that last season 11,000 acres were planted, 11,000 acres prepared for planting, and 4,000 acres cleared of scrub at a cost of under £70,000, and he pointed out that for every £100 granted by the State, labour obtained £275, as the result of private enterprise. He expressed deep regret that the Government had decided not to support this method of providing for unemployment during the coming winter. He estimated that the annual consumption of timber during the next decade would be between 11,000,000 and 13,000,000 loads of sawn and hewn timber, and 1,500,000 loads of pulpwood, and these quantities, on a 1920 basis, would cost over £120,000,000. Russia being ruled out as a factor, and with America and Canada steadily needing a larger proportion of their output, we should be chiefly dependent upon the Baltic for supplies, whereas if 1,770,000 acres of State forest and 3,000,000 acres of private forests were made productive at home they would ensure the supplies of timber in any case of emergency of not more than three years' duration.

**Distribution of Plants from the Trinidad Botanic Gardens.**—The first issue for the current year of the *Bulletin* of the Department of Agriculture of Trinidad and Tobago contains an interesting catalogue of plants offered for sale to planters and residents. These plants are supplied at low prices chiefly from the St. Clair Experiment Station, Trinidad, and they include forty-eight kinds of fruits, Oranges being represented by as many as twelve, and Grape Fruit by eight, and Mango by twenty-two varieties; seven kinds of "beverage" plants; nine kinds of spice and perfume plants; six kinds of rubber producing plants; six producing drugs; five fibre plants; eight different timber and decorative trees; thirty-one kinds of decorative foliage plants; forty of decorative flowering plants; twenty decorative climbers; and forty-nine Palms. The catalogue is much more than a list of names; it is educational, as a short description follows each name, and notes are attached indicating the particular value of each plant, its peculiarities, and often, a word or two concerning cultivation.

**Enfield Manor House in Danger.**—The iron hand of so-called "progress" proceeds in its work of the destruction of interesting relics of former days, and we hear that the latest building to be threatened with destruction, in order that a cinema may be built upon its site, is the ancient Manor House at Enfield. This house is of special interest to horticulturists on account of its having been the residence from 1664 to 1696 of Dr. Robert Uvedale, the famous botanist. He was at the time headmaster of the Enfield Grammar School. Here he lived with his boarders, whom he kept in good health by taking them for a walk over Winchmore Hill every morning and making them hold their heads over boiling vinegar on their return! The house was formerly known as Queen Elizabeth's Palace, and was reputed to have been a hunting lodge of the Virgin Queen. There is an exceptionally fine Cedar at the back of the house—now used as the local post office—which is sometimes said to have been planted by Queen Elizabeth, but was actually brought to Dr. Uvedale by two of his old pupils who had made a journey to Palestine. Dr. Uvedale's Herbarium, in fourteen volumes, forms Volumes 302-315 of the Sloane Collection in the British Museum. He died at Enfield in August, 1722, and was buried in the churchyard there. It would be a sad way of celebrating the bi-centenary of his death to destroy the house in which he lived so long.

**Modification of American Quarantine Law.**—The United States Department of Agriculture Press Service reports that, on account of the scarcity of supply of certain plants which have been excluded from the States by the regulation popularly known as "Quarantine 37," the Federal Horticultural Board has temporarily modified its provisions extending the period in which they may be brought in. This applies to *Rhododendron ponticum* and *Azalea pontica*, which have not been permitted entrance since June, 1922, except for propagation purposes. Permits valid until July, 1923, will be issued for plants of three years' growth or less, with the roots washed free from sand, soil or earth. Special permits will also be issued for the same period permitting the importation of seedlings of the Japanese Maple, *Acer palmatum*, of three years' growth or less, with the roots thoroughly washed.

**Appointments for the Ensuing Week.**—Monday, September 18.—National Chrysanthemum Society's Floral Committee meeting, at R.H.S. Hall, 3.15 p.m. Tuesday, September 19.—Royal Horticultural Society's Committees meet; lecture by Dr. A. B. Rendle on "Plants of interest in the day's exhibition." Wednesday, September 20.—Hertford Horticultural Society's meeting. Thursday, September 21.—National Rose Society's autumn show at R.H.S. Hall; Manchester and North of England Orchid Society's meeting. Saturday, September 23.—Paisley Florists' Society's show; Walkerburn Flower show.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*New Red Currant.* We have received through Messrs. Knight and Perry, some very fine red Currants, from Mr. Roberts, gardener to his Grace the Duke of Cleveland, at Raby. They were large, handsome, less red than the common red Currant, and less acid; to us their flavour appeared to be intermediate between the red and white varieties. Mr. Thompson has furnished the following memorandum respecting them.—Raby Castle Red Currant.—Very handsome bunches of a large red Currant, from Raby Castle, Durham, were seen in excellent condition on the 8th inst. The racemes were nearly six inches in length; the berries large, of a darker colour than Wilmot's Red, but not so deep as the Red Dutch. The pulp contains more mucilage than is usual in red Currants, and consequently the sharpness of the flavour is not so perceptible in the first instance. In size it is equal to Knight's Large Red; but its principal merit is its late ripening." *Gard. Chron.*, Sept. 18, 1847.

**Publication Received.**—*The Dahlia in Australia.* By E. E. Pescott. Whitcombe and Tombs, Ltd., 9-10, St. Andrew's Hill, Queen Victoria Street, E.C.4. Price 3s. 6d.

## THE ROSE GARDEN.

### THE ROSE SEASON IN SOUTH-WESTERN SCOTLAND.

ROSES in this peninsular region of Scotland have been wonderfully successful during the past summer, considering the difficulties with which their cultivators have had to contend. The season, compared with that of last year, has been comparatively sunless, with a lamentable superabundance of wind and rain. Nevertheless, the Roses in many notable Wigtownshire gardens, and at the Messrs. Smith's greatly extended nurseries, on the confines of Stranraer, so intelligently and successfully superintended by Mr. Baxter (a nephew of the famous firm of rosarians), have been wonderfully fine. Grown in strong clay, which is very retentive of moisture, they require very little stimulant of a manurial description. There I had the privilege of

also grown in the flower gardens at Logan House, in Kirkmaiden, where also luxuriate such splendid apricot and yellow varieties as Golden Emblem and Mrs. Wemyss Quin. Of lemon-coloured Roses of recent origination, two of the most attractive are Mr. Arthur Wm. Paul's radiant Emmeline, and Golden Opbelia; the latter, raised at Colchester, is a derivative from the famous Ophelia of Waltham Cross. *David R. Williamson.*

## HARDY FLOWER BORDER

### ADENOPHORA POLYMORPHA.

THE above species was originally described by Ledebour in *Flora Altaica*, but the plant is scattered over China as well, and is variable in form. I had specimens recently from the garden of Miss Willmott, Warley Place, Great Warley, which serve to show how closely allied Adeno-

FIG. 64.—SOLIDAGO MISSOURIENSIS: R.H.S. AWARD OF MERIT, AUGUST 22, 1922.

seeing a new variety, of a rarely beautiful dark cerise colour and artistic formation, bearing the name of Mrs. Tom Smith, which has not yet been introduced to general cultivation, but will soon be available. In those nurseries, such dark Roses as George Dickson, Victor Hugo, and especially Commandant Felix Faure, are grandly grown. Golden Emblem and its finest yellow contemporaries also luxuriate there. These varieties, whose largest and perhaps noblest representative is Souvenir de Claudius Pernet, have succeeded admirably in my own Rose borders this year, notwithstanding the blasts and frequent deluges of desolation to which they were exposed. My French namesake, raised by Monsieur J. Pernet Dueher, of Lyons, after flowering exquisitely in the tropical summer of last year, was destroyed during the late autumn by frost.

Among the most effective of my Roses this season have been Gorgeons (a variety eminently entitled to its expressive name, which I recently saw in magnificent form in Messrs. Hayes' Rose gardens at Ambleside), Hugh Dickson, and George Dickson, still the finest and most fragrant of the bright and dark red varieties that are yet in cultivation; the beautiful pink-coloured George Gordon; the uniquely attractive Juliet and Queen Alexandra, and the pre-eminently popular Golden Emblem. That distinctive yellow variety, entitled Margaret Dickson Hamill, which I recently saw at the Stranraer Rose Nurseries, is

phora is to Campanula. At first sight I thought the plant was *C. rapunculoides*. The purple blue flowers were similar in size and colour in both cases, as well as the irregularly ornate leaves. In good soil both plants produce long racemose branches on the lower part of the main stem. The Adenophora differed generically in having a deeply cup-shaped disc around the base of the style, and the stems and leaves were simply more coarsely hispid than those of *Campanula rapunculoides*. The Adenophora also had the credit of not being stoloniferous, or creeping below ground, and therefore a better behaved garden plant. Many people have a liking for *C. rapunculoides* until they introduce it to their herbaceous borders, where it soon runs riot and is difficult to eradicate. *J. F.*

### SOLIDAGO MISSOURIENSIS.

UNDER the name of *Aster hybridus luteus*, this plant (see Fig. 64) received an Award of Merit at the R.H.S. meeting on August 22 last, when exhibited by Mr. Amos Perry, of Enfield. It has small, star-like flowers of a clear Primrose yellow, and they are produced in such abundance as to form a veritable bouquet or shower of blossoms. The habit is all that could be desired, and, as the plant grows only about 2 feet tall, it is suitable for the middle row of an herbaceous border. It will be eagerly sought after by those who desire bright flowers in the garden in July and August. *W. L.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Treatment of Newly Potted Orchids.**—It is advisable to place all the newly potted plants together, where they may receive special treatment as regards spraying, shading and damping between the pots to cause them to become re-established at the roots as quickly as possible. The compost should not be used in too dry or too wet a condition, and when it is observed to have become dry a surface watering with a rose-can will be sufficient to settle the compost around the plant, letting the plant almost dry out between each application of moisture. The dull, cool weather recently experienced has suited these plants, and as proper atmospheric conditions are of primary importance in the cultivation of all plants in glass-houses, the nearer the houses are kept at an equable temperature the better the plants will thrive. At this season the night temperature of the house should range from 58° to 60°, with a rise of 10° during the day time according to the weather and with the higher temperature a greater amount of humidity should be used to counteract the drying effects of fire-heat.

**General Remarks.**—In autumn the majority of Orchids are completing their season's development, and the grower should endeavour to get the growth of the plants consolidated as much as possible, to prepare the plants for the coming winter. Should the weather continue damp and unsettled, as it has been during the greater part of August, the management of Orchids should be modified as regards atmospheric moisture, it being a mistake to overcharge any of the houses during such weather as we have recently experienced. More especially does this apply to inmates of the Cattleya, intermediate, and cool houses. As regards the warmer houses, a certain amount of atmospheric moisture must be maintained in order to counteract the drying effects of artificial warmth and to prevent the spread of insect pests. Differences of locality and in the positions and structure of the houses must also be taken into consideration, as these affect their capacity for holding atmospheric moisture. Everything depends upon a proper balance being maintained in the different departments. Even in the warmest division, atmospheric moisture can be overdone, especially during damp, cold weather, as an excess of moisture in any house has a tendency to lower the temperature very considerably. It is not good practice to continue syringing or spraying each time the air in the houses gets in the least dry, especially in the autumn, when numbers of the plants are finishing their growths and preparing for rest. To enable the new growths of those plants still growing, and the new pseudo-bulbs to mature, and to prevent the development of spot disease, each division should be allowed to set comparatively dry for a few hours during the middle of each day. It is essential at this season that plenty of light should reach such plants as the deciduous Calanthes, Thunias, Cattleyas and Laelias, Vandas, Catasetums, Cynoches, Mormodes, Dendrobiums, etc., which have finished their growths, and all those plants which require well ripening or maturing to produce a full crop of flowers.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Radish.**—One or two sowings of Radishes should be made now in frames for late use. The plants should be kept well syringed and the frame closed towards the evening to ensure a quick development of the roots.

**Mustard and Cress.**—To maintain the supply of these salads, make sowings every fortnight in shallow boxes or small frames. Sow on a flat surface and cover the seeds with brown paper until they commence to germinate.

**Brussels Sprouts.**—The wet weather has suited these plants, and any that seem inclined to become blown over should be supported to a stake. Shorten a few of the bottom leaves on the early crop, as this will make the buttons swell better.

**Frost.**—In the colder parts of the country frost may be expected this month, and materials for covering French Beans, Marrows, etc., should be kept in readiness. A constant watch should be kept for a sudden fall in the temperature, as often a short snap of frost in September is followed by good weather until November.

**Tomatos.**—Plants intended for winter cropping should be planted out or placed in large pots. Do not use too much fire heat, but give the plants every encouragement to form sturdy growth by admitting plenty of air and exposing them fully to the sunlight.

**Leeks.**—As Leeks continue to grow, earth soil about the stems, but before doing this see that the plants are in a moist condition at the roots.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Clarkia elegans.**—This annual is very useful for cultivating in pots, and will produce a fine display of colour in the cool greenhouse next spring. It may be obtained in double and single forms and also in distinct colours. *Clarkia elegans* and its varieties produce their flowers in long, loose sprays, which make the plants more effective for pot culture than the pulchella varieties. The seed should be sown thinly in small pots and the seedlings thinned out to one or more; or it may be sown in pans and the seedlings pricked off into small pots when large enough to handle. To be successful with *Clarkias*, a cool treatment is necessary at all stages of growth, and the plants should be stood near the roof glass to prevent them becoming drawn and weakly. The young plants should be potted when needed until the roots are in receptacles from 6 to 7 inches in diameter. Pinch out the tops of the main shoots on one or two occasions to promote a bushy habit, and thus make more floriferous specimens.

**Antirrhinum.**—This popular plant is useful for cultivating in pots, and will provide a fine display of flowers in their many beautiful colours. *Antirrhinums* should be grown in cold frames during the winter and given plenty of fresh air whenever weather conditions will allow, but they need protection from severe frost.

**Mignonette.**—Plants of *Mignonette* that are being grown to produce flowers in the autumn should be secured to neat stakes to keep the young growth erect. When the receptacles are well filled with roots, the latter should be given liquid manure water on two occasions each week. Another sowing may be made now to produce plants for flowering next spring. Prepare the pots and compost as advised in a former calendar. When the seedlings appear, grow them near the roof glass in a cool pit, and admit air freely on all possible occasions.

**Achimenes.**—As the various batches of *Achimenes* pass out of flower, the plants should be removed to a cold frame where they can be fully exposed to the sun and air. Continue to water the plants for so long as the foliage remains green, but once the leaves and stems have died down, water should be withheld and the roots kept dry and stored in a moderately warm house during the winter. The same treatment applies to tuberous-rooted *Begonia* and the later batches of *Gloxinias*.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Planting Bulbs.**—Tulips of the Darwin and Cottage sections may now be planted. These lovely May and June flowering bulbs are well worthy of inclusion in the herbaceous borders, blooming, as they do, at an early period, when the general collection of plants is not yet at a flowering stage. Hardy *Cyclamens* may be planted now. *C. neapolitanum*, *C. neapolitanum album*, *C. Coum*, *C. repandum*, and *C. europaeum* are gems for inclusion in the rocky and rock edges, and they look very pretty planted in big batches between hardy Ferns.

**Pentstemons, Calceolarias, Phloxes.**—The propagation of these useful plants from cuttings should be commenced also, and for these I prefer the box method in cold frames.

**Climbers.**—The moist, sunless season has encouraged climbers to make very quick, rampant growth, and careful training is essential, otherwise the plants will rapidly become a tangled mass of growths, rendering them the opposite of interesting and beautiful. In connection with the training, judicious thinning of the growths should be carried out. Members of the *Vitis* family have made especially free growth, and *Vines* that are grown for their autumn colouring will be much benefited at the present time by a little feeding with manure water.

**Hedges and Lawns.**—Attention is also required with regard to the quick growth of these. Where *Lavender* is grown to form a low hedge, the plants should be clipped over when the flowers have been gathered for drying, in order to keep the hedge in a trim shape. The lawn mowers should be used freely to maintain the lawns in a healthy condition; the grass verges should also be kept trim and neat by means of the edging shears.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Early Vines.**—The work of root-lifting and root-pruning early vines, also adding top dressing to the border, should be completed while the weather is favourable. Although each of these operations is performed in a different way, not one can be completed without the aid of a good compost, which should be prepared in quantity equal to the probable demand. Ordinary soil at this season is by no means cold, and the roots will have a chance to recuperate before the vines are started in December. Root-lifting is undertaken when the compost of the border is exhausted. The work should be commenced at the extreme front of the border, removing the old compost bit by bit, saving all the roots from injury and keeping them tied in bundles, and moist, until the drainage is put in order.

**Soil for the Vine Border.** New turves placed grass side downwards on the drainage material should form a good base for the compost, which should be made firm by even treading and placed high enough for accommodating the first layer of roots arising from the lowest part of the undisturbed border. The roots should be carefully spread out, examined, and all faulty or injured parts removed. When this is done, place a little soil over them and make it firm. Another layer should follow, and so on until all is finished. The atmosphere of theinery during this process may be kept rather closer, but, having an abundance of roots in the undisturbed border, the vines seldom show signs of having been interfered with. All good Grape growers make their borders piecemeal, adding a little from year to year as the roots require it. The best time to perform this work is soon after the crop is cleared or the premier leaves show signs of ripening. *Vines* always do best before the roots reach the extremity of the space allotted to them, especially when the front is made up of a turf wall. In this case the drainage

need not extend beyond the front of the border, as fresh air by this means and warmth from fermenting materials in the front of the turf wall can then exercise their beneficial influences beneath the compost. The space may be filled with fresh fermenting leaves of Oak or Beech, if not before, certainly when the vines are started. Gentle warmth working into the front of the border soon causes a profusion of active roots to develop at that part, but on no account should decaying matter be allowed to remain for more than one season, otherwise the vines will receive a check in growth when it is taken away to make room for the extension of the border. The addition of two feet at a time is ample; the old retaining wall should be forked down and the roots tipped back with a sharp knife. The old border being firm, some care is necessary in building the old and new together, otherwise, if the soil is loose enough to settle, the young roots will be broken and water will pass through the cavity instead of penetrating evenly through the border.

**Top-dressing Vine Borders.**—Early vine borders should be top-dressed in September, and, being an annual operation, all old mulching material and inert soil should be removed to prevent the surface of the border becoming too high. When the surface roots have been laid bare by pricking over, the loose material may be drawn off with an old broom, a rake, or the hands. Substitute fresh compost, well enriched with bone-meal, to the depth of two inches. This covering cannot be made too firm. Besides the bone-meal, old vines may have, in addition, a dressing of a suitable vine manure. Outside borders should be treated in a similar manner, but the mulch of fresh stable litter should not exceed three inches in depth.

**HARDY FRUIT GARDEN.**

By H. MARKEHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Peaches and Nectarines.**—The crops of Peaches and Nectarines in the open are, generally, very good and the individual fruits have grown to a good size and coloured well, especially the midseason varieties. Examine daily the fruits that are ripening and remove them a trifle underripe so that they may be taken from the branches without undue squeezing by pressure of the hand. All fruits intended for travelling long distances, also those for marketing, should be gathered a few days underripe and should be very carefully packed in soft material in shallow boxes. Peaches ripen very quickly when gathered and packed in boxes after they have attained a certain stage. The trees are making an abundance of new, soft growth which should be removed forthwith. Some of the leaves overhanging the fruits may be tipped a little to expose the latter to the light and air.

**Pears.**—A goodly number of these fruits are approaching maturity and to prolong their season too many should not be gathered at one time. In gathering them be careful not to bruise them. The variety Williams Bon Chrétien is, with us, over and Madame Treyve, Beurré d'Amanlis, Margaret Marillat, Louise Bonne of Jersey, and Beurré de l'Assomption are amongst the next to follow, these in turn being succeeded by Conference, Doyenné du Comice and many others of the best varieties. Keep all late Pears worked on the Quince well supplied with nourishment and do not over-crop the trees.

**Apples.**—Examine the trees carefully and remove a few fruits at intervals of several of the early dessert kinds, so that the supply may be lengthened. Quarrenden, Irish Peach, Benoni, Kerry Pippin, James Grieve, Lady Sudeley, Ellison's Orange, and Worcester Pearmain are all useful early sorts. Choice dessert kinds which are frequently attacked by tits should be protected with nets of small mesh, otherwise many of the best of the fruits will be spoiled. In the orchards, starlings and blackbirds are our worst enemies, and these birds usually attack the fruits of Ecklinville Seedling, Keswick Codlin, and other soft-fleshed varieties.

**NOTICES OF BOOKS.**

**Champs et Bois Fleuris.**

MONSIEUR HENRY CORREVEON, to whom lovers of plants are already indebted for the *Flora of the Alps* and other works, has added to the happy obligation by a new volume bearing the title, fragrant with promise, of *Champs et Bois Fleuris*.\* Monsieur Correveon has an international reputation for his knowledge of the Alpine flora, and his frequent visits to this country have resulted in his forming many friendships amongst garden lovers in Great

entirely covered by it at blossom time. In the course of his account of the common Hazel, the author recalls the strangely long endurance of belief in the magical qualities of the twig which were extolled so long ago as 1665 by the Jesuit father Jean-François in a work on the art of discovering springs. In far more remote times the Greeks held, also, that by means of Hazel wands hidden water courses and hidden treasures may be found—a belief which endures actively at the present day.

The change of flower colour with change of station is referred to on several occasions;

FIG. 65.—DAHLIA COCCINEA (SEE P. 164).

Britain. In these wintry days of late summer it is a solace for those who tend their gardens under sombre skies to turn to the radiant pictures which illustrate this volume. They epitomise and idealise the seasons and recall memories of Alpine woods and meadows, and provoke desires to revisit the pleasant cantons of Switzerland when the fields are ablaze with their spring flowers.

Monsieur Correveon writes charmingly and with a rare knowledge of plants. Of each subject illustrated he has something useful to say, and he says it as becomes a lover of Nature with simple directness. Thus of the Perce-neige (*Galanthus nivalis*), which, with *Eranthis hyemalis*, holds the place of honour in Plate 1, he points out that the popular name is a misnomer in that, unlike the *Crocus* or the *Soldanella*, the flowers of which really do come up through the frozen snow, the *Galanthus* only appears after the snows are melted. Of the *Eranthis* we learn that it occurs by millions among the vines on the hills of Wusenthal, the sides of which are

thus the Dog Tooth Violet (*Erythronium Dens-canis*), illustrated in Plate 4, like many other Swiss Alpine plants, an intruder from the South, is of a pale rose colour in Northern Italy, whereas in Switzerland it takes on a deep rose colour. Similarly *Campanula glomerata* (Plate 34) has deep violet blue flowers in the lower meadows and paler colours in the mountains.

Though many of the plants figured are good garden plants, others are the proper ornaments of wild places. Among the latter is, for example, *Campanula rapunculoides* (Plate 50), which no one who knows its possessive habit would ever introduce into a garden—its place, as M. Correveon says, is in Nature's arid and empty spaces.

M. Correveon is a delightful guide. He knows the Alpine flora, and in leading us, his companions, in search of plant treasures, he discourses charmingly and learnedly of the properties and histories of the plants which will meet our journey's end. We are grateful to him for his work in popularising the love of plants, and can recommend his book to all who have a large love of plants and a little knowledge of French.

\* *Champs et Bois Fleuris*. By Henry Correveon, illustrated by 75 plates in colour by Mlle. E. Rivier. Published by Delachaux et Niestlé, Neuchâtel. 30 frs.

**EDITORIAL NOTICE.**

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

**Letters for Publication**, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

**THE DAHLIA.**

THE National Dahlia Society's Exhibition during the past week marked a notable occasion in the recent history of the Dahlia, seeing that the show was the first held entirely under the auspices of the National Dahlia Society since pre-war days, and those responsible are to be congratulated on the success of the exhibition, which assumed an international character in view of the fine display made by the Dutch Dahlia Society, several members of which body exhibited flowers selected by the Floral Committee for trial in the Wisley gardens.

Those who have an especial interest in this beautiful autumn flower cannot fail to be pleased with the modern developments in the direction of garden varieties, for, beautiful as the exhibition varieties may be, it is a notorious fact that many of the choicest exhibition sorts are totally unsuitable for the garden. The ordinary grower needs a plant which possesses a neat, compact habit of growth and one which bears a profusion of flowers on tall, wiry stems, enabling the blooms to be displayed well above the foliage. These qualities are found in certain varieties of all the types, but we think that the modern decorative kinds best fulfil the requirements of the garden, and especially the Decorative, Paeony-flowered, Colletterette, Single, and Star types, varieties of most of which gained recognition at the recent show as being worthy of trial at Wisley. It is true that there are many beautiful varieties in the Cactus section, and especially when we consider such sorts as Mary Purrier, Red Ensign, C. E. Wilkins, John Riding, and Amos Perry, for these are as free-flowering as could be wished and extremely valuable for use as cut blooms indoors.

To the ordinary observer one of the most puzzling problems is how such a variety of form in the flowers of these plants has been evolved by the florist, for a Show or Pompon Dahlia is as different as could be from, say, a Cactus or a Star variety, and, again, a Star, or Single, Dahlia differs enormously from either of the other types. Doubtless this has been brought about by the introduction and cultivation of more than one species. These various species have been used by the hybridist for effecting his purpose, and visitors at the Dahlia Society's Exhibition were afforded the opportunity of seeing three of the species, namely, *D. coccinea*, *D. variabilis*, and *D. Merckii*, which were sent by the Director of the Royal Botanic Gardens, Kew. We took the opportunity of photographing all three

species, and they are reproduced in Figs. 65, 66, and 67. Of these, the oldest in gardens are *D. coccinea* and *D. variabilis*, for *D. pinnata* and *D. rosea* of Cayanilles are synonyms of *D. variabilis*.

The story of the introduction of the Dahlia into this country is well dealt with by Mr Harman Payne in an article entitled "When Was the Dahlia First Introduced into England?" in *Gard. Chron.*, September 23, 1916, in which he explodes the generally accepted belief that Lady Bute, said to be the wife of the English Ambassador at Madrid, sent seeds to the Royal Gardens at Kew in 1789. His researches elicited the fact that the

nineteenth century, but this is not the only evidence of the great progress that has been made in the evolution of the Dahlia in recent years.

According to Mr. Shirley Hibberd, the formation of the florists' Dahlia began in the year 1813, when Donkelaar, of the Botanical Gardens at Louvain, obtained a series of double flowers which were freely distributed. Early in the nineteenth century, the French had been assiduously cultivating Dahlias, though but little was heard of their operations owing to the influence of politics in every department of public intelligence. When the Allies entered Paris, in 1814, single and double

FIG. 66.—DAHLIA VARIABILIS.

flower was apparently not introduced into this country until after 1796, and probably not until 1802 or 1803. Specimens in the Natural History Museum Herbarium have been found, with the inscription on the back, "C. G. Ortega (Lady Bute)." These were grown in Lord Holland's garden about the year 1805, but it is stated in *Bot. Mag.*, Tab. 762, that a nurseryman of Chelsea, one Fraser, grew *Dahlia coccinea* in 1803.

When, however, we come to the introduction of the Cactus Dahlia, we are on surer ground, for the progenitor of this type, *D. Yvarezii*, was shown by that grand old florist, Mr. Henry Cannell, of Swanley, in 1879, he having obtained it from Mr. Cullingford, of Phillimore Gardens, who in his turn received it from Messrs. Ant. Rozen and Sons, of Overveen, nr. Haarlem, Holland. This firm had obtained it some years previously from a French nurseryman who is supposed to have imported it from Mexico. It seems hardly credible that a plant now so well known as the Cactus Dahlia should have been unknown in this country in the early 'seventies of the

varieties of Dahlias were seen in profusion, and doubtless the credit for their origin was due to Donkelaar. By the year 1830 British florists had popularised the flower in this country, and had founded a publication known as the *Dahlia Register*. It was not, however, until 1870 that the National Dahlia Society was formed, by which time apparently there was a decline in interest for the flower, but from that time onward the popularity of the Dahlia has been steadily maintained.

*Dahlia coccinea* (see Fig. 65), of which *acutiflora*, *bidentifolia*, *Cervantesii*, *crocea*, and *frustranea* are synonyms, has, as shown in the Kew specimens, scarlet florets and a yellow disc, but, according to L. H. Bailey, in the *Standard Cyclopaedia of Horticulture*, the colour range is from scarlet through orange to yellow. It is doubtless to this species that we owe the single races, for there are no apparently double forms.

*Dahlia variabilis* (see Fig. 66) has many synonyms, among others *rosea*, *pinnata*, and *superflua*. It has been cultivated certainly since 1805 in this country, and its evolution

from a single flower to the handsome, double florist's form now known as the Show Dahlia is a remarkable horticultural transformation. It must be remembered, however, that each floret of the Dahlia consists of a separate individual flower, and the disc florets have all been metamorphosed into rays. This type of Dahlia is not so much in favour nowadays as with the older florists, for many people object to its stiff, formal appearance. Nevertheless, the colours are exceedingly beautiful, and a well-grown bloom still secures a certain number of admirers.

*D. Merckii* (see Fig. 67) (syns. *minor*, *glabrata*, *Decaisneana*) is the best-marked species of the genus, and, as a wilding, a most elegant plant. The stems grow to a height of some four feet, and are much branched. The leaves, as may be seen from the illustration, are of a very distinct form, and the leaf stalk is more or less winged. The flowers are only about two inches in diameter, and coloured a pretty pale lilac, set off by the central yellow disc. The plant is dwarfer and rather more spreading than most species of Dahlia, and the finely cut character of the foliage makes it more attractive than that of the two other species we have described.

THE ALPINE GARDEN.

CAMPANULA HAYLODGENSIS.

THE pretty little *Campanula haylodgensis* has been in cultivation for very many years, but it never seems very plentiful, although it is not difficult to cultivate. It originated in the garden at Hay Lodge, Edinburgh, where several pleasing hybrid *Campanulas* were raised, and, as there were not so many dwarf Bellflowers in cultivation thirty or forty years ago, it was more plentiful at that time than it is now.

GARDEN NOTES FROM S.W. SCOTLAND.

I AM afraid I must withdraw all that I wrote about *Veronica salicifolia* on page 110, and suspend judgment, for Mr. Richardson has gone far to convict me of error by sending me specimens of the species which he grows. I must plead in excuse that I was misled, if misled I have been, by a very high botanical authority in whose company I visited Mr. Walpole's famous garden in county Wicklow. He taught me to regard the *Veronica* with pendent racemes as true *salicifolia*.

Any gardener, amateur or professional, who has suffered, as we have done here, from the inordinate exuberance of *Polygonum sachalinense* and *P. cuspidatum*, will think twice before admitting another species; it is, therefore, with some hesitation that I venture to report favourably on *P. campanulatum*. Thus far it has shown no disposition to ramble, and its pretty panicles of white, rose-tinted little bells are very freely produced in August. The stems and foliage are seductively succulent, yet rabbits leave it alone, as they do the rest of this most variable genus. One of the quaintest species and the latest to flower is *P. equisetiforme*, which poses as a slender Rush all the summer, until in autumn it studs its two to three foot stems with little starry white flowers. It is not a spreader.

Mr. Arnott bestows well-merited praise on *Inula glandulosa* (page 119), a fine thing, and so is *I. grandiflora*, which closely resembles it; but for brilliancy, good habit and persistence of bloom, commend me to the Himalayan, *I. Royleana*. Beginning to flower here this year on 9th July it is still on this 26th August carrying flat golden blooms five inches across on stiff two foot stems.

I know not where *Cnicus pulcherrimus* comes from, nor where I got it, but it is an attractive member of a generally unattractive genus. From a tuft of boldly pinnate radical leaves, it sends up a three foot stem, so stiff as to require no staking, bearing a large, solitary Thistle head of good crimson. The stem is set with smaller pinnate leaves, gleaming white on the under surface. Altogether it is a desirable plant.

For those who have plenty of room and can command a moist, open glade, *Spiræa arborea*, one of the *Sorbaria* group, introduced from China by Wilson, makes magnificent display at this season, flinging out its great panicles of chalk-white blossom, 12 to 18 inches long. But room it must have, for it may grow 20 feet high and as much across, enough to smother any neighbour of less robust habit.

The flowering season of *Rhododendrons* has closed here with the last blossoms of *R. Scottianum*, one of the *Maddeni* series, and

reputed to be tender. Hitherto it has made good growth in the open under a north wall, and has flowered freely. The leaves are bright green, 4 inches long and 2 inches broad, densely lepidote below; the flowers are in groups of two to four, more widely funnel-shaped than those of *R. Edgworthii* and *R. crassum*, but with narrower perianth segments, pure white with occasional carmine splashes outside, not so powerfully fragrant as the two species above-named. Having only 10 stamens with pale anthers, the blossom lacks the richness imparted to that of *R. crassum*

FIG. 67.—DAHLIA MERCKII.

by its twenty tawny anthers, and to that of *R. Edgworthii* by its rose-coloured pistil and stigma.

To those who are now studying the autumn bulb lists, let me recommend a trial of *Ornithogalum pyramidale*, whereof the cheerful white panicles are not so often seen in June borders as they deserve to be. It requires as little care after being deeply planted as the common Star of Bethlehem, and is far more ornamental.

The profusion of strap-shaped leaves which *Lycoris squamigera* sent up in spring have entirely disappeared, and now the stout, two-foot stems are pushing up, each with a cluster of large, fragrant flowers of pale flesh colour and lavender. I don't know who was the sponsor of this Japanese species, nor why he chose the name of a Roman general's mistress to bestow on a blameless Amaryllid. *Herbert Maxwell, Monreith.*

At least, this is my impression from observations. It was understood that it was raised from *Campanula Bellardii* (*pusilla*) and *C. turbinata*, but I observe that the late Mr. Farrer hazarded the opinion that it was probably between the former and *C. isophylla*. The habit of the plant would support Mr. Farrer's suggestion, as it is difficult to trace the trailing habit to either *C. Bellardii* or *C. turbinata*. But this is mainly a matter of academic interest, and in writing of the plant from a gardening standpoint it is unnecessary to elaborate the question. It is a remarkably pretty, low-growing, trailing *Campanula*, never aggressively rampant, and has pleasing, shining, yellowish-green leaves and wide, open, saucer-like flowers of a clear blue in late summer and autumn. It has some resemblance to *C. Profusion*, raised by the late Mr. E. H. Jenkins. For some time a double form, the origin of which I am totally ignorant, has been in cultivation. *S. Arnott.*

ORCHID NOTES AND GLEANINGS.

LAELIO-CATTELEYA RUBICON.

A TWO-FLOWERED inflorescence of this fine new hybrid from Mr. J. E. Shill, gardener to Baron Bruno Schröder, The Dell Park, Eaglefield Green, shows its fine quality in size, colour and shape, all of which are excellently well developed by the fine culture always manifest in The Dell Orchids.

The parentage is Laelio-Cattleya George Woodhams x C. Hardyana. The sepals and very broad, well-displayed petals are clear mauve colour, and the lip deep ruby claret in front, the colour extending in a broad margin over the side lobes, the disc and base being bright orange yellow with some ruby lines. Attractive features are the great contrast between the dark front of the lip, the orange yellow of the base, and the velvety appearance of the surface.

FOUR NEW HYBRIDS.

FIRST flowers of four new hybrids, taken in most cases from plants in two-and-a-half-inch pots, are sent by Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tisbury, Wells, the records showing careful consideration in the selection of parents.

LAELIO-CATTELEYA RUBY KING.—Raised between their charming L.-C. Golden Wren (C. iridescens x L.-C. Thyone) and C. Hardyana; this has for basic species C. bicolor, C. Eldorado, C. Warszewiczii, C. Dowiana twice, and L. xanthina. Cattleya Dowiana influences the size and shape of the flower, which has rose-pink sepals with a gold shade and rosy mauve petals. The lip, which will compare favourably with any known Laelio-Cattleya for beauty and intensity of colour, is clear Buttercup yellow on the lower half, the broad front lobe and margins of the side lobes being bright ruby red, with a slight purple shade.

CATTELEYA ORIENT.—Raised by crossing C. Adula (bicolor x Hardyana) and C. Venus (Dowiana x Iris), this showy flower retains the C. Dowiana shape, but evidence of C. bicolor appears in the thick, ivory-white column and the firm substance of the flower. The sepals and petals are sulphur yellow with a rose flush and the lip deep Tyrian purple, with thin gold lines from the base.

CATTELEYA BRIGHT EYES.—This variety results from a cross between C. Prince John (Dowiana Rosita x Hardyana) and C. Armstrongiae (Hardyana x Loddigesii), the latter parent much influencing the form of the lip and the intensity of its colour, which is deep ruby claret, with gold blotches on each side and a gold base, the sepals and petals being light rosy mauve.

CATTELEYA MULLERI ORCHIDHURST VARIETY. The origin of this large, snow-white hybrid is the crossing of C. Mrs. Myra Peeters (Gaskelliana alba x Warneri alba) and C. intermedia alba, and with such a pedigree a fine flower was assured. It is firm in substance and without colour except the faintest suspicion of sulphur yellow in the finely crimped lip. The cross has also been raised by Messrs. Sander.

CHINESE TREES AT ALDENHAM.

(Continued from page 138.)

HIPPOPHAE RHAMNOIDES PROCERA: 11 ft. This variety has the appearance of being an intermediate form between H. rhamnoides and H. salicifolia, inasmuch as its habit approximates to the first-named, whilst the foliage more closely resembles the latter. It may readily be distinguished from the type by the silky (villous) pubescence of the young growths, and by the downy character of the leaf surfaces. A handsome variety of this genus than any of the above was introduced in quite recent years by Mr. Geo. Forrest, and is still under number, viz., 10,396, though it has been determined as a variety of H. rhamnoides.

IDESIA POLYCARPA VESTITA: 12 ft. This apparently differs from the type in having densely pubescent undersides to the leaves. It is a very distinct tree, with fine foliage, and it is said to have yellow flowers, that are followed by brick-red fruits.

LIRIODENDRON CHINENSE: 12 ft. This is of much interest, and, though it closely resembles its American ally, the leaf has a much more pronounced waist. It is perfectly hardy, and will undoubtedly make a very handsome tree in this climate. Mr. Wilson speaks of a fine specimen he saw, 70 ft. tall and 5 ft. in girth. It has not yet flowered in England; the bloom is stated to be similar to, but smaller than, that of its congener.

MELIOSMA BEANIANA: In the warmer parts of the country the Meliosmas may be expected to prove very successful, and it is to be hoped that they will thrive in less favoured localities. At Aldenham, where the climatic conditions are not the most congenial, this species, named in honour of Mr. W. J. Bean, V.M.H., who is one of the greatest living authorities on trees and shrubs, grows freely and makes well-ripened wood. A very fine specimen at Aldenham is now 12 ft. in height. This species suffers less from the effect of spring frost than is the case with either of the two relations that follow.

MELIOSMA CUNEIFOLIA: This tree is said to grow, in a wild state, about 20 ft. high, and in

this country will probably make a large shrub. The foliage is ornamental, and Mr. Bean speaks highly of the flowers. They are small, but freely produced in terminal panicles, and are pleasantly scented with a Hawthorn-like fragrance. MELIOSMA VEITCHIUM: Little can be said of this species in cultivation, but from Mr. Wilson's enthusiastic description of it in its native habitat it must be a grand tree of great beauty. This, and M. Beaniana, belong to the pinnate-leaved section of the genus, and the foliage, suggestive of Rhus typhina, is very ornamental. The Aldenham specimen is now a healthy young tree, 7 ft. tall; it has proved, however, a slow grower.

PAULOWNIA TOMENTOSA LANATA (see Fig. 68): I do not know whether this species of Paulownia will flower more freely in our uncertain climate than the old P. imperialis, but its behaviour up to the present has been quite satisfactory. It is now a fine young tree, about 30 ft. in height, and by the well-ripened condition of the wood it has already proved itself to be a far harder and more suitable subject for gardens north of London than the other species. It bears white flowers, not purple, as P. imperialis does.

POLIOHYRSIS SINENSIS: This is an interesting and rare tree of moderate growth, the specimen at Aldenham being 10 ft. high. It evidently needs some age before the flowers are produced, and these are described as white, changing to yellow, and produced in a terminal inflorescence.

POPULUS LASIOCARPA: This, the most striking of all Poplars, is a very ornamental tree, with fine, bold foliage, each leaf being nine or ten inches long and almost as wide. The beauty of the foliage is enhanced by the deep red colour of the stalks and midrib. The tree succeeds well near the water's edge, and the 18-ft. tall specimen at Aldenham is very handsome. It grows more slowly, and in the end makes a smaller tree, than the average members of this genus.

POPULUS SZECHUANICA: Although not quite so fine in foliage as the foregoing, this is a valuable tree of rapid growth, now measuring 25 ft. tall, with a stem girth of 18 in. There seems to be two forms, in the better of which the young leaves have a very pretty rosy pink underside shading to grey.

PRUNUS: Mr. Wilson introduced a large number of members of this large family; many had been previously known through the botanical travellers of China, some had already found their way into cultivation, but certain numbers were quite new. Of the latter I have selected a few that call for description, having already made good-sized trees at Aldenham.

PRUNUS CONRADINAE: 13 ft. As a standard this makes an effective tree of somewhat pendulous habit. It carries quantities of white flowers early in March.

PRUNUS PILOSUSCULA MEDIA: A free-growing tree, now 15 ft. high. It is one of the most beautiful of the genus when in blossom, and was given an Award of Merit when shown before the Royal Horticultural Society on 5th April, 1921. The flowers are pale pink and produced in clusters all along the branches; they are made additionally attractive by the prominent stamens, and by the purplish tone of the expanding foliage. P. PILOSUSCULA BARBATA is a very closely allied variety, and there is probably only a slight botanical difference whereby the two are separated.

PRUNUS SERRULATA THIBETICA: 10 ft. This is an attractive tree, with quantities of small white flowers that are succeeded by bright red fruits. If the stem is kept clear by the removal of the lower branches the ornamental reddish-brown bark, peeling like that of a Birch, is seen to great advantage.

PRUNUS TENUIFLORA: 16 ft. A beautiful Cherry, allied to, and not unlike, the handsome Prunus Sargentii. The flowers vary from white to pink, and are succeeded by small black fruits. A. E. Thatcher.

NEW HYBRIDS.

(Continued from July 29, page 68.)

Name.	Parentage.	Exhibitor.
Cattleya Avalanche	C. Mary Sander x C. Snow Queen	Sanders.
Cattleya Bright Eyes	C. Prince John x C. Armstrongiae	Armstrong & Brown.
Cattleya Courtra	C. Luddemanniana x C. Rex	Sanders.
Cattleya Jules Serrie	C. Warszewiczii x C. Dietrichiana	Sanders.
Cattleya Margaret	C. Maggie Raphael alba x Iris	Pantia Ralli, Esq.
Cattleya Orient	C. Adula x C. Venus	Armstrong & Brown.
Cattleya Shrewsbury	C. intertexta Juliettae x C. Dusselderfei Undine	Sanders.
Cattleya Thisbe	C. micans x C. Pittiana	Sanders.
Cattleya White Lady	C. O'Brieniana alba x C. Percivaliana alba	Stuart Low & Co.
Cyrtopodium Albion	C. niveum x C. Astarte	Flory & Black.
Disa Julia A. Stuckey	D. Italia x D. grandiflora	Duke of Marlborough.
Laelia 'harm'	L. autumnalis x L. grandiflora	Baron Schröder.
Laelio-Cattleya Golden Glow	L.-C. Sunrise x C. Venus	Flory & Black.
Laelio-Cattleya Idina	L.-C. Soulangue x C. Nena	Hassall & Co.
Laelio-Cattleya Ophir	L.-C. Ophir x C. Sybil	Hassall & Co.
Laelio-Cattleya Osric	L.-C. Oriens x C. Dowiana	Hassall & Co.
Laelio-Cattleya Praxiteles	L.-C. Mrs. Phayre x C. Hardyana Countess of Derby	Pantia Ralli, Esq.
Laelio-Cattleya Queen Mary	L.-C. Lustré x C. Peetersii	Lt.-Col. Sir George Hoelford
Laelio-Cattleya Rosita	L.-C. Ingramii x C. Tityus	Flory & Black.
Laelio-Cattleya Rubicon	L.-C. Geo. Woodhams x C. Hardyana	Baron Schröder.
Laelio-Cattleya Ruby King	L.-C. Golden Wren x C. Hardyana	Armstrong & Brown.
Laelio-Cattleya Victor	L.-C. Purple Emperor x L.-C. Rubens	Stuart Low & Co.
Miltonia gottensis	M. Bleuana x M. Charlesworthii	Sir J. Colman.
Odontoglossum Agapetum	O. amabile x O. Maillardianum	Charlesworth & Co.
Odontoglossum citrinum	O. eximium xanthotes x O. Boadicea	P. Smith, Esq.
Odontoglossum luridum	O. Harryanum x O. Olympia	Charlesworth & Co.
Odontoglossum Queen Astarte	O. Astarte x O. Queen of Gatten	Sir J. Colman.
Odontoglossum Tepez	O. Pegale x O. Lambeauianum	Sir J. Colman.
Odontoglossum Yellow Prince	O. King George x O. Queen of Gatten	R. Ge. Rich, Esq.
Phalaenopsis Requier	P. Luddemanniana x P. Schilleriana	Sir J. Colman.
Sophro-Laelio-Cattleya Mac	S.-C. Atreus x L.-C. Maqueda	A. Requier.

(To be continued.)

**MARKET FRUIT GARDEN.**

It would hardly be possible to find a greater contrast in seasons than that presented by 1921 and 1922. Last year the total rainfall up to the end of August was only 8.90 inches at my place. This year, for the same period, the rainfall amounted to 20.49 inches, which is 5.26 inches more than the total for the whole twelve months of 1921.

Of the two extremes of drought and wet I prefer the latter. Work is frequently upset by rain, it is true, and this means irritating difficulties in harvesting and marketing the crops of fruit; but that is better than seeing the trees suffering and crops deteriorating week after week in a monotonous drought. On my light land, at any rate, the fruit is infinitely superior in a moist season. It is a pleasure to handle the fine, well-grown specimens of Apples and Plums. Curiously enough, the fruit is much sounder than it was last year; there is scarcely any scab to be found on Apples, and Plums are very much freer from brown rot. Yet one would expect fungous diseases to be more serious in a wet season.

**THE PLUM CROP.**

Although a cold, wet summer spoils the demand for fruit (that is its worst feature), I am inclined to think that it has been advantageous on the whole for the disposal of the immense Plum crop this year. The season has been lengthened. Varieties come on one after the other, instead of ripening with a rush, as they do in a hot, dry summer. The glut of Plums would have been far worse if this had been a season like 1921.

There has been much talk about the glut of Plums, but really the demand for good coloured varieties has been remarkable, considering the quantity of fruit. During the height of the glut of Evesham Egg Plums, which were certainly dirt cheap, I was selling Belle de Louvain and Victoria at 6s. 6d. per half-bushel in some markets, and only a few went as low as 4s. 6d. in London. Certainly they were a splendid sample and all carefully graded. These prices are not high, but I was quite prepared to find mid-season Plums down to a penny a pound wholesale with such a big crop. I have never attempted to grade Plums before. The labour has been heavy, but there is no doubt that it has paid well. During a glut a good, sound sample sells where others can hardly be given away.

**GOOD AND BAD PLUMS.**

I suppose the growers of the Evesham Egg Plum score in a scarce season, but when there is a good crop of other varieties these Plums are practically useless to the growers, and they spoil the market for better kinds. It is to be hoped that no one plants the Egg Plum now. Its heavy-cropping powers are the only point in its favour. The public very much prefer coloured varieties like Rivers' Early Prolific, Czar, Belle de Louvain, Victoria, Pond's Seedling, and Monarch. These are the varieties for large growers. I should say that it would pay small growers to plant some of the choicer dessert kinds and sell them direct to shops, fancifully packed in small, non-returnable packages.

**APPLE PROSPECTS.**

As is usual when there is a heavy crop of Plums, Apples are in very little demand. The best dessert kinds are realising fair prices, but mid-season cookers can hardly be sold at all. It will probably pay to keep back everything that will stand it until after the rush of Plums is over. Late Apples are certainly not over-abundant, and will probably sell very much better.

The reports on the Apple crop collected by *The Gardeners' Chronicle* indicate a good yield in gardens, taking the country as a whole; but it is noticeable that all the reports from Kent are under average. This supports the evidence from commercial growers that late Apples are scarce in the Kentish orchards. This must have a great influence on the commercial crop of the whole country, which is not very abundant. There are plenty of fine fruits of Worcester Pearmain to come forward, and many growers

have good crops of Cox's Orange Pippin; but Bramley's Seedling, Lane's Prince Albert and other late kinds are on the short side and should be worth money.

**BOXING APPLES.**

I am going to try my hand at the packing of Apples in British standard boxes as soon as there is a large enough quantity of Worcester Pearmain ready to gather. Boxing should help the sale of this variety, as several growers found it did in last year's glut. Boxes are now reasonable in price. In small quantities they can be had at 9d. each, and in large quantities at between 7d. and 8d. These prices are for the wood cut to size; but the putting together of the boxes is very quickly done, and makes a suitable job for wet weather. The large, coloured

unsightly as it may be, has its value. The weeds use and hold soluble plant food which must otherwise be washed out of the ground, and will return them to the soil when eventually turned in, together with a great deal of humus which is built up of materials obtained free from the air. The orchards will receive almost as good a green manuring as if a corn crop had been grown for the purpose.

**BUD-FORMING MANURES.**

The August dressing of bud-forming fertilisers was applied to all my plantations in bearing in the latter part of the month. It was promptly washed in by rain, and ought to get to work at once, unless the weeds get most of it. I used a compound manure which is largely employed under glass as a top-dressing for Vines

FIG. 68.—PAULOWNIA TOMENTOSA LANATA AT ALDENHAM HOUSE GARDENS (SEE P. 166).

label of the Federation of British Growers looks well on these boxes.

**WEEDS.**

One drawback of a wet season is the prevalence of weeds in orchards. My plantations have never been worse in this respect. There seems to be no way of avoiding it. For weeks the ground has been too wet to cultivate or hoe, even if time could be spared for the latter, while in the brief dry periods little horse cultivation could be done owing to the trees being weighed down with fruit. Now I am having the weeds mown off, and motor cultivation and hoeing will follow as soon as the surface is dry enough to make it useful.

As a matter of fact, this carpet of weeds,

and Tomatos. It contains 5 per cent. ammonia, 7 per cent. water-soluble phosphate, and 7 per cent. potash; and 80 per cent. of the materials are organic. I do not know whether these are the right proportions for fruit trees, and, in the absence of research on any large scale, I doubt if anyone else knows either. We are still working in the dark in manuring fruit trees. Last year I used a home-made mixture of mineral fertilisers, which was cheaper, and apparently answered very well; but organic manures are supposed to be better for fruit. I believe they are, but it is a point that badly needs proving definitely. We pay very highly for plant food in organic forms without really knowing whether the cheaper mineral forms would not do equally well. *Market Grower.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from page 154.)

### MIDLAND COUNTIES (Continued).

**OXFORDSHIRE.**—Taken on the whole, the fruit crops are excellent, and the trees much cleaner and freer from blight than usual, taking into consideration the extremely dry season of last year. I have the heaviest crop of Peaches out-of-doors I have ever had, and the trees are clean and vigorous. *J. A. Hall, Shiploke Court Gardens, Henley-on-Thames.*

—The fruit crops generally are good in every respect. Some Apple trees which carried heavy crops last year are rather thinly cropped this season. Victoria and Early Rivers' Plums are carrying very heavy crops; all leading branches have needed support, and even with that I have lost some branches during the recent strong winds. Standard Pear trees are well cropped, especially Marie Louise, Prince of Wales, and Fondant d'Automne. Wall trees of these fruits were in flower earlier, during which time the nights were very cold, with frost, and a good deal of the fruit failed to swell. Strawberries were good and plentiful, as also were Raspberries, Gooseberries, and Currants, rain falling just in time to develop the fruits. At the present time we are much in need of sunshine. Insect pests have not been nearly so troublesome as last year, but American blight is appearing on some of the older Apple trees. The soil is a stiff loam on very heavy clay. *Victor R. S. Gammon, Eynsham Hall Gardens, Witney.*

**STAFFORDSHIRE.**—The fruit crops are very good. Stone fruits of all kinds are excellent. Strawberries were good, but the berries were damaged by the heavy falls of rain. Apples and Pears set well and benefited much by the rain. Soft fruits of all kinds were in abundance. The soil is of a light texture, with a sandy and gravelly subsoil. *Edwin Gilman, Ingestre Gardens, Stafford.*

—Apples are an average crop. The fruits of the varieties Lord Suffield and Charles Ross have been thinned to increase their value. Pears and Plums on walls are abundant crops, and I removed about two-thirds of the number of fruits. Small fruits were abundant and good. American blight is more prevalent than usual this season. The destruction of this pest should be made compulsory. *John Bates, Meaford Gardens, Stone.*

—The soil in these gardens is of a stiff and retentive nature, consequently our crops did not suffer so much from the drought in May as those on lighter soils. During that month Pears and Plums were very badly infested with aphid, especially those on walls, but after the rains came the pest disappeared, and the trees have made vigorous growth. Strawberries set a fair crop, but the berries rotted, owing to an excess of rain. Although Plums are a very heavy crop, Damsons are only an average yield. Apple trees in grass orchards have not made much growth, but are bearing fair crops of fruit, particularly the varieties Blenheim Pippin, Ribston Pippin, and Ecklinville Seedling. The Apple crop here last year was a poor one, and many fruits have fallen this season, but there are sufficient left on the trees. *J. W. Miskin, Woodseat Gardens, Rocester.*

**SHERBORNESHIRE.**—The fruit crops are as good as one could wish. We are favoured with a good, deep, heavy, loamy soil. All trees are making good growth. There are several meres around here; the atmosphere seems to be always moist, which appears to me to help the trees to resist fly, etc. Damsons are very plentiful everywhere. *R. F. Jones, Oteley Gardens, Bllesmere.*

**WARWICKSHIRE.**—The wealth of bloom on fruit trees and bushes this season was such that I have not seen its like for some years, and the early promise was followed by good crops all round. One feature of the season has been the prevalence of mildew, especially on

Apples and Gooseberries. The possession of an unlimited water supply during the drought and every convenience for applying it was an untold blessing, and has had a great influence on the nature of my report. *Ben H. Martin, Moreton Paddox Gardens, Warwick.*

—The fruit crops would have been very good if we had not experienced such a dry time after most of the fruit set. On the light soils, many fruits dropped from the trees for lack of sufficient moisture in the soil. Birds devoured many of the small fruits, where they were unprotected, during the drought in May and June. Cherries, with the exception of Morellos, were almost a failure. *H. F. Smale, Warwick Castle Gardens, Warwick.*

### ENGLAND, S.

**BERKSHIRE.**—The fruit crops are somewhat varied. Pears, Peaches, and Nectarines are good average crops, and the quality of the fruit is excellent. Apples and Plums are under the average yield, owing to frost at the flowering period. Strawberries flowered earlier than usual, and the finest berries were destroyed; the late fruit failed to swell, owing to want of moisture at the roots. Small fruits were under the average numbers, and suffered in a similar manner to Strawberries. *J. Minty, Oakley Court Gardens, Windsor.*

—The fruit crops are light; Strawberries were very small, owing to the drought last summer and the early part of this season. Our two best varieties this year were President and The Earl. Standard Plums in the open are cropping well, but Plums on walls are poor. Apples, Pears, Peaches, and bush fruits are all good and the trees clean. *A. B. Wadds, Englefield Gardens, Reading.*

—With the exception of four trees in the orchard on grass, Apples are a complete failure. Most of the varieties in the kitchen garden are carrying a fair crop on bush trees and cordons, Irish Peach, Worcester Pearmain, Lane's Prince Albert, and Lord Derby being the best. Pears are much above an average yield, and the trees are clean. Strawberries and Raspberries were average crops, but the berries were small, owing to drought. Small fruits are an average quantity. Plums are a good crop, as also were Cherries. The trees generally are very free from insect pests. Nuts are the heaviest crop that I can remember. *J. Howard, Benham Park Gardens, Newbury.*

(To be continued.)

## VARIEGATED FRUITS.

VARIATION is well known in horticulture, but for reasons which are obvious it is most common in ornamental plants.

Among fruits it is less conspicuous and has no "survival value," so that mention of variegated fruits comes to many as a novelty. There are, however, among our hardy fruits many such cases, and a consideration of them raises some points of practical and scientific interest.

The Citrus family is well known for the variety of forms assumed, and for the frequent production of bud sports. It is not therefore surprising to find that variegated fruits occur rather frequently in this genus.

One of the most interesting is the Bicolor Orange, which has silver variegated leaves, and the fruit also shows a segment of the skin having a darker colour. Still more remarkable is the Orange known as Bizarrerie, in which the oval-shaped fruit bears longitudinal warty stripes of a Lemon colour, alternating with patches of a smooth Orange skin. The effect is therefore of a fruit made up of alternate segments of Orange and Lemon.

In Pears there seems to be a strong tendency to variegation of the stem and fruit, and striped forms have occurred in the following varieties:—Alexandre Lambré, Soldat Laboureur, Crasanne, Alexandrine Douillard, Beurré Gris, Grüne Magdalene, Louise Banne of Jersey, Glou Morceau, Duchesse d'Angoulême, Delices d'Hardenpont d'Aagers, Passe Colmar, Bergamotte d'Ete, Rousselet de Rheims, St. Germain,

Triomphe de Vienne, Doyenné du Comice, Chaumontel, Williams' Bon Chrétien, Marie Leseur, and Vicar of Winkfield. This list is not, of course, exhaustive; there are many others recorded, and, doubtless, hundreds of trees must have thrown variegations which have not been recorded. In nearly all of the above Pears the variegation is seen on the wood and fruit as a stripe of dark green on a yellow ground; in none are the leaves markedly variegated.

A case of a striped Benrre d'Amanlis was recorded in France in 1893, of which the fruit was said to be always earlier in ripening and the leaves slightly variegated, and it is also said that variegated Pears are usually less hardy than their parents.

In Apples, obvious instances of leaf and wood variegation are rare, and so far I have only found it in Duke of Devonshire. This pale yellowish green Apple has darker stripes on the fruit and the leaves are golden variegated with green edges. The young wood shows the disjunction of characters very plainly; a dark reddish brown line stands out conspicuously on the pale yellow green colour of the rest of the shoot. It should be said that the leaf variegation is not easily seen in old trees of this variety; a strongly growing young tree will show it best. There seems a tendency for the yellow to turn green as the leaf ages.

The variegations so far dealt with are all produced by a dissociation of green colour from a yellow ground, but it is possible that there may also be a dissociation of the red colouring matter as well. It is often seen that red Apples, such as Gladstone, have a fifth or more of their surface free from pigment, and, though no striping is seen on the wood, there may be there, also, a corresponding dissociation. If this were so, we should expect to find such Apples splitting up into two types, a pale and a deep coloured form, according to whether the buds were taken from a coloured or a colourless area. In Gladstone this has undoubtedly happened, as an examination of any large number of fruiting trees will prove. There will be found a small proportion of trees bearing always fruits of a pale colour, and the rest having the dark red fruits typical of this variety. Precisely the same is seen in the variety Lady Sudeley, which has thrown the pale striped yellow form from the scarlet heavily striped original type. I think, also, the Red Margaret Apple and the Red Juneating are a similar pair, the Margaret being the deep-coloured form and Juneating the paler.

The Red Bramley's is said to have arisen as a bud sport from the old type, and there are probably many other similar cases. If it be that the selection of buds from a "coloured or plain" area is the cause of such variation, it is obvious that striped coloured varieties will continue to give pale forms, while the pale forms should give only their own type. This, I think, proved from the fact that Lady Sudeley, though propagated only from dark coloured trees at first, has given the pale form in many places, and it is evidently a chimera which it is not possible to keep true by vegetative propagation. Cox's Orange Pippin has also given a strongly striped variety, and this, I am told, is true to type when grafted.

This throws an interesting light on the origin of identical varieties in two different places, and raises a nice point—is such a fruit one variety or two for the purposes of awards?

In Grapes, green and yellow variegated forms are known, and Warrington Gooseberry has introduced a striped variety named Helen Hohaes (*Gard. Chron.*, October 20, 1906, p. 280), and a case is also on record of the same fruit having a green or yellow skin and red pulp (See *Gard. Chron.*, 1855, p. 612.) Red-striped White Currants are also known.

The old story, long treated as fabulous, which told of an Apple of which half was sweet and half sour, is now less incredible, and the similar case of Peaches producing Nectarines or fruits with smooth portions becomes clear if Peaches are in some cases chimeras. It is, therefore, evident that certain fruits may have three colour forms—the

original green (or red) form, the striped form, and, lastly, a pale form, probably propagated from a bud taken from an uncoloured area of a striped shoot. In the Pear Vicar of Winkfield these three forms exist—the type, the striped or variegated, and the variety known in France as "à fruits Jaune," which is a clear yellow.

These facts are worthy of remembrance by raisers of fruits, as a bud sport of such type will very possibly occur in more than one place, and for such exclusive rights of propagation can hardly be maintained.

Much scientific interest is now manifested in variegated plants and bud sports, and it is hoped that any reader who has had such under his notice will bring them forward, so that they may be recorded. *E. A. Bunyard.*

## FLORISTS' FLOWERS.

### A FINE CHRYSANTHEMUM PLANT.

THERE is no plant that responds better to good cultivation than the Chrysanthemum. The photograph reproduced in Fig. 69 shows a specimen plant in bloom over six feet in height, and grown in a No. 12 pot. It is of the variety Louisa Pockett, a large, pure white flower of the Japanese incurved type, the blooms being of fine form and substance, those on the plant illustrated being from second crown buds. The habit of growth of this variety is all that could be desired and it has stiff, erect stems, which do not require any support. The plant carried nine large blooms of full exhibition size; each flower was nearly one foot across and the same in depth, which is exceptional when the number of blooms on the one plant is considered; only five blooms can be seen, four being hidden from view behind. The best exhibition blooms are obtained from those produced on second crown buds. The plants should be stopped early in March and again in the middle of May. The flowers are then more refined and open much easier and are more incurved than from first crown buds.

This variety is a vigorous grower, requiring a large pot and should be fed freely during the growing season; but feeding should be discontinued when the flowers are one-quarter open. It is advisable to discontinue feeding at this stage as the blooms keep better and last much longer if only clear water is used; for preference rain-water should be given. The plant illustrated was treated in the manner I describe. It began to expand its flowers at the end of September and lasted in bloom until nearly Christmas, which proves it to be a good keeper. This splendid variety is of Australian origin; it was raised by Mr. T. W. Pockett, of Malvern, Australia, and received the First-Class Certificate of the National Chrysanthemum Society and the Award of Merit of the Royal Horticultural Society, in 1916. It is undoubtedly one of the best white exhibition Japanese Chrysanthemums in cultivation. *C. W. Garner, 15, George Street, Bedford.*

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Grape Spot** (see p. 141).—In answer to Mr. J. L. Mottram, we have had the worst attack of the disease known as "Spot" on Grapes this year that we have ever had. The variety of Grape attacked is Lady Downe's; the same vine has been affected for years in a mild form, but only once before rather disastrously in its effect on the crop. All the diseased berries have been carefully cut off and burned, the house thoroughly cleansed, and the surface soil removed, yet this year we have lost all but three bunches on a triple vine grown in gridiron shape. In *The Fruit Growers' Guide*, the late Mr. John Wright states (page 329) that Cannon Hall Muscat and Muscat of Alexandria are the varieties subject to a small, uneven, whitish spot on the berries while young and tender and swelling quickly. On the depressed patches a series of minute dots

shortly afterwards appears, and under the microscope they prove to be a fungus, *Gloeosporium laeticolor*, which grows outwards, and its mycelial threads traverse the interior of the fruit. Spot also appears on ripening or ripe Muscat of Alexandria, Duke of Buccleuch, and other Grapes with skins highly susceptible to injury by damp. This disease, he states, is very disastrous, often causing serious loss of fruit in a short time. It is also associated with, if not caused by, *Gloeosporium laeticolor* in the half-ripe fruit, whilst that of the ripe fruit is probably *Gloeosporium fructigenum*. There is, he says, no remedy, except attention to ventilation, preventing cold draughts, by admitting air freely and late on sunny mornings, or after a period of sunless weather, during which time the house has been kept close and moist. There is no doubt that the wintering of pot plants in vineries creates a sodden state of the border, and an unhealthy atmosphere, more especially if the hot-water system is not carefully attended to. *Gloeosporium ampelophagnum*, mentioned by your correspondent, I have understood to be the Grape stem rot, which causes the pedicel or fruit stalk and berries to become shrivelled. This is often

FIG. 69.—A FINE PLANT OF CHRYSANTHEMUM LOUISA PCKETT.

mistaken for shanking. The latter complaint is not the result of organic disease, but bad management. Only one vine in our vineries out of the twenty-three has been affected with "spot." I intend this winter to see if something cannot be done to check this terrible scourge. I have not as yet been very successful with it under the microscope. *Mayflower.*

"Calendar of Garden Operations" (see p. 156).—The Rev. Joseph Jacob may be interested to know that I have a small paper-covered edition of Sir Joseph Paxton's *Cottagers' Calendar of Garden Operations*, which was published in 1887 by *The Gardeners' Chronicle*. The price was threepence, with a great reduction for a quantity, and it bears the words "Two hundred and seventy-ninth thousand" on the title-page. In addition to the hints on fruit cooking, pickles, etc., it contains articles on pigs, the cox, and garden tools. There is a "Floricultural Calendar" contained in *The Flower Garden*, published in 1840 and written by "Mr. McIntosh, Gardener to His Majesty the King of the Belgians at Claremont." It is noteworthy that this author's "calendarial observations" commence in August. Another point of interest in this quaint but quite practical book is the "current market price" of almost every variety of bulb and plant mentioned. Mr. McIntosh's august master must have had extravagant tastes, for the former thinks lightly of including rows of ten

or fifteen guinea Tulip bulbs in ordinary border planting. *A. T. Johnson, Bo Wen, Tal-y-Cafn, N. Wales.*

**Branch Cuttings of Apples.**—I am very pleased to see the interest my simple inquiry with regard to branch cuttings of Apples has aroused. It seems I have touched upon a sixteenth-century method of producing Apple trees to bear fruit at once, without the period of waiting usually necessary. The Apples I saw raised from cuttings or branches were one fine tree of Blenheim Pippin, and another, as I stated on page 101, of Bramley's Seedling. *H. J. W.'s* note on page 126 gives a good description of one variety of Apple that I noticed, called by my neighbour "a very good cooker." Also "burrs" were apparent on the branches. But I was shown in the first instance a quite ordinary, rather ancient, but quite healthy Apple tree as a suitable subject to obtain cuttings from. My neighbour evidently has a gift in striking Apple branches wherever he chooses, even in the rough hedgerows on his land, which is slightly marshy. But the variety of Apple with burr knots on the branches is, he considers, the easiest to strike. Mr. Treloar's note in the issue for September 2nd throws even more light on the subject. I wonder if he takes his Apple cuttings below an elbow-like bend, and how far below the ground are they inserted? Would Mr. Treloar oblige us with a little more information on the subject, as he seems a successful grower of Apple cuttings? As Mr. Farmer remarks on page 141, "Pitcher" is a curious name, but I expect it originated from the shape of the fruit of the variety Burr Knot described by *H. J. W.* on p. 127. *E. F. M. Howat.*

—In these gardens there are three trees that produce burrs on the branches. They are known to have been here over a hundred years. Two employees have been on this estate for over sixty years, and they inform me the trees were as big then as they are now. Several people have taken branches of these trees home, and I was surprised to find them growing and producing crops of fruit. They never fail to produce a crop, even in most unfavourable seasons. There are two varieties here. One is a yellow fruit with a red cheek that ripens in October, and has a rather acid taste. The other is yellow spotted, and not so acid. On looking up *Bunvard's Apples and Pears*, the first seems to be Burr Knot by the description given, only the fruit does not grow so large as the measurements given. The other agrees with the variety Oslin, for the description is identical. Apples do not grow to their full size here, as the soil and weather conditions are not favourable to them. The garden is situated in a valley with the river running close by, 580 ft. above sea level, and there is much iron in the soil. *H. J. W.* gives an explanation of how the name Bide's Walking Stick was given. It may interest some to know how easily this variety rots. On marking out some rows for Peas stakes of this Apple were stuck in at each end and left until the Peas were cleared off. When their time came to be pulled up they were found to be quite firmly rooted, and had to be taken up with the aid of a spade. They were given to two workmen on the estate, and have grown into good-sized trees and bear fruit each year. *D. H. Dunn, Hafod, Devil's Bridge.*

**Bees Attacking Fruit.**—Bees have attacked Peaches on the walls in the gardens here this season. Is not this unusual? We have no hives in the garden, but there are some in cottage gardens near. I am also informed that bees are destroying quantities of Peaches in a neighbouring garden where they have never given any trouble previously. One is led to suppose that, owing to the continual dull, wet weather flowers are not providing the usual attraction this season, and that the bees diligently turn to fruit for supplies. Wasps have given very little trouble up to the time of writing (August 30), whereas during former seasons they have done considerable damage to fruit. On an average we have destroyed forty wasp nests annually. This year we have, so far, found only one. *C. Ruse, Polly Farm Gardens, Lulhamstead, Reading.*

## SOCIETIES.

### NATIONAL DAHLIA.

SEPTEMBER 6.—For the first time since 1913 the above Society has found it possible to hold an independent show and, while Dahlias were not quite so numerous as might have been wished, the Society have reason for satisfaction in that the R.H.S. hall was well filled with exhibits of great interest and that there was a large attendance. In view of the sunless weather, many would-be exhibitors found themselves in the unenviable position of having to cancel their entries because their blooms would not be sufficiently developed on the day of the show, and this was the experience of some large trade growers as well as amateurs. But what the Dahlias lacked in quantity, they made up in quality, which was fully equal, if not superior, to any that have been shown in past years.

The DIRECTOR of the Royal Botanic Gardens, Kew, sent vases of three Mexican species from which innumerable garden Dahlias have been raised; these are illustrated in Figs. 65, 66, 67. The small, graceful Lilac-coloured blooms of *D. Merckii* and the brilliant crimson flowers of *D. variabilis*, together with the vivid scarlet of *D. coccinea* attracted a great deal of interest as well as admiration for their grace and beauty.

Various miscellaneous exhibits of the previous day remained, and these materially assisted to make the success of the show. Several medals were awarded to trade groups, including Gold Medals to Mr. H. J. JONES for a magnificent collection of Phloxes and Delphiniums, and to Messrs. KELWAY AND SON for Gladioli.

The Joint Dahlia Committee met in the morning and selected the following novelties for trial at Wisley:

*Adorable*.—A hold Decorative variety of uncommon colouring. The large, perfectly-formed blooms are set on long, stout stalks and their orange-buff coloured florets are definitely tipped with white.

*Arthur Bouquet*.—Another large, handsome bloom of Decorative type. The colour is a very pleasing tone of warm orange-yellow.

*Nectar*.—A large Decorative variety of equally good type as the above, but of bright yellow colour.

*Edith Page*.—A beautiful exhibition variety of soft yellow colour which becomes flushed with pale colour on the outer florets. This variety was adjudged the best seedling exhibition Cactus Dahlia in the show.

*Shepherdess*.—A very large, pure white Decorative variety of great merit. The above were shown by Messrs. J. STREDWICK AND SON.

*Lady Greer*.—A delightful, medium-sized, Paecy-flowered variety of delicate, rosy-mauve colouring.

*Leonic Cobb*.—This is a charming miniature Paecy-flowered variety of compact rounded shape and Lilac-pink shading, with a gold-dusted centre. These two varieties were shown by Messrs. J. CHEAL AND SONS.

*Border Perfection*.—A very large bloom of the Decorative type and rich crimson colour. This and the following were shown by the DUTCH DAHLIA SOCIETY.

*Nelly*.—As a cut flower the stems of this small Decorative variety seemed unduly long and stout, but probably it would be ornamental in the border. The compact little flowers are of orange-scarlet colour.

*Jubilee*.—One of the most striking novelties of the year. It is of rather more than medium size, and although of Decorative type, the narrow, incurving petals give it a suggestion of Cactus form. The colouring is pleasing shades of lilac.

### OPEN CLASSES.

In both classes for show and fancy Dahlias Mr. S. MORTIMER was first, and Messrs. WM. TRESEDER, LTD., were second, with exceedingly good specimens of the types of Dahlias which were so prominent at the bygone shows. The perfectness of form and delightful colouring of such varieties as Standard, Prince Bismarck,

Arthur Rawlings, Tom Jones, John Hickley, and Wm. Powell (in the first prize collection) attracted a great deal of attention, as also did Dandy, Nansen, Arthur Harrison, and Tom Jones in the second prize exhibit.

The only exhibit of eighteen Cactus Dahlias, six blooms each of distinct varieties, was by Messrs. J. STREDWICK AND SON, who were deservedly awarded the first prize for a magnificent collection of such sorts as Supreme, Thos. Want, Sunbeam, Valour, British Lion and Washington. Messrs. STREDWICK were also first with 24 blooms on boards, showing Megantic, Silverhill Park, Washington, Valour, F. W. Fellowes, and Mr. A. Harvey in great excellence. Messrs. WM. TRESEDER, LTD., were placed second.

The twelve Cactus blooms, distinct, which won the first prize for Mr. W. G. CRAMP, were also deserving of high praise; his best specimens were of Emperor and Abbotsford. Mr. H. WOOLMAN, who was a close second, had a fine bloom of the variety E. S. Jackson. The best six blooms of any one Cactus variety were of Miss Stredwick, shown by Messrs. WM. TRESEDER, LTD., who were awarded a first prize for six splendid blooms of the show Dahlia Arthur Morrison.

MESSRS. J. CHEAL AND SONS were alone in the class for twelve varieties of garden Cactus Dahlias, but they made a splendid display with such varieties as Guardian, Richard Box, Empire, and Sweet Briar. They also were awarded first prizes for six varieties of Miniature Cactus Dahlias, showing beautiful blooms of Firefly, Minima, and Little Fred; for twenty-four Pompon varieties, of which the very best were Phyllis, Daisy, Electra, Rufus, and Girlie; for twenty-four vases single Dahlias of great merit; for six vases small Paecy flowered, arranged with great taste with hardy foliage; and for twelve varieties of Collette Dahlias, amongst which the vases of Cadet, Diadem, Bonfire and Ustance were especially meritorious. In the last-named class Messrs. WM. TRESEDER were placed second with good vases of such sorts as Crimson Queen, Lilian and Peronne, and they were first with somewhat similar varieties in the class for six varieties; while they also secured chief honours in the class for six varieties of large Decorative Dahlias.

### AMATEURS' CLASSES.

The Show and Fancy Dahlias were not so well represented in this section, though the first prize six varieties by Mr. H. LAGDEN, were very good and included especially fine blooms of Merlin and Mr. Glasscock. The most popular and best contested class was that for six blooms, distinct varieties, and the first prize was won by Mr. F. A. BROWN with a fine set. Mr. M. HOWARD was first for six varieties of garden Cactus Dahlias; his best vases were of F. W. Fellowes and Planet.

The Gold Dean Memorial Medal, offered for the best nine varieties of Cactus Dahlias was won by Mr. W. G. CRAMP with a worthy collection, which included Mrs. A. Harvey, Sidney Jones, and Abbotsford of great merit. Mr. CRAMP was also first for twelve blooms in four vases. Mr. A. F. BARNES, who included good blooms of Golden Rain and Corona, was awarded first prize for six varieties.

Although they lacked competition, the classes for Pompoms were a great feature of the show on account of the high merit of the exhibits. Mr. H. BROWN was awarded first prize for twelve varieties of great excellence. He had such sorts as Glow, Bacchus, and Little Winnie. The six varieties by Mr. A. F. BARNES even surpassed the high standard of the former class, and his were perfect examples of these dainty and charming little flowers.

The first prize six vases of single Dahlias by Mr. A. BROWN, were also exceptionally meritorious, and included Margaret Chouse, Ada Dickens, Princess of Wales, and Fred Brown; Mr. D. B. CRANE, who was a good second in this and the class for six vases of Star Dahlias, was awarded the first prize for a graceful exhibit of four vases of small Decorative varieties arranged with hardy foliage. The first-prize Star Dahlias were

shown by Mr. H. P. HOWARD, who included beautiful vases of Eastern Star and Horley Star.

In the Floral Division, the best dinner table decoration in the class for Star Dahlias was by Mrs. RALPH, who used Dorking Star very effectively. Mr. A. BROWN was first in the class where Star Dahlias are debarred, and Mr. W. STEPHENS was second in each case. Messrs. WM. TRESEDER, LTD., were first with decorative vases of Paecy flowered and many other kinds of Dahlia blooms.

### TRADE GROUPS.

The DUTCH DAHLIA SOCIETY (hon. sec. Mr. J. G. Ballego) arranged a handsome and imposing group of novelties raised by its members. The valuable, large-flowered Decorative type predominated, and the outstanding sorts were Mr. H. C. Dresselhuys, Apple Blossom, Messrs. J. G. Wurzbain, Jubilee, Mr. J. G. Ballego, Prince of Wales, King Harold, and Kroonprinzess Margaretha. Along the front of the group there were large bowls of dwarf, free-flowering varieties of delicately beautiful colouring (Gold Medal).

Mr. J. T. WEST set up a large collection of great merit. Amongst the Decorative varieties were Victoria, Nancy, Blanche, and The Prince. Prominent varieties of the singles included Oberon, Dazzle and Malcolm, while of the many Collettertes, the best were Judith, White Fox, Arran and Ulva (Gold Medal).

Messrs. CARTER PAGE AND Co. arranged an attractive group against the end wall, and this was representative of nearly all the types. Beauty, Jupiter, Paul Crampel, Lady Lavender (Decorative), Royal Luses, Arcturus, Paragon (Cactus), Starling, Arran, Peronne, and Cameron (Collettertes), are the names of only a few of the varieties so well shown (Silver-Gilt Medal).

Mr. CHARLES TURNER gave prominence to many of the Pompoms which have long been a speciality at Slough, and also showed beautiful blooms of Loveliness, Sunray (Decorative), Our Annie, and Aphrodite (Paecy flowered), as well as representatives of the other types (Silver Medal).

Messrs. J. CHEAL AND SONS also had an interesting collection. This was particularly strong in the elegant and valuable Star Dahlias, of which Bronze Star, Brighton Star, Eastern Star, Morning Star, and Ifield Star may be mentioned. A large vase of a "new type novelty" attracted a deal of attention. This was a vivid crimson Collette Dahlia, which had a double row of ray florets and short, yellow quills (Silver Medal).

### SANDY AND DISTRICT FLORAL AND HORTICULTURAL.

THIS society held its show on Thursday, August 31, in the beautiful park of Sandy Place, by kind permission of Mrs. Graves. The weather was not all that could be desired, but during the afternoon there were bright spells of sunshine, and the attendance was good. The display of Roses, Gladioli, herbaceous flowers, and Dahlias, has hardly ever been equalled in the history of the show. Ten Gold Medals were awarded, chiefly for Roses, Gladioli, and Dahlias. In Division A, Class 1, a group of ornamental and foliage plants was arranged on a space 15 ft. x 10 ft. by Sir CHARLES NALL-CAIN, of the Noda, Welwyn, who was awarded 1st prize and Gold Medal. The group consisted chiefly of Caladiums, Crotons, Dracaenas, and Palms. He was awarded a similar distinction for a group of miscellaneous plants—Carnations, Bouvardias, and Orchids. For a group of hardy cut flowers arranged on a space of 10 ft. x 10 ft., there were five competitors. Messrs. ARTINDALE, of Sheffield, were placed 1st.

A class for a collection of Roses arranged on tabling 4 feet wide by 5 feet long brought some strong competition. Messrs. CHAPLIN BROS. gained the 1st award, showing Mrs. H. Bowles, K. of K., and Isabel; Mr. J. PIGG, Royston, 2nd; and Messrs. R. HARKNESS AND SONS 3rd. In the class for forty-eight cut Roses, Mr. J. PIGG, Royston, won 1st prize with well-coloured flowers, and Messrs. CHAPLIN BROS. 2nd.

For eighteen Tea Roses, Mr. GEORGE BURCH, Peterborough, won 1st place, and Mr. J. PIGG 2nd. For 24 spikes of Gladioli, Mr. W. KITCHENER, Hitchin, was placed 1st amongst four exhibitors. For 24 Dahlias, not fewer than 12 varieties, Mr. S. MORTIMER led, with excellent flowers. In the class for 24 Cactus Dahlias, the 1st prize was awarded to Mr. H. WOOLMAN, Shirley, Birmingham; Messrs. J. CHEAL AND SONS, Crawley, being a good 2nd. In the class for 12 bunches of Cactus Dahlias (six in each bunch), Messrs. J. CHEAL AND SONS led with very fine samples, the same competitors winning 1st place for 12 bunches of Pompon Dahlias, 10 in each bunch.

In a class for a collection of Dahlias, all varieties, staged on tabling 4 feet wide by 10 feet long, lightness and beauty of arrangement being the test of merit, Mr. H. WOOLMAN (Shirley) was 1st. For a collection of cut, hardy herbaceous and bulbous flowers, Messrs. EAMES AND SON came 1st, and Messrs. W. ARTINDALE AND SONS 2nd. Special mention should be given to Messrs. R. H. Bath, Ltd., for their Gladioli, which filled the space at one end of the large tent. Mr. H. Ellison occupied the other end with well-grown Ferns, Palms and Cacti. Messrs. Laxton Bros. made an excellent display of Roses, herbaceous flowers and fruit.

In Section B (open to all except nurserymen) for fruit, the EARL OF SANDWICH (gr. Mr. Prowting) was a successful exhibitor, taking 1st place for a collection of hardy fruits (10 dishes), and six dishes of ripe dessert fruit. Sir CHARLES NALL-CAIN was successful with Grapes, Melons and Nectarines.

For a collection of vegetables (8 varieties) there were nine exhibits, and Sir CHARLES NALL-CAIN was placed 1st, showing excellent Potatos, Cauliflowers and Carrots; Mr. ROBINSON, of Great Barford, being 2nd.

**OXFORD ROYAL HORTICULTURAL.**

By kind permission of Mrs. H. Morrell, of Headington Hill Hall, the above society held its summer show in the South Park, Headington, on August 31. The exhibits, both in quality and number, were quite up to pre-war level.

Mrs. MORRELL's head gardener (Mr. A. Gibson) staged, not for competition, a wonderful group of plants, including *Humea elegans*, *Lilium* of many varieties, *Acalypha Sanderiana*, *Crotons*, *Campanula pyramidalis*, *Dracaenas*, and *Gloxinias* (Gold Medal).

In the competitive class for a group of plants, Mrs. LESSING secured 1st prize for a well set-up group which included some fine *Lilium*, *Crotons*, and *Caladiums*. The 2nd prize winner was Mr. T. H. ROSE, who had a good variety of flower and foliage plants, well staged. H. BALFOUR, Esq. (gr. Mr. A. Hewlett) showed some fine Gladioli, Roses, and perennial Phloxes. The groups of Begonias were very good and made a bold show. Here Mr. T. H. ROSE was 1st, and Mr. E. J. DOUGLAS 2nd. Sweet Peas were very good, although the weather has been somewhat against these flowers. Mr. G. PRINCE, of Longworth, Berks, had on view an excellent stand of Roses. Amongst the most prominent were Los Angeles, Hoosier Beauty, Isobel, Austrian Copper, and Padre. Mr. J. MATTOCK, of Headington, also staged Roses, including K. of K., Golden Emblem, Christine, and Los Angeles. The table decorations were extra good, and the competition very keen. The judges awarded two Special Prizes, and one exhibit was Highly Commended. Mr. H. KEEN was 1st with a choice arrangement of Rose Irish Elegance. Second place was taken by Mr. J. C. HALLY, for a very dainty display of Carnations; Mr. G. E. COUSINS securing third place. Special prizes were awarded to Mr. A. JACONS and Mrs. E. MOSS. Mr. JOHN WALKER put up a stand of Cactus and Single Dahlias. Messrs. RICH AND CO., of Bath, staged Perennial Phloxes, and Mr. ARTHUR ROWLES, Market Street, Oxford, exhibited a very pretty group of miscellaneous cut flowers, Sweet Peas being the outstanding feature. The children's exhibits of wild flowers and grasses added variety and charm to the show.

Fruit was strongly represented and some fine specimens were on view. The Black Hamburg

Grapes, for which A. BRADSHAW, Esq., won 1st prize, were models of form and finish. This exhibitor also won 1st place for Peaches. For Melons, Pears and dessert Plums, Mrs. LESSING secured three 1st prizes.

In the single dish classes for vegetables, H. BALFOUR, Esq., had the best dish of Tomatos. For Runner Beans, Mrs. LESSING was 1st; and for Marrows, Mr. W. JACOBS. For Peas, Mr. H. DICKENS won premier honours; and for Cauliflowers Mr. W. JACOBS took 1st prize. Onions were a very strong class. Here Mrs. LESSING won the 1st prize with a very fine dish, and for Celery she was again first. Mr. A. BRADSHAW's exhibit of Carrots secured the 1st place. Mr. R. T. ALDEN was placed 1st in the class for Potatos, with an excellent dish. For Turnips, Mrs. LESSING was again 1st; and Mr. A. E. BRADSHAW secured the 1st prize for Beet.

In Messrs. Sutton and Sons class for vegetables Mr. A. E. BRADSHAW took premier honours; Mrs. LESSING was placed 2nd; and Mr. R. F. ALDEN 3rd. In Mr. Arthur Rowles' class, Mr. A. BALL was 1st, and Mr. R. ING 2nd. In Messrs. Webb and Sons' class, Mr. W. H. R. POWELL took 1st prize, and Mr. G. SOANES secured the 2nd.

**DUMFRIES AND DISTRICT HORTICULTURAL.**

AUG. 26.—The annual show of this society was held in the Drill Hall, Dumfries, on the 26th ult. Sir James Crichton-Browne performed the opening ceremony. There was a slight reduction in the number of entries compared with last year, due to the unfavourable season and some leading exhibitors reserving their exhibits for the Glasgow Show. Quality in most classes, however, was excellent, although cut flowers evidenced the unfavourable character of the season. Vegetables were very good, and pot plants were about the average, though they are never a strong section at this show. The most successful exhibitor in the open classes was D. LANDALE, Esq., Dalswinton (gr. Mr. R. A. Grigor), who won the "Courier and Herald" Cup, as being the most successful exhibitor; and the cup for 12 vases Sweet Peas, with first prizes in numerous classes, including the decorated table of plants. C. LOGAN, Esq., Gribton (gr. Mr. E. E. Arnold), was also a very successful exhibitor, and among other leading prizes, secured the silver cup offered for Apples. The prize for the best collection of vegetables went to the same exhibitor. Among other leading first prize winners were J. DAVIDSON, Esq., Summerville (gr. Mr. J. Wilson); Sir C. LUTRIE-BART, Maxwellton House (gr. Mr. F. Maxey); Mrs. SANDERSON, Glenlaggan (gr. Mr. F. Penfeld); Major C. R. DUDGEON, Cargenholm (gr. Mr. J. Carruthers); Major KESWICK, Cowhill Tower (gr. Mr. C. G. M. Murray); and Mr. J. TWEEDIE, Monswald. The Dumfries Burgh Challenge Cup, offered for the best allotment in the burgh, was won by Mr. J. BURNIE.

Mr. D. T. WALLET, Castle-Douglas, won outright the "Dumfries and Galloway Standard" Cup, for the best collection of vegetables in the amateur classes.

**ROYAL LANCASHIRE SHOW.**

AUGUST 6, 7, 8, and 9.—The horticultural show held at Preston during the Preston Guild week, an event which takes place once in every 20 years, and in conjunction with the exhibition of the Royal Lancashire Agricultural Society, will long be remembered as a record, not only for the large number of exhibitors, but for the exceedingly high quality of the produce. All the exhibits were staged in a large, wooden building, which had to be extended to find room for them. Liberal prizes were given, and everything done to ensure success. No fewer than ten Gold and twelve Silver Medals were awarded.

Competition was keen in the open classes for collections of vegetables, decorated dinner tables, Sweet Peas, hardy herbaceous flowers, and collections of Roses, of which four excellent exhibits were staged. In the class for

a group of miscellaneous plants, in a space not exceeding 300 square feet, Messrs. J. CYPHER AND SONS, Cheltenham, was placed 1st with a beautifully arranged exhibit of high quality; 2nd, Mr. W. A. HOLMES, Chesterfield. Mr. J. McCARTNEY excelled in the class for a collection of Orchids arranged for effect; Messrs. JAMES CYPHER AND SONS were 1st for six Orchids, with fine plants. Mr. JOHN NIXON, Miss NEWSHAM, and Mrs. A. G. BLAIR were the winners in the three classes for table decoration.

Mr. THOMAS WADSWORTH, Bishops Wilton, York, was placed 1st for eighteen distinct varieties of Sweet Peas, and also for twelve distinct varieties, with grand flowers. Mr. W. D. INGHAM excelled in the class for twelve Gladioli. Mr. G. GARNETT, Lancaster, was 1st for twelve bunches of hardy herbaceous flowers; for eight bunches of Phloxes and for six vases of border Carnations, with well-grown flowers in each case, finely staged. The sum of £15 was offered as the prize for a collection of cut Tree Carnations, which Mr. C. ENGELMAN won with a grand display. The class for a collection of cut Roses was the best in the show, all the exhibits being of splendid quality. Mr. THOMAS ROBINSON, Nottingham, was placed 1st, and Messrs. ALEX. DICKSON AND SONS, Hawtmark, 2nd. Messrs. HARKNESS AND SONS, Bedale, won the prize of £25 offered for a collection of hardy perennials, Messrs. G. GIBSON AND CO., Bedale, being placed 2nd owing to an oversight in staging. Mr. W. ROBINSON, Junr., Garstang, was 1st for three collections of vegetables with well-grown and well staged exhibits. Allotment exhibits were numerous and good.

**NON-COMPETITIVE EXHIBITS.**

Gold Medals were awarded to Messrs. SUTTON AND SONS, for an exhibit of flowers, fruits and vegetables; to Messrs. ALLWOOD BROS., for Carnations; to the COUNCIL FARM, Preston, for a very fine exhibit of plants, pot fruit trees, vegetables, and interesting experimental subjects; to Messrs. BLACKMORE AND LANGDON for Begonias and Delphiniums; to Messrs. R. BOLTON AND SON, for Sweet Peas; to Messrs. DICKSON AND ROBINSON, for Dahlias and very large Onions of the Premier variety; to Messrs. A. DICKSON AND SONS, Belfast, for Roses and Sweet Peas; to Messrs. DOBBIE AND CO., for Roses; and to Messrs. LITTLE AND BALLANTYNE, Carlisle, for trees, shrubs, seedling Pines, etc.

Silver Medals were awarded to Mr. E. W. PARSONS, Worcester, for fruit; to Mr. W. DUCKWORTH, for fruit; to Mr. JOHN ORME, Messrs. ISAAC HOUSE AND SONS, Messrs. ELLINSON AND SONS, Messrs. BAKERS, LTD., Messrs. JOHN FORBES AND SON, Messrs. FAIRBAIRN AND CO., Balfour, Messrs. HIRD BROS., and Messrs. CALDWELL, for bright and interesting exhibits of flowers, etc.

**Obituary.**

Thomas N. Cox.—We very much regret to announce the death of Mr. Thomas N. Cox, who passed away on Tuesday, the 5th inst., at the age of 63. His death has come as a great shock to Messrs. Hurst and Son, and all members of their staff. Mr. Cox was with Messrs. Hurst and Son something like 52 years, and for many years was general manager. He only retired in November, 1920, when a full account of his retirement appeared in our columns. He was then in good health, and it was hoped that he would enjoy many years of happy leisure. Unfortunately during last winter and spring he had a prolonged and painful illness, and although he seemed to be making very satisfactory progress, the long illness must have left him very much weakened. On Friday, the 1st inst., he was taken ill, and was removed to a nursing home, but he passed away on Tuesday, the 5th inst. Everyone who knew him had the greatest esteem for him, and the wide circle of friends in the trade, who knew him so well, will, we are sure, join with us in tendering heartfelt sympathy to the members of the bereaved family.

## TRADE NOTES.

THE statutory meeting of Messrs. John Russell (Hampstead), Limited, the company which has been formed to take over the nursery business of the late Mr. W. H. Russell, at Haverstock Hill, etc., was held on September 11, at the Haverstock Hill premises. A statement of accounts to March 31, 1922, was presented, and Mr. J. B. Slade (Messrs. Protheroe and Morris), who was appointed receiver in bankruptcy for the affairs of the late Mr. Russell, and has conducted the formation of the new company, gave an encouraging account of the trading during the summer months. An amount equivalent to a dividend of 7 per cent. for the year ended March 31, had been paid to the preference shareholders, the overdraft at the bank had been completely paid off, and all accounts owing up to the end of June had been paid by the end of July; the business might, therefore, be considered to be, for the first time for many years, in a stable and flourishing condition. The stock and other assets had been valued on a conservative basis, and would be systematically written down each year. A lease of seven years, subject only to the land being required for actual railway purposes, had been arranged with the railway company on whose land the Haverstock Hill nurseries stands, which would give greater stability than the previous arrangement by which the land could be taken at any time if required for any purpose. A considerable portion of the land which was not actually required for stock had been let off as tennis courts, which were bringing in a steady income. So far as contract work was concerned, the policy was being pursued of accepting contracts which consisted chiefly of the supply of material, but avoiding those where labour was chiefly required, as being very difficult to estimate beforehand and likely to lead to loss.

The shareholders present took the opportunity of inspecting the nurseries, and expressed their pleasure at their greatly improved appearance, and the evident value of the stock-in-trade. A vote of thanks to Mr. Slade, for the valuable services he had rendered in stabilising the business and forming the company, was carried unanimously.

## NEW HORTICULTURAL INVENTIONS

THE Acme Showcard Co., Ltd., has forwarded a specimen of their collapsible pedestal stand, which they recommend for use in exhibiting cut flowers, etc. The stands are made of cardboard, in various colours, of waterproof material, and are supplied either plain or with the name of the firm exhibiting in the panels.

## THE WEATHER.

### WEATHER IN AUGUST.

The cold, unsettled, but mainly westerly weather, which commenced in the middle of June, continued in a rather modified form, to the end of August; but during the early hours of September 1, it was terminated by the heaviest fall of rain that had occurred in any one day since the Farnley Observatory was established 51 years ago. As a whole, August was dull, cool, damp, and exceptionally equable, with excessive durations of westerly and southerly currents, but the latter were out of normal strength. It was the fourth successive month with a marked deficiency of easterly winds. Ozone was plentiful, though far less evaporation than usual took place. The mean temperature was barely 56<sup>o</sup>, and was 2<sup>o</sup> below the average. Only 140 hours of sunshine were recorded, there being a deficiency of 44 hours. Just over six inches of rain fell, the average being exceeded by 2<sup>1</sup>/<sub>2</sub> inches. The underground water level was normal. A thunderstorm occurred on the evening of the 8th. G.M.T., on September 1, was 2.59 inches in Hesketh Park, but over Birkdale only 1<sup>1</sup>/<sub>2</sub> inches, and near Woodvale, Ainsdale, less than 1<sup>1</sup>/<sub>2</sub> inch, even including an Inter fall at the latter stations. The largest previous falls in one day at Hesketh Park, Southport, were 2.14 inches on July 7, 1872, and 2.13 inches on September 2, 1875.—Joseph Bazendell, *The Farnley Observatory, Southport.*

### THE WEATHER IN SCOTLAND.

THE low temperature which characterised June and July continued through August, which showed a deficit of fully 3<sup>o</sup> on the normal mean. The rainfall, however, was not excessive, the total being 2.86 inches for 15 days, against a normal of 3.38 inches for 17 days; on the 2nd (the wettest day), the considerable amount of 0.99 inch was collected. Bright sunshine was below the normal, with an aggregate of 137.8 hours, giving a daily average of 4.4 hours and a percentage of 29; as in July, there were no sunless days. With a mean of 29.85 inches, the barometer fluctuated from a highest of 30.24 inches on the 10th, to a lowest of 29.44 inches on the 30th. The mean temperature for the month was 54<sup>o</sup>, with a mean maximum of 63<sup>o</sup> and a mean minimum of 45<sup>o</sup>. On the 19th and 21st the highest maximum of 68<sup>o</sup> was recorded, and the lowest minimum of 39<sup>o</sup> on the 14th; it is worthy of remark that the minimum temperature shows a greater deficit from the normal than the maximum. On the grass the mean minimum was 40<sup>o</sup>, with a lowest of 30<sup>o</sup> on the 26th. This last was the only night of ground frost. At 1 ft. deep the soil temperature showed little variation, the highest being 57<sup>o</sup>, and the lowest 55<sup>o</sup>. Dew was frequent during the month. Light winds prevailed, chiefly from the south and west. *John Davidson, Training College Gardens, Kirkton-of-Mains, near Dundee.*

## ANSWERS TO CORRESPONDENTS.

**BEGONIA MANURE:** *T. C. S.* The best manure to use for tuberous-rooted Begonias is dilute liquid manure or dilute soot water; the liquid manure is best made from cow or sheep manure. Good guano is safe, and is an excellent all-round manure; it may be used at the rate of one ounce to a gallon of water.

**DIANTHUS BARBATUS:** *A. Mc., N. W.* *Dianthus barbatus* is a biennial.

**DRESSING FOR LAWN:** *H. J.* The best way to apply copper sulphate is to mix it with sand, thus ensuring even distribution. The proportion of sulphate to the square yard is  $\frac{1}{4}$  oz.; if about a quarter of a pound is required, it should be mixed with a barrow load of sand and scattered evenly over the surface. The amount of sulphate required is easily ascertained by measuring the surface of the lawn, and the quantity of the sand can be roughly calculated afterwards. The salt should be applied direct to the Plantains, a pinch on each crown.

**"EVERLASTING" FLOWERS:** *M. O. S.* The flowers should be gathered before they are fully opened, and hung up to dry.

**GRAPES DISEASED:** *S. W. H. and Perplexed.* The Grapes are affected by Grape Spot, caused by the fungus *Gloeosporium ampelophagum*. Spray the vines and bunches with liver of sulphur at the strength of  $\frac{1}{2}$  oz. in two gallons of water, or dust flowers of sulphur on to the leaves and bunches, and repeat the operation at intervals of ten days. It is sometimes of service to wet the rods thoroughly with a solution of iron sulphate when the vines are dormant. Do not feed the roots excessively with nitrogenous manures.

**HERBACEOUS PLANTS:** *T. C. S. and D. C.* Kniphofias, Montbretias and Gladiolus may all be classed as herbaceous plants, as they all more or less die down every year. Montbretias and Gladiolus, of course, produce corms, and are grouped under bulbous or tuberous-rooted plants; but in the broadest sense they are herbaceous.

**LOGANBERRY:** *A. R.* The Loganberry is easily increased by placing the tips of the shoots underground. They "layer" of their own accord if allowed to ramble and touch the soil with the tips.

**NAMES OF FRUITS:** *X. Y. Z.* 1, Pond's Seedling; 2, Denniston's Superb; 3, Early Transparent Gage; 4, Kirke's Blue; 5, Heron; 6, Jefferson's; 7, Probably Giant Prune. *E. V. J.* 1, Potts's Seedling; 2, Cockle Pippin; 3, Mère de Ménage; 4, Lady Henniker; 5, Ecklinville Seedling; 6, not recognised.

**NAMES OF PLANTS:** *C. R.* *Leycesteria formosa*.—*L. C.* *Chlorophytum clatum variegatum*.

**PROPAGATION OF BIGNONIA CHERERE:** *C. A., Cape Town.* Our experience is that *Bignonia Chere* is quite easily propagated by means of cuttings, so we do not consider it at all necessary to find a stock upon which to graft it.

**PURPLE PODDED PEA:** *S. B. D.* The Pea sent is the purple podded variety of *Pisum sativum hortense* named Nero. It is only offered, so far as we know, in Germany, by Messrs. Haage and Schmidt, of Erfurt.

**SPRAYING PUMP:** *W. H. R.* The bucket sprayer sold by Messrs. Cooper, Pegler and Co., 24a, Christopher-street, E.C.2, has an excellent pump which would force the spray to the top of any wall tree; but the nozzle must be mounted on a 10 ft. Bamboo lance, not on the short brass tube supplied with the machine. Any of the larger machines of barrow type, such as those sold by Messrs. W. Weeks and Son, Maidstone, would also do this work easily, if fitted with a 10 ft. lance.

**STEPHANOTIS FRUITS AND SEEDS:** *York.* The *Stephanotis* has fruited and seeded on numerous occasions in British gardens, but we do not remember to have heard of a plant fruiting regularly each year as yours does. We doubt whether the seeds have any special commercial value, but we expect some seedsmen would be glad to know where seed could be obtained.

**TIGER LILIES DYING DOWN:** *H. P. K.* The plants are attacked with the Lily disease, caused by the fungus *Botrytis*. Burn all diseased leaves of the plants and also all vegetable refuse in their vicinity.

**TOMATOS AND CUCUMBERS DISEASED:** *Regular Reader.* Both the Tomatos and the Cucumbers have received a check of some kind. Drought at the roots or an excessive amount of moisture in the soil might be the cause of the trouble, or any one of the conditions you mention in your letter. The soil in the tub from which the water was drawn for watering would be likely to affect the plants; empty the tub, dry it thoroughly, and then char the inside before it is used again as a receptacle for water.

**TOMATO SEED WITH BLACK MARKINGS:** *C. G.* Recent research has shown that black spots on Tomato seeds are of a physiological nature, and only seldom due to a fungus. Experiments with spotted seed prove that the latter give perfectly healthy plants, and you would probably find such seed as you send quite suitable for use.

**WOOD WASP:** *T. W. B.* You are quite correct in assuming the specimen to be an example of the Wood Wasp or Giant Sirex (*Sirex gigas*).

**Communications Received.**—*W. A. C.*—*R. H. C.*—*E. N.*—*H. C.*—*G. C.*—*D. H.*—*D.*—*J. R.*—*N. H.*—*F. J. N.*—*C. A. P.*—*H. E. G.*—*Miss A.*—*A. M.*—*T. G.*—*C. H.*—*Mrs. H.*—*H. E. G.*—*F. W. H.*—*H. W. A.*—*W. J. W. D.*—*A. W. E.*—*R. S.*—*J. J.*—*G. A.*—*S. L. H.*

## GARDENING APPOINTMENTS.

**Mr. Edward Montague**, for fifteen years' Gardener to the late COLONEL BENDISH, Grey Court, Ham, Richmond, as Gardener to LADY EMMA CRIGHTON, Netley Castle, Netley Abbey, Southampton, Hampshire.—(Thanks for 2s. 6d. for the R.G.O.F. Box.—Eds.).

**Mr. E. Hunt**, for the past two years Second Gardener at Greenhill Gardens, Sutton Veny, Wiltshire, as Gardener to Mrs. Leech, Britford Moor, Salisbury.

**Mr. R. Eton**, previously for twenty years Gardener at Walden Heath, Harrogate, and for two years at "The Convent," Harrogate, as Gardener at "The Stray" Hotel, Harrogate.

**Mr. M. L. Sargent**, for the past two years Gardener and Bulfill to Mrs. WARNER HOOKE, at The Rocks, Bours Head, near Tunbridge Wells, as Manager and Chrysanthemum expert at the Bridgewater Nurseries, Somerset. Mr. Sargent enters on his new duties about the middle of October.

### Growing Narcissus in the Scilly Isles.

It is in some respects a sad picture to which Major A. A. Dorrien-Smith points in his sketch of *Narcissus Culture in the Isles of Scilly: its Decline and Prospects of Regeneration*. Up till 1912, the industry, built up mainly by the energy and enterprise of the Dorrien-Smith family, prospered, after which time it declined. The chief cause of the decline appears to have been the spread of Narcissus pests and particularly eelworm. But Major Dorrien-Smith is undoubtedly right in recognising in the methods of cultivation the original cause of the falling-off in the industry. The need for rotation of crops was a lesson dearly learned in the past and one, unfortunately, which has often to be learned by hard experience over and over again. To grow the same plants year after year in the same soil is to supply ideal conditions for pests and to derive the worst consequences of their ravages. With such a climate as that of the Scilly Isles, it should be possible—provided transport is adequate, expeditious and regular—to grow many other profitable crops besides Narcissus and early Potatoes. Major Dorrien-Smith is inclined to think that late cropping, as well as early cropping, should receive the attention of the islanders. It is an idea well worth consideration, but at the same time we think that early crops will always secure the best returns. The advantage of organisation on co-operative lines is insisted on by Major

Dorrien-Smith, who points out that at present the produce from the Scilly Isles ranks below that grown in England or in Germany. No one who has sailed past the sunny islands, often passing just eastward of their shores into the mist or fog, can doubt that the Scillies have great natural advantages for crop production. Like all seaward places, to reap the full benefit of this advantage they must have shelter—but that is obtainable with time and energy. Given shelter from the winds, the rapidity of growth in such places is phenomenal, and this gift of Nature ought to be turned to the fullest account by the inhabitants of the islands. Everyone will wish that success may attend the efforts of Major Dorrien-Smith to build up in the Scillies a flourishing horticultural industry.

### The National Botanic Gardens at Kirstenbosch,

The Journal of the Botanical Society of South Africa (Part VIII., 1922) contains a series of impressions by distinguished American visitors of the Botanic Gardens at Kirstenbosch. The most interesting point made by all these visitors—Prof. McLean, Dr. Cannon and Mr. E. H. Wilson—is their commendation of the object to which the gardens are chiefly devoted—that of forming a large, representative and well displayed collection of South African plants. There is scarcely a garden in the world which has set itself a corresponding task. Most seek to assemble plants from elsewhere rather than to grow native kinds. Each method has its advantages, though there can be no doubt that at Kirstenbosch the method which is being pursued is the right one. For, in the first place, the richness and variety of the flora which occupies the different regions of the Union provide endless and fruitful scope for the establishment of one of the most beautiful gardens in the world, and one, moreover, possessed of features not shared or rivalled by any other garden now in being, or likely to come into existence. As Mr. E. H. Wilson, who knows the botanical world better, perhaps, than anyone, observes in his appreciation of Kirstenbosch, "I have travelled in many lands and have grown tired of seeing the same species of plants repeating themselves in cultivation in every botanical garden; so it was a great pleasure to me to find (at Kirstenbosch) at last one devoted to the preservation of the local flora and to the cultivation of indigenous plants." In the second place, the despoiling of the flora of South Africa has already begun, and once begun, none may say how fast it may continue. As cited in the Journal, one coloured man alone does at the present time a trade in wild Cape plants to the extent of £300 a month. His coloured scouts are busy collecting Heaths and rare Proteas, and thus it is that the face of the south-western veldt is changing and its glories are becoming a mere memory. Increased interest in the Gardens on the part of the members of the Union is the sure means of enabling Kirstenbosch to realise its aim and become a great national garden. We believe that it will realise this object and that the steady increase in membership, which the Botanical Society of South Africa is experiencing, means that every year a larger number of members of the Union are coming to realise that they have in Kirstenbosch a splendid national possession, destined to become one of the best of all botanic gardens and an example to other parts of the Empire.

**New Roses at Bagatelle.**—A supplementary meeting of the jury to judge the new Roses at Bagatelle, Bois de Boulogne, Paris, which had been called in consequence of the bad weather prevailing on the date of the original meeting in June, was held on the 11th September. The President of the Jury was M. Rebeillard, and the other members were MM. Pernet-Ducher, Cochet-Cochet, H. Graveaux, Nonin, Turbat, Lévêque, etc., besides local notables, among whom were MM. Malherbe and Garnier; the Inspector General of Architecture, M. L. Bonnier; and also two foreign specialists, M. Looymans, of Holland, and Senor Rubio, of Barcelona, Spain. M. Forestier, the Curator of the Bois de Boulogne Promenades, conducted the visitors over the Rosery, and gave them information as to the behaviour during their flowering period of the various Roses entered in the competition. The Jury confirmed the award of the Gold Medal to the Dutch Rose *Elvira Aramayo*, which is remarkable for its curious new colour—Indian Red—and for its continuous and abundant flowering. Another Gold Medal was awarded to a new Rose, *Toison d'Or*, of yellow colour, raised by M. Pernet-Ducher, of Lyons. Mme. Alexandre Dreux, also yellow, but of a lighter colour than the last, almost approaching citron, which does not fade in the sun, raised by Messrs. Souppert et Notting, Luxembourg, was awarded a First-class Certificate. Other certificates were awarded to the deep yellow Rose, *Souvenir de H. A. Verschuren*, raised by the Dutch grower of that name, and to *Jules Tabart*, a salmon-pink variety sent by M. Barbier, of Orleans. A Special Certificate was awarded to a new and extremely interesting climbing Rose of the Hybrid Tea section, *Vicomtesse du Fou*. It is vigorous, produces fine, large foliage, and yields throughout the whole season fairly large, light, fragrant flowers of a very pretty metallic pink, with a touch of yellow. This variety was raised by a young workman employed on a private estate in the Doubs, M. Sauvageot. The Jury also noticed the Rose *Independence Day*, a British-raised variety, and especially a variety from Lyons, named Reverend W. Williamson, coral red, transfused with orange—a *Pernetiana* hybrid. They further took particular notice of a lovely white Rose, bearing a name much beloved in France, *Regina de Alvear*. Three other interesting Roses should be mentioned, viz., *Lady Elphinstone*, *Ariel*, and *Vanity Fair*. The varieties *Dental*, *Commandant Lequerré*, and *Maman Dental* did not display their charms to advantage, being intended for more southerly climes. Among Roses which have lately arrived at Bagatelle for inclusion in the next competition is a new variety from M. Pernet-Ducher named *Président Chérioux*, a *Pernetiana* hybrid of bright salmon-pink colour. Messrs. Alex Dickson and Sons have sent two red Roses, *Crimson Hawlmark*—a development of their previous varieties, *Red Letter Day* and *K. of K.*—and *Earl Haig*, the latter a departure from the light, almost single style of the ones previously mentioned, being large and very full. The bad weather prevailing at present makes it impossible to judge of the merits of these varieties, which will be properly examined in June, 1923.

**Horticultural Exhibition in Berlin.**—The great centenary horticultural exhibition which opened in Berlin on the 30th ult. remained open until the 18th September. A visitor to the exhibition observes:—In order to realise the immense labour involved in such an exhibition it is necessary not merely to see the completed show, but to consider the circumstances attending it, and it must be confessed that seldom has an exhibition been arranged in such unfavourable conditions—at least, so far as the florists' trade is concerned. Not only had the exhibits to be brought in sufficient quantities to fill a space of 2,000 square yards, but they had to be transported long distances, in some cases from Leipzig to Berlin, many being held up on the way and arriving absolutely dead and useless. Furthermore, the state of finance and the value of the mark are such that business with foreign countries is rendered almost impossible, quotations being given or accepted one

day which the next day are utterly unacceptable. The lowering of the standard of life in Germany has had a considerable influence on the florists' trade, an influence which is clearly shown in the exhibits. Costly flowers, such as Orchids, are very scarce, their places being occupied by much cheaper blooms, such as Asters, Roses, Dahlias, etc. The admirable results obtained with these humble flowers go to show that it is not so much the material which matters as the art with which the materials are made up. It is by no means a light task to keep in its freshness and beauty for twenty days an exhibition of the magnitude of the recent one. But the Berlin florists made it a point of honour to keep the flowers and plants in "exhibition condition" during the three weeks, both for their own sakes and for the sake of the public, who took the greatest interest in the exhibition. Some of the schemes of floral decoration were extremely pleasing, especially one, which was entitled "The Sparrow's Joy." It represented a little attic, suitably furnished and beautifully decorated. Many people who looked at this little exhibit came away with tears in their eyes, it reminded them so forcibly of days gone by.

There was a tendency to evolve systems more closely adapted to available markets and local conditions. The old farmers were being replaced by specialists, such as expert Potato growers and expert fruit growers. Increased crop production involved not only improvement of the land, but improvement of the men on the land.

**Organisation at Tresco.**—A most successful meeting of all the growers on the island of Tresco, Isles of Scilly, was held in the Reading Room on the evening of the 12th instant. The object of this gathering was to ascertain if it was possible to form an association of growers with a view to trading co-operatively. The chair was taken by Major A. A. Dorrien-Smith, D.S.O., who briefly outlined what was meant by co-operation and earnestly urged the growers to be loyal to each other and to the community at large. "Much harm had been caused by the retrogressive policy of the past, and disintegration and dissatisfaction had ensued as a result. They had met to see if they could work together for the common good." After an interesting discussion, the chairman proposed and Mr. F. Oyster seconded a resolution that "A bulb-growers' association be formed on the island"—

a member of the staff of the Chinese Imperial Maritime Customs he had ample opportunity in his spare time to pursue his hobby. He was encouraged by Sir Joseph Hooker whilst Director of Kew to send home numbered and labelled specimens, and he forwarded a succession of packets of plants collected by him in China, Formosa, Japan, Java, Sumatra and, later, Central America and the West Indies. A large number of new flowering plants and Ferns discovered by Hancock were named after him, as was the genus *Hancockia*. His own private herbarium, which contained about ten thousand specimens, has been placed by Miss Hancock at the disposal of Kew, with the condition that the part not required by the Kew Herbarium should be given to the University of Bristol.

**The Potato Crop.**—The Potato crop this year is estimated to be one of the best on record, and there is said to be a surplus of more than two million tons over possible requirements. In view of the very low prices prevailing growers may find their Potatoes more profitable for use as food for stock than to sell them. According to the Ministry of Agriculture, in the majority of cases Potatoes may be

THE EARL AND COUNTESS OF MINTO WITH OFFICIALS AT THE OPENING OF THE ROYAL CALEDONIAN HORTICULTURAL SOCIETY'S SHOW ON THE 13TH INST. (SEE P. 185).

Left to right: The President, Mr. David King, the Countess of Minto, Lord Provost Hutchinsonson, and the Earl of Minto.

**Increased Crop Production.**—In his address at the joint session of the Sections of Economics and Agriculture, at the British Association's meeting, Sir John Russell emphasised the need for levelling up production in this country. He stated that we produced only 20 per cent. of the Wheat and cheese we consumed, 30 per cent. of the fruit, 40 per cent. of the butter, 60 per cent. of the meat and eggs, 70 to 80 per cent. of the Barley and poultry, and 90 to 95 per cent. of the Oats and Potatoes, vegetables, and milk. With regard to corn and other crops, there were only limited possibilities of adding to the acreage, but something could be done to level up production. The yield per acre for Wheat, Oats, Potatoes, and Swedes varied greatly even in the same county, and it should not be beyond the resources of science to analyse conditions so that those bestowedy by Nature on one district might be reproduced in another. A more intelligent and judicious use should be made of artificial fertilisers, and something could also be done by the introduction of new varieties of crops. Meanwhile research was going on in connection with the control of diseases and pests and the investigation of minute organisms working in the soil.

this was carried unanimously. On the proposition of Mr. W. Hartley, seconded by Mr. F. Eveleigh, Mr. S. P. Wells was then unanimously appointed hon. secretary *pro tem*. It was also decided by the meeting that all present and future members should sign a declaration of loyalty to the association in the matter of trading; this rule, among others, is to be incorporated into the Articles of Association. It was further decided to ask the hon. secretary to issue to the Press a *précis* of the proceedings in so far as was relevant, and to invite interested firms trading in agricultural and horticultural requisites to forward trade catalogues, price lists, and literature for the use of members. All communications should be addressed to Mr. S. P. Wells, hon. secretary, Tresco Bulb-growers' Association, Tresco, Isles of Scilly.

**Presentation of a Herbarium to Kew.**—We learn from the *Kew Bulletin* that Mr. W. Hancock's herbarium has been placed at the disposal of Kew. Mr. Hancock, who died in 1914, was in the Chinese Imperial Maritime Service and was for many years a regular correspondent of Kew. He was a student of botany from his earliest years, and when he settled in China as

facilities for steaming or cooking are available it is better that they should be cooked or steamed before use. Owners of stock should remember that green Potatoes are not only distasteful, but also poisonous. For pigs, 6 lb. of Potatoes to every pound of dry meal or concentrate may be used; the Potatoes should be thoroughly cooked in a small quantity of water, and the meal then added, the whole being fed as a mash. The maximum quantities for other classes of animals are 17 lb. per head for horses and 23 lb. per head per day for fattening bullocks and cows.

**The Cabbage Caterpillar.**—In many parts of the country Caterpillars of the common white butterfly are very prevalent, these being the second brood, which hatches about August and usually feeds all through that month and September. The second brood causes the bulk of the damage to winter Brassicas. Simple sprays which have been found successful for the destruction of the pest consist of (a) 1½ to 2 oz. of soap in one gallon of water, mixed to give a good lather; (b) 2 ozs. of common salt

NOTES FROM MID-LANARK.

in one gallon of water. If either of these solutions is not effective, naphthalene emulsion, which may be bought from the horticultural sundriesmen, will probably be found suitable. A simple plan used by some is to water the plants by means of a rose can with water warmed to a temperature of 130°.

**Peach Growing in the Var.**—The Cherries grown in the valley of the Gapeau, in France, are already well known, but the cultivation of another fruit—the Peach—is rapidly gaining ground in the department of the Var. In the vicinity of Toulon, in the Gapeau Valley, and in many other places, Peaches are being extensively grown, one proprietor possessing in some cases a thousand trees. As a rule, the Peaches are grown on the same ground as Vines, both being planted at the same time, the Vines being placed two metres apart, and the Peaches six metres apart one way, and four the other. This system saves much labour and expense, the same manuring and other attention serving for both kinds of trees. The pruning of the Peaches takes place in January, when also measures have to be taken to ward off disease. This year a new pest has made its appearance, *Anarsia lineatella*, a moth, of which the caterpillars eat the young shoots of the Peach and arrest their development. The chief varieties grown are Earliest of All, Amsden, and Précoce des Halles, which ripen in succession. Most of the fruits are sent to Paris. The produce is packed in shallow crates, the smaller fruits in two layers of about 40 in each, the larger fruits in one layer only. They are carefully packed, with white paper and fibre, and are not permitted to touch one another.

**Horticultural Exhibition at Geneva.**—An exhibition of horticulture has been arranged by the Genevese Federation of Horticultural Societies, to take place in September, 1923, at Geneva, Switzerland, in which an International Horticultural Competition will be included. The schedule and other information will be forthcoming a little later, but any particulars desired may be obtained now by application to the Secretary, M. J. Wolf, at Geneva.

**Appointments for the Ensuing Week.**—Wednesday, September 27: Irish Gardeners' Association's meeting. Thursday, September 28: Bristol and District Gardeners' Association's meeting; Royal Botanic Society's meeting; Wargrave and District Gardeners' Society's meeting. Saturday, September 30: Finchley Chrysanthemum Society's Show; Carlisle Chrys. show.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Shakespeare's Mulberry Tree.*—"Shakespeare's Mulberry" was planted, it is supposed, in 1609, the year in which, by order of King James, many hundred thousand young Mulberry trees were imported from France, and sent into the different counties, with a view to the feeding of silkworms. Plants being thus abundant, in all probability Shakespeare, in this very year, planted the tree on his return from London in the spring. It might have been still in existence had it not been cut down by the Rev. Mr. Gastrell, a man of large fortune, who purchased the property about the year 1752, and soon after cut down Shakespeare's celebrated Mulberry tree, to save himself the trouble of showing it to those whose admiration of our great poet led them to visit the place. The tree must have been between 140 and 150 years of age when it was thus destroyed. But previously Garrick had a plant secured from Shakespeare's identical tree; and this is still in existence at Garrick's villa. It is upwards of 90 years of age. The trunk reclines in nearly a horizontal position, but the present proprietor of the above villa takes due care of the relic. The stem is supported near its extremity; and very near its base two perpendicular stems have sprung up and are growing vigorously. There is a plant propagated from this tree in the garden of the Horticultural Society. *Gard. Chron.*, September 25, 1847.

It is interesting to note that, in spite of the damp and sunless summer, the flower garden is scarcely less gay than in other and more favourable seasons; indeed, the flowering period of some subjects has been prolonged. Stocks are very good, and flowering over a longer period than usual. *Nemesia* is another subject which has been unusually fine and a blaze of colour all through the summer. *Pentstemon* also are particularly fine; it is seldom that we get so much lateral flowering growth as this year.

Dahlias have grown well and are flowering freely; the Collette sorts are largely grown, being very floriferous, and less rank in growth than some of the other kinds. Of the miniature Dahlias, the variety *Coltens Gem*—*Waterloo*—

or medium-sized bed, but it should be planted thickly, as it is not very robust in growth. The cool season has suited *Calceolarias*, and also the perennial *Lobelias*.

Border *Chrysanthemums* were never healthier, and they are free from the leaf mining maggot, which so often spoils the foliage. It was remarked some years ago that the late propagation of these plants was invariably followed by earlier flowering, and it would be interesting to know if experience confirms this idea. *Godetias* sown at the usual time are much later than usual in flowering; the variety *Duchess of Albany* is a useful subject for the margin of beds of *Rhododendrons* or other evergreens. Sweet Peas have grown vigorously this year, and in the intervals between rain the flowers have opened clean and bright. *Fred. W. Jeffery, Dalserf, N.B.*

FIG. 70.—DAHLIA CRIMSON GLOW. SELECTED FOR TRIAL AT WISLEY WHEN SHOWN BY MESSRS. BURRELL AND CO., ON SEPTEMBER 5.

is very much in evidence. The most effective display of this variety I have seen is in the Queens' Park, Glasgow; the centre of the long flower border, on each side of the terrace steps, is planted with this variety—twelve hundred plants together!

Antirrhinums are flowering fairly, and they are, without doubt, among the most popular summer bedding plants, being easy of culture, free from disease, and with a colour range to fit in with any scheme. Larkspurs have lately developed a tantalising habit of dying off in all stages, from the seedling to the adult plant. Before this failing became so pronounced Larkspurs and Antirrhinums were successfully employed in combination here. The dwarf variety of Larkspur, *Blue Butterfly*, appears to be less susceptible, and is a bright subject for a small

NEW DAHLIAS.

EXTRAORDINARY numbers of new Dahlias have been submitted to the joint floral committee of the Royal Horticultural Society and the National Dahlia Society at the fortnightly R.H.S. meetings this season, and of these considerable numbers have been selected as worthy of trial in the Wisley gardens. A large proportion of these novelties are varieties of the decorative section.

In these new sorts it is obvious that growers are paying considerable attention to the length of flower stem, so that in most cases the blooms are held erect, well above the foliage. An example of this type of Dahlia is *Crimson Glow*, illustrated in Fig. 70, a *Paenony*-flowered variety of glowing crimson colour.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARCHMONT, K.G., Blenheim Palace, Woodstock, Oxon.

**Maxillaria.**—In the cool division there are nearly always some plants that need repotting; and amongst the most important at the present time, besides the *Odontoglossums*, are the *Maxillarias*, of which there are some species that produce their flowers in a downward direction, and are best grown in shallow teak wood baskets. *M. Sanderiana* is the best known species that produces its flowers in this way; the others may be grown in ordinary pots. These plants grow well in any ordinary Orchid compost, but it is essential that the material should be pressed firmly around the base of the plants. There are other species which occupy the cool house that may have attention at this season, and if it is observed that they are developing new roots they may be repotted if they are in need of fresh material, keeping the compost on the dry side until the new roots enter it freely.

**Calanthe.**—The new pseudo-bulbs of the deciduous *Calanthes* are well advanced, and in order to obtain strong flower spikes with clear, brightly coloured flowers, the plants should be afforded plenty of room, so that each may receive its full share of sunlight. To this end it is advisable to elevate them near to the roof-glass, and to shade them no more than is absolutely necessary to prevent the sun's rays damaging the foliage or pseudo-bulbs. During the warmest part of the day, when the sun is bright, only a very thin shade is needed, but if exposed to the sunshine early in the morning, and again in the afternoon, the bulbs will finish well, and produce strong spikes of flowers. In the extra light the plants will dry more quickly, and will require water at the roots more frequently. They may be watered on alternate occasions with liquid manure, which will assist them considerably at this season. Plants of *C. Regneri*, and other varieties that bloom in the spring, are only half-way through their growing season, and should therefore be treated the same as the others were when in full growth. Plants of the evergreen section, which include *C. veratrifolia*, *C. Masuca* and the hybrid *C. Dominyi*, are also making their growth, and should be plentifully supplied with water if well rooted. Vigorous, well-rooted plants appreciate an occasional application of manure water. These plants thrive best in a shady part of the Cattleya or intermediate house, with the foliage well up to the roof-glass. Plenty of light is beneficial to all Orchids, but strong, direct sunshine will injure the foliage and check growth of most of them. These evergreen *Calanthes* are occasionally seen growing vigorously when given ordinary store-house treatment.

### HARDY FRUIT GARDEN.

By H. MARSHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Figs.**—Owing to the cold nights and sunless days the development of fruits of Figs has been greatly retarded, and in some instances they ceased to swell and finally dropped from the trees. To hasten the maturation of the remainder of the crop see that the shoots are well thinned, and some of the leaves, where they are very numerous, may be removed in order that both light and air may circulate freely amongst the branches. All coarse soft growths that are not required for furnishing the space should be cut away, reserving as much as possible of the best short-jointed wood for supplying next year's crop. Examine the roots of trees

growing in restricted borders, and if the soil is found to be dry apply a good soaking of water. The Brown Turkey variety is one of the most dependable sorts to grow on walls, and in some seasons White Marseilles, growing in bush form in a warm corner, ripens a good crop of delicious fruits.

**Pruning.**—If the usual trimming and pruning of all fruit trees has received prompt attention by this date some of the trees will have developed secondary growths, and these may be stopped, with, probably, the exception of any that are intended to be root-lifted and replanted early. Trees with very strong unfruitful growth should receive early attention.

**Plum Coe's Golden Drop.**—Trees of this Plum, which are bearing heavily, should not be allowed to get excessively dry at the roots, as nothing is more detrimental to the size and flavour of the fruit than a very dry soil and enfeebled root action. I have known whole crops of this Plum to be almost completely spoiled from the want of water and nourishment at the roots after the stoning period.

**Autumn Fruiting Raspberries.**—As soon as the fruits commence to colour clear away all weeds, remove useless growths, and net the beds before the fruits are attacked by birds. The berries are ripening very slowly, and require more warmth to hasten their development.

**Nuts.**—Although the crop at Wrotham at one time looked exceptionally good and promising, recently large numbers of the nuts have dropped without any kernels in them. A sharp watch should be kept for rats, mice and squirrels, otherwise these marauders will quickly take the good ones that remain.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Coddicote, Welwyn, Hertfordshire.

**Roses.**—Where Roses are cultivated in pots to produce flowers in the early spring the present is a suitable time to overhaul the plants. Any that require repotting should have a considerable portion of the old soil removed and substituted with fresh, sweet loam. Where the soil is found to be in good condition remove only a few inches of the surface and apply a top dressing of rich fibrous loam, enriched with a six-inch potful of bone meal to every bushel of soil. It is not always advisable when repotting Roses to use larger receptacles, but if the same pots are used again see that they are made clean. Plants that only require top-dressing should be turned out of their pots to examine the drainage to see that it is perfect. The plants may then be placed in the open, plunging them in a bed of coal ashes up to the rims of the pots to prevent the latter becoming broken during severe frost. Long shoots may be shortened to prevent the plants becoming loosened at the collar by strong winds.

**Chrysanthemums.**—After this date it will be advisable to have the house prepared to receive these plants, so that when frost is expected they may be placed out of danger in a very short time. It is not advisable to house Chrysanthemums too early, but, as a rule, after the end of the present month the plants are no longer safe from frost. Any plants that are showing colours in the flowers should be stood in a cool house, or the night dews will spoil the florets, the injury showing at a later date. The later-flowering varieties are best kept out of doors as late as possible, but for preference they should be stood in sheltered positions near a skeleton frame, so that they can be given protection at the first signs of a sharp frost. After housing the plants a watch must be kept for mildew, and the affected parts dusted with sulphur. Fumigate the plants on several occasions to prevent an attack of aphids.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VISCOUNT GIBBS, Aldenham House, Hertfordshire.

**Herbaceous Border.**—Continue to look well after the plants in herbaceous borders, cutting away dead foliage and flowers in order to prevent an untidy appearance, and from time to time give an eye to the staking of Chrysanthemums, Dahlias, Asters and other top-heavy flowering subjects, so that they do not get broken, for at this time of the year heavy winds may be expected at any time, even though they may not occur.

**Autumn Fruits.**—The shrubberies are now very beautiful, many of the trees and shrubs being laden with bright fruits, whilst the foliage of others is assuming glorious autumn tints. This aspect of gardening is certainly worthy of consideration, for bright fruits and foliage make the pleasure grounds very attractive at a dull period of the year. The list of fruiting trees and shrubs is a large one, and perhaps the best subjects are found in the various members of the Rosaceae. They include the *Crataeguses* or Thorns, and of these the members of the American group are the best for fruiting. Various tones of red are to be found amongst them, and the fruits are, for the main part, considerably larger than those of the ordinary Hawthorns of this country, and are borne generally in great profusion. There are also one or two with yellow fruits and one with blue berries, though this is, I think, almost unknown in this country, and is, I believe, of a tender nature. Following these come the various Hawthorn varieties, both red and yellow, there also being a white-fruited form. *Cotoneasters* and *Pyracanthas*, closely related to the Thorns, are especially fine now, with their freely borne bunches of orange and red-coloured fruits, and we certainly cannot overlook the claims of the *Roses* themselves when one considers the magnificent and striking fruits of such species as *Rosa rugosa*, *R. pomifera*, *R. Moyesii*, *R. setipoda*, *R. Sweginzowii*, and *R. Helenae*. There are many beautiful fruiting Crabs, whilst their allies, the Mountain Ash, Whitebeam, Chokeberry, members of the *Pyrus* group, and their close relatives, the *Cydonias* (Quinces) and *Medlars*, all contribute their share in providing colour and interest in the garden in autumn. *Raspberries* are most charming subjects when in fruit, and whilst tones of red and pink predominate, there are certain numbers with black fruits, and one or two with white ones. *Viburnums* offer a large choice of berried plants, carrying fine bunches of red and blue fruits, whilst there is a magnificent yellow-fruited form of *Viburnum Opulus*. The *Enonymus* or Spindle Wood, *Celastrus*, *Coriaria*, and *Billardiera* (tender) are others that provide coloured fruits, and are valuable additions to the list. *Symphoricarpos*, *Lonicera*, *Maples*, *Hollies*, *Skimmias*, and *Pernettyas* are others that should be planted freely for their beautiful berries.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col., SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Peaches.**—Peach crops in glasshouses will now be over, and the abundance or scarcity of fruits another year will greatly depend upon the treatment the trees receive from now to the end of October. Many growers believe that dryness at the roots causes the wood and foliage to ripen, and only give the roots a few barrels of water, yet when the time arrives for root-lifting or renovating the borders discover that the trees have not received more than half the water they actually required. If properly drained and made, an inside Peach border may be watered practically every week throughout the growing season, and then it will be found that the soil is not too wet to swell and plump up the buds for another season. It is now somewhat late to restore trees that have only been half watered, but no time should be lost in trying to set matters right, as a good set of fruit cannot be expected where the borders are not

TREES AND SHRUBS.

THE WEeping LARCH AT HENHAM HALL.

AMONGST the less common trees that are growing in Henham Park, Suffolk, the estate of Lord Stradbroke, by far the most interesting is a magnificent specimen of the weeping Larch. The greatest branch spread is 99 feet, while the stem, which girths 8 feet at a yard from the ground, rises almost perpendicular for a height of 8 feet, after which it suddenly divides into several branches, which extend horizontally and almost at right angles to the trunk for a distance of 50 feet. For the support of these branches some ninety props are in use, these keeping the branches at such a height that one can walk comfortably beneath their shade. The tree is in excellent health, with a plentiful supply of Pea-green foliage, and bears an unusual quantity of cones, which are thickly arranged along the branchlets.

but when introduced in 1899 the plant must have been spelt *O. nummulariaefolia*, as it was recorded in *The Gardeners' Chronicle*, 1899, xxvi., 101, and quoted in the *Kew Bulletin*, appendix II., 1900, with the diphthong. It has appeared elsewhere under that spelling. If the name was taken from the old genus *Nummularia*, the spelling, in my opinion, should have been *O. nummulariaefolia*, as in other feminine Latin nouns. We have evidence of this by the same author in the book above cited, where he describes another species as *O. avicenniaefolia*. Of course the name in dispute might have been derived from *numularius* or *nummularius*, the adjective, and that from the noun *numus* or *nummus*, a silver coin of the Greeks. Both Greeks and Latins varied the spelling. Botanists, too, have their variations. In *Erythroxylum Nummularia* the name is evidently derived from the old generic name. There are, however, such spellings as *Euphorbia Nummularia*, and *E. nummulariaefolia*; and *Gentiana nummulariaefolia* and *G.*

moist enough to keep the roots active throughout the winter. These remarks apply to early mid-season and late houses, and those who wish to escape bud-dropping should thoroughly examine their Peach borders. The hose is invaluable for washing the trees, but the main point is a moist border.

**Pruning.**—The trees in all the Peach houses, with the exception of the late ones, having been pruned—that is, so far as cutting out superfluous shoots can be done, the late trees should now receive the same attention. These trees should be kept extra thin of growth, five to six inches apart being quite close enough to train the shoots. All the shoots retained, especially the leaders in extension-trained trees and the weakest with one bud at the base, should be retained their full length. It is not necessary to cut close home, as the final trimming may be deferred until the trees are detached from the frellis, the chief point now being to let plenty of light and air enter the trees. Borders in which the trees are growing too strongly or too weakly should be dealt with. If growth is too strong root-lifting and relaying are the best remedies, and the firmer the soil is rammed the better. If too weak from age or overcropping, the borders should be well watered with diluted liquid manure, or the surface may be forked over, the old upper soil removed, and fresh compost, enriched with a little soot, lime rubble and bone meal, substituted. The compost can hardly be used too dry, neither can it be made too firm; fresh roots will soon develop, and the weakest trees will be restored by the time the fruit commences stoning. Manure may be used in very extreme cases, but generally the weakest trees can be restored by mulching, top-dressing, and careful summer feeding. As soon as the work is finished tepid water may be given freely, for if they are kept too dry the roots will remain dormant through the winter. Now is a suitable time to obtain a good stock of old turf for use through the coming season, always provided it is cut and stacked in a fairly dry condition.

THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Carrots.**—The main crop of Carrots is ready for lifting, which should be done when the weather is dry. The tops should be cut off to within an inch of the crown and all badly split or damaged roots cast out. Store the sound roots in a root house or other cool place. The top of the pie should be left open to prevent sweating if the weather is hot, covering it in later as the weather becomes colder. Later crops should be kept free from weeds and watered if the weather is dry. Carrots are subject to attacks of aphis, and on the first signs of this pest syringe the foliage well with Quassia extract.

**Autumn-sown Onions.**—The rows of autumn-sown Onions should be kept well hoed, watered and dressed well with soot and lime. If the seedlings are too numerous they should be thinned, for with plenty of space the plants will harden and winter better.

**Cardoons.**—These plants should be bleached by using stiff brown paper. First tie the tops and secure the plant to a stake. Then place the paper in position and draw the soil to the height of the paper, afterwards releasing the tie at the top.

**Late Potatoes.**—The crops of late Potatoes should now be lifted and the tubers stored in clamps. Choose dry weather for the work. Clear away the tops and burn them, and watch carefully for any diseased tubers, for disease soon spreads amongst Potatoes that are clamped. The pies should be made in a dry position and slightly raised above the level of the surrounding soil. Leave air spaces at the top of the clamps for the present.

FIG. 71.—GENTIANA PURDOMII (SEE P. 179).

The cones are smaller than those of the common Larch, averaging from  $\frac{3}{4}$  to  $\frac{1}{2}$  of an inch in length, by an inch in diameter, while the leaves are fully an inch long and arranged in clusters from forty downwards. This tree should not be confused with the usual weeping Larch, as that at Woburn Abbey, or with the hybrid named *Pendula*, both of which have erect stems with pendulous branch tips, while in the tree under notice the trunk is short and divided into flatly-spreading branches at a few feet from the ground. When grafted on a stock of the common Larch, this pendulous or rather horizontally spreading variety still retains its original character, as several trees that are growing in the grounds adjoining the hall demonstrate. A. D. Webster.

OLEARIA NUMMULARIFOLIA.

I MUST have been side-slipping to have made two errors in one short note (see pp. 91 and 147); but I am not alone in the matter. The original spelling in the *Handbook of the New Zealand Flora*, p. 127, was as given above;

*nummularifolia*. I did not consult the index to *Trees and Shrubs Hardy in the British Isles*, and did not think of it, seeing that the order is alphabetical, and should have said the plant was not fully described there. J. P.

THE OLDEST TREE.

ACCORDING to the *Kew Bulletin*, the famous tree known as the Big Tree of Tule at Santa Maria de Tule, eighteen miles from Oaxaca, Mexico, is the oldest in the world. This tree is closely related to the swamp or deciduous Cypress (*Taxodium distichum*), and is known to botanists as *T. mucronatum*. Its height is about 150 ft., the diameter of its trunk is 50 ft., and its age is supposed to be about 5,000 years. In 1903 Mr. C. J. Chamberlain, of the University of Chicago, saw the tree, and it was then in perfect health, not a dead twig being in sight. "Before the Pyramids of Egypt were built it was a sturdy tree, and before Moses led the children of Israel into the wilderness it must have reached the usual size of the species; when Rome was founded it must have been known as a big tree."

**EDITORIAL NOTICE.**

**ADVERTISEMENTS** should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.**

**Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

## MR. MARCH AND FLORAL DECORATION.

IN gardening, as in other things, at intervals, long or short, methods that seemed impossible of improvement have had to give place to others, leaving people to wonder how they could have failed to see how much more desirable the new method was than the old. Something of this kind happened in 1861, on the occasion of the opening of the Royal Horticultural Society's Gardens at South Kensington, in connection with which there was a special exhibition, and for the first time in the history of gardening prizes were offered for table decorations of flowers and fruit, to be arranged in a series of three pieces. Sir Wentworth Dilke provided the prizes, the amount of the first being £10, with several smaller ones following; the judges were Countess of Sherborne, Countess of Ducie, Lady Middleton, and Professor Westmacott. There were twenty-one competitors, and the first prize was awarded to a set so remarkable for the simplicity of its arrangement and the material employed as must have almost taken away the breath of the visitors to the show.

The *Gardener's Chronicle*, on page 647 of that year, presented a full page engraving of the 1st, 2nd and 3rd prize decorations, and so wide is the gulf separating the former from the others that there could be no question as to the fairness of the judgment. But the engraving does not do full justice to the group, which is presented better in colours in the book to which these notes more particularly refer. The receptacles were composed of a flat glass dish, into the middle of which a glass rod was fastened and which supported a smaller glass dish, the centre piece being a little taller than the side pieces. One of these was furnished with *de Meaux* Roses, with a ring of deep blue Pansies, and the other with *Lily of the Valley* arranged among its own foliage and surrounded with *Forget-me-nots*, and each had a setting of common Fern, the tips of the lower fronds lying on the cloth; the rods were slightly wreathed.

The centre piece was furnished, top and bottom, with small clusters of black Grapes resting among vine leaves. The 1861 engravings would need to be reproduced to enable readers to properly estimate the value of these designs as compared with the others, and how it came about that from that time floral decorating was revolutionised. The arranging of the material was done by Mrs. Pickering and Miss March, sisters of Mr. T. C. March, the acknowledged initiator of the designs. The following year the prizes were renewed with additional ones for baskets of flowers, Lady Dorothy Neville joining with Sir W. Dilke in providing the prizes, and the premiums in both cases was scored by Mr. March's designs.

In order to understand in some degree the position of floral decorations at the period in question, it must be remembered that, up to about ten years previously, flowers were not

admitted to the dinner-table at all, nor, in many instances, into any apartment. Where the mistress of a household had flowers, it formed part of the duty of the gardener to make up a bouquet, circular and squat, which was replaced every morning. But the rule was that flowers were cultivated to look at and not to be picked until age or the attention of insects had changed their beauty to ugliness.

The horror of the mid-Victorian gardener at the innovation may therefore be imagined. Mostly the butler relieved him of the irksome duty when shooting, or other parties were entertained. That functionary filled *Majolica* vases with flour-batter, and after raiding mixed borders for double Dahlias and Hollyhocks in all the colours obtainable, stuck the stalkless blooms as closely together as he could upon the surface of that medium. On other occasions the housekeeper would take her turn with a collection of all the kinds of fruits available. Although the "March" flower stand was by no means perfect, and the arrangement of the material not at all artistic, still the simple glass receptacles were at least many degrees more beautiful than those they were decreed to replace, and the management of the flowers showed what could be done with even the commonest kinds. The immediate result was orders for similar receptacles to an extent that defied the resources of the manufacturers to supply, and the beginning of a demand for flowers that has gone on increasing in volume ever since that day.

Moreover, the demand induced Mr. March to write a book to instruct the uninitiated—which embraced a nation—how to set to work. The book is entitled *Flower and Fruit Decoration, with some remarks on the treatment of Town Gardens, Terraces, etc.; and with many illustrations of colour and contrast applicable to both subjects*. It is an 8vo of 108 pages, and seems to have been issued in a coloured wrapper, an obvious reason why it is now scarce. The volume is lavishly illustrated throughout with woodcuts elucidating the text; a coloured frontispiece of the pieces that gained the 1861 premium, and a series of coloured figures in circles showing "what colours will agree," and also thirteen schemes in colour for "bedding" small London gardens. Every detail is described with meticulous care, even to where the sand and clay used to fasten the stems of flowers could be obtained. Similarly, the position to be occupied by every flower, Fern or leaf, is pointed out, and, of course, the arrangement was absolutely formal. It was indeed so formal as to possess a certain attraction, just as there is an attraction in a long avenue of Beech or Lime so great as in the beauty of the pathless woods. This formality, however, soon gave place to what became an exaggerated naturalness.

Mr. March rose early in the morning to deal at Covent Garden, and advised any who might follow his example to keep to the middle of the streets if they wished to escape the dust set abroad from rugs shaken by maid servants early astir. He tells us that very few loose flowers were to be had, and for special occasions these had to be ordered three or four days in advance. Nurserymen at that time were the chief providers of flowers. *Forget-me-not* was chiefly in the hands of an old gentleman at Croydon, who brought it up when he had a mind to do so, and an Essex man supplied all the *Maiden Hair Fern*. Some of those who kept up a supply of bouquets during the summer threw off their butterfly state at the approach of autumn, and devoted themselves entirely to fruit and mushrooms. And, in a word, it would appear that one Bird was the only merchant who could strictly be called a florist. It was many years subsequent to this period that shops for the sale of flowers were opened in Edinburgh, and other provincial centres would no doubt be equally backward.

We have seen how the production of floral receptacles was accelerated, if not introduced, immediately subsequently to the appearance of "March" stands. And one might be not far wrong in attributing to these and to him the initial impulse to the flower trade in its various sections, in field, shop and home.

Mr. March, though he had no ground, was a keen gardener. His garden occupied the leads of a second story building, measuring 30 feet by 15 feet. Chimney pots and ngly gables were excluded from view by Irish Ivy trained on trellises, and rooted in boxes in which also he cultivated plants which afforded a protection from the heat of the sun. An interesting volume, not the less interesting on account of the side lights it throws on the state of the flower trade and Covent Garden Market sixty years ago, concludes with a list of the chief London nurserymen from whom plants and flowers could be bought.

Very soon the original "March" stand was developed into other designs. Miss Anne Hassard, who also wrote a book on cut flowers, erected a small trumpet vase atop of Mr. March's upper dish, and usually the latter had a trumpet substituted for it. A common style was that of a plate for the under part upon which a trumpet vase was set, the former being furnished with clay to hold the stems, and the trumpet with water. The arrangement of the material and the kind of material as well soon underwent change, not always for the better either, and the rage for wiring flowers, which was advocated by a Miss E. A. Malsing, in 1862, was carried to extraordinary length. But of this lady's doings I may have something to write some other day. *R. P. Brotherton.*

## MR. KINGDON WARD'S SIXTH EXPEDITION IN ASIA.\*

NO. 24.—WINTER COMES IN THE MOUNTAINS.

TOWARDS the end of August one of the high lamas returned from Wa-kin (whither he had escorted the spiritual government) to take up his duties at Mu-li. This priest called on me, preceded by a small present of groceries. He was quite friendly, and transport was promised for September 10. Accordingly, on that day, after the usual wrangling, we started once more into the mountains. There was no certainty of fine weather, but it was due, and I did not care to delay longer.

Half a day was absorbed changing transport at the first village; consequently, we did not reach our camping ground till dusk—indeed, some of the ponies were delayed till nearly ten o'clock. Luckily, it was a fine night, a circumstance for which I was particularly thankful, since it was my bedding, tent and dinner which hung in the rear.

Next day we reached the summit of the divide, and camped amongst the "woolly cows," as the Chinese call the yak.

In the woods, chocolate and golden Saxifrages still flowered by the wayside, and at one spot were masses of *Balsam*, whose curiously shaped flowers, of the clearest gamboge, were decidedly attractive. Few of the many species of *Impatiens* met with in the drenched forests of Upper Burma are worth cultivating. They run rather to crimson, magenta, purple and other impure colours; or to blotched yellows, pinks, and indecisive colours. But this plant was without blemish, so far as colour was concerned.

A brilliant deep blue trumpet *Gentian* was just peeping open on the alpine grass slopes. Though not unlike the marsh *Gentian* already noted, it was distinct in foliage at least; also its flowers were of a deeper hue. Higher up on the scree was another species with delicate china blue flowers, enveloped in Ferny foliage—it recalled the charming *G. heptaphylla*.

We spent three days at the pass, amongst the "woolly cows." It rained nearly all the time, but I consoled myself with the reflection that Mu-li is accounted a "dry" place. Anyhow, we collected some seeds—*Primula sino-plataginifera* and a dwarf *Mecconopsis* were the chief.

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 22, May 6, May 20, June 3, June 17, July 1, July 15, July 22, August 5, August 20, and September 9, 1922.

THE ALPINE GARDEN.

GENTIANA PURDOMII.

Of all the Gentians sent home by the late Mr. Purdom when he was collecting for Messrs. Jas. Veitch and Sons, of Chelsea, *Gentiana Purdomii* (see Fig. 71) is one of the best. It is perfectly hardy, and will grow in a situation where many other Gentians would fail. The growth is strong and of good habit, but not in

than in ordinary *P. capitata*. According to Farrer, in *The English Rock Garden*, *P. Mooreana* is, indeed, only a form of *P. capitata*, but the floriferous nature of the plant and its extremely handsome heads of violet-purple flowers stamps it as a first-rate garden plant and one worthy of the award it received. Farrer states that *P. capitata* is a garden name embracing a whole number of allied but quite definite species, of which several are in cultivation. *P. Mooreana* is by far the finest of the

FIG. 72.—PRIMULA MOOREANA IMPROVED.

any way coarse. The plant flowers very profusely in July and August on prostrate stems of about twelve to eighteen inches in length; the colour is of a lovely *Gentiana verna* blue, and the individual bloom is very similar to that *Gentian*, only of far larger size. It needs a compost of turfy loam and leaf-mould, with a liberal addition of silver sand, and should be planted in full sun.

The plant illustrated was exhibited at the R.H.S. meeting on August 22 by Mr. Allgrove, Middle Green Nurseries, Langley, and was first exhibited by him in 1919, when it received a Award of Merit. *H. C.*

PRIMULA MOOREANA IMPROVED.

At the meeting of the Royal Horticultural Society on September 5, a very handsome *Primula* with violet purple flowers received an Award of Merit under the name of *Primula Mooreana Improved* (see Fig. 72). No one appeared to know whether *Mooreana* was a species, but its obvious similarity to *P. capitata* was freely commented on, although everyone recognised that the flowers were much more beautiful

set; "long lived and stout, with stalwart white-powdered stems contrasting beautifully with the round head of Tyrian violet flowers." He describes it as "a first-class treasure for any rich, cool, well-drained position, and the one 'capitata' that deserves diligently ensuing."

PRATIA ANGULATA.

Of the few *Pratias* in cultivation the most pleasing and most satisfactory in our gardens appears to be *P. angulata*, a native of New Zealand, which has been in cultivation for a good number of years. It is an exquisite little plant, and in the rock garden forms a close carpet of small, oval, coarsely-toothed, fleshy leaves, and is spangled in July and August and frequently later with numerous, prettily formed, white flowers, like those of a small *Lobelia*.

Where its conditions are congenial the plant will grow a few feet across, but it is not always so free, and many lose their plants in winter unless protected in some way. It is one of the rock plants which seem to delight in moisture in summer but resent it in winter. *N.*

On the 15th we moved up the old glaciated valley, and settled down at Glacier Lake Camp for the third time; and then followed three fine days—almost the only fine weather experienced in the course of five weeks.

We concentrated our efforts on collecting *Primula* seed—there was little else ripe, except *Mecynopsis*, which we also garnered. The capsules of the sky blue *Aculeate Poppy* were full of grubs, eating the seeds, but those of the two dwarf *Primulinas* were apparently immune. The former is by far the commonest species met with. Is this a case of mutual co-operation? Does the *Poppy* support the grubs in the autumn and winter in order that the perfect insect may pollinate the flowers in the following summer? For it is to be noted that the blue *Poppies*, in spite of their bright attractive colours, are visited chiefly by small flies. Bees and butterflies do not waste time over honeyless flowers.

One must collect seeds on a mountain to realise the vast wastage there is. Very few plants but furnish food in their swelling capsules to hungry larvae. Even the stout *Rhododendron* capsules are not proof against these depredations; but the fact is, they are pierced while yet succulent, and the egg deposited inside. Not till the wooden capsule opens, disclosing the full-grown caterpillar with all the seeds inside him, is the damage revealed. The *Saxifrages*, as a whole, come well out of the ordeal; so do many of the *Primulas*, especially in the section *Muscarioides*. The *Gentians*, however, are often fair game—but one could continue this theme indefinitely. It is an interesting subject, and for the present we will leave it at that.

On the night of the 18th the storm began. The wind blew from the south, and heavy rain fell in the valley. Next morning the peaks all round were white with snow.

For the next ten days we were treated to every variety of vile weather—rain and snow, clammy mist, and a gnawing wind which chilled us through and through. It did not freeze in the valley at night—rarely did the temperature fall below 39° F., but on the contrary, in the daytime it did not rise much above that. Little seed-collecting could we do under such conditions; indeed, for three days we were confined to our tents, so utterly hopeless was the weather.

The last day of the month, however, was more promising, and we seized the opportunity to cross the range to our other camp, opposite the snow peaks. My chief aim was to collect seed of a charming little *Primula* which is confined to the limestone. However, when we reached the sill which runs across the head of the valley, we found that nearly all the fruits of this species had perished—aborted apparently, from lack of pollination. This was a blow; however, we had a reserve cliff where the species might have been more successful in setting seed.

After one moderately fine day in our new camp, the storm resumed its attentions, and now it snowed day and night with scarcely a break. So thick was the mist we could not see the nearest peaks, and so deep the snow we could not find our plants. Matters began to look serious for harvesting seeds. Moreover, we were cut off for two days, the transport being unable to cross the pass and take us back. At last, on October 8, we were treated to a really fine day, which was spent returning to Glacier Lake Camp. Unfortunately, the sunshine made the snow very soft; it lay a foot deep on the precipitous slope, and the ponies had a rough time.

No sooner were we safely back at our old camp than the snowstorm came on again with renewed vigour. For three days and nights it snowed without stopping, till the entire valley was mantled. Nothing was visible but a mist of whirling flakes through which the white mountains loomed dimly. However, we managed to hire a few yak and ponies on the 13th and get down to Mu-li, marching ten hours. We had been in camp for five weeks, and despite the conditions, had secured seed of over fifty species, including seventeen *Primulas* and three blue *Poppies*. *F. Kingdon Ward.*

## BATTY LANGLEY. WANTED A TITLE.

PERHAPS some literary reader of *The Gardeners' Chronicle* can help me out of a difficulty. I am the possessor of a series of eight large folio plates of flowers—they are 20 by 16 inches, unnumbered, and there is nothing to indicate whether the set is a complete one or not. They are bound up in a volume with Robert Furber's collections of Flowers and Fruit for January to December, 1730 and 1732.

It is reasonable to suppose from certain indications on the plates that they were designed for the purpose of illustrating some gardening work by Batty Langley, although a second-hand bookseller informs me "they were not incorporated in any book of his, but were sold as plates," possibly as Furber's were.

Reference to every accessible bibliography and catalogue reveals no solution of my query—for what purpose or what book were these plates intended?

On some of the plates attached to the figures of the various flowers are their names, botanical explanations, cultural remarks, etc., and most of the figures are numbered. This fact leads me to suppose that it was intended for the purpose of reference to some text, elsewhere than that on the plates.

The flowers depicted are life-size and are all hand-coloured.

At the bottom left-hand corner of some of the plates are the words, "Batty Langley Invent, etc." One or two have in addition the year 1741. On the right-hand bottom corner of some we read, "Published pursuant to VIII George II., by Thomas Langley, 1741." In one case his address is given as of "Meard's Court, Dean Street, Soho." Three out of the eight have engraved at the bottom and inside the plate-mark, "Printed, colour'd, and sold by H. Overton, at the White Horse, without Newgate, 1743." The plate-mark inside measurement is 16½ by 13½ inches or thereabouts, some being a little more or less.

These plates are evidently but little known. I understand that in the library of the botanical department of the Natural History Museum, South Kensington, there is one only of the series, which is catalogued under the name of Batty Langley and numbered 12.

It may be useful to place on record here short particulars of the subjects illustrated in these plates. Such particulars may be useful for identification. I give them in the order in which the plates are arranged in my volume. The title of each plate is engraved in large capitals in the middle top end of the plate.

1. "Polyanthos's. In February and March." Eight figures.

2. "Anemone's. In March and April." There are thirteen figures in this plate, inclusive of a *Fraxinella* marked "B in June."

3. "Turkey and Persian Ranunculus's. In April and May." Seventeen figures.

4. "Rose's. In May and June." Fourteen figures of different varieties. A most instructive sheet. The velvet Rose and the Province Moss are easily seen to be distinct varieties. The others are the single yellow, the great Royal, the Austrian, the Damask, the Monthly, the cinamon (*sic*), the red, the York and Lancaster, the Province, the Belgick, the Mundi, the Eglantine.

5. "Garden Poppy, Lilly's, etc. In June." Seven figures, including *Pisum Odoratorius*, Sweet-smelling Pea.

6. "Carnation's and Pink's. In July." Twenty figures, the largest of which are Topham's King George, Epicurus, Count Serge.

7. "Amaranthus Coxcomb, Annual Sunflower, etc. In August and September." Nine figures.

8. This is the one in the library of the Natural History Museum, No. 12. "In October, the Guernsey Lilly, French Marigold, Perennial Sunflower, etc." Eight figures.

Any information or suggested means of discovering more about these plates will be very acceptable. *C. Harman Payne.*

## THE BULB GARDEN.

## GLADIOLUS RARITY.

THIS variety (see Fig. 73) was shown by Messrs. Lowe and Gibson at the R.H.S. meeting on August 22 last. It was raised by Mr. Kunderd and introduced to cultivation last year. The flowers are not so well placed as on most of the raiser's varieties. Apart from this, it is a very pleasing flower. The colour is a bright lavender, with a deep line on the lower petals and touched lavender white at the sides. The flower measures over three inches. *Smilax.*

FIG. 73.—GLADIOLUS RARITY.

## THE DOUBLE WHITE LILY.

FOR many years past I have noted at intervals what passes for a double form of the *Lilium candidum* (the White Lily or Madonna Lily). A few days ago I had a specimen of it from the north of England. The grower of it had been patiently waiting for the blossoms to open for the past two months. The fact is it has been in bloom all that time, for it is very durable. The specimen consisted of what should have been eight blooms in the normal form, the stalks of which were united at the base like a bundle of crow-quills, held together by a narrow strip along the contiguous sides. There the peduncle is free for two to four inches, on the top of which is the bloom, 1-4 inches long, without an ovary, but in place of it a continuation of the floral axis, thickly clothed with perianth segments, sometimes crowded at the base or somewhat whorled, and

then mostly all alternate, or with an occasional whorl of three. In some cases the bloom opens in a scattered way from the first. All these segments are grey and as thin as tissue paper, while the terminal long bud is whiter, and gives promise of expanding ultimately; but it seems to consist of dozens of the same kind of thin segments that continue to open till the plant gets exhausted and the stem dies. There is no beauty in this form whatever. *J. F.*

## ORCHID NOTES AND GLEANINGS.

## BRIGHTLY COLOURED DENDROBIUMS.

IN reviewing the genus *Dendrobium*, the numbers of pretty species of distinct habit or unusually rich colour, which have been represented in gardens, but which have not been seen at exhibitions for some years, present themselves, and some reminder of their beauty and the necessity for taking special care of occasional plants which may yet be in gardens, and of arranging for the reintroduction of such as have been lost, may not be out of place. Distinct and showy colours are specially desirable, not only for their beauty as species, but for the opportunities they give to the hybridist to vary the range of colour in the genus. Nor is the size of the flower of the first importance in colour production by hybridisation, if we consider that the finest results in other genera have come through the smaller species with the one quality of desirable colour—for example, *Laelia flava*, *Sophranitis grandiflora*, and *Cochlidoda Noezliana*. Although a very large genus, not much more than a score of species has been used by the hybridist, and only about half of them to any extent, the great bulk of hybrid *Dendrobiums* being with garden-raised crosses, and new introductions of colour and habit would be worth trying, although in sections widely separated it does not follow that crosses will be readily accomplished in some cases.

*DENDROBIUM ARACHNITES*, ROXB. (*Gard. Chron.*, Sept. 19, 1874, p. 354).—This a dwarf, tufted plant of the section *fasciculatae*, and was collected by Boxall in Moulmein for Messrs. Lowe. A few plants being received alive. One of these flowered, with the late Sir Trevor Lawrence, and another with Mr. Wm. Lee, at Downside, Leatherhead. The flowers, which are about two inches across, are bright red, the lip veined with purple and freely produced in fascicles of two or three from the nodes at the upper parts of the leafy stems.

*D. JERDONIANUM* is a charming little species, first known to gardens through a small specimen which gained a Botanical Certificate when shown by Messrs. J. Veitch and Sons on May 22, 1869. The plant is dwarf, densely tufted, and bears short sprays of bright orange-coloured flowers with nearly equal segments. The late Sir Trevor Lawrence obtained a Botanical Certificate for a fine, bushy specimen with many flowers on February 27, 1900, the plant being received by him from a correspondent in the Travancore Hills, India, who sent it by parcels post—a method which might be imitated with advantage, and many rare species thus obtained.

*D. SANGUINEUM*, ROLFE.—This species was introduced from North Borneo by Messrs. Lowe, who first flowered it in 1895, and for several years after it frequently appeared, the late Sir Trevor Lawrence obtaining an Award of Merit for it on September 8, 1893. It belongs to the *D. crumenatum* section, its 2-ft. to 3-ft. stems being slender, but thickened and grooved at the base. The flowers, which are nearly as large as those of *D. Phalaenopsis*, are produced singly from the upper part of the stems, and are bright crimson in colour. As with those of most members of the section, the individual flowers do not last for many days, but a succession is maintained if the plant is given suitable treatment in a warm, moist house.

*D. SUBCLAUSUM*, ROLFE (*Gard. Chron.*, Dec. 1, 1894, p. 656).—This is a very remarkable species, and was introduced from the Moluccas by Messrs. J. Veitch and Sons. The stems are a

foot to eighteen inches in height, and the flowers brilliant cinnabar-orange, a singular feature being the crimped and infolded labe-lum. One of the original specimens flowered by Messrs. J. Veitch and Sons at Chelsea had over a hundred flowers open at the same time, and was much admired.

**D. VICTORIAE REGINAE LOEHER.**—This species is unique in colour, and good specimens are still to be found in gardens, a probable reason being that in consequence of its collector's remark in his description that the plant was not found at a lower altitude in its Manila habitat than about 6,000 ft., successful growers treated it as a cool or temperate house plant. Its pendulous habit well adapts it for growing in baskets or in a suspended pan. Its waxlike, violet-blue flowers, with white bases to the segments, are always attractive. To get the colour into other sections of *Dendrobium* would be a great event.

**D. STRIATUM**, from the same region as the Blue Dendrobe, is a remarkable and little-known species, with curved stems, bearing in pairs pretty cream-white flowers, tinged with rose and having regularly arranged purple lines on the segments. *J. O'B.*

## INDOOR PLANTS.

### SCHIZANTHUS RETUSUS.

**SCHIZANTHUS RETUSUS** is a very profitable plant for house decoration and the conservatory in the spring, for it is dwarfer and harder than many of the other varieties, and may be grown with great success in small pots. If the white variety and the deep rose-coloured form are sown now the plants will bloom in March and April in a cold house, from which frost is excluded. These two varieties make a charming group when used in the conservatory, and are equally of value for vases in the dwelling house.

Raise the plants in a fairly light soil, pans being the best receptacles at this period, and place them in a cold frame. As soon as the seed germinates the seedlings should be watched for any tendency to damping; in fact, the safest way is to prick the seedlings off as soon as ever they can be handled. Admit plenty of air and light, and as soon as the plants have made four or five leaves transfer them to three-inch pots. For this potting use a mixture of four parts yellow, fibrous loam, one of leaf mould, a liberal addition of sharp sand, and a little spent Mushroom manure. Place the plants in a close house for a few days until root action commences, after which there is no better place to grow them than on a shelf near the roof-glass.

During the winter keep the plants on the dry side, as over-watering is fatal. Watch for any signs of aphid and spray the plants with an insecticide on the first suspicion of this pest; guard also against damage by slugs.

About February the plants may be given their final shift, and though it is a matter for the individual, I suggest that 4½-in. pots are suitable, leaving a few plants in the smaller-sized pots to make specimens for decorating work. Similar mixture as recommended for the previous potting will be suitable, adding a sprinkling of fertiliser if thought necessary.

When growth commences the top of the leading shoot may be pinched out, though very elegant plants are obtained by growing them naturally.

Water with weak liquid manure when the roots are growing actively, about twice a week, and if the weather is dull and mildew sets in spray the plants with a weak solution of potassium sulphide.

### EARLY ANNUAL CARNATIONS.

MAKE a sowing of a good strain of annual Carnations during early October. Give the seedlings very cool treatment and transfer them as soon as possible into very small pots. Grow them on an airy shelf until early spring. Shift the plants into larger receptacles as needed, using a loamy mixture. The plants will give an excellent display of bloom by June, whereas the spring-sown ones will not bloom until August. The time thus gained is worth the little trouble involved. *J. S. D.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from page 168.)

ENGLAND, S. (continued).

**DORSETSHIRE.**—There was profuse bloom on all fruit trees. Apples are a very good crop. The high winds have done a certain amount of damage, but still there are plenty of fruits left. We have the best crop of Pears for several seasons past. Plums of most sorts are a very heavy crop, and we have excellent crops of Damsons and Bullaces. Gooseberries were very plentiful, but the fruits were on the small side, owing to the spring drought. The rains did not come soon enough for them, but they fell in time to save the Raspberries, which were a heavy crop. Strawberries were a very light crop. The drought spoiled what the late frosts left. Figs promise to be a full crop, and we have plenty of Filberts. *Thos. Denny, Down House Garden, Blandford.*

—The Apple crop is a good average one in quantity and quality. Trees of all early varieties have full crops, but Bramley's Seedling and Cox's Orange Pippin are very light. King of the Pippins failed to flower and is the only failure. Standard Plums are good, but the crop on wall trees is very thin. Peach trees suffered last year so much that the crop of this fruit is a failure. Strawberries promised well, but the berries dried out, though late ones were saved by rain. With only 1.62 inch of rain in May and June, fruit fell freely and nothing grew. On both clay and chalk the crops were more distressed than at the same time last year. In July, however, we had 4.66 inches of rain, and it made all the difference. *W. E. Axford, St. Giles' Garden.*

**HAMPSHIRE.**—The remarkable absence of all insect pests among the various fruits, both tree and bush, will long be remembered, so clean, vigorous, and healthy are all growths, which portends a fruitful year for 1923. The welcome rains which came in mid-June were very beneficial to all fruits, and particularly to late Strawberries and Raspberries. The latter crop was very good. Black Currant bushes were clean, and the crop was very good, though Plums are under the average yield generally. The various Damsons and Michaelmas Plums are abundant. Our soil generally is a stony, clayey loam over chalk, and 400 feet above sea level. *George Ellwood, Swanmore Park Gardens, Bishops Waltham.*

**KENT.**—Every kind of fruit tree, also bush fruits, flowered abundantly, promising a glut of fruit of all kinds, although we could scarcely hope for a heavy crop of Apples after last year's bounteous supply. Pears appear to be fairly plentiful on some trees that cropped well last season. I am of opinion that next year will give us abundant blossom, the effect of the tropical heat experienced in 1921, and, provided weather conditions are good, we should expect heavy crops in 1923. Crops vary considerably within a five-mile radius, some trees carrying plenty of fruits, others with very few, doubtless owing to the last frost that occurred during the time the Apple trees were in full bloom. The best crops are noted where the soil is of a tenacious character, although intermingled with plenty of stones. *James Mayor, 32, Wigtown Road, Eltham, S.E.*

—Apples vary very much from place to place. There was a fine show of bloom, but the weather was too dry for some soils, although the crops look well after the recent rains. Pears are a more equal crop, and were greatly benefited by the rain. Plums also are a heavy crop in most places. All but early varieties are thin. Cherries were a heavy crop, but spoiled by the weather. Small fruits were of extra good quality on young bushes. The dry weather last year and this spring spoiled the Strawberry crop. The soil was very dry early in the season, and the differ-

ence between the bulk and quality of the fruit on gravelly or light soils and the heavier soils is very pronounced, being much inferior on the gravelly soils. *J. D. Colledge, Cobham Hall Gardens, Cobham.*

—Apples show, as usual, a large crop of late varieties, which means little or none next year. This does not hold with early varieties, owing to the fact that the tree has time to recover after the fruit is gathered. Pears and Nuts are the crops of the year with me, Plums of all sorts being very poor, but the varieties Czar and Dawson's are good. *E. A. Bungard, Maidstone.*

—The apple crop is the worst for 50 years. Curiously, some isolated trees have full crops, while all around is scarcely an Apple, although the trees are growing in the same soil and aspect. Strawberries British Queen and Givon's Late Prolific gave the best crops. St. Hilaire was also good, but the rest were very poor. Raspberries were a big crop. *Charles E. Shea, The Elms, Foots Cray.*

—It seems to me to be a very difficult matter to assign any sure reason for the short crop of Apples in this district. All varieties, without exception, flowered well, but from some cause or other many of our trees are bare of fruit. Hitherto we have attributed the failure to frost and cold winds, but I begin to wonder if there is some other subtle cause or causes to bring about this failure in the Apple. Take, for example, Peaches. These were in bloom at the time we were experiencing frosts, rain, and cold winds, and I often remarked, "If we get a good set of fruit under such circumstances, I shall never despair of them in the future." I well remember the time past, when, from my own point of view, the spring had been most suitable for a good set, yet partial failure was the result. In some districts a few miles away I hear of good crops of Apples, but on the whole they are patchy. It is remarkable that aphid has given very little trouble. As for red spider, it seems to be non-existent up to the present. Raspberries were a splendid crop on the farm. Scores of women and children were busy all day long gathering them to be despatched to London by motor by the ton to the jam makers. *J. George Woodward, Barham Court, Teston, Maidstone.*

—The fruit crops are under the average. Cherries were good, but Apples are only half a crop, and trees that have a fair crop are those that had very few fruits last year. Raspberries, Currants, and Gooseberries were all of good quality, but Strawberries were only very moderate. I think the drought of 1921 had a good deal to do with the failure, for everything was dried up in the latter part of last summer, and we had a dry winter. Pears are a fair crop. Our soil overlies chalk. *J. H. Shann, Betteshanger Park Gardens, Eastry.*

—Pears, Plums, Peaches, Nectarines, Apricots and Cherries all gave great promise in these gardens in early spring, but very cold east winds prevailed during the flowering period, thus reducing the setting very considerably. Apples, with the exception of a few old trees, had very little bloom. Strawberries appeared to still be suffering from the drought of last summer, the fruits being rather small and growth restricted. All small fruits were very plentiful and of good quality. Big bud is rather prevalent in our Black Currants. We experienced a gale in the first week of July, which considerably reduced our Plum crop, and almost totally destroyed the few Apples we had. The soil is a good, strong loam over clay. *H. E. Kemp, Holmwood Gardens, nr. Tunbridge Wells.*

—Strawberries appear to have suffered very much from last year's drought, this crop generally being very disappointing, the rain not falling sufficiently early to save the situation. Cherries were a splendid crop and of good quality. Small fruits generally were good also. Apples and, in fact, nearly all fruit trees

bloomed profusely, but in many cases the blooms did not set and Apples are very patchy. Fruit trees of all descriptions have kept remarkably clean this season. Insect pests, so far, have given very little trouble. Pears look very promising. Our soil is a fairly heavy, retentive loam. *J. E. Weston, Eastwell Park Gardens, Ashford.*

MIDDLESEX.—Peaches, Cherries, and Raspberries are very satisfactory. The trees are healthy and the fruit excellent. Plums are not so good, but some trees of Coe's Golden Drop and Victoria are bearing ample fruits. Strawberries, on the whole, were very unsatisfactory. Pears are good, but Apples are patchy. Our best crops of Apples are on trees growing in a grass orchard. Both Black and Red Currants were much below the average yield. The Raspberry crop was the best we have had for some years past. Our soil is light, resting on a very sandy subsoil. *H. Markham, Wrotham Park Gardens, Barnet.*

SURREY.—With the exception of Apples, the fruit crops in this district are very satisfactory. Apples are the lightest crop for very many years. Only one variety, James Grieve, is carrying an average yield in every position. Strawberries were soon over, but other small fruits, and especially Raspberries, were abundant and of excellent quality. *F. Jordan, Ford Manor Gardens, Lingfield.*

(To be continued.)

## VEGETABLES.

### BEET.

The large variety of Beets now growing in the gardens of the Royal Horticultural Society at Wisley remind us how small is the use to which this vegetable is put in England compared with its multitudinous uses in America and in Europe. Scarcely anyone is familiar with it on the table, except as a component of a salad or sliced and soaked in vinegar. If these were its only uses, many varieties of Beet would be condemned as soon as they were cut, for intense colour, bright, "beetroot," or purple, carried evenly through the root would be regarded as a *sine qua non*. Yet many Beets sent in for trial do not conform to this requirement, and should not be hastily condemned on that account. Some are wholly yellow, others show alternating zones of red and white. These are usually condemned by the cook, who is so often careful not to break the skin before the Beet is boiled, not because she fears the loss of sugar (which is the chief nutrient in the Beet), but lest the root should bleed and its colour suffer. Other nations have recognised the value of the Beet as a vegetable, and it finds a place on their tables as Salsify, Artichokes, and Parsnips do upon ours. They have learned that fine colour is not always and not necessarily an accompaniment of good flavour. They find, as the committee appointed by the Council to adjudicate upon the trials found, that Beetroots are not all of one flavour. While all considered the very fine stock of Egyptian Turnip-rooted Beet, evenly red all through, sent by Messrs. Carter, to be of excellent flavour when cooked and eaten as a vegetable, others considered the yellow-fleshed Beet surpassed it, and others, again, would place a particular stock of a white-zoned globe Beet before it. It was evident that careful comparisons would soon reveal substantial differences in palatability, just as in Apples, and such knowledge would hasten the time when many would add a most valuable vegetable to their dietary. Speaking generally, the round Beets are better suited for use as a vegetable than either the intermediate or the long type. Most cookery books give recipes for the cooking of Beets in various ways, but probably it would be wise to go to French and American sources, with their long experience, for recipes to start with, unless some of your correspondents, versed in the value of Beets so used, will tell their methods of preparing them. *Fred J. Chittenden, Wisley.*

## AMERICAN NOTES.

### HISTORY OF THE DAHLIA.

It was a great pleasure to note that my little book, written only to help the struggling beginner on Dahlias, was considered deserving of notice by your magazine.

There were many typographical errors which slipped through in spite of many corrections, repeated during several proof readings. However, a new edition shortly to appear, will, I hope, make these corrections final.

The historical "error" which you criticise concerning the Marquis of Bute you will find on page 8 in *Dahlias*, written by the late George Gordon, V.M.H., then President of your National Dahlia Society, and edited by the late Mr. R. Hooper Pearson, then Managing Editor of the *Gardeners' Chronicle*:

"In the year 1789 the Dahlia was introduced into this country, but unfortunately the plants that were first raised failed to retain their vitality in the conditions to which they were subjected. In the course of that year Vincentes Cervantes, director of the Mexican

FIG. 74.—THE DOUBLE-FLOWERED LOGANBERRY.

Botanic Gardens, sent seeds of the Dahlia to the Abbé Cavanilles, director of the Royal Gardens at Madrid. At that time the Marquis of Bute was the English Ambassador at the Spanish Court, and the Marchioness, who was greatly interested in floricultural matters, obtained some of these seeds and sent them home. From them plants were raised," etc.

I naturally took a statement made by the President of your Society, and your Editor to be correct. "No one has any right to falsify history." On that point we agree. *H. M. Stout, Charlcote, Short Hills, New Jersey.*

## COLONIAL CORRESPONDENCE.

### A DOUBLE-FLOWERED LOGANBERRY.

HEREWITH I send a photograph of a few flowering sprays from a self-sown seedling Loganberry (Fig. 74) found by Mrs. Kvarno, Uchelet, Vancouver, growing among rocks outside her garden fence. The individual flowers come in bunches of five or so, but only the terminal or central one is double to any extent. These flowers have about sixty petals (mostly petaloid stamens), snow white, two inches across, and they are quite ornamental, but the petals are very fugacious, and fall off on the slightest touch. In the upper division of the Loganberry's system of inflorescence most of the flower stalks rise from about the same level, so that they resemble a modified Umbel; it is, therefore, significant that only the central flowers are double, and this is particularly interesting after reading the article on "The Carrot's Crimson Eye," which appears in *The Gardeners' Chronicle* of July 22! *George Fraser, Uchelet, B.C.*

## ANNUALS.

IN *The Gardeners' Chronicle* of August 26 (p. 127), under "Annuals at Reading," some account was given of the many beautiful strains of annuals in Messrs. Sutton and Sons' extensive seed grounds there. It is well known that most of the large seed firms have steadily increased their efforts in the same direction, and that since the new strains developed have been what one may call "all British" greater improvement has been shown in all classes than was formerly the case.

It may be stated that with the difficulties experienced in gardening of late the demand for these pretty annuals and biennials which adapt themselves to similar treatment has increased, and in most cottage gardens what are known as common flowers give the most satisfactory results. The term "common garden flower" as applied to these pretty annuals honours them greatly, for it is their great beauty, small cost, and adaptability to produce their charming displays, even under the treatment of those who have little knowledge of gardening generally, which has gained them the title.

On the fine estate developed under the Harrow Council on Garden City lines, and in which the small but conveniently arranged gardens are in their first year, the hundred and fifty gardens, each with its floral display arranged by a different dweller, are gay with the annuals, which have been acquired from many traders. These simple flowers form the greater part of the display this year, and the season seems to have favoured them and prolonged their flowering.

Two of the commonest, the Virginian Stock and Candytuft, each in several colours, and generally sown as edgings, appear in most of the gardens, and it is difficult to imagine anything which would give so good an effect. Antirrhinums are also general favourites, and appear in great variety of colours, either as small beds or mixed with other flowers. Stocks have also done well, and the new ground seems to have increased their vigour, the branching kinds having as many as a dozen flower heads, forming a pretty, bushy tuft. Asters, planted alone and mixed, both single and double and of different habit of growth; Godetias, with Orchid-like colours; Eschscholzia, orange and red-tinted; blue Nigella; Larkspur of various colours; Coreopsis, and in fact most of the flowers obtained annually from seeds which are dignified by the name "common" appear effectively.

In some front gardens where a tree-stump—the last rural remains—is available, it is covered with Tropaeolums, and generally a good show has been secured. Broad bands of fragrant Mignonette seem to like the soil and situation; Lavateras, which are blooming where they were sown; Sweet Peas in clumps where they can be supported; and Nicotianas, chiefly white, are covered with their fragrant flowers, and all give evidence of the utility of the inexpensive seed packet, and collections of seeds, for even in the cheapest sets the purchaser gets the advantage of the greatly improved home-raised strains.

With the Annuals proper, other common plants, which were probably purchased in seed boxes, have a place, but in all cases the annuals and Antirrhinums are especial favourites.

The Shasta Daisy in several forms has given a wealth of clear white flowers, which seem to withstand all weathers. Most of the gardens have a grass plot, with a bed in the middle and borders next the house and inside the light railing, and in many cases much art has been displayed in the development of the spaces to the best advantage.

The highest example is a corner position with two sides, in the centre of each being an oval bed, one filled with Roses and Pentstemons and edged with tufts of white Alyssum maritima and blue Lobelia alternately, and the other with scarlet Pelargoniums, Verbenas, and some annuals, edged with Centaurea. The front border consists of double white Pyrethrums, and at the back are some good

Phloxes, a flower which appears to have done well this season and lasted longer in bloom than usual. But this pretty garden must have been more expensive than most.

At the back or side of many of the houses, vegetables are grown, and at the end of the estate a fine block of allotments gives pleasure and profit to the holders. It is the cottage gardens, and especially in the recently constructed blocks of model tenements developed under the authorities, that the love of gardening and the value of the subjects available to satisfy the possessor of a small garden at a nominal cost are seen at their best. J. O'B.

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Abercrombie's Calendar of Gardening** (see page 136).—Mr. Joseph Jacob's remarks are very interesting. I lived at Hendon in the later days of Prebendary Scrivener, who then resided at the vicarage, and was well acquainted with those old gardens. I glanced around my books and found I have a copy of Abercrombie's book, the fourteenth edition, in splendid condition. I should like to know if the book is very rare. I am sure the routine of operations would not do for the gardens of the present time, but at the same time it is very interesting and quaint. W. J. Chillingworth, *Sidestrand Hall Gardens, Cromer*.

—Abercrombie's literary work lies somewhat outside the field of my interest in bibliography, and I do not propose to attempt to answer the Rev. Joseph Jacob's inquiry: "Did both a Mean and a Main enlarge Abercrombie?" But there is no doubt that the Hon. Mrs. Evelyn Cecil is wrong in spelling James Main's name "Maine." This does not imply that she meant James Main or Maine when she refers to "James Mean." James Mean was gardener to Sir Abraham Hume, Bart., of Wormleybury, Hertfordshire, and was probably a much older man than James Main. His employer was a keen lover of horticulture, and in the early days of Chrysanthemum culture Sir Abraham Hume did much to encourage the importation of novelties direct from China. Johnson says (page 293) that James Mean edited in 1816 Abercrombie's two works, *The Practical Gardener* and *The Practical Gardener's Companion*. Between 1798 and 1808 some important additions were made to the then very limited collection of Chrysanthemums in this country by Sir Abraham Hume. His gardener, James Mean, evidently had some literary ability, for in Vol. II. of the *Horticultural Society's Transactions* he was the author of several communications in 1816 and 1817 to that publication. Sabine, in one of his valuable contributions on the Chrysanthemum to the same work, refers to James Mean as having been of service to him in a question of historic interest concerning the first sport. C. H. P.

—*The Gardeners' Chronicle* for 1906 published an article from me which contains much, if not all, of the accumulation, apocryphal and otherwise, that had gathered round the name and history of Abercrombie. The entire title-page of the original edition of *Every Man* is there transcribed. Along with Maine's name as the author "other gardeners" is added as having assisted in its production. The sentence quoted by Mr. Jacob as occurring in the twentieth edition appears also in the first and subsequent ones, and, of course, Abercrombie was dead before the twentieth edition appeared! *The Gardener's Pocket Journal and Annual Register* naturally was republished year by year. There were probably two posthumous works of Abercrombie. One, *The Practical Gardener*, edited by his friend, Don, of Cambridge, in 1813, and revised by James Mean, head gardener to Sir Abraham Hume, Bart. (1816), but my copy is dated 1817. "Some Account of the Author" is prefixed to this work and copied entire by Loudon. In this account it is stated that *The Garden and Seed Register* was in the press. I have a copy of *Every Man*, entitled *The Com-*

*plete Gardener* (1839), revised and improved, with an appendix on "Forcing," by William Gowans, C.M.H.S. One object of this edition was to accommodate it to the climate of Scotland. J. Main, F.L.S., wrote on agriculture and arboriculture, as well as on gardening. *The Gardener's Daily Assistant*, with plates (1794), is also a calendar written in short paragraphs, the engraved title-page being adorned with a vignette of Abercrombie. I would add that I fail to see what Abercrombie's family had to do with "his anxiety." If his wife had been so prolific as to present him with a family of eighteen by the time he was forty the conclusion would be that the marriage took place when he was extremely young. Such was not the case. But he was so diffident of his power to compose a book when Griffen approached him that he only accepted the proposal on condition that his name should not be disclosed. The Hon. Mrs. Evelyn Cecil's brief note on Abercrombie is an instance of how many mistakes can be included in a few sentences. R. P. Brotherston.

**The History of the Moss Rose.**—There must be a fatality connected with the history of the Moss Rose, for the chimerical quotation from *L'Ecole du Jardinier Fleuriste* which Mr. Harman Payne refers to on page 124 of *The Gardeners' Chronicle* can be exactly paralleled by a reference to page 57 of *Les Roses*, by Hippolyte Jarmain and Eugène Forney (preface by Ch. Naudin), Paris, 1875. Much the same tale about Mme. de Genlis as that quoted from *Roses and Rosiers* is said to be found in the 1746 edition of *Le Jardinier Fleuriste*. This book began life in 1702. I have the 1742 edition, in which there is no mention even of such a Rose, let alone any record of its history. It is the same in the case of a very much later one. Is it likely, then, that that of 1746 would contain any reference with the above facts to go upon? If I am wrong, perhaps someone who has this edition will correct me. The circumstances are so peculiar in their similitude that this note may not be amiss. That elusive 1746 again!! Joseph Jacob.

**Glogs for the Garden.**—I consider clogs (see p. 85, August 5) are far better for winter wear than boots, for garden use, and more comfortable. The soles do not bend, and consequently the stiff leather used in the uppers does not hurt the feet, as so frequently happens with heavy boots. W. J. Farmer, *Redruth*.

**A Hornets' Nest.**—Hornets have been very troublesome here this summer and have destroyed a large number of the earlier Pears. About mid-August a nest was discovered in the centre of the park, and a large wad of cotton-wool soaked in potassium cyanide solution was placed in the entrance. The hornets coming home and those which attempted to leave the nest were killed. On digging out the nest it was found that the remainder were still living, and had to be killed by more direct methods. This is the first time I have known these insects to build in the earth, their favourite place being a hollow tree, and usually at about twenty feet from the ground. On the 8th inst. one was noticed at that height in a hollow Elm some 200 yards from the gardens here, and half an ounce of cyanide of potassium was dissolved, a ladder placed in position, and a large wad of cotton-wool tied firmly to a stick was thoroughly soaked with the liquid and rammed well into the entrance, penetrating the nest. This was done at 3 p.m., and next morning 359 hornets, including four queens, were picked up at the foot of the tree. The majority were dead; some were crawling around, and a few were flying about unburnt. It was thought impossible to extract the nest, so a couple of shots from a sporting gun were fired into it, hoping to destroy any which had not been killed outright. Owing to the fact that the hornets work throughout the summer nights they are difficult to destroy, and for this reason it is safest to kill them in full daylight, the operator wearing a veil and gauntlets, as their sting is very poisonous. I send some queens, a few workers, and a wasp—the latter for comparison. Charles Hodgson, *Acton Place Gardens, Acton, Suffolk*.

**The Romance of Our Trees.**—Mr. Wilson's love of plants and gardens is at least as great as his passion for roving about the world, "searching remote regions" for Nature's best. His success as collector and introducer has been proclaimed from the house tops, and the world's horticulture has quickened as a result of his efforts. Before he went collecting he revealed at Kew extraordinary gifts as a cultivator and student, and he still retains that admiration for a beautiful plant, well grown, that distinguishes the real gardener. Although his interests are now American—more's the pity!—British horticulture still fascinates him, and during his recent short stay in England, after a tour in tropical countries beyond Suez, he spent most of his time visiting gardens and nurseries with all the keenness of a novice whose spurs have yet to be won. To hear Wilson talk about plants is to get inspiration, and to read what he finds time to write about them is to be enthused with his spirit. Two books by him have recently been published, and there are others, we believe, in preparation, including one about Eastern Lilies. One of the two issued he calls "Aristocrats of the Garden," and in it tells much that is interesting about the best plants he has met with in his travels. The other, now noticed, is Wilson's effort to tell of the "intimate association of trees and mankind from the earliest times." It isn't so much what he says as his way of putting it that makes the book a delight. Wise men have written about trees and tree lore, but Wilson has struck a different note from theirs, and his chapters, or essays, as he calls them—sermons they might be called—endow trees with life and meaning. Their economic value is the prosaic side of them, but there is also the sentimental side. "They are indeed," he says, "the most vigorous expression of life and its most enduring form this planet boasts, and a nation's trees should be esteemed as national treasure." The particular trees chosen for their romantic associations are the Ginkgo, Cedar of Lebanon, Yew, Horsechestnut, Magnolia, Beech, Poplar and Willow. Our common fruit and nut trees also come into the romance. There are twenty-four illustrations, all worthy of the subject, and the type and paper are good. The book is dedicated to Professor Charles S. Sargent, Founder and Director of the Arnold Arboretum, "who has done more than any other man in America to awaken an interest and promote knowledge in the trees of the Northern Hemisphere." A notice of this book has already appeared (page 63), but I could not refrain from adding a few words. W. W.

**Wasps.**—Mr. Markham, on page 134, remarks how scarce wasps are this season. They are a plague here. I have taken eleven nests up to date, and they are still far too plentiful. I expected them to be very scarce this summer, as only five queens were seen this spring; usually over a hundred are killed here each evening. The queens were very late in making an appearance this year. The first seen this spring was on May 7, compared with March 5 last year, or ten weeks later. The reason so few were seen is during the time the Gooseberries and Cotoneasters were in flower the weather was very cold, and prevented them venturing out, and they found new pastures from which to get their food. D. H. Dunn, *Aberystwyth*.

**Collerette and Collarette.**—It is gratifying to find (p. 127) that somebody besides myself objects to the use of the mongrel word "Collerette." There is no such word in the English language, and if it is necessary to translate the French word at all, then the proper English equivalent is "Collaret," meaning a small collar. The persistent use of "Collerette" by certain persons is probably due to the adoption of that form by the National Dahlia Society, in whose schedule it has invariably appeared. We sometimes borrow a foreign word for convenience just as we did "pompon." I protested on numerous occasions against the spelling of this word "pompon," which, for a time, was systematically used by certain persons in the Dahlia world. For such a form there is no justification. C. H. P.

## SOCIETIES.

### ROYAL HORTICULTURAL.

SEPTEMBER 19.—Despite the cold and wet day there was a goodly attendance of Fellows and visitors at the Royal Horticultural Hall, Westminster, and those who braved the elements were amply rewarded by the large and brilliant exhibition provided for their inspection. Dahlias occupied the major part of the hall, and of these handsome autumn flowers there were two Gold Medal displays. Hardy autumn flowers, Clematis, Begonias, "China" Asters and admirably cropped fruit trees in pots were the other principal subjects of interest. There were very few novelties, other than the twenty-one Dahlias selected for trial at Wisley.

#### Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Messrs. Jas. O'Brien (Hon. Sec.), Gurney Wilson, Arthur Dye, C. J. Lucas, J. E. Shill, H. T. Pitt, Pantia Ralli, Frederick J. Hanbury, J. Wilson Potter, Stuart H. Low, and Chas. H. Curtis.

#### FIRST-CLASS CERTIFICATE.

*Laelio-Cattleya Pyramus* (L.-C. St. Gothard × L.-C. *Thurgoodiana*), from Messrs. CHARLESWORTH AND Co. A grand hybrid, in its main features nearest to L.-C. St. Gothard, but with that improvement to be expected by the second introduction of C. Hardyana, and consequently its parents C. Warszewiczii and C. Dowiana. The finely grown plant bore a strong spike of several perfectly formed flowers, the sepals and petals being clear mauve colour and the broad lip intense ruby-crimson with two yellow patches in the centre characteristic of C. Warszewiczii.

#### AWARD OF MERIT.

*Odontioda Renown* (Oda. *Coronation* × Odm. *Victory*), from Messrs. ARMSTRONG AND BROWN. A grand new *Odontioda* shown for the first time, with a very strong spike of twenty-seven flowers and buds, seven of them being fully expanded. The flowers, which are of the largest in *Odontioda* and of a fine shape, are red with a narrow white margin, the lip being white in front and red around the clear yellow crest.

#### CULTURAL COMMENDATION.

To Mr. J. E. SKILL, gardener to Bruno Schröder, The Dell Park, Englefield Green, for a finely grown specimen of the large chrome yellow *Brasso-Laelio-Cattleya Amber*, the spike bearing three flowers each over eight inches across. A First-Class Certificate has been previously given to the plant.

#### GROUPS.

A Silver Flora Medal was awarded to Messrs. ARMSTRONG AND BROWN, Orchardhurst, Tunbridge Wells, for a group of specially well-grown plants, amongst which were three noble specimens of varieties of *Cattleya Iris*; their richly coloured *Laelio-Cattleya* Geo. Woodhams, which has played such an important part in hybridising; a new and fine form of L.-C. Henry Greenwood, and other *Laelio-Cattleyas* and *Cattleyas*, the tawny-yellow C. Maronii being well represented. Messrs. CHARLESWORTH, Haywards Heath, were also awarded a Silver Flora Medal for a group of showy hybrids in splendid condition, the best being the new *Laelio-Cattleya Pyramus*, which secured a First-Class Certificate. The collection included *Laelio-Cattleya* St. George, a variety with large and richly coloured flowers, and other *Laelio-Cattleyas*; the clear yellow *Brasso-Cattleya Soirano*, the charming, delicately tinted B.-C. Caroline (B.-C. *Rutherfordii* × C. *Dowiana aurea*), and a good selection of *Cattleyas* and *Odontoglossums*. Specially interesting were the rare *Cypripedium* J. H. Veitch; and C. *Kimballianum*, the latter a natural hybrid.

A Silver Banksian Medal was awarded to Messrs. SANDERS, St. Albans, for an interesting group, in which were the new *Cattleya nivea* (Leopoldii alba × Lady Veitch), a promising white flower, well intermediate between the two parents and promising well when mature; C.

*Dupreana alba*, the pretty and fragrant C. *Kienastiana*; *Laelio-Cattleya Soulange* and other *Laelio-Cattleyas*, *Odontoglossums* and the perpetual-flowering *Odontonia brugenis*, with several sprays of bright mauve flowers.

Messrs. FLORY AND BLACK, Slough, showed the handsome *Laelio-Cattleya Chimaera* var. *Rosita* (C. *Dowiana* × L.-C. *Hector*), a large cream white flower with entirely deep claret crimson lip; the new *Brasso-Cattleya Caduceus* (C. *Caduceus* × B.-C. *Digbyano-Mendelii*), a large, cream white flower with sky-blue front to the lip; a fine form of their handsome B.-C. *Ilene*; and the handsome *Cirrhopetalum Rothschildianum*.

Messrs. STUART LOW AND Co., Jarvisbrook, showed the handsome *Cattleya Sauvior* var. *picta* (intermedia *Aquinii* × *Mendelii*), a neat, white flower of good substance with purple blotch on the petals and purple front to the lip, and a pretty *Laelio-Cattleya* hybrid of L.-C. *Colmaniana*.

#### Floral Committee.

Present: Messrs. H. B. May (in the chair), G. Reuthe, Geo. Harrow, John Heal, W. Howe, C. R. Fielder, Donald Allan, Arthur Turner, D. B. Crane, Chas. E. Shea, Chas. E. Pearson, W. P. Thomson, R. W. Wallace, Gerald Loder, Hugh Dickson, A. G. Jackman, W. B. Gingell, E. A. Bowles and Reginald Cory.

#### AWARDS OF MERIT.

*Codonopsis tibetica*.—A twining plant with more or less lanceolate, dull green leaves. The flowers are borne singly or three or four together; they are five-petaled, soft blue, with darker blue veins; the stamens almost rest on a round boss-like base in the centre of the flower and the roundish fuzzy stigma is shortly stemmed and of a deep rose-red shade. This is one of the plants collected by Forrest. Shown by Mr. A. K. BULLEY, Ness, Neston, Cheshire.

*Aster Queen of Colwall*.—An excellent addition to large-flowered Michaelmas Daisies. It is robust and the stems carry a great sheaf of showy semi-double flowers and in many instances the lower branches on a stem carry one flower measuring about 2½ inches in diameter. The colour is a pleasing shade of bright lavender blue. Shown by Mr. BALLARD, Colwall.

*Pyrus Malus transitoria*.—This handsome variety has deep green leaves, which are often somewhat deeply cut and suggestive of the Hawthorn. The fruits, borne in pendulous, axillary clusters on the stiffly branching growths, are like quite small cherries and of a rich cherry-red colour, almost scarlet, sometimes shaded with yellow. Shown by C. J. LUCAS, Esq., Warnham Court.

*Gentiana Kurroo*.—An interesting species which sends up dark, shining stems in late summer or autumn, and these carry several rich blue flowers, paler in the interior. According to Mr. Reginald Farrar in *The English Rock Garden*, "these dark and shining stems, although so solid, do not stand erect, but lie along the ground for 4 or 5 inches and then rise up with the grace of a swan's neck, to show off at respectful distances from each other those three or four magnificent great flowers, widely gaping cups of pure rich blue with folded lobes, and flecked with interior pallors, and altogether lovely." Shown by Mr. W. WELLS, junr., Merstham.

(Varieties of Dahlias selected for trial at Wisley will be described in the next issue.)

#### GROUPS.

The predominance of Dahlias plainly indicated that the National Dahlia Society were unfortunate in the choice of date for their annual show, and had it been a fortnight later a really splendid show would have been the result. The quality at the show a fortnight ago was not surpassed on the present occasion, and it was in the matter of quantity that the exhibits were superior. This, in the circumstances, was inevitable, and due to the general backwardness of the season. Mr. H. J. JONES had a large and imposing display of highly decorative Dahlias, of which the most prominent were such white varieties as *Roem van Aalsmeer*, *White Queen* and *Triumph*, though the large *Paeony-*

flowered section was also well represented, and of these *Duchess of Brunswick*, *Carmen Sylva* and *Nancy* were particularly charming. In other parts of the hall Mr. JONES staged very good herbaceous *Phloxes* and *Montbretias* (Gold Medal). Messrs. DOBBIE AND Co. also filled a large space with a first rate collection of Dahlias. Here it was the *collechettes* that claimed first attention, and a selection would include *Scarlet Queen*, *Glencoe*, *Linnet* and *Clyde*. The *Cactus*, *Star* and *Single* sections were also represented, and in front there were vases of *Pompons*, including *Ideal*, *Bacchus*, *Dagmar*, *Little Beeswing* and *Regulus* (Gold Medal).

*Pompon* Dahlias were also splendidly shown by Messrs. J. CHEAL AND SONS, but even these were surpassed by the great excellence of their highly decorative *Star* and *Single* varieties. Of the latter Mrs. J. HICKS, *Betah*, *Marion*, *Lady Bountiful* and *Talma* are the names of only a few so well displayed (Silver-Gilt Banksian Medal). In a very attractive collection by Mr. J. T. WEST the *Decorative* and small *Paeony*-flowered varieties were very delightful. Of the latter several seedlings, *Kenneth*, *Freddie* and *Lovelight* found many admirers, while the very best of the former were *The Prince*, *Nancy*, *Delightful* and *Windermere* (Silver Flora Medal).

*Cactus* varieties were prominently displayed by Messrs. CARTER PAGE AND Co.; *Pennant*, *White Queen* and *Border Yellow* were of value. *Lady Derby* and *Canary* of the *Decorative* and *Beauty* and *Oriana* of the *Paeony*-flowered section were also of great merit (Silver Flora Medal). In a noteworthy collection by Messrs. BERRELL AND Co. the small *Paeony*-flowered varieties were especially beautiful, and these included *Jessie*, *Oliver*, *Fusee*, and some fine seedlings (Silver Flora Medal). Brilliant colour was provided by such sorts as *Freebooter*, *Red Chief* and *Nelson's Xarifa* in a collection by Mr. J. B. RIDING. Regularity and *Diadem* amongst the *collechettes* were also of great merit (Silver Flora Medal).

Messrs. SUTTON AND SONS again set up a very large collection of "China Asters" from their trial grounds. These occupied nearly the whole of the end of the hall and illustrated all the different classes of this popular flower. The most graceful were the large baskets of elegant singles and *sinensis* varieties in many charming shades of colour. Amongst the great number of double-flowered sorts the deep, rich colour of *French Blood Red* and *Scarlet Mammoth* was splendid. The *Ostrich Plume* varieties were also of much more than ordinary quality (Silver-Gilt Banksian Medal).

General border flowers were very plentiful and in great variety. Mr. F. G. WOOD had a large and highly meritorious collection. Amongst the many *Michaelmas Daisies* the massed sprays of the dark blue *Rev. Chas. Lunn* were especially effective. Mr. WOOD also showed various alpine, and miniature rock gardens (Silver-Gilt Banksian Medal). A large collection of *Michaelmas Daisies*, principally of the older varieties, was arranged by Messrs. W. H. CURBUSH AND SON (Silver Flora Medal), while in a corner space Mr. ERNEST BALLARD had a very effective display. *Anita Ballard*, medium blue, *Little Boy Blue*, a dark blue of sturdy habit, *Bee's Pink* and *Aster cordibellii*, a graceful hybrid between *A. cordifolia* and *A. Novibelgii*, were all highly decorative (Silver Banksian Medal). Near the annex Messrs. WATERER, SONS AND CRISP associated *Michaelmas Daisies* with some excellent *Lupins*, *Gladioli*, *Delphiniums*, and other border flowers (Silver Banksian Medal). Messrs. J. PIPER AND SON also showed various perennial Asters and had Dahlias and *Pentstemons* of fine quality (Silver Flora Medal).

Besides a good collection of general border flowers, amongst which various herbaceous *Phloxes* and *Lupins* were very prominent, Mr. W. WELLS, junr., showed several pots and pans of the interesting *Gentiana Farreri* (Silver Banksian Medal). Mr. J. REUTHE had his usual collection of border flowers and alpine, and a couple of vases of flowering sprays of *Clethra arborea* (Silver Flora Medal). Messrs. ISAAC HOUSE AND SONS showed a quantity of excellent

varieties of *Scabiosa caucasica* (Silver Flora Medal). Messrs. B. LADHAMS, LTD., included many excellent varieties of tall *Lobelias* in their collection of border flowers. Of the many varieties, *L. carmineus*, *D. Ladhams*, Mrs. Humbert and Shirley Beauty were highly decorative (Silver Flora Medal). Messrs. RICH AND CO. had *Phloxes* and *Asters* (Bronze Flora Medal).

A good strain of *Antirrhinum* was staged by the CHALK HILL NURSERY Co. with well-formed *Lupins* and *Pentstemons*, while along the front they had a great many of the large-flowered *Mimulus*, which they grow so finely (Silver Banksian Medal). Messrs. MAXWELL AND BEALE (Silver Banksian Medal); Messrs. G. G. WHITELEGG AND Co. had various *Kniphofias* and *Gladioli* (Silver Banksian Medal); Mr. T. CARLIE showed *Phloxes*, *Lupins* and *Kniphofia corallina* with other hardy flowers (Silver Flora Medal), and the Misses HOPKINS had various interesting border flowers and a small rock garden (Bronze Banksian Medal).

*Gladioli*, chiefly *Primulinus* hybrids, were set up by Messrs. LOWE AND GIBSON (Bronze Flora Medal). A goodly collection of *Clematis*, flowering in relatively small pots, was included in an exhibit by Messrs. L. R. RUSSELL, LTD. The principal varieties were Nelly Moser, Ville de Lyon, President, Viscountess Northcliffe and Lasurstein (Silver Flora Medal).

Early-flowering *Chrysanthemums* were shown by Messrs. KEITH, LUXFORD AND Co. and Mr. N. YANDALL. The former included good vases of *Red Anemone*, *Mary Mason*, *J. Bannister* and a collection of pretty *Pompon* varieties (Silver Flora Medal). Mr. YANDALL had various seasonable varieties and also showed a good collection of *Violas* (Silver Flora Medal). Messrs. J. CHEAL AND SONS contributed, in addition to their *Dahlias*, an interesting group of cut sprays of trees and shrubs. Various fruiting *Crabs* include the *Dartmouth* and *Transcendent*. Flowering shrubs were represented by sprays of *Indigofera Dosua*, shrubby *Veronicas*, *Daboecia polifolia*, and *Buddleia variabilis* var. *magnifica*.

*Carnations* of great merit were staged by Mr. C. ENGELMANN, Messrs. ALLWOOD BROS. (Silver Flora Medals), and Messrs. STUART LOW AND Co. (Silver Banksian Medal). The chief varieties were *Tarzan*, *Wivelsfield Apricot*, *Wivelsfield White*, *Marian Willson*, *Thor*, *Delice*, *Vindictive* and *Royal Emblem*.

In the annexe Mr. G. W. MILLER staged an attractive collection of border flowers. Fresh and fragrant *Violets* were shown by Mr. J. J. KETTLE and Mr. B. PINNEY.

**Fruit and Vegetable Committee.**

*Present:* Messrs. C. G. A. Nix (Chairman), S. T. Rivers, J. Cheal, P. C. M. Veitch, Geo. F. Tinley, S. B. Dicks, J. C. Allgrove, G. P. Berry, E. Neal, A. Bullock, W. Bates, E. A. Bunyard, W. H. Divers, Rev. W. Wilks, and A. W. Metcalfe.

Mr. J. C. ALLGROVE, nurseryman, Middle Green, Langley, showed his beautiful new *Apple S. T. Wright*, which received an Award of Merit on October 21, 1913, the fruits being submitted on this occasion for the higher award of a First-Class Certificate. This is a remarkably handsome variety; the skin is heavily marked with bright red streaks and is suffused over nearly the whole of the surface with a glowing rose colour. It is more handsome than such highly coloured sorts as *Gascoyne's Scarlet* and *Peasgood's Nonesuch*, and promises to be of great value for exhibition purposes in mixed collections of choice fruits. It is stated that the variety is in season until January.

Messrs. T. RIVERS AND SON exhibited a number of pot *Plum* trees very heavily fruited. The varieties were *Coe's Golden Drop*, *Coe's Violet*, *President* and *Late Orange* (Silver-Gilt Hogg Medal). A *Bronze Hogg Medal* was awarded to Messrs. D. PRIOR AND SON, Colchester, for an exhibit of *Apples* and *Pears*. It was a representative collection of varieties in season.

Mr. P. C. M. VEITCH showed an old *Devon Apple* named *Sweet Reinette*. Mr. Veitch stated that this is a favourite *Devon Apple*, but he could find no record of it. Mr. Bunyard considered that it most nearly resembled

*Fenouillet de Gris*. The variety is not mentioned by Hogg in the *Fruit Manual*, but appears in *Barron's British Apples*, and was shown by Sir T. D. Acland, Bt., M.P., Killerton, Exeter, at the National Apple Congress of 1883. Baron describes it as follows:—dessert, small, flat, golden russet, sweet, late and resembles *Pitmaston Russett Nonpareil*.

The only exhibit of vegetables was shown by the CHURCH ARMY from an allotment on waste ground within a short distance of the Hall.

**ROYAL CALEDONIAN HORTICULTURAL.**

September 13 and 14.—The autumn show of this Society, which was held in the Waverley Market, Edinburgh, on these dates, was the best which has been held by the Society since pre-war days, and there was also a decided increase in the number of entries, which were just over 1,100, against 950 last year. The exhibits of fruit were very good, although the effect of the want of sufficient sunshine was evident in the hardy fruit section; taken generally, however, the quality was decidedly above the average. The displays of vegetables, and especially of *Potatoes*, made by the garden allotment holders belonging to the Edinburgh and District Federation, whose exhibition was again held in conjunction with the show, was exceedingly good, and surpassed all their former efforts. The trade exhibits were of great excellence, and on this occasion the President, Mr. David King, introduced a novel feature at these shows in the form of a neatly executed and realistic piece of rock-work. At the formal opening of the show, the Lord Provost of Edinburgh took the chair, and the exhibition was declared open by the Countess of Minto. The weather was favourable, and the takings at the doors exceeded those of last year by about £130.

**GARDENERS AND AMATEURS.**

*Fruit.*—There were three entrants in the class for a decorative table, 6 ft. by 4 ft., of twelve dishes of fruit—namely, the EARL OF BALFOUR, K.G., Whittingehame, East Lothian (gr. G. Anierison), JOHN NEILSON, Esq., of Mollance, Castle Douglas (gr. J. M. Stewart), and the MARCHIONESS OF TWEEDALE, Yester, East Lothian (gr. A. McLeod). The first prize of £5 5s., with the Laird and Dickson special prize of silver plate, to be won three times, was awarded to the EARL OF BALFOUR, who obtained 9½ points out of a possible of 114. His fruits were *Grapes*, *Muscat of Alexandria* and *Appley Towers*; *Peaches*, *Dymond* and *Princeps of Wales*; *Nectarines*, *Humboldt* and *Pine Apple*; *Apricot*, *Moorpark*; *Melon*, *Universal*; *Apples*, *Emperor Alexander* and *Peasgood's Nonesuch*; and *Pears*, *Marguerite Marillat*. Mr. NEILSON was placed second with 86 points, and the MARCHIONESS OF TWEEDALE third with 78½ points.

In the class for six bunches of *Grapes*, not fewer than three varieties, and not more than two bunches of any variety, there were also three entrants, and the first prize of £4 and a gold badge, with the Thomson Challenge Trophy for *Grapes* (to be won three times), was awarded to Mr. NEILSON; second, LADY WATSON, Farnock, Hamilton (gr. D. Halliday); and third, Sir HERBERT E. MAXWELL, Bart., Monreith, Wigtownshire (gr. S. Gordon). The points awarded to Mr. NEILSON's bunches were as follow:—

	Points awarded.	Maximum
1. Muscat of Alexandria ...	8	10
2. Muscat of Alexandria ...	7½	10
3. Black Hamburg ...	8½	9
4. Black Hamburg ...	8	9
5. Madresfield Court ...	7½	9
6. Madresfield Court ...	8	9
	47½	56

Lady WATSON's bunches obtained 42 points out of 55, and Sir HERBERT MAXWELL's 41 out of 55. Having now been won three times by the same competitor, the Thomson Trophy becomes his property.

For four bunches of *Grapes*, distinct varieties, the first prize was awarded to GILBERT F. M.

Ogilvy, Esq., Winton Castle, East Lothian (gr. J. McFadyen). Mr. NEILSON was placed first for two bunches of *Muscat of Alexandria*, and in the single-bunch classes for *Muscat of Alexandria*, and *Black Hamburg*. Major C. L. GORDON, Threave House, Castle Douglas (gr. J. Duff), excelled for two bunches of *Black Hamburg*, and in the single-bunch classes; Lady WATSON excelled for *Alicante* and *Madresfield Court*, and Mr. OGILVY for *Appley Towers* and *Gros Colman*.

Lady WATSON also excelled for one green or white-fleshed *Melon*, with *Emerald Gem*, and for one red-fleshed *Melon*, with *Superlative*. Mr. R. McQUEEN, Dalkeith Palace Gardens, Midlothian, was placed first for twelve *Figs*, with *Brown Turkey*, and Mr. W. ATTCHISON, Thurston Gardens, East Lothian, excelled for six *Peaches*, with *Royal George*. D. LANDALE, Esq., Dalswinton, Dumfries (gr. R. A. Grigor) was first for six *Nectarines*, with *Humboldt*, and FRANK J. USHER, Esq., Dunglass, East Lothian (gr. J. Notman), was first for twelve *Apricots*, with *Moor Park*.

In the *Plum* classes, for fruits from trees grown out of doors, Lady WATSON excelled for *Gages*, with *Transparent Gage*; Mr. J. McKENZIE, Lochend Gardens, Dunbar, for yellow *Plums* (excluding *Jefferson*), with *White Magnum Bonum*; Major C. L. GORDON, for twelve red *Plums*, with *Pond's Seedling*; and the Honourable Mrs. ASKEW ROBERTSON, Ladykirk, Norham (gr. G. Little), for purple *Plums*, with *Kirke's*. Sir W. H. MAY, Bughtrigg, Coldstream (gr. J. Loan), was first for a collection of dessert *Plums*, and Mr. USHER for a collection of culinary *Plums*.

For fruit from trees permanently planted out of doors, W. M. CURZON HERRICK, Esq., Beau Manor, Loughborough (gr. J. J. Stewart), excelled for six varieties of *Apples*, five fruits of each, while for twelve varieties, five fruits of each, grown in Scotland, Major GORDON was placed first. Mr. J. MALCOLM, Dunbar, excelled for two varieties of dessert *Apples*, fit for the table, grown in Scotland. In the single-dish classes, six fruits of each, restricted to growers in Scotland, Mr. J. P. REID, Aberlady, East Lothian, excelled for *Newton Wonder*, *Ecklinville Seedling*, *Warner's King*, and *Bramley's Seedling*; Mr. D. FRASER, Saltoun Hall Gardens, East Lothian, for *Gascoigne's Scarlet*; Sir W. H. MAY, for *Irish Peach*; Sir H. E. MAXWELL, for *James Grieve*, and *Lord Suffield*; Major GORDON, for *Worcester Pearmain*, *Grenadier*, *Lord Derby*, and *Lord Grosvenor*; J. J. BELL IRVING, Esq., Makerston, Kelso (gr. R. Auldjo), for *Peasgood's Nonesuch* and *Stirling Castle*; Mrs. BAIRD, Colstoun, East Lothian (gr. J. McCartney), for *Golden Spire*, and Sir R. WALDIE GRIFFITH, Bart., Hendersyde Park, Kelso (gr. G. S. Macdonald), for *Lane's Prince Albert*.

For six varieties of *Pears*, four fruits of each, grown in Scotland, Mr. J. MACKENZIE, Dunbar, was placed first, and in the single-dish classes, six fruits of each, also grown in Scotland, Mr. D. FRASER, Saltoun Hall Gardens, excelled for *Beurré d'Amanlis*; J. B. HOTHAM, Esq., Milne Graden, Coldstream (gr. W. Clayton), for *Doyenné du Comice*; Mr. J. P. REID, for *Durondeau*, Mr. J. MACKENZIE, for *Jargonelle*, Mr. W. ATTCHISON, for *Louise Bonne of Jersey*; the MARCHIONESS OF TWEEDALE, for *Pitmaston Duchess* and *Souvenir du Congrès*, and the EARL OF BALFOUR, for *Williams' Bon Chrétien*.

*Plants.*—In this section the first prizes were awarded as follows:—Mr. R. KERR, Edinburgh, for nine dwarf hardy *Ferns*; JOHN TURNER, Esq., Inverarmund, Midlothian (gr. J. A. Sword), for three single tuberous-rooted *Begonias*; Mrs. J. CAMPRELL, Dolphinton, Peebleshire (gr. W. Howieson), for two tuberous-rooted *Begonias* (single and double). Mrs. E. H. BEVERIDGE, Beechwood, Kirkcaldy (gr. P. Reid), for two *Fuchsias*, one *Fuchsia*, three *Zonale Pelargoniums*, and two *Coleus*.

*Cut Flowers.*—The winners of the first prizes in this section were as follow:—Mr. J. RICHARDSON, Polmont, for twelve vases of *Phloxes*; Mr. D. WHITELAW, Laurencekirk, for twelve *Gladioli*, and six *Gladioli*; Mr. CLAUDE JEN-

KINS, Cambuslang, for six bunches of colerette Dahlias, six bunches of single Dahlias, six vases of early-flowering Chrysanthemums (disbudded and not disbudded), one vase of white early-flowering Chrysanthemum, and one vase of early-flowering yellow Chrysanthemum; Sir W. H. MAX, for twelve bunches of Sweet Peas; CLAUDE ALLAN, Esq., Kilmahew Castle, Cardross (gr. R. Middleton), for six bunches of Sweet Peas; Mr. J. MATTHEWS, Uphall, for twelve Fancy Pansies; Mr. T. LEES, Nempflar, Lanark, for twelve Show Pansies; Mr. J. NELSON, Dalkeith, for twelve bunches of Violas; Mrs. SELLAR, Drylaw House, Midlothian (gr. W. Galloway), for one vase of early-flowering Chrysanthemum (not disbudded); Col. Sr. CLAIR OSWALD, of Dunnkeir, Kirkcaldy (gr. R. Astley), for one vase and other early-flowering Chrysanthemum (not disbudded); Major A. D. FORBES GORDON, Ashiestiel, Selkirkshire (gr. J. Cochrane), for one vase of Michaelmas Daisies; Sir BASIL MONTGOMERY, Kinross House, Kinross (gr. R. Fraser), for three vases of Montbretias, and six bunches of hardy perennials; Col. MORE NISBETT, The Drum, Midlothian (gr. D. Armstrong), for four bunches of Antirrhinums; Mr. P. DONALDSON, Blackford, Perthshire, for twelve French Marigolds; Mr. J. STEVENSON, Melrose, for six vases of annuals; Mrs. REID, Thomanean, Milnathort (gr. J. Pearson), for eighteen vases of cut flowers; FRANK WARRACK, Esq., Kersewell, Thurston, for two vases of perpetual-flowering Carnations.

In the Rose classes, the first prizes were gained by the following:—Mr. LAURENCE BLACK, Kinglassie, Fife, for twenty-four blooms; G. H. MACNEAL, Esq., Dhallingmohr, Kinn (gr. D. Murchison), for twelve H.T. Roses, one vase of a Rambler Rose, and one vase of Roses (four blooms); Mrs. RUSSELL, Newton Mearns, for six of any crimson or Scarlet Rose; for six blooms of any pink Rose, and for six vases of Roses (six varieties); Sir BASIL MONTGOMERY excelled in the class for six white Rose.

OPEN CLASSES.

Cut Flowers.—Messrs. G. MAIR AND SONS, Prestwick, won the first prize for twenty-four spikes of Gladioli, and Messrs. TORRENCE AND HOPKINS, Busby, won the first prize for six vases of colerette Dahlias. In the Rose section, Messrs. HUGH DICKSON, LTD., Belfast, were placed first in the classes for thirty-six Roses; eighteen H.T. Roses; twelve blooms of any pink Rose; twelve of any white Rose; and twelve vases of roses; Messrs. G. PATON AND SONS, Dundee, for eighteen Tea Roses; and Mr. R. C. FERGOUSON, Dunfermline, for twelve blooms of a red or crimson Rose, and twelve vases of garden or decorative Roses. Messrs. T. SMITH AND SONS, Stranraer, were awarded the first prize for a bowl of China Roses.

Vegetables.—For a collection of twelve dishes of vegetables, Mr. J. GRAY, Uddingston, was placed first with 61 points out of 76, the EARL OF BALFOUR being second with 59½ points, and G. F. M. OGLIVY, Esq., third, with 58 points. These exhibits were excellent, and the competition was very keen. Mr. GRAY was also first for six varieties of Potatos, six tubers of each; while D. LANDALES, Esq., excelled for twelve varieties, six tubers of each. In the single-dish classes, the first prizes were awarded as follow:—Major A. D. FORBES GORDON, for kidney Potatos; Mrs. RUSSELL, Inchdairnie, Fife (gr. P. Bell), for round Potatos; Major C. L. GORDON, for French Beans, Broad Beans, White Turnips, and Celery; JAMES HOOD, Esq., Lasswade (gr. N. Leyden), for Cucumbers; Mr. R. MASON, Lanark, for Tomatos and Cauliflowers; Sir W. H. MAX, for long Carrots, and stump-rooted Carrots; Col. R. AIKMAN, Hamilton (gr. R. Macdonald), for Peas; J. TURNER, Esq., for Cabbages; W. S. DAVIDSON, Esq., Leuchie, North Berwick (gr. J. M. Mason), for Brussels Sprouts; F. NORIE MILLER, Esq., Perth (gr. H. Young), for Savoys; Lord HAWKE, Glasclue, North Berwick (gr. M. Matheson), for Leeks; Mr. T. WATSON, Carluke, for Onions; Mr. C. JENKINS, for Parsnips and Beet; Mr. P. LAWRIE, Kirknewton, for Curled Greens; D. LANDALE, Esq., for yellow Turnips; and Mr. J. WATT, Carnwath, for Lettuce.

(To be concluded.)

REMARKS.—Trade generally has shown some improvement during the past week. With fewer Plums available, values in some sections tended to improve, but generally speaking, up to time of writing, any advance in prices is duly checked by sales. Choice fruits, such as Grapes, Peaches, Nectarines and Figs, are plentiful, and moderately cheap, the fairly heavy supplies of Grapes from Belgium and Guernsey being adverse factors. A good demand exists for well coloured dessert Apples, but prices keep low, and many growers are holding stocks of Worcester Pearmain for improvement in values. Large cookers are in request, and supplies go out freely. Apples arriving from America and Nova Scotia, as well as from the Continent, and these imported fruits are doubtless influencing adversely the prices of home grown Apples. Plums are much better trade, supplies mainly consisting of Monarch and a Pond's Seedling. Damsons and Prunes are fairly plentiful, and quotations keep steady. Pears are a good market, particularly William's Bon Chretien. The variety Calabasse is also inquired for. Increased quantities of Oranges from South Africa have caused a fall in prices, for this fruit. Home grown Tomatos firmer in price, due to shorter supplies and fewer Tomatos from Dutch and Jersey growers. Cucumbers are quoted slightly firmer. Kent Cob Nuts are in fairly heavy supply, and although very low in price, are not selling very freely. Vegetables are still very plentiful and cheap, and at the moment there is but slight prospect of an improvement in their value. Potato stocks are in excess of the demand.

Plants in Pots, etc.: Average Wholesale Prices. (All 4's except where otherwise stated.)

REMARKS.—Ericas are the newest and most attractive subjects, consisting of E. gracilis and E. nivalis. These are on sale in forty-eight's and sixty sized pots. Chrysanthemums in pots include well grown plants. A few Solanums are on offer, but there is only a small demand for them. Trade generally is quiet.

ANSWERS TO CORRESPONDENTS.

CANKER ON ROSE TREES: E. S. The trouble is due to the presence of a fungus named Coniothyrium Fuckelii, which often causes cankers on the stems of Roses. Cut off and burn the affected parts.

IDENTIFICATION OF FRUITS: D. B. R. For the purpose of identifying Apples and Pears you will find Mr. E. A. Bunyard's Handbook of Hardy Fruits a most useful work, while for the cultivation of fruits in general we recommend Fruit and its Cultivation, by T. W. Sander. These works may be obtained from our publishing department, price 8s. 3d. post free, each.

MELON PLANTS DISEASED: J. B. The plants are affected with both a fungus (Verticillium) on the roots and a bacterium in the stem-tissues. All affected plants should be destroyed and fresh soil used.

NAMES OF FRUITS: F. H. 4, Apple Ribston Pippin; 5, Cox's Orange Pippin; 10, Pear William's Bon Chretien; 11, Marechal de la Cour; 13, Apple Washington Goff.—E. J. B. and Sons. Early Harvest. G. H. S. 1, Bramley's Seeding; 2, Echlinville Seeding; 3, Dumelow's Seeding (syn. Wellington); 4, Jolly Beggar; 5, New Hawthornden; 6, Wadhurst Pippin; 7, Duchesse d'Angoulême.—C. C. 1, Beurré d'Amanlis; 2, 3, 4, and 5, Durondau; 6, Conference; 7, Marguerite Marillat; 8, Beurré Bachelier; 9, Bonne d'Ezée (syn. Brockworth Park).—J. J. A. 1, Charles Ross; 2, Lord Derby; 3, Yorkshire Beauty; 4, Stirling Castle; 5, Cellini; 6, not recognised.—R. G. 1, Northern Greening; 2, Stirling Castle; 3, not recognised; 4, Early Nonpareil; 5, Broad End; 6, Cockle Pippin.—J. W. D. Pyrus Niedzwetzkyana (Crab Apple).

NAMES OF PLANTS: J. L. W. Fagopyrum esculentum, Buckwheat.—P. M. B. 1, Alyssum maritimum; 2, Cerastium Biebersteinii; 3, Saxifraga trifurcata (?); 4, S. ligulata; 5, Lysimachia vulgaris.

ST. BRIGID ANEMONES: P. M. B. St. Brigid Anemones are quite hardy. In heavy soils the tubers should be dug up after the plants have flowered and died down. Keep them in a cool place to ripen thoroughly and plant them again in autumn.

TOMATOS WITH HARD GREEN PATCHES: M. Q. and J. M. The hard green patches at the base of your Tomato fruits are not due to an attack by a fungus, but are generally ascribed to a lack of potash in the soil. In future use plenty of wood ash with the compost for Tomatos.

TREATMENT OF DECAY IN PLANE TREE: F. J. F. This work calls for expert treatment, because unless properly done the mischief is aggravated. The method employed depends on local considerations, but one often used is to thoroughly remove all decayed matter, dress the wound with Stockholm tar, and crown-fill with a wet mixture of one part cement, two parts sand and four parts gravel. It is most important that a perfect union is formed with the sides of the hole in the tree and that the filling does not crack.

WEED IN A LAKE: J. V. The water plant is Elodea canadensis, which is known as the Canadian Pond weed. This is a very difficult weed to eradicate from ornamental waters once it has become established, as every part of the plant will develop into a fresh specimen. The green scum on the water is probably one of the Algae, and this could be destroyed by copper sulphate. This should be placed in a sack and dragged through the water behind a boat. With regard to the Canadian Pond Weed, we can suggest no other means for its eradication than those you have adopted. The smaller weeds may be killed by copper sulphate.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 54.9.

CURRENT TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London. Wednesday, September 27, 10 a.m. Bar, 29.7, temp. 60°. Weather—Fine.

Few horticultural problems have given rise to more discussion than the subject of degeneration in Potatos. To many people, of course, the evidence for degeneration seems so clear and convincing that discussion is unnecessary. Certain varieties only too evidently deteriorate—in certain districts at all events—and in the course of a few years from bearing heavy crops come to produce scarcely any crop at all. It is but natural that cultivators who have observed examples of deterioration of this kind should have invented hypotheses to account for the phenomena. Of such hypotheses that of "degeneration" has been put forward frequently and often with high authority, and yet it may be said, with confidence, that this hypothesis is not supported by unchallengeable evidence, nor does it take into account all the known facts. Briefly stated, the hypothesis of degeneration claims that a Potato with a consistently falling yield is worn out—has become a victim of senile decay, and hence lacks the vigour necessary for the production of a crop of tubers. In support of this hypothesis, it is plausibly suggested that continued vegetative propagation necessarily weakens a plant's constitution, and those who support the degeneration hypothesis point to the unhealthy look of the degenerate plants, their curled leaves and poor stature, in support of the view that they have lost constitutional vigour. Recent discoveries, however, throw considerable doubt on the validity of this hypothesis, and many of the most experienced investigators of Potato problems are already inclined to

discard it. They will be encouraged in their inclination by a perusal of the extremely interesting paper read by Dr. Redcliffe N. Salaman at the International Potato Conference of last year.\* Dr. Salaman devotes the first part of his paper to a review of the arguments brought forward by observers of degeneration since the year 1795. Apparently Parmentier (1796) and Andrew Knight (1818) are responsible for the earliest formulations of the degeneration hypothesis, Knight maintaining that an individual can only live to a certain age, and that whether it is grown as a whole or divided into different individuals by budding and grafting, its span of life is limited. Yet, although we may admit the mortality of the undivided individual, there is strong evidence against the view that a plant propagated vegetatively necessarily becomes weaker with age and ultimately dies of senility. Vast numbers of plants of certain of the lower divisions of the vegetable kingdom reproduce themselves exclusively by vegetative division, and yet continue to flourish. Among the higher plants, as Dr. Salaman points out, the Banana is seedless and has never been known except as an asexually reproduced plant. Ancient varieties of the Vine still flourish, and many existing varieties of Apple and Pear date back to the time of the introduction of the Potato. The Jerusalem Artichoke, introduced about the same time as the Potato, is still irrepressibly vigorous and yet is propagated by tubers. Taking all the known facts into consideration, it would seem that the proper conclusion to draw is that continued vegetative propagation does not necessarily lead to loss of vigour, and that, provided the plant is of a constitution sufficiently strong to enable it to resist the attack of enemies and adverse meteorological conditions, it can maintain itself indefinitely by means of vegetative propagation. The difference between such a plant and one propagated by seed would appear to be that, whereas the latter may produce offsprings, some of which are of stronger constitution and it may be different in other respects from the parents, the successive generations of the asexually produced plant are, with the rare exceptions of bud sports, of the same constitution as, and similar in all other respects to, the original parent which begat them. If the degeneration hypothesis were true then it would be expected that all the plants of a given variety would show degeneration at the same time. That this is not the case is illustrated by such facts as those cited by Dr. Salaman with respect to the once popular variety Magnum Bonum. In England, this variety has passed out of cultivation because English stocks deteriorated, yet at the present day this variety is the one most grown in Sweden, where it has been in cultivation for the past fifty years. Again, if there were a natural term of years to the life of a vegetatively produced plant it would be expected that all varieties of Potato would, after a definite period of years, show degeneration. This, however, is not the case. Some show signs of deterioration very early, others after a few years of cultivation, and others, if at all, only after very long periods. There is, however, a method of putting this controversy to the crucial test of experiment. Degeneration, if it means anything at all, means that the cells and tissues of the degenerate plant have suffered deterioration. Among these deteriorated cells the reproductive cells are included. Therefore the sexually produced offspring of a degenerate

variety should also show degeneration. This test Dr. Salaman has applied, and the results of his experiments, fully described in his paper, show that the sexually-produced offspring of plants which have undergone progressive deterioration exhibit the cropping power of the parents in the heyday of their existence before signs of deterioration began to appear. It is, therefore, to be concluded that deterioration is a sign not of an inevitable degeneration or senility, but of constitution. Like all plants, the Potato is beset with enemies. Whether it is to fall a victim to, or to resist their attack, depends on constitution. A variety of weakly constitution succumbs, a variety of stronger constitution puts up a stronger resistance, but may ultimately fall a victim to successive attack, and a variety of yet stronger constitution may resist indefinitely. All recent discoveries with respect to the diseases of the Potato support this view. Among these diseases are several of a peculiarly insidious nature. Chief of these are Leaf Curl, and it is significant that in deterioration of yield the mark of degeneration is accompanied by the same signs—crinkling of leaf, loss of stature, brittleness of haulm—as those evoked by the obscure but undoubtedly infectious disease known as Leaf Curl. The conclusions to be drawn from these observations are, that varieties of Potato, all of which originated as seedlings, differ from one another in power of resisting diseases, that power of resistance varies also with locality—a district which is an ideal one for Potatos being naturally one in which soil and meteorological conditions favour the Potato and aid it in its resistance to attack of disease; that in less favoured districts the balance of power is transferred to the attacker, and as a result, the variety becomes diseased and shows its unhealthy condition in the poorness of its crop. The discussion is not of merely academic importance; it has important practical issues. If degeneration means disease, then the problem is open to experimental solution. The plant-breeder has the power to abolish or at least mitigate degeneration by breeding varieties which are resistant to such diseases as Leaf Curl and Leaf Roll. This is the conclusion reached by Dr. Salaman, and we think that those who study the argument, which is set forth in his paper, will agree that it is sound.

Royal Horticultural Society's Great Autumn Show.—The exhibition arranged by the Royal Horticultural Society to be held in Holland Park Skating Rink on Tuesday, Wednesday, Thursday, and Friday, October 3, 4, 5, and 6, promises to be a great success. The Skating Rink is nearly four times the size of the Royal Horticultural Hall, and we understand that every inch of space will be fully occupied by exhibits. The schedule provides thirty-eight classes for vegetables and one hundred and five classes for fruits, Chrysanthemums and other autumn flowers, Orchids, Roses, and ornamental trees and shrubs will be exhibited extensively, in addition to many other interesting contributions. Thus it will be seen that the show is a combination of the Vegetable and Fruit Shows previously held on separate occasions, with the additions already mentioned. On this occasion the Coronation Cup will be offered for the most meritorious group; the Gordon-Lennox Cup for the best exhibit of fruit from an amateur; the Sutton Cup for the best collection of vegetables; the R.H.S. Cup for the competitor who secures the greatest number of first prize points for vegetables; the Wigan Cup for Roses; the George Monro Memorial Cup for the best exhibit of Grapes grown by an amateur; the National Chrysanthemum Society's Cup for the best exhibit of Chry-

\* Degeneration of Potatos, by Redcliffe N. Salaman, M.D., p. 79. Report of the International Potato Conference. Edited by W. R. Dykes, M.A. Printed for the R.H.S. Price 2s., post free 3s. 4d.

santhemums; the Bunyard Cup for the most promising seedling Apple not previously exhibited at a meeting of the Society; Messrs. Allwood Bros.' Bowl for the best group of Carnations exhibited by an amateur; and the Affiliated Societies' Cup for fruits exhibited by an Affiliated Society. Judging will commence at 9 a.m. on October 5, and the exhibition will be opened to the holders of Fellows' tickets at 12 noon and to the public at 2 o'clock on payment of 10s. The exhibition will remain open until 9 p.m. on the first day and from 10 a.m. to 9 p.m. on the Wednesday and Thursday, and from 10 a.m. to 7 p.m. on Friday.

**Sir Lawrence Weaver's New Appointment.**—Sir Lawrence Weaver, K.B.E., will shortly relinquish the post of Second Secretary and Director-General of Land Settlement at the Ministry of Agriculture in order to take up the appointment of director of the art section and the agriculture section of the British Empire Exhibition, 1924. In view of the approaching completion of the Land Settlement scheme and of the reduction in the work of the Ministry owing to the repeal of Part II. of the Agriculture Act, it has been decided that the vacancy created by Sir Lawrence Weaver's retirement shall not be filled. In making this announcement, Sir Arthur Griffith-Boscawen, Minister of Agriculture, expresses his warm appreciation of the conspicuous energy and administrative ability which Sir Lawrence Weaver has devoted to the work of the Ministry and his regret at the loss of his services.

**French Chrysanthemum Society.**—The annual congress of this society will be held on October 27, in conjunction with the International Autumn Exhibition of the National Horticultural Society of France. The Congress Committee, quite independent of the committees dealing with the show, is composed of the president of the French Chrysanthemum Society, M. Blot, vice-president, M. Ph. Rivoire; secretary, M. G. Clement, together with the president and secretary of the Chrysanthemum section of the National Horticultural Society of France. The agenda contains six items. Papers will be read and discussion ensue on late flowering varieties, market plants, the crown bud, improvement of new varieties, sports, remedies for diseases and insect pests. Medals will be awarded to the best papers read at the meeting. The programme is as follows: Friday, October 27, 8.30 a.m., the Floral Committee will judge the novelties; 12.30, judges' luncheon. The afternoon will be devoted to a visit to the show; 4 p.m., meeting of the General Committee. Saturday, October 28, 9 a.m., meeting of the congress in the hall of the National Horticultural Society; mid-day, luncheon at the Brasserie Dumesnil; 2.30 p.m., the party will visit the establishment of Messrs. Vilmorin, Andrieux and Co.; 7.30, official banquet at the Hotel du P.L.M. Sunday, October 29, 9 a.m., at the Montmartre Cemetery there will be a demonstration of sympathy by the graveside of the late M. René Momméja, the society's new president, who died suddenly a few weeks ago.

**Meteorological Station for Greenland.**—At a meeting of members of the International Meteorological Committee, held in London in July, 1919, the importance of obtaining meteorological information from Greenland for use in daily weather forecasting was emphasised, and it was agreed that the views of the members should be communicated to the Danish Government. We learn from the *Meteorological Magazine* for the current month that at subsequent meetings of the Commission for Weather Telegraphy, the importance was urged of establishing a wireless station in the South of Greenland, even if it were only powerful enough to communicate with Ireland and not direct with the Continent of Europe. It is now understood that an expert, sent by the Danish Government, left for Greenland early in August in order to study the local conditions, so that the Government may be in a position to come to a definite decision on the question of establishing a meteorological and wireless station in Southern Greenland.

**Mr. George P. Berry.**—Horticulturists owe a debt to Mr. George P. Berry for his efforts in promoting and maintaining their interests at the Ministry of Agriculture, of which he is Senior Instructor in the Horticultural Division. His appointment in 1913 was an event of horticultural importance, so far as the Ministry of Agriculture was concerned, for he was the first professional horticulturist on the Ministry's staff, and his good work during the time he has held that important position is well known to most of our readers. During the war years he was Technical Adviser in Horticulture at the Food Production Department, and to such men as Mr. Berry the country owes a great debt for the valuable work they did in helping to increase our home supplies at that critical period in our history. Mr. Berry comes of a gardening stock, for his father was for twenty-three years head gardener at Dalvey, near Forres, the seat of the late Norman M'Leod, Esq. Mr. Berry, jun., was born at Dalvey, but, when a boy, his family removed to Cullen House, Banffshire, where Mr. Berry, sen., had a new appointment as gardener, owing to the death of his former employer. It was at Cullen House that Mr. George Berry commenced his gardening career. Later he entered the services of

MR. GEORGE P. BERRY.

Messrs. Methven and Sons, of Edinburgh, and subsequently obtained an appointment in the gardens at Coltness House, near Wishaw, which were accounted among the finest in the West of Scotland. After two years at Coltness he joined the staff of the Royal Botanic Gardens at Edinburgh, rising to be foreman of the glass department. His next change was to take charge of the horticultural and forestry departments of the experimental station of the Northumberland County Council at Cockle Park, Morpeth, where he remained until he was appointed lecturer in horticulture at the Armstrong College, Newcastle. During his eight years' residence at Newcastle he gained a high reputation as an exponent of horticultural practice, and, when the governors of the Edinburgh and East of Scotland College of Agriculture appointed their first horticultural lecturer, they selected Mr. Berry. The good work he did throughout the Eastern Counties of Scotland brought him into considerable prominence, and, when his appointment at the Ministry of Agriculture was announced, it was received with general approbation in the horticultural world. In addition to high professional abilities, Mr. Berry has a pleasing personality which has endeared to him a wide circle of friends throughout the whole of England and Scotland.

**Royal English Arhicultural Society's Summer Meeting.**—The summer meeting of this Society, which was held this year at Monmouth from September 4 to 8, under the presidency of the Earl of Selborne, was in every way successful and enjoyable. On Tuesday morning, the 5th inst., a visit was made by motor coach to the Forest of Dean. On Wednesday, Highmeadow Woods were visited, a compact block to the west of the Forest of Dean, intersected by the River Wye, and extending to between three and four thousand acres. In the evening the Annual General Meeting was held, with the Earl of Selborne in the chair. Mr. Edward Davidson, the Secretary, read the annual report, and the Treasurer presented a satisfactory balance-sheet. A resolution was moved by Lord Selborne and seconded by the Earl of Plymouth, asking the Government to renew the grant for the purpose of utilising unemployed labour for forestry work, which was carried unanimously. The Earl of Plymouth was then elected President of the Society in succession to Lord Selborne, who had occupied the position for two years. On Thursday a visit was made to Tintern Woods, which extend over nearly four thousand acres. They were for the most part bought by the Crown in 1901-1902 from the Duke of Beaufort. The annual dinner was held at the Beaufort Arms, Monmouth, in the evening, at which the Earl of Plymouth, as the newly appointed President of the Society, occupied the chair. The meeting was brought to a close on Friday by a visit to Eastnor Castle, Ledbury, and to Huntley Manor, Gloucester.

**National Chrysanthemum Society's Floral Committee Meeting at Holland Park.**—The next meeting of the Floral Committee of the National Chrysanthemum Society will be held on Monday, October 2, at 3.15 p.m., at Holland Park Rink, Notting Hill, and not on Tuesday, October 3, as previously announced. The National Chrysanthemum Society is offering a twenty-guinea cup, to be awarded to the best exhibit of Chrysanthemums at the Holland Park Rink show.

**Chrysanthemum Lecture at Catford.**—Those of our readers who reside in the south-eastern district of London may be interested to know that Mr. C. Haruan Payne will give his lantern lecture on "The Golden Flower (Chrysanthemum); its Poetical, Mythical and Romantic Associations," in the Parish Hall, St. Andrew's, Catford, S.E., at a meeting of the newly-formed Men's Association, to be held on Friday evening, the 20th prox., at 8 p.m.

**Gift of Allotment Produce to London Hospitals.**—The scheme instituted by the National Union of Allotment Holders to obtain produce of a non-perishable nature for hospitals met with great success. The contribution was made on Saturday, the 23rd inst., which was known as the Greater London Allotment Holders' Gift Day. About two hundred and fifty societies contributed to the scheme and hundreds of tons of Potatoes and other storable vegetables were contributed on behalf of some fifty hospitals. In some cases a single group of allotment holders contributed as much as three and four tons of vegetables, while gifts of half-hundredweights of vegetables from individual plot holders were quite common. It is stated that London's example will be followed by allotment holders in other cities, and it is likely that next year there will be a great national thanksgiving day by allotment holders throughout the country.

**R.H.S. and Kindred Societies.**—For some time past somewhat strained relations have existed between the Royal Horticultural Society and the several horticultural societies which hold exhibitions at the Royal Horticultural Hall. We are glad, however, to learn that, as a result of the conference held at the Horticultural Hall, on the 18th inst., an amicable agreement has been arrived at. At this conference, Mr. W. Cuthbertson presided, and with him were Mr. Musgrave, Treasurer, and Mr. W. R. Dykes, Secretary, representing the Royal Horticultural

TREES AND SHRUBS. 14

POTENTILLA FRUTICOSA PROSTRATA.

For duration in flowering and general attractiveness throughout the late summer and autumn this shrubby Cinquefoil stands pre-eminent to keep our borders and rockeries gay and cheerful. The type is well known for its freedom of flowering, erect habit, and general attractive appearance. The variety prostrata is, as its name implies, of trailing or prostrate habit, and densely bushy. As a rockery subject it is most useful. The prostrate, woody stems and acute, pinnate, warm green leaves, covered with fine silky hairs, and almost silvery under surface, are most charming. On the russet-coloured, woody stems are irregular, short branches with bunches of terminal golden yellow flowers, much larger

was first published in 1838, and the second edition, from which I quoted, in 1844. It contains practically everything that had then been published about the introduction of the Larch, including all the facts given by Grigor in his *Arboriculture* (which was not published until 1868, nearly thirty years after Loudon's death), Headrick's statement about the Lee Larches, which is not given by the author of the report as anything more than a legend, and the views of Dr. Walker, Sir T. Dick Lauder, and others. It is quite possible that Grigor was right in his surmise that the Dunkeld Larches were raised from seed produced in England, and if they were really introduced in 1738 I think this is extremely likely, as Larch plants four and five feet high were being sold by a nurseryman in Midlothian in February of that year (see *Gard. Chron.*, May 20, p. 258); but in view

FIG. 75.—ASTER QUEEN OF COLWALL. R.H.S. AWARD OF MERIT, SEPTEMBER 19. (SEE P. 184.)

than in the type; indeed, many flowers are larger than a half-a-crown piece. The plant continues in bloom over a very long period; indeed, it is one of the most persistent flowering shrubs we have. It is not fastidious as regards soil, but the latter should be well drained; it should be planted in full exposure to the sun. W. L.

THE DUNKELD LARCHES.

The statement Mr. Mark Mills makes at page 141 that I passed over Grigor "with contempt" is untrue. I passed over no authority in this way. Further, I fear I shall have to disappoint Mr. Mills if he expects me to attempt to demolish the Rev. Mr. Headrick's statement about the Lee Larches, or to defend Loudon against his rather pointless criticism. Loudon's *Arboretum et Fruticetum Britannicum*

of the statement by Dr. Walker, who paid much attention to the history of the introduction of exotic trees into Scotland, that the "first Larches were planted at Dunkeld in 1727" (*Arboretum et Fruticetum Britannicum*, Vol. IV., p. 2359), the 1738 date must be accepted with considerable doubt, even although the statement in the *Transactions of the Highland Society* was published under the authority of the Duke of Athol's trustees.

With reference to Mr. Clinton Baker's statement of the girth of the Dunkeld Larch (see *Gard. Chron.*, June 24, p. 337), I find that Strutt (*Sylva Britannica*, p. 146) gives the girth of the larger of the parent Larches as 13 feet at three feet from the ground in 1825, which seems to corroborate both Dr. Blackadder's measurement and that given by Hunter. A. D. Richardson, Edinburgh.

Society, while the kindred societies were represented by Mr. Courtney Page (National Rose Society), Mr. Charles H. Curtis (National Chrysanthemum Society), Mr. H. D. Tigwell (National Sweet Pea Society), Mr. J. S. Brunton (British Carnation Society), and Mr. J. Green (National Dahlia Society). The conditions of letting the hall to kindred societies, agreed upon at the conference, have been approved by the Council of the R.H.S. and are as follow:—

- (1) For a one-day show on the day following one of the R.H.S. shows; five guineas inclusive.
- (2) For a one-day show with one day intervening between an R.H.S. show, which the kindred society shall be allowed for preparation and staging; ten guineas inclusive.
- (3) For a two-day show, on a Thursday and Friday, which is only possible at present between July 1 and Feb. 25; fifteen guineas inclusive, the Wednesday in this case to be allowed for preparation and staging.
- (4) For a two-day show in a week when the R.H.S. has no show, twenty-five guineas, made up of ten guineas for each day and five guineas for the day previous, for preparation.
- (5) For a one-day show in a similar week it was suggested that the charge be sixteen guineas (i.e., one day for the show and one for preparation). "Inclusive" means that the R.H.S. will give a hall service free, similar to the service provided for its own shows. All exhibits must be removed by 10 p.m. on the evening on which the show closes. R.H.S. Fellows' tickets to admit free to all kindred societies' shows held under these arrangements. Dates cannot be guaranteed unless booked at least twelve months in advance.

**Appointments for the Ensuing Week.**—Monday, October 2.—National Chrysanthemum Society's meeting at Holland Park Rink. Tuesday, October 3.—Royal Horticultural Society's committee meetings at Holland Park Rink (four days); Royal Caledonian Horticultural Society's meeting; Bournemouth Gardeners' Association's meeting. Wednesday, October 4.—United Horticultural Benefit and Provident Society's dinner at the Imperial Hotel, Russell Square; Royal Agricultural Society's Council meeting; Helensburgh and Gareloch Horticultural Society's annual meeting; National Viola and Pansy Society's meeting; Glasgow and West of Scotland Horticultural Society's lecture on "The Culture and Training of Hardy Fruit," by Mr. D. Grant M'Iver. Thursday, October 5.—Manchester and North of England Orchid Society's meeting. Saturday, October 7.—British Mycological Society's autumn foray for London students; Locherbie Flower Show.

"Gardeners' Chronicle" Seventy-Five Years Ago.—*Edgeworthia chrysantha*. This shrub was sent by Mr. Fortune to the Horticultural Society in April, 1845. It flowered for the first time in February, 1847, in a greenhouse. In the Society's *Journal* it is described as "A dwarf soft-wooded plant, throwing up reed-like dull green stems from its base, and bearing the leaves exclusively near their ends. The leaves are about eight or nine inches long, very dull green, and covered with fine hairs. The flowers have not yet been produced in England; but Mr. Fortune's Chinese drawings and specimens show them to be bright golden yellow, something less than an inch long, covered with exceedingly thick hairs on the outside, and collected into balls about two inches in diameter at the ends of the shoots. He adds that they are sweet-scented, and appear in Chusan in July. The species is allied to *Edgeworthia* (or *Daphne*) *Gardneri*, a Nepal plant with a similar habit. It grows freely in a compost of three parts sandy-loam, and one of turfy-peat. A free drainage is necessary; for although it requires an ample supply of water during the summer months, it is liable to damp off if this point is not properly attended to. For a few weeks in winter very little water is required. It will probably be multiplied without difficulty from cuttings of young wood. In order to induce it to flower, the Chinese bind the stems so as to form a loop; and this practice has been followed, with success in the garden of the Horticultural Society, where it has now flowered in the month of May.—*Botanical Register, Gard. Chron.*, Oct. 2, 1847.

## The Week's Work.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**New Borders.**—Where planting is contemplated this autumn advantage should be taken of fine, dry weather for moving soil, especially if it be of a heavy nature. Preparations for planting often entail a good deal of wheeling. Early preparation allows for the settling of the soil, which is now some degrees warmer than it will be in November. Opinions differ as to the proper depth for fruit tree borders, for soils, subsoils and situations vary; it is best to err on the safe side by adopting the shallow border of, say, 20 inches or an intermediate standard of 30 inches. On light soils, through which water passes quickly, a fairly deep, sustaining border is needed.

**Pot Vines.**—Vines in pots intended for starting into growth in November or early December may be shortened to a suitable length, washed and placed in a position where they can be kept quite cool and sheltered from heavy rains. All loose surfacing material should be removed, and when the soil has been made suitably moist, top-dress the border with rich turfy loam to which a good sprinkling of bone-meal has been added.

**Plums.**—Early and mid-season Plums cannot be kept too cool, and certainly no quarter must be given to insect pests, as green fly and black aphid often put in an appearance after a warm, dry time. Where a house is devoted to Coe's Golden Drop, the fruits will now be in perfection, and worthy of the greatest care. A free circulation of dry air being imperative, the ventilators and doors should be constantly kept open. As the Plums improve in quality after they are ripe, the roots of the trees should be kept moderately moist and well-covered to prevent them from drying out.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. Vicar, Grass, Aldenham House, Hertfordshire.

**Autumn Tints.**—The fading of green foliage to tints of yellow, red, purple and brown is one of the most lovely sights during autumn, and amongst the most beautiful subjects are the various Maples, Amelanchiers, Caryas, American Thorns, Ginkgo biloba, Liquidambar, Parrotia persica, various species of Pyrus and Oaks amongst trees, whilst among the shrubs and creepers may be mentioned Barberries, such as Berberis Thunbergii, B. coccinea, B. Wilsonae and B. vulgaris; Cornus sanguinea, Eonymus alatus, Rhus of sorts, Spiraea Thunbergii, and the different members of the Vitis group.

**Phytolacca.**—There is a handsome group of plants that may be included in large herbaceous borders for the sake of their fruit at the present season. I advisedly use the term large borders, inasmuch as the plants are of very robust growth in height and spread. I refer to the Phytolaccas or "Pokeweeds," the members of which are natives of such diverse regions as Japan, India, and Florida. They carry remarkable spikes, generally over a foot long, of purple-black fruits. Always a matter of great interest to visitors, they are apparently but little known, although so handsome, and though greatly similar in appearance, such species as P. acinosa, P. decandra and P. octandra are well worth growing, whilst there has been a new species introduced in recent years by Mr. G. Forrest, and known as P. clavigera. All these are raised easily from seed—in fact, they will spring up from natural-sown seed provided the spikes are not gathered before the seed scatters.

**Roses from Cuttings.**—The wood of Wichuriana and other Roses that it is desirable to in-

crease from cuttings is now ripe, and the shoots may be inserted. The wood should be of this season's growth in well ripened condition. Make the cutting about nine inches in length, and cut just below an eye, removing the foliage other than that at the top, and inserting the cutting in good, sandy compost to within about two inches of the top. They will strike best in a cold frame, though they will root in open ground, but measures should be taken to protect the cuttings from frost during inclement weather.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Ixora.**—As plants of Ixora pass out of flower select some of the stronger shoots for use as cuttings. If rooted quickly the cuttings will make good plants and produce two or three trusses of flowers next spring. By careful treatment these young plants will make useful specimens by the autumn. Ixoras are not grown so extensively as in former days, owing probably to the high temperature required to grow them successfully. Ixoras require a minimum temperature of 65 deg. to 70 deg. and the roots should be kept in a uniform state of moisture; never allowed to become dust dry, but not overwatered.

**Begonias.**—Autumn and winter flowering Begonias are growing freely, and the main shoots of the Optima varieties require to be kept neatly staked to prevent them from bending over with the weight of the flowers. These Begonias may be had in flower over a long season by allowing the earliest plants to develop their blooms after this date, but continue to pinch out all blossom buds of the later plants for another four or five weeks. Encourage these latter plants to make healthy growth, when they may be allowed to flower and form a succession to those allowed to bloom earlier. The same treatment may also be extended to Begonias of the Gloire de Lorraine type. Well rooted examples of these Begonias should be assisted by feeding them with weak liquid manure and soot water on alternate occasions with clear water. Allow the plants sufficient space so that each may form a fine specimen. An average night temperature of 55° should be maintained in the house in which they are growing.

**Caladium.**—These plants have practically finished their growth and water should be withheld from the roots gradually. It is not advisable to dry these plants off too suddenly or the tubers will fail to develop and not mature properly. Much of next season's success will depend on the treatment of the tubers during the time that they are ripening. When the foliage is completely died down the plants should be stood under the stage of a moderately warm house where a night temperature of 50° is maintained during the winter. They will be found to keep best in the pots in which they have been grown, the soil giving sufficient moisture to prevent shrivelling.

### THE ORCHID HOUSES.

By J. T. BARRETT, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

**Oncidium.**—The members of this genus are usually represented by plants in flower, no matter what the time of year. One very pretty and useful species now in flower is *O. obryzatum*, its long and much-branched spikes carrying large quantities of pretty golden yellow flowers that are spotted with light brown, and these at a season when Orchid flowers are not over plentiful in most collections, are doubly valuable. The plants belonging to the *O. crispum* section, namely, *O. Forbesii*, *O. curtum*, *O. Gardneri*, *O. Marshallianum*, and *O. crispum* itself, although not flattering to present-day Orchid growers, are most useful subjects, even if they cannot be kept in a robust condition over a series of

years. *O. Marshallianum* produces its flowers during the late spring and early summer, whilst the others display their beautiful flowering sprays during late summer and autumn. *O. varicosum* is one of the most beautiful and free flowering Orchids in cultivation, and those plants that are at the present time producing flower spikes should be placed well up to the light, the spikes, as they become long enough, being neatly staked to prevent accidents. *O. ornithorhynchum* and its beautiful variety album, with others that have been growing during the summer months in the cool house, will be better placed in a cool position in a cool intermediate house for the winter. There are other *Oncidiums*, all of which should be grown in quantity where cut flowers are in great demand, as their flowers adapt themselves to all kinds of decorative work, but unfortunately at the present time there is some difficulty in obtaining them. After flowering they should be rested, as these plants delight in a long, decided rest, no matter if they are species which require much fire heat, or a moderate temperature, but in no case should they be allowed to shrivel.

**Repotting.**—The cultivator often has to decide between two evils, namely, repotting a plant at an unsuitable time or allowing it to remain in half decomposed material. My advice in such cases is to repot, as decomposed material at the roots is the cause of many plants declining in health and vigour. Some little discretion is necessary in the application of water to the roots of any plant repotted out of its normal season.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAN, Esq., Baldersby Park, Thirsk, Yorkshire.

**Wintering Crops in Frames.**—Frames should be got in readiness for pricking out Cauliflowers, Lettuces, Endives and Parsley. The old soil should be removed and a mixture of old potting soil, leaf-soil and wood ash substituted. Do not overcrowd the plants, and avoid coddling them, placing the lights in position only when protection is absolutely necessary.

**Cucumbers.**—A bed should be made for planting the winter crop of Cucumbers in a light house. Warmth should be provided by the use of fermenting materials, in addition to plenty of hot water piping. Place on the bed a light mixture of two parts loam and two parts leaf-mould, with coarse sand, and small pieces of charcoal added. Keep the plants well thinned and do not crop them heavily. Any sign of aphid or thrip should be dealt with at once by fumigating the house with XL-All insecticide. Keep the glass of the house well washed to admit all the light possible.

**General Remarks.**—The recent wet weather has caused weeds to get out of hand, and advantage should be taken of any fine days to hoe them up, rake them off the ground, and burn them. Birds are very troublesome to late Peas, which should be protected with nets. All stumps of vegetable plants should be removed as soon as the crop is cut.

### HARDY FRUIT GARDEN.

By H. MARSHAM, Gardener to the EARL OF STAFFORD, Wrotham Park, Barset.

**Peaches and Nectarines.**—Those intending to plant young Peach and Nectarine trees this autumn should prepare the borders and stations forthwith. Peaches and all stone fruits require plenty of lime and sweet, fertile loam of medium texture. Manure is not greatly needed if the soil is of good quality, with plenty of fibrous matter present in it, but if it is somewhat poor, with only a little fibre present in it, decayed manure should be thoroughly mixed with the compost. The trees will then grow freely and produce wood of firm, medium texture. The borders at the foot of newly erected walls should be thoroughly trenched from one end to the other, and ample drainage mate-

rial employed. Place turves grass-side downwards over the drainage, and then fill the trench with the specially prepared compost. Make the latter rather firm previous to planting the trees. Peaches do best in a firm, sweet root run, resting on good drainage. If the walls are high, plant standards and dwarfs alternately and varieties that will keep up a long supply of good fruits. There are many good varieties to select from; the following, I find, from many years' experience, all dependable sorts—Peaches: Hales' Early, Rivers' Early York, Peregrine, Dymond, Stirling Castle, Royal George, Bellegarde, Crimson Galande, Barrington and Sea Eagle. Nectarines: Early Rivers', Lord Napier, Dryden, Pine Apple, and Humboldt.

**HARDY FLOWER BORDER.**

**ROMNEYA TRICOCALYX.**

DWARFER, and less imposing in consequence, than *Romneya Coulteri*, *R. trichocalyx* (Fig. 76) promises to take a place in gardens denied to its congener, which was introduced much earlier. It appears to be hardier than the older species and also much freer in flowering; plants I have seen this year have improved considerably over their records of former seasons. This is a most beautiful Californian Tree Poppy. Its foliage is not only graceful in form, but is of delightful glaucous colour, and the flowers, held erect, are of the highest charm, with their

vation that the differences were recognised. The plant is illustrated in *Bot. Mag.*, tab. 8002, and the accompanying text states that it first flowered in this country in 1902.

Just before writing this note I had the pleasure of seeing two small beds filled with this fine *Romneya* in the garden of the Rev. Father Douglas-Dick, St. Mary's, Newabbey, a place of which I wrote last year. In these small beds the plants of *R. trichocalyx* were exceedingly beautiful, with their charming foliage and delightful, large flowers, enhanced in beauty by the surrounding admirably kept grass. At St. Mary's this *Romneya* is hardy, and seems to have greatly increased in beauty since it was first planted. *S. Arnott.*

FIG. 76.—ROMNEYA TRICOCALYX.

**Black Currants.**—If Black Currant bushes are much crowded with useless wood the present is a suitable time to remove several of the shoots and branches. The removal of these branches will allow both light and air to circulate freely amongst those that are left for bearing fruit next year. Do not shorten the young, fruiting shoots, simply open out the heads and reduce the number of growths springing up from the base if they are too numerous. Black Currants thrive best in a somewhat cool, moist soil that is well drained. Shallow land resting on gravel should be liberally mixed with rich, decayed manure and heavily mulched during the summer. The hot summer of last year proved very disastrous to Black Currants in many gardens, thus proving their evident need of plenty of moisture.

pure white petals and golden filaments. The blooms also appear to have more substance than those of *R. Coulteri*, and a good plant gives a prolonged succession of flowers, which generally begin in July and continue until September. Its height is stated to be about two feet, but it is taller in most places where I have seen it. The plant seems to need a rather dry, well-drained, but not too poor soil, and should have plenty of sun. In very cold districts it may require a little protection, but this does not usually appear to be necessary, judging from the reports I have had from different parts of the United Kingdom.

The two species were at one time confused and it was not until Miss A. Eastwood, of the Herbarium of the Californian Academy, pointed out that two distinct species were in culti-

**HELIANTHUS MULTIFLORUS LONDON GOLD.**

This beautiful Sunflower is a fine plant for the shrubby and herbaceous border, being of average height and bushy habit. It may be interplanted with low-growing shrubs and is suitable for the back row of the herbaceous border. It grows from 3 feet to 4 feet tall, producing stout, erect stems, that are crowned at this season with numerous, double flowers of stout texture. The variety London Gold is best described as a gigantic form of *H. m. plenus*, the flowers being much larger, with a more double crown or disc, and with broader and more uniform golden ray florets. It received an Award of Merit at the R.H.S. meeting on August 28, when exhibited by Mr. T. Carlile, of Twyford. *H. L.*

**EDITORIAL NOTICE.**

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## A VIEW OF WESTERN ORCHARDS.

As we travel westward from London it always seems that the fields take on a richer green, and the bricks a deeper red, and as we approach Bristol orchards of veteran Cider trees announce the fact that we have reached the "West Country."

Appropriately enough, the Cider Institute at Long Ashton was the object of our first visit, and it is pleasant to record that the ravages of war have now been effaced and the general aspect of the station is more interesting than ever. The recent expansion of the station has enabled experiments to be extended, and many now in progress show already some points of interest and suggestiveness. Pot experiments with fruit trees indicate that Leaf Scorch may be due in some cases to lack of potash, and those who have trees in this state would find it interesting to dress a few trees with a potash manure, and also with lime, the latter releasing potash in the soil if present.

A plot of Apples whose roots have been treated by various mutilations do not show the harmful effects of removing fibre which some would expect, and seem to be tending to confirm the Woburn results on this point. Near by are the Paradise Apples on the stocks which have been selected at Malling, and it is interesting to note that they do not show such early fruiting characters as at Malling. This is very probably due to the heavier soil and greater rainfall at Long Ashton.

A large assortment of Raspberries has been collected for trial, and it is hoped that the combined efforts of Wisley, Malling and Long Ashton will bring some order into the disordered nomenclature of this fruit. Of the many other aspects of Long Ashton, chemical, entomological, etc., we cannot now write, but it is evident that the enlarged resources of the station are being put to good use, and will in due season bear valuable fruit.

It was a grey and moist day that saw us starting from Worcester for a tour of the Severn Valley, under the guidance of Mr. Hollingworth, agricultural organiser for the country. The fertile soil each side of the river has as yet been but little devoted to fruit, but that it is well suited many isolated orchards prove. This is the country of the Blaisden Red Plum, a variety resembling closely the Purple Egg Plum in fruit, but distinct in growth. It is raised from suckers, and makes a medium-sized tree of dense habit. We visited an isolated orchard entirely of this variety, cropping marvelously, so it is presumably quite self-fertile. The fruit is sold in the local "pot" and by weight, and with such a heavy fruit as this, the baskets are often only three-parts full. This seems a great waste of space, and we wondered that some effort had not been made to sell by total weight of basket when filled. One great merit of the Blaisden Plum is its firmness, so that a full basket of this variety should not, we imagine, be unattainable. In all the orchards we visited this Plum predominated, and the only other varieties we noted were the Yellow Egg and a few Cox's Emperor, a variety we were rather surprised to find still grown commercially.

Most of the fruit in this district is grown on grass; but we visited a farm, famous in the district, and not unknown beyond it, where Apples are grown as bushes on cultivated land. Here we saw the largest area of King Edward

Apple we have yet found, and many other sorts, such as Gascoyne's Scarlet and Lord Grosvenor, errors of a previous occupant, which will take the present owner some time to live down. The country around is very like the typical Devonshire country, hills and valleys, the deep red earth and wonderful green of the trees and herbage. We were told that the Simar cultivator had successfully negotiated the steepest hills. A plantation of Pears recently added to the farm showed that this fruit will do as well as others in this fertile valley.

Hereford being our next objective, we entered at Newport and passed through the fine hilly pastoral country of Monmouth by Abergavenny, and so arrived at the city of cattle

dominate so far as we could see, but Rivers' Early and Monarch are often found; but no grower we met seemed very anxious to replant these two varieties. The Prune Damson is found everywhere, and was bearing amazing crops. The trees are nearly all raised from suckers, and it is thought that they bear better than grafted trees, and trees seen on one farm certainly support this opinion. The plantations we visited would not bear comparison with the best in Kent or elsewhere, and it was interesting in one case to see Superlative Raspberry doing well, and to hear on another that Marlboro' (Perfection) was the only possible one; and so do contiguous soils and opinions differ.

No fruit-grower can be in the neighbourhood of Hereford without remembering Thomas Andrew Knight, the great pomologist of last century. The name of his home and of many houses and villages around recall many an old fruit, some forgotten, others still with us, as the Elton Cherry and Ingestre Apple. It was, therefore, with some interest that we turned our car to the steep hill on which stands the lonely little church of Wormsley, where he lies buried. Clouds of soft rain did not entirely hide the wonderful view of distant hills and folded valleys, and finally we pulled up at a farm gate, passed through a field, and suddenly found ourselves before the church. It is a small and unpretentious building, standing almost alone in the fields, neighboured only by a farm and its buildings. The tombs of the Knight family are conspicuous at once, being the largest in the churchyard, and it is a plain, and even severe, memorial that marks the grave of Thomas Andrew Knight.

An oblong stone bears on each side an inscription, one in Latin and the other in English, as follows:—

"Under this stone rests the remains of Thomas Andrew Knight, of Downton Castle and Wormsley Grange, in the county, and late president of the Horticultural Society of London. He possessed a mind capable of investigating the most secret works of Nature, a heart overflowing with charity to all mankind, and a mind which never refused assistance to the deserving or withheld relief and consolation from the poor.

"His family, friends and neighbours will ever mourn their irreparable loss. His widow has caused this monument to be erected in memory of her beloved husband, who died in his LXXXth year, May 11, MDCCCXXXVIII."

It is necessary to add that owing to the nature of the stone this inscription is fast becoming illegible, and it would seem that, failing immediate attention, it will not be long before the last resting place of the great horticulturist will be no longer discoverable. Surely some interested persons, or even the Royal Horticultural Society, should see to it that this should not be.

As we left the tiny churchyard and descended the steep hill in the ceaseless rain it was pleasant to think of him resting, so peacefully and secluded, amongst the orchards that he loved so well. As we turned our faces eastward we carried with us pleasant remembrances of West Country hospitality and an enduring memory of the colloidal properties of the old red sandstone.

## SOLIDAGO BUCKLEYI.

Among the numerous species of *Solidago* comparatively few are sufficiently dwarf for use in the front line of a flower border, and not many are compact enough for the rock garden. One species which appears to be suitable for either of these positions is *S. Buckleyi*, about 15 inches or 10 inches high. It is early flowering and the individual growths, closely and densely branched, are quite elegant when covered with the small yellow flowers. The accompanying illustration (Fig. 77) shows the style of the individual flowering growth and represents one of several specimens exhibited at the R.H.S. Hall at the end of July by Messrs. Prichard and Sons, Christchurch.

FIG. 77.—*SOLIDAGO BUCKLEYI*.

and cider. Here we again found the old and new styles of fruit growing in close juxtaposition. Large orchards of Cider and Perry Pears are found throughout the district, and here and there modern fruit farms, which cannot be bettered in any part of the country. The Cider and Perry varieties are beyond our scope; but the most casual eye could not be other than impressed by the Giant Barlands, Blakeney's and all their race, preserving as they do their individual habits of growth into old age much more than the greater number of our culinary fruits.

Many of the Perry Pears would make fine park trees, and when in flower must present a mass of blossom unequalled by any other flowering tree growing in this country. In the grass orchards we visited Ecklinville Seedling Apple was largely grown, along with Devonshire Quarrenden; but Bramley's and Newton Wonder seem to be invading this district, as they have done elsewhere, there being, perhaps, a preference for the latter in many cases.

In Plums, the Pershore, purple and yellow, Victoria and Belle de Louvain seem to pre-

**NOTES FROM WISLEY.**

THE coming of autumn is announced by nature in the colouring of fruits and foliage; in the garden the berries and bright-foliaged shrubs offer more vivid colouring now than at any other time of the year. Unfortunately, birds have a liking for the fruits of many shrubs, and in a few days will strip bushes which would otherwise have borne berries for months longer.

Experiments are being made at Wisley with a view to keeping the birds away. Netting being too costly, and undesirable for use on an extensive scale, solutions of various chemicals are being sprayed over the shrubs.

A fine specimen of *Euryphia pinnatifolia*, some 18 feet high, has nearly finished flowering. This shrub, handsome in leaf and habit and deserving of greater popularity, produces a number of large white blossoms, not unlike those of a *Hypericum* in form, though, of course, it belongs to *Rosaceae*. Another useful late-flowering shrub is *Clethra alnifolia*, which seems very happy in its position near the water. The flowers are fragrant, as are those of *Buddleia Forrestii*, now in flower and distinguished by its white stems and under sides of its leaves. There seems to be some variation in the colour of the flower of this *Buddleia*, some plants having flowers of a pale lilac and others of a deeper shade.

Many *Ericas* are flowering in the wild garden, notably *E. tetralix*, *E. cinerea*, *E. vagans*, *E. australis*, and *E. Maweana*. The beautiful *St. Dabeoc's Heath* (*Dabeocia*, or *Menziesia, polifolia*) has become naturalised and is increasing rapidly. A white variety is common, and one, also, in which both white and purple flowers occur on the same plant.

The trial of *Carnations* is being continued, and there will soon be a good display of bloom. The majority of the plants are very healthy and stocky for second-year plants. A trial of *Salpiglossis* under glass has been started, while in the open *Beets*, *Leeks*, and *Lettuces* (120 varieties) are being tested.

There is still a good show of *Dahlias*, the continuation of last year's trial. Among the singles, two beautiful varieties are *Clematis*, which has pale, rosy-lavender florets with orange centre; and the scarlet *Amy Barrilii*, which is further remarkable for its dark red stems and foliage. Among the dwarf, *Paeony*-flowered section, *Charlotte*, with brownish apricot flowers of attractive form, has been prolific, and is very suitable for garden decoration.

In the rock garden the scarlet *Zauschneria californiana* var. *mexicana* makes one of the few bright patches of colour. Less noticeable is *Carlina acaulis*, a beautiful dwarf *Thistle*, which looks its best when the sun is shining on its bright silvery petals. *Convolvulus althaeoides*, with clear pink flowers and light grey foliage, is a desirable plant if kept within bounds. Another less hardy and later-flowering kind is *C. mauritanicus*, with a bluish-lilac corolla, in the centre of which are the white styles and stamens.

The fruit crop has been but moderate. In almost every case the trees which have borne an exceptionally large number of Apples were those which "missed a crop" last year at Wisley. *J. D. G. White*.

**GARDEN NOTES FROM S.W. SCOTLAND.**

THE genus *Roscoea*, a family of the *Scitamineae* or *Ginger* Order, contains some ornamental species, introduced in recent years from China. With the Himalayan *R. purpurea* we have long been familiar, but the Chinese species are far more attractive. *R. cautilioides*, with sulphur-coloured flowers, and *R. Humeana*, with purple flowers, are at their best in June; but the handsomest of all is *R. capitata*, which bears rich purple blossoms in August and September. This species was introduced by Messrs. Bees, Limited, who also sent out a late-flowering counterpart of *R. cautilioides* under the unsatis-

factory name of *August Beauty*. These late-flowering species have this peculiarity in common, that they make no appearance above ground until July is half sped. Therefore, unless their position is marked by permanent metal labels, they are almost certain to be destroyed in the process of hoeing, forking, and weeding. Not only so, but the ground for a considerable space around the plants must not be disturbed, for they spread far by subterranean runners, mostly invisible till they push up leaves, in early autumn. If these are unimpaired, they soon repay the extra care required by making a fine thicket of flowering stems. They also seed freely; cross-fertilisation being secured by a mechanism similar to that of the blue *Salvia patens*, consisting of levers projecting from near the base of the stamens.

object at this season when veiled in a cloud of small yellow blossoms. A native of Sicily, it takes as kindly to our sloppy western shores as it does to the sun-baked slopes of Mount *Aetna*, furnishing an example of acclimatisation as remarkable as that of the June-flowering *Madeira broom—G. virgata*.

Lilies, on the whole, have fared far better than might have been expected in such a cold, wet season. In our garden, the fell *Botrytis* has appeared here and there, some clumps of *L. candidum* and *L. testaceum* being badly disfigured, while others in similar soil and exposure have been without blemish. One species, however, that usually thrives with peculiar vigour here, namely, *L. Sargentiae*, has shown resentment at the inclement summer. It has grown as strongly as usual and has not suffered from

FIG. 78.—CODONOPSIS TIBETICA. R.H.S. AWARD OF MERIT, SEPTEMBER 19 (SEE P. 184.)

which are set in action by any insect attempting to reach the nectary.

If I were restricted to growing four varieties of *Gladiolus*, I should be quite content with the scarlet *Princeps*, the pink *Halley*, the purple *Baron Joseph Hulot*, and the white *l'Immaculée*. The effect of the last named is greatly enhanced

fungoid mischief; but many of the stems were flowerless, while the flower-buds on others were malformed. In common with all other things flowering later than May, Lilies have been from a fortnight to three weeks later this season than the average date, as shown in the following table:—

	1918	1919	1920	1921	1922
<i>Lilium auratum</i> ... ..	Aug. 18	Aug. 17	Aug. 28	Aug. 17	Sept. 7
<i>Lilium Brownii</i> ... ..	—	July 23	—	July 15	July 28
<i>Lilium candidum</i> ... ..	July 18	July 26	July 17	July 13	Aug. 3
<i>Lilium chalcidonicum</i> ... ..	Aug. 1	Aug. 7	Aug. 5	July 25	Aug. 19
<i>Lilium croceum</i> ... ..	July 5	July 5	June 26	July 1	July 9
<i>Lilium davuricum</i> ... ..	—	—	June 17	June 16	June 14
<i>Lilium giganteum</i> ... ..	—	—	June 16	June 4	July 13
<i>Lilium Henryi</i> ... ..	—	—	July 4	—	July 13
<i>Lilium Martagon album</i> ... ..	—	—	Aug. 18	Aug. 5	Sept. 7
<i>Lilium monadelphum</i> ... ..	—	—	June 26	June 20	June 30
<i>Lilium pardalinum</i> ... ..	June 10	June 17	June 11	June 6	June 22
<i>Lilium pyrenaicum</i> ... ..	June 29	July 9	July 2	July 3	July 19
<i>Lilium pseudo-tigrinum</i> ... ..	June 4	June 9	June 8	June 6	June 16
<i>Lilium regale</i> ... ..	Aug. 8	—	—	July 25	Aug. 19
<i>Lilium Sargentiae</i> ... ..	July 17	July 25	July 21	July 13	Aug. 4
<i>Lilium testaceum</i> ... ..	Aug. 14	Aug. 18	Aug. 20	July 30	Sept. 2
<i>Lilium tigrinum</i> ... ..	July 18	July 21	July 20	July 13	July 26
<i>Lilium Willmottiae</i> ... ..	Aug. 8	Aug. 17	Aug. 14	July 27	Aug. 30
<i>Lilium Willmottiae</i> ... ..	July 10	—	June 30	July 5	July 7

by the number of flowers which open simultaneously. *Gladiolus primulinus* is a beautiful species, but it should be kept apart from the gaudier florist's hybrids, with which it is a mistake to cause it to compete. Having made that mistake myself, I do a mild form of penance by warning other amateurs against it.

Good autumn-flowering shrubs being none too common, it is a pity that *Genista aethnensis* is not more often seen. Growing to any height between ten and twenty feet, it is a pretty

During five-and-twenty years or more that we have grown and flowered the grotesque *Dragon's Mouth—Arum (Helicodictyon) crinitum*—in the open without any protection, I have never known it set seed until this season. A native of sunny Corsica, it is strange that it should have chosen the coldest summer that we have had for sixty years to do so. I suppose the heavy spikes of berries that it is now bearing are the outcome of the heat and drought of 1921. *Herbert Maxwell, Monroith.*

## HYBRID PINKS AND CARNATIONS.

THE communications published from time to time in these pages in favour of *Dianthus Allwoodii* varieties ought to satisfy most people that they may enter on the cultivation of these plants with every expectation of success. At the same time, it must not be assumed that they may be grown just anyhow, as some folk would lead us to expect. They respond to generous treatment quite as certainly as any other plant, and though two-year or three-year-old plants yield enormous crops of bloom, they do not, with me, give so large a succession of bloom as one-year-olds do. I consider they require a particular treatment, and not merely to root the cuttings and plant them without more attention.

We have had an enormous display of flowers of *D. Allwoodii* all the summer from young plants, and at present there are as many coming on in succession, so it is obvious that those who have written about them in a derogatory manner cannot have treated the plants with the degree of care that is their due. Of course, bought-in stock cannot be expected to give equally good results to home-grown material, no matter how satisfactory the former may be—most of us buy for stock purposes.

I have rooted almost all cuttings in the sand propagating bed in which perpetual Carnations are rooted, and find *D. Allwoodii* takes about the same time to root. Stock for next year is already rooted and boxed off, it being essential here, on account of vermin, to winter these and other Carnations under glass. And an important part of the treatment is carried out as soon as the young stuff has got a good grip of the soil. That is, pinching them close down, or to the sixth leaf from the base. This forces several growths, which, by the time the plants can be put out in February, have become strong shoots, with the result that the beds or clumps are fully furnished by the flowering period.

Moreover, I find they like liberal treatment during the summer months quite as much as any other plants. Accordingly, they are mulched with rotted dung or pigeon manure, soot and light dressings of artificial manure. I may add that the flowers are equally valued for cutting with other sections of Carnations. It is possible to increase stock with great rapidity by rooting the tops that are pinched off.

About border Carnations. There is a similarity between modern varieties and *D. Allwoodii* so far as a perpetual habit of flowering obtains. Both, too, are very sweetly scented, though the one possesses the scent of the Pink and the other that of the Clove. Also, the border sorts root from cuttings as freely as perpetuals under the same conditions. However, they do not flower so early as plants from layers, and they differ also from these in not growing so tall. Even the tall growing Grenadier is quite dwarf and stiff-stemmed from autumn-struck cuttings.

Where autumn planting is the rule, the layers should be put out without delay in order to get them established before winter. There should be, then, no upheavals by frost, but it is very important that the soil of the beds or borders be very firmly compressed, not only around the plants but all over as well. Rather shallow planting also conduces to the well-being of the plants. Very strong layers should be steadied by tying them to a short stick inserted at an acute angle to the plant, and the whole may be finished with the application of a thin layer of very rotten manure. Plants not to be set out till spring may be potted, using not less than a four-inch sized pot. Or they do very well in ordinary cutting boxes four inches deep, the roots to be cut about ten days previous to planting. Or where frames stand on a perfectly dry platform, they may be bedded safely therein. Here, also, the compost should be made very firm, and need be not more than three to four inches in depth, and, as in the case of boxed plants, cutting the roots previous to planting in spring. A thin layer of sharp sand spread over the surface of the bed will keep it clean and dry during the darkest part

of winter. From my experience in wintering Carnations in pits, I should not hesitate to keep the sashes on from the end of October till the end of January, but always, except during frosts, with a current of air passing over the plants. They do not mind dryness with cold, nor cold, even intense cold, so long as the soil is not wet. Even perpetual Carnations may be frozen hard for days without much harm. In conclusion, growers will find it best to study the soil they have to do with, so long as general principles are not disregarded. *R. P. Brotherton.*

## THE ROSE GARDEN.

### THE PASSING OF JULIET.

A DECADE or more ago, the sensation of the Rose year was afforded by the variety Juliet, introduced by Messrs. Wm. Paul and Son. A striking break in colour was here manifested. A new race of bicolors was, in fact, inaugurated. Though double-tinted or parti-coloured Roses were known previously, such as pink Roses with amber hearts, yellow Roses with their petals margined with red, and striped varieties, such as the red *Rosa Mundi*, nothing like the colour contrast as shown by Juliet had been seen before. Here the double chromatic effect is due to a marked difference in coloration between the upper and lower surface of the petal, viz., crimson above and gold beneath. Such a colour contrast arose through the infusion of Austrian Briar (*Rosa lutea*) "blood," which has this century given us the Pernetiana race of garden Roses, characterised by their strong yellows, oranges, and terracottas, as exemplified in *Rayon d'Or*, *Golden Emblem*, *Lyon*, and *Mme. Edouard Herriot*.

Juliet resulted from a cross between the Rose *Capt. Hayward* and *Soleil d'Or* of Austrian Briar origin. Instead of the parental colours blending or one dominating the other in the offspring, they have, as it were, separated out, the upper surface of the petal taking the crimson of the Hybrid Perpetual and the lower the gold of the Austrian parent. Though there may be difference of opinion as to the aesthetic merit of such a colour contrast in a Rose, for the sake of its novel hues Juliet became a necessity and was much planted.

Like most new Rose varieties, it was not long in revealing its faults as well as its virtues. Seemingly a strong grower, it had also the following points to its credit—a highly perfumed flower, undamaged by rain and borne on a stiff stalk, and further, a point not often mentioned, fragrant foliage like that of the Sweet Briar. Its defects are evident in its lack of form, the flowers often coming double-centred, and in a certain unreliability as to colour. The blooms, especially in dry, sunny weather, are apt to lack the gold, its chief attraction, and in a vase this colour is not long sustained. In fact, Juliet often wears a "washy" look.

However, in spite of such faults, this variety would be well worth growing—at any rate, in the wetter, cooler, westerly parts of the kingdom—if it were not for a more serious drawback, viz., its great susceptibility to that bane of the Rose-grower, black spot. It may be possible to ward off this fungous disease by repeated drenchings with some liquid, or by copious dusting with some dry fungicide; but without treatment—in the writer's experience—its foliage invariably becomes attacked in the early summer, and by August the plant is well-nigh stripped of its first leaves. Fresh shoots may be pushed forth, but these are weakly and incapable of yielding autumn blooms of any quality. For this reason Juliet is little else but a summer flowerer, and can be disappointing as such. In fact, it has become somewhat the despair of the ordinary grower—at least, in this part of the country.

Now, fortunately, there is no longer any need to wrestle with Juliet for the sake of its colour novelty. The Queen Alexandra Rose, introduced by Messrs. S. McGredy and Son in 1917, is to all intents and purposes a Juliet in

colouring, and at the same time is free from the grave defect of being a martyr to black spot. It is also a better-shaped Rose, though not ideal in this respect, and is more reliable as to colour—at any rate, it is less inclined to washiness and maintains its brightness better on the bush and as a cut flower. It does not, however, beat Juliet on all points. Its scent is not so pronounced nor so sweet, and its stalk is not so strong. Juliet at its best may be a more telling Rose, with a greater depth of gold, but its rival will give many more good blooms in a season and is superior as a bedding variety. One feels that Juliet will soon become a memory—it has already fallen out of the National Rose Society's list—but The Queen Alexandra has come to stay—at least, for a while, until a greater in this line of bicolors arises. There is room for improvement, but it may be some time before a better variety with this colour contrast is forthcoming, suitable for the N.W. of England. Judging from this summer, The Queen Alexandra delights in a cool season, and, further, its bloom is unharmed by the wet—a great point in its favour. It would be interesting to know the parentage of this Rose. *J. P., Carlisle.*

## AMERICAN NOTES.

It seems unlikely that we shall get much modification of Quarantine 37 from the Federal Horticultural Board, as they have recently issued a lengthy memorandum filled with commendatory words from Federal and State officials, nurserymen, and a few others, all of whom are interested in excluding plants from foreign countries, not so much from fears of additional insect pests and diseases as from less altruistic reasons. Nurserymen are in the main satisfied to bar practically everything out, so that they can demand greatly enhanced prices for their products, and quite a number of them are now busy propagating Azaleas, Rhododendrons, Boxwoods, and other debarred plants. Others, particularly in California and the South and Far West, are growing bulbous Iris and other debarred bulbous stock. Roses are being propagated, many from cuttings, others from buds or grafts in California, Ohio, and New Jersey amongst other States. *Rosa multiflora japonica* is being much used as a stock for Roses. How well these plants will succeed in the colder States, where horticulture is the most advanced, time only will tell. Own-root plants are all but valueless except in the warm States, and I have not yet seen hybrid Teas or hybrid Perpetuals equal to the British plants worked on the seedling Briar or Manetti.

Orchids in immense numbers are being raised from seed. It will be years before many are of flowering size, and practically all are Cattleyas or hybrids with Cattleyas as one of the parents. In America, if Orchids are mentioned, the average retail florist, grower, and wholesaler concludes that Cattleyas are meant, as other beautiful Orchids like *Vanda coerulea*, *Phalaenopsis*, *Odontoglossums*, *Oncidiums*, *Cymbidiums*, *Cypripediums*, and *Dendrobiums* are so little offered for sale commercially. The total debarring of all collected Orchids is absolutely indefensible, as the powers that be are very well aware that no serious pests have come in with them in the past, nor are likely to do so in the future, which will cause damage to our gardens, orchards, or forests. The Federal Horticultural Board was appointed to protect the United States from insect pests and diseases; it has functioned largely as a tariff board, to protect and build up home products. Of course, the whole array of States and Federal bacteriologists, plant pathologists, and entomologists commend its work, as do many commercial growers, but it is encouraging to note that the great and growing amateur horticultural interests are overwhelmingly opposed to the present embargo policy.

In reading reports of the great exhibitions held at Shrewsbury, York, Chelsea, Wolver-

hampton, Birmingham, and elsewhere in *The Gardeners' Chronicle*, many held under canvas, we are regretfully reminded that such shows are all but impossible here. We have some wonderful spring exhibitions in the Eastern cities and a fair sprinkling of Chrysanthemum shows in November, but apart from special exhibitions of Dahlias, Paeonies, Roses and Gladioli we have virtually no summer shows of any size. For this our warm summer climate is largely responsible. Canvas tents become unbearably hot and make both exhibits and visitors miserable.

Special exhibitions of Dahlias and Gladioli are quite numerous in America at this season. These two flowers are grown in enormous numbers. Fields covering ten, twenty, or fifty acres are not uncommon, and there are some even larger. Many who are now specialists in these flowers started as amateurs, and now grow them by the acre. While the *gandavensis* section of Gladioli is most grown and favoured commercially, there is a steady advance in the culture and popularity of the more graceful *primulinus* section. The introductions of such noted hybridists as A. E. Kunderd, of Goshen, Ind., has opened up a veritable new world of Gladioli fanciers.

Amongst Dahlias the Paeony-flowered section is now most in favour; decoratives and Cactus follow. Flowers are now produced of such size that they resemble the big disbudded Chrysanthemums. Artistic arrangement of Dahlias at all exhibitions is in large measure lacking. Stereotyped rows of small glass bottles containing single flowers, or larger ones with bunches often badly crowded, are generally in evidence. Groups and baskets arranged for effect are being encouraged, but the average Dahlia fancier cares little for the artistic, but is well satisfied to view a solid bank of flowers, many thousands in number, such as are displayed each autumn at our numerous fairs—as agricultural exhibitions are called. Great numbers of orders are booked by the Dahlia specialists at these shows, sometimes five, ten, or even twenty dollars being charged for a plant for spring delivery, usually a single dry tuber. Green cuttings do not find much favour here.

In the Arnold Arboretum, Jamaica Plains, Mass., the fine collection of Cotoneasters, mainly natives of Western China, are particularly beautiful from mid-August onwards, when their fruits have fully coloured. For rockery work *C. horizontalis perpusilla* is probably the best. At the present time the plants are smothered with red fruits, and while not exceeding thirty inches in height are 10-12 ft. across. The less dense-growing *C. apiculata* is another charming rock-garden subject. The rather slender and fragile habit of *C. Dielsiana* makes it appeal to many; plants here are 6-8 ft. in height, and the numerous clusters of red Crataegus-like berries are quite effective. *C. racemiflora sanguinea* is the most striking of all the Cotoneasters in August and September; plants 7-8 ft. high and 12 ft. across present a most brilliant appearance with their masses of scarlet fruit. The only possible criticism to be made of this shrub would be that the foliage was entirely disproportionate to the fruits, being somewhat scanty.

The dark-fruited Cotoneasters, like *C. tennipes* and *C. multiflora calocarpa*, are much less effective than the scarlet ones, though very interesting botanically and good garden plants. The Cotoneasters have come very much into favour here of late years, and varieties I have reared have withstood minimum temperatures of 20 deg. below zero without injury.

A study of the fruit reports in *The Gardeners' Chronicle* of August 12 shows that your conditions rather closely parallel ours in New England. Here we had an abnormally moist June and July, whilst even in August showers have come with such frequency that no dried-up lawns are to be seen, and trees have looked more healthy and luxuriant. Apples, Pears, Plums, and Peaches are all heavy crops. Amongst small fruits Strawberries were an exception. Very wet weather prevailed during the ripening period, and a large part of the crop rotted. All other small fruits were abundant. *William N. Craig, Brookline, Mass., U.S.A.*

## ORCHID NOTES AND GLEANINGS.

### ORCHID HYBRIDS.

MESSRS. FLORY AND BLACK, Slough, send flowers of six exceptionally good new hybrids:—  
BRASSO-LAELIO-CATTLEYA THURGOODIANA (B.-L.-C. Eric × C. Thurgoodiana) is a very handsome flower over 7 inches across, the main features being the retention of the firm substance of the original ancestor, *Brassavola Digbyana*, and its fragrance; the colour being set by *C. Thurgoodiana*, the *C. Luddemania* in which is distinctly traceable. The sepals and petals are light rose pink, the base of the broad lip being of the same colour and its flatly expanded front light violet, darker in the centre. The disc of the lip is chrome yellow on white ground.

CATTLEYA CYTHEREA (Venus × King George). This showy hybrid has *C. Dowiana* in all its parents, with the addition of *C. bicolor* and *C. Rex*. The result is a bright yellow flower with orange base to the lip, on which are purple veining, the front being ruby red.

CATTLEYA VERONA (Octave Doin × Pittiana). This gives a very interesting instance of the manner in which true species of peculiar form assert themselves in their progeny, the *C. granulosa* in *C. Pittiana*, with its well-defined isthmus and broadly expanded front lobe of the lip, so well defined in that parent, being carried on unchanged, except for some enlargement. The sepals and petals are silver white, tinged with mauve, the side lobes of the lip darker and the front veined and tinged with purple.

LAELIO-CATTLEYA CLARINDA (L.-C. *blechleyensis* × *C. Rhoda*). This is a very brilliantly coloured flower, in which the *Laelia tenebrosa* in *L.-C. blechleyensis* imparts a gold-bronze tint to the sepals. The petals are bright violet with a gold tint and the lip entirely Tyrian purple.

LAELIO-CATTLEYA LUCRETIA (*C. Maggie Raphael alba* × *L.-C. Luminosa*). This is a good flower, with Cowslip yellow sepals and petals and violet lip, with prismatic rays at the base.

LAELIO-CATTLEYA IVER (L.-C. *Rubens* × *C. Luddemania Stanleyi*) is rose pink, with a distinct lip tinged and veined with purple and with orange veining at the base.

### INDOOR PLANTS.

#### GESNERA (NAEGELIA) AND ACHIMENES.

The Gesneras are an extremely pretty race of plants for the decoration of the warm greenhouse and conservatory during the summer and winter and are also invaluable as table plants. Many of them have strong root tubers, rich velvety leaves, and long paniced racemes of flowers, whilst others have scaly root corms, richly coloured velvety crimson or mottled leaves, and erect, pyramidal spikes of drooping, bell-shaped flowers, richly and variously coloured from white to fine shades of rose, violet crimson and scarlet, prettily dotted or marked. A choice race of hybrids has been raised from time to time, the members of which are a great improvement on the original species. The flower spikes are thrown up in great abundance, and they carry numerous, bright, pendulous flowers in various shades of colour. Seeds should be selected from plants with the finest and brightest coloured flowers. Seedlings will flower the first season, provided the seed is sown early in February or March. After the blooming season is over the plants should be allowed to rest, by gradually withholding water. They will do well in a brick pit or frame, and the pots should be stood on a cool base. During the winter the tubers should be kept in their pots in a temperature of about 50°; in a lower temperature they are apt to rot, but, on the contrary, if kept too hot, they are liable to start into growth before their time.

To have a succession of bloom pot a portion of the tubers in the middle of January, another batch in the middle of February, and another in

March, and place them in a moist atmosphere with a temperature of about 60° to 65°. Treated in that way they will supply flowers over a considerable period. Gesneras do not require large pots, but should be afforded receptacles according to the size of the tubers. Water the latter sparingly at first, but after they have commenced to grow give more moisture at the roots, but at no time over-water them. When they begin to show flower buds, and if well-rooted in the pots, a little liquid manure is beneficial, applied once a week. These plants are invaluable for conservatory and other decoration, and are so easily grown they should be included in collections of indoor plants. The following are a few of the best-named kinds. *G. Donkelaariana*, red; *G. exoniensis*, orange-scarlet and yellow, a fine winter-flowering kind; *G. pyramidalis*, pink; *G. zebрина discolor*, bright orange scarlet; *G. cardinalis*, scarlet; *G. splendens*, bright scarlet; *G. multiflora*, white; and *G. magnifica*, purple. They may be propagated from cuttings of the young shoots springing from the old tubers, or by leaves similar to the *Gloxinia*. Cuttings of the young shoots, if rooted early, will flower the following autumn, whereas those struck from leaves will only form small tubers the first year. Place the cuttings in a warm, moist atmosphere and a temperature of 65° to 70°. The soil should consist of a mixture of rich, turfy loam, fibrous peat, or leaf-mould in equal parts, with silver sand added.

Achimenes is a free-blooming, warm greenhouse plant, closely allied to *Gesnera*. The plants flower in May and June, and are suitable for pot culture. They are also useful for flowering in hanging baskets suspended from the roof rafters of a glasshouse; basket plants give a charming effect in a warm greenhouse or conservatory, and last in flower for several weeks. The flowers vary considerably in size, and are of many distinct shades of colour. The Achimenes is not grown so extensively as formerly, which is to be regretted, as it makes a grand display when in flower with a very little trouble, requiring less heat than the *Gloxinia*. A stock is easily raised from seed, or the plants may be increased from cuttings about 2 inches to 3 inches long. The cuttings will root in a moist bottom-heat under a hand light in a temperature about 65° to 70°. They form tubers and should remain in their cutting pots, allowing the tops to gradually die down in the autumn. In the following spring they should be shaken out of the pots and started in fresh soil in small pots, putting several tubers in a pot according to their size.

After the plants have done flowering withhold water gradually, and place the pots on their sides in a house having a temperature of about 50°, until the middle of January or February, when the tubers should be started into growth again. Shake the roots free of the old soil, and repot the tubers in rich soil similar to that recommended for Gesneras, putting 5 to 6 of the strongest tubers in a 3 inch or 4 inch pot.

Start the tubers in a steady heat of about 60°, with plenty of atmospheric moisture. As the plants become stronger, gradually use less fire-heat, to prevent the growth from becoming weak and spindly. The Achimenes may be grown in an ordinary warm greenhouse or pit near the roof-glass, admitting a little air when necessary. Shade the plants from bright sunshine until they are sufficiently strong to be placed in the conservatory.

The following named sorts offer a good selection:—*Longiflora alba*, white, with slight markings in the centre; *Mauve Queen*, large, mauve-coloured flowers; *Pink Perfection*, magenta rose; *Scarlet Perfection*, rich carmine scarlet with an orange eye; *Unique*, beautifully fringed with deep carmine, eye yellow, spotted with crimson; *Ambrose Verschaffelt*, fine white, with dark, starry centre; *Rose Queen*, rosy lake, shading to deep purple; *Argus*, rich purple, with a deep orange eye; *Dazzle*, vivid scarlet, a variety of dwarf habit; *Carl Woolforth*, large, purplish crimson; *Firefly*, very large, deeply fringed rich magenta, with a yellow eye; and *Margaretta*, pure white. Achimenes require similar treatment to *Gloxinias*, but several tubers should be placed in each pot for flowering, instead of one. *John Neal, V.M.H.*

## CAVENS, KIRKCUDBRIGHTSHIRE.

It is some years since I visited the gardens at Cavens, in Kirkcudbrightshire, the seat of Major Oswald, though they have been long familiar to me, for I resided for many years quite near to Cavens, and frequently enjoyed a visit to them, when they belonged to the late Mr. R. A. Oswald, brother of the present proprietor, and were cared for by his gardener, Mr. John Cooper, a splendid gardener, who is now in well-earned retirement in the neighbouring village. My first visit was paid in the time of Mr. Cooper's predecessor, and I well remember the pleasure experienced in seeing the old herbaceous borders, then furnished with many good old flowers. Mr. Cooper, encouraged by his employer, added some good features to the place. He kept abreast of the times, but retained the best of the old charms, and even to-day most of these remain, well-preserved by a worthy successor, Mr. Taylor.

The flower garden proper at Cavens is exceedingly pretty, and an excellent illustration of a portion of it appeared as the frontispiece to the *Handy Book of Horticulture*, by the Rev. F. C. Hayes, Rector of Raheny, Ireland, published in 1900. Mr. Hayes asked me for a few photographs of horticultural features in Scotland and was so pleased with the one of Cavens flower garden that he used it as the frontispiece. It remains much as it was in 1900, and consists largely of beds laid out in the grass with some good herbaceous borders. Two of the latter on the east side of the garden have long been examples of well-furnished and well-cared for herbaceous borders. Big plants of Pyrethrums, Delphiniums, Eryngiums, Aconitums, Phloxes, Rudbeckias, and other hardy plants show how excellent is the effect of these old-fashioned flowers when well arranged. One difference exists. Mr. Taylor does not stake the plants, and opinions may differ as to whether this is an improvement or not. No two can exist, however, with regard to cultivation, as this is well attended to.

Another broad border on the west side, which was at one time devoted to Dahlias, Hollyhocks, and other summer flowers, has been planted with hardy border plants, and these are well grown. In front, however, a great feature of the garden still remains. This is a magnificent broad margin of *Gentiana acaulis*, which seems to thrive and flower as well as it did more than thirty years ago. Of the beds in the grass it may be said that they are well planted with a variety of flowers. Some are mainly given up to hardy flowers, and there are still, as years ago, good Starworts, Sunflowers, Rudbeckias, and Irises, among which I still saw good numbers of the old Spanish Iris often called Thunderbolt.

Roses have always been well grown, although the soil is on the light side. Such flowers as Carnations, Heliotrope, Verbenas and other bedding subjects are still much employed for the beds at Cavens. One feature I looked for was a big clump of *Lilium auratum*, but it has been divided and numbers of the bulbs planted on the garden front of the house. What have been left and those which have been removed are thriving as of old. *Lilium giganteum* has long been cultivated at Cavens also, and Mr. Cooper had one plant about sixteen feet high one season. There were none of conspicuous stature this year, but a good many plants are still grown of this commanding Lily.

Passing from the flower garden to the vegetable and fruit quarters the path is flanked on either side by charming borders of hardy flowers, among which I noted an old friend in the garden, *Statice latifolia*. Wall and other fruits are always well grown at Cavens, and the crops in general are good this season, both large and small fruits giving excellent results. Vegetables, also, receive full attention, though there is no effort to grow what may be called exhibition produce. At the mansion some extension has been made in the way of flowers and a greater variety introduced with good effect. The old house, which has no pretensions to architectural charm, is well covered with climbers, which do much to redeem its inherent plain-

ness, while the magnificent trees on the splendidly kept lawn give a sense of delight in the beautiful surroundings of this fine old place, moderate in size, yet a delightful home for a family whose connection with Cavens has existed for many years, and whose present representative, Major Oswald, takes the keenest interest in his estate and in the welfare of those who dwell upon it. *S. Arnott.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from p. 182.)

### ENGLAND, S.

MIDDLESEX.—Apples are under the average, but the fruits are of good quality. Pears are an abundant crop, and the trees in a clean condition. Plums are of good quality, and these trees also are in a clean condition after spraying. Early Cherries were not good. Strawberries were of excellent quality and good in quantity. All small fruits were plentiful. The soil in these gardens is a medium loam resting on a clay subsoil. From observations I find that the hot, dry season of 1921 had a good effect in ripening the wood of fruit trees, especially on our soil, which is naturally damp. *W. Griffiths, Wildwoods Gardens, Clay Hill, Enfield.*

—All fruit trees flowered profusely, but the promise of bumper crops has not been fulfilled. Strawberries never recovered from the scorching they received last year. Some varieties of Apples, such as Lord Suffield, James Grieve, Lord Hindlip, Barnack Beauty, King of the Pippins, Ribston Pippin, and Lane's Prince Albert have set freely, but others only carry moderate crops. The fruit seems to promise good colouring this year, but whether this is due to the conditions or to other causes I am not certain. *Geo. H. Head, Fulwell Park Gardens, Twickenham.*

SURREY.—Apples are a very poor crop in this district. The majority of the trees blossomed well, but the flowers fell before they were properly matured. Trees of Allington Pippin and King of the Pippins are fruiting better here than any of the other dessert kinds. Culinary Apples, particularly Bramley's Seedling, are very scarce. Pears are a good crop and have required a great deal of thinning. Plums are a good average crop, more especially on the wall trees. Cherries in some parts of this district were a good average crop. Peaches and Nectarines are scarce. We have a heavy crop of Apricots, and these trees are very clean and healthy. Small fruits were plentiful, particularly Red Currants and Gooseberries. Nuts are very numerous. The early kinds of Strawberries, such as Royal Sovereign, were nearly complete failures. Many of the later kinds, including Givon's Late Prolific, greatly improved after the rains, and produced some fine fruit. *J. Collier, Gatton Park Gardens, Reigate.*

—The fruit crops in general with me this season are very indifferent. The drought in 1921 and the cold spring of this year are responsible for the failure. Many Strawberry plants and bush fruits were killed by the drought. Although Currants showed well, they failed to hang after setting, the dryness of the soil being the cause. Apples also suffered, but Pears look exceptionally well. *James Lock, Outlands Lodge Gardens, Weybridge.*

—The effect of last summer's drought is undoubtedly the cause of the light crops of Apples and Plums, and this, coupled with the dry spring, also made the Strawberry crops small, the plants making very poor crops. There was a fair show of blossom on the top fruits, but little of it matured. Pears are good, being in a little heavier soil than the Apples and Plums, and consequently felt the dry period rather less. *Alan A. Rawes, R.H.S. Gardens, Wisley, Ripley.*

—The fruit crops here, on the whole, are very satisfactory. Although Apples and Pears were covered with blossom, the crops will only be average ones, with the promise of good-quality fruit. Plums and Damsons are very good, Damsons in particular being laden with fruit. Of the smaller fruits, Raspberries in particular were excellent, the heavy rains coming in time to save the crop. Strawberries were practically a failure. Our soil is very light and shallow, with a subsoil of solid chalk. *H. Prince, Polesden Lacey Gardens, Dorking.*

SUSSEX.—Apples are a heavy crop for the second year in succession, except for some trees in a grass orchard which yielded heavily last season. The fruit promises to be much larger and cleaner than in 1921. Pears are scarce and inclined to be scabby, but this is not a good district for them. Early and mid-season varieties of Plums are very plentiful, but the latest kinds are scarce. With Cherries the reverse was the case. Strawberries were a very short crop and the fruit small, owing to drought. Gooseberries were very heavy, and Raspberries and Red Currants full crops; but Black Currants were under the average, owing to the dropping of the fruit during the dry weather. Cobnuts are a good average crop, and Walnuts over average. Insect pests have been easily controlled, except Pear midge and Currant-leaf blister aphid. Silver-leaf is less noticeable than of late years, particularly in Victoria Plums; Monarch is now more often attacked. The rains of late June and early July came just in time to help all top fruits and all the bush fruits, except Black Currants. The soil is mainly sandy loam. *E. M. Bear, Magham Down, Hailsham.*

—Fruit trees are generally clean and healthy, free from aphid. Ladybirds (*Coccinella*) were more abundant than we have had for years, which accounts for the scarcity of aphid. Black Currants, Raspberries, and Gooseberries were very heavy crops. Strawberries were completely dried up, consequently the fruits were very small indeed. There was an abundance of bloom on all fruit trees, and weather conditions were favourable at that period, but large numbers of fruits were cast owing to the drought, but this was an advantage, as it saved the labour in thinning. The soil here is an excellent loam resting on sandstone and shale. *Leon Squibbs, Stenchurst Gardens, Ardingly.*

—The fruit trees here, without exception, flowered with the greatest profusion, there being every indication of record crops of Apples, Pears, and Plums. A succession of cold easterly winds, followed by excessive drought, however, caused a number of Apples to cast their fruits. Never have I seen the trees in a cleaner and more healthy condition than at the present time, there having been an absence of aphid. Pears are heavily laden with fine, clean fruit. Plums are also abundant, and there is a good percentage of Apples; some trees of the latter I estimate to be carrying over a quarter of a ton of fruit. Apricots flowered very freely, but late frosts and biting winds ruined their prospects. Figs are fair, and Raspberries have been very fine and cropped heavily. Bush fruits were good and abundant, and, our soil being heavy, Strawberries have been plentiful and very good. *E. Markham, Gravetye Manor Gardens, East Grinstead.*

—All fruit trees in these gardens, with the exception of Plums, blossomed splendidly, and there are good average crops of Apples, Pears, Cherries, Peaches, Nectarines, Apricots and small fruit. Apples and Pears, in spite of the early drought, look well. Trees are very free from insects this season, and in some cases no summer spraying was required. The Strawberry crop was a failure—in fact, some of the plants did not recover from the drought of 1921. These gardens are very secluded, and the soil is light and sandy. *J. W. Buckingham, Milland Place Gardens, Liphook.*

(To be continued.)

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Grape Spot.**—(See pp. 141, 169).—I was very pleased to see this subject discussed by *May-flower* as I am sure it is a very important matter for gardeners, judging by the number of inquiries on the complaint you answer through your Answers to Correspondents columns. I have followed the advice given by you, and dressed the leaves and bunches with flowers of sulphur, with lime added to the last two dressings. I am not prepared to say whether it is doing good or not, as it is too early to give an opinion, for this is a very late season, and the berries suffer most when they are fully ripe. I am very much surprised at your correspondent mentioning *Lady Downes* as being troubled with spot, for the skin of this variety is very hard and of quite a different texture to that of *Muscat of Alexandria* and *Cannon Hall*. I have not the slightest sign of the disease in the late vinery, which is planted with *Lady Downes*, *Alicante* and *Gros Colmar*. There is not the slightest sign of the stalks of the berries shrivelling; they are perfect and green. The description given by Mr. John Wright in *The Fruit Growers' Guide* does not correspond with the disease. It starts with a small, brown spot, and radiates in circles; it is only the skin of the berry which is affected. There is no connection whatever between this disease and shanking. My experience of shanking is that it occurs at a definite time, i.e., between the stoning and the ripening of the fruit. If your correspondent could give us the latest scientific name of the fungus I should be much obliged. *J. L. Mottram, Cheshire.*

[Grape Spot is caused by the fungus *Gloeosporium ampelophagum*.—Eds.]

**East Lothian Stocks.**—(See p. 152).—Last summer at a village flower show I saw some exquisite white and purple Stocks. I inquired from whence they came, and was informed they were Scotch Stocks. The interesting topic of doubling in Stocks had been under discussion, and these being of more than ordinary merit attracted my notice. Assuming the said stocks to be of the East Lothian type. I procured seed from the same source and elsewhere. The seedlings were treated in accordance with gardening practice by pricking them out into boxes, judiciously saving and potting up all weakly ones to ensure worthy doubles of large size and rich colour of bloom, finally, hardening them off prior to transference then to open quarters. After the plants became established, they soon grew into symmetrical models of healthy growth, but the resultant flower spikes were disappointing, non-existent, in some cases, except for a tuft of bloom deplorable in size and colour; the singles are so numerous that I am very much like the grower, whom Mr. Brotherston referred to as growing all singles. I am familiar with the charming strains, within the reach of all, offered through our seedsmen to beautify our gardens, and the embellishment of the greenhouse in winter and spring, but I was seeking the true East Lothian Stock for personal gratification to adorn the borders and associate with the other types of Stocks. The poor results substantiate the statement given by Mr. Brotherston in his article on the subject in the issue of September 9, with which I agree, and feel convinced that inferior strains predominates over the true type. *F. Gooch, Bossington Gardens, Stockbridge, Hants.*

**Abercrombie's Calendars** (see page 136).—My copy of *The Amateur Gardener's Pocket Journal*, which contains "a Treatise on Window Gardening, Warden Cases, and Fern Culture" by George Glenn, F.H.S., contains also a short "Preface to the Seventeenth Edition" signed "M. A. M." undated, but written in Hackney. *F. G. M.*

**Wasps in 1922.**—In this neighbourhood wasps have been remarkably scarce this year. I know of only two nests so far, one of which, a fine, strong one of *Vespa germanica*, I took from a

neighbour's garden on Saturday last. The other is a *V. vulgaris* one which I have not yet discovered, but the wasps are occasionally seen in my garden. It is a great contrast to last year, when nests were common. On the other hand, I learn from a friend who has recently returned from a holiday near Newquay, in Cornwall, that wasps were very troublesome there. How have other parts of the country fared?—*C. Nicholson, 35, The Avenue, Hale End, E.A.*

I agree with Mr. Dunn, *Gard. Chron.*, Sept. 23, p. 183, that wasps are a plague this season. I have, up to date, taken 75 nests, and am at my wits' end how to deal with these insects, as they are attacking our early Pears and destroying them before they are nearly ripe. I attribute the large number of nests to the cold and wet spring, as I noticed very few queens at that time and only killed nine;

SOCIETIES.

NATIONAL ROSE.

September 21.—By general opinion, this autumn show was the very best of the excellent series the Society has held. The Royal Horticultural Society's Hall, Vincent Square, was well filled with a great array of excellent blooms, and the attendance was so great as to render an inspection of the flowers a matter of difficulty. As usual, the new Roses were a great attraction and throughout most of the day a procession of visitors, often four deep, slowly passed before them. Besides the one which was awarded the Gold Medal, and the five Certificated varieties, there were many others of more than average merit. Those who desire fragrance above all other qualities in a Rose were delighted

FIG. 79.—ROSE FLORENCE M. IZZARD. N.R.S. GOLD MEDAL, SEPTEMBER 21. SHOWN BY MESSRS. S. MCGREY AND SON, PORTADOWN. (SEE P. 198.)

other seasons we generally kill from 60 to 70 queens. Cotton-wool fastened to a stick and soaked in a solution of cyanide of potassium should be thrust into the hole of the nest, leaving a small space for the wasps to enter. In an hour or two the wasps may be dug out and the nest destroyed. It would be interesting to know if any of your readers have exceeded me total of nests this season. *Geo. Bayliss, Criccieth.*

**Hornets' Nests.**—As Mr. Hodgson states (p. 183), hornets prefer to build their nests in hollow trees and, of course, that is the most natural situation for them, but they have also been known to build in outhouses and other buildings and underground nests have been recorded before. If Mr. Hodgson, or any other reader, meets with or hears of another nest this season I shall be very glad to have particulars of it before it is destroyed; also I shall at any time be glad to have a few freshly killed queens and drones. The latter, as with the smaller wasps, are slimmer than the queens, but larger than the workers, and they have longer antennae than either. *C. Nicholson, 35, The Avenue, Hale End, E.A.*

with *Herald*, which possesses that pleasing attribute in a marked degree. It is an H.T. variety, of deep, velvety claret-maroon colour, and was shown by Messrs. S. MCGREY AND SON, who also showed *Albert E. Amos*, another particularly fragrant H.T. Rose. It is of smoky crimson colour, but lacks good form in any stage of development. *Doris Trayler*, exhibited by the same raisers, is a showy, H.T. variety of orange-yellow colour, which changes to pale golden yellow when the blooms are fully open. *Climbing Madame Ed. Herriot*, raised by Messrs. KETTEN FRERES, Luxembourg, is, as shown, by no means equal to the bush variety. Messrs. BEES, LTD., have, in *Ariel*, *Macbeth*, *Firefly*, and *Sybil*, four very good garden Roses, even though they were not considered sufficiently meritorious to receive awards.

The *Cory Cup*, offered for the best seedling climbing Rose of the year, was awarded to *Sanctity*, shown by Messrs. F. CANT AND CO., Colchester.

The Silver Medal blooms were *Annie Crawford*, in the open classes, shown by Messrs. A. DICKSON AND SONS, and *George Dickson*, in the amateurs' classes, shown by Mr. G. SPEIGHT.

AWARDS.  
GOLD MEDAL.

*Florence M. Izard*.—This very beautiful rich yellow H.T. Rose received a Certificate of Merit in 1921, and now has the highest award. It was shown in splendid condition and has a slight perfume. It is, perhaps, best in the bud stage and half opened, when the form is very good and the petals recurve in a fascinating manner. The foliage is excellent and, in the deep green shining leaves, suggests *Rosa Pernetiana* parentage. Shown by Messrs. S. MCGREY AND SON.

CERTIFICATES OF MERIT.

*Arthur Cook*.—A fragrant, deep, velvety-crimson H.T. Rose, which occasionally is of very deep purple shading. It is especially shapely when in the bud stage, and when fully expanded is of flattish shape. This deliciously fragrant Rose is named in compliment to the son of Mr. Cook, who in an unobtrusive manner at the offices has done a deal of valuable work for the Society.

*Mrs. G. Heath*.—This medium-sized H.T. variety is essentially a garden Rose and is especially effective in quantity. It is of soft yellow colour freely shaded with apricot. In shape, it is much like *Independence Day*, and it possesses firm, dark green foliage.

*Vesuvius*.—No doubt the crater-like form of this uncommon single H.T. Rose suggested its name, while the glowing velvety-crimson colour and the little cluster of golden stamens add to the suggestion. The vase-shaped blooms are about 2½ inches across and the margins recurve. It is very free-flowering and has substantial petals. These three varieties were shown by Messrs. S. MCGREY AND SON.

*Westfield Star*.—Although it is stated to be a *Polyantha* seedling, this is a fully double H.T. Rose of medium size. It is recommended for bedding and for forcing. The colour is a good milk-white, which is relieved by yellow in the heart of the flowers, giving them the appearance of robust Tea Roses.

*Nur Mahal*.—This is a delicately fragrant hybrid Musk Rose of very bright crimson colour fading to what may be termed blotting-paper red, and there is a small, irregular white zone. The flowers are what the N.R.S. term "semi-single," and average three inches across. They are freely borne on branching stems. Shown by the Rev. J. H. PEMBERTON.

GROUPS OF ROSES.

These generous masses of Roses are always a source of great attraction to the visitors, and the present occasion was no exception to the rule. The competition was very keen and the quality of all the exhibits was so high that the judges awarded extra prizes, and these were justly deserved. In the large class, the first prize was won by Mr. ELISHA J. HICKS, with a delightful display. His arches of *Joanna Bridge* and *Ophelia* were particularly charming, and among the many handsome stands of bloom we noted *Climbing Lady Hillingdon*, *Golden Ophelia*, *Hoosier Beauty*, and *Isobel*, as being of superlative merit. Messrs. BEES, LTD., who were second, had great masses of their highly decorative variety *Independence Day*, and also gave special prominence to the large, single *Isobel*, which is of especially bright colouring. The *Queen Alexandra Rose*, *Venus* and *Padre* were also of great merit. Messrs. CHAPLIN BROS. were third, and they arranged their very good blooms chiefly in tall stands, making a fine effect. The principal varieties so displayed were *Red Letter Day*, *Isobel*, *K. of K.*, *Lady Pirrie*, and *Golden Emblem*. Messrs. WATERER, SONS AND CRISP were fourth, and Messrs. ALEX. DICKSON AND SONS were fifth, and each arranged collections of considerable merit.

In the smaller group class, which calls for a collection on a space of 10 ft. by 4 ft., the same high quality and artistic arrangement obtained. The first prize was won by Mr. GEORGE PRINCE with a splendid collection of such varieties as *Isobel*, *Ophelia*, *Padre*, *Souv. de Claudius Pernet*, and *Golden Ophelia*. Although the second prize was awarded to Messrs. A. J. and G. ALLEN, the judges endorsed the card "more representative next time, please."

Although the group was not fully representative, it was of very high quality. Messrs. S. MCGREY AND SON were third, with Mr. T. B. EDWARDS fourth.

The exhibits of 36 varieties made a splendid show, and the first prize was awarded to Messrs. J. JEFFRIES AND SONS for a brilliant display of such sorts as *Miss Buller*, *Madame Ed. Herriot*, *Isobel*, *Lady Hillingdon*, and *Golden Emblem*. Mr. JOHN MATTOCK was second; his best vases were of *Lady Pirrie*, *Margaret Dickson Hamill*, and *Lady Hillingdon*. Messrs. F. CANT AND CO. were a good third. The exhibits in the class for 18 distinct varieties were also of great merit, and the chief honour was won by Mr. HENRY STREET, who had excellent vases of *Isobel*, *Christine Hadley*, *K. of K.*, and *Golden Emblem*. Messrs. CHAPLIN BROS. were placed second.

The best exhibit of 24 varieties of Decorative Roses, excluding *Polyanthas*, was shown by Mr. JOHN MATTOCK, who included beautiful vases of *Hadley*, *Padre*, and *Golden Emblem*; in the second prize collection by Messrs. F. CANT AND CO., there were very good vases of *Los Angeles*, *Isobel*, and *Red Cross*. Messrs. CHAPLIN BROS. had the best 12 varieties, and Messrs. F. SPOONER AND SON were second in that class.

EXHIBITION ROSES.

The same high quality was to be observed in the classes for general exhibition Roses. The best 24 blooms, distinct varieties, were shown by Messrs. ALEX. DICKSON AND SONS, and these were very fresh and shapely specimens of particularly even quality. The very best were *Edgar M. Burnett*, *Annie Crawford*, *Florence Forrester*, *George Dickson*, *Hugh Dickson*, *Marjorie Bulkeley*, and *Edward Bohane*. Messrs. HUGH DICKSON, LTD., were a good second, and their outstanding blooms were *Alex. Emslie*, *Earl Haig*, *Hugh Dickson*, *George Dickson*, and *Caroline Testout*. Messrs. B. R. CANT AND SONS were third.

In the class for 18 distinct varieties, Mr. GEORGE PRINCE was decidedly first, for he staged a superb collection of such sorts as *Augustus Hartmann*, *Mrs. C. Lamplough*, *Earl Haig*, and *George Dickson*. Messrs. G. and W. BURCH were second, and Mr. HY. DREW was third.

Tea and Noisette Roses were not quite so good, though the first prize board of 12 varieties, shown by Mr. GEORGE PRINCE, included beautiful blooms of *Lady Plymouth*, *Mrs. Foley Hobbs* and *Madame C. Soupert*. Messrs. D. PRIOR AND SON were second.

Baskets of Roses in the four classes were of particularly high quality. The best three of exhibition Roses were of *W. E. Wallace*, *Marjorie Bulkeley*, and *Gorgeous*. Shown by Messrs. HUGH DICKSON, LTD. Messrs. S. MCGREY AND SON, who were second, had splendid baskets of *Una Wallace* and *Admiration*. The best five baskets of decorative varieties were shown by Messrs. CHAPLIN BROS., though during the afternoon these were eclipsed by the second prize exhibit of Messrs. ALEX. DICKSON AND SONS, who included most beautiful baskets of *Lady Inchiquin*, *Betty Urpichard*, *Mrs. Wenys Quinn*, and *K. of K.* Mr. G. LILLY, showing excellent blooms of *Miss May Marriott*, *Ophelia*, and *Madame Abel Chatenay*, was first in the class for three similar baskets, and Mr. JOHN MATTOCK was second. The best three baskets of *Polyantha* Roses were shown by Mr. GEORGE PRINCE, who had highly decorative baskets of *Orleans*, *Nurse Cavell*, and *Coral Cluster*. Messrs. G. JACKMAN AND SONS were second.

AMATEURS' CLASSES.

While competition generally in these classes was not so keen as in the open section, there were many highly meritorious blooms shown. The best 12 exhibition blooms by Mr. G. SREIGHT, *Market Harbro'*, included fine examples of *E. Bennett*, *George Dickson*, and *Mrs. C. Lamplough*. Mr. F. H. FIELDGATE, *Colchester*, who was second, had a fine set of blooms, amongst which *Colestria*, *Augustus Hartmann*, and *Florence Forrester*, were very good indeed. The first prize, 6 distinct varieties, by Mr. R. DE V. PRYOR, *Hitchin*, included a magnificent bloom of *Candeur Lyonnaise*. Mr. J. T. OWEN, *Wood Green*, was awarded the first prize in the class

for growers residing within 10 miles of *Charing Cross*, and Mr. W. G. BANBRIDGE, *Kettering*, who showed good blooms of *Mrs. Foley Hobbs* and *White Maman Cochet*, was first for 6 Tea or *Noisette* blooms.

The class for 6 vases of Decorative Roses was especially popular and included many splendid exhibits. The first prize was won by Mr. G. A. HAMMOND, *Burgess Hill*, with such varieties as *Golden Emblem*, *Irish Fireflame*, and *Mrs. Redford*. Mr. JOHN HART, *Potters Bar*, was a very good second.

DECORATIVE CLASSES.

The dinner table decorations were particularly effective and there were many exhibits in the two sections. In the open class, Mrs. A. BIDE, *Farnham*, added to her many triumphs with a most beautiful table of *Madame Butterfly*, and Miss PRINCE, *Oxford*, was second with *Irish Fireflame*.

In the amateurs' class, Mrs. COURTNEY PAGE was first with a very charmingly arranged table of *Madame Butterfly*; Mrs. OAKLEY FISHER, who used *Isobel* to good effect, was second, and Mrs. A. ROBINSON was third. The bowls of Roses was delightfully arranged. Mrs. MAY, *Waltham Cross*, was first in the open class, and Mrs. C. GEDDENS, *South Mimms*, was equally successful in the amateurs' class, while Mrs. CHARLTON, *Yiewsley*, who used *Madame Butterfly* with great taste, had the best vase of Roses.

ROYAL CALEDONIAN HORTICULTURAL.

(Concluded from p. 186.)

AMATEURS' CLASSES.

In the classes restricted to amateurs, the leading prize-takers were:—Mr. D. A. HILL, *St. Boswells*, for a collection of vegetables; Messrs. J. SINCLAIR, *Edinburgh*; A. ARCHIBALD, *V.C.*, *Leith*; R. KERR, *Edinburgh*; and J. ARNOTT, *Corstorphine*, for plants; Messrs. W. GRAHAM, *Lanark*; P. LUGTON, *Ayton*; R. ROBERTSON, *Swinton*; R. GRANT, *Bo'ness*; C. JENKINS, *Cambuslang*; and D. B. DOUGHTY, *Ayton*, for cut flowers; and Messrs. J. MALCOLM, *Dunbar*; D. KERR, *Menstrie*; T. WATSON, *Carlisle*; and T. NICHOL, *Earlston*, for fruit.

GARDEN ALLOTMENTS' FEDERATION.

The Silver Challenge Cup offered by Messrs. J. W. SCARLETT, J.P., *Sweethope*, and T. A. SCARLETT, *Edinburgh*, for the best exhibit in the section of the exhibition for collections of vegetables, was awarded for the year to Mr. W. KENNEDY, *Craigmillar, Edinburgh*; and the Gold Badge offered by the Royal Caledonian Horticultural Society to the competitor who obtained the best results from an allotment was won by Mr. ALEX. M'KEAN, *St. Bernard's Allotments, Edinburgh*.

AWARDS TO NOVELTIES.

*First-Class Certificates*.—Decorative Dahlias *Ben More*, *Ben Ledi*, and *Ben Lomond*, exhibited by Messrs. DORRIE AND CO., LTD., *Edinburgh*; H.T. Roses *W. E. Wallace* and *Oliver Mee*, exhibited by Messrs. HUGH DICKSON, LTD., *Belfast*.

*Awards of Merit*.—*Collerette Dahlia Sunbeam*, exhibited by Messrs. TORRANCE AND HOPKINS, *Busby*; *Begonia Mrs. F. B. McLaren*, exhibited by Mr. J. STEVENSON, *Melrose*; *Fancy Pansy Dr. Kelso*, exhibited by Mr. J. M'KILLOP, *Uphall*; *Fancy Pansy Dryden M'Coll*, exhibited by Mr. H. M'COLL, *Preston House, Linlithgow*.

NON-COMPETITIVE EXHIBITS.

The following awards were made to non-competitive exhibits:—

*Gold Medals and Special Appreciations*.—To Mr. DAVID KING, *Osborne Nursery, Murrayfield, Edinburgh*, for rockwork; Messrs. DOBBIE AND CO., *Edinburgh*, for Roses and Dahlias; Messrs. AUSTIN AND M'ASLAN, *Glasgow*, for fruits and vegetables; and Messrs. ALLWOOD BROTHERS, *Haywards Heath*, for Carnations and *Dianthus Woodii*.

*Gold Medals*.—To Messrs. CUNNINGHAM, FRASER AND CO., *Edinburgh*, for *Coniferae*,

etc.; Messrs. ISAAC HOUSE AND SON, Bristol, for hybrid Scabious; Messrs. LAIRD AND DICKSON, Edinburgh, for Gladioli; and Messrs. STORRIE AND STORRIE, Glencorse, for fruit trees in pots, etc.

**Silver-Gilt Medals.**—To Messrs. CUNNINGHAM, FRASER AND CO., Edinburgh, for cut flowers; Messrs. JOHN FORBES (Hawick) LTD., for cut flowers; Mr. JOHN DOWNIE, Edinburgh, for cut flowers; Messrs. TILLIE, WHITE AND CO., Edinburgh, for vegetables and Gladioli; and the SCOTTISH CO-OPERATIVE WHOLESALE SOCIETY, for fruits and cut flowers.

**Silver Medal and Cultural Certificate.**—To Mr. JOHN A. MURIE, Market Gardener, Edinburgh, for Leeks and Cauliflower.

**Silver Medals.**—To Messrs. BAKERS, Codsall, for cut flowers; Mr. W. FERGUSON, Dunfermline, for Roses; Messrs. G. MAIR AND SON, Prestwick, for Gladioli; and Mr. JOHN WILSON, Hereford, for Onions.

**Bronze Medal.**—To Mr. JAMES BISHOP, Biggar, for Violas.

SEPTEMBER 7.—The monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. David King, president, in the chair.

A paper on "Shrubs and Climbers" was read by Mr. D. M'Gran, Coatham Gardens, Kilmarnock.

The exhibits were:—Dahlias, by Messrs. DOBBIE AND CO., Edinburgh (Gold Medal); Potatoes, Onions, etc., by Miss BURTON, New Saughtonhall, Midlothian (Special Appreciation and a Cultural Certificate); Chrysanthemum maximum vars. Peggy and Stenhouse Giant, by Mr. FRANCIS BAILLIE, Stenhouse, Liberton (Cultural Certificate).

**ROYAL HORTICULTURAL.**

**Present:** Messrs. H. B. May (in the chair), D. B. Crane, J. Cheal, John Green, A. C. Bartlett, J. B. Riding, A. Turner and C. H. Curtis.

The following varieties of Dahlias were selected for trial by the joint floral committee of the Royal Horticultural Society and the National Dahlia Society at the R.H.S. fortnightly meeting on the 19th inst:—

**Doris Tisdale.**—A large fawn-coloured Cactus variety.

**Cameo.**—A light yellow Collerette variety, of good size and form.

**Cavalier.**—A very full, Paeony-flowered sort, deep crimson scarlet, tipped with white.

**Primrose.**—A large and shapely collerette variety, with almost white collar. The above were shown by Messrs. J. STREDWICK AND SON, St. Leonards.

**Leonie.**—This miniature Paeony-flowered variety is deep pink, marked and shaded with scarlet over the greater part of the flower.

**Betty.**—A miniature Paeony-flowered Dahlia, almost single, and with broad florets; the colour is light mauve, almost a blue shade.

**Spicy.**—A charming miniature Paeony-flowered variety, light crimson, with purplish tips. The flowers have stiff stems.

**Welcome.**—A shapely miniature-flowered Dahlia of striking appearance; blush or pink ground with rose and crimson flushing.

**Peach.**—A lovely glowing pink Paeony-flowered variety with golden centre and with golden shading running into the pink area.

**Princess.**—A miniature Paeony-flowered sort, pink, with golden centre and shading.

**Tipsy.**—A splendid Camellia-flowered variety of fine form and rich deep scarlet colouring.

**Raider.**—A miniature decorative variety of soft terra cotta shade, with purplish centre. The foregoing eight varieties were shown by Messrs. J. BURRELL AND CO., Cambridge.

**Mrs. Lowes.**—A handsome clear yellow Cactus variety of excellent form.

**Lady Hurst.**—This belongs to the miniature Paeony-flowered section, but shows "Star" parentage; rich pink with golden centre and shading.

**Mrs. Trist.**—A large Camellia-flowered sort, shapely and full; purplish magenta.

**Rowett Star.**—Very bright and belonging to the Star section; yellow, tipped with rose-pink.

**Peggy Lobjoit.**—A Star Dahlia, pink with light yellow centre.

**Crawley Beauty.**—A Parisian single Dahlia, intense crimson, deeply edged with dark scarlet. The foregoing six varieties were shown by Messrs. J. CHEAL AND SON, Crawley.

**Sweet Dorothy.**—A pretty Star Dahlia of deep rose-pink shade.

**Dainty.**—An elegant and somewhat quaint Star Dahlia, yellow, with lilac-mauve tips.

**Snowdrift.**—A useful white Cactus variety, with narrow, pointed florets of purest white. The three last-named varieties were shown by Mr. CHARLES TURNER, Slough.

**Trial of Sweet Peas at Wisley.**

The following awards have been made to Sweet Peas by the Council of the Royal Horticultural Society after trial at Wisley:—

**AWARDS OF MERIT.**

No. 34, *Hebe*, sent by Mr. J. STEVENSON; Nos. 47, 48, *Hawmark*, salmon-pink sent by Messrs. A. DICKSON AND SONS and Messrs. CULLEN; No. 74, *Cottage Rose*, sent by Mr. BIRTLES; No. 84, *Royal Cherry*, sent by Mr. H. DICKSON; Nos. 90, 91, 92, *Doris*, sent by Messrs. DOBBIE AND CO., Messrs. E. W. KING AND CO., and Messrs. KING, WEBB AND SONS; No. 116, *Fair Lady*, sent by Mr. J. STEVENSON; and Nos. 144, 151, *Picture*, sent by Messrs. DOBBIE AND CO., and Messrs. WEBB AND SONS.

**HIGHLY COMMENDED.**

No. 13, *Mavis*, sent by Messrs. E. W. KING AND CO.; No. 16, *Joan of Arc*, sent by Mr. J. STEVENSON; Nos. 18, 19, *Annie Bownass*, sent by Messrs. CULLEN and Messrs. A. DICKSON AND SONS; Nos. 60, 65, *Hawmark Pink No. 1*, sent by Mr. UNWIN and Messrs. DICKSON AND SONS; No. 72, *Mignonne*, sent by Messrs. E. W. KING AND CO.; No. 76, *Rosamund*, sent by Mr. H. DICKSON; No. 81, *Glory*, sent by Messrs. R. BOLTON AND SON; No. 83, *Mrs. Jessop*, sent by Messrs. R. BOLTON AND SON; No. 85, *Hawmark Cerise*, sent by Messrs. A. DICKSON AND SONS; and No. 87, *Eva*, sent by Messrs. S. F. CURTIS.

**Trial of Beet at Wisley.**

The following awards have been made to Beet by the Council of the Royal Horticultural Society after trial at Wisley (judged August 2, 1922):—

**AWARD OF MERIT.**

No. 37, *Egyptian*, re-selected, sent by Messrs. CARTER AND CO.

**HIGHLY COMMENDED.**

No. 4, *Crimson Globe*, sent by Messrs. HURST AND SON; No. 4, *Express Crimson Globe*, sent by Messrs. DICKSON AND ROBINSON; No. 12, *Reliance Globe*, sent by Messrs. E. WEBB AND SON; No. 17, *Eclipse Turnip-rooted*, sent by Messrs. BARR AND SONS; and No. 20, *Perfect Model Globe*, sent by Messrs. KELWAY AND SON.

**COMMENDED.**

No. 14, *Globe Selected No. 2*, sent by Messrs. DOBBIE AND CO.; No. 24, *Crimson Globe* (sent as *Model Globe*), sent by Messrs. R. VEITCH AND SON; and No. 30, *The Cooper Taber Turnip-rooted*, sent by Messrs. COOPER, TABER AND CO.

JUDGED AUGUST 16, 1922.

**AWARD OF MERIT.**

No. 39, *Feltham Intermediate*, sent by Messrs. WATKINS AND SIMPSON.

**HIGHLY COMMENDED.**

No. 42, *Intermediate*, sent by Messrs. KING; No. 46, *New Intermediate*, sent by Messrs. R. VEITCH AND SON; No. 51, *Queen Mary*, sent by Messrs. HARRISON.

**UNITED HORTICULTURAL BENEFIT AND PROVIDENT.**

THE monthly meeting of this society was held in the R.H.S. Hall on Monday, September 11, Mr. Chas. Curtis presiding. An extra benefit of £5 was granted to one member for dental treatment. Two members withdrew interest from their deposit, the sum of £5 1s. 8d. each. The sick pay for the month on the private side was £33 3s. 8d., and on the State section £37 7s. 8d., maternity benefits came to £12. Arrangements were made for the annual dinner to take place at the Imperial Hotel, on October 4, when a presentation will be made to Mr. C. H. Curtis as a token of esteem and regard and to mark his completion of twenty-one years' service as chairman of the society; Mr. Leonard Sutton will preside.

**MANCHESTER AND NORTH OF ENGLAND ORCHID.**

THURSDAY, SEPT. 7.—*Committee present:* The Rev. J. Crombleholme (in the chair), Messrs. B. J. Beckton, A. Burns, A. Coningsby, A. T. Cussons, J. Cypher, A. G. Ellwood, W. Gives, Dr. R. N. Hartley, J. Howes, J. Jackson, A. Keeling, J. Lupton, D. McLeod, W. Thompson, and H. Arthur (Sec.).

**FIRST-CLASS CERTIFICATES.**

*Brasso-Laelio-Cattleya Maculata (B.-C. The Baroness × L.-C. Thylene); Cattleya Venus var. Grand Monarch; and L.-C. Golden Sunset (L.-C. Appam × C. Aureole)*, from S. GRATRUX, Esq.

*Laelio-Cattleya Eloasca (L.-C. Elva × C. Rubens Lambearianum); L.-C. Sargon majestica (C. Hardyana × L.-C. Lustre)*, from P. SMITH, Esq.

*Cypripedium Albion (C. naevium × Astarte)*, from Mrs. GRATRUX.

**AWARDS OF MERIT.**

*Odontoglossum St. George var. Eileen; Odm. amabile The Prince*, from A. HANMER, Esq.

*Cattleya Aenas (Venus × aurea) and Cattleya Frazziana (L.-C. Schulzeana × C. Fabia)*, from Messrs. KEELING AND SONS.

*Cattleya Gaskelliana Pallens*. From Dr. R. N. HARTLEY.

*Cattleya Hardyana var. Ruby*. From Messrs. STUART LOW AND CO.

**GROUPS.**

The Rev. J. CROMBLEHOLME, Clayton-le-moors (gr. Mr. E. Marshall), was awarded a Silver-Gilt Medal for a group of Cypripediums in variety. J. MCCHEENEY, Esq., Bolton (gr. Mr. E. H. Potts), was also awarded a Silver-Gilt Medal for a group of miscellaneous Orchids. Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), staged a group for which a Silver Medal was awarded.

Dr. R. N. HARTLEY, Wigan, was awarded a Silver Medal for a group.

SEPTEMBER 21.—*Committee present:* The Rev. J. Crombleholme (in the chair), Messrs. B. J. Beckton, J. Birchenall, A. Coningsby, A. T. Cussons, J. Cypher, A. G. Ellwood, J. Evans, Dr. R. N. Hartley, J. Howes, W. Morton Jackson, A. Keeling, D. McLeod, E. W. Thompson, J. Witham, and A. Arthur (Sec.).

**FIRST-CLASS CERTIFICATE.**

*Brasso-Laelia-Cattleya Golden Crown var. Diadem (B.-L.-C. Joun × C. Venus)*. One of the largest and best coloured of the type. From P. SMITH, Esq.

**AWARDS OF MERIT.**

*Cattleya Abkeniae var. Aurora; Cattleya Hardyana var. Albion; Brasso-Laelio-Cattleya Asmodia West Point var.* From S. GRATRUX, Esq.

**GROUPS.**

S. GRATRUX, Esq., West Point (gr. Mr. J. Howes), staged a group for which a Silver-Gilt Medal was awarded.

A Silver Medal was awarded to Messrs. CYPHER AND SONS, Cheltenham, for a group in variety.

TRADE NOTES.

MR. GEORGE MONRO presided at a well-attended meeting of the Council of the Chamber of Horticulture, held on the 20th inst. Railway rates were considered, and the sub-committee dealing with the matter urged that the Chamber should support the co-ordinated objections drawn up by the Co-ordinating Committee. It appeared that a re-classification concession for plants and shrubs, minimum 30 cwt. per truck, in Class 16, being an additional concession to those gained at the Royal Courts of Justice in February last, was considered to be insufficient to meet the sub-committee's requirements, and a further communication to the Railway Rates Tribunal was made.

It was reported that the Parliamentary Committee had met on July 20 to consider the Merchandise Marks Bill now before the House of Commons. The Bill was considered satisfactory in principle, but objections were raised to some of its phrasing, which would appear to endanger a case presented for horticulture under Clause I of the Bill. The Ministry of Agriculture was communicated with on this subject, who replied that such an amendment would not be necessary, as Clause I would enable an order to be made requiring the indication to be given in some manner other than application to the goods. With this assurance the Bill is being supported. Reference was made to the meeting of representatives of non-trading societies with reference to the terms proposed by the Royal Horticultural Society for the letting of their hall for show purposes. Hope was expressed that the outcome of the meeting would be favourable to the societies. Arrangements have been made for the Chamber to be represented at the Crystal Palace Fruit Show on somewhat similar lines to those obtaining at the exhibition of 1921. The Secretary reported that the Chamber's *Bulletin* had been well received by the horticultural Press, with one exception. The matter of advertisements in the *Bulletin* was referred back to the committee, as there was no intention on the part of the Council to compete with the horticultural Press in advertisements. The Secretary reported that with regard to co-operative advertising of flowers, the Retailers' Association expressed sympathy with the movement, but could not offer any assistance; the British Florists' Federation was of the opinion that retailers as a whole should participate, so, in view of the fundamental difficulties, it was considered that the time was not yet ripe for embarking upon such a scheme, and the matter was postponed for the present. The Shop Assistants' (Facilities) Bill was explained, and as this appears likely to impose further restrictions upon trade, it was referred to the Parliamentary Committee to watch, and take any necessary action.

Mr. A. White and Mr. Seymour Cobley requested that action should be taken with regard to the excessive railway charges for flowers. This matter was discussed, but it was decided to adjourn further consideration until the next meeting, it being too late to obtain any benefit for this season's produce; moreover, it was considered that the whole question of existing railway charges for horticultural produce should be discussed and some decisive action taken to obtain relief.

GARDENING APPOINTMENTS.

Mr. W. J. Baker, for the past six years Gardener to Mrs. Evelyn Heslop, at Goldings, Great Warley, Essex, as Gardener to J. A. FAIRBURN, Esq., J.P., Arlington Manor, Newbury, Berkshire.

Mr. M. L. Sargent, for the past two years Gardener and Bailiff to Mrs. WALTER HOOKE, at The Rocks, Boars Head, near Tunbridge Wells, as Manager and Chrysanthemum expert at the Bridgewater Nurseries, Somerset.

Mr. G. T. Watson, previously for ten years Gardener to the late R. C. DE-GREY, Esq., Newby Hall, Ripon, Yorkshire, as Gardener to W. G. TARRANT, Esq., Lake House, Byfleet, Surrey. (Thanks for 2s. 6d. for R.O.G.F. Box.—Ems.)

REMARKS.—The smelmen's stands are crowded with cut blooms, but there is a lot of inferior grade, more especially amongst outdoor flowers, for which there is little demand. Chrysanthemums are very much in evidence, and there are many cheap "lines" in these flowers, principally coloured sprays in bunches. Dishudded blooms are more in demand; some fine blooms of white, yellow, pink, and bronze colours are now available in such sorts as Almirante, Duchess, Debutante, Sanctity, Delight (shell pink), Mercedes, Golden King and Rosbe Pink. The quantities of Carnations and Roses appear to be sufficient for all requirements, and their prices show no change from those of last week. Liliun longiflorum is again lowering in value. Richardias (Arums) are also arriving in better condition. The weather is most favourable to Gladioli, and some fine varieties are still on sale. Large consignments of Michaelmas Daisies are being sent by the growers. Physalis is also pretty plentiful. Violets are arriving in excellent condition. Trade does not show any general improvement, and there is no particular shortage of anything.

REMARKS.—Fruiting was on a fairly large scale toward last week-end, but it has since subsided to very meagre proportions. Prices all round are at a comparatively moderate level, which should have the effect of stimulating trade. Hothouse Grapes are plentiful, and with ample supplies from Belgium and Gurnsey as well as home grown, prices are low. Peaches are plentiful, and selling moderately well. The quantities of Worcester Pearmain Apples, both in standard ones and sieves, are ample for the demand, and prices for this variety remain low. Cooking varieties of large size and sound quality are a good trade, and realising more than good average dessert Apples. The Plum season is drawing to a close. Some good fruits of President have been making satisfactory prices. Victorias are rather waxy, and have been difficult to clear. Prunes and Damsons are slightly easier in price. Pears are available in moderate quantities, and parcels of good fruits have sold without difficulty, but some proportion consists of nondescript sorts, badly graded, and these are not wanted. Tomatoes, after a recovery in price, are inclined to be cheaper again. The first consignment from the Canary Islands has arrived in good condition. Cucumbers are a slightly firmer trade. Oranges from Australia and S. Africa are in good condition and larger quantities have brought about lower values. Bananas are a steady trade, but values are inclined to be easier. Green vegetables are cheap and plentiful. The Potato trade is quiet, with plentiful stocks on offer.

ANSWERS TO CORRESPONDENTS.

ADDRESS: J. W. M. The address you ask for is Messrs. C. J. Van Tubergen, Junr., Zwanenburg, Haarlem, Holland.

HEAD GARDENER'S NOTICE TO LEAVE: A. B. You are entitled to a month's notice or a month's wages in lieu of notice. You are also entitled to a month's notice to quit the cottage. If you cannot find alternative accommodation within that time you should explain the position to the court in the event of your employer issuing a summons for possession.

LENGTH OF NOTICE TO QUIT NURSERY LAND: E. W. A market gardener is entitled to recover certain compensation from his landlord, but a nurseryman has no such rights in the absence of any definite bargain on the point. If you use the land only as a nursery and if you are a yearly tenant, you are entitled to six months' notice to quit, expiring on the anniversary of the date when your tenancy commenced, unless you made any definite arrangement to the contrary.

NAMES OF FRUIT: M. H. E. 1, Yellow Ingestre; 2, Baumann's Red Winter Reinette; 3, Seedling; 4, Queen; 5, Keswick Codlin; 6, probably Gascoyne's Scarlet; 7, Bramley's Seedling; 8, local seedling; 9, Souvenir du Congres; 10, Pitmaston Duchess; 11, Glou Moreau.

NAMES OF PLANTS: J. N. and T. J. II. We cannot undertake to name florists' flowers.—J. W. C. Nepeta Glechoma variegata; variegated Ground Ivy.

Bearded Irises.

All who grow bearded Irises will find interest, and not a few satisfaction, in the perusal of the article on the classification of garden Irises published in the *Journal of the Royal Horticultural Society* for January of this year. The learned in Iris nomenclature, whose long experience enables them to "place" each Iris with greater or less certainty in its proper group will, perhaps, as Mr. Dykes suggests in his admirable introduction, regret that these sections are brushed aside by the Iris Committee; yet the cogency of the reasons which have led the Committee to adopt a purely empirical classification of bearded Irises is set forth so clearly and authoritatively by Mr. Dykes as to convince them that a classification based on apparent affinity is impossible. That this is so would follow from a consideration of the gaps in our knowledge as to the true origin of garden Irises. Apart from the early flowering quartet Iris pumila, I. Chamaeiris (which is often offered for I. pumila), I. mellita and I. Reichenbachii, the garden Irises are hybrids to which two or more species or species-like hybrids have contributed. According to Mr. Dykes, the older among the later flowering varieties of Irises are derived from I. pallida and I. variegata, whilst among more modern kinds some owe their origin to the co-operation of I. trojana—characterised by pointed buds and much branched stem. The beautiful variety, Isoline, has I. trojana blood in it and

crosses between this species and I. variegata have, according to Mr. Dykes, produced not a few valuable hybrids. Other species or introduced varieties have also been used in crosses. Of these, Mr. Dykes enumerates Amas or macrantha, which Sir Michael Foster received from Asia Minor, Foster's I. cypriana and I. mesopotamica. Permutations and combinations of these parents are represented in garden Irises of the present day, and although the expert will always find an interest in judging of parentage, it is idle to attempt to base a working classification on what must, in many cases, be at best conjecture. Moreover, as Mr. Dykes shows, I. germanica is of unknown origin. He gives valid reasons—that it does not lose its leaves in winter and that it does not seed freely—against its being a native of Germany, and he points to the fact that seedlings from I. germanica often resemble I. aphylla, in support of the opinion that I. germanica is itself a hybrid between I. aphylla and some not yet identified species. Of the first parents of the older, late-flowering Irises—I. pallida and I. variegata, the former is to be recognised by its scarios spathes, relatively tall stem, short laterals and glaucous or green leaves, the latter by its herbaceous spathes, much branched stem and strongly ribbed, green leaves. These species are native of southern central Europe, and in their habitat may be found the types and also forms of what used to be known as I. squalens and I. sambucina. Mr. Dykes points out that the purple of I. pallida and the yellow of I. variegata are combined in these hybrids to give the characteristic "murky shot-effect" of their flowers. Both I. pallida and I. variegata seem to be—as might be expected—very variable species. I. pallida dalmatica, with its largeness and glaucousness appears to be of garden origin and I. variegata, even as a wild plant, has produced as a sport leucographa in which the yellow ground of the type is replaced by white. Such a form crossed with pallida has doubtless been responsible for many of our garden varieties. In confirmation of this view, Mr. Dykes mentions the fact that Black Prince self-fertilised has given Richard II, with pure white standards, and other forms with the yellow standards of I. variegata; indicating clearly that the natural variety leucographa of I. variegata is a "dominant" white. With such a complex and not entirely known genealogy it is useless to attempt to do more than establish a working classification for garden purposes. That sketched by the Iris Committee consists of eight classes based on colour: white; white feathered with purple; standard white, or nearly so, falls purple; purple bicolors (standards paler than falls); purple selfs; standard of shot shades; standards yellow, falls blue-, red-, or brown-purple, yellow selfs. Each class is, of course, further subdivided on a colour basis. The full classification will also take into consideration another character of great importance in the garden, namely, height. What the Society has done in the case of the Iris it will, we hope, attempt in that of other flowers of garden importance and mixed origin.

Memorials to the late Mr. S. T. Wright.—Members of the Fruit and Vegetable Committee of the Royal Horticultural Society are placing a memorial to the late Mr. S. T. Wright, who for twenty-three years was secretary to the committee, in the Wisley Gardens. The memorial will take the form of a sundial with an inscription relating to Mr. Wright's services to the Society and the committee. It will be erected on the lawn between the superintendent's house

and the laboratory, a spot that will ensure it being seen by everyone who visits the gardens. Contributors to the cost of the memorial are restricted to past and present members of the Royal Horticultural Society's Fruit and Vegetable Committee, and the subscription has been limited to 10s. The chairman of the committee, Mr. C. G. A. Nix, Tilgate Forest Lodge, Crawley, Sussex, has been authorised to receive subscriptions. The members of the R.H.S. Gardens' Club have also decided to provide a memorial to the late Mr. S. T. Wright in memory of his long and valued association with the club as treasurer and vice-president. The memorial will take the form of a framed photograph of Mr. Wright, suitably inscribed, and this will be hung in the laboratory at Wisley.

Bacterial Spot of Cucumbers.—The not uncommon disease of Cucumbers, known as Bacterial spot, has been investigated by Messrs. F. C. Meier and G. K. Link, pathologists in the United States Department of Agriculture. The results of this investigation, published in *Department Circular* 234, show that the malady, which is due to a bacterium (*B. lachrymans*) is carried in the seed, and that to prevent infection the seed suspected of contamination with the bacterium should be disinfected by treatment for five minutes with mercuric chloride of a strength of one part in one thousand of water. After treatment, the seed should be washed for fifteen minutes in running water and allowed to dry. Bacterial spot of Cucumber may be recognised by the occurrence on the fruit of minute, circular, water-soaked areas. These areas, as the disease progresses, become more conspicuous and often take on a chalky-white appearance owing to the exudation of white, gummy masses from the diseased tissues. Although the disease itself does not generally do much damage, it often paves the way to rapid deterioration of the fruit as the result of the penetration through the diseased areas of other micro-organisms.

Association of Economic Biologists.—A general meeting of this Association will be held at 2.30 p.m. on Friday, October 13, in the Botanical Lecture Theatre of the Imperial College of Science, Prince Consort Road, South Kensington, London, S.W.7, when a discussion on "Virus Diseases" will be opened by Dr. E. J. Butler (Imperial Bureau of Mycology), who will speak on "Virus Diseases in Plants"; and Dr. J. A. Arkwright (Lister Institute of Preventive Medicine), who will speak on "Virus Diseases in Animals and Man."

The roses of Ancient Egypt.—Some interesting facts concerning the cultivation of the Rose in ancient Egypt were given by Mon. C. Cochet-Cochet in a lecture to the members of the French Horticultural Society on July 27. It is a remarkable fact that the Rose was unknown to the Hebrews in ancient times, the mention of this flower in the Song of Songs being probably an error in translation. It was not until after the Babylonian captivity that the Rose became known to the Jews, and it is mentioned in the later books of the Bible, Wisdom and Ecclesiasticus. Much later still, a mention of it is found in the Talmud. The ancient Egyptians, who had frequent communications with the Jews, were also unacquainted with the Rose. The flower does not occur on any monument of the Pharaohs. It is not until the period of the Ptolemies, i.e., until after 308 B.C., that one can trace, in frescoes and on fabrics, and in the form of dried natural flowers, evidences that the flower had become known to them. As there is no Rose which is native to Egypt, any species grown there must have been imported, and it is certain that even two or three centuries after Christ, it was still considered as an imported flower. M. Gayet, the well known Egyptologist, imported into Paris, in 1902 or 1903, the mummies of Thais and the sorceress Myrthis, from Antinois, where he also found, with the latter mummy, a fine collection of petals and buds of a Rose which he identified as *R. sancta*. Myrthis lived in the third century A.D. He also discovered silken fabrics worked with Roses which had five petals, and were yellow in colour, the colour signifying that they were of

Eastern origin—colour in Egyptian lore being conventional rather than imitative. It is plain, then, that the Rose at that time was still considered an exotic, but it must have been in cultivation at least five or six hundred years before that, for Theophrastus, who died in 287 B.C., mentioned that Roses flowered in Egypt two months before those in Europe. It would be interesting to know from whence in the first place Roses were imported into Egypt, and it is reasonable to suppose that it was from Greece, where the Rose was well known in very ancient times. Probably it was introduced with the Greeks who entered Egypt with Alexander, 332 B.C. As regards the species and varieties cultivated in Ancient Egypt, with the exception of *R. sancta*, of which numbers of dried specimens have been found at Fayoum, there is evidence in frescoes, fabrics, etc., only of Roses with five petals; but it is probable that they had the same sorts as the Greeks, who, according to Theophrastus, cultivated *R. gallica*, the Damask Rose, and the "Hundred Petalled Rose." Pliny reported that they were exported from Egypt to Rome in winter, before the Romans discovered how to make them flower in Italy at that season; and Martial, in 81 A.D., spoke of the Roses which the Egyptians sent to the Roman Emperor Domitian on the occasion of his birthday. The Rose finally became of great importance in Egypt, the famous Cleopatra using the flower in her entertainments, and it even displaced the Lotus, that once very popular flower. The history of the Rose in Egypt between the Roman era and comparatively recent times is not known, but about 1800, at the time of the Bonapartist expedition to Egypt, the French travellers in that country reported vast tracts of land covered with Rose trees, from which great quantities of Rose-water were made annually. As regards the *Rosa sancta*, discovered in Egyptian tombs, and also imported in a living condition into France, both this species and also *R. Ward Ballady*, which has been cultivated for the past few centuries at Fayoum, Damietta, and Alexandria, appertain to *R. gallica*.

**National Sweet Pea Society.**—A novelty trial of Sweet Peas will be held as usual in 1923, at Shinfield, the trial grounds of the University College, Reading. All seeds sent for trial must be in the hands of the Secretary, Mr. H. D. Tigwell, Greenford, Middlesex, on or before Tuesday, the 10th inst. Each separate trial must be placed in a blank packet, which must be enclosed in an outer cover upon which must appear the colour section, name or number of variety, and sender's name and address. A fee of 7s. 6d. must be sent for each trial.

**A Big Deal in Cotton Seed.**—An idea of the extent of Cotton cultivation in the Southern United States may be gathered from the statement in *The Seed World* to the effect that one purchase of cotton planting-seed, made recently at San Marcos, Texas, consisted of fifteen train-car loads, valued at 42,000 dollars; this was of pedigree seed for distribution among several cotton farmers.

**Fine Exhibit of Fruits and Flowers at Llandudno.**—On the occasion of the Llandudno Allotment Holders' Show, on the 16th ult., A. Bradbury, Esq., Bryn Lupus, exhibited a very fine collection of fruits and flowers, to which the Royal Horticultural Society's medal was awarded. The display occupied a space of eighty square feet and consisted of finely-grown specimen Begonias, and a decorated table of excellent fruits. The exhibit was pleasingly arranged by Mr. H. Shaw, the gardener, who is a successful exhibitor in the North Wales district.

**Horticultural Exhibition at Geneva.**—Further particulars are now to hand of the forthcoming horticultural exhibition to be held at Geneva from September 5 to 13, 1923, which was briefly referred to in our issue of September 23, 1922, p. 175. The programme will include two competitions, one for groups of new plants, the other for horticultural sundries, the prizes for which are provided for by an endowment of the late Mr. Marc Estalla. The first prize in each class is a Gold Medal and a sum of money, and there

are also several smaller money prizes. Fuller particulars may be obtained from the Secretary, Mr. John Wolf, Le Pavillon, Grand-Saconnex, Geneva, Switzerland.

**Legacy to a Gardener.**—Under the terms of the will of the late Sir Hylton Ralph Briscoe, Bart., his gardener, Mr. W. J. Crossman, receives the sum of £200, while three other employees in the gardens receive six months' wages.

**Sir Arthur Fenton Hort, Bart.**—Sir Arthur Hort, whose portrait we have much pleasure in publishing, is well known both as a gardener and as a scholar. After a distinguished classical career at Cambridge, which ended in a Fellowship at Trinity College, Sir Arthur became an Assistant Master at Harrow, a post which he only resigned this year. As a scholar he is known for his masterly translation of Theophrastus, a work which he undertook with the help of Sir William Thiselton-Dyer for the Loeb Library of Classical Translations. As a gardener he had the advantage of an early acquaintance with Sir Michael Foster's garden at Shelford, from which many good Irises went to Harrow. There, in a sheltered wall-garden, Sir Arthur has raised a number of fine hybrids which he has named after Shakespearean

SIR ARTHUR HORT, BART.

characters, most of them of the self colours, which many growers prefer to the art shades so popular in France. Many of these hybrids are remarkable for their broad foliage, tall stature, and large flowers. Sir Arthur has been a frequent visitor to the Pyrenees, and brought back from there plants to furnish his rock garden, as well as many Narcissi, which have flourished in the grass slopes round his house at Harrow. There he could always show patches of *N. pallidus* *praecox* in full flower long before the ordinary varieties of Daffodils had opened their buds. From the same region he obtained, among other things, various forms of *Saxifraga longifolia* and many coloured varieties of *Anemone Hepatica*. Those who have had to move a garden full of plants which have been collected through a number of years will realise the difficulty of the task, but Sir Arthur's gardening friends will be quite sure that his new garden, at Hurstbourne Tarrant, near Andover, will be at least as interesting as that which he has left at Harrow.

**Corky Scab of Potatoes.**—This disease of the Potato tuber is caused by a fungus in the soil. Potentially it may be as serious as Wart Disease, but fortunately, although widespread in England, it rarely does serious damage except in undrained and damp or waterlogged

soils, where it may cause severe losses. Its appearance varies from slight scabs which are merely superficial to distorted tubers somewhat resembling those attacked by Wart Disease, and as varieties of Potatoes immune from Wart Disease are often attacked in this way, their immunity from Wart Disease has been doubted and incorrect reports have been spread that certain immune varieties have broken down. In slight cases, it is almost impossible to be certain that the disease is Corky Scab and not ordinary scab, unless a microscopical examination is made. In the more serious cases, the disease, unlike ordinary scab, penetrates into the tuber, though the spore balls which appear on the surface are almost sandy in colour. In wet seasons like the present, Potatoes instead of ripening may produce second growths and give rise to sappy protuberances which are very susceptible to this disease, and these when attacked slightly may appear to the casual observer to be suffering from Wart Disease. Any such specimens should be sent to the Horticultural Division, Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1 for examination. As already mentioned, the disease is most prevalent in seasons of excessive summer rainfall and most common in damp and waterlogged soils. Very little can be done to cure the disease, lime rather increasing it than otherwise, though proper drainage of damp soils will generally be found sufficient to lessen the severity of attack of the disease.

**Appointments.**—According to the *New Bulletin*, Mr. R. E. Holtum, B.A., Junior Demonstrator in Botany in the University of Cambridge, has been appointed by the Secretary of State for the Colonies, Assistant Director of Gardens, Straits Settlements. Mr. H. K. Hewison has been appointed by the Secretary of State for the Colonies as Assistant Superintendent, Agricultural Department, Gold Coast. Captain J. W. D. Fisher has been appointed Assistant in the Agricultural Department, Sierra Leone.

**Mr. W. A. Cook.**—We understand that Drynham, Walton-on-Thames, is in the market and that Mr. W. A. Cook, the gardener, is seeking another appointment. The gardens at Drynham were described in *Gard. Chron.*, May 22, 1920, p. 257, and we have on other occasions referred to the fine plants and beautiful garden features of that suburban residence. Previous to entering Mr. John Osborne's services at Drynham, Mr. W. A. Cook was for many years gardener to the late Sir Edmund Loder, at Leonardslee. We trust that he will soon have fresh opportunities for displaying his skill as a first-rate, all-round gardener.

**Potato Dunvegan at Ormskirk.**—The National Institute of Agricultural Botany has awarded a Certificate of Merit to Potato Dunvegan as the best new variety immune to Wart Disease grown at the Ormskirk Testing Station. Dunvegan was raised by Messrs. Sutton and Sons, of Reading, and thus the honour of having the best variety in the trials falls to England this year, whereas, for many years past, Scottish raisers have secured this honour.

**Seed Testing.**—The Ministry of Agriculture reminds us that in accordance with the requirements of the Seeds Act, 1920, and the Regulations made thereunder, it is necessary, in the case of a sale of any of the principal kinds of farm and garden seeds, for a statement to be made to the purchaser at, or before, the time of sale or delivery, containing certain specified particulars as to the quality of the seed. These particulars must be based on a test carried out at an official seed testing station, or a private testing station licensed for this purpose by the ministry, not earlier than August 1, preceding the date of the sale, except in the case of seeds sold during August and September, when the test may have been made since August 1 in the preceding year. In order to comply with the Regulations, seedsmen and others carrying over stocks of seed for sale from last season must, therefore, arrange to have them re-tested before offering them for sale from October, onwards.

**Flowers in Season.**—Messrs. John Forbes, Ltd., of Hawick, have sent some spikes of their very fine strain of Pentstemons in a variety of beautiful colours, and also the dwarf, or Mignon, Dahlia Coltness Gem, which is now being extensively used in Scotland for bedding. The flowers of this dwarf Dahlia are glowing red, almost scarlet.

**The Queensland Sugar Crop of 1922.**—The General Superintendent of the Queensland Bureau of Sugar Experiment Stations states that, owing to the very dry weather experienced, it has been necessary to reduce the previous estimate of the Queensland Sugar crop from 290,000 tons to 283,000 tons. This is only a rough estimate, as a warm, moist winter may increase the yield as a dry frosty period would reduce it. This tonnage, however, if realised, will suffice for Australia's requirements, and, with the production of New South Wales, may leave a small carry-over. The production in 1921 for Queensland was 281,000 tons, and a good proportion of this was made up during the latter part of the season, which was very favourable, the earlier estimates being considerably less.

**Appointments for the Ensuing Week.**—Monday, October 9.—United Horticultural Benefit and Provident Society's meeting; Bath Gardeners' Society's meeting; Purley Horticultural Society's meeting. Wednesday, October 11.—East Anglian Horticultural Society's meeting; Sheffield Chrysanthemum Society's meeting; North of England Horticultural Society's Show (3 days). Thursday, October 12.—Bristol and District Gardeners' Association's meeting; Hornsey and District Chrysanthemum Society's meeting; Wargrave and District Gardeners' Society's meeting. Friday, October 13.—Foots Cray and North Cray Horticultural Society's Show. Saturday, October 14.—Ringwood Horticultural Society's meeting; British Mycological Society's combined Foray with Essex Field Club; Peebles Chrysanthemum Society's Show.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Horticultural Society's Schedule of Prizes.*—*Cape Pelargoniums.*—I see by the advertised schedule of awards that the Horticultural Society again offers prizes for six species of Cape Pelargoniums, and as a probable exhibitor in that class I beg to offer a few remarks on the subject. On one occasion this season I exhibited six plants, which were beaten by Mr. Stanly, in whose collection there were well-grown plants of *Phymatanthus tricolor*, *P. elatus*, and *Campylia holosericea*. Now, what I wish to observe is, that if the Society is desirous to encourage the cultivation of the high-coloured species, such as *Pelargonium ardens*, *P. quinquevulnerum*, *P. bicolor*, etc., or the more curious but less showy kinds, such as *P. trieste*, *P. gibbosum*, *Jenkinsoni*, *triquetrum*, etc., there ought to be two distinct classes made, because these last cannot under the best culture compete with the free-growing and free-blooming *Campylia* and *Phymatanthus* tribe. At any rate, the experience of the last season leads me to this conclusion, for the plants I exhibited were more distinct, and considering the sorts, better grown than those which the judges placed before them. Not that I blame the judges in this instance, for it is very probable, I may say certain, that neither of them had ever previously seen some of the kinds, and therefore they were unable to estimate fairly the merits of the two collections. It is well known to the few who cultivate this tribe of plants that *Campylia holosericea* and *Phymatanthus elatus* will attain a larger size in two years from the time of sowing the seed than many of the tuberous-rooted species will in ten years under the best management; unless, therefore, an alteration is made in the mode of showing, or some other method of placing the various kinds on a more equal footing is adopted, exhibitors will confine themselves to a few of the most easily cultivated sorts, and neglect the choicer species. In the list of prizes there is Class CC for "New Hybrid Pelargoniums," and Class RR for "Seedling Hybrid Pelargoniums, of entirely new crosses." Is either of these classes intended for seedlings or hybrids from the Cape species? *J. B. Whiting, The Deepdene, Dorking.*—*Gard. Chron.*, October 9, 1847.

## HARDY FLOWER BORDER.

### ARTEMISIA LACTIFLORA.

ONE most frequently meets with *Artemisia lactiflora* growing under conditions which do not reveal its true beauty. Too commonly it is crowded among other tall flowers at the back of a broad herbaceous border, where neither its foliage nor the plume-like flowers can be seen to advantage. On the contrary, if a good plant of this Wormwood is set so as to stand up among dwarfier flowers, or planted in front of other tall subjects of autumn, its grace is revealed in a most attractive way. My first acquaintance with it was in a truly magnificent border of autumn flowers, where it was crowded, as I have just indicated. There it did not impress me so favourably as such a good plant ought to have done. Since then, however, I have formed a much higher opinion of its capabilities for garden decoration, and recently I met with *A. lactiflora* standing high up among

England, but it cannot be trusted, and it is generally necessary to keep a small stock of cuttings under glass to replace any plants that are lost.

I have an impression that this pretty Lavender came from Corsica, but I cannot verify this at present. Apart from the defect of tenderness—a rather serious one, it is true—this Lavender is a pretty plant of much quiet and attractive beauty.

### CAMPANULA EXCISA.

OF the numerous dwarf Campanulas which are cultivated by the lover of alpine flowers, there are few less seldom seen than the rare *Campanula excisa*, which many have coveted, but few have succeeded with for any length of time. It is difficult to procure as good plants, and in cultivation it seldom, if ever, reveals the beauty it displays in its native home when growing under the happiest conditions. Those who have seen it there, at the glacier levels of Monte Rosa, are eloquent of its charms when viewed

Fig. 80.—HOLLAND PARK SKATING RINK, IN WHICH THE ROYAL HORTICULTURAL SOCIETY'S GREAT AUTUMN EXHIBITION WAS HELD. (See p. 210.)

lower-growing plants, revealing its beauty in its attractive foliage and graceful masses of creamy white flowers, of little consequence individually but of high charm when together. This easily grown plant is valuable for associating with and toning down the brilliancy of the gay, golden Composites of the season, and for associating with the Gailardias and early Asters of autumn. The plant is very fragrant when in bloom, which is an additional reason for including it in gardens, as scent is as much appreciated as beauty of flower and foliage. *S. Arnott.*

## THE ALPINE GARDEN.

### LAVENDULA PROSTRATA.

THIS pretty dwarf Lavender appears to be gradually going out of cultivation, after what would almost seem an ephemeral popularity among alpinists. It appears to have disappeared from many trade lists, and at the moment I cannot find it in any which I have available. So far as its beauty is concerned, its disappearance is unjustified, as it is a charming plant for trailing over rocks. In a light soil and a sunny place it constitutes a real ornament for the rock garden. We shall, I think, find the reason for its present scarcity in the fact that it is undoubtedly tender and cannot be relied on to stand the winters of all but the most favoured parts of the British Isles. It will survive mild winters, even in Scotland and the North of

in the masses it forms; but those who have cultivated it in gardens cannot realise its full beauty, for, as I have it, this little Bell-flower seems starved, with small, thin-petalled flowers. Still, it is always well to know the plant and something of its ways, so that those who have an opportunity of obtaining it can give it the conditions it enjoys, at least as nearly as our gardens will permit.

*Campanula excisa* is only a few inches high (of much the same height as the well-known *C. Bellardii*, but better known as *C. pusilla* or *C. pumila*), and has little leaves and small blue flowers, easily recognised by the holes at the base, which look as if punched out by some instrument or eaten through by an insect. In cultivation it should be planted in a moraine, with moisture below, and plenty of grit about its roots. Before the moraine became so common in gardens I cultivated *C. excisa* on a flat terrace of a rock garden in very light, gritty, well-drained soil, and with plenty of fine grit or small gravel well worked into the plant and laid round it to ward off slugs, which seem to have a special liking for this plant. It succeeded there for several years and increased, not so quickly as one would have desired, but still it did increase. But it had to be kept well supplied with clear water to keep it growing, and one unlucky enforced absence from my garden for a month or so led to its loss, a *nicé* to my disappointment. I consider *C. excisa* needs plenty of grit and sand, and a sufficient supply of moisture during dry weather in spring, summer and autumn, together with partial shade. *S. Arnott.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from page 196.)

ENGLAND, S.

WILTSHIRE.—Apple trees have fair crops, and Pears are also carrying a heavy crop on walls. Morello Cherries were very plentiful, but dessert sorts only fair, although of good quality. Plums and Damsons are plentiful. Peaches and Apricots are good. Small fruits set badly, especially Black Currants and Gooseberries. Strawberries collapsed under the intense heat. Walnuts are plentiful in some places, and Filberts and Cob Nuts are good. Our soil is loam on chalk, and the position is sheltered from N. and N.E. *H. H. Mills, Fonthill House Gardens, Tisbury.*

Pears, Peaches, and Nectarines are carrying good crops. Plum blossom in exposed positions suffered from late frosts, whilst Plum trees in more favoured places have good crops. Apple trees blossomed fairly well, and amongst the best croppers are Lord Suffield, King of the Pippins, Ribston Pippin, Brownlee's Russet, and Allington Pippin. The heavy crops of Apples last year and the extreme drought doubtless account for the thin crop this season. Strawberries were an excellent crop. Black and Red Currants yielded plentifully, while Raspberries, Loganberries, and Gooseberries were all good crops. Insect pests have not been troublesome, very little spraying being necessary. *G. Vandell, Manor Gardens, Ramsbury.*

SUSSEX.—We have an abundance of Pears, Apples, Plums, and Damsons, some of the trees carrying exceptionally heavy crops. Apple trees appear to be very clean this year, and there is much less bitter pit in the fruits. Raspberries, Gooseberries, and Red Currants were all very plentiful, but the crop of Black Currants was rather a light one, owing to the bushes being infected with big bud. Strawberries were only an average crop. The plants suffered very much from drought from the latter part of May and early June, when the days were hot and the nights cool. Nuts, including Walnuts, are very plentiful. *Edwin Neal, Tilgate Gardens, Crawley.*

ENGLAND, N.W.

CUMBERLAND.—After the hot, dry summer of 1921, we had every reason to anticipate a record fruit year in 1922, but adverse weather conditions for small fruits prevailed at a critical time, especially in the case of Strawberries. Apples are a heavy crop, old varieties, such as Tower of Glammis, Stirling Castle, Warner's King, Dumelow's Seedling, King of the Pippins, Ribston Pippin, and Cox's Orange Pippin quite holding their own with Apples of more recent date. Pears are a disappointment. Trees of Jargonelle, Williams' Bon Chrétien, and Clapp's Favourite have fair crops, but Doyenné du Comice, Marie Louise, Beurré Diel, and other well-known varieties are a failure. Our soil is a fairly heavy loam over a sandy subsoil. *J. Service, Holme Hill Gardens, Dalston, R.S.O.*

Owing to the late season, many crops escaped frosts, but Black Currants suffered from a frost in May, and half of the crop dropped from the bushes. Peaches and Nectarines, although protected by double folds of fish netting, suffered through the long period of cold, sunless weather. The dry weather at the end of May and beginning of June affected the crops, but the copious rains we have had since have more than compensated for it. Many of our Black Currants are badly affected with big bud, and, although I have been experimenting with different washes and insecticides, I have not found a remedy. The soils in this district vary very much from light, mossy soil to heavy loam. *James Tail, Justice town Gardens, Carlisle.*

WESTMORLAND.—Our soil is on the limestone and very quickly dries out, and the dry weather at Whitsuntide had a bad effect on the crops in some places. Fruit trees generally set an enormous number of fruits, but in

some places, owing to the late frost and north winds, the Pear crop was thinned very much, and Damsons considerably. *Richard F. Lambe, Witherslack Hall Gardens, Grange-over-Sands.*

We had a very fine spring, and consequently the trees escaped frosts. I never saw Apple trees bloom so abundantly, and the set of fruit was enormous. Rains fell in sufficient quantity to swell the fruits. Plums are also a big crop. Pears are scarce. Small fruits were very plentiful. Strawberry plants are not very vigorous, and good runners are scarce. The soil is of a gravelly nature. *W. A. Miller, Underley.*

All Apple trees in this district are carrying heavy crops. Late Plums were fair crops, and Victorias an abundant yield. Owing to the fine summer of last year, the fruit buds were strong and plentiful, with the result that there was a fine show of bloom, which escaped injury by frost, but, owing to a cold, dry spring, we have a late general fruit crop, and have suffered from attacks of aphid, etc., considerably. Wet, cold weather ruined the Strawberry crop. Raspberries were a good yield. *James Jeffrey, Louth Gardens, Penrith.*

ENGLAND, S.W.

CORNWALL.—The fruit crops generally are well up to the average, and, considering the drought of last year, surprisingly good in quality. In some areas, field Strawberries were a failure, owing, probably, to the variety having become spent or to the soil getting "Strawberry sick," or to both causes. Most of our Apples are too thickly set on the branches, and have had to be thinned, a labour which gives no return. Pears are unusually good and prolific. Insect pests are noticeably absent. Our soil lies on greenstone, and we have a good, deep loam. *Harry Williams, Tolvean Gardens, Redruth.*

The fruit crops are, on the whole, about average. The Apple crop is not so abundant as was expected, judging by the amount of blossom the trees produced, but we have to take into consideration the heavy crop of last year and the drought, which are the chief reasons why the crop is not more abundant this year. It is very interesting to see the large number of fruits some of the trees are carrying on last year's wood, which is not usual in this district. The Pear crop is above the average, due, I think, to a light crop last year and an abundance of sunshine last autumn, which well ripened the wood and gave extra energy to the trees. Red Currants, Raspberries, Gooseberries, and Loganberries were abundant and of good size. Black Currants and Strawberries were a little under the average yield. These fruits suffered very considerably from the drought of last year and this spring. *James Treloar, Trevanno Gardens, Sithney Helston.*

DEVONSHIRE.—There was a fine show of blossom on all fruit trees. Apples probably failed to set owing to dryness at the roots. Pears are extra plentiful, but a few fruits dropped during the dry weather in May. Plums, Peaches, and Cherries were all light crops. Small fruits were a good average yield, but the season for Strawberries did not last very long. The soil is gravelly and dries out quickly. *G. Sleep, Hartland Abbey, Hartland S.O.*

SOMERSETSHIRE.—The show of blossom in the spring on Plum, Pear, and Cherry trees was remarkable. Peach trees, too, flowered profusely. Apple bloom was not so pronounced, being later than usual and very short-lived. Cold winds and frosts prevailed in the spring and checked vegetation in general. Apples are only a moderate crop, some trees carrying a fair number of fruits, others having practically none. Plums are probably the best crop, although Pears are good, and Cherries were excellent. Peaches and Nectarines were good average crops, whilst Apricots were better than usual. Bush fruits were good, especially Black Currants. Early Strawberries were a light crop, but later sorts were good after beneficial rains. *James Glasheen, Hestercombe, Taunton.*

Certain varieties of Apples, such as Lane's Prince Albert, King of the Pippins, Peasgood's Nonesuch, Blenheim Pippin, and a local Apple called Morgan Sweet set in abundance, and the trees are loaded with fruits. Peaches, Nectarines, and Apricots also set abundantly, and had to be very severely thinned. Strawberries were almost a failure in the open, but on the east side of a high wall, where they were shaded from the sun after twelve o'clock, we had a fair crop. Raspberries were plentiful after the drought broke, although they looked poor and stunted during May. Our soil is a deep, red loam. *Grigor Roy, Halswell Park Gardens, Bridgwater.*

## HISTORY OF THE DAHLIA.

MRS. STOUT, the author of *The Amateur's Book of the Dahlia*, recently noticed in these columns, seems to think (p. 182) that if other people make mistakes she has a right to copy them, and thus aid in perpetuating error, without giving herself any further trouble in the matter. She excuses herself on the ground that the late George Gordon made a certain statement in his work on *Dahlia*, published under the editorial supervision of the late Mr. R. Hooper Pearson.

Mr. Gordon did what every other English Dahlia historian did before him for a hundred years or so. He accepted evidence on the introduction of the Dahlia into England without submitting it to independent verification. And this is precisely what Mrs. Stout has done in her turn and what probably others will do in the future, judging by what experience in such matters teaches us. But that is no legitimate excuse for her, for him, or for their predecessors.

With regard to the extract quoted from Mr. Gordon's book, it is almost identical, in words, with every other Dahlia historian's account. I do not hesitate to say that it is not only improbable that the Dahlia was imported into England in 1789, but that it is impossible to find any contemporary record to prove it. This date obtained currency owing to a misprint in the *Hortus Kewensis*, Vol. V., 1815. Prior to that date nobody ever asserted that the flower was introduced here in 1789, but after 1815 everybody accepted that authority.

The contradiction can be strengthened by the fact that in 1789 there was no such person as the "Marquis" of Bute. The title was not created till 1796, as a reference to any peerage will show. Therefore, in 1789 there could not have been an English ambassador of that name at the Spanish Court. The Rt. Hon. Wm. Eden occupied that position up to July, 1789, when he was replaced by Mr. Chas. Hy. Fraser. It is true that John Smart, fourth Earl and first Marquess of Bute, was ambassador in 1795, but he and his wife returned to England in 1797. It was in 1798, after this event, that Lady Bute, as the Marchioness is commonly called, procured for Kew Gardens, through Dr. Ortega, of the Madrid Botanic Garden, three varieties of Dahlias, which had been previously sent there by Cervantes of Mexico.

Aiton blundered when he put the date of introduction as 1789, in his *Hortus Kewensis*, but tried to remedy it when he published his epitome of the 2nd edition of the *Hortus Kewensis* in 1814, where the date is correctly given as 1798. Unfortunately, the rectification was too late. People had become accustomed to refer to the *Hortus Kewensis*, Vol. V. 1815, and to rely upon it, and so it went on.

Experience teaches us, day by day, that in all matters of floricultural history modern writers are in duty bound to make independent research. They cannot be excused for accepting statements of dates and facts, without verification, simply on the ground that some other previous writer, in whom they may have confidence, is responsible. Prove all things! is the old injunction, and if this were more generally the rule there would be little danger of falsifying history either carelessly or intentionally.—*The Reviewer.*

## ORCHID NOTES AND GLEANINGS.

## DENDROBIUMS OF THE D. DEAREI SECTION.

*DENDROBIUM DEAREI* was discovered by Col. Deare in 1882 on the island of Dinagat, one of the Philippine Isles. The late Sir Trevor Lawrence obtained a First-class Certificate for the species on May 22, 1883. It constituted a very remarkable introduction of quite a new type, its reed-like stems, two feet or so in height, clad with bright green leaves on the upper part, and sending from them drooping sprays of five to ten pure white flowers, with yellowish-green disc to the lip and each about two and a half inches across, being very distinct from other species. The flowering of several of the small plants originally obtained caused much competition for the limited supply available, and lack of knowledge of its requirements in most cases caused failure to obtain good results.

In later years *Dendrobium Dearei* was found to be plentiful on several of the islands

1909, p. 374) is a grand plant, introduced from the Philippines by Messrs. Sanders, St. Albans, but unfortunately in small quantity. Its strong stems, clad with thick, bright green leaves, are often over three feet in height. In habit it is similar to *D. Dearei*, and bears racemes of four to six large white flowers with greenish disc to the lip, the side lobes and throat being streaked with dark purple, the same colour suffusing the inside of the spur.

*D. SCHUTZEI*, ROLFE is the latest introduction of Messrs. Sanders from the same region as *D. Sanderae*, which it much resembles, though dwarfier, in habit. It secured a First-Class Certificate when shown at the Royal Horticultural Society. *D. Schützei* (Fig. 81) is the largest flowered species of this interesting section. Its flowers are pure white, with emerald green disc to the lip.

*D. PARTHENIUM*, REHB. (*Gard. Chron.*, 1885 II, p. 489), is a Bornean species of the same class, and a few others of the section not yet in cultivation may be introduced later. *J. O'B.*

Class Certificate on December 5, 1905. A similar award was made to *O. Woodroffeae* on September 24, 1912, when shown by Mr. Davidson, who was one of our great losses in the war. The flowers sent have the yellow ground of *O. triumphans* nearly covered with dark chocolate red blotches, the yellow only appearing in thin, wavy lines between the markings. The lip is one of the finest pieces of colour in the section, being bright violet-purple, with a distinct ovate, yellow blotch at the base; the crest is yellow.

## BLUE ORCHIDS.

WHAT are now known as Gatton Blue Cattleyas, blue forms of *Laelia pumila* and some other Orchids developed in Sir Jeremiah Colman's collection at Gatton Park, are familiar to Orchidists, especially to those who have seen a group with flowers all of the blue tint best shown in *Vanda coerulea*, exhibited on several occasions from Gatton Park (gr. Mr. J. Collier) at the Royal Horticultural Hall. Blue-tinted forms of *Cattleya Bowringiana*, *C. Portia*, *C.*

FIG. 81.—DENDROBIUM SCHUTZEI.

## LAELIO-CATTELEYA NOVARA

MESSRS. STUART LOW AND Co., Jarvisbrook, Sussex, send us a first inflorescence of this promising hybrid between *Cattleya Mrs. Frank Hurndell* (*Iris* × *Trianae*) and *Laelio-Cattleya Colmaniana* (*C. Dowiana* × *L.C. callistoglossa*), to which latter it is nearest. The sepals and petals are silvery white tinged with mauve, and the lip purple, with yellow lines from the base. A very distinct type of the same cross as *C. Mrs. Frank Hurndell* was raised by Messrs. Charlesworth and named *C. Hybla*.

## ODONTOGLOSSUM WOODROFFEAE.

A TWO-FLOWERED inflorescence of this rare and beautiful hybrid between *O. Rossii rubescens* and *O. Queen Alexandra* (*Harryanum* × *triumphans*) is sent by H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. F. W. Thurgood). It is the darkest of the favourite class of *O. Rossii* crosses so well begun by Messrs. Charlesworth's *O. Smithii* (*Rossii rubescens* × *crispo-Harryanum*), which obtained a First

*labiata*, *C. Trianae*, *C. Gaskelliana*, and of *Laelia Dayana*, and some crosses with them, have been raised at Gatton Park, and the latter have generally carried on the blue colour.

But that the hybridist does not always get what he aims at is shown in a flower now received, produced by crossing *Cattleya Aleimeda coerulea* (*labiata coerulea* × *Gaskelliana coerulea*) and a blue-tinted form of *Laelia Dayana*, and which has reverted to the normal rose and reddish purple tints of its ancestors. The flower, of medium or small size for a *Laelio-Cattleya*, has rose sepals and petals and a reddish purple lip crimped at the edge; the base, which is coloured yellow, shows some constriction, acquired from the tubular lip of *L. Dayana*, but in the dried flower, however, a decided blue tint appears. Blue-tinted *Laelio-Cattleyas* are rare; the only two we can call to mind are *L.C. Parysatis coerulea* (*C. Bowringiana lilacina* × *L. pumila* Gatton Blue), and *L.C. Portia-pumila* (*C. Portia coerulea* × *L. pumila*, blue form), flowered at Gatton Park. *J. O'Brien.*

in the Philippine group, and good importations were made, but still some failed to grow the plant satisfactorily, mainly because they grew it in too warm a house or maintained the high temperature too long after the growths were completed.

*D. Dearei* and other members of this useful section may be said to be evergreen species, for they retain their glossy bright green leaves for two or more years, the last made young leaves being always perfect.

Messrs. McBEAN, of Cooksbridge, are among the most successful cultivators of *D. Dearei*, and they suspend their plants in the warmer end of a large *Cattleya* house, where they get free circulation of air and a clear light. Water is liberally supplied during the season of growth, and afterwards the plants are shifted to the cooler end of the house and receive a restricted water supply. When well grown it is an ideal florist's species, its numerous stems supplying a profusion of charming flowers suitable for bouquets.

*D. SANDEBAE*, ROLFE (*Gard. Chron.*, June 12,

### THE ORCHID HOUSES.

By J. T. BARBER, Gardener to His Grace the  
DUKE OF MARLBOROUGH, K.G., Blenheim Palace,  
Woodstock, Oxon.

**Seasonable Remarks.**—At this time of the year it is very necessary for the Orchid cultivator to watch for signs of change in the weather. Cold winds and high winds may be the means of reducing the temperatures of the houses considerably; and if the temperature is allowed to remain too long at a low point irreparable harm may be done, especially after such a sunless summer. Frost may be expected at any time, hence the necessity of paying the strictest attention to sudden changes of the atmospheric conditions outside. On a still, clear, frosty night the temperatures are easily maintained, but the thermometer usually shows a sudden fall about daybreak. This would have no ill-effects provided the atmosphere within the house is moderately dry. Between, say, 10 p.m. and morning, the fires should be so regulated that there is no danger of the temperatures falling too low. Should the temperatures be too high, a little damping will counteract the effects of overheating. Should the reverse occur, no damping should be done until the temperatures reach their normal degree. A damp, cold atmosphere has the worst possible effect on any plants at this season of the year, and may be the means of many Orchids contracting black spot and other diseases.

**Fuel Economy.**—Every means should be taken to economise fuel, owing to its high cost, and unless the stoking of the furnace is done carefully and intelligently, much may be wasted. During October the sun often has considerable power; and should there be much warmth in the water pipes and the sun shining strongly, the temperatures will rise considerably and much harm may accrue, and plants may even get scorched. It is advisable to begin preparing for winter by reducing the temperatures in all the houses a few degrees by night, and also by day in the absence of sun-heat; at the same time a corresponding reduction of atmospheric moisture must take place. A buoyant atmosphere is of the greatest importance in all the houses, and especially at this season, as the health of the various plants depends entirely on the conditions provided. Orchids need all the sun-heat and light available, and so long as the sun is capable of increasing the warmth in the houses considerably, full advantage should be taken to admit fresh air to the plants, which will be the means of strengthening them. Evaporation will be much less in every department as the days become shorter. All blinds that are not required for protection during the winter should be removed, and any that require repairs should be attended to, and a note made of those that require replacing.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY  
GIBBS, Aldeham House, Hertfordshire.

**Bulbs in Grassland and Woodland.**—At this period of the year bulbs of suitable subjects should be planted in woodland and grass, where it is desired to naturalise them in what are probably their most ideal growing quarters. Many lovely bulbous plants may be grown in this way, and where planted in big stretches they form a lovely sight in early spring. Do not plant bulbs where early mowing has to be carried out, for if the leaves are removed the plants will be spoiled. This may appear unnecessary advice, yet bulbs are often planted on lawns that are subject to early mowing, and the planter wonders why he gets no results. Such subjects as Daffodils, Narcissus, Squills, Bluebells, Grape

Hyacinths, Chionodoxas, Snowdrops, Crocus, Colchicums, Snowflakes and Tulips, all lend themselves readily to free planting. The bulbs should be planted under the turf at a similar depth to that adopted for bulbs in borders, and the planter will find a trowel the best tool to use. Scatter the bulbs irregularly and plant them where they come to rest.

**Early Frosts.**—There have been one or two early frosts in this district. Where it is desirable to leave any plants of a tender nature in the open, steps should be taken to devise some means of protection to be used when necessity arises, until such time as the plants can be removed to more congenial quarters for the winter months. The frosts, damp periods, and heavy winds are also causing the foliage of deciduous trees and shrubs to fall, and the leaves should be swept up carefully from time to time, so that they do not get trodden underfoot and render gravel paths and lawns unsightly. Fallen leaves need not be collected in the shrubberies, as they may be forked in later, affording a certain amount of fertilising material as they decompose, and many prefer to leave the fallen foliage around the plants as a means of giving slight protection to the roots from frosts.

**General Work.**—Continue to remove decaying foliage from herbaceous borders. Keep drains and gulleys free from fallen leaves and silt, otherwise they may get blocked in stormy weather.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY,  
M.P., Ford Manor, Llogfield, Surrey.

**Cherries.**—Trained Cherry trees on trellises under a fixed roof should be given the fullest amount of fresh air, both day and night, especially if Red Spider has been troublesome and injured the leaves. If the weather is hot and the trees are kept too moist this will cause leafless buds to swell, and especially if the shoots are inclined to be gross. Exuberant growth may be checked by working the soil from about the ball of roots and shortening the latter. Trees in pots that are plunged in the open air have had the benefit of cool nights, and, provided the foliage is still hanging, the buds will now be safe. A mass of roots being essential to success, water should be given in sufficient quantity to prevent an unduly dry condition of the soil. If the pots are well covered with plunging material, the demand for water will not be frequent, but when moisture is required it should be given in sufficient quantity to penetrate down to the drainage.

**Vineries.**—Early vines may be pruned and cleaned, and the rods slung from the wires, where they may remain until the time arrives for starting the vines. If the vines are young and not overburdened with loose bark, a double washing with strong soapy water or a solution of Gishurst Compound at a strength of 4 to 6 oz. to the gallon should suffice. If the vines are aged and have old spurs, and mealy bug has been troublesome, this pest must be dealt with. The old bark should be carefully removed, and the smallest holes and crevices stopped with undiluted Gishurst Compound from the box. If this is done thoroughly and the vines washed as advised, there should be no necessity for divesting the rods of every portion of sound bark. Every part of the house, including the woodwork and walls, should be scrubbed and lime-washed, and all loose mulching material and soil, especially near the stems, removed, and fresh compost substituted. Cleansing the vines is less difficult than cleaning old vineries, as every crack in the walls and woodwork of the latter needs to be carefully watched throughout the following spring. Outside borders may be cleared of loose soil and top-dressed afresh with loam mixed with bone-meal. This dressing should be left exposed to the weather until November, when a thin covering of fresh stable litter will prevent the new compost from being lifted by frost.

### HARDY FRUIT GARDEN.

By H. MARHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet.

**Raspberries.**—Although Raspberries will grow well and yield good crops in the same beds for a number of years, fresh beds are essential at intervals if large fruits are expected. The most suitable soil for this fruit is a moderately light, deep loam, with ample decayed manure thoroughly incorporated with it. Heavy mulchings of dung should be placed over the roots during the summer, and if the land is heavy in texture a liberal dressing of charred soil from the rubbish heap or any other light material that will help to keep the soil open should be added. These materials should be well mixed, as the work of trenching and preparing the land proceeds. If the soil is very light, resting on gravel, an abundance of manure and soil of a somewhat heavier texture should be incorporated with it when digging the ground. The digging should be done early, so that the soil may settle before the planting season arrives. Hornet, Baumforth's Seedling and Superlative are three good varieties, and the canes should be obtained from a strong, healthy stock.

**Pears.**—Most Pear trees are bearing very good crops, yet the fruits are not ripening satisfactorily, owing to the cold nights and sunless days. In order to maintain a reasonable supply without a break, the ripening of the fruits may be hastened under glass. The method which I have practised for a number of years is to gather and place the more forward fruits in boxes when dry, resting them on some soft material and covering them with tissue paper and a coating of wool. The lids are placed in position and the boxes stood in a moderately warm structure. I have repeatedly lengthened the season of Marguerite Marillat by several days. Louise Bonne of Jersey, Buerré Hardy, Marie Louise, Doyenné du Comice, and others, have readily responded to this treatment. Give every attention to the gathering of all varieties of Pears as fast as they show signs of approaching maturity, and store them in a dry, sweet structure that is a few degrees warmer than the Apple store.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart.,  
The Noce, Codicote, Welwyn, Hertfordshire.

**Violets.**—These plants should now be lifted and replanted in cold frames. When this has been done give them a thorough watering in order to settle the soil about their roots. Keep the lights rather close for a few days, but as soon as the plants have recovered from the check caused by transplanting, admit air freely during the day and also at night whenever the weather conditions will allow. Keep all runners removed as they appear in order that the plants may produce fine, large blooms.

**Azalea indica.**—Where these shrubby plants have been stood out of doors for the summer return them to a cool greenhouse or frame, where they can be protected from frost. If thrip is present on the plants, spray them with an insecticide and see that the wash reaches the underside of the leaves.

**Sweet Peas.**—The Sweet Pea is a valuable plant for growing in pots, and it is useful for providing flowers during the early spring. The seeds should be sown now in three-inch pots, placing three seeds in each receptacle, which should be well drained. Use a light, sandy soil. It is preferable to germinate the seeds in mild warmth, but immediately the seedlings appear they should be removed to a position near the roof-glass in a light, airy glasshouse. When the shoots are about 4 inches high the tips may be pinched out to cause side shoots to develop, and of these only two should be retained. About the turn of the year the plants should be shifted into five-inch pots, and finally transferred to 10-inch or 12-inch receptacles. The compost for the final potting may be enriched with a little decayed manure. Careful watering is necessary during the winter, and a high temperature caused by excessive fire-heat must be guarded against, otherwise growth will be weakly.

## THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**French Beans.**—A sowing of French Beans in pots should be made every fortnight. Give the plants every encouragement to develop by placing them where they will receive plenty of light. Use the syringe freely on bright days to keep down red spider; the floor may be damped with liquid manure.

**Cauliflowers.**—The plants should be examined every day, and where the curds are ready the outer leaves should be turned in over them to protect them from frost, a very little of which will injure them. Covering them in this way will also help to keep the heads white. If much frost threatens, the head may be cut, and will keep fresh for a considerable time if the stem is placed in water.

**Tomatos.**—At the first sign of frost outdoor Tomato plants should be cut off at the base and hung up inside in a warm place, where the

## HARDY FERNS.

HARDY Ferns are extensively used at exhibitions in the arrangement of various hardy plants with good effect, giving a very cool and refreshing tone to their surroundings. It is not, however, as exhibition plants that I wish to refer to them, but their value as garden plants. The subject of hardy Ferns brings clearly to my mind journeys to various parts of England, Cornwall and Scotland, roaming through the rural lanes and hedge-rows where many of our British Ferns abound in shady nooks and dells, on hedge banks, etc., their tall, graceful, feathery fronds rising through bushes and grasses which support them at the base, developing a most luxuriant growth of tenderest green during the summer, while the decaying fronds during the autumn and winter present the most pleasing tints of russet bronze. A visit to the homes of many of our British Ferns is an object lesson in their culture, and to note how the common *Polypodium vulgare* clings with its creeping rootlets to the rough, stone walls and

pretty and decorative water-loving plant, which will grow in 2 to 3 inches of water, and if given plenty of room, will soon form a colony.

*Lastrea Filix-mas* the Soft Male Fern, is a good plant for London gardens. *Lastrea pseudo-mas*, the Hard Male Fern, is very ornamental until well into the winter months, and of stout, leathery texture. Ferns suitable for the shady parts of a rockery are *Polypodium Phegopteris*, the Beech Fern; *Polypodium Dryopteris*, the Oak Fern; and *Cystopteris fragilis*, *C. alpina* and *C. montana*, Bladder Ferns.

For growing on walls *Polypodium calcareum*, the Limestone Polypody, is a most beautiful subject its lovely, fresh, green foliage appealing to all.

The cultivation of hardy Ferns is a most fascinating hobby, and it is gratifying to see in many gardens shady nooks and banks planted with these cool and refreshing foliage plants. Those desirous of adding to the beauty and interest of their gardens would do well to plant hardy Ferns in a spot sheltered from high winds, where it is shaded from sunshine. The Ferns should be planted in well-worked soil, consisting

FIG. 82.—A BANK OF SCOLOPENDRIUM VULGARE CRISPUM SPECIOSUM, IN MR. W. B. CRANFIELD'S GARDEN AT ENFIELD CHASE.

fruits will ripen. The smaller and immature fruits should be picked off and used for the making of chutney.

**Globe Artichokes.**—All old flowering stalks should be removed from Globe Artichokes and the young heads protected from frost. Before very cold weather sets in the old plants should be protected by placing ashes around their bases; stable litter or Bracken Fern may also be used as protective materials. Young, strong suckers should be placed in good-sized pots filled with a mixture of 2 parts light loam, 1 part each leaf-mould and grit, and put in a cold frame to winter.

**Salads.**—Make frequent sowings of Mustard and Cress, and also of Onions in boxes.

**Leeks.**—The soil about late-planted Leeks should be kept well stirred with the Dutch hoe, and liberal supplies of farmyard manure water should be given to encourage the plants to make quick growth.

**Cabbage.**—Continue to plant Spring Cabbages as land becomes available. Plant in firm ground as this will favour compact growth that will withstand cold better than loose, gross growth.

rocks, or on mossy banks, always in sheltered, moist positions, is a sight not easily forgotten.

The common Hart's Tongue Fern (*Scolopendrium vulgare*), although one of the most plentiful of our native Ferns, is one that adapts itself to any congenial form of cultivation, no matter whether it is on a bank (see Fig. 81), on moist, old walls, or the shady nooks of a rock garden, and it is especially suitable for pot culture, retaining its freshness and verdure nearly all through the winter.

Those with Water Lily ponds could not do better than plant *Osmunda regalis*, the Royal Fern, the most majestic of our native species. It grows luxuriantly by lakes and streams in Devonshire and Killarney, its graceful, arching fronds frequently attaining to a height of 7 to 8 feet. It grows best in a spongy bank, watered by a stream, the shady end of a Water Lily pond, or anywhere where its fibrous roots can descend into water below.

*Struthiopteris germanica*, the Ostrich Fern, is a good companion to the Royal Fern, and, when systematically planted with it, makes a beautiful combination, its large, drooping, spreading fronds adding materially to the effect produced. Another moisture-loving Fern is *Lastrea Thelypteris*, the Marsh Buckler Fern, a very

of a mixture of fibrous, turfy loam, leaf-mould, and sufficient sandstone grit to render the texture porous.

The following are a few of the more recently introduced varieties that are especially meritorious:—*Scolopendrium vulgare crispum nobile*, with large, deeply frilled fronds that are frequently 5 inches broad and 2 feet long; *Scolopendrium vulgare plumosum*, Perry, undoubtedly the most beautiful of Hart's Tongue Ferns, the edges of the long fronds being beautifully waved and crimped, and with dense, tassel-like crests; *Polystichum angulosum divisilobum plumosum densum*, Perry, the nearest approach to vegetable mosaic tracery. The fronds are of a pale green tone, with a gold-coloured sheen at the edges of the pinnules. *Polystichum angulare divisilobum plumosum superbum*, undoubtedly the nearest approach to a *Todea superba* and very handsome. *Polypodium Dryopteris plumosum*, a densely plumose form of the Oak Fern. *Adiantum pedatum Klondyke var.*, the Bird's foot Maidenhair, a large and handsome form of *A. pedatum*; it is a good pot plant for the cool greenhouse, and very decorative; and *Lastrea pseudo-mas angustata cristata*, a variety with long, strap-shaped fronds, that are prettily crested, with terminating tufts of glossy pinnules. W. Z.

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would oblige by sending answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

## MR. KINGDON WARD'S SIXTH EXPEDITION IN ASIA.\*

## No 25.—THE LAST MOUNTAIN JOURNEY.

CHANGES had been wrought during our five weeks' absence from Mu-li. The grass slopes were dotted with a violet coloured Gentian which now basked in the winter sunshine. A slender, pale blue Campanula, and masses of shrill yellow Saxifrage fringed the Oak wood. Even the Rhododendrons burst their buds, *R. racemosum* and an Azalea being discovered in furtive flower; the latter was a particularly beautiful sight, for its leaves were turning colour. My collectors were scattered. Two crossed the Litang river; two went north to a pass we had crossed so far back as June; and I climbed the cliffs of Mu-li. In this way we collected seeds of Primulas, Rhododendrons and other desirable flowers.

Gradually the snow was melting on the heights till, after ten days, scarcely a vestige was visible from the valley; but the men, returning, reported deep snow on the passes.

It never quite froze in the valley at this period, though the temperature fell as low as 35°, and on one occasion rose as high as 71°; generally the maximum recorded was over 65°.

Clearly the time had come to return to Glacier Lake Camp. We hurried on with the seed collecting—some species gave trouble by setting very little seed—and decided to start on October 27.

That night the weather changed, and rain fell steadily. When I awoke and saw from my tent

... What envious streaks

Do lace the severing clouds in yonder East! I could have wept with disappointment. More snow on the peaks, everything buried again!

The bad weather continued for a couple of days, but on October 30 we started under more promising conditions. On the second afternoon we camped behind the cliffs of Mu-li, at the foot of the limestone screes, and next day, in splendid weather, collected seed of the wonderful Gentian we had found here in August. Every peak stood out hard as flint against a sky of frosted, blue glass, and the wind corroded our flesh; but the gorgeous sunshine was delightful. It had brought into flower a striking new Gentian on the ruthless white cliffs, a large, squat trumpet of violet tint, not very beautiful, indeed, but certainly unexpected at 13,000 feet;

for November was on us. It resembled, if indeed it was not actually, *G. Georgii*.

We now moved on over the pass into the glacier valley, and found that nearly all the snow which had given us such trouble a fortnight before had disappeared; only the peaks were still white. So we pitched our tents once more.

In the three days we allowed ourselves here, all the seeds required, with the exception of a dwarf Larkspur, were collected. The weather remained fine—yet it snowed one night. Hard frosts by night—the temperature falling to 17° below zero—were succeeded by warm, sunny days; only the wind was hostile on the high peaks. Gentians, Saxifrages and Rhododendrons were collected.

On the screes the typical scree plants were not merely dead, but snow and wind had broken the brittle stems off short, and they were blowing about loose on the scree. *Myosotis Hookeri* was frozen into a solid block. The Rhododendron capsules gaped wide, and a fine powder

but when spread out to dry, a faint crepitation arose from them, and on closer examination almost every seed was observed to be rocking to and fro! It was a most quaint sight. Further investigation showed that, though outwardly sound, each seed comprised merely a shell—the testa—within which lay curled up a small grub, whose uneasy movements, consequent upon the removal of the seeds from the capsule no doubt, caused the creeping of the seeds. Out of hundreds of seeds collected, only a few dozen were not

As is the bud bit by an envious worm,  
Ere he can spread his sweet leaves to the air,  
Or dedicate his beauty to the sun!

The brilliant blue Gentian of the grass slopes had only just been uncovered, and we could find no seed, all the capsules aborting; a few flowers were just opening after the melting of the snow. But the bog Gentian, which appeared to be exactly the same plant growing under different conditions (though the flowers are often of a less intense blue), had set plenty of seed.

At higher altitudes, *G. heptaphylla* had suffered, too, but we found some seed, nevertheless. The late alpine had suffered cruelly from the heavy snow fall; but there were other plants growing on the cliffs, which had suffered just as badly from the brilliant sunshine with which they were now being drenched. Amongst these latter may be noted especially the dwarf Campanula, which was utterly shrivelled up, the small Primula, which is associated with it, and a species of *Didissandra*. These three yielded hardly any seed.

At this time we obtained our first uninterrupted views of the group of snow peaks to the west, which are fine. We also went up the valley behind the Mu-li cliffs and over the pass, till the Litang river came into view again—or, rather, the gorge at the bottom of which it flowed. These cliffs, indeed, are completely severed from the range of which they form a part, and present on every side the most formidable precipices.

There was something about the meagre flora of these sunny, white cliffs not quite in order. One felt that it ought not to be there at all. Here were these shattered spires and crimped scarps absolutely devoid of life for the most part; with rarely a ledge or cranny supporting a few flowers which clung desperately to their insecure footing. And after a hectic season, they set no seed, these despairing vegetables. Perhaps they thought it would be too cruel, after they had been so badgered themselves; perhaps they thought it would be better to give up the struggle altogether and clear out. Anyhow, it was obvious these plants—Saxifrages, Gentians, Primula, Campanula and a few others—were by no means at home. And when I thought of the glaciers which had once crept down the valleys, and of the rainfall necessary to feed them, I could not but look upon these plants as the last remnant of a once rich alpine flora, fighting a hopeless rearguard action before they, too, were overwhelmed by the increasing drought. On November 8 we broke camp and returned to Mu-li. The fine weather also broke, and it was snowing as we came down into the valley; but it was only the last dregs of the autumn storm, and two days later it was as fine as ever. The snow had crept down the cliffs, however, and hung on the trees just above the monastery, though it quickly melted again.

The hillsides were a maze of colour, scarlet, orange and lemon yellow; even the Gentians had faded during the last ten days.

We now set about making preparations for our departure, which was fixed for November 13. Seed collecting continued, however, till the last minute. On the appointed day the transport arrived. The two head lamas came to bid us good-bye, and escorted me though the courts of the monastery.

It was perfect weather, the sky of that soft, sapphire blue only seen during an eastern "cold weather." Before us rose the limestone towers of the Yungning range, mantled with snow.

By noon we had finally left the monastery behind us, and were on our way south. *F. Kingdon Ward.*

FIG. 83.—SEEDLING OF GINKGO BILOBA.  
(See p. 209.)

of seeds rose in the air as we brushed through the scrub. Curiously enough, it was easier to make progress on south slopes than on north slopes, though at 15,000 feet the snow lay equally deep on both; but on south slopes a crust had been formed by alternate melting and freezing of the snow, whereas on north slopes the wind had pulverised it to a fine dust; and in this dust we sank almost to our knees. We had an experience of what the wind could do in this direction on one occasion. A gale was blowing and as we turned the corner to the pass we caught the full force of it. We could see nothing—it was like a London fog. The air was filled with flying spicules of ice, which scratched our faces and filled our eyes. With each gust the surface snow rose in spouts of whirling mist as sharp as steel filings.

A curious phenomenon was observed in connection with some Caragana seeds we gathered. Outwardly these appeared to be quite sound,

## TREES AND SHRUBS.

### THE RED-FRUITED SYCAMORE.

THE observant cannot have failed to notice many trees of *Acer Pseudo-platanus* with fruits of a beautiful red colour during the early summer months in different parts of the country. This has been named *A. Pseudo-platanus erythrocarpum* by L. H. Bailey in his standard work on American horticulture, though I have not yet seen it in European books of reference. The amount of colour varies in different trees, which may be due to frequent crossing by bees and the method of raising trees from seeds. Where trees occur with the deepest coloured fruit, they are highly ornamental. I have seen many trees during the present and previous years, but the finest was a well-furnished and symmetrical tree in an open position at Thames Ditton, where it was about 30 ft. high. The Maples have fruited heavily this year, and that in question was highly attractive from June till the fruits faded late in August. The variety in its best form is as worthy of propagation by budding or grafting as any of the variegated or coloured-leaved varieties; for the red fruits show themselves a good way off and suggest a red-flowered tree in bloom. *J. F.*

### LILACS.

THE near approach of the planting season is an opportune time to draw attention to the many beautiful named varieties of Lilacs available for planting.

It is cause for very considerable surprise to see so little attention paid to the cultivation of the best sorts in the majority of private gardens and public parks. Far too frequently Lilac bushes are represented only by poor varieties, and little attention is given them in regard to cultivation, soil, and pruning. We place great stress on the trenching of the ground and the pruning of fruit trees; if similar attention is given to the trenching of the ground and manuring before planting Lilacs and other flowering shrubs, the outlay of time and labour will be more than repaid in the flowering of the bushes, assuming also that the old flowers are removed when they fade, and the young shoots duly thinned. There is no better time for planting than late October and November.

The following is a selection of ten varieties, five single and five double-flowered:—Single—Gloire de Cronceels, reddish carmine; Madame F. Morel, violet pink; Madame Florence Stepmann, white; Rubra de Marley, purple; Souvenir de Louis Späth, dark red purple. Double—Alphonse Lavallée, bright violet; Charles Joly, dark red; Michael Buehner, pale lilac; Miss Ellen Willmott, snow white; Virginité, pale blush.

A further ten varieties are worth planting, if space for planting permits:—Single—Geant des Batailles, dark red; Lucie Baltet, flesh; Toussaint-Louvertre, crimson changing to dark violet; Princess Marie, pinkish lilac; alba grandiflora, large white. Double—Enile Lemoine, rosy flesh; Leon Simon, coral buds turning to blue; Madame Abel Chatenay, pure white; President Carnot, pale lilac, white centre; Senateur Volland, violaceous red.

The two single varieties, Charles X., rosy purple, and Marie Legraye, white, are not included in the above list, as they are well known varieties for growing in pots. *A. O.*

### HYDRANGEA PANICULATA.

AMONG showy autumn-flowering shrubs this *Hydrangea* occupies a high place. Generally cultivated as a bush in China and Japan, it is described as a large shrub or small tree up to 20 or 25 feet in height. Much hardier than *Hydrangea hortensis*, its large white pyramidal panicles last in beauty throughout September. The largest inflorescences are obtained by pruning the vigorous young shoots of the previous year back to one or two eyes during March. In addition, if need be, the young shoots are thinned when an inch long, leaving, perhaps, not more than ten or twelve on each bush. To continue this treatment year after year, rich soil is necessary, with a

mulching of manure over the roots given about midsummer. The variety *grandiflora* is, perhaps, better known, being used for spring forcing in greenhouses; out of doors it flowers three to four weeks before the species. *A. O.*

### FRUITING OF GINKGO BILOBA.

UNTIL the production of several fruits on the Maidenhair Tree at Kew in the autumn of 1919, no authentic record of its fruiting in this country appears to exist. The male and female flowers are borne on separate trees, and curiously enough, all the larger trees in Britain, though, no doubt, seedlings, appear to be males. At one time it was said to be possible to distinguish the sex of the tree by its growth, the male being upright in growth, and the branches of the female more or less spreading.

During Mr. E. H. Wilson's extensive tours

## INDOOR PLANTS.

### THE SMALLER CYRTANTHUS.

GENERALLY speaking, the members of this group of *Cyrtanthus* form bulbs not much larger than those of a Snowdrop. From these bulbs are produced dark green, grass-like leaves, from a quarter to one-third of an inch in width and about a foot long. The flower spike reaches a height of a foot to 18 inches, and is terminated by a loose umbel of flowers, usually from six to nine in number. The flowers are of a tubular shape, somewhat curved, about 1½ inch long and half an inch across the expanded mouth. Some of them vary a little in size and other particulars, but not to any great extent, except in colour. Among the best are *C. angustifolius*, orange

FIG. 84.—FRUITS OF GINKGO BILOBA.

in China and Japan he made many inquiries on this point, the result being that he found it impossible to determine the sex by its mode of growth, in which Chinese and Japanese arboriculturists agreed.

*Ginkgo biloba* was first introduced to Britain about 1760, the Kew tree being planted in its present position in 1760 or 1761. It bore the first flowers, which proved to be male, in 1795. The tree produced quantities of staminate flowers in most years, and it was for this reason that shoots from the famous female tree in the Montpellier Botanic garden were obtained in February, 1911. Several of the grafts united satisfactorily, but it was not until the autumn of 1919 that the first fruits were produced. This year, as shown by the illustration in Fig. 84, the grafts are carrying a heavy crop of fruits. The fruits, or, to be strictly botanical, the seeds with a fleshy covering, are bright yellow, a little over 1 inch long, borne on stalks 1½ to 2 inches long. The fleshy portion has a disagreeable smell, but the kernel of the seed is roasted and eaten in China and Japan.

In addition to the propagation of the *Ginkgo* by seeds (see Fig. 83), the identity of the young plants as male or female can be determined by the propagation of cuttings. There are small plants at Kew, rooted from cuttings made of the young growths, with a thin heel of the old wood, inserted this year in June in a close propagating frame with slight bottom heat. *A. O.*

*C. lutescens*, pale yellow; *C. Macowanii*, bright red; *C. McKenii*, white; *C. Flambeau*, deep scarlet; and *C. intermedius*, orange buff. The last two are garden forms, *Flambeau* being a selected seedling from *C. Macowanii*, whilst *C. intermedius* is the result of a cross between *C. McKenii* and *C. angustifolius*.

All of these just named increase rapidly by means of offsets, and in a greenhouse under conditions favourable to *Pelargonium* they will grow and flower well. During the spring they bloom freely; then, as a rule, in early summer new growth is made, the flowers from which are at their best about August. The growth made after that will give a spring display. This refers only to the general flowering, as scattered blooms make their appearance at any time. The culture of these *Cyrtanthi* is simple. Owing to their slender nature and the fact that the roots do not descend very deeply, they are seen to the best advantage when grouped in a deep pan; but, if grown singly in pots, receptacles 4 inches in diameter will be large enough. The soil should be of a good lasting nature, such as a mixture of two parts yellow loam to one part of well-decayed leaf mould and silver sand combined. Though they require very little water in winter, the bulbs must at no time be dried off.

These small-growing *Cyrtanthi* are easily raised from seeds, as well as from offsets. *T.*

# ROYAL HORTICULTURAL SOCIETY.

## EXHIBITION AT HOLLAND PARK SKATING RINK.

OCTOBER 3, 4, 5 and 6.

THE great combined exhibition, held in the spacious Holland Park Rink on the above dates, was in the nature of an experiment. In past years the Royal Horticultural Society's Summer Show at Holland House was held at the height of the exhibition season and, by certain folk, was considered to follow too closely upon the Chelsea Show as regards both time and material. With Holland House grounds no longer available for a summer show, the R.H.S. Council considered the question of a great autumn show, in which the Vegetable and Fruit Shows—held separately in other years—might be combined with autumn flowers and the autumn colouring of trees and shrubs. Eventually, the idea developed and arrangements were made for such a show as soon as suitable accommodation could be found. The choice of a suitable building was not an easy matter, and tents were out of the question for a show so late in the season, as in wet weather these would soon afford uncomfortable conditions.

Holland Park Skating Rink was finally chosen as offering sufficient room for the anticipated show. It is fully four times as large as the R.H.S. Hall and has a spacious gallery all round the building and from where the larger exhibits in the body of the hall may be viewed as a whole. We confess to some disappointment at the spectacular effect of the show; it was sombre in general effect and this was accentuated by the comparative lack of light overhead. The impression created was that many of the groups presenting fine colouring were placed just below the gallery, where their effectiveness was hidden by groups in front of them. Perhaps, if the show is a financial success, the knowledge gained on this occasion will be used to alter these matters and get more colour massed down the central part of the hall.

Horticulturally, the show was a great success. The trade contributed magnificent exhibits and, on the whole, the material was in excellent condition and the arrangement good, though it was possible to find displays of poor material, and several where crowding was an obvious fault. Amateurs' exhibits, save in the competitive classes, were few, but the outstanding one was the great central group of the newer trees and shrubs, staged by the Hon. VICARY GIBBS.

Trees and shrubs, berried, or showing autumn colouring. Dahlias, Carnations, Orchids, Clematises, Roses, Chrysanthemums, and Michaelmas Daisies, were the leading floral subjects. Fruits and vegetables were contributed in quantity and many of the trade displays were as interesting as they were beautiful. Here again the Hon. VICARY GIBBS was the foremost amateur exhibitor, contributing one of his wonderful and instructive displays of vegetables. The exhibits in the competitive classes for fruits and vegetables were, for the most part, accommodated in the gallery.

For a short time after the exhibition was opened the attendance was small, but at about 2 o'clock in the afternoon of the first day the attendance increased rapidly until between 3 o'clock and 4 o'clock the great hall was crowded with Fellows and visitors, and the whole scene, as viewed from the gallery, was a most animated one.

During the evening of the opening day the President and Council of the Society entertained the members of the Standing Committees, the judges and principal exhibitors at dinner at the Hotel Cecil. This pleasant function took the place of the luncheon formerly given at the Holland House Show.

### Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Prince Shimadzu, Messrs. Jas. O'Brien (hon. secretary), Arthur Dye, Fred. K. Sander,

E. R. Ashton, W. H. White, S. W. Flory, J. W. Potter, H. G. Alexander, R. G. Thwaites, C. H. Curtis, J. Cypher, Stuart H. Low, R. Brooman White, Pantia Ralli, H. J. Hatcher, Frederick J. Hanbury, A. McBean, J. E. Shill, Gurney Wilson, W. J. Kaye and H. T. Pitt.

### FIRST-CLASS CERTIFICATE.

*Brasso-Laelio-Cattleya Golden Crown, var. Prince Humbert (B.-L.-C. Joan × C. Venus)*, from Messrs. CHARLESWORTH AND Co. One of the fine series developed by Messrs. Charlesworth and Co. from their fine yellow B.-L.-C. Joan (B.-L. Mrs. M. Gratrix × C. Octave Doin), which contains remarkable elements that have been very successfully developed, the highest example being the new form of B.-L.-C. Golden Crown, which was unanimously given the highest award. The flowers are of fine substance and good shape; the colour is golden-yellow with a rich, ruby-crimson lip.

### AWARDS OF MERIT.

*Cattleya Desdemona (Fabia × Thurgoodiana)*, from Messrs. CHARLESWORTH AND Co. *C. Thurgoodiana* is derived from *C. Hardyana* and *C. Luddemanniana*, the latter giving large size, and the former rich colour, which has been admirably blended by the *C. labiata* and *C. Dowiana* in the other parent. The flower, which is of the largest size and of perfect shape, is clear mauve, with deep ruby-crimson front to the broadly expanded lip, which has a clear chrome yellow disc.

*Oncidioida Medina (Cochlioda Noezliana × Oncidium corynephorum)*, from Messrs. CHARLESWORTH AND Co. An elegant hybrid, bearing a much-branched spike of pretty mauve coloured flowers.

*Miltonia Warscewiczii Rosslyn variety*, from Messrs. CHARLESWORTH AND Co. The largest and most remarkable variety of the species, the branched spike bearing flowers twice the size of those of the type. The sepals and petals are blackish-chocolate with yellow tips; the broad lip is deep violet at the base and white in front.

*Brasso-Cattleya Viscount Toda (C. Rhoda × B.-C. Helene)*, from Messrs. FLORY AND BLACK. A welcome new type of Brasso-Cattleya, of perfect form. The segments are flatly arranged and of firm substance, distinct from the usual run of Brasso-Cattleyas. The sepals are rose-coloured, with a yellowish tinge, the petals broad and a darker rosy mauve; the showy lip is tinged and veined with mauve. A very sturdy and floriferous plant.

*Laelio-Cattleya Mrs. Medo (C. Venus × L.-C. Luminosa)*, from Messrs. STUART LOW. A showy hybrid with good golden-yellow sepals and petals and ruby-purple front to the well-formed lip.

### GROUPS.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey (gr. Mr. J. Collier), the only amateur exhibitor, loyally faced the perils of a four days' show and staged a remarkable group replete in good plants, both species and hybrids. Cattleyas and Laelio-Cattleyas were largely represented; among the former were the Gatton blue *C. Alcimedea coerulea*, C. Browniae Gatton Park variety; fine forms of *C. Iris* and *C. Hardyana*; the large, pure white *C. Lady Veitch* and other fine forms. Laelio Cattleyas were equally well represented and there were fine Brasso Cattleyas of varied tints. To many the large number of curious species was the greatest attraction, the Butterfly Orchid, *Oncidium Papilio*, and other insect-like species never failing to draw attention. Among the more curious were *Cirrhopetalum miniatum* with umbels of long, orange-

red flowers; the curious fleshy-green *Catasetum* discolour, a nice batch of the slender pale yellow *Spathoglottis*, a selection of *Dendrobium Phalaenopsis*, the singular *Angraecum distichum*, the profuse flowering orange-coloured *Pleurothallis fateritia*, and various pretty *Masdevallias*.

MESSRS. CHARLESWORTH AND Co. staged a fine group in which were large numbers of showy novelties, including *Brasso-Laelio-Cattleya Golden Crown* ar. *Prince Humbert* (B.-L.-C. Joan × *C. Venus*), a noble golden yellow flower with dark crimson purple lip; *Odontonia inter* (*Odontonia Magali Sander* var. *xanthotes* × *Odm. luteo-purpureum Vuylstekeanum*) with a spray of pretty, staw-yellow flowers; *Oncidioida Medina* (*Cochlioda Noezliana* × *Oncidium corynephorum*) with a graceful, branched spike of mauve flowers that have a yellow crest to the lip; and *Sophro-Laelio Cattleya Flamingo* (L.-C. St. Gothard × S.-L.-C. Carna), dark mauve with a golden shade, and a purple lip. The group well displayed the many pure white *Odontoglossums* of the *xanthotes* type raised by the firm, and among the home-raised hybrids were grand forms of *O. crispum*, both white and richly coloured. Among the species *Miltonia Warscewiczii Rosslyn* var. represented the finest type of the species ever seen, the large flowers having blackish-chocolate coloured sepals and petals, tipped with yellow, and the broad lip violet at the base and clear white in front.

MESSRS. STUART LOW AND Co. staged a fine group. They utilised to great advantage tall, slender *Oncidiums* arching over from Palms at the back, that associated well with the larger flowered Cattleyas, Laelio-Cattleyas and *Odontoglossums* well displayed with them. Noticeable among the *Odontoglossums* was a fine plant of the handsome *Odm. Woodroffeae*. The Brasso-Cattleyas and their allies included an exceptionally fine B.-L.-C. *Truffautiana*, whilst the Cattleyas embraced the clear white and mauve *C. Snavior* var. *Glory*; the showy *C. Don* (*Remula* × *Armstrongiae*) which shows much of the yellow in the lip of the latter parent; *C. Orita* (*Vestris* × *Dowiana*) and a good selection of white forms and *Cypripediums*.

MESSRS. SANDERS had an extensive and well-arranged group, in which forms of *Cattleya Hardyana*, both white and coloured, were well displayed, together with specially fine *Laelio-Cattleyas*, the best of which was L.-C. J. Ansaldo var. *atro-violacea*, a noble flower with mauve sepals and petals and entirely deep ruby elaret lip. It was obtained between L.-C. Hildegarde and L.-C. Lustre. Among the white varieties L.-C. *Cremona alba* (*C. Suzanne Hye de Crom* × L.-C. *Ophir*) was a fine example, with clear white flowers and chrome yellow disc to the lip. The *Odontoglossums* in the group were excellent, and the whole collection was well arranged.

MESSRS. FLORY AND BLACK had one of the neatest groups, all of good, well-grown and perfectly flowered specimens, raised in their nurseries. Among the Cattleyas, C. Dr. G. G. Macdonald (*Kienastiana* × *Dowiana*) one of the firm's raising and the best of its class, bore large, cream-white flowers with wholly deep violet-crimson lip; *C. Mimosa* (*Venus* × *triumphans*) is a good new yellow variety with a purple lip. The pure white forms were specially good. *Sophro Laelio-Cattleya Antoine* and S.-L.-C. *Cytherea* (S.-L. *Gratrixiae* × *C. Empress Frederick*) were finely coloured.

MESSRS. CYPHER AND SONS had a beautiful and artistically displayed group, in which a fine selection of Cattleyas, Laelio-Cattleyas and Brasso-Cattleyas were arranged with richly coloured *Cyclopiums* and *Caladiums*. Slender yellow *Oncidiums* and countless pretty things were displayed on each side of the bold group in a manner which few artistic florists could excel.

**Floral Committee.**

*Present:* Messrs. H. B. May (in the chair), J. W. Barr, W. J. Bean, Sydney Morris, G. Reuthe, H. R. Darlington, Arthur Turner, D. B. Crane, John Heal, J. F. McLeod, T. Hay, W. Howe, W. H. Page, H. J. Jones, J. Jennings, W. B. Gingell, R. C. Notcutt, Andrew Ireland, M. C. Allwood, W. G. Baker, Thos. Stevenson, Hugh Dickson, and Clarence Elliott.

**AWARDS.****FIRST-CLASS CERTIFICATE.**

*Pyrus Eleyi.*—A handsome *Pyrus*, which, like so many of its congeners, is of great garden value when flowering as well as when fruiting. It secured an Award of Merit when shown as a flowering tree at one of the fortnightly meetings, and on this occasion secured the higher award for its attractiveness while in fruit. The leaves show a little autumn tinting, but the pendulous, elongated Apple-shaped fruits of rich, reddish scarlet colouring, provide the great attraction. Shown by Mr. R. C. NOTCUTT, Ipswich.

**AWARD OF MERIT.**

*Aster Little Boy Blue.*—This very attractive Michaelmas Daisy has double flowers of a rich shade of purplish-blue. The individual flower heads are about an inch in diameter. This name needs to be altered as, we believe, Mr. Beckett raised a variety named Little Boy Blue several years ago. Shown by Mr. E. BALLARD, Colwall.

*Kniphofia The Rocket.*—This showy addition to the decorative Red-hot Poker family, has symmetrical heads of clear coral red flowers. Shown by Messrs. W. ARTINDALE AND SON, Sheffield.

*Chrysanthemum Cissbury White.*—A very useful early-flowering variety with medium-sized, incurved white flowers, which are faintly cream tinted. As an outdoor variety, this is a very distinct advance and a useful addition. Shown by Mr. S. AISH, Cissbury, Dunstable.

*Aster Barr's Pink.*—One of the finest of late-flowering Michaelmas Daisies. It belongs to the *Novae Angliae* group and carries large flower heads in great abundance. The colour is bright, deep rosy, but scarcely pink according to ordinary ideas; it is a famous variety none the less, and its individual flower heads measure 2½ inches across. Shown by Messrs. BARR AND SONS, Covent Garden.

*Viburnum Davidii.*—The charm of this shrub lies in its deep-green leaves, with paler underside, and in the flattish heads of small turquoise-blue fruits. The flowers are small and white. Shown by LIONEL DE ROTHSCHILD, Esq., (gardener Mr. F. Kneller), Exbury, Southampton.

**Chrysanthemums.**

A handsome collection of both large-flowered Japanese and decorative varieties was arranged in an imposing group by Mr. H. J. JONES. He had exhibition-sized blooms of such sorts as Mona Davis, Mrs. G. Lloyd Wigg, and Donatello, a yellow incurving variety, unusually early in the season. Of the smaller, but highly decorative sorts, September Glory, October Glow, Red Almirante, Pink Delight, Pink Profusion, Uxbridge Pink, and Blanche de Poiteau were particularly effective.

At the far end of the hall Messrs. W. WELLS AND Co. displayed a fascinating collection of sprays and disbudded blooms from the open ground. Blanche de Poiteau is very large for this type and the blooms were a particularly clear white. Of the many other sorts, we were especially impressed with Verona, of intense terra-cotta colour, Golden Polly, Sanctity, Pink Delight, Knaresboro Yellow, Harvester, September Glow, September Gem, as well as the varieties which received awards on the previous day.

A very large quantity of decorative sprays was well arranged by Messrs KEITH LUXFORD AND Co., whose display occupied both sides of a length of tabling. The outstanding varieties were Early Buttercup, Uxbridge Pink, J. Banister, Marie Massé, Polly, Verona, and some beautiful sprays of Framfield White.

A collection of well-grown Chrysanthemums of market type was arranged by Mr. WM. YANDELL, who included such varieties as Normandie,

Mr. Roots, Miss E. Harvey, Craufordia, Crimson Pride, Le Pactole, and Horace Martin.

**Carnations.**

Perpetual-flowering Carnations were shown in admirable form by a number of exhibitors, including Messrs. ALLWOOD BROS., Haywards Heath, who staged a magnificent display just inside the main entrance. The large centre piece of Edward Allwood, a fine scarlet flower, attracted attention, and there were also large panels of Wivelsfield Apricot, and the paler Wivelsfield Beauty and Wivelsfield White. The new yellow Maine Sunshine, Triumph, crimson; Benora, white, flaked with crimson; and Chintz, pale mauve with crimson pencilling, were also shown, whilst the hanging baskets were filled with the varieties Walter Demus, salmon pink, and May Day, pink. The ends of the group were occupied with *Dianthus Allwoodii*, some of the newer varieties of which included Arthur, maroon with deep scarlet eye; Vera, pale pink; and Alfred, white. There were also some epergues filled with the new perpetual border Carnations, raised from the perpetual and border

those shown in that manner, Isobel, Covent Garden, Padre, Mrs. Elisha Hicks, and Mrs. C. Lamplough were perhaps the very best, but when all are so good, a selection seems invidious. A large vase containing sprays of *Rosa Fargesii*, bearing its large brilliant hips, attracted a deal of attention.

Alongside this fine exhibit, Messrs. ALEX. DICKSON AND SONS displayed many excellent roses, and also arranged those with considerable taste. Of the many sorts, we selected Lulu, Earl Haig, Elizabeth Cullin, Betty Uprichard, Lady Inchquin, Sunstar, La Tosca, and Lady Pirrie as being the very best of a meritorious collection.

Messrs. B. R. CANT AND SONS were prominent among the exhibitors of particularly good Roses. They included large stands of fresh and well coloured blooms of The Queen Alexandra Rose, K. of K., Lady Pirrie, Golden Emblem, Covent Garden, Lady Hillingdon, General MacArthur, and Ophelia.

In an interesting collection of Roses, chiefly of his own raising, the Rev. J. H. PEMBERTON showed the new fragrant Nur Mahal, with The Adjutant, Pax, Mermaid, Ruth, of delightful

FIG. 85.—THE NATIONAL CHRYSANTHEMUM SOCIETY'S CUP. WON BY MR. H. J. JONES.

types and claimed to be perfectly hardy. The flowers were of exceptionally fine quality with a fine range of colouring.

Mr. C. ENGELMANN, Saffron Walden, staged a wonderful group and rarely, if ever, have we seen such perfectly grown flowers. A huge mass of the salmon-pink Jaddie occupied the central position, flanked with columns and epergues of Cupid, pale salmon pink; Tarzan, a very fine scarlet flower; Yellow Saffron, and its sport, Cream Saffron, White Eucharist, Maine Sunshine, yellow; Bona, deep salmon pink; Surprise, pale pink; and White Delight. Messrs. STUART LOW AND Co., Bush Hill Park, also devoted a part of their exhibit to Carnations, chief among which were White Pearl, Red Ensign, Mrs. Mackay Edgar, crimson, Eileen Low, a good salmon pink, and Mrs. T. Ives, salmon pink, together with a number of promising seedlings.

A small, effective group was also staged by the PRESTON HALL NURSERIES, Aylesford, the chief varieties being Eucharist Supreme, salmon pink; Destiny, rose; Marion Wilson, yellow ground flaked scarlet; and Lady Northlife, pink.

**Roses.**

In spite of the sunless weather, Roses were extensively shown, and in particularly fresh and good condition. Mr. ELISHA J. HICKS almost surpassed himself with an especially fine display. His arches of Mrs. Henry Stevens, Madame Butterfly, Climbing Lady Hillingdon, and Ophelia were very fascinating and served to draw attention to the very many beautiful blooms arranged in tall stands and vases. Of

golden Apricot shading, and the beautiful pink Mary Monro.

Tea and Noisette Roses of great merit were shown by Mr. GEORGE PRINCE. The chief sorts were Mrs. Henry Stevens, Lady Plymouth, Souvenir de Claudius Pernet, and Alex. Hill Gray. Of his many H.T. sorts, Golden Mail, an orange-yellow sport from Madame Ed. Herriott, Lady Pirrie, Hadley, Sunstar, and Golden Emblem were very prominent.

A collection by Messrs. F. CANT AND Co. included their new Capt. F. S. Harvey Cant, Los Angeles, Joanna Bridge, The Queen Alexandra Rose, Covent Garden, and Ophelia. A smaller collection, which included good blooms of Caroline Testout, General McArthur, and Climbing Madame E. Herriot, was displayed by Messrs. D. PRIOR AND SON, while Messrs. W. H. CUTBUSH AND SON associated with Polyantha varieties as Ellen Poulsen and Girlie with herbaceous flowers.

Mr. JOHN MATTOCK had a most beautiful basket of the old favourite Niphotos, and also showed Walter C. Clarke, Isobel, Hadley, La Tosca, Pax, and Ophelia in great excellence. Alongside their Carnations Messrs. STUART LOW AND Co. arranged such Roses as Hoosier Beauty, Hadley, The Queen Alexandra Rose, and Golden Emblem. Messrs. JARMAN AND Co. displayed Souvenir de Claudius Pernet and Mrs. Henry Morse in a collection, while Messrs. DONNE AND Co. had a noteworthy exhibit with their Dahlias. The chief Roses were Madame Ed. Herriott, Christine, Col. Oswald Fitzgerald, and Lieut. Chauré.

### Dahlias.

A large and comprehensive display of Dahlias came from Messrs. CARTER PAGE AND Co., LTD., London Wall, the flowers being arranged in epergnes with bracken foliage. The principal varieties were Harmony, pure white decorative; Beauty, rose decorative; Ivory White, Cactus; Border King, red Cactus; Queen of the Whites, pompon; Ada Finch, cream Anemone-flowered; and Peronne, scarlet collerette.

Mr. C. TURNER, Slough, showed magnificent flowers of a pretty Star Dahlia, the blooms having a yellow ground tinted with magenta rose at the tips of the florets. Other good things were Ladas, scarlet collerette; Creation, a Paony-flowered variety of rich brick rose colour; Aphrodite, white Paony-flowered; Fusilier, scarlet Paony-flowered; Mrs. Douglas Fleming, ivory-white Cactus; and Orpheus, yellow pompon.

Messrs. DOBBIE AND Co., Edinburgh, staged a very effective group of high quality flowers, including Arran, a pretty deep rose collerette with white collar; Scarlet Queen, a fine scarlet with yellow collar; Avon, a fiery brick-red collerette variety; and Goldendale, a large yellow flower of self amber-yellow colour. Cactus varieties were seen in Saffron, yellow; Amos Perry, scarlet; and Alabaster, creamy white. Duchess, scarlet, and Queen of the Belgians, pale flesh pink were two beautiful large-flowered pompon varieties, and Queen of the Yellows, Dagmar, deep maroon; and Bacchus, scarlet, were noted among the dwarf varieties.

Opposite the latter group Mr. J. T. WEST, Brentwood, had a pleasing display of the newer varieties of Dahlias, including Mrs. W. H. Hussey, pure white Paony-flowered; Roy Hay, a fine decorative flower of amber and orange colours; Mrs. Carl Salbach, lavender pink on a white ground; Lovelight, pale pink; and Dazzle, scarlet, two good miniature decorative varieties; Rona, crimson collerette with white tips and yellow collar; and Lolah, crimson and yellow.

Messrs. JARMAN AND Co., Chard, made a feature of the rose-pink decorative variety Rosie, and a selection of Cactus varieties, while Mr. J. B. RIDING, Chingford, was responsible for a large group of Dahlias, chief of the large decorative varieties being Salmonea salmon pink; Star, amber; Sunset, old gold; and Ebor, cerise. Belonging to the small decorative class were Lady Bird, rose, with golden eye; and Madame Herriot, rich red; while amongst large Paony-flowered varieties were King of the Autumn, apricot; King Harold, crimson; and Yellow King, Judith, brick red; Our Annie, pink with yellow centre; and Audrey, amber, were noted in the small, Paony-flowered section, and there were also excellent pompon collerette, and star-flowered varieties.

Messrs. TRESEDER, LTD., Cardiff, filled a table-length with a miscellaneous collection of Dahlias, chief of which were David, Magenta, Big Ben, crimson-rose; and Scarlet King, scarlet, of the decorative section. Good Paony-flowered varieties were Harmony, white; and Iliad, amber, while there were also some magnificent show-blooms of Cactus and large-flowered pompon varieties. A very pleasing display was also staged by Messrs. J. CHEAL AND SONS, LTD., Crawley, who included large epergnes of Silver Queen, a decorative variety of silver-rose on white ground; Princess Juliana, white decorative; Darkest of All, deep maroon pompon; and single Star and collerette flowers in variety.

### Hardy Flowers.

Hardy herbaceous plants were shown in abundance, Michaelmas Daisies predominating. A very bright group was arranged on the ground level by Mr. AMOS PERRY, Enfield, and amongst Michaelmas Daisies were Nancy Ballard, semi-double, purple; Brightest and Best, violet purple; Mrs. Eisle, lavender; Cloudy Blue, Rye-croft Pink, and the large flowered Maggie Perry, lavender mauve. Other attractive subjects included Helenium Gartensoone, H. autumnale rubrum, Solidago Shortii, also known as Golden Wings; Chrysanthemum Kenneth, a single white flower with serrated ray-florets, *Salvia uliginosa*, blue; *Helianthus multiflorus maximus*, and the double variety H. Soleil d'Or; and *Tritoma gracilis*.

Messrs. R. WALLACE AND Co., LTD., Tunbridge Wells, effectively displayed hardy herbaceous plants amongst ornamental shrubs. *Lilium auratum*, *L. speciosum rubrum*, and *L. album Kraetzeri* were represented by fine spikes of flowers, as were also a variety of hybrids of *Gladiolus primulinus* and spikes of *Hyacinthus candicans*. Asters provided banks of colour and included such good things as Cloudy Blue, Brightest and Best, Blue Gem, Beauty of Colwall, and Cleopatra, a single white flower tinged with mauve.

From Messrs. JACKMAN AND SONS, Woking, came a pleasing display, the centre of the group being occupied by graceful plumes of Pampas Grass, around which were some magnificent specimens of pot-grown Clematis. Asters were shown in variety, and other autumn-flowering plants were *Helianthus sparsifolius*, *Poterium canadensis*, *Pentstemon Southgate Gem*, *Rudbeckia Nemanni*, *Salvia uliginosa*, *Gaillardia Sunrise*, and *Delphinium Capri*, light blue. Messrs. RICH AND Co., Bath, had a table group of miscellaneous herbaceous plants, the back of the exhibit being occupied with tall epergnes of *Helenium Riverton Gem*, H. Riverton Beauty, H. autumnale superbum rubrum, and the large flowered *Helianthus Monarch*. *Michaelmas Daisies*, border *Chrysanthemums*, Dahlias and *Phloxes* were also shown in variety. Mr. E. SCAPLEHORN, Haywards Heath, brought Asters in variety, including King of the Blues, deep blue; Mons, rose; and the large-flowered King George and King of the Belgians. *Sedum atropurpureum*, *Hemerocallis Sir M. Forster*, *Tritoma Corallina*, and *T. Macowani* were also shown. Close by, Messrs. BAKERS, LTD., Codsall, filled a low table with herbaceous flowers arranged in bottles, over which was placed wire netting. The centre consisted of a mass of blue Aster Anita Ballard, and *Scabiosa caucasica*, while other good things were *Pyrethrum Fire Fly*, *Primula Wanda*, *Spiraea Codsall Queen*, with creamy white flowers, the deep blue *Delphinium Mrs. H. Kay*, *Astilbe Brilliance*, rosy mauve, *Gentiana Farreri*, blue, and their strain of Sunbeam Poppies, which flower from May until October.

Messrs. LADHAMS, Southampton, made a feature of hybrid *Lobelia*s obtained from *L. cardinalis* and *L. siphylitica*. Among the fifteen named varieties were Mrs. Humbert, rose; B. Latham, scarlet; Purple King, a very distinct colour; Shirley Beauty, crimson; Delight, mauve; and Carmineus, cerise. *Pentstemon*, Pink Gem, *Aconitum Wilsoni*, *Lavatera Olbia rosea*, and *Cimicifuga simplex* were also staged.

Violets were shown by Mr. J. J. KITTLE, Corie Mullen, the flowers being cut from the open. The chief varieties were Princess of Wales, La France, Mrs. J. J. Kettle, Lloyd George, and the new Princess Mary.

Messrs. W. CUTBUSH AND SON, Highgate, had a pleasing arrangement of Michaelmas Daisies, Dahlias and Pentstemons. Among the former were Brussels, pale blue; Elta, double flower of rose colour; Mons, rose; and Robinson V.C., blue. Dahlias were represented by Delice, rose; Porthos, mauve; Yellow Transparent; and Paul Crampel, scarlet; while amongst Pentstemons were Bronze Lass, pink; Mrs. Leonard Cutbush, red; and Magnificence, rose. *Lilium tigrinum* was freely used in the groundwork, and one part of the exhibit was occupied with *Polyantha Roses*.

Asters were freely used in the exhibit from Mr. W. WELLS, Junr., Merstham, who showed large vases of King of the Blues, Grace Sweet, Robinson V.C., Rose Queen, and King George. *Rudbeckia purpurea*, *Lupinus Merstham Gem*, *Helenium Crimson Beauty*, were also shown, and at one end of the exhibit were some fine spikes of *Tritoma Princess Juliana*, in front of which was a mass of *Gentiana Farreri*. Mr. G. RETTIE, Keston, had a very pretty group in which he showed Asters in variety. *Solidago altissima*, *Boltonia latissuama*, *Lobelia cardinalis*, and *L.C. Queen Victoria* were also included in the group, together with *Lilium sulphureum*, *L. tigrinum*; *L. Fortunei giganteum*, and *L. superbum*. *Colchicums* and autumn flowering *Crocuses* were also shown, the former including *C. speciosum*, *C. s. album*, and *C. s. rubrum*, *C. autumnale flora plena*, and *C. Bornmülleri*.

The CHALK HILLS NURSERIES, Reading, showed Antirrhinums in variety, the plants of which have provided flowers for exhibiting purposes from May onwards. Monarch, a fine crimson; Prima Donna, salmon buff; Silver Queen, silvery mauve; and Harmony, rose with yellow centre, were some of the best varieties. A delightful strain of seedling Pentstemons and hybrid Lupins were included in the exhibit, and at one end were staged sprays of Zonal Pelargoniums, of which Maxim Kovalensky salmon scarlet; Prince of Orange, double orange; The Speaker, semi-double salmon; Snowstorm, white; and Victory salmon; were a few of the best.

Mr. T. CARLILE, Tyford, made a feature of *Kniphofia corallina*, together with hybrid Lupins, Aster *Amellus Queen Mary*, large deep blue flowers; *Helianthus Monarch*, and some very fine sprays of *Delphiniums*, including *Lavanda*, magenta blue; and *Nora Ferguson*, pale blue. From Messrs. ISAAC HOUSE AND SON, Bristol, came a beautiful collection of forms of *Scabiosa caucasica*, and among the deeper shades of blue were *Mary Witchell*, *Diamond*, and *Isaac House*. Paler varieties were *Silver Queen*, *Silver Prince*, and *Silver King*, and included in the white forms were *Mrs. Isaac House*, *alba perfecta*, and *alba nana*.

Mr. H. J. JONES, Lewisham made a very effective display of Michaelmas Daisies heightened in colour by the judicious use of *Helianthus Monarch*. At the back were arranged large columns of *Elsa*, deep blue; *Amellus major*, large-flowered, deep blue; and *Dainty*, double lavender rose, while towards the front were good clumps of *R. Von Gersche*, *King George*, *Weinholtz*, *White Climax*, and *Robinson*, V.C. Mr. ERNEST BALLARD, Colwall, showed a very beautiful ground group of Michaelmas Daisies, and amongst the many fine things noted were *Maid of Colwall*, white; *Queen of Colwall*, lavender blue; *Ethel Ballard*, rose; *Purple Emperor*, deep purplish blue; *Snowdrift*, white; and *Anita Ballard*, double lavender blue. Messrs. BOWELL AND SKARRAIT, Cheltenham, brought a miscellaneous collection of herbaceous plants, and towards the front of the exhibit were clumps of *Colecium Bornmülleri*, *Crocus zonatus*, *Primula Forbesii*, and *Chaerostoma bispida*.

A magnificent display of *Lilium auratum* came from Mrs. C. LEMON, Carlton Hill, N.W., some of the spikes carrying over two dozen flowers and cut from plants growing in the open at Brodick, Arran, N.B.

Messrs. G. GIBSON AND Co., Bedale, showed *Papaver orientale Ethel Swete*, cerise; *Verbascum Bronze Beauty*, reddish bronze; *V. Indiana*, Indian lake; good blooms of *Pyrethrum Queen Mary*, new hybrid Lupins of many shades of colour and *Scabiosa caucasica* together with *Iceland Poppy*, *Gibson's Giant Orange* and *Gladioli* in variety. From Messrs. HARKNESS AND SONS, Bedale, came a collection of herbaceous plants, included amongst which were *Tritoma uvaria*, *Hyacinthus candicans*, *Lupinus* in variety, *Michaelmas Daisies*, *Chrysanthemums*, and *Gladioli*. Mr. H. VIGARS showed small plants of his *Delphinium Sky Blue*, the plants being specially prepared for forcing.

One of the features of the show was the charming grass gardens arranged by Mr. J. MACDONALD, Harpenden. Ornamental grasses were grouped in beds set in a beautiful lawn, and the tall, graceful red spikes of *Tricholaena rosea* were employed with much effect with such beautiful things as *Eragrostis elegans*, *Agrostis nebulosa*, and the dwarf *A. pulchella*, *Pheum aurea*, the blue *Festuca glauca*, *Eulalia japonica variegata*, the new hybrid *Trichagrostis*, and *Dactylis glomerata*. The silvery *Glyceria spectabilis argentea* was used with much effect as an edging to the beds.

Messrs. LOWE AND GIBSON, Crawley Down, showed an interesting collection of *Gladioli* raised from seed sown under glass in early spring.

### Alpine Plants.

At this time of the year alpine plants are not freely shown, but there was nevertheless a few interesting groups. Messrs. CLARENCE ELLIOTT, LTD., Stevenage, showed some very choice things, such as the true *Saxifraga valdensis* and a fine pan of *S. Greisbachii*. The prostrate *Rhododendron Williamsii*, a lime loving species,

*Artemisia canescens*, *Scutellaria indica japonica*, *Anthemis Hausknechtii*, and the free flowering *Primula Jnlina* Elliott's variety were also seen, whilst spikes of *Polygonum affine* and *P. campanulatum* added a touch of colour.

Messrs. MAXWELL AND BEALE, Broadstone, had a rock garden arrangement, in which were shown *Rosa pumila*, *Gentiana Farreri*, *G. pneumonanthe*, and the white form *G. p. alba*, *Erica vagans*, *E. cinerea alba*, and *E. ciliaris* (the Dorset Heath). The same firm also staged herbaceous plants in variety, and bowls of Violet Princess of Wales cut from the open fields. A small rock-garden display was staged by Mr. F. G. WOOD, Ashstead, who showed *Nierembergia rivularis*, *Sedum spectabile*, *Verbena venosa*, and *Artemisia pedemontana* backed with a miscellaneous display of *Michaenas* Daisies, *Phloxes*, and hardy *Chrysanthemums* in variety.

Mr. ERNEST DIXON, Putney, arranged a small formal garden and rock garden on the table, and the Misses K. and E. HOPKINS, Shepperton-on-Thames, also had a neat rock garden exhibit.

#### Trees and Shrubs.

Collections of growing specimens and cut sprays of many ornamental trees and shrubs were important features of the show.

In the centre of the hall there was a very large circular group from the Hon. VICARY GIBBS (gr., Mr. E. Beckett), Aldenham House, Elstree, which was noteworthy for the great number of very interesting subjects it contained. For the most part it was the newer Chinese specimens that were displayed, but there were also examples of the older and valuable shrubs, especially amongst those in flower. These included *Erythrina Crista-galli*, *Viburnum Tinus*, *Spartium junceum*, with *Lespedeza Sieboldii* and *Spiraea sorbifolia*. Amongst the many berried shrubs there were *Rhamnus Erythroxyloides*, *Pyrus Aucuparia munda subarachnoides*, bearing good bunches of its pure white fruits; *Pyrus firma*, of glowing crimson colour, and *Cydonia japonica Wilsonii*. The most brilliant foliage colour was provided by *Acer japonicum laciniatum*. A small plant of *Vitis Brandtii* bore small clean bunches of small Grapes.

Near by Messrs. J. CHEAL AND SONS arranged a group of autumn trees and shrubs, surmounted by a golden specimen of *Pseudolarix Kaempferi*. The fruiting shrubs included *Crataegus yumanense*, *C. coccinea dentata*, *C. mollis* and *Pyrus discolor*. Amongst the flowering species were *Eucryphia cordifolia*, *Clerodendron foetidum*, *Buddleia variabilis compacta* and *Kerria japonica fl. pl.* A small plant of *Ginkgo biloba* in its rich yellow autumn colour was very fascinating.

A particularly interesting collection of Conifers was contributed by Messrs. HILLIER AND SONS, who also showed general shrubs. The Conifers included fruiting specimens of *Pinus Ayacahuite*, *P. sinensis*, *Picea bicolor* and its variety *reflexa*, *Abies arizonica* and *A. brachyphylla*. *Pinus Massoniana*, *Picea excelsa aurea*, *P. Kosteri*, *Abies Delavayi*, *glabra* variety, and *A. homolepis* were also of more than usual interest. Various Conifers and other trees and shrubs were associated with border flowers by Messrs. R. WALLACE AND CO.

On a table space Mr. SIDNEY MORRIS, Earlhams Hall, Norwich, contributed an interesting and instructive collection of berried shrubs. The most uncommon was the fruits of the half-hardy *Lonicera Hildebrandtii*, which accompanied a spray of the very long yellow tubular flowers. *Hippophae rhamnoides*, *Berberis aggregata nana*, *Euonymus intermedia* and many varieties of *Crataegus* were well represented. In a general exhibit Messrs. J. PIPER AND SON had *Elcagnus glabra*, *Berberis* in variety, Conifers and Topiary. The largest group of Topiary was from Messrs. W. CUTBUSH AND SON, who had a well-trained collection.

One of the most uncommon objects in the group by Mr. G. REUTHE was the pods of *Descainsea Fargesii*. These are like rounded Pea pods and are of a dark violet colour. The flatish seeds are set in a greenish viscid pulp. *Rhododendrons*, particularly those with large, handsome foliage, *Berberis* in variety and dwarf rock shrubs were also represented.

*Ceanothus*, in such sorts as *Ceres*, *Gloire de Versailles*, and *floribunda* were very interesting in an exhibit by Messrs. WATERER, SONS AND CRISP, who also included specimens of *Taxus nova aurea*, *T. japonica* and many *Barberries*. *Clematis* were particularly good. Messrs. L. R. RUSSELL, LTD., had a magnificent collection in practically all the best sorts. These were shown as young plants in quite small pots, and each plant was a perfect specimen, in robust health, bearing half a dozen or so of beautiful flowers. The principal varieties were King Edward VII., Gipsy Queen, Lady Northcliffe, Lasurster, Marie Boisselet, Lady Neville, Lord Neville, Jackmanii rubra and *Viticella alba luxurians*.

Many *Clematis* were arranged with border flowers by Messrs. G. JACKMAN AND SONS. Their outstanding varieties were *Crimson King*, *Jack-*

*Humea elegans* were used with effect amongst finely coloured *Codiaeums*, the scarlet *Clerodendron fallax*, *Statiche intermedia*, *Nandina domestica* and *Jacaranda mimosaefolia*, the latter with fine, light green foliage. Close by Messrs. L. R. RUSSELL, LTD., displayed flowering and foliage stove plants in variety. Among the former was the gigantic flowered *Aristolochia gigas Sturtevantii*, with *Acalypha Sanderiana*; *Bilbergia rhodocyanea*, *Nidularium Meyendorffii*, and baskets of *Columnnea gloriosa purpurea*. Among foliage plants noted were *Alocasia argentea*, *Dracaena Victoria*, *Codiaeum Reidii*, *C. Golden Bracelet*, and *Acalypha Hamiltoniensis*. Messrs. R. and G. CUTHBERT filled a table length with their delightful strain of hybrid *Streptocarpus* in white, rose and mauve shades, while from Mr. H. N. ELLISON, West Bromwich, came some very fine specimens of greenhouse Ferns.

FIG. 86.—MR. H. J. JONES' EXHIBIT OF CHRYSANTHEMUMS, AWARDED THE NATIONAL CHRYSANTHEMUM SOCIETY'S SILVER CUP (SEE P. 211).

*manii superba*, *Mrs. Cholmondeley*, *Empress of India*, *Beauty of Worcester*, *Alba Magna* and *C. tangutica*, *obtusiuscula*, the last named bearing small, quaint pendulous yellow flowers.

#### Greenhouse Plants.

Messrs. BLACKMORE AND LANGDON were again excellent with *Begonias*, a central position being allotted to *Begonia Hilda Langdon*, a pretty rose-pink variety; *Mrs. J. Davidson*, yellow; *Sir J. Wilson*, scarlet; *Lord Lambourne*, orange; *Lady Cory*, salmon; and *Queen of the Belgians*, rose. Along the front were arranged tuberous varieties suitable for hanging baskets, and including such beautiful things as *Fleur de Chrysantheme*, pale rose; *Sirius*, salmon red; *Rose Cactus*, pink; and *Gladys*, deep rose. *Begonias* were also shown by Messrs. BASTIN AND SONS, Bexley Heath. Among named varieties were King Edward VII., scarlet; *Lady Sebright*, rose; *Mrs. H. J. Kilker*, white; and the Hon. Maurice Glynn, orange. Numerous seedlings of single and double varieties were also on view.

A very attractive group of stove and greenhouse plants was staged by Messrs. J. CYPHER AND SONS, Cheltenham. The arrangement was very light and effective, foliage and greenhouse flowering plants being gracefully employed in conjunction with *Orchids*. Feathery sprays of

including *Polypodium glaucum crispum*, *Platy-cerium Veitchii*, *Gleichenia longipinnata*, *Nephrolepis Scholzei*, and *Cibotum Scheidii*. A miscellaneous collection of *Cacti* occupied the front of the exhibit.

From Mr. S. SMITH, Enfield, came a unique display of *Cacti* and miniature planted gardens for room and table decoration. There were some very fine specimens of *Mamillaria viridis*, *M. Walleni*, *Cephalocereus senilis*, and *C. polycephalus*, *Cereus formosus monstrosa*, *Aloe vera*, *Cyanotis somalica*, and *Echeveria rosea*.

Zonal *Pelargoniums* were shown by Mr. R. J. CASE, Staplegrave Nurseries, Taunton, including *Chavarrri Hermanos*, semi-double scarlet; *Champ de Neige*, white; *Pasteur*, rose; *Staple-grove Wonder*, rose salmon; and *Mars*, crimson.

#### Joint Dahlia Committee.

Present: Messrs. H. B. May (in the chair), J. Green, J. Cheal, H. J. Jones, D. B. Crane, A. Turner, J. B. Riding.

The following varieties were selected for trial at the R.H.S. Gardens, Wisley.

*Lady Hall*.—This is a deep rose-pink Paeony-flowered variety of medium size.

*Mrs. Barris*.—A miniature Paeony-flowered variety, of pale pink colouring, with white veins; the flowers, however, seemed to be somewhat pendulous.

*Hector*.—A showy miniature Paeony-flowered variety; scarlet shaded with rose. These three varieties were shown by Messrs. J CHEAL AND SONS, Crawley.

*F. G. Bird*.—A scarlet single variety, some what after the Coltness Gem style, but of better shape. Shown by Mr. W. TRESEDER, Cardiff.

#### Fruit and Vegetable Committee.

*Present*: Messrs. J. Cheal (in the chair), J. C. Allgrove, W. H. Divers, W. Bates, J. G. Weston, P. D. Tuckett, P. C. Veitch, S. B. Dicks, T. Pateman, A. H. Pearson, E. Neal, E. Beckett, G. Reynolds, W. Pope, W. F. Giles, T. Coomber, Owen Thomas, F. Jordan, G. F. Tinley, A. C. Smith, G. Bunyard, H. S. Rivers, A. Bullock, A. W. Metcalfe, H. Prince, J. Wilson, E. Harriss, G. P. Berry, W. Crump, J. Basham, F. G. Treseder, F. Barnes and G. Woodward.

Several seedling Apples were submitted for award, the most promising being a very large culinary variety named John Waterer, which

Wilks, and Cox's Orange Pippin. There were also fine trees of Coe's Golden Drop Plum and Bullaces The Langley and White Bullace. The baskets contained magnificent fruits of such sorts as the new S. T. Wright, Rev. W. Wilks, King of the Pippins, The Queen, Emperor Alexander, Blenheim Pippin, Peasgood's Nonesuch, Lord Derby, and James Grieve.

Messrs. STUART LOW AND Co., Enfield, exhibited a collection of fruit in baskets and epergnes, decorated with Adiantum Ferns and Pyracantha plants in berry. The Pears were exceptionally fine, especially the varieties Marguerite Marillat, Pitmaston Duchess, Doyenné du Comice, Conference, Beurré Hardy and Roosevelt. There were also splendid fruits of such Apples as Cox's Orange Pippin, Early Victoria, Rival and Lord Derby.

KING'S ACNE NURSERY, Hereford, showed pot fruit trees, and baskets of gathered fruits. The fruits on the trees carried very high colouring, the more notable varieties being Chas. Ross, James Grieve, Gascoyne's Scarlet Seedling, King

James Grieve; whilst of the Pears there were choice fruits of Pitmaston Duchess, Doyenné du Comice, Roosevelt, Conference, and Marguerite Marillat.

Messrs. J. CHEAL AND SONS, Crawley, put up a very attractive exhibit of hardy fruits, in which were seen most of the best sorts of Apples in cultivation. There were also several excellent varieties of Pears. We noticed fine dishes of Ellison's Orange, St. Everard, Herring's Pippin, The Houblon, and James Grieve amongst the Apples, and Beurré de Naghan, Roosevelt, and General Todleben amongst the Pears.

J. A. Nix, Esq., Tilgate, Crawley (gr. Mr. E. Neal), showed nearly one hundred dishes of Apples and Pears, with a central stand of Grapes. The last included fine bunches of Laüy Hastings, Appley Towers, Muscat Hamburgh, Black Hamburgh, Madresfield Court, Muscat of Alexandria, Mrs. Pince, and Gros Maroc. Those of Lady Hastings variety were exceptionally large in berry and bunch. The hardy fruit was of the largest exhibition size and most of the Apples splendidly coloured.

Messrs. WATERER, SONS AND CRISP, LTD., showed sixty dishes of Apples and a few of Pears. The fruits were exceptionally fresh and clear looking, the coloured varieties being splendidly tinted. Lord Derby, Chas. Ross (remarkably large), Golden Spire, Cox's Orange Pippin, Ellison's Orange, and Rev. W. Wilks are a selection of the best Apples.

THE STUDLEY COLLEGE, Warwickshire, showed sixty varieties of Apples and Pears. The fruits were attractively arranged in baskets with a stand in the centre and at either end, and included some of the most useful kinds in cultivation.

Messrs. LAXTON BROS., Bedford, put up a very attractive exhibit of hardy fruits, which were displayed in fancy baskets and epergnes decorated with coloured foliage and berries. Gascoyne's Scarlet Seedling, Worcester Pearmain, Chas. Ross, James Grieve, The Premier, Beauty of Bedford, Rival, and St. Everard, were all remarkable for high colouring, and Pott's Seedling, Newton Wonder, The Queen, Cellini Pippin, and Rev. W. Wilks for large size. The Pears included the varieties Pitmaston Duchess, Louise Bonne of Jersey, Princess, Doyenné du Comice and Conference.

Messrs. G. G. WHITELEGG AND Co., Orpington, showed 85 varieties of Apples and 20 sorts of Pears, with a few Medlars and Nuts. They also exhibited their late Gage Plum, Orpington Prolific, which is most prolific in cropping. The culinary Apples were exceptionally fine and there was an outstanding dish of the highly-coloured dessert variety Duchess's Favourite. The biggest Pears were Souvenir du Congres and Conference.

Messrs. T. RIVERS AND SON, Sawhridgeworth, showed an imposing collection of choice fruit trees in pots, of Apples, Pears, Plums, Cherries, and Peaches. All the trees were laden with fruits, and the various subjects contributed a pleasing range of colours from the red of Cherry Guigne de Winkler through scarlet and orange of such Apples as Cox's Orange Pippin and Gascoyne's Scarlet Seedling, with russet brown of Conference Pears to purple of President Plum. The central Cherry trees were outstandingly good, the branches bearing down with the numerous fruits.

THE BARNHAM NURSERIES, Sussex, showed a collection of Apples and Pears on tabling, the exhibit being raised on tiers in the centre. There were excellent fruits of Apples Lord Derby, Cox's Orange, Worcester Pearmain, Newton Wonder, Peasgood's Nonesuch, Bramley's Seedlings, James Grieve, and Devonshire. In all, the collection embraced 100 varieties of Apples and 12 sorts of Pears.

RUDGWICK FRUIT FARM, Rudgwick, Sussex, showed fruit in baskets and barrels as packed for market. The quality was excellent, outstanding varieties of Apples being Cox's Orange Pippin, Warner's King, Newton Wonder, Lane's Prince Albert, Worcester Pearmain, and Allington Pippin.

Mr. R. C. NOTCUTT, Woodbridge, Suffolk, exhibited Apples and Pears of remarkable quality both as regards size and colour. The handsome

FIG. 87.—FRUITING SPRAY OF PYRUS ELEIY.

SEE AWARDS BY THE FLORAL COMMITTEE (P. 211).

appears to be a cross between Warner's King and Lord Derby. This variety was shown by Messrs. WATERER, SONS AND CRISP, and the Committee expressed a desire to see fruits again later in the season. Messrs. LAXTON BROS., Bedford, submitted their variety Lord Lambourne in competition for the Bunyard Cup. This was the only variety submitted, but the award was not recommended as the Committee did not think the variety was of sufficiently outstanding merit. It has the general appearance of Cox's Orange Pippin, but is not so good in quality.

The Committee unanimously requested the Chairman to inform the Council that it was undesirable to meet on the occasions of these special shows, as many of the members were engaged in judging and could take no part in the deliberations, whilst there was seldom any business of importance that could not be dealt with at the subsequent fortnightly meeting.

#### GROUPS.

Mr. J. C. ALLGROVE, Middle Green, Langley, Slough, exhibited a collection of Apple trees in pots, with choice gathered fruits in baskets. The biggest tree was of the variety Ontario, and it was laden with fruits. Others carrying heavy crops were Charles Ross, Allington Pippin, Bramley's Seedling, Bismarck, Rival, Rev. W.

of Tompkin's County, Emperor Alexander and Peasgood's Nonesuch.

Mr. WILL TAYLER, Godalming, showed Apple Pantia Ralli, a seedling dessert variety, like Ellison's Orange in shape, and suggesting James Grieve in the parentage.

Messrs. G. BUNYARD, LTD., Maidstone, contributed a distinct exhibit in a trellis furnished with vines in bearing, and pleasingly grouped about with pot Fig trees. The vines carried numerous bunches of ripe Grapes and included the two excellent varieties Diamant Tranbe and Frontignan. This firm had also a striking exhibit of hardy fruits, principally Apples and Pears; a number of Cobnuts and Filberts added interest to the exhibit. The fruits were displayed in mahogany-coloured baskets of attractive design, and some of the baskets were hung from stands, making a pleasing change to the usual style of showing these fruits. The Apples were splendid, outstanding varieties, being Jubilee, Thorle, Cutler Grieve, Lady Sudeley, Ben's Red (exceptionally fine), Belle de Boskoop, and Adams's Pearmain.

Messrs. DANIEL BROS., Norwich, showed trained fruit trees and fruits of Apples and Pears. Of the Apples, the principal varieties were Cox's Pomona, Rev. W. Wilks, Ellison's Orange, Chas. Ross, Bramley's Seedling, and

Apple Guelph was especially prominent and the dish of Gascoyne's Scarlet Seedling was the best of its kind in the show. Others of special merit were New Hawthornden, Vicar of Winkfield, King Harry (very large), Cutler Grieve, and Cox's Pomona. The Pears were of the same high standard of merit, Roosevelt, Beurré Hardy, and Conference being three of the best dishes.

Mr. H. M. JONES, Letchworth, Hertfordshire, showed a handsome, coloured form of James Grieve Apple named Redcote Grieve.

E. A. WATTS, Esq., Copford Lodge, Colchester, showed a small collection of fruits including Apples, Plums, Pears, Figs, and nuts.

W. H. THICKETT, Esq., Bradley, near Grimby (gr. Mr. J. Irving), showed two dozen bunches of Grapes, of the varieties Cooner's Black, Black Alicante, Muscat of Alexandria, Mrs. Pince, Cannon Hall and Black Hamburg. They were all of commendable quality.

Mr. E. J. PARSONS, Worcester, showed Apples, Pears and Cherries against a pleasing background formed of sprays of the Darnmouth Crab and Shropshire Prune.

#### GROUPS OF VEGETABLES.

Messrs. SUTTON AND SONS put up one of the largest exhibits of vegetables we have ever seen at an exhibition. The display was made very attractive by the skilful disposition of the various coloured subjects, and the whole plan was worked out to present an exhibit of great interest. Almost every vegetable in season, and a great many out of season, were included in this remarkable collection, whilst the quality of the various dishes was exceptionally good, being an object lesson in high cultivation, as well as in clever exhibiting. The varieties represented the specialities of the firm, as well as the finest of the standard sorts. Of the various kinds included special mention may be made of Leeks, Celery, Onions, Carrots, Beets, Cauliflowers, Potatos, Tomatos, and Peas. Not the least pleasing feature of this imposing exhibit were numerous very decorative plants of Casicums in pots, with fruits of various colours, these being distributed throughout the collection.

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr., Mr. E. Beckett), also contributed a collection of vegetables. Although the group was not so large as that of Messrs. Sutton and Sons, it was pre-eminent for its fine quality, as every dish was almost as perfect as could be wished. It is to be regretted that Mr. Beckett was unable to obtain the whole of the space he needed, as he would doubtless have made a record display, even for Aldenham produce. In this case also, the staging and arrangement generally were all that could be desired, whilst from an educational point of view in growing and showing high-class vegetables the display was outstanding. There were very few vegetables that were not included, and in most cases the best types and varieties were represented.

Messrs. H. CHAPMAN, LTD., Rye, exhibited Casicums and Tomatos, representing many new and desirable varieties of both kinds. He also showed a stringless Bean.

#### COMPETITIVE FRUIT CLASSES.

##### FRUITS GROWN UNDER GLASS

The most important class in this section was that for a collection of nine dishes representing at least six kinds, but not more than one Pineapple, one Melon, one white or one black Grape. There were two exhibits and the better was shown by LORD HILLINGDON, Wilderness, Sevenoaks (gr. Mr. J. Shelton), with excellent dishes of Triomphe de Vienne and Marguerite Marillat Pears, Rival and Cox's Orange Pir in Apples, Sea Eagle Peaches, Pineapple Nectarines, White Marseilles Figs and Grapes Muscat of Alexandria and Madresfield Court. Mr. PATEMAN, gardener to Sir Charles Nall-Cain, The Node, Welwyn, was a good second, but his Grapes were smaller bunches, although of nice finish and evenly matched. He also showed fine fruits of Ellison's Orange Apple, Pineapple Nectarines and splendid Dovenné Boussoch Pears.

In the smaller class for six dishes there were three exhibits, and much the best collection was shown by G. MILLER, Esq., Radlett (gr. Mr. J. Kidd), who had a magnificent dish of Marguerite Marillat Pears, good Appley Towers

Grapes, Countess Melon, Ribston Pippin and Cox's Orange Pippin Apples; 2nd, F. A. HORNE, Esq., Colley Manor, Reigate (gr. Mr. E. Coleman); 3rd, Mrs. O. BARWELL, Barkfold House, Billingshurst (gr. Mr. W. Mould).

#### GRAPES.

LORD HILLINGDON had remarkable success in these classes, winning no fewer than six first prizes.

The principal class for Grapes was for six distinct varieties, two bunches of each sort, of which two at least must be white Grapes. Two competed and the first prize was awarded to Mr. G. MILLER, whose bunches were the largest. Those of Appley Towers and Mrs. Pince were of large size, but the latter required a little more time for perfect finish. Those of Alnwick Seedling were remarkably good, and there were splendid bunches of Lady Hutt. The berries of Prince of Wales were sloe-black and finely finished generally. The berries of Muscat of Alexandria were of a nice amber colour, the bunches long and narrow; 2nd, LORD HILLINGDON, with bunches on the small side but of excellent quality, especially Muscat of Alexandria, Black Hamburg, Muscat Hamburg and Mrs. Pince.

The first prize for three varieties was awarded to Sir CHARLES NALL-CAIN for the varieties Mrs. Pearson, Madresfield Court and Muscat of Alexandria, the bunches being of good exhibition quality.

Four competed in the class for Black Hamburg variety, and LORD HILLINGDON won the first prize easily with two heavy shapely bunches; the berries were not large, but finely finished. G. MAYER, Esq., Wistlers Wood, Woldingham, Surrey (gr. Mr. W. Sayer) was second, but the berries were not so plump or so black as Lord Hillingdon's, although of large size; 3rd, Mrs. ARTHUR WILSON, Tanby Croft, Hull (gr. Mr. W. J. Earl).

LORD HILLINGDON also excelled in the class for two bunches of Mrs. Pince variety, in which Mr. MAYER, the only other competitor, was second; the first prize bunches were much superior.

The variety Black Alicante was also shown best by LORD HILLINGDON, with Mr. MILLER a close second. They both showed large bunches with well-finished berries. Three competed in this class. Mr. MAYER was placed first for Prince of Wales variety; 2nd, Capt. R. B. BRASSEY, Cannesbrooke Hall, Northampton (gr. Mr. J. G. Quinn).

LORD HILLINGDON met with further success in the three remaining classes for Grapes, viz., for Any Other Black Grape with Muscat Hamburg, in which Mr. MAYER was second with Lady Downe's Seedling; for Muscat of Alexandria, again followed by Mr. MAYER; and for Any Other White Grape with Cannon Hall Muscat; 2nd, Mr. MILLER, with two exceptionally fine bunches of Lady Hutt.

#### COLLECTION OF HARDY FRUITS.

This class called for a collection of 30 dishes, distinct, of hardy fruits, arranged in a space of 10 feet by 3 feet. Not more than 12 varieties of Apples nor more than 8 varieties of Pears were permitted, and because of this stipulation the finest collection was disqualified, for Mr. Pateman showed nine sorts of Pears in the exhibit from Sir Charles Nall-Cain's gardens. The first prize was awarded to V. C. VICKARS, Esq., Newells Park, Royston (gr. Mr. W. Watkins). This representative collection included excellent Plums of the varieties President, Jefferson and Coe's Golden Drop. Pineapple Nectarines were good, as were Apples Emperor Alexandra, King of the Pippins, The Queen and Chas. Ross; Pears Beurré Hardy, Dovenné du Comice, Pitmaston Duchess and Emile d'Heyst. There were also Brown Turkey Figs, Mulberries, Peaches, and Red Currants; 2nd, Major-General Sir CHAS. F. HADDEN, K.C.B., Rossway, Berkhamsted (gr. Mr. O. Hayles), whose Plums Magnum Bonum, Coe's Golden Drop and Reine Claude de Bavay were especially good.

#### DISTRICT COUNTY CLASSES.

In the class open to Kent growers, Mr. J. H. LOUDEN (gardener, Mr. G. Bond), Wye, Kent, gained first prize with six dishes of

Apples of good colour and size, and Capt. M. DRUMMOND (gardener, Mr. E. Smith), Cadland Park, Southampton, was first in a similar class open to Surrey, Sussex and Hampshire growers, and first for six dishes of Pears with excellent fruits of Marguerite Marillat, Triomphe de Vienne, and Pitmaston Duchess.

For six dishes of Apples, open to growers of Wilts, Dorset, Somerset, Cornwall, and Devon, Lady MARY MORRISON (gardener, Mr. H. Mills), Tisbury, Wilts, led with good specimens of Peasgood's Nonesuch, Rev. W. Wilks, and Cox's Orange Pippin, and the same exhibitor also carried off first prize with six excellent dishes of Pears. Mrs. AUSTIN (gardener, Mr. E. G. Loughurst), Totteridge, scored in the class for Apples open to growers in Gloucester, Oxford, Bucks, Beds, Herts and Middlesex, and C. V. SALE, Esq. (gardener, Mr. R. Learnmouth), Aston Rowant, was placed first with six dishes of Pears.

Mr. S. H. GOODWIN, Ramsey, St. Mary's, Huntingdon, was first with highly coloured Apples in the class open to growers in Essex, Suffolk, Norfolk, Cambridge, Hunts and Rutland, and Capt. R. B. BRASSEY (gardener, Mr. J. G. Quinn), Cottesbrooke Hall, Northampton, was first for both Apples and Pears in the class open to growers in Lincoln, Northampton, Warwick, Leicester, Notts, Derby, Staffs, Shropshire and Cheshire. Of the two exhibits of Apples open to growers in Worcester, Hereford, Monmouth and Wales, the EARL OF COVENTRY (gardener, Mr. W. H. Wilson), Crombe Court, Worcester, was first, and Mrs. A. WILSON (gardener, Mr. W. J. Earl), Hull, won first prize for Apples and Pears open to growers in the six northern counties and the Isle of Man.

The EARL OF BESSBOROUGH (gardener, Mr. T. E. Tomalin), Pittown, Co. Kilkenny, was the only exhibitor in the class open to growers in Ireland, and was awarded first prizes for Apples and Pears.

#### SPECIAL AMATEURS' CLASS FOR APPLES.

In the class open to amateurs possessing not more than 25 Apple trees, for the best dish of one dessert variety, there were six entries. Mr. A. R. CARLISLE, The Maltings, Henlow, Biggleswade, won the first prize with an excellent dish of Cox's Orange Pippin, and the same competitor was also first in a similar class for a cooking Apple, with fine specimens of Peasgood's Nonesuch.

#### SINGLE DISH CLASSES.

The following are the first prize winners in the single dish classes for Apples with the number of competitors:—

DESSERT APPLES.—*Adam's Pearmain*, six entries, Mr. J. A. STIDSTON, with highly coloured fruits; *Allington Pippin*, 10, Mr. A. R. CARLISLE; *American Mother*, 8, Mr. J. A. LOUDON; *Ellison's Orange*, 5, Mr. J. A. STIDSTON, an excellent dish; *Blenheim Orange*, 14, Mr. F. M. VOKES, Southampton, well coloured fruits of good dessert size; *Charles Ross*, 13, Mr. A. H. PULLIN, Wallington, fine, well-coloured fruits; *Claygate Pearmain*, 3, Mr. W. B. WRIGHT, Wallington; *Cox's Orange Pippin*, 14, Mr. F. C. STROP (gardener Mr. A. Carpenter), West Hall, Byfleet, a very excellent dish; *Egremont Russett*, 3, Mr. J. H. LOUDON, Wye, for fruits of beautiful colour; *James Grieve*, 13, Mr. J. A. STIDSTON, highly-coloured fruits; *Lord Hindlip*, 6, Capt. M. DRUMMOND; *Margil*, 4, Mr. F. C. STROP; *Ribston Pippin*, 13, Mr. A. H. PULLIN, fruits of exceptional quality; *Rival*, 8, Mr. J. H. LOUDON, excellent fruits; *St. Edmund's Pippin*, 3, Mr. J. A. STIDSTON; *St. Everard*, 4, Mr. J. A. STIDSTON, richly coloured; *King's Acre Pippin*, 3, Sir H. WEBB (agent Mr. F. Demys, Holme Lacey, Hereford); *Sturmer Pippin*, 4, Mr. W. B. WRIGHT.

For eight fruits of an early variety not named above, Lady MARY MORRISON, Tisbury, was awarded the first prize for choice, even fruits of Coronation, while for a late variety Mr. J. A. STIDSTON was first with a good dish of Winter Ribston or Orleans Reinette.

COOKING APPLES.—*Bismarck*, 7, Mr. F. C. STROP, with excellent fruits of high colour; *Blenheim Orange* (large fruits), 2, Mr. F. C. STROP; *Bramley's Seedling*, 4, Rev. C. G. KEAN; *Dunelm's Seedling*, 6, The EARL OF

BESSBOROUGH; *Ecklinville Seedling*, 5, Sir HENRY WEBB, an excellent dish; *Edward VII.*, 4, Mr. F. C. STOOP; *Golden Noble*, 5, Mr. F. C. STOOP, a grand dish; *Grenadier*, 5, the EARL OF BESSBOROUGH; *Lane's Prince Albert*, 10 the EARL OF BESSBOROUGH, excellent fruits of large size; *Lord Derby*, 9, Capt. M. DRUMMOND; *Crawley Beauty*, 3, Mr. F. C. STOOP, a fine dish; *Newton Wonder*, 8, Mr. J. H. LONDON, very large fruits; *Peasgood's Nonesuch*, 4, Sir H. WEBB, beautiful specimens; *Golden Spire*, 5, Capt. M. DRUMMOND; *Annie Elizabeth*, Mr. F. C. STOOP; *Rev. W. Wilks*, 6, the EARL OF BESSBOROUGH; *Stirling Castle*, 4, Sir H. WEBB; *Warner's King*, 8, Mr. J. H. LONDON; *The Queen*, 5, Mr. J. H. LONDON.

In the class for eight fruits of any variety not named above, there were nine competitors, and the first prize was awarded to Mr. F. J. LONG, Belmont, Surrey, for a good dish of Emperor Alexander.

For the best flavoured Apple not mentioned in the single dish classes, Mr. J. A. STIDSON was first, out of eight competitors, with the variety -Gravenstein.

#### DESSERT PEARS.

DESSERT PEARS.—*Burré d'Anjou*, 2, Rev. C. G. KEAN; *Burré Bosc*, 3, Rev. C. G. KEAN, with large, shapely fruits; *Burré Hardy*, 9, Capt. M. DRUMMOND, an excellent dish; *Burré Superfin*, 7, Mr. J. H. LONDON, good fruits; *Conference*, 7, Rev. C. G. KEAN (gardener Mr. A. Basile), Woburn Park, Weybridge, an excellent dish; *Doyenné du Comice*, 6, Capt. M. DRUMMOND, very fine, well coloured fruits. *Durondeau*, 6, Rev. C. G. KEAN; *Easter Burré*, 2, Rev. C. G. KEAN; *Emile D'Heyst*, 5, Capt. M. DRUMMOND; *Fondante d'Automne*, 5, Mr. F. C. STOOP, fine fruits; *Glou Morceau*, 3, Rev. C. G. KEAN, an excellent dish; *Josephine de Malines*, 6, Mrs. HELSHAM-JONES, Newbury; *Louise Bonne de Jersey*, 9, Rev. C. G. KEAN, fine fruits; *Marie Louise*, 7, Rev. C. G. KEAN; *Thompson*, 3, Mrs. HELSHAM-JONES; *Winter Nelis*, 3, Mrs. HELSHAM-JONES; *Pitmaston Duchess*, 7, Capt. M. DRUMMOND, a very good dish; *Margaret Marillat*, 6, Rev. C. G. KEAN, highly coloured and of fine size.

In the class for eight fruits of an early variety not named above, Capt. M. DRUMMOND, was first, out of nine entries, with a good dish of Doyenné Bussoch, and for a late variety, the same competitor was first with excellent fruits of Roosevelt.

Mr. A. P. BRANDT (gardener, Mr. J. W. Banks), Bletchingley Castle, Surrey, was first, with Comte de Lamy, in the class for the best-flavoured dessert Pear not enumerated in the single dish classes.

Our Report of other Fruit Classes and of the Competitive Vegetable Classes is held over till the next issue.

#### List of Cup and Medal Awards.

The following is a list of the awards made by the Council of the Royal Horticultural Society:—

##### CHALLENGE CUPS.

*Coronation Cup*.—To Messrs. G. BUNYARD AND Co., LTD., Maidstone, for the most meritorious group in the show.

*Gordon-Lennox Cup*.—To J. A. NIX, Esq. (gr. Mr. E. Neal), Tilgate, for the most meritorious exhibit of fruit by an amateur.

*Sutton Cup*.—To T. H. JONES, Esq., for the best collection of vegetables.

*R.H.S. Cup for Vegetables*.—To W. H. MYERS, Esq. (gr. Mr. Elland), Swanmore, for the competitor who secured the greatest number of first prize points.

*George Monro Memorial Cup*.—To G. MILLER, Esq., for the best exhibit of Grapes by an amateur.

*National Chrysanthemum Society's Piece of Plate*.—To Mr. H. J. JONES, Lewisham, for the best exhibit of Chrysanthemums.

*Wigan Cup*.—To Messrs. ALEX. DICKSON AND Sons, Newtownards, for the best exhibit of Roses.

*Large Silver Cup*.—To the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Elstree for a collection of trees and shrubs; to Messrs. ALLWOOD BROS.,

Haywards Heath, for Carnations; to Messrs. ALEX. DICKSON AND Sons, Newtownards, for Roses; to J. A. NIX, Esq. (gr. Mr. E. Neal), Tilgate, for fruits; to KING'S ACRE NURSERIES, Hereford, for fruit trees in pots and picked fruit.

*Small Silver Cup*.—To Messrs. J. PIPER AND SON, Bayswater, for trees and shrubs; to Mr. L. R. RUSSELL, Richmond, for Clematis, etc., and also one for stove plants; to Messrs. DOBBIE AND Co., Edinburgh, for Dahlias, etc.; to Mr. G. PRINCE, Oxford, for Roses; to Messrs. SANDERS, St. Albans, for Orchids; to Messrs. STUART LOW AND Co., Enfield, for Orchids; to Messrs. BLACKMORE AND LANGDON, Tiverton-on-Avon, for Begonias; to Messrs. LAXTON BROS., Bedford, for fruits; to the RUDWICK FRUIT SCHOOL, for fruits; and to Messrs. T. RIVERS AND SON, Sawbridgeworth, for fruit trees in pots.

#### MEDALS.

*Gold*.—To Messrs. G. BUNYARD AND Co., Maidstone—with congratulations—for fruit trees and fruits; to Messrs. SUTTON AND Sons, Reading, for vegetables, also with congratulations; to Mr. J. C. ALLGROVE, Slough, for fruit trees in pots; to the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree, for vegetables; to Messrs. DOBBIE AND Co., Edinburgh, for Potatoes; to Mr. H. J. JONES, Lewisham, for Chrysanthemums; to Messrs. CHARLESWORTH AND Co., Haywards Heath, for Orchids; to Messrs. JAS. CYPHER AND SON, Cheltenham, for Orchids and foliage plants; to Mr. R. C. NOTCUTT, Ipswich, for fruits; to Mr. C. ENGELMANN, Saffron Walden, for Carnations; and to Mr. ELISHA J. HICKS, Twyford, for Roses.

*Silver-Gilt Lindley Medal*.—To Messrs. HILLIER AND Sons, Winchester, for trees and shrubs.

*Silver-Gilt Hogg Medal*.—To Messrs. J. CHEAL AND Sons, Crawley, for fruits; to Messrs. WATERER, Sons and CRISP, Twyford, for fruits; to Messrs. G. G. WHITELEGG AND Co., Chislehurst, for fruits; and to STUDLEY COLLEGE, for fruits.

*Silver-Gilt Flora Medal*.—To Mr. E. BALLARD, Colwall, for Michaelmas Daisies; to Mr. AMOS PERRY, for hardy autumn flowers; to Mr. J. MATTOCK, Headington, for Roses; to Messrs. R. WALLACE AND Co., Tunbridge Wells, for trees and shrubs; to Messrs. WATERER, Sons and CRISP, for trees and shrubs; and to Mr. CLARENCE ELLIOTT, Stevenage, for Alpines.

*Silver-Gilt Banksian Medal*.—To Messrs. CARTER PAGE AND Co., London Wall, for Dahlias; to Mr. J. B. RIDING, Chingford, for Dahlias; to Messrs. B. R. CANT AND Sons, Colchester, for Roses; to Messrs. FRANK CANT AND Co., Colchester, for Roses; to Mr. J. DIXON, Putney, for small rock garden; to Messrs. J. CHEAL AND Sons, for Topiary; to Messrs. WM. CUTBUSH AND SON, Highgate, for Topiary; to SYDNEY MORRIS, Esq., Earham Hall, Norwich, for trees and shrubs; to Mr. W. YANDELL, Maidenhead, for Chrysanthemums; to Mr. H. J. JONES, Lewisham, for Michaelmas Daisies; to Mr. W. WELLS, Junr., Merstham, for hardy flowers; to Messrs. WM. CUTBUSH AND SON, Highgate, for hardy flowers.

*Silver Lindley Medal*.—To Sir JEREMIAH COLMAN, Bl. (gr. Mr. J. Collier), Gattin Park, Reigate, for Orchids; to the Hon. VICARY GIBBS, Elstree, for shrubs of botanical interest; to Messrs. J. MACDONALD AND SON, Harpenden, for a grass garden.

*Silver Hogg Medal*.—To Mr. E. J. PARSONS, Worcester, for fruits; to Messrs. S. LOW AND Co., Enfield, for fruits; and to Messrs. DANIELS BROS., Norwich, for fruits and fruit trees.

*Silver Flora Medal*.—To Messrs. MAXWELL AND BEALE, Broadstone, for Alpines; to Mr. F. G. WOOD, Ashstead, for Alpines; to Mr. G. REUTHE, Keston, for shrubs; to Messrs. G. JACKMAN AND SON, Woking, for Clematis, etc.; to Mr. K. LUXFORD, Harlow, for Chrysanthemums; to Messrs. W. WELLS AND Co., Merstham, for Chrysanthemums; to Mrs. C. LEMON, Carlton Hill, London, for Liliun aratum; to Messrs. S. LOW AND Co., Enfield, for Carnations; to Messrs. W. TRESEDER, LTD., Cardiff, for Dahlias; to Mr. J. T. WEST, Brentwood, for Dahlias; to Messrs. DOBBIE AND Co., Edinburgh, for Roses; to the

Rev. J. H. PEMBERTON, Havering, for Roses; to Messrs. FLORY AND BLACK, Slough, for Orchids; to Messrs. MANSELL AND HATCHER, Leeds, for Orchids; to Mr. H. N. ELLISON, West Bromwich, for Cacti and Ferns; to Mr. S. SMITH, Enfield, for Cacti; to Messrs. HARKNESS AND SON, Bedale, for hardy flowers; to Messrs. ISAAC HOUSE AND SON, Bristol, for Scabious; to Mr. G. REUTHE, Keston, for hardy flowers; to Messrs. RICH AND Co., Bath, for hardy flowers; and to Mr. E. SCAPLEHORN, Haywards Heath, for hardy flowers.

*Silver Knightian Medal*.—To Messrs. H. CHAPMAN, LTD., Rye, for vegetables.

*Silver Banksian Medal*.—To Mr. CHAS. TURNER, Slough, for Dahlias; to Messrs. J. CHEAL AND Sons, Crawley, for Dahlias; to Messrs. D. W. PRIOR AND SON, Colchester, for Roses; to Messrs. BOWELL AND SKARRATT, Cheltenham, for Alpines and hardy flowers; to Messrs. R. J. BISTON AND SON, Bexley Heath, for Begonias; to Messrs. R. AND G. CUTHBERT, Southgate, for Streptocarpus; to Messrs. BAKERS, Codsall, Wolverhampton, for hardy flowers; and to Messrs. B. LADHAMS, LTD., Shirley, Southampton, for hardy Lobelias.

*Bronze Hogg Medal*.—To Mr. H. M. JONES, Letchworth, for Apples; to Mr. E. A. WATTS, Colchester, for fruits.

*Bronze Flora Medal*.—To Mr. J. J. KETTLE, Corfe Mullen, for Violets; to PRESTON HALL NURSERIES, Aylesford, for Carnations; to Messrs. JARMAN AND Co., Chard, for Carnations; to CHALK HILL NURSERIES, Reading, for Pelargoniums; to Messrs. G. GIBSON AND Co., Bedale, for Gladioli; etc.; to Mr. T. CARLILE, Twyford, for hardy flowers; and to Messrs. JOHN FORBES, LTD., Hawick, for Pentstemons.

*Addenda*.—Messrs. MANSELL AND HATCHER, Rawdon, Leeds, had a very fine group of Orchids, in which were a score or so of varieties of Cattleya Iris of their raising, and varying much in the fine colour of the flowers; they also showed a good selection of other hybrid Cattleyas and Laelio-Cattleyas and showy hybrid Odontoglossums. Cypripediums were well represented also, with a number of fine examples of the old favourite Odontoglossum grande and other Orchid species.

#### NATIONAL CHRYSANTHEMUM.

The first meeting of the Floral Committee for 1922-23 was held in the R.H.S. Hall on Monday, September 18. Mr. W. B. Crane was elected chairman of the committee for the twenty-first time. Awards were made as follows:—

##### FIRST-CLASS CERTIFICATE.

*Cissbury White*.—An early-flowered white, incurved variety (I. b), free flowering and elegant, shown by Mr. S. AISE, Cissbury, Dunstable.

*Mrs. A. W. Thorpe*.—A buff terra cotta market variety, very attractive (II., 1 b) Shown by Mr. A. W. THORPE, Lichfield.

*Lichfield Early White*.—A useful white market variety (II., 1 b). Shown by Mr. A. W. THORPE.

OCTOBER 2.—The Floral Committee met on this date in the gallery of the Holland Park Rink. There was a capital attendance, but few novelties. The following awards were made:—

##### FIRST-CLASS CERTIFICATE.

*Mdme. E. David*.—An early-flowering, stiff-petalled variety (II., 1 b), of rosy magenta colour; very distinct. From Messrs. W. WELLS AND Co., Merstham.

##### FIRST-CLASS MARKET CERTIFICATE.

*Blanche de Poitou*.—This fine early-flowering white Japanese variety, previously awarded a First-Class Certificate, was now granted a Market Certificate. Shown by Messrs. W. WELLS AND Co.

##### COMMENDATION.

*September Gem*.—A pretty, golden-yellow single variety (V., 1 b), and a good spray flower. Shown by Messrs. W. WELLS AND Co.

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**The History of the Moss Rose.**—In *The Gardeners' Chronicle*, page 69, July 29th, Mr. Harman Payne states that from Gerard to Furber the evidence is purely on the negative side. I have an edition of Culpeper's *Complete Herbal*, in which the author states, on page 242: "What a pother have authors made with roses! What a racket have they kept! I shall add that red roses are under Jupiter, damask under Venus, white under the moon, and provence under the King of France." Culpeper lived in the middle of the 17th century, and evidently knew the Provence Rose. I do not know the number of my edition, and would suggest that if any reader has an original edition he may find therein further reference to the Provence Rose, or perhaps to the Moss Rose. I also have another book called *The Accomplished Housewife and Gentlewoman's Companion*, dated 1745; Printed by J. Newman, at The Bible and Sun, near the Chapter House in St. Paul's Churchyard. The Garden Calendar in this book states that the Musk and Monthly Roses are in flower in November. It appears that Monthly Roses have been grown many years in our English Gardens. *Mark Mills.*

**Tomatos with Hard Patches.**—Having noticed from time to time replies in your Answers to Correspondents column on the subject of Tomato fruits with hard, green patches at the base, my experience may be of interest to Tomato growers. Up till about ten years ago, I was bothered with this defect in Tomatos, and I always noticed there were more green patches after hot, dry weather, which suggested to me that it was caused by a hardening of the skin of the fruit, due to an excessively dry atmosphere. I therefore syringed the house and closed the ventilators for about two hours every fine afternoon, well wetting the fruits and plants all over with a fine spray. From that time I have never seen more than an odd fruit or two with hard, green patches where I had previously had 12 lb. or more at a single picking. I may add that I usually grow about a ton of Tomatos each year, and am not troubled with any disease whatever. *W. R. Catt, Hodnet Hall Gardens, Market Drayton.*

**Reversion in *Epipactis latifolia*.**—Quite recently I found a curiously malformed plant of the above, or as it is sometimes named, *Helleborine latifolia*. A few of the flowers at the top of the inflorescence only were normal. The lowest bract carried two flowers of unequal size in its axil. The most common malformation consisted of three small flowers within the original one in place of the axis or column. The dorsal one often remained on the peduncle and the dorsal sepal remained with it at various heights on the peduncle, the ovary in all cases of abnormal flowers being suppressed. In many cases there were two or three lips, the supernumerary ones being younger and fresher than the original. There were three processes resembling filaments, in a thin and petaloid condition, but convolute. In some cases these filaments bore brown knobs on the top like imperfect anthers. The secondary flowers had pedicels, and some of the latter carried a bracteole, also an innovation. The crenate lip, with its short, recurved point, on the few normal flowers, showed the plant to be the typical *Epipactis latifolia*. It was growing under the shade of Beech trees in a wood, its usual habitat, with nothing to suggest the cause of reversion. *J. F.*

***Dianthus Allwoodii*.**—Last season (1921) my *Dianthus Allwoodii* flowered so profusely all through the summer and right into late autumn that I then formed the opinion that they enjoyed a hot, dry time. Now I have had to considerably modify that opinion, for this season—a cool, moist one—the plants have been even better than last. I planted them out in March in some fairly good soil. They were in bloom in June, and have been so ever

since. Now, at the end of September, they have a miniature forest of stems, many of which are two feet high and carrying eight and ten buds and blooms each. There will evidently be plenty of bloom, so long as the weather remains open. All the attention they have had is removal of weeds and some hazel twigs placed among the stems to keep the blooms from the ground, and this assistance is, I think, better than stakes and ties. *R. B. Leech, Teddington.*

## Obituary.

**John Davis.**—We learn with regret of the death of Mr. John Davis, which occurred on the 26th ult. For over twenty years Mr. Davis was gardener to the late Lord Glenconner at Wilsford Manor, Salisbury. He was a clever gardener, and particularly well known among the gardening fraternity of Wiltshire. About a year ago his health broke down, but not seriously, hence the end came with unexpected suddenness. Mr. Davis was 55 years of age; he leaves a widow and grown-up family.

## TRADE NOTES.

Mr. C. T. Kew, the British Flower Shop, Nanking Road, Shanghai, will be glad to receive trade catalogues of nursery, horticultural, and florists' supplies.

THE adjourned Conference of the Chamber of Horticulture and its affiliated associations was held on Wednesday, September 27 last, under the chairmanship of the Controller of Horticulture, Mr. W. G. Lohjoit.

Those present were:—Messrs. G. W. Leak, W. H. Page, Geo. Shawyer, Geo. Monro, G. H. Barr (representing Chamber of Horticulture), Messrs. A. G. Daniels, A. T. Miller, E. C. Boughton, and W. F. Seabrook (Federation of British Growers), Messrs. C. J. L. Du Cann, E. Horton, and W. R. Oldham (Horticultural Trades' Association), Mr. A. W. White (British Florists' Federation), Mr. C. H. Shonlts (Lea Valley Growers' Association), Mr. F. W. Ladds (N.W. Kent Growers' Association), Mr. J. S. Brunton (Birkenhead Horticultural Trade Society), Mr. W. A. Binley (Royal Horticultural Society), Mr. C. H. Curtis (Non-Trading Societies), and the secretary, Mr. C. M. Matthews.

The minutes of the previous conference having been read and approved, the chairman asked the meeting to consider the report of the committee appointed by that conference. This report, copies of which had been previously posted to members, dealt with the terms of reference as passed by a majority vote at the first conference, and the committee's decision, not to attempt any propositions thereon, but suggesting the advisability of a round-table conference. Following discussion, it was unanimously agreed that the report be received and that the committee be discharged. It was ruled that the Terms of Reference were thus dispensed with, and would not apply to a new committee.

The conference then unanimously passed the following resolution:—

"That the whole question of organised horticulture be referred to a committee to report to an adjourned conference."

It was agreed that the membership of this committee be formed as to five of the Chamber of Horticulture (to include representatives of the affiliated commercial associations), three of the Federation of British Growers, and two of the Horticultural Trades' Association.

Mr. W. G. Lohjoit was unanimously requested to act as independent chairman to this committee, to which he agreed. The committee will, therefore, meet at the offices of the Ministry of Agriculture, Whitehall Place, on Friday, October 20.

## ANSWERS TO CORRESPONDENTS.

**WESTERN ORCHARDS.**—*Correction.*—We regret that an error crept into the article on "A View of Western Orchards," on page 192. In the third column of that page, line 10, the words "would not bear comparison" should read "would not fear comparison," which, of course, is an entirely different matter.

**NAMES OF PLANTS:** *M. H. E. A.*, *Berberis aristata*; *B.*, *Ligustrum chinense*; *C.*, *Viburnum lantana*; *D.*, *Cotoneaster frigida*; *E.*, *C. orientalis*; *F.*, *Colutea arborescens*; *Roses*, 1 and 2, we cannot undertake to name florists' flowers.—*T. G.*, *Datura Stramonium* (the Thorn Apple), a native.—*R. C.*, *Hibiscus syriacus* var. *Painted Lady*.—*W. A.*, *Lonicera involucrata*.—*J. M.*, *Myrtus Ugni*, a native of Chili.—*J. S. C.*, 1, *Abies nobilis*; 2, *Sequoia sempervirens*; 3, *Cupressus Lawsoniana*; 4, *Thuja plicata*; 5, *Tsuga canadensis*; 6, *Cornus Kousa*.—*F. E. W.*, *Artemisia lactiflora*.

**ONIONS DISEASED:** *P. E.* The Onions are affected with disease caused by the fungus *Botrytis cinerea*, Pers. In the early stages the fungus may be kept in check by spraying with a solution of potassium sulphide (1 oz. of potassium sulphide in 3 gallons of water). As this does not kill the fungus already in the tissues it cannot be regarded as a cure, but it is a useful preventive measure, and unless it is resorted to the disease spreads rapidly, especially during damp, warm weather. Badly infected bulbs should be destroyed. The soil will be infected, therefore Onions should not be planted on the same ground for at least three years.

**PLANTING FRUIT TREES:** *Amateur.* We advise you to plant two-year-old trees in preference to maidens and to plant them from fifteen to eighteen feet apart each way.

**TO PRESERVE CUCUMBERS:** *T. A.* Cucumbers could be treated like other vegetables, for keeping, by sterilising. Clean the fruit and plunge them into boiling water to which has been added a small quantity of salt and a little soda. After about five minutes' immersion remove and plunge them in cold water. The skins, when cold, may then be removed. This treatment also keeps the flesh a good colour. Place the Cucumbers in sterilising jars, closely packed, and fill with water. After placing the caps of the bottles in position and making sure they are secure, place the latter in the sterilising vessel, and warm the water gradually to 190° to 212° Fahr., according to the size of the fruit, and maintain this degree of warmth from 2 hours to 2½ hours, again according to size. Thereafter remove the jars to a draught-proof place to cool. After two or three days, carefully test the caps of the bottles to make sure that they are perfectly airtight and secure.

**WEEDS IN POND:** *J. V.* Ascertain the amount of water contained in the pond by multiplying together the average length, breadth, and depth, and multiplying the result (in feet) by 6½, the approximate number of gallons in a cubic foot. This will give you roughly the number of gallons of water in the pond, and one pound of copper sulphate should be used to every 100,000 gallons. Break the copper sulphate into small portions, and tie it in a bag of loosely woven material, such as coarse sacking. Then tie the bag behind a boat and draw it along in the water in parallel lines about ten to twenty feet apart. The copper sulphate will not injure live stock if care is taken not to allow the bag to remain stationary in one part of the pond, but it would be as well not to allow animals to drink the water until twenty-four hours after the operation.

**Communications Received.**—*A. D. C.*—*E. T. & S.*—*A. H.*—*F. G.*—*W. W.*—*E. F.*—*G. M.*—*F. B.*—*H. G.*—*W. G.*—*A. P.*—*H. E. Z.*—*J. McC.*—*A. J. P.*—*G. R.*—*E. M. B.*—*H. P.*—*W. K.*—*A. H.*—*G. F.*—*C. N.*—*H. G. F.*—*J. M.*—*Amateur*—*H. C.*—*D. R. W.*

MARKETS.

COVENT GARDEN, Tuesday, October 3, 1922.

Cut Flowers, etc.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Astatum, Asparagus, Carnations, Croton, Fern, Gardenias, Gladioli, Heather, Lapageria, Lily of the Valley, Marguerites, Michaelmas Daisies, Orchids, Pelargonium, Physalis, Richardias, Roses, Scabiosa, Statice, Sweet Sultan, and Violets.

REMARKS.—Similar conditions of trade prevail as last week. Asters, Gladioli, and many other outdoor flowers begin to show signs of autumn; many subjects have been damaged by heavy rains and cold

weather, and are practically unaleable. Chrysanthemums are much in evidence; there is an ample supply of coloured blooms. White Chrysanthemums are a better trade, and their prices are firmer, especially for disbudded blooms, the supply being slightly reduced. Many of the earlier varieties are getting over, but some fine exhibition blooms are now on sale. Stephanotis and Lapageria are almost finished for the season. A few Tuberoses and White Bouvardia are the newest arrivals. Other choice flowers include Lily-of-the-Valley, Gardenias and a few Eucharis. Orchids are still a very uncertain quantity; Cyripediums are making their first appearance for the season. Lilies show no change in trade, and supplies of these flowers are sufficient for present requirements. Single Violets are more plentiful and in better condition. Trade appears to be more brisk in hardy foliage, such as Oak, Maple, Prunus and Physalis.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Lemons, Melons, Nuts, Oranges, Peaches, Pears, and Plums.

REMARKS.—A rather better tone has prevailed during the past week, and in some things values have been inclined to harden. Choice fruits, such as Grapes, Peaches, and Figs, have sold fairly well, after a rather slack period. English Apples are in slightly better demand; large cookers are inquired for, and Worcester Pearmain if of good colour, slightly higher in price. Apples from Nova Scotia have, so far, been somewhat lacking in colour and have, in consequence, not sold freely. Plums are getting over and the few fruits of

President and Magaun Bonam arriving are realising satisfactory prices. Prunes and Damsons are, however, comparatively cheap. The Cucumber trade is better, supplies showing a slight expansion. Tomatoes are a steady trade, and their values are being maintained, as the quantities of Duteb Tomatoes are lighter and there are comparatively few Tomatoes arriving from Jersey. Green vegetables are abundant and their prices very low. Ample stocks of Potatoes are on offer and the prices are unchanged.

GARDENING APPOINTMENTS.

Mr. D. Wilmshurst, previously for eight years Gardener to M. F. YOAKE, Esq., Hillbrook Place, Iver Heath, Bucks, as Gardener to D. A. BEVAN, Esq., J.P., Burloes, Royston, Hertfordshire. (Thanks for 2s. for R.G.O.F. Box.—Eps.)

Mr. E. Belton, for the past two years General Foreman at Hole Park, Rolvenden, Kent, and previously for 18 months Gardener to J. H. MACKAY, Esq., East Ridge, Totteridge, Hertfordshire, as Gardener to H. SAVES, Esq., Beacon Hall, Benenden, Kent. (Thanks for 2s. for R.G.O.F. Box.—Eps.)

Mr. E. C. Pullin, for nearly four years Gardener to Mrs. TARBINE, Coedardhydyglyo Park, nr. Cardiff, as Gardener to SIDNEY HILL, Esq., Laugford House, near Bristol.

Mr. Robert A. Hatton, who has been laying out the grounds at Coombe Green, Kingston Hill, for Major LAN BULLOCK, has been appointed Gardener-Bailiff to the same gentleman at Drury Laas Farm, Red Marley, Gloucestershire.

Mr. Geo. Gilbert, for the past thirteen years and eight months Gardener to Mrs. HOLBECK, The Grange, Farnborough, nr. Basingstoke, Warwickshire, as Gardener to RONALD HOLECK Esq., at the same place. (Thanks for 1/- for R.G.O.F. Box.—Eps.)

Mr. R. C. Anderson, as Gardener to Lady TATE, at Bodrbyddan, Rhuddla, Flintshire.

Mr. Howard Grace, during the past month General Foreman at Belton Gardens, Grantham, and previously at Lambton Castle, Shipley Hall and Elvaston Castle, as Head Gardener to SIR EDWARD MOUNTAIN, Bart., Norbury Park, Dorking. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eps.)

Mr. L. W. Apps, for the past eight years and nine months Gardener to the late SIR EDWARD and LADY LOVER, of Leonardlee, Horsham, Sussex, as Gardener to JAMES GROVES, Esq., Heathfield Park, Sussex. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eps.)

HORTICULTURAL DIRECTORY AND YEAR BOOK

The HORTICULTURAL DIRECTORY is to be republished for 1923, and revision forms have been sent to all gardeners included in the lists. Will any Head Gardener who has NOT received a form kindly fill up the form below, and return it to us in an open envelope (postage a halfpenny)? In this way a wrong or out-of-date entry which might otherwise remain in the new edition can be corrected.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 50.9.

ACTUAL TEMPERATURE:—  
Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, October 11, 10 a.m. Bar. 30.1; temp. 66°. Weather—Sunny.

### Celery growing in the United States.

During recent years the cultivation of Celery in the United States of America has been extended to an enormous extent, although within comparatively recent times Celery was considered a novelty in that country and found only on the tables of a very few. Mr. W. R. Beattie, of the Horticultural and Pomological Investigations Section, Bureau of Plant Industry\*, states that commercial Celery growing in the United States finds its greatest development in the general region of the Great Lakes, in Florida, and in California. In Florida the crop is largely grown on "hammock" lands and the drained lake-shore areas of the counties of Orange, Manatee and Hillsborough. The soil is very similar in the Great Lakes region, although not so old in its formation. In California the crop is grown over a wide area. As the seasons in these districts vary, Celery is available for use over the greater part of the year. The earliest Celery is produced in northern New Jersey and southern New York, the Californian crop being available during the winter and the Florida crop during the early spring months. Beside the blanched leaf stems the seed of Celery is used extensively for flavouring soups and other dishes, whilst the fleshy root is often used in soups or cooked in small

\* U.S. Department of Agriculture, Farmers' Bulletin, No. 1269.

portions and served with white sauce or "drawn" butter. The most successful growers in the north-eastern section manure their ground with from 1,400 to 1,800 pounds of high-grade commercial fertiliser, containing, as a rule, four per cent. of nitrogen, eight per cent. of phosphoric acid, and six or seven per cent. of potash. This is followed by one or two dressings of nitrate of soda or sulphate of ammonia during the growing season. The Celery growers of Florida frequently apply as much as 4,000 pounds of fertiliser to the acre. Most of the seed is imported, and an interesting fact, discovered at the Massachusetts Experiment Station, is that four-year-old seed yields plants with greater freedom from disease and is in many respects preferable to strictly fresh seed. It is estimated that there are 14,000 Celery seeds to an ounce, and that 21,000 to 60,000 plants are required to plant an acre, according to planting methods and distances. Plants comprising the late or main crop are grown in cold frames or in specially-prepared field beds. For the extremely early crop, the plants are, as a rule, transplanted into trays and grown in greenhouses or cold frames. It is found that the transplanting has a value in that the tap-root is broken, causing large masses of fibrous roots to form. The plants that remain in the seed bed send this tap-root far down into the soil, so that such plants form very few side roots and consequently do not transplant in the field so satisfactorily. They are sometimes grown on benches in greenhouses, and in this case when the plants are about one-and-a-half inches high, a knife is run beneath them for the express purpose of cutting off the taproot, six to eight days before the plants are to be set in the field. The usual method of planting is in single or double rows four or five feet apart, with the plants six inches apart in the rows. Where space is limited, the plants are set in solid beds eight or ten inches apart in each direction. As Celery is a moisture-loving plant, the crop is irrigated, and the three systems of applying water are (1) the overhead-sprinkler system; (2) the furrow or surface system; and (3) the underground or sub-irrigation system. Although blanching is largely practised by the common method of earthing, boards and specially prepared paper are also extensively used; the early Celery is usually blanched by means of boards or paper. Boards are held in position by stakes, and the tops are sloped slightly downward; the depth of the board is ten inches. After eight or ten days, when the Celery has grown so that the centre leaves are even with the tops of the boards, the latter are drawn together more closely and fastened in place by means of wire spanners. It takes from fifteen to twenty-four days to effect complete etiolation, and the boards are used several times during the one season. The paper used is waterproof, and about ten or twelve inches wide. The paper is unrolled along the rows and held in place by means of stakes, or more often by special wire brackets. The varieties most largely grown are Golden, Self-Blanching, Easton Market and Giant Pascal.

**Dahlia Conference at Westminster.**—A Conference on Dahlias, under the auspices of the National Dahlia Society, will be held in the R.H.S. Lecture Room, on Tuesday, October 17, at 4.30 p.m. Sir Frederick W. Keeble, F.R.S., will preside, and papers will be read by Mr. T. Hay, Superintendent of Regent's Park, on "Dahlias for Parks and Gardens," and by Mr. J. T. West, Brentwood, on "Exhibiting Dahlias." All persons interested are invited to attend the meeting, whether members of the National Dahlia Society or not.

**Fruiterers' Company at the Mansion House.**—The Master of the Fruiterers' Company made the customary presentation of fruit to the Lord Mayor on Thursday, the 5th inst. Subsequent to the presentation, the Lord Mayor gave a dinner at the Mansion House, the guests including the Master, Wardens, and Court of the Company.

**Sale of the Millbank Orchids.**—The second and final sale of the collection of Orchids brought together by the late Alderman William Bolton, Millbank, Wilderspool, Warrington, was conducted by Messrs. Protheroe and Morris, at Millbank, on Tuesday, the 3rd inst., and the two following days. In the sale of the first portion of the collection, in May, 10,000 plants were disposed of, and the remainder, comprising about 13,000 plants, with 16 extensive greenhouses, hot-water piping, a boiler, brickwork, and a large quantity of flower pots, have now been sold. Remarkably good prices were obtained for the houses and building material, but the Orchids realised comparatively low prices, ranging from five shillings to ten guineas per lot. The plants were, for the most part, in excellent condition, and many exceptionally fine varieties were amongst them, while a large number of home-raised seedlings from the finest parents were also included. There were also paintings of many of the plants at the disposal of purchasers of the first lots in which such plants occurred, on payment of five shillings for each painting, but upon the understanding that they were to be loaned for copying, if required, by purchasers of succeeding lots. Purchasers came from all parts of the British Isles, and there was a large attendance of specialists. This sale finally disperses one of the largest and most comprehensive collections of Orchids in the kingdom.

**A Nut Growers' Association.**—America boasts of a nut growers' society under the name of Northern Nut Growers' Association. The Society met at Rochester, New York, on September 7 and 8, when papers were read on the different phases of Nut culture; the improvement and utilisation of Nuts; and an explanation by Dr. R. T. Morris, of New York, of his method of grafting, based on surgical principles. Local nurseries and Nut orchards in the vicinity were visited, and a Walnut tree was planted in Highland Park. As showing the enthusiasm of the members, one pledged himself to obtain one hundred new recruits within a year, while ten others promised to bring in ten new members each in the same period.

**Fungi on Royal Deeside.**—The valley of the Dee, near the head of which nestles amid sylvan beauties their Majesties' highland home, Balmoral Castle, is rich in various species of mycetoza and fungi. For some time past organised search parties have been at work over large tracts of woodland with the object of making a complete classification and detailed account of the mycetoza to be found in the woods this year. Mr. Lawrence Ogilvie, M.A., B.Sc., The Botany School, Cambridge University, diagnosed the fungi, and the Rev. W. Cran, B.D., Skene, Aberdeenshire, no mean authority on the subject, lent valuable assistance. This year it was found there was a marked scarcity of the larger fungi, the great drought of 1921 leaving the ground extremely dry. Occasionally, however, bright patches of Amanita muscaria were found, but these were generally of poor size and badly eaten by slugs. The usual species of Milky fungi (Lactarius) were seldom seen, but the Chantarelles, Boleti, and Russula rubra were more frequently met, and the Small Puffball (Lycoperdon gemmatum) was not uncommon. In the beautiful woods of Crathes, owned by Sir Thomas Burnett, Bart., of Leys, Crathes Castle, were found in moist and shady spots, clusters of the bright Coral fungi (Clavaria), and a fine, grey one (Clavaria cinerea) was especially abundant there. On decaying wood species of Poria and Stereum were common, while beautiful growths of Stereum hirsutum decorated fallen logs with their pale orange brackets. One of the most conspicuous of fungi in the woods just now is the Birch Polypore (Polyporus betulinus), the beautiful snow-white, bracket-like fructifications of which seem to harmonise so delightfully

with the silvery bark of the decaying Birch trunks. The Black Spot of Sycamore leaves (*Rhytisma acerinum*) had evidently been exceedingly destructive this year, while on young trees the white mildew (*Uncinula aceris*) was much in evidence. Scarcely a Birch tree was found free from leaf rust (*Melampsoidium betulinum*). On Sycamore leaves the ravages of the gall-forming mite, *Phyllocoptes acericola*, were found on every hand, its presence betrayed by the premature reddish tints which the leaves had taken on. Alder leaves were ornamented with the globular galls of the mite, *Eriophyes laevis*. The mycetozoa, though more difficult to find, reward the searcher with a variety of form and colour sufficiently diverse to recompense even the impatient tyro. The acquaintance of many old friends was renewed this year among the myxomycetes, and several species were found which are regarded by the highest authorities as of rare occurrence in the British Isles. Among species fairly common to the district were found *Physarum viride* and *P. nutans*, *Didymium squamulosum* and *D. melanospermum*, *Leocarpus fragilis*, *Stemonitis fusca*, *S. flaxefinita* and *S. hyperopta*, *Comatricha nigra*, *Cribraria argillacea*, *C. vulgaris* and *C. rufa*, *Tubifera ferruginosa*; *Trichia varia*, *T. decipiens* and *T. Botrytis*; *Arcyria cinerea*, *A. denudata*, *A. nutans* and *A. incarnata*. The quest was further rewarded by the discovery of a few rare species. In the woods of Finzean were found *Colloderma oculatum*, which was constituted a new genus and new species on the strength of a specimen gathered in Skene (near Aberdeen) in 1910. Another rare species, *Licea pusilla*, so far restricted to Scotland, was obtained in the woods of Corsedarder. Crathes woods provided a specimen of the exceedingly rare *Physarum globuliferum*, which was recorded in Britain for the first time at Ballogie—situated some twenty miles farther up the Dee valley—in 1913.

**Carlyle and Tree Planting.**—In connection with the forthcoming sale of Keston Lodge, near Bromley, in Kent, it is of interest to observe that the Lodge and grounds were on several occasions lent to Thomas Carlyle by the then Lord Derby, and in a secluded part of the woodlands, shaded by Oak and Spanish Chestnut trees and surrounded by underwood of Azalea and Rhododendron, the great author did much of his work. A summer house to his memory was erected on the spot, and a suitably worded tablet attached to the building records the fact. When on his deathbed Carlyle planted a number of acorns from trees in the grounds of Keston Lodge in pots of soil which were taken to his house in Cheyne Walk by one of the gardeners. The adjoining Holwood Park, once the home of Pitt, the great statesman, with its Brito-Roman camp and Wilberforce Oak are well known to visitors.

**The Value of Grading Apples.**—Some interesting facts on the Canadian Apple trade with Great Britain were given by Mr. J. Forsyth Smith, Canadian Fruit Trade Commissioner in the United Kingdom, at meetings held in various fruit growing provinces in Canada during the past summer. Mr. Smith described the British system of selling on consignment, and referred to the advantage of buyers being able to see the fruits and judge of their grade, standard, quality and condition before buying. He stated that certain packs regularly sell in the United Kingdom markets at a premium of 7s. per box over others of the same grade. He referred to one outstanding instance of a barrel Apple packer who never fails to receive from 3s. to 5s. per barrel over the average market value for the same variety, and whose premium at times has reached 15s. Another packer of high reputation realised for his fruits of Baldwin Apples 60s. for No. 1 grade, 52s. for No. 2, and 45s. for No. 3 at a time when the market range for this variety was, No. 1 40s. to 51s., No. 2 37s. to 43s. and No. 3 30s. to 34s. Thus, for his No. 3 grade he was realising almost as much as other growers were for their No. 1 grade. The most popular Canadian Apples in our markets, in their order of merit, are, according to Mr. Smith, Jonathan, Newtown Pippin, Cox's Orange Pippin, Winesap, Spy, McIntosh, Spitzenberg, Wealthy, and Winter Banana.

**Mr. Courtney Page.**—Mr. Courtney Page, the Hon. Secretary of the National Rose Society, is a keen amateur gardener, and as such has acquired considerable reputation as an amateur rosarian who, during the past thirty years, has tested in his garden at Earlsdoms, Ridgeway, Enfield, most of the Roses put into commerce during that period. But it is chiefly as the secretary of the National Rose Society that Mr. Page has become famous. Before taking up the secretarial duties in 1914, Mr. Courtney Page already had a wide experience in the management of the Society, as he was a member of its Council and of its Exhibition and General Purposes Committees for many years previously. He occupied the secretarial position during the very trying war period, when, as in the case of so many other horticultural societies, the membership suffered considerably; indeed, at the end of 1918 the total membership of the N.R.S. had fallen to 3,800. Since then, however, largely due to the forward policy adopted by the Council of the National Rose Society, but in no small measure to the initiative and enterprise of Mr. Page, the Society has flourished in a most extra-

MR. COURTNEY PAGE.

(HON. SECRETARY OF THE NATIONAL ROSE SOCIETY.)

ordinary manner, until at present the membership is over 9,000, and new members are being added at the rate of about twenty per day. The exhibitions held by the N.R.S. are among the wonders of the horticultural world, and never before in the history of the Rose has the public had such an opportunity of seeing splendid Roses displayed in so delightful a way as on the occasion of the exhibitions at Regent's Park, Wolverhampton, and the R.H.S. Hall this year. No fewer than 14,000 people visited the exhibition held in Regent's Park, and it will be readily conceded that it is no small task to make suitable arrangements for such a wonderful show and for the accommodation of so many people, and these arrangements it falls to the lot of the secretary to make. The Rose is our national flower, and the National Rose Society exists to encourage, extend, and improve its cultivation, which it does, not only by means of its exhibitions, but also by its excellent publications, to which every member is entitled. The Society is extremely fortunate in having as its Hon. Secretary a gentleman who can bring to his office the ability and enthusiasm which Mr. Courtney Page possesses, and it is a pleasure to us to publish his portrait.

**Distribution of Surplus Bedding Plants in the London Parks.**—The surplus bedding plants at the London County Council parks will be distributed to the public between the hours of 9 a.m. and 11 a.m. on Saturday, October 14,

1922. Persons desiring to participate in the distribution should make personal application to the officer in charge at the various parks. Plants will not be handed to children under the age of 14 unless they present a note from their parents or teachers.

**Allotment Society's Dinner.**—In celebration of the passing of the new Allotment Act, the National Union of Allotment Holders is entertaining Sir Arthur Boscawen and other Parliamentary friends of the movement at dinner on the 25th inst.

**Bulletin of the Chamber of Horticulture.**—Though scarcely so interesting to the general reader as was the first issue, the newly published Part 2 of Vol. 1 of the *Bulletin* of the Chamber of Horticulture is in many respects more important than its predecessor. Mr. W. G. Lobjeit, the Controller of Horticulture, gives his impressions of horticultural conditions in the United States of America, and has some very interesting things to say about the flower trade and the horticultural Press of the United States. With regard to the latter, he observes "the vast area and the complex conditions existing in America have had an effect upon the horticultural Press. The horticultural publications of America are many and diverse in character; some of them very enterprising, some of them almost sensational, and many of them informative, but there is not, and there cannot, be any journal of unquestioned authority equally respected in all parts of the States, as is the case with several journals in this country." Articles useful for reference purposes include: "The Food Habits of Wasps," by Mr. E. B. Watson, illustrated; "Narcissus Culture in the Scillies," by Major Dorrien-Smith; a report of the proceedings of the International Commercial Horticultural Federation, "The Testing of Horticultural Seeds"; and "In Parliament," which is a record of Parliamentary matters of interest to the horticultural trade. There is also an appreciation and portrait of Mr. G. W. Leak, President of the Chamber.

**Popularity of the Gladiolus in America.**—At the American Gladiolus Society's exhibition, held in Kalamazoo, Michigan, in August last, exhibitors came from places a thousand miles apart. It is recorded that one specialist at Connecticut, Massachusetts, cultivates no fewer than thirty-eight acres of Gladioli.

**The Late Mrs. Berkeley of Spetchley.**—It seems very right and fit that the passing away of such a noted and successful horticulturist as Mrs. Berkeley of Spetchley, should receive more than passing notice in the pages of *The Gardeners' Chronicle*. Mr. J. T. Bennett Poë writes:—Cultivation of a very high order has been for years the feature of the vast herbaceous borders in her garden, where plants have been grouped to make a notable garden picture. The practical outcome of years of patient selecting and seeding her strain of Primroses has been the very fine exhibits at the spring shows of the R.H.S. in both 1921 and 1922, when the groups of plants and cut blooms were awarded silver medals. Great has been the demand for seeds of this remarkable strain, which produces blooms of great size and with a large range of very varied colours, and for the first time seed has been procurable this year. Soil and climate seem very suitable in Worcestershire for the Primula family, and the vigour and size of the plants shown at Vincent Square was much commented on. Narcissus, too, received her attention in cross-breeding for many years, and a successful result was shown last spring at Vincent Square, where a white trumpet variety received an Award of Merit. It was as beautiful a variety of the white trumpet section as any yet shown, being tall, strong, and of faultless form and colour. It was a pleasure to meet Mrs. Berkeley, a lady of charming personality, very gracious and human, and a privilege to be personally conducted around the garden she so deeply loved. Very remarkable was the development of the garden under her skilful care during the many years she resided at Spetchley. When she began to work on it the chief items of importance were the fine old trees in the grounds,

notably the Cedars sent there by Evelyn to Sir Robert Berkeley, which, happily, are still flourishing and in fine condition. Letters now in the British Museum from Sir Robert Berkeley to Evelyn refer to the Cedars here mentioned. During the war, when there was an endeavour to get people to grow garden produce on every available scrap of ground, Mrs. Berkeley persuaded the tenants and cottagers on her husband's estate to enter into the project, and so determined she to make it a success that she bought a motor-lorry, learned to drive it, and used to go around in the early morning and collect the baskets of vegetables and take them to the market at Pershore, and seldom returned to Spetchley until one or, sometimes, two o'clock in the afternoon. Thus the growers had the full benefit of their labours. It would require much time and space to tell fully of the memorable work Mrs. Berkeley did in connection with the war, and the colony of some twenty to thirty Belgian refugees, housed in cottages and generally looked after until the armistice, and also of the entertainments, both at Worcester and at Spetchley, in aid of the funds for the disabled men of the Worcestershire Regiment.

#### Appointments for the Ensuing Week.—

Monday, October 16.—National Chrysanthemum Society's Floral and Executive Committees meet at R.H.S. Hall. Tuesday, October 17.—Royal Horticultural Society's committees meet; lecture by Mr. R. G. Hatton on "Fruit Stocks," at 3 p.m. Wednesday, October 18.—Hertford Horticultural Society's meeting. Thursday, October 19.—Manchester and North of England Orchid Society's meeting. Friday, October 20.—Paisley Florists' Society's meeting; Eastbourne Horticultural Society's meeting; Carnwath Chrysanthemum Society's show. Saturday, October 21.—British Mycological Society's combined foray with Ecological Society.

"Gardeners' Chronicle" Seventy-five Years Ago.—*The Administration of the Allotment System.*—In most of the Rules for the guidance of allotment tenants that we have seen, there has been what we are very sure is a far too detailed statement of the obligations under which these tenants are supposed to lie. The men are, in fact, made children of: that species of wardhood, often condemned in these columns, in which some proprietors keep their tenantry, is exhibited in an excessive degree; the men are not treated as *men*, but as those whom, not only is it necessary to restrain on all sides, but to whom it is also necessary on all sides to point out the restraint which hems them in. And instead of feeling the entire independence—so far as this goes—of the man on whom, as he pays his rent in return for his occupation, there rests no obligation other than that which spontaneous respect or friendship imposes; the occupier of 40 perches of land is, if possible, taught, at all events he is told, that he owes much to his *Patron*, the owner of the field—a debt, indeed, which it becomes him by extra morality and submissive respect to acknowledge as plainly as possible. Not altogether a bad lesson either; but one which ought to be taught—not by rote from the conditions of his lease, but—by the experience during years of his landlords' conduct. Tell the man in the *lease* that it is wrong to get drunk, to steal, to work his ground on the Sabbath, to curse and swear! Do you think that he does not already know all this? Bind him down not to trespass on his neighbour's land or take his goods! Do you not think that by interfering in this way between them you lower them to the status of children, or of imbeciles unable to take care of themselves? We submit that your relations to your allotment tenantry—as to all your other occupying tenants—are two-fold, embracing that of Landlord, and, apart from this, that of "*Neighbour*."—*Gard. Chron.*, October 16, 1847.

**Publications Received.**—*Textbook of Landscape Gardening.* By Frank A. Waugh. Illustrated. Chapman and Hall, Ltd., 11, Henrietta Street, W.C.2. Price, 25s. net. *Plant Materials of Decorative Gardening; Winter Botany.* By William Trelease. Price \$1.00 and \$2.50 respectively.

## NOTES FROM WISLEY.

IN most plants the beauty of the flower exceeds that of the fruit, and this is essentially true in the case of the Rose. It is interesting, therefore, to come across Roses which have been planted for the brilliant effect of their fruits. A number of these are to be seen at Wisley on the side of a path by the river, and although the majority are as yet small they are fruiting well. One of the most striking is *Rosa Sweginzowii* (figured in *Gard. Chron.* of Sept. 2, p. 155), which has deep red fruits similar in shape to those of *R. Moyesii*, and handsome purplish foliage. The fruits of *R. pomifera* are fuller and darker in colour than those of *R. Sweginzowii*. They are also hairy and present the appearance of ripe Gooseberries.

FIG. 88.—ASTER BARR'S PINK: R.H.S. AWARD OF MERIT, OCTOBER 3 (SEE P. 211).

The autumnal garden value of plants bearing lightly coloured fruit has become more and more recognised with the introduction of new species and varieties of *Berberis*, *Cotoneaster*, *Viburnum* and other plants, many of which can be seen and studied at Wisley. Many Japanese Quinces are colouring their aromatic fruits, such as *Cydonia Sargentii* and *C. Maulei*, from which good jelly may be made. The low growing *Gaultheria Shallon* is also in fruit. The berries are edible but not very pleasant to the taste. When this plant was introduced it was thought that it would be popular as yielding edible fruit, and although it has not become so its value as a wild-garden plant has been appreciated.

*Colchicum speciosum* has for some time been covering the ground around the trees of the lower walk assisted by very large numbers of *Crocus nudiflorus*. Many species of *Crocus* are also in flower in the alpine frames such as *C. zonatus*, *C. cancellatus albidus*, *C. speciosus* and *C. s. Aitchisonii*. The last-named is of a delicate colour, approximately that of the pale blue *Iris stylosa*.

In the rock garden *Gentiana Farreri* is very economical with its flowers. Quite a number of blooms are, however, to be seen on *Gentiana Pneumonanthe*, and this particular specimen observed is the less common upright form. The clear, pink *Geranium Endressii* continues to flower and seems quite happy even in shade. It is kept company by the oval-flowered *G. Wallichii*. Other late-flowering plants are *Polygonum vacinifolium* and *Spenceria rammalana*, which came through last winter quite satisfactorily.

*Aster Amellus Little Gem* is not too large for some parts of the rock garden, as it grows about a foot high. Among the larger varieties of this section and suitable for the herbaceous border, *King George* is one of the best. Many species of *Asters* are flowering well now, such as *A. acris*, of which a good variety is *dracun-*

*culoides*. A handsome pink-flowered species is *A. Wienholtzii*. It is worthy of note that the old *A. Thompsonii*, which is now being almost entirely supplanted by newer kinds, has been flowering steadily since mid-July and has been free from disease.

*Aster* mildew has been prevalent this year, starting at the time of the early drought. *Aster* "wilt" has also been taking its toll. This is caused by a fungus which attacks the base of the stem and stops the food supply. A satisfactory remedy has not yet been discovered but experiments are still in progress at Wisley and it has been found that the disease is not perpetuated when plants are propagated from healthy cuttings.

Some of the varieties of the *Novi-Belgii* *Asters* have become naturalised in the field near the herbaceous borders, prolonging the succession of flower there, and following on after the *Harebells*. The latter have been very beautiful and made a very fine show for wild plants, coming up after the grass had been scythed in June. *J. E. G. White*.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARRER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Cypripedium.**—Cypripediums of the winter flowering section are sending up their flowers and some of the earliest varieties are already in bloom. The scapes should be neatly staked as soon as they are long enough, as it is a most difficult matter to get them into position again if they fall over the sides of the plant, and the stalks become twisted. When properly staked, the flowers may be seen to the best advantage, and the stalks being straight, the flowers may be used in a cut state for indoor decoration, for which, owing to their long lasting properties, they are admirably adapted. Plants of the summer flowering section, of which there are many very desirable and beautiful varieties, may, should they need it, be repotted when they have passed out of bloom. The usual compost advised from time to time for these plants should be used, and it is most desirable if the best results are to be attained, to attend regularly to the repotting, using the best materials obtainable.

**Dendrobium.**—By this time the whole of the members of the deciduous section of Dendrobiums, both species and hybrids, should have completed their growths. Those which produce their flowers early in the new year should be induced to rest for as long as possible, as without sufficient rest the succeeding growth is unsatisfactory. Some kinds are later in completing their growths, but as soon as this is accomplished they should be removed to the resting house, where the drier and more airy conditions will help to mature them, and enable them to produce an abundant crop of flowers. The completion of growth in these plants is easily seen by the last leaf of each pseudo-bulb being fully developed. The plants should receive water at the roots in much less quantities, but sufficient should be given to keep the leaves and roots in a healthy condition. Shrivelling must not be allowed under any circumstances, and premature ripening must be avoided. The withholding of water, also the reduction of temperature, should be gradual, as should the foliage of the plants suffer during the resting season the plants will not start into growth in the spring so vigorously as they ought. Any Dendrobium plants that are still growing, and any that have made a secondary growth, should receive liberal treatment, and be induced to reach the resting stage as soon as possible.

### THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. Vicar Gibbs, Aldenham House, Hertfordshire.

**Bedding Plants.**—With the arrival of frost it will be necessary to give consideration to the question of the dismantling of the summer bedding scheme, and note should be made of the plants that are to be retained during the winter. Such plants can then receive first attention when the work of clearing the beds commences. The work of lifting and storing should be well advanced by the end of the present month, with a view to completing it before November, for, after the damp summer, growth generally is tender and sappy, and the plants will be more susceptible to injury from slight frost than usual. Agapanthus, Fuchsias, Lantanas, Pelargoniums, Heliotropes, Plumbagos, Streptosolens, etc., should be lifted early. Plants that have been plunged in their pots should have the roots that have grown out of the pots trimmed, and the receptacles well washed free from soil. After the plants have been pruned back to the hard wood, they should be stood in a cool house or pit, where they may easily receive attention, it being necessary to afford them occasional syringings on fine days, until such time as severe weather sets in. Other plants should be potted and treated similarly, using pots of as small a

size as will just accommodate the plants. Various other plants for winter storing will also require attention. Those of *Lobelia cardinalis* and its hybrids should be cut back, lifted from the beds, the roots placed in boxes filled with good compost and stored in a frost-free place for the winter. *Dahlia* tubers should also be lifted and stored in sand. *Gladiolus* corms should be dried off for storing, and *Salvia patens* lifted and potted for placing in frames. Some prefer to leave *Lobelias*, *Dahlias*, *Gladioli*, *Kniphofias*, and other somewhat tender, tuberous-rooted plants, in the ground during the winter, and this may safely be done on light, warm soils, but they should have a deep covering of ashes placed over them to ward off as much frost as possible.

**Echeveria.**—At Aldenham we carefully sort the *Echeverias* used as edgings to beds and borders into large and small specimens, clean off any damaged or decayed foliage, and then box the small ones and winter them in a cool house. The larger plants are set in soil against a greenhouse wall to form a bank that is easily covered during severe weather. Mats are sufficient during average frosty periods, but in very severe weather additional covering, such as straw, Bracken, or similar material should be used as well as the mats.

**Carnations and Pinks.**—Early layers of Carnations and Pinks that are well rooted should be severed from the parent plants and placed in 60-sized pots, using a compost of good loam, a small quantity of leaf-mould, and a little fine mortar rubble. Place the plants in a cold frame, which should be kept close until they have become established, and spray them lightly on fine days.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDEB CLAT, M.P., Ford Manor, Lingfield, Surrey.

**Succession Vineries.**—Where the foliage is changing colour, the vines may be washed with the hose, and the inside borders watered with soft water if it is available. Inside borders in late summer frequently become a little too dry, especially after a long drought, and, after the vines have been cleared of the bunches, this is apt to be overlooked. When roots and leaves feel the want of water, the vines suffer. So long as the leaves retain their vitality and the house is freely ventilated, there is no danger of giving inside vine borders too much water.

**Late Grapes.**—Alicante and other late Grapes intended for autumn use should now be fully ripe, but some time will elapse before they are at their best for eating. This Grape, like Lady Downes, pays for being kept in a dry, fairly warm house until the vines are nearly leafless. The weather lately has not been favourable to this treatment, and fire heat should be used until the foliage shows signs of changing colour. These vines, being strong and late growers, will have made late laterals, but the time has arrived for shortening these to allow air to circulate freely about the vines. The borders, too, should be examined carefully, and, if found to need moisture, select a suitable day and give sufficient tepid water to make the whole of the soil moist.

**Muscat Grapes.**—Muscat Grapes are now fairly ripe and well coloured, and the temperature of the vinery may be reduced by degrees, reducing the amount of atmospheric moisture in proportion. These grapes being subject to damping, the house should be kept dry, and watering done only on bright days in the early morning. Although light and sunshine favour the colouring of the berries, the laterals should not be too freely reduced, especially where the foliage is thin and faulty. Mrs. Pearson is an excellent white Grape for use after Christmas. Like the variety Lady Downes, it requires plenty of time to mature, and, when well finished, the berries, which never crack, are superior in flavour to any other white Grape, except Muscat of Alexandria. The vine is a strong grower and crops freely.

### THE KITCHEN GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Tomatos.**—Sow a batch of seeds now to raise plants for cropping in early spring. The plants will succeed best in a light, sandy mixture in small pots, which should be placed close to the roof glass to prevent them becoming drawn. The temperature should not be higher than 65°. Guard against over-watering the soil.

**Rhubarb.**—Crowns for early forcing should be dug up, exposed to the weather for a few days and afterwards placed in the Mushroom house, or, if such a house is not available, under a greenhouse stage or in a cellar. The crowns should be placed on the ground and a mixture of litter and leaves placed between each. Keep them moistened regularly by means of the syringe.

**Chicory and Dandelion.**—Lift a batch of these plants for an early crop of blanched leaves. Place the roots in boxes or in pots and stand the receptacles in a dark, cool place, for if these salads are forced hard they become coarse. Keep the plants well supplied with moisture. The remainder of the crop should be left in the ground till required for forcing.

**Box-Edging.**—The present is a suitable season for replanting Box-edging in the kitchen garden, carrying out the work as previously recommended.

**Winter Spinach, Lettuce and Cabbage.**—Transplanting of Spinach may still be done to make good any plants that have failed. Lift the plants carefully and make them firm in the soil when planting. The plants in the permanent rows should be thinned to 6 inches apart, and kept well dusted with soot and lime. Winter Lettuce should be given similar treatment. Complete the work of planting Cabbages.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Francoa ramosa.**—These plants having passed out of flower may be attended to at the roots. In these gardens this plant is grown in various sized receptacles from pots 3 inches in diameter to those of 12-inch size, and plants that have been grown in the smaller pots will now be potted into larger sizes. This plant gives the best results when grown in a restricted root space, therefore in repotting allow for only just sufficient room to enable a rammer to be used between the plant and the pot to consolidate the soil. Cuttings may be inserted now, and these should be taken with a heel from the base of the old plants; they will root readily in a frame from which frost is excluded. The *Francoa* may also be propagated from seed, but I much prefer cuttings taken from a reliable strain.

**Bouvardia.**—Bouvardias that have been given cool treatment to retard their flowering season should be removed to a house having a warm temperature. Although Bouvardias will flower in a fairly warm greenhouse, much better results are obtained when they are grown in an intermediate temperature. Bouvardias are gross feeders and as their receptacles are well filled with roots they will need frequent applications of liquid manure alternated with a concentrated fertiliser to produce good flowers in quantity. Mite, also green aphid and white fly are sometimes troublesome to these plants, but much may be done to keep these pests in check by frequently fumigating the house.

**Cyclamen.**—Where a quantity of these useful plants have been raised from seed sown some fifteen months since, some of the more forward plants may be placed in a greenhouse having a minimum temperature of 50°. The plants should, if possible, be arranged near the roof glass and for a short time shaded from bright sunshine. Where it is found that the receptacles are well filled with roots, a sprinkling of fertiliser, used according to directions given by the maker, will be found very beneficial to the plants and will greatly improve the size of the

flowers; it will also favour free growth. Keep the surroundings of the plants moist. Seed sown as advised in a previous calendar has now germinated, and to encourage the seedlings to make sturdy growth they should be stood near the root-glass in a house having a minimum temperature of 50°.

**Zonal Pelargoniums.**—Plants that have been grown in cold frames to produce flowers in the autumn and winter should now be placed in a light, airy house or pit, where a little fire-heat is available, to keep the atmosphere dry and buoyant, otherwise the flowers will be found to damp very badly. After housing the plants exercise great care in watering, and do not use strong stimulating manures, which would tend to produce soft growth.

**Cineraria.**—Plants comprising the late batch of Cinerarias, growing in small pots, may be transferred to larger receptacles. After repotting they should be returned to a cold frame, with a layer of ashes at the bottom. Damp the plants overhead for a short time, but when they have recovered from the disturbance caused by repotting, damping should be discontinued. It will be advisable to have some protective material at hand to cover the frames in the event of frost.

**Calceolaria.**—Small plants of Calceolarias that have filled their receptacles with roots may be placed in their flowering pots. Use rich, open compost. The plants may be grown in a cold frame where protection can be given in the event of frost. Watering should always be done in moderation. Green-fly is sometimes troublesome to Calceolarias, but if the plants are sprayed occasionally with Quassia extract the foliage will be kept free from this pest.

#### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Filberts and Cob Nuts.**—As soon as these Nuts part freely from the branches and the shells are of a somewhat brown colour they may be gathered when perfectly dry and stored for winter use. The atmosphere of the store should not be too dry and warm, as this would cause the kernels to shrivel. I have stored Nuts in dark cellars in boxes and large pots very successfully, the Nuts keeping exceptionally plump and crisp for many weeks. Good varieties are Kentish Filbert, Pearson's Prolific, Prolific Filbert and Kentish Cob.

**Strawberries.**—Plants that were lightly cropped this season are developing fine, sturdy crowns, and the foliage of several kinds is exceptionally strong and robust. See that the beds are kept free from weeds, and remove all runners as fast as they appear. Each variety should be correctly named and worn-out labels renewed if necessary. Runners that were raised and planted early are looking very satisfactory and have made good headway; they will need attention, and any weeds springing up amongst them should be destroyed at once to enable the plants to ripen their crowns fully before the end of the season. Beds that have been neglected should receive prompt attention. Remove all runners, also a few of the outer leaves, and fork lightly between the rows, afterwards applying a mulch of decayed manure as near the plants as possible. This will act as a protection to the roots in severe weather, and also assist growth.

**Gooseberries and Currants.**—In order to have a sufficient stock of healthy, young fruitful bushes, either for filling gaps in the rows or for making new plantations, sufficient cuttings should be rooted annually to meet the requirements of the garden. Cuttings of both Gooseberries and Currants may be made at once and inserted in suitably prepared beds. Select medium sized, firm shoots, take out some of the lower buds and insert the cuttings four inches deep in ground prepared for the purpose. Plant them in rows 14 inches apart and six inches asunder in the rows. Make the soil firm and keep the beds clean and free from weeds. In two years, with good attention, these should make good plants, useful for a variety of purposes.

### HISTORY OF THE MOSS ROSE.

I AM reluctant to encroach upon your valuable space, after all I have had to say upon this subject; but it is agreeable to find that the Rev. Joseph Jacob (p. 183), in the course of a little independent investigation, has come across "a poser."

*Les Roses* by Jamain and Forney is the modern source from which Major Hurst has drawn some of the untrustworthy matter in his several articles criticised by me, so that Mr. Jacob need not be surprised at the parallel. Why does Mr. Jacob inquire for a 1746 edition of *Le Jardinier Fleuriste*? Is he quite sure that there is one? Because I am not. He tells us that he possesses the 1742 edition, and that in it there is no mention of the Moss Rose. In my library there are the 1706 and the 1776 editions, and in neither is there the slightest mention of the Moss Rose nor of the story of its

Those published in Paris are dated 1703, 1719, 1738, 1742, 1754, 1763, 1764, 1768 and 1776. In Amsterdam two dated 1706 and 1708 were published. In Rouen, also, two dated 1787 and 1792. In Avignon one edition appeared as late as 1821.

Mr. Jacob will, therefore, see that Jamain and Forney's supposed edition of 1746 wants finding, just the same as one of the places in Normandy where they say, and Major Hurst says so too (*R.H.S. Journal*, vol. xlvii., Pt. I., p. 32) that the Moss Rose was grown in 1746. I mean *Messin*. Will some kind reader skilled in French geography be good enough to enlighten us where this place is?

During the whole of my forty years' research work in horticulture I have never yet, in any subject in which my interest has been aroused, felt the need to so great an extent of the apostolic injunction "Prove all things, hold fast that which is good," or, it may be added, true. C. Harman Payne.

FIG. 89.—SCUTELLARIA BAICALENSIS COELESTINA.

### THE ALPINE GARDEN.

#### SCUTELLARIA BAICALENSIS COELESTINA.

ALTHOUGH not of recent introduction, this plant is one of the daintiest of the Skull-caps.

The flowers are of a lovely pale mauve, and they are abundantly produced on stems of about twelve to fifteen inches in length through June and July. The plant is quite hardy, and it revels in a compost of turfy loam and crushed mortar rubbish, planted in full sun. As the flower spikes appear a few twigs should be placed about them as supports, to prevent them from being blown about. It resents being moved from the open ground, and should therefore be planted where it is required to become established. The plant illustrated (Fig. 89) was exhibited by Mr. Allgrove at the meeting of the Royal Horticultural Society on August 22 last.

#### GALANTHUS ELWESII.

ELWES'S Snowdrop is exceedingly variable, and those who wish to obtain a good type of the plant should buy bulbs, which have been grown in this country, from a reliable dealer, who will guarantee that the form is a good one. Numbers of names have been given to varieties from different districts, but the Cassaba neighbourhood appears to have given us a superior type. S. Arnott.

introduction into Normandy, which Major Hurst relates, without the slightest foundation, is to be found in *L'Ecole du Jardinier Fleuriste* (1746), an edition which is non-existent. On the fly leaf of my 1776 copy of *Le Jardinier Fleuriste*, a different work altogether from that just mentioned, is a pencil note made by me some years ago. It reads, "practically a reprint of the edition of 1742. Contents the same. Title down to the imprint the same.—1742 larger print, 514 pages." It should be mentioned that the later edition, being in much smaller type, contains only 421 pages.

Mr. Jacob appeals to the possessor of a 1746 edition of *Le Jardinier Fleuriste* to enlighten him on the questionable point. How does he know there is such an edition? Simply because he, like Major Hurst, has assumed that the passing reference, in the short paragraph on the Moss Rose, by Jamain and Forney (p. 57) is true. I do not believe that there is such an edition as a 1746 one—and if there be, that it will contain an account of the Moss Rose any more than Mr. Jacob's 1742 edition or my later one of 1776. Most of these old French so-called editions are mere reprints, and do not vary to any appreciable extent.

To attempt to prove a negative is, of course, not a very satisfactory task, but I have traced all the recorded editions of *Le Jardinier Fleuriste* that I can, with the following result:

### EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communicators should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

### ACCLIMATISATION.

THIS very familiar word has been little in serious use for a long time. It has been used, unfortunately, with very different meanings. It may mean merely to naturalise or it may mean a physiological alteration of constitution by which a plant or animal can flourish in a climate which before the alteration it could not endure. Its use appears to be similarly indefinite both in France and Germany, with the addition that in France even the abstract and non-living, as, for instance, a custom, may be spoken of as acclimatised. For us, since we have the word naturalisation in extensive and correct use, there should, perhaps, be only one correct meaning, viz., the physiological alteration of constitution by which a plant can flourish in a strange climate. With this meaning we have something before us that must be of serious significance, and after years of neglect it may be well to consider our position.

From the little or nothing that we seem to expect from it the question may well arise whether there is such a thing as acclimatisation. I have thought that it does not go very far, for if it did there could hardly have been much dispute as to fact; it ought indeed to be much in evidence, and we might well expect that certain plants would be guaranteed to a certain degree of attained hardiness. I am convinced, however, that we have to do with a reality, but chiefly, I think, under artificial selection, for in nature the geographical distribution of plants does not appear to have been much modified by its agency. There has been the smallest amount of "creep" from one climate to another, though I am aware of the fact that there is a difference in the hardiness of a plant, whether it comes from a northern or southern habitat, and this might result from natural selection as a plant extends its range.

Darwin appears to regard acclimatisation as chiefly belonging to the sphere of human agency, but he remarks, "if it be true that all the species of a genus are descended from a single parent form, acclimatisation must be readily effected during a long course of descent."

We have an infinite number of examples of naturalisation both in this country and in others, and although it is quite a different thing a few examples may be referred to by way of illustration. In Australia, for instance, *Opuntias* have become a nuisance; but they had, I believe, no laboured difficulty in getting acclimatised. They found a climate and conditions exactly suited to them, and so increased with full speed from the first. So it is, I believe, in the case of a num-

ber of plants and animals that have found a home in the Antipodes. It seems not unlikely, indeed, that plants would die out rather than acclimatise in an unsuitable climate, though, if able to exist long enough they might become acclimatised. Darwin writes in his *Origin of Species*: "The conditions of life are nearly the same, so that a multitude of European animals and plants have become naturalised in America and Australia."

The naturalisation of plants in Britain is an interesting study, but it is never spoken of as acclimatisation. The great vigour of *Anacharis*, when first introduced from America, was probably the same in character as the increased vigour of certain subjects like *Watercress* when established in New Zealand. It would be interesting to know whether this is still as vigorous as ever in that country. *Anacharis* does not

the exception of two, which are now the chief representatives of this tree in the Cambridge garden. From these it is easy to believe that if they bore seed a type of superior hardiness could be raised. It is interesting that Darwin mentions a very similar example of selection by cold in the case of a bed of young *Araucarias*. Again, at Cambridge, in the same winter, some of the trees of *Evergreen Oak* were killed to the ground, while others were quite uninjured, and this I have always attributed to the locality whence the trees originated, for it is native from the middle of France to the Mediterranean region where temperature is much higher. If this is the correct explanation, it might mean that there was a natural acclimatisation from an original ancient centre, either north or south, or it might be a case only of variation from seed, as in *Deodar* and *Araucaria*.

For illustrations, and for a few special remarks, we may best turn to Darwin's *Variation of Animals and Plants under Domestication*, which has been described as a storehouse of information. A section of chapter xxiv, vol. II., is devoted to the subject of acclimatisation, and I have been interested to find that all regarded as belonging to it comes under the definition I have given, though Darwin includes the short-season kinds of *Maize*, which I have looked upon as still fairly tropical, from the fact that a good season is needed for their success in this country. He definitely states that the production of early flowering and early seeding varieties deserves to be considered as one form of acclimatisation. It is a statement to notice that we can have "some degree of acclimatisation in the individual, independently of the production of new varieties by seed," the evidence for which is that *Vine* plants taken to the West Indies from *Madeira* are said to succeed better than plants brought directly from France. We may be quite sure, however, that effective acclimatisation can be attained only by raising from seed and selecting those plants that carry the variation of greater hardiness. This, indeed, is evolution—first of all, variation, without which nothing can be done, then the survival of the fittest. Darwin says: "I am aware that the attempt to acclimatise animals or plants has been called a vain chimera," and he adds that "no doubt the attempt in most cases deserves to be thus called if made independently of the production of new varieties endowed with a different constitution."

It is shown, as in the case of the *Kidney Bean*, and as I have mentioned in the case of the *Deodar*, that plants from seed do vary in the degree of cold they are able to stand. Darwin certainly did believe in the fact of acclimatisation, (once or twice he uses the word naturalisation apparently to mean the same thing) but he does not seem to have thought that it had been carried very far. He writes: "As no single instance has been recorded either with animals or plants of hardier individuals having been long and steadily selected, though such selection is admitted to be indispensable for the improvement of any other character, it is not surprising that man has done little in the acclimatisation of domesticated animals and cultivated plants." Nevertheless he gives many instances of interest which seem to demonstrate the fact of acclimatisation, even if it has not gone very far. It is well known, he says, that of almost every plant long cultivated varieties exist which are endowed with constitutions fitted for very different climates, and numerous examples of this are given.

Many plants have become suited to the climate of America, and in the case of Apples not one will succeed in England [?—Eds.]. It is interesting that *Mignonette*, *Sweet Peas*, *Turnips* and *Carrots*, succeed in India from seed saved there, but not so well from seed imported from Europe, and we are reminded that acclimatisation refers to hotter as well as to colder climates. It was found by Prince Troubetzkoy that of several kinds of *Pear* planted near *Moscow*, the *Poire sans Pepins* was the only one that could stand the cold of winter. The *Forelle Pear* flowers early, and the flowers can stand a frost which kills the flowers of all other kinds. It is unlikely that these *Pears* had an origin differing from that of other *Pears*. *Oranges* in Italy appear to have made them-

FIG. 90.—*CIRSIUM ERIOPHORUM* (SEE P. 225).

now cause the blocking of streams as it formerly did, but this may be due to the need of reproduction from seed, which cannot take place, if, as stated, there is only the male plant in this country. It is well known, however, as Darwin, I believe, states in his *Origin of Species*, that "slight changes in the conditions of life are beneficial to all living things."

In the Cambridge Botanic Garden I have myself observed several facts which are not recorded as evidence, and which appear to have a bearing upon the subject of acclimatisation. The *Soya Bean*, for instance, is usually regarded as tropical, but I had one variety which reproduced itself for years, like any hardy annual, and in some seasons obviously could produce a very fair crop. An illustration of a plant in fruit appeared in *Gard. Chron.*, January 26, 1918, p. 38. This variety, I believe, is grown in the north of China, and it is, of course, only another example of an anciently cultivated plant which has varied to suit more or less differing climates. Another case to place on record is that of a large bed of many *Deodars* raised from Indian seed, all of which were killed in the severe winter of 1879-80, with

selves a home there as soon as they were raised from seed instead of being grafted. The Peach apparently in spreading during the last 2,000 years over the middle part of Europe, must have become much hardier. The Irish Yew in New York is quite hardy, while the common Yew is cut down. The former must have been a seedling from the latter, since it was found in the mountains above Florence Court. Of the Sweet Potato there are varieties suited for colder and for warmer climates. French Beans in May, 1836, are recorded as killed, with the exception of one in thirty, and in Darwin's own garden Scarlet Runners have been killed with the exception of a dozen in 390.

Sufficient has, perhaps, been referred to, and the question may now be asked whether the possibilities of acclimatisation amount to anything of practical value. If there are possibilities of any value, it is surely time that experiments were carried out in a systematic manner. We are precisely where we were when Darwin wrote, and his words quoted last above stand as a live indictment of present-day neglect. In conclusion, it may be said, in a word, that acclimatisation does not consist in finding out how to manage a plant or animal under strange conditions, as some seem to have thought. It consists in the alteration of habit or constitution in the plant or animal itself, so that it is adapted to the strange conditions. *R. Irwin Lynch, V.M.H.*

**PALMS OF THE RIVIERA.\***

A FEW individuals are found here and there in Riviera gardens of a Palm which very much resembles *Livistona australis*, but is readily distinguished from that species by its leaves, which have incisions reaching almost to the petiole, and which hang down around the stalk in a way which reminds me of certain brooms made of long strips of cloth. This Palm was always known as *Copernicia cerifera*, and it was introduced about the same time as *Livistona chinensis* and *L. australis*, which explains why large specimens exist here. I was always perplexed and doubtful as to the identity of this Palm, which does not produce the least wax, while *Copernicia cerifera*, as its name indicates, does produce wax, the latter forming a coating on the leaves and is scraped off to use for making candles.

I sent materials of this Palm to Prof. Beccari, who found that it was not a *Copernicia*, but an undescribed species of *Livistona*, and he named it *Livistona decipiens*. Prof. Beccari gave me, at the same time, an illustration of the plant, which well shows its habit, and the bases of the dead leaves nearest the lowest part of the trunk, while the middle part of the stem is clear of such. He regarded the presence of these leaf bases as a useful character for distinguishing the species, but I think that I can give a very simple explanation of their presence only on the lower part. When these leaf bases have been soaked by rain, which sinks down from the top of the tree, being slowly conducted towards the trunk by the position of the petioles, they are easily pulled off, while when they are dry, they can only be detached with the greatest difficulty. A gardener passing this Palm just after rain would be likely to pull off the dead leaf bases which are wet, but the lower ones, which the rain has not reached, are too difficult to detach. Thus they are left and perhaps never removed, and we have the curious appearance of a Palm trunk without bases of dead leaves on the younger part, but retaining them on the lower and older part. In confirmation of this simple explanation I have found instances of this species with the trunk free of all bases of dead leaves right down to the ground, and I may also add that quite lately I saw in a garden a very old specimen of *Livis-*

*tona australis*, on which the bases of the dead leafstalks existed near the ground, while for many metres high above them the trunk was quite clear. Thus the character in question, which Prof. Beccari gave as distinctive of *Livistona decipiens*, is not a reliable one. The leaves, however, are so characteristic in shape that the species is easily recognised, at least when not very young. *Livistona decipiens*, the habitat of which is up to now unknown, probably comes from Australia. It is as hardy as *Livistona australis*, and though it is less ornamental than this last it merits a place in gardens by its rather curious appearance, where variety is sought for.

*Livistona Mariae*, F. Miel, another Australian species, is of very great interest, on account of its red leaves, a most rare character in Palms. I never saw large individuals of this species, which, if I am not mistaken, does not exist in any Riviera garden, except my own. Young plants have proved quite hardy, not hav-

measured just three feet in length, and the tallest plants, over five feet in height, were extremely picturesque; particularly as the underside of the leaves is white and cottony, and the veins are nearly white. The leaf-segments alternately point upwards and downwards, and each ends in a long sharp spine. Well-grown globose flower-heads are seven inches in circumference, but the purple flowers do not much exceed the shaggy involucre bracts, with their slender recurved spines. The plant is therefore difficult to handle, and yet Hooker says, in his *Students' Flora*, that "young parts are eatable as salad and cooked."

This Thistle is frequent in Somerset, and especially on the Lias (it grows finely on the Liasic Polden Hills, between Street and Bridgewater), and on the Kenper Marls and Oolite. Indeed, the first British record, of Lobelius, in 1570, spoke of it as *Frequens hæc in Anglia collibus strigosis Sommerseti*. It is very rare, in west Gloucestershire, but appears in most

FIG. 91.—*VIBURNUM DAVIDII*: FRUITS TURQUOISE BLUE. R.H.S. AWARD OF MERIT, OCTOBER 3. (SEE P. 211).

ing suffered even by the severe frost of December, 1920. If the quite distinct purplish-red colour is retained when the Palm reaches the adult stage, I should consider it a most important acquisition. If I am well informed, this species is very rare in its native country, Australia, and menaced, as are many other interesting plants, by extinction. It would appear to be very desirable that it should be propagated in gardens before it is too late. *Dr. A. Robertson Proschowsky, Jardin d'Acclimatation, Les Tropiques, Nice, France.*

**CIRSIUM EROPHORUM, SCOP.**

The photograph of the Woolly-headed Thistle (Fig. 90), was taken on August 21, on a steep slope of rough pasture resting on Lower Lias above the Chew valley, between Bristol and Bath. There, and on the plateau above, this handsome biennial Thistle is abundant, and is associated with Teasels and other attractive plants. The actual slope, where many hundreds of rosettes of root-leaves and some 150 flowering spikes, three to five feet high, adorned the landscape, was also dotted with small bushes of Hawthorn.

The largest of the root-leaves of the *Cirsium*

of the English counties from Durham to Somerset and Kent. It is not recorded from Scotland or Ireland.

On the Continent the Woolly-headed Thistle occurs in most of the central and southern countries, and extends north to Belgium. But it is very polymorphic, many varieties, and at least one hybrid,\* being named; and it would seem that the English form is peculiar,\*\* for Prof. Petrak, of Czecho-Slovakia, much wanted forty English specimens for his *Cirsiotheca*. These I have succeeded in drying, and shall shortly send to him.

On cutting the heads in two it was desirable to immediately poison them with corrosive sublimate and camphor in methylated spirit, and to add a copious supply of naphthaline to the dried sheets. The stout, furrowed stems of this Thistle not only contain much pith, but they possess extremely strong fibres. Probably, however, the very prickly nature of the plant would tend to make it unsuitable to grow for commercial purposes. *H. Stuart Thompson, Clifton.*

\* The hybrid recorded by Rouy in *Flora de France* is with *C. arvense*; but I believe one of my Somerset specimens is crossed with *C. oxtans*. It may also hybridise on the Polden Hills with *C. laecolatus*.

\*\* It may be added that Dr. Petrak, in his Monograph on *Cirsium*, refers to the English *C. eriophorum* as sub. sp. *anglicum*. *H. S. T.*

\* The previous articles by Dr. Proschowsky were published in our issues for May 1, June 12, July 10, September 4, November 29, December 18, 1920; March 12, April 30, June 11, October 8, November 19, 1921; January 21, February 11, April 1, June 17 and July 29, 1922.

## CHINESE TREES AT ALDENHAM.

(Continued from p. 166.)

**PYRUS:** In order to differentiate between the various sections that form the *Pyrus* group I have, in dealing with Mr. Wilson's introductions, abandoned the American practice, under which they were determined, of according specific right to such as *Sorbus*, *Malus*, etc., and followed the lines employed at Aldenham, whereby the term *Pyrus* is reserved for the true Pear section, and certain hybrids, the Mountain Ash or Rowans being referred to as *Pyrus Aucuparia*, Whitebeams as *Pyrus Aria*, the Crab Section as *Pyrus Malus*, whilst the term *Pyrus Sorbus* is reserved for the true Service Tree representatives. There are three other small sections known as *Micromeles*, *Erolobus* (closely allied to the *Malus* group), and the *Chokeberries* which are placed in the section *Aronia*. This system, whilst grouping the different sections under their generic name of *Pyrus*, has the advantage of distinguishing each section by the adoption of what may be referred to as a subgeneric name. Reference to *Docynia* exhibits the only case where I have thought advisable to depart from this procedure.

Amongst the many species and varieties of *Pyrus* collected in China by Mr. Wilson the following are worthy of special mention:—

**PYRUS CALLERYANA:** This species was known long prior to Wilson's journeys, but a specimen at Aldenham, now 20 feet high, was raised from seed collected by him. The spring colouring of the young foliage is very pleasing, and is enhanced by the clusters of white flowers.

**PYRUS PASHIA:** Like the preceding, this species has been long in cultivation, but the Aldenham specimens, now 20 feet high, are from Mr. Wilson's collecting. It is a very pretty Pear, with white or rose-coloured flowers, the beauty of which is much augmented by clusters of deep red stamens.

**PYRUS AUCUPARIA CONARDINAE:** 14 feet. This is a very effective Mountain Ash, the leaves of which are snowy-white on the underside, and the freely-borne fruit, coloured scarlet to golden-red.

**PYRUS AUCUPARIA SARGENTIANA:** The Aldenham specimen is 7 feet high, and gives promise of making a fine tree. Even when leafless the strong branches and rich brown buds are conspicuous. It is described in *Plantae Wilsonianae* as being a remarkable species, and one of the most beautiful of the whole genus. The large corymbs of small, red fruits are very striking, resembling those of *P. A. Harroviana*, which though also very attractive, has not done well at Aldenham.

**PYRUS AUCUPARIA SCALARIS:** 8 feet. This is a very distinct Mountain Ash with fine red fruits and deeply-cut foliage, and proves a close competitor in beauty with its two near relations which follow immediately.

**PYRUS AUCUPARIA SUBARACHNOIDEA:** 10 feet. This is unquestionably one of the most distinct and beautiful of newly-introduced Chinese trees. It develops large corymbs of small, pearly-white fruits, and is of great interest when they are ripe.

**PYRUS AUCUPARIA VILMORINII** (Syn. *P. foliolosa*): This *Pyrus* was originally sent to France by the Abbé Delavay in 1889, and is justly considered by Mr. Bean to be one of the most elegant species introduced in recent years. It is particularly attractive when in fruit, the berries being of a distinct, rosy-red colour, which whitens as they become fully ripe.

**PYRUS MALUS PRATTII:** 10 feet. A very distinct species, appertaining to the Crab Section, with white flowers and red fruits.

**PYRUS MALUS PRUNIFOLIA VAR. RINKII:** A very interesting Crab which has been long known in cultivation, but was discovered in a wild state by Mr. Wilson in Central China. When grown in standard form it is particularly good, and a specimen at Aldenham, 14 feet high, with a

girth of one foot, is an ornamental tree of great merit.

**PYRUS MALUS THEIFERA:** 12 feet. One of the most attractive of spring-flowering trees; the beauty of the large Medlar-like, bluish-pink flowers is intensified by the colour of the young leaves as they are unfolding.

**PYRUS MALUS TRANSITORIA TORINGOIDES:** 12 feet. This is a handsome tree with pretty foliage, a little resembling that of the common *Crataegus oxyacantha*, though larger and more deeply cut. The flowers are not particularly showy, but the bright red fruits, in size and colour like a White-heart Cherry, are produced in abundance, and make a charming display.

**PYRUS MALUS YUNNANENSIS:** 15 feet. This, which is also known as *Pyrus Veitchii*, is a handsome tree, with numerous corymbs of white flowers that are succeeded by red fruits.

**PYRUS MICROMELES MEGALOCARPA CUNEATA:** 6 feet. The fruits of this tree are described by Mr. Wilson as being russet-green in colour. It belongs to the section of this great genus, which was formerly separated under the name *Micromeles*, and in common with others of this type has the fault of coming into leaf too early, in our changeable climate, and so suffering from late frosts.

**PYRUS MICROMELES FOLGNERI:** 12 feet. A very pretty tree, with somewhat pendulous branches and dark green leaves. It bears large corymbs of white flowers, which are succeeded by quantities of bright red fruits.

**PYRUS MICROMELES CALONEURA** AND **PYRUS MICROMELES MELIOSMIFOLIA** are two other members of the same section as the last two mentioned. The former is now a shapely specimen, 12 feet in height, and is chiefly remarkable for the light reddish-brown tone of the expanding foliage. It develops numerous white flowers which are borne in corymbs, and these are followed by interesting, brown-coloured, Pear-shaped fruit. As the varietal name implies, the foliage of *P. m. meliosmifolia* bears a distinct resemblance to that of an entire-leaved *Meliosma*, and, like the preceding, the colouring of the young foliage is very attractive in spring. The plants at Aldenham are 8 feet tall.

**RHUS VERNICIFLUA:** Generally known as *R. vernicifera*, the "Chinese Lacquer Tree" has proved, when grown from Mr. Wilson's seed, to be a very hardy and fast-growing tree. The Aldenham specimen has reached a height of 25 feet and has a girth of 27 inches. The old form from Japan was tried and failed at Aldenham, but Wilson collected seed at much higher altitudes, and the plants raised from his seed have proved quite immune from damage by frost. *A. E. Thatcher*.

## COLONIAL CORRESPONDENCE.

### AN EXPERIMENT WITH LATE-FLOWERING CHRYSANTHEMUMS.

REMEMBERING that many of our deciduous shrubs give a wealth of flower without at the time having any foliage, it occurred to me that the same thing might happen with the *Chrysanthemum*, and last year, about the latter end of October, before lifting the two dozen or so late-flowering varieties which had been grown in the open ground all the summer, I picked off all their leaves, lifted the plants carefully, and replanted them in the border of a greenhouse, where they got midday and afternoon sun. The plants were sprayed three times, watered very sparingly, and left pretty much to their own devices. They began flowering about the middle of November, and continued—some of them—up to the third week in January of this year. The flowers were normal in size and colour, and almost as plentiful as if they had been grown on pot plants and better in every way than any previous attempts of mine had been in connection with lifting and trying to keep the foliage on.

It may be unnatural to remove the leaves of herbaceous perennials, but I think in the case of the *Chrysanthemum* the stems, stipules and bracts contain enough energy and are suffi-

ciently green to bring the half-developed flower-buds to perfection. No doubt those in question were helped by the sun heat they had for a short time, with the rest of the 24 hours cool, and sometimes a little frost. These are the conditions under which many of the deciduous shrubs flower in the early spring. Those who have no time to bother with growing *Chrysanthemums* in pots may by this plan have cut flowers for the house all the early winter months if they have a glasshouse from which the severest of the frosts are kept out. *G. Fraser, Ucleulet, B.C.*

## INDOOR PLANTS.

### ASPARAGUS.

Few plants are more useful or popular for supplying foliage for all kinds of decorative purposes than the greenhouse members of *Asparagus*. As decorative foliage plants they have largely taken the place of *Adiantums* and other Ferns on account of their lasting properties. At the present day one or two species of *Asparagus* are grown by tens of thousands for the market as pot plants, and in many nurseries whole houses are devoted to them for supplying cut foliage to the florist for all kinds of decoration. Certain species are much more in demand than others. *Asparagus plumosus*, commonly known as the *Asparagus Fern*, may be considered the most useful and best on account of its value and uses as cut foliage, whilst as a pot plant it is also valuable; it may be planted out in a warm greenhouse, or conservatory with a moist atmosphere, against a back wall, or trained up pillars.

When in good condition it will make growths 10 feet to 12 feet in length in one season, and is much in demand for the making of shower bouquets, as trails of greenery in floral designs and for other purposes.

It requires to be grown in a moist, warm house in rich turfy soil; free drainage is essential and plenty of root room. When well rooted the plants may be given liquid manure once a week during the summer.

This *Asparagus* does not do well in a low temperature; in too cold a house it loses its beauty and is of no further use. *A. plumosus nanus* is a dwarf variety of the popular *A. plumosus*. Its Fern-like foliage is light and refined, its shade of green so soft and bright, and there is no other plant that can be compared with it.

The plant makes dwarf, compact shoots about 12 inches to 15 inches high; the frond-like growth is rather flat. As a table plant, or when grown in small pots, for the decoration of small vases, it is invaluable, lasting fresh for a considerable time.

*A. myriocladus* is a very distinct species, with long, erect, light green, feathery fronds of great substance on stiff stems, an admirable plant for pot culture.

*A. Sprengeri* is a charming species and most useful for all kinds of decoration on account of its long, light sprays, with short branchlets, producing a profusion of elegant sprays 4 feet to 6 feet in length, of a vivid green hue. The plant is a rapid grower and does well in pots or baskets. Suspended from the roof rafters it is unsurpassed in beauty, with its long trails of foliage hanging gracefully down for several feet. It is a most popular plant of great durability, and the shoots will last fresh many days after being cut. It is fairly hardy, and will withstand a low temperature during the summer, which makes it invaluable for suspending in baskets in a cool conservatory, large hall, dwelling or room. *A. Sprengeri compacta* is a remarkably pretty basket plant. In some respects it is an improvement on the type in producing a profusion of elegant sprays, 24 inches to 30 inches in length, which impart a dense habit to the plant. It is a very useful addition to the list of subjects for growing in suspended baskets, and is equally suitable for pot culture.

*A. racemosus*, a climbing species of elegant habit, is admirably adapted for covering pillars, or trellis work in a conservatory or warm greenhouse. The slender branchlets and sprays of glossy green foliage are very effective.

*A. crispus* (syn. *A. decumbens*) has long

branches of dark green, delicate foliage, and a drooping habit that makes it specially suitable for growing in hanging baskets.

*A. tenuissimus* is a charming contrast to any of the others, having a light green colour and delicate appearance. It is invaluable as a pot plant for table or other decoration. It does well planted out against a damp, moist wall, with the young growth fastened as closely as possible to the brickwork, when it will take root at every joint, and form small plants which look very effective, and are always greatly admired. There are other species and varieties, but those described are the best for general purposes.

All the species of *Asparagus* may be increased by divisions of the roots in the spring, or by seed sown early in heat. The seedlings, if grown on in moderate heat during the summer, will make good plants by the following season. They do well in rich soil; when well rooted watering with liquid manure once a week during the summer is beneficial to them. They need plenty of moisture and shade from the hot sun. They may be grown in a house having a winter temperature of 55° to 60°. The summer temperature should be 65° to 70°. Artificial warmth is not needed during hot weather, provided the house is kept moderately warm.

*Myrsiphyllum (Smilax) asparagoides* is allied to the *Asparagus* and makes an excellent climbing plant, with slender, graceful, bright, glossy green sprays unequalled for festooning, or for use in bouquets, and as trails for table and other decoration. Sprays may be cut 4 feet to 6 feet in length when the plant is grown in a warm house with moisture, and trained against a damp wall or up pillars.

*M. asparagoides myrtifolia* is a pretty, Myrtle-leaved variety. It grows very rapidly when planted out, and produces sprays freely. The foliage is of great durability and will last fresh for several days after being cut. Both are increased by divisions of the roots, or by seed sown in a warm temperature in spring. *John Heal, V.M.H.*

### KNIPHOFIA GRACILIS.

THE *Kniphofias* are picturesque and noble plants, popularly known as the "Torch Lily," "The Flame Flower," and "Red Hot Poker" plants. They were formerly classed as *Tritomas*, and are sometimes met with in gardens under this name.

Since their introduction during the 18th century from the Cape of Good Hope vast numbers have been added to the list, and during the past ten to twenty years many magnificent varieties have superseded the older kinds, in both large and small flowered sections. The latest introduction are those of the *K. gracilis* group, a small-flowering race that will revolutionise all previous introductions when known, and used extensively for rockeries. They form a group of many shades of colour, and flower in unbroken succession from the end of June until quite late in the year. At the time of writing, September 23rd, plants are in flower in abundance, in shades of citron, yellow and tones of gold to bright scarlet and coral. They are charming as cut flowers for the table or any form of decoration, and make a beautiful display when mixed with a little of their own Grass-like foliage. The flower scapes are not so large as in the stouter types, but what they lack in size is richly compensated for by the more floriferous character of this type, for the plants continually throw up, in rapid succession, numerous scapes from 2½ to 3½ feet tall.

It is a common occurrence to count 20 to 50 flower spikes on one clump, and their graceful Grass-like foliage adds considerably to the general effect. When planted in groups of 6 to 12 plants, and from 9 inches to 12 inches apart, they will quickly form effective clumps, and when intermittently grouped amongst low-growing shrubs, or clumps of *Aconitums*, *Delphiniums*, *Spiraea venusta*, *Pannas Grass*, or other taller growing subjects backed by such plants, they lend great charm to the landscape; clumps may also be planted on lawns, or in any part of the garden where colour is required to be

visible at a long distance. If planted on the lawn such plants as *Erigeron Elsie*, *E. Edina*, *Violas*, *Epimedium* or other dwarf-growing plants, may be used as an edging or groundwork, which considerably adds to the general effect.

An open situation, with a good, deeply dug, sandy loam, and well-drained soil suits these plants admirably, and they should be transplanted in the spring. Should the weather of winter be severe all the covering or protection necessary is a few Bracken leaves.

A few of the better forms of *Kniphofia gracilis* are *Golden West*, rich golden self, very free,

*Sovereign*, golden yellow, very showy, 3 feet; *Alaska*, rich canary yellow self, very free, 3 feet; *Jaune Supreme*, deep orange yellow, 3 feet; and *Golden Spire*, rich yellow, very free, 3 feet. *W. Logan.*

### GLADIOLUS PRIMULINUS GELYCE.

As is well known, the type of *Gladiolus primulinus* is a small yellow flower, spaced rather widely apart on a slender stem. Many of the hybrids described as yellow are much paler than the type, and even run down the range to

FIG. 92.—GLADIOLUS PRIMULINUS GELYCE.

2½ feet tall; *Chrysolora*, dark lemon yellow, orange tipped, 3 feet; *Daybreak*, yellow flushed green, with orange tip, 2½ feet; *Solferino*, a beautiful guinea-golden yellow, with a transparent-like effect, very effective, 2½ feet; *Coral Queen*, pretty coral red, very attractive, 2½ feet; *Prince of the Netherlands*, long, tapering spikes of translucent orange scarlet flowers, very distinct, 3 feet; *Défiance*, brilliant scarlet, 3 feet; *Orange Queen*, deep orange yellow, compact rounded heads, very distinct, 3 feet; *Victorine*, a pretty, rich orange yellow, very free, 3 feet; *Sunset*, orange scarlet with translucent-like appearance, very effective, 3 feet; *Nympe*, brilliant orange, passing to a bright red, 3 feet; *Scarlet Prince*, rich scarlet shading to orange, 3½ feet; *Lady Hillingdon*, sulphur yellow, top half orange red, large, tapering flowers, 3½ feet;

cream; further, most of them have markings, more or less pronounced, of scarlet, red, maroon, and even brown. Two new yellow varieties were recently shown at the R.H.S. fortnightly meetings—*Butterboy*, which received an Award of Merit, and *Gelyce*. The former is one of the largest and finest I have yet seen, but it is paler than the type, and has a fine dark line on the inferior petals. It is not butter yellow, as generally understood. *Gelyce*, which is illustrated in Fig. 92, is not so large as *Butterboy*, but is the purest yellow I have yet seen, and has no marking whatsoever. The flowers, which are borne on a tall spike, are rounder than those of the type. Both are strong growers, and when stocks have increased should be in great demand. *Smilax.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from p. 204.)

ENGLAND, S.W. (continued).

**GLoucestershire.**—The fruit crops generally are good, excepting Apricots and Peaches. Apples are exceptionally good. Trees of Bramley's Seedling, Newton Wonder, Allington Pippin, and Lane's Prince Albert are carrying very heavy crops. Beauty of Bath was also very good, but was quite a month later in ripening than last year. Small fruits, and especially Gooseberries, were all plentiful. Strawberries were a good crop, but smaller in berry than usual. We have a big crop of Damsons, also Filberts. Pears, with the exception of Williams' Bon Chrétien, are poor. *A. B. Smith, Balminton Gardens.*

—Fruit trees and fruit gardens never presented a more beautiful appearance in my experience than in the spring, due, of course, to the splendid maturation of the wood in 1921. Apples are promising an average crop of first-rate quality. Pears set freely, especially on espalier trees and trees in the open. Pear trees on walls, owing to their earlier flowering, suffered a little from frosts, but are bearing good, average crops. There were heavy yields of culinary Plums, but dessert varieties were rather light. Small, soft fruits were rather below the average, excepting Strawberries, which gave a heavy and good crop, and Raspberries, which were plentiful. Our best variety of Strawberry is Laxton's Bountiful. Peaches, Nectarines, and Apricots were disappointing, which is accounted for by the fact that sharp frosts and snowstorms prevailed at the time of flowering. Our soil is a light, sandy loam, overlying limestone. *Frank J. Clark, Westonbirt Gardens, Tetbury.*

—The Apple crop is a good one; 3½ inches of rain that fell from July 1 to July 8 did wonders. Raspberries and Loganberries quickly responded to it. Apples, Pears, and Plums are satisfactory. Filberts are wonderfully good. These trees, of which we have a hundred or so, were neglected during the war and became much overgrown. They were cut down about three years ago, and are now good, dwarf bushes well laden with fruit. Walnuts appear to be bountiful. There is also a heavy crop of Beech mast. Our kitchen garden is on the old red sandstone, and through continued cultivation and dressings is rich in humus. *John Banting, Tortworth Gardens, Falfeld.*

—The Apple crop is rather patchy in this county, but there is a fair average crop on the whole. Blossom weevils and caterpillars have done much damage in some places. The Pear crop is a fair average one, but not so heavy as was anticipated. Plums were a good crop, especially the variety Pershore. Blaisdon Red was a varying quantity, and other varieties are, on the whole, good. Victoria Plums are suffering badly through silver-leaf disease. Gooseberries suffered early and severely through American Gooseberry mildew, in spite of dry conditions. The crops of Black Currants in the county are being reduced considerably through "reversion." Strawberries have done well. *G. H. Hollingworth, Shire Hall, Gloucester.*

—The cold weather during spring retarded the blossoming period advantageously until May. The trees, generally, were heavily laden with bloom, but, fortunately, only a moderate amount of fruit set, and, in spite of Apples dropping freely, enough remain to form good specimens. Owing to cold, sunless, wet weather, Cherries were not so good flavoured as they should be, whilst Strawberries were more acid than usual. *George H. Emmett, Lindore Gardens, St. Briavels.*

—Plums were on the small size, and especially the varieties Early Prolific and Pershore. One thing very noticeable is the average crop of Blenheim Pippin Apples, which we get only every other year. Gooseberries and Red Currants were very good. Black Currants were under the average yield, as a

lot of the bunches tailed off. Raspberries and Loganberries were very good. Plums Early Rivers, Czar, Pershore Yellow, Black Diamond, Cox's Emperor, and Magnum Bonum were very plentiful. Cooking Apples are an average yield, but dessert sorts are under. Pears Red Lammas, Williams' Bon Chrétien, and Pitmaston Duchess are under the average yield, but of good quality. Our soil is very good for dry seasons, and does not get waterlogged in rainy weather, but it is difficult to work for a day or two after rain, as it gets sticky. It is on rotten-stone and rock, but the top soil is over 2 feet deep, and so, of course, retains moisture. *J. Osmond, Ebrington Hall Gardens, Campden, Glos.*

**HEREFORDSHIRE.**—The fruit crops generally are good, and the trees clean and healthy. Apples, Pears, and Plums are heavily cropped, and the trees are free of insect pests. Strawberries were a good crop, but, owing to the spring drought, the berries were on the small side. Nuts are a heavy crop. *Thos. Spencer, Goodrich Court Gardens, Ross.*

—The Apple crop is good after the bumper year of 1921, and much better than could be expected. Pears are an enormous crop. The trees are laden with fruit. Plums are also plentiful, and all other stone fruits, especially Damsons, are a heavy yield. Small fruits have been good, especially Strawberries and Raspberries. The soil is somewhat heavy in texture. *W. G. Crooked, Kentchurch Court Gardens.*

—Some Apple trees which bore heavily last year have fair crops; others had not a single blossom. On the whole, the blossom was good, but the nights were chilly in spring and rather unfavourable to the fruits setting well. The quantity of Pear blossoms was very exhausting to the trees, and comparatively few fruits set, and the weather was not very good at setting time. Plum trees produced an abundant amount of blossom generally, and a fair number of these set fruit. There is some leaf curl following aphid attack. Red Currants did not set very freely, and were a short crop in comparison with other years. The weather was bad. Gooseberries set well. Sawfly and *Abraxis grossulariata* have not been troublesome on the bushes. Some Black Currants "tailed off," but we had a fair crop. Strawberries were badly affected by the drought. *H. E. Durham, Dunelm, Hereford.*

(To be continued.)

## MARKET FRUIT GARDEN.

HOPE of a spell of fine autumn weather in which to get the plantations clear of weeds has almost disappeared. There was no chance to do any hoeing or horse cultivation during September, for rain fell on eleven days, the total amounting to 2.96 inches. Altogether it was a very unpleasant month, cold and wet, with a gale on the 16th, and a severe thunderstorm with heavy rain on the 23rd, both of which took their toll of the Apples and Pears.

### FRUIT IN A WET SEASON.

The effect of the sunless season is seen in lack of colour in Apples, particularly late varieties. In this respect the fruit is much superior from grassed orchards, which generally score in a wet year. The grass causes earlier finishing of the fruit; and colour comes with maturity. One naturally expects size in a wet season, but it is curious how varieties differ. With me, fruits of Lane's Prince Albert are extra large, but Bramley's Seedling are rather small. Cox's Orange is much smaller than it was last year, when it reached an astonishing size almost everywhere, seeming to revel in the drought. No doubt it is warmth that is lacking this season. On the whole, however, Apples are larger and of better quality than they were in 1921. Even Worcester Pearmain is worth eating. Pears, on the other hand, though large, are lacking in flavour.

Fruit trees are losing their leaves much earlier than they did last year; so little further development of the fruit can be expected. The

heavy crops of Cox's Orange Pippin, Allington Pippin, Blenheim Pippin, Bramley's Seedling, and Newton Wonder are yet to be gathered; and the market offers no temptation to proceed with the work before it is absolutely necessary.

### FIRST EXPERIENCE OF BOXING.

Worcester Pearmain is generally a popular Apple with the public, but this year it has sold very slowly. I found, as anticipated, that boxing helped greatly in the disposal of a heavy crop of this variety. Prices were by no means sensational, even for fine Worcesters in boxes, but they did sell readily at 2s. to 3s. a bushel more than in half-sieves. I doubt if this difference in price is enough to make boxing pay; but there is great satisfaction in placing the fruit on the market in such attractive form.

I found the process of boxing much easier to learn than I expected. Anyone who starts with a grasp of the theory of the business should pack quite well after half a day's work, though he will be some time in gaining speed. Even the separate wrapping of each Apple in tissue paper, to which people are apt to demur, proves quite a simple matter if a rubber stall is worn on the middle finger of the left hand to facilitate picking up the paper; and it certainly helps matters by making the Apples lie just where they are put in the box.

Beginners should note that in Covent Garden, at any rate, only large fruit is wanted in boxes in a season of plenty. Worcesters, for instance, were not appreciated under 2½ inches in diameter, and they sold much better if over 2½ inches, or not more than 175 to the bushel box. Enormous specimens, which went only 138 to the box, and seemed really too big for dessert, made the highest prices.

### A NEW GRADER.

The greatest help in boxing Apples is to have the fruit accurately sized in advance. It is possible to box from a mixed sample, but it is much slower and more difficult. On a small scale the fruit can be sized by hand, but on anything like a large scale this becomes a tedious and expensive process. A mechanical grader, even if it does not give perfect results, is certainly a great help and labour-saver. The machines at present available occupy a lot of space in the packing house and are expensive. I recently had the opportunity of inspecting a new grader which is free from these objections. It is the invention of a practical fruit-grower, Mr. F. B. Purchas, of Hitchin, and works on an entirely new principle. The Apples are fed from a hopper on to rotating discs bored with holes of various sizes. There are two of these grading discs, one above the other, with a padded disc below each for catching the graded Apples and distributing them to their respective collecting trays. The machine works easily and smoothly, and delivers the Apples in five grades without injuring them in any way. It is, indeed, quite capable of dealing with Tomatos, which are much more tender. It is expected that this new grader will form an interesting exhibit at the coming Imperial Fruit Show, and that it will shortly be placed on the market.

### APPLE CRIMSON BRAMLEY.

A few trees of this variety are bearing a light crop for the first time this year. In spite of the sunless season the fruit is entirely covered with deep crimson, and is most attractive. In every particular, except colour, this Apple is identical with the ordinary Bramley, from which it originated as a bud sport. Market growers have planted it to some extent; and those who are planting new orchards might be well advised to choose the crimson form of Bramley. Its brilliant colour can hardly fail to give it preference with the public.

### MARKETING DIFFICULTIES.

This is a small country, but it is almost impossible to send fruit from one end of it to the other, owing to high railway rates. London is usually the worst market of all, especially during the summer months, when people are on holiday. The northern markets have been much better this season; but they are quite out of reach of a southern grower. I inquired the owner's risk rate for Apples in ton lots by goods train from my station to Glasgow, which is a

good market for graded fruit. It is £4 18s. 3d. per ton! I have no doubt that an American grower can get his Apples on to the Glasgow market for much less. Midland and eastern counties growers are in the best position for marketing, as they are within about equal distance of London and the northern towns. We have some good seaside markets in the south, but they are easily glutted, and they are busy for a short season only. Anyone who thinks of starting fruit growing should get within reach of northern markets, and leave Covent Garden out of account altogether.

#### LIVE STOCK IN ORCHARDS.

Visitors are always surprised that I do not run live stock of some kind in my grass orchard, but they do not satisfy me that it could be done without injury to the trees, which have stems only 3 feet high. Sheep would keep the grass down and do the land most good, but they would probably reach up into the trees after the leaves if they did not gnaw the stems. Pigs are open to the objection that they root about and leave the land very rough. Poultry need a great deal of attention and do not keep the grass down. Then with any stock there is the difficulty of finding another run for them whenever spraying is in progress. I believe it is best to keep to the present plan of mowing the grass and letting it lie on the surface, though I am quite open to be convinced to the contrary by any grower with experience of stock in an orchard of low half-standards.

#### NO WASPS.

I have never known a season so free from wasps. A store of carbon disulphide was laid in ready for destroying the nests, which are often very numerous on this farm; but not a single nest has been found. When there is a plague of aphids we are generally told that it serves us right for killing off the wasps; but this year we have no aphides to speak of and no wasps.

Several correspondents mention the killing of queen wasps in the spring; but it is not a fact that the vast majority of the wasps taken at that time and exhibited at country flower shows are not really queens at all, but drones that have been in hibernation? There were hundreds of these so-called queens amongst my trees in the spring; yet we had no nests. *Market Grower.*

### FRUIT TREE GROWTH IN 1922.

THE differences in the two seasons of 1921 and 1922, recalled by *Market Grower*, in your issue of September 16, bring forward an interesting problem. In the course of several visits to fruit plantations, I was impressed by the exceedingly healthy growth of all fruit trees, which is not always the case in a wet season. It seems to me probable that fruit trees, judging not only by the amount, but more especially by the health, of their growth, are benefiting more this year than last from the abundant sunshine of 1921.

Also, since growth is practically proportional to the supply of nitrogen so long as that supply is below the maximum required by the plant, and as the sun is well known to favour the work of the millions of nitrifying bacteria in the soil, besides being detrimental to the life of protozoa, which feed upon these beneficial bacteria (protozoa are killed by a relatively low temperature and are entirely absent from the soil at a temperature of 100° F.), probably an excess of nitrogen was stored in the soil, and fruit trees were able to draw on an available supply directly conditions became favourable for growth, and, in this way, were able to get ahead of pests and go right on without a check. This steady growth must have meant that a large supply of food was manufactured, and this again must have had a great effect on the development of the fruit.

Likewise *Market Grower* says—one would expect fungous diseases to be especially prevalent owing to the wet season, but here also, is it not likely that the effects of last year's sun have lasted over till this year, and that the different fungi have not yet recovered from "sun-shock"? *Pip Pin.*

### WART DISEASE OF POTATOS IMMUNITY TRIALS.

At the testing station of the Scottish Board of Agriculture, at Philipstoun, West Lothian, which was established three years ago, a public demonstration of the results of the immunity tests carried out there this season was held on the 28th ult., the demonstrators being Mr. T. Anderson, of the Board's Testing and Registration Stations, and Mr. A. Millar, of the Registration Station.

As was the case last year, the tests this season were carried out on single tubers, and also on six tubers of each kind, the former, which do not qualify for the official certificate of immunity, being for the purpose of assisting breeders to eliminate seedlings which were not immune, and thus obviate waste of time in pursuing their further cultivation. Of these single tubers 567 were being tested for the first time, while 267 of those found to be immune last year were again under observation. The 45 varieties which proved to be immune last year under the official immunity test were again under observation, and 58 varieties were under test for the first time. In addition to these there were 42 German varieties and a French one under test. The test is a severe one, as, in addition to the infection already in the soil, each individual tuber is infected at the time of planting.

Referring to the general results, Mr. Anderson explained that in the single tuber tests numbers of pedigree seedlings of both immune and non-immune varieties were included, both from selfed and crossed plants, the object being to obtain a knowledge of the probable percentage of immune types which might be expected in either case. The most of the plants seemed to be genuine seedlings, but occasionally standard varieties appeared, which no doubt were accidental plants from tubers left in the ground. Of these single tubers at least 50 will qualify for inclusion in next season's tests.

It was found that selfed immune varieties produced a large number of immune seedlings, and that in many respects these reproduced the characteristics of the parents, and that in a few cases, as, for example, Ally, Abundance, and Templar, they were indistinguishable from the parents, and showed a high percentage of immune individuals. One series, the result of crossing a non-immune with an immune variety (President × Flourball), showed about 40 per cent. of immune individuals after a two years' test, but by crossing two immunes (Majestic × Flourball), a percentage of 70 to 80 of immunes was obtained. Seedlings of Up-to-date × Majestic also showed a fair proportion of immune types.

In the official immunity tests, for which six tubers of each variety are required, the results were disappointing, and indicated that raisers required the guidance afforded by the single tuber tests. Of the new and distinct varieties tested for the second season, 38 were found to be free from disease, and of those tested for the first time 16 were free from and an equal number susceptible to the disease. Numerous Continental varieties were also tested, some of which were free from the disease.

An inspection of the plots showed that some varieties had done much better than others. Dunvegan seemed to be a very poor cropper, and the haulm was affected with mosaic disease. Katie Glover (second early) showed a large yield, but of rather under-sized tubers. Majestic (early main-crop) produced a good crop of tubers of large size, while in Crusader the haulm seemed to die down too early, before the tubers were full grown. King Edward (non-immune) had done well, and Roderick Dhu showed a heavy crop of full-sized tubers. Field Marshal (non-immune) proved an excellent cropper, but some of the older varieties, such as Cardinal, Fortyfold, Pink Eye, Buchan's Beauty, Ashleaf, Kerr's Pink and Golden Wonder were producing quite as good crops as the majority of the new varieties. Among those undergoing trial for the second season the most promising were P., Ardnail Rose, Achievement, Dreadnought and East Neuk.

### HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**The Dunkeld Larches.**—Mr. A. D. Richardson has misrepresented my remarks in the *Gard. Chron.*, and also Grigor's *Arboriculture*. I therefore ask who was responsible for the publication of the Rev. James Headrick's report in 1813? Grigor states that the Rev. James Headrick published a report in 1813, and that he saw three large trees growing near the mansion house of the Lockhart of Lee. I completely fail to see that this is a legend. I think it is essential that some of this author's points are made clear. There is not the slightest doubt but that many of the accounts and reports of the Dunkeld, Menzie, Blair and Dalwick Larches do not agree, and Grigor states this in his *Arboriculture*. Loudon's *Arboretum et Fruticetum Britannicum* must therefore be unreliable, especially as Grigor's work appeared nearly 30 years later, and states the above. The pointless criticism which Mr. A. D. Richardson refers to on p. 189 is also misleading. It is not mine, but the publication I referred to. It is very essential to be correct on these points if one is to gain knowledge and unravel some of the inaccuracies of past authors. *Mark Mills.*

**Collerette and Collarette.**—Whilst I do not doubt that the word "Collerette" was originally applied to the ugly little Dahlias so-called, it is idle to say that "there is no such word as 'Collarette' in the English language." Had *C. H. P.* (p. 183) consulted a few dictionaries before making that statement he might have thought better. It is given in Funk and Wagnall's *Standard Dictionary* and also in Cassell's *English Dictionary*, in both cases with, no doubt, its original meaning; a collar, or a little collar, for ladies, in which sense it is still used. I suppose it was considered necessary to adopt a fresh word to describe Dahlias with a little collar, rather than use a word already in use in English—with precisely the same meaning as the French one, which has no more to do with Dahlias than the other! *C. N.*

**Autumn Show at Holland Park Hall.**—It is to be hoped that this great show was financially successful, so that the Council of the R.H.S. may be able to continue it for a series of years. So far as the show itself was concerned, there can be but one opinion, viz., that it was a huge success in every way. Of course, there may on future occasions be improvements here and there, but it must be remembered that this was a first effort in a strange place. The hall is not so suitable for exhibiting flowers as the one at Vincent Square, but then it was not built for this purpose; but, given fine weather, as on the first day of the show, no one will complain. It would be no easy task to decide which was the outstanding feature of the show. To me everything was good. Fruit was much better in quality than I expected to find it, and there was high colour in the Apples, and the size was good, whilst most of the fruits were free from blemishes. Hardy flowers were very fine, and few could have expected to find such an array of Lupins as was to be seen in several of the exhibits. Pot fruit trees have seldom been shown in better condition or more heavily laden with clean, full-sized fruits. Groups of plants like that of Messrs. J. Cypher and Sons are seldom seen at the London shows, and this firm deserves the thanks of London people. Carnations, particularly those from Mr. Engelmann, were excellent indeed, and so I could go on. Mr. H. J. Jones's Chrysanthemums were fine, but the exhibit which appealed to me as an outstanding feature was Mr. E. Becket's vegetables. The competitive exhibits in the gallery were excellent, and were the more interesting as coming from amateurs. Displays of Orchids are always fine and indispensable at a show of this kind. My only object, however, in sending this note is to encourage the Council of the R.H.S. to "carry on." The old fruit shows were fine, but became monotonous; this Holland Park Hall Show was an immense improvement on anything yet done at this season of the year. *T. E. Arnold, Cirencester Park Gardens.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

Exhibition at Holland Park Skating Rink.

(Concluded from p. 216.)

#### VEGETABLES: COMPETITIVE CLASSES.

COMPETITION was very keen in the vegetable classes, and practically all the exhibits reached a high standard of excellence. The collections attracted a considerable amount of well-deserved admiration from the visitors.

The Sutton Challenge Cup, offered for the best 12 distinct kinds, was won by Mr. T. M. JONES, 3, Bank Buildings, Llandilo, with a particularly meritorious exhibit, in which every item was of first-rate quality. His varieties included Autumn Giant Cauliflowers, selected Ailsa Craig Onions, Black Beets, The Bishop Potatos, Prize-taker Leeks, Gladstone Peas, Prize-winner Runner Beans, Gem Brussels Sprouts, and Aldenham Pink Celery. Sir CHARLES NALL-CAIN, Bt. (gr. Mr. T. Pateman), The Node, Welwyn, was an exceedingly good second, and he had superb examples of Red Elephant Carrots, Michaelmas White Cauliflowers, and Tender and True Parsnips. CHARLES V. SALE, Esq. (gr. Mr. R. Learmouth), Aston Rowant, Oxon, won third prize.

The R.H.S. Vegetable Cup was offered for 9 distinct kinds of vegetables of the size and quality most acceptable for table use, and it was won by W. H. MYERS, Esq. (gr. Mr. G. Ellwood), Swanmore Park, Bishop's Waltham, with a well-nigh perfect collection. He included Early Giant Cauliflowers, Duchess of Albany Peas, Champion Horn Carrots, Best of All Runner Beans, Sutton's Globe Onions, and Stirling Castle Potatos. Mrs. JENNER (gr. Mr. H. Wheeler), Wenvoe Castle, Cardiff, who won the second prize, had excellent examples of Scarlet Intermediate Carrot, Gladstone Pea, and Standwell Cauliflower. R. C. STAFFYLLON, Esq., Headlands, Berkhamstead, third.

The best six kinds were shown by Mr. Tom JONES, Manordils, Carmarthenshire, and this set was also of great merit. He had Aldenham Pink Celery, Gladstone Peas, Selected Ailsa Craig Onions, The Bishop Potato, and Princess of Wales Tomato. Mr. J. DAY, Newnham, Berkhamstead, who was second, included excellent Intermediate Carrots and King Edward VII. Potatos. Mr. G. THORN, Willesborough, was third.

The collections of Potatos were particularly good, and seldom have so many clear, shapely, and shallow-eyed tubers been seen as at the Holland Park Hall show. The Rev. C. G. KEAN (gr. Mr. A. Basile), Weybridge, won the first prize. His best varieties were Mr. Breeze, Arran Rose, Tinwald Perfection, The Ally, and Arran Comrade. Mr. G. THORN was second, and he included perfect examples of White City, Factor, and Arran Comrade. Sir CHAS. NALL-CAIN was third. The class for 6 immune varieties also created a keen competition. The first prize was won by Mrs. JENNER with such sorts as Great Scott, Arran Comrade, and The Bishop; second Mr. F. HEAD.

Onions, though not so numerous as in some former years, were large and shapely, and, in spite of the difficulties of the season, well-ripened. The best 6 varieties were shown by Mrs. JENNER. The bulbs of Ailsa Craig (globe-shaped), Premier, Golden Ball, Sutton's Globe, and Selected Red were particularly fine. Mr. W. H. MYERS was second, and Mr. T. M. JONES was third.

There were many collections of saladings, but the quality was scarcely equal to the rest of the section. Mr. W. H. MYERS, showing Batavian Endive, Black Beet, and Golden Ball Lettuce, was first; Mr. T. M. JONES was second; and Mr. CHARLES W. SALE was third.

The Single Dish Classes were fully equal to those of any former year. Celery, Leeks, Carrots, Parsnips, Peas, Beans, and Potatos were first rate. The first-prize winners were:—W. H. MYERS, Esq., with Scarlet Runner Beans, French Climbers, French Dwarf Beans, long type Beet, Cucumbers, and Leeks. F. C. SPOOR, Esq. (gr. Mr. G. Carpenter), West Hall, Byfleet, with Globe Beet and Cauliflower.

Mrs. JENNER, with 50 buttons of Brussels Sprouts, White Celery, and Yellow Tomatos. Sir CHARLES NALL-CAIN, with 5 plants of Brussels Sprouts, Parsnips, and Curled Kale. The Rev. F. G. WYATT (gr. Mr. J. Shirley), Little Haywards, Horley, with Wittingstadt Cabbage, Celeric, and Marrows. Mr. T. M. JONES, with Savoy Cabbage, Onions, and long Carrots. Mrs. FARNHAM (gr. Mr. J. Binnington), The Heights, Wisley, with red Celery. A. P. BRANDT, Esq. (gr. Mr. J. W. Barks), Bletchingley, with short Carrots. CHARLES V. SALE, Esq., with Peas. Mr. W. J. STAWARD, Alfreton Park Gardens, Alfreton, with white, purple, and yellow-fleshed Turnips. Mrs. G. F. AUSTEN (gr. Mr. A. Woodgate), Capel Manor, Horsmonden, with white Potatos. Mr. J. DAY, with coloured Potatos. Mr. T. N. HORN, with red Tomatos. In the class for any other vegetable the first prize was won by Mrs. JENNER with Mammoth Salsify of excellent quality.

#### Fruit.

##### TRADE GROWERS' COLLECTIONS.

There appeared to be only one exhibit of a collection of hardy fruit on a table 30 feet by 6 feet, and this was a splendid exhibit by Mr. J. C. ALLGROVE in a recess in the gallery. It was composed chiefly of Apples, and the quality was very high. His new variety, S. T. Wright, a large shapely, culinary Apple, which is beautifully streaked with crimson, was very prominent, as also were the Rev. W. Wilks and James Grieve, both of which were also shown in large quantities. Other especially good cooking sorts were The Queen, Lord Derby, Bramley's Seedling, and Warner's King. Amongst the many dessert Apples, Charles Ross, Allington Pippin, Ellison's Orange, Cox's Orange Pippin, and Margil were splendid. The Pears included handsome fruits of Doyenné Boussoch, St. Luke, Mrs. Seden, and Marie Louise. Plums, Filberts, and Cob Nuts were also represented in this memorable collection, which deservedly received the first prize.

In the smaller, but still large class, the first prize was won by the BARNHAM NURSERIES COMPANY, with a collection which was particularly noteworthy for the high colour on many of the very shapely Apples. These were Peacemaker, Caville Rouge Precoce, King Pippin, Rival, Guelph, and Lady Sudeley. The cooking varieties included Norfolk Beauty, Golden Spire, Bismarck, Bramley's Seedling, and Peasgood's Nonesuch, while chief amongst the Pears we noted Marguerite Marillat, Beurré Fouquieray, and Triomphe de Vienne. Messrs. S. SPOONER AND SONS were second, and they had a handsome collection of such dessert Apples as Worcester Pearmain, Royal Snow, Cox's Pomona, and Cox's Orange. The principal culinary sorts were Rev. W. Wilks, Peasgood's Nonesuch, and Pott's Seedling. The outstanding Pears were Paroquet, Calabash, Marie Louise d'Uccle, and Durondeau.

The Market Growers' Class, which requires 12 baskets of cooking and dessert Apples, brought several excellent exhibits. The first prize was won by the HORTICULTURAL COLLEGE, Swanley, with a magnificent collection of such sorts as Peasgood's Nonesuch, Alfriston, Bismarck, of the cooking sorts, and Charles Ross, Rival, Cox's Orange, and James Grieve, of the dessert varieties. Lieut.-Col. LUMLEY WEBB, Upchurch, was a good second, with Tower of Glamis. Peasgood's Nonesuch, Rival, Ben's Red, and similar varieties.

##### AMATEURS' HARDY FRUITS.

Sir CHARLES NALL-CAIN was the only exhibitor of a collection of 8 dishes of dessert and 16 of cooking Apples, and he was awarded the first prize for a highly meritorious display. He had magnificent examples of Paroquet, American Mother, and Cox's Orange in the first row with Rev. W. Wilks, Peasgood's Nonesuch, The Queen, and Emperor Alexander behind. The best collection of 4 dishes of dessert and 8 of cooking Apples was shown by G. MILLER, Esq. (gr. Mr. J. Kidd), Newberries, Radlet, and this included perfect specimens of Mére de Ménage, Rev. W. Wilks, Rival, and Ribston Pippin. Capt. H. B. TATE (gr.

Mr. A. E. Moss), Billersby Manor, Warwick, was a good second.

Major H. R. CAYZER (gr. Mr. T. Hengate), Tylney Hall, was first in the classes for 6 dishes each of dessert and cooking Apples. In the former class he included splendid dishes of St. Everard's Pippin, Wealthy, and Mabbott's Pearmain, while in the latter he had The Queen and Peasgood's Nonesuch in excellent condition. Major BAYNES, Kinnesbourne, Green, Luton, was second with dessert Apples, and Sir CHAS. NALL-CAIN was similarly placed in the cooking Apple class.

The best 18 dishes of dessert Pears was shown by Sir CHAS. NALL-CAIN, and this was a superb collection of very shapely fruits, including Doyenné Boussoch, Le Lectier, Marguerite Marillat, and Clapp's Favourite. G. MILLER, Esq., was a good second, and he had typical fruits of similar varieties. Lord HILLINGDON was awarded the first prize for 9 dishes of dessert Pears, and his excellent collection included Brockworth Park, Durondeau, and Marie Louise d'Uccle.

Lady MARY MORRISON (gr. Mr. H. H. Mills), Fenthill House, Tisbury, Wilts, won first prizes for Plums and Damsons. In the former class Late Orange was shown, and in the latter Bradley's King was the variety. Showing Coe's Golden Drop, Sir CHAS. NALL-CAIN was second with Plums. The best Morello Cherries were shown by Maj.-Gen. Sir C. HADDEEN (gr. Mr. O. Hayles), Rossway, Berkhamstead, while Capt. DRUMMOND, showing Queen Alexandra, was awarded first prize for Autumn Raspberries, and with Negro Largo for Figs. J. H. LONDON, Esq., was second for Figs with Brown Turkey, of luscious appearance.

### SOCIÉTÉ POMOLOGIQUE DE FRANCE.

THIS year the principal French horticultural exhibitions have been held in Paris; since the spring International Horticultural Show and the Iris Conference, the Pomological Congress has taken place, while the Autumn International Exhibition and the Chrysanthemum Congress are yet to come.

The 58th Congress of the Pomological Society of France took place in Paris from the 11th to the 15th of September, at which Dr. Viger, the President of the French National Horticultural Society, presided. The Congress was well attended, nearly 200 persons being present, of whom a number were delegates from Switzerland, Belgium, Italy, and Luxemburg, viz.: MM. Blanc, from Lausanne; Bocquard, from Geneva; Dufour, from Vilvorde; Molon, from Milan; Wagner, from Luxemburg, etc.

At the opening of the first session of the Congress, Dr. Viger and M. Sylvestre, vice-president of the Pomological Society, spoke in feeling terms of the late President of the Society, M. Gabriel Luizet, who died a few months ago.

Among the questions discussed was the following: "What are the indispensable conditions for obtaining a good return for commercial fruit culture in different places?" Two interesting papers were read on this subject by MM. A. Nomblet and Magnan, and a good discussion followed. It was observed that in Switzerland, in the Valais, the local government has made regulations regarding the sale of fruit, and the packing and despatch of the goods are subject to inspection.

The Congress passed a resolution inviting agricultural and horticultural syndicates to advise as to the date of harvesting fruits intended for despatch by rail or sea, and drawing attention to the great losses resulting from the sale of green fruits which did not ripen properly, but which hindered the sale and consumption of the same fruits later on when they were mature.

Another question discussed was: "What should be the directing principles of nurserymen and seed growers in organising production with a view to satisfying post-war requirements?"

An excellent paper by M. A. Nomblet laid down the principles of the cultivation of fruits on a large scale and in rotation, laying stress on the necessity of planting sufficiently far apart to allow of the passage of mechanical cultivators between the rows.

A resolution was passed claiming for fruit

growers the privileges now extended to Grape growers, in favour of whom the railway companies have allowed a 50 per cent. rebate in freight charges.

A discussion ensued on the necessity, for the proper development of fruit cultivation, of establishing in the principal centres of production experimental stations, which should popularise the best methods of cultivation, the most remunerative kinds and varieties, the proper fertilisers, and the most effective means of combating the effects of inclement weather, and insect and fungous pests. Co-operation could also be encouraged in the way of buying collectively in the first place, and combining for purposes of the sale of produce.

The question of the effects of pinching pip-fruit-trees was also discussed. MM. Opex and Coffigniez recommended the practice, but M. Rivière considered it useless, and cited in support of his contention the practice obtaining in Montreuil, Bagnolet, Fontenay-sous-Bois, Nogent, Deuil, and Montmagny, all in the vicinity of Paris, where the trees were never disbudded, and where the fruits produced surpass in fineness and flavour those of other centres of production. M. Dufour, of Belgium, considered disbudding necessary in certain localities. The general conclusion was that it did not do to generalise, and that pinching is necessary or not according to local conditions and methods of cultivation.

The influence of the stock on maladies of Peaches and Apriquets formed the subject of a memorandum by M. Chifflet, of Lyons. The author had examined Apricot trees and Peach trees on different stocks; Almond, Plum, seedling, etc., and had come to the conclusion that the stock had absolutely no influence in this respect whatever.

Some interesting observations on *Monilia* of fruit trees were contributed by M. Passy. He also laid before the Congress some Pears attacked by a malady which is very rare and happily not of a serious nature, *Phoma umbilicaris*—a fungus which attacks the eye of the fruit and causes it to fall prematurely. For all maladies of fruit trees, early sprayings with sulphides were recommended.

MM. Rivière and Passy gave details of Silver Leaf Disease. They had never observed the mycelium of *Stereum purpureum*. The disease was chiefly confined to stone fruit trees: Plums, Cherries, and Almonds; it was less common on the Pear, and had been observed for the first time in France during the present year on the Pear tree, by M. Ducomet. It was also frequently found on ornamental shrubs such as the Lilac, *Philadelphus*, *Aesculus*, etc.

M. Chifflet also read a paper on the subject, and said he had not observed any traces of mycelium. Was it possible that a mycelium existed in the trunk which secreted toxins?

M. Passy remarked that the nature of the soil had no influence on the development of the malady. M. Opex reported that at Ferrières, injections of powdered sulphate of iron applied directly to the trunk had cured a Peach tree affected with the disease, which was being forced in an orchard house. M. Dufour, of Vilvorde, gave an example of the influence of environment on the development of the disease. In a Peach-house, only the branches which were in the neighbourhood of the pipes were attacked by disease. M. Chasset gave an example of some trees which were very badly attacked by disease, but on being severely cut back were completely cured.

The disease known as "La Molle," or "Water-core," was then discussed, and M. Rivière drew attention to the analogy which existed between this disease and the softening of the fruit which is observed in the Medlar. M. Chifflet had also studied the question, and had found in all the examples he had examined a valved mycelium. It was doubtful, however, whether this was the cause of the disease, or a saprophytic mycelium which was a consequence. M. Chifflet recalled the fact that MacAlpine believed this malady to be due to a want of balance in vegetation. M. Chasset remarked that the disease had been found in the Pear *Passe Crassane*. In the Midi of France there was a variety of Apple called "Pomme

Glacée," which was always "vitreous," and was much liked on that account, especially for the making of sweetmeats, as it had a very distinct flavour.

The next item was a study of the disease *Oidium* of Apples. M. Chasset observed that the malady was much on the increase in the vicinity of Paris, but treatment with polysulphides had given good results. A solution of 4 gr. per litre of polysulphide of potassium in winter and 2 gr. per litre in summer prevented the development of the disease.

A discussion ensued on the subject of hybrid Vines for the production of dessert Grapes. There are many such hybrids now in existence, resulting from crosses between American species resistant to *Phylloxera* and French varieties. They have the advantage of being more robust, and more resistant to diseases, than the older kinds, thus necessitating less in the way of precautions against mildew and *Oidium*. M. Salomon questioned the value of several of these hybrids, and thought that it was not possible to obtain hybrid "direct producers" equal to the pure French kinds, but few of those present agreed with him. At any rate, there are many of the hybrids which, while perhaps not possessing quite the same quality as the old French varieties, are at any rate useful for the production of dessert Grapes in certain cases.

At the first session, the Congress examined various fruits, and the three following were definitely admitted:—

Apricot Poizat; Pear Duchesse Bérard; Pear Président Héron.

The following were retained for further examination, but were favourably regarded:—Strawberries, Alphonse XIII. (non-perpetual) and Saint-Fiacre (perpetual), both from Messrs. Vilmorin; Apricots, Blanchet and Corot; Almond, Bruantine; Cherries, Bigarreau Antoine Nombrot, Bigarreau Président Vigier, Guigne la Reine, Noire de Montreux, etc.; Peaches, Commandant Bossu, Colonel Dusevel; Nectarine Brugnon Camille Maheut; Pears, Baronne Leroy, Beurré Henri Courcelles, Bési de Saint-Agyl, Directeur Tisserand, Fauneville, Merveille Ribet, etc.; Apples, André Sauvage, Bébé Resse, Delicious, Edouard VII., Isabelle Luizet, Serveau, etc.; Plum, Mirabelle de Flotow; Grape, Mme. Girerd.

The prize-winners at the Congress were:—M. BAHOUD, of Thoisse, Ain; M. RIVIÈRE, Laboratory Director at the Agronomic Station, Versailles; and M. OPOIX, late head gardener at the Luxembourg.

The Congress nominated Mrs. Edison and Mr. Kuntz, members of the Committee of the American Society "Friends of Trees" for the devastated regions of France, honorary members of the Society.

Interesting excursions were made by the delegates to the Congress to the garden and houses of the Luxembourg; to the nurseries of Messrs. Nombrot, at Bourg-la-Reine; Messrs. Croux, at Chatenay; and Messrs. Moser, at Versailles; to the College of Horticulture and the park at Versailles; and to the gardens of the Trianon; forming an agreeable conclusion to this important Congress.

On Thursday, September 14, a large exhibition of fruits took place in the hall of the Société Nationale d'Horticulture. M.

#### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

The annual festival dinner of this Society was held on Wednesday, October 4, at the Imperial Hotel, Russell Square. Mr. Leonard Sutton presided, and the company numbered about sixty. In proposing the toast of the United Horticultural Benefit and Provident Society, Mr. Sutton stated that he felt greatly honoured in being asked to preside at the dinner. A benefit Society of this character was commendable in so much as the members were insuring that they would not be a drag on anyone in their times of trouble. By co-operating it gave them an opportunity of doing things for themselves, and in that way they were doing one of the best things for their

country. It was a gardening society for gardeners managed by gardeners, and Mr. Sutton's advice to members of the gardening profession was to join it. His firm had been connected with this Association for some 42 years; his father was an hon. member, and he could only wish that he was alive now to see the prosperous state it had arrived at, for the annual income amounted to £5,000, and during the past year the sum of £600 had been disbursed in sick pay. He would like a Society of this nature to take up the question of a pension fund and he thought this could be easily arranged if the gardeners themselves subscribed a certain amount and their employers subscribed a similar sum. Mr. Sutton associated the name of Mr. Bedford, vice-chairman of Committee, with the toast. He stated that Mr. Bedford was one of our most famous gardeners, in charge of one of the most important gardens in the country.

Mr. Bedford, in response, stated that the Society was the only one of its kind in existence and it was difficult to understand why more gardeners did not join as members. He referred to the various benefits the members received during illness and the amount payable to their representatives on death. The Society had also been able to give many additional benefits to State members, such as dental treatment, optical treatment, surgical appliances, etc.

The chairman read several letters from members and others, including Sir Harry Veitch, regretting their inability to be present.

At this stage the presentation of a gentleman's wardrobe in Mahogany and a handsome barometer was made to the chairman of Committee, Mr. Charles H. Curtis, as a mark of appreciation for his twenty-one years in that office. Mr. Sutton stated that during the 21 years Mr. Curtis had placed his energies and service at the disposal of the Society. But this was only one of his many activities in the horticultural world, for he had done valuable work for such institutions as the Kew Guild, the National Sweet Pea Society, and the National Chrysanthemum Society, and was well known as a horticultural journalist. In making the presentation, Mr. Sutton proposed the health of Mr. and Mrs. Curtis.

Mr. Curtis, who, on rising, was received with much applause, thanked the chairman and members for the beautiful gifts, which he said he would treasure so long as he lived. He stated that during 21 years the Society had disbursed in sick pay, £13,000, in benevolent grants £2,600, and in other ways £8,000, making a total of £23,600. In 1901 the sums invested amounted to about £17,000, whereas by the end of this year the investments would come to nearly £65,000, or an average of £44 per head for every member on the private side. Mr. Curtis estimated the time he had spent at meetings during the 21 years as chairman. The meetings of the Committee occupied about 2½ hours each. This works out at about eighty days during 21 years, but as there are numerous additional meetings and sub-committees to attend it would not be unreasonable to assume that a committee man is actually engaged on the work of the Society for one hundred days during the period under notice. He pointed out that a considerable amount of a member's time is occupied in going to and returning from Committee meetings and such time is at least twice as long as that occupied in the actual sittings of the Committee. In short, twenty-one years of office as a Committee man meant that the Society had received a whole year of service, assuming the working day to be eight hours in length.

Mr. W. H. Divers next proposed the health of the visitors, to which Sir Frederick W. Keeble, F.R.S., and Mr. G. Challis responded. Sir Frederick stated that it would have been more in keeping had a lady been asked to respond for the visitors, as it would have been a further indication of the pleasure they felt at their presence. He always considered that there was no type of man more capable of enduring hardships and exhibiting fortitude than the British gardener, and he supported Mr. Sutton's proposal of a pension fund for gardeners, to ensure them a means of subsistence in their old age. He was pleased to identify him-

self with this excellent gardeners' benefit Society, and would be pleased to become one of its hon. members.

The toast of the health of the chairman proposed by Mr. Curtis terminated the business proceedings. During the evening a selection of vocal and instrumental music was ably rendered under the direction of Mr. Fred Verity.

### CARDIFF GARDENERS'

The first meeting of the new session was held at the Queen's Hotel on the 3rd inst., (forty members were present), with Mr. P. Meyers in the chair.

The meeting opened with a lively discussion on the good cropping of Potatoes in the district this year. Majestic appeared to be most in favour for cropping and cooking qualities. The subjects of Scotch seed and immature seed were keenly debated.

Prizes offered for the best dish of five Potatoes were won by Messrs. Couch, Radcliffe and Giles respectively.

### ABSTRACT PUBLISHED LAST MONTH.

#### PLANT SUPPORT. PATENT No. 183779

An inexpensive design of wire plant support has been invented by Mr. H. J. Greenwood, of Kirkleigh, Church Road, Bracknell, Berkshire. The support is constructed from two lengths of wire, or one length doubled upon itself, twisted together. The ends of the untwisted portions being bent to form a vertical loop, the arms of which cross one another and are bent to form a loop. When the two parts of the loop are pressed together, the ends of the wire separate so that the loop may enclose the plant stem, the loop being returned to its normal position by the spring arms. An additional wire may be twisted and bent to form an extra supporting loop lower down the support.

This list is specially compiled for *The Gardeners' Chronicle* by Messrs. Rayner and Co., registered patent agents, of 5, Chancery Lane, London, from whom all information relating to patents, trade marks, and designs can be obtained gratuitously.

Messrs. Rayner and Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1s. each.

## INQUIRY.

### EPIPHYLLUM GAERTNERI.

A CORRESPONDENT asks if any of our readers will be kind enough to state where plants of *Epiphyllum Gaertneri* may be obtained.

REMARKS.—Rather brighter conditions have prevailed lately, and although values have not materially improved at the moment, continued buying should force up prices to a better level. Supplies of home-grown Apples are augmented by consignments from Nova Scotia as well as from Central Europe. Worcester Pearmain is quoted higher, and the demand for large cookers is firm. Pears are plentiful, and except for specimen fruits, their prices are very moderate. Hot-house Grapes are moving more freely, the low level of prices probably inducing a better demand. Home-grown Tomatoes are in shorter supply, and with reduced quantities from Jersey and Holland, prices are higher. Cucumbers have also advanced in price. Some choice Guernsey Beans are now arriving, and are in firm request. Vegetables are still plentiful and in excess of demand. The Potato trade is very quiet, with prices at a low level.

REMARKS.—In this department, there appears to be a general improvement in trade, there being a good demand for flowers during the week-end, with a slight advance in prices. The scarcest subjects during the past week have been *Lilium speciosum album* and *L. s. rubrum*. Trade in *L. longiflorum* remains unchanged, which also applies to *Roses*, *Carnations*, *Lily-of-the-Valley* and *Violets*. *Chrysanthemums* remain the chief attraction. Disbudded blooms appeared to be scarcer during the end of last week, but supplies this morning were more plentiful. Prices show a tendency to rise for best quality blooms. Some fine specimen blooms of numerous varieties are also on sale. *Richardias* (*Arums*) are coming to hand in better condition, and the supply of this flower is larger. A little white *Bouvardia* is taking the place of *Stephanotis*, which is finishing. Of foliage *Asparagus plumosus*, *A. Sprengerii*, *Adiantum*, *Fern* and *Smilax* are in moderate demand; the last is arriving from Guernsey in excellent condition. *Croton* leaves, which have been absent from the market for the past three months, are again on sale, the small consignments being soon cleared.

## GARDENING APPOINTMENTS.

Mr. Wm Povey, previously for fifteen years Gardener to Colonel MAY, Down Grange, Basingstoke, Hampshire, as Gardener to R. E. LAMBERT, Esq., Telham Court, Battle, Sussex.

Mr. C. Prosser, previously Foreman at Raage-more Gardens, Burton-on-Trent, Staffordshire, as Gardener to the Marylebone Council Public Gardens Department. (Thanks for 2s. for R.G.O.F. Box.—Ens.).

## ANSWERS TO CORRESPONDENTS.

APPLE WITH BROWN SPOTS UNDER THE SKIN: *G. R. R.* The fruit you sent is affected with bitter pit disease, caused by a fungus, which is often associated with a canker disease on the young branches. Remove all diseased fruits and destroy them by burning. Cankered shoots should be cut off below the seat of the disease, and these also should be burnt. Next spring spray the trees with Bordeaux mixture just before the buds burst and again after an interval of five weeks. It is not an easy matter to determine the name of the Apple from the diseased specimen you sent but it is probably Manks Codlin.

BOOKS: *R. A. L.* Books suitable for your purpose are:—L. H. Bailey's *Plant Breeding*, price 17s.; Farrer's *English Rock Garden*, two vols., price £5 4s. 6d.; *Commercial Forestry*, price 6s. 9d.; *Trees and Shrubs Hardy in the British Isles*, by W. J. Bean, two vols., price 64s. 6d.; *Fruit and their Cultivation*, by T. W. Sanders, price 6s. 9d., and *Vegetables for Home and Exhibition*, by E. Beckett, price 6s. All these can be obtained from our Publishing Department, at the prices given, post free.

CELERY DISEASED: *J. T. S.* The Celery is suffering from a bad attack of the infectious disease caused by the fungus *Septoria petroselinella* Apii. As a preventive measure against attacks of Celery leaf blight, the seed should be treated with hydrogen peroxide, the twenty-volume solution being the best strength. Affected plants in the rows should be sprayed with Bordeaux mixture on the first appearance of disease.

NAMES OF FRUIT: *E. H. W.* Apples: 1, Lane's Prince Albert; 2, Benn's Red; 3, 8 and 10, Newton Wonder; 4 and 14, Allington Pippin; 5, Fearn's Pippin; 6, 7 and 16, Cox's Orange Pippin; 9 and 11, Manks Codlin; 12 and 18, Norfolk Stone Pippin; 13, Cox's Pomona; 15, King of the Pippins; 17, Round Winter Nonesuch; 19, Peasgood's Nonesuch. Pears: 1, Vicar of Winkfield; 2, Pitmaston Duchess; 3, Bergamotte d'Esperen; 4, Beurré Diel.—*T. T.* 1, Lord Suffield; 2 and 7, Ecklinville Seedling; 3, Cellini; 4, Wealthy; 5, Dean's Codlin; 6, St. Saviour; 8, not recognised; 9, Shepherd's Fame; 10, Golden Noble; 11, White Nonpareil; 12, Lady Sudeley; 13, Belle Pointoise; 14, Landsberger Reimette; 15, Baxter's Pearmain.—*A. B. D.* 1, Margil; 2, Waltham Abbey Seedling.—*A. W. G.* 1, Cellini; 2, badly scabbed, not in character; 3, Blenheim Pippin; 4, Dartmouth Crab; 5, Ashmead's Kernel; 6, Pear Souvenir du Congrès.—*H. J.* Apples: 1, Keswick Codlin; 2, Strawberry Norman; 3, Lady Sudeley; 4, Wvken Pippin; 5, Cox's Orange Pippin; 6, Margil. Pears: 1, decayed; 2, Beurré Clairgeau; 4, William's Bon Chrétien; 6, Pitmaston Duchess; 10, Doyenné Boussoch.—*Ruts.* 1, Beurré Sterckmans; 2, Beurré Superfin; 3, Louise Bonne of Jersey; 4, Cox's Pomona; 5, Doyenné du Comice; 6, Marie Louise; 7, Tyler's Kernel.—*G. P. J.* 1, Beurré Superfin; 2, Maréchal de Cour; 3, Catillac; 4, Beurré Sterckmans; 5, Thompson's; 6, Beurré Hardy; 7, General Todleben; 8, Chaudumontel; 9, Beurré Bachelier.—*C. H. A. W.* 1 and 2, decayed; 3, Clapp's Favorite; 4, 5, 6, 7 and 8, William's Bon Chrétien; 9, Cox's Orange Pippin; 10, Lady's Finger; 11, Nancy Jackson; 12, Stirling; 13, Potts's Seedling.—*A. D. R.* Not recognised, probably a local seedling.

NAMES OF PLANTS: *Rose.* 1, *Potentilla*, sp. not recognised without flowers; 2, *Corydalis cheilanthifolia*; 3, *Stachys Betonica*; 3, *Senecio tanguticus*; 5, *Muehlenbeckia complexa*; 6, *Artemisia lactiflora*; we cannot undertake to name *Roses*.—*E. S.* 1, *Aster Amellus*; 2, *Helianthus multiflorus plenus*; 3, *Aster*, garden seedling; 4, *Aster turbinellus*.—*G. S.* *Asclepias curassavica*.

**AVERAGE MEAN TEMPERATURE** for the ensuing week deduced from observations during the last fifty years at Greenwich, 49.3.

**ACTUAL TEMPERATURE:—**  
Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, October 18, 10 a.m. Bar. 30.3; temp. 60°. Weather—Sunny, with showers at intervals.

Students of history and of the history of science are under a great debt of gratitude to Mr. Gunther, Librarian and Research Fellow of Magdalen College, Oxford, for having presented them with a life-like and finished portrait\* of one of the most distinguished of early British botanists, John Goodyer. It is but fitting that this work should emanate from Magdalen, for by his will, dated April 22, 1664, John Goodyer bequeathed his valuable collection of botanical books and manuscripts to that College, where they have been treasured so straitly as to have become all but forgotten until the pious hands of Mr. Gunther rescued these works of "an incomparable botanist, of sound judgment and of immense industry" from the oblivion of three and a half centuries. From them the author has been able to reconstruct a vivid picture of the work of Elizabethan and Jacobean botanists—Parkinson, the elder Tradescant, William Coys, Johnson, Stonehouse and others. Those who date the beginning of modern botany from the time of Linnaeus may find reason to modify their opinion in the study of the work of Goodyer and his contemporaries. Born in 1592, at Alton, in Hampshire, John Goodyer passed practically the whole of his life in that part of the country which lies

among the chalk hills at the junction of the North and South Downs. His youth was spent at Meon, and his manhood at Petersfield, where the "Great House" in which he resided from about 1633 until his death bears the recent inscription, "John Goodyer, 1592-1664, Botanist and Royalist, lived here." This and a local charity which he founded, and a plant which it is probable that he never saw—the Orchid *Goodyera repens*, were his only memorials until Mr. Gunther's work appeared. The distinguishing features of Goodyer's botanical work were acute observation and disinterested love of plants. In youth and early manhood he explored far more thoroughly than had been done before, the flora of his native county and added many new plants to existing lists. His knowledge and the records of his observations he put at the service of others, particularly Dr. Thomas Johnson, for inclusion in the new edition of *Gerard's Herbal*, which appeared in 1633, where Goodyer's generosity is handsomely acknowledged. Goodyer was a gardener, as well as a botanist, and his gardening friends included Parkinson, Coys and Franqueville. His earliest garden notes date from 1616, when he first gathered seeds of *Astragalus lusitanicus* "in the garden of my good friend Mr. John Parkinson, an Apothecarie of London." Parkinson's garden, as well as those of his contemporaries, had recently been enriched by Spanish and Portuguese plants introduced by Guillaume Boel, in 1608. Coys's garden at Stubbers, North Okington, Essex, which Goodyer visited, was one of the oldest in the country. Already well established and well known to Gerard in 1597, it still flourishes under the present ownership of Mr. Champion Branfill Russell. In the course of a pilgrimage which he made to this garden on the three hundredth anniversary of Goodyer's visit thereto, Mr. Gunther was able to trace the plan of the seventeenth century garden and to see on the walls the Ivy-leaved Toad flax still growing where it was first established as a garden plant in England. This garden is famous in the world of horticulture, not only because of its antiquity, but also because in it, in 1604, the *Yucca* first flowered in this country. Of the lists of plants grown in the garden of Coys published by Mr. Gunther is one which is dated 1616-17—the oldest known manuscript list of an English garden and second in time only to the printed Catalogue of Trees, Fruits and Plants grown by John Gerard in his Holborn Garden. Already, at this early date, fruit gardens existed around London, and Goodyer may have visited and certainly knew of the Twickenham fruit garden of Mr. Vincent Pointer or Corbet. Ben Johnson's well-known epitaph (1640) of Master Vincent Corbet must always please gardeners:—

"Deare Vincent Corbet who so long  
Had wrestled with Diseases strong  
That though they did possess each limbe,  
Yet he broke them ere they could him,  
With the just Canon of his life  
A life that knew no noise nor strife:  
His Mind was pure and neatly kept  
As were his Nurceries; and swept  
So of uncleannesse or offence  
That never came ill odour thence:  
And add his Actions into these  
They were as specious as his trees."

Nor may any account of John Goodyer as a horticulturist omit reference to the fact that it was he who first in 1617 introduced the Jerusalem Artichoke to English gardens and to cookery. His own account of this feat runs—"In Anno 1617 I received two small roots thereof from Master Franqueville of London, no bigger than hen's eggs,

the one I planted, the other I gave to a friend," (the mark of a true gardener) "mine brought me a peck of roots wherewith I stored Hampshire." His comments on the virtues of the Artichoke as an article of diet were couched in the vigorous language of the time and very adverse—"a meat more fit for swine than man." One final example of Goodyer's powers of observation: Gerrard in 1597 had recognised two species of Elm, Goodyer distinguished four, *Ulmus campestris*, *U. minor*, the narrow-leaved Elm, *U. montana*, Wych Elm, and *U. glabra*, smooth-leaved Elm, and described them all excellently. Thus, as Mr. Gunther amply shows, Goodyer won for himself a high place in the ranks of British botanists, loving plants, observing them carefully, growing them and using them also for medicinal purposes. Doubtless in this avocation he found solace and refreshment of spirit not only from the routine work of estate management, but also from the anxieties and perils of the Civil War, during which Petersfield was garrisoned for King Charles, and in which his friend Thomas Johnson, author of the *Gerard emaculatus*—a new and revised edition of Gerard—lost his life in 1644, in the defence of Basing House.

The publication of this valuable work—which should be on the shelves of all botanical and horticultural libraries—is due to the labours of Mr. Gunther, the generosity of Magdalen College and the enterprise of the Oxford University Press. All who appreciate beautifully-printed works will desire to add the name of the printer, Mr. Frederick Hall, to the list of those to whom thanks are due for this worthy memorial of a great pioneer botanist.

**Horticultural Superintendent at Wembley Park.**—We are glad to have the pleasure of announcing that Mr. A. C. Bartlett, an old Kewite, and landscape gardener, who formerly had charge of the famous gardens at Pencarrow, Cornwall, has been appointed Horticultural Superintendent to the British Empire Exhibition authorities at Wembley Park.

**Mr. Kingdon Ward's Plant Collecting Expeditions in Asia.**—The instalment on page 238 brings to a close Mr. Kingdon Ward's narrative of his sixth plant collecting expedition in Asia. Those who have followed the series of interesting notes by Mr. Ward will realise that the expedition has been a very fruitful one, and promises to enrich our gardens with many new and beautiful plants. As soon as Mr. Ward had completed this expedition he immediately took steps to undertake another journey into the remote districts of China and its hinterlands, and exactly a month after the Christmas revels, to which he refers on page 238, were over—most of which time was spent in looking for a travelling companion—he left Bhamo on his seventh expedition. Readers will be pleased to know that Mr. Ward is well, and he has sent us accounts of his further journeys, which we hope to publish in subsequent issues.

**Royal Horticultural Society of Aberdeen.**—The following is the report of the directors of this society, which is to be submitted to the annual meeting of members on Saturday, 21st inst.:—With regard to the annual exhibition, which was held in Union Terrace Gardens, Aberdeen, on 24th, 25th, and 26th August last, the change of venue to the centre of the city was a wise one. This was proved by the fact that, notwithstanding there being no music and no attractions other than those provided by the proper objects of the exhibition, nearly three hundred more people paid for admission to the Union Terrace Gardens this year than to the Dulcie Park last year on the occasion of the exhibition there. The total gate receipts were less this year than last, owing to the reduction of the charge of admission on the Saturday at this year's show. From a horticultural point of

\* *Early British Botanists and Their Gardens*. Based on unpublished writings of Goodyer, Tradescant and others. By R. T. Gunther, M.A., F.L.S. With 9 plates and 21 other illustrations. Oxford University Press, 1922.

view this year's show was a remarkably good one. The income for the year amounts to £373 10s. 9d., and the expenditure has been £367 10s. 11d., leaving a surplus of income over expenditure for the year of £5 19s. 10d. This is the more satisfactory when it is considered that the previous year's debit balance has been entirely wiped off by voluntary subscriptions from members and friends of the society. It is hoped that the society will be able to do something in the coming winter, by holding lectures on horticultural subjects, to carry on the work undertaken by the North of Scotland Horticultural Association (now amalgamated with the society), and an appeal is made to members to help to increase the membership and so add to the usefulness of the society. The balance sheet shows that the sum of £165 5s. was collected towards last year's deficit of £176 18s. 9d., and the balance at the credit of the society stands at £14 18s. 11d.

**New Public Park at Rowley Regis.**—An interesting ceremony took place at Rowley Regis, near Birmingham, on Saturday, the 14th inst., when the title deeds of the Haden Hill estate were handed over to the Rowley Regis Urban Council on the occasion of the completion of the purchase of the estate for the purpose of a public park. The original intention of the Purchase Fund Committee was to secure thirty-four acres of land, but the wonderful response to the appeal enabled the Committee to acquire an additional sixteen acres as a playing space for children. Mr. H. Lench, the Chairman of the Purchase Fund Committee, stated that the generosity of the inhabitants was wonderful, especially considering that a sum of over £11,000 had been subscribed during a period of industrial depression, and, in handing over the deeds to Mr. J. E. Shaw, Chairman of the Rowley Regis Council, he expressed the hope that the people would treasure the park and use it to the best advantage. In accepting the deeds, Mr. Shaw said that Rowley Regis now possessed a people's park purchased by the voluntary subscriptions of the inhabitants of the district, and he hoped that the pleasure and happiness the park would give to the people would be the lasting reward of those who had worked so nobly to secure this fine open space. In commemoration of the event, Mr. Lench was presented with a silver casket by the members of the Committee, and gold medallions were presented to Messrs. J. and L. Perry, who had undertaken the collection of the whole of the purchase money. At the close of the ceremony the subscribers inspected the park, which was opened to the public during the present week.

**Messrs. William Paul and Sons.**—We learn that the freehold land occupied for many years by Messrs. William Paul and Sons at Waltham Cross, and also the business of this firm as a going concern, have been sold by Messrs. Protheroe and Morris to Mr. W. E. Chaplin, who also has a long association with Rose-growing in the Waltham Cross district.

**A Protest by Scottish Fruit Growers.**—We learn from the *Glasgow Herald* that the committee of Perthshire and Forfarshire Fruitgrowers' Association have considered the question of the importations to this country of Dutch-grown Raspberries, which were responsible for the price of home-grown Raspberries being brought much below an economic one. It was stated that the imported fruit was of a much inferior keeping quality to the home-grown berries. The meeting was of opinion that manufacturers should be under obligation to label each container of jam showing clearly whether the contents are manufactured from foreign or home-grown fruit; and the secretary, Mr. A. J. Macaskill, Blairgowrie, was instructed to make a representation to this effect to the Government department concerned, and to make application to the Board of Trade for a report by the British Consulate in Holland as to the conditions of labour under which Raspberries are grown in that country.

**British Mycological Society.**—A series of three lectures by Professor A. H. R. Buller, Ph.D., Professor of Botany at the University of Manitoba, will be given on "Studies in the Mor-

phology and Physiology of Fungi," in the Botany Department, University College, Gower Street, W.C.1, at 5 p.m., as follows:—Friday, October 20, "Pilobolus and the Ocellus Function of its Subsporangial Swelling." Friday, October 27, "Sex and Social Organisation in the Hymenozetes." Friday, November 3, "The Production and Liberation of Spores in the Genus *Coprinus*."

**Mr. Elisha J. Hicks.**—Among cultivators and raisers of Roses Mr. Elisha J. Hicks occupies a foremost position. Born at Cirencester in 1874, he entered the service of Messrs. J. Jefferies and Son after leaving school, and worked in the Rose department of that firm under Mr. Coney for seven years. He was fourteen years of age when he attended his first flower show, which was at Dursley, in Gloucestershire; he had to cut and get ready twenty-four Rose blooms necessary for that show, and the flowers won a silver medal. He left the service of Messrs. Jefferies and Son when eighteen years of age, and was subsequently employed at two small establishments over a period of three years. He next entered service with Mr.

MR. ELISHA J. HICKS.

George Prince, with whom he spent a very happy ten years, and then settled at Twyford to start business on his own account. He planted 2,000 standard and 10,000 dwarf Briar stocks to begin with, and filled up his spare time working for other people. Since that period he has won no fewer than sixty gold medals, besides numerous cups, including the Wigan Challenge Cup six times and the National Rose Society's Champion Trophy for a group of Roses on three occasions. Mr. Hicks was the first Englishman to win the City of Portland (U.S.A.) gold medal for the raising of new Roses, and he has won two out of the four Edward Mawley memorial medals offered for the most meritorious exhibit at the National Rose Society's show. Among the principal Roses raised or distributed by Mr. Elisha J. Hicks the following come to mind: Princess Mary, Queen of the Belgians, Mrs. E. J. Hicks, Mrs. George Norwood, Chas. E. Shea, Margaret Horton, John Hart, Lady Verey, Lucille Barker and Climbing Lady Hillington. Mr. Hicks is not only a first-rate cultivator and raiser of Roses, but he is a clever exhibitor, and his large groups invariably attract attention and are greatly admired. Mr. Hicks is a member of the Council of the National Rose Society and of its Exhibition and Publication Committees; he is also a Freemason and takes a considerable interest in local affairs at Hurst, Berkshire.

**Progress of the British Empire Exhibition.**—Wonderful progress has been made at Wembley Park—where the British Empire Exhibition is to be held—during the past three months, and the huge stadium is now sufficiently advanced to show what it will look like when completed. The foundations and ground flooring of several of the huge exhibition buildings, one of which will have over five times the floor space of Olympia, are almost complete. On the occasion of a recent visit we were glad to notice that great care has been taken to preserve the fine trees which abound in the one hundred and forty acres of this exhibition site. Unfortunately, it has not been found possible to preserve the lake in its entirety, but one or two smaller lakes will be made as some compensation for this loss. A great deal of undergrowth has been cleared in several of the woodland areas, and a number of particularly fine examples of *Prunus*, *Crataegus* and *Pyrus* have been given the prominence their beauty demands. Within the stadium the whole of the playing area has been turved. Some of the clay was first excavated on the two and three-quarter-acre site, and the remainder was levelled, then covered with ten inches depth of ashes and small clinker. After this foundation had been thoroughly rammed and levelled it was covered with five and a half inches depth of turfy soil from another part of the park, and this also was levelled and rammed firmly. Finally, 76,250 turves, each measuring twelve inches by eighteen, and two and a half inches thick, were laid in position, and all the turves were taken from the fairway of the old golf course, where the grass has been carefully treated and looked after for many months past. Turf laying commenced on September 1 and was finished on October 14. So well did the newly-laid turf become established that mowing was necessary on October 10 on the part just finished, and it is safe to say that one of the finest playing areas ever produced will be in first-rate condition for the football cup-tie final in April next.

**Flowering of *Iris unguicularis*.**—Mr. D. Chaplin, Frognaal Gardens, Sunninghill, Ascot, informs us that *Iris unguicularis* opened its first flower at Frognaal Gardens on October 16, four days later than last year, when the first bloom appeared on October 12.

**New Chair of Geology at Aberdeen University.**—On Tuesday, the 10th inst., Dr. A. W. Gibb was installed in the new Kilgour Chair of Geology at Aberdeen University. Under the trust disposition by the late Dr. Kilgour, of Loirston and Cove, Kincardineshire, and his son, Mr. Alexander Kilgour, munificent bequests have enabled the authorities of this University to make large provisions for the rapidly increasing needs of scientific teaching in the donors' native city. The donors directed that a number of scholarships in natural history and a professorship of natural science or natural history should be founded in Aberdeen University. Seeing there is a Chair of Natural History already in the University, it was resolved to found a Chair in Geology, and to transfer the endowment of the existing lectureship in geology to the establishment of an additional lectureship in natural history. The Chair of Natural History in Aberdeen University was founded in 1753. At that time even the name "geology" was not in existence, and so far as Aberdeen is concerned it was not till the '40's of last century, when the eminent botanist, William Macgillivray, was the first teacher in Aberdeen to give a scientific course on geology, and his lectures aroused considerable interest. That Macgillivray interested himself practically in the subject is evident, for there are still in the Aberdeen University Museum many specimens labelled in his characteristic handwriting—neat and legible. He was followed by James Nicol and Henry Alleyne Nicholson—two professors whose names will always be most closely associated with the development of geological teaching in Aberdeen. It was not, however, till 1908 that an independent lectureship in geology was established at Aberdeen from funds provided by the Carnegie Trust, and Dr. A. W. Gibb appointed lecturer.

**Appointments for the Ensuing Week.**—Tuesday, October 24.—Southampton Royal Horticultural Society's Chrysanthemum Show (2 days); Bournemouth Horticultural Society's Show (2 days). Wednesday, October 25.—Irish Gardeners' Association meeting; Elgin Horticultural Society's meeting. Thursday, October 26.—Bristol and District Gardeners' Association's meeting; Royal Botanic Society's meeting; Hertford Horticultural Society's meeting; Wargrave and District Gardeners' Society's meeting; Holland (Lincs.) County Potato Show. Friday, October 27.—Daily Mail Imperial Fruit Show (9 days); French National Horticultural Society's Autumn Show (8 days).

**"Gardeners' Chronicle" Seventy-five Years Ago.**—Pruning. Now that the summer's business is fairly at an end, it is time to take steps to provide against an inordinate pressure of business in the forthcoming spring; for any arrears of autumn or winter business at that busy period will prove a great hindrance to the carrying out of a properly devised system through the ensuing season, and can be justified on the grounds of necessity alone. Planting, pruning, training, trenching, etc., are matters that belong peculiarly to this dormant period, and having before disposed of planting and trenching, by directing attention to its importance, we will now offer a few practical remarks on pruning. The habits of fruit trees vary, more especially as to the manner of forming and exhibiting their buds; thus there is no difficulty in distinguishing the fructiferous portions of the Apple, or of bush fruit in general, whilst the Apricot and Filbert are at this period somewhat obscure in regard of these points. Even in the Pear, more especially some of the newer kinds, such as the Passe Colmar, the Seckle, the Marie Louise, and some others, it is difficult to prune with safety in the early part of winter. For these reasons, therefore, we say, prune bush fruit the moment you can find time. Follow closely with Cherries, Plums and Apples, and towards Christmas lay by the knife until the early part of February, when the Filberts will be blossoming; then, after a slight thinning of the crowded and inside spray, male catkins may be brought in requisite and suspended amongst the bushes. The Apricots will, by this time, give unequivocal signs by which to know the true blossom buds; these, then, may immediately receive their pruning. The Peach and Nectarine will succeed the Apricot, and these may be followed by the Pear, and lastly by the Fig. In pruning bush fruit thin liberally. Let no two branches in the Black Currant and the Gooseberry touch when finally thinned; these seldom require shortening; an equal and judicious thinning is therefore everything here. In pruning Apples the thinning of the branches or old wood should be the first step; this, however, requires caution. The late Mr. Knight, of Downton, was much against cutting out large limbs unless a severe necessity existed. His authority is too weighty to be passed over easily, more especially as he lived most of his time in a cider district. In thinning the young wood of espaliers, remember that the first point is to secure a continuance of leading shoots to form a compact tree; and the second to secure a free admission of light to all parts of the tree. The same remarks will apply to the pruning of all the rough espaliers or dwarf standards of the kitchen garden, be they of what kind they may. Raspberries may now be planted and pruned. *Gard. Chron.*, October 25, 1847.

## TREES AND SHRUBS.

### HYPERICUM PATULUM (ROTHSCHILD'S FORM).

ORIGINALLY discovered and named by Thunberg in 1784, *Hypericum patulum* was not introduced until seventy to eighty years later, when Oldham sent it to Kew from Japan. In recent times, several forms of it have been found in China, and they are proving very handsome flowering shrubs. The best known of them has been called var. Henry, after Prof. A. Henry, who introduced it from China in 1898. Even more attractive probably as a garden plant will prove to be the form illustrated in Fig. 93. It was exhibited by Mr. Lionel de Rothschild at the meeting of the Royal Horticultural Society on July 11. Compared with the variety Henry, the plant did not differ much in the character of the flowers, although they were, perhaps, of a brighter yellow. But, so far as could be judged from a single plant, the growth was more graceful and more bushy. As may be judged from the figure, it was very floriferous, and there

FIG. 93.—HYPERICUM PATULUM (ROTHSCHILD'S FORM).

can be no doubt that it is a valuable acquisition among hardy shrubs. Although the sprays examined at Kew did not afford any character sufficiently marked to justify a varietal name, this shrub may be distinguished in gardens as *Hypericum patulum* (Rothschild's form). W. J. B.

### HARDY FUCHSIAS.

THE hardy Fuchsias comprise a most useful group of shrubby plants, adaptable for the sheltered rock garden, herbaceous border, or, indeed, anywhere where it is desirable to break straight lines which so frequently occur in many and sundry places. Quite recently I noticed along the coast many beautiful specimens of hardy Fuchsias of various species, flourishing in full flower, and their graceful, pendulous habit added considerably to the charm of the particular gardens.

The following are the hardiest species and varieties:—

F. GLOBOSA.—A desirable plant for any position, having numerous globose flowers, the corolla rich purple, and the sepals scarlet.

F. RICCARTONII.—This variety originated at Riccarton, in Edinburgh. It is one of the

hardiest members, and possesses great beauty. The plant is a strong, vigorous grower, producing its flowers, with straight red sepals and purple corolla, in abundance.

F. CORALLINA.—This species has a tall, slender habit, and is specially suited for training against walls. Its growth is vigorous and very free. The flowers are rich carmine red.

F. GRACILIS, and its variety *folio variegata*, are both graceful in habit, producing long, slender stems that are well furnished with crimson flowers. The variety has pretty white and green foliage that contrasts effectively with the blossoms.

F. EXCORTICATA.—This species has large carmine crimson sepals and purple petals. In its native home, New Zealand, it attains a height of 10 feet to 20 feet.

F. MICROPHYLIA.—This is a most beautiful subject for the rock garden, forming a neat, bushy plant that is smothered in summer with deep crimson flowers.

F. THOMPSONII.—A vigorous growing kind,

with rich crimson purple sepals, and crimson petals. The flowers are produced in profusion.

F. VIRGATA is a pretty, medium sized plant, with crimson flowers.

F. LONGIPEDUNCULATA.—The flowers of this Fuchsia have very long, tubular, carmine sepals, and rosy purple petals. The plant is very handsome, and profuse blooming.

F. PUMILA is a small, bushy species, adapted for the rockery. The flowers are purple and crimson.

MARKET RED is a hardy variety with very large double flowers of rich violet blue, with carmine pink sepals. The variety Madame Cornillon produces large flowers, with carmine, crimson and white petals. It is a very conspicuous plant and exceedingly beautiful; the variety is frequently used for summer bedding.

The most suitable position for hardy Fuchsias is the base of a south or west wall, or other sheltered position. They grow well in ordinary deeply trenched soil that has been mulched with a little well-rotted manure. In winter a mulch of leaves or manure will afford them the necessary protection, or they may be cut down when the leaves have fallen and the stools protected with dry earth or coal ash. H. Logan.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

**Laelia.**—*Laelia anceps* and its varieties are sending up their flower spikes rapidly, and need generous treatment. The members of this family of Orchids produce their flowers at a season when choice flowers are very valuable. The dark-coloured varieties are usually the first to bloom, followed by the many beautiful white forms, and where a representative collection is grown their flowering extends over a considerable period. Before they commence to open their flowers, it will be advisable to thoroughly cleanse and arrange the plants, neatly staking the long spikes, which should be tied in such a manner that their tips are clear of the roof glass. *L. albida* and *L. autumnalis* are other winter-flowering species. At this season they need plenty of moisture at the roots, also all the light available, and free ventilation whenever the outside conditions are favourable, with a temperature of about 60° at night.

**Laelia pumila.**—The flowers of *Laelia pumila* and its many varieties are highly prized where "buttonholes" are in demand, the somewhat small flowers being most suitable for the purpose. These dwarf-growing plants, and others of a similar nature, which have been growing in a cool house during the summer, should be removed to a house having an intermediate temperature. They should be suspended from the roof rafters, where the plants will receive the maximum amount of sunlight and air, and the extra heat will assist the flowers to develop and the pseudo-bulbs to complete their growths. The roots should be well supplied with water whilst the plants are in active growth, but much less moisture will suffice when growth is completed, although care must be taken that the roots are not allowed to become quite dry. These Orchids are best grown in shallow pans. The usual rooting medium may be used, and any necessary repotting is best done when roots are seen emerging from the base of the current pseudo-bulbs.

**Other Laelias.**—*Laelia purpurata*, *L. crispata*, *L. tenebrosa*, and many *Laelio-Cattleyas* may still have attention as regards repotting, but care must be taken that only sufficient water is applied to the new compost to prevent the plant from shrivelling. It will be observed how quickly the roots develop in the new material, and if the plants are kept on the dry side during the winter the new growths will break away readily and strongly in the spring. Failure in many cases to grow these delightful plants satisfactorily is attributable to giving them too much water during the winter, and not sufficient during their season of growth.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Apples.**—As these fruits become ready for gathering, remove them very carefully from the trees when perfectly dry, and store them in a sweet, well-ventilated fruit room. Do not rest the fruits on hay or straw unless it is perfectly sweet and dry, as nothing spoils the taste of good Apples so much as a musty atmosphere. Do not gather very late keeping varieties until the fruits part with ease from the branches and the pips are turning brown. If carefully handled the fruits may be placed three deep in a layer where room is scarce. Keep all bruised and inferior fruits by themselves and use them first. Varieties that ripen first should be placed in the most accessible place, as they will need to be examined frequently, and when the space they occupy is vacant, this may be used to spread out the later keeping sorts more thinly.

**Fruit Trees.**—It is always advisable to have a good stock of young trained trees in reserve to replace any that are worn out or that are undesirable sorts. Such trees should be lifted and replanted early so that the damaged ends of the roots may callous over and fresh roots push forth before the ground loses its warmth. November is probably the best time for planting most kinds of fruit trees; I have lifted and replanted large trees of Peaches, Pears, Plums, etc., that have been specially prepared, in the last week of October with excellent results, and the trees have borne useful crops the following year. Before disturbing the roots see that the soil is thoroughly moist and that the stations are properly prepared in readiness for the reception of the trees. Having prepared the sites, unfasten the branches of the trees to be lifted, and tie them loosely together to prevent any injury in transit. Dig a trench beyond the point to which the main roots have extended and quite two feet deep; then gradually remove the soil with a fork and work towards the stem, doing as little damage to the roots as possible. Undermine

FIG. 94.—IRIS PARIISIANA × I. GATESII.  
(SEE P. 237.)

the tree and lift the bulk of soil and roots on to a strong mat for transit to the place of planting. Previous to relaying the roots, trim the ends of any that are injured; spread the main roots at even distances apart and cover them with good soil, working some of it well amongst the fibrous roots. Make the soil firm at the base of the hole and plant a little above the ground level to allow for the soil sinking. When the work of planting is finished cover the soil with a little straw manure and secure the main branches temporarily to prevent damage by winds, but do not fasten them in such a way that the tree cannot sink as the soil settles. Ample space should be allowed between the wall and the stem to allow for the latter's thickening. In the case of stone fruits see that the compost contains plenty of lime and old mortar rubble.

**Young Trees.**—Young trees for planting this autumn should be ordered from the nurseryman early, as the orders are executed in rotation. Autumn planting is far preferable to spring planting and trees set before the ground gets very cold often become well furnished with new roots by the following spring.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Watering.**—At this season of the year and during the coming winter plants growing in the greenhouse need to be watered very carefully. With the lower temperature of all plant-houses during the winter there should be a corresponding reduction of atmospheric moisture. And during times of cold, damp weather the floors need to be kept comparatively dry. Whilst endeavouring always to allow a circulation of air, whenever the weather is favourable, by ventilating, it is always necessary to shut out fog, which is one of the greatest enemies of indoor flowering plants.

**Campanula pyramidalis.**—Plants of the Chimney Campanula raised from seed, sown as advised in a previous calendar, and intended for growing in pots to furnish flower spikes next season, should be placed in their flowering pots. Receptacles 7 inches in diameter will be suitable for these plants, and they will do well in ordinary soil with a little bone meal added. After potting them, the plants should be arranged in a cold frame, plunging them in a bed of ashes up to the rim of the pots to prevent the latter becoming broken by severe frost and removing the lights on all possible occasions. Stock of an extra fine variety may also be raised from root cuttings.

**Regal Pelargoniums.**—Members of the fancy section of Pelargonium that have been cut back and have been allowed a slight rest by the treatment advised in a previous calendar, should now have most of the old soil shaken from their roots and be repotted in the smallest receptacles that will accommodate them. When they have recovered from this operation and have become well furnished with roots again they may be placed in their flowering pots. Young plants should be potted as they become ready, and, if possible, grown near the roof glass in a cool greenhouse during the winter. These plants are subject to attacks of green fly; but if sprayed with Quassia extract occasionally they will keep free from this pest.

### THE FLOWER GARDEN.

By EDWIN BUCKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Michaelmas Daisies.**—Those who have patiently carried out all the necessary details in the culture of perennial Asters are receiving their reward in the wonderful display of flowers that these lovely plants give year after year. Whatever the aspect in which they are grown, they seem to thrive; neither does changeable weather appear to affect them, though great extremes of climate do, to a certain extent, hinder their complete and full development, though the Michaelmas Daisy does not show the effects of weather to anything like the extent that many other hardy herbaceous plants do. Soils, again, do not make any appreciable difference to them, and yet, despite all these great advantages, combined with the lateness of their flowering season, some persons still profess to dislike Michaelmas Daisies. This is probably because they are not acquainted with the modern Michaelmas Daisy, but know only the poor, weedy plants that were common in gardens a few decades since. Those, however, who saw the wonderful varieties in blue, red, purple, white, pink, and other shades at the Holland Park Rink Exhibition know that the modern type of perennial Aster bears as much resemblance to its progenitors as the exhibition Rose does to the Dog Rose of the hedgerows. The following varieties of the *Novi Belgi* section have been raised in these gardens:—Dainty (semi-double, pink), Grace Sweet (rich deep blue), Moonbeam (pale mauve); Pink Perfection (bright pink), Queen of the Lilacs (pale Lilac blue), Sunset (single pink), Wedgwood (Wedgwood blue). Other fine varieties are Blue Gem (one of the loveliest blue varieties), Wells White (a fine pure white, tall growing variety), Antwerp. Brightest and Best, General Leman, Heather Glow, Ghent, Louvain, Liege, Marne, Mons, Namur, Nurse Cavell, Walloon, and Ypres (all with pink flowers), Aerschott, Belgian

## AMERICAN IRISES.

For some years Mr. William Mohr, Mt. Eden, Alameda County, California, has been interested in the breeding of Irises. He has produced many fine seedlings in the bearded section, one of the parents, *I. mesopotamica*, or, very possibly, a variety of *I. cypriana*, having been found to give great size, height and, in California, great vigor to its offspring. He has also some crosses between *I. Korolkowii* and various bearded Irises, in particular *I. germanica major*, and *I. mesopotamica*. The enclosed photograph (Fig. 95), of three flowers, shows, from the left, *I. Korolkowii*, *I. mesopotamica*, and a resultant seedling, the latter a finer flower than either and of novel colouring, but rather weak in the stem.

His particular pride is, however, a seedling of *I. Parisiana* × *I. Gatesii*. It is a huge flower (Fig. 94), with standards sometimes measuring 4 inches high and 3½ inches wide; falls 3½ inches long and 3 inches wide. The ground is white, heavily veined with manganese violet (Ridgway), with a lilac flush to the standards. The general effect is much lighter,

**Melons.**—At this late season, great care is necessary in watering Melons, and especially when fruits are on the verge of ripening, or splitting will occur. In order to have good-flavoured Melons at this season of the year, they should be grown in a suitable pit, where the atmosphere can be kept dry and warm. When they are colouring, take advantage of every gleam of sunshine to ventilate the pit freely. Later plants that are swelling their fruits must not be allowed to suffer a check of any kind. The syringe should be dispensed with, and the grower should guard especially against moisture lodging on the stems, or canker may set in. Keep the night temperature as near 70° as possible, with a few degrees higher by day with sun heat.

## THE KITCHEN GARDEN

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Digging and Trenching.**—As soon as the ground is cleared of crops it is advisable to commence tillage operations as soon as possible. A

FIG. 95.—IRIS KOROLKOWII, *I. MESOPOTAMICA* AND THE HYBRID THEREFROM; FROM LEFT TO RIGHT.

certain area of the kitchen garden should be trenched every year. Land intended for cropping with Onions or for making new Asparagus beds should be trenched as early as possible. Ground dug at this season of the year should be left as rough on the surface as possible to allow frost and air to penetrate it readily; heavy land is benefited by being thrown up in ridges.

**Asparagus Beds.**—As soon as the stems of Asparagus plants ripen they should be cut close to the ground with a pair of hedge shears and removed. The beds should be covered with a good quantity of half-decayed farmyard manure; if the dung is very rotten it is apt to keep the beds cold in spring. A post should be inserted at the corner of each bed, a line stretched therefrom the length of the bed, and sufficient soil taken from the alleys to cover the manure thinly. Crowns for forcing early should be lifted and placed on a gentle hotbed, covering them with a mixture of leaf-mould, sand, and old potting soil, about 4 inches thick. Maintain a moist atmosphere in the forcing house.

**General Remarks.**—Cauliflowers that are ready for use may be kept in good condition for some time if hung upside down in a cool shed. Turnips which have completed their growths should be stored. French Beans should be kept closely gathered on any sign of frost, and all growing crops kept free from weeds.

brighter and warmer than I have yet seen in any cross between a pogoniris and an onco-cyclus—usually they are rather dark and dull. Its stem is good and, as will be seen from the illustration, produces two flowers. In California, where, of course, conditions are favourable, it has an excellent constitution and will stand moderate watering throughout the summer. Being so new its reproductive qualities have not yet been much tested.

It has been stated that *I. Gatesii* has never been used in breeding. If anyone has had success with it Mr. Mohr would be glad to hear from him. He has been unable to reproduce his own cross, as he lost his single plant of *I. Gatesii*. Sydney B. Mitchell, Vice-President, American Iris Society, Berkeley, California.

## CELSIA ARCTURUS.

Sow a few seeds of this biennial now and grow the plants on through the winter in small pots in a cool house. In the early spring they will make rapid growth. Place the plants on a shelf to keep them sturdy. The spikes of flower are very pretty, and the plant is useful for May and June flowering. The soil for potting should consist of loam, with a little well-decayed cow dung and leaves added. Plants will bloom well in 4½ in. or 6-in. pots. J. S. D.

Queen, Cardinal Mercier, King of the Belgians, Mairnes and Climax (blue); whilst of lavender and mauve sorts I may enumerate Bruges, Brussels, Joan Vaughan, King Albert, and Robinson, V.C. Sam Banham is a very strong growing variety, white suffused with very pale pink. The *Novae Angliae* section offers us Lil Fardell, Mrs. Raynor, and Rycerott Pink, in pink shades, and Wm. Bowman, Purple Prince, and Mrs. S. T. Wright in purple. The other sections, such as the *ericoides*, *cordifolia*, *vimineus*, and *diffusus*, all contain many gems, and two that should not be overlooked are members of the *Amellus* group, Beauty of Ronsdorf (mauve) and the magnificent King George, of great size and fine bluish-violet tone.

**Sweet Peas.**—The practice of sowing Sweet Peas in pots in order to ensure early flowers is one that gains in favour each year. It is a simple method, and one that enables the raiser to have full control of the plants until such time as they are ready to plant out in the open ground. Three seeds should be placed in a 60-sized pot, provided with efficient drainage, and filled with a sandy compost sufficiently moist to obviate the necessity for watering until the seed has germinated. Place the pots in a cold frame and shade them with sheets of brown paper until the young plants are through the soil, as this will assist the seeds to germinate and prevent drip from the root reaching the soil, an important point inasmuch as if the soil is allowed to get too damp the seed is more likely to rot than to germinate. After the young plants are through the surface, remove the paper, gradually harden them off, and thereafter afford them the freest ventilation possible according to the weather, taking the lights off the frames on fine days. The great aim should be to promote sturdy and hardy growth to enable the plants to pass through the winter without harm. Guard well against mice getting at the plants, and cover the frame with a net when the lights are wide open, or off, otherwise birds will eat the young growths.

## FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**The Orchard House.**—The trees in the orchard house, being clear of fruit, should be fit for removal to the open, if this has not already been done, to give them a four months' rest. Peaches, Pears, Plums, and Cherries which have ripened their wood under glass will withstand any reasonable amount of frost, so long as they remain dormant. Their greatest enemies are birds and worms, and it is important that protection be taken against these, if necessary. When placed in position, the spaces between the pots should be packed with Bracken fronds or dried litter to ward off frost and keep the roots moist. Provided the soil is moist at the time of plunging, the plants will take little harm through the winter. A careful watch must be kept for mice in severe weather, for they sometimes cause much injury to the stems when the ground is covered with snow for a considerable time.

**Potting.**—Late trees may still be potted. This operation might have been performed a month earlier, but, as these trees will not be forced, roots being plentiful, they will fruit well even after severe disturbance. Young trees root-lifted last autumn, pinched and specially prepared for potting, may now be lifted and placed in pots varying from 8 inches to 10 inches in diameter. All stone fruits and Pears need a sound, fairly heavy, calcareous loam, mixed with burnt earth, lime rubble, bone meal, and a little soot. The soil cannot be made too firm by ramming, and the roots should receive one good watering prior to plunging the pots.

**Figs.**—These are the only trees which should be kept in the orchard house, as they are liable to injury where fire heat cannot be used in severe weather. In the event of the whole house being required, they may be stored, completely covered with dry Bracken fronds, when all the leaves have fallen, in a frost-proof shed or other shelter.

**EDITORIAL NOTICE.**

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## MR. KINGDON WARD'S SIXTH EXPEDITION IN ASIA.\*

No. 26.—GOODBYE TO MU-LI.

OWING to the usual transport difficulties it was November 15 before we found ourselves actually climbing the high Mu-li range and collecting seeds. By lunch time we were in the snow. Here, on a south bank, where the snow had disappeared, was a carpet of the big, trumpet Gentian, its brilliant blue eyes turned wistfully towards the sun, low down in the sky. Most of them, however, were already withered, without setting any seed. Just below in the marsh were many more plants, their long, thin capsules gaping. Undoubtedly it is the same species, and it would be advisable to grow the plant both in boggy places and on dry sunny banks; it ought to be quite hardy. The grey seeds, by the way, viewed under a lens which shows the fine network of minute pits, are extremely pretty objects.

We had to collect seed of several Rhododendrons, and in two cases knew of only one tree of each species; however, we found them and secured seed. We also collected much seed of the species accidentally discovered, by virtue of its distinctive foliage, in August, and of Rhododendron Lemon Bell—to adopt the jargon of those who scatter bastard Rhododendrons up and down the country. This last is a graceful little tree, as pretty as anything met with.

At nightfall we camped in the snow—luckily frozen hard—just below the pass, at an altitude of about 14,000 feet. Even under the trees the cold was severe, nearly 20° of frost being registered. When the full moon appeared between the fangs of the limestone range like an arc lamp, the sight was unforgettable; a lance of light slipped between the trunks of the Fir trees and was shivered into a thousand glistening fragments.

Next day we crossed the pass, and the most formidable obstacle on our journey south lay behind us.

That day—November 16, was a busy day of seed collecting, too. But a disappointment was in store. Of all that wealth of fragrant blossom on the Daphne calcicola bushes which had greeted us in June, not a vestige remained to prove that there had ever been a flower! Not a fruit to be seen. It was inexplicable.

Down by the stream I found a *Crawfordia* in fruit, and collected the seed as a speculation, though the little colonies differed in no degree from others found on the N.E. frontier, and even at the Doker-la. Two more days were consumed on the journey to Yung-ning, which, bathed in winter sunshine, was pleasantly warm. On the dry rocky slopes a Gentian with bright, china blue flowers massed in heads, was met

with; but we found it at Yung-pei, too, and almost so far as Ta-li. In fact it may safely be asserted that below 10,000 or 12,000 feet very few plants in Yunnan have a restricted range, whereas on the contrary above 14,000 or 15,000 feet, a good proportion of plants on any range are endemic. The inference is obvious.

We spent three days in Yung-uing getting warm. We had one more serious range to climb, with seeds of several plants to collect; but I had serious misgivings over the *Nomocharis*, which by this time was probably beyond recall.

On November 22 we halted by the lake, and on the following day ascended the range above. To my surprise the *Nomocharis* gave no trouble,

FIG. 96.—LISSOCHILUS HORSFALLII.

(See p. 239.)

and though we secured comparatively little seed, this was more than counter-balanced by over a score of bulbs dug up. Also we found a tree Rhododendron which I had completely overlooked on the up journey, and collected seed of that, too.

Our task was now virtually over, though we collected a few seeds on the way to Yung-pei, reached on November 29; there was the orange *Candelabra* Primula, for example, which gave some trouble, as the cattle had not exercised as much care to avoid trampling on it as we could have wished. For the same reason the crimson-pink *Candelabra*, close to Yung-pei, had almost disappeared from the landscape; however, we purloined samples of both after a vigorous search.

An interesting plant found here in seed—we had not observed any trace of it in May—was a *Muscarioid* Primula, which might have been *P. Littoniana*. On the other hand, it might not have been, so we took no risks. I had not previously noticed any plants of *P. Littoniana* with several stems arising from the same scape.

At Yung-pei I took stock of our collection. One *Rhododendron* had been missed, the men collecting the wrong species. The "Martagon" Lily and *Daphne calcicola* had both refused to set any seed; and a curious *Impatiens* with unusual, flame-yellow flowers had been swamped in surrounding vegetation and lost. But apart from these I believe we collected seed of everything I wanted, and quite a lot I didn't want, but had not the heart to throw away after the zeal shown by my assistants. On one point I flattered myself. I do not think there was a single plant found—certainly no first-class plant—which I did not myself see growing in its native haunts. I might go further than that, and say that I found practically every plant independently, though, of course, I was not always the first discoverer. Even the rare, big *Primulina Meconopsis*—perhaps the gem of the collection—I found subsequently in fruit, though the honour of the original discovery belongs rightly to my head collector.

For all this boast, however, I could not have done without my four collectors; they were invaluable, especially when it came to collecting seeds. Sometimes I felt I could have done with two or three more.

The plant collection numbered nearly a thousand species, the seed collection about 200 species. How many of them are new to science or to cultivation time will show; but that a very fair proportion are first-class garden plants I do not doubt.

At Yung-pei three of my collectors left to return to their home at Likang by the shortest route, the fourth going on with me to Ta-li. We did not reach Ta-li till December 9.

Below, *Primula malacoides* was coming into flower, and the dainty *P. nensensis*, fragrant and mealy, crowded the marshes. So, too, did *P. Beesiana*.

I thought I knew all the Primulas between Ta-li and T'eng-yueh—all that grow by the roadside, that is. Yet a few days out from Yang-pi I found one I had never seen before—a bog Primula. There were some half-dozen plants just coming into flower in one spot, but I did not see it again—nor do I know now what it is. Probably I had never seen it before because I had never crossed Yunnan in December—but, on the other hand, I had travelled this road in February or March, when the winter-flowering Primulas are at their best.

We reached T'eng-yueh on December 22, in time for Christmas revels, and dined seven strong at the Consulate on Christmas Eve. Then, setting out on the last lap of the journey, we crossed the Burma frontier on New Year's Day, and reached Bhamo on January 4, fifty-three days having been required for the journey from Mu-li. *P. Kingdon Ward*.

## ORCHID NOTES AND GLEANINGS.

### CATLEYA IRIS VARIETIES.

SINCE the two fine forms of the showy and useful cross raised originally by Messrs. Charlesworth and Co., between *C. bicolor* and *C. Dowiana aurea* gained First-Class Certificates at the Royal Horticultural Society in the autumn of 1901, ten forms of the same cross have received distinction at a similar season of the year, and it has been established as a general favourite, its forms exhibiting endless variation of shape and colour. The same cross has also been raised by other hybridists. Messrs. Mansell and Hatcher, Rawdon, Leeds, being among the more successful, as evidenced by the thirty or so charming varieties of it shown in their effective group at Holland Park Skating Rink, the flowers showing great variation in the yellow and bronze tints of the sepals and petals, and the carmine to purplish-crimson of the lip.

\* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, October 29, 1921; January 7, January 21, March 11, March 25, April 8, April 22, May 6, May 20, June 3, June 17, July 1, July 15, July 22, August 5, August 26, September 9, September 23, and October 7, 1922.

## SOME UGANDA ORCHIDS.

THE part of Africa known as the Uganda Protectorate, bordering Lake Victoria and the Nile at its source, contains considerable areas which may yet yield some interesting finds to the Orchid hunter.

On the whole, Uganda Orchids are not brilliant, compared with the most popular genera grown to-day, but botanically, some of the most interesting species have been, and will be, found in this country. Showy plants are, however, by no means non-existent. What Orchids are more beautiful than *Angraecum infundibulare*, *A. Kotschyi*, and *A. Rothschildianum*, or some of the species of *Listrochysis*? The genus *Lissochilus* is represented by many fine species that are a feature of the grass lands.

These African Orchids have not been very successfully cultivated in the British Isles; indeed, they have never been considered worthy of the special care given to *Odontoglossums* or *Cattleyas*. Yet it is obvious that if they are to be brought to perfection the same individual attention must be given them, and then African Orchids would hold their own.

The African *Lissochilus* have been practically complete failures under cultivation. Yet I am certain success could be achieved with them. What is the factor against success at home? They are not fastidious plants. They need good, rich, deep soil, and plenty of sunlight. They will never succeed in the moist, shady house in which so many Orchids are found. They will pine in an Orchid pan half full of crocks, and covered with a handful of peat and moss, but give them conditions as similar as possible to those they grow in naturally, and I feel confident they will succeed. Consider how the plants are found in nature. The flower spike and strong leaves may be seen above a field of grass 2 ft. high. To find the bulb one must dig down about a foot. A huge mass of roots is then uncovered, each root as thick as a lead pencil, and in order to remove these entire digging must proceed another 2 feet. The soil may be anything; sandy, or a stiff clay, or the red coloured loam common to the ironstone subsoil of the country. The only factor which should cause failure in this country is light. Yet we grow successfully many plants as fond of the sun as *Lissochilus*.

The epiphytic Orchids, again, need diverse treatment for different species. *Angraecum infundibulare* would be scorched up if given the amount of sunshine which *A. Kotschyi* (see Fig. 97) delights in. Yet both may be found in the same forest: one under the almost negligible shade of *Acacia*, the other in the dark recesses of the forest. The grower receiving a mixed lot of these Orchids will naturally give all similar treatment, and probably fail with all. Only the collector can give precise details and a basis for their treatment, and had this been done, many fine plants would be in our collections, and African Orchids would not have their present reputation of being hardly worth growing.

In describing some of the best of the known species, I propose to indicate the treatment most likely to give success.

### LISSOCHILUS.

*Lissochilus Horsfallii* (see Fig. 96) under cultivation, is probably the gem of the genus. It grows in short grass in swampy places, where it receives full sunlight. The tubers are a foot below ground, the roots extending to 3 feet. The leaves grow up to 4 feet, and the flower spike to 6 feet. As a growth reaches full size, it flowers. Growth is perennial, the plant never resting. Flowering takes place several times a year, and a spike bears as many as sixty flowers, each 2 inches across, and several weeks elapse between the opening of the first and last flowers. This species has been flowered a few times in England.

*L. arenarius* is a dwarfier species. It rests completely each year, and the flower precedes the growth. The spike grows to only 2 feet in height, and bears only four to six flowers.

These are a purplish pink in colour, and of the same size as those of *L. Horsfallii*. It occurs in drier land than the latter, but always in full sunlight. It is a very beautiful plant, and I can imagine the furor that a group of 200 spikes would create if shown in the R.H.S. hall.

*L. Mahonii*, *L. giganteus* and *L. cristatus* are large growing species, but with smaller flowers than the two preceding. There is also a host of smaller growing species, unnamed so far as I am aware.

All species of *Lissochilus* are sun lovers, and all like soil a little stronger in texture than the typical Orchid compost. *E. Brown.*

(To be continued.)

ing for bulk with the old stand-bys. The same thing has happened with such a Pear as *Citron des Carmes*, the second time I have known it to crop in 48 years, and wild Plums, usually barren, and Almonds seldom bearing fruit, are in fertility-line with the others.

For a time it looked as if fruits of all kinds would be small, the season being late, and in some cases that is true. At the same time such Apples as *Warner's King*, *Bismarck*, *Lord Suffield* and some others are nearly normal; Pears also are late, and scarcely an average size. Both Apples and Pears have dropped their fruits far beyond the usual, and in gathering the slightest touch is enough to loosen their hold. This condition is apparently due to the

FIG. 97.—*ANGRAECUM KOTSCHYI*, ON A TREE IN UGANDA.

## A WONDERFUL YEAR

THIS year has been a year of wonders in the garden! The reports of fruit crops show that in many districts the quantity exceeds the most sanguine expectations. Plums, I should think, occasionally have bulked as largely, and Pears, perhaps, also; but Apples have produced a crop such as probably will not be equalled in a lifetime. It is not so much that trees are laden to excess; that has happened frequently, but in numerous instances every flower in a cluster produced a fruit, thereby increasing a normal set many fold, and thereby, too, incurring the expenditure of much extra time in reducing the numbers to reasonable proportions. That, however, is not all, for varieties that only at wide intervals produce a crop are this year compet-

dry state of the lower layers of soil, which trenching in late September shows never to have been quite moistened since the drought of last year. The drought has had another ill effect, inasmuch as shrubs, and at least one fruit tree, have died since spring. Against that has to be placed the benefit derived from it. It has undoubtedly affected all kinds of woody vegetation similarly to root-pruning. The show of blossom was beyond precedent, and the blossom was so perfect that, as all know, the set was almost phenomenal. Other garden produce has been equally exceptionally good.

Large Onions are not esteemed here, and to stop this year's crop from becoming individually over large the bulbs had to be partly lifted with a fork to hinder further increase in size. Peas, French Beans, Scarlet Runners and Cauliflowers, that in some years show gaps in

the succession, have this year done their duty without a break. A striking instance occurred with some of the earliest batch of Cauliflowers sown in October, and planted on a border in April. Two days after setting them out they were found to be mere bits or sticks, the leaves having been devoured by pncasants. Strange to say, they soon began to grow, and, finally, produced a good crop, only a little later than they ought to have been. But of all the vegetables that have demonstrated the exceptional character of the year the Globe Artichoke is the most remarkable. Offsets planted in spring for a late crop have filled not only the 4 feet allotted them, but have overlapped each other.

Flowers have been similarly exceptional. I continue a practice, begun during the war, of cutting over herbaceous plants in June in order to obviate staking. This summer the cutting over has had no apparent effect in reducing the height of the autumnal flowering section. Never have plants been so vigorous and tall, and staking had to be resumed. I might mention Gladioli, Carnations, Hollyhocks, Stocks and Roses as being outstanding. And freedom from disease generally has been marked, though Roses had to be sprayed and again sprayed for mildew.

Everybody has been complaining about the weather, the cold summer, the want of sun. There must be a reason for the results, such as, no doubt, have been usual elsewhere. I think the explanation is that the soil was heated to dryness and by absence of moisture last year. It acted, as already noted, similarly to root pruning in the case of trees; and the soil was pulverised to a depth that frost never reaches, with the further difference that the benefit of frost soon vanishes, while that of dryness lasts much longer. But the best results are only seen in deeply-worked soil.

Though, perhaps, not apropos, one may yet express regret that with such abundance neither the community nor the growers are benefiting as they should from it. From near and far one hears the same story of fruit and vegetables being unsaleable or saleable at unremunerative prices. And at the same time foreign material is doing well. I hear of Spanish Onions at £10 per ton; home onions unsaleable at £3—take it or leave it! Apples from America are selling in country villages at 6d. per lb., and home-grown Apples in Scotland are being returned to growers unsold. Surely in a year like the present means might have been taken to see that the superabundance was not lost. The old, old lines—

“So Thou the year most lib'rally dost with  
Thy goodness crown,

And all Thy paths abundantly on us drop  
fatness down.”

if not very poetical, have had a practical demonstration—if only we would benefit by it, which appears to be doubtful. *R. P. Brotherston.*

## THE ROSE GARDEN.

### SOME GOOD AUTUMN FLOWERING ROSES.

ALTHOUGH September does not as yet appeal to popular imagination as a month of Roses like June, the time has arrived when it should have equal recognition. Indeed, certain varieties appear at their best in autumn, for they seem to grow more freely in July and August than during the period between pruning and the opening of the first bloom. Those who propose to plant Roses should not overlook the claims of autumn, and hence I refer to a few varieties which are useful for autumn display.

Hoosier Beauty is a dark, red rose of perfect form, and has rich perfume. It is a dwarf, yet free grower, and blooms all the summer, but the climax is not reached until the early autumn, when every bloom stands revealed in its true colour.

The only fault I have to find with W. C. Gaunt is that it is practically scentless, and in dark blooms this is a disappointment; but if it is planted solely for its autumn brightness, then its place is assured. In the bud stage it reminds one of Richmond, but several shades darker.

Mrs. Wemyss Quin is essentially an all-the-

season variety, and as such must rank for some time as one of the leading bedding sorts; the colour is deep canary yellow, tipped with crimson, and it is non-fading. Lady Inchiquin is one of Messrs. Alex Dickson and Sons' best Roses, and promises to be capable of living up to the style which we expect from a Gold Medalist, with the further backing of an A.M. from the R.H.S. So far, its reputation rests on exhibition form, but there is little to be desired from a decorative standpoint, for it has the necessary vigour in growth. The colour is described as orange-cerise, but that of a glorious September sunset is as near the shade as anything I can think of.

Many scarlet Roses have been introduced since General McArthur first appeared, but as yet I have not found a better for planting in the mass. It is one of the first to open, and nothing but frost finishes its season. It is such varieties as this that are most capable of solving the bedding problem of these times. Old Gold is a typical garden Rose, with a name which in no way overstates the colour description. Free in growth, the plants are presentable throughout the summer, but never more so than in early autumn, when the cooler days and nights make for longer lasting and more highly-coloured blooms.

Some Roses seem destined to draw attention to the necessity of catering for autumn colour, and Ophelia is not the least amongst them. It is never without blooms from the end of June, but under a summer sky, neither the salmon nor the rose tints are so vivid as they become later. To name a more useful bedding variety would be difficult. Pink Roses are not over plentiful, and one very often finds that good old variety Caroline Testout, the chief representative in a bedding scheme. For this reason Ethel Somerset should have a future. It has all the vigour of the variety just named, and promises to be as free in flowering, the blooms, however, are of more up-to-date form, being above average size, with a high, pointed centre, and carried on a good stem; the colour is a lovely shrimp pink, which deepens at the edges of the petals, especially in early autumn, to rich coral.

A garden Maréchal Niel Rose has long been dreamt of by Rose growers, and as I saw the variety Rev. F. Page Roberts under a cloudy sky a few weeks ago in a famous nursery, I am inclined to believe it has arrived. Whatever its other qualities may turn out to be, I can vouch for it as a garden variety and an autumn bloomer, although it will also probably be much in evidence at exhibitions for some time to come. The growth is strong and upright, and the foliage has every appearance of being mildew proof. On the blooms as seen in early autumn, there were no signs of any colour but rich, clear yellow; earlier buds were veined with buff on the outer petals. Long and pointed buds invariably indicate wet-weather resisting blooms, and in seasons like the present we can hardly have too many of this kind. Amongst several which answer this description, the beautiful orange-yellow Lady Hillingdon should be in every collection, for it remains presentable the summer through.

Sovereign is a deep golden-yellow variety, aptly named. It has by no means a large bloom, but just the type which comes freely over a long period, when the habit is bushy.

Although but semi-double, Hawmark Crimson must appeal to those who delight in autumn brilliance. Crimson in the bud, the fully opened bloom takes on a more scarlet tone, and this remains to the last. K. of K. and Red Letter Day are of similar form and most useful. John Hart brings to mind that delightful variety (in the bud stage) Lady Battersea, but it will probably enjoy a longer career, because it has greater substance in the open bloom, and autumn finds it at its best. In the modern variety Betty Uprichard, salmon pink and carmine are delightfully blended, and a refreshing perfume arises from the shapely bloom. In some respects it resembles the better known Mme. Abel Chatenay in form, but it is freer in its mode of flowering. As a decorative variety, its free-branching habit alone will commend it. Reddish orange seems a fair descrip-

tion for the very free grower, Lamia, and those who prefer new comers might find it a good substitute for Old Gold.

It is often remarked that for quality in dark Roses we must turn to the H.P.s. Before the advent of Courtney Page, one of Messrs. McGredy's best sorts, the observation may have had some point. Now, however, there is no excuse for placing form or colour before continuity of flowering, for in this H.T. there are enough of these qualities to satisfy the most critical, and the scent is very pleasing.

Many other Roses might be named for autumn effect, and a few of the older sorts for planting in large numbers, include Mrs. Aaron Ward, Indian yellow; Liberty, scarlet; Autumn Tints, coppery red; Iona Herdman, orange; Mme. Edouard Herriot, terra-cotta; and Richmond, scarlet. *Yorkshire Grower.*

## THE ALPINE GARDEN.

### THE ALPINE POPPY.

PAPAVER ALPINUM is one of the most charming of the small perennial Poppies, and is not out of place in the most select rock garden or flower border. This Papaver is not, however, one which lovers of showy, gaudily coloured flowers will appreciate, although it is not restricted to one or two colours and shades. It resembles a miniature form of the Iceland Poppy, *Papaver nudicaule*, but with a greater diversity of colour and tint, reminding one more of the newer varieties of the latter than of the older ones. But it is far more refined in every way. Its height is less than half of that of *P. nudicaule*; its flowers are much smaller; its foliage is more finely divided, and is much more beautiful generally. The colours of the flowers embrace shades of white, cream, yellow, blush, pink, orange, and scarlet. A still smaller form, called *P. alpinum pyrenaicum*, is also in existence, and is exceedingly beautiful in a miniature fashion. There is also a hybrid with fringed petals, called *P. alpinum fimbriatum*.

Nominally the Alpine Poppy is a perennial, but it is not always so enduring as could be wished. Sometimes our wet winters appear too trying for it, and at times plants are lost through unfavourable weather.

Self-sown seedlings often appear, and these will continue the succession, although it is not always safe to count on these, and it is more prudent to save a pinch of seeds from the best plants and to sow them, either in the open or under glass, in the spring. Like other Poppies, the plants do not always transplant well, and the best ones are produced by sowing where they are to bloom. Sow very thinly, and thin the seedlings to 3 inches or so apart. When sown under glass, damp weather should be chosen for transplanting.

I have always found *P. alpinum* and its varieties do best on a sandy soil, with a good proportion of small grit among it, but it is also excellent in a moraine with a fine surface, where the plants stand the winter better than elsewhere.

A good group of plants of *P. alpinum* makes an exceedingly pretty picture with the lovely foliage and charming flowers, which last from June onwards for a long period.

### PRATIA ANGULATA (see p. 179.)

A FREE, sandy soil with a little peat or leaf-mould appears to suit this *Pratia*, but it must be confessed that it may be lost in winter even in soil of this nature. It is, therefore, an excellent plan to keep a small plant or two in a frame or cool greenhouse in winter to replace those outside should they perish. An alternative is to cover the plant with a sheet of glass, but to allow plenty of air to reach it; but even with this shelter the plant may be lost unless the position is well drained. It does not seem to mind much whether it has sun or partial shade. It has been known to me for some forty years, and it is always a plant which gives me pleasure when I see it well grown. *P. ilicifolia*, *P. begonifolia*, *P. macrodon*, and *P. alienaria* have been in cultivation, but possess no superiority to commend them. *S. Arnott.*

## GARDEN NOTES FROM S.W. SCOTLAND.

"... the spring, the summer, the chilling autumn, angry winter, change Their wonted liveries; and the mazed world, By their increase, now knows not which is which."

*Midsummer Night's Dream*, Act ii., Sc. 1.

It is well worth reading Titania's speech to Oberon, whereof the closing lines are quoted above, to find a vivid description of the seasons of 1922—the most untoward in the recollection of most of us. It is, at least, some consolation to be reminded that the sky sometimes lowered as gloomily and harvest was as laggard in the golden Elizabethan age as in our own day. It may be worth noting some of the results of the drenching cold of the past summer upon shrubs and herbs in this district. *Rhododendrons* have revelled in it, making almost extravagant growth, many of the finer Asiatic species being heavily set with flower-buds. The *Sorbaria* section of shrubby *Spiraea*, *Deutzia corymbiflora*, *Hypericum Hookerianum*, *H. patulum*, and its variety *Henryi*, and *Olearia* of many species have been companions among late-flowering shrubs; *Eucryphia pinnatifolia*, generally over in a fortnight, prolonged its bloom for a month, and *E. cordifolia*, fully four weeks later than usual, will continue in beauty till stopped by frost. *Clerodendron trichotomum*, though thickly set with flower buds, has failed to open a single blossom, while *C. foetidum* will not be in time to display its charming crimson corymbs.

This time last year *Amaryllis Belladonna* was "a sight for sair e'en," as we say in Scots; to-day, there is not a flowering stem above ground. A single bloom stands for fulfilment of the promise made by abundant leafage thrown up in spring by two clumps of *Lycoris squamigera*. On the other hand, *Nerine Bowdenii* is only ten days later than usual, and carries its prettily-crimped, carmine flowers in defiance of wet and cold. The only herb, however, which is not behind time is the great Christmas Rose—*Helleborus niger altifolius*—which never fails to begin its long flowering season in the first week of October.

In all the multitude of herbaceous *Speedwells* there is none equal in splendour to *Veronica longifolia subsessilis* (see Fig. 93), a Japanese variety of a European species. Beginning to flower in late summer, it continues for several weeks to produce spikes of blossom eight or nine inches long on stems two feet high. The flowers are of the richest Tyrian purple, relieved by small, white anthers. Unluckily, the plant has not the irrepressible vitality of many others of the genus, and we have found it apt to die off after flowering. Would that it had the same reproductive quality as *V. spuria*, which is a poor imitation of *V. subsessilis*, sowing itself freely where it is not wanted. It is worth any amount of trouble to keep the finer species in vigour, for in foliage, flower and habit, it takes rank with the foremost herbaceous plants.

Utterly different in habit and stature is another species of *Speedwell* which I have received from Mr. E. A. Bowles under the name of *V. filiformis* (not to be confused with *V. filifolia*, which had grown here for many years) and which the late Mr. Farrer faithfully described as "growing erect into a filmy fuzz of fine greenery, starred with china-blue blossoms." Mr. Bowles's plant is invaluable as a carpet, grateful for any space, in sun or shade, that needs covering; spreading fast, but never rising more than an inch high, a mere film of close, pale-green foliage, through which bulbous things easily push their way. In spring, the green carpet becomes wan blue with crowded blossom.

Any vacant nook in shrubbery or woodland may be turned to good account by filling it with roots of *Arum italicum*, which is nearly related to our native *Wake-robin* or *Cuckoo-pint*, but is larger in all its parts and has the merit of clothing the ground in winter with shining, hastate leaves. In autumn, it sends up massive spikes of orange-scarlet berries twelve to eighteen inches high. This morning I counted 73 such spikes within a space of nine

feet by three, among which were the soft, violet blooms of *Crocus speciosus*, a most gratifying feast of colour under an October sun. Luckily, neither birds nor mice seem to fancy the berries.

As for mice, both the long-tailed field mouse and the short-tailed vole are among the gardeners' worst enemies, and seem to consider that a retaining wall assigned to rock plants has been specially designed here for their harbour. Wide-mouthed jars, sunk in the soil with their rims flush with the surface, capture a good many; but we have had to give up that device because so many friendly toads fell into them. One might, indeed, despair of cultivating

## INDOOR PLANTS.

## BOUGAINVILLEA.

*BOUGAINVILLEAS* were formerly included in most collections of stove and greenhouse plants, and *B. glabra* was a popular subject in collections of specimen flowering plants in pots at horticultural exhibitions. Many growers flowered it to perfection, others, again, found it to be less tractable; indeed, some were inclined to believe that there were stocks of this plant which refused to flower under any cultural treatment.

I recently saw *Bougainvillea speciosa* planted

FIG 93.—*VERONICA LONGIFOLIA* VAR. *SUBSESSILIS* (REDUCED)

anything in the nature of a Tulip or a Crocus, but for the beneficent vigilance of a pair of barn owls that rear an annual brood hard by, and of a stoat which haunts these mischievous little rodents indefatigably. The antics of the said stoat, racing in circles and throwing somersaults in the endeavour to fascinate a blackbird, are most diverting; but I suspect he was the culprit that murdered a goldfinch after she had laid two eggs. The nest was built in the fork of a *Rhododendron arboreum*, and stoats are adept tree-climbers. *Herbert Maxwell, Monreith.*

**Spring Bedding.**—As most of the beds are now clear of the summer-flowering plants, the soil should be prepared for receiving the spring-flowering subjects. Dig the ground and add plenty of well-decayed manure, also use lime freely or basic slag on the surface. Such small-growing plants as *Arabis*, *Aubrietias*, *Mycosotis*, *Theris* and *Viola* should be made firm in the soil by hand pressure. *C.*

out and trained under the rafters of the roof in the show house in Queen's Park, Glasgow. It was flowering magnificently, the long, pendant growths being wreathed with bracts, the whole plant a mass of flower, from the plant staging to the apex of the roof. At the winter pruning the weak growth is removed, leaving the stronger growths nearly full length; by this method of pruning it has been found to flower more freely than when closely spurred in. *Fred W. Jeffery, Dalserf, N.B.*

## SAXIFRAGA FORTUNEI.

ALTHOUGH this species is hardy, it flowers so late (October) that in most seasons the blooms are damaged by early frosts. It is, however, a beautiful subject for pot culture, and its requirements are simple—just the shelter of a cold frame. During the summer it does best in a cool position at the foot of a north or east wall, and needs liberal supplies of water. *J. Coultis.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Continued from p. 228).

ENGLAND, S.W. (continued).

WORCESTERSHIRE.—Apples are a good average crop, but trees that were heavily laden last year are thinly cropped this season, which is to be expected. Pears look very promising, the growth of the trees being healthy and quite satisfactory, and the fruit clean and of good quality, although attacks of Pear midge increase annually; it is a persistent and ever increasing insect pest. Plums were a great crop, except River's Early Prolific which, flowering early, was damaged by bad weather. Purple Pershore has established itself as the coming Plum, both for bottling and culinary purposes. Fruit growing commercially on farms is evidently becoming better understood; an improved and entirely changed system of cultivation is proving a very valuable asset to the intelligent farmer. *William Crump, Oakridge, Malvern Link.*

—The fruit crops are not nearly so heavy as they promised, especially after such an abundance of blossom in the spring, which was the most plentiful during my 22 years' charge here. The following varieties of Apples are carrying good crops: Bramley's Seedling, Newton Wonder, Gascoyne's Scarlet Seedling, James Grieve, Lord Grosvenor, Lord Suffield, and Ecklinville Seedling. The Plum crop was a very heavy one. Of Pears we have about half an average crop. Our soil is of a fairly heavy nature. *Ernest Avery, Finstall Park Gardens, Bromsgrove.*

—The frosty mornings and cold winds of April damaged both flowers and foliage of many varieties of Pears, thus affecting the quantity and quality of the fruit. Apple blossom was plentiful and strong, and altogether above the average. Flowers of the Plum were not so abundant as in some former years; but the crop was all that could be desired. Cherries were fine in promise and fulfilment. Small fruits were as good as we expected, but a little below the average in quality owing to the drought. *James Udale, 7, Ombersley Road, Droitwich.*

—On the whole the fruit crops are not up to the standard. The dry weather just after the fruits had set did a great deal of harm. Fruit blossom of all kinds was very good. The top soil is, on the average, 12 inches to 18 inches deep and rather sandy with a certain amount of limestone in it, and our garden dries up very quickly. *G. E. Roden, Overbury Court Gardens, Tewkesbury.*

SHROPSHIRE.—Apples are an average crop. Damsons and Plums were very numerous. Pears on walls, too, are a heavy crop. The yield of Morello and Sweet Cherries exceeded the average and the quality was excellent. Fruit trees in general have been fairly free from insect pests this season. The soil is variable, in some parts it is very stiff, in others it is light and gravelly. *S. Horton, Binford House Gardens, Tenbury Wells.*

WALES.

CARDIGANSHIRE.—All fruit trees blossomed most abundantly, and all have set fruits freely, with the exception of certain varieties of Plums, including Gages. Apples and Pears are making clean, healthy growth, but some of the Plums were affected with blister and green fly. The following varieties are bearing abundantly:—Plums—Mamarch, Czar, Pond's Seedling, Victoria, and Transparent Gage. Pears—Beurré d'Amanlis, William's Bon Chrétien, Madame Treve, Blickling, Souvenir du Congrès, Conference, Clapp's Favourite, Fertility, Jargonelle, and Santa Claus. Apples—Desert—Cox's Orange Pippin, King of the Pippins, King's Acre Pippin, Langley Pippin, Worcester Pearmain, and Charles Ross; cooking—Bismarck, Norfolk Beauty, King's Acre Bountiful, Warner's King, Ecklinville Seedling, Annie Elizabeth, Lane's Prince Albert, and Bramley's Seedling. The soil is cold and heavy, overlying slaty rock. *W. Phillips, Derry Ormond, Llangybi.*

(To be continued.)

## AUTUMN WORK IN THE FRUIT GARDEN.

I HAVE never known Apples to be so late in maturing as they are this autumn, and this I attribute to the lateness of flowering and the long spell of wet weather during the past two months. It has been a difficult task to gather hardy fruit in a dry condition, for there have been heavy dews and rain almost every day of the past few weeks, at least in the Midlands.

Some large bush trees of Emperor Alexander Apple are bearing big crops for the first time in ten years, which goes to prove that the wood of this variety, to mention only one, requires to be well ripened.

The present is a suitable time to examine the trees, and mark any branches that need to be removed to admit sunlight and air. Trees growing in rich soil very quickly become congested with growth, especially those trained as pyramids. The branches should be thinned, but care must be taken not to spoil the shape of the tree in doing this. Later in the autumn some of the spurs may be removed entirely, but this operation should be extended over a reasonable period, doing, say, half at one time and the other half a fortnight or so later. It is surprising what a difference this thinning of superfluous spurs will make.

As soon as the leaves turn yellow and begin to fall, such trees as require it may be root pruned. Trees planted in very fertile, loamy soil will almost be sure to require attention at the roots after a few years, and any that are making too much growth should be marked for treatment. Young trees can be root-pruned in one operation by taking out a trench all round them, about two or three feet from the stem—or even more if the tree is a large one, and cutting the large roots through. The severed roots should be trimmed neatly with a sharp knife. A trench 2 feet deep will in most cases be suitable, and the fork should be worked underneath the tree to determine if there is a tap-root. If one is found it should be cut through, the soil placed in position again and made firm. It will benefit the trees if a liberal amount of old mortar rubble is incorporated with the soil before it is replaced. Root pruning should only be done when the soil is in a good condition for working, to permit of it being rammed and made very firm.

In the majority of cases trees that have carried large crops of fruit this season, whether Apples, Pears or stone fruit, will be benefited by manual assistance after the fruit is gathered to assist them in forming buds for next season. The fertiliser should be applied either in solution or sprinkled on the surface, to be washed into the soil by the autumn rains. A dressing of sulphate of potash is excellent; or, failing this, soot and wood ash may be applied. Scatter the fertiliser evenly over the surface as far round the tree as the branches extend, and lightly fork it in.

Trees growing on walls should be examined to ascertain if the roots are dry, for they often need moisture even in a rainy season. Fork the ground up lightly, draw some of the soil away from the wall, and thoroughly soak the ground close to it. After watering apply a light mulch of well-decayed manure.

Examine the ties on the branches, and loosen them if necessary. The strangling of the bark by tight ligatures is a frequent cause of gumming in Apricots, Plums, and Cherries.

Secondary growths that have resulted from summer pruning should be cut away.

Bush fruits, such as Currants and Gooseberries, should be attended to, and branches causing crowding removed while they are in leaf, as it is easy now to see where they are too thick. If not already done, the old Raspberry canes should be cut out, and the young ones trained in their places, allowing a foot between each. Hand-weed between the rows, and apply a good dressing of well-rotted farmyard manure to the roots. This autumn dressing will be of great assistance to the canes next summer, and will also serve to ward off frost from the roots, should the weather be very severe later. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Pyrus Eleyi.**—The handsome Crab figured in the *Gard. Chron.* of October 7 (Fig. 87) was raised by Mr. Charles Eley, in his garden at East Bergholt, Suffolk. Very rarely has a Crab obtained honours from the R.H.S. Floral Committee for its capabilities as a flowering and also as a fruiting plant. The illustration in the *Gard. Chron.* of August 14, 1921, shows a flowering spray of this handsome hybrid between *P. Niedswetskyana* and *P. spectabilis*, and this figure, together with the more recent one, form a pictorial record of what promises to be a popular small tree for garden decoration. *C.*

**Wasps in 1922** (see p. 197).—Like Mr. Bayliss we have had a plague of wasps this year. I have never before taken so many nests in one season; up to date I have taken 156 nests (a number I could easily exceed) from the home farm adjoining and around the garden. Reports in the district are the same. Very few queens were seen in the spring; the majority of the wasps were of a small variety. *H. Perry, The Woodhouse, Gardens, Wolverhampton.*

**The Wigan Cup for Roses at Holland Park Rink Show.**—In the list of awards made by the Royal Horticultural Society at the Holland Park Rink Show it is stated that the Wigan Cup for Roses was won by Messrs. Alex. Dickson and Sons; but an explanation is needed for those who have not heard the whole of the events leading up to this award. Who really did win the Wigan Cup, and what is it offered for? If your readers refer to the list of awards on p. 216 they will find that my exhibit was placed first, and received a Gold Medal. When the award cards were sent out the Wigan Cup card came with the Gold Medal card, and was filled in to show the cup was awarded to me. I went out to notify the results to my friends, but imagine my surprise on returning to the show to find someone had taken away the Wigan Cup card! This was very annoying, and I at once sought the reason at the inquiry office, but only discovered that I must wait until the secretary had dealt with the matter, as something was not in order. I cannot understand why the Council did not make quite sure before sending out the cards and making me look like an impostor. The Wigan Cup is offered (see p. 5 of the R.H.S. Autumn Schedule) for the best exhibit of Roses, and even if I was not eligible for the award because I won it in 1921, now can it be said truthfully and fairly that the cup was given to the best exhibit if it was finally awarded to another exhibit, which was placed second? I consider that if I was not eligible, the only fair course was for the R.H.S. to withhold the cup. Even Mr. Dickson could not understand the action. To see two cards upon two separate groups with records in various papers giving both myself and Messrs. Alex. Dickson and Sons as the winners makes the whole business ridiculous, and I trust that the R.H.S. Council will see that such a blunder never occurs again. But why have such stupid conditions? Surely the only way of maintaining the standard of the exhibits and getting everyone to do their best is to give all a free hand, and if any firm can win the cup in successive years, let them have what is their just reward. *E. J. Hicks, Twyford.*

[It is regrettable that an error such as our correspondent refers to should have occurred at Holland Park Show; but Mr. Hicks is not a new exhibitor, and must have known he was not entitled to hold the Wigan Cup this year, because (see R.H.S. *Book of Arrangements* for 1922, p. 47), "With certain specified exceptions, no challenge cup may be awarded to the winner of the previous year; but if that winner be recommended for the award on the second occasion, a special medal and card will be awarded." Exhibitors must abide by the conditions, and if the conditions are considered to be unsatisfactory, those immediately concerned should endeavour to have them altered.—Eds.]

## SOCIETIES.

### ROYAL HORTICULTURAL.

OCTOBER 17.—A bright and interesting exhibition greeted the comparatively few Fellows and visitors who attended the R.H.S. meeting at Westminster on the above date. The Floral Committee awarded no fewer than thirty-two medals for groups, which is fairly good evidence of the extent of the display. Autumn flowers, including Dahlias and Chrysanthemums, were shown largely, and other subjects exhibited prominently were Orchids, Begonias, Nerines, Gladioli and Clematis, with a contribution of fruit.

#### Orchid Committee.

*Present:* Sir Jeremiah Colman, Bart. (in the chair), Messrs. Jas. O'Brien (hon. secretary), Gurney Wilson, C. J. Lucas, F. K. Sander, Arthur Dye, S. W. Flory, J. E. Shill, H. T. Pitt, A. McBean, J. T. Barker, Chas. H. Curtis, J. Wilson Potter, Pantia Ralli, T. Armstrong, Stuart H. Low and E. R. Ashton.

#### AWARDS OF MERIT.

*Miltonia spectabilis extraria*, from Messrs. SANDERS, St. Albans. A very pleasant reminder of the days when importations of *Miltonia spectabilis* brought considerable variety in this remarkable species, the nearest to the handsome form now shown being *M. spectabilis bicolor*, to which the new variety is superior in size and shape. The one flowered scape bore a very attractive, pure white flower with a large crimson blotch in the centre of the lip.

*Laelio-Cattleya St. George var. Victory (C. Folia × L.-C. St. Gothard)*, from Messrs. STUART LOW, Javisbrook, Sussex. A grand flower with very broad petals of clear rose colour, the large and finely expanded lip being entirely ruby-claret. It is one of the finest of its class.

*Odontoglossum St. George var. Solum (Alexandrina × eximium)*, from Messrs. J. AND A. McBEAN, Cooksbridge. The fifth of this very fine cross to receive an award, and the most distinct and beautiful. The fine spike bore large and perfectly formed flowers, the inner two-thirds being claret red with very remarkable oblong, white blotches, the margins and tips also being white. The lip is white with claret purple blotches.

*Brasso-Cattleya Dr. G. G. Macdonald (B.-C. Ilene × C. Peetersii)*, from Messrs. FLORY AND BLACK, Slough. A true *Brasso-Cattleya* of the finest class. The large flowers are clear, rosy mauve, with darker mauve on the lip, which has a pale yellow disc.

#### GROUPS.

MESSRS. SANDERS, St. Albans, were awarded a Silver Banksian Medal for a group containing specially good forms of *Cattleya Hardyana* and its variety *alba*; *Vanda coerulesa* and other species, and a good selection of *Cypripediums*. Noticeable among the species was a fine form of the best old type of *Oncidium tigrinum*.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), showed his new *Odontioda* James O'Brien (*Oakwoodiensis* × *Chantecleer*), remarkable for its reversion to the true *Odontoglossum* form, the *Odm. percultum*, which, with *Oda. Bradshawiae*, produced *Oda. Oakwoodiensis*, predominating. The flowers are large, and of perfect form, the lip being especially showy; it is white with heavy claret-red blotches on the inner parts of the segments.

The Duke of MARLBOROUGH, Blenheim Palace, Woodstock (gr. Mr. J. T. Barker), sent *Cattleya Sylvia* Blenheim variety, a pretty flower of the *C. Hardyana* class with gold-veined lip; and a fine example of *Laelio-Cattleya Cornelia*.

PANTIA RALLI, Esq., Ashstead Park (Orchid grower, Mr. Farnes), sent *Odontoglossum Zenith* (*percultum* × *colossus*), a charming flower of large size and fine shape, white, heavily blotched with mauve.

MESSRS. FLORY AND BLACK, Slough, sent *Potimara Royal Purple (B.-L.-C. Gerald × S.-C. westfieldensis)*, a dark mauve flower of attractive form, and other hybrids.

MESSRS. STUART LOW showed various hybrids, a novelty being *Cattleya Vuldow (Vulcan × Dowiana)*, a rose-purple flower with ex-

panded front to the lip, which has yellow lines. Messrs J. AND A. McBEAN, Cooksbridge, showed a selection, in which *Odontoglossum Laurentia (Jasper × Olympia)* with large white flowers richly blotched with mauve; and the new *Brasso-Laelio-Cattleya Vashti (B.-C. Bianca × L.-C. Beatrice)*, were the best novelties.

#### Floral Committee.

*Present:* Messrs. H. B. May (in the chair), J. W. Barr, W. G. Baker, John Heal, W. B. Gingell, Sydney Morris, W. P. Thomson, G. Harrow, W. Howe, J. F. McLeod, J. W. Blakey, Thos. Stevenson, J. Jennings, D. B. Crane, M. C. Allwood, H. J. Jones, H. R. Darlington, Chas. E. Pearson, R. C. Notcutt, Reginald Cory, E. A. Bowles, W. B. Cranfield, G. W. Loder, and W. Cuthbertson.

#### AWARDS OF MERIT.

*Chrysanthemum Godfrey's Triumph*. A large deep yellow, single variety, with about three rows of flattish, substantial florets. Shown by Messrs. W. J. GODFREY AND SON, Exmouth.

*Euonymus europaeus aldenhamensis*. This is a handsome autumn-fruiting form of the Spindle tree; the fruits are of more brilliant pink, larger and less rigidly held on the stems than in the case of the well-known type plant. Shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree.

*Carnation Tangerine*. This very showy perpetual-flowering *Carnation* is a fancy variety, with light salmon-buff ground colour and flakings of rosy red. The name is scarcely descriptive, but the flower is good. Shown by Mr. KEITH LUXFORD, Sheering, Harlow.

*Acer griseum*. A distinct and handsome Maple, with rich crimson trifoliate leaves, measuring 2½ in. by 3 in.; white and slightly downy beneath. Although this species has fruited freely enough at Warnham, no fertile seeds have been found. The tree from which the specimens were taken is 16 ft. to 18 ft. high. Shown by C. J. LUCAS, Esq., Warnham Court, Horsham.

*Rosa Fargyssi*. Fruiting sprays of this interesting *Rose* were exhibited; they are elongated and quaintly shaped, and of bright scarlet colour. Fruits of this species were illustrated in *Gard. Chron.*, Fig. 6, page 19, January 11, 1919. Shown by Mr. J. C. ALLGROVE.

#### OTHER NOVELTIES.

*Viburnum tohangense (Wilson, No. 22)*, shown by Mr. C. J. LUCAS, has red, shining berries, carried in pendulous clusters, and should be a showy plant if of shapely growth. *Pyrus Malus aldenhamensis* was shown in fruit by the Hon. VICARY GIBBS, but the Cherry-like fruits are of a somewhat sombre hue.

#### GROUPS.

Chrysanthemums were prominently shown in various parts of the hall. Mr. H. J. JONES associated highly decorative blooms with an immense quantity of *Michaelmas Daisies* and perennial *Sunflowers*. This was an imposing group of considerable artistic merit and great garden value. The tall stands of *Helianthus Monarch*, alternating with such *Michaelmas Daisies* as *Henry Adams*, *Rubellus*, *Sirius*, *Elsa* and *Sam Barham* were particularly effective, while on a lower level there were many baskets of *Chrysanthemums* of decorative type. The principal varieties were *Red Almirante*, of brilliant colour; *Sanctity*; *October Glow*, orange scarlet; *Pink Profusion* and *Harvester* (Gold Medal).

Chief amongst the excellent *Chrysanthemums* shown by Messrs. W. WELLS AND CO. was a large stand of the rich golden yellow *Viscount Chinda*, which received a First Class Certificate on the previous day. Other large flowered Japanese varieties were *James Stredwick*, Mrs. G. Monro, *Majestic* and Mrs. R. Luxford. Amongst the many vases of decorative types were *Ethel Blades*, Mrs. A. Thomson, *Verona*, and *Goacher's Crimson* (Silver Flora Medal).

A great quantity of *Chrysanthemums*, in spray form, was shown by Messrs. K. LUXFORD AND CO., and these were particularly decorative. The chief varieties were *Countess*, *Goldfinch*, *Bouquet Rose*, Mrs. H. Field, and *Nathalie* (Silver Gilt Banksian Medal).

*Chrysanthemums* of decorative size and in considerable quantity were displayed by Mr. WM. YANDELL, who staged such sorts as *Betty Spink*, *Dolores*, *Uxbridge Bronze*, and *Lichfield Purple*; the last-named was of especially rich colouring (Silver-Gilt Banksian Medal). Messrs. GODFREY AND SON showed vases of *Cassiope*, a soft mauve pink variety of decorative type, and *Godfrey's Gem*, a medium-sized single of bronzy yellow colouring, with *Scabiosa caucasica Pride of Exmouth*.

Although the blooms were somewhat smaller than of late, *Roses* were very fresh and bright. Mr. G. PRINCE had beautiful vases of *Ophelia*, *Madame Butterfly*, *Lady Pirrie*, *Los Angeles*, and other sorts (Silver-Gilt Banksian Medal). Messrs. D. PRIOR AND SON, staged *Rodhatte*, *Ophelia*, *Golden Emblem*, Mrs. H. Stevens, and many other sorts (Silver Banksian Medal). The Rev. J. H. PEMBERTON included a splendid vase of his new musk-scented *Nur Mahal*, *The General* and *Vanity* in his collection (Silver Flora Medal). Particularly fresh and fragrant *Roses* were shown by Mr. E. J. HICKS (Silver Flora Medal). Messrs. STUART LOW AND CO. associated *Roses* with *Carnations*, and prominent amongst the latter was a magnificent stand of *White Pearl* (Silver Banksian Medal). *Carnations* of considerable merit were also shown by Mr. C. ENGELMANN (Silver Banksian Medal), and Messrs. ALLWOOD BROS., who also staged *Dianthus Allwoodii* in many varieties (Silver Flora Medal).

Near the annexe Messrs. SUTTON AND SONS had an interesting collection of *Begonia Lloydii* seedlings in a variety of interesting and beautiful shades of colour. The plants were exceedingly floriferous (Silver Banksian Medal). Messrs. BARR AND SONS contributed border flowers and spikes of particularly good *Nerines* in such sorts as *Scintilla*, *crimson*; *Vivid*, *Carolus*, deep scarlet; *Ariadne*, *Jupiter* and *Miss Jekyll*, pink; and also had very vigorous plants of two hybrids named *Aurora* and *Hero*. Both hybrids are of pink shades and were so tall as to appear, at a little distance, as though they were pink-flowered *Agapanthus* (Bronze Flora Medal). A good strain of *Antirrhinum*s was staged by Messrs. W. TRESEDER, LTD. (Silver Banksian Medal), while Messrs. J. PIPER AND SONS exhibited particularly good plants of *Primula obconica* (Silver Banksian Medal).

A comprehensive collection of general border flowers was shown by Mr. F. G. WOOD. Tall snowy white plumes of *Pampas Grass* and the purplish-tinged variety (*Cortaderia kermesiana*) stood out prominently. The comparatively rare *Yucca gloriosa superba* was also on view adjoining a small, neat rockery, while at the far end there were border *Chrysanthemums*, *Erigonans* and other hardy flowers (Silver Flora Medal). Considerable space was also occupied by Messrs. WATERER, SONS AND CRISP with a good collection of hardy flowers. *Delphiniums*, *Michaelmas Daisies*, *Kniphofias* and *Lupins* were particularly prominent (Silver Banksian Medal). Mr. G. REUTHE included a little collection of hardy *Heaths*, *Colchicum albus* and autumn *Crocuses* in his collection (Silver Banksian Medal). Mr. W. WELLS, Junr., had very good *Michaelmas Daisies*, in such sorts as *Rose Queen*, *Louvain* and *Advance* (Silver Banksian Medal).

Hardy border flowers were well shown by Messrs. RICH AND CO. (Bronze Banksian Medal). Messrs. I. HOUSE AND SONS had their valuable perennial *Scabious* (Silver Flora Medal). Mr. THOS. CARLILE showed *Delphiniums*, *Lupins* and *Michaelmas Daisies* (Silver Banksian Medal). The Misses HOPKINS had *Asters*, *Scabious*, *Plumbago* *Larpentae* and early *Polyanthuses* (Bronze Banksian Medal). In an interesting collection Messrs. B. LADHAMS, LTD., included a number of showy *Lobelia* hybrids; *B. Ladhams*, *Queen Victoria* and *Magnificans* of scarlet colouring and Mrs. Humbert, soft pink, were very delightful (Silver Flora Medal). Violets were shown by the Misses ALLEN-BROWN (Bronze Banksian Medal).

Several interesting New Zealand shrubs, particularly shrubby *Veronicas*, were staged by Messrs. J. CHEAL AND SONS. Sprays of *Quercus rubra* and *Pyrus discolor* displayed rich autumn tints. They also showed border flowers and

Dahlias in another part of the hall (Silver Flora Medal). Messrs. L. R. RUSSELL, LTD., arranged a collection of floriferous Clematis (Silver Banksian Medal). Messrs. SKELTON AND KIRBY included showy branches of *Crataegus Crus-galli* and *Berberis Thunbergii* in their group (Bronze Banksian Medal). Messrs. LOWE AND GIBSON staged some interesting *Gladolus* seedlings from seed sown early this year (Bronze Flora Medal).

Dahlias of good quality were staged by Mr. J. T. WEST (Silver Flora Medal), Mr. CHARLES TURNER (Silver Banksian Medal), Messrs. JARMAN AND CO. and Messrs. J. CHEAL AND SONS.

#### Fruit and Vegetable Committee.

*Present:* Messrs. C. G. A. Nix (in the chair), J. Cheal, H. S. Rivers, Geo. F. Tinley, S. B. Dicks, E. Neal, Owen Thomas, E. A. Bunyard, Geo. Reynolds, H. Prince, J. C. Allgrove, W. Bates, W. H. Divers, W. Wilks, Owen Thomas, Ed. Beckett, T. Pateman, and A. Metcalfe.

Several seedling Apples were submitted for awards. The variety Victory, a cross between Bismarck and Peasgood's Nonesuch, was considered promising, and as the fruits had passed a culinary test with satisfaction, a deputation was appointed to inspect the tree. It is like a highly-coloured Peasgood Nonesuch, but much heavier. The exhibitor was Mr. G. CARPENTER, West Hall Gardens, Byfleet, Surrey.

By far the most promising new fruit was a seedling Black Grape, shown by Mr. W. BUTCHER, Ecclesden Manor. Mr. Butcher stated that he raised it from a seed taken from a white Grape, and that the vinery in which it was grown was unheated and shaded by Elm trees. Three bunches were exhibited, the largest of which weighed four pounds, and the berries, considering the conditions under which they were grown, were well coloured and of excellent flavour. If this new variety proves to be distinct, it will be a notable addition to Grapes, as the fact that it was grown in a cool house and ripened so well in such a sunless summer, points to it being a very valuable sort.

Lady BICKERSTETH, Cottingham, Yorkshire, showed two splendid bunches of the white, seedless Sultana Grape, for which a Cultural Commendation was recommended.

Messrs. G. G. WHITELEGG AND CO., Chislehurst, showed a collection of Apples and Pears, for which a Silver Hogg Medal was awarded. Many of the Apples were coloured to an extraordinary degree, and there were some remarkably fine fruits, very highly coloured, of Catillac Pears.

#### HOVE HORTICULTURAL AND ALLOTMENT HOLDERS'.

THE sixth annual show, under the auspices of the Hove Horticultural and Allotment Holders' Association, was held in the local Town Hall on Wednesday and Thursday, the 13th and 14th ult. The exhibition was a great success, and attracted numerous traders, whose non-competitive collections contributed much to the success of the show. In the competitive classes an outstanding exhibit was a semi-circular group of plants staged by Mr. G. PAGET WALFORD, Hove (gr., Mr. Reed), for which the Association's silver challenge cup, presented by the chairman, Councillor Ed. Bull, was awarded. A challenge cup was also offered in a class for a collection of vegetables of six varieties, and this was won by Mr. H. SMITH. Mr. J. C. REEVES was successful in winning first prizes for a collection of four dishes of fruit and for six vases of Dahlias, six blooms in each receptacle, and he was also second in the classes for six vases of Asters and six vases of hardy perennials, in which Mr. G. PAGET WALFORD was first in both cases. The number of exhibits was 800, as compared with only 300 last year.

The following medals were awarded to non-competitive collections:—*Gold Medals:* Messrs. ALLWOOD BROS., Haywards Heath; BARNHAM NURSERIES, Barnham; Messrs. CHARLESWORTH AND CO., Haywards Heath; Messrs. STUART LOW AND CO., Enfield; Messrs. BLACKMORE AND LANGDON, Bath; Messrs. BALCHIN, Hove; Mr. F. WOOLLARD, Brighton; and the HOVE CORPORATION, for an exhibit from the local parks.

*Silver Medals,* to Mr. W. WELLS, Jun., Mersham; Messrs. J. CHEAL AND SONS, Crawley; Mr. HEMSLEY, Crawley; Messrs. BOX AND CO., Lingfield; and Mr. GOLDSMITH, Hove.

#### SPALDING FRUIT SHOW.

THE third annual fruit show of the Spalding and District Bulb and Fruit Gardeners' Association was held in the Masonic Hall on Friday, the 13th inst. Although the show was by no means a large one, the quality of the exhibits was of exceptional merit.

The culinary Apples were shown in Potato trays (one layer only), and it is a pity that the schedule does not definitely stipulate the size of the tray, the number of Apples to the tray, and whether the fruits should be exhibited "eye" upwards or on their sides, as a certain tray contained nearly twice as many fruits as others.

In the class for the best tray of Bramley's Seedling, the first prize was gained by Mr. A. W. WHITE, Hillegom, Spalding, who showed even specimens of good size and colour. Messrs. HENLEY AND SONS, Spalding, were second with a tray of red and green types mixed, and Mr. F. TIFER, Spalding, 3rd. Eleven entered the class for a tray of Newton Wonder, chief honours going to Mr. R. WELLBAND, London Road, Spalding, his fruits being of exceptionally fine colour, Mr. A. E. EDWARDS 2nd, and Mr. A. W. WHITE 3rd.

The last-named competitor was placed first and 2nd in the class for Lane's Prince Albert out of eight entries. There was little to choose between the two sets, the first prize going to the better coloured fruits; Mr. F. TIFER, 3rd. Lord Derby is a variety which is not so commonly grown in the district as those mentioned above, and in this class the same exhibitor, Mr. A. W. WHITE, gained first and second prizes with large-sized fruits, free from blemish.

In the class for the best tray of "any variety," Mr. A. E. EDWARDS won first prize with Warner's King, and Messrs. HENLEY AND SONS, 2nd, with Blenheim Pippin.

In the single dish classes Messrs. B. N. and C. E. SMITH won first prize in the class for nine fruits of Cox's Orange Pippin; Mr. C. KITCHING, 2nd; Messrs. ANDERSON BROS., 3rd. The last-named competitors were first prize winners for a dish of Allington Pippin, and Mr. J. BEESHAM and Mr. E. JACOB were first and second respectively in the class for a dish of Blenheim Pippin. In the class for "any other variety" first prize went to Mr. A. E. EDWARDS for magnificent specimens of Charles Ross.

There was but one class for Pears, the winning dish coming from Mr. J. J. BARNARD, Fulney, who exhibited nine perfect fruits of Louise Bonne of Jersey; Mr. C. KITCHING, 2nd, with a good dish of Doyenné du Comice.

The Challenge Cup, awarded for the best tray of culinary Apples, was won by Mr. A. W. WHITE with his tray of highly coloured Lane's Prince Albert, and as he has won it the second time in succession it becomes his property.

#### Obituary.

**Mrs. Clarisse Bischoffsheim.**—We regret to record the death of Mrs. Bischoffsheim, of The Warren House, Stanmore, Middlesex, widow of the late H. L. Bischoffsheim, Esq., at the age of 85 years. Mrs. Bischoffsheim was a keen gardener, and both in Mr. Bischoffsheim's time and since, the gardens at The Warren House were amongst the finest in the neighbourhood of London. The grounds are naturally beautiful and have been improved by the gardeners' art. Carnations and most florists' flowers are extensively grown under glass for decorative purposes, and a fine block of Orchid houses contains good examples of both hybrids and species, many of which have been noted from time to time in our columns. The long ranges of vineries and Peach and Nectarine houses are other notable features in a garden which is maintained in a high degree of excellence. The death of the mistress of Warren House gardens is a great loss to horticulture.

#### ANSWERS TO CORRESPONDENTS.

**BEECH NUTS:** W. M. The fruits or, as they are commonly known, mast, of the Beech, are not poisonous and the kernels are often eaten by children, and also used by vegetarians as an article of diet. In some parts of the country pigs are turned into forests and woods to feed on the Beech mast.

**CUCUMBERS DISEASED:** C. and Sons. This disease, which is frequently combined with a bacterial disease, is generally an indication of improper cultivation. Thus an excess of water, unsuitable manure in the border, or imperfect drainage are factors favourable to the disease. On the contrary, the borders may be so infected with the fungus that no method of cultivation will produce healthy plants.

**FLUE DUST FROM A COLLIERY:** H. G. Flue dust from blast furnaces contains potash, and is of great value as a fertiliser, but the dust obtained from ordinary furnaces such as destructors, boilers and factory furnaces is of no value for application to the soil. Write to the Ministry of Agriculture, Whitehall Place, for Leaflet No. 25, dealing with the subject of flue dust as a fertiliser.

**FRUIT GATHERING AND HOP-PICKING:** Amateur. You would probably be able to obtain work in fruit harvesting and hop-picking in any of the large fruit-growing centres of Kent, such as Maidstone or Swanley. With regard to Flax pulling, very little Flax is grown in this country, although we believe it is still cultivated in some districts in the west.

**NAMES OF FRUIT:** L. H. P. 1, Winter Greening; 2, Reimette très Tardive; 3, White Nonpareil; 4, Ross Nonpareil; 5, Brockworth Park; 6, Colmar d'Été; 7 and 8 (Plums), decayed—J. J. Apple: Rymer Pears: 1, Doyenné Boussoch; 2, Summer Doyenné; 3, Fondante de Cuerne; 4, Beurré d'Amanlis; 5, Winter Nelis.—M. Q. 1, and 2, decayed; 3, Northern Spy; 4, Winter Greening; 5, Malster; 6, Lord Derby; 7, Summer Strawberry; 8, Cellini; 9, (Pear) Doyenné du Comice; 10, Nouvelle Fulvie; 11, Le Lectier; 12, Clapp's Favourite.—J. T. W. 1, Keswick Codlin; 2, Marie Louise; 3, Stirling Castle; 4, Duchesse d'Angoulême.—W. G. W. A. Radford Beauty; B. Dumelow's Seedling (syn. Wellington); C. Lord Derby.—H. W. 1, Beurré Gifford; 2, Doyenné Boussoch.—A. J. P. 1, Gravenstein; 2, Doyenné Boussoch.—G. A. 1, Hambling's Seedling; 2, Lady Sudeley; 3, Stirling Castle; 4, Mère de Ménage; 5, Duchess of Oldenburgh; 6, Flanders Pippin. S. L. H. 1, not recognised; 2, Warner's King; 3, James Grieve; 4, Yorkshire Beauty; 5, Blenheim Pippin; 6, Winter Hawthornden; 7, Stirling Castle; 8, Colonel Vaughan; 9, Smart's Prince Arthur; 10, Lady Henniker; 11, Herefordshire Pearmain; 12, Northern Greening; 13, Bramley's Seedling; 14, Gloria Mundi; 15, Baumann's Red Winter Reinette.—G. B. The specimens were not in good character; 2, 3, 4, and 8 not recognised; 1, Apple: King of the Pippins. Pears: 1, Doyenné Boussoch; 2, Beurré Gifford; 3, Beurré d'Amanlis.—Somerton. 1, Magnate; 2, President d'Osmonville; 3, Nouveau Poiteau; 4, Huyshe's Prince Consort; 5, Uvedale St. Germain; 6, Marie Louise.—Erie. 1, not recognised; 2, Dutch Mignon; 3, Cellini Pippin; 4, French Crab; 5, Lord Suffield; 6, Pitmaston Duchess. The Plum is probably Cee's Violet.—W. H. B. 1, Blenheim Pippin; 2, Lord Suffield.

**NAMES OF PLANTS:** E. W. 1, Aster amellus var.; 2, *Catanaeche caerulea*, var. alba; 3, *Arctotis stoechadifolia*; 4, *Salvia coccinea*; 5, *Trachelium caeruleum*; 6, *Artemisia lactiflora*; 7, *Nepeta* sp? (material insufficient for identification); 8, *Cunicifuga racerosa*.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 47.7.

ACTUAL TEMPERATURE:—Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, October 25, 10 a.m. Bar. 30.3; temp. 55°. Weather—Sunny.

More important to growers  
**Anthracnose** of Cucumbers under glass or Cucumbers, than Bacterium spot, described on page 201, is Anthracnose which, according to Dr. W. F. Bewley, the Director of the Experimental and Research Station, Cheshunt, causes annually a loss of many thousands of pounds to growers in this country. Anthracnose is due to the fungus *Colletotrichum oligochaetum*. According to Dr. Bewley\* it sometimes causes a damping off of seedlings and may attack the young Cucumber plants. Its point of attack is the ground level—plants suffering from the disease shrink and fall over. Generally the leaves are attacked first, and that at a time when in March or April the plants are already well established and beginning to bear fruits. On leaves spots appear usually above a vein. They are of a pale green water-soaked colour and very minute, but soon are easily recognised by their dry, reddish-brown centre surrounded by a yellowish zone. The spots vary in shape and frequently crack; they increase rapidly in size and coalesce, and the leaf dies. In the advanced stages of the disease, stem and leaf stalks are also affected and

show similar spots. On these spores are produced in abundance, giving rise first to a pink and later to a black colour. Similar appearances are produced on the fruit. Dr. Bewley has made a searching investigation into the mode of infection, starting from the fact that the fungus thrives not only on the living Cucumber, but also on new and rotten wood, straw and cotton-wool, provided that the atmosphere is moist. He investigated the wood, manure and boxes of houses of plants both free from and recently afflicted with anthracnose. He found that the materials in the latter case gave abundant evidence of the existence of the fungus and reached the important conclusion that present methods of cleaning Cucumber houses during the winter months are insufficient to exterminate the fungus, which can exist and cause infection from season to season. The most important source of new infection appears to be straw manure. When the manure is obtained direct from the country it does not contain the fungus, but if allowed to stand in the nursery near to heaps of straw manure which have been previously used in infected houses it rapidly becomes infected. The fungus was also isolated in several cases from manure obtained from London stables. Water supply and the clothes of workers in the nursery are other important sources of infection and, as stated on p. 103, Dr. Bewley is at present engaged in following up these clues with the object of, if possible, eliminating the risks of infection from these several sources.

**The Apple Blossom Weevil.**—Since Thomas Andrew Knight made mention of the Apple Blossom Weevil in 1801, in his *Treatise on the Culture of the Apple and the Pear*, very much has been written concerning the habits of this pest and the methods to be followed in controlling it. It appears, however, that much confusion has existed with regard to the habits and life history of the weevil, and as the pest was so much in evidence during 1919 and 1920, the authorities at the Agricultural and Horticultural Research Station at Long Ashton considered it advisable to work out the details and study control methods. The result of the investigations made are contributed by Mr. H. W. Miles, B.Sc., of the University of Bristol, to the October issue of the *Journal of the Ministry of Agriculture*. In his most interesting contribution, Mr. Miles points out that the weevils leave their winter quarters towards the end of March, and under the warming influence of the sun, crawl to the smaller branches of Apple and Pear trees and pierce the blossom buds as soon as these show green at the tips. The weevil thrusts its rostrum downwards toward the growing point and sucks the juices therefrom. Mating takes place about this period, and the weevil rests and feeds alternately until the blossom buds reach the "cluster bud" stage, and the first young leaves bend outwards, revealing the flower buds in a compact cluster. This stage of development is usually reached about five weeks after the first appearance of the weevil, and egg laying then takes place. The female weevil drills a hole in the selected flower bud with her rostrum, which penetrates calyx and petals, and scoops a hollow cavity in the anther lobes. Mr. Miles states that this operation occupies from ten to twelve minutes, and then the female reverses her position and thrusts her ovipositor into the hole already made and deposits an egg in the cavity in the anther. This process occupies from one to two minutes. The hole is closed by means of a sappy exudation from the damaged tissues of the calyx. From eight to thirteen days later the eggs hatch and the young larvae commence to feed on the pollen cells of the anthers. Feeding continues until anthers, filaments and styles are destroyed, and the base of the petals may be gnawed so that they dry and form a covering under which the larvae live. In such cases the blossoms are said to be "capped." The adult weevil emerges

about the beginning of June. The principal enemy of the Apple Blossom Weevil is an Ichneumon fly, the female of which seeks out the flowers infested with weevil grubs and lays therein an egg on or near the body of the grub. When this hatches the young parasite attaches itself to the grub of the weevil and proceeds to feed thereon, growing very rapidly at the expense of its host, which it finally destroys. Mr. Miles deals at considerable length with control measures and refers especially to banding, jarring and spraying, but concludes "that no one method is likely to give complete control, but where two or three are employed in conjunction in plantations, a reasonable freedom from this pest is obtainable."

**Fraud at a Scottish Flower Show.**—A case which has caused a good deal of interest had its dénouement at Edinburgh Police Court on October 20, when an exhibitor at the exhibition of the Garden Allotments' Federation (Edinburgh and district) in the Waverley Market, Edinburgh, was charged with fraud. This exhibitor had sent in a signed declaration to the secretary of the Federation to the effect that his exhibits were grown by him on his own allotment. It was stated that the accused had won prizes of 5s. and 21s. respectively, together with a medal, and that the Onions he exhibited were grown in Perthshire. The accused, who admitted the charge, was fined £5, with the alternative of imprisonment for 30 days.

**National Sweet Pea Society's Annual Meeting.**—The annual general meeting of the National Sweet Pea Society will be held at the offices of the Chamber of Horticulture, 18, Bedford Square, London, W.C. on Tuesday, October 31, 1922, commencing at 3 o'clock.

**A Large Potato Crop.**—Mr. T. A. Scarlett, the well-known Potato grower of Edinburgh, has obtained a crop of Crusader Potatoes equal to 25 tons 14 cwt. per acre. The seed was planted on April 10 at the rate of one ton per acre. The ground was manured with 1 cwt. of potash, 3 cwt. of superphosphates, and 5 cwt. of fish guano when the tubers were planted, and 1 cwt. of sulphate of ammonia was applied on June 23, just before earthing up. The total cost of the manures was £12 10s. per acre. The best yield, of 70 st. 12 lb. from a row 120 yards long, equal to 25 tons 14 cwt. per acre, was from seed grown on the grey soil in Fifeshire. The next best crop was from seed from the red soil of Dunbar. The rows were made 25 inches apart and the tubers were set nine inches asunder in the rows, of which there were three, each row being 120 yards long. The average crop of the three rows was 22 tons 2 cwt. per acre.

**The Chrysanthemum.**—On Friday evening, the 20th inst., Mr. Harman Payne, the Foreign Corresponding Secretary of the National Chrysanthemum Society, gave a lecture entitled, "The Golden Flower (Chrysanthemum): Its Poetical, Mythical and Romantic Associations." It was the second lecture of a series organised by the recently formed Men's Association in connection with St. Andrew's Church, Catford, and was given in the Parish Hall, adjoining. Although the weather was none too favourable, there was an excellent audience, who frequently gave expression to their appreciation of the way in which the lecturer handled his subject. Mr. Harman Payne opened his lecture by giving a series, in chronological order, of poetical references to the Chrysanthemum by some of the eminent Chinese writers of antiquity. Beginning with the great sage and philosopher Confucius, who was born 550 B.C., who is the first known author to mention the flower, the lecturer quoted from Wu-Ti (157-87 B.C.); T'ao-yuan-Ming (A.D. 365-427); Tu Fu (A.D. 712-770), whom his countrymen called the God of Verse; Po Chu-i (A.D. 772-846); Ssu-K'ung T'u (A.D. 834-908); Chou-tun-i (A.D. 1017-1075), and others who had referred to the Golden Flower in the course of their writings, including Ch'eng-Fu-iao, the author of the gossipy little treatise known as "The Flower Mirror," in which much information about the Golden Flower is given. Various curious facts, superstitions and quaint items of folk-lore current in

\* Journal of the Ministry of Agriculture XXIX., No. 5, August, 1922.

China were related. The Imperial Chrysanthemum party inaugurated by the Emperor Uda about A.D. 900 and continued to this day in the Palace Gardens, with some photographic views of it in modern times, were of much interest. Quaint examples of Chinese and Japanese nomenclature were touched upon and compared with Western methods. The Japanese Festival of Happiness, the fête at Dangosaka, where curious images and natural objects are constructed out of living plants of Chrysanthemums, were all fully explained. Then followed a selection of interesting Japanese stories in which the Chrysanthemum plays a part of some importance, for, as Mr. Payne pointed out, it would appear that whenever the Japanese wishes to point a moral and adorn a tale, there is no flower that he resorts to more frequently than the ever-popular and highly esteemed Kiku, or Chrysanthemum. Selections of many dainty little extracts from Japanese poets, ancient and modern, were recited. There were also some very amusing quotations from American poets, the humour of which was keenly enjoyed by the audience. The evening's entertainment, which was considerably brightened by a very fine collection of beautifully executed coloured lantern slides, was brought to a close with a graphic account of the true story of the life and labours of Dr. Joseph Neesima, the Japanese Christian, with whose name the famous hairy Chrysanthemum Mrs. Alphens Hardy is inseparably linked. Mr. Harman Payne was heartily thanked for his interesting discourse.

**Lower Railway Rates.**—The new reductions in passenger fares and rates for perishable goods by passenger trains announced by the railway companies to come into operation at the beginning of next year, include a decrease from the 75 per cent. increase imposed during the war to 50 per cent. above pre-war rates in the transit of perishable goods, including every sort of fish, fruit and vegetable. These reductions, with the concessions obtained by the Chamber of Horticulture and allied associations through the Railway Clearing House in the case of pot plants, should be of material assistance to growers for market as well as private exhibitors.

**Flora of Papua.**—According to Mr. C. T. White,\* Government Botanist of Queensland, the vegetation about Port Moresby includes white-barked Eucalyptus, E. papuana, and E. alba, species of rather stunted growth dotted about on grass-covered hills. Other common trees are *Alstonia scholaris*, *Albizia procera* and a Cycad, *Cycas media*. In gullies and around the sea beach patches of thin scrub are brightened with masses of the scarlet flowers of *Bombax malabaricum*, the Silk Cotton tree, while around about the rocky sea coast near the town, *Cochlospermum Gullivraei* is conspicuous with its numerous, large, yellow Buttercup-like flowers. The Sago Palm, *Metroxylon* sp. and the Bread Fruit, *Artocarpus incisa*, are found in swampy patches. There is a Mangrove flora similar to that of the North Australian and Malayan regions; the common climber over the Mangrove trees is *Dalbergia monosperma*. The Nipa Palm is a conspicuous feature along both banks of the Ethel River and Bioto Creek. In this district, also, is an apparently little known tree, *Sonneratia lanceolata*, very much resembling in appearance some forms of *Avicennia officinalis*. On the Astrolabe Range, which is about 3,000 feet elevation, the vegetation is for the most part of an open character, with forest trees, principally *Eucalyptus tetricornis*, *Banksia dentata*, *Melaleuca* sp., *Diplazium tetraphyllum*, *Grevillea pinnatifida* and *Timonius Rumphii*. *Nepenthes Moorei* is a common plant in the poorer, open, dry forest country around Bisiatabu. On the Sogeri Plateau vegetation is very rich and tropical, and includes very large numbers of Zingiberaceae and Marantaceae. One of the most conspicuous of the flowering plants is *Mucuna Kroetkei*, a forest climber with long, pendulous racemes of brilliant scarlet flowers. On Yule Island, and on the mainland opposite, the vegetation is somewhat similar to that about Port Moresby.

In the ranges about Mafulu (about 4,000 feet) the vegetation is extremely rich and varied, consisting almost entirely of heavy rain-forests. Among trees the ordinary Malayan types predominate: Ferns, Lycopods, Begonias, Palms, Bamboos, and other typical tropical forms are abundant. The occurrence of *Grevillea* is a connecting link with the flora of Australia, while *Quercus*, *Castanopsis*, and *Begonia* are Asiatic types not as yet found in Australia.

**Mr. John Ramsbottom, M.A.**—Born at Manchester and educated at Cambridge and Manchester Universities, Mr. John Ramsbottom devoted his energies to science, notwithstanding that his father and elder brother both gave their attention to commerce. In 1910, he entered service in the British Museum as a mycologist, and it is in that sphere of activity that he has acquired considerable fame, and our readers will remember that he was very intimately associated with the late Mr. Joseph Charlesworth, of Haywards Heath, in working out the association of certain fungi with seedling Orchids, and the development of this association by artificial means in such a way as to render the raising

MR. JOHN RAMSBOTTOM, M.A.

of seedling Orchids almost as easy as the raising of Mustard and Cress. His devotion to science, his unbounded energy and hearty geniality have secured him a large number of friends, and have also led these friends to lay certain burdens upon his shoulders. Thus we find that he is general secretary and editor to the British Mycological Society, vice-president of the British Ecological Society; a member of the Royal Horticultural Society's Scientific Committee; a member of the Council of the Linnean Society, and of the Tropical Diseases Section of the Royal Medical Society. He has served on the War Office Committee concerned with the destruction of the tsetse fly, and on the Organising Committee of the British Association, and is a member of the Tropical Diseases Committee of the British Empire Exhibition. From this enumeration of offices it will be seen that Mr. Ramsbottom is an exceedingly busy man and his various appointments are proof of the excellence of his work in the Botanical Department of the Natural History Museum, South Kensington. During the years 1917-1919 Mr. Ramsbottom was at Salonika, where he held the rank of Captain and was attached to the R.A.M.C. as a protozoologist, and rendered splendid service on behalf of the troops. He was three times mentioned in dispatches, and for his services gained the distinctions of M.B.E., and also O.B.E. It was during his services at Salonika that Capt. Ramsbottom, with the permission of the Com-

mander-in-Chief, conducted a plant-collecting competition amongst the warrant officers, non-commissioned officers, and men, and the conditions of the competition were published in General Routine Orders so that they reached every member of the Force. The result of the competition was a collection of over 4,000 sheets of specimens and many of the specimens were gathered at considerable risk to the collectors. In Dr. Rendle's view, this is the best of all service collections, and resulted in a large accession of specimens for the British Museum, while it is also of great importance as allowing a fairly intensive study of a definite area. Mr. Ramsbottom is a capital speaker, an excellent teacher, and, in addition, he has the pen of a ready writer, as our pages have testified on many occasions.

**Fire at Enham Village Centre.**—We much regret to learn that a fire occurred at Enham Village Centre for disabled Service men, near Andover, on Friday, the 20th inst., causing damage amounting to about £450. An illustrated article on this excellent institution for ex-Service men appeared in *Gard. Chron.*, March 8, 1919, p. 112.

**New Assistant Horticultural Lecturer for East Anglia.**—From a large number of applicants the Essex Education Committee has selected Mr. Henry Fraser, a member of the staff of the Royal Botanic Gardens, Edinburgh, to fill the position of Assistant Lecturer in Horticulture at the East Anglian Institute of Agriculture, Chelmsford. Mr. Fraser holds the first-class certificate of the Royal Horticultural Society, having passed first in practical gardening among 180 candidates at the General Examination of 1920. He also passed the qualifying and preliminary examinations for the National Diploma in Horticulture (N.D.H.), and he holds certificates in botany, chemistry, entomology, surveying, and allied subjects.

**National Potato Exhibition, 1922.**—The annual exhibition of the National Potato Society will this year be held in conjunction with the annual exhibition of the Sheffield Chrysanthemum Society, at the Artillery Drill Hall, Sheffield, on November 10 and 11. An excellent exhibition is anticipated, and many fine exhibits will be staged. Messrs. Dobbie and Co., Messrs. Sutton and Sons, Messrs. E. Webb and Sons, and other leading firms will exhibit, and the Ministry of Agriculture are sending an exhibit from their testing stations. These exhibits will be of a most interesting and instructive nature. A series of lectures will be given at the hall on the first day of the exhibition, the speakers being Messrs. W. G. Lobjoit, F. J. Chittenden, A. B. Cotton, William Cuthbertson, and H. V. Taylor. Allotment holders and all interested in Potato growing will therefore have a unique opportunity of obtaining some of the best advice upon this important subject.

**Trial of New Roses at Bagatelle.**—We are informed that the trials of new Roses at Bagatelle will be continued in 1923-24, as in previous years. New Roses sent for trial should have been grown in pots, and five specimens of each variety should be sent to the Rosery, Bagatelle, before April 30, 1923. At the same time, notification of the origin and parentage of the varieties, and any special treatment needed, should be sent to the Conservator of the Promenades, Paris, but the Roses should be directed to the Rosery, Bagatelle, Bois de Boulogne, for which the station is Neuilly, Port-Maillot, Paris.

**Chrysanthemum Show at Amsterdam.**—Readers who are visiting Holland during this week-end will be interested in learning that a Chrysanthemum show is being held at the Palais voor Volkslyst, Amsterdam, from October 26 to October 31. Many of the Dutch nurserymen grow Chrysanthemums extensively and well.

**Forecasting Rain.**—The weather has probably a greater bearing on agriculture and horticulture than on any other industry, and any sure means of forecasting rain is of great service to cultivators. It is a widely held belief

\* A Contribution to our Knowledge of the Flora of Papua, British New Guinea, Vol. XXIV, No. 1, *Proceedings of the Royal Society of Queensland*.

that exceptional visibility is a sign of coming rain, but observations taken at the Meteorological Office, Cranwell, upset the popular theory and rather show the reverse to be true. According to the *Meteorological Magazine* for October, rain followed on only two-thirds of the days on which visibility reached 21 miles, while in the case of days on which visibility did not reach 13 miles the proportion was one-half. Visibility is observed hourly at Cranwell.

**Appointments for the Ensuing Week.**—Monday, October 30.—National Chrysanthemum Society's Floral Committee meeting. Tuesday, October 31.—Royal Horticultural Society's committees meet; lecture by Mr. C. T. Musgrave on "Methods of Propagation in an Amateur's Garden" at 3 p.m.; National Sweet Pea Society, annual meeting; Bath and West and Southern Counties Society's Council meeting; Brighton, Hove and Sussex Horticultural Society's show (two days). Wednesday, November 1.—Royal Agricultural Society's Council meeting; National Viola and Pansy Society's meeting; Highgate and District Chrysanthemum Society's show (two days); Croydon Chrysanthemum Society's show; Bath Gardeners' Chrysanthemum Show (two days); Glasgow and West of Scotland Horticultural Society's annual general meeting; Ormskirk Potato show (two days); Forest Hill Chrysanthemum Society's show. Thursday, November 2.—Manchester and North of England Orchid Society's meeting. Friday, November 3.—Paisley Florists' Society meeting.

"The Gardeners' Chronicle" Seventy-Five Years Ago.—*The Houghton Castle, alias May's Victoria, alias the Raby Castle Red Currant.* The following is the history of this excellent Currant, which I took down a few days ago from its discoverer, Mr. Robert Charlton, nurseryman, Wall, near Hexham, Northumberland. About forty years ago Mr. Charlton, then apprentice to a Mr. John Gray, a jobbing gardener, who took care of Captain Smith's gardens, at Houghton Castle, situate a few miles from Hexham, on the banks of the North Tyne river, was sent by his master to gather Red Currants for the house, to be used for preserving. He commenced his labours on the bushes trained as riders on the north side of a wall which had been built about six years previously. When he reached the last bush, at the west end of the wall, he was much struck with the appearance of the fruit it bore, which was very superior and larger than that of the other bushes. He at once went to his master, to ask him what sort of Currant it was, who said he did not know, but returned with Charlton to look at it. Mr. Gray then recollected that when he planted the wall he had a bush too few, and looking about the garden found a seedling growing under a Gooseberry bush which he took up and planted, and which proved to be the bush in question. The lad set to work and propagated it extensively, giving it to everyone, and when he commenced a nursery on his own account, regularly sold it as the Houghton Castle Currant, under which it was advertised in an early volume of the *Chronicle*. When, some eight or nine years ago, Mr. May, after being satisfied at Mr. Charlton's nursery with the identity of it and his Victoria Currant, was asked how and where he got his plants, he informed Mr. Charlton that he received the variety from the gardener at Raby Castle, whither it had been sent from the late Mr. Falla's nursery at Gateshead. Charlton had previously been regularly supplying Mr. Falla with plants. It is, therefore, an accidental seedling variety, and is very generally cultivated in the gardens of Northumberland, where it is much esteemed and deservedly so. I have no doubt Mr. Charlton can supply any of your readers with plants, and I trust it will now be extensively grown all over the kingdom, for it certainly is a valuable addition to our list of fruits. *G. W., Gard. Chron. October 30, 1847.*

**Publications Received.**—*Guide to the University Botanic Garden, Cambridge.* By Humphrey Gilbert Carter. Cambridge University Press, Fetter Lane, E.C.4. Price 3s. 6d. net. *Potato Growing in New Zealand.* By David Tannock. Whitecombe and Tombs, Ltd., Christchurch, N.Z. and London. Price 2s. 6d.

## TREES AND SHRUBS.

### CISTUS OBTUSIFOLIUS.

THE blunt-leaved Cretan Rock Rose is a densely lushy evergreen shrub 1 foot to 1½ foot (seldom more) in height, but more in width. The leaves are sessile, or nearly so, ovate-oblong, 1 inch to 1½ inch long, ½ inch wide, tapering to both ends, three-nerved, dark green above, lighter beneath, rugose, clothed with starry pubescence. The flowers are terminal, borne in a many-flowered cyme 1½ inch to 1¾ inch across; they are white with a yellow stain at the base of the petals.

Though during the past few winters we have not experienced sufficiently hard frosts to cause many losses amongst the Rock Roses, *Cistus obtusifolius* has survived unharmed frosts which have crippled *C. purpureus*. A valuable shrub for the rock garden and front of the sunny shrub borders, its greatest asset is that the flowering season extends from June to September. On September 25 there were dozens of blossoms on this species, while on the

which it is I forget. That there is a difference has apparently been borne out by the two trees on the south wall of the Botany School at Cambridge, and they have also shown a difference of growth, at least in stature. These trees are from grafts from the tree at Montpellier, referred to in your issue of October 7, and they were planted in this position with the hope that wall treatment might favour their flowering. It is of interest to know that cuttings will strike to practical purpose, but grafts take readily on seedlings and unite perfectly. It is possible that seedlings make the best roots in the case of trees that will have to stand without support. *R. Irwin Lynch.*

## THE ALPINE GARDEN.

### LITHOSPERMUM ROSMARINIFOLIUM.

FOR a sunny nook in the rock garden in any of our milder counties this is a most delightful plant, since it comes into bloom in the late autumn, and continues in flower during fine intervals until spring is well advanced. Though

FIG. 99.—RHUS COTINUS; A BEAUTIFUL SPECIMEN AT AMPHILL PARK.

other Rock Roses there were few, if any, flowers. *A. O.*

### RHUS COTINUS.

THIS shrub (see Fig. 99) is, on account of its curious cobweb-like floral mace, one of the most distinctive of late summer and early autumn features in the garden, while the colouring of its leafage adds still more to its ornamental worth and striking effect. *Rhus Cotinus* will thrive in most soils, but the lovely tinting of its foliage is more pronounced when the soil is neither too rich nor too moist. To fully display its picturesque habit and appearance, this shrub must be grouped clear of other shrubs, or, if planted in a mixed shrubbery, be allotted enough space to permit of an all-round development, otherwise much of its beauty will be lost. Though so attractive a plant one may look in vain in many large gardens for a good specimen. The cloudy inflorescence, which, by the way, is almost sterile, has gained for this shrub the name of Smoke Bush. *C. Turner.*

### DISTINGUISHING THE SEX OF GINKGO.

IT may be of interest to mention that it is perhaps possible to distinguish the sex of Ginkgo by observing the relative time of defoliation under the same conditions. It has been said that one of the sexes is earlier than the other, but

*L. rosmarinifolium* is quite reasonably hardy it is obvious that its habit of flowering in winter would only lead to disappointment save in districts where bright and mild intervals may be expected. In bleak localities, however, it makes an ideal cold house plant, and as such its blossoms are even larger and more beautiful in colour and form than they are in the open.

*L. rosmarinifolium* is a native of the limestone rocks of Capri. With us, in the open, it makes a sub-shrubby plant about 9 inches high spreading to 1 foot or more in width. The Rosemary-like foliage is dense and of a rich, glistening green, and the flowers, which are produced at the ends of the new growths, are purple in the bud opening to a velvety Gentian blue of remarkable depth and purity. The individual blooms when fully expanded are slightly larger than a sixpence. The plant is easily propagated by means of cuttings struck in a cold frame during summer, and the young plants will come on remarkably quickly in any free, gritty soil containing lumps of limestone or old mortar. They should not be set out on a flat bed, but given such support as would be provided by a rock crevice or adjacent stones between which the growing branches can dispose themselves after the manner of the prostrate Rosemary. *A. T. Johnson, N. Wales.*

## INDOOR PLANTS.

## FOLIAGE PLANTS FOR TABLE DECORATION.

THERE is room for a more extended use of foliage plants for table decoration, and especially plants grown in thumb-pots for small vases or in pots 3 inches to 4 inches in diameter. A far greater variety may be used for this purpose than those generally employed. Ornamental foliage plants, especially when well rooted in small pots, will bear liberal treatment as regards watering. They should never be allowed to get dry at the roots.

Amongst the many suitable plants available the following may safely be relied upon as being most useful and possessing last-

handsome foliage plants. *P. Veitchii* is the most popular and one of the finest of all table plants. The foliage is green and white, and the upper leaves, in which the symmetrical character of its growth is most clearly defined, are of the purest white. The plant may be increased from suckers, which are produced freely by old plants. The suckers need to be carefully detached from the parent plant, with a root or two if possible, but even when they possess a few roots they often remain some time before starting freely into growth. As a rule the stronger suckers are the more difficult to establish; small pieces often grow more readily, frequently overtake the others, and form more handsome plants than the larger ones. They should be placed in a gentle bottom heat under a frame or handlight. *P. Baptistii* is a

and make useful plants grown in small pots. Cuttings placed in a moist hot bed root freely. *Cyperus alternifolius variegatus* is an ornamental grass-like plant, with long, narrow, variegated leaves, and is much used for decoration. This *Cyperus* needs plenty of moisture, and may be increased by division in the spring. *Paulinia thalictroides* is a beautiful, semi-scandent, foliage plant, with foliage resembling that of an *Adiantum* Fern. The matured leaves are of a bright green, the young shoots and foliage being of a beautiful rosy tint. The plant may be grown on a trellis, or as a bush specimen, and is a great acquisition for table decoration. The shoots keep fresh for a long time when gathered. Cuttings formed of ripe shoots root freely in bottom heat. *Maranta major*, a plant 1½ ft. to 2 ft. high, has leaves 4 to 8 inches long, of different shades of green, and is a useful decorative plant on account of its lasting properties. It may be increased by division of the roots in the spring. The culture of the majority of the plants mentioned is not difficult when the means for growing them are fairly good. Any ordinary warm house, having a temperature of about 60° during the winter, will suit them. All will do well grown in a mixture of good turfy loam and fibrous peat, or leaf-mould in equal portions, with silver sand added. It is far better to pot in good soil than to mix artificial manure with the compost. It should also be remembered that plants for house decoration suffer less from exposure when grown in proportionally small pots. *John Heat, V.M.H.*

FIG. 100.—CIRRHOPE TALUM ORNATISSIMUM.

ing qualities. Aralias furnish us with a great variety, and the plants are suitable for table decoration on account of their light and graceful habit. The colour of the foliage of *A. elegantissima* is deep green, shaded brown; the mid-rib of each leaf is greenish white. The leaves of *A. Veitchii* are dark greenish-brown; it is a most useful plant for the table, or other purposes. *A. Veitchii gracillima* has a more elegant and graceful appearance than is met with in any other plant. The leaves of *A. Kerchoveana* are digitate, composed of 9 to 10 spreading leaflets, the whole making almost a circular outline. There are other good species and varieties of Aralia, but those enumerated are the best. Unfortunately, cuttings of these plants do not root well. They may, however, be grafted on to *A. reticulata*, which roots readily.

*Pandanus*, the Screw Pine, includes several

useful and elegant species; the leaves arch gracefully on all sides and are spineless. Some of the green-leaved kinds, such as *P. utilis* and *P. odoratissimus*, are pretty and useful in a young state.

The Crotons (*Codiaeums*) and Dracaenas are invaluable plants for decorations, with their beautiful coloured foliage. Palms, such as *Kentia Belmoreana*, *Phoenix Roehelimi*, *Cocos Weddelliana*, and *Geonoma gracilis* are of the greatest value, when grown in small pots, for table decoration. *Leea amabilis splendens* is a handsome foliage plant, having leaves of deep bronze-green with white markings above and purple underneath. It may be propagated freely from cuttings placed in bottom heat, with plenty of moisture. *Acalypha musaica* has bronze-green leaves, variegated with orange. *A. Macaleeana* has red and bronzy-crimson leaves. The *Acalyphas* look well under artificial light,

## ORCHID NOTES AND GLEANINGS.

## CIRRHOPE TALUM ROTHSCHILDIANUM AND OTHER SPECIES.

APART from the charm of their quaint flowers, to those who have been interested in them for many years, is the number of incidents and associations which the flowering of rare species of *Cirrhopetalum* always presents.

*Cirrhopetalum Rothschildianum* offered me an instance of the kind when shown by Messrs. Flory and Black recently. Looking round Messrs. Stevens' rooms in Covent Garden in 1892, I saw a small, battered box containing a bunch of nearly dead Orchids of several species and which were said to have been collected by an explorer in the hills above Darjeeling. I told the faithful "Charles," that friend of all the old-time Orchidists, to buy the lot for me. He did so, at a very reasonable price, and I passed the plants on to the Hon. Walter Rothschild (now Lord Rothschild) and, in the course of time some plants became established, among them being this finest of all *Cirrhopetalums*, which I named and described in *The Gardeners' Chronicle*, Nov. 23, 1895, p. 608. The colouring of the flower is bright crimson-purple on a pale yellow ground, the fringe of the upper segments being darker purple. A curious feature in the flower is the tendril-like clasp of the elongated continuations of the broadly-expanded lower sepals. There seems to be no other record of the introduction of this fine species, although a stray plant or two may have been introduced with others. It was given a First-Class Certificate at the Royal Horticultural Society, October 15, 1895.

*Cirrhopetalum Andersonii*—Hook f. *Fl. Brit. Ind.*, V. 1890, was another find from the same set. When it flowered I was much impressed by its pretty umbels of pink-spotted flowers, entirely new to me. I took the plant to the Kew Herbarium and Mr. Rolfe, who told me that he had recently been through the material at Kew, thought it a new species. But the test was made again without result. I asked whether there were any drawings likely to assist, and he remembered that there were some of Sir Joseph Hooker's, and these were produced, and the first one to present itself was our plant, well rendered—*Cirrhopetalum Andersonii*. Sir Joseph Hooker was present, saw the final identification, and was well pleased that it should be through his aid a species not known in gardens was thus identified, and one

of those never-dying synonyms was avoided. A plant flowered recently with Messrs Sauder.

*Cirrhopetalum ornatissimum*, Rehb., *Gard. Chron.*, 1882, p. 424. This very distinct species (Fig 100) is closely related to *C. Rothsehdianum*, though with smaller individual flowers. In 1879, two or three small plants without name or habitat appeared in gardens, and about 1892 a remarkably fine specimen in a teak basket and bearing five or six spikes appeared at Messrs. Stevens' rooms. I was there with the late Sir Chas. W. Strickland, of Hildenley, Malton, Yorkshire, an enthusiastic collector of curious species, and he obtained it for seven guineas, which was thought to be a good sum to give for a "botanical" Orchid, but Sir Charles would not have given a like sum for the showiest *Cattleya* or *Laelia*. Would that we had more of his kind of plant-lover in the present day! It is known that *C. ornatissimum* has been found in several parts of the Himalaya region. Its ovate-oblong, glaucous leaves render it easily distinguishable.

*Cirrhopetalum Collettii*, Hensley, 1890, native of Burma, is an elegant species with long and narrow flowers displayed in a partial umbel and of red colour on a yellowish ground. Its pseudo-bulbs, like the others of the class usually bearing but one leaf, are of very firm texture, and the plant if grown in a cool, intermediate house is easy to cultivate.

*Cirrhopetalum Wendlandianum*, Kranzl., *Gard. Chron.*, 1891, p. 612, is only a variety of *C. Collettii* if correctly represented in our gardens. I have not seen the type plant, but from the description, it is not distinct, and the specimens in gardens are *C. Collettii*.

*Cirrhopetalum Thouarsii*, with graceful umbels of yellowish flowers, striped and spotted with rose or purple, is remarkable as being one of the most widely distributed of Orchids, it being recorded from Madagascar, Java, the Philippines, Mauritius and Otaheite, and other islands in the region. I also had it from East Africa. It is the typical species on which the genus has been founded, dating from 1831. It is of trailing habit and grows freely in a warm, moist house, being an island plant in all its habitats.

*Cirrhopetalum Mastersianum*, Rolfe, 1890, named in honour of the late Dr. Maxwell T. Masters, F.L.S., was introduced by Linden from the Dutch Indies. It is a very graceful species, its slender stems bearing umbels of ten or twelve light copper-coloured flowers and unlike any of the other species.

*Cirrhopetalum Brienianum*, Rolfe, native of Borneo, is an elegant species with umbels of straw-yellow flowers, and one of the most floriferous if grown in a warm, moist house.

*Cirrhopetalum mysorensis*, C. nodosum, and *C. setiferum*, all described by Mr. Rolfe in the *Kew Bulletin*, 1895, and *C. elegantulum*, Rolfe, all remind me of interesting exchanges of bulbs

*Cirrhopetalum picturatum*, native of Burma and Moulmein, and which first flowered with Messrs. Loddiges, in 1840, is one of the prettiest and freest growing of species and may be found in many gardens at the present day.

*Cirrhopetalum*, as a section of Orchids, is convenient to keep up, although it merges in *Bulbophyllum*, as for example in the plume-

FIG. 101.—ODONTIODA JAMES O'BRIEN.

with Tea-planting friends in the Nilgiri and Mysore districts in India, the little parcels arriving chiefly by post. They are all pretty, compact-growing species, the little *C. elegantulum*, which I have had with a dozen or so umbels of reddish flowers, being a gem in its class.

like *C. Medusae*, and others even more markedly. Those enumerated are of the class called evergreen, which do not require rigorous drying-off, but merely a reduced temperature in the resting season. The upland, Indian *C. fimbriatum*, *C. refractum*, and some others, lose their leaves after growth is completed, and must be treated like resting *Dendrobiums*. J. O'Brien.

ODONTIODA JAMES O'BRIEN

OUR illustration (Fig. 101), taken from the plant of this very remarkable *Odontioda* shown by Sir Jeremiah Colman, Bart., Gatton Park (gr. Mr. J. Collier), at the Royal Horticultural Hall on October 17, represents one of the most interesting crosses in which *Odontioda* and *Odontoglossum* merge. It is surprising that the scarlet in *Cochlioda Noezliana* has been so pronounced, even in hybrids in which the *Odontoglossum* largely predominates. Crosses with this species in their parentage rarely appear with such strong resemblance to *Odontoglossum* as in this case. But when its ancestry is analysed, the explanation readily presents itself. The present fine novelty results from crossing *Odontioda Oakwoodensis* (Oda. Bradshawiae x Odm. percultum) and *Odontioda Chasteeler* (*Cochlioda Noezliana* x *Odontioda Cooksoniae*). Working out the species in its composition, their presence and influence may be best expressed by estimating the component parts as *Cochlioda Noezliana* 5, *Odontoglossum crispum* 3, *Odontoglossum Pescatorei* 3, and *Odontoglossum Harryanum* 1. If the flower is examined on these lines, it is evident that *Odm. crispum* and *Odm. Pescatorei* take the lead, the latter imparting broad segments of fine substance, and the well-known broad, flatly displayed lip. The plant has short, red-brown tinted pseudo-bulbs, suggesting *Cochlioda Noezliana*. The flowers are pure white, with claret-red blotches on the inner parts of the segments. The crest of the lip and some other points well show true *Odontioda* characters.

# The Week's Work.

## THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

**Miltonia.**—*Miltonia spectabilis* and its varieties *Moreliana* and *atrorubens*, with *M. Clowesii* and *M. Regnellii*, are interesting members of this genus for flowering during the late summer and early autumn. After the plants have bloomed, and the pseudo-bulbs finished growing, the supply of moisture at the roots should be reduced gradually, and the rooting material kept on the dry side until growth becomes active again in the New Year. *M. Roezlii* and its variety *alba*, with any late flowering plants of *M. vexillaria* or its hybrids, of which there are several, may still be repotted, when the new growths are in a desirable condition, namely, nearly half made and about to develop new roots. The whole of these plants should be placed in their winter quarters, at the warmer end of the intermediate house, and watered only when moisture is absolutely necessary.

**Disa.**—The members of this most attractive genus of terrestrial Orchids are best repotted at this season, just as the new growths push up from the sides of the old flower spikes. The pots should be well drained, and the compost should consist of equal portions of fibrous peat, *Osmunda* fibre, and Sphagnum moss, with a fair sprinkling of half-decayed leaves and coarse silver sand, or better still, powdered sandstone, all mixed thoroughly well together. After repotting, one watering should be given the plants to settle the compost around them, and then for some time spraying them lightly once or twice a day, according to outside conditions, will suffice to keep them moist. The house in which they are growing should be freely ventilated, with only sufficient fire-heat to keep them safe from frost in very cold weather. The plants should be grown near the roof-glass, as they need all the light available. *Disas* delight in cool, moist, airy conditions at all times. Every means possible should be taken to prevent attacks of insect pests, as these Orchids are injured by fumigants of any kind.

**Cleansing the Houses.**—Now that the work of repotting is not very pressing, it is advisable, where sufficient room is available, to thoroughly cleanse the houses, both inside and out, by scrubbing both woodwork and glass. In most districts this is a common necessity, as the accumulation of dirt and other matter upon the roofs prevents the light from reaching the plants during the winter. Whilst this work is in progress, means should be taken to remove all the foreign substance between the laps of the glass, as this entirely seals up the cavities, and often causes drip from condensed moisture, which might mean the loss of a valuable plant. At the same time it is advisable, whilst removing the plants, to thoroughly clean and rearrange them, so that every plant may receive the maximum amount of light. In order that the leaves should perform their functions unhindered, it is essential that they should be kept clean, although it is not necessary to do this more than twice a year, especially when the plants are not infested with scale or other pests. Scale insects must be consistently eradicated, as they spread rapidly, and, if allowed to increase, will soon kill the strongest plant. Dipping and hand-cleaning with some safe nicotine insecticide is the only remedy.

## THE KITCHEN GARDEN

By JAMES E. HATHAWAY, Gardener to JOHN BRESNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

**Seakale.**—The crowns intended for forcing should be lifted as soon as the foliage dies down, and they will force better if exposed to the weather for a few days. The side roots should be trimmed into root-cuttings, about 6 inches long, with a sharp knife, tied in

bundles, and placed in boxes containing fine soil. They will be ready for planting next spring. Seakale should not be forced in a temperature higher than 60°. A Mushroom house is a suitable place, or they may be forced under a greenhouse stage, but it is necessary to exclude the light from them.

**Peas.**—A sowing of Peas should be made on a warm border, in broad, shallow drills 4 feet apart. Cover the seed with about one inch of soil, and dress the latter with soot and lime, raking it under the surface. Select a round-seeded type of an early sort for this sowing. Slugs and mice are the chief enemies of Peas sown at this time of the year and must be guarded against. A few ashes and a little soot scattered along the rows will tend to ward off slugs. I have practised this method, and have had good results for years in obtaining early crops of Peas.

**General Remarks.**—The recent dry weather has enabled growers to proceed with the work of weeding. Hoe up the weeds, rake them together and burn them. Old Pea and Bean baulms should be cleared off the land, the latter cleared of weeds, and dug forthwith. All winter crops should be examined, and yellow and decaying leaves removed. Continue to earth up Celery when the weather is fine, and keep the plants dusted with soot to ward off slugs.

## FRUITS UNDER GLASS.

By F. JORDAN, Gardener to Lieut.-Col. SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Peaches.**—Root-lifting and renovating the borders should be brought to a close in the early houses. The autumn having been favourable, any vacancies for large trees may be filled with plants from the open. This work should be quickly and carefully performed. Trees that were root-pruned last season may now be lifted with perfect safety, provided one or two good soakings of water be given the roots before lifting is attempted. When placed in position and tied loosely to allow for the soil settling, keep the house somewhat close for a few days, and syringe the trees frequently with tepid water. Treated in this way, large trees may be lifted in full leaf, and will become re-established within a month, when ordinary management will fit them for forcing gently with the others next season. Except for neatness, the tying of the trees may be deferred until the blossoms are nearly open. Pruning may be commenced, and, if my former advice has been followed, this work will be very slight, necessitating merely the removal of a shoot here and there, and making good all imperfect cuts. All other trees, no matter how large, should be detached from the trellis and carefully washed with Gishurst compound, using the same solution, but a little stronger, for washing the wires and woodwork. One washing will suffice for trees which have been free from insects. Painting with various mixtures often does more harm than good. If scale has been troublesome, the old wood may be washed with Gishurst compound twice.

**Succession Houses.**—If the buds of Peach trees in succession houses are well advanced, the trees may be washed with the hose once a week to keep down red spider. The roots should be kept thoroughly moist until the leaves fall, and then the branches may be cleansed and trained and the house subsequently kept freely ventilated until the time arrives for starting the trees. Avoid wintering pot plants in these houses if possible, especially those of a tender nature, as keeping the house closed on mild days will cause the buds of the Peach trees to swell when they should be resting and dormant.

**Late Peach Houses.**—Where the trees in late houses are clear of fruit, well syringe or wash them with the hose, and, if green or black fly are present on the points of the half-ripened shoots, fumigate the house or use an insecticide. If in doubt about the wood being ripe, a little steady fire heat will do no harm, always provided ventilation is on a liberal scale. These trees should be well thinned out to allow light and air to enter them freely.

## THE FLOWER GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

**Spring Bedding.**—Beautiful as are the present occupants of the flower-beds, they must make way for their successors in order to permit the latter to be placed in position in good weather, so that they may become established in their new quarters before the advent of inclement weather. Once the summer plants are lifted, the beds should be cleared of all rubbish and other undesirable matter and then dug deeply, incorporating with the soil a good quantity of well-decayed manure. Carry out this work and the planting operations during fine, dry weather, and as neatly and tidily as possible, otherwise contiguous gravel and turf may suffer ugly defacement, from which they will hardly recover before the time of spring floral beauty arrives. Lift the young plants awaiting the transplanting, carefully, by means of a hand-fork, retaining as much soil on the roots as possible, in order to obviate too much root disturbance. When placed into position, make the plants firm at the roots, leaving the surface soil loose around the collars. Bulbs that are to be used in conjunction with such plants as Wallflowers, *Myosotis*, *Arabis* and *Aubrietias* should be planted by means of a dibber. When all the necessary planting details are completed, finish off the beds neatly. It will be necessary to examine the beds during the winter after frost, to make sure that the latter has not loosened the plants in the soil. Should they be found to be disturbed, immediately make them firm again. It is always as well to keep a few plants of each sort in reserve to replace any that may fail.

**Preparation for Shrub and Tree Planting.**—Make timely preparations for the moving and planting of hard-wooded subjects before the actual time for planting arrives, especially where there is a large number to deal with. Where new plantations are to be prepared, trench the soil, and if it is of a heavy, retentive character, adopt some simple means of drainage. In making the holes for the roots see that they are of sufficient size to allow the latter to be spread out to their fullest extent. In the case of heavy, tenacious soils, make the holes with a digging fork, rather than with a graft or spade, and leave the bottom and sides broken up. I have seen holes very neatly and tidily made with grafts, but left so smooth and firm that they must have served as water-tight basins during wet weather, and held stagnant water around the roots for weeks. Planting too deeply is another fault that should be guarded against. Fallen leaves and other vegetable rubbish may be placed in the holes, and, when they decay, serve as food for the roots of the trees. Before lifting shrubs, etc., make sure that the labels are tied securely to them. Trees and shrubs with heavy heads should be staked to prevent rough winds loosening them at the roots before they become re-established, and to enable standards to retain an upright position.

**Lawns.**—Keep the lawn well brushed and free from fallen leaves. The latter material will be valuable for forming mild hotbeds, converting into leaf-mould, etc., whilst the sweeping will benefit the turf considerably.

## PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to Sir C. NALL-CAIN, Bart., The Node, Codicote, Welwyn, Hertfordshire.

**Canterbury Bells.**—*Campanula medium* is a most useful plant for growing in pots, and may be had in flower in the cool greenhouse from eight to ten weeks earlier than in the open ground. The earliest raised plants should be potted in their flowering receptacles, and treated as advised for *Campanula pyramidalis* during the winter.

**Shrubs for Forcing.**—The greenhouse may be kept well furnished with flowers during winter and spring by introducing a few shrubs into heat at intervals. Subjects suitable for the purpose include *Lilacs*, species of *Prunus* and *Pyrus*, *Deutzias* and *Wistarias*. Plants that have been grown in pots especially for the

purpose may now be overhauled and top-dressed if needed, after first seeing that the drainage is in perfect order. Shrubs that have been planted out specially for forcing may be lifted and potted, but in this case only those that are well set with flower-buds should be chosen, leaving the others to remain for another season. After potting, all the plants should be plunged in a bed of ashes in the open until such time as they are required for forcing.

**Euphorbia pulcherrima.**—This plant, which is better known to gardeners as Poinsettia, will now soon begin to develop its showy bracts, and some assistance will be needed at the roots in the form of weak liquid manure and soot water. To prevent undue loss of foliage, the roots should not be overdone with water; at the same time do not let the plants suffer for want of moisture. The loss of foliage is, in my opinion, often due to the two extremes of watering and sudden changes of atmospheric conditions. Maintain a minimum temperature of 55°, and admit air through the top ventilators whenever the outside conditions are favourable.

**Potting Materials.**—It is always advisable to have sufficient potting materials in store for the winter months, such as loam, leaf-mould, peat and wood ash. If these are stored now, in not too dry a place, it will greatly facilitate the work of potting during the coming months. Where a shed is not available, the materials should be protected from heavy rains by some covering, such as of boards or felt.

#### HARDY FRUIT GARDEN.

By H. MARHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet.

**Plum Coe's Golden Drop.**—Although the fruits of this excellent dessert Plum will hang on the trees very late in the season, it is better to gather the ripest fruits when they are quite dry, place them in shallow boxes and stand the boxes in a dry, airy fruit room, or on shelves in a cool vinery. If a piece of tissue paper is placed over the fruits they will assume a rich golden colour, and the flavour will be superb.

**Morello Cherries.**—As the majority of these trees are usually trained on north walls, it is prudent to push forward with the work of pruning, etc., before very cold weather sets in. Short, well-ripened shoots of the current season's growth should be trained in close to the walls at intervals, as these are the best for producing heavy crops of large fruits. See that all the old shreds and ties likely to compress the bark of the branches are removed and fresh ones substituted if necessary. Remove some of the shoots where they are too thick, and fill their places with young, fruitful growths. Young shoots should be secured at intervals all over the trees, both for fruiting and taking the places of older branches. Strict attention to keeping the trees somewhat thin and the growths free from crowding must be observed when pruning and training the Morello Cherry. The branches should be evenly balanced to form a neatly trained tree.

**Orchard Trees.**—Preparations for planting orchard trees should receive early attention. Healthy, clean-stemmed, young trees, when planted early in autumn, usually develop fine heads the following season. If the land has not been trenched, it should be thoroughly broken up for several feet around where each tree is to be planted. The drainage should be ample and some provisions made to prevent the main roots growing in a downward direction. If the soil is somewhat heavy, a quantity of old brick rubbish, lime, and decayed manure (not of too rich a character) should be thoroughly incorporated with the staple. Standard trees should be placed 30 feet apart. Let all trees to be planted be of proved merit for the different purposes, and, should the site be rather bleak, plant a thick belt of Damsons on the north and east sides to form a wind screen. In most seasons the Damson trees will yield good crops of fruit.

#### HARDY FLOWER BORDER.

##### REVERSION IN HELENIUM AUTUMNALE.

MANY have noted examples of peculiar behaviour in the above species of Composite. Those I have hitherto seen produced heads of good average size, but more or less green and leafy in appearance. I recently had a specimen sent me from a garden, where it refused to open any flowers. The piece was eighteen inches long, and the main stem of average thickness, with leaves of normal size. It was branched throughout its length, and all the branches were quite slender, with occasional secondary branches. Branches and branchlets were furnished with very narrow leaves, crowded towards the extremities. Most of the ramifications terminated in a capitulum of bracts, one-eighth to one-fourth inch in diameter, with a very small and hard disc of florets. About the beginning of September there was no sign of a coloured inflorescence whatever, every part being green and leafy. *J. F.*

#### SOME GOOD AUTUMN PLANTS.

AMONGST the numerous autumn-flowering plants in the herbaceous border none gives a more brilliant effect than *Tritoma* Lord Roberts, which sends up big spikes of rich scarlet blossoms, some of the flower heads measuring fourteen or fifteen inches in length. The plant is a robust grower, and soon makes a big, bold clump. *Lythrum virgatum* Rose Queen is one of the best of the Willow Herbs, and very beautiful in autumn when covered with its rosy coloured spikes; in addition the plant is very compact growing. *Pentstemon Middleton Gem*, rosy pink, and *Southgate Gem*, scarlet, are two very desirable plants for the herbaceous border, and they continue in bloom right through the summer until very late in the autumn.

These floriferous plants send out numerous side shoots, and if the leading growth is pinched out, these side shoots produce a wealth of flowers. Another fine *Pentstemon* is *Newbury Gem*, a very dwarf, compact grower with

FIG. 102.—ACER GRISEUM. R.H.S. AWARD OF MERIT, OCTOBER 17 (SEE P. 243).

#### TIARELLA UNIFOLIATA.

THIS is a species which deserves wider recognition since it combines many of the good qualities of *T. cordifolia* with larger leaves and much greater stature. The most notable point of distinction, however, between it and the common "Foam Flower" is that whilst the latter creeps about by means of runners the former never does so. *T. unifoliata* makes a large clump after the manner of *Tellima grandiflora*. Though the outer leaves assume brilliant tints in autumn the plant is not entirely herbaceous here, and soon after the new spring foliage has commenced to develop the flower stems appear. These grow quickly, and attain a height of 18 in. or 2 ft., the fluffy spike of blossoms being of a warmer, creamier hue than that of *T. cordifolia*, and it is suffused with the rosy red of the anthers. *T. unifoliata* responds to generous treatment. It enjoys good soil (not too dry); given sufficient moisture and an open exposure, it will give the best results.

With the treatment described a long succession of inflorescences will be assured, and a group of plants, in suitable company, is an attractive feature in the border. Old clumps should be broken up and replanted in fresh soil enriched with well-decayed cow manure as soon as they begin to show signs of losing vigour. *A. T. Johnson, N. Wales*

crimson scarlet flowers. It is a very suitable subject for massing; there is also a white form of this beautiful plant. As a change to these red and scarlet varieties, *Pentstemon Kellermani* with plum-purple coloured flowers stands out very distinct. This variety also is excellent for massing.

The Japanese Anemones have done exceedingly well this season, and at the time of writing they are producing a splendid effect in the borders. The best of the white sorts is *Geante des Blanches*, the silvery-white flowers being of very large size, and much superior to those of *A. japonica alba*. *Helenium Riverton Gem* is quite the best of the Sneezeworts, and is as strong growing as the type of *H. autumnale*, which it greatly surpasses in colouring, the gold of the florets being suffused with terra-cotta passing to reddish bronze. This fine Composite gives a delightful touch of colouring in autumn in the herbaceous border, and the spikes are excellent for use as cut blooms. The variety *pumilum* is also worthy of inclusion in a select list of autumn flowers, as the plant is of dwarf, compact habit, and the flowers of very bright yellow, and large size. Another beautiful Composite is *Solidago Golden Wings*, which gives dense heads of bright yellow flowers, and will grow well in shady spots, such as under trees. *T.*

## EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## GARDEN KALENDARS.

No. 3.—VARIOUS AUTHORS.

THE work of the big four—Evelyn, Miller, Abercrombie and Paxton—has been dealt with in the two previous articles. It is now the turn of the others who have contributed to this particular form of garden literature. In making out a list of these little works it has not been altogether easy to decide which to include and which to leave out, but as my aim is to follow so far as possible in the footsteps of those famous men whose works have already occupied our attention, it will be found that only those calendars are mentioned which take in more or less the whole of the sections into which a garden may be divided. In coming to this decision, it must not be thought that there are no others of interest or merit. Such is very far indeed from being the case, and to prove the point *The Fruit Garden Calendar*, by John Lawrence, who was first Rector of Yelvertoft in Northamptonshire, and later (1721) of Bishop's Wearmouth in the county of Durham, may be instanced. The above work was published in 1718. There is a great deal in it worth our attention beyond the excellent first-hand directions about the management of different kinds of fruit trees. The practice of cutting a ring round the bark, or, as he calls it, "circumcising" trees, to make them more fruitful, must have been in vogue in his day. Then how informing are his remarks about the out-of-door cultivation of Grapes and the management of English vineyards in the last part of his introduction, when he deals with the "Management of the Vine, that glorious plant which, amongst all others, justly claims the Precedency, being esteemed by Ancients and Moderns, the King of the Vegetable Kingdom, as Man is of the Animal and Gold of the Mineral."

How this whole-hearted enthusiasm reminds one of the commencement of *Le Floriste François*, in which De la Chesnee-Monstereuil writes: "Comme l'on voit qu'entre les animaux l'Homme a la domination; entre les astres le soleil tient le premier rang et entre les pierres le Diamant est le plus estimable; ainsi il est certain qu'entre les fleurs la Tulipe emporte le prix." (As man is lord of the animal creation, as the sun is the first of the heavenly bodies, and the diamond of all precious stones, so among flowers the Tulip bears the palm.) The dictum of these authors may be disputed. The talking in the Dail would be as nothing if all those who might urge as rivals of the Vine, the Rice plant, the Date Palm, Wheat, Potato and the Apple were to be heard.

The cultivation of vineyards in England is always more or less of a mystery, just like the profitable cultivation of Saffron, hence anything that throws light upon the subject is welcome reading.

It would appear that in Lawrence's day many people had vines on the walls of their houses; but they were planted without any idea of gathering any fruit from them. They were just put there "to cover the Walls of a House with something Green, to make it look Pleasant and Beautiful to the Eye without any Prospect of reaping good or ripe Grapes from them." For this he blames some statements of Sir William Temple in his *Garden of Epicurus*. He urges that it is very largely a question of selecting deep, warm soils and properly sheltered positions, together with correct pruning. Incidentally, Lawrence alludes to the hot walls at Belvoir Castle by means of which Frontignac Grapes were ripened in July, which was an unheard-of feat up to then, and may be compared to the presentation of a Cucumber to King George the First on New Year's Day, 1721.

I proceed to give a list of all the gardening calendars that I have been able to find. Doubtless there are omissions. Perhaps it would not be asking too much if I suggest that those who know of others would send a note about them to *The Gardeners' Chronicle*. They are all of greater or less interest.

When an asterisk follows a date it means that there has been more than one edition. To save space in several cases the title has been abbreviated, but I hope it has not interfered with the identity of the book.

## LIST OF GARDENING KALENDARS.

- 1664\* *Kalendarium Hortense*: J. Evelyn.  
 1675 *Kalendarium Rusticum*: J. Worlidge.  
 1682\* *Florists' Vade-Mecum*: S. S. Gilbert.  
 1683\* *Gardeners' Calendar*: J. Reid.  
 1688\* *Gardeners' Monthly Directions*: J. Worlidge.  
 1716 *Gentleman Gardener*: H. Stevenson.  
 1717 *Lady's Recreation*: C. Evelyn.  
 1718\* *Gentleman's and Gardeners' Calendar*: R. Bradley.  
 1726\* *Kalendarium Universale*: B. Whitmill.  
 1731\* *Gardeners' Calendar*: P. Miller.  
 1754 *Scots' Gardeners' Director*: J. Justice.  
 1758 *Gardeners' New Calendar*: J. Hill.  
 1758 *Gardeners' New Calendar*: W. Hambury.  
 — *Complete English Gardener*: S. Cooke.  
 — *Complete Florist*  
 1763 *Gardeners' New Calendar*  
 1767 *Modern Eden*: J. Rutter and D. Carter.  
 1769 *Practical Gardener*: J. Garton.  
 1769\* *Royal Gardener*: A. Powell.  
 1771 *Planters' Guide*: J. Meader.  
 1773 *Gardeners' and Planters' Calendar*: R. Weston.  
 1774\* *Every Man His Own Gardener*: J. Abercrombie.  
 1776 *Gardeners' Pocket Calendar*: T. Ellis.  
 1791 *Gardeners' Pocket Journal*: J. Abercrombie.  
 1810 *Planters' Calendar*: W. Nicol.  
 1836\* *Flower and Fruit Garden*: M. Doyle.  
 1839 *Floral Calendar*: J. Mangles.  
 1842\* *Cottage's Calendar*: J. Paxton.  
 1843 *Gardener's Almanack*: G. W. Johnson.
- In reading over this list of authors, it must impress everyone how many of the foremost gardeners of the past have published these little works. They are not all the work of unknown men. Over and above the names of Evelyn, Miller, Abercrombie and Paxton we find those of Gilbert, Whitmill, Worlidge, Bradley, Justice, Reid, Powell and Weston. It is an unpremeditated and magnificent testimony to their utility. It is pleasant to think that if there have been lame dogs in the past, the great ones in our calling have been ready to give them at all times a leg over the stile. In such a list it goes without saying that items of historical interest, as, for example, Evelyn's reference to the "worthy and ingenious Gentleman, Robert Berkeley, Esquire, of Speechley, in Worcestershire," and Worlidge's reference to the hard winter of 1683, when almost all the "artichoaks" in England were destroyed, must be many in number and that little tit-bits of quaint thoughts and uncommon expressions must be as the sand on the sea-shore.
- Of these none is calculated to stir the imagination of the curious more than the *Astrological Calendar*, bound up with the first edition of Gilbert's *Vade-Mecum* (1682), and the short notices about the stars which occupy one column of Worlidge's *Kalendarium Rusticum*. Gilbert tells us in his introduction that he has included it so that "the Gardener or young Flowerist may do all things in due and fit seasons." Reading between the lines it would appear that the ten instructions given are but a few chosen from a greater number. However this may be, if only those given are to be followed, a calendar which gives the necessary details of what is happening among the heavenly bodies is imperative. How else could such advice as this be carried out? "Set or sow all kind of Pulse, the Moon in Cancer?" Worlidge's notes are similar. Under January 3rd we find, "Castor and Pollux rise in the evening," and on December the 30th, "The left foot of Gemini rises in the evening." In many books of the period the astrological part was concentrated entirely upon the moon. It was when this luminary was old, or full, or new; whether it was waxing or waning that

sowing, planting, pruning and gathering depended.

The following quotation doubtless represents the spirit of the age when it was written:—  
 "If you, with flowers, would stock the pregnant earth,

Mark well the moon propitious to their birth:  
 For earth the silent Midnight Queen obeys,  
 Observes her course, who, clad in silver rays,  
 Th' eternal round of Times and Seasons guides,  
 Controls the Air, and o'er the wind presides,  
 Four days expired you have your time to sow,  
 From Moon's increasing toll full-orb'd they grow;

This past, your labour you in vain bestow,  
 Nor let the Gard'ner dare to plant a Flow'r,  
 While on his work the Heav'n's ill-brooding low'r;  
 When Moons forbid, forbidding Moons obey,  
 And hasten when the Stars' inviting Beams display."

(*Rapin of Gardens*, Englished by Rev. James Gardiner, about 1706.)

With regard to Gilbert's and Worlidge's monthly directions, the curious thing is that in them neither author refers to the moon or any of the heavenly bodies. The question now arises, did they insert these items about Cancer, Gemini, etc., etc., with their tongue in their cheek, knowing them to be all moonshine, but not openly daring to say so; or was all this mere current coin and so well known and so universally followed, that they took it for granted? It would appear that astrological gardening is a *terra incognita*, which has never yet been thoroughly explored, else I would have come across its history and explanation in some book or another.

More space has been devoted to the moon and the stars than I intended, hence references to other points of interest in these calendars must be very brief.

In Garton's *Practical Gardener* (1769) we get what must be one of the last instances of the herbal united with the purely gardening book. One division is called "The Physical Garden," and is confined to the "cultivation of such Herbs as at some times are necessary in all Families." Their uses as medicines are given. Whitmill, in the fourth edition of his *Kalendarium Universale* (1748) tells us "that there are few gentlemen of late who are not themselves their chief gardeners."

*The Complete English Gardener*, by Samuel Cooke, gardener, at Overton, in Wiltshire, is a quaint little book without a date, and must be something of a rarity, as it is not mentioned by Mrs. Evelyn Cecil or Weston in their bibliographies. Hot walls are advocated, and in addition to a good deal about the management of bees, we get five pages given up to the "Shepherd's Barometer." One "old proverb" would certainly have been quoted in such a year as the present.

"If the grass grow in Janiver,  
 It grows the worse for 't all the year."

*The Floral Calendar* (1839) of James Mangles, Commander, R.N., was printed for private circulation only, and merits attention for all the numerous odd bits of information which quite overshadow the calendar proper. Ellaconibe's wonderful Rectory garden at Bitton has an earlier counterpart in Theodore Williams's equally notable one at Henden Rectory. Such out-of-the-way subjects as suitable birds for aviaries, and where to buy gold and silver fish for greenhouse and garden tanks, find a place among its miscellaneous collection, as well as a long price list of the best Geraniums, several of which are valued at two and three guineas each. It is full of bits of historical and sometimes of very practical information.

Anthony Powell, Esq., gardener to his late Majesty King George III., in his *Royal Gardener* (2nd Edition, 1769), tells how he must have provided the royal table with early Cherries, "about three changes of dung will be sufficient to bring your Cherries to ripeness in February, allowing each parcel to remain a month at the back of the pales."

Of quaint remarks there are, of course, no end. Imagine Worlidge's advice under December appearing in the 1920 edition of Paxton:—  
 "The evenings are long, which gives the in-

dustrious an opportunity to indulge themselves by the fireside over a glass of Hearts-ease"; and what would Mrs. Grundy think about Evelyn's animadversions against the ants that used to trouble his Nectarines, "They are cursed Devourers"? Ellis, gardener to the Bishop of Lincoln, in his lists of annuals, puts Love Apples amongst the flowers. No further examples are needed to show that many a pleasant half-hour may be spent with these quaint old kalendars. *Joseph Jacob.*

## AMERICAN NOTES.

I WAS interested in the note and illustration of *Enstoma Russellianum*, the Texas Bluebell, in *Gard Chron.*, September 2, p. 137, Fig. 55. This flower is not cultivated in the States, but it is made much of by the Texan florists, and quantities of the flowers are shipped to distant parts, although none, so far as I know, reaches New York. One man near Houston specialises in the flower, devoting his farm to it; but, according to reports, it cannot easily be cultivated. The plant is erratic and migratory, for one year part of his ground is literally covered with it, and the next season it takes possession elsewhere. Because of this queer habit, he waits to see where the plants are coming up before he ploughs any part of his farm.

The fact that Mr. Preston is able to cultivate it is another illustration of how ready American horticulturists have been to accept the declaration that this, that, and the other cannot be grown here. As a matter of fact, this great country is so varied in its climates and soils that it is possible to grow practically everything in the plant world in one or another centre. In three summers here I have found I can grow not a few things that others have informed me were difficult or impossible.

I am planting over 70 sorts of late Tulips this fall, for I never grew better blooms than those of Krelage's new hybrids I flowered last spring. The bulbs I lifted in late June were as fine as any I grew in Kent, and the offsets were quite numerous.

The autumn here is truly glorious; but for the short days it might be mid-summer. The vacant ground is a mass of Michaelmas Daisies; *Aster ericoides*, *A. cordifolius*, *A. vimineus*, and other types are everywhere, especially the first named, which establishes itself even on the grass bank in front of my house. It is surprising to see this dainty Aster flowering on plants from 4 inches to 2 feet high in the grass. The purple *Novae-Angliae* type is also abundant in places, but I have not seen the pink form. I have selected eight or nine good forms of these Asters; the variation is considerable, and I am not sure of the identity of some.

It is odd that in the garden these Asters are rone to mildew, but it is not noticeable in the wildings. The *ericoides* type grows in sheer gravel oftentimes. Most people here ignore them, as they do many other beautiful native plants. The same people will strive their utmost to grow the English Primrose.

English flowers are the things; English Delphiniums are special favourites. These flowers, however, are troubled with a disease which turns the foliage black. In bad attacks it stunts the plants and prevents them blooming. It reminds me of the disease that affects early Chrysanthemums in the open. Many residents have informed me that only the small Pompon Chrysanthemums were of any use in the open in this country, but I have Cranford White in fine form, and several other English varieties showing colour. For some reason the earlies are later here; Normandis is not yet in its prime, and the pink shade is totally absent, but, under glass, it is possible to get Advance, an American variety, in bloom in August. This, and several others, are now fairly prominent in the market; but the real Chrysanthemum season here is from mid-October to about the end of November.

I fancy it is only a question of varieties and proper handling; personally, I see no reason why spray Chrysanthemums should not be grown here in fields and lifted before frost, as is generally done in England, but this method is

not practised. Planting on benches under glass is done in June, usually quite small plants being used. Carnations, on the contrary, are invariably planted in the field in April, and lifted and benched in July or August.

I am afraid I disconcert my neighbours by persisting in flowering Pansies all the season, and sundry other things that are not orthodox. If anything, some of the Americanised British are even more emphatic about things than the natives. I was assured I would never grow Peas, Sweet Peas, or Cauliflowers on my ground; as a matter of fact, my autumn giant Cauliflowers grew so large that I had to stake them, and if it hadn't been for a plague of caterpillars during the fearful wet spell, early in September, when neither spraying nor dusting could be done, the heads would have been far bigger than they are. Club root is a great pest of Brassicas here, especially on Cabbages and Brussels Sprouts. Kales and Cauliflowers are not much affected save on soil that is lacking in humus. The soils in many States are greatly lacking in lime, but I am frequently dusting my ground with it. Oddly enough, I never had better Wallflowers

taken for a Violet. I have just planted out a batch of 150 rooted cuttings. I have a big batch of Primrose Polyanthus, including the blue variety. The common *P. vulgaris*, sown last spring, has not yet shown up; maybe the seed will germinate after a hard frost.

Touching on the rooting of Apple cuttings, one of the colleges here has made experiments in this direction; but, according to a bulletin issued on the subject, only a small percentage of varieties responded.

I have invested in a new instrument named the Multitool. The man who invented it is a genius. It consists of a handle with a screw and a ball joint at one end; it will take five different-sized or patterned hoes with teeth and plain edge. The ball joint permits any one of the hoes to be set at a desired angle for shallow or deep working, and, as the teeth are broad and edged like knives, they pass through the ground about four times as easily as the plain draw hoe, and do not miss weeds, like the prong cultivators. It certainly is a wonderful tool for working between rows, and the small hoes are useful in the border. I have scrapped my Dutch

FIG. 103.—*EUONYMUS EUROPAEUS ALDENHAMENSIS*. R.H.S. AWARD OF MERIT, OCTOBER 17 (SEE P. 243).

than I now have growing in my hot, dry soil. The plants are so strong that it will be a problem to find frame room for them. Lupins are prone to rot, due, I imagine, to lack of lime in the soil, and Honesty clubs, too. Few Americans seem to be acquainted with this latter plant.

I visited the Brooklyn Botanical Garden this week; Montague Free, an old Kewite, has built there the best rock garden I have so far seen, despite the fact that the natural rocks are not of the best type. The Japanese garden, too, is a gem; it was made by Japanese. The Bronx, or New York Botanical Garden, is more like a park, covering a great area, but neither can compare with Kew.

Roses Mme. Butterfly, Mme. E. Rostand, and W. F. Dreer gave fine blooms in June and July; all were April planted. In August my plants were divested of foliage owing to spot disease. They are now in new growth and flowering again; I cut a bloom of Claudius Pernet to-day. I am trying to ward off a second attack of spot by spraying constantly with copper ammonia; the ground I have heavily dressed with iron sulphate after collecting all the fallen leaves possible.

*Viola cornuta* Lord Nelson raised from Watkins and Simpson's seed, has been a gem, full of flower since June, and it has been mis-

and draw hoes, the cultivator and the rake, too, for most purposes. The tool is retailed here at \$5 the set.

In conclusion, I may refer to the behaviour of *Dianthus Allwoodii*. I have the varieties Phyllis, Robert and Harold on my rough and ready rockery. Early in the season the plants flowered well, and they have since made such a mass of growth that I am anticipating a great show next season. The cuttings were propagated last fall and wintered in the open; but, unlike the common Pink, they do not make enough growth the first season to give a big crop. I might add that I raised a few *Dianthus* plants for my rockery from seed; two of the plants proved to be Carnations, and apparently of the perpetual type. Both are double and are flowering now. I also have a few perpetual border Carnations, which were sown in a pot in August of last year. Tiny as they were, they withstood the winter in a cold frame, protected only by bags, with the temperature falling once or twice to zero. The plants are now splendid; but as I stopped them they have not flowered. Their survival last winter as tiny seedlings, less than an inch tall, is a proof of the hardness of Carnations provided they are protected from sunshine while frozen. *T. A. W., New Jersey.*

## REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Concluded from page 242.)

WALES (continued.)

**CARDIGANSHIRE.**—All fruit trees flowered well. Apples are an exceptionally heavy crop, especially the varieties James Grieve, Mr. Gladstone, Keswick Codlin, Bramley's Seedling, Blenheim Pippin, Ecklinville Seedling, Beauty of Bath, Lord Derby and Golden Harvey. Pear trees are carrying heavy crops in the case of such varieties as Beurré Diel, Citron des Carmes, Clapp's Favourite, Conference, Dr. Jules Guyot, Doyenné du Comice, Hessle, Josephine de Malines and William's Bon Chrétien. Plums in the open are hanging like ropes of Onions, the branches being borne to the ground with the weight of fruit. Those on walls were not so good. Cherries were good, also Apricots. All small fruits were satisfactory, with the exception of Raspberries and Strawberries, which were very bad. The exceptionally heavy rains in the first four months of the year, followed by drought, ruined them. Frost was registered here every night during April. All fruit trees were very late in flowering. The first to flower was Early River's Plum on May 1; the last, Apple Sure Crop, on June 2. All trees are free from pests. No spraying was done, owing to shortage of water. The soil is a medium loam resting on gravel. *D. H. Dunn, Hafod Gardens, Devil's Bridge, Aberystwyth.*

**GLAMORGANSHIRE.**—The Apple crop is an average one. Trees of James Grieve, Lord Grosvenor, Cox's Orange Pippin, Allington Pippin, and Worcester Pearmain are cropped the best. Pears are quite up to the average and very good in quality. Gooseberries were plentiful, and the bushes free from blight, and Raspberries and Currants were also excellent. *C. T. Warmington, Penllergaer Gardens, Swansea.*

**PEMBROKESHIRE.**—The fruit crops are not very good. Apples, Plums, and Cherries were very poor. Plums and Cherries suffered from very cold winds and heavy sea fogs at the flowering period. Our Apple trees developed a large quantity of bloom—in fact, I never saw more—but the flower trusses were weak and very few Apples set. Peaches, Nectarines and Apricots were all extra good. Bush fruits, also, were very plentiful. Strawberries were short in quantity, but the few berries that ripened were very good. *Charles McInroy, Stockpool Gardens, Pembroke.*

—Apple, Pear, and Plum trees flowered exceptionally freely, and the whole county looked as if covered with a white sheet. The result is we have a splendid crop of Apples and a good average crop of Pears and Plums. Small fruits, including Gooseberries, Black Currants, Red Currants, Raspberries, and Loganberries, all set very freely, and the fruits were very good. There was an average crop of Strawberries, but bad weather set in at the time of ripening, and a lot of the berries rotted on the plants. *T. H. Roberts, Heywood Meadow, Tenby.*

IRELAND.

**KILKENNY.**—All fruit trees blossomed with extraordinary profusion, in common with all other flowering trees and shrubs after last year's wonderful summer and autumn. Apples, which last year were terribly thinned by bullfinches in the dormant bud stage in January, are this year carrying heavy crops. This is true of all varieties, with the one exception of American Mother. Pears are a heavier and a cleaner crop than for years. Plums and Damsons are very plentiful, as also are Apricots and Peaches, but Cherries have suffered somewhat from the drought during May and June, which also badly affected the Strawberry crop. Rain fell too late for the Strawberries, but ensured a very heavy crop of Raspberries, whilst Currants and Gooseberries also were plentiful and good. Figs out of doors are a very fine crop. The long-continued drought

caused Apple trees to be rather badly affected with red spider—a most unusual condition for them here. Otherwise insect pests have not been very troublesome, although, in patches in a young orchard, the work of the capsid bug is now painfully evident. The soil varies from medium to sandy loam over veins of limestone or yellow clay. *T. E. Tomalin, Bessborough Gardens, Piltown.*

**MEATH.**—Plums and Damsons were bountiful crops all over this county, but, owing to a late spring and cold weather in May and June, Plums were slow in swelling, and were only colouring at a date when in other years they would be ripe. The soil is everything that could be desired and of the best quality for fruit growing. *Michael McKewen, Julianstown, Drogheda.*

**TYRONE.**—The fruit crops were fairly satisfactory on the whole, but rather late. Apples are a very heavy crop, and are not swelling well, unless where thinned. Fruit bloom was exceptionally abundant, and in a few cases, Pears especially; the trees seemed to be exhausted by the effort of flowering and failed to set fruits. Strawberries suffered from dull, showery weather, and many showed signs of decay long before they commenced to colour. Insects and fungous pests are not more than usually in evidence, except that American blight seems rather on the increase. *Fred W. Walker, Sion House Gardens, Sion Mills.*

**CAVAN.**—Apple trees in sheltered positions set fruit freely and are carrying good crops. In exposed situations the trees suffered very much in the first week of June from a drying east wind, which ruined the fruit prospects. Gooseberries were an excellent crop. Red Currants and White Currants bore fairly well. The Strawberry crop was an extra fine one, and the berries finished well. Plums were a heavy crop, but the trees were badly attacked by aphid. *Edward Rutherford, Farnham Gardens.*

**DOWN.**—There was a remarkable profusion of blossom on all fruit trees, and the weather was favourable to the setting of all kinds of fruits, except Plums, which were in bloom when 9°, 10°, and 11° of frost were registered, although sufficient blooms escaped damage to ensure a crop. May was an exceedingly dry month; rain came in time to swell out a fine Strawberry crop and all bush fruits. Many varieties of Apples required to be thinned. *T. W. Bolas, Mount Stewart, Newtownards.*

**WESTMEATH.**—The fruit crops generally are good in this district, except Strawberries, which were very poor. The latter part of May and beginning of June was hot and dry, but the summer was cold, and rain fell on nearly every day. The soil is light on a gravelly subsoil. *Wm. Allan, Pakenham Hall Gardens, Castlepollard.*

**CORK.**—All fruit trees are very healthy; they have scarcely been attacked by codlin moth or American blight, which are our chief enemies of fruit. *M. Colbert, Aghera Gardens, Coona.*

—Apples, Pears, and Plums are very satisfactory. As a result of the cold, harsh weather during April, May, and the early part of June, bush fruits were, on the whole, disappointing, and were fully three weeks later ripening than in 1920-21. Gooseberries were undersized. Black Currant bushes on light soil suffered from drought and aphid, and in many places Strawberries dried up. Raspberries and Loganberries, however, were satisfactory. Insects and fungous pests not so prevalent as in most years. *J. Dearnaley, 17, St. Patrick's Terrace, Magazine Road, Cork.*

**KILDARE.**—All fruit trees in these gardens are bearing abundantly, and the crops required to be thinned on several occasions. Owing to the great heat at the end of May, Pears on walls have a wonderful colour. Insect pests were most troublesome during the summer, but spraying with an insecticide killed them. The winter of 1921-22 was exceptionally

mild until March and April; during those months we registered frost almost every night, causing the trees to flower very late. The soil is a medium loam over clay. *Fredrick Streeter, Straffan House Gardens.*
