Cæsalpinia brevifolia.—Will you allow me to reply to your remarks at p. 151, on the native names for the *Cæsalpinia brevifolia*, or *Balsamocarpon*, *Algaroba*, &c. I had a drawing of the plant made, and sent copies of it to many parts of South America. From the gentlemen who replied and forwarded the real pods with the native names, I selected for my pamphlet the two most frequently employed. I might have given many others, but although I described what was wanted, I had pods sent me home of other plants which weighed 4 or 5 oz. each. These were also known as *Algaroba*. The best known *Algaroba* is the *Ceratonia Siliqua*, or *Locust Bean*, on which the Spaniards feed their cattle. *Balsamocarpon* is

when No. 2 was put to work, in fact I should decidedly say there would not be any. What with cutting *Asparagus* in three days after the placing of the crows in heat, and growing Mushrooms in a temperature of 90°, 1877 certainly, so far, abounds in horticultural wonders. I had the privilege a short time since of seeing a remarkably fine crop of Mushrooms in the garden of H. Bramwell, Esq., Crown East Court, Worcester, which far surpasses anything I ever saw before; these were grown in an arched cellar underneath a range of early and forced vineries. There is no piping or flue in the place, and Mr. Helman, the head gardener, informed me it was not necessary, the temperature of the house being very steady at about 58°. The beds were of the usual form, and made on the paved floor, corresponding in depth with those usually seen, but the Mushrooms were decidedly the best I ever saw. The spawn, I was told, was supplied by Messrs. Francis & Arthur Dickson & Sons, 106, Eastgate Street, Chester, and they have just cause to be proud of its excellent quality. *W. C.*

Bedding *Lobelias*.—I am in possession of a variety named *Emperor William*, which for brilliancy of colour and compactness of habit surpasses any that I have ever grown or even seen. I am unable to give its history beyond the fact that it was raised by a Harrow gardener, and three years ago obtained a First-class Certificate. I have grown it two years, and it has

Lobelias? For the past year or two the beds there have been too unreservedly placed at the disposal of the Felargonium Society as a trial garden for the seedlings of its members, but all the *Felows* are not affected with the scarlet fever, and therefore may well be desirous to see some space given to other plants quite as useful and not less meritorious than bedding *Felargoniums*. It should be the aim of the Council to make the Chiswick garden as practical as possible, relegating the mere decorative element to its proper place. *A.*

Polyanthus Sports.—Were it not for the facility you have of visiting Covent Garden, and seeing everything interesting from all parts of the world, I should pity your town life very much at this the most interesting season of the year. The winter is rapidly passing away, but except a rather sharp frost early in November we have had no winter weather, with the exception of wind and rain, of which we have had our share. Only in the delay of work does the rain inconvenience us in this county, where the subsoil is mostly like a riddle, and the uneven surface of ground at once throws off all superfluous. Vegetation is much too far in advance. The Gooseberries are in flower, and the generality of fruit buds rapidly expanding. *Primroses*, *Polyanthuses*, *Cyclamens*, &c., have been flowering all winter, and are now quite gay, as you will see by the few I enclose.

My principal object in sending it to call your attention to some singular strays derived from one or two varieties, show you to what extent they perpetuate themselves, and throw off others even more grotesque than themselves; and, still more strange, to sport back, not only to the normal form, but to produce some really new and older bracteate forms of Polyanthus, such as the old blue Polyanthus, which equally produces single or compound flowers. I also send you the nearest approach to a double Cyclamen I have seen; this variety of *Ibericum* is quite constant, but I have not yet been able to identify it with *Ziermayeri*, *Tregoneyi*, *Cornwalli*, *Fibryi*. (The rich and varied bouquet above referred to included—1. Two fine varieties of white Primrose, found wild in the woods near Tregoney, and which usually flower some weeks before the common sort. 2. Seeds of flowers for the first time, and likely to be useful for spring decoration; a maroon-crimson variety is very rich. 3. Seedlings from bracteate varieties, showing how greatly they vary; later on they will be more interesting; quite one-half of those I have not had in the monochrome form from seedling-bred Polyanthus, which invariably produces solitary flowers, like the Primrose. 5. A double-flowered Cyclamen *Ibericum*; this, being a short-petalled species, looks much better in the duplicated form than does C. persicum. ERS.)

Skimmia japonica.—The above plant, when well grown in large pots or tubs, is one of the most hardy and ornamental berried shrubs in cultivation. From its low-spreading habit it can be trained into a nice bushy form, and in the winter months, when covered with coral berries, it is not a less attractive sight than the more popular *Holly*. Owing to the scarcity of *Holly* berries last year my plants of the *Skimmia* in pots have been much noticed this winter, and I have had no end of applications for sprigs of them covered with berries, and some for berries for sowing. I find that the tree will bear a heavy crop of berries in a light loamy soil, mixed with a little peat or leaf soil, and as it flowers early in the spring, a little protection is required in severe spring frosts to insure a full crop of berries. *William Tillyer*.

An Early-blooming Ornithogalum.—During the past week I have noticed some plants of a very dwarf species of Ornithogalum in bloom in the nurseries of Messrs. Backhouse & Son, at York. It appears to be a stemless species, the umbel of flowers springing from amid the leaves, and rising to a height of about 1 inch. The flowers are generally only 2 inches across, with very narrow petals. I understand it was received under the name of *O. sororum*, but I have not been able to ascertain anything about its origin. *Ebor*.

Mr. R. S. Yates' Nursery at Sale, Cheshire.—All lovers of plants who have paid Mr. Yates a visit during the last twenty years (and their name is legion) will remember the grand plants of *Coleogyne cristata* in the houses at Sale. I have seen them on several occasions, but never saw them in such fine condition as they are at present. They are the finest of culture, and in a most perfect state of health. There can be no doubt that this is the most beautiful and useful of the genus; and the reason why all who grow the plant are not so successful as Mr. Yates is because they do not adopt the same simple method as ought to be remembered that there are *Coleogyne* and *Coleogyne*s. For instance, C. *Gardneriana* is found on trees in moist, shady woods—its favourite locality is in the immediate vicinity of a waterfall, whilst C. *cristata* is found growing on rocks exposed to the full glare of the sun (and, if you can) large masses of this plant, 4 or 5 feet in diameter, with 150 spikes of large blossoms, pure white, with the exception of the centre of the labellum, which has bright yellow fringes and plaits, the blossoms 4 inches in diameter, and four or five flowers on a spike. This is what I saw at the above gardens the other day; and there is also in the same house a large quantity of another equally charming flower, about 200 spikes of bloom being open. I refer to the lovely *Lelia anceps*, which has royal blue flowers, and is really splendid, and, if you grow of no two winter flowering *Orchids* more beautiful than these; and I feel sure that Mr. Yates' collection of these two gems are the finest to be seen in the country. There are hosts of other things one might mention, but I must draw attention to the above-named, inasmuch as I consider the quantity and quality extraordinary. *Bruce Lindley*.

Omphalodes verna.—*Arceps* of the association of *Omphalodes verna* with double white Primrose, alluded to at p. 50, permit me to send you a drawing similar which I have observed on one of the banks flanking the noble rockwork of Messrs. Backhouse & Son, York. The upper part of this bank is covered with *Omphalodes verna*, which has spread itself, in wild fashion, over an area of some yards in extent, and,

in the course of the spring, when the plants are well in flower, and the entire surface is one sheet of brilliant blue, numerous random plants of the common Wood Anemone (*A. nemorosa*) crop up in bloom here and there through the carpet of *Omphalodes*, with charming effect, the pure white of the Anemones coming out strongly in the deep blue of the *Omphalodes*. In addition to this, on the brow of the bank, immediately under the expanse of *Omphalodes*, are broad patches of *Myosotis dissitiflora*, while, lower down still, the base of the bank is covered with a yellow of *Thysanopetalum alterniflorum*, which, by its yellow flowers, which lay close down upon, and contrasted with its dark green foliage, when seen in mass have a peculiarly rich appearance. When these plants are all in bloom together, the effect is indescribably fine; and, although it is simply the result of the natural growth and grading of the plants for some years, I do not remember to have seen anything to be at all compared to it, in the most elaborate attempts at "bedding" or premeditated arrangement which have come under my notice. *Ebor*.

West's Patent Trellis.—Whether the above is a patent or not, I beg to state that a trellis in every respect similar, according to your description and illustration, except that it was lowered by means of chains, instead of by "turning a handle," was erected here about fourteen years ago, in two years before I took charge; but its use was discontinued after the first trial. The worst objection to it, however, was that to let the trellis down to within reach of a man 6 feet high it required to be some 2 or 3 feet shorter than the rafters, thereby entailing a loss of training space equal to about 150 square feet in our lean to vinery 50 feet long, or nearly 1 cwt. of Grapes in the season, which we thought would more than compensate for the extra trouble of using ladders at thinning time, if that can be reckoned of any account. It will be seen by the drawing in last week's *Gardener's Chronicle* that the trellis has to be shortened half the length of the "hip-rafter" at the back in order to leave room for it to descend. Another objection to it, especially in the case of stove climbers, is that the trellis lay hold of the permanent fixtures of the roof if the plants are left untrussed for a short time, and then the trellis won't work. A Vine tendril, once it gets woody, will carry a stone weight. The vinery in question here was designed by Ormson, of London, if I remember rightly, but was erected by the old crew joiners, J. Simpson, Woolley Hall, Salford.

Reports of Societies.

Royal Horticultural.—Last Tuesday the annual general meeting of this Society was held in the Council-room, South Kensington, under the chairmanship of Mr. J. G. Repton, F.R.S., and the following were present by the following members—Lord Alfred S. Churchill, Major Mason, Dr. Denny, Mr. Henry Webb (Treasurer), Dr. R. Hogg (Secretary), Mr. William Haughton, Mr. Kellock, and Mr. Campion. Amongst other business to be transacted in the evening were the names of Messrs. C. B., Dr. Masters, D. Wooster, Gueldra, Shirley Hibberd, De Castro, Godson, sen., G. F. Wilson, J. Lee, A. Grote, B. S. Williams, Maurice Young, H. J. Elwes, H. Veitch, Liggins, G. T. Saul, J. Fraser, Tweedy, &c.

The meetings of the Secretary, Mr. Dick, having read the minutes of the last meetings, which were confirmed, and scrutineers for the ballot of the Council and officers having been appointed in the persons of Messrs. Veitch and Lee, the report, as follows, was taken as read:—

REPORT OF THE COUNCIL TO THE ANNUAL GENERAL MEETING, ON FEBRUARY 13, 1877.

Notwithstanding the many disadvantages with which it has to contend, the Society has, by the satisfaction of congratulating the Society on the progress that has been made during the past year in the advancement of scientific and practical horticulture.

The Secretary of the Society has greater interest been manifested in this pursuit, both commercially and as an intellectual recreation; and the operations of the Society have been directed not only to promote and encourage horticulture, but to assist in the progress of horticulture by all the means it has at command.

The Scientific, the Fruit and the Floral Committees have met during the year without intermission, and worked assiduously at their respective duties, and under their superintendence and direction much valuable work has been done in the garden at Chiswick as well as at the meetings at South Kensington.

The meetings of the Scientific Committee have been well attended. Many most interesting facts in the morphology and physiology of plants, as well as in the branches of teratology and pathology, have from time to time been brought before the Society, and the investigations of the entomological department, with reference to the injuries produced by insects on plants, have been of great importance. Mr. G. S. Burdett, in connection with the meeting-spores of the *Peronospora*, referred to in last year's report, were on several occasions fully confirmed, while the facts afforded by the late lamented Mr.

Snee's very numerous microscopical preparations of the aphides which attack Potatoes, and which were found to be infested by the *Peronospora*, actually producing *coopersii* *in situ*, tended greatly to confirm the accuracy of Mr. Snee's conclusions. Some hundreds of mouldy spores in the *Fusisporium Solani*, a fungus which is sometimes almost as destructive as the *Peronospora*, demands especial attention. Amongst other matters, the grafting of plants with the *Peronospora* of Artichoke, and that of different species of Solanum one on another, as effected by Mr. Maule, of Bristol, though requiring confirmation, were of high interest; while Dr. Hogg's attempt to classify the *Peronospora* of Artichoke before the committee and thoroughly discussed, its secretary bearing ample testimony to its usefulness, and the experiments that are already published there are others in the Horticultural Society.

The Fruit Committee has also been engaged in doing good work in its department, and the reports of the experiments that were conducted at Chiswick under its superintendence will be found in the part of the Society's Journal which has recently been issued. These consist of elaborate trials of 243 varieties of vegetables. Besides the reports that are already published there are others in preparation which will treat on 150 varieties of Strawberries.

The large collection of garden-trained Cherry trees, covering the west wall of the conservatory at Chiswick, last season for the first time, and of these many notes were taken, which will furnish matter for a special report. This is the most complete collection of Cherries that can be obtained in the country, and some hundreds of varieties, all of which will be proved as to their adaptability to the climate and their uses in this country. The cord-trained Peaches on the south wall show a great promise of fruit, and the notes taken by the members of the Committee to compare them with one another, to ascertain their merits and to settle their synonyms. The crop of Peaches in the large orchard-house was most satisfactory, as well as that of the ones in the large conservatory.

The distributions among the Fellows in this department were 357 packets of seeds and plants.

It would be well if the floral department had been by no means unimportant from a practical point of view. The most useful of the observations made during the past year have been those relating to the new class of flowered Zonal Pelargoniums—a class which had rapidly increased in numbers, and of which it was highly desirable that a knowledge of the best sorts should be obtained. This has not been a great measure, being secured, as will be seen by a reference to the report in the recently issued number of the Journal of the Society.

Some modification has also been made in the mode of testing the merits of the new varieties of Zonal Pelargoniums, of which an extensive series has, thanks to the raisers and growers of these plants, been annually brought together at Chiswick for some considerable period. It is to be regretted that the number of plants of this year, as has hitherto been done, the Floral Committee thought it would be more desirable to grow the new sorts for the first year under glass, in order to test their suitability for being proposed to the second year, when better established plants would as a rule be attainable, in the open air, in order to ascertain their adaptability for being proposed. This has accordingly been done, and will be proposed to follow the same plan in future.

The actual trial collections consisted of 165 varieties of double Pelargoniums, 150 of single Pelargoniums, and 150 sorts of new Zonal Pelargoniums. For the opportunity of procuring these very complete collections of Pelargoniums, the Council were indebted to the Pelargonium Society.

The distributions in this department to Fellows have been 2500 plants of various kinds, 1500 packets of cuttings, and 20,000 packets of seeds. It has been found that the mode of proposing to the second year, which was better established plants would as a rule be attainable, in the open air, in order to ascertain their adaptability for being proposed. This has accordingly been done, and will be proposed to follow the same plan in future.

A valuable mixed collection of ornamental hardy herbaceous plants, by the new varieties of Zonal Pelargoniums, has been made for making beds of the popular old florist's flowers, such as *Ranunculus*, *Anemones*, *Carnations*, *Pioteles*, *Anthriscus*, &c.

The collection of plants that was supplied from Chiswick for the decoration of the conservatory and gardens at South Kensington was 47,872 up to July 18, when the supply was discontinued; and the estimated value of this collection was £1,000.

The state of the subscription list has not as yet been such as to justify the Council in issuing the usual schedules of flower shows, but they hope that it will ere long enable them to do so. The Council has greater interest in the Society. Although the great shows are, except under unusually favourable circumstances, attended with considerable loss, the Council, having regard to the general feeling of the horticulturists of the country, and to the practical use in popularising horticulture, have decided to continue them in as efficient a manner as the funds at their command will permit. The provincial shows stand on a more favourable footing, and the Council have determined under consideration where and when the next shall be held.

The Council will continue to encourage the fortnightly meetings which form so great an attraction to all lovers of flowers, fruit and horticulture generally. At these meetings may be seen all the novelties that have been collected and commenced privately by the horticulturist part of the world, and also many of not less interest which art has produced in our gardens at home. The large attendances of Fellows and their friends that are usually seen at these meetings, and the interest that is taken in this part of the Society's work. To make these meetings even more attractive it is

intended to try the experiment of holding them in the Conservatory, and to have a military band in attendance.

Through the liberality of many of the exhibitors and some of the horticulturists, a small number of exhibitors who have from a spirit of devotion to horticultural science supported it at great personal expense, the Council were enabled in July and November of last year to present two as grand exhibitions as ever have been seen in the gardens at South Kensington, and they have reason to believe that it is in contemplation to act in the same liberal manner some time during the present season.

The agreement entered into with Her Majesty's Commissioners in April last authorised the Royal Horticultural Society to borrow upon the security of the establishment, in case they assumed possession of the gardens. The Council have borrowed upon this security £5000, which enabled them to pay outstanding liabilities, prizes and awards, so that on December 31st the Society had a balance in hand more than sufficient to pay all their outstanding liabilities. The Society may be said to have commenced this year without debt or liability, except the attaching to surplus income in respect of debentures, which has not been the case for very many years past.

On the other hand, the Council have to regret that the result of the gardens had not proved sufficient to pay the interest on the debentures.

The strictest economy has been exercised—salaries and outgoings have been reduced by about £1000 a year, and towards the close of the season it was thought desirable to reduce the expenditure still further, by closing the entrance on the west side of the gardens. This has, however, been re-opened, and will go on as long as the funds permit.

The Council have, in their circular of December 31st, 1876, so recently addressed the Fellows on their position with reference both to Her Majesty's Commissioners and the South Kensington Gardens, that it appears unnecessary to return to the subject, more especially as that position remains unchanged. They content themselves with reminding the Fellows that, while their connection with the Kensington Gardens, the Commissioners remain together unpaid, but the Council were obliged, by a necessary regard for economy, to make an inadequate provision for the maintenance of the gardens and their enjoyment by the public, it appears to them that they and they trust that in this view they will be supported by the Society, that, unless sufficient funds are forthcoming for the fulfilment of their obligations, a proper regard to the interests of the Society, dictates the earliest possible retreat from a connection which was entered into with so much hopefulness and with such fair prospects of enlarged utility.

The President said no doubt they had all read with satisfaction the report of the result of the actual work done towards the advancement of the science of horticulture, and he drew special attention to that because the Council, like the rest of the Fellows, had read the disparaging remarks which had appeared from time to time as to the management of the Society. No doubt the unfortunate circumstances which had been the subject of so much conversation in that room had had to some extent a prejudicial effect upon the working of the Society. It was undoubtedly true that a large portion of the funds which might have been devoted to the advancement of horticultural science had been necessarily applied to the maintenance of the gardens at South Kensington. It was also true that the *Journal* of the proceedings of the Society, which had been read in the usual public meetings, had been attached to horticultural science, had been discontinued. There was no question that the connection of the Society with the South Kensington Gardens under the modern phase which had unfortunately existed for some time past, was to some extent prejudicial to the interests of the Society. The subject had been made the matter of very unjust comment in consequence of that union with South Kensington. It was not for him to defend it; it had been proposed by the Council that management should be taken by him on the one hand, and by Dr. Lindley and the most earnest supporters of the Society on the other. There had been then a hope that the effect of this union would be to popularise science to a very great extent, that he could not say in his opinion, this anticipation had been realised, and he doubted whether the anticipations entertained at that time were even realised at the time when the Society was most prosperous, because their prosperity meant the enrolling of a large number of members from South Kensington to enjoy the pleasure and advantages of these gardens. But when they read that 47,000 plants a year had been brought from Chiswick to these gardens (and he might have added the published reports of experimental trials) he could not say that the attention which had been given to the work had been neglected. Well, they must all feel that having entered into this union it was not possible lightly or easily to withdraw from it. In the first

place it was absolutely necessary that, as its men of honour and principle, should do their utmost to give effect to the intentions of those who brought about that union. Even supposing there was a failure of the object which had been in view, they had still a sense of honour left towards those who had advanced large sums of money in the hope of the project becoming prosperous. There were some persons who had advanced a sum, in round numbers, of £50,000, and there were also the holders of life tickets, who had paid down their money on the faith of the undertaking; so that while there was a vestige of hope left it was the duty of the Council to do their best to advance the prospects of the Society, and to secure for the interests of the debenture-holders and the holders of life tickets. Well, they were all aware of the results of all that had been done. They were under a special interposed lease for three years, during which time the Royal Horticultural Society could not be extinguished. It was the end of the three years that the annual sum in subscriptions of £10,000 were not realised, the Commissioners would be in a position to extinguish the Society.

Mr. Wm. HAUGHTON (Council), interposing, said that the condition was, that if the amount for one year was not realised, the Society should be dissolved.

The PRESIDENT: In any case we must show that we have brought up the subscriptions to £10,000. All that we received from all sources during last year was £5800, and therefore you can judge for yourselves what an amount of effort must be made to secure the sum which it is proposed we must raise. No doubt it may be that the attempting the absorption of the gardens by the Commissioners may lead to increased efforts, and may lead, as we and all the Fellows desire, to the promotion of real benefit both to the horticulturist and the Kensington public. But, so you must see that it is utterly impossible for the Society to go on in its present position. I ask, can we remain as tenants, bound to pay £2500 a year rent which we cannot pay? Again, of what use is it for us, who have a balance-sheet in our hands, which shows that we owe the debenture-holders, to remain here, when during the past year we were equally unable to keep up the gardens in proper condition, and when we were obliged to close all the entrances but one? I think you will feel with me and with the Council that it is not a fitting position for this Society to occupy. You will agree with me that it is not right that this Society should be constantly exposed to the charge that they are endeavouring to keep up a position which they are unable to maintain, and that in an ordinary life that he is spending more than his income, it is his duty to make his income and expenditure balance, and to give up every source of unnecessary expenditure. It is equally the duty of this Society to endeavour to square its expenditure with its income, by trying to support gardens like these, for which an adequate income is not provided. Ladies and gentlemen, I have stated before, and I am glad to state it again, that having by the assistance of the Commissioners rescued the Society from a state of bankruptcy, I think it my duty to do my best to keep from incurring fresh debt. You will bear in mind that during the next two years we shall not be, I am sorry to say, able to keep up the present gardens in their former condition; we shall be obliged, I am sorry to say, to refrain from doing many things we should much like to do for the extension of horticulture; but I think one great object we should keep in view during the two years is, that your Society should not suffer any disability by entering into pecuniary commitments which it cannot meet.

I think you understand distinctly that only for the Commissioners we should be involved in debt; the sum of £5000 which was advanced by Mr. Freake was applied to the payment of debts. I say again, that it is the duty of the Society to pay its debts, and in liabilities it has not the prospect of clearing, and especially as it has no likelihood of getting assistance from Her Majesty's Commissioners. I tell you candidly that my view of the question is this, that the horticulturists, and the public generally, and those of this neighbourhood, exert themselves to raise the annual sum of £10,000, it is not possible for us to meet our ordinary obligations, and I think the union between South Kensington and Chiswick ought to be dissolved. I think that if the terms of the lease, a fair notice, and ought to be clearly understood; and I am glad to find in the report of the Council that their concluding sentence puts their position in very clear, unmistakable language. With these observations I beg to move the adoption of the report.

Mr. HIBBERD called attention to the balance-sheet, and contended that the Fellows had a right to have in their hands a fuller and more complete statement of accounts than that which they had been furnished. This statement did not include the £5000 lent by Mr. Freake, and he contended that it was a statement of £18000 of which there was no mention. He should like to ask Mr. Webb, the Treasurer, how it was he had put in the hands of the Fellows such a statement of accounts as rendered it almost impossible

for them to go on with the business? The noble Chairman would permit him to say that some few years ago it was determined to hold an exhibition in the provinces, and a Finance Committee representing the Royal Commissioners and also the Council of the Society determined that the funds of the Society could not be made in any way responsible for an exhibition in the provinces. Upon that, finding themselves in a difficult position, the Fellow of the Society provided a fund of their own, portions of which came out of private pockets, sometimes in the shape of guarantees, and sometimes in the shape of earnings from distant places. The last exhibition in Bath left the Society in possession of £2000, and it is a profit of £1000, and to be devoted to exhibitions in the provinces. He was reminded by the circular issued by the Council that it was announced that the provincial exhibitions would be resumed. Now, however, they had no money to carry them on. He asked the attention of the meeting to the fact that in the year 1873, when Viscount Bury was chairman of the Council, a sum of £1800 was borrowed from the provincial, and transferred to the general funds of the Society in the very same year a sum of £1900 interest on debentures was paid, so that what was intended for the provision of provincial exhibitions was turned to account by expending it on payment of interest on the debentures, which should have been applied to the redemption of the Society. He contended that the Society had no business to touch that money, because it was solely for the use of provincial business, and he would ask the Treasurer to tell the meeting what he knew about this. He said that he had not at that time it ought to have been paid back into the horticultural fund, so as to enable horticulturists to promote some provincial shows with the same prospect of success as they had had before the money was abstracted. He wanted to know the money was, and to whom it was to look for it.

Mr. WEBB, the Treasurer of the Society, said he thought Mr. Hibberd had answered the question as to the £1900, because he had told the meeting it was spent. He quite admitted the money was improperly taken from the particular fund to which it belonged, but that was done before he was Treasurer. There was also a large sum resulting from life-compositions taken, and he regretted it was so, and if it had not been done the Society would have been able to go on without borrowing money from Mr. Freake. According to the charter, they were bound to let that money appear from year to year in the balance-sheets, which rendered them to that extent inaccurate and misleading. There was really no such fund now, although it was brought into the account, and one-fifth-part of that sum for the year was brought into revenue. It appeared on the face of the accounts that they had a larger sum in revenue than they actually possessed. He much regretted that the balance-sheet had not been made out until he might say, the present moment, but a fresh statement of accounts would be placed in the hands of the Fellows.

Mr. HIBBERD asked the Secretary if he could furnish the meeting with a copy of the minute which authorised the transfer of the money in question.

The PRESIDENT: You will bear in mind that all these proceedings took place before the existence of the present Council, and they appeared in the accounts. It was, no doubt, a subject of animadversion, but I really cannot see what advantage can arise from this. I think the balance-sheet of accounts which has already appeared. I think Mr. Hibberd has received a very clear and full answer as to this unfortunate sum of money. Certainly no advantage can arise from reopening a question which has so long been at rest.

Mr. GUEBALLA was quite of opinion with Mr. Hibberd, that the accounts should have been better kept.

The PRESIDENT felt that a fuller account ought to be furnished to the members of the Society.

Mr. GUEBALLA: We should have a printed statement of accounts. I should like to know how the subscriptions are coming in, as there are many reports on the subject flying about.

The PRESIDENT: In reply to that, I am happy to be able to announce to you that we shall be in the course of the day's proceedings, elect thirty-nine new Fellows.

The TREASURER: And I may add that a great many of those who withdrew from the Society are coming back to us again.

Mr. GUEBALLA said he felt convinced that the course laid down by the noble Lord in the chair was the only one for the Council to pursue, and he should, therefore, gladly second the motion for the adoption of the resolution of the meeting.

Mr. GOUDON, Sen., asked the Chairman what arrangements had been made with the Commissioners in the event of the £10,000 being raised?

The PRESIDENT: I am very glad you have asked the question, because it is a very important one, and

the precise answer to it ought to be comprehended by every person present. Supposing the conditions of lease are fulfilled by our raising the revenue of the Society to £20,000 a year, by paying our interest rent, it will be impossible for Her Majesty's Commissioners to put an end to the lease, and it will be our duty to continue our connection with them, and, among others, for this reason, that that is the only chance of debenture-holders having of raising on their £50,000. So long as the Society receives money over and above the cost of maintaining the gardens, that sum should be paid to the debenture-holders; and that is their sole right. The only legal right to the payment of capital rises from the source. One of the explanations of the lease in 1891 the Society fulfils all the conditions of the lease, and the Commissioners then choose to extinguish the debt, the Commissioners will be bound to pay half the debenture debt. Well now, that is the one half; the other half is to be obtained by putting aside excess of receipts over the expenditure to be applied to the payment of the interest due to the debenture-holders during the continuance of the lease. A part of this excess is put aside to redeem the interest of the debenture-holders, and that is the second part of the explanation I have given will give very much comfort to the minds of the debenture-holders; but if we raise this sum of £10,000, it will be our duty as honest men to keep alive the security of the debenture-holders.

MR. GODSON : I should like to know, supposing that £10,000 is not raised after the three years, what will be our position then?

MR. WM. HAUGHTON : It will be from Christmas next to Christmas following. If the income for that period is what is stated, the gardens will be continued.

MR. GODSON : But there is still one thing which regards the position in which we stand. Supposing that £10,000 is not raised, what will be the result as to our property? Have we to wait for three years or for two years?

THE PRESIDENT : Of course that will depend upon the action of the Commissioners.

MR. GODSON : That is just what I want to know.

THE PRESIDENT : It, at the end of that time, we have not raised the amount of revenue, and that we are, therefore, not in a position to pay our rent, the Commissioners, just as any other landlords, would be in a position to terminate the lease.

MR. GODSON : I think, in that case, then, we are at their mercy, whatever they like to do?

THE PRESIDENT : Yes.

MR. GODSON : Well, then, I say that this is the most extraordinary report which has ever been brought before a meeting. Why, here you start by saying that you borrowed £50,000.

THE PRESIDENT : Let me remind you that that is a liability of the Commissioners, and not of the Society.

MR. GODSON : I must say I am very glad to have that explanation from your Lordship.

MR. TREWEDY said it appeared to him that the Chiswick garden had been the subject of a long discussion in the Society. What he should suggest was, that the Society should sell the Chiswick Gardens. He should very much rather that those gardens should be sold, and the sum of money realised applied to the payment of their debts, than that the gardens should be carried on at an enormous expense. He did not see the use in keeping up these gardens at the expense of the whole establishment.

THE PRESIDENT : My old friend proposes to give up these gardens. I would remind him that 47,000 plants have been brought from them in these gardens. He would be taking away the only plants which we have, when, during some few years, it was a fashionable resort, and when there was a beautiful wood adjoining them, which is now simply a garden devoted to scientific experiments. No doubt a large amount of expense was incurred in the applying plants to these gardens. I entirely disagree with my friend as to the sale or the parting with the gardens. I do not know whether my friend saw the undignified entry of the President of this Society into this room, and the look on the face of the present position of the Society. The leg which was firm and stout I conceive to be, or to represent, the Chiswick Gardens, while the weak and tottering one makes a respectable resemblance of the South Kensington Gardens. The crutches alluding to his Lordship's assistance in commercial view, or combined it with the South Kensington view, they ought to place the Society on a firm basis. From letters which he had received from every part of the country, it appeared that that was the view that was taken.

MR. TREVEDY, who said he was a life member, mentioned that he had been told the Society had always been in difficulties. Now, supposing the state of things which his Lordship had sketched out became an accomplished fact, and that Her Majesty's Commissioners distrained upon the gardens and turned the Society out of them, what position would they then be likely to be, because, from all the facts he had

back to Chiswick Gardens would be more detrimental to their interests than anything which they could possibly do. He had been always one of those who thought that the best course for going back for London and South Kensington, not so much because they were gardens, as because the connection would give the Society the means of employing a large income. These gardens were in the midst of London, and were for the benefit of those who cared for nothing but for London and its pleasures, which were far more desirable to them than the pursuit of horticulture. However, it was only by the union of the two concerns that the Society could be made a paying one. He hoped some means might be taken to raise the income of the Society, and to enable them to continue their connection with the Royal Commissioners.

MR. D. WOOSTER said he regretted the stormy crisis through which the Society had passed. He knew that unfortunately the Society was suffering in reputation by the impression which had spread abroad that there existed no security for either capital or interest due to the debenture-holders.

THE PRESIDENT : Would Mr. Wooster suggest what possible security this Society can offer for £50,000.

MR. WOOSTER said there was in the agreement with the Commissioners a clause touching the funding of a certain proportion of the amount paid for life Fellowships for the purpose of promoting scientific objects connected with horticulture, and always providing that the surplus should be in the nature of a grant. He only wished to remind his Lordship of the fact that the Fellowships were not intended to submit to his Lordship and the meeting that the impression to which he had referred was acting very seriously upon the future prospects of the Society. The original interest payable to the debenture-holders was 5 per cent., but after the expiration of a year the rate was thought to be too much, and then under a letter dated July 21, 1861, a proposition was made to reduce the interest by 1 per cent.; the debenture-holders agreed to that proposition, and he really thought that all these things showed that there was a legal debt due to the debenture-holders by the Society which the Society ought to feel itself bound to pay.

THE PRESIDENT : What property have we in our possession for the payment of this debt?

MR. WOOSTER : I am only saying that the unfortunate impression which is abroad is keeping back the public from joining the Society.

THE PRESIDENT : The practical solution of the whole matter would be for new Fellows to come in and pay the debenture-holders out of the increased subscriptions. That is the practical solution. What other solution can there be?

MR. WOOSTER would only observe that in the report there was no mention of the non-fulfilment of the circular issued on March 7, 1876, touching a certain series of lectures which were to have been given by the Society.

THE PRESIDENT : My answer to that last remark is that the circular was sent to all the various Fellows, and that the circular was got one answer. We therefore, thought it not right to establish lectures for one auditor.

MR. GUEDELLA thought that the Council ought to disavow the action taken by Mr. Wilson. Some gentleman sitting at the Council board ought to take notice of this.

MR. WILSON rose to say that he thought they had considered the subject before them almost exclusively from the South Kensington point of view. They were told that the hopes of the Society rested upon the collection in that neighbourhood of £10,000 for one year.

THE PRESIDENT : I said that the hopes of the continuance of the Society depended upon that sum being raised.

MR. WILSON reminded his Lordship that the letter in the *Chronicle* was not perfectly conclusive. They had always this fact before them, that every society more or less prospered except the Royal Horticultural Society. He did not believe in the old plan of trusting to the neighbourhood of South Kensington to propose the plan of appealing at once to the great body of horticulturists throughout the country. If there were 5000 country horticulturists, or horticulturists generally throughout the town and country who would come forward, the Society would be well supported. Whether they took a horticultural view, or combined it with the South Kensington view, they ought to place the Society on a firm basis. From letters which he had received from every part of the country, it appeared that that was the view that was taken.

MR. TREVEDY, who said he was a life member, mentioned that he had been told the Society had always been in difficulties. Now, supposing the state of things which his Lordship had sketched out became an accomplished fact, and that Her Majesty's Commissioners distrained upon the gardens and turned the Society out of them, what position would they then be likely to be, because, from all the facts he had

ascertained, they would have to go back to Chiswick—to the old condition of debt and difficulty.

THE PRESIDENT : I quite recognise the fact that the Society has no more genuine friend to it than Mr. Wilson. I would not wish to see any man want to extend the usefulness of the Society. I think that if the Society were simply a scientific society and unconnected with South Kensington, we should get a great deal of independent support on that ground; but have been misled on that point by people who do not join these gardens, and for that I think I would be bound hand and foot to South Kensington, and that the whole object here is to keep up the gardens in a magnificent state. That impression I am told is very strong, and it cannot be removed without disturbing the two establishments. I would do nothing to disunite the two, but endeavour to preserve union between them; yet I will say certainly that if disunion did take place a large number of horticulturists would be induced to come forward and join the Society. We must recollect that the case of Chiswick, that it had a large debt—some £10,000—in its own many sacrifices. A large scheme was set on foot in 1860, and a great amount of money was spent in scientific proceedings, whilst our debt at South Kensington was increasing. I have not the opportunity of scientific research. I am told that for some years past they had at Chiswick beautiful weather—fine summers, and hence large gatherings, therefore the receipts at the Chiswick gardens were very good. Then came three or four successive years of bad weather, with very large expenditure and next to no receipts, during which a large portion of the debts were incurred. Since these days horticulture has spread enormously. I should not be surprised that there would be 5000 men ready and willing to give £5000 for the purpose of realising the debt of the Society. I think it much more likely to be got from members of the Society where there is a scientific society united for social purposes with South Kensington.

LORD ALFRED CHURCHILL said that, in proposing his scheme, MR. WILSON would recollect that the Society was first made up, and that these gardens until two years expired, or until they had raised the money to a certain amount. He could hardly agree that they were once freed of these gardens they would get a large amount of horticultural support from the country. He had lately returned from Dublin, and there they maladjusted the horticultural Society in a most flourishing condition. They had their scientific meetings, they gave away prizes, and did all the scientific work which a horticultural society ought to do. He said to a friend the other day in Dublin that he should like to see Mr. Wilson's gardens. "Oh," said his friend, "we have got our gardens." They worked on without gardens, and subscribed together for a common purpose. Therefore, if it answered in Dublin it ought to answer in London; but in addition, it had got the Chiswick Gardens, which were considerably reduced in value through our money being spent so prodigally, so that they could maintain the gardens at a reduced cost. If they once got rid of these gardens at South Kensington their expenses would be reduced considerably, and they could keep up other objects of horticultural purposes. If they could get rid of the incumbrance of these gardens, Mr. Wilson's scheme might work well. At any rate, under present circumstances they must do the best they could, and in view of that they had proposed various modifications in the grades of subscriptions of Fellows.

MR. H. VEITCH wished to say that his name unfortunately appeared as one of those who gave their sanction to Mr. Wilson's scheme; but he was not prepared to go the length to which Mr. Wilson had gone. He had given his name to the Press in the way he had done, because it seemed to him (Mr. Veitch) that Mr. Wilson was trying to coerce the Society into adopting a policy which would be very dangerous to it. He wished to add to that to disavow his intention to adopt Mr. Wilson's plan. Mr. Wilson's scheme was that a great body of people would come from the country to subscribe to the Society, but in the list which Mr. Wilson had recently circulated—that of January 5 last—he found that the whole number of people who had given their names was only 372. A very large number considering the circulation the scheme had had; and out of these 373 he should think about one-third of them were already members or Fellows of the Society. Now, that would reduce Mr. Wilson's list very considerably. With regard to the Society itself, it seemed to him that neither the horticulturists pure and simple nor the horticulturists of South Kensington could only by themselves keep the Society going. It could only be kept up by all working together. They would have to do more than go to the meetings and to the buildings at South Kensington, to make want them. They must bring their fruits and flowers there to be exhibited, for it was their interest to do so. As regarded the gardens themselves they did not actually want them, and they wanted a place for their meetings and for their Council, and for their all connected with. On the other hand, if the South Kensingtonians would

come forward and generously support the institution, he thought it would be the best thing for the country to come up to the gardens, and that they could be enjoyed. If the people would only come next day (Wednesday) afternoon from the country, he could promise them a very beautiful show, and that they would find, not only a horticultural treat, but a band of music playing for their recreation and enjoyment. That was what he called a very proper amalgamation. There was one point on which he should like to ask a question. On page 3 of the report, in the last paragraph, it is stated: "The provisions now made for the more general footings at the Council have been under consideration where and when the next shall be held." He should be sorry to hear that nothing was to be done as to provincial shows. It did seem hard that when the meeting had been fairly earned the first fruits of the provincial shows should have been forcibly taken away for other purposes. If they had the money in hand these provincial shows would be held, and, judging by the results of former shows, would be a band of music playing for their recreation and enjoyment. He should like to know what steps had been taken towards holding provincial shows this year—on what footing they were to be, and what amount of consideration the Council had given to the subject, which was an important one.

The PRESIDENT said: I am hardly in a position to give a distinct answer to the question which I can give, as we are in communication with one of the principal cities of England, and have a very strong hope that we shall be able to do something successfully, and lay perhaps the foundation of a new future for the Society. I have no doubt, if we are successful, we will be able to have a guarantee fund which will put us out of all difficulties of a financial character. If some surplus remained, we would have the nucleus of a capital sum, which should enable the Society to have a show—a provincial show—annually. I can give you an instance of the intention of the Council to invest in trustees any surplus they receive. Let me correct a mistake I involuntarily fell into. I said that at the time the Society joined South Kensington they had a debt of £10,000. Dr. Hogg, who knows much more about the matter than I do, tells me that though the original debt was £10,000, it had been reduced by the sale of the house in Regent Street, and the actual amount of debt remaining was £5,000. But, whether it was £5,000 or £10,000, it shows the method of dealing with the debt to be successful. I can give you an instance of the management of a kingdom, as is necessary to a society. I am of opinion that all this indirect and unnecessary expenditure ought to be abolished. It is through our financial management, from Mr. H. Veitch and others, that we have been enabled to have our exhibitions, and I am sure the Society cannot be too thankful for the assistance received from Mr. Veitch and other gentlemen.

Mr. ELWES thought there was no reason whatever why they should not have a perfectly fair union between the South Kensington and the horticultural Fellows; and the South Kensington Fellows should remember that, after all, the Society being a horticultural one, horticultural objects must be the first objects of the Society. By the action of the Zoological Society was evident such a union was perfectly possible. No Society was more popular, and although some of the members worked in a purely scientific groove, matters were so arranged that the Society has attracted three-fourths of their members who did not care a straw about zoology, but who joined the Society for the purpose of attending the gardens on Sunday. They also opened the gardens at a low figure on Whit Monday and other days, and so attracted a large number of the people to the gardens. Although it is impossible for the Horticultural Gardens to have so much general attraction as the Zoological Gardens, if the South Kensingtonians wished them to be kept up they could do it by contributing their fair share, which would enable the Fellows to have a garden to carry on the gardens as they ought to be carried on, but also to do good horticultural work.

The PRESIDENT then put the motion that the report be adopted, and it was carried with only one dissenting vote. Thirty-nine new Fellows were elected. The President announced the result of the ballot. Those recommended by the Council were declared elected, as follows:—Members of the Council: Sir Charles Strickland, Mr. H. J. Elwes, and Mr. T. M. Shuttleworth. Office Bearers: President, Lord Abercrombie; Treasurer, Mr. G. Webb; Secretary, Dr. Robert Hogg; Expenses Committee—Men, Mr. H. Champion, Mr. Henry Webb, and Mr. William Houghton; Auditors, Mr. J. Lee, Mr. Henry Little, and Mr. James West.

ALTERATION OF BYE-LAWS.

The PRESIDENT then said the Council had made a last effort to conciliate the inhabitants of the neighbourhood, and that they had failed. He expressed the expression of feeling the proposed alteration of the bye-laws would have a good result. They had just elected the good number of thirty-nine Fellows, and

in addition to that fact they had a great many of those who had left the Society returning to it. In that respect the affairs of the Society looked more promising. He thought they should unanimously adopt the new bye-laws, which could not fail to be beneficial in their operation.

Dr. HOGG explained that it was proposed to suspend the payment of the entrance fee, which was provided for by the 14th bye-law. The 19th bye-law provided that no Fellow whose entrance fee was not paid should be entitled to vote at meetings of the Society: it was now proposed to strike out the words "whose entrance fee has not been paid," as a matter of course following on the alteration of the 14th bye-law.

The CHAIRMAN, replying to Mr. Veitch, who asked information respecting the guinea membership, said he had not been able to attend the Council meetings lately, and was therefore unable to say what attention had been given to that subject. He took the view of Lord Alfred Churchill on the matter, that it would be an excellent plan, if this were simply a horticultural society, to have a guinea membership.

Lord ALFRED S. CHURCHILL said the guinea members should have all the privileges of Fellows, except that of voting at the meetings of the Society. It had been felt that it would be open to any person who was not a Fellow to object to the Council or to the policy of the Society, to induce people to become guinea members in order to control the action of the other Fellows. The Council thought they should give to guinea members all the privileges of personal admission to the gardens, and shows, exhibitions, &c.; in fact, all the existing privileges, with the right of voting at the general meeting. He was glad to say two members had been elected according to this plan, and no doubt others would come in.

Lord A. S. CHURCHILL said, in reply to Mr. Gordon, that the guinea ticket was not transferable. Any guinea Fellow who desired to exercise his voice in the management of the Society could do so by paying an additional guinea.

The alterations in the bye-laws were then agreed to unanimously. The CHAIRMAN said that he thought in the present position of the Society the entrance fee would operate in preventing people from joining, and that it was wise therefore to exercise the power of doing away with any entrance fee.

Lord ALFRED S. CHURCHILL spoke of an additional source of income to which they looked forward with hopeful anticipations. Throughout the whole country there was a large number of local horticultural societies, and the Council were desirous of affiliating these with the local Horticultural Society. A large number of them had been affiliated to the Society for years, and were put in the position of individual subscribers. The Council proposed to give gold or silver medals for distribution in the local shows. That would enable the local societies to distribute as many for merit at their shows the medals of the Royal Horticultural Society. He hoped the result of the proposition would be, as he did not doubt it would, to bring to them a large number of the local horticultural societies scattered all over the country, which was most desirable.

Dr. DENNY explained, with reference to refunding the money which was taken, that the Council could not refund it out of the money which was lent them.

Mr. GORDON asked if the Council did not apply that money to pay the rent?

The CHAIRMAN: No; we did not.

Dr. DENNY said the Finance Committee, consisting of three of Her Majesty's Commissioners, objected to any money being spent on provincial shows. He could not give the reasons, but that it had been properly put before the Finance Committee the money might have been raised by guarantee; but he did not believe the committee would allow them to refund the money.

The TREASURER: I may say this, that if I ever get any provincial show money again it shall be properly invested, and not at the dictation of President, Vice-President, or anybody else.

Mr. H. VEITCH: I can promise you that if you get up another provincial show you will have money to invest.

The proceedings were brought to a close by a vote of thanks to Lord Aberdeen.

COMMITTEE MEETINGS.

Feb. 14.—The committee meetings were held today in the large conservatory, and the contributions sent in by Messrs. Veitch & Sons, Mr. William Bull, Mr. S. S. Williams, Messrs. Osborn & Sons, W. H. Michael, Esq., Mr. James, got to W. F. Watson, Esq., and Mr. Veitch, were very nice. The plants were staged on a temporary structure running the entire length of the garden side of the conservatory, and the effect produced was certainly a pleasing improvement on the dingy Council-room. It had not been long since the conservatory had been in neighbourhood, so scanty was the attendance of visitors. There was no meeting of Fellows in the afternoon.

SCIENTIFIC COMMITTEE.—Dr. Hooker, Pres. R.S., C.B., in the chair.

Australian Insects (see p. 85).—Mr. McLachlan stated that he had determined the insect which attacks certain trees at the Cape to be a species of *Coccas*.

Oaks from Finna.—Rev. M. J. Berkeley exhibited a number of specimens which he collected with an *Acacia*, also specimens of Beech attacked by *Cecidomya* fagi, specimens of *Pyrola uniflora* with *Aecidium* on the leaves, and with unusually prominent styles. The same gentleman also showed a species of *Boletus* from Ireland which he collected with water and used during Lent as a substitute for meat.

Embrya.—Mr. McLachlan stated that he had seen the Embrya in the pupa stage, and that the specimen from which the figure in the *Gardener's Chronicle*, p. 845, vol. vi., was taken had lost its anterior wings.

Crocus.—Col. Trevor Clarke exhibited a series of specimens, and communicated the following notes thereon:—

"No. 1, varieties of Herbert's group *Anniæ*. All, I think, to be found in the *Synopsis*, Vol. II., the old sterile *Steno*, *Crocus biflorus*, *Steno*; another white, or nearly white form, perhaps *argenteus* proper; the Barton Park form, once called *minimus*; another blue tinted kind, which I have named *Steno*, and which, with rich purple sepals outside; and the two sorts mentioned by Herbert as *purpurascens* (one nearly white), known sometimes under the name of *Weldeni*.

"No. 2, *Crocus* *insularis*.—Herbert's name, proposed by Herbert, under the names of *insularis*, with its variety *medius* and variety *minimus*, *minimus* having been De Candolle's name for the smaller form.

"No. 3, *Crocus* *luteus*.—Herbert's common yellow; aureus, with its remarkable variety; *luteus concolor*, also a sort received from M. Chappelin, under the name of *synicus*. This appears identical with the old sterile *salvatoris stratus*, perhaps *stellatus*.

"No. 4, *Crocus* *nivalis* (Sieberii of Herbert), and a veral *Crocus* unknown to me."

Action of Pollen on the Seed.—Colonel Clarke exhibited a pod of Woodford Marrow *Fava*, the flower which was fertilised by pollen from the white-seeded *Auvergne*. In the centre of the pod were two pure white seeds, those on either side being blue like the pure Woodford. Mr. Laxton has not observed this, and Knight's observations on this subject are obviously erroneous. Colonel Clarke said he knew of but one other instance, that of Matthioli's paper, which he read a paper at the Botanic Congress in 1866.

Dr. Masters called attention to Maximowicz's paper translated by Professor Dyer in the *Journal of the Society*, 1874, p. 161.

Oenothera lutea.—Mr. Young, Milford Nurseries, sent a plant of this, figured and described at p. 113, vol. i.

Homolomena pilata.—Mr. Bull contributed leaves and flowers of a new species of this Aroidaceous genus, which is of a very handsome and remarkable character. We intend shortly to publish a figure and description of this species.

Coleurad Barley.—Dr. Voelcker exhibited seeds of Barley with a more or less blue tint pervading them, from Nowshera, India. It had been suggested that the disease of horses, known as "kankur" in India, was due to their eating unwholesome Barley, but this was refuted by Mr. Grote, who explained that in Bengal, where the disease is equally prevalent, horses are fed upon grain or pulse. Dr. Masters had not been able to find grains mycelium in the grain, but suggested that the grains might have been steeped in some salt of copper, but Dr. Voelcker explained that the colouring was organic, and that no trace of copper was to be found. The specimens were referred to Mr. Berkeley for further examination.

Frickly Pear as Forage.—Mr. Grote stated that in some parts of India the *Opatunia* were used as fodder for cattle, the spines being previously rasped off.

FLORAL COMMITTEE.—Mr. B. S. Williams in the chair. First-class Certificates were awarded to Messrs. Veitch & Sons for *Masdevallia Chimeræ*, figured and described in our columns at p. 41, vol. iii.; for *Amaryllis Flores-de-Teck*, a large smooth flower of a rich glowing crimson colour; and for *Cyclonia (Fyrus) japonica* fire-plant, an improvement as shown on the old form in cultivation, by reason of its larger and purer white flowers. To Mr. William Bull for a very handsome *Cycad*—*Cycas media latissima*; and for Croton *fratilis*, both distinct from those previously, handsomely marked with gold. To Mr. Spyers, Orchid grower to Sir Trevor Lawrence, Bart., M.P., for *Calanthe vestita rubra oculata gigantea*, a very fine spike of which was shown; and for *Odontoglossum Cervantesii decorum*, a great improvement on the old *Cervantesii*, both in size of flower, dense markings, and brighter colour. To Mr. C. Edmunds, Hayes, for *Claytonia persicum compactum magnificum*, a large and very fine white flower, the petals of which are broader and smoother at the tips than those yet seen. To Mr. Spyers, gardener to Sir Trevor Lawrence, for *Claytonia persicum compactum magnificum*; and for *Sparganium Lobbia*, a species with bright

straw-coloured flowers; and for *Catsnap scura*, a very curious plant, with white wax-like flowers, the one in which the petals are like those of *Denning*, gr. to Lord Londesborough, also shown in a freely-flowered condition the plant of the Cobweb Dendrobium—*Dendrobium teretifolium*—for which he gained a First-class Certificate last year. It is the only plant in Europe of the kind, and a Cultural Commendation was awarded. A silver-gilt Davis Medal was awarded to Messrs. James Veitch & Sons for a very showy group of plants, which consisted principally of Orchids and hybrid *Arcas*. Old flowers were very well-developed examples of *Cypripedium pubescens*, *Lycaste Skinneri* and *L. Skinneri alba*, *Laelia Polgaueriana alba*, *Odontoglossum gloriosum*, *Angreum sesquipedale*, with five flowers, *Odontoglossum histioneum*, *Cypripedium Harrisonianum*, *Dendrobium Boxallii*, *Mastoveilla polystachya*, *Denhamium plumbeum*, *Arides Huttoni*, *Cattleya Trianae*, and its pretty variety *Penelope*, &c. The fine white *Euryclis australis* was well represented by some half-dozen or more plants. The large group of hybrid *Amyclis* included of course many flowers which show no improvement on varieties already in cultivation, but it included capital examples of the following named sorts:—*Phoebe* and *Agatha*, both certificated last year; *Leopoldi*, Princess of Wales, *Charles Main*, *Agnes Phoenix*, *Victoria*, *Arthur Potts*, *Aglaia*, and *Calliope*. The same firm also sent *Cyclamen*, *Lily of the Valley*, cut *Camellias*, and forced specimens of the showy *Rhododendron Early Gem*. A silver Davis Medal was also voted to Mr. Bell, for a fine group of ornamental leaved and flowering plants, the best including principally *Palms*, *Crotons*, and *Cycads*, and the latter specimens of *Coleogyne fasciata*, *Dendrobium speciosum*, *Odontoglossum cirrhosum*, *Uropodium pictum*, *Lycaste Skinneri rubella*, very fine in size, and richly coloured. A silver Davis Medal was also voted to Mr. Newman, gr. to W. H. Michael, Esq., for a very attractive group of Orchids, which included several freely flowered pieces of *Phalaenopsis amabilis*, *grandiflora*, and *Schilleriana*, *Celaenoglossum Odontoglossum Roscii*, *Zygopetalum crinitum*, *Dendrobium Wardianum* Lowii, *Vanda Cathartica*, *Dendrobium crassinode Barkerianum*, *Coleogyne cristata*, *Dendrobium chrysoyctum*, &c. Mr. B. S. Williams received a vote of thanks for a group of plants, which included some capital *Cyclamens*, *Lilies*, *Camellias*, *Calliope*, *Dendrobium Wardianum*, *Cypripedium villosum*, *Lycaste Skinneri*, &c., and examples of *Primula sinensis fimbriata alba*, a very pure silver *Davis Medal* was voted to Mr. James, gr. to Mr. F. Watson, Esq., Earl Leith, for a splendid group of *Cyclamens* and *Cinerarias*, the former being very good indeed, and the latter—well, the finest that have ever come under our notice. Votes of thanks were accorded to Mr. Turner for a group of *Camellias*, *Ivies*, &c.; to Mr. Wills, for a showy miscellaneous group; to Messrs. Osborn & Sons, for a small group of *Palms*; to Mr. Aldous, for a small group of plants; to Mr. R. Dean, for a collection of hardy *Primroses*; to Mr. Roberts for a group of *Tulips*; and Mr. St. John (gr. to Henry Peck), for small groups of Orchids; and to Mr. Clarke, Twickenham, for a collection of *Cyclamens*. Mr. Overhead was the winner of the 1st prize offered by Messrs. Veitch & Sons for an example, cut or otherwise, of *Poinsettia pulcherrima plenisima*, and which was of very good quality.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. The most interesting subject that came under the notice of the committee on this evening was a very fine collection of Apples and Pears, staged by Mr. Sydney Ford, gr. to W. E. Hubbard, Esq., Leonardslane, Horsham, and which included five sorts of Pears and thirty-four of Apples, including all the best and most valuable varieties in the world, of colour, and in a fine state of preservation. The committee recommended the collection to the Council for the award of a bronze Davis Medal. From Sir W. C. Trevelyan came some fruits of the Lime, *Citrus acida*, grown in his hot-house at Netcot, Somerset; and from Mr. Harrison Weir, Weirleigh, Kent, came a bunch of Mrs. Pince's Black Muscat Grape. Two very good bunches of Black Alicante Grapes were shown by Mr. Atkins, gr. to Colonel Lloyd Lindsay, Longs Park, Wantage, and Mr. Stevens, gr. to the Duke of Sutherland, Trentham, showed a tree in a pot of the Calville Blanche Apple, on which some ten fine fruits were still hanging. Messrs. Stuart & Mein, Kelso, sent forced examples of the *Lily-white* *St. Michael* Apple. Mr. Batters, gr. to Mrs. Willis Fleming, Chilworth Manor, Romsey, sent a good dish of Mushrooms, and another of new Potatoes grown in pots—the variety being Snowflake. Some examples of the old *Old* Apple were brought up by Mr. Aaron, from Chiswick. The committee also had under their consideration the recent correspondence in reference to the Grape exhibited before them on December 6, 1876, by Mr. Bell, of Clive House, Alnwick, and the members

expressed a desire to place on record their regret that Mr. Bell should have withheld the facts as to the origin of the Grape, and more particularly to draw attention to the circumstance that in his letter to the committee, which accompanied the Grapes, he stated that the parentage was "a cross with Black Morocco and a seedling raised, I understand, at Wortley," which in his letter of January 25, 1877, in the *Journal of Horticulture*, and in our own columns last week, he affirmed "it is a founding, the parentage and connection of which none can vouch." On these grounds it was determined that had the committee known, at the time of making the award, the whole facts of the case, they would not have recognised the name of the Clive House Seedling, and which they now cancelled.

TULIP LORE.—When giving some account of the process of raising Tulips from seed on p. 596 of our last volume, such terms were used as "breeder," "breaking," "character," &c., and it has been suggested to me that, though any Tulip grown can follow the rules, and comprehend the terms readily enough, yet the "readers of poor Tulip seed" might be at a loss to understand these terms in their full significance. What is implied in these terms is fully known to Tulip growers; it has lived traditionally among them, and is an example of one of those small facts supposed to be too well known to mention, because so well known among florists, and yet one which really is not known to floriculturists at large.

Except in rare instances, when they shine out in full character at the first time of blooming, seedling Tulips take on a self, or what the Tulip growers term the breeder form. This is but a temporary self-coloured existence, and in course of time they recede or break into character, some in two, and others at varying times up to the seventh year, or even longer. There is no known principle in vegetable physiology to govern the breaking of breeder Tulips. The late Mr. John Edwards once termed the breaking of Tulips "a splendid mystery," and he was correct in giving it this designation. There are wonders in the physiology of the Tulip not dreamed of in the philosophy of other flowers; and, indeed, it would be difficult to name another plant more suggestive of this than our "glorious florists' Tulip."

The future character of the Tulip is, to a great extent, decided for it in the breeder state; that is, whether it will be a bizarre, byblomen, or rose—the three classes into which Tulips are divided. A bizarre Tulip, when it has broken into character, has a yellow ground colour, and is either feathered, *i.e.*, the colour pencilled round the edge alone; or flamed, *i.e.*, having a beam of rich colour dashing up the petal centre, and striking the feather at the edge in bold flashes, or being feathered and flamed both, with some colour graduating between black, brown and red. Thus a flower may be feathered only, or feathered and flamed both. A byblomen Tulip has a white ground colour, and is either feathered or feathered and flamed with some colour graduating between black, purple, and red. A rose Tulip has a white ground also, and is either feathered only or feathered and flamed with some colour graduating between crimson, red, scarlet and carmine. In the case of the breeder or self-form, the bizarre has a yellow base and stamens, and petals clouded with a combination of the colours peculiar to it; and the byblomen and rose breeders white grounds and stamens, and the petals also clouded with their peculiar colours; but the difference between the two consists in the absence of a purple tint in the breeder colour of the rose. So much then for the differences of the Tulip in the breeder and in the broken states.

The raising of seedling Tulips and their cultivation having raised many most interesting facts, some of which may be set forth for the information of those who have had little or no experience of the Tulip. And in regard to seedlings it may be stated that in the case of seed taken from the rose Tulip, for instance, say a Tulip that had been carefully crossed with another rose, will give a majority of rose breeders, but there will probably be some twenty per cent. of byblomen breeders and a few bizarres. This is in illustration of the fact that a Tulip, if carefully crossed

with the pollen of another variety of its own section, cannot be depended on to produce wholly flowers belonging to the section. It may also produce a few "selfs." As the term "self" as here employed means a type of flower distinct from the uncorrected breeder, a few words of explanation are necessary in respect to it.

There are two classes of selfs among the florists' Tulips; the white and the yellow. The white self represents the ground colour of the byblomen and the rose, but with the entire absence of any tint of the colours peculiar to them. The yellow self represents in the same manner the ground colour of the bizarre class. The selfs are very seldom raised, but they occasionally come among the seedlings. The late Mr. William Willison, of Whitby, a noted raiser of Tulips, raised several selfs, notably White Perfection; and a very nice yellow also, the name of which I am unable to give. In the old Tulip shows prizes used to be offered for self Tulips, there being classes for the best white and the best yellow self; but the practice is now almost wholly discontinued. David Jackson, of Middleton, an old florist whose floral enthusiasm does not appear to slacken as he increases in age, raised some seedling selfs, among them some very good flowers, using as a seed-parent the old rose *Aglaia*, well crossed, and he had more than a dozen self yellows among the progeny. I am informed by Mr. Samuel Barlow, of Stake Hill House, Chadderton, Manchester, to whom I am indebted for much useful knowledge in relation to the Tulip, that the white of *Aglaia* is very yellow on opening, and needs a week's bleaching to get it pure. He is of opinion that there exists a taint of the bizarre parentage in the ancestry of *Aglaia*.

In selecting rose Tulips to breed from, the parents should both be bright in colour, or a large proportion of byblomen will follow; and the same remark holds good with respect to byblomen—the colour of the parents should be as near black as possible, or of a bluish purple colour. Parents having tints of red in the purple are very apt to give reddish purple breeders, and they seldom break into good distinct forms of either byblomen or roses.

I recently inquired of Mr. Barlow if he had ever crossed a bizarre Tulip with a rose or a byblomen, and his reply was in the negative; but, he added, "from chance seed I have seen some very 'foxy' flowers." By "foxy" flowers Mr. Barlow means those of a stained, intermediate, or nondescript character, which the most comprehensive-minded florist would scarcely care to admit to his collection. Mr. Barlow added, "I should never try such crosses as one has to wait from five to eight years to get blooms from seed, and the results would certainly not repay the labour, time, and patience necessary to get them."

Seedlings from feathered or feathered and flamed flowers will produce both feathered and flamed flowers. Let me here remark that the Tulip grower speaks of a feathered and flamed flower as a flamed flower, even though the feather is present also. And there is another singular fact in connection with the physiology of the Tulip, that it is not uncommon for bulbs to flower one year flamed and another year feathered only. The variety which shows this appearance is an instance. A Tulip grower may possess a fine strain of a variety which has bloomed in, say, a fathered state for years; and then, without any note of warning, there comes a season when most, if not all the flowers are flamed. I remember Mr. Barlow telling me that Martin's 101 feathered byblomen bloomed with him for eight or ten years, always perfectly feathered; but two years ago every bloom came finely flamed! Last year at blooming time the flowers were found to have nearly lost their beam; and in a year or two Mr. Barlow quite expects they will all get back to the feathered. On what principle can this extraordinary phenomenon be explained? Mr. Barlow further mentioned that George Hayward bizarre had "served him in the same way," for this beautiful feathered flower, always so much admired for its perfection, after keeping the feathered character for five or six years in succession, was last year all flamed. "Emperor Nicholas, nine years perfectly feathered, last year bloomed perfectly flamed. Hundreds of instances can be given *vice versa*. I have had many flamed flowers which have turned to feather, but they are not so numerous as those which change from feather to flamed." It is impossible to predict of a breeder Tulip that it will break into a

feathered or flamed flower. If a grower has a stock of any particular breeder, most probably some will break feathered and some flamed. And these again are subject to the changes just stated.

I have already remarked, "There is no known principle in vegetable physiology to govern the breaking of Tulips." The act of breaking may be hastened by growing the bulbs for a year under changed conditions of soil and atmosphere, and then bringing them back and growing them in their original situation. A check in the growth of the plants also serves to promote the breaking of breeders. In 1875, through some hitherto unexplained cause, the beds of Tulips at Mr. Darlow's residence at Chadderton almost entirely failed, and fully three-fourths of his breeders did not bloom, and the bulbs at taking-up time were small, and many of them rootless. During last summer the number of breaks among the breeders was something extraordinary, nearly one-third of those most severely punished the preceding year broke into character. In Mr. Barlow's opinion "the cause of the rectification is connected with the growth of the season in which the flower bloomed for the last time as a breeder," but nothing in the appearance of the flower will indicate that next year it will bloom a feathered or a flamed flower.

I have sought for information as to instances in which the rectified flower has resorted again to the breeder character, and among other scraps of knowledge bearing on this matter Mr. Barlow states, "I have had many instances in which broken flowers have returned again to the breeder state; but these cases are comparatively rare, and the breeder will probably bloom again rectified the following season. I bought *Hepworth's* President of the late Dr. Hardy when in bloom as a noble flamed *bizarre*: the following year it flowered with me a perfect breeder (Dr. Hardy had only this one bulb, so you will perceive there was no chance of a mistake); the year following it bloomed with me as fine as *Lass* it is in Dr. Hardy's bed. Since then, out of some twelve or fourteen years it has flowered twice as a breeder, and the remaining years in character. Certain varieties are more liable to this eccentric vagary than others."

It is only those who are privileged to mingle with Tulip fanciers and listen to their gossip about their favourite flower, that can be made acquainted with the rich stores of information connected with it, or come to understand something of the peculiar fascination it has to those whose hearts are aglow with a great love for this gorgeous floral revelation in Nature. The Tulip is indeed "a splendid mystery," and while the men of science are found following Nature with a faithful love, and an unwavering fidelity to a great purpose—which refuses to divide its loyalty with superstition; whatever the tribe, the physiology of the Tulip yet baffles the earnest seeker in botanical science—it, "eccentric varieties," are problems as yet difficult of solution. R. D.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEB. 14, 1877.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometric Depression, Wind, Rainfall. Rows for Feb. 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20.

Feb. 18.—A fine day, partially cloudy. Mild.
19.—A fine day, though very cloudy at times. Mild.
20.—A dull cloudy day. A little thin rain between 1 and 3 P.M. Dull.
21.—A fine bright day, very mild. Rain fell in early morning.

Feb. 12.—Overcast, dull, and wet till 8 P.M.; but, cloudy after. Mild.
13.—Overcast, dull, and wet. Mild.
14.—A dull, cloudy day. Mild. Heavy rain in early morning.

LONDON: Barometer.—During the week ending Saturday, February 10, in the vicinity of London the reading of the barometer at the level of the sea increased from 30 inches at the beginning of the week to 30.36 inches by the morning of the 5th, decreased to 30.12 inches by the afternoon of the 7th, increased to 30.22 inches by noon of the 8th, decreased to 29.91 inches by the morning of the 10th, and was 29.95 inches at the end of the week. The mean reading for the week at sea level was 30.16 inches, being 0.17 inch above that of the preceding week, and 0.21 inch above the average.

Temperatures.—The highest temperatures of the air ranged from 60° on the 7th to 60° on the 4th; the mean value for the week was 53°. The lowest temperatures of the air varied from 32° on the 5th to 46° on the 7th; the mean for the week being 39°. The mean daily range of temperature in the week was 12° at the beginning, in the middle of the week 10°, 5th, and the least 10° on the 4th and 6th. The mean daily temperatures of the air were as follows:— 4th, 40° 5'; 5th, 41° 2'; 6th, 48° 9'; 7th, 52° 5'; 8th, 40° 3'; 9th, 45° 5'; 10th, 45° 2'; 11th, 47° 2', 9.8, 13° 4', 7° 6', 4, and 9° 2' respectively in excess of the average. The mean temperature of the air for the week was 47.6°, being 7° 2' above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb, 20° 20' in sun, 29° 75' were 102° on the 8th, and 78° on the 4th and 7th; on the 6th the highest reading was 58°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 28° on the 5th, 20° on the 9th, and 30° on the 4th. The mean value for the week was 36°.

Wind.—The direction of the wind was W.S.W., and its strength moderate. The weather during the week was fine, but very cloudy and mild.

Rain fell on two days during the week; the amount collected was 0.66 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 60° at Blackheath, and 58° at Sunderland; at Bradford 51° was the highest temperature. The mean value from all stations was 54°. The lowest temperature of the air was 34°. The range of temperature in the week was the least at Liverpool, 14°; and the greatest at Blackheath, 28°. The mean range of temperature for the week was 20°.

The mean of the seven high day temperatures was the highest at Truro, 54°, and the lowest at Bradford, 47°; the general mean from all stations was 50°. The mean of the seven low night temperatures was the lowest at Manchester, 36°, and the highest at Truro, 45°; the mean from all stations was 40°. The mean daily range of temperature was the greatest at Manchester, 14°, and the least at Bradford and Liverpool, both 6°; the mean daily range from all stations was 10°.

The mean temperature of the air for the week from all stations was 45°, being 12° above the value for the corresponding week in 1876. The highest was 49°, at Truro, and the lowest 42°, at Wolverhampton.

Rain fell on every day in the week at Truro, and on three or four days at most other stations; at Portsmouth rain fell on only one day. The amounts collected varied from three-quarters of an inch at Manchester and Eccles to about one-tenth of an inch at Portsmouth, Blackheath, Cambridge, Norwich, Leicester, and Nottingham; the average fall from all stations was 0.39 inch.

The weather during the week was very mild, and fine but cloudy.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 53°, both at Edinburgh and Leith, to 50° at Aberdeen. The mean from all stations was 52°. The lowest temperatures of the air ranged from 35° at Dundee, Paisley, and Perth, to 35° at Leith. The mean value from all stations was 38°. The mean range of temperature in the week from all stations was 18°. The mean temperature of the air for the week from all stations was 42°, being 9° above the value for the corresponding week in 1876. The highest was 44°, at both Paisley and Leith; and the lowest 40°, at Aberdeen.

Rain.—The amounts of rain measured at the several stations varied from 3 inches at Greenock to half an inch at Edinburgh, Aberdeen, and Leith. The average fall over the country was an inch and one-tenth.

DUBLIN.—The highest temperature of the air was 56°, the lowest 36°, the range 20°, the mean 47°, and the fall of rain 0.17 inch. JAMES GLAISHER.

Variorum.

THE POTATO CROP IN AMERICA.—Last year's crop appears, from the reports issued, to have been not only far below the extraordinary yield of 1875, but considerably below an average crop. Among the causes of diminished yield drought was the most widespread and effective. During the season for the formation and growth of the tubers excessively dry weather prevailed, with a few local exceptions, throughout the entire section north of the thirty-sixth parallel and east of the Rocky Mountains, since which parallel the Potato crop is mainly good. The drought was the most severe and protracted in the Middle and Eastern States, except a northern belt including the greater part of Maine. Within this designated area also the beetles east of the Mississippi, and the grasshoppers west, effected some reduction in localities, though not to a serious extent. Another cause of diminished production was an unusual decrease in acreage, especially in States which grow this crop extensively, amounting to 15 per cent. in New York, 31 in New Jersey, 7 in Pennsylvania, 10 in Ohio, and 8 in the entire country. This was occasioned, in part, by the very low prices realised in 1875. Among the Northern States east of the Mississippi, Maine alone wisely planted an undiminished acreage, and her farmers were not being well rewarded by very remunerative prices for a crop which averages only 3 per cent. below that of 1875 in production, while it is 6 per cent. above it in quality. Vermont had the next best crop in the eastern section, falling 15 per cent. below that of 1875, and 10 per cent. below the average of Island 85. The great failure in the latter State was owing to a drought protracted beyond precedent, helped efficiently in its work of reduction by the beetle. New York, growing one-fifth of the entire crop, and the largest quantity in the entire State, fell off from 1875 49 per cent. The small crop grown in the southern section approached nearer to the yield of 1875, equaling it in Alabama, and rising 1 per cent. above it in South Carolina. These States and Oregon are the only ones in which the production was not below that of 1875. The entire crop is about 34 per cent. less than the previous one. There is also a very general decline in quality.

TANNING SUBSTANCES.—The last monthly report issued by the American Government Department of Agriculture contains the results of the analyses of the vegetable substances containing sufficient tannic acid to make them of value for tanning that were being well rewarded by very remunerative prices in the late International Exhibition in Philadelphia. "The list may not comprise all the indigenous products that are of value in this respect, but some of them, at least, have not yet received extended application. The method employed in our estimations was devised by F. Jean, and published in the Bulletin de la Société Chimique de Paris (xxv., 511), and depends upon the absorption of iodine by tannic acid." By this method the quantity of tannic acid found in the various samples respectively was as follows:—

Table with columns: Substance, Per cent. Includes items like Ground Sumac (mixed), Sumac (Rhus Cotinus), Sumac (Rhus glabra), Leaves of Sweet Fern, Ephedra antipathetica, Bark of Sweet Gum, Bark of Red Oak, Bark of White Oak, Crushed Quercus bark, Bark of Quercus macrocarpa, Bark of Hemlock.

Enquiries.

171. FRUITING OF THE ARBUTUS.—I have an Arbutus, a fine large healthy shrub, which is every season laden with pink blossoms, but it never fruits, though three years ago I found a solitary berry on it. Can you give me any reason for this, or tell me how to remedy it? H. A. B. [Please send some flowers for examination. Eds.]

Answers to Correspondents.

ARBUTUS: S. K. Ford.—Your seedling, a cross between Eagle and Queen of the Mountains, is a handsome one, and will be valuable acquisition. It is a clear yellow, like that of Linum trigynum, and large, the petals being upwards of 1 1/2 inch long. BOOKS: J. G. Cooper.—The Royal Horticultural Society may be obtained from the Secretary, at the Society's Gardens, South Kensington, S.W. "Lignorum" will find the address on the front page of our last issue. CHINESE YAMBS: An Old Subscriber. Next week.

EUCHARIS AMAZONICA: J. W. A. A dozen bulbs in the size of pot you name are too many by half to have a chance of attaining full maturity. They should have had a pot at least 3 inches in diameter larger, which give at once without disturbing the roots from the ball they are in. The night temperature keep up at 60 to 70 degrees, and during the winter season in a satisfactory way, however strong. Like most other bulbs it flowers free, especially in the winter, with bottom-heat, although it can be made satisfactory without it, will most likely bloom during the spring or summer.

INSECTS: C. H. The grubs which have destroyed your Primulas, &c., are those of the common weevil (*Otitus sulcatus*). The grubs round the roots of the plants must be carefully searched for, and if necessary the plants removed to sifted earth. The insects are large and plain enough to be easily seen.—*G. B.* The apple shoots which have been killed by the work of an aphid (most probably the American blight). Wash the trees carefully with a mixture of lime, soft soap, and sulphur.—*R. S.* The minute white insects in your hot-house are the nearly-winged aphid, the young state of which is a flattened scale on the leaves. Repeated fumigation, and washing the leaves with diluted spirit, will stamp out the pest.

NAMES OF PLANTS: L. Hartley. Professor Reichenbach has named the *Orchid Lucia albostriata*, nov. var.—*T. J.* *Garrya elliptica*. Propagate by layers.—*W. Taylor & Co.* *Excelsiora monticolaensis A. Sabinerii*. *Salvia purpurea*. The specimens received in a note without a signature, No. 1 is *Senecio Petasites*; of No. 2 our unknown correspondent is desired to send the best specimen; No. 3 is *Senecio calycina*.—*Appleby*, *Gilia pinnifolia*.—*K. G. W. 1.* The Arctley plant, *Filix serpyllifolia*, 2, not recognisable, possibly *Calliopsis*; 3, *Fraxinea latifolia*.—*T. J. P.* 1, *Crocus chrysanthus*, var. *fusco-lanceolatus*; Baker; 2, *Crocus chrysanthus*, we suppose, but cannot be certain without a corium; 3 and 4, *C. chrysanthus*, var. *fusco-lanceolatus*, Baker. See our number for May 13, last year, p. 222.

POTATS FOR EXHIBITION: A. B. V. White kidneys: Waterloo Kidney, Lapstone, and Excelsior Kidney. White roots: Porter's Excelsior, Rector of Woodstock, Schoolmaster, and Model. Coloured kidneys: Purple Ashleaf, Garibaldi, and Late American Rose. Coloured roots: Red Emperor, Scotch Elbe, Blanchard, and Vermont Beauty. All the foregoing of good exhibition size, and symmetrical in shape.

WEEDING POTATS: T. G. The tree in question has not been put into commerce.

Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors will be obliged by such communications being sent as early in the week as possible. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

CATALOGUES RECEIVED:—MESSRS. HARRISON & SONS (Leicester), Catalogue of Choice Seeds for the Farm and Garden.—*T. W. Daley* (Yeovil, Somerset), Catalogue of Flower, Vegetable, and Farm Seeds, Gladioli, &c.—*Messrs. Vilmorin-Andrieux & Co.* (Paris), *Quai de Mégevrie*, Paris, Catalogue of Seeds, Trees, Shrubs, &c.—*Messrs. Kerr & Fotheringham* (Dumfriesshire), General Catalogue of 1877.—*H. Cannell's* Illustrated Florid Guide for 1877.

COMMUNICATIONS RECEIVED.—H. G. R. (foo letter)—*J. C.* (many thanks)—*J. S. W. P. D. S. Cork*—*H. A. R.*—*W. S. A. B. M.*—*J. M. T. R. D.*—*D. G. W.*—*W. J. S. H. E. F.*—*H. E. D. T. F. R. H.* (we only see a few spaw-threads of some fungus such as are rarely found among the roots of the plants).—*W. W. H. M. S. E. F.*, Florence.—*J. G. Amsterdam*.

Markets.

COVENT GARDEN, February 15.

Business has continued brisk during the past week, and the supply is still moderate, with a slight advance. *James Webber, Wholesale Apple Market.*

CORN.

At Mark Lane on Monday the market was extremely dull. Wheat holders were not so well disposed to make any concession, but sales could only be effected at some instances. Barley was decidedly cheaper in some lots. Malt was much the same in value. Oats fetched a low price, and in some instances being fully 6d. per quarter cheaper than last week. Maize had a downward tendency, as also had Beans, Peas, and Flour; but the business passing in them was almost none. The market was decided on sale. The number of sheep was also very small. Everything was excessively dull, and it was very difficult to make a clearance at reduced rates. Choice calves were scarce, and dear no doubt. *Beasts*, 4s. 4d. to 5s. 4d.; 5s. 10d.; calves, 5s. 6d. to 7s. 10d.; 5s. 4d. to 6s. 4d. and 6s. 6d. to 7s. 2d.; pigs, 4d. 4d. to 5s. 4d. The best market on Thursday was for the wheat, which was being established downwards. Sheep at a fair demand, at Monday's prices. Prime calves continued scarce.

HAY.

The Whitechapel report of Tuesday states that the supply of fodder, although short on account of the unsettled weather, was fully equal to the demand, and quotations receded somewhat. Prime Clover, 100s. to 125s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 125s.; inferior, 75s. to 85s.; and straw, 40s. to 54s. per ton.—Thursday's market was fully supplied, and the demand moderate. Quotations.—Clover, best, 125s.; inferior, 85s. to 95s.; hay, 90s. to 125s.; and straw, 40s. to 54s. per ton.—Cumberland Market quotations.—Superior meadow hay, 125s. to 135s.; inferior, 100s. to 120s.; superior clover, 125s. to 140s.; inferior, 110s. to 125s.; and straw, 50s. to 57s. per ton.

POTATOS.

The Borough and Spitalfields reports state that trade remains quiet, and that the position of the market for Sound Potatoes, of which there is only a moderate supply, are in demand at full quotations, while a dull sale prevails for inferior kinds at irregular prices. *King Regents*, 12s. to 13s. per ton; *Essex Regents*, 12s. to 13s.; *Rock's*, 10s. to 11s.; *Victoria's*, 12s. to 14s.; *Flukes*, 14s. to 17s.—The imports into London last week comprised 17,715 bags from Antwerp, 14,286 from Hamburg, 1,465 from Cherbourg, 185,000 from Bremen, 265 sacks from Boulogne, 930 bags from Harlingen, 573 from Bremen, 150 from Rotterdam, 370 tons from Rouen, and 95 from Pont'Abbé.

COALS.

At the market on Monday the trade was unchanged, a steady business being done at last prices. The following are the quotations respecting Wednesday's business.—*Holywell Main*, 16s.; *W. Hartley*, 16s. 2d.; *Walls End-Harton*, 15s.; *Hetton*, 17s.; *Hetton Lyons*, 15s.; *Walthams*, 15s.; *Lambton*, 16s. 6d.; *Oldfield*, Hartlepool, 17s.; *South Hetton*, 17s.; *Walls End*, 15s.; *Hartlepool*, 16s.; *Walls End*, 15s. 9d.; *East Hartlepool*, 16s. 9d.; *Tees*, 16s. 6d.

Publishing Office, and Office for Advertisements:

7, CATHERINE STREET, STRAND, LONDON, W.C.

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

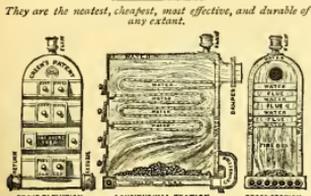

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

Estimates and Plans free.

GREEN'S PATENT
Wrought-iron Hot-water Boilers,
With Shelves and Hollow Grate Bars.
 Specially adapted for heating Greenhouses, Conservatories,
 Churches, Chapels, Schools, Public Buildings, Entrance
 Halls, Warehouses, Workshops, &c.
*They are the nearest, cheapest, most effective, and durable of
 any extent.*

Descriptive Illustrated Price List may be had free on application to
THOMAS GREEN AND SON, Smithfield Ironworks,
 Leeds; and 54 and 55, Blackfriars Road, London, S.E.

COWAN'S PATENT
COMPENSATING SYSTEM
OF HEATING,
*FOR HORTICULTURAL, PUBLIC, AND
 OTHER BUILDINGS.*

The most important discovery for saving the cost of
 fuel, for steadiness in heating power, and dispensing
 with night stockings. One Apparatus will do the work of
 several Boilers, and in some cases produce a profit.

Heating by the Ordinary Systems.
 Hothouses, Mansions, Churches, and other Buildings
 efficiently heated by other approved methods, where the
 Patent Apparatus cannot be adopted.

*A large Stock of the most improved forms of Boilers to
 select from.*

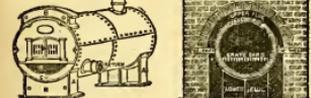

HEAT AND LIGHT.
**COWAN'S PATENT COMBINED GAS-MAKING
 AND HEATING APPARATUS,**
 By which Country Mansions and Public Institutions may
 be heated and lighted, in most cases free of cost.

HORTICULTURAL BUILDING.
 All structures specially adapted to the purposes for
 which they are required, built of the best materials and
 workmanship, at moderate prices.

Plans and Estimates free. An Illustrated Pamphlet free.
 All work done by the Company is guaranteed.

THE
Cowan Patents Company (Limited),
 21, WHITEHALL PLACE, LONDON, S.W.,
 and The Vineyard, Garston, near Liverpool.

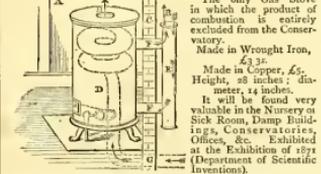

STEVENS'
TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE,
 ECONOMICAL, EFFICIENT, and DRAINING BOILER
 extant; recently improved. For Illustrations, with full par-
 ticulars, apply to the Sole Makers,
F. & J. SILVESTER,
 HOT-WATER ENGINEERS, &c., &c.,
 Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the only ones made with a section
 and under the inspection of the inventor, Mr. Stevens—all
 others being base imitations.

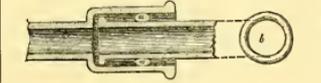

GEORGE'S PATENT CALORIGEN,
 FOR
*Warming and Ventilating Small
 Conservatories.*

The only Gas Stove in which the product of
 combustion is entirely excluded from the Conservatory.
 Made in Wrought Iron,
 4 1/2 ft. High, 28 inches; dia-
 meter 14 inches.
 It will be found very
 valuable in the Nursery or
 Sick-Room, Damp Build-
 ings, Conservatories, Offices, &c. Exhibited
 at the Exhibition of 1873
 (Department of Science
 Invention).

Illustrated Prospectuses and Testimonials on application.
J. F. FARWIG AND CO., 36, Queen Street, Chelsea, E.C.
 This Stove introduces a strong current of warmed
 (not burnt) fresh air.

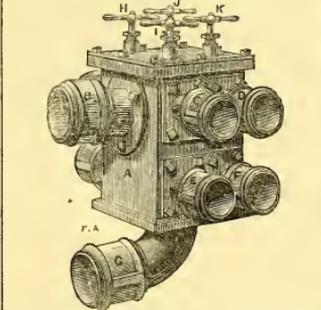

JAMES LYNNE HANCOCK'S
Improved India-rubber Socket-rings
 FOR THE
JOINTS OF HOT-WATER PIPES.

Description of Sketch:—
 A. The Rubber Ring as rolled into the Socket.
 B. The Ring before inserted in the Pipe.
 These Rings are made any size to order. All ordi-
 nary sizes are kept in stock.
 Illustrated Price List on application.

J. L. HANCOCK,
 VULCANISED INDIA-RUBBER WORKS,
 26, GOSWELL ROAD, LONDON, E.C.

CRITCHLEY'S PATENT
HEAT REGULATOR,
 AN APPARATUS FOR REGULATING THE HEAT
 IN HORTICULTURAL BUILDINGS.

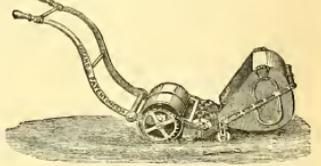

A. Iron Box fitted up water-tight. B. Pipe for Supply of
 Water from Boiler. C, D, Pipes for Circulating Hot-
 Water. E, F, Pipes for Return of Water to Iron Box.
 G, Pipe for Returning Water to Boiler. H, I, J, K,
 Piston-Rods for Opening and Closing Valves.
 The advantages of these Regulators are that houses may be
 kept at different degrees of heat, or the circulation of water
 and heat entirely stopped in one part and not in others. They
 may be fitted with as many valves as required, and are particu-
 larly adapted for forcing houses where top and bottom
 heat is used. They may be fixed in any part of the apparatus
 most suitable for working, without regard to the position of
 the Boiler.

The following Testimonial has been received:—
 "Berkley Castle, April 13, 1875.
 "Gentlemen,—I am happy to inform you, now that the
 late severe winter is past, that the Hot-Water Apparatus
 erected by you does its work to my entire satisfaction. As
 to the two Heat Regulators, which represent thirty valves, I
 have had ample opportunities of practically proving them, and
 unhesitatingly admit they are far superior to any other valve;
 in fact, I think it the greatest improvement that has come out
 for horticultural purposes.
 "I am, Gentlemen, yours truly,
 "Gardener to the Right Hon. Lord Fitzharding."
 Estimates and Plans furnished for Warming Gentlemen's
 Mansions and Public Buildings. Orders attended to in any
 part of the kingdom, and guaranteed to answer their intended
 purposes. Prospectus and Price Lists post-free.

Messrs. CRITCHLEY & CO.,
 Horticultural Engineers and Builders,
 GROSVENOR WORKS, CHELTENHAM.

GREEN'S
PATENT "SILENS MESSOR,"
 Or Noiseless Lawn-Mowing, Rolling, and
 Collecting Machines for 1877.

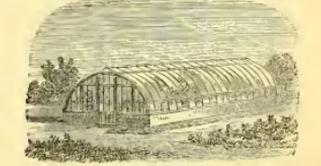

The Winner of every Prize in all cases of competition.

They can be had from all respectable Ironmongers and Seeds-
 men in the United Kingdom, or direct from the Manufacturers,
THOMAS GREEN & SON,
 SMITHFIELD IRONWORKS, LEEDS; and
 And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E.

Descriptive Illustrated Price List free on application.
 N.B.—Those who have Lawn Mowers to repair will do well
 to send them either to our Leeds or London establishment,
 where they will have prompt attention, as an Efficient Staff of
 Workmen is kept at both places.

 to Rough Sketches, with plans required. Heating apparatus
 fixed complete. Pamphlet, with Illustrations, post-free, of
HEREMAN AND MORTON, 2, Gloucester Street, Regent's
Park, London, N.W.

LASCHELLES' PATENT BENT WOOD
CONSERVATORIES AND GREENHOUSES.—All
 Gardeners know that Wood is better than Iron for Plant
 Growing, and by the above system a handsome curved house can
 be erected as cheaply as a plain straight one.
 The curved wood is more durable, stronger, lighter in con-
 struction, and no bent glass is required.
W. H. LASCHELLES, 121, Bushell Row, London, E.C., will
 supply Drawings and Estimates free of charge.

EP P S S C O C O A :

GRATEFUL-COMFORTING.
By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which will save us many a doctor's bill, and by the judicious use of such articles of diet that a constitution may be gradually built up, and the system restored to its normal tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure Bile and a properly nourished Frame.—Civil Service Gazette.
Solely sold in packets, labelled EP'S PATENT.
JAMES EPPS & COMPANY, HOMOEOPATHIC CHEMISTS, 48, Threadneedle Street, London, W.

KINAHAN'S OLD WHISKY.

Kinahan & Co. find that, through the recommendation of the Medical Profession, the demand for their CELEBRATED OLD L.L. WHISKY for purely medicinal purposes is very great, and they are pleased to supply the following Analysis by a leading Analyst, and to state that the samples of this well-known and popular Whisky. The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Water was pure, and the proof was pronounced to be of very excellent quality. The Medical Profession may feel full confidence in the purity and quality of this Whisky.
ANALYSIS BY
DR. GREAT FITZGERALD, Surgeon, St. Luke's Hospital, London, W.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY OF THE STOMACH, HEADACHE, BRUISES, COLIC, &c. &c. It is a SURE REMEDY FOR INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.

DINNEFORD AND CO., 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S OINTMENT AND PILLS.

Dangerous chest complaints.—The emanation of these diseases, which is necessary, and which most Englishmen know to their cost, Coughs, Croup, influenza, bronchitis, asthma, pleurisy, inflammation of the lungs, and all other pulmonary affections, are cured by rubbing Holloway's Ointment upon the chest and upon the back between the shoulders. It penetrates internally, checks the cold shiverings, relieves over-gorged lungs, gradually removes the oppression from the chest, and restores the obstructed circulation of the blood, promotes perspiration, and highly energizes. In treating this class of diseases, Holloway's Pills should always be taken while using his Ointment; it purifies the blood, promotes perspiration, and allays dangerous irritations.

More Cures of Asthma and Coughs by DR. LOCOCK'S PULMONIC WAFERS.

—MR. C. COLLINS, Chemist, *Brettlebone, Stourbridge*, writes: "I have used your Pulmonic Wafers, Coughs, &c., and in every case they have had the desired effect. In my opinion they surpass anything that has been offered to the public. They instantly relieve Asthma, Consumption, Coughs, Cold, Gout, Rheumatism, and all other ailments, and they are pleasantly. Sold by all druggists, at 12, 15, and 18, Coler, York.

SUTTON'S CHOICE SEED POTATOS

Carriage Free.

"A GOOD CHANGE OF SEED OFTEN PREVENTS DISEASE."

THE BEST DISEASE RESISTING ROUND POTATO,

Shown at the Horticultural Exhibition, 1876, London, and at the International Exhibition, 1877, Philadelphia, and at the Horticultural Exhibition, 1878, London.

SUTTON'S RED-SKIN FLOURBALL.

This well-known and popular variety ranks as one of the most valuable Round Potatoes ever sent out. It is especially useful late in the spring, when all other Potatoes are worthless, and it is unequalled as a cropper by any other round variety.

Price—3s. per peck, 10s. 6d. per bushel.

Cheaper by the Sack or Ton.

THE BEST KIDNEY POTATO FOR MEDIUM AND LATE CROPS,

SUTTON'S MAGNUM BONUM.

Without exception, the finest medium and late Kidney Potato in cultivation, and highly recommended by all the principal Potato Growers in the country.

Price—5s. per peck, 17s. 6d. per bushel.

CHEAPER BY THE SACK OR TON.

A VALUABLE AND DISTINCT LATE KIDNEY POTATO,

Shown at the Horticultural Exhibition, 1876, London, and at the International Exhibition, 1877, Philadelphia, and at the Horticultural Exhibition, 1878, London.

SUTTON'S HUNDREDFOLD FLUKE.

Those who have given this Potato a fair trial describe it as one of the best Kidney varieties they have grown. It is a very heavy cropper, and a variety which we can recommend for every garden.

Price—3s. 6d. per peck, 12s. per bushel.

Cheaper by the Sack or Ton.

Superb Ridge Cucumber.
CUCUMBER, Foster's X.L. Superb Ridge.
 This variety is a remarkably fine hardy, long, dark green Cucumber, and one that can be recommended with the greatest confidence. It is very prolific, and keeps 25 inches or the last; all who have seen it growing are satisfied that it can be had of all Seedsmen in sealed packets, and are convinced of its excellent quality, length, 12 to 18 inches. Price 6d. and 2s. per packet, price to the Trade on application.
EDMUND PHILIP DIXON, The Yorkshire Seed Establishment, Hull.

Shallot Seed.
DAVIS' PRIZE JERSEY.—A true Shallot, of immense size and exceedingly mild; with ordinary treatment have been grown from 10 to 25 inches in circumference—by far the best method of growing the Shallot. Treatment same as Onions, but 12 weeks. Can be had of all Seedsmen in sealed packets. Wholesale, of Messrs. HURST AND SON, 6, Leadenhall Street, London, E.C., or
R. R. DAVIS, Nursery and Seed Warehouse, Yeovil.

SPECIMEN AZALEAS (Winter flowers).
 An abundance of splendid flowers can be had in a row or two, or at once, by purchasing a few Specimen Azaleas, now opening in flower. They are of 12 to 15 feet over perfect shape, some hundreds of flowers and buds, which will last for months at the time of the year. All new and valuable sorts, 21s. 6d. each, and 42s. each, according to size and stock. Eighteen plants only are for Sale. They are all worth double the money.
JOHN H. LEY, Royal Nursery, Croydon.

To the Trade.—Seed Potatoes.
H. AND F. SHARPE will be pleased to send their SPECIAL CATALOGUE OF SEED POTATOES, showing the Trade and Retail prices. It comprises all the principal English and American varieties worthy of cultivation; they are all grown from the finest selected stocks, and will be found very moderate. See Growing Establishment, Wisbech.

GREEN TREE BOX.—The hardest evergreen, exclusive of the Conifers, thrives in almost any soil, especially on chalk. It is very hardy, and, on account of being applied in increasing quantities, it is now, as is rapidly rising in price. A few extra boxes planted annually would be a most judicious investment, with an almost fabulous amount of money. Very bushy and extra well rooted plants can be supplied.
 150 feet, 4s. per dozen, 25s. per 100, £10 per 1000.
 20 to 2 1/2 feet, 6s. per dozen, 35s. per 100, £15 per 1000.
 2 1/2 to 3 feet, 9s. per dozen, 60s. per 100, £25 per 1000.

CATALOGUES free on application.

JAMES TYNAN, Seed Warehouse, 55, Great George Street, Liverpool.

Splendid New Melon, 1877.

CHARLES LEE AND SON (Successors to Messrs. J. & C. Lee) have the pleasure to announce that they have purchased the entire Stock of **MANN'S HYBRID GREEN-FLESH MELON**, which they now offer for the first time. It has already earned a First-class Certificate in London and the provinces for its many excellent qualities, among which may be mentioned a remarkably high and exquisite quality at all seasons of the year, perfect shape and size for dessert—its thin rind and melting flesh, with an overflow of perfumed juice, which is very refreshing.

Dr. Hoop has spoken of this excellent Melon in the highest terms, and after tasting it pronounced it a fruit of the highest merit.

Mr. CULVERWELL, of Thorpe Perrow, fellow judge with Mr. FOWLER, of Horewood House, at the Crystal Palace Show, when they displayed a First-class Certificate in London of his Hybrid Green-flesh Melon. "speaks of it as 'an exceedingly good melon, especially at that early season—the early part of June.'"
 Mr. INGRAM, of Belvoir Castle, writes, in the third week of October, "it is in the condition of a melon, and has a very gloomy weather, at that season of the year." "Mann's Hybrid Green-flesh Melon" was sweet, tender in both, very juicy, and distinct in character.
 Messrs. Charles Lee & Son are now prepared to offer this very delicious and delicious new Melon in sealed packets, at 2s. 6d. per packet.
CHARLES LEE AND SON, Hammersmith, W.

STOCK VERBENAS.

 42s. 12s. per 1000.
HARDY AQUATICS at the lowest prices.

NEW AMERICAN POTATOS.

No. 1. **CENTENNIAL.**—A seedling of the well-known
 Brownell's Beauty crossed with the White Pearl Blue; haulm
 stout, vigorous, 4 to 5 feet medium; tubers medium and of
 uniform size; shape round, somewhat flattened, symmetrical
 and handsome; colour deep red; flesh fine-grained, white and
 mealy; very productive, and of fine quality.

No. 2. **BROWNELL'S SUPERIOR.**—Of a same parentage
 as the preceding. Its tubers are medium to large, kidney-
 shaped, of a peculiar dark copper colour, very uniform and
 handsome in appearance; skin fine and smooth; eyes few and
 small; the haulm is strong and healthy; the tubers are thickly
 clustered round the stalks. It is a second early variety, keeps
 well, and is enormously productive, 673 lbs. having been grown
 from 1 lb. of seed with ordinary farm culture. A Certificate of
 Merit was awarded this variety at the International Potato Show.

No. 3. **IMPROVED PEARL BLUE.**—A cross between the
 well-known Jersey Pearl Blue and the Excelsior. It par-
 ticles of some of the characteristics of each of its parents, having
 the haulm of the Excelsior, while its tubers resemble the Pearl
 Blue, though better formed; white in quality it equals that of
 old standard sort, it is far more productive and matures earlier.

One pound of either of the above varieties will be mailed
 post-paid to any address in Europe upon receipt of 4s., or its
 equivalent in English currency.

Remittances can be made in Post-office Stamps or Postal
 Money Order on New York or London, payable to B. K. Bliss
 and Son.

The above varieties can also be obtained of Messrs. HOOPER
 AND CO., Covent Garden, W.C.; of LARBER, DUNN, & CO.,
 45, BEALE, London, W.C.; of CHRISTMAS QUINCEY,
 Peterborough.

Our Illustrated and Descriptive POTATO CATALOGUE,
 40 pages, will be mailed free and post-paid to all applicants.

Address, B. K. BLISS and SON, Seed Merchants,
 34, Barclay Street, New York, U.S.A.

THOUGHTFUL-HEADED KALE FOR SHEEP FEED.

HURST & SON

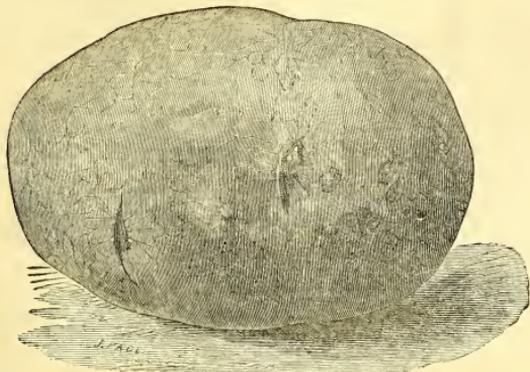

Can now supply NEW SEED of the true variety of the above (to the Trade only). Price on application.
 6, LEADENHALL STREET, LONDON, E.C.

Extract from the "Agricultural Gazette" of March 13, 1876.

In a Paper read by Mr. ROBERT RUSSELL, before the London Farmers' Club, on *Green Crops for Sheep Feeding*, he said:—"Towards the end of March we drill in the celebrated Thousand-headed Kale, which is the best known and most desirable of any green crop I have ever seen. It is a plant that produces more feed per acre than any other, and does not disagree with the stock, nor does it impoverish the land. With me it has never caused either sheep or lambs to blow or scour."

HURST & SON, 6, LEADENHALL STREET, LONDON, E.C.

THE BEST NEW POTATOS.

HOOPER'S COVENT GARDEN PERFECTION.

CHARACTERS:—Rough skin, white flesh, level eyes, good medium size, medium growth, good cropper, Second Early. On the table perfect both in flavour and flouriness.

Mr. Shirley Hibberd, after two years' trial, thus speaks of it:—"I believe it to be distinct. It is of remarkably fine quality, the very model of a Gentleman's Potato." It will bear close cutting in planting.

Price, 2s. 6d. per lb., 7 lb. 15s.

ALL POTATO GROWERS SHOULD TRY THE ABOVE NEW VARIETIES.

HOOPER & CO., COVENT GARDEN, LONDON, W.C.

Other NEW POTATOS offered by
HOOPER & CO.

CENTENNIAL.

Second Early Red American variety—very fine; by the raiser of Brownell's Beauty, upon which it claims to be an improvement. Price, 3s. 6d. per lb., 7 lb. 21s.

SUPERIOR (Brownell's).

Large Red Kidney, of extraordinary productiveness. In our trial last year we had a produce of 240 lb. from 4 lb. Price, 2s. 6d. per lb., 7 lb. 15s.

SUCCESS (Brownell's).

Fiat White Potato. Wonderful for size. Our crop from 3½ lb. planted was 167 lb. Price, 2s. 6d. per lb., 7 lb. 15s.

LADY WEBSTER (McKinlay).

A little beauty, red streaks about the eyes. Very high class variety, fine quality. Price, 3s. 6d. per lb.

RUBY.

A thoroughly good novelty, of which a few were sent out last year—red, rough skin; good cropper. Price, 2s. 6d. per lb., 7 lb. 9s., peck, 15s. 6d.

DANIELS' SEED POTATOS.

Our Stocks of POTATOS are warranted True to Name and Free from Disease, all being carefully selected at the time of growth, and afterwards passed through the bands at least three or four times before being sent out, and all inferior, misshapen and forked tubers carefully discarded.

To improve the culture and encourage the diffusion of really good varieties, we have determined to offer at the lowest possible rates COLLECTIONS of POTATOS FOR EXHIBITION PURPOSES, and trust our efforts in this direction will meet a want so much felt by our Customers and the gardening community generally. The selection in all cases must be left to us; it will be very carefully made, and only those of known excellence and superior qualities included.

COLLECTIONS.

The most practical and comprehensive Guide for the Amateur yet issued, and should be read by every Horticulturist.

DR. DENNY'S PELARGONIUMS.

MESSRS. J. VEITCH & SONS

Have the pleasure to announce that they have made arrangements with Dr. Denny for the distribution in April, next, of his fine new Zonal Pelargoniums, remarkable for the size of their trusses, the brilliant colouring and perfect shape of their flowers, and for the persistency of their petals, which are of great substance, the trusses thence continuing in perfection for a long period.

They are especially adapted for pot culture for the conservatory, where their richly-coloured flowers and fine trusses will be found a welcome, as well as a useful addition to the decorative resources, and for which purpose James Veitch & Sons beg to recommend them, particularly for the winter months.

HEATHER BELL.

A magnificent florist's flower, of a distinct bluish tinted or black-pink colour, with a white blush on upper petals; the petals are of good substance and overlapping, and the pipes expand to slight convexity. The trusses, which are large and globular, stand erect over a neat sown dark green foliage. Owing to the persistency of the petals (in this respect unlike other varieties of the pink section), the trusses retain their perfection of shape and beauty for a long period. It is especially desirable in a dry conservatory, where its fine flowers in perfection throughout the winter months. Habit stout and branching. This variety undoubtedly possesses the nearest approach to perfection as regards florist's qualities yet attained in the pink section, and for pot culture is unrivalled. It is believed it will make an excellent border, but its bedding qualities have not yet been fully tested. Price 10s. 6d. each.

AMAZON.

A deep brilliant scarlet with a rich velvety lustre, of the finest florist's petals of great substance, with smooth edge, and very large, so as to considerably overlap each other; trusses large and well formed. Habit robust, and of free growth, suited for pot culture, or for being trained up the sides of pillars in a conservatory. It is not adapted for bedding purposes, but is well recommended for the purpose of the Flora Medal of the Royal Horticultural Society for the perfection of its florist's qualities. Price 10s. 6d. each.

IRENE.

Flowers of a deeper shade purple-gamoge than any previously raised by Dr. Denny, being a very considerable advance in colour upon Imogen, as well as in the quality of its flowers. The petals and pipes are of being shape and open, with slight convexity. Trusses of good size, and produced in the greatest abundance. A dwarf and compact-habited plant, with a deep green zonal foliage. This variety, with proper treatment, will flower throughout the winter months, and during that season its flowers show a deeper shade of purple and greater brilliancy of colour than at any other period of the year. Price 10s. 6d. each.

CLEOPATRA.

Flowers of a brilliant shade of carmine-gamoge, a large pip which expands to perfect flatness; trusses of fine form, and produced in abundance; habit robust and branching. For pot culture Cleopatra is a distinct and conspicuously beautiful variety. Price 10s. 6d. each.

NYNZA.

Flowers of a fine soft scarlet, of large size, great substance, and well formed; truss of good size; habit free, robust, and dwarf. Price 5s. each.

EGERIA.

Flowers of a deep purplish magenta-crimson, and of good form; trusses large, and owing to great persistency of petals retain their perfection of shape and beauty for unusually long period. Habit dwarf and good. Price 5s. each.

GLOBOSA MAJOR.

A deep maroon-crimson flower of the novelty or decorative type, producing trusses of immense size and of great globular form, which, owing to the persistency of the petals, is retained for a long period. For conservatory decoration this variety is unrivalled for brilliant effect. Price 5s. each.

Price for the above Set of Seven, one plant of each, 42s.

DISTINGUE.

A double bluish white, producing large trusses of a semi-nosegay character, which stand erect over a dark brilliant green foliage; habit robust, dwarf and compact. Price 7s. 6d. each.

DEIWEISS.

A neatly pure white double variety, with large petals and finely-formed pipes, trusses of good size and very freely produced; handsome dark green zonal foliage; habit free, but dwarf and compact. A great advance upon Aline Sisley. Price 7s. 6d. each.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

 - JACKSONII, scarlet, 1 foot, 40s. per 100; 2 to 1½ feet, 60s. per 100.
 - HYDRIS, from all the choicest named varieties, 1 foot, bushy, 20s. per 100; 1 to 1½ feet, 30s. per 100; 1½ to 2 feet, 40s. per 100.
 - PONTICUM, 10 to 12 inches, 50s. per 1000; 12 to 18 inches, 50s. per 100; 18 to 24 inches, 50s. per 100; 24 to 30 inches, 50s. per 100; 30 to 36 inches, 50s. per 100; 36 to 42 inches, 50s. per 100.
 - LYCII, 10 to 12 inches, 50s. per 1000; 12 to 18 inches, 50s. per 100; 18 to 24 inches, 50s. per 100; 24 to 30 inches, 50s. per 100; 30 to 36 inches, 50s. per 100; 36 to 42 inches, 50s. per 100.
 - CUPRESSUS LAWSONIANA, fine Ornamental tree for Lawns or Wood Planting as shelter for Game, also for Garden Fencing, 2 to 3 feet, 30s. per 100; 3 to 4 feet, 40s. per 100.
 - ASH, Mountain, 2½ to 3½ feet, 25s. per 1000.
 - BON, Tree, 2 to 1½ feet, 50s. per 100; 1½ to 2 feet, 50s. per 100; 2 to 3 feet, 50s. per 100.
 - CURRANTS, quantity of extra strong Black Grape, 50s. per 100.
- CATALOGUES of all other Nursery Stock free on application.

WEBB'S HOME GROWN SEEDS FREE

COMPLETE COLLECTION OF VEGETABLE SEEDS.
Produce the best vegetables of all the year round

CARRIAGE FREE TO ANY RAILWAY STATION **21/-** FIVE PER CENT DISCOUNT FOR CASH

WE ALSO SUPPLY COLLECTIONS AT 10s. 6d., 15s., 30s., 42s., 63s., and 100s.

The above contain liberal assortments of the best varieties in cultivation.

All Goods of 20s. value and upwards Carriage-free to any Railway Station in England or Wales.

WEBB'S CHOICE COLLECTIONS OF FLOWER SEEDS.

Specially selected to produce a splendid and continuous display during Summer and Autumn.

No. 1. Collection of Choice Flower Seeds	..	42 0

NEW PLANTS.

WILLIAM BULL, F.L.S.,

Is constantly receiving accessions of New Plants from his Correspondents and Collectors in various parts of the World, and in his Illustrated CATALOGUE of New, Beautiful, and Rare Plants (price 1s.) will be found Names, Descriptions, and Prices of the following:—

- NEW ARIALIS,
- NEW AROIDS,
- NEW BEGONIAS,
- NEW CALADIUMS,
- NEW CROTONS,
- NEW CYCADACEOUS PLANTS,
- NEW DOUBLE-FLOWERED PELARGONIUMS,
- NEW DRACENAS,
- NEW FERNS,
- NEW GLOXINIAS,
- NEW GREENHOUSE PLANTS,
- NEW HARDY PLANTS,
- NEW LILIES,
- NEW NOSEGAY PELARGONIUMS,
- NEW ODONTOGLOSSUMS,
- NEW ORNAMENTAL-FOLIAGED PLANTS,
- NEW ORCHIDS,
- NEW PALMS,
- NEW REGAL PELARGONIUMS,
- NEW STOVE PLANTS,
- NEW TREE FERNS,
- NEW VARIEGATED-FOLIAGED PLANTS.

MR. W. BULL'S Illustrated CATALOGUE

(price 1s.) contains Names, Descriptions and Prices of:—

- NEW PLANTS from AFRICA,
- NEW PLANTS from AMBOYNA,
- NEW PLANTS from AUSTRALIA,
- NEW PLANTS from BRAZIL,
- NEW PLANTS from CALIFORNIA,
- NEW PLANTS from COSTA RICA,
- NEW PLANTS from EAST INDIES,
- NEW PLANTS from ECUADOR,
- NEW PLANTS from FIJI ISLANDS,
- NEW PLANTS from JAPAN,
- NEW PLANTS from JAVA,
- NEW PLANTS from LORD HOWE'S ISLAND,
- NEW PLANTS from MADAGASCAR,
- NEW PLANTS from MANILLA,
- NEW PLANTS from MEXICO,
- NEW PLANTS from NEW HEBRIDES,
- NEW PLANTS from NEW SOUTH WALES,
- NEW PLANTS from NEW ZEALAND,
- NEW PLANTS from NICARAGUA,
- NEW PLANTS from PERU,
- NEW PLANTS from QUEENSLAND,
- NEW PLANTS from SANDWICH ISLANDS,
- NEW PLANTS from SOUTH AMERICA,
- NEW PLANTS from SOUTH SEA ISLANDS.

Mr. William Bull's New Catalogue of Seeds, "Only the Best," is just published, and can be had on application.

ESTABLISHMENT for NEW and RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

FLOWER AND VEGETABLE SEEDS FOR 1877.

BALSAM, Williams' Superb Strain	Per packet—s. d.
BEGONIA FRIEDELII	.. 2s. 6d. and .. 2 6
BEGONIA SEDIENI SEMI-PLENA 2 6
BEGONIA, Hybrid, finest mixed 2 6
CYCLAMEN PERSICUM GIANTUM 2 6
This is a great improvement on the old type, the flowers being thrown well above the foliage, each flower measuring from 2 to 2½ inches in length; pure white, with a fine bold violet-purple eye .. 5s. and 2 6	
CYCLAMEN PERSICUM, Williams' Superb Strain,	5s., 3s. 6d., 2s. 6d., and 2 6
CALCEOLARIA, Williams' SUPERBOSA 2 0
CALCEOLARIA, Williams' Superb Strain,	5s., 3s. 6d., 2s. 6d., and 2 6
CINERARIA, Weatherill's Extra Choice Strain,	2s. 6d., and 2 6
GLOXINIA, Finest Drooping Varieties 2 6
GLOXINIA, Finest Erect Varieties 2 6
PRIMULA, Williams' Superb Strain, Red, White, or Mixed 2 6
PRIMULA SINENSIS' FIMBRILATA COCCINEA (new) colour brilliant scarlet with bright sulphur eye, exquisitely fringed and of great substance 2 0
FRIMULA COCCINEA GOLDEN GEM 2 0
SOLANUM, Williams' Improved Hybrids 2 6
STOCK, Williams' Improved Giant Scarlet Brompton 2 6
WALLFLOWER, Harbinger, Autumn and Winter flowering 2 0

Packets of Flower Seeds, excepting heavy kinds, Free by Post.

VEGETABLE SEEDS.

BEANS, Williams' Early Prolific Dwarf French—per qt.	3 0
BRUSSELS SPROUTS, Welch's Giant, one of the finest in cultivation per packet 1 0
CUCUMBER, Walker's Hero (New) 2 6
.. .. Osaston Manor 2 6
ENDIVE, Williams' Gloria Mundi 2 0
MELON, Osaston Manor Hybrid 2 6
.. .. Laura's Beauty (New) 2 6
.. .. Surprise (New) 2 6
ONION, Williams' Magnum Bonum 2 6
PEA, Williams' Emperor of the Marrows	per quart 2 6
TOMATO, The Zoo Days per packet 1 6

*All seeds amounting to 50s. will be delivered free of carriage to any Railway Station in England.

Illustrated SEED CATALOGUE gratis and post-free to all applicants.

SATURDAY, FEBRUARY 24, 1877.

WALKS AND ROADS.

NOTHING adds so much to the comfort of a garden or estate as good sound walks and roads, and yet how seldom do we see or experience such, although plenty of material may be ready to hand, or easily obtainable in the immediate neighbourhood to put them into that very desirable condition. The principal thing in the formation of walks and roads, like that of building a house or other structure, is to have a good solid foundation, without which they are never afterwards in a satisfactory condition, whatever amount of labour may be expended on them with the view of rendering them so, unless they are entirely remade. Many commit the grave mistake of using gravel just as it is obtained from the pit, in which state, however good, it is seldom that a comfortable walk can be made. It frequently happens that gravel so raised is simply placed on the natural soil after a few inches of the top has been dug out, the result of which is, that after a little wear, wet, or frost, the bottom oses through, and the worms cast it up, when it at once causes a discoloration of the surface, and forms a bed for a prolific crop of weeds that soon take possession and luxuriate in such a congenial home. Besides all this, the gravel having no proper foundation to rest on, the walk or road becomes soft and rotten at a time when most needed for use. At no season has this been more forcibly brought home to us than during the present winter, when the country has been almost inundated with water.

In cases where either walks or roads are in an unsatisfactory state, the best way is to break them up at once, and set about remaking them in a proper manner. As before observed, the foundation is the principal thing, and the next is proper and efficient drainage to carry off the surface-water, which should never be allowed to lie on the gravel or percolate through to the rough bed below. The depth to which the walk or road should be dug out will depend entirely on the nature of the soil, the amount and kind of traffic that is likely to take place over it, and the general purposes for which it may be required. If the roads are simply wanted for carriage use or for other light vehicles to pass over them, from 8 inches to a foot of good sound stuff will be amply sufficient. The lower part of this should consist of broken burrs from brick-kilns, slags from iron-foundries, rough stones, or any hard material of that character that is most readily accessible. This should be spread uniformly over the bottom, and the interstices filled up with fine chalk or good binding gravel, that it may not lie loose and hollow, for when this is the case the top can never be firm, but will shift about under the pressure of any vehicle or heavy weight that may pass over it. Having laid a solid foundation as above advised, the next thing is to ram it firmly, so as to get it well together, and that done, add for the next 3 inches a layer of hard angular stones, such as may be obtained by sifting coarse gravel, in doing which sufficient of the fine should be left to bind the whole firmly together. The quantity required for that purpose will vary according to the character of the gravel made use of, but may roughly be set down at one-fourth. If the fine part should be at all of a sandy nature, and not possess good binding qualities, fine chalk should be substituted in-

stead, or, failing this, a slight portion of pulverised marl or clay may be used. The great thing is, to have materials that will bind firmly together so as to be impervious to wet, and that will not become loose and detached in dry weather, as all gravels of a sandy description do.

To finish the road off with a nice smooth surface, the top should consist of a similar kind of stone, varying in size from an acorn down to that of a pea. This assortment can easily be arranged at the sifting by passing the material through suitable screens or sieves, first of all taking away the excess of fine the stuff may contain, when the separation of the other may be readily carried out. It is very important that the top layer of the road should be of the very best binding material that can be obtained. Chalk near the surface could not be made use of without its appearance being objectionable on account of its colour, otherwise there is nothing more suitable or better, otherwise for mixing with stone for roadmaking purposes than that is. The binding qualities of gravel may always be judged of, and its value estimated, by the appearance it presents in the pit before being dug, for if found solid and firm, and adhering closely together, it will get in the same state again when laid down after having a heavy roller passed over it a few times.

In forming the road the centre should be laid higher than the sides, but not so much so as to throw all the traffic in one part, otherwise ruts will occur or the middle will be kicked up and disfigured. The water being thus thrown to the sides, provision should be made to conduct it away either by gratings and drains or by laying the gravel sufficiently high to throw it over the sides, where, unless the soil is unusually close and heavy, it will soon soak away.

GARDEN WALKS.

For ordinary walks in pleasure grounds and gardens, a less depth than is requisite for a carriage road will answer every purpose, and as the same remarks relating to their formation are applicable to these also, it is useless going over the same ground again. It may be well however to observe that to give them a smoother and more finished appearance, the top inch or so should consist of very fine stones and binding material that when rolled will become compact.

To render such walks always dry and comfortable, it is very requisite that they should have a good main drain under the middle, with side branches at suitable intervals to conduct the surface-water into it. These side drains should be placed at from 30 to 50 feet apart according to the width of the walk, and each terminate in a small cesspool made to catch the silt or washing, which may be carried off after heavy storms, by which means it will be intercepted before reaching the main and thus blocking the water-way. Over each cesspool a neat iron grating will be required, none of which need exceed 6 inches square, and as they are made to set without any stone curb around them, they are not at all conspicuous objects, or the least objectionable in appearance. Those now sold for the purpose have cast-iron frames with a narrow inner groove for the grating to rest on, so that it can be lifted out and the cesspool cleared of any deposit without disturbing the frame. By making use of these much needless expense is saved, and the objectionable appearance of stone or other settings that would otherwise be required is entirely avoided.

To get the newly made walks in a solid firm state as quickly as possible after their formation, they should be thoroughly rolled when wet till they show that they are becoming soft and will not bear the weight of the roller any longer, when they should be left to settle for a time, and then be rolled again, after which they will become thoroughly consolidated, and in a sound

condition for ever after with very little attention beyond keeping them free from weeds.

SALTING FOR WEEDS.

Weeds may be destroyed by scattering a small quantity of salt regularly over the walk, but this should only be done when the weather is fine, or it may be washed to the sides and do much damage to the verges. By treating walks to a slight dressing of salt every spring and autumn, they may be kept free of weeds at a minimum of the amount of labour and cost that would be required to pull them up, and not only this, but it has such an effect in killing all mossy *conferva* as to render the gravel always bright and new looking, nearly equalling in that respect any fresh raised from the pit and newly laid down. It may be remarked, however, that it does not do to use salt where the edgings are of Box, as that is sure to suffer injury, and perhaps be killed altogether, but grass verges will stand it well if not sown too close to soak to the roots, or get washed to them, should rain by chance occur immediately afterwards. Many other remedies have been recommended to extirpate weeds from walks, such as the use of some of the mineral acids, but there is nothing so cheap and simple, or that can be so readily and safely applied, as salt, which can be had in most places at from $\text{£}1$ to $\text{£}1\ 10\text{s}$. per ton.

GARDEN EDGINGS.

The value of salt as a labour-saving medium brings us to the question of what is the most suitable edging to use that salt may be applied as occasion requires without risk of destroying or disfiguring the same. For kitchen gardens, where utility is more considered than mere ornament, there is no doubt that brick would be the most serviceable, and if a suitable selection were made to get such as are of a hard nature and thoroughly burned, they would last for many years in good condition. Indeed there is no limit to the endurance of some makes of these, and notably so with those from Staffordshire that are much in use at railway stations, and which are almost as hard as iron, so that there need be no fear of breakages, as they are impervious to wet, and frost has not the slightest effect on them. If these could only be obtained with the edges on one side of the brick rounded off and left with a recess at each end, for a dab of cement to be put when laying them, so as to keep them firmly together and hold them in their proper position, it would leave little to be desired, and it is to be hoped that makers will take the hint and mould them in this form. Edging tiles have been so disappointing hitherto, from the way they get displaced and the manner they are shivered about by frost or become disfigured by breakages, that most people have abandoned their use, but with such as these they would only be too glad to revert to them again, instead of employing Box, which is always a harbour for slugs, which are a plague in most gardens.

Were it not for this, and the gappy state into which it frequently gets, through the carelessness of labourers, there is no edging perhaps that has a better appearance than Box; indeed except for the time and attention necessary to keep it in order, and other drawbacks already noticed, it has everything to recommend it. In cases where this is decided on, and it is desired to have it of a special green colour and in first-rate order, healthy preparations should be made that it may have a suitable soil, one of the principal ingredients in which should be some calcareous matter, such as pulverised mortar rubbish or fine chalk. Either of these mixed up with the border where the Box is to be laid in will ensure its well-doing; and another important thing in its management is to clip it

at the right time, which is about the middle or end of May, according as the season may be early or late. Box clipped at that time makes just sufficient growth to give it a close compact appearance, which it retains till it starts afresh the following spring.

In suitable soils, such as are loamy and rather inclined to adhesiveness, *Gentiana acutis* may be used with most excellent effect, indeed there is no place where the beauty of this plant is seen to such advantage or produces such a striking effect as when grown in long lines as an edging. In order to get it to do really well, and produce its lovely blue flowers in the free way it is capable of doing, its roots must have a cool moist bottom afforded them, which can best be secured by making use of any very large pebbles or flints that may be handy to hand for the purpose. These should be so arranged as to afford room for a tuft of *Gentian* to be planted between each, which can be done by nearly burying up the stones at from 3 to 6 inches apart, when the plants will spread and unite over them, and form such a mass of colour most beautiful to behold, and which cannot be secured in anything like the same state of perfection in any other way. The roots so favoured enjoy much the same conditions they do when growing on their native Alps, where, from the constant melting of the snow, they are kept cool and moist, while the tops of the plants are exposed to the cheering sun, under the influence of which they expand their blooms. J. S.

NOTES FROM A LANCASHIRE GARDEN.

February 14.—Let me take advantage of this quiet moment in a garden's life, and speak of the year that has passed, and the year that lies before us. There may be little indeed of interest in the present, but at least the "pleasures of memory" and the "pleasures of hope" are ours; and yet, except when all the earth is frost-bound, we are sure to have some flowers to cheer the darker days. Here is the "hardy Laurustinus," Mrs. B. and the "yellow" and "white" clusters of golden Aconites peep up under the bare branches of a Chestnut; here tufts of Snowdrops pierce through the grass upon the lawn; here the yellow winter Jasmine stretches out sprays all laden with bloom, and looks in upon us through the great hall window. Then in the hall itself we have had *Primulas* and Roman Hyacinths, and the spring bulbs are now taking their place.

What an open winter it has been, but how incessant has been the rain. Day after day the men have had to leave off work, and spend their time in cutting up wood in the log-house. I have been relaying part of my lawn, and the task has been terribly delayed, but it is done at last. We have also been altering some of the garden beds. We have cut out the large *Athanas* from the border where it was, and it now stands alone, with a gravel walk round it. The *Buddleia*, too, is now the centre of a round bed, with clumps of Iris growing underneath it.

This last year was a very bad one for us. The spring was cold and treacherous—the summer was broiling—the autumn was rainy and ungenial. And yet, while I complain of the summer, I recall delightful summer evenings, when the house was too hot, and we sat upon the terrace after dinner with the claret and dessert; in the air was all perfume, and the light lingered long in the east over the church steeple, 3 miles away. The big dog and the children were at our feet, and as the night fell there was no sound but of our own voices to break the silence and the peace.

But one night, a little later on, a strange noise alarmed our gardener. It was the jarring of the nightjar, an unusual bird with us, and I don't think he quite knew what to make of it. However, our poor visitor was shot, and is now stuffed, with a cockchafer in his mouth, and stands under a glass-case in the dining-room.

In the porch a swallow had built her nest, and it was pretty to watch her as she skimmed round and round in anxious flight till we had left the place. I look upon it as good luck to have a swallow building on the house. We all remember how Bangoo says, when he notices their "pendent beds" on Mabeth's castle that—

"Where they most breed and haunt, I have observed,
The air is delicate."

But all poets love the swallow. Can any of us, who has once read it, forget *Les Hirondelles* of Béranger, and how the French captive among the Moors questions the swallows about his country, his home, his friends, which they perhaps have seen? Then is there not Tennyson's delightful—

"O swallow, swallow, flying, flying south,"

and bearing the message that—

"Dark and true and tender is the north."

Even American poetising of the swallow, and Lowell has one particularly happy line when he describes—

"The thin-winged swallow skating on the air."

But I must get back to the garden and the flowers. The *Desfontainia spinosa* flowered twice with me—

more ordinary sorts, white Haricot Beans, Scorzonera, Salsify (the "Oyster plant" as it is sometimes called), and Water Cress.

A word now about our spring beds. We shall have one entire bed of Crown Imperials, which ought to look handsome, and two of *Ranunculus*, one mixed, and one of the brightest scarlet. The other beds will be for the most part much as I have described them in former years.

This open winter has given us more Violets than we ever had before, but which are certainly not the "Violets *dim*," of which Shakespeare speaks, but deep, richly coloured blossoms. The Wallflowers, too, have scented the air on the few sunny days we have had, and I now see the *Rhododendron dauricum* and the *Daphne Mezereum* just bursting out.

represented the general opinion of cultivators on the subject, we advert to the question again to show how the case really stands.

The original name was *Olea Aquifolium* of Siebold and Zuccarini. In due time the flowers were found to be different from those of *Olea*, and the plant therefore became *Osmanthus Aquifolium*. This plant in its native country (Japan and China) is so variable in the shape of its leaves, as the specimens in the Kew herbarium testify, and as M. Franchet and Savatier tell us that it is impossible even to distinguish varieties, as on the same branch leaves of very varied form may be met with. Miquel had observed and recorded the same fact. Such being the case, we were justified in applying the name *Osmanthus Aquifolium* to the plant commonly known in gardens as *Olea ilicifolia*.

Then comes the question, "What is *Osmanthus ilicifolius* of the nurseries? To this we answer, after examination of the fresh flowers of both forms, as well as of the books and dried specimens, that the so-called *O. ilicifolius* is the same as *O. Aquifolium*. On the wild plant it is easy to pick leaves of both so-called species from the same bough. Seeing, however, that in British gardens the two plants maintain their distinctive characters, and do not as yet manifest any such sportive tendency as we have mentioned, we suggest that for garden purposes two names be made use of. The broad-leaved less deeply cut variety, commonly known as *Olea ilicifolia* (fig. 37), we propose should bear the original and correct name of *O. Aquifolium*. The more deeply cut form we propose should still be called (as it is now) *Osmanthus ilicifolius* (fig. 38). Botanists will with greater pro-

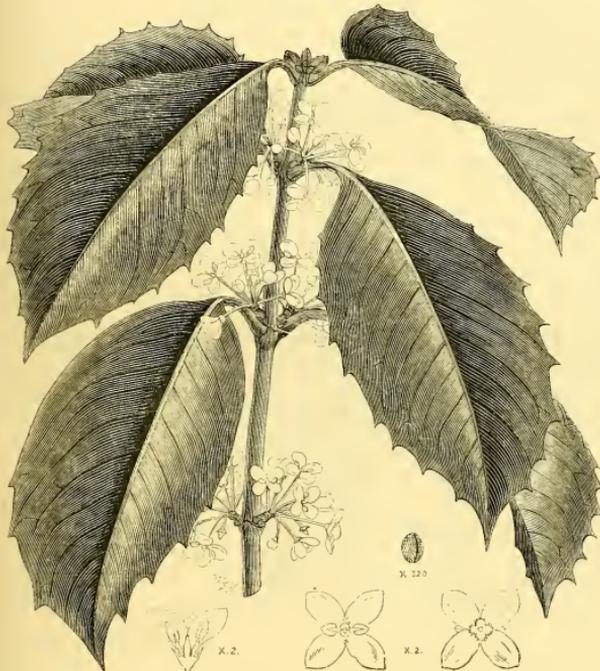

FIG. 37.—OSMANTHUS AQUIFOLIUM.]

FIG. 38.—OSMANTHUS ILICIFOLIUS (FLATTENED BY PRESSURE)

piety call it *Osmanthus Aquifolium* variety *ilicifolius*, though, after what has been before said, it is doubtful whether they would think it worth while to keep up such a variety.

THE KITCHEN GARDEN.

The management of the kitchen garden is a branch of practical gardening which does not receive from gardeners generally the attention it deserves, and, with your permission, I would beg to address myself mainly to my younger brethren in the profession, because it is from their ranks that the head gardeners of the future must be chosen.

At the present time the want of a knowledge of the culinary garden is undoubtedly an ugly fact in connection with the rising generation of gardeners. This no doubt arises from one of two causes—either from want of opportunity, or a disinclination on the part of young men to undergo the laborious drudgery of cultivating the soil.

Journeyman gardeners who can very creditably stake a Heath, turn a large Azalea bush into a shapely pyramid, or neatly train a Peach tree to the wires, are frequently met with, but, whilst these things are all very desirable in their way, how seldom do you find a young gardener who can make an Onion-bed in a workmanlike manner; and I hold that no man has a right to call himself a gardener until he is capable of making a neat and trim Onion-bed.

Again, how rarely do we meet with a young gardener having any knowledge of the different varieties of either hardy fruits or vegetables; and I ask how many are there who can name at sight, say half a dozen sorts of Gooseberries or Strawberries?

* Read at the Darlington Gardeners' Institute on the evening of February 15.

once in July, and once at the beginning of October. It is the greatest addition to the garden I have made for a long time. Now, too, I have got another curious Holly-leaved shrub, the *Osmanthus ilicifolius*, and with this I hope to be equally successful. Other flowering shrubs I have also been adding to the shrubberies, and to the clumps in the outer garden. I cannot bear to see a lawn cut up into little twisted knots of *Verbenas* and *Pelargoniums*, but colour is wanted and flowering shrubs with a few herbaceous plants seem to me to give all that is necessary. So I have been planting among the *Lilacs*, *Syringas*, *Brooms*, *Azaleas*, *Rhododendrons*, and *Laburnums*, several varieties of *Spirea*, and many other beautiful things which scarcely any one takes the trouble to grow, and of which I will tell you more hereafter.

Our fruit this last year was miserable. We had some Figs and Apples, and that was really almost all, when once the summer fruit was over. Our vegetables are generally pretty good, and we grow besides the

The *Crocuses* are late, but their yellow cups are peering here and there above the soil. The Christmas *Roses* have been beautiful, as they always are, and I have planted in one of the shrubbery borders some other varieties of *Heliolepis*, all well worth growing.

The rooks have been noisy among the Elms, for is not to-day the sacred festival of St. Valentine? They and the other birds will now begin to pair and build, and all the sights and sounds of spring will come to us once again. H.

NOTE ON OSMANTHUS.

SOME time since we published a woodcut of a very useful and now well-known evergreen Japanese shrub, under the name of *Osmanthus Aquifolium* (fig. 37). No sooner had we done so than the propriety of our procedure was challenged by various nurserymen and amateurs. Knowing that our correspondents rightly

How many could at sight name three varieties of Peas or Broccoli?

This, I think, a state of things which we ought all to try and remedy without further delay, as I can conceive nothing so humiliating to a head gardener as his being obliged to acquire a knowledge of kitchen gardening from those under him; and what can lower him so much in the estimation of his men as an inability to show them how to properly handle the spade or rake—arts which cannot well be learnt in after life.

I would sincerely urge those who have not had the good fortune to be well trained in the kitchen garden during their apprenticeship to lose no time in placing themselves under some good practical gardener, where kitchen gardening is well done, even if this step should involve pecuniary loss and a sacrifice of personal comfort.

When a gardener enters upon his first responsible situation he should make it one of his first duties to take stock of the kitchen garden, and, having ascertained as soon as possible the requirements, likes, and dislikes of the family, he should arrange his crops for the year, allotting as nearly as he can to each vegetable the proportion likely to be at his disposal, and taking care to avoid a glut or a famine at any time. The following is the plan I adopt.—On some fine day in autumn I go round, pocket-book in hand, and on one page I draw a rough plan of the garden, on which I affix a number to each border and quarter. I then number the succeeding pages to correspond, and proceed to allot the next year's crops to each plot, arranging what is to be dug or trenched, or heavily or lightly manured.

The south borders I consider most valuable, inasmuch as the earliest vegetables are always most highly appreciated, for which reason these borders should always be divided into several parts, of which the first would be occupied by early Peas, sown about the second week in November, and which I consider a good crop to precede Strawberries for the following year. Allow me to remark in passing that notwithstanding all the high trumpet soundings about Alpha, King Edward, Emerald Gem, Blue Peter, or William the First, I have not found one to surpass the old Dillstone's Early for the first dish.

The adjoining piece of ground I give to early Potatoes, always taking care to have them well sprouted before planting, and for the first dish I have not found any better than the "Early Celery," of which however there are many superior kinds, representing so-called improved Asparagus Kidneys. The true sort is easily known, as when commencing their growth, they have smooth yellow sprouts with green points, whilst the bulk of the others have purple sprouts.

In the remaining portions of the south borders places should be found for winter Onions, early Carrots, Turnips, Cauliflowers, Broad and Kidney Beans, Radishes, Lettuces, &c., and, when these come off, the land is usually in good condition for late crops of French Beans, Spinach, Turnips, saladings, &c.

The east and west borders are always useful for a variety of crops successional to those grown under more favourable circumstances, whilst the north border is valuable for late Strawberries, Turnips, saladings, Parsley, herbs, and many other things. I may remark that it is better not to occupy fruit tree borders with tall vegetables or anything likely to injure the trees on the walls.

Turning now to the main portion of the garden, we shall have to determine how the quarters are to be cropped. In the first place a good space must be set apart for Potatoes, and in my experience I have always found that, in addition to mature, Potatoes are much benefited by a little fresh line being applied to the land at planting time, besides the good done to the land, the quality of the Potatoes is much improved. If the land has been recently trenched, and is in good condition after the second early Potatoes, fine crops of late Broccoli, Savoy, or winter greens may be got, and these in turn may be advantageously succeeded by Celery. The year following the main crop of Peas will do very well where the Celery has been, taking care to have the Peas where the Celery trenches were, as in this way the manure serves for two crops.

The part of the garden allotted to Carrots, Beet, Parsnips, and Onions ought always to be trenched at least two spits deep some time during the preceding autumn, and well manured for the crop of Onions.

The best time to sow spring Onions is so soon as

you can trample on the ground without the soil sticking to your boots. I have for a number of years found wood ashes very beneficial to Onions, Carrots, Beet, and Turnips. When the seed is sown I have the drills filled up with the ashes; and the back of the rake is then drawn over the whole, and in due time the seed sprouts strongly through the loose surface, which never cracks, no matter how many showers there may have been in the interim; and, moreover, I never knew Onions, when treated as I have described, to be badly attacked with the grub so common in old gardens. Onions make a very good crop to precede Cabbages, as they are got off the ground early in the autumn, and the Cabbage plants get a good hold of the soil before winter sets in.

You will observe I have not said anything about such vegetables as Asparagus, Globe Artichoke, Seakale, or Rhubarb, which are so often found in back, out-of-the-way places; these I consider most valuable vegetables, and they will well repay any extra labour bestowed upon them. Before making a new plantation of these be sure to have the land well manured and deeply trenched, then, with ordinary attention afterwards, success is almost certain.

For the opportunity of figuring this fine species (fig. 39) we are indebted to the courtesy of J. T. Peacock, Esq., Sadbury House, Hammersmith. At one time it was supposed to be specifically identical with *E. viridescens*, recently figured by us (p. 172), but Dr. Engelmann now considers the two as distinct. In the new *Botany of California*, vol. 1, p. 245, the plant is thus described:—

"Heads middle-sized, or large oval, or cylindrical; often profliferous at the base, with 2-7 obtuse, somewhat tubercled, or woolly, spinules, and 2-7 depressed top; reddish spines, all stout and annulated, recurved or flexuous, 12-18 exterior, the lowest usually hooked, and four very stout central ones; yellowish flowers, 2 inches long, with 40-50 stamens; the petals sepals on the exterior are only twenty-five fringed petals. Stigmas and fruits as in *E. viridescens*." (*E. cylindracea*, Engelm. *Cact. Mex. Bound.* 25, t. 30; *E. viridescens* var. *B. cylindracea*, Engelm. in *Amer. Journ. Science*, 2 ser., 14, 338.)

The plant is a native of the desert of Colorado, and is distinguished from *E. viridescens* by its taller growth, more numerous ribs, larger and more numerous spines, and larger flowers and fruits.

GRAMMATOPHYLLUM REMPELRIANUM, n. sp.

Unexpected pleasures are the best ones. You have believed in a new large-flowered Grammatophyllum, with a lip resembling that of *Phajus tuberosus*, but without its basilar fur? The flowers are larger than those of the favourite Grammatophyllum Ellisi, Lindl., scarcely smaller than those of the three heroes of the beautiful genus, macranthum, speciosum, Wallisi. There it is, the newest sailor from Madagascar. If I rightly understand, *en route* for Mr. Steven's garden. The flowers are like the flowers, as far as I may judge of it from dry specimens, is unusually strong and firm. Sepals oblong; petals ovate; lip trifid, the side lacinia broad, angled, the middle lacinia protracted, narrower, emarginate. There are two grand, obtuse-angled lamellae, and a small one between before the base of column; and three smaller angular lamellae before the end of the lip, and both connected with emerging lines. "Colours?" Don't ask too much. The flower looks as if it had been white or light yellow, but I can take no responsibility. But that I see not decidedly is some purplish hue on the tip of the lip. I obtained the flowers from my excellent correspondent, Mr. Luedemann, 18, Boulevard d'Italie, Paris, the famous Orchid Eden, who once directed Mr. Pescatore's Orchidic Eden. They have been obtained by Mr. Keweler, of Nancy, who is said to have made a curious importation from that mysterious island, Madagascar. H. G. Rehb. j.

* *Grammatophyllum Rempelrianum*. — Grandiflorum; sepalis oblongo-ligulatis obtuse-acutis; petalis multo latioribus; lacinia suboblongo, prope Phajus tuberosus; lacinia latiuscula, subulata, lobis cordatis; lamellis parvis, curvis angulatis magnis geminis in basi media, intersecta curvis angulatis parvis geminis in basi laterali; columnis lacinia apicis incrassatis conjunctis. Videntur hinc generis planta certissime nova. Mosco me unicum pollinatum incompletum vidisse. Madagascar.

PARAGUAY TEA, OR MATÉ.

I WAS delighted to see in your issue of December 30, 1876, that among the novelties presented at the Centennial Exposition at Philadelphia was the Maté, a decoction of the leaves of the Maté tree (*Ilex paraguayensis*), and that a pamphlet had been written on its claims, which pamphlet had been translated into four of the European languages, viz., Portuguese, French, English, and German. The quantity exported is said to be over 95,000,000 lb. annually. The home consumption in Paraná is said to be about 9,000,000 lb. annually, and that of Rio Grande do Sul about four times as much. It is claimed for the Maté that it is very nourishing, and it is spoken of as "the king of teas for a day," and that it has become the favorite beverage of a large portion of the people of South America. It costs about 5*d.* per pound in Rio Janeiro, and 6*d.* is estimated as a supply for one individual for a whole year; but the author of the report wisely adds that it requires intelligent expert and observation to appreciate the real qualities of the plant. This account is just such as a commercial man would give of the wares he offered along with the canister containing the goods, but leaves out of the question the whole art of preparing the "black drink" of the Indians. It is mentioned by the Jesuit Fathers, and from all that can be gathered from authentic sources there were three species of Hollies used—namely, the *Ilex paraguayensis*, *I. Daboon*, and *I. dipyrrena*. Now, this last species grows freely in England. I grew it in Devon, and find and choose it as it is sweeter than the *Ilex Aquifolium* that it requires some skill to tell them apart. The Paraguay species differs widely from the others in size of the leaf and in general appearance; but when I roasted the few leaves I had of this species it yielded the same characters as the other, and it is evident that the tea-roasters of Paraguay could make good tea out of all the three Hollies of the country. Be that as it may, I am delighted to see such evidence of the great importance of an article which I have taken so much pains to bring to the front, and Dr. Antonio Joazim de Macedo Soares deserves the thanks of the whole European family for exhibiting the Maté in its true colours. There is little doubt that if our native Holly grew in the Argentine Republic, its foliage would be roasted, and used as a beverage. It is worth trying every experiment at home; it is not a quackery where 70,000,000 lb. are got annually for home and foreign supplies. *Alex. Forsyth.*

DUPPLIN CASTLE,

THE seat of the Right Honourable the Earl of Kinnoull (see fig. 49, p. 245), one of the most beautifully situated mansions in Scotland, stands about 4 miles west from Perth, and about the same distance from the Bridge of Earn, and commands magnificent views of nearly the whole basin of the Earn. The Castle was accidentally burnt down in 1827, and the present one, which is in the Elizabethan style of architecture, and is most tastefully and elaborately furnished, was rebuilt at a cost of £30,000. Dupplin Castle was visited by Her Majesty Queen Victoria and Prince Albert in September, 1842, in their progress to the Highlands. This neighbourhood was the scene of an engagement on August 18, 1332, between Edward Baliol and the Earl of Mar, which ended in the complete overthrow of the latter. There are some monuments of antiquity in this quarter, but whether they have been erected as memorials of this disastrous battle, or claim an earlier era, is uncertain. There is also here a stone cross of enormous workmanship, quite entire.

At the south of the Castle, and close up to it, is a very neat flower garden devoted to the usual bedding-out plants, with figures cut in the grass. Here there are four very unique bronze vases of large size. At the south side of this garden there is a wall 4 feet high, covered with Ivy. To the right there is a handsome balustrade stair, where neat bronze vases of smaller size than the above have been placed at intervals along the top. This stair leads down to the lower flower garden. Here the walk curves gently to the left round the top of a deep dell, at the bottom of which there is a fine run of water, and in front of the Castle there is a pretty waterfall of good height, which adds much to the appearance of the place. The banks of this beautiful dell have been most judiciously planted with Rhododendrons, Ferns, Spices, Bays, and Yews, with here

and there a fine *Cupressus Lawsoniana* and *Cedrus Deodara*. To the east again there is what is called the Horse-shoe Dell, which forms part of the above, and is planted very much in the same manner. This fine glen is seen in nearly all its extent from the windows of the Castle, and when the *Rhododendrons*, &c., are in flower the effect is most charming. At the top of the dell, and stretching away to the south and east, there is also a flower garden. In this department there are large clumps of *Rhododendrons*, each figure consisting wholly of one variety, edged round with hardy mixed *Azaleas*. As those plants have not as yet attained a very large size, there are some open spaces here and there in the figures. Advantage has

Birch, *Cedrus Deodara*, *Thujaopsis borealis*, *T. gigantea*, and an immense specimen of Portugal Laurel.

This garden is intersected through its entire length by a gravel walk 7 feet wide, which at the south-east corner turns round sharply to the left, and leads straight on to the dell above-mentioned. At this point a complete clearance has been made of nearly everything lofty that would obstruct the view from the Castle. Looking north by east, the prospect is almost univalued. The eye takes in nearly the whole of the lower valley of Strathearn, with the beautiful River Earn winding its way in gentle curves towards the sea. About 4 miles distant is seen the finely-wooded

and a little further off is Condie, the seat of Lawrence Oliphant, Esq. One cannot fail to be struck with the beautiful appearance of this district. A little further on stands Ardasie, the seat of the late Donald Lindsay, Esq., with its beautiful deep dell, full of openings, where one gets sweet glimpses of rural scenery. A little further west stands Invermay, celebrated in song. Here there is a finely sculptured stone, of a very ancient date. Two miles further off is Duncrub, the residence of Lord Kollo, and looking still to the west, a good distance off, are seen the woods and mansion of Ardoch, the seat of G. Home Drummond, Esq. Here there is a Roman camp, a celebrated remnant of antiquity, considered the most

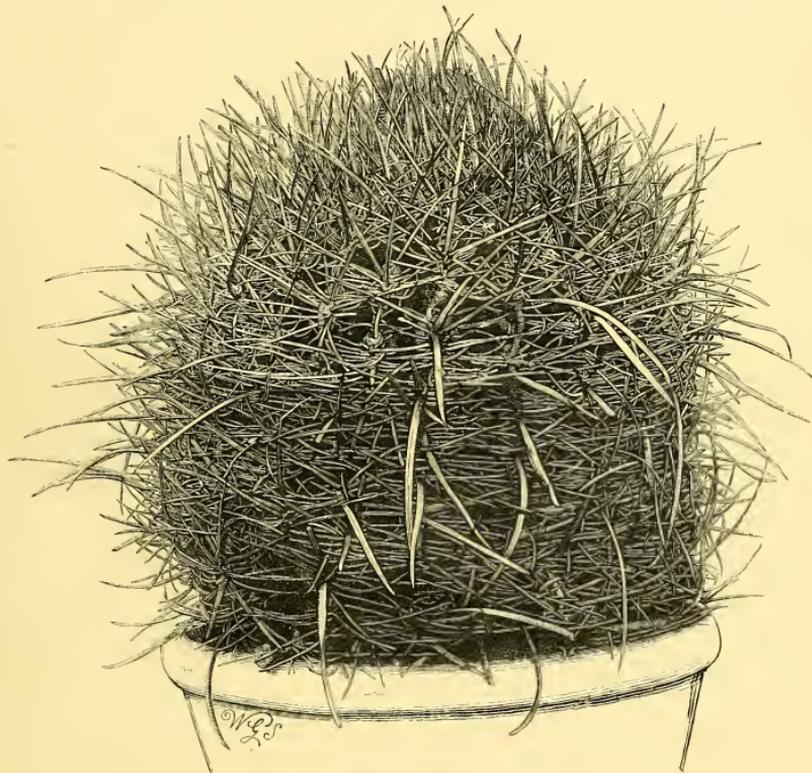

FIG. 39.—ECHINOCACTUS CYLINDRACEUS.

been taken of these to sow the single scarlet Poppy, and when in flower the effect at a distance is very striking indeed. Here there are a few very fine specimens of Swedish Junipers, Irish Yews, &c., and in the centre of the garden there is a small stream of water, which is crossed by a very neat rustic bridge. The banks of this stream, which slope down to the water, have been planted with large clumps of Bays and common Yews, all neatly and evenly cut back to within 2 feet of the ground. Here there are a few very fine specimens of *Araucarias*, averaging 40 feet in height; and also large figure-beds of *Rhododendrons*, each figure planted with one sort only, and bordered with *Azaleas*. The same style is carried out here as in the first-mentioned. There are a few very fine trees at stated distances of Silver Fir, Weeping

and picturesque Hill of Moncreiff, with Moncreiff House, the seat of Sir Thomas Moncreiff, Bart., on its southern base—a fine place, surrounded by many both natural and artificial beauties. In the distance the view is bounded by the hills in Fifeshire, some 20 miles off, and, nearly opposite, the thriving town of Dundee. Turning west, the whole range of the Ochil Hills is seen. On their northern slopes there are the prettily situated little towns of Newburgh and Abernethy. The latter is supposed to have been an ancient Pictish capital. Here there is a very fine specimen of a round tower, in good preservation, 74 feet in height, and built about the middle of the twelfth century. On again, there is the picturesque Pass of Glenfarg and Freeland, the seat of Colonel Wood, with its grand old Lime trees,

perfect of its kind in the kingdom. The whole measures 1060 feet by 900 feet, and was capable of containing over 20,000 men. To the north in the distance from this point is seen the pretty village of Crieff, with the hills all about Drummond Castle, &c.

About 6 miles east from Crieff are the ruins of Inchafrae Abbey. It was the Abbot of Inchafrae that said mass in sight of the Scottish army at Bannockburn, and exhorted them to be valiant in combat for their rights and liberty; and to the east again there is Methven Castle, the seat of W. Smythe, Esq. Within the grounds of this mansion there is an old Oak, called the Pepperwell Oak, with a trunk 18 feet in circumference. A little to the north of the above place is Lynedoch House, and near to it, in a secluded spot called Dronch-haugh, at the foot of a

beautiful bank or cave of the same name, on the River Almond, is the grave of Bessie Bell and Mary Gray, celebrated in pathetic song. Bessie Bell, according to tradition, was the daughter of the ordinary brewer, and Mary Gray of the Laird of Lynedoch, mutually attached in strong and tender friendship. They lived together at Lynedoch when the plague broke out in 1645, and to avoid it they retired to a romantic spot called Burnbraes, on the estate of Lynedoch, and there in a bower or temporary dwelling lived in complete seclusion. A young gentleman of Perth visited them in their solitude for the purpose, it is said, of supplying them with food, but unhappily he communicated to them the very pestilence from which they had fled. Falling victims to the disease, they were, according to the usage of the period, refused sepulchre in the ordinary burying grounds, and they sleep together, as they had latterly lived, amid a scene of solitude and romance—

"They thocht to lie in Methven kirkyard,
Among their noble kin,
But they maun lie on Lynedoch brae
To beek forenent the sun."

The late Lord Lynedoch put an iron railing round their grave, and planted several Yew trees beside it.

From this district fine views are had of the highland mountain ranges of Ben-y-gloe, 3704 feet, the lofty hills that form the northern part of the great Athole forest, and the finely wooded slopes all about Dunkeld. To the east from Lynedoch House stands the ancient Castle of Ruthven, the scene of the memorable incident known in Scottish history as the Raid of Ruthven. Here tradition has it that an extraordinary exploit of a young lady has added to the notoriety of this Castle, and has given the name of "The Maiden's Leap" to the space between its two towers, which though now united by late buildings were originally separate. The lady was a daughter of the first Earl of Gowrie, and her exploit consisted in leaping in a fit of terror from the leads of the one tower to the battlements of the other, a space of 9 feet 4 inches, and over a chasm of 60 feet. In the middle distance, about 2 miles off, is Scone Palace, surrounded by fine healthy plantations of large extent, with the River Tay sweeping round its western base; and 2 miles to the south is the fair city of Perth, with its beautiful surroundings. A short distance to the east stands Kinfauns Castle, the residence of Lady Grey. Such are some of the environs of this grand old place.

Returning to Dupplin, and entering by the north lodge, there is here an avenue of good breadth nearly mile in length, which runs on in almost a straight line for two-thirds of its length, when it turns sharply to the right, and leads on with a gentle curve to the left till the Castle is reached. To the right from the lodge, and leading on to the south, there is a fine row of grand old Beeches, while here and there between these trees Scotch Fir has been planted as underwood, which adds very much to the appearance of the place during winter. In this avenue an octagon is passed through, at the east end of which, and extending on to the lodge, there is a row of very healthy *Araucaria imbricata*, from 15 to 20 feet in height. Between these, and a little in front, are clumps of *Rhododendrons* recently planted, which can be seen in full time to produce a good effect. In front of the Castle, and stretching away to the north-west in a straight line, there is an avenue 20 feet broad, passing through a thriving plantation, with many trees in it of very large size, and in it about 600 yards from the Castle up this avenue, and to the left, there is the Pinetum, occupying a large space, and finely sheltered. Here I found the ground intersected in all directions with grass walks 20 feet broad. I have noted a few of the plants, with their heights, that struck me as being particularly fine:—

Taxodium sempervirens	Feet.	Thuja Loblii	Feet.
<i>Picea nobilis</i>	35	<i>Cedrus Deodora</i>	40
<i>Pinus grandis</i>	35	<i>Abies Douglasii</i>	40
<i>Northmanniana</i>	40	<i>Weylandia gigantea</i>	33
<i>Phedonatica</i>	40	<i>Cryptomeria japonica</i>	30
<i>Thuja Warreana</i>	40	<i>Cupressus Lawsoniana</i>	25

I may here mention that in this department the Earl of Kinnoull personally takes great interest, and Lady Kinnoull has been long known as an ardent lover of flowers, and for her fine taste in gardening matters. She at her own expense some years ago set agoing what is termed a Parish Flower Show, where prizes are given to the cottagers for the best-cropped kitchen gardens, and nearest and best arranged flower-plots in front of their houses, which has been the

means of doing much good among those whom it was intended to benefit. May such kindness and generosity be always appreciated as it deserves. In Lady Kinnoull's old and infirm have a true friend.

To the west of the above there is the parsonage, a very neat, substantial building; and a little to the south there is what is termed the western approach, in the midst of which, about midway between the entrance and the Castle, there is a circular piece of grass, kept short, of about 3 acres in extent, where the avenues sweep round on both sides. Round this circle there is a row of immense Beeches, with clean stems, and trunks branchless to a great height. From the Castle the road leads down to the kitchen garden, by a grass walk some 10 feet broad, through a deep well wooded glen. Here there is a line of Spanish chestnut of very large size and great age; and to the left, on the steep hillside, there are wonderful specimens of *Cupressus Lawsoniana*, *Yew*, &c. Just outside this plantation, and before entering the kitchen garden, there is a space of ground in short grass, sloping sharply to the south. Here there is an *Araucaria imbricata* some 40 feet in height, considered one of the most perfect specimens of its kind in the country. A little from the above there is a *Cryptomeria japonica* 30 feet in height, and bushy in proportion; a grand plant.

THE KITCHEN GARDEN.

Entering the kitchen garden from the west there is first a greenhouse, 100 feet by 17 feet, filled with a miscellaneous collection of over 1000 plants, largely the following *Camellias*—*imbricata*, 11 feet by 5 1/2 feet; *Triumphans*, 10 feet by 4 feet; *Mathotiana*, 7 feet by 3 feet; *Lady Hume's Bush*, 4 feet by 4 feet; *Frankfortensis*, 8 feet by 4 feet; *Jubilee*, 5 1/2 feet by 3 feet, with a host of others of smaller size, also many large plants of *Rhododendrons* in tubs. The next is a small house, 13 feet by 9 1/2 feet. This is chiefly planted with *Tea Roses*, which are found very useful for cutting purposes during the season. The next is a Fig-house, 55 feet by 10 feet, planted chiefly with Lee's Perpetual, good healthy plants, bearing a fine crop all the year. The next is a Rose-house, 12 feet by 10 feet, planted with *Roses Lamarque* and *Climbing Devonians*, both sorts very fine; next a Peach-house, 90 feet by 10 feet; *Grosse Mignonne*, *Noblesse*, and *Chancellor* are the only three sorts in this house—good trees, and very fine crop. The next is a Nectarine-house, 45 feet by 9 1/2 feet, the trees in it not yet in a bearing state; and next come a Plum-house, newly erected, 40 feet by 9 1/2 feet, a viney, 60 feet by 9 1/2 feet, and a Peach-house, 30 feet by 9 1/2 feet; the last two are in course of erection.

To the extreme east of the garden there is the Melon-ground, &c. In it the first house is a Cucurbit-house, 40 feet by 9 feet. The second is a Gardenia-house of the same size; the plants in this house are remarkably well managed, and flower most abundantly. In front of the last-mentioned house there are two brick pits, 80 feet by 6 feet, and to the south, in a lower division, there is a new span-roofed house, running south and north, 21 feet by 11 feet. There are other two houses of the same dimensions as the last, in course of erection. These three houses are to be entirely devoted to plant culture. In front of them there is another range of brick pits, 70 feet by 6 feet, used for growing on young soft-wooded plants, &c.

Returning to the kitchen garden, there are in the centre three divisions of houses, running east and west, on three different elevations, divided by a span-roofed verandah, 66 feet by 11 feet. This house is planted its entire length with climbers of the finer sorts, and on its different stages there are some excellent plants of *Camellias*, among which are the following—*alpa* plants, 10 feet by 4 feet; *Colvillii*, 10 feet by 5 feet; *Marchioness of Exeter*, 6 feet by 4 1/2 feet; and many others that might be enumerated. All the houses are entered from this verandah, right and left, with a handsome stairway leading down to each division. Entering from the north end, the first to the right is a Gardenia-house, 46 feet by 10 feet, filled with plants of good size, and remarkably healthy. To the left is a house 48 feet by 10 feet, filled with finely-established plants. The second division to the right is an Orchid-house, 36 feet by 15 feet. In this house I found a very select collection of the above, among which the following were very superior:—*Lælia* anæta, *Dendrobium Dalhousiana*, *D. nobile*, 10 pots of *Calanthe vestita*, throwing up grand flower-spikes; *Cattleya crispata superba*, *Phajus grand-*

folius and *P. Wallichii*, *Corylogyne cristata*, *Dendrobium Wardianum*, *D. Devonianum*, *D. densiflorum*, and *D. thyrsiflorum*, *Vanda savais*, &c. To the left is a plant stove, 26 feet by 15 feet, with a very select collection, but the growth of large plants is not encouraged, as many in this department are required for table decoration.

Entering from this by a few steps down, there is an intermediate house, 28 feet by 10 feet, principally filled with cool Orchids. The next is a general forcing pit, 36 feet by 6 feet, with a small stove leading off from it, used as a nursery for new and rare plants as occasion requires. To the right is a Fern pit, 36 feet by 6 feet, containing a choice collection in fine condition. Leading off from this to the left is a miscellaneous intermediate house, 28 feet by 11 feet, with a small stove adjoining, principally filled with choice exotic Ferns. Descending to the lower division, to the left is the potting shed, 48 feet by 15 feet, and to the right is the stockhole, above which is a greenhouse, 27 feet by 14 feet, principally used for wintering *Pelargoniums*, and resting bulbous plants when past flowering. At the extreme south end of the verandah are three lean-to vineries. The centre one is a Black Hamburgh house, 46 feet by 16 feet; a most excellent crop all over the house. To the left is a late house, 31 feet by 16 feet, planted principally with Black Alicante, Lady Downe's and Gros Colman, and other fine crops. To the right is a Muscat-house, 31 feet by 16 feet, with a choice crop. I may mention that the whole of these divisions are heated by one of Crombie's boilers, which does its work most efficiently.

The kitchen garden here is over 8 acres in extent, and all sorts of crops are had in abundance. Over 200 Apple trees on Paradise stocks have been planted in it lately, most of which have done well, and carried fine crops last season. To the north of the garden there is the young men's dwelling—a most substantial two-storied erection, most comfortably fitted up, to the west of which, on a steep, sloping bank, there are a few extraordinary specimens of *Cupressus Lawsoniana*, perfect models both in shape and size. To the south of the garden, on a gentle eminence, stands the gardener's house, a handsome modern erection of two storeys, which for situation, comfort, and convenience is just what a gardener's house ought to be.

In concluding this cursory notice I have to compliment Mr. Browning, his Lordship's head gardener here, who is well-known as a thorough enthusiast in his profession, on the next condition and high state of culture that I found everywhere in, and which gives ample evidence that he was a faithful and painstaking gardener. *John Downie, West Coast Nursery, Edinburgh.*

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—If the stove is a good light house, and the plants are in a vigorous healthy state and well elevated up to the glass, the temperature may now very shortly be increased, letting it be in the daytime 80° or 85°, on very bright days, 5° higher will do no harm so early as this in the season. I would rather let the thermometer run up as high as 90° than give air, more particularly at the roof, the external air being so different to what the plants at this time require. A lower temperature than above recommended must be maintained till later on, where the house and plants are not such as here spoke of. Stop the fires sufficiently soon in the morning, when there is a probability of the day being bright, to prevent the house getting too hot. All potting here should be got on with as quickly as possible, and brought to a conclusion as soon as circumstances will permit. The syringe may be used more freely now than the days are lengthening; but it is necessary to exercise judgment in this matter too much syringing is not good for plants that have delicate roots, and will do more harm by excess of moisture to them. All twining and climbing subjects must be well and regularly attended to in training their shoots, so as to never let them get entangled. If this occurs, the points are sure to be injured more or less in separating them. Where all the stove plants are grown in one house, those that require shading should be put at one end, leaving such as do not need it at the other. It sometimes happens that much mischief is done through the plants that are not protected from the sun by shading, but they are. It will be well to get the shading ready, so as to prevent this happening. The space devoted to the roots of stove climbers is often very small, and as those that are planted out are principally of a vigorous, tree-growth habit, and the soil is very liable to become too poor to enable them to either flower or grow as they ought to do. It is a good plan every

year to remove as much of the surface soil as it is possible to get away without much disturbance of the roots, replacing it with good new material. *Ardisia crenulata* and *crenulata alba* are extremely useful decorative plants. They may be increased either by seeds or cuttings. They are best to be sown in shallow pans filled with sandy peat, just covered with sand and put in a brisk heat. As soon as the young plants are big enough put them singly into small pots. If last year's seedlings have not been potted on, they should be put in now, giving them a shift; do not, however, let them have too much root-room, as, like all other plants intended for the same purpose, they are much the best in as small pots as they will succeed in. *Achimenes* started some time ago possibly in the autumn, and are now ready to bloom in. When grown in pots they are the most useful for ordinary decorative purposes of a comparatively small size. Do not put too many bulbs into a little pot, and when the growths get 4 inches long stop the plants; this will cause them to break out, and be bushy and dwarf. Baskets for *Achimenes* ought to be small or medium-sized, unless the houses they are intended for are very large. They are the best made of galvanised wire, and they should be covered with a material like the one which has to be put to prevent the soil coming out.

If *Sarracenia* are not yet potted, they should be attended to without delay; it is absolutely necessary to renew the soil entirely every year, or else it gets entirely bad state, and the plants will not be able to come out equal parts of good fibrous peat, from which the early portion has been got away, and chopped sphagnum, with which mix a fifth of crocks broken small and some sand. *Nepenthes* likewise should not be seen to. If they need it, give them larger pots than the very best not to let them have too much root-room. The roots of these plants are of the tenderest description, and always look as if they were dead. There must be no potting be attempted getting the old soil away, or reducing the bank. This being settled, it is to be noted that the soil and water material they are put in should be such as will last long; a mixture similar to that recommended for *Sarracenia* will answer well for *Nepenthes*. The reason many do not succeed in growing them in a satisfactory way is that they keep them too dark, too close, and too far away from the light. They ought to be hung up close to the glass, and, as they need more head-room, they can, of course, be lowered. They look the best in baskets, but these are not the best as their roots are so tender that they protrude through. The pots can, however, be placed in baskets, thus having the advantage in appearance, without its being at the expense of the well-being of the plants. Both *Nepenthes* and *Sarracenia* ought to be watered in the same way as they are growing. The *Nepenthes* also will be benefited by syringing in the afternoons. *T. Baines.*

FLOWER GARDEN, ETC.

Shrubby *Calceolarias* which have been struck in frames or boxes may soon be removed to a sheltered place to remain until planted out; previous to removal the lights had better be taken off daily (weather permitting) and the plants get all the air possible in order to harden them for the change. Have protecting material at hand in the event of frost, when the plants can be covered as required. After the plants get well established they had better be looked over and all their tips pinched out, which will make them grow bushy in the frames where the *Calceolarias* were struck can then be filled with *Lobelias*, *Fyrethrums*, *Verbenas* and such things. Stocks and *Asters* may be sown in boxes or pans, and set in a moist warm place where they will soon come up strong, but take care they are not too close together. Such plants may be sown up weakly; when fit, they can be pricked out and receive attention. Where heat cannot be applied, keep the plants as dry as possible in cold weather, and where watering must be done let it be looked over in the day and the soil surface in the morning may be dispelled before night. Herbaceous borders will soon require attention, as the mild weather has brought forward the plants before their usual time. The plants may be divided and reduced in size as required, and the blanks filled with new and fresh labels added where worn out. New borders may be made by trenching and preparing the ground; after being properly levelled the tallest growing kinds should be arranged along the back row and the shorter ones brought to the front. Such borders may be old-fashioned, but when well arranged according to height and colour are very interesting in certain places. The planting of trees and shrubs had better be brought to a close as early as possible; where the soil is so recent, and planting may be done in a better manner than with light porous soil. Lawns and pleasure grounds never looked fresher and better at this time of the year, not a leaf injured by frost. *Laurelums* are now in full flower, and at a distance looking like *Thorns* in May, and at a close view are undistinguishable from them, and if frost does not come soon, the mowing machine must be had in

readiness; have the lawns well swept, rolled, and made ready for mowing. *T. Blair, Shrewsbury Park.*

FRUIT HOUSES.

VINES.—To have Lady Downe's, Mrs. Prince's Black Muscat, and other late kinds of Grapes, thoroughly ripe and in the best condition for keeping without shrinking for some months after removal to the Grape-room, the buds in late houses should be fairly potted in the first week in March; and as thoroughly ripened wood and roots have a great deal to do with abundant shows and free setting, a little extra attention to firing and early closing, up to the stoning period, will be well repaid by the time so extra being given to the collection of the fruit, which should be complete by the first week in September, when the outside borders may be covered with a good layer of dry Fern and shutters over it to throw off heavy rains. Assuming that all inside borders have been top-dressed and put into a growing state by the liberal application of tepid liquid manure, houses which have been started may range from 5° at night to 65° by day, with a rise of 5° more when closed with sun-heat. Sprinkle three or four times a day with vigorous young roots in a horizontal position until all the buds have started into growth. Attend to disbanding and tying out in succession-houses. Remove all surplus bunches from free setting kinds, turn the points of the bunches of Muscats up to the light, and increase the temperature to 70° at night, with a rise of 15° by day when in bloom. If artificial fertilisation is resorted to, foreign pollen should be applied with a camel-hair pencil; this process may be more tedious, but it is safer and does not heat the house so much as when the weather is warm, as the perspiration sometimes causes a small spot to appear on the apex of the berries when ripe. Pot Vines carrying full crops of fruit will require liberal supplies of liquid manure 10° warmer than the temperature of the house in which they are growing, and plunged in fermenting material the quality of the fruit will be greatly improved if the roots are allowed to run into the bed. *W. C.*

MELONS.—Although nearly all the early Melons are grown under the influence of hot-water, there are a great number of gardeners who still have to depend upon fermenting material, either in pits or under frames, for their first crop. Where fermentation alone is depended upon for the production of a steady heat, it is better to decrease the temperature of the preparation of the materials, otherwise the heat is liable to come to a stand just when an extra spurt would be acceptable. The best materials for the beds are good stable dung which has not been robbed of its droppings for the Madroppo-houses. Oak leaves collected in a dry state and kept under cover until wanted for use. These should be thoroughly mixed together in a heap on a dry bottom, protected from heavy rain, and turned twice in the course of a fortnight, to prevent burning. Select a light, airy situation on a dry bottom on which to build the bed. If only just large enough to receive the frame so much the better, as new linings can be brought into nearer proximity to the roots when the fruit is finishing. Make 5 feet high at back, tread firmly, put on the frame at once, keep close until the heat rises, when the soil may be introduced. If the bed is likely to get very hot 6-inch drain pipes may be laid across under each hill, which should be small at first, very firm, and rest upon solids of stiff loam turned grass-side downwards. Nothing is gained in turning the plants out too early; the cultivators will therefore do well to have vigorous young stocks ready for planting when the heat in the bed has declined a little below 90°. Guard against injury from rank steam by keeping the lights down at night and day until danger is past. *W. Coleman.*

Figs.—A temperature of about 60° at night, and 65° by day, will be maintained in a house where the fruit is swelling, unless very unpropitious weather abounds, when it would in those houses which are not efficiently heated be advisable to be content with a few degrees less, particularly at night, than to have resort to excessive heat being continuously. None of these subjects and in all others of this nature take advantage of the presence of daylight to accelerate forcing operations. See, therefore, that the fires are pushed on early in the morning, so that the standard heat for the day is attained by the advent of daylight. At the present time the condition of the earlier started trees will be such as to require some stimulating agent in a mild form mixed with the water, which should be given at about the same temperature as the house; and in this important matter the same rule should be followed, both as regards trees in pots or otherwise. Continue to give the useful attention to pinching out the points of the shoots which are to be stopped as before advised, and at the earliest opportunity it can be effected, allowing the plants to be planted in the house as they run when the space in the house will admit it. Keep the atmosphere in the house sweet and agreeable

to vegetation by means of sprinkling and syringing, applying the latter with considerable force over any leaves which may be infested with red-spider. Bring to a close at once the necessary operations of cleaning and training of the trees, &c. in late houses. As Fig trees are so readily obtained from suckers, other means of propagation is not in private establishments often requisite, excepting in the case of new varieties. Those shoots of from 3 to 6 inches long, which can be got out of the last year's wood, and which are the best for the purpose. Eyes will also strike very freely if they be placed in a warm house or pit, and be plunged in a brisk bottom-heat, in both cases employing sandy soil and well drained pots. *G. T. Miles, Wycombe Abbey.*

HARDY FRUIT GARDEN.

PROTECTION OF FRUIT BLOSSOMS, &c.—As a natural consequence of the extraordinary mildness of the weather up to the present time, all kinds of hardy fruits are at least a fortnight or three weeks forwarder than they usually are at this season; and unless means are at once taken to retard the opening of the blossoms of Apples, Peaches, and Nectarines, and to guard them against frost, should such an event occur, the chances of a crop will be very slight indeed. So long as the branches are shaded or kept close to the sun in any other way, every gleam of sunshine by warming the bricks immediately behind them gives a great impetus to their growth. The best that can be done at present is to unfasten the trees from the wall and so place the branches where they are the most exposed to the sun by putting mats or a few Laurel or other evergreen branches in front of them during bright weather, the effect of which will be to cause a current of air behind, whereby the expansion of the buds will be retarded, and the fruit will be smaller, and appear to run to wood, and the blights in front of these will be no necessity to detach them from the wall, as these may be let down to ward off the sun till the flowers expand, when they will be in position to protect them by night.

PRUNING.—In the advanced state both Peaches and Appriots are now in, pruning should be no longer deferred, and in the case of the latter attention ought principally to be directed to keeping the spurs as short together as they possibly can be. This may be done by shortening back all such as are well situated, leaving just sufficient flower-bud for a crop, and by cutting entirely out any that are gnarled and project far away from the tree, as these are perfectly useless, owing to the fact that they are so far from the wall, from which they derive little or no benefit as regards protection, and only prevent other healthy young shoots starting out to occupy their places. In the cultivation of the Appriot I find that the best way of pruning and managing the trees to secure a crop of fruit is to adopt a compromise between the spur system and that of laying in young wood of the previous year, after the manner of Peaches; this I do wherever space can be found, as it frequently occurs when the trees are so close together that the cut off by frost those nestling close to the warm bricks escape injury, such a difference is there in the degree of heat in the two places. Of course these young shoots, to furnish vacant spaces, have to be thought of and left when the summer disbanding and stopping takes place, and little can be done in the matter now beyond turning to account any that may be so situated as to be available for the purpose. As regards Peaches and Nectarines, the skillful pruner will look well to furnishing the trees with medium-sized wood, and to see that the spurs are equally well distributed over the entire surface, having special regard to the bottom, where, unless well managed, they are sure to run bare. Nothing injures either a Peach or Nectarine so much as allowing them to make those gross and unproductive shoots, which constitute a portion of sap to themselves, and starve the rest of the plant. If any of these were overlooked at the time when they should have been removed, cut them away at once, unless absolutely required to fill in any bare space, and the same rule should not be covered by such as is of a more useful character. Unless the trees are infested with scale, the labour and time spent in painting them over with the many mixtures in use is completely thrown away, and when such injurious insecticides as Gishurst Compound gets into hands that are not particular as to the quantity used, much harm frequently results. Spider and green-fly, the most troublesome insects that infest Peach trees, lurk in the joints and nail holes in the walls or deposit their eggs there, and time may be wasted in applying a wash of lime and sulphur mixed with soft soap, glue, and sulphur mixed up as a wash, which will effectually seal them in without causing the walls to present an unsightly appearance. Bullfinches and sparrows will now come in, and, according to the standard, the Damson and Gooseberry bushes, the latter of which may be readily protected by syringing over them freshly slaked lime made to the consistency of whitewash. *J. Sheppard, Woolverstone.*

THE
Gardeners' Chronicle.

SATURDAY, FEBRUARY 24, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Feb. 26. Sale of Orchids at Stevens' Rooms, &c.
WEDNESDAY, Feb. 28. Sale of Camellias, Shrubs, Roses, &c., at Stevens' Rooms.
THURSDAY, Mar. 1. Linnæan Society: Meeting at 8 p.m.
SATURDAY, Mar. 3. Sale of Mr. Wilkins' Collection of Orchids at Stevens' Rooms (two days).
Crystal Palace: Exhibition of Artificial Flowers and Fruit.

WE have received the programme for the horticultural and agricultural departments of the Universal International Exhibition at Paris in 1878, from which we extract the following particulars. The Exhibition will be open from May 1 to October 31. A garden will be formed in the Champs de Mars, in which will be erected hothouses, greenhouses, tents, &c. Every description of horticultural produce may be exhibited, and all classes of plant growers, whatever their nationality, are invited to compete for prizes (*recompenses*). Twelve series of exhibitions will be held in regular succession, each lasting a fortnight. Every exhibitor will have to allow his plants to remain for the whole fortnight, and to take care of them for that period. Fruit and forest trees, ornamental shrubs, and the like must be planted before March 15, 1878, and if possible in the spring of 1877, and will remain throughout the whole period. Soil and other requisites will be provided by the Commissioners. All plants must be duly labelled, and in the case of seedlings the name proposed must be enclosed in a sealed envelope, which will not be opened if the plant does not receive an award.

For the first series, May 1 to 15, 1878, the principal subjects invited are Azaleas, eight classes; Conifers, fourteen classes; new plants, new seedlings, &c., thirteen classes; stove plants, eighteen classes, including foliage plants, four classes; Orchids, one class; Cacti, ten classes; Selaginellas, three classes; greenhouse plants, thirty-five classes, including Heaths, Ferns, Wallflowers, Cinerarias, Agaves, Aloes, Yuccas, Rhododendrons, Epacris; hardy plants, nineteen classes; forced shrubs, eight classes; Pæonies, sixteen classes; Clematis, Tulips, Stocks, vegetables, &c.

The second series, May 16 to 31, includes classes for Rhododendrons, trained fruit trees, Orchids, Ferns, Azaleas, Calceolarias, Clematis, hardy shrubs, herbaceous plants, Roses, vegetables, &c.

The third series, June 1 to 15, comprises Orchids, eight classes; Pelargoniums, eight classes; stove, greenhouse, and hardy plants, including Roses, &c.

The fourth series, June 16 to 30, will be devoted to Palms, Cycads, and Pandanads, with Roses, Pelargoniums, various stove and greenhouse plants, herbaceous and alpine plants, &c.

The fifth series, July 1 to 15, is to be devoted to Pelargoniums and Gloxinias, Orchids, Nepenthes, economic plants, Begonias, Sarracenias, hardy plants, Roses, &c.

The sixth series, July 16 to 31, comprises stove plants, herbaceous plants, Hollyhocks, Gladioli, Phlox, fruits, &c.

The seventh series, August 1 to 15, is principally devoted to Fuchsias, Gladioli and Hollyhocks, together with climbing plants, Heaths, Dahlias, Lilies, Tropæolums, fruits, &c.

The eighth series, August 16 to 31, includes Aroids and Tree Ferns, seventeen classes; Orchids, Achimenes, Fuchsias, Dahlias, Phlox, &c.

The ninth series, September 1 to 16, is to be mainly devoted to Dahlias and Asters, with classes for Crotons, Allamandas, Veronicas, with other classes for fruits and deciduous trees.

For the tenth series, September 16 to 30, the

competition requested is for Aralias, Dracænas, stove plants, Fuchsias, Pelargoniums, Dahlias, Gladioli, cut Roses, hardy Bamboos, annuals, &c.

The eleventh series, October 1 to 15, is specially devoted to fruits of all kinds, together with Orchids, Chrysanthemums, &c.

The twelfth series, October 16 to 31, is to be particularly set apart for vegetables of all kinds, together with forest trees, seeds, and Chrysanthemums.

On each occasion vegetables and fruits may be shown according to the season. It will thus be seen that special classes are framed for the main groups of plants, so timed as to suit the period when they may be expected to be in greatest perfection; but, in addition, subordinate classes are allotted to them at various other exhibitions, so as to secure early and late varieties, as well as the main crop, if we may so speak. Nothing is said as to the nature of the *recompenses* to be allotted.

In due time we suppose our Government will cause the programme to be translated for the benefit of British exhibitors.

The Botanical Society of France is, we learn, engaged in organising a Botanical Congress during the Exhibition, and doubtless other arrangements in which horticulturists are interested will be hereafter made public.

— A CORRESPONDENT writes to ask if the FLOW OF SAP IN TREES is influenced by the age of the MOON?—

"Two or three years ago I was much interested by seeing in your journal that a distinguished vegetable physiologist was making experiments on this subject, and was nearly convinced of the truth of a theory that the flow of sap in trees was greatest at the full, and least at new moon. I then drew attention to the circumstance that the architects of ancient Rome believed them to be so, and that in their contracts for timber works they specified that the timber should be cut in winter, and at the wane of the moon, the reason for this being that there was then least sap in the wood. Can any one tell me whether any additional confirmation of this theory has been obtained? C. W. D."

— We have received from Mr. JAMES MENZIES, gr. to W. R. FRYER, Esq., South Lytchett, Poole, Dorset, a sample of *CAMELLIA BLOOMS*, cut on the morning of February 17 from plants growing in the open air at that place. Mr. MENZIES states that, owing to the mildness of the season, the trees have been more or less in flower all the winter, and are mostly now in full bloom, and will last up to the middle of May. The flowers, about three dozen in number, and of various colours, are of fine size and very bright. With such a climate and such a display as the Camellias at South Lytchett now afford, no wonder that that place is called the Sans Souci of England.

— Mr. CANNELL sends us cut flowers of *FUCHSIA SLENDENS*, which he states is in very fine condition with him just now. We are surprised that this beautiful and very distinct *Fuchsia* is not more frequently seen.

— The complimentary DINNER to Mr. JOHN LEE, on the occasion of the retirement of that gentleman from the firm with which he has been so long connected, came off with great success on the 15th inst. The dinner was presided over by Dr. HOGG. It was well served by the manager of the Horticultural Club, to members of which and their friends it was limited; the tables were decorated by Mr. WILLS, and the dessert enriched by the contributions of Mr. KILLICK. Mr. LEE acknowledged in heartfelt and touching terms the compliment paid him, and gave an interesting sketch of the history of this old-established firm, embracing much of general interest concerning horticulture in general. If the firm of LEE had done no more than introduce the *Fuchsia*, they would have earned the gratitude of all flower-lovers.

— *Nature* states that Mr. DARWIN has received as a testimonial, on the occasion of his sixty-ninth

birthday, an album, a magnificent folio, bound in velvet and silver, containing the photographs of 154 men of science in Germany. The list contains some of the best-known and most highly-honoured names in Europe. He has likewise received on the same occasion from Holland an album with the photographs of 217 distinguished Professors and lovers of science in that country. A German correspondent informs us that the German album bears on the handsome title-page the inscription—"Dem Reformator der Naturgeschichte, CHARLES DARWIN."

— It is proposed by the horticultural friends of Mr. JOSEPH DALE, of the Middle Temple Gardens, to present him with a suitable testimonial in recognition of his services as a promoter of the culture of the Chrysanthemum in towns. Mr. DALE first introduced the Chrysanthemum into the Temple Gardens, so far back as 1841, and it has flourished there ever since, furnishing annually an abundance of proof of what may be done with flowers, and with the Chrysanthemum in particular, in the heart of a smoky city. Those of our readers who may be willing to assist in such a desirable proceeding should communicate with Mr. J. S. HOBSON, Gray's Inn Chambers, High Holborn, W.C.

— An interesting question with reference to the fertilisation of *ERUVALVE FEROX* has presented itself. The plant is usually propagated by seeds, the offspring of the flower's own pollen on its ovules. This, then, is a case of self-fertilisation, which might be expected to be productive, in the long run at least, of more unfavourable results as to the number of seeds, vigour of plants, &c., than appears to be the case. In order to arrive at such conclusions on this matter it is requisite to know definitely whether the plants in British gardens are the offspring of recently introduced Indian seeds, or whether they are the lineal descendants of the plant originally introduced in 1809.

— Under the heading "Industrial Celebrities" the *British Trade Journal*, in its last issue, has given a portrait and biographical notice of Mr. MARTIN HOPE SUTTON, as the head and virtual constructor of the well-known firm of "SUTTONS." The memoir is one of great interest, as affording one more illustration of what may be done by determined industry and well-directed zeal.

— OUR AMERICAN cousins are determined that we shall not lack POTATOS for cultivation, even though the beetle should presently come over and eat them all up. Three new kinds are offered for sale this year, at doubtless fairly remunerative prices, but it is evident that the rage that once existed for new American kinds has nearly died out. Superior is a large, handsome, bright red tuber, the haulm robust, and the plant generally a good cropper. Success is a large, even, coarse-looking form of Snowflake, and probably does not excel that popular variety. In "Centennial" we find our cousins outbidding us in names, as in the face of such an unusual anniversary the "International" must hide its diminished head. Centennial has yet to be grown to test its qualities, but it is to be desired that with such an appellation we may have also a variety worthy of it.

— FOR THE INTERNATIONAL HORTICULTURAL EXHIBITION, to be held at OPORTO on the 23rd and 30th of June and the 1st and 2d of July next, Messrs. VERTCH, WILLS, and WILLIAMS are agents in this country. Steamers leave for Oporto once a week, the agents being Messrs. COVERLEY & WESTRAY, 73, Great Tower Street. A reduction of 75 per cent. will be granted for plants sent to the Exhibition; and tickets for exhibitors to go and return will be issued at £8. The cost of unloading and placing in the exhibition will be defrayed by the Society. The Secretary is DUARTE DE OLIVEIRA.

— The POLYANTHUS is just now one of the most refreshing of spring flowers. In regard to its time of flowering it may be said to precede its congeners, the Auricula, by a few weeks, and especially is this true of the fine early varieties. Even in the open ground, without shelter of any kind, the plants have been in flower for nearly two months past; they are now gay from autumn trusses, and the spring trusses are also on the move, and before the former have faded the

latter will be unfolding their blossoms. What a flush of hues these Polyanthus afford? In this respect they are superior to the old gold-laced varieties, which, while displaying much refinement of beauty in their marking, afford but little variation of character. As in the case of the Auricula, so in the case of the Polyanthus, the florist top-dresses his plants in February or early in March, and adopts the same practice as that followed with the Auricula. Top-dressing is required more especially in the case of well-established plants in pots, but it is certain to benefit all the plants, as in spring young roots are thrown out near the surface. At this season of the year the Polyanthus is particularly liable to be infested with green-fly, which cluster on the undersides of the leaves and about the young growths in the hearts of the plants. An occasional washing with Fowler's Gardener's Insecticide will keep the plants clean and healthy. These remarks apply to plants cultivated in pots, and when it is remembered that

four years old, and about 18 inches high. At the beginning of last year it was a handsome tree 36 feet high, with the branches covering an area 55 feet in circumference. The girth of trunk close to the ground was 8 feet; at 5 feet above the ground 4 feet, and at 10 feet above the ground no less than 3 feet. The Duchess of KENT's Wellingtonia was planted in 1858, two years later. This is not so compact in habit as the other, but already at the beginning of last year it had reached the height of 51 feet, and the circumference of the branches close to the ground was 56 feet. The trunk measured 9 feet in girth at the base, 5 at 5 feet from the ground, and 4 at 10 feet above the ground. The foregoing particulars are borrowed from the Berlin *Monatsschrift des Vereines zur Beförderung des Gartenbaues*.

— At a recent meeting of the Horticultural Society of Berlin, Dr. KARL KOCH exhibited a series of twenty-four diagrams, intended to illustrate a course

poses in the vicinity of BERLIN. The Horticultural Society of that city has taken up the subject with spirit, and it is to be hoped that its efforts will be rewarded with success. From Mr. C. BOLLE we have received a copy of an article entitled "A Word in Favour of the Dendrological Garden," addressed to all lovers of trees. The writer very ably discusses the advantages that might accrue from a good collection of named trees and shrubs suitable for the climate of the district, and points out the utter ignorance of the general public in all that concerns, not alone the trees of other countries, but often also of those indigenous in the country. In such an establishment as the promoters wish to found, the aim should be not so much to form a large collection as to thoroughly cultivate a selection that will flourish in the climate, both of useful and purely ornamental species. Each subject should have sufficient space to attain its full development and assert its own merits. Mr. BOLLE concludes by expressing the hope that Dr. K. KOCH,

FIG. 40. — DUFLIN CASTLE, THE SEAT OF THE EARL OF KINNOULL (SEE P. 240).

the peculiar beauty of the Polyanthus is heightened by growing it with the greatest care in an even genial temperature, it is easy to appreciate the force of the directions given by the old florists for applying extra coverings to the frames in time of frost.

— THE RATE OF GROWTH OF THE WELLINGTONIA and other North American Conifers, under favourable circumstances, in this country encourages the belief that in sheltered situations they will attain dimensions greatly exceeding those of any of our indigenous trees, though probably even in plantations of considerable extent it is doubtful whether they will reach anything approaching the size of the largest of their species in their native mountain sides and valleys. In the January number of the organ of the Berlin Horticultural Society the size is given of the Wellingtonia planted by the Crown Princess of PRUSSIA in Windsor Park, on the occasion of her confirmation, as also of another planted by the late Duchess of KENT. The first was planted in March, 1856, and it was then

of instruction on FRUIT TREE CULTURE. They were designed by C. MAIER, of Baden, a pomologist of experience, and published by the Landwirthschafts- und Gartenbau-Verein. Dr. KOCH strongly recommended them as being admirably adapted to the requirements of general schools, as well as agricultural and horticultural establishments.

— On the same occasion Dr. KOCH called attention to a NEW SPIRÆA, received from BAUMANN under the name of *S. splendens*. It comes near the dwarf forms of *S. callosa*, and is described as of dwarf, bushy habit, with a profusion of peach-coloured flowers. It is also stated that it will bear forcing, and flowers nearly all the year round. The same plant, it was mentioned, is also grown under the names of *S. callosa rosea*, *S. hydrangeifolia*, and *S. paniculata grandiflora*.

— We recently mentioned the project of an ARBORETUM and SHRUBBERY for educational pur-

who has long laboured in the cause, and was the originator of the movement, may be appointed the director.

— In our article on SCHOOL GARDENS IN SWEDEN in last week's issue we should perhaps have referred to an abstract of an article "On the Position of the School Garden Question in Austria," which appeared in the *Gardener's Chronicle*, vol. vi., new series, p. 136. Some statistics and other interesting information bearing upon the subject will be found in the place to which we refer. The statement that there were 2000 school gardens in existence in Sweden in 1871, seems somewhat at variance with more recent information, but these figures were taken from the original article in the *Neue Freie Presse*.

— From the Berlin *Monatsschrift des Vereines zur Beförderung des Gartenbaues*, we learn that a prize of £10 is offered for a short practical guide to the MANAGEMENT OF THE KITCHEN GARDEN, for

the use of teachers in country schools. The object is to disseminate the knowledge of a good system of planting and keeping cottage gardens, so that the owners may obtain a maximum of pleasure and profit from them, and the country generally present a more smiling appearance. It is hoped that the guide will enable teachers to cultivate their gardens in a superior manner, and thus make them good examples for the instruction of others.

— A fine specimen of *AGAVE ELLEMEETIANA* is now flowering in the Succulent-house at KEW. The spike reaches a height of 11 feet above the base of the plant, and is about 8 feet in length. The flowers are expanded for a space of 2 feet at the same time, and from the yellow anthers, which reach from side to side about 9 inches, have a very ornamental appearance. It belongs to the group with soft unarmoured leaves; the edges are quite smooth, and the surface of a distinct glaucous green, quite unlike any other species. This specimen has about twenty-five leaves, the largest of which are 2½ feet long and 6½ inches wide, lanceolate-spathulate in form. It is shortly caulescent, and it is said not necessarily to die after flowering. It was figured in the *Journal of Botanicum* from a specimen grown by Mr. W. W. SAUNDERS.

— We have the *Index Seminum Horti Mons-peliensis* for the present year before us. It includes about 2000 species, and is especially rich in herbaceous plants, including some 360 Composite, 200 Gramineæ, &c. The seeds of shrubs and trees offered are almost exclusively those of quite common species. Lists of desiderata should be sent in before March 1.

— The next meeting of the INSTITUTION OF SURVEYORS will be held on Monday evening, Feb. 26, when a paper will be read by Mr. J. LUCAS, F.G.S., entitled "Modern Geology; or one of the Developments of Modern Practical Geology." The chair to be taken at 8 o'clock.

— At a recent meeting of the Society of Arts Sir JOHN LUBBOCK gave a lecture on the subject of certain relations between PLANTS and INSECTS. With reference to the attractions which plants offered to insects capable of fertilising them, and to their means of defence against insects incapable of doing so, Sir JOHN LUBBOCK asked why it was that ants, whose fondness for honey was well-known, did not anticipate the visits of bees to honey flowers. Ants were kept of such plants by *chevaux de frise* of hairs, and by slippery and glutinous surfaces. The hairs on the stem of a honey plant would be found to point downwards, and there would be a prickly beard surrounding the flower, so that an ant could only with great difficulty reach the honey; and if it succeeded in passing the *chevaux de frise*, it would rob the plant without fertilising it, whereas a flying insect could hardly settle to sip the honey without touching the stigma. The stickiness of some plants was a similar precaution against ants, and some of the Lettuce species only exuded a sticky fluid when touched, so that the walking of an ant would stimulate the exudation, and the insect would be unable to proceed, and would come to a miserable death. Where the protection of the plant consisted in a slippery surface, the flowers were often pendulous, as in the Snowdrop and the Cyclamen, and an ant could walk all over the leaves, but in trying to reach the flower it would fall over. The so-called sleep of plants was governed, he considered, by the habits of the insects which visited and fertilised them. He could not at first understand what advantage a certain plant derived from opening its flowers about six o'clock in the morning and shutting them about ten; but it occurred to him as an explanation that bees and wasps got up early, but that ants did not come out until the dew was off the ground. The second part of the lecture, on the action of plants on insects, related chiefly to the colouring of caterpillars. Why were caterpillars first of all pale green, and why did they then gain longitudinal and diagonal lines, become brown, and have eye-spots? These questions were answered by the lecturer in a series of suggestions based on observation. First of all, the small caterpillar was light green because, obviously, that was the colour of the leaves on which it fed, and thus the creature was concealed. When the caterpillar grew large, it was important that there should be lines to divert the eye from the outline of the body, and the longitudinal lines resembled those

of grasses and narrow-leaved plants. Caterpillars that fed on broad-leaved plants did not have longitudinal but diagonal lines. Longitudinal and diagonal lines were not found on the same segment, for the crossing of these lines would not agree with any leaves in Nature. White lines were edged with violet, producing the effect of shadow, in the case of caterpillars which fed on the under-side of leaves, near the mid-rib. Caterpillars that fed upon large trees and could not very well come down to hide by day, retained their original green colour, but others which fed on small plants were known, approximating to the colour of the ground on which they lay in hiding during the day. Some brown caterpillars placed themselves at an angle when feeding, and looked like a bit of dead wood. The eye-spots resembled light shining through a thick foliage; and in the case of some caterpillars which derived no protection from this cause it was found that their marking gave them a snake-like appearance which frightened birds. *Daily News*.

— The Astronomer-Royal, having undertaken to register the hours of SUNSHINE in comparison with the number of hours the sun is above the horizon, some interesting results have been obtained. Thus last week the sun was above the horizon 69.3 hours, but his light was intercepted, and he only shone on London 9.3 hours; four days not at all; Sunday, 5.3 hours; Friday, 3½ hours, and Saturday half an hour.

Home Correspondence.

Fertilisation of Plants.—In the last number of the *Gardener's Chronicle* (p. 203) Mr. Henslow's words, that "the seeds from which the self-fertilised plants of the third generation (of *Petunia*) were raised were not well ripened." The word *self-fertilised* is a misprint for *crossed*, as he would have seen if he had looked to the full account of my experiments given at p. 194, where I say, "The sole conjecture which I can form is that the *crossed* seeds had not been sufficiently ripened, &c." But I have no right to expect a critic to take so much trouble, and I am much obliged to him for having led me to detect this unfortunate error. Mr. Henslow then went on to say that "Mr. Darwin also accounts for the greater growth of the eighth generation of *Ipomoea* from their having been raised from unhealthy seeds." He ought, I think, to have added that the greater growth of the self-fertilised plants was confined to the early part of their lives, and that they were ultimately beaten in height by the *crossed* plants in the ratio of one hundred to eighty-five. It was this anomalous manner of growth which led me to compare these plants with those of *Iberis* which were raised from seeds not well ripened. I have long been convinced that controversy is a mere waste of time; I will, therefore, not make any other remarks on Mr. Henslow's criticisms, though I think that I could answer them satisfactorily. I hope that any reader who is interested in the subject will not take Mr. Henslow's interpretation of my statements without consulting my book. *Charles Darwin, February 19.*

Utricularia montana seeding.—It may interest some of your readers to know that last spring *Utricularia montana* seeded with me very freely. The plant was very strong, and there were several pods on every spike. The flowers were consequently last autumn, a very short time, leading me to regret the profuse seeding. My Orchid grower, Spyers, showed the seed when ripe in pans of moss mixed with a little fibrous peat, and we now have hundreds of young plants. I may mention that the correct name of this species is *Utricularia*, as shown by me at the meeting of the Floral Committee of the Royal Horticultural Society on January 17 is *D. Findlayannum*, not *Lindleyannum*, T. L.

Royal Horticultural Society.—Will you permit me to make a few remarks on what passed at the meeting on the 13th. Mr. Elwes, who, as a horticulturist, will add nothing, and as a writer, has no need after the loss of the well-known name of Bos-cawen, instances the Zoological Society as a case in point. The comparison with the Royal Horticultural Society having once occurred to me, I worked it out, when many points of difference occurred; these seemed the principal ones. "The Zoo" has a show every day; it has no serious competitors in the country; its objects of exhibition have motion as well as life, and these are always the most attractive; and last, but not least important, it has its own special friends. As the Zoological has its children, its travellers, and its foreigners, it will have its own numerous visitors, in addition to the general public. Mr. Veitch's speech, I admit, fairly puzzled me. Believing that he has influence with the owners of gardens, I spoke to him

among the first about the guinea Fellowship. He seemed to adopt the idea warmly, and until his speech at the meeting I never had a hint that he had changed his mind; and what added to the puzzle, he, after the meeting, said publicly that he still fully believed in guinea Fellowships. It was difficult to work with uncertain supporters. Now to the more important part of my letter. I am constantly being asked—"What are we to do now the Society offers guinea memberships?" My advice is, for the present hold yourselves in reserve, and do nothing. You agreed to become guinea Fellows when the Society was free—the Society is not free, and we will not yet be received as Fellows, but only as members without a vote. I have, however, sent a proposal to the President, and I think, fairly meet the circumstances. Immediately on the receipt of the meeting, I will make known. *George F. Wilson, Heatherbank, Weybridge.*

— The next meeting of the committees will be held on March 7, and, looking at the advanced nature of the season, it is probable that a very charming display of plants will be found. What steps does the Council propose to take to ensure the attendance of the Fellows and others, and thus give to their enterprising exhibitors the only reward at present available in repayment for considerable outlay of expense and labour? If things are not improved in that respect, the display will be a failure, and will not soon follow. I venture the suggestion that the Council should have some neat circular announcements of the meeting, or future meetings, printed and circulated amongst all London fellows, and at the houses of the local horticulturists, and that the meeting should be at 11 o'clock, as there being no competition, it is a waste of time for the committees to absorb the entire show for two of the best hours of the day. *Exhibitor.*

— I perceive by the reports of the Royal Horticultural Society's annual meeting (*vide p. 210*) that the remarks of Mr. Henslow, in regard to the Horticultural Show Fund either were not distinctly heard by the reporters, owing to the confusion caused by the breaking up of the meeting, or I failed to make myself clearly understood. The first paragraph of your report gives correctly the substance of what I said, but the second bears a directly opposite construction to what I meant to say; I should therefore be obliged by your permitting me to state that what I wished to convey to the meeting was, that I did not believe, if the matter were properly put before the Finance Committee, that that body could do anything to assist me in my endeavours to be refunded out of the Society's current account. It will be remembered that, in instituting the Society's provincial shows, the Finance Committee refused to allow any of the Society's money to be spent for that purpose, so that I was obliged to carry on through the exertions and personal guarantee of a few spirited horticulturists outside of and on the Council, but with the understanding that the profits (if any) resulting should be allowed to constitute a distinct fund for similar undertakings in future. This arrangement was subsequently confirmed by the action of the Finance Committee. I therefore maintain that the money borrowed by a former treasurer (Mr. Dobree) from this fund is as much a debt due to the Society as that which was borrowed, to meet the same object, by the Society, from Messrs. Conyngers, and which has been repaid. *John Denmy.*

Corsican Crocuses.—I have long had misgivings as to the identity of the highland and lowland Croci of Corsica, which since the time of De Candolle, and other writers, have been generally supposed together as one species under the synonyms of *minimus*, D.C., and *insularis*, Gay. The larger mountain plant has, however, been known to all collectors in the island. Dean Herbert separated it as a variety under the name of *major*, and named in 1838 described it as a distinct, and as well separated, form from the smaller plant of the coast, from which all of Gay's MS. figures appear to have been taken. I would here correct an error that crept into some notes on Corsica, that appeared in the *Gardener's Chronicle* in 1856, p. 768, the name of the variety of *versicolor* (for which I had mistaken *Vanucci's* C. corsicus) as occurring abundantly on Monte Rotundo. I have not till to-day had an opportunity of comparing the two plants in a living state. They are not identical, and are well separated in essential specific characters as any other species of the *versicolor* group of Croci. Their geographical distribution is suggestive, for whilst the smaller plant, with a yellow stigma much exceeding the anthers, is so far as I am aware restricted to low levels near the sea, the large mountain form is only found above 2200 feet, and occurs profusely on Monte Rotundo up to 6000 feet. It is truly as large as *Crocus versicolor*, though a little shorter and much broader in the limb, which is generally of a paler purple than the latter, and has a most placid aspect, and in nearly the whole of my specimens the anthers overtop the stigma, which is bright orange-scarlet instead of yellow. I know of no habitier for either the large or small forms between the coast line and

2200 feet. I believe the two plants are specifically distinct, and would suggest that Vanucci's name "coruscus" be retained for the mountain plant, to separate it from De Candolle's *minimus*. As I have distributed both plants under the name of *minimus*, I would state that the bulbs from the mountains above Corte, and from the range between Bastia and St. Florent (1873), are of the larger species (*Crocus corsicus* of Vanucci), and those from Portigliolo, near Ajaccio, distributed last year, are the typical *Crocus minimus*, a good figure of which will be found in the *Botanical Magazine* (plate 6176). The yellow stigma flowers of the latter are clearly visible in the figure. *George Mason, F.L.S., Benitelli Hall, Broadway.*

Lobelia Emperor William.—I can fully endorse all the praise bestowed on this excellent *Lobelia* by Mr. Davidson (p. 215). As a variety for carpet bedding it has few, if any, equals, being of dwarf robust growth, with large brilliant flowers, which continue to produce in great abundance throughout the summer and autumn months. This the punila section does not do; even when well supplied with water during hot, dry weather, it often ceases to flower during the summer. Distributed at a number of nurseries and other carpet-bedding plants are at their best, thus leaving a blank in the beds which very much detracts from the effect of the whole arrangement. Emperor William only requires to be better known to become one of our favourites. *J. Drummond, The Cedars, Harrow Weald.*

Action of Pollen on the Seed of Peas.—I notice in your last issue (at p. 210) that Colonel Trevor Clarke exhibited before the Scientific Committee of the Royal Horticultural Society a pod of Woodford Marrow Pea, the flower of which was fertilised with the white-seeded Avergine, the result being the production of blue and white Peas in the same pod. Colonel Clarke considered it a novelty, and said that Mr. Laxton had not observed it; but I beg to say that when my father was gardener to Mr. Laxton, at the Swanwick, near Bath, this was one way in which he obtained his new varieties. Sometimes the blue Peas revert to white ones, and *vice versa*. My father and Mr. Laxton have also noticed round and wrinkled Peas in the same pod. *W. E., Waltham Cross.*

Brassica Napus (see ante, p. 148).—I beg to make a few remarks on the note added by the Editors to my account of a hereditary deformity in *Brassica Napus* (*Gardeners' Chronicle*, Feb. 3, 1877, p. 148). The Editors say:—"The specimen in question resembles those figured in the *Gardeners' Chronicle* in 1875, and is a variety of the monstrous tubers, the result of a Committee of the Royal Horticultural Society in the same year by Mr. Wilson Saunders." And in fig. 24 a woodcut of "adventitious buds on underground stem of Brussels Sprout" is represented, which exhibits nothing of tuberosity or deformity, but only a fast-growing drawing is clear enough to enable me to judge, adventitious leaf-buds, directly breaking forth from the tap-root. The similarity consists, therefore, only in the presence of adventitious buds in both cases, but as regards the essential point, in the *Brassica Napus* these break forth from the monstrous tubers, and not from the roots themselves, whilst in the Brussels Sprout they originate from the root directly, the two cases are wholly different. The Editors say furthermore:—"As the tuber is of cauline rather than radical nature, the production of adventitious buds is not so surprising." I add that it would not be at all surprising if the monstrous tubers were of radical nature, as a great quantity of roots, such as those of some kinds of Poplar, of Horse-chestnut, and of the *Convolvulus* species, some of which I gave a list in *Schriften der Physik-Äthionom. Gesellschaft zu Königsberg*, 1873, p. 109, make leaf-buds. The thing surprising is this, that these adventitious buds spring from the monstrous tubers, which, as far as I know, never occur before the first time. Monstrous tubers on roots, although perhaps originating from different causes, are not of a very rare occurrence, as on those of the Alder, of *Cycadeis*, of a great quantity of *Convolvulus* roots, and even of *Brassica Napus*, &c., but on none has an adventitious leaf-bud ever been observed. The reasons why I consider those monstrous tubers of *Brassica Napus* as deformed roots are—firstly, because all those tubers, most of which have no tuberosity, are, as a whole, destitute of any sort of leaf, even of the minutest scale: as far as I know no organ of cauline nature exists without leaves, except sometimes the embryo (*Bertholletia excelsa*, *Garciniaæ*, *Orobanchæ*, &c.); and, secondly, because the terminal bud is wanting, and then, as a proof, that all are adventitious, as far as I have seen, and that those tubers seem to have an analogy to the monstrous tubers of the Alder and *Cycadeis*, which are doubtfully deformed roots on account of their

mode of development, their root-sheath and anatomical structure (*Of Schacht, Flora of Regensburg*, 1853, 261). *Trievrims* (*Botanische Anzeiger*, 37, 66) considered the tuberosus swellings of the Leguminosæ as of cauline nature, chiefly on the analogy with flowering and fruiting underground buds which some Leguminosæ have—a reason which proves this analogy is not existing. If, as the Editors seem to think these tubers are cauline, may I ask them to state, for the benefit of science, the reason for their view? *Professor R. Caspary.* [In writing from memory some errors crept into our commentary. In Mr. Davidson's account of the monstrous tubers of sprouting Broccoli, without the intervention of any such tubers as Professor Caspary describes. These tubers, like the buds in the other case, are apparently of root-origin. It is not sometimes the caulicle which becomes tuberosus? Adventitious buds sometimes spring from the caulicle, which is a stem-organ, though generally without leaves other than the cotyledons. Eds.]

Celogyne cristata.—Foremost among many things well done by Mr. Beesley (who took charge of the gardens after the retirement of my old friend, Mr. Drummond) at the Swanwick, during the few days ago a fine lot of the lovely *Celogyne cristata* in various sizes; the plants were in the most vigorous health and totally covered with fine racemes, and in their lovely white flowers they are quite equal in point of cultivation and for the quality of flowers to the grand plants grown by Mr. R. S. Yates. *J. Wills, Ousley Crescent, Feb. 20.*

Gardeners' Royal Benevolent Institution.—I am one of those who think that the present system of canvassing for votes for pensioners on the funds of this institution should be discontinued, as all the needful information is furnished to every subscriber by the Secretary. In the second part of Mr. Grieve's excellent letter there is just one little error which he in common with a good many others has fallen into, and that is, he ignores the fact that subscribers for fifteen years are placed upon the list without the trouble of election. I quite agree with his remarks on the smallness of the pensions, and I know that there are hundreds of gardeners who think as I do—that subscribers and non-subscribers should not be placed upon the list, except for the purpose of being elected. The non-provident man has equal shares with those who have toiled hard to pay their subscriptions; this is one cause I know which keeps many gardeners from subscribing. Allow me to suggest also that it would be much better for subscribers, who are short, to give pensions to subscribers of £20 or £25, and allow the non-subscribers to remain as they are. *James Clark, The Gardens, Colchester, Somerset.* [At present, subscribers of fifteen years are placed on the fund, if there is room for them—without election. Would it not remove many of the objections to the present system, if subscribers of ten and of five years respectively were at the elections credited with a proportionate number of votes by the committee? Thus for five years one-third the average number of subscribers elected, for ten years two-thirds, and for ten years two-thirds, while the fifteen years subscribers would be saved the trouble of election. Eds.]

Winter-flowering Eupatoriums.—How many species are in ordinary cultivation for decorative purposes? I find all the following names floating about, but they seem to belong to not more than a couple of species. Which are the recognised names, and which are the synonyms, or how is it? The names are *adenophorum*, *ageratoides*, *corymbosum*, *fragrans*, *glabrum*, *glandulosum*, *ligustrinum*, *Mertensia oclorum*, *riparium*, *roscum*, and *Weinmanniana*. *G.*

Rhododendron Nobileanum.—I was much surprised on going through the pleasure-grounds at The Denbies, near Dorking, a few days ago, to see huge bushes of this bright-coloured *Rhododendron* covered with finely-developed flower-trusses, the flowers being in. Have any I ever remember to have seen of this variety under the most favourable circumstances. The plants were flowering freely in all positions, and have been in blossom for the last two or three weeks. *J. Wills, Ousley Crescent.*

Orchid Collecting.—The remark at p. 81 "that the well-known collector, Colombia will have some competition in affording a fallow time to the Orchids, which otherwise would run a fair chance of extirpation, if there be not some of their extirpated already," reminds me of a passage in the last letter I received from Mr. W. Bull, when he has been in the country, and the collectors of the present day. Not satisfied with taking 300 or 500 specimens of a fine Orchid, they must needs scour the whole country, and leave nothing for many miles round. At least 15,000 of the beautiful *Odontoglossum cirratum*, (some 2000) he lately, some 6000 *Oncidium macranthum*, &c. have lately

been sent over to England, and Mr. Wallis says that the environs of Quito and Caena have been perfectly plundered in even the remotest corner, and that no collector will henceforward there find any of these beautiful Orchids, the natural treasure of these districts, as not even the smallest bits escaped in the general slaughter. Fishermen spare the young fishes, and hunters do not kill indiscriminately, but these modern collectors spare nothing. This is no longer collecting, it is wanton robbery, and I wonder that public opinion is not stronger against it. Professor Reichenow has, in his own original way, given unmistakable hints in this direction, and has even dealt a blow now and then with no reluctant hand, but to no purpose as it seems. No fallow time will help these poor Orchids, where everything is gone already; only a general and strongly expressed indignation against the collector, and, moreover, most unpolitic behaviour can bring back a more reasonable and more honourable way of collecting. Let collectors take by all means as many of a good Orchid as the market reasonably will bear, but no more. Most likely they themselves, or at all events their employers, ought to be very glad if they can some years later get a fresh supply from the same locality. *E. Orzig, Botanic Garden, Zurich.*

West's Patent Trellis.—In reply to Mr. Simpson's letter on the above, which appeared in the last issue of the *Chronicle*, I beg to state, in contradiction to "the worst objection," that in the case of the trellis being fitted in a span-roof house it need not be 1 inch shorter than the rafters; the reason it appeared so in my diagram was to make it more distinguishable, and in a lean-to, where it is 18 inches to 2 feet at the outside is lost, which is amply compensated for by the advantages gained as the training space is lost where the Vine bears least. With reference to the trellis getting out of order I can only say that it has happened to me only once in 20 years in the patentee's vineyard and has never done so yet, and no such complaints have been received from others who have the trellis in use. *W. McGrath Compton, Hibernia Works, London Bridge, S.E.*

"Royal" Nurseries.—Is it allowed to any one in England, whoever and whatever he may be, to style his place of business as "Royal," and to use the royal arms? If so, I think it is a great mistake, as many people are undoubtedly misled by certain individuals using largely the above qualification of "Royal," which ought not to be employed except on sound grounds. For instance, Continental nurserymen, who are not entitled to use the royal arms, are selling by certain English firms (sometimes very small people indeed) on the credit of their "Royal" place. I think the title of a "Royal" nursery ought not to be advertised or used in any way without the consent of the high party to whom it is given. It is not a shame to see people neither whose establishment nor any personal merit or capability could ever command the highly respectable title of a "Royal" nursery, paying one day perhaps 1s. 6d. or 2s. in the pound, and advertising that they are the "Royal" nursery, the dazzling puff of a "Royal Nursery"? Such practices should not be permitted; it hurts the feelings of all honest men. *F. N. V.* [A general association of the trade seems wanted for many purposes, among others to put an end to misleading advertisements of all kinds. Eds.]

Fruit Blossom.—In all my experience I have never seen such profusion of blossoms as exist on some trees here about this spring, and this has more particular reference to the young wood of the past season's formation. I send you examples of Pear shoots, whereon I will perceive, though but few young wood of the past year's growth, almost every wood-bud has developed into a fine plump flower-truss. Plums are similarly fertile, whilst the same characteristic in some degree or other prevails generally. Filberts and Hazel-nuts are wonderfully loaded with the pretty crimson-pointed female blossoms, and Peaches, &c., have clusters of blooms at every bud. In passing through Kent this week I saw several Damsons in full bloom, and many Pears with blossoms expanding, or a week or two earlier than they are here in Essex. *William Earley, Ilford, E.*

How to Renew a Vine Border without Losing a Crop.—In reply to "E. P.," of Jersey, p. 117, I may state that if he follows the directions here given he can renew his Vine borders and not lose a crop. I may here premise that I don't pretend to say I can do the border all at once, and save the crop. I do it in one year, but I do it in the following manner. In my case the Vines had been planted nearly thirty years, and were showing signs of distress. I began in March to take away some of the old soil around the stems of the Vines, replacing with fresh soil to encounter the first frost, which was in July. Then in August following, when the grapes were

* By mistake, *Brassica Rapa*, instead of *Brassica Napus*, is put under the woodcut, fig. 25.

cut, and the leaves yet green, I prepared to renew the one half of the border. To make it plain, we shall number the Vines, one, two, three, four, &c. Having the soil ready, rather dry, I had a line set from the stem of No. 1 Vine to the front of the border, and a mark made along the line, which was then shifted to No. 2 Vine, and a similar mark made parallel to the first line. The soil is now to be dug up between the two marks, taking roots and soil clean out till you get within 6 feet of the stems of the Vines. Then take forks and fork out the remainder of the soil from among the roots, shovelling it away as you go on. Have a mat on each side to place the roots under as you fork them out. The sides of the trench are to be cut down on each side with the spade, not perpendicularly, but a little inwards, or undermined a little: the reason for this will be seen by-and-by. If the border wants any draining, have broken stones ready to place in the bottom of the trench, when all is cleared out. After the broken stones are put in cover with turves, the grass side downwards; now wheel in the soil, levelling and ramming it carefully, more especially at the sides and end of the trench next the front wall. Fill up to within 8 inches of the top. Spread out the roots of each Vine, regularly over the surface. There will, no doubt, be some dead or rotten roots to cut away. Shorten the strong roots to different lengths, cutting from the under-side. Cover the roots carefully, give some water, and the work is done. You then begin with No. 3 and 4 Vines, do the half of each, as in the first instance. Then you go to 5 and 6, and so on till you get to the far end of the house. This will complete the first part of the process. I put some short grass, the moving of a lawn, to raise a little heat in the border, and keep it moist. The artificial heat, however, is not essential, as the soil is naturally warm at that season of the year. In the November following the renewal of my border the roots were running in the fresh soil very freely. You have now to commence next year with, one half of the roots of each Vine in the old border, and the other half of each Vine having vigorous roots in the new border, a considerable improvement on the old border. In August the following year you have to do the intermediate spaces, in the same way as was done in the first instance, by clearing out the soil to within 6 feet of the stems of the Vines, then forking out the roots, and cleaning the bottom of the border. You will get quite beneath the stems of the Vines this time, and, in putting in the soil, advantage will be seen of previously undermining the sides of the border. The soil now put in will act as a wedge, and leave no crevices, if well rammed as it is. Be careful in firming the soil among the roots under the stems of the Vines, so that no vacancies are left. The above plan was a great success with me, and I have no doubt it will be equally successful with "E. P." if he has the work carefully done. Given the soil and labour, who need have had Vine borders? "E. P." probably spurs his Vines, and very likely the spurs have got long; get young shoots from the bottom, cutting out the old spurs as the shoots grow up. In my own case I had young shoots from the bottom, cutting out the old spurs every year for four years; then I cut down the old stems so that, hazing the old stems at the bottom, my Vines looked always like four-year-old Vines. As to soil, bones and charcoal are good ingredients in it. I have neither bones nor charcoal in my border, and I had Black Hamburgs weighing 7½ lb. a bunch last year. W. Hutchison, *The Gardens, Llynvyn Court.*

Lilies of the Valley. Having read several articles in your paper on Lilies of the Valley, wherein opinions have been expressed by several correspondents about the quality of these roots from different origin, I have to-day sent you a small box containing a pot of Lilies of the Valley for your inspection, and I would feel obliged if you will give your opinion about them. The pot contains a clump as generally grown here for the trade, and of the sort which is considered here as the best. Growing the Lily of the Valley very largely, I have some refuse clumps, from which I selected and forced a few, to adorn a small plant-house of my own; these, of course, were not the finest, the best having been sent to my customers. If you care to have my opinion of the reason why our Dutch Lilies of the Valley are judged by some parties to be of inferior quality, I beg to say that some people abroad, paying from everybody and often under market price, are sometimes imposed upon by growers, who sell the roots growing here in a wild state, and which are of very inferior quality. The difference between the two sorts however, were very obvious, the one being much smaller and of a darker green, and the flower-stems shorter and giving only a few bells. An experienced man can distinguish at once the wild sort, even when leafless, the crowns being not so plump by far as those of the cultivated variety. As to the plants I have just received was a very good one, and much better than many other Dutch Lilies of the Valley that have come under our notice. EDS.]

STEMLESS MUSHROOM.

The accompanying illustration, fig. 41, is a representation, natural size, of a stemless Mushroom, found last November near Newbury, by Mr. J. A. Bartholomew, of Penelope, Chicheley. The first in-

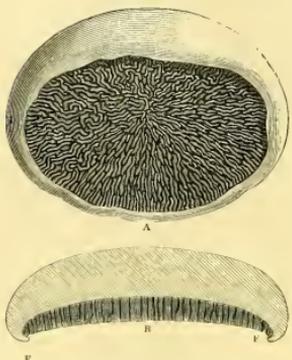

FIG. 41.—STEMLESS MUSHROOM AND SECTION.

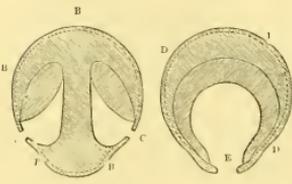

FIG. 42.

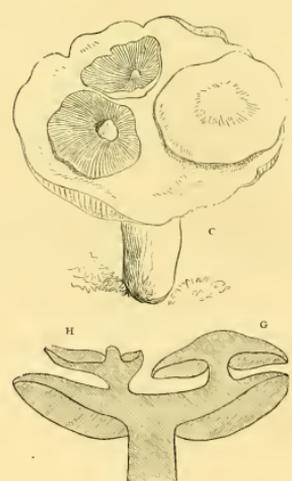

FIG. 43.—MONSTROUS RUSSULA AND SECTION.

mination which reached me regarding this singular monstrosity was contained in a letter from Mr. Henry Reeks, F.L.S., of Thruxton, and through this gentleman's kind offices I was enabled to exhibit the actual specimen before the Scientific Committee of the Royal Horticultural Society, on December 9 last.

In a letter from Mr. Bartholomew, the writer therein says he gathered the Mushroom himself in his

own meadow at Penelope; the fungus was lying in a natural growing position (the dewy grass partly hiding it from observation) with no sign of a stem or any connection with the ground in any way, above or below.

By reference to the illustration it will be seen that the gills do not radiate from a centre as they usually do in Mushrooms, but are disposed in labyrinthiform patterns, after the manner of *Dodeaea*, *Boletus* or *Paxillus*. Nevertheless the plant is a genuine specimen of the true meadow Mushroom, *Agaricus campestris*. This is proved by the nature of the trama and the size and colour of the spores, which I have examined microscopically. The upper figure, A, shows a general view of the complete plant, and the lower figure, B, a section.

It is by no means an easy task to explain the meaning of this singular monstrosity, and as far as my experience goes the specimen is quite unique. A stem is not invariably present in every member of the Mushroom tribe, but of necessity there is always a distinct point visible, showing where the fungus has been attached to the matrix which has carried it. In the plant here illustrated there is not the slightest trace of attachment to the ground, either above or below.

I am inclined to explain the abnormal growth of the plant in the following manner. In one way or other all members of the Mushroom tribe are in infancy enclosed in an entire wrapper; this wrapper may either take the form of a cloth-like veil, a mass of spider-web-like thread, or a coating of slime. An entire veil or wrapper is shown at B, in F, fig. 42. When an *Agaricus* is present in every member of the Mushroom tribe, and does not put on the appearance of a Puff-ball, till the wrapper is cracked all round (by the growth of the stem), as at C, C. No doubt the stemless Mushroom was veiled in infancy by a wrapper which entirely covered it (B, D), and the point of attachment to the ground was at the bottom of the veil at the same point where the veil was ultimately ruptured (E); the edge of the veil is clearly seen in the actual specimen, at F, F, fig. 41.

The entire absence of a stem in the Penelope Mushroom is very remarkable, and the lesson it teaches should not be lost sight of by mycologists.

In the *Gardener's Chronicle* for July 26, 1873, pp. 1016, 1017, we have found a series of illustrations of monstrosities in the Mushroom tribe, and a set of singular "twin Mushrooms" may be seen in the number for March 25, 1876, but in neither paper is there anything like the monstrosity now described.

The following example, fig. 43 C, is also different from any of the specimens hitherto figured in the *Gardener's Chronicle*, and therefore may be worth a place at the present time. It represents a specimen of *Russula vitellina*, exhibited at the last fungus meeting of the Woolpoole Club at Hereford. The remarkable point in the plant is that it has three smaller specimens growing upon and confluent with the top. One of the upper plants has its gills placed downwards, as seen in the section at G, whilst the two others have them displayed upwards, as at H. W. G. Smith.

Florists' Flowers.

THE PROPOSED CARNATION SHOW IN LONDON.—You will greatly oblige if you will allow me through the medium of your pages to invite the attention of your readers to, and solicit their support for, the show of Carnations and Picotees intended to be held in London in July next.

It owes its origin to the fact that, save by this special show, no opportunity is afforded to the cultivators of these flowers for their presentation before the public, neither of the two societies devoted to horticulture offering inducements in the shape of prizes or days of exhibition suitable for their production, whilst an additional incentive to this action may be found in an assertion made some time since in the pages of the *Journal of Horticulture*, that "Florists' flowers were hopelessly at a discount in the South."

When I state further that the proposed show is due directly to the suggestion of Mr. Charles Turner, of the Royal Nursery, Slough, and Mr. Douglas, who has charge of the fine collections at Loxford Hall, I shall have said enough to assure your readers that the display will be of great merit, and worthy the notice of all lovers of these very beautiful flowers, whilst, further, a reference to the subscription list, a copy of which I enclose, will show the promoters

do not solicit aid without first contributing liberally from their own pockets.

A schedule of prizes which has been proposed, and which the promoters believe would appropriately illustrate the cultivation and development of the flowers, offers ninety-one prizes, including, in Carnations, collections of twenty-four and twelve, and single specimens in each class; Pinks, white ground, and the same; yellow ground Picotees, prizes for collections of twelve and for single specimens; miscellaneous Selfs or fancies, a class usually especially interesting to Ladies, three prizes each of twelve blooms; and Plants in Pots, two prizes each for twelve specimens. Resulting in an aggregate of 462 specimens, and a money total of £54 16s.

The funds thus far contributed amount in round numbers to fifty guineas, a further sum of £15 to £20 is therefore needed to provide the desired prizes, and for the expenses incidental to the show, and to this extent the promoters will gladly accept of help from any of your readers disposed thereto. E. S. DeWull, Hon. Sec., 11, Clatham Terrace, Larkhall Rise, Clapham, S.W.

AURICULA SHOW.—We are glad to learn that the fund for carrying out the Southern Show of Auriculas, fixed to take place at the Crystal Palace on April 24 next, may be regarded as complete, allowing for a probable addition of £5, which, in the experience of the promoters, generally accrues at the last moment, as the contribution of the lagards in floriculture.

The tenacity with which the **AURICULA** cultivators cling to their traditional ideal of what constitutes a perfect Alpine Auricula is well set forth by the Rev. F. D. Horner in the current number of the *Florist and Pencilist*. In the January number of that periodical Mr. K. Dean put in a plea for the recognition of the Self Alpine Auriculas at the coming exhibition of Auriculas. Several very beautiful flowers have been raised by Mr. C. Turner and others, but being destitute of the shaded petal they have been practically excluded from competition at the exhibitions of the National Auricula Society. Referring to this plea the Rev. Mr. Horner states:—

"The flower comes before us with a broad enough distinction, but it is a rather awkward one, for it makes the flower an alpine with the very first and prettiest property of the alpine left out. For it is not a mere berefted notion idea that the alpine should be a flower of shaded ground colour, but it is a leading property universally recognised among florists; it is the golden eye; and flowers possessing these properties will always take high precedence of those with pale eyes, or those nondescript neo-covers the self alpine. Beautiful they are, and cannot fail to be; but to me, they have the same dark piercing eyes, of an intensity that is almost fierce; and I see no such loveliness in them as I find in the true alpine, with all its tender, sweet expressiveness of softly-shaded petal, and the beauty of the golden centre. This class, in its strict integrity, forms a very lovely contrast to the self proper, the consort to the edged classes. The self, with its densely mottled centre, most not trespass on the shadings of the alpine, nor the alpine appropriate the pure ground colours of the self. Intermixture and confusion among them, in so far as they are florists' flowers, are to be deprecated. If there be self alpine, why not also alpine self, and a host of perplexing half-breeds? Were I a grower of alpine, I would dissent none to the raising of show varieties, but of the one legitimate and not necessarily limited class of golden centres and heavy shaded petals."

It may be remarked that the National Auricula Society have broken through this limitation set up by the Rev. Mr. Horner, by making a class for alpine with white centres; and now that a beautiful race of self alpine has been obtained, it does seem a pity to exclude them altogether from competition; but what was admitted it would be best if they were classed by themselves, and not in companionship with edged alpine proper, as some growers of the alpine Auricula will not admit the self flowers to their collections.

Natural History.

WITCH KNOTS ON THE BIRCH.—The great mass of twigs looking like a large bird's nest fallen in a loose bunch amongst the branches of the Birch tree, and commonly known as a Witch Knot, is familiar to all, but its origin, from the attack of a minute four-legged Acarus (Phytostus), very similar to the one causing much mischief to young buds of the black Currant, is not so well known.

During the last winter there has been a deal of this peculiar growth on some Birches planted by the roadside in the neighbourhood of Isleworth, which has given an opportunity of studying its progress from the beginning.

In the autumn leaf-buds are observable, distinguishable from the natural smooth lanceolate shape by their swollen appearance, being roughly spheroidal, comparatively large, and composed of loosely imbricated scales. In November the Phytostus may be found in these buds, and it continues active through the winter. About the beginning of February these scales will drop to a touch, and show inside a short thickened axis, beset with numerous very minute round huds at the base of the scales—the beginning of the future diseased mass of twigs.

By examining the tree this growth may probably be found in every progressive stage, from the shortened twig, with the infested loose made buds placed as close as they can grow on it; the second stage, when some of these buds have again produced diseased twigs; what may be called the third, when the great numbers of swollen buds near together have formed a cluster, with diseased twigs proceeding centrifugally from it; up to the complete growth, a central nucleus of diseased buds, with a mass of variously diseased twigs in all stages of growth, disease and decay surrounding it, these often forming together a bunch a yard or more in diameter. The gall mite originating the malformation is cylindrical, whitish, about the two-thousandth of an inch long, and a quarter that width at its broadest diameter, and in walking appears to make much use of the sucker-like appendage with which its legs are terminated; and in February the creature may be found in the act of dis-

FIG. 44.—WITCH KNOT ON THE BIRCH.

closure from egg-like bodies, occurring in some numbers in the Phytostus-infested buds. Whether these, however, are eggs or a stage of change in the Phytostus I was unable to discover.

The matter is of some interest, from the Acarus attack producing woody growth, instead of simply galls from the cellular tissue, and it would be interesting to find whether, in cases where the black Currant buds were similarly infested, any instance could be found of increased woody growth taking place. In the Birch the numbers of Phytostus are so much smaller than those given for the black Currant that it suggests the probability of their exciting the diseased growth instead of destroying the point of attack.

The mischief in a case like the present is considerable, and would make it worth while to cut down the infested trees. O.

Notices of Books.

The Cactus and other Tropical Succulents. By H. Allnutt. (*Estates Gazette Office, Fleet Street.*)

Mr. Allnutt is an enthusiastic and, we may add, a very successful amateur town gardener, and in the little book before us, of 133 pages with sixty illustrations, he has rendered his flower and plant loving fellow citizens a service of no little value in bringing prominently under their notice, in a plain, agreeable, and instructive manner, a class of plants which, of all others, are the most calculated to afford them a maximum amount of enjoyment for a minimum expenditure of labour or money. As our author well puts it, "there are about five months out of the twelve in which little or nothing can be done in a flower garden," and as a consequence the ardent amateur's love and enthusiasm for plants has to be somewhat

shelved during the winter months; but should he obtain, as Mr. Allnutt has done, a choice collection of small succulents, this order of things is at once changed, inasmuch that "the interest we may feel in a Cactus does not depend solely on its flowering, as is the case with the generality of plants." On the contrary, the Cactus is, by reason of its grotesque forms or individual peculiarity, a source of never-fading interest in the family circle. For culture in windows, or in a small frame as Mr. Allnutt has figured and described in his book, the succulent plants have a great advantage over such subjects as Fuchsias and Pelargoniums, and which consists in the grower being able to keep a dozen or more of the former in the space taken up by one or two of the latter. Like everything else in the plant world, the succulent pays for attention in the matter of cleansing, watering, and potting as required, but where a little neglect in the case of any other plants would be fatal to their well-doing, it does little or no harm to the Cactus, and would, indeed, often prove beneficial. Written by an amateur for amateurs, practical gardeners being warned off, we shall not attempt to judge the merits of the book by a strictly horticultural standard; but we unhesitatingly recommend it to the class for whom it is intended.

—We take the first opportunity of announcing the publication of the first of a series of volumes on *Economic Entomology*, by Mr. Andrew Murray, for the Committee of Council on Education (Chapman & Hall). The present volume is devoted to the wingless insects and, like those which are to follow, is intended as a guide to the admirable collections now in the Bethnal Green Museum. We shall have to speak more at length of this excellent book when our space is less crowded, but whatever we may find to criticise hereafter we at once say that no other library should be without the book in question. It is copiously illustrated.

PUBLICATIONS RECEIVED.—A *Nep Kertész*.—An Agricultural Rip Van Winkle (C. Matthews, 265, Strand).—*Bulletino della R. Società Toscana di Orlicoltura*.—Notes on the Colony of Victoria.—The Principles of Fumigation, by E. W. Cox, Sergeant-at-Law (*Law Times Office*).—The Gardeners' Monthly.—Report of the Royal Botanic Garden, Edinburgh.—Delcous Seminars, &c. (Imperial Botanic Garden, St. Petersburg).—Annual Report on the Melbourne Botanic Gardens.

Reports of Societies.

Edinburgh Botanical. Feb. 8.—Dr. Cleghorn, V.P., in the chair. The following communications were read:—1. Experiments with Turnip Seeds, by A. Stephen Wilson, of North Kilmarnock. 2. Notes on some British Plants in the Herbarium at the Royal Botanic Garden, Part IV., by Mr. F. M. Webb. 3. Notes on some Plants Introduced by Wool collected on the Banks of the Tweed in 1876, by Mr. C. W. Peach. 4. Notes on Open-air Garden Vegetation, by Mr. J. McNab (see p. 205). 5. Notice of Donation of Specimens of Palms to the Herbarium at the Royal Botanic Garden from Islands in the Indian Ocean, by Dr. Isaac Bayley Balcan, 6. Notes on Tillandsia anodes, by Mr. M'Nab. Dr. Bremner exhibited a mass of roots taken from the interior of an old Willow tree. The tree was a very large one, and had the lower part of its trunk completely decayed. An upper branch, however, was quite fresh, being supported by a great quantity of roots which descended from it into the bark. Mr. Boyd, of Ormiston, exhibited a cone of the common Spruce, having one half of its bracts reflexed.

The Villa Garden.

THE GREENHOUSE.—This, in the case of a well-cared-for house, is becoming alive with floral pleasures; there is scarcely a thing but what is on the move. Spring is advancing with rapid strides, accompanied by soft, balmy, sunny weather more like that we look for in the general April days than in February—one of the principal months of the winter. Some things demand immediate attention, and must have it.

Fuchsia cuttings in stone pots—the cuttings put in early in September—are putting forth budding growth, and must soon be potted to have nice plants in June. Placed on a warm airy shelf in the early part of the winter, and watered in favourable weather, they are

breaking into growth at every joint, and urgently need root-room. Store pots of show Pelargoniums wintered in the same way require the same treatment. Some of the plants, by reason of being crowded in the pots, are a little lank in appearance, but by pinching out the tops as soon as the plants get a little established after potting off, they break into a free growth, and quickly make stocky bushy plants. Two or three pots of cuttings struck in this way come in very useful, when they bloom late, after the larger plants have gone out of flower; and as the show Pelargonium is not only a fine and effective decorative plant, but also very useful to cut from, as the flowers keep fresh for a considerable time in water, their value is increased thereby.

A friend having a small greenhouse wrote a few days ago in a state of some alarm, on the ground that his plants of show Pelargoniums were making such a rapid growth, though kept in the coolest and airiest part of the house, that he was afraid the flowers would be expanding before the chances of wintry weather had quite worn themselves out; and he does not stand alone in this respect, for the rapid movement into growth is something remarkable, and it is difficult to divest one's mind of the fear that March, April and May, will in all probability be, in some part at least, chilly, and most unpleasantly unconventional. The wintry frosts are locked up somewhere, and must free themselves sooner or later, and with the exception of last and other winters, there has not been in one's memory, the later spring months may be waited for with some misgivings. Our advice to our friend was not to pinch out the tops of the shoots of his Pelargoniums as he had proposed, but simply to keep them in the coolest and airiest part of his house, and not allow them to suffer in any way through drought. The plants were reported earlier than usual during the latter part of the past summer, and got into growth before the usual time. After the buds begin to shoot they are some time coming up, and it will be later than our friend imagines before they begin to bloom. The few plants are wanted specially to bloom in June, perhaps for an exhibition, the growing shoots should then be stopped, pinching them back to about six leaves.

BEDDING LOBELIAS.—As the blue Lobelia is such a favourite and indispensable bedding plant, attention should be turned to getting up a stock of it from wintered plants. These are always to be preferred to seedlings, inasmuch as they can be better depended on for uniformity and similarity of colour. The seedlings of the blue Lobelia varies very much in character, and spoils the effect of a mass. If three or four plants of a good variety be selected at the end of the summer, and wintered in pots on the shelf of a greenhouse, they make a free growth in spring, and can then be divided into a great number. But amateur gardeners are sometimes very unsuccessful in wintering the Lobelia: they keep them too dry, and kill them with mistaken kindness. We have wintered some plants in a cold house, by simply planting them out in a shallow box, and keeping them on a plant stage. They grow nearly all the winter, and each shoot is now throwing out roots just above the surface of the soil. These shoots can now be divided and potted singly in small pots, and kept in the greenhouse, where they cannot fall to grow into nice plants by May.

The Weather.

LONDON: Barometer.—During the week ending Saturday, February 17, in the vicinity of London the reading of the barometer at the level of the sea decreased from 29.98 inches at the beginning of the week to 29.82 inches by the morning of the 11th, increased to 29.94 inches by the evening of the same day, decreased to 29.69 inches by the morning of the 12th, increased to 29.04 inches by the evening of the 14th, decreased to 29.77 inches by the evening of the 15th, and increased to 30.10 inches by the end of the week. The mean reading for the week at sea level, was 29.88 inches, being 0.28 inch below that of the preceding week, and 0.10 inch below the average.

Temperature.—The highest temperatures of the air were from 56° on the 12th to 50½ on the 17th. The mean for the week was 47½. The lowest temperatures of the air ranged from 36° on the 17th to 45½ on the 11th. The mean for the week was 41½. The mean daily range of temperature in the week was 11½, the greatest range in the day being 14½ both on the 14th and 17th, and the least 8½ on the 15th. The mean daily temperatures of the air were as follows:—11th, 50°; 12th, 48½; 13th, 47°; 14th, 48½; 15th, 48½; 16th, 43½; 17th, 42½; and the departures in excess of their respective averages

were 1½, 9° 3', 8° 1', 9° 9', 9° 8', 4° 8, and 4° 2. The mean temperature of the air for the week was 47½, being 0.2 above the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 102° on the 11th, 95½° on the 16th, and 93° on the 12th, on the 15th 60½° was the highest reading. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 31° on the 16th and 17th, and 38½° on the 12th, the mean for the seven low readings was 37½.

The direction of the wind was W.S.W., and its strength brisk. The weather during the week was mild, occasionally fine, but generally dull and cloudy.

Rain fell on five days in the week, the amount collected was 0.77 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 58½ at Bradford and 57½ at Plymouth; at Brighton, Portsmouth, Norwich, Wolverhampton, and Eccles 54½ was the highest temperature; the mean value from all stations was 55½. The lowest temperatures of the air were 31° at Wolverhampton, and 34° at Nottingham and Eccles; at Truro 43° was the lowest temperature; the general mean from all stations was 37°. The range of temperature in the week was the greatest at Wolverhampton, 23½, and the least at Truro, 14°; the mean range of temperature from all stations was 18½.

The mean of the seven high day temperatures was the highest at Truro and Plymouth, 54½, and the lowest at Nottingham, Manchester, Exeter, and Hull, all 50½; the general mean from all stations was 52°. The mean of the seven low night temperatures was the lowest at Hull, 38½, and the highest at Truro, 47½; the mean value from all stations was 42½. The mean daily range of temperature was the least at Portsmouth, Truro, and Liverpool, all 17°, and the greatest at Sunderland, 12½. The mean daily range from all stations was 9½.

The mean temperature of the air for the week from all stations was 46½, being 4° above the value for the corresponding week in 1876. The highest was 50½, at Truro, and the lowest 44°, at Hull.

Rain fell on every day of the week at Bradford, and on four or five other days at most places. The amounts of rain varied from three-quarters of an inch at Farnham, Truro, Blacketh, Bristol, Liverpool, Manchester, and Sunderland, to a quarter of an inch at Sheffield and Leeds; the average fall over the country was six-tenths of an inch.

The weather during the week was mild, generally dull, and the sky cloudy, but fine at times.

SCOTLAND: Temperature.—The highest temperatures of the air ranged from 55° at Leith to 52° at both Dundee and Aberdeen; the mean for the week from all stations was 53½. The lowest temperatures of the air varied from 31½ at Aberdeen to 36° at Leith; the mean from all stations was 33½. The mean range of temperature in the week from all stations was 19½.

The mean temperature of the air for the week from all stations was 42½, being 4½ above the value for the corresponding week in 1876. The highest occurred at Leith 44½, and the lowest at Aberdeen, 40°.

Rain. The amount of rain measured during the week at Greenock and Paisley was rather more than 2½ inches, whilst at Dundee half an inch only fell. The average fall over the country was 1½ inch.

DUBLIN.—The highest temperature of the air was 58½, the lowest 33°, the range 25½, the mean 47½, and the fall of rain 0.63 inch.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEB. 21, 1877.

- Feb. 15.—A very dull cloudy day. Mild.
- 16.—A fine light day, partially cloudy. Rain in early morning.
- 17.—A fine day, very cloudy, and little thin rain at times.
- 18.—A dull cloudy day; occasional thin rain.
- 19.—A fine day, very cloudy. Dull and wet, at night. Little rain in morning.
- 20.—Overcast, dull with sleet till 11 a.m. Fine, but cloudy after. Cool. Strong wind. Cloudless night.
- 21.—A fine but very cloudy day. Cold wind. A little thin rain fell at 10.

JAMES GLAISHER.

Enquiries.

He that questioneth much shall learn much.—BACON.
172. THE OLD BABY CUCUMBER.—*The Gardener*, Old Forge, Dunmurry, Belfast, was so much obliged to any of our readers for a few seeds of this old Cucumber.

Answers to Correspondents.

THE BOUTOUPE PEA, which "R. D." enquires about (Cly. 200) is a very fine variety. The best specimen was the Mummy Pea. There are two varieties—one white-flowered, the other as dark. B.—I think the Pea your correspondent "R. D." inquires after in yours of February 17 is identical with a French variety—*Pois sans parchemin Turc à fleur rouge*. This is a kind of Sugar Pea, 6 feet high, with a very strong branchless stem, and the flowers crimson and pale pink or white in a normal state. It is a very beautiful variety. Can any of your readers tell me what the "Organ Herb" is? It is puzzled by it. J. Gould. [? Origanum = Marjoram.]

BOOKS: T. F. The last edition of *Parson's Botanical Dictionary* contains many more references than the pocket edition, and is besides the best that you can get.

CAMELLIA: F. A. S. A full-double well-formed symmetrical flower, but rather small, and not very novel in colour—a bright carmine-red, mottled with white.

CATALOGUE: G. T. *Crossford*. We know of no illustrated catalogue that gives descriptions of rustic summer-houses, seats, bridges, gates, and fountains, &c. Mr. J. Caven Fox, Royal Horticultural Society, South Kensington, would be glad to send you a catalogue of summer-houses; for the others consult our advertising columns.

INSECTS: A. P. M. D. The beetles seen are the omnivorous weevil, *Oryctolynchus scabellus*. If you would be a sheet on the ground under your Orchids, they would be easily seen when they fall down on being disturbed by the introduction of a light after nightfall. They are a British species of too common occurrence. I. O. W.

LARCH: Larix. You would do best to consult the chapters on Larch in Grigor's *Arboriculture* (Edinburgh, Edmonston & Douglas), or Town's *Forester* (Blackwood & Sons).

LOBELIA EMPEROR WILLIAM.—Since writing in your last number I have had numerous applications for cuttings. Many of my correspondents I have supplied, and the others shall receive my best attention as soon as I can spare the cuttings. P. Davidson, *The Gardener*, 10, St. James's Place, London, W.

MISTLETOE: R. May. The best scientific account is that by Dr. Harley in the *Transactions of the Linnean Society*. See also Dr. Bull's paper in *Seymour's Journal of Botany*, and numerous references in our back volumes.

NAMES OF FRUIT: D. B. Apple. We do not know the name of the American variety sent. J. Dimmick, York, and I are not now send you a catalogue of small Pear is believed to be Bezi Quessé, but as the fruit was very much bruised and decaying we are not quite sure.

NAMES OF PLANTS: An Old Subscriber. Sparmannia africana.—G. T. We cannot undertake to name garden varieties of flowers, to which class your *Camellias* belong. They were, moreover, sent before our identification of them. H. W. D. Probably a species of Swainsonia. A. B. C. A double form of *Anemone pavonia*.—W. W. 1. *Rivina* sp. 2. *Saxifraga sarmentosa*. 3. *Delandrea Martensii*, probably ? 4. *Senecio (Kleinia) articulata*; 5. *Tradescantia zebrina*; 2, 4, 5, send these again, but not such scrappy specimens. D. D. *Saxifraga*. The variety is *Stenandrium californicum*. *Cypripedium* probably *C. Goveniana*, but send fruit. Send the other shrub again when in flower, and kindly number your specimens.—A. B. *Burrows*. We believe your Begonia are—1, *B. Elmira*; 2, *B. Delandrea*; 3, *B. nitida*. The specimens are not good enough to determine with accuracy.

PARSLEY: Wm. Cochran & Son. The sample sent is very vigorous, and the variety will probably prove to be a useful one for winter work; but we have seen more finely cut-leaved varieties.

PINES: J. H. G. Some of the suckers were quite rotten, and they had the appearance of having rotted by being seized either by hot water or by the hot dung which they may have been laid in.

PLANTING: G. T. *Delandrea*. We would recommend you to plant the trees as you receive them from the nursery, and leave them so until the buds are swelling a little; then cut the shoots back to, say, half their length or so, and water them. Delandrea, B. G., so that no precise rules can be given.

PRUNING VINES. *St. Andreæ.* Cut them back at once to a feet 6 inches, and then trim back the young growths to the required width every autumn, leaving the tops to grow till they attain the desired height.

QUERCUS FORDII. *A Constant Reader.* Probably a hybrid form of *Q. Grammatica*.

RASPBERRY. *J. L.* We will endeavour to meet your wish shortly.

REUSE FOR GASWORKS. *R. V. A.* You can do no harm in using the ordinary law of the **ROCKY MOUNTAIN LOCUST.** *J. S. D.* The best account that we have seen of the Rocky Mountain Locust, *Calopternus asperus*, is that published by Professor W. Riley, in his *Exploring and Collecting Report on the Noxious, Beneficial, and other Insects of the State of Missouri*. You may possibly get a copy from the author, if you write to him at St. Louis, Missouri, or from Mr. John Montross, Secretary to the State Board of Agriculture, St. Louis. We do not know the price.

SOULS. *P. L. N.* We do not care for snap-a-ups as manure for any kind of plant. They will be least injurious—may perhaps do a little good—amongst strong-growing vegetables or Vines, but do not use them for anything tender. Your Strawberry leaves have been attacked with a fungus or mildew, which is now dead. They will be none the worse.

STRAWBERRIES. *G. A. H.* The great point is to secure the runners early, and to get the crowns well ripened and thoroughly established in the pots before winter. It does not matter whether it is the first, second, or third runner that is taken.

VINES. *A Subscriber.* In planting Vines out of pots at this season the soil should be shaken clear from the roots, and they should be spread out carefully in layers amongst the soil.

CATALOGUES RECEIVED.—*Fred. Geo.* (Biggleswade, Beds), Catalogue of Seeds, Plants, Roots, &c.—*R. W. & Co.* (London), Catalogue of Seeds, Plants, &c.—**Catalogue of Hardy Annuals and Herbaceous Plants, Aquatic and Marsh Plants, Bulbous Roots, Violets, Fruit Trees, &c.**—*W. B. Rowe* (65, Broad Street, Worcester), General Catalogue.—*Messrs. W. W. Wright & Co.* (Aurdie, N.B.), Catalogue of Hot-water Apparatus.—*Messrs. W. Clibran & Son* (Oldfield Nursery, Atrincham, Cheshire), Catalogue of Plants and Seeds.—*Messrs. E. G. Henderson & Son* (Pine-apple Nursery, Madia Vale, London, W.), Catalogue of Flower, Vegetable and Agricultural Seedlings.—*Messrs. J. Algate* (Lynn, France), Catalogue of New Plants, Florist's Seeds, &c.—*W. Ford* (Fulmer, Basingstoke), Descriptive Catalogue of Seed Potatoes, Vegetable, Flower, and Agricultural Seeds, &c.—*G. W. Little* (Littleport, Dorset), Descriptive Catalogue of Vegetable and Flower Seeds, Gladioli, &c.—*Messrs. Cole & Brother* (Pella, Iowa, U.S.A.), Catalogue of Vegetable and Flower Seeds.—*Henry Brierley* (Manor Farm, Nursery, St. Leonards, near Witton), Trade List of New Roses for 1897.

COMMUNICATIONS RECEIVED.—*Justitia* (the subject of your letter is not the same with which we cannot interfere).—*L. Sanders*—*J. C. F. D. H.* (many thanks).—*G. W. M.* (please send us the name of the raiser).—*A. D. C.* (We will be glad to see the raiser).—*R. E.* (probably the raiser).—*W. A.* (we will give you a fuller answer next week).—*J. T. B.*—*E. A.*—*W. H. R.*—*R. C. W.*

Markets.

COVENT GARDEN, February 22.

Trade has fallen off again this week, and prices are lower, though superior sorts of Apples are maintaining their full value. Cist Apples are scarcely asked for. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON. Feb. 21.—No great activity is yet seen on the seed market; the recent unfavourable weather and the disastrous exhibitions in the provinces, however, to the high prices of the present season combine to impart a quiet tone to the trade. As previously mentioned, advices from the American seaboard and interior state that the home demand there has now set in. In continuation of this the imports into this country from across the Atlantic have lately been reduced to a very narrow compass—the total quantity arrived in London from New York since the beginning of the present month being only 67½ bags, equal to a small weekly average of 14½ tons. For fine Canadian seed, which the supply in New York is plentiful, long prices are demanded. As regards home-grown seed, the quantity of samples still find their way to Mark Lane, but most of these parcels are brown and weathered, and are consequently sold at irregular rates. For winter Clover the inquiry is limited, and there is at present no response here. The advance reported in Germany. Alsike keeps steady; of choice seed the stock held is small. In Trefoils the business has been limited. In the case of Mustard and Rape seed are scarce, and for such, when forthcoming, buyers are readily found. For fine white Mustard quite a considerable advance has lately been established. Cane and Linseed, as well as Rape, are scarce. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday trade was steady. Fine dry samples of English Wheat were about 1s. per quarter dearer than on Monday's night; but there was a dull market for inferior samples, and no improvement was noticed in foreign Wheat. Barley underwent no particular change in value. Malt was rather firm on the week. Sound Oats advanced 3d. per quarter on the week, but other corn remained at its previous level. Maize had rather improving tendency. Beans and Peas were quoted as before. Flour was without alteration, the tone of the market remaining steady.—On Wednesday trade was quiet, and quotations showed little or no change from Monday. As regards Wheat there was a scarcity of fine dry samples, the market for which had a hardening tendency. Barley and Malt met with slow sale, and rates remained steady. Oats were in moderate request, and sound old corn was perhaps worth a trifle more money. Maize was firm, while previous quotations were supported for Beans, Peas, and Flour.—Average prices for the week ending February 17:—Wheat, 40s. 3d.; Oats, 24s. 0d. For corresponding week last year:—Wheat, 42s. 8d.; Barley, 32s. 0d.; Oats, 24s. 0d.

CATTLE.

At the Metropolitan Market on Monday there was only a short supply of beasts, and trade was more active at the London market. Choice specimens were few and dearer, and an early clearance was effected. The absence of foreign supplies caused the short numbers here. Calves were dear. Quotations: Beasts, 47. 6d. to 55. 4d.; sheep, 45. 0d. to 55. 0d.; pigs, 45. 0d. to 55. 0d.—There was a small supply of stock at Thursday's market, and the few beasts, being of inferior quality, were cleared off readily, at advanced rates. Prime calves firmly uphold their value. Pork quotations nominal.

POTATOS.

The reports from the Borough and Spitalfields markets state that there was a pretty good market for sound Potatoes, whether English or foreign. A considerable quantity was witnessed for inferior kinds. The supplies were ample. Kent Regents, 100s. to 126s. per ton; Essex do., 90s. to 120s.; Scotch, 100s. to 135s. 0d. to 140s.; Victoria, 100s. to 120s.; Kidneys, 100s. to 120s.; Loeks, 75s. to 90s.—The imports into London last week consisted of 26,875 bags from Antwerp, 19,812 from Rotterdam, 28,126 from Ghent, 29,825 from London, 959 from Rotterdam, 661 from Dunkirk, 667 bags 138 barrels from Harlingen, 208 tons 137 sacks from Rouen, and 321 sacks from Boulogne.

SURPLUS NURSERY STOCK
all transplanted, healthy and well-rooted:—
MAULE'S AQUIFOLIA, 9 to 10 inches.
LAURELS, Portugal, 7 to 1½ foot.
ALIVE, 2 to 3 feet.

 Picking included. Terms, cash.
 Cemetery Nurseries, Gravesend, S.E.

To the Trade
A FEW NOVELTIES AND SPECIALITIES WELL WORTHY OF A TRIAL.
J. SCOTT, The Royal Seed Stores, Yeovil, has the great pleasure of offering the following—
NEW SUMMER CABBAGE LETTUCE—"THE FAVORITE"—This is, without exception, the finest Lettuce ever offered. It is exceptionally early, and will stand through the driest summer without showing any signs of bolting—"in fact, no other variety need be sown, as 'The Favorite' is equally fit for use in its young state as when it is fully matured. Price, 6d. and 1s. per packet. Trade prices, per annum.
MELON, DUKE OF EDINBURGH—True, 2s. 6d. per 100 seeds.
SHARPLEY SCOTT'S NEW GIANT—Eggs grown from one of this excellent sort attain the size of from 8 to 10 inches in circumference. They are mild in flavour, and are good and sound till late in the season. Treat the same as Onions. Per 100, 1s.; Trade price, 7s. 6d. per dozen.
"THE MUMMY" PEA—This is a remarkable Pea, and has somewhat a strange history as to its origin. It is said to have been taken from the mummy of a mummy, hence its name. It grows upwards of 11 feet high, branching and bearing from the bottom, and like the Scarlet Runner bears large bearing pods, 4 to 6 inches long, and no uncommon occurrence to see "ripe pods" pods fit to gather, and blossoms on the same branch. Price, 1s. per 2 oz. packet; 1s. Trade price, 6s. per dozen packets.
JOHN SCOTT, The Royal Seed Stores, Yeovil.

Special Offer of Good and Cheap NURSERY STOCK,
 all the whole of the healthy and well-rooted.

*. A large Stock of GRAPE VINES and FRUIT TREES generally, in splendid condition.

WM. PAUL & SON,
PAUL'S NURSERIES, WALTHAM CROSS, HERTS.

JEFFERIES' LITTLE QUEEN COS LETTUCE,

Per Packet, 1s. 6d.,

Is the Earliest, Best Flavoured and Best Coloured Lettuce in cultivation.

MR. FARLEY, *The Gardens, Valentines*, says:—"Your Little Queen Lettuce proved a good selection, although the weather was very adverse to the trial."

MR. MEADES, *Gr. to the Rt. Hon. Viscount Barrington, Bachel Park*, says:—"Your Little Queen Lettuce is a capital variety, as hard as a stone, and has kept well from running to seed this dry summer."

MR. FARR, *Gr. to Sir R. Knightley, Bart., Waverley Park*, says:—"Your little Lettuce has proved a very useful one, although the season has been very trying for that class of staff; its early hearting and crisp sweet flavour are sufficient to recommend it to all who are desirous of a small but good Lettuce."

A Packet of this excellent Lettuce will be included in all our Collections of Vegetable Seeds.

JEFFERIES' HALF GUINEA COLLECTION OF VEGETABLE SEEDS,
JEFFERIES' GUINEA COLLECTION OF VEGETABLE SEEDS,
JEFFERIES' TWO GUINEA COLLECTION OF VEGETABLE SEEDS,
JEFFERIES' THREE GUINEA COLLECTION OF VEGETABLE SEEDS,
Are the best obtainable. For particulars, obtain our "Illustrated Garden Guide."

JNO. JEFFERIES & SONS,
GIRENCESTER.

SEED POTATOS
And the POTATO DISEASE.

After many years of close investigation it has been decided, beyond any dispute, that the Potato Disease is solely caused by the attacks of two fungi, named *Peronospora* and *Fusarium*—the disease being accelerated by the attacks of minute worms, grubs, and mites. The latter can stand both freezing and boiling without losing their vitality—the two fungi of the Potato Disease and the minute parasitic animals are alike destroyed by a material named SALUS, and completed by Mr. Worthington Smith, of 15, Midland Grove, London. Mr. Smith is a well-known scientific microscopist, and the SALUS is at once a destroyer of diseases in plants and a powerful fertilizer. SALUS possesses FIFTY TIMES THE STRENGTH OF ORDINARY FERTILISERS, FUNGUS DESTROYERS, AND INSECTICIDES. The application is very easily accomplished by merely mixing it with common soil, and sowing in any manner, at the rate of 14 lb. per acre, at the cost of 14s.; or a sample sufficient to dress a hushel of Seed Potatoes may be had for 12s. at Messrs. WHEELER and SON'S London Office, 59, Mark Lane, E.C., or it will be sent free by post on receipt of a Post-office Order for 1s. 6d., made payable to J. C. WHEELER and SON, Seed Growers, Gloucester.

NEW WATERPROOF GARDEN

LABELS—These Labels, made of a new and unique Insoluble Card, are highly recommended for all Horticultural purposes. They are indestructible by water, are as easy to write upon as on common paper, and are offered to the Trade at prices lower than any useful labels hitherto produced. WILLIAM WRIGHT & CO.,

HOT-WATER ENGINEERS, AIRDIRY, N.B.

AN EXTRAORDINARY BOILER.

During the Great Boiler Contest at Birmingham, in 1877, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat, and the water in each pipe, and yet had more than a ton and a half of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners! This was THE CHAMPION, Deards' Patent Close Coil Boiler, for Drawings and Prices of which send two stamps to

Messrs. DEARDS, Boiler Works, Harlow, who now have the Boilers of work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz. the water-space at back and over/stop of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Fect.	£ s. d.
20 in.	18 in.	18 in.	300	0 0 0
20 "	18 "	24 "	350	0 0 0
20 "	18 "	30 "	500	0 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	1,000	16 0 0
24 "	24 "	36 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in use."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.

When ordering Boilers please refer to the above advertisement.

AGRICULTURAL LOCOMOTIVES,

STEAM PLOUGHING MACHINERY, ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES, STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers,

AVELING & PORTER,

ROCHESTER, KENT; 72, CANNON ST., LONDON, E.C.; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

Silver Medal, 1874.

THE TERMINAL SADDLE BOILER.

First-class Certificate, 1867; Highly Commended, 1873; and First-class Certificate, 1875.

"This Boiler possesses the rare merit of sucking all the heat from the fire."—*Review of Machinery*, p. 23.
"I have had done the Best Boiler, that I have ever had any kind of fuel, in the Terminal Saddle."—*Journal of Horticulture*, p. 377.

"For moderate cost and real efficiency the Terminal Saddle is one of the very best."—*The Gardener*, p. 95.

**COWAN'S PATENT
 COMPENSATING SYSTEM
 OF HEATING,**
 FOR HORTICULTURAL, PUBLIC, AND
 OTHER BUILDINGS.

The most important discovery for saving the cost of
 fuel, for steadiness in heating power, and dispensing
 with night stoking. One Apparatus will do the work of
 several Boilers, and in some cases produce a profit.

Heating by the Ordinary Systems.
 Hothouses, Mansions, Churches, and other Buildings
 efficiently heated by other approved methods, where the
 Patent Apparatus cannot be adopted.

*A large Stock of the most improved forms of Boilers to
 select from.*

HEAT and LIGHT.
**COWAN'S PATENT COMBINED GAS-MAKING
 and HEATING APPARATUS,**
 By which Country Mansions and Public Institutions may
 be heated and lighted, in most cases free of cost.

HORTICULTURAL BUILDING.
 All structures specially adapted to the purposes for
 which they are required, built of the best materials and
 workmanship, at moderate prices.

Plans and Estimates free. An Illustrated Pamphlet free.
 All work done by the Company is guaranteed.

THE
Cowan Patents Company (Limited),

EPPS'S COCOA.—By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame.—*Civil Service Gazette.*

JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS, 48, Thredenneedle Street, London, W.

KINAHAN'S OLD WHISKY.—Kinahan & Co. finding that, through the recommendation of the late Dr. Cassell, their Old Blend Whisky was being adulterated with inferior spirits, they have now introduced a BRATED OLD OLD WHISKY for purely medicinal purposes in very great, supplied with pleasure the following Analysis by Dr. Cassell:—It is very carefully and fully analysed, and the Whisky is found to be of a pure and healthy character, and of very excellent quality. The Medical Profession may feel full confidence in the purity and quality of the Whisky.—**Dr. Cassell, 20, Great Titchfield Street, Oxford Street, London, W.**

DINNENFORD'S FLUID MAGNESIA.—The best remedy for ACIDITY OF THE STOMACH, HEADACHE, DYSPEPSIA, BILIOUSNESS, COLIC, INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.

DINNENFORD AND CO., 179, New Bond Street, London, and all Chemists.

HOLLOWAY'S OINTMENT AND PILLS.—Rheumatism and rheumatic gout are the most dreaded of all diseases, because their victims know that they are safe at no season, and that they are never cured. Holloway's Ointment and Pills have proved the greatest blessings in removing Rheumatism, Gout, and all the kindred affections, and have assisted persons previously healthy and in the prime of life.

BLACK THORN or **SLOE**, fine, 2-yr. Seedling, Special offers of the above at exceedingly low prices will be made on application to
THOMAS FERKINS, 42, Drapery, Northampton.

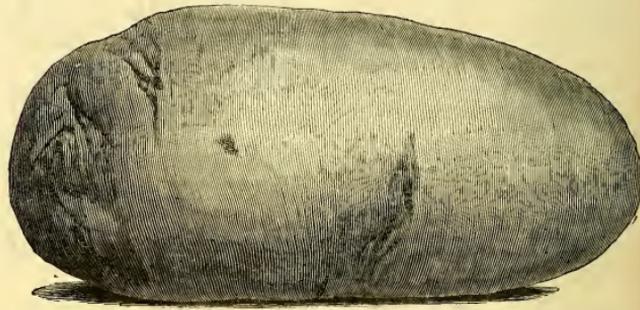

GREEN TREE BOX.—The hardest evergreen, exclusive of the Conifers, thrives in almost any soil, especially on chalk. The wood is very valuable, and, on account of its being applied in increasing quantities to new uses, is rapidly rising in price. A few acres of Box trees planted now would in a comparatively few years be worth an almost fabulous amount of money. Very bushy and extra well-rooted plants can be supplied.
 1 1/2 to 2 feet, 4s. per dozen, 48s. per 100, 480s. per 1000.
 2 to 2 1/2 feet, 6s. per dozen, 72s. per 100, 720s. per 1000.
 2 1/2 to 3 feet, 9s. per dozen, 108s. per 100, 1080s. per 1000.
CATALOGUES OF ROSES, FRUIT TREES, and General NURSERY STOCK, free.
EWING AND COMPANY, Eaton, Norwich.

From Paris.—Roses, Primroses, Camellias.
L'ÉVÈQUE AND SON, NURSERYMEN, 26, Rue du Liégar, Ivry-sur-Seine, near Paris, have many thousand ROSE TREES, Standards, Half-standards, Dwarf, and on our new—New and Old sorts.
L'ÉVÈQUE AND SON respectfully solicit Gentlemen and Nurserymen visiting Paris to inspect their stock, the largest in Paris.
SPLENDID PYRAMID CAMELLIAS, price 12s. to 50s. each; small, 2s. to 10s.
CATALOGUES and LISTS on application.

From Paris—Large Bulbs of Gladioli, Seedlings and Named Sorts.
L'ÉVÈQUE AND SON, NURSERYMEN, 26, Rue du Liégar, Ivry-sur-Seine, near Paris, have many thousand strong, healthy Flowering BULBS of GLADIOLI. The Seedling Bulbs are particularly recommended—their flowers equal to the named sorts (seeds have been taken from the best sorts of the collection). GLADIOLI Seedlings, 4s. per 100, 40s. per 1000; 4s. per 1000; mixed white, red, pink. Separate colours, 12s. to 20s. per 100; yellow, 24s. per 100. Named sorts per 100, 10s. to 100s. 15 white, 20s.; 30 or 100 sorts (the best), from 25s. to 26s. less or more, according to the novelty. All good flowering bulbs. English Cheques on London, or Post-office Orders on Paris, accepted in payment.

THE BEST MARKET POTATO IN THE WORLD.

Opinion of **SHIRLEY HIBBERD, Esq.,** Editor of the "Gardeners' Magazine."

SUTTON'S MAGNUM BONUM.

From the "Gardeners' Magazine," February 24, 1877.
 "Sutton's Magnum Bonum Potato was selected by Mr. Martin Sutton from a set of seedlings raised by Mr. Clarke, of Cranmoor, and subjected to proof of quality and distinctness in Mr. Hibberd's trial ground at Stoke Newington. This variety proving of excellent quality and remarkably productive was secured by Messrs. Sutton for trade purposes. The entire stock was purchased by them, and in anticipation of a large sale they withheld it for a season, in order to raise a sufficient quantity. The heavy crop produced in 1875 enabled them to send it out in 1876, and one season's experience of it by cultivators sufficed to establish its fame. These facts will have some interest for those who are enquiring into the history of this useful variety."

From the "Pictorial World," February 24, 1877.
 "In our opinion the best market Potato in the world, all points considered, is Sutton's Magnum Bonum. It is not a perfect beauty, and therefore does not shine as an exhibition Potato. But it is a good-looking market root, and cooks well, the flesh being white, mealy, and of excellent flavour. None but a fastidious amateur, such as the undersigned, would wish for a better Potato than Magnum Bonum, and being of good quality and appearance the next question is as to its cropping capabilities. Well, what do you think of lifting stools of 5 lb. to 10 lb. weight of ware Potatoes? Such is the capability of this sort that a set weighing 6 ounces will in a good soil, with the aid of a good season, swell up a heap of handsome tubers weighing as much as 12 lb. We speak from knowledge, and will add, that with good cultivation this sort may be expected to produce stools averaging 5 lb. to 7 lb. at the very least, and therefore it must be a profitable Potato. This variety requires extra space to grow in, and the best way to do it is to put the rows 4 feet asunder, and dib in some kind of winter greens or Broccolis, or some other crop that will pay for the extra space required by the vigorous haulm of this productive Potato." S. H.

Price, 5s. per Peck.
 No customer can be supplied with a larger quantity than One Peck.

DANIELS' SEED POTATOES.

Our Stocks of **POTATOES** are warranted True to Name and Free from Disease, all being carefully selected at the time of growth, and afterwards passed through the hands at least three or four times before being sent out, and all inferior, misshapen and forked tubers carefully discarded.

To improve the culture and encourage the diffusion of really good varieties, we have determined to offer at the lowest possible rates **COLLECTIONS OF POTATOS FOR EXHIBITION PURPOSES**, and trust our efforts in this direction will meet a want so much felt by our Customers and the gardening community generally. The selection in all cases must be left to us; it will be very carefully made, and only those of known excellence and superior qualities included.

VALUABLE LILIES.

MR. J. C. STEVENS will **SELL BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **MONDAY**, March 5, at half-past 12 o'clock,

1500 LILIUM KRAMERI,

and good Bulbs of the beautiful **LILIUM NEILGHERRENSE**. The white flowers of this magnificent Lily are deliciously fragrant, and of great substance; it bears several flowers on a stem, each flower nearly a foot long. Also some excellent Bulbs of the following new varieties of **LILIUM neilgherrense**, viz. :—

- LILIUM NEILGHERRENSE ROSEUM**—the exterior of the flower-tubes of this variety is pink, the interior white.
- LILIUM NEILGHERRENSE FLAVUM**—a handsome light yellow-coloured form of this charming Lily.
- LILIUM NEILGHERRENSE TUBIFLORUM**—a magnificent pure white Lily, with very long flowers; figured in Wight's *Icones Plantarum India Orientalis*.
- LILIUM NEILGHERRENSE TUBIFLORUM LUTEUM**—a very handsome yellow-flowered variety of tubiflorum. And some

Splendid flowering Bulbs of other choice **LILIES**, including **BLOOMERIANUM OCELLATUM**, **PURPUREUM**, **HUMBOLDTII**, **PARDALINUM**, **PARVUM**, **CALIFORNICUM**, and **WALLICHIANUM**; also a quantity of choice Bulbs and Tubers from California, including **CALOCHORTUS**, **CYCLOBOTHRAS**, **BRODLEAS**, **TRITELEIAS**, **CALLIPHORAS**, **ERYTHROLIUS**, **BLOOMERIAS**, &c.; and some fine blooming Bulbs of the handsome **CRINUM BRACHYNEMA**, **C. AUSTRALE**, **C. PRATENSE**, **CANALICULATUM**, tuberous-rooted **BEGONIAS**, **PANCRATIUMS**, **AMARYLLIS**, North American **CYPRIPEDIUMS**, with a variety of other Bulbs and Tubers.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

SPLENDID NEW MELON, 1877.

CHARLES LEE & SON

(Successors to Messrs. J. & C. LEE)

Have the pleasure to announce that they have purchased the entire Stock of

MANN'S HYBRID GREEN-FLESH MELON,

Which they now offer for the first time.

It has already earned a high reputation in London and the provinces for its many excellent qualities, which may be mentioned a remarkably high and exquisite flavour at all seasons of the year—perfection of shape and size for dessert—a thin rind and melting flesh, with an overflow of perfumed juice. It is also a heavy cropper, and forces well.

Dr. Hogg has spoken of this excellent Melon in the highest terms, and after tasting it pronounced it a fruit of the highest merit.
Mr. CULVERWELL, of Thorpe Perrow, fellow judge with Mr. FOWLER, of Harewood House, at the Leeds Horticultural Show, where they awarded a First-class Certificate to "Mann's Hybrid Green-flesh Melon," speaks of it as "an exceedingly fine Melon, especially at that early season—the early part of June."

Mr. INGRAM, of Belvoir Castle, writes, in the third week of October, "that in spite of the disadvantage of a long term of gloomy weather, at that season of the year, 'Mann's Hybrid Green-flesh Melon' was sweet, tender in flesh, very juicy, and distinct in character."

Messrs. Charles Lee & Son are now prepared to offer this very useful and delicious new Melon in Sealed Packets, at 3s. 6d. per Packet.

CHARLES LEE AND SON, HAMMERSMITH, W.

DANIELS' ILLUSTRATED GUIDE FOR AMATEUR GARDENERS.

JOHN KEYNES'

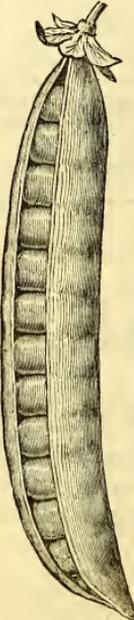

STOCK PLANTS are now ready. Very fine and clean.

CASTLE STREET NURSERY, SALISBURY.

TO THE TRADE ONLY.

HURST & SON

Can still supply the following NEW PEAS:—

MARKET FAVOURITE.

This variety was tested last season by a number of practical growers in various parts of the country, and, notwithstanding the unfavourable season, it was proved to be one of the most useful for Market Gardeners, as it is not subject to mildew in wet seasons, and was able to withstand the drought of last summer. It is Second Early, and of excellent flavour, medium height, and producing a most abundant crop of large, broad, well-filled pods. Highly commended by all who have tested it.

Price per Bush on application.

- Laxton's Filbasket
Laxton's Splunderer
Dr. Maclean,
Allen's Champion,
Balmoral Castle,
Cullingford's Magnanimous,
Giant Emerald, &c.

Orders despatched without delay.

6, LEADENHALL STREET, LONDON.

GOETZIA, LADY ALBEMARLE.

First-class Certificate Royal Horticultural Society, August 2, 1876.

A most fine new variety, growing 1 foot high. Flowers 1 1/2 to 4 inches across, and of the most intense glowing, carmine-crimson colour, which being produced in wonderful profusion give the plants the most charming appearance. This is the finest annual ever sent out, and being extremely hardy and easy of culture, should be in every garden.

Seed, with full cultural directions, per packet, 1s. 6d. post-free. "We have scarcely any plant of such a lovely shade of colour."—The Veget. Gardener, September, 1876. "An extremely beautiful variety bearing flowers quite 4 inches in diameter, of a glowing crimson colour."—Gardener's Magazine, August 5, 1876. "A remarkable and splendid variety, far superior to any other of the family."—Journal of Horticulture, Aug. 3, 1876. May be had of all Seedsmen, and Wholesale and Retail of DANIELS BROS., THE ROYAL NORFOLK SEED ESTABLISHMENT, Norwich.

Offer the following in Seed, of quality the best that can be had, at per packet:—

- CALCEOLARIA—the variety of colours, size, and shape of the flowers is of great importance. Improved 1s. 6d. and 5s. double-flowered, 2s. 6d. and 5s. PRIMUM SINENSIS, crimson, scarlet, and white (better than any we had), separate or mixed, 2s. 6d. and 5s. double-flowered, true from seed, 2s. 6d. and 5s. CYCLAMEN PESTICUM GRANIFLORUM—brilliant colours, with large-laced petals and perfumed flowers, it is the quality here offered, 1s. and 2s. 6d. BEGONIA, tuberous-rooted (four collection is unequalled), 1s. and 2s. 6d. tuberos-rooted, double-flowered, mixed colours, 2s. 6d. BALSAM—see list to note, but our own saving-maxed, 1s. 2s. and 3s. PINK, from named collection, 1s. and 2s. 6d. CARNATION, mixed, 2s. 6d. See Catalogue for separate sections. MIMULUS, several strains, same as exhibited every year at the Royal Horticultural Society, 1s. 6d. LOBELIA, Brilliant Improved, White Brillant, Marzrine Gem, speciosa—from pot plants, punia grandiflora, Lustre Improved, Dehance—the best red, Bluestoes, and Magnifica, 1s. each. PANSY, French, show flowers, 1s. 6d. French, bloomed, 1s. 6d. PÉTUNIA, very best, saved in pots, in separate sections at the Wellington Road Nursery, 1s. double-flowered, 1s. and 2s. 6d. Intermediate, Brilliantissima, and others. See Catalogue. AFRICULA, extra choice alpine varieties, 2s. 6d. SOLANUM, Improved Hybrid, as grown for the London Market, 1s. HENDERSON'S, conical-shaped berries, 1s. GLOXINIA, drooping, 1s. HOLLYHOCK, from named collection, 1s. and 2s. 6d. PRIMROSE, POLYANTHUS, and OXLIP, best quality, mixed colours of each, 1s. WALLFLOWER, double German, mixed colours, 6d. and 1s.

NOVELTIES in FLOWER SEEDS.

- ALONSO ALBIFLORA.—New distinct species from collector, flowering freely, from 10 inches up to a feet in height, producing long terminal spikes of pure white flowers with yellow eye. It is recommended for pot-culture, as in the conservatory it will produce a succession of its flowers throughout the autumn and winter. See Catalogue for a desirable and useful substitute for Lily of the Valley as used in our bouquets with so charming an effect when arranged so as to overtop the other flowers by its spikes. BROWALLIA ROZELI, 2s. COBEA HIRSUTA, 2s. 6d. HUMEA ELEGANS ALBA, 1s. AGERATUM SNOW-FLAKE, 1s. MIMULUS BRILLANTISSIMA, scarlet seed, 1s. MENTZELIA ORNATA, fine plant (see description in Catalogue). TORRENIA FOURNIERI, new annual form of this beautiful collection, 1s. ERYNGIUM LAEVENWORTHII, ornamental plant, 1s. PYRETHRUM AUREUM CILINIATUM, fringed-leaved Garden Daisy, 1s. ASTER, Freight, most beautiful and brilliant new quilled variety, 1s. SAKIYA NEPALENSIS, fine ornamental species for pot culture, 1s. PAFAGA, New Zealand, showy flowers, 1s. LIATRIS PNCYNOSTACHYA, 1s. CANTERBURY BELLS, double filled flowers, beautiful variety, 1s. CUPHEA ROZELI, 1s. BAMBUA GRACILIS, 1s. PINE-APPLE NURSERY, MAIDA VALE LONDON, W.

G. GLENNY, Esq., reports H. Cannell's "Floral Guide" thus:—

"The most important feature in this work is a vivid description of the subjects he has grown and proved. Cannell in floriculture is what Loudon was in general gardening, his research is somewhat astounding. It contains a mass of information from which the amateur may learn much."

SHIRLEY HIBBERD, Esq., the Editor of "The Gardener's Magazine," also reports it thus:—
"Literature.—This is something more than a trade list: it is a book, and requires to be dealt with as such. It differs materially from trade lists generally, and instead of giving lists of all the florists' flowers that are cultivated, gives a few only of the best and most distinct in the several classes, accompanied with wonderfully full and accurate descriptions. The cultural and other notes are remarkable for their freshness and originality, and should be read by all."
The EDITOR of "The Floral World" also speaks of it thus:—
"Cannell's Illustrated Floral Guide refers to flowers and bedding plants, and their seeds solely, and may be considered the most complete representative Catalogue of its kind published."

H. C.'s Seed List is also by far the most valuable ever issued; sent post-free to all applicants.

SWANLEY, KENT.

NEW FUCHSIA, EARL OF BEACONSFIELD.

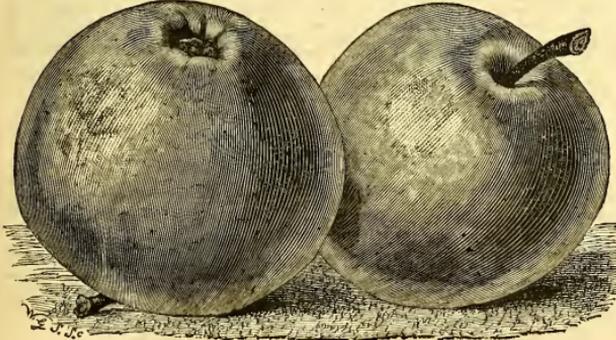

Vigorous growing, free flowering, beautiful habit, quite distinct, and described by Dr. Masters as one of the best hybrid varieties of Fuchsia. The blooms, 3 inches in length, are of great substance. The tube and sepals are of a light rosy carmine, corolla deep carmine.

This is a valuable decorative plant. It was awarded First-class Certificates at the Crystal Palace and Royal Botanic Society, Regent's Park, and is figured in the *Floral Magazine* for February.

Orders executed after the 15th March. Price, 5s.

JOHN LAING & CO., STANSTEAD PARK, FOREST HILL, LONDON, S.E.

NEW PLANTS, 1877.

CHARLES LEE & SON, SUCCESSORS TO Messrs. JOHN & CHARLES LEE,

OF THE
ROYAL VINEYARD NURSERY, HAMMERSMITH, near LONDON,
Have the pleasure to offer the following very beautiful and interesting

NOVELTIES, NOW OFFERED BY THEM FOR THE FIRST TIME:—

BEGONIA COLTONI.
This distinct and beautiful Begonia was raised at the Royal Vineyard Nursery. The colour of the flowers is quite new in Begonias, being of an orange-crimson. It is a most abundant bloomer, and the flowers are of the largest size.
It received a First-class Certificate from the Floral Committee of the Royal Horticultural Society in 1875.
Good Plants, price 10s. 6d. each.

BEGONIA RODWELLI.
This lovely Begonia was also raised at the Royal Vineyard Nursery. The flowers are of a bright vermilion-scarlet, and of the largest size; and the plant is a very abundant bloomer.
It received a First-class Certificate from the Committee of the Royal Horticultural Society.
Good Plants, price 10s. 6d. each.

CORNUS MASCULA AUREA ELEGANTISSIMA (J. & C. Lee).
This elegant and lovely hardy shrub was raised from seed in our Isleworth Nursery, and has been proved to be perfectly constant in its beautiful variegation.
A broad margin of pure gold surrounding a bright green centre is of itself a sufficient attraction, but when in July the tips of the leaves become suffused with the brightest carmine, it is impossible to give an idea of the beauty and elegance of the plant, which will bear a favourable comparison with the best variegated stove or greenhouse exotics. Suffice it to say, that it has been seen and admired by many amateurs and nurserymen, and has been awarded a First-class Certificate at South Kensington.
The habit of the plant is semi-pendulous, and very graceful.
Price of Maiden Plants, 15s. each; Larger Specimens, 21s. each.
A Coloured Plate may be had on application for 1s.

JUNIPERUS VIRGINIANA ELEGANS (J. & C. Lee).
This very elegant variety of the Red Cedar was raised from seed in our own grounds in 1869. It is scarcely necessary to remark upon the hardness of this plant, but it is due to its character to state that the elegant cream-coloured variegation with which the whole plant is suffused is perfectly constant, and has never been injured by frost or burned in the least degree by the hottest sunshine, although fully exposed in the open air.
The plant is of neat and free growth, and received the honour of a First-class Certificate from the Floral Committee at South Kensington, in July, 1875.
Price 15s. each; Larger Specimens, 21s. each.
A Photograph of the Plant may be had on application for 1s.

POPULUS CANADENSIS AUREA VAN GEERTI (1876).
The golden variety of this noble Poplar sent out in February last by Mr. Charles Van Geert, of Antwerp, has fully borne out in our Nurseries the description he gave of it, and has retained its golden colour much better than either the Golden Catalpa or the Golden Oak during the last tropical summer.
Extract from Mr. Van Geert's Description:—
"We have the pleasure of offering an extremely remarkable variety of the Canadian Poplar, with a foliage which presents during the whole summer the finest hue of golden-yellow."
"It is in our opinion a most valuable acquisition, and has been pronounced so by every connoisseur who has admired it in our nursery, for the coloured foliage now so frequently met with among low shrubs falls almost entirely among the larger trees. The Catalpa aurea and the Quercus Robur concordia are the only trees known as possessing the same golden foliage; but the former is only a second-sized tree, and the latter has not the vigour of the common Oak."
"Our golden Poplar, on the contrary, is a first-sized tree, of rapid and vigorous growth."
"Its leaves are quite as large as those of the common Canadian Poplar, and the yellow hue, instead of looking sickly, has a warm and vigorous tint. The better nourished the tree is, and the more it is exposed to the sun, the more vivid is the golden hue."

Having received in February last a large consignment of this magnificent novelty from Mr. Van Geert, we are enabled to offer
Nice Plants at 7s. 6d. each.

ABIES EXCELSA AUREA (J. & C. Lee, 1875).
This is decidedly the finest golden Conifer of large growth yet introduced. It is of free growth, and requires to be planted in the full sunshine. In such a position the whole tree is suffused with the richest gold.
A First-class Certificate has been awarded to this valuable tree at South Kensington.
Price of Nice Plants, 15s. each; Larger Specimens, 21s. each.

LAURUS CAMELIFOLIA (Wood, 1875).
We can still supply a few hundreds of this extraordinary and elegant Laurel.
Price 2s. 6d. each; per dozen, 18s.

SATURDAY, MARCH 3, 1877.

YELLOW GRAVEL.

THERE are some kinds of gravel that recommend themselves to our notice on account of certain inherent qualities which they possess, among which we reckon that of strength to stand the wear of traffic; that of binding, to carry a good face after the roller; and last, but not least, to be of an agreeable colour, so as to harmonise with the green of the lawn and the foliage of the flower-beds. The celebrated Kensington gravel was always considered the very perfection of gravel, and other kinds were valued according to their resemblance to Kensington gravel. Now, as I lived in the parish of Kensington, and trod the walks of Kensington Gardens, I may be allowed to speak of the article with some kind of authority, for the trade in gravel in my time was great, and we can form some idea of the statistics of the trade when a ton of coals and a ton of gravel from Kensington gravel-pits were the same price in Edinburgh, whither the gravel was conveyed for important purposes.

When the elder Nesfield designed a monogram to be worked in Box embroidery and yellow gravel at Alton Towers, we had recourse to baked fire-clay of a light yellow colour, got from the Staffordshire potteries, called by the workmen "grog," being "sagers" pounded and riddled, these sagers being the outer cases containing the ware when in the oven, and this grog is a regular article in the business of the potter.

I have mentioned these two kinds of road-stuff in order to contrast them with an article very superior to either, the price of which, including cartage 5 or 6 miles, is 10s. per ton. I have used several tons of it, and find that it binds firmly, is clean from sand or small particles, and is of a rich yellow colour, with a dash of brown, perhaps from iron ore; it was obtained for me by the good offices of a jobbing gardener, and comes from a place called "Fool's Neuk," near Macclesfield, Cheshire. I have often been astonished to see asphalted paths in front of the principal windows of gentlemen's villas done up in true coffin colours—white tears upon a black ground. In the North we frequently see a black coffin studded with white commas, called there tears, and it is very becoming in that case to give a place for tears for those who have died young, but the taste is very doubtful to put gas-tar and Derbyshire spar side by side on a walk or terrace in front of a gentleman's house, for as long as blue and yellow colours when mixed make green, so long will yellow gravel harmonise with green grass; and this rule is not subject to caprice, for it "altereth not."

Mr. Nesfield was a landscape painter of the highest order, and designed many beautiful gardens, but he confessed that he was neither botanist nor gardener, but, relying on the "brush," he doled out in his parterres, panels, &c., many strange colours, for if I recollect aright coloured glass broken fine made up part of the patterns in the garden of the Horticultural Society at Kensington, and in the garden designed by Nesfield at Alton Towers some twenty or thirty circular beds were paved with white pebbles, which could not be endured, and were planted with exotics warm and bright. Neither white pebbles nor white spar are ever likely to give any good effect in a flower garden, and the same may be said of red brick pounce.

Cracked limestone, when of a bluish tint, makes the carriage-way as good as it can be; and, for the reasons given above, the blue tinge harmonises with the greensward just as the yellow does. I have no interest whatever in praising the gravel from Maclesfield. I was agreeably surprised to see its fine colour and other fine qualities, and therefore resolved to send a paragraph to the *Gardeners' Chronicle*, in order that those who do the asphaltting on the coffin pattern may have no excuse if they do not finish with yellow; for be it observed that this fine gravel is not in egg-sized pebbles and made up with foreign matter, as clay and sand, such as we see everywhere, but confined to the size of one-inch pieces and down to that of Kidney Beans, so that a ton would cost a large surface of asphalted walk, and it is equally available for any ordinary gravel walk, especially where clay predominates.

For asphalt the gravel should be thoroughly dry, for one of the many odd properties of gassar is that it is not soluble in water and does not take kindly to wet substances. For facing ordinary gravel walks the gravel should be put on wet, and treated as if they were puddle, for you may water ordinary garden earth to any extent so long as you do not tread upon it, but if you poach it you make puddle of it, and although a headland in a cornfield may be poached and yet recover itself and bring a good crop, it is not so in gardening operations, and soil that has been puddled will take a long time to recover a healthy open texture. Let no one despise these practical hints, for the loss of one spoke in the wheel ruins the "turn." I recollect setting a gentleman right as to how he was to roof a building with paper and gas-tar and lime, and when I met him after, he said he had tried it and it was a failure, but when he detailed the process he said "I slaked the lime." That was sufficient; he had added water, which he should not have done, and the lime should have been fresh and pounded to powder. He thanked me, and we parted; but the next time I saw him he pointed out a building nicely roofed in this way, and laughed heartily at his blunder in not knowing water when it was apparently dry in powder lime; but all doubt on that score is powdered when you see a man put a hoghead of water to a cartload of lime, and though the mixture is dry as dust it is useless to say that there is no water there when you have just added twice the bulk of the lime in water.

The prevalence of weeds on walks is frequently owing to the prevalence of dirt in the gravel, which acts as a seedbed for grass, and this gravel, being clean and very likely highly charged with iron, from its appearance, is not likely to feed weeds of any kind. If used with judgment and discrimination it will brighten many a dull walk and terrace at little cost, and its brightness will remain after the flowers have faded, for it will exhibit itself all the year round "a thing of beauty," which, if not "a joy for ever," will, with its face of iron and its heart of stone, have a long lease. *Alex. Forsyth.*

MELONS FROM CENTRAL ASIA.

In the course of last year we received at Kew from Dr. King, Superintendent of the Royal Botanic Garden, Calcutta, a collection of Melon seeds brought from Yarkand and Kashgar, in Western Turkestan. Anything from a country so little known botanically could not fail to have some interest, and Dr. King especially directed our attention to these Melons, as likely to be of some horticultural value. He remarked, in an accompanying letter, "Mr. Scully brought me the seed, and he tells me some of the Melons are very fine. They will probably be worth cultivation in Europe, and though not quite in your way may be of some use. Should you have to refer to them, kindly quote the numbers on the packets." We divided the seeds, of fifteen kinds, between the Royal Horticultural Society and M. Naudin, the well-known

monographer of Cucurbitaceæ. I believe that some at least of the kinds fruited at Chiswick, but I have not obtained any reply in answer to my inquiries, nor do I find any notice of the Melons amongst the reports in the recently published number of the Society's *Journal*. M. Naudin has, however, most kindly sent me the results of his trials at Calouire. This note may probably meet the eye of Dr. King, and I therefore mention that, perhaps because I forgot to ask that it might be done, M. Naudin has unfortunately not preserved Dr. King's numbers. He, however, has been careful to give the native name, which may answer the purpose equally well. The result is somewhat disappointing. This is M. Naudin's report:—"I send you seeds of the eight best of the Melons from Central Asia. All belong to the same race; they are small, round in form, more or less depressed, with a few are oval. Speaking generally, their quality is moderate, but perhaps they may improve on cultivation, and even serve for the production of new and more valuable varieties by crossing with older kinds. Your skilful horticulturists will be able to exercise their industry on these novelties."

No. 1. Bajin Koghun.—Oblong, slightly netted, without ribs; flesh white, sugary. This is one of the best of the collection; Yarkand.

No. 2. Jori-Kand.—Round, depressed—tolerably good; Kashgar and Yarkand.

No. 3. Jori-Kand.—Ovoid, netted, without ribs; flesh entirely white, with the odour and taste of white Sugar-Melons. Another form with the same name as the preceding, but quite different.

No. 4. Topkin.—Ovoid, without ribs, slightly netted, small, odour none; flesh pinkish, delicate, melting, slightly sugary—seems a late variety; Yarkand.

No. 5. Lobiari.—Small, round, depressed, ribs imperceptible; flesh sugary, tolerably good—might probably be improved by cultivation; Yarkand.

No. 6. Au-Nabat.—Small, round, ribless; flesh reddish—tolerably good; Yarkand.

No. 7. Na-Shakar.—Small, round, depressed, sugary and good; Yarkand.

No. 8. Bihiki.—Small, round; flesh of no great thickness, and but slightly sugary—quality moderate; Kashgar and Yarkand.

Following M. Naudin's suggestion we have distributed the seeds to Mr. Gilbert of Barghley House, Mr. Speed of Clatsworth, and Mr. Woodbridge of Sion House, at whose hands their horticultural capabilities will no doubt have a fair trial.

It is worth mentioning as a curious contrast to the weather that we have had this winter in England, that M. Naudin informs me in his letter that since October 20, that is during 115 days, there has only been a single shower at Collioure (Eastern Pyrenees) of about half-an-inch—a rainfall, as he remarks, altogether insignificant. *W. T. Thistleton Dyer.*

CENTROPOGON LUCYANUS.

I DO not remember to have seen any notice of this Centropogon, and as I have found it one of the most showy and useful among the few really good winter blooming plants, I am induced to bring it before the notice of your readers, many of whom, although greatly put to for flowers at that dull season, may not have met with it as yet. *Centropogon Lucyanus* is one of those good things that you may cut and come again, for after the terminal head is severed, or without lifting on the plant, it starts again from the soil of almost every leaf down the whole of the stems, and forms laterals, all of which bloom in succession, thus keeping up a continuous supply for a long period of time. And another equally good quality pertaining to it is that it lasts well in water when cut, which is a great consideration, taking into account how ephemeral many flowers are that are forced or come in naturally during the short days, when there is very little sun or light to aid in giving substance to the petals, whereby alone they are able to endure the dry air of a room, unless they happen to be borne on soft porous stems that take up water freely, which this Centropogon does, and thus maintains its freshness. Its habit, too, is such, that it is admirable subject for decaying ferns, or hall vases, as it is naturally somewhat pendulous, so that it may be arranged to droop naturally over the sides, in which position it shows off its bright *Æschynanthus*-like flowers to the greatest advantage.

Small plants obtained now will come in admirably for working up a stock, as they propagate most readily and make excellent plants by the autumn if treated liberally during the summer, by growing them on a bed without check. The soft young side shoots should be chosen for cuttings, and taken off with a heel, and if then inserted in sandy soil in a brick heat they will soon root and be ready for potting off, which should be done either in peat and loam in about equal parts, or leaf-soil and the latter in the same proportion, with just sufficient sand to keep it open and porous, as it is a plant that delights in vegetable matter and a somewhat loose medium for its roots to ramble in, with the addition of a plentiful supply of water when growing. From March to the end of May they should be pushed on in stove-heat, standing them in a nice light position near the glass, where they can be kept well syringed and otherwise attended to according to their requirements. In June, and for the remainder of the summer months, the best situation for all plants of this class is a deep pit, where they can be plunged in a bed of gently fermenting leaves or tan, as here they are under control, and can be kept more uniform, both in regard to heat and moisture, than when treated with the ordinary occupants of the stove. By the end of July they should receive their final shift into 6-inch or 8-inch pots, according to their size and strength, and all the after-treatment they will require during the summer, in addition to the requisite watering and a very thin shade for an hour or two in the middle of bright sunny days, is a good damping overhead both morning and afternoon, closing them up immediately after the latter application, by which means their growth will be most rapid.

Towards the autumn fall exposure to sun, with an abundant supply of air, will be necessary to consolidate and ripen the young wood so as to induce a free-flowering habit, and by the end of September they should be again introduced to mild stove heat, where by Christmas, or before, they will be in full beauty, and last in that condition for at least two months if kept in a moderately cool temperature, from which they may be removed to use in vases for dinner-table decoration, or for purposes for which their bright colour and scented, or scitiferous habit render them particularly valuable. Not only are they most valuable as pot-plants, but they are alike suitable for baskets on account of their drooping habit, and when seen suspended from the roof they have a very bright, cheerful appearance. Whichever way they are grown, the shoots should not be stopped, but allowed to grow naturally to their full length, as the plants start freely from the crown, thus affording plenty of flowering wood; and as all of this makes laterals freely, as before observed, the longer it is the better effect it has, especially if depending over the sides of ornamental baskets. The treatment requisite after introducing them to the light, and in an intermediate-house temperature till the end of April, when the old shoots should be shortened back, and the plants shook out and repotted in smaller pots in the same kind of soil as that advised for growing them in.

Existing greenly, they are fortunately not subject to insects, which is a great point in their favour. 7. S. [This is a beautiful hybrid, too little known. It was raised at Marseilles in 1856, between *Siphocampylus betulinifolius* as the pollen parent, and *Centropogon fastuosus* as the female parent. Eos.]

FERTILISATION OF PLANTS.*

(Continued from p. 204.)

MR. DARWIN has been good enough to notice one of my criticisms and to explain it as due to a misprint of "self-fertilised" for "crossed," so that the sentence on p. 275 now runs as follows:—"The most probable explanation [of the ratio 100 : 131] is that the seeds from which the crossed plants of the third generation were raised were not well ripened [i.e., this will account for the self-fertilised beating the crossed], for I observed an analogous case with *Theris*. Self-fertilised seedlings of this latter plant, which were known to have been produced from seeds not well matured, grew from the first much more quickly than the crossed plants, which were raised from better matured seeds; so that having thus once got a better start they were enabled ever afterwards to retain

* *Cross and Self Fertilization of Plants.* By C. Darwin. (Macmillan.)

their advantage . . . and when in full flower were 5 to 6 inches higher than the crossed" (p. 103). So that if I were hypercritical in detecting an error due to the misprint, my inference is not altered, viz., that Mr. Darwin attributes the inferiority of the crossed *Petasia* to unripened seeds, and the superiority of the self-fertilised *Iberis* to the same cause! So that the case of *Iberis*, though in harmony with the original misprint, is no longer analogous, but exactly the reverse. I echo Mr. Darwin's hope that any reader who is interested in the subject will not take my interpretation of his statements without consulting his book.

After having devoted seven chapters to the details of the experiments, and to tables and summaries of the results, Mr. Darwin, in the eighth and ninth, deals with the comparative advantages and the reverse of crossing and of self-fertilisation respectively. Then follow two chapters on "the means of fertilisation and the habits of insects in relation to the fertilisation of flowers," and the last (twelfth) is devoted to general results.

Mr. Darwin commences the eighth chapter by observing that, "as the seedlings were planted on opposite sides of the same pot, they had to compete with one another, and the greater height, weight, and fertility of the [inter]crossed plants might have been expected," that the [inter]crossed plants did not exceed in height the self-fertilised. He notes that whilst very young—*i.e.*, before competition began—they were, with some exceptions, of equal height; but afterwards the intercrossed exceeded the self-fertilised. He next observes (p. 286), "that the [inter]crossed plants have an inherent superiority independently of competition, was sometimes well shown when both lots were planted separately in good soil in the open ground." But the word "sometimes" I have italicised is rather misleading, for on p. 288 the force of this sentence is reversed, where he says of plants thus grown—"The result was in several cases (but not so invariably as might have been expected), that the [inter]crossed plants did not exceed in height the self-fertilised in nearly so great a degree as when grown in pairs in the pots."

The sentence in brackets is an important admission in favour of self-fertilised plants when they can grow freely; and agrees with the tables, which clearly show such to be the case (*vide, &c.*, A. Vandellia, Eschscholtzia, *Reseda*, *Petasia*, 5th gen.; *Beta*, B., *Reseda* lutea, & C., *Nicotiana*). The rule, therefore, appears to be that when self-fertilised plants are compared with intercrossed in open ground, the vigour of the former often evinces itself either in an equal degree to or in a higher ratio than the intercrossed. Mr. Darwin's later experiences as detailed in this book thus corroborate his statement given in 1868: "If [the seeds are] sown in ample and good soil, there is often but little difference in their growth." Nevertheless as plants for the most part are certainly compelled to compete with one another in Nature, the superiority of intercrossed and crossed plants is specially shown in that capacity. Mr. Darwin next observes that "the innate power of the [inter]crossed plants to resist unfavourable conditions far better than did the self-fertilised plants, was shown on two occasions in a curious manner . . . when both sets were grown under extremely unfavourable conditions."

He here refers to seedlings of the plants of *Petasia* and *Iberis*, referred to in the last paper, of which when sown in sand and burnt earth, *i.e.*, without any organic matter, the intercrossed without the self-fertilised in height until they all died: a fact obviously of no great trustworthiness for deducing a general result, especially as the seeds were in an abnormal condition. Mr. Darwin refers to some analogous case with the first generation of *Nicotiana*. Unfortunately he does not appear to have recorded it, for his other observations on that plant are all in favour of the self-fertilised, not only in the first year during which he says "the self-fertilised were greatly superior to the [inter]crossed," but also mostly in the two following generations!

The stronger constitution of the intercrossed was also seen in withstanding sudden changes of temperature—*i.e.*, from the house to the open ground—as well as in resisting cold and intermediate weather. He illustrates this fact with *Ipomoea*, *Mimulus*, *Viola*, and *Sarothamnus* and *Nicotiana*; and *Eschscholtzia* formed an exception. There appears, on the other hand, however, to be some correlation between a

reduction of temperature and self-fertilisation. Several observations have led me to draw the conclusion that flowers, perhaps usually intercrossed, become self-fertilised not only, as has been by others inferred, in the absence of insects; which is apparently another and distinct cause, as, *e.g.*, in *Pisum sativum* and *Lathyrus odoratus* in England; but when the autumn draws on, and habitually in winter for such of our wild flowers as blossom in that season: several cases are mentioned incidentally by Mr. Darwin, which corroborate my observations. Thus he speaks of *Reseda odorata*, that while some plants were quite sterile in one year, three other plants in the next "became loaded with capsules, especially during the early part of the summer; and this fact indicates that temperature produces some effect." What that effect is I think I have discovered, and will explain hereafter.

Another fact in favour of intercrossing is that the intercrossed are less liable to premature death, independently of any apparent external cause. The self-fertilised plants often germinated sooner, but the seedlings often died than their competitors. They also arrived at maturity quicker, and began to wither sooner than the intercrossed; just as these latter did before the offspring of a cross with a fresh stock.

Lastly, the intercrossed often threw up a larger number of stems, and the result probably of greater vigour, and showed a tendency to flower before the self-fertilised. Mr. Darwin gives lists of species which flowered first. Thus forty-four intercrossed flowered first, either in a majority of the pots or in all. In nine cases a self-fertilised plant flowered first; in five the two lots flowered together. In the case of *Cyclamen* the intercrossed actually flowered some weeks before the self-fertilised.

"On the whole," concludes Mr. Darwin, "there can be no doubt that the [inter]crossed plants exhibit a tendency to flower before the self-fertilised, almost, though not quite so strongly marked as to grow to a greater height, to weigh more, and to be more fertile." *George Huxley.*

(To be continued.)

ORCHIDS IN FLOWER AT KEW.

This fine display of good ornamental kinds is at present chief attraction to professional and other visitors. Dendrobiums are in strong force; a fine specimen of the primrose-coloured form of *D. Hillii* has seventeen spikes, and smaller plants of the pure white have spikes 15 inches long, producing a considerable show of this species alone. It should perhaps be considered as a well marked variety of the old *D. speciosum*, with which, as it also is in bloom, comparison can be made, and doubtless from a horticultural point of view *D. Hillii* will be considered the best. As a fine variety and well flowered, *D. crassinode* may be mentioned as one of the most attractive; the curious stems along their whole length are laden with flowers of the brightest colour. Of *D. Wardianum* are several plants in pots, of different shades, and there is one of splendid size and colour, suspended in a basket. *D. primum* is very select, having delicately coloured flowers of crystalline appearance, and quite distinct. *D. heterocarpum* presents an uncommon colour among Orchids, and its strong perfume at once arrests attention. A hybrid from this with *D. japonicum* was recently exhibited by Messrs. Veitch, as *D. endocharis*. The flowers are intermediate in size, having chiefly the colour of *D. japonicum*, but with a decided touch in the lip from *D. heterocarpum*. Of *D. nobile* are several forms, including the varieties *pendulum* and *elegans*; the latter is beautifully coloured. *D. moniliforme* and *D. gratioissimum* have flowers most delicately tinted, and the rare *D. linguiforme* unites its starry white blooms with curious tongue-like leaves. *D. hirsutum* has been in flower for the last two months; it has white sepals and petals, with an orange-coloured fringed lip. The Australian *D. gracilicaule* and others of botanical interest are also in bloom. The graceful *Dendrobium glaucum* is represented by a fine plant having fifteen spikes. There are good spikes of *Vanda nasutus* and *V. tricolor*, and a solitary flower of the rare *V. Cathartii*. The *Saccolabium* are *S. giganteum*, and *S. Harrisonianum* with white flowers of pleasing perfume. *S. distichum* of the Himalayas is indeed curious; it has a trailing

habit, and the leaves, stems, and flowers are all green. The species of *Phalænopsis* are *P. rosea*, *P. grandifolia*, and *P. Schilleriana*. The curious genus *Mormodes* is illustrated by *M. hucatorum*. *Angreum sesquipedale* and two others, *A. eburneum* and the variety *vires*, are considerably ornamental; the curious *A. distichum* is pretty, from its habit of growth and number of small flowers. The *Cypripedium* are not only always in flower, but ever present some of their choicer kinds. There are at present the rare *C. pardinum*, the stock of which was distributed from Kew some years ago, and two of Mr. Dominy's hybrids, *× C. Harrisonianum* and *× C. Dominicanum*. There are also *C. venustum*, *C. hibernum*, *C. barbatum*, *C. insigne*, and its variety *Maclei*.

Among terrestrial Orchids the most handsome is *Stenorhynchus speciosus*, which is not often seen out of Kew. It has a tuft of dark green ovate-lanceolate spreading leaves, from which rises a scape bearing crimson flowers, springing from bracts of the same colour. The spotted variety, frequently known as *Neottia maculata*, is also in bloom. Other terrestrials are *Bletia* and *Wittichia*, *Phycanthus*, whose flowers come with the light green leaves, and the not very ornamental *Sauroglossum elatum* and *Prescottia gigantea*. Many *Odontoglossum* are showing for bloom, and of those already in flower are *O. pulchellum*, *O. crispum*, *O. coccineum*, *O. colobium*, *O. triumphans*, *O. Rossi* and the variety *superbum*, *O. gloriosum*, *O. nelusolum*, *O. lato-purpureum*, and *O. odoratum*. *Restrepia elegans* is a pretty member of a curious genus; it is like a small edition of *R. antennifera*, but much more richly coloured. A few Orchids are suggestive of *Stipelia*, but scarcely any more so than *Trias picta*, which by its marking, flat form, and somewhat regular outline, allows of no difficulty in forming a comparison. *Oncidium cheiranthum* is a beautiful and elegant plant, a multitude of bright yellow flowers on slender stems. It figured in the *Botanical Magazine* for the last month, where it is described as a charming, very sweetly-scented little species. Others are *O. flexuosum*, *O. pulchellum*, *O. reflexum*, *O. cucullatum*, *O. triquetrum*, *O. anomalum*, and the remarkable *O. abortivum*. *Lycaste linguella* has seventeen flowers growing from a single bulb; the sepals and petals are greenish, and the lip white; there are also light and dark forms of *L. Skinneri*. The smaller *Mixilabium* are here grown on Tree fern stems, a method found both convenient and graceful. The kinds in flower are *M. punctata*, *M. variabilis*, *var. lutea*, and the variety *idea*. *Kefersteinia graminea* is an interesting species, with narrow grassy leaves and small yellowish flowers, with transverse markings. The *Mixilabium* are *M. gibberosa*, *M. ignea*, and *M. ochthodes*, which, in a famous London collection, has been said to flower continuously for eleven years. Among *Epidendrum* are several of interest: *E. xanthinum* has bright yellow flowers; *E. stratum* purple ones, and less ornamental species are *E. fragrans*, which is worth growing on account of its sweet perfume and free flowering habit, and *E. cochlearium*, with a dark purple lip. *E. saphronites* is extremely curious, the leaves are more densely covered with white meal than any other Orchid we remember, and if protected from moisture are almost like an *Echeveria farinosa*. The flowers are large in proportion to the size of the plant, green in colour and marked with purple. A large plant of *Lelia superbiens* has three fine spikes, while a smaller specimen has still more. *Cattleya* *tricolor* is showy in light and dark forms; one plant has eight large flowers of rich colour, *C. quadricolor* is also in bloom. *Calanthe viridi-virens* is quite unlike the more familiar species; the sepals and petals are yellowish-brown, twice the size of the lip, and the petals are much reduced in size. *Eria obesa* is a pretty deciduous species, with white starry flowers in dense clusters. Showy well-known plants are *Ada aurantiaca* and *Sophrontes grandiflora*. *Rodriguezia crispata* has pale yellow flowers of pleasing perfume. *Cymbidium sinense*, *Brassavola cordata*, and several others of various genera, are also in bloom.

New Garden Plants.

LELIA ALBIDA STOBARTIANA, *nov. var.*

This is a very pretty novelty, sometimes with very large flowers. The sepals and petals have beautiful purplish large tips, and the borders of the anterior lacinia of the lip is deep purplish. It looks in colour just like *Chysis Limningheii*. What a curious fact that amidst the *Lælias*, usually so constant in colour, and with white variegated varieties of purple-flowered species, there is one single species so very unusual. These are, however, I think, of great pleasure, of the beautiful introductions made once by Mr. Low—the magnificent purplish *var. Tuckeri*, the brown *var. brunnea*, and the ochre-coloured *var. ochracea*—genus, which appear not to have been sailing to England

* *Animals and Plants under Domestication*, vol. ii., p. 128

* Mr. A. Bennett has also observed the same fact. *Nature* 1869, p. 12.

since 1868. I believe it is well known that a fabulous immense mass of the old *Laelia albida* exists in the wonderful collection of Mr. Day. Now our latest novelty was sent to me by Mr. L. Hartley, gr. to William C. Stobart, Esq., Etherley Lodge, Darlington, to whom it is dedicated. I obtained later several flowers from Messrs. Veitch, and there is just at hand a flower from Messrs. Haage & Schmidt, Erfurt. *H. G. Rehb. f.*

*MASDEVALLIA VESPERTILIO, Rehb. f.**

This rather modest and yet pretty species of the Chimera group I had hitherto only known in a dried state, from specimens collected by Messrs. Wallis, Roezl, Chesterton, and Patin. It is much in the way of *M. Nycteria*. The sepals are pallid yellow, blotched with brownish purple; the petals small, yellow with brown, and the lip extended in a very broad transverse epichile without any keel, when the small hypochile shows a nearly horse-shoe-like, more angular, blunt keel. Column white, beaked, in a fringed appendage over the anther. Sepals inside with numerous yellow bristles, and with yellow tails longer than their bodies. The six crenate hooker-green wings of ovary are very peculiar. A very small bud is observed at the base of the pedicel, wrapped round by the bract. The habitat is New Grenada. The first fresh flower I ever saw is just at hand from Sir Trevor Lawrence, who purchased it as *M. Houtteana*, a nice white-flowered species, with purplish tails. *H. G. Rehb. f.*

CYPRIPEDIUM HAYNALDIANUM, Rehb. f.†

Laber improbus omnia vincit! For years and years an object of my greatest interest was to ask after the health of the Philippines *Cyripedium* Lowei when I went to Messrs. Veitch's nursery. They were very few plants, and since they suffered very much by most accidentally travelling twice the usual time, they were for a time near to breathe out their last. All medications a good grower thinks of were applied—changes of air, change of light, change of soil, various quantities of beverage. Such tender care was finally well paid for, and if we consider the sufferings of the endless travelling we may believe the species as strong as *C. Lowei*, which is regarded—I don't know whether British orchidists are of same opinion—as much stronger than *C. Stonei*; finally, it has just flowered. I knew well before that it was a highly curious beauty, having seen a photograph and obtained dry flowers of it. It is very near *Cyripedium Lowei*, Lindl., so near that a casual observer might confuse the two. There are, however, judges who prefer the new one, not alone because it is new, but also for its far richer blotches spread over all the flowers excepting the lip. I write this having at hand five flowers of the new one (two fresh ones), and thirty-five flowers of the old one, and several sketches and analyses prepared from living specimens. The chief differences in the shape are the following—The staminode is much narrower and most distinctly bilobed, and the lobes are contiguous and bent down, quite covering a small tooth between them. In *C. Lowei* there is a much broader staminode, with three flat, equally expanded, not touching lobes, the middle one acute, centiform, the lateral ones blunt, all straight. The side lobes of the lip are much more prominent in the new one, and in their sinus with the channelled nail there is but a small entire keel. In *C. Lowei* those lobes are blunt and shorter, and the keel in the sinus has several teeth. The stigma is round and bent in *C. Lowei*, blunt, pentagonal, straight in the new one. The inferior sepal is broader, and much shorter in the new one. Now, speaking of colour, the upper sepal of *C. Lowei* is yellowish green, and the inferior sepal too. There are purplish lines and very small punctiform dots on the inner base of the superior one. In the new one the upper sepal is white at the tip, pallid green, with large, beautiful brown spots in the inferior part, when the borders are broadly violet. The inferior sepal is pallid green, with some brown spots. The colours of the petals and of the lips are nearly alike. The new species produced a two-flowered raceme, with a rudiment of a third

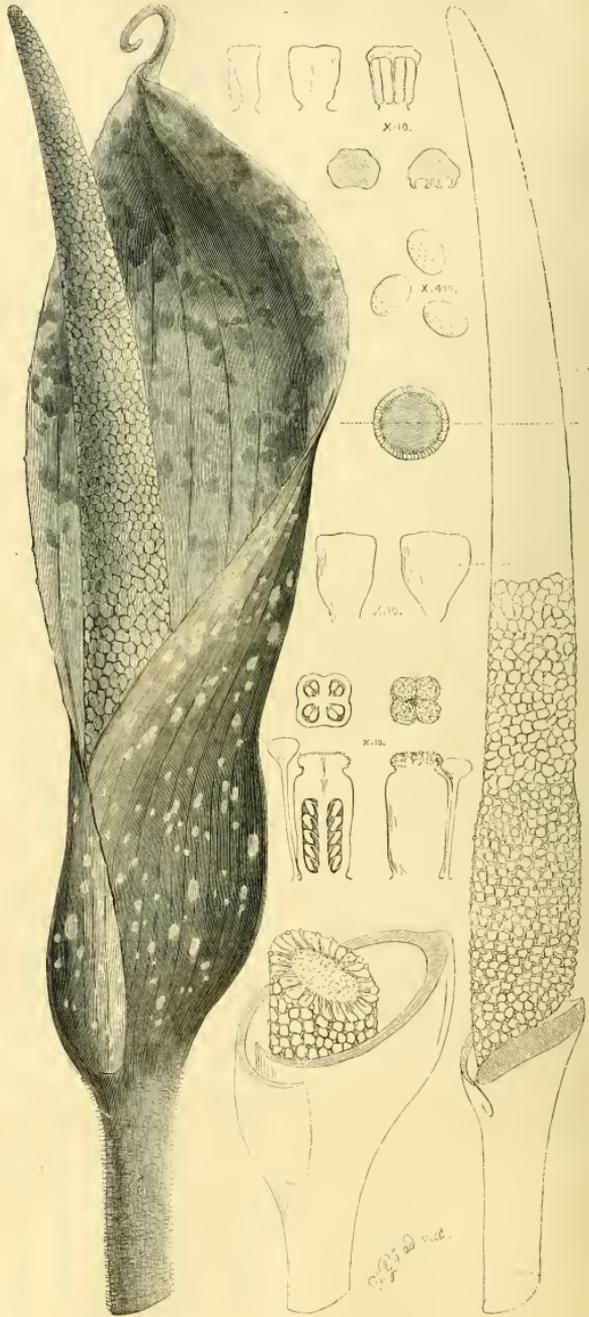

FIG. 45.—*HOMALOMENA FELTATA.* (SPATHE AND SPADIX NAT. SIZE; FLORAL DETAILS MAGN.)

* *Masdevallia Vespertilio*, Rehb. f. in *Gardener's Chronicle*, 1874, p. 817, June 24, nomen.—(Saccilabiata) uniflora (flure seu floribus succedentibus hysterocronis); sepalis oblongo-triangularibus ovatis hispidis, in caulis longioribus atramentis; tepalibus subunivalvibus, papillis adnatis in valva unica accedentibus, valva altera prope obliterata interna; labello pandurato; hypochilio angusto utrinque obtusangulo; carina anteriori angulata in disco; epichilio transverso latissimo oblongo utrinque involuto, laevi; columinae apice lacero rosata. Pedunculus purpurascens. Sepala cum caudis flavida, purpureo-maculata. Tepala eburnea coloris. Labello albidum. Columina alba. Nova Grenata.

† *Cyripedium Haynaldianum*, Rehb. f.—Aff. *C. Lowei*, Lindl. Pedunculo stricto deorsum ac patentem viloso; usque quadrifido (in pinnae apertione); bracteis oblongis acutis vilosis; ovaria pedicellata villosa non sequentibus; sepalis dorsali linearibus obtusangulo acuto; sepalis inferioribus oblongis acutis lacinato labello breviori; tepalibus linearitrigulatis anteriorum dilatatis oblongis acutis; labello saccato utrinque juxta succum in angulum angustum producto; lamellis in sinus inter angulum et unguem integra (eom planidentata); staminodeo spatuliformi apice obtuse bilobo; lobis contiguis, deorsum flexis, denticulatis, medium abscondentibus; processu cordato in basi. Rehb. fil. *Xenia Orchidacea*, II., p. 222.—Insul. Philipp., Wallis.

flower. It may even produce four flowers like the beautiful *C. Lowei*. It is one of the very best Philippine discoveries of Mr. Wallis. I had the great satisfaction of dedicating, a few years ago, this splendid plant to his Excellency Dr. Ludwig Haynald, Archbishop of Kalocsa, a zealous botanist, and a most liberal promoter of science and art in modern Hungary. His Excellency's name will for ever be connected with the development of that wonderful land. *H. G. Rehb. f.*

HOMALOMENA FELTATA, Mast.*

This is a new Aroid, alike of striking appearance and much interest. It was, we believe, introduced to Mr. Bull's establishment at Chelsea by Mr.

Be this as it may, the present plant is undoubtedly not a *Carmeria*, but a true *Homalomena*. It is of tufted habit, with numerous leaves springing from a contracted stem, and interspersed among them in due season are formed numerous flower-stalks. The leaf-stalks in Mr. Bull's plant are about 30 inches in length, sheathing at the base, nearly cylindrical above, where they are about the thickness of the finger, covered with soft rusty brown simple conical multicellular hairs, interspersed amid which, near the base, are numerous conical prickles. The blade of the leaf is convolute in vernation, about 2 feet in length by 16 or 17 inches in width, rather coriaceous in texture, dark green and glabrous above, covered with soft ferruginous pubescence

sistent, 6-7 inches long, tightly rolled round, except near the apex; constricted in the middle, acuminate at the apex, prominently but obtusely keeled at the back, glabrous externally, pinkish in colour, and white-spotted, internally greenish, shining; margins thin, pinkish, finely denticulate. It opens rather more than half-way down, and subsequently closes again. The spathe is nearly as long as the spathe, of the thickness of the forefinger, entirely covered with flowers, those of the upper two-thirds or rather less being cream-coloured male flowers, the lower third or rather less being occupied by female flowers of a greenish colour, mixed in with abortive female flowers, the intervening space being occupied by neutral flowers. The stamens

FIG. 46.—*HOMALOMENA FELTATA* (MUCH REDUCED).

Shuttleworth, from Colombia. Our illustrations (figs. 45, 46) will suffice to convey a general idea of its habit and botanical structure, and from the latter it may be seen that the plant is a true member of the genus *Homalomena*, the other species of which, with one exception (*H. Werderlandi*), are East Indian. In the *Gartenflora* for October, 1876, and again in the number for February, 1877, our learned friend Dr. Regel reduces the genus *Carmeria* of Linden and André to *Homalomena*, but if so then *Carmeria* must form a distinct section, for it possesses none of the neutral flowers of *Homalomena*, nor are the fertile ovaries mixed with abortive ones, as they are in the last-named genus.

* *Homalomena feltata*, Mast., n. sp.—Cespitosa: petiolo basi vaginato superne tereti cancellato pubescente, basin versus mucronato; foliis peltatis cordato ovatis acuminate superne glabris subtus ferrugineo-pubescentibus, spathe valde carinata.

beneath, especially along the nerves. It is attached in a peltate manner to the stalk about half-way between the base and the centre, and in form is cordate ovate acuminate. The base is deeply cordate, spreading, and separated by a triangular sinus. The nervation is prominent on the lower, depressed on the upper surface; from each side of the midrib proceed alternately, at intervals of about an inch, eight secondary nerves, which run obliquely to the margin, where they march with their fellows. Seven of these ribs are unbranched, but each of the basal nerves divides into two divisions, and of the latter one is again bifurcated. The tertiary nerves are very much smaller, parallel to the secondary ones, and enclose a fine reticulation. The peduncle is about a span long, sub-compressed, oval in outline, channelled on the anterior side, setose, and marked with linear pinkish blotches. The spathe is per-

are 4-5-cornered, oblong, with very thick white filaments, and two-keeled anthers bursting inwardly below the flat truncate apex of the filament. Pollen coherent, the individual grains oval. The neutral or abortive flowers are club-shaped, with a slender stalk and a thick whitish club-shaped head. The fertile ovaries are frequently intermixed with abortive club-shaped flowers, and are free, or more or less connected by mucous threads. Each ovary is obtusely four-cornered, with four cells, and a sessile 4-lobed viscid stigma. The placentation is axile, the ovules being very numerous, minute, horizontal, anatropal, and stalked. When open the flowers have a peculiar somewhat aromatic perfume, comparable to anised or turmeric.

The appearance of the plant is, as we have said, very striking, and the flowers are produced in great abundance. Our examination was made in February, *M. T. M.*

Florists' Flowers.

TULIPS.—It is fifteen years since I sowed my first Tulip seed, and it takes a seedling from five to seven or eight years to give its maiden bloom, the latest attaching to one's own seedlings, and especially the batch due to bloom in the current season, becomes intense—a very agony of pleasure.

Just now, when the plants are getting fairly above-ground, the chief excitement over the seedling-bed lies in watching the growth of the largest yet un-bloomed, to catch a glimpse of the significant second leaf. For this is the one sure sign that the bulb intends to flower this time; whereas the very boldest first or "guard" leaf, if it does not contain a second within its fold, will only result in that well-known blank, single leaf which florists—borrowing a term curiously remote from all horticultural pursuits—term a "wreath." Still, the idea of loneliness which the word conveys gives it an expressiveness for these solitary leaves.

I do not know any seedling raiser of Tulips who would cross out of the classes, *i.e.*, a yellow ground (bizarre) with a white ground (a byblomen or a rose). White blood would tend to pale the rich yellows of bizarre ground colours, and yellow blood would stain the lustrous purity of the white ground classes. It would also greatly increase a mongrel and now un- tolerated class called tricolors. One pod of seed is capable of giving flowers in all the three classes, just as a pod of Piceæ seed will give three seedlings in all the classes—light or heavy. This being so, in the Tulip, there are now and then some seedlings which, instead of being purely of this or that class, drop in between two, and in their rectified state exhibit a combination, more or less confused, of colours belonging to white and yellow ground classes.

In the seedling or "breeder" state, these "tricolors" are detected by their base or ground colour belonging to one class, and their body colour to another; thus, a yellow base belongs to the bizarre, and a lilac body colour to the byblomen breeders.

But sometimes a lilac seedling comes with a yellow base. Here we have elements of two classes; and this confused flower will break into a yellow base and a breeder form, or a yellow base and the byblomen marking, and also strike a byblomen white ground colour into the yellow, either in the form of streak or shading.

Though I have had tricolor seedlings with bizarre base and byblomen body, I have never seen the combination of byblomen base with bizarre body, or known of it occurring.

But the "rose" class body colours, which are red or pink, are combined with yellow bizarre bases, and produce tricolors of scarlet, white, and yellow. Sometimes, however, the yellow base and red body are the breeder form, or the "red bizarres," a grand sub-class. However, a practised eye can at once distinguish between the red ground colour of a "rose" seedling, and that slightly browner or yellowish red which denotes the undeveloped red bizarre.

A very interesting point in Tulip culture is the origination of "strains." Name is something in a florist Tulip, but strain is everything. For strains we are indebted to the "breaking" of the breeders into their permanent form.

Every breeder that breaks, originates a new strain of the flower that bears its name. If the breeder breaks badly, it and all its offsets after it are a "bad strain" of the name it bears. If it break in a fine feathered character, that is the foundation of a fine "feathered strain," which it and its offsets will (with a sport now and then to a flame and back again) maintain.

Many breeders break into no distinct character at all—a muddle between the flamed and feathered state,—the "feather" full of "skips" or misses, and the flame a smudge or dab. Bad breaks are thrown away, however high the name of the flower in its fine strains. The breeders help a flower into circulation very much, as in this state both bulbs and increase are larger than when "rectified" in good "breaks."

Tulips are a mystery in many ways. Why does a flat offset always bloom when a round one of equal, or even greater weight, will be a widow for the year? My only guess is that the flat offset has been fed at its mother's side, being connected with the old bulb, while a round offset is entirely on its own root. The flat offset may, perhaps, thereby draw

sustenance enough to allow of its forming a blooming herb, which these bulbs do at their leisure when at rest.

Seed should be sown when the old bulbs are planted in November, and it will appear with them in spring. Bulbs may but never should be planted as late as January, and seed may be sown as late, and still will appear the same season. But if not sown till, say, April, it will remain idle until the succeeding autumn, when it is natural for its parent to rot again.

I have twice had seed do this, and that is all the experience I can speak from. I thought twice was often enough, and have ever since taken the hint to be more punctual. It is no light matter to incur yet more outlay of time than the necessary five to eight years. *F. D. Horner, Kirkby Malwood, Ripon.*

Forestry.

PLANTING as a branch of rural industry may be divided into two classes, namely, the planting of large and small trees; but between the tree 30 feet high and the seedling a few inches in length there is a wide and important difference. The one is attended with much difficulty, labour, skill, and expense, while the other is exempt from almost any—the one is very difficult, the other is very simple.

The operation of planting is in general well known, but there are a few particulars of such vital importance as to require more than a cursory remark. The first thing to which I wish to direct attention is the thickness of the turf or herbage of the ground into which the trees are to be planted. Nothing is more injurious to plants than excluding the air and other elements from the lower part of the stem, or, more properly speaking, the neck of the plant. That part of the plant where the stem and root are connected is very sensitive, and requires the greatest possible care and attention; and it is more on account of the requisite treatment plants receive in the nursery, compared with what they receive in the forest, that their early growth is so much superior.

Thousands of plants at five years, planted in the forest, have scarcely begun to grow, and a large portion are quite dead. It is often asked, what becomes of all the plants grown in the public nurseries year after year, and what of the 3000 or 4000 trees that were planted per acre. The answer doubtless is, they all died in infancy, and for want of air rather than want of food. It is quite a common thing to find patches of the best soil, and favourable situations, either entirely destitute of trees or occupied with distorted ones, the result of too rank herbage amongst them in their early stage of growth.

In planting rich old pasture-ground, or hollow places in moorlands, it is well either to pare off the turf, and cart it away, for enriching bare hillsides in arable fields, or to turn it over by means of the spade or plough, and allow it to remain. By either means of preparation the plants are allowed to be planted without burying the stems too deep, and the herbage is thereby prevented from injuring them till they are sufficiently advanced to keep it down, for nothing more effectually keeps down weeds than a good close crop.

Next in importance to avoiding deep planting, and giving air, light, and sunshine, to every part of the plant—stem, branch, spray, and leaf—is that of adapting the roots to the soil in which they are destined to grow. With very small plants, and even medium-size ones, up to 30 inches, with ordinary precautions and situation, nothing serious need result from the operation of planting or transplanting, since up to that stage the roots have scarcely acquired a fixed state or condition. With older trees, however, the case is widely different, so much so, indeed, that when a tree is removed from one quality and condition of soil to another of an opposite and different one, the roots all decay and rot, frequently back to the very stem and base from whence they originally started. To remove a tree from a poor to a rich soil does not prevent the roots from decaying, neither is it prevented by removal from a clay to a loam. The most disastrous failure I have met with has been when the trees grew in strong clay wet or dry, and were transplanted into light loam or sandy moss; nor does it appear that different species are differently affected: I have seen Oak, Beech, Elm, and Ash, all influenced in a manner similar to Lime, Poplar, Willows, and Alder. Experience has taught me, however, that unless a large tree can be removed with

a good ball of earth it should not be attempted to transplant from clay soils, even although into loam of a superior quality. It is a common and in some respects desirable thing, to form hedgerows of large trees by transplanting these either close, or a few feet distant from the hedge. In doing this, sometimes the trees usually die the first season, and every successive year others gradually sicken, lose their tops and side branches, until nothing but bare poles remain as relics of what were once handsome and flourishing trees. The situation is blamed for it, the air is charged with the evil, the planter is censured, and the hedge itself into which the trees are planted is also accused. It is seldom or never suspected that the evil is all at the root, and it was only after taking up trees in the various conditions described that I found out where the evil lay.

Removal with a good-sized ball prevents decay of the roots, as, by it they are protected and nourished till they shake their fibres, and reach the new soil for nourishment, when they are safe. Next to these, another important consideration is abundance of branches upon the stem, and the lower down the better, as by the lower branches the roots are supplied with food, as much so as from the soil in which they grow. The soil in being returned upon the roots, in planting large trees, should be in a dry state, and never in the form of puddle or mortar; and when the soil is naturally destitute of sand, that should be added, as it greatly incites to growth. *C. J. Michie, Culliton House, Culliton, Feb. 24.*

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Continuity of supply is one of the first desiderata in a garden, equally as much in flowers as in eatable commodities. This can only be attained by timely forethought. There are many species of hard-wooded plants that can be retarded for several weeks, or even months, so as to give a succession without injuring them in the least, provided the retarding process is conducted by proper means and in a proper manner, by the use of such a lean-to with a northern aspect, and not by matting up or the use of material that darkens an ordinary plant-house. The latter course is always injurious in its effects, as, despite the shading occasioned by the structure of a house fully exposed to the sun is always so much raised during bright weather as to expose growth, which through the shading is unavoidably weaker than is consistent with the future well-being of the plants. If some of the late-flowering varieties of *Epacris*, such as *miniata*, *minuta*, *spicantans*, *Eclipte*, or *grandiflora* races, are now put in a retarding-house before the flowers have made much progress, they will move little further for the next six weeks, and then come on for greenhouse or conservatory decoration up to the end of the year. These plants, if they are now put, will be kept back until later on, when their flowers are further advanced, it will frequently cause them to fall off. *Polygals*, *Aphelexis*, *Boronia*, *Dillwynia*, *Chorizanthes*, *Eriostemon*, *Hoves*, and *Rhysochortos* *jasminoides*—these also will submit without injury to their time of blooming being retarded, as well with the *Epacris*; set them well up to the glass, and in giving air be guided by the state of the weather, for even if a minimum of growth is progressing, they should never be subjected to the lights being kept back. Use no shades of any kind, and if the presence of plants like the above is more acceptable in the conservatory than late in the spring, when they are useful for mixing with such things as *Pelargoniums* and *Fuchsias*, of which at this time there is usually a superabundance. Any of the latest-flowering varieties of *Camellias* that have not been put when their blooming will be retarded, may now be subjected to treatment similar to that of the above-named plants; they will open their flowers here equally as well, and furnish a supply most acceptable during a later favourable disposition in these late kinds by delaying the time of their making growth. The worst feature in *Camellia* culture is often a glut of flowers at one time, with few early in the winter or late in spring, whereas by careful management, with a moderate number of healthy plants, there is no difficulty in keeping up a supply from November till the end of April. A portion of the latest blooming *Cinerarias*, herbaceous *Calcitricas*, as also some of the shrubby kinds, should be kept back in like manner. Hence, no more caution is necessary in the admission of air during the next six weeks than at any other time in the year. An

impression often prevails that these air-polluting plants, when well established in the soil and in rude health, will at all times bear the heat of a blazing fire through the house. Yet this is by no means the case, especially with the hardest-wooded kinds. I have seen large and valuable plants at this season, in a few days so injured in their foliage by the incautious admission of too much fire, as to have a considerable portion of them necessarily destroyed; the leaves are affected first turn of a reddish brown colour, which, if the inexperienced might be taken as an evidence of health; but when they have so suffered they soon lose their vitality, become brown, &c. no further assistance to the plant, and very unprofitably, will remove. *T. Baines.*

ORCHIDS.—Continue with the potting and top-dressing of the plants as previously advised, so that as soon as possible the whole of the collection will have been gone over, and by this means the state of the roots and breaks will be more clearly perceived and better understood than they would otherwise be. As soon also as signs of returning activity and growth are observed, the fresh soil will be at hand for the young roots to push into; and this in the case of the majority of these plants is the best and most judicious remedy to have recourse to for the exciting of new soil about them. No doubt many things are potted late on in the season, sometimes probably through purchase, or some cause may have prevented their being seen in the early months of the year. These may, and do, succeed as successfully as the extra care must be given, both in regard to shading and water, otherwise the bulbs and leaves shrivel and turn yellow before the roots can again start away, and keep up the regular and requisite amount of life-giving and sustaining sap. The best mode of setting racks for the plants, is in the middle of the day, and though it may seem early to speak about shading, it will be advisable to look to the blinds and see that they are sound and fit to be put up with a likelihood of lasting the season through, and then on a dry day to draw them down to top-dress the houses, or by the admission of a greater quantity of external air. The evergreen section of the Dendrobiums, such as densiflorum, Schroederi, Farmeri, thysiflorum, chrysocamum, &c., will now be commencing to show their new growth in points, chiefly in the case of the bulbs. Such of these which were stood out in a cooler division should now be brought back into the Dendrobium-house, where, under the influence of a little more heat, the spikes will push out and develop. In the case of flowers at first only a small quantity of water will be required, the amount being increased when the growths appear. If this is not kept in mind the buds are apt to push out, and to damp off at the tip of the spikes, and thus a great quantity of the blooms are lost. *D. Farnesii aureo-flavum* is a variety that is still very scarce, but its rich and showy racemes of deep yellow flowers, and the number that are produced on a spike, though the spike may have started away from a comparatively small bulb, are sufficient reasons why this should be highly appreciated. This should be grown in a basket, as in all probability the plants will be small, and thus being near the light, it will come on better than if it were in a pot and stood under some of the larger plants. *D. Falconeri*, too, that has been in the soil long, and is now in the same stage, and provided the growths are strong and well-ripened, will quickly push out a number of its charming flowers—generally singly, but sometimes in pairs—at the joints of last year's or the previous year's growth. The light spikes of the preceding year will be light spotted, and it must not be done away with at present, or the young points will start growing very vigorously before the buds appear. The plants of *Chysis* must be looked to, for it will be found that *C. limninghi*, which is by far the most desirable and attractive when their richly coloured flowers expand. Small plants of any of the genus will succeed well in baskets in moss and peat, and liberally supplied with water when growing. These all during the growing season have the temperature of the Cattleyas, and if the plants are in the height of the growing season they were to be placed in the Dendrobium-house, the little extra heat would be of great assistance in swelling up the bulbs. The little yellow thrips is apt to get into the young growth, it must, therefore, be watched, and if any are observed, they must immediately be got rid of by

smoking the house with tobacco-paper or cloth. *W. Swan, Fallowfield.*

FRUIT HOUSES.

PINES.—In the preceding Calendar for this department an intimation as to the careful preparations necessary for potting and other requirements was given. At any time now, when the heat at about a foot beneath the surface of the bed is steady at from 85° to 90°, proceed in potting those plants which demand very attention; for this operation select only those specimens of root which when they are done plant them into the bed forthwith. If on the other hand the temperature as indicated be not attained, defer these operations; and in the event of an insufficient amount of heat being apparent, at once add some fresh materials and turn the bed over again. Plants which are shifted without having the roots much disturbed, should be watered with tepid water after they are potted, and be placed where the ventilation of the house is carried on in the usual way, but in the case of disrooted plants or rootless suckers water should be entirely withheld for about a fortnight, by which time new roots will begin to appear at the side of the pot; water may then be freely given whenever it is required. During the period named the object will be to induce the formation of new roots to re-establish the plants; for this end the atmospheric conditions about the plants should be such as will sustain Nature in the absence of these essentials, and should therefore be temperate and invigorating without aridity; artificial heat, if used, should be such as to keep the house close, whilst its temperature remains below 80°, with an abundance of moisture about it; exclude powerful sunshine altogether, and lightly dew the plants overhead with a fine syringe twice or thrice every week. The size of the pot to be used in regard should be given to the variety and the time the plants are required to produce ripe fruit. If plants of the Queen and kindred kinds which are now in from 5 to 7 inch pots, are, when full of roots, transferred to 10-inch ones, the plants under proper care will surely give a crop of fruit the subsequent February, and be ripe early in the succeeding June; if those of larger size be employed it generally makes them later. The rapid way of cultivating these now-a-days dispenses with the annual overhauling of stock, which formerly was necessary at the end of each year, and confines it to a more limited number of plants—which is assuredly an advantage, inasmuch as the maintenance of an over-abundant supply of stock often tends to impair the quality of the fruit, and thereby upset calculations which are deduced from practical observation. See that no lack of heat exists at the roots of plants which are started into fruit. Avoid wetting the fruits whilst in flower, and maintain an equal temperature in the house as where this is tried. To prolong the supply of the Pine-apples, if necessary, remove to cooler quarters those which are just ripe. *G. T. Miles, Wycombe Abbey.*

CUCUMBERS.—A period extending over many weeks of mild sunless weather is now likely to be succeeded by cold cutting storms from the North, which will necessitate extra firing, and as the days are now increasing in length, and the plants may be more frequently syringed to keep down red-spider, which generally accompanies increased fire-heat, and spreads, if left unchecked, with alarming rapidity, particularly if the plants have been weakened by heat in the previous season, the best does not recur to the liberal use of clean water, a weak solution of Gishurst or soft soap may be applied towards night, when the foliage is likely to hold the moisture, or the foliage may be dusted with flowers of sulphur, the probability of the success of this measure is remedily is not objectionable. To keep up a good supply of Cucumbers through February and March, every means must be employed for keeping the plants in free growth, for if once allowed to stand unhealthily the season over, Cucumbers are most in demand will have passed away before they can be restored to a bearing state. Of equal importance with the management of the foliage is the bottom-heat, which should never fall below 80°, or 85°, which secures the plants to the better. Attend to top-dressing with this layers of turfy loam and old mortar; as the roots appear water with tepid liquid manure at a temperature of 85°, and syringe the surfaces of the beds and floors with the same at nightfall. Sow seeds and start cuttings for succession in pots and frames; be ready in readiness a supply of warm turfy compost for earthing up plants which were turned out last month on small hills as soon as the roots begin to work on the surface. Attend to linings before the heat is too far kept up, and keep the plants in a permanent fermenting state for this purpose, and turn the back and front linings alternately.

THE ORCHARD-HOUSE.—If not already done, fruit trees growing in pots should now be placed in

their summer station, and if the pots can be sunk one-third of their depth in the border, where they can root through into good turfy loam, the fruit will be finer, of better quality, and less liable to injury from an irregular supply of water through the hot months of July and August. The pots should be plunged regularly in water, and be protected by covering to pass freely away after it leaves the drainage, otherwise the soil will soon become sour and unhealthy. In lofty houses, where it is desirable to keep the trees near the glass as possible, the evil effects of drought may be counteracted by planting out in each pot a nearly dry sod of new turf, to slide downwards. See that all the trees are perfectly free from aphid at the time the first blossoms begin to unfold by syringing occasionally with quassia or weak tobacco-water. Always make plants of the first quality of tobacco-paper, and before the earliest tree unfolds its bloom, and I find the trees are then safe until after the fruit is set.

Owing to the mildness of the season many kinds will now be in flower and fit for fertilisation, which is best performed with a camel-hair pencil stuck on fine days, when the atmosphere is warm and dry. Ventilate freely on all favourable occasions, close the house sufficiently early to insure a few degrees warmer than the house, and apply it early on fine mornings, in order that the atmospheric temperature of the unheated orchard-house when the trees are in bloom. Watering will now require careful attention. Let the water used be a few degrees warmer than the house, and apply it early on fine mornings, in order that the atmospheric temperature of the unheated orchard-house when the trees are in bloom. Watering will now require careful attention. Let the water used be a few degrees warmer than the house, and apply it early on fine mornings, in order that the atmospheric temperature of the unheated orchard-house when the trees are in bloom. Watering will now require careful attention. Let the water used be a few degrees warmer than the house, and apply it early on fine mornings, in order that the atmospheric temperature of the unheated orchard-house when the trees are in bloom. Watering will now require careful attention. Let the water used be a few degrees warmer than the house, and apply it early on fine mornings, in order that the atmospheric temperature of the unheated orchard-house when the trees are in bloom.

KITCHEN GARDEN.

With the advance of the season there will be less risk in committing seeds to the earth, and taking stock of what has already been sown and the appearance of such as are through the surface. The sowings of Peas may be at once supplemented by a larger sowing of various sorts of very good selections for this sowing would be Champion of England, extra Perfection, and Ne Plus Ultra. Also Longpod and Windsor Beans for succession; the improved varieties are best for the purpose. Sow on the open border—a sheltered south one is much to be preferred. Let *Ranunculus acris*, *R. ficaria*, *R. flammula*, *R. abortivus*, Sprouts, salading, and a moderate bed of Prickly Spinach, also Celery in heat at once, if not already sown, and prick out that which was sown for early purposes in frames on a gentle heat, where also must be pricked out the sowing of *Wolfeana* and other Cauliflowers, as well as the different sorts of autumn Broccoli as before-mentioned. Another sowing of all the sorts for succession should be made at once on the open border, and the choice sorts will be better, or the protection of handlights. Cauliflowers under handlights will now require attention; the ground should be picked up all round them. During the operation the earth should be laid round each group of plants in a basin-like form, so that if the necessity for watering should arise, the water may be retained in contact with the roots; for the same reason it will prevent the waste of the liquid manure, good doses of which should be given at intervals as soon as the plants are growing freely. The Cauliflower plants which have been kept in frames on the open border, and in the open garden, if the temporary shelter is obtained by planting them in deep drills, which may be filled up with advantage as they advance in growth. The alleys between Asparagus beds are excellent sites for these early Cauliflower plants, and as the crowing of the Asparagus plants is on the move, the sooner they are dressed over and pricked up the better; when the alleys are well thrown out over the surface, they should be heavily manured with rich dung, and the Cauliflowers planted at once. Where the beds of Asparagus, Sea-kale, and Globe Artichokes are required, and the beds have been entrenched up as recommended last month, let no opportunity be lost of bringing the ground into good condition for planting, by tormenting and knocking about the dry weeds and roots of last year which are left up the beds intended for the main crop of Onions; this should be well manured, and frequently tramped over and knocked about on dry days to get it into a fine seasonable condition for sowing sown. Also the beds for the main crop of Carrots will require a considerable amount of cultivation and tormenting to get the soil well pulverised to a good depth. The ground for this crop should always be heavily manured the previous year, so that it may be thoroughly decayed and intimately incorporated with the soil, and the frequent trappings should in the cultivation necessary to bring it into condition for sowing; the reason for this is that if there are lumps of dung in the bed, and it incorporated with the soil, as soon as the Carrots start into growth they will be in search of it, instead of the straight tapering roots so desirable in this crop. *John Cox, Rolford.*

THE

Gardeners' Chronicle.

SATURDAY, MARCH 3, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 5	Salisbury Hort. Socy. Meeting of the Fruit and Floral Committees at 11 P.M. and Scientific Committee at 12 P.M.
WEDNESDAY, Mar. 7	Salisbury Hort. Socy. Meeting of the Fruit and Floral Committees at 11 P.M. and Scientific Committee at 12 P.M.

FOR our horticultural readers the great value of Mr. DARWIN'S last work on CROSS AND SELF FERTILISATION OF PLANTS, of which Mr. HENSLOW is providing us with an abstract suitable for our purposes, consists in the practical applications which follow from the author's very numerous, protracted, and laborious experiments. Seed growers and hybridisers will find, as we have already pointed out, and as we shall have occasion to repeat again and again, that much that was mere haphazard and of a tentative nature in their practice has been by Mr. DARWIN reduced to rule and method. Uncertainty and loss of time are thus to a considerable extent replaced by certainty and confidence as to result, with a corresponding gain as to time. But although this is apparent to those who read the book carefully, nay, in many cases, is proved to demonstration to those who can read figures and form anything like a clear estimate of the value of evidence, yet it is certain, judging from all past experience, that these practical results will be a long time filtering into the minds of those who will eventually most profit by them. The theories and speculations, on the other hand, that may be and are based on these facts, will be keenly discussed from the first. Good cannot fail to result from what may seem at first sight profitless discussion. New facts will be brought to light and old facts will be viewed in a new light, and so the results cannot fail to be of advantage. One of the first points which has elicited discussion is as to the ORIGIN OF THE SEXES IN PLANTS, and the question whether the ancestors of existing plants were "dicocious," that is, whether they had their male flowers on one plant and their female flowers on another, or whether the primordial flowers were hermaphrodite. Mr. Darwin (p. 410) adopts the former view, and in so doing is considered to be in so far opposed to those great doctrines of evolution and progressive development of which he is the high priest. We should as soon think of controverting as of defending so mighty a master, but if there is one quality for which he is more remarkable than another it is his perfect candour and freedom from dogmatism. We cannot doubt, therefore, that, however averse to barren controversy, free discussion on a proper scientific basis will be welcomed by him. It is under such an impression that we venture to make some remarks on this question of the origin of the sexes in plants. Without going into minute botanical details, though at the risk of sacrifice of precision, we may premise that there are some plants in which no difference of sex has been yet observed, others in which two sexes have been discovered in the same flower, as in the so-called hermaphrodite flowers, such as Lilies; others again, in which the two sexes are borne, not in the same flower, but on the same plant, as in the Hazel (mœnœuous); while still another class of plants, like the Acubia, for instance, bear the sexes on different plants (dicocious). All this, of course, well known to most of our readers, but it is necessary to start with clear notions in discussing so intricate a problem. So far, then, we have (1) plants which bear sexless flowers (we use the latter word here in its widest sense, including the reproductive organs

of the so-called flowerless plants), (2) others which are as to structure and conformation two-sexed in the same flower, or (3) two-sexed on the same plant but not in the same flower, and (4) others again two-sexed on different plants. But now arises a complication: a flower may be two-sexed as to structure and as to function also. These are the so-called "self-fertilised" plants, of which a prominent instance is the common Bee Orchis. But in the majority of cases, albeit both sexes exist in the same flower, yet the pollen from one flower must be carried by insects, or by the wind, or by some other agency, to another flower; and thus cross-fertilisation is effected. The necessity for this arises from the circumstance that structural peculiarities of various kinds, or the fact that one sex is mature while the other is immature, prevent self-fertilisation and necessitate cross-fertilisation. So then a flower may be structurally two-sexed, but physiologically one-sexed, or "dichogamous."

The assumption on the principles of evolution, adaptation, and survival of the fittest, would therefore be that hermaphrodite or two-sexed flowers were the progenitors of one-sexed flowers. In course of time the advantages accruing from the union of two parents of the same stock, but of remote degree, as contrasted with the results of the union of two very nearly related parents, would become greater and greater. The tendency of growth would therefore show itself in the production of one-sexed flowers, and ultimately of one-sexed plants, rather than of two-sexed flowers. In other words, the hermaphrodite condition would precede the dichogamous, that the mœnœuous, and that again the dicocious, the latter being considered the latest stage of evolution. We may put this in the form of a table, thus:—

Sexless plants?	
Flowers two-sexed—	
Structurally and functionally	1. Hermaphrodite.
Structurally only	2. Dichogamous.
Flowers one-sexed—	
On the same plant	3. Mœnœuous.
On different plants	4. Dicocious.

The order of progression would be from 1 to 4, according to the general principles of subdivision of labour and least expenditure of power to attain a given result.

Mr. DARWIN, on the other hand, to the surprise of some of his followers, supposes plants to have been originally dicocious, and that the hermaphrodite condition was subsequent.

If we look at the matter physiologically, it is difficult to resist the hypothesis of a primitive oneness of sex. No difference of sex exists in the first instance in the structure of any plant or animal; it is only after development has proceeded some way that any difference is observable. There is, then, in the life of every individual a primordial oneness of sex. What happens in the individual may be true, as PLATO surmised, of the race. It may even be the foundation of the myth of the development of EVE from ADAM'S rib. Reverting to plants, among the lowest forms we have an apparent oneness, or inseparable condition of sexes. The first stage of duality is merely a subdivision of one into two; and, indeed, looked at in its simplest form, the process of reproduction is nothing more than the repeated subdivision of an original unit. It is the cause of this subdivision which remains at present a mystery. From the very simple stage of plant life just referred to we advance gradually to those in which the sexes become well marked, and placed in proximity, or apart, or even on different plants. Now, if we could trace a gradual unbroken line upwards from the lowest mass of mucus or protoplasm to the most highly specialised flowering plant, the pedigree would, of

course, be as complete as it would be interesting. It happens, however, unfortunately for the pedigree-makers, that the self-same conditions of one or two-sexed flowers (if we may so call them), and one or two-sexed plants, exist, broadly speaking, among fungi, among Algae, among Charas, among Ferns, &c., so that we cannot look upon these conditions as marks of progressive development from one group to another, though they may be so within the limits of each individual group.

If we regard the matter from a structural point of view only, then it appears as if we must begin by the simplest forms, and ascend gradually to the more highly-developed ones. We find good evidence of the very simple-flowered, wind-fertilised Cycads and Conifers long before there is any evidence of ordinary flowering-plants, much less of such highly specialised forms as Compositae, Umbellifers, or Orchids. These latter, so far as we know, were late developments on the earth's surface. Again, in point of individual development, we have, first, the simplest sexless structure, then a development of stamens, then a development of pistils, so that each individual flower begins as sexless, but it becomes in time male, and afterwards hermaphrodite (structurally); or if growth and development of either stamen or pistil be arrested it may remain one-sexed. How, then, can the hermaphrodite precede the dicocious condition? From this point of view, then, Mr. DARWIN seems to us to be unquestionably right. But it stands to reason, in a case of this kind, we must look at the matter on all sides, and so, in direct proportion to the diversity we see, is, of course, our ignorance of the matter. If a particular opinion is borne out by the facts of morphology or structure, and is not consonant with what we know of physiology, or vice versa, it is quite certain some part of our theories is untenable.

We cannot doubt that the existing structure of plants and animals is the direct consequence of a long inheritance by descent, modified more or less by necessary adaptation to surrounding circumstances. It is our business to study these relations and to profit by them. To know the exact line and course of descent of existing plants and animals may partake of that knowledge which is too wonderful for us. In any case it is quite certain that the depth of our ignorance is such that all speculations as to the pedigree, or, as it is the fashion now to call it, the "phylogeny" of existing organisms, are little more than guesses, more or less wild.

— The accompanying figure of *EURYCLIS AUSTRALISICA* (fig. 47), an almost forgotten amygdaloidaceous plant, was made from one of a number of well-flowered specimens exhibited at South Kensington on the 14th ult. by Messrs. VITCH & SONS, of Chelsea. It is one of those paniciform plants in which the flower-structure is developed in the advance of the leaves, the latter being very broad, with a strongly marked cordate base, and petiolate. The flowers are white, produced in a many-flowered umbel, and have a cylindrical tube and regular limb of equal segments, with an inner cup or crown. The genus comes very near to *Calostemma*, and has the curious property of the seeds germinating in the capsule. HERBERT makes two species—*E. amboniensis*, a stove bulb, requiring winter rest, and subject to great variation in the development of the crown; and *E. australisica*, our present subject, which, he says, has much narrower leaves, and is sufficiently hardy to bear greenhouse treatment. ALLAN CUNNINGHAM, writing in the *Botanical Magazine* (t. 3399), where E. Cunninghami is figured, makes three species—*E. sylvestris* or *amboniensis*, *E. australis* or *australisica*, and *E. Cunninghamii*, distinguishing the last from *E. australis*, which has a simple stigma, by its smaller and fewer-flowered umbel, and its three-lobed stigma. KUNTH adopts the same three species. Finally, BENTHAM, in the *Flora Australiensis*, adopts two species—*E. amboniensis*, in which he includes *australisica*, distinguishing it by its very broad cordate leaves, and its

* We add the signs commonly used to express these conditions—thus, ♂ for hermaphrodite, ♀ for mœnœuous, and ♂-♀ for dicocious; to these we venture to add ♂ for dichogamous flowers.

FIG. 47.—EURYCLIS AUSTRALASICA. (LEAF $\frac{2}{3}$ NAT. SIZE; POLLEN $\times 160$.)

corona not being one-fourth as long as the perianth-lobes; and E. Cunninghami, distinguished by its ovate not cordate leaves, and its corona not being two-thirds as long as the lobes. Of the published figures our plant certainly most nearly resembles the former, but it has the spiky corona attributed to the form named E. australis.

— The Thirty-fourth Anniversary Dinner of the GARDENERS' ROYAL BENEVOLENT INSTITUTION will take place on Wednesday, July 4, when Sir TREVOR LAWRENCE, Bart., will preside.

— We have received the schedule of prizes arranged by the committee of the NATIONAL ROSE SOCIETY for their first exhibition at St. James' Hall on July 4, and it fully justifies the term that has been applied to it of "liberal," the prizes amounting to upwards of £250, including three silver cups; of these, Messrs. CRANSTON & Co., of Hereford, offer one for amateurs—a challenge cup of fifty guineas, with the liberal condition that it must be won in three years, unlike some challenge cups which go on for an indefinite time; thus it is won by A. in 1877, and by B. in 1878, only A. and B. can compete for it in 1879. There have been already promised in donations towards the prize-list upwards of £120, and since then 100 members have joined, and the committee have great hopes that before long they will be able to announce that the prize-list has been equalled by donations, and the number of members trebled, for the terms are very generous. The subscription is fixed at ten shillings, and for that each member is to receive two five-shilling tickets of admission, entitling the holders to see the Roses for an hour before the show is open to the general public. As the only Rose show in or about the metropolis this year is likely to be that at the Crystal Palace (although that is not yet announced), there can be little doubt that the new venture will be successful in point of flowers, and we hope may be equally so in the attendance of visitors. The Horticultural Club has permitted the Society to use its rooms, and all intending members can address the Secretary of the National Rose Show, 3, Adelphi Terrace, W.C. Seeing that Wednesday, July 4, is the day fixed for the evening *fête* at the Botanic Garden, Regent's Park, for the holding of the committee meetings at South Kensington, and for the anniversary dinner of the Gardeners' Royal Benevolent Institution, we would ask why this date has been selected for the holding of the Rose show, while the previous and subsequent Wednesdays are disregarded. Rose growers cannot tell to such a nicety when their flowers will be at their best as to make this clashing at all necessary, and it certainly will produce much embarrassment.

— THE CLIMBING PLANTS in the Conservatory No. 4 at KEW are just now very interesting. Most beautiful of all is perhaps Clematis indivisa, whose white star-like blossoms must be seen to be appreciated. In addition there are *Lonicera sempervirens*, *Hardenbergia Compertiana*, *Kenedia rubicunda*, *Akbia quinata*, *Hibiscus dentata*, a species whose rich bronzy leaves contrast well with the large yellow flowers. In the Succulent-house the very magnificent *Agave Eileneana*, though past its best, is still worth a journey to Kew to see.

— Following the example of the Belgians, the Italians propose combining the chief horticultural societies of the kingdom into a HORTICULTURAL FEDERATION, and to hold periodic exhibitions at Milan, Venice, Florence, Turin, Naples, Rome and Genoa—the first to take place at Milan in 1878, the second in Florence in 1880.

— THE WATER PLAGUE at KEW has not much abated yet. Only a few days since there were, we were told, two feet of water in the stockholes of the Temperate-house. In the case of the Palm stove an attempt is being made by means of steam fire-engines to empty the lake in front, in hopes that in this way the water may be reduced in the stockholes.

— We desire to call attention to the interesting lecture of Sir JOHN LUBBOCK, on the RELATIONS BETWEEN PLANTS AND INSECTS, before the Society of Arts, and a portion of which we reprint from the

Journal of the Society. Apart from its special interest, it has a value as affording one more and most striking evidence of the value of the Darwinian hypothesis in supporting what theologians call the argument of design, and which was made use of so effectively in the case of PALEY and the watch. The evidence, says Sir JOHN LUBBOCK in closing his lecture, "is sufficient to justify the conclusion that there is not a hair nor a line, not a spot nor a colour, for which there is not a reason, or which has not a purpose and a function in the economy of Nature."

A recent number of the *Moniteur* gives full particulars as to the measures proposed to mitigate the disasters caused by the PHYLLOXERA in France, such as remission of taxation, &c. The vineyards devastated are estimated at 200,000 hectares (a hectare = 2.4 acres), 50,000 hectares being now completely devoted to some other crop. The Government are desirous of aiding all those who are exerting themselves against this pest, and without definitely pronouncing in favour of any particular course—the facts not being, in their opinion, sufficient to justify such a proceeding on their part—they yet call special attention to the replanting of the French vineyards with American Vines. M. FABRE writes that the resistance of the American Vine has now been conclusively proved. Four years ago he grafted on some "Aramons" some American scions, and these he double-grafted with Bordeaux varieties. The roots of the Bordeaux varieties, and of the "Aramons," have been completely destroyed by the Phylloxera, while the American roots are quite healthy. No alteration in the quality of the wine was noticed. It is not clear, however, from M. FABRE'S letter what the effect of the double-grafting was. We imagine, however, from the context, that it is essential that the roots should be of American origin. As the insect is of American origin, it is recommended that these American Vines be introduced solely into those regions already affected by the Phylloxera, and not planted in districts up to this time free from the pest. The stamping-out process is also strongly insisted on.

— We are requested to state that, in addition to Messrs. VETICH, WILLS, and WILLIAMS, Mr. WILLIAM BULL is also an agent in this country for the International Horticultural Exhibition to be held at Oporto on June 29 and 30 and July 1 and 2 next.

— It is stated that, on account of the unfavourable weather, the clay soils on the coast-lands of Scotland will probably this year be cut off from cultivation, and this, added to the scarcity of the crop, owing to the dry summer of last year, may account for the high prices now being obtained for what is known as CARSE TARES, a variety the seed of which is almost as large again as our ordinary English Tares. The price per quarter is now some 20 or 25 per cent. higher than it was at this time last year.

— We are again reminded of the recent MILDNESS OF THE SEASON by the receipt from Mr. BESTER of a spike of flowers of a single blue Hyacinth, cut from a plant growing in the open air at Tottenham. We are also informed that at the residence of the Dowager Lady WILLIAMS, at Tregallow, near Truro, a fine dish of Asparagus was cut on the 15th ult. from an old bed in the open air, without any forcing. The garden lies on very high ground, and exposed to north and east winds.

— The experimental grounds of Messrs. BARR & SUDDEN, at Tooting, just now afford an admirable illustration of the wealth of SPRING FLOWERING PLANTS available for decorative purposes this season of the year. We were too late to see *Galambus Elwesii*, the blooms being just over, but *G. Imperati* and *G. pictus* were both in flower. *Scilla bifida* and its white variety are very beautiful, and *S. sibirica* is rapidly throwing up its charming blue blossoms. Iris reticulata shines out in the gleaming sunlight with a richness of purple beauty peculiarly its own. A few days' bright sunshine would bring into flower a new Dog's-tooth Violet, which may probably prove to be *E. grandiflorum*; and *E. giganteum* is showing for bloom. Hepaticas in variety are getting into full flower. These soft and delicate plants are known to who appreciate these fine old plants. *Anemone blanda* and the gorgeous *A. fulgens* are out, and *A. appennina*

is following close on their wake. All the spring-flowering Cyclamens are also in bloom; any one seeking for information in respect to these plants has a good opportunity for obtaining it at Tooting. The foregoing are but a selection representative of many subjects of something more than common interest, and from Christmas onwards there are always subjects to charm and instruct. The Daffodils are coming on apace, and by the middle of this month they will be well worth an inspection. In many gardens the common double Daffodil is already in full bloom, and clumps that have remained undisturbed for years are again with an auriferous sheen that seems to set at defiance the wintry influences that have played about them during the past week.

— Mr. T. W. BOND, late gardener to GILEAD A. SMITH, Esq., The Beeches, Weybridge, has been appointed to the management of the gardens, Oak Lodge, Addison Road, Kensington, W., the residence of James MCHENRY, Esq., in the room of Mr. A. WILKIE, who is leaving.

— The next meeting of the Fruit and Floral Committees of the ROYAL HORTICULTURAL SOCIETY will be held on the 7th inst., in the conservatory, on which occasion a flower show will take place. A meeting will also be held in the afternoon for the election of Fellows, &c. It is expected that the show will be of superior character.

— Those who propagate DAHLIAS largely are already at work increasing their stock. In nurseries, where large numbers of plants are required, a low lean-to border is used, with the hot-water pipes running underneath the bed on which the plants are placed. The "ground roots," as they are termed, which have been carefully preserved all the winter, are well examined, in case any decay has set in. They are then half buried in a bed of appropriate soil, but all the dormant buds which surround the base of the main stem cut away in the autumn are left exposed. As soon as planted the bed is watered and a brisk heat maintained. Small fibrous roots are thrown out from the thick fleshy roots, and from the eyes spring forth growths, which are carefully cut through just beneath an eye when 4 inches or so in length, put into store-pots, and placed in the hot-water heat, generally in a frame heated with a good dressing of manure. Here they root, and the cuttings are best potted singly into large thumb-pots, and hardened off for sale. Some roots throw out a much larger number of cuttings than others, and it will occasionally happen that a root will remain altogether blind. This is sometimes a very serious matter when the variety is a valuable or scarce one. The Dahlia propagation season is one of extreme activity in the instances of such nursery establishments as Mr. TURNER'S at Slough, or Mr. KAYNES' at Salisbury. The closest attention is required, and in this important business the propagator must be instant in season and out of season. When the young stock has to be counted by tens of thousands, a careless activity is absolutely necessary.

— Mr. W. J. CROSS, gardener to Lady ASHBURTON, Melchet Court Gardens, Kilmory, has sent us a photograph of a specimen of *CELECYNE CRISTATA* which is bearing seventy-five spikes, or about 350 flowers, and which measures over five feet in side 5 feet 2 inches. Some ten or twelve years ago the plant was growing in a 6-inch pot, and it looks well in the flat rusticated pot made by Mr. MATTHEWS, of Weston-super-Mare. The pot measures 30 inches in diameter, and its outside is a good imitation of Elm bark.

— THE BRITISH AND SUESS FLORICULTURAL AND HORTICULTURAL SOCIETY'S ANNUAL EXHIBITIONS are announced to be held on June 27 and 28, and September 12 and 13.

— In reference to the ENCLOSURE OF COMMON LANDS, the *Globe* has the following remarks on the recent decision in the Chobham Common case:—

"Another of the long series of actions which are now pending with respect to the rights of commoners and of the public against lords of manors was decided a few days since, and the decision was in favour of the lord. Its effect may be very briefly stated, and is one at which those now enjoying such rights have good reason to be alarmed. It assures practically to the lords of a very

great many manors—perhaps most manors—in England the right to turn the wastes of the manor, that is to say, the village common, into a brickfield. Chubbam Common is an open space of five square miles in extent. The commoners have all their rights of pasture, turbary, and estovers, which usually belong to the tenants of such a manor, and it was admitted that they had not given any assent to the action of the lord in granting out parts of the common to be destroyed for brick-making purposes. Upon these facts the judges of the Queen's Bench Division have held that the action brought by the lord was perfectly legitimate, and that there is no remedy at all, either for the commoners or for the inhabitants of the parish, to interfere with the proceeding. The practice is now just as usual, the existence of which the judges inferred from the fact that in ancient times the commoners had not protested against its exercise. It is unnecessary to say that on similar negative grounds a like custom might be supported in a vast number of commons throughout the country. But the most alarming feature in this as in the other cases is that the interests of the public and the neighbouring estates are quietly and slyly ignored. This is the consideration which makes it so abundantly clear that the Legislature must step in and practically recognise rights which the common law is unable to discern.

RELATIONS BETWEEN PLANTS AND INSECTS.

[The following extracts are taken from a recent lecture of Sir John Lubbock before the Society of Arts.]

Neither plants nor insects, indeed, would be what they are, but for the influence which each has exercised on the other. We know now, for instance, that certain plants produce no seeds at all unless visited by insects. Thus, in some of our colonies, the flowers of the red clover do not set on account of the absence of humble-bees; for the proboscis of the hive bee is not long enough to effect the object. According to Mr. Belt, the same is the case for the same reason in Nicaragua with the Scarlet Runner.

But even in those cases in which it is not absolutely necessary, it is a great advantage that the flowers should be fertilised by pollen brought from a different plant, and, with this object in view, insects are tempted to visit flowers for the sake of the honey and pollen; while the colours and scents are useful in making the flowers more easy to find.

USE OF HONEY.

The real use of honey, indeed, now seems so obvious that it is remarkable to see the various theories which were entertained on the subject. Patrick Blair thought it absorbed the pollen, and then fertilised the ovary. Fontana thought it kept the ovary in a moist condition. Linnæus confessed his inability to solve the question. Other botanists considered that it was useless material, thrown off in the process of growth. Kützner even observed that in meadows much visited by bees the plants were more healthy, but the inference he drew was that the honey, unless removed, was very injurious, that the bees were of use in carrying it off. Sprengel was the first to show that the real office of the honey is to attract insects, but his view was far from meeting with general consent, and even so lately as 1833 was altogether rejected by Karst, who came to the conclusion that the secretion of honey is the result of developmental energy, which afterwards concentrates itself on the ovary.

One reason why the earlier botanists missed the true explanation was, perhaps, that some plants secrete honey on other parts besides the flowers. Belt and Delpino have, I think, suggested the true function of these extra floral nectaries.

ANTS.

The former of these excellent observers describes a South American species of *Acacia*, which, unprotected, is apt to be stripped of the leaves by a leaf-cutting ant, which uses the leaves, not directly for food, but, according to Mr. Belt, to grow Mushrooms on. The *Acacia*, however, bears hollow thorns, and each leaflet produces honey in a crate-formed gland at the base, and a small, sweet, pear-shaped body at the tip. In consequence, it is inhabited by myriads of a small ant, *Pseudomyrmex bicolor*, which nests in the hollow thorns, and thus finds meat, drink, and lodging all provided for it. These ants are constantly roaming over the plants, and constitute a most efficient body-guard, not only driving off the leaf-cutting ants, but, in Mr. Belt's opinion, rendering the leaves less liable to be eaten by herbivorous manna.

Delpino mentions that on one occasion he saw

gathering a flower of *Clerodendron fragrans*, when he was suddenly attacked by a whole army of small ants.

I am not aware that any of our English plants are protected in this manner from the browsing quadrupeds, but not the less do our ants perform for them a very similar function, by keeping down the number of small insects, which would otherwise rob them of their sap and strip them of their leaves.

Mr. Forel watched, from this point of view, a nest of *Formica pratensis*. It found that the ants brought in dead insects, small caterpillars, grasshoppers, centipedes, &c., at the rate of about twenty-eight a minute, or more than 1600 in an hour. When it is considered that the ants work not only all day, but in warm weather often all night too, it is easy to see how important a function they fulfil in keeping down the numbers of small insects.

Some of the most mischievous, indeed—certain species, for instance, of aphids and coccidæ—have turned the tables on the plants, and converted the ants from enemies into friends, by themselves developing nectaries, and secreting honey, which the ants love. We have all seen the little brown garden ant, for instance, assiduously running up the stems of plants, to milk their curious little aphid. By this ingenious idea not only do the aphides and coccidæ secure immunity from the attacks of the ants, but even turn them from foes into friends. They are subject to the attacks of a species of ichneumon, which lays its eggs in them; and Delpino has seen the ants watching over them with truly maternal vigilance, and driving off the ichneumons whenever they attempted to approach.

Though ants are in some respects very useful to plants, they are not wanted in the flowers. The great object is to secure cross-fertilisation; but for this purpose winged insects are almost necessary, because they fly readily from one plant to another, and generally confine themselves for a certain time to the same species. Creeping insects, on the other hand, naturally would pass from each flower to the next; and, as Mr. Darwin has shown in his last work, it is of little use to bring pollen from a different flower of the same plant—it must be from a different plant altogether. Moreover, when they quit a plant they would naturally creep to another close by without any regard to species. Hence, even to small flowers (such as many Cruciferæ, Compositæ, Saxifragæ, &c.), which, as far as size is concerned, might well be fertilised by ants, the visits of flying insects are much more advantageous. Moreover, if larger flowers were visited by ants, not only would they deprive the flowers of their honey without fulfilling any useful function in return, but they would probably prevent the really useful visits of bees. If you touch an ant with a needle or a bristle she is almost sure to seize it in her jaws, and if bees when visiting any particular plant were liable to have the delicate tip of their proboscis seized on by the horny jaws of an ant, we may be sure that such a species would soon cease to be visited.

On the other hand, we know how fond ants are of honey, and how zealously and unremotely they search for food. How is it, then, that they do not anticipate the bees, and secure the honey for themselves? Kerner has recently published a most interesting memoir on this subject, and pointed out a number of ingenious contrivances by which flowers protect themselves from the unwelcome visits of such intruders.

The most frequent are by the interposition of *chevrons de Fritz*, which ants cannot penetrate, glutinous parts, which they cannot traverse, slippery slopes which they cannot climb, or barriers which close the way.

Firstly, then, as regard *chevrons de Fritz*.

In some respects they are the most effectual protection, since they exclude not only creeping insects, but also other creatures, such as slugs.

With this object it will be observed that the hairs which cover the stalks of so many herbs usually point downwards. A good example of this is afforded, for instance, by a plant allied to our common Blue Scabious, *Kassatia dipsacifolia*. The heads of the common *Carolina allertia*, again, present a like effect, which must offer an impenetrable barrier to ants. Some species of plants are quite smooth, excepting just below the flowers. The common but beautiful Cornflower (*Centaurea Cyanus*) is quite smooth, but the involucres forming the flower-head are bordered with recurved teeth.

In this case neither the stem nor the leaves show a trace of such prickles. In this species the stigma projects about one-fifth of an inch above the flower, so that if ants could obtain access they would steal the honey without fertilising the flower; a flying insect, on the contrary, alighting on the flower could scarcely fail to touch the stigma.

Kerner has called attention to very interesting illustration addressed by the Polygonum amphibium. The beautiful rosy flowers of this species are rich in nectar, the stamens are short, the pistil, on the contrary, projects considerably above the corolla. The nectar is not protected by any special arrangement of the flower itself, and is accessible even to very small insects. The stamens ripen before the pistil, and any flying insect, however small, coming from above, would assist in cross-fertilisation. Creeping insects, on the contrary, which in most cases would enter from below, would rob the honey without benefiting the plant. Polygonum, as its name denotes, grows sometimes in water, sometimes on land. So long, of course, however, as it grows in water it is thoroughly protected, and the stem is smooth, while, on the other hand, those specimens which live on land throw out certain hairs which terminate in sticky glands, and thus prevent small insects from creeping up to the flowers. In this case, therefore, the plant is not sticky, except just when this condition is useful.

All these viscous plants, as far as I know, have upright or horizontal flowers. On the other hand, where the same object is effected by slippery surfaces, the flowers are often pendulous, creeping creepers being thus kept off from them, just as the pendulous nests of the water-bird are a protection from snakes and other enemies. As instances of this kind, I may mention the common Snowdrop and the Cyclamen.

(To be continued.)

Home Correspondence.

Double-Bearing Raspberry. — All Raspberries delight in a deep rich sandy loam, resting on a moderately dry bottom, and unless these conditions can be secured either naturally or artificially it is almost useless attempting to grow the autumn-fruiting kinds, for should the weather by chance be favourable to ripen them, their flavour will be so inferior as to be of little value. A well-sheltered site having a southern aspect, but sufficiently far away from trees not to have their roots encroaching on those of the Raspberry, is the best place to make the plantation, which may be done at once by proceeding in the following manner. Trench the ground from 15 inches to 2 feet deep, and thoroughly break up the soil by using the water-bark or other suitable tool, but do not bring any of the subsoil to the surface—a mistake many make, by which trenching has been brought into bad repute. As the work proceeds, shake and work in plenty of thoroughly decomposed manure, keeping the same well down, and if the land is at all stiff and adhesive add a good proportion of road scrapings or sharp sand, to keep it open and porous. In planting choose young healthy single canes, and place them triangularly at about 6 inches apart, and each clump a yard distant from each other, allowing the same space between the rows, which will afford ample room for growth and admit plenty of light and air. When the planting is complete cut away the tops, so as to induce them to push strongly from below, and to encourage a good growth of young canes which will be drawn off during the summer keep the surface well mulched with half-rotten dung, which will shade the ground and keep their roots cool. With autumn-fruiting Raspberries there should be no attempt to get a summer crop, as the whole strength of the plant ought to be concentrated in the young canes, which should be all cut clean away during the winter, and the ground top-dressed, but never dug or disturbed beyond what is necessary to remove weeds or to thin out the suckers, an operation these become necessary to prevent any overcropping that would otherwise take place. *J. Sheppard.*

The R.H.S. Provincial Show Fund.—I do not think Dr. Denny (p. 245) quite fully states the way in which the first country show was started; but, as I believe he was not at the time a Fellow of the Society, he cannot be expected to be conversant with the circumstances. When a country show was suggested in the Council, one of the "expenses committee," though approving of the idea, pointed out that as the expenditure would not be connected with the Commissioners' estate it could not be sanctioned. The Council, notwithstanding this, decided on the show being held, but said that, as they took the risk of loss, any profit must be applied to purely horticultural purposes. I believe, had there been a failure instead of a success,

the members of Council would have been personally responsible. I know I considered so at the time, and accept my share of the blame. In some of the proposals, to a considerable extent, due to local efforts, in which Mr. Fish took the lead. I do not agree with all that gentleman writes, but I have always thought that the Society owes him a great debt for his unwearied energy to ensure success in the attempt which he made the first, was a most important one. *George F. Wilson.* [We owe it to Dr. Denny to correct an unfortunate error into which we fell in the publication of his last letter on this subject. Dr. Denny's contention is, that the Society owes a great debt of gratitude to Mr. Dobree, borrowed from the Provincial Show account, that sum should be considered as a debt due from the Society to the Provincial Fund. Eds.]

Orchids in February.—Promise is still far in excess of performance in the Orchid-house. Nevertheless, the month has been graced by the presence of the following:—

Dendrobium Wardianum	Ada arantacea
„ crassinode	Leptotes serrulata
„ cecilioides	Cyrtopogon villosus
„ ardens	„ venustum
„ capillipes	„ niveum
„ andamanicum	„ aurantiacum
„ nobile pendulum	Calanthe Turneri
Brassavola grandis	Odontoglossum Rozellii
Cyclopis chinensis	Alexandra
„ media	„ Cervantesii
„ flavo-rosea	„ Koenigii
„ Veitchii	„ pallidulum majus
„ savana	„ Reticionense
„ aurantiaca	Phalaenopsis Schilleriana
Cattleya Trianae (supposed one of the lot sold a year ago to Sir Newton, numbered 2 to R. This is a new variety with a superb flower. Petals pure white, labellum rich purple, large, and of fine form)	„ grandiflora
„ Trianae	„ amabilis
„ chromolaia	„ Onidii-cantabrigiense
Zygopetalum crinitum cornutum	„ Cavendishii
„ Mackayi	„ sphaerulatum
„ maculiferum	„ Barkeri
„ Gouletii	„ polyanthum
Leelia crispilabia	„ orthobotrychum
„ anepi	„ Isidleyi leopoldinum
„ Dayana	„ chrysanthum
Madevillia polysacta	„ Angraecum sesquipedale
„ bicincta	„ eburneum viridum
„ Nyerberia	Epistadium dichroanthum
„ meliopolita (not worth growing)	„ fragrans
	„ saxatilis
	„ cochlearium
	„ recurvatum
	„ subulatum
	„ Heliconia sanguinolenta
	„ Macleania luteo-alba

Edward W. Cox, Mount Mount, Hendon, Feb. 24.

Coronilla glauca.—In the village of Havering at Bower there are two plants of *Coronilla glauca* which have been standing out in a cottage garden all the winter, and which are to-day (February 26) in full bloom, and looking quite healthy. The foliage is much better than on many plants grown inside, but the flowers look rather pale as compared with those on plants grown in a greenhouse. *J. Lant, Brygo Park.*

An Ancient Pear Tree.—During the late storm a large Pear tree in the orchard of Mr. Robert Hay, Chase Farm, Ambergate, was blown down. Mr. Hay says that when his great-grandfather took possession of the place in 1750, or 1727 years ago, it was a much larger tree than when (Mr. Hay) was born, and it has since then had a long and large life in exceptionally high winds. Mr. Hay believes it to be considerably over 300 years old, and the dimensions taken to-day, as below, will, I think, to some extent bear out his assertions. The tree has been a great favourite with the old man, and last year it bore a large crop of very good fruit. It had two trunks, dividing about 3 feet from the ground line. The measurements are—Circumference at ground 9 feet 6 inches; at 3 feet above ground, 11 feet; at largest trunk, 14 feet above ground, 6 feet 6 inches; at smaller trunk, 6 feet above ground, 5 feet 6 inches; at largest bough, 4 feet 6 inches; next largest bough, 4 feet; height from ground to top, 45 feet. *T. C., Crick Chase, Ambergate (on the "Derby Mercury").*

Spiral Growth of Plants.—This was induced by the action in the Gardeners' Chronicle of January 13 (p. 48) on twining plants to look round—though at an unfavourable time to find the generality of twiners—to see what I could find that coiled in different directions. To make plainer my meaning as to the direction the plant takes in twining, suppose you have a statue with the face to the south. Fix a string to the left foot, twine it over the right leg round the body as many times as you may, and the direction of the coil I consider as being, from left to right, like the apparent course of the sun in twining, upon the dial, and the hands of the clock; but if you face the plant, and follow its growth round, you will perceive it progresses from your right shoulder to your left—no matter from what point of the compass you view it, the coil follows its course round the statue, column, or

stake just the same. On the same principle, if you fix the string on the right foot of the statue or to a stake, twining it over the left leg and round the body, you have the coiling from right to left, contrary to or "against the sun" (as we hear sometimes remarked), and contrary to the shade on the dial, and clock hands, or in this case going from west to east, but in the first from east to west. I have only found one genus that coils from east to west, or from left to right—viz., *Lonicera Caprifoliata*. I enclose two specimens—*Lonicera brachyoda* and *L. flexuosa*. I apprehend those twining from west to east, or right to left, are more numerous. I send specimens of them—viz., *Alekkia quinata*, *Convolvulus sepium*, *Gratiola Bindevede*, *Perilopa græca*, *Stigmaphyllon ciliatum*, *Mandevilla*, *Wistaria Consequiana* or *sinensis*, *Physianthus albens*, and *Stauntonia latifolia* (this fine hardy evergreen climber twines firmly round a stake or other support, and also throws out a curious corkswear-like tendril as an additional holdfast). *Alstromeria acutiloba* I find no stems of, but in the summer I perfectly recollect it coiled round the stakes from west to east. *W.*

One of the Gardeners' Friends.—By all means kill the slugs—hand-pick them, salt them, and burn them up with unshaken lime, use all and every means to keep them under—but don't destroy the ear-shaped Testacella. This most useful garden scavenger is a slug of a pale-yellow colour, when crawling about 2½ inches long (fig. 48), and carries an external ear-shaped shell a quarter of an inch in length on its tail. It is difficult to persuade gardeners that they are harmless, but they would starve on a seed-bed of the tenderest young Cabbage plants, while the food in which they revel

FIG. 48.—THE EAR-SHAPED SLOG.

consists chiefly of worms and other animal matter, in fact they are exclusively carnivorous. Where these slugs exist they may be met with on garden paths early in the day on any mild morning after rain, especially during the months of April, May, and June. I have seen as many as two dozen at one time on one path in my garden during these months, and the fall-grown ones will sack down a worm twice their own length. I would, therefore, urge all who have the opportunity to notice whether their gardens are favoured by the presence of such a useful coadjutor, and if so, to issue an order to have them strictly preserved. *John Miller, Southgate, N.*

Euryale ferox.—This plant is self-fertilised, for some seasons, although the flowers have remained entirely submerged, perfect seeds have been produced—indeed, for the flowers to expand above the water has been the exception rather than the general habit of the plants we have grown here. Last year, however, perhaps owing to the unusually hot, bright weather which prevailed during the time our plant was flowering, a considerable number of the flowers expanded above the water level, and although comparatively small were very beautiful. We had many self-sown young plants of *Euryale* in our tank up to the end of December last, when, unfortunately, the hot-water boiler failed, and while replacing it with a new one the water became too cold for them, and they perished. *W. H. Baxter, Botanic Garden, Oxford.*

Root Lifting.—This is an operation which has hitherto received much less attention amongst fruit cultivators than it deserves. Success in open air fruit culture hinges upon well ripened wood. The uncertainty of obtaining this end is very great in a climate so fickle and uncertain as ours, especially when the roots are allowed to ramble and get where they

please. In dry summers such as the past roots penetrate to a depth too far below the surface to be properly aërated, and finally acted upon by solar heat; they are therefore feeding upon air forcing up a crude sap, to encourage rampant growth and large foliage, which continues to grow too late in the autumn months to become thoroughly matured and ripened. This remedy consequently is to be found in the management of the roots to obviate the existing evil. Root-pruning has been strenuously advocated by some fruit growers to check luxuriant growth, and no doubt some good results have been obtained from it. It has however, the disadvantage of requiring repeated operations, which becomes troublesome, and expending, and does not altogether serve the desired end, as the central root of the tree, which commonly penetrates deepest into the soil, is frequently not reached, and therefore the supply of nutritious fluids is not entirely cut off, whereas if root-lifting trees of good size and well established, the large and long roots are brought up near to the surface and are annually acted upon by solar heat, even although a portion of the smaller branching rootlets will penetrate deeper. From long experience of root-lifting at all seasons, even in midsummer when convenient, I am convinced that all fruit trees growing against walls or in the open ground are improved by root-lifting and relying as near the surface as possible to admit of being either dug or forked over for light cropping—a practice in most gardens indispensable, but one which should be avoided if at all practicable, as the roots of vegetables and fruit trees are in constant antagonism. A good method of getting the roots of trees well exposed to be much more in accordance with good fruit cultivation, so as to coax and keep up the roots near the surface, thus enabling the wood and buds to ripen with greater ease and certainty, and attaining the not less important end of getting the fruit better ripened and higher flavoured. My practice is, when I have the roots up, to take out a portion of the exhausted soil, put to a good layer of fresh loam, and mix it well in the bottom before laying the roots out. Fresh soil is laid over the roots, and about 2 inches of well-rotted manure, which serves to draw the roots up. The remainder of the soil is then covered all over the opened trench. One or two copious waterings will be necessary the first year after lifting, if the summer is a dry one. *J. Webster.*

The Fruit Prospects.—The weather has been extremely mild here all through the winter, and we have had rain almost daily. Vegetation is very forward around us, and we have here, on a west wall, a fine lot of Peas and Beans, and over the wall. It has been in bloom for some time, and in the Peach-house there is a splendid picture of bloom, without the least aid from fire-heat. Peas are bursting their flower-buds, and promise well, and Apples, especially the earlier varieties, are in a very forward state, and likewise promise an abundant crop. The fruit crop this season promises to be excellent, if the spring frosts do not kill the blossoms. *Henry C. Ogil, Efford Park, Lynton, Hants.*

The Vagaries of Ferns.—The reversion of *Athyrium Filix-æmas* Frisellii to the normal type in consequence of transplanting, as mentioned by Dr. Reichenbach at Ilmsburg, is somewhat out of common experience [Normal ferns have been always occasionally produced, but in very small quantity, Eds.], but the production of fructe fronds by the ordinary *Scolopendrium vulgare* is a circumstance quite common both in the wild and cultivated condition. But the most extraordinary of the similar varieties, are in a very forward state, and likewise promise an abundant crop. The fruit crop this season promises to be excellent, if the spring frosts do not kill the blossoms. *Henry C. Ogil, Efford Park, Lynton, Hants.*

Asperula this, in 1874, we raised a batch of plants from spores from a frond of *Polystichum mucronatum* (or *triangulum*). Among these were some plants of *P. filicinum*. The plate given by Hooker of that species is so good that we could not be mistaken, but, to be doubly sure, we forwarded a frond to Mr. Baker, of Kew, who said it was undoubtedly *P. filicinum* of Hooker. I am aware it will be said, "Oh, but you had *P. filicinum* growing near, and the spores given to me by the P. filicinum." I can assure you that *P. filicinum* had never been in our possession, and I do not even know there was such a thing till we saw Hooker's plate. Among the batch was another form, very different from either *P. mucronatum* or *P. filicinum*, and most beautiful either of them. The fronds are from 12 to 18 inches long, not more than 1 inch broad, bipinnate, the pinnules linear-lanceolate and acute, the lobes terminated by a long mucro. We had several plants of both these forms; the rest of the seedlings were of *P. mucronatum*. Who will tell us of these three is the species, and which the variety? *A. Stansfield, Vale Nurseries, Totterdean.*

Ants.—I have been very much pestered with an ant's nest in one of our Peach houses, and found very troublesome when the trees were in flower; but on visiting Mr. Muir, of Oulton Park, Cheshire, he showed me a most successful plan of keeping them at bay, at which was done by tying a mixture of brown oil or carvas around the stems of the trees, and painting it over occasionally with gas tar. Having none of the mixture at hand, I used a mixture of lamp-black and oil, which has answered the same purpose. I must remark, however, that the trees are grown in pots, and do remarkably well. *Wm. Driver, G. to Thos. Wrigley, Esq., Timberhurst, Bury, Lancashire.*

The Organ Plant.—Mr. T. Goulli's question respecting the "Organ Beet," reminds me of the days of childhood in South Wales, where the cottagers make what they call tea (pronounced "tay") "organs" out of the leaves of the *Organum vulgare*, or common Marjoram, and the garden cultivated kind, *Organum Marjorana*, Sweet Marjoram, which is distinguished from the former by its more compact spikes and more elliptical leaves. It really is a valuable herb-medicine in nervous complaints, relieves headaches of this class, and acts as a tonic. Some people throw a small bunch of the dried plant into their beer, and say that it makes the beer the ale turning acid. The name of Marjoram comes from the Arabic for this herb, "Maryamch," and *Organ* is a corruption of *Organum* I believe, but I never heard it except in South Wales. *Helen E. Watne, Erry Garden.*

The Organ herb is what is commonly known in the west of England as Pennyroyal. It was formerly used as a beverage by the poorer classes. *Edwin Sanford, The Gardens, Dale Park, Arundel.*

The Influence of the Moon on the Flow of the Sap.—Your correspondent "C. W. D.," asks if there be "any additional confirmation of the theory that the flow of sap is greatest at the full, and least at the new moon?" This is a subject to which I have paid some attention, and I think I have satisfied myself that there is not a title of evidence to support the opinion. Many years ago I spent nearly a year in Cuba, and there I found the opinion was held—I may say universally—that wood or any vegetable matter perished speedily if cut during the waxing moon; and a friend at whose house in the country I was staying informed me that "it was well known in fact that the Palm leaves used for thatching would not last more than a few months if cut at the one period, though they would last for as many years if cut at the other; but notwithstanding my friend's positive assurance that he had not had any of his wood which was heaped up by me (and his friends around him), I still remained a sceptic, and with some difficulty I induced him to make an actual experiment by re-thatching a shed that needed it with Palm leaves, saying half that should be cut at one, and half at the other period of the moon's age; and in a letter that I received from him about four years afterwards he frankly confessed that he could discover no difference in the rate of decay, and therefore he had come over to my opinion. "It may be," he said, "but was concerned"—viz., that this faith in the moon's influence was the relic of an older religion, that was not yet effaced by more modern intelligence. *J. P. G. Smith, Sweeney Cliff.*

Orchids.—Herewith I send you flowers of *Phalaenopsis amabilis* and *Dendrobium crassinode*. The variety of *P. amabilis* is the best that has ever come under my notice [Very fine. Eds.], and considering that the plant has been in flower since December 20, it shows how valuable *Phalaenopsis* are for the decoration of the Orchid-houses during winter. The variety

of *Dendrobium crassinode*, I think, also merits praise, as it is the best coloured flower of the *Barbaterium* section that I have seen. [A very bright flower. Eds.] *J. P. G. Smith, The Gardens, Routhall Hall, Woodbridge.*

Diospyros Kaki.—I will remember a Tomatolooking fruit in the Canton River, which must have been the *Diospyros Kaki* mentioned at p. 269. It was sweet and luscious, but had always a slightly stringy part, which I think was near the seed. *H. K.*

Action of Pollen on the Seed of Peas.—Upon reading the letter of your correspondent, "W. E.," I have sometimes, but not always, changed by the cross, and others, that the colours of the envelopes of the seeds of Peas immediately resulting from a cross are never changed; and "I find, however, that the colour, and probably the substance, of the cotyledons is sometimes, but not always, changed by the cross." The other matter seems to affect rather the phenomena subsequent, and appearing in after generations. In the letter to Mr. Darwin, however, which, strange to say, I had never read, other and very interesting observations are made, and which seem to indicate a change of seed, but of the pod also. I was very ill at the time this appeared, and conclude I missed it. There is "a certain degree of uncertainty" in the wording, and I should feel greatly obliged if "W. E.," or any correspondent, who has written me, would send me more accurately worded, upon this subject, which has long occupied my attention. *T. C. K., Welton Place, February 28.*

Referring to the report of the meeting of the Scientific Committee of the Royal Horticultural Society on February 14, 1877 (*Gardener's Chronicle*, p. 219), when Col. Clarke exhibited a pod of Woodford Marrow Pea from a flower fertilised by pollen from the white-seeded *Avergue*, the pod containing a single seed, and which it is stated he slightly observed the change; this is a misapprehension, for which I am sure Col. Clarke will forgive me calling attention. At the Botanical Congress in 1866, I exhibited a case containing diagrams illustrating the various changes, with the actual or parallel representative seeds, one of which diagrams showed the results of fertilising "Evergreen," a round green-seeded Pea, with a round white-seeded variety, the produce being green and bright yellow seeds in the same pod. I also communicated to Mr. Darwin about the same time the particulars of crosses between blue and white Peas, showing the changes of colours in the seeds, but these changes were all in the envelopes of the cotyledons of the seeds, and not in the envelope. I, however, found that by fertilising purple-flowered Peas with the pollen of white varieties some changes took place in the colours of the envelopes. Purple-flowered Peas seem to be permeated with the purple colour all through the plants, as this colour shows itself not only in the flower, but in the seeds, the pods, and at the axils of the leaf-stalks, the grey and brown maple or partridge colours of the seeds being derived from fine particles of the purple colour on the surface. It is the yellow tone being due to the transmission of the colour of the cotyledons through the semi-opaque envelope. In one case I found that by crossing the purple-flowered "Sugar" or "Mangout" Peas, with a white-seeded variety, with a white-flowered and white-seeded variety, some of the Peas in the pod were positively in-coloured, or nearly black, others broadly streaked with the same colour, and others grey only; and although the produce in the following generations showed clearly the results of the cross, some of the seeds being grey and others white, the purple and striated forms only appeared rarely and at intervals, and were never fixed or permanent, and I have never seen any running or permanent colour, which cross-fertilisation seems to induce. The same "running" character of the purple colour was also evident in crosses with the purple-podded Pea, the grey colour appearing both on the envelopes and the seeds. I have also seen the latter change of colour. Mr. Darwin, to whom I sent some of the specimens. By crossing, also, the brown maple or partridge Pea with a white-flowered kind, I obtained fixed varieties with grey and purplish striated seeds, but in these there was no change of colour in the envelopes of the seeds from the fertilised flowers. In my paper on the cross-fertilisation of Peas read before the Scientific Committee of the Royal Horticultural Society I showed the results which followed from crosses between a white round and white partridge, and that the blue and white wrinkled and blue round

varieties threw off, during more than one generation, pods containing seeds in all the four forms, viz., blue wrinkled and round; and white wrinkled and round seeds in the same pod; and I have since frequently confirmed this, although a change has not always been apparent in the seeds of the crossed flowers. I have never, however, observed a case where the round white seed after the second generation produced the other forms, but I have seen many cases where there is more fixity and permanence in the round white-seeded Pea with white flowers than in the blue and wrinkled forms. Perhaps the former may be the original stock of the garden Pea, and the others merely subsequent varieties of it. The colour of the envelopes, the colour of the embryo, the envelope, and the pericarp by the action of pollen is of such interest that I trust Colonel Clarke will continue to follow out what has so well begun in Matthioli's *Leguminosae*, and especially the part as being practically of interest, and affording an excellent field for logic and continued investigation. *Thomas Laxton.*

The "Annuaire Belge."—In reply to your correspondent of p. 178, permit me to say that it is a frequent custom on the Continent to send books by post, "on approval" to persons likely to be interested in them. These persons retain the books if they please, or they return them. The option of so doing is expressly stated in print on the cover. Many persons are glad to be made acquainted in this way with the contents of such books. The book, moreover, was not accompanied by a post-card, but one was sent twenty days subsequently. *E. Rodigas.* [No one who knows the Editors of the publication in question would for a moment be personally interested in them, and they were doubtless not aware that it is not the custom to send books in this country in the way above indicated, unless intended as presentation copies. The conditions should be printed in English. Moreover, we inular Britons are apt to consider such unauthorised communications in the light of intrusions. Eds.]

Natural History.

WITCH KNOTS.—The observations of your correspondent "O.," on the cause of the Witch Knots of the Birch deserve more credit as a discovery than is claimed for them by the modern element that their origin is "not so well known." Unless I am mistaken, it was not known at all. It is not very long since the Rev. Mr. Berkeley brought specimens of these Witch Knots to one of the meetings of the Scientific Committee of the Royal Horticultural Society, and on that occasion I believe no satisfactory explanation of their cause was offered. Neither can I find any *Phytophthora* described as infesting the Birch except one that produces an Eriumph on the back of the leaves, described by Schumacher under the name of *Eriumph betulinum*, on which is something quite distinct from the one residing in the buds. It may, no doubt, have occurred to many that these Witch Knots were probably due to insect agency; that, however, is something very different from having detected the *Phytophthora* in the deformed buds and traced their growth. Guided by "O.'s" researches, I have examined some of these buds, but had no difficulty in finding the *Phytophthora* in numbers. It seems to me little different from other species that I have seen elsewhere. It is more abundant at the head, and its legs look more clumsy; no doubt it is a distinct species, although it is scarcely possible to formulate a distinctive definition.

The very curious question remains that is suggested by "O.'s" inquiry at the end of the notice, whether the Carrant species causes Witch Knots or no. We know that it does not. We know that the *Yew Phytophthora* does not, that the *Sloe Phytophthora* does not, in fact that Witch Knots are found on comparatively few species of trees. Why is this, and how comes the *Phytophthora* in most cases merely to cause enlargement of the buds, whereas in this instance it causes the production of woody fibre?

But we must not confound them. It is only indirectly that it causes the growth of woody fibre, the actual and direct action is the same in all cases. By the irritation its presence and feeding creates, it causes the buds first to swell and afterwards destroys them. In the plants where the *Witch knots* appear, after it has destroyed the buds, it would appear that the plant accepts the condition and makes no more effort to send out a bud at the same spot. In the Birch it would appear that a new bud in the place of, or new buds close to, the old one, come out to be

again destroyed by the Phytoptus; and after a series of repetitions of this in successive years that it ends in producing the accumulation of arrested buds that finally become a Witch Knot. *Andrew Murray.*

— May I ask to be allowed to correct an error which by some misadventure has occurred in the measure of the Phytoptus, p. 249. It is given as the two-thousandth, it should have been the two-hundredth of an inch in length. *O.*

The Villa Garden.

SEED RAISING.—He who loves his garden will be led to essay experiments with a view to extending his knowledge and adding to his resources; and his success will in a great measure depend on the forethought he exercises, and the intelligence he applies to the overcoming of difficulties. There are thousands of gardeners who purchase seeds to raise them for the sake of having plants they themselves produce; and a varying success crown their efforts. Some succeed wonderfully well, others find themselves as far off from anything like success as they can well be. Happy is the gardener who, though in the very alphabet of his procedure, is not deterred by failures, but accepts them and perseveres till they become changed into successes. A few years ago a soldier exhibited, at one of the meetings of the Royal Horticultural Society, some seedling Pelargoniums he had raised on the mantelshelf of the living-room he occupied. The productions justly received a good deal of praise, and they served as a valuable illustration of what can be done, under apparently unpromising circumstances, when the true gardening spirit rises superior to conditions that scarcely promise desirable results may be forthcoming.

There are those who raise Stocks, Asters, Verbenas, Pelargoniums, Marigolds, Petunias, and suchlike in sitting-room windows, and secure plants by his means with which to make their gardens look gay in summer. Such attempts are not at all uncommon, they are being achieved day after day during the spring season; but we are not generally familiar with them, because so seldom recorded, that they are possibilities transmuted into actual results.

Those who find their greenhouse and conservatory only in their sitting-room window use flower-pots in preference to pans for raising seeds. The pots are first of all thoroughly cleansed inside and out. The next proceeding is to fill them nearly or quite one-third full of crocks, made up of broken pots or small pieces of bricks, placing over this draining material a thin layer of moss to prevent the soil being washed down among the *drivis* at the bottom. Then the pots are filled with a fine sandy soil to within an inch or so of the rims. This is gently pressed down till the surface is smooth and level, and then the soil is ready for the reception of the seed.

The next proceeding is to place a very thin layer of silver-sand over the top—only enough to give a slightly sanded surface, and then the seed is sown. This is done thin—much more than is generally done, and that for two reasons worthy of being well borne in mind; 1st, that the plants be not too thick to cause damp to destroy some of them, as will happen in the case of Stocks and other subjects where too much crowded; and, 2dly, as the space for growing the plants is necessarily limited, it is sometimes requisite that they remain in the seed-pots almost till planted out. Room is thus of some importance, for a few strong plants are better than a crowd of weak ones, and therefore this sowing is an imperative necessity. The seed being sown, and gently pressed into the soil, a very slight covering of sand may be spread over it, and then a gentle sprinkling be given. In the absence of a fine-rose watering-pot the surface of the soil can be moistened by placing the fingers in water and gently sprinkling what adheres to them over the newly-sown seed. Later on, when the soil gets well settled down, the pots can be immersed in a pail or tub of water up to the level of the surface of the soil, and then the water well drained off before they are restored to the place they occupy in the window.

If the pots are in a window having a south or west aspect it is obvious that the effects of the sun will be felt, and the soil will dry quickly; therefore it is a good plan to place a piece of glass over each pot, and over this again a piece of newspaper, to screen the glass from the sun. The glass may be kept down

close to the rims of the pots till the seeds begin to germinate, then it should be slightly raised on one side. This will admit a little air and prevent the plants from damping off, which they will sometimes do when too closely confined. Nothing should be allowed to lie on the surface of the soil, such as a piece of leaf, or any similar substance that would hold the damp and spread mildew. It is a somewhat critical time when the seeds are through the soil, and the pots should be inspected daily, to see that no harm is spreading among them. In dull weather the paper covering may be wholly removed, and when the plants grow into size it need only be placed over the pots when the sun shines forth at its greatest heat. In this manner may have raised seeds of choice things, and then during the summer, when they are making their gardens look gay, they are able to point with justifiable pride to what they have so well done.

As the weather grows milder the pots of seedlings can be stood out in the sun for a time, and sprinkled overhead to keep the young leaves clean and free from dust, and a fine-rose watering-pot is of great value for this purpose. A pot holding half a gallon or so of water will be quite large enough, and it should have a long narrow spout a feet in length, at the end of which a fine rose can be fitted on. Watering-pots of this kind are sometimes constructed with a rose which is a fixture, and cannot be removed, as the pot is then very useful for watering other plants when it may not be expedient to wet the leaves. The exposure of the plants to the sun will prevent them from becoming drawn, and cause the growth to be sturdy, and infuse a certain degree of hardiness into the constitution.

It may be said that all this labour can be avoided by purchasing plants from a nurseryman at the proper time for planting in the open ground. This is quite true, but then it considerably narrows the extent of pleasure to be derived from gardening operations. Some persons are apt to think that all the pleasure of gardening pursuits is confined to the witnessing of plants breaking into flower; but that is a mistake. Our aim always has been to create and foster a love for raising and growing, as well as a simply blooming them; and in all our gardening experiences we have ever found that they who raise a few flowers from seed, and assist in maturing their growth till they can be planted out in their gardens, experience a higher sense of enjoyment than those who merely purchase a few plants at the blooming time. Every experiment made in the way of raising seeds, however simple it may be, becomes a pleasant occupation, and a daily source of engaging interest and hopeful speculation; and, let it be recorded to the credit of human nature, failure has proved with many only a powerful incentive to attaining ultimate success; and he who finally conquers in small matters is thereby encouraged to essay larger attempts. The teachings of experience surmount obstacles; the harvest of enjoyment corresponds to the labour spent, and the patience and hopefulness exhibited. As the Eastern poet puts it—

"Be of good cheer; the sunless month will die,
And a young moon requite us by-and-by."

SOWING SEEDS OF BEDDING PLANTS.—Now should be sown *Lobelia speciosa*, *Pyrethrum Golden Feather*, *Salvia patens*, *Petunias*, *Perilla nankiensis*, and any other things of this character that may be wanted for bedding purposes by-and-by. There is nothing like the old seed-pan, with holes at the bottom to secure drainage. Place some pieces of broken crocks at the bottom, and over these a little leaf-mould, and then fill up to within three-quarters of an inch with a light sandy soil; press the soil down till it is smooth and level, and then sow the seed very thin, and sprinkle the most careful covering of sand over it. Then place the pans away on a shelf or any convenient place, cover each with a piece of glass, and cover the whole with newspapers for a few days, when the seeds will soon begin to germinate.

Obituary.

WE deeply regret to announce the death, on the 20th ult., at Fern Bank, Ventnor, of Mr. HENRY ORMOND, the well-known horticultural builder, of Stanley Bridge, Chelsea.

Mr. Ormond was born at Reed House, Antrobus, Cheshire, on April 13, 1816, and in early life was

employed in the Manchester Botanic Garden under the late Mr. Campbell, whom he survived but a few weeks. From Manchester Mr. Ormond went to Alton Towers, Staffordshire, when that garden and princely seat was at its best. Here he distinguished himself by his great aptitude for learning, and the Earl of Shrewsbury's chaplain taught the young man among other things perspective drawing, and this one thing was the turning point of Mr. Ormond's success in business, for when he left Staffordshire and got to London his ready sketching always got him favour and a preference to other competitors. Along with two other young men, Mr. Gray and Mr. Brown, he started his business career about the year 1847, the title of the firm being Gray, Ormond & Brown. At the end of 1850 the business came into the hands of Messrs. Gray and Ormond only, but when in the autumn of 1857 he began to see his way clearly to the touch the business of horticultural builder entirely into his own hands, and he has stated that however late he might be at night with either business or pleasure he always lighted the gas and opened the works himself to see that he got value for his money in the way of labour. By bold strokes and often repeated, he worked up an extensive connection, and as may be seen by his advertisements he did business with names of note, from royalty downward.

The late Joseph Knight and the late James Veitch, both of Chelsea, were both of them tried friends of Mr. Ormond, and though greatly assisted in getting him into the high position he attained, but much depended upon his own practical acquaintance with all the details, for he had been well grounded in horticulture under Mr. Campbell and Mr. Forsyth, and could advise as well as execute, which no mere builder could aspire to. His death will leave a blank that will not easily be made good, for he was not only trustworthy with what he took in hand, but spared no pains or cost to give his patrons satisfaction; and it is to be regretted that, having worked up such a business to that pitch of perfection, he has left neither son nor daughter to enjoy it. Those whom he has benefited by beneficial employment as well as by acts of charity will suffer an irreparable loss. He was interred at St. Thomas' Church, Fulham, on Tuesday last.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON.
FOR THE WEEK ENDING WEDNESDAY, FEB. 28, 1877.

- Feb. 22.—Fine, but dull and very cloudy. Cold.
— 23.—A fine day, cloudy at times. Cold. Rain in early morning.
— 24.—A dull, cloudy day. Rain fell at 11 A.M. Mild.
— 25.—Lunar halo at night.
— 26.—Cloudy and showery, frequently fine and bright. Strong winds.
— 27.—Fine, but frequently dull, with hail and snow showers. Cold day. Temperature at 0 A.M. = 44.7; decreased to 36° at 0.30; and to 33° at 0.45. Then increased to 38.5° at noon. The maximum, 46.1°, occurred very early in the morning.
— 28.—A very fine day, cloudless at times. Cold. Hoar-frost in morning. The lowest temperature in the month occurred on this day.

LONDON: *Barometer.*—During the week ending Saturday, February 24, in the suburbs of London the reading of the barometer at the level of the sea in-

creased from 30.10 inches at the beginning of the week to 30.11 inches by noon on the 18th, decreased to 29.56 inches by the early morning of the 20th, increased to 30.07 inches by the morning of the 21st, decreased to 29.71 inches by the evening of the same day, increased to 29.96 inches by the afternoon of the 23rd, and decreased to 29.56 inches by the end of the week. The mean reading for the week at 9 a.m. level was 29.79 inches, being 0.7 inch below that of the preceding week, and 0.23 inch below the average.

Temperature.—The highest temperatures of the air varied from 51° on the 24th to 42½° on the 21st. The mean for the week was 47½°. The lowest temperatures of the air ranged from 41° on the 23rd to 40° on the 18th. The mean value for the week was 35½°. The mean daily range of temperature in the air was 11½°, the greatest range in the day was 16½° on the 24th, and the least 8½° on the 18th. The mean daily temperatures of the air and the departures from their respective averages were:—18th, 44.4°, + 5.6; 19th, 43°, + 4.2; 20th, 39.4°, - 6.5; 21st, 38½°, - 0.9; 22d, 36.7°, - 2.4; 23d, 39.7°, + 1.9; 24th, 42°, + 3.7°. The mean temperature of the air for the week was 40.3°, being 1.3 above the average of sixty years' observations.

The highest readings of a thermometer, with blackened bulb in vacuo placed in sun's rays, were 98° on the 23rd, and 94° on the 19th; on the 18th the highest reading was 57°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 20½° on the 21st, 22d, and 23d, and 30½° on the 24th; and the mean of the seven low readings was 30°.

Wind.—The direction of the wind was W.S.W. and N.W., and its strength brisk. The weather during the week was more reasonable, but generally dull and cloudy. A lunar halo was seen on Saturday night, February 24.

Rain fell on five days in the week; the amount collected was 0.66 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 56° at Sunderland and 55° at Portsmouth and Cambridge; at Liverpool and Bradford 49° was the highest temperature; the mean at all stations was 48°. The lowest temperatures of the air observed by night were 26° at Wolverhampton and 27½° at Eccles; at Portsmouth 35½° was the lowest temperature; the general mean from all stations was 31½°. The range of temperature at all stations was from 11° at Liverpool, 15°, and the greatest at Sunderland and Wolverhampton, both 25°; the mean range of temperature from all stations was 20°.

The mean of the seven high day temperatures was 44° at Newcastle and Sunderland, both 49½°, and the lowest at Wolverhampton and Hull, both 44½°; the mean from all stations was 46½°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 35½°, and the highest at Truro, 41½°; the mean from all stations was 36½°. The mean daily range of temperature in the week was the greatest at Sunderland 13½°, and the least at Liverpool, 6½°; the mean daily range of temperature from all stations was 10½°. The mean temperature of the air for the week for all stations was 41°, being 2½° below the value for the corresponding week in 1876. The highest occurred at Truro, 44½°, and the lowest at Wolverhampton, 38½°.

Rain fell on every day in the week at Truro, Cambridge, Sheffield, and Hull, and on five or six days at the other stations. The amounts measured varied from 1 inch at Norwich, Manchester, Eccles, and Hull, to four-tenths of an inch at Truro, Portsmouth, Plymouth, and Leeds. The average fall over the country was scarcely more than an inch. The weather during the week was fine and reasonable, but showery, and the sky generally cloudy. A lunar halo was seen on the 24th inst.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 54° at Dundee to 47° at Greenock; the mean value from all stations was 50°. The lowest temperatures of the air ranged from 26° at Paisley to 30½° at Aberdeen; the mean from all stations was 28½°. The mean range of temperature in the week from all stations was 22½°.

The mean temperature of the air for the week for all stations was 39½°, being 2½° above the value for the corresponding week in 1876. The highest was 46½° at Leith, and the lowest 39° at Greenock.

Rain fell at Greenock to the amount of seven-tenths of an inch, at Perth two-tenths only fell, and at Dundee no rain fell; the average fall over the country was four-tenths of an inch.

DUBLIN.—The highest temperature of the air was 54½°, the lowest 32½°, the range 22½°, the mean 42½°, and the fall of rain 0.35 inch.

JAMES GLAISHER.

Enquiries.

He that questioneth much shall learn much.—BACON.
173. GREAT TREE OF PULO PENANG.—Can any of your readers inform me of what species is the great tree of Pulo Penang? H. K.

Answers to Correspondents.

ARALIA SIBIROLA VARIEGATA.—This plant to flower and ripen its seeds in the country.

ARCHIMEDEAN LAWN MOWER.—A *Constant Reader*. The London agents are Messrs. J. G. Rollins & Co.

AZALEAS: W. M. R.—Probably the plants have been kept in too warm and close an atmosphere. See instructions given from time to time in our "Garden Operations."

BEANS: A. D. The Saville Longpod Bean has been forwarded by Messrs. W. E. Lubin & Co. Your correspondent's statement, "unknown to English-grown Beans," correct?

BOOBY: D. R. Paxton's *Botanical Dictionary*, published by Bradbury, Agnew & Co., Bowdler Street, Fleet Street, E. C.

CAMELLIAS: H. C. We cannot, and do not, understand the use of Camellias which are florists' flowers. Send them to some nurseryman who grows a large collection.

CATERILLAR POISONING: H. W. G. We have no direct knowledge of any case of poisoning by *Rhododendron ponticum* or *Andromeda floribunda*, but from what we have read, we should be inclined to think that the cause is the same as in the right.

CREEPERS FOR A VINERY: A. I. We are afraid that any plants used to screen hot-water pipes in a vinery will give you a great deal of trouble.

FLYING: A. I. Camellias which are florists' flowers. Send them to some nurseryman who grows a large collection.

WATER: A. I. We are afraid that any plants used to screen hot-water pipes in a vinery will give you a great deal of trouble.

WATER: A. I. We are afraid that any plants used to screen hot-water pipes in a vinery will give you a great deal of trouble.

WATER: A. I. We are afraid that any plants used to screen hot-water pipes in a vinery will give you a great deal of trouble.

WATER: A. I. We are afraid that any plants used to screen hot-water pipes in a vinery will give you a great deal of trouble.

WATER: A. I. We are afraid that any plants used to screen hot-water pipes in a vinery will give you a great deal of trouble.

NAMES OF PLANTS: J. C. r. *Cupressus Japonica*; 4, *Thuja Cunninghamii*; 3, *Cupressus Japonica*; 4, *Thuja dolabrata*; 5, *Thuja gigantea* (Lobbi); 6, *Pinus insignis*—*Hayes*. *Pinus serrulata*.—*J. H.* *Masdevallia polystachya*. The *Lobelia* is noticed by Professor Reichenbach in another column.—*D. Saunders*. *Cissua aurantiaca*, probably, but there is very little to judge by.—*J. W.* *Wormaster*. Possibly a *Dianella*, so far as we can tell from a single leaf.

RHUBARB: D. R. A Vegetable.

SHADING: E. H. A mixture of whitening, new milk, and thin paste or starch, will answer your purpose; but you must be careful to wash the plants, as not to touch the point or patty, which the paste causes to curl off.

SLUGS: Only a Notice. Dred the plants with soot or fresh horse manure. Salt would not do the slugs and the plants too, and is a dangerous thing in the garden in the heads of a novice.

VANDALEN IN PICCADILLY: H. K. The cutting down of the Elm trees in Piccadilly by Vandaleen, at all, but a measure of necessity. The Elm trees were planted alternately with Planes to shelter the latter, and to afford some little shade until the Planes got up, when it was always intended that they should be cut out. The time has now come when to leave the Elms would be to do injury to the Planes, and they have been rightly retained. The Editor who considers "the cutting down of these trees the most extraordinary piece of Vandalism of modern times," so doubt that he would have been more prudent in not the strippling, but in planting any knowledge of trees, and of Elms in particular, would dream now-days of planting them permanently near to any thoroughfare.

VINE ROOTS: Anxious Enquirer. Your Vine roots are infested with abundant mycelium of some fungus threads and fruits of a Saprolegnia, and a number of living infusorial animals. The latter point unmistakably to superabundant moisture.

VIOLETS: G. Lee. Your seedling, which might well be called *Odoratissima*, is the finest we have seen.

The flowers are large, and of a rich purple, with broad rounded well-set petals, of a bluish purple, and deliciously fragrant. Judging from the leaves sent, the foliage does not appear to be so coarse as in some of the other large-flowered sorts.

WOODICE: E. H. Turn a few Toads into the house; or, failing to get them, pour scalding water into the runs of the woodlice, and repeat the application until you have exterminated them.

CATALOGUES RECEIVED.—Messrs. Webb & Sons (Woolley, Southampton), Annual Catalogue of Flower Seeds.—H. Bennett & Co. (Lancaster Flower Nursery, Stapleford, Wilt), Trade List of New Roses.—R. Buist (Roseale Nurseries, Darley Avenue, Philadelphia, Pa., U.S.A.), Catalogue of New Roses.—W. Paul & Sons (Backhouse & Son (York), Catalogue of Hardy Perennials and Alpine Plants.—Messrs. DIED, at Pinefield Cottage, on Thursday afternoon, the 28th inst., Mr. GEORGE MORRISON, seedman, Elgin, aged sixty-six years. Friends will please accept this intimation.

Markets.

COVENT GARDEN, March 1.

Trade remains quiet in this market, and will be so until we get through Lent and Easter. The supply of Apples is getting very short, and prices are well maintained. Apples are in demand, and making high prices. Stocks of Kent Cobs appear to be nearly exhausted, and scarcely any inquiries are made for them. *James Webb, Wholesale Apple Market.*

CORN.

Trade at Mark Lane on Monday was quiet. Fine dry Wheat, either English or foreign, was well held; but the bulk being more or less affected by the weather, the rates of Monday se enight were not as a rule exceeded. For Barley prices were barely so firm. Malt was steady without much demand. In Oats and Maize the better qualities had an upward tendency. Beans and Pens were in very limited request. There was a quiet sale for all descriptions of flour, at the rates of last week.—Trade on Wednesday was very quiet, and quotations showed no material change. The continuance of cold, frosty weather would improve the condition of the produce, and increase the marketable supply; hence holders were not so firm as might be anticipated from the change in temperature, and with very little doing there was even some difficulty in supporting previous quotations in some instances.—Average prices of corn for the week ending February 21—Wheat, 45s. 3d.; Barley, 45s. 4d.; oats, 25s. 7d. For the corresponding week of the year—1876—Wheat, 43s. 3d.; Barley, 43s. 4d.; oats, 24s. 7d.

CATTLE.

At Copenhagen Fields on Monday there was a slow sale of beasts, and in some instances rather less money was taken, but there was scarcely a quotable reduction. There was a good demand for sheep, and late rates were well maintained. Choice calves were in request at high rates. Quotations—Beasts, 47. 6d. to 57., and 65. to 67.; calves, 6s. to 7s.; sheep, 5s. 10d. to 6s., and 6s. 10d. to 7s. 6d.; pigs, 4s. 4d. to 5s. 4d. On Thursday the supply of beasts equalled the demand, and both were limited; prices were lower than on Wednesday, and sheep were readily bought at the figures quoted above, but otherwise trade was not brisk.

HAY.

At Whitechapel on Tuesday there was only a moderate supply, and trade improved. Clover was decidedly firm, the better sorts making from 100s. to 128s., while inferior produce was quoted from 85s. to 95s.; prime meadow hay was held at 105s. to 124s.; inferior, 70s. to 85s.; and straw, 40s. to 54s. per load.—Trade was not brisk on Thursday, at the following quotations—Clover, best, 98s. to 125s.; inferior, 85s. to 90s.; hay, best, 95s. to 122s.; inferior, 65s. to 72s.; straw, 40s. to 52s. per load.—Cumberland Market quotations—Superior meadow hay, 126s. to 135s.; inferior, 110s. to 114s.; superior Clover, 138s. to 147s.; inferior, 115s. to 130s.; and straw, 52s. 57s. per load.

POTATOS.

The Borough and Spitalfields reports state that the Potato markets remain steady. There are moderate supplies, and no material change is apparent in quotations. Kent Regents, 100s. to 125s.; Essex do., 90s. to 120s.; Scotch, 100s. to 130s.; Flukes, 125s. to 130s.; Victorias, 140s. to 170s.; Kidneys, 100s. to 120s.; Hooks, 75s. to 90s.—The market in London on last week consisted of 29,514 bags from Hamburg, 16,465 from Antwerp, 5428 from Ghent, 3029 from Bremen, 710 sacks from Boulogne, 745 bags from Harlingen, 643 from Brussels, 677 from Rotterdam, 200 from Malta, 175 tons Dunkirk, and 52 Dahouet.

COALS.

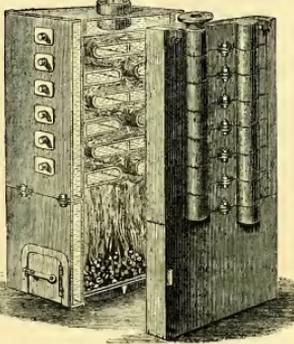

The market on Monday was firm, and house coals made an advance. There was a small supply on Wednesday, owing to the vessel which was detained by the stormy weather, and house coals were sold at an advance of about 2s. per ton. Quotations—Belside West Hartley, 16s. 6d.; East Nylam, 16s. 6d.; Hartley, 16s. 3d.; Walls End—Hawthorns, 17s. 6d.; Hartlepool, 18s. 6d.; Kellou, 18s.; East Hartlepool, 19s. 3d.; South Hartlepool, 18s.; Tees, 19s.

Sole Medalists for the Best Hot-Water Apparatus at the United States Centennial International Exhibition, Philadelphia.

By Her Majesty's Royal Letters Patent

WRIGHT'S ENDLESS-FLAME-IMPACT HOT-WATER BOILERS.

GUARANTEED THE MOST POWERFUL, THE MOST RAPID, THE MOST ECONOMICAL, THE SIMPLEST, AND THE CHEAPEST IN THE WORLD.

It is the only Hot-water Boiler in which

The whole interior is specially arranged to secure the largest amount of the direct and most powerful "flame impact," delivered on the most effective surfaces. Outside deposit reduced to a minimum by the endless strokes. The interior currents are specially arranged for the most powerful circulation, whereby nearly treble the amount of water is rushed through the furnace and nearly treble the amount of heat absorbed from the ascending products. Inside deposit reduced to a minimum by the extraordinary circulation. Every volume of heat, large or small, is forced in its travel (until it will fill) over the entire surfaces, from bottom to top, delivering scorching blows on surfaces at right angles to its ascent.

Entirely water-jacketed: loss of costly heat, therefore, absolutely impossible; and danger from fire reduced to a minimum. The flame-stream is entirely broken up and disintegrated. Air and gases thoroughly mixed and burnt, and the formation of smoke largely prevented. The whole interior one large combustion chamber. The flame kept in most intimate contact with the entire surfaces. From its extraordinary rapidity it will be found of the extreme value in case of accident or mistake. By means of the "central rib" every inch of the interior is visited by the water in rapid circulation. Cold water fed in on one side, and taken away hot on the other. Water, once heated, never submitted to flame-action again. The whole ten sections deliver into the "hot column," one above the other. Extraordinary power for actuating the circulation when so situated. May be erected, repaired, and taken down by any ordinary workman. India-rubber between all the joints, allowing every facility for expansion or contraction. Not a "fitter's" work. Will be altered in any power or level. In handy sections. Breakages easily repaired at trifling cost, &c. No horizontal heating. No brickwork. Outside fitted entirely with sheet-iron, &c.

For details and particulars as to the various sizes made, and prices, please see our pamphlet, entitled, "OUR BOILERS AND HEATING," which will be handed to all applicants, post-free. We are prepared to supply Thirty Different Boilers of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement.

WM. WRIGHT & CO., HOT-WATER ENGINEERS, AIRDRIE, near GLASGOW, N.B.

WM. PAUL & SON,

(Successors to the late A. Paul & Son, Established 1806.)

BARB and SEAKALE POTS, &c. Price Lists post-free.
Sheets of Designs, 6d. Books of Designs, 2s.

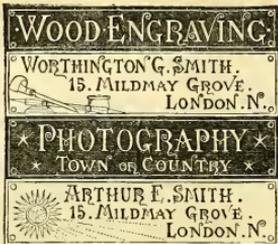

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK
VARNISH for Preserving Ironwork, Wood, or Stone.
This Varnish is an excellent substitute for oil paint on all out-
door work, while it is fully two-thirds cheaper. It was intro-
duced upwards of thirty years ago, by the advertisers, and its
genuine good quality, notwithstanding a host of unprincipled
imitations, is fully attested by its constantly increasing sale. It
may be applied by an ordinary labourer, requires no mixing or
thinning, and is used cold. It is used in the grounds at
Windsor Castle, Kew Gardens, and at the seats of many hun-
dreds of the Nobility and Gentry, from whom the most flattering
testimonials have been received, which HILL & SMITH will
forward on application.
Sold in casks of about 30 gallons each, at 2s. 6d. per gallon,
at the Manufactory, or 1s. 6d. per gallon carriage paid to any
Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
Glanville, Lissonwood, Co. Wick, Nov. 27, 1872.—
"Mr. Lloyd Lloyd encloses cheque for £3 5s, amount due to
Messrs. Hill & Smith, and he considers the Black Varnish
one of the most useful things he ever possessed."
Apply to **HILL and SMITH**, Brewery Hill Ironworks, near
Dunlany, and 118, Queen Victoria Street, London, E.C., from
whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of
HILL & SMITH that spurious imitations of this Varnish are
being offered by unprincipled dealers at a slight reduction in
price, they would especially draw attention to the fact that every
cask of their Varnish is legibly marked with their name and
address, without which none is genuine.

BELGIAN GLASS for GREENHOUSES, &c.,

Can be obtained in all sizes and qualities, of

BETHAM & SON,

9, LOWER THAMES STREET, LONDON, E.C.

B. & S. have always a large Stock in London of 20-in., by
18-in., 20-in. by 14 in., 20-in. by 16 in., in 16-oz. and 21-oz.

COWAN'S PATENT COMPENSATING SYSTEM OF HEATING,

FOR HORTICULTURAL, PUBLIC, AND
OTHER BUILDINGS.

The most important discovery for saving the cost of
fuel, for steadiness in heating power, and dispensing
with night stoking. One Apparatus will do the work of
several Boilers, and in some cases produce a profit.

Heating by the Ordinary Systems.

Hothouses, Mansions, Churches, and other Buildings
efficiently heated by other approved methods, where the
Patent Apparatus would be adopted.

A large Stock of the most improved forms of Boilers to
select from.

HEAT and LIGHT.

**COWAN'S PATENT COMBINED GAS-MAKING
and HEATING APPARATUS,**

By which Country Mansions and Public Institutions may
be heated and lighted, in most cases free of cost.

HORTICULTURAL BUILDING.

All structures specially adapted to the purposes for
which they are required, built of the best materials and
workmanship, at moderate prices.

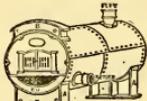

Plans and Estimates free. An Illustrated Pamphlet free.

All work done by the Company is guaranteed.

THE
Cowan Patents Company (Limited),

21, WHITEHALL PLACE, LONDON, S.W.,
and The Vineyard, Garston, near Liverpool.

STEVENS' TRENTHAM GREENHOUSE BOILER.

After long experience, has proved the most SIMPLE,
ECONOMICAL, EFFECTUAL, and LASTING BOILER
extant; recently improved. For Illustrations, with full par-
ticulars, apply to the Sole Makers,

F. & J. SILVESTER,

HOT-WATER ENGINEERS, &c., &c.,

Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the only ones made with the sanction
and under the inspection of the inventor, Mr. Stevens—
all others being base imitations.

JAMES LYNE HANCOCK'S
Improved India-rubber Socket-rings
FOR THE
JOINTS of HOT-WATER PIPES.

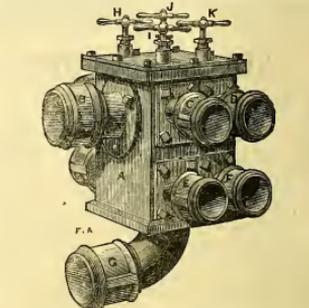

Description of Socket.—
A. The Rubber Ring as rolled into the Socket.
B. The Ring before inserted in the Pipe.
These Rings are made any size to order. All ordinary sizes are
kept in stock.

Illustrated Price List on application.

J. L. HANCOCK,
VULCANISED INDIA-RUBBER WORKS,
266, GOSWELL ROAD, LONDON, E.C.

CRITCHLEY'S PATENT
HEAT REGULATOR,
AN APPARATUS FOR REGULATING THE HEAT
IN HORTICULTURAL BUILDINGS.

A. Iron Box fitted up water-tight. B. Pipe for Supply of
Water from Boiler. C. D. Pipes for Circulating Hot
Water. E. F. Pipes for Return of Water to Iron Box.
G. Pipe for Returning Water to Boiler. H. I. J. K.
Fusion-Rods for Opening and Closing Valves.

The advantages of these Regulators are that houses may be
kept at different degrees of heat, or the circulation of water
and heat entirely stopped in one part and not in others. They
may be fitted with as many valves as required, and are particu-
larly adapted for forcing houses where top and bottom
heat is used. They may be fixed in any part of the apparatus
most suitable for working, without regard to the position of
the Boiler.

The following Testimonial has been received:—
"Berkeley Castle, April 13, 1872.
"Gentlemen,—I am happy to inform you, now that the
late severe winter is past, that the Hot-Water Apparatus
erected by you does its work to my entire satisfaction. As to
the two Heat Regulators, which represent thirty valves, I
have had ample opportunities of practically proving them, and
unhesitatingly admit they are far superior to any other valve
in fact, I think it the greatest improvement that has come out
for horticultural purposes.

"I am, Gentlemen, yours truly,
"Gardener to the Right Hon. Lord Fitzhardinge."
Estimates and Plans furnished for Warming Gentlemen's
Mansions and Public Buildings. Orders attended to in any
part of the kingdom, and guaranteed to answer their intended
purposes. Prospectus and Price Lists post-free.

Messrs. CRITCHLEY & CO.,
Horticultural Engineers and Builders,
GROSVENOR WORKS, CHELTENHAM.

GEORGE'S PATENT CALORIGEN,
FOR
**Warming and Ventilating Small
Conservatories.**

The only Gas Stove
in which the product
of combustion is
entirely
excluded from the
Conservatory.
Made in Wrought Iron,
Height, 42 3/4
inches; in Copper, 45
inches; 8 inches; dia-
meter, 10 inches.
It will be found very
valuable in the Nursery or
Stock Room, Range Build-
ings, Conservatories, &c.
at the Exhibition of 1872
(Department of Scientific
Inventions).

EPPS'S COCOA.—By a thorough knowledge of the nature of the operations of digestion and nutrition, and by careful application of the most improved and scientifically ascertained process, we have prepared a pure and delicious beverage which may save us many heavy doctors' bills. It is by the judicious use of this article of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of little children are brought around us ready to attack where there is a weak point. We may escape many a fatal shill by keeping ourselves well fortified with pure Biscuits, and a properly prepared Cocoa.—GROZ'S Gazette.

Sold only in packets, labelled JAMES EPFS and CO., HOMOEPATHIC CHEMISTS, 172, New Bond Street, London, W.

KNAHAN'S LL WHISKY.—K. N. H. & Co. find that, through the recommendation of the Medical Profession, the demand for their CELEBRATED OLD LL WHISKY for purely medicinal purposes is very great. They submit with pleasure the following analysis by Dr. Hassall:—"I have very carefully and fully analysed samples of the purest Scotch Whisky, and find that the purest are soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality. It is a most beneficial and a most useful food in the purity and quality of this Whisky."

20, Great Titchell Street, Oxford Street, London, W.

DINNREDFORD'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION; and the safest aperient for delicate Constitutions. Sold in all the Dispensaries.—DINNREDFORD and CO., 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS.—The Body's Bulwark.—Nine-tenths of the maladies afflicting modern man, arise from the impurities of the blood. Holloway's Pills correct the first symptoms of indigestion by acting healthily on the gastric juice, and wholesomely exciting the liver. They remove the impurities of the blood, and overcome heat, distension, and pain attending more advanced and neglected stages of this Pills invariably restore the dyspeptic from the great and sudden depression of strength always accompanying stomacal disorders or bilious derangement. They are a most valuable and successful remedy in rectifying disorders of the digestive apparatus; these Pills prove themselves to be a most valuable and successful remedy in all cases of biliousness, health, and life.

Cure of Consumption, Asthma, Coughs, &c. by DR. LOCOCK'S PULMONIC WAFERS.—Dr. Locock's Pulmonic Wafers.—"I have seen their beneficial effect for years; in cases of consumption, asthma, coughs, &c., their effects are most wonderful."—See testimonials, &c., in Nos. 1364, &c., 9th, 10th, and 11th, per box.

GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

Or NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

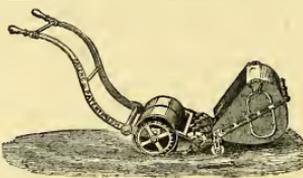

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

1st. Simplicity of Construction—every part being free of excess. 2d. They are worked with far greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either long or short Grass, wet or dry.

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

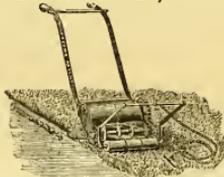

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

A Stock of 500 Mowers, including all sizes, is kept at our London establishment, from which Purchasers can make their selection and have prompt delivery.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

**CHARLES LEE AND SON (Successors to
 Messrs. John & Charles Lee)** of 1, Leam-
 ington, Hammersmith, W., beg to announce that, in con-
 sequence of the Retirement of Mr. John Lee from the Business, they
 have **TAKEN OVER** the **TRADE** of the
SEED TRADE so successfully carried on for many years by
 the late firm, and they trust the same liberal patronage so long
 given to Messrs. John & Charles Lee will be continued to the
 New Firm.

Charles Lee & Son pledge themselves to devote all their
 energy to raising First-class Stock in every department, which
 the large resources at their command will enable them to
 supply with considerable advantage to the Public both as
 regards quality and price. With a view to a more extensive
 production of Stock and Greenhouse Plants of the best quality
 they intend to almost entirely rebuild their extensive ranges of
 Glass on a new site, a portion of the old Nursery being taken
 up for building purposes. All orders
CHARLES LEE AND SON, Royal Vineyard Nursery,
 1, Leamington, W., Hammersmith, W., general importers of the Nursery
 and Seed Trade will be carried on; or to
 Mr. DIXON, Feltham Nursery; Mr. CANNON, Ealing
 Nursery; Mr. WEBB, Acton, W.; Mr. HANSLER,
 Wood Lane, Isleworth.

Presented by (post) on application,
 NEW CATALOGUE for 1877.

MESSRS. CLIBRAN AND SON
 will have great pleasure in sending their **PRICED
 DESCRIPTIVE LIST** for this Spring, free by post on
 application. Their stock of Flower-Furnishings, Bedding and Soft-
 wooded Plants generally, are unsurpassed in quantity, and
 in extent or quality, all the newest and best varieties being
 constantly added to the various classes, and the greatest care is
 taken to keep the varieties true to the original number and
 advantage to Purchasers is that none of the plants offered are
 taken directly from a warm propagating house and sent off, but
 are all carefully hardened and most of them potted off singly,
 and are thereby fitted to travel either by rail or post without
 the slightest injury. A great proportion are autumn-stocked
 plants, and many of the undermentioned can be sent by post—

CHARLES NOBLE, BAGSHOT.

JEFFERIES' LITTLE QUEEN COS LETTUCE,

Per Packet, 1s. 6d.,

Is the Earliest, Best Flavoured and Best Coloured Lettuce in cultivation.

MR. EARLEY, *The Gardens, Valentines*, says:—"Your Little Queen Lettuce proved a good selection, although the weather was very adverse to the trial."

MR. MEADES, *Gr. to the Rt. Hon. Viscount Barington, Becken Park*, says:—"Your Little Queen Lettuce is a capital variety, as hard as a stone, and has kept well from running to seed this dry summer."

MR. FARR, *Gr. to Sir R. Knightley, Bart., Fawley Park*, says:—"Your little Lettuce has proved a very useful one, although the season has been very trying for that class of stuff; its early heading and crisp sweet flavour are sufficient to recommend it to all who are desirous of a small but good Lettuce."

A Packet of this excellent Lettuce will be included in all our Collections of Vegetable Seeds.

JEFFERIES' HALF GUINEA COLLECTION OF VEGETABLE SEEDS,
JEFFERIES' GUINEA COLLECTION OF VEGETABLE SEEDS,
JEFFERIES' TWO GUINEA COLLECTION OF VEGETABLE SEEDS,
JEFFERIES' THREE GUINEA COLLECTION OF VEGETABLE SEEDS,

Are the best obtainable. For particulars, obtain our "Illustrated Garden Guide."

JNO. JEFFERIES & SONS,
CIRENCESTER.

NEW FUCHSIA, EARL OF BEAONSFIELD.

Vigorous growing, free flowering, beautiful habit, quite distinct, and described by Dr. Masters as one of the best hybrid varieties of Fuchsia. The blooms, 3 inches in length, are of great substance. The tube and sepals are of a light rosy carmine, corolla deep carmine.

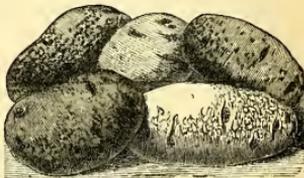

This is a valuable decorative plant. It was awarded First-class Certificates at the Crystal Palace and Royal Botanic Society, Regent's Park, and is figured in the *Floral Magazine* for February.

Orders executed after the 15th March. Price, 6s.

JOHN LAING & CO.,
STANSTEAD PARK, FOREST HILL, LONDON, S.E.

DANIELS' SEED POTATOS.

Our Stocks of POTATOS are warranted True to Name and Free from Disease, all being carefully selected at the time of growth, and afterwards passed through the hands at least three or four times before being sent out, and all inferior, misshapen and forked tubers carefully discarded.

To improve the culture and encourage the diffusion of really good varieties, we have determined to offer at the lowest possible rates COLLECTIONS of POTATOS for EXHIBITION PURPOSES, and trust our efforts in this direction will meet a want so much felt by our Customers and the gardening community generally. The selection in all cases must be left to us; it will be very carefully made, and only those of known excellence and superior qualities included.

- WALLFLOWER**, double German, mixed colours, 6d. and 1s.

NOVELTIES IN FLOWER SEEDS.

- ALONSOA ALBIFLORA**.—New distinct species from Mexico, introduced by Mr. Roze!, the distinguished collector, flowering freely from 12 inches up to 1 feet in height, producing long terminal spikes of pure white flowers with yellow eye. It is recommended for pot-culture, as in the conservatory it will produce a succession of its flowers throughout the autumn and winter when most acceptable for bouquets and table-decoration.
 - VALLEY**, as used in our bouquets with so charming an effect, has arranged so as to outstrip the other flowers by 2 or 3 inches.
 - BROWALLIA ROZEI**, 1s. **COBEA HIRSUTA**, 2s. 6d.
 - HELEBRANDIA**, 1s. **AGERATUM SNOW-FLAKE**, 1s.
 - MIMULUS BRILLANTISSIMA**, scarlet self, 1s.
 - MYZANTHUS ORNATA**, fine plant (see description in Catalogue), 1s.
 - TORRENTIA FOURNIERI**, new annual form of this beautiful combination of coloring, 1s.
 - ERYNGIUM LEAVENWORTHII**, ornamental plant, 1s.
 - FRYTRIUM AUREUM LACINIATUM**, fringed-leaved Golden Feather, 1s.
 - ASTER**, Firelight, most beautiful and brilliant new quilled variety, 1s.
 - SAXIFRAGA NEPALENSIS**, fine ornamental species for pot culture, 1s.
 - PAFAVER UMBROSA**, showy flowers, 1s.
 - LAIETIS PYNOSACHIA**, 1s.
 - CANARY BELLS**, double filled flowers, beautiful variety of colours, 1s.
 - CUPHEA ROZEI**, 1s. **BAMBUA GRACILIS**, 1s.
- PINE-APPLE NURSERY, MAIDA VALE, LONDON, W.**
- GODETIA, LADY ALBEMARLE.**
First-class Certificate Royal Horticultural Society, August 2, 1874.
- A magnificent new variety, growing 1 foot high. Flowers 2½ to 3 inches across, and of the most intense glowing carmine-crimson colour, which, being produced in wonderful profusion give the plants the most charming appearance. This is the finest annual ever sent out, and being extremely hardy and easy of cultivation, should be in every garden.
- Seed, with full cultural directions, per packet, 1s. 6d. post-free.
- "We have scarcely any plant of such a lovely shade of colour."—*The Villa Gardener*, September, 1876.
- "An extremely beautiful variety bearing flowers quite 4 inches in diameter, of a glowing crimson colour."—*Gardener's Magazine*, April 5, 1876.
- "A remarkable variety, far superior to any other of the family."—*Journal of Horticulture*, Aug. 3, 1876.
- May be had of all Seedsmen, and Wholesale and Retail of
- DANIELS BROS.,**
THE ROYAL NORFOLK SEED ESTABLISHMENT, Norwich.

NEW AMERICAN POTATOS.

No. 1. CENTENNIAL.—A seedling of the well-known Broun's Beauty crossed with the White Pearl Blue; haulm stout, vigorous, of medium height; tubers medium and of uniform size; shape round, somewhat flattened, symmetrical and handsome; colour deep red; flesh fine grain, white and mealy; very productive, and of fine quality.

No. 2. JERONVILLE SUPERIOR.—Of the same parentage as the preceding. Its tubers are medium to large, kidney-shaped, of a peculiar dark copper colour, very uniform and handsome in appearance; skin fine and smooth; eyes few and small; the haulm is strong and healthy; the tubers are thickly clustered around the stalks. It is a second early variety, keeps well, and is enormously productive, 67½ lb. having been grown from 1 lb. of seed with ordinary farm culture. A Certificate of Merit was awarded this variety at the International Potato Show.

No. 3. IMPROVED PEARL BLUE.—A cross between the well-known Jersey Pearl Blue and the Excelsior. It partakes of some of the characteristics of each of its parents, having the haulm of the Excelsior, while its tubers resemble the Pearl Blue, though better formed; while in quality it equals that old standard sort, it is far more productive and earlier.

One pound of either of the above varieties will be mailed post-paid to any address in Europe upon receipt of 4s., or its equivalent in English currency.

Remittances can be made in Post-office Stamps or Postal Money Order on New York or London, payable to E. K. Bliss and Son.

The above varieties can also be obtained of Messrs. HOOPER AND CO., Covent Garden, W.C.; of CARTER R. DUNNETT, and BEALE, London, W.C.; CHRISTMAS QUINCY, Peterborough.

Our illustrated and Descriptive POTATO CATALOGUE, 40 pages, will be mailed free and post-paid to all applicants.

Address, E. K. BLISS AND SON, Seed Merchants, 34, Barclay Street, New York, U.S.A.

Splendid New Melon, 1877. CHARLES LEE and SON (Successors to Messrs J. & C. Lee) have the pleasure to announce that they have purchased the entire Stock of MANN'S HYBRID CANTON CUSH MELON, which they now have on for the first time. It has already acquired a high reputation in London and the provinces for its many excellent qualities, among which may be mentioned its remarkably high and exceedingly fine flavor all season of the year - perfection of shape and size for dessert - a thin rind and melting flesh, with an overflow of perfumed juices. It is also a heavy cropper, and forces well. Dr. Hooc has spoken of this excellent Melon in the highest terms, and after tasting it pronounced it a fruit of the highest merit. Mr. CULWELL, of Thorpe Perrow, fellow judge with Mr. Fowler, of Harewood House, at the Leeds Horticultural Show, where they awarded a First-class Certificate to "Mann's and Crossed-Melon," speaks of it as "the most wonderfully fine Melon, especially at that early season - the early part of June." Mr. INGRAM, of Belvoir Castle, writes, in the third week of October, "that in spite of the disadvantages of a long term of gloom of weather, and a season of the year," Mann's Green-dish Melon "was sweet, tender in flesh, very juicy, and distinct in character." Messrs. Charles Lee & Son are now prepared to offer this very useful and delicious new Melon in sealed packets, at 3s. 6d. per packet. CHARLES LEE and SON, Hammesmith, W.

FLOWER and VEGETABLE SEEDS FOR 1877.

THE BEST MARKET POTATO, SUTTON'S MAGNUM BONUM.

"In our opinion the best market Potato in the world, at present considered, is Sutton's 'Magnum Bonum.' - From the 'Pictorial World,' Feb. 24, 1877.

THE HEAVIEST CROPPING WHITE KIDNEY POTATO, SUTTON'S MAGNUM BONUM.

"Such is the capability of this sort that a set weighing six ounces, in a good soil, with the aid of a good season, will up a heap of handsome tubers weighing as much as 22 lb. We speak from knowledge, and will add that with good cultivation this sort may be expected to produce stools averaging 5 lb. to 7 lb. at the very least, and therefore it must be a profitable Potato." - S. H., in the 'Pictorial World,' Feb. 24, 1877.

THE BEST FLOURED WHITE KIDNEY POTATO, SUTTON'S MAGNUM BONUM.

"It is a good looking market root, and cooks well, the flesh being white, mealy, and of excellent flavour. None would wish for a better Potato." - S. H., in the 'Pictorial World,' Feb. 24, 1877.

Sutton's Magnum Bonum Potato.

Introduced by Messrs. Sutton in 1876, previous to which there was no Potato known by that name.

"Sutton's Magnum Bonum Potato was selected by Mr. Martin Sutton from a set of seedlings raised by Mr. Clarke, of Cranecroft, and proving of excellent quality and remarkably productive, was secured by Messrs. Sutton for trade purposes." - From the 'Gardener's Chronicle,' Feb. 24, 1877.

Sutton's Magnum Bonum Potato.

Price, 5s. per peck. IN CONSEQUENCE OF THE GREAT DEMAND No Customer can be supplied with a large quantity than One Peck.

SPECIALITIES - CALIFLOR, Veitch's Autumn Giant, 1s. 6d. per packet. LETTUCE, Alexandria Co. true, 5s. per packet. ONION, Gantrell's extra, true, 1s. per packet. BROCCOLI, Lemonington, finest late, 1s. 6d. per packet. CABBAGE, Alpha, fine, large, and early, 1s. per packet. CATALOGUE of New and Choice Seeds on application. R. B. M'COMBIE, Grower of Choice Seeds, &c., Christchurch, Hants.

Bedding Potatoes.

HENDER and SONS beg to recommend their strain as being particularly adapted for bedding purposes, not being the small, thin, Convolvulus-like variety, but large, thick, and well flowered, very short-jointed and bushy naturally, and exceedingly thick-flowering. This has been exclusively our own distinct strain for the past twenty-four years.

The following are among those who have borne testimony to their superiority - Mr. W. Waterston, Gardener to Her Majesty the Queen, Balmoral Castle; Rev. A. H. Criviny, Merchant, Trevelyan & Co. Row, Fins. Trepanier, Hotelier; N. Hadam, Esq., St. Just; Mr. C. Brown, Kensington Park; Mrs. Forester, Northbury; Mr. J. Snow, Gardener to Earl of Maresfield, Brighton; Mr. J. Burtley, Hareford Road Nursery, Baywater; Mr. J. Berry, Gardener to Lord Roberts, at Leamington; Messrs. Lupton, Nurserymen, Salisbury; Mr. G. Jarrett, Nursery Newbery; Mr. J. Gill, Nursery, Bradford; Messrs. Fuller & Sons, Nursery, Newton Abbot; Messrs. Bryant & Hoskins, Nurserymen, Bristol; Mr. J. Rolland, Gardener to W. Kniford, Esq., Plymouth; the Gleaner, Magazine for the Gardeners' Chronicle, The Gardeners' Journal of Horticulture, and several reports on its local papers. Seed, 2s. per packet (100 seeds). None genuine without our Seal.

We will supply a dozen plants including the best varieties we ever raised, for 12s. post-free, in May.

HENDER and SONS, Bedford Nursery, Plymouth.

AVENUE TREES.

- PLANKS, 12 to 14 feet. CHESTNUTS, Horse, 11 to 12 feet. CHESTNUTS, Scarlet, 9 to 10 feet. LIMES, 12 to 14 feet. POPLARS, Canadian, 12 to 14 feet. CHESTNUTS, Spanish, 9 to 10 feet. POPLARS, Lombardy, 15 to 20 feet.

All with clean cut stems.

CHARLES LEE & SON, Royal Vineyard Nursery and Seed Establishment, HAMMESMITH, W.

WILLS' NEW HYBRID DRACÆNAS.

RAISED BY F. BAUSÉ.

The following Six splendid Novelties will be ready for sending out on and after April 1, 1877.

For descriptions see various articles in the *Gardeners' Chronicle*, *Journal of Horticulture*, *The Gardeners' Magazine*, &c.

D. ELIZABETHÆ (Cooperii, × regina).

A very handsome variety, and remarkably distinct, not only on account of its variegation, but also of the tendency of its leaves to curve under volutely. It is of dense habit, with broad, strongly recurved leaves, measuring 5 inches across, of a dark green colour, with a dark midrib, and a narrow edge of bright rosy crimson on the older leaves, and with a broad-margined variegation of deep pink and creamy white on the younger leaves, the leaf-stalks being conspicuously coloured of a fine rosy tint. It is a wonderful free-growing and very early-colouring variety of great merit. *Fine established plants, price 31s. 6d. each.*

Large specimen plants in full character. Prices on application.

D. GLADSTONEI (excelsa, × ferrea).

A variety of bold habit, with densely set drooping or recurved oblong leaves 4 inches broad, of a very dark bronze colour, the younger leaves breaking into a deep crimson suffused with salmony rose, the margins of the petioles being also coloured. It will form an invaluable plant for decorative purposes, being of a very hardy constitution, of very free and erect growth, and calculated to form a tall specimen.

Fine established plants, price 31s. 6d. each.

Large specimen plants in full character. Prices on application.

D. REBECCÆ (Cooperii, × regina).

A variety of dense stocky habit, having the leaves drooping, oblong, $3\frac{1}{2}$ inches broad, the lower ones variously spotted with purple-rose, the upper ones freely marbled with magenta-pink and creamy white, changing to yellowish green, and broadly edged with dark rosy purple, in some leaves almost wholly coloured, the centre of the variegation showing a broadish varied band of green. The rosy coloration of the leaf-stalk adds much to the effect of this plant, being an exceedingly pretty and early-colouring variety.

Fine established plants, price, 31s. 6d. each.

Large specimen plants in full character. Prices on application.

Three Medals were awarded to the above Novelties, including the Grand State Medal, at the Brussels International Exhibition, on April 30, 1876.

The First Prize for the three best Dracænas in cultivation was also awarded to Mr. Wills at the same Exhibition.

THE USUAL DISCOUNT TO THE TRADE.

THE ANERLEY DRACÆNAS.

Extract from the "Gardeners' Chronicle," May 27, 1876.

"Some time since (*Gardeners' Chronicle*, 1875, iv., 615) we gave an account of a marvellously fine collection of seedling Dracænas, which had been raised by Mr. Bausé, at Mr. Wills' Nursery, at Anerley. That account referred to a selection of a considerable number of the finest of the varieties which had at that time broken into colour. As was to be expected, however, amongst the thousands of judiciously crossed seedlings Mr. Bausé had obtained, the first selection by no means exhausted all the gems that were worth preserving, and a subsequent visit has enabled us to confirm Mr. Wills' opinion that a further selection from amongst Mr. Bausé's fondlings should be made."

SPECIAL ADVANTAGES
OF
Rendle's Patent System of Glazing.

This System is now being universally adopted by Her Majesty's Government, several of the leading Railway Companies, some of the principal Corporations, including Metropolitan Board of Works, Commissioners of Sewers, and the New Winter Garden Companies throughout the country.

There will be an enormous saving in the Maintenance and Repairs of Roofs on this System—say from 80 to 90 per Cent.—and there is no reason why a roof should not be as perfect in 20 years as the first week, because all the perishable materials, such as wood, iron, or paint, are completely covered by the glass from the destructive influences of the weather.

Another grand recommendation is, that there is no breakage from contraction or expansion either from heat or cold, as the glass has full play in every direction. Tens of thousands of squares are broken from this cause every year. Not is there any breakage from vibration of large Railway Roofs in heavy gales of wind, or from the passing of express or fast trains. Indeed, it is well known that a puttyed roof is never perfect in a station where express trains run through.

In adopting this System, all the overbalancing expenses of re-jointing, re-painting or re-glazing are completely done away with, and it is now in use throughout several of the Great Railway Companies, such an enormous saving would be effected that it would have a considerable influence in supplying an addition to the yearly dividends.

Summary of Special Advantages.

- 1.—Saving of from 80 to 90 per cent. in maintenance and repairs.
- 2.—No breakage from contraction or expansion, from heat and frost.
- 3.—No breakage from vibration caused by heavy winds or passing trains.
- 4.—Squares of glass can be instantly replaced.
- 5.—The construction is very strong and durable.
- 6.—The glass can be put in in one-fourth the time of the old plan.

For all the other advantages, see illustrated CATALOGUES and BOOKS of DESIGN, which can be obtained from the Inventor and Patentee—

SATURDAY, MARCH 10, 1877.

LLEWELYN'S DINGLE.

IT is the fate of forests that they must diminish or disappear before the advance of progressive communities. France, which has always led the van of civilisation, was one of the first countries to invent contrivances for economising the consumption of fuel. Germany, a land once covered by dense and trackless forests, was constrained years since to adopt the uncomfortable expedient of the close stove. New England has recognised her comparatively scanty sticks in the same manner for many years, and the classic shout of menaced patriots—*pro aris et focis* ("for hearths and altars")—must now be rendered in all those countries "Fight for your stoves!" Our own case would be similar even in England but for coal.

Many of the attacks upon the forests of these islands took place under Acts of Parliament, for the purpose of dislodging outlaws and wolves from their favourite haunts. In Ireland, Henry II. swept down the forests in pursuit of his scheme of conquest. Edward I. thinned those of Wales with the same object, at the period of his wars with Llewelyn. Yet it happens that the very grove called locally "a dingle," in which the last native Prince of Wales lost his life, still remains. The scene of this tragic event is on the banks of the Wye, near the ancient town of Builth, and not far from the edge of Radnor Forest. Builth was a favourite residence of Llewelyn's, and the old town stood immediately beneath the walls of his castle, as the present town does beneath the mound on which its relics may still be distinguished, though hardly a stone remains of the once formidable stronghold. The position was important, being immediately upon the line of communication between North and South Wales. Builth Bridge spanned the Wye opposite the castle gates, as a more recent bridge does the same part of the river at the present time. A broken ridge of hills, following the long valley, approaches the winding stream on either side, and Oaks and Oak scrub cover the highest level that vegetation of that kind can obtain. The scenery of the locality is smoother than that of North Wales, and wilder and more picturesque than the pastoral yet hilly districts of South Wales, where the land is more valuable and trees are therefore less abundant.

The original stamp of Nature upon the country around Builth was too bold to be easily obliterated, and it probably presents much the same aspect as in the days of Llewelyn. The river makes the same music as of old, and no polluting manufacture at present destroys the salmon. The people have perhaps changed more than their surroundings, which cannot have altered very much in their leading features since the thirteenth century. At the time of our visit to Builth the Brecon volunteers, marching through the street, and their band playing Rule Britannia, seemed a decided incongruity, and was certainly a decided change since the thirteenth century. As to other alterations there is now a pump room—modern Builth being a watering place—and in the hotel was an old gentleman connected with minerals—coal or copper—in Glamorganshire. He had come out for a holiday, and was napping in an

to see how freely everything that is planted grows in the sheltered bed. A Wellingtonia that was less than 6 feet in 1871 is now 23 feet, and Decodars that were then 24 feet are now 38 feet, expanding laterally in like proportion.

In the stove where some charming Ferns; the lovely Adiantum Farleyense expands its ample fronds in great perfection, and, favoured by the warmth and moisture, other kinds multiply in all directions. A pretty variety has established itself among the miniature rocks at the back of the tank, in which a jet often throws up a fine spray supplied from a spring that rises half-way up the cliff behind us. This Fern partakes of the character of *A. concinnum*, *A. concinnum latum*, and *A. Farleyense*, but is identical with neither; and I am inclined to think will prove an interesting subject of study, and may throw some light upon the variations in Ferns. The *Echaris amethystina* has been lovely, so has a plant of the elegant *Thyracanthus*, and now we have all the *Cadatum* tribe rushing out with beauty from their short but necessary rest.

The *Tecoma* variety, which gave great promise of flowering in the autumn, has disappointed us, probably from the want of sun, but it is so healthy and vigorous that it may make another effort.

In the greenhouse the *Brugmansia*, the scarlet *Salvia*, the *Callas* and *Habrothamnus*, with an abundance of *Primulas*, *Hyacinths*, and other bulbs, kept us gay in the mid-winter; and now we have the *Cinerarias*, *Deutzias*, *Spiræas*, *Libonias floribunda*, *Azaleas* and *Camellias*, to cheer and carry us on till April brings the *Pelargoniums* and all the other favourites of the year.

In the vinery we began to fire up on February 26, and planted the early Potatoes in the frame on the same day.

We have not yet seen any salmon passing over the river, but it has been so full of water that they might easily escape notice. We did not suffer any inconvenience from the floods which were so disastrous above and below us, but the sight of the rapid torrent at these times is very fine—

Viduus flavus Tiberin, retorts
Litore Etrusca violenter undis
lit.

From observations made from time to time, I have been led to estimate that upwards of 1,250,000 cubic feet of water per minute flowed past this garden—a stupendous volume, which one can easily understand would flood all the low-lying ground before it reached the sea.

The pretty-water hens now visit us daily; they come from the pool in the river upon our lawn, in search of food, strolling about close to the windows, with their coquetish rick of tail. I see them sometimes perched in a Laurel, but they hardly seem at home in a tree. The great green woodpecker are now beginning to startle us with their loud wild laughing cry as they fly across the garden, and the thrushes make the trees echo with their songs; but, all these signs notwithstanding, we must remember the words of the poet—

"Mindful of disaster past,
And shivering at the northern blast,
The sleety storm returning still,
The morning hour and evening chill,
Reluctant comes the timid spring."

THE GENUS AGAVE.

(Continued from p. 171.)

SERIES I.—CORIACEO-CARNOSE.—Texture of the leaf rigid, not at all fleshy or yielding to the touch when mature. End spine large, hard, and pungent.

Group I. Filifera.—Edge of the leaf splitting out into distinct threads.

1. *A. (Littoa) filifera*, Salmдық; Jacobi, Mon., pp. 35 and 193; Lemaire, Ill. Hort. vii., t. 243; fig. 49.—Aculescent; leaves 60—90 in a dense rosette, stiff, striate, ensiform, 6—9 inches long, 1 inch broad at the middle, narrowed gradually to a grey pungent tip, flat on the face, pale green, not at all glaucous, the continuous grey edge splitting off centro to irregular spreading grey wiry threads, the outer ½ inch, the base ½ inch thick, the back rounded, marked with conspicuous grey vertical lines where the edge of the other leaves have pressed against it; outer leaves of the rosette not at all recurved, but spreading stiffer. Scape 3—4 feet long, its bract-leaves subulate, the lower ones ascending, the upper squarrose. Flowers in a dense spike 2—3 feet long; bracts purplish-brown, linear, about as long

as the unexpanded flowers; pedicels very short and stout. Perianth greenish, about 2 inches long; ovary oblong, ½—¾ inch long; tube funnel-shaped, about as long as the ovary, suddenly dilated in the upper half; segments brownish, spreading, obtuse, half as long as the tube. Filaments 1½ inch long, inserted at the base of the segments; anthers yellowish-red, ligulate, ¾ inch long. Style reaching to the top of the anthers.

Var. *filamentosa*—*A. filamentosa*, Salmдық; Jacobi, Mon., pp. 36 and 199; Baker, in Saund. Res. Bot., t. 164; Gard. Chron. 1870, p. 8.—Leaves larger, attaining a length of 18—24 inches, and a breadth of 1½—1½ inch. Scape, including the spike, attaining a length of 10—12 feet.

A native of Mexico; a plant which has been long well known to all collectors. The two varieties named by Salmдық, and kept up by Jacobi as species, differ from one another in size only, and run into one another most gradually. An excellent coloured figure of the large one, from a specimen that flourished with Mr. Saunders, will be found in the *Refigium*, as just quoted. The plant flowered at Kew in the summer of 1875. There are three forms represented in Mr. Saunders' set of photographs, one very dwarf and stiff, with leaves under half a foot long.

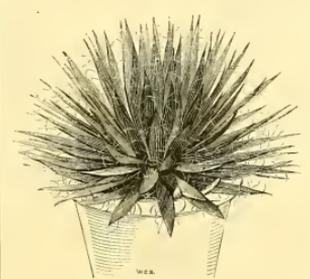

FIG. 40.—A. FILIFERA.

2. *A. (Littoa) schidigera*, Lemaire, Ill. Hort. vol. ix., t. 330; Jacobi, Mon., pp. 36 and 200; Bot. Mag., t. 594.—Aculescent; leaves 50—80, in a dense rosette, stiff, ensiform, 12—15 inches long, ¾—1 inch broad at the middle, similar in colour and texture to those of *filifera*, but the grey margin broader, and splitting off into flat shavings half a line broad, not mere threads. Scape about 3 feet long. Spine dense, as long as the scape. Perianth and stamens just like those of *filifera*.

A native of Mexico, introduced by Verschaffelt in 1801. It cannot be considered as more than a variety of *filifera* in a broad sense, the flowers being just the same, and the only appreciable difference between the two being in the character of the threads that split off from the edge of the leaf. There is a good coloured figure in the *Botanical Magazine*, as just cited. It is to be seen in all the best English collections. The variety *Ortiziana*, which I have seen in Mr. Peacock's and at Kew, is a dwarf form of *schidigera*, with a pale central band to the leaf. The type is well represented in Mr. Saunders' set of photographs.

3. *A. (Littoa) Schottii*, Engelm., Notes, p. 17; *A. geminiflora* (L.) var. *Sorensii*, Torrey, in Bot. Mex. Bound., p. 211.—Aculescent; leaves linear, 6—12 inches long, 3—4 lines broad, rigid, flat or concave on the face, convex on the back, ending in a terete pungent brown tip ½ inch long, the margin splitting off into copious fine whitish fibrous threads. Scape 5—6 feet long. Flowers spicate; primary and secondary pedicels each about a line long. Perianth ½ inch long; ovary under ½ inch long; tube funnel-shaped, gradually widening from the bottom to the top, ½ inch long; segments linear-oblong, cretato-petiole, ½ inch long. Filaments scarcely protruding beyond the segments, inserted a little below the throat of the tube, 8 lines long; anthers ½ inch long. Style reaching to the top of the stamens.

A native of Southern Arizona, where it was discovered by the late Dr. Arthur Schott in 1855. It is known only from his dried specimens, described by Dr. Engelm., from whose notes mine are entirely taken.

4. *A. (Littoa) pariflora*, Torrey, in Bot. Mex. Bound., p. 211; Engelm., Notes, p. 16.—Aculescent; leaves linear-lanceolate, from a broad deltoid base, 2½—3 inches long, 4 lines broad above the base, ending in a pungent finally grey spine ¼ inch long, the edge below the middle furnished with minute brown cartilaginous teeth, above the middle splitting off into a few short stout white threads. Scape 4—5 feet long. Flowers spicate, not more than ½ inch long; ovary oblong, over ½ inch long; tube campanulate, a little longer than the ovary; segments oblong, suberect, half as long as the tube. Filaments 4 lines long, inserted low down in the tube, like the style, scarcely protruding beyond the tip of the segments. Capsule amblobose, shortly cuspidate, 4—5 lines long.

Like the last, a native of the Sierras of Southern Arizona, and discovered in the exploration of the Mexican boundary by the late Dr. Schott. It has not been yet brought into cultivation, and is a most curious and distinct little plant, forming a connecting link between the *Filifera* and *Striata*.

A fifth species of this section, as yet known very imperfectly, is *A. angustissima*, Engelm., Notes, p. 18, gathered by the late Dr. Schott and Geotille in Western Mexico, which is said to have narrow linear leaves 2—3 feet long, 2½—3 lines broad, convex on the back, filamentose on the edges, ending in a brown spine under ½ inch long, and a scape 5—6 feet long. *J. G. Baker.*

MELONS FROM CENTRAL ASIA.

Since commencing the *Gardener's Chronicle* the result of M. Naudin's trial of the Melon seeds from Turkistan, p. 303, I have received through the kindness of Dr. Hogg the accompanying report on the results obtained from those grown at Chiswick. *W. T. Thistleton Dyer.*

Report on Varieties of Sweet Melons from Yarkand, received from Dr. Hooker, May 16, 1876.—

The seeds were sown in the end of May, which proved somewhat late. The plants grew well, but only five of the varieties fruited satisfactorily. Several varieties never produced any female flowers. Of the five which fruited, the following notes were taken:—
1. *Yarkand*; 4. *Labidi*; and 3. *Nashakar*, were identical. Fruits of fair average size, roundish ovate, even surface; skin pale green, changing to pale greenish yellow, covered with a fine down; flesh pale orange, very tender, juicy and sweetly flavoured; with a very thin rind. Distinct from any known variety; very promising.
5. *Chikla*.—Fruit ovate in form, but otherwise very similar to No. 1.
6. *Chiguldah*.—Fruits of medium size, roundish ovate, deeply ribbed; skin pale green, changing as the fruit ripens to a splashed greenish yellow, and covered with a fine down; flesh pale scarlet; tender, juicy, and sweetly flavoured. A sweet melon.

It may be noted that, for reddish-fleshed Melons, the flesh was far more tender than is usually found in those of that class.

ASPECTS FOR PLANT HOUSES.

If "Aqua Calida" had taken a little more notice of the altitude of the sun at mid-day during the months of December and January, he would not have spoken of his (the sun's) rays striking perpendicularly or even comparatively perpendicularly—whatever that may mean—on any side of a house, at that period of the year, but he would have seen rays of light thrown from a low elevation casting long shadows where obstructed and reaching far into an interior where no obstruction exists; and even now (March 5th) shall be thrown by the ridge of a house standing ends north and south is rather longer than the height of the ridge, and every bar and rafter throws a corresponding shadow, so that the light is rather diffused than direct till afternoon, when the sun works round to the west.

It follows, then, that the sun shining full on the south side of a house sends his rays as far through the house as a shadow would fall in case an object intervened; hence it arises that the north side of a span-roofed house, with a face to the south, receives the full force of what little sunshine there is during the dead of winter, and is brighter even than the south side, which receives the shadow of the framework or front wall, as the case may be, and the elevation of temperature consequent on the sunshine melts the ice on the north side before even the west side of a house standing the other way feels any benefit, and the east face is rarely touched by the sun in the depth of winter.

It might perhaps have struck "Aqua Calida," if he

had given it a thought, that to modify the heat from the sun on a summer's morning so early as 5 o'clock air must be "left on" over night, which is not always desirable, for instance, when the wind is either rough or cold, or some one must be up to pay attention to the matter before the early hour named—not always an agreeable alternative.

Then, again, with respect to closing the houses on a summer's evening: without either directly or by implication finding fault with the course of the sun, I most undoubtedly prefer the soft diffused light of a house shaded by its own framework to the gloom of a house shaded by a drawn blind.

"Aqua Calida's" remark about a tall bank of plants in the centre of a house obstructing light applies to both aspects, but much more forcibly to the one where the blinds are much used, in that case the plants on both sides lose the reflected light they receive when not artificially shaded.

I wrote the original paper with a view to encourage amateurs who had not a site in the fashionable position. The one I recommend is quite as good, at any rate, as that generally adopted; as I said before, it says a great deal better. Its advantages are a greater amount of sunlight in the winter, when it is most needed, and a less amount in summer, when we take pains to keep it out.

I might perhaps tell "Aqua Calida" I should greatly prefer a lean-to facing the south for mere winter work to a span in his fancy position, but it was more for houses of general utility I was writing.

I am no mouthpiece for hot-house builders, few of whom know anything of practical gardening, and build the structures ordered upon any site selected by the proprietor. I do not think any one of them (the builders) would refuse an order on account of the unsuitability of a position assigned to them.

The rest of "Aqua Calida's" remarks call for no answer from me; the mere business details may be safely left to the persons most concerned; still I do not see if the man who has to pay for the work desires the woodwork unpainted any reason why he should not have it. I fancy the conclusion was an effort of wit, which some people may understand, but I candidly confess I do not. *J. Bester.*

LANTANAS FOR BEDDING.

As a most useful and durable bedding plant the Lantana deserves more attention than it actually receives at the hands of gardeners. It is a more desirable plant than the Verbena in this respect, the varieties have been multiplied so much of late that they are now very varied in point of colour; they flower for a long time—it is computed by some for eight months in the year—and they are much less liable to those attacks of insects, &c., that will frequently convert a bed of Verbenas into a most unamiable floral expression.

Some of the most charming beds seen in the pretty circular flower garden at Lockinge Park, Wantage, during the past summer were those formed of Lantanas, and it did appear to be a happy accident which had resulted in these beds being planted with varieties of different colours instead of one variety only, as was originally intended. Mr. B. S. Williams has expressed the opinion that the Lantana has been much neglected, owing to its having strongly scented foliage, "the peculiar tone of which is not grateful to most people," but this peculiar scent is not very apparent unless the plants are handled.

There are two uses to which the Lantana can be put. To one, viz., for bedding, reference has already been made; the other is that of being grown in pots for conservatory decoration and exhibition purposes; and especially by those who have but scant accommodation for growing choice plants. Sometimes at country shows admirably grown specimens of Lantanas can be met with, and the plants always appear to be well-bred and flowered and singularly clean. "Lantanas," says Mr. B. S. Williams, "are rapid growers, and will soon form large specimens; and, wherever space can be given, a few should be grown for the sake of the bright coloured and abundant summer autumn flowers."

From the time of species have been introduced from day to day from South America and the West Indies; but the main of these now cultivated are improved garden hybrids, and in point of variation in colour they range from pure white to rich orange crimson and purple. Plants are easily raised from cuttings struck in a brisk moist bed in spring; and those so obtained, after being sufficiently hardened off, make most useful subjects for bedding.

The most effective beds are formed by pegging down the young shoots till the surface of the bed is covered and then permitting them to flower, which they do almost if not quite as freely as the Verbena; and as a bed of mixed Verbenas is generally much more attractive than one wholly composed of one variety, so a bed of mixed Lantanas is to be preferred to beds wholly of one colour or variety.

A warm well-drained spot appears to suit the Lantana best when bedded out, and it is perhaps owing to this that beds of this plant on raised terraces are generally so effective. A good light loam, some peat and leaf-mould make an excellent compost for the Lantana.

The plants grown in pots for house decoration require to be kept partially dry during the winter, and be cut-in in the spring time and repotted. The soil recommended by Mr. B. S. Williams is loam, peat, and sand in equal parts. Plenty of pot-room is requisite, as the Lantana puts forth a great number of roots.

There are now a large number of varieties: some of the best are *Angusta* Wilhelm, white and orange; *Distinction*, rich orange-yellow, changing to rose; *Mine d'Or*, orange and red; *Madame Thibaut*, orange-scarlet; *Nec Plus Ultra*, purple and yellow; *Mons. Kougier*, yellow bordered with scarlet, a fine bedding variety; *Magenta King*, bright purplish scarlet; *Doum Calmet*, pink, with peach and yellow centre; and *Princess Louise*, dark maroon-red with white centre. *R. D.*

CATASETUM SCURRA.

THIS curious plant, which was described by Professor Reichenbach in our volume for 1872 (p. 1003),

FIG. 50.—CATASETUM SCURRA.

was exhibited by Sir Trevor Lawrence, Bart., M.P., at the meeting of the Royal Horticultural Society on the 14th ult., and attracted a good deal of interest on account of its curious aspect. It is comparatively a small plant. The pseudobulbs are ovate, acute, from an inch to an inch and a half long. The leaves are stalked, oblong-lanceolate, and the flowers are in drooping racemes, each bearing five or more blossoms, of a pale straw-colour or waxy white, the chief peculiarity of which resides in the lip. The sepals are obovate blunt; the petals broader, shorter, and rounder, and the lip trifid, its "side lacinia erect, with bent borders, rhomboid, denticulate, the middle lacinia with a very short, broad, linear stalk, expanded into a subreniform blade, with crisp and toothletted margins." The species comes from Demerara, and was first flowered in the collection of W. Wilson Saunders, Esq., whose plants furnished Professor Reichenbach with the materials for his description.

The flowers have a peculiar scent, Reichenbach even calls it a most beautiful perfume. Mr. Saunders, it appears, compared the odour to that of Lemons, while Reichenbach could not detect the Lemon-scent, but found that of essence of Roses. The subject did not escape notice at the meeting of the Floral Committee on the occasion of its being recently exhibited, and both ourselves and many members of the

committee, as well as our artist, compared the scent to that of stale or somewhat mouldy Lemons, not disagreeable, but certainly not particularly fascinating. The plant was awarded a Botanical Certificate, and furnished our artist with materials for the accompanying woodcuts (figs. 50, 51). It is said to be very nearly related to *C. Warszewiczii* and *C. roseum*, both of which have a fringed labellum.

RELATIONS BETWEEN PLANTS AND INSECTS.

(Continued from page 279.)

SLEEP OF PLANTS.

I HAVE elsewhere ventured to suggest that the so-called "sleep" of flowers had reference to the habits of insects, on the ground that flowers which are fertilised by night-flying insects would derive no advantage by being open in the day; while, on the other hand, those which are fertilised by bees would gain nothing by being open at night. I confess that I suggested this with much diffidence, but it may now, I think, be regarded as well-established.

Silene nutans, the Nottingham catchfly, is a very interesting species from this point of view, and indeed illustrates a number of interesting points in the relations between plants and insects. Its life history has recently been well described by Kerner. The upper part of the flowering-stem is visible, from which it has derived its local name, the Nottingham catchfly. This prevents the access of ants and other small creeping insects. Each flower lasts three days, or rather three nights. The stamens are ten in number, arranged in two sets, the one set standing in front of the sepals, the other in front of the petals. Like other night flowers, it is white, and opens towards evening, when it also becomes extremely fragrant. The first evening, towards dusk, the stamens in front of the sepals grow very rapidly for about two hours, so that they emerge from the flower; the pollen-tubes, and is exposed by the bursting of the anther. So the flower remains through the night, very attractive to, and much visited by, moths. Towards three in the morning the scent ceases, the anthers begin to shrivel up or drop off, the filaments turn themselves outwards, so as to be out of the way, while the petals, on the contrary, begin to roll themselves up, so that by daylight they close the aperture of the flower, and present only their brownish-green undersides to view, which, moreover, are thrown into numerous wrinkles. Thus, by the morning's light, the flower has all the appearance of being faded. It has no smell, and the honey is covered over by the petals. So it remains all day. Towards evening, however, everything is changed. The petals unfold themselves, by 8 o'clock the flower is as fragrant as before, the second set of stamens have rapidly grown, their anthers are open, and the pollen again exposed. By morning the plant is again asleep, the anthers are shrivelled, the scent has ceased, and the petals rolled up as before. The third evening again the same process, but this time it is the pistil which grows, and the long spiral stigmas on the third evening take the position which on the previous two had been occupied by the anthers, and can hardly fail to be dusted by the moths with pollen brought from another flower.

An objection to the view that the sleep of flowers is regulated by the visits of insects, might be derived from the cases of those flowers which close early in the day, the well-known *Tragopogon pratense*, or "John Go-to-bed at Noon," for instance; still more, such species as *Lapsana communis*, or *Crepis pilulera*, which open before 6 a.m. and close again before 10 in the morning. Bees, however, are very early risers, while ants come out much later, when the dew is off the grass; so that it might well be an advantage to a flower which was quite unprotected to open early for the bees, and close again before the ants were out, thus preserving its honey for another day.

ACTION OF PLANTS ON INSECTS.

So much for the first part of my subject. I must now pass to the second—the action of plants on insects. It would here, perhaps, be most natural to discuss the modifications which have been produced in insects by the search after honey and pollen, especially the gradual lengthening of the proboscis in butterflies, moths, and bees, to enable them to suck the honey, and the adaptation of the legs of bees to enable them to carry off the more or less dry and dusty

pollen. Having, however, already treated of them elsewhere, it will be better for me to take other illustrations, and fortunately there is no lack or difficulty.

Many of the cases in which certain insects escape danger by their similarity to plants are well known; the leaf insect and the walking-stick insect are familiar and most remarkable cases.

The larvae of insects afford also many interesting examples.

I will not, however, refer to isolated cases—however interesting in themselves—on the present occasion, but will take a group and see how far we can explain its various colours and markings, and what are the lessons which they teach us. For this purpose I think I cannot do better than select the larvae of the *Sphinxidae*, which has just been the subject of a masterly monograph by Dr. Weismann, the learned Professor of Freiburg.

COLOURS OF CATERPILLARS.

Let us begin with the *Charocampa elenor*, the elephant hawk-moth. The caterpillars, as represented in most entomological works, are of two varieties, most of them brown, but some green. Both have a white line on the three first segments; two remarkable eye-like spots* on the fourth and fifth, a very faint median line, and another more than 4 inches long. I will direct your attention specially, for the moment, to three points:—What mean the eye-spots and the faint lateral line? and why are some green and some brown, offering thus such a marked contrast to the leaves of the *Epilobium parvum*, on which they feed? Other questions will suggest themselves later, for I must now call your attention to the fact that, when they first quit the egg, and come into the world, they are quite different in appearance, being, like so many other small caterpillars, bright green,

appear on the fourth and fifth segments. There is also a second pale line running along the side. Please remark these two lines. After another five or six days, and when about half-inch in length our caterpillars moult again. In their third stage the commencement of the eye-spots is more marked, while, on the contrary, the lower longitudinal line has disappeared. After another moult, the eye-spots are still more distinct, the white gradually becomes surrounded by a black line, while the centre becomes somewhat violet. The subdorsal line has almost, or entirely, disappeared, and in some specimens faint diagonal lines make their appearance. Some few assume a brownish tint, but not many. A fourth moult takes place in seven or eight days, and when the caterpillars are about 1½ inch in length. Now, the difference shows itself still more between the two varieties—some remaining green, while the majority become brown.

FIG. 51.—CATASETUM SCURRA. NAT. SIZE. FLOWERS WHITE.

The caterpillars are very different in colour—green, white, yellow, brown, sometimes even gaudy, varied with spots, patches, streaks, and lines. Now are these merely casual and accidental, or have they a meaning and a purpose?

In many, perhaps in most cases, the markings serve for the purpose of concealment. When, indeed, we see caterpillars represented on a white sheet of paper, or if we put them on a plain table, and focus the eye on them, the colours and markings would seem, if possible, to render them even more conspicuous, as, for instance, in this diagram of *Dellephila galli*; but amongst the intricate lines and varied colours of foliage and flowers, and if the insect is a little out of focus, the effect is very different.

and almost exactly the colour of the leaves on which they feed. That this colour is not a necessary or direct consequence of the food, we see from the case of quadrupeds, which, as I need not say, are never green. It is, however, so obviously a protection to them, that the explanation of the green colour of small caterpillars suggests itself to every one. After five or six days, and when they are about a quarter of an inch in length, they go through their first moult. In their second stage they have a white subdorsal line stretching along the body, from the horn to the head; and after a few days, but not at first, traces of the eye-spots

* The shaded portions, which replace the eye-spots on the other segments, are an instance of the general rule that a character which appears on every two segments has a tendency to develop itself on every other segment.

The eye-spots are more marked and the pupil more distinct, the diagonal lines plainer, while the subdorsal line is only indicated on the first three and the eleventh segments. The last stage has been already described.

Now, the principal points to which I desire to draw your attention are (1) the green colour, (2) the longitudinal lines, (3) the diagonal lines, (4) the brown colour, and (5) the eye-spots.

USES OF THE COLOUR AND MARKINGS.

As regards the first—the green colour—I think I need say no more. The value to the young insect, the protection it affords, is obvious. We must all have observed how difficult it is to distinguish small green caterpillars from the leaves on which they feed.

When, however, they become somewhat larger their form betrays them, and it is important that there should be certain marks to direct the eye from the outermost of the body. This is effected, and much protection given, by longitudinal lines, such as those occurring in the second stage of our larvae. These lines, both in colour and thickness, much resemble some of the lines on leaves (especially those, for instance, of grasses), and also the streaks of shadow which occur among foliage. If, however, this is the explanation of them, then they ought to be wanting, as a general rule, in very small caterpillars, and to prevail most among those which feed on or among green leaves. Now, similar lines occur in a great number of caterpillars belonging to that distinct group of butterflies and moths, as you may see by turning over the illustrations of any monograph of the Lepidoptera. We have seen that they exist among the hawk-moths, as, for instance, in *Ch. elenor*; they occur in many butterflies, as, for instance, in *ARGE galathea*, which feeds on the Cat's-tail grass; and among moths, as, for instance, in *Pyrophila traspogonius*, which feeds on the leaves of the "John Go-to-bed at Noon" (*Traspogon*). Now you will find that the smallest caterpillar rarely possesses these streaks. As regards the second point also, the streaks are generally wanting in caterpillars which feed on large-leaved plants. The *Staytride*, on the contrary, all possess them, and all live on grass. In fact we may say, as a general rule, that these longitudinal streaks only occur on caterpillars which live on or among narrow-leaved plants. We have seen that in a later stage these lines disappear on certain segments, and are replaced by diagonal lines.

THE DIAGONAL MARKINGS.

In this particular species these diagonal lines are faint, but in a great many other caterpillars belonging to the most distinct families of butterflies and moths, they are conspicuous and no doubt important. Now these diagonal lines come off just at the angle of the ribs of leaves, and resemble them very much in general effect. They occur also especially in species which feed on large-leaved plants, and I believe that it is because of this that a great many species of caterpillars present these lines, they are rarely if ever present in species which live on grass. In the diagram are represented three of such caterpillars, one belonging to each of the three great divisions of lepidoptera, namely, that of the purple Emperor (*Apatura iris*), which feeds on the Oak, as representing the butterflies; that of the Privet hawk-moth; and lastly, that of a moth, the Kentish Glory (*Endromis versicolor*), which feed on large-leaved plants, and I believe I may say that, though very frequent, they rarely occur in species which live on grass. It might at first be objected to the view that there are many cases, as indeed in our elephant hawk-moth, in which caterpillars have both. A little consideration, however, will explain this. In small caterpillars these oblique lines would be useless, because they must have some relation, not only in colour, but in their distances apart, to the ribs of the leaves. Hence, while there are a great many species which have longitudinal lines when young, and diagonal ones when they are older and larger, they are not, I believe, a single one of which begins with diagonal lines and then replaces them with longitudinal ones. You will also observe that the longitudinal lines still remain in our caterpillar on those segments which have no diagonal ones. This also often occurs, and it is striking where the lines are marked. This is also an advantage, because white lines crossing one another at such an angle have no relation to anything which occurs in plants, and would make the creature more conspicuous. It is an advantage, therefore, that when the diagonal lines are developed, the longitudinal ones should disappear. There is one other point in connection with these diagonal lines to which I must call your attention. In our species they are white, but in some cases, as for instance in the beautiful green caterpillar of the Privet hawk-moth, the white streak is accompanied by a coloured one—in that case blue. At first we might think that this would be a disadvantage, as tending to make the caterpillar more conspicuous; and in fact if we put one in full view over, for instance, on a table, the coloured lines are very striking. But we must remember that the habit of the insect is to sit on the inside of the leaf, generally in the middle, and in such a position as to form a situation the coloured lines beautifully simulate a line of soft shadow, such as must always accompany a strong rib, and I need not tell any artist that the shadows of yellowish green would be purplish. Larger over any one who has ever found one of these large

caterpillars will, I am sure, agree with me that it is surprising, when we consider their size and conspicuous colouring, how difficult they are to see.

The next point is the colour of the mature caterpillars. We have seen that some are green and others brown; and the green ones are obviously merely those which have retained their original colour. *Sir J. Lubbock*, in the *Journal of Arts & Crafts*.

(To be continued.)

CLIMATE AND PRODUCTIONS OF TURKISTAN.

M. A. REGEL, son of Dr. Regel, Director of the St. Petersburg Botanic Garden, is travelling in Turkistan, where he will make a stay of some years to investigate the flora. Already Dr. Regel has published many of the novelties sent home by his son, and he expects a rich harvest in the future. The following notes we have extracted from a narrative of considerable length in the *Gartenflora* for January—
Taschkend is a town of the extent of St. Petersburg, consisting entirely of one-storied houses surrounded by gardens. Nearly all the streets in the Russian part are planted with Poplars and Willows, and parallel to the pavements are ditches of running water, by means of which the gardens are irrigated, without which no crops can be raised. The heat in the summer months rarely descends below 85° Fahr., even during the night, and for six months very little rain falls. In winter the temperature is sometimes as low as 10° Fahr., but the spring is so warm that the first Grapes are ripe in June, and the first Apples by the end of May. Beyond the town, where artificial irrigation cannot be effected, the country has a burnt and desolate aspect.

From Taschkend to Verneje the traveller traversed nearly a thousand miles, and he has some 250 miles further to go to reach Kalcha, his destination, where he will stay some years. The results of his journey so far include many very interesting new plants, and he has sent seeds of upwards of 400 species to St. Petersburg, and the collection of dried plants is much richer. The number of bulbous plants secured is also large: the pretty *Lycoris Sewerzowii* is one of them. A peculiarity of the flora of the highlands of Turkistan is the total absence of Ericaceæ. On the other hand, it appears to be the native country of many of our old garden plants. Thus *Rosa gallica*, the precursor of *R. centifolia* and of *R. alba*, from which the hardy double white *Roses* of our gardens have descended; *Eremurus robustus*, Kaufmanni, Olge, Korolkow, &c.; *Tulipa Greigi*, *Fritillaria pallidiflora*, *Solida sogdiana*, are other gains of this expedition. The flora is particularly rich in bulbous plants and the salt-loving plants of the Chenopodiaceæ. Of *Allium* seventy species are known to occur in Turkistan, of *Gagea* fourteen, *Eremurus* ten, *Tulip* eleven, including five mostly very showy new species; *Fritillaria* four, &c. Only one species of *Lilium*, *L. Martagon*, is found, and that on north-eastern confines. *Rhinopetalum Karlinii* and *R. stenopetalum* are two interesting bulbous plants not yet introduced. A charmingly pretty new genus of Campanulaceæ, *Cylindrocarya Sewerzowii*, was collected at Karatan. Ten species of *Primula* are endemical, among them the lovely and variable *P. nivialis*. *P. Fedtschenkoi* rivals the finest species of the European Alps, and *P. Kaufmanniana* is likely to become one of the most favoured garden plants. *Kauffmanniana* is now an interesting new genus of *Primulaceæ*, with the habit of *Crocus Martialis*, and has yellow flowers. Finally, the beautiful and often magnificent species of *Astragalus* and *Oxytropis* may be counted by hundreds; and the *Salsola* tribe are represented by an incredible number of different forms, many of them exceedingly ornamental.

Florists' Flowers.

THE FANCY POLYANTHUS.—The determined set that so well-know a cultivator of the Auricula as the Rev. Mr. Horner has made against the introduction of self-alpines into competitions, shows how technically conservative it is possible for persons to become even in relation to so apparently progressive a vocation as that of gardening. It seems impossible to believe that the introduction of another section of a beautiful flower can in any way affect the status of recognised varieties, and one is at loss to perceive why self sowing Auriculas should not receive the same attention that has been bestowed upon their shaded brethren.

In this strict horticultural conservatism lies the danger for the fancy Polyanthus, for florists have hitherto only recognised the gold-laced section as exhibition flowers, and by the majority of at least the Northern school a "fancy" flower would be looked upon as decidedly heterodox. If the hard-and-fast lines of this school have not exterminated the gold-laced kinds, it is certain that really good forms are rarities, and that, further, these perfect flowers seem chiefly to be allied to growths of the most delicate kind, for propagation seems to kill rather than to increase. Well enough in their way, the gold-laced Polyanthus lacked size of pip, variety of colour and marking, and robustness of habit; but all these merits and more are found in the fancy variety, whilst in form and substance they are also, as compared with the gold-laced kinds, more than hold their own. Here, then, are offered at once the elements of a class of exhibition plants that are far more worthy the attention of florists than is the old show Polyanthus, whilst adding so greatly the charm of variety—for that appears to be endless. The committee of the new Auricula Society have admitted the Polyanthus to a place in their schedule for their show next April, but with two of the judges out of one three named men of the old school, and possibly full of prejudices for the old gold-laced forms, what sort of a chance will the fancy kinds possess at their hands? This is not a question as affecting that particular show, but is one that has a wide bearing, as these fancy kinds have been dispersed far and wide for show purposes, and, of course, the growers expect to find them duly recognised as show plants by judges. The fancy Polyanthus is so easily cultivated that it may well become a favoured flower for those myriads of amateur growers whose means are confined to a few rods of ground, and a few rods of ground. It does not require one tenth the attention and labour required by the Auricula, yet is so productive of beautiful kinds that even the Auricula may soon have to "pale its ineffectual fires" before its less pretentious compeer. For exhibition purposes the Polyanthus should be classed in gold-laced, self, and fancy sections, and then all kinds of good flowers would receive due encouragement. *Thurin Eye*.

Foreign Correspondence.

ATHENS: Feb. 14.—It is very pleasant to find the hills already covered with flowers, Anemones, Calendula, Arab. Arisarum, Crucis, &c., and as one looks at the white buildings, and the blue sea and sky, to find these little gems around one's feet. My object in coming here is to visit Mycenæ, and some of the large Asiatic tombs; it may not accord with the subjects in your paper to mention it, but I search for special Apples and Asphodel as I go along. It is curious that the Apple—rare in the Ionian Islands—is found about the mountain of Cressida in Coreyra, Corin—the place where Ulysses was received by Nausicaæ and her maidens, and where to this day an annual festival is held at midsummer, or, as a native described it, "When the Melons are ripe," apparently in honour of Pomona or Flora, and where the Pyrrhic dance is still kept up. The festival is now, however, much Christianised. The Greek priests of the little chapel are habited in robes covered with flowers; the chapel is situated at the foot of the little hill, which has been artificially levelled, and now forms a truncated cone, the summit of which is inhabited by a Sibyl-like old crone. Inside the chapel, and above the paintings of the flower-robed priests, who are represented life-size, and occupy what would in our old churches be called the roof screen, are two carved semi fish, semi-dragon like figures, each of which's base rests on a pedestal. The statues of the two are very similar in device to some of the dragons in Brittany, who are thought to swallow saints. The dragon is here evidently identified, as is so often the case, with the limpid fountain, which issues from the rock, and whose secluded waters are approached through a grove of unusually large and lofty Olive trees, whose matted and perforated trunks look like lacework against the sky. This feature in the trunk of the Olive is not seen at Athens, nor have I elsewhere seen it so marked as in Corin.

I have collected this letter till Feb. 18, the last day of the Carnival, outside of the Cathedral are being sold bundles of Narcissus. There are no other flowers for sale but this. *P.*

with four, five, and six large blossoms on a spike, and certainly not less than 900 blossoms altogether.

— We learn from the report of the ROYAL BOTANIC GARDEN, EDINBURGH, that the funds granted for the ordinary expenditure of the garden are only £1400, a sum very inadequate, and that for the bare support of the garden £200 more of annual income is required. Additions to the plants in the garden are only effected by voluntary contributions, and there is no Government allowance made for the payment of a Curator for the herbarium, library, and museum.

— A description of a portion of the rich collection of the late Dr. WELWITSCH'S Angolan herbarium was given by Mr. J. G. BAKER, of Kew, at the Linnean Society on March 1. The groups which this indefatigable worker has brought his knowledge to

— In some notes on the EFFECTS OF THE MILD WEATHER ON VEGETATION (*ante*, p. 177-8) we mentioned the ornamental foliage of some species of the genus *Ferula* so early in the year as the beginning of February. We very much feared that the sharp frosts of last week would have injured them and more or less destroyed their beauty, but it is worthy of note that they do not appear to have suffered in the least. It has long been known to those who admire beauty and elegance in leaves as well as brilliantly coloured flowers that the leaves of most species of *Ferula* appear in the middle of winter, or at the latest in early spring, in the climate of London; but it may not be so well known that they will bear a sudden change from very mild weather to 10° to 15° of frost with impunity. Certainly there is no class of herbaceous plants deserving of cultivation more for the imposing habit of

vegetables, flowers, and fruit, and that is an intense degree of cold during a usually long winter. If we get a continuous frost of from 15° to 20°, especially if accompanied by a sharp wind, it is as much as the boilers can do to perform the task allotted to them of keeping up the temperature of one or more houses, according to their area. But what must it be when the thermometer stands 50° below zero, and wood the only kind of fuel to be had? Such, according to a writer in the *Revue Horticole*, are the conditions under which the gardeners of Moscow manage to grow excellent Cucumbers, for instance, during the months of November, December, January, and February. Mild as we have had the weather, REAUMUR'S thermometer stood at 37° below zero at MOSCOW on Dec. 10 last, which is more than 50° below FAHRENHEIT'S zero, or 83° 5 of frost!—not far short

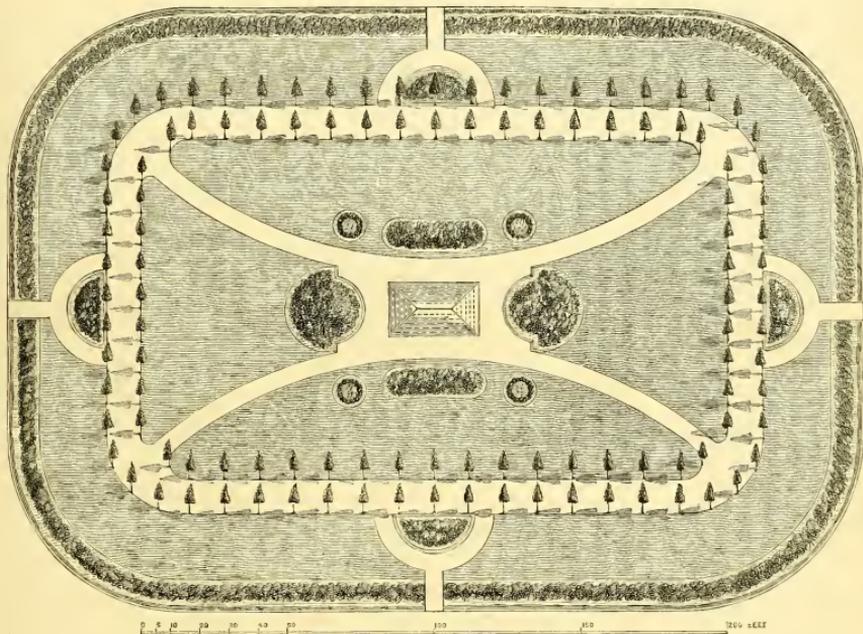

FIG. 52.—PLAN FOR TOWN SQUARE.

bear upon, are the Liliaceæ, Iridaceæ, Hypoxidaceæ, and Hamodraceæ. A very large number of entirely new species and two new genera of Liliaceæ are described. Notwithstanding this large accession of specific forms, Mr. BAKER believes they will not alter materially what is already known of the character of the Central African facies of vegetation.

— The Council of the ROYAL HORTICULTURAL SOCIETY having decided to receive provincial horticultural and floral societies into association with it upon an annual subscription of five guineas, they offer them the following privileges:—One silver Knightian Medal, one silver Banksian Medal, one bronze Knightian Medal, one bronze Banksian Medal, to be given as prizes at the shows of the provincial society; one members' ticket for the secretary, and twelve single tickets admitting the bearer to any meeting or show of the Royal Horticultural Society. Horticultural societies already in union will retain their present privileges.

growth and elegance of foliage than for the brilliancy or fragrance of their flowers that should be more strongly recommended than the *Ferulas*. As single specimens, when once properly established, they are exceedingly effective from early spring to midsummer, when their striking inflorescence is the signal for the beginning of the decay of the foliage. *F. communis* is one of the best; it makes fine clumps of foliage as finely cut as that of Fennel, and the candle-brush-like inflorescence reaches a height of 10 feet or more, according to the conditions under which it may be growing. *F. glauca*, *F. tingitana*, and *F. ferulago* are also handsome plants, quite distinct from each other in their general aspect.

— The Fourteenth Annual Exhibition of the LEEDS HORTICULTURAL SOCIETY will be held in the Horticultural Gardens, Hyde Park Road, Leeds, on June 27, 28, and 29.

— THE GARDENER AT MOSCOW has one great difficulty to contend against in supplying the table with

of the intense cold experienced by our latest Arctic explorers. Of course, in so rigorous a climate, few of the fruit trees that flourish with us can exist; but on the other hand the summers are more favourable than ours to the rapid growth and maturation of many plants. The writer alluded to treats more particularly of Cucumber forcing. The kind of house used for this purpose is a very low lean-to, with a slope of 20° to 25°, and from 12 to 15 feet wide, consisting almost entirely of wood and glass. The heating apparatus is a massive brick flue some 2 feet or 2 feet 3 inches in thickness on all sides, and wood is the only available fuel. In a house of this kind, 65 feet long, a skilful cultivator will raise from 4000 to 5000 Cucumbers per annum. But even then it is not a very remunerative industry, because wood becomes scarcer and dearer every year. These Cucumbers, the writer adds, must be at least 10 centimetres (about 4 inches) in length. Is this a misprint, or do they cultivate varieties of what we term the ridge type?

— We understand that the Hurlingham Club has made arrangements with the Messrs. JOHN WATERER & SONS, of Bagshot, Surrey, for an exhibition of Rhododendrons in the gardens at Hurlingham during the month of June next.

— The last part of COHN'S *Beitrag zur Biologie der Pflanzen* contains two additional articles on BACTERIA, one by COHN himself—relating more particularly to the development of the germs in various infusions, and the question of spontaneous generation, and the other by Dr. KOCH, on the etiology of the cattle distemper (*Adi-brand-krankheit*), founded upon the development of *Bacillus Anthracis*. With regard to spontaneous generation, COHN says that his investigations have removed the last support which the phenomena in connection with boiled infusions of hay gave to the hypothesis of spontaneous generation. In reference to the connection between these organisms and contagious diseases, KOCH'S researches, as far as they go, seem to prove that they are actually the medium in which the contagion is conveyed.

— It is well known that WALNUT TREES sometimes attain prodigious size and great age. An Italian architect mentions having seen at St. Nicholas, in Lorraine, a single plank of the wood of the Walnut, 25 feet wide, upon which the Emperor FREDERICK III. had given a sumptuous banquet. In the Baidar Valley, near Balacava, in the Crimea, stands a Walnut tree at least 1000 years old. It yields annually from 80,000 to 100,000 nuts, and belongs to five Tartar families, who share its produce equally.

— Mr. ISAAC DAVIES, Brook Lane Nursery, Omkirk, Litchfield, has arranged to exhibit his sweet-scented Rhododendrons, Azalea mollis, and other novelties, at the Winter Gardens, Southport, at about the end of the present month. We hear that the plants are now a mass of flower-buds, and will certainly be very interesting when in bloom.

— Dr. A. FAMINTZIN has published in detail in the *Bulletin de l'Académie des Sciences de St. Petersburg* his researches on the DEVELOPMENT of what he formerly termed the EMBRYONIC MEMBRANES OF PLANTS, but which he now proposes, in order to avoid ambiguity, calling the initial layers. He proposes to have treated the initial layers through every stage of development in several organs of a number of Leguminosae, and he finds that each of the initial layers into which the cellular substance of the embryo is differentiated in a very early stage of its existence is the foundation of, and develops only, its characteristic tissue. This being so, Dr. FAMINTZIN maintains that animal and vegetable embryos are perfectly identical in their mode of development. The paper is illustrated by eight quarto plates of anatomical details.

— The Grand Summer Rose Show of the LEICESTER AND LEICESTERSHIRE FLORAL AND HORTICULTURAL SOCIETY is fixed for Tuesday and Wednesday, the 3d and 4th of July.

— Dr. H. DINGLER describes (*Botanische Zeitung*, 1877, p. 74) a NEW SPECIES of LATHRÆA, *R. rhodopea*, a native of the dense shady Beech forests of Rhodope, in Thrace. It is intermediate in character between *L. squammaria* and *L. intermedium*, having the flowers and fruit of the one and the habit of the other.

— The other day the first number of a new "NATURAL HISTORY JOURNAL" was put into our hands, the scope and object of which entitle it to more than the passing notice of it given here. It is the production of the teachers and scholars of the Friends' schools scattered over various parts of the country, and is intended to encourage the study of natural history among the scholars from the youngest to the oldest, not merely for the sake of cultivating their powers of observation, but more especially for the ennobling and purifying influence it is believed to exercise on the development of the mind and disposition. Among other things it contains a list of wild flowers in bloom out-of-doors in various places, from Devon and Cornwall to Wigton and York, from December 20 to January 31, and also a list of garden plants in bloom during the same period. The former

includes seventy-one species, and the latter no fewer than 122. Judging from the part devoted to botany the journal is ably and carefully edited, and seems calculated to add to the number of distinguished botanists belonging to the "Society of Friends." Meteorology, ornithology, school reports, abstract of a lecture on carnivorous plants by A. W. EMMETT, &c., occupy the rest of this number. We wish it were possible to heartily recommend it for imitation in other educational institutions.

— The following prices were realised at the SALE of the collection of ORCHIDS formed by the late F. G. WILKINS, Esq., Leyton, which took place at Stevens' Rooms on March 1 and 2.—*Oncidium Lancanum*, 210*g.*; *O. ampliatum majus*, 241*g.* 6*d.*; two plants of *O. Phalenopsis*, in 12-inch pots, 58*g.* each; *Cattleya pigas*, 20*g.*; *Lelia elegans Turneri*, 320*g.* and 696*g.*; *Lelia* says Dawson, 210*g.*; *Odontoglossum vestitulum*, 882*g.*; *Aztec*; *Epidendrum vitellinum majus*, 253*g.* 6*d.*; *Odontoglossum Bliumii*, 200*g.*; 273*g.*, 294*g.*; *Oncidium macranthum*, 210*g.* and 325*g.* 6*d.*; *Dendrobium Warianum*, 252*g.* Total amount of sale, between £1300 and £1400.

— M. ROTHSCHILD, of Paris, is well known for his enterprise, not only in the publication of magnificent *ouvrages de luxe* like that on the parks and promenades of Paris, but also for the good service he has done in diffusing useful information by means of small low-priced but well-composed and well-illustrated books. Two such are now before us—*Les Ravageurs des Forêts et Les Ravageurs des Vergers et des Verges*, devoted especially to the insects injurious to forests, avenue and fruit trees and Vines. These little books are the work of M. H. DE LA BLANCHÈRE, and may be strongly commended to those who read French as excellent epitomes of the subjects on which they treat. With reference to the devastation caused by the Phylloxera in France, the author attributes the destruction indirectly to the practice of cultivating the Vineyard after year, for centuries perhaps, on the same soil.

— The usual monthly dinner of the HORTICULTURAL CLUB was well attended on Wednesday evening last, and the following new members were admitted:—Benjamin R. Cant, Colchester; William Lee, Brandenburgh Road, Gunnersbury; Charles Lee, Croxhey House, Hounslow; H. J. Elwes, Preston, Cirencester; James F. West, Lynechurch Lodge, Reigate; H. G. Quilter, Birmingham; and John Smith, Royal Gardens, Kew.

— Mr. BURRELL, in the course of an exhaustive paper on INDIAN TEA CULTURE before the Society of Arts, alluded to the splendid services of such men as SCOTT, WALLICH, JAMESON, FALCONER, ROYLE, and others, and made some remarks which illustrate the advantages of a progressive system of botany rather than a purely artificial one. Alluding to the discovery of the wild Tea plant in Nepal about 1816, and by other observers in other parts of India, such as Assam, Mr. BURRELL asks:—

"It naturally occurs to me to ask how came it that all the information was neglected? It all went before the authorities at Bengal, and reached England. Well, the answer is this:—At that time the Linnean system of botany was in the ascendant, its great author had made Tea a separate species, parting it from the Camellia, to which it was nearly allied. The great botanical authority at Calcutta, Dr. WALLICH—a Dane—was a pupil of that school, and whenever any of these Tea plants were submitted to him he decided they were Camellias, and not Tea plants at all, and took-pooched the possibility of any Tea being found wild."

It is only fair to add that subsequently no one was more zealous in the matter than Dr. WALLICH.

— One remarkable branch of HORTICULTURAL INDUSTRY is the extent to which plants of various kinds are grown for supplying those who publicly hawk them in the streets. The fine open weather has made the trade quite active, and Carnations, Hollyhocks, Polyanthuses, Daisies, Pansies, and many others are being bought up by the cottagers. Large breadths of these are grown in the neighbourhood of London, and being of inferior strains, are sold at a cheap rate. One London grower sends consignments of Carnations all the way to Newcastle-on-Tyne,

where the fine vigorous plants he cultivates find a ready sale. Everything is sold as of a double character—that is, Carnations, Hollyhocks, &c., in the habit of throwing double flowers; but whether the main bulk of the plants deserve this designation when they bloom is open to some doubt. But every year finds them being grown and sold by thousands, and it may be presumed, to the satisfaction of buyers.

— Several SPRING FLOWERING SHRUBS are coming into beauty at KEW. *Nuttallia cerasiformis* is one worth individual mention. It is of small size, and bears on erect branches a multitude of depressed racemes of white flowers in company with young leaves of the freshest green. It is a native of California, and though introduced long ago, does not seem common. A fine specimen may be seen near the Ferris, and another near the Temperate house. The fine example of *Prunus divaricata* near the new range is now in its finest condition.

— Mr. DANIELS, lately gardener to Lady FITZGERON, Mount Shannon, Limerick, has been appointed to the management of Fortham Park, Bury St. Edmunds; and Mr. PFYER, formerly gardener to Lord HASTINGS, Melton Constable, Norfolk, is appointed to the management of the gardens of Colonel PINNEY, Somerset, Ereligh, Taunton, Somersetshire.

— Mr. ANDREW MURRAY has addressed a letter to the Government on the desirability of adopting measures to exterminate INSECTS INJURIOUS TO AGRICULTURE. Mr. MURRAY'S letter was suggested by an article in the *Times*, which we here reproduce:—

"Our knowledge—that is, the knowledge of our men of science—is in a sufficiently advanced state to know what to do to check insect ravages. The life history of nearly all crop pests has been worked out. The time of egg-laying, the places selected for their deposition, the habits of the larva, the condition of the chrysalis, when there is one, the life of the fully-developed insect, are all known. The most effective way of destroying the insects, selecting either the egg, larva, or chrysalis state, are also known, and much of this has been known for years. It is to be hoped that this collection [the Collection of the life history of insects] will draw the direct attention to this question—'How is it that with so much knowledge we annually suffer such great losses?' The question has been asked in America, where in many States there is a State entomologist; and the answer has taken this form:—'The individual application of the knowledge of no good; it is necessary that attention be cleared of pests while surrounding properties still breed them. Combination is needed, and the interference of Congress can alone secure this.' Dr. LECOMTE, in his address before the American Association for the Advancement of Science, at the Detroit meeting, suggested that the importance of combination should be urged upon farmers, and that information as to probable benefits should be supplied to them. Bills have been introduced into Congress on the subject, but the report for 1867 of Mr. RILEY, which has just reached England, does not show more than that earnest attention is being given to the question. That Mr. MURRAY'S hopes do not end with the arrangement of his collection as a means of usefulness is foreshadowed by a paper on insect damage he read before the Royal Horticultural Society a year ago. He wishes to see some unified active steps taken for clearing the most districts at once of pests. If any action could by any means be secured, the work would be simple. A scientific inspection of a district would decide with regard to a particular pest the condition of development in which it would be on certain days. Instruction would be given as to the course to be adopted, and if this were simultaneously acted on throughout a district, the pest might be checked, if not entirely removed. It is sincerely to be hoped that either some society or the Department will take so important a matter up."

"The attempt is not new. It has been already tried on a greater or less scale in various ways, and with more or less success both in this country and on the Continent—the degree of success being almost invariably correspondent to the care taken and the extent of the district subjected to the experiment."

"General and simultaneous voluntary efforts have been tried in many countries by offering prizes for the destruction of insects at once of pests. In Sweden children in their search, &c., and where this has been done under the auspices of some central authority it has had good results. The difficulty, however, has usually been to get a central authority of sufficient weight and autho-

riety and extent of influence to charge itself with the task.

"I would humbly submit that some such permissive measure, conducted under the authority and direction of the Government, would be best suited to the requirements of this country. Compulsory legislation is probably premature, and at any rate could be more effectively demanded if the permissive action had been tried and failed. A central directing authority is absolutely essential: if the experiment is to be tried let us use our best means.

"I would suggest that next year the attempt should be made in two or three counties to begin with. Cheshire, Lancashire, and Derbyshire have suffered greatly for some years past from the Onion and Carrot flies. Let the diminution or extirpation of these flies in these counties be the first experiment. A trial to that extent would neither be troublesome nor costly, and it would to a certain extent serve as a test and guide for further proceedings. All that would be necessary would be the circulation in these counties through the clergymen, schoolmasters, municipal authorities, and local papers of an appeal urging every one to pull up and burn his infected plants (which are easily distinguished) on a particular day about a certain date, and to get the parochial authorities to take some trouble to see that this is done. Some brief lectures or explanations of what is wanted should also be given in as many parts of the counties as possible in a few weeks previously.

"Two or three years' perseverance in such a course should gradually diminish the numbers of the insects; and the process, if successful, should each year be extended to other insects and other counties until the whole kingdom is embraced.

"It may not be irrelevant to notice a rumour that the Colorado Potato Beetle has reached Europe in some places than one. In the event of that scourge finding its way into this country, it would surely be very convenient that some preparation for, or experience of the machinery suitable for, stamping out such pests should have been previously acquired."

—IN GARDEN ROOTS, as well as in those common to field culture, it is so much the fashion to appraise size at the expense of other qualities that it may not be out of place to draw further attention to the facts demonstrated in relation to the value of large roots by Professor ARMSTRONG, at the London Institution last week. The Professor said that roots were specially benefited by phosphatic manures as adding to them valuable nutritious constituents. It was well known that the largest roots contained proportionally the least nutritious matter—a fact of practical importance to the Potato sugar-refiners of Germany who paid duty on the roots they imported. This illustration might well be applied nearer home, where big roots are so highly and evidently so injudiciously favoured at our root exhibitions. If in a ton of Mangels of medium size there is more real nutriment or flesh-forming matter than there is in a ton of large roots, it is evident that the growth of large roots is a mistake and a waste of labour, equally if applied to such a popular article of human consumption as the Potato. We see evidenced the mistake made in cultivating kinds of great size, or rather in growing for tubers of great size. Primarily the Potato is an article of food, and its merits as such are not to be judged by the bulk eaten or grown, but by the amount of actual good found in the crop. Viewed in this light, and in accordance with Professor ARMSTRONG'S experience, it is more meritorious to raise a crop of medium-sized, thoroughly nutritious tubers than to produce a crop in which great size is attained at the expense of nutritious qualities. These things are worthy the attention of all root cultivators.

—There is at the present time a magnificent display of PHALLOSPIS in the Orchid-houses of Messrs. LOW, at Clapton; some idea of the extent of which may be gleaned from the statement that there are about 1000 spikes on the small plants, and each with from four to six flowers.

—Another case of POISONING BY LEAVES is recorded as having taken place at Coppock Hall, near Ipswich; twenty sheep had eaten some half-decayed Yew leaves, and of this number eight died. So often are cases of this kind occurring, that it is strange no better precautions are taken to keep cattle from such dangerous food. In this case the Yew branches had been used for church decoration at Christmas, and were not removed until just prior to the beginning of Lent. It may be worth the attention of churchwardens to inquire as to whether the continuance of

these decayed branches in places of worship for so long a period may not be detrimental to human life, as it is notorious that whilst much of certain kinds of leafage may be eaten almost with impunity by animals whilst fresh and green, yet it becomes most dangerous and comparatively poisonous when in a state of partial decay.

—At the last meeting of the Linnean Society Dr. MASTERS exhibited a very interesting series of "BUBES" AND BUD VARIATIONS on various trees, sent by Mr. WEBSTER, gardener to the Duke of RICHMOND and GORDON. These excrescences appear to be reducible to two main divisions—viz., those in which the precise modes of origin are not known, as in the so-called sports or bud variations, and those wherein the peculiarities arise from some injury to the terminal bud from frost, the attacks of insects, damage inflicted by birds, the agency of the wind, &c. In connection with the arrest of growth in the terminal bud is the increased development of lateral buds and a swollen condition of the main branch. In this way are formed the curious tufts and nest-like excrescences, as in

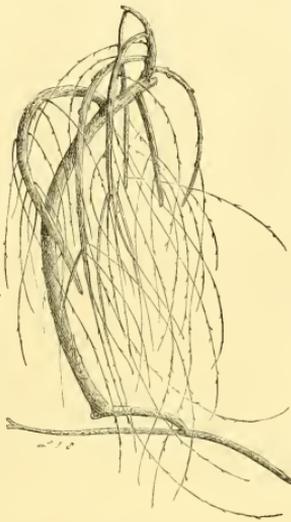

FIG. 53.—MONSTROUS GROWTH OF LABURNUM.

the Birch, wherein, as recently shown by Miss ORMEROD, the injury is due to a species of Phytomyza (see p. 249). Mr. WEBSTER'S specimens were numerous, and of a very interesting character, and have been deposited in the Kew Museum. The specimens exhibited showed outgrowths of this character in the Birch, wild Cherry, Poplar, &c. A branch of Scots Fir was shown bearing a tuft of shortened contracted shoots and densely clustered leaves, forming a condition analogous to that known as the Clabgrass Fir. Dr. MASTERS stated that he had seen in Switzerland a similar contracted form both as a sport and as a seedling. The Laburnum branch, of which we give a figure (fig. 53), was of very singular nature, the upper portion of the branch being thicker than the lower end, while the smaller branches curve downwards, as in the Weeping Ash.

—While the Royal Horticultural Society shows a tendency to waste what little strength it has in the attempt to conciliate the fashionable world of South Kensington, it is instructive to see what is done in Germany, in Belgium, and the United States, in the way of EDUCATING PRACTICAL HORTICULTURISTS. We have before us the reports of thirty-nine agricultural colleges in various of the United States, in almost all of

which instruction in the practice as well as in the principles of horticulture is given. The number of students is nearly 400, the prevalent idea being, that it is better "to educate a few thoroughly than many superficially." Model farms and experimental gardens are connected with most of these institutions, and special lines of inquiry and research are pursued in many of them. We cite as an illustration one extract from the report of the University of Minnesota, which ought to open our eyes as to the probable consequence of our own tardiness in these matters. The course of lectures for the present year embraces agricultural botany, horticulture, arboriculture, landscape gardening, and economic entomology. The following are some of the special topics discussed:—The botanical characters, properties, and peculiarities of the natural orders containing plants of interest to the farmer and horticulturist, with a special study of the most important individuals of these orders; the relations of heat, light, moisture, and food to plant growth, and the means of controlling their supply and intensity; plant-wooms and hotheds; soils and manures, and their manipulation; propagation of plants; grafting, budding, pruning and training; planting and transplanting; hybridising, crossing, and selecting; cultivation of the Apple, Pear, Plum, and other large fruits; cultivation of the Currant, Strawberry, Raspberry, Cranberry, and other small fruits; kitchen-gardening, market-gardening, and floriculture; seasons for planting forest trees; what trees to plant; methods of propagating; care in the nursery; special culture of each species; the different systems of landscape-gardening, and their applications; the principles of the art; desirable effects, and how to secure them; undesirable effects, and how to avoid them; a brief general view of the animal kingdom and the general characters of insects; characters and peculiarities of the families containing useful or injurious members, with a special study of the most important individuals of the families.

—The next meeting of the INSTITUTION OF SURVEYORS will be held on Monday evening, March 12, when the adjourned discussion on the paper read by Mr. J. LUCAS, at the last meeting, entitled "Hydrogeology: one of the developments of modern practical geology," will be resumed. The chair to be taken at 8 o'clock.

Home Correspondence.

—While All a Cure for Scale.—Many years ago I had under my charge, amongst others, a very large Ribston Pippin Apple tree on a wall facing the south, which somehow or other got so affected with scale that it ceased bearing fruit, and afterwards almost gave up producing foliage. At this time I was visited by an old gardener, who advised me to paint the tree all over with whale oil. I thought at the time the cure an extreme one; however, I had it painted about the middle of December, and waited patiently for the result, when, to my astonishment, by the following year the tree had much more healthy foliage than it had borne for several years previously. The second season the tree was covered with fine healthy foliage, and made shoots from 6 to 9 inches long, and there was not a trace of scale to be seen, and the tree afterwards continued to bear fine crops of fruit. Two years ago we received into our nursery 400 standard Apple trees from the South of England, which were literally covered with scale. On discovering this I had them planted in a quarter by themselves, and every one of them painted all over with the oil, as above, and I must confess they were a shining lot. However, this process cleared them wholly of scale, and the second season after the above dressing a healthier set of trees could hardly be found. Some months ago I received from a gentleman in this neighbourhood a few Camellias of a pretty large size, but not in very good health, and to my surprise I found them very much affected with scale. I confess I had my doubts about applying such a remedy to such plants, but at length I made up my mind to either kill or cure them, and I set a young man to paint the stems and branches all over, but he went further than I had bargained for, as he painted the foliage also, and I must say they placed in a gentle heat for about four weeks, and I find they are beginning to push out young wood as freely as the others, which gives me hopes that I have saved them from the scale without killing the plants. Should any one be tempted to try the above remedy, care must be taken that it is not any kind of mineral oil that is used. John Downie, West Coates, Edinburgh.

× Centropogon Lucyanus.—I can fully endorse all that your correspondent "L. S." writes as to the decorative qualities of this plant. It has been cultivated at Chiswick for some years, and a few well-grown specimens in 48 or 32-sized pots often grace the conservatory at South Kensington during the winter and spring. Still I believe it is really glorified by decorative florists generally, and I do not at the moment remember seeing it in any English trade list. That it really is a free-growing and reliable winter decorative plant when well grown (as I have seen it under Mr. A. F. Barr's care at Chiswick) there can be no doubt whatever. An excellent coloured figure is given in the *Revue Horticole* for 1868, pl. 291, together with a description by M. Houlet, whence I learn that, as stated in your last issue, the plant was obtained or raised by M. de la Roche, a nurseryman at Marseilles, the seeds being borne by a plant of Centropogon fastuosus, Decne, fertilised with pollen from Siphocampylus betulifolius, D. C., and that the name Lucyanus was given as a compliment to M. Lacy, some time President of the Marseilles Horticultural Society. It was sent out in 1857-8 by M. Geoffre, a nurseryman of the last-named city. I think the plant is a hybrid, and if so, doubtless this production, or other experiments in the same direction, must lead to Centropogon and Siphocampylus being merged together, as has been done already in the case of Libonia and Sericographis by Hooker and Benth in the *Genera Plantarum*, and in other botanical grounds in the nomenclature of the hybrid Sericobonia agnes, Linden and Andrieux (*Illustration Hort.*, 1875, pl. 30 and 64, Libonia penthosensis, Hort. Bull.), I cannot say. The last-named hybrid was raised between Libonia floribunda and Sericographis Giesbreghtiana 20 years ago. By I believe, Mr. H. Rowland, at Penrhos Castle, North Wales. To return to the × Centropogon, however, I may say that I am just a little sceptical as to its hybrid origin, my only reason, however, being the same as that which I give in the *Botanical Magazine*, tab. 225 (Curtis, 1793), which so nearly resembles × Centropogon Lucyanus in flower and foliage as well as season of blooming, that if it is really the same plant, it is a very singular case, wherein a hybrid closely resembles a natural species, that is, a plant imported as such direct from its native habitat. It is possible that this old Libonia surinamensis may have been one of the parents since I do not happen to know of any Libonia in the Continental nurseries as Centropogon fastuosus; and at any rate there are not many of the external characters of the Siphocampylus parent—albeit that it was the male—visible in the supposed hybrid offspring. I have not yet returned to the name of the Libonia parent, *Revue Horticole*, 1853, 10, nor yet to the figures of Centropogon (Libonia) surinamensis (Presl) in *Paxton's Magazine*, vol. xiii., p. 149; and *Annales de Gand*, 1846, p. 96, but shall do the first opportunity, as you may clear up the doubt pointed out above. >

The Lindley Library.—The value of the Lindley Library is much impaired through the want of access to it on the days of committee meetings of the Royal Horticultural Society. Could no arrangement be made that, on these days above all others, when nurserymen and gardeners are congregated, and would often be glad to avail themselves of the privilege, the library should be available the whole day? Frequently have I endeavoured to make use of the books, as these are the principal opportunities I have of getting to South Kensington. I have made an effort to look up the question of the Christmas Roses, but was shut out by the various meetings held in the library room. A valuable collection of books which is represented in the Lindley Library might be made available in connection with the Royal Horticultural Society, and might be kept in a room where reference might be made at all times, without the expense of a permanent librarian, by including the office of the Society and the library in one room. There appear to be plenty of good apartments at South Kensington at present. *P. Barr.* [This matter rests with the Council of the Society. The Trustees are most desirous that every facility should be given to use the library, but both Trustees and Council labour under the disease of impempenity. Eds.]

The Provincial Shows and Fund of the Royal Horticultural Society.—There have been various references, by Mr. Wilson and others, to the personal or collective risk incurred by the Council in starting these shows. There must be some misunderstanding in relation to this matter, for the Council incurred no risk whatever. When there was a risk of loss, or great responsibility, the Council declined holding the show. The important facts that the Council sent down Mr. Eyles to reconnoitre the ground and confer with the town authorities of Ipswich on the prospects of success, and that these were so problematic as to involve much risk,

and that the idea of holding the show was given up by the Council in consequence, seem to be wholly ignored. It was not until the refusal of the Council of the Royal Horticultural Society to hold the show was announced, and the enterprise was so far discredited and local enthusiasm—what little there was—quenched, that the great work of organizing the Royal Agricultural Show—had begun to be aroused in favour of a local horticultural show in connection with the Bury society, that I took the matter up, and undertook four things—to ensure a good show, a nice site and good special prizes, to secure a good site, and a guarantee against all loss up to £500. The Society accepted these terms, and as it also took the money for admission, your readers will see that it ran no risk whatever. So real, however, did the risk appear to be, that I worked for some time on a fund till it reached £1200, in order that should it all have been to pay—and every word of it would have been forthcoming if wanted—those who had kindly trusted me so generously for a public object could not have had to pay more than the value of the pound. It was not until all those objects were secured that a local committee was formed, and the Society agreed to visit Bury. Though there was the rival attraction of the Royal Agricultural Society, and the fact that the weather was so good on the day, the Society's share of the profits reached £200, which was, I believe, invested in a new glasshouse for horticultural purposes at South Kensington. From Bury to Manchester we went with high hopes, but that the blundering of the Council had created local support, and the grand show was held in an out-of-the-way place, and neglected. Almost equal misfortune followed the Royal Horticultural Society in their place; but it had a triumph at Bath, and saved the £1200. That the Council should have thought, might have kept it on the road for years. But no; the money was absorbed or frittered away, and for some years past the Society has been going on in the country, and not going on, never could understand why the guarantee principle was given up. It was simple, safe, and an equal share of risk and profit excited alike metropolitan and local zeal, interest, and enthusiasm; and that, with a handling of the profits for special expenses, it would have gone to the benefit of the exhibitors and revive the waning credit of the Society. I had hoped to the last for its resuscitation, but recent events seem to show that the union of horticulturalists in the country is not of the Kensingtonian dough of demagogues, but better than a rope of sand and conflicting interests. *D. T. Fish.*

Saxifraga hypnoides.—Lovers of carpet bedding will find in *Saxifraga hypnoides* a very useful subject in the flower garden. It may be used either for designs of carpet bedding, scroll beds, or ground cover of succulent beds. I planted five succulent beds last summer, and the groundwork consisted of the above and *Mesembryanthemum cordifolium*, and the effect was very pleasing. It will also be found as a useful winter bedding, as in the case of *S. sp.* as it perfects its growth in the autumn, and I think when it cannot fail to be more largely used for the purposes mentioned. *J. Clarke, The Gardens, Melton Constable, East Dereham, Norfolk.*

Cheap, Simple, and Efficacious Guard for Fruit.—Under the caption of carrying, or on the top of the wall, holdfasts projecting from 5 to 7 inches, with hook or eye in the end, one at each outside of the tree, one in the centre, which may project an inch beyond all the others. Prepare a curtain for each side of the tree, and fix it to the rod to the wall. Provide rings down the side of the curtain, with strings, and tie them close to the wall or to the adjoining string. The bottom rod should be fixed on posts 6 inches from the ground, 1 foot to 1 foot apart from the wall, the centre post, or rather further from the wall than the outside one. Five minutes will cover or uncover an indefinite number of trees, untying the sides, passing the curtain to the centre, and tying all together. I have used Frigi Domo or coarse half-wool netting, which I obtained at E. T. Archer's; the netting I do not see advertised this year. These I have used on alternate trees, Frigi Domo on the earliest. Netting has one advantage, it does not require daily uncovering, and is a shelter against occasional storms. *R. B.*

The Organ Plant.—Penrynol in Devonshire is known by the name of "Organs," or "Organ herb." It is, or was, very generally used there by the cottagers as a substitute for tea, and is considered by them to contain valuable medicinal properties. In some cases it has been used as a diuretic, and has been used, and believed to perform wonders with those

who have in a great measure to doctor themselves. The "Organ herb" is used externally as a discutient, and is taken internally with great benefit in asthma, hysteria, and chronic catarrh. Scarcely a cottage could be found in North Devon without a bed of "Organ" in the garden thereunto belonging. I do not believe that there is a concentration of "Organ" in any one soil, but it is cultivated in the garden of Marjoram, but solely applied to Penrynol. *John Col McAvail.*

Persian Melons.—Some years ago we received here fifteen varieties of Melon from Kabisar; some of them answered to the names given at p. 270. They were all tried, and the best was one we bore the name of Cocoa-nut, a good Melon to keep after ripening. The next best was a small yellow smooth-skinned fruit, the chief merit of which was its earliness and the easy way of eating it, as it is fit for use for March or April, and will keep for some time. They all proved difficult to keep, but a number of them were large and most handsome in appearance, but had no flavour, which I have often since considered was our fault. These large Melons are strong and gross in growth, and require a house like a vine in fully developed and mature them. In the same manner we used the growth was stunted and pinched; and under the circumstances it is hardly possible they could have been otherwise than watery. *F. F. Clivedon, Maidenhead.*

The National Rose Show.—Will you permit me to say, with reference to your notice of the various events which are announced to come off on July 4, that, with the exception of the committee meetings of the Royal Horticultural Society, I believe I am correct in saying that the Rose Show was never before the others. We do not think that a more fashionable promenade, such as the Botanic *file*, can possibly interfere with us; but we should be exceedingly sorry if the Gardeners' Benevolent Institution were in any way to be hindered. The object of the Rose Show institution (not knowing that the Rose exhibitors contemplated a dinner) thought it would be a good plan to have both on the same day, and now it seems almost impossible to alter. We endeavoured to change our day to the 29th, but we could not get the hat for that day—and I believe Mr. Cutler is in a like difficulty with respect to the "Allison." We must therefore only hope that in this huge metropolis there will be found enough to patronise all. *The Hon. Sec., Victoria Park, London.* [Why not lunch with the Roses and dine with benevolence? Eds.]

Lunar Influence on the Felling of Timber.—The inhabitants of Cuba are, according to Mr. Smith's note, quite at variance on this point with English, French, and Germans, who say that trees ought to be cut out in the moon's light. I have seen a notice from France did, and I believe still do, interdict the felling of timber during the increase of the moon. The same idea is acted on in Brazil—a well-known agriculturist, Signor Francisco Pinto, having affirmed that he had cut out the trees in the moon's light, in his own knowledge (derived from experiments made) be full of worms, and soon decay. The ascending force of the sap is said to be greatest during the increase of the moon, therefore the vessels are more spongy and liable to the attacks of worms, more prone to split and warp, being more difficult to season; but recent experiments have proved that timber cut in different parts of the lunar month possesses exactly the same qualities, provided the soil on which it grew and the age of the trees be the same. *Allen E. Watson, List, Hants.*

Does the moon influence the flow of sap? Yes; sometimes. In what way? By means of the tides. Above thirty years ago we, the members of the Victoria Association, settled the above questions to our satisfaction in a particular manner.—The first question having come before us, the great majority of those present treated the subject with complete scepticism, some even with ridicule; but two or three members strenuously held out in defence of the moon's influence. The latter were persons living within the basin of the Thames, consequently within the influence of tidal waters. Among other arguments they told us the market gardeners in their own neighbourhoods were all acted on their own belief. On the other hand, all those who were against the doctrine were residing within the basin of the Ravensbourne, the waters of which are not tidal. It was then agreed that we should make further inquiries in the neighbourhood of Deptford, Rotherhithe, &c. We thus found they held a very general belief in the moon's influence on vegetation, and we concluded at the next meeting that this influence was not direct, but secondary, through the flow of the tides. The market gardeners' plots were covered with bricks and mortar; what influence the moon has on them at present I know not, but by no means advise the sale of house property in some parts of the neighbourhood to be fixed to come off at a late period of a spring tide. *John Hall, Turner Road, &c.*

The Weather.—Abundance of snow and slight frost here, *St. Feknon, Royal Botanic Garden, Belfast, Feb. 27.*

—Last night we had 13° of frost, and the ground all around North Staffordshire is covered with snow. We hope to get ice to-morrow. I find *Roses, Clematis*, &c., are cut with frost last night, and bright sun to-day. Fruit trees are not forward enough to get injured. We have a fine show for Apricots under glass again, and most fruit trees look promising. *W. Hill, Kells Hall, Newcastle, Feb. 28.*

—We have a heavy snow to keep, as of the land, and a temperature of from 14° to 17° below freezing at night, but I do not think vegetation is forward enough here to receive any injury, perhaps the reverse. *W. W. Lawrence, Newcastle Abbey, Nottingham, Feb. 28.*

—On February 25 and March 1 the thermometer registered here 12° and 14° of frost respectively. A heavy fall of snow on February 26 covered the ground to the depth of 6 inches, and the plants preserved some early vegetables and seeds just vegetating. Although January and February have been such mild months, the soil has been so cold and soddened with water that vegetation is not so far advanced at this date as might be expected. The *Primroses*, *Jonquills*, and *Nectarine* flower-buds are far advanced, but being well protected on glass-cased walls are safe. Some *Prunus* and bush *Pears* on the Quince stock are, however, I am afraid, much injured in the flower-buds, and will be lost to the season. The *Apple*, *Quince*, and *Nectarine* flower-buds are likewise all blackened and destroyed, as well as some of the earliest *Gosberries* nearly in leaf. The ice-bombs here were felled on March 1, the latest date I ever recorded in this time for a late frost. The ground on March 2, and the weather since has been mild and wet. *William Tillyer.*

Saxifraga Burseriana.—This beautiful little alpine is again in full flower, and has been so for some weeks past. Its neat habit, forming as it does compact hillocks composed of small rosettes of greyish leaves, makes this species specially adapted for cultivation in pots. The flowers are pure white, borne on slender scarlet stems 1 to 1½ inches high. Messrs. Backhouse & Son, of York, have a large quantity of this lovely little plant. I took the trouble to measure one specimen and to count its flowers—the little tuft was only 3½ inches in diameter, on which was produced sixty flowers. *R. P.*

Fruit Prospects.—Judging from present appearances, fruit trees of all kinds promise an abundant show this season. Apricots, as yet only partially in flower, are very fine, and perfect in the formation of the fruit. The *Plum* and *Nectarine* trees, which are now in leaf, have a fine crop of buds, but will not be in flower for a fortnight. The present cold winds will be beneficial in retarding the early flowering kinds of fruit trees generally, which, owing to the extremely mild winter, are on warm soils somewhat more forward than is desirable with a probability of late spring frosts. There is, however, one advantage, that the wood having been so well ripened last season, as a natural consequence the seasons will be more vigorous and better able to bear severe weather than when the wood is imperfectly matured. And with favourable weather we may anticipate a heavy fruit crop this season. *W. Cox, Madresfield Court.*

Lobelia Emperor William.—At p. 215 Mr. Davidson speaks in favour of a variety of *Lobelia* called *Emperor William*, ever since which I can fully endorse, inasmuch that I can unhesitatingly recommend it to every one who may require a first-class *Lobelia* in preference to any I have ever seen. As its origin is British, it is quite correct, it being raised here by a friend of mine, Mr. Crowninshield, a gardener to J. Aspinall, Esq., who finding it to be an acquisition soon worked up a large stock of it, and his good nature induced him to distribute some cuttings to his neighbours. One of these friends, under the name of *Emperor William*. In the meantime Mr. Bester, late manager of the Pine-apple Nursery Co., happened to call upon him, and was so struck with its effectiveness as a border, that he offered to take the entire stock, but when ignorant of the fact that it had been distributed in the neighbourhood or not, I am unable to say, at any rate the remaining stock passed into his hands, after which it was advertised for sale by him, in the *Gardener's Chronicle*, under the name of *L. pumila magnifica*, at 1s. each, and described as the finest of all blue *Lobelias* (see No. 83, vol. iv). Any one, therefore, possessing *L. pumila magnifica* (true) has the variety Mr. Davidson so justly describes as the best he has ever seen. *E. Morgan, The Dells, Harrow-on-the-Hill.*

The Season.—In reference to the unusual forwardness of the season, allow me to mention that on

February 25 I picked two stalks of sweet-wetted long-jointed bloom in my garden here, and several more have come into flower since. Almost trees were seen in blossom here on February 10, and on the 20th I saw a standard *Plum* tree in full bloom. A gentleman who had resided here for thirty-two years never remembers anything approaching to the precocity of this season here. He informs me that the cuckoo has been heard in the Isle of Man before the expiration of last month. *Mary E. Hume Rothery, Merton Lodge, Twivel, Cheltenham.*

Garden Walks.—I hear in mind an inquiry in a late issue of *The Chronicle* from a correspondent to your readers, as to the best way of making garden walks. He will have seen, subsequently, abundant instruction on this art, with suggestions of a great variety of materials. I can very strongly recommend to your correspondent the siliceous gravel beds in the neighbourhood of Reading, after more than thirty years' experience in a carriage drive and garden walks. The former was laid out as soon as the Great Western Railway was opened to this town. My grounds lie immediately on the great colliery, which affords a natural drainage; the broken stone of the district for a depth of 5 or 6 inches formed a sufficient foundation for the gravel. This varies much in size, from flints to fine yellowish or white sand-grains. The coarser may be readily separated for a carriage-drive, and the residue used for garden walks. My carriage-drive was carefully formed with a gentle fall from the centre to either side, with a coat of the gravel about 6 inches in depth over the foundation of stone before-mentioned. This being the regular road for the turnpike road to the house and offices, has necessarily been in use occasionally for the heavy carriage of coals, manures, hay, straw, &c., and cartage for various purposes, so that considerable portion of the drive has not required any repairs or additions during the period I have mentioned. Some addition of gravel has been made in some places where it was found the centre had been laid too flat; but I think it may safely say that has not exceeded a truck-load of the gravel. The walks were formed for the most part of the same gravel passed through a coarse screen, and have been equally successful in point of wear and colour. The cost of this gravel at Reading is 6s. a ton placed on a truck on the railway. The distance from Reading is a material point as respects expense—this brings the cost to this place to about 6s. a ton in addition. The distance from Reading to Cirencester is, I believe, about 60 miles by the road. I visited the gravel firm which now supplies the gravel is Messrs. Brinkworth, contractors, Reading, *Charles Lawrence, The Querns, Cirencester.*

Reports of Societies.

Royal Horticultural.—*March 7.*—At the general meeting held on this occasion, the Treasurer, H. Webb, Esq., in the chair, some formal business only was transacted. The committee meetings, as on the last occasion, were held in the large conservatory, and though the weather was very cold and winterly, the contributions of choice plants were both numerous and good, and another bright and cheerful little show was the result.

SCIENTIFIC COMMITTEE.—Dr. Hooker, C.B., Pres. R.S., in the chair.

Divided Barley.—A letter was read from Rev. Mr. J. Berkeley, relating to the samples of Barley referred to him in a previous communication. Mr. Berkeley confirmed Dr. Masters' opinion as to the absence of fungus, except that in some cases there was a trace of the ubiquitous *Cladosporium herbarum*, but that had nothing to do with the blue colour of the grain.

Munsey Wheat.—A letter was read from Mr. E. Falkner on this subject—a subject generally discredited by the committee.

Colts Disease.—A letter, accompanied by specimens, was read on the table from Mr. W. Saunders, and the matter was referred to Mr. Berkeley.

Prunus cerasifera.—Dr. Hooker showed flowering branches of the beautiful *Plum* now in full bloom at Kew, near the Succulent-house. Dr. Hooker remarked that it has never bore fruit, although there was a quantity of pollen.

Plants Exhibited.—Mr. Green exhibited flowers of *Malva coccinea* and *Æchmea glomerata* from the gardens of Sir George Macleay, Colonel Trevor Clarke, Rev. H. Harpur-Crewe, and Mr. Elwes showed numerous other bulbous plants in flower, and commented on their condition.

Action of Pollen on Seed.—In reference to this matter, which occupied the attention of the committee on the last occasion, Colonel Clarke made the following statement:

—At the last meeting of this committee, when I brought before you an example of the direct influence of foreign pollen upon the seeds of Peas, I remarked that

Mr. Laxton had not observed any case of this kind. I found, however, subsequently that very valuable and interesting paper of this gentleman's, which I had not before seen, facts of this kind had been accurately noted and described by him. My attention was directed to a letter of Mr. Laxton to the Scientific Committee, in which he certainly seemed to give his decided opinion that the colour of the seed was not directly affected. I desire to make his statement generally known, and to hope that it would be to detract in any way from Mr. Laxton's very valuable investigations of the subject."

Crocus.—Colonel Clarke further stated that—

"The pale blue *Crocus* exhibited by me is one which I have had for many years as *velutichinus*. I received it from the gardener of the Earl of Devonshire, and it is one of Herbert's collection. I have been inclined to believe, however, latterly, that it is true *Crocus* *leucanthus*, and in fact the long-lost and remarkable *C. verus leucanthus* of Sabine's Catalogue, which is a *leucanthus* (basal spathe of Baker), and seems to conform generally with *verus* proper. A bunch of three or four varieties, scarcely distinguishable generally, except that each of *Crocus lagenaeformis*, Herbert. One, however, has indications of lineation at the base of the flower outside, thus approaching the old garden form called by Ker *mosaicus*."

FLORAL COMMITTEE.—H. Little, Esq., in the chair. First-class Certificates were awarded to Messrs. Veitch & Sons for the fine varieties *Crataegus* shown by them at the last meeting, and figured at p. 277 in our last issue; for *Denndastia davallioides* *Voungii*, for *Osmunda palustris*, an evergreen Brazilian plant, with the aspect of *O. spectabilis*, and for *Rhododendron Taylori*, a valuable early flowering variety, raised by them at the last meeting, and figured by the descendants of a cross between *Rhododendron jasminiflorum* and *R. javanicum*; the colour is a deep pink shaded with carmine. To Mr. B. S. Williams for a hybrid *Azalea*, raised by Mr. Carmichael, a variety of the amona type, but having larger flowers of a dark rosy purple colour; a useful decorative plant. To Sir Trevor Lawrence, Bart., M.P., Burford Lodge, Dorset (Mr. Spyers, gr.), for a distinct and well marked variety of *Androsymbium crataegifolium* *Barbartenianum*. To Mr. John Wills, South Kensington, for *X Dracena terminalis* alba, a very distinct and well marked white variegated hybrid between *D. nigrescens* and *D. regina*—one of the valuable set of seedlings raised by Mr. Banté and fully described in our vol. iv., 1874, p. 615. To Mr. Turner, Slough, for *Tree Carnations* *Guelder Rose*, a very fine full white, and *Rose Perfection*, a large, full, bright rose-coloured, and deliciously scented flower; and to W. Turner, Slough, for *Tree Carnations* *White*, a very fine flower for *Cinerarias* *Mary* and *Thomas Winter*—the former a charming flower of a clear bright rose colour, of great substance, and exquisite form, and the latter a little larger, of a pucey purple shade of colour, and great form. These two varieties were also well marked remarkable group of seedlings, a decided advance on anything seen before, and which gained from the committee a very high commendation for the strain. The demands on our space to-day forbid our giving other than a few words of notice to the objects which were acknowledged by the committee by the awards of medals, &c. To His Grace the Duke of Westminster, Eaton Hall, Chester (Mr. Selwood, gr.), the committee awarded a silver gilt medal for a magnificent example of *Dendrobium Fierardi*. It had twenty-two well-cloned spikes of flowers, averaging about 3 feet in length, the total number of fully developed blossoms being 1124—an example of culture seldom highly creditable to the grower. A silver gilt medal was also voted to Messrs. James Veitch & Sons for a miscellaneous group of plants, which included a charming collection of *Orchids*, numerous examples of a good strain of *Cyclamen persicum*, and a showy collection of hybrid *Campanulas*. Small silver medals were awarded to Mr. W. H. Turner, Cholmeley Park, Highgate (Mr. Newman, gr.), and Sir Henry Peck, M.P., Wimbledon House (Mr. Ollerhead, gr.), for admirable groups of *Orchids*, the examples of *Phalaenopsis Schilleriana* from the first-named gentleman being specially attractive. Small silver medals were also awarded to Messrs. William Paul & Son, Waltham Cross, for a remarkably fine display of cut blooms of *Camellias*, consisting of a dozen boxes of fine blooms, and to Messrs. Turner, Slough, for a fine group of white *Camellias* and standard *Aucubas*, finely berried. Votes of thanks were accorded to Mr. B. S. Williams and Mr. John Wills for admirable groups of miscellaneous flowering and fine foliage plants, and to Mr. Turner for the last-named exhibitor including bright and well-grown medium-sized specimens of several of his new *Dracenas*; to W. Terry, Esq., Peterborough House, Fulham (Mr. Roberts, gr.), for a small but select group of *Orchids*; and to Mr. Ollerhead for an attractive display of hairy *Primroses*, *Polyanthuses*, *Trimulias*, and *Hepaticas*; to J. L. Tyerman, Esq., Preydon, Cornwall, for cut specimens of some fine hairy flowers, principally *Narcissus*, and to Sir George Macleay, Kew, for a fine group of cut flowers of *Æchmea glomerata* and *Malva coccinea*. Messrs. Paul & Son, The Old Nurseries,

Cheshunt, exhibited flowering plants of the valuable, old, but sadly neglected Fortune's Yellow Rose, and the "striped" variety of which we have heard so much but seen so little, named Beauty of Glazewood, and drew attention to the approximate identity of the two plants. The committee have examined the plants in different stages of growth and bloom, resolved, on the proposition of Mr. C. Noble, seconded by Mr. C. Turner, "that in the opinion of this committee the Rose known as Fortune's Yellow and Beauty of Glazewood are identical." The old Fortune's Yellow, generally, is of a bright orange colour, and occasionally it is seen of the buff tint, as shown to-day, and sometimes, too, it has a tendency to come faintly striped, but it is no excuse for its being sent out as a novelty. The best example we can call to mind of the bright orange form was the remarkable plant which occupied the roof of the old ridge-and-furrow Faxon-house at Chiswick, that was pulled down a few years ago to make room for the orchard-house.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. The only subjects that came under the notice of this body was a fine dish of Garibaldi Strawberries, from Mr. Edward Bennett, Rabley Nursery, Barnet; and examples of St. Michael and Maltese Blood Oranges, grown by Messrs. T. Rivers & Sons, Sawbridgeworth, to both of which valuable commendations were awarded. A letter received from Mr. D. P. Bell, with reference to the cancelling of the name of Clive House Seedling, as applied by him to a Grape which the committee had certificated, was read, and it was resolved to cancel with the certificate the name of Alnwick Seedling.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 7, 1877.

MONTH AND DAY.	BAROMETER.	TEMPERATURE OF THE AIR.		WIND.	RAINFALL.
		Thermometer from 6 a.m. to 6 p.m.	Thermometer from 6 p.m. to 6 a.m.		
Mar. 1	30.0	48	38	W	0.0
2	30.2	+3.0	54	W.S.W.	0.10
3	30.1	+0.5	53	W	0.0
4	29.6	-1.0	45	W	0.34
5	29.7	-0.1	43	N.W.	0.0
6	29.5	-0.8	37	N.W.	0.0
7	29.3	-0.6	41	N.W.	0.3
Mean	29.77	-0.4	43.5		0.15

March 1.—Fine, but cloudy and cold day. Misty. Hoar frost in morning. Mild. Rain fell in evening.

2.—A dull cloudy day. Mild. Rain fell in morning.

3.—A very dull day. Mild. Frequent thin rain.

4.—Overcast. Frequent dull and drab showers. Extremely dull in morning. Gale necessary.

5.—A fine but not a very bright day. Cool.

6.—A very dull cloudy day. Cool.

7.—A dull, cloudy day, but fine at intervals. Frequent showers of hail and snow. Rain at night.

LONDON: Barometer.—During the week ending Saturday, March 3, in the vicinity of London, the reading of the barometer at the level of the sea decreased from 29.56 inches at the beginning of the week to 29.14 inches by the early morning of February 26, increased to 30.39 inches by the morning of March 1, and decreased to 30.06 inches by the end of the week. The mean reading for the week at sea level was 29.96 inches, being 17 inch above that of last week, and 0.05 inch below the average.

Temperature.—The highest temperatures of the air observed by day ranged from 55° on the 25th of February to 40° on the 28th; the mean for the week was 47°. The lowest temperatures of the air observed by night varied from 22° on March 1 to 44° on February 25; the mean for the week was 32°. The mean daily range of temperature in the week was 14°, the greatest in the week was 17° on March 2, and the least 10°, on February 25 and March 3.

The mean daily temperatures of the air and the departures from their respective averages were:—February 25, 48°-9; 26, 44°-4; 27, 46, 44°-3; 27th, 34, 33°-5; 28th, 31°-5; 29, 31°-5; 30, 30°-9; 31, 30°-4; 2d, 43°-4; 3d, 30, 47°-3; 4th, 36°-8. The mean temperature of the air for the week was

39°-5, being 0.6 below the average of sixty years' observations.

The highest readings of a thermometer, with blackened bulb in vacuo placed in sun's rays, were 102° on Feb. 27, 88° on Feb. 28, 88° on Feb. 28; on March 2 the 28th; on March 3 the reading did not rise above 60°. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 19° on February 28, and 18° on March 1; on March 3 the reading was 28° on Feb. 28, 33°. The mean for the seven low readings was 21°.

Wind.—The direction of the wind was W.S.W. and N.W., and its strength moderate. The weather during the week was somewhat fine, though cloudy and drab, and somewhat stormy.

Rain fell on three days during the week, the amount collected was 0.36 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 55° at Cambridge, and 55° at Blackheath and Sunderland; at Bradford, 50° was the highest temperature; the mean value at all stations was 52°. The lowest temperatures of the air were 17° at both Sheffield and Eccles, and 18° at Nottingham; at Portsmouth and Plymouth 27° was the lowest temperature; the mean for the week was 22°. The range of temperature during the week was the greatest at Eccles, 36°; and the least at Portsmouth and Plymouth, both 25°; the mean range from all stations was 30°.

The mean of the seven high day temperatures was the highest at Truro, 61°, and the lowest at Sunderland, 42°; the general mean from all stations was 45°. The mean of the seven low night temperatures was the lowest at Bradford, 30°, and the highest at Truro, 40°; the general mean from all stations was 33°. The mean of the seven high day temperatures was the highest at Sunderland, 61°, and the least at Norwich and Liverpool, both 42°; the mean daily range from all stations was 12°.

The mean temperature of the air for the week from all stations being 3° lower than the value for the corresponding week in 1876. The highest was 45° at Truro, and the lowest 35°, at Bradford.

Rain fell on four or five days in the week at most places. The amounts varied from 1½ inch at Sheffield to 0.05 inch at Eccles, one-tenth of an inch at Truro and Sunderland; the average fall over the country was three-quarters of an inch.

The weather during the week was generally fine, though cloudy and changeable. Snow or hail fell generally over the country on February 27.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 56° at both Dundee and Paisley to 53° at Edinburgh, Aberdeen, and Leith; the average value from all stations was 54°. The lowest temperatures of the air ranged from 18° at both Perth and Dundee, 24° at Glasgow, and 21° at Aberdeen; the average value from all stations was 21°. The mean range of temperature from all stations was 33°.

The mean temperature of the air for the week from all stations was 35½°, being 6½° lower than the value for the corresponding week in 1876. The highest was 56° at Greenock, Paisley, and Leith, and the lowest 34½° at Aberdeen and Perth.

Rain.—The amount of rain measured during the week varied from half an inch at Greenock, to three-hundredths of an inch at Edinburgh, Leith, and Perth; at Dundee no rain fell. The average fall over the country was two-tenths of an inch.

DUBLIN.—The highest temperature was 56°, the lowest 24°, the range 31½°, the mean 41½°, and the fall of rain three-fourths of an inch.

Answers to Correspondents.

CAMELLIAS: F. H. The leaves are evidently sunburnt. Either there are lenses in the glass itself, or drops of water hanging about the glass have concentrated the sun's rays upon the affected portion of the leaves.

CINERARIAS: E. F. The flowers received are all bright in colour, and many of them larger than usual, but coarse, and not up to the florist's standard of form and substance. No doubt they are a showy and useful lot for general decorative purposes, and with care and attention and seedling may obtain a good strain from the larger forms. Mr. James has flowers quite as large, but of very superior to yours in quality.

COCCUS MIDELELLANA: E. Fischer. Coccus is a molluscivorous genus, not diocious. The species in question does not die after flowering, like Cayota.

CYANTHUS: H. E. A good strain, well known to us. **GROWTH ON THE YEW: B. and Others.** This is by no means uncommon. It is the result of the puncture of an insect—Credomyia taxii.

INSECTICIDES: C. H. *U. V. Bruchus rufimanus.* As bred in England as in France. **A. M.—W. Cramp.** The Leopard moth, *Zenura rusticata*. **A. M.**

ONION-FLY: C. H. The directions you allude to are perfectly intelligible. When the writer said "the pots should be plunged perfectly level," he could not have meant level with the ground, because in a line or row it would have given different directions to "one-third of their depth." What he means, therefore, is, that the pots should be set level, i.e., water-level.

NAMES OF PLANTS: T. F. Canarina Campanula, a very old plant, introduced so far back as 1596 from the Canary Islands, and figured in the *Botanical Magazine* in 1779, p. 219. It is a very common plant, without a cone.—**K. S. W.** Kennedy prostrata var. major.—**J. Lane.** It would appear from your note that you intended to send two flowers, but only one came to hand, and it was a very curious variety of *Aerides Fieldingii*, and you may see a coloured plate of something like it in Morren's *La Belgique Botanique*, 1876, p. 219. It comes near the var. Lobbia in the shape of the lip, which is usually folded up at the sides in the typical *A. Fieldingii*, *H. G. Koch*.

NEPHROPLETIS: F. Cooker & Sons. Your Fern appears to be not *Nephrolepis exaltata*, but *N. tuberosa*, which usually has such tubers on the roots. If you would send us a good piece of the frond it will enable us to send you the question.

STRELTZIA REGINE: W. S. This plant succeeds best in an intermediate temperature. Although it will live in a greenhouse it does not well, neither will it in a high temperature. Where it is kept growing through the winter this is not calculated to induce a disposition to flower. It is a strong grower, and requires considerable pot-room; it can be increased by division of the crowns. Plants with a single crown should have a 10 or 12-inch pot, well drained, and good loam with sand, and 2 inches of peat, during the spring and summer, in a night temperature of 55° or 60°, proportionately higher in the day; keep drier at the roots and cooler during the winter; and they cannot fail to flower the following summer.

CATALOGUES RECEIVED.—Messrs J. A. Bruce & Co. (Hamilton, Ontario, Canada), Illustrated Seed Catalogue for 1877. Messrs J. A. Bruce & Co. (Edinburgh, Street, Chester), Catalogue of Farm Seeds.—Messrs. Downie & Laird (17, South Frederick Street, Edinburgh), Catalogue of Florists' Flowers, Stoves and Greenhouses.—Messrs. C. E. & S. Ware (11, Farm Nurseries, Tottenham, London), Catalogue of Florists' Flowers, and Catalogue of Perennials, Aquatics, Bulbs, and Plants.—Messrs. J. & S. G. H. & S. (Downham Market), Select List of Kitchen Garden, Agricultural, and Farm Seeds.

Markets.

COVEY GARDEN, March 8.

Trade remains quiet, with no alteration worth noticing. A few Garibaldi Strawberries have been sent to the market by Mr. Bennett, and are making about 5s. per cone. **James Webber, Wholesale Apple Market.**

SEEDS.

LONDON: *March 7*—There has been more business doing this week in farm seeds, country dealers having manifested a determination to delay no longer getting in a portion, at any rate, of their supplies for the spring. A good spell of fine weather is, however, needed to impart life to the trade in English seeds, the supply coming forward shows this week a marked falling off; this, of course, tends to strengthen the values of foreign parcels. The stock of American Clover now left in the trade would soon clear the market of this description. As regards white Clover seed, the last few days have developed nothing new, present quotations are considered quite safe, even for holding over. Alsike and Trefoil are both steady; in the latter article a good number of transactions are reported. For grass seeds there is an active demand, at unchanged currencies. Small spring Tares are offered on easier terms. The demand for Canary seed is almost nil; notwithstanding the almost unprecedentedly low figure at which it is now obtainable, buyers still hold aloof. Other seeds, for the lack of business, are without alteration in price. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

Trade was somewhat quiet at Mark Lane on Monday, and prices had a downward tendency. To effect sales holders of Wheat found it now and then necessary to give way to the extent of about 1s. per quarter, but fine dry samples were worth perhaps as much as Monday's eight. In Barley quotations were flat for the inferior sorts. Malt was steady, with a limited inquiry. Oats were a trifle easier in some instances, and for these, especially the supporting market for white Beans, Peas, and flour were nominally unaltered in value.—On Wednesday fine samples of English Wheat were held at full prices, and inferior produce attracted scarcely any attention. Foreign Wheat was purchased to a limited extent, at about previous quotations. Choice Barley realized full rates, but medium and inferior produce sold slowly, on former terms. Oats were in slow request, at late rates; and Beans and Peas moved off slowly on former terms. The flour trade was quiet at previous quotations.—Average prices for the week ending March 7:—Wheat, 50s. 12s.; Barley, 40s.; Oats, 26s. 3d. For the corresponding week last year:—Wheat, 43s.; Barley, 32s. 7d.; Oats, 25s. 4d.

CATTLE.

At Copenhagen Fields on Monday there was a short supply of beasts, but trade was not at all brisk, yet the quotations of Monday's eight were well maintained throughout. Trade in sheep was dull, and the rates were with difficulty realised; inferior quality especially met with a dull sale. Calves continued scarce and dear. Quotations:—Beasts, 4s. 6d. to 5s. and 5s. 6d. to 6s.; calves, 6s. to 7s.; sheep, 4s. 6d. to 5s. 6d. and 6s. to 7s. 6d.; and pigs, 4s. 4d. to 5s. 4d.—The market underwent no material change on Thursday. Prime beasts met a moderate inquiry, and brought steady value. The sheep trade ruled firm, especially for prime qualities, and the tendency of prices was against buyers. Prime calves were scarce and dear, and pigs dull of sale.

HAY.

The Whitechapel report for Tuesday states that trade was steady, quotations being generally well supported. The supply was moderate. Prime Clover, 100s. to 130s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 120s.; inferior, 70s. to 85s.; and straw, 40s. to 50s. per load.—On Thursday there was a steady demand for good hay-stuffs; inferior sorts dull. Quotations:—Clover, best, 100s. to 130s.; inferior, 85s. to 95s.; hay, best, 100s. to 120s.; inferior, 65s. to 75s.; and straw, 40s. to 50s. per load.—Camden Market quotations:—Superior meadow hay, 128s. to 137s.; inferior, 110s. to 117s.; superior Clover, 132s. to 140s.; inferior, 110s. to 120s.; and straw, 54s. to 58s. per load.

POTATOS.

The Borough and Spitalfields markets reports state that sound Potatoes are in moderate request, trade generally steady, but the supplies somewhat excessive. Kent Regents, 90s. to 120s. per ton; Essex do., 70s. to 115s.; Regents, 70s. to 80s.; flukes, 120s. to 160s.; Kidneys, 100s. to 130s.; and Scotch Regents, 100s. to 130s.—The imports into London last week consisted of 30,476 bags from Hamburg, 8,597 Bremen, 4,776 Antwerp, 203 Brussels, 942 Harlingen, 635 sacks Boulogne, 97 bags Rotterdam, and 61 from Dunkirk.

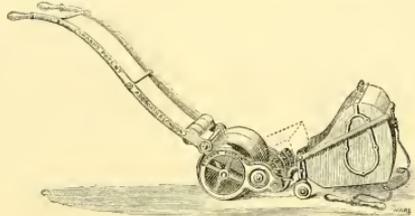

COALS.

The market on Monday was steady, and previous prices were current for house coals, but Hartleys were 6d. per ton lower. There was a steady business in the market on Wednesday, with a fair supply of house coals. Quotations:—Bebeade West Hartley, 175s. 9d.; Wilkin, 165s. 6d.; Walk End, 165s. 6d.; East Hartley, Lyons, 165s. 6d.; Hawthorns, 165s. 9d.; Lambton, 185s.; South Hetton, 185s. 6d.; Tunstall, 165s. 9d.; Clifton, 175s. 6d.; Hartlepool, 175s. 6d.; Easington, 175s. 6d.; East Hartlepool, 185s. 3d.; South Hartlepool, 175s. 3d.; Tees, 185s.

SHANKS' NEW PATENT LAWN MOWERS,

Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plots* or *Grass Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine £3 10 0	25-inch Machine £13 10 0
14-inch Machine 4 15 0	28-inch Machine 15 15 0
16-inch Machine 5 15 0	30-inch Machine 17 0 0
18-inch Machine 6 15 0		
20-inch Machine 7 0 0		
24-inch Machine 9 10 0		

The Hand Machines are all fitted with Silent Movement, and can be used either with or without the Front Rollers.

NEW HORSE MACHINE.

30-inch Machine £20 10 0	40-inch Machine £28 0 0
36-inch Machine 24 0 0	48-inch Machine 32 0 0

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.

Price, for the 28-inch and 30-inch Machines, 30s. extra; 35-inch Machine, 35s. extra. Silent Movement, 12s. 6d. extra. 15s. for Pony, 21s.; Donkey, 25s. per set.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

Are warranted to give ample satisfaction, and if not approved of can be at once returned.

ALEXANDER SHANKS & SON,

Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.

27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power. Orders executed same day as received.

Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 50s.

MR. WORTHINGTON SMITH'S SALUS,

Founded on Compounds of SULPHUR and POTASSIUM,

PREVENTION OF THE POTATO DISEASE.

J. C. WHEELER & SON, SEED GROWERS, GLOUCESTER

Beg to inform the Trade that they are the Sole Agents in Great Britain for the Sale of this valuable material.

The retail price of 14 lb. of Salus, which is sufficient for 1 acre of Potatoes, is 14s.; or in smaller quantities, 7 lb. for 7s.; or a good sized packet, sufficient to dress 1 bushel of Seed Potatoes, for 1s., or post-free for sixpence.

WHOLESALE PRICES ON APPLICATION TO

J. C. WHEELER & SON, Seed Growers, GLOUCESTER.

NEW PLANTS, 1877.

CHARLES LEE & SON,
SUCCESSORS TO
MESSRS. JOHN AND CHARLES LEE,
OF THE

Royal Vineyard Nursery,
HAMMERSMITH, near LONDON,
Have the pleasure to offer the following very beautiful and interesting

NOVELTIES,
now offered by them for the first time:—

BEGONIA COLTONI.
This distinct and beautiful Begonia was raised at the Royal Vineyard Nursery. The colour of the flowers is a quite new Begonia, being of an orange-crimson. It is a most abundant bloomer, and the flowers are of the largest size. It received a First-class Certificate from the Floral Committee of the Royal Horticultural Society in 1875. Good plants, price 10s. 6d. each.

BEGONIA RODWELLI.
This lovely Begonia was also raised at the Royal Vineyard Nursery. The flowers are of a bright vermilion-scarlet, and of the same size as the plant is very hardy and free flowering. It received a First-class Certificate from the Committee of the Royal Horticultural Society. Good plants, price 10s. 6d. each.

CORNUS MAScula AUREA ELEGANTISSIMA (J. & C. Lee).

This elegant and lovely hardy shrub was raised from seed in our Isleworth Nursery, and has been proved to be perfectly constant in its beautiful variegation. The broad masses of pure gold surrounding a bright green centre is of itself a sufficient attraction, but when in July the leaves become suffused with the brightest carmine it is impossible to give an idea of the beauty and elegance of the plant, which will bear a favourable comparison with the best variegated stoves, greenhouse exotics. Suffice it to say, that it has been seen and admired by many amateurs and nurserymen, and has been awarded a First-class Certificate at South Kensington. The habit of the plant is semi-decumbent, and very graceful. Price of maiden plants, 12s. each; larger specimens, 21s. each. A Coloured Plate may be had on application for 2s.

JUNIPERUS VIRGINIANA ELEGANS (J. & C. Lee).

This very elegant variety of the Red Cedar was raised from seed in our own gardens in 1865. It is scarcely necessary to remark upon the hardness of this plant, but it is due to its character to state that the most unexpected variegation with which the whole plant is suffused is perfectly constant, and has never been injured by frost in any of its twenty years of the best summer, although it is fully exposed in the open air. The plants in pot and free growth, and received the honour of a First-class Certificate from the Floral Committee of South Kensington, in July, 1875. Price 15s. each; larger specimens, 21s. each. A Photograph of the plant may be had on application for 2s.

POPULUS CANADENSIS AUREA VAN GEERTI (1876).

The golden variety of this noble Poplar Asters was introduced by Mr. Charles Van Geert, of Antwerp, has fully borne out in our Nurseries the description he gave of it, and has retained its golden colour much longer than either the Golden Catalpa or the Golden Oak during the late tropical summer.

EXTRACT FROM MR. VAN GEERT'S DESCRIPTION.
"We have the pleasure of offering an extremely remarkable variety of the Canadian Poplar, with a foliage which presents during the whole summer the finest hue of golden-yellow. It is in our opinion a more valuable acquisition, and yet more prized by us, because so very conspicuous who has admitted it in our nursery, for the coloured foliage now so frequently met with among shrubs falls almost entirely away during the larger trees. The Catalpa aurea and the Quebec Ruber cordocera are the only trees known as possessing the same golden foliage; but the former is only a second-class tree, and the latter has not the vigor of the common Oak. Our golden Poplar, on the other hand, is of a first-class tree, and its leaves are quite as large as those of the common Canadian Poplar, and the yellow hue, instead of looking sickly, has a warm and vigorous appearance. The larger the tree is, and the more it is exposed to the sun, the more vivid is the golden hue."

Having received in February last a large consignment of this magnificent novelty from Mr. Van Geert, are enabled to offer nice plants at 7s. 6d. each.

ABIES EXCELSA AUREA (J. & C. Lee, 1876).

This is decidedly the finest golden Conifer of large growth yet introduced. It is of free growth, and requires to be planted in the full sunshine. In such a position the golden tree is suffused with the richest gold. A First-class Certificate has been awarded to this valuable tree at South Kensington. Price of nice plants, 12s. 6d. each; larger specimens, 21s. each.

LAURUS CAMPYLOLEPIS (Wood, 1876).

We can still supply a few hundreds of this extraordinary and elegant Laurel. Price 2s. 6d. each; per dozen, 18s.

THE MAGNUM BONUM POTATO.

MR. CHARLES PENNY,

Head Gardener to H.R.H. the PRINCE OF WALES, referring to the very favourable opinion he had given of this Potato, says, in a

LETTER to Mr. MARTIN HOPE SUTTON, dated Sandringham, Feb. 28, 1877,

"MAGNUM BONUM I NEVER HAD FROM ANY ONE BUT YOU OR
YOUR FIRM."

FOR PRICES OF THIS AND OTHER SEED POTATOS APPLY TO

SUTTON & SONS, (The Queen's Seedsmen), READING, BERKS.

SEED POTATOS And the POTATO DISEASE.

After many years of close investigation it has been decided, beyond any dispute, that the Potato Disease is solely caused by the attacks of two fungi, named *Peronospora* and *Fusarium*—the disease being accelerated by the after-attacks of minute worms, grubs, and mites. The latter can stand both freezing and boiling without losing their vitality—the two fungi of the Potato Disease and the minute parasitic animals are alike destroyed by a material named SALUS, and completed by Mr. Worthington Smith, of 15, Midway Row, London. Mr. Smith is a well-known scientific microscopist, and the SALUS is at once a destroyer of diseases in plants and a powerful fertilizer. SALUS possesses FIFTY TIMES THE STRENGTH OF ORDINARY FERTILISERS, FUNGUS DESTROYERS, AND INSECTICIDES. The application is very easily accomplished by merely sowing it with guano, soot, lime, or any other manure, at the rate of 14 lb. per acre, or 14 oz. of a sample sufficient to treat a bushel of Seed Potatoes may be had for 12s. at Messrs. WHEELER AND SONS' London Office, 59, Mark Lane, E.C. 4; or it will be sent free by post on receipt of a Post-office Order for 2s. 6d., made payable to

J. C. WHEELER & SON,
SEED GROWERS,

GLOUCESTER.

BEST & CHEAPEST INSECTICIDES

Duty Free, under permission of the Hon. Board of Customs.

THE "LONDON" TOBACCO POWDER;

FIXED

ART-WITH-ECONOMY-APPLIED-TO-CONSERVATORIES

FIXED

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches \times 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

Estimates and Plans free.

FURNITURE.—To be sold a bargain, a solid oak LIBRARY or DINING ROOM SUITE, in first-class condition, covered in Green Leather. Mrs. T., 9, High Street, Putney, S.W.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plaster sorts are especially suited for KITCHEN GARDENS, &c., as they harbour no Slugs or Insects, take up little room, and once put down, incur no further labour or expense.

Edgings, consequently being much cheaper GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; and Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FAMES" PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BRASS AND GALVANIZED WALL-BRICKS.

Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES. For Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheets, of plain or more elaborate designs, with prices, sent on selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Suitable Paving of great durability. Wall Copings, Down Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See addresses above.

SILVER SAND. fine or coarse grain as desired. Prices by Post per ton or truck-load, on Wharf in London, or delivered direct from Pit to any Railway Station. Samples of Sand free by post.

PLINTS and BRICK BURNERS for Rockeries or Ferarries. KENT PETERS or LOAM supplied at lowest rates in any quantity. See addresses above.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. Liberal Discount to the Trade.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil painting, and is an outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the inventors, and its genuine quality and outstanding, but of unimpaired imitations, is fully attested by its constantly increasing sale. It may be applied by ordinary labourers, and is of great economy in thinning, and is used cold. It is used in the grounds at Windsor Castle, New Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 2s. 6d. per gallon, or at the Manufactory, or in 8d. per gallon carriage paid to any destination in the Kingdom.

UNSOLICITED TESTIMONIAL.

Glasgow, Langmuir, Carmarthen, Nov. 29, 1873. "Mr. Lloyd Lloyd encloses cheque for £5 5s., amount due to Messrs HILL & SMITH, and he considers the Black Varnish one of the most useful articles he ever possessed." Apply to HILL and SMITH, Bricklayers Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained. **CAUTION**—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unscrupulous dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is fully marked with their name and address, without which no one is genuine.

GEORGE'S PATENT CALORIGEN,

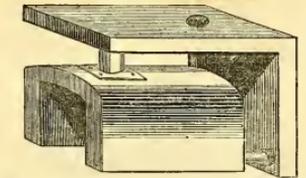

FOR Warming and Ventilating Small Conservatories.

The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory. Made in Wrought Iron. Made in Copper, &c. Height, 38 inches; diameter, 14 inches. It will be found very valuable in the Nursery or Sick Chamber, and in Damp Buildings. Cons. Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Invention).

Illustrated Prospectuses and Testimonials on application. J. F. FARWIG AND CO., 36, Queen Street, Cheapside, E.C. This Stove introduces a strong current of warmed (not burnt) fresh air.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz, the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L" SADDLE BOILER boils about twice the quantity of water with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes—

Sizes.		To heat of 4-in. Pipe.		Price.

Larger sizes if required.

From MR. CHARLES YOUNG, Nursery, Batham Hill, S.W.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PUMPS and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.

When ordering Boilers please refer to the above advertisement.

AN EXTRAORDINARY BOILER.

During the Great Boiler Contest at Birmingham, in 1874, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler run without 'Night Attention'?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 200 feet of 4-in. pipes, and yet had more than a bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon for Gardeners. This was THE CHAMPION, Deards' Patent Close Coil Boiler, for Drawings and Prices of which send two stamps to

MESSES. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. About the only one left in THE WOODS, &c., smaller kind of Boiler, equally as satisfactory, and certainly "the best thing out." Awarded five First Prize Silver Medals.

AGRICULTURAL LOCOMOTIVES,

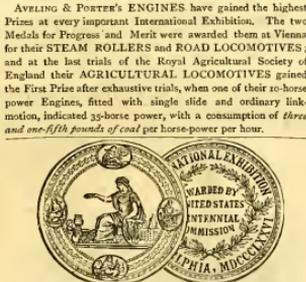

STEAM PLOUGHING MACHINERY, ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES, STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers.

AVELING & PORTER,

ROCHESTER, KENT; 79, CANNON ST., LONDON, E.C.; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the late trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 20-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fourth pounds of coal per horse-power per hour.

WRIGHT'S PATENT ENDLESS-FLAME IMPACT HOT-WATER BOILER.

Awarded the only English Medal for the best Hot-Water Apparatus at the United States Centennial Exhibition at Philadelphia, 1876. For prices and full particulars please see our pamphlet, entitled "Our Boilers and Heating," which will be handed post-free on application.

ALFRED SVER, Glass, Lead, Zinc, Oil, and Colour Merchant, 8, Pentonville Road, London, N.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved. For Illustrations, with full particulars, apply to the Sole Makers.

F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c., Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the only ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all other being false imitations.

COWAN'S PATENT COMPENSATING SYSTEM OF HEATING,

FOR HORTICULTURAL, PUBLIC, AND OTHER BUILDINGS. The most important discovery for saving the cost of fuel, for steadiness in heating power, and dispensing with night stoking. One Apparatus will do the work of several Boilers, and in some cases produce a profit.

Heating by the Ordinary Systems. Hothouses, Mansions, Churches, and other Buildings efficiently heated by other approved methods, where the Patent Apparatus cannot be adopted.

A large Stock of the most improved forms of Boilers to select from.

HEAT and LIGHT. COWAN'S PATENT COMBINED GAS-MAKING and HEATING APPARATUS, By which Country Mansions and Public Institutions may be heated and lighted, in most cases free of cost.

HORTICULTURAL BUILDING. All structures specially adapted to the purposes for which they are required, built of the best materials and workmanship, at moderate prices.

Plans and Estimates free. An Illustrated Pamphlet free. All work done by the Company is guaranteed.

GREEN'S PATENT "SILENS MESSOR,"

Or Noiseless Lawn-mowing, Rolling, and Collecting Machines for 1877.

The Winner of every Prize in all cases of competition.

The superiority of these Machines over those of all other makers is universally acknowledged. They will Cut either long or short Grass, Bents, &c., wet or dry.

These advantages no other Lawn Mowers possess.

They are the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant.

Every Lawn Mower sent out is guaranteed to give entire satisfaction, otherwise it may be returned at once free of cost to the Purchaser.

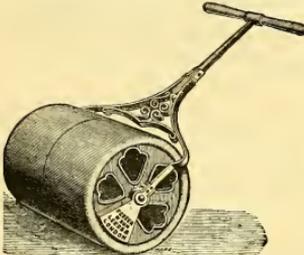

N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Descriptive Illustrated Price List free on application.

EP P S S C O C O A : GRATEFUL-COMFORTING.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle miasms are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure Food and a properly nourished frame.—*Civil Service*—**W. D. ANDERSON,** Sole and General Packeter, JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS, 48, Thredenolde Street, and 170, Piccadilly.

KINAHAN'S LL WHISKY.

Kinahan's finding, through the recommendation of the Medical Profession, the demand for his **EXTRACTED OLD LL WHISKY** for purely medicinal purposes very gradually increasing, he has been pleased to inform by Dr. Hassall—"I have very carefully and fully analysed samples of this well-known and popular Whisky. The samples were 20s and 25s and 30s, and were found to be pure, well-matured, and of very excellent quality. It is of a very high and successful full confidence in the purity and quality of this Whisky."—**W. GARDNER,** 103, St. Paul's Road, Highbury, London, N.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and RHEUMATISM, and for all the ailments for which the Constitution, Ladies, Children, and Infants, require.

DINNEFORD AND CO., 175, New Bond Street, London, and all Chemists.

HOLLOWAY'S OINTMENT and PILLS.

"Safety against Danger."—Surrounded on all sides by the cause of diseases (especially if the old proverb hold, "As the worm in the bud will eat its way through the apple"), it is constant watch if it would retain and preserve his health. These purifying Pills present the most certain and effectual means of removing the cause of disease, and restoring the system to that regularity which it requires to preserve its health. It is peculiarly well adapted for the young and delicate, who can with impunity only take tender treatment.

SALES BY AUCTION.

Periodical Sale of Poultry and Pigeons (4917).

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, March 26, at half-past 12 o'clock precisely, surplus stock of CARRIERS from Colonel Hassard; TURBITS from Mr. S. Sater; and a great variety of Game POULTRY and PIGEONS from the Yards and Lots of well-known breeders and exhibitors.

mixed colours of each, 1s.
WALLFLOWER, double German, mixed colours, 6d. and 1s.

NOVELTIES IN MIXED SEEDS.

ALONSOA ALBIFLORA.—New distinct species from
Mexico, introduced by Mr. Rose, the distinguished col-
lector, flowering from 12 inches up to 3 feet in
height, producing long terminal spikes of pure white
flowers with yellow eye. It is recommended for pot-culture,
as, conservatively, it will produce a succession of its
flowers throughout the autumn and winter when most
acceptable for bouquets and table-decoration. It will be
found a desirable and useful substitute for Lily of the
Valley, as used in our bouquets with so charming an
effect arranged so as to overtop the other flowers by
1 or 2 inches. 1s.
BROWALLIA ROZEII, 1s. COBEA HIRSUATA, 2s. 6d.
FLAKE, 1s.
HUMEA ELIANS ALEA, 1s. AGEAERAN SNOW-
FLAKE, 1s.
MIMULUS BRILLIANTISSIMA, scarlet self, 1s.
MENTZELIA ORNATA, fine plant (see description in
Catalogue), 1s.
TORENIA PERNIERI, new annual form of this beautiful
combination of colouring, 1s.
PYRETHUM LEANWORTHII, ornamental plant, 1s.
PYRETHUM ALBUM LACINIATUM, fringed-leaved
Golden Feather, 1s.
ASTER, Fringed, most beautiful and brilliant new quilled
variety, 1s.
SAXIFRAGA NEPALENSIS, fine ornamental species for
pot culture, 1s.
PAFAYER UMBROSA, showy flowers, 1s.
LAIRES PUNCTICATA, 1s.
CANTERBURY BELLS, double filled flowers, beautiful
variety of colours, 1s.
PINK, ROZEII, 1s. BAMBUSA GRACILIS, 1s.

The best New
Potato
Hooper's Garden
Perfection

Mr. SHIRLEY HIBBERD describes it, after two years' trial, as "the very model of a gentleman's Potato."

Price 2s. 6d. per lb., 7 lb. 15s.

HOOPER AND CO., Covent Garden, London, W. C.

ANNUAL EXHIBITION OF HYACINTHS, TULIPS,
NARCISSUS, ROSES, CLEMATIS, &c.

MESSRS. JAMES VEITCH & SONS

INVITE INSPECTION OF THEIR COLLECTION OF THE ABOVE, WHICH ARE NOW IN FINE BLOOM.

The CAMELLIAS are also still very fine.

ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

NEW FUCHSIA,
EARL OF BEAONSFIELD.

Vigorous growing, free flowering, beautiful habit, quite distinct, and described by Dr. Masters as one of the best hybrid varieties of Fuchsia. The blooms, 3 inches in length, are of great substance. The tube and sepals are of a light rosy carmine, corolla deep carmine.

This is a valuable decorative plant. It was awarded First-class Certificates at the Crystal Palace and Royal Botanic Society, Regent's Park, and is figured in the *Floral Magazine* for February.

Orders executed after the 15th March. Price, 5s.

JOHN LAING & CO.,
STANSTEAD PARK, FOREST HILL, LONDON, S.E.

THE NEW ROSE,
QUEEN OF BEDDERS (NOBLE).

Perhaps the Finest Rose for Bedding ever sent out.

The most practical and comprehensive Guide for the Amateur yet issued, and should be read by every Horticulturist.

NEW PLANTS, 1877.

CHARLES LEE & SON,

SUCCESSORS TO MESSRS. JOHN AND CHARLES LEE, OF THE

Royal Vineyard Nursery, HAMMERSMITH, near LONDON.

Have the pleasure to offer the following very beautiful and interesting

NOVELTIES,

now offered by them for the first time:—

BEGONIA COLTONI.

This distinct and beautiful Begonia was raised at the Royal Vineyard Nursery. The colour of the flowers is quite new in Begonia, being of an orange-crimson. It is a most abundant bloomer, and the flowers are of the largest size. It received a First-class Certificate from the Floral Committee of the Royal Horticultural Society in 1875. Good plants, price 2s. 6d. each.

BEGONIA RODWELLI.

This lovely Begonia was also raised at the Royal Vineyard Nursery. The flowers are of a bright vermilion-scarlet, and of the Royal Horticultural Society in 1875. Good plants, price 2s. 6d. each.

CORNUS MAScula AUREA ELEGANTISSIMA (J. & C. Lee).

This elegant and lovely hardy shrub was raised from seed in our Hammersmith Nursery, and has been proved to be perfectly constant in its beautiful variegation. A broad margin of pure gold surrounding a bright green centre is itself a sufficient attraction, but when in July the tips of the leaves become suffused with the brightest carmine it is possible to give an idea of the beauty and elegance of the plant, which is far more favourable comparison with the best variegated stove or greenhouse exotics. Suffice it to say, that it has been seen and admired by many amateurs and nurserymen, and has been awarded a First-class Certificate at South Kensington. The habit of the plant is semi-pendulous, and very graceful. Price of standard plants, 2s. each; larger specimens, 2s. each. A Coloured Plate may be had on application for 1s.

JUNIPERUS VIRGINIANA ELEGANS (J. & C. Lee).

This very elegant variety of the Red Cedar was raised from seed in our own grounds in 1866. It is scarcely necessary to remark upon the hardness of this plant, but it is due to its character to state that the elegant cream-coloured variegation with which the whole plant is suffused is perfectly constant, and has never been injured by frost or exposed in the least degree by the hottest sunshine, although fully borne in the open air. The plant has been raised from free growth, and received the honour of a First-class Certificate from the Floral Committee at South Kensington, in July, 1875. Price 15s. each; larger specimens, 2s. each. A Photograph of the plant may be had on application for 1s.

POPULUS CANADENSIS AUREA VAN GEERTI (1876).

The golden variety of this noble Poplar sent out in February last by Mr. Charles Van Geert, of Antwerp, has fully borne out in our Nurseries the description he gave of it, and has retained its golden colour much better than either the Golden Catalpa or the Golden Oak during the late tropical summer.

EXTRACT FROM MR. VAN GEERT'S DESCRIPTION.
"We have the pleasure of offering an extremely remarkable variety of the Canadian Poplar, with a foliage which presents during the whole summer the finest hue of golden-yellow. It is in our opinion a most valuable acquisition, and has been pronounced so by every connoisseur who has admitted it to our Nurseries. For the coloured foliage now so frequently met with among low shrubs falls almost entirely among the larger trees. The Catalpa aurea and the Quercus Robur concordia are the only trees known as possessing the same golden foliage; but the former is only a second-sized tree, and the latter has not the vigour the common Oak. Our golden poplar, on the contrary, is a first-sized tree, of rapid and vigorous growth. Its leaves are quite as large as those of the common Canadian Poplar, and the low, instead of looking sickly, has a warm and vigorous tint. The better nourished the tree is, and the more it is exposed to the sun, the more vivid is the golden hue."

Having received in February last a large consignment of this magnificent novelty from Mr. Van Geert, we are enabled to offer nice plants at 2s. 6d. each.

ABIES EXCELSA AUREA (J. & C. Lee, 1875).

This is decidedly the finest golden Conifer of large growth yet introduced. It is of free growth, and requires to be planted in the full sunshine. In such a position the whole tree is suffused with the richest gold. A First-class Certificate has been awarded to this valuable tree at South Kensington. Price of nice plants, 15s. each; larger specimens, 2s. each.

LAURUS CAMELLEIFOLIA (Wood, 1875).

We can still supply a few hundreds of this extraordinary and elegant Laurel. Price 2s. 6d. each; per dozen, 15s.

CHARLES LEE & SON, HAMMERSMITH, W.

HENRY ORMSON,

HORTICULTURAL BUILDER TO HER MAJESTY,

AND

*HOT-WATER APPARATUS MANUFACTURER TO THE COMMISSIONERS OF HER MAJESTY'S ROYAL PALACES
AND PUBLIC BUILDINGS, AND TO THE ROYAL HORTICULTURAL SOCIETY,*

BEGS TO CALL ATTENTION TO HIS

SUPERIOR MANNER OF ERECTING EVERY DESCRIPTION OF HORTICULTURAL BUILDING,

and trusts, by unremitting attention to the details of his business, by using only the very best materials, by employing the most skilful and efficient workmen, and by the most moderate possible charges, to merit the support so kindly and liberally bestowed on him for many years past.

IN THE BUILDING DEPARTMENT

his object will be—having a practical knowledge of Horticultural Science—to adapt all erections to the particular purposes for which they are required. He will devote equal attention to the plain, inexpensive, practical erections of Pits, Orchard Houses, Greenhouses, Vineries, &c., as to the more elaborate and architectural erections of Conservatories, Winter Gardens, &c., either in Wood or Iron.

THE HEATING DEPARTMENT

always engages his especial personal attention, and he feels justified in saying that in simplicity, safety, durability, and economy of fuel, combined with thorough effectiveness, his system cannot be surpassed.

Knowing the absolute necessity for well regulated and properly arranged ventilation, he makes it a matter of first consideration.

H. O. having competent Draughtsmen and an efficient Office Staff, is prepared and will be happy to forward Plans, Estimates and Specifications, and to wait on any Ladies or Gentlemen who may desire to see him on their Grounds.

LISTS OF PRICES AND BOOK OF DESIGNS ON APPLICATION.

SUTTON'S
CHOICE FLOWER SEEDS,
 FREE BY POST OR RAIL.

Sutton's Improved Miniature Aster.

A profuse flowering variety, of dwarf compact habit,
 remaining in bloom for a considerable period, hence it
 is invaluable for growing in pots for conservatory or
 drawing-room decoration. We have this season
 succeeded in saving six distinct colours, which greatly
 increases the value of this beautiful Aster for bedding
 purposes.

Price per Packet, mixed, 2s. 6d.

 application.

TO OBTAIN THE

Best Garden Lawns and Croquet Grounds

SO

SUTTON'S
LAWN GRASS MIXTURE,

Which forms a close velvety turf in a very
 short time.

For making New Lawns or Croquet Grounds
 3 bushels, or 60 lb., is required per acre, or 1 gallon to
 every six rods (or perches) of ground.

For improving those already in turf, 20 lb. should be
 sown per acre.

March, April, and May are the best months for sowing.

Price, 1s. 3d. per lb., 22s. 6d. per bushel,
 carriage free.

Instructions on the Formation and Improvement
 of Garden Lawns and Croquet Grounds
 Gratis and post-free.

 READING, BERKS.

SATURDAY, MARCH 17, 1877.

THE COLORADO BEETLE.

IN a recent notice of Mr. Riley's last entomological report we pointed out the grounds there were for fearing that the Colorado beetle might be introduced into this country. We now propose to devote a short space to considering how it should be dealt with if it should come; and that the reasonableness of our prescription may commend itself to our readers, we must give them a very brief summary of the conditions under which it is likely to present itself.

The eggs are laid on the leaves, the larvae feed on the leaves, and the pupæ undergo their metamorphosis underground, and as there is no importation of growing Potato plants from America to England its coming in any of these forms need not be dreaded. But the perfect insect has wings, flies on board ships in the American harbours, and may easily be brought over in them. Therefore, if the insect comes at all, it is almost certain that it will arrive in the beetle stage. When winter comes it burrows into the ground, often to a considerable depth, and remains there in a torpid state, coming out in spring. In other words, it goes down in the beginning of October and comes up in the end of May, hence the only time when we have to fear its coming is from the beginning of June to the end of September.

We see that our Board of Trade and our Colonial Department have both been taking precautions against its arrival during the rest of the year—when the beetle is sound asleep 12 or 18 inches underground. We can guarantee the success of their precautionary measures until the beetle wakes up again; when it does so, the importation of Potatoes and relative measures of precaution will be at an end!

On reappearing the first business of the beetle is to begin to propagate a fresh brood, and the female will lay her eggs on the young shoots of the Potato plant in about a week after her reappearance. The eggs are hatched in about a week after being laid. The larvae take about a fortnight to become full fed. They then descend and bury themselves in the earth, and in three or four days become pupæ, in which state they remain for about ten days, after which the perfect insect appears.

It is said that the perfect insect does not pair for about seven days after its appearance, but this is opposed to the analogy of insects in general, which do not usually lose any time in pairing after emerging from the pupa state; but, assuming that it is as stated, the above periods give about thirty-five days as the time required to produce a new generation, and as the number of eggs which each female is said to lay is from 700 to 1000, perhaps an increase of 300 fertile females would be a fair estimate for each. The total increase at that rate from one female in one year is put down at upwards of 38,000,000.

Now applying these premises to our own position let us see during what month the insect is most likely to arrive in England. The period when there is least fear of their coming over is during the thirty-five days (June) when the first brood is, so to say, being manufactured. The numbers of the old last year's insects are comparatively few, and the new hordes are not yet

the north end of the lake there was abundance of the alpine aquatic form of *Carex vulgaris*, and at a considerable distance from the shore *Isotetes lacustris*, *Subularia aquatica*, and *Lobelia Dortmanna* were obtained by wading. On the north side there are patches of beautiful strand composed of disintegrated granite and porphyry, with which the mountain abounds. Leaving the lake we continued the ascent till we reached a point about 2700 feet, where there is a rocky ravine or gorge called Coire na h-Urcharie, through which a small stream runs. This stream has its rise in the last spring met with before reaching the summit. It flows westwards, and has a very abrupt and precipitous course. In the ascent from the loch to this point we gathered *Saxifraga aizoides*, *S. hypnoides*, *Gnaphalium supinum*, *Alchemilla*

ravine and the spring, which is 3363 feet above the sea, we gathered fine specimens of *Silbaldia procumbens*, *Aira alpina*, *Ranunculus acris*, alpine form; *Veronica humifusa*, *Salix herbacea*, *Cerastium pubescens*, and *C. compactum*, the last being in considerable quantity and in fine flower. At a short distance above the spring, or about 3500 feet, Phanerogamic vegetation and soil almost wholly disappear, and only lichens and a few mosses are seen on the large blocks of porphyry, with which the upper part of the mountain is covered. At 3900 feet we reached the verge of the precipices immediately overlooking Coire na Ciste, where there is a cairn. From this we proceeded along the top of these precipices, which face north-east, and form the back of the mountain. All the corries were filled with snow. The summit was reached amidst

mingled with sensations of a different kind, when we take our attention from the objects at a distance to the spot on which we stand. On looking beneath us, a few paces from the summit, we see the edge of a frightful precipice, which cannot be approached without caution, and from which the boldest must shrink with terror. What adds to the danger of the trembling spectator, the edge is in a wholly constant, loose fragment, which a little pressure is often sufficient to displace, and, when of any considerable size, their own weight soon urges down the precipice with a rushing noise and tremendous crash. This sound, produced by the rattling of the stone as it impinges successively during its fall on the projecting points of the perpendicular rock, is reverberated among the surrounding cliffs, and filling the vast adjacent cavity, thunders along the valley below. The effect accordingly on the ear is grand and impressive, and has occasioned the common but perilous amusement of heaving stones from the top of the precipice into the dreadful abyss."

The summit of the mountain, which is 4406 feet above the sea, is crowned by a cairn about 6 feet high. This was mounted by the party, who, standing shoulder to shoulder, shouted into space a toast which will never be forgotten by any who joined in it, viz., the health of Professor Balfour, the veteran President of the Club. Close by the cairn a single very minute plant of the starry *Saxifraga* (*Saxifraga stellaris*) was picked, thus being the highest flowering plant in Britain. A few feet below the summit, and on the very verge of the precipice, we met with a rare moss (*Andreaea nivalis*), in great cushion-like masses.

The next day (26th) we visited the precipices or "snow corries" on the north-east side of Ben Nevis. Our course was following the stone burn, or as it is called in Gaelic, Ailt a Mhuilinn, which takes its rise in Coire Less, a little to the south of the snow corries. In the ascent we again observed many species of plants common to similar moorish and subalpine situations in the North of Scotland. Several species of mosses and lichens were collected, including *Mnium subglobosum*, *Dicranum falcatum*, magnificent specimens of *Sphagnum compactum*, and *Cladonia deformis*. At about 2000 feet above the sea we noted in one or two spots abundance of *Cornus suecica*, both in flower and fruit, along with *Lycopodium alpinum*, *Equisetum rigum*, *Rubus Chamaemoras*, and *Hookeria lucens*, a moss not usually found at such an elevation. On the northmost rocks, or those nearest the point of ascent, little of interest was met with.

Proceeding southward, and climbing into all accessible places, we met with *Vaccinium uliginosum*, *Thalictrum alpinum*, *Silene acaulis*, *Potentilla alpestris*, *Saxifraga oppositifolia*, *S. nivalis*, *Cherleria scoldies*, *Salix reticulata*, *Oxyria reniformis*, *Veronica humifusa*, *Silene maritima*, *Armeria maritima*, and *Carex atrata* sparingly. *C. rigida* was more plentiful, and very large, but most of the specimens had their fruit affected by *Ustilago urceolorum*, a fungus almost peculiar to *Cyperaceae*. *Saussurea alpina*, *Draba incana*, *Juncus trifidus*, and *J. triglumis* were noticed. The only species of *Hieracium* met with were *H. anglicum* and a single specimen of *H. chrysanthum*, *Veronica saxatilis* was seen in one spot in flower. This removes the query put after the plant in Watson's *Zoogeographical Zoology*. Few Ferns were observed, the only species worthy of note being *Aspidium Lonchitis* and *Hymenophyllum unilaterale*. The two best plants collected were undoubtedly *Saxifraga rivalaris* and *Juncus castaneus*. The former was found in the first snow corrie, and the latter by the marshy sides of a small stream proceeding from the second snow corrie. This is a new country for the *Juncus*, so far as botanical works go. It is noted, however, in a guide-book to the district, as being found on the mountain. Below the upper snow corrie *Carex pulla* was abundant and in fine flower, and some of the large blocks of stone were almost completely covered with patches of *Andreaea alpina* in fruit. These snow corries and precipices are very grand, and at some points perfectly overwhelming when viewed from below. Imagine a precipitous front of rock, at least 1500 feet high, bending forwards at many of its points with a threatening aspect, and extending itself to a distance of more than a mile and a half, with enormous projecting masses or shelves, which fill the great re-entering angle of the mountain, and divide it into vast recesses or aisles of the wildest aspect. Of this stupendous and impressive object the grand and singularly picturesque feature is what

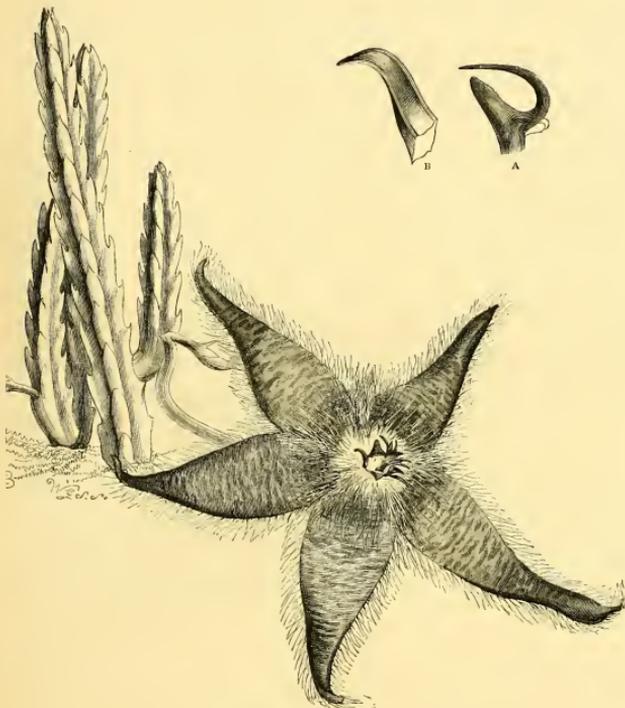

FIG. 54.—STAPEFIA UNGUIFETALA. A, ROSTRUM AND ALA; B, LIGULA (MAGNIFIED).

alpina, *Silene maritima*, *S. acaulis*, *Luzula spicata*, *Poa alpina*, and *Cryptogramme crispata*. The ravine is only 200 or 300 feet in length, and is certainly the best botanising spot on this side of the mountain. Here we met with *Thalictrum alpinum*, *Sagina saxatilis*, *Rhodiola rosea*, *Epilobium alsinifolium*, *E. alpinum*, *Armeria maritima*, *Cochlearia officinalis*, *Polypodium alpestre*, beautiful specimens of *Cerastium Smithii*, and *C. trigynum*, the last being in great abundance near the upper part of the ravine, and for 200 feet above it. The most remarkable plant of all was a form of *Saxifraga stellaris*, which grew in large mossy-looking patches, resembling *Montia fontana*, the leaves being as small, the branches as delicate, and the flowers nearly as tiny as those of that plant. Several species of *Hepatica* were also collected, including *Jungermannia cochleariformis* and two varieties of *Saxipania undulata*. Between the upper end of the

torrents of sleet and rain, thick mist, and a fierce cold wind, which unfortunately prevented us from seeing fully one of the most boundless prospects in Scotland. The leading characters that give the interest to this sublime and unrivalled scene are elevation, immensity, and extent. On a clear day are seen mountain ranges in all directions, intermingled with extensive water surfaces; the view ranges from the Murray Firth and the mountains in the shires of Ross and Sutherland in the north and north-east to Ben Lomond and the island of Colonsay in the south and south-west, comprehending a distance of about 180 miles. The scene is one which can scarcely be equalled or at least surpassed in the diversity of magnificent and striking objects, and in majesty and grandeur. The late Dr. Macknight, in speaking of what he saw from the summit says that, "the feelings excited at this commanding elevation are not, however, entirely un-

may be called the angularity of its appearance, both as a whole and in its subordinate parts. The face of the rock, in the progress of waste and decomposition, is everywhere furrowed or fretted by lines, which at a distance seem to shape it into innumerable fasciculi of small columns or fluted pillars, resembling columnar distinct concretions. These again are joined together in an endless variety of groups, ascending into pointed summits and serrated ridges, which form the most elegant mountain-lines, and which accumulate in the projections and recesses, towering successively behind each other, till the whole terminate at the summit of the mountain. But notwithstanding all this diversity of form and position, these rocks cannot be said to be rich in alpine vegetation, either in the number of species or number of individuals of a species.

Several distasteful gatherings were made both on the 27th and the previous day above 2000 feet. These were submitted to the Rev. Eugene O'Meara, of Hazelhatch, for examination, and the following is a list of the species which he detected:—*Coincinosidus Smitthii*, *Enanthe camelus*, *E. diodon*, *E. triodon*, *E. tetradium*, *Hemantidium bidens*, *H. majus*, *H. Soleirolii*, *Nivalia angustata*, *N. alpina*, *N. crassivenia*, *N. concocinifera*, *N. gibba*, *N. limosa*, *N. icostanum*, *N. rhomboides*, *N. serians*, *N. viridis*, and *Saurirella linearis*.

On the morning of the 27th the Club broke up. Our party proceeded by an early boat to Beaulieu or Fairlie town, and thence by coach to Glencoe, with its amazing scenery, and Inveroran to Tyndrum, and then by rail to Killin, and conveyance to Bridge of Lochy, in Perthshire. In several places by the roadsides about Inveroran the *Drosera obovata* was observed. On the 28th, Cama-crag, or the Crooked Rock, on the Breadalbane mountains, was visited, where *Woodia hyperborea*, *Myosotis alpestris*, *Hieracium pallidum*, *Gentiana nivalis*, and several other alpine plants were gathered.

The other party left Fort William later in the day on the 27th, and proceeded by Curranfer and Ardlough to Stronachan, at the head of Loch Sunard, in Argyllshire. They ascended the Beacpipe, a mountain the summit of which is 2800 feet above the sea, but they found it very unproductive. By the sides of the loch, however, a few good plants were collected, including *Malaxis paludosa*, *Pinguicula listanica*, *Utricularia minor*, *Osmanda repens*, *Lythrum Salicaria* (this plant was also observed in several spots by the sides of the Crinan Canal), *Drosera anglica*, *Jasione montana* abundant, *Scutellaria galericulata*, *Nephridium zelandicum*, and *Sedum anglicum*. This party returned by Ballahulish and Glencoe, and so ended a very pleasant week's botanical excursion. Specimens of the plants collected during the trip were exhibited.

ARTIFICIAL FLOWERS AND FRUIT.

THE first competitive exhibition of artificial flowers and fruit at the Crystal Palace may be regarded as a successful show, if the variety of materials out of which the so-called "flowers" are made be taken as the measure of success. Those who are curious to see how caricatures of flowers can be manufactured out of the most dissimilar materials should certainly visit this collection. Here they will find gold, silver and iron, wood, ivory and paper, hair, leather and feathers, silk, wool, wax, paper, chenille, muslin and wax, employed in the construction of a large collection of highly-coloured ornaments, the botanical determination of which would sorely puzzle the authorities at Kew. We have called them caricatures, but we doubt whether that is quite the correct word to use, since that word implies knowledge of the subject depicted, and power to produce it in an amusing form. The great majority of these flowers indicate on the part of the makers a surprising amount of ignorance of the form and structure of the objects which they have attempted to imitate. At the same time we must do them the justice to applaud their ingenuity in the fabrication of their special materials.

We recently referred to the successful career of the late Mr. Ormson as a horticultural builder, which was mainly attributable to his early education as a gardener, and consequently to his knowledge of what plants required for their growth. In like manner many manufacturers of artificial flowers make themselves acquainted with the construction of the flower

which they propose to copy before they can hope to attain a creditable result. Our remarks will be better understood if we refer to the only really well-made group of flowers in the whole collection, that exhibited by Mrs. Clara Mogridge (*née* Minton), of 13, Charlotte Street, Bedford Square. This group consisted of *Allamanda*, *Eschscholzia*, *Impatiens*, *Anturium*, *Stephanotis*, *Ondotloglossum Pescatorei*, *Plumbago rosea*, a species of *Franciscana*, and two species of *Dendrobium*, all accurately copied from Nature, and most tastefully arranged with a few equally well-made variegated leaves. The next best collections, though scarcely so natural, were those of Mr. H. Minton, and the twelve varieties of *Roses* shown by Mr. Edward Fox, of Market Street, Brighton; in these the foliage was nearly as true to Nature as the flowers, which is more than we can say for any other group in the exhibition, which no gardener could look through without making the same remark. There was not so much fault to find with the shape of the leaves as with their colour, the rich dark green of well grown *Camellias* was nowhere to be seen on plants bearing these flowers. A tall plant of "white thorn" in full bloom was decorated with foliage of richly coloured autumnal hues, and the same incongruity was observable more or less throughout. From these remarks we wish to exclude the flowers and foliage of the *Primroses* and *Viola*s, exhibited in small Sussex "twig" baskets by Mr. Fox, of Brighton.

There was a very small display of fruit, which consisted of Apples and Pears, Plums, Apricots, Peaches, Nectarines, Cherries, Strawberries, and Nuts. The white *Bigarreau* Cherries, and the Plums shown by Mr. J. Johnson, of Notting Hill, were the best among them, but none of the rest were so good as they can be made.

We shall be very pleased if this first attempt at a show of this kind should result in an improvement on the part of the exhibitors generally, or in inducing more experienced manufacturers to show upon another occasion. We regret to say that the general impression left on our mind by the majority of the exhibits was similar to that of the collector of choice violins on being shown a home-made article, and on being told, "I made this fiddle out of my own head, and I have wood enough left to make another."

FERTILISATION OF PLANTS.

(Continued from p. 321.)

MR. DARWIN devotes a portion of chapter 8 to "the transmission of the good effects of a cross," and shows that when a previously intercrossed, a crossed, and a self-fertilised plant are allowed to be fertilised naturally by insects, the good effects of the "cross" is seen in the greater fertility and vigour of the offspring of the first two than in that of the self-fertilised; and that this benefit may be continued, not only to the grandchildren, but for many years, as appears from A. Knight's varieties of Peas, which were originally raised by crossing, and which kept true for more than sixty years, during which time they retained their superiority, though invariably self-fertilised. This fact, as Mr. Darwin observes, is due to the "force of inheritance being very strong in plants." On the other hand, continued interbreeding between very closely related plants brings ultimately no benefit at all as far as fertility is concerned; and, with reference to colour, such interbreeding is closely analogous to self-fertilisation; that is, tends to produce great uniformity of tints, but still much less so than the self-fertilised plants, for Mr. Darwin observed that the seventh to the tenth generations of *Ipomoea* were absolutely uniform in tint, "like those of a constant species living in a state of Nature." That last sentence is not followed up, but is suggestive of queries. Why are wild flowers so uniform? They must be abundantly intercrossed, and as in Nature we often get a great variety of soils and climatal conditions within reasonable distances, we should think there would be abundant resources for crossing distinct stocks, yet there are many species identical not only in the same country, but in opposite hemispheres of the globe! However this "retention of specific type" may be explained, the practical benefit of Mr. Darwin's observations to horticulturists is plain, for, as he says:—"We learn from them that new and slight shades of colour may be quickly and firmly fixed, independently of any selection, if the conditions are kept as nearly uniform as is possible, and

no interesting [much less crossing with a new stock] be permitted."

Mr. Darwin gives a table (D.) of "the relative fertility of crossed, intercrossed, and self-fertilised parentage, the fertility being estimated by the number of seeds per capsule, number of capsules, or else the weight of seeds per capsule, the first being the most valuable method." Eliminating the *Ipomoea*, from table D., all cases judged by capsules, as well as that by weight of seeds, and also deducting five cases of plants crossed by a new stock, there are left eleven instances for comparison between the intercrossed and self-fertilised; and if 100 be standard for the intercrossed, that of the self-fertilised is 91.5—a result which, considering the data, is very nearly a ratio of equality, and had he introduced into table D., "Hiero" and the "white variety of *Mimulus*," the ratio would have been probably, if not in favour of the self-fertilised, at least one of equality (see p. 50, for when *Ipomoea*, under a net, gives a ratio of 100 : 90, and another instance, uncovered, gives a ratio of 100 : 89, we see at once that there must be conditions which may vary the proportions to a considerable extent one way or the other. Indeed, Mr. Darwin himself says:—"It should be observed that the results [of this table] cannot be considered as fully trustworthy, for the fertility of a plant is a most variable element, depending on many causes, such as the soil, the amount of water given, and the temperature, if it is exposed." Next, selecting from table D. the five cases of plants crossed by a new stock, the highest and lowest ratios are 100 : 30, and as 100 : 75, their mean being as 100 : 49.4, which shows a much more decided degree of fertility for crossed plants than that of intercrossed or self-fertilised.

The mean ratio deduced from the number of capsules produced by the plants of intercrossed and self-fertilised parentage would be very misleading, for the ratios vary from 100 : 3.5 to absolute equality; though the intercrossed plants doubtless as a rule yield more than the self-fertilised. As they are more numerous plants, this is what one would anticipate; but the seeds per capsule may be the same; thus, of *Nothofagus prostrata* thirty intercrossed flowers produced twenty-seven capsules, each with five seeds; thirty-two self-fertilised flowers yielded six capsules; each, however, had also five seeds; hence their fertility is the same, but the proportion of capsules as 100 : 21.

Table E. gives the innate fertility of four plants crossed with a fresh stock, calculated as 100, and compared with those of intercrossed and self-fertilised respectively, as follows:—*Mimulus* as 100 : 4 and 100 : 13; *Eschscholzia* as 100 : 45 and 100 : 41; *Dianthus* as 100 : 45 and 33; and *Petunia* as 100 : 54 and 46.

Table F. gives the relative fertility of the flowers of thirty of the "parent plants" when intercrossed and when self-fertilised. Of these six are equal, and four of the self-fertilised are most fertile. The ratios of fertility for the "cleistogame" flowers of the *Vandellia* and of *Ononis minutissima* are omitted from this table. They would have lessened the difference in the mean proportion, as they are so highly self-fertile. Mr. Darwin puts 100 : 67; as the ratio for the conspicuous flower of *Vandellia*, but on p. 20, he says he thinks that 100 : 100 would be more correct. Subtracting this case with the above, we have twenty left, which give an average ratio of 100 : 64; but, if we substitute 100 : 100 for the conspicuous flower of *Vandellia*, 100 : 106 for the cleistogame flowers of the same plant, and 100 : 111 for those of *Ononis* (deduced from the number of seeds given in p. 167), we get a total mean ratio of 100 : 96, which is, of course, practically *nearly*; but this conclusion does not destroy the fact, that the whole number of intercrossed plants given in this table are more fertile than the self-fertilised in the proportion of two to one. Mr. Darwin observes that "this fertility ranges from zero to a fertility equaling (or exceeding) that of the [inter] crossed plants. Of this fact no explanation can be offered." Moreover in table G., which is analogous to F., only treating of descendants instead of the parent plants, the infertility of the self-fertilised plants does not decrease, indeed in *Dianthus* it steadily increases. We have already observed, "There is, therefore, no evidence at present that the fertility of plants goes on diminishing in successive self-fertilised generations."

As the chapter (9) is here devoted to self-sterility and self-fertility it will be better to defer further remarks until another issue, when my communication will deal with self-fertilisation especially. *George Henslow*.

(To be continued.)

OPEN-AIR VEGETATION

AT THE ROYAL BOTANIC GARDEN, EDINBURGH.*

The weather during the month of February was in general very pleasant, and drier than it had been during the four previous months. Owing to this comparatively dry state of the ground much outdoor work has been accomplished.

During the month the thermometer was seven times at or below the freezing point, indicating collectively 36°, while the United February frosts during the last twenty-three years amounted to 1492°. The highest markings were during 1855, when 220° were registered, and the lowest during 1869, when 6° only were noted. Up to February 21 this year only 4° were noticed, but since that date frost continued to the end. The lowest markings were on the 5th, 20th, 22d, 26th, 27th, and 28th, when 31°, 30°, 24°, 28°, 20°, and 24° were respectively registered, while the highest markings were on the 20th, 7th, 9th, 15th, 18th, and 24th, indicating 39°, 44°, 40°, 41°, 35°, and 40°. This comparative mild state of the weather has brought forward vegetation, which had been so long kept back by the excessive moisture of the previous months, as will be seen by annexed list of spring flowering plants. It contains the names of the selected species fixed on for annually recording their dates of blooming:—

	1877.	1876.
<i>Erubilla hymalis</i>	February 1	January 26
<i>Rhododendron atroviolaceum</i>	" 5	" 25
<i>Leucodion verum</i>	" 8	" 25
<i>Galanthus nivalis</i>	" 11	" 26
<i>Crocus susianus</i>	" 14	" 20
<i>Scilla maritima</i>	" 14	February 1
<i>Galanthus plicatus</i>	" 16	January 29
<i>Crocus verus</i> and varieties	" 16	" 28
<i>Androsace cordata</i>	" 18	January 29
<i>Daphne Mezereum</i>	" 23	January 26
<i>Rhododendron grandifolium album</i>	" 24	February 17
<i>Scilla sibirica</i>	" 24	" 26
" <i>biifida</i>	" 24	" 24
<i>Soyricium grandifolium</i>	" 26	" 20
<i>Bulbocodium verum</i>	" 26	" 26
<i>Horia sibirica</i>	" 27	" 21
<i>Begonia Faguetii</i>	" 27	" 21
<i>Tussilago alba</i>	" 29	March 8
<i>Rhododendron Nobilemum</i>	" 29	February 17
<i>Austriaca grandiflora</i>	" 29	" 17
<i>Tussilago nivea</i>	" 29	March 18

On February 28, notwithstanding a slight fall of snow and a hard frozen surface, above fifty species of plants were counted in flower on the rock garden; the most interesting at that time being *Rhododendron procerum* Susiana, *Erica carnea*, *Erica carnea* alba, *Daphne Mezereum*, *Andromeda floribunda*, *Primula denticulata*, *Primula vulgaris rubra*, *Corydalis angustifolia*, *Iberis trachelium*, *Crocus Imperati*, *C. nivalis*, and *C. susianus*, *Leucodion verum*, *Galanthus plicatus*, *Diondia Epipactis*, and *Helleborus colchicus* and seven other varieties. The frost of the 28th had partially injured some of the blooms of the more tender species, while it had the desirable effect of destroying slugs and other vermin harbouring near the surface.

ON THE ROAD TO AMSTERDAM:—ANTWERP.

On the high road to Amsterdam, whose International Horticultural Exhibition and Botanical Congress are fixed for April 12 next, lies Antwerp. For those who have the time, it is well worth a visit. There are steamers direct from St. Katherine's Wharf to Antwerp; but we will suppose that the horticulturist has accompanied us by the land route, making a halt on the way at Ghent, whose treasures have often been described in these columns.

To reach Antwerp from Ghent, you proceed not to the Station de l'Etat, by which you arrived from Lille, but to the Station du Pays de Waes, whence you start on a single-lined railway. The Pays de Waes, which you then traverse, is an unbroken plain made fertile by human industry, divided here and there by rows rather than hedges of mixed copse-wood—Poplar, Willow, Alder—which now and then rise into trees. There is no picturesqueness, but a considerable look of comfort, about the scenery. The land seems to yield a sufficiency of most things, even of tall trees in places, to give shade in summer and break the force of the winds in winter. One of the stations is at Mile-Pommes (a Thousand Apples);

* Read at the March Meeting of the Botanical Society, Edinburgh, by Mr. M'Nab, Curator.

the next is St. Nicolas, a large prosperous town, at least as rich in religious intolerance as in fruits; for the *Times* correspondent tells us that, owing to the supremacy of the priest, a Protestant would be unable to hire a house there, and that a Belgian gentleman married to an Englishwoman was looked down upon until it was ascertained that she was a good Catholic. The field crops along the line, including a great breadth of Potatoes, are interspersed with patches of Hemp, Haricots, Buckwheat, Tobacco, and other little luxuries. Potatoes last autumn showed patches where their haulm much or entirely decayed by means contiguous to other patches in full verdant vigour, and seemingly ailing nothing. Whether the difference is one sort or of the times of planting, a passing railway traveller had no means of learning. His attention would be principally absorbed in the jolts he receives from the rough state of the line. A week spent on it in going to and fro, would be an effectual remedial course for patients whose organs require a good shaking. At last you feel a breeze on your cheek which betrays the neighbourhood of wide-spread water; a stately colonial style of pier in the air, the train stops, but you are not yet at your journey's end. The broad stream of the Escart or Scheldt has to be crossed in a steamboat, which lands you at the Antwerp station of the Pays de Waes. If ignorant what quarters to choose, you may safely go to the Hôtel St. Antoine, at one of the corners of the Place Verte (which is not green but gravelly).

THE PARK.

The park of Antwerp deserves a visit, first because it shows what may be done with a triangular piece of ground in the midst of town buildings, with the help of water, rocks, a peninsula, and a bridge; secondly, because it illustrates the good effects produced by combining the same sorts of trees and shrubs into homogeneous groups and masses, instead of mixing them up promiscuously, so as to produce a blurred appearance, making every group alike, or at least without any distinctive character. In a public garden, which is to be an ornament an arboretum, there must, of course, be just a little spotiness, especially with the specimens have made larger growth, so that plants now standing singly are united, or have made a new approach to each other in clumps.

Unusual varieties of usual trees at least show their merits and their demerits. The purple-leaved Maple deserves honourable mention; the fastigiate and variegated-leaved Elms remove all doubts as to their ugliness; an uncommon plain-leaved Holly is prepossessing, and promises usefulness. The Rosemary-leaved Willow and the red-berried Elder are turned to good account amongst the rocks. The silver Lime tree is both sweet and graceful. A scrap of reed-bed in the lake, of a point of the peninsula, looks natural, and serves as covert for water-fowl, but betrays the shallowness of the water, which had better have been concealed as much as may be.

THE ZOOLOGICAL GARDENS.

For those who have to wait an hour or two for a train to the Zoological Gardens, close to the station, after a pleasant lounge, and contain an inviting *restaurant*. With this, the architect, the refreshment tables and chairs, and the Noah's arkful of animals, the Antwerp Zoo, though quite on the outskirts, has less the air of country than the park. "How nice it would have been," a philosopher said, "had all our towns been built in the country!" To obviate the omission, endeavours are made to bring bits of the country into most large towns. A French *sarrazin*, M. Haulier, goes further. He proposes to introduce country air into cities, to be drawn from elevated woods and other salubrious spots, pumped thence through pipes laid down like those for gas and water for distribution to public buildings and private dwellings. Only think of that, all ye who are shut up in factories, theatres, reading-rooms, ball-rooms, schools, offices, and other places where experiments are tried on how little oxygen human beings can exist. When you are unable to go and breathe sea breezes, it will be something to have sea breezes sent to you, even on the payment of so much per cubic yard.

The Antwerp Zoo, besides good specimen trees and shrubs and examples of the effectiveness of certain plants. (*Hypargyreus paniculata*, for instance), when appropriately employed, exhibits during the season admirable carpet-bedding, some exactly like richly ornamented cake, others resembling embroidered

hearth-rugs competing in contrasted colours with cloth patterned ottoman covers, inviting you to do what you must not, namely, sit or lie upon them. On a large scale, and well carried out, such carpet-bedding is beyond the means of private individuals with moderate fortunes, and must be left to millionaires, public companies, Belgian and Dutch zoologists, and the parks and gardens maintained by wealthy cities. To those travelling on that line of railroad the carpet-bedding in the Jardin Vauban at Lille (once the Jardin de l'Impératrice) is well worth a halt. By going early, before the hour of general promenading, you may see the artist-gardeners at work with their scissors and brushes, their pegs and pins. No dandy's lack can be more assiduous to provide a hair or a violet, or a leaf or a spray, from exceeding due proportions and assuming an unkempt look. The materials, in fact, are within most gardeners' reach, and when once obtained will serve from year to year, with proper care of housing and propagation. Every year the designs may be varied. The same forces may be mastered to combine in perfectly different patterns; taste to design, adapt, or copy which, may always be expected to be a good thing. It is the keeping up and the increasing high finish which such carpet-bedding is penible to success. And then, the quantity of plants required—not trifling for the making even of a modest carpet-bed—is enough to frighten many amateurs.

MADAME LEGRELLLE'S GARDEN.

Little known to the crowd of tourists is the rich garden of Madame Legrelle Dhanis, at Berchem, a suburb of Antwerp, Rue de la Chapelle, No. 12, behind La Pépinière, which said *pépinière*, or nursery, is the old yellow-ground, or hanging-place, promoted to the more cheerful condition of a garden, beside which is the summer resort of the Harmonie Royale Society. You reach it by following the Boulevard, starting from the statue of Leopold I. Many of the Antwerp boulevards deserve imitation. In the middle is a double row of trees (Planes are the favourites), with a broad footpath between them. On each side of the trees is a carriage-road, thus leaving an open space between them and the lines of houses, which are consequently less shaded by their branches. There are certainly great ornaments in a town; still they may be too near a dwelling, preventing the circulation of air and the entrance of the sun's rays, besides harbouring insects and shedding withering leaves.

Amateurs were, and no doubt still are, admitted to Madame D'hanis' garden on the presentation of their card. Immediately after entering the gate, you are struck by standard Myrtles, large-leaved and small-leaved, in tubs, which must be at least sixty or seventy years old, in the enjoyment of perfect health, and, as we might say, retaining all their faculties. The antechamber in which you sign your name in the register of visitors, contains a few pictures worth looking at. Naturalists will have their attention attracted by a choice collection of insects, birds, and shells. A conservatory leading out of the billiard-room is not a mere tropical plant-house, but serves as an evening reception-room, where after-dinner coffee may be chatted over. Evidences of a lady's taste are visible in the fountains backed by looking-glasses, which thus play double—fountain and reflection; in the disposition of the lamps and the seats, one group of which latter have a fine *Ceratostyia mexicana* overhanging them, or a weeping *Populus monophylla*. Remarkable specimen plants are not wanting; as *Zamia mexicana*, 200 years old; of *Livistonia* Beiro, *Cycas revoluta*, *Angiopteris evecta*, *Cyathea medullaris*, *Encephalartos Altensteinii*, *Bonapartea tenuifolia*. Variegated *Phormium*s in flower (at the time of my visit) shot up their tall stems after the fashion of Agaves. Beneath the stately Palms and Tree Ferns, *Begonias* (as *B. longipilis* and *semperflora*) in richness below, while *Gloxinias* of exquisite spots and hues peep out here and there to court approval.

Indeed, the main interest of this garden is centred in the houses, which have been filled, to use the title expression, "regardless of expense." One, for instance, contains a little fortune invested in a unique collection of Marantas, and comprising, besides other things, M. Wagneri, tubispatria, Makoyana, Veitchii, majestica, regalis, roseo-picta, all fine specimens in perfect health. *Cyrtipedium parviflorum* flourishes in low terrestrial-Orchid-house, whose 28° Centigrade (82° Fahr.) does not need over-weighy hot-beds. Seen in August although very much compared with the air outdoors. A house for variegated-

leaved plants tempt many to linger, by its variegated Pine-apple in fruit, and its variegated Cucurbit and Pandanus utilla. During their passage from house to house amateurs will be attracted by the rich cushions of Selaginella apoda, Eucharis amazzonica, the scarlet flowers and crimped leaves of *Cortyleia fragrans*, the curious slimmness of *Bignonia Rozeiana*, by *Anturium crystallinum* or *Bescheronia multiflora*. Then there is an avary to see and experimental beds of seedlings whose quality has yet to be ascertained; the bouquet of the whole being the handsome room containing the medals, gold and silver, framed and placed, won at horticultural shows so numerous and liberal that, were the said medals to be melted in the crucible, they would make Madame D'hanis a small service of plate. We retire thankful for the privilege of witnessing how admirably a lady amateur can follow up her favourite pursuit.

It may be useful to some to know, *apropos* to Antwerp, that valuable information respecting Belgian gardening may be obtained from Monsieur Jean Baptiste Debecker, Horticulteur et Marchand Grainier, rue Carnot, 107. †

THE AUCUCULA AND POLYANTHUS.—"Thrum Eye" is the second writer in this classic column who considers that I have made a dead set against "self alpinas," and there may be other correspondents in the end.

Perhaps, therefore, it may be well to explain that I have advanced no mere fancy of my own. I did but state the thoroughly determined points which, in the alpine Auricula, constitute the first-class flower. These have long been fixed, understood, and worked up to, and no one in order to humour some pretty seedling is authorized to break down boundary lines and confuse distinctions in strict florists' flowers. It is not that I wish self alpinas dead, or that there were no such things as self and fancy Polyanthus. I admire them all as flowers, they are all beautiful, and well worth growing in their place. But if an Auricula, entirely deficient in the leading and recognised property of its class as a florist's flower, or if a Polyanthus glaringly at variance with its florist standard, be brought, by claim, into competition with the highest flowers of full properties, then I either must receive a crushing defeat, which it is hardly fair to expose it to, or to the more refined and rare and gifted flowers must be brought down to the lower level—a degradation which florists will not suffer their flowers to endure. A most eminent florist, the Rev. Geo. Jeans, used to say when seedling Auriculas were sent for his criticism, "I have grown very particular in the case of show seedlings usually deficient in these properties" (the more solid ones of florist flowers).

I am sorry I cannot see "Thrum Eye" through the disguise of his name, for a bird in the band is, in this sense, worth two in the bush; but I should scarcely take him for a veritable florist, or he would know how much the progress always being made in florists' flowers is due to that same technical conservatism of which he complains.

Herein precision is the principle of progression, and laxity is the reverse. A florist flower is a classical flower. It is, as it were, a picture, not a panorama. It is not grown merely to see what is the effect of so many bunches of it in a pot, or yards of it on a ribbon border. Florists cannot but rejoice in the blaze of beauty that a whole collection of Auriculas, Tulips, or Carnations exhibits when in bloom, but their pride and enjoyment are immeasurably heightened because that each component blossom is a study, Nature-painted, in itself.

"Thrum Eye" thinks that "in this strict floral conservatism lies the danger for the fancy Polyanthus," and that "if the hard and fast lines of florists have not exterminated the gold-laced kinds, it is certain that really good forms are rarities." So they are; but the reason of rarity is not refinement, but neglect. The flower has been forgotten. It never lacked a vigorous variety while it was cared for. The florist Polyanthus is not a particularly "miffy" thing, and if seedlings be raised from the wreck that remains of a beautiful old favourite there will be no need to seek constitution and brilliancy from the border varie-

ties; while as for refinement the fancies will have to follow the advances of a fairer, gentler rival that is ever before them. When "Thrum Eye" thinks the future of the fancy Polyanthus may be to extinguish the florist Auricula, or make it "pale its ineffectual fires," he can hardly have seriously compared the flowers.

No one placing side by side a black gold-laced Polyanthus such as Cheshire Favourite, and a white-edged Auricula such as Smiling Beauty, can have any doubt as to which is the more gifted sister, though both are beautiful. The Auricula, with all its variety in frosted silver foliage, as well as green, and with the rare loveliness of the green, grey, white edges, and the rich coloured velvet of the self, is a flower of far greater worth than the Polyanthus.

I have written more on this subject in the current issue of the *Journal of Horticulture*, but I had rather ask "Thrum Eye" to study the work of an abler pen than mine, on "The Philosophy of Florist Flowers." I humbly venture to say it will do him good. It was written for the *Florist* of 1849 by the Rev. Geo. Jeans, under the modest signature of "Iota." I append an applicable extract:—

"As for a person unaccustomed to any species of flower making a wrong selection for his approval, it happens in everything else as well as in flowers, and therefore loses its force. Lace, for instance, is made for the same purpose that the flower was created—to please the eye; and an unpractised eye would be as apt to pass by the rare and costly, and to select the valueless in both as beautiful. The Auricula, with all its variety, is the most showy qualities are not the most useful; nor is that which will most permanently please that which first catches the unaccustomed eye. But that which is sterling, which will attract without fatiguing the sight, and gratify without offending the judgment, will be the most valued. The farmer, ever first to notice, and therefore it is no more a reproach to the study which investigated these facts, or to the art which is founded upon them, that the eye of a novice should make a choice which the same eye when tutored by experience would reject, than it is an argument against a more cultivated taste in diet that a child prefers green fruit to ripe, and leaves wholesome food for gingerbread."

And again—

"The work of the florist is simply to follow whither Nature leads, selecting always that track in which there is the greatest promise of success; and in his judgment in never departing from this, and in using the best means for securing the accomplishment of his desires, depends the correctness of his practical science. And, though mistakes have, of course, been made, and a system of such development in Nature, and all its parts in each particular object of our culture, yet these still become fewer as progress is made in developing the natural powers and characteristic excellences of the plant, whereby the philosophy of its improvement is seen; and we do not work in the dark, because there is a system of such development in Nature, and a definite point of perfection, the constant approach to which constitutes improvement in each species."

F. D. Horner, Kirby Mabeard, Ripon.

AUCUCULA.—There appears now every probability that Auriculas will not be in flower so early as was generally expected six weeks ago. Then the Southern growers were asking themselves what they could do to retard the growth, but now they are beginning to consider what can be done to induce development. In another month the floral forces will be gathering for competition at the two great exhibitions, one in the North, the other in the South, and the question naturally arises, will any flowers be forthcoming from the North at the latter meeting-place? The anticipated early bloom threatens to be an anomaly late one. The dull sunless moist weather certainly excites to growth, but it is very gradual and slow. The bright dry, sunny March of last year considerably quickened the progress of the plants, but this year this exciting influence is wanting. Just now Auriculas may be allowed the benefit of warm showers, for there is no danger of injury to the pipes while the calyx covers the tube or pip; and these warm showers greatly strengthen and improve the plants and tend to increase the size and quality of the blossoms. As a rule, however, look for the truest rise up to the buds or the hearts of the plants by the middle of March, but plants that have been wintered in a warm position under glass make but little sign as yet.

—PINKS have wintered badly in the open ground during the winter; the excessive wet has

affected them much more injuriously than frost. Some growers assert that they have lost a great many of their plants; and those who grow the commonest Pinks for the costumongers round London are found stating that the inferior varieties have suffered in common with the good ones. On the other hand common Carnations have grown with something akin to luxuriance all the winter, and are as healthy looking as they can well be. The grower of florists' Pinks invariably grows his plants in the open air during the winter, unless the locality will not admit of their being planted in pots; and always, in such cases, in beds well raised to secure drainage during winter. But this precaution, sufficient in ordinary seasons, appears to have failed during the present winter in preventing the plants from dying through the excessive rainfall.

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD WOODED PLANTS.—Large and medium-sized specimens of hard-wooded plants that need more root-room should now be potted. If the soil was got under cover, as advised some weeks back, and turned over as occasion might require, the recent drying will have brought it into a fit condition for use, but if at all too dark, this to some extent may be corrected by drying the sand well before mixing with it, and as it is desirable to complete the potting of all plants of this description with as little delay as possible before the hot weather commences, the above expedient will be preferable to waiting till the weather gets warmer. The proportion of sand to peat for plants of all descriptions, but especially for those under consideration, is an important matter. The quantity in all cases must be regulated by the character of the peat and the nature of the plants to be potted. With peat of a very liberal addition is necessary than with such as is harder. Where too much sand is used, as might be supposed, it has the effect of making the soil poorer, from the consequent less vigorous growth the plants in it will make, but it is much better to err on the side of using too much sand than too little, and it is in the latter direction that those who have had the most experience in the cultivation of these plants generally go wrong. The sand required may vary from one-sixth to one-tenth. As a safe rule the finer the description of roots a plant possesses, and the slower its growth, the more sand will be necessary to keep the soil in a sweet, healthy condition. If the sand obtainable is of a dusty nature, that is, a great portion of it composed of very fine particles, the labour of washing it will be well repaid by the improvement it will make. The washing process may be effected in a large shallow tub, or in a similar open vessel, set under a tap running, putting in a few bushels of sand at a time, and keeping it stirred up with a spade; as the water will thus necessarily overflow, the fine portion will be washed away, leaving that of a heavier, coarser description in the bottom. In potting, the old barbarous practice of loosening the roots from the ball, so as to spread them out more or less into the new soil, is a thing of the past with those who grow hard-wooded plants, and is a practice which is gradually being put by puncturing with a pointed stick the surface of the ball, where the great mass of active roots are situated, and on which the vital energies of the plants depend, which used to be advised, has caused the destruction of many plants, and it is to some extent the practice might be looked upon as the least of two evils, in the case of plants that were in a stunted condition, the roots of which were spirally curved in the smallest possible space, by being confined to their little pots; but such plants as these are not worth the trouble of potting at all by any one attempting to cultivate them in a creditable manner. It is well to bear in mind that the greater the quantity of roots a plant possesses the more solid and impetuous to water it will be, and the more so the more recently the harder it is necessary to ram the new soil. It is also quite time to pot the small-growing stock that are intended to have a second shift during the summer. See that they are free from scale, especially the white species; any plant, however valuable, that is affected with this, immeasurably the worst pest that infests greenhouse plants, had much better be consigned to the fire than introduced amongst clean stock, as if through inadvertence the infested plant is ever allowed to rise in the house, it will, in course of actual contact with such as are clean, the insect is certain to spread, and it is so tenacious of life that except on vigorous strong-leaved things any insecticide that will destroy it completely generally destroys the plant as well as the insect. See also on this subject neglected *Gumholubium polymorphum* and *C. bar-*

bigerum are not allowed to go too long without their shoots being trained, especially whilst the plants are in a young state, so that they may clearly be distinguished, but allowed to become entangled in that cord-like condition they soon get into, it is difficult afterwards, and always at some sacrifice of the growths already made, to get them to rights. Kennedys, Laperouses, and all other plants of a twining nature which grow as a pot specimen require similar attention in this respect.

CONSERVATORY.—At no season of the year can the conservatory be made more attractive than at the present young state of the plants, especially of the fine-leaved plants, such as Tree Ferns, Rhopalas, Agaves, Yuccas, and subjects like these of handsome, yet dissimilar habit, to mix with and form a background for the numerous flowering plants now coming into the conservatory. The plants, if they are of sufficient quantities, the measure of success as to the effect produced will be commensurate with the artistic arrangement of the whole; the aim should be from time to time to vary the general aspect. Where there is an absence of old-fashioned formal stages, which in most conservatories of any pretensions are now generally done away with, there is every opportunity for relieving the monotony resulting from seeing the same plants, and flowers, in the same places. When there is little that is attractive outside, it is doubly necessary to make plant-houses as pleasing as possible with late flowering Camellias, Azaleas brought on in a little heat, forced shrubs, and several succulent plants. Dieffenbachia, Begonia, S. palustris and S. japonica, late blooming bulbs, Cinerarias, and forced Pelargoniums. There need be no lack of material to produce the best and most varied effect. *T. Paines.*

ORCHIDS.—The many varieties of Cattleya Trianae that are now to be met with, are so varied in their markings and differ so considerably in the depth of colour of the labellum, the form of the sepals and petals, that a number of these should be sought for and obtained; and since great quantities have during the last few years been sent from their native habitat in New Grenada to some of our leading nurserymen, a serious inspection should be made of the stock made of such as exhibit the most distinct characteristics. These will now be mostly in full bloom; probably, indeed, in some cases the flowers may have appeared soon after the advent of the new year, in consequence of the plants having been collected in the now being the house gay and attractive; and whilst the flowers are open and fresh, and as scarcely two of them are exactly alike, advantage should be taken of the opportunity, and either a memorandum should be kept of the forms, or some of the markings should be noted down, so that at any future time, when any doubt may arise as to these individual traits, a reference may be at hand by which any such inquiry may quickly be set at rest. And not only so, but perhaps the contingency might arise, that the collection had to be reduced, or the whole to be parted with, it will be found that such plants of almost any species, Cattleyas or otherwise, that can be recommended distinct and desirable qualities, will always fetch higher prices than those that are bought at haphazard, and with which a certain amount of risk is incurred. Among the forms of C. Trianae there is one which, however, is very rare, the flowers of which are of large size, and of a pure white colour, the only exception being the throat of the labellum, which is of a deep yellow. In many respects this is similar to the Wagneri variety of C. Mossii; only in the case of the Trianae the narrow sepals and broad petals are more obvious than in the case with the Wagneri. Another variety more often seen is one the sepals and petals of which are of a bright rose colour, the lip, which is very broad, is of a deep rosy purple, and the throat of a rich orange-yellow, altogether a first-class article, the colour of the lip being so very distinct and distinct. As soon as there have gone out of flower the young growths will start away, the flowering bulb sometimes producing two breaks; very soon these new growths commence to root, and as the roots, entering the soil, supply aid and help to the young breaks, and thus during the greater part of our summer the bulbs increase and get matured and ripened during the time when we have the greatest amount of sunlight. Amongst Cattleyas of the same type mention must be made of C. Leopoldii, C. amabilis, C. toglossa and C. guttata. These C. amabilis to represent the long bulbous section, and are not quite so easy to manage as many of the others. The reason why they can be so long in the market is to be found on trees, would seem to indicate the nature of a little more heat, and a rather drier atmosphere than is recommended for the most of the others, and, if it can be managed, a little more sunlight during the season will be of great advantage to them. In the ripening and hardening of the bulbs. The flower-spikes coming up between the stout leaves on the top of the bulb are generally very strong, and will often bring from ten to twenty of their stout, fleshy flowers. These are not only very beautiful, but also of an amethystous, and the dark chocolate and crimson

of Cattleya Leopoldii, are such that, when in good condition and freely flowered, the plants are objects of constant interest and admiration. All plants on which a new, either by syringing or careful dipping, be kept moistened, so as to induce the new roots to start away, and assist the first appearance of returning vigour. Make a point to finish up all the potting and syringing as early as possible, so that you will not require to be attended to when the new roots are pushing away, for often then the risk and damage are very great, and a corresponding check and loss are given to the plant which should be avoided by all means if possible. *W. Sisson, Falmouth.*

FRUIT HOUSES.

PEACHES AND NECTARINES.—Where a plentiful and successful supply of ripe fruit has to be provided for the London season, it involves the employment of two or three houses, which at this time will be in different stages of active operation. In the foremost division the fruit will now be of sufficient size to indicate its progress as being almost certain, and the foliage on the trees will be sufficiently dense to admit of any superfluous space being removed without detriment. In regard to the number of fruit to be retained for maturity, much must depend on the variety, the season of ripening, the size and condition of the trees, and the circumstances of the market. It is generally much more valuable than small, and as such in general is held in high esteem, this should also be considered. As a rule, we estimate that a tree which is in a healthy state, which covers an area of 200 feet of ground, is capable of producing a moderate quantity of good-sized fruits. When there is a superabundance of fruit, which is usually the case after making due allowance for any loss which may happen through the attacks of mildew, or gum, or any other injury from insects, the test should be pulled off at once, and in the case of Peaches, such should be reserved for making tarts, as these are much appreciated in some places. In doing this, it is almost needless to add that the most perfect fruit is that of the upper side of the tree which will be retained. In like manner go over the trees now, and where the spurs which have recently been pinched-in are too thickly placed sufficient should be removed by a clean cut with a knife to afford those which are retained every advantage of soil and influences. On mild occasions the temperature should range from 55° to 60° at night, and from 65° to 70° by day, allowing the minimum degree as the standard under other conditions. Fly the windows twice a week over the trees, rather being preferable for this purpose if any sedimentary deposits are present in that which is commonly used. Continue to give the requisite attention to stopping and tying in the main divisions; and in those which are as yet required to furnish the trees will admit of being heeled in at the base, it should be done, particularly if symmetrical training is much studied. The temperatures in the first and second divisions should be identical; in the latter ones, where the fruit is not required before July, more air should be given, and a lower temperature will suffice in all cases. After the fruit is well set dust the surface of the mulching material over with a thin sprinkling of guano once every week; this will impart a stimulating effect to the atmosphere, which is highly beneficial to vegetation. *G. T. Miles, Wycombe Abbey.*

MELONS.—The first batch of plants, which were selected for growing and fruiting in pots, plunged in a bottom heat of 85°, will now be making rapid progress, and will show favourably in the autumn, and be generously treated. By the time fruitful kinds like Gilbert's Victory of Bath and Scarlet Gem have filled two-thirds of the trellis, they will commence showing male blossoms on the main stems, and fruit blossoms at the first joint in the later ones; where very early fruit is wanted, will require a change of treatment to insure a good set. Assuming that the strongest plants were placed at the warmest end of the pit these should be selected for the first crop, and as dry heat is favourable to the production of pollen, syringing may be discontinued for a few days; and if water is withheld from the roots until the plants show signs of flagging every fruit will set with the aid of treatment. When two to four inches in length the plants should be pinched out the leaves, also the laterals at the first leaf beyond the joint; the remainder of the laterals may be stopped to the first joint, to prevent crowding of the foliage; syringing and watering with tepid liquid manure must be resumed, having previously top-dressed with a compost of turf, lime rubbish, and rotten dung. To insure a succession the remaining plants should be stopped once, when every break will produce a female blossom. Make the plants great at the first joint, and stop the joints that vigorous young plants are preferable to those which have become pot-bound; also that they will be ready for turning out in a month from the time the seeds are inserted in the soil. Attend to the earthing, and syringing of plants, and in the case of the latter the soil firm by means of ramming when in a dry

state. Renovate linings and guard against injury from rank steam by leaving a chink of air open at night. *W. Coleman.*

ORCHARD-HOUSE.—In the management of this department it is very important that the soil in which all stone-fruit trees are growing should be brought into a thoroughly moorish state, and that it should begin to swell. It frequently happens that pot trees are kept too dry all through the winter, and when this is the case the buds fall off just as they are beginning to move. Apricots, Peaches, and Nectarines show the effect of drought first, but Apples and Cherries are also affected by it, and all set the best crops of fruit when the roots are wintered in soil the reverse of dust-dry. The principal work in the orchard-house will be attention to the fertilisation of all early kinds as they come into bloom, and protection from frost, which if set in very severe, by the use of blinds, which are best fixed on rollers the same as for shading, or light pieces of tiffany may be thrown over individual trees without injury to the blossoms. If the water is bright by day and frosty at night, the ventilators may be opened about 9 A.M. and closed at 3.30 in the afternoon. In low, damp situations, particularly in dull weather, the atmosphere must be kept as dry as possible, and artificial fertilisation will need very little extra care. Where Figs are grown in unheated houses, trees which have been wintered in dry sheds or cellars should now be potted or top-dressed, and placed in their summer quarters at the warmest end of the house, and the soil should be piced fairly and frequently. One of the best kinds for this purpose is Brown Turkey or Lee's Perpetual. *W. Coleman.*

KITCHEN GARDEN.

Operations in this department grow upon us now so thick and fast, and most of them are so equally imperative, that the value of our previous recommendations to the effect that syringing can be piled fairly ahead with all operations connected with the trenching up and preparation of the soil for the reception of seeds will be best appreciated by those who have been best able to get forward with all such work. The heavy rains of the past winter have, however, rendered manual operations have been generally retarded. As I before advised a little extra manual labour thrown into this department now work is so pressing, will probably assist to prevent the produce being short or inferior to what it might otherwise have been. Lettuce, Cauliflowers, and Cabbages, which have been stored through the winter, should be completed at once, so that the appliances may be at liberty for other important purposes, such as pricking out the earlier sown plants of the Autumn months, such as flowers, Brussels Sprouts, and Lettuce, as before recommended. These prickings out of such early crops are of very great advantage to the kitchen gardener, if he can keep them growing freely, and plant them out in their quarters for succession as soon as they are fit for the purpose, for if allowed to become either too much drawn or stunted they will turn in prematurely, and it will be just a chance whether any of them arrive at the state of perfection, and are very much grown by generous and timely cultivation. The principal sowings of Celery for the main crops should now be pretty well ready for pricking out. This is another of those crops in which to succeed perfectly there should be no check in the growth; thus, in order to make the plants sturdy and robust, do not sow them too thickly in the frame, and as soon as they are well up take every opportunity of hardening them by a free exposure to the open air, and by bending them over, and setting them out on the open border about the end of the month, or a little later, according to the weather, taking care to protect them for a time by bending tools over them and covering with mats. After such a mild and moist winter as the last, it is not surprising that the plants and dressings are absolutely indispensable at this season, because the plants do not grow fast enough to escape these voracious enemies, and must be assisted by such means as the above. Succession sowings of Longpod and Windsor Beans must be followed up in quantity proportioned to the demand. Sowings of Peas for the main crops should be kept up; three good sorts for this sowing would be G. F. Wilson, and the two other sorts, and the variety Calverwell's is a grand Pea, highly to be recommended. Another sowing of Early Dutch Turnips should be got in, and also a bed of Early Horn Carrot, to succeed those advancing in pits or frames, which as the new crop is getting up, and the plants are about to have their being drawn up weakly. The principal beds for the main crops of Onions should be prepared at once, and the seeds sown on the first really dry day, when the soil is sufficiently dry for a heavy stratum to be passed over it without clumping. *John Cox, Redfern.*

THE
Gardeners' Chronicle.

SATURDAY, MARCH 17, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 19	Sale of Mr. Marshall's Collection of Minerals at Stevens' Room Royal Horticultural Society: Meeting of the Fruit and Floral Committees at A.M., and Scientific Committee at P.M.
WEDNESDAY, Mar. 21	Royal Botanic Society: Egeen's Park Spring Show. Nurserymen's Lysie Horticultural Spring Exhibition (two days). Sale of Camellias, Palms and Roses, at Stevens' Rooms. Sale of Lilies auratum and L. Krameri at Stevens' Rooms.
THURSDAY, Mar. 22	Sale of Mr. Willing's Collection of Stone and Greenhouse Plants, by Stevens, at Leyton.
SATURDAY, Mar. 23	Sale of Shrubs, Fruit Trees, Gladioli, &c., at Stevens' Rooms.

THE letter of Mr. P. BARR, in our last issue, calls attention to a defect in the management of the LINDLEY LIBRARY, which we trust the Council of the Royal Horticultural Society will speedily see their way to remove.

The Library, as well as some of the portraits in the Council-room, are, it may be well to remind our readers, invested in the hands of Trustees for the good of the public. The benefit was never intended to be limited to the Fellows of the Royal Horticultural Society. The Society at the time of the institution of the Library, had none of its own, its former valuable collection having disappeared in one of the many attacks of impetuosity to which the Society has been liable. It was, therefore, considered best that the Library should be placed in the hands of Trustees, to prevent such misfortunes as befell the former collection; and that it should be deposited at South Kensington in the rooms of the Royal Horticultural Society, where it would be most useful for horticultural purposes. This was agreed on, and the Society further undertook to provide and pay a proper librarian. It is not necessary to tell all the history of the Library; how, for a time, it was, so to speak, huddled away in a sort of den (since swept away), where access to the books was all but an impossibility. After a time the books were transferred to the Council-room of the Society, where they were carefully and systematically arranged by Professor DYER. Subsequently the care of the Library devolved upon Mr. HEMSLEY.

With the scanty funds at their disposal, the Trustees can do no more than keep up the periodicals, pay for the binding of the yearly volumes, and occasionally indulge in the luxury of a new book. Some use has been made of the Library; the officers of the Society in particular have found it all-important to them, but the difficulties mentioned by Mr. BARR no doubt prevent a much freer use of it by outsiders. What is wanted is the housing of the Library in an apartment where it would readily be accessible at all reasonable times; while the more constant services of a competent librarian are also to be desired. Some former Councils seem to have treated the Library as a nuisance, and an unwelcome intrusion; others have ignored it; others, again, have been profoundly ignorant of it. The present Council, however, is more horticultural in its aspirations than some of its predecessors, and has shown more sympathy with the horticulturists and a greater appreciation of their wants. We may, therefore, not unreasonably look to them to remedy the matters justly complained of by Mr. BARR. A voluntary subscription from the Fellows of, say, ten shillings a year, or even five, would go a great way towards fitting up a proper room and paying a librarian. We are certain the Trustees would gladly co-operate in any measures calculated to enhance the utility of the Library, and promote the scientific status of the Society; and that there need be no fear

of the Society's interests being neglected in the matter is clear from the circumstance that the Treasurer and Secretary of the Society are *ex-officio* Trustees, the other members of the trust being Mr. WILSON SAUNDERS, Mr. THOMAS MOORE, and Dr. MASTERS.

THE ISSUE of the SCHEDULE of PRIZES of the PELARGONIUM SOCIETY, for the exhibition to be held during the ensuing summer, offers an opportunity of again inviting attention to its operations. One object of the Society is to promote the improvement of the different sections of the Pelargonium—a work which is best done by specialists, since it requires that the operator should take a special interest in the pursuit, and bring to bear upon it the light of special experience. For this cause alone the Society deserves support and encouragement; but it is equally worthy of sympathy for its efforts to facilitate the introduction of novel forms, and to give system and method generally to the practice of hybridisation in this particular class of plants.

That the limit of improvement or of variation in the Pelargonium is not reached is quite evident, since scarcely anything has yet been done with the cut-leaved and scented-leaved kinds; and the recent appearance of what have been called "regal" Pelargoniums—varieties of great promise in a decorative point of view—affords further evidence of this fact.

That there is scope for the operations of this Society, which is by no means antagonistic, but rather supplementary to more general institutions, is evident, because by its instrumentalities a very large collection of the new double Zonal Pelargoniums were got together last summer, and grown under uniform conditions, which enabled both amateur fanciers and members of the trade to form a true estimate of their merits.

The prize-list which has been issued for the show to be held on June 20 next comprises some twenty-four classes, amongst which considerably over £100 are offered as prize-money. The date has been fixed especially to fit the blooming season; and not only the Zonals, but the large-flowered show sorts, the fancies, the hybrid ly-leaved sorts, and the Cape species are provided for, liberal prizes being offered for each. Among the Zonals a distinction has been made between the model flowers of the florists' class and the decorative sorts belonging to the Nosegay and hybrid Nosegay groups; and in the large-flowered or show type the same endeavour has been made to give increased prominence to the showy so-called "regal" and "decorative" varieties.

To accomplish all this, and to carry forward its work with sufficient spirit, the Society needs an accession of members, which ought to be forthcoming from amongst the admirers of the several groups of Pelargoniums, since the Society caters for them all.

The schedule, as stated in our advertising columns, may be had on application to Mr. MOORE, Botanic Garden, Chelsea; and intending subscribers should send in their names and contributions to Dr. DENNY, Stoke Newington. The ordinary annual subscription is one guinea.

—We trust it may be found practicable to amalgamate the FEAST OF ROSES with the entertainments of benevolence on July 4. Should the rosarians desire to have their special symposium all to themselves they might accomplish that at a light luncheon; and then, all grateful for the honor of appearing at the court of the queen of flowers, and for the pleasures of meeting with kindred spirits, they might show their sympathy with horticulture in general, and with distressed or decayed horticulturists in particular, by presenting themselves at the Benevolent feast. Rosarians are not likely to be deaf to the calls upon their sympathy, if only the opportunity be afforded them. Hence we trust it may yet be found practicable to combine the festival of the Roses with the feast of benevolence, to the advantage of all concerned.

—The Council of the Royal Horticultural Society propose instituting at the Chiswick Gardens this season, under the direction of the Fruit and Floral Committees, comparative trials of the following subjects:—Of vegetables, viz., Tomatos, Cabbages, Savoy, Turnips, new Peas, and new Potatos; of flowers:—Euparises, Gloxinias, Begonias, Cannas, new Zonal Pelargoniums, Stocks, Asters, and new annuals. Fellows of the Society, and those desiring to contribute subjects for this purpose, should communicate with Dr. HOGG, Secretary to the Society; or Mr. BARRON, Superintendent at the Royal Horticultural Society's Gardens, Chiswick.

—A very fine specimen of the beautiful white Himalayan RHODODENDRON ARGENTUM is now in flower in Messrs. DOWNIE & LAIRD'S Winter Garden, at West Coast, Edinburgh. A specimen of Rhododendron Falconeri with twenty-two flower-buds upon it will also be in flower in the same house in about ten days' time, together with a large number of well set plants of other varieties which the firm are forcing in pots with the view of holding an exhibition, which we hear is to be open during the last week of this month and the first fortnight in April.

—The North British Advertiser reports that a large meeting of the horticulturists of Edinburgh and neighbourhood was held at No. 5, St. Andrew Square, on March 6, to consider what steps could be taken in order to secure the better recognition of NEW AND RARE PLANTS, whether native or imported, and also of a better mode of ensuring that certificates should be granted in a manner which would carry more weight in the trade than they do at present. After Mr. DENNY, of Dalkeith Gardens, who was in the chair, had explained the object of the meeting, and the matter had been fully discussed, a deputation was appointed to meet the Council of the Royal Caledonian Horticultural Society, in order to get them to appoint a fruit, floral, and scientific committee, somewhat after the manner of the Royal Horticultural Society of London, which would meet at least once a month, and would therefore be in a better position to take cognisance of any novelties than the Caledonian Society, which at present can only take cognisance of what is brought forward at their shows, which are held only three times annually. When this matter was arranged, Mr. D. SYME, of the Lawson Company (Limited), suggested the expediency of forming a Horticultural Club or Mutual Improvement Society, whereat papers relative to all branches of horticulture could be read and discussed. Some conversation having taken place on the subject, the suggestion was highly approved of by all present, and a committee was appointed to draw up rules for the new society. After a vote of thanks to the Chairman, the proceedings terminated.

—It is to be hoped that full trial will this season be made of Mr. WORTHINGTON SMITH'S alleged PREVENTIVE OF THE POTATO DISEASE, called SALUS, and which is in the hands of Messrs. WHEELER, of Gloucester and 59, Mark Lane. The preparation consists of "compounds of sulphur and potassium," and the theory is that this preparation will kill the fungi, infusoria, mites, &c., in the soil before they attack the Potato, Cucumber, or other plant. Prevention, then, rather than cure is the object to be aimed at, seeing that cure is often impossible from the nature of things. Mr. SMITH claims for his compound that it is new, that it benefits the constitution of all plants, and at the same time it destroys the originators of diseases in plants. We trust that experiments will be made as far as possible to test the value of this substance. In the case of the Potato disease it must be ascertained definitely beforehand whether there are any resting-spores in the soil. It is not many people who have sufficient patience and ability to make this preliminary experiment.

—We have lately examined some flowers of DOUBLE CYCLAMEN, which possess some interest from their regularity and from their relation to the structure of other genera of Primulaceae. In the flowers in question there were ten petals in two rows, the stamens being superposed to, or in front of, the outer row of petals. The inner row of petals then corresponds with the little scales that are met with in the throat of the flowers of Androsace, Soldanella, or Samolus, and of which an indication may perhaps be

found in the little bosses which surround the mouth of the tube in the common Primrose. In one of the Cyclamen flowers, moreover, some of the anthers opened outwardly, others inwardly in regular alternation. At present we do not perceive the significance of this latter peculiarity.

— In *IMANTOPHYLLUM MINIATUM* PRINCEPS, Mr. BULL has the finest variety of this useful *Amaryllidaceae* plant that has come under our notice. The flowers are larger, more campanulate in form, and altogether smoother in outline, while the colour is a deep orange faintly shaded with rose. Three of the six segments are much broader than in the ordinary form, and very much rounder at the apex. It is as great an advancement on the variety called *speciosum*

demonstrates the fitness of this treatment, at this season of the year at least. Mr. BAUSÉ's method of propagating this plant may not lay claim to originality, but it is both rapid and effectual. A well-established plant of this *Yucca* will throw out a number of tuberous roots like hard knots, which form themselves round the sides of the pot. In course of time these make an upward growth in the form of suckers, and in this way any particular form has been increased. Mr. BAUSÉ may be said to force the hand of the plants, for at intervals they are turned out of their pots and these tuberous roots removed before they have made only upward growth, and then put into small pots in a light sandy soil in a stove-house. Growth soon sets in, and in this manner a tuber will send up three or four shoots, or more or less, which

Individually the flowers are quite half as large again as those of *E. onosmedora flore-pleno*, and are of snowy whiteness as compared with those of the last-named plant, which are distinctly flesh-tinted. The plant is a stronger grower, and produces longer and denser spikes of flowers.

— An old gardener once remarked that "there were many little ways and means of stealing a march on inclement seasons, and taking advantage of fine ones," and in enumerating these means he instanced that of SOWING PEAS IN POTS early in March, from which to obtain an early crop, rather than sowing them in the open ground in November. His plan was to sow nine seeds each in pots 4 inches in diameter, selecting as many seeds as he wanted for his early

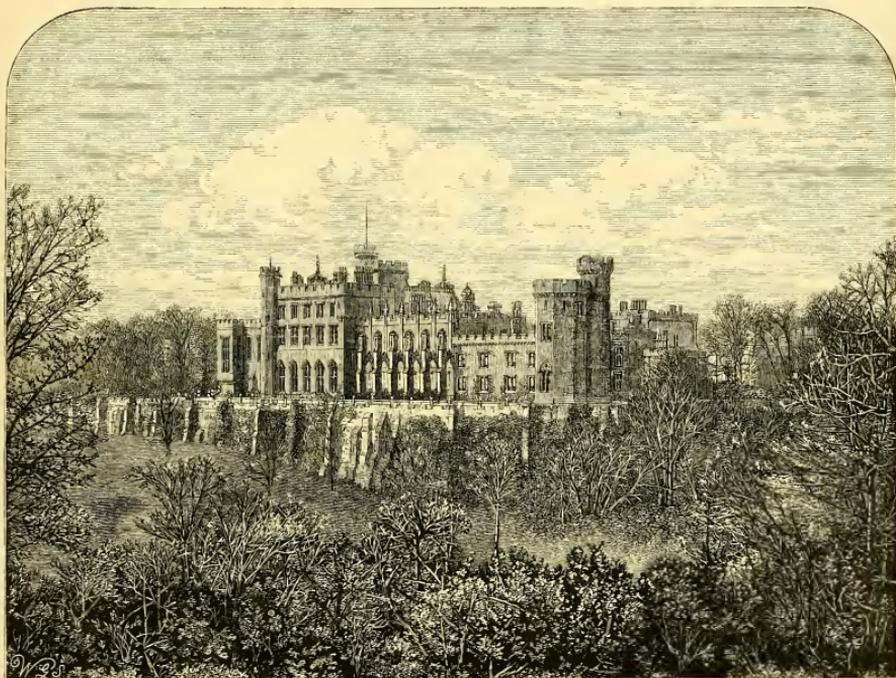

FIG. 55.—LAMTON CASTLE, THE SEAT OF THE EARL OF DURHAM.

as that is on the ordinary *I. miniatum*, and will be a valuable exhibition plant.

— In the open competition for designs for laying out Dartmouth Park, as advertised for by the Improvement Commissioners of West Devon, the premier premium was awarded to Mr. JOHN MACLEAN, of Dorrington Park, Derby, and the second to Mr. R. P. GLENDINNING, Croydon.

— Some superb examples of *YUCCA FILAMENTOSA VARIEGATA* can now be seen at Mr. JOHN WILLS' Melbourne Nursery, Atherley, the plants being of good size, and the peculiar variegation finely developed. Mr. BAUSÉ, Mr. WILLS' manager, is giving these plants a much warmer treatment than is usually accorded to them—they are in an intermediate-house; the generally robust character of the plants, and the radiance of the silvery variegation just now,

can be removed as soon as they are large enough. The success of this system is shown by the fine lot of young plants Mr. BAUSÉ has gathered about him, and which soon grow into acceptable specimens.

— It is not often that we have to chronicle such a motive for establishing a great flower show as that which has influenced the Bremen Horticultural Society, viz., to celebrate the 100th birthday of ISAAC HERMANN ALBERT ALTMAN. The show is to be held in the Bürger Park at Bremen, from August 15 to 19. The schedule comprises 100 classes.

— Mr. BULL has another NEW DOUBLE WHITE EPACRIS in flower, and a grand acquisition it proves to be. This is *E. onosmedora flore-pleno nivalis*, a variety at once distinguishable from the double one shown last year for the first time, by reason of the purer whiteness of its flowers and their larger size.

crop. They were then placed in a gentle warmth in a frame or pit, and, when well up, the growing plants were gradually hardened off by exposure to the air, and when 4 inches in height, advantage was taken of a calm day to plant them out in as warm a situation as could be found for them, and with the balls of earth entire as they were turned out of the pots. The groups of plants were placed 6 inches apart in the rows, they were earthed-up at once, and some twigs placed about them for support as well as for protection. A little leaf-mould placed about the roots was, to use his own words, "warmer than common garden soil, and helped them to start freely into growth." The season has been so wet, and the soil so thoroughly saturated with moisture that it is not surprising it should be stated early sown Peas and Beans are having rather a trying time of it, and many failures can be noted. But gardeners will sow early, although the authority referred to above,

and others, are found asserting that but little is gained by sowing in November in preference to sowing in February or early in March. For early Pea crops a light dry soil, *i.e.*, a soil from which wet is soon drained off, and a warm situation, should be chosen, the drills should be drawn 3 feet apart, and the seed covered to the depth of 2 inches at least. The depth at which Peas should be sown must be regulated by the nature of the soil; if it is of a dry and warm nature the seed may be covered to the depth of 3 inches, or even more; the later the seed is sown as summer is approached the deeper it should be placed in the ground, and not only without injury, but with positive advantage, because a certain amount of moisture is necessary to the well-being of the plants, and they would be more likely to obtain it by deep rather than by shallow sowing. On the other hand, in strong soils which are much more retentive of moisture shallow sowing is to be recommended, even in some instances the sowing of the seeds on the surface, and drawing earth over them, thus forming a ridge. Some have even, in extreme cases, been obliged to raise ridges, and sow thereon. Peas, like other vegetable productions, will not bear stagnant moisture about the roots, and yet will not flourish without a certain supply; and thus deep sowing in one instance, and shallow sowing in the other, seems to be the most rational mode of securing to them the necessary conditions. If these remarks appear to some unnecessary, let it be remembered there are always learners among us, and simple matters are sometimes apt to be overlooked in the attention bestowed on greater ones.

— The annual report of the MELBOURNE BOTANIC GARDEN for 1875 is occupied with details of the work done in the garden during the year, and is necessarily chiefly of local interest. Mr. GUILFOYLE speaks highly of the *Bufo-lago* grass (*Stenotaphrum plabrum*) as a lawn grass mixed with *Doubt-Cynodon Dactylon*. This may be a useful hint to gardeners in the south of Europe and other dry climates. Among the plants recommended for trial as a fibre plant is *Sparmannia africana*.

— The Belgian committee established for the purpose of erecting a monument to the memory of the late LOUIS VAN HOUTTE have decided on erecting a monument at the tomb of the deceased in the cemetery of Gendriegrue, wherein VAN HOUTTE acted as burgo-master for nearly a quarter of a century. The square will be called the Place Van Houtte, and will form part of a new street which will pass in the immediate vicinity of the establishment founded by VAN HOUTTE.

— Agriculturists who believe in the maxim "Work and learn" will be interested in an article reprinted from the *Langham Magazine* and called AN AGRICULTURAL RIP VAN WINKLE (C. Matthews, 265, Strand, London), in which are very amusingly, and, we may add, convincingly set forth, the principal requirements of modern progressive agriculture.

— The fine specimen of *LIVISTONA AUSTRALIS*, upwards of 60 feet high, in the Botanic Garden of Sydney, we learn, now in full bloom.

— The General Secretary of the Central Horticultural Society of France, M. A. LAVALLÉE, after some experience in FORCING THE LILAC, states that he is fully convinced that the cause of the colour not being developed is the high temperature which induces a very rapid growth; that is to say, the plant has not time to form the blue colouring matter of the flowers, and therefore they appear white. Below a temperature of 60 Fahr. the flowers begin to show blue, whereas, if forced in a higher temperature in the full light, they come pure white. One of the members present contended that, although this might hold good for the varieties of *Syringa vulgaris*, it would not be for *S. persica*. It was also mentioned that many vegetable colours, particularly those of flowers, are generated in the dark. Professor DUCHARTE described the granular nature of chlorophyll as opposed to the liquid colouring matter of flowers, especially the blue-violets and purples, and mentioned that as long ago as 1853 he had proved most conclusively by a long series of experiments, that the white flowers, instead of blue, are due to a high temperature. In one case a part of the plant was

inside exposed to a high temperature, and almost close to the glass, and a part outside in the open air. The flowers on the first were perfectly white, whilst those produced on the branches out-of-doors about a fortnight later were of the normal colour. M. LAVALLÉE recommends the variety called Charles X. for forcing because the ladies prefer it; but, as it will not bear forcing till towards the end of December nearly, it should not be selected for the earlier forcing. He also stated that withered flowers of forced *Lilac* will regain their freshness in about ten minutes if the lower ends of the panicles are placed in very hot water; and this operation may be successfully repeated several times.

— Mr. MACKELLAR, gardener, Abney Hall, Chesham, has sent us two flower-heads of FRANCISCA CONFERTIFOLIA, which are very fine, both having upwards of two dozen fully expanded flowers. He also informs us that even larger heads have been produced by a pot plant about 4 feet through that is under his charge. This is a very beautiful early-flowering stove plant.

— A writer in the *Bulletin* of the Belgian Horticultural Societies says that he has hit upon a most effectual means of preventing HARES AND RABBITS from gnawing off the bark of his Apple and Pear trees in severe winters. Last November he besmeared the trunks of the trees on two separate occasions with dog's dung, and the effect has been that the hares and rabbits have gone elsewhere for their food. Having himself experienced considerable loss in previous seasons from the ravages of these rodents, he thinks it a duty to make known the cheap and simple remedy he has discovered.

— A correspondent sends us a cutting from a northern paper, which states that last week, when one of the joiners employed at the Camperdown Linen Works, Loches, was engaged working upon a plank of wood, he observed what at first seemed to be a large knot in the wood. On closer examination, however, he found it to be something of the nature of bone. Having acquainted the head of the department, Mr. SILVESTER SMITH, of the "find," by his orders the corresponding plank was searched for and got, and the piece of each board containing the curiosity cut out and dressed. On this being done, the appearance was presented of a deer's antler horn in a state of perfect preservation. The saw had cut almost through the centre of the horn, showing the vacuum in both pieces of wood, and also part of two antlers shooting off from the horn proper. The two planks in which the horn was were in the very centre of the tree, which measured in diameter about 21 inches. The wood was of *Sycamore* variety. This very interesting and extraordinary curiosity is, we understand, to be sent at once for exhibition to the Dundee Museum.

— From the *Bulletin de la Société Centrale d'Horticulture de France* we learn that certain M. DURAND has devised a new kind of collar for fixing young trees to their stakes. It is of galvanised iron with an interior ring of plaited rushes. The authorities of the city of Paris have adopted it, and the Society awarded the inventor a certificate.

— STAPHYLEA COLCHICA, which appears from an examination of a series of specimens at Kew to be nothing more than a state or form of *S. pinnata*, is likely, according to M. LAVALLÉE, to become a useful plant for winter decoration, as it bears forcing very well and produces its elegant white flowers in great profusion. M. CH. BALET observed that the principal reason why this charming shrub is not so often seen in collections as it deserves is the difficulty experienced in propagating it. However, this has been overcome, and a perfectly easy and successful method of increasing discovered by M. COULOMBIER, of Vitry. It is briefly this—the layering of the young current year's shoots, which in July are sufficiently rooted for separation and planting out. Plants raised in this way are far preferable to those grafted on *S. pinnata*. Layers of the old wood frequently do not throw roots till the second year.

— If any one were asked to name a hardy flower of more than usual merit on the score of attractiveness at this season of the year, they would be likely to

name ANEMONE FULGENS. This gorgeous native of the South of Europe is not only perfectly hardy, but it is also very early, and is now blooming freely in the open air. Within the rich scarlet flowers there is a black disc, which contrasts in a marked manner. Clumps of this grand Anemone, if planted in sheltered spots with a southern exposure, would, no doubt, bloom early in January when the season proved favourable. As if flowers freely, it may be commended to the attention of those who grow early flowers for market, as bunches of this Anemone would be certain to command a ready sale. It is also well deserving the attention of those who are interested in wild gardening, and are accustomed to plant flowers by the side of woodland walks. There is quite a group of early Anemones suited for the purpose, *viz.*, A. fulgens, the blue A. blanda, the mauve A. apennina, the yellow A. ranunculoides, and the wood Anemone, A. nemorosa, and its varieties. In the open ground A. apennina is fast throwing up its flowers in sheltered places, and the others are coming on with rapid successions. Such a rich group of plants claim and merit attention.

— We have received a copy of the schedule of prizes to be competed for at the INTERNATIONAL HORTICULTURAL EXHIBITION to be held at CARLISLE on September 6, 7, and 8 next, under the auspices of the Carlisle and Cumberland Floral and Horticultural Society. There are 218 classes in which money prizes or plate are awarded, and ten in which certificates only are given. The amount of prize money actually offered is nearly £1250. The schedule is divided into fourteen divisions, *viz.*, 7, fruit, open to all; 2, fruit, open to amateurs only; 3, fruits of foreign growth; 4, plants in pots, nurserymen only; 5, plants in pots, for gardeners and amateurs; 6, plants in pots, for amateurs only; 7, cut flowers, for nurserymen only; 8, cut flowers, for gardeners and amateurs only; 9, cut flowers, for amateurs only; 10, dinner-table decorations, open to all; 11, vegetables, for gardeners and amateurs only; 12, vegetables, amateurs only; 13, new plants, open to gentlemen and amateurs; and 14, horticultural requisites. Amongst the principal prizes were those of £20, £10, £10, and £5 for "a collection of sixteen sorts of fruit, not more than four varieties of Grapes, two sorts of Pines, and two of Melons;" £15, £12, £7, £3, for "a collection of twelve sorts of fruit, not more than four sorts of Grapes, Pines excluded;" £10, £7, £5, £3, for "a collection of ten sorts of fruit, Grapes and Pines excluded;" £15, £12, £10, £8, for "eight varieties of Grapes, one bunch of each;" £10, £8, £5, £3, for "four varieties of Grapes, one bunch of each;" £5, £3, £2, for "a collection of hardy fruits, eight varieties, grown in the open air;" £15, and £10, for "the finest collection of Grapes, Lemons, Oranges, and Citrus" grown on the Continent; £15, and £7, for "the finest collection of Apples and Pears," grown on the Continent; £15, and £7, for "the finest collection of Apples, Pears, Peaches, and Nectarines," grown in the United States or British North America; £20, £15, £10, for "twenty stove and greenhouse plants;" £10, £8, £4, for "six Orchids in bloom;" £8, £6, £4, for "ten exotic Ferns;" £20, £15, £10, for "the finest new plants not yet in commerce, Orchids excluded;" £15, £10, £5, for "fifteen specimens of hardy Conifers;" £25, £10, £5, for "the best collection of twenty-five stove and/or greenhouse plants" [Does this mean "stove and greenhouse plants," or "stove or greenhouse plants?"]; shown by Continental nurserymen only; £20, £15, £10, £5, for "twelve stove and/or greenhouse plants, six to be in bloom, and Orchids excluded;" £10, £6, £4, for "nine stove and/or greenhouse plants, in pots not exceeding 12 inches in diameter;" silver cups of the value of £15, £10, £5, £3, £2, £1, for "twelve new plants sent out by Mr. Bull since the commencement of 1874. In addition to these special prizes offered by Mr. Bull, there are others given by Lady Masgrave, Edin Hall, Penrith, for dinner-table decorations; Mr. William Wright, draper, Carlisle, for vegetables; Mr. J. C. Mason, bookseller, Carlisle, for stove and greenhouse plants; J. Jardine, Esq., Arkleton, for hardy fruits; Messrs. Symon, Cooke & Ridal, for Jargonelle and Pear; Messrs. James & Co., Glasgow, Edinburgh and Glasgow; Messrs. James B. & Sons, Paisley, and Mr. David Low, Edinburgh, for grapes. The entries close on August 30, and intending exhibitors should apply for a copy of the schedule to the Acting Secretary, Mr. JOHN MOUNSEY, Victoria Hall, Louth Street, Carlisle.

LAMBTON CASTLE,

THE SEAT OF THE EARL OF DURHAM (see p. 341).

—This place is situated in the county of Durham, at an easy distance from Fence House Station, on the North-Eastern Railway Company's line, betwixt Durham and Newcastle. As those who have visited this part are doubtless aware, the district is more famed for its mineral wealth than anything particularly prepossessing in landscape effect; yet it must by no means be supposed that the surrounding country is so unattractive as are some of the great coalfields in other portions of the kingdom, as the land is of fair quality for agricultural purposes, and moreover is generally well farmed—a circumstance that contributes so much to a favourable impression, seen either by road or rail.

The home portion of the estate is well timbered, although the trees individually do not attain a large size. The Castle stands with its surrounding pleasure-grounds on the sloping ground on the northern bank of the River Wear, which is here considerably under the influence of the tide. The principal entrance is on the Durham and Newcastle Road, about 2 miles distant from the Castle, through the park; a broad drive leads up to the carriage front, which is on the north side of the building, opposite which is a wide gravelled space divided by an open stone balustrade from a considerable expanse of the richest of green lawn interspersed with trees, and enclosed on the north by a shelter-belt of timber, in front of which are dispersed a few large vases filled with flowering plants, not too numerous, but sufficient for the object in view—to give some specks of colour. At the western end of the mansion is a grass terrace traversed by a broad walk, from which slopes another piece of closely-shaven lawn which, at some distance, descends quietly. The garden of the Castle is bounded its entire length, 384 feet, by a gravel terrace 54 feet in width, which is separated from the outer grounds (which here descend precipitately to the river) by an immensely strong buttressed wall, the foundation of which is some 24 feet below the level of the terrace. From this point the noble proportions of the building are seen to advantage, and at once strike the beholder with its substantial character and beauty of outline.

There are also other circumstances connected with Lambton Castle, peculiarly worthy of notice, which increase the interest attached to it in common with all fine buildings. Some twenty-five years ago the walls began to give way, cracking and shrinking in many parts. The cause was not far to seek: in common with a great portion of the surrounding country the ground on which the Castle stands had been mined under, and when the seam of coal was exhausted the workings were at once abandoned, after which the upper strata began to sink. In this serious state of matters only one of two alternatives could be followed: either to take down the building and abandon the site, or attempt to build up the old coal-workings. The Earl determined on the latter course; and this gigantic operation was commenced, and its magnitude of which would have appalled many. The work occupied between seven and eight years, and it was used 14,000,000 of bricks: these figures are easier read than the quantity they represent realised. The remedy has proved thoroughly effectual. Iron tie-bars were inserted through the walls in all directions where required, and the work of repairing the building commenced, and lasted four years; and it was seen with this carried out that nothing is now to be seen of the severe ordeal through which it has gone.

Running immediately in front of it, at a few feet distant, is a low wall, on which are stood at intervals vases containing blooming plants, which lighten up the immense mass of stonework. Coming round to the eastern end there is a walk that winds on a lower level at a short distance from the river in the direction of the flower garden, and the work of repairing the garden ground in the same direction through the upper portion of the pleasure grounds.

Rhododendrons appear to succeed well here. Yews and other trees of a kindred nature do fairly, except Wellingtonias, which thrive up to a certain point, and then assume a somewhat stunted aspect. Cedrus Deodara and atlantica and the Hemlock Spruce grow vigorously. Pursuing the course of the low wall already alluded to we arrive at the flower garden; the design is simple, pleasing, and devoid of ornament—the beds arranged on the sides of the walks that take easy curves in different directions. Echeverias and plants of a similar habit are largely intermixed with flowering subjects. A dwarf

Protopium is extensively used in conjunction with *Blue Lobelia*. The mass of colour is toned down by plenty of grass in the background, which obviates any approach to glare. This portion of the grounds is divided from the fruit garden by a wall which is separated from a broad walk by a wide flower border well arranged. Next the grass verge a row of Golden Pyrethrum, then a row of Little Drift violet, Pelargonium; next a 5 feet centre of *Blue Scilla*, backed next the vase with another row of scarlet Pelargonium. The broad central band of *Viola* is relieved at intervals of about 6 yards by small circular groups of plants, the middle of each consisting of an erect-growing Conifer about 2 feet high, round which are pink Pelargoniums and yellow Pyrethrum. By this means the unbroken line of colour and monotonous surface is avoided.

From this we arrive at the terrace flower garden fronting the front range of vineries. It is some 115 yards in length, by 20 yards in width. It is separated longitudinally from the fruit garden by a wall surmounted by an ornamental iron railing, covered with Clematis Jackmanni, which was nicely in flower on September 5. Two gravel walks run the entire length, one in front of the Vine border, and the other at the opposite side, leaving a narrow border up to the Clematis-covered railing. This was planted in four rows; next to the dwarf Ageratum, the white Alyssum, next *Vesuvius Pelargonium*, backed by *Verbena venosa*.

The middle portion of this garden was arranged as follows:—Centre, 5 feet strip of the orange-red *Violet Hill Pelargonium*, with a row on each side of the white-leaved Flower of Spring; on the outside of this again a wide strip of *Blue Lobelia*, then a corresponding row on each side of Mangles' Variegated Pelargonium, margined next the Box with Golden Pyrethrum; the central band of Pelargoniums had patches of *Iresine* planted 6 yards apart, and the *Blue Lobelia*, single plants of *Centaurea*, at similar intervals, which added much to the general effect. The Vine border on the opposite side of the walk has a winding row of *Echeveria* running the whole length, with small patches of other bedding plants that do not spread much dotted at considerable distances apart—just sufficient to take off the bare appearance, but not so as to interfere to any extent with sun and air getting to the soil. There is another terrace flower-garden betwixt the two principal ranges of houses running the whole length, which will be described as we proceed.

The planting may be described as a combination of such things as are generally used in carpet bedding and flowering plants. This and the other terrace-garden is filled with spring bedding after the summer occupants are removed. *T. Baines*.

(To be continued.)

Home Correspondence.

Forsythia.—This is the time when search should be made for the female flowers of *Forsythia suspensa* and the blossom of *F. viridissima*, which have examined many hundred flowers of both species from many individual plants. In all the plants of *viridissima* the stamens were much shorter than the pistil, which was fully formed, and bore a slender style; in all but one of the plants of *viridissima* the stamens were longer than the pistil, which had a very short style, and I found withered. In one plant alone of *F. suspensa* I found one flower, and one only, with the short stamens and long style; in this the anthers had turned brown, and the ovary had commenced to swell. *J. D. Hooper, Royal Gardens, Kew, March 12.*

The Gardeners' Royal Benevolent Institution.—Having read Mr. Findlay's remarks on canvassing for votes for this Institution, allow me to say that, in a great measure, I share his views. We know that it is natural for any member who is personally known to a candidate, and who feels some interest in the case, to give the latter the benefit of his votes, and to ask other friends to do the same; but when an individual has power and influence taken up, and carries the candidate past those who have been trying for two or three elections, and lands them safe with votes to spare, who can be surprised that gardeners, not knowing where to look for such supporters, could give this as one of their reasons for not joining the Institution? I also see Mr. Grieve, in his good and encouraging letter, has dwelt on this point, and also raises the question which, to my knowledge, has been discussed at the Society's meetings—and, as I have anticipated, it is, that it would be better to reduce the number of pensioners and give larger pen-

sions; but, on the other hand, it has often been urged that, while the applicants for the pension are in excess of the number to whom pensioners are granted, and who would be glad and thankful to receive the pension in its present form, would it be wise to reduce the number, as all the applicants are fit and proper candidates according to the present rules? The question, I apprehend, can only be answered by the result of a general meeting, but I am led more particularly to offer a few remarks from reading the communication in a recent number of the *Gardener's Chronicle*. I have spoken to a great many gardeners with a view to their joining the Institution, and have been asked, in the same answer as that set forth in Mr. Clark's letter, but I cannot think this a sufficient cause to keep gardeners who have the means from subscribing, for, supposing this were altered, I fail to see how we could expect to gentlemen who are subscribers, and who have hitherto added so largely to the funds of the Institution. It might be that a gentleman who had been a supporter would wish to recommend a candidate for the pension who had not been a subscriber, and he himself had been induced to become one from the fact that it was the Gardeners' Royal Benevolent Institution, and I think I am not wrong in saying that the annual dinner, for which the funds have been largely increased, is based on the same principle. There is again a large class of men, such as nurserymen, and especially salesmen in Covent Garden, which latter are excluded by the rules from receiving any support, but who, nevertheless give, not only their own aid, but extend it to others, and are, in fact, towards the support and management of the Institution, and, although I have no authority to speak for them, I have every reason to think it has been done on the understanding that it had something of charity about it, and extended to those who are not deserving. Let me here remark, too, that the voting papers clearly show who has been a subscriber, and for what length of time; and if canvassing were discontinued, each member has the opportunity of voting for the candidate he considers the most deserving, and I cannot but think that under these conditions the longest subscribers, as a rule, would have the preference; but I still think the Society would never have been what it now is but for the aid it gives even beyond this to non-subscribers, and to the worthy Secretary, who has done much to raise the funds, and is ever bringing its claims under the notice of those who are likely to become supporters, would then find that the principal ground on which to fix his appeal, and to which to rest his case, is the opinion of the Institution is quite enough a benefit society to be in any way worthy of its present title. *J. Willard, Holy Lodge Garden, Highbury.*

Royal Horticultural Society.—To the Gardeners' Chronicle I remain.—It is not my intention to ask that the members of the present Council of the Royal Horticultural Society are doing all and everything in their power to induce gardeners to become Fellows of guinea subscribers to the Society. I therefore desire to say to my brother gardeners, "Come, and you will be welcome." Many will no doubt begin railing at the bad management of the financial affairs, and no doubt the managers of the Society have taken leaps in the dark, but which of us has not done the same? Forget the past, and a bright and glorious future is before you. What signification is there in guinea subscribers not being allowed to vote? Which amongst us all have had good places until we made them good ones, by strictly keeping the employer's interest in view, and by using to our own advantage to cultivate the garden under our care to the best advantage? I say, then, no councilship, no generalship can successfully combat against such numbers as we can bring to the Society. Therefore, if you find any one who is not a Fellow, we shall see such orators as our Ingrams, Speeds, and Smiths grace the Council-room. Dr. Hogg is not leaving a stone unturned, and the grand display of the 14th ult. in the huge conservatory speaks volumes in favour of the old Society. In conclusion, let me beg of you all to come at once, and don't delay. God willing, I shall attend the next meeting, and hope to see all my old friends. They will be welcomed with the right hand of fellowship by those in power, and last, but not least, by the smiling smile from the gardener at Buryleigh. *R. Gilbert.*

—May I beg the favour of space for a last letter on guinea Fellowships? The Council have adopted the guineas, but, alas! only to the extent of members without a vote, instead of, as we asked, fellowship with a vote. As our one object has been to infuse good new horticultural blood, and so strengthen the Society, I need hardly say that the restriction renders the concession, in this view, worthless. It is, however, to be considered that if a vote had been given, so many persons living in the neighbourhood of the gardens would have become guinea Fellows, that the votes of those not on the spot might have been counted. It was suggested from a former Council after the last general meeting, I suggested to the President that if the

Council would give guinea Fellowships with votes to those living outside the London letters, I thought many good country horticulturists might be induced to come in. This was only on the principle that if you cannot get best you must try for second best, the Society having still old London Fellowships on its back, but I thought that our Fellows would get horticultural consideration for their guineas, and that they would leave the Society. This proposal was not adopted. Some of your readers who have given the names as would-be guinea Fellows, ask what they ought to do. I think our best course is to go on quietly collecting names, and waiting, trusting to the chapter of accidents: the Council may rechange their policy. It is an unpleasant feeling long for horticulturists to give their guineas without getting a vote would be, I think, merely to that extent to bolster up a state of things which the experience of now very many years has shown to lead only to constantly recurring seasons of discontent and failure. The question is, as I have had to repeat over and over again, one of simple common sense. Every scientific society with headquarters in London has more or less prospered except the Royal Horticultural Society; there is no science with nearly as many names as horticultural science. Every other scientific society (excepting the Zoological Society, with its show every day, and the position of which is essentially peculiar) trusts for its support to those interested in its object. The Royal Horticultural Society, except quite at its commencement, has never done so; surely it is a fair inference that if, in this respect, it followed the course of its sister societies, with the advantages of its wide sweep and more general consistency, it would become the most prosperous of all. It now only remains for me to thank you for the valuable space given to me, and to thank those good horticulturists in the country who have taken so much trouble in this matter; their work will assuredly bring fruit hereafter. Four years ago the guinea Fellowships and my support, their supporters were crumpled by teas, they now are by hundreds, including the best horticulturists of the country. When they come up next (with the gained experience) they should be by thousands. I ought, perhaps, to apologise for losing part myself forward, but having served for many years in almost every office of the Society I know exactly its requirements, and having time and means, knowing its past troubles, and seeing a remedy against future ones, it seemed that I ought (as one else having come forward) to undertake the work at first. Before long I became the mouthpiece of many of the best and most experienced horticulturists of the country of all ranks, who urged me not to let the matter rest till the guinea Fellowship was reconstituted and the Society reconstituted. *George F. Wilson, Hutterback, Walsbridge, P.S.*—Mr. Fish is probably quite right in supposing that owing to his exertions and those of his friends at the time the show at Bury was held, the Council ran no real risk. The risk was at the commencement, when they proposed to hold the show without the sanction of the Expenses Committee, before the very large guarantee fund was raised. *George F. Wilson.*

Lobelia Emperor William.—Permit me to thank Mr. Morgan for the information he has given respecting this Lobelia. All I can say is, that I have not seen it beyond this immediate neighbourhood, and my only object in recommending it to the gardening public was, that a plant possessing so much merit should be better known and more extensively cultivated. I have not written one word to much in favour of Emperor William. *P. Davidson.*

Palm Seeds from Africa.—Last November I received a packet of Palm seeds which were obtained for me through the kindness of Colonel Gordon. In December I distributed them, not knowing whether they had been gathered fresh, and I am happy to say that Mr. Sowerby tells me that three have vegetated in the Royal Botanic Gardens, Regent's Park; and one of two which I planted myself in Scotland is thriving nicely. The risk was at the commencement, that in less than two months the other husk was above ground. The plant is a species of *Hyphene*, described in vol. xxix. *Ann. Travels*, and sent brought from Africa by me in 1783, and supposed to be new, but a more decided opinion may be formed in a few years hence if the plants have the good fortune to live. *J. A. Grant, Colt., March 3.*

The Weather.—We had 14" of frost here on Saturday night, and to-day, March 12, it is piercingly cold and crisp, and as the sun is out, the trees look well and promising, as do all other fruit trees, but sadly too forward. *J. Sheppard, Woolverstone Park, Ipswich.*

Aspects for Plant Houses.—As Mr. Bester has been so introduced, I personally remarks into the discussion of this subject, do not think it necessary any further notice of it, indeed if I had had the least

idea that he would have taken offence at a little friendly criticism, I should never have written anything on the subject at all. With regard to the proper aspect for span-roofed plant-houses, I confidently leave the matter in the hands of the readers of the *Gardeners' Chronicle* to judge for themselves, which view of the subject is the right one. *Aqua Calida.*

The Black Prince Pine-apple.—The fruit of this well-known sort is readily distinguished from most other kinds (particularly when it attains a large size) by the great depth of its pyramidal-shaped fruit. The accompanying illustration (fig. 56) represents one which was cut in the last week of October, 1876, which measured 13 inches from its base to the top, and weighed 10 lb. 2 oz. The chief defect in this variety is the liability of some of the pins to become discoloured before the others are perfectly ripe; this is especially the case oftentimes with large fruits, and is very detri-

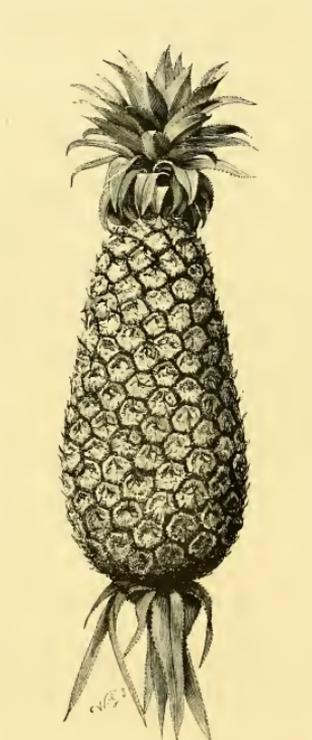

FIG. 56.—BLACK PRINCE PINE-APPLE.

mental to it, otherwise its noble proportions render it very attractive, and it is not altogether a bad autumn or early winter variety, and worth a place in all large collections. To remedy its tendency to spot, which generally happens in large fruits, cease to water the plant as soon as the colouring process begins, and if the conditions under which the plant is growing will admit of its being removed, by all means transfer it to a house where only a moderate temperature is maintained and a plentiful supply of fresh air is admitted, and where shading can be applied when powerful sunshine exists. Under these conditions it will assume a bright colour, and will generally finish off perfectly. In the case of those fruits which cannot be removed, to shade the fruit when it begins colouring, and to give more air will likewise be attended with highly satisfactory results. *G. T. Atiles, Wycombe Abbey.*

Dodder on Azalea.—The accompanying Azalea is from a plant I procured from London some time last year. When I came to notice some very peculiar parasitical-looking roots upon it; and when the

roots came in contact with other plants that were placed near the Azalea bearing these strange-looking plants they very soon established themselves upon them. I have tried various means to destroy them without injury to the plant, but it appears nothing short of destroying the plants will effect the purpose. *C. Coombs, Toller House Gardens.* [The threads are those of a Dodder—*Cuscuta*—such as is common on wild kinds of heath in the country. Probably it was introduced with the peat in which the plant is potted. Should it flower we shall be able to tell you the species. Eds.]

Fortune's Yellow Rose.—I have grown this Rose here for many years, and Messrs. Paul's plants are, I believe, derived from cuttings sent by me to them. It then was planted in the colonnade of the garden in different soils; indeed, it differs in blooms on the same plant, according as they are more or less shaded. I have them sometimes of a bright canary shaded with carmine, sometimes a lively tint of buff, or nearly imitating the tint of a new leucopannary. Occasionally some blooms are splashed rather than striped with a darker shade. Strange to say, I have never seen the Rose except in my own garden. Of the Beauty of Glazenwood I have not before heard. *T. R. R., Pansy Rectory, Wilts, March 12.*

Whole Oil a Cure for "American" Blight on Apple Trees.—Reading my old friend Mr. John Downie's remarks in last week's *Gardeners' Chronicle* on this subject suggested the following:—Many years ago we had a quarter of standard Apples infested with American blight. My father set me to paint the stems with "the crevices," as he called them, with pure whale oil, not a pleasant operation for the olfactory nerves, but it utterly destroyed the blight, and certainly improved the appearance of the trees generally. The only drawback was a personal one. When we had washed away "the crevices" in any order, one's hands were much of the same appearance, if not the odour, of a lamp cleaner at a railway station. I have always since, on the slightest appearance of the pest, adopted the whole oil painting, with the best results, I shall certainly try it on scale, for which I hope I may not have the chance, if any crops up with us. *James Culbush, Highgate.*

Organ Tea.—The words Organ tea originated with me in a local newspaper, and were used in quite different sense to what has been applied to them by your correspondents in previous numbers of the *Gardeners' Chronicle*. Pennyroyal is known as Organ herb in most of the western counties, and is much prized by old women herbalists as a blood purifier. I saw an old recipe that Organ broth was used in witchcraft to make people see everything double. It was in this sense I used the term Organ tea, in reply to a well-known writer in one of the garden periodicals, he having criticised a letter of mine in a local newspaper on the rain for the last ten years. After he had taken great pains and written a volume of figures, we only differed in this wise, he saw my hundreds as those sat, and multiplied them as such; in doing so he created a mare's nest. In my reply I accused him of having had an extra strong dose of Organ tea, and had seen my figures more than double. I hope my friend Mr. Gould's curiosity is now satisfied, as well as those who have asked for an explanation. *William Culbush, Thorne Perrow.*

Poisonous Plant.—According to a recent number of the *British Medical Journal*, some Italian sailors, belonging to a vessel lying in Falmouth harbour, were recently poisoned by eating herbs which grew on a shore near St. Just. One of the men who was most affected was taken to the Sailors' Home Hospital, where he died, after suffering great agony. The poisonous plant resembles Watercress, and is mistaken for it by the common people. A few years since two Italians died immediately after partaking of it. The name of the plant is not mentioned, but it is probably *Sium latifolium*, which grows with Watercresses, and is sufficient like Watercress to deceive unobservant people. The more common *Sium angustifolium* also commonly grows with Watercresses, and is sometimes found in the bundles when exposed for sale in the markets. This plant in infancy has a superficial resemblance to the Watercress, and it is considered dangerous by some authorities. It was a great pest in the late Mr. Smees' Watercress beds. *W. G. S.*

Rhododendron argenteum.—A few days ago, when looking through the gardens at Osberton, the seat of F. J. S. Fojambee, Esq., M.P., my attention was directed to the beautiful specimen of *Rhododendron argenteum*, which was of the following dimensions and in the best of condition:—Height 12 feet by 10 feet through the branches. At the time of my visit there were over fifty trusses of flowers open, averaging from 9 to 12 inches in diameter; the individual flowers open of a pale pink colour marked with chocolate, the older

blom changing to white, which gives the plant a very striking appearance. Mr. Woodfield, Mr. Foljambé's able gardener, informed me he found the plant in a pot when he took charge of the gardens nearly seven years ago, and as those kinds of plants are greatly appreciated by the owner, a suitable place was selected in one of the greenhouses, and the plant planted out—the result being one of the finest floral sights I ever saw on one plant. There were several other Rhododendrons planted out in the same house growing into fine specimens. I have never seen the species growing at any other place, and considering it one of the best as an indoor decorative plant I have thought it might be useful to send these few remarks. There are many other things worthy of noticing at Osberton, and any other having a little leisure, I should be glad to regret a visit, and might feel certain of being courteously received by Mr. Woodfield. *Joseph Jefferson, Worksop.*

Paraguay Tea.—I read with interest Mr. Forsyth's recommendation of the Paraguay tea, and his remarks at once reminded me of the tea preparable from our Holly, a weed in many forests adjacent to Hamburg, and in Holstein-Lauenburg. As early as 1855 our late Grand Master of Botany—Hugo von Mohl—made some remarks on this subject in his *Botanische Zeitung*, p. 39 (January 12).—"Spending last autumn some time in the Schwarzwald, I was informed to my surprise that the leaves of *Ilex Aquifolium*, a common plant in those mountains, were dried and exposed to a strong wind, and the best of Chinese tea. Since I could not obtain such tea at my place, I collected fresh leaves for an experiment. I had not to make an infusion, but a full decoction, though being a tea drinker and detecting everything that the inhabitants of the Schwarzwald had long used that beverage or whether they only did so after having been informed of the use of Mate tea." As to myself, I tried such tea in 1850 at Sharrand, in Saxony, from garden leaves. It was just a drinkable beverage, but neither my friend nor myself were enchanted with it. The leaves had, however, not been roasted long enough. Such things may, too, be regarded as questions of taste. I well remember of the great excitement created on this subject among the devotees to drink tea of Coffee leaves. Enthusiastic gentlemen said that one would in future have to drink one's coffee, coffee tea and Chinese tea each day. When I asked Dr. Lindley if, he told me he had once tested it; and that a peculiar, but not a powerful effect on his living physiognomy, he added, no power of the world would engage him to try it a second time. Yet speaking of *Ilex Aquifolium*, I would recommend it for another purpose. A great difficulty in gardening is to have good plants under older overshadowing trees; *Ilex* being well adapted for hedges and growing in the woods in the deepest shadow, would appear very suitable for the purpose. It even may have been used for this purpose long since, though I do not remember having seen it. *H. G. Kitchin.*

Desfontainia spinosa.—Would your correspondent "H," who wrote the "Notes from a Lancashire Garden" in your issue of February 24, kindly say in what position he grows his *Desfontainia spinosa* and what sort of soil he grows it in? *F. H. C.*

Reports of Societies.

Edinburgh Botanical: *March 8.*—Dr. Cleghorn, Vice-President, in the chair. The following communications were read:

I. Professor E. Morren on Vegetable Digestion. By Isaac Bayley Falfour, Sc.D., F.L.S.

II. On some Fossil Plants from the Calciferous Sandstone near Edinburgh, agreeing with species figured and described by Visconti in his *Di. Palm. Flore* published at Vienna in 1875. By C. W. Pease, A.L.S. (Specimens of the fossils referred to were exhibited.)

III. Notes on the Open-air Vegetation at the Royal Botanic Garden. By Mr. McNab. (See p. 337.)

IV. Miscellaneous Communications.

I. Professor Balfour exhibited specimens, which had been sent to him from the Royal Gardens, Kew, of a new variety of *Mercurialis*, (*Synonocarpus pubescens*), a small tree indigenous to the north of Mexico and Arizona. The Screw Bean, it appeared, was largely used in these countries for feeding cattle and horses, and it also produced a very good cake. The British Consul at Toronto, who had recently called attention to the Bean, had recommended that it should be grown in India, Ceylon, Australia, and the Cape, where—in dry seasons especially—it would doubtless prove a great boon.

2. Professor Balfour read a communication which he had received from the Rev. David Landsborough, noticing the growth of *Pittosporum tenuifolium*, a New Zealand plant, in the open air at Mauchline. The plant, which is evergreen, was grown from seed brought from Canterbury, New Zealand, by T. Deans, Esq., in 1865, and is now to feet 6 inches high.

3. Professor Balfour exhibited grains of Wheat, from Captain Sir George Nares, picked up in Polaris Bay, where it had lain from 1871 to 1876, N. lat. 84° 30' exposed to all the rigours of the climate. The grains had been tested at Kew, and 84 per cent. were found to be capable of germination. Two Peas and a grain of Maize had also sprouted, which were found among the Wheat.

4. Sir W. C. Trevelyan exhibited specimens of *Madragora officinarum* and *M. microcarpa* presented in flower in his garden at Wallington. The last-named species was noticed in the *Gardener's Chronicle*, February 17, p. 212.

Notices of Books.

We have received a copy of the second edition of the *Nurseryman's Directory*, a reference book of the nurserymen, florists, seedsmen, tree dealers, &c., for the United States, and all that is new concerning it is that a more useless work of its kind has seldom or never passed through our hands. Instead of giving an alphabetical list of the nurserymen, &c.—the handiest of all plans for reference—the compiler has alphabetically arranged the States and the post-offices in each State, and then given the Christian names first, so that any one turning to the book to find the address of any particular American nurseryman, whose surname only may be known to them, must wade through it page by page until they find what they want. A useful Directory truly! A list of foreign nurserymen and seedsmen given in an appendix is very amusing. There are only two addresses given under England, and the same number under Scotland. France is credited with twenty-one names, several of which are wrongly spelled; and under Germany are a dozen names, five of which, on a closer examination, we find belong to Holland and two to Belgium.

—The *Villa Gardener* for the present month contains an article which may be commended to Mr. Ruskin. It is entitled "Horticulture as a manly exercise." The editor of course has no difficulty in proving his point, and we see no reason why the wife should not be combined with the *dulci*. The use of force in rowing, cricketing, and the like becomes rather an appalling consideration when one considers how much more profitably it might be employed, and with at least equal pleasure. The article "Stoking" may be commended to all young gardeners as a subject for their special study.

—The *Journal of the Bath and West of England Society for 1876* contains *inter alia* a *resumé* of the controversy as to the mode of reproduction and specific identity of the fungi producing the Potato disease, wherein full justice is meted to Mr. W. G. Smith. It is a pity that the Royal Agricultural Society of England does not follow the example of its provincial counterparts. Dr. Peard, the author of the paper alluded to, has also a note on the cultivation of Peas and Apples in gardens, based in a great measure on the teaching of Dubreuil.

—The last issued number (88) of the *Journal of the Linnean Society* contains, in addition to some additional reports on the botany of the Challenger Expedition, Mr. Bentham's paper on the arrangements of Monocotyledonous plants. An index, much more elaborate than usual—one which is indeed an analysis rather than a mere index—closes the volume, and bears testimony to the assiduity of the editor.

PUBLICATIONS RECEIVED.—Le Bulletin Horticole.—Gardener's Monthly.—Grevillea.—The Entomologist.—Révue Horticole.—Science Gospiv.—Vila Gardener.—Revue de l'Horticulture Belge.—Monsieur Venes sur les Jardins.—Journal des Horticulteurs, in d. K. Preuss. Staaten.—Journal de la Société Centrale d'Horticulture de France.—Bulletin d'Arboriculture.—Bullefino della R. Società Toscana di Orticoltura.—Journal of the Bath and West of

England Society, 1876.—Le Moniteur de l'Horticulture Belge. Cultivated Plants, their Propagation and Improvement; by F. W. Burbridge (Blackwood).—De l'Épuration des Eaux d'égouts; par C. Joly (Paris, Michels). The author recommends well-derivat irrigation as the solution of this vexed problem.

The Weather.

March 8.—A fine day, partially cloudy. Cold wind. Rain fell in morning. Frequent snow showers afterwards. — 9.—A fine day, cold and cloudy. Very heavy clouds from 5 to 6 P.M. — 10.—A very fine clear day. Cold. — 11.—A brilliantly fine day. Cloudless, cold. — 12.—A very dull cloudy day. Slight rain 4 P.M., windy. — 13.—A very dry day. Frequent drops of rain. — 14.—A fine day, cloudy at times. Mild.

LONDON: Barometer.—During the week ending Saturday, March 10, in the neighbourhood of London the reading of the barometer at the level of the sea, decreased from 30.06 inches at the beginning of the week to 29.84 inches by noon on the 4th, increased to 29.92 inches by the morning of the 5th, decreased to 29.33 inches by the afternoon of the 7th, increased to 30.13 inches by noon on the 10th, and was 30.13 inches at the end of the week. The mean reading for the week at sea level was 29.89 inches, being 0.07 inch below that of the preceding week, and 0.22 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 46½° on the 5th to 41½° on the 8th and 10th; the mean value for the week was 43½°. The lowest temperatures of the air observed by night varied from 29° on the 9th and 10th to 40° on the 4th; the mean for the week was 32½°. The mean daily range of temperature in the week was 10½°, the greatest range in the day being 13° on the 9th, and the least 5½° on the 4th.

The mean daily temperatures of the air, and the departures from their respective averages, were:—4th, 42° 3', +1° 8'; 5th, 39° 3', -1° 2'; 6th, 37° 2', -3° 3'; 7th, 35° 9' -4° 6'; 8th, 35° 4' -5° 1'; 9th, 34° 6' -5° 9'; 10th, 34° 4' -6° 2'. The mean temperature of the air for the week was 37° 7', being 2° 5' below the average of sixty years. The highest readings of a thermometer with blackened bulb *in vacuo*, placed in sun's rays, were 85° on the 5th, 92° on the 8th, and 108° on the 10th; on the 4th the highest reading was 56½°. The lowest readings of a thermometer with blackened bulb exposed to the sky, were 24½° on the 9th and 10th; and the mean of the seven low readings was 29°.

Wind.—The direction of the wind was variable, and its strength brisk. The weather during the week was dull, and the sky generally very cloudy. Snow fell on the 7th and 8th.

Rain fell on three days during the week; the amount collected was 0.50 inch.

England: Temperature.—The highest temperatures of the air observed by day were 54° at Manchester, and 53° at Turro, Plymouth, and Sunderland; at Liverpool and Hull 45° was the highest temperature. The mean value from all stations was 49½°. The lowest temperatures of the air observed by night were 26° at Birmingham and 25° at Ecdes; at Liverpool 32½° was the lowest temperature. The general mean from all stations was 29½°. The range of temperature in the week was the greatest at Manchester, 26°; at Birmingham and at Ecdes it was 20°. The mean range of temperature from all stations was 20°. The mean of the seven high day temperatures was the highest at Plymouth, 49½°, and the lowest at Liverpool, 41½°; the mean from all stations was 43½°.

SPECIAL NOTICE.

GRAND FINE-ART GIFT.

THE FINEST AND MOST VALUABLE GIFT EVER OFFERED.

EACH READER of this PAPER will be entitled to receive from the NATIONAL FINE-ART UNION, 35, Great James Street, London, W.C., a copy (23 inches by 16 inches) of the beautiful Steel-Plate Engraving, entitled

WINDSOR CASTLE.

(COPYRIGHT.)

This grand work may fairly be considered as one of the finest productions of high art of modern times. It is from the celebrated picture painted by E. DUNCAN, Esq., and is engraved in the finest style on steel by T. A. PRIOR, Esq.

The originality of treatment brings the scene most vividly before the beholder, and makes it difficult for any one to look upon it and realise the fact that they are miles away. Upon an eminence to the right of the picture stands the stately historic pile of WINDSOR CASTLE, with the Royal Standard flying. The scene in which gay courtiers have played their parts, and in which the more sober business of the nation has been consummated, must always be one of great interest to Englishmen; and when, as in this case, the most consummate artistic ability is brought to bear upon it, the picture gains a new value as an artistic production. At the foot of the Castle is the historic town of Windsor, resting secure in the protection the Castle affords, and forming a striking contrast to the remaining gaiety of the scene. To the left runs our noblest of English rivers, with its rippling wavelets dancing in the sunlight, and reflecting the fleecy clouds sailing overhead, while the life upon the water gives an animation to the picture nothing can excel. Here is a crack Etonian crew, that may perchance one day compete in our national Boat-Race, clumsily getting athwart a barge (which, with its swan-like sails filled with wind, is rapidly speeding down the river), while their better-steered rivals are leaving them behind; and there is a party of fishermen embarking in their well-found punt, eager for a day of the sport old Izaak Walton loved so well. The magnificence of the foliage and general treatment of the whole picture is most unique, and leaves nothing to be desired.

THIS GRAND PRESENTATION PICTURE will be sent post-free to each reader of this Paper who cuts out the Redemption Bond found below and sends it to the National Fine-Art Union, 35, Great James Street, London, W.C., together with 16 stamps, or P.O. Order for 1s. 3d., payable at the General Post Office, London, E.C., to CHARLES GOOLD, to pay the cost of the case, transmission, copyright, and other charges. It will then be sent free to all parts of Great Britain and Ireland, securely packed and warranted to reach its destination uninjured.

Cut out this Bond and send it to the National Fine-Art Union, 35, Great James Street, London, W.C.

G. C.	REDEMPTION BOND.
<i>This Bond entitles the holder to one copy of the beautiful Steel Plate Engraving of</i>	
“WINDSOR CASTLE”	
(Copyright),	
And must be sent, together with Sixteen Stamps, or Post-office Order for 1s. 3d., to	
NATIONAL FINE-ART UNION,	
who will redeem it in the order it is received.	
(Signed)	NATIONAL FINE-ART UNION, 35, Great James Street, London, W.C.
N.B.—NOT AVAILABLE AFTER MARCH 27, 1877.	

NOTE THESE INSTRUCTIONS.—All Bonds must be sent in on or before March 27, 1877. The Bond must in all cases be sent. Each copy will be sent securely packed. One copy will be sent for each Bond, and NONE CAN BE SENT WITHOUT ONE, EXCEPT UPON THE RECEIPT OF TWO GUINEAS. The Bond will not again be printed in this Paper, hence the advisability of at once cutting it out and sending it for redemption, as each will be attended to in rotation as received.

 *The Picture is well worth handsomely framing, and its artistic merit and intrinsic value will render it a desirable addition to every household.*

WORKS: ANCHOR STREET, CHELMSFORD.

SHANKS' NEW PATENT LAWN MOWERS,

Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & S. would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate* or *Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES.

Including Carriage to any Railway Station or Shipping Port in the Kingdom.—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	10-inch Machine	£13 10 0
12-inch Machine	4 5 0	12-inch Machine	15 15 0
14-inch Machine	5 15 0	14-inch Machine	17 0 0
16-inch Machine	6 15 0		
18-inch Machine	8 5 0		
20-inch Machine	9 0 0		
24-inch Machine	10 0 0		

The Hand Machines are all fitted with Silent Movement, and can be used either with or without the usual Front Rollers.

NEW HORSE MACHINE.

30-inch Machine	£20 10 0	48-inch Machine	£68 0 0
36-inch Machine	24 0 0	48-inch Machine	32 0 0

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.
 Price, for the 48-inch, 49-inch, and 30-inch Machines, 20s. extra. Silent Movement, 20s. extra.
 Boots for Hoes' feet, 10s. per set.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

Are warranted to give ample satisfaction, and if not approved of can be at once returned.

LASCELLES SHANKS & SON,

Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.

27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Force. Orders executed same day as received.

Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 50s.

LASCELLES' PATENT BENT WOOD CONSERVATORIES and GREENHOUSES—All the Gardeners know that Wood is better adapted for Plant Growth, and by the above system a handsome curved house can be erected as cheaply as a plain straight one. The curved house is more durable, stronger, lighter in construction, and no bent glass is required.
 W. H. LASCELLES, 121, Finsbury Row, London, E.C., will supply Drawings and Estimates free of charge.

Metallic Hothouse Builder to Her Majesty.
H. E. N. R. V. H. O. P. E.
 (late Clark & Hope, formerly Clark & W.)

NEW BEDDING PLANTS FOR 1877.

IRELAND & THOMSON

DESIRE TO CALL ATTENTION TO THE FOLLOWING SPLENDID NOVELTIES,
NOW OFFERED FOR THE FIRST TIME:—

NEW BRONZED-LEAVED LOBELIA, ST. MARTIN'S BLUE.

This is a great acquisition in bedding Lobelias, and is acknowledged to be the best blue bedding plant yet sent out. The colour of its foliage and stems is a bluish bronze. Its flowers, which are intensely blue, are produced in great profusion, so that it gives a much more dense mass of deep blue than any green-leaved variety. It was awarded a First-class Certificate by the Royal Horticultural Society of London.

Price 12s. per dozen, £4 per 100.

SPLENDID NEW BEDDING VIOLA, SIR WALTER SCOTT.

This is admitted by all who have seen it to be the finest and most effective Viola for bedding that has yet been raised. It produces flowers of immense size and substance, and is of a bright violet-purple colour. It was awarded a First-class Certificate by the Royal Caledonian Horticultural Society of Edinburgh.

Price 12s. per dozen, £4 per 100.

NEW BRONZE GERANIUM, MARCHIONESS of HUNTLY.

This is a splendid variety, with very distinct and effectively-marked foliage, the groundwork of which is of a very rich golden yellow, with a broad, well defined zone of bright, bronzy crimson. Its habit is very free, and foliage large and of great substance, causing it to stand all weathers remarkably well.

Price 18s. per dozen.

IRELAND & THOMSON

Are now booking Orders for the above, to be sent out the first week in May. Orders will be executed in rotation. One-third off above prices to the Trade.

CRAIGLEITH NURSERY, COMELY BANK; Seed Warehouse, 20, WATERLOO PLACE, EDINBURGH.

ENDLESS FLAME-IMPACT HOT-WATER BOILERS.

GUARANTEED

The most Powerful, the most rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The **'Boiler of the Future'**" I have no doubt about this."—**W. THOMSON, Trenchard Vineyards.**

From the **'Gardener,'** March, 1877.

WRITING PATENT.
ENDLESS FLAME-IMPACT BOILER.
This boiler is attracting a good deal of attention in the horticultural world at the present time; and as I have just had one of their largest-sized ones fitted up here, and have now got it well tested, perhaps a few lines from me upon its capabilities may not be without some advantage to some of your numerous readers. I have had some experience as to its performance and extra labour caused by badly-constructed boilers, and any improvement effected in them will save labour and fuel demands the attention of all interested parties.

To give your readers a better idea of the work this boiler has to do, I may begin by stating that our apparatus is of a range having a total length of 190 feet, a ridge-and-furrow-roofed greenhouse being in the centre, two two-to-Vineries on each side, with Lamellia-houses and general plant-houses, &c. on opposite side of wall we have a Fern-house, partly heated and partly spanned in length, varying in width from 10 to 30 feet. Attached to end of boiler-house is our laundry, with a drying chamber fitted up with about 250 feet of 4-inch piping.

The whole of the above houses are heated with hot water, & have a total of about 3200 feet of 4-inch piping. We had formerly two oval fire boilers, one being 4 1/2 inches long, the other 4 feet long. With these two boilers kept hard fire we always found great difficulty in heating the temperature during frosty weather, and had frequently to lose a night's sleep attending to the fires. On the last day of last year the larger boiler came to grief—the water from it dropped out the fire, and in taking down some of the brickwork it was found to have cracked beyond repairs. To be thus left in the middle of winter with only the one boiler was no joke. I had to look out for another without delay. I have given a good deal of attention to the construction of hot-water boilers, & I may say I had never seen one that came up to my idea of what a boiler should be until some time ago my attention was called to a drawing of Wright & Co.'s Boiler, which appeared in the **Gardener.**

After talking the matter over with my employer, W. S. Munnings, Esq., and the gentleman in charge of the works, the boiler I had formed such an opinion of, I at once put the order into the hands of Messrs. Melick & Philp, hot-house builders & boiler-makers, Tottenham Street, who have fitted it up and attached the piping in the most complete manner. I also got some additional trial attached, so that if anything should at any time go wrong it can be attended to without disturbing the piping.

And now as to the capabilities of the boiler for the work. As formerly stated, I had considerably difficulty in keeping up the heat with the two oval fire boilers kept hard at work. I now find that with the remaining oval fire boiler, I can heat up the whole of the houses and the laundry to a degree they never were before, and do so with much less coal than I was doing with one of the oval fire boilers.

Our chimney consists of a flue 29 feet long, led horizontally through centre of back wall with 18 feet of a perpendicular stack. Some doubt was expressed of this, as we required a chimney pipe attached to a boiler about 6 feet long, there would be deficiency of draught; but we have found the opposite to be the case. I attached a 6-feet length of 8-inch stove pipe, with flow at boiler, and cleaning door at the neck, and the draught very strong. I got a three-valve damper fitted into the bend of the stove pipe, and am able to regulate the fire to a nicety, and by looking the fire at a reasonable hour, closing the damper fully half round, I can leave it to its work with the greatest confidence in the usual time of closing it the following morning; and instead of, as formerly, having to sit up firing the half of the night at times, and sometimes whole ones, we can retire to rest at a reasonable hour confident of sleeping undisturbed by unpleasant dreams of plants and fruits going to ruin. In concluding my remarks, I may say that the best of the good qualities of this boiler is its portability. We had not the slightest difficulty in putting it down in our country stables, through a trap-door 4 feet long by 2 feet broad, and fitting it up in a recess 4 feet square, and I am confident that with the assistance of two men I could take the whole to pieces and have it again in full working order in two hours. I have no hesitation in saying that for rapidity of circulation, small consumption of fuel, cleanliness, &c., it has no rival, and I have no doubt this boiler will win its way; and where coals are high in price it will effect a considerable saving, and as there is good fire space, it is equally suitable as a capital boiler for burning wood and other fuel."—**J. CLARKE, The Gardener, Trenchard Vineyards.**

[We have a very high opinion of this boiler, and predict that it will take a foremost place in heating hot-houses and all other buildings, and shall have some further to make about the principles of its next issue.—**E. D. Gardner.**]

"I think yours the most perfect **'Heat Trap'**" yet invented."—**DAVID THOMSON, Trenchard Vineyards.**

For details and particulars as to the various sizes made, and prices, please see advertisement on opposite page under the heading **"HEATING,"** which will be handed to all applicants, post-free.

We are prepared to supply **Thirty Different Boilers** of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement.

W. M. WRIGHT & CO.,
HOT-WATER ENGINEERS,
AIRDRIE, near GLASGOW, N.B.

JAMES LYNE HANCOCK'S Improved India-rubber Socket-rings FOR THE JOINTS of HOT-WATER PIPES.

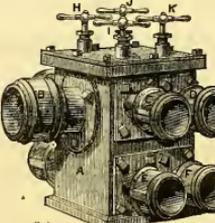

Description of Socket.—
A. The Rubber Ring as rolled into the Socket.
B. The Ring before inserted in the Pipe.
These Rings are made any size to order. All ordinary sizes are kept in stock.

Illustrated Price List on application.

J. L. HANCOCK,
VULCANISED INDIA-RUBBER WORKS,
266, GOSWELL ROAD, LONDON E.C.

CRITCHLEY'S PATENT HEAT REGULATOR, AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A. Iron Box fitted up water-tight. B. Pipe or Supply of Water from Boiler. C. D. Pipes for Circulating Hot Water. E. F. Pipes for Return of Water to Iron Box. G. Pipe for Returning Water to Boiler. H. J. K. L. Piston Rods for Opening and Closing Valves.

The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler.

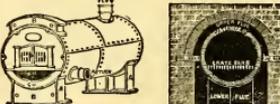

The following Testimonial has been received:—

"Gentlemen,—I am happy to inform you, now that the late severe winter is past, that the Hot-Water Apparatus erected by you does its work to my entire satisfaction. As to the two Heat Regulators, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes."

"R. H. CROWE,
Gardener to the Right Hon. Lord Fitzharding."
Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

ALFRED SVERER, Glass, Lead, Zinc, Oil, and Colour Merchant, 5, Pentonville Road, London, N.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the inventors, and its genuine good quality, notwithstanding a host of unprincipled imitations, has been constantly increasing since. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 20 gallons each, at 12. 6d. per gallon, at the Manufactory, or 11. 6d. per gallon carriage paid to any Station in the Kingdom.

UNUSUAL TESTIMONIAL.
Gleaningly Illustrated, Carmichael's, Nov. 27, 1875.
"Mr. Lloyd Lloyd encloses cheque for £3 5s. amount due to Messrs. HILL & SMITH, and he comments on the Black Varnish one of the most useful things he ever possessed."
Apply to HILL and SMITH, Briery Hill Ironworks, near Dudley, and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.
CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, we beg to draw attention to the fact that their own copy of their Varnish is legibly marked with their name and address, without which none is genuine.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS,

Will Cut Long and Wet Grass (as well as Dry and Short) without Clogging.

They are especially adapted for Cutting Slopes, Steep Embankments, under Shrubs, and close up to Trees, &c.; and are also extremely light in draught, simple in construction, well made, and not likely to get out of order.

To Nobleman and Gentleman.

GARDENER (HEAD), in a good Establishment—As above. Has three fine acres of land, and a thorough practical Man is wanted. Age 41, married; understands the Management of a Small Home Farm; required. Over nineteen years' good character. No small place treated with.—D. HAZELL, Messrs. Gurnish & Son, Highgate, N.

GARDENER (HEAD), where two or more are kept—Married; two children; understands gardening in all its branches. Leaving through the gentleman breaking up the Estate. For particulars, character form, &c., apply to the four years' previous under Mr. Ward, or to the late F. G. GARDNER, Esq., at the late residence, 10, St. James's Place, London.—GARDNER, E. A. Short, Esq., Clay Hill, Enfield, Middlesex.

GARDENER (HEAD), to any Nobleman or Gentleman wanting a thoroughly experienced and trustworthy Man.—A Gentleman giving up his Establishment, owing to the death of his father, is desirous of finding a successor as above. Ten years in present situation; has had the Management of fourteen Glasshouses, and a large number of good crops. —W. HEMING, Sandways, Tatslow, Liverpool.

To Nobleman and Gentleman.

GARDENER (HEAD), age 40, married.—WILLIAM MEREDITH, Gardener for the last eight years to the Vicarage House, Hilsberry Park Gardens, Thirsk, Yorkshire, wishes for a re-engagement as above. Is well acquainted with the Management of a Small Home Farm, and other Fruits, Flowers, and Forcing of Early Vegetables, required in a large establishment. Excellent character from present employer. —WILLIAM MEREDITH, Lakeside Park Gardens, Thirsk, Yorkshire.

GARDENER (HEAD), to any Nobleman or Gentleman requiring the services of a competent Man: Age 40, married, one boy aged 39.—MUSSELL, Head Gardener to the Hon. Sir W. Wyke, Bart., at Wyke, Yorkshire, is now at liberty to engage as above; well acquainted with all kinds of Fruits, Flowers and Kitchen Gardening. Has twenty-three years' experience in some of the best places in England and Scotland; eleven years' previous as Gardener here. Can be highly recommended by late and present employer, and the leading Gentry of this neighbourhood.

GARDENER (HEAD, WORKING), where one or two are kept—Age 30, married.—S. Mr. Laue, The Nurseries, Berkehamstead, Herts.

GARDENER (HEAD, WORKING)—Age 26; well experienced in all kinds of Flowers, Fruits, and Vegetables, and all kinds of Forcing, Flower and Kitchen Gardening. Good character. —W. G. WILLIAMS Street, London.

GARDENER (HEAD, WORKING), where two or more are kept—Married, no family; understands Stove and Greenhouse Plants, Fruits, Flowers, and Kitchen Gardening. Well recommended.—T. O. GRESHAM Place, Tottenham, Middlesex.

GARDENER (HEAD, WORKING)—Married, one boy (age 19); respectable, trustworthy; thoroughly experienced in all branches of the profession. Good character. —A. E. Post-office, Hendon, Middlesex, N.W.

GARDENER (HEAD, WORKING)—Age 28, single; ten years' practical experience in the Culture of Orchids, Stove and Greenhouse Plants, Fruits, Flowers, and Vegetables. Well recommended.—T. O. GRESHAM Place, Tottenham, London, W.

GARDENER (HEAD, WORKING)—Two thoroughly understands all branches of the profession. Good character can be given from previous and present employers, who he has lived five and five years.—O. JOHNSON, Aisle Park, Chelmsford, Essex, Chelmsford.

GARDENER (HEAD, WORKING)—Age 35, married; understands the profession in all its branches. Good character from last situation, and good testimonials from previous ones.—A. B. C., The Lodge, Woodside Court, Croydon, Surrey.

GARDENER (HEAD, WORKING)—Age 30, married, two children; three years' good character. Understands Vines, Fruits, Flower and Kitchen Gardening.—W. J. R. Burnett, Stationer, Grove Lane, Caniswell, S.

GARDENER (HEAD, WORKING)—Age 37, married, five children; competent in all branches. No objection to Land and Stock. Near London preferred. Good character.—A. R. M. Derrick, Bradford Lea, Bradford-on-Avon.

GARDENER (HEAD, WORKING), to any Lady or Gentleman requiring the services of a singularly active, intelligent, and trustworthy Man.—A. B. C., The Lodge, Woodside Court, Croydon, Surrey.

GARDENER (HEAD, WORKING)—Middle-aged, married, no children; strictly honest, sober, and industrious. Cried Grower of Grapes, Stove and Greenhouse Plants, Fruits, Cucumbers, &c., and all kinds of good Kitchen Gardening. Also Land and Stock. Good character.—W. J., Earl Grey Cottages, Upper Ferry Street, Gravesend, Kent.

GARDENER (HEAD, or SINGLE-HANDED)—Married; understands Vines, Cucumbers, Flower and Kitchen Gardening. &c. Good character from last place. Near London preferred.—G. C., 3, Margaret's Cottages, Epsom Common.

GARDENER—JOHN COWAN, The Vineyard, Garston, near Liverpool, would be glad to recommend to any No. 10 or Gentleman requiring a first-class Gardener a man in the prime of life, who thoroughly understands the profession in all its branches, having had many years' experience in some of the best places in England and Scotland.

GARDENER, to any Lady, Nobleman, or Gentleman requiring the services of a thoroughly practical Man in the Management of a Small Home Farm, Salisbury, would be very pleased to recommend a thoroughly practical man in every department of Horticulture (at one time an expert of himself), as above. Thirteen years' good character.

GARDENER (SINGLE-HANDED)—Age 26; has a fair knowledge of Vines, Greenhouse Plants, and Kitchen Gardening.—W. C., Mrs. Pettie, 3, Chestnut Row, Ballham, Surrey.

E P P S C O C O A :

GRATEFUL-COMFORTING. It affords a thorough knowledge of the natural laws which govern the operations of the digestive and nutritive systems, and the application of the fine properties of well-selected Cocoa, Mr. Epps has provided a most reliable, palatable, and healthily-nourishing beverage which may save as many beloved ones' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up, and thus enabled to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame.—*Civil Service Gazette.* Sold only in pack-sts., labelled JAMES EPPS AND CO., HOMOEPATHIC CHEMISTS, 45, Thredensted Street, and 170, Piccadilly.

K I N A H A N ' S L L W H I S K Y .

—A Gentleman & Co. finding that, through the recommendation of the Medical Profession, the demand for their CELEBRATED OLD LL WHISKY for purely medicinal purposes was very great, and that with increasing frequency, they were ordered to supply a more carefully and fully analysed sample of this well-known and popular Whisky. The samples were analysed and found to be of the highest quality, and the Whisky was pronounced to be pure, well-matured, and of very superior quality. It was found to be of the highest quality in the purity and quality of this Whisky.—No. 6, Great Titchfield Street, Oxford Street, London, W.

D I N N E R F O R D ' S F L U I D M A G N E S I A .

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION. Indispensable for delicate Constitutions, Ladies, Children, and Infants.

H O L L O W A Y ' S P I L L S .

The Female's Friend.—The wonderful cure effected by these Pills have alone enabled them to withstand the keenest opposition from all quarters, and to retain their popularity as well as in the houses of comfort and wealth. Holloway's Pills work a thorough purification of the whole system without disordering, weakening, or otherwise interfering with the natural action of any organ. They are adapted to be the best restorer of appetite for comfort, and perfect health to the most delicate constitution. They give colour and freshness to the face, and by their gentle alterative properties eradicate from the system the cause of the obstructions of the bowels, and of humours, consign ten of thousands of females annually to an early grave, who, by the use of these Pills, be spared to their families.

Cures of Asthma, Coughs, &c. in Bangor. by DR. LOCKE'S PULMONIC WAFERS.

—From MR. ELIZABETH JONES, *Bethesda, Bangor*—"Many who have suffered for years from Asthma, Coughs, and other complaints of the chest are ready to give evidence of the wonderful relief and cure they have obtained. They give instant relief and cure pleasantly. Sold by all Druggists, at 2s. 1/2 and 2s. 6d. per box.

GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

Or NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1856,

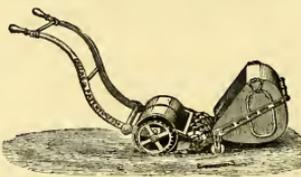

And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

- 1st. Simplicity of Construction—every part being free of access. 2d. They are worked with far greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either long or short Grass, wet or dry.

SINGLE AND DOUBLE-HANDED "SILENS MESSOR" LAWN MOWER.

To cut	£	s.	d.
6 inches	1	15	0
Can be worked by a Lady.			
8 inches	2	10	0
10 inches	3	10	0
12 inches	4	15	0
Can be worked by one Person.			
14 inches	5	15	0
16 inches	6	15	0
Can be worked by one Person on an even Lawn.

18 inches	8	0	0
Can be worked by a Man and Boy.			
20 inches	8	10	0
22 inches	9	0	0
24 inches	9	10	0

* If made stronger, suitable for Donkey, 30s. extra.

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Slide Delivery Box; Cross-stay complete; suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£	15	0
28 "	17	0	0
30 "	18	10	0
Leather Boots for Donkey	1	0	0
Do. " Pony	1	4	0

HORSE MACHINES.

To cut 30 inches	£	22	0
36 "	26	0	0
42 "	30	0	0
48 "	34	0	0
Leather Boots for Horse	1	9	0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

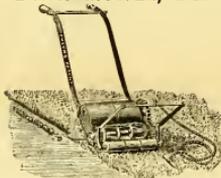

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

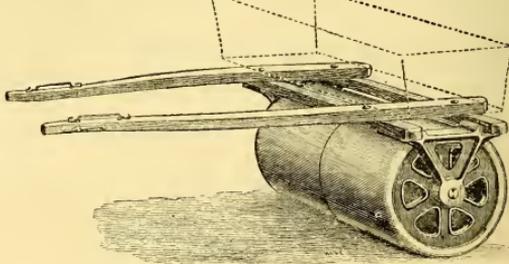

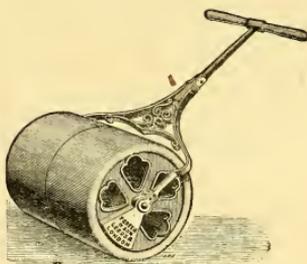

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 Machines of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

ИМПЕРАТОРСКАГО РОССІЙСКАГО ОБЩЕСТВА САДОВОДСТВА.
 Редакція, "Вѣстникъ,"

"St. Petersburg.

"Dear Sir,—Many thanks for your 'Floral Guide.' I will strongly recommend it to the Fellows of our Society and to the readers of our periodicals as the best and plainest index of the choicest and most valuable new varieties of flowers and florists' plants and their seeds.—Believe me, Sir, yours most truly,

"P. WOLKENSTEIN, Secretary of the Imperial Russian Horticultural Society."

GLENNY says thus:—"H. Cannell's 'Floral Guide' is, as usual, full of practical information and liberally illustrated. It partakes more of a standard work than a catalogue, and should be in the possession of every lover of a garden."

"The *Viragee*, Thornton Steward, *Bedale*, March 2, 1877.
 "The Rev. H. FITCH says:—"Accept my best thanks for your most excellent and beautiful catalogue, or rather Floral Guide, received by this morning's post."

H. C.'s Seed List is also by far the most valuable ever issued; sent post-free to all applicants.

SWANLEY KENT.

JEFFERIES' LITTLE QUEEN COS LETTUCE,

Per Packet, 1s. 6d.,

Is the Earliest, Best Flavoured and Best Coloured Lettuce in cultivation.

MR. FARLEY, *The Gardens, Valentines*, says:—"Your Little Queen Lettuce proved a good selection, although the weather was very adverse to the trial."
 MR. MEADES, *Gr. to the Rt. Hon. Viscount Harrington, Becket Park*, says:—"Your Little Queen Lettuce is a capital variety, as hard as a stone, and has kept well from running to seed this dry summer."

MR. FARR, *Gr. to Sir R. Knightley, Bart., Fawley Park*, says:—"Your Little Lettuce has proved a very useful one, although the season has been very trying for that class of stuff; its early hearting and crisp sweet flavour are sufficient to recommend it to all who are desirous of a small but good Lettuce."

A Packet of this excellent Lettuce will be included in all our Collections of Vegetable Seeds.

JEFFERIES' HALF GUINEA COLLECTION OF VEGETABLE SEEDS,
 JEFFERIES' GUINEA COLLECTION OF VEGETABLE SEEDS,
 JEFFERIES' TWO GUINEA COLLECTION OF VEGETABLE SEEDS,
 JEFFERIES' THREE GUINEA COLLECTION OF VEGETABLE SEEDS,

Are the best obtainable. For particulars, obtain our "Illustrated Garden Guide."

JNO. JEFFERIES & SONS,
 GIRENCESTER.

THE NEW ROSE,
 QUEEN OF BEDDERS (NOBLE).

Perhaps the Finest Rose for Bidding ever sent out.

COLOUR OF "CHARLES LEFEBVRE."

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that flowers were cut daily from June to November 20, 1876.

Good Plants will be sent out, in strict rotation, at 10s. 6d. each,

COMMENCING FIRST WEEK IN MAY.

CHARLES NOBLE, BAGSHOT.

NEW PLANTS, 1877.

CHARLES LEE & SON,

SUCCESSORS TO
 MESSRS. JOHN AND CHARLES LEE,

OF THE
 Royal Vineyard Nursery,
 HAMMERSMITH, near LONDON,

Have the pleasure to offer the following very beautiful and interesting

NOVELTIES,

now offered by them for the first time:—

BEGONIA COLTONI.

¶ This distinct and beautiful Begonia was raised at the Royal Vineyard Nursery. The colour of the flowers is quite new in Begonia, being of an orange-crimson. It is a magnificent bloomer, and the flowers are of the largest size. It received a First-class Certificate from the Floral Committee of the Royal Horticultural Society in 1875. Good plants, price 10s. 6d. each.

BEGONIA RODWELLI.

This lovely Begonia was also raised at the Royal Vineyard Nursery. The flowers are of a bright vermilion-crimson of the largest size; and the plant is a very abundant bloomer. It received a First-class Certificate from the Committee of the Royal Horticultural Society. Good plants, price 10s. 6d. each.

CORNUS MASCULA AUREA ELEGANTISSIMA (J. & C. Lee).

This elegant and lovely hardy shrub was raised from seed in our Isleworth Nursery, and has been proved to be perfectly constant in its beautiful variegation. A broad margin of pure gold surrounding a bright green centre is of itself a sufficient attraction, but when in July the tips of the leaves become suffused with the brightest crimson it is impossible to give an idea of the beauty and elegance of the plant, which will bear a favourable comparison with the best variegated stove or greenhouse exotics. Suffice it to say, that it has been seen and admired by many amateurs and nurserymen, and has been awarded a First-class Certificate at South Kensington. The habit of the plant is semi-procumbent, and very graceful. Price of maiden plants, 12s. each; larger specimens, 21s. each. A Coloured Plate may be had on application for 1s.

JUNIPERUS VIRGINIANA ELEGANS (J. & C. Lee).

This very elegant variety of the Red Cedar was raised from seed in our own grounds, and is scarcely necessary to remark upon the hardness of this plant, but it is due to its character in that the elegant cream-coloured variegation which is the whole plant is perfectly constant, and has never been injured by frost or burned in the least degree by the hottest sun. It is a very free grower, and has received the honour of a First-class Certificate from the Floral Committee at South Kensington, in July, 1875. Price 12s. each; larger specimens, 21s. each. A Photograph of the plant may be had on application for 1s.

POPULUS CANADENSIS AUREA VAN GEERTT (1876).

The golden variety of this noble Poplar sent out in its February list by Mr. Charles Van Geertt, of Antwerp, has fully borne out in our Nurseries the description he gave of it, and has retained its golden colour much better than either the Golden Catalpa or the Golden Oak during the late tropical summer.

EXTRACT FROM MR. VAN GEERTT'S DESCRIPTION.
 "We have the pleasure of offering an extremely remarkable variety of the Common Poplar, with a foliage which presents during the whole summer the finest hue of golden-yellow. It is in our opinion a most valuable acquisition, and has been pronounced to by every connoisseur who has admired it in our nursery; for the coloured foliage now so frequently met with among low shrubs falls almost entirely among the larger trees. The Catalpa aurea and the Quercus Robur concordia are the only trees known as possessing the same golden foliage; but the former is only a second-rate tree, and the latter has not the vigour of the common Oak. Our golden Poplar, on the contrary, is a first-rate tree, of rapid and vigorous growth. Its leaves are quite as large as those of the common Canadian Poplar, and the yellow hue, instead of looking sickly, has a warm and vigorous tint. The better acquainted the tree is, and the more it is exposed to the sun, the more vivid is the golden hue."

Having received in February last a large consignment of this magnificent novelty from Mr. Van Geertt, we are enabled to offer nice plants at 7s. 6d. each.

ABIES EXCELSA AUREA (J. & C. Lee, 1875).

This is decidedly the finest golden Conifer of large growth yet introduced. It is of free growth, and requires to be planted in the full sun. In such a position the whole tree is suffused with the richest gold. A First-class Certificate has been awarded to this noble tree at South Kensington. Price of nice plants, 12s. each; larger specimens, 21s. each.

LAURUS CAMELLEIFOLIA (Wood, 1875).

We can still supply a few hundreds of this extraordinary and elegant Laurel. Price 2s. 6d. each; per dozen, 12s.

CHARLES LEE & SON,
 HAMMERSMITH, W.

NEW AMERICAN POTATOS.

New Continental Roses for 1877.

H. BENNETT'S own selection, in the best possible Plants, ready in March. Descriptive LISTS may now be had post-free on application.

MANOR FARM NURSERY, STAPLEFORD SALISBURY.

Vines. E. G. HENDERSON AND SON offer splendid Fruiting Canes of all leading kinds. Flamingo Canes, 25 6d., 25 6d., and 25 6d. each; Golden Queen, Ven's Black Muscat, and Waltham Cross, 42s. and 60s. per dozen. Trade supplied. Pic-a-apple Nursery, Maida Vale, W.

GROS GUILLAUME GRAPE (Roberts' Variety).

The largest Black Grape in Cultivation. Eyes or Scions from fine, strong, well-ripened wood, 12s. 6d. each. Ditto ditto ditto second size 7s. 6d. For particulars of this remarkable New Grape see Gardeners' Chronicle of January 27, pages 20 and 117, or apply to Messrs. W. TAIT & CO., SEED AND NURSERY ESTABLISHMENT, 45, CABLE STREET, DUBLIN.

FRIMROSE, POLYANTHUS, and OXIP, first quality, mixed colours of each, 1s.
WALLFLOWER, Double German, mixed colours, 6d. and 1s.

NOVELTIES IN FLOWER SEEDS.

- ALONSOA ALBIFLORA.—New distinct species from Mexico, introduced by Mr. Roehl, the distinguished collector, flowering freely from 12 inches up to a foot in height, producing long terminal spikes of pure white flowers with yellow eye. It is recommended for pot-culture, as in the conservatory it will produce a succession of its flowers throughout the autumn and winter when most acceptable for bouquets and table decorations. It will be found a desirable and useful substitute for Lily of the Valley, as when arranged so as to overtop the other flowers it will stand up to 24 inches.
BOMBAXA ROZEA 12. COBEA HIRSUTA 2s. 6d.
HUMEA ELEGANS ALBA. 2s. AERANTHUM SNOW-FLAKE, 1s.
MIMULUS BRILLIANTISSIMA, scarlet self, 1s.
MENTZIA OKNATA, fine plant (see description in Catalogue) 1s.
TORRENTA FOURNIERI, new annual form of this beautiful combination of colouring, 1s.
ERYNGIUM LEAVENWORTHII, ornamental plant, 1s.
PYRETHRUM AUREUM LACINIATUM, fringed-leaved Golden Feather, 1s.
ASTER, Freighting, most beautiful and brilliant new quilled variety, 1s.
SAXIFRAGA NEPALENSIS, fine ornamental species for pot culture, 1s.
PAPAVER UMBROSA, showy flowers, 1s.
LAIUS PYNCOCHRYA, 1s.
CANTERBURY BELLS, double filled flowers, beautiful variety of colours, 1s.
CUPHEA ROZEA 1s. BAMBUSA GRACILIS, 1s.
PINE-APPLE NURSERY, MAIDA VALE, LONDON, W.

GOETIA, LADY ALBEMARLE.

First-class Certificate Royal Horticultural Society, August 4, 1876. A magnificent new variety, growing 1 foot high. Flowers 2 1/2 to 3 inches across and of the most intense glowing carmine-crimson colour, which being produced in wonderful profusion give the plants the most charming appearance. This is the first annual ever sent out, and being extremely hardy and easy of cultivation, should be in every garden. Seed, with full cultural directions, per packet, 1s. 6d., post-free. "We have scarcely any plant of such a lovely shade of colour."—The Villa Gardener, September, 1876. "An extremely beautiful variety bearing flowers quite 4 inches in diameter, of a glowing crimson colour."—Gardener's Magazine, June, 1876. "A remarkable and splendid variety, far superior to any other of the family."—Journal of Horticulture, Aug. 3, 1876. May be had of all Wholesale and Retail of DANIELS BROS., THE ROYAL NORFOLK SEED ESTABLISHMENT, Norwich.

No. 1. CENTENAL.—A seedling of the well-known Howell's Beauty crossed with the White Pearl Blue; haulm stout, vigorous, of medium height; tubers medium and of uniform size; shape round, somewhat flattened, symmetrical and handsome; colour deep red; flesh fine grain, white and mealy; very productive, and of fine quality.

No. 2. BROWNELL'S SUPERIOR.—Of the same parentage as the preceding. Its tubers are medium to large, kidney-shaped, of a peculiar dark copper colour, very uniform and handsome in appearance; skin fine and smooth; eyes few and small; the haulm is strong and healthy; the tubers are thickly clustered around the stalks. It is a second early variety, keeps well, and is commonly productive, 67s. lb. having been grown from 1 lb. of seed with ordinary farm culture. A Certificate of Merit was awarded this variety at the International Potato Show.

No. 3. IMPROVED PEACH BLOW.—A cross between the well-known Jersey Pearl Blue and the Excelsior. It partakes of some of the characteristics of each of its parents, having the haulm of the Excelsior, while its tubers resemble the Pearl Blue, though better formed; white in quality it equals that old standard sort, it is far more productive and matures earlier.

One pound of either of the above varieties will be mailed post-paid in any address in Europe upon receipt of 4s., or its equivalent in English currency. Remittances can be made in Post-office Stamps or Postal Money Order on New York or London, payable to B. K. Bliss and Son. The above varieties can also be obtained of Messrs. HOOPER AND CO., Covent Garden, W.C.; of CARTER, DUNNETT, AND BEALE, London, W.C.; CHRISTMAS QUINCY, Peterborough. Our Illustrated and Descriptive POTATO CATALOGUE, 40 pages, will be mailed free and post-paid to all applicants. Address, E. G. HENDERSON AND SON, Seed Merchants, 24, Barclay Street, New York, U.S.A.

- LÆLIA ANCEPS BARKERIANA
- DENDROCHILUM GLUMACEUM
- CATTLEYA WAGNERI
- ONCIDIUM MACRANTHUM HASTIFERUM
- ODONTOGLOSSUM SUPERBIENS
- TRICHOPIA GLONNIFLORA
- DENDROBIUM MACARIZÆ

And several good established Plants of ODONTOGLOSSUM VEXILLARIUM, O. ROEZHII, a fine lot of the beautiful O. CORONARIUM; also an importation of the handsome CÆLYGNE GLANDULOSA, DENDROBIUM BARBATULUM, D. AUREUM, and the true D. ALBUM—Wight, in describing this beautiful Dendrobium, in *Iones Plantarum India Orientalis*, says: "This is one of the handsomest of the genus I have yet met with; large pure white flowers."

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

HIGHLY IMPORTANT SALE OF EAST INDIAN ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, March 29, at half-past 12 o'clock precisely, a very large quantity of Choice EAST INDIAN ORCHIDS, consisting of DENDROBIUM WARDIANUM, D. CRASSINODE, D. DEVONIANUM, D. FALCONERI, D. SAUVISSIMUM, D. HETEROCARPUM, D. THYRSIFLORUM, D. CHRYSOTOMUM, and others; VANDA CÆRULESCENS; the new CYPRIEDIUM BOXALLI, offered for the first time; AERIDES, SACCOLABIUMS, &c. At the same time will be offered a quantity of Plants of CATTLEYA MAXIMA, from the Province of Manabi, just received by R.M.S. Nile; and twenty-five fine established Plants of PHALÆNOPSIS SCHILLERIANA, in flower. All are in the finest possible condition, and amongst the East Indian Orchids are many specimens of a size rarely seen.

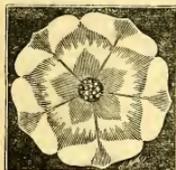

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

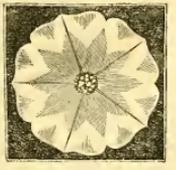

HOME-GROWN FLOWER SEEDS.

H. CANNELL, F.R.H.S.

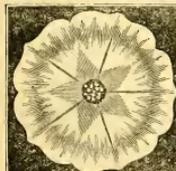

Heggs to remind the Public generally that his Business is exclusively devoted to FLORIST FLOWERS and their SEEDS only, and as a proof of his superior strain he simply presents the following Opinions of the Press of his PETUNIAS, which are unquestionably the finest in the world—

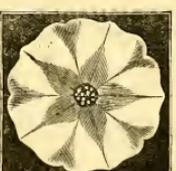

"From 'Gardener's Magazine,' August 30.
"Mr. H. Cannell continues at Swanley the careful cultivation of florist's flowers, and desires to prove to us that he is in earnest. His mode of procedure is agreeable and convincing for we have just received from him a boxful of Seedling Petunias and Fuchsias of the most sumptuous character. He describes them in simply impressive, and perhaps the best we can do is to recommend those who are interested in such things to run down to Swanley to see and judge for themselves. At all events, we place it on record that we have never seen a finer lot of Petunias and Fuchsias than we have now before us."

"Extract from the 'Gardener,' August 30, 1876.
"BEAUTIFUL PETUNIAS.—Mr. Cannell of Swanley, has sent us a whole flower garden of Petunias of the most beautiful and varied colours. We fancied we had some knowledge of the variety in which Petunias varied, but had no conception that the variation was so great until we received this batch. Words, however, fail to convey any adequate idea of their variety and beauty."

"Year's of Horticulture,' August 30, 1876.
"Just on the eve of going to press we have received a box of blooms of Single Petunias from Mr. Cannell, Swanley, Kent, which for size, richness of colour, and purity of markings, surpass all that have previously come under our notice."

"Extract from the 'Gardener's Chronicle,' August 19, 1876.
"We have received from Mr. H. Cannell of Swanley, Kent, samples of Petunia flowers of a remarkably fine strain, selected from a bank of flowers occupying a house 100 feet long, which we have since seen. The flowers are generally very large, some beautifully striped, and a great number of others, some of the richest velvety crimson. One variety was especially noticeable, and to us entirely novel and particularly fine."

Seed, 1s. and 2s. per Packet.

Your address on a halfpenny card will bring you the most instructive and best Illustrated FLOWER SEED CATALOGUE ever published.

H. CANNELL, Swanley, Kent.

The Greatest Novelty of the Season.

MIMULUS MOSCHATUS HARRISONI.

Awarded a First-class Certificate by the

Royal Horticultural Society and Royal Botanic Society of London, 1876.

This exquisite plant is a Hybrid between the Large Spotted Mimulus and the Giant Musk. The flowers are as large as the former, with the rich golden-yellow colour of the latter, exquisitely spotted on the lower segments with rich brown. Its habit is recumbent and neat, blooming at every joint, thus producing an abundance of elegant flowers which are brilliant and interesting. A few plants will effectually brighten and scent a Conservatory or Greenhouse. It will succeed admirably in all situations where it can be freely supplied with moisture, although a cool shady place is the best. Being an excellent Bedding Plant, and especially adapted for Rockwork, it will be rapidly brought into requisition, and its universal cultivation will quickly be accomplished. Its easy culture and other qualities will secure for it a popularity and extensive sale. It continues to bloom from March until December, and retains its scent throughout the year. As a free-growing odorous plant it is admirably adapted for Asylums, Hospitals, and other Public Institutions.

NATURAL SIZE.

Harrison's New Musk.

OPINIONS:—

"From THOMAS MOORE, Esq., Chelsea Botanic Garden, Nov. 17, 1876.

"I was much pleased with your Hybrid Musk as exhibited at South Kensington. I thought it likely to make a useful decorative 'everybody's' plant, fit for the conservatory or the cottage."

"From SHIRLEY HERRICK, Esq., F.R.H.S., Stoke Newington.

"Harrison's Musk is one of the most interesting of the novelties of the season, for the Musk in its old form is a universal favourite, and in this new variety we see it improved in all its attractive characters, so that it may rank with the florists' flowers, while continuing to charm us with its refreshing odour."

Nov. 12, 1876.

From Mr. A. F. BARRON, Chiswick Gardens, W.

"I like Mimulus Moschatus Harrisoni very much. It is as strongly perfumed as the ordinary Musk plants, with the addition of large yellow flowers, like the common Mimulus. It is sure to be largely grown as a window plant."

Nov. 12, 1876.

From Mr. R. DEAN, Nurseries, Esq., Basing.

"MIMULUS MOSCHATUS HARRISONI.—This is a bold-growing perfumed Musk, with large yellow red-spotted flowers. In addition to the spotting, it may give us a race of scented-floored Mimulus with flowers at large and beautifully spotted as any now to be found on the improved varieties. This interesting hybrid was exhibited by Messrs. Harrison & Sons, Nurseries, Leicester, and awarded a First-class Certificate of Merit—the highest award a new plant can receive."

From Mr. J. W. HILLS, Nurseries, Oakville Crescent, South Kensington, Nov. 23, 1876.

"I was much pleased with your new Mimulus Moschatus Harrisoni when I saw it exhibited some time since, and consider it a great acquisition, and shall be glad to have some plants of it as soon as it is in commerce."

This beautiful plant will be distributed on or before May 1.

Plants 5s. each; Six for 25s.; Twelve for 48s.

Orders booked and executed in rotation, as received.

INTERNATIONAL
HORTICULTURAL EXHIBITION & CONGRESS
 In 1877, at AMSTERDAM.

The Direction and Managers for the International Horticultural Exhibition and Congress, which will be held in this city in the month of April, have authorised us to publish an Illustrated Daily JOURNAL exclusively devoted to this Exhibition, which will be of great importance.

This JOURNAL, being the official medium of the Direction, will contain all that can be of interest to the Exhibitors, Directors, Jurymen, Members of the Congress, and visitors in general.

As for the further contents of this Journal we shall take every care that they may answer the requirements which may be expected from such a publication, in order that every number, in every respect, will be a general Guide as well for strangers as for inhabitants.

To realise these plans no efforts nor expenses will be spared.

This Daily JOURNAL will be, without doubt, a very desirable and effective medium for the insertion of Advertisements, especially of all articles appertaining to Horticulture, but also of those intended for the public in general. It will certainly have a very extensive sale, not only in the Exhibition grounds, but also in the country and abroad, to every one who takes an interest in this Exhibition.

Advertisements are inserted on the following Terms:—

Ten Lines, 4s. 2d.: each Line beyond this number, 5d. Displayed Advertisements, either in Columns or across the Page, are charged according to the space occupied.

These Advertisements must be prepaid. The amount can be remitted by Post-office Order, which may be obtained for Holland at all Post-offices of Great Britain and Ireland.

Amsterdam, March, 1877.

HOW TO GROW LILIES.

THERE are few who have not seen and admired the gorgeous beauties of one or other of the many varieties of Lilies now in cultivation, or who have not been charmed by the stately purity of *L. candidum* and its sweet odour. It was, however, reserved to *Lilium auratum* to take us by storm, and bring the merits of this beautiful genus of plants prominently before the public. Never before, probably, has there been anything like the demand for a particular flower that has now existed for years for bulbs of this Lily. Hundreds of thousands have been sent over from Japan, and it is to be hoped as many more will follow, that every one who has a garden may feast his eyes on one of the most magnificent flowers it is possible to see. Some of the varieties of Lilies, such as the Martagon, tigrinum, candidum, chalcedonicum, and a few others, will do in almost any kind of soil, and succeed admirably in such as is of a stiff loamy nature. The choice kinds, however, are more particular, and require either peat or plenty of sharp grit, but in the latter case it must be where they can drive their roots down in a cool, moist bottom. The margins of Rhododendron beds, where gaps occur among the plants, is just the place to grow them to perfection, and in no position do they show up so effectively as when backed by the rich glossy deep green leaves of this favourite shrub. Failing a situation of this kind, the next best place is the shrubby border, as it is essential they should have partial shade and shelter of some kind.

The heads of flowers require it on account of their enormous size and consequent liability to be blown about and damaged by the wind, while the roots will only succeed really well where they are so situated as to be screened from the sun, which causes the ground to become too much heated and robs it of its moisture. This dryness of the soil is one of the most frequent causes of failure in Lily culture, as it generally occurs at or about the time the plants are developing their flowers, when they require more assistance than they do at any other time owing to the demand that is made on the roots, and if these cannot respond in a proper manner the bulbs as a natural consequence become so weak and exhausted that they dwindle away and eventually die altogether. To grow them in the style they may be had, one of the principal and most important things is to keep the foliage fresh and healthy up to the latest period possible, so as to prevent any premature ripening, which must of necessity take place at the expense of the bulb; and this can only be done by affording them an abundant supply of water and mulching the soil immediately surrounding them. Although the price of most of the best kinds of Lilies is somewhat against them, they are of such a permanent character compared with most other plants, that their first cost ought not to be so much a matter of consideration, as they are really cheap in the end, and there is nothing that can at all compare with them in the grand display they make and the small amount of labour entailed in their cultivation.

Unfortunately of late the best and most valu-

27 ILLUSTRATED SEED CATALOGUE gratis and post-free to all applicants.

able of our hardy plants have been sadly neglected, and almost elbowed out of existence to make room for others, the merits of many of which consist merely in the bigness of their leaves, or whose beauty at the best is only of such short duration, that it in no way compensates for the room they take up under glass, and the constant recurring expense there is in raising them and getting them fit to plant out. In the cultivation of the Lily there is nothing of this, for if a proper position be chosen, and suitable preparation made, they become more vigorous each succeeding year, and increase at such a rate as to form grand masses if left undisturbed. For shrubby borders, where they can be kept clear of the roots of trees or other surface-feeding plants, there is nothing more suitable to grow than Lilies, and there are few gardens attached to any place but what have an appendage of this kind, all of which would be greatly improved by the introduction of a few clumps of the different varieties of these stately plants.

HOW TO PLANT THEM.

As the season is now getting advanced, those who contemplate planting them should lose no time in setting about making the necessary preparations. If it is intended to grow them in borders at the front of shrubs, the proper course will be to dig large holes from 2 to 3 feet across, and as much deep, and to fill these in with properly prepared soil, such as a mixture of leaf-mould and the turfy trimmings from the roadside, or any old pasture that has a sharp gritty soil. This should be chopped up small, and the whole well mixed up together, but on no account ought manure to be added in any form, or it will be likely to cause the bulbs to rot away before they are in a sufficiently forward state to make use of it. If applied at all, it should be towards the bottom of the hole where it can only be reached when the plant is in an advanced stage of growth; at which time the roots are actively at work, and can turn it to proper account.

Having filled in the holes with the parings from the sides of paths or roads, or any good turfy loam and peat, which should be rendered tolerably firm by gentle treading, the next thing is to plant the bulbs, either singly, or in groups of three where bold masses are required. Excepting for such as *giganteum*, with its massive leaves and gigantic stem towering aloft, most of the others look best placed in clumps triangularly at from 6 to 9 inches apart, and the front plant so arranged as to face the border or walk, in which way they are seen to great advantage. In placing the bulbs in position it is of the greatest importance that they should have a good handful of sharp, clean sand under their base, and a shovelful of the same scattered over and around them, which will keep them in a clean, healthy state, and prevent them from rotting—a thing they are very liable to if the soil is allowed to come in immediate contact with them. The proper depth to plant is about 6 inches, and when all is covered in securely with the same kind of mixture as the holes have been previously filled in with, the surface should be mulched over with some half-rotten leaves, cocoanut fibres, or any material of that kind, to keep out frost; for, although Lily bulbs are perfectly hardy, when they become established, they are readily injured after being fresh-planted, especially if at the time they are forming young growth, or emitting their large fleshy roots.

The principal attention required through their growing season is to keep them securely staked and tied as they advance, the best and nearest supports for which purpose are Bamboo rods of suitable length, which for colour and structure so closely resembles the Lily stems that they are scarcely observed, while they are far stronger than any other stick of double their size. It is the practice with many cultivators of Lilies to take up their bulbs after they have done

blooming, and to winter them out of the ground; but this tends to weaken them very considerably, as the large fleshy roots that would live in the ground if left undisturbed are completely destroyed; and not only is this the case, but the bulbs shrivel a good deal, thereby losing much of their weight and vital force, which prevents them starting away so strong or flourishing with anything like the vigour and freedom they do when not interfered with. This being so, the stems should be simply cut away close to the ground when thoroughly ripe, which they generally are by the end of October; and in order to keep them snug for the winter it is as well to remove the mud. Treatments in this way they soon become strong and throw out fine stems, which carry from ten to twenty or more of their magnificent flowers, many of which are so strongly perfumed as to scent a moderate-sized garden.

POT CULTURE.

For pot culture *Lilium auratum* is most valuable, as are also the several kinds of specimen that come in later in the autumn. These give a richness and character in the greenhouse or conservatory at that season quite unattainable by any other plant, and a few pots of each should therefore be grown wherever there is a structure of the above kind to furnish. Single bulbs of *L. auratum* may be grown in deep 6 or 8-inch pots to great perfection, and are even more suitable to stand among other plants than when named and grown together. The best soil for them is a mixture of good fat fibry loam in any old pit, of the proportion of two-thirds of the former to one of the latter, with just sufficient sand to keep it open and porous, that water, of which they can scarce have too much when growing freely and flowering, may pass readily through. In potting the bulbs should be placed low down in the pot, and simply covered, so as to leave sufficient room to pack round pieces of turfy loam around the young stems as growth proceeds, in which they will root freely and stand the most strongly than they otherwise would. In the case of all dormant bulbs, and especially of the Lily, any soil used for potting should be in a nice healthy state to moisture, which will obviate the necessity of having to water till they have started well into growth and are able to take it up before any injury results from its lodging about their base and among the scales of the bulbs, which is a frequent cause of so many coming up weak and afterwards dwindling away altogether. The best place to stand them in will appear above the soil is under the greenhouse stage away from drip, in any cold pit having a damp firm bottom impervious to worms, as there the soil can be kept in much the same state with regard to moisture as at the time of potting, and the longer it remains in that condition without having to water, the stronger and better will the growth be.

After the pots have become well filled with roots and the plants are moving on freely, weak liquid manure applied occasionally will be of the greatest assistance to them till just after the flowers are fully expanded, when its use should be discontinued and less water given as the ripening off proceeds—a process that in no case should be hurried on, as is frequently done by laying them down on their sides. It is quite time enough for this when they begin to show the sear and yellow leaf, and to die off, a time when heavy rains or any excess of wet would prove injurious. At no season, however, will Lilies bear the amount of drying-off that most other bulbs can endure, and the pots containing them should, therefore, be placed to winter where they will not be subjected to currents of air, or in such a position as that the soil would lose too much of its moisture. The great mistake many make who grow Lilies in pots is in not attending to them sufficiently early as regards shifting and dividing, for if this operation is too long deferred it is impossible to perform it without injuring or destroying a large portion of the thick fleshy roots at Lily bulbs have in such abundance when they are in a state of good health, and, therefore, the necessary repotting, &c., should be done as soon after the top die away as they can be taken in hand. This ought in all cases to be carried out with as little disturbance as possible to the old ball where there are any live roots in possession, and by picking out the soil carefully from amongst them it may be requisite to remove with a sharp-pointed stick.

RAISING NEW VARIETIES.

In the raising of new Lilies from seed there is a fine field open for the hybridist, and there

is no lack of choice varieties to work from. *Lilium auratum*, when grown out in the open, seeds freely in favourable seasons, and so also does *giganteum*, both of which are on that account, and from their general superiority over most others, capital seeds to be had from, although there is no reason why efforts to obtain new varieties of great worth and distinctness should be confined to any particular kind. As the flowers do not require any delicate manipulation, such as is needed by most others, any amateur can work at it with equal chances of success as those more skilled in the art. The principal thing is when the blooms expand to remove the anthers from all those to be fertilised, which may be done by clipping them off with a pair of sharp-pointed scissors. This must be accomplished before any of the pollen becomes ripe, otherwise some of it is sure to fall and adhere to the pistil, which Nature has so abundantly provided with viscid matter to insure that at least some portion of the pollen grains may fall on it and adhere, and thus carry out their allotted functions. Plants, as a rule, will always become fecundated with their own pollen much more readily than they will with that from other species, hence the necessity for removing their anthers while they are in an unripe state. Both these and the pistil are so conspicuous in the Lily, and the importance of the pollen so far as generally understood that any attempt here at an explanation would be superfluous. To those unacquainted with either a mere cursory glance will show their several positions and the purposes they are intended to serve, and how readily they may be turned to account in increasing our floral treasures and adding to our pleasures and happiness. It should be borne in mind that bees may frustrate the work, even after the removal of the anthers; and in order to guard against this the operation should be operated on should be protected by placing very fine gauze or hexagon net over them, keeping the net or chafin against them by using a few twiggie sticks stuck in the ground on which to support it.

When the stigmas are in a ripe state they may be seen by the coating of glutinous matter they will have on them, the ripe pollen from any other Lily may be readily introduced, either by using a camel's-hair brush or by tipping off the anthers and holding them between a pair of tweezers, in which way they can be carried, and the stigma slightly touched till thoroughly coated with the snuff-like pollen. One plant will bear sufficient of this, if judiciously and carefully used, to fertilise a great many, and each separate stigma may be so successively treated as well with as many varieties, and if each is numbered to correspond with a memorandum kept of the kinds employed, the result can be seen afterwards, and the work will thus be rendered more interesting. Having operated, the flowers as above, they should again be protected with the gauze or net, which should be allowed to remain on till the seeds are fit to gather, as birds are fond of them, for I unfortunately lost the whole of mine of last year from their depredations while I considered them safe.

Any one who commences such an interesting branch of gardening as this is sure not to rest satisfied with trying his hand on Lilies, but will seek fresh honours with other flowers equally deserving of attention; and if those who grow a list of such plants grow who never before grew, deserve well of their country, how much more must the originator of any new and beautiful flower do so, the slight and possession of which is destined to be a source of delight to so many? It is only those who have some once tried the occupation of raising plants from seed, the result of artificial fertilisation, that can realise what pleasure there is to be derived from the work, and how absorbingly interesting it is to watch the successive stages of the young, trying each change in leaf or bud, and hanging with fond hope on the ultimate result to be revealed only when the bloom—so slow for one's impatience in unfolding—shall open that we may see what it is like, and perhaps find it disappointing as a whole, yet the success is sufficient to give fresh zest, and spur one on to renewed effort. J. Sheppard.

New Garden Plants.

BOLLEA CELESTIS, *Rhb.*, J. *Gardener's Chronicle*, 1876, vol. v, p. 756; *Linnæa*, xl, p. 5 (*Orchideæ Ruziziænsis*).

What a pleasure it is to make the acquaintance of one's species in a fresh state!—and what vexation they are submitted to under extreme changes by pressing in the case of Bollea and *Tricostema*. One would not believe in the possibility of such changes, which cause the botanist great embarrassment. After all it is one of the greatest satisfactions of my Orchidic life, to see this wonderful flower, most probably the first ever developed in Europe. It is as large

as a well-formed flower of Mr. Day's *Pescatorea*. My wild-grown flowers, however, and most of those given by Messrs. Lamb, & Co. are nearly one half larger. The warm purple blue tint is darkest and most dazzling as a zone over the middle of the sepals and petals; the other parts are lighter, the white. The lip has a very large area of blue of fifteen nearly contiguous lamellae, all yellowish white. The anterior part is blue too. The boat-shaped (or, if you like it better, rope-like) column is of a beautiful blue outside, and blue, too, inside, excepting, however, the base, which is of a bright yellowish colour with numerous small spots. It is partially covered with numerous strong hairs, which are of no effect in the living plant, because they are quite pellicid. It is a great satisfaction to know the discoverer. I believe the plant is due not to M. Koed himself, yet to his gallant nephews, who put their hands on *Ondolagium cirrhosum*. I have to thank for the great pleasure of seeing the flower Messrs. Backhouse, York. They imported it fresh last autumn. They had a plant of the superior sort, from one of ours, 15 to 18 inches high. It must be regarded as a very grand plant. *H. G. Rehb., j.*

CYRIPEDIUM BOXALLII, n. sp.*

I did not expect when the other day, I had the splendour of *C. Haydonianum* at hand, that I should have a fresh novelty to describe so soon. There is no doubt of *C. Boxallii* standing near the well-known *C. villosum*, Lindl., but it has many points of difference. The bract is much larger, covering the basal part of the superior sepal, and it besides much broader. The peduncle is covered with dark blotches, which I never saw in *C. villosum*, and the hairs have alternating pellicid and rather blackish cellules. Both sepals are much broader at their bases, and quite white, while the inferior sepal of *C. villosum* is very acute. The petals, too, are much less concave. The lip has not the long lateral horns of *C. villosum*, and the staminoide is narrower at its base. In a pencil-like stem, the upper sepal and petals (which are of greenish white) are very nicely marked with numerous blackish spots. The plant is a discovery of the keen and successful explorer, Mr. Boxall. It comes from Tropical Asia—I suspect from Indo-British Sumatra, it is one of the numerous presents I have to thank Mr. H. Low for. *H. G. Rehb., j.*

NOVELTIES.

AMONG the plants to be sent out this spring, are the following:—

DENNSTEDTIA DAVALLIOIDES YOUNGII.—This fine new garden Fern comes to us from Australia. It is no doubt very nearly related to the old *Dicksonia davallioides* Sibtholm, *Stavillea* Young, now referred to the genus *Dennstedtia*, but it is much larger in its growth than we have ever seen that plant, which for practical purposes it may therefore be regarded as a giant form. In its native state it is said to produce fronds 17 feet in length; and as seen in this country, under pot culture, it has caudices as thick as one's finger, and fronds of 7 or 8 feet in length. To this stout and vigorous constitution it adds the elegance and gracefulness of minute subdivision, so that its fronds, though large, are utterly devoid of coarseness, and, in their set, a remarkably ornamental plant, well adapted for occupying any bold and prominent position in a stove rockery, or even as a pot plant in a collection of stove or greenhouse Ferns it will always hold its position. The caudex, as already described, is as stout as one's finger, and of creeping habit, progressing forward somewhat freely, and throwing up its ample spreading fronds at intervals. The spikes stout, nearly half an inch in diameter, and of a dark brown colour below, golden-brown above, and quite smooth. The fronds are nearly ovate in outline, and decomposed, the pinnæ $1\frac{1}{2}$ foot long, the pinnules 5 to 6 inches long, lanceolate-acuminate, and the ultimate pinnules, those of the third order, $\frac{1}{2}$ — $\frac{3}{4}$ inch long; these ultimate pinnules are obliquely-oblong, deeply cut into blunt oblong-toothed lobes, of which those at the base of the anterior side are the largest. The sori small, placed near the base of these ultimate lobes in the sinus of one of the anterior marginal teeth. The fronds are herbaceous in texture. It will thus be seen that this Fern, while growing to a large size, is one of the most finely cut of all the large-growing sorts, of herbaceous texture, and when

throwing out its boldly arching fronds, from an elevated position on rockwork, or from a large pot up on a pedestal, it will have a very fine effect. It, however, requires to be grown on freely to secure it in this condition, as if starved down to the size of an ordinary trade plant it will appear to be but little different from *D. davallioides* itself. The plant is in the hands of Messrs. Venable & Sons, of Chelsea, and of Mr. B. S. Williams, of Holloway, by whom we believe it will be sent out during the ensuing spring. It was unanimously awarded a First-class Certificate by the Floral Committee when exhibited at South Kensington on the 7th inst., and gained a similar award on the spring show of the Royal Botanic Society on a Wednesday last. *T. Moore.*

ARALIA FILICIFOLIA (Hl. Hort., t. 240).—This has been shown by MM. Linden, Ball, Veitch, and Williams, and perhaps by others. The plants are too young for their exact position to be determined, hence the name given is to be regarded as merely provisional. It is a very elegant foliage plant, suitable when small for table decoration. The stems are of a deep olive colour, speckled with white spots; the leaves are dark green, glabrous, twice pinnately divided, with a single lobe at the end; the pinnæ are about eight in number on each side of the midrib, each one being divided nearly to the base into linear, minutely saw-toothed and spine-pointed segments. The younger leaves are more finely cut than those first formed. The plant is a native of New Guinea.

CROTON (CODAURA) PARADOXUS.—A narrow-leaved form, with short footstalks, purplish in the middle, paler at either end. The blade of the leaves measures to 12 inches in length by $\frac{1}{2}$ inch in width, the leaves are in form linear-oblong with a spiny point. They are at first green, but subsequently become variegated with yellow or cream-coloured stripes and spots, especially in the centre on either side of the pink midrib. The under surface is paler, and the central portion of a pale pinkish tint. Some of the leaves are twisted in the centre, others are "interrupted," the blade not being continuous throughout. (Williams.)

CROTON FASCIATUS.—A bold, broad leaved form. Leaves 9—10 by 4—5 inches. Leafstalk about an inch long, brownish in the centre, paler at either end. The blade of the leaf is inversely egg-shaped, tailed, rounded at the base, of a lively green colour, traversed by bright yellow veins, and marked with a few irregular spots and blotches. It is a fine variegated kind, of bold habit. (Williams.)

CROTON CAMPTOPHYLLUS.—A very narrow leaved form. Leafstalk $\frac{1}{2}$ — $\frac{3}{4}$ inch, green in the centre, paler at the ends. The leaves 6—9 inch long, and $\frac{1}{4}$ inch wide, in form linear-oblong, dilated at the base, and with a central yellow stripe. The apex of the leaf is obtuse or shortly pointed. The leaves are variously twisted and curved. (Williams.)

CROTON PALCATUS.—A form of loose habit. Leaves 18—24 inches by 2—3 inches. Leafstalk 1 inch long, pink in the centre, paler at each end. The leaves are strap-shaped, dilated and rounded at the base, sword-shaped or sickle-shaped, with a dark purple midrib and margins, and with irregular blotches of yellow. The under surface is pale purple with green veins. (Williams.)

ABNEY HALL, CHEADLE.

AT any season of the year a visit to the extensive grounds and glass erections at the above gardens, the seat of Sir James Watts, Knt., will be found to be one of peculiar interest and pleasure, for the number of the houses and the general high-class character of the plants under cultivation ensures a fine display of choice subjects at almost any time. It was my good fortune a few days ago to have the opportunity of going through the houses with the gardener, Mr. R. Mackellar, and from a few observations made at the time, perhaps, a little notice may be acceptable to your readers, and of sufficient interest to find a place in your pages. The grounds and mansion stand just on the borders of Cheshire, about 6 miles in a southward direction from Manchester. The grounds, which are kept in fine order, and are very diversified in appearance, contain a number of very fine specimens of Conifers and other shrubs of an ornamental character, among which special mention must be made of

an avenue of *Cypress Lawsoniana*, and though these in general pass for very much of a similar habit and appearance, yet on a closer inspection and comparison it will be found that great variety exists among them, the habit of some being exceedingly beautiful, whilst others differ so much that it seems scarcely credible that such different forms should spring up from the seeds of probably the same cones.

The conservatory is a large and ornamental structure adjoining the mansion, and in it are planted out some of the finest specimens of *Camellias* that are to be seen anywhere in the neighbourhood of Manchester or in the miles around. Another large house is devoted to these fine plants, and at the present time the blooms may be counted by the hundred. Two grand plants of *Imbricata*, about 20 feet, are literally covered with blooms. The old double white is also very strong, and flowers fine and numerous. Here also are large plants of *Storly*, with flowers of fine form, of a deep rose colour; *Countess of Orkney*, a magnificent form—pure white mottled with pink; the half-expanded flowers of this variety have a very chaste and distinct; *Countess of Derby*, pure white striped with rose; *Cap of Beauty*, La Reine, Jubilee, *ambriata*, and also represented by fine well-blotted plants; whilst amongst those of a large scarlet type mention may be made of *Monarch*, the stamens of which are very prominent, and also of one named *Triumph*, the flowers of which are of an immense size.

From the conservatory, through a small portion of the pleasure grounds and across the kitchen garden, we come to a fine range of vineries, and just adjoining these is also the Peach-house. The Vines in this peach house have broken very strong with foliage good and plentiful. Here the Vines were just flowering, some already being set. The number of bunches, and the size of the greater part of them, would seem to indicate that here again Mr. Mackellar will be amply repaid for the constant care and attention he bestows upon this part of his labours. In the stove were many plants of an ornamental character, whilst for blooming purposes a quantity of *Eucharis amazonica* is grown, the variety there has been an abundance of bloom—twenty spikes on one or two of the plants will give some idea of their size and vigour. Here also were two fine plants of *Franseria confertiflora*, measuring about 4 feet by 4. The heads of bloom were thickly set all over the plants, some of the trusses having developed from twenty to thirty flowers. These are two plants that it would be difficult to match. *Calanthes* are grown in great quantity for cut flowers; about ten or twelve bulbs are planted in a 10-inch pot, and in their season are certainly a sight worth looking upon. A number of plants of *C. Veitchii* among those of *C. vestita* adds interest and charm to the display. In this house and another adjoining are several specimen *Orchids*, notably *Dendrobium monilliforme*, a grand mass, and well flowered; *densiflorum*, 4 feet through, showing well for bloom; *Farreri*, almost as large; while a quantity of noble are also grown, and when in flower are used for the decoration of the conservatory. Some grand specimens of *Vacc. filamentum* that are to be seen in great quantity of smaller plants of the same species, are to be met with here, and are all in very fine health.

A house of large size is specially devoted to *Azaleas*, and in a half-trained, half-natural form are a splendid lot of plants of very large size and in robust health. In the course of a couple of months these will be a picture. A fine lot of hard-wooded plants is also done well here, the principal varieties of *Heaths* being in many cases plants 3 or 4 feet high, and as much through, whilst a number of half specimens are coming on very freely. A prize plant of *Boronia pinnata* is in fine health and a splendid colour. I also noticed several fine pans of *Nertera depressa* in the Peach-house, and feel sure that in their season they will be covered with their pretty orange-coloured berries. I also noticed large quantities of bedding plants in almost every conceivable position, this being a part that is done rather extensively and with great taste. This by no means exhausts the many objects of interest that are to be met with here, however, give some idea of the number and variety of the duties devolving upon the gardener; at the same time I feel I cannot close this notice without bearing testimony to the satisfactory state of everything under his charge, as well also as to the kindness and courtesy that I have, not on this occasion only, but at other times, received at the hands of Mr. Mackellar. *W. Swan, Fallowfield, March 13.*

* *Cyrtopodium Boxallii*, n. sp.—Javica, *C. villosum*, Lindl. *Caulis obscurus muricatus; pilis pellicidosis infirmis; stricis amplexibus latis; sepalis summaris integerrimis tegente; sepalis utriusque obtusis; basi latioribus; lobis ovatis, subobovatis, mucronatis; comis labeis lateralibus abbreviatis; staminoide basi angustato.*—*Abney Hall, H. G. Rehb., j.*

THE GENUS AGAVE.

(Continued from p. 303.)

SERIES I.—CORIACEO-CARNOSÆ.—Texture of the leaf rigid, not at all fleshy or yielding to the touch when mature. End spine large, hard and pungent.

Group II. Marginatæ.—Edge of the leaf furnished all the way down from the top to the bottom with a distinct horny border, of the same texture as the teeth.

This group is too large to treat in a single paper, so I will take this time the species that belong to it which have sword-shaped leaves not appreciably narrowed

brown, the lower ones half a foot long. Flowers arranged in a dense spike 4–5 feet long. Capsule $1\frac{1}{2}$ inch long.

Var. *corulescens*, Jacobi, Cat. 2, p. 3; *A. corulescens*, Salmidyck; Jacobi, Monogr., p. 38.—Differs from the type by its leaves having a decided glaucous bloom.

A native of Mexico, now widely spread in our collections. Marked by its large, stiff, typically ensiform, dull grey-green leaves, narrowed gradually from the middle to a long point, and by their narrow grey border and small prickles. Although the plant is so well-known there is no figure of it in the flowering stage. Jacobi gives a description of a plant that flowered at Hamburg, but no note was kept with re-

pp. 47 and 205; Ref. Bot., tab. 215; fig. 58. Acaulescent. Leaves 50–80 to a rosette, rigid, ensiform, 2–2 $\frac{1}{2}$ feet long, 2–3 inches broad at the middle, narrowed slightly downwards, and very gradually upwards to a brown pungent point $\frac{1}{2}$ inch long, $\frac{1}{4}$ inch thick in the centre, dull green, with a broad pale band down the face, faintly lineate on the back, the margin bordered by a narrow, continuous, grey horny line, furnished with hooked, lanceolate prickles, $\frac{1}{4}$ – $\frac{1}{2}$ inch long, placed $\frac{1}{2}$ –1 inch from one another. Scape 4 feet long, exclusive of the spike, its bracts dense and squarrose. Spike 10–12 feet long, 6–7 inches thick; pedicels $\frac{1}{2}$ inch long; bracteoles lanceolate and deltoid. Perianth green, 16–18 lines long; ovary oblong-cylindrical, $\frac{1}{2}$ inch long, narrowed gradually into the very short tube; seg-

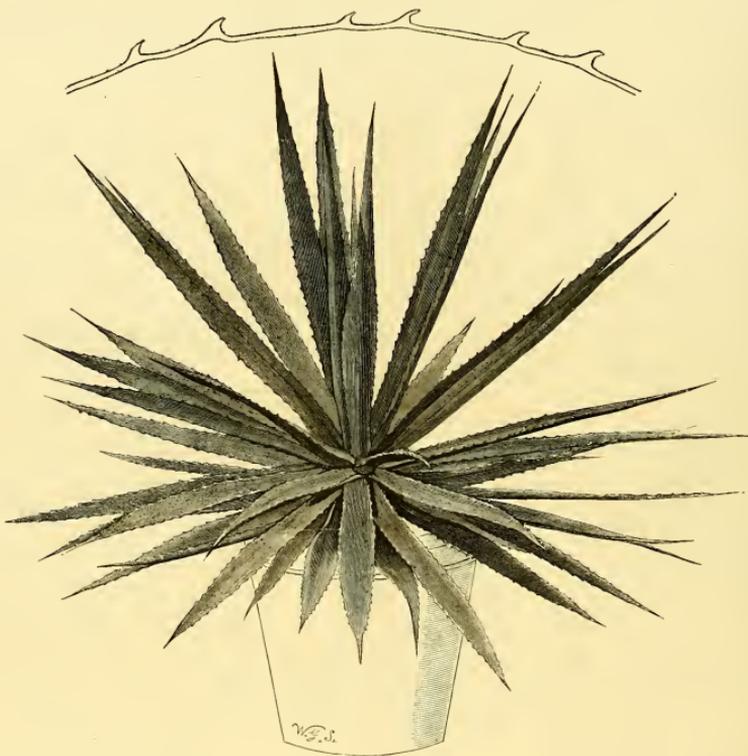

FIG. 58.—AGAVE UNIVITTATA.

from the middle to the base, leaving for the next time the Marginatæ with broader oblanceolate or oblong decidedly spatulate leaves, and will divide these Ensiformes into two sets, Grandifolice and Parvifolice.

* GRANDIFOLICE.

5. *A. (Littora) lophanta*, Schiede; Jacobi, Monogr., pp. 39 and 202.—Acaulescent. Leaves 30–40 to a rosette, rigid, ensiform, 2–3 feet long, $1\frac{1}{2}$ inch broad at the middle, equal in width from the middle to the top of the deltoid base, $\frac{1}{2}$ inch thick in the centre, rather concave down the face, rounded on the back, not marked with any lines, dull green in the typical form, narrowed gradually to a pungent brown spine $\frac{1}{2}$ inch long, the margin bordered by a very narrow continuous grey horny line, furnished with distant linear grey falcate teeth about a line long. Scape 7–8 feet long, its leaves

guard to its perianth and stamens, so that I hope the next time one of the numerous plants in this country flowers, some botanist will be communicated with, and a drawing made. There are many varieties in the size and colour of the leaves. Longifolia, of Jacobi, is an unusually large variety; in a specimen seen in the Saundersian collection with 40–50 leaves, forming a rosette 6 feet in breadth. *A. corulescens*, Salmidyck, of which there is a fine plant now at Kew, is clearly a mere variety of lophanta, running into the type through vars. subcaulescens and grisea. Judging from the description alone, I strongly suspect *A. Funkiana*, K. Koch and Bonché (Jacobi, Monogr., p. 38), to be a form of lophanta with vittate leaves.

6. *A. (Littora) univittata*, Haworth; Jacobi, Monogr.,

ments thick, ligulate, obtuse, suberect, $\frac{1}{2}$ inch long. Filaments inserted at the throat of the tube, twice as long as the segments; anthers above $\frac{1}{2}$ inch long. Style reaching to the top of the segments.

A native of Mexico, long known in Europe, and of which all the large collections of the present day contain specimens. An adequate coloured figure will be found in the *Refugium* as just cited, and the plant has also flowered lately both with Mr. Peacock and at Kew. It has the same stiff habit as lophanta, but is always, so far as I have seen, handed down the face, the leaves being more numerous, broader, and not so strictly ensiform, with a faintly lineate back, and a broader border, with rather stronger teeth. I cannot make out from the description that *A. ensifera*,

Jacobi, Nachtrage, 14, differs from univittata to any appreciable extent.

7. *A. (Littles) heteracantha*, Zucc. ?; Jacobi, Monogr., pp. 41 and 206, and Nachtrage, p. 14?; Regel, Gartenfl., 1870, p. 4. t. 639?; fig. 59.—Acaulescent. Leaves 50–80 to a rosette, rigid, ensiform, $1\frac{1}{2}$ –2 feet long, 2–2½ inches broad in the middle, narrowed gradually to a brown pungent point 7 inch long, $\frac{1}{4}$ inch thick in the centre, dull green, not vittate, marked conspicuously with numerous darker green lines on the back, furnished with a distinct grey horny border, and numerous strongly hooked lanceolate spines $\frac{1}{4}$ – $\frac{1}{2}$ inch long. Scape 3 to 4 feet long. Spike dense, 3 feet long. Perianth greenish, $1\frac{1}{2}$ inch long; ovary oblong, $1\frac{1}{2}$ – $2\frac{1}{2}$ inch long; tube short, funnel-shaped, segments equalling the tube. Filaments $1\frac{1}{2}$ inch long, inserted near the throat of the tube; anthers ligulate, $\frac{1}{2}$ inch long.

and crowded very strong lanceolate prickles, from a deltoid base, reaching a length of half an inch. Inflorescence unknown.

Described by Jacobi, from the collection of Baron de Jonge van Ellemet and Muilman, of Utrecht. The native country is not known; I have not seen the plant in England. Its alliance is evidently close to *A. heteracantha*. *J. G. Baber.*

THE ROYAL HORTICULTURAL SOCIETY.

HAVING reason to know, from conversation with numerous amateurs and others, that the lengthened correspondence which has recently appeared in the

of great scientific and practical value have for years been carried on and are still continued at Chiswick, with excellent results, whilst the reports in the horticultural papers are sufficient testimony to the thoroughly successful working of the Scientific, Fruit, and Floral Committees connected with the Society. The fortnightly shows are also a great success, even beyond the most sanguine expectations.

31. What is now required is to obtain an increase of Fellows and members, and I think it cannot be too well known that those who wish to join the Society can do so on the following terms:—

A. By payment of one guinea per annum, which payment entitles the member to see the gardens at all times, including all shows, *fêtes*, *conversations*, and promenades, both at Chiswick and South Kensington,

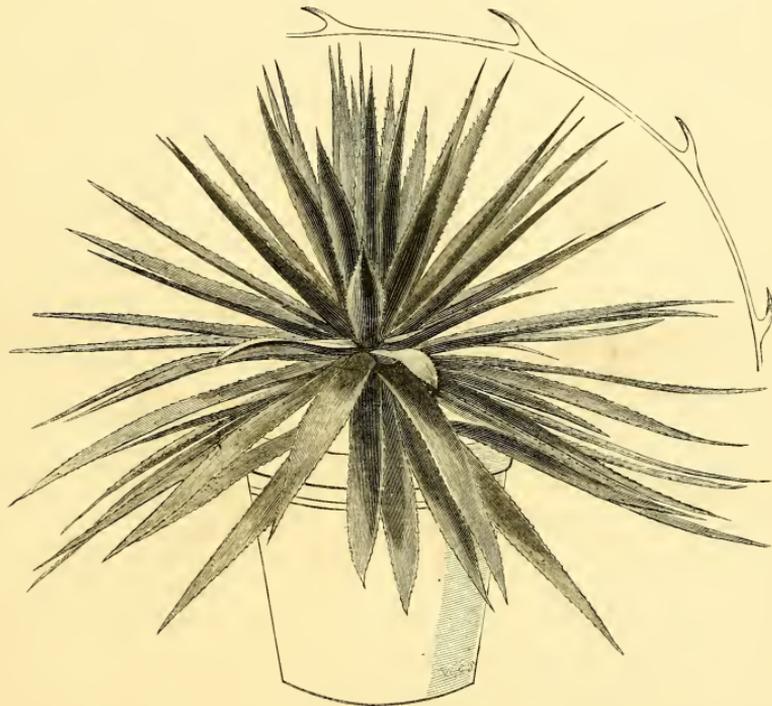

FIG. 59.—AGAVE HETERACANTIA.

Our figure represents the plant grown in English gardens at the present time as *A. heteracantha*, but I doubt its being what was intended by Zaccarini, of which the prickles are said to be very large, very close, and deltoid. Our plant is a close ally of *A. univittata*, but is smaller, not vittate, with larger prickles, and very distinct stripes on the back of the leaf. There is a fine specimen at Kew at the present time. My description of the inflorescence is taken from Regel's figure. It is said to be an inhabitant of Mexico.

8. *A. splendens*, Jacobi, Nachtrage, 2, p. 63.—Shortly caulescent. Leaves 50–60 in a rosette, about 12 feet long, very rigid, slightly narrowed from the middle downwards and upwards to a brown terminal spine 1 inch long, olive-green, not vittate, slightly hollowed down the face, furnished with a continuous broad margin,

newspapers has tended only still further to mystify the public, and consequently to injure the Society even more than was previously the case, I venture to ask the favour of space in your paper that I may briefly draw attention to the following facts, hoping thereby to remove the doubts of many who would be willing to come forward and aid by their subscriptions a Society which has done in the past and is still doing much valuable work.

1st. The Society is now financially in a better position than it has been for several years past, but its income is still most inadequate, but with additional aid it would be able to carry on its experiments and maintain the efficient working of those committees whose labours have been, and are still, so beneficial to the public.

2d. Besides other valuable work, competitive trials

but without giving a vote at the meeting of the Society; or

B. By payment of two guineas a-year, which entitles the Fellow to one yearly transferable ticket, admitting the bearer every day, and to all shows, *fêtes*, *conversations*, and promenades, both at Chiswick and South Kensington, and enabling him to visit the shows at an earlier hour than the general public; also admitting the bearer with two friends on all ordinary days, to receive forty orders giving free admission to promenades on all days excepting show and special days, to have the right of voting at all meetings, besides other minor privileges; or

C. By payment of four guineas a-year, which entitles the Fellow to two yearly tickets, both of which are transferable, and which gives the bearer admission every day, and to all shows, *fêtes*, *conver-*

ositions, and promanets, both at Chiswick and South Kensington; to visit the shows at an earlier hour than the general public, to receive forty orders giving free admission to the promanets and on the days excepting show and special days, the right of voting at all meetings, free admission to the reading-room, besides many other minor privileges.

D. Bond *head* gardeners, on payment of 10s. 6d. yearly, are admitted as members, with the same privileges as those amateurs who pay one guinea per annum.

E. There is now no entrance fee, and any one subscribing is in no way liable for any amount beyond the subscription for the year.

I am surely not too sanguine in expressing the hope that throughout Great Britain, where the love of flowers is so universal, there are many who will be willing to come forward, and at so small a cost to themselves help to support a society which has done so much good in the past, and which, I feel confident, must, with efficient aid, have a very brilliant future. I venture to appeal on its behalf for such support, and shall gladly receive the names of any who are willing to become members, and I shall be happy to obtain the necessary signatures to the nomination papers so as to save as much trouble as possible as regards election, &c. *Harry T. Vitch, Royal Exotic Nursery, Chelsea, S.W.*

— Having on the 10th written a "last" letter on guinea Fellowships in the Royal Horticultural Society, I hardly venture to trouble you with another. I believed that the matter would have to rest for a considerable time, but circumstances have changed. The day after my letter was sent came an answer from the President. His Lordship's accident had prevented his getting up to the Council. His views as to the policy of the Society in the future are to my mind entirely satisfactory. There came a very well-known amateur horticulturist from Clifton, who has great knowledge of business and of the world. He considers that it is so great a gain having the guineas admitted in any shape, that we ought to be satisfied for the present, and make the most of it. I have not the time to give a representative of another section of horticulturists, Mr. Gilbert, gardener to the Marquis of Exeter at Buryleigh, wrote exactly to the same effect in last week's *Gardener's Chronicle*. Both these opinions carry weight. Some of our correspondents will not join the present Society; others will not join it while it has the maintenance of the London branch at South Kensington, but I believe that by far the largest number will trust to us on the spot, knowing that our only object is the promotion of horticultural science, and will act as advised. I think if fellowship with a vote for those living outside the London limits had been proposed at the general meeting it would have been adopted, and take great blame to myself for not having thought of this. It is now too late for this year, but I think, and have reason for thinking, that if a large number of country horticulturists will join the Society on the terms now offered—that is, membership without a vote, for a guinea subscription—that we have good hope of getting the vote hereafter. Happily, the tickets attached to the two guinea subscription, having now been made transferable, that the sufficient difference in value between this and the non-transferable ticket given to the guinea subscribers.

On the whole then I would advise those who have given their names as would-be guinea subscribers to accept the same members, and thus the influx of a large body of country horticulturists will better strengthen and improve the Society, and besides that, their guineas will be applied to horticultural objects. Those who come up to London will have full consideration for their money, as, judging by the shows on the days of the committee meetings which have been held this year, both the leading nurserymen and amateur cultivators have determined on exhibiting so many Orchids and other beautiful flowers and plants that the shows now held the first and third Wednesday of the month are well worth the subscription. I have only to add that it is to be hoped that those who come in will bear in mind that the greater the number of guinea members the greater chance they will receive, and that they will try and influence their friends to follow their example. In this neighbourhood, where our canvass was completely successful, the principal argument used was, "You take delight in your garden, we would ask a substitute to promote it, and we will not give this (or find a substitute) to promote the science which improves gardens." *George F. Wilson.*

[We have received several communications on the subject of Mr. Gilbert's proposal in our last issue. Our advice to the gardeners is—join in numbers; help the Society, and in time they will work. We believe it would not be refused if anything like a general wish

for it were manifest; meanwhile strengthen the gardening element, in this way only on the Society to be made truly horticultural and free when the time comes—and it will come—when its fetters can be knocked off. When that time comes, if the horticulturists are not to be the South Kensington bondage will be perpetuated. Eds.]

HAVING considerably, judiciously, and carefully performed the work of planting either a single tree, a group, or forest, the next and most essential thing to do is to guard and protect the trees from injuries of every kind to which they are liable and exposed. It matters little as to ultimate results whether planting is well or ill performed, if the plants are not properly attended to and cared for afterwards.

Sheep, cattle, hares, deer, and ground game of all kinds are the most dangerous enemies to trees, and the amount of damage inflicted by them is only a matter of extent influenced by circumstances too vast to enumerate. If only the delicate structure of plants was better known and considered, they would doubtless be better cared for, more tenderly nursed and assiduously guarded and protected than they are. Every part of the plant is liable to injury, and no part can be injured without prejudice to the whole structure. If the root is injured the top suffers, and if the buds or leaves are injured the roots correspondingly suffer, although this is not so obvious to the general observer.

Some species of trees are more susceptible of injuries than others. Brises are more fatal to resinous than to non-resinous species; and others, as the common Beech and Holly, are impatient of any injury or interference with their leading shoots and top buds. The epidermis or inner bark of the Alder may be, as I have frequently seen it, completely stripped off with a knife and replaced without the tree sustaining any apparent injury, while the common Ash and holly, if generally and not judiciously treated, suffer similar treatment. The roots also, and especially the neck, or point of connection between the root and the stem, vary greatly in their sensitiveness and liability to injury in various ways.

In operations of levelling ground it is often found necessary to bare the roots of some trees severely, and to bury others too deep with the excavations. Now, with few exceptions the barring of the roots never proves injurious, while, on the other hand, comparatively few operations will endure cutting up. Hence, in cases where it is absolutely necessary to raise the earth upon trees, means should be taken to prevent it from coming into close contact with the bark, for which purpose a rubble wall should be built round the tree, leaving a clear space between it and the wall.

The species of trees that suffer least from placing earth against their stems are the English Elm, and the tree varieties of Willow, Lime, and Poplar; and those most impatient of earth laid against them or confinement are of various kinds, as the Beech, Wych Elm, Ash, and the whole family of Pines and Firs. Apart from the actual burying of stems too deep, another and not unimportant evil is produced by applications of rich manures to the general surface of the ground, such as the folding of sheep amongst them, laying down manurial composts, sewerage from farm steadings, &c. Some species of trees die from such treatment more readily than others, of which the Beech, Birch, and Wych Elm are especially liable; but, indeed, no forest tree is safe under the influence of rich manures, and every precaution should be taken in laying down dung-heap, not only that it be kept a great distance from trees and hedges of every kind, but that provision should be made for conducting all liquid from such heaps into proper receptacles or open ditches, so that none of it may find its way to their roots. Attention should also be paid to all flat, and especially basin-shaped, grounds, after floods and winter rains have ceased, to see that the surface of the ground is not unduly silted up with mud, so that the water may be prevented from seeping from finding a passage into the soil and subsoil, for it is found that whatever means prevents the air from entering the soil is injurious to trees. It is this more than anything else that causes stiring the surface of the ground, a necessary condition for the welfare of forest trees. The free and frequent use of the forester's footpick cannot in many instances be too

strongly recommended, for no implement is better adapted for rendering the soil loose and admitting air to the roots of the plants; and all soils, whether in young plantations, shrubberies, or hedges, where inclined to clay, should be periodically stirred up by means of the forester's footpick.

In all operations this is not required, as the trees perform the work for themselves by heaving and shaking the soil in which they grow during windy weather; but in all cases where the trees are of an age and size below which the wind can act upon them, free and frequent use should be made of this implement. In many cases, too, it is also of immense advantage, entirely to remove the surface turf, as by doing so the roots are encouraged to spread upon the surface; for, strange as it may, the trees never grow better than in a pliantly unobstructed soil. I have seen trees freely exposed—indeed, I have seen in footpaths through plantations the network of roots so complete as to constitute a solid pavement of woody fibre. In connection with this fact, it may be further stated that all very aged and notable trees known in this country have a large proportion of their roots running up on the surface, and in every case the swell of the stem is well exposed. The healthy state of the roots is manifestly unobstructed, and the surface of trees sufficiently accounts for old trees remaining in comparatively good health, notwithstanding that the central part of the tree has long since crumbled and decayed, and were the necessary conditions of root life maintained, such a state of perfection, maturity, and age, hitherto unknown. *C. Y. Meale, Cullen House, Cullen, March 13.*

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—There are several handsome varieties of the tuberous-rooted Gesners that are not so well known and generally cultivated as they deserve; their compact habit and moderate growth render them suitable for dispersing amongst larger subjects in a roomy stove, where on the side stages they mix well with other things. They are especially adapted for small structures. Amongst the best are *G. glouxiensis*, *G. macrantha*, *G. tubiflora* (longiflora), *G. carnea*, *G. Leopoldi* lilacina, *G. magnifica*, and *G. Mercki*. The varied colours of these, from white to crimson, and their free habit of flowering, make them very attractive. Gesners of this class will not require answers well for them. The forms of *Achimenes* known as *Tydeas* are also deserving of a place in any collection; their disposition to flower later in the autumn than the ordinary *Achimenes* being a feature not to be lost sight of. Tubers should be started now in shallow pans in sandy soil, and a little leaf-mould added, which will enable their removal for alimate potting with their roots intact. They will be found most useful for ordinary purposes grown in 8-inch pots, and in 8-inch pots. It is a great mistake to crowd too much of such things as these in the pots, as by this means the soil becomes exhausted, which tends to shorten the duration of their flowering. By stopping one-half the number grown when 3 or 4 inches high a succession will be secured. Winter-blooming Gesners of the zebra section that have done flowering should not be thrust sideways under stages, or in out-of-the-way corners, where they receive little light and water, but they ought to be placed in the centre of the stove, in a position to die down, or their roots do not get fully matured, and are liable to perish through an excess of rest, or to start weakly when growth again commences. *Achimenes*, *Philodendrons*, and *Nidaliads*.—Sucker plants of these offshoots should be cut off and placed singly in small pots towards the close of last summer or autumn, will by this time have got well rooted, and should be moved on into from 5 to 7 or 8 inch pots, according to the size of the respective kind. They are most useful warm conservatory stove decorative subjects, especially when confined to single corners in small pots. One of the advantages they possess is, they can be stood as required whilst in flower, overhung the plants, or placed in anything of the same nature that continues to bear leaf-growth would be injured by such usage. To keep up an effective display in both stove and conservatory, it is necessary to cultivate a sufficient number of plants, which in this treatment will be more than a difficulty in finding flowering things that can be placed in the lowest positions on the stages and floors. The Mexican rush-like *Ruellia juncea* is a striking plant either in or out of flower, particularly so when dotted with white flowers. It is a very hardy plant, keeping well to the light, with little or no shade, otherwise it does not flower with its wonted freeness. It makes an excellent plant for the side stages in the stove, where, elevated on an inverted pot, it is seen to advantage. It is a very hardy plant, and may be conservatory during its time of blooming, which is in the summer months. Ordinary loam, with not too much

room-temperature, will suit it. Moderate sized plants in 9 or 10-inch pots are the most useful. Plants of *Mediterranean magnifica* which have been kept comparatively dry and at rest, should not be started. They will bear syringing overhead until the flowers show, after which they do not wet them in this way or the panicles are liable to damp; it succeeds best with more exposure to sun and a drier atmosphere than the generality of stove plants, by which treatment it will be found to flourish in a small state. The erect flowering *M. anabilis* is a distinct and handsome kind, a perfect contrast by its upright habit to *M. magnifica*. *Francisca* confertiflora and *F. calycina* are plants that will last for many years if well treated, and they are not so tender as they need it; they more than many stove plants are liable to get bare and naked of foliage at the bottom, but old stools headed down are preferable to young plants from the stronger shoots they afterwards make, the quantity flowers they produce, and the duration of their blooming being dependent on the strength of the previous season's shoots. Now is a good time to cut such back as require it, which will give them a long season of growth and will even get well furnished. After they are fairly broken they should be turned out, and if the pots they have occupied are large, half the soil may be shaken away, replacing them in others a size or two smaller. Plants that are growing well will not begin to take more water; in all cases see that it is sufficiently warm before being applied; water used too cold to tender stove plants is much more injurious at this time than at any other time of year. It is a good plan to have several large tubs of water, and to let the plants require at one application stood near or over the pipes, where the water they contain will be as warm when wanted for use as the temperature of the water in the hottest part of the day, in which will be the most successful means of securing the health and progress of the plants than if used cold. Be very careful not to admit too much air when cold winds exist, as even if it does not come in direct contact with the young tender foliage, it dries the inside of a too much. *T. Baines.*

FLOWER GARDEN, ETC.

While the walks are tolerably dry the wheeling of dung, loam, &c., for the flower beds and borders had better be pushed forward, and all spare ground dug and prepared for the winter. Hardy annuals may be sown in pots or boxes, and got ready for pricking out, but some of the more tender kinds, which require to be grown on without receiving a check, will succeed better if sown in the pots or toward the end of next month in soil plants, *Maize*, &c., do best when thus treated. *Cannas* (Indian Shot) which have been wintered under a greenhouse stage, or any similar place, may now be divided and replanted, and if planted in a warm moist atmosphere will make fine plants for the winter after which they may be gradually hardened for cooler quarters. *Mignonette* and other hardy annuals may be sown in borders, or wherever required for blooming during summer. Roses that have not yet been pruned can now be done at any time, and the ground looked between the plants, to leave all clean and tidy. Teas and other tender kinds will be better left until all danger from frost is past, when they can be pruned, and any banks that have occurred during winter filled up. *Bulfinches*, which are very destructive to fruit-buds, are also very partial to the flower-buds of *Lilacs*, *Laborer's*, and *Scarlet Thorns*, and they will require attention this sharp weather, for they do a vast amount of mischief to the young buds of these and other moderate-sized plants, when damp, may be dusted over with soot or lime; this keeps the birds from doing much harm. As bedding plants now begin to require more room than they are having, it is often necessary at this time to get the plants well prepared, where they may safely remain until planting out time. Turf pits can be got ready, and covered with lymf, mats, or anything hard, and in out-of-the-way places branches may be used, which will protect plants from several degrees of frost. But all best plants in cool places must only get just enough water to keep them from flagging, for the drier they are kept the more cold they will resist. *T. Blair, Shrubland Park.*

FRUIT HOUSES.

VINES.—Complaints of late kinds of Grapes keeping badly after removal from the Vines would be less frequent if a longer period of growth could be secured. To suppose that Grapes, particularly *Lady Downes*, which are not to be used until after Christmas, can be brought up to keeping condition by the aid of sun-heat alone is a mistake, and as one month in the spring will do more than two in the autumn all houses in which late kinds of Grapes are raised should be warmed by means of fire-heat and frequent syringings to break early. If the system which I recommend has been followed, the buds will now be breaking; if unevenly, and sometimes the buds will be broken, and the sap may be equalized by a board being started in a horizontal position until all the buds have started, when

they may be tied up to the wires. Maintain a temperature of 55° at night, with a rise of 10° to 15° by day. Ventilate at 65°, run up to 75° with sun-heat, and close early, with plenty of moisture. Attend to the syringing, and if syringing in succession-houses, and keep the thinning of the bunches and berries well in hand. In the performance of the latter operation the cultivator must be guided by the bunch and caper-vines. When a bunch is properly thinned every berry should have room to expand, and when ripe it should be sufficiently firm to retain its form when cut and laid upon the dish. A steady circulation of warm air should be kept up where the grapes are raised, and in succession-houses of the late vintage. Hanburghs and other first-setters may range from 65° to 70° by night, and Muscats may have 5° to 10° more. If, as is often the case with badly ripened wood, the bunches incline to run into tendrils, increase the heat by day, and reduce the supply of atmospheric moisture until the danger is past. As days increase in length, Grapes that are swelling must have liberal supplies of moisture charged with ammonia, and when they have passed the stoning process the inside tendrils will be greatly benefited by a liberal supply of tepid liquid manure. The close stopping of laterals should be discontinued until every part of the trellis is covered with healthy foliage, and to avoid sudden changes of temperature, they will be better kept in a temperature not to be admitted by small quantities at a time. Close early on sunny afternoons, at 80°, and allow the heat to decline to 65° at night. Put Vines swelling off crops of fruit will require liberal supplies of liquid manure, and when the fruit has nearly reached maturity, and encourage the roots over the sides of the pots, into the plunging material. *W. Coleman.*

CUCUMBERS.—Although it is possible by constant renewal of the soil to keep Cucumbers in bearing for an indefinite length of time, an occasional clearance of one of the compartments, where the pit is divided into sections, will enable the cultivator to keep up a steady succession of tender fruit from sight, young plants than can be obtained from those which have been forced and heavily cropped all through the winter; and as Cucumbers plants after this date will make rapid growth, a good batch should now be ready for sowing, and the soil may be newly formed, and kept as far as may be convenient, from the hot-water pipes. Having cleared away every particle of old soil, plunging and fermenting material, if found too much decomposed, dust the sides and bottom of the compartments with fine sand, or a mixture of glass, pitch, and walls before the new material, which will consist of well-worked stable-dung and Oak-leaves, is introduced. The soil used for the hills may be somewhat heavier than that recommended for the same purpose, and should be well watered through before the plants are turned out. If a compartment cannot be spared, the gradual removal of old bearing vines and leaves, combined with the most attention to earthing and the removal of old wood with care, will greatly improve the quality and increase the quantity of fruit, provided the plants have not become infested with red-spider, in which case the enemy must be made to succumb to persistent syringing, and the application of dry sulphur, before satisfactory progress can be expected. Examine all beds which have been some time undisturbed, and if worms are present let them be removed without loss of time. Where short dung is used for manching the hills a great number of these troublesome pests may be captured by carefully turning and hand-picking a few hours after the plants have been watered with tepid liquid manure or lime-water. The bright sunshine which now follows sharp frosts, and the too strong heat which causes the fruits swelling off, if not well protected with leaves. The young fruit of Telegraph are very soon scalded and show a brown excoriated surface, which much disfigures them when cut. To prevent this some very strong manure should be drawn on the ground a short time as soon as the sun falls on the house. No material difference need be made in the temperature. To have good Cucumbers in quantity we must have fall command of heat and moisture, and it is better to have a drier weather than to be rated by any fixed rule of figures. *W. Coleman.*

FIGS.—Under the influence of heat and humidity which is afforded in forcing operations these trees make rapid and rampant growth, the character of which will naturally depend on the nature of the treatment applied at this season. As no after-treatment is fully adequate for a defective growth made at this period, it is prudent to give the matter every consideration, lest by promoting it too rapidly now, it may lack that important desideratum which is at all times inseparably connected with future success. The trees may be kept in a moderate heat, and as to those trees which are placed in confined structures than is necessary in the case where the houses are large and of loftier dimensions, which, taking all points into consideration, are undoubtedly preferable for the purpose, the standard of heat may be raised by a fire by artificial means still be 60° at night and 65°

in the daytime; slightly open the top ventilators at 75°, and shut them up if the temperature in the house recedes below this point. At 85° permit a warm current of air to circulate through the house; keep all the shoots, except the tendrils, pinched in at about the fifth eye, and remove as they appear all those which are not required to form spurs. Continue to ply the syringe freely every day about those houses which are not of a close nature, and, on the contrary, exercise discretion in its use in such a particular character. In later houses give constant attention to stopping-in shoots; this matter should be done before they become too much elongated. *G. T. Miles, Wycombe Abbey.*

HARDY FRUIT GARDEN.

There are few gardens of either large or small extent but have some of the hardier fruit trees, such as the Pear and Apple, in a more or less unsatisfactory state, or, where this is not the case, it often occurs that varieties have been planted which are quite unsuited to the locality. This happens more frequently with the Pear, a fruit that is exceedingly variable in its qualities, than with any other fruit. *Clou Moreau*, *Ester Beauré*, *Bergamot Espere*, *Josephine de Malines*, and other sterling varieties that are all that can be desired in some soils and situations are comparatively worthless in others. Aspect has much to do with the success of any planting, although soil exerts a considerable influence, especially in the case of those in the Quince, the roots of which do not penetrate near so deep or ramble in search of food to anything like the distance the Pear stock is capable of doing. In such a case, a check to the roots, a check through lack of nutriment, so as to affect their regular growth and swelling, they must inevitably become gritty and be of inferior quality. Much, therefore, depends on choice of stock; and where the soil is of a chalky nature, the most suitable should be given to the Pear, as in every way the most suitable, especially where the trees can be trained to walls and have plenty of room to develop themselves. It sometimes happens that the branches of these through bare or other causes, become gnarled or the bark so rough and excoriated, as to preclude the possibility of a vigorous healthy flow of sap, such as is required to obtain fine fruit of good quality; and where this is the case, the remedy is to head them in entirely back, leaving only a few inches of the main branches to break again to re-form the wall. Old trees so treated often become rejuvenated, and from the strong hold they have of the ground are able to shake themselves free of the soil, and fear outstripping in this respect any young one may be planted. In cases where it is desired to substitute other kinds on those benighted, that may now be done without regard to the age or size of those planted, and which may be cut in long sloping cut on one side, extending about 12 inches, so as to fit part of the wood under the bark, the latter of which should be slit through with a sharp knife, and then gently raised by inserting under it a piece of hard wood, such as a stick, and the bark may then be pushed in after, in the same manner, as carefully as possible, so as not to bruise or injure the same. They should then be tightly bound in their places, by using either very soft string or moss matting, and have the usual preparation of grafting clay worked well around them, so as to exclude every particle of air; and the more effectually to do this a covering of moss tied over to ward off the sun from the clay will be found of great assistance in keeping it from drying, and the trees may be cut in the same manner, but there should be no delay in carrying out the operations, as vegetation is in a more than usually forward state this season, and the sooner it is done the greater will be the chance of success. It is worth the notice of the cultivator, that really good kinds that are known to do well in any particular district than to be barren with a number of varieties of doubtful value, that only entail disappointment, and the grafting should be done on particular favour. Among Pears I can strongly recommend *Bergamot Espere* as one of the very best late kinds, provided it has a suitable situation accorded it, such as that of a chalky soil, and where the trees in aspect all late-keeping Pears require, except in the warmest and driest parts of England, where they succeed as pyramids or espaliers. Fortunately for the safety of the Apricot crop, but few of the blooms were injured by the frost on the night of the 10th, we had 14° of frost, but now prospects of a good set appear to be favourable, except on Peaches and Nectarines, which from some cause or other have cast a good many of their buds. The pruning and nailing of these trees may be commenced, and the buds may be cut in as close as quickly as possible, and a sharp watch kept for frosty nights, with the necessary protecting materials always ready to hand and available for use when wanted, as may yet be case, so exceedingly uncertain is the standard of the winter climate of ours. *T. Sheppard, Wellesford Park.*

THE
Gardeners' Chronicle.

SATURDAY, MARCH 24, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 26	— Sale of Orchids at Stevens' Rooms.
TUESDAY, Mar. 27	— Sale of Larkia elegans, &c. at Stevens' Rooms.
WEDNESDAY, Mar. 28	— Royal Calceolonia Horticultural Society's Show, Glasgow and West of Scotland Horticultural Society's Spring Show.
THURSDAY, Mar. 29	— Sale of Camellias, Azaleas, Roses, Fruit Trees, Bulbs, &c. at Stevens' Rooms.
	— Sale of Best Indian Orchids at Stevens' Rooms.

IT is pleasant to note from time to time the steps Horticulture, or, rather, some of its devotees, take to raise their art from a mere empirical rule-of-thumb procedure, guided by routine and checked carefully by the leading-rings of prejudice, to the higher level of a rational progressive science. It is true a considerable measure of excellence has been obtained by mere individual experience, handed down from father to son, from predecessor to successor. Still it is clear that for anything like a general advance along the whole line, for anything like a successful incursion into new territory or unbroken ground, traditional experience is of little value as compared with the accumulation of carefully observed facts by many competent observers, and the guiding principles which are gradually but surely evolved from the study and comparison of those facts. It is with much satisfaction then that we have to bring under the notice of our readers a recently published volume by Mr. BURBIDGE,* in which the author has classified and brought together in a manner to render them easy of access to gardeners and to physiologists a large accumulation of facts concerning the propagation of plants and their improvement by cultivation.

Starting with the very practical details involved in the consideration of propagating-houses, seed sowing, the means of transmitting to long distances seeds or plants, the modes of grafting and the like—all subjects more or less familiar to every practical gardener—the author passes on to what we consider the most valuable parts of his book. This consists first in the discussion of the process of fertilisation in plants, whether by natural or artificial means. The whole subject of hybridism and cross-breeding hence is passed under review. Under this head Mr. BURBIDGE with much labour and industry has collected from the scattered records in our columns and in those of other gardening journals an immense mass of information. It should be a matter of satisfaction to journalists to find so good a use made of the facts which they have been the means of making public, and it should be an inducement to gardeners and others who have the opportunity to record their observations, in the confident expectation that every fact, provided it be carefully observed and accurately recorded, must sooner or later be of value. The present work also will, we hope, do much towards inducing our raisers of new plants and florists' flowers to systematise their experiments, to start with a well-defined object, to pursue it steadily and carefully, and to record every step in the process, every failure, as well as every success, with strict accuracy. Much profitless labour may be saved by the careful study of Mr. DAWKIN'S works and of the present volume. In many cases there will no longer be any excuse for blind groping, but a sure basis or a trustworthy indication may be found in the treatises to which we have alluded.

From the discussion of generalities Mr. BURBIDGE proceeds secondly to give a re-

view of a large number of the most popular or useful genera of plants arranged under their natural orders, and these disposed alphabetically. But little is done in the way of description, nor is this necessary, as there are plenty of works which supply that kind of information. The most usually adopted modes of propagation are, however, described, and, what is especially useful, the history of the principal garden forms is given. For this latter information we cordially thank Mr. BURBIDGE. Only those who know the labour and difficulty of searching—often in vain—through the now voluminous records of horticulture for the history and introduction of a particular form raised in gardens, can sufficiently estimate the value of this portion of Mr. BURBIDGE'S labours. It is comparatively easy to trace the history of a wild plant, from whatever country, in the records of science, but the records of horticulture are in many respects, and often unavoidably so, chaotic.

To illustrate the value of Mr. BURBIDGE'S labours in this department it will suffice to mention that under the head Begonia a pretty complete list of all the more desirable hybrid Begonias is given, together with their parentage and other details. No doubt some will look for this in some particular favourite, but in this case it may be assumed that he who raised or sent out the plant was too careless to publish at the same time any authentic or trustworthy information on the history of the plant in question. If this be the case it is no wonder that a compiler of a book like Mr. BURBIDGE'S should pass over all such plants as waifs and strays whose papers are not in order, and which therefore he is not bound to take notice of. A well drawn-up calendar of directions for each month in the year is given, and so full of information is the book that it wells over into the index, where we find intermixed with the usual formal array of words little descriptive paragraphs, which we suppose have arrived too late for insertion in the ordinary course. Mr. BURBIDGE may fairly congratulate himself on having produced one of the most interesting and useful books with which gardening literature has of late been enriched.

The committee appointed to inquire into the probable causes of the outbreak of SCURVY in the recent ARCTIC EXPEDITION was composed of naval officers, former arctic explorers, and medical men. The result at which they arrived was exactly what might have been expected, and is in full accord with the teachings of science and the dictates of experience. The matter is very simple. The Commander of the Expedition, disregarding the warnings of his medical subordinates, allowed the sledge parties to start on their exhausting and perilous duties without a proper supply of lime-juce. Of course great allowances must be made for a commander under such difficult circumstances, and where an additional ounce weight is a matter for consideration. Sir GEORGE NARES, too, had won the cordial esteem of his officers and men when in the command of the *Challenger*, and was no less popular and efficient when transferred to the command of the Arctic Expedition. The lamentable want of judgment on this special occasion can therefore hardly be severely visited upon so distinguished an officer, unless by those who never make mistakes either of omission or of commission.

Unless the cause of a disease be known, prevention, in the true sense of the word, is an impossibility, and the cure impracticable. In too many cases the actual cause of disease is either unknown, or, if known, it is beyond the reach either of prevention or of cure. Palliation then is the only resource left. These conditions do not apply in the case of scurvy. According to the generally received opinion of medical men, the cause of scurvy is thoroughly well known; its prevention is as much, or more,

a matter of certainty as that of small-pox by vaccination, very much more than that of fever by quinine; its cure far more within the power of the doctors. Whatever regrets then we may feel at this unfortunate matter, they are tempered by the renewed assurance that in this matter we have prevention and cure both within our grasp, if we would but use them. Lime-juce, however, is by no means the only antiscorbutic, though it may be the most generally convenient. Where neither it nor fresh vegetables nor fruits can be obtained, it might be well to try the seeds of crucifers, such as those of Mustard, Cress, Turnip, &c., and, as we have pointed out, it would even be possible, on a small scale, to ensure something approaching a salad even in the Arctic regions by the use of heated cases such as those constructed for trying seeds, raising cuttings, and the like. Of course the quantity would be very limited, and, therefore, selection would have to be exercised as to those to whom such luxuries should be permitted. Potatoes, preserved vegetables, dried Apples, and other fruits form part of the equipment of all expeditions, but they are bulky and not so efficacious as lime-juce, still less so than fresh vegetables.

—IMPORTANT as are the Palms generally for their varied economic uses, the produce of a few only find their way into European commerce, the most valued being the Cocoa-nut, the Date Palm, and the Oil Palm. The habits of the two former are familiar to most persons having any interest in plants, from figures in scientific and popular works. The form of the Oil Palm (*Elaeis guineensis*, L.) is, on the other hand, but very little known, the tree never having been accurately reproduced in any popular book. It is usually described as growing to a height of from 30 to 40 feet, the trunk being thickly covered with the remains of the old leaf-stalks. Two species of *Elaeis* only are described—the one under notice, which is a native of West Tropical Africa, and *Elaeis melanococca*, Gaertn., a South American species; this latter, however, is of no economic or commercial value, while the oil obtained from the former is one of the most valuable products imported into this country from the great African continent. This Palm is very abundant in various districts of Western Tropical Africa; Dr. BAUCHE describes it as being most abundant in Ibo, Benin, Yoruba, and Bonu, also very abundant in Kororua, and in countries behind Adamawa; plentiful in Bauta, Zarya, Gbari, and Nupe, and along the road to Gonja, and along the Niger to near Yaori. He further says: "At West Day in Prince's Island we saw either a variety of the Oil Palm, or else another species of *Elaeis*. The nuts were larger, the foliage brighter green, and the trunk more robust, but we saw neither flowers nor ripe fruit." The principal ports in the right hemisphere are the Bights of Benue and Biafra, Badagry, Porto Novo, Whydah, Aliquah, Lagos, and Palmaria; from Liberia also large quantities are exported to Great Britain and the United States. The River Bonny supplies the largest quantity of palm oil that is brought from any river in Western Africa. The trade with the natives is carried on by barter, the oil being paid for mostly in Birmingham and Manchester manufactures, glass and agate beads of various forms, sizes, and finish, being some of the recognised articles of exchange. The fruits from which the oil is obtained are borne in dense heads or spadices, sometimes measuring 2 feet long and 2 or more feet in circumference, the fruits themselves being each about an inch or an inch and a half long, and an inch in diameter. The seeds are enclosed in a very hard bony shell, which is again covered with a softish pulpy substance, outwardly, when ripe, of a bright orange or yellow colour. It is from this outer, fleshy portion of the fruit that the best oil is obtained. On the west African coast one of the most important branches of manufacture is that of palm oil. When sufficiently ripe the fruits are gathered chiefly by men. They are boiled by women in large earthenware pots, after which they are crushed in mortars. They are then placed in large clay vats filled with water, and women are employed to tread out the oil, which immediately comes to the surface, when it is collected and again boiled to throw off the water, after which it is placed in barrels or casks for

* *Cultivated Plants: their Propagation and Improvement*, By F. W. Burbidge. (Blackwood.)

exportation. Good palm oil is of a bright orange or deep yellow colour, about the consistence of butter, and when fresh it has an agreeable smell, somewhat resembling Violets. It is now most extensively used in the manufacture of soap and candles, and also for greasing the axles of railway carriage wheels. The two first uses, however, are what the plants are mostly prized for. In Africa the solid oil is used for culinary purposes, often in place of butter, and the hard seeds are made into various ornamental articles. The engraving (fig. 60) is from a photograph

continued almost without cessation all through the mild winter, and, therefore, the mass of bloom is almost exhausted. That Violets will be found to grace the festival with their perfume there can be little doubt, but hardly in such quantities as humble speculators may think desirable, especially with the dark blue highest in public esteem. Cambridge could hardly have found in all our hardy flora a more lovely or fitting light blue than the *Myosotis dissitiflora*. Sprays of this charming Forget-me-Not are in great request either for bouquets or button-holes, but the date is

— Some two years ago, Mr. WILLS, of South Kensington, conceived the idea of covering the late Prince CONSORT'S National Memorial in Kensington Gardens with glass, and in connection with it the formation of a series of gardens in which to represent the vegetation of each quarter of the globe. Mr. WILLS has been fortunate in securing the advice and assistance of Mr. ALFRED BEDBOROUGH, the eminent architect, of Westminster, who has successfully produced a set of plans and drawings, quite unique in design, and totally different from those of any building

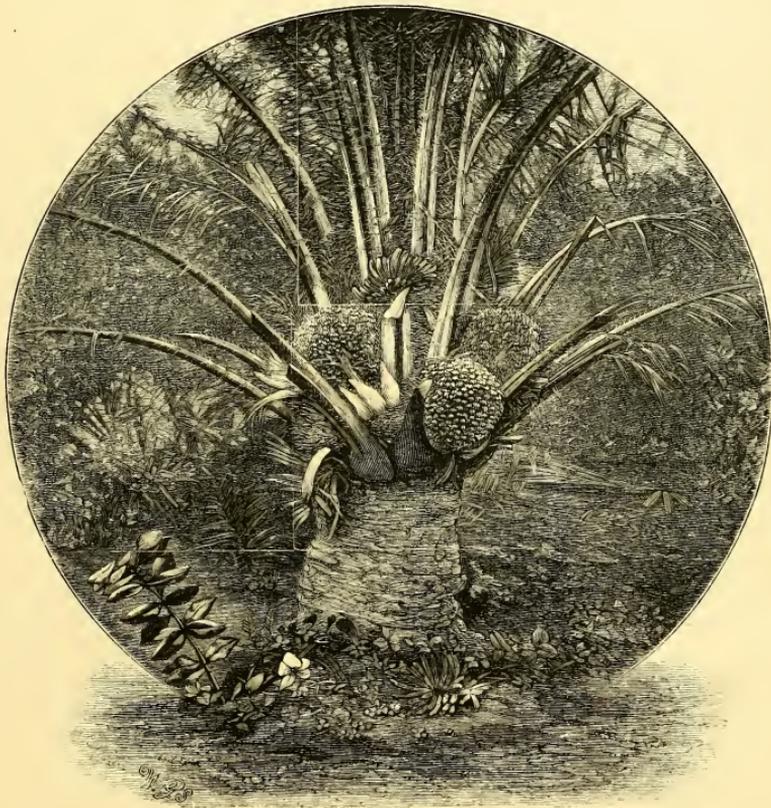

FIG. 60.—THE OIL PALM TREE, ELAIS GUINEENSIS.

recently presented to the Kew Museum, and represents a young plant growing in a dry, and not a swampy situation.

— The great AQUATIC CONTEST of the Universities which takes place this morning will, for various reasons, be somewhat shorn of the FLORAL ACCOMPANIMENTS with which popular taste has associated it. Usually falling at a time when the dark blue Violet is in great abundance, Oxford has seldom wanted for floral favours of its favourite hue to dispense to its myriads of followers. Curiously enough this year, although the race falls earlier than usual, the Violet harvest is nearly over, as the gathering has con-

too early to get these in beauty from the open air, and it is possibly portentous of the result of the coming struggle that even under glass the flowers persist in remaining pale red rather than turning to the desired tint of corulean blue. Some useful material for both sides may be found in the pretty Grape Hyacinths where growing in sheltered nooks, but early hardy blue flowers are not abundant. The Cineraria will probably furnish no small share of the popular colours, but flowers grown under glass are not for the millions. Nevertheless it is pleasant to find that even under the popular excitement consequent upon such a contest, flowers and their sweet influences are not forgotten.

hitherto executed in glass and iron. Mr. WILLS and Mr. BEDBOROUGH have had the honour of submitting to HER MAJESTY and His Royal Highness the Prince of WALES the plans and drawings above alluded to, and His Royal Highness was graciously expressed to signify his approval of the scheme, and expressed a wish that the undertaking might be carried out. We purpose shortly giving an engraving from this magnificent design, and shall then give further details as to its construction, &c.

— Under the name of PERSIAN "MANNA" some samples of an olive-green, solid, waxy-looking substance were exhibited by Mr. A. Y. STEWART, of the

Apothecaries' Hall, at the last meeting of the Linnean Society. Although the information forwarded was to the effect that it had been gathered on the rocks after dense mist hung about, there is some reason to believe it may be the product of the Tamarisk. Whether it has any value as a medicinal agent, or may be valuable as an article of commerce, remains to be proved. At present its chemical constitution and properties are under examination.

— The *Melbourne Argus* states that Mr. GOLDFIE, the plant collector, who has been exploring in New Guinea around Port Moresby, has returned to Sydney on account of ill health, bringing with him a large botanical and zoological collection of a very interesting character. Fifteen cases of living plants have been sent to this country, while preserved specimens have been forwarded to HIRON MÜLLER, of the Melbourne University, for description and comparison. Mr. GOLDFIE started from Port Moresby, but did not penetrate farther inland than about 20 miles from the shore. He was enabled, however, to observe many interesting facts, as well as to study the manners and customs of several tribes of natives, whose confidence he in every instance won by kindness. A splendid grazing country, with many grasses identical with those found in Australia, well watered with numerous small rivers, and dotted with stunted Eucalypti, was found to be the general character of the coast district, beyond which a mountain range was seen to rise far inland. Here and there were seen villages, surrounded by extensive plains, on which the natives had large Cocoa-nut and Banana plantations in cultivation. A little way inland the traveller met with an insufferable torment in the shape of a minute reddish insect, which covered the body from head to foot with pimples, causing the greatest irritation. It was found extremely unorthly on the coast, and the mission station at Port Moresby has been entirely abandoned by Europeans; a few Rotongona native teachers remain, but great sickness abounds even amongst them. It was observed as remarkable that the sea breeze was invariably unhealthy, while the wind from the interior was salubrious.

— From REGEI'S *Gartenflora* we learn that the FOUKROYA GIGANTEA, already mentioned in these columns as having flowered at Munich, attained a height of about 21 feet, and of this it made nearly half during the month of October. The greatest elongation in twenty-four hours was 6.3 inches, in a day temperature of 92°-75 and a night temperature of 56°-75. No particulars are given respecting the period of the twenty-four hours in which the maximum intensity of growth took place. At the beginning of October it was about 10 feet high, and by the 16th it had increased nearly 8 feet, or at the rate of about 6 inches per day. After this date, with a much lower temperature both day and night, the rate of growth was much slower.

— THE VEGETABLE POISONS USED BY THE SAMOA ISLANDERS to coat their spears and arrows formed the subject of a paper by the Rev. THOMAS FOWELL, read at the Linnean Society, March 15. It is stated that human thigh-bones are used to tip the spears. The arrows are dipped in a preparation of the chief poisonous ingredient of which is a milky juice from several trees, among others Calophyllum Inophyllum? To this is added a substance got from wasps' nests, and also the fluid derived from putrescent Sea Cucumbers (Holothuria). After dipping, the arrows are smoked in a kind of kiln, and stuck into the flower-stalk of a species of Tacca. This preserved from damp they are laid aside ready for use as occasion may arise. The poison it is said brings on convulsions, tetanus, and death follows; but occasionally only local irritating wounds arise. ERNSTHOLD SEEMANN in his *Flora Vitiensis* has already described certain trees said to yield poisonous extracts, and these somewhat agree with this later account; there are others, however, that are dubious as to the virulent effects that may arise from the said poisoned weapons.

— Although outside of the charmed circle of florists' flowers, the many beautiful species of the HARDY FERULAS offer to the florist material worth both of his love and attention. Perhaps no class of plants present so excellent advantages for hybridisation, especially to the patient and industrious worker;

but even if no beneficial result should flow out of hours so spent there is a fund of happiness in store at all times in the possession of a nice selection of these hardy gems. That the majority begin to flower in the early spring months is rather an advantage, as few of them boast of beauty of a ready kind. Their blooms are rather simple and unpretentious, that might fade into insignificance when compared with the gorgeous Rose or the brilliant Pelargonium; but when seen in spring, ere the eye has become satiated with rich hues, they are gems indeed. How beautiful just now are the forms of denticulata and purpurea, the latter especially presenting a great advance on the first-named in size of truss and colour of flower. The snowy white nivalls is bursting its way to open the petals of the green back of foliage, and intermedia with its pretty pale flowers is doing the same thing. Margiata, charming at all times in the beauty of its foliage, has expanded its purplish blue flowers, that are rather darker than those of intermedia; and minima is following with its pale red blooms. The earliest forms of the cortosides amœna section are already coming into flower, and these will be gay for the next two months or longer. F. abyssinica has its whorl-like truss of blooms ready to open the pale yellow tint of which will give variety to the others. Although later to bloom, the pale powdered fan-like section is not wanting in beauty, the plants looking like the albinos of a large and vari-coloured family.

— Most of our readers, and those especially who are interested in any way in hot-water boilers, will have heard of the "ENDLESS-FLAME-IMPACT BOILER," patented and manufactured by MESSRS. WILLIAM WRIGHT & CO., of Aldrie, N.B. and who, in a pamphlet of the same name, have somewhat volitionally advocated the merits of the new-comer in a pamphlet, entitled *Our Boilers and Heating*, several copies of which have reached us. The Messrs. WRIGHT appear to be very anxious to have their invention taken notice of, and have no doubt an honest belief, in their own interests, in the thing, as indeed they are justly entitled to have; but in the pamphlet before us, which is well reasoned out, and gives some good and sound advice, they have rather oversteer the mark, and claim more for their invention than it is entitled to. The principle of the endless-flame-impact boiler is a good one for attaining quick action, the line of draught being the natural or upright one, which causes the fire, when the damper is the least open, to rush swiftly and smoothly through the flues of the boiler into the chimney at the speed of a racehorse, giving off a fair amount of heat as it passes smoothly over each compartment of the boiler, and carrying a considerable amount of flame, and a large amount of heat, into the chimney, where, of course, it is of no use for heating the boiler. This is a defect in all upright draught boilers, and the more they are pushed the more heat they send into the chimney. The latter fact, of course, applies also to the horizontal boilers, but in a less degree, and, as a consequence, they are more economical. This is a fact apparent to every practical gardener who has to use boilers, and no amount of argument can alter it. Messrs. WRIGHT & Co. claim for their boiler that it is "the most economical;" but on the strength of an opinion which we have obtained from a gentleman qualified to judge of its economy in heating, and who has seen the boiler at work on a moderately cold day when it was being briskly driven, we are of opinion that, with an equal amount of the same kind of coal, as great or greater heat can be got into the same length of 4-inch pipes by means of a well-constructed and properly-set flued saddle, or, what is as good, Stevens' Trentham Boiler. With such a boiler set in the right way, and stoked in a proper manner, more heat will pass into the water for the benefit of the houses, and less up the chimney. When they are pushed, &c., when there is no draught, the action of the endless-flame-impact boilers, and that of the others we have mentioned, is the same, but when the damper is out, there is this difference between them—that the new one is likely to be more wasteful, the older ones fairly economical. What is still wanted in horizontal boilers is the means of effecting more economy when they are being pushed, as must be the case daily where any attempt is made at forcing—a necessity, now-a-days, in every garden of no great kind. Generally speaking, it is in this particular point that all complicated boilers fail, and we have to fall back

again on our old friend the saddle, or an improved modification of it. The Messrs. WRIGHT claim for their boiler that it "requires no setting," but as a matter of fact it would be much better for it, the heat being off by such an amount of highly heated surface being quite sufficient to heat an ordinary sized hot-house, and it really does make the stoker's moon, or, at least, a very hot one. The boiler undoubtedly does require "setting," and would be the better for being beicked round, because in practice it is found that flues with hot air in them, outside and in contact with a hot-water boiler, are the best preservers of the heat in the boiler. This statement is against Messrs. WRIGHT's theory, but it is a fact nevertheless, and every day's experience with horticultural boilers proves it. "Many more such theories as this in the pamphlet are quite as open to objection. The form of boiler is that at work at Drumpeller, the residence of Colonel BUCHANAN, in Lanarkshire, and at Parson's Green, near Edinburgh, the residence of W. S. MITCHELL INNES, Esq., and testimonials highly in favour of the boiler have been sent to the firm from both places. As regards the one issued by the gardener at Parson's Green, it is right that we should point out that while this boiler, a "No. 4 D.," is said in Messrs. WRIGHT's pamphlet to be heated by a steam test of 4-inch piping, it is actually heated under 2200 (not 2300 feet, as inferred by Mr. CLARK in the *Gardener*), and not a fourth of this number of feet requires to be heated above a warm greenhouse temperature at any time—that is, an average of 45° at night, and 50° to 55° during the day, so that it is ridiculous to speak of the hard work required of such a reputed powerful boiler. We will only further say of the boiler that it is a compact and useful one for a small place where room is an object, as small as a greenhouse. It will also be found very quick in getting up heat, and may be classed with GREEN'S and CANNELL'S, being very similar in principle and effect. Like all complicated boilers, it will be liable to get out of order just at the time it is most wanted, a sharp storm bringing all such cast-iron boilers to grief sooner or later. It is, we are of opinion, no more economical than other well-known boilers already in common use, and from its complicated nature we should anticipate that it is not likely to stand hard work, nor many years of wear and tear.

— Dr. KAMITZ, of Kolosvar, Hungary, has issued the first number of a Journal of Botany, under the title of *Magyar Növénytanulok*. As it is written wholly in Hungarian its circulation in this country is likely to be very limited.

— We are informed that the following gentlemen have consented to act as local hon. secretaries of the NATIONAL ROS SOCIETY, and to promote its interest in their several localities:—Bath: R. B. Cater, Esq.; Bromsgrove: R. Cordell, Esq.; Cheshie; J. Tinsley, Esq.; Croydon: E. Mawley, Esq.; Exeter: R. G. B. Baker, Esq.; Canterbury: W. Mount, Esq.; Hereford: the Rev. C. H. Balmer; Maidstone: Hubert Densted, Esq.; Leek: W. Newall, Esq.; Newark: the Rev. H. G. Cresswell, Esq.; Northampton: Alan Charles Windsor; and vicinity: G. Hawtrey Esq.; Westminster: J. Harton, Esq.; and Oxford: C. R. Ridley, Esq.

— The Swiss Government has not hesitated to make any sacrifice to stop the progress of the PHYLLOXERA, considering that if success be only temporary the arrest will save millions (francs). The stamping-out measures carried out at Pregny, near Geneva, have, according to the *Journal Officiel de la République Française*, March 8, 1877, been so far entirely successful. In consideration of these facts the French Academy of Sciences has recommended to the Government:—1. The prohibition of the export of Vines out of infested districts. 2. The prohibition of the introduction and planting of infested Vines in districts not yet affected. 3. To uproot and burn all Vines and roots of Vines, and to disinfest the soil in the neighbourhood of an infested district, so as to afford no point for fresh attack. 4. To disinfest the soil and the plants around the district in which the Vines have been thus destroyed. 5. To disinfest the Vines in the district around the last-mentioned area.

— In consequence of the death of the late EDWARD NEWMAN some changes have been made

in the editorial staff of that useful publication, the *Entomologist*. A list of the more recently discovered insects and gaul producers is given, together with a great variety of useful and interesting information, showing a healthy tendency on the part of entomologists to break away from the mere collecting and recording tendencies of former days, or rather to add to it by notes on the life history of the observed insects. Woodcuts are also given, that in the February number representing a bumble bee in this country, or, at least, not previously recorded—*Melitta didyma*. A new feature is to be introduced in the shape of photographic portraits of eminent naturalists.

— Some members of the Central Horticultural Society of France are engaged on some cultural and applicatory EXPERIMENTS WITH *CYPERUS ESCULENTUS*, a sedge having edible tuberos roots. Some cakes and a preparation of a kind of oregan from the tubers were declared by the Society to be excellent, and further experiments were recommended. It had been objected that the cultivation of this plant in the climate of Paris would often prove unprofitable, because it is very susceptible to frosts, and the tubers are destroyed by comparatively slight frosts; but by the method of cultivation found most successful this is of little consequence, as the sowing or planting is done in May, and the season for lifting and using the tubers commences in August and terminates in October. The following analysis of the composition of the tubers is interesting, though it does not appear probable that the products of this plant will ever be of sufficient quantity to become of real commercial importance. In two parts there are 7.10 of water, 28.0 of oil, 29.0 of starch, 14.07 of crystallisable sugar, 0.87 of albumen, 14.01 of cellulose, and 6.89 of gum, colouring matter, salts.

— According to a report made to the General Council of Savoie and Loire, as quoted from the *Sud-Est* by the *Revue Horticole*, the experiments with the SULPHO-CARBONATE OF POTASSIUM as a remedy against the Phylloxera have been unsatisfactory. The sulpho-carbonate indeed kills the Phylloxera when it comes into contact with them, but if even only a very few insects escape contact with the poison their fertility is so great that a new population takes the place of that which has been destroyed. But a short time, therefore, has been required to show that the apparent success of the application was but temporary. In fact those Vines which on August 10 were free from Phylloxera to all appearance, on October 21 were found infested with legions of the insect, and those Vines to which the sulpho-carbonate was twice applied were fully as much affected as those to which one application only was made. The experiments were carefully carried out according to M. DUBAS' directions over a space of 2½ hectares (5 acres about) of vineyard for forty-seven days, and the result is that the sulpho-carbonate of potassium has been found powerless to destroy the Phylloxera. The cost of the experiment was calculated to be 8522 francs.

— The great YORKSHIRE GALA, which is the great floral exhibition of York, opened this year on June 13, and comprised in the schedule of prizes are a few features of more than ordinary interest. One of these is a class for twelve large Roses, distinct, in pots, for which a 1st prize of £25, and a 2d prize of £15 is offered, and the competition is limited to exhibitors residing south of the Trent. The York people, who always infuse great spirit into their shows, would, no doubt, be highly gratified by a visit from Mr. C. TURNER and others. PAUL & SON, of Leamington, in competition for the fine prizes and seeing there is a marked death of large shows in the South, these celebrated growers may perhaps be induced to take their productions to the metropolis of Yorkshire. Good prizes are also offered for sixteen hardy Rhododendrons in flower, which is a new feature in the schedule, and one likely to bring a spirited competition.

— The next meeting of the INSTITUTION OF SURVEYORS will be held on Monday evening, March 26, when the adjourned discussion on Mr. J. LUGAS' paper, entitled "Hydrogeology; one of the Developments of Modern Practical Geology," will be resumed. The chair to be taken at eight o'clock.

LAMBTON CASTLE.

(Continued from p. 343.)

THE VINERIES.—The glass department is very extensive, but that portion of it which is devoted to Vines, especially the principal range, wherein have been grown the Grapes that have produced such a sensation amongst growers of this fruit, and have earned for Mr. Hunter such a widespread reputation as a Grape grower, will no doubt to others, as it was to me, be of more than ordinary interest. In the early part of the immense bunches which Mr. Hunter has grown which culminated in his 21 lb. 12 oz. bunch of Black Hamburgh, exhibited at the International Show at Belfast in 1874, and which, taking the variety into account, still stands unrivalled for weight, his greatest achievement, I hold, was the collection of ten varieties shown at the Manchester International Fruit Show, September, 1873; these would fully average from 7 lb. 10 8 lb. each. Those who can grow good Grapes know how easy it is to give perfect finish to small bunches as compared with large ones; yet, notwithstanding the unusual weight of Mr. Hunter's Grapes on this occasion, they were as near perfection of finish as possible.

After Mr. Hunter had grown the extraordinary bunch of Hamburgh exhibited at the Belfast International Show already alluded to, he gave to the gardening world an account of his practice, yet the details were scarcely so complete in some respects as to clearly convey the exceptional nature of the ground on which these vineries are built, as also the considerable difference in level and temporary means connected with the cultivation of the Vines, between his practice, and that usually followed by Grape growers. The ground here presents natural difficulties such as seldom have to be contended with. There are over 30 feet of quicksand before coming to a solid foundation, yet the surface slopes rapidly to the south by south-east, necessitating the formation of terraces, on which the ranges, which are placed parallel at a considerable distance apart, are found. The first range, a lean-to 330 feet long, is a single house, and the second, a double house, is built upon pillars driven through the quicksand into the solid clay underneath, upon which the walls stand on arches. The front wall is 12 inches high above the ground-level, with hinged lights about 2 feet deep above. The top ventilation consists of a hinged light 2 feet wide, and ventilating shutters near the top of the back wall between each rafter, 2½ feet long by 10 inches wide. The rafters are 6 feet apart, and are each supported by an upright iron pillar midway from top to bottom. The rafters occupy all the inside of the house, and about 15 feet outside as well, and average 4 feet in depth, the whole concreted underneath. It is a very difficult matter to insure permanency in the drainage in such ground, as if ever the sand can get into the pipes they are certain to become choked. A brick-built drain with pipes laid inside of it runs immediately in front of the border, a little below the bottom of the concrete. Into this from back to front of the border at intervals of 6 feet are placed rows of 6-inch pipes, and in the opposite direction, from end to end of the border, are rows of 6 feet apart; between and over these was put 12 inches of bricks, above these broken stones and clean gravel, on the top and over all fresh turf, with the grass side downwards. As will be seen, such drainage is not only ample in quantity but necessarily quick in its action, and its construction is such as to render it scarcely possible that it should become choked.

The soil consists of the ordinary loam of the neighbourhood. To each six loads of loam was added one of lime rubbish, one of charcoal, one of cow manure, and 3 cwt. of broken bones; 12 portions of the loam had been stacked for a year before use, the rest was fresh cut. The first house, commencing at the eastern end, is some 90 feet by 16 feet. The Vines in this house were planted in 1869, also in the adjoining houses inside. They are seventeen in number, consisting of White Nice, Trebbiano, Royal Vineyard, Alicante, Gros Colman, Lady Downe's, both black and white varieties; Raisin de Calabre, Gros Guillaume, and Muscat Troveren. At the time of my visit an immense crop of large bunches were about ripe, as follows: White Nice Vineyard, seven bunches, 3 lb. to 4 lb.; Alicante, ten bunches, 4 lb. to 7 lb.; Gros Colman, six bunches, 4 lb. to 6 lb. Another Gros Colman,

grafted two years ago, and not more than half way up the rafter, was carrying four immense bunches, from 4 lb. to 7 lb. (see fig. 61, p. 376.) Black Lady Downe's had twelve bunches, the largest berries I have ever seen: some of the bunches would run 4 lbs.; Raisin de Calabre, one of its each (one of these I afterwards saw weighed drew 10 lb. 3 oz.); a Gros Guillaume, with two rods each, carrying six bunches, all except one of which would draw from 6 lb. to 11 lb.; Muscat Troveren, seven bunches, 5 lb. to 7 lb. The above weights I feel confident are rather under the mark, and in some cases the number of bunches mentioned are the produce of one of the two rods of which the Vine consists. The description conveys a very imperfect idea of the fine appearance of the bunches, and the unusual weight of the crop collectively, which in the case of two or three of the black varieties was too much to permit their quite covering up.

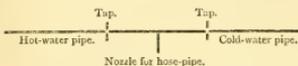

The next house is 55 feet by 22, containing thirteen Vines, all Muscats, planted about the same time as the last; half the crop was cut, the remainder was fine in every way, averaging from 3 to 5 lb. per bunch. Next this, and occupying the centre of the range, is a conservatory, which will be noticed hereafter, and through which we pass to the adjoining Vinery, in which is the Black Hamburgh Vine which bore the enormous bunch of 21 lb. 12 oz. The house is 55 feet by 22 feet, and in it are fourteen Vines, comprising Gros Guillaume, Trebbiano, Raisin de Calabre, Mrs. Pince's Black Mafta, Foster's Seedling, Burchard's Prince; the remainder, Hamburghs, collectively bearing a heavy crop of big, finely-finished bunches, similar in character to the house first described. The Burchard's Prince had eight bunches that would run from 6 lb. to 8 lb. each. The Hamburgh Vine which has grown the large bunches still shows a disposition to produce larger bunches than others in the same house.

The next and last house in this block is similar in length and width to the first vinery at the other end of the range; it is filled with Peaches and Nectarines—most of the old-established kinds, and some of the new varieties. The crop was all but over. Rivers' Victoria Nectarine was bearing some very fine highly coloured fruit.

To make the whole course of treatment, which the extraordinary Vines in this range are subject to, intelligible, it is necessary to again revert to them, and give some details as to the watering and other matters. Many things which I have conversed with, have not seen the Vines, are under the impression that the foliage and wood, especially the latter, must be of an unusual strength; in fact, proportionately with the fruit, larger and stronger than has been seen before, yet such is by no means the case. The main stems of the Vines collectively are thick for their age, but not extraordinarily so. The current year's shoots of most of them are also strong, yet not more so than ordinary varieties with, neither is the foliage anything remarkable in size, as this is made up by the immense quantity of leaves which the Vines carry. Most of the shoots before being stopped are allowed to run twice or three the length most growers permit them, often taken across the adjoining cane right up to the next Vine, 6 or 7 feet in length, but not suffered to extend further afterwards, except a few laterals that are allowed to run a short distance when the crop is approaching completion.

More front air is given them in the earlier stages of the crop than many growers admit. As Mr. Hunter stated in the paper he read before the members of the Gardeners' Institute at Darlington, he gives an extra quantity of manure-water both to the inside and outside borders. To provide this special provision is made; the natural ascent of the ground behind this range favours the supply of both hot and cold water. At the back of the next range, which runs parallel with this on the higher ground, with a considerable space betwixt, there is an immense open tank, into which can be run at pleasure from land still higher an unlimited quantity of water, so to supply the whole requirements of the houses and conservatory. From this an inch-and-a-half pipe is laid to a very large cistern, several yards square, at the back of the range of vineries in question. It is considerably elevated, so as to give sufficient pressure. This furnishes the cold water, and into it a bag of guano at a time is emptied, and kept stirred continually whilst the

water is being run on to the borders. To afford the warm water requisite to bring it up to the temperature it is applied at—85° to 90°—a similar pipe is brought from the hot-water pipes in the upper range of houses and connected together, thus—

As will be seen, the hot and cold water pipes are joined together at the junction, where is the nozzle on which to screw the hose-pipes. It will be easily understood that the temperature of the water thus mixed together can be regulated to a nicety by the use of the taps on the hot and cold water pipes respectively. The arrangement is both simple and effectual. The border inside and out of the thirdinery already noticed—and all, I understand, were similarly treated—received in a single season over 14,000 gallons of the warm manure-water, applied in this way. As Mr. Hunter truly said, if it had to be put on by the use of the watering-pot the quantity would fall very far short. A warm day is chosen for applying it, when little or no fire-heat would be needed in the range of houses from the pipes of which the warm water is brought; the fires are then put on as hard as they can go, to heat the cold water that is running into the boiler to supply the place of what is being run off.

Many have supposed there must be something in the constituents of the soil here more than usually favourable to the development of the Vine; but such evidently is not the case. From what I could see of the surrounding land I should take it to be a fair loam, but I have seen plenty I should prefer before it. The fact of the whole district resting on a bed of coal does not speak favourably for the surface soil. The capabilities of these Vines to produce such extraordinary bunches is evidently due to a combination of several conditions, any one of which, being absent would render the others nugatory. The more than ordinary root-space both in depth and superficial extent of border, and the rich ingredients in the soil, favour the existence of an unusual quantity of roots, which in their turn cause the production of an immense amount of leaf-surface, the retention of which is rendered possible by the ample head-room which the Vines have allowed them, all nourished and sustained by an unstinted supply of rich liquid feeding, which, from the porous nature of the border and perfect drainage, can be applied with the best results; whereas, if the soil were of an adhesive nature, or the drainage all deficient, it would have quickly caused the destruction of the roots, which again are prevented by the concreted bottom from getting down into anything objectionable that might be in the subsoil.

To the above collective favourable conditions, conjointly with skilful and intelligent management, I consider are due the results that have given these Vines such deserved celebrity. The way they succeed with quantities of water so much above that which is usually given, bears out an opinion I have long entertained, and frequently expressed, that Vines in this country rarely get as much water as they require, and that a good deal of the shanking and deficiency of colour we see is the result of an insufficient supply of moisture to the roots during the time it is most required when the fruit is swelling, and through which the roots are partially stagnated, and not fully able to answer the demand made upon them by the fruit in its last stages of completion. There has been so much said and written about the roots of Vines being too wet, and of the ills resulting from it, that hundreds of people are deterred from giving enough water, forgetting the widely different conditions under which the roots exist when in a close, adhesive, badly-drained border, and that in which they are placed when the border is composed of the right materials properly put together, and thoroughly drained. *T. Barnes.*

(To be continued.)

Home Correspondence.

Disease-Prevention in Potatoes.—The two concluding sentences bearing reference to my proposed treatment of Potatoes (p. 340, *ante*) will tend to produce an erroneous impression unless corrected. Will you, therefore, allow me to say I proceed upon the basis that the germs of disease are in the ground everywhere. These disease-producers need not, therefore, be looked for, because it is certain they are present in every place and in every position. My plan is simply to destroy all spores, resting-spores, and eggs in the manurial dressings (where they most abound) and in the ground during the winter and spring months. This will give the

Potatoes a fair chance at starting. In the experiments I have arranged to personally superintend I shall treat the Potatoes again just before the early autumnal rains set in in the following manner:—A dry, impalpable powder of such extreme lightness has been prepared that the slightest possible agitation will distribute it through the air in almost invisible clouds to considerable distances. This powder will be disseminated over all the plants included in the experiment, so that it may fall with tolerable evenness over the entire crop. The powder is of such a nature that the slightest moisture will dissolve it, and every individual grain thus dissolved will be simply fatal to all fungus life. It will be therefore seen my plan is to treat the Potatoes from within and from without. Thus fortified I have little fear of stray spores from infected districts, as I hope to prevent their gaining a foothold. *W. G. Smith.*

Lobelia pumila magnifica.—Mr. Morgan has given a true history, as far as it goes, of the Lobelia pumila magnifica which Mr. Davidson calls Emperor William. I have only to add that I raised the Lobelia at the Pine-apple Nursery, and received a First-class Certificate for it, both at Kensington and Regent's Park in 1874. *The Gardeners' Year Book* has it thus:—“Lobelia (pumila) magnifica” (J. Baxter). Large, deep violet-blue flowers, very free and effective.” I gave Mr. Brownell, gardener at The Mount, Harrow, a pinch of the seed from which I raised it, and on my visiting him in the September after I had received the certificate, I found he had the correct sort. Being afraid of its getting too widely distributed, as Mr. B. told me all the gardeners in the neighbourhood were asking him for some, I offered to take the lot. He would not part with all of it, so, for obvious reasons, I did not tell him what he really

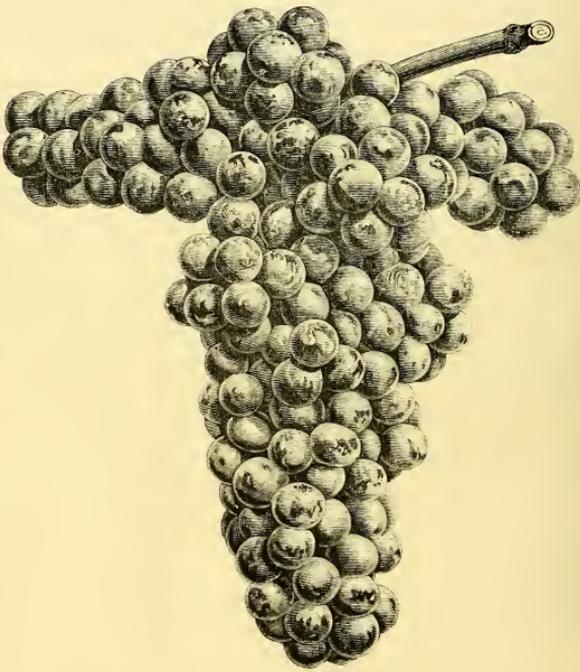

FIG. 61.—BUNCH OF GROS COLMAN GRAPE GROWN BY MR. HUNTER AT LAMPTON CASTLE.

The National Rose Society.—We must all regret that there is a clashing between the National Rose Society's exhibition and the Gardeners' Benevolent dinner on July 4, but I fear there is no remedy for it; the fact is, Mr. Cutler, who is always on the look out for some favourable gap to swell the sails of his vessel, thought, when our exhibition was announced for July 4, that he had caught the breeze, being ignorant that the members of the National Rose Society contemplated dining together also, and so the two ships have fouled one another; but, after all, I do not suppose it will affect half a dozen persons. As to the suggestion that the Rose dinner should be turned into a lunch, imagine a lunch at 2 or 3 o'clock (it could not be before) of somewhat excited exhibitors, managers, &c., and then to add to that a dinner at 6 [7] o'clock, with I do not know how many courses, &c.—what a gallant crop of headaches, bad stomachs, &c., and what a capital time for the family doctor! I do not think that plan could answer, and so I fear things must remain as they were. The committee meets on Wednesday, and their decision will be final. *D. Dial.*

had, although when he showed it me he said, “There—how is that, compared with pumila magnifica?” I should add that I sent the Pine-apple stock out in April, 1875; those Mr. Morgan speaks of I sold on my own account from Mr. Brownell's stock. *John Baxter.*

The Alnwick Seedling Grape.—I have to beg your publishing in next week's issue the enclosed letter, which I addressed to the secretary of the Fruit Committee of the Royal Horticultural Society. I think I am in all fairness entitled to this consideration, as it will serve to remove any false impression caused by the misapprehension of my previous letter, which the committee evidently had, and which will also give a fair reason for the change in the name. *D. P. Bell, Clive House, Alnwick.*

“To the Secretary of the Fruit Committee of the Royal Horticultural Society.

“SIR,—I beg to acknowledge receipt of extract from the minutes of the Fruit Committee of the Royal Horticultural Society respecting Clive House Seedling, and

most express my astonishment that the committee should have passed such a minute without first asking from me an explanation of the apparent inconsistency.

The whole of the seedlings raised by Mr. Bailey were from the same cross—the cross as given by me in my letter to the committee. You may think it paradoxical to state, in the *Journal of Horticulture*, that it is a founding, &c., but I hold that the two statements are perfectly reconcilable. The first refers to the origin of my Vine, the second to the origin of the plants now at Alnwick Castle, as the rest of my letter clearly shows.

"In addition to previous evidence I have now that of Mr. G. G. Hill, head-gardener at Alnwick Castle, Glasgow, and formerly foreman at Alnwick Castle Gardens, who planted the Vine in question, and testifies that there are no other seedlings than those left by Mr. Bailey, as he is well known to us."

"My explanation then on this point is that my statement about the uncertainty of the percentage and composition of nothing do to with the original production of the seedling, but referred to the immediate source, to the particular plant from which my plant was taken, and its relation to those now being detected to be the same as have been known to us."

"As for the name Clive House Seedling, which you may remember I reluctantly gave on the spur of the moment to have been maintained against me by the Committee, if they look upon it as implying—that I have never once pretended—that it was my own raising, and I am quite willing to adopt any name they may suggest, provided it should be free from local or personal bias."

"In closing, I must strongly disclaim the charge of the Fruit Committee, that I withheld the name of the origin of the Grape. My readiness to answer all questions, my immediate contradiction in the *Journal of Horticulture* of a groundless claim, and my full statement of the facts of the case, ought to have produced such a charge; and I trust that the Fruit Committee will see their way to withdraw it, and to place their withdrawal on their minutes.

"I have nothing of conceal. If required, I am prepared to show that I obtained my Vines fairly and openly, and am indebted to no man for them, and that I never got to blame for a mistake made which put me in possession of this one and has preserved it from destruction. At the risk of unpleasant personalities I will, if required, defend my own name and property; but I trust that my present silence on personal transactions will not be deemed a withholding of the facts of the case. If the Fruit Committee have any questions to ask, my suggestion to make it all give them my full and candid consideration.—I am, Sir, &c."

"D. P. BELL."

Chilidanthus fragrans.—It has often been a source of surprise to us that such difficulty has been experienced in flowering *Chilidanthus fragrans*, and on mentioning the fact to several well-known bulb cultivators, we were met with the reply that "they had tried all means to induce it to flower with success, and were satisfied if they could not do better than our selves." We have tried, and, as a proof that we are not boasting, enclose herewith a flower for your inspection, and think you will be delighted with its delicious fragrance. We got a great number planted out in beds during the summer of last year, and these, on the first appearance of frost, were lifted. We selected four strong bulbs from the bulk as an experiment. These were placed in a small open box containing leaf-soil, and placed in the stove. No moisture was given; in fact, they received quite a baking. About the middle of February they were placed singly in pots of loam and sand, watering gradually as growth became apparent. The first flower-spike showed itself a week ago, and it fully opened on the 17th inst. The length of the house varies from 65° to 70°. It is clear from this experiment that treating the *Chilidanthus* as a border plant is not its proper mode of culture. We think, however, that if treated as a warm greenhouse plant, and that it is a great deal of ground, you will do well to Nerine, that it will prove more easy of flowering. Mrs. Loudon, in the *Ladies' Flower Garden*, gives a plate of it, but it is represented as having an umbel of flowers, while the flowers in this case are solitary. I have mentioned *Chilidanthus fragrans* to Mr. Herbert from a dried specimen, but which appears to differ from *Chilidanthus*, the flowers of the latter being twice as large as the former and the limb four times as large. One of the flowers of the latter was collected by Koelz, in Peru, and it is possible that this may be the *Clinanthus* spoken of by Mrs. Loudon as not having yet been introduced—we shall be glad of your opinion.

The New Plant and Bulb Company, Colchester. [Since it is covered with roses, and the plants in the cross are not very uncommon, and when it happens the one flower is generally larger, by comparison. ED.]

Mice and the Peas.—I have always been troubled with the attack of mice on the earliest Peas, and have considered every means to be taken that I could think of to resist their ravages. Chopping up Gorse, and mixing it along the drills, or spreading ashes, to prevent the mice from destroying the Peas, are both failures, and the only remedy that I have found, by tracing the sun's rays to draw the Peas through the ground much earlier and cleaner. I

have trapped them in various ways, but the best way to keep mice at bay is to soak the Peas in benzoline or paraffin for a few minutes previous to sowing. Since doing this I have not had the Peas attacked in the slightest way, and even the birds have kept away, while in no respect does the oil have the least effect on the germinating power of the Peas. I should like to hear if any of your correspondents have tried this remedy, and what results? *H. C. Oyle, The Gardens, Efford Park, Lynton, Hants.*

Desfontainia spinosa.—In answer to your correspondent's question, I have pleasure in telling him what little there is to tell about my *Desfontainia*, which I planted there in a clump of cypress on my lawn. It is well surrounded by tall Cupressus and Hollies, and faces the south. I gave it good bog soil mixed with some sand. *H.*

Lilium giganteum.—A friend lately brought me from his garden in Norfolk a bulb of *Lilium giganteum*, and told me how the Lily was grown there. As the treatment is rather different from what I have tried and heard of, and seems to be thoroughly successful, I requested a note of it; my mail, I think, is useful to some of your readers. The bulb was placed at the side of a rich Vine border, which had had a heavy dressing of horse and cow manure. These have grown strongly, have flowered and seeded, while other bulbs were placed in the same soil, but in not so much large bulbs and have not flowered. *George F. Wilson, Heatherbank, Weybridge Heath, March 17.*

Reports of Societies.

Royal Horticultural: March 21.—The Treasurer, H. Webb, Esq., in the chair. The only business transacted at the ordinary general meeting was the election of numerous new Fellows. The committee meetings were held in the conservatory, and owing to the very liberal contributions made by several nurserymen the display was an eminently satisfactory one, though we are sorry to have to add that the attendance of visitors was again small.

SCIENTIFIC COMMITTEE.—Dr. Maxwell T. Masters, F.R.S., in the chair.

Secretary to the Committee.—It was announced that Mr. Andrew Murray had undertaken to act as honorary secretary to the committee, an announcement which was received with much gratification by the committee.

Hybrid Silene.—The following communication was read from Mr. Anderson Henry:—

"I embrace the opportunity to submit a notice of a hybridising operation which may be worthy of a place in the Scientific Committee. Having, shortly after Messrs. Hooker let it out, obtained a plant of the charming *Silene Hookeri* imported by them from the Oregon, it struck me as a thing capable of improvement, both in its constitution (it is not a vigorous plant) and in the beauty of its flowers. If I could effect a cross between it and the scarcely less beautiful *Silene Elizabethæ*, from the Tyrol Alps, which, with large rose-coloured and more compact flowers, had a stronger constitution, besides being a European species, much harder and better suited to our climate, I accordingly set to work. The cross took, and from the hybridised seedlings, arising on raising one, I obtained a stock more of the habit and aspect of the male parent, *S. Elizabethæ*. Of this hybrid I was very desirous to procure seeds, and to this fact I beg to call your attention. I found that with its own pollen it was sterile, yet while the male property was deficient the female organ had all the appearance of being perfect. I then tried it with the pollen of *S. Elizabethæ*, and from the cross I obtained finely ripened seeds, which I have sown, but which have not yet vegetated. I tried a further cross on the same plan, with the pollen of *S. Elizabethæ*, but though the seed-pods swelled, and promised seeds, none came to perfection. The experiment in its result is quite new to me, as I never before found the potency of the female to be so great in the case of the majority of the plants."

Coffin-lid Disease.—The following communication was received from Mr. Berkeley, to whom the specimens referred to were submitted:—

"The Coffin-lid forwarded to me from the Scientific Committee of the Royal Horticultural Society are infested with *Hemelia*, a genus belonging to the family of the Uredineæ. I have been a student of Wadham College, Oxford, has been making numerous observations on the germination of the spores, and purposes continuing them this spring as soon as the weather is favourable. In every specimen I have seen has been a species of *Penicillium*, but whether from spores of *Penicillium* attached to the *Hemelia* spores is at present uncertain. I have numerous drawings from Mr. Abbey, some of which are highly curious, but last year, when at my request making new observations with a particular view, the spores refused to germinate altogether, and the germination of the majority of them to Mr. Thwaites, who, like myself, is in a state of

philosophic doubt. Doubtless sulphur in some form would destroy the fungus."

Exudation from Leaves of Pines.—Dr. Moore of Glasgow forwarded Pine leaves encrusted with a whitish exudation, which it was suggested might be the work of some fungus. The general opinion of the committee was that it was an exudation not necessarily connected with either fungus or insect.

Aspidiotus Latensis.—Leaves of a species of *Latania* infested with this insect were shown.

Haplus humuli.—Mr. G. F. Wilson showed specimens of the larva of this insect, which had attacked the roots of various species of Heliolebe.

Removal of Male Flowers of Maize.—Mr. A. W. Bennett, of Alnwick Castle, Alnwick, Northumberland, had observed that the farmers cut off the male spikes of the Maize except in one corner of the field, and, on inquiry, he had learnt that it was done either as a matter of routine or with a view of strengthening the plant. He considered that the practice might be advantageous in securing cross-fertilisation. It was stated that in North Italy and in India the practice was not generally followed, and inquiry had been made as to whether the practice was adopted in America.

American Blight on Auricula.—The existence of this was mentioned, and it was desired that specimens be sent for examination.

Japanese Auricula.—Professor Dyer showed a volume of botanical plates executed in Japan, with the native name, as well as with the botanical appellations affixed.

Curious Specimen of Silver Fir.—Mr. Green, Botanic Nurseries, Scapton, showed a specimen of Silver Fir, the trunk of which was rotten and hollow, except at the points whence the branches emerged. It was mentioned that similar phenomena were caused by horrets, which scooped out the softer tissues, leaving the hard and woody portions.

Species of Muscari.—Mr. Harpur-Crewe showed several specimens, which were referred to Mr. Baker for identification. Mr. Crewe also showed a hybrid form from *Cheiranthus matulis*, with darker flowers than usual.

Lachnalia, &c.—Mr. Green showed a flowering plant of *Tillandsia* sp. and of a *Lachnalia*, which were referred to Mr. Baker for determination.

Dryopteris exaltata.—Dr. Masters showed a flower of this plant which he had taken from the garden of the conservatory of the Dowager Marchioness of Normandy, and to which, on account of its rarity, a silver medal was awarded by the Floral Committee. The plant flourishes in the Lakes in the West of England, and was figured in their *Botanical Cabinet*. It has also flowered several times on the Continent, and is figured in Kegel's *Gartenflora*, 1864, t. 421.

Cycad Genus.—Dr. Masters showed, on the part of Mr. W. Bull, a male spike of *Macrozamia M. Kennii*, supposed to be from New Australia, and a female cone of *Lacœpalcarrus cycadifolius*.

Athous niger.—Mr. Barclay, q. to the Earl of Rosebery, showed specimens of this beetle, which was found in a piece of decayed wood.

Proceedings.—A discussion ensued as to the best mode of improving the procedure of the committee so as to render its meetings more generally useful, and to permit freer admission to it on the part of the public. It was ultimately agreed that a sub-committee, consisting of the President, Dr. Hooker, Dr. Masters, Mr. Green, and Mr. Andrew Murray, be appointed to confer with the Council on the subject.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair. A silver-gilt medal was awarded to Messrs. James Veitch & Sons for a large and in all respects admirable display of flowering plants, which consisted of 15 vases of Hyacinths, 2 of Tulips, 2 of the batch shown at Regent's Park, and more fully alluded to in another column; a nice lot of Tulips, a fine display of small flowering plants of various sorts of Clematis, and a charming group of Roses in pots. A silver-gilt medal was also awarded to Mr. John Wills for a large and effective group of admirably grown examples of his various new hybrid *Dracœnas*; and to the same exhibitor the award of a silver medal was made for a large and tastefully arranged group of decorative plants. A silver-gilt medal was also awarded to Mr. Turner for a beautiful group of flowering *Camellias* and *Azaleas*; to Messrs. Cutbush & Son, for an admirable display of Hyacinths; to Messrs. Osborn & Sons for a charming group of plants, principally beautifully grown young specimens of various *Fatimas*; and to Mr. Head, q. to Sir Henry Deek, M.P., Wimbledon House, for a small but select group of Orchids. Certificates of the first class were awarded to Messrs. Veitch and Sons, for *Croton MacArthur*, a large and handsome variety with yellow leaf-stalks and long narrow arching leaves, dilated at the base, intruding towards the apex in some cases, the midrib running out with long thread-like hairs owing to the young specimens of *Fatima*; and to Mr. Turner, for a very pretty, consisting of abundant irregular blotches of clear yellow on a dark green ground; and

Markets.

COVENT GARDEN, March 23. Few samples of good late Grapes are now coming, consequently prices are much enhanced. Strawberries are quite equal to the demand, and are realising some prices as last week. Forced vegetables are in good request, and, with the exception of Cucumbers and new Potatoes, are making higher prices. We are still well supplied with St. Michael's Finest, and also with the following quotations: James Webber, Wholesale Apple Market.

VEGETABLES.

Table listing vegetable prices: Arichokes, per bush, 4 0-; Egg Globe, do., 2 0-; Asparagus, Fr. bun, 1 0-; English, p. bun, 8 0-; Natural bun, 1 0-; Marrows, per bun, 1 6-; Beans, French (new), per 100, 2 0-; French Long-pod, 1/2 bushel, 1 0-; Cauliflowers, per dozen, 1 0-; Brussels Spets, 7 0-; Cabbages, per doz., 1 0-; Carrots, per bunch, 0 6-; New Fr. p. bun, 2 0-; Rhubarb, per bundle, 1 0-; Celery, per bundle, 1 6-; Chalk, per doz., 3 0-; Cucumbers, each, 4 0-; Endive, per doz., 1 0-; Garlic, per lb., 0 6-; Herts, per bunch, 10 0-; Potatoes - Kent, 10 0-; Kidney, £8 per ton.

FRUIT.

Table listing fruit prices: Apples, per 1/2 bushel, 1 0-; Coles, per lb., 1 0-; Raspberries, per 100, 1 0-; Oranges, per 100, 4 0-; Peaches, per doz., 1 0-; Pears, per doz., 1 0-; Pine-apples, per lb., 1 0-; Strawberries, per doz., 1 6-; Plums, per doz., 1 0-.

PLANTS IN POTS.

Table listing potted plants: Azaleas, per dozen, 14 0-; Begonias, per doz., 6 0-; Fuchsias, do., 12 0-; Geraniums, do., 9 0-; Calceolarias, per doz., 9 0-; Pelargoniums, do., 9 0-; Cereus, per dozen, 3 0-; Cyclamen, per doz., 12 0-; Dracena terminalis, 30 0-; Ficus, per doz., 10 0-; Ferns, in pot, p. doz., 6 0-; Ficus elastica, 2 6-; Geraniums, per doz., 9 0-; Heaths, variety, doz., 6 0-; Heliotrope, per doz., 6 0-.

CUT FLOWERS.

Table listing cut flowers: Azaleas, 12 sprays, 0 6-; Carnations, 12 blooms, 2 0-; Camellias, per dozen, 1 6-; Cyclamen, per doz., 3 0-; Fuchsias, per doz., 1 0-; Euphyllium, 12 blms., 1 0-; Euphorbia, 12 sprays, 2 0-; Geraniums, per doz., 9 0-; Heliotrope, 12 spr., 6 0-; Hyacinths, p. dozen, 2 0-; Roman, 12 spr., 1 0-.

SEEDS.

LONDON: March 21. - We have to report an improved inquiry for farm seeds, which, with a continuance of favourable weather, would develop into a brisk demand. For all the leading varieties the prices show this week no alteration. In the absence of any reports from the moderate stocks held in London are of course being reduced by every order which comes to hand. The recent exports of American seed to London from the Continent have also tended to lighten our market. Nearly all the home-grown samples of red Clover which now find their way to Mark Lane are brown and yellow. In the absence of a good harvest of clover at the moderate currencies now ruling, Alkali and white Clover are steady alike in value and demand. Ryegrasses have a lively request, and the same may be said of other varieties which better prices are obtaining. For Sanfoin there is a fair sale at last week's quotations: this article when milled experiences every year increased favour. Ryegrass sown in the autumn is doing well, and seed is held on former terms: the demand continues extremely meagre. For feeding Linseed the trade is also very dull. Lucerne seed being cheap attracts notice. Other articles in the market are at the seed rate, call for no remark. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

POTATOS.

The thorough and Spitalfields markets reports state that there has been a quiet sale for Potatoes, and prices have recently varied very little. The market is moderately extensive scale. Kent Regents, 10s. to 11s. per ton; Essex do., 8s. to 10s.; Scotch do., 9s. to 10s.; rocks, 6s. to 10s.; flukes, 12s. to 16s.; Victoria, 10s. to 12s. per ton. In the London market the week comprised 21,322 bags from Hamburg, 16,395 Antwerp, 1797 Bremen, 1503 Brussels, 300 Rango, 49 Rotterdam, 1500 a plingling, 1300 cat. 95 barrels M. 240 sacks. Bolognese, 139 bags Dautic and 115 Herts.

SEED POTATOS.

Special Offer. WARMED True and Free from Disease. In cwt. bags. FLESKIND FLOWER, 5s. per cwt. JERSEY BLUE, 8s. per cwt. DUTCH BELG, 5s. per cwt. EARLY ROSE, 12s. 6d. per cwt. EARLY ORFORD, 10s. per cwt. Fifty other sorts in stock. Net prices for cash orders. No charge for bags, and delivered free on Rail, Norwich. DANIELS BROS., Norwich.

Presented (by post) on application, NEW CATALOGUE for 1877.

MESSRS. CLIBRAN AND SON will have great pleasure in sending their PRICED CATALOGUE, 5s. per copy, free by post on application. Their stock of Florist Flowers, Bedding and Soft-wooded Plants generally, are surpassed by few, if any, either in extent or quality, and most of the best varieties being constantly added to the various classes, and the greatest care is taken to keep the varieties true to name. Another great advantage to Customers that order of the plants sent direct from a warm propagating house and sent off, but are all carefully hardened and most of them potted off singly, and are thereby fitted to travel either by rail or post without the slightest injury. A great proportion are autumn-struck plants, and of the best underculture. A. Abutilon, in variety, 3s. per doz. Achillea, in variety, 3s. per doz. Ageratums, in variety, 3s. per doz. Begonias, tuberosa, 6s. and 9s. per doz. Caladium, 12s. per dozen. Camellias, 30s. and 42s. per dozen. Carnations and Fuchsias, 12 plants, 6s.; 12 pairs, 10s. 6d. Carnation, tree, in variety, 2s. per pair. Centaurea rugulosa, 3s. per doz. Christmas trees, near 10,000 now ready, 30s. per 100, 3s. 6d. per doz. Cinerarias, 42s. per 100, 6s. per dozen. Clematis, in variety, 6s. per doz. Cyclamen, in variety, 30s. per 100, 3s. 6d. per doz. Dactylis elegantissima, 3s. per 100, 3s. 6d. per doz. Dahlias, 25s. per 100, 4s. per doz. Delphiniums, splendid sorts, 10s. to 12s. per dozen. Euphorbia, 12s. to 18s. per dozen. Ferns, in pot, and greenhouse, 2s. to 18s. per dozen. Fuchsias, 30s. per 100, 3s. per dozen. Garden Florida, 6s. to 12s. per dozen. Geraniums, in pots, 9s. to 18s. per dozen. Geraniums, Tricolor, 3s. 6d. per dozen. "Bicolor, 30s. per 100, 3s. per dozen. "Silver-edged, 3s. 6d. per dozen. "Double, 30s. per 100, 3s. per dozen. "In pot, for bedding, 12s. to 30s. per dozen. "Zonal, for pot culture, no alteration. Gladioli, to name, 6s. to 9s. per doz. "splendid seedlings, 2s. per 100, 3s. per dozen. "for cutting, 2s. to 6s. per 100, 1s. 2d. per dozen. Helianthus, 2s. 6d. per dozen. "in pot, 12s. to 18s. per dozen. Heraculus Plants, 2s. per doz. "in pot, 12s. to 18s. per dozen. Heliotrope, in variety, 2s. 6d. per dozen. The Oldfield Nurseries, Altrincham.

SURPLUS NURSERY STOCK.

TAMARIX, 200 sorts, to 3 feet, 12s. 6d. per 100. "FUTURA, 100 sorts, 12s. 6d. per 100. FUCHSIA GRACILIS, 30s. per 100. "VINE, 100 sorts, 12s. 6d. per 100. YEW, English (small), 15s. to 25s. feet, 25s. per 100. "VINE, 6 to 12 inches, 20s. to 24s. per 100. BERBERIS DARWINII, 15s. to 2s. feet, 16s. per 100; 2 to 3 feet, 20s. per 100. COTON-EASTER MICROPHYLLA, 2 to 3 feet, 16s. per 100. BUDDLEA GLOIOSA, 15s. to 1 feet, 16s. per 100. "INDICA, about 12 feet, 12s. per dozen, 75s. per 100; stronger, 30s. per 100. CISTUS, strong, many sorts, 4s. per dozen. "VINE, 100 sorts, 12s. 6d. per 100. Ceanothus, many sorts, 6s. to 12s. per dozen. "VINE, 100 sorts, 12s. 6d. per 100. "VINE, 100 sorts, 12s. 6d. per 100. POPLAR, Lombardy, 2 to 4 feet, 35s. per 100. "Canadian, 4 to 5 feet, 35s. per 100; 5 to 6 feet, 30s. per 100; 6 to 8 feet, 20s. per 100; 8 to 10 feet, 12s. per 100. PRIVET, green, 2 to 4 feet, 30s. per 100. SYCAMORE, 4 to 6 feet, 30s. per 100. RODGER McCLELLAN & Co., 64, Hill Street, Newry.

RHODODENDRON PONTICUM, 500,000.

All twice or three transplanted, bushy plants: 4 to 6 inches, 150 per 100, £4 per 1000. 6 to 12 inches, 12s. per 100, £2 per 1000. 9 to 12 inches, 15s. per 100, £2 1/2 per 1000. 12 to 15 inches, 18s. per 100, £3 per 1000. 15 to 18 inches, 20s. per 100, £4 per 1000. RHODODENDRON HYBRIDUM, 300,000, bushy plants: 4 to 6 inches, 12s. per 100, £3 per 1000. 6 to 12 inches, 15s. per 100, £3 1/2 per 1000. 9 to 12 inches, 20s. per 100, £4 1/2 per 1000. 12 to 15 inches, 25s. per 100, £5 per 1000. 15 to 18 inches, 30s. per 100, £5 1/2 per 1000. 18 to 24 inches, 40s. per 100, £7 per 1000. See CATALOGUE. JAMES SMITH, Darley Dale Nurseries, near Matlock.

From Paris - Roses, Frontons, Camellias.

LEVEQUE AND SON, NURSERYMEN, 67, Rue du Louvre, Paris. Their plants are particularly recommended - their flowers equal to the named sorts (seeds have been taken from the best sorts of the collection). GLADIOLI Seedlings, 4s. per 100, £4 per 1000 mixed white, red, pink. Separate colours, 12s. to 20s. per 100; 12s. to 20s. per 1000. Named sorts, 20s. to 30s. per 100; 20s. to 30s. per 1000. All good flowering bulbs, English Catalogue London, or Post-office Orders on Paris, accepted in payment.

From Paris - Large Bulbs of Gladioli, Seedlings and Named Sorts.

LEVEQUE AND SON, NURSERYMEN, 67, Rue du Louvre, Paris. Their plants are particularly recommended - their flowers equal to the named sorts (seeds have been taken from the best sorts of the collection). GLADIOLI Seedlings, 4s. per 100, £4 per 1000 mixed white, red, pink. Separate colours, 12s. to 20s. per 100; 12s. to 20s. per 1000. Named sorts, 20s. to 30s. per 100; 20s. to 30s. per 1000. All good flowering bulbs, English Catalogue London, or Post-office Orders on Paris, accepted in payment.

BLOOMING RHODODENDRONS.

Two Hundred Thousand good healthy plants, having not less than five up to ten and fifteen buds each, of the finest named hardy kinds, will be supplied at from £5 to £10 per 100, and 18s. to 30s. per dozen. Samples, with lists of the sorts, will be forwarded on application.

KALMIA LATIFOLIA.

Well furnished and healthy and covered with bloom-buds, 15s. to 18s., in 12s. and 18s. per doz., or £5 per 100.

HARDY AZALEAS.

The finest English and Ghent varieties, splendidly budded, £5 to £7 per 100, or 18s. per dozen.

ANTHONY WATERER, KNAP HILL NURSERY, WOKING, SURREY.

NEW PLANTS FOR MAY, 1877.

FRINGED PELARGONIUM, ROYALTY, 10s. 6d. each. PICOTEE, PRINCESS OF WALES, 5s. each.

Orders are now being booked, and will be sent out on and after May 1.

FREDERICK PERKINS, NURSERYMAN, REGENT STREET, LEMINGTON.

Pelargonium "Wonderful" (George Smith's). GEORGE SMITH has again much pleasure in offering this most popular and successful flower. Having received most pleasing accounts from all parts of the County, G. S. can confidently recommend it as the finest German ever offered, and highly recommended for pot culture, being a very bloomer, colour a brilliant orange-scarlet, and the petals of a most grand acquisition - the flowers fine in shape, and will be used in the choicest bouquet where no other variety can find a place. It has taken six First-class Certificates, and highly recommended by the Floral Press. Prices: 12s. per dozen; selected, 18s. per dozen; stronger, 24s. per dozen. Special prices for larger quantities on application.

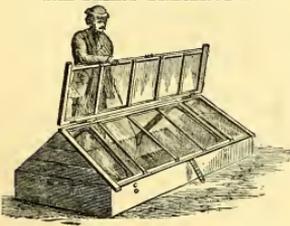

EVENING STAR (George Smith's) - This new and beautiful variety is most attractive and successful flower. It has a large pink eye, giving it a very striking appearance; the flowers of great substance, smooth, and a fine tinge of orange a light rose, and of good habit. This is an every year first-class flower, and no collection will be complete without it. It has taken six First-class Certificates.

"DREAMUGHT" (George Smith's) - A most distinct and beautiful variety, colour rich peach-blush, with white eye; the colour is particularly rich and fine, the pipe are large, with fine tuess; a very fine bloomer, and good habit. It is in every way first-class, and of great acquisition. 6s. per dozen. Orders made payable at Lemington. Road to GEORGE SMITH, to accompany all orders from unknown correspondents.

Tollington Nursery, Hornsey Road, Hillingdon, N.

BOULTON & PAUL, NORWICH, HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS.

No. 60.—PATENT PORTABLE UNIVERSAL PLANT PRESERVER.

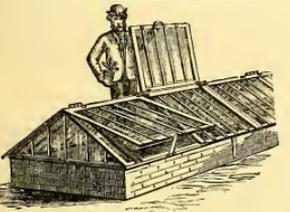

These excellent span-roof frames are made with wood sides, which are bolted iron girders to carry the lights. These lights will turn completely over and lie on the other side while attending to the plants inside. They are very portable; a man can easily remove the small size, two men can carry any size up to 12 feet by 4 feet. The use to which they may be applied is unlimited, as almost any class of plants can be grown in them.

CASH PRICES—CARRIAGE PAID ON Orders of goods and upwards.

No. 64.—PATENT PLANT PRESERVERS, ARRANGED TO BUILD ON BRICK WALLS.

This is the Practical Gardener's and Nurseryman's favourite frame, now largely used for storing the great quantities of bedding plants in winter, and in summer for growing Melons, &c. This is made for building on brickwork, as shown by section of No. 64.

Section No. 64 shows the frame built on brickwork, with a pit sunk low enough for making a dung bed for growing Cucumbers, Melons, &c. This form can be adapted to any length required.

Carriage paid to any Railway Station in England, also to Dublin, Edinburgh, and Glasgow.

CASH PRICES—CARRIAGE PAID. Including a glass ends to each end, pointed 4 times, glazed with 21-oz. glass. Carriage paid.

"Gentlemen,—The frames arrived safely, and give satisfaction. I would not have thought they could have been packed to have come in such good order, the point on the lights was not even scratched.

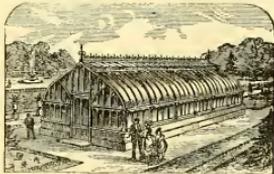

Carriage paid to any Railway Station in England, also to Dublin, Edinburgh, and Glasgow.

Packing Cases are charged, and half of the cost allowed if they are returned in good order, carriage paid, to our Works, within a month of delivery of the frame. New Illustrated CATALOGUE of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., post-free, on receipt of 24 penny stamps, the cost of which will be deducted from the amount of first order.

No. 62.—PLANT CASES.

These neat and ornamental frames will be found useful to place on a Lawn or Terrace, or may be used for a Fern Case indoors. The larger sizes make excellent Vicerays; in No. 6 size 11 to 15 ft. of Grapes may be grown. Made of the best material, painted four coats, glazed with best zinc sheet glass. Any size can be put together in a few minutes, and is then ready for use. All sizes are 2 feet high at the sides.

For LARGER SIZES see SPECIAL LIST.

Winter Gardens, Conservatories, Greenhouses, Orchard-houses, Vinerias, Plant-houses, Forcing-houses, Ferneries, Peach-houses, Cucumber and Melon-houses, Patent Plant Preservers, Forcing Pits and Frames, Melon Frames, &c., constructed of the best materials in Wood and Iron combined, on a thoroughly practical and scientific principle, efficiency being our first consideration, while due regard is paid to design and ornament.

Conservatories visited upon and advised as to the best method of arranging Horticultural Buildings of every description.

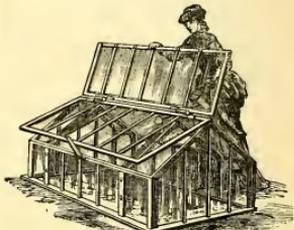

Designs prepared, Plans and Estimates furnished, Architects' Designs carried out, Hot-water Apparatus of all descriptions, on the best system erected and guaranteed to work in the most satisfactory manner. Estimates on application.

Boilers.—A great variety of the best Hot-water Boilers and Stop-valves kept in stock. Illustrated Price Lists free on application.

A new Catalogue of Horticultural Buildings post-free for 24 penny stamps, the cost of which will be deducted from the amount of first order. Ready March 1, 1877.

Amateurs' Greenhouses as Tenants' Fixtures, Price Lists free on application. Plant Preservers, Grand Vinerias, Melon Frames, &c., Price Lists free on application.

Melon Frames and Forcing Frames.—The largest stock in the kingdom. Price Lists free on application.

CASH PRICES—CARRIAGE PAID.

No. 6	9 feet	5 feet	7 0 0

No. 1 and 2 made with bottoms and side trays for planting Ferns; extra for No. 1 size, 12s. 6d., No. 2 size, 15s.

No. 74.—NEW THREE-QUARTER SPAN-ROOF GARDEN FRAME.

Our illustration shows a New Frame for growing Cucumbers, Melons, and for straining plants. It is made to give greater height and more convenience than the Melon frame, No. 75. The front is 11 ft. high, without the light, 21 in. high at the ridge, and 21 in. high at the back. The front lights are turned back on the lights behind, and back lights turned on to the front lights, giving access to all the plants inside. They are made of the best red deal, sides and ends 1 1/2 in. thick, 2 in. lights; all are painted four times, and glazed with 21-oz. sheet glass, milled and gutted in, same as the Melon Frame, No. 75. The illustration shows the lights to open with gearing; any of the lights can be lifted up when required without the other lights. Back and front gearing work separately.

CASH PRICES—CARRIAGE PAID. Geiring extra to 8 ft. size and upwards.

No.	Length.	Width.	£ s. d.
No. 1	4 feet long	6 feet from front to back	3 0 0
No. 2	8 "	6 "	4 15 0
No. 3	12 "	6 "	5 15 0
No. 4	16 "	6 "	7 6 0
No. 5	20 "	6 "	8 10 0

These frames are the most convenient, best made, and strongest things of the kind that are in use.

"Hunting Cottage, Oskmere, Northwich, January 7, 1877.

"I remain, gentlemen, your humble servant, "ALBERT LAING, Gardener.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS,

Will cut Long and Wet Grass (as well as Dry and Short) without Clogging.

They are especially adapted for Cutting Slopes, Steep Embankments, under Shrubs, and close up to Trees, &c.; and are also extremely light in draught, simple in construction, well made, and not likely to get out of order.

AWARDED

**AGRICULTURAL LOCOMOTIVES,
STEAM PLOUGHING MACHINERY,
ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
STEAM ROAD ROLLERS.**

For Prices, Description, and Reports of Working, apply to the Manufacturers,

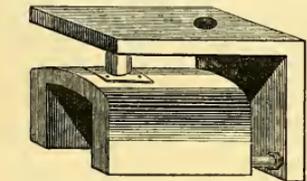

**AVELING & PORTER,
ROCHESTER, KENT; 72, CANNON ST., LONDON,
E.C.; and 9, AVENUE MONTAIGNE, PARIS.**

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the first trials of the Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

AN EXTRAORDINARY BOILER.
During the Great Boiler Contest at Birmingham, in 1875, all Boilers were severely tested to prove their respective merits. One test was "How long can each Boiler go without Night Attention?" However, one Boiler proved that to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.) it still retained its heat in 1000 feet of 4-inch pipes, and yet had made more than a barrel of fire drawn from four bars of common iron. What a boon to Gardeners. This was THE CHAMPION, Deards' Patent Close Coil Boiler, for Drawings and Prices of which send two stamps to Messrs. DEARDS, Boiler Works, Harlow.

who now have their Boilers at work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Silver Medals.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

This Boiler possesses all the advantages of the old Saddle Boiler with the further improvement of being open at the back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and the pipes occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:

Sizes.		To heat of 4-in. Pipe.		Price.	
High.	Wide.	Logg.	Feet.	£	d.
18 in.	15 in.	300	400	6	0
20 "	15 "	300	400	8	0
20 "	15 "	300	500	9	0
24 "	15 "	300	700	12	0
24 "	15 "	300	850	14	0
24 "	15 "	300	1,000	15	0
24 "	15 "	300	1,400	20	0
24 "	15 "	300	1,800	25	0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W., May 29, 1877.

"Having given your Patent 'Double L' Boilers a fair trial a number of times, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES AND CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES FOR HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, LONDON S.E.

GREEN'S
PATENT "SILENS MESSOR,"
 Or Noiseless Lawn-mowing, Rolling, and
 Collecting Machines for 1877.

The Winner of every Prize in all cases of competition.

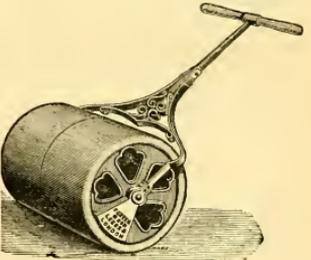

The superiority of these Machines over those of all other
 machines is universally acknowledged. They will Cut either long
 or short Grass, Bents, &c., wet or dry.
These advantages no other Lawn Mowers possess.
 They are the simplest in construction, the easiest to work,
 the least liable to get out of order, make little noise when
 in use, and are the most durable Lawn Mowers extant.
 Every Lawn Mower sent out is guaranteed to give entire
 satisfaction, otherwise it may be returned at once free of cost to
 the Purchaser.
 N.B.—Those who have Lawn Mowers to repair will do well
 to send them either to our Leeds or London Establishment, where
 they will have prompt attention, as an Efficient Staff of
 Workmen is kept at all places.

Descriptive Illustrated Price List free on application.

THOMAS GREEN & SON,
 SMITHFIELD IRONWORKS, LEEDS;
 And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E.

SHANKS' NEW PATENT
LAWN MOWERS,
 Under the Patronage of Her Most Gracious Majesty the Queen, and
 most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally
 established, that a detailed description is no longer necessary. A. S. & SON would here simply
 refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is
 made to be self-sharpening. The *Sole-Plate* or *Bottom Blade* is made with *Two Edges*, enabling
 the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced,
 which prevents the Grass escaping the Box when the Machine is in use during the prevalence
 of wind.

PRICES,
 Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	22-inch Machine	£13 10 0
12-inch Machine	4 15 0	28-inch Machine	15 15 0
14-inch Machine	5 15 0	30-inch Machine	17 0 0
16-inch Machine	6 15 0	The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.	
18-inch Machine	8 0 0	Price, for the 28-inch and 30-inch Machines, 50s. extra; 25-inch Machine, 25s. extra. Silent Movement, 12s. 6d. extra. Boots for Pony, 24s.; for Donkey, 20s. per set.	
24-inch Machine	10 0 0	NEW HORSE MACHINE.	
The Hand Machines are all fitted with Silens Movement, and can be used either with or without the usual Front Rollers.			
30-inch Machine	£10 10 0	42-inch Machine	£18 0 0
36-inch Machine	11 0 0	48-inch Machine	32 0 0

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.
 Price, for the 48-inch, 42-inch, and 36-inch Machines, 40s. extra; for the 30-inch, 30s. extra. Silent Movement, 20s. extra.
 Boots for Horse's feet, 20s. per set.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS
 Are warranted to give ample satisfaction, and if not approved of can be at once returned.

ALEXANDER SHANKS & SON,
 Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.

27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can
 choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power.
 Orders executed same day as received.

Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 50s.

THE PATENT "EXCELSIOR" LAWN MOWER,

The simplest and best ever introduced.

Waite, Burnell, Huggins & Co.,

235, UPPER THAMES STREET, LONDON, E.C.

Sole Consignees for Great Britain, Ireland and France.

The "Excelsior" has never been beaten in Competitive Trials. For Agencies, Catalogues, and Trade Terms, apply to above.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and it used cold. It is made in the grounds at Woodstock Castle, Reading, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. The name 'HILL and SMITH' will forward on application 30 gallons each, at 2s. 6d. per gallon, at the Manufactory, or 1s. 6d. per gallon carriage paid to any Station in the Kingdom.

DISCOURTEGE TESTIMONIAL. Glazebury, Llanpharrog, Carmarthen, Nov. 27, 1875.—Mr. Lloyd Lloyd encloses cheque for £35, amount due to Messrs. Hill & Smith, and he considers the Black Varnish one of the most useful things he ever possessed. Apply to HILL and SMITH, Brewery Hill Ironworks, near Dunfermline, and 115, Queen Victoria Street, London, E.C., from whom only it can be obtained. HILL & SMITH.—It having lately come to the knowledge of Hill & Smith that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which name is genuine.

Bosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plinth stones are specially suited for the Edging of GARDENS, as they take up no space, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in a great variety of design. F. ROSHER and Co., Manufacturers, Upper Ground Street, Blackfriars, S.E.1. King's Road, London, S.W.1. Kingland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and BRICKPATING LONDON, and F. FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 2s. per square yard upwards. Patterns, sheets, of plain or more elaborate designs, with prices, sent free direct. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchens, Ranges, and Groceries, and other suitable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. F. ROSHER and Co., Brick and Tile Merchants. See addresses above.

SILVER SAND, fine or coarse grain as desired. Rises by Pat or Sand on or trucked on Wharf in London, or delivered direct from any Railway Station. Samples of Sand free by post. FLEETS and BINS, BEDS, REEDS, or Ferneries, KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER and Co.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

In 1 vol. 8vo, with above 12,000 Woodcuts, price 3s. LONDON'S ENCYCLOPEDIA of PLANTS: comprising the specific character, description, culture, history, application in the arts, and every other desirable particular respecting all the plants indigenous to, cultivated in, or introduced into Britain. Compiled by Mrs. Loudon, assisted by George Don, F.L.S. and David Wootter. This celebrated work is of the greatest utility to gardeners, and, indeed, to all who have access to great libraries. The great reconstruction of the work has always been its woodcuts, which, although only miniature, were necessarily drawn by Mr. Sowerby with such happy and so skillfully engraved by Prout, that the plants could always be recognised, even by those who are unacquainted with the nomenclature. *Gardener's Chronicle.* London, LONGMANS AND CO.

THE CULTIVATOR.—A Portuguese Monthly Agricultural Journal, which circulates in Portugal and her possessions, and in the Principal Towns of the Brazils. This Paper offers an excellent medium for Advertisements of every description of industry of every article of production in the countries and places above mentioned. Advertising charges, 2d. per square inch, Translation included. Ten per cent. discount for six months; 20 per cent. discount for twelve months, if paid in advance. Address, the Editor of the Cultivator, St. Michael's, Azores.

Farms, Estates, Residences. Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the MIDLAND COUNTIES HERALD supplied free for six weeks on stating the purpose for which the paper is required, forwarding name and address, and six halfpenny stamps for postage, adroitly drawn by the Herald Office, Birmingham. The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

This day, in Crown 8vo, price 2s. 6d., GARDEN RECEIPTS. Edited by C. W. QUIN.

MACMILLAN AND CO., LONDON. Just Published. AGROSTOGRAPHIA, A Treatise on the Cultivated Grasses.

REVISED EDITION, WITH ILLUSTRATIONS. MAY OR HEAD OF THE LAWSON SEED AND NURSERY COMPANY Messrs. WILLIAM BLACKWOOD AND SONS, Edinburgh and London.

KING'S HILL STREET, NEWRY.

Splendid New Melon, 1877.

CHARLES LEE AND SON (Successors to Messrs J. & C. Lee) have the pleasure to announce that they have purchased the entire Stock of **MAN'S HYBRID GREEN-FLESH MELON**, which they now offer for the first time. It has already earned a high reputation in London and the provinces for its uniformly excellent qualities, among which may be mentioned a remarkably high and exquisite flavour at all seasons of the year, perfection of shape, and a thin rind and melting flesh, with an overtop of perfumed juice. It is also a heavy cropper, and forces well.

Dr. HENRI has spoken of this excellent Melon in the highest terms, and after tasting it pronounced it a fruit of the highest merit.
Mr. CULVERWELL, of Thorpe Perrow, fellow judge with Mr. FOWLER, of Harwood House, at the Leeds Horticultural show, when they awarded a First-class Certificate to "Man's Hybrid Green-flesh Melon," speaks of it as "an exceedingly fine Melon, especially at that early season—the early part of June."

Mr. INGRAM, of Belvoir Castle, writes, in the third week of October, that in view of the disadvantage of a long term of gloomy weather, at that season of the year, "Man's Hybrid Green-flesh Melon" was sweet, tender in flesh, very juicy, and suited in character.

Messrs. Charles Lee & Son are now prepared to offer this very useful and delicious New Melon in sealed packets, at 3s. 6d. per dozen, in character.

CHARLES LEE AND SON, HAMMERSMITH, W.

FRUM PARIA—ROSES, FROONIES, CAMELIAS
LÉVEQUE AND SON, NURSERYMEN,

GOETIA, LADY ALBEMARLE.

First-class Certificate Royal Horticultural Society, August 2, 1876.

A magnificent new variety, growing 4 feet high, and bearing 2½ to 4 inches long, and of the most intense glowing crimson-crimson colour, which, being produced in wonderful profusion give the plants the most charming appearance. This is the finest annual ever sent out, and being extremely hardy and easy of cultivation, should be in every garden.

Seed, with full cultural directions, per packet, 1s. post-free.

We have scarcely any plant of such a lovely shade of colour.—*The Villa Gardener, September, 1876.*
"An extremely beautiful variety bearing flowers quite 4 inches in diameter, of a glowing crimson colour."—*Gardener's Magazine, August, 1876.*

"A remarkable and splendid variety, far superior to any other of the family."—*Journal of Horticulture, Aug. 2, 1876.*
"May be had of all Seedsmen, and Wholesale and Retail of."

DANIELS BROS.,
THE ROYAL NORFOLK SEED ESTABLISHMENT,
Norwich.

TOPIARIA, 18, from names of fruit and 2s. 6d.

FRIMROSE, POLYANTHUS, and OXLIP, best quality, mixed colours of each, 12s. 6d. and 2s.

WALLFLOWER, double German, mixed colours, 6d. and 2s.

NOVELTIES IN FLOWER SEEDS.

ALONSOA ALBIFLORA.—New distinct species from Mexico, introduced by Mevelli, the distinguished collector, flowering freely, from 12 inches up to 2 feet in height, producing long terminal spikes of pure white flowers with yellow centres. It is recommended for pot-culture as in the conservatory it will produce a succession of its flowers throughout the season, and is especially adapted for bouquets and table-decoration. It will be found a desirable and useful substitute for Lily of the Valley, if used in conjunction with its charming effect when arranged so as to overtop the other flowers by 2 or 3 inches.

BROWALLIA ROZELII, 2s. **COBEA HIRSUTA**, 2s. 6d.

HUMEA ELEGANS ALBA, 1s. **AGERATUM SNOW-HILL**, 2s. 6d.

MIMULUS BRILLIANTISSIMA, scarlet self, 2s.

MENTZELIA ORNATA, blue plant (see description in Catalogue), 2s. 6d.

TORENIA FOURNIERI, new annual form of this beautiful combination of blue and white, 2s. 6d.

ERYNGIUM LEAVENWORTHII, ornamental plant, 2s.

PYRETHRUM AUREUM LACINIATUM, fringed-leaved Golden Feather, 2s.

ASTER, Firelight, most beautiful and brilliant new quilled variety, 12s. 6d.

ANTHEMIS NEPALENSIS, fine ornamental species for pot-culture, 2s. 6d.

PAFANUS HENDERSONIA, showy flowers, 2s.

LIATRIS FYNOSTACHYA, 1s.

CANTERBURY BELLS, double filled flowers, beautiful variety, 2s. 6d.

CUPHEA ROZELII, 2s. **BAMBUUSA GRACILIS**, 1s.

PINE-APPLE NURSERY, MAIDA VALE, LONDON, W.

THE NEW ROSE,
QUEEN OF BEDDERS (NOBLE).

Perhaps the Finest Rose for Bedding ever sent out.

COLOUR OF "CHARLES LEFEBVRE."

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that flowers were cut daily from June to November 20, 1876.

Good Plants will be sent out, in strict rotation, at 10s. 6d. each,
 COMMENCING FIRST WEEK IN MAY.

CHARLES NOBLE, BAGSHOT.

Branded on every Casting.

FOR HOME & EXPORT.

Illustrated CATALOGUE with Price List and Estimates for special Designs on application.

WALTER MACFARLANE & CO, GLASGOW.

MESSRS. JNO. STANDISH AND CO.'S CATALOGUE for Autumn, 1876, and Spring, 1877, is now ready, and may be had, post-free, on application.

It contains the following:—
 Plants of Recent Introduction. Climbers. Hardy Climbers, Clematis, &c.
 Stove and Greenhouse Plants. Rhododendrons, Azaleas, &c.
 Plants for Winter Forcing. Kalmsia, &c.
 Azalea indica and Cuscuta. Roses, Standards and Dwarfs, also in pots.
 Tree Carnations and Ericas. Fruit Trees.
 Ferns and Lyopodia. Transplanted Forest Trees. Grape Vines.
 Hardy Trees and Shrubs. Dutch Bulbs, Flower Roots, &c.
 Royal Nurseries, Ascot, Berks.

THREE BUNCHES OF GRAPES,
 3 stones 3 lb. 6 oz.!

GROS GUILLAUME,
 ROBERTS' VARIETY.

This extraordinary variety is the largest bunch-producing Black Grape in the world.
 Three bunches from one Vine weighed 3 st. 3 lb. 6 oz. They were exhibited in Dublin last November, and in addition to First Prize were awarded a SPECIAL MEDAL. This variety is quite distinct from the ordinary varieties bearing its name, or that of Blackcross. It is a good grower, and has a good constitution; never shanks or scalds.

A few Eyes or Scions of this remarkable Grape still to be had.
 Price, strongest, 10s. 6d. each; second size, 7s. 6d. each.

W. TAIT & CO.,
 SEED AND NURSERY ESTABLISHMENT,
 45, CAPEL STREET, DUBLIN.

Vines
E. G. HENDERSON AND SON offer splendid Fruiting Canes of all leading kinds. Planting Canes, 3s. 6d., 5s., and 7s. 6d. each; Golden Queen, Venn's Black Muscat, and Waltham Cross, 4s. and 6s. per dozen. Trade supplied.
 Fine-apple Nursery, Maida Vale, W.

BLOOMING RHODODENDRONS.

Two Hundred Thousand good healthy plants, having not less than five up to ten and fifteen buds each, of the finest named hardy kinds, will be supplied at from £5 to £10 per 100, and 18s. to 30s. per dozen.

Samples, with lists of the sorts, will be forwarded on application.

KALMIA LATIFOLIA.

Well furnished and healthy and covered with bloom-buds, 15 to 18 in., at 12s. and 18s. per doz., or £5 per 100.

HARDY AZALEAS.

The finest English and Ghent varieties, splendidly budded, £5 to £7 10s. per 100, or 18s. per dozen.

Coloured and other Suitable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. **ROSE TILES** in great variety. **Stiles, Cement, &c.**
F. ROSHER AND CO., Brick and Tile Merchants. See addresses above.

SILVER SAND,

fine or coarse grain as desired. Prices by Post per ton or truck-load, on Wharf in London, or delivered direct from Pitt to any Railway Station, by **Thames and Seaside** per **PLINTS and BRICK BURS** for Rockers or Ferries. **KENT PEALS** or **LOAM** supplied at lowest rates in any quantities.
F. ROSHER AND CO.—Addresses see above.
N.B.—Orders promptly executed by Rail or to Wharves. A Liberal Discount to the Trade.

For Sale, a STEVENS' IMPROVED TRENTHAM

WROUGHT IRON HORTICULTURAL BOILER, 6 feet long by 3 feet diameter, fitted with Inlet and Outlet Pipes, Fire-door and Grate complete. For price and particulars apply to **HILL & SMITH,** Brierley Hill Ironworks, Dudley.

CRITCHLEY'S PATENT HEAT REGULATOR,

AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

Water from Pipes, &c. Pipes Circulating Hot-Water, &c. Pipes for Return of Water to Tank, &c. Pipes for Returning Water to Boiler, &c. &c. &c. Pipes for Opening and Closing Valves.

The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler.

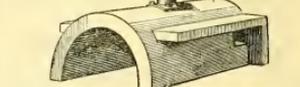

The following Testimonial has been received:—"Gentlemen, I am happy to inform you that the late severe winter is past, that the Hot-Water Apparatus erected by you does its work to my entire satisfaction. As to the Heat Regulator, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes."

"I am, Gentlemen, yours truly," **R. H. COOME,** "Gardener to the Right Hon. Lord Fitzharding."
Estimates and Plans furnished for Warming Gentlemen's Public Buildings. Orders executed for any part of the Kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

Messrs. CRITCHLEY & CO., Horticultural Engineers and Builders, GROSVENOR WORKS, CHELTENHAM.

Silver Medal, 1874. THE TERMINAL SADDLE BOILER—

First-class Certificate, 1867; Highly Commended, 1873; and First-class Certificate, 1875.

"This Boiler possesses the rare merit of tucking all the heat from the fire.—*Gardener's Magazine*, p. 254.
"I have no doubt the Best Boiler, that will burn any kind of fuel, is the Terminal Saddle."—*Journal of Horticulture*, p. 379.
"For moderate cost and real efficiency the Terminal Saddle is one of the very best."—*The Gardener*, p. 95.
Prospectus post free.

London Office:—No. 1, DELAHAY STREET, WESTMINSTER, S.W.

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

Estimates and Plans free.

INTERNATIONAL HORTICULTURAL EXHIBITION & CONGRESS

In 1877, at AMSTERDAM.

The Direction and Managers for the International Horticultural Exhibition and Congress, which will be held in this city in the month of April, have authorised us to publish an Illustrated Daily JOURNAL exclusively devoted to this Exhibition, which will be of great importance.

This JOURNAL, being the official medium of the Direction, will contain all that can be of interest to the Exhibitors, Directors, Jurymen, Members of the Congress, and visitors in general.

As for the further contents of this Journal we shall take every care that they may answer the requirements which may be expected from such a publication, in order that every number, in every respect, will be a general Guide as well for strangers as for inhabitants.

To realise these plans no efforts nor expenses will be spared.

This Daily JOURNAL will be, without doubt, a very desirable and effective medium for the insertion of Advertisements, especially of all articles appertaining to Horticulture, but also of those intended for the public in general. It will certainly have a very extensive sale, not only in the Exhibition grounds, but also in the country and abroad, to every one who takes an interest in this Exhibition.

Advertisements are inserted on the following Terms:—

Ten Lines, 4s. 2d.: each Line beyond this number, 5d. Displayed Advertisements, either in Columns or across the Page, are charged according to the space occupied.

These Advertisements must be prepaid. The amount can be remitted by Post-office Order, which may be obtained for Holland at all Post-offices of Great Britain and Ireland.

Amsterdam, March, 1877.

VAN ES BROTHERS.

PAXTON'S CALENDAR.

New Ready, a New and thoroughly Revised Edition of the

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruit, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of public cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald.*

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such, who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's.*

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine.*

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger.*

Price 3d., Post Free 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS,

Will Cut Long and Wet Grass (as well as Dry and Short) without Clogging.

They are especially adapted for Cutting Slopes, Steep Embankments, under Shrubs, and close up to Trees, &c.; and are also extremely light in draught, simple in construction, well made, and not likely to get out of order.

AWARDED

PEA, Williams' Emperor of the Marrows	per quart	2 6
TOMATO, The 100 Days	per packet	2 6

* All seeds answering to nos. will be delivered free of carriage to any Railway Station in England.
 ** ILLUSTRATED SEED CATALOGUE gratis and post-free to all applicants.

SUTTON'S CHOICE FLOWER SEEDS,
 FREE BY POST OR RAIL.

Sutton's Improved Miniature Aster.

A profuse flowering variety, of dwarf compact habit, remaining in bloom for a considerable period, hence it is invaluable for growing in pots for conservatory or drawing-room decoration. We have this season succeeded in saving six distinct colours, which greatly increases the value of this beautiful Aster for bedding purposes.

Price per Packet, mixed, 2s. 6d.
 Six varieties, separate, 5s.

SUTTON'S COLLECTIONS OF CHOICE FLOWER SEEDS,

To produce a beautiful and continuous display during Summer and Autumn.

	Free by Post or Rail.	£ s. d.
No. 1 Collection of Flower Seeds	2 2 0
No. 2 Collection Ditto	1 11 6
No. 3 Collection Ditto	1 1 0
No. 4 Collection Ditto	1 5 0
No. 5 Collection Ditto	0 10 6

Small and useful Collections can also be had, from 2s. 6d. to 7s. 6d., free by post.
 Full particulars may be had, gratis and post-free, on application.

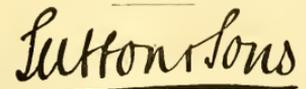

TO OBTAIN THE
 Best Garden Lawns and Croquet Grounds
 SOW
SUTTON'S LAWN GRASS MIXTURE,
 Which forms a close velvety turf in a very short time.

For making New Lawns or Croquet Grounds 3 bushels, or 60 lb., is required per acre, or 1 gallon to every six rods (or perches) of ground.

For improving those already in turf, 20 lb. should be sown per acre.

March, April, and May are the best months for sowing.
 Price, 1s. 3d. per lb., 22s. 6d. per bushel, carriage free.

Instructions on the Formation and Improvement of Garden Lawns and Croquet Grounds
 Gratis and post-free.

THE QUEEN'S SEEDSMEN,
 READING, BERKS.

SATURDAY, MARCH 31, 1877.

SPRING.

LIKE Conn, the Shaughraun, who snatches a draught of whiskey when stretched upon his bier, vegetable nature does not die completely even during the winter months. She assists, like the above-mentioned Irishman, in her own wake, especially when the winter is as mild as the past has been. Yet, in spite of Winter Roses, patches of green beneath the snow, and other occasional proofs of Nature not being quite dead, the winter season—and more particularly November, when the leaves are still rotting before our eyes—is the most melancholy period of the year. Sad indeed is the spectacle of falling leaves, browned evergreens, and all other evidences of the annual descent of vegetation into an apparent tomb. Then the litter of Asparagus and Bean stalks, the disorder of Potato haulms, and the uninviting look of Scarlet Runners blackened in a night, and of old, unweaten Cabbages frozen to the ground! These first forbidding symptoms of decay mark that melancholy period of the year when winter's grip, in a sudden frost, spoils the gardens, and snatches the leaves from twig and branch to mingle with earth. This occurred last year after the heavy rains, when the frost-bite smote all deciduous vegetation and brought down the leaves shivering to the ground. It is a most distressing period for those who pride themselves upon their lawns. In a case of that kind last year twelve men were employed walking in a row, with brooms and aprons, to catch and sweep off the falling leaves. This period of decay is unquestionably the least joyous period of the year. A little later and all signs of what has happened—death without immediate burial—will be covered up a spit deep, and the calm of resignation, or even the anticipation of a merry Christmas, will succeed to the dark hour of autumn's first hard frost.

Then how rapidly the season marches on! Early in November last year a winding-sheet of snow was spread over the Scotch mountains from Thurso to the Tweed. The Fir plantations of Strathpey were muffled early in the white familiar mantle, and in travelling homewards the same covering was on the trees at Perth, and southward to the English border, where the snow lay a mere film upon the hills. In the south of England the land last winter escaped the usual ice-lock. There were outdoor fountains at Christmas, and a hedgerow near Eastbourne sheltered a Primrose on January 15. As a rule, Nature lies conventionally dead five months. Then comes the annual summons, and before the earth is quite awake, and previous to the commencement of the general bird-chorus, you see that Nature's sleep in field and forest is over. Presently the leaves burst their wrappers, prepared to flutter till October; but first of all the pastures exchange their brown coats for the brightest liveries of green, and amidst the many touching incidents of the general revival there is nothing more affecting than this resurrection of the myriad lowly herbs which are individually too obscure for the general eye, though they form collectively the pastoral covering of more than one-half of England.

And while the earth is being re-decorated the gardener beckons his bedding plants, and

commences the work of grouping them and arranging their various hues in due harmony and contrast. What a magician he is in spring-time. "Man cannot live by bread alone," might be his motto. It is because of that constant yearning of the soul for beauty that all men must have flowers, gardens, and gardeners, if attainable. For what is beauty but perfection? and where can that be found if not in a flower? True, it must be evanescent, but so are most things, and we have preached throughout this sermon its renewal. Flowers, and indeed all plants, resemble, in that respect, our lives, and the bounding of the heart and joy in the annual spectacle and miracle of spring are premonitions of immortality.

We have here laid down a principle which covers all the reasons why the heart is touched by the phenomena of spring. Young grass is, in one aspect, only prospective beef and mutton, and a promise of butter yet to come. A cornfield is equally a promise of new bread; and the routes by which the hearts of some men may be reached being circuitous, the source of their pleasure in spring is simply appetite. But happily most persons are more spiritual than they imagine, and hence the general love of gardening. An increasing number of gardeners is continually being trained for the cultivation, to a large extent, of unnecessary crops, because the world is growing less utilitarian and more disposed to grow those crops which fancy alone can feed on. In that noble structure of Nathaniel Hawthorne's, "the Hall of Phantasy," he enumerated among the crowds upon its marble floors, poets and other men of fancy—the greatest benefactors of their race. And we would add gardeners to the number, as the greatest annual creators of beauty in an important department of decorative art.

NOVELTY.

THE BANDED RUSH.—At present we do not know the botanical position of this singular novelty. What we do know is that it is a very striking hardy variegated plant, and variegated as few plants are, viz., in the form of rings, of yellow colour, alternating with similar rings in which the green colouring matter is present, as usual, thus presenting a near resemblance to a porcupine quill (fig. 62). To what cause are we to attribute the absence of colour in this particular manner? To this question we can at present give no answer. It is an interesting illustration of the independent action and separate life of individual cells or groups of cells, but the reason of it in this case we do not know. The plant, from what we have seen of it, is likely to be a favourite, as the variegation is distinct, the plant hardy, and the culture of the simplest. It was introduced from Japan by way of America, we believe, at any rate the stock is now in the hands of Mr. W. Bull, by whom it will be sent out. The similarly banded *Eulalia* we shall figure on a future occasion.

EXPERIMENTS IN VINE CULTURE.*

As a rule horticulturalists welcome and hail with pleasure any substantial aid to their profession brought under their notice. Hence a few experiments made after nine years' experience, painstaking and careful observation in the county of Durham, will, I trust, be thought worthy of notice. Having been invited to read a paper, I agreed, I confess somewhat reluctantly, fearing I might fail to make you evening as instructive and enjoyable as it might be, by some one more used and better adapted to public speaking.

It will be remembered that some two years ago, when here, I partially promised to give some account of an experiment made with a house of Vines planted (if the term may be considered correct) without natural soil. Some three or four years ago the influence of soil on Grape growing attracted a fair share of attention, and was criticised freely in the horticultural papers by practical men. It occurred to me that Grapes could

be grown without soil, and I resolved to give such a method a trial, and soon after an opportunity was presented, and the experiment was made in a small house, 30 feet by 12 feet. In the month of August, 1873, immediately after gathering a crop of Hamburgs, the Vines, which for several years had been severely forced, were taken out. Immediately inside of the front wall I had the old soil removed down to the drainage for a width of 4 feet; this was refilled with the freshest of last year's leaves, and green cow-manure pressed as firmly together as possible. The Vines were then planted, and a little soil was used to surround the balls; in November I added to the border 4 feet outside and 4 feet inside, making a compost, but the soil was a most unmanageable mixture in which to plant young Vines. The first part of the border made has become a light black soil without any adhesive texture, and is soft and spongy when trod on. No doubt to some this experiment will appear very startling, more especially to those who condemn the practice of using manure in a raw state in the formation of a Vine border. But we are told clear-sighted men of science sometimes get into mental fog, and make comical delinquencies. We are also told that one fact is worth a thousand arguments. Now let us set this border to prepare for producing fruit equal in every respect to what the house before produced, and to what houses of the same size are now producing where the borders have been prepared in the old way. The varieties planted were varied for experiment, and consisted of Dr. Hogg, Canon Hall Muscat, Barbarosa, Foster's Seedling, Black Hamburg, Duke of Buccleuch, Waltham Cross, and a seedling. There was nothing in the Vines or fruit that would lead one to suppose that they were growing in any other than the usually prepared soil. The borders were the first to ripen and flavour, Canon Hall set like Hamburgs, and Waltham Cross had none of the small berries it often produces from imperfect setting. This Grape was good, and well liked at the table, in February, at Lambton.

In the latter end of August, 1875, I planted another house of the same dimensions as the one already described, and with a view of retaining the turf as long as possible in a fresh condition it was not broken up, as is generally done when making a Vine border, but put in the following 5 inches, commencing at the bottom and working upwards, placing the turves as a mason would bricks in building, and using cow manure as mortar. To quote the words of Mr. Westcott, of Raby, when looking over the gardens at Lambton, after an explanation, he said, "Well, you have just gained a year on my young Vines," when only the year before I had congratulated him on their vigorous growth. I don't wish it to be understood that I prefer manure to grow Vines, or that I consider it better than other mixtures, but I believe it to be good along with them, and that in my estimation no newly made border is perfect without it. In the many gardening periodicals now published we have writers who may differ in their management of the Vine, but whose articles are hailed with interest and read with pleasure by those in pursuit of knowledge. If every one were as fond of writing on the Vine as I am of reading about it, we should have a periodical devoted to the Vine alone. I read all the conflicting evidence on its cultivation, and hope that we may ultimately agree as to the perfection of Grape growing. Many ills are caused against an over-rich border, such as mildew, gross growth, watery shoots, badly ripened wood, an abnormal amount of pith, shanking, bad coloured Grapes, and so forth; but when one ventures an experiment and finds it puts all these aside, what then?

I cannot help thinking there is much to be learned, but when we are able to put our hand with more certainty on the causes which produce the ills the Vine is heathen, we shall become more ready to remedy them. I have shared myself (but more so after another year's experience) to say, that the build of a

Vine depends more upon the internal atmosphere, the amount of moisture it is charged with, and the light under which it is grown, than upon the richness of the border; it seems to me one of those plants which cannot be grown too fast or too strong. Some tell us it is not from the strongest wood we get our finest fruit; granted in some cases, there being so many ways of growing and ripening the canes. While some house has every attention paid to it—properly drained, and as a rule looked through in the evening, and a temperature of 65°, 70°, or 75° rigidly adhered to, a close growing atmosphere kept up, and the Vines encouraged to make their growth in darkness, instead of daylight—hence come the watery shoots if you like, and an abnormal amount of pith. And from such management the strength of the Vine is reduced until tendrils instead of bunches are the reward.

From the time Vines commence to grow a little air should be considered of the greatest importance, and the quantity should be increased as the foliage becomes stouter and able to endure it. A given temperature sufficiently high for the well-being of the Vine can easily be maintained with a requisite quantity of air to prevent the growth of watery shoots, if encouraged and grown in sufficient light to do so. One of these plants, I find glass used as extensively to indicate the strength of light as they now are to register so correctly the temperature. Before finishing my paper I may add I trust my experiments may lead to some further researches in this or some other way that will be advantageous to Grape growers, and denote a secure future progress. *F. Hunter, The Gardens, Lambton Castle.*

ON HOLLAND-BELGIAN BORDER-LAND.

RAILWAY travelling will not be perfect until you can traverse large towns—small capitals, or cities which think themselves as important as capitals—without a break; especially as the distance between some of them is inconsiderable from a railway point of view. If you want to see them, or to halt for rest, the rupture of continuity is of little consequence; but if you have seen them, and don't want refreshment but do want to get on, it is a waste of time and patience—the travelling time is so inflated with delay as to be a bore because inevitable. On arriving at Brussels from Calais, for instance, you cannot go straight to the Rhine without stopping and driving from one station to another, although many tourists might like to do so. And on proceeding from Ghent to Holland *via* Antwerp, you take your departure from the latter city by the Station Hollandaise, the Hollando-Belgian Station.

The line carries you over a plain in no wise remarkable and in some respects disagreeable, irrespective of its monotony, which is broken by a field or two of yellow-flowered Rapine, stretching the landscape's dull tints in due season with patches of gamboge. Then you have plantations of Firs, sown and left to grow much too thick, so that a struggle for life ensues in which all seem likely to succumb and not one to survive victorious. Their only use appears to be to furnish sticks and firewood, perhaps also to prevent the light soil from being carried off by the winds to improve and manure the heavier lands of some distant region. The possibility of this contingency is demonstrated when you come to wide-railroad tracks, where a crossing which the train raises clouds of fine dust, whose penetrating powers are manifested by every fold of your garments when you would tidy yourself up a little at your hotel before dinner.

After their first passage through this pulverised plague of heated silver-sand and desiccated heath-mould, many people make a stern resolve. "Most unpleasant," they say; "disgusting, unbearable! Next time we come, we'll avoid this nuisance by taking the steamer from Rotterdam to Rotterdam. On that, we shall not be stifled and choked. Plenty of fresh air—must be a delightful passage." Yes, but inquiry acquaints them with the fact that the steamer, whose movements are regulated by the tide, sometimes starts at inconveniently small hours of the morning, that it is from seven to nine hours in going from port to port. "And," suggests a descendant of one of Job's comforters, "it probably carries a good deal of merchandise, to make it pay. How do you know that your travelling companions won't be a flock of sheep or a drove of pigs? Moreover, your guide-book says that, when the weather is rough, sea sickness is no rarity." So the firm resolution to

* Read at the Darlington Gardeners' Institute, on March 15.

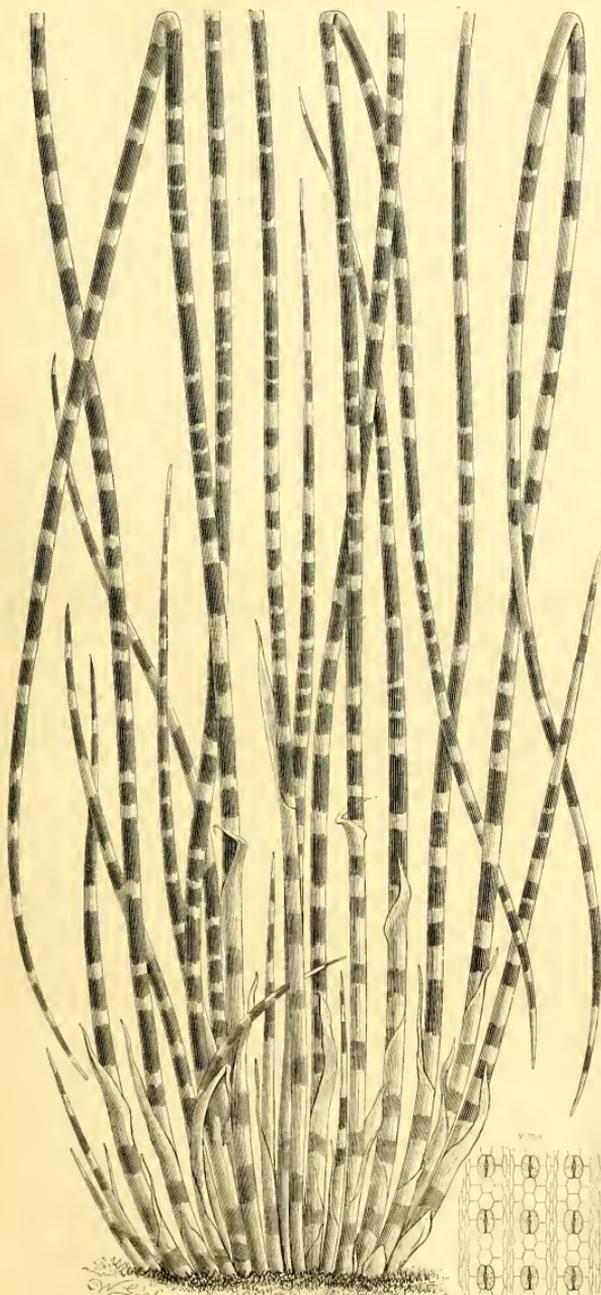

FIG. 62.—THE BANDED RUSH, WITH EPIDERMAL CELLS AND STOMATES.

steam it gives way, and the traveller, choosing the least of two evils, elects to enter Holland by land.

Crossing an untried frontier is always an interesting step. Who would hesitate here, when the very name invites you—Rozendaal, the Dale of Roses? The Dutch have not a few localities very idyllic in their significance. Haarlem possesses Vogelenzang, Bird's Song, a village of bulbous celebrity; also Bloemendaal, the Vale of Blooms; also Zomerzorg, the Summer Delight. As in passing from France into Belgium, so in crossing the frontier between Belgium and Holland, no natural limit indicates a change. The fact is revealed by the request, that is the order, to submit your baggage to the inspection of the Dutch gentlemen of the customs, whom my own experience cannot accuse of unpoliteness. They have a formality which they are compelled to fulfil; and if you don't even know what is contraband, through having nothing with you but travelling necessaries, certainly, in that case, ignorance is bliss.

After starting from Rozendaal, you soon perceive a difference. When a train halts at a station, waiters or women offer on trays tall glasses of nice looking beer, which you may drink and pay for without stirring from your seat. Dutchmen get out, offering you and (when declined with a shake of the head) leaving behind them the Dutch newspaper which they have bought and skimmed, much as some Frenchmen think it fine to leave half a glass or the quarter of a bottle of wine on the table where they have been dining. The stations are paper-hung and ornamented with printed bills, advertisements, and notices in Dutch, one of which, recommending Hardenberg's Bible Hotel at Amsterdam, is a strange novelty to English eyes. More serious than all, the moneys have changed. The coins so cheerfully received in Belgium, France, Italy, and Switzerland, are no longer current here. One single reason is sufficient to stop them; they are of less value than the corresponding pieces (when there are any) of the Dutch coinage. English and French gold is taken, by exchange, at the hotels, but "put money in thy purse" of the Dutch stamp only, for use in the streets and at railway stations.

The Dutch coinage is less easily compared with English money than with French, by which latter I will therefore measure it. Accounts are kept in florins or gulden and cents, the cent is the hundredth part of the florin, so that it is a decimal system of money; as in France, the florin is worth a little more than two francs. When your bill is brought in, or the price of an article stated in florins and cents, double it, mentally add a trifle more, and you have the very approximate amount in francs and centimes. The half florin corresponds to the franc, the quarter florin (silver) or twenty-five cents to the half franc or fifty centimes piece. Coppers are the weak point of the Dutch coinage, they have only their trumpery little copper cents, worth rather more than two French centimes, or the fifth of a penny each, but nothing corresponding to our halfpenny or penny, or to the French five and ten centimes (one and two sou) pieces. Moreover, small copper coins of other countries, as of Belgium, pass for cents; whence it comes to pass that you often receive as change a handful of rubbish, which tempts you to fling it into the first canal rather than put it into your pocket. The Dutch cent is open to the further objection that it has no relation whatever to the American cent except in being the hundredth part of something. The stuiver (four cents) is non-existent in the metal, although some small dealers may count by stuivers, twenty of which would go to the florin—just as country people in France still reckon by écus (three francs) and pistoles (ten francs), all trace of which in the currency has long since disappeared. For the gold twenty-franc piece you get at hotels, perhaps varying a trifle with the rate of exchange, nine florins forty cents. But in such exchange you can only expect to receive *pas*.

If the exchange were in your favour, the exchanger might hardly feel bound to give it you, as he saves you the trouble of going to the bank; if against you, he would probably deduct the difference. Of the gold currency, to which Holland is returning, after having demonetised gold, I have seen nothing; not one of the new gold ten-franc pieces, about 16*s*. 8*d*., which are now made legal tender. There are ten-florin notes, which are so far convenient on account of their small bulk and their lightness.

No passport is needed for entrance into and circulation in Holland, but prudence will urge every traveller to be provided with one, nevertheless. At

the first opportunity he will buy the latest issue of the *Officiele Reizigs voor Nederland*, with the map, if he can get it with the map. This, being printed in Dutch, raises the important question of language. Nobody is supposed to know Dutch, but the tourist will find it most useful to learn the numerals, the days of the week, and a few other indispensable words. This is not difficult for an Englishman, especially if he have some knowledge of German. With this, a good will, and a little hard study, Dutch does not look as if it would prove an insurmountable tongue. The inscriptions in the streets invite you to learn it. No prophet is needed to help you to interpret "Takak Snuf en Sigaren," or "Koffij en Thee," or even "Boekdrukkerij" over a shop-front. "Zadelmakerij" is equally obvious to any one who ever bestrode a horse; as are "Goud en Zilver Werken" to lovers of finery; and "Broodbakkerij" and "Boter en Kaas" to hungry boys and girls. Need I explain that "Aardappelen" are earth-apples, Potatoes; "Boterhuis" a butterhouse; "Haarschijder en Scheerder" a haircutter and barber, represented perhaps by a father "en zoon?"

French will not carry you so far as you may fancy, it is little use in the streets, of almost none in the country. The gentlemen at the head of the best hotels are mostly accomplished linguists, some (not all) of the waiters also speak English or French more or less fluently. At any rate, a foreigner who speaks no language but his own is not worse off in Holland (if so badly) than he would be in France. Taken as a nation, the French are perhaps the most accomplished linguists in Europe, unless the Spaniards beat them in that negative quality. Their language is admitted as the language of Courts, and consequently of diplomacy, often too of business affairs. The French is not so great a barrier to the foreigner. In country districts, in the days when military service was not compulsory and universal, he was content to pass his life in moving in an irregular orbit round his village steeple, beyond whose sphere of attraction he never went, rarely losing sight of it for more than a few hours. Here therefore demands it a work of supererogation to acquire any other tongue than his own. If strangers come to him, he expects them not only to speak his language, but to speak it well, in which he is unusually exacting, for, at least amongst the middle classes, however correct may be the speech, the spelling is often amusingly at fault.

In Holland, on the other hand, the educated classes are often admirable linguists, wealthy not only in worldly goods, but in an acquirement of foreign tongues. Their high position as a maritime power, their colonies and their wide-spread commerce, have brought them into contact with many and various peoples, and as few strangers think it worth their while to learn Dutch, the Dutch, in all sheer necessity, learn the languages of other peoples. Dutch ladies even are to be found possessing the accomplishment of passing from one language to another with an ease and fluency which would astonish any young woman whose schooling is supposed to be "finished," although education in this world is never finished, unless by those who are contentedly resolved never to pass some given milestone of practical routine or of ignorance.

Why, then, do men, the first motive for learning a language is its social or commercial utility. Otherwise, we are told great things of Dutch literature and its attractions. The Dutch language is not, as many people fancy, a corruption of the German language. On the contrary, its independent existence, its special forms, its own peculiar character, together with great copiousness of expression. Although Dutch is called Neder Duitsch and German Hoog Duitsch, that is, low and high Dutch, the latter the more refined, the more cultivated, the nations who speak those languages. For, taking into consideration their respective areas and populations, Dutch literature has produced during the last four centuries more *chefs d'œuvre*, some of which are perhaps not less than the number of the languages. And yet nobody takes to learning Dutch, whence the Dutchman takes to learning everybody's language. †

who have worked hardest in investigating the exact nature of the Potato murrain. The men who associated the disease and guano together could give no solid and convincing reason for such association. Latterly the "guano theory" has had a strong fascination for me, and I am inclined to think the rastics of 1845 and 1846 had good reason for associating the Potato pest and the guano together: for instance—From 1814 to 1854 more than a million tons of guano were imported into this country from the China Islands. This guano came direct from the very home of the Potato plant.

2. The exotic origin of the fungus which destroys our Potatos has never been doubted, and all known facts point to the neighbourhood of Peru as its home.

3. The Potato fungus attacks other Peruvian and Chilian plants, as the Tomato, the Petunia, Schizanthus Grahami, &c.

4. The Potato fungus not only germinates readily in water and in dung, but the last two years' experiments clearly prove that it will live through one or more years in a resting condition in dry manure or its expressed juices.

5. Thick fogs at some seasons are described as being of highly occurrence on the Peruvian guano islands, and in the old times of guano collection these fogs converted the whole surface of the guano into a "greasy paste." This "greasy paste" would be the very resting-spores of the Potato fungus.

6. Known facts prove that the neighbourhood of Peru is the home of the Potato and the Potato-fungus. That the fungus there perfects its resting-spores as it does here, viz., upon excrement and refuse, there can be no reason to doubt. That the ordinary spores will grow in and upon guano, and in this material proper resting-spores, seems highly probable, and that resting-spores and guano were at one and the same time brought to Europe would also appear quite within the bounds of probability and reason. The Potato-fungus clearly does not, as because it flourishes far better on the cultivated plants of Europe than the wild and rank Solanaceæ and Scrophulariaceæ of Peru and Chili.

With these views in mind, I propose carrying out some experiments during the forthcoming autumn. In the meantime I shall be glad to make a microscopical examination of any samples of guano sent on to me, with a view towards the detection of any fungoid bodies that may possibly be present. *Worthington G. Smith.*

LAMBTON CASTLE.

(Concluded from p. 376.)

THE FRUIT-HOUSES.

The range on higher ground behind, and which has been already alluded to, consists of a number of houses, the ends standing north and south, at right angles with the others that connect them. Commencing at the westward end, the first we enter is a span-roofed Peach-house, 40 feet by 22 feet; the trees are planted on both sides, trained up near the roof, the roots occupying both outside and inside borders; they are mostly old favourite varieties. The adjoining house is a span-roofed viney, the same size and similar in every way, principally Lady Downe's and Black Alicante; they were planted before Mr. Hunter came here; although bearing a nice crop they are not quite right at the roots—a new border is to be made and replanted. The next is a hip-roofed Peach-house, 48 feet long, the trees planted in a raised border in front, and are in very good order.

We then come to a Cucumber and Melon house, each 30 feet in length. A number of varieties are grown. In continuation is a lean-to Peach-house, 33 feet by 12 feet, it is filled with one very fine tree, a Royal George, forced early every year. The back wall is covered with Figs.

Next comes a lean-to viney, 33 feet by 14 feet, two years planted with Black Hamburgs, Duke of Devon, and William Seckling; these are the Vines mentioned in the paper Mr. Hunter read and described as planted without a particle of natural soil, except a small quantity used round them at the time of planting; and as no further details were given many were puzzled not a little to conjecture what they could be planted in. The border occupies the whole of the inside of the house, and 12 feet outside; it was made in August, and consisted altogether of leaves gathered the preceding year, and cow-dung in equal proportions. It was done for an experiment, and it so far a success; as Mr. Hunter says, it remains to be seen

how long they will last in such material. They have made splendid growth, and for their age carried a very heavy crop of large-berried highly coloured fruit; so that some of the bunches of Hamburgs were not far short of 5 lb. each. I tasted some of these and the flavour was as good as their appearance, which goes to show that rich feeding does not always injure flavour. From our own house I saw many more vines, up to the last, all Black Hamburgs, and planted before Mr. Hunter's time; they were carrying a good crop of even sized, finely coloured bunches. Next is a similar viney; this house has been planted one year with Black Hamburg and some Golden Queen; the border is made of two parts loam to one of cow manure, without rubble, lime rubbish, or any material of a like nature added; they have made very fine growth.

This leads to another viney, the same size, filled with Black Hamburg and some Golden Queen; three years planted; these were forced early, and had all the appearance of having borne a good crop.

The next are two succession Pine-houses, each 28 feet long, filled with strong promising plants. Adjoining are two more hip-roofed Fig-houses, similar to that already described at the opposite end of this very long range.

The last two houses are span-roofed fruiting Pine-houses, the same size and standing in the same position—at right angles with the centre of the range as does that occupied by the trees at the opposite end. A large proportion of the plants in the first house are seedlings raised by Mr. Hunter; they are all raised from Montserrat, but differ very much in appearance from each other, and still more from the parent, being double the size with much smaller crowns than Montserrat. Many of the seedlings were in fruit, and would run from 8 lb. to 10 lb. each, one in particular Mr. Hunter has grown up to 1½ lb. In the adjoining house, which is connected with this by a narrow lean-to, in which are grown Bananas planted amazonica, all planted out, the Pines were similar in condition to the last, comprising Charlotte Rothschild, Smooth Cayenne, Black Prince, Thorsby Cayne, and Providence. These fruiting Pine-houses were the only structures I saw at Lambton that did not appear well adapted to the purpose for which they were employed, being somewhat heavy and much too lofty; for although the beds in which the plants are grown are raised much higher than usual, the tops of the Pines were almost as many feet from the glass as they should be inches. In this house I noticed a number of seedlings of the fine and scarce Palm, *Stevensonia grandifolia*.

THE CONSERVATORY.

The conservatory, as already stated, stands in the centre of the front range and at right angles to it. It is 40 feet wide by 60 in length, and, therefore, runs back 40 feet behind the back of the fruit-houses in the range. The roof is a treble span, the floor is not all on the same level the entire length, the quickly rising nature of the ground behind rendering this not possible, consequently the northern portion has to be reached by a considerable flight of steps from the southern end, and which, so far as the plants being seen from different points of view, rather enhances their appearance than otherwise. In the southern end are two noble specimens of *Dicksonia antarctica*, with clean straight stems 10 feet high, and fine spreading heads. Ascending the steps, the plants at short intervals are spanned by stout ornamental iron arches covered with twiners, and the centre of each surmounted by a low-spreading specimen plant, such as *Cibotium Schiedii*, which, with its drooping fronds, in this position is very effective. Palms, Agaves, Yuccas, *Phormium tenax variegatum*, and other subjects of a kindred character, along with whatever flowering things are in season, make up the display. This leads to a warm span-roofed fernery, 40 feet by 40 feet in which, amongst a nice assortment of these elegant plants, were some beautiful examples of *Adiantum farleyense* and *Todea superba*.

In the frame ground is a long span-roofed house, 130 feet by 18 feet, divided for stove and greenhouse plants for conservatory decoration; in the greenhouse division were *Azaleas*, *Euparacis*, *Epiphyllums*, *Valotas*, *Pelargoniums*, &c.; and on the surrounding stage next the wall in the warm portion is a nice selection of Orchids, consisting of *Cattleyas*, *Odontoglossums*, *Alexandras*, *O. Rosea*, *Cochlosoma*, *Onchidium*, *Cypripediums*, and *Calanthes*, for cutting; the centre pit

was filled with Exoras, Crotons, Palms, Dracenas, Marantas, Alocasias, and similar stock. The pits in which are wintered and propagated the bedding plants, 100,000 of which are grown, occupy a considerable space. During the summer season a great quantity of Melons are grown in these.

One thing I particularly noticed:—that the sheds, offices, backs of the lean-to-houses, as also the brick-work of those that are span-roofed, are all covered, or in course of being covered, with Concrete, Pyracantha, Ivy, or similar plants, so as to show as little of the bricks as may be. The result is, that even such places as are necessary for carrying out the garden work, and which are often unappealing but inviting in appearance, are here fair to look upon.

The ground which is occupied by the fruit and kitchen garden, including the space on which the fruit and plant houses stand, is about 11 acres. The fruit garden is fronting the principal range of vinerias, and separated from it by the broad terrace flower garden already mentioned. It is about 3 acres in extent, and enclosed by 14-foot walls, well stocked with Peaches, Apricots, Nectarines, Pears, Plums, and Cherries. The Peaches were carrying a nice crop, which residents in the South would scarcely have looked for so far north last season. This garden is divided into four quarters by broad walks, which intersect each other in the centre, at which point is a fountain and basin. The walks are edged with Box, nicely kept, within which on each side is a broad ribbon border. These were very effective, particularly when seen from the centre of the terrace above. The arrangement consisted of a front row of scarlet Pelargoniums, then a 5-feet centre of *Verbena venosa*, backed by another row of scarlet Pelargonium and Crystal Palace Gem, yellow-leaved; at the back of this border is a light iron trellis covered with Pears, the back of the corresponding cross borders being composed of pyramidal Pears and Apples—young healthy trees in good bearing condition, but this season, like most others, not over-done with fruit. Precedence is given to the harder kinds of Pears, such as Marie Louise, Louis Bonoe, Jargonelle, Beurré Rance, Hesse, and Swan's Egg.

The kitchen garden adjoins this on the eastern side, and is also in excellent order; the greater portion of this was a deep hollow, and has been filled up several feet; here the sides of the walks are planted with pyramidal Pears and Apples, well-managed young trees, just coming into bearing condition. Cullinary vegetables are thoroughly well done—Peas in bearing and full bloom without a trace of midew, showing the advantage of the unlimited supply of water at command, especially in such summers as the past, when it was next to an impossibility to keep Peas in a bearing condition where water had to be given in dribbles by hand. Cauliflowers and Veitch's Autumn Broccoli were as strong, and producing heads as large as if we had experienced a wet season.

There is one thing in particular that contributes very much to the appearance of the place—the beautiful gravel that is used in the walks both of the kitchen and fruit garden, and also of the pleasure grounds; it is of a bright yellowish brown colour, about the size of large Peas. I understand it is brought in the Earl's vessels in ballast from France, and is unequalled by any I have ever met with elsewhere. The body of the walks is made of a material got in the neighbourhood, something like a mixture of clay, loam, and lime, which binds quite close and solid, so as to have any reasonable weight. On this the gravel is laid about an inch and a half thick, left loose, and the surface raked as required. It is always perfectly clean, bright looking, and pleasant to walk upon. It gives the last touch of a complete finish to this well-kept, well-managed garden, that so favourably reflects the interest taken by the noble Earl in horticulture, and affords equal evidence of the abilities of his gardener, Mr. Hunter.

There is yet another matter that deserves mentioning. The garden is not alone thought of, but the health and comfort of the men receive great consideration. There is a large, commodious house just about completion, to accommodate some half-dozen of the young men, wherein each has a spacious lofty

bedroom, with dining-room, reading-room, and bathroom. The most effectual way to induce young men to exert themselves, and take that interest in their work alike essential to a successful fulfilment of their duties and their own well-being, is to show them that they are cared for. *T. Bates.* [The actual weight of the bunch of Gros Colman Grapes illustrated in our last issue was not stated, and we take this opportunity of supplying the omission. It was 5 lb. 2 oz.—an enormous weight for the variety. EDS.]

BRITISH GARDENERS.

JOHN WIGHTON.

Mr. WIGHTON, who has long occupied the post of gardener to the Earl of Stafford, Cossey Park, Norwich, sends us the following reminiscences of his gardening career:—

"My father began life as a gardener in the famed gardens of Dunkeld. I was born on May 25, 1803, when my father was gardener at Craiglochart to Dr. Munro, Professor of Anatomy in Edinburgh College. At the time I refer to I was only about four years of age, yet I remember seeing my father

John Wighton

with a rake catching toads, frogs, and lizards from a pond, which he said were for my uncle to dissect for Dr. Munro. I likewise remember seeing him shooting *Fi* seeds from a short gun among the crags, so that they might fall into the fissures of the rocks. I mention these little incidents merely to show how long early impressions last, and that they mould or shape the character or disposition of a man for good or evil through life. I have named my uncle because he was a gardener, but by dint of perseverance became dissector to Dr. Munro, which enabled him to publish his *Fiji's Anatomy*, yet he never lost his love for gardening.

"After Dr. Munro's death my father became gardener to the Earl of Leven, Melville House, Fifehire. I was sent to an old woman's school, and learned some short words, but stopped at the long ones, some of which the good woman did not know herself, and she used to say 'hip (miss) them'; but 'hippin' or 'skipping' words would not do afterwards at Letham parish school under a sharp master. There I had every opportunity of learning, but I regret to say I did not profit by it. I never could spell nor read correctly, perhaps owing to a 'dull ear' and slight impediment of speech, consequently I was always nearer 'hooby' than 'dux' of my class; in fact I never liked school, and used to 'cover' at the sight

of slates and pens. But this I deeply lamented in after-life, because I lost the chance of the means of acquiring knowledge which I never could recover. However, I took an interest in my father's wishes, however, and was pleased with the common Chinese Rose, which was then a novelty, so much so that Lord Leven used to invite friends to see his 'monthly Rose' in bloom trained to a warm wall.

"I now advert to my father being gardener to Ramsay Williamson, Lixmouth, near Edinburgh, which was a sweet little place, kept in excellent order. For this he had the 24 prize offered by the Horticultural Society for the best-kept garden near Edinburgh. I began now to do a little gardening work, as at my father's wishes, however, and was placed on trial to a grocer and spirit dealer of Edinburgh; but being in the heart of "Auld Reekie" weighing sugar and handing drams of whiskey over the counter to bicar-eyed women went sore against the grain with me, therefore I gave up all thoughts of shopkeeping, and told my parents I would be a gardener if I earned only 'salt to my porridge.' This led to my being apprenticed to Mr. Wright, gardener to the Earl of Rosburgh, Dumfriess Park. Being now in my proper elements, I soon acquired the knowledge of practical gardening, and was foreman during the latter part of my time there, where I passed the last five years of my 'teens.' But as my master had no taste for rare plants I left him, and went to Sir Robert Liston's, Milburn Tower. Lady Liston was a sincere lover of rare plants, and had the best private collection of them near Edinburgh. I now studied hard, and used to think a day was lost if I had not learned the names of a few plants, and also added a few specimens of them to my *hortus siccus*. When young men are thus employed they should write the names of plants correctly from a catalogue, because the act of doing so fixes them the better on the memory.

"I advert again to my own bad spelling while at school, in order to record a little anecdote of Sir Robert Liston, who came and held up a label on which was the name of a plant, and inquired who wrote it. I said it was an old one, and that I had been only a short time in his service. Then he turned to my neighbour, and put the same question, and he said 'I dinna ken.' 'Eh, ch' I replied Sir Robert, 'I find no one will own it, but I advise young men to learn to spell correctly,' and further observed that if he had not done so when at school he could not have been able to keep either plants or gardeners. I may mention that he began life as a ploughman, but by great perseverance and good patronage he became an Ambassador. While in his service I first saw the Chinese Primrose, which cost a guinea; now a better one may be had for a penny. I went from Milburn Tower to be foreman to Mr. Gibson, gardener to—Balfour, Esq., Whittinghame, East Lothian. The gardens were new, and my master's time was chiefly occupied in the general improvement of the pleasure-grounds, which was his *forte*, consequently the management of the hothouses and kitchen garden were chiefly left to my care. But though my master was kind to me still I never liked the place, because there were so many 'drinking bouts,' encouraged by some old 'dronthy' neighbors.

"The flower-gardens were formed by Gilpin in the 'natural style'—just the reverse of the geometrical, now in vogue. By the first the flower beds are irregular, while those of the latter are regular, and often within the range of the eye, hence their beauty is seen at once. Formerly our best landscape gardeners considered this bad taste, and perhaps they were right. In general pleasure arises more from looking for or expecting a thing, than the possession of it. However, there is no accounting for taste, whether of the palate or the eye. This is exemplified by the conversation of two gentlemen respecting the Serpentine, when it was first formed. One admired its graceful windings, the other said a little more expense would have made it straight. Now, on these opposite views hinges the whole art of landscape gardening.

"The natural style is the best for undulated or shaggy places like that of Whittinghame. When there I took my turn at watching the churchyard against

'resurrection men,' and so strict was the watch in Scotland that the high prices offered for subjects for dissection led brutal ruffians to strangle the living for the purpose. In these days this may seem incredible, but it is nevertheless true. Witness Burk and his associate, Hare, who were accused of strangling poor Dick Jennie, a well-known character there. The most brutal conduct of the whole band of Barkers, to which they both belonged, seemed to be of deeper dye than that of the Thags, because these strangled for the sake of some religious rite, or human offering to their satanic deity.

"I used to visit the principal gardens in the neighbourhood to see the different ways of doing gardening work. I first saw dwarf Apple and Pear trees in pots at Dunbar House, and observed the Earl of Lauderdale watering them himself. The gardens at Tyngburn were in excellent order, but the grandest feature of the place was the fine Holly hedge, the top of which was broad enough to drive a carriage upon it. At Beal—Mr. Nesbit's—the flower gardens were in the mixed style, and kept in excellent trim; so much so, indeed, that the workmen were forbidden to have large-headed nails in their shoes, because they marked the walks. At Luffness, where I had roomed to, there was a fruit wall of the southern aspect on the oval or curved plan, by which the trees are the whole length of the sun, besides which, the curves fence the cutting winds. The borders were covered with smooth turf to prevent the roots of the trees being injured by the spade. Newbyth, the seat of—Baird, Esq., was where I first saw Mushrooms grown to perfection; the gardener seemed to follow the good old maxim of doing a thing himself when he wished it to be extra well done.

"I now mention being in Messrs. Peacock's nursery, which was famed for Roses. These were raised from layers of the current season, and being on their own roots were not apt to die in the days when they were budded on Briars. From the nursery I was sent to Dalhousie Castle to put the wall trees in order, these having been neglected while Lord Dalhousie was in Canada; yet the tender plants were cared for. That, however, was mistaken economy, because it takes several years to redeem trees, while money can soon restore plants. However, I leaped from Dalhousie to Cossey Park, the seat of Lord Stafford, when I was twenty-four years of age; and in this family I remained upwards of forty years, and have been always kindly treated. I have brought up a large family, three of my sons being gardeners; and I give them and others the following advice:—Pay always due respect to your employers. Be honest and kind to the men under you, and when reproff is required do it gently but firmly. Mind your own business only, never mix up with the petty quarrels of your fellow servants. In leisure time improve your minds in reading and writing, but be careful what books you read, for 'though some give light, some blindly lead the blind.' If this advice was necessary in Ramsey's time it seems doubly so now when so much trash is published.

"As regards writing, I have myself more or less been engaged in it since the latter part of Loudon's time. I have published a book on Bees, and wrote the article on bees in *Norton's Cyclopædia* of Gardening. I have written on the following papers on various subjects, ranging from the formation of coal in antediluvian bogs, to the formation of ice at the bottom of water instead of at the top. This phenomenon, which is called 'stock frost,' and is known to the Germans as *grandee*, was discussed in *Notes and Queries*, and a 'Fen-man' said I had 'hit the right nail on the head.' I have corresponded with leading writers on natural history, among them the late Mr. Waterson, whom I have reason to remember, because he threatened me with a birch rod for having backed up what a correspondent stated in *London's Magazine* concerning squirrels being carnivorous: at least they sometimes hury birds' nests of their young.

"As gardeners by their calling are often exposed to extreme heat and cold, and thus break the organic laws, which the Almighty has wisely ordained for their benefit, I regret to say that my heedlessness against those laws has been very costly to me, and that I have, especially in after-life, with impunity."

Early in January last Mr. Wighton was presented with a valuable piece of money by his employer, Lord Sinfleur, an old man, and a friend of the late Lord's to his lordship's family. It is always pleasing to hear of such kindness, which exemplifies the good feeling that should exist between masters and

THE AURICULA AND POLYANTHUS.—I have no doubt the differences of opinion that may be assumed to exist between the Rev. Mr. Horner, as the representative of the rigid school of florists, and myself, are more fanciful than real, because I have the highest possible respect for the determined way in which he strives to maintain the rules recognised as law by which Alpine Auriculas and the Polyanthus are judged, that is, as far as they relate to the shaded flowers in one class and to the gold-laced forms in the other. Not being an Auricula fancier in the accepted sense, I prefer not to argue in relation to that flower, as no doubt those who may feel that the Northern rules are not in common with the ideas reigning in the South can take care of their own interests in the matter, but it nevertheless does appear obvious that unless some common ground of agreement is arrived at between Northern and Southern growers in relation to this question of shaded and self flowers, it will be extremely difficult to carry out a truly national Auricula exhibition either in the North or at the Crystal Palace.

In my former note it was rather my contention that, inasmuch as it is in the schedule of prizes offered for competition at the Crystal Palace on the 24th of next month, fancy and gold-laced Polyanthus were placed on equal terms, that the danger of partiality towards the latter lay in the fact that a majority of the judges were of the old Northern or rigid school, and that these would possibly refuse to look at fancy or self Polyanthus altogether. If it were a case of merit viewed as things of beauty I should have no fear of the result, but if the judgment is to resolve itself into one of "lacing," that will settle the point even before the plants are staged. The committee, with liberal intent, does not restrict the competition to gold-laced varieties, but if the judges are not influenced by the same cosmopolitan ideas, the liberal intentions of the committee are at once frustrated. It is only too evident that the establishment of classes specially for sections, the florists' merits of which are in dispute, is the only possible solution of the difficulty. At the same time, I trust it is not asking too much of the Northern florists to invite toleration, if nothing more, towards a beautiful class of hardy flowers that if not at present offering the highest conception of their ideal, may eventually lead up to it. The Auricula and gold-laced Polyanthus once had a beginning, and probably out of much inferior material to that from which a possible florist's race of self and fancy Polyanthus are being evolved. It scarcely laid in my imagination to suppose that the Polyanthus could ever "pale" the fires of the beautiful Auricula in the eyes of the genuine and enthusiastic fancier. What I desired to suggest was rather that in the beautiful and robust fancy section a powerful counter attraction to the Auricula was growing up as respects that large class of amateur cultivators who, being neither fanciers nor enthusiasts, and indeed, hardly florists, are nevertheless deeply imbued with a love for early spring flowers. To a large number the Auricula is too costly and too difficult to cultivate, thus leading to frequent loss and disappointment. To amateur growers of this class the fancy Polyanthus offers attractions that are thus far formidable to the future of the Auricula. *Thrum Etc.*

—The recent frosty and snowy weather has put TULIP CULTIVATORS on the alert. It is now a critical time with this flower, for generally there is the promise of a generous growth, but a sharp frost following on a heavy rain or snowstorm may do much harm to the occupants of an unprotected bed. The Tulip is a hardy plant, but it is wise to take all possible care of choice varieties. A mulching of short dung and leaf-mould may be given with advantage, to protect the plants from injury from frost near the surface of the soil. The covering should now be on the bed; putting it down at night when frost and snow threaten, and drawing it up by day to give the plants the benefit of sun, balmy weather, and genial soft rains. It is again very mild, but it is also a time of uncertainty, and there is no knowing how soon a change may occur, bringing with it the wintry weather

experienced last week. A little care and watchfulness at the right time will be abundantly rewarded at the blooming season.

Natural History.

SQUIRRELS AND DEAYS.—In answer to the inquiry (p. 379) with regard to squirrels' nests, or "deays," it is of some interest to note the presence of young squirrels so early, as both Professors Bell and Wood give the usual time of birth as June, or the middle of the summer. With regard to the "deay," it is a great bunch of moss, twigs, and fibres tightly worked together, and placed in the most concealable or inaccessible spot attainable, such as the fork of a high bush, or a fork or cavity of the tree; and as squirrels prefer remaining about their old haunts, the foresters or wood-worshippers of the large proprietors who suffer, would be able to give every information of a likely position. But, practically, I would recommend your correspondent to be cautious in meddling with the contents of the nest, or as certainly as his fingers are placed inside, the sharp teeth of the owner will revenge his or her wrong, and when once locked in the flesh it is no easy matter to choke the squirrel off, where all is free; and with the advantage of the nest to drag against, the bite might border on a serious matter. *O.*

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Heaths.—Seasonal winter flowering Heaths as they go out of bloom should be well cared for, otherwise it is useless expecting them to do much for the future. It is not the easiest matter to get these plants to make satisfactory growth, when they have flowered for the first time after leaving the hands of those who grow them for sale, as the treatment they usually receive is more with a view to produce an effective appearance than any consideration of their being of further service when they have once flowered. Nevertheless, if carefully managed they may be induced to grow on and attain considerable size, but their quick growth as compared with other Heaths, and their erect habit, necessitates a free use of the knife; two-thirds of their year's growth should be cut away, they should then be stood in a good light pit with attention as to air and water, and as soon as they evince signs of growing ought to be moved into pots 2 or 3 inches larger, being especially careful in their care to press the new soil firm. Their progress will be materially assisted through the spring by shutting up a little earlier in the afternoon than would be advisable for the hard-wooded section of Heaths.

Plants of Genista and Acaia armata, which were forced early into bloom and cut back after flowering some time ago, are not already potted, they should be seen to at once, otherwise the current growth will be too far advanced to benefit to the full extent by the new soil. Roses that are well established in pots by being grown in them one season at least, and have now been for some time in a house or pit where they have flowered, a little more warmth than the temperature of a greenhouse, will be fast pushing up their flowers. Plants treated in this way will bloom much finer and be of more use than such as were hurried into flower earlier with more heat. There are a few things more useful for conservatory decoration than Roses so managed, nor at any time of the year will they be found more acceptable. They will be much benefited by liberal applications of manure-water until the flowers begin to open; not only will the flowering of the present year be improved by its use, but this, too, the strength of the plants will be increased for the future. Avoid cold draughts, or midwived foliage is sure to be the result. Syringe freely, to keep down red-spider, and famigate or dip in tobacco or quassia water the moment green-fly is detected. It is useless attempting to grow pot Roses unless the growth is well forward, and ploughed after feeding, and they are thoroughly cleaned from the ground and mildew. Where there is any deficiency in the stock of pot Roses, if not already done, a sufficient number should now be potted, and plunged out-of-doors in a bed of coal ashes if possible, and regularly watered with water, and kept free from insect pests through the summer. So treated they will flower much more satisfactorily than by the makeshift practice of removing them from the open ground and potting in the autumn, as by such means they cannot be expected

THE

Gardeners' Chronicle.

SATURDAY, MARCH 31, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	April 2	Leeds Spring Show (two days).
		Royal Horticultural Society's Meeting of the Fruit and Floral Committees, at 11 A.M.; and Scientific, at 8 P.M.
WEDNESDAY,	April 3	Linnean Society's Meeting, at 8 P.M.
THURSDAY,	April 4	Sale of Scientific Apparatus, &c., at Stevens' Rooms.
FRIDAY,	April 5	Sale of Roses, Shrub, & Fruit Trees, at Stevens' Rooms.
SATURDAY	April 7	Gladioli, &c., at Stevens' Rooms.

TO no class of the community is a knowledge of ECONOMIC ENTOMOLOGY more important than to plant-cultivators. It is soothing to our vanity, no doubt, to consider ourselves as Lords of the Creation, but what with "blights" and "moulds," and the hosts of insects and fungi which prey upon ourselves and our crops, it becomes a question whether they are not the lords, and we the slaves. At any rate, nothing but knowledge of their forms and habits of life can afford us any reasonable chance of obtaining dominion over them. As a matter of pure science, the study of any of GOD'S creatures is invariably of importance and practically inexhaustible. But the gardeners and farmers have special reasons for appreciating the action of the Government in establishing a Museum of Economic Entomology. Such a museum, however, is of relatively little value, unless it is illustrated by a good catalogue. It is, therefore, with special interest that we call attention to Mr. MURRAY'S* recently published volume, which, whether as a scientific record or for practical use in matters of daily life, is of great value. Mr. MURRAY'S perfect grasp of his subject enables him to lay it before his readers in a form which all can understand, whilst those who may not be disposed for the study of the more strictly scientific parts will be led on simply by the charm of the well-given descriptions.

The volume now issued, containing APTERA, is the first part of the catalogue which it is proposed to publish of the Collection of Economic Entomology now at the Bethnal Green Museum, and which was commenced at South Kensington in 1868, when Mr. MURRAY was requested to undertake the charge of its formation and arrangement. The object of the collection is, by means of specimens, models, and drawings, to give the history of the insects most noticeable as beneficial or injurious, and (where it is possible) the remedies. The descriptive catalogue is intended not only as a guide but also for practical reference. Under the head of APTERA this volume contains Crustaceans (represented by Oniscidea), Myriapoda (centipedes), Arachnoida (spiders, scorpions and mites), Thysanura (springtails), and Parasitica (lice). Of this number, some are insects, and some come under the head of animals allied to, or likely to be mistaken for insects by similarities in habit and locality or structural affinities. Economically it is requisite they should be classed together, and the scientific reasons of the arrangement will be found given in various parts of Mr. MURRAY'S book.

After the requisite notes on the Oniscidea (the woodlice of our gardens, and the representatives here of the Crustacea), Mr. MURRAY passes to the Myriapods, giving here, as throughout the volume, a view of the distinguishing characteristics of the orders, and where (as in the case of the Acarina) the minor divisions have been little studied throwing the distinctive points (as known up to the present time) into a clearly condensed and, at the same time, readable form. The generic differences are shortly given, and

in most cases each species has its locality and habits and specialities of appearance extended, according to the interest of the subject, into longer notices. The illustrations are in some instances from life, in others of details, or of the objects scientifically displayed, and in the case of the plant gall-mites sketches are given of some of the peculiar life or bud-diseases following their attacks. In many instances each species has its illustration, and amongst the ample number, which in their clear definition no leave even the most general reader under no doubt as to the appearance of the described object, the beautiful woodcuts of the Glycyphagus palmifer, p. 284, by Mr. WHYMPER, deserve a word.

Proceeding onwards from the Oniscidea, under the Myriapoda we have the two great divisions of Julida, injurious as preying on vegetable matter, and the Scolopendride (centipedes), whose bite, dreaded in warmer latitudes, is here useful as a means of keeping the smaller insects in check.

Amongst the Arachnoida, after the scorpions (represented with us by the minute tail-less Chelifer), we pass through the link of the Galeodes (spider-like but distinguished by its segmented abdomen and tracheal breathing apparatus) to the true spiders, the Arachnoida, "the most powerful insect friends to man," as contributing largely to the destruction of other insects, and generally interesting with regard to the trap-door spiders with underground galleries, and weakly hinged doors perpetually requiring replacing; the huge hairy Mygale, and the delusions connected with the bite of the Lycosa tarantula, and other special peculiarities.

The subdivision of the Acarina or mites occupies nearly half the volume, and is of great importance economically. Here we have vast numbers of minute, sometimes microscopic insects, whose special mission in a large proportion of cases appear to be as tormentors of the vegetable animals, or injurers of vegetable growth. Amongst the eight families we have the spinning mites, represented amongst many other species by the red-spider of our gardens, harvest mites, Ixodes or ticks (adapted even to their hold position on the scaly coat of the python), and others too numerous to enter on, but the Trombidium gryllarium deserves a word as the especial scourge of the American locust. Of this species Mr. MURRAY mentions that in 1852 the locusts of the eastern coasts of America were found infested by little red mites. "Ten or a dozen of them would frequently be found pertinaciously adhering to the body of a locust beneath its wing-covers and wings. The dread of the locust has now passed from New England. It is in the Western prairies that it now reigns, where immense swarms of locusts descend from the Rocky Mountains, where they breed, and spread desolation and famine over thousands of square miles. But the little red mite that helped to reduce their numbers in the East, or an equivalent species, is there at its post in the West, employed on the same duty." The eighth division of the Acarina is of especial importance, for here we have the Phytoides, or gall-mites, the originators of the curiously shaped nail-like galls of the Lime and Maple leaf, and many others by which the leaves and young leaf-buds of our plants are injured; and the Sarcopside, the itch and louse mites.

At the first glance this particular branch of the subject is uninviting, but it is, therefore, all the more necessary to be brought forward; the prevalent ignorance of treatment and symptoms of the diseases consequent on attacks of these parasitic pests, often allowing them to gain a footing only to be met by the destruction of the attacked animal, and in this division the notes of the Sarcopside cat and S. mutans are especially to be recommended to the study of poultry

and rabbit fanciers, and those of Pisorotes equi to the caretakers of farm stock.

In the succeeding order, Anoplura (lice), we pass in the first group of Mallophaga from the feather-eating and bird-infesting louse mites just noticed to the six-legged pests of our poultry, and of some others of the vertebrata; and in the second group (Hæmatopina), restricted to mammalia, we have a most interesting account of the genus Pediculus, including LEEWEN-HOEK'S personal experiments (by tying up two large female lice between his own leg and a fine black stocking) as to the rate of increase, the result showing that "two female lice might in eight weeks be grand-mothers, and see 10,000 of their own offspring!" The methods of prevention and cure will be valuable to many, and the concluding sentence with regard to the effects of white precipitate ointment will be read with singular satisfaction—"it kills them all." Nevertheless, we have seen such ill results from careless use of so potent a poison that we think it right to add the caution, that even in this case the remedy may be worse than the disease.

Under the Thysanura (springtails), minute insects especially injurious to young vegetables, conclude the book, of which the contents are made easily attainable by an excellent index. In addition there is a list of illustrations numbering more than 400, and a list of the contents of the cases at Bethnal Green Museum described in it. It is difficult in short space to do justice to the great research powers of condensation by which the mass of useful information contained in the volume is placed so as to be clear and comprehensible to the general as well as the scientific reader.

It is an excellent book, and of a practical utility which makes it desirable that it should find a place both in our private and public libraries.

In subsequent volumes we would suggest that the index of common names be extended; for instance, there are not many gardeners who would think of looking for red-spider under the name Tetranychus telarius.

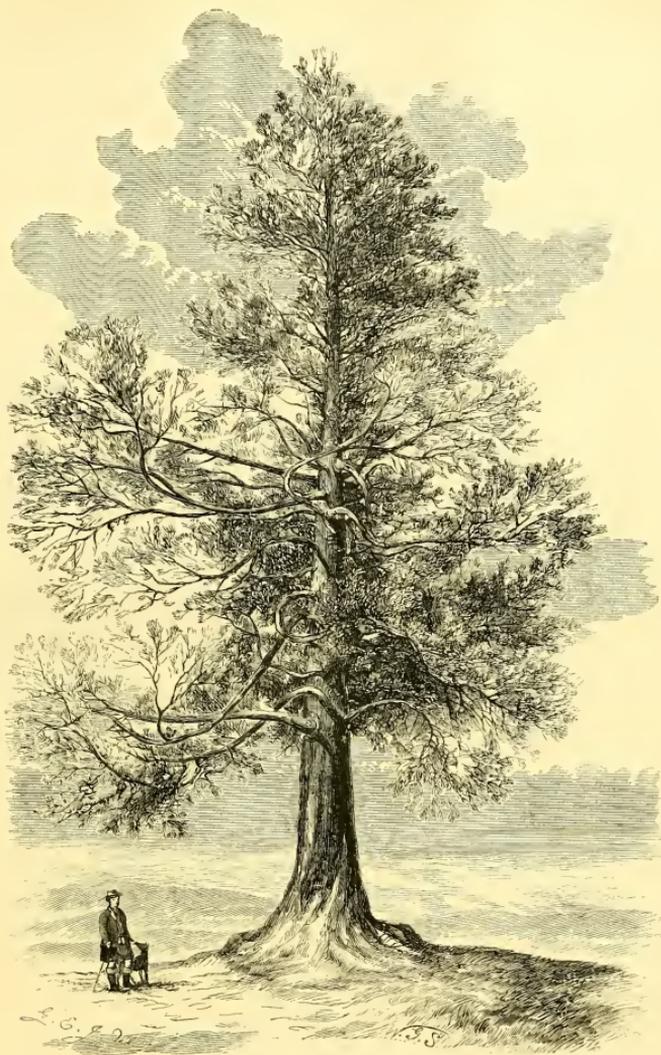

— We understand that there is a probability of the growers for Covent Garden Market having a grand field day in the Royal Horticultural Society's Gardens, South Kensington, shortly. The idea is to have an EXHIBITION OF COVENT GARDEN PRODUCE, i.e., plants, cut flowers, fruits, and vegetables, shown in exactly the same manner as they are sent to market. Such an exhibition should prove highly popular and instructive, and we heartily hope that it will be carried out to a successful issue.

— THE INTERNATIONAL POTATO EXHIBITION will not take place as originally announced, the negotiations having, through some accident, fallen through. It is now definitely arranged to be held at the Royal Aquarium, Westminster, on October 3, 4, and 5 next. The schedule provides for a series of classes ranging from twenty-four to single dishes, and the prizes amount to about £130. Copies of the schedule may be obtained on application to Mr. J. McKENZIE, Nos. 2 and 2, Great Winchester Street Buildings, E.C.

— In the descriptive account of the gardens and pleasure-grounds, woods and plantations, attached to Iweray Castle, the seat of the Duke of ARGYLE, which appeared in our columns in December last, Mr. EVERESH alludes (p. 836) to a RED CEDAR tree—a large one of its kind—measuring 6 feet in circumference at 5 feet from the ground, and at least 50 feet in height, of which we are now enabled to give an illustration (fig. 64), thanks to Mr. CAIR, who kindly obtained for us a beautiful sketch by Miss JOHNSTONE. Mr. CAIR informs us that, about the beginning of the year, some of the branches were broken off by the high winds, and this has somewhat destroyed the well-balanced appearance which the tree previously had.

— The *Hamburgers* of the *Gartencultur*, reports that last year's harvest of the Clover, grasses, and other seeds was generally very short, consequently increasingly high prices must be expected. Some kinds of

* *Economic Entomology: APTERA.* By Andrew Murray, F.L.S. (Chapman & Hall.)

FIG. 64.—THE RED CEDAR (*JUNIPERUS VIRGINIANUS*) AT INVERARY.

grass and Clover are no longer to be had first-hand. Lucerne especially is very scarce, and Clovers are short both in Europe and America. Seed of the Scots Pine, Weymouth Pine, and Pinus Abies was abundant last autumn, whereas Larch and Spruce Fir was almost wholly wanting. Acorns were scarce, and Beech-mast a total failure. It is a noteworthy fact that the same scarceness or almost total absence of certain fruits extended to this country.

— Some time since we had occasion to mention a volume by M. E. VIANNÉ, entitled *Prairies et Plantes*

Fourragères, published by M. ROTHSCHILD, of Paris; and we have now to mention a companion volume, under the title of *Les Prairies Artificielles*. It is devoted to the history and culture of the principal forage plants. The researches of Messrs. LAWES and GILBERT are laid under contribution, as well as those of French authors, the result being that we have in small compass a mass of information of great value to agriculturists. The work is copiously and well illustrated.

— The propriety of leaving FRUIT TREES UNPRUNED has been again discussed at a meeting of

the Cercle d'Arboriculture of Ghent by M. BURVENICH and others. M. BURVENICH, while admitting that the advocates of non-pruning are to some extent right in their notions, yet points out that as long as it is desirable to secure the production of fruit in a given place, so long will pruning be necessary. So long as there are walls, trellises, borders, so long will pruning be required. The unpruned tree bears fruit, but the pruned one yields them in convenient and predetermined spots. Orchard culture is not possible in all places, but there are many odd corners where fruit trees, such as Doyenné du Comice, Louise Bonne

d'Aranches, Duchesse d'Angoulême, &c., may be profitably grown as orchard trees without pruning.

— We must go abroad to read foreign journals if we wish to know what we do, and what we eat and drink, in this country. A French journal tells us, for example, that the rootstocks of *Typha latifolia* (Barrush) are eaten pickled in vinegar. It may be so, but never heard of this. The Russians in some parts of their vast territory, on the same authority, eat the young shoots of the same plant, instead of and with as much relish as Asparagus. The French comment on this is, "Quand on n'a pas ce qu'on aime, il faut aimer ce qu'on a."

— At a meeting of the SOUTHAMPTON LITERARY AND PHILOSOPHICAL SOCIETY, held on March 23, in the council chamber of the Hartley Institution, a paper entitled "The Microscope as a Means of Recreation" was read by Mr. A. C. ROGERS, son of Mr. W. H. ROGERS, J.P., of the Red Lodge Nursery, Southampton.

— French papers record the death of M. THOMAS, of the firm of SIMON LOUIS, of Metz, well-known for his pomological attainments, and author of a recently published book on fruits and their synonyms.

— The next exhibition of the NATIONAL AURICULA SOCIETY will be held in Manchester, in connection with the Botanical Society's show, in the Town Hall, King Street, on Friday, April 27.

— A correspondent in the *Journal of the Society of Arts* draws attention to the distinctly different methods which prevail in China and England in making Tea, or rather the infusion, by which he says that the millions of tea drinkers out of China are perfectly ignorant of the proper mode of extracting from the tea leaf all that is valuable, just so much and no more. First and foremost, of course, a great deal depends on the quality of the tea itself, and we are reminded that, "the upper classes in China from very long experience in the matter select the very choicest tea which they can afford, generally the young leaves from old trees. To make the infusion a few leaves are put into a cup and water not quite boiling is added; it soon cools sufficiently to be quaffed by the Chinese, who usually take their tea very hot." By the above quick method they skin, as it were, only the superficial flavour of the leaf, which is very capable of yielding up, when required, a bitter extract, which they avoid. This is the prime source whence the use leaves spoken of by analysts come from. In England, on the other hand, every resource which science can conceive is brought to bear on the opposite extreme, viz., to take out every atom of the tannic matter if possible to the last iota. Now, the infusions from choice Tea may be compared to those scents which in their concentrated form are offensive, but which when diluted are very fragrant and exhilarating. The march of science, therefore, is driving the British public in a wrong direction—one in which ladies and men with delicate or nervous constitutions so suffer that medical men here and there peremptorily put a stop to the use of tea at all." There is no doubt a great deal of truth in these remarks. Instead of a carefully prepared infusion, tea, as used in this country, is more of the character of a liquor from stewed leaves. The conclusions of the writer from whom we have gathered the foregoing remarks are, that a very delicately flavoured beverage is unknown to the bulk of the English people, because they have been taught to prepare tea by a method which "appears to have been brought in at the very extreme point of the wrong end of the matter." It is further suggested that the choicest tea at 10s. per pound is cheaper in the end than the advertised "strong tea" at 2s. 6d. per pound, inasmuch as a few leaves of the former, if used after the Chinese fashion, will suffice to make an agreeable beverage.

— We are requested to state that the address of Professor REICHENBACH for the next ten days is at the Herbarium, Royal Gardens, Kew.

— If any illustration were needed of the great decorative value of some of the hardy Primulæ at this season of the year, it would be found in a group of *PRIMULA DENTICULATA* now in bloom in the

Auricula-house of the Rev. F. D. HORNER, at Kirkby Malzeard. They are strong plants in 48 and 32 pots, each plant bearing several trusses of flower, and as they are having the advantage of some artificial heat necessary to the Auricula bloom, not only are the trusses of unusual size, but the individual blossoms are of great beauty. If this plant were now introduced for the first time, the horticultural world would go into ecstasies over it, for its delicate beauty is of a very high order. And yet it is almost new to many; and there is need for a constant reference to its excellencies of habit, freedom and duration of bloom, to attract to it some of the worship given to floral objects of a less valuable character. At Kirkby, Mr. HORNER illustrates its great fitness as an indoor plant, shining out with redoubled beauty when aided by a little general artificial warmth. At Chadderton, Manchester, during the month of April, and at the time when the genus *Primula* holds his highest festival in Cottonopolis, Mr. SAMUEL BARLOW uses it as an edging on a sheltered border by the side of his carriage drive, and with equally happy results. When is the *Primula*, with all its varied beauty of expression and transcendent charms, to have a Society formed for its encouragement, and that not nearly so much to obtain new forms as to reintroduce those already known?

— At a recent meeting of the Central Horticultural Society of France, M. DUCHARTRE adverted to his experiments made some years since on the FORCED LILAC. The learned Professor then showed—and his results have been abundantly confirmed since—that by forcing a Lilac in a well-lit forcing-house at an average temperature of +15° Cent. (59° Fahr.), perfectly white flowers were produced. In one of his experiments one branch of a Lilac was allowed to escape into the open air through a hole in the glass, while the rest of the shrub was within the forcing-house. Under these conditions the forced flowers were white, as above; but those which were on the branch exposed to the open air expanded a fortnight later, and were of the usual blue colour. M. H. DEUX added that it is only the *S. vulgaris* which acts in this manner, the flowers of *S. persica* when forced assuming the ordinary lilac colour.

— The practice of thinning-out the berries of GRAPES in order to obtain larger and more perfectly ripened fruit, appears to be gaining advocates on the Continent. The *Hamburger Gartenzeitung* describes the results of some experiments in this direction with the Early Black July Grape. Instead of an almost uneatable fruit, which is usually abandoned to sparrows, wasps, and children, good-flavoured, well-ripened bunches were produced. If such an improvement can be effected with an inferior variety, it is clear that the practice of thinning might profitably be extended to all dense-clustered varieties, when the object is to gain the best quality, and it is recommended for outdoor culture as well as under glass.

— Mr. STEPHEN OSBORN, formerly gardener to the late Sir CHARLES LOCOCK, Bart., at Binsted, Isle of Wight, has been appointed gardener and bailiff to the Earl of EPPINGHAM, at Inmoure House, Bicester, Oxon.

— *ODONTOGLOSSUM ANGSTATUM INTEGRAUM* now is fast in bloom in the splendid collection of plants belonging to J. BROME, Esq., Diddbury. The sepals and petals are sulphur in colour, beautifully spotted with purplish brown; the lip white, tipped with sulphur, and blotched on the anterior part with lilac. It is a very striking plant when flowered as this is, with branching spikes about 3 feet in height, with forty of its fully expanded blossoms. This variety is far better than *angstatum*, and is worthy of a place in every collection; and in blooming as this does, during the winter and spring months, it is the more valuable.

— The Leicester Advertiser states that all the farm labourers and workmen employed on the BEAUMANOR estate were lately summoned to the steward's office, no intimation having been given as to the reason why their presence was required. Their surprise was only equalled by their gratitude when they were informed that they had been called together to receive a legacy of one year's wages bequeathed to

them by their late benevolent master. This last proof of Mr. HERBICK'S kind consideration for all about him was fully appreciated by the poor men as they hastened home with the (to them) large sums of money they had so unexpectedly received.

— Intending visitors to London during the Easter holidays will find the DISPLAYS OF FLOWERS in all or any of the nurseries very interesting just now. The exhibitions of opening-flowering bulbous plants provided by Messrs. VEITCH & SONS and Messrs. W. CUTNISH & SONS are still in fine order, and well worth inspection. In addition to the Hyacinths, Tulips, &c., Messrs. VEITCH & SONS' Orchid-houses contain many fine things in flower, and in other departments the Roses and Clematises make a show in themselves, whilst in a few days a house of Gloxinias will provide a rich floral treat.

— THE DESTRUCTION CAUSED BY COCK-CHAFERS in some parts of the Continent is so great in some seasons as to almost ruin nurserymen and market-gardeners. It is well known that the larva of a nurseryman losing more in one season than the total revenue of his commune, and of another saving scarcely a hundredth part of his trees. All the crops in market gardens, whole fields of Lucerne, and meadows of great extent are sometimes completely devastated. Strawberry plants and Lettuce are favourite prey, and row after row disappears till none are left. It is in the larva state that they effect this kind of destruction; but the perfect insect feeds upon the leaves of trees and herbs, and does much damage. The larva feeds upon the roots, and their presence is usually indicated by the withering of the plants, of which they have devoured the roots. All sorts of remedies have been suggested and tried, but the larva in its burrow is tolerably safe until it reveals its whereabouts by the destruction of one plant at least. A Belgian contemporary recommends that a law should be enacted compelling owners to wage war with the perfect insect, just as they are now obliged to beat their hedge and trees for caterpillars before February 19. It would not be altogether without direct benefit to the nurseryman, inasmuch as that, mixed with Barley or some other meal, they form a good fattening food for pigs. In 1872 cockchafers were so abundant in Wurtemberg that they were collected by bushels and cartloads, and their value as food was tried on a large scale. Fortunately, we are seldom seriously overrun by this insect, or, indeed, by any other; and we doubtless owe our immunity in a great measure to the preservation of rooks, and the abundance of small insectivorous birds. On the other hand, there is reason to fear that the latter are becoming scarcer from year to year, in spite of the now necessary licence to use a gun, and the Birds' Protection Act. Thousands of small birds are netted to afford the abominable amusement of shooting them from a trap. We have frequently called attention to the dismal reports on the damage caused by insects in various parts of France, where a lag has long existed for shooting every bird that comes within range. Now efforts are being made to preserve the birds and restore something like an equilibrium between these different classes of the animal kingdom, which must certainly result in a great advantage to the vegetable kingdom. Without over-preserving birds, we should be careful not to give insects the chance of multiplying to an alarming extent.

— Amongst other Orchids in flower in Mr. BULL'S nursery at the present time is a very distinct variety of *ODONTOGLOSSUM TRIUMPHANS*. The lip is white, with a blotch of crimson instead of yellow and brown—the colour usually predominant in this species; and the sepals and petals are broader and smoother, more spotted rather than barred, and more intense in colour. Altogether the plant presents a pleasing variation from the common forms of *O. triumphans*. The beautiful upright flowering *Medinilla anabilis* is flowering in 5-inch pots in the same establishment.

— It would appear from a paper published by Mr. CHAS. B. FLOWRIGHT, surgeon, of King's Lynn, in the *Fuland Meteorological Circular* for February 1, that he has repeated the experiments first made by Mr. WORTHINGTON SMITH, and secondly by Mr. C. EDMUND BROME, with Potato haulms, as originally reported in these columns. As far as our knowledge went, no one, up to the present time, either

here or abroad (other than the two gentlemen above named), had succeeded in raising the RESTING SPORES OF THE POTATO FUNGUS—*Peronospora infestans*. It would now, however, appear that a third gentleman, Mr. PLOWRIGHT, has gone over the experiments with diseased Potato foliage and haulms and water, and obtained results quite similar to those recorded by Messrs. SMITH and BROOM. Mr. PLOWRIGHT writes:—"It must not be supposed that because a haulm has perished and become reduced to the state of a mere dry stick that the rest-spores in it have lost their vitality. I have before me some haulms that have been rotting in water for several months, until they have ceased to bear all semblance to haulms, and are a mere mash, yet the rest-spores are unimpaired;" and elsewhere in the same paper, "In the May of last year I had the opportunity of watching the development of some rest-spores which

other defenceless creatures, you would feed by night and lie concealed by day. So do these caterpillars. When the morning light comes they creep down the stem of the food plant, and lie concealed among the thick herbage and dry sticks and leaves near the ground, and it is obvious that under such circumstances the brown colour really becomes a protection. It might indeed be said that the caterpillars having become brown, concealed themselves on the ground; but in fact we were reversing the state of things. But this is not so, because while we may say, as a general rule, that (with some exceptions due to obvious causes) large caterpillars feed by night and lie concealed by day, it is by no means always the case that they are brown, some of them still retaining the green colour. We may then conclude that the habit of concealing themselves by day came first, and that the brown colour is a later adaptation. It is, moreover,

THE EYE SPOTS.

The last of the five points to which I called your attention was the eye-spots. In some cases spots may serve for concealment, by resembling the marks on dead leaves. In *Delilephila hippobas*, which feeds on the Hippobas, or Sea Buckthorn, a very grey-green plant, the caterpillar also is a very similar grey-green, and has, when full grown, a single red spot on each side, which, as Weismann suggests, at first sight much resembles in colour and size one of the berries of Hippobas, which, moreover, are present, though not ripe, at the same period of the year. Again, in *Cheroocampa tersa*, there is an eye-spot on each segment, which mimics the flower of the plant on which it feeds (*Spermacoe hyssopifolia*). White spots, in some cases, also resemble the spots of light which penetrate foliage. In other cases, however, eye-spots certainly render the insect more conspicuous. Now in some cases, as Wallace has pointed out, this is an advantage rather than a drawback. Suppose that from the nature of its food, or any other cause, as for instance from being covered with hair, a small green caterpillar was very bitter, or in any way disagreeable or dangerous as food, still in the number of small green caterpillars which birds love it would be continually swallowed by mistake. If on the other hand it had a conspicuous and peculiar colour, its evil taste would serve to protect it, because the birds would soon recognise and avoid it, as Weir and others have proved experimentally. We have a striking case of this among the hawk-moths in *Delilephila euphorbiae*, which feeding on the Euphorbia with its bitter milky juice, is very distasteful to birds, and is thus actually protected by its bold and striking colours. The spots on our elephant hawk-moth caterpillar do not admit of this explanation, because the insect is quite good to eat, I mean for birds; we must, therefore, if possible, account for them in some other way. There can, however, I think be little doubt that Weismann is right when he suggests that they actually protect the caterpillar by frightening its foes.

Every one must have observed that these large caterpillars have a sort of uncanny, poisonous appearance; that they suggest a small thick snake or other evil beast, and the eyes do much to increase the deception. Moreover, the segment on which they are placed is swollen, and the insect when in danger has the habit of retracting its head and front segments which gives it an additional resemblance to some small reptile. That small birds are, as a matter of fact, afraid of these caterpillars (which, however, I need not say are in reality altogether harmless) Weismann has proved by actual experiment. He put a caterpillar in a tray in which he was accustomed to place seed for birds. Soon a little flock of sparrows and other small birds assembled to feed as usual. One of them lit on the edge of this tray, and was just going to hop in, when she spied the caterpillar. Immediately she began bobbing her head up and down, but was afraid to go nearer. Another joined her, and then another, until at last there was a little company of ten or twelve birds, all looking on in astonishment, but not one ventured into the tray, while one which lit in it unsuspectingly beat a hasty retreat in evident alarm as soon as she perceived the caterpillar. After watching for some time, Weismann removed the caterpillar, when the birds soon attacked the seeds.

Other caterpillars also, probably of nearly allied species, are protected by their curious resemblance to spotted snakes.

The peculiar hues of the death's-head hawk-moth caterpillar, which feeds on the Potato, and imitates so beautifully the brown of the earth, the yellow and green of the leaves, and the blue of the flowers, that, in spite of its size, it can scarcely be perceived unless the eye be focussed exactly upon it. The other is the anercy. The caterpillars of this genus differ in style of colouring from all other sphinx larvae, having longitudinal bands of brown and green. Why is this? Their habitat is different. They feed on the leaves of the Pinaster, and their peculiar colouring offers a general similarity to the brown twigs and narrow green leaves of a conifer. There are not many species of Lepidoptera which feed on the Pine, but there are a few, and I have here diagrams of two, *Achthis spreta* and *Dendrobrius pini*, both of which, as you will see, have a very analogous style of colouring, while the latter has also tints of bluish green hair which singularly mimic the leaves of the Pine. I have added also

FIG. 65.—SPRAY OF THE RED CEDAR, JUNIPERUS VIRGINIANUS. (SEE P. 405.)

Mr. SMITH obtained last summer. It was very interesting to observe them produce the *Peronospora* and its conidia."

— The thirty-third annual competition of the SCOTCH FANSY SOCIETY will be held in the Calton Convening Rooms, Waterloo Place, Edinburgh, on Friday, June 15.

RELATIONS BETWEEN PLANTS AND INSECTS.

(Continued from page 396.)

USE OF THE BROWN COLOUR.

Now for the brown colour. It is evident that this makes the caterpillar even more conspicuous among the green leaves than would otherwise be the case. Let us see then whether the habits of the insects will throw any light upon the riddle. What would you do if you were a big caterpillar? Why, like most

interesting that while the caterpillars which live on plants often go down to the ground and turn brown, those which feed on large trees or plants remain on the underside of the leaves, and retain their green colour.

Thus, in *Smerinthus ocellatus*, which feeds on the Willow and Sallow; *S. populi*, which feeds on the Poplar; and *S. tilie*, which frequents the Lime, the caterpillars all remain green; while in the *Convolvulus* hawk-moth, which frequents the *Convolvulus*, *Cheroocampa nerii*, which feeds in this country on the Periwinkle; *Cheroocampa celeris*, *Ch. elpenor*, and *Ch. porcellus*, which feed on *Galium*, most of the caterpillars turn brown.

There are, indeed, some caterpillars which are brown, and yet do not go down to the ground, as for instance those of *Aspilathes asperaria*, and indeed of the *geometridæ* generally. These caterpillars, however, place themselves in peculiar attitudes, which, combined with their brown colour, make them look almost exactly like bits of stick or dead twigs.

which, on account of our not wanting a stock, was allowed to grow on. It came into bloom in the middle of December, and, as you will see, it began shortly after to shed the large outer bracts, and throw up thick clusters of small bracts from the centre, until the flower-bearing stem is elongated several inches with a fine rich double top and centre—not at all coarse, like the single one, but perfection itself in the bouquet and cutting. You can fancy the effect of this placed against white. I doubt not but that it will ultimately be had half the year round—at least, this looks in every way likely to continue growing shortly after to shed the large outer bracts, and if the bracts diminish will not render it the less useful for many purposes, and large plants will be particularly useful and showy. I think it the best and most useful new plant sent out for several years. *J. F., March 26.*

Mice and the Peas.—I have put a mixture of red-lead and sweet oil on my early Peas previous to sowing for the last ten years, and have never known a mouse to touch them. I have tried benzoline this year for the first time, with the same result. If any one is troubled with mice will give either of these remedies one trial, I feel assured they will be quite satisfied with the results. I sowed my first Peas on November 18 last, and neither mouse nor bird has touched them since. *George Clingen, The Gardens, Becklands, Caterham Valley, Surrey.*

Chlidanthus fragrans.—We are much pleased to be able to confirm your opinion, expressed in your last issue, p. 377, that "single-flowered varieties of species usually bearing a true and constant double flower or have to-day in flower a spike of Chlidanthus, with three flowers fully expanded." *F. H., The New Plant and Bulb Company, Colchester, March 27.*

Waltham Cross Grape.—In reference to your reply to "J. McL.," at p. 346, on the merits of the above Grape, permit me to remark that whatever may be the good qualities of that variety when it chances to be seen in good form, it will not, according to my observations, ever be generally grown or valued by two noted Grape growers who have completely failed with it. It would be interesting, if your readers who have grown Waltham Cross would give a candid report in your columns as to how it has behaved with them. Should you be inclined to do so, please send it to your editorial office. We annually grow a number of pot Vines for fruiting, and amongst our this year's batch was a strong well ripened case of Waltham Cross. The other varieties were the Hampton, Gros Colman, and the one of Foster's Seedling, all of which showed an abundance of fruit, except Waltham Cross, which did not show a single bunch. By all means let us have as many new Grapes as possible so long as they are realising a profit for their kinds, but not unless, I do not think the Fruit Committee should certificate any new Grape without having growing specimens in fruit before them, so that they may judge of its habit, constitution, &c. There are several good practical gardeners on the committee who could tell at a glance whether a Vine was likely to be a fruitful variety or not. Personally, I feel strongly on this point, as I think all true lovers of gardening must, seeing that many gardeners have got into trouble by their employing such Grapes that in a few years have had to be discarded as not worth growing. I do not think the fortunate owner of any good thing would at all suffer by mortgaging it to his employer, and the same may be said in these days of free communication amongst both employers and gardeners a real good thing soon becomes widely known, and is sure to sell in quantities. I have several times of late asked myself and other gardeners, "Is it worth the price you would our employers' desert tables or gardeners' reputations have suffered had, say, two-thirds of the new Grapes sent out this last twelve or fourteen years never seen light? My own reply and that of several gentlemen with me are in the affirmative, and not denials. What say your readers? *H. J. C. G.,*

Cyclamen Culture.—I have often heard people in this part of the country say that they have failed to grow these beautiful Cyclamens as well as they could wish, and having had myself a fair amount of success in several years past, I beg to send you the details of my mode of culture. The compost I use is made up of equal parts of loam, peat, and leaf-mould, with a liberal quantity of river-sand. Six-inch pots are well drained one-third of their depth, and the soil in them is compacted within an inch of the rims, when they are well watered with warm water, and the seeds sown thinly, and covered with about one-eighth of an inch of silver-sand. A piece of glass is placed over the pots, and they are put on a shelf near the glass in the plant-stove, and kept constantly moist. When the plants

are 1½ inch high they are potted singly into 2-inch pots, the bulbs being carefully kept above the soil at all times. They are again returned to the stove, kept in the glass, and constantly moist, and sprinkled overhead with a fine rose once or twice a day, and shaded from bright sunshine. As soon as the roots reach the side of the pots they are shifted into 5-inch pots, an addition being made to the bulk of the compost, and the plants are set in horse manure. After this the plants are kept in the stove till the pots are well filled with roots—about the third week in June—when they are removed to a pit, and the pots plunged to the time in slight bottom-heat. The plants are sprinkled overhead with warm water daily in bright weather, and an abundance of air is given when the weather is favourable, with a little shade in the middle of the day. About September they are removed to shelves in the conservatory, where a temperature of from 50° to 60° is kept up. Here they commence to flower from November, and continue to do so till May. Seed may be sown any time. I find it takes with me from twelve to fifteen months to produce good plants from seed; but I have always found young plants to produce the finest flowers. *Henry Ellis, The Hollis Garden, Timperley.*

Botryanthus conicus.—When was in Italy, some years ago, I found in the Campagna, and elsewhere a Grape Hyacinth, which appeared to me exactly intermediate between Muscari botryoides and racemosum. It has always puzzled me. The bulbs I brought home have flourished and increased in my garden, and I have since I was in Italy, sent you a specimen to the inspection of Mr. Baker, of Kew. He pronounces it to be *Botryanthus (Muscari) conicus* of Jordan. *H. Harpur-Crewe, Drayton Basschamp Rectory, Irving, March 20.*

La Grosse Sucrée Strawberry.—We find the above to be a capital variety for early forcing. We put fifty plants on a shelf in our second vinery when we started it the second week in January, and they are now ripening off a good crop of fruit, of which the enclosed is a fair average sample. One great point in its favour is that it sets its fruit well in a temperature 6° to 8° higher than our usual standard variety, viz., Keens' Seedling, consequently saving time. Our plants are growing in 5-inch pots, and average about 12 to 15 plants of all which swell to an equal size. *H. T. Clayton, Grimston Gardens, Tadcaster.*

Spent Hops.—I have been reading in your valuable paper the remarks of Mr. Duns on spent Hops for Potato culture. I notice that the use of spent Hops, if used in moderation, will do you no harm, and all agree with you. Many of your readers must know the great value of Hops as manure but many I am convinced do not. Less than ten years ago one large firm in Bristol carted their refuse Hops to the great extent as the best way of getting rid of them, that I know for a fact, which plainly shows that the market gardeners of Bristol did not believe much in Hops. With us it is quite the reverse, spent Hops are sought after quite as much as any animal manure. Near all large cities they are difficult to obtain, and fetch as good a price as the best stable manure. As I have used during the last seven years many hundred tons, I can, I think, say that I have given it a fair trial. I have tried it side by side with the best manure on such crops as Cabbages, Cabbets, Celery, Carrots, and even Wheat, Barley and Oats, and proved it quite equal to the manure, more particularly on heavy loam; on a very light soil I think it would be less beneficial. If used fresh from the brewery it will do no harm, and I prefer to have it lay in a good big heap for a year and be well turned a few times. Hotbeds made of one-half stable manure and one-half fresh spent Hops will retain heat much longer than any made entirely of stable manure. When two or three years old, and thoroughly rotten, so rotten that it will easily run through a half-inch sieve, it is a fine substitute for leaf-mould, so good in fact that we never look for it in any of our common greenhouse plants, such as Pelargoniums, Carnations, Fuchsias, Begonias, &c., in fact almost without an exception all soft-wooded greenhouse plants, thrively flourish with a liberal allowance of rotten Hops. *William Scott, Buffalo, Iowa, U.S.A.* [Spent Hops are largely used in London market gardens. Eds.]

Town Squares.—I have read with some interest your remarks and Mr. Eyles' explanation of his plan for laying out squares, &c., in London and other large towns, and I am glad to hear that you have had the consideration of those who have to take action in matters of this kind, and as I happen to fall under this denomination, will you kindly find space for one or two observations on the subject? In treating the matter of Town Squares, it must be looked at from a different point of view. The landscape gardener must consider whether his first duty is to give satisfaction

to the powers that have the management of the square, or whether he should simply seek to conscientiously fulfil his mission; by this I mean to say, is he to lay out the garden so that it shall be beautiful and pretty for a few years, or should he rather not look to the future? This is the great difficulty to contend with. Mr. Eyles' design, he tells us, is eventually to shade the promenade and gravel walk in summer time or sunny weather, and to give a good airy path for the winter (next year) and he considers a good greensward one of the greatest desiderata. Now if Mr. Eyles plants his Planes, as he proposes, at the edge of the grass, by the time they have grown sufficiently to form the arch that he speaks of, the shade will be mainly given, and a very considerably greater distance on either of the external sides, and one may safely say not less than 10 feet; and we all know that it is simply impossible in the London smoke to have the faintest semblance of grass under a dense mass of trees, and more particularly when an unlimited number of children and nursemaids convert it into a playground. I think myself, with such a number of trees in so small a space, in a few years you would neither have a good walk nor a fair sward; and I feel sure, if Mr. Eyles will give the matter a little further consideration, he will find a better issue out of the difficulty. There is one point in laying out these squares that has not been mentioned by Mr. Eyles, which will have their host of Laburnum and other such trees. It is no use—they will not be denied them; and in the old squares the inhabitants know every peculiarity of the time of flowering, difference of colour, &c., and do not care to have any such trees, and as they look with pride on the one big Plane or one Alder, or what not. These are points that must be considered, and indeed never lost sight of, or the landscape gardener is in trouble in a moment. As you justly remark, it is not the business of a landscape gardener of private gardens for those who have the right of entry, and in some of the old ones in the inner London one may see a little gardening, under almost every disadvantage, that fairly puts Belgravia and South Kensington to the blush. *R. P. G.*

Mushroom Culture.—There have been several writers of late discussing some very interesting facts respecting Mushroom and Asparagus forcing, which will make us think there has been some fairy agency at work. If the year 1877 goes on as it has begun, abounding in horticultural wonders, may we not expect to see some of the late writers have been made up of private gardeners for those who have the right of entry, and in some of the old ones in the inner London one may see a little gardening, under almost every disadvantage, that fairly puts Belgravia and South Kensington to the blush. *R. P. G.*

There have been several writers of late discussing some very interesting facts respecting Mushroom and Asparagus forcing, which will make us think there has been some fairy agency at work. If the year 1877 goes on as it has begun, abounding in horticultural wonders, may we not expect to see some of the late writers have been made up of private gardeners for those who have the right of entry, and in some of the old ones in the inner London one may see a little gardening, under almost every disadvantage, that fairly puts Belgravia and South Kensington to the blush. *R. the part so injured, young fibrous roots were forming freely, and this decided me to prune off all the decorated part, as I could plainly see that any of the root below was not likely to be of any further use to the Vines. I attributed their presence in this position to having top-dressed the loam with some rather fresh cow manure that was allowed to lie on the surface as a mulching, where it remained till it became so decomposed as to be incorporated with the surface soil. This matter I have collected as it laid on the pasture, and which the weevil was introduced in that way I know not, but certain it is I never had it before, except an occasional one or two, while in this case we often found as many as twenty or thirty by searching for them at night, and we had to continue destroying them in that way to prevent them devouring the whole of the lower leaves, which they otherwise would soon have accomplished. My knowledge of entomology is not sufficient to allow me to say anything as to the length of their remain in the larva state, or what becomes of them after they assume the beetle form, but no doubt many of your readers can fully enlighten us on this head, and tell us how to guard against having them in our vineyards, for which information I shall be very glad to be as they are sly, destructive fellows, working in the dark as becomes them; but this I would not object to if they would only keep above-ground, as then we could cope with them. *J. Sheppard.*

Orchids in March.—The show-house is rich in beauty but not variety, and the supply is the most abundant are not the least valuable. Next month promises to be fertile of both.

Edward W. Cox, Mount Mount, Hendon, March 26.

Japanese Mushrooms.—The Japanese are famous for doing things in a different manner from ordinary people, and in their cultivation of Mushrooms they illustrate their character for this peculiarity. In growing Mushroom-cultures they use fungi, as we learn from the report of Her Majesty's Consul in Japan, the Japanese (of Yenshin) cause Mushrooms of more than ordinary large growth to appear by heavily beating logs of wood till the wood swells. We also obtain knowledge of the remarkable fact that the same logs "are beaten given a great number of small sized Mushrooms grow up in succession." There is still another plan for forcing Mushrooms in Japan, sometimes the cut logs are covered in the ground for a year, when twelve months have passed over the logs are resurrected and "beaten in the manner above described." In all these cases the logs have been previously split by the Japanese each into four pieces, incised with hatchets and placed in a wood. "Every morning" (after three years have rolled over), says the report, these logs are "put in water, where they remain till the afternoon, when they are taken out, laid lengthwise on the ground, and beat with a mallet. They are then ranged out end in the same slanting position as before, and in two or three days Mushrooms will again make their appearance." These logs are not cut from the Walnut tree, and so can hardly be said to confirm the truth of the "Walnut tree—the more you beat it the better it is." The name of the tree, says Her Majesty's Consul, is the "Shü-tree," and the name of the fungus the "Shü-take." The report does not inform us whether

this "Shü-tree" is in any way related to the familiar British boot-maker's "boot-tree," although this relationship would not seem improbable, for we are told in the same report that the second-best Japanese Mushroom is the "Kik-uro." The names of the Mushroom localities in Japan are most peculiar, and some sound like a sneeze, as "Idza" and "Hitachi." Small parcels of fungi, says Her Majesty's Consul, "come from *Zoo*," and are estimated in "piculs and catties." *W. G. S.*

Vegetables for India.—We hear of such terrible famines in India from failure of the crops that I venture to ask whether there are not some vegetables or roots (differing from those now sown) which might resist long droughts better. There would be a great use to the country if experienced gardeners could suggest such auxiliaries, not to supersede, but to aid when the favourite crops failed, and assist at all times. I am in hopes that through your so well known *Gardener's Chronicle* some good hints may be given. *I. B.*

The Royal Horticultural Society.—Now that Mr. Veitch has set the good example of opening a list for Fellows and guinea members, it is most desirable that other nurserymen, not only in London but in the country, should follow his in this regard, but that the list of members cannot be prepared without at the same time increasing the demand for plants. *George F. Wilson, Heatherbank, Weybridge Heath, March 26.*

Reports of Societies.

Newcastle-on-Tyne Horticultural. *March 21 and 22.*—The spring exhibition of this Society was the oldest in England, having been established in 1824—took place on the above dates, and proved a success beyond the most sanguine expectations of its promoters. Long as the Society has existed it is the first spring exhibition it has ever held, and the bold venture now marks the era of a great change in the circumstances of the Society. For years past it has existed—and that is all. As this great centre of commercial enterprise increased on every hand the Society progressed in an inverse ratio, and depended on the support on money taken at the gates, and as the weather regulated the number of those who visited the shows, the committee often found themselves in grave financial difficulties. It would appear to be the fate of all societies connected with the garden, small and large, to be made involved, and in 1872, so small was the amount of money taken at the gates, that it was not sufficient to meet the working expenses, and the prize money could not be paid.

During the time of the greatest depth of depression some local horticulturists were found believing in the possibility of a better state of things, and it was considered that the claims of the Society only required to be more prominently brought before the public to result in an improved state of things. The attempt was made, the basis of the committee was broadened, two gentlemen of position—Messrs. W. J. Taylor and J. H. French—were appointed hon. secretaries, with the assistance of a working Secretary; it was put forth for the residents in the counties of Durham and Northumberland, and the venture succeeded beyond the most sanguine expectations of the promoters. The assistance so much required has been unparalytically tendered, and there is now a body of 2500 members, with an assured annual income of some £1200. The list of Vice-Presidents and Patrons includes a large number of the nobility and Members of Parliament of the counties of Durham and Northumberland, and the list is open to be liberally added to. The committee arranged to hold three Exhibitions during the present year: the spring exhibition, as above, in the Town Hall and Corn Exchange; a large summer exhibition on July 12 and 13, in the Town Hall; and a small autumn exhibition on September 12 and 13, in the Town Hall.

On the occasion of the spring show the whole of the spacious Corn Exchange was filled with plants, while the Town Hall was crowded with the floral decorations. These have long been a leading feature of interest in the district. Each competitor had to provide a table decoration of flowers, plants, and fruit, each competitor allowed table-room 10 feet by 5 feet 4 inches, and the cost of the table cloth 25s. There were five competitors for the handsome money prizes given by the President, Major Woods, of Holey Hall, the 1st prize being taken by Mr. J. Sanderson, gr. to W. H. Parker, Esq., Gosforth; the 2nd by J. Thompson, gr. to E. C. Wood, Esq., in addition there were ferns, bouquets, and buttonholes, the competition being confined to ladies, and which brought an extensive and spirited competition.

The extensive Corn Exchange had a very pleasant display of Hyacinths were the leading feature—the principal class being for twelve pots of Hyacinths, three bulbs in each. The bulbs were naturally in 32-pots, and there were some

remarkably fine spikes in the three leading collections, the exhibitors having three spikes of one variety in a pot. Some had three different varieties, viz., white, blue and red, but the result was uneven, and a confusion. The first prize was won by Mr. J. Thompson, Ravenside Nursery, Fenham, who had Charles Dickens, Grand Litas, Lord Macaulay, Ornament de la Nature, Alba Maxima, Grandcaul, Merveille, Argus (ver. Mr. W. Schiller, Victoria Mecanica), Madame Gooden and Bazan. Several other examples; (2d, Mr. W. J. Watson, seridan, Town Hall Buildings, with fine examples of Lord Macaulay, Leonidas, General Havelock, Miss Nightingale, Ida, Greenhouse, Lord Palmerston, and Hazell; 3d, Mr. Moore, Blane, and Hadyn. Mr. Thompson was also 3d, and after that there was a considerable falling off. Hyacinths were also shown in glasses. Narcissi were very attractive, the best sorts being Grand Primo, Soleil d'Or, States-General and Bazan. Several bulbs were in a pot, and good heads of blooms resulted. Narcissi were in much larger pots than are usually seen in London, and they were generally well grown—the leading varieties, Queen Victoria, white; Sir Walter Scott, pale striped, very fine; David Rizzio, purple and large yellow. Scillas in pots were capitally done, and were represented by sibirica, bifolia, and bifolia alba. Tulips were but sparingly produced, and there is no reason why they should not be more numerous, and they were better grown, as there are many fine sorts well suited for pot culture. Of single varieties the best were White Pottebakker, Van der Neer, Vermilion Brilliant, Van Vondel, Royal Standard, and Canary Bird; double varieties, Tournesol and Rex Kalbroum.

Of spring-flowering plants, Rhododendrons, Camellias, Azaleas, and Acacias were represented; and of commoner forms, Cinerarias, Lily of the Valley, Deutzias, some of them well grown and bloomed; Astilbe, and very good; Cyclamen, Mignonette, Epacris, Heatsis, &c., were in plenty. Of hardy flowering plants there were Deutzias, Anemones, Polyanthus, among which we were glad to see some new introductions, gold-veined varieties, such as Great Yellow Formosa, &c.; Arterias, Wallflowers, and Daisies.

Handsome foliage plants were shown by Mr. A. Methven, gr. to J. Lange, Esq., and other exhibitors, and flowering plants by several; and among these were some of the most beautiful megapotaemic variegatum, well grown and flowered.

Large and varied collections of spring-flowering and foliage plants, of great advantage from a decorative point of view, were furnished by the following nurserymen: Messrs. J. G. Dickson, gr. to J. J. Watson, J. Thompson, J. Charlton, R. Balfour, and Stuart & Mein, Kelso, N.B. A box of coloured Primroses, sent by Mr. R. Dean, Ealing, London, excited considerable interest.

Royal Horticultural of Antwerp.—This Society held its 128th exhibition on March 11 and following days. Although held at an unusually early date the flower show exceeded all expectations, and the variety as in the beauty, freshness, and abundance of flowering of the plants. The splendid room of the Royal Society of Harmony, so well adapted for exhibitions, was, while the show lasted, the favourite meeting-place of the aristocracy and lovers of art-culture. The room presented a dazzling appearance, and the cold weather out-of-doors made a singular contrast to this attractive glare, glittering with the brightest colours of spring flowers, and perfumed by the rich reticulated odors of the flowers. The exhibition we should be obliged to touch on every staged object, hence we shall only mention the most prominent things.

Let us speak first of the amateurs. M. Beaucaere, of Esmarne, carried off the palm of the day. He staged a remarkable lot of specimens—standard foliage, ornamental plants, Azaleas and Camellias of an uncommon height, combined with perfect culture and abundant flowering. The Ericas, Epacris, and New Holland plants of the Baron de Caters, the President of the Society, as well as the Oculids, Palms, the former especially, of Mme. Le Grelle-D'Haln, excited general admiration. A brilliant collection of hybrid Anemones, raised by M. H. Vander Linden, attracted all spectators—standard foliage, grey colours, fine forms, strong stems, no fault was to be found with these handsome flowers. In his rich group of bulbous ones plants we observed a Grimm raised so that we considered one of the finest of its kind. The flowers were generally standard. M. Flor. Pauwels were, however, surpassed by his incomparable group of hardy Rhododendrons, amongst them a Prince Camille de Rohan displayed its enormous crown, ornamented with more than 4000 crosses of fine and brilliant Hyacinths. M. Van der Linden, Enonymus, and Pelargoniums of Mme. Riquie, M. Le Comte de Bergey's good collection of hardy plants, the splendid Anthuriums and Cyceads of M. Van de Womper, the striking standard Roses of M. Van

Bomberghe, the charming new Azalea of M. de Meule, of Ghent, together with the superb *Cyclops*, the *Roses* and *Cyclamens* of M. Everaert all deserve high praise.

The nurserymen, too, contributed very much to the beauty of the exhibition. M. De Bencker had many very pretty strong *Phloxes*, many varieties of *Cacti*, and an entirely new species of *Maranta* from Brazil. M. L. Berckelaers received much praise for his *Cyclamens*, his large group of flowering plants, as also M. H. De Beukeler for his very arranged groups of annual flowers. M. Ch. Vuytsteke, of Lochristy, near Ghent, sent a most beautiful collection of a distinct variety of *Azalea indica*, with an exquisite group of hardy *Rhododendrons*, the most beautiful of which were rich and varied in colours, from the palest white to the brightest red. The valuable plants staged by M. Vander Mersch formed an attractive display, and the *Coniferæ*, &c., of M. Nagels produced a very good office.

Lastly, but not least, it must be mentioned that several artists had decorated the room with their pictures. Amongst them Mdlle. Anna Peters, of Stuttgart, held a prominent position with her charming picture in the foreground. M. De Bencker, M. and M. De Naeyer, of St. Jossent-Node, also exhibited proofs of their great talent. By means of this highly successful show Antwerp proves once more that it has made, especially of late years, a rapid improvement in its art and manufactures. We exemplify set by Ghent, the famous flower city of Belgium. C.

The Villa Garden.

ROCKWORK IN THE VILLA GARDEN.—A piece of rock garden is very often a part of a Villa residence. In a great many cases it is thought to be "the thing," and it is very frequently constructed in such a way that the plants placed thereon are characterised by a kind of unhappy existence, the appearance of the rockwork having been the first consideration, to which the well-being of the plants is subordinate, and of quite a secondary matter of importance. In many cases it happens that the rockwork is set up in a hot, dry, elevated position, in full exposure to the sun; it is therefore impossible plants can grow thereon, but then it is not unrequently the case the erection is so ornamented as that it, and not the plants, becomes the attraction.

In his pleasant book on *Rustic Adornments and Homes of Taste*, Mr. Shirley Hibberd amusingly sketches such a piece of rockwork as we have just referred to. He states:—"Take a flower garden, and in the midst of it make a pyramid of vitrified bricks and flints, or throw up a hillock of huge stones, and set upon the top of it a small plaster stage, or a cast of Queen Elizabeth, or Shakespeare, or Paganini; dash the stones over with blue and green paint, in fact, moss them and bronze them, and use plenty of colour. Then stick in anywhere a *Geranium*, a *Fern* or two, put a few shabby *Lilacs* at the back, and make round the whole a gravel path, edged with white flints or brick-rabbish, to correspond with the prominence, and you are done with those 'model rockeries' that delight Londoners when they take their walks abroad, and which many of them copy in arranging their own grounds. It is the best fun in the world to visit a garden where there is plenty of rockwork, but you must be reticent as to your opinion of it, or risk all the consequences of giving an unforgettable opinion if you should speak your mind on the matter." Grotesque as it seems, this is a very true picture of many constructions under the name of rockwork. Not long since we were invited to inspect a piece of home-constructed rockery that had cost its designer—no, not designer, for there was no design about it, as all kinds of pericled conceits had been worked in as the task proceeded, in order to make it effective—had cost the worker immense trouble; but successfully a plant was growing on it. There was scarcely a fissure into which the plants could make roots; even the common *Stonecrop* and House *Leek* looked miserable in the hot sun. To make amends for the lack of plants pieces of coloured glass, tinted shells, lumps of spar, &c., had been introduced in plenty; and this garish, gaudy, unnatural performance was considered a masterpiece of local inventive genius. Such a picture may provoke a smile; but it is a correct one, and copies of it abound.

Many residents of Villas think a piece of rockwork indispensable, and sometimes it is set up under a north wall, sometimes under a south wall; in the

former case it is rarely blessed with a gleam of sunshine, the latter it is in the full exposure of the sun, and literally roasts for want of shade. Another time a piece of rockwork is set up under trees and shut in from the genial influences of sun and air; it becomes a habitation for vermin, and the drip from the overhanging branches quenches almost every aspect of plant life.

A piece of rockwork, if properly constructed, is calculated to maintain plants in a flourishing condition in the fullest exposure, provided there be a sufficient bed of soil to root into. It is in regard to this point that so many failures occur. As we would have in our mind's eye a rocky bank, set up to separate a flower garden on a lower level from a piece of kitchen garden raised some 3 feet or so above it. Some large pieces of Bath-stone formed the foundation, but as the work proceeded the spaces were filled up with suitable soil, and as the work mounted upwards this was even more carefully attended to, the result being that a bed of soil extending to the very bottom and around well holes was provided for the plants to root into. This bank is now completely covered with plants in the most flourishing condition. In early spring there are bulbs, *Primroses*, *Aubrietias*, *Aralis*, &c., and these are followed by *Alyssum saxatile*, *Helleboricus*, *Plumbago*, *Larpete*, *Convolvulus mauritanicus*, &c.; and almost all the year round there is something of interest to attract. The secret of its success lies in the fact that there is an abundance of soil within the rockwork for the maintenance of the plants, and all such things are carefully planted in specially prepared nooks, where they cannot starve in the driest weather.

The chief mistake made is that of not providing a feeding place for the roots of plants for the embellishment of the rockwork. If the openings between the stones, however narrow they are, are filled with soil, the roots will go down deep into it, and this is how it is that the plants can bear so much exposure during hot dry weather.

The practice of employing roots or stumps of trees to maintain rockwork for rockwork, or even of constructing such a piece of work wholly of wood, is one to be condemned, and for this reason apart from others that will be given—the woodwork rots in course of time and subsides, the soil sinks down, and the arrangement becomes uneven and practically useless.

In planting rockwork a few choice subjects should be used, mixing them with a selection of plants suitable for covering it, or else certain quick-growing plants that will cover it quickly should be introduced. Much depends on the position of the rockwork. If it be in the shade, and away from the sunlight, then it may be planted with things suitable as a screen; if it be in the open let some good things form a part of the arrangement, but taking care they do not become too large in the course of time by the more robust growing plants employed for covering purposes.

Notices of Books.

The Life of a Scotch Naturalist (Thomas Edward, A.L.S.). By Samuel Smiles. London: Murray.

A book so remarkable as this should not so long have remained unnoticed in these pages had it not been necessitated by exigencies of space, and the necessity of inserting matter of more strictly horticultural character which admitted less delay. As it is, the history of "Tom Edward" is now known through the length and breadth of the land, and the thoughtful kindness of the Queen has been placed beyond the reach of absolute want.

The history of this Scottish naturalist is at once a most painful and a most amusing one. It is painful to find in Scotland, which boasts of its educational advantages and appreciation of the benefits of knowledge, that a man of such rare singleness of purpose and absolute devotion to natural history should have been suffered to drag on a miserable existence, unaided by those of his neighbours who had the means of assisting him. Whatever lessons may be learnt from his life, and they are many, "virtue is its own reward" is either not one of them, or if it be, then the reward is not what most people would desire for themselves. Apart from the grievous injustice which has somehow befallen the hero of this book, the loss to science must have been very great indeed. Much indeed has been done by Edward, as is testified by the fact that the Linnean Society of

London fulfilled one of its missions by conferring on him the honorary title of Associate, but that is rather a barren honor for a literary man. How much more might he have done had he been placed beyond the necessity of toiling for his daily bread at the cobblers' stool. We observe that a contemporary points out the very different way in which a poor country like Norway knew how to appreciate, and then how to treat a man of such rare qualities. Sars, the great Norwegian zoologist, was, it appears, raised from a position almost as unfavourable to scientific research as that of Edward by the Government. He was made a Professor in the University of Christiania, and allotted a stipend as ample as that which the general researches without the fear of penury before his eyes. It is useless, however, to lament the sins of omission on the part of those who had the opportunity of doing good service and missed it, rather would we congratulate Edward that at last he has found a good friend in Mr. Smiles, and a sympathetic benefactor in the Queen, while, following these examples, the Aberdeenians have at length done something to redress their neglect. Turning over to the darker shadows of the book we are glad that the general reader who appreciates a well-told story of a remarkable life, will find much to gratify, interest, and amuse him in the pages of this book. The story is simply that of a child born in the humblest circumstances, growing up under the most adverse and depressing conditions, over and over again almost borne to the ground in manhood by adversity, nevertheless pursuing throughout, with perfectly unquenchable zeal and love, the search for and the study of the creator's works. A theologian pursuing his studies with equal zeal and enthusiasm would have looked on in the light of a martyr or a saint, but poor Tom Edward, in spite of his homeless life, was considered simply as one not quite *comport mentis*. It is a book every one should read if he can, and may be especially commendable to young gardeners; that they will not find the task very irksome we may show by appending the following extract, of one of many showing the strains to which Edward was reduced in his love of Nature:—

"On one occasion he got some boys to accompany him to a wood near Polmuir, about two miles from town, on a bird-nesting expedition. While they were going through the wood the boys remarked one of the called out, 'A byke, a byke [a bee's' nest], stickin' on a tree, and made o' paper.'

"A byke was regarded as a glorious capture, not only for the sake of the honey, but because of the fun the boys had in skelpin' out the bees. Before they had quite reached the spot, one of the youngest boys yelled out, 'Oh, I'm stung! I'm stung!' He took to his feet, and all of them followed. They had run some distance, and there being no appearance of a foe, a halt was made, and they stood still to consider the state of affairs. But all that could be ascertained was that the byke was on a tree, that it was made of paper, and that it had lots of yellow bees about it.

"This so excited Tom's curiosity that he at once proposed to go back and take down the paper byke. His proposal was met with a decided refusal; and as his insisting upon going back, all the other boys ran away home. Nothing daunted, however, he went back to that part of the wood where the byke had been seen. He found it, and was taking it from the underside of the branch to which it was attached, when a bee lit upon one of his fingers and stung it severely. The pain was greater than from any sting that he had ever had before. He drew back, and sucked and blew the wound alternately, in vain.

"Then he thought, 'What can I do next?' There the byke hung before him. It was still in his power to remove it—if he could. To leave it was impossible. Although he had nothing to defend himself from the attacks of the bees, nor anything to put the byke into when he had taken down, still he would not go without it. His blood would scarcely do. It was too little and too holey. His stockings would not do; as though he wished to take the byke home whole. A thought struck him. There was his shirt! That would do. So he took off his jacket, and disrobed himself of his shirt. Approaching the tree very gently, though getting numerous stings by the way, he contrived to remove the byke from the branch to which it was hanging, and tucked it into his shirt. He tied the whole up into a sort of round knot, so as to keep all in that was in.

"It was now getting quite dark, and he hurried away with his prize. He got home in safety. He crept up the stairs, and put the byke into a box, so that the light of day was clear. But no! he saw his father sitting in his chair. There was an old iron pot in a recess on one side of the chair, in which Tom used to keep his numerous 'things,' and there he deposited his prize until he could

upack it in the morning. He now entered the house as if nothing had happened. 'Late as usual, Tam,' said his father. 'No farther notice was taken. Tom got his supper shortly after, and went to bed. "Where's getting into bed, he went a little out of the way to get undressed, and then, as much unseen as possible, he crept down beneath the blankets. His brother, having caught sight of his nudity, suddenly called out—

"Eh, mother, mother, look at Tam, he hasna gotten his sk'."

"Straightway his mother appeared at the bedside, and found that the statement was correct. Then the father made his appearance.

"Where's your shirt, sir?"

"A I hanna ken."

"What d'na ken I"—addressing his wife—"Where's my strap?" Tom knew the power of the strap, and found that there was no hope of escaping it.

"The strap was brought.

"Now, sir, tell me this instant—where is your shirt?"

"It's in the hole on the stair."

"Go and get it, and bring it here immediately."

"Tom went and brought it sorrowfully enough, for he dreaded the issue.

"And what have you got in it?"

"Yellow bumbee's byke."

"A What?" exclaimed his father and mother in a breath.

"A yellow bumbee's byke."

"Did I not tell you, sir," said his father, "only the other day, and made you promise me, not to bring any more of these things into the house, endangering and molesting us as well as the whole of our neighbours. Besides, only think of your stripping yourself in a wood, to get off your shirt to hold a bees' byke!"

"But this is a new one," said Tom, "it's made o' Paper."

"I made o' fiddlers' ticks!"

"Na; I'll let ye see it!"

"Let it alone, I don't want to see it. Go to bed at once, sir, or I shall give you something (shaking his strap) that will do you more good than bees' bykes!"

"Before the old couple went to bed they put Tom's shirt into a big bowl, poured a quantity of boiling water over it, and, after it was cold, they opened the shirt and found—a wasp's nest!"

Food: some Account of its Sources, Constituents, and Uses. By A. H. Church, M.A. OXON.

This is one of those marvellously cheap and good handbooks for which South Kensington Museum has become famous. As its title indicates, it bears upon the food collection, once a great point of attraction at South Kensington, but now removed to the branch museum at Bethnal Green. The history of this collection, at once so instructive and interesting, is told in a very few words in the preface to the book under notice, how the first suggestion for the formation of such a series was made by Thomas Twining, Esq., the proprietor of the ill-fated Economic Museum at Twickenham, the first arrangement of the collection at South Kensington being made in 1857—Dr. Lyon Playfair, and subsequently Dr. Lancaster, having charge of it, which charge, since its removal to Bethnal Green, has been entrusted to Professor Church, who has re-arranged and enlarged the collection, and produced the admirable descriptions attached to the different products, which in an enlarged and detailed form constitute the bulk of the present volume. The introductory part of the book, on the uses of food, the composition of the human body, the supply and qualities of water, and the chemical composition of foods, is explicitly told in a brief but comprehensive manner. Under the head of "Carbon Compounds or Heat-Givers," we have some information regarding the part which starch plays as a heat-giver in human food. Starch is abundantly contained in the cereal grains, particularly in Rice and Indian Corn, and about 15 per cent. can be obtained from Potatoes. Starch is known in various forms, as Tapioca, arrowroot, sago, &c., amounting each respectively to 81 lb. in every 100, while in fine wheaten flour it is 74 per cent. Wheat 71, and Maize 64. Sugar is another well-known and largely consumed heat-giver. The two principal commercial sources of this commodity is the Beetroot (*Beta vulgaris*) and the Sugar-cane (*Saccharum officinarum*), the latter being the best known, as the bulk of the sugar consumed in this country has until quite a recent date been derived from it. Though widely spread in tropical countries our present supplies of sugar from the Sugar-cane come from Brazil, Mauritius, and the West Indies. Latterly, however, the

Beetroot has become more extensively cultivated for sugar-making purposes, and has largely supplanted the cane. In proof of this we are told that "it has been stated that 700,000 tons of sugar from Beetroot are annually prepared in Europe, an amount which is about half of the total European import of sugar from the Sugar-cane." Of maple-sugar, furnished by *Acer saccharinum*, *A. pennsylvanicum*, *A. Negundo*, and *A. dasycarpum*, we read that "these trees of Canada and the northern United States contain a sap in which about 2 per cent. of cane-sugar occurs. In the spring the sap is collected and boiled down. It is stated that 1,546,000 lb. of maple-sugar were produced in Pennsylvania in 1870."

The distinction between cane and grape sugars is treated in such an interesting manner that we give it in the author's own words:—

"Grape-sugar," he says, "comes next in importance to cane-sugar. Just as the latter sugar is found in many plants besides the Sugar-cane, so grape-sugar is abundantly distributed through the vegetable kingdom; more than this, it may be readily made from starch, dextrin, and cane-sugar by the action of weak acids. But perhaps a still more remarkable mode of obtaining this sugar is by means of the action of strong sulphuric acid or oil of vitriol upon cellulose, the compound which forms the main substance of paper, cotton, linen rags, and some woods. Thus it happens that all these substances are now used for the manufacture of grape-sugar, or glucose, as it is called. This glucose, being immediately fermentable, may be used to strengthen the wort in brewing, and for the direct production of alcohol, which may be made from old rags and waste pawnbrokers' tickets!"

"Grape-sugar, or glucose, exists in three forms at least. Two of these, dextrose and levulose, make up the main bulk of honey; the third, maltose, occurs in malt, a sprouted grain. The variety of glucose called dextrose exists largely in sweet fruits, as the Grape, and crystallises out in hard warty masses when Ripe Grapes are dried, as in the case of Raisins and French Plums. The levulose of honey and of acid fruits will not crystallise, but can only be dried up into a glassy or resinous mass. These sugars, as well as maltose, are less sweet than the common English name being placed first, than the French, German, and Italian, and finally the Latin names, renders the book what it professes to be—a handbook on the all-important subject of food. The analyses also will be found of great interest, many of them being absolutely new and made expressly for this work.

The Lawson Company have issued a sixth edition, in a very elegant guise, of their treatise on cultivated grasses, called *Agrostographia*. But in addition to the text have been rendered necessary, but a series of illustrations have been given of the principal grasses. Of these illustrations the botanical details appear to be the best part, the specimens of the entire plant selected for illustration being in general much too small to be characteristic. The portrait of the late Lord Provost of Edinburgh will be welcome to all those who had the pleasure of his acquaintance.

The indefatigable Baron Von Mueller has gathered into one volume of about 300 pages a great amount of information concerning various plants which might be profitably introduced into cultivation in the colony of Victoria. The volume is entitled *Select Plants readily Eligible for Industrial Culture, or Naturalization in Victoria*, and, apart from its strictly local value, will be useful as a reference-book on the subject of economic botany. The plants are arranged first alphabetically, then geographically, lastly according to their uses. In addition, an index of vernacular names is given.

The *Victorian Year Book, or Notes on the Colony of Victoria* (London: Trübner), is a very valuable digest of the history, geography, meteorology, and social statistics of the colony, which should be perused by all intending emigrants, and should be kept for reference on the library shelves of those who

may at any time need information on this flourishing colony. The climate of Melbourne approximates to that of Lisbon, the seasons, of course, being reversed—thus the spring months are from September to November, the summer months from December to February, the autumn months from March to May, and the winter from June to August. The following are the mean temperatures for the several months:—

January	60.7	July	49.7
February	60.6	August	50.5
March	61.8	September	53.3
April	53.8	October	57.4
May	53.3	November	57.4
June	49.8	December	65.9

In seven years the thermometer in the shade has risen sixty-one times to or above 100° (in the months of November, December, January, and February). In the same seven years there were fifty instances wherein the thermometer fell to or below the freezing-point, July being the coldest month, the lowest temperature registered being only 27° on July, 1869. The mean temperature of the soil at the surface is noted at 62° in spring, 76° in summer, 61.9° in autumn, and 49° in winter, the yearly mean being 62.4°. The following table gives the temperature, omitting fractions, at different depths below the surface:—

Seasons.	14 inches.	3 feet.	6 feet.	8 feet.
Spring	53	87	57	56
Summer	65	67	66	63
Autumn	61	61	61	61
Winter	46	51	53	56
Year.	56	56	56	60

The rainfall is very variable in amount in different seasons, the mean of thirty-five years being 27½ inches, and the number of days on which rain fell 136. In spring there are on the average of fourteen years forty-one days on which rain falls, the amount being 7.79 inches; in summer, twenty-four days, and 6.41 inches; in autumn, twenty-eight days, and 5.7 inches; and in winter, forty-one days, and 5.6 inches of rain. The annual rainfall is not so great as that of Sydney, but much greater than that of Adelaide.

We have next to bring under the notice of our readers a similar publication to the above on the parent colony of the Australias, New South Wales, drawn up by Mr. G. H. Reid (Trübner & Co.). In this volume we have a summary of the history, physical geography, climate, social and commercial history of the colony, and of its various provinces and towns. The account of the various natural resources of the colony, of the favourable climate and other local advantages, impress the reader with a wonderful sense of the future development and possibilities of this the oldest of the Australian colonies—so old, that it has only passed its centenary by seven years, so that Lady Smith, whose death we recorded a few weeks ago, was an infant of three years when Captain Cook first landed in Australia!

Under the title of *Les Aliments*, M. Rothschild has published a translation of Vogt's treatise on the adulteration of articles of food and the means of detecting it. For those to whom Dr. Hassall's book is too bulky the present treatise may be commended. The woodcuts are excellent, and may be recommended to microscopists.

Variorum.

FRENCH STATISTICS.—An article by M. Dubost in *Annales Agronomiques* states that the number of sheep and cattle generally greatly diminished in France in 1872 as compared with 1862 and 1866—a diminution accounted for by the war, the loss of territory, cattle plague, &c. The diminution in the quantity of sheep amounted to no less than five or six millions of animals. The total value of Cabbages, Carrots, and Gourds consumed by thirty-six millions of inhabitants is estimated at fifty millions of francs, or 1 fr. 40 c. a head. Melons are estimated at twelve millions of francs, Asparagus ten millions, Artichokes seventeen millions, salads thirty-five millions, and for various vegetable produce twenty-seven millions of francs. The value of fruits exported annually from France is stated to be thirty millions of francs. In spite of the ravages of the Phylloxera, which have caused the abandonment of 200,000 hectares of vineyards, and will speedily cause the abandonment of an equal area—in

spite of all this, the three last vintages have yielded supplies above the average. The annual produce is about 55,000,000 of hectolires, rather more than half of which are sold; 5,000,000 of 6,000,000 of hectolires are converted into alcohol, and the remainder is consumed by the growers. Of cider the production is estimated at 11,000,000 of hectolires. Of beetroot sugar, 400,000,000 of kilograms are made on the average. The general annual value of the subjoined products is thus given:—

Beetroot (sugar)	180,000,000 francs.
Old-yeilding wines, &c. .. .	100,000,000 „
Wines of the vintage of 1876 ..	100,000,000 „
Olive, Walnut, and Almond ..	75,000,000 „
Silk-worms	35,000,000 „
Dye-plants	35,000,000 „
Miscellaneous	25,000,000 „
Total	513,000,000 „

TREE FILLING BY ELECTRICITY.—The accompanying note is from the *Homesward Mail*:—

“A novel and interesting experiment has been attempted in the compound of the Strangers' Home, Marazion, and there can be little doubt that ultimately great results will accrue from what may at first sight appear to have been not a great success. The experiment referred to was tree-filling by electricity instead of by the ordinary method of the clumsy axe. The patentees of the recent Mr. R. S. Furlinson and Mr. W. J. H. Martio, both of Bombay, and the experiment was conducted by Dr. Lyons. The plan is simple. The two ends of the copper wire of a galvanic battery are suspended with platinum wire, which of course instantly becomes red-hot, and while in that state it is gently sawed across the trunk of the tree to be felled. When arrangements were made for the experiment, it was never for a moment doubted that the enterprising merchants of Bombay were possessed of all the made thickness of platinum wire, but it turned out that the thickest that could be got was only that of crochot cotton. It was at once seen that a wire of such thinness would be consumed before the tree was half severed from its trunk. However, the attempt was made. The burning wire performed its task very well so long as it lasted, but, as anticipated, the wire continually broke, and at length there was no wire left. There can be little doubt that with a stronger battery—the one used was only a twelve-chambered one—and a thicker wire, the experiment would have been entirely successful. As it was the wires of a galvanic battery are through. It is calculated that under proper conditions a tree, which at present takes two hours to fell, will come to the ground by this process in fifteen minutes. It is needless to add that there is no waste of wood, no saw-dust. The process is one worth the attention of all Governments engaged on forest clearing.”

THE NETTLE TREE, CELTIS AUSTRALIS, although of moderate dimensions, furnishes a timber of great commercial value, and the slender flexible branches are in great request in many parts of Europe for whip stocks. In the neighbourhood of Udine, according to the German papers, large plantations are now cultivated, actually tilled, and manured. The trees are planted about 6 feet apart, the lower branches being trained off, and in two years the trunks attain a diameter of 6 to 8 inches. The wood from these plantations is fine-grained, is easily cleft, and, being of a beautiful yellow colour, fetches a higher price than the ordinary quality. In Istria this tree is commonly planted in the squares and near churches. In Moschenizza there is a tree with a trunk 5 feet in diameter at the base; and in Gemino there is one 6 feet in diameter, supposed to be a thousand years old.

The Weather

STATE OF THE WEATHER AT BLACKHATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 28, 1877.

MORNING AND DAY.	BAROMETER.	TEMPERATURE OF THE AIR.		HYGROMETRY.	DIRECTIONS AND QUANTITIES OF WIND.	RAINFALL.
		At 8 A.M.	At 4 P.M.			
Mar 27	30.1	49.3	36.7	92	S.W.	0.1
28	30.0	49.3	36.7	92	S.W.	0.1
29	30.0	49.3	36.7	92	S.W.	0.1
30	30.0	49.3	36.7	92	S.W.	0.1
31	30.0	49.3	36.7	92	S.W.	0.1
Mean	30.0	49.3	36.7	92	S.W.	0.1

- March 22.—Fine but cloudy till 3 p.m. Very dull and cloudy with heavy showers of rain till 10 p.m. High 8.8 p.m.; cloudless afterwards. Hoar-frost in morning.
- 23.—A fine day, partially cloudy. Snow and sharp frost in morning. Rain at eight.
- 24.—A fine, cloudy day, with intervals. Heavy rain in early morning, and frequent showers after 3 p.m.
- 25.—A very fine bright day, partially cloudy. Showers in early morning, and at 6.30 p.m.
- 26.—A fine, cloudy day, with rain throughout.
- 27.—Fine and bright till 3 p.m. overcast, dull with rain till 9 p.m. Cloudless afterwards. A little rain also fell in early morning.
- 28.—Fine and bright, cloudy at times. Little rain fell in early morning.

LONDON: Barometer.—During the week ending Saturday, March 24, in the suburbs of London the reading of the barometer at the level of the sea decreased from 29.66 inches at the beginning of the week to 29.29 inches by the night of the 20th, increased to 29.79 inches by the morning of the 23d, and decreased to 29.01 inches by the end of the week. The mean reading for the week at sea level was 29.43 inches, being 0.25 inch below that of the preceding week, and 0.51 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 53° on the 24th to 41° on the 21st; the mean value for the week was 48°. The lowest temperatures of the air observed by night ranged from 20½° both on the 22d and 23d to 33° on the 24th; the mean value for the week was 29½°. The mean daily range of temperature in the week was 18½°, the greatest range in the day being 24½°, being 0.25 inch below that of the preceding week. The mean daily temperatures of the air during the week were as follows:—18th, 39.6; 19th, 30.7; 20th, 35.3; 21st, 35.2; 22d, 35.6; 23d, 36.7; 24th, 41.3; and the departures in defect of their respective averages were:—21st, 4.8; 22d, 3.8; 23d, 6.6; 24th, 5.3, and 0.8. The mean temperature of the air for the week was 37.2°, being 4.6 below the average of observations extending over a period of six years.

The highest readings of a thermometer, with blackened bulb in vacuum placed in sun's rays, were 109° on the 18th, 111½° on the 23d, 115½° on the 24th; on the 20th the reading did not rise above 46°. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 22° on the 22d, and 25° on the 19th, on the 24th the lowest reading was 30°.

Wind.—The direction of the wind was variable, and its strength moderate. The weather during the week was fine and cold, with fine and hail showers fell on the 20th, 21st, 22d, and 23d.

Rain, hail, or melted snow was measured on five days during the week, the amount collected was 0.73 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 54½° at Bristol and 53½° at Cambridge; at Bradford 46° was the highest temperature, the mean value for all stations was 50½°. The lowest temperatures of the air observed by night were 23° at Nottingham, and 24° at both Eccles and Hull; at Leeds 31° was the lowest temperature. The general mean from all stations was 27°. The range of temperature in the week was the greatest at Nottingham, 28½°, and the least at Leeds, 16°. The mean range of temperature from all stations was 23½°.

The mean of the seven high day temperatures at Bristol, 49½°, and the lowest at Bradford, 43½°, the mean value from all stations was 46½°. The mean of the seven low night temperatures was the lowest at Wolverhampton and Eccles, 27½°, and the highest at Portsmouth, Norwich, Liverpool, and Sunderland, all 30°. The mean daily range of temperature in the week was the greatest at Eccles, 20½°, and the least at Norwich, Liverpool, and Bradford, all 16°. The mean daily range from all stations was 16°.

The mean temperature of the air for the week from all stations was 37½°, being 2½° higher than the value for the corresponding week in 1876. The highest temperature at Sunderland, 39°, and the lowest at Wolverhampton, 34½°.

Rain.—The amounts of rain and melted snow measured at the various stations ranged between 1½ inch at Stratford and Sheffield, and one-tenth of an inch at Nottingham, Bradford, and Leeds; the average fall from all stations was half an inch.

The weather during the week was somewhat fine but cold, with snow showers. Thunder was heard at Cambridge and Sunderland on the 22d, and lunar halos were seen at Cambridge on the 19th, 20th, 21st, 22d, and 23d inst.

SCOTLAND: Temperature.—The highest temperatures of the air observed by day varied from 49° at Edinburgh and Aberdeen to 44° at Aberdeen; the general mean from all stations was 47½°. The lowest temperatures of the air observed by night ranged from 23° at Perth to 28° at Greenock; the mean

from all stations was 25½°. The mean range of temperature in the week from all stations was 21½°.

The mean temperature of the air for the week from all stations was 56½°, being 1° lower than the value for the corresponding week in 1876. The highest was 38° at Greenock, and the lowest 3° at Perth. *Rain.*—The amounts of rain or melted snow measured at the several stations varied from six-tenths of an inch at Greenock to one-tenth of an inch at Leith and Perth; the average fall over the country was a quarter of an inch.

DUBLIN.—The highest temperature of the air was 49°, the lowest 23½°, the range 25½°, the mean 37½°, and the fall of rain was 1½ inches. **JAMES GLAISHER.**

Obituary.

WE regret to record the death, on March 23, of Mr. THOMAS DICKSON of Chester, the youngest son of the late Mr. Francis Dickson, the founder of the well-known firm of Francis & Arthur Dickson & Sons, of which Mr. Arthur Dickson is now the head.

Enquiries.

17. HOSE REEL WANTED.—I shall be obliged if you, or any of your readers, can inform me where I can obtain a reel of the kind alluded to in article 16, and my water tubing for watering my garden and glass houses in the following manner: I have 80 feet of tubing fixed to a waterworks tap, whereby I get an unlimited supply of water at all times, and I wish to connect this tubing round a wheel placed as a fixture near the tap, which will revolve so easily as to admit of my carrying, in my hand, the end of the hose and delivering the water just as I require to water the plants or borders and no further, leaving the rest of the tubing round the wheel, and which must be sufficient diameter to allow the water to pass through it, and so that when I have finished watering I can wind back the tubing on to the wheel, there to remain until again required to be used. The utility of such an implement must be apparent to all, and the amount of preserving the tubing from constant bursting by getting into angles whilst in use. *A Constant Reader.*

178. TOXICOPHILA SPECTABILIS.—I shall be obliged to any of your correspondents who have flowered this plant if they would give me the course of cultivation they followed. The plant I have is old, apparently healthy, ripens its growth, and is in fruit, in a small pot for the size of plant, but it never shows for bloom. *T. P.*

179. LIME FOR CHALK SOILS.—A great part of our nursery is a light sandy loam, resting on a subsoil of broken chalk and stones, and where the soil is present chalk is thrown in more or less quantities to the surface. There are some spots in this soil (which, however, are not by any means those where the chalk is present in greatest quantities) which, in spite of heavy manurings, refuse to grow the trees planted on them with any degree of vigour. Can any of your correspondents give me any information as to what soil is this, and in what quantities in considerable quantities are ever benefited by applications of lime, and, if so, to what extent the lime should be applied? *E.*

Answers to Correspondents.

ADIANTUMS: A.M. The fronds have probably been caught by some of the gleams of sunshine we have had, and in this way become browned. The remedy would be to keep them shaded during bright intervals.

AVICULARIA EQUISETI. The next of this plant is Cornacene.

BEETLES: E. Holmes. *Hylobius Abietis*; feeds on Conifers.

CLEMATIS: J. E. M. J. You can propagate either by layering or grafting the eyes on pieces of Clematis root. The latter is the best process if you require quantity—that is, supposing you have the proper appliances of propagating pits, &c., but the former will give you a limited number of strong plants in a short period.

CREPES: O. M. Barrett. *Stantonia latifolia*, or *Passiflora coralica*.

GLADIOLUS: F. O. C. No. 3 is the correct one—*Gladiolus*.

GRAPES: F. J. Your Grapes are badly attacked by a disease known as "rust," which is brought about in several different ways, such as sanding a cone or net, or by rubbing them with the hand while thinning them, or by the application of sulphur to the pipes, &c. The only way to stop it is to guard against these contingencies.

INSECTS ON VINES: A. E. The insect was hopelessly smashed when it reached the soil, and your sample in a quart jar is all that remains.

NAMES OF PLANTS: P. Ered. We cannot undertake to name garden varieties of *Camellia*, or forists' flowers, or plants of the same name, such as *Camellia Lowiana*; 2, *Picea grandis*;—*J. K. M.* The Orchid is *Trichopilia suavis*;—*L. P.* *Eria obesa*.—*P. H. G.* *Schlimia trifida*.—*C. R.* 1, *Dendrobium*

also sanguineum, one of the best flowers we ever saw; ...

NEPENTHES RAFFLESIANA: Y. A. S. Your plant with 9 inches of bare stem and only four leaves is evidently ...

UPAS TREE, &c. I. C. A. I. Antiaris toxicaria, nat. ord. Artocarpaceae, native of Java; ...

VINE LEAVES, &c. I. W. The Primroses and Poly-anthuses we cannot undertake to name. The vine shines appear to have been scalded. The bright sun ...

VINES: Y. S. Your vines, we fear, hopeless. The insects which have been attacked at an earlier stage ...

CATALOGUES RECEIVED: Messrs. Ellwanger & Barry (Mont Hope Nurseries, Catalogue of Plants, &c. ...

COMMUNICATIONS RECEIVED: W. D. Anticipated in the ...

Markets.

COVENT GARDEN, March 28.

This being Passion Week, business has been at a standstill, consequently perishable goods have been with difficulty cleared off lower rates. James Walker, Wholesale Apple Market.

PLANTS IN POTTS.

Table listing various plants in pots such as Anselms, Begonias, Bouvardias, etc., with prices per dozen.

CUT FLOWERS table listing items like Lily of the Valley, Carnations, Cyclamen, etc., with prices per dozen.

VEGETABLES table listing items like Artichokes, Egg, Globe, d. 0-6, etc., with prices per bush or per 100.

FRUIT table listing items like Apples, Peaches, Pears, etc., with prices per dozen.

CORN.

Trade at Mark Lane on Monday was on the whole decidedly heavy. Wheat of superior quality and in good condition was well held at the prices of the previous Monday. But for inferior and ill-conditioned ...

CATTLE.

At the Metropolitan Market on Monday trade in beasts was dull and prices lower. There being a reduced demand for sheep, prices gave way in some instances. Good calves continued scarce and dear. Cumbrian ...

HAY.

Owing to the supply at Whitechapel market on Tuesday being large, trade was dull, and prices for clover were somewhat lower. Prime clover, 100s. to 120s.; inferior, 70s. to 85s.; and straw, 40s. to 45s. per load. Cumbrian Market quotations: Superior meadow hay, 120s. to 135s.; inferior, 100s. to 115s.; superior ...

POTATOS.

At the Borough and Spinnfields markets supplies of Potatoes have been plentiful and prices were very well supported. Kent Regents, 100s. to 120s. per ton; Essex do, 80s. to 110s.; Scotch do, 95s. to 110s.; rocks, 65s. to 80s.; Bales, 120s. to 150s.; Victoria, 120s. to 125s. bags 4s 6d. The imports into London last week comprised 28,553 bags from Hamburg, 21,375 Antwerp, 6,095 Ghent, 1,200 Bremen, 250 packages 291 casks Malaga, 100 bags Bonaire, 2,245 casks 100, 200, 250, 275 bags 4s 6d. Bonaire, 210 sacks Rouen, 223 bags Dordrecht, and 100 Rotterdam.

COALS.

There was a small supply of house coals at market on Monday owing to the detention of the steamers through stormy weather, and the prices advanced 1s. per ton. Quotations: Best Wyllin, 12s. 6d.; Victoria, 12s.; Hutton, 2s.; Hutton Lyons, 17s. 9d.; Lambton, 19s. 6d.; Tunstall, 17s. 9d.

By Her Majesty's Patent Solicitors, Messrs. W. & A. G. Letters Patent

WRIGHT'S ENDLESS-FRAME-IMPACT HOT-WATER BOILERS.

GUARANTEED The most Powerful, the most rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future.' I have no doubt about this."—Wm. THOMSON, Trinidad Vineyards.

From the "Gardener," March, 1877.

WRIGHT'S PATENT ENDLESS FLAME-IMPACT BOILER.

"This boiler is attracting a good deal of attention in the horticultural world at the present time; and as I have just had one of their largest-sized ones fitted up here, and have now got it in operation, I will be allowed to give you some information which may not be without some advantage to some of your numerous readers. I have had some experience as to the annoyance and extra labour which would be incurred by any improvement effected in these to save labour and fuel demands the attention of all horticulturists who are engaged in the raising of plants in the open air, and in the case of the greenhouse being in the centre, two lean-to Vineries on each side, with Camellia-houses and general plant-houses at right angles to the main body, and a Fern-house, partly lean-to and partly span, 10 feet in length, varying in width from 20 to 25 feet. Attached to each lean-to-house is our laundry, with a drying chamber fitted up with about 50 sq. ft. of 4-inch piping.

The whole of the above houses are heated with hot water, and have a total of about 2500 feet of 4-inch piping. We had formerly used a boiler, one being 12 feet 6 inches long, the other 4 feet long. With these two boilers kept hard fire we always found great difficulty in keeping up the temperature during the winter months, and it was necessary to attend to the fires. On the last day of last year the larger boiler came to grief, the water from it dropped out of the fire; and in the evening the boiler was so hot that it had cracked beyond repair. To be thus left in the middle of winter with a boiler out of the job, was a most serious matter, and another without delay. I have given a good deal of attention to the construction of hot-water boilers, and I must say I had never seen a boiler of the kind you describe, and I thought I would until some time ago my attention was called to a drawing of a boiler of the kind you describe, and I thought I would try it. After talking the matter over with my employer, W. S. Mitchell, Esq., he at once granted permission to get the boiler in the hands of Messrs. Melkic & Philp, boilerhouse builders and hot-water engineers, Torphichen Street, and they have fitted up and attached the fire at the end of the boiler. I also got some additional light valves attached, so that if any stoppage should occur it may be attended to without disturbing the plants.

And now as to the capabilities of the boiler for the work. As formerly used, it was a considerable difficulty in keeping up the heat of the two oval boilers kept hard at work. I now find that with the remaining boiler, and the addition of the heat of the boiler in the laundry to a degree they were never before, and that with much less coal than it took to fire one of the oval fires.

"Our chimney consists of a 7-foot 70 feet long, led horizontally through centre of back wall, with 18 feet of a perpendicular stack. Some doubt was expressed that, as we required a chimney pipe attached to boiler about 6 feet long, there would be deficiency of draught; but we have found the opposite to be the case. I attached a 6-foot length of 8-inch stove pipe, with elbow at boiler, and cleaning door on the angle, and 4s I found the draught to be very good, and the boiler to be kept at the bend of the stove pipe, and am able to regulate the fire to a nicety, and by breaking up the fire at the end of the boiler, I find it is very easy to leave it to its work with the greatest confidence till the usual time of commencing labour the following morning, and it may be attended to sit up firing the half of the night at times, and sometimes whole of the night, we can retire to rest at a reasonable hour, confident of sleep, and undisturbed by any noise or smoke, or the fire getting fraint to go out. In concluding my remarks I may say that I have no objection in saying that for rapidity of circulation, small consumption of fuel, portability, and cleanliness, it is, in my opinion, the best boiler in the world. I am, Sir, your obedient servant, Wm. Wright & Co., Glasgow.

"I have taken the most perfect 'Heat Trap' yet invented."—THOMAS THOMSON, Drumsburg Park.

For details and particulars as to the various sizes made, and prices, please see our pamphlet, entitled, 'OUR HOT-WATER AND STEAM-BOILERS, &c.' which will be handed to you on application. We are prepared to supply Thirty Different Boilers of all powers, sizes, and heights, and can vary them to suit any particular situation or requirement.

WM. WRIGHT & CO., HOT-WATER ENGINEERS, AIRDIE, near GLASGOW, N.B.

SPECIAL NOTICE.

GRAND EASTER GIFT.

THE FINEST AND MOST VALUABLE GIFT EVER OFFERED.

EACH READER of this PAPER will be entitled to receive from the NATIONAL FINE-ART UNION, 35, Great James Street, London, W.C., a copy (23 inches by 16 inches) of the beautiful Steel-Plate Engraving, entitled

WARWICK CASTLE.

(COPYRIGHT.)

This Magnificent Picture has been specially Engraved to form a companion to that of WINDSOR CASTLE, and it is only necessary to state that the artistic merit and skill displayed in Engraving WARWICK CASTLE is fully equal, if not superior, to that of WINDSOR CASTLE.

This great work may fairly be considered as one of the finest productions of high art of modern times: it is from the celebrated Picture painted by E. DUNCAN, Esq., and is engraved in the finest style on steel by that well-known artist, G. GODFREY, Esq.

The scene is an English Pastoral one, and is one of the best examples of the English School, which is well-known to be the finest and richest in Landscapes of all the various Schools of Art. In the foreground are groups of cattle drinking from a stream of crystal clearness, which meanders through the most luxuriant and picturesque district of our island home. The magnificent woodland, in all the glories of light and shadow, stretching away to the right, leaves the central portion of the picture open for the portrayal of the most complete representation of simple and sweet country life, while the gigantic old Castle rising upward in the distance tells of a power and greatness which shall protect our hearths and homes for all time. In this picture will be found the only representation extant of that portion of Warwick Castle lately destroyed by fire. The associations that crowd around this historic structure, in which the Great Earl of Warwick, called "The King Maker," lived, are fitly exemplified in the work itself, while the ability displayed in engraving it cannot be too highly praised. It has both an historical and an artistic value, while its intrinsic worth may be gathered from the following:—

"March 29, 1877.

"Dear Sir,—The Engraving of WARWICK CASTLE is copyright, and has never been issued under the regular retail price of One Guinea. (Signed) "CHARLES GOOLD, Manager.
"National Fine-Art Union, 35, Great James Street, London, W.C."

THIS GRAND PRESENTATION PICTURE, the original of which was only finished in 1876, will be given to each reader of this Paper who cuts out the Redemption Bond found below, and sends it to the National Fine-Art Union, 35, Great James Street, London, W.C., together with 13 stamps, or P.O. Order for 1s., payable to CHARLES GOOLD, at the General Post Office, London, E.C., to pay the cost of case, transmission, copyright, and other charges. It will then be sent free to all parts of Great Britain and Ireland, securely packed and warranted to reach its destination uninjured.

Cut out this Bond, and send it to the National Fine-Art Union, 35, Great James Street, London, W.C.

G. C., 18	REDEMPTION BOND.
<i>This Bond entitles the holder to one copy of the beautiful Steel Plate Engraving of</i>	
"WARWICK CASTLE"	
(Copyright),	
And must be sent, together with Thirteen Stamps, or Post-office Order for 1s., to	
THE NATIONAL FINE-ART UNION,	
<small>who will redeem it in the order it is received.</small>	
(Signed)	NATIONAL FINE-ART UNION, <small>35, Great James Street, London, W.C.</small>
N.B.—NOT AVAILABLE AFTER APRIL 17, 1877.	

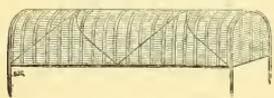

NOTE THESE INSTRUCTIONS.—All Bonds must be sent in on or before April 17, 1877. The Bond must in all cases be sent. Each copy will be sent securely packed. One copy will be sent for each Bond, and NONE CAN BE SENT WITHOUT ONE, EXCEPT UPON THE RECEIPT OF TWO GUINEAS. The Bond will not again be printed in this Paper, hence the advisability of at once cutting it out and sending it for redemption, as each will be attended to in rotation as received.

 *The Picture is well worth handsomely framing, and its artistic merit and intrinsic value will render it a desirable addition to every household.*

**MESSENGER & COMPANY,
 CONTRACTORS, MIDLAND HORTICULTURAL BUILDING
 and HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,**

Req. to inform their numerous Patrons and the Public
 generally, that having erected new, more extensive, and com-
 modious works, fitted with the best steam-power machinery, for
 the construction of Horticultural Buildings in wood or iron,
 plain or ornamental, large or small, they are in a position, from
 their great facilities and experience, to carry out with dispatch,
 in the best manner, at very moderate cost, the orders with
 which they are entrusted. Only thoroughly well-seasoned

timber used. Glasshouses erected on Messenger's patent
 principles are, owing to mechanical arrangements, very strong,
 most durable, light, elegant; perfect efficiency for purpose
 intended is guaranteed; are economical in cost and maintenance.
 Messenger's Patent Boilers, Flexible Jointed Hot-water Pipes
 and Valves, are now in use in many thousands of instances,
 with the greatest success. Particulars on application. Plans
 and Estimates forwarded. Ladies and Gentlemen waited upon.

The Plans of Landscape Gardeners, Architects, and others carried out. Richly Illustrated CATALOGUE post-free for 3d stamps.
 Illustrated CIRCULAR of Messenger's Improved Patent Tubular Saddle Boiler free.

THE THAMES BANK IRON COMPANY,

"None who take an interest in the construction of houses, or in the management of their contents, should fail in adding this to their collection, however complete that may already be."—*The Farmer, November 13, 1877.*

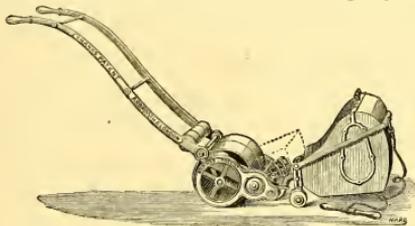

"The instructions given for the cultivation of the Vine and other crops are essentially practical, and are evidently written by one who has himself performed all the operations before he attempted to instruct others."—*Journal of Horticulture.*

SHANKS' NEW PATENT

LAWN MOWERS,

Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate* or *Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY AND DONKEY MACHINE.	
10-inch Machine	£13 0 0	25-inch Machine	£13 10 0
12-inch Machine 15 0 0	28-inch Machine 15 15 0
14-inch Machine 18 0 0	30-inch Machine 17 0 0
16-inch Machine 21 0 0	The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.	
18-inch Machine 25 0 0	Price, for the 25-inch and 30-inch Machines, 30s. extra; 25-inch Machine, 22s. extra. Silent Movement, 22s. 6d. extra. Boots for Pony, 24s.; Donkey, 20s. per set.	
20-inch Machine 30 0 0	NEW HORSE MACHINE.	
22-inch Machine 35 0 0	42-inch Machine	£28 0 0
24-inch Machine 40 0 0	48-inch Machine 32 0 0

The Hand Machines are all fitted with Silent Movement, and can be used either with or without the usual Front Rollers.

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.

Price, for the 28-inch, 42-inch, and 36-inch Machines, 42s. extra; for the 30-inch, 30s. extra. Silent Movement, 20s. extra. Boots for Horse's feet, 25s. per set.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

Are warranted to give ample satisfaction, and if not approved of can be at once returned.

ALEXANDER SHANKS & SON,

Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.

27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power. Orders executed same day as received.

Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 50s.

SHAW'S TIFFANY, ELASTIC NETTING, CANVAS, &c., for Shading, Protecting, and other Horticultural Purposes. For Samples and Prices apply to JOHN SHAW AND CO., 29, Oxford Street, Manchester.

BOULTON & PAUL, HORTICULTURAL BUILDERS, NORWICH.

One Hundred Melon and Cucumber Frames and Lights, glazed with best 21-oz. glass of the following sizes, ready for delivery. LISTS, with full particulars, post-free:—

1-light frame, 4 feet by 6 feet ..	£1 7 6
2 " " 8 " " 6 " " ..	3 5 0
3 " " 12 " " 6 " " ..	4 17 6
4 " " 16 " " 6 " " ..	6 7 6

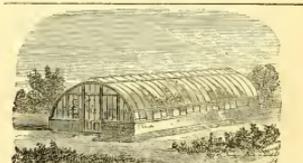

Carriage paid to any Railway Station in England and Wales, also to Dublin, Edinburgh, and Glasgow, on Orders amounting to 40s. and upwards.

PATENT PLANT PRESERVER LISTS post-free. GREENHOUSE LISTS post-free. Horticultural Buildings of any description and dimension. Designs prepared. Estimates free of charge. BOULTON & PAUL, Norwich.

Metallic Hothouse Builder to Her Majesty. HENRY HOE & CO.

(late Clark & Hope, formerly Clark), HOTHOUSE BUILDER and HOT-WATER APPARATUS ENGINEER.

55, Lionel Street, Birmingham. Established A.D. 1848. BOOKS of DESIGNS, 2s. each. The Extensive Ranges of Metallic Hothouses in the Royal Gardens, Windsor and Osborne, were executed at this Establishment.

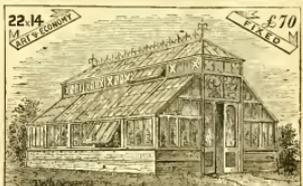

LASCALLE'S PATENT BENT WOOD CONSERVATORIES and GREENHOUSES.—All Gardeners know that Wood is better than Iron for Plant Growing, and by the above system a handsome curved house can be erected as cheaply as a plain straight one. The curved house is more durable, stronger, lighter in construction, and no bent glass is required. W. H. LASCALLE, 222, Finsbury Row, London, E.C., will supply Drawings and Estimates free of charge.

WORKS: ANCHOR STREET, CHELMSFORD.

THE FLORIST and POMOLOGIST for

MARCH contains splendidly coloured Portraits of the NEW MAGNA CHARTA, and two little-known winter Pearls of high merit, viz., AMIRAL CEXILE and BEURRE DE JONGHE, with Mr. Horner's Chapter XI. on Avocado, Mr. Dowell's Chapter XV. on Carnations; Mr. Barron's Chapter XII. on Vases and Vine Culture; Mr. Webster's Essay on a Garden of Flowers from July to November, and other interesting papers.

The number for APRIL will contain fine illustrations of the seedling of the GARDEN CALVEY, the new variety of the BEGONIA DAVISI, and the following papers on interesting garden topics:—Chapter XII. By the Rev. F. D. Horner. Chalmers Boule de Neige. By Mr. J. W. Lawrence. Claretine de Cassagnes, hardy in Faints. By Mr. H. Chalmers. By Mr. F. D. Horner. By Mr. J. W. Lawrence. Striped Bearing Apple (Illustrated). By Mr. J. W. Lawrence. By Mr. F. D. Horner. The Chief Source of Improvement. By Mr. W. Easley. Notes on Melons and Cucumbers. By Mr. W. Tillery. Culture of France in the South as always been its strength. The Culture of Wall Fruits.—Chapter IX. By Mr. J. Cox. The Carnation and Plectro.—Chapter XVI. By Mr. A. S. Dowell.

Vills Gardener for April. By D. Gardner. The National Fruit Society, National Agricultural Society, National Rose Society, Pelargonium Society, Spanish Memorial Fruit, White Crown and the Birch, Memorial to Mr. Van Houtte, Altes Melocotron, Argyraema. Price, 1s. monthly, or free by post, 3s. Publishing Office, 171, Fleet Street, London, E.C.

In a vol. 8vo, with about 10,000 Woodcuts, price 4s. QUINN'S & CO.'S ENCYCLOPEDIA OF THE ARTS AND PLANTS: comprising the specific character, description, culture, history, application in the arts, and every other desiderata pertaining to the same. The Midland Counties Herald cultivated in, or introduced into Britain. Corrected by Mrs. London; assisted by George Don, F.L.S. and David Wooster. This delightful work is of the greatest utility to gardeners, and indeed, to all who have not access to great libraries. The great number of the work has always been its only drawback, which, although only miniatures, were nevertheless drawn by Mr. Sowerby with such happy art, and so skillfully engraved by Francis & Taylor, as to always be recognised, even by those little acquainted with the vegetable kingdom. Gardener's Chronicle. London, LONGMAN, AND CO.

Farms, Estates, Residences. Any one desiring Renting a Farm, or Residence, or Purchasing an Estate, can have copies of the MIDLAND COUNTIES HERALD supplied gratis for the purpose of forwarding the particulars of the property required, forwarding name and address, and six halfpenny stamps for postage, addressed, "The Midland Counties Herald, Advertising Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to Let.

BULLETIN HORTICULTURE DE FLORE CULTURE, et de CULTURE MARAICHERE. A monthly horticultural work, with superb Coloured Plates and Illustrations. Published by B. BOUVIER, E. PAYMART, R. ROZAS, and H. J. VAN HULLE, Professors at the Horticultural Garden of the Belgian Royal Gardens. Post paid, 10c per annum. H. J. VAN HULLE, Botanical Garden, Ghent, Belgium.

ADVERTISERS are requested to note that although we do not object to receive advertisements to be called for, we cannot undertake to forward them.

WANTED, by a Nurseryman and Seedsmen in the North of Ireland, a YOUNG MAN to assist at the Books and Seed Department when required.—Address, stating previous engagements, salary required, &c., Z. Hurst & Son, 6, Leadenhall Street, London, E.C.

WANT PLACES.

B. S. WILLIAMS, having at the present time several very handsome and practical Men's Registers, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time be glad to state that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence.—Apply to B. S. WILLIAMS, Victoria and Portland Road, High Holborn, London, N.

E. G. HENDERSON. E. G. AND SON have many excellent GARDENERS of approved testimonials for ability now waiting in their Nurseries for engagement.

E. G. H. & S. can be pleased to answer any enquiries from Nobleman and Gentleman requiring such.—Pine-apple Nursery, Maida Vale, London, W.

Head Gardeners. JOHN LAING AND CO. can at present recommend several very experienced and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments or Simple-hand Situations, can be suited, and have full particulars by applying at Standed Park and Keston Park Nurseries, Great Hill, London, S.E.

GARDENER (HEAD).—Age 30, married; understands Vines, Melons, Cucumbers, Orchids, Stove and Greenhouse Plants, Fencing, &c., and general routine of gardeners' work.—Apply to—GIBBS, Siskington Hall, Wansford.

GARDENER (HEAD), where two or more are kept.—A. HUGHES, Gardener to Sir Gilbert Gubbins, at Welton Hall, Lincolnshire, has the confidence recommended his Foreman, who has been with him six years, as a thoroughly competent, practical, and trustworthy man. He has had sixteen years' experience.—Apply to—GIBBS, Siskington Hall, Wansford.

GARDENER (HEAD), where one or more are kept.—Married; thoroughly understands the profession in all its branches. Fifteen years' experience in some of the best establishments in the country. Formerly employed of Land. Good character from present and previous employers.—CHARLES HENDON, The Gardens, Kenwood House, Hampstead, N.W.

GARDENER (HEAD, or SINGLE-HANDED).—Age 31, married; fifteen years' experience. Good character.—J. P., Post-office, Oxford.

GARDENER (HEAD, WORKING).—Age 32, married, one child; understands the profession. Good character.—A. B., Post-office, Emsay Heath, Herts.

GARDENER (HEAD, WORKING).—Young; experienced in all branches of the profession. Highest references as to character and ability.—A. B., Nevent, near Gloucestershire.

GARDENER.—JOHN COWAN, the Vineyard, Goring near Liverpool, would be glad to recommend to any Nobleman or Gentleman requiring a first-class Gardener, a man in the prime of life, who thoroughly understands the profession in all its branches, and who has had twenty years' experience in some of the best places in England and Scotland.

GARDENER (SECOND), or FOREMAN in a good Establishment.—Age 25, married; thoroughly experienced; good character.—E. VINCE, Sandridge Park, Bromley, Kent.

GARDENER (UNDER), in the Houses, in a Gentleman's Garden (large).—Young; steady. Excellent character.—Apply, by letter, to—W. CLAYDON, The Lodge, Waltham, Essex.

GARDENER (UNDER), where several are kept.—Age 18. Good character.—W. CLAYDON, The Lodge, Waltham, Essex.

GARDENER (UNDER).—Age 22; well up in Glass. Two years' good character.—Apply, by letter, to—C. W. ROSE, 10, Old Street, London, W.

GARDENER (UNDER).—Age 18. Three years' good character. Country not objected to.—Apply, stating wages, to J. S., 11, Queen's Road, Norland Square, Notting Hill, London, W.

FOREMAN, or SECOND, in a good Establishment.—Age 25; eleven years' experience. Good references.—J. S., Post-office, Dorking, Surrey.

FOREMAN, or SECOND, in a Nobleman's or Gentleman's Garden.—Age 45; twelve years' experience in all branches of the profession. Good character. State wages given.—J. T., Post-office, Streatham, S.W.

FOREMAN, or SECOND, in a good Establishment.—Age 23; seven years' experience. Good testimonials.—Apply, stating particulars, to A. B., 20, Cleveland Street, Holgate, York.

FOREMAN, or SECOND, in a Gentleman's or Nobleman's Garden.—Age 44; has a good general knowledge of the House Work. First-class character from present and previous employers.—Apply, by letter, to—J. D. O'LEARY, Terrace, Nightingale Road, Wood Green, N.

FOREMAN, or SECOND, in a Nobleman's or Gentleman's Garden.—Age 25; understands Early and Late Fencing, both Fruit and Flowering, &c., and good recommendation from last place. State wages given and all particulars.—F. W., Branton, near Hereford.

To the Nursery and Seed Trade. TRAVELLER.—SYDNEY BARRATT will shortly be disengaged, and offers his services to those requiring an efficient Traveller. References.—68, Copwer Road, South Hoxsey, London, N.

E. P. S. S. C. O. C. O. A. —By a thorough knowledge of the natural, which governs the operations of digestion and nutrition, and by careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure and healthful food, and good habits of living.—GEO. JAMES EPPS & CO., Sole Importers, London, W.

JAMES EPPS & CO., HOMEOPATHIC CHEMISTS, 175, New Bond Street, London, W.

KINAHAN'S L.L. WHISKY. Kinahan & Co. finding that, through the recognition of the Medical Profession, the demand for their CELEBRATED OLD L.L. WHISKY for purely medicinal purposes was increasing, they have caused the following Analysis by Dr. Hassall:—"I have very carefully and fully analysed samples of this Whisky, and find that it is of a pure, wholesome, soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality. The Medical Profession may feel confidence in the purity and quality of this Whisky."—No. 26, Great Titchfield Street, Oxford Street, London, W.

DINNFORDE'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOIT, and INDIGESTION; also for the relief of the most delicate Constitutions. Ladies, Children, and Infants.

DINNFORDE AND CO., 175, New Bond Street, London, W., and all Chemists.

HOLLOWAY'S PILLS.—Importance of the Blood. To ensure health it is absolutely necessary that the fluids and solids of the human body should be kept free from those impurities which are continually gaining admission to the system, either by the action of some atmosphere, or disordered stomachs. The only safe and certain mode of getting rid of these impurities is by the use of Holloway's Pills, which have the power of cleansing the blood from all obnoxious matters, at the same time removing all irregularities which their presence may have already produced. Holloway's Pills effect all humours which taint or impoverish the blood, and thereby purely and invigorate and give general tone to the system. Young or old, robust or delicate, may experience their beneficial effects.

GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

Or NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H. R. H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

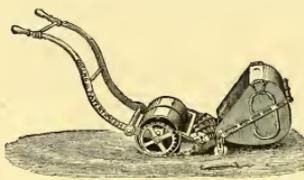

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their special advantages:—
 1st. Simplicity of Construction—every part being free of access.
 2d. They are worked with far greater ease than any other.
 3d. They are the least liable to get out of order.
 4th. They make little or no noise in working.
 5th. They will cut either long or short Grass, wet or dry.

SINGLE AND DOUBLE-HANDED "SILENS MESSOR" LAWN MOWER.

To cut 6 inches	£ 1 5 0
Can be worked by a Lady.		
To cut 8 inches	2 10 0
Ditto.		
To cut 10 inches	3 10 0
Ditto.		
To cut 12 inches	4 15 0
Can be worked by one Person.		
To cut 14 inches	5 15 0
Ditto.		
To cut 16 inches	6 15 0
Can be worked by one Person on an even Lawn.		

To cut 18 inches	£ 8 0 0
Can be worked by a Man and Boy.		
To cut 20 inches	8 10 0
Ditto.		
" 22 "	9 0 0
Ditto.		
" 24 "	9 10 0
Ditto.		

* If made stronger, suitable for Donkey, &c. extra.

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Slide Delivery Box; Cross-stay complete; suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£ 15 0 0	Leather Boots for Donkey	£ 1 0 0
" 28 "	17 0 0	" " Pony	1 4 0
" 30 "	18 10 0			

HORSE MACHINES.

To cut 30 inches	£ 22 0 0	To cut 42 inches	£ 30 0 0
" 36 "	26 0 0	" 48 "	34 0 0
" 42 "	30 0 0	" 54 "	38 0 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 Machines of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

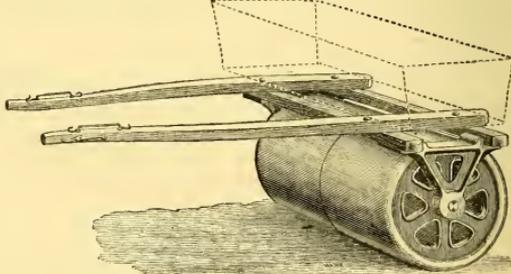

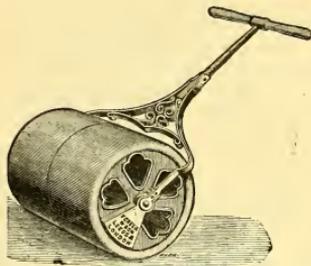

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT ROLLERS FOR LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, AND GRAVEL PATHS, SUITABLE FOR HAND OR HORSE POWER.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, April 16, at half-past 12 o'clock precisely, a large importation of some hundreds of plants of *CYMBIDIUM EBURNEUM*, just arrived in splendid condition, several of the plants with flowers on them that have expanded in the cases while in transit; many of the plants are large and fine masses, with from six, eight, ten to twelve growths each. At the same time will be sold immense quantities of many other CHOICE ORCHIDS, such as *Vanda striata*, *Cymbidium giganteum*, *Vanda corulea*, *Vanda Cathcartii*, some hundreds of good plants of *Aerides Fieldingii* (Foxbrush), *Dendrobium formosum*, *Dendrobium nobile Wallichii*; hundreds of plants of the rare *Ceologyne barbata*, various *Pleiones*, and some good plants, just imported, of *Oncidium varicosum* varieties, *O. Rogersii* type, and some healthy plants of *Odontoglossum vexillarium*.

On view morning of Sale, and Catalogues had.

Upper Edmonton, N.

TO NURSERYMEN, FLORISTS, and OTHERS.

MR. F. W. SEARLE is instructed to SELL by AUCTION, at the Angel Hotel, Edmonton, on WEDNESDAY, April 11, at 6 o'clock in the evening, the LEASE, STOCK, and GOODWILL of all those premises situate and known as Grove Street Nursery, Snells Park, comprising about Half an Acre of Ground, Five Greenhouses, and Stock of about 30,000 Bedding and Greenhouse Plants. Held on lease, at a low ground rent. It is situate within easy distance of the markets and on good road, within 5½ miles of town.

May be viewed, and Catalogues had of the Auctioneer, Tottenham and Enfield.

Edmonton, N. (421-)

Seven miles from Covent Garden, and close to the Station. TO BE DISPOSED OF, as a Going Concern, a CAPITAL MARKET NURSERY, about 2½ Acres in extent, comprising a six-roomed detached Dwelling House, nine Greenhouses in good repair, and several Ranges of Pits. Lease nineteen years unexpired, at £100 per annum. Stock and Utensils in Trade at a Valuation, or open to an offer. Incoming about £400. Further particulars of Messrs. PROTHEROE and MORRIS, 98, Gracechurch Street, E.C.

To Nurserymen, Seedsmen, and Florists. FOR DISPOSAL, a BUSINESS, fine large HOUSE and SHOP, small compact NURSERY close to, three Greenhouses well heated with hot water, and sixteen Frames, fully stocked with saleable Bedding Plants. Good Jobbing connection, and every chance of greatly increasing it. Shop in first-class position. Long Lease and moderate rent. Apply for further particulars on the premises, 2, Swiss Terrace (adjoining Swiss Cottage Station, Metropolitan Railway), Belsize Road, St. John's Wood, N.W.

To Nurserymen and Florists.

TO BE LET on LEASE, in a commanding position for Business, in south-west district of London, a HOUSE and SHOP, with HALF AN ACRE of GROUND adjoining; has been a Nursery for the last thirty years. To an energetic man with small capital a first-rate opening. For terms apply by letter to Mr. JOHN EASTERBROOK, Gloucester Brewery, Croydon, Surrey.

Centenary Celebration.

BATH and WEST OF ENGLAND SOCIETY (Established 1777), and SOUTHERN COUNTIES ASSOCIATION.

Items include BEANS, Williams' Early Prolific Dwarf French; BRUSSELS SPROUTS, Welch's Giant; CUCUMBER, Walker's Hero (New); ENDIVE, Williams' Gloria Mundi; MELON, Osmoston Manor Hybrid; ONION, Williams' Magnum Bonum; PEA, Williams' Emperor of the Marrows; TOMATO, The 100 Days.

All seeds amounting to 20s. will be delivered free carriage to any Railway Station in England. ILLUSTRATED SEED CATALOGUE gratis and post-free to all applicants.

All the Best Selected NEW CONTINENTAL ROSES for 1877. Fine plants of the above now ready. Descriptive CATALOGUES on application. WILLIAM WOOD AND SON, The Nurseries, Maresfield, Uckfield, Sussex.

LYE'S FAVOURITE.—The handsomest and best Potato ever offered. Indispensable for Exhibition. This variety will be the greatest Prize Winner of the season. We have purchased the entire Stock of Mr. James Lye, Clyffe Hall, Market Lavington, and parties wishing to grow this remarkably handsome and beautiful variety should order at once, as the stock is getting very limited. It can only be obtained direct from us. Price 5s. per lb. Orders of 20s. and upwards carriage free. DANIELS BROS., The Royal Seedsmen, Norwich.

Shallot Seed. DAVIS' PRIZE JERSEY.—A true Shallot, of immense size and exceedingly mild; with ordinary treatment bulbs have been grown 10 and even 12 inches in circumference—by far the best method of growing the Shallot. Treatment same as Onions. Price 12s. per packet. May be had of all Seedsmen in sealed packets, 20s. Wholesale of Messrs. HURST AND SON, 6, Leadenhall Street, London, E.C., or E. R. DAVIS, Nursery and Seed Warehouse, Yeovil.

The Best Hardy Bedding Plant. CLEMATIS JACKMANII.—Flowers rich purple, 4 inches across, and so profuse as to completely cover the bed. Begins to bloom in June, and continues until severe frost. It is perfectly hardy, and the stools improve annually. The only secret of success is a rich soil, to keep up free growth. Extra strong plants, 18s. per dozen. Other sorts of Clematis and Climbers in great variety. Descriptive LIST on application. RICHARD SMITH, Nurseryman, Worcester.

Cheap Bedding Geraniums. ALFRED FRYER offers the following good Bedders at per dozen for cash:—Golden Tricolors; Peter Grieve, 12s.; Prince of Wales, 6s.; Lady Collin, 3s. 6d.; Sir Robert Napier, 3s. 6d.; Mrs. Pollock, 3s.; Sophia Dumaresque, 3s.; Silver Tricolors; Lass of Gowrie, 4s. 6d.; Queen of Hearts, 4s. 6d.; Miss Burdett Coutts, 3s. 6d.; Mrs. John Clutton, 3s. 6d.; Prince Silverwings, 3s. Double flowered; Marie Lemoine, 3s.; or one of each for 5s. No charge for packing, if empties are returned at once; also post-free for 6d. per dozen extra. For Priced LISTS apply to ALFRED FRYER, The Nurseries, Chatteris, Cambridge-shire.

AZALEA INDICA, Splendid New. EMPEREUR DU BRÉSIL (J. Verschaffelt).—Good plants, 12s. each; strong plants, with buds, 20s. each. TRIOMPHE DES DOUBLES BLANCH (J. Verschaffelt).—Good Plants, 12s. each; larger size, no more to hand. Four for three to the Trade. For full description vide CATALOGUE No. 19, sent free on application. N.B.—A few fine plants, well set with buds, of the beautiful AZALEA IMPERATRICE CHARLOTTE, are still disposable, at 5s. each, or six plants for 25s. JEAN VERCHAFELT'S Nurseries, Ledebeg, Ghent, Belgium.

New Bedding Tropaeolum, "Hunteri." DOWNIE AND LAIRD have much pleasure in offering for Spring delivery the above Tropaeolum, which has been raised by Mr. Andrew Hunter, gardener to Lord Shaad, New Hailes House, near Edinburgh. This is an excellent Bedding Tropaeolum, surpassing its parent Cooperi, being of a dwarfier habit, and we can with perfect confidence recommend it. The Editors of the Gardeners' Chronicle say, "It grows about 6 inches high, is very neat and compact in habit, and a most profuse bloomer, the flowers being of medium size, nice form, and of a bright scarlet colour." Price, per dozen plants, 12s.; each, 1s. 6s. Usual discount to the Trade. West Coates Nursery, Edinburgh.

HARDY HEATHS, 100,000:— 12 plants in 12 varieties, 6s. 24 plants in 24 varieties, 12s. 50 plants in 25 varieties, £1. 100 plants in 40 varieties, £2. For varieties see CATALOGUE. ANDROMEDAS, various. LEDUMS, various. JAMES SMITH, Darley Dale Nurseries, Matlock.

VINES, VINES, VINES. Strong planting Canes of the following sorts:— Black Alicante, Muscat Hamburg. Howard Muscat, Mrs. Pince. Golden Champion, West's St. Peter's. Price 3s. each. W. G. CALDWELL AND SONS, The Nurseries, Knutsford, Cheshire.

FIFTY THOUSAND MAGNIFICENT DWARF ROSES, in POTS. ROSES for BEDDING, at 12s. to 18s. per dozen, 100s. per 100. TEA-SCENTED ROSES, superb, established in 6-in. pots, adapted for greenhouse or conservatory, 30s. per dozen, 200s. per 100. Descriptive CATALOGUES on application. WILLIAM WOOD AND SON, The Nurseries, Maresfield, Uckfield, Sussex.

SAMUEL SHEPPERSON, FLORIST and SEEDSMAN, Prospect House, Belper, offer the following:— PANSIES, PENTSTEMONS, ANTIRRHINUMS and PHLOX, the newest and very finest varieties out, 3s. per dozen, post-free, with Descriptive List all correctly named. POLYANTHUS, fancy, in flower, for immediate effect, 7s. per 100, 60s. per 1000; sample, 12 sorts, 1s. 3d., post-free. BEDDING PANSIES and VIOLAS, finest sorts, blue, white and yellow, 12s. per 100; sample dozen, in 6 sorts, 2s., post-free.

CABBAGE PLANTS, SEEDS, ROOTS, &c., of all kinds, for the Farm or Garden.—"Gee's superior Bedfordshire-grown Plants and Seeds have attained much celebrity."—The Bedford Mercury, July 29, 1876. "The seeds of the district offer facilities enjoyed at few places for bringing away plants, &c., and under the skill and perseverance of Mr. F. Gee they are turned to good account."—The Agricultural Gazette, July 31, 1876. See other opinions of the Press, also a Treatise on the Cabbage. CATALOGUES, lowest prices, &c., on application to FREDERICK GEE, Seed and Plant Grower, &c., Biggleswade, Beds.

NOVELTIES FOR 1877.

JAMES VEITCH & SONS

THE UNDEVELOPED SPLENDID NOVELTIES.

BEG TO ANNOUNCE THAT THEY ARE NOW SENDING OUT

ADIANTUM LUDEMANNIANUM.

A remarkable novelty, quite unlike any other Maidenhair Fern in cultivation, obtained by us from M. Ludemann, of Paris, who was the first to introduce it.

The peculiarity which distinguishes this Adiantum from all others consists in the pinnules being crested or agglomerated at the extremities of the stipes and their rachides; they are also high, stipes slender, smooth, at first deep crimson, changing to shony-black when mature, branched either near the base or higher up, pinnules on short petioles, generally fan-shaped, and deep green in colour.

It thrives well in a warm greenhouse, where it will prove one of the most attractive as well as one of the most distinct of Ferns.

It received a First-class Certificate from the Royal Horticultural Society, August 18, 1875, and a Certificate of Merit from the Royal Botanic Society, May 29, 1876.

Price 15s. each.

ADIANTUM PALMATUM.

A Maidenhair Fern, one of the most beautiful and attractive of the tribe, found at a high elevation on Chimborazo, South America. From the following description given by Mr. Moore in the *Gardener's Chronicle* of January 12, 1877, page 41, where it is also figured, it will be seen that it is quite distinct:—

The rhizome is creeping, and the fronds are of an indefinitely elongated form. A very noticeable feature in the plant is the frequent or large change of the rachides, most marked near the apex of the fronds, and in the rachides of the primary pinnae. The pinnules are herbaceous in texture, smooth, large, from 1 to 2 inches in breadth, distant and very distinctly stalked; the terminal ones are mostly wedge-shaped, while the lateral ones are usually truncate at the base, so as to become semicircular in outline; they are deeply cut down into from three to five large lobes, which are again more or less parted, an oblong, some terminating each of the divisions in the fertile portions. The fronds are deciduous.

This elegant Fern should be cultivated in an intermediate or warm house, where it attains a considerable size.

It received a Certificate of Merit, under the name of Adiantum digitatum, from the Royal Horticultural Society, March 21, 1875, and a Certificate of Merit, under the same name, from the Royal Botanic Society, April 5, 1876. Price 21s. each.

BEGONIA EMPEROR.

A magnificent hybrid of the tuberous-rooted section, of vigorous habit, and free-flowering; raised by our foreman, Mr. Sedden, at our Chelsea Nurseries.

The flowers are large and of a brilliant orange-scarlet, with the petals distinctly veined, and in diameter from seven to ten inches, according to the size and strength of the plant; the pedicels being of the same brilliant colour as the corolla.

It is figured in the *Floral and Pomologist* for 1875, at p. 265, where it is mentioned by Mr. Moore as being "one of the finest of the tuberous-rooted Begonias, and is most highly to be commended as a decorative plant."

It is also figured in the *Illustrated Magazine* for January, 1876, and described "as not only likely to prove a gorgeous ornament to the greenhouse, but also suitable for the summer flower bed."

It received the award of a First-class Certificate from the Royal Horticultural Society, and a Certificate of Merit from the Royal Botanic Society, June 16, 1875.

Price 10s. 6d. each.

CROTON EARL OF DERBY.

A splendid novelty, with leaves of the C. Ditchaei form, very highly coloured, and quite distinct from every other Croton of its class. It was received from A. H. C. Macfarre, Esq., of Sydney, N.S.W.

The stem during its earlier growth is of a remarkably bright yellow, the petioles and midribs of the three-lobed leaves springing from it are of the same rich colour, which also spreads over the greater part of the lamina or blades, the extremity of each lobe being green. As the plant increases in age the colour deepens, and finally becomes suffused with red.

Thus the *earls* of the plant presents a centre of bright yellow of almost golden hue, with the later growth of a little deeper shade, and the older growth changing to red, relieved by the cheerful green tint of the extremities of the leaves.

The habit of the plant is erect; the foliage of even growth, and gives a symmetrical outline to the whole.

We confidently recommend this Croton for decorative and for exhibition purposes as one of the best so offered.

It received a First-class Certificate from the Royal Horticultural Society, March 21 of the present year, and a Certificate of Merit from the Royal Botanic Society on the same day.

Price 63s. each.

CROTON NOBILIS.

A beautiful novelty, with long pendulous lanceolate leaves, richly coloured with many tints. The colours are crimson, yellow, and green in many shades, the crimson being predominant in the stem, the foot-stalks of the leaves, and in many of the midribs, where it is bordered by a deep green yellow-tint. The greatest charm and recommendation of the plant are the blue-green portion of the plant, at first a bright glossy hue, shadowed by age to the deepest olive-green.

The gracefully-weeping habit of the plant, together with its showy colours, cannot fail to secure for it a large share of favour. It is altogether a noble Croton, which we consider a decided improvement on C. majesticus, and worthy of a place in every collection.

Price 21s. each.

CROTON MACARTHURI.

We have cultivated this fine and distinct variety at Sir William Macarthur, the eminent amateur horticulturist of Carlton Park, near Sydney, from whom we received it. It presents indistinct diversity in the form and markings of the leaves.

The leaves are of many forms, and of various varieties of colour, numerous and remarkable; some are dilated at the base and much narrowed at the opposite end; may have the midrib and blade twisted like a spiral, in others the edges are undulated, in others again the extremities are serrated, while there are others in which two or more of these peculiarities are present.

The colour is more constant, but the markings on the different leaves are as varied as the form assumed by the leaves. The greatest charm and recommendation of the plant are its yellow, and barred or spotted variety. The midribs are yellow, and the bright green ground of the blades are spotted, blotched, and barred in indistinct variety.

A First-class Certificate was awarded to this Croton by the Royal Horticultural Society, March 21 of the present year.

Price 21s. each.

CROTON TORTILIS.

A remarkably interesting variety with twisted foliage, very ornamental and distinct. The midrib of each leaf grows in a spiral from the base to the point, the extent of the spiral twist varying in the different leaves from a slight deviation from the plain form to more than one complete turn.

The ground colour of the foliage is a deep olive-green; the midribs of the mature leaves are bright crimson, bordered on each side with a line of deep yellow; the blades are blotched and spotted with yellow. Owing to its varied colours and large foliage it is superior to C. spiralis.

Price 10s. 6d. each.

CROTON VARIABILIS.

A robust variety, sent to us by A. H. C. Macfarre, Esq., of Sydney, N.S.W. It has long leaves, marked and blotched with different shades of yellow, orange, and crimson.

The leaves, both in colour and shape, are very variable; some are straight, others are recurved, falcate, or often distorted, their surface either smooth or undulated. Some of the shades of colour are peculiar to this variety, and are seen in every tint, from deep orange-red to light sulphur-yellow.

It is quite unlike any other Croton in cultivation.

Price 21s. each.

DENNSTÆTTIA DAVALLOIDES YOUNG.

For this splendid Fern we are indebted to the kindness of J. R. Young, Esq., of Sydney, N.S.W., with whose name it is associated. It is a native of the New Hebrides, of very robust habit and vigorous growth.

The rhizome is creeping; the fronds are of noble proportions, attaining a length of 10 feet and upwards, and have stout erect or sub-erect stipes, quite smooth, rounded on one side, and flattened on the opposite or upper side, with a furrow running along the entire length; the leafy portion of the frond is arching, bi- and tripinnate, broadly lanceolate and acuminate; the pinnae are sessile or sub-sessile, spreading, the rachides furrowed on the upper side like the stipe; the pinnules are finely cut, and of a light cheerful green; the aspect of the whole frond is very bold and graceful.

It is a grand Fern for a warm collection. For a central subject in grouping, where bold and spreading foliage is required, it will be found a great acquisition to our decorative resources, and, as an exhibition Fern, it will be invaluable.

Price 10s. 6d. and 21s. each.

DRAÆNA MACARTHURI.

A Draena of very dwarf compact growth and bright coloured foliage, sent to us by Sir William Macarthur, after which it is named.

The leaves, including their petioles, scarcely reach a foot in length, with a breadth of 1 inch; they are very elegant both in form and colouring, the latter being especially brilliant and attractive, rendering this variety one of the most distinct in cultivation.

In many leaves almost the entire upper surface is coloured with a vivid rose carmine, interrupted by a few lines of deep olive-green; in others the bright colouring is confined to the margins; they are slightly undulated. It is a distinct variety, which we can confidently recommend for the many useful purposes to which this numerous family of plants is applied.

Price 10s. 6d. each.

DRAÆNA ROSEO-PINCA.

A plant of robust habit and bold aspect.

The leaves are sub-erect or slightly spreading, from 18 to 20 inches long, including the foot-stalk, with a width of 4 inches. They are beautifully coloured with a delicate rose tint, which deepens by age to a bright crimson, finely contrasting with the ground-colour, which is a deep olive-green. It appears to have a very hardy constitution, which enhances its value as a fine decorative plant. It is also useful for exhibition.

Price 10s. 6d. each.

DRAÆNA SPECIOSA.

This variety certainly rivals, if it is not superior to the well-known D. ambalis, and is of spreading habit, free growth, and showy appearance.

The leaves are broadly striped or margined with a yellowish creamy white, stained and edged with light rose pink; the ground-colour is a rather light but pleasing olive-green; it is, therefore, a rich exhibition plant, and most useful for decorative purposes generally.

Price 21s. each.

HABROTAMNUS NEWELLI.

A seedling of great merit, raised by Mr. Newell, of Rytton Hall Gardens, Downham Market.

It is a robust growing plant, with most beautiful foliage, the autumn months, in its young state, of the well-known H. elegans or H. fascicularis, whose habit it much resembles. As an ornamental conservatory and greenhouse climber it will be found one of the most useful of subjects.

It received a Certificate of Merit from the Royal Horticultural Society, May 24, and a First-class Certificate from the Royal Botanic Society, June 7, 1876.

Price 7s. 6d. each.

HYMENANTHERA CRASSIFOLIA.

A beautiful hardy evergreen shrub, a native of New Zealand, very distinct in all its leading characteristics.

It is described by Dr. Masters in the *Gardener's Chronicle* for 1875, p. 237 (Feb. 20), as "a striking shrub." He adds, "the shrub is erect or partially procumbent, with stiff cylindrical branches ramifying at acute angles, and covered with imbricated wrinkled coat, thinly leaved with which, serrate hairs. The leaves are alternate or tufted, small, apex, with a few minute whitish scales on both sides, rounded or slightly emarginate at the apex, tapering at the base into a very fine point." The flowers are small and inconspicuous, but they are succeeded by pure white berries, which render the plant particularly attractive and ornamental during the autumn months; it is therefore a fine contrast with the *Conocarpus* and other berry-bearing shrubs.

Dr. Master further adds:—"It is a welcome addition to our lists of hardy shrubs, among which it holds a noble place, and which we believe will give it a distinctive character. Essentially it is interesting as a shrubby violaceous plant, having in superficial glance nothing of the Violet about it. The structure of the flower and seed is, however, quite that of the Violet."

Price 7s. 6d. each.

HEITCH & SONS' NOVELTIES FOR 1877—(Continued).

PANAX LAOINIATUS.

An Araliaceous shrub from the South Sea Islands, sent to us by A. H. C. Macfarle, Esq., of Sydney, N.S.W. It is a foliage plant of great merit, and possesses very attractive features in the form and colour of its leaves, which are much subdivided in the most elegant manner, the ultimate segments being uniform and fern-like, and of an unlimited variety of shapes, all delicately serrated, and of a pale green.

The soft light green tint of the beautifully-cut foliage is strikingly distinct and attractive. It will prove a valuable addition to the plants used for the decoration of the dinner-table. It received a Certificate of Merit from the Royal Botanic Society, March 21st of the present year.

Price 10s. 6d. each.

PHYLANTHUS ROSEO-PICTUM.

An Euphorbiaceous shrubby plant of free growth and good habit, with beautifully variegated foliage, and of such easy culture as to be especially valuable for decorative purposes.

The variegation is exceedingly rich and varied, both in colour and form; no two coloured leaves showing precisely the same markings with like tints. Many of the leaves are bright crimson, which is also the colour of the stems during the early stage of growth; some are a light cream colour, tinged with white, others again, have a dark green hue, shaded with crimson; some are dark green, with blotches and spots of rose, while others are tricoloured, white, with different shades of rose and green.

The blending and intermixture of these pleasing tints render this plant very ornamental and distinct; it will be found invaluable for cutting sprigs for bouquets. It grows well in an intermediate stove or warm greenhouse.

"This slender growing, gracefully branching shrub well deserves culture, being one of the most elegant of new fine-foliated plants."—*The Gardener*, vol. x., p. 261.

It received a Certificate of Merit from the Royal Horticultural Society, April 19, and a Certificate of Merit from the Royal Botanic Society, May 24, 1876.

Price 10s. 6d. and 21s. each.

PLATYCERIUM WILLINKII.

We reproduce, in an abbreviated form, from the *Gardener's Chronicle* of March 6, 1875, Mr. Moore's description of this new Fern—

"This fine and very distinct species of Stag's-horn Fern is a native of Java, whence it was introduced by M. Willink, of Amsterdam."

"It is a creeping fern, with a thick, and protects its rootstock by the broad, smooth, sterile fronds of its sterile fronds, which in good specimens are 6 inches across. The fertile fronds are erect and slightly spreading, the fertile ones, which are produced in threes, fall straight down to a length of 2½ feet, are quite naked in all their parts, and forked. The fronds appear to be less coriaceous than those of the other species known in gardens."

"As a species this plant is thoroughly distinct from any of those at present known. With regard to its general habit, it groups with *P. grande*, *P. Wallisii*, and *P. bifurc.*, in having long pendent fertile fronds cut into many narrow furcate divisions, and very broad erect sessile barren fronds, with a lobate margin; but it differs entirely in its fructification. This novelty will prove a welcome addition to the few well-marked and very ornamental species of Stag's-horn Fern already familiar to our hortosists."

It received a Certificate of Merit from the Royal Botanic Society, June 16, 1875, and a First-class Certificate from the Royal Horticultural Society on August 4 following.

Price 10s. 6d. and 21s. each.

A NEW ILLUSTRATED DESCRIPTIVE CATALOGUE will be forwarded free on application.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

SPECIAL NOTICE.

APRIL and MAY the best Season for Transplanting HOLLIES.

WM. CUTBUSH & SON

POSSESS MANY THOUSANDS OF

VARIEGATED AND OTHER CHOICE HOLLIES,

varying from 2 to 6 feet, bushy, all transplanted in 1874, and will move with splendid roots.

An Inspection invited, or Prices, &c., sent on application.

EXTRA STRONG IRISH and OTHER IVIES.

WM. CUTBUSH & SON have a very large Stock of IVIES in Pots, which they are offering at low prices, which can be had on application—especially low to the Trade.

HIGHGATE NURSERIES, N., OR BARNET, HERTS.

IMPORTED ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, April 16, at half-past 12 o'clock precisely, a large importation of some hundreds of plants of CYMBIDIUM EBURNEUM, just arrived in splendid condition, several of the plants with flowers on them that have expanded in the cases while in transit; many of the plants are large and fine masses, with from six, eight, ten, to twelve growths each. At the same time will be sold immense quantities of many other choice ORCHIDS, such as VANDA STRIATA, CYMBIDIUM GIGANTEUM, VANDA CŒRULEA, V. CATHARTI; some hundreds of good plants of AERIDES FIELDINGII (FOXBRUSH), DENDROBIUM FERMOSUM, D. NOBILE WALLICHII, hundreds of plants of the rare CŒLYGNE BARBATA, various PLEIONES, and some good plants, just imported, of ONCIDIUM VARICOSUM varieties, O. ROGERSII type, and some healthy plants of ODONTOGLOSSUM VEXILLARIUM.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

RHODODENDRON DUCHESS OF EDINBURGH.

We have much pleasure in offering this season the first Rhododendron of a splendid progeny of hybrids raised by our foreman Mr. Taylor, and obtained by the intercrossing of *R. javanicum*, *R. Loblii*, *R. Broodi*, and *R. Princess Royal*, and in which the gorgeous and pleasing colours of these kinds are blended into a great variety of brilliant and distinct tints.

These hybrids are of far better habit than the parents, and far more floriferous; they produce their magnificent masses of bloom while the plant is still young, and as they increase in age and strength yield splendid masses of colour; there is scarcely any season of the year in which there is not more or less bloom.

They require the same temperature as *R. Princess Royal*, and are very suitable for a warm conservatory or greenhouse, where their brilliant flowers will be found an invaluable addition to the decorative resources.

Rhododendron Duchess of Edinburgh has brilliant scarlet flowers with a perceptible shading of crimson; the flowers are of great size, and the colouring uniform throughout.

It is figured in the *Floral Magazine* for 1874, and was awarded a First-class Certificate by the Royal Horticultural Society in March of the same year.

Price 42s. and 84s. each.

RHODODENDRON TAYLORI.

We have named this variety after our foreman, Mr. Taylor, "to whose skill as a hybridist no better testimony is needed than this lovely rare greenhouse Rhododendron" (*Floral Magazine*, January, 1877, in which this beautiful kind is figured).

Rhododendron Taylori has pink flowers of a perfectly rich and brilliant hue; the tube of the corolla is white both in the interior and on the exterior; the form is perfect and the texture firm.

This variety is one of the most robust of the group, of excellent habit and very free flowering. A First-class Certificate was awarded to it by the Royal Horticultural Society, March 7 of the present year.

Price 42s. and 84s. each.

SARACENIA MOOREANA.

A hybrid plant of no ordinary interest, and exhibited for the first time at the International Exhibition held at Florence in May, 1874, by Dr. Moore, the Director of the Botanic Garden at Glasgow, by whom it was raised.

In a paper read before the Congress held during the Exhibition, Dr. Moore thus referred to this hybrid:—"It is supposed to be the first hybrid *Saracenia* which has ever yet flowered. It is the offspring of *S. flava* fertilized with pollen of *S. Drummondii*. The plant is as nearly intermediate with these two noble species of this curious genus as it will be can; and no hybrid which has hitherto come under my notice proves more decidedly the marked influence of the pollen of one plant applied to the stigma of another than this does. It makes its growth of patches similarly as *S. Drummondii*, and they are nearly as well marked with purple and white colours, but they decay much sooner in spring, and in this way they resemble those of the female parent, *S. flava*."

Price 10s. each.

AVENUE TREES.

PLATANUS OCCIDENTALIS (true), 10 to 12 feet high, and girthing 4 to 8 inches at 4 feet from the ground.

LIMES, 12 to 20 feet high, and girthing 6 to 10 inches at 4 feet from the ground.

POPULUS CANADENSIS NOVA, 15 to 16 feet high, and girthing 6 inches at 4 feet from the ground.

ANTHONY WATERER

Has to offer many thousands of the above. They may be seen growing at Knap Hill. They are straight, handsome, and well rooted, and altogether the finest Trees of the kind to be found in any nursery in Europe.

KNAP HILL NURSERY, WOKING, SURREY.

RICHARD SMITH'S LIST of Evergreen and Deciduous Shrubs, Rhododendrons, Standard Ornamental Trees, Climbing and Twining Plants, with their Scientific, Popular, and Botanical Names, Derivations, Description, Form, Colour, Foliage, Growth, Timber, Use in Arts, Native Country, and Size there, Situation, Soil, and other information, with Copious Index of their Synonyms. Free by post for six stamps.

RICHARD SMITH'S LIST of Roses, containing all the best of the new and old varieties, arranged in their several sections, and fully described as to their Shape, Colours, and Adaptations; with ample instructions as to their Treatment and Prizes.

RICHARD SMITH'S LIST of Herbaceous and Alpine Plants, with their Scientific and English Names, Height, Colour, Time of Flowering, Price, &c.

RICHARD SMITH'S LIST of all the Evergreen Fir Tribe suitable for Britain, giving Size, Price, Popular and Botanical Names, Derivations, Description, Form, Colour, Foliage, Growth, Timber, Use in Arts, Native Country, and Size there, Situation, Soil, and other information, with Copious Index of their Synonyms. Free by post for six stamps.

Presented (by post) on application,

NEW CATALOGUE for 1877.

MESSRS. CLIBRAN AND SON will have great pleasure in sending their PRICED DESCRIPTIVE LIST for this Spring, free by post on application. Their stock of Florist and Soft-wooded Plants generally, are surpassed by few, if any, either in extent or quality, all the newest and best varieties being constantly added to the various classes, and the greatest care is taken to keep the varieties true to name. Another great advantage to Purchasers is that none of the plants offered are taken directly from a warm propagating house and sent off, but are all carefully hardened and most of them potted off singly, and are thus fitted to travel either by rail or post without the slightest injury. A great proportion are autumn-striking plants, and many of the undermentioned can be sent by post—

- Abutilons, in variety, 3s. 6d.
Achimenes, in variety, 3s. per doz.
Agapanthus, in variety, 8s. 6d. per doz.
Begonias, tuberous, 6s. and 9s. per doz.
non-tuberous, 4s. per doz.
Cactaceae, 12s. per doz.
Calceolarias, Golden Gem, &c., 3s. per doz.
Begonias, tuberous, 6s. and 9s. per doz.
Candelinas, Golden Gem, &c., 3s. per doz.
Carnations and Picotees, 22 plants, 6s.; 22 pairs, 10s. per doz.
Carnations, tree, in variety, 9s. per doz.
Centaurium majuscula, 3s. per doz.
Chrysanthemums, near 10,000 now ready, 20s. per 100, 3s. per doz.
Cinerarias, 40s. per 100, 6s. per doz.
to name, 9s. per doz.

Sedums, in variety, 3s. per doz.
to name, 2s. 6d. per doz.
Succulents, 4s. to 6s. per doz.
Impatiens, 3s. per doz.
Violas (of immense stock of all the best sorts), 8s. to 12s. per 100, 3s. per doz.
Vines, all the leading kinds for planting and fruiting, 3s. to 6s. per doz.
Strawberry runners: our collection contains thirty-five sorts: 2s. 6d. per doz.
Apples, Pears, Plums, and Cherries, pyramidal, 12s. to 15s. per doz.; dwarf trained, 4s. to 10s. per doz.
The Oldfield Nurseries, Atrincham.

E. G. HENDERSON & SON

Offer the following in Seed, of quality the best that can be had, at per packet:—

- CALCEOLARIA—the variety of colours, size, and shape of the flowers is the result of many years' continual improvement; 2s. 6d. and 3s.
CINERARIA—the shape and brilliancy of colour in these flowers is of great importance; 2s. 6d. and 3s.
double-flowered, 2s. 6d. and 3s.
PRIMUM SINENSIS, crimson, scarlet, and white (better called the half separate or half double); 2s. 6d. and 3s.
double-flowered, true from seed, 2s. 6d. and 3s.
CVCAMEN PERSICUM GRANDIFLORUM—brilliant flowers, with large-size petals and perfumed flowers, is the quality here offered; 2s. 6d. and 3s.
BEGONIA, tuberous-rooted (for collection is unequalled), 1s. and 2s. 6d.
tuberous-rooted, double-flowered, mixed colours, 2s. 6d.
BALSAM—we trust to come, but our own sowing—mixed, 1s. and 2s. 6d.
PINK, from named collection, 1s. and 2s. 6d.
CARNATION, mixed, 4s. See Catalogue for separate sections.
MIMULUS, superb strain, name as exhibited every year at the Royal Horticultural Society, 1s. 6d.
LOBELIA, Brilliant Improved, White Brilliant, Marine Green, species—from pot plants, purple grandiflora, Laute Improved, Defiance—the best red, Bluestone, and Magnolia, 1s. each.
PANSY, English, show flowers, 2s. 6d.
French, blotched, 2s. 6d.
PETUNIA, very beautiful, sown in pots, in separate sections at their Wellington Road Nursery, 1s.
double-flowered, 1s. and 2s. 6d.
SWEET WILLIAMS, extra fine, 1s.
from named flowers, 1s. and 2s. 6d.
SOLANUM—Lobelia, scarlet, white, and purple, 6d. and 1s.
Intermediate, Britishissima, and others. See Catalogue.
AURICULA, extra choice alpine varieties, 2s. 6d.
SOLANUM Improved Hybrid, as grown for the London Market, 1s.
HENDERSON'S, conical-shaped berries, 1s.
GLOXINIA, drooping and erect, 1s. 6d. each; mixed, 2s. 6d.
HOLLYHOCK, from named collection, 1s. and 2s. 6d.
PRIMROSE, POLYANTHUS, and OXLIP, best quality, mixed colours, each, 1s.
WALLFLOWER, double German, mixed colours, 6d. and 1s.

NOVELTIES IN FLOWER SEEDS.

- ALONSOA ALFIFLORA.—New distinct species from Mexico, introduced by Mr. Roehl, the distinguished collector; flowering freely, from 12 inches up to 4 feet in height, producing long terminal spikes of pure white flowers with yellow eye. It is recommended for pot-culture, as in the conservatory it will produce a succession of its flowers throughout the autumn and winter when most acceptable for bouquets and table-decoration; will be found a desirable and useful substitute for Holly of the Valley, as used in our bouquets with such charming effect when arranged in 20s as to surpass the other flowers by 2 or 3 inches. 1s.
BOMBEILLA ROZELI, 1s.
COCYBIA HIRSUTA, 2s. 6d.
HUMMEL'S ALBA, 1s.
AGERATUM SNOW-FLAKE, 1s.
TORRENTIA BRILLANTISSIMA, self seed, 1s.
MENZAELLA ORNATA, fine plant (see description in Catalogue), 1s.
TORRENTIA FOURNIERI, new annual form of this beautiful combination of colouring, 1s.
ERYNTHUM LEAVENWORTH, ornamental plant, 1s.
FRETHERUM AUREUM LACINIATUM, long-leaved Golden Feather, 1s.
ASTER, Firelight, most beautiful and brilliant new quilled variety, 1s.
SAXIFRAGA NEPALENSIS, fine ornamental species for pot culture, 1s.
PAPAVER UMBROSA, showy flowers, 1s.
LITAIUM CYCNERIFLORA, 1s.
CANTERBURY BELLS, double frilled flowers, beautiful variety of colours, 1s.
CUPHEA ROZELI, 1s.
EAMEUSA GRACILIS, 1s.

GODETIA, LADY ALBEMARLE.

First-class Certificate Royal Horticultural Society, August 2, 1875.

A magnificent new variety, growing 2 foot high. Flowers 2 1/2 to 4 inches across, and of the most intense glowing crimson-crimson colour, and being produced in wonderful profusion give the plants the most charming appearance. This the first annual ever sent out, and being extremely hardy and easy of cultivation, should be in every garden.
Seed, with full cultural directions, per packet, 1s. 6d., post-free.
We have scarcely any plant of such a lovely shade of colour.—The Villa Gardener, September, 1876.
An extremely unusual variety bearing flowers quite 4 inches in diameter, of a glowing crimson colour.—Gardener's Magazine, 1876.
A remarkable and splendid variety, far superior to any other of the family.—Journal of Horticulture, Aug. 3, 1876.
May be had of all Seedsmen, and Wholesale and Retail of DANIELS BROS., THE ROYAL NORFOLK SEED ESTABLISHMENT, Norwich.

Fine-apple Nursery, Malda Vale, W.

THREE BUNCHES OF GRAPES, 3 stones 3 lb. 6 oz.!

GROU GUILLAUME, ROBERTS' VARIETY.

This extraordinary variety is the largest bunch-producing Black Grape in the world.
Three bunches from one Vine weighed 3 st. 3 lb. 6 oz. They were exhibited in Dublin last November, and in addition to First Prize were awarded a SPECIAL MEDAL. This variety is quite distinct from the ordinary varieties bearing its name, or that of Barbarossa. It is a good grower, and has a good constitution; never shanks or scalds.
A few Ewes or Scions of this remarkable Grape still to be had.
Price, strongest, 10s. 6d. each; second size, 7s. 6d. each.

W. TAIT & CO., SEED AND NURSERY ESTABLISHMENT, 45, CAPEL STREET, DUBLIN.

MAURICE YOUNG, MILFORD NURSERIES, near GODALMING, SURREY.

New Zealand - Anzela americana Caldwellii. BENT CUT BY W. G. CALDWELL AND SONS, The Nurseries, Knutsford, Cheshire. This is a striking improvement of the old and well-known Anzela americana, obtained by crossing that variety with Anzela Magnifica. The flower is four times the size of the original, of a bright rosy purple colour, very free blooming; especially adapted for forcing (coming in as early as November), and very suitable for buttonhole bouquets.

W. G. CALDWELL AND SONS are now sending out the above which was originally distributed in August last. Strong Plants, 3s. 6d. each, 25s. per dozen.

TO THE TRADE and Large Buyers. FUCHSIAS, CHRYSANTHEMUMS, COLEUS, HELIOTROPES, SALVIA, HELIANthemUMS, in all the best sorts, 15s. per 100. PINKS, PENTSTEMONS, PHLOXES, FANSIES, 20s. per 100. PYRETHRUMS, PEONIES, CARNATIONS, PICO-TEES, 15s. per 100. GERANIUMS, Zonal and Nonzeng, in the greatest variety, 15s. to 20s. per 100; bicolor, 30s. per 100. F. WILLIAM CLIBRAM AND SON, Oldfield Works, Altrincham.

To Parties Furnishing New Houses. H. WALTON begs to intimate to the above that he has for sale an unrivalled collection of FLOWERING and FOLIAGE PLANTS of extra size suitable for immediate effect, which must be cleared out to make room. Also an immense stock of STOVE and GREENHOUSE PLANTS of all the best and most approved varieties. H. W.'S CATALOGUE is now ready, and will be forwarded post-free on application to H. WALTON, Edge End Nurseries, Bierfield, near Burnley, Lancashire. Edge End is distant from Burnley, 3 miles; Accrington, 5 miles; Slough, 24 miles; Bedford, 30 miles; Manchester, 20 miles; Buxton, 20 miles; Leeds, 35 miles; Wakefield, 40 miles.

to 704, 704 to 706, 706 to 708, 708 to 710, 710 to 712, 712 to 714, 714 to 716, 716 to 718, 718 to 720, 720 to 722, 722 to 724, 724 to 726, 726 to 728, 728 to 730, 730 to 732, 732 to 734, 734 to 736, 736 to 738, 738 to 740, 740 to 742, 742 to 744, 744 to 746, 746 to 748, 748 to 750, 750 to 752, 752 to 754, 754 to 756, 756 to 758, 758 to 760, 760 to 762, 762 to 764, 764 to 766, 766 to 768, 768 to 770, 770 to 772, 772 to 774, 774 to 776, 776 to 778, 778 to 780, 780 to 782, 782 to 784, 784 to 786, 786 to 788, 788 to 790, 790 to 792, 792 to 794, 794 to 796, 796 to 798, 798 to 800, 800 to 802, 802 to 804, 804 to 806, 806 to 808, 808 to 810, 810 to 812, 812 to 814, 814 to 816, 816 to 818, 818 to 820, 820 to 822, 822 to 824, 824 to 826, 826 to 828, 828 to 830, 830 to 832, 832 to 834, 834 to 836, 836 to 838, 838 to 840, 840 to 842, 842 to 844, 844 to 846, 846 to 848, 848 to 850, 850 to 852, 852 to 854, 854 to 856, 856 to 858, 858 to 860, 860 to 862, 862 to 864, 864 to 866, 866 to 868, 868 to 870, 870 to 872, 872 to 874, 874 to 876, 876 to 878, 878 to 880, 880 to 882, 882 to 884, 884 to 886, 886 to 888, 888 to 890, 890 to 892, 892 to 894, 894 to 896, 896 to 898, 898 to 900, 900 to 902, 902 to 904, 904 to 906, 906 to 908, 908 to 910, 910 to 912, 912 to 914, 914 to 916, 916 to 918, 918 to 920, 920 to 922, 922 to 924, 924 to 926, 926 to 928, 928 to 930, 930 to 932, 932 to 934, 934 to 936, 936 to 938, 938 to 940, 940 to 942, 942 to 944, 944 to 946, 946 to 948, 948 to 950, 950 to 952, 952 to 954, 954 to 956, 956 to 958, 958 to 960, 960 to 962, 962 to 964, 964 to 966, 966 to 968, 968 to 970, 970 to 972, 972 to 974, 974 to 976, 976 to 978, 978 to 980, 980 to 982, 982 to 984, 984 to 986, 986 to 988, 988 to 990, 990 to 992, 992 to 994, 994 to 996, 996 to 998, 998 to 1000.

TREE FERNS. THE LARGEST AND BEST STOCK IN EUROPE.

WILLIAM BULL, F.L.S.

Respectfully invites the Nobility and Gentry to an inspection of the above: also of his MAGNIFICENT SPECIMEN ORNAMENTAL PLANTS, Adapted for the decoration of Conservatories and Greenhouses, or suited for Sub-tropical Gardening.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

THE NEW ROSE, QUEEN OF BEDERS (NOBLE).

Perhaps the Finest Rose for Bedding ever sent out. COLOUR OF "CHARLES LEFEBVRE".

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that flowers were cut daily from June to November 20, 1876.

Good Plants will be sent out, in strict rotation, at 10s. 6d. each, COMMENCING FIRST WEEK IN MAY.

CHARLES NOBLE, BAGSHOT.

WILLIAM S. BURTON, GENERAL FURNISHING BROOMING, by appointment to H.R.H. the Prince of Wales, sends a Catalogue gratis and post-paid, on receipt of a constant list of illustrations of his unrivalled Stock with Lists of Prices and Plans of the Thirty Large Show-rooms, at 39, Oxford Street, W. 1, 14, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540,

BY SPECIAL APPOINTMENT TO HER MAJESTY AND HIS ROYAL HIGHNESS THE PRINCE OF WALES.

JOHN WILLS, F.R.H.S.,

Nurseryman, Florist, and Bouquetist to Her Majesty and the Royal Family,

ROYAL EXOTIC NURSERY and WINTER GARDEN,

ONSLow CRESCENT, SOUTH KENSINGTON, LONDON, S.W.

The most extensive Floral Decorations in London for many years have been arranged under J. W.'s personal superintendence.

J. W. is extensively engaged in the Arranging and Planting of Conservatories, the Construction of Waterfalls, Rockeries, &c., in all parts of this country and on the Continent, and may be consulted in any part of the world. References are kindly permitted to many large and important Works already carried out. A large Staff of most reliable Workmen are kept.

Choice Cut Flowers, &c., carefully packed and sent to any part of the country on the shortest notice.

NURSERIES FOR ORCHIDS, NEW PLANTS, &c., FULHAM, S.W.,
AND ANERLEY, NEAR THE CRYSTAL PALACE.

WILLS' NEW HYBRID DRACÆNAS.

The following Six splendid Novelties will be ready for sending out on and after April 1, 1877.

For descriptions see various articles in the *Gardeners' Chronicle*, *Journal of Horticulture*, *The Gardeners' Magazine*, &c.

D. ELIZABETHÆ (Cooperii, × regina).

Fine established plants, price 31s. 6d. each.

Large specimen plants in full character. Prices on application.

D. GLADSTONEI (excelsa, × ferrea).

Fine established plants, price 31s. 6d. each.

Large specimen plants in full character. Prices on application.

D. REBECCÆ (Cooperii, × regina).

Fine established plants, price 31s. 6d. each.

Large specimen plants in full character. Prices on application.

D. SALMONEA (concinna, × regina).

Fine established plants, price 42s. each.

Large specimen plants in full character. Prices on application.

D. SYDNEYI (concinna, × regina).

Fine established plants, price 21s. each.

Large specimen plants in full character. Prices on application.

D. TERMINALIS ALBA (nigrescens, × regina).

Fine established plants, price 42s. each.

Large specimen plants in full character. Prices on application.

Three Medals were awarded to the above Novelties, including the Grand State Medal, at the Brussels International Exhibition, on April 30, 1876.

The First Prize for the three best Dracænas in cultivation was also awarded to Mr. Wills at the same Exhibition.

WEDDING AND OTHER BOUQUETS.

ROYAL EXOTIC NURSERY AND WINTER GARDEN,
ONSLow CRESCENT, SOUTH KENSINGTON, LONDON, S.W.

NEW PLANTS, 1877.

CHARLES LEE & SON,

SUCCESSORS TO

MESSRS. JOHN AND CHARLES LEE,

OF THE

**Royal Vineyard Nursery,
HAMMERSMITH, near LONDON,**

Have the pleasure to offer the following very beautiful and interesting

NOVELTIES,

now offered by them for the first time:—

BEGONIA COLTONI.

This distinct and beautiful Begonia was raised at the Royal Vineyard Nursery. The colour of the flowers is quite new in Begonias, being of an orange-crimson. It is a most abundant bloomer, and the flowers are of the largest size. It received a First-class Certificate from the Floral Committee of the Royal Horticultural Society in 1875. Good plants, price *ret.* 6d. each.

BEGONIA RODWELLI.

This lovely Begonia was also raised at the Royal Vineyard Nursery. The flowers are of a bright vermilion-scarlet, and of the largest size; and the plant is a very abundant bloomer. It received a First-class Certificate from the Committee of the Royal Horticultural Society. Good plants, price *ret.* 6d. each.

CORNUS MAScula AUREA ELEGANTISSIMA (J. & C. Lee).

This elegant and lovely hardy shrub was raised from seed in our Isleworth Nursery, and has been proved to be perfectly constant in its beautiful variegation. A broad margin of pure gold surrounding a bright green centre is of itself a sufficient attraction, but when in July the tips of the leaves become suffused with the brightest crimson it is impossible to give an idea of the beauty and elegance of the plant, which will bear a favourable comparison with the best variegated tree or greenhouse exotics. Suffice it to say, that it has been seen and admired by many amateurs and nurserymen, and has been awarded a First-class Certificate at South Kensington. The habit of the plant is semi-pendulous, and very graceful. Price of maiden plants, 12s. each; larger specimens, 21s. each. A Coloured Plant may be had on application for 12s.

JUNIPERUS VIRGINIANA ELEGANS (J. & C. Lee).

This very elegant variety of the Red Cedar was raised from seed in our own grounds in 1850. It is scarcely necessary to remark upon the hardiness of this plant, but it is due to its character to state that the elegant cream-coloured variegation, with which the whole plant is suffused is perfectly constant, and has never been injured by frost or hard frosts in the least degree; in the hottest sunshine it is happily in the open air. The plant is of neat and free growth, and received the honour of a First-class Certificate from the Floral Committee at South Kensington, in July, 1875. Price 15s. each; larger specimens, 22s. each. A Photograph of the plant may be had on application for 2s.

POPULUS CANADENSIS AUREA VAN GEERTI (1876).

The golden variety of this noble Poplar was sent out in February last by Mr. Charles Van Geert, of Antwerp, has fully borne out in our Nurseries the description he gave of it, and has retained its golden colour much better than either the Golden Catalpa or the Golden Oak during the last tropical summer.

EXTRACT FROM MR. VAN GEERT'S DESCRIPTION:—
"We have the pleasure of offering an extremely remarkable variety of the Canadian Poplar, with a foliage which presents during the whole summer the finest taw of golden-yellow. It is in our opinion a most valuable addition to the larger trees, pronounced so by every connoisseur who has admired it in our nursery, for the coloured foliage now so frequently met with among low shrubs fails most entirely among the larger trees. The Catalpa aurea and the Quercus Robur concordia are the only trees known as possessing the same golden foliage; but the former is only a second-classified tree, and the latter has not the vigour of the common Oak. Our golden Poplar, on the other hand, is a first-class tree, of rapid and vigorous growth. Its leaves are quite as large as those of the common Canadian Poplar, and the yellow hue instead of being confined to the under and vigorous parts. The better nourished the tree is, and the more it is exposed to the sun, the more vivid is the golden hue."

Having received in February last a large consignment of this magnificent novelty from Mr. Van Geert, we are enabled to offer nice plants at 2s. 6d. each.

ABIES EXCELSA AUREA (J. & C. Lee, 1875).

This is decidedly the finest golden Conifer of large growth yet introduced. It is of free growth, and requires to be planted in the full sunshine. In such a position the whole tree is suffused with the richest gold. A First-class Certificate has been awarded to this valuable tree at South Kensington. Price of nice plants, 15s. each; larger specimens, 22s. each.

LAURUS CAMELLEIFOLIA (1876).

We can still supply a few hundreds of this extraordinary and elegant Laurel. Price 2s. 6d. each; by dozen, 25s.

**CHARLES LEE & SON,
HAMMERSMITH, W.**

**SUTTON'S
CHOICE FLOWER SEEDS,
FREE BY POST OR RAIL.**

Sutton's Improved Miniature Astrer.

A profuse flowering variety, of dwarf compact habit, remaining in bloom for a considerable period, hence it is invaluable for growing in pots for conservatory or drawing-room decoration. We have this season succeeded in sowing six distinct colours, which greatly increases the value of this beautiful Astrer for bedding purposes.

Price per Packet, mixed, 2s. 6d.

Six varieties, separate, 6s.

**SUTTON'S
COLLECTIONS of CHOICE FLOWER
SEEDS,**

To produce a beautiful and continuous display during Summer and Autumn.

Free by Post or Rail. *L. s. d.*

No. 1 Collection of Flower Seeds	2	0	0
No. 2 Collection Ditto	1	1	0
No. 3 Collection Ditto	1	1	0
No. 4 Collection Ditto	0	15	0
No. 5 Collection Ditto	0	10	0

Small and useful Collections can also be had, from 2s. 6d. to 7s. 6d., free by post.

Full particulars may be had, gratis and post-free, on application.

TO OBTAIN THE

Best Garden Lawns and Croquet Grounds

SOW

**SUTTON'S
LAWN GRASS MIXTURE,**

Which forms a close velvety turf in a very short time.

For making New Lawns or Croquet Grounds 5 bushels, or 60 lb., is required per acre, or 1 gallon to every six rods (or perches) of ground.

For improving those already in turf, 20 lb. should be sown per acre.

March, April, and May are the best months for sowing.

Price, 1s. 3d. per lb., 22s. 6d. per bushel, cartage free.

Instructions on the Formation and Improvement of Garden Lawns and Croquet Grounds
Gratis and post-free.

SATURDAY, APRIL 7, 1877.

THE IVY.

"In days when Arthur ruled the land,
As ancient legends tell,
The Ivy was a gardener lad,
And loved a lady well."

THE Ivy may be regarded as a classical as well as a decorative plant; poets in all ages, and in various moods, have sung of it: and as illustrating its early adaptation to decorative purposes, it is said that—

"The Roman on his battle plains,
Where kings before his eagles bent,
Entwined it with exulting strains
Around the victor's tent."

Another writer, in strains less complimentary, says that—

"No flower can bear the Ivy's shade,
No tree support its cold embrace.
The Oak which rears it from the ground,
And bears its tendrils to the skies,
Feels in his heart the rankling wound,
Till in its poisonous arms he dies."

Another, in writing about this plant, has said truly enough—

"Thou that will climb the loftiest height
Or deck the lowliest grave."

Among the various genera, however, of perfectly hardy ornamental plants, there are few more useful than the Hedera. The genus does not contain many species, but there are now many varieties, many of them being possessed of variegated and exceedingly ornamental foliage. One of the best known sorts, however, and one of the most useful, is the Hedera canariensis, better known as the Irish Ivy, although I am unable to say why it receives the latter appellation, as, according to Loudon, it is, as its specific name implies, a native of the Canary Isles. It is, however, perfectly hardy, and under favourable circumstances is of very rapid development, and has been known to clothe or cover a wall 12 feet high in the short space of three seasons.

Wherever it is desired to speedily cover an unsightly wall or other object with this plant, a preparation of tolerably rich soil should be made in which to plant the roots, and the shoots should at the same time be pegged to the surface of the soil (close to the object intended to be covered), into which they will very quickly root, and the young shoots as they are produced will at once adhere to the surface of the wall or other object without the assistance of nails, or any other attempt to secure its adherence. Where abundance of rooted portions of the plant can be had they may be planted pretty close together, and the shoots may be cut off to within an inch or two of the surface of the soil, and the young shoots as produced will at once cling to the object intended to be covered.

As regards the after-treatment of the plants, much will, of course, depend upon the nature or character of the objects they are intended to clothe. If this should be a ruin, artificial or otherwise, a dead or decaying tree or any similar object, it is then advisable to allow the plants to assume their natural character, modified to whatever extent may be found desirable. The power of adaptation possessed by this plant is one of its most striking peculiarities, and the aerial roots by which it adheres so tenaciously to walls or other objects, cease to be

produced as soon as the plant has outgrown the same, or whenever there is no longer any object to which it can cling. And it then assumes a tree or bush-like form, and generally flowers and bears fruits or berries in abundance, which add very considerably to its ornamental appearance.

In preparing a site for planting a collection of hardy Ferns many years since it was found necessary to uproot many shrubs and trees, and the roots of these were piled up in rough pyramidal forms, in some instances to a considerable height, surrounding and to some extent enclosing the prepared space. Around these rather unsightly piles of tree-roots, plants of some of the various kinds of strong-growing Ivies were planted, and in the course of a very few years the piles were entirely hidden, being densely clothed by the luxuriant and rich dark green foliage of the plants, which soon commenced to flower and fruit freely, presenting a very remarkable appearance, but they are nevertheless well suited to the situation they occupy.

It is found that when cuttings are taken from those parts of the plants which have assumed the tree or bush-like form, they continue to retain that habit when they become rooted, and are found to make useful decorative plants for pot culture or otherwise in the form of dwarf bushes, pyramids, or standards.

Most of the varieties of the Ivy are also very suitable for the purpose of forming margins to flower-beds of considerable dimensions, and as edgings to walks in shrubberies, to coach roads, &c.

The surface of the ground under large and ornamental trees in pleasure-grounds, when grass as well as most other plants will refuse to grow, may be carpeted with the common Irish Ivy, and margined with a band of some of the variegated kinds, so as to produce a very pleasing effect, and the beauty of the trees may by this means be very considerably enhanced by being made to stand in the centre of a circle of the richest verdure.

In cases where it is merely desired to clothe the surface of a wall or a portion of a building, so as to present the more cheerful aspect of rich green foliage, in preference to the dreary appearance of bare brick or stone walls, if the common Irish ivy, or any of the strong-growing, green-leaved kinds be used for the purpose, as soon as the plants have fairly covered the surface of the wall, they should be annually clipped or cut in as closely as possible. The best time to perform this operation is early during the month of April, when danger from injury by severe frost may be supposed to have passed; for although the several varieties are all perfectly hardy, still injury from frost is not unlikely to be sustained when the plants are in a somewhat mutilated condition, yet after this period no danger from this cause need be apprehended. It will be found that the plants will, in a very short space of time after cutting, put forth abundance of fresh green leaves, all of which they will retain throughout the season; so that there will be no litter from the gradual shedding of leaves during the summer, which would be the case if the old leaves were allowed to remain upon the plants. I have now in view a high wall which has been treated in this manner for more than twenty years, and the plants are still perfectly healthy. This annual clipping in as closely as possible to the wall is absolutely necessary where the strong-growing sorts are used, otherwise the increasing weight of the plants, acted upon by strong wind, would be almost sure to cause them to separate from the comparatively smooth surface of a wall. But in cases where the more delicate and slower growing sorts, with very beautifully variegated foliage, are used, they will generally be found to cling more closely to the surface of

walls or other objects, and less clipping will in their case be required.

By the judicious use of a selection of Ivies, what may be very unsightly or an eyesore may be easily and quickly converted into an object of considerable beauty and interest, considerable diversity existing in the form as well as in the shade of colour in the foliage of some of the varieties, which varies also to some extent at different periods of the year. But in making a selection care should be taken to avoid mixing the delicate growing kinds with those of more rapid and vigorous growth. If this should not be done, the former will be speedily smothered or overgrown by the latter. Considerable taste may, however, be displayed and pleasing effects produced upon the surface of walls, and on buildings which it may be desired to clothe with this plant, by using the variegated and more ornamental-leaved kinds to form fringes or borders to archways, doors, windows, &c.; panels or other appropriate

large-leaved kinds well worthy of cultivation; and among the best of the smaller green-leaved kinds, which as a rule cling closer to the wall or other object they may be placed in contact with, and are consequently less likely to be torn off by the action of the wind, are *H. caenwoodiana*, *H. conglomerata*, *H. digitata*, *H. chrysocarpa*, bearing yellow berries; *H. Glymci*, *H. palmata*, &c.

The best of the variegated kinds belong to the small-leaved section, and all of them are very beautiful, the variegation being permanent, very neat, and effective, such as—*H. aurea elegantissima*, *H. alba lutescens*, *H. marmorata* elegans, the old and new silver-striped varieties, and *H. tricolor*, with small, white-margined foliage, beautifully tinged with pink during its young condition. *P. Grieve*.

EASTER FLOWERS.

THESE are now almost as much in demand as Christmas decorations. Every season the demand for both increases, until one begins to fear that the Holly

FIG. 66.—STAFELIA BAYFIELDII.

designs may also be formed upon the surface of walls, &c., and a little occasional care is only required to keep such designs properly defined by preventing the sorts used from mixing with each other, and by confining each variety to its place in the design.

As regards the different varieties of this plant, among the strong-growing kinds *Hedera canariensis*, or the common Irish Ivy, is, as has already been said, one of the best; but there are at the same time several other varieties which are exceedingly useful and ornamental as decorative plants, such as *H. Rœngneriana*, or heart-leaved, a very fine, free-growing, hardy, and distinct variety; *H. dentata*, with large dentate leaves, distinct and fine; *H. algeriensis*, with large foliage of a light green colour, with its variegated variety, *H. algeriensis variegata*, together with the gold-striped and maculated varieties of *H. canariensis*. The variegation, however, of the three last-named sorts is somewhat irregular, and the plants frequently run into the green condition. In addition to those mentioned, there are several other free-growing,

will be cut down and all the Mistletoe gathered every Christmas, and all the flowers used up at Easter. But the more of either used one year the more come again to the front the next, and so on and "for ever," for it is not likely that either decorations or flowers for the winter or vernal festival will ever be wanting. It is perhaps one of the most pleasing signs of the times, horticulturally considered, that flowers are daily becoming more indispensable to the enjoyment of all our secular feasts and even our religious observances. Who can calculate the tons of flowers that have been used in the decoration of churches along this Easter-tide? And society seems to catch the flower decorating mania with their prayers; for hardly have the services of Easter Sunday closed when the season of the fashionable decorators opens, and runs on until the partridge arises on the brown heath and the peasant in his shaggy wood, and puts an end to the season—to open up an infinity of "little goes" in private families throughout the country.

Primroses, Lilies of the Valley, Camellias, Azaleas, Deutzias, Spiræas, Hollies, Roses, Narcissus, Hyacinths, Tulips, Cyclamens, Arums, Eucharis, Gardenias, &c., have all played a very important part in the Easter decorations of the year, and these and many more are sweet, beautiful, and suitable—a trio of

adjectives not found in all flowers, such, for instance, as the golden Broom-like *Cytisus*. But there is a class of plants, cheap, easily grown, and most effective, that are second to none in Eastern or other decorations, and yet they are seldom or ever seen in London or other large towns, and are, in fact, almost as rare in the provinces. These are the different varieties of Thorn—pink, scarlet, white, red, single and double. These are chaste, simple, sweet, freshness itself, as if bathed in the very spirit of spring or early summer; and dripping with the dew of a lovely May morning, I know no flowers that can speak in more persuasive tone of the certainty of a resurrection to a newer and better life than those of *Meibomia*, forming the most exquisite rosettes, set round with their own tender and delicate leaves. They are a perfect symbol of spring or early summer, set free for good from the binding influence of wintry frosts, and blasting, biting winds.

Every one also loves the blossom of the May—old and young rich and poor—high and low, delight in its pleasing fragrance, and rejoice in its simple beauty. The plants are so cheap and so plentiful as to bring them within reach of all. Plants of flowering size of most varieties of the Thorns may be purchased for a few pence, and the plants of *Meibomia* for more than twice the price only asked for; the May may also be readily moulded into any desired size or shape. The most striking shape for flowering-pots is that of dwarf, medium, or tall standards or pyramids. It is either of these forms that may be made to keep them with ease. The plants need little training, and almost less pruning, and enjoy under fair treatment an entire immunity from insect pests; they will grow in any soil, and force will be almost raised, provided attention be given to heat them by an excess of heat. From 55° to 60°, or at the most 65°, is the utmost degree of forcing that Thorns should be subjected to. The plants, however, enjoy a moist atmosphere, and frequent overhead sprinklings, even when in flower, taking care, however, that the water used is at once soft and clean.

Neither does the May like early forcing. I once tried to have it flower at Christmas, and it almost ruined the plants, and the flowers produced were small and puny. But from the Festus corner, the May is easily forced or brought on with, in fact, but little forcing. The first batches of plants take nearly two months to come fully into flower, the second may be forced in about one month, the six weeks, and the last under a month. It does well either with or without bottom-heat in excess of the top, so long as the heat is not excessive. After flowering the plants will stand for a month or six weeks in the conservatory fresh at the softest, and in the open air, provided they are occasionally soured overhead with clean soft water. As soon as the flowers fade the plants should be removed to an open place in the open air, and plunged 2 inches below the rims of the pots. Next season they may be forced again, and so on for many years, flowering more freely every year; in fact, unless they are potted carefully, as well as rather early the first season, they will flower more sparsely that year than any other. They should be potted up as early in October as possible, to force fairly well or flower freely the first season from the open air.

May plants covered with bloom form some of the richest and most spring-like decorations we have for church and roomy. They are good for corridors, halls, staircases, and conservatories at Easter. The cut flowers, especially of the double varieties, are also invaluable for bouquets, wreaths, dwarf designs on dinner-tables, letters, &c. The flowers are of the same shades, and the plants are of their simple beauty, fragrance, and freshness; they are also distinguished by a great richness and diversity of colouring. Double and single whites without flaw or spot, the brightest scarlets, reds, and the palest pinks, all delicate and a finish to May decorations that few other flowers can equal—none rival. *D. T. Fish.*

New Garden Plants.

STAPELIA BAYFIELDII, *N. E. Br.* (Fig. 66)

Stems erect, branching at the base, 6–8 inches high, 7–9 lines thick, puberulous, four-angled, with the angles and toetee rather short, stout caudex, nearly horizontal. Peduncle from near the base of young branches, 2 lines long, stout, 3–5 flowered. Pedicels short, 8–10 lines long, puberulous. Calyx lobes 4-angled, 2 lines long, pubescent. Corolla tubular, 2½–3 inches in diameter, with the lobes expanded; back puberulous, green tinged with purplish, the nerves darker; face glabrous, with a few short scattered hairs inside the very short tube. Corolla immediately around the corolla smooth, or nearly so, purple-red, darker towards the tips, the centre to half way up the lobes marked with numerous, narrow, undulated, pale yellow transverse lines; the lobes 1–1¼ inch long, 9–10 lines broad,

ovate-acuminate, revolute, fringed with rather short, simple, pale purple hairs. Ligula directly spreading, apex a little recurved, 2 lines long, slightly concave in the upper part, linear, truncate, with a central projecting tooth, dull brownish red or dark purple-brown, the edges minutely mottled with dirty yellowish. *Rostia subulata*, erect, with diverging apices, 3 lines long, dark purple-brown, minutely mottled with dirty yellowish. *Als deltoide*, subulate, obtuse, entire, 1 line long, coloured like the rostr.

This species has been in cultivation for several years under the name I have adopted, but has hitherto remained undescribed. The stems have a considerable resemblance to those of *S. matulibis*; and indeed, I have seen in other collections, and grown in my own, the latter species as *S. Bayfieldii*, and at one time I thought that *S. Bayfieldii* was simply *S. matulibis* under another name; but *Justus Cordroy*, of Blewbury, was the first to send me the true plant, and from his specimen my drawing was made. I have since seen it elsewhere. Besides the very distinct flowers, the present species may always be distinguished from *S. matulibis* by its puberulous stems (in *S. matulibis* they are glabrous), and more erect habit. The woodcut (fig. 66) represents but a small portion of the plant. *N. E. Brown.*

PULTENEA ROSEA, *F. Muell.**

This very distinct and pretty greenhouse plant (fig. 67) will be quite an acquisition on account of its neat and novel habit of growth, and its bright and cheerful coloured blossoms. It comes from Moon's William in the Grampians of Victoria, where it grows

FIG. 67.—PULTENEA ROSEA.

at an elevation of 5000 feet, and has quite the aspect of the small *Pea*-flowered shrubs which used formerly to abound in collections, but which have now generally been allowed to run out amongst us. The flowers are produced at the tip of all the numerous twiggy branchlets, and impart quite a gay appearance to the plant; they are of a bright rosylilac colour, and grow in small roundish heads. The following is Mr. Bentham's description:—

"An erect herb-like shrub, the branches virgate, glabrous, or sprinkled with a few hairs. Leaves linear-terete, obtuse, or with short calulate points, under 1 inch long, channelled above by the involute margins, slightly scabrous. Stipules subulate-pointed. Flowers pink, in terminal heads, sessile within the last leaves. Bracts few, narrow, trifid. Bracteoles inserted under the calyx, linear-lanceolate. Calyx silky pubescent, 2½ lines long, lobes lanceolate, as long as the tube, the two upper ones more united. Petals nearly of equal length, not twice as long as the calyx. Ovary villous; style subulate. Pod two lines long, acuminate."

Mr. Bentham remarks that this species is chiefly distinguished from *P. hibertioides* by the unusual colour of the flowers—the very feature which will give it especial interest for our plant-growers and exhibitors of hard-wooded plants, since it will in some degree, though not in the present instance, represent the *Burtonias* which used to be so effectively exhibited some quarter of a century ago. It has been exhibited lately both at Regent's Park and South Kensington, by Messrs. William Robinson & Sons, to whom we are indebted for the opportunity of illustrating it.

* *P. rosea*, F. Mueller, Fragm. II. 12; Bentham, *Flora Australasica*, t. 28. *Burtonia subuliflora*, in Trans. Phil. Inst. Vict. 1. 39; Id. Hook. New. Musciv. 41.

HOLLAND.

(Continued from p. 400.)

For we have passed the frontier station of Rozendaal, and have had no misunderstanding with the Customs' gentlemen; but, before proceeding further, the geographically-inclined tourist ought to be informed that this is not the only, nor the most noteworthy, Rozendaal in Holland. Close to Danckerke there is also a Rozendaal, famous for Asparagus and nightingales, where the rich Danckerkepoels have their country villas, and where there are quite as many *Fotostas* as *Roses*. That, however, does not concern us now. What does it that a portion of Gelderland (whence *Guelder Roses*) is called "the Dutch Switzerland"—an ambitious title not wholly unjustified. There are tall woods and broken ground, fresh springs and waterfalls, which attracted the patricians of the neighbouring provinces, causing the erection first of large hosteries, and then of *Adlonas*, with their surrounding gardens and parks, amongst them of Rozendaal, which was a favourite residence of our William III. They still show a *sovereign* of his last visit, or rather of Queen Mary's—namely, an embroidered screen presented to the Mistress of Rozendaal by the ladies in waiting of the Queen of England. Due note being taken of this we proceed.

Immediately the eye lights on black and white coes—the race which takes the lead of all others in Holland. We are rolling across an interminable hoo-green, divided only by rows of trees, marking lines of roads which serve also as dykes. What a charming landscape, were it not always the same—an endless plain. Everything is so neat, so fresh, so green, so well-kept. Even the sky-to-day is swept clean by the good old woman who clears it of cobwebs on the happy occasion of our visit. One would like to guess what lies beyond that level horizon. Is it still fat pasture, with more and more bowing-green of rich meadow-land?

Fully to appreciate Holland, I fancy that one ought to look down upon it from a balloon, thence we should see what might appear like a desert of green prairies, without trees, bushes, or hedges to break their wearisome sameness, in which towns and villages are the welcome oases; Holland, in fact, was once a country of deserts, which have been inhabited in spite of their natural peculiarities and resistance—deserts of water, deserts of marsh, deserts of sand, deserts of tangled weeds and bushes. The swellers therein are bold intruders, who keep up a constant fight with the nature of the land, which would repel them, but cannot. It may draw them now and then by hundreds and thousands, but can neither make them lose their hold nor break their spirit. Truly, the old dogrel is right—the Dutch have taken Holland.

But what is that in the distance, like a row of grey beehives? We near it, and find at Moerdijk, or Moerdijk, an arm of the sea called Hollandisch Diep, which, till recently, was crossed in ferry-boats, weather and ice permitting; but is now spanned unbroken by those grey arches which help to sustain the line of railway. There is a waste of waters, a wilderness of swamps, seeming to deny all further progress, yet conquered by Dutch enterprise; an admirable work. This is the only way, if any, in which I would consent to cross the English Channel by rail. In the tunnel, if ever finished, there will be a choice of death—suffocation, drowning, collision, caving in, besides others which will be revealed by experience.

Gliding past Dordrecht, with its tall and solid steeples—what big substantial churches and steeples they do build in Holland!—and its busy much-frequented canal or river—here it is hard to say which is which, often they are both in one—you reach without change the left or south bank of the Meuse, where a steamer takes you across to Rotterdam. The bridge over the Meuse being not yet finished, there is a break in the railway.

ROTTERDAM.

Rotterdam at first sight makes a favourable impression, which closer inspection does not weaken. Trees, shipping, buildings, and water combine together in admirable groups. Streets, canals, quays, and sailing vessels or barges form an inexhaustible kaleidoscope of picturesque views. The place is wealthy, and makes no secret of its wealth. Plate-glass windows in abundance, gay streets, party of promenades, well-dressed ladies and children, working-women with gold screws or vine tendrils in their caps, are symptoms sufficiently significant. The conformation of the city,

through its intersection by canals, puts a check on inland driving about; consequently no trucks for merchandise—merchandise is drawn by dogs—both private carriages are seen in the streets. Dogs, indeed, are much used as beasts of draught both in Holland and in Belgium.

Strangers who are not over hard to please may safely go to the Hotel St. Lucas, in the Hoog Straat, or High Street, which is excellent as well as central. The new Bath Hotel, on the Quai des Boompjes (the little trees), facing the river, is perhaps more pretentious and may be first-rate, but is less certain. No apology is made for offering this advice, because it is disinterested and may prove useful. On arriving in a strange town one is often thankful to know to what inn one may betake one's self in confidence. Hotels in Holland are somewhat more expensive than those of the corresponding class in France; but then they are good and comfortable. Wise throughout is an imported article; its quality is satisfactory, and its price not excessive; and in towns, as Rotterdam, where the drinking water has got a bad name, everybody takes Schor or other aerated water at meals. The hills of France are sometimes tied with local colouring. A sweet tooth is one inheritance of northern nations. Accordingly they give you red currant jam with roast chicken, and stewed pears with wild fruit. Smoke-dried eels, like brown wallop-sticks that have lost their handles, hang in shops awaiting purchasers. They might reward their discoverer and prove worth a trial, but I had no opportunity of testing their merits.

Amongst Rotterdam's most striking objects are its colossal mills, not the small shadowy phantoms of Rembrandt's pictures, but Towers of Babel built with solid brick. Mills, however, are a specially Dutch institution, and are almost the only things in Holland that make a fuss. They intrude their whirrlings everywhere. A landscape without a mill, or a concourse of mills, would not be a Dutch landscape. They serve all sorts of purposes, from the high function of rendering the country habitable by draining it, and grinding bread for those who venture to eat it, to the humble offices of extracting oil and making stuff. Water-power being very limited, in consequence of the almost uniform level of the land, the Dutch wisely turn air-power to the best account. When insufficient, they help it with steam. The living forces of the atmosphere are made the most of—a breath of air can hardly stir without putting some useful machine in motion.

In taking a drive round and about Rotterdam, the difficulties which its founders and embellishers have had to contend with must not be forgotten. The park is laid out with the street and the shrubbery and copsewood, purposely preventing distant views—which they have only too much in the open country—and giving the shade and shelter of a natural wood. A labyrinth of winding waters is only a matter of course in Holland. Suburban country boxes, although not small, give the idea of toy houses stuck into bouquets of flowers and foliage. Each is the pet of some wealthy bourgeois, "who in trim gardens seeks his pleasure." Here, as in Ghent, the eye rests with approval on balconies and iron festoons, with Tropæolums, Virginian Creepers, Petunias, and other common things, showing how much may be done by good taste aided by regular tendings and waterings, and affording a pleasing instance of workmanship surpassing the materials.

In the Zoological Gardens (whose tigers and white bears are unsurpassed), and elsewhere, there is a good deal of carpet bedding, public and private, as befits rich individuals and well-to-do societies, some specimens of which we may presume to be experimental merely. Contingent and pyramidal, as at plants-embroidery, a sugar-loaf of Pelargoniums, in sorts stretching from top to bottom, surmounted by a Yucca, and bordered at foot by starlike rays of Alternanthera and the rest, may be praiseworthy as effects, but are failures as results. The Zoological presents the apparent miracle of a basket filled with heavy flowering plants pretending to float in the middle of a piece of water—doubtfully pretty, and certainly incongruous. But every effort after novelty cannot be in excess, and to rail at the changes of fashion is useless, if indeed it be not absurd. "Something new" is no fresh object of human wishes. We accept the unchanging forms of oriental costume simply because, to us, they are new. Some fashions last longer than others; some are laid aside, and then re-adopted; but

in every case there is continued change. Now, if there are variations in the style of dress or personal decoration, of furniture or house decoration, why should there not be changes in the style of planting and bedding-out, i.e., of garden decoration?

Instead of smiling too critically, let us listen to the chimes of those sweet-voiced bells; although, as to any tune they may be singing, being unable to catch the accent or the measure, it may be as unintelligible to us as spoken Dutch itself. That, however, is often as much the fault of the chimes themselves as of the listener's ear. And, look! the storks in the garden are pinioned, and cannot perform their autumnal migration. Nevertheless, the free domesticated and protected storks of the neighbourhood have come hovering and circling round them, clattering their long bills—for the stork is absolutely voiceless; the most he can utter is a faint sigh—to tell them that the time for starting is drawing near. †

THE SPECIES OF HELLEBORUS.

I HAVE had so many inquiries lately about the genus Helleborus, and so many specimens sent to me, that I am led to think that a brief account of the known species and forms would be useful, especially as the best recent information about them is scattered in publications that are accessible but to few. The genus consists of four well-marked and little-variable species; and, in addition to these, of two that may be called either groups of closely allied species, or single species which have several strongly-marked varieties. Treating these latter as single species, the following key will give an idea of the characters in which the principal differences which exist in the genus are to be found:—

Group I. CAULESCENS.—Flower-stems furnished with leaves below the inflorescence.

- | | |
|--|---------------------------|
| Leaves thin and deciduous. Foliolae flat, 2-2½ inches long. | 1. <i>H. VESICARATUS.</i> |
| Leaves coriaceous and persistent. Foliolae thick, rigid, under an inch long. | 2. <i>H. LIVIDUS.</i> |
| Leaves many, narrow, arranged pedately. | 3. <i>H. FORTIUS.</i> |

Group II. ACAULES.—Flower-stems without any leaves below the inflorescence.

- | | |
|--|--------------------------|
| Flowers 1-2. Bracts pale green. | 4. <i>H. NIGER.</i> |
| Flowers usually many. Bracts leaf-like, connate. | 5. <i>H. VIROIDEUS.</i> |
| Leaves thin, deciduous; segments ½-1½ inch long. Root-leaves very rarely more than one to a flower-stem. | 6. <i>H. ORIENTALIS.</i> |

H. vesicarius, Aucher-Eloy, MSS.; Boiss. in Ann. Sci. Nat., ser. 2, vol. xvi. (1841), p. 547; Fl. Orient., vol. 1, p. 60.—Stem annual, erect, reaching a height of a couple of feet, bearing one or two leaves below the inflorescence, the radical rosette faded by the time it flowers. Petiole reaching a length of nearly 1 foot; blade membranous, glabrous, composed of three distinct divisions, the upper furnished with short stalks and palmately cut into very numerous linear segments ¼-1 inch broad. Petioles of the reduced stem-leaves broad and channelled. Flower-stem forked about half a foot from the top, with about three branches, bearing each 1-2 copiously flowers, the bracts leafy in texture and generally furnished with leafy segments, oblong, 1-1½ inch long, cuneate, conniving in a cup. Stamens as long as the sepals; anthers oblong, 1 line long. Follicles 3-4, hemispherical, united by their inner suture in the lower half, 2-2½ inches long, 1-1½ inch broad, flattened laterally, with fine cross anatomising veins. Style incurved horizontally, 1-1½ inch long.

A native of mountain woods in Syria at Mount Cassius near Antioch and Aintaly, in the upper part of the Euphrates valley. The leaves resemble those of a Trollius in cutting and texture, and it differs totally from all the other species in its enormously large laterally-flattened fruit-carpsels. It flowers in January and February, and has not yet been introduced into cultivation.

2. *H. lividus*, Soland. in Alt. Hort. Kew., vol. ii, p. 272; Bot. Mag., tab. 72; Bot. Reg., vol. xxiv., t. 54; Sweet, Flower Gard., ser. 2, t. 150; Gren. Fl. France, vol. 1, p. 42; *H. argutifolius*, Visiani, Fl. Cors., p. 8; *H. virgatus*, Miller, Gard. Dict., edit. vi.; *H. viridis*, Lamour., p. 27; *H. cordata*, Willd., Coroll. Suppl., p. 40.—Stems erect, perennial, 1-1½ foot high, bearing eight or ten leaves crowded near the base below

the inflorescence. Petioles 1-1 foot long, blade glabrous, coriaceous in texture, persistent, always trifid, the segments oblong-lanceolate, acute, sharply toothed to a depth of ½-1 inch, the central one 6-9 inches long, 1-2 inches broad at the middle, the side ones oblique at the base, broadly rounded on the lower side. Flowers 10-20 in a deltid corolla, bracts copious, simple, oblong, acute, pale green, sharply toothed. Sepals pale green, nearly flat and spreading, round, ½-1 inch long and broad. Petals ½ inch long, cylindrical, stipitate. Stamens about half as long as the sepals; anthers pale yellow, oblong, 1 line long. Follicles 4-5, oblong, as long as the sepals, with an incurved style 1 inch long.

A native of Corsica, Sardinia, and the Balearic Isles. A very old inhabitant of our gardens, introduced at the beginning of the 18th century. It resembles best of all a good deal in habit, texture and inflorescence, but the leaves are extremely different. This is the only Helleborus with a trifoliate leaf. There is a variety integrifolius, D.C., in which the characteristic sharp toothing nearly or quite disappears.

3. *H. fortius*, Linn. Sp. Plant., p. 724; Engl. Bot., t. 613; 3 edit., t. 45; Reich. Fl. Germ., tab. 178; Hayne, Arzng., t. 10; Woodw. Med. Bot., vol. iii., t. 10.—Flower-stem perennial, about 1 foot high, naked near the base, marked with the scars of fallen leaves, bearing two or a dozen leaves below the inflorescence. Petioles 1-1 foot long; blade glabrous, coriaceous, persistent, very distinctly pectate; segments linear, shallowly incised-errate, 4-5 inches long when fully developed, 3-½ inch broad at the middle, one centrally and 4-5 lateral on each side on a recurved axis about ½ inch long. Flowering stem branched low down; inflorescence an ample deltid corolla, simple, like that of the preceding, but with copious simple pale green bracts, which, like the branches, are furnished with the fine glands which yield the odour from which the plant takes its name. Sepals obovate-oblong, green or sometimes bordered with bright purple, under 1 inch long and broad, connivent permanently in a cup, stamens nearly or quite as long as the sepals; anthers oblong, pale yellow, 1 line long. Follicles 3-4, oblong, about as long as the sepals, strongly ribbed transversely, terminated by a persistent stout rather incurved style ¾-1 inch long.

Spread through the western half of Europe from England to Austria, Italy, Spain, and Portugal. Flowers from February to May. An extremely little-variable species, well marked by its caulescent habit, strongly pectate leaves, and copious cup-shaped green flowers.

4. *H. niger*, Linn. Sp. Plant., p. 723; Jacq. Fl. Austr., t. 204; Woodw. Med. Bot., vol. iii., t. 159; Bot. Mag., t. 8; Reich. Fl. Germ., t. 111; Gren. Fl. France, vol. 1, p. 41; Boiss. Fl. Orient., vol. 1, p. 61.—Acaulescent, producing a single leaf and a simple or once-forked peduncle in a tuft, the tufts crowded on a short rootstock. Petiole in the typical form about ½ foot long; blade coriaceous, persistent, very distinctly pectate, the segments obovate-oblong, 3-6 inches long, 1-2 inches broad above the middle, shallowly incised in the upper half or third, entire and narrowly gradually in the rest, the central one distinctly stalked, with three or four leaflets on each side of it springing from a recurved axis nearly 1 inch long. Scape rather shorter than the petiole, rarely forked; bracts small, simple, ovate, pale green. Sepals the largest in the genus, nearly round, white flushed with purple, spreading, 15-18 lines long and broad. Stamens less than half as long as the sepals; anthers pale yellow, oblong, producing a single leaf, shorter than the stamens. Follicles 6 or 8, much shorter than the sepals; style stout, suberect, ½ inch long.

Spread through Central and Southern Europe, from France to Greece, Turkey, and the South of Russia. It is the earliest to flower of any of the species, and well known in the East. The stem is cylindrical, coriaceous leaf, and usually single flower, with only a small bract on the short peduncle, mark it at a glance from all the forms of viridis and orientalis. *H. altifolius*, Reich. Fl. excurs. No. 4727; Fl. Germ., tab. 112, is a large-flowered variety, with a petiole reaching 1 foot in length, and mottled with green and purple. It is often grown in gardens as *H. niger* var. major, and is figured as a variety of *niger* by Hayne, Arzng., vol. 1, tab. 8. *F. G. Baker.*

(To be continued.)

NOVELTIES.

PRINTING ON WOOD.—We have on one or two previous occasions alluded to a new process showing the connection between economic botany and art, devised by Whitman and his associates, and now in a position to illustrate it by the accompanying illustrations (fig. 68). The process is, as we have said, nothing more in essential than printing on wood. A design is drawn on the wood, as in the ordinary process of wood engraving; the block is then cut away, leaving the

design in relief. A cast is taken in metal from the wood-block, and from this cast impressions are taken, as in an ordinary printing-press, but on soft wood, instead of on paper, in one or more colours, as may be desired. The process is thus exceedingly well adapted for the decoration of houses, panels, skirting-boards, dados, cabinets, and thousands of other articles. Cheapness, cleanliness, durability, and effectiveness are thus secured. Given a good and artistic design suitable

JAPANESE HOUSE GARDENS.

SOME time since you figured two specimens of these from a work brought home by Mr. Moseley. It so happens that I have a Japanese pupil attending my lectures, and who has been a frequent visitor at my house for the last five years. With the help of this gentleman—Mr. Nagai—I have inspected two of the volumes which Mr. Moseley has been so good as to

curiously-shaped limestone or slag, under water, or with only the upper part above the surface, and they are placed under a glass frame or in a large glass jar; but in Japan a hard stone in rock-form is used and placed in an earthen vessel full of sand. We use delicate water plants, lizards, molluscs, &c., which live in the water, while other people plant gay leaves, Begonias, &c., on the top of the rock above water. The Japanese use, as already said, dry rocks; on the

FIG. 68.—EXAMPLES OF MR. WHITBURN'S WOOD-PRINTING AS APPLIED TO HOUSE DECORATION, ETC.

for the purpose intended, to begin with, and all the rest is a matter of mechanical detail, and as such is inexpensive in proportion to the quantity required. Mr. Whitburn is well known as a master of design in his particular style, but the process, of course, admits of any design being employed consistent with the nature of the material. Our illustrations are taken direct from the blocks designed and drawn by Mr. Whitburn, but printed on paper, instead of on wood. Those who are interested in this ready and inexpensive mode of embellishing a house should pay a visit to the show-room of Messrs. Whitburn & Young, at 4, Ludgate Circus-Buildings, E.C.

send me. These books were described as a *Treatise on Miniature Gardens*, but they are descriptive of aquaria which are introduced from China. According to Mr. Nagai, the Japanese (at least at this time) are inferior in their art to the Chinese. Peking is to the Japanese what Paris is to the Germans, and, indeed, to the other nations of Europe. As we look to Paris for the height of good taste and fashion, so the ladies of Japan dress themselves after the fashion of the Chinese nobility.

These Japanese aquaria differ from ours in many particulars. Ours are for the most part formed of

sand around the rocks lie cleverly made boats, as the sand is intended to represent water. The miniature plants which are placed in various parts of the rocks are planted by the Japanese very skilfully. Many Conifers, especially *Sciadopitys verticillata*, *Pinus Massoniana*, and certain *Thuja*s, play a prominent part. The rocks, which are scarcely 1-1½ foot high, are often like large barren rocks, for they are generally formed according to one regular rule, pierced with holes, and filled up with water, as if they were mountain lakes. In the large aquaria rocks are used, and water also flows at their feet, as the rocks repre-

sent lands. Little ships sail on the water, and various tall plants, such as Bamboos, Palms, and the like, or small plants are planted at the water's edge. Sometimes the rock is done away with, and an old rugged tree, often a Conifer, occupies most of the space, or the aquarium represents a whole landscape, with rocks, trees, and little houses. The rock may also represent a landscape, with houses and little villages placed at the foot or at a certain height on it, and planted with groves or single large trees. It will also be understood that all things being on a small scale, little figures of men are also used. A great variety is to be seen on these rockworks, as the form of natural rocks is exactly imitated. As we recognise in Nature the form of the rocks, so also is it in these clever miniatures. The various limestones, slates, stones are easily recognised as tufa, stalactites, and rocks full of water.

In the beginning of one of these books I find a plate with Chinese in various attitudes, stags, &c., to be imitated in clay. This shows that not only the Japanese but the Chinese are introduced in these aquariums. The next plate gives various designs of buildings and temples, bridges with men on them, boats and ships in the distance. These also are Chinese, not Japanese, so that the Chinese origin may be easily observed.

Finally, I must state that I have given the name of aquaria to these rockworks only in consequence of the custom of placing them in rooms; they are not aquaria, according to the generally recognised sense of the word. The Japanese term is untranslatable, the nearest approach to it is "miniature rock gardens for rooms." They are just at present so much the fashion in Japan that they are to be found in the dwellings even of the poorest classes. *Karl Koch, Berlin, March 15.*

FLORISTS & FLOWERS

THE NATIONAL AURICULA SOCIETY'S SOUTHERN SHOW.—Will you kindly permit me to say to all interested, that in addition to the legible naming of exhibits, as required by the fifth condition of the schedule of prizes, it has been determined that the name of the exhibitor shall be attached to each of the respective specimens. By this requirement necessary information will be supplied to the public, the secretarial work will be simplified, and confusion, and possibly loss, at the close of the exhibition obviated.

Exhibitors from the North will find the earliest morning trains to the Crystal Palace by the high level route convenient, and Mr. Thompson, the garden superintendent, has kindly promised to have men in readiness to aid in the removal of the cherished specimens to the exhibition tables.

At an early day I shall be glad to hear from those who may propose to partake of the cold collation which will be provided for the judges, in order that suitable arrangements may be made.

This is, I believe, all I have necessity to say, and I should not have occasion to ask your permission to say it in your pages, but that my long exile from floriculture, and the ravages wrought by death in the ranks of old and valued friends, have so broken my concentration, that I can only address privately all known to me, or of whom I ought to obtain account, I am persuaded there are many to whom otherwise I could not have access.

But, having the pen in hand, I should like to say a word as to the paragraph in the fifth condition of the schedule of prizes, in which the committee "recommend that the trusses be supported with a neat stick." This paragraph has so far been misunderstood apparently by my valued friend Mr. Horner, and possibly some other friends in the North, as to lead to the supposition that here in the South we approve "faecid attitudes and stiffnesses" to the elegance and grace properly belonging to a plant able by its "possession of a firm, elastic, self-supporting stem" to carry its head erect. And "D., Deal," who takes care to inform us he was not present when this, to him, objectionable recommendation was adopted, suggests a very grave latitude indeed, when he tells us he has been "brought up in the straightest sect of the old school," and this is a "practice" he has "invariably condemned." Really I must take the liberty to

say, much has been assumed of a very small matter. The delinquents involved are: Mr. C. Turner, Mr. James Douglas, and myself; and I humbly presume to think either of us can afford to smile at the assumption that we favour stiffnesses or forced attitudes. But we have had some experience in the management of exhibitions, and what is effective as a display; and with this recommendation we hope to do what the drill-sergeant does for the country, to get him out a smart man, and diminish the numbers of the "awkward squad." Let it be borne in mind, it is a "recommendation" only; that no plant possessed "of a firm, elastic, self-supporting stem" will be compelled to be crutched or forced into stiffnesses or ungraceful attitudes; only it will go hard with any specimens, if with this concession on the part of the committee they be shown with dependent, I had almost said despondent, drooping heads. But I augur we shall find neither dependent drooping heads nor despondent hearts on the 24th.

One parting word with "D." of Deal. It is quite true he was not at the meeting, at which this recommendation was adopted—that he has attended no meeting since the first, but it is equally true that he was furnished with a draft proof of the recommendation, and that he favoured his colleagues with no expression of his opinion: a fact surely somewhat suggestive of a lack of candour, or of courage, since now he tells us it involved a "practice" he has "invariably condemned." As to the "straightest sect" of the old school, in which he claims to have been brought up, "D." of Deal, memory has betrayed him; and, as I turn to a discussion which may be found in the volume of *Gossip of the Garden* for 1859, in which "D." was sharply castigated by the late Revs. George Jeans and J. Bramhall for his proposal to drop the classification, greens, greys, or whites, then, as now existing, I cannot but feel surprised at his delusion. But "D.'s" fault then was passed over, almost condoned, because of a suggestion of a meeting of Northern and Southern Auricula growers he made, and the good to be derived from it, as Mr. Jeans explained. And now we are to have another meeting of North and South, and I have little doubt, whatever may be our assumed differences, they will vanish into thin air on the eventual 24th. And, so, thanking you in advance for your consideration, and wishing the meeting may have the attention and success I believe it deserves, I remain, &c., *E. S. Dodwell, 11, Chatham Terrace, Larkhall Rise, Clapham, S.W.*

Apiary.

HOW AND WHEN TO BECOME A BEE-KEEPER.—So many inquiries come to me for the information the above heading indicates that I am led to believe the reply would be useful to many besides my correspondents. Taking it for granted that the would-be bee-keeper is quite a novice, I would advise that he commences with a swarm as early in May as he can get it, although to the middle of June will be in very good time. Two momentous questions now arise: English or Ligurian bees?—straw skep or frame hive? As to the bees let the pocket decide; Ligurian bees cost twice as much as English. I believe them to be the superior variety, but I do not go so far as to say one hive of Liguian will be as profitable as two of the English; therefore, unless the cost is of no consequence, it is better to culture the English. For the hive let it at all events be new, nothing old, stout, or it may perhaps harbor a nefarious germ of the bee plague, "foul brood," which defies the skilled bee-master to eradicate it from his apiary, and to the novice could bring nothing but trouble, expense, and disappointment.

Bee-keeping is not all sunshine, and we must be content to accept losses as well as profits. But to return to our hives: the choice should mainly depend on the kind of attention the bees are destined to receive. If their owner is likely to be too busy or too faint-hearted to make intimate acquaintance with his little labourers, does not wish to investigate their domestic matters, cannot be troubled to watch for all their wants and ailments, but simply desires some honey, and is not particular as to the appearance of the same dainty article, then adopt a large flat-topped straw skep, having a 2-inch hole in the centre of the crown—such a hive as is known as "the Pettigrew skep," well made and roomy, say 16 inches or 18 inches in diameter. The common hives of the South of England

are far too small, and do not give the bees a fair chance to do their duty to their master. To the hive add a stout floor-board, a transverse section of a log of timber makes a very serviceable floor. Surmount with a good watertight roof. The common country covering is an inverted milk-pan, such as is used to set the cream in, but a well-made straw huckle is perhaps better. Remember, a straw hive, being porous, requires shelter from drifting storms, as well as ordinary shelter. Nothing is more injurious than damp, and with a cold, leaking domicile in winter, no stock can thrive.

To those who intend to devote a greater share of attention to the bees, by all means let me recommend a frame hive—it need not be costly. In the summer of 1875, in the columns of the *Gardener's Chronicle*, I gave full instructions how to make a serviceable hive at a cost of about 6s. Moreover, a drawing was given of every piece of wood required, which has enabled many men to set up bee-keeping in frame hives. The British Bee-keepers' Association, at their annual shows, by their offer of medals and money prizes, stimulated the hive-makers to work for the poor man as well as the rich, and now frame hives may be bought at any price, indeed quite as cheaply as well-made skeps with their floor-boards and covers. The adoption of a frame hive gives numerous facilities of observing the bees as a scientific study, as well as a means of obtaining a honey harvest in the best possible condition, and when it is hoped to send the surplus to market the difference in value will be found as great as the produce of a hothouse Vine, gathered, packed and delivered by a skilful gardener, and the same Grapes sent to market by an ignorant labourer. There is no best hive; the man who often obtains an abundant honey harvest has the best hive for him, alter his system and probably his gains would diminish.

The hive, therefore, being procured, next requires stocking. If the straw skep should be the hive of our choice, should be ready and furnished to the bee-keeper who is to supply the swarm, which will doubtless be delivered hived in it, only requiring to be taken home, set down on the stand they are to occupy, and left to their own devices; but if the frame-hive is to be adopted, let the bees be first hived in an ordinary skep, and so brought home to the hive, which, before being ready for its inhabitants, requires some preparation. The object of having frames in the hive is, that the bees should build straight combs within the prescribed space, and that the bees, when in the hive without some guidance, they would be quite as likely to build their combs across the frames as along them: this may be obviated by giving them a straight wax foundation to start their building on. Where the comb cannot be had, a straight line of melted wax poured from a spoon on the same place will answer every purpose—the bees will adopt the guide, and build straight.

The Americans take much more trouble than we do in this particular, for they use a wooden board for the whole frame with a thin sheet of wax beautifully impressed with the foundations of worker cells, thus insuring a minimum of drone comb being built in the hive. The skilful bee-keeper could insure that every cell in his hives should be of worker construction, and would do well, for he may rest satisfied his more careless neighbour will rear drones in their hives to answer all the purposes of his bees. The absence of drones may be induced to a commonwealth—all workers and no idlers. The worker bees, when they make a lot of honey, which would otherwise go to fill the cells. Having safely housed the bees in their hive one thing should never be lost sight of—that is, to feed them if bad weather should immediately ensue, for remember the bees have no stores, and are therefore unable to gather any they must starve. *John Hunter, Eaton Rise, Ealing.*

Garden Operations.

PLANT STOVES.

Since fine-leaved plants became fashionable they are grown more or less by all who have the means. With some few exceptions they are very much more easily managed than flowering subjects, nevertheless there is very great difference in their appearance, and the use that can be made of them for decorative purposes, and when they require the treatment they require from that which they present when indifferently managed. Especially is this the case amongst the softer-growing kinds, such as Calce-

THE
Gardeners' Chronicle.

SATURDAY, APRIL 7, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, April 12. ^(American International Horticultural Exhibition opens.)
Sale of Fine Ferns, Orchids, Plants, &c., at
FIDAY, April 13. ^(Sale of Seeds, Lilium auratum, Orchid, Arancius, &c., at Stevens' Rooms.)

WE have before us a pamphlet which we believe would be read with interest by Vine growers were it readily attainable in this country. It is a brief account of various EXPERIMENTS undertaken for the purpose of obtaining new and desirable GRAPES in the Eastern States of North America. Mr. HASKELL, of Ipswich, Massachusetts, the experimenter in question, set before him as the object to be attained, Vines hardy enough to bear the severe winters of the New England States, which should not be subject to mildew, and which should produce good fruit.

Mr. HASKELL began by selecting various wild species and cultivating them, but without good results. He then tried seeds of the best natives, and selected the offspring for three generations without obtaining a single fruit worth propagating; he grafted native varieties on foreign stocks, and planted the seeds of the native Vines, but without improvement. Inarching in various ways was tried, white Grapes were grown under the foliage of black Grapes, and black under the foliage of white, but the fruits retained each its proper colour, though the texture and quality of the fruit seemed to be changed by the alien foliage. Seeds of Grapes so treated were sown, but yielded no good results.

Cross-fertilisation was then adopted, and more than a thousand varieties were thus raised, the history and parentage of each being recorded. The results from cross-breeding have been much more encouraging than those obtained by other methods, so much so that the American Pomological Society considered several of them to be of excellent quality. Dr. HOGG, who examined some sent over to this country, reports on them as "very excellent." Mr. HASKELL is desirous of making these Vines better known, and to have them tried in various situations, as no doubt some would be much better suited for some situations than for others. It is further hoped that some of them may be of value in resisting the Phylloxera. "It will be observed," writes Mr. HASKELL, "that most of the Vines described are from crosses with what is popularly called the Fox Grape, but accurately it is *Vitis riparia*, a species which is found generally in a wild state only in swamps and on the banks of streams. The *V. vulpina* and *V. Labrusca* are only other names for varieties of the same species, and they do not accurately describe any species, as the pungency on the lips and the foxy odour are not uniformly found in the fruit of either of them. Recent experiments in France (first undertaken in Ireland) have shown that the most effectual eradication of the Phylloxera was by flooding the ground, and thus drowning the insects. As the *V. riparia* flourishes and does best in wet bogs and meadows, even when the roots are immersed in water all the winter, and the soil is saturated all the summer, may we not expect that this trait will prevail in some of these hybrids and make them almost proof against the Phylloxera, especially if planted in wet soil?"

Mr. HASKELL'S perseverance, even though it may not have brought him the results he wished, is by no means thrown away. The general result of his experiments goes to illustrate once

more the advantage of endeavouring to improve what we may call old-established varieties by cross-breeding and otherwise, rather than by attempting to educate wild forms *de novo*. Time and the gradual accumulation of inherited characteristics are thus all gained, though, on the contrary, it must not be overlooked that degeneracy of constitution may be induced by over-cultivation when a little infusion of the original stock may serve to restore vigour. The negative results of the various modes of grafting and inarching tried, are also by no means without value, however discouraging they may have been to Mr. HASKELL.

WE suppose, if there was not a "good deal to be said on the other side," that no one would venture to suggest that the ALBERT MEMORIAL in Hyde Park should be covered with glass. Still no one who has seen what effect London smoke has had upon the statuary portion in the comparatively short time it has been erected, will doubt the desirability of protection. Mr. WILLS has had the boldness of conception to devise, in association with Mr. BEDBROUGH, the architect of the Westminster Aquarium, a plan for constructing a casket in iron, copper, and glass, to enclose the Memorial. As may be seen from our illustration (fig. 69), the design is strictly in harmony with the general architectural design of the Memorial. It consists of an octagonal dome, raised on the central intersection of a four-armed cross—300 feet in diameter, and surmounted by a spire or lantern, the summit of which is 350 feet from the ground.

The principal entrance, which is 25 feet wide, is from Kensington Gore. The archway of this entrance, richly decorated, is carried into the gable, which is filled with elaborate Gothic tracery. The other principal faces of the octagon are similarly treated. Clusters of columns, forming the piers at the intersecting angles of the octagon, are carried up in stages to the springing of the dome, terminating in pinnacles and open-traceried spires. From these piers, at the base of the dome, spring the gables which terminate the faces of the octagon. These are also filled in with floriated Gothic tracery.

East and west of the central building it is proposed to erect wings 350 feet in length by 125 in width, to be devoted to the illustration of the vegetation of the various regions of the world, and of such plants as are specially serviceable to humanity, not only for decorative purposes, but also as supplying articles of food, timber, and the like. THE PRINCE CONSORT'S idea of diffusing knowledge, and of binding different nationalities into one league by the bonds of peace and reciprocal interest, would thus be fittingly illustrated, while Horticulture, as the sister of Art, the handmaid of Science, and of ever-increasing commercial importance, would appropriately play its part. These are the ideas which prompted Mr. WILLS' letter on the subject to HER MAJESTY, who has, as have other members of the Royal Family, expressed satisfaction with the plan advocated by Mr. WILLS, and admiration of the manner in which it is proposed to be carried out. Whether the whole or any portion of the design be carried out or no, is a question of finance to a large extent. In any case the design is so novel and so striking that we have thought it desirable to bring it before the eyes of our readers interested in horticultural structures.

WE are requested to announce that the Council of the Royal Horticultural Society have decided to change the days of meeting from Wednesdays to Tuesdays, on and after the 1st of May next. This step was taken by the Council, in accordance with a numerous signed requisition presented on Wednesday last, and a copy of which we annex—

"To the Council of the Royal Horticultural Society. We, the undersigned exhibitors at the meetings of the Royal Horticultural Society, respectfully call the

attention of the Council to the great inconvenience arising from the meetings of the Society being held on the same day as those of the Royal Botanic Society. This inconvenience has existed more or less ever since the Council altered the meetings from Tuesday to Wednesday; but this year the recurrence of simultaneous meetings and shows of the two Societies is so frequent that we suggest to the Council whether it would not be better for the interests of both the Societies and Exhibitors, that the Council of the Royal Horticultural Society were to revert to the former arrangements. So far as the exhibitors are concerned the earlier day in the week would best suit them, as it would interfere less with the ordinary routine of their establishments."

WE heard at South Kensington on Wednesday that over 4600 persons visited the Royal Horticultural Society's gardens on Easter Monday. The price of admission was 2s., and the amount taken at the gates was £38 18s. 2d.

IT has now been definitely arranged that the exhibition of PLANTS, CUT FLOWERS, BOUQUETS, WREATHS, BASKETS, FRIGED VEGETABLES, and SALADS, by the growers and salesmen of Covent Garden Market, shall be held on Wednesday, April 18, in the gardens of the Royal Horticultural Society at South Kensington. We understand that gold, silver, and bronze medals, with Certificates of Commendation, will be awarded by the Society to the most meritorious exhibitors; and free tickets of admission will be given to all exhibitors. The exhibition will be a novel and interesting one, and it is believed that the whole of the growers and salesmen will accord to the Council their valuable assistance and co-operation; the determination being that, so far as Covent Garden is concerned, the show shall be a great success. Those who may be desirous of exhibiting should communicate with Mr. BARRON, Royal Horticultural Gardens, South Kensington, at once. We also hear that an attempt is being made to get the exhibitors to dine together the same evening at the "Criterion," when it is hoped that His Grace the Duke of Bedford will preside.

MESRS. DOWNIE & LAIRD, of Edinburgh, have lately taken on a long lease a piece of ground about 10 acres in extent, near to their Pinkhill nursery, which, instead of having trench-dug in the ordinary way, they have had very successfully cultivated by the Scottish Steam Cultivation Company. The steam plough was first run over the ground at the depth of 10 inches, this operation being followed by a grabber set at 15 inches, and again by the same implement set at 20 inches, the whole being subsequently harrowed by steam at the rate of 5 miles an hour. This, we believe, is the first time the steam plough has been used for nursery purposes in Scotland.

BARBOSA SERRATIFOLIA is flowering in the Economic-house at Kew, to which an interest attaches from its probably being the only plant of the *Buchu* species now cultivated in this country. It is an erect, thinly branched shrub, with linear-lanceolate leaves about 1 inch long, and pretty pure white flowers. *Buchu* leaves are used in medicine as a slight tonic and aromatic stimulant. Several other plants of interest are also in bloom. The flowers of *Omanthus fragrans*, used for scenting Tea, perfume the house with an exquisite fragrance. *Erythroxylon Coca* must be mentioned, from the great interest it has recently excited. Carefully conducted experiments on its medicinal action have given the most conflicting results, but a preparation is now advertised as "the greatest restorative in atrophical, blood, and exhaustive diseases!" Eight varieties of Tobacco are in bloom, and are considerably ornamental. Others in flower are *Aloe vulgaris*, *Chamerops humilis* (polygamus), and *Peumus Boldus* is about to open. *Drimys Winteri* is ripening fruit, which it rarely does.

As a useful, early, free flowering and handsome FUCHSIA we can strongly recommend Mr. JOHN LAING'S valuable hybrid, the EARL OF BEACONSFIELD. We saw in the Royal Horticultural Society's gardens at Chiswick, the other day, some plants which, after being cut back, broke into flower almost at once, while other varieties were, comparatively speaking, at a standstill. This is a valuable character, and should increase its popularity.

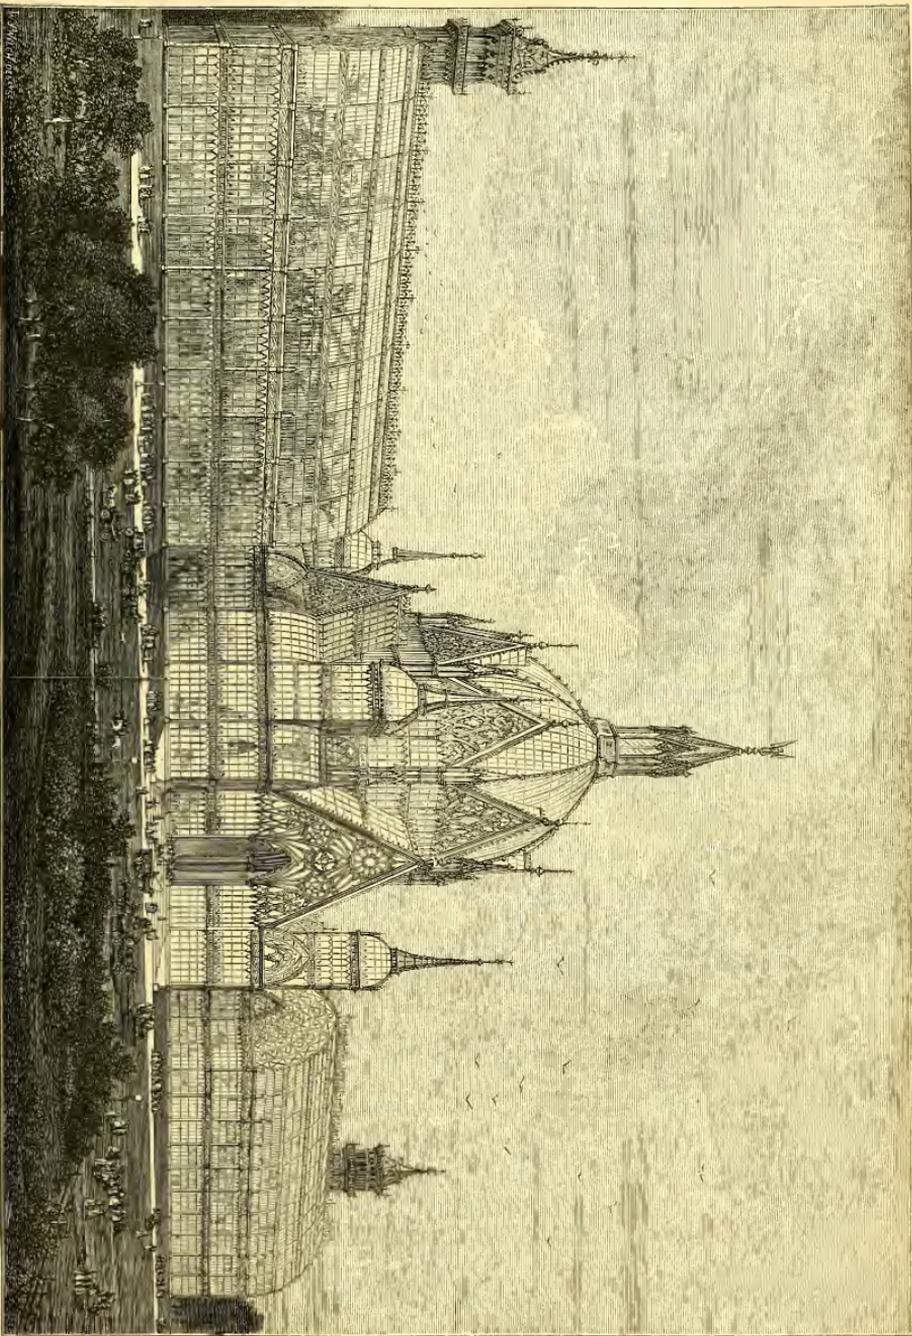

FIG. 69.—MR. WILLS' PROPOSED DESIGN FOR COVERING THE ALBERT MEMORIAL IN HYDE PARK.

— THE MONTH OF MARCH, through which we have just passed, must have been influenced by the prevalent axioms in diplomacy, for it has powerfully sustained the *status quo* in Nature. Literally, as we were at the beginning so we are at the end, and this has indeed proved a remarkable and successful effort in counteracting the possibly disastrous influences that might arise from a comparatively mild winter. As the end of February things bore an unpleasantly premature aspect, and wise people shook their heads when they thought of the storms and frosts that might yet come. Since then five weeks have elapsed, and we see but the most trifling advance in Nature. The prevalent cold winds and occasional frosts of the month have kept the forces in subjection, but yet have most favourably influenced the land, and permitted a vast amount of sowing and planting to be done, so that in spite of the previous excessive rainfall the earth has now largely received her portion of spring cultivation and cropping. The present backward condition of vegetation adds immensely to the chances of a good fruit season. We have the trees of all kinds covered with fruit-buds on well ripened and seasoned wood; we have the humbler bush-fruits promising great yields; we have, indeed, all the material out of which a great fruit crop can be got, and we only need the favourable season, with its temperate atmosphere and occasional softening showers, to bring all things to a glorious and profitable fruition. It has been often remarked that an early spring is by no means a natural result of a mild winter. To an ordinary observer such a result might invariably be anticipated to follow, but the present spring-time proves that the converse is not only possible but natural. The cold that will not come in severity at its expected time will come somewhat attenuated later on, and a late spring inevitably results.

— It is but a short time since we had occasion to announce the death of ADOLPHUS BRONGNIART, and now it is our sad duty to record the death, on the 29th ult., in his seventy-second year, of Dr. ALEXANDER BEAUN, Professor of Botany in the University of Berlin, one of the foremost botanists of his time, and a man of no common order of intellect. Professor BRAUN was perhaps better known as a morphologist than as a descriptive botanist, but his services to science have been of such importance, that it will be universally felt among botanists that a mighty leader has fallen. We shall hope shortly to be able to give some account of his career.

— The first portion of Mr. ELWES' superb MONOGRAPH of the GENUS *LILIUM* has just been issued. To begin at the beginning, we may say that the titlepage, designed by FITCH and executed by WORTHINGTON SMITH, is very elegant and striking, giving good promise of what is to be found within. The work is in folio size, and contains eight coloured plates representing the following species and varieties: *L. philippinense*, Hance's *syn. svenicum*, pomponium, *s. Parkmannii*, *s. Wittii*, *pyrenicum*, *testaceum*, David's—the latter a new species of M. DUCHARTRE, founded on an East Tibetan plant, discovered by the Abbé DAVID, and polyphyllum. Lastly, one of BOURNE'S beautiful Himalayan photographs is given, illustrating the locality where the last-mentioned plant is found. We shall speak more at length of this publication on another occasion, but we cannot delay thus briefly adverting to one of the finest botanical works of recent years. We are glad to learn that there is every probability of a speedy publication of the remaining parts, the drawings being all completed, with one or two exceptions only. As a small matter of detail, it is to be wished that the plates were numbered.

— We learn from ANTWERP that the horticultural and agricultural society known by the name VAN MONS, intend to organise during the RUBENS' *jeûtes* in August next, an horticultural exhibition on a large scale. The exhibition will be open alike to Belgian and foreign exhibitors. The general secretary is M. CHARLES DE BOSSCHER, 57, Rue St. Thomas, Antvers.

— THE HEREFORD SOCIETY FOR AIDING THE INDUSTRIOUS has become the champion of a manure which it calls the MOULE and WITH compound. Mr. MOULE is well-known for his zealous advocacy of the dry-earth system, and Mr. WITH is a chemist who has devised a compound to be added to

the dry earth to increase the manurial value of the earth used in closets, pig-styes, &c. The pamphlet before us details the method of employment of the compound, and speaks in high terms of its efficacy, but is silent as to the nature and composition of the "WITH" addition. The object of the Hereford Society seems to be a philanthropic one, and it carries out its object by supplying to the working classes manure, seeds, Potatoes, &c., of the best quality at moderate prices.

— The following notice is, says the *Bulletin d'Agriculture*, conspicuously set up in the State forests of France, and it is to be desired that a similar plan were followed here also:—

"HEDGEHOG.

Feeds on mice, small rodents (*vongeurs*), slugs, and grubs.

Do not kill a hedgehog.

TOAD.

A farmer's friend; destroys twenty to thirty insects per hour.

Do not kill a toad.

MOLE.

Destroys insectary grubs, mole-crickets, and insects injurious to agriculture. No trace of vegetable matter is ever found in its stomach. Does more good than harm.

Do not kill a mole.

COCKCHAFER (*Hanneton*) and its GRUB (*var. blanc*). Mortal enemy to the farmer. Each insect kills seventy to one hundred eggs.

Kill the cockchafers.

BIRDS.

Each department of France loses annually many thousands of francs by the injuries of insects. Birds are the only enemies capable of contending with them.

Children, do not rob birds' nests.

A reward of twenty-five centimes will be given to every child who brings 500 cockchafers to the *Garde Champêtre* (parish constable).

— A fine specimen of *TESTUDINARIA ELPHANTINE* is flowering in the Succulent-house at Kew. Its strange roostock, combined with twining stems and graceful foliage of the most lively green, give it a most unique appearance. Bomarea Caldasii, growing against the end of the house, is extremely showy. It has about ten umbels, some having as many as thirty open flowers, similar to those of *Alströméria*, and of bright orange colour.

— Dr. TRAILL has been elected Professor of Botany in the University of Aberdeen, in the room of Professor DICKIE, resigned.

— One of the most useful greenhouse plants is *GERANIUM ANEMONIFOLIUM*, a species which is in flower nearly all the year round. It has a caulescent stem a foot or so in height, from the top of which radiate several stalked palmately divided leaves, the divisions themselves twice pinnately cut. The flowers are of a reddish yellow colour.

— In spite of its abominably long name, *ORYCHOPHRAGMUS SONCHIFOLIUS* is a desirable plant for greenhouse decoration. It is a low-growing annual Crucifer, with large pale yellow flowers. It is closely allied to *Moricandia*. Plants of it may now be seen in the cool greenhouse at Kew.

— The business carried on by the late Mr. C. PFERSDORFF, of Paris, at 73, South Row, Kensal New Town, has passed into the hands of Messrs. CROUCHER & BOLLER, the former of whom is the well-known gardener to J. T. PEACOCK, Esq., Sudbury House, Hammersmith. Mr. BOLLER being an employé of the late proprietor.

Home Correspondence.

Lime for Chalk Soils.—On p. 413 a correspondent asks whether soils in which chalk is already present in considerable quantities are ever benefited by applications of lime. Under certain circumstances such soils may decidedly derive considerable advantage from dressings of quicklime, since the benefits arising from the liming of soils may be classed under two distinct heads. The first of these is the supply of the element calcium itself, which while absolutely essential to ordinary vegetation, is frequently deficient in land, the sterility of which may be traced by

analysis to its poverty in this constituent. Chalky soils, it is scarcely necessary to say, abound in calcium, chalk being simply the carbonate of that metal. The benefits conferred by lime on such soils, therefore, are not due to the supply of calcium, but to the chemical action of caustic lime upon the substance of the soil, this chemical action being the second head above referred to. Quicklime, when slaked, produces a substance of a granular condition, ultimately absorbing carbonic acid from the air and becoming transformed into carbonate of lime, identical in composition with the chalk already in the soil, but in a much finer state of division and more readily soluble for the supply of plant food. It is, however, before assuming the carbonated state that the lime does the better part of its work, by aiding the destruction of organic matters in the soil and rendering part of their nitrogen available to the plants, reacting upon the silicates present in the form of clay, and setting free alkalies previously locked up from the roots by their peculiarly insoluble forms of combination. It may be added, that the mere fact that a soil is situated on a subsoil of chalk is no guarantee that the soil itself should contain even a fair proportion of lime. Lime, as farmers well know, shows a peculiar disposition to "settle," unless frequently brought up to the surface, and it thus not uncommonly happens that a soil gradually becomes sterile, without any obvious cause, its situation on the surface, perhaps, of a chalk hill being sufficient to avert from an inexperienced mind the idea of its being deficient in lime. In such cases a chemical examination in the laboratory will often show that to settle 6 or 7 inches, or more, of the surface soil of a chalky soil having gradually caused that substance to settle in or on the subsoil. Such cases, of course, occur more frequently on pasture than on arable land, as the disturbing influences of the plough are absent. Such pasture land has fallen into this condition may be frequently restored to fertility by ploughing a couple of inches deeper than usual, without any fresh application of lime. *Bernard Dyer, F.R.S., Laboratory, 17, Great Tower Street, London, E.C.3.*

Bananas.—It is said that Bananas are usually cut and hung up to ripen, or even in some cases buried for that purpose, but the fruit of *Musa Cavendishii* gets the better of this, and will ripen on the stalk with the gentlest twist. When the central fruit stem is cut across, it is a strong odour resembling that of a Cucumber. *T. T., Culmpton.*

Lilium giganteum.—Having seen a few remarks on the growing of this Lily, I beg to say that the bulbs I have raised on January 3, 1877, in turf loam, and in 12-inch pots, four bulbs in one each, and they have flowering spikes now 18 or 20 inches long. They will flower in pots as well as where planted out, and make a fine show for a conservatory or greenhouse. *F. May, Gr., Duddell's, Bangor.*

Mandragora microcarpa.—I enclose an abnormal blossom (two united) from the plant of *Mandragora microcarpa* in my garden here, which still continues freely flowering, uninjured by any of the severe weather we have had since I sent you the notice of it printed in the *Gardener's Chronicle* of February 17, p. 212, in which I find that by a misprint it is named "*macrocarpa*." I enclose also a blossom of *M. officinalis*, which did not come into flower until some weeks later than the other. Its leaves seem to be more numerous than those of *M. microcarpa*. The plants are larger than in *microcarpa*, and the flower and leaves have a light yellowish tint, very different to the darker purplish tint of that species. *W. C. Trevelyan, Wallington, Newcastle-on-Tyne, March 3.*

Watering Plants.—We hear a deal now-a-days about the "cold-water" system for watering hot-houses, Vines, &c. I shall deem it a favour, and I think the horticultural community will be greatly benefited, if some of your numerous correspondents who are plant and Grape growers will kindly give their views and experience about the matter. It is said that our best nursery propagators use cold water for their most tender cuttings and plants. The late Mr. J. K. Pearson, Chilwell, one of the best Grape and Vine growers we ever had, and who well understood the subject, told me he used quite cold water for his Vines and choice plants. Every one who saw the Grapes produced at Chilwell some eight or ten years since can testify to their excellence; also the pot Vines of late years. On the other hand, we read from the *Gardener's Chronicle* of March 24 that Mr. Hunter, the grower and producer of the most prodigious and best Grapes of the day, waters his Vine borders with warm water. The system of cultivation pursued by Mr. Hunter, with respect to the roots, shoots, laterals, &c., is a counterpart of Mr. Pearson's, but one used cold water, the other uses warm water. Are we to say that one system is as good as the other? We know that if we boil water it is deprived of the

gases essential to sustain animal life, and that if live fish are put into it they soon die. Would Mr. Hunter be able to increase the weight of his fine productions by using cold water instead of warm? *B. Wadley, Gr. to Lord Mildred, Birdslow House, York.*

Hybrid Agaves.—Mr. J. G. Baker's interesting papers on the large and intricate genus *Agave*, like all his other monographic papers, must be read with service alike to botanist and cultivator. Observations on the seedling variations of the different species are, however, most desirable, as in some cases they are very variable. In *A. (Littrea) geminiflora*, for example, we get smooth and ridged forms, and also large-growing and dense-growing variations. *A. perbella* is said to be a hybrid raised by M. Kerchove, its parents being *A. xylinoantha* and *A. univittata*. A. Taylor is an English hybrid, its parents being *A. densiflora* and *A. geminiflora*. Appended is a list of hybrid varieties offered in the catalogue (1877) of MM. Nardy et Cie., Establishment Horticole de Salvador, Hyères, and these gentlemen very wisely add the percentage of their numerous insects which struggle among their plants, in their eagerness to obtain the honey-like fluid so copiously furnished by these plants when in flower. Even if no insects be present cross-fertilisation must be the rule in this genus, seeing that all the species have yet examined are protandrous, the pollen being shed, and the anthers hanging down limp and lifeless, before the stigma is fully developed and receptive. I pointed out this fact in these columns in January, 1870; and Dr. Engelmann, of St. Louis, who has just superintended the raising of their native habitats, also alludes to the subject. —>

A. chilipensis x *xylinoantha* *A. Verschaffeltii* heterodon
A. latifolia *A. heterocarpa* *Tonielliana*.
A. chilipensis x *Dasyllaria* *A. Verschaffeltii* x *micrantha*.
A. chilipensis x *Tonielliana* *A. Verschaffeltii* x *schiligeri*.
A. Verschaffeltii x *A. Verschaffeltii* x *xylinoantha*.
A. micrantha x *Sataris*. *A. Verschaffeltii* x *longifolia*.
A. xylinoantha x *xylinoantha* *A. xylinoantha* x *densiflora*.
micrantha.

In a state of Nature *Agaves* must nearly always be cross-fertilised and very often hybridised by the numerous insects which struggle among their plants, in their eagerness to obtain the honey-like fluid so copiously furnished by these plants when in flower. Even if no insects be present cross-fertilisation must be the rule in this genus, seeing that all the species have yet examined are protandrous, the pollen being shed, and the anthers hanging down limp and lifeless, before the stigma is fully developed and receptive. I pointed out this fact in these columns in January, 1870; and Dr. Engelmann, of St. Louis, who has just superintended the raising of their native habitats, also alludes to the subject. —>

Stautonia hexaphylla.—Mr. Bland, gr. to Graham Smith, Esq., Cranbourn Court, Windsor Forest, called my attention a few days ago to a plant of *Stautonia hexaphylla*, which was blooming very freely. The habit was that of a *Stautonia*, and it much resembles in its form of flowering *Clematis Flammula*, only that the flowers are larger. I think it would be very useful for bouquet work used in the bud, and an excellent conservatory climber, being a very rapid grower and free bloomer. *S. Johnson, Royal Nurseries, Ascot.*

The Lilies at Heatherbank, Weybridge Heath.—As some of my gardening friends forboded all manner of evil to Lily bulbs from the continued rain of autumn and winter, and as the shoots of most Lilies are now above-ground to speak for themselves, will you allow me to say that in the gardens here they are more than usually strong and healthy, and that blank spots are few and far between. Owing to a pressure of correspondence at the time, I could not superintend the raising of their native habitats, also alludes to the subject. —>

The Staying Qualities of the Flowers of the Poinsettia pulcherrima plenissima.—I have much pleasure in confirming your correspondent of last week on this matter. It is one of those valuable specimens that impressed me from the first. Most cultivators know that the fine specimen *P. pulcherrima* is somewhat evanescent at the best. No doubt the durability of all *Poinsettias* bracts turns a good deal on treatment, but finding under identical treatment a difference of months in the duration of this new variety, shows that it has far better staying powers than the old one; in fact, this flower is a gradual development, and building up, on, or over, of bract after bract. From this it is peculiarly alone, it must not continue longer in flower than a variety which makes one spreading of bracts only. But independently of the addition of new parts the individual bracts last much longer. In addition to our strong plant which lasted several months, all the other specimens I saw while some of them were under 6 inches high. Observing the tenacity with which the single rows of bracts adhered to these small plants, I was called to order by a contemporary for venturing the assertion that, with a succession of plants, we might readily have *Poinsettias* from November to May. I confess that when that was written, I did not expect to be able to chronicle the fact that we have still a small

plant of *P. p. plenissima* in flower (April 2), that was in bloom last November, and the bracts look as if they might continue fresh for some time longer. With such a fact before us, *Poinsettias* even all the year round hardly seem an impossibility. For these plants are so tenacious that they have been long exercised as yet. If instead of cutting them back the bracts merely are cut off and the plants are subjected to a brisk heat (I am now writing of the old varieties) they will break into one or more secondary coloured forms, assuming that *P. pulcherrima plenissima* also has this quality, it might and will surely be possible, by taking advantage of the power of second flowering, and also by keeping up a brisk supply of succession plants, to have it in flower all the year round. I would earnestly recommend that without any special treatment a vision of *Poinsettias* may now be enjoyed from foggy November to balmy May, thanks to *P. p. plenissima*. *D. T. Fish.*

Dendrobium Pierardii.—I was much pleased on reading the account given in your paper about the above old-fashioned plant, which, like many other good things, are neglected and disregarded, not because they are unworthy of special care and attention, but because they never claim it. I have been long glowing characters that we forget the real merits of many of our old favourites. It is only now and then, when unusual care has been bestowed upon them, and that they attain such a size as will afford plenty of space to every collector of flowers, that we see them take a commanding position, and win honours and draw forth the admiration and praise of the floral connoisseurs who appreciate the beautiful wherever found. Like many others, *D. Pierardii* is not very common in our gardens, and I have never flowered individually would not compare favourably with such lovely forms as *D. Devonianum* or *D. Wardianum*, or many others among the new or old, nor could *Pierardii* compare with plants of other orders, but it is every way worthy of our notice, taking size and number of blooms into account, but there is a distinctness of colour, a lightness of texture, an unobtrusive beauty in *Pierardii* which has been simply fascinating to me and to others, and so well adapted for either stove or intermediate-house. Many years ago I grew a very large plant of this variety, which made growths quite 4 feet in length, and which produced a wonderful profusion of bloom. I had many plants of it, some in pots, some in the open air, and I have never seen any other variety which grew more than was required to grow any little stove plant, but the large plant alluded to, and which surpassed all the others, was grown upon a very large scale, and produced half a dozen feet (I suppose) in length, and three in living state. I fastened six nice pieces with roots to four leads, covering the roots in the usual way; whether the Fern afforded nourishment to the Orchid roots, I do not know, but I never saw anything grow as it did, or flower like it. I have many some charming effects by placing a large pan of *Gesnera cinnabarina*, or *G. refulgens*, or *G. ignea*, full of their bright glowing colours, for a centre, and hanging some logs of *Pierardii* in bloom round them, which indication the friends of *Maidenhead* would recommend my brother gardeners to try. I once had a variety of *Pierardii* from Chatsworth—we called it *latifolia*; this I have grown 7 feet in length; and another miniature one called *cauculatum*, neither of which I have seen for some time; and there is yet one more lovely little Orchid, *Dendrobium pulchellum*, which when well done is a perfect beauty. *William Payne, Covent Garden House, Tarrant.*

The Potato Fungus.—Mr. Smith's proposal to microscopically examine guano to look for germs of the Potato fungus will create much diversion, and excite not a little scepticism. It will probably be said that guano has been analysed and examined so many times by analytical chemists, that it is hardly more feasible than the notion still so strongly entertained by some of our legislators that the Colorado Potato-disease might be imported either in a cargo of Potatoes: indeed the one is as probable as the other is unlikely. It may be that when the first importers of guano to replace the article was manually of a much purer character than it now is, and did not undergo so much mixing or manipulation. Of course that would greatly favour the introduction of the pest, and assure that

the guano was the agent of introduction, its use had already become sufficiently common in 1844 for the rainfall of that summer to bring about the great calamity which startled the entire community. Now supposing that Mr. Smith should succeed in finding in any samples of imported guano sent him evidences of the fungus spores it will afford most conclusive proof that the disease might have been introduced in that way. That further, it might also be so long as the importation of Peruvian guano continues in its present form the disease can never be stamped out. It is doubtless in some such mysterious fashion as this that we have introduced the Hollyhock and other apparently exotic fungi. It will then remain for Mr. Smith to discover first whether the fungus-spores can be destroyed by heat, and at how low a temperature, and also to test whether, if such is the case, the guano can be exposed to the same degree of heat without losing any of its natural properties. In this way only does it seem to me that imported guano can be rendered innocuous as far as this particular disease is concerned. Assuming that these spores are found—further, that it is deemed necessary to take some drastic measures to prevent the introduction of guano in its raw state, and that it can be shown that a subjection to a high temperature at once destroys the fungus germs and does not detract from the quality of the guano, it will be important to import the guano subjected to a great heat as saving cost in transit and for storage. It would be best perhaps in the long-run if Mr. Smith's surmises should be found baseless, as if shown otherwise an unfortunate pest would be introduced into our gardens. It is a good or bad, it is best to know the truth, and in his efforts to find it in relation to this destructive disease Mr. Smith merits our heartiest thanks. *A. D.*

RELATIONS BETWEEN PLANTS AND INSECTS.

(Concluded from page 408.)

STARIS.

The genus *Staris* (a small beetle allied to *Cantharis*, the blister-fly, and to the oil-beetle) is parasitic to a kind of bee (*Anthophora*) which excavates subterranean galleries, each leading to a cell. The eggs of the *Staris*, which are deposited at the entrance of the galleries, are hatched at the end of September or beginning of October, and M. Fabre not unreasonably expected that the young larvae, which are active little creatures with six serviceable legs, would at once enter their way into the cells, and fasten upon their victim: till the month of April following they remain without leaving their birthplace, and consequently without food; nor do they in this long time change either in form or size. M. Fabre ascertained this, not only by examining the burrow of the *Anthophora* but also by direct observations of some young larvae kept in captivity. In April, however, his captives at last awoke from their long lethargy, and hurried anxiously about their prisons. Naturally inferring that they were in search of food, M. Fabre supposed that this would consist either of the larvae or pupae of the *Anthophora*, or of the honey with which it stores its cell. All three were tried without success. The first two were neglected, and the larvae, when placed on the latter, either hurried away or perished in the attempt, being evidently unable to deal with the sticky substance. M. Fabre was in despair: "Jamais experience," he says, "m'a éprouvé pareille déconforte. Larves, nymphes, cellules, moi, je vous ai tout offert; que voulez-vous, bon? Je n'ai pas manqué à moi-même, car la lumière est venue de mon paysan, Newport, qui ascertained that a small parasite found by Léon Dufour on one of the wild bees was in fact, the larva of the oil-beetle. The larvae of *Staris* much resembled Dufour's larvae; acting on this hint M. Fabre examined many specimens of *Anthophora*, and found on them at last the larvae of his *Staris*. The males of *Anthophora* emerge from the pupae sooner than the females, and M. Fabre ascertained that, as they come out of their galleries, the little *Staris* larvae fasten upon them. Not, however, for long; instinct teaches them that they are not yet in the straight paths of development; and, watching their opportunity, they pass from the male to the female bee. Guided by these indications M. Fabre examined several cells of the *Anthophora*; in some, the egg of the *Anthophora* floated by itself on the surface of the honey, in others on the egg so on a mit sat the still more minute larvae of the *Staris*. The mystery was solved. At the moment when the egg is laid the *Staris* larva springs upon it. Even while the poor mother is carefully fastening up her

cell her mortal enemy is beginning to devour her offspring; for the egg of the Anthophora serves not only as a raft, but as a repast. The honey which is enough for either, would be too little for both; and the Sitaris, therefore, at its first meal, relieves itself from its only rival. After eight days the egg is consumed, and on the empty shell the Sitaris undergoes its first transformation, and makes its appearance in a very different form.

The honey, which was fatal before, is now necessary; the activity, which before was necessary, is now useless; consequently, with the change of skin, the active, slim larvæ changes into a white fleshy grub, so organised as to float on the surface of the honey, with the mouth beneath and the spiracles above the surface: "à gâche à l'enfoncement du ventre," says M. Fabre, "la larve est à l'abri de l'oxygène"; in this state it remains until the honey is consumed; and then the animal contracts, and detaches itself from its skin within which the further transformations take place. In the next stage, which M. Fabre calls the pseudo-chrysalis, the larva has a solid corneous envelope and an oval shape, and in its colour, consistency, and immobility reminds one of a dipterous pupa. The time passed in this condition varies much. When it has elapsed the animal moults again, again changes its form; after this it becomes a pupa, without any remarkable peculiarities. Finally, after these wonderful changes and adventures, in the month of August the perfect Sitaris makes its appearance.

In fact, whenever in any group we find differences in form or colour, we shall always find them associated with differences in habit.

To return, however, to my principal subject, the sphinx caterpillars. For such an inquiry as this, the larvæ of Lepidoptera are particularly suitable, because they live an exposed life; the different species even of the same genus often feed on different plants, and are therefore exposed to different conditions; and last, not least, because we know more about the larvæ of the Lepidoptera than of any other insects. The larvæ of ants all live in the wet; they are fed by the perfect ants, and being therefore all subject to very similar conditions are all very much alike. It would puzzle one to find good naturalists to determine the species of an ant larva, while, as we all know, the caterpillars of butterflies and moths are as easy to distinguish as the butterflies and moths; they differ from one another as much as, sometimes more than, the perfect insect.

There are five principal types of colouring among caterpillars. Those which live inside wood, or leaves, or underground, are generally of a uniform pale hue; the small leaf-eating caterpillars are green, like the leaves on which they feed. The other three types may, *si parva licet conferre magna*, be compared with the three types of colouring among cats. There are three ground cats, such as the lion or puma, which are brownish or sand colour, like the open places they frequent. So also caterpillars which conceal themselves by day at the roots of their food-plant tend, as we have seen, even if originally green, to assume the colour of earth. The spotted or eyed cats, such as the leopard, live among trees; and their peculiar colouring renders them less conspicuous by mimicking spots of light which penetrate through foliage. Lastly, there are the jungle cats, of which the tiger is the typical species, and which have stripes, rendering them very difficult to see among the tall grass which they frequent. It may, perhaps, be said that this comparison fails, because the stripes of tigers are perpendicular, while those of caterpillars are either longitudinal or oblique. This, however, so far from constituting a real difference, confirms the explanation, because in each case the direction of the lines follows those of the foliage. The tiger, that walks horizontally on the ground, has transverse bars; the caterpillar which clings to the grass in a vertical position, has longitudinal lines, while those which live on large veined leaves have oblique lines like the oblique ribs of the leaves.

Thus then, I think, we see reasons for many at any rate of the variations of colour and markings in caterpillars, which at first sight seem so fantastic and inexplicable. I should, however, produce an impression very different from that which I wish to convey, were I to lead you to suppose that all these varieties have been explained or are understood. Far from it, they still offer a large field for study; nevertheless I venture to think the evidence brought before you to-day, however imperfectly, is at least sufficient to justify the conclusion that there is not a hair, or a

line, not a spot or a colour, for which there is not a reason, which has not a purpose and a function in the economy of Nature. *Sir J. Lubbock, in the Society of Arts Journal.*

AGRICULTURE AND GARDENING IN COSTA RICA.

Dr. POLAKOWSKY contributes the first of some articles on these subjects to the *Monatsschrift des Vereins zur Beförderung des Gartenbauers* for February, from which we extract the following notes. The mineral wealth for which the country was formerly celebrated lies undeveloped, but the country fully deserved the name of "rice-land," from the fertility of its soil and the great productiveness of cultivated plants. In the value of the Coffee exports it surpasses the "Queen of the Antilles," the beautiful Cuba, where it amounts to 21 dollars annually per head of the population. In 1875 the amount for Costa Rica, with a population of 180,000, was 4,295,333 dollars, or 23 6 dollars per head. No other part of Spanish America can show such statistics, which furnish good evidence of the fertility of the soil and the industry of the people. The number of cultivated plants in the country is limited, only a few of the most profitable being grown on a large scale. Even Beans and Maize raised are not sufficient to supply the demand. Gardening proper cannot be said to exist, and the gorgeous Orchids and other floral treasures of the country scarcely receive a glance. Very rarely some of the Indian women bring wreaths of them to the market of Cartago. But if one exhibits any interest in such things, and employs a person to collect some, and bring them to the house, one must pay enormous prices, although they cost the collector absolutely nothing. On the other hand, the most varied and exquisitely flavoured wild fruits may be had for ridiculously small sums. The hedges enclosing the haciendas were found to be the richest in plant life, and furnished the collector with a large proportion of his treasures.

There is usually a ditch running parallel to it, and the weeds are allowed to grow undisturbed. The common hedge plant near San José is a species of *Erythrina*. Stout branches are stuck in the ground, and they quickly root, and form a dense fence. Another occasionally used are the stems of the genera *Agave*, *Carex*, *Datura*, *Yucca*, *Lantana*, *Amorpha*, *Euphorbia*, of the *Croton* group, and very commonly a Rubiaceous shrub with small leaves, inconspicuous flowers, and large thorns. A few things are carefully cultivated in the gardens, such as various species of Capsicum, Tomatos, and, more rarely, the Egg plant. The former, under the name of Chile, is used as a condiment in nearly all dishes. Our common Watercress is very highly esteemed, and frequently cultivated. There are two German gardeners in the country, one of whom, Mr. J. Carmigol, has been in the country twenty-three years, and is well acquainted with the vegetable productions of this little-known country. He has a beautiful large garden near the capital, well stocked with various indigenous and exotic fruits and vegetables, as well as some ornamental plants. Varieties of the Cabbage tribe degenerate in a few years, and it is necessary to procure fresh seed from Europe.

The method of cultivating the Coffee tree here differs from that practised in any other country, and the result produced is a rational method. The ground consists of the great central mountain plains, the only regularly cultivated and inhabited part of the Republic; and the soil consists of the decomposed volcanic rock forming a clayey loam mixed with a large portion of decayed vegetable matter. The climate is the most regular and agreeable in the world; and the greatest difference between the temperature of the hottest and coldest day at San José, based upon ten years' observations, is less than 20° Fahr. The mean temperature for 1875 was 70° Fahr. From the beginning of May until the end of October it rains almost daily, and from the middle of December to the middle of April only occasionally.

It is the practice to raise the Coffee trees from seed, because the tap-root of the seedling penetrates the soil to a considerable depth, and enables the tree to withstand the dry season without injury. They are planted in rows, interspersed with Bananas for shade during the first two years' growth. Between the rows are shallow ditches, and the greatest care is

exercised in keeping the weeds under, and the removal of epiphytical and parasitical plants. Labour is very dear, and, therefore, the cost of production is rather high. Nevertheless, the clear profit, after all expenses have been paid, including tending the plants during the first three years, fluctuates between 25 and 25 per cent. This is in the most favourable localities, on the plateaus at an elevation of between 3000 and 4000 feet. The quality of the Coffee leaves nothing to be desired, and it is greatly in request in England and America for its fine aromatic flavour.

NORTH AMERICAN OAKS.

SOME months ago I contributed to the *Gardener's Chronicle* some notes on hardy shrubs and trees at Kew, under the title of "Half-hours at Kew." By some mischance those relating to North American Oaks were lost, and not having time then to replace them the article on Oaks appeared short of this part. Quite recently the lost notes turned up. Perhaps they may still be worth publishing. Doubtless much more might be said about the west coast ornamental trees, but I prefer leaving the notes as they were originally written. In the spring I shall probably visit all the plantations again, for some additional notes on the same subject.

The next group bears the name of Willow Oaks in American books, and comprises three or four species and several hybrids or varieties. *Q. Phellos* has lanceolate smooth leaves, tapering towards both ends, and very much like those of a Willow, but in habit of growth this species more resembles our native Oaks, having very crooked branches and short shoots, with the leaves clustered near the ends. Introduced in 1723. A large tree of this species may be seen about midway on the left-hand side of the walk leading from the south end of the Succulent-house to the lake and No. 1 museum. *Q. aquatica* is an allied species, with ovate lanceolate leaves. There are several small trees of this species in various parts of the grounds, one near the Temple of the Sun. *Q. laurifolia*, regarded as a variety of *A. aquatica*, has ovate leaves, 4 to 6 inches or more in length, rather thin in texture. It is a handsome and very distinct form. *Q. nigra* and *Q. imbricaria* belong to this group of species, which are not remarkable for ornamental character. *Q. heterophylla*, of which there are several large bushes in the plantation, is supposed to be a hybrid, with ovate lanceolate leaves. It has almost coriaceous shining leaves of very irregular shape, being linear lanceolate or variously lobed; sometimes there is a single odd lobe on one side, sometimes one on each side, sometimes two on one side, and only one on the other, and so on. *Q. falcata* belongs to a small group in which the mature leaves are clothed with a short dense grey pubescence on the under surface. The leaves of *Q. falcata* taper towards the base, and are deeply three or five-lobed in the upper half, the lobes bristle-toothed, and more or less curved. This grows in dry or sandy soil, as also *Q. Phellos*; *Q. palustris* and *Q. aquatica* in wet places, bordering streams and ponds; *Q. coccinea* inhabits rich woods; and *Q. rubra* is found in rocky woods. Another group is called the Chestnut Oaks, but although there is a general resemblance in their leaves to those of the Sweet Chestnut, it is not so marked as in the case mentioned above, and in some others not in cultivation. *Q. Prinus* and *Q. Prinus discolor* (bicolor) belong here. There are several trees in the low plantations. Among the latter the names and the same form I believe, is also called *Q. alba*. Whatever may be its proper application, it is readily distinguished from all others. In the first place the trunk and tufts of short, dead twigs on the main branches bear a wonderful resemblance to old Hazel trees; but the leaves are very different, and larger than those of any other Oak in the plantations, being a foot long by 9 inches broad in some specimens. They are somewhat ovate in outline, and clothed with soft, white down on the under side. Passing by a group which forms deserving of comment I must conclude with a mention of the hardiest of the North American evergreen species, *Q. virns*. This is the Live Oak of the Americans inhabiting the coast of Virginia and the States southward. It has oblong, coriaceous leaves, hoary beneath, and is one of the most valuable timber trees in the South, dwindling down to a shrub in its northern habitats. Though not so ornamental as many evergreens we have, it might be planted for variety on the south and west coasts. There is yet

lanes but attractive group of plants, which included, besides various Orchids and Palms, some nice flowered plants of the useful *Erica ovata*, and the newly discovered white *Azalea imbricata*.
 First-class Certificates were awarded to Messrs. Veitch & Sons for *Anthurium Scherzerianum* Wardii, the magnificent variety which was formerly in the possession of the late F. G. Wilkins, Esq., and which now bears a new name, as its name has been changed by the late Mr. Nephrolepis DuRoi. To Messrs. Ross & Son for the beautiful *Pultenea rosea*, more fully noticed in another column. To Mr. R. Clarke, Twickenham, for *Cyclamen rotundum* var. *Brilliant*, an intense deep red crimson flower of great beauty. To Sir Trevor Lawrence, Bart., M.P. (Mr. Spyers, gr.), for *Dendrobium sculatum*, a very fine white-flowered species, with broad petals and sepals, and a distinct orange blotch on the lip. To Mr. R. Dean, Ramsgate, Kent, for *Primrose* named *Brilliant*, a large finely-formed flower of a rich deep maroon-crimson colour; and to Mr. C. Noble, Bagshot, for *Clematis Aurora*, a seedling semi-double-flowered variety of quite a new colour—pink shaded with purple. Second-class Certificate was awarded to Sir Trevor Lawrence for a fine variety of the sweet-scented *Dendrobium barbatulum*, named *grandiflorum*; and Botanical Certificates were voted to Messrs. Veitch & Sons for *Sarcocolla* var. *Golden Betty*, but diminutive Orchid from Australia, believed to be flowering now for the first time in England; and for *Panax laciniatum*, a beautifully cut-leaved plant.
